### ABSTRACT

According to the World Health Organization (WHO), breast cancer diagnosis is the main cause of cancer death among women in the world. Breast cancer occurs generally in world especially underdevelopment and developing countries. From the clinical point of view, mammography is still the most effective diagnostic technology, given the wide distribution of the use and analysis of these images. The main propose of this paper is to detect and classify mammographic injuries using the regions of attention of breast images. This research work proposes decomposing of each image using Enhanced fuzzy c means (FCM) based algorithm and classification by using local linear radial basis functional neural network (LLRBFNN). Further to enhance the performance of accuracy by controlling parameters of level set evaluation are considered from the results of fuzzy clustering. This approach will combine image and shape of surface features, which can be applied for detection and classification of breast cancer diseases. The result of this research will encourage, the best methods needed to detect different classes of breast cancer such as benign or malignant.

**Keywords:** Fuzzy c means, k-means, Radial basis function network, Multilayer neural network

## INTRODUCTION

Cancer is a leading cause of the unintentional death in the worldwide which is estimated 2.09 million deaths of people per year in 2018 G.C [1-2]. Breast cancer occurs almost entirely in women, had applied deferent technologies such as multilayer perceptron's (MLP), and probabilistic neural network [3] researched on "Wisconsin breast cancer" dataset. It is observed that the neural ensemble based detection (NED) are the most precise model for breast cancer classification [4]. "Radial basis functions (RBF)" represents substitute approach to "MLP's" in universal function approximation [5]. Early technologies use for detection of breast cancer images are: X-ray, Ultrasound, and Computer Aided Tomography (CT), magnetic resonance imaging (MRI) and mammogram that are seen one by one under background.

E. Mammography is one of the greatest current methods for finding of breast cancer. It has been recognized effectively to lessen mortality as much as by 30% [6]. Mammography has false negative rate of 10%-30%, false positive of 10%. Over 90% of breast cancer could be detected by mammography. The mammography machines is utilized to spot the cancerous tumor and eliminate it before the formation of metastases. Multiple factors affect accuracy of mammography are breast density, radiologist experience and body habitus. However, the primary signs for breast cancer challenging separated abnormalities scene due to contrast breast tissue [7]. Based on contrast breast tissue mammogram have been limited to below 40 aged women and pregnant women which can hide a tumor. There are several techniques available in the literature for the detection and classification breast cancer. However, clearly detection and classification of the breast cancer there are great challenge. Motivated by this, the development of new algorithms for local linear radial basis functional neural network method is very important for clear identification in to benign and malignant breast cancer detection. The aim of this paper is to proposed new efficient system for breast cancer classification. The remaining part of the paper is organized as follows section 2 presents related work and back ground of research work, section 3 presents the material and methods which includes the explanation of the FCM based algorithm, LLRBFNN model section 4 presents results and discussion and section -5 presents conclusion followed by reference.

### Related work

The initial pre-processing of mammogram leads to eliminate the noise, from the mammogram image [8, 9]. The filtering, segmentation, features extraction, features selection and classification are one type of transform based on shape features to increase the contrast of images into benign and malignant cases [10]. The regular features are also called as morphological shape features and provides a detail description of features in this category [11]. Accuracy scale rises the redundant data due to that the Computer-Aided-Diagnosis has been proposed for the medical diagnosis [12].

Segmenting mass regions computing texture features based on gray level co-occurrence matrix (GLCM) [13]. BPNN classifier has been trained to decrease the number of false positives executed the elimination of FP segments using shape analysis. Used LBP for on behalf of the textural properties of the masses [14]. The regions of cancer tissues are identified by filtering, DWT (enhancement), thresholding (feature extraction) and classification is done by SVM Classifier. MIAS db (75 images) is used for the purpose and achieved 88.75% accuracy [15]. The intensity features are extracted and computed to calculate volumetric values. Detection by using Gabor filter (feature extraction), histogram equalization (enhancement) by k-means clustering algorithm with MIAS db dataset provides 99% accuracy [16]. Using sequential floating forward (SFFS) as feature selection and PNN method the classification is also achieved [17]. Detection of tissues from mammographic images by utilizing wavelet neural network and classification by using particle swarm optimized neural network (PSO-WNN) with MIAS db achieved 93.67% accuracy [18-20]. The radial basis function neural network (RBFNN) [21], convolution neural network [22], "general regression neural network (GRNN)" [21], "probabilistic neural network (PNN)" [33], resilient back propagation neural network and hybrid with fuzzy logic [21]. According to [24] a supervised artificial neural

network and achieved accuracy of trained neural network to be 82.21%[25]. The accuracy of GLDM + SVM, Gabor Filter + KNN and PNN methods results 95.83%,71.83%and 92.5% respectively[25]. Szilagyi et al. [30] proposed enhanced FCM algorithm (EnFCM). The parameter  $\alpha$  (adjustable) in EnFCM improves segmentation results. This paper presents segmentation based on FCM and classification by machine learning model to show that greatness of the proposed LLRBFNN model.

## MATERIALS AND METHODS

### METHODOLOGY

Different methods were used to investigate detected and classified breast cancers. This paper proposed new method, as LLRBFNN model.

#### General Block Diagram Proposed Method

The attained system was designed based on general block-diagram of this method was followed. Breast cancer was detected and the exact point of scheme was showed by new fuzzy mean segmentation and classified as benign and malignant by local linear radial basis function neural network depending on the following steps of diagram.

#### Implementation of Research Work

The flow chart of research shown for detection and classification of breast cancer disease. In the first phase (i) the input image is segmented by EnFCM techniques, (ii) the statistical features are extracted from images (iv) The LLRBFNN has been trained by least mean square algorithm to differentiate the diseases from the healthy and non-healthy tumors. Mammogram input images identified potential abnormalities and segmented color image and regions of a contrast margin [29]. The systems use image processing correlation and de-correlation algorithms analyzed mammograms help of the histogram and scattering selected variables to plot.

#### Filtering Method

Image filtering used to translates an input image to its smoothed variety, where small intensity difference between neighboring pixels was minimizing by edge detection and removing noise. The goal edge detection and removing noise in filter techniques were smoothing image. The two filtering method linear filters and nonlinear filters are based on its scheme, in linear operations addition and constant multiplication, whereas nonlinear operations, minimum value selection used.

#### Removing Noise

Smoothing filter to minimize gray-level difference among neighboring pixels in which the resulting image becomes smooth and a median filter can remove salt-and-pepper noise. Gaussian filter used to reduce the amount of noise present in a signal at small value of the variance, wiener2 performs more smoothing value and a random, Gaussian distributed noise value, which is using Gaussian noise with a fixed variance. The adaptive mean filter used as preserved edges and other high-frequency parts of an image using a Weiner filter this noise can be reduced to very much extent.

#### Enhanced Fuzzy C Means Segmentation

Binary images are used for difference between dark regions and bright regions. Segmented colors in an automated fashion using the L\*a\*b\* color space.

The EnFCM algorithm achieved by adding up image  $\xi$  in FCM\_S [31] as:

$$\xi_k = \frac{1}{\alpha} \left( x_k + \frac{\alpha}{P_R} \sum_{j \in P_k} x_j \right) \quad (1)$$

**Satyasis Mishra et al.**

Where  $\xi_k$  indicate the gray value of the  $k^{\text{th}}$  pixel of the picture  $\xi$ , and the fast segmentation process is achieved with the objective function as:

$$J_p = \sum_{i=1}^c \sum_{l=1}^q \lambda_l u_{il}^m (\xi_l - v_i)^2 \tag{2}$$

where  $v_i$  represents the example of the  $i^{\text{th}}$  cluster,  $\lambda_l$  is the amount of the pixels carry the gray value equal to  $l$ , where  $l=1, \dots, q$ . obviously, we have

$$\sum_{i=1}^q \lambda_l = P \tag{3}$$

And below the constraint so as to  $\sum_{i=1}^c u_{il} = 1$  for any  $l$ , minimize  $J_s$ , correspondingly  $J_s$  to be at its limited extrema as follows

$$U_{il} = \frac{(\xi_l - v_i)^{-\frac{2}{m-1}}}{\sum_{j=1}^c (\xi_l - v_j)^{-\frac{2}{m-1}}} \tag{4}$$

EnFCM depends the factor  $\alpha$  and the filtering system. The value of  $\alpha$  has to be plays an important role in segmentation.

**Local Linear Radial Basis Function Neural Network Model**

In comparison of LLRBFN [27] considered for classification task.

Where " $x_1, x_2, \dots, x_n$ " are inputs (attributes) and " $Z_1, Z_2, \dots, Z_N$ " are the Gaussian activation function in the hidden elements.

The "Gaussian Kernel" is defined as

$$Z_n(x) = e^{\left( \frac{-\|x - v_i(n)\|^2}{2\sigma_n^2} \right)} \tag{5}$$

The "objective function is to minimize" the mean square error which can be written as

$$MSE(e) = \frac{1}{N} \sum_{n=1}^N (d_n - y_n)^2 \tag{6}$$

Where "d" is the required desired vector.

**RESULT AND DISCUSSION**

**Data Collection**

This breast cancer databases was obtained from the University Wisconsin Hospitals, Madison [27]. Dataset contained number of instances 400 (July /15/1992) ten plus the class attribute. Each instance has one of 2 possible classes: benign (245) or malignant. The arranging data were ID, nine variables measured and class attribute respectively coded. The Wisconsin breast cancer diagnose (WDBC) presents 9 variables descriptors related to the cell nucleus and modelled. Samples collected were 60 benign and 100 malignant masses from desire of mammographic image analysis Society (MIAS) database masses and calcifications [28]. The collection of dataset was not normalized for

**Satyasis Mishra et al.**

computer reading as binary image, color image and grayscale image. For this reason, we prepared suitable for design in required normalization dataset for recognized as essential images. Normalized dataset attributes between zero and one (0, 1) range by multiplying zero point one (0.1) by all instances of attribute except ID of patient. The last attribute class converted logical 0 or 1 to one if it's true or zero if it's false with the help of supervised learning with neural network. The classes is either benign or malignant when the output zero (0) and one (1) respectively.

**Simulation Results for Detection**

The simulation results for medical input image, filtering images, segmentation images extraction features were described separately. Output result for medical input image compared original image, true color image and grayscale image by histogram plot system. Figure 4.1 showed the original image was displayed with the RGB color values left as a subplot figure 4.1a and subplot of the same image was displayed the transformed intensity image as a heat map right figure 4.1b.

Grayscale and true color images analysis after de-correlation by histogram was observed as different shapes on the right hand histogram has greater contrast than the left histogram sides. The maximum value of the histogram count data 8000 was automatically reduced to 450, since outlier spikes do not dominate as its edge was easily detected.

**Noise Removal Results Using Filtering Method**

Output result for filtering evaluated mean filter, median filter and adaptive mean filter used grayscale image. Fig. 6 a, b showed edge detection and the rest two showed remove noise on the region of images. Figure 7 shows the removal of the noise by utilizing median filtering and adaptive filtering.

**Segmentation Results**

The segmentation results are presented in Fig. 8 to Fig. 9. It is found that the EnFCM algorithm shows good result than K-Means segmentation presented in table 2.

**Simulation Results for Classification**

The output simulation result for LLRBFNN provides reduced error was showed figure below. From figure 10 the Y axis of represents the simulation result error in number and the X axis showed the number of iteration of LLRBFNN. RMS performance of LLRBFNN is 0.0013 at iteration 500. The output results of overall designed for classification the combination of RBFNN, FFNN, and PRNN were obtained from MATLAB simulation showed figure 11 that observed LLRBFNN provides better classification performance among the others. The X axis of this graph represents the simulation number of iteration and the Y axis demonstrates the MSE in percent. The proposed LLRBFNN graph was the blue line, steadily approaching convergence at 300 iterations. Whereas graphs were the red, yellow and magenta lines, steadily approaching convergence at 350, 600 and 850 iterations respectively. The statistic of this parameters is given in the table 3.

**CONCLUSION**

The classification of breast cancer is a complex and difficult task. This research work proposes a novel LLRBFNN classification model for breast cancer classification. The images are decomposed using EnFCM segmentation. For detection of breast cancer areas, adaptive mean filter is employed to have better smooth image than median filter, as it is preserving edges and other parts of an image. In order to classify breast tumor clearly from mammogram image LLRBFNN has been applied. LLRBFNN has been proposed to increase the accuracy of breast cancer classification, as it is potential to take proper initiative in different levels of hidden layer and spread of radial basis functions implementation. Appropriate parameters selection in the neural network can be one of the ways to improve the accuracy of classification. The K-mean algorithm has also been considered for segmentation. It can support the cluster by minimizing distance of the centroids. So to overcome this barrier of other conventional algorithm,

**Satyasis Mishra et al.**

LLRBFNN can play an effective role by converting nonlinear to linear function. As experienced from the result, it can be seen that figure 6 and figure 7 detection of mammogram image can be seen by adaptive mean filter and mean filter to performs smoothest and segment exact tumor respectively. For classification design of LLRBFNN reduce error best among the others as observed figure 11. The future work may be done using hybrid models along with soft computing applications.

### ABSTRACT

A smart phone became essential part of our life and it is not limited to voice or text communication but for financial transactions, education, entertainment. The smart phone is a part of digital India programme and government is promoting more digital applications for the welfare of citizens. Today the smart phone is mostly used for entertainment, high quality content and video streaming. As per Omidyar Network serve the smart phone penetration rising 85-90 % by 2020 in India. The direct impact will be on mobile traffic, which is increasing from 10-100 time by 2030 and more than 80% global traffic will be internet video. This will demand more bandwidth and channel capacity. The study is given the brief of ATSC 3.0 architecture and different layers for implementation of Digital Terrestrial broadcast services and the scope and applications of 5G networks. The future scope of LDM for improvement the channel efficiency for better reception video quality in mobile and fixed services.

**Keywords:** Mobile Communication , 5G,, ATSC 3.0, 5G network, broadcasting, LDM, channel efficiency

### INTRODUCTION

Today the viewer's platform shifts from scheduled viewing on television to on demand viewing on smart phone. More than 70 percent viewers watch TV content and video on a smart phone. It is expected that by 2020 India will become second largest country on video viewing audience globally and digital subscription in India is estimated to cross Rs 2000 crore by 2020 from Rs 260 crore in 2016. The exponential growth in video content has given the best income opportunity to studios and content owners. In India more than 65 percent of viewers subscribe the channel

24821

**Madhusmita Shial and Satyasis Mishra**

and 7 out of 10 viewers watch ads with audio turned on, which directly impacts the advertising industry to generate revenue and 90 % of viewers like to watch video in local language. Future media services target Ultra High Definition (UHD), virtual and augmented reality contents with high resolution and with high reliability. But it is a great challenge to provide best media services with existing networks. This needs more bandwidth and spectrum efficiency. So, the time has come to switch from unicast to broadcast network. Broadcast video networks provide constant quality networks compared to the unicast mobile networks, especially for video delivery [1][2]. The Prasar Bharati introduced DVB-T2 technology for access the video streaming over the mobile phone with external antenna devices. But viewers need more user-friendly solution to access the TV over the phone without any external devices. Today, there are two different technologies moving parallel as ATSC 3.0 and 5G network.

The ATSC 3.0 is introduced as the upcoming generation broadcasting system on terrestrial network. The Advanced television system committee (ATSC) initiated the advanced upcoming generation system known as ATSC 3.0, the orthogonal FDM system along with LDPC for error correction[3][4]. The overall advantage of ATSC 3.0 is technical standard for broadcasting, which includes the management layer, physical layer and transport protocol layer. The Physical layer is the foundation for building of ATSC 3.0 standard for terrestrial network for TV broadcasting. The ATSC 3.0 standards increase the 30% capacity of A/53 SNR (signals to noise) for operating point [4][5]. The primary goal of ATSC 3.0 was to provide the platform for TV fixed and for mobile users with separate operational modes depends on the anticipated trade-off for user coverage (robustness) and capacity. ATSC 3.0 offers the different operating mode and toolbox for improving the signals for terrestrial TV broadcasting [4].

The 5G network is enhancing the “mobile phone broadband” (eMBB) application, which is “ultra-reliable at low latency” (URLLC) and “massive machine type communications” (mMTC) for mobile network [6][7]. The 5G network has a main objective of assuring the “Quality -Of-Experience” (QoE) for mobile users during dynamic and challenging network scenarios. The 5G network is also compatible with terrestrial digital communication for multicasting the video content at high efficiency, which improves the performance of network for content delivery at different geographical locations [7]. The improvement of services of ATSC 3.0 for broadcasting and 5G network targeted for employing a cut-off value for coding and modulation technique for video Streaming [8]. ATSC 3.0 and 5G network are more compatible for their capability approach performance with excluding complexity for comparable decoding hardware execution [6]. The study describes the basic architecture of ATSC 3.0 and 5G Network for broadcasting. In section 2, the architecture, and different layers of ATSC 3.0, Section-3 the 5G Technology and Applications and Section IV, Layered Division Multiplexing technology for broadcasting in ATSC 3.0 and 5G and finally, concluding remarks.

**ATSC 3.0 Architecture**

The ATSC 3.0 is introduced as the future generation broadcasting system on terrestrial network. ATSC 3.0 has been designed to deliver content to various categories of receivers, such as, fixed, portable, vehicular and handheld etc. It supports High efficiency video compression (HEVC/H.265). ATSC 3.0 includes upgraded transmission tools, like LDPC (“low-density parity-check”) codes, non-uniform QAM (nuQAM) modulation, advanced antenna technologies, and “layered-division-multiplexing” (LDM), a physical-layer “non-orthogonal multiplexing” (NOM) technology [3]. ATSC 3.0 is based on Internet Protocol (IP) and has a similar layer structure. Content can be broadcast in the same 6 MHz channels, but using OFDM modulation. ATSC 3.0 is designed with layered architecture as shown in Figure-1 due to future upgradability and extensibility [9].

As shown in Figure 1, the basic layered architecture of ATSC 3.0, each layer has its unique functionality. The First layer is System Discovery and signaling, this layer also refers to bootstrap. The bootstrap is starting the frame with necessary information to demodulate the preamble and preamble demodulates the remaining data in the frame and sub-frames. The second Layer is Transmission or physical layer, it is also foundation layer of ATSC 3.0. The framing process of physical layer in ATSC 3.0 takes coded, modulated and time interleaved PLP data, then it multiplexes with other transmission parameters such as pilot signal, control signal. Then the combined information

**Madhusmita Shial and Satyasis Mishra**

transforms into a waveform, which can be transmitted [10][11]. The third layer is Protocol Layer, which uses TCP/IP protocol to manage all the services delivery and synchronization of ATSC 3.0. It is also allowing the integration with other systems. The Fourth layer is presentation layer for applications and this layer concentrates on the consumer experiences. The final layer is application layer, which is providing the interface for the users through web pages [10][11]. The main features of ATSC 3.0 are "Orthogonal Frequency Division Multiplexing" (OFDM) modulation, LDPC forward error correction codes and it supports "16200" and "64800" bits two code lengths. The ATSC 3.0 supports 12 code rates which varies from 2/15 to 13/15. ATSC 3.0 also supports three multiplexing modes such as "time division multiplexing" (TDM), "frequency division multiplexing" (FDM) and power. There are 12 guard interval (GI) lengths from ~27  $\mu$ s up to ~700  $\mu$ s. ATSC 3.0 has 3 FFT sizes such as 8K, 16K and 32K. By using channel bonding or cross-polarized MIMO technology data rate can be improved.

**ATSC 3.0 Physical Layer**

The Figure 2 shows a basic building block of physical layer in ATSC 3.0. It consists of four main blocks: first block is Input formatting, second block is BICM (Bit Interleaved and Coded Modulation), third block is Framing and interleaving and last block is Waveform generation. In Figure 3 shows the block diagram of multiple PLP system with LDM combining. ATSC 3.0 can decode 4 PLP parallel per services. The first and second block will differ for each PLP. The LDM injection block after input formatting and BICM block. All PLPs will combine before the third block i.e. framing and interleaving block.

The input formatting block consists of three different blocks, the first block is the encapsulation block also known as ALP ("ATSC Link layer protocol"), which interface between ATSC 3.0 physical layer and various input packets like internet protocol, MPEG-2 TS, link layer signaling etc. In ALP the different input packets processed into a one single packet format with variable length. The maximum length of a packet should not exceed 64KB and minimum length should be 4 bytes including header. The second block is scheduler block, which schedules the input data stream between ALP and physical layer with assistance of system management functions. The scheduler allocates the physical resources for the packets and directs baseband framing block for output packets. The third block is baseband formatting block, which output consists of baseband stream packets. The baseband packet has fixed length as per defined FEC Frame. One or more PLP can be created at baseband formatting block as directed by the scheduler. The Bit-Interleaved and code modulation (BICM) also has three different blocks, first block is Forward Error Correction block, the second block is Bit Interleaver (BIL) block and third block Constellation mapper Block. The Framing and Interleaving block has three blocks: time interleaving block, framing block and frequency interleaving block. The input to Time interleaving block is a stream of cells and output is a stream of "time interleaved" cells. One or more PLP can be the input of time interleaving but at output it can be only OFDM symbol. The waveform generation block consists of pilot insertion, MISO, IFFT, PAPR, guard interval (GI) and bootstrap blocks [12].

**The 5G Technology and Applications**

The 1st standard for enabling the internet access on mobile with 3rd generation (3G) is launched in 2002. Which is also known as UMTS and WCDMA network. For increasing the data rate over the mobile 4th generation (4G) LTE introduced in 2011. In 4G also data rate is unsaturable for video streaming and gaming apps having epidemic demand. The 5th Generation (5G) network also on the same path for improving the data rate access over mobile, IOT devices (Internet of things) and for low latency application such as vehicle to vehicle communication [13]. The 5G network in one step forward for smart technology implementation, with high data rate, low latency, improved network resilience and with very low power consumption. The 5G network implemented through millimetre wave's for transmitter share the information with high speed communication. Because of shorter wavelength, the antenna size reduced, which is providing the large-scale technical support [14].

For implementation of 5G network, the study is based on the basic theory of Shannon Formula as follow [2]

$$C = B \log_2 \left( 1 + \frac{S}{N} \right)$$

Here

C= Maximum transmission rate (bit/sec)

N= Noise power (watt)

S= Signal Power (watt)

B= Chanel Bandwidth (Hz)

For improving the transmission rate, in 5G network the more dense area with number of base station increasing w.r.t. area as shown in Figure-4. It is also implemented through new spectrum range and new frequency band, which improve the utilization rate of the spectrum with large scale antenna technology. The large-scale antenna technology is the key technology for improvement of communication network by hundreds of times in 5G network compare with previous single antenna. The beam forming technology is used in large scale antenna for small area. In Figure-4, the large scale antenna is shown with separate cities and basic data transmission between base station and micro & small terminals[14].The main advantage of large-scale antenna with beam forming technology, it has improved the efficiency and capacity of network at low cost of unit hardware. The large-scale antenna with ultra-dense network improve the spectrum access under 5G network. On other side the main challenges for implementation of large-scale antenna technology is channel estimation and modelling when mobile user terminal become more. The second challenges cost control for commercial layout as number of base stations are increasing [14].

### 5G technology for Broadcasting

The Application of 5G technology not only focus on the improvement of data rate on mobile devices for telecommunication services, it has the broad focus on different applications like autonomous vehicle driving, tracking devices, smart city applications, medical applications etc. The focus area of 5G technology is shown in Figure-5. As 5G technology improves the spectrum efficiency and reduces latency for mobile and smart devices.

It also supports the multimedia contents for broadcasting services with eMBMS (“Evolved Multimedia Broadcast Multicast Services”) technology for delivering the audio video contents. The major different between 4LTE network and broadcasting work is communication network or we can say point to point communication. The 5G technology has number of advantages for TV broadcasting network. It’s more reliable network for gathering the news with high performance of network. 5G improve the reliability and operation flexibility of broadcasting network with high efficiency. The broadcasting network covers the large area with 5G network. It has suitable business module at low cost implementation. It will add the value to the traditional TV broadcasting network with additional functionalities, features and applications. It contributes efficient distribution TV signal over the mobile network or mobile users. The 5G improves the remote content production for TV [15]. The 5G network will bring the revolution for TV broadcasting and remote content production with broad network signals over the mobiles.

### Layered Division Multiplexing in ATSC 3.0 And 5G Broadcasting

The LDM is a power based “non- orthogonal multiplexing” (P- NOM) technology. It delivers multiple services with different power level, channel coding and modulation. It provides high efficiency through spectrum utilization for broadcast services compared to Time/Frequency Division Multiplexing. In LDM system multiple PLPs are transmitting the signals using overlapped time and frequency of broadcasting resources. Each PLP have different and specific transmission power level and technology to deliver the services. In LDM multiple signal layers interface with each other and in receiver do the separation of signal layers to decode the different services based on power

### Madhusmita Shial and Satyasis Mishra

level and signal configuration. Initially LDM technology used in future digital Terrestrial transmitter but today LDM technology used in 5G broadcasting for simultaneously delivering multiple UHD quality for fixed services and HD quality to mobile services over a 20 MHz LTE band [3][16]. The scope of the research is implementation and comparison of channel efficiency for two and three-Layered Division Multiplexing in ATSC 3.0 and 5G technology for broadcast services.

## CONCLUSION

The study given the brief introduction of Digital Terrestrial broadcasting services over the smart phone and TV with better quality and reliability. The ATSC 3.0 is introducing as the next generation broadcasting system on digital terrestrial network. The study explains the layered Architecture of ATSC 3.0 along with physical layer functionality. As 5G network targeted for utilizing a cut-off value for modulation and coding scheme for broadcasting of video streaming. The study given the overview of 5G Technology and Applications for broadcasting services with ATSC 3.0. The future scope of research is implementation of two and three layered LDM for improvement of channel efficiency for Digital Terrestrial broadcasting services over the smart phone and TV.

**AUTHORS**

**Mrs. Madhusmita Shial** received B.Tech and M.Tech from Jawaharlal Nehru Technological University, Hyderabad and PhD research scholar of Centurion University. and continuing her PhD in Centurion University of Technology and Management, Paralakhemundi. She is working in Prasar Bharati as Engineering Assistant, Doordarshan Kendra Hyderabad. Her area of research is Transmission technology with ATSC. She has published more than 15 research paper in international journals and conferences proceedings..

**Dr. Satyasis Mishra**, completed Ph.D in (Electronics and Communication Engineering) from Biju Patnaik University of Technology, Odisha, India and M.Tech (Electronics System and Communication) from NIT Rourkela, Odisha, India. He has published 85 national and international journal and conference papers. Presently he is working as Associate Professor in the School of Electrical Engineering and Computing, Electronics And Communication Department, Adama Science and Technology University, Ethiopia. He is having More than 20 years of experience in teaching in different universities of India and Abroad. He is guiding Ph.D and MS students in Centurion University of Technology and Management, Odisha, India and Adama Science and Technology University, Ethiopia. He is currently working with Artificial Intelligence, Machine Learning , Optimization Technique applications to Biomedical imaging and Signal processing.

## Recent Breeding Advancement and Divergent Species in Kokum: A Preliminary Study

### ABSTRACT

Kokum, botanically *Garcinia indica* Choisy (Thouars), is a commercially under-utilized perennial tree species, found wide spread as a native species in Goa. It belongs to family Clusiaceae of order Theales and sub class Dilleniidae. The kokum is indigenous to the western coastal regions of southern India and is rarely seen beyond this area. It is popularly used either as an infusion, or as direct application, in skin ailments such as rashes caused by allergies. Kokum butter is an emollient beneficial in the treatment of burns, scalds and chaffed skin. The fruits are marinated in sugar syrup to make amrutkokum which is drunk to relieve sunstroke. Kokum is used for treatment of flatulence. The fruit is useful for curing of piles, dysentery, tumours, pains and heart complaints. Kokum juice is effective against allergies due to insect bites; sun exposure related symptoms as well as acidity. It also has shown anti-carcinogenic properties. Kokum possess excellent cooking quality in addition with the pharmaceutical value. But kokum cultivation and breeding advancement is yet to be exploiting in India.

**Keywords:** Kokum, *Garcinia sp.* Micro propagation

### INTRODUCTION

*Garcinia*, *Hypericum*, *Vismia*, *Cratoxylon*, *Triandenum*, *Pentadesma*, *Mammea*, *Allenblackia*, *Calophyllum*, *Mesua* etc. are the some major important genera under this family (Robson and Adams, 1968). The genus *Garcinia* comprised 200 species, among them 30 different species are reported to be found in India (Korikanthimath and Desai, 2005).

**Datta Nilanjana and Sarkar Tapas**

However, Karnik (1978) mentioned that over 400 species of *Garcinia* have been identified and 40 edible species listed. Few economically important species distributed in tropical Asia are *G. mangostana*, *G. indica*, *G. gummigutta*, *G. xanthochymus*, *G. hombroniana*, *G. cowa*, *G. morella* etc. Around 30 species of *Garcinia* are available in India (Nadkarni et al., 2001). A feature of the genus is the presence of yellow or white latex plant parts. Out of thirty species, *G. indica* is confined to India and Sri Lanka only (Patilet al, 2005) It flower bud differentiation occur during the hot season and fruits ripen during the rains. The fruits are consumable, but too acid to be eaten raw. They are valued for their dried rind, which is used in Travancore - Cochin and Malabar as a condiment for flavouring curries in place of tamarind or lime. In Ceylon, the fruits are pickled under ripe, the thick pericarp cut into sections, dried in the sun and preserved for future use.

***Garcinia atroviridis***

Plants under this classification possess a moderate - sized, graceful tree, 30 - 50 feet high, found in the north - eastern districts of upper Assam. The fruit rind is too sour to be eaten raw, but tastes excellent when stewed with sugar. In Malaya, the rinds of under - ripe fruits are cut into slices, dried in the sun and sold in bazaars as a sour relish for use in curries in place of tamarind and for dressing fish. The fruit is used as fixative with alum in the dyeing of silk. A decoction from leaves and roots is used in the treatment of earaches.

***Garcinia cowa roxb***

A tall or medium - sized dioecious tree with short drooping branches often reaching the ground. The tree is found in the eastern parts of India (Orissa, Bihar, Bengal and Assam) and in Andaman Islands. The fruits are edible, though not very appetizing due to their acid taste. They can be made into jam or preserve. In Assam, sun-dried slices of the fruits are used in dysentery. In Burma, young leaves of the tree are cooked and eaten as vegetable. The bark is utilized as dyeing material (yellow). The tree produces a yellow gum - resin, which resembles gamboges.

***Garcinia dulcis***

30 - 40 feet high, found wild primarily in Malaysia. It has been introduced into India and cultivated in botanical gardens. The fruit contains citric acid and is suitable for jams and preserves. The seeds are medicinal and are used externally. The bark is used in Java for dyeing mats.

***Garcinia echinocarpa***

A robuste tree, 4-50 feet high, with sub-globose dark red fruits, containing 1-3 seeds, exist in the moist forests of southern Travancore and Tinnevely at altitudes of 3000 - 5000 feet and in Ceylon. The seeds yield a thick viscous oil (64.4% on the weight of kernels and 49.6% on the weight of seeds), which solidifies slowly at about 26°C to a soft brown fat.

***Garcinia hombroniana***

A small tree seems alike *Garcinia mangosfana*, rose red fruits, 1-2 inches in diameter, found in Nicobar Islands and further east in Malaya, chiefly on sandy and rocky coasts. The pulp surrounding the seeds is edible. It has a sour taste and a delicate peachy flavour. The fruit is reported to cause constipation. The root and leaves are used for itch in Malaya. The timber is used for house building and oars.

***Garcinia indica***

A slender evergreen tree having drooping branches, leaves ovate or oblong lanceolate, 2.5 - 3.5 inch long and 1 - 1.5 inch broad, dark green above and pale beneath, fruits globose or spherical 1 - 1.5 inch diameter, dark purple when ripe enclosing 5 - 8 large seeds. The tree is mostly available in tropical rain forests of Western Ghats, from Konkan southwards in Mysore, Coorg and Wynaad. The fruit has an agreeable flavour and a sweetish acid taste. It is used in Konkan preparation chiefly in the form of Kokam prepared by drying the outer rind, soaking it frequently in the juice of the pulp and sun-drying. Kokam contains approximately 10% malic acid and a little tartaric or citric acid. The fruit

**Datta Nilanjana and Sarkar Tapas**

of the *GarciniaIndica* is anthelmintic and cardiotoxic and useful in piles, dysentery, tumours, pains and heart complaints. The fruit rind also contains Hydroxy citric acid (Krishnamurthy *et al.*, 1982). The seeds of the fruit yield (23 - 26% on the weight of seed, and 44% on the weight of kernels) a valuable palatable fat known in commerce as Kokam butter. Kokam butter, like other *Garcinia* fats, is affluent in combined stearic and oleic acids. It consists about 75% of mono-oleodisaturated glycerides and possesses a fairly low melting point. Kokam butter is considered to be nutritive, demulcent, astringent and emollient. It is suitable for ointments, suppositories and other pharmaceutical purposes. It is used as a local application for ulcerations and fissures of lips, hands etc.

***Garcinia lanceafolia***

It is a shrub or small tree up to 12 feet high, growing under the dense shade of other trees. The tree is common in the evergreen forests of Assam and Khasi hills up to 3000 feet and is often cultivated in villages for its fruits, which are acidic and eaten with relish. The leaves are sub-acid and are reported to be eaten by Mikirs after cooking.

***Garcinia livingstonei***

Plants are small tree with short branches and oblong elliptic leathery leaves introduced into India from tropical East Africa and grown in botanical gardens. It produces reddish or purple fruits, 2-2.5 inch long and 1-1.2 inch broad, which are consumable. The fleshy pericarp and the colored pulp are utilized in preparing a fermented beverage. The plant is a promising rootstock for mangosteen.

***Garcinia mangostana* Linn.**

A small or medium sized tree, 20 -45 feet high, with deep green, leathery leaves

**SURVEY AND COLLECTION**

Surveys were conducted in the forests of Western Ghats based on the floristic data and in the north eastern regions based on GIS predictions as well as floristic data. About 144 collections of *Garcinia* from Western Ghats region and 60 collections from north eastern region were made. The altitude of collection sites ranged from 50 to 1040 MSL. The species recognition was ascertained based on regional herbaria and with Floras of the region of Botanical Survey of India, Kolkata.

**GIS Predictions**

A systematic survey was conducted in the Western Ghats region of Kerala for collection of *Garcinia* species. Data on variables like altitude, rainfall and temperature were recorded during the collection surveys, along with longitude and latitude with the help of GPS. The records were arranged in the map with the help of DIVA GIS software along with collection sites of Kerala, Karnataka and Tamil Nadu. Bioclim model of DIVA GIS (Hijmans *et al.*, 2003) for altitude, and rainfall suitable for the *Garcinia* was created. Bioclim summarizes the bioclimatic parameters for an array of sites to produce a species profile, these points can be supplied either as a list of coordinates or as a regular grid. Surveys were conducted in the predicted suitable areas for *Garcinia* in the North Eastern states of Meghalaya, Assam (Kamrup District of lower Assam and Jorhat and Sibsagar Districts of upper Assam) and Nagaland.

**Micropropagation**

The seeds explants were cultured on MS medium (Murashige and Skoog, 1962) augmented with various concentrations of BAP (0, 1, 2, 2.5, 3, 4 mg/L). The media were supplemented with 30 g/L sucrose and solidified with 8 g/L agar after adjusting the pH to 5.7-5.8. After the shoot developed, the cultures were shifted to media containing BAP (1-4 mg/L) and NAA (1 and 2 mg/L). The cultures were first rest in dark for 72 hours. Culture were incubated at 22°C and were given a photoperiod of 16 hours with a light intensity of 2000 lux. Sub culturing was done in every 21 days.

**Datta Nilanjana and Sarkar Tapas****Molecular Characterization**

DNA was isolated from *Garcinia* leaves as well as dried fruit rinds using the modified protocol of Doyle and Doyle (1990). About 30 unspecified primers were screened and 12 random primers, which gave good polymorphism, were used in molecular profiling. NTSYS was used for diversity analysis.

**Biochemical Characterization****Estimation of HCA Content**

HCA content was estimated based on the methodology standardized at IISR using HPLC (Ashiset *al.*, 2008).

**Identification of Volatile compound and Fatty Acid from *Garcinia* spp. By the process of Gas Chromatography (GC)**

From four common *Garcinia* species Essential oil was extracted by hydro distillation. The oil was further subjected to GC-MS profiling and corresponding constituents were identified by matching the mass spectral data with those stored in NIST and Wiley libraries. Similarly, the free fatty acids exist in the seed kernel of *G. gummigutta* and *G. indica* were converted to fatty acid methyl esters (FAME) and were recognized by GC-FID using authentic standards.

**Extraction of Butter from the Seed Kernels**

Fresh fruits were cut into halves and separated seeds were dried for 15-20 days. The dried seeds were rubbed on a hard surface with a wooden plank to separate the kernels from the seed coat. About 100 g of kernel paste was boiled in 500 ml of water for 4-6 h in an open pan. Next step is continued by covering the pan with cloth and butter was separated by decantation and yield of butter was noted.

**Conversion of Free Fatty Acid to Fatty Acid Methyl Esters (FAME)**

About 500 mg of butter was incubated (70°C) with 5 ml of 3 N of NaOH and methanol in the ratio 1:9 for 2 h. It was segregated with 15 ml of hexane for removing steroids from free fatty acids. The lower fraction compiled from the separating funnel followed by acidifying with 0.8 ml of 6 N HCl. The acidified fraction was further splited with 15 ml of hexane and the upper fraction was taken for treatment. The separated upper fraction was treated with methanol and HCl in the ratio 5:1 and incubated at 70°C for 5 h. Again it was separated with 15 ml of hexane and again the upper fraction was taken for further analysis. Thus the conversion of FAME was used for recognition of free fatty acids by using GC-FID.

**Chromatographic Condition for Fatty Acid Standards and Samples**

The carrier gas used was Nitrogen. The injection port was maintained at 240°C; the detector temperature was 240°C; the oven was programmed as follows; 150° C for 3 min and then increased to 200°C at the rate of 5°C/min at which the column was maintained for 4 min. Perkin Elmer Gas chromatographic system identified constituents of the hexane extract with authentic standards of stearic, palmitic and arachidic acid methyl esters.

**Micropropagation**

Due to hindrance of the traditional method of propagation in *Garcinia* paved the way to innovate and using efficient method for micropropagation of 3 endemic species of *Garcinia* – *G. indica*, *G. tinctoria* and *G. gummigutta*. The detailed of the process is such; MS medium supplemented with 2.5 mg/L 6 benzyl amino purine (BAP) gave best response and induced multiple shoot initiation. Root initiation in MS medium ignited with or without  $\alpha$  Naphthalene Acetic Acid (NAA) but root elongation only get fastened in MS medium with supplementation of 2 mg/L of NAA. Species differences in in vitro response were observed. In vivo seed germination studies were also conducted to understand the seed germination pattern in the three species. This technology can be used for multiplication of elite genotypes and conservation of *Garcinia* species. Most of the earlier studies pertaining to in vitro culture of genus *Garcinia* have been conducted in *G. mangostana* using seed and leaf explants. Kulkarni and Deodhar (2002) experimented on immature seeds, young leaves, apical and axillary buds as explants for in vitro

**Datta Nilanjana and Sarkar Tapas**

establishment of *G. indica*. Deshpande et al. (1999) and Mathew et al. (2001) carried out preliminary studies on in vitro establishment of kokum apical buds. Murthy and Patil (2010) had elaborated that in *G. tinctoria* with seed explants developed an average of around 11.1 multiple shoots on the MS medium supplemented with 3 mg BAP/L.

**Molecular Characterization**

RAPD profiling of *Garcinia* sp. Achieved for better accession of inter-specific genetic diversity. The markers could successfully distinguish different species of the genus. Rao et al. (2003) studied both intra- and inter-species relationship among six *Garcinia* species, namely *G. indica*, *G. cambogia*, *G. cowa*, *G. mangostana*, *G. xanthochymus* and *G. hombroniana*, using RAPD polymorphism. Also elaborated molecular diversity within *G. cambogia*. Utpal et al. (unpublished) studied RAPD polymorphism in 33 accessions of *Garcinia* species collected from different areas of Western Ghats. The dendrogram clearly recognized the identification of the 3 main species studied, *G. gummigutta*, *G. indica* and *G. xanthochymus* and suggested high amount of diversity within the collections of the same species. A like study was also conducted on *Garcinia* collections from North Eastern India using RAPD. High molecular diversity was noticed with the heterogeneity index within species of 0.81 to 0.82 in four species, *G. gummigutta*, *G. indica*, *G. cowa* and *G. xanthochymus*.

**Biochemical Characterization****Hydroxy Citric Acid (HCA)**

Variability of hydroxy citric acid and lycopene contents has been assessed in *Garcinia* species. Lycopene content did not show much variation. HCA content was higher in leaf, fresh and dry fruit samples of *G. gummigutta* followed by *G. indica* and low in *G. pedunculata*. In the Western Ghat collections as well as in N.E. samples HCA could not be perceived from leaf, fresh and dry fruit samples of *Garcinia xanthochymus*.

**Estimation and Identification Volatile Oil**

Constituents in *Garcinia* spp. volatile oil content was estimated by hydro distillation of dried leaves of *Garcinia* species. The volatile oils were further subjected to gas chromatography-mass spectrum (GC-MS) for the identification of various secondary metabolites. In the reports of GC-MS profiling of different *Garcinia* species indicates that *G. cowa* compose a total of 7 compounds, *G. indicacombined* 12 compounds, *G. tinctoria* has 9 compounds and *G. gummigutta* has 8 important volatile compounds. Trans-Caryophyllene and Gamma-Murolene are generally found in all. A recent study, trace of secondary metabolites such as beta-bourbonene, Alpha-humulene, Gamma-Gurjunene and Gamma-Cadinene were present in all the species except *G. cowa*. These secondary metabolites are mainly used in fragrance industry.

**Identification of Free Fatty Acids**

Seeds of *G. gummigutta* and *G. indicacombined* analyzed by the process of GC-FID. The main economic importance *G. indica* is the rich content of 'kokum butter' present in the seed kernel. Free fatty acids present in *G. gummigutta* and *G. indica* seed kernels were adapted to the purpose of producing fatty acid methyl esters (FAME) and were subjected to GC-FID. The free fatty acids in butter were identified by comparing their retention time with authentic standards. Here in both cases stearic acid was found as the more common (28-40%) fatty acid in *G. gummigutta* and *G. indica* samples. Jayanth et al. (2003) reported that scanning of fatty acids in *G. indica* at different developmental stages marked that stearic acid is the primer fatty acid and its concentration increases during maturation (40- 60%). According to the study of Reddy and Prabhakar (1994), presence of stearic (50 -60%) and palmitic (10-20%) acid in *G. indica* butter. Andrea and Scott (1988) reported plasma total cholesterol reduced by an average of 14% during consumption of the high stearic-acid diet. Obesity is correlated with insulin resistance and some reproductive abnormalities. Palmitic acid and stearic acid, markedly subdue these abnormalities (Ming et al., 2001). Thus *Garcinia* species are the noble sources of these useful fatty acid methyl esters.

### ABSTRACT

An experiment was conducted in the field experimentation center of department of Genetics and Plant Breeding, SHUATS, Allahabad during *Kharif* 2015 in Randomized Block Design with 19 genotypes and 3 replications. The data were recorded for 13 quantitative characters to study genetic variability, heritability, and genetic advance analysis. Analysis of variance among 19 genotypes showed highly significant differences for all the characters indicated the presence of substantial amount of genetic variability. On the basis of mean performance the highest yield per plant observed in SHIATS DHAN-2. Highest Phenotypic Coefficient of Variation (PCV) and Genotypic Coefficient of Variation (GCV) observed for number of spikelets per panicle, biological yield per hill and biological yield per hill indicating that these characters could be used as selection for crop improvement. High estimate of heritability coupled with genetic advance was found in Number of spikelets/panicle and plant height. Biological yield, biological yield per hill, plant height and number of spikelets per panicle showed positive and significant correlation with grain yield per plant and direct effect on grain yield per plant hence direct selection for these traits could be helpful for the improvement of rice genotypes.

**Keywords:** Genetic variability, Heritability, Genetic advance, correlation coefficient and Path analysis.

### INTRODUCTION

Rice is one of the important food crops in the world and grown on 155 million hectares with annual production of around 596 million tonnes and average productivity of 3.9 tonnes per hectare. Correlation studies provide better understanding of yield components. Path coefficient analysis furnishes information about influence of each contributing trait to yield directly as well as indirectly and also enables breeders to rank the genetic attributes

24835

**C Umesh et al.**

according to their contribution and thus, useful in indirect selection of elite genotypes from diverse genetic populations. (Wright, 1935 Fisher, 1981). Selection of high yielding varieties based only on grain yield will not be much effective unless adequate information on genetic parameters are available to formulate hybridisation and selection programme for further improvement because the estimate of the mean serves as a basis for eliminating the undesirable genotypes. Whereas genetic variability (GCV and PCV) help to choose the potential genotypes. Heritability along with genetic advance would be more useful tool in predicting the resultant effect from selection of the best genotypes for yield and some of its components in rice. It is very difficult to judge whether observed variability is highly heritable or not. Moreover, knowledge of heritability is essential for selection based improvement as it indicates the extent of transmissibility of a character into future generations. (Kumar, 2003) Genetic variability, character association and path coefficients are pre-requisites for improvement of any crop including rice for selection of superior genotypes and improvement of any trait (Krishnaveniet al., 2006). Realizing the importance of this crop, the present investigation was undertaken.

## MATERIALS AND METHODS

Experimental materials for the present study consist of 19 Advanced Breeding lines of Rice such as IR11A479, IR11A410, IR11A293, BP16732E-6, HHZ24DT11-LI1-LI1, IR11A106, NDR2026, NDR1045, V-PR-113, V-DM6600, MTU1001, BPT-2615, NLR-34449, SONAM LOCAL, DWARF MANSURI, AAIR-208, SHIATS DHAN-1, SHIATS DHAN-2 and SHIATS DHAN-3 received from the department of GPB, SHUATS during *Kharif*-2015. The experiment was laid down in a Randomized Block Design with 19 rice genotypes. The genotypes were replicated thrice; each genotype was grown in a plot of size 2.8m<sup>2</sup> (0.4 m X 7 m) square meter with a spacing of 20cm between rows and 15cm between plants. Recommended agronomic and plant protection package of practices were followed to raise healthy crop. The data were recorded on five randomly selected plants from each rice hybrids in each replication leaving the first one border rows from all the four sides, in order to avoid the sampling error. The observations such as days to 50% flowering, Plant height (cm), Flag leaf length (cm), Flag leaf width (cm), Panicles length (cm), Number of tillers per hill, Number of panicles per hill, Number of spikelets per panicle, Days to maturity, Biological yield per hill (g), Harvest index (%), Test weight (g) and Grain yield per hill (g) were recorded as per the following procedure. Readings from five plants were averaged replication wise and the mean data was used for statistical analysis for 13 characters.

## RESULT AND DISCUSSION

### ANOVA

Analysis of variance showed highest significant difference among 19 rice genotypes for all the characters studied, indicating that there is ample scope for selection of promising lines from present gene pool for yield and quality improvement.

### Mean Performance

On the basis of mean performance the genotypes Shiats Dhan-2 (43.40 g), Shiats Dhan-1 (41.80g), Sonam local (23.70g), NDR2026 (23.12g) Shiats Dhan-3 (22g) were regarded as the best genotypes for grain yield per hill.

### PCV and GCV

The phenotypic coefficient of variation (PCV) was higher than the genotypic coefficient of variation (GCV) for all the characters. The maximum phenotypic coefficient of variation (PCV) was observed for grain yield per plant (43.43) and maximum genotypic coefficient of variation (GCV) was observed for grain yield per plant (43.25). Similar findings were reported by (Chaubey and Singh (1994).

C Umesh *et al.*

### Heritability and Genetic Advance

Heritability estimates revealed that character like seed yield per plant (99.00), biological yield (99.00), spikelets per panicle (99.00) and plant height (99.00) exhibited highest heritability followed by harvest index (97.00), panicles length (95.00) and panicles per plant (94.00) panicle length (99.90). Estimates of genetic advance revealed that character Total spikelets per panicle (89.51) exhibited highest genetic advance followed by biological per hill (46.46) and plant height (32.56). Similar results were also reported by Rather *et al.* (1998). High heritability for grain yield per plant. Osman *et al.* (2012) recorded high heritability for plant height. However, Nayaket *et al.* (2002), Patel *et al.* (2013) Viveket *et al.* (2015) and Akhtaret *et al.* (2011) registered high estimated of heritability for grain yield per plant. Prasad *et al.* (2006) reported the genetic advance percentage of mean was highest for total number of spikelets per panicle, biological yield per hill.

### Correlation Coefficient

Grain yield per hill showed positive significant association with biological yield per hill (0.78\*\*), plant height (0.59\*\*), number of spikelets per panicle (0.44\*\*), tillers per plant (0.42\*\*), panicles per plant (0.38\*\*), days to 50% flowering (0.14\*\*), flag leaf length (0.12\*\*). It shows positive non-significant association with panicle length (0.04\*\*) and leaf width (0.01\*\*). It shows negative significant association with days to maturity (-0.25\*), harvest index (-0.15\*). It showed negative non-significant association with test weight (-0.04\*) at phenotypic level. Grain yield per hill showed positive significant association with biological yield per hill (0.79\*\*), plant height (0.60\*\*), tillers per plant (0.44\*\*), number of spikelets per panicle (0.44\*\*), panicle per plant (0.38\*\*), days to 50 per cent flowering (0.14\*\*) and flag leaf length (0.11\*\*). It showed positive non-significant association with panicle length (0.04\*\*). The correlation of grain yield per hill showed negative significant association with days to maturity (-0.26\*\*) and harvest index (-0.16\*\*). It showed negative non-significant association with test weight (-0.04\*\*), and flag leaf width (-0.02\*\*) at genotypic level. Similar results were also reported by Choudhary and Das (1998), Bala (2001), Nayaket *et al.* (2002), Shakthivel (2001) and Madhavilatha (2005).

### Path Analysis

The perusal of path analysis indicated that biological yield /hill (0.79), plant height (0.60), tillers /plant (0.44) spikelets per panicle (0.44), panicle / plant (0.38), flag leaf length (0.11) and days to 50% flowering (0.14) had positive direct effect on grain yield per hill at genotypic level, where as biological yield /hill (0.78), Plant height (0.59), spikelets / panicle (0.44), tillers /plant (0.42), panicle / plant (0.38), days to 50% flowering (0.14) and flag leaf length (0.12) had positive direct effect on grain yield per hill at phenotypic level. Thus, these characters may serve as effective selection parameters in direct breeding programmes for yield improvement in rice. Similar results were also reported by Nandan *et al.* (2010).

## CONCLUSION

It was concluded on the basis of mean performance the genotype SHIATS DHAN-2 (43.40gm) was recorded highest yield. The PCV was higher than GCV in all these characters. The high heritability coupled with genetic advance was observed for number of spikelets per panicle, Test weight, Biological yield per hill, Harvest index and Flag leaf length.

### ABSTRACT

Southern Odisha is considered as the rice bowl of the state and is home to a rich diversity of rice landraces. Rice landraces are ecotypes which are cultivated in pristine habitats since time immemorial by tribal communities who serve as custodians of these races and thereby contribute immensely towards the conservation of their gene pool. The Jeypore tract in Koraput district of Southern Odisha is recognized for its rich diversity of Asian cultivated rice (*Oryza sativa* L.) and is one of the agro-biodiversity hot spots in India. Traditional rice landraces are important reservoirs of valuable traits such as nutrition, taste, aroma, excellent cooking and eating characteristics, tolerance to abiotic and biotic stresses, medicinal properties and other special features thereby sheltering a potential genetic diversity. The present work is an attempt to review the origin and domestication of rice landraces of Southern Odisha with an emphasis to provide information on their important attributes which will be helpful for farmers, researchers, food processors, nutritionists, physicians in selecting different rice landraces for food fortification processes to combat nutritional and elemental deficiencies. The study concludes that the rice land races of Odisha need immediate attention to conserve their gene pool for future generations and restore the rice biodiversity of Southern Odisha. Further the information provided in the study would help in broadening the crop genepool for their successful exploitation in various rice breeding programs.

**Keywords:** Landraces, ecotype, diversity, fortification, genepool

## INTRODUCTION

The Indian sub-continent is a mega centre of biodiversity and is a treasure house of rice landraces which are grown in pockets in different states. Each state of India has its own special traditional rice varieties that have been maintained by a small group of marginal farmers mainly for their individual consumption and for sustaining certain religious rituals and social ceremonies (Bhagwat *et al.*, 2008; Agnihotri and Palni, 2007). The cultivation of these races is believed to have spread from the foothills of the Himalayas, Southwest into the Indian subcontinent, into Southeast Asia, and eastward into China and Japan. Rice landraces in India are traditionally cultivated in regions having contrasting eco-climates and therefore represent a wide array of genetic diversity for adapting to climates from sea level to high altitudes, to water stress from dry to submerged, to temperatures from cold to 45°C.

Well-known Indian rice researchers (Richharia and Govindasamy, 1990) in their book *Rices of India* have provided vedic and literature evidence to show that the country had been endowed with more than 2 lakhs (200,000) rice varieties, a rich biodiversity that no other country on earth possesses. Each and every variety of rice is the result of the vision and hard work of women and men of generations past who toiled to select rice varieties adapting to different climates, soil types, topography and agronomic practices. The famous book entitled *Seeds of Tradition, Seeds of Future* (Deb, 2005) provides morphological descriptions of 416 Indian folk rice varieties. Similarly, other workers Kangle 1966, Keith 1967, Cleveland *et al.* 1993, 2000, Arumugasamy *et al.* 2006 and Sathya *et al.* 2007 had recorded large numbers of traditional rice varieties from different parts of India and their adaptation to specific conditions like tolerance to drought, frost, water-logging, salt stress, resistance to diseases, insect pests etc. Various surveys and collection programmes taken up by the National Rice Research Institute (NRRI), Cuttack, Indian Agricultural Research Institute (IARI) and National Bureau of Plant Genetic Resources (NBPGR), New Delhi and State Agricultural Universities (SAUs) for conserving rice germplasm have indicated that nearly 50,000 local rice varieties are still being grown in the country (Roy, 1979).

The traditional rice landraces cultivated in India hold potential for a good number of characteristics such as drought tolerance, frost tolerance, disease resistance, pest resistance, tolerance to salinity and alkalinity, yield rate, suitability of growth in various ecological habitats, medicinal and nutritional traits. The information about selected rice landraces with their unique characteristics is given in Table 1 and Table 2.

### Rice landraces of Southern Odisha

Odisha is known as the genetic paradise of rice and rice constitutes the main crop and staple food for the people of Odisha. Odisha has a rich and diverse genetic wealth of rice and most of the diversity found at the national level is found in Odisha. The first collection of 1,745 types of rice landraces was done from a small tract in Jeypore representing practically the entire range of genetic variability and it helped in establishing the region as the "Secondary centre of origin of cultivated rice" (Ramiah and Ghosh, 1951; Govindswamy and Krishnamurty, 1958). This area has been an amalgamation of primitive tribes who had been preserving their culture and conserving the traditional crops and their wild relatives for thousands of years (Sharma *et al.*, 2000). The region and its surrounding areas constitute a major "Gene Treasury" for rice germplasm. The districts representing South Odisha like Koraput, Nawarangpur, Rayagada and Malkangiri is the home to a vast tribal population who belong to the Proto-Australoid ethnic stock speaking the Munda language of the Austro-Asiatic ethno-linguistic group and patronizing the age old rice landraces for several generations by way of domestication and conservation of these races including shifting cultivation. The dominant tribes including Bhattada, Gond, Paroja, Bhumia, Gadaba, Kandha, Amanatya, Bhatra, Bhumia, Didayi, Dora, Rana, Sabarkandha, Soura Langia, Soura, Pentia, Bondo and Koya (Mishra, 2009) residing in this region have played a crucial role in the domestication of rice by way of its cultivation, conservation and enhancement. The rice landraces used in various occasions like festivals, ancestral ceremonies, family functions and rituals were given top priority for conservation. The traditional life style of these people has always been insulated from the present modern ways of life and comforts. The rice landraces found in Odisha represent a wide range of

**Koustava Kumar Panda et al.**

genetic variability particularly for more useful characteristics such as growth in various land types (upland, medium land, lowlands), possession of strong aroma, drought tolerance nature, stable yield (without the use of chemical fertilizers), weed competitiveness, moderate tolerance to pests/diseases, good cooking quality as well as taste, higher grain number, suitability for various fast food preparations etc. During 1955-59, the National Rice Research Institute (NRRI), Cuttack collected 1,745 germplasm accessions of cultivated rice and 150 accessions of wild rice from Jeypore tract of Odisha under a project Jeypore Botanical Survey (Govindaswamy and Krishnamurty, 1958). Among the collections some perennial wild species (*O.rufipogon*), annual wild species (*O.nivara*), and natural hybrids (Spontanea rices) were dominant. Natural hybrids are still available in plenty in the cultivated fields as weeds. Resource poor and tribal people harvest the grains of these weeds from the cultivated fields for their own consumption. Processed wild rice like *Titing chuda* is sold during festivals and eaten on days of fasting (Tripathy, 1994; Sharma, 2005).

The rice landraces cultivated today were allowed to evolve naturally with the changing environment and agricultural practices and they are the products of careful and continuous selection by tribal women and men. The tribal farmers adopt age-old cultivation practices and grow a number of traditional rice varieties timed to mature in months matching festive or ritual occasions. The rice landraces are harvested in months of September when the earlier harvested food gets exhausted. The socio-cultural characteristics of the different tribes found in Jeypore tract vary and are geographically distinct with unique cultures, traditions and practices. These tribal women and men have largely remained unrecognized and unrewarded (Swaminathan, 1996) for several generations. A total of 256 rice landraces documented from 67 tribal villages were claimed to harbor many dominant genes including genes for resistance to diseases, insect pests, physiological stress as well as their nutritive quality, palatability etc. (Tripathy et al., 2005). The National Rice Research Institute, Cuttack and the National Bureau of Plant Genetic Resources (NBPGR), New Delhi jointly explored the undivided Koraput district (1995-96) for rice germplasm covering a distance of 3,080 Kms and collected 318 accessions of which 120 were upland varieties and 198 were medium land and lowland varieties which represent less than one-third of the collections made during the Jeypore Botanical Survey in the late 1950s (Patra and Dhua, 2003). M.S.Swaminathan Research Foundation created partnership for conservation of biodiversity and reduction of poverty involving tribal women and men of Jeypore tract. It was one of the 25 projects that were awarded the Equator Initiative Innovative Partnerships Award for Sustainable Development in Tropical Ecosystems at the World Summit on Sustainable Development held in Johannesburg in August 2002.

M.S.Swaminathan Research Foundation collected 325 rice varieties from Jeypore tract mainly from Koraput, Kalahandi and Phulbani districts. As for the other districts in Odisha, only 3 varieties were collected from Bolangir and Nuapada districts. They found that the traditional varieties available in Bolangir and Nuapada are different from those collected from other places. Out of the total collection, they studied the characteristics of 102 varieties as per NBPGR descriptor. Farmers' opinions on some of the characteristics were also recorded. The traditional varieties were collected with the objective of purifying the seed in participation with the farmers and make the seed available to the farmers. It was found that the yield increases significantly (up to 30%) after purifying the variety.

**Prominent organizations involved in the collection and evaluation of rice landraces of Odisha:**

- National Rice Research Institute, Cuttack, Odisha
- Orissa University of Agriculture & Technology, Bhubaneswar (Departments of Plant Breeding and Agronomy), Odisha
- Orissa University of Agriculture & Technology, Bhawanipatna, Odisha
- Krishi Vigyan Kendra, Bhawanipatna, Odisha
- Sahbhagi Vikas Abhiyan, Bolangir, Odisha
- Action aid, Bhubaneswar and Bolangir, Odisha
- Department of Agriculture, Bolangir, Odisha
- M.S. Swaminathan Research Foundation, Jeypore, Odisha

Koustava Kumar Panda *et al.*

## Important Attributes of Rice Landraces

### Disease Resistance

Genetic diversity substantially decreases a crop's vulnerability to diseases. Rice resistance genes remain effective only for a few years of agricultural production before becoming susceptible to pests but diversification in rice landraces has served as a successful pest management strategy. According to reports, farmers cultivating 50 different rice landraces in two upland municipalities in the Alkan province of Philippines do not face any rice pest infestation. The same was also found true for the rice landraces cultivated in the Yunnan province where rice could be cultivated in more than 40,000 hectares of rice land. (Zhu *et.al*, 2000; Frei and Becker, 2004).

### Cultural and Market Value

Rice landraces form an integral part of the rural culture in Asia. A large diversity of rice landraces is still maintained in areas attributed with a cultural value to these races. The most highly valued varieties are reserved for festivals and social occasions or sometimes offered to distinguished visitors. Some of the varieties are used for the preparation of sweetmeats while others with relatively higher yields are used as everyday food. Many varieties are characterized by a very specific taste and seeds of different varieties are exchanged among neighbours and relatives or given as presents. The demand for rice landraces is so high that certain varieties can only be obtained by ordering in advance directly from the farmers. The high status of rice landraces and their superior quality is reflected in a higher market value which in turn makes their cultivation economically attractive. The local rice varieties are sold as 'food for the royals' in the local markets and this has caused the price level to soar three times than that of the ordinary high yielding varieties of rice (Kennedy and Burlingame, 2003).

### Yield Potential

A number of rice landraces have high yield potential even under adverse conditions. When the supply of water is adequate and naturally occurring nitrogen fixing organisms exist in the paddy fields, no synthetic fertilizers are required to produce upto 2 tonnes/ ha of the local variety of rice (Swaminathan, 1984). Characteristics that determine the yield potential of rice cultivars are the nodal number of productive tillers per hill panicle density (number of grains per panicle and grain weight). Many rice landraces have greater mean panicle density and grain weight than most high yielding varieties.

When yield is calculated as production of grains per unit inputs of water and agrochemicals, most of the local rice landraces have better yields than that of high yielding varieties (Cleveland *et al.*, 1993; Deb, 1995, 2000). The yields of most local rice landraces seem to be spectacularly higher when compared to high yielding varieties. A significant feature of rice is that the grain to seed ratio is very high. A single panicle of any of the native rice varieties may contain between 80- 400 grains and in wet cultivation, each plant may produce up to 30 tillers. Thus, an average transplanted native rice variety may produce upto 1,200 grains per seed.

### Grain and Straw Quality

Rice landraces are highly valued for their high grain quality characteristics. Grain quality refers to the palatability, texture and particularly the nutritional value. The attractive grain appearances, nutritional value, cooking and eating quality characteristics have made the rice landraces highly popular among the consumers. The grain consists of the starchy endosperm, the bran including the embryo, the outer grain layers and the inedible fibrous hull. The endosperm contains mostly starch and around 6-10% protein. The bran is diverse in its composition and contains protein, lipid, fiber, vitamins and minerals. The major vitamins are the B-vitamins (thiamine, riboflavin, niacin) and vitamin E ( $\alpha$ -tocopherol). The mineral fraction is mainly composed of phosphorous, potassium, magnesium, zinc, calcium, iron. Carbon, hydrogen, nitrogen and sulphur basically make up the elemental profile. The physical, chemical and cooking quality characteristics of the grain has assumed much greater importance as its demand for local and export consumption are on the increase.

Koustava Kumar Panda *et al.*

### Nutritional Value

The traditional rice varieties serve as important elements of crop genetic resources and are highly valued by plant breeders and farmers for their diversity, rarity and adaptability. Rice landraces harbor rich nutrient value in the bran and possess excellent eating quality attributes leading to their nutritional excellence.

### Carbohydrates

Rice is basically a starchy food which provides a large proportion of dietary energy. The properties of starch therefore serve as an important factor in determining the grain quality of rice. The proportion of amylose and amylopectin differ widely in different grain types of rice. Amylopectin containing varieties absorb less water upon cooking and have a sticky structure whereas the amylose containing varieties absorb more water and have a fluffy texture after cooking. The landraces of rice contain a high proportion of amylose and thereby offer fairly slower starch digestion and hence a lower glycemic index was observed in many types (Frei and Becker, 2003). The amylose content in the rice landraces not only decides its cooking and processing behaviour but also the brightness of the grain. (Frei and Becker, 2003).

### Protein

Rice serves as an important source of protein in diet and rice protein is of very high quality compared to other food crops. The protein quality in rice is determined by its amino acid composition and by its digestibility. Rice landraces not only have a higher protein content but also have a higher proportion of lysine which is the limiting amino acid and is particularly essential for the growth of children. Protein content in the high yielding varieties range from 6-10% but rice landraces exhibit protein content up to 14% which is double the amount for an ordinary high yielding variety. The highest values reported in scientific literature reach upto 16 percent of protein for Chinese fragrant long grain rice (Kennedy and Burlingame, 2003).

### Oil and Essential Fatty Acids

Rice lipids, commonly denoted as oil ('rice bran oil') are characterized by a high nutritional value. The liquid consistency of the oil is caused by the high proportion of unsaturated fatty acids accounting for up to 80%. Due to its high level of unsaturation, rice bran oil is known to have blood cholesterol lowering effects. The major unsaturated fatty acids in rice oil are oleic acid (a monounsaturated acid) and linoleic acid (an essential polyunsaturated fatty acid). The average lipid content in the rice landraces was significantly higher than that of the high yielding varieties (Frei and Becker, 2004). The fatty acid content in the high yielding varieties (brown rice) ranged between 2.0 and 2.1 percent, the average value for the landraces was 2.3 percent with individual varieties reaching upto 3.2 percent.

### $\beta$ -Carotene and other Carotenoids

Carotenoids play important roles in photosynthetic processes and act as antioxidants against oxidative damage.  $\beta$ -Carotene is the most effective vitamin A precursor of all carotenoids and play an important role in diets lacking animal products. Rice is usually a very poor source of provitamin A. While the endosperm is virtually free of carotenoids, some traces may be present in the bran fraction. Higher levels of  $\beta$ -carotene are found only in pigmented, i.e. coloured rice varieties. Such coloured rice varieties, especially red and black sorts are only cultivated in areas that maintain a high diversity of rice genotypes. The analysis of  $\beta$ -carotene concentrations revealed upto 0.38 mg/kg in a black/purple landrace rice from the Philippines (Frei and Becker, 2005).

### Iron

Iron deficiency anaemia is considered as one of the most widespread micronutrient disorders in the world. Some estimates say that around half of the world's population is deficient in dietary iron supply. Analysis of a number of rice samples grown under greenhouse conditions at the International Rice Research Institute (IRRI) showed that local varieties had iron content up to 2.5 times higher than that of the common high yielding varieties. In contrast to landraces, the most commonly grown high yielding varieties were at the lowest end of the scale with an average iron

**Koustava Kumar Panda et al.**

content of around 10 mg/kg. The highest value cited in the same study was 26 mg/kg for a landrace (Kennedy and Burlingame, 2003).

**Zinc**

Zinc plays an important role in many enzymatic reactions in the body and is also essential for DNA synthesis. Zinc present in the rice grain is found in the outer layers therefore the preference of consumers for milled rice substantially reduces the availability of zinc. Zinc values ranging from 14-59 mg/kg are available in different rice varieties as is proved from the scientific literatures. Zinc concentration is comparatively higher in certain rice landraces than in the commonly grown high yielding varieties. A set of rice landraces from Southeast Asia exhibited an average zinc content of 41mg/kg with values reaching as high as 57mg/kg. (Gregorio,2002).

**Antioxidants**

The bran of rice varieties is rich in antioxidant compounds. Antioxidants play a role in the sequestration of aggressive and carcinogenic molecules which serve as free radicals and thus protect the body tissues and DNA from oxidative damage. The diverse rice landraces serve as rich sources of antioxidants and thus exert important physiological effects on the systems of humans. These landraces also offer tremendous scope for the rice scientists to investigate the potential for the synthesis of antioxidants and their possible beneficial effects (Ling et al, 2001, 2002).

**CONCLUSION**

*In situ*, on-farm conservation is an important means to *ex situ* conservation of traditional crop varieties as this form of management is easy to implement and links farmers' economic concerns with conservation. Crop diversity management can promote on-farm conservation of rice landraces in a feasible and sustainable way. The rice landraces of Odisha need immediate attention for conserving their gene pool in view of the introduction of many high yielding rice varieties which has led to the erosion of local germplasm and their genetic diversity. Rice landraces are thriving in the farmers' field only due to their special phenotypic characteristics that are controlled by the respective genes. The typical rice landraces with useful genes are finding tough replacement challenge from modern rice varieties to survive *in situ*. Therefore the collection, documentation, morphological and molecular characterization of germplasm of each of these varieties is important for utilizing the appropriate attribute based donors in breeding programmes and for protecting the gene pool of these unique rice landraces. Further the diversity and unique features of the rice landraces examined in this study could be quite relevant to both domestic and global rice development. The need of the day is to aggressively market these varieties and promote them through greater public awareness about their important attributes especially among the younger generation to save the qualitative and quantitative traits for future exploitation and restore the rice biodiversity of Southern Odisha.

**ACKNOWLEDGEMENT**

The authors greatly acknowledge the support rendered by the management of Centurion University of Technology and Management, Paralakhemundi for carrying out the study.

**Table 1. States of India with prominent rice landraces (Deb, 2005)**

SL. No.	Name of the States	Important rice landraces
1.	Assam	Rangajoha, Bhabeli, kanjoha, kanku, Bagribhog, Tulasibhog, Rampal, Badshshbhog, Prasadbhog, Malbhog, kalajira, Ranga, Kopausali, Khorikakala, Manki, Tezpuria, Saphila, Koiamari, Kola ahu, Bengoonguti, Hatidotia, Nania, Kolajoha.
2.	Bihar	Sonachur, Badshshbhog, Kanakchura, Shapasand, Tulsiphool, Tulsimanjari, Kesarbani, Marueya, Lakhisar, Kamini, Deobhog, Ramjain, Tulsipasand, Sonalari, Mohinidhan, Sagarbhog, Hansraj.
3.	Gujrat	Krishnakamod, Zeersal, Pankhali.
4.	Haryana	Karnal local, Kaithal.
5.	Himachal Pradesh	Madhumalati, Mushkan, Ramjawain, Achhoo.
6.	Jammu & Kashmir	Muskkanti, Tumlazag, Gul Zag, Qadir Baig.
7.	Karnataka	Krishnapasangi, Kunsumkesari, Kalabatta, Kavali, Ratansagar, Vasane Sanna Batta, Yalakkisali, Jeerigisanna, Kagisali, Gandhsali, Gulvadi, Karigajaville, Mugad Sugandha, Beeraga, Huggibhatta.
8.	Kerala	Gandhakasala, Jeerakasala, Velumbala, Chomala, Kayama, Kothampalari, Pookkilathari.
9.	Madhya Pradesh	Chakarbhata, Badshshbhog, Chhatri, Chinoor, Badshshbhog, Chirnakhai, Dubraj, Gangaprasad, Adamchini, Antraved, Amarjyoti, Kapursar, Loktimanchi, Srikamal, Samor chini, Vishnuparag, vanaspatri, Chiranki, Tedai.
10.	Maharashtra	Gham, Ghansal, Banaspatri, Chinoor, Krishna sal, Ambemohor.
11.	Manipur	Chakao poireiton, Chakao angouba, Chakao amubi, Phoren mubi, Langgphou Anganba.
12.	Mizoram	Tai, Pharate, Phanrai, Mawang buh, Zongam, Bawang buh.
13.	Odisha	Thakurbhog, Durgabhog, Pimpidibasa, Tulasiphulla, Gangabali, Sitakesari, Barangamalli, Mugajai, Laxmivilas, Suragaja, Dubraj, Basnaphalli, Kalajira, Jhilpanjiri, Lektimahi, Karpurakali, Nalidhan, Chinikamini, Tikichudi, Asamchudi, Baunsidubraj, Deulabhoga, Kanakchudi, Muktabali, Kalamalli, Kandulakathi, Dudhamani, Sapuri, Umuriachudi, Tulasiganthi, Pathangada, Sunaseri, Mugudi, Baramasi.
14.	Punjab	Quadian basmati, Basmati 370.
15.	Rajasthan	Zed zeera, Sutar, Danger, Pathania, Ratipanne.
16.	Tamilnadu	Jeerakasambha, Dharichal, Dular, Tilak kacheri, Kappakar, Samba mosanam.
17.	Tripura	Kalijira, Govindbhog, Sadakhaja, Kalakhau.
18.	Uttarpradesh	Kalanamak, Adamchini, Bindli, Badshshbhog, Batanphul, Hansraj, Benibhog, Dulhania, Kamalijira, Lalmati, Jeerabati, Tulsimanjri, Vishnuparag, Tilakchandan, Ramjawain, Dhania, Shakarchini.
19.	West Bengal	Badshshbhog, Tulasibhog, Govindbhog, Seetabhog, Chinisakar, Ramtulsi, Kalijira, Mahishadhan, Tulaipani, Kataribhog, Patina, Kalonunia.

Koustava Kumar Panda *et al.***Table 2. List of some important rice landraces with unique characteristics (Deb, 2005)**

Name of the Landrace	characteristics
Dharichal, Dular, Tilak Kacheri	Suitable for different ecotypes
Kapakkar	Tolerant to drought, floods, pests and diseases
Samba Mosanam	Tolerant to water logging
Kelas, Bhutmuri	Suitable for dry land
Jabra, Lakshmi, Dighal, Pantara	Deep water varieties
Katari Bhog, Bans kathi, Kamal Bhog, Srabanti Sal, Simul kuri, Ban Kata, Heera Moti, Kabirajsal, Kaya Kelas, Tulasi manjari, Gangajal, Sharita, Dahar Nugna, Sindur Mukhi,	Disease resistant varieties
Agnisal , Ashu, Kalam Kathi, Bou Bhog, ,	Tall varieties
Mala, Narayanmani	Semi-dwarf varieties
Kalam Kathi, Lakshmi Chura, Padmasal,	Long straw yielding varieties
Badshahbhog, Chinnikamini, Jagannath Bhog, Tulasi Manjari, Swarnakanthi, Garam Masala, Talsa, Gandhamalati, Jata Subasita, Rani Kajal, Mohon Bhog,	Fragrant rice varieties
Tenduphool, Njavara, Bhat Mooori, Parmai-sal, kabiraj-sal, Karunguruvai,	Medicinal rice varieties
Bahupuri, Kabiraj sal, Darkasal, Tulsu Mukul,	High yielding varieties
Ashphal, Bakul phool, Bokva, Ganga sal, Patnai	Varieties with heavy grains
Ashphal, Bahurupi, Bansh Pata, Juqal, Kabiraj-sal, Kerala-sundari, Panjab-sal	Higher panicle weight

**Table 3. Comprehensive list of some important rice landraces from Odisha**

S.N.	Southern Odisha	Western Odisha	Eastern Odisha	Northern Odisha
1.	Basubhoga	Dubraj	Kedara Gouri	Krishnbhog
2.	Deulabhoga	Laxmi Bhog	Padma Kishori	Govindbhog
3.	Baunsudubraj	Karpurakanti	Khas Kamini	Tulsibhog
4.	Kalamalli	Pruthiraj	Gobinda Bhog	Prasadbhog
5.	Bayagunda	Sorishaphula	Pimpudi Basa	Badshahbhog
6.	Sunaseri	Mayur chulia	Kalajeera	Rajbhog
7.	Muktabali	Nadiakata	Ratna Chudi	Kaminibhog
8.	Pandakagura	Nadiakora	Kannia Patia	Kalajeera
9.	Haldichudi	Tulasibasa	Sohra	Durgabhog
10.	Kandulakathi	Dhoba-Baspatri	Kalakiyari	Pimpudibasa
11.	Asamchudi	Jeerabati	Nadia Phulo	Basnaphali

Koustava Kumar Panda *et al.***Table 6. Important rice landraces of Southern Odisha and their characteristics (Adapted from MS Swaminathan Research Foundation, Chennai)**

S.N.	Name of the Varieties	Duration required for flowering(days)	Specific Characters	Avg.YI (QI/ha)
1.	Asamchudi	138	Tall plant, long slender grain, strong and long straw, disease and pest resistant	15-20
2.	Barapanka	142	Medium quality grain having good yield potential	15-20
3.	Bhaktichudi	130	Medium slender grain, best for fried rice	15-20
4.	Dangardhan	100	Early matured, popular variety, medium grain, drought resistance, provide food during lean period	17-20
5.	Gathia	122	Popular variety, bold grain, drought resistant, tasty, early cooked	15-19
6.	Haldichudi	130	Popular variety, slender grain, better market price (Rs 16/kg), tasty, best for preparing fried rice & biriyani	15-20
7.	Kalamalli	140	Long medium sized grain, tasty, long straw used for thatching, cultivated by the tribals to have a control over wild rice in the field due to black base colour	15-20
8.	Kandulakathi	147	Medium grain, best for puffed rice, strong straw, provides more energy	17-22
9.	Machhakanta	140	Long slender grain, flood resistant, better local market price (Rs 18/kg), tasty, good for fried rice	15-20
10.	Muktabali	120	Dwarf variety, medium grain, very good yield potential, high tillering density, disease and pest resistance, used as food for daily needs	20-25
11.	Osagathiali	90	Early matured, popular variety, medium slender grain, used by tribals for NUAKHAI (eat first rice in the festival)	10-12
12.	Pathangada	142	Tall, bold grain, tasty, provide more energy to the tribals to work for longer durations, used for perched rice	15-20
13.	Pandakagura	110	Early matured, drought resistant, bold grain, tasty, popular, cultivated by almost by each and every tribal household, provide food during lean period, cultivated singly as well as in mixed cultivation	10-12
14.	Sapuri	130	Medium slender grain, good yield potential, good market price (Rs 13/kg) locally, good quality straw	25-30
15.	Sekra	132	Awne black husk, used as boarder plant to save main crop	15-18
16.	Sindhikoli	145	Cluster spikelet, medium grain, tasty	15-20
17.	Paradhan	100	Early matured, drought resistant, medium grain, tasty, popular, cultivated by almost each and every tribal household, provide food during lean period, cultivated with both solo and mixed cultivation, used by tribals for the first menstrual festival of the young girl child	15-20
18.	Umuriachudi	150	Medium grain, popular variety, disease, pest & flood resistant, tasty, long straw	20-25

## Statistical Time Series Modelling for Price Forecasting of Crops

### ABSTRACT

Time series modelling is a dynamic research, which mostly aims to carefully collect and rigorously study the past observations of a time series to develop an appropriate model which describes the inherent structure of the series. Further, this model is used to generate future values for the series, i.e. to make forecasts. Time series forecasting thus can be termed as the act of predicting the future by understanding the past. Forecasting the price of agriculture commodity such as vegetables, fruits (Horticultural crops) cereals, pulses, oilseeds (Agricultural crop) etc. is important related to economic concerned, farmer perspective, Agriculturist and Industrialist. Price forecasting help famers to take effective decision regarding market price (mandi price) or selling price of their crop, which crop to grow to earn profit, ultimately improve the condition and income of famer and also helps policy maker for agriculture decision. For forecasting area, production & productivity of agricultural crops, mostly ARIMA (Autoregressive integrated Moving average) Model is used but in case of price forecasting of agricultural crops ANN (Artificial Neural Network) is used. Neural Network approaches are applied in the field of agriculture for price forecasting in both short term and long terms. Large amount of data related to commodity price, daily market price, arrival price is available. Neural approach with fuzzy can be used and also neuro fuzzy system may help in future for future price forecasting of commodity.

**Keywords:** Time series modelling, price forecasting, ARIMA, ANN, fuzzy

### INTRODUCTION

Time series forecasting can be termed as the act of predicting the future by understanding the past. Due to the indispensable importance of time series forecasting in numerous practical fields such as business, economics, finance, science and engineering, etc. proper care should be taken to fit an adequate model to the underlying time series. It is

**Chinmayee Patra**

obvious that a successful time series forecasting depends on an appropriate model fitting. A lot of efforts have been done by researchers over many years for the development of efficient models to improve the forecasting accuracy. As a result, various important time series forecasting models have been evolved in literature.

**ARIMA Model**

One of the most popular and frequently used stochastic time series models is the Autoregressive Integrated Moving Average (ARIMA). The basic assumption made to implement this model is that the considered time series is linear and follows a particular known statistical distribution, such as the normal distribution. ARIMA model has subclasses of other models, such as the Autoregressive (AR), Moving Average (MA) and Autoregressive Moving Average (ARMA) models. The ARIMA model, also known as the Box-Jenkins model or methodology, is commonly used in analysis and forecasting. It is widely regarded as the most efficient forecasting technique in social science and is used extensively for time series. The use of ARIMA for forecasting time series is essential with uncertainty as it does not assume knowledge of any underlying model or relationships as in some other methods. ARIMA essentially relies on past values of the series as well as previous error terms for forecasting. However, ARIMA models are relatively more robust and efficient than more complex structural models in relation to short-run forecasting

**SARIMA Model**

For seasonal time series forecasting, Box and Jenkins had proposed a quite successful variation of ARIMA model, viz. the Seasonal ARIMA (SARIMA) The popularity of the ARIMA model is mainly due to its flexibility to represent several varieties of time series with simplicity as well as the associated Box-Jenkins methodology for optimal model building process. But the severe limitation of these models is the pre-assumed linear form of the associated time series which becomes inadequate in many practical situations. To overcome this drawback, various non-linear stochastic models have been proposed in literature however from implementation point of view these are not so straight-forward and simple as the ARIMA models.

**ANNs Model**

Recently, artificial neural networks (ANNs) have attracted increasing attentions in the domain of time series forecasting. Although initially biologically inspired, but later on ANNs have been successfully applied in many different areas, especially for forecasting and classification purposes. The excellent feature of ANNs, when applied to time series forecasting problems is their inherent capability of non-linear modelling, without any presumption about the statistical distribution followed by the observations. The appropriate model is adaptively formed based on the given data. Due to this reason, ANNs are data-driven and self-adaptive by nature. During the past few years a substantial amount of research works have been carried out towards the application of neural networks for time series modeling and forecasting. In 2008, C. Hamzacebi had presented a new ANN model, viz. the Seasonal Artificial Neural Network (SANN) model for seasonal time series forecasting. His proposed model is surprisingly simple and also has been experimentally verified to be quite successful and efficient in forecasting seasonal time series.

Artificial neural networks (ANNs) as a soft computing technique are the most accurate and widely used as forecasting models in many areas including social, engineering, economic, business, finance, foreign exchange, and stock problems. Its wide usage is due to the several distinguishing features of ANNs that make them attractive to both researchers and industrial practitioners. As stated in ANNs are data-driven, self-adaptive methods with few prior assumptions. They are also good predictor with the ability to make generalized observations from the results learnt from original data, thereby permitting correct inference of the latent part of the population. Furthermore, ANNs are universal approximator as a network can efficiently approximate a continuous function to the desired level of accuracy. Finally, ANNs have been found to be very efficient in solving nonlinear problems including those in real world. This is in contrast to many traditional techniques for time series predictions, such as ARIMA, which assume that the series are generated from linear processes and as a result might be inappropriate for most real-world problems that are nonlinear. There is growing need to solve highly nonlinear, time-variant problems as many

**Chinmayee Patra**

applications such as stock markets are nonlinear with uncertain behaviour that changes with time .ANNs are known to provide competitive results to various traditional time series models such as ARIMA model .

**Price Forecasting**

Price forecasting helps farmer and agriculturist to know about the growth or trend or price value of product before selling to mandi also help the policy maker for creation of different policy by generating rules according to price analysis. By analysing the price value, demand or supply as well as cultivated area related to crop helps farmer for decision making activity and ultimately helps in economic growth of our country.

**LITERATURE STUDY**

Shih *et al.* proposed a model for price prediction based on weighted case-based reasoning approach. Three cases such as equal wighted,unequalweigth and linear weighted CBR are investigated and compare. Most suitable weight for features are selected by genetic algorithm. For prediction model data related to imported chicken ,economic index and production data from Taiwan agriculture is used. Result of proposed research shows that CBR approach performance is better than other predcition approach such as linear regression,regressiointree,CART and neural net.Result also give information that colourful boiler and chiks price affect the price . Kohzadiet *al.* for price forecasting of commodity compare neural network model with time series model. They used price data of US live cattle and wheat of forty years taken from USDA. Multi Layer Feed forward neural approach a supervised leraning technique is compared with ARIMA. Slinding window and walk forward approach is used. They suggested that NN perform better than ARIMA and Mean square error is about 27 and 56 percent lower than ARIMA. Also other measure shows by a neural network such as absolute mean error and mean absolute percent error were also lower.Neuralnetwokr has the capabiltiy to show major turning points for both wheat and cattle. Zouet *al.* for forecasting china food grain price, explore and compare the neural network and time series model.

Researcher gives a new concept to create a model by combining two model such as time series model ARIMA and neural network approach such as back propagation using Equal weight method i.e using arithmetic average of individual forecast as it is an easy method. Two kinds of evaluation criteria such as quantitative evaluation such as MSE,MAPE,and MAE and turning point is evaluated by advance version of Mertons test used by researcher. The result shows that forecasting performance of combine model is better then individual in terms of error evaluation measurement. Network structure such as 2\*4\*1 is selected to model price series and ARIMA(1,1,0) is realtively best as per researcher findings.Also suggested that ANN is best suited model for capturing profit and turning points and better then traditional ARIMA and also accuracy achieve by combine model is better than individual one. In financial market, back propagation is used for discovering nonlinearity in financial data. But back propagation suffer from problem of low converges and is not robust method so the researchers Haofei*etal.*for price froecasting learning task in nerual nets bring in concept of multi stage optimization in back propagation.

In their paper they state that problem of backpropagation can be overcome by MSOA and performance of forecasting in terms of error and directional evaluation measurement is better achieved by MSOA. Average Training time of MSOA is 4.25s and of Back propagation is 7.83s respectively. Yu *et al.* uses neural network as a meta learning technique for designing a time series forecasting model to increase prediction accuracy while data consist of noise. Researchers do metamodelling by performing data partition and sampling for creation of different subset of training based on that base learning model is created and Fuzzy neural network is used in study for both as base learner and meta learner. They used PCA technique for model selection and pruning and then meta model is created from selected model.They concluded that prediction performance of nonlinear metamodelling technique is better when compare to single time series forecasting models such as ARIMA, FNN and SVM and other linear metamodelling technique such as simple averaging, simple MSE, Stack dregression ,variance weighting for financial time series data.netwrok perform well with pruning using PCA. Gan-Qiong Li *et al.*, proposed a forecasting model where short term price forecasting of tomato has been done by three layer Feed forward neural network and result compared

**Chinmayee Patra**

with time series ARIMA model and shows that neural network performs better for price prediction of one day with accuracy is about 90 % or week before price prediction with accuracy about 80 %. Riberio *et al.* proposed a hybrid commodity price forecasting model for sugar price prediction using feed forward neural network such as multilayer perceptron model and Kalman filter. Data from Brazilian and Indian market is taken for study. Kalman filter is used to consider price as stochastic process and also include future price in forecasting and also minimize the error measure. ANN is used for Exogenous variable analysis and also ANN applied to Kalman filter result to get improvement in result. Subhasree *et al.* predict the next day price of vegetable using time series data. Machine learning algorithm such as Radial basis function, back propagation neural network and genetic based neural network is used for study and comparative result concluded that predictive accuracy achieved by genetic based neural network is about 89% and error rate is 0.11 which is better than both back propagation whose accuracy is about 79 % and error rate is 0.21 and radial basis function accuracy is 52 % and error rate of 0.48. Ahumada *et al.* discussed that the forecasting accuracy of individual food price model can be improved by considering their cross dependency.

Food price of Soyabean, corn and wheat are strongly correlated. They estimated Equilibrium correction model for each food price and then studied the residual cross correlation for interdependency and thus perform a joint modelling. Four different econometric model are studied such as EqCM, DEqCM, DVAR and random walk econometric model are tested for each food price with different time horizon and scheme such as recursive or fixed. And they concluded that EqCM (Single for wheat and joint for corn and soyabean) perform best for time horizon  $h=4$ . For forecasting price of agricultural product in Brazil, researchers Pinheiro and Senna perform multivariate analysis of price of products and also use neural network application for forecasting price i.e., combine the ANN model with multivariate analysis. They study on time series of price for product. Product chooses based on the export volume growth of product. Daily time series data is converted into weekly data. In their study, Forecast for ANN-MSSA and ANN are compared with 12 week data to final week sample. In this study the difference between ANN-MSSA and the ANN model is given by the treatment to separate noise from the original time series. Empirical data states that performance of MSSA-ANN methodology is better than that of ANN model. Study combines MSSA to decompose the time series with ANN model and good alternative for forecasting price of different commodity. Result will be useful to formulate and implement policies directed to agriculture sector.

**CONCLUSION**

To maximize profit in agriculture marketing, there is need to forecast the future price of commodity among the farmers and other participant of market. In the aforementioned work a study of different forecasting methodologies is done in agricultural market environment. Multiple factor such as seasonality, trend, cycle, holidays, economic index etc., affects the price of commodity, for that reason price forecasting is not a simpler task. It can be concluded that Forecasting require filtering, smoothing of data due to missing and noisy data, storage and retrieval of historical data, model creation for processing past data and predicting future trend or value. Performance measure such as MSE, MAPE is used for evaluating the performance of forecasting model. There are several linear and nonlinear method individually or jointly used for forecasting such as ARIMA, Hybrid ARIMA-GARCH, and back propagation, Feed forward neural network, radial basis, genetic is used for optimization etc. are used by the researcher for forecasting. Accordingly, in future other Time series modelling, Evolutionary approach with fuzzy can be used for better forecasting and also one can employ deep learning with big data for agriculture commodity price forecasting.

### ABSTRACT

Plot use and plot cover changes are derived by natural process and anthropogenic interference in ecosystem. Appropriate management of natural resources requires quick and up-to-date information for effective decision making. The aim of this study is to generate such kind of information using RS (Remote Sensing) and GIS (Geographical Information System) technology to support the land use planning and strategy formulation of the newly emerging problem of the study area. Two satellite imageries of LANDSAT TM, MSS 2000, and LANDSAT MSS 2010 were utilized for detection of LULC with wasteland demarcation. Land under cultivation (Cultivated area), waterbodies, Land not suitable for cultivation (waste land) and other classes.

**Keywords:** Remote Sensing, Monitoring, Work environment, Land Use, GIS, Land Cover

### INTRODUCTION

A cutting edge country, as an innovative corporate must have enough numbers on several complex interconnected parts of its exercises so as to settle on choice. The land which is used as perspective, so far the information regarding the use and also its spread has acquired a significant progress with time as intends to conquer issue the random, turn of events, decaying ecological quality, loss of prime horticultural grounds, and decimation of significant wetlands. Land use is just a single such perspective, yet information about land use and land spread has gotten progressively significant as the Nation intends to conquer the issue of random, uncontrolled turn of events, decaying ecological quality, loss of prime horticultural grounds, decimation of significant wetlands. The information on spatial land spread data is basic for legitimate administration, arranging and observing of normal assets.

**K. Lalit Kumar**

Land use/land spread mapping both by visual understanding and advanced investigation is conceivable by satellite remote detecting procedures. The land use/land spread classes can be extended or decreased to any degree and be made progressively receptive to the data the client needs. Late innovative advances made in space made of spatial innovation causes impressive sway in arranging exercises. Quick pace of industrialization, urbanization, rural turn of events what's more, populace development have squeezed the utilization of land, water and vegetation in all aspects of the earth. Land, one of the most significant assets of Himalayan district is under consistent pressure and is quickly changing over into no man's land. The well-balanced land and vegetation/crop affiliations have been disturbed. In real practice, the condition is abandoning terrible to more regrettable. Along these lines, there is an earnest need of recovering these corrupted terrains by proper practices, which relies on the consciousness of individuals.

This coordination of spatial information and their joined investigation is performed through GIS strategy. It is a PC helped framework for catch, recovery, examination and show of spatial information and non-spatial characteristic information. With expanding consideration being paid to alleviating the impacts of a worldwide temperature alteration, there has additionally been an ascent in consideration about vitality strategy. In the United States, the arrangement of Barack Obama as President and his course of action of Stephen Chu as the Secretary of Vitality – the two devotees to an unnatural weather change and promoters of bringing down dependence on fossil energizes – vows to acquire changes national vitality strategy. National vitality strategy alludes to government the executives and guideline of vitality creation, appropriation, also, utilization, which can have suggestions for state and nearby government vitality strategy. Significant partners in national vitality strategy can incorporate the president, Congress, bureaucratic associations (Department of Energy), state and close by governments, Native American nations, industry, and publics. President Obama's (Whitehouse.gov 2009) national game plan for "ensuring about our essentialness future" remembers diminished dependence for remote wellsprings of fossil powers and expanded dependence on household petroleum derivatives, sustainable power source, biofuels, and atomic force alongside the advancement of vitality effectiveness.

## LITERATURE REVIEW

Each package of plot on the world's surface is exceptional in the spread it has. Land use and land spread are unmistakable yet firmly connected quality of the Earth's surface. Land Use is the way where individuals utilize the land and its assets. Example of land use incorporate agribusiness, urban turn of events, brushing, logging, and mining. The term land cover originally referred to the kind and state of vegetation, such as forests, wetlands, pasture, roads and urban areas. The term land cover originally referred to the kind and state of vegetation, such as forest or grass cover, but it has broadened in subsequent usage to include human structures such as building or pavement and other aspects of the natural environment, such as soil type, biodiversity, and surface and groundwater.

Land use influences land spread and changes in land influence land use. A change in either anyway isn't really the result of the other. Changes in land spread via land use don't really infer a debasement of the land. Be that as it may, many moving area use designs, driven by an assortment of social causes, bring about land spread changes that effect global climate and biosphere ( Riebsame, Meyer ,and Turner ,1994). Land use/land bay changes has been the center program of worldwide ecological change inquire about. Its effects on local natural condition are one of the significant substance of land use/land spread research. This paper investigated the impacts of land use/land spread changes on provincial atmosphere, climatic quality, soil properties, water amount and quality. Land use/land spread changes impact territorial atmosphere by adjusting the surface albedo and the organization of green gas and follow gas in environment. They influence some dirt biological procedures and various organizations of land use/land spread effect sly affect supplement stream in soil. Non-point source contamination is the primary techniques by which land use/land spread changes impact water quality, numerous significant Non-point contamination sources are connected with the changes. Some eco-natural issues brought about by human ill-advised utility, for example, soil disintegration, land corruption, water shortage and ocean drawing closer are likewise proposed. The loss of

**K. Lalit Kumar**

rainforests all through the tropical areas of the world because of deforestation for lumber assets and transformation to farming grounds has become a subject of worldwide consideration with the guide of across the board media inclusion. Examination authorities, for example, Skole and Tucker (1993), Skole et al (1994), and Kummer and Turner (1994) perform broad investigations trying to point out further this circumstance by concentrating on the social ramifications and the ecological debasement related with tropical deforestation in the Amazon of South America and in Southeast Asia.

### **RS and GIS for Plot use /Plot Cover**

Development of Remote Sensing and Geographic Information System (GIS) technologies have lead to the advancement of mapping and interpretation techniques as a means of understanding and effectively managing the natural resources in a sustainable manner. At present, remote sensing in combination with the land use/land cover dynamics (Codjoe, 2007). As a result, the GIS Serve as a tool for analyzing interaction among and within the various spatially referenced data schemes.

GIS have four principle capacities identified with information:

- A. Information input,
- B. Information stockpiling, recovery, and database the board,
- C. Information examination (information control, investigation, and affirmation), and
- D. Yield (show and item age)

### **Description of the Study Area**

This territory was governed by various Hindu heads of Kalinga (old Orissa) up to the medieval period. After the fall of the brought together Gajapati realm of Orissa, the locale was represented by the Golkonda rulers. The progenitors of the Maharajas of Vizianagram are expressed to be plunged from the Ranas of Udaipur, the Sisodia part of the Guhilot clan and Vasishtgotra.

### **Location and Composition**

Vizianagram area was shaped on first June 1979, with central station at Vizianagram according to G.O.Ms.No 700/income (U) Department dated fifteenth May 1979 with partition cut from srikakulam & Visakhapatnam Districts. Vizianagram district is situated within the geographical co-ordinates of 17-16' and 18-16' of the northern latitude and 85-00' and 84-47' of the western longitude. The district is bounded on the east by Srikakulam District on the west and south by Visakhapatnam districts, on the south east by the Bay of Bengal and North West by Orissa State.

### **Geography**

Vizianagram is located at 18.12 N 83.42E. It has a normal rise of 74 meters (244 feet).

### **Demographics**

As of 2003 Indian census, Vizianagram had a populace of 200,000. Male establish 45% of the populace and females 53%. Vizianagram has a normal education rate of 67%, higher than the national normal of 58.5%. Male education is 75%, Female education is 62%

### **Earths**

The fundamental muds in the areas remain red soils, dirty topsoil's and sandy dirt and they establish 96% of the all-out zone. The dirt's in the locale are overwhelmingly loamy with medium richness. Around persist for the most part red loamy soils, undoubtedly and earth loamy in the event of wet terrains.

**K. Lalit Kumar****Natural Resources**

The Major rivers flowing in the district are

1. Nagavali
2. Champavati
3. Gomukhi
4. Krishna
5. Bansadhra
6. Godvari

**Total Geographic Area 1243 hec.**

Uncultivated land covered 16.46% of total area .Forest area covered by 3.34% Scrubs, vegetation and plantation covered 0.8%, 5.16% and 9.6% of the study area respectively. The percentage of classification is shown below.

**RESULTS**

To determine wastelands lands and landuse classification in the study area (viziangarammandalam, vizianangram district, A.P) satellite imageries, topo sheet and statistical hand books data has been studied. Field check was done to verify the results of unsupervised classification .For Accurate results Supervised classification of land use was done using G.I.S. Base map of vizianangrammandal has been prepared and merged the satellite data to identify the classification of land use using unsupervised classification.

**CONCLUSIONS**

The following conclusions are made in this study built up lands and water bodies are also classified in this work. it is observed that Cropped area is decreased by 30% in 2010.80% LULC classification concurrent when compared to statistical reports of Vizianangrammandal 2000 and 2010.98% of the results obtained in this study are concurrent in forest area demarcation.85% of the results obtained in this study are concurrent in the waste lands covered by the study area.

### ABSTRACT

The article here speaks about the teenagers and their addiction towards the substance abuse. The analysis in this article is all about how the young adults harm themselves with the usage of the compelling substance abuse. As the teenager brain is not fully developed but is in a developing state until they reach the mid-20s. It indicates that what ever decision they take may not be wise for them and can ruin them mentally and physically. They fail to decide what is right and wrong because of lack of thinking capability and get influenced by various dominating factors which lug them towards substance abuse like drug, tobacco and alcohol. This article highlights the genesis that leads to substance abuse used by the teens as well as showcase the safeguards to plug up the path that steer the movement of the teens and make them aware of the perilous substance abuse.

**Keywords:** Substance abuse, Teenagers, Addiction

### INTRODUCTION

Discerning the drivers of dependence producing drug, adoption among youth is alarming and has become a threat all over the world. It is becoming wonted atop the indefinite continued progress in the past as well as in the present scenario. Young adults are more attracted towards this substance abuse. The degree of consumption of substance abuse is more in teenagers than the older adults. Teenagers, especially students joining college and university have more feasibility of exposure of being attacked or harmed by dependence drug that leads to addiction. Now a days, it is not only that young adults experience their independence after joining college[1], university and acquire the freedom of staying in hostel, or outdoors, get attacked by the dependence drug but also the teens staying at home also experience the feeling of freedom are likely to be stormed by the abusive substances. It has been also observed that teenagers are not only attacked when they reach college or university but are also striked by substance abuse, by the time they reach the high school. The thought of independence that prevails in the mind of the teens and they try to explore it for gaining new experiences, like socializing and partying, making new friends navigate them towards

**Suchismita Nayak**

these substance abuse[1][3]. They have the mentality that having these substance abuse help them in standardizing their status among their friends and peer group[1]. The college life and the young adulthood work as a perfect storm for substance abuse like drug, tobacco, alcohol and many more. Observation states that, nearly 60% of pupils having the age group between 18-22 are thumped by these substance abuses. Teens basically follow their impulses for getting pleasure in the connection to taking alcohol, tobacco and drug. These narcotics are of great menace to young adults, because their brain are still in the stage of development until and unless an individual reaches mid 20s[6].

Although the young adults are at risk to the substance abuse, these enslavement can be treated and avoided. This is possible only if proper guidance and support of the parents at home as well as of teachers at schools, colleges and universities is provided to the teens by means of counselling and proper educational guidance, regarding the impact and effect of these dependence producing drug. As all most all school, colleges and universities promote awareness campaign against these narco products and promote drug free environment which proves to be very effective and will escort the young adults to follow healthy path to live a fit and disease free life.

**Drug dependence and Addiction**

Drug dependence involves the physical or mental feature which is regarded as indicating a condition of disease showcasing dependency or compulsion progress of the high endurance for the material or substance, as the body acclimatize to the drug, which further drives to a proclivity for immense and perennial dosage. Behavioural changes can be observed when the dependence of drug in an individual increases. The dependency of drug lead to physical indication of withdrawal when an individual tries to avoid its consumption[5]. If a person is addicted to drugs and has not taken for a period of time, may lead to physical reaction and the symptoms of withdrawal take place when the body experience mental or emotional strain or tension without the intake of drug, alcohol or tobacco. without being dependent on drugs addiction can eventuate and vise-verse. Addiction and dependence may involve certain aspects that are observed in an individual that showcase the attributes like

1. unable to keep away or stop oneself from imbibing alcohol or ingesting drug or tobacco notwithstanding aftermath.
2. Impuissant to occlude using drug, alcohol and tobacco.
3. Rundown from family and socialization as well as from the course of action to which a person is morally or legally bound due to usage of drug, alcohol and tobacco[1].
4. Makes a person more forbearing to the negative consequence and continue to have the substance abuse in increased quantity.
5. Anxiety and depression level increases due to dependency on the substance abuse if the person fails to quaff or utilize it[5].
6. Cause weakness in the muscles with a continual and protract plodding soreness in part of one's body if the abusive substances are not utilized at the required time[3][5].
7. Cause vomiting, nausea and sweating of a person if addicted or has become dependable for the substance abuse and fail to get in time[5].
8. Finally the addiction and dependency on substance abuse like alcohol, tobacco and drug leads to body collapse.

**Teens and Substance Abuse**

Substance abuse is very dangerous for all human beings. It is very minacious especially for the teenagers who have the feeling of independence after gaining adolescence and after joining college or university[1]. The teenagers travel through the phase of independence, where they are involved in making friends and traverse different types of escapade that further unlock the chapter that pave the way towards substance abuses. Observation says, there are many such minor enfeeblement or eccentricity in one's character that leads towards the tribulation. Some of the units of the unlocked chapter that teens are attacked by substance abuse are as follows;

**Suchismita Nayak**

**Inquisitiveness**

It can be considered as one of the factor that enforce the young adults of being pounced by the substance abuse. Inquisitiveness or we can say curiosity is a natural phenomenon that bring about or instigate the young people to do or try something which they know very well is not to be desired or approved of. Teens are very much eager to know that how it feel like after having drug or alcohol and how it feels like after having it, drags them towards the substance abuse. These young adults have the misconception that nothing can harm them even if they know the consequences of the usage of substance abuse.

**Experience Escalation**

To escalate certain experiences, teenagers take the help of drug and alcohol. Teens have the feeling that these abusive substances help them to increase their strength and capabilities and also escalate their focus, when negative thoughts surround them. They consider these substance abuse as a strong support to accomplish the task. They also have the feeling that taking drug and alcohol works as relaxing agents, that help them to relax mentally and physically.

**Depression**

This is another factor which has an influence upon the young adults to get enticed towards drug and alcohol. They have the feeling these substance abuse acts as an anti depression pill that helps them to forget their pain and sorrows and bring them to the state of happiness and normalcy. At that moment, the teens are in such a state where the sense of understanding and the knowledge fails to stop them from these evil substances.

**Stress**

Teens believe that life is all about fun, freedom and enjoyment. Some of the teens have a mindset that they need not have to do anything and achieve what they want. This type of mind set make them lethargic. They lack confidence and positive attitude to accomplish any given task. They come under stress when they have to perform certain task, say educational task and other curricular activities and to subdue the stress they take succour of the addictive and dependence abuse or substance abuse for relaxation.

**Peer Coerce**

It has been observed that peer influence is another element for substance abuse by young adults. Experimentation of drug and alcohol takes place among the teens due to peer coerce. It can be rightly said that peers have great impact on the individual who does not take drug and tobacco or drink alcohol and that first time becomes the routine or schedule for every day. A teen get influenced by the other members in the group that force the teen to think "if others can do, then why can't I". Teens believe that if they take drug, alcohol and tobacco then only they will be recognized in the group and will become popular in the group. Specially in parties and gatherings where they involve themselves in these abusive substances to be able to fit in.

**Body Shaming**

It is good to look attractive and to maintain good physic. This good looking concept is there in the society from the beginning but this has become a trend in this 21 st century. All love to have good physic. But it becomes very difficult for most of the teens to maintain a proper shape of their body and face mockery or criticism leading to body shaming. To get over from this body shaming, the teens lose patience to do work out and have healthy diet to get a perfect body shape, instead they simply opt for the most easiest way of losing weight by taking drugs which help them to reduce their weight within a very short time period and slowly they get addicted to it and these substance abuse give them the desired result with much more negative effects.

**Suchismita Nayak****Subdued Self-Respect**

Lack of self respect, paves the way for self destruction. Poor performance in academics, physical appearance and rareness of companions and family pressure to achieve the target level set by the parents are the reasons that give development to subdued self respect which further brings a lot of devastation among the teens. These factors are responsible in stimulating the teen towards the substance abuse as they lose belief in themselves, if they fail to reach the standards set for them. Teenagers believe that drugs, alcohol and tobacco act as an healing agent and feel that these abusive substances give them support in escaping from the reality.

**Idleness**

“An idle brain is a devil’s workshop”. This quote states that, when an individual has nothing to do, then that particular person invite troubles and get involved in it. It is clear from the quote that empty mind is the devil atelier for all worthless work and decision. It is wise that the young adults must keep themselves engaged or employed in some type of positive productive activity. From the above quote, we can conclude that, when teens or the young adults have nothing to do they get bored and don’t have an urge to do something worthwhile and end up experimenting with the substance abuse like drug, tobacco, and alcohol with friends of same class.

**Now or Neve**

This is a situation where the teenagers have the feeling that they belong to the age group where they can try, experiment and experience all that they can. They think that it is the right time and perfect age to experiment and gain experience and if this phase passes away can never return. This thought process leads them towards the substance abuse, later turns out to be fatal.

**Inherent Attributes**

In some cases, it has come to the light that some of the teenagers inherent the quality of experimenting with substance abuse as because of their family history. The teenagers get very much influenced, if they observe that someone in their family is addicted to drug, tobacco and alcohol. Teenagers try to experiment these substance abuse in the absence of the family members which later becomes an habit and they get addicted to it.

**Deadly Effect of Substance Abuse**

Addiction of substance abuse always has negative effect upon all individuals. Teenagers are the ones who get badly affected by these substance abuse. It has an instantaneous effect with long term upshot. Critical changes are observed in the behaviour of the person addicted with drug abuse. It is deleterious for the teenagers as they start harming themselves by using these abusive substances which reduce their ability to do something and also truncate their life span. Some of the deadly effects of drug abuse are;

- Brain dys functionality takes place, where the brain stops functioning normally leading to loss of memory, lack of attentiveness, thinking and decision making capability.
- Substance abuse weakens the immune system which opens the door for different malicious diseases.
- Weight loss is observed due to change in appetite with abdominal ache and vomiting[3].
- Abnormal heart rates are observed, further causing heart attack and crumble of trachea and blood vessel due to substance abuse.
- Damage of liver and lungs occurs due to the practice of substance abuse.
- Friend circle change is observed[3].
- Career gets washed out because of the substance abuse.
- Lying and stealing becomes a part and parcel of the life to satisfy the need for substance abuse.
- Deterioration of relationship with family members and caring friends occur due to the abusive substances.

**Suchismita Nayak**

### **Inhibitory Measures**

There are numerous reasons that why a teenager is exposed to the substance abuse. It is all important to understand the degree and guard the teens from being attacked by this dreadful substance abuse consisting of drug tobacco and alcohol. Inhibitory measures must be adopted by the parents as well as educators for failing or preventing the usage or practice of substance abuse.

### **Family Guidance**

It is rightly said "Charity begins from home". The same quote is applicable in the prevention of substance abuse by teens. First and foremost duty of the parents is to have a friendly atmosphere at home and need to spend quality time with their children[7]. This creates a positive environment and the teens get never distracted. Parents can educate their children about the dreadful consequences of substance abuse and create awareness within their children.

### **Drug Awareness Program**

To create awareness among the young adults or the teenagers. It is very much essential to create awareness program by the government agencies as well as by the NGOs. These programs must feature videos showcasing the devastating effect of substance abuse and also to highlight the specific preventive measures, to enlighten the young adults about the fatalistic impact of the substance abuse. All most all educational organisations must have a session on weekly basis based on the awareness of drug and also to screen stories of drug addict and their sufferings[7]. Inviting doctors to the campus and organizing sessions with the students to make them aware of the deadly consequences of the substance abuse must be initiated to stop and remove these deadly substance abuse as a whole to protect the teenagers, society and the nation.

## **CONCLUSION**

Teenage is the age where lots of changes and development occurs in the brain and body of an individual. At this stage the brain is not completely developed and it is in the developing form. The area which the brain uses for critical thinking and decision making is pre-frontal cortex, which is not fully developed of a teenager until an individual reaches mid-20s[6]. It is clear that the teenagers lack the capacity to analyse, do critical thinking and take correct decision. It is the duty and responsibility of the parents as well as the educators to have friendly atmosphere so that the teens never hide anything to them and share feelings, emotions and any wrong deeds without any hesitation[7]. Both parents and educators must make the young adults aware about the hazardous effect of substance abuse educate them to analyse, what is ethical and beneficial for them.

### ABSTRACT

There have been different models of language curriculum proposed by many. These include classical humanism, reconstructionism and progressivism. These models can broadly be divided into either a 'product' approach to curriculum development, or a 'process' approach to curriculum development. The paper highlights how each model is a part of various approaches and suggest which model would be best suitable for technical education in India. Further, it has been argued in this paper that there is a need to adopt any approach based on the needs of learners.

**Keywords:** Models of Curriculum, Process and Product Approach and Language Curriculum

### INTRODUCTION

As Clark(1987) has referred to the frame work developed by Selinker to explore how they are related to the curriculum planning. The three models i.e. Classical Humanism. Reconstructionism and Progressivism vary from one another in different ways and they have their own principles and ideologies.

#### Classical Humanism: A Product Approach

Classical Humanism is more bent towards product approach than the process approach. An orientation of the classical humanism development focuses on the transmission of content and knowledge. The curriculum is 'content driven'. The syllabus is pre-determined. 'What is taught is what is learnt' is the intention of this approach. As has been pointed out by Clark (1987), Classical Humanism takes the following things in to considerations in curriculum design(Clark, 1987):

- Promoting intellectual capacity
- A coursebook to carry various aspects of information and knowledge
- Graded information

**Ajit Kumar Pradhan**

- Learners should progress in the same pace
- Conscious awareness of rules and patterns
- Norm-reference reference

It can be observed from Clark's points that classical humanists look to the curriculum planning from a product-oriented approach. Classical humanism believes in the model of input-output. Here learners are treated as mere objects and learning can be planned and pre-determined. There is therefore a linear progression of teaching and learning of language, as the listing items to be taught in each academic semester/year. Here teachers are 'instructor, explainer, transmitter of knowledge predetermined in advance'.

**Reconstructionism: A product-process Approach**

Unlike 'contents' of the classical humanism, reconstructionism focuses on the 'objectives', as the main objective of reconstructionism was to bring about some social changes. According to Richards and Renandya (2002) this model provides:

1. clarity of goals
2. ease of evaluation
3. accountability

Further, Clark (1987:15) states that Reconstructionism emphasizes 'objective-driven' curriculum. This model believes in clarity of goals, which has been fixed earlier the teaching and learning programme. Here more focussed is given to 'mastery learning'. What is learnt is more than how to learn. As the model already has got a pre specified objectives, the success of the programme is evaluated how far the set objectives have been fulfilled. So emphasis is given to pre-determined goals. As in classical humanism teachers are not playing any role in the process of making the syllabus rather, they are now playing the role of manager, who will look out how far the objectives are to be achieved. Because of the pre-determined programme, in this model, like classical humanism, the progression is linear. This mode strongly believes Tyler's ends-means approach, as particular ends can be achieved through proper instructional planning. Taba (1962) clearly points out the high product orientation of this model.

**Progressivism: A Process Approach**

Unlike Classical Humanism and Reconstructionism, Progressivism believes in process approach. In Clark's (1987:49) view, progressivism offers 'a learner-centred approach to education'. In other words, all the decisions made on the curriculum are related to learners needs and requirements. Developing holistic personality is one of the key roles of the approach. Making errors in the process of learning imply that learners are making attempts to learn and thus errors are considered to be a part of learning and thus highly encouraged. The central idea of it is 'growth through experience' which learners develop through proper inputs from the classroom and support from outside the classroom. Thus, through education learners develop skills to learn by themselves and progressively become 'autonomous'. Teachers need to take conscious and firm decisions on 'what' and 'how' of learning. This requires teachers to undertake proper research of their students to recommend. The methodology, unlike the earlier two models, provides focuses on providing opportunities for learners, spontaneous learning through experience. It is clear that learners experience and creativity is value. Roger (1969) rightly agrees with this concept and believes that an educated man should be able to learn by oneself and focus should be given to the process of learning.

Progressivism is a process-oriented approach, has been clearly stated by Clark (1987). This approach is based on 'individual growth' through exposure to environment stimuli and learning through personal experience. Further, a speculative knowledge-view is highly suggested where the focus is given on natural ways of learning. Learner as a social being is also recognised in this model where learning is emphasised through interaction and learners need to take partial onus on themselves.

### Ajit Kumar Pradhan

Here the stress is on the development of the whole person, on process and sequencing of tasks. The curriculum is a flexible one, there is much more importance to learning how to learn, not to any predetermined or fixed objectives. Much more emphasis is given to teaching methodology. Unlike the earlier two models, here the role of learners is significant. They rather impose their own sequence what to learn and what not. This model takes care on learn how to learn. It looks to the learning process rather the end product.

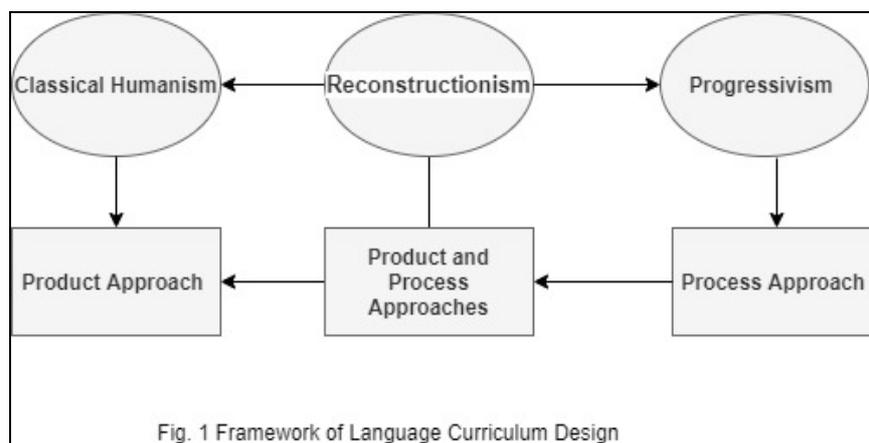

Richards and Renandys (2002) rightly emphasize that '*the purpose of education from the point of view of the process model is to enable the individual to progress towards self fulfilment*'. Unlike, mere reception of knowledge, progressivism gives importance to the development of understanding, further they say that the goals of education is not the end but the process, where individual develops understanding and creates the possibility of future learning.

## CONCLUSION

English language plays a significant role in technical education. There has been an argument which model of curriculum to be adopted to suit the needs of the learners. It is not possible to discard the role and significance of each model. Both process and product approaches to language learning has its own relevance. However, a mixed approach is always recommended where the best of each approach can be taken into consideration keeping the needs of the learners into consideration. The curriculum should not be completely rigid and fixed. It should provide space for the teachers to tailor it keeping his or her learners needs.

### ABSTRACT

This paper is concerned on the basic idea on pulse width modulation techniques & the application of SPWM on matrix converter. This matrix converter is famed as forced commutated ac-ac converter. Using the Sinusoidal Pulse Width Modulation (SPWM) technique, the output can be generated from matrix converter. This techniques has many advantages like less switching loss, low harmonic content & the method of implementation is easier. This uses a reference (modulated) signal & carrier wave to produce pulse & generate output. The many intersection on triangular carrier wave of sine modulated signals generate the gate signals for switches used in the circuit. This can be presented & simulated through MATLAB/Simulink.

**Keywords:** Pulse Width Modulation, Matrix Converter, SPWM Technique, Sinusoidal Pulse Width Modulation, Forced Commutator

### INTRODUCTION

As the name PWM suggests, it stands for Pulse Width Modulation Technique. It is a method for generating a modulated output signal from analog device using a digital source. It is mostly used in communication devices for encoding the amplitude of the signal to the precise pulse width of the carrier signal. It is the most well liked method for controlling output voltages. The benefit of PWM is that the power losses are very minimal.

#### Different Types of PWM

- Single Pulse Width Modulation
- Multiple Pulse Width Modulation
- Sinusoidal Pulse Width Modulation

**Dinesh Kumar****Single Pulse Width Modulation**

One pulse width equals to one half cycle in this modulation technique. The adjustment of the single pulse width is done in order to regulate the output voltage of the inverter. In this method, the rectangular modulated signal is carried over the triangular carrier wave & the output voltage frequency is determined by the modulated signal's frequency. This technique produces high harmonic content which is the main disadvantage. This Single PWM can be understood from the following figure.

**Multiple Pulse Width Modulation**

This Multiple PWM techniques overcomes the drawback of Single PWM by lessening the high harmonic content. This is done using more pulses in each half cycle of the output voltage as shown in the following figure 2. The gate signals are generated for turning on & off of a thyristor by comparing a modulated signal to a triangular carrier wave. The no. of pulses is determined by the carrier wave's frequency & the output frequency is set by the modulated signal frequency. In this technique modulation index administers output voltage. This technique is advantageous over the Single PWM technique & however it has its drawback too. In order to produce large no. of pulses per half cycle, continual turning on & off of thyristors is required which increases the switching losses.

**Note:** Modulation Index ( $m$ ): It is the ratio of the peak magnitudes of the modulated signal to the carrier wave & its magnitude lies within 0 to 1 i.e.  $0 < m < 1$ .

**Sinusoidal Pulse Width Modulation**

Sinusoidal PWM is a technique of pulse width modulation mostly applied in inverters & have a large applications in industries. This technique is also famed as Wave Shaping Technique in power electronics. In this method, by comparing a sine modulated signal to high frequency triangular carrier wave, the gate signals could be generated. Since this needs high frequency carrier for voltage modulation, hence also known as carrier-based PWM technique or Triangle-comparison PWM technique. The magnitude of the sine modulated signal should be sparse to the peak magnitude of the triangular carrier wave. Utilising the frequency of the sinusoidal modulated signal, the output frequency can be determined. But controlling the output rms voltage can only be done by Modulation Index & this modulation index is controlled by the peak amplitude of the modulated signal. The no. of pulses per half cycle is directly proportional to carrier wave frequency.

The range of the modulation index limits from 0 to 1 i.e.  $0 < m < 1$ . This region is called linear modulation region. In this consideration, the PWM inverter can be known as voltage amplifier with a unit gain. The region where modulation index gets greater than 1 i.e.  $m > 1$ , it's called overmodulation region as shown in the above figure 6. The efficiency of the SPWM technique gets to 78.5% of the max. output voltage. The switching frequency PWM inverter is equivalent to that of the carrier wave. Once every time period of the triangular carrier wave, the switch is turned on or off having the advantage of constant switching frequency. Due to this advantage, it's feasible to compute the switching losses. In addition of a low-pass filter to designed inverter circuit, the reducing of harmonics gets easier. The supremacies of SPWM are increased fundamental component, enhanced harmonic contents, less number of switching power devices & decreased switching losses.

**Application of SPWM Technique**

Sinusoidal Pulse Width Modulation (SPWM) technique is utilised to produce control pulses for the Matrix Converter switches to generate the output. The sequences of switching for the Matrix Converter to work as cycloconverter can be represented & evaluated using MATLAB/Simulink.

**Matrix Converter**

The matrix converter converts direct ac-ac power in the absence of intermediate dc-link circuit. An array of controlled bi-directional semiconductor switches are utilised in this device as the master power circuit, or so it is named as a forced commutated ac-ac converter. Variable ac voltage with unhindered output frequency is transferred from ac

**Dinesh Kumar**

input voltage through this device. This converter has an array of 'm x n' bi-directional power switches where 'm' represents the phase voltage source & 'n' represents the phase load. A 3-ø matrix converter comprises of 9 switches laid in 3x3 matrix form. The positioning of BDS is made in such a manner that random input phases A, B, C is concatenated to random output phases a, b, c. These laid switches are administered in a precise manner that the average output voltage is a sinusoidal of required frequency & amplitude. The laid switches in 3x3 matrix form provide 512 amalgamations of switching states.

The pragmatic model of this forced commutated converter needs bi-directional switches (BDS) proficient of blocking voltage & conducting current in both directions, yet no such method is available in present time. BDS can be executed by wielding a befitting amalgamation of unidirectional switches with diodes. The Matrix Converter utilizes an array of controlled 9 bi-directional IGBT switches which are the default power elements to produce a changeable output voltage system with unrestricted frequency. Each IGBT are proficient of conducting current in both directions, blocking forward & reverse voltages. The SPMC is added only in passive (i.e., R, R-L) load conditions. SPMC topology is confined due to intrinsic restraints. One of those restraints is the truanting of the natural free-wheeling path.

The input & output voltage of the Matrix Converter is given by (a) and (b) respectively with loads in (c);

$$V_i(t) = 2V_f \sin \omega_f t \dots\dots\dots (a)$$

$$V_o(t) = 2V_o \sin \omega_o t \dots\dots\dots (b)$$

$$V_o(t) = R i_o(t) + L \frac{di_o(t)}{dt} \dots\dots\dots (c)$$

When the model of Matrix Converter is evaluated through MATLAB/SIMULINK, these are the reports framed from it. The computation time for the simulation is the main constraint during the theoretical analysis of a matrix converter. The mathematical model bridges the drawback that favors the operation of power conversion stage of Matrix converter. This study compels the ensuing research on Matrix converter easy and buoyant. The functioning of Matrix converter was pursued for loads with both 0.866 voltage transfer ratio.

**CONCLUSION**

There are various methods of PWM techniques that can be adopted on different converters according to our desired output. But SPWM technique has acquired a lot of attention in present time due to its benefits & in application of matrix converter as cycloconverter. The BDS used in these simulation act as freewheeling path with amalgamation sequences of switching, thus providing a converter topology for further research. A matrix converter can input either AC supply & using SPWM technique it generate a synthesized AC desired output. For the operations & maintenance of these converters skilled manpower & expertise is highly essential.

### ABSTRACT

Waste management may be world environmental issue which concerns about a terribly important drawback in nowadays world. There may be a considerable amount of disposal of waste without correct segregation that has cause each economic and surroundings sufferings. It's still practiced in many cities. There is a tremendous quantity of loss in terms of environmental degradation, health hazards and economic descend because of direct disposal of waste .It's higher to segregate the waste at the initial stages where it's generated, rather than going for a later choice which is inconvenient and expensive There has got to be acceptable coming up with for proper waste management by means of analysis of the waste state of affairs of the world. The study represents preliminary study of legal framework for local solid waste management and explains the issue and challenge that stand in the way of India's objective to establish a solid waste management system which is comprehensive, consolidated, cost-saving, expendable and tolerable to the community.

**Keywords:** Solid waste management, India, legal framework, consolidated.

### INTRODUCTION

Waste is generated in a large mass by the society. Disposal of this waste is now a global issue for a healthy environment. Solid waste includes street sweeping, household wastes, sanitation part etc. Direct dumping of these wastes without any treatment effects the environment. The waste dumping without proper inspection and separation causes environmental pollution and become perennial problems for mankind. When we think about the waste management policies, we may have been in Neolithic time. Till 2000 we had low concern about the pollution and waste management. A number of laws were adopted in India such as water Act (prevention and control of Pollution) on 1974, Air (prevention and control of pollution) act on 1981 and environment protection act in 1986. But the subject of MSW was neglected legislatively. Other rules and laws were also adopted in India like Hazardous waste rules in

**Rachana Mohanty**

1989 and biomedical waste rules in 1998 (suppressed) dealt with the MSW tangentially. The day by day crisis on solid waste management brought later versions of laws to protect the environment. They are solid waste (management and handling) 2000, solid waste management rules 2016, hazardous and other waste (management and transboundary movement) 2016, construction and demolition waste management rules 2016, biomedical waste management rules 2016, plastic waste management rules 2016 and e waste management rules 2016.

### **Analysis of Qualitative and Quantitative Measures on MSW**

Various categories of MSW such as kitchen waste, rubbish, commercial waste, educational wastes, garbage, building construction wastes and sanitation waste. The waste contains recyclable substances and non recyclable substances. The recyclable waste likes plastic, metal, paper, glass, etc, organic matter, toxic substances such as paints, pesticides, insecticides, inverter batteries, medicines foils, sanitary napkins, disposable syringes and used cotton etc. The quantity of MSW generated depends on a number of factors of the society such as standard of living, food habits, commercial activities and seasons. The planning for collection and disposal systems is mainly depends on the data on quantity variation and generation. The change in life style is responsible for the increase of MSW. Presently more than 90 million tones of solid waste are generated annually as byproducts of various processes. As per the table 1 data ward no 19 shows the highest range of solid waste produced i.e 2500kg/day and ward no 4 produced 629.5 kg per day (if each person produce 0.5 kg/day solid waste approx.). Therefore a total of 36 ton approx is produced in each normal day. In a month it is calculated as 1080 ton approx. in a year it is calculated as 12960 ton approx. The rate of waste may fluctuate due to festivals, other holy occasions.

### **Disposal of the Solid Waste in Rayagada Town**

In general view solid waste disposal is the placement of solid waste so that it is no longer more implants in the society. The garbage is either understood fully so that they can no longer be reorganization in the environment. The total solid waste management includes Assortment, dumping, and betterment. Around 36 tons of waste is caused in the town daily and is dumped between Burdalpamma and Majhigariani temples. The total dumping area is about 3 acres. This is the unused area near the famous temple Maa Majhigouri. There is also 12 acres of rubbish heap plant is also recognized near Antariguda village of Rayagada block, which remains unexploited.

### **Modes of Transportation of Garbage**

Out of 24 numbers of wards, local municipality manages 8 numbers of wards and rest 16 wards are managed by private contractors. In this work around 4 tractors are engaged.

## **CONCLUSION**

No doubt the disposal of the waste is done in a defeated manner in Rayagada to fill the dump yard near the Majhigouri Temple, Rayagada. Due to the waste dumping the temple surrounding gets polluted, which affects the health of the Thousands of pilgrims coming to the Temple every day. But if we see the positive side of dumping, then we will find the un-useable area of 3 acres of land in the heart of the town will become a flat land for reuse by the people of Rayagada. From the dumping a lots of materials are collected back by the scavengers (scrape collecting people), for getting their bread and butter. This dumping when complete, there will be a direct path for the Rayagada people to reach the temple in a short distance.

### ABSTRACT

Population growth rate is increasing every year and everywhere. So the use of different varieties of products are also increasing directly and indirectly. To carry the light and medium weight substances generally plastic bags are being used by most of the community. Also for the packaging of the heavyweight substances and goods polythene is used. These plastics are now days reused and recycled, but after this also plastics are considered as a threat to the environment. This threat can be vanished or eradicated by simply avoiding and saying no to the use of plastics. But the fact is that, what can be used in the place of plastic bags are the point of discussion. The plastic bags are easy to manufacture, less cost, available everywhere and can be used by everybody. But its effect is harmful to the nature. So to avoid the use of plastics, different biodegradable bags are now available in the market. By using these eco-friendly products we can get the same facilities like plastic bags with a promise to the environment to protect it from pollution. This paper work focuses on the collection of information on different impacts of plastics and plastic bags on environment, human health with the alternatives bags that can be used instead of plastic bags like paper bag, jute bag, cotton bag, etc.

**Keywords:** Plastic bags, Nature, Biodegradable bags, Eco-friendly, Pollution, Paper bag, Jute bag.

### INTRODUCTION

Everyday for the livelihood the buying and selling actions are going on restlessly around the globe. Everywhere the large sized items, goods, heavyweight machineries, small items, food items, vegetables, footwear are being sold and purchased by the consumers. Mainly during the dealings of small items, light weight items, daily use items, vegetable items the plastic bags are generally used and comes into the attention of everyone. The plastics bags are used extensively by everyone starting from the persons those who are moving door to door to do business for earning for their livelihood like vegetable sellers, fruit sellers, milk mans to the persons those who are dealings in

24884

**Kula Bhusan Pradhan**

large shopping malls and multiple starer hotels. The reason for the huge use of plastic bags is it is cheap, available everywhere, light weight, easy to handle, easy to carry and can be thrown out after a single use of it. Also during the packaging of heavy machineries plastics are used as cushioning element with the bubble like air packages formed around the base plastics that are made up of plastics. Also nowadays before using the costlier items, quartz, steel items, one layer of plastics is used as coating element and just before the use it is removed from the product. After the use, these plastic items are thrown to the dustbins or exposed to the atmosphere any how. These plastic elements are then may be collected by the plastic collectors for the recycling purpose, dumped somewhere for land filling, openly placed in the dump yards or burned by the local community of people. Then the effect of it is on the environment and pollute it and when the environment get polluted then it affects everyone those who are present inside the atmosphere.

Today everyone including the marine animals and the animals residing beneath the earth's surface are affected by these plastics indirectly or directly. Animal's food digestion system is affected by plastics that leads to the death of the animals[8]. Marine animals are also affected by the plastics by eating the debris, the animals are choked by plastic elements and unable to breath and swim and finally facing the death. Birds are also consuming the tiny plastic items during the consumption of food and finally meets death. Plastics releases chemicals in soil, that chemicals affect the crops grown in that soil. Due to plastics in the soil the water in the soil is contaminated and when it is consumed by any one it affects their lives. So new technologies were developed by using the ideas of the environment friendly persons those who are thinking to protect this environment. Instead of using plastics, first the focus was given on the materials that are biodegradable in nature. Materials those are extracted from plants are everyone's concern then, as plant extracts are quick biodegradable and organic in nature. Then some chemical processes are also analyzed and experimented where the bags like plastic bags can be manufactured from some chemicals and eatable oils, but these bags are looking like plastic bags and they are biodegradable in nature. Focuses on these biodegradable carrier bags are now a major concern for the technologies developers and everyday new processes are analyzed, tested and implemented to get the better solution for the problem of use of plastic bags. In the following paragraphs the detail analysis of effect of plastic bags on environment and the alternatives that are accepted against it are described briefly.

**Reviews on Effects of Plastic and Plastic Bags On Environment and Human Health**

Plastic bags are made up of plastics, which is the combination of polymers and additives. These polymers are the summation of monomers and monomers are the chemicals. So when these plastic bags are exposed to the environment it affects badly to the residents of the environment which includes everyone such as human beings, animals, birds, plants, air, water and soil.

**Impact on Environment**

Plastic bags, when present on or wrapped around the leaf of the plants they obstruct the sunlight to reach the leaves and affects the photosynthesis process [10]. Also plastic bags are easily flown away by the air from one place to another and makes the environment ugly[11]. Animals when eat the plastics during the grazing, then they are facing the diseases and most of the time facing death[10]. Plastic bags, when buried under soil then it acts as a layer of insulation for the rain water and and the other fertilizers from going down at that particular place[10]. Due to the lightness properties plastics floats on the water and create a required environment for the development of bacteria[10]. plastics also block the passages of water channel and affects the irrigation process[10]. Even though plastic bag materials are very thin, the roots of the plants are unable to pass through them and unable to get the required nutrients from the soil and the agricultural issues are also generated due to the plastic bags[11]. These plastics also affects the nitrogen fixation, decreases the soil fertility and affects the life of flora and fauna of soil[11]. The earthworm who is called as the farmer's friend also day by day decreasing in number due to the pollution created by plastics and chemicals used. When plastics are burned, as these are produced from the fossil fuels so they emitted toxic and harmful gases to the environment. Also during the extraction of plastics it releases harmful gases that pollute the air. When plastics are burnt they emits the harmful gases like chlorine dioxide, carbon dioxides,

**Kula Bhusan Pradhan**

acids, dioxins and other gases that affects everyone's life[10]. Polystyrene, used for the packaging of teacups and burger is very dangerous for ozone layer as it contains chlorofluorocarbon(CFC) gas[10]. Death of millions of sea birds, one lakh marine mammals and huge number of fishes were happened due to the plastic waste [12]. The marine animals were also entangled in the plastic waste like fishing nets, these nets travels through the water bodies like seas and oceans from one place to another and numbers of animals like shark, tortoise and sea birds trapped and facing death[13]. Ingestion of plastics affects the digestive tract, reduced appetite as the plastic present inside stomach feels like full of stomach and leads to starvation of the animals[12]. Micro plastics are found in river, lake and oceans which affects and pollutes water and its residents[9].

**Impact on Human Health**

When plastic bags are used for packaging purposes of hot food, pickle and fatty foods then the plastics have interacted with the heat generated and produces carcinogenic dioxin[10] that leads to the development of cancer. Water, that is coming through the tap is also having plastic pollution. Plastics are having a greater impact on human health. Diseases like failure of vision, cancers, lung diseases, reproductive problems, skin infections, headaches are the major problems that are found due to the use of plastics that are toxic in nature. Additives in the plastics are provided to make it more hard, clear, flexible and resilient. The additives like Bisphenol A can causes cardiovascular diseases, type 2 diabetes and hormonal changes in adults[12], this additives affects more to the fetus and children[14]. Additive, Phthalates also having negative effect on testicular dysgenesis syndrome that affects the reproductive system of animals [15]. Both the additives Bisphenol A and Phthalates can also causes aggressive behaviour, decreased male fertility and early sexual maturation in human beings[16]. Persistent organic pollutants are the plastic additives that causes neurological and reproductive damages[17]. The additive, polychlorinated biphenyls affects the thyroid hormones [17]. Today 60% of the medical plastic wastes are incinerated which are infectious wastes[18], if the incineration process is improper then it affects the human health as it releases the dioxins[19]. The incineration produces ashes that ashes are also disposed for landfill but these are toxic in nature and that can affect the groundwater that is present below the landfill and affects the life of human beings as ground water is consumed for drinking purposes [19].

**Alternatives Available for Plastic Bags**

Nowadays the problems due to the plastics are present everywhere. The air we breathe and the water we drink are also under the harmful effects of plastic. To reduce the use of plastics used as bags can be replaced by the following options.

**Paper Bags**

Paper bags, as the name suggests these are bags which are manufactured from the recycled paper. These bags are fashionable, also can take medium loads, for most of the shopping items, vegetable items, malls these paper bags are most suited. As these are mainly produced from the paper waste so the overall waste of the globe is also reduced. Also these bags are reusable for certain number of times. Once they are worn out, again they can be recycled. If these bags are exposed to atmosphere, then also these are biodegradable [3].

**Cotton Bags**

These are the bags that can be used in place of plastic bags. These bags are produced from the different types of cottons such as traditional cotton, recycled cotton and organic cotton. Out of these three organic cottons are produced without the use of chemicals and recycled cottons are produced from both traditional and organic cottons. Traditional cottons are grown by using some chemicals. These cotton bags can be used for hundreds of time. Unlike paper bags these can be washed and water cannot harm these bags. They can bear more load than the polythene carriers and paper bags. Again, these bags are biodegradable and whenever exposed to the environment it will not pollute anything [3].

### Kula Bhusan Pradhan

#### **Jute Bags**

Jute bags are the made from the plant fibres naturally. More impact on jute bags also enhances the agricultural growth for jute plant and other plants plants from where jute can be extracted. Jute bags are also designed to take various types of loads. These bags can be used many times and the end it can be recycled once again, if it is exposed to atmosphere then it is completely biodegradable [2].

#### **Denim Bags**

Denims are durable, degradable and reliable. Bags can be made out of old denims and denim bags can take more load than the plastic bags. Also it is washable and can be used again and again. The denim bags can be made at home also. When the denim bags are worn out, these are biodegradable [1,6].

#### **Compostable Bags**

These are the bags made from the raw materials that can be renewable. These bags after the use can be converted into compost. But they are having limited life and limited use [3].

#### **Metal Containers as Bag**

Stainless containers can be used as carrier object. Different shapes and sizes of the container is available. These metallic bags can be used for a longer period of time. Also at the end it will be recycled and can be used again.[6]

#### **Required Behavioral Changes in Human Beings to Say No to Plastic Bags**

Plastics bags and its wastes are found only when we use it, in order to reduce the quantity of plastic bag wastes or single used plastic carriers wastes globally, the use of theses commodities should be decreased and if possible the production of new plastic bags should be stopped and the existing plastic bags will be recycled to the maximum number until it will be completely unusable. Ban on plastic bags are imposed on various regions across the world, but after it also the generated waste is huge. When the individuals will think about their own life along with the environment then the use of these plastics may be reduced. Instead of using the use and through or single used water bottles, food packaging systems, plastic bags, the options like refillable water bottles, reusable food packaging systems and multiple time usable non plastic bags can be used[20]. If these practices will be accepted at individual, corporate and social level then a large change in the pollution will occur that will be the advantage for the whole world. Some coffee shops are providing discounts for them, those who are coming with reusable cups[20]. The discount is important but higher priority is that people are changing and that puts positive impacts on environment and everyone's life. Complete prohibition of plastic bags in the corporate sector, zoological and botanical area will also helps in to say no to plastic bags in these areas.

### **CONCLUSIONS**

First, all of us should educate ourselves and others to not accept the things that are harmful to the environment and human beings. The whole world is facing the problems related to plastics today, the replacement for the plastic bags are the important topic to rethink for everyone. In this work the ill effects of plastics are discussed along with the different varieties of non plastic bags, these bags can be used in a better way than the plastic bags. Some of these non plastic alternatives are washable, multiple time usable, more load bearer than plastic bags and finally they are biodegradable. By using these environment friendly and user friendly bags the environment can be protected, the overall waste of the world can be reduced. The animals of the planets will not be affected if the above discussed five varieties of bags used by everyone. It is believed that new technologies and new ideas will be developed soon as other alternatives to the use of plastic bags.

### ABSTRACT

Among the different concerns of syllabus designers, teachers, curriculum developers and the whole educational body, poor academic performance of students is treated as the main concern now a days. In this case one has to identify the causal factors which influence the poor academic performance of the students and then find the interventions for it. Centurion University that aims to shape especially the academically poor students made it successful by identifying the factors and then implementing the necessary interventions. 255 students were examined carefully who enrolled for Diploma program at Centurion University of Technology & Management. The academically poor students were categorized in to two main groups, ignored students and other academically poor students. Accordingly necessary interventions had been implemented to improve their academic performance and concluded as the performance of the academically poor students can be improved by providing some extra focus to them.

**Keywords:** Bridging Classes, Ecosystem, Ignored students, Social service

### INTRODUCTION

Education is one of the most important aspects of human resource development. Every child should have the opportunity to achieve his or her academic potential. In January 2019, India had over 900 universities and 40,000 colleges. This indicates that, the country has suitable number of institutional facilities for higher education. Still, it is generally noticed that at least 20% of children in a classroom get poor marks - they are "scholastically backward". Poor school performance should be seen as a "symptom" reflecting a larger underlying problem in children. This symptom not only results in the child having a low self-esteem, but also can cause significant stress to the parents. It is essential that this symptom be scientifically analysed to discover its underlying cause(s) and find a remedy. State enacted multi-sector University, Centurion University of Technology and Management, established in the remote

**Aloka Kumar Rana**

district of Gajapati in Odisha reviews the causes for children having poor academic performance and describes its management.

**Centurion University as a Suitable Ecosystem**

Centurion University of Technology and Management is a multi-sector, private state university from Odisha, India. With its main campus at Paralakhemundi in the Gajapati district and another constituent campus located at Jatni, on the fringes of Bhubaneswar. The university offers under-graduate, post-graduate and doctoral courses in the fields of engineering & technology, agricultural sciences, architecture planning and design, mining, teachers' education, media and communication, paramedics and allied Health Sciences, pharmacy and life sciences, management, applied sciences and a number of vocational trades in its two major campuses, to provide alternate pathways to young people who have dropped out of formal education. It further provides an opportunity for these young people to get back into formal education if they so desire. The University has also set up a number of social enterprises which operate as teaching and learning laboratories for students, staff and alumni with the intention of making a last mile connect with the local populations, be it tribal farmers, women entrepreneurs or young unemployed youth with little skills. Now a days, most of the pupils are getting admitted in various academic programs without setting their goals even not having any interest to learn. It has also been found that, some of them have intention only to get a certificate. Lastly a few of them will be found to be both academically & financially poor from the ground level. In this situation, the University also works as an incubator for the academically poor students to explore new ideas for enhancing production & productivity. Further, the promoters, mentors and senior management of the University have a 'grounded intelligence' and 'grounded imagination' that considered 'ground up' learning as the best and application of theories in the 'local' and 'context-specific'.

**The Ignored Students**

There are some pupils upon whom, not only the society but also their parents even the pupils themselves lost hope that, they can't do anything. They don't have any curiosity and are very casual in academic learning. Such pupils may be here named as ignored pupils. Among the 255 examined students (selection held on September 2015) of the University, 77 of them were found to be of this category. The promoters of the University suggested the faculties to identify the positivity inside them carefully. Being a skill university, the positivity was strictly in terms of both existing skill and the skills in which they had interest. Basing upon this, all the 77 students were found to be of 6 categories. They had been encouraged and accordingly provided special training on their specified skill categories and allotted their academic branches aligned to the respective skill categories. Exactly 16 of them were provided special training on electrician, 15 for sewing, 11 for CCD (Cafe coffee day), 11 for software designing, 17 for MMV (Mechanic Motor Vehicle), and 7 for Entrepreneurship. It has been marked that, almost all the ignored students became motivated after their special skill training (October 2015 to March 2015) which they were practicing after their regular academic classes. Further being academically poor, they were being provided some extra focus from the faculty's side regarding their academic courses. In June 2018, they completed their Diploma and up to that time 9 from electrician, 7 from CCD, 10 from sewing, 9 from software designing, 11 from MMV had been selected in some campuses. Again till December 2019, in total 14 from electrician, 11 from CCD, 13 from sewing, 10 from software designing, 16 from MMV had been placed in different companies & 3 from Entrepreneurship have been started business( 2 of them started chicken firm & 1 have dairy firm).

**How did they learn?**

There were some strategies adopted by the university in order to shape this category of students. According to the instruction of the higher management team, all the teaching and non-teaching staff included by making a correlated team to make then streamlined. Basically the following four strategies like "Learning by Social Service", "Learning by Doing", "Learning by Group" and "Learning by Shaping" were followed for this purpose. Those each of the strategies have one aim, but they acted as different objectives to reach the aim.

**Aloka Kumar Rana****Learning by Social Service**

The students of different trades were allowed to visit door to door in the nearest community. They had to ask each door about their needs in terms of maintenance which the students can do in free of cost. The main aim was to learn the students, whereas the mode was through social services. In this mode the students were serving the people according to their trade knowledge. For example, the Electrical students were serving people by repairing their electrical equipment like fan, grinder, washing machine, motor, air conditioner etc. Students from MMV trade were repairing the vehicles and so on. In this mode of learning the students were not only gaining knowledge but also the mental satisfaction that was reflecting from the face of the people being served. Once they were ignored not only by themselves but also by the family and the community. But now the community started to encourage them both on the spot and in terms of some expectations in the future to be served once again in more advance manner. All those things created some aspirations to improve further by gaining more knowledge and skills [4].

**Learning by Doing**

The personal nature of experiential learning engages the students' emotions as well as enhancing their knowledge and skills. When students see the concrete fruits of their labour, they experience greater gratification and pride, thus enhancing their enthusiasm for continued learning. Being a Skill University, the Centurion University provides many skill courses in which the students have learn by doing or practicing a particular skill. The skill courses includes RAC, CCD, Solar, CNC etc. In the courses the students were given both training and practice from the first day. Practicing from the beginning avoided the fear to gain a theoretical or conceptual knowledge. This mode of learning also increased the students involvement consequently decreasing boring and making them more curious and happy. Once they were ignoring themselves. But doing something from the first day induced some aspirations to improve. A person having knowledge without any skill suffers a lot to survive in the society. Practicing the skill courses from the first day helped the students to survive easily. Also the students were visited to different Orphanages and Old age homes to serve the physically. This activities were conducted by the CSR team. Directly the activities induced humanity and social responsibilities inside the students and taught them to be a good human being. Consequently this influenced to improve again their performance academically [1].

**Learning by Groups**

Studying with other individuals gives each other the opportunity to utilize auditory learning by talking through the material at hand. When a student study with other students of his/her class, he/she will ensure he/she covering all of the bases and not leaving out any important information. Additionally, he/she can gain different perspectives from other students. For instance, there might be material that seems confusing to him, but could potentially be clear to his study partner. Study groups are the perfect place to gain different viewpoints on the same topic. By studying with a group of people, the students have the opportunity to quiz each other on difficult subject matter and allow themselves to stay focused on their studies. Reaching the full potential in college courses is widely dependent on how you choose to spend your time. Refining your studying techniques can help improve your grades and optimize your learning. Keeping this as objective, Centurion University provides group learning strategies which not only helpful to accelerate the academically poor students but also for all. Especially the ignored students who lost their faith upon then could be encouraged and learned from each other. While visiting the nearest community to serve people in terms of maintenance, they noted their difficulties as well as the success and shared with each other at night. As a result of which all of them could be benefited at a time [6].

**Learning by Shaping of Habits & Discipline**

Here the word shaping includes all the physical and mental development techniques that are responsible for the enhancement of concentration and curiosity which consequently make them to think about a right path for themselves. Generally the strategies like motivation, counselling and guidance services, physical exercises, yoga, remaining away from toxic substances etc. Though all those opportunities are open for all the students in Centurion University, still it influenced a lot for the ignored students. The management of the university provides serious focus

**Aloka Kumar Rana**

on the execution of all those activities. The hostellers are guided to rise earlier in the morning and the go to bed in time at night. In the morning and evening they had to do the physical exercise and yoga. All of them were also provided motivational classes and proper guidance counselling services. The parents were given required instructions to guide their children accordingly. Every month the most disciplined students were rewarded. All those interventions taken by the university could change the habits of the students and consequently enhancing their curiosity and concentration level [5].

**Other Academically Weak Students**

This category of students includes those having below average or poor standard in academic performance due to different reasons. For example some of them having lack of fundamental knowledge from the primary to high school level. Some of them had not proper financial support where as some had no support from family side or some have health related issues. Due to the lack of either one or all the factors the students were marked to be having either lack of interest or less interest in study and were academically weak. The mission and vision of the university was to shape those students and empower the community, some necessary interventions were taken to improve their academic performance.

**Bridging Classes**

Basically the weak standard in academic performance in college or university level is due to the lack of fundamental knowledge up to high school level. In addition to some of the students after completing their school study in their local language may face problem which comes due to the change in the medium of study to English in the college level. To make the basic fundamental level stronger, Centurion University offers the Bridging classes before the commencement of the classes of regular academic session. The syllabus of the classes includes all the basic mathematics and science topics. The concerned faculties were instructed to teach the topics in simple English language [8].

**Productive Environment**

The role of environment is a vital part of learning. Without a suitable environment one can't achieve an efficient knowledge. For example studying near a TV, with the kitchen only a step away, keeping cell phone on the table are all distractions that can waste the study time [3]. Centurion University tracks all those activities during study hour for hostellers by wardens, security staff, hostel coordinators and visiting faculties. Similarly to improve the quality of room teaching, initially the School of Vocational Education and Training (SoVET) and gradually all Schools started class room decoration by the respective students. They painted the class room by themselves, made a mini library inside the class room, kept some teaching learning materials inside the class room and so on. The faculties used to teach students to use visual images. In addition to this SoVET also initiated "Open Air Classes" and "Free Learning Day" especially to enhance the curiosity of the weak students. The Open Air Classes were conducted outside the class room either on the lawn, near the swimming pool or over the roof etc. This could made the teaching-learning process interesting and increased their curiosity. During the Free Learning Day, the students could visited to any lab, workshop to gain any knowledge as per their interest. The lab or workshop in charges were also instructed to guide the students accordingly. This strategy also helped the students to enhance their curiosity and gain independently [7].

**Retrieval Practice for Students**

Research has shown that long-term memory is enhanced when students engage in retrieval practice. For example, taking a test is a retrieval practice, which is the act of recalling information that has been studied from long-term memory. Thus, attaining the practice tests can be very helpful for students. When teachers are reviewing information prior to tests and exams, they could ask the students questions or have the students make up questions for everyone to answer rather than just retelling students the to-be-learned information. Also, if students are required or encouraged to make up their own tests and take them, it will give their parents and/or teachers information about whether they know the most important information or are instead focused on details that are less important [2].

**Aloka Kumar Rana**

Taking this in to account, Centurion University gives special focus on the retrieval classes. The academically weak students were motivated to attain the classes by some special counselling team and the faculties. The absentees were marked and motivated again. In this way of repeated follow up made the students to attain the classes finally which became a part of the reasons behind their improvement.

**Preparatory Classes**

To enhance the End semester performance, Centurion University offers preparatory classes just before one week from the semester examination. Each theory subject is allotted a total duration of 12 hours to complete the whole topic in a week. Just before one week from the commencement of the classes the concerned faculties have to share a question bank containing 75 number of questions in accordance with the semester examination pattern. The students are instructed to find and practice the answers by themselves and note down the doubts within 7 days. After that when the preparatory classes start, the concerned faculties discuss all the questions from the question bank and clear the doubts that have been noted by the students. Each day the faculties also give some assignments on the topics that had been discussed in that day and verify the same on the next day. It has been found that, after conducting the preparatory classes the performance in the semester examination improved.

**CONCLUSIONS**

This research has provided valuable contributions to literature. It has increased our knowledge about the types of motivational beliefs and learning strategies used by Centurion University and how these beliefs and strategies have implications for the academic performance of the academically weak students. Specifically, we have been able to establish the stimulating forces (beliefs) and mechanisms (strategies) propelling their progression or retrogression in learning various subjects both at school and home. At the same time, we juxtaposed the belief and strategy constructs as well as investigated participants' genders in the framework of motivational beliefs and strategy use for learning. Furthermore, the research enabled students to identify potential hindrances to their learning in order to derive a way of alleviating the challenges. Drawing from the findings, this study offers a number of conclusions, vital for teaching, learning, and policy-making, particularly in Centurion University. The following are conclusions of this research.

- There are some students upon whom the society, their family and they themselves lost hope and think that, they can't do anything in their life. Those students are mentally harassed and are named as ignored students.
- There are also some category of students those are academically weak due to different reasons like lack of fundamental knowledge from the primary to high school level, poor financial condition of family, lack of resources or health related issues etc.
- There are some interventions taken by Centurion University to shape the ignored students and enhance their academic performance. The major strategies includes "Learning by Social Service", "Learning by Doing", "Learning by Group" and "Learning by Shaping".
- There are also some interventions taken by Centurion University to shape the academically weak students and enhance their academic performance. The strategies include "Bridging Classes", "Productive Environment", "Retrieval Practice for Students" and "Preparatory Classes"
- All those interventions not could be able to improve the academic performance of the students but also became helpful to be a good human being in future.

### ABSTRACT

Excellence and Quality are the major concerns in our education sector. Focus has been given on imparting quality and excellence in higher education as well as teacher education. Discussion on what teacher quality is, how it is developed, and its connection to student achievement has become the facet of educational jargon in the 21<sup>st</sup> century. Quality of the teaching-learning process is primarily shaped by policy and to review how quality is cultivated in teachers. Several factors such as poor quality teaching, lack of accountability and quality assurance, shortage of faculty, outdated and rigid curricula and pedagogy and in concurrence of research and training strongly affects the process of teacher education. Also, a weak ecosystem for innovation and low levels of industry engagement are the major issues in teacher education. The three central pillars of the government's plans for education reflect these realities: expansion, equity and excellence. We are living in an era of knowledge revolution. With the advent of new and innovative ICT tools, teaching and learning process become more innovative and effective. Adapting Open Educational Resources in science education, facilitates cost effective and yet quality science education for all. Digital learning technologies like management and support systems in teacher education, online and blended learning, instructional design possesses huge potential. Within this scope, this article provides an overview of teacher education in India and issues and challenges in it. The present study seeks to address the prevailing teacher education process and highlights the significance of open educational resources.

**Keywords:** Quality, excellence, teacher education, effective, open educational resources.

**Smita Mishra Panda**

## INTRODUCTION

Since pre-independence days, education policy has played an enormously vital role in the development of an educational system in India. Education policy sets the framework ranging from development of course curriculum to pedagogical practices. Time to time the thrust of educational policies has been changing in India in response to the emerging socioeconomic needs of the nation. Post independence, a number of education commissions have been set up by the Government of India. Teacher education primarily refers to the policies and procedures designed to equip teachers with the skills, knowledge, behaviours and attitudes they require to effectively execute their tasks. It is well known that for the development of an inclusive education system, teachers play a pivotal role. Highly trained, motivated and qualified teachers are key factors for ensuring timely access to education. Teacher education is the process for the growth of adeptness and aptitude of teachers which in turn enable and empower them for meeting the requirements and challenges in the present context. Teacher education encompasses professional skills, teaching skills and sound pedagogical practices. In the 21st century the world is becoming more and more technologically oriented. The industrial age gave way to the information age, an info-tech era which is highly crucial because this has brought changes to education, business and society.

Today, the objectives of education have become multidimensional. Following the classical teaching methods such as classroom lectures only, would not suffice in achieving the objectives of teacher education. Flexible methods of teaching, is the need of the hour. With the current pandemic lockdown due to COVID 19, many educational institutions have resorted to on-line teaching. There are several digital platforms created to meet the demand for imparting education using such mediums. This has opened up a whole new area in use of digital medium for providing education in schools and higher educational institutions. Technological interventions can tackle the shortcomings of the present education system. At present, Computer Assisted Instruction (CAI) is being widely used for providing instructions to the learners of different groups to update their existing knowledge. CAI is one of the most valuable methods of providing individualized and self-paced instructions to the learners in classroom situations. Primarily CAI includes presentation of the instructional materials to the learners having varied individual differences [1-3]. We are living in an era of knowledge revolution. With the advent of new and innovative ICT tools, teaching and learning process become more and learning process become more innovative and effective. Reaching the widespread segment of the country which is considered to be one of the largest schooling systems in the world is a concern. Open Educational Resources (OER) by the means of enabling free use, reuse and remix of high quality teaching learning materials improves the access and quality of education in India.

### Policy Initiatives

Investing in the process of teacher development has always been prioritized as evident from several educational policies. Several vital steps essentially to improvise the teacher building capacity were adopted earlier in the Plan of Action (1992) and National Policy of Education (NPE) 1986. During 1997-98, over 400 District Institutes of Education and Training (DIET) were established. Also, the National Council of Teacher Education (NCTE) was established in the year 1995. Primarily, the Curriculum Framework for Quality Teacher Education was established by NCTE in 1998 and subsequently a revised National Curriculum Framework on Teacher Education was put in place in 2009. By and large, this framework resulted into a paradigm shift from behaviourism to constructivism approach, emphasizing particularly on collaborative learning, experimental and hands-on training. Teachers were related to be facilitators of learning.

### Open Educational Resources (OER)

According to William and Flora Hewlett Foundation "OER are the teaching learning and research resources that reside in the public domain or have been released under an intellectual property license that permits their free use and repurposing by others." OER in general includes all teaching learning contents like syllabi, full courses, modules, learning objects, PPT's, lecture notes, data etc, all tools that assist in generation of teaching learning process such as

**Smita Mishra Panda**

content development tools, software that supports OER development, or their delivery, enrichment etc [4]. National Repository of open Educational Resources (NROER) launched during the National Conference on ICT for school education is an initiative of MHRD Govt of India and CIET-NCERT. The aim of NROER is to bring together all the digital resources in different languages, cultures and social context in one platform. Students who used open textbooks have enrolled in more credits compared to students who used traditional textbooks [5]. Hilton III and Laman have observed that students who used open textbooks had better overall outcomes, than students who used traditional textbook [6]. There were significant differences in students' performance in courses with the open online textbooks controlled for students' previous academic performance [7]. Grewe and Davis analyzed the effect of enrolment in an OER course had on student academic achievement [8]. Results indicated a significant positive correlation between OER and students achievement. What was observed was that OER has direct impact on the factors related to student's performance and self reflection on the part of educators [9]. The current state of repositories of open educational resources (ROER) in higher education at international level has been analyzed [10]. It revealed that most of the ROER that included one or more of the proposed reuse indicators was created exclusively for educational resources. Educational aspects are not yet firmly embedded into ROER. Broad use of digital downloads as learning materials, conflation of open educational resources with free online resources have been identified [11].

**12<sup>th</sup> Five Year Plan (2013-17): Key Reforms in India**

Three foremost challenges named as excellence, equity and expansion in the higher education sector were addressed in the twelfth five-year plan (2013-17). *Excellence* primarily deals with the improvisation techniques to be employed in the teaching-learning process. Excellence also includes faculty development programmes, learning outcomes, teaching-research integration. International partnerships in the research and teaching sector are also vital. Connecting institutions through consortia and alliances is also significant. *Equity* largely targets the undeserved and underprivileged populations irrespective of their gender, disabilities, geography and, other social divisions in society. *Expansion* chiefly refers to the augmentation in the existing institutional capacity, rather than creating new government-funded institutions. Expansion also deals with enhancing growth in the engineering and technical sector. Skill-based learning is also given due importance, to be practiced throughout the nation. Privatization to be encouraged keeping an eye on the economic needs of the society.

**Concluding Remarks**

Improving teacher education quality for employability and better learning outcomes is need of the hour. This can be achieved, provided that high-end educational opportunities reach to all citizens, irrespective of caste, creed, gender, economic ability and geography, social position and so on. At the district levels, large numbers of comprehensive institutions can be set up primarily to look after the pre-service education of teachers for elementary schools and instructors for the non-formal and adult education programmes, as well as in-service education of teachers. Distance education through electronic media communications could be heavily used to meet the increasing needs of large numbers of learners and teachers. Open Educational Resources should be prioritized which would help the learners to be digitalized and also lead to a fun and exciting way to approach learning.

### ABSTRACT

2019 Novel corona-virus (2019-nCoV) also referred to as severe acute respiratory syndrome Corona-virus 2 (SARS-CoV-2) emerged as a global risk and put the entire world into unrest. Unavailability of specific drug against the virus is more imperative. The pandemic situation caused due to the 2019-nCoV represents a severe public health calamity across the globe. The city of Wuhan was the epicentre where the outbreak of this human pathogen emerged, and resulted to human ailment, termed as COVID-19. The current pandemic has exposed the frailty and responsiveness of healthcare systems across the globe. The article highlights the impact of mass religious gatherings and religious tourism on the spread of COVID-19 and what measures can be taken to mitigate its negative consequences.

**Keywords:** 2019-nCoV, pandemic, outbreak, healthcare, tourism.

## INTRODUCTION

Public Health Emergency of International Concern (PHEIC) was declared by the World Health Organization (WHO) owing to its fast rate of transmission within the humans [1, 2, 3]. Several countries have widely adopted precautionary measures, such as use of face masks, frequent use of hand wash/sanitizer, strict social distancing so as to restrict the outbreak of 2019-nCoV. There are two significant questions which would give us an insight on the spread of COVID-19 across different countries. To start with, how did COVID-19 spread from one country to another? It is also important to factor in the extent to which countries are prepared to deal with the crucial issue of mass gatherings in future? There are several theories being put out in print and social media on spread of the virus across and within countries. The paper however, will focus on the latter question, more specifically religious tourism.

### Religious Tourism

Religious tourism or mass religious gatherings primarily signifies for visit to sacred places of any given country. Religious tourism has significant contribution towards a country's economy. It is a huge market that brings in large revenue in countless countries. Huge numbers of tourists are attracted for religious places like temples, gurudwaras, churches, shrines, mosques and others places of religious significance [4]. Essentially, religious tourism is observed throughout the year but as peaks are observed mainly during specific months where the mass religious gatherings

24899

**Smita Mishra Panda**

takes full swing. This poses a considerable public health risk essentially in the context of spread of infections across the territories. It has always been demanding for the state authorities to effectively implement preventive measures against diseases that have potential to lead to an epidemic during religious mass gatherings. For instance, the epicentre of the current pandemic shifted swiftly from China to Iran and finally to Italy in no time. Introspecting the current perspectives related to mass religious gatherings or religious tourism, may assist us to be prepared for future such pandemics. A few worldwide recognized mass religious gatherings are enlisted in Table 1. *KumbMela*, *Hajj* has already been acknowledged as the source for spread of respiratory infections and antibiotic resistant bacteria [5]. Present pandemic also have been linked to mass religious gatherings contributing to the fast spread of COVID-19.

A mass religious gathering event at Malaysia where almost 19,000 people gathered led to spread of COVID-19, whereby 35% of Malaysians were infected, which included 1,500 foreigners from 30 different countries [6]. This event was organized by a muslim evangelists group known as *Tableeghi Jammata* at Sri Petaling Mosque in Kuala Lumpur. Unfortunately, this infectious transmission occurred due to this religious mass gathering now has been recognized as the largest vector for the spread of 2019-nCoV to other countries [7]. Similarly in India too, the *Tableeghi Jammata* event held in mid-March at Nizamuddin Markaz in New Delhi, was responsible for 30% Covid 19 cases in India at that time. Out of a total of 14,378 total cases, 4,291 were linked to the religious event, during that time. Countries like Iran attract around 8 million foreigners annually and generate a good amount of revenue from religious tourism sector. During this pandemic, officials of the Iranian state did precious little to ban mass religious gatherings of pilgrims from attending holy shrines until Iran was declared as the new epicentre of the virus.

The infected pilgrims spread the pandemic in their home countries such as seen in the case of Pakistan where a large number of infectious cases were observed particularly in the province of Punjab and Sindh. In Pakistan also, several mass religious gatherings occurred. For instance *Raiwind Tableeghi Jemata*, gathered almost 250,000 pilgrims from 70 different countries during the month of March, which was believed to be a very critical phase for the spread of this pandemic. The worst affected countries owing to such mass religious gatherings were Indonesia, Kyrgyzstan, Palestine and Malaysia [8]. Another such instance is the *Hajj* which is considered to be the obligatory pilgrimage for muslims. Around 2.5 to 3 million pilgrims join for this event at Mecca, Saudi Arabia. Previously it was observed that *Hajj* pilgrims suffered from respiratory infections owing to substandard preventive measures and contributed largely for previous MERS outbreak (2013) and pandemic of H1N1 (2009) [9,10]. But for the current pandemic situation, Saudi government cancelled the Hajj in 2020. However, they are considering opening up their borders for Hajj-2020 (28<sup>th</sup> July- 2<sup>nd</sup> August), keeping in view the religious emotions of pilgrims and more importantly the economic benefits. Complete closure of Hajj may contribute to a loss of \$8.5 billion in revenue. In this case, it would be mandatory to follow stringent policies and regulations to avoid any further outbreak of the pandemic and its irreparable consequences in terms of loss of lives.

**Concluding Remarks**

Religious tourism or mass religious gatherings possesses significant amount of religious emotions. However, conservative religious rejection of science as part of the extreme cultural and political polarisation makes it impossible to reach consensus, and make progress, on many social and environmental problems [11]. It would be inappropriate to ban the religious gatherings provided strict surveillance mechanisms are deployed. Any country opening their territory during pandemics like Covid 19, for outsiders must exhibit competence to execute sufficient preventive measures and diagnostic capabilities. Furthermore, to stay away from any potential ramifications, it is suggested that restrictions should be put on the religious pilgrims, primarily from hotspots and epicentres, chronic disease patients, pilgrims over 50 years old, pilgrims with cardiovascular complications. Politicising the issue and blaming specific religions for their fallacy in spread of the virus is no solution to the dangerous pandemic. Countries need to organize a defensive approach for all the required arrangements. More than anything, it is imperative to convince the religious leaders of different religions as they wield a lot of influence on followers, to understand the scientific complexity of the pandemic and its implications. This can not be forced on anyone. People have to be convinced that religious gatherings can prove to be super-spreaders of the virus. This reality has to be internalised by

**Smita Mishra Panda**

the religious leaders first and transferred to the followers. The jeopardy of the virus spread due to mass religious gatherings is a reality and is a wake up call for governments and religious institutions to view the scenarios scientifically and take action for the sake of humanity.

### ABSTRACT

The Indian mining sector plays a critical role in economic growth and improving livelihoods, as well as providing space for degrading the environment. It also impacts environmental instability on local air, water, and natural resources. This study represents an overview on haematological parameters *Clarias batrachus* and *Gallus gallus domesticus* of Talcher mining area. Haematological indices have shown important results in the measurement of concentration of haemoglobin, total red blood cells, white blood cells, packed cell volume, mean cell haemoglobin and mean cell haemoglobin concentration. Nevertheless, mining plays an significant role in socio-economic growth, but it does build mitigation for environmental sustainability. Proper management strategies can help to conserve biodiversity in the mining areas. Haematological profiling plays a crucial role in nutritional and physiological status of an animal, as blood constituents' change in relation to an animal's micro and macro-environment.

**Keywords:** Haematology, *Clarias batrachus*, *Gallus gallus domesticus*, mining

### INTRODUCTION

Indian mineral sector plays a significant role to generate employment opportunities and improved livelihoods . Development of socio-economic status of a country as well as the bio-physical characters of an environment are generally changed by the influence of mining at that particular region [1]. Minerals are an important resource that has supported the economic development of our country. The ongoing decline in the quality of the natural environment in mining areas seriously threatens to public and animal health and prevents sustainable resource and environmental sustainability [2]. Long term effect of mining areas create negative impact on local water ,air, climatic condition as

**Karishma Sultana and Sitaram Swain**

well as depletion of natural resources. Blood is a fluid connective tissue and it contains many cellular constituents along with liquid portion consisting of carbohydrates, lipids, proteins, amino acids and other macromolecules [3]. Haematology generally helps in determining the basic profiles of cellular elements and the use of these results in the diagnosis and monitoring of disease [4]. The haematological parameters provide essential information on the balance between the production and destruction of cells of the circulatory system as well as the blood's ability of clotting [5]. Haematological studies are very significant for diagnosing of the structural and functional status of an animal's body [6]. Haematological analysis help us to obtain knowledge about the haematological parameters like red blood cells (RBC) count, white blood cells (WBC) count, concentration of haemoglobin (Hb), Packed cell volume (PCV), mean corpuscular haemoglobin(MCH), Mean cell volume(MCV) and Mean corpuscular haemoglobin concentration (MCHC). These parameters can indicate the health status of different vertebrates of mining area and disease caused due to their environmental conditions. Haematological analysis can contribute to the understanding of physical adaptations which simplifies the use of different habitats by the species[7].This study provides a haematological base line of *Clarias batrachus* and *Gallus gallus domesticus* in Talcher mining area of Odisha.

**MATERIALS AND METHODOLOGY**

This present experimental study included collection and identification of the species with haematological analysis. This entire investigation study was undertaken from the month of November, 2019 to March, 2020. The vertebrate species taken for the experimental work were catfish (*Clarias batrachus*) and domesticated fowl (*Gallus gallus domesticus*).The experimental analysis was done in the Laboratory of Department of Zoology of Centurion University of Technology and Management, Bhubaneswar Campus, Odisha.

The blood sample of the vertebrates was collected from the meat and fish market of the mining area. The blood sample from the hen was collected from its wing vein. For fish the number of methods employed for the collection of blood include; the puncture of dorsal aorta or cardiac and caudal vein. The blood was drawn with the help of a 2.5 ml syringe (needle size 0.55\*25 mm) manufactured by Hindustan Syringes and Medical Devices LTD; 174,178/25, Ballabgarh, Faridabad, India-121004. The blood was then transferred immediately to EDTA vial of 2 ml which acts as an anticoagulant. The haematological analyses were done for the examination of haemoglobin concentration with the help of Sahli's Haemocytometer, Red blood cell (RBC) and white blood cell (WBC) count by using Neubauer Chamber, Packed Cell Volume (PCV) was calculated by taking blood in Wintrobe's Tube and centrifuged at 3000 rpm for 30 minutes, total RBC and WBC count in neubauer's chamber. Concentration of Hb was done with sahli's haemocytometer, PCV, MCH, MCV and MCHC), were analysed by standard protocol[8]. Erythrocytes indices such as Mean Corpuscular Volume (MCV), Mean Corpuscular Haemoglobin (MCH), and Mean Corpuscular Haemoglobin Concentration (MCHC) were calculated as per the formulae[8].

**RESULTS AND DISCUSSION**

Results of haematological analyses of *Clarias batrachus* of the area are shown in Table 1. Mean value for haemoglobin (g/dl) differed significantly ( $P < 0.001$ ) between blood samples of the two *C. batrachus* of the mining area. The result of this study revealed the effect of pollutants on blood parameters of catfish. The mean value of RBC differed significantly ( $P < 0.05$ ) between the two fishes. The value of RBC is higher in catfish number in comparison to that of the second catfish. This is due to the bioaccumulation of heavy metals like Fe, Zn, Cu, Mn, Ni, Cd, Pb and Cr in the various tissues of catfish [9,10]. The value of WBC differed significantly and the value of WBC was higher in the second fish which indicates that the immune system is working against the pollutants/heavy metals accumulated in the body. PCV value was slightly higher in the first fish and MCV value differed significantly between the two fishes. MCH values were not statistically significant between the fishes. High value of MCHC indicates more Hb in a unit of RBC and the value is higher in fish A. The value of MCHC differed significantly ( $P < 0.001$ ). MCH value refers

**Karishma Sultana and Sitaram Swain**

to the average quantity of haemoglobin present in a single red blood cell. MCH is calculated by dividing the amount of haemoglobin in a given volume of blood by the number of red blood cell present. The mean corpuscular volume is the estimation of the average volume of Red blood corpuscles [11].

The results of haematological analyses of *Gallus gallus domesticus* are shown in Table 2. Mean value for haemoglobin (g/dl) differed significantly ( $P < 0.01$ ) between the two *G.gallus domesticus*. The mean value of RBC differed significantly ( $P < 0.05$ ) between the two hens. The value of RBC is higher in the first hen in comparison to that of the second one. The value of WBC was slightly higher in hen-2 and is not statistically significant. The increase in WBC observed could be due to stimulation of the immune system in response to the accumulation of pollutants in the tissues. PCV value differed significantly ( $P < 0.01$ ) between the two hens whereas the values of MCV and MCH were not statistically significant. The high level of MCHC indicates more Hb in a unit of RBC [12] and the value of MCHC did not differ significantly. The blood parameters have been used as sensitive indicator of stress in different vertebrates exposed to different toxicants and pollutants, such as metals, chemical industrial effluents, biocides, etc. The most common hematological parameters measured during stress included red blood cells (RBCs) and white blood cells (WBCs), hemoglobin content, haematocrit (PCV) value and red blood cells indices. The haematological parameters are often determined as an indication of the health status. The RBC of the vertebrates determines the dissolved oxygen carrying capacity. Fluctuations in the blood cell indices correspond with values of RBC count, PCV and hemoglobin concentration.

A significant decrease erythrocyte (RBC) counts, haemoglobin (Hb), increase of white blood cells (WBC) of the vertebrates from its normal value can be related to the effect of pollutants due to the mining in that area and the decrease in RBC counts during the study may be due to anemic condition and haemolysis caused by chromium since chromium is one of the major resulting wastes of coal mining activities along with Ni, Cu, Zn, Cd and Pb[13]. The blood parameters level decrease due to Pb. The level of RBC decreased may be due to the effect of Pb and Cd, the decrease in Hb synthesis and the reduced life span of RBC may be also due to the effect of high level of Pb. The increase in the WBC level and MCH may be due to Cd present at high level in that area [14].

## CONCLUSION

This study focused on vertebrates being subjected to mining environment and its effect on their haematological parameters. Assessing those haematological indices determines an organism's physiological status. The impact of this mining zone may pose a threat to the biodiversity. The effect of mining environment was demonstrated by a significant reduction in haematological parameters such as erythrocytes, haemoglobin as well as an increase in MCH, MCHC and MCV values. Since mining activity is an integral part of development, it does have some mitigation with society. So appropriate management strategies should be taken for socio-economic status development and sustainable ecosystem development.

### ABSTRACT

A survey has been undertaken in some parts of South Odisha in particular where there was a prospect of marketing of solar lights in particular. This paper consist of two sections. The prices for all these solar products should be kept low or the same unless it is manufactured in large whether it is consumer electronic, FMCG or renewable energy product. Product share pricing strategy is another concept where the rural consumers if cannot afford high value solar operated products even if they need it, they cooperate with other consumers who wants to use the same product. Another model for solar product marketing in the rural areas can be through Pay-as-You-Go (PAYG) business model. The Entrepreneurial-cum- SHG model was adopted in rural context for marketing of solar products in rural areas of South Odisha.

**Keywords:** marketing, Product, consumers, solar

## INTRODUCTION

This study examines the different models undertaken for marketing of solar products in the rural areas of Odisha. A survey has been undertaken in some parts of South Odisha in particular where there was a prospect of marketing of solar lights in particular. This paper consist of two sections. The first section focuses on different models undertaken and also suggests some strategies for marketing of solar products in the rural areas of Odisha and the second section focuses on the survey and the implementation of Entrepreneurial-cum- SHG Model for selling of solar products.

### Marketing of Solar Products

The size of rural market for solar products is huge but the the companies generally target the rural region closest to its area of operation – a convenient and obvious choice for them by which people living in distant are deprived of it. Hence, an effective distribution model should be in place for last mile consumer (Solanki, 2005). The prices for all these solar products should be kept low or the same unless it is manufactured in large whether it is consumer electronic, FMCG or renewable energy product (Solanki, 2005). Direct marketing is an option, by having a store in a rural location. Example: Electrical stores, Mobile sales and service shops, Cable TV DTH service shops etc.

24906

**Shiv Sankar Das**

The crucial factors for a broader marketing of PV systems are: financial incentives, government led initiatives, reduction of investment costs, and increase in reliability, dissemination of information and environmental awareness. A persuaded individual can make an adoption decision that a person with inadequate knowledge cannot. There are different marketing and selling strategy are being adopted for different rural consumers depending upon the location factors. Other factors that help in promoting the solar business in Odisha are documentation, quality, process, design and innovation, production capability and, finally, cost effectiveness.

Among the few which are highly required for marketing are door to door selling of solar operated products, selling in haats, melas, etc. There are different models of distribution, most effective one is the Entrepreneurial-cum- SHG Model which is discussed in the later part of the paper. Here, the members are sensitized for using solar product for lighting purpose and other income generation activity. Explaining and demonstrating the use of solar product to the SHG members at the village level during their weekly meetings, preferably in evenings is a low cost distribution model needs to be adopted for PV penetration in the rural areas of Odisha. Affordability, availability are the major concern for any rural consumer to think on getting a product. Having access to get a credit is a major concern for rural people to get hold to the product. They need to spend less but they deserve a good quality product. Many households in rural Odisha neither have access to electricity, and more importantly, nor do they have access to credit. Why is access to credit important? When a reliable product say a solar light is introduced into the market its cost is naturally higher which in turn makes it not affordable to buy.

Affordable does not mean its cheap quality product but rather it should be able to generate repayments and help in income generating. Rural consumers should be provided with a low-interest credit which becomes a headache for both institutional and financing organisation. For example, if a household wants to purchase a solar home lighting system, then he finds it difficult to pay the full amount, now some of the organisations are giving these systems on credit and going for payments in a equal monthly instalments (EMI) but it affects the organisation in terms of the running of the business the operational cost more precisely to say. Hence, a desirable system like jointly purchasing the product and giving it for rent, would be a good option for it. There are different branding and advertising strategy but for selling solar operated products the following strategy are adopted like that of word of mouth where the company people organise "tea party" at the home of satisfied customers, where people from around the village are invited to watch a demonstration of how the solar product is working. They do often create noise so that people come outside to see what is happening which further acts like a free publicity (SELCO Case Study). Other initiatives like banks themselves plays an important role in marketing the solar product at their own branch, when they identified a potential customer who could afford and benefit from the system they give loan to purchase it (ibid).

Another model is the demonstration model where the company installs a system in the house of a influential or wealthy person of a village as a part of a one-to-two month trial. The program starts off with a tea party similar to one described above. At the end of the trial period technicians return and began to disconnect the system. The experience of living with the lighting along with the family and social pressures eventually induced most customers to take the loan and purchase the system (SELCO, Yale SoM, Case Study). Product share pricing strategy is another concept where the rural consumers if cannot afford high value solar operated products even if they need it, they cooperate with other consumers who wants to use the same product. for example the use of solar operated drip irrigation system was purchased by a farmer at Rs. 25000/- then it was shared with other farmers for irrigating their fields which could be near by., the system is given in rent with a specific amount, per hour basis or per day basis. This business model acts as a income generation activity for the farmer and subsequently helping him to lead good living condition. Solar being an emerging industry, trade shows and exhibitions are another powerful avenue for marketing the products. Participating in an expo attract a good number of customers and subsequently helps in building a network chain of customers if the product is of good quality, this helps in scaling up the production and fulfilling the target, in all it is targeted and very efficient advertising campaign.

**Shiv Sankar Das**

Solar products can be financed by providing micro-credit to rural people. Micro credit refers to purveyance of loans in small quantities. The term “micro” literally means “small”, as per micro credit special cell of the Reserve Bank of India (RBI), the borrowing amounts up to the limit of Rs 25000 could be considered as micro credit products and this amount could be gradually increased up to Rs 40000 over a period of time. Micro-credit providers through different schemes often comes with a relatively high interest rate because of the high costs of repayment collection, irregularity of loan payment and absence of securities. The loan extended to members of community-based savings, cooperatives and other finance institutions have high interest rate. The interest rates vary from 23 to 25 percent in India. Rural consumers are unable to reimburse the overall amount in which the interests represent a non-negligible amount. As a result a group based delivery model for financing of solar products products is advised which can be used by different members of the SHG by involvement of various financial institutions.

A group is formed by the rural consumers in the target community to offer finance services (micro savings, microcredit, micro-insurance, etc.) to themselves. Groups is composed of rural youth, or women from the local regions as they can create support structures for micro-enterprises and other work-based issues. This method can be the basic unit of operation for the Micro-Finance Institutions (MFIs). As MFIs have to provide collateral free loans, group methodology can help in creating social collateral (peer pressure) that can effectively substitute physical collateral. In lending agreements, collateral is a borrower's pledge of specific property to a lender, to secure repayment of a loan. The collateral serves as a lender's protection against a borrower's default and so can be used to offset the loan if the borrower fails to pay the principal and interest satisfactorily under the terms of the lending agreement. The group approach delegates the entire financial process to the group rather than to the financial institutions. All financial activities like savings, getting loans, repayment of loans and record keeping should be managed at the group level. In this method, 10-20 members are organised to form a group. These group members need to make regular savings of fixed amount in a common fund. The amount and frequency of savings is mutually to be decided by the group members.

After the successful working of such a group for some months the group is required to be linked to a financial institution for getting credit. The financial institutions will issue loan in the name of group and whole group will be responsible for repayment. The amount of loan will depend upon the total accumulated amount of saving of the group. The group itself will select its members before acquiring a loan. Loans will be granted to selected member(s) of the group first and then to the rest of the members. Most financial institutions require a percentage of the loan that is supposed to be saved in advance, which points out the ability to make regular payments and serve as collateral. Group members themselves will decide about the criteria of dividing the loan among their group members. With this loan the whole group may jointly start a micro-enterprise or the members may start their individual businesses.

An individual may also use his loan for consumptive purpose or meeting other priority needs. Group members will be jointly accountable for the repayment of each other's loans and will usually meet weekly to collect repayments. To ensure repayment, peer pressure and joint liability needs to work well. The entire group will be disqualified and will not be eligible for further loans, even if one member of the group becomes a defaulter. The creditworthiness of the borrower will therefore be determined by the members. This type of group based delivery method can help to empower the group members because they will remain involve in various group activities. They will visit the bank, market and hold group meetings which would help them to increase self-confidence. This model will help in self-sustaining of the group and will also act as an effective monitoring mechanism for repayment of loans, for the products and services they buy.

### **Entrepreneurial-cum- SHG Model**

In order to create an entrepreneurial-driven market for solar energy products a model has been devised called entrepreneurial-cum- SHG model for solar products intervention into the rural areas through the SHG or cooperative. Here, we need to understand how an SHG, which is a community based organisation can help in marketing of any solar product into the rural areas. Any SHG group consist of 5-10 members that identify possible

**Shiv Sankar Das**

initiatives to be undertaken for the development of the livelihood in local context specific. The members in the SHGs are like minded group and consist of farmers, vendors, street hawkers, etc. who live in close vicinity to each other and can avail many schemes related to bank and others. Sometimes bank become reluctant to lend them loans to poor households for any solar products, for instance for the use of solar home lighting systems. Bank worries over the defaults and the high transaction costs associated with the small sized loans. For the same SHG can play an important role by bridging between the consumers and the bank.

In this model, the clean energy organisation approaches to an SHG to market their products, whether in form of an CSR initiative or from marketing perspective. The SHG leader who acts as a Solar Energy Entrepreneur (SEE) must be trained by the clean energy organisation to provide technical, managerial support to the consumers. Now, if the bank provide loans to SHG (here SEE needs to identify and submit loan proposals which can be finally sanctioned by the bank manager, before the loans are granted, more time and effort should be spend for training the SHGs members on banking habits, policies and how to maintain the books of accounts) then they would meet with the SHG members on a weekly basis who would pay the loan in instalments. The interest rates depends upon the bank which provides the loan to the SHG. Training sessions can be given to each SHG at the field level quarterly or semi-annually.

The important aspects of this model is that once the loans are provided to the SHGs, they can conduct meetings on weekly basis or every 15 days with the members, where instalments are collected. Conducting such weekly meetings can be a check against the default members and subsequently it creates a platform for a discussion. This model not only can offer an easy finance but also SHG members can deposit a nominal fee with SHG leader so as to promote banking habits. The socio-economic benefits is that the by the use of solar products people can advance in their secondary sources of livelihood. From entrepreneurial perspective now if the loan is provided to the SEE directly through the bank, then the SEE can procure the Solar Products (SP) from the clean energy organizations, companies and market it to the members, or generate possible leads, subsequently going for selling of the product. Consumers can take loans from the SHG through SEE (who is also a member of the SHG) and he/she constantly monitor the actual utilization of all types of loans to prevent non-payments or any diversion.

For this purpose, a solar energy programme card can be prepared for keeping the track of payment of installments. Two cards can be prepared and one card will be maintained with the SEE and the other card will be kept by the consumer, bearing the same serial number. Duration for the loan of any solar product (like solar light, solar operated irrigation pump, solar dryer, etc.) can be kept for a short term period say 6-8 months depending on the interest and other terms and conditions of the bank. Consumers need to pay the amount within the particular time period.

**Pay-as-You-Go (PAYG) Model**

Another model for solar product marketing in the rural areas can be through Pay-as-You-Go (PAYG) business model. Here the consumers make a small deposit for the installation of the product and then pay regular installments through mobile payment systems. It will have two main approaches that is energy as service approach, where the consumer pays for the electricity provided and does own the product and other approach is lease-to-own model, where the consumer becomes the owner of the product after a period of time. Out of these two models, lease-to-own is the most appropriate one. Two of the possible models has been recommended for solar product marketing. In this model the consumer pays a down payment for the product, which is attached to the smart meter. Regular payment has to be made by the consumer, if the consumer is unable to pay the amount then it will defer. The credit recharge, the payment point sends the consumer identification and recharge information to the service provider and it sends a recharge code. Then, the consumer uses this recharge code to unlock the system and gets the energy credits, further allowing the consumer to use the system till the energy credit gets exhausted. After the completion of 28 months the system permanently unlocks and the system is owned by the consumer. The meter locks the system after the consumer energy credit have run out.

**Shiv Sankar Das**

Another possible model where the consumer purchases the solar product by paying some initial amount and takes the system and installs it. Consumer uses the system till the energy credits are exhausted, when finished the consumer brings the system attached to the charge controller to the service provider, where the provider attached the dongle to his/ her mobile and transfers the energy credits pertaining to the amount paid by the consumer. Dongle gets updated and the recharge is done. The consumer plugs the dongle into the charge controller and the system gets activated. This process goes on till full payment for the system is done and the system gets unlock for lifetime of the product.

**Product Sharing Model**

The product sharing model where the rural consumers when cannot afford high priced product even if they need it, they can share it with other consumers who wants to use the same product. For example the use of a solar operated drip irrigation system by farmers for irrigating their fields. The system given in rent with a specific amount, per hour basis or on day basis. This business model can acts as a income generation activity for the farmer, repayment of loans and subsequently helping leading him to a better quality of life. For any model to be successful it is required to build a partnership between companies and institutions, distributors, dealers, SHG members, cooperatives etc. for an effective distribution of products and services into the rural areas.

**Survey for Marketing of Solar Products in South Odisha and Implementation**

A survey was conducted in the areas of South Odisha preferably the districts of Koraput, Nabarangapur and Malkanagiri. Samples were collected from Jeypur, Kotpad, Kundra, Boipariguda, and Koraput blocks of Koraput district. Similarly samples were also collected from Papadahandi, Chatahandi and Nabarangapur blocks of Nabarangapur district and Mathili block of Malkanagiri district. About 120 respondents were taken into account for this survey. From the survey it was found that 63 percent of the respondents depended on the agricultural activity for their livelihood. Rest of the respondents undertook various activities such as livestock, forestry, tailoring, carpentry, etc. Forty one percent of the respondents were members of a cooperative, operating locally. About, 72 percent of the respondents were having a BPL card. From the survey it was found that 59 percent of the respondents did not have electricity at their homes and were facing the problem of lighting. Although 41 percent of the respondents were having electricity connection but they were facing the problem of fluctuation and low voltage due to which they were not getting a continuous supply of electricity during evening hours. Almost all respondents used kerosene for lighting purpose at home. Five percent of the respondents used 1 ltr, 26 percent used 2 ltr 31 percent used 3ltr, 26 percent used 4ltr, 7 percent used 5ltr and 5 percent used 6ltr of kerosene on each day for lighting, cooking and other activity during evening time. From the survey it was also found that about 83 percent of the respondents were not able to carry out any activity due to lighting problem and 69 percent of them required good lighting for at least 8 hours from evening till dawn of next day.

From the survey it was also found about 74 percent of the respondents did not have any idea about solar lighting and about 73 percent of them were interested to know about solar lighting. It was also found that, about 17 percent of the respondents could buy solar light with the range from Rs 1000-2000, 58 percent from Rs 2000-3000, 18 percent from Rs 3000-4000 and 7 percent from Rs 4000-5000. After undertaking the survey a model was initiated for marketing of the solar products. The model of Entrepreneurial-cum- SHG model was adopted for use of solar products. Here, the SHG members helped in marketing of any solar product into the rural areas. SHG members identified possible initiatives to be undertaken for the development of the livelihood in local context specific. The members in the SHGs were like minded group and consist of farmers, vendors, street hawkers, etc. who lived in close vicinity to each other. They availed many schemes related to bank and others. Sometimes bank was reluctant to lend loans them for solar products, for instance for the use of solar home lighting systems. Bank worried over the defaults and the high transaction costs associated with the small sized loans. For the same SHG played an important role by bridging between the members and the bank.

**Shiv Sankar Das**

In this model, the clean energy organisation, here the Auroville Energy Products (AEP) approached to the SHG to market their products. The SHG leader who acts here as a Solar Energy Entrepreneur (SEE) was trained by AEP to provide technical, managerial support to the consumers. Bank provided loans to SHG and they meet with the SHG members on a weekly basis who paid the loan in instalments. The interest rates depended on the bank which provided the loan to the SHG. Training sessions were given to each SHG at the field level on a quarterly. The important aspects of this model was that once the loans were provided to the SHG, they conducted meetings on weekly basis with the members, where instalments were collected. Conducting such weekly meetings helped in checking the default members and subsequently it created a platform for a discussion. This helped not only for an easy finance but also SHG members could deposit a nominal fee with SHG leader so as to promote banking habits. The socio-economic benefits was that the by the use of solar products members could advance in their secondary sources of livelihood.

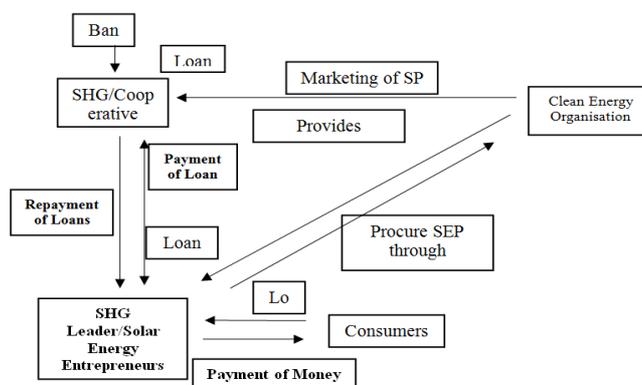

For this purpose, a solar energy programme card was prepared for keeping the track of payment of instalments. Two cards can be prepared and one card was maintained with the SEE and the other card was kept by the member, bearing the same serial number. Duration for the loan of the product (like solar light, solar operated irrigation pump, solar dryer, etc.) kept for a short term period of 6 months depending on the interest and other terms and conditions of the bank. Members paid the amount within the particular time period.

**CONCLUSION**

Although there are different models still prevailing in rural India for marketing of solar products, here a snapshot of models prevailing in rural Odisha and in South Odisha in particular was undertaken. The Entrepreneurial-cum-SHG model was adopted in rural context for marketing of solar products in rural areas of South Odisha.

### ABSTRACT

A majority of Indian population resides in villages. Once Mahatma Gandhi has said real India resides in villages and we need to put effort to develop our villages. The most common clean energy sources are solar, wind, biomass, hydropower and geothermal. "Clean technology" refers to any goods, services and process that reduces negative environmental impacts by adopting a major energy efficiency advancement, by the use of sustainable resources, and going for environmental safe guard initiatives. Lighting for work after dark improves the productivity and income, particularly in the areas where the consumers have a demand for evening services. Government and its agencies through its policies are important actors which initiates and guides to promote and achieve current and future deployment goals towards an energy transition. Target areas needs be accessed where there is non availability of electricity or is available in scarcity.

**Keywords:** population, agencies, policies, reduces, environmental

### INTRODUCTION

A majority of Indian population resides in villages. Once Mahatma Gandhi has said real India resides in villages and we need to put effort to develop our villages. Key ingredient for socio-economic development of any country depends on the use of energy (World Energy Resources, 2013). Energy is the foundation of modern industrial economy (ibid). Every sector whether it is agriculture, industry, transport, businesses and households requires energy to fulfill the basic needs. Having link to energy is required for improving health, agricultural productivity, education (UNDP, 2001). Growing need of energy has led to depend on harnessing and use of fossil fuels in a large quantity. This has led to environmental degradation, pollution and ecological imbalance. In providing solution to it the role of clean energy is maximum. Hence, there is a need to focus on shifting from conventional source of energy to clean energy. This paper consists of two sections. The first section focuses on two aspects. First it describes the clean

**Shiv Sankar Das and Debashree Debadatta Behera**

energy and clean energy products. Second it focuses on mapping of possible clean energy products with different activities in rural context. Second section focuses on a distribution and revenue collection model which can help in diffusion of clean energy products in rural areas.

**Clean Energy, Clean Energy Product and Rural Users**

“Clean energy” is basically derived from clean, zero-emission sources, as well as energy saved through efficiency measures (energync.org). The most common clean energy sources are solar, wind, biomass, hydropower and geothermal. “Clean technology” refers to any goods, services and process that reduces negative environmental impacts by adopting a major energy efficiency advancement, by the use of sustainable resources, and going for environmental safeguard initiatives (Clean Edge, 2011). Although there is no standard definition of “Clean Technology”, but it can be described as a diverse range of products, services and process that harness clean materials and energy sources, dramatically reducing the use of natural resources, eliminating emissions and wastes (ibid). It also includes a variety of technology related to use of clean energy products, recycling of products, use of e-vehicles, energy efficient motors, smokeless chulha, DC lighting systems etc. “Clean energy product” are those products which uses this technology. Use of clean energy products help in creating new avenues for earning, reduce cost, reduce drudgery and improve health conditions, thus enhancing quality of life in rural areas. In the present context, quality of life can be visualized as a better living conditions in terms of accessing to modern services like electricity, modern cooking fuel, etc. “Clean energy services” are those services which basically starts from the site selection, to project management of the construction, installation, and operation and maintenance. For example, installation of a solar based home lighting system, to provide training services on how to operate it, maintain and repair it when damaged, etc.

**Clean Energy Products**

There are different clean energy products available in the market such as solar lights, solar pumps, biomass cook stove, solar cook stove, LPG cook stove, biomass gasifier, PNG, LPG etc. Table 1 focuses on classifying the clean energy products on the basis of cooking, transforming energy and utility. With different clean energy products available, there is need to compare these technologies to have a clear understanding which technology is more sustainable. Table 2 focuses on a comparison between different clean energy options available under various parameters like cost, availability, ease of handling, health, sources, efficiency etc. From table 2 it was found that solar operated products are cleanest, more sustainable, with high degree of efficiency with respect to other clean technology options. Solar operated clean energy products are absolutely clean, efficiency is high, sustainable and the requires low operational cost.

Energy is required at every levels, starting from household to organisation level, from cooking to manufacturing of a product, to processing to marketing of a product or service. It is also required for shared services from schools to health centres to transport to telecommunication network setc. There is a basic connection between energy access and livelihood. Lighting for work after dark improves the productivity and income, particularly in the areas where the consumers have a demand for evening services. Lighting helps in increasing flexibility of operating hours, allowing other activities to be performed. Energy services like heating, cooling, use of information communication technology applications including mobile, TV, radio etc. helps in providing comfort and entertainment to all stakeholders. Diffusion of clean energy product in rural context is important. In table 3 an attempt has been made for mapping of possible clean energy products with different activities in rural context on the basis of service, manufacturing and processing.

**Clean Energy Access: An Institutional Web**

“Clean energy access” is the process of transferring clean energy products and services to a household, community or a place that people require towards lighting, cooking, heating, cooling, etc. It is the right for every people in this world. Clean energy access cannot operate in isolation. It can only be achieved when the households, community,

**Shiv Sankar Das and Debashree Debadatta Behera**

organisations, etc. be in a web. Here all the members need to work together to achieve clean energy access. "Government and its agencies through its policies are important actors which initiate and guides to promote and achieve current and future deployment goals towards an energy transition" (Chapman, Itaoka, 2018). "Policies are the result of interactions between government and various interest groups or actors within a society and play an important role in providing a collective strategic direction in promoting a social change" (ibid). "They make contributions to create and support development, infrastructure and provision of locations for experimentation-enabled innovation" (Foxon, Hammond, Pearson, 2010; Sovacool, 2012). Govt. take initiatives that help in access of clean energy products and services through its policies. Policies is framed at Govt. level and is implemented through institutions at ground level. It is made by legislative assembly, parliament, planning commission, ministries of power and other related to energy (conventional and non-conventional) both at state and central level. At the central level, the Ministry of New and Renewable Energy (MNRE) is the nodal ministry of the Government of India (GoI).

Altogether ministries (industry, agriculture, rural development etc,) Central Electricity Regulatory Commission (CERC), independent power producers, government owned generating and transmission companies, private distributors, financial institutions (banks, international agencies, rural electrification corporation etc.), peoples institutions like cooperatives, SHG, producers company, farmers club, joint liability groups etc. work in ground level for diffusion of clean energy products and services. Supporting agencies like equipment suppliers (DC pumps, batter, LED lights, panels, charge controller, conductors, insulators, wires etc.) service and maintenance agencies, standard organisation like (Bureau of Energy Efficiency), consulting agencies, panchayat raj institutions, industry organisations and civil society are some of the other institutions. Figure 1 gives the institutional web for different actors involved in framing of policies and implementation both at central and state level. Altogether the presence of institutions, Govt policies, etc. should be made available for access of clean energy products and services in the rural areas. MNRE, IREDA, electricity board, tax department, district industry corporation, presence of block development office, presence of panchayat office, presence of testing centres, R&D labs, rural development agencies and other agencies both at state and central level are all possible members of this web.

**Clean Energy Product-Services Distribution, Revenue Collection Model for Rural Area**

Considering the access of any clean energy product significantly depends upon on the distribution of product, there has been a number of innovative methods in rural distribution. One such method which can be initiated by private companies is the model of distribution and revenue collection model. The model is presented in Figure 3. Under this model, it is envisaged that each village should have a Village Clean Energy Committee (VCEC) to act as an interface between the rural consumers and the company. The VCEC with appropriate power can provide a platform to the consumers to give their thoughts regarding the products and services received and facilitate the company through giving feedback and collecting revenues. Some of the key activities that VCEC should be engaged in handholding of consumers in providing information about the product, EMI schemes, maintenance and repair, complaint redressal, revenue collection, disconnections and reconnections, maintaining of stock the product, etc.

The VCEC should represents all sections of the village and should be constituted after careful consideration of the village dynamics. It should have a 5 to 10 members, including president, secretary of the area and a village contact person. Some of the advantages which can arouse from the creation of village clean energy committee are it will facilitate active involvement of consumers in the decision making process. It will increase the level of awareness on usage, utility etc. It will help in effective and time bound delivery of service and maintenance. It will lead to timely redressal of consumer complaints. Help in timely collection of revenues and information flow. The companies should use VCEC for improving service delivery, sensitising people to adopt clean energy product and how clean energy product can be used as a income generating activity. This model is a sustainable business model which will help in revenue flow from rural consumers to the companies, service flow from the company to the rural consumers, and incentive flow from company to village clean energy committee. This model will help in effective access of any clean energy product across our country, helping in generating entrepreneurs and creating an ecosystem for sustainable access.

**Shiv Sankar Das and Debashree Debadatta Behera**

## CONCLUSION

Marketers need to intervene into the market by developing products according to their consumers needs and want. They need to ensure to provide high quality product with low price accompanied with timely service. Purchasing of these products needs to be financed through EMI schemes, loans, subsidy, grants, etc. so as even a poorest of poor will get a better product. Target areas needs to be accessed where there is non availability of electricity or is available in scarcity. For promotion of clean energy products emphasis should be given for conducting awareness camps at village levels, in haats, group meetings, cultural events, conducting like cycle rallies, conducting workshops in colleges, universities, sensitising youths and their parents, etc. Organising national and international exhibition, event sponsorships, etc. will also help in diffusion of clean energy products. For access of clean energy products in rural context there is a need of clarity on policy in the ground level, availability of last mile delivery people, availability of skilled manpower, availability of apathetic financiers, and supportive institutional environment. There is a need for proper coordination and collaboration with all members for having a successful access of clean energy products.

### ABSTRACT

It was planned to design an airship to be capable of continuous indoor flight for 30 minutes with a payload of 500g and maintain a flight at constant altitude. In this work it was aimed to sizing of the stabilizer, material selection, propulsion system, gondola box designing, and sensor selection for flight control. The design of the gondola focused on reducing weight whilst still having enough strength to support the weight of the internal components. Ducted fans powered by electric motors were chosen to provide propulsion to the airship. The effects of different fan arrangements on airship maneuverability were then analysed. Statistical analysis of similar airships was done to find out to calculate the area of their stabilizers. Different materials were taken to consider strength to weight ratio for material selection for a small airship. Different design was taken for better performance of the propulsion system. For gondola design many box shape were taken and analysis for better aerodynamics and structural strength. Also sensor and camera selection were done for automatic control low altitude airship

**Keywords:** Airship, Blimp, Gondola, Airship stabilizer

### INTRODUCTION

Aircraft can be divided into two groups: lighter-than-air aircraft (LTA) and heavier-than air aircraft (HTA) [1]. Conventional fix-wing and rotation-wing aircraft which utilize lifting surfaces like wings and blades as the source of lift belong to HTA. LTA is mainly referring to aircraft such as balloons and airships (blimps). Unlike HTA, LTA is designed to contain within their structure a sufficient volume of gas lighter than air (heated air, hydrogen, or

S. K. Samal *et al.*

helium) to acquire enough lift force from the buoyancy of the gas. Without consuming extra fuel to generate necessary lift for floating, airships offer advantages over air cargo transportation in the past. Many different types of aircraft are designed and fabricated for diverse applications and scenarios. A survey of recent developments in aerial robotics gives a general overview of the definition, types, categories, and topics of aerial robotics [2]. This work describes and briefly introduces more than one hundred high-quality aircraft papers from more than thirty thousand that have been published in the top journals and conferences in a systematic way.

In the last 50 years airships have been used for certain niche applications such as advertising, surveillance and aerial photography. The most well known advertising craft is the Goodyear blimp which has been prominent at major sporting events. Smaller craft have been used for advertising and photography in large indoor arenas such as basketball and ice hockey stadiums. The United States Coast Guard has also experimented with using airships for high altitude surveillance of its borders and coastline. Some earlier scientific and technical notes and documents about airship design can be found as technical reports from NASA. There are two famous reports by Tuckerman [3] [4], emphasizing two most critical issues of airship design - the determination of forces on an airship hull and inertia factors.

Regarding airship, [5] introduced the recent researches and conceptual designs of airships and classifies the airships according to its body. In paper [5], a state-of-the-art literature review on airship dynamics modeling is presented. In this aerodynamics and flight dynamics modeling method are described. This also provides the structural flexibility, incorporation of atmospheric turbulence as well. Based on six degrees of freedom, an attractive dynamic model is presented in ref. [6]. In ref. [7], a blimp-based robot and its navigation system are introduced. The blimp is a commercial kit which can be used as platform directly. Ref. [8] introduces a design methodology and fabrication of an easily deployable finless airship for indoor surveillance and advertisement. The detailed and step-wise procedure for designing and fabricating indoor remotely controlled airships are discussed in [9].

A comparison between the airships using design methodology introduced in this work with some other commercially available airships are also exhibited. Paper [10] introduces an airship that mimics fish-like movement in the air, propelling an airship by undulating its hull and a caudal fin. A work on DEA predicted that DEA strip actuators could reach 90% maximal efficiency in optimal conditions. However, an actual peak efficiency of 18% was measured in the experiment due to the high energy loss of such a voltage transform [11]. The propulsion efficiency analysis of fish-like robot is exhibited in [12], the relationship of speed and energy efficiency are analyzed. Ref. [13] does a research on the efficiency of fish propulsion. As a commonly used propulsion unit for indoor airships, small-diameter propellers performance data including energy performance are tested and a reliable database of performance data of many propellers has been created in [14]. Recent years, several fish-like indoor airship projects appeared due to high efficiency of fish propulsion. [15] [16] the propulsion efficiency of both propeller and fish movement is studied. The efficiency of fish movement and propeller is studied in [17] and [18] respectively.

### Stabiliser Design

Stabilisers have a very small frontal area compared to their longitudinal area. The larger longitudinal area produces more resistance to motion in the yaw, roll and pitch planes. Stabilisers are needed on the tail of the envelope to add stability to the airship. The airship's small weight, relative to its surface area, means that it was susceptible to the effects of air currents. As the airship was designed for indoor use, the wind forces are small. Consequently, the stabilisers are not required to be as large as those that would be required for an outdoor altitude. Larger airships which travel at greater speeds use the stabilisers with control surfaces to control airship movement. The comparatively slow speeds of this airship meant that control surfaces would be less effective and hence control surfaces were not included in the design. The area of the stabilisers was calculated using a statistical analysis of similar airships and the area of their stabilisers. From this analysis

S. K. Sama *et al.*

an average ratio of envelope longitudinal area and stabiliser longitudinal profile area was determined. The area of stabilisers for the airship was then calculated using this ratio and the longitudinal area of the airship. The calculations are shown in Table 1

### Propulsion System Design

The propulsion system design requirements were such that the airship could perform the desired modes of flight described in section 3.1. The propulsion system must also provide the required thrust, as discussed in section 3.2. The majority of lift force will be provided by the helium filled envelope. Batteries would provide the power for the electric motors as a combustion engine was determined to be too heavy for such a small airship.

### Propulsion Methods

Three different types of propulsion methods were investigated for use on the airship: ballonets, propellers and ducted fans. Ballonets are air filled bags usually located within the envelope. As air is heavier than helium, deflating or inflating these tanks will cause the airship to rise or fall respectively. Initial research showed that a pump small enough to fit on the airship would not pump air quickly enough to make the airship move within the desired response time. The highest pump rate achievable was found to be 13 litres per minute (Sensidyne 2007). This meant that to produce a vertical thrust of 10 grams, the pump would have to run for over 30 seconds before that force would be achieved. As a result, ballonets were rejected as a feasible design alternative. Propellers and ducted fans were very similar concepts, a ducted fan is essentially a propeller mounted within a cylindrical duct. The aerofoil shaped blades of the propeller and ducted fans rotate to produce thrust. The thrust is a result of the pressure difference on the upper and lower surfaces of the blades.

### Propulsion System Selection

As previously mentioned, the two feasible propulsion options were propellers and ducted fans. To decide which was most suitable, several design criteria were established: reversible thrust, response time, quantity of thrust, safety and size. Reversible thrust was required to reverse the airship out of a corner or to rapidly decrease the altitude of the airship. Propellers can be reversed by changing the direction of rotation, although this results in efficiency losses due to disturbed airflow prior to the propeller. A ducted fan can also be reversed but with more significant efficiency losses. The airship needs to be able to react to situations reasonably quickly and hence response time was significant. Propellers and ducted fans both have quick response times, with only a short 1-2 second delay between the remote input and the propellers producing the required thrust. The quantity of thrust produced was an important consideration in designing the propulsion system. There are many propeller and ducted fan systems available that fulfill the thrust requirements, with most being capable of more thrust than is needed for a small airship. The ducted fans deliver more efficient uni-directional thrust than the propellers.

Safety was also an issue for the design of the propulsion system as the airship will be used indoors and will be relatively close to people. A propeller system has the potential to be dangerous as the spinning blades are unprotected. The ducted fans also contain propellers but they are enclosed within the duct and are hence relatively protected. Weight was a critical factor in the propulsion design as extra weight increases the lifting force required. The lightest of the options was the propeller system with the ducted fans slightly heavier due to the addition of a duct. Each of these criteria has been evaluated for each system and a table showing each criterion, the criteria rating and each methods score was created. From this table a decision upon the most suitable propulsion system was made. From Table 2 it was determined that the ducted fan propulsion system was most suited for the project.

### Propulsion Layout

The propulsion system must be arranged so as to achieve all the flight modes described in section This means the layout must allow the motors to produce thrust vertically, horizontally and a combination of both. Fixed and rotating rods were mounted through the gondola and used to support the engines.

Figure 1 shows one concept for propeller layout. In this concept engine 1 was fixed in position and produces thrust in the vertical direction to control the altitude of the airship. Engines 2 and 3 are mounted on a supporting rod which can be rotated to achieve thrust in the horizontal and vertical direction, as well as a vector combination of both. The speed of Engines 2 and 3 can be altered to control roll and yaw. One feature of this design is that the altitude control is separate from forward motion. The second propeller layout concept, Figure 2, is quite similar to the first layout. Engines 1 and 2 on this design operate the same the engines 2 and 3 did on layout 1. The main difference is that instead of a single engine mounted under the gondola providing altitude control, there are two engines each mounted at the end of a supporting rod. The purpose of this is to give greater stability and control to the airship. Positioning these engines in this way also gives the operator the ability to adjust the pitch of the airship.

The last propulsion layout concept, Figure 3, has two sets of two engines on rotating axles. For this configuration all the engines point in the same direction and hence all produce thrust in the same direction. The required direction of thrust can be achieved by rotating the axles. The benefit of this design is that no engine is inactive during powered flight. To control the yaw, pitch and roll of the airship the speed of certain engines is altered.

### Propulsion Layout Decision

The previously described propulsion layout concepts were analysed based on: their effect on overall stability, their aesthetics and their ability to cooperate with an automatic control system. It was essential that the propulsion layout be able to meet all the requirements of the flight modes. This means that the system can move the airship horizontally, vertically and a combination of both. Stability is enhanced by keeping the design symmetrical as well as increasing the distance between the thrusting force and the centre of gravity of the airship. Layout 1 has one of its engines at the centre of gravity and as a result the pitch of the airship is cannot be controlled. Layouts 2 and 3 have all their engines positioned some distance from the centre of gravity increasing the airship controllability.

As the altitude of the airship is to be controlled automatically, the propulsion layout must easily incorporate an automatic and manual control system simultaneously. Layout 1 and 2 have the altitude control engines separate from the other engines hence it is easier to make the control system using these layouts. Layout 2 would also incorporate a level sensor into the automatic control loop to control the pitch of the airship. The automatic control system for layout 3 would be significantly more complicated as both horizontal and vertical components of thrust would need to be controlled. Each of the criteria was evaluated and a score was given to each design. Above scores a decision matrix (Table 3) was used to select layout 2 as the propulsion layout design.

### Gondola Design

The gondola structure needed to fulfil three main functions: to house the electrical equipment/payload for the airship, to be detachable from the envelope, to hold the engines in place and transfer the engine thrust to the airship.

### Material selection

Potential gondola construction materials were assessed based on their strength, weight and ease of manufacture. The properties of a number of materials are shown in Table 4. The table above shows that foam and balsa wood are suitable for the gondola design due to their low weight. These materials could be used in conjunction with fiberglass and epoxy coatings to ensure that the gondola is strong and lightweight. Steel and aluminium could be used for the engine supporting rods and mountings.

### Shape and Aerodynamics

The form of the gondola was designed based on structural, aerodynamic and aesthetic requirements. Three alternative shape concepts were created with some similarities including: a flat platform to mount parts to, a lip at

S. K. Sama *et al.*

the top to join the gondola to the airship as well as several holes to insert different supports for the engines. The main differences between the designs are their appearance and ease of manufacture. Concept 1 shown in Figure 4 has a rounded base and sides. This has a dual benefit of making the gondola more aesthetically pleasing and also reducing the amount of drag created. However, rounded edges reduce the size of the mounting platform and are also more difficult and expensive to produce.

The second concept (Figure 5) included a simple box shape with an aerodynamic shell. The box is used to hold all the necessary parts for the gondola and being a simple box is easier to make. The aerodynamic shell is a rounded piece that covers the majority of the box. The use of this shell creates a second area between the shell and box, hence increasing the possible storage space in the gondola. Like the 'bath tub' design, the curves of this shell would also be difficult and more expensive to make. The final concept was the shaped box design (Figure 6). This design was based on the gondola box used in concept 2. The box was shaped to create a more aerodynamic profile, leading to a reduction in drag. The lack of curved surfaces in this design meant that it would be easier and cheaper to manufacture. The aerodynamic shaping of the underside of the box means that, like concept 2, there was additional storage space on the underside of the flat platform.

### Design Selection

All three of the concepts adequately met all the structural requirements of the gondola hence the decision on which concept was based on the ease of manufacture and aesthetics. Generally, straight parts are much easier to manufacture than curved parts. Only concept 3 had no curved parts making it easier to manufacture. Concept 1 had a large amount of curved surfaces and hence was considered to be hardest to manufacture. While the gondola box of concept 2 would be easy to produce, the curved shell would cause some difficulties. It was suggested that this could be produced from a blow molded plastic shell, however this was not possible, as the University did not have the machinery required. Balsa wood, used throughout concepts 2 and 3, was also readily available from most model/hobby shops. The curved and shaped pieces used in concepts 1 and 2 gave the airship a more aerodynamic and smooth finish. Concept 3 although not curved, does have an aerodynamic shape to improve its appearance over a simple box. Using these criteria a decision matrix (Table 5) was formed to decide on the best possible design. Concept 3 meets all the structural requirements for the gondola and best meets the aesthetic and manufacturing criteria and hence was chosen for use in the final design.

### Control System Design

The airship was designed to incorporate both automatic and manual control systems. The automatic control governs the altitude and pitch of the airship. The manual system was initially designed to control all aspects of airship flight. Once the automatic control system was implemented, the manual control will be responsible for movement in the horizontal plane.

### Manual Control System

The manual control system will operate via a remote controller hand unit. The two functions of the manual controller are to control the individual speeds of the engines and to control the angle of any rotating axles. Remote control hand unit consist of a number of variable and fixed channels. Variable channels send a variable signal to the onboard speed controllers, which alter the speed of the engines and the thrust produced. The fixed channels produce a binary signal that enables the axle to rotate a set angle. Rotation of the axle was achieved using a servo-motor. The servo-motor would be connected to the axle by means of a belt and gear system.

### Automatic Control System

The automatic control system utilises an onboard microprocessor and a control code to maintain a desired altitude and pitch. The microprocessor determines the thrust required based on the difference between the desired values and the inputs from the pitch and altitude sensor. A computer on the ground wirelessly communicates with the

**S. K. Samalet al.**

onboard processor to change the desired altitude value. A sensor was required to take continuous measurements of altitude during flight. The two main options for an altitude sensor were a pressure sensor or an ultrasonic sensor. The pressure difference in a 6 meter range cannot accurately be determined and hence an ultrasonic sensor was better. The ultrasonic sensor sends a pulse to the ground which is reflected back to the sensor. The time for the pulse to return is used to calculate the height of the airship in the automatic control code. A second sensor was required to measure the pitch of the airship. The two principal options were a capacitance-based tilt sensor and an electrolytic tilt sensor. Each provided similar measurement accuracy and could be integrated into the automatic control system. Capacitance-based sensors were found to be considerably cheaper and more readily available. A capacitance sensor is a strain-based sensor that uses two springs. When the sensor is not level, an unbalance in the two strains is recorded and converted to an output voltage. The microprocessor then interprets the voltage as an angle using the automatic control code.

### **Payload and Ground Station Design**

The airship was to be fitted with a camera to record flight footage. The footage would be sent wirelessly, in real time, to a ground station. A number of different cameras were researched as options. The principal criterion for camera selection was cost, as the budget only allowed \$200 to be spent. As with all other components in the airship, the weight of the camera system was extremely important. The camera also needed to be able to transmit a clear image over a distance of at least 50 meters.

### **Camera Options**

It was possible to use either a still or video camera to record images. A camera for still images generally provides excellent picture quality but is also heavy and expensive. The digital still camera mechanism used by Airship Solutions (Figure 7) has a maximum resolution of 5 Megapixels and can pan and tilt via remote control. The total weight of the camera and frame was roughly 400 grams. The cost of the system was estimated at \$700. The main advantages of a video camera, when compared to a still camera, are its size, weight and ease of use. The JMK wireless video camera weighs only 25 grams and is roughly the size of a 20-cent coin. The receiving unit can be connected to a television or a VCR over a standard composite-video connection. An analogue to digital video converter also allows the stream to be viewed and recorded on a computer. The camera, receiver and converter could be purchased for a total of less than \$200. Another small wireless video camera was also considered as an option. The Jaycar camera had a resolution of 0.3 Megapixels and a range of 100 meters. The range and resolution were therefore equivalent to the JMK camera specifications, although the Jaycar camera was a significantly more expensive option with a total system cost of around \$400.

### **Camera Selection**

A decision matrix was used to determine the most suitable camera system for the airship. The weight and cost of the camera were considered the two most important parameters. The ease of use criterion includes factors such as computer connectivity, power supply and installation into the gondola. The resolution, image interference and range were included under a general heading of picture quality. Based on the total scores in the decision matrix, the JMK camera system was deemed to be the most suitable for the airship.

## **CONCLUSIONS**

This paper aims to sizing of the stabilizer, material selection, propulsion layout design, gondola box designing, and sensor selection for flight control. The area of the stabilisers was calculated using a statistical analysis of similar airships and the area of their stabilisers. The area of stabilisers for this airship was calculated taking the ratio and the longitudinal area of the airship from statistical analysis. From the analysis it was found that foam and balsa wood are suitable materials to make the gondola design due to the low weight for this small type of airship. But Steel and aluminium material can be used for the engine supporting rods and mountings. Three different designs (layouts) were taken for better performance of propulsion system. From analysis it was found

**S. K. Sama et al.**

“layout 2” type better compare with other two types design. Different box design were taken to find out better aerodynamics and structural strength for gondola. It was observed that “Shaped Box” design meets all the structural requirements and better aerodynamics for the gondola and also best meets for manufacturing criteria. This one was chosen for use in the final gondola design. In this low altitude the pressure sensor cannot accurately be determined the altitude and hence an ultrasonic sensor was selected. The ultrasonic sensor sends a pulse to the ground which is reflected back to the sensor. The time for the pulse to return is used to calculate the height of the airship in the automatic control.

### ABSTRACT

Every year millions of tons of agricultural wastes are generated which are either destroyed or burnt inefficiently in loose form causing air pollution. These wastes can be recycled & can provide a renewable source of energy by converting biomass waste into high density - fuel briquettes without addition of any binder. This recycled fuel is beneficial for the environment as it conserves natural resources. For this the biomass briquetting is the main renewable energy resource. In this project the raw material including ground nutshell were densified into briquettes at high temperature and pressure using different technologies. We discuss the various advantages, factors that affecting the biomass briquetting and comparison between coal and biomass briquetting.

**Keywords:** Ash, Volatile matter, Moisture, and Char-coal

## INTRODUCTION

Biomass is a renewable energy resource derived with from the carbonaceous waste of various human and natural activities. Currently, the biomass sources contribute 14% of global energy and 38% of energy in developing countries. Densification and optimization of biomass is briquette. Biomass does not add carbon dioxide to the atmosphere as it absorbs the same amount of carbon in growing as it releases when consumes as a fuel. Its advantage is that it can be used to generate electricity with the same equipment or power plants that are now burning fossil fuels. Availability of biomass in large quantity and scarcity of fossil fuel coal, oil and gas lead industries to use the biomass as fuel. India has started to replace charcoal with biomass briquettes in regards to boiler fuel, especially in the southern parts of the country because the biomass briquettes can created domestically, depending on the availability of land. Therefore, constantly rising fuel prices will be less influential in an economy if sources of fuel can be easily produced domestically. Biomass briquettes are more flexible these can use from house hold purpose to large scale industrial purpose at any were easily. Here the major thing is from which biomass we get high thermal energy with less biomass consumption (simply calorific value) we should know for getting high economical efficiency and to reduce the environmental pollution.

**SCOPE**

- Enhancing the usage of renewable resource (like biomass).
- Providing economically efficient fuel.
- Reducing environmental pollution.
- Reducing energy cost (like thermal and electrical energies etc.).
- Ultimately which leads our country development.

**METHODS FOR CHARACTERIZATION OF BRIQUETTES**

1. x-ray diffraction method
2. scanning electronic microscope
3. Proximate and ultimate analysis

**EXPERIMENTAL PROCEDURE****Briquetting the biomass**

Biomass briquetting and characterization project and is simply a process of converting agro waste and forestry waste into biomass briquettes. The biomass briquetting is the best renewable source of energy for healthy environment and economy. It's a complete ecofriendly project. Successful test have been carried out with groundnut shell. The biomass can be briquetted individually or in combination depending on their availability and blending properties. Main concept of this project is to produce the material as a bio-coal, which is made from the wastages. We cannot destroy the wastage totally. But we can use it with the help of briquetting plant and produce the briquettes, which ultimately produce the energy. The use of these cheap fertilizers gives low yield as compared to the modern fertilizer available however the major quantity of press mud goes just as waste. We can use such above wastage as an input to the briquetting plant machinery to produce conventional source of energy.

**Screw Press and Piston Press Technologies**

High compaction technology or binder less technology consists of the piston press and the screw press. Most of the units currently installed in India are the reciprocating type where the biomass is pressed in a die by a reciprocating ram at a very high pressure. In a screw extruder press, the biomass is extruded continuously by a screw through a heated taper die. In a piston press the wear of the contact parts e.g., the ram and die is less compared to the wear of the screw and die in a screw extruder press. The power consumption in the former is less than that of the latter. But in terms of briquette quality and production procedure screw press is definitely superior to the piston press technology. The central hole incorporated into the briquettes produced by a screw extruder helps to achieve uniform and efficient combustion and, also, these briquettes can be carbonized.

**Characterizing the biomass briquette**

Hare we are followed procedure to characterize the briquette is: Proximate & ultimate analysis and Proximate analysis: Proximate analysis indicates the percentage by weight of fixed carbon

- ⊙ Moisture content
- ⊙ Volatile matter
- ⊙ Ash content
- ⊙ Fixed carbon
- ⊙ Calorific value (heating value)

**Ultimate analysis**

- ⊙ Carbon content
- ⊙ Hydrogen content
- ⊙ Nitrogen content

- ⊙ Sulphur content
- ⊙ Oxygen content

Here we have did ultimate analysis for carbon, hydrogen, nitrogen contents of briquette is by using some empirical equations which are related with proximate analysis results like moisture content, volatile matter, ash content and fixed carbon. These empirical equations are proposed by two scientists 1. Vanloos & 2.J.koppejan.

## RESULTS AND DISCUSSIONS

### Moisture content:

**Observed weight of mass of briquette according to time:** Where the graph indicates that at constant temperature (105°C) according to the time the weight loss of briquette to a certain time, from the particular time the weight of briquette becomes constant the time is optimum time of heating to evaluate moisture content in the briquette.

**Observed weight of mass of briquette according to time:** Where the graph indicates that at constant temperature (300°C) according to the time the weight losses of briquette to a certain time, from the particular time the weight of briquette becomes constant the time is optimum time of heating to evaluate volatile matter in the briquette.

### ASH CONTENT

**Observed weight of mass of briquette according to time:** where the graph indicates that at constant temperature (600°C) according to the time the weight loss of briquette to a certain time, from the particular time the weight of briquette becomes constant the time is optimum time of heating to evaluate ASH content in the briquette.

### Results and comparison of biomass briquette with coal

Proximate analysis  
Ultimate analysis

## CONCLUSION

Biomass samples from different sources and its types needs to be characterized for its proximate analysis and other metal impurities. Prior knowledge of biomass type and its chemical composition would help in understanding combustion related problems for biomass based energy generation. The coal is a non-renewable resource and present days which is available in very less amount with high cost. so, Even the heating value of briquette is less but it is renewable resource, eco-friendly fuel, more amount is available with cheaper cost and also which is a efficient method to generate energies like thermal, electrical etc. Agricultural waste are produced in large quantities and are disposed indiscriminately most especially in the rural areas of developing countries, thereby causing health hazard. The increasingly use of these wastes in composite briquette form, also help in solving disposal problem apart from providing good alternatives to fossil fuel. This study revealed that the biomass briquettes from groundnut shell is suitable for the production of environmentally solid fuel that can be useful of both domestic and industrial heating applications.

### ABSTRACT

Preparation of Nanomagnesia (NM) and its application in water purification has been studied in the present work. The synthesis is based on various methods. Various characterization studies confirmed that NM formed is crystalline with high phase purity, and the particle size varied in the range of nm scale. The fluoride adsorption by NM is highly favorable and the capacity does not vary in the pH range usually encountered in groundwater. The effects of various co-existing ions usually found in drinking water, on fluoride removal were also investigated. Phosphate was the greatest competitor for fluoride followed by bicarbonate. The presence of other ions studied did not affect the fluoride adsorption capacity of NM significantly. The adsorption technique is followed to remove the fluoride. A batch process is carried out using precipitation– sedimentation–filtration techniques, addressing the problems of high fluoride concentration as well as the problem of alkaline pH of the magnesia treated water. The method of synthesis reported here is advantageous from the perspectives of small size of the nanoparticle, cost-effective recovery of the material and improvement in the fluoride adsorption capacity

**Keywords:** Adsorption, Defluoridation, Drinking water, Nano magnesia

### INTRODUCTION

Fluorine is one the common elements present in earth crust. Its atomic number is 9 and chemical symbol is F. Its atomic weight is 18.9, melting point of is  $-219.6^{\circ}\text{C}$  and the boiling point is  $-188^{\circ}\text{C}$ . Many fluoride minerals are known, but of paramount commercial importance is fluorite ( $\text{CaF}_2$ ). The soft, colourful mineral is found worldwide. Seawater fluoride levels are usually in the range of 0.86 to 1.4 mg/L, and average 1.1 mg/L. The chloride concentration in seawater is about 19 g/L. The low concentration of fluoride reflects the insolubility of the alkaline earth fluorides, e.g.,  $\text{CaF}_2$ . Fluoride is present naturally in low concentration in drinking water and foods. Fresh water supplies generally contain between 0.01–0.3 ppm. In some locations, the fresh water contains dangerously high levels of fluoride, leading to serious health problems. The fluoride occurs mainly as sellaite ( $\text{MgF}_2$ ), fluorspar ( $\text{CaF}_2$ ), cryolite

24937

**Vijay Miditana and Dasari Kamalakar**

( $\text{Na}_3\text{AlF}_6$ ) and fluorapatite [ $3\text{Ca}_3(\text{PO}_4)_2\text{Ca}(\text{F},\text{Cl}_2)$ ]. As fluorapatite it is found in sedimentary rocks and as cryolite in igneous rocks. These fluoride minerals are nearly insoluble in water. Hence fluorides will be present in groundwater only when conditions favour their dissolution or high fluoride containing effluents are discharged to the water bodies from industries. Fluoride in drinking water has a profound effect on teeth and bones. Fluoride displaces hydroxide ions from hydroxyapatite,  $\text{Ca}_5(\text{PO}_4)_3\text{OH}$ , the principal mineral constituent of teeth and bones, to form the harder and tougher fluoroapatite,  $\text{Ca}_5(\text{PO}_4)_3\text{F}$ . Up to a small level this strengthens the enamel. However, fluoroapatite is an order of magnitude less soluble than hydroxyapatite, and at high fluoride concentration the conversion of a large amount of the hydroxyapatite into fluoroapatite makes the teeth and the bone denser, harder and more brittle.

In the teeth this causes mottling and embrittlement, a condition known as dental fluorosis. With prolonged exposure at higher fluoride concentrations dental fluorosis progresses to skeletal fluorosis. Fluoride is thus considered beneficial in drinking water at levels of about 0.7 mg/L but harmful once it exceeds 1.5 mg/L which is the World Health Organization limit being followed in most of the nations and is also the Australian recommended limit. The difference between desirable doses and toxic doses of fluoride is ill-defined, and fluoride may therefore be considered as an essential mineral with a narrow margin of safety. The effect of fluoride on bone of human body and its effects results in deformation of bone and teeth is called fluorosis. There are two types of fluorosis, they are dental fluorosis and skeletal fluorosis. Dental fluorosis is hypo mineralization of tooth enamel caused by ingestion of excessive fluoride during enamel formation. It appears as a range of visual changes in enamel causing degrees of intrinsic tooth discoloration. The severity of the condition is dependent on the dose, duration and age of the individual during the exposure. In the mildest form there are faint white lines or specks. Slightly more severe cases appear as white mottled patches, while severe fluorosis is characterized by brown discoloration and brittle, pitted and rough enamel. Barring the most severe cases, teeth with fluorosis are relatively resistant to dental caries although they may be of potential cosmetic concern.

**Skeletal fluorosis**

Skeletal fluorosis is a bone disease caused by excessive accumulation of fluoride in the bones. In advanced cases, skeletal fluorosis causes pain and damage to bones and joints. In India, the most common cause of fluorosis is fluoride-laden drinking water which is sourced as groundwater from deep-bore wells. Over half of groundwater sources in India have fluoride above recommended levels. Common causes of fluorosis include inhalation of fluoride dusts/fumes by workers in industry, use of coal as an indoor fuel source, consumption of fluoride from drinking water, and consumption of fluoride from drinking tea. Skeletal fluorosis can be caused by cryolite, and the disease was first recognized among workers processing cryolite.

**Nano particles**

Nanoparticles are particles between 1 and 100 nanometers in size. In nanotechnology, a particle is defined as a small object that behaves as a whole unit with respect to its transport and properties. Particles are further classified according to diameter. Ultrafine particles are the same as nanoparticles and between 1 and 100 nanometers in size, fine particles are sized between 100 and 2,500 nanometers, and coarse particles cover a range between 2,500 and 10,000 nanometers. Nanoparticles are of great scientific interest as they are, in effect, a bridge between bulk materials and atomic or molecular structures. A bulk material should have constant physical properties regardless of its size, but at the Nano-scale size-dependent properties are often observed. Thus, the properties of materials change as their size approaches the nanoscale and as the percentage of atoms at the surface of a material becomes significant.

## SYNTHESIS OF NANO PARTICLES

The methods employed to prepare the nanoparticles are:

- Sol-Gel process,
- Self-propagated combustion,

## SOL GEL PROCESS

The sol-gel process is a wet-chemical technique also known as chemical solution deposition widely used recently in the fields of materials science and ceramic engineering. Such methods are used primarily for the fabrication of materials typically a metal oxide starting from a chemical solution sol, short for solution, which acts as the precursor for an integrated network or gel of either discrete particles or network polymers.

## MATERIALS REQUIRED

**CHEMICALS:** Chemicals used in this study were of analytical grade. Magnesium nitrate, urea and potassium permanganate was procured from Ranbaxy Fine Chemicals Limited, India. Glycine was procured from SRL, India. A stock solution of 1000 mg l<sup>-1</sup> fluoride was prepared from sodium fluoride using distilled water. Required concentrations of the samples were prepared by serial dilutions of the stock solution.

### Self-propagated combustion

Materials required:

Calcium nitrate

Urea

Potassium permanganate

Glycine..

- In method of the calcium nitrate trapped in cellulose fibers.
- Glycine and urea are the most commonly used fuels in most of the self-sustained combustion reactions.
- The In a typical synthesis process, calcium nitrate, urea, glycine and cellulose fibers were initially mixed and kept overnight.
- The weight ratio of calcium nitrate : urea : glycine : cellulose used mixture was then heated on a hot plate under stirring for 20min to evaporate the excess water and was subsequently fired in a muffle furnace at 450 °C for 45 min.
- Combustion time of 45 min was used to completely burn the organic matter present in the product so as to get pure CaO.

## PREPARATION OF NANO MAGNESIUM OXIDE

For preparation of Nano magnesium oxide we are used SOL-GEL method.

**Reagents:** The following chemicals are use in this preparation, they are Magnesium nitrate, Mg(NO<sub>3</sub>)<sub>2</sub>·6H<sub>2</sub>O , Sodium hydroxide, NaOH, and Distilled water.

**Procedure:** In this method we prepare solution of 0.2 M Magnesium nitrate was dissolved in 100 mL of DD water and taken in a 250 mL beaker. And we will make another solution of 0.4 M NaOH was dissolved in 100 mL of DD water and taken in a 250 mL beaker. Now both solutions are prepared. Now the 0.2 M Magnesium nitrate solution was kept under stirring using magnetic stirrer then 0.4 M NaOH was added drop by drop. The molar ratio of metal ions to hydroxide ions was maintained as 1:2. The mixture was stirred for 2 hours at room temperature to form magnesium hydroxide without any agglomeration. After two hours the mixture is allowed to settle for an one hour then a precipitate is formed at bottom of the conical flask. That is nothing but magnesium hydroxide. the chemical reaction is as follows.

**Vijay Miditana and Dasari Kamalakar**

Now filter the solution using whatman filter paper, such that we collected the precipitate and place it in 250ml glass jar. And allow it dry for some time after that add 50ml of ethanol to the precipitate and place the jar in drier for 24 hours and temperature 120°C is maintained for 24 hours. So that any water molecules present in precipitate will be evaporated and form as a small crystal formed. Now place the precipitate powder in muffle furnace and calcined at 400°C for 4 hours then it is taken out of furnace and cooled then it is grinded then it forms white powder nothing but nano magnesium oxide. The following chemical reaction takes place in the calcination reaction and results in the nano particles or nano magnesium oxide.

Such that by removing water molecules from magnesium hydroxide magnesium oxide is formed.

**Characterization of material**

The synthesized samples were characterized by the following analytical techniques, such as FTIR, SEM and XRD.

**FTIR:** Fourier transform infrared spectroscopy (FTIR) is a technique which is used to obtain an infrared spectrum of absorption or emission of a solid, liquid or gas. An FTIR spectrometer simultaneously collects high spectral resolution data over a wide spectral range. This confers a significant advantage over a dispersive spectrometer which measures intensity over a narrow range of wavelengths at a time

**FTIR graph:** FTIR Spectra of MgO particles are shown in below graph. Peaks at 3664 cm<sup>-1</sup>, 3448 cm<sup>-1</sup> corresponding to the O–H stretching mode of hydroxyl groups were present on the surface due to moisture.

**Scanning Electron Microscope:** A scanning electron microscope (SEM) is a type of electron microscope that produces images of a sample by scanning it with a focused beam of electrons. The electrons interact with atoms in the sample, producing various signals that contain information about the sample's surface topography and composition. The electron beam is generally scanned in a raster scan pattern, and the beam's position is combined with the detected signal to produce an image. SEM can achieve resolution better than 1 nanometer. Specimens can be observed in high vacuum, in low vacuum, in wet conditions, and at a wide range of cryogenic or elevated temperatures.

**Results of SEM:** The following one is the picture nothing but result of SEM. Size of the particle found, Minimum: 72nm. Maximum: 1420nm, Average: 700 nm.

**XRD analysis:** X-ray powder diffraction (XRD) is a rapid analytical technique primarily used for phase identification of a crystalline material and can provide information on unit cell dimensions. The **analyzed** material is finely ground, homogenized, and average bulk composition is determined.

**REMOVAL OF FLOURIDES:** Prepare 8 ppm concentration of flouride solution. molecular weight of NaF =41.98. Prepare 1 lit solution of 8 ppm conc. NaF solution. By taking 19.52 milligrams of nano magnesium oxide and preparing a stock solution by adding that in the one litre solution. Later divide the samples into 7 various 100ml samples and add 10, 20, 30, 40, 50,60, and 70 mg of MgO in each sample respectively and place it on magnetic stirring for 15, 25, 35 minutes respectively. After stirring filter the sample using whatman filter paper and collect the sample in conical flasks. Calculate the concentration of fluoride in the sample by using fluorimeter. Take each sample and follow the method.

**Vijay Mditana and Dasari Kamalakar**

**Optimum time:** From the graphs the optimum time is determined as 15 minutes since her maximum removal of flouride takes place.

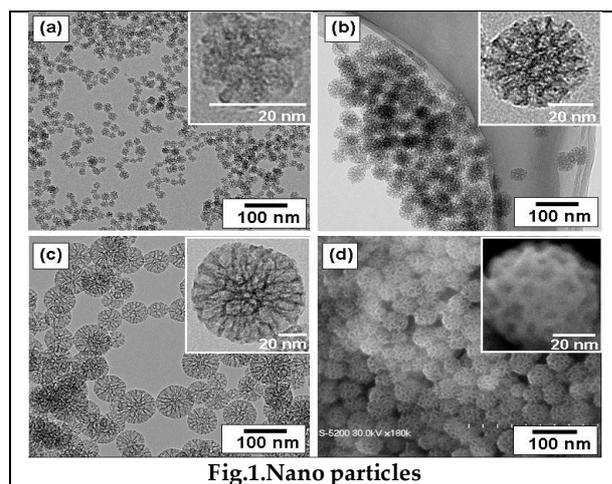

**Optimum dosage:** From the graph the optimum dosage is found as 50 mg since at this point maximum removal of flouride takes place. The concentration reduces from 8ppm to 3.1ppm.

### ABSTRACT

Drying processes has been one of the oldest technologies among the industrialized processes in the preservation of agricultural food materials and the oldest food preservation method known to man since it has great effect on the quality of the dried products. The major objective in drying agricultural products is the reduction of the moisture content to a level, which allows safe storage over an extended period. The dent in the food production caused by crop failures as well as significant seasonal fluctuations in availability can be ignored out by food conservation e.g. by DRYING. In this regard some of the vegetables have been traditionally processed by drying to extend their storage life well beyond few weeks and make it available in off season.

**Keywords:** drying, food products, moisture content, hot air drying

### INTRODUCTION

Vegetables and fruits are indispensable part of human diet and can be regarded as the fuel for physiological processes. Despite large numbers of national food production still does not meet the needs of the population. The wastage during handling from point of production to consumer's places, lack of appropriate preservation & storage systems causes considerable losses, thus reducing the food supply significantly. Drying is a heat and mass transfer process resulting in the removal of water moisture, by evaporation from a solid, semi-solid or liquid to end in a solid state. It provides a long term conservation and marketability of product. Nowadays, food safety and quality, first of all the preservation of active ingredients, are strongly focused on by researchers, producers, processors, and consumers (Vadivambal & Jayas 2007). Good quality is judged by the freshness, expected appearance, flavor, and texture. Food safety characteristics are mostly defined by legislations – i.e. there are defined limits of undesirable impurities, chemical compounds, heavy metals, and microbial count. The changes in quality that can occur in any product during drying are those in its optical properties (color, appearance), sensory properties (odor, taste, flavor), and structural properties (density, porosity, specific volume, textural properties, etc.). Drying of fruit and vegetables

24944

**Vijay Miditana and Dasari Kamalakar**

may result in physical, structural and nutritional changes such as case hardening, shrinkage and loss of volatile components and antioxidants. Many of these changes are functions of shrinkage, moisture content, temperature and time. Therefore, knowledge of the shrinkage behavior, the average moisture content and temperature gradient of the product as a function of the drying time is needed in order to maintain its stability during storage, evaluate its final quality and simulate the drying process. Fruit and vegetables can be dried in different forms such as halves, slices and quarters during the drying process and it is reported that this process is a complex procedure in which heat and mass transfer phenomena contribute to moisture removal leading to substantial reduction in mass and volume product minimizing packaging, storage and transportation costs, to enhance the storage and enables storability of the product under ambient temperatures. Drying studies are usually performed at constant drying conditions of temperature, velocity and humidity using a thin layer of sample. Basically, constant condition batch thin layer drying experiments will consist of measurement of moisture loss with time. Drying processes can be classified as batch, where the material is inserted to the drying equipment and drying proceeds for a given period of time, or as continuous, where the material is continuously added to the dryer and dried material continuously removed.

For this purpose, heat is added by different ways, such as, by direct contact with heated air at atmospheric pressure and the water vapor formed is removed by air. The other way is to add the heat indirectly by contact with a metal wall or by radiation. It is important to determine the drying parameters of drying process for the food materials that result in minimal change of quality parameters, we need to mathematical equations. There are several mathematical models are found for determining the drying parameters of the food materials such as Page's, Henderson & Pabis, Wang & Sing, Midilli, Weibull and Logarithmic models. The mathematical modeling allows the food researchers to choose the most suitable operating conditions either to describe the drying equipment or minimize the drying times for the final product specifications. These models can be categorized as theoretical, semi-theoretical, and empirical. Recently, there has been a lot of research in mathematical modeling and experimental studies of the drying characteristics of various vegetables and fruits. The plot of moisture content against time is known as the drying curve. The slope of a tangent to a point on the drying curve is the drying rate.

The plot of drying rate against moisture content is called the drying rate curve (Watson and Harper, 1988). The thin layer drying curves of agricultural products were usually modeled using empirical, semi-empirical and analytical equations. The drying characteristic curves of most of these food materials were modeled using different drying models such as the Newton model (O'Callaghan et al., 1971), Page model (Akpınar et al., 2003), Henderson and Pabis model (Karathanos and Belessiotis, 1999), logarithmic model (Yaldiz et al., 2001), two term exponential model (Akpınar et al., 2003). The studies based on simulation models are needed for design and operation of dryers as well as useful in improving the existing drying system. Thus, several researchers in recent times have investigated the drying characteristics or behavior of different food materials including fruit and vegetables, sea food products using different drying methods such as open sun drying for grapes ((Togrul and Pehlivan, 2004), fish (Jain and Pathare, 2007), and onion slices (Arslan and Ozcan, 2010); solar drying for green pepper (Akpınar and Bicer, 2008), strawberry (Beltagy et al., 2007), Brook mangoes (Dissa et al., 2011), and okra (Doymaz, 2011; Ismail and IbnIdriss, 2013)); and hot air drying for red pepper (Simal et al., 2005), okra (Doymaz, 2005), tomato (Doymaz, 2007), and carrot (Zielinska and Markowski, 2010), respectively.

## MATERIALS AND METHODS

### Material

The bottle gourd, *Lagenaria siceraria* (synonym *Lagenaria vulgaris* ser.), also known as opo squash or long melon is a vine grown for its fruit, which can either be harvested young and used as a vegetable, or harvested mature, dried, and used as a bottle, utensil, or pipe. It is having various pharmacological activities. The chemical constituents present in the bottle gourd responsible for treatment of various diseases. Various literature survey revealed that the pharmacological properties of *Lagenaria*. The bottle gourd are generally available in the warmer region of the world.

**Vijay Miditana and Dasari Kamalakar**

All the cucurbitaceae family plants having major medicinal and nutritive values (Habib-ur-rahman2003). Among the cucurbitaceae family lagenaria species having major medicinal properties. Bottle gourd belongs to genus lagenaria that is derived from the word lagna means bottle.. The lagenaria available in two variety one is bitter bottle gourds and another one is sweet variety useful bottle gourd. The bitter variety available as wild plant and used for the pharmacological application, sweet variety used as vegetable. Due to scarcity nowadays sweet variety using as medicine.

**Different species of lagenaria are available**

*Lagenaria vulgaris* (common) in olden literature

*Lagenaria leucantha* (white flowered gourd)

*Lagenaria siceraria* (Mol) standal in recent literature survey.

*Lagenaria abbreviflora* (Benth)

*Lagenaria asphaerica*

Drying processes range from open sun drying to industrial drying

**Hot air drying**

Currently hot air drying is the most widely used method in post-harvest technology of agricultural products because of its simplicity and low cost. Using this method, a more uniform, hygienic and attractively colored dried product can be produced rapidly. Convective drying, mainly using tray driers, is also widely used, especially by small producers. This process can eliminate the disadvantages of the natural drying. Drying out to the desired level and achieving the equilibrium moisture content (Krokida&Marinos-Kouris 2003) is extremely difficult. Under- or over drying is likely to occur. The consequence of under drying, with the moisture content higher than equilibrium, results in a higher microbial count (Martinovet al. 2007). This procedure could also result in an undesirable reduction of active ingredients contents and inadequate rehydration characteristics.

Drying of material is considered to occur in two stages, a constant rate period followed by a falling rate period. In the constant rate period the rate of drying corresponds to the removal of water from the surface of material. The falling rate period corresponds to the removal of water from the interior of the material. The rate in either case is dependent on:

- a). Flow rate of air
- b). Material characteristics
- c). Tray material.

In tray dryers, the food is spread out, generally quite thinly, on trays in which the drying takes place. Heating may be by an air current sweeping across the trays, by conduction from heated trays or heated shelves on which the trays lie, or by radiation from heated surfaces. Most tray dryers are heated by air, which also removes the moist vapors. A typical drying procedure was applied with tray dryer to investigate properties of tray dryers, its advantages or disadvantages, drying kinetics of foods that are dried in tray dryers. For these purposes, equilibrium moisture content, drying rate, mathematical and experimental Drying time were calculated with some engineering formulas.

**Drying procedure**

Bottle gourd slices are weighting about 100 g were placed in a stainless steel tray in a tray drying unit, which is placed in the middle of the drying unit. Air flowed parallel to the horizontal drying surfaces on the samples. The mass flow rate of the drying air was regulated by a blower driven via a variable speed motor and the temperature was regulated using a rheostat.. Each drying experiment was independent, and the bottle gourds used for all trials were from the same farm and had the same average initial moisture content. During the experiments, the sample weight and temperature (ambient, before and after the tray) were recorded at every 10 minutes. Furthermore, the velocity of the air was constant for all the trails. The moisture loss of samples was determined with the help of a

digital electronic balance having an accuracy of 0.01 g. drying was continued until the sample reached the desired moisture level.

### Open sun drying

The traditional open sun drying practiced on a large scale in the rural areas of the developing countries. The traditional way of drying food materials has been by open sun drying.

### Drying procedure

The open sun drying experiment is carried out during the periods of February-March under the clean climatic conditions. Each experiment started at 10:00 am and continued till 3:00 pm. To determine the moisture loss of drying samples during experiments, bottle gourd samples were taken out and weighed at various time intervals, ranging from 30 min at the beginning of the drying to 1hr during the last stage of the process. The moisture loss of samples was determined with the help of a digital electronic balance having an accuracy of 0.01 g. The drying process was continued until no further changes in their mass were observed.

## EXPERIMENTAL PROCEDURE

### Hot Air Drying

- Tray dryer (TD) is popular for drying due to a relatively short drying time, uniform heating and more hygienic characteristics.
- The temperature ranges from 110 to 170°C (approximately 20% of moisture content).
- This temperature range gives maximum color values and minimizes the loss of volatile oils
- Selected bottle gourd (100 grams) were processed in a tray dryer and they were dried under controlled temperature and parallel air flow until constant weight.
- The water removed during the drying process was determined by periodic weighing of the samples using a digital balance.
- The drying tests were conducted at temperatures of 110, 130, 150 and 170°C and at constant air velocity for two hours.

### Open Sun Drying

Approximately 100 g of sliced okra samples of thickness 10 and 20 mm were spread in different metal tray and then placed in the open sun from 10.00 a.m to 4.00 p.m daily.

- During experiment, bottle gourd samples were taken out and weighed at various time intervals, generally for every 1hr.
- The weights were determined by using digital electronic balance.
- The drying process was continued until no further changes in their mass were observed

## RESULTS AND DISCUSSION

The effect of different drying methods on drying time, color and texture of the bottle gourd slices were determined. The result shown that there was a general decline in moisture content of the sample from 100 g to 10 g in all methods of drying. Time required for open sun drying of bottle gourd was 4 hours where as hot air drying was found to be quicker drying method. It took lesser time of about 100 minutes at 170°C air temperature for 95.5 grams reduction, 120 minutes at 150°C air temperature for 95.3 grams reduction and 120 minutes at 130°C air temperature for 93.4 grams reduction and 120 minutes at 110°C for 62.6 grams reduction. The results pertaining to drying of bottle gourd as recorded in two different methods *viz*, open sun drying and hot air drying are shown in fig. 1 and 2. The data indicated that the loss of moisture was at its highest magnitude in the first hour of drying however the moisture loss was slowed down in the subsequent drying period. The reduction in moisture content of bottle gourd during first

**Vijay Muditana and Dasari Kamalakar**

hour in hot air drying was at higher rate than the samples dried in open sun drying condition. Similar trend was also observed by Bhosale and Arya (2004), in cabbage, cluster bean, fenugreek, spinach and okra. Among the drying methods the removal of moisture from okra slices was found to be at faster rate in hot air drier followed by open sun conditions. This was attributed to the level of temperature and rate of air flow in the dryer which might be responsible for higher difference in loss of moisture. Differences in final weight were observed with the samples dried under different methods of drying. The final weight achieved were, 9.7gm under open sun drying. Similarly final weight recorded with different levels of air temperature under hot air drying were 37.4 gm, 6.6 gm, 4.7 gm and 4.5gm at the air temperature of 110°C, 130°C, 150°C and 170°C respectively.

Figure 1 reveals the percentage of moisture content in dry basis of bottle gourd samples during the air drying at the different temperatures were studied. As expected, there is an acceleration of the drying process due to the increase in the temperature of the drying from 110 °C to 170 °C. However, in the early stages of drying the temperature of 170 °C shows a much faster decrease of percentage of moisture content in dry basis as compared to the temperature of 110 °C, 130 °C and 150 °C. It is evident from these curves that the moisture content decreases continuously with the drying time. As expected, the air temperature had a significant effect on the moisture content of samples. During the drying experiments, the weather was generally sunny. The ambient air temperatures were reached the highest figures between 11:00 and 16:00. Fig.2 suggests drying curves for bottle gourd dried by open sun drying method. Whereas the drying is smooth and controlled by temperature variation using hot air dryer. From the above graph we can say that moisture content removal takes less time in hot air dryer at 170 °C compared to open sun drying. Figure 4 shows that how the drying rate changes with time for different temperatures 110°C, 130°C, 150°C, 170°C. Drying rate increases with increasing air temperature. Figure 5 shows that The drying rate increases up to certain time and then decreases with time. Profile shows Dryingrate versus moisture content curve for temperatures of 110, 130, 150, and 170 °C with constant air velocity. It also show that the period of constant Drying rate, which sometimes is observed in fruits, is very small or does not exist for the four temperatures studied. In addition, the rise in temperature allowed an increase in the drying rate.

## CONCLUSION

Although good progress has been made in drying technology, there is a need for further development of cost effective and energy efficient drying methods. During the drying process, the desirable aspects of fruits and vegetables must be preserved. Combinations of drying techniques produce products that are most appreciated by consumers and reduce heat-induced spoilage in fruits and vegetables. The consumption of large amounts of energy by the instruments used for drying increases the cost of the finished final product. The application of the natural drying method not only reduces the cost but is much easier to use. The main drawback of the natural drying method is that it is time consuming and the drying conditions cannot be manipulated compared to the artificial drying method.

### ABSTRACT

This paper tries to give a scope on application of 3D technology for Planning and designing in Indian mining industry. As per present production target of Coal India 2023 -24. There is an immense need of software modules and technology for optimal production in a safe environment. In order to implement and adapt the new technology to the industry there is a need for wide understanding of the software modules. In this discussed about the software band pack and in detail about the modules. The modules like 3D visulisation, date base management, tools for reserve estimation . It also dicuss about scope of 2D -3D mapping, Graphical image, user interface interactivivty, current trends in the 3D technology, virtual simulation, Artificial Intelllignce. It also tries to throw light on present available softwares available in market and its review ratings.

**Keywords:** 3D technology, exploration, planning and designing

### INTRODUCTION

Coal India has a target for the production of 1 billion ton of coal for the year 2023-24. In India production of iron ore in the year 2018-19 is 200.96 million tonnes. The Production of metallic ore bauxite is 22,313 thousand tonne during 2017-18. From the above facts it can be understood that the mining industry need a strategic planning and design as required. For meeting such challenges required quantification of downstream processes and their integration into orebody models; spatial characterization of geo metallurgical variables and their integration into block models, scheduling and mine optimization. (Dowd, 2016). Opencast mining has been proved very economical for low grade coal lying at shallow depth and there a lot of scopes(Valmike Sahu, 2017). Mining company needs a promising technology like 3D to manage explorations and production, optomize the human resources and equipment. The planning and designing factors have a direct or indirect bearing on the mine scheduling decision making for mining companies (Malisa, 2019)

**R.M. Perumalla and Amiya Singh**

### Background

In modern mining, it is inevitable to have sharing of stream flow of data between corporate level and to the field level. The clefs that arise between these ovals creates a poor environment for managerial people to get a timely information efficient decision making. Any mining industry requires needs instantaneous visibility on production, quality, day shift timings, equipment status, and other regular centred operational parameters to achieve optimum and effective operations. Adapting of Industry 4.0 technologies at a mining industry, the integration of shattered a shop floor and production level systems enables absolute communication in discharging outstanding operations. Wireless sensor networking technologies have evolved significantly, and industrial sector is one of the beneficiaries. Communication technologies such as Zigbee etc.

### 3D modelling Technology in Band

**The normal functionality of these 3D modelling software modelling carried out by packages include**

**Visualization:** In 3d visualization includes realistic 3D graphics, exploring it immersively through virtual reality (VR) and analysing overlaid information through augmented reality (AR) without having to trawl through siloed databases is starting to gain traction in the industry. geological exploration data, Statistical data management, (MINING TECHNOLOGY, 2020) .

**Modelling:** 3D modelling software comprises of tools which can perform exploration of geological data, block modelling, surveying, drill and blast data, geological reserve estimation, design of open pit and underground minng, design of ramps, design of raods in open cast mines (MAPTEK, 2020)

**Database Management :** The data management software provison to deal data like drillhole datamanagement, it manages, stores and process the data. It records the data related to equipment, personnel, material. This data management provides the overall view of the current status of the mine. (MICROMINE , 2020)

**Reserve estimation:** The reserve calculation comprises of block model which is the foundation of almost all the design and planning decisions made during the mining process. Resource estimation relies on the development of detail resource model using data from different resources including data management . (MICROMINE , 2018)

- Mine Design
- Mine Planning and Scheduling

**Model of Mine Planning and design Software:** Flexibility is a routuine vague in all the advanced mine planning software packages. Regularly in any software there will be a core program that governs remaining modules and enables data exchange between the modules. The modularity function enables the user to import, validate and displays a wide variety of surface surface, drillhole and subsurface data (MICROMINE , 2017). Plenty modules are commonly available in hands, everything with specialized functionality. Such modules can include:

- 2D 3D mapping ,
- Contouring algorithms,
- Resource estimation
- Block modeling editor
- Reserving module
- Open pit design
- Underground design

**R.M. Perumalla and Amiya Singh**

**Graphical image:** The 3d graphical features governs every aspects of visualization and editing and analysis of data. Information from various sources such as packet databases, strings block models, etc. are visualized in 3D within the graphical environment. The 3D graphical mapping reveals the rock complexity of the mine. Graphical tools made it possible to document the geological phenomenon in digital form (Marcisz, 2018). In drill hole graphics interpretation uses a database data has a input source. Interactive graphic manipulation is performed by using the color graphics. Digitising with VULCAN tool is accomplished by using large format table digitiser (JOHNSON, 1987).

**File Structures and Data Exchange:** In the minerals industries, data comes from many different sources like such as drill data, assalyum data, survey data, field data or real time vehicle locations. So how the data will be shared or exchanged between two sever systems, even at offices and also two different software packages. In Open Mining format supports basic structures including points, lines, surfaces, meshes and volumes. Mining requires a huge spatial data and new technologies add to its complexity (GMG group, 2017).

**User Interface and Interactivity:** 3D user interface since long period have a provision of desktop computing, Virtual environment, augmented reality, large screen display. In latest advance mining Virtual Reality has become a boon to the mining industry. User interface must be adaptive and customizable. The graphical environments give the user the visual capabilities to work with the data. The integrated interactive mine software for planning and scheduling is important for stream data flow (Kim, 2019).

**Future Trends other than 3D technology:** Mining design software has to face severly competitive market place which stable drives the levels of improvement to new levels. 3D imaging technologies plays a great role and have transformed the exploration of bigger mines. The 3D laser scanning which helps to capture the spatial data using laser light which is a new technology.

**Industrial Internet of things IIOT** is a network of physical things adding sensors and interconnectivity to vehicles, machinery. This helps to advanced automation and operation of machines, ensure miner and equipment safety and visibility.

**Virtual simulation and Artificial Intelligence -AI** trying to reduces the time and cost requirement associated with physical testing by experimenting and analysing in a virtual setting. Mining companies aims how quickly and efficient can adjust parameters and re-simulate everyday mining processes with 3D modeling software (Mines and Technology London, 2019).

- Automated Machinery
- Robotics in Mining
- Driverless Vehicles in Mining

**Current Industry needs :** The 3D image approach for geological and mine exploaration is a good potential to estimate the reserves while designing the safe mining. Automated drilling helps in reducing the human intervention and safety . This manless operating drilling can be possible by the combination of control systems and Information Technology. This type of advancement technology helps in achieving mininmizing the casualties and fatal rates. It can smoothens the tasks and helps to reach the high levels of accuracy compare to human acitivities. The 3D printing is one area where still miming sector need to adapot at faster rate. 3D printing is process of making of physical objects from a digital model Mining (Bartels, 2016) . The table 6.1 shows about the data that how different softwares developed and popular in mining market and its rating from the reviews . The fig 6.1 depicts the different brand softwares developed for mine exploration and data interpretation.

**R.M. Perumalla and Amiya Singh**

## COCLUSIONS

The 3D modelling software provide the band pack with features like Data Visulisation, modelling, Database management, mine designing, mine planning and scheduling. The Software module for designing and planning enables to exchange the data between different collegues and departments.The 3D image approach is best approach and a good potential to estimate the reserves. There is a hunger need for the industry to optimise the production at minmal cost in exploration, this all can be possible by proper prediction, sharing of information among different personnels in optimal decision making. So Indian mining industry has to wake up at faster pace and has to adapot the change.

### ABSTRACT

In past two decades, the globe has faced many infectious disease outbreaks. 2019 Novel Corona-virus (2019-nCoV) or the severe acute respiratory syndrome Corona-virus 2 (SARS-CoV-2) emerged as a global risk and put the entire globe into unrest. Unavailability of specific drug against the virus is more imperative. This demanding situation requires development of biomolecules for competent treatment against the SARS-CoV-2. *In silico* Molecular Docking revealed that the phytochemical, Quercitin effectively binds to the active pocket of the SARS-CoV-2 main protease.

**Keywords:** 2019-nCoV, SARS-CoV-2, SARS-CoV-2 main protease, docking, phytochemicals, Quercitin.

## INTRODUCTION

The pandemic situation caused due to the 2019-nCoV represents a severe public health calamity across the globe [1,2]. SARS-CoV-2 belongs to the Beta corona-virus genus, closely related to the previously identified severe acute respiratory syndrome corona-virus (SARS-CoV) [3,4]. Public Health Emergency of International Concern (PHEIC) was declared by the World Health Organization (WHO) owing to its fast rate of transmission within the humans [1,5,6]. Crystal structure of the Post Fusion Core of 2019-nCoV S2 Subunit proves to be an exceptional ground for screening specific ligands [7]. SARS-CoV-2 main protease can be beleaguered for developing antibodies, diagnostics and vaccines [8,9,10]. The effectiveness of traditional medications on the restriction of COVID-19 growth does not have any scientific back up as of now, since the underlying molecular mechanisms are unclear. The phytochemicals are fundamentally bioactive compounds and has the potential to amend cellular physiology. Here, we report that quercitin, a phytochemical, mostly enriched in some selected plants binds into the active site of the SARS-CoV-2 main protease as revealed by the *in silico* molecular docking and thus further studies may reveal the effectiveness of Quercitin to be used as COVID-19 therapeutics.

## METHODS

**Viral Protein Structure and Phytochemical dataset collection:** The 3D structure of M<sup>PRO</sup> was accessed from Protein Data Bank accession 6LXT. The SDF accession corresponding to the Quercetin was obtained and consequently both the protein and the ligands were used for *in silico* analysis.

**Molecular docking:** For the *in silico* molecular docking, BIOVIA's Discovery Studio docking method [11] was used for molecular docking. The catalytic pocket of the Post Fusion Core of 2019-nCoV S2 Subunit was specified and targeted for binding of the ligand. -CDOCKER Energy and -CDOCKER Interaction Energy signify the affinity of the ligands with the protein receptors (Table 1). Basically, high positive values of the CDOCKER Energy, CDOCKER Interaction Energy and a diminutive difference between the -CDOCKER Energy and -CDOCKER Interaction Energy are considered to be the most favourable [12].

## RESULTS AND DISCUSSION

Through the process of molecular docking i.e. *in silico* molecular docking, some phytochemicals have shown their effectiveness against the particular disease. Through *in silico* molecular docking, Quercetin has remarkably shown the effectiveness against COVID-19 by binding to the active sites of Post Fusion Core of 2019-nCoV S2 Subunit. It was found that Quercetin, a common phytochemical, specifically binds to the active pocket of the Post Fusion Core of 2019-nCoV S2 Subunit, as apparent from higher -CDOCKER energy and -CDOCKER interaction energy.

## CONCLUSION AND FUTURE PERSPECTIVES

As the coronavirus outbreak became the nightmare for the whole human society and the devastation caused by it is unpredictable and beyond imagination, the world has not left with enough time to discover a new drug or vaccine for it due to the requirement of sufficient time. Due to its highly contagious nature, it is considered as global pandemic within no time by taking many lives of people. But future studies on Quercetin may become the building block for the medication and treatment against the SARS-CoV-2. The current *in silico* molecular docking based study reveals that Quercetin can target the reported Post Fusion Core of 2019-nCoV S2 Subunit. It would be extremely noteworthy being confirmed *in vivo*. It is crucial to develop diagnostic tools, potential therapeutics and antibodies selectively for the COVID-19 proteins. Phytochemicals like Quercetin is commercially available and thus may be effectively prescribed to circumvent the current global scenario. Essentially, this study makes an attempt to reveal simple phytochemicals like Quercetin which can be employed for designing novel therapeutics.

This demanding situation requires development of biomolecules for competent treatment against the SARS-CoV-2. *In silico* Molecular Docking revealed that the phytochemical, Benzyl Isothiocyanate effectively binds to the active pocket of the SARS-CoV-2 main protease.

**Keywords:** 2019-nCoV, SARS-CoV-2, SARS-CoV-2 main protease, docking, phytochemicals, Benzyl Isothiocyanate.

### INTRODUCTION

The pandemic situation caused due to the 2019-nCoV represents a severe public health calamity across the globe [1,2]. SARS-CoV-2 belongs to the Beta corona-virus genus, closely related to the previously identified severe acute respiratory syndrome corona-virus (SARS-CoV) [3,4]. Public Health Emergency of International Concern (PHEIC) was declared by the World Health Organization (WHO) owing to its fast rate of transmission within the humans [1,5,6]. Crystal structure of the Post Fusion Core of 2019-nCoV S2 Subunit proves to be an exceptional ground for screening specific ligands [7]. SARS-CoV-2 main protease can be beleaguered for developing antibodies, diagnostics and vaccines [8,9,10]. The effectiveness of traditional medications on the restriction of COVID-19 growth does not have any scientific back up as of now, since the underlying molecular mechanisms are unclear. The phytochemicals are fundamentally bioactive compounds and has the potential to amend cellular physiology. Here, we report that Benzyl Isothiocyanate, a phytochemical, mostly enriched in some selected plants binds into the active site of the SARS-CoV-2 main protease as revealed by the *in silico* molecular docking and thus further studies may reveal the effectiveness of Benzyl Isothiocyanate to be used as COVID-19 therapeutics.

## METHODS

**Viral Protein Structure and Phytochemical dataset collection:** The 3D structure of M<sup>PRO</sup> was accessed from Protein Data Bank accession 6LXT. The SDF accession corresponding to the Benzyl Isothiocyanate was obtained and consequently both the protein and the ligands were used for *in silico* analysis.

**Molecular docking:** For the *in silico* molecular docking, BIOVIA's Discovery Studio docking method [11] was used for molecular docking. The catalytic pocket of the Post Fusion Core of 2019-nCoV S2 Subunit was specified and targeted for binding of the ligand. -CDOCKER Energy and -CDOCKER Interaction Energy signify the affinity of the ligands with the protein receptors (Table 1). Basically, high positive values of the CDOCKER Energy, CDOCKER Interaction Energy and a diminutive difference between the -CDOCKER Energy and -CDOCKER Interaction Energy are considered to be the most favourable [12].

## RESULTS AND DISCUSSION

Through the process of molecular docking i.e. *in silico* molecular docking, some phytochemicals have shown their effectiveness against the particular disease. Through *in silico* molecular docking, Benzyl Isothiocyanate has remarkably shown the effectiveness against COVID-19 by binding to the active sites of Post Fusion Core of 2019-nCoV S2 Subunit. It was found that Benzyl Isothiocyanate, a common phytochemical, specifically binds to the active pocket of the Post Fusion Core of 2019-nCoV S2 Subunit, as apparent from higher -CDOCKER energy and -CDOCKER interaction energy.

## CONCLUSION AND FUTURE PERSPECTIVES

As the coronavirus outbreak became the nightmare for the whole human society and the devastation caused by it is unpredictable and beyond imagination, the world has not left with enough time to discover a new drug or vaccine for it due to the requirement of sufficient time. Due to its highly contagious nature, it is considered as global pandemic within no time by taking many lives of people. But future studies on Benzyl Isothiocyanate may become the building block for the medication and treatment against the SARS-CoV-2. The current *in silico* molecular docking based study reveals that Benzyl Isothiocyanate can target the reported Post Fusion Core of 2019-nCoV S2 Subunit. It would be extremely noteworthy being confirmed *in vivo*. It is crucial to develop diagnostic tools, potential therapeutics and antibodies selectively for the COVID-19 proteins. Phytochemicals like Benzyl Isothiocyanate is commercially available and thus may be effectively prescribed to circumvent the current global scenario. Essentially, this study makes an attempt to reveal simple phytochemicals like Benzyl Isothiocyanate which can be employed for designing novel therapeutics.

### ABSTRACT

In past two decades, the globe has faced many infectious disease outbreaks. 2019 Novel Corona-virus (2019-nCoV) or the severe acute respiratory syndrome Corona-virus 2 (SARS-CoV-2) emerged as a global risk and put the entire globe into unrest. Unavailability of specific drug against the virus is more imperative. This demanding situation requires development of biomolecules for competent treatment against the SARS-CoV-2. *In silico* Molecular Docking revealed that the phytochemical, Ferulic Acid effectively binds to the active pocket of the SARS-CoV-2 main protease.

**Keywords:** 2019-nCoV, SARS-CoV-2, SARS-CoV-2 main protease, docking, phytochemicals, Ferulic Acid.

## INTRODUCTION

The pandemic situation caused due to the 2019-nCoV represents a severe public health calamity across the globe [1,2]. SARS-CoV-2 belongs to the Beta corona-virus genus, closely related to the previously identified severe acute respiratory syndrome corona-virus (SARS-CoV) [3,4]. Public Health Emergency of International Concern (PHEIC) was declared by the World Health Organization (WHO) owing to its fast rate of transmission within the humans [1,5,6]. Crystal structure of the Post Fusion Core of 2019-nCoV S2 Subunit proves to be an exceptional ground for screening specific ligands [7]. SARS-CoV-2 main protease can be beleaguered for developing antibodies, diagnostics and vaccines [8,9,10]. The effectiveness of traditional medications on the restriction of COVID-19 growth does not have any scientific back up as of now, since the underlying molecular mechanisms are unclear. The phytochemicals are fundamentally bioactive compounds and has the potential to amend cellular physiology. Here, we report that Ferulic acid, a phytochemical, mostly enriched in some selected plants binds into the active site of the SARS-CoV-2 main protease as revealed by the *in silico* molecular docking and thus further studies may reveal the effectiveness of Ferulic Acid to be used as COVID-19 therapeutics.

## METHODS

**Viral Protein Structure and Phytochemical dataset collection:** The 3D structure of M<sup>pro</sup> was accessed from Protein Data Bank accession 6LXT. The SDF accession corresponding to the Ferulic Acid was obtained and consequently both the protein and the ligands were used for *in silico* analysis.

**Molecular docking:** For the *in silico* molecular docking, BIOVIA's Discovery Studio docking method [11] was used for molecular docking. The catalytic pocket of the Post Fusion Core of 2019-nCoV S2 Subunit was specified and targeted for binding of the ligand. -CDOCKER Energy and -CDOCKER Interaction Energy signify the affinity of the ligands with the protein receptors (Table 1). Basically, high positive values of the CDOCKER Energy, CDOCKER Interaction Energy and a diminutive difference between the -CDOCKER Energy and -CDOCKER Interaction Energy are considered to be the most favourable [12].

## RESULTS AND DISCUSSION

Through the process of molecular docking i.e. *in silico* molecular docking, some phytochemicals have shown their effectiveness against the particular disease. Through *in silico* molecular docking, Ferulic Acid has remarkably shown the effectiveness against COVID-19 by binding to the active sites of Post Fusion Core of 2019-nCoV S2 Subunit. It was found that Ferulic Acid, a common phytochemical, specifically binds to the active pocket of the Post Fusion Core of 2019-nCoV S2 Subunit, as apparent from higher -CDOCKER energy and -CDOCKER interaction energy.

## CONCLUSION AND FUTURE PERSPECTIVES

As the coronavirus outbreak became the nightmare for the whole human society and the devastation caused by it is unpredictable and beyond imagination, the world has not left with enough time to discover a new drug or vaccine for it due to the requirement of sufficient time. Due to its highly contagious nature, it is considered as global pandemic within no time by taking many lives of people. But future studies on Ferulic Acid may become the building block for the medication and treatment against the SARS-CoV-2. The current *in silico* molecular docking based study reveals that like Ferulic acid can target the reported Post Fusion Core of 2019-nCoV S2 Subunit. It would be extremely noteworthy being confirmed *in vivo*. It is crucial to develop diagnostic tools, potential therapeutics and antibodies selectively for the COVID-19 proteins. Phytochemicals like Ferulic Acid is commercially available and thus may be effectively prescribed to circumvent the current global scenario. ### ABSTRACT

In past two decades, the globe has faced many infectious disease outbreaks. 2019 Novel Corona-virus (2019-nCoV) or the severe acute respiratory syndrome Corona-virus 2 (SARS-CoV-2) emerged as a global risk and put the entire globe into unrest. Unavailability of specific drug against the virus is more imperative. This demanding situation requires development of biomolecules for competent treatment against the SARS-CoV-2. *In silico* Molecular Docking revealed that the phytochemical, Luteolin effectively binds to the active pocket of the SARS-CoV-2 main protease.

**Keywords:** 2019-nCoV, SARS-CoV-2, SARS-CoV-2 main protease, docking, phytochemicals, Luteolin.

### INTRODUCTION

The pandemic situation caused due to the 2019-nCoV represents a severe public health calamity across the globe [1,2]. SARS-CoV-2 belongs to the Beta corona-virus genus, closely related to the previously identified severe acute respiratory syndrome corona-virus (SARS-CoV) [3,4]. Public Health Emergency of International Concern (PHEIC) was declared by the World Health Organization (WHO) owing to its fast rate of transmission within the humans [1,5,6]. Crystal structure of the Post Fusion Core of 2019-nCoV S2 Subunit proves to be an exceptional ground for screening specific ligands [7]. SARS-CoV-2 main protease can be beleaguered for developing antibodies, diagnostics and vaccines [8,9,10]. The effectiveness of traditional medications on the restriction of COVID-19 growth does not have any scientific back up as of now, since the underlying molecular mechanisms are unclear. The phytochemicals are fundamentally bioactive compounds and has the potential to amend cellular physiology. Here, we report that Luteolin, a phytochemical, mostly enriched in some selected plants binds into the active site of the SARS-CoV-2 main protease as revealed by the *in silico* molecular docking and thus further studies may reveal the effectiveness of Luteolinto be used as COVID-19 therapeutics.

P.K. Prusty *et al.*

## METHODS

**Viral Protein Structure and Phytochemical dataset collection:** The 3D structure of M<sup>pro</sup> was accessed from Protein Data Bank accession 6LXT. The SDF accession corresponding to the Luteolin was obtained and consequently both the protein and the ligands were used for *in silico* analysis.

**Molecular docking:** For the *in silico* molecular docking, BIOVIA's Discovery Studio docking method [11] was used for molecular docking. The catalytic pocket of the Post Fusion Core of 2019-nCoV S2 Subunit was specified and targeted for binding of the ligand. -CDOCKER Energy and -CDOCKER Interaction Energy signify the affinity of the ligands with the protein receptors (Table 1). Basically, high positive values of the CDOCKER Energy, CDOCKER Interaction Energy and a diminutive difference between the -CDOCKER Energy and -CDOCKER Interaction Energy are considered to be the most favourable [12].

## RESULTS AND DISCUSSION

Through the process of molecular docking i.e. *in silico* molecular docking, some phytochemicals have shown their effectiveness against the particular disease. Through *in silico* molecular docking, Luteolin has remarkably shown the effectiveness against COVID-19 by binding to the active sites of Post Fusion Core of 2019-nCoV S2 Subunit. It was found that Luteolin, a common phytochemical, specifically binds to the active pocket of the Post Fusion Core of 2019-nCoV S2 Subunit, as apparent from higher -CDOCKER energy and -CDOCKER interaction energy.

## CONCLUSION AND FUTURE PERSPECTIVES

As the coronavirus outbreak became the nightmare for the whole human society and the devastation caused by it is unpredictable and beyond imagination, the world has not left with enough time to discover a new drug or vaccine for it due to the requirement of sufficient time. Due to its highly contagious nature, it is considered as global pandemic within no time by taking many lives of people. But future studies on Luteolin may become the building block for the medication and treatment against the SARS-CoV-2. The current *in silico* molecular docking based study reveals that like Luteolin can target the reported Post Fusion Core of 2019-nCoV S2 Subunit. It would be extremely noteworthy being confirmed *in vivo*. It is crucial to develop diagnostic tools, potential therapeutics and antibodies selectively for the COVID-19 proteins. Phytochemicals like Luteolin is commercially available and thus may be effectively prescribed to circumvent the current global scenario. Essentially, this study makes an attempt to reveal simple phytochemicals like Luteolin which can be employed for designing novel therapeutics.

**Keywords:** 2019-nCoV, SARS-CoV-2, SARS-CoV-2 main protease, docking, phytochemicals, Genistein.

### INTRODUCTION

The pandemic situation caused due to the 2019-nCoV represents a severe public health calamity across the globe [1,2]. SARS-CoV-2 belongs to the Beta corona-virus genus, closely related to the previously identified severe acute respiratory syndrome corona-virus (SARS-CoV) [3,4]. Public Health Emergency of International Concern (PHEIC) was declared by the World Health Organization (WHO) owing to its fast rate of transmission within the humans [1,5,6]. Crystal structure of the Post Fusion Core of 2019-nCoV S2 Subunit proves to be an exceptional ground for screening specific ligands [7]. SARS-CoV-2 main protease can be beleaguered for developing antibodies, diagnostics and vaccines [8,9,10]. The effectiveness of traditional medications on the restriction of COVID-19 growth does not have any scientific back up as of now, since the underlying molecular mechanisms are unclear. The phytochemicals are fundamentally bioactive compounds and has the potential to amend cellular physiology. Here, we report that Genistein, a phytochemical, mostly enriched in some selected plants binds into the active site of the SARS-CoV-2 main protease as revealed by the *in silico* molecular docking and thus further studies may reveal the effectiveness of Genistein to be used as COVID-19 therapeutics.

P.K. Prusty *et al.*

## METHODS

**Viral Protein Structure and Phytochemical dataset collection:** The 3D structure of M<sup>pro</sup> was accessed from Protein Data Bank accession 6LXT. The SDF accession corresponding to the Genistein was obtained and consequently both the protein and the ligands were used for *in silico* analysis.

**Molecular docking:** For the *in silico* molecular docking, BIOVIA's Discovery Studio docking method [11] was used for molecular docking. The catalytic pocket of the Post Fusion Core of 2019-nCoV S2 Subunit was specified and targeted for binding of the ligand. -CDOCKER Energy and -CDOCKER Interaction Energy signify the affinity of the ligands with the protein receptors (Table 1). Basically, high positive values of the CDOCKER Energy, CDOCKER Interaction Energy and a diminutive difference between the -CDOCKER Energy and -CDOCKER Interaction Energy are considered to be the most favourable [12].

## RESULTS AND DISCUSSION

Through the process of molecular docking i.e. *in silico* molecular docking, some phytochemicals have shown their effectiveness against the particular disease. Through *in silico* molecular docking, Genistein has remarkably shown the effectiveness against COVID-19 by binding to the active sites of Post Fusion Core of 2019-nCoV S2 Subunit. It was found that Genistein, a common phytochemical, specifically binds to the active pocket of the Post Fusion Core of 2019-nCoV S2 Subunit, as apparent from higher -CDOCKER energy and -CDOCKER interaction energy.

## CONCLUSION AND FUTURE PERSPECTIVES

As the coronavirus outbreak became the nightmare for the whole human society and the devastation caused by it is unpredictable and beyond imagination, the world has not left with enough time to discover a new drug or vaccine for it due to the requirement of sufficient time. Due to its highly contagious nature, it is considered as global pandemic within no time by taking many lives of people. But future studies on Genistein may become the building block for the medication and treatment against the SARS-CoV-2. The current *in silico* molecular docking based study reveals that like Genistein can target the reported Post Fusion Core of 2019-nCoV S2 Subunit. It would be extremely noteworthy being confirmed *in vivo*. It is crucial to develop diagnostic tools, potential therapeutics and antibodies selectively for the COVID-19 proteins. Phytochemicals like Genistein is commercially available and thus may be effectively prescribed to circumvent the current global scenario. Essentially, this study makes an attempt to reveal simple phytochemicals like Genistein which can be employed for designing novel therapeutics.

### ABSTRACT

In past two decades, the globe has faced many infectious disease outbreaks. 2019 Novel Corona-virus (2019-nCoV) or the severe acute respiratory syndrome Corona-virus 2 (SARS-CoV-2) emerged as a global risk and put the entire globe into unrest. Unavailability of specific drug against the virus is more imperative. This demanding situation requires development of biomolecules for competent treatment against the SARS-CoV-2. *In silico* Molecular Docking revealed that the phytochemical, Daidzein effectively binds to the active pocket of the SARS-CoV-2 main protease.

**Keywords:** 2019-nCoV, SARS-CoV-2, SARS-CoV-2 main protease, docking, phytochemicals, Daidzein.

### INTRODUCTION

The pandemic situation caused due to the 2019-nCoV represents a severe public health calamity across the globe [1,2]. SARS-CoV-2 belongs to the Beta corona-virus genus, closely related to the previously identified severe acute respiratory syndrome corona-virus (SARS-CoV) [3,4]. Public Health Emergency of International Concern (PHEIC) was declared by the World Health Organization (WHO) owing to its fast rate of transmission within the humans [1,5,6]. Crystal structure of the Post Fusion Core of 2019-nCoV S2 Subunit proves to be an exceptional ground for screening specific ligands [7]. SARS-CoV-2 main protease can be beleaguered for developing antibodies, diagnostics and vaccines [8,9,10]. The effectiveness of traditional medications on the restriction of COVID-19 growth does not have any scientific back up as of now, since the underlying molecular mechanisms are unclear. The phytochemicals are fundamentally bioactive compounds and has the potential to amend cellular physiology. Here, we report that Daidzein, a phytochemical, mostly enriched in some selected plants binds into the active site of the SARS-CoV-2 main protease as revealed by the *in silico* molecular docking and thus further studies may reveal the effectiveness of Daidzein to be used as COVID-19 therapeutics.

## METHODS

**Viral Protein Structure and Phytochemical dataset collection:** The 3D structure of M<sup>PRO</sup> was accessed from Protein Data Bank accession 6LXT. The SDF accession corresponding to the Daidzein was obtained and consequently both the protein and the ligands were used for *in silico* analysis.

**Molecular docking:** For the *in silico* molecular docking, BIOVIA's Discovery Studio docking method [11] was used for molecular docking. The catalytic pocket of the Post Fusion Core of 2019-nCoV S2 Subunit was specified and targeted for binding of the ligand. -CDOCKER Energy and -CDOCKER Interaction Energy signify the affinity of the ligands with the protein receptors (Table 1). Basically, high positive values of the CDOCKER Energy, CDOCKER Interaction Energy and a diminutive difference between the -CDOCKER Energy and -CDOCKER Interaction Energy are considered to be the most favourable [12].

## RESULTS AND DISCUSSION

Through the process of molecular docking i.e. *in silico* molecular docking, some phytochemicals have shown their effectiveness against the particular disease. Through *in silico* molecular docking, Daidzein has remarkably shown the effectiveness against COVID-19 by binding to the active sites of Post Fusion Core of 2019-nCoV S2 Subunit. It was found that Daidzein, a common phytochemical, specifically binds to the active pocket of the Post Fusion Core of 2019-nCoV S2 Subunit, as apparent from higher -CDOCKER energy and -CDOCKER interaction energy.

## CONCLUSION AND FUTURE PERSPECTIVES

As the coronavirus outbreak became the nightmare for the whole human society and the devastation caused by it is unpredictable and beyond imagination, the world has not left with enough time to discover a new drug or vaccine for it due to the requirement of sufficient time. Due to its highly contagious nature, it is considered as global pandemic within no time by taking many lives of people. ### ABSTRACT

In past two decades, the globe has faced many infectious disease outbreaks. 2019 Novel Corona-virus (2019-nCoV) or the severe acute respiratory syndrome Corona-virus 2 (SARS-CoV-2) emerged as a global risk and put the entire globe into unrest. Unavailability of specific drug against the virus is more imperative. This demanding situation requires development of biomolecules for competent treatment against the SARS-CoV-2. *In silico* Molecular Docking revealed that the phytochemical, Theobromine effectively binds to the active pocket of the SARS-CoV-2 main protease.

**Keywords:** 2019-nCoV, SARS-CoV-2, SARS-CoV-2 main protease, docking, phytochemicals, Theobromine.

### INTRODUCTION

The pandemic situation caused due to the 2019-nCoV represents a severe public health calamity across the globe [1,2]. SARS-CoV-2 belongs to the Beta corona-virus genus, closely related to the previously identified severe acute respiratory syndrome corona-virus (SARS-CoV) [3,4]. Public Health Emergency of International Concern (PHEIC) was declared by the World Health Organization (WHO) owing to its fast rate of transmission within the humans [1,5,6]. Crystal structure of the Post Fusion Core of 2019-nCoV S2 Subunit proves to be an exceptional ground for screening specific ligands [7]. SARS-CoV-2 main protease can be beleaguered for developing antibodies, diagnostics and vaccines [8,9,10]. The effectiveness of traditional medications on the restriction of COVID-19 growth does not have any scientific back up as of now, since the underlying molecular mechanisms are unclear. The phytochemicals are fundamentally bioactive compounds and has the potential to amend cellular physiology. Here, we report that Theobromine, a phytochemical, mostly enriched in some selected plants binds into the active site of the SARS-CoV-2 main protease as revealed by the *in silico* molecular docking and thus further studies may reveal the effectiveness of Theobromine to be used as COVID-19 therapeutics.

P.K. Prusty *et al.*

## METHODS

**Viral Protein Structure and Phytochemical dataset collection:** The 3D structure of M<sup>PRO</sup> was accessed from Protein Data Bank accession 6LXT. The SDF accession corresponding to the Theobromine was obtained and consequently both the protein and the ligands were used for *in silico* analysis.

**Molecular docking:** For the *in silico* molecular docking, BIOVIA's Discovery Studio docking method [11] was used for molecular docking. The catalytic pocket of the Post Fusion Core of 2019-nCoV S2 Subunit was specified and targeted for binding of the ligand. -CDOCKER Energy and -CDOCKER Interaction Energy signify the affinity of the ligands with the protein receptors (Table 1). Basically, high positive values of the CDOCKER Energy, CDOCKER Interaction Energy and a diminutive difference between the -CDOCKER Energy and -CDOCKER Interaction Energy are considered to be the most favourable [12].

## RESULTS AND DISCUSSION

Through the process of molecular docking i.e. *in silico* molecular docking, some phytochemicals have shown their effectiveness against the particular disease. Through *in silico* molecular docking, Theobromine has remarkably shown the effectiveness against COVID-19 by binding to the active sites of Post Fusion Core of 2019-nCoV S2 Subunit. It was found that Theobromine, a common phytochemical, specifically binds to the active pocket of the Post Fusion Core of 2019-nCoV S2 Subunit, as apparent from higher -CDOCKER energy and -CDOCKER interaction energy.

## CONCLUSION AND FUTURE PERSPECTIVES

As the coronavirus outbreak became the nightmare for the whole human society and the devastation caused by it is unpredictable and beyond imagination, the world has not left with enough time to discover a new drug or vaccine for it due to the requirement of sufficient time. Due to its highly contagious nature, it is considered as global pandemic within no time by taking many lives of people. But future studies on Theobromine may become the building block for the medication and treatment against the SARS-CoV-2. The current *in silico* molecular docking based study reveals that like Theobromine can target the reported Post Fusion Core of 2019-nCoV S2 Subunit. It would be extremely noteworthy being confirmed *in vivo*. It is crucial to develop diagnostic tools, potential therapeutics and antibodies selectively for the COVID-19 proteins. Phytochemicals like Theobromine is commercially available and thus may be effectively prescribed to circumvent the current global scenario. Essentially, this study makes an attempt to reveal simple phytochemicals like Theobromine which can be employed for designing novel therapeutics.

### Author contribution statement

**Keywords:** 2019-nCoV, SARS-CoV-2, SARS-CoV-2 main protease, docking, phytochemicals, Trans-resveratrol.

### INTRODUCTION

The pandemic situation caused due to the 2019-nCoV represents a severe public health calamity across the globe [1,2]. SARS-CoV-2 belongs to the Beta corona-virus genus, closely related to the previously identified severe acute respiratory syndrome corona-virus (SARS-CoV) [3,4]. Public Health Emergency of International Concern (PHEIC) was declared by the World Health Organization (WHO) owing to its fast rate of transmission within the humans [1,5,6]. Crystal structure of the Post Fusion Core of 2019-nCoV S2 Subunit proves to be an exceptional ground for screening specific ligands [7]. SARS-CoV-2 main protease can be beleaguered for developing antibodies, diagnostics and vaccines [8,9,10]. The effectiveness of traditional medications on the restriction of COVID-19 growth does not have any scientific back up as of now, since the underlying molecular mechanisms are unclear. The phytochemicals are fundamentally bioactive compounds and has the potential to amend cellular physiology. Here, we report that Trans-resveratrol, a phytochemical, mostly enriched in some selected plants binds into the active site of the SARS-CoV-2 main protease as revealed by the *in silico* molecular docking and thus further studies may reveal the effectiveness of Trans-resveratrol to be used as COVID-19 therapeutics.

P.K. Prusty *et al.*

## METHODS

**Viral Protein Structure and Phytochemical dataset collection:** The 3D structure of M<sup>PRO</sup> was accessed from Protein Data Bank accession 6LXT. The SDF accession corresponding to the Trans-resveratrol was obtained and consequently both the protein and the ligands were used for *in silico* analysis.

**Molecular docking:** For the *in silico* molecular docking, BIOVIA's Discovery Studio docking method [11] was used for molecular docking. The catalytic pocket of the Post Fusion Core of 2019-nCoV S2 Subunit was specified and targeted for binding of the ligand. -CDOCKER Energy and -CDOCKER Interaction Energy signify the affinity of the ligands with the protein receptors (Table 1). Basically, high positive values of the CDOCKER Energy, CDOCKER Interaction Energy and a diminutive difference between the -CDOCKER Energy and -CDOCKER Interaction Energy are considered to be the most favourable [12].

## RESULTS AND DISCUSSION

Through the process of molecular docking i.e. *in silico* molecular docking, some phytochemicals have shown their effectiveness against the particular disease. Through *in silico* molecular docking, Trans-resveratrol has remarkably shown the effectiveness against COVID-19 by binding to the active sites of Post Fusion Core of 2019-nCoV S2 Subunit. It was found that Trans-resveratrol, a common phytochemical, specifically binds to the active pocket of the Post Fusion Core of 2019-nCoV S2 Subunit, as apparent from higher -CDOCKER energy and -CDOCKER interaction energy.

## CONCLUSION AND FUTURE PERSPECTIVES

As the coronavirus outbreak became the nightmare for the whole human society and the devastation caused by it is unpredictable and beyond imagination, the world has not left with enough time to discover a new drug or vaccine for it due to the requirement of sufficient time. Due to its highly contagious nature, it is considered as global pandemic within no time by taking many lives of people. But future studies on Trans-resveratrol may become the building block for the medication and treatment against the SARS-CoV-2. The current *in silico* molecular docking based study reveals that like Trans-resveratrol can target the reported Post Fusion Core of 2019-nCoV S2 Subunit. It would be extremely noteworthy being confirmed *in vivo*. It is crucial to develop diagnostic tools, potential therapeutics and antibodies selectively for the COVID-19 proteins. Phytochemicals like Trans-resveratrol is commercially available and thus may be effectively prescribed to circumvent the current global scenario. Essentially, this study makes an attempt to reveal simple phytochemicals like Trans-resveratrol which can be employed for designing novel therapeutics.

### ABSTRACT

In past two decades, the globe has faced many infectious disease outbreaks. 2019 Novel Corona-virus (2019-nCoV) or the severe acute respiratory syndrome Corona-virus 2 (SARS-CoV-2) emerged as a global risk and put the entire globe into unrest. Unavailability of specific drug against the virus is more imperative. This demanding situation requires development of biomolecules for competent treatment against the SARS-CoV-2. *In silico* Molecular Docking revealed that the phytochemical, Ellagic acid effectively binds to the active pocket of the SARS-CoV-2 main protease.

**Keywords:** 2019-nCoV, SARS-CoV-2, SARS-CoV-2 main protease, docking, phytochemicals, Ellagic acid.

### INTRODUCTION

The pandemic situation caused due to the 2019-nCoV represents a severe public health calamity across the globe [1,2]. SARS-CoV-2 belongs to the Beta corona-virus genus, closely related to the previously identified severe acute respiratory syndrome corona-virus (SARS-CoV) [3,4]. Public Health Emergency of International Concern (PHEIC) was declared by the World Health Organization (WHO) owing to its fast rate of transmission within the humans [1,5,6]. Crystal structure of the Post Fusion Core of 2019-nCoV S2 Subunit proves to be an exceptional ground for screening specific ligands [7]. SARS-CoV-2 main protease can be beleaguered for developing antibodies, diagnostics and vaccines [8,9,10]. The effectiveness of traditional medications on the restriction of COVID-19 growth does not have any scientific back up as of now, since the underlying molecular mechanisms are unclear. The phytochemicals are fundamentally bioactive compounds and has the potential to amend cellular physiology. Here, we report that Ellagic acid, a phytochemical, mostly enriched in some selected plants binds into the active site of the SARS-CoV-2 main protease as revealed by the *in silico* molecular docking and thus further studies may reveal the effectiveness of Ellagic acid to be used as COVID-19 therapeutics.

## METHODS

**Viral Protein Structure and Phytochemical dataset collection:** The 3D structure of M<sup>pro</sup> was accessed from Protein Data Bank accession 6LXT. The SDF accession corresponding to the Ellagic acid was obtained and consequently both the protein and the ligands were used for *in silico* analysis.

**Molecular docking:** For the *in silico* molecular docking, BIOVIA's Discovery Studio docking method [11] was used for molecular docking. The catalytic pocket of the Post Fusion Core of 2019-nCoV S2 Subunit was specified and targeted for binding of the ligand. -CDOCKER Energy and -CDOCKER Interaction Energy signify the affinity of the ligands with the protein receptors (Table 1). Basically, high positive values of the CDOCKER Energy, CDOCKER Interaction Energy and a diminutive difference between the -CDOCKER Energy and -CDOCKER Interaction Energy are considered to be the most favourable [12].

## RESULTS AND DISCUSSION

Through the process of molecular docking i.e. *in silico* molecular docking, some phytochemicals have shown their effectiveness against the particular disease. Through *in silico* molecular docking, Ellagic acid has remarkably shown the effectiveness against COVID-19 by binding to the active sites of Post Fusion Core of 2019-nCoV S2 Subunit. It was found that Ellagic acid, a common phytochemical, specifically binds to the active pocket of the Post Fusion Core of 2019-nCoV S2 Subunit, as apparent from higher -CDOCKER energy and -CDOCKER interaction energy.

## CONCLUSION AND FUTURE PERSPECTIVES

As the coronavirus outbreak became the nightmare for the whole human society and the devastation caused by it is unpredictable and beyond imagination, the world has not left with enough time to discover a new drug or vaccine for it due to the requirement of sufficient time. ### ABSTRACT

In past two decades, the globe has faced many infectious disease outbreaks. 2019 Novel Corona-virus (2019-nCoV) or the severe acute respiratory syndrome Corona-virus 2 (SARS-CoV-2) emerged as a global risk and put the entire globe into unrest. Unavailability of specific drug against the virus is more imperative. This demanding situation requires development of biomolecules for competent treatment against the SARS-CoV-2. *In silico* Molecular Docking revealed that the phytochemical, Isorhamnetin effectively binds to the active pocket of the SARS-CoV-2 main protease.

**Keywords:** 2019-nCoV, SARS-CoV-2, SARS-CoV-2 main protease, docking, phytochemicals, Isorhamnetin .

### INTRODUCTION

The pandemic situation caused due to the 2019-nCoV represents a severe public health calamity across the globe [1,2]. SARS-CoV-2 belongs to the Beta corona-virus genus, closely related to the previously identified severe acute respiratory syndrome corona-virus (SARS-CoV) [3,4]. Public Health Emergency of International Concern (PHEIC) was declared by the World Health Organization (WHO) owing to its fast rate of transmission within the humans [1,5,6]. Crystal structure of the Post Fusion Core of 2019-nCoV S2 Subunit proves to be an exceptional ground for screening specific ligands [7]. SARS-CoV-2 main protease can be beleaguered for developing antibodies, diagnostics and vaccines [8,9,10]. The effectiveness of traditional medications on the restriction of COVID-19 growth does not have any scientific back up as of now, since the underlying molecular mechanisms are unclear. The phytochemicals are fundamentally bioactive compounds and has the potential to amend cellular physiology. Here, we report that Isorhamnetin, a phytochemical, mostly enriched in some selected plants binds into the active site of the SARS-CoV-2 main protease as revealed by the *in silico* molecular docking and thus further studies may reveal the effectiveness of Isorhamnetin to be used as COVID-19 therapeutics.

P.K. Prusty *et al.*

## METHODS

**Viral Protein Structure and Phytochemical dataset collection:** The 3D structure of M<sup>pro</sup> was accessed from Protein Data Bank accession 6LXT. The SDF accession corresponding to the Isorhamnetin was obtained and consequently both the protein and the ligands were used for *in silico* analysis.

**Molecular docking:** For the *in silico* molecular docking, BIOVIA's Discovery Studio docking method [11] was used for molecular docking. The catalytic pocket of the Post Fusion Core of 2019-nCoV S2 Subunit was specified and targeted for binding of the ligand. -CDOCKER Energy and -CDOCKER Interaction Energy signify the affinity of the ligands with the protein receptors (Table 1). Basically, high positive values of the CDOCKER Energy, CDOCKER Interaction Energy and a diminutive difference between the -CDOCKER Energy and -CDOCKER Interaction Energy are considered to be the most favourable [12].

## RESULTS AND DISCUSSION

Through the process of molecular docking i.e. *in silico* molecular docking, some phytochemicals have shown their effectiveness against the particular disease. Through *in silico* molecular docking, Isorhamnetin has remarkably shown the effectiveness against COVID-19 by binding to the active sites of Post Fusion Core of 2019-nCoV S2 Subunit. It was found that Isorhamnetin, a common phytochemical, specifically binds to the active pocket of the Post Fusion Core of 2019-nCoV S2 Subunit, as apparent from higher -CDOCKER energy and -CDOCKER interaction energy.

## CONCLUSION AND FUTURE PERSPECTIVES

As the coronavirus outbreak became the nightmare for the whole human society and the devastation caused by it is unpredictable and beyond imagination, the world has not left with enough time to discover a new drug or vaccine for it due to the requirement of sufficient time. Due to its highly contagious nature, it is considered as global pandemic within no time by taking many lives of people. But future studies on Isorhamnetin may become the building block for the medication and treatment against the SARS-CoV-2. The current *in silico* molecular docking based study reveals that like Isorhamnetin can target the reported Post Fusion Core of 2019-nCoV S2 Subunit. It would be extremely noteworthy being confirmed *in vivo*. It is crucial to develop diagnostic tools, potential therapeutics and antibodies selectively for the COVID-19 proteins. Phytochemicals like Isorhamnetin is commercially available and thus may be effectively prescribed to circumvent the current global scenario. Essentially, this study makes an attempt to reveal simple phytochemicals like Isorhamnetin which can be employed for designing novel therapeutics.

## INTRODUCTION

The pandemic situation caused due to the 2019-nCoV represents a severe public health calamity across the globe [1,2]. SARS-CoV-2 belongs to the Beta corona-virus genus, closely related to the previously identified severe acute respiratory syndrome corona-virus (SARS-CoV) [3,4]. Public Health Emergency of International Concern (PHEIC) was declared by the World Health Organization (WHO) owing to its fast rate of transmission within the humans [1,5,6]. Crystal structure of the Post Fusion Core of 2019-nCoV S2 Subunit proves to be an exceptional ground for screening specific ligands [7]. SARS-CoV-2 main protease can be beleaguered for developing antibodies, diagnostics and vaccines [8,9,10]. The effectiveness of traditional medications on the restriction of COVID-19 growth does not have any scientific back up as of now, since the underlying molecular mechanisms are unclear. The phytochemicals are fundamentally bioactive compounds and has the potential to amend cellular physiology. Here, we report that Epicatechin , a phytochemical, mostly enriched in some selected plants binds into the active site of the SARS-CoV-2 main protease as revealed by the *in silico* molecular docking and thus further studies may reveal the effectiveness of Epicatechin to be used as COVID-19 therapeutics.

P.K. Prusty et al.

## METHODS

**Viral Protein Structure and Phytochemical dataset collection:** The 3D structure of M<sup>PRO</sup> was accessed from Protein Data Bank accession 6LXT. The SDF accession corresponding to the Epicatechin was obtained and consequently both the protein and the ligands were used for *in silico* analysis.

**Molecular docking:** For the *in silico* molecular docking, BIOVIA's Discovery Studio docking method [11] was used for molecular docking. The catalytic pocket of the Post Fusion Core of 2019-nCoV S2 Subunit was specified and targeted for binding of the ligand. -CDOCKER Energy and -CDOCKER Interaction Energy signify the affinity of the ligands with the protein receptors (Table 1). Basically, high positive values of the CDOCKER Energy, CDOCKER Interaction Energy and a diminutive difference between the -CDOCKER Energy and -CDOCKER Interaction Energy are considered to be the most favourable [12].

## RESULTS AND DISCUSSION

Through the process of molecular docking i.e. *in silico* molecular docking, some phytochemicals have shown their effectiveness against the particular disease. Through *in silico* molecular docking, Epicatechin has remarkably shown the effectiveness against COVID-19 by binding to the active sites of Post Fusion Core of 2019-nCoV S2 Subunit. It was found that Epicatechin, a common phytochemical, specifically binds to the active pocket of the Post Fusion Core of 2019-nCoV S2 Subunit, as apparent from higher -CDOCKER energy and -CDOCKER interaction energy.

## CONCLUSION AND FUTURE PERSPECTIVES

As the coronavirus outbreak became the nightmare for the whole human society and the devastation caused by it is unpredictable and beyond imagination, the world has not left with enough time to discover a new drug or vaccine for it due to the requirement of sufficient time. Due to its highly contagious nature, it is considered as global pandemic within no time by taking many lives of people. But future studies on Epicatechin may become the building block for the medication and treatment against the SARS-CoV-2. The current *in silico* molecular docking based study reveals that like Epicatechin can target the reported Post Fusion Core of 2019-nCoV S2 Subunit. It would be extremely noteworthy being confirmed *in vivo*. It is crucial to develop diagnostic tools, potential therapeutics and antibodies selectively for the COVID-19 proteins. Phytochemicals like Epicatechin is commercially available and thus may be effectively prescribed to circumvent the current global scenario. Essentially, this study makes an attempt to reveal simple phytochemicals like Epicatechin which can be employed for designing novel therapeutics.

### ABSTRACT

In past two decades, the globe has faced many infectious disease outbreaks. 2019 Novel Corona-virus (2019-nCoV) or the severe acute respiratory syndrome Corona-virus 2 (SARS-CoV-2) emerged as a global risk and put the entire globe into unrest. Unavailability of specific drug against the virus is more imperative. This demanding situation requires development of biomolecules for competent treatment against the SARS-CoV-2. *In silico* Molecular Docking revealed that the phytochemical, Phenyl Isothiocyanate effectively binds to the active pocket of the SARS-CoV-2 main protease.

**Keywords:** 2019-nCoV, SARS-CoV-2, SARS-CoV-2 main protease, docking, phytochemicals, Phenyl Isothiocyanate.

### INTRODUCTION

The pandemic situation caused due to the 2019-nCoV represents a severe public health calamity across the globe [1,2]. SARS-CoV-2 belongs to the Beta corona-virus genus, closely related to the previously identified severe acute respiratory syndrome corona-virus (SARS-CoV) [3,4]. Public Health Emergency of International Concern (PHEIC) was declared by the World Health Organization (WHO) owing to its fast rate of transmission within the humans [1,5,6]. Crystal structure of the Post Fusion Core of 2019-nCoV S2 Subunit proves to be an exceptional ground for screening specific ligands [7]. SARS-CoV-2 main protease can be beleaguered for developing antibodies, diagnostics and vaccines [8,9,10]. The effectiveness of traditional medications on the restriction of COVID-19 growth does not have any scientific back up as of now, since the underlying molecular mechanisms are unclear. The phytochemicals are fundamentally bioactive compounds and has the potential to amend cellular physiology. Here, we report that Phenyl Isothiocyanate, a phytochemical, mostly enriched in some selected plants binds into the active site of the SARS-CoV-2 main protease as revealed by the *in silico* molecular docking and thus further studies may reveal the effectiveness of Phenyl Isothiocyanate to be used as COVID-19 therapeutics.

P.K. Prusty *et al.*

## METHODS

### ABSTRACT

In the presence of N<sub>2</sub>:H<sub>2</sub> gas mixtures of 80:20 and 20:80 ratios, plasma nitriding was performed on AISI 304 stainless steel samples at 500 °C under 4 mbar pressures for 24 h. X-ray diffractograms indicate that the untreated sample consists of a total of four phases of  $\alpha$ Fe (austenite) and one phase of  $\alpha$ Fe (ferrite), while the plasma nitrided samples consist of mixed phases of Fe<sub>3</sub>N + CrN, Fe<sub>3</sub>N + Fe<sub>4</sub>N and Fe<sub>4</sub>N. A Vickers micro hardness tester was used to evaluate the surface hardness as a function of indentation depth ( $\mu$ m). The treated samples were analysed by X-ray diffraction (XRD) to explore the changes induced in the crystallographic structure. The XRD pattern confirmed the formation of an expanded austenite phase ( $\gamma$ N) owing to incorporation of nitrogen as an interstitial solid solution in the iron lattice. For rising concentrations of N<sub>2</sub> the strength of those peaks is slowly increased. In the sample handled at 80N<sub>2</sub>:20H<sub>2</sub> a maximum hardness of 1020 Hv and a case depth of 105  $\mu$ m were achieved.

**Key words:** Plasma nitriding, Stainless steel, Hardness, and Case depth.

### INTRODUCTION

Stainless steel having more than twelve percent chromium content [1] is commonly used in the chemical and food processing industry because of its high corrosion resistance [2-4]. This is seldom used in tribological applications [3] and manufacturing parts for engineering equipments and machine because of poor wear resistance, surface hardness and low load bearing capacity [4-6]. There were several ways to increase the surface hardness, wear properties and fatigue properties of steels by using conventional process such as gas nitriding, and several new techniques including plasma nitriding, microwave plasma nitriding, radio-frequency plasma nitriding, and plasma immersion ion implantation [7, 8].

**Babuli Kumar Jena**

Plasma nitriding provides better results to provide the mechanical properties and properties of austenitic steel among all conventional processes [9, 10]. It has been reported that plasma nitriding performed at 450°C provides enhancement in mechanical properties without deteriorating the corrosion properties of the stainless steel. This is due to formation of precipitation free hardened layer usually known as S-phase or expanded austenite phase [9-14]. But whenever, plasma nitriding is carried out at above 450°C, it produces significant improvement in hardness and wear properties but poor corrosion resistance. The deterioration of corrosion properties is due to precipitation of Cr<sub>x</sub>N in the surface nitrided layer [15,16].

Nevertheless, in some applications materials should be of high hardness, wear as well as strong properties of corrosion resistance. Therefore the purpose of this research is to investigate the mechanical properties of AISI304 stainless steel plasma nitride in terms of improving surface hardness and other properties. The subsequent post sputtering was performed in an Ar: H<sub>2</sub> plasma atmosphere to achieve the good corrosion properties of the samples nitrided above 500°C without CrN precipitation. The phase analysis, surface micro-hardness, and nitrogen diffusion layer thickness/case depth of plasma nitrided samples were characterized by X-ray Diffractogram, Microhardness tester for Vickers, and optical microscope, respectively.

**Experimental Procedure**

For the present analysis, AISI 304 austenitic stainless steel was selected and has a chemical composition of 0.05C, 18.09Cr, 9.2Si, 2.0 Mn, 0.02S, 0.03P and rest Fe. The sample was in the form of circular disc having diameter 25 mm. The plasma nitriding was done in a stainless steel vacuum chamber built in a diameter of 500 mm and a height of 500 mm. All samples were first sputter cleaned using 80Ar:20H<sub>2</sub> gas mixture. The plasma was developed with a D.C. Pulsed power supply with 10 kHz repeat rate. After the sputter cleaning process had been completed, the plasma nitriding reactor added a mixture of nitrogen and hydrogen gas. For 24 hours plasma nitriding was conducted using gas mixtures of 80N<sub>2</sub>:20H<sub>2</sub> and 20N<sub>2</sub>:80H<sub>2</sub> at a pressure of 4 m bar at 500 ° C.

Microhardness tests were performed with a Leitz Vickers Hardness tester using a load of 100 gm on untreated and plasma nitrided surfaces of samples. Leitz has tested the case depth of the adjusted layer for an optical microscope with a magnification of 100 X. X-ray diffraction (XRD) was performed in two – degree grazing incidence diffraction mode using Seifert made XRD-3000 PTS diffractometer. At 40 kV and 30 mA, the Cu anode X-ray tube was worked to get Cu K $\alpha$  radiation ( $\lambda=1.5418 \text{ \AA}$ ). The patterns of diffraction were obtained in the 2 $\theta$  range of 40- 700 with step of 0.10 and counting time of 3s per step.

**Analysis of Results****Structural analysis**

X-ray diffraction patterns of untreated and plasma nitrided samples are displayed in Figure 1. It reveals that untreated sample consists of total four phases of  $\gamma$ Fe (austenite) and single phase of  $\alpha$ Fe (ferrite). The  $\alpha$ Fe phase is attributed due to stress assisted during polishing of the sample [15]. After plasma nitriding, the mixed phase of Fe<sub>3</sub>N + CrN, Fe<sub>3</sub>N + Fe<sub>4</sub>N and Fe<sub>4</sub>N phase with high intensity were detected. The intensity of  $\alpha$ Fe peaks are gradually increased compare to untreated samples after plasma nitriding with decreasing the N<sub>2</sub> concentration. The highest and lowest intensity of ferrite phase were detected in sample nitrided at 20N<sub>2</sub>:80H<sub>2</sub> and 80N<sub>2</sub>:20H<sub>2</sub> respectively because of Cr is a ferrite stabilizer element [16-18]. The highest and lowest intensity of mixed phase of CrN+Fe<sub>3</sub>N was detected in samples nitrided at 80N<sub>2</sub>:20H<sub>2</sub> and 20N<sub>2</sub>:80H<sub>2</sub> respectively. As the nitrogen percentage increases in gas compositions, the intensity of mixed phase of Fe<sub>3</sub>N and Fe<sub>4</sub>N increase after plasma nitriding. The high intensity mixed phase of Fe<sub>3</sub>N and Fe<sub>4</sub>N contributes due to the maximum diffusion of nitrogen inside the samples.

**Babuli Kumar Jena****Nitrogen diffusion depth/Case depth measurement**

The cross-section of the plasma nitrided samples was observed in optical microscope. The nitrogen diffusion depth/case depth with different gas compositions is quite visible as shown in Figure 2. Case depth measurements indicate that the nitrogen diffusion depth decreases with decreasing the N<sub>2</sub> concentration in plasma nitriding. The maximum case depth of 105 μm is observed in the sample, which is nitrided at 80N<sub>2</sub>:20H<sub>2</sub>. The lowest case depth of 85 μm is observed in sample treated at 20N<sub>2</sub>:80H<sub>2</sub>. The increase in percentage of hydrogen leads to decrease in the density of active nitrogen species and iron ions [17, 18]. But, higher nitrogen contents leads to increase nitrogen species as well as iron atoms. These reactive species reacts in plasma atmosphere to form iron nitride, thereafter it is probably more condense on the surface compared to less nitrogen in plasma atmosphere. Whenever, the hydrogen percentage increases in plasma it tends to increase sputtering rate due to increase in concentration of excited hydrogen species [18], which may lead to lower formation of iron nitride.

**Surface hardness Measurement**

Figure 3 shows the plasma nitrided AISI 304 stainless steel case depth vs hardness profile at a load of 100 gm in the presence of gas mixture 80N<sub>2</sub>:20H<sub>2</sub> and 20N<sub>2</sub>:80H<sub>2</sub>. The value of the hardness increases from about 325 Hv for untreated sample to a maximum value about 1030 Hv for sample nitrided at 80N<sub>2</sub>:20H<sub>2</sub> while the sample nitrided at 20N<sub>2</sub>:80H<sub>2</sub> improves the hardness about 975 Hv comparison to hardness of 525 Hv of untreated samples. The maximum hardness is observed in samples nitrided with more nitrogen concentration in plasma atmosphere. The more nitrogen concentration in plasma produces more nitrogen species near the samples surface with less sputtering rate, which results more nitrogen incorporation in metal matrix. Plasma nitriding at higher temperatures results in surface precipitation of CrN and association of compressive stress in the modified layer that contributes enhancement of hardness [15,19].

Phase analysis reveals that untreated sample consists of total four phases of γFe (austenite) and single phase of αFe (ferrite), while the plasma nitrided samples consist of mixed phase of Fe<sub>3</sub>N + CrN, Fe<sub>3</sub>N + Fe<sub>4</sub>N and Fe<sub>4</sub>N phase. The intensity of αFe peak gradually increased compare to untreated samples after plasma nitriding with decreasing the N<sub>2</sub> concentration. The highest and lowest intensity of mixed phase of CrN+Fe<sub>3</sub>N was detected in samples nitrided at 80N<sub>2</sub>:20H<sub>2</sub> and 20N<sub>2</sub>:80H<sub>2</sub>, respectively. As the nitrogen percentage increases in gas compositions, the strength of the Fe<sub>3</sub>N and Fe<sub>4</sub>N mixed phase increases after nitriding with plasma. The calculation of surface hardness and case depth also reveals behavior depends on gas compositions. The plasma nitrided at higher N<sub>2</sub> concentration produces a maximum hardness ~1030 Hv and case depth~105 μm.

### ABSTRACT

Plasma arc cutting (PAC) is a commonly used industrial method for cutting different types of metals under many conditions of operation. There has been enormous work in machining and technology growth in the last forty years. Compared with its main competitors, PAC is considered a challenging technology: oxyfuel and laser cutting, particularly for cutting mild steel in the thickness range of 5-40 mm. Plasma Arc Machining is one of the most important non-conventional machining processes. Its high precision, coating, machining capacity to produce any hard materials and intricate design enhances consumer demand. The purpose of the research is to maximize the Production of mild steel thin plates, both in terms of cut quality and consumables output, in order to achieve cut quality standards and rates of productivity that are normally achieved via laser cutting processes. By using Taguchi Method as the statistical tool to calculate the optimum level of the operation, the Gas provides, Cutting Speed and Arc Gap were considered as the important parameters. The performance parameters are kerf and roughness of the surface, both are undesirable and thus must be minimized. The Taguchi L9 orthogonal array is implemented with parameters of three stages. The Taguchi method has allowed a deeper understanding of the physical phenomena relating to the crucial aspects initially highlighted and the identification of effective optimum design solutions.

Key words: Surface Roughness (Ra), Kerf, Taguchi method, Process parameters

### INTRODUCTION

Plasma cutting technology is one in which argon, nitrogen and compressed air are used to create a plasma stream, and then nonferrous metal, stainless steel and black metal are cut by the high plasma arc temperature and the strong plasma stream mechanical erosion. Recently, it has been commonly used for blanking processes, rough machining and structural components processed in shipbuilding, computer manufacturing, etc. However, to accurately

25038

**Babuli Kumar Jena**

describe the cutting characteristics, it is difficult to establish a special mathematical model, because the power supply has nonlinearity and its cutting parameters have dynamic coupling and static superposition in the cutting. The plasma cutters replaced the typical cutting done by stitching, punching, drilling, machining and cutting. The plasma arc that is considered high temperature cuts at high speed with the aid of different metals. Using the support of plasma torch, plasma arc cutting is considered the tool used to cut aluminum or metals or even other materials. The process of plasma arc method, inert gas i.e. inert gas such as argon is blown through the nozzle with tremendous acceleration and at the same time an electric arc is made from the nozzle to cut surface using that argon which converts some part of the gas into plasma. At high temperature to melt the cut metal and fast movement of plasma helps the blowing metal away from cutting. Plasma is very useful breaking plasma arcs. Using DOE (Experiment Design) fractional factorial, the efficiency and feasibility plasma arc cutting usage needs approval.

**Principle of Plasma Arc Cutting**

This method uses a focused electric arc that melts the material through a plasma beam at high temperatures. Plasma cutting devices with currents from 20 to 1000 amperes to cut plates with inert gas, thicknesses from 5 to 160 mm. Plasma gasses consist of compressed air, nitrogen, oxygen or argon / hydrogen to cut

Additionally, the plasma is bound with a water cooled nozzle. With this energy density inside the plasma beam can be achieved up to  $2 \times 10^6$  W/ cm<sup>2</sup>. Due to the high temperature the plasma expands and flows to the work piece (anode) at supersonic velocity level. Inside the plasma arc temperatures of 30000°C may arise which realize very high cutting speeds on all electrically conductive materials in connection with the high kinetic energy of the plasma beam and depending on the material thickness. This low energy pilot arc prepares the way between plasma torch and job piece by ionization into pieces. When the pilot arc hits the piece of work (flying cutting, flying piercing) the main arc begins with an automatic power increase.

The power source required for the phase of the plasma arc will decay control and high voltage. Although the operating voltage to sustain the plasma is usually between 100 and 160 V, the open circuit voltage needed to initiate the arc can be up to 400 V DC. On initiation, the pilot arc is formed between the electrode and the nozzle within the torch body. In the so called 'transferred' arc mode the arc must be transferred to the work piece for cutting. The electrode has a negative polarity and the work piece has a positive polarity so that most (approximately two thirds) of the arc energy is used for cutting.

**Experimental Procedure**

This research is performed on KALI-100 Plasma Arc Cutter platform. Within these models, we can have three variables that are cutting speed, gas provides and arc gap. The output are Surface Rughness and Kerf that are to be minimized to optimize process parameter settings. The statistical instrument used in the i

**Specimens Preparation**

The actual work pieces of material from the suppliers were in standard size (200 mm x 100 mm x 3&6 mm). With the aid of Handsaw all this content was cut into 25 test samples (100 mm x 40 mm x 3&6 mm) as shown in fig.4 below. The next step is surface finishing with the help of Million Machine to get the test samples accurate. Table 1 below shows the chemical composition of the 1100 aluminum alloy.

**Experiments Conduct**

The tests are performed for PAC method and will proceed in similar setting environment until all conditions are repeated two times. The impact of design factors over the result can be judged and the values and the optimum condition can be predicted. As the optimum condition was gained the confirmation test for the

**Babuli Kumar Jena**

purpose of verification of the estimated values is conducted. The results obtained from experiments are then compared with the estimated values in order to achieve accuracy of the work done.

**Design Factors**

Design of Experiments technique has been utilized to obtain the best combination of design factors to achieve optimum performance measures. Plasma Arc Cutting involves several input parameters to be considered during machining process. In this thesis, the combination factors such as Gas Pressure [bar], Cutting Speed [mm/min] and Arc Gap [mm] are considered. These factors are the most important to have the best value for Kerf and Surface Roughness (Ra) when cutting material like Stainless Steel or Nickel Base Alloy etc.

**RESULTS AND DISCUSSION**

The experimental findings were obtained and analyzed from experiment design. The experiment was performed with L9 orthogonal arrays, based on the Taguchi standard protocol. The results from the experiments were described, characterized and analyzed using Mini Tab17 after the variance analysis. Unable to persuade, S/N was used as an analytical method to aid in simple factor response virtualization. Moreover, for the ANOVA analysis, for the determination of Kerf and Ra respectively, the smaller the better was considered. A tabular based on the variance analysis (ANOVA) generated by the experimental values selected an optimal condition through the contribution of parameters in both S/N and percent. The optimum individual level was defined using the optimum condition values, this defined level helps to define approximate values to compare with optimum produced value.

**CONCLUSIONS**

This project provided an implementation of the Taguchi process for optimizing Plasma ArcCutting Machine's machining parameters. The Taguchi method, as shown in this study, provides a systematic and efficient methodology for determining optimum parameters with far less work than most optimization techniques would require. The PAC parameters studied were the Cutting Speed, providing power, and using L9 Orthogonal Array, using the Arc Distance. The findings show that the arc distance and cutting speed are the most relevant parameters, accompanied by the gas that provides both surface roughness and kerf.

### ABSTRACT

Die-casting demands extensive empirical knowledge of the function and structure of the mould components. As a knowledge based system application it therefore has very good potential for success. Because each tool's design is some what different from each other, each mold or die is complex with its complicated shapes and there are several machining laws to remember, a great deal of experience is needed in the preparation of the machining operations. This paper describes a mould construction process based on sample descriptions which offers an intuitive framework for mould designers integrating methods which elements for the mould functionality.

**Keywords:** Die casting, knowledge-based system

## INTRODUCTION

Die casting is an integral part of the casting industry. Die casting is a versatile process for the production of engineered metal parts by forcing the molten metal into reusable steel mould under high pressure. Die casting utilizes two blocks of heat resistant metal mechanized to meet resistant metal mechanized to meet along the dividing line plane and having cavities machined precisely and smoothly into each one to form opposite shape halves as the shape to be around the edges of the mould. Such moulds can be designed to create complicated shapes with a high degree of precision and reproducibility. This method is particularly suited for high volume casting production with relatively uniform wall thickness and restricted under or complex internal coring. The Die casting processes can be classified as:

- Hot chamber process.
- Cold chamber process.
- Gooseneck type process.

Metal which are commonly cast in die casting process include Al, Zn, Pb, Mg, and alloys of Cu & Sn. In die casting, mould construction for product consistency and effective production is of vital importance. Such efforts should be aimed primarily at improving the entire design process in terms of the achievement of results and accelerating the start of production. It must have enough strength to lock and hold the dies under considerable pressure together, so

25045

**Babuli Kumar Jena**

that no leakage occurs at the parting line. Knowledge based mold design procedure which provides an interactive system for mold designers, including methods and mold features.

### Summary of Mould Designing

The basic components of typical die casting mould are as follows.

**Feeding Process:** If a constricted heat flow condition cannot be designed out of the die, the use of a die material with a high thermal conductivity such as molybdenum or tungsten alloy might reduce the calculated gradient. Conversely, if the problem is that of excessive divergence, a low thermal conductivity material such as titanium might be applicable.

**Cooling Process:** To extract heat from the molding, a network of cooling channel from which a coolant is pumped in must be supplied to the mould.

**Ejection System:** The injection method of the die casting machine of the present invention contains the first means of sensing pressure of the pressurized liquid at the injection piston end.

**Mould Construction:** The designer in this case utilizes the automated accelerated ejector pins to strip the casting from the ejector pins. Once free, the casting falls out of the die, usually into a tank of water. A conveyor at the bottom of the water tank delivers the castings out of the water and to a secondary operation, bin, tray or other desired location.

## KNOWLEDGE BASE APPROACH

Broadly speaking, a knowledgebased approach means developing a system, typically called a knowledge based process, solve critical problem-solving decisions in a given domain. A KBS, typically in the form of a smart computer program, uses knowledge and inference technique to solve problems that are complex enough to require considerable human skill to solve them. The facts are a body of evidence that is commonly shared, accessible to the public and usually agreed upon by experts in a sector. The good judgment principles that defined the good decision making experts at the field level.

**(G) Ejection System.**

**V. Design Details**

In feed system, following factors have been considered.

**1. Pouring Time**

For aluminum alloys, pouring time,

$$t = K \sqrt[3]{W}$$

Where W = mass of the casting, (kg.)

K = constant

For Aluminum K = 1.9

t = 6 sec

Generally for aluminum casting pouring time is 30 – 45 sec.

**2. Choke Area**

The choke area is calculated by using Bernoulli's theorem, and continuity equation as

$$A = W / (d * t * c * \sqrt{2gh})$$

Where

A= Chock area, mm<sup>2</sup>

W= casting mass, kg

d= mass density of the molten metal, Kg/ mm<sup>3</sup>

t= pouring time, sec

g=acceleration due to gravity

h= effective head or sprue height, mm

c= efficiency factor which is a factor of casting system whose value varies between 0.65 to 0.90 , For single runner, c=0.90

A = 4 mm<sup>2</sup> , there for d<sup>2</sup> = 2.25mm

**Babuli Kumar Jena**

### 3. Sprue design

Let, the subscripts 1 and 2 denotes the top and choke sections of the sprue respectively.

From continuity equation, we get

$$A^1 V^1 = A^2 V^2$$

$$\text{Or, } A^1 = [A^2 V^2] / V^1$$

Since the velocities are proportional to the square root of the potential head, therefore

$$A^1 = A^2 \left( \sqrt{h_2 / h_1} \right). \text{ There for } A^1 = 6\text{mm}^2 \text{ and } d^1 = 2.8\text{mm}$$

h = height from parting line.

### 4. Pouring basin

Experimentally, we have the following relationship

The entrance in to the sprue is a smooth radius of at least 25mm, pouring basin depth of 2.5 times the sprue- entrance diameter.

Depth = 7mm

### 5. Sprue-base well

Experimentally, sprue base area should be five times that of sprue choke area and the well depth should be approximately equal to that of the runner.

Sprue base well area = 20mm

And well depth 2.8mm

### 6. In-gate design

The in-gate design can be done by the following formulae,

Free height or head of the metal

$$h = 1.6 \sqrt[3]{(q^2 / gb^2) + (v^2 / 2g)}$$

Where, q = metal flow rate, mm<sup>3</sup> / sec.

b = gate width, mm

v = metal velocity in runner, mm/sec

g = acceleration due to gravity, mm/sec<sup>2</sup>.

Therefore, the height of the gate = (h-5) mm = 3mm, and width of the gate = 4 x depth of the gate = 8mm

### 7. Slag- traps system

1. Runner- extension

2. Whirl- gate

### 8. Riser design

For riser design, chaine's method is used

According to the chaine's

$$X = a / (Y - b) + c$$

Where, X = Freezing ratio

$$X = (SA)_{\text{casting}} / (v)_{\text{casting}}$$

$$(SA)_{\text{riser}} / (v)_{\text{riser}}$$

$$Y = \text{Riser volume} / \text{casting volume}$$

**Babuli Kumar Jena**

For Aluminum

$$a = 0.1, b = 0.06, c = 1.08$$

Thus, the ratio of the diameter to height for cylindrical riser is calculated from Chaine’s method generally,  $(h/d) = 2$ . Therefore,  $h$  and  $d$  can be calculated from the above.

**9. Air-venting system**

The molten metal is ejected in to the die must displace the gas initially within the die cavity or absorb it as compressed bubbles, for this purpose air venting is necessary otherwise back pressure will directly affects the fluid flow.

**CONCLUSIONS**

The selection of the actual solutions and their final creation into a finished design left to the mould designer so that complete mould design could also add its own intelligent and experience. In general, mold design requires complex and multi related design problems and thus lacks a full quantitative and structural approach. The current methodology involved breaking down the whole problem of design into a number of sub-problems (functional design, e.g. feed system, cooling system, etc.) and developing a knowledge base of solutions for the various sub-problems.

### ABSTRACT

Simulation was used as a way of modeling the performance of computer integrated fabrication systems. However, the simulation modeling process for the CIM system is rather complex and expensive. Where simulation is one aspect which should be completely combined with the other components to help real-time decisions. Simulation was also either to explain a fabrication system behavior or to compare multiple alternative configuration schemes. The simulation model built up to now has concentrated primarily on modeling particular device components. CIM programs and how to turn criteria into a working framework that has been widely used in many applications. Its suitability for CIM is currently being tested and there are also presented ways of deriving simulation models from on information repository and generating executable simulation programs.

**Keywords:** Simulation, Computer Integrated Manufacturing

### INTRODUCTION

In the past decade a great deal of attention has been centered on the advantages that computerization can offer to product design and manufacturing practices. It is apparent in technologies such as CAD, CAM, and FMS. However, it is accepted that greater gains could be achieved if functions like these could be merged into a single automated operating system called Computer – Integrated Manufacturing (CIM). The design of production systems is a complex process involving the integration of multiple systems designed by multiple designers to optimize their own sub-systems each. By coordinating work cells, robots, automatic storage and retrieval facilities (AS / AR), and material handling systems, CIM has the ability to largely or completely automate flexible production. This is a fundamentally different use of simulation from the conventional one, whose purpose is to plan. The aim of this paper is to present a general simulation library that is especially appropriate for CIM, in comparison to present simulation software that supports planning but is not well adapted as a feature in a CIM framework. Given these problems, we recommend that the design processes of the

25051

**Dillip Kumar Mohanta and Babuli Kumar Jena**

production processes become less serial and more concomitant, as with the component's concurrent design. CIM stands for a holistic and methodological approach to the activities of the manufacturing enterprise in order to achieve vast improvement in its performance. This methodological approach is applied to all activities from the design of the product to customer support in an integrated way, using various methods, means and techniques in order to achieve production improvement, cost reduction, fulfillment of scheduled delivery dates, quality improvement and total flexibility in the manufacturing system. CIM also encompasses the whole lot of enabling technologies including total quality management, business process reengineering, concurrent engineering, workflow automation, enterprise resource planning and flexible manufacturing.

**EVOLUTION OF COMPUTER INTEGRATED MANUFACTURING**

Computer Integrated Manufacturing (CIM) is considered a natural evolution of the technology of CAD/CAM which by itself evolved by the integration of CAD and CAM. Massachusetts Institute of Technology (MIT, USA) is credited with pioneering the development in both CAD and CAM. The need to meet the design and manufacturing requirements of aerospace industries after the Second World War necessitated the development these technologies. The manufacturing technology available during late 40's and early 50's could not meet the design and manufacturing challenges arising out of the need to develop sophisticated aircraft and satellite launch vehicles. This prompted the US Air Force to approach MIT to develop suitable control systems, drives and programming techniques for machine tools using electronic control. If we review the manufacturing scenario during 80's we will find that the manufacturing is characterized by a few islands of automation. In the case of design, the task is well automated. Thus the implementation of CIM required the development of whole lot of computer technologies related to hardware and software.

**MANUFACTURING ORGANIZATION SIMULATION AND EVALUATION SYSTEM**

The key to the successful "factory of the future" will be the effective coordination of managerial functions and production operations. The simulation model described in this paper addresses this "coordination" issue, especially in terms of managing the impact of interrelated alternatives and activities in an information-rich environment. An evolutionary simulation modeling program, MOSES (Manufacturing Organization Simulation & Evaluation System), has been developed for the purpose of describing, analyzing, and understanding manufacturing organizations. MOSES is evolutionary in several ways: (1) the user is able to build a meaningful manufacturing organization simulation model without writing any computer code; (2) the model spans the entire manufacturing organization, not just the production function; (3) the model includes optimization techniques and heuristics along with traditional logical modeling principles; (4) the model stores and manipulates data using database technology rather than more traditional file techniques; (5) the system includes the user as an integral part of the simulation process.

**CIM HARDWARE AND CIM SOFTWARE CIM**

Hardware comprises the following: i. Manufacturing equipment such as CNC machines or computerized work centers, robotic work cells, DNC/FMS systems, work handling and tool handling devices, storage devices, sensors, shop floor data collection devices, inspection machines etc. ii. Computers, controllers, CAD/CAM systems, workstations / terminals, data entry terminals, bar code readers, RFID tags, printers, plotters and other peripheral devices, modems, cables, connectors etc.,

**COMPUTER BASED SIMULATION**

Computer simulation has long been acknowledged as a powerful tool for studying the behaviour of mathematically intractable complex systems. The near term aim was to research the proposed computer communication structure of the network and to schterm aim was to research the proposed computer communication structure of the network and to schedule execution of the output flow. The simulation is to be real time system status information over the long term and act as a tool for sequencing and scheduling in real time decision making. Consequently,

**Dillip Kumar Mohanta and Babuli Kumar Jena**

the experimental paradigm followed a significantly different methodology than traditional implementations of manufacturing. In standard simulation models of production environments, the algorithm describes the problem from a conventional point of view, taking into account individual workpieces that travel between deeds. This type of structure also fits well with the long-term goal of eventually linking into real time status information, to be processed. The performance measurements used as an indicator for operations are part flow times and use of the equipment. Instead, the simulation logic should be regulated by the real device contact signals dictating robot movement start and end, equipment loading, and cart movement. So the simulation will always reflect the current status of the system. When a decision on the control of system production is needed, multiple simulation runs may be executed under different control decision options for a set period of time.

**CONCLUSIONS**

The use of simulation as a tool of analysis in a CIM environment requires specific consideration of the structure of the computer communication. When it comes to computers Communication controls and delays are accurately modelled, and the insight gained can significantly guide future changes or upgrades to the communication network. The use of simulation as a decisionmaking instrument for system control in real time is attractive. The simulation construction described in the illustrative example, using the signaltriggering concept, shows promise to be able to interface easily with the actual system status when that data becomes available eventually.

### ABSTRACT

This paper describes the implementation of a basic distributed system using the RMI object model in J2SE. A method implemented on a remote JVM is invoked by a JVM acting as a client .RMI implementation is a classic method of remote object access.

**Keywords:** RMI, Remote method invocation, RPC, Request-Response Protocol

## INTRODUCTION

Java RMI is a mechanism of APIs implemented to access objects remotely. Remote method invocation enables us to access objects running completely on a different address space, but can be called and implemented in our accessible JVM. Dynamic loading of classes is also possible in a foreign JVM over the TCP network. Basically RMI is an implementation of RPC model. As RMI is able to load new classes into memory on the go, by providing enough abstraction, developer does not need to worry about the updates of the classes running in the JVM. There are 2 types of class achievable in RMI:-

1. Remote class-This class has the ability to be called or invoked remotely.
2. Serializable class- This class is also known as serializable object, which can be accessed or directly copied from one machine to another through a TCP connection.

### A Basic Demonstration of RMI in J2SE

(i) Remote interface:-

```
import java.rmi.*;  
public interface Gcd extends Remote {  
    public int gcd(int x, int y) throws RemoteException;
```

}

(ii) Remote interface implemented:-

```
import java.rmi.*;
import java.rmi.server.*;
```

```
public class GcdImp extends UnicastRemoteObject implements Gcdcall{
```

```
GcdImp() throws RemoteException{
    super();
}
```

```
public int gcd(int x, int y){
    G1 ob = new G1(x, y);
    return ob.getVal();
}
```

}

(iii) Client implementation

```
import java.rmi.*;
```

```
public class Client{
```

```
public static void main(String args[]){
    try{
```

```
        Adder stub = (GcdImp) Naming.lookup("rmi://localhost:5000/serv");
        System.out.println(stub.gcd(60, 90));
```

```
    } catch (Exception e) { System.out.println(e); }
}
```

}

(iv) Server implemented

```
import java.rmi.*;
import java.rmi.registry.*;
```

```
public class Server{
```

```
public static void main(String args[]){
    try{
```

```
        GcdImp stub = new GcdImp();
        Naming.rebind("rmi://localhost:5000/serv", stub);
```

```
    } catch (Exception e) { System.out.println(e); }
}
```

}

## RESULTS

CLI arguments:-

```
$>rmicGcdImp
```

```
$>rmiregistry5000
```

Output: Fig.1

### Overview of Stub and Skeleton

Stub acts as a gateway, it is present on client side for the remote object identification all the requests from client side is from Stub. It unmarshalls everything. Skeleton acts from the server side, all the requests are handled by Skeleton. It marshalls(packs) everything.

## CONCLUSION

In this article we can use J2SE RMI object implementation to remotely update the classes on the server which are never encountered before, we can implemented synchronized and secure distributed web applications and systems using RMI.

### ABSTRACT

Today, smartphones are becoming an integral and essential part of our daily life. To overcome these limitations, mobile cloud computing is introduced which increases the capabilities of smartphones and resources of the cloud to provide better performance and experience to the user. The idea is to save resources in the smartphones by offloading the computationally intensive tasks to the remote servers. In this paper, the objective is to explore more specifically, we are analyzing different types of networking libraries and study their performance on various dynamic factors such as data size, request time and response time, communication media, hardware and software of the device. Here objective is to explore if an application uses the same networking library for all the devices and for all purposes or there is a need to make an adaptive decision based on the local constraints.

**Keywords:** Android, Mobile Cloud Computing (MCC), Network libraries, offloading performance

### INTRODUCTION

In the last decade, we have seen extraordinary and exponential growth in the popularity of smartphones and smart devices. With the modern technology increasing capability of the smart devices, consumers are becoming more demanding, and the developers are building more sophisticated applications with interesting features and complexity. In spite of significant progress, smartphones are unable to accommodate user/application demands, particularly for applications that require resource-intensive processing, memory, and power. To solve the above problem, the concept of *computation offloading* or simply *offloading* is introduced in mobile cloud computing (MCC). Offloading is an idea that has been around for a long time and evolved from various paradigms of distributed

**Soumyo Deepto Dash and Sashi Bhusan Maharana**

computing. The concept gained more attention with the popularity of smart mobile devices and the demand for incorporating more sophisticated applications on these well-connected devices.

**Synchronous or Asynchronous Offloading**

An offloading operation can either be executed synchronously or asynchronously dependent upon the requirements of an application. Synchronous execution means the execution in a series. For example, in a chess game, a player makes the next move when the opponent turn is over. Asynchronous execution means to split the problem into multiple tasks and process them independently, for example, the discussion forums where every user can post their views independent of any other user.

**Data Size**

Library performance also depends on the amount of data an application needs to offload. For some application, we need to transfer only a small amount of data such as program files for execution. On the other hand, some application may require transferring large files such as video or images for analysis. Hence, there is a need to decide which of the above libraries is best suited for transferring a particular data size.

**Network Medium**

The performance of the library also depends upon the communication media used for transferring the data, such as Wi-Fi or 4G.

**Hardware/Software**

The effect of hardware configuration and operating system of the mobile devices on these libraries.

**METHOD**

To analyze the performance of the networking libraries, we develop android applications for implementing these libraries. We consider a scenario, where a network library needs to offload data to the cloud, either in synchronous or asynchronous mode, via its underlay communication media. Evaluation is done on a test-bed, involving different file sizes, code execution, network medium and mobile devices of various configuration. For this evaluation, we spawn a virtual machine in Amazon Web Services (AWS) cloud to study and analyze the behaviors of these libraries in a real environment.

**Different network libraries that are commonly used for exchanging Data****HttpURLConnection**

*Http URL Connection* is an abstract class of JAVA extended from the *URLConnection* class. Developers popularly use it for exchanging data from the web servers. As the name suggests, it works on HTTP protocol and contains additional HTTP specific features. A single instance of *Http URL Connection* is used to make a single request from the HTTP server. *HttpURLConnection* can be used only for the synchronous networking calls; it does not support asynchronous calls.

To use the *HttpURLConnection* class for uploading data from a client or smart-device to the server is started by obtaining a new *HttpURLConnection* by calling *URL.openConnection()* and casting the result to *Http URL-Connection* and configure the connection for output using *set Do Output (true)*. If the size of the file or data is known in advance we can call *set Fixed Length Streaming Mode (int)* or *set Chunked Streaming Mode (int)* when it is not. Below we give the abstract code to perform an upload using *HttpURLCon-nection* class:

```
URL url=newURL(uploadServerUrl); HttpURLConnection urlConnection =
(HttpURLConnection) url.openConnection(); try{
urlConnection.setDoOutput(true); urlConnection.setChunkedStreamingMode(0);
OutputStream out =new BufferedOutputStream (urlConnection.getOutputStream());
writeStream(out);
```

### Soumyo Deepto Dash and Sashi Bhusan Maharana

```
InputStream in =newBufferedInputStream (urlConnection.getInputStream());
readStream(in);
}finally{ urlConnection.disconnect();
}
```

#### Ok Http

OkHttp networking library is an open source project which is introduced by Square . OkHttp is an efficient HTTP client which supports HTTP, HTTP 2.0 and SPDY protocols. OkHttp multiplex several HTTP requests over one socket connection. OkHttp is a powerful networking tool which does not require any REST library and its also support both syn-chronous and asynchronous networking calls. It also provides the caching mechanism to cache the response from the server to avoid repeated network request. Below we give an abstract code to perform a file upload synchronously and asynchronously. For synchronous network call, create a call object using client and use the execute method. The synchronous request should be executed on a background thread; otherwise, it gives network error. For asynchronous network call, execute method is replaced with the enqueue method. There is no need for background thread for making asynchronous network calls.

```
OkHttpClient client =newOkHttpClient();
RequestBody file_body = RequestBody.create
(MediaType.parse(content_type), file);
MultipartBody.Builder()
.setType(MultipartBody.FORM)
.addFormDataPart ("name", file_name, file_body)
.build();
Request request =newRequest.Builder()
.url(ServerUrl)
.post(request_body)
.build();

//ForSynchronousCalls Response response =
client.newCall(request).execute();
//ForAsynchronousCalls client.newCall(request).enqueue(new
Callback() { publicvoidonFailure(Call
call,IOException e) {
}
publicvoidonResponse(Call call,final
Response response)throwsIOException {
//dosomethingwihtheresult
}
}
```

#### Volley

Volley is a HTTP networking library introduced by Google in Google I/O 2013. Volley provides many powerful network- ing tools out of the box for the users. Some of the prominent features are multiple concurrent network request, automatic scheduling, and prioritization of the network request, cancel- lation of single or blocks of requests and provide effective memory response caching. Volley is easy to code, and it fetched data asynchronously from the network . Here is the abstract code of sending a file to the server using Volley.

```
RequestQueue queue =
Volley.newRequestQueue(this); String url ="http://www.serverip.com";
```

### Soumyo Deepto Dash and Sashi Bhusan Maharana

```
//Requestastringresponsefromthe providedURL.
```

```
MultiPartRequest request =new SimpleMultiPartRequest(Request.Method.GET, serverUrl,
newResponse.Listener<String>() { @Override
publicvoidonResponse(String response) {
}
},newResponse.ErrorListener() { @Override publicvoidonErrorResponse(VolleyError
error) {
}
});
//AddtherequesttotheRequestQueue request.addFile("name", file); queue.add(request);
```

### Retrofit

Retrofit is type-safe and one of the most popular HTTP client for Android by Square. It is very easy to use and convert the HTTP API into Java interface. It performs network function using REST based web services. Retrofit support both synchronous and asynchronous network request to the remote web server. It also provides a caching mechanism for repeated network request [31]. Retrofit converts HTTP API into Java interface which helps to treat your network calls as simple Java method calls. Below is the abstract code for uploading files to the server in both synchronous and asynchronous manner:

```
Call<LoginResponse> call = RetrofitClient
.getInstance()
.getApi()
.loginTeacher(teach_email,password);
call.enqueue(new Callback<LoginResponse>() {
@Override
public void onResponse(Call<LoginResponse> call, Response<LoginResponse> response) {
LoginResponse loginResponse = response.body();

if (!loginResponse.isError()){
progressBar.setVisibility(View.GONE);

Toast.makeText(TeacherLoginActivity.this,loginResponse.getTeacher().getTeach_name(),Toast.LENGTH_LO
NG).show();
SharedPreferences.getInstance(TeacherLoginActivity.this)
.saveTeacher(loginResponse.getTeacher());
Intent intent = new Intent(TeacherLoginActivity.this, TeachersMainActivity.class);
intent.setFlags(Intent.FLAG_ACTIVITY_NEW_TASK | Intent.FLAG_ACTIVITY_CLEAR_TASK);
startActivity(intent);
}else{
progressBar.setVisibility(View.GONE);
findViewById(R.id.forgot_pass).setClickable(true);
findViewById(R.id.signup).setClickable(true);
Toast.makeText(TeacherLoginActivity.this,"Invalid Credentials",Toast.LENGTH_LONG).show();
}
}
@Override
public void onFailure(Call<LoginResponse> call, Throwable t) {
Toast.makeText(TeacherLoginActivity.this,"Time out Retry again",Toast.LENGTH_LONG).show();
```

**Soumyo Deepto Dash and Sashi Bhusan Maharana**

```
findViewById(R.id.forgot_pass).setClickable(true);
findViewById(R.id.signup).setClickable(true);
progressBar.setVisibility(View.GONE);
}
});
}
```

The experiments were performed in different wireless networks, i.e. WiFi and 4G. Moreover, we analyze the effect of hardware and software of the smart devices on the performance of libraries as there is a huge difference in the hardware capabilities of different smart devices. The configurations of the smartphones used in our evaluation are in Table-3. We evaluate all libraries on both mobiles at the same time by executing the process of uploading and downloading on different threads simultaneously. The overall result is averaged.

**Performance Evaluation****Total Delay**

Total delay is the time required for uploading/downloading files to and from a mobile device to the AWS cloud. This includes the time required for reading the file from secondary storage to the internal buffer, transmission time and ACK time from the cloud. This parameter is very crucial for time-sensitive applications.

**Success rate**

The success rate is calculated as a ratio of the total successful acknowledgments received by the total number of files sent. This parameter shows the reliability of a library for an offloading application.

**Battery utilization**

One of the major goals of offloading is to save the energy of mobile devices by migrating heavy computation to the cloud. This parameter evaluates the battery consumption of networking libraries in different circumstances.

**CONCLUSION**

In this paper, a comprehensive analysis of HttpUrl, OkHttp, Retrofit and Volley networking libraries that are commonly used for offloading data from the mobile devices. The main objective of this work is to understand “how to offload” data in a real environment, to optimize the performance of an offloading model. In this paper, we investigate the performance of the libraries for parameters like code execution, data size, network medium, hardware and software of mobile devices. Our evaluation shows that, depending upon the nature of the application, available resources and offloading goals like execution speed, reducing energy consumption, reliability of data transmission, an adaptive network library selection framework can be developed for offloading computational tasks to the cloud. In the future, we intend to propose an offloading framework for adaptive network library selection depending upon the above criteria.

### ABSTRACT

According to recent scientific reports, many of the Gram-negative bacteria such as: *Salmonella typhimurium* and *Escherichia coli* are known for causing life-threatening diseases in human and many other animals. These bacteria have high tendency to survive in the host body rather quickly due to the presence of protective cell wall which defends from invasion of exogenous toxic agent. Therefore, finding potential inhibitors against these pathogenic bacteria is always fascinating to scientific community. Herein, we have covered the recent scientific development of potential inhibitors against the life-threatening pathogenic Gram-negative bacteria. This brief review on inhibitors against gram-negative bacteriamay open up a door way to design highly specific inhibitors with high efficacy against the pathogenic gram-negative bacteria.

**Keywords:** Gram-negative bacteria, *Salmonella typhimurium*, *Escherichia coli*, infected diseases, antibacterial activity, small organic molecule, pathogenic bacteria.

### INTRODUCTION

*Salmonella* is a major type of Gram-negative pathogenic bacteria can cause different infections in case of animals as well as humans [1,2]. *Salmonella* are looks like rod shaped and their size varying from 0.4  $\mu\text{m}$  to 3  $\mu\text{m}$  and this rod shape is because of the actin-like bacterial cytoskeleton [3,4]. *Salmonella* pathogens can cause a number of diseases in humans from minor gastroenteritis to very dangerous typhoid fever [5]. *Salmonellosis* is a major health problem of the world even now and have significant mortality and morbidity. Most of these species can infect a broad range of hosts as in case of *Salmonella enterica* Serovar *typhimurium* (*S. typhimurium*), but other serotype bacteria such as *S. Gallinarum*, *S. Typhi*, *D. Pullorum*, are exquisitely host-restricted in nature [6]. Infection in human being lead to acute gastroenteritis, nausea, diarrhea, abdominal pain and vomiting.

**Biswaranjan Dalai et al.**

The pathogen which causes diarrheal disease are *S. typhimurium*, and *S. enteric serovar Enteritidis (S. enteritidis)* and are main cause of acute gastroenteritis [7]. The *S. typhimurium* bacteria is primary enteric gastrointestinal pathogen and can cause many food-borne diseases [8]. The organic compounds such as quinolones and fluoroquinolones are used as antibacterial agents for the bacterial infections [9]. Quaternary ammonium compounds (QAC) were also used to inhibit and remove the bacteria like *S. typhimurium* from chicken skin [10]. To develop them inside the host, bacterial pathogens evolved in variety strategies such as invasion and multiplication, avoidance of human immune system or damage of the gastrointestinal system. For disease the pathogenic bacteria firstly subvert host factors to induce their uptake into nonphagocytic epithelial cells [11-13]. Bacteria pass through the highly acidic gastric fluids present in the stomach and the strongly alkaline secretions from bile duct in the upper small intestine of the host body.

The infection power of the pathogen affected by the gastrointestinal pH and sensitivity of the host with the body. The number of pathogens needed for infection is reduced by reducing the acidity of the stomach by adding antacid agents. Certain food materials or dairy products protects the pathogenic bacteria from being killed by the gastric fluids in the stomach. Bacteria having low infectious ability can easily transmitted by food materials. The bacteria having high infectious ability causes less diseases in the host, contaminated food processing, storage and handling conditions can increase the bacterial infections in the body.

*Salmonella* species are major cause of diarrhea. Several categories of diarrhea genic *Escherichia coli* such as enterotoxigenic *E. coli* (EPEC), enterohemorrhagic *E. coli* (EHEC) and entero aggregative *E. coli* (EAEC), enteropathogenic *E. coli* (EPEC), enteroinvasive *E. coli* (EIEC) are also causes infection in intestine in those geographic areas [14]. *Salmonella* species are recognized as major type of waterborne and foodborne pathogens and can cause significant range of illnesses. *Salmonella* is considered as the most important casual agents for food borne diseases almost everywhere and thousands off the food borne salmonellosis happens every year in the world. Herein, in the latter part of this review, we have briefly overviewed different strategic development of inhibitors against gram-negative bacteria. This overview on inhibitors against gram-negative bacteriamay be highly valuable for designing new potential inhibitors against gram-negative bacteria.

**Overview of antibacterial against gram-negative bacteria****Antibacterial activities of almond gum**

Francisco J. Barba and co-scientist evaluated the antibacterial activity of almond gum against ten different pathogenic bacteria (Figure 1). They have isolated the bioactive poly phenols along with different volatile compounds from almond gum such as: 9-octadecenoic acid, 3-eicosen, hexadecanoic acid, benzyl salicylate etc. These isolated compounds showed strong inhibition against pathogenic bacteria like *Enterobacter spp.*, *Salmonella typhimurium*, *Listeria monocytogenes*, *Micrococcus luteus* and *Bacillus subtilis* [15]. This can be also used as food additive because of their potential effect of controlling the growth of pathogenic bacteria.

**Antibacterial activities of quaternary ammonium compounds**

Philips J. Breen and co-workers studied the inhibition efficacy of different quaternary ammonium compounds (Figure 2) against pathogenic bacteria. The systematic analysis of inhibition properties against the bacteria, *S. typhimurium* clearly showed strong inhibition after staining with small quaternary ammonium compound (QAC) like cetylpyridinium chloride (CPC). The bacteria, *S. typhimurium* generally found in chicken skin. The experimental result clearly showed the inhibition of *S. typhimurium* bacterial growth into a chicken skin after treating with QAC compounds like CPC (0.1%) [16].

**Antibacterial activities of acid and formaldehyde**

Carrique-Mas and co-workers studied potential effect of organic acid or formaldehyde against the growth of *Salmonella* bacteria. They have evaluated the masking of these compounds into animal feed contaminated with

*Salmonella* bacteria. The experimental results showed that the formaldehyde-based compound have more efficacy and less masking ability than organic acid. Both the compounds clearly showed the increase in masking level with increase in *Salmonella* content in the feed. This may act as potential tool for evaluating the level of contamination in feed ingredient upon treatment with formaldehyde or organic acid [17].

#### **Antibacterial activities of organic acid with supercritical carbon dioxide**

Rhee and co-scientists studied the potential effect of organic acids such as: acetic acid and lactic acid in combination with supercritical carbon dioxide (SC-CO<sub>2</sub>) as well as individual effect towards the pathogenic bacteria like *Escherichia coli* present in the fresh pork. The results showed that combination of organic acids with supercritical carbon dioxide were found to be potentially more effective in preventing the growth of food borne pathogens than the treatments of SC-CO<sub>2</sub> and organic acid alone. And this may be useful in the meat industry to help increase microbial safety [18].

#### **Antibacterial activities of organic acid for storing beef**

Disckon and co-workers analyzed the action of organic acids such as lactic acid, acetic acid for avoiding contamination of *Salmonella typhimurium*, *Escherichia coli* during storage of beef. They concluded that the organic acid does not have any effect on sprayed and non-sprayed sample [19].

#### **Antibacterial activities of small organic compounds isolated from Streptomyces**

Ignacimuthu and co-scientists have established an isolation method for small organic compounds such as: Dibutyl phthalate, 8-Hydroxyquinoline and 2-amino-3-chlorobenzoic acid from *Streptomyces* using ethyl acetate as an extracting solvent. The compounds isolated from these methods were tested against different pathogenic bacteria such as: *Staphylococcus aureus*, *Bacillus subtilis*, and *Escherichia coli* by disc diffusion and bioautography methods (Figure 3). The result clearly showed strong anti-bacterial activity against these bacteria [20].

#### **Antibacterial activities of aromatic and heteroaromatic amines**

Herein the authors, Debnath and co-workers carried out a systematic structure-activity study (SAR) to understand the mutagenic activity of *Salmonella typhimurium* bacteria using wide collection of aromatic and heteroaromatic amines [21]. The mutagenic study of such bacteria against these compounds showed a linear relation with hydrophobicity, size of the aromatic ring, energy of the highest occupied molecular orbital, and the energy of the lowest unoccupied molecular orbital of the aromatic and heteroaromatic amines.

#### **Antibacterial activities of roasted coffee filtrate**

Maletta and co-workers studied the antibacterial activity against *Salmonella typhimurium* and *Salmonella enteritidis* in raw ground chicken breast meat using roasted coffee filtrate along with dicarbonyl compounds. The study showed a strong prevention of these bacterial growth in presence of roasted coffee filtrate with dicarbonyl compounds. However, only with roasted coffee extract prevention of these bacterial growth were found to be low [22].

#### **Antibacterial activities of carvacrol, citral and geraniol**

Kim and co-workers evaluated the antibacterial activity of carvacrol, citral and geraniol against *Salmonella typhimurium*. These compounds were found to have potential antibacterial activity against *Salmonella typhimurium*. The comparable inhibition of these strains of *Salmonella* and species of Gram-negative bacteria by carvacrol and geraniol support their application as potential antibacterial agents in food systems [23].

**Biswaranjan Dalai et al.****Antibacterial activities of a hydrolyzed Tenin extract of sweet chestnut wood**

Parys and co-workers analyzed the antibacterial inhibition characteristics of a hydrolyzed Tenin extract of sweet chestnut wood (Globatan) against *S. typhimurium* in both vitro and vivo in pig body. Concluded that, the Tenin extract showed greater inhibition properties in the bacteria in vitro as compared to the vivo [24].

**Antibacterial activities of natural occurring organic molecules with or without the nisin**

Olasupo and co-workers evaluated the antibacterial inhibition property of many natural occurring organic molecules with or without the nisin against *Salmonella typhimurium* and *Escherichia coli* pathogenic gram-negative bacteria [25]. Here, they have carried out the antibacterial study of natural organic compound in combination with nisin which resulted in decreasing the antibacterial activity against gram-negative bacteria.

**Antibacterial activities of combined effect of nisin and ethanol**

Phongphakdee and co-workers studied the combined effect of nisin and ethanol together against pathogenic Gram-negative bacteria. The result showed strong inhibitory activity of such combination against pathogenic bacteria and also analyzed the efficacy of this combination against food substances. And the result suggested that combined solution of nisin and ethanol may be a beneficial sanitizer for food industry to inhibit the growth of *E. coli* and *Salmonella* species (Figure 5) [26].

**Antibacterial activities of lactic acid**

Keersmaecker and co-workers found that lactic acid was main antimicrobial compound against *Salmonella* produced by *L.rhamnosus* GG. In this work they showed that the antibacterial nature of organisms can be mediated according to their effect on redox potential-regulated RpoS induction [27].

**Antibacterial activities of glycosides**

S. N. Devaraj and co-workers analyzed the protective and inhibition role of glycosides produced from *Hemidesmus indicus* against the pathogenesis of *Salmonella typhimurium* bacteria. Here, they suggested that glycosides could change the adherence pattern inside the bacterial species from diffuse to local. Glycosides showed a strong inhibition property against these type of Gram-negative pathogenic bacteria (Figure 6) [28].

**Antibacterial activities of glycosides**

Zhang and co-scientists tested the action of syringaldehyde for protection mice from *Salmonella enterica serovar typhimurium*. They found that the syringaldehyde showed a very strong and systematic protection of mice infected by *S. typhimurium* bacteria and also reduced the mortality about 40 % [29].

**CONCLUSION**

Gram-negative bacteria are responsible for causing many noxious diseases such as: neurological abnormalities, gastroenteritis, and life-threatening Typhoid fever in human being and many other animals. The toxicity nature of these bacteria is because of their high tendency to survive in the host body rather quickly due to the presence of protective cell wall which defends from invasion of exogenous toxic agent. Therefore, developing new organic small molecule with ideally disposed functional unit which can easily prevent the growth of bacteria is always demanding. Herein, we have briefly overviewed different strategic development of inhibitors against gram-negative bacteria. This overview on inhibitors against gram-negative bacteriamay be highly valuable for designing new potential inhibitors against gram-negative bacteria.

## ACKNOWLEDGEMENTS

### ABSTRACT

The method of modeling and simulating the machining process attracts researchers to better apprehend the mechanism of chip formation, localized heat generation, the friction properties of the device and the pair, and the accuracy of the machine surface. . Predictions of physical parameters such as temperature distribution and stress play an important role in predicting the technological performance of the processing process. The geometry of the edge of the device is particularly important because of its effect in obtaining the most desired life of the device and the integrity of the surface is very large. Therefore, it is necessary to develop accurate and robust continuous models to study the effect of geometry, tool edges, tool wear mechanisms and shear conditions on residual stresses and surface accuracy on machine planes. The present work aims to analyze the FEM modeling studies that have been conducted inearlier and to employFEM models for the most satisfactory simulation of shear processes and the most reasonable forecasts of shear forces. Temperature and residual stresses on the treated surface of Aluminum Components.

**Keywords:** FEM, Surface Integrity, Simulation, Heat Affected Zone, Residual Stress.

### INTRODUCTION

The engineering examination of mechanical systems is considered by obtaining differential equations related to variables through simple physical ethics such as equilibrium, energy conservation, mass conservation, thermodynamics, Maxwell's equations, and Newton's laws of motion. However, once established, solving the mathematical model obtained is impossible, especially when the obtained model is a non-linear partial differential equation. Only the simplest problems of correct geometry can be tracked, such as one rectangle with the modest boundary conditions.

**P. P. Debata and B. R. Pattanaik**

The finite element method (FEM) is the dominant modeling technique in structural mechanics. The basic idea in interpreting the physics of FM is the division of mathematical models into non-overlapping components of a simple geometry, called short or finite elements. The response of each element is expressed by the number of degrees of freedom defined as the value of the unknown function or function in the set of nodal points. The answer to the mathematical model is then considered to be similar to the discrete model obtained by the conjugation or aggregation of all elements. The concept of alienation occurs logically in the study of different artificial and natural systems. It is easy to imagine a machine, bridge, bridge, plane, or skeleton made of simple components. Analysis of finite elements in the software system requires the following information. Geographical (geometry) of nodal points, interconnected elements, mass properties, boundary conditions or constraints, details for loading or forcing analysis functions and options. Since the FEMM is a sampling method, the degrees of freedom of the FEM model are required.

Khan et al. Al. And Cunningham et al. Al. [1-2] uses the FE method to simulate drug product consolidation. In both studies, a modified Drucker-Prager model was used, and a non-linear elastic rule was proposed to cover the nonlinear behavior. They implemented their model using the ABAQUS software using a user subform and were able to generate accurate experimental observations. They used the FE and the non-linear model proposed to predict stress and density distributions during the compaction, contraction, and rejection Ma et al. Al. [3] use finite element methods to predict the density and stress distributions associated with both compact and instrumental materials. The formation of multifunctional components in the matrix usually results in an inhomogeneous density distribution.

Arbizu and Perez [4] used factorial designs with regression methods to develop multidimensional, first- and second-order models to predict surface roughness. Madi and Zhang [5] presented a finite element model with a predetermined fracture plane to predict shear and thrust forces in cutting bone composition. They also used the same model of materials and the results of their work agree well with the experimental values. However, the prediction of traction does not match the experimental trend. Jan et al. Al. [6] developed another model with finite elements to study the effects of fiber orientation, shear depth, and tool angle on shear and torque. And this study is only for the orientation of the fiber below 90 degrees. Umbrello et al. Al. [7] states that the application of finite element method (FEM) in metal cutting processes is of great benefit to researchers in the study of metal cutting and chip making. Numerical simulations are useful for studying various phenomena, such as chip distributions, shear forces, and shear velocities. Giles, Esq. Al. [8] states that the shear device operating on a specific digital model is highly dependent on the flow voltage of the working material, i.e. Modeling of stress, velocity and strain, friction and temperature between working material and cutting edge. Ozz et al. Al. [9] states that numerical models are suitable and can predict the effects of machine parameters such as cut, wear, damage, cutter and machine surfaces. Mackerle [10] states that wearing a sampling device using FEM has advantages over conventional statistical methods because it requires less effort and provides useful information such as strain, strain, strain, and temperature in chip formation. Kalhori [11] states that longer chip production causes more network changes, as shown at the end of the established chip. The largest deformities occurred on the primary deformation region followed by the secondary deformation region.

This is the reason for the added stress in this section. The major deformations during the shear process are concentrated in two regions near the edge of the cutter, and the largest deformations occur in the primary deformation region, followed by the secondary deformation region, the slip zone, and the attachment region. Choudhury and Bajpai[12] state that complex technological processes are better appreciated as new technologies with many features, sub-sets, and individual development needs adapted to modern production. This is one of the key destinations for the development of future production technologies. Turning and milling of complex machines has become one of the fastest developing methods for the production of complex machines with a wide range of machines and strong machine capabilities. A study from Stanlow [13] that the impact of grinding machine processing technology is not yet fully known in the manufacturing area, mainly because of the important technology of the implementation of complex laser machining machines, such as the processing of complex sewing machines, the

**P. P. Debata and B. R. Pattanaik**

technology for NS programming, post-processing and simulation technologies are still in the research stage. Zhang and Yang [14 - 15] stated that by studying the critical technology of the implementation of laser drilling techniques, the development and custom of the processors of the saw-mill processors were well aware of the authenticity of The CNC mill. Software for machining and simulation and optimization of machine performance fully integrates the machining of complex machining centers with tailors and improves performance levels. In the present work, the modeling of the FM and simulations of the orthogonal reduction of aluminum are investigated. The simulation model uses the advantages of simulating the plastic flow around the radial edge of the cutter and eliminates the need for chip separation criteria. The simulation results include the projected chip formation as well as temperature and voltage distributions. These results are crucial for residual stress prediction and other properties of the treated surface.

**FINITE ELEMENT MODELING & SIMULATION**

In the present work, the commercial software code “DEFORM 2D” is used to perform the MAS simulation of orthogonal shear, taking into account the geometry of the edges of the circular device, and all the above characteristics have been successfully applied in this model. The chip formulation is mimicked by the adapter network and the plastic flow of the working material. Therefore, there is no need for chip separation criteria.

The simulation model was developed, including the thermal and mechanical properties of the components, the boundary conditions, the interaction between the device and the component, as shown in Figure 1. For the plane of deformity in the vertebra. The shear process, a dynamic event, causes large distortions, with several steps leading to a great distortion of the network and the end of the simulation. It is very important to use the adapter grid with the optimized parameters to make the plastic stream across the perimeter of the device. Therefore, the frequency, frequency, and frequency of the adaptive mesh are adjusted to the optimum setting to maintain a successful network during shear. During steel shear, the flow voltage is highly dependent on the temperature field as conversed earlier. Therefore, the integrated thermal stress analysis is necessary for accurate prediction in FEM simulations. Figure 2 shows the refined two-dimensional mesh of the part of the thermocouple including the active junction. It establishes the location of the mesh with respect to the geometry. This mesh is acceptable since the elements are undistorted rectangular shaped. The machining of PM Aluminium cylindrical component was simulated at two different cutting speeds i.e. 4.24 mm/min and 18.37 mm/min.

**PARAMETRIC ANALYSIS**

Here, the various aspects are discussed at different steps of simulation. Figure 3 (a) and (b) shows the variation of stress with respect to time during two different cutting process. From the graph it is observed that, the stress value increases linearly with time at the beginning of machining, but at a particular time its value remains almost same with respect to time. This graph was generated by the simulation software at the end of machining process. Figure 4 (a) and (b) shows the variation of effective strain rate which is defined as a ratio between indentation velocity and structure width with respect to time during machining process. From the graph it is observed that, the effective strain value increases rapidly and falls to a constant value after which it remains linear with respect to time. This graph was generated by the simulation software at the end of machining process.

Figure 5 (a) and (b) shows the variation of effective strain with respect to time during machining process. From the graph it is observed that, the stress value increases linearly with time at the beginning of machining, but at a particular time its value remains almost same with respect to time which shows the deformation in material during machining. This graph was generated by the simulation software at the end of machining process. Figure 6 (a) and (b) shows the variation of heat flux which is defined as defined as the rate of heat flow over machining surface with respect to time during machining process. From the graph it is observed that, the heat flux value increases rapidly at the beginning of process and remains almost constant with a high value with respect to time. This graph was generated by the simulation software at the end of machining process.

P. P. Debata and B. R. Pattanaik

The dispersals of the anticipated von Mises stress dispersals are shown in Figure 7 (a) and (b). The figure also shows the distributions of stress on the machined surfaces. From the simulation outcomes, it was detected that there exists a region of very high distortion rate around the round edge of cutting tool. The curved edge of the cutting tool & the extremely deformed has a dominant influence on the residual stresses of the machined planes. The distributions of the anticipated von effective strains are given in figure 8 (a) and (b). The figure also shows the distributions of effective strain on the machined surface. From the results of simulation it was also observed that there exists a county of very high distortion rate around the curved edge of cutting tool. The curved edge of cutting tool and the highly distorted regions underneath has a dominant effect on the effective strain of the machined surface.

Figure 9 (a) and (b) shows the temperature predictions at increments of cutting length as maximum temperatures of 74.5 °C and 191°C respectively at two cutting speeds. It is also observed that, the temperature during machining is maximum at the place of tool specimen interface. For this study the maximum temperature observed was 74.5 °C and 191°C at simulation step no. 530. For this current study at given machining condition. Figure 10 (a) and (b) shows that maximum force developed at simulation step no 530 is 1.00N. It is also observed that, maximum force is developed at tool work piece interface and at the resisting surface. Figure 11 (a) and (b) shows the velocity flow of work piece material and chip as well during machining. It was observed at simulation step 530 that, velocity of work piece material is 71.7 mm/sec and is 307 mm/sec where as the velocity of chip at tool work piece interface is 23.9 mm/sec and is 102 mm/sec for this particular machining condition respectively for both the cutting speeds.

## CONCLUSIONS

The machining of Aluminium components was simulated on DEFORM 2D software for the observation of machining condition and investigation of the complex interaction of parameters stress, strain, temperature, heat flux. The major conclusions of the present work may be summarized as follows: FEM simulation of machining PM Aluminium components gives a better understanding of the complex interaction of the lot of process parameters, which otherwise is very time consuming and expensive to investigate experimentally. In the present study, the interaction of effective stress, effective strain, effective strain rate, heat flux etc with machining time has been investigated. Also, the distribution of effective stress, effective strain, temperature at shear zone, cutting force, material flow velocity etc at tool-chip workpiece interface has been critically investigated and presented. It was observed that, during machining, effective stress decreases as cutting speed increases. Also, temperature at tool-workpiece interface and velocity of material flow increases with increase in the cutting speed during machining. It has also been observed that, the chips produced during machining are deflected away from the tool surface as the cutting speed increases. Also, the distribution of material flow around the tool-workpiece interface is higher at the higher value of cutting speed.

### ABSTRACT

The present study describes the synthesis of ZnO and Ag:ZnO nanoparticles by sonication method. Ultrasonication method was found to be very useful for the synthesis of these nanomaterials. The phase characteristics of samples were characterized by X-ray diffraction (XRD) technique. The XRD analysis reveals that the obtained nanopowder is ZnO with hexagonal wurtzite crystalline structure which shows peaks between 20° and 80 ° regions and the crystallite size is 42 nm. The crystal lattice structure has been analyzed using the Material studio tool of Biovia software which gives information on the c-axis growth of hexagonal ZnO. Ag doping induces an increase in the crystallite size of ZnO which reaches to 62 nm after doping. Surface morphology of the samples was investigated by scanning electron microscopy. The study reveals the Ag doped nanoparticles have rough morphology. Antibacterial property of Ag:ZnO nanoparticles against different bacterial stains has also been studied. The study shows that both ZnO and Ag:ZnO show high inhibition activity towards gram positive and gram negative bacterial strain. But, Ag doping enhances the antibacterial property of ZnO.

### INTRODUCTION

Nanomaterials have shown mesmerizing commercial applications in different domains of science and technology [1, 2]. Metal oxide nanoparticles constituting inorganic metal ions, such as silver, copper and gold exhibit good microbe inhibition mechanism, optoelectronic technology, medical implants and ecological remediation [3]. The physical and chemical properties of these nanoparticles often change with their size and also find tremendous application in pharmaceutical and biological industry. So, effort is being devoted in selecting metals and metal oxide nanoparticles showing high impact on eliminating microorganisms such as bacteria present in food chain of the ecosystem.

**Prasanta Kumar Mahanta et al.**

Environmental remediation and water decontamination are also two major dimensions where these nanomaterials are exploited to obtain a sustainable habitat for humans [4]. Metal oxides like ZnO and TiO<sub>2</sub> have been most applicable in these fields with novelty in their properties like good photosensitivity, augmented efficiency, nontoxicity, lower cost, chemical/thermal stability and strong oxidizing power [5-7].

Zinc oxide (ZnO) is a good photocatalyst and has a stable nature with exposure to light. It has a larger band gap (3.37 eV), high excitonic binding energy (60 meV), significantly high biocompatibility and a relatively cheaper material which is utilized in a high scale in industry [8]. Investigations are going on to enhance different properties of ZnO by doping of impurities like Ag which can check the recombination process of electron-hole pair under irradiation of light which significantly uplift the antibacterial and photocatalytic activity of ZnO [8, 9]. Unorthodox physicochemical and geometrical properties are expected to be observed with Ag doping into ZnO which takes place due to events like the crystalline transformation, induction of oxygen vacancies and alterations in light scattering attributes after doping [10, 11]. Ag: ZnO has shown its effectiveness as antibacterial and antifungal agent against many bacteria such as *Staphylococcus epidermidis* which depends upon the size/shape and the Ag doping concentration [12, 13].

These nanoparticles kill the bacterial cell by disrupting the nucleic acids and protein linkages present in the cell of the microbe. Higher antimicrobial activity has been reported with increasing Ag doping provides the availability of silver ions followed by ZnO in generation of hydrogen peroxide [11-13]. So, an amplified inhibitory activity is achieved with Ag and ZnO working in synergistic manner which interferes with the enzymatic assemblage of respiratory chain and annihilating DNA formation. This leads to the development of economical and commercially ascendable antimicrobial product formulation using Ag doped ZnO nanoparticles [14]. A number of methods like sonochemical, hydrothermal, co-precipitation, sol-gel, oxidative reactions, thermo-evaporation and vapor deposition have been adopted for the synthesis of Ag:ZnO nanoparticles [8-14]. In the present study, we have utilized sonochemical method for this synthesis and subsequent study on the structural and antibacterial properties have been carried out.

### Experimental

Zinc acetate (Zn(CH<sub>3</sub>COO)<sub>2</sub>·2H<sub>2</sub>O) and silver nitrate (AgNO<sub>3</sub>) were the starting reagent and source of dopant respectively. Distilled water was used to dissolve these materials and a magnetic stirrer was deployed to stir the resulting solution continuously. A clear solution was obtained by adding liquid ammonia (25%) drop wise to the above solution. The above mixture was subjected to sonication for about 2 hour. The pH of the solution was measured before and after the process of precipitation and the experiment was carried out in the range of 8.5 to 10.5 pH. The precipitates were collected through decant process. These were washed with double distilled water three times and then using acetone. To dry these powders, an oven operated at ambient pressure was deployed to work at 100 °C for 7-8 hr inside. Following the above practice, we synthesized ZnO and Ag (4%) doped ZnO nanoparticles. The chemical reactions behind the synthesis have been given below.

The antimicrobial well diffusion procedure is used with Mueller Hinton Agar plates. The well diffusion method is performed using Mueller-Hinton Agar (MHA), which is the best medium for routine susceptibility tests because it has good reproducibility, gives satisfactory growth of most bacterial pathogens. In this well-known procedure, agar plates are inoculated with standardized inoculums of the test microorganism. Then, discs containing the test

Prasanta Kumar Mahanta et al.

compound at a desired concentration are placed on the agar surface. The Petri dishes were incubated under suitable conditions. Generally, antimicrobial agent diffuses into the agar and inhibits germination and growth of the three test microorganisms (i.e. *Enterococcus*, *Klebsiella pneumonia* and *Acinetobacter*) and then the diameters of inhibition growth zones were measured. Similarly the minimum inhibitory concentration (MIC) was measured which is the lowest concentration of a chemical, which prevents visible growth of a bacterium or bacteria. For this study Micro broth dilution method using 96-well micro titer plate along with Muller Hinton Broth (MHB) were used [15]. MIC was observed by taking minimum about of broth solution of 1mg/ml, 2mg/ml, 3mg/ml to have an antibacterial study and given in Table-II .

## RESULT AND DISCUSSION

The XRD patterns of ZnO and Ag:ZnO nanoparticles have been illustrated in Figure-1 (a) & (b) respectively. The diffraction peaks at  $2\theta=31.92^\circ$ ,  $34.59^\circ$ ,  $36.32^\circ$ ,  $47.62^\circ$ ,  $56.68^\circ$ ,  $62.95^\circ$ , are assigned to (100), (002), (101), (102), (110) and (103) planes respectively for ZnO for Fig. 1. In Fig. 1(b), along with the ZnO diffraction peaks, some peaks at  $2\theta=38.194^\circ$ ,  $44.36^\circ$  &  $64.47^\circ$  are assigned to (111), (200) and (220) planes of metallic Ag [16]. The wurtzite crystalline structure of ZnO is observed through the sharp XRD peaks observed in the patterns. The slight shifting of XRD peaks indicates doping [17]. Fig.2 is a proposed structure of hexagonal ZnO obtained from Biovia Material Studio tools. To estimate the crystallite size, Debye Scherer equation  $D = k\lambda/\beta\cos\theta$ , was used. Here, D is denoted as the crystallite size in nanometer,  $\lambda$  is the wavelength of the x-ray light used which is  $1.54056 \text{ \AA}$ ,  $k = 0.9$  (a constant),  $\beta$  is termed as FWHM and  $\theta$  is the peak position. The particle size was found to 43 and 62 nm for undoped and 4% Ag doped ZnO respectively.

Scanning electron microscopic tool has been deployed to study the morphological features and size ranges for Ag:ZnO nanoparticles. This has been depicted in Figure-3. It has been report that the inclusion and its concentration variation not only influence the shapes of nanoparticles but size reduction/increase is also observed. It can be noticed that rough surface morphology is exhibited by the Ag:ZnO nanoparticles. The SEM image also shows that synthesized Ag doped ZnO nanoparticles are in nano range and can be of potential interest for photocatalytic and biomedical applications. Generally, the antibacterial activity significantly affected by the particle size of nanoparticles as it is indirectly proportional to the particle size. The antibacterial activity of ZnO is due to the visible light irradiation and its exposure with the microbial cell wall leads to destruction of bacterial cell wall, thus release of antimicrobial  $\text{Zn}^{2+}$  ions, and formation of ROS [18, 19]. In fact, binding between the bacteria (with negative charge) and ZnO NPs is an outcome of the electromagnetic attraction between the above two [20]. Generally bacteria cell wall contain some protein and enzyme with some thiol groups along with lipid membrane .

When silver doped ZnO nanoparticles penetrate inside the bacterial cell the Phosphorous (P) and Sulphur (S) containing molecule or compounds become inactive .The generation of reactive species from the nanoparticles inhibit the growth of bacteria which observed from the zone of inhibition for all the prepared sample. In this study, three types of bacterial strain of gram positive and gram negative have been taken for the antibacterial activity. It has been shown in Fig.4 and the MIC and zone of inhibition for different bacteria with undoped and doped ZnO has tabulated in Table-1. The antibacterial activities of nanoparticles were tested against, gram positive bacterial strains *Enterococcus*, *Acinetobacter* a gram negative bacteria and *Klebsiella pneumonia* gram-negative bacteria. It has been found that the MIC values are below 1 mg for all the doped sample as compare to undoped where the MIC value were more than 2 mg.

The antimicrobial activity of Ag doped ZnO nanoparticles is observed to be the highest for *Enterococcus* as compare to other gram negative strain. *Enterococcus* is an optionally anaerobic gram-positive bacterium and most dominant species in endodontically treated teeth. *Enterococcus* has the ability to adhere to teeth and to form bio films under harsh environmental conditions. Similarly the undoped ZnO shows greater inhibition in *Enterococcus* than other

Prasanta Kumar Mahanta et al.

bacterial stain. So the prepared sample was found to be effective for gram positive bacteria then gram negative stain. Again in silver doping, silver play an immense role to maximize the bacterial inhibition when exposed to bacteria.

## CONCLUSION

Study on the synthesis and characterization of ZnO and Ag doped ZnO nanoparticles has been carried out. The nanoparticles have been synthesized by sonication method which has been found as a successful technique to produce nanomaterials. The XRD studies of the nanomaterials reveal that with Ag doping the crystallite size of ZnO increases to 62 nm from 42 nm. Further, the prepared nanoparticles are crystalline and having hexagonal wurtzite phase. FESEM studies show that the Ag doped ZnO nanoparticles have rough surface morphology and have an average size of 60-70 nm which matches well with the XRD data. Antibacterial study shows that the prepared sample is very effective towards inhibiting gram positive bacteria and gram negative bacterial stains. Silver doping enhances the antibacterial property of ZnO as silver play an immense role to maximize the bacterial inhibition when exposed to bacteria.

### ABSTRACT

The present study proposed the theoretical analysis of crystallographic structure and stability of the polar surfaces of wurtzite ZnO. Effort has been devoted in calculating the surface energy of ZnO (0001)-Zn and Zn (0001 □)-O surfaces which are treated to be polar in nature. Density-Functional Theory (DFT) method has been adopted to determine the band gap structure and predicts that the terminal ZnO (0001 □)-O position is more stable than the terminal ZnO(0001)-Zn position. The O<sup>-2</sup> surface is regarded to have high polarizability in comparison to Zn<sup>+2</sup> surfaces which is the reason behind the above observation. The crystal structure of the proposed surface has also been analyzed. The X-Ray analysis shows the crystallinity along [111] direction with lattice parameter well matched with experimental result. The density of states shows the surfaces of ZnO-O are better than that of the surface in bulk makes ZnO qualified in the field of catalysis

**Keywords:** Band structure, Density of State, XRD, Zinc oxide

### INTRODUCTION

Metal oxide semiconducting materials show very interesting properties. Many of these materials are n-type semiconductors and some show p-type conduction also. Metal oxide like ZnO shows both p-type and n-type conduction upon selective doping of impurities. ZnO is regarded as a functional material which exhibit exceptional quality and new properties in the field of material science. Structural, electrical, optical, magnetic and biological properties of ZnO are too much interesting to study as it finds many applications in different industry. So, new interest to study different properties of ZnO, especially its structure and morphology has been developed using different theoretical and experimental techniques. ZnO crystal shows hexagonal wurtzite structure. It crystal comprises of different polar and non polar surfaces but these polar surfaces have received more attention due to their higher activity. This type of activity of polar surfaces is basically shown in catalytic, photo-catalytic and gas sensing features than the non-polar ones. Zinc Oxide (ZnO) crystallizes in the hexagonal wurtzite structure P63mc. ZnO is a

25085

**Dojalisa Sahu**

group (II-VI) wide band gap semiconductor (3.37 eV) material with numerous application in the field of optoelectronic due to high chemical stability, high order transmittance and piezoelectric properties plane [1]. ZnO is nontoxic, cost effective, environmental friendly and biocompatible material, and can be used for biomedical application [2]. Several typical surface orientations have been shown by ZnO crystals. Some of the prime surfaces are the (0001) basal plane and (0001  $\bar{1}$ ), (1010  $\bar{1}$ ) and (1120  $\bar{1}$ ) (prism planes) and (1121  $\bar{1}$ ) (pyramidal plane) crystal faces. In theory, the (0001) planes are terminated by Zn atoms only, and the (0001  $\bar{1}$ ) planes are terminated by O. The energy between the surface with and without hydrogen passivation is estimated from the calculated surface energy. The surface energies of ZnO polar surfaces are essential to be calculated using theoretical techniques which will be more direct. There exist a difference in energy between the bulk and the surface around one unit area and this is defined as the surface energy theoretically. The surface energy can be calculated conveniently by the *ab initio* calculation method.

## METHODOLOGY AND COMPUTATIONAL DETAILS

The present calculations are based on DFT by using material studio, Biovia software. The band gap energy and density of state was determined from the CASTEP module of material studio tool. The diffraction pattern was obtained from the REFLEX module of material studio. A cutoff energy of 200 eV has been possessed by the calculate basis. The lattice parameters of bulk wurtzite ZnO structure are  $a=b=3.284 \text{ \AA}$ ,  $c=5.33 \text{ \AA}$  with lattice plane [101] which has been optimized. The value of these lattice parameters closely matches with the experimental values obtained as  $a=3.2496 \text{ \AA}$  and  $c=5.2042 \text{ \AA}$  [3]. The surface energy was calculated from the computational tool. The energy per unit area required to create a surface is termed as the surface energy ( $E_{\text{surf}}$ ) of a material [4].

## RESULTS AND DISCUSSION

### Unit cell structure

The unit cell structure ZnO has been depicted in Figure-1. This is a stable (B4) structure which constitutes of a hexagonal unit cell which is primitive in nature and having space group C46v P63mc. There are four atoms in one unit cell of ZnO which is regarded as primitive. Out of the four, two zinc atoms are placed at positions (1/3, 2/3, 0), (1/3, 2/3, 1/2). But, the oxygen atoms find themselves at (1/3, 2/3,  $\mu$ ), (1/3, 2/3,  $\mu+1/2$ ) positions. The lattice parameters of ZnO in bulk form are calculated and given as,  $a=3.281 \text{ \AA}$ ,  $c=5.321 \text{ \AA}$  and  $E_g=0.529 \text{ eV}$ . These values closely matches with the values obtained from the previous DFT calculation which are  $a=3.283 \text{ \AA}$ ,  $c=5.289 \text{ \AA}$  [5]. The lattice parameters such as;  $a$ ,  $c$ ,  $c/a$  and band gap ( $E_g$ ) have been summarized in Table-1. Our result obtained from the theoretical calculations using the Biovia software (Material Studio) is in good agreement with the values reported earlier [6-7]. These values are lower than the experimental values for band gap. Surface energy (J/m<sup>2</sup>) was found to be 2.83 and 3.21 for ZnO: Zn-polar (0001) and ZnO:O (0001) layers respectively for 4 layers. Fig.2 shows the XRD pattern of ZnO on [101] plane and predicts the crystalline structure of the proposed wurtzite ZnO by Biovia tools.

### Band structure and density of states

By using the calculated lattice parameters ( $a=3.284 \text{ \AA}$ ,  $c=5.33 \text{ \AA}$ ), the band structure of wurtzite ZnO is evaluated. The band structure has been illustrated in Figure-3. From the figure, it is clear that the valence band maximum and conduction band minimum lie on the same point which indicates the existence of direct band. The values of band gap obtained from this theoretical calculation with material studio are quite lower than the values obtained from experiment. This indicates that consistent results for band gap energy similar to other forms LDA may not be obtained using the above tool. The calculated value of band gap for wurtzite ZnO is about 70.00% less than the value obtained from experiment [8].

**Dojalisa Sahu**

The electronic structures of the ZnO-Zn and ZnO-O surfaces of the semiconductor material are usually influenced by surface termination. The surfaces which are regarded as polar in nature have different atomic compositions and different surface morphologies but have the same bulk structure. The electronic states arising out of the surfaces of a material are called as surface states. These are originated from the sharp transition from solid, semiconducting or crystalline material.

This transition ends with a surface and is found only at the atomic layers nearer to the surface. So the termination of a material near the surface leads to the alteration of the electronic band structure from the bulk material to the vacuum. In our study, the nature of surface states has been investigated by comparing the surface band structures with pseudo hydrogen saturation. So to study the exact surface state either the ZnO-Zn surface or ZnO-O surface is passivity at a time in order to have a exact positions of the ZnO-Zn and ZnO-O surface states. The position of ZnO-O and ZnO-Zn surface states are at the top of the valence band and the bottom of the conduction band respectively. The ZnO-Zn surface declines a lot as a whole relative to the Fermi level and the ZnO-Zn surface states become steeper.

It is also observed that the inclusion of Fermi level is deeper into the conduction band and the position of partial surface states is below the Fermi level. Therefore, n-type conduction is shown by the ZnO-Zn surface. The ZnO-O surface has characteristic which is completely different from the ZnO-Zn surface. It has a surface band gap about 0.6 eV, and the Fermi level transfers into the valence band. This leads to the p-type conduction behavior of ZnO-O. Fig. 5 shows the density of states of ZnO at one layer. At the bottom part of the figure, it has been shown that the highest density peak at Fermi level lies nearer 2.5 states/eV which is characterized by the presence of densities of our study compared to the solid state surface. In general, the case density of the three surfaces is more chemically active than the surface state in its solid state, in both the valence ring and the conduction ring, and that the increase in the value of the density relates to the number of layers formed for the surface, in other words, there is a positive relationship to the density of cases with the number of layers formed for the latter. The densest surfaces are the most stimulating surfaces.

## CONCLUSION

In the present study, study on the structural property of hexagonal wurtzite phased ZnO has been carried out. The band gap structure and density of state for ZnO at different planes have been estimated. Theoretical simulative methods have been adapted to calculate and determine different properties of ZnO surfaces. The energy  $e$  of Zn-polar (0001) surface is bigger than that of O-polar (0001  $\bar{1}$ ) indicating ZnO-O surface is more stable than the ZnO-Zn surface. ZnO in wurtzite phases is a direct band gap semiconductor. The three surfaces of ZnO-O are better than that of the surface in bulk which makes ZnO suitable in the field of catalysis.

### ABSTRACT

Titanium dioxide (TiO<sub>2</sub>) nanoparticles were synthesized via modified so-gel technique taking titanium isopropoxide as the precursor material. The nanopowder was characterized by using X-ray diffraction (XRD) and UV-VIS spectroscopy to structural and optical properties. The XRD diffraction study of the synthesized TiO<sub>2</sub> nanoparticles reveals the formation of rutile structure. Electronic band structure of TiO<sub>2</sub> was also been studied theoretically using simulation techniques by the help of *Material Studio* tool. The band structure and the density of states were studied and analyzed which corroborated the XRD data. The UV-VIS absorbance spectrum of TiO<sub>2</sub> shows the peak around 376 nm. The optical band gap of TiO<sub>2</sub> was obtained from the Tauc plot which was found to be 3.18 eV. TiO<sub>2</sub> nanoparticles exhibit enhanced UV absorbance leading to various optoelectronic applications.

**Keywords:** TiO<sub>2</sub>, Band Structure, X-Ray Diffraction, Density of state

### INTRODUCTION

Nanostructures of semiconducting materials are considered to have unique physical, chemical, optical, electronic and catalytic properties which significantly alter from the properties shown in bulk form. This is the reason why more and more research has been invested to study nano structured materials based wide band gap semiconductor. Metal oxides nanomaterials have displayed novel properties which find application in all branches of science such as physics, physics, chemistry, and materials science. These metal oxides possess unique characteristic attributes which make them a functional class of materials widely admired by material scientists and solid-state physicists [1]. Titanium oxide is a high band gap material having band gap  $E_g=3.2$  eV at 27 °C and also shows dielectric property. Out of the three structural phases, TiO<sub>2</sub> exists in rutile (tetragonal) phase generally. TiO<sub>2</sub> owes its application for its high oxidizing effect which makes it suitable for decomposition of organic and inorganic compounds. TiO<sub>2</sub> is also non-toxic and highly abundant and has a high chemical and optical stability [2, 3]. It is an n-type semiconductor

25089

which exists in both amorphous and crystalline phases. Also, known as Titania,  $\text{TiO}_2$ , consists of oxygen ( $\text{O}^{2-}$ ) and Titanium ( $\text{Ti}^{4+}$ ) ions arranged in a way that one  $\text{Ti}^{4+}$  ion is surrounded by six  $\text{O}^{2-}$  ions bonded to create a distorted structure with majority carriers being electrons. There are three  $\text{TiO}_2$  polymorphs, that is; rutile, brookite, and anatase. Rutile is the most stable and available polymorph [4]. Crystal structures of anatase and rutile phases have tetragonal structures although the octahedron in rutile is slightly distorted than that for anatase. Brookite shows an orthorhombic structure [5]. It is highly bright in powder form with a high refractive index. Usually, it is also the most preferred semiconductor for application in photocatalytic processes such as self-cleaning, air-purification and waste-water treatment since it is non-toxic, highly abundant and has a high thermal and chemical stability.

Anatase form exhibits a high photocatalytic activity. Structural and electronic properties of  $\text{TiO}_2$  have been rigorously studied basing on both experimental and theoretical calculations but these all are in debate till date. The main difference between the theoretical and experimental correlation is due to the difference arising in the value of the observed band gap. Since, the band gap of a nano semiconducting material has a significant role in explaining the optical and catalytic properties, it is necessary to calculate the band gap by theoretical method. The (110) and (100) surfaces of  $\text{TiO}_2$  have electronic structures which are similar to the bulk phase. This is the reason why the value of the band gap is close for (110) surface as compared to the bulk [5-7]. Therefore, a clear study on the electronic band structure of  $\text{TiO}_2$  is required based on both theoretical and experimental result to draw any conclusion. Our, present study is comprised of structural and optical investigations on  $\text{TiO}_2$  using experiment and theory.

## MATERIALS AND METHOD

### Synthesis of $\text{TiO}_2$ nanopowder

Sodium hydroxide was used as a precipitating agent and isopropyl alcohol was as a solvent for all the experiments. Titanium isopropoxide was taken as Titanium precursor while sodium hydroxide used for adjusting pH. 5g of titanium (IV) isopropoxide were dissolved in 50 ml of isopropyl alcohol and the mixture stirred for 1 h. Sodium hydroxide was then added drop wise to form a solution of pH ranging 2-3 and then further stirred for 1hr. 0.5 M nitric acid solution was added to the  $\text{Ti}(\text{OH})_4$  gel formed and stirred for 1 h after which the pH was adjusted to between 6 and 7. The sol was stirred for 5 h above 70 °C to form a  $\text{Ti}(\text{OH})_4$  slurry which was aged for 24 h. Subsequently, the slurry was filtered and washed with sufficient amounts of de-ionized water, dried at 100 °C for 24 h and calcined at 500 °C for 2 h.

### Experimental characterization method

All the analysis was carried out on the calcined samples of  $\text{TiO}_2$ . X-ray diffraction (Perkin Elmer) was used to investigate the structural orientation, crystallite size and phase analysis. UV-Vis spectroscopy was carried out to investigate the optical properties and record the absorbance spectra from 200 to 700 nm by a EI, UV-2600.

### Computational methods

For computational analysis of electronic band structure and density of states of  $\text{TiO}_2$ , the *Material Studio* of *Biovia* software was utilized. The CASTEP module with analysis part was used to predict the band structure of rutile phase. Density functional theory (DFT) within the local density approximation (LDA) was adopted to predict the band gap of rutile  $\text{TiO}_2$  which has been found to be 2.0 eV. This value is found to be 30 % lesser than the value (3.0 eV) obtained from experiment. Localized atomic orbital basis set embedded CASTEP module was utilized to perform these calculations. The cut off value and threshold energy set was at  $10^{-6}$  au and  $10^{-6}$  respectively. The lattice parameter was  $a=3.776 \text{ \AA}$  and  $c=9.486 \text{ \AA}$ ,  $\alpha=\beta=\gamma=90^\circ$ . In this crystal structure phase the orientation were along Z and B in YZ plane.

## RESULT DISCUSSION

### XRD analysis

X-ray diffraction (XRD) study of the synthesized TiO<sub>2</sub> nanopowders has been carried out and the pattern has been illustrated in Fig.1. Seven diffraction peaks are observed to appear at different 2θ values such as 27.29°, 36.69°, 39.29°, 41.15°, 44.11°, 54.239° and 56.01° which have been ascribed to (101), (004), (011), (111), (105), (211) and (220) crystal planes of TiO<sub>2</sub>. This has been matched with the standard pattern (JCPDS Card No.21-1272) of TiO<sub>2</sub> and indexed accordingly. So, XRD study confirms the formation of rutile TiO<sub>2</sub> nanoparticles. The dominant diffraction peak (101) was found in between the 2θ angle of 25 - 30°. There are no impurity peaks observed from the XRD pattern meaning that the synthesized samples are pure. The prepared nano TiO<sub>2</sub> is crystalline in nature and the crystallite size has been calculated by the Debye-scherrer equation as given below.

$$D = k\lambda / \beta \cos\theta$$

In the above equation, D, k, λ, β and θ are the crystallite size (nm), Scherrer constant =0.94, the wavelength of the incident CuKα radiation (1.54059 Å), the line broadening at half maximum (FWHM) and Bragg's diffraction angle respectively. The particle size and strain was found to be 22 nm and 0.00121 which are extracted from the y-intercept and slope respectively. The equation  $\epsilon = \beta / 4 \tan\theta$  was used for calculating the strain which arises after the synthesis of nanopowder where ε is the strain. This has been calculated from XRD data and shown in the Fig 2. The plot has been obtained by plotting 4sinθ on x-axis and βcosθ on the y-axis (in radians). A linear fit gives the y-intercept and slope of which the particle size and strain are estimated respectively. And it was found that the prepared titanium dioxide nanopowder have minimum strain as compared to other reported value.

### UV-visible spectral analysis

UV-Visible spectroscopy is an innovative tool to study the optical properties of nanoparticles and many parameters linked with the characteristic property of the concerned material can be found out from this. Accordingly, we recorded the optical absorption spectrum of TiO<sub>2</sub> which has been depicted in Fig.3a. The absorption band is found to appear at 376 nm for the TiO<sub>2</sub> nanoparticles. To calculate the band gap energy (E<sub>g</sub>), the Tauc plot for the synthesized nano TiO<sub>2</sub> was plotted. This has been illustrated in Fig.3b. To determine the optical band gap of semiconductors, the method of Tauc plot is adopted. The photon energy is plotted versus square root of the product of the absorption coefficient and photon energy. The section of straight line from the curve touching the x-axis gives the value of band gap. The value of band gap energy is found to be 3.18 eV from this spectrum which is the gap between the conduction band and valence band.

### Electronic band structure and density of state

The density of state and band structure has given in Fig. 4 having of rutile phase for δ = 13%. For the O2s states, the calculated bandwidth of 2.11 eV is consistent with the experimental value of 1.81 eV, having lattice parameter= 4.594 Å and c= 2.958 Å. For the upper valence band, the band width of 6.5 eV agrees with the range of 5-6 eV for reported data [8-10]. The conduction band can be divided into two sets which are mainly linked with t<sub>2g</sub> and e<sub>g</sub> symmetries and the energy difference between the average energies of two sets is roughly about 3.0 eV. The band gap energy was obtained 0.067Ha (2.33-3.0 eV experimental value) [11-13]. The crystal lattice structure has been depicted in Figure-5 below.

## CONCLUSION

Nanosized TiO<sub>2</sub> was successfully prepared by sol-gel method and characterized by XRD, UV-Visible spectral studies. The X-ray diffraction (XRD) analysis confirms the presence of rutile phased TiO<sub>2</sub> nanocrystallites. The calculated grain size of nano TiO<sub>2</sub> was ~22 nm and the preferred orientation plane was (101). The band gap energy (E<sub>g</sub>) value

**Manas Ranjan Sahoo and Dojalisa Sahu**

calculated from the UV-Visible spectral studies was 3.18 eV. The band structure and density of state was theoretically analyzed the value was found to be 30 % less as compare the experimental value reported.

### ABSTRACT

In this present study CASTEP module of Material Studio method was used the energy band structure of stannic oxide. The electronic band structures along with total energy of the build SnO<sub>2</sub> layer have been analysed using DFT within the local density approximation(LDA) method .It has been found that by manipulating the interatomic distances between Sn and O along with relative positions of atoms leads to change in band-gap energy of SnO<sub>2</sub> semiconductors

**Keywords:** Band Structure, DFT, Density of State, SnO<sub>2</sub>

## INTRODUCTION

Tin dioxide (SnO<sub>2</sub>) is considered as one of the most promising and used materials for the fabrication of solid state gas sensors, transparent conductors, and catalysts [1]. Tin dioxide (SnO<sub>2</sub>) as gained wide attention of researchers over the last decades due to its excellent optoelectronic properties, for potential applications in solar cells and flat panel displays[2-6]. SnO<sub>2</sub>(110) surface is one of the most studied surface in both theoretically and experimentally due all the defects and oxygen absorption site[7-8] .So the two surface (110) and (101) are of widely simulated for its application towards catalyst and other optical application [9-10]. Bulk and surface oxygen vacancies are extremely important for determining the electrical conductivity of tin dioxide [11] . Moreover, they are also responsible for a very efficient luminescence activity of SnO<sub>2</sub> nanobelts. The interstitial tin and oxygen vacancies can be known from first-principles calculations have a low formation energy [12-15]. Stannic oxide exhibits the rutile structure having space group P4<sub>2</sub>mm. SnO<sub>2</sub> crystal structure contain tetragonal unit cell , with a c/a ratio of 0.673, and having six atoms, two tin and four oxygen (Fig. 1).The prime objective of this work is to analyze the structural ,optical and electronic properties.

## COMPUTATIONAL METHOD

 Total number of symmetry-unique tetrahedra: 43

The optimized (a) unit cell and (b) 1 layer of SnO<sub>2</sub> in the rutile-type structure are displayed in Fig. 1.

## RESULTS AND DISCUSSION

The structures optimizations for SnO<sub>2</sub> layers have been done according to three different methods i.e. by fixing the lattice parameter a and a/c ratio one by one. Minimal energies are calculated for the equilibrium parameters for each cases where a, c and c/a parameter varied one by one. So the optimized parameters "a, c" and "c/a" of the layers are lower than those of SnO<sub>2</sub> bulk and increase by increasing the numbers of layers from second layer to multilayers of SnO<sub>2</sub> [14]. Electronic structure calculations of multilayer SnO<sub>2</sub> materials, based on the detail understanding of electronic properties of bulk SnO<sub>2</sub>. In this respect, the total density of state and partial density of state of the electronic level of SnO<sub>2</sub> have been calculated ( Fig. 3.) The electronic structure of the rutile SnO<sub>2</sub> with a band gap equal to 2.30eV calculated by the CASTEP-LDA method (Fig.3), which is smaller than the experimental value 3.40eV [16]. Due to the first principles calculations both the theoretical and experimental value was found to be different based on the density functional theory which may be due to the errors in the estimation of the band-gap from CASTEP Material studio. Again it was seen that the valence band of SnO<sub>2</sub> consists mainly of O-2p states with 5p states of Sn. This can be observed by decrease /increase of the band gap energy by CASTEP calculation. It follows

### Jyoti Prakash Bharati and Dojalisa Sahu

that the SnO<sub>2</sub> layer exhibit a semiconductor character like the bulk SnO<sub>2</sub> and contain a direct band gaps at the  $\Gamma$  point. In rutile SnO<sub>2</sub>, band gaps for layer structure are bigger as compare to bulk. Also it decreases with increasing the layer thickness. This should probably may due to the fact that with increasing of the layer thickness, the electrons in the layers are confined less. Consequently, the confinement effects in the layer become weaker with decrease in the bandgap. It was reported that the band structure of SnO<sub>2</sub> semiconductors could be modified by the inter atomic distances and relative positions of atom, and the epitaxial along "c-axis" is more efficient than the epitaxial along "a-" or "b-axis" for tuning the band gap of SnO<sub>2</sub>.

## CONCLUSION

Band gap engineering is an important tool for the design of new semiconductor materials and devices. In this study it has been seen that the bulk SnO<sub>2</sub> band gap was found to 0.634 which is lower than experimental value .The band structure and density of state

### ABSTRACT

Clove (*Syzygium aromaticum*) is one among the mostly used spices in India that generally used as food preservative and lots of medicinal purposes. This spice should deserve a special attention due to its antioxidant and antimicrobial activity as compared to other spices used in India. The objective of the study is to extract clove oil from clove powder by using ethanol and water as solvent and to see the efficient solvent that gives maximum effective result. The oil was extracted from 50gm of clove with 250ml. of above solvents at their boiling temperature in soxhlation. The amount of solvent present along with it was separated by rotary evaporator. The oil so obtained was characterized by UV-Visible, FT-IR analysis. Finally it was concluded that the clove oil produced by using ethanol as solvent is most effective and we use the clove powdered residue (waste powder produced after preparing clove oil) on soil to see their effect. As we can't use those clove residue efficiently at our daily life so we may throw it out. So in this study, those clove residue waste powder was added to the garden soil and both initial and final physicochemical parameters and elemental contents of soil were examined. So clove waste can be recommended as the pesticide and organic fertilizer which can boost the nutrient level of soil and increase the soil fertility.

**Keywords:** Clove (*Syzygium aromaticum*), UV-Visible, FT-IR, residue, soil fertility.

### INTRODUCTION

Clove (*Syzygium aromaticum*) is an aromatic flower bud of a tree belongs to the family of *Myrtaceae*. Clove is usually found in the aromatherapy section of health, food storage and is employed in the flavoring of medicines. Madagascar and Indonesia are the most common producers of oil of cloves. Due to anti-oxidant property it helps in the prevention of cancer. Oral problems like dry socket following tooth extraction, pain and swelling of the mouth and throat can be relieved by using it [1]. Roughly, clove essential oil consists of 89% eugenol and 5% to 15% eugenol

**Debasmita sethi and Chittaranjan Routray**

acetate and  $\beta$ -caryophyllene, 2.1% of  $\alpha$ -humulene. Other volatile compounds present in lower concentrations in clove oil are  $\beta$ -pinene, limonene, farnesol, benzaldehyde, 2-heptanone and ethyl hexanoate [2]. Generally the most important component eugenol may be a colorless to pale yellow, aromatic oily liquid extracted from certain essential oils especially from clove oil [3]. It is present in concentration of 80-90% in clove bud oil and at 82-88% in clove leaf oil [4]. Eugenol has a pleasant, spicy, clove-like scent [5]. Chemical formula of eugenol is  $C_{10}H_{12}O_2$ . Eugenol is employed in perfumes, flavorings and essential oils. Essential oils have high antioxidant so they participate in destruction mechanism against pathogens, viruses, microbes and bacteria [6]. Eugenol is used in perfumes, flavorings, essential oils and also used as a local antiseptic and anesthetic [7]. Eugenol is often combined with zinc oxide to form zinc oxide eugenol which has restorative and prosthodontic application in dentistry.

For persons with an alveolar osteitis as a complication of tooth extraction, packing the alveolar osteitis with eugenol-zinc oxide paste on iodo form gauze is effective for reducing acute pain [8]. Eugenol-zinc oxide paste is also used for root canal sealing [9]. In India we used clove in almost all spicy rich dishes to enhance the taste and as one of the home remedy. But at Indonesia clove used to make cigarettes by adding clove and tobacco in 1:2 ratios respectively [10]. Some of the literature study cited as Clove powder soaked with distilled water and ethanol to have respective extract, then it was mixed on a rotary system and filtered. The samples were processed until dry through a special lyophilizing flask that connected to a vacuum pump [11]. Clove extract was found to be effective against almost all of the food borne microbes but it was most effective against *Staphylococcus aureus*. And clove oil was mostly effective against common food spoilage fungi on SDA medium. Clove oil shows better result in vitro antibacterial and antifungal activity than its extract and sodium propionate [12]. It has been shown that clove oil was very effective against *Sphingobium indicum*, *Escherichia coli*, *Staphylococcus aureus* and *Bacillus subtilis*. This oil created a halo or zone of inhibition shown by *Bacillus* (halo area 7.543  $cm^2$ ) was more as compared to *E. coli*(halo area 5.144  $cm^2$ ) [13].

Depends on the chemical composition of the clove oil for analysis of medicinal values, the essential constituents are m-eugenol i.e. 3-allyl-6-methoxyphenol (69.43%), eugenol acetate (10.78%), caryophyllene (6.80%), 2-pentanone (7.78%) etc. [14]. Essential oil like clove oil can be used as reduction of fungal spoilage in *in vitro* systems and in bread system [15]. Clove oil can also eliminate the growth of *R. solanacearum* in overspread soil. Also depending on concentration used, clove oil could protect tomato and geranium plants from bacterial infection. It has been shown that clove oil and other essential oils possess wide activity against plant pathogens [16]. A study based on phytotoxicity of clove oil to vegetable crop seedlings and nematotoxicity to root-knot nematodes examined that in the case of cucumber phytotoxicity observed at lowest clove oil concentration. It was shown that the clove oil formulation was not effective on decreasing nematode population on cucumber [17]. Organic wastes may improve soil physicochemical properties, soil biological activity and also it helps to sustain soil health.

They also help in increase of plant nutrient and maintain soil fertility, by which crop growth and yield also increases [18]. Generally increase in potassium uptake and decrease in sodium uptake reinforces by addition of nano silicon that derived from  $SiO_2$  was the major mechanism responsible for more growth of plants under salinity [19]. According to previous researches the concentrations of soil nutrient are good indicators of soil quality and productivity due to their favorable effects on the physicochemical and biological properties of soil [20]. Soil pH affects the chemical reactions occur in soil [21]. Effect of clove bud residue on soil fertility after oil extraction has been rarely reported anywhere in the literature. So in the present research work we have extracted clove oil from the bud powder and study the effects of the residue on soil fertility.

**Experimental****MATERIALS**

The main ingredient Clove was purchased from a local grocery shop at Cuttack. Then those raw cloves were thoroughly washed with tap water and air dried. Then half of the cloves were kept aside and other half were

**Debasmita sethi and Chittaranjan Routray**

powdered by using an electric blender and finely clove powdered sample was prepared. Then ethanol and distilled water was purchased from a local chemical store.

## METHODS

### Extraction of Clove Oil from bud powder

50gm. Of air dried clove powders were weighed by using digital weigh machine at laboratory. Then it was filled in soxhlet. And 250ml. of ethanol was taken as solvent. The solvent was heated to reflux. The solvent vapour travelled up a distillation arm and flooded into the chamber housing the thimble of solid. When the soxhlet chamber was almost full, the chamber was emptied by the siphon and the solvent was returned to the distillation flask. This cycle was allowed to repeat many times over days. After many cycles the specified compound is concentrated within the distillation flask. After extraction the solvent is removed by means of rotary evaporator, yielding the extracted compound. The non-soluble portion of the extracted solid remains within the thimble and is usually discarded. According to above process clove extract was also prepared by using 50gm. Of clove powder and 250ml. of distilled water as solvent. 85 mL clove oil was obtained using ethanol as solvent whereas 47 mL clove oil extracted by using distilled water as solvent from 50gm of clove powder.

### Soil Analysis by adding clove residue:

The residues obtained after extraction of oil was added to the soil in Centurion University of Technology and Management, Odisha (Bhubaneswar Campus) garden and after 15 days some of the soil sample was collected and various physicochemical properties like pH, E.C, Water holding capacity and Moisture content were determined and recorded in a table and compared with the soil in order to know the effect of the residues on its fertility. After this the XRF analysis was carried out to know the different types of elements present in initial garden soil, clove residue and garden soil with clove residue one and the results were noted as tabular form.

### Characterizations

UV-Vis absorption study of the oil extracted with ethanol and water were carried out by perkin- Elmer Lamda 25 spectrophotometer in a range of 200 to 800 nm. FT-IR Spectra of clove oils were recorded on a perkin Elmer spectrometer(Spectrum RX1,Perkin Elmer, Singapore) using KBr pellet technique, in the range 4000-500  $\text{cm}^{-1}$  with a resolution of 2 $\text{cm}^{-1}$  using 4 scans per sample. X-Ray Fluorescence of the Garden soil, clove residue and Garden soil mixed clove residue were done by Epselon-1 XRF Spectrophotometer from Malvern Panaytical, in the X-ray fluorescence range of elements Na-Am calibrated by LLD 1ppm-100% containing high resolution of 135v

## RESULT AND DISCUSSION

### FTIR analysis

The result of FTIR analysis showed a characteristic clear and high intensive band at 3336  $\text{cm}^{-1}$  corresponding to OH groups of extracts. The signals which appeared between 2972-2883  $\text{cm}^{-1}$  are caused by the group  $\text{CH}_3$  of the extract. The band at 1653  $\text{cm}^{-1}$  which is responsible for the presence of conjugated  $\text{C}=\text{C}$  group. The bands present at 1454  $\text{cm}^{-1}$  and 1416  $\text{cm}^{-1}$  represents the presence of  $\text{CH}_2$  group. Other strong band at 1045  $\text{cm}^{-1}$  and 1086  $\text{cm}^{-1}$  represents the presence of secondary cyclic alcohol of C-O group. Another moderate band at 803  $\text{cm}^{-1}$  and 879  $\text{cm}^{-1}$  represents the presence of  $\text{CH}_2$  in the extracts [22].

ethanol extract, the absorption at 252nm is due to  $n-\pi^*$  electronic transition OH group of ethanol bind that with aromatic ring. Also the absorption at 295 nm is due to electronic move of type  $n-\pi^*$  of group carbonyl bind with aromatic ring of quinone which reach up to 340nm and provide the yellow color of those compounds. Absorption at 360nm is belonging to the electronic moving of the type  $\pi-\pi^*$  of the group of ketone that bind with aromatic ring

**Debasmita sethi and Chittaranjan Routray**

[22]. Distilled water extracted oil showed absorption at 218 nm and 254 nm is due to  $\pi$ - $\pi^*$  transition for benzene ring and allyl group of the eugenol.

**Effect of clove residue on garden soil**

Here, different physicochemical parameters like pH, Electrical conductivity(E.C), soil moisture content(%), water holding capacity (W.H.C) and different elements/compound contents of a garden soil and garden soil treated with clove residue were analyzed and compared in table-1 & 2. In this study the pH value of the garden soil was measured as 7.32. But the pH value of soil treated with clove residue was measured as 6.98. The pH was decreased after mixing the clove residue, so this residue can help to neutralize the pH which is more important for plants. As the clove residue mixed soil shows 6-7pH, which is the desirable pH range for optimum plant growth in India. Electrical conductivity of the initial soil was 0.75mho/cm. But after mixing with clove residue it was 0.79 mho/cm. Moisture content of the garden soil increased from 9.76% to 1.23%. Also the water holding capacity increased from 9.76ml/kg to 10.23ml/kg. By the help of XRF spectroscopy it has been shown that clove residue enriched with several elements and compounds that increase the nutrient level of garden soil. The concentration of different elements like  $K_2O$ ,  $CaO$ ,  $Cl$ ,  $SO_3$ ,  $P_2O_5$ ,  $SiO_2$ ,  $MnO$  and  $Fe_2O_3$  increased after addition of clove residue into the garden soil. These elements amplify the soil nutritional level.

**CONCLUSION**

Clove oil was prepared successfully. The clove oil prepared by using ethanol was more efficient than water. Also yield of this type of clove oil was more. It can be used as antibacterial or antifungal diseases. Eugenol can be extracted and used further. There was no more wastage, clove residue can be used as fertilizer due to the presence of different valuable macro and micro nutrient for plants and can also be used as pesticide due to the presence of eugenol. Clove residue may help certain crops to grow effectively. Depending on clove oil concentration clove oil could protect different crops from infection by the bacterium.

### ABSTRACT

The depletion of petroleum fuels is a major concern now a day. The growth in automobile sector and population are the prime causes for it. Moreover the emission from vehicles that uses petroleum fuels such as petrol, diesel and kerosene possess a threat to the environment and mankind. The major gases coming out from the vehicle emission such as Carbon Monoxide (CO), Carbon Dioxide (CO<sub>2</sub>), Oxides of Nitrogen (NO<sub>x</sub>), Hydro Carbon (HC), Particulate Matter (PM) are polluting atmosphere to great extent. Many researchers have proposed several ways of reducing pollution by using alternate energy sources. Use of biodiesel as a liquid alternate fuel is one of the biggest achievement so far. As the name suggests, it can be produced from biofuels and has similar properties with conventional diesel fuel. The wide availability of plant such as karanja, Mahua, Sunflower, Kusuma, jatropha, Castor is favourable for biodiesel production. Researchers are going in favour of different non edible oil sources because they are non-consumable for human being. Characteristics of these oils need to be carefully studied before proceeding for biodiesel production. However the use of biodiesel as fuel for vehicles decreases the performance slightly due to less calorific value as compared to conventional diesel and petrol. But on the other hand, there is a significant reduction in pollution level as reported by different researchers. In this work, a mixed biodiesel blend of Mahua and castor has been prepared and used as an alternate fuel to run a diesel engine. The results obtained give comparable engine performances while there is a reduction in emission gases as compared to castor biodiesel of same blend.

**Key Words:** Diesel Engine, Performance test, biodiesel, blend of Mahua and castor Oil

## INTRODUCTION

The extensive use of petroleum fuels in automobile is the main reason behind air pollution in recent times. The emissions from the automobiles consisting of hazardous gases like Carbon Monoxide (CO), Carbon Dioxide (CO<sub>2</sub>), Oxides of Nitrogen (NO<sub>x</sub>), and Hydrocarbon (HC). This emission from automobiles is the reason behind global warming and possesses threat for the mankind. Hence use of alternate fuel is a wise option as the emission comes out as a result of burning these fuels is very less as compared to petroleum fuels. Biodiesel which is a liquid alternative fuel is an excellent option to be used as fuel in automobiles. It is alkyl esters of long chain fatty acid and having properties resembles with diesel. Moreover it can be used in automobile engines without or very little modification in engine. This biodiesel can be obtained from large variety of plants which are the sources of edible and non-edible oils. The non-edible oils, such as Jatropha, Microalgae, Neem, Karanja, Rubber seed, Mahua, Silk cotton tree, etc., are easily available in developing countries and are very economical comparable to edible oils. Castor oil is potential non edible oil which is prepared from castor beans. Castor oil has wide variety of industrial and medicinal use. Oil is extracted from castor beans as a result of crushing in mills. Mahua has a place to species of Sapotaceae. It is an Indian tropical tree found over the northern part. Mahua oil is acquired from the piece of mahua seed (*Madhuca Indica*) which have 50-55% oil. The oil contains unsaturated fats like those in cooking oils as oleic corrosive, Linoleic acid. Stearic corrosive and palmitic corrosive. The particular gravity of mahua oil is 9.11% higher than diesel.

The kinematic thickness of Mahua oil is 15.23 occasions more than diesel at temperature of 400 C. The kinematic consistency of mahua oil diminishes with increment in temperature upto 800 C and by expanding the proportion of diesel in fuel mixes. Numerous researchers and specialists had grown altogether different techniques for the creation of biodiesel from different feed supplies of vegetable oil and creature fats [1]. Produced biodiesel from transesterification procedure of Soya crude, with potassium hydroxide catalyzed methanol (KOH) [2]. Considered non-eatable separated (Jatropha Curcas, Karanja (*Pongamia pinnata*) and polanga (*Calophyllum inophyllum*) mono esters (biodiesel) dependent on oil delivered and mixed with diesel were tried for their utilization as elective energizers of diesel engine [3]. Examined the reasonability of creating biodiesel from three kinds of waste creature fats [4]. In his paper looked into production, characterization and current vegetable oil and biodiesel status. Ghaly et al. revealed that the exploration on the creation of biodiesel has expanded surprisingly lately as a result of the requirement for an elective fuel which invests with biodegradability, low harmfulness and sustainability [5].

Deepanraj et al. portrayed that the less mixes of biodiesel expanded the brake warm effectiveness and limited the fuel utilization. Moreover, biodiesel mixes produce lower motor emanation than diesel [6]. Biodiesel is delivered by means of the transesterification response among oils and liquor within the sight of a suitable impetus. All in all, either homogeneous or heterogeneous, and salt or acidic impetuses can be utilized in the transesterification response to boost transesterification response execution and upgrade biodiesel creation returns [7]. Transesterification process within the sight of salt impetuses is a general procedure for biodiesel creation, since this response within the sight of soluble base impetuses is around 4,000 overlap quicker than within the sight of acidic impetuses, making the procedure all the more monetarily feasible [8]. It has increased extraordinary arrangements of consideration on account of its biodegradability, biocompatibility, non-poisonousness, simple amalgamation, safe activity [9], high cetane number, natural lubricity, liberated from sulfur, and high glimmer point [10]. Notwithstanding the points of interest, the biodiesel has been perceived as a green fuel, since it restricts low measures of gases, for example, SO<sub>x</sub>, CO<sub>x</sub>, NO<sub>x</sub> and Suspension strong particles by burning [11]. Biodiesel is perceived like most plentiful accessible wellspring of fluid liquid which can be delivered from lipid material. On account of its comparative attributes to those of oil determined fills, biodiesel can be straightforwardly utilized in diesel motors. Biodiesels are predominantly created from sustainable materials, for example, vegetable oils, creature fats, squander oils, microalgae, and so on [12].

**Itishree Moharana and Chittaranjan Routray**

Biodiesels creation from eatable oils builds the expense of biodiesel creation given that around 60-80% the all out expense of biodiesel creation is connected to crude material. In this way, it tends to be expressed that biodiesel creation from eatable oils is financially inefficacious as it offers ascend to an opposition between human utilization for such oils and of biodiesel creation advertise. As needs be, generally, the present and future biodiesel work creation is probably going to concentrate on biodiesel creation from minimal effort, non-eatable and natural sources is a plan to decrease the expense of biodiesel creation while securing the environment[13]. Utilization of biodiesel would make high openings for work in creating nations taking into account division of agribusiness where as of now level of business is low [14]. Castor oil is delivered by methods for extraction from castor bean. Castor oil is recognized by its high substance (over 85%) of ricinoleic corrosive.

No other vegetable oil has this high content an extent of greasy hydroxyl acids. Castor oil has a high quality sub-atomic weight (298), low dissolving point (50C) and low hardening point (- 120C to - 180C) that make it mechanically valuable, above all it is has the most noteworthy and most stable consistency of any vegetable oil[15]. The compound structure of castor oil is of incredible intrigue in view of the wide scope of responses it bears to the oleochemical business and the extraordinary synthetic concoctions that can be gotten from it. These subordinates are altogether better than petrochemical items Since they come from inexhaustible sources, bio-degradable and eco-accommodating. Ongoing examination had worries in the utilizing Of castor oil as a feedstock to manufacture biodiesel [16]. The mahua tree lasts for 8 to 15 years to get develop and can attract organic products as long as 60 years age.

As talked about it has profoundly spreaded roots which retains the dirt and all these occurs on squander land which encourages our rustic individuals to develop alongside national economy[17]. The monetary examination shows that karanja oil biodiesel can be utilized without rotating the current motor in a diesel motor to prompt employment creation and investment funds of crucial monetary standards. Discharges in the diesel, CO emanations were very higher for blends B20 and B40. HC discharges diminished to B20 and B40 pairs 12.8 percent not 2.85 percent dependent on Diesel with full load [18].For jatropha biodiesel blended in this was with diesel tentatively seen that a blend of half diesel traditional flammable with half jatropha biodiesel (B50) gives execution unadulterated diesel not as (D100) tantamount. A blend of 80% diesel customary and Jatropha biodiesel (B20) yields 20 percent a decent mechanical exhibition at full throttle [19].The greater part of the investigations depend on the consequences of the investigation of the biodiesel procedure. Supports the utilization of biodiesel to limit discharges of carbon monoxide.

The prevailing perspective is that HC outflows are decreased when biodiesel mixes are utilized rather than diesel. This decrease is because of the higher the oxygen level [20]. The oxidation soundness of mixes of biodiesel got From karanja, neem and jatropha oil and diesel minerals and finding the oxidation to steadiness of 10% mixed biodiesel is the most elevated among all the mixes. In any case, when the mixing rate builds, the oxidation dependability diminishes and at 20% mixing the oxidation strength of karanja oil decreases and doesn't fit the bill for the standard norms[21].In the present work we have synthesized bio diesel from Castor and Mahua oil mixture and perform various engine efficiency test with it.

## MATERIALS AND METHODS

### Materials

Castor and Mahua oils were purchased from local market and used directly without further purification.  $H_2SO_4$ , methanol, KOH were reagent grade chemicals and used with out purification.

### Methods

1 L of castor and Mahua oil mixture was heated at 110° C to remove moisture content .Then the oil was Cooled and 10g of  $H_2SO_4$  and 200 ml of methanol was added and mixed well. Then the Oil mixture was placed in the biodiesel

**Itishree Moharana and Chittaranjan Routray**

reactor and heated for 3hr maintaining the temperature 60-64 °C. After 3hr the sample was cooled and collected in a separating Funnel then on the next day the sample was filtered and the unreacted methanol was Separated and the remaining product was transesterified. Esterification reaction is mostly used for reducing the FFA level of oil. The esterified product was blended in with 10g of KOH and 200 ml methanol arrangement. The blend was then warmed up to 3hr at 70°C in a biodiesel reactor with nonstop mixing . Then the example was cooled and kept in an isolating channel. At that point on the following day we seen that two layers were framed and the upper layer which is the methyl ester was isolated from the lower layer which is the glycerol. The methyl ester which is acquired is then water washed to evacuate the rest of the glycerol and debasements of arrangement. The methyl ester was blended in with water in 1:3 proportion and shaken well for 2 moment. At that point it was saved for 15 minutes. After that water was contracts debasements and the unadulterated methyl ester was gathered. This procedure was rehashed for 5-6 times. The gathered example after water wash was warmed at 1100C for 40-50 minutes then the biodiesel was gathered.

**Engine performance test set up**

A four-stroke single-tube shaped diesel motor (figure no.) with the current dynamometer in whirlpool was used for this test. The determinations of the motor are appeared in Table no. 2. The channel valve opens at 4.50 before top right on target and shuts down at 35.50 after base perfectly focused, the fumes valve opens 35.50 before base flawlessly focused and closes 4.50 after top flawlessly focused. The motor was tried with unadulterated diesel and arranged mixes of mahua and castor biodiesel at 25%, half, 75% and 100% stacking at a speed of 1500 rpm in particular. The motor was turned over with standard diesel fuel and heated up. The Heat Up periods closes Once temperature of the cooling water is is settled. The brake power, Explicit fuel utilization, brake warm proficiency and fumes gas temperature were estimated with various mixes of mahua and castor methyl ester.

**RESULT AND DISCUSSION**

Transient motors tests were done utilizing mixer of mahua and castor biodiesel with diesel so as to consider their impact on motor execution parameters at different burdens 2, 4, 6 and 8. The significant exhibition parameters of the motor, for example, BP, SFC and BTE acquired because of running the motor with biodiesel are contrasted and that of utilizing diesel fuel. The engine discharges is additionally estimated by methods for fumes gas analyser. A relative report is made on the sythesis of various gases, for example, CO, CO<sub>2</sub>, NO<sub>x</sub> and HC with the outcomes acquired by utilizing diesel and castor biodiesel.

**Engine Performance test**

The castor and mahua biodiesel blends are B10, B20, B30 i.e. 10% biodiesel in 90% diesel, 20% biodiesel in 80% diesel and 30% biodiesel with 70% diesel respectively and table 2 shows the BP of biodiesels against the loads and it's increasing with increase in loads. Here the BP of Diesel, castor and Mahua-Castor Mix slightly changed with respect to the load value. When the load increases the BP of Diesel, castor and the mahua- Castor mix is increasing and is clear from figure-1. The castor and mahua biodiesel blends are B10, B20, B30 i.e. 10% biodiesel in 90% diesel, 20% biodiesel in 80% diesel and 30% biodiesel with 70% diesel respectively. When the load increases the  $\eta_{bth}$  of Diesel, castor and the mahua- Castor mix is increasing. Here the  $\eta_{bth}$  of Diesel, castor and Mahua-Castor Mix slightly changed with respect to the load value as evidence from table-3 and figure-2.

The castor and mahua biodiesel blends are B10, B20, B30 i.e. 10% biodiesel in 90% diesel, 20% biodiesel in 80% diesel and 30% biodiesel with 70% diesel respectively and SFC of Diesel, castor and Mahua-Castor Mix slightly changed with respect to the load value. When the load decreases the SFC of Diesel, castor and the mahua- Castor mix is decreasing and the data were recorded in table-4. Figure-3 shows the variation of the SFC with respect to the load of the Diesel, castor and the Mahua- Castor mixer.

**Itishree Moharana and Chittaranjan Routray****Emission of CO (Carbon Monoxide)**

Analysis of Diesel, Castor B10 and Mahua-Castor Mix. The castor and mahua biodiesel blends are B10, B20, B30 i.e. 10% biodiesel in 90% diesel, 20% biodiesel in 80% diesel and 30% biodiesel with 70% diesel respectively. CO% of Diesel, Castor B10 and Mahua-Castor Mix Here the CO% of was Castor B10 and Mahua-Castor Mix slightly changed with respect to the load value. When the load increases the Co% of Diesel, castor B10 and the mahua- Castor mix is decreasing respectively as evidence from table-5 and figure-4.

**Emission with CO<sub>2</sub> (Carbon dioxide)**

Analysis of Diesel, Castor B10 and Mahua-Castor Mix. The castor and mahua biodiesel blends are B10, B20, B30 i.e. 10% biodiesel in 90% diesel, 20% biodiesel in 80% diesel and 30% biodiesel with 70% diesel respectively. CO<sub>2</sub>% of Diesel, Castor B10 and Mahua-Castor Mix Here the CO<sub>2</sub>% of was Castor B10 and Mahua-Castor Mix slightly changed with respect to the load value. When the load increases the CO<sub>2</sub>% of Diesel, castor B10 and the mahua- Castor mix is increasing respectively as shown in Table-6.

**Emission with HC (Hydrocarbon)**

Analysis of Diesel, Castor B10 and Mahua-Castor Mix. The castor and mahua biodiesel blends are B10, B20, B30 i.e. 10% biodiesel in 90% diesel, 20% biodiesel in 80% diesel and 30% biodiesel with 70% diesel respectively. HC% of Diesel, Castor B10 and Mahua-Castor Mix. Here the HC% of was Castor B10 and Mahua-Castor Mix slightly changed with respect to the load value. When the load increases the HC of Diesel, castor B10 and the mahua- Castor mix is increasing respectively as recorded in table-7 and analyzed in figure-6.

**Emission with NO<sub>x</sub> (Nitric Oxide)**

Analysis of Diesel, Castor B10 and Mahua-Castor Mix: The castor and mahua biodiesel blends are B10, B20, B30 i.e. 10% biodiesel in 90% diesel, 20% biodiesel in 80% diesel and 30% biodiesel with 70% diesel respectively. HC% of Diesel, Castor B10 and Mahua-Castor Mix. Here the HC% of was Castor B10 and Mahua-Castor Mix slightly changed with respect to the load value. When the load increases the HC of Diesel, castor B10 and the mahua- Castor mix is increasing respectively as given in table-8. Figure-7 shows the variation of the HC% with respect to the load of the Diesel, castor B10 and the Mahua- Castor mix.

**CONCLUSION**

Biodiesel has attracted considerable research due to its economic and environmental benefits and its renewable origin. Biodiesel produced from non-edible oil resources will defy the use of biodiesel production from edible oil. Consequently, its demand is gradually rising, and researchers are looking for possible newer sources of non-edible oil is a promising source that can sustain biodiesel growth. The performance and emissions tests were conducted with diesel, and blends of Castor oil biodiesel and Mahua oil biodiesel at different loads and constant speed (1500rpm). Double biodiesel from the experimental results obtained compared to smooth diesel service of Castor oil and Mahua oil. The engine output is comparable and emissions are slightly higher. All the dual biodiesels tested result in a slightly lower Thermal performance and increased levels of smoke, and CO. The biodiesel emission analysis and its blend yielded the best results compared to the single fuel. The existing engine could be operated on the dual biodiesel tested without any modification. India being an agricultural country, the energy from bio sectors will be highly beneficial for both plantation as well as transportation. Thus Castor oil biodiesel, Mahua oil biodiesel blended dual biodiesel will be a highly beneficial fuel in terms of both economy as well as fuel independence because this Castor oil, Mahua oil will be easily available as long as air and water are available in the earth. The results show that, dual blended biodiesel will be a good substitute and it could replace diesel in future.

### ABSTRACT

The main purpose of this paper is to study of Navier stokes equations, Concept of boundary layer. Prandtl hypothesis & implications, Nal of Boundary layer equations, Solution techniques and then we Illustrate Biasus flow.

**Keywords:** Biasus flow, Navier stokes equations, prandtl boundary layer equation

## INTRODUCTION

We study the boundary layer formed near a rigid wall by a low-viscosity incompressible fluid that solves the Navier-Stokes equations (NSE) linearized around a smooth and stationary Euler flow. In exterior domains, such equations model the flow around an obstacle moving at constant velocity, the classical Oseen system, where the steady profile is also spatially homogeneous.

### Navier Stokes Equations

(For incompressible fluids)

$$\frac{Du}{Dt} = \bar{g} - \frac{1}{\rho} \nabla p + \nabla^2 \bar{u}$$

where  $\rho$  = density of fluid  
 $\nu$  = kinematic viscosity of fluid  
 $p$  = static pressure  
 $\bar{u}$  = velocity field

**Saubhagalaxmi Singh**

$$\vec{g} = \text{body force per unit mass}$$

$$\frac{D}{Dt} = \frac{\partial}{\partial t} + u \frac{\partial}{\partial x} + v \frac{\partial}{\partial y} + w \frac{\partial}{\partial z}$$

substantial derivative

**Navier Stokes equations-features**

- Elliptic partial differential equations.
- Boundary conditions required on entire boundary.
- Difficult to get analytical solutions for the general case
- Simplifying assumptions and/or approximations required.

**Concept of boundary layer-Application**

- Wherever fluid flows near a solid surface of another stationary fluid.
- Ex. Fluid flow around submerged bodies in pipes, in jets etc.
- Boundary layer entirely accounts for the effects of fluid viscosity.
- Primarily useful for calculating shear stresses on the surface of the solid body and thus the total drag force on it due to the flowing fluid.
- Ex. Estimation of drag force on an airplane, the body of a swimmer, on a racing car, in wind tunnel testing etc. [1]
- Also useful for estimating other parameters such as entrance length in pipe flow, momentum transfer due to jet etc.

**Concept of boundary layer-Need**

- Away from solid boundaries effect of fluid viscosity negligible.
- Navier stokes equations reduced to Euler equations[2]

$$\frac{D\vec{u}}{Dt} = \vec{g} - \frac{1}{\rho} \nabla p$$

$\vec{u}$  = Velocity fluid

$\vec{g}$  = body force per unit volume

$\rho$  = density of fluid

P = static pressure

$$\frac{D}{Dt} = \text{substantial derivative}$$

- Euler’s equation is of first order
- Cannot satisfy both boundary conditions near solid surface.

$$u_n = 0 \quad (\text{no penetration condition})$$

$$u_t = 0 \quad (\text{no slip condition})$$

where  $u_n$  = velocity component normal to solid surface

$u_t$  = velocity component tangential to solid surface

- So it’s a good approximation near the surface
- On the surface of the solid boundary.

- $u = 0$  where  $u$  = component of velocity parallel to free stream velocity.
- In the free stream:  
 $u = U$ , where  $U$  = free stream velocity.

Boundary layer thickness defined as the thickness over the solid surface over which  $u$  varies from 0 to  $99U$ .

**Main Results**

**Prandtl hypothesis & implications**

The hypothesis:

For fluids of low viscosity, viscous forces significant only in a narrow region surrounding the solid boundary.

i.e.  $\delta \ll L$

where  $\delta$  = boundary layer thickness

$L$  = characteristic length of system

Implications of this hypothesis brought out by examining non-dimensional form of the Navier-Stokes and continuity equations.

Non-dimensional variables:[3]

$$u^* = \frac{u}{U_\infty}, v^* = \frac{v}{U_\infty}, p^* = \frac{p}{\rho U_\infty^2}, x^* = \frac{x}{L}, y^* = \frac{y}{L}$$

where  $U_\infty$  = free stream velocity

$\rho$  = density of fluid

$L$  = characteristic length of system

$u$  = velocity component parallel to  $U_\infty$

$v$  = velocity component normal to  $U_\infty$

$x$  = co-ordinate along the free stream velocity

$y$  = co-ordinate normal to the free stream velocity

$p$  = static pressure

Order of magnitude of boundary layer variables:

$$\partial u \sim U_\infty, \partial x \sim L, \partial y \sim \delta$$

$$\Rightarrow \partial u^* \sim 1, dx^* \sim 1, dy^* \sim \epsilon$$

$$\epsilon = \frac{\delta}{L} \ll 1$$

where

Non-dimensional form of governing equations (2-D steady flow continuity equation)

$$\frac{\partial u^*}{\partial x^*} + \frac{\partial v^*}{\partial y^*} = 0$$

$$\frac{1}{1} + \frac{?}{\epsilon} = 0$$

$$\Rightarrow \partial v^* \sim \epsilon$$

Order of magnitude of boundary layer variables:

$$v^*(x^*, y^*) = v^*(x^*, 0) + \left( \frac{\partial v^*}{\partial y^*} \right) \delta y^* \sim \epsilon$$

$$\Rightarrow v^* \approx (0) + (1)(\epsilon) \Rightarrow v^* \sim \epsilon$$

$$u^*(x^*, y^*) \approx u^*(x^*, \epsilon) + \frac{\partial u^*}{\partial y^*}(y^* - \epsilon)$$

$$\Rightarrow u^* \sim (1) + \left(\frac{\partial u^*}{\partial y^*}\right)(\epsilon - \epsilon) \Rightarrow u^* \sim 1$$

x-momentum (neglecting gravity effects):

$$u^* \frac{\partial u^*}{\partial x^*} + v^* \frac{\partial u^*}{\partial y^*} = -\frac{\partial p^*}{\partial x^*} + \frac{1}{\text{Re}} \left[ \frac{\partial^2 u^*}{\partial x^{*2}} + \frac{\partial^2 u^*}{\partial y^{*2}} \right]$$

$$(1) \frac{(1)}{(1)} + (\epsilon) \frac{(1)}{(\epsilon)} = ? + \frac{1}{\text{Re}} \left[ \frac{(1)}{(1)} + \frac{(1)}{(\epsilon^2)} \right]$$

$$\Rightarrow \frac{\partial p^*}{\partial x^*} - 1 \quad \& \quad \frac{\partial^2 u^*}{\partial x^{*2}} \square \frac{\partial^2 u^*}{\partial y^{*2}}$$

$$\Rightarrow \text{Re} - \frac{1}{\epsilon^2} \quad (\text{Re} = \text{Reynolds number})$$

Another way of showing  $\text{Re} \sim 1/\epsilon^2$

- Let  $L_1 =$  inertial force &  $V_1 =$  Viscous force in a high Re flow
- At  $y > \delta.1 \gg V_1$ , while at  $y = 0.1, f_1 = 0, V_1 \gg 1$
- Hence for  $0 < y < \delta.1$

$$u \frac{\partial u}{\partial x} \sim v \frac{\partial^2 u}{\partial y^2} \Rightarrow \frac{U_\infty^2}{L} - \frac{vU_\infty}{\delta^2}$$

$$\Rightarrow \frac{U_\infty L}{v} - \frac{L^2}{\delta^2} \Rightarrow \text{Re} - \frac{1}{\epsilon^2}$$

y-momentum equation (neglecting gravity effects):

$$u^* \frac{\partial v^*}{\partial x^*} + v^* \frac{\partial v^*}{\partial y^*} = \frac{\partial p^*}{\partial y^*} + \frac{1}{\text{Re}} \left[ \frac{\partial^2 v^*}{\partial x^{*2}} + \frac{\partial^2 v^*}{\partial y^{*2}} \right]$$

$$(1) \frac{(\epsilon)}{(1)} + (\epsilon) \frac{(\epsilon)}{(\epsilon)} = ? + (\epsilon) \left[ \frac{(\epsilon)}{(1)} + \frac{(\epsilon)}{(\epsilon^2)} \right]$$

$$\Rightarrow \frac{\partial p^*}{\partial y^*} \sim \epsilon \Rightarrow \frac{\partial p^*}{\partial y^*} \approx 0$$

Final form of the boundary layer equations;

$$\frac{\partial u^*}{\partial x^*} + \frac{\partial v^*}{\partial y^*} = 0 \Rightarrow \frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} = 0$$

$$\frac{\partial p^*}{\partial y^*} = 0 \Rightarrow \frac{\partial p}{\partial y} = 0$$

**Saubhagalaxmi Singh**

$$u^* \frac{\partial u^*}{\partial x^*} + v^* \frac{\partial u^*}{\partial y^*} = -\frac{dp^*}{dx^*} + \frac{1}{\text{Re}} \frac{\partial^2 u^*}{\partial y^{*2}} \Rightarrow u \frac{\partial u}{\partial x} + v \frac{\partial v}{\partial y} = -\frac{1}{\rho} \frac{dp}{dx} + \nu \frac{\partial^2 u}{\partial y^2}$$

Boundary conditions:

$$\text{at } y = 0, u = v = 0 \Rightarrow \text{at } y^* = 0, u^* = v^* = 0$$

$$\text{at } y = \delta, u = U_\infty \Rightarrow \text{at } y^* = \varepsilon, u^* = 1$$

To show that the boundary layer equations reduce to those for inviscid flow at the edge of the boundary layer: [4]

At  $y = \delta$  and beyond,  $u = U_\infty$  and

$$\frac{\partial u}{\partial y} = 0 \Rightarrow \frac{\partial^2 u}{\partial y^2} = 0$$

The x-momentum equation then reduces to:

$$u \frac{\partial u}{\partial x} + v(0) = -\frac{1}{\rho} \frac{dp}{dx} + v(0)$$

$$\Rightarrow U_\infty \frac{dU_\infty}{dx} + \frac{1}{\rho} \frac{dp}{dx} = 0$$

$$\Rightarrow p \frac{1}{2} \rho U_\infty^2, \frac{d}{dx} \left[ \left( \frac{1}{2} \rho v^2 + p \right) \right] = 0$$

= constant (Bernoulli equation)

### Physical significance of the terms

#### Continuity equations

$$\frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} = 0$$

- The continuity equation expresses the law of mass conservation for an incompressible fluid.
- The LHS is the divergence (in 2-D) of the velocity field which signifies the rate of mass production at a given point in the flow field.
- Since in the flow field considered there are no sources of mass production, it is identically equal to zero throughout the field.

#### y-momentum equation

$$\frac{\partial p}{\partial y} = 0$$

- Expresses the fact that there is no pressure variation along the direction normal to the solid surface.
- This means that the pressure at any location  $x$  in the boundary layer is same as that in the outer inviscid region.[5]
- The variation of pressure in the inviscid region can be calculated by solving the Euler equations for the external flow field and the same can be used inside the boundary layer.
- Thus pressure is not an unknown quantity in the boundary layer equations. It is simply imposed on it by the external inviscid flow.

**Saubhagalaxmi Singh**

### Z-momentum equation

$$u \frac{\partial u}{\partial x} + v \frac{\partial u}{\partial y} = -\frac{1}{\rho} \frac{dp}{dx} + \nu \frac{\partial^2 u}{\partial y^2}$$

- LHS denotes the inertial force on a fluid element.
- First term on RHS denotes the driving force for fluid flow in the boundary layer.
- It determines when separation of boundary layer from solid surface will occur.
- The last term accounts for the viscous shear stresses set up in the fluid due to the velocity gradient inside the boundary layer.
- Outside the boundary layer, it becomes negligible as the partial derivative goes to zero: hence the flow is essentially inviscid outside the boundary layer.
- Boundary layer equations are parabolic in nature.[6]
- Require only initial conditions.
- Solution progresses in flow direction by forward marching integration techniques.
- Based on the laws of similarity for boundary layer flows.
- u component of velocity with two velocity profiles of u(x,y) at different x locations differ only by scale factors in u & y.
- Hence, velocity profiles u(x, y) at all values of x can be made congruent if they are plotted in coordinate which have been made dimensionless with reference to the scale factors.
- Local free stream velocity  $U_\infty(x)$  at a section x obvious scale factor for u, because dimensionless  $U^*(X^*)$  varies from 0 to 1 with y at all sections.
- Scale factor for y, g(x) taken equal to local boundary layer thickness so that  $y^*$  itself varies between 0 to 1.

$$\frac{u \left[ x \left\{ y / g(x) \right\} \right]}{U_\infty(x)} = \frac{u \left[ x \left\{ y / g(x) \right\} \right]}{U_\infty(x)}$$

The underlying principle of the analytical solution by the similarity technique is to define a similarity variable, which is a function of coordinates. [7]

Dependent variables expressed as function of the similarity variable.

Then we try to reduce the boundary layer equations which are partial differential equations to ordinary differential equations in terms of functions of the similarity variable.

Successfully accomplishing this leads to an ordinary differential equation with boundary conditions in terms of the similarity variable which can be solved very easily.

As an illustration, consider fluid flow over a flat plate (Blasius flow)

Flow field unbounded above the plate.

Hence no pressure variation in direction of flow.

Flow incident on flat plate with an angle of incidence zero.

We assume fluid is incompressible & gravity effects negligible in the thin boundary layer.

Hence we may apply the boundary layer equations derived earlier.

### Illustration: Blasius Flow Governing equations

$$\frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} = 0$$

$$\frac{\partial p}{\partial y} = 0$$

**Saubhagalaxmi Singh**

$$\frac{1}{\rho} \frac{dp}{dx} = -U_{\infty} \frac{dU_{\infty}}{dx} = 0$$

$$\Rightarrow u \frac{\partial u}{\partial x} + v \frac{\partial u}{\partial y} = v \frac{\partial^2 u}{\partial y^2}$$

Boundary conditions:

At  $y = 0, u = v = 0$

At  $y = \infty, u = U_{\infty}$

Eliminate continuity equation using stream function

$$u = \frac{\partial \psi}{\partial y}, v = \frac{\partial \psi}{\partial x}$$

The boundary layer equation transforms to:

$$\frac{\partial \psi}{\partial y} \frac{\partial^2 \psi}{\partial x \partial y} - \frac{\partial \psi}{\partial x} \frac{\partial^2 \psi}{\partial y^2} = v \frac{\partial^2 \psi}{\partial y^2} \dots\dots\dots(*)$$

$$\frac{\partial \psi}{\partial y} = U_{\infty} \text{ as } y \rightarrow \infty$$

$$\frac{\partial \psi}{\partial x} = 0, \frac{\partial \psi}{\partial y} = 0 \text{ at } y = 0$$

In accordance with the law of similarity we define a similarity variable

$$\eta = Ax^2 \text{ so that } \psi = \psi(x, y) = \psi(\eta, x)$$

Using boundary condition

as  $y \rightarrow \infty, u \rightarrow U_{\infty}$

$$\Rightarrow u(x, \infty) = \frac{\partial \psi}{\partial y} \Big|_{y \rightarrow \infty} = \frac{\partial \psi}{\partial \eta} \Big|_{\eta \rightarrow \infty} \frac{\partial \eta}{\partial y} = U_{\infty}$$

$$\Rightarrow Ax^2 \frac{\partial \psi}{\partial \eta} \Big|_{\eta \rightarrow \infty} = U_{\infty}$$

RHS is constant, so to make LHS constant  $\psi$  must be of the form:

$$\psi = Bx^* f(\eta) \Rightarrow u(x, \infty) = ABf(\infty) = U_{\infty}$$

Let  $AB = U_{\infty}$

$$\therefore f(\infty) = 1$$

Using second boundary condition:

$$u(x, 0) = \frac{\partial \psi}{\partial y} \Big|_{x=0} = ABf'(\eta) \Big|_{\eta=0} = 0 \Rightarrow f'(0) = 0$$

Using third boundary condition:

$$v(x, 0) = -\frac{\partial \psi}{\partial x} \Big|_{x=0} = -Bbx^{b-1} (\eta f' - f) \Big|_{\eta=0} = 0 \Rightarrow f(0) = 0$$

Saubhagalaxmi Singh

- Substitute  $\psi$  in forms of  $\eta$  in the differential equation (.)
- Choose the free constants A, B & b such that x & y do not appear in the final equation resulting in:[8]

$$A = \sqrt{\frac{U_\infty}{v}}, B = \sqrt{U_\infty v} \quad \& \quad b = -\frac{1}{2}$$

Giving:

$$f(\eta)f'(\eta) + 2f''(\eta) = 0$$

With the boundary conditions:

$$f(0) = f'(0) = 0 \quad \& \quad f'(\infty) = 1$$

$$\eta = y\sqrt{\frac{U_\infty}{vx}} = \frac{y}{x} \text{Re}, \quad \psi = \sqrt{vU_\infty} f(\eta)$$

$$u = \frac{\partial \psi}{\partial y} = U_\infty f'(\eta), \quad v = -\frac{\partial \psi}{\partial x} = \frac{1}{2} \sqrt{\frac{vU_\infty}{x}} (\eta f' - f)$$

$$r_w = \mu \left. \frac{\partial u}{\partial y} \right|_{y=0} = \mu U_\infty f'(\eta) \left. \frac{\partial \eta}{\partial y} \right|_{y=0} = \mu U_\infty \sqrt{\frac{U_\infty}{vx}} f'(0)$$

$$\text{Re} = \frac{U_\infty}{v} = \text{Reynolds number}$$

$r_w$  = wall shear stress

$\mu$  = dynamic viscosity

- Thus the original variables (x, y, u and  $\phi$ ) are replaced by the two variables  $f'(u/U_\infty)$  &  $\eta$  in the similarity technique.
- By the Blasius equation, those two variable will uniquely determine the velocity profile at any location.
- Values of  $G(\infty)$  estimated from G curves, as in upper graph.
- Calculate improved guess of  $H(0)$  by finding the value  $H(0)$ , at which the line a b in the lower graph crosses the line  $G(\infty)=1$ .
- Using similar triangles

$$\frac{H(0)_2 - H(0)_1}{1 - G(\infty)} = \frac{H(0)_2 - H(0)_1}{G(\infty) - G(\infty)}$$

- Solve for  $H(0)_1$
- Repeat whole procedure using  $H(0)_2$  and better of the two initial guesses  $H(0)_1$  &  $H(0)_2$
- Continue till satisfactory results are obtained.

$f(\eta), f'(\eta)$  &  $f''(\eta)$  in the boundary layer.

Boundary layer thickness ( $\delta$ ):

$$u = 0.99U_\infty \Rightarrow f'(\eta) = 0.99 \Rightarrow \eta = 5$$

$$\Rightarrow \delta = \frac{50}{\sqrt{\text{Re}}}$$

### Saubhagalaxmi Singh

Displacement thickness ( $\delta_0$ ):

$$\delta_0 = \int_0^{\infty} \left(1 - \frac{u}{U_{\infty}}\right) dy = \frac{1.73}{\sqrt{Re}}$$

Momentum thickness ( $\delta_m$ ):

$$\delta_m = \int_0^{\infty} \frac{u}{U_{\infty}} \left(1 - \frac{u}{U_{\infty}}\right) dy = \frac{1.328}{\sqrt{Re}}$$

Location skin friction coefficient

$$C_{\infty} = \frac{r_w(x)}{\frac{1}{2}\rho U_{\infty}^2} = \frac{0.664}{\sqrt{Re}}$$

This result experimentally confirmed by Liepmann & Dhawan (1951).

If F is the total frictional force per unit width on a plate of length L.

$$F = \int_0^L r_w dx$$

Average skin friction coefficient:

$$\bar{C}_1 = \frac{F}{\frac{1}{2}\rho U_{\infty}^2 L} = \frac{1.328}{\sqrt{Re}}$$

$$Re = \frac{U_{\infty} L}{\nu}$$

#### Conclusion

Boundary layer flows occur ubiquitously in nature, hence important topic of study.

Prandtl's hypothesis reduces the general Navier Stokes equation to the boundary layer equations which are easier to solve. Analytical approach based on laws of similarity.

As an illustration, Blasius flow (unbounded fluid flow over a flat plate) was solved analytically.

### ABSTRACT

*Sorghum* production depends upon different parameters like longitude, latitude, Rain (Jan-Dec), Rain (Nov-May), Rain (June-Oct), Temperature (Jan-Dec), Temperature(Nov-May), and Temperature(June-Oct) etc. The effect of these parameters on production of *Sorghum* is studied. *Sorghum* is the fifth most important cereal in the world in terms of the cropped area. It is mainly grown for animals and it is also used in food industry. *Sorghum* grain is generally a rich source of antioxidants such as polyphenols and carotenoids. Some *Sorghum* types are suitable for sugar extraction for ethanol production and the Stover can be used for the manufacture of plastics. Pipeline pilot module of Biovia software (DassultSystem of France) is used for computation. The software provides different built –in mechanism to develop a machine learning model and use the model for calculation.

**Keywords:** Neural network, *Sorghum*, Latitude, Longitude, Rain, Temperature.

## INTRODUCTION

### Machine Learning

Machine learning is a sub area of artificial intelligence, where by the terms refers to the ability of IT systems to independently find all the solutions of the problem by recognizing patterns in database. In order to enable the software to independently generate solution, the required algorithm and data must be fed into the system in advance and the respective analysis rules for the reorganisation of pattern in data stock must be defined. The system can perform the following tasks by machine learning.

### **Sorghum Production**

*Sorghum* is truly a versatile crop that can be grown as a grain, forage or sweet crop. *Sorghum* is one of the top five cereal crops in the world [1]. *Sorghum* is used for food, fodder and alcoholic beverages. It is drought-tolerant and heat-tolerant. It is an important food crop in Africa, Central America, south Asia [3] while the grain of *Sorghum* is edible, its leaves can sometimes contain hydrogen cyanide that are toxic to humans and animals also. Identification of genes that control cyanide production and release could lead to the development of cyanide-free *Sorghum* plants. In the *Sorghum* growing regions of Africa and Asia the grain is made into flour by hand pounding. Traditionally, water was added to the grain by up to 30-40% and the grain was decorticated by hand pounding with wooden pestles in a mortar for 10-15 min. The products of *Sorghum* are- Breads from Anna original bread mix, Kellogg's special k gluten free touch of brown sugar cereal etc.

*Sorghum* is an important tropical crop for food, fodder [2]. Botanically *Sorghum* belongs to the genus *Sorghum* and family Gramineae. There are several types of *Sorghum* including grain *Sorghum*, grass *Sorghum*, sweet *Sorghum* and broom corn [4]. Among known species the genus, *Sorghum* bicolor (L) Moench is important. *Sorghum* contains hydrogen cyanide [5]. It can tolerate high temperature throughout its life cycle better than any other crop. The maximum temperature for good growth of *Sorghum* is 26-30°C and the minimum temperature is 7-10°C and seedling growth may result if planted before soil temperature reaches 35°C. For high production, a medium-to-late maturing *Sorghum* cultivar (maturity within 110 to 130 days) requires approximately 450 to 650 mm of water during the growing season, daily use is low approximately 1 to 2.5 mm per day.

### **Objectives**

Objective of the present study is to determine the effect of various parameters on production of *Sorghum* using machine learning. In this study we can determine the suitable condition where the rice grows in a manner that we can get maximum profit.

## **MATERIALS AND METHODS**

### **Software used**

"Pipeline Pilot module of Biovia software" (Dassault Systems of France) is used for analysis. The software provides different built-in components to develop a "machine learning model" and use the model for prediction.

### **Methodology**

#### **Collection of data**

Data was collected about Longitude, Latitude and considered as input while production of *Sorghum* is used as output parameter.

#### **Development of deep learning neural network model**

The dataset was read using "Delimited Text Reader" component of pipeline pilot. The component was connected to the "Learn R Deep Neural Net Model". The output of the model was displayed using "HTML Table Viewer" component. The parameters for the "Learn R Deep Neural Net Model" component is a set as shown in Figure 3. The setting for which the experimental output parameter and the predicted parameter were close to a 45°C line were considered for the final model.

#### **Study of effect of different input parameters on *Sorghum* production**

Text files were prepared where one parameter was varied within the range of data analyzed. All other parameters were kept constant at an average value.

## RESULTS AND DISCUSSION

*Sorghum* production varies due to different reasons. However, the relationships are difficult to predict. Thus, this study focuses on the effect of various input parameters on the *Sorghum* production.

### Prediction ability of the model

Figure: 4 (a) shows the model developed. Figure 4(b) shows that the prediction ability of the model was good and the predictions were close to the experimental values.

### Prediction by the model

Figure 5: shows that the *Sorghum* production in the particular area is gradually increasing after the longitude crossed above  $85^{\circ}E$ , while the production of *Sorghum* is minimum in between longitude  $85^{\circ}E$  to  $90^{\circ}E$ . The results showed that high value of longitude favoured rice production. Figure 6: shows that the production of *Sorghum* is gradually increasing if the latitude exceeds  $18^{\circ}N$ . The analysis shows that *Sorghum* production is high at around  $25^{\circ}N$ . Figure 7: indicates that the production of *Sorghum* gradually decreasing when the rain amount in the month June-October exceeds  $300\text{ mm}$ . The production of crop is minimum when the rain is in between around  $80 - 300\text{ mm}$ . The production of *Sorghum* is very low if the rainfall during June-October is high (around  $600\text{ mm}$ ). Figure 8: shows that the *Sorghum* production is gradually increasing in the month November-May when the rain amount exceeds  $120$  and the *Sorghum* production is in the pick if the rain amount is between  $0$  to  $120$ . Figure-9: shows that the production of *Sorghum* gradually decreasing at the temperature increases. We can say *Sorghum* production in (jan –dec) inversely proportional to temperature. Figure-10: shows that the production of *Sorghum* is gradually decreasing when the temperature is increasing in November-May and after the temperature exceeds upto  $25$  crop production decreases. Figure 11: indicates that the production of *Sorghum* is inversely proportional to the temperature in June-October i.e. the *Sorghum* production is gradually decreasing when the temperature is increasing in June-October. Figure [12] shows that the production of *Sorghum* is gradually decreasing if the rain is increasing in between January-December. The production of *Sorghum* is maximum when the amount of the rain is minimum in January-December.

## CONCLUSIONS

The effect of different parameters on *Sorghum* production has been studied using Pipeline pilot. In figure 5 the results showed that *Sorghum* production is high at high values of longitude (above  $85^{\circ}N$ ). In figure 6 the result showed that the effect of latitude on *Sorghum* production increases in between  $0-25^{\circ}N$ .

### ABSTRACT

The stock markets reflect to a large extent the economic development of a country. The banking industry has a strong grip on majority of shares in Indian stock trading market. The investors in the stock market use to bear certain risk for their predictable returns in the future. Investment decisions are usually taken by considering different fundamental factors both internal and external. Apart from fundamental factors which replicated in the security prices, there are numerous additional factors that can influence investment are stock prices, volume of trading, spread, turnover etc. The paper explores the effect of different variables on the high stock price of Axis Bank considering daily data over the period 4 Jan 2010 to 23 Apr 2020. For the study the “weighted average price (WAP), number of shares, number of trades, total turnover (in INR), deliverable quantity, percent deliverable quantity to traded quantity, spread high and low, spread open and close and the high stock price of the organization” were noted. High stock price was considered as output while other parameters were used as input. Pipeline Pilot module of Biovia software (Dassault Systemes of France) was used for analysis. The software provides different built-in components to develop a machine learning model and use the model for prediction.

**Keywords:** Bombay Stock Market, Axis Bank, High Stock Prices, WAP, Spread, Deliverable Quantity

## INTRODUCTION

### Background of the Study

Stock markets play a significant role in reflecting the monetary and economic condition of developing nations. Trading in the financial instruments like share, debenture and bonds of different companies used to be carried out in

**Mohammed Siddique and Pramod Kumar Patjoshi**

the capital market. The investors buy and sell on various financial instruments of different companies in the stocks market. As the demand and supply of different stocks in a specific time determines the stock prices, it varies in every minute. Thus, investments in the capital market involve risks as well as uncertainties associated with high level of instability or volatility. The investors in the stock market use to bear certain risk for their predictable returns in the future. As a result investments in stock market involve risk and returns (Savsani and Rathod, 2018).

While investing in the stock market, investors respond to the accessible data with them and take the decisions consequently based on their analysis. Investment decisions are usually taken by considering different variables like types of “investors, family back ground, age, occupation, sex, income, marital status, risk tolerance capacity, education, demographic environment and advice of financial expert and advisor” (Singh and Yadav, 2016). On the other hand, an investor considers internal factors (firm particulars) like company news and performance, industry performance, board structure, asset situation, dividends and earnings and external factors comprising of governmental policies, interest rates, economic outlook, inflation, business cycle, approach of investor, market environments and contingencies like strikes, lock outs etc. before making an investment decision (Graham and Dodd, 1934). Different theories indicate that apart from fundamental factors which replicated in the security prices, there are numerous additional factors that can influence investment are stock prices, volume of trading, spread, turnover etc. (Debasis, 2006).

Indian stock market has seen remarkable progress in last three decades in relations of contribution, volume of trade, financial instruments, procedures, dynamics and strategies of investment. The stock market is creating new record by achieving high market capitalisation in addition to incorporated with the international stock markets. Simultaneously, the various stock markets of different countries inside the economy are getting better (Ashraf and Baig, 2015). BSE has aided the development of the Indian company by contributing towards well-organized fund raising platform. Currently BSE delivers an effective and apparent market for buying and selling in equity, currencies, debt instruments, derivatives, mutual funds (bseindia.com).

**LITERATURE REVIEW**

DeBondt and Thaler (1985) examined the share prices by means of low long-term returns inclined to achieve higher expected returns. While Pesaran and Timmermann (1995), observed the strength of the indication on certainty of U.S. share prices returns and studied prediction of stock prices depends upon past trend oppressed by investors to earn profits in excess of a buy and hold strategy. Yartey (2008) investigated that the in developing countries the macro-economic issues like income level, gross domestic investment, banking sector development, private capital flows, and stock market liquidity are vital elements for the growth in stock market. The research also indicates that political risk, law and order, and bureaucratic quality are important elements of growth in stock market. Similarly, Hosseini, Ahmad and Lai (2011) observed the associations among stock market indices and four macro-economic elements, specifically crude oil price, money supply, industrial production as well as inflation rate in China and India. Aduda, Masila, and Onsongo (2012) examined the factors influencing the Nairobi Stock Exchange and brought out that, macro-economic features like stock market liquidity, institutional excellence, income per capita, domestic savings and bank growth are vital factors of growth in stock market. While Joshi (2013) in his research suggested that the foremost issues of accountable fluctuation in Indian stock market are investment of FIIs, political condition, growth of GDP, price level changes, liquidity and altered in interest rate. As indicated in the literature that performance of banking sector has an impact on stock market, an attempt is made to study the same.

**Indian Banking Industry**

India's banking sector is adequately capitalized by Reserve Bank of India (RBI) and well governed. RBI's new steps could go a long way in helping the domestic banking industry restructure. “The Indian banking system consists of 18 public sector banks, 22 private sector banks, 46 foreign banks, 53 regional rural banks, 1542 urban cooperative banks

**Mohammed Siddique and Pramod Kumar Patjoshi**

and 94384 rural cooperative banks as of September 2019. In FY2017-18, total lending increased at a CAGR of 10.94 per cent and total deposits increased at a CAGR of 11.66 per cent. India's retail credit market is the fourth largest in the emerging countries. It increased to US\$ 281 billion on December 2017 from US\$ 181 billion on December 2014" (www.ibef.org) Credit, market and liquidity risk studies suggest that Indian banks are generally resilient and have withstood the global downturn well. Indian banking industry has recently witnessed the roll out of innovative banking models like payments and small finance banks. The digital payments system in India has evolved in the last decade and with India's Immediate Payment Service (IMPS), being the only system at level 5, is the Faster Payments Innovation Index (FPII). Axis Bank is one of the pioneer public sector banks which are introducing innovative digital platforms for smooth running of the bank.

**MATERIALS AND METHODS****Software used**

Pipeline Pilot module of Biovia software (Dassault Systems of France) was used for analysis. The software provides different built-in components to develop a machine learning model and use the model for prediction.

**Methodology****Collection of data**

Data was collected from Bombay Stock Exchange on 23 Apr 2020 at around 9 PM for the period 4 Jan 2010 to 23 Apr 2020 for Axis Bank. Data for certain dates were not available. For each of the available dates weighted average price (WAP), number of shares, number of trades, total turnover (in INR), deliverable quantity, percent deliverable quantity to traded quantity, spread high and low, spread open and close and the high stock price of the organization were noted. High stock price was considered as output while other parameters were used as input. In order to avoid numerical difficulties during computation and to prevent dominance of features with greater numerical ranges over smaller numerical ranges, normalization has been implemented during pre-processing stage. Here, normalization of data has been achieved by linearly scaling to [0, 1] using the following equation

$$NV_i = \frac{A_i - A_{min}}{A_{max} - A_{min}}, \text{ for } i = 1, 2, 3, \dots, l$$

where,  $A_i$  is the actual value of the  $i$ -th feature,  $l$  is the total number of data points available,  $A_{max}$  and  $A_{min}$  are the maximum and minimum values respectively, and  $NV_i$  is the corresponding normalized value

**Development of Deep Learning Neural Network Model**

The normalized dataset was read using "Delimited Text Reader" component of pipeline pilot. The component was connected to the "Learn R Deep Neural Net Model" component. The output of the model was displayed using "HTML Table Viewer" component. The parameters for the "Learn R Deep Neural Net Model" component were set as shown in Figure 1. The setting for which the experimental output parameter and the predicted parameter were close to a 45° line were considered for the final model.

**Study of effect of different input parameters on high stock price**

Text files were prepared where one parameter was varied within the range of 0 to 1. All other parameters were kept constant at 0.5. The 0.5 value was chosen arbitrarily for the normalized parameter value. Figure 2 shows a sample application developed for the purpose of studying the effect of parameter 1 (WAP) on high stock price.

**RESULTS AND DISCUSSION**

Stock prices vary every day due to different market forces. Share prices, on principle, change because of supply and demand. If more people want to buy a stock (demand) than sell it (supply), then the price moves up. On the other

**Mohammed Siddique and Pramod Kumar Patjoshi**

hand, if more people want to sell a stock than buy it, the price would fall. However, it is difficult to predict the factors what make people prefer a particular stock and dislike another stock. If an organization's earnings surprise (are better than expected), the stock price jumps up. If a company's results disappoint (are worse than expected), then the price falls. Apart from earnings, the sentiment towards a stock can control its price. The stock prices are volatile and can change due to number of parameters. However, the relationships are difficult to predict. Thus, this study focuses on the effect of various input parameters on the high stock price.

**Prediction ability of the model**

Figure 3 shows that the prediction ability of the model was good and the predictions were close to the experimental values.

**WAP**

A weighted average takes into account the number of shares purchased with each trade. It is important because it provides traders with insight into both the trend and value of a security. Institutions usually try to buy below the WAP, and sell above it. Thus, WAP controls the stock prices. As expected, Figure 4 shows that an increase in WAP increases the stock prices.

**Number of shares**

The principal theory is that the price movement of a stock indicates what investors feel about the worth of a company is worth. The number of shares a company holds controls the impression about the company. Thus, increase in number of shares increase the stock price (Figure 5).

**Number of Trades**

Every stock has a component of number of trades. Higher numbers of trades create a positive impression in the mind of the investors. Figure 6 shows that an increase in number of trades increases the stock price, as expected.

**Total turnover (in INR)**

In an emerging market, one of the noise indicators is turnover. Usually the investors use these noises to predict future prices of the stocks on a short-term time horizon. Turnover parameter is dynamic in nature and usually depends on the choice for the investors. For a rising market, a high turnover reflects the investors' affinity and is likely to increase the stock price. On the other hand, in falling market, usually high turnover accelerates fall in stock prices. Figure 7 shows that an increase in turnover decreases fall in stock prices indicating a possibility of a falling market.

**Deliverable Quantity**

Deliverable quantity is that portion of total traded quantity which actually drives a person taking delivery into Demat or selling from Demat. When the deliverable quantity increases and the stock price do not increase, then people are waiting for something nice to happen in the near future. This is a good indicator to hold the stock for a long term. Usually an increase in deliverable quantity should increase the stock price. Figure 8 shows that the stock price shows an increasing trend with the increase in the deliverable quantity.

**Percent deliverable quantity to traded quantity**

When the deliverable quantity percentage (with respect to total traded quantity) increases with increase in the stock price, then there is a bullish move on the stock. When the stock price decreases with increase in deliverable quantity percentage (with respect to total traded quantity), then there is a bearish move on the stock. Figure 9 shows that stock prices drop sharply after a slight hike with the increases in percent deliverable quantity to traded quantity.

**Mohammed Siddique and Pramod Kumar Patjoshi****Spread high and low**

One of the noise indicators is spread high and low. Usually the investors use these noises to predict future prices of the stocks on a short-term time horizon. The spread between high and low prices reflects the extremities of intra-day movement and it indicates boundaries of intra-day volatility. If the difference is high, the prices are susceptible to react more on instant market information. As this indicator is usually used under falling market condition, a hike in stock price with an increase in the spread high and low indicates good sign in the market for the investor (Figure 10).

**Spread open and close**

One of the noise indicators is spread open and close. Usually the investors use these noises to predict future prices of the stocks on a short-term basis. The spread between opening and previous closing prices is a differentially static price phenomenon. It shows the impulse of price movement during the period of no trading. Even if the nature of this noise is comparatively static, it can have a negative relationship with the stock price movements. Figure 11 also shows that increase in spread open and close negatively affects the stock price.

**CONCLUSIONS**

The fluctuation in the stock prices is effected by different fundamental factors both internal and external. Apart from fundamental factors which replicated in the security prices, there are numerous additional factors that can influence investment are stock prices, volume of trading, spread, turnover etc. This paper explores the effect of different variables on the high stock price of Axis Bank considering daily data over the period 4 Jan 2010 to 23 Apr 2020. Pipeline Pilot module of Biovia software (DassaultSystemes of France) was used for analysis. The software provides different built-in components to develop a machine learning model and use the model for prediction. The results show that WAP, number of shares, number of trades, deliverable quantity as well as spread high and low have similar effect on high price of Axis Bank during the study period. The increases in WAP, number of shares, number of trades, deliverable quantity as well as spread high and low increases the stock prices. On the contrary turnover as well as spread open and close have a reverse effect on high price of Axis Bank. And it is found that increase in turnover as well as spread open and closed decreases in stock prices indicating a possibility of a falling market. On the other hand stock prices drop sharply after a slight hike with the increases in percent of deliverable quantity of Axis Bank stock prices during the study period. Therefore, it can be concluded that relationship between WAP, number of shares, number of trades, deliverable quantity as well as spread high and low have significant effect on high price on stock of Axis Bank.

### ABSTRACT

The stock markets immensely contribute to the economic development of India. The banking industry has in its grip majority of shares in Indian stock trading market. The investors in the stock market use to bear certain risk for their predictable returns in the future. Investment decisions are usually taken by considering different fundamental factors both internal and external. Apart from fundamental factors which replicated in the security prices, there are numerous additional factors that can influence investment are stock prices, volume of trading, spread, turnover etc. The paper explores the effect of different variables on the high stock price of State Bank of India considering daily data over the period 4 Jan 2010 to 23 Apr 2020. For the study the “weighted average price (WAP), number of shares, number of trades, total turnover (in INR), deliverable quantity, percent deliverable quantity to traded quantity, spread high and low, spread open and close” and the high stock price of the organization were noted. High stock price was considered as output while other parameters were used as input. Pipeline Pilot module of Biovia software (Dassault Systemes of France) was used for analysis. The software provides different built-in components to develop a machine learning model and use the model for prediction.

### INTRODUCTION

Stock markets play a significant role in reflecting the monetary and economic condition of developing nations. Trading in the financial instruments like share, debenture and bonds of different companies used to be carried out in the capital market. The investors buy and sell on various financial instruments of different companies in the stocks

25136

**Pramod Kumar Patjoshi and Mohammed Siddique**

market. As the demand and supply of different stocks in a specific time determines the stock prices, it varies in every minute. Thus, investments in the capital market involve risks as well as uncertainties associated with high level of instability or volatility. The investors in the stock market use to bear certain risk for their predictable returns in the future. As a result investments in stock market involve risk and returns (Savsani and Rathod, 2018).

While investing in the stock market, investors respond to the accessible data with them and take the decisions consequently based on their analysis. Investment decisions are usually taken by considering different variables like types of “investors, family back ground, age, occupation, sex, income, marital status, risk tolerance capacity, education, demographic environment and advice of financial expert and advisor” (Singh and Yadav, 2016). On the other hand, an investor considers internal factors (firm particulars) like company news and performance, industry performance, board structure, asset situation, dividends and earnings and external factors comprising of governmental policies, interest rates, economic outlook, inflation, business cycle, approach of investor, market environments and contingencies like strikes, lock outs etc. before making an investment decision (Graham and Dodd, 1934). Different theories indicate that apart from fundamental factors which replicated in the security prices, there are numerous additional factors that can influence investment are stock prices, volume of trading, spread, turnover etc. (Debasis, 2006).

Indian stock market has seen remarkable progress in last three decades in relations of contribution, volume of trade, financial instruments, procedures, dynamics and strategies of investment. The stock market is creating new record by achieving high market capitalisation in addition to incorporated with the international stock markets. Simultaneously, the various stock markets of different countries inside the economy are getting better (Ashraf and Baig, 2015). BSE has aided the development of the Indian company by contributing towards well-organized fund raising platform. Currently BSE delivers an effective and apparent market for buying and selling in equity, currencies, debt instruments, derivatives, mutual funds (bseindia.com).

**Objective of the Study**

To analyse the effect of different variables on the high stock price of State Bank of India

**LITERATURE REVIEW**

DeBondt and Thaler (1985) examined the share prices by means of low long-term returns inclined to achieve higher expected returns. While Pesaran and Timmermann (1995), observed the strength of the indication on certainty of U.S. share prices returns and studied prediction of stock prices depends upon past trend oppressed by investors to earn profits in excess of a buy and hold strategy. Yartey (2008) investigated that the in developing countries the macro-economic issues like income level, gross domestic investment, banking sector development, private capital flows, and stock market liquidity are vital elements for the growth in stock market. The research also indicates that political risk, law and order, and bureaucratic quality are important elements of growth in stock market. Similarly, Hosseini, Ahmad and Lai (2011) observed the associations among stock market indices and four macro-economic elements, specifically crude oil price, money supply, industrial production as well as inflation rate in China and India. Aduda, Masila, and Onsongo (2012) examined the factors influencing the Nairobi Stock Exchange and brought out that, macro-economic features like stock market liquidity, institutional excellence, income per capita, domestic savings and bank growth are vital factors of growth in stock market. While Joshi (2013) in his research suggested that the foremost issues of accountable fluctuation in Indian stock market are investment of FIIs, political condition, growth of GDP, price level changes, liquidity and altered in interest rate. As indicated in the literature that performance of banking sector has an impact on stock market, an attempt is made to study the same.

### Pramod Kumar Patjoshi and Mohammed Siddique

#### Indian Banking Industry

India's banking sector is adequately capitalized by Reserve Bank of India (RBI) and well governed. RBI's new steps could go a long way in helping the domestic banking industry restructure. "The Indian banking system consists of 18 public sector banks, 22 private sector banks, 46 foreign banks, 53 regional rural banks, 1542 urban cooperative banks and 94384 rural cooperative banks as of September 2019. In FY2017-18, total lending increased at a CAGR of 10.94 per cent and total deposits increased at a CAGR of 11.66 per cent. India's retail credit market is the fourth largest in the emerging countries. It increased to US\$ 281 billion on December 2017 from US\$ 181 billion on December 2014" (www.ibef.org) Credit, market and liquidity risk studies suggest that Indian banks are generally resilient and have withstood the global downturn well. Indian banking industry has recently witnessed the roll out of innovative banking models like payments and small finance banks. The digital payments system in India has evolved in the last decade and with India's Immediate Payment Service (IMPS), being the only system at level 5, is the Faster Payments Innovation Index (FPII). State Bank of India (SBI) is one of the pioneer public sector banks which are introducing innovative digital platforms for smooth running of the bank.

#### METHODOLOGY

##### Software Used

Pipeline Pilot module of Biovia software (Dassault Systemes of France) was used for analysis. The software provides different built-in components to develop a machine learning model and use the model for prediction.

##### Collection of Data

Data was collected from Bombay Stock Exchange on 23 Apr 2020 at around 9 PM for the period 4 Jan 2010 to 23 Apr 2020 for State Bank of India. Data for certain dates were not available. For each of the available dates weighted average price (WAP), number of shares, number of trades, total turnover (in INR), deliverable quantity, percent deliverable quantity to traded quantity, spread high and low, spread open and close and the high stock price of the organization were noted. High stock price was considered as output while other parameters were used as input.

In order to avoid numerical difficulties during computation and to prevent dominance of features with greater numerical ranges over smaller numerical ranges, normalization has been implemented during pre-processing stage. Here, normalization of data has been achieved by linearly scaling to [0, 1] using the following equation

$$NV_i = \frac{A_i - A_{min}}{A_{max} - A_{min}}, \text{ for } i = 1, 2, 3, \dots, l$$

where,  $A_i$  is the actual value of the  $i$ -th feature,  $l$  is the total number of data points available,  $A_{max}$  and  $A_{min}$  are the maximum and minimum values respectively, and  $NV_i$  is the corresponding normalized value

##### Development of Deep Learning Neural Network Model

The normalized dataset was read using "Delimited Text Reader" component of pipeline pilot. The component was connected to the "Learn R Deep Neural Net Model" component. The output of the model was displayed using "HTML Table Viewer" component. The parameters for the "Learn R Deep Neural Net Model" component were set as shown in Figure 1. The setting for which the experimental output parameter and the predicted parameter were close to a 45° line were considered for the final model.

##### Study of effect of different input parameters on high stock price

Text files were prepared where one parameter was varied within the range of 0 to 1. All other parameters were kept constant at 0.5. The 0.5 value was chosen arbitrarily for the normalized parameter value. Figure 2 shows a sample application developed for the purpose of studying the effect of parameter 1 (WAP) on high stock price.

**Pramod Kumar Patjoshi and Mohammed Siddique**

## RESULTS AND DISCUSSION

Stock prices vary every day due to different market forces. Share prices, on principle, change because of supply and demand. If more people want to buy a stock (demand) than sell it (supply), then the price moves up. On the other hand, if more people want to sell a stock than buy it, the price would fall. However, it is difficult to predict the factors what make people prefer a particular stock and dislike another stock. If an organization's earnings surprise (are better than expected), the stock price jumps up. If a company's results disappoint (are worse than expected), then the price falls. Apart from earnings, the sentiment towards a stock can control its price. The stock prices are volatile and can change due to number of parameters. However, the relationships are difficult to predict. Thus, this study focuses on the effect of various input parameters on the high stock price.

### Prediction Ability of the Model

Figure 3 shows that the prediction ability of the model was good and the predictions were close to the experimental values.

### WAP

A weighted average takes into account the number of shares purchased with each trade. It is important because it provides traders with insight into both the trend and value of a security. Institutions usually try to buy below the WAP, and sell above it. Thus, WAP controls the stock prices. As expected, Figure 4 shows that an increase in WAP increases the stock prices.

### Number of shares

The principal theory is that the price movement of a stock indicates what investors feel about the worth of a company is worth. The number of shares a company holds controls the impression about the company. Thus, increase in number of shares increase the stock price (Figure 5).

### Number of Trades

Every stock has a component of number of trades. Higher numbers of trades create a positive impression in the mind of the investors. Figure 6 shows that an increase in number of trades increases the stock price, as expected.

### Total Turnover (in INR)

In an emerging market, one of the noise indicators is turnover. Usually the investors use these noises to predict future prices of the stocks on a short-term time horizon. Turnover parameter is dynamic in nature and usually depends on the choice for the investors. For a rising market, a high turnover reflects the investors' affinity and is likely to increase the stock price. On the other hand, in falling market, usually high turnover accelerates fall in stock prices. Figure 7 shows that an increase in turnover decreases fall in stock prices indicating a possibility of a falling market.

### Deliverable Quantity

Deliverable quantity is that portion of total traded quantity which actually drives a person taking delivery into Demat or selling from Demat. When the deliverable quantity increases and the stock price do not increase, then people are waiting for something nice to happen in the near future. This is a good indicator to hold the stock for a long term. Usually an increase in deliverable quantity should increase the stock price. Figure 8 shows that the stock price increased to a threshold value of deliverable quantity followed by a decrease. Above the threshold value there might be some uncertainty in the minds of the investors.

**Pramod Kumar Patjoshi and Mohammed Siddique****Percent deliverable quantity to traded quantity**

When the deliverable quantity percentage (with respect to total traded quantity) increases with increase in the stock price, then there is a bullish move on the stock. When the stock price decreases with increase in deliverable quantity percentage (with respect to total traded quantity), then there is a bearish move on the stock. Figure 9 shows that there is a threshold below which there is interest in the stock and above which the investors lose interest in the stock.

**Spread high and low**

One of the noise indicators is spread high and low. Usually the investors use these noises to predict future prices of the stocks on a short-term time horizon. The spread between high and low prices reflects the extremities of intra-day movement and it indicates boundaries of intra-day volatility. If the difference is high, the prices are susceptible to react more on instant market information. As this indicator is usually used under falling market condition, a drop in stock price with an increase in the parameter indicates some issues in the market. In certain cases, spread of high and low may trigger selling (Figure 10).

**Spread open and close**

One of the noise indicators is spread open and close. Usually the investors use these noises to predict future prices of the stocks on a short-term basis. The spread between opening and previous closing prices is a differentially static price phenomenon. It shows the impulse of price movement during the period of no trading. Even if the nature of this noise is comparatively static, it can have a positive relationship with the stock price movements. Figure 11 also shows that above a threshold value it negatively affects the stock price.

**CONCLUSIONS**

The fluctuation in the stock prices is due to various fundamental internal and external factors. Apart from fundamental factors which replicated in the security prices, there are numerous additional factors that can influence investment are stock prices, volume of trading, spread, turnover etc. This paper explores the effect of different variables on the high stock price of State Bank of India considering daily data over the period 4 Jan 2010 to 23 Apr 2020. Pipeline Pilot module of Biovia software (Dassault Systems of France) was used for analysis. The software provides different built-in components to develop a machine learning model and use the model for prediction. The results show that WAP, number of shares and number of trades have similar effect on high price of State Bank of India during the study period. The increases in WAP, number of shares and number of trades increases the stock prices. On the contrary turnover have a reverse effect on high price of State Bank of India and found increase in turnover decreases in stock prices indicating a possibility of a falling market. On the other hand the percent deliverable quantities to traded quantity, deliverable quantity in addition to spread open and close have identical effect on State Bank of India stock prices during the study period. It found from the analysis that the percent deliverable quantities to traded quantity, deliverable quantity as well as spread open and close positive relationship with the stock price movements for a certain period and then shows above a threshold value it negatively affects the stock price. Therefore, it can conclude that relationship between WAP, number of shares, number of trades, percent deliverable quantities to traded quantity, deliverable quantity in addition to spread open and close have significant effect on high price on stock of State Bank of India.

### ABSTRACT

Different parameters influence the production of cotton. For the study, the effects of longitude, latitude, Rain (Jan-Dec), Rain (Nov-May), Rain (June-Oct), Temperature (Jan-Dec), Temperature(Nov-May), and Temperature(June-Oct) on production of cotton was studied. "Pipeline Pilot module of Biovia software" (DassaultSystems of France) was used for analysis. The software provides different built-in components to develop a "machine learning model" and use the model for prediction.

**Keywords:**Neural network, Cotton, Latitude, Longitude, Rain, Temperature.

## INTRODUCTION

### Machine Learning

Machine learning is an software of synthetic intelligent (AI) that provide the system capacity to robotically research and improve from reveal in without being explicitly of programmed. Machine learning specialize in the development of laptop programmes that may access record and use it study for themselves. The system of getting to know being with observation or information such as example direct experience or instructions in order to search for styles in information and may better selection in the future based totally the example that we provide. The Primary aim is to allow the computer systems learn routinely without human intervention or assistant and alter movements accordingly.

### Cotton Production

Being a cash crop, cotton is known for it's intensive cultivation. Some Production Practice like wide plant to plant and row to row spacing. Nearly 65% cotton area is rainfed mainly in the central and southern states. Cotton crop is highly prons to pests and disease. Wide fluctuation in cotton prices, inadequate market infrastructure and cotton

export policy. Cotton is a semi-xerophyte is grown in tropical & subtropical conditions. A minimum temperature of 15°C is required for better germination at field conditions. The optimum temperature for vegetable growth is 21-27°C and it can tolerate temperature to the extent of 43°C but temperature below 21°C is detrimental to the crop warm days of cool nights with large diurnal variation during the period of fruiting are conducive to good boll and fiber development. Cotton is a kharif crop in the major parts of the country such as Rajasthan, Uttar Pradesh, Gujrat, Madhya Pradesh etc.

## REVIEW OF LITERATURE

Cotton is one of the most important cash crops in India. Every year the production of cotton is reducing due to the attack of the disease. Plant diseases are generally caused by pest insect and pathogens and decrease the productivity to large scale if not controlled within time. This paper presents a system for detection and controlling of disease on cotton leaf along with soil quality monitoring. The work proposes a support vector machine based regression system for identification and classification for five cotton leaf diseases i.e. Bacterial Blight, Alternaria, Gray Mildew, Cereospora, and Fusarium wilt. Cotton is one of the most important cash crops in India and affects India's economy in many ways. Large number of the population depends on cotton crop either for its cultivation or for the purpose of processing. It is observed that the development in agriculture is sluggish nowadays due to attack of disease.

P. R. Rothe, R. V. Kshirsagar[1] in "Cotton Leaf Disease Identification using Pattern Recognition Techniques" presents Active contour model is used for image segmentation and Hu's moments are extracted as features for the training of adaptive neuro-fuzzy inference system. Ratih Kartika Dewi, R. V. Hari Ginardi[3], in "Feature Extraction for Identification of Sugarcane Rust Disease" presents image pattern classification to identify rust disease in sugarcane leaf with a combination of texture and color feature extraction. Rajneet Kaur, Miss. Manjeet Kaur[2], in "A Brief Review on Plant Disease Detection using in Image Processing" presents identification of diseased part on the leaf and classify the disease using SVM classifier. [4] P. Revathi, M. Hemalatha, in "Advance Computing Enrichment Evaluation of Cotton Leaf Spot Disease Detection Using Image Edge detection" presents mobile captured symptoms of Cotton Leaf Spot images and categorize the diseases using neural network. The classifier is being trained to achieve intelligent farming, including early detection of disease in the groves, selective fungicide.

## Objectives

To determine the effect of parameters on production of Cotton using machine learning. In this study we can determine the suitable condition where the cotton grows in a manner that we can get maximum profit.

## MATERIALS AND METHODS

### Software used

"Pipeline Pilot module of Biovia software" (DassaultSystems of France) is used for analysis. The software provides different built-in components to develop a "machine learning model" and use the model for prediction.

### Methodology

#### Collection of data

Data was collected from website. Longitude, latitude, Temperature (Jan-Dec), Temperature (Nov-May), Temperature (June-Oct), Rain (Jan-Oct), Rain (Nov-May), Rain (June-Oct) were taken as input while production of cotton was used as output parameter.

### Development of deep learning neural network model

The dataset was read using "Delimited Text Reader" component of "pipeline pilot". The component was connected to the "Learn R Deep Neural Net Model" component. The output of the model was displayed using "HTML Table Viewer" component. The parameters for the "Learn R Deep Neural Net Model" component were set as shown in Figure 1. The setting for which the experimental output parameter and the predicted parameter were close to a 45° line were considered for the final model.

### Study of effect of different input parameters on cotton production

Text files were prepared where one parameter was varied within the range of data analyzed. All other parameters were kept constant at an average value.

## RESULTS AND DISCUSSION

Cotton production varies due to different reasons. However, the relationships are difficult to predict. Thus, this study focuses on the effect of various input parameters on the cotton production. Figure 2 shows that cotton production in particular area is gradually decreasing till the longitude reaches around 85°E. The result shows that low value of longitude favored cotton production. Figure 3 shows that cotton production in the particular area is constantly decreasing when latitude varies from 0°N to 30°N. Figure 4 indicates that cotton production in particular area is gradually decreasing when the rainfall varies from 0 mm to 250 mm then it is increasing after crossing 300 mm. Figure 5 shows that cotton production in the particular area is gradually decreasing when the rainfall varies from 0 mm to 120 mm. Figure 6 represents that the cotton production in the particular area is gradually increasing when temperature increases from 0°C to 25°C. Figure 7 shows that the cotton production in the particular area is gradually decreasing with the variation in temperature from 0°C to 25°C. Figure 8 indicates that the cotton production in the particular area is gradually increasing when temperature increases from 0°C to 30°C. Figure 9 shows that cotton production in the particular area is gradually increasing from 0 mm to 100mm. Then it starts decreasing after crossed 100mm.

## CONCLUSIONS

The effects of different parameters on cotton production have been studied using Pipeline pilot. The results shown that cotton production is high around longitude 70°E, latitude (at 10°N), 600mm rain in June-Oct, below 20mm rain in Nov-May, 110mm rain in Jan-Dec, 30°C temperature in June-Oct, 10°C temperature in Nov-May and 30°C temperature in Jan-Dec.

### ABSTRACT

The abstract is to be in fully-justified italicized text as it is here, below the author information. Use the word “Abstract” as the title, in 12-point Times New Roman, boldface type, centered relative to the column, initially capitalized. The abstract is to be in 11-point, single-spaced type, and may be up to 3 in. (18 picas or 7.62 cm) long. Leave two blank lines after the abstract, and then begin the main text. All manuscripts must be in English.

**Keywords:** Pre Engineered Buildings (PEB), Design of PEB

### INTRODUCTION

PEB is very versatile building systems and can be finished internally to serve any functions and accessorized externally to achieve attractive and unique designing styles. It is very advantageous over the conventional buildings and is really helpful in the low rise building design. Pre engineered buildings are generally low rise buildings however the maximum eave height can go up to 25 to 30 meters. Low rise buildings are ideal for offices, houses, showrooms, shop fronts etc. The application of pre engineered buildings concept to low raise buildings is very economical and speedy. The roof of low rise buildings may be flat or sloped. One such revolution was the Pre Engineered Buildings. Although PEB systems are extensively used in industrial and many other non residential constructions worldwide, it is relatively a new concept in India. As compared to other countries Indian codes for building design are stringent but safer in design of PEB.

Technological improvement over the years has contributed immensely to the enhancement of quality of life through various new products and services. One such revolution was the Pre Engineered Buildings. Although PEB systems are extensively used in industrial and many other non residential constructions worldwide, it is relatively a new

**Babuli Kumar Jena and Mohammed Siddique**

concept in India. As compared to other countries Indian codes for building design are stringent but safer in design of PEB. Cold formed Z- and C-shaped members may be used as secondary structural elements to fasten and support the external cladding. Roll-formed profiled steel sheet, wood, tensioned fabric, precast concrete, masonry block, glass curtain wall or other materials may be used for the external cladding of the building. While pre-engineered buildings can be adapted to suit a wide variety of structural applications, the greatest economy will be realized when utilizing standard details. An efficiently designed pre-engineered building can be lighter than the conventional steel buildings by up to 30%. Lighter weight equates to less steel and a potential price savings in structural framework.

**Components of PEB Building****Main Frame**

Rigid steel frames of the building are mainly considered as the Main Frames of PEB. PEB rigid frame comprises of tapered columns and tapered rafters (the fabricated tapered sections are referred to as built-up members). The tapered sections are fabricated using the state of ART technology wherein the flanges are welded to the web. Splice plates are welded to the ends of the tapered sections. The frame is erected by bolting the splice plates of connecting sections together.

**Sheeting's and Insulation**

Panels used for sheeting purpose are generally of ribbed steel sheets used as roof and wall sheeting, roof and wall liners, partition and soffit sheeting. The steel sheets are generally produced from steel coils having thickness 0.5 mm to 0.7 mm high tensile stress. In present day scenario, newly developed type "S" panel, whose profile is designed to withstand heavy loads, such as roof snow loads and uplift loads resulting from high velocity (cyclonic) winds is widely prevalent.

**Paints and Finishes**

Normally the primary and secondary steel are coated with one coat (35 microns) of red oxide paint without any special treatment to steel. However, if some special paint has to be applied to steel in order to give better anti – corrosion properties, then the steel members have to be shot – blasted and then coated with the special paints. For houses; inside and outside painting on walls and false ceiling is to be provided.

**Doors and Windows**

Steel or aluminum framed doors and windows are fixed to the Purlins or the supporting profiled steel either by welding or bolted to the flanges already fixed to the Purlins. Proper flashings are applied wherever necessary.

**Ribbed Sheet Used for Roof and Wall Liners**

The other form of panels that are widely available is the G shaped panel. This deep – ribbed type 'G' panel is generally used as deck paneling for mezzanines and floor systems. Although exceptionally strong, 'G' shaped panel is used as shuttering for mezzanine reinforced concrete floors and panel is not a substitute for the reinforcement of mezzanine concrete slabs. The type 'G' panel is available only (unpainted) in 0.7 mm pre – galvanized coating over steel conforming to ASTM A653M SS Grade 550: Coating Z180.

**False Ceiling**

False ceiling is usually required for residential buildings or offices. A metal frame work is hung from the ceiling and false ceiling of rigid boards are either bolted or placed over the frame work.

**Babuli Kumar Jena and Mohammed Siddique**

**Partition Walls**

Partition walls are usually required for residential building or offices. Partition wall comprises of two rigid having insulation sandwiched in between and fixed to the steel columns or supporting profiled steel and Purlins. Alternatively prefabricated sandwich panels can also be fixed to the columns and Purlins.

**Flooring**

Flooring is usually of conventional nature consisting of cement concrete. For intermediate floors metal decking sheet is fixed to Purlins and concrete poured over it.

**Columns and Rafters**

The most important parts of the Pre Engineered Building are Columns and Rafters which are otherwise called as Primary Structure. The major load of the building is being borne these members. Assembled Columns and Rafters make the frame of the buildings on which all other parts of the buildings are fixed. The design of this structure is done using advance software such as STAAD PRO, Tekla etc. The usual load considerations are Live Load, Dead Load, Wind load, Collateral Load etc. Once the designs of these are completed, detailed engineering and shop drawings will be prepared.

**Z-Purlin and C-Purlin**

Z-Purlin, Girts, Eave struts etc are secondary members of structural framing. Z-Purlins are cold formed from steel which has minimum yield strength of 345 MPa. Purlins and Girts shall be roll formed Z sections, 200 mm deep with 64mm flanges(depends). Purlins are used in all Pre Engineered building as a secondary load member.

**Hi-rib Roofing Sheets**

Trafford roof sheets come with various profiles and colors. These sheets are widely used for the Warehouses, Factory sheds etc. Trafford sheets are becoming more popular among residential building applications also these days. The various application include Warehouses, Garages, Community Halls, factory shed. A panel assembly used as covering and consists of an insulating core material with inner and outer skins.

**Curved Eaves**

Curved eaves are formed from color coated steel after crimping and curving. Crimping is done in order to give an aesthetic appearance to the building. Curved eaves are widely used in Pre Engineered buildings.

**Pre Engineered Buildings Vs Conventional Steel Buildings**

PROPERTY	PEB BUILDINGS	CONVENTIONAL STEEL BUILDINGS
<b>STRUCTURE WEIGHT</b>	Pre engineered buildings are on the average 30% lighter because of the efficient use of steel. Primary framing members are tapered built up section. With the large depths in areas of higher stress.	Primary steel members are selected hot rolled "T" sections. Which are, in many segments of the members heavier than what is actually required by design? Members have constant cross section regardless of the varying magnitude of the local stresses along the member length.
	Secondary members are light weight roll formed "Z" or "C" shaped members.	Secondary members are selected from standard hot rolled sections which are much heavier.
	Quick and efficient: since PEB's are mainly formed by standard sections and connections design, time is significantly reduced. Basic	Each conventional steel structure is designed from scratch with fewer design aids available to the engineer.

**Babuli Kumar Jena and Mohammed Siddique**

<b>DESIGN</b>	design based on international design codes are used over and over.	
	Specialized computer analysis design programs optimize material required. Drafting is also computerized using standard details that minimize the use of project custom details.	Substantial engineering and detailing work is required from the very basic is required by the consultant with fewer design aids.
	Design shop detail sketches and erection drawings are supplied free of cost by the manufacturer. Approval drawing is usually prepared within in 2 weeks.	Extensive amount of consultant time is devoted to the alterations that have to be done.
	PEB designers design and detail PEB buildings almost every day of the year resulting in improving the quality of designs every time they work	As each project is a new project engineers need more time to develop the designs and details of the unique structure.
<b>FOUNDATIONS</b>	Simple design, easy to construct and light weight.	Extensive, heavy foundation required.
<b>DELIEVERY</b>	Average 6 to 8 weeks	Average 20 to 26 weeks
<b>SEISMIC RESISTANCE</b>	The low weight flexible frames offer higher resistance to seismic forces.	Rigid heavy frames do not perform well in seismic zones.

### Application

Applications of pre-engineered steel buildings include (but are not limited) to the following:

- Houses & Living Shelters
- Factories
- Warehouses
- Sport Halls
- Aircraft Hangers
- Supermarkets
- Workshops
- Distribution Centers
- Commercial Showrooms
- Office Buildings
- Labor Camps
- Petrol Pumps/Service Buildings
- Schools
- Community Centers
- Railway Stations
- Equipment housing/shelters
- Telecommunication shelters
- Restaurants

### Scope of Work

The major study of the project is on Moment Frame System and is explained in this work. Steel frames shall be so designed and detailed as to give them adequate strength and ductility to resist severe earthquakes in all zones classified. Frames, which form a part of the gravity load resisting system but are not intended to resist the lateral earthquake loads, need not satisfy the requirements of this section, provided they can accommodate the resulting deformation without premature failure.

### Types of lateral load resisting system

1. Braced Frame System
  - a. Ordinary Concentrically Braced Frame (OCBF)
  - b. Special Concentrically Braced Frame (SCBF)
  - c. Eccentrically Braced Frame (OCBF)
2. Moment Frame System
  - a. Normal Moment Resisting Frame (NMF)
  - b. Ordinary Moment Resisting Frame (OMF)
  - c. Special Moment Resisting Frame (SMF)

### Major Points Considered While Making the Model

- 1) Frames with same h/w ratio (0.2) and l/w (1.5) have been considered.
- 2) Supports are considered as pinned.
- 3) Member length has been maintained as 3 m for maximum members in the frame.
- 4) Columns depth is not varied along height as the moments will be high for frames with mezzanine floors.
- 5) Rafter and column depths are taken as tapered as per bending moment profile by not reducing the depth less than 50% than required.
- 6) The section properties of member has been calculated using following formulas taken from practice:
  1.  $d = \frac{\text{span}}{28}$
  2.  $\frac{d}{t_w} \leq \text{Max limit value for web section classification}$
  3. Width of flange =  $\frac{d}{5}$
  4.  $\frac{b}{t_f} \leq \text{Max limit value for flange section classification}$
  5. Overall section classification is the minimum of web and flange section classification.
- 7) Dimensions of steel members available in market
  1. Max length of any section available is 12m
  2. Thicknesses of web available are 4, 5, 6, 8, 10, 12, 14, 16, 20, 22, 24, 28, 32, 36, 40
  3. Widths of flange available are 130, 150, 180, 200, 225, 250, 275, 300, 325, 375, 400, 425, 450, 500
- 8) For each set of dimensions 3 different frames have been modeled
  1. Normal Moment Resisting Frame (NMF)
  2. Ordinary Moment Resisting Frame (OMF)
  3. Special Moment Resisting Frame (SMF)
- 9) For Normal and Ordinary Moment Resisting Frames:
  1. Column minimum as semi compact.
  2. Rafter minimum as Slender.
- 10) Load Combinations are taken from Table 1 of IS 800-2007 For Ordinary Moment Resisting Frame:
  1. Same member sections as considered as in Normal Moment resisting frame.
  2. Extra load combinations from Section 12.2.3 are considered along with Load Combinations from Table 4 of IS 800-2007 .
- 11) For Special Moment Resisting Frame:
  1. Column and Rafter minimum compact.
  2. Plastic potential zone is considered as 1.5 times depth required (d calculated above)
  3. In plastic potential zone the member is taken as plastic section.
  4. Plastic sections are considered at column-rafter junction and near support.

### Babuli Kumar Jena and Mohammed Siddique

12) Load Combinations are taken from Table 4 of IS800-2007

13) Deflection limit =  $\frac{Span}{180}$

By considering different frames (without cranes, with cranes and with mezzanine floors) with different dimensions given in following table, the results have been tabulated below.

Aspect Ratio: h/w = 0.2

Bay width = 7.5 m

Internal wind coefficient,  $C_{pi} = \pm 0.2$  as %opening is <5%

Wind Load Calculations done As per IS: 875-Part3

Sample STAAD frame models for an Ordinary Moment Resisting Frame, along with crane and with mezzanine are shown below

## CONCLUSIONS

By comparing different frames with and without section-12 load combinations state that there is no necessity of providing ductile sections or sections satisfying requirements of Section-12 of IS-800:2007. Compared to the previous code i.e. IS-800:1984, the weight of the structures is increasing when designed with the latest code, IS-800:2007. Therefore there is a increase in cost of the structure. But when observed, the section-12 load combinations are not governed for the same structure designed with new code. Hence the sections may be reduced by satisfying the minimum criteria as per the zone and type of structure through which weight of structure can be reduced which ultimately decreases the cost parameter.
