Table 1: Associated Traditional Knowledge of Weeds

1	2	3	4	5	6
Sl No	Plant	Scientific Name	Family	Local Name	Associated Traditional Knowledge
1	Country mallow	*Abutilon indicum*	Malvaceae	Mallow	It used as a traditional medicine as a laxative, emollient, analgesic, anti-diabetic, anti-inflammatory and blood tonic agent and also in the treatment of leprosy, urinary disease, jaundice, piles, relieving thirst, cleaning wounds and ulcers, vaginal infections, diarrhea, rheumatism, mumps, pulmonary tuberculosis, bronchitis, allergy, blood dysentery, some nervous and some ear problems.
2	Indian copperleaf	*Acalypha indica*	Euphorbiaceae	Kuppe gida	Used as anthelmintic, anti-inflammation, anti-bacterial, anti-cancer, anti-diabetes, anti-hyperlipidemic, anti-obesity, anti-venom, hepatoprotective, hypoxia, and wound healing medicine.
3	Bristly starbur	*Acanthospermum hispidum*	Asteraceae	--	Used for treatment of jaundice, malaria, vomiting, cephalgias, head-ache, abdominal pain,convulsions, stomachache, constipation, eruptive fever, snake bite, epilepsy, blennorrhoea, hepato-biliary disorders,malaria, microbial infection and viral infections.
4	Uttaraani	*Achyranthes aspera*	Amaranthaceae	Uttaraani	Used as medicine , used in the treatment of boils, asthma, in facilitating delivery, bleeding, bronchitis, debility, dropsy, cold, colic, cough, dog bite, snake bite, scorpion bite, dysentery, earache, headache, leukoderma, renal complications, pneumonia, and skin diseases. Used in Poojas during festival
5	Acmella	*Acmella oleracea*	Asteraceae	Acmella	used as a Used as medicine, analgesic, antiseptic, antioxidant and diuretic Used as fodder
6	Grass	*Aegilops tauschii*	Poaceae	Hullu	Flowers are used in festival,, it has medicine property
7	Bilikasa	*Aerva lanata*	Amaranthaceae	Bilikasa	Fodder, used as medicine, used **as** diuretic with anti-inflammatory, antihelmintic, anti-bacterial and mild analgesic effects**.** It is used in the treatment of lithiasis, cough, asthma, and headache and as an antidote for rat poisoning
8	Goat weed	*Ageratum*		---	Used as common wound and the burned

		conyzoides	Asteraceae		one, antimicrobe, arthrosis, headache, and dyspnea. an antimicrobial, and mouthwash as manure, insecticide, pesticide, herbicide, nematicide, fodder.
9	Floss flower	*Ageratum houstonianum*	Asteracea	--	Used as curing fever, paste of leaves is useful in wound healing, essential oil shows cytotoxic effect, antimicrobial and mosquitocidal effects anti- fungal and antibacterial *properties*
10	Red calico plant	*Alternanthera bettzickiana*	Amaranthaceae	--	Used as laxative, galactagogue, antipyretic, wound healing. - Studies have suggested antibacterial, antioxidant, antiviral, antioxidant, phytoremediative, mutagenic, hypoglycemic, anti-arthritic, anticancer properties.
11	Brazilian joyweed	*Alternanthera brasiliana*	Amaranthaceae	--	used against inflammation, cough, and diarrhea, *used* as digestive, depurative and diuretic
12	Smooth joyweed	*Alternanthera paronychioides*	Amaranthaceae	--	Used to treat hepatitis, tight chest, bronchitis, asthma and other lung troubles. The leaves and shoots boiled and drunk as antihypertensive remedy
13	Sonna Mullu	*Alternanthera pungens*	Amaranthaceae	Khaki weed	Used as medicine, for constipation with griping, and as an enema for diarrhoea
14	Jal jamba	*Alternanthera sessilis*	Amaranthaceae	Jal jamna	Flowers are used in festivals, it has medicine property used to treat hepatitis, bronchitis, asthma and other longs problems. The leaves and shoots boiled and drunk as antihypertensive remedy. and milky latex is poisonous
15	Mullu dantu	*Amaranthus spinosus*	Amaranthaceae	Mullu dantu	Used as Ayurveda medicine, the boiled leaves and roots are used as laxative, diuretic, anti-diabetic, antipyretic, anti-snake venom, antileprotic, anti-gonorrheal, expectorant and to relieve breathing in acute bronchitis. It also has anti-inflammatory, immune modulator, anti-androgenic and anthelmintic properties.
16	Datura	*Argemone maxicana*	Papaveraceae	Daturi	Used as Ayurveda medicine, Seeds are poisonous, for the treatment of several diseases including tumors, warts, skin diseases, inflammations, rheumatism, jaundice, leprosy, microbial infections, and malaria.
17	Red spiderling	*Boerhavia diffusa*	Nyctaginaceae	--	Used to treating inflammation, jaundice, asthma, rheumatism, nephrological disorders, ascites, anemia, and

				gynecological disorders.
18	Shaggy button weed	*Borreria hispida*	Rubiaceae	--	Used to treating urinary infections, oliguria, venereal diseases, conjunctivitis, hemorrhoids, gallstones, stomach ailments, internal injuries of nerves, and kidney, coughs, malaria, internal heat, dyslipidemia, and for reducing weight.
19	Buffalo grass	*Bouteloua dactyloides*	Poaceae	Yemme hullu	Used as medicine for piles
20	Crown flower	*Calotropis gigantean*	Asclepiadaceae	Ekka	Used to treating skin, digestive, respiratory, circulatory and neurological disorders and was used to treat fevers, elephantiasis, nausea, vomiting, and diarrhea.
21	Calotropis	*Calotropis procera*	Asclepiadaceae	Ekka	Used as medicine, fevers, rheumatism, indigestion, cough, cold, eczema, asthma, elephantiasis, nausea, vomiting and diarrhea.
22	Sicklepod	*Cassia tora*	Fabaceae	Sicklepod	used in the treatment of leprosy, ring worm, flatulence, colic, dyspepsia, constipation, cough, bronchitis and cardiac disorders
23	Cassia	*Cassia fistula*	Caesalpiniaceae	Cassia	Used as medicine, antifungal, antiviral, antidiahorreal and antidysentry properties, used for treatment of diabetes, asthma, leprosy, thoracic obstructions
24	Ondelaga	*Centella asiatica*	Apiaceae.	Ondelaga	Used as medicine, used to treat various disorders, dermatological conditions, and minor wounds
25	Hurhur	*Cleome gynandra*	Capparidaceae	Hurhur	Fodder, used as medicine, used to treat conditions including food poisoning, rheumatism, inflammation, bacterial infections, and especially pain-related conditions such as headache toothache, headache, neuralgia, stomach pain, ear-ache, rheumatoid arthritis, skeletal fractures, colic pain and chest pain
26	Tick weed	*Cleome pentaphylla*	Capparidaceae	Kolikalina gida	Used to cure diseases such as scurvy. anti-inflammatory, anti-bacterial, antimicrobial, anticancer, antioxidant, antiallergenic.
27	Tick weed	*Cleome viscosa*	Capparidaceae	--	Used as medicine for rheumatic arthritis, hypertension, malaria, neurasthenia, stomachic, laxative, diuretic, and anthelmintic and wound healing
28	Kanne soppu	*Commelina benghalensis*	Commelinaceae	Kanne soppu	Flowers are used in festival, it has medicine property, used to treat leprosy, sore throat, opthalmia, burns, pain and infammation and also used as de pressant, demulcent,

Ramesh

				emollient and laxative.
29	Crotolaria	*Crotalaria juncea*	Fabaceae	Crotolaria	Used as medicine for wounds and anti-inflammatory and antinociceptive activity Used to clean the black board
30	Three-leaved caper	*Croton bonplandianum*	Euphorbiaceaee	--	Used as fodder, used as *a laxative, expectorant, analgesic.*
31	Bermuda grass	*Cynodon dactylon*	Poaceae	Garike	Used as fodder, used as *a laxative, expectorant, analgesic.*
32	Datura	*Datura stramonium*	Solanaceae	Datura	Used for medicine, Used to treat back pain, antiepileptic, anti-asthmatic, analgesic, antioxidant, antimicrobial, insecticidal, repellent and organophosphate protective effects.
33	Duranta	*Duranta erecta*	*Verbenaceae*	Durantha	Used as medicine, diuretics, antidote to treat itches, infertility, pneumonia, malaria, intestinal worms, abscesses and neuralgic disorder. It exhibits antioxidant, antiparasitic, antibacterial, antifungal and antiviral activities against human pathogens
34	Indian globethistle	*Echinops echinatus*	Asteraceae	Brahmadhande	used as a stimulant to treat use the term Sexual debility, used to *treat different infectious diseases including trachoma, sepsis, typhoid, gonorrhea.*
35	Wild poinsettia	*Euphorbia geniculata*	Euphorbiaceae	Euphorbia	It is used as antibacterial, anti-inflammatory, antimalarial, galactogenic, antiasthmatic, antidiarrheal, anticancer, antioxidant, antiferlity, antiamoebic, and antifungal activities.
36	Euphorbia	*Euphorbia heterophylla*	Euphorbiacae	Euphorbia	Seeds are poisonous, used to treat ailments such as skin infections, fever, and gastrointestinal disorders.
37	Asthma herb	*Euphorbia hirta*	Euphorbiaceae	Euphorbia	It is used traditionally for female disorders, respiratory ailments ,cough, coryza, bronchitis, and asthma, worm infestations in children, dysentery, jaundice, pimples, gonorrhea, digestive problems, and tumors.
38	Morning glory	*Evolvulus alsinoides*	Convolvulaceae	----	used in Ayurveda as a brain tonic in the treatment of neurodegenerative diseases, asthma and amnesia, *treatment of neurodegenerative diseases as brain tonic, amnesia and asthma, epilepsy, nervous debility and loss of memory.*
39	Lantana	*Lantana camara*	Verbanaceae	Lantana, gadhigulabi	Used as fodder, medicine for wound healing, fever treatment, cough treatment, influenza treatment, stomach ache, malaria,
40	Leucas	*Leucas aspera*		Thumbe	Used as fodder, Used for cooking, it

Ramesh

		Lamiaceae		shows antifungal, antioxidant, antimicrobial, antinociceptive and cytotoxic activity, *antipyretic and insecticide*
41	Touch me not plant	*Mimosa pudica*	Mimosaceae	Muttidare muni	Used as medicine, cure several disorders like cancer, diabetes, hepatitis, obesity, and urinary infections, piles
42	Opuntia	*Opuntia stricta*	Cactaceae	Papaskalli	Used as medicine, used *in the management of diseases that involves oxidative stress, especially diabetes*, obesity and cancer
43	Parthenium	*Parthenium hysterophorus*	Asteraceae	Parthenium	Used as medicine, for skin inflammation, rheumatic pain, diarrhoea, urinary tract infections, dysentery, malaria and neuralgia
44	Akki hullu	*Paspalum floridanum*	*Poaceae*	Akki hullu	Used as fodder, Used for cooking
45	Nele nelli	*Phyllanthus niruri*	Euphorbiaceae	Nele nelli	antibacterial, anti-hyperglycemia, anti-viral, diuretic, hepatoprotector, and immunomodulator, *role in treating ulcers and urinary tract stones*
46	Plumbago	*Plumbago zeylanica*	Plumbaginaceae	Plumbago	Used as medicine, used in the treatment of stubborn chronic rheumatoid arthritis, skin diseases and tumerous chronic menstrual disorders, viral warts and chronic diseases of nervous system Seeds are poisonous
47	Jigali	*Portulaca oleracea*	*Portulacaceae*	Jigali	Used as medicine acting as a febrifuge, antiseptic, vermifuge, anti-inflammatory, antidiabetic, skeletal muscle relaxant, hepatoprotective, anticancer/antitumor, antioxidant, gastroprotective, neuroprotective, wound healing
48	Sida	*Sida acuta*	Malvaceae	Sida	Used as medicine, used as astringent, tonic and useful in treating urinary diseases and blood disorders, bile, liver and as treatment for nervous diseases Seeds are poisonous
49	Heart-leaf sida	*Sida cordifolia*	Malvaceae	Heart-leaf sida	It is used to treat bronchial asthma, cold and flu, chills, lack of perspiration, head ache, nasal congestion, aching joints and bones, cough and wheezing, and edema.
50	Ganige gida	*Solanum nigrum*	Solanaceae	Ganige gida	Used as fodder, Used as Ayurveda medicine to treat pneumonia, aching teeth, stomach ache, tonsillitis, wing worms, pain, inflammation and fever, tumor, inflammation, and also as hepaprotective, diuretic, antipyretic
51	Mouth fresh	*Spilanthes calva*	Asteraceae	Mouth fresh	Used as medicine, antipyretic, antidiuretic, antiinflammatory, antioxidant,

				immunomodulatory, hepatoprotective, anticancer and antitoothache, leg pain
52	Kolkondika mullu	*Strobilanthes barbatus*	Acanthaceae	Kolkondika mullu	Used as fodder, Used during poojas, used as a valid anti-inflammatory and anti-microbial herbal drug
53	Wild indigo	*Tephrosia purpuria*	Fabaceae	----	Used as medicine, used to treat impotency, asthma, dyspepsia, hemorrhoids, syphilis gonorrhea, rheumatism, enlargement of kidney and spleen.
54	Puncture vine	*Tribulus terrestris*	Zygophyllaceae	Neggilu mullu	It has diuretic, aphrodisiac, antiurolithic, immunomodulatory, antidiabetic, absorption enhancing, hypolipidemic, cardiotonic, central nervous system, hepatoprotective, anti-inflammatory, analgesic, antispasmodic, anticancer, antibacterial, anthelmintic, larvicidal, and anticariogenic activities.
55	Tridax	*Tridax procumbens*	Asteraceae	Tridax	Used as medicine , used to treat bronchial catarrh, diarrhea, dysentery and liver diseases.
56	Burbush	*Triumfetta rhomboidea*	Tiliaceae	----	It is used to treat skin disorders or sometimes dysentery. The roots are used in the treatment of conjunctivitis. The leaves have analgesic, anti-inflammatory and antiviral effects. The seeds have powerful purgative virtues.
57	Ashwagandha	*Withania somnifera,*	Solanaceae	Ashwagandha	It is useful for different types of diseases like Parkinson, dementia, memory loss, stress induced diseases, malignoma and others.

Table-2: Familywise Distribution of weeds in Hiriyur

Sl. No	Family	Number of plants	Per centage	Sl. No	Family	Number of plants	Per centage

ABSTRACT

Workforce diversity refers to the differences and similarities of the employees in terms of age, gender, race, sexual orientation, etc. With demographic shifts and the opening up of geographical boundaries, workforce diversity has presumed an important role in firm innovation. Diversity brings in a heterogeneous workforce. The heterogeneity in them helps in better and more creative idea generation. The study aims to understand the relationship between workforce diversity and firm innovation. The available literature on different dimensions of workforce diversity was reviewed to know its impact on firm innovation. This study will help the management to understand the importance of recruiting a diverse workforce and how to effectively manage them to achieve organizational goals.

Keywords: Workforce diversity, Cognitive diversity, Firm innovation, Value creation, Decision Making

INTRODUCTION

There is a rapid change in the world economy since the 21st century. Globalization and the advancement of technology have brought people around the globe closer to one another (Rizwan et al., 2016). The distance is shrinking day by day due to the advancements in transportation and telecommunication technology(Saxena, 2014). To be competent in the business world companies need to contemplate the statistics and work to attract, recruit, and retain a diverse group of the workforce(Aghazadeh, 2004). The concept of workforce diversity has transformed from a mandatory or government compulsion to a strategic move to improve the organization's performance(Kundu & Mor, 2017). Thus, the organization must recruit and maintain a diverse group of employees. Workforce diversity is

one of the core strategic values where companies are taking the responsibility to promote fairness and equality in the organization(Li et al., 2020). It creates a multicultural workspace that helps the employees to learn from multiple cultures. This also helps in coming up with innovative ideas as it creates a talent pool in the organization (Tamunomiebi & John-Eke, 2020). Organizational culture should be such that every employee can achieve his or her goal without being inhabited by diverse factors such as gender, age, religion, race, nationality, etc(Kundu, 2003). It is very important to give equal opportunities to all employees irrespective of their differences to ensure the achievement of workforce diversity(Kyriakidou, 2003). At the organizational level, the encouragement of a diverse workforce can lead to the pooling of talents that benefit the organization to provide better and more innovative products(Hossain et al., 2020). Innovation is a collaborative process that involves communication and interaction between people in the organization and draws diverse talents from all levels of the firm (Østergaard et al., 2011). There have been numerous research papers on innovation since the second half of the 20th century(República et al., n.d.). There is empirical and theoretical evidence from previous studies which suggest that there is a positive and direct relationship between workforce diversity and innovation (Maré et al., 2014).

Recent research studies on diversity factors like age, gender, status, and educational background explain its contribution to firm innovation(República et al., n.d.). Contemporary companies are facing a lot of pressure due to fierce market competition and rapid technological advancements which highlights the importance of firm innovation (Human, 1996). Every human being has cognitive and democratic characteristics in them. Intelligence level, vocational training, reasoning ability, and experience are some of the cognitive characteristics and age, gender, and ethnicity are democratic characteristics(Østergaard et al., 2011). Diversity creates a knowledge base for the company which builds the basis for learning and helps to develop new combinations. Innovation is an interactive process and diversity is a knowledge base. Diversity among the people who interact can develop innovative ideas. Consequently, workforce diversity creates a positive result on innovation, but too much diversity can also lead to conflicts(Østergaard et al., 2011). The ability of a firm to innovate is a critical aspect of success and growth. Creative Environment has an impact on both the organization and also on the individual employees. The evaluation of the inputs (innovative ideas) and outputs (productivity) of innovation have helped to improve the growth of organizations (Lhuillery et al., 2017). Knowledge creation is considered as the foundation of creating competitive advantage (Mitchell et al., 2009). As the organizations become complex, the employees are expected to engage in the innovation aspect along with the formal job requirements. As such innovation is a critical aspect that decides the future growth of the organization. The majority of the innovations happen while working in teams which may differ in size, structure, and location(Jones et al., 2021). Existing studies have shown that a culturally diverse workforce helps in firm innovation, especially in the ideation and implementation phase(Jones et al., 2021). Companies with higher diversity especially in the management rank are considered to be more innovative. A study conducted by Boston Consulting Group in 2018 highlighted the six diversity factors (age, gender, national origin, career path, industry background education) that have a positive impact on firm innovation (Jones et al., 2020).

It was found that companies in both developed and developing countries with above-average diversity had better payoffs from innovation (BCG, 2018). The ability to offer innovative products is recognized as a critical factor for organizational success and growth (Elias Carayannis, 2008)Innovation is the key to survival for the organization in the current competitive business world. Innovation means offering something new in the operations of the company, which is gained by using once analytical knowledge(Ozgen et al., 2013). Companies that offer a wide range of innovative products can be successful as they have a competitive advantage over others in the same industry. Studies of inventors and their close groups highlight the importance of exchanging knowledge among diverse groups(Ozgen et al., 2013). There is a chance that diversity can lead to an increase in conflicts within the organization, but in the meantime, it will have a greater positive impact on the decision-making of the firm(Bae & Han, 2020). In today's world, workforce diversity is an essential aspect of every organization but managing a diverse workforce is a great challenge for the organization (Saxena, 2014). The research scholars as well as the recruiters have argued that initiatives to foster a higher diversity of employees have a positive bearing on the bottom line(Manoharan & Singal, 2017). Despite stating the importance of workforce diversity most of the studies have focused on individual identity grouping without questioning the differences within these categories(Dennissen et al., 2020). The biggest

advancement in scientific literature shows it is not the firm but the employees in the organization that are seen as a source of innovation (Ozgen et al., 2013). Some studies have shown that workforce diversity areas are associated in improving innovation, decision-making, and also the overall organizational performance (Prasad, 2017). Diversity has become a fact of life and a major challenge to the business organization(Maturo et al., 2019). Workforce diversity also educates the employees to respect the difference and this understanding can increase innovative ideas (Alghazo & Shaiban, 2016). Promoting workforce diversity will result in an improved bottom line, competitive advantage, improved performance and loyalty of employees, ensuring better relationships, etc which affects the firm innovation (Callahan, 2016). This study helps to validate the effect of the workforce diversity factors on firm innovation which provides valuable insights for decision making and also increasing innovations in an organization. This paper highlights the impact of workforce diversity on firm innovation which will result in real economic benefits in terms of innovation and performance (Hossain et al., 2020). It can be said that firms with workforce diversity will be rewarded with high productivity and inventive efficiency (Manoharan & Singal, 2017). This is mainly because the diversity of the workforce leads to the pooling of ideas and sharing of knowledge which promotes employee involvement that will help the company to increase profits help the employee fulfill their psychological needs and also provide job security (Bizri, 2018).

Cognitive diversity theory

Cognitive diversity theory suggests that diversity provokes team members with creative ideas as there is exposure to people with diverse cultures and perceptions which can stimulate innovative ideas(Wang et al., 2016). This can lead to sharing a wide range of knowledge, skills, and abilities which are unique and non-redundant(Wang et al., 2016). The theory also suggests that the diverse group of employees analyses the problems from different angles which gives a wide range of alternatives for decision making(Wang et al., 2016). Thus, the decisions taken by such groups are considered to be the best compared to the groups with low cognitive diversity(Wang et al., 2016). This theory suggests that a work environment with heterogeneous employees provides the most creative and innovative ideas which also lead to the value creation of the firm. The cognitive diversity hypothesis explains how including heterogeneous groups can help in problem-solving and innovation. According to the theory, this change has a positive impact on the organization as the cognitive diversity of the group comprises diverse viewpoints which can generate more innovative ideas (Wang et al., 2016). Moreover, it helps in high-quality decision-making with the counter-arguments of the diverse group. It also broadens the network of relationships and contacts, which can help the company widen its horizon. The information and decision-making theories suggest that cognitive diversity provides a wide range of knowledge, abilities, and innovative ideas.

This knowledge base can create new strategies, products, and services. A diverse workforce with different value systems and cultures can use different viewpoints to explore the environment for opportunities, considering diverse angles and quite a lot of alternatives (Wang et al., 2016). Studies have shown that cognitive diversity helps in creating innovative ideas especially when the organization follows a transformational leadership style (Kim et al., 2021). Perception cognitive diversity helps to understand individuals' perceptions which can be directly related to motivation and creativity. Different perceptions give different outlooks within the team that may inspire the team members to come up with innovative ideas. Studies suggest that cognitive diversity results in a positive effect on the overall organizational outcome (Almeida et al., 2009). This study will assist managersin understanding the significance of recruiting a diverse workforce. Most managers believe that diversity among employees can benefit the firm, but it is difficult to verify or quantify, especially when it comes to measuring the impact of workforce diversity on firm innovation. The new researches provide evidence that diversity unlocks firm innovation and future growth, even then only a few common variables and dimensions have been focused on by the researchers. This study will highlight the importance of workforce diversity on firm innovation and also explore the unexplored diversity variables which have an impact on firms ability to innovate.

Objectives
- To explore the importance of workforce diversity on Firm Innovation
- To discover the diversity factors which have an impact on firm innovation.

Nikhitha S Thomas and Lijeesh

REVIEW OF LITERATURE

(Waterbury, 2018)In this article, the researcher has defined diversity as the collective combination of similarities and differences in the characteristics of employees in terms of value, beliefs, background, preferences, etc. He points out the significance of a diverse workforce in the growth of all sectors and emphasizes how diversity training leads to the value creation of executive managers.(James Bernard et al., 2019)In this article, the author points out that workforce diversity is an important asset for an organization. It helps in problem-solving, as the employees come up with different and innovative ideas that benefit the organization, giving a competitive advantage. Treating the employees well and understanding their expectations is an important factor in managing a diverse workforce. The results of the study show that there is no relationship between the challenges faced by managers due to diversity and the extent of workforce diversity.(Bantel and Jackson, 1989; Williams and O'Reilly, 1998; Faems and Subranamian, 2013) In this article, the author emphasizes that diversity enhances innovation as it leads to increasing the ability of employees to create new strategies and integrate diverse perceptions. Information processing is another benefit associated with team diversity which outweighs the challenges connected with diversity. (Maré et al., 2014)In this article, the author points out that a survey done to know the geography of innovation summarized the different ways to create knowledge spillover, and workforce composition had a very significant impact on innovation. Every individual is different in terms of skills and fundamentally how they interpret and solve a problem. This feature itself can be considered the origin of the connection between a heterogeneous workforce and firm innovation. He further emphasized that inclusion will help to maximize the creative advantage of the diverse team. (Biga-Diambeidou et al., 2021)The author points out that new undertakings are rarely the product of a single entrepreneur and they do usually depend upon co-founders and other employees for launching and managing the venture. The innovativeness of an organization can be increased by accepting the uniqueness of the employees and benefiting from it. Studies have shown that diversity increases the knowledge base thereby increasing the propensity for innovation(República et al., n.d.). (Griffin et al., 2021) The author of this article suggests that corporate innovation is the key to firm competitiveness, increasing productivity, and also a firm's value creation. The author has also depicted that broad gender diversity positively impacts corporate innovation. (Eklund & van Criekingen, 2022)In this article, the author points out that growth potential is more with the new ventures than the well-established firms and the main reason for this is the openness of new ventures to diversity. He emphasizes that diversity of knowledge helps firms to improve their product innovatively. He further suggests havinga diverse workforce in all levels of an organization as all the levels contribute to the outcome.(El Chaarani & Raimi, 2022) In this article, the author points out that to survive in the emerging knowledge-based economy, organizations need to rely on intangible assets like skills, knowledge base, ability, etc to gain a competitive advantage. This can be achieved by recruiting a diverse workforce.

(Yadav & Lenka, 2020)In this article, the author suggests that the dimensions of diversity such as disability, LGBT, language, and the community they belong to have a direct impact on firm innovation which has to be explored. The minority group faces a lot of challenges dealing with discernment, prejudice, and stereotyping(Aghazadeh, 2004). To overcome this situation, organizations have to set realistic goals for their management and employees to work together(Aghazadeh, 2004). (Vu, 2020) in his article has emphasized the importance of inclusion of LGBT in accelerating the innovation capability, through the enhancement of the quality of human capital.(Patel & Feng, 2021)Including LGBT in the workforce is beyond social and moral responsibilities. Studies have shown that including this minority community in the workforce has economic benefits in terms of firm performance, credit rating, and innovation. Moreover, it helps the companies in improving returns in intangibles.(Agovino & Corbisiero, 2021) The existence of LGBT employees inspires innovation and entrepreneurship as the diverse population contributes unique products and services, creating new opportunities and attracting new industrialists. (Vu, 2020)Creating an LGBT-friendly workplace environment helps in the inflow of human resources since it indicates the acceptance of diversity, creativity, and open-mindedness of the organization. Policies supporting minority groups in the workplace reduce job anxiety and improve firm performance. (Love, 2020)In this article, the author points out that the knowledge base of Indigenous people is unique and grounded in the incorporation of ideas. Even then, Indigenous cultural knowledge is given less importance in managing and organizing business.(Lazonick, 2004)the researcher has pointed

Nikhitha S Thomas and Lijeesh

out that the innovation capacity of the society is the main determinant for economic development. A strategy of indigenous innovation can lead to the development of the economy. (Waterbury, 2018)points out that companies hesitate to recruit people with disability as they are anxious about the lack of skills, efficiency, and accommodation costs. However, studies have shown that people with disability are more loyal and committed to the company resulting in low turnover and high productivity as well as profit**.** (Mayer & Zhao, 2016)In this article, the author points out that firms that treat their employees better have greater performance and creative ideas in general. This is because the employees get the economic benefit of profit sharing, promotions, etc for better performance which creates job security and commitment. Thus, inspiring the employees to come up with creative and innovative ideas without worrying about the negative consequences.(Yadav & Lenka, 2020)In this article, the author has discussed in detail the scope of workforce diversity in the future and emphasizes the importance of a diverse workforce in improving firm performance. He has mentioned the future opportunities due to a diverse workforce and ways to mitigate the negative impact of it on the business.

Statement of the Problem

There are many articles on workforce diversity factors like age, gender, race, etc. Diversity of ideas and strategies is beneficial in the innovation process, which thrives on creative tension and different viewpoints. This study proposes to highlight the importance of workforce diversity on firm innovation. Despite its potential to improve firm performance, very few studies have reported the influence of diversity on firm innovation. Besides, only a very few recent researchers have explored factors such as LGBT, Language, and Disability which have a significant role in problem-solving.

RESULTS AND DISCUSSIONS

After examining the existing literature on workforce diversity, it is clear that workforce diversity does have a greater impact on increasing firm innovation. Profit maximization is the objective of an organization and workforce diversity helps in achieving it by offering innovative products, better decision-making, and increasing productivity. Studies have shown that diversity is a very important essence in the current scenario for organizations to sustain in the competitive business world, but only if managed properly. It is a challenge for the management to coordinate the diverse workforce but if done properly can boost the organization's growth. Business organizations should be willing to adapt to policies that motivate and encourage the diverse workforce to reap the benefits. Some of the ways to tackle the negative effects are to adopt policies such as:

1. Equal opportunities for all employees irrespective of their culture, race, background, etc.
2. Use of common language in the workspace.
3. Every team with a diverse workforce encourages equal participation.
4. Take the problems faced by the workforce into consideration and have revisions in the policy for better employee management.
5. Conduct motivational and team-building sessions.
6. Consider the minority groups during the recruitment process.

CONCLUSION

Workforce diversity and managing the diverse workforce are considered to be complex tasks for the management, but in the current scenario, it is the need of the hour. Diversity in employees can have both positive and negative impacts and the positives surpass the negatives. Thus, the management must understand the diverse workforce and manage them effectively so that the positives are used effectively towards achieving organizational goals. The diverse workforce has diverse opinions, perceptions, attitudes, etc which leads to looking into problems from different angles which provides many alternative solutions and better decisions. The study focused on exploring the importance of workforce diversity on firm innovation and the diversity factors that impact firm innovation. A

descriptive method of research is used to analyze the data. The study is based on secondary data, including various Scopus articles, company reports, and the latest news articles. From the review of existing literature, it can be concluded that workforce diversity has a greater impact on a firm's creativity and innovation. The majority of the research papers have considered the common diversity factors such as age, gender, religion, and education background, ignoring the factors that can have an impact on innovation. By reviewing the existing literature, it is clear that workforce diversity increases the potential of the business in terms of Innovation and is the need of the hour. Proper implication of workforce diversity can impact the firm'sinnovation positively and can lead to better performance.

ABSTRACT

A straightforward green synthesis method was employed to produce silver oxide nanoparticles. Following synthesis, the nanoparticles underwent thorough characterization using various analytical techniques including X-ray diffraction (XRD), scanning electron microscopy (SEM), Fourier transform infrared spectroscopy (FT-IR) and nuclear magnetic resonance (NMR). XRD analysis revealed a crystalline size of 32.4 nm for the silver oxide nanoparticles. SEM imaging displayed irregular structures and a spherical, agglomerated matrix on the surface of the nanoparticles. These nanoparticles were then evaluated for their potential as an anti-cancer agent. Remarkably, they demonstrated significant efficacy, exhibiting the ability to eliminate up to 86% of cancer-infected cells. The material also used as a anti-microbial agent to require the infected cells on human body tissue.

Keywords: Green synthesis, Silver nanoparticles, Cancer activity, MCF-7

INTRODUCTION

Nanobiotechnology represents a cutting-edge field with diverse applications in health and medicine, leveraging nanoscale particles for various biological activities. Nanoparticles, owing to their unique structural[1], biological[2], and optical properties[3], play pivotal roles across multiple domains, including drug delivery, biosensing, modulation of molecular processes, combating infectious agents, and regulating cell proliferation. Among the myriad of metal-based nanoparticles available, gold, silver, zinc, iron, titanium, magnesium, and alginate nanoparticles stand out. Cancer, a devastating illness claiming millions of lives annually worldwide, particularly affects women with cervical cancer being one of the most prevalent types[4]. Originating from the Human Papilloma Virus, cervical cancer ranks as the fourth leading cause of cancer-related deaths in women. Timely intervention can prevent and

treat it, as indicated by the development of warts around the vaginal area. This study focuses on evaluating the cytotoxic and apoptotic effects of environmentally friendly synthesized nanoparticles using HeLa cell lines. The unique morphological characteristics of silver nanoparticles may facilitate their penetration through barriers to reach target cells effectively[5].

MATERIALS AND METHODS

This work examined the pace at which the development of cancer cells is inhibited, as well as the generation of reactive oxygen species, malondialdehyde, and glutathione storage in MCF7 cells. The 48 hours, cancer cells were exposed to nanoparticles. Silver nanoparticles both slowed MCF-7's rate of development.

Synthesis of silver oxide nanoparticles
Silver oxide nanoparticles were synthesized using an environmentally friendly green synthesized sol-gel approach. Initially, 20 mg of plant extract underwent washing with water and ethanol. Subsequently, the washed extract was mixed with 70 mL of ethanol and 30 mL of water in a beaker. To this mixture, 3.2 g of silver nitrate was added[6]. The resulting reaction mixture was stirred at room temperature for 10 minutes before raising the temperature to 90°C, where it was maintained for one hour. Following this, a green-colored precipitate formed, which was then filtered to obtain silver hydroxide nanoparticles. The obtained silver hydroxide was subjected to calcination at 450°C for 5 hours, yielding the final product of silver oxide nanoparticles[7].

XRD analysis
XRD analysis was conducted to determine the crystalline size and structure of the prepared material, utilizing the Debye-Scherrer equation. Notably, the corresponding planes 202, 001, 111, 200, 132, 220 and 311 exhibited 2θ values of 32, 34, 36, 47, 56, 63 and 68, respectively. The presence of sharp peaks in the XRD pattern indicates that the prepared materials possess a well-crystallized nature with high purity[8]. The crystalline size of the prepared silver oxide (AgO) nanoparticles was measured to be 32.4 nm. Given their smaller crystalline size, AgO nanoparticles demonstrate promising potential as effective anti-cancer and anti-bacterial agents[9].

Functional group analysis
Functional group analysis was employed to identify the various functional groups present in our prepared material. The stretching vibration modes of M-O were observed at 623.4 and 1004 cm^{-1} respectively. Additionally, stretching modes of C=O and C-O were detected at 1486 cm^{-1}respectively[9]. The vibration peaks corresponding to H-O-H appeared at 3425 cm^{-1}. Furthermore, FT-IR analysis confirmed the presence of metal-oxygen stretching vibration modes below 1000 cm^{-1}, underscoring the purity of the prepared materials[10].

Morphology Analysis
Surface morphology analysis of prepared nanoparticle of AgO was conducted using SEM micrographs, as illustrated in Fig.3. The SEM images revealed distinct characteristics for each nanoparticle type. In Fig. 3, AgO nanoparticles displayed an agglomerated structure, indicating particle clustering[11]. Notably, AgOnanoparticles exhibited a agglomerated morphology from different viewpoints, as reported previously.

NMR analysis
^{1}H and ^{13}C NMR analysis A Bruker Avance DRX 500 was used to record NMR spectra. Every NMR spectrum was recorded at 303 K in DMSO-d6. The solvent resonance was used as a reference point for the ^{1}H and ^{13}C NMR chemical shifts (δ in ppm) for DMSO-d6 (2.50 (^{1}H) and 39.50 (^{13}C) respectively. The distinct 1H and 13C resonances were identified using gradient-selected COSY, gs-HSQC, gs-HMBC, and 2D NMR studies. The ^{1}H-^{13}C HMBC experiment was calibrated for long-range coupling of 500.13 and 125.758 MHz, and the gradient ratio was 30:18:24 G cm^{-1}[12].

Vishnu subash *et al.,*

Anticancer Activity

Cancer is a multifaceted illness that often has a broad spectrum of increasingly severe consequences at the cellular and molecular levels. Therefore, it doesn't appear plausible that chemoprevention adheres to rigid guidelines and specifications.

Cell culture

The human gastric carcinoma cell line Kato-III, hepatocellular carcinoma cell line Hep G2, lung adenocarcinoma epithelial cell line SHP-77, and various mammalian breast cancer cell lines MCF-7 were all cultured in minimum essential medium (MEM) supplemented with EDTA, sodium bicarbonate, and fetal calf serum. Cultures were maintained in a humidified environment at 37℃ with 5% CO_2, and the medium was changed every two days. To closely mimic the potential effects of plant extracts on human cancer cells, only human cell lines were utilized. Cells were typically grown in 75 cm^2 tissue culture (T-75) flasks with 10 mL of the appropriate media at 37°C in a humidified atmosphere of 5% CO_2/95% air[13]. Weekly passages and bi-weekly medium changes were conducted.

Subculture

Aspiration was employed to remove the medium, followed by washing the adherent cells with 5 milliliters of Calcium and Magnesium Free solution (CMFS) to eliminate any residual media containing FCS and trypsin inhibitor. Subsequently, to detach the cells and dissolve the extracellular matrix, each flask was treated with approximately 1 milliliter of a 1X trypsin-EDTA solution in CMFS. Incubation at 37℃ for a maximum of 10 minutes allowed observation under a microscope for signs of cell detachment [14]. The addition of 9 milliliters of suitable medium containing FCS neutralized the trypsin. Depending on the cell line and the desired cell density, subculturing ratios ranging from 1/5 to 1/50 were utilized.

Cell viability assay

The MTT assay is utilized to quantify the number of viable cells by measuring the conversion of yellow tetrazolium salt (MTT) into purple formazan crystals, as described by Mosmann in 1983. Cells were plated at a density of $2×10^5$ cells/mL per well in 100 µL of Rosewell Park Memorial Institute 1640 (RPMI 1640) and then incubated in a CO_2 incubator at 37°C with 5% CO_2 for 24 hours. After this initial incubation period, each well received an ethanolic extract of Butea monosperma dissolved in DMSO, followed by further incubation for 48 hours [15]. Control groups received an equivalent volume of DMSO. Tamoxifen served as the positive control. Following 24 to 48 hours of incubation at 37℃ with 5% CO_2, 100 µL of MTT solution (0.5 mg/mL in Dulbecco's modified Eagle's medium) was added to each well and incubated for three hours. The ability of live cells to convert MTT into formazan was used to assess tumoral cell growth. The formazan product resulting from MTT reduction was dissolved in DMSO. After removing the medium, 100 µL of DMSO was added to each well to dissolve the MTT metabolic product. The plate was then shaken for five minutes at 150 rpm, and the optical density at 570 nm was measured. IC50 values were determined by calculating the percentage inhibition [100 - (absorbance of test wells/absorbance of control wells) × 100] and plotting against concentrations.

RESULTS

In the present day, Butea monosperma is employed as a medicinal remedy by the largest tribal community in the region. There is significant interest in refining natural treatments for various human ailments using plant-based components. Across rural areas worldwide, herbal remedies are widely used for medicinal purposes. Cancer is characterized by uncontrolled growth and proliferation of cells, infiltration and destruction of neighboring tissues, and potential metastasis to distant anatomical sites. Although cancer can affect individuals of any age, the risk tends to increase with age for the most common types, contributing to approximately 17% of all fatalities[16]. Traditional Indian medicine heavily incorporates plants, especially in the realm of cancer prevention. Numerous herbs and herbal products have been suggested for the prevention and treatment of cancer disorders. Recent research has demonstrated the antioxidant activity of the ethanolic extract of Butea monosperma, indicating its potential role in

preventing the development of cancer disorders.

Anticancer Activity of *Butea monosperma*

Cancer arises from an imbalance between cell growth and cell death, leading to abnormal cell proliferation and tumor formation. The study investigated the anticancer properties of the ethanolic whole plant extract of Butea monosperma through an MTT experiment conducted on four human cancer cell lines: HepG2, MCF7, SHP-77, and Kato-III. Succinate dehydrogenase, a mitochondrial enzyme, catalyzes the breakdown of the tetrazolium ring in viable cells, converting MTT into insoluble purple formazan[17]. The amount of formazan produced is directly proportional to the number of viable cells. As a positive control, 5-fluorouracil, a widely used anticancer drug, was employed in this study. The experiment evaluated four cell lines originating from different tissues: MCF-7 (breast cancer), HepG-2 (liver cancer), SHP-77 (lung cancer), and Kato-III (gastric cancer). All tested extract samples demonstrated cytotoxic effects ranging from 0% to 88.8% across the various cell lines. Notably, the highest cytotoxic activity was observed in SHP-77 cells, with growth inhibition rates exceeding 85.7%, followed by HepG2 and Kato-III cells with rates of 84.3% and 84.3%, respectively. The ethanolic whole plant extract of Butea monosperma exhibited significant growth suppression against all examined cell lines.

Anti-bacterial activity
Procedure

The antibacterial activity of the synthesized AgO nanoparticles was evaluated against bacterial pathogens using the agar well diffusion method. Initially, bacterial pathogens were cultured in nutrient broth and incubated for 12 hours prior to conducting the antibacterial assay. Each bacterial strain was then individually spread onto Muller Hinton agar plates. Wells were created in the agar plates using a cork borer with a diameter of 6mm. Samples were dissolved in DMSO, and different concentrations ranging from 25 μl to 100 μl of the samples were added to the wells. The plates were then incubated at 37°C for 24 hours. Chloramphenicol was utilized as a positive control in the assay[18]. The experiment was performed in triplicate. Following the incubation period, the zone of inhibition was measured in millimeters to assess the antibacterial activity of the nanocomposites.

Results of antibacterial activity

The antibacterial efficacy of the AgO was assessed against four clinical bacterial pathogens: Gram-positive bacteria including Staphylococcus aureus and Streptococcus pneumoniae, and Gram-negative bacteria including Escherichia coli and Klebsiella pneumoniae. Various concentrations (ranging from 25 μl to 100 μl) of the samples were employed to evaluate their antibacterial activity[19]. Notably, the AgO exhibited the highest zone of inhibition against Streptococcus pneumoniae (14 mm), followed by Escherichia coli (16 mm), Staphylococcus aureus (13 mm), with the minimum zone of inhibition observed against Klebsiella pneumoniae (12 mm) at a concentration of 100 μl. These findings underscore the potential antibacterial effectiveness of the AgOnanoparticles against the tested bacterial pathogens[20].

CONCLUSION

The continued prevalence of conventional medicine is attributed to various factors such as population growth, limited access to pharmaceuticals, adverse effects associated with allopathic treatments, and the emergence of resistance to current therapies. These challenges underscore the importance of utilizing plant-based materials as medicinal resources for human health. This review comprehensively discusses the phytochemical composition and biological activities of plant extracts, providing compelling evidence supporting their medicinal use. Butea monosperma shows promise as a potential source of beneficial phytochemicals that could significantly impact modern medicine. Further clinical investigations are warranted to validate the cytotoxic effects of β-sitosterol and the ethanolic extract of Butea monosperma in cancer patients. The study also highlights the antibacterial properties of Butea monosperma extract against both gram-positive and gram-negative infections, suggesting its potential therapeutic utility in combating bacterial and fungal infections. Additionally, the research underscores the significant

anti-cancer activity of the ethanolic extract of Butea monosperma, likely attributed to the presence of β-sitosterol phytochemical compounds. Also, the AgO nanoparticles used as a anti-bacterial agent to reduce the affected human cells.

ABSTRACT

Divalproex Sodium (valproic acid and sodium valproate) is a widely used antiepileptic therapy that is important for treating epilepsy, bipolar disorder, and preventing migraines. Our research focused on designing a bilayered valproic acid-containing anticonvulsant and antimanic drug. The tablet should release the drug as soon as it is administered and maintain a continuous released layer. The study used an FT-IR instrument to analyze the compatibility of divalproex sodium with the selected polymers and revealed no differences between the polymer and the drug. Therefore, tablets containing divalproex sodium can be safely developed using the formulated ingredients. The optimized immediate-release layer (IF6) which had a peak level of 98.11 in the laboratory study, was chosen for the bilayered tablet preparation. Polymers such as HPMC K4M and HPMCK100M were used to enhance the cohesive strength and its combinations. The optimized sustained-release (SF8) layer, which prolongs the antiepileptic therapeutic effect for up to eighteen hours or more, was selected. The USP Type II apparatus (paddle method) was used to perform the drug release evaluation in 900 mL of phosphate buffer at pH 6.8 and 50 rpm in the laboratory. Finally, Divalproex sodium bilayer tablets were created by compression technique. Bilayer tablets of divalproex sodium were studied for their physical proportions such as friability, hardness, thickness, weight variation, and drug release. All physical proportions result in acceptable limits according to pharmacopoeial specifications. The formulated divalproex sodium remained stable at75% relative humidity while the room temperature was set at 40C for a duration of three months.

Keywords: Bilayer tablet, wet granulation, epilepsy, sodium valproate, valproic acid, immediate-release, and sustained-release, FT-IR study, HPMC K4M, HPMC K100M

INTRODUCTION

Despite various routes of administration being available for drug delivery, designing flexible drugs taken by mouth remains the best way to ensure patient compliance [1]. This preference is rooted in several factors, such as drug administration, high levels of patient acceptance, precise dosing, cost- effective manufacturing, and generally prolonged time frame of the product [2]. Bi-layer tablets are designed with one layer releasing the drug immediately, while the sustained layer release the drug later, either as a second dose or through extended release. These tablets are well-suited for sequentially releasing two drugs in combination, separating two incompatible substances, and serving as sustained-release tablets. The sodium valproate layer provides an immediate dose, while the valproic acid layer serves as the maintenance dose. The primary therapeutic objective is to create a consistent level of medication in the circulatory system for an extended period [3]. Epilepsy consists of abnormal high-frequency of nerve cell activity in the brain, leading to transient episodes known as seizures. These seizure attacks may occur when there is or isn't a loss of sense of the current moment and are often accompanied by distinctive body movements, such as convulsions. Globally, epilepsy ranks as the third major neurological disorder, following cerebrovascular and Alzheimer's disease[4]. Around 10 percent of individuals are expected to experience illness in the spaces between their childhood and older age. Medications that have a therapeutic effect in alleviating seizures operate through various mechanisms. These mechanisms include the blocking of voltage-gated channels (such as Na+ or Ca2+ channels), enhancing inhibitory GABAergic impulses, or disrupting excitatory glutamate transmission. Certain antiepileptic drugs have the ability to target multiple sites within degenerated neurons, while the functions of others remain unclear[5].

METHODOLOGY

Pre-formulation studies
The initial phase in the systematic development of dosage forms for a drug substance begins with pre-formulation testing. This preliminary evaluation is designed to improve drug delivery by analyzing the excipient's physicochemical properties. Pharmaceutical additives play a significant role in influencing the drug's performance and contribute to creating a dosage form that is effective and stable. This ensures safety by minimizing problems related to biopharmaceuticals and bioavailability. In summary, pre-formulation testing establishes a foundation for combining the drug with pharmaceutical additives in the dosage unit form[6].

Determination of λ 23
Initially, the main ingredient was added to methanol, which resulted in a solution that was further dissolved using the same solvent. The solution obtained was then placed inside a UV double beam to identify the maximum absorbance. FT-IR spectroscopy was conducted to assess the compatibility of the excipient and drug. Infrared spectroscopy was done using a Thermo Nicolet FT-IR instrument, and the spectrum was recorded within the range of 4000 to 400 cm-1. For this analysis, a sample consisting of the main ingredient and a drug- filling compound mixture in a 1:1 ratio was formed with KBr (200- 400mg) and compressed into discs by exerting a force of 5 tons for 5 minutes using a press. The compatibility between the adjuvants and the drug was examined through IR- spectral studies, with a focus on any shifts in the peaks of the remedy within the spectrum of the formulated coordination of the appropriate additives and the drug. Additionally, UV spectrophotometry was employed using a Shimadzu 1800 spectrophotometer to cover the wavelength range of 190 to 380 nm[7].

Solubility
Using the agitation flask method, we dissolved divalproex sodium in ethanol, methanol, chloroform, acetone, phosphate buffer at pH6.8 and distilled water to assess its solubility. An adequate quantity of the medication was dissolved into the selected solvent containing 10 mL in each vial until the solution reached saturation. In an isothermal shaker, the mixtures were agitated for 48 hours at 25°C ± 10°C, followed by filtration through Whatman's

filter paper. The absorbance was measured using a UV-Visible Spectrophotometer. Based on a standard graph, the solubility has been calculated[8].

Melting point
We determined Divalproex sodium by melting it using the capillary technique in triplicate[9].

Standardization Curve for Divalproex sodium
We precisely weighed 1000 mg of the drug and diluted it in 1000 mL of methanol to create the first stock solution. Then, 100 mL of the first stock solution was taken and dissolved in 1000 mL of methanol to create the II stock solution. The aliquot amount of the II stock solution was subsequently dissolved to obtain 5, 10, 15, 20, 25 and 30 grams of the drug per milliliter of the final solution. The absorbance was measured in a UV spectrophotometer at 210 nm against a methanol blank[10].

Compatibility studies
The drug's affinity for polymers using FT-IR spectroscopy[11].

FT-IR Spectroscopy
FT-IR spectroscopy was employed to assess the compatibility between the excipients and the drug. Infrared spectroscopy was performed using an FTIR instrument from Thermo Nicolet, with the spectrum recorded in the range of 4000 to 400 cm-1[12]. A sample consisting of the main ingredient and a drug-excipient mixture in a 1:1 ratio was mixed with potassium bromide (200-400mg) and compressed into discs. The study of the components and excipients was examined through IR-spectral studies, with a focus on any shifts in the peaks within the drug surface and excipient spectra. FT-IR spectroscopy was conducted to assess the compatibility of the excipient and drug. Infrared spectroscopy was done using a Thermo Nicolet FT-IR instrument, and the spectrum was recorded within the range of 4000 to 400 cm-1. For this analysis, a sample consisting of the main ingredient and a drug- filling compound mixture in a 1:1 ratio was formed with KBr (200- 400mg) and compressed into discs by exerting a force of 5 tons for 5 minutes using a press[13].

DSC Analysis for Formulation
The temperatures of the pure drug,excipient, physical mixture were examined using a Shimadzu Limited Differential Scanning Calorimeter -60. The illustrative powders were dried in tight closed aluminum surface. Heat runs for each drug were programmed to range from 25 to 350°C at a heating system rate of 10°C/min, with nitrogen serving as the blanket gas[14].

Design of the Sustained Release Layer, the design of the Immediate Release Layer
Preparation of the IRL
Immediate drug delivery was formulated through wet granulation, using various adjuvants such as SSG and croscarmellose sodium. A binding solution of PVP K30, along with a coloring agent, were utilized. Due to the oily characteristics of DS, the MCC adsorbent was preferred[15]. The manufacturing steps included:
- To sieve all ingredients through sieve #80.
- Geometrically mixed the ingredients with MCC and then combined it with lactose.
- Introduced super disintegrants and blended for a duration of 15 to 20 minutes with a mortar and pestle.
- Formed an aggregate using the colorant solution.
- Passed the mass through a sieve #16 to achieve uniform granules.
- To dry the granules at 50°C for 20 minutes in an autoclave.
- To Lubricate the granules with a lubricating agent and compressing them into 250 mg tablets each, adjusting the hardness accordingly[16].
- The formulations were detailed in Table No. 13.

Milly Gladys Iteriteka *et al.,*

Preparation of SRL

We accurately weighed the active ingredient, polymer, and other ingredients in a mortar and pestle,mixed them well, and then mixed the resulting powder with the binding solution until a wet mass formed. The aggregates obtained through sieve # 16 should be dried as granules at 50℃ for 20 minutes. Then they should be reduced through sieve # 22. Next, the granules with magnesium stearate and talc are compressed into 300 mg tablets by adjusting the hardness[17]. The formulations are detailed in Table No. 14.

Formulation of Divalproex sodium

After studying the kinetic drug release profiles of SRL and IRL, the best formulations were selected, and the drugs were formed using double compression in a single rotary tableting machine[18].

Evaluation of pre-formulation parameters

Angle of repose

The direction of the flow of gunpowder was adjusted based on the funnel technique. The granules, which were accurately weighed, were placed into a funnel. The height of the funnel was set thus the sharp end would touch the top of the heap of granules. Next, we allowed the mass to enter the cone freely. Measure the length of the surface and the position of the viewpoint using the equation:

$\theta = \tan^{-1}(h/r)$

Where θ = the angle of repose,

h = height of the height of the powder, and r = radius of the heap of the powder[19]

Determination of Bulk Density and Tapped Density

We added 2 g of powder (W) from each formula to a 25 ml measuring cylinder. The cylinder was allowed to fall under its own weight onto a hard surface from a height of 2.5 cm at 2 sec intervals after appropriate consideration of the initial volume. The sound persisted until there was no further change in volume. The tapped density and bulk density were determined using the following formulas:

Db = mass of powder/bulk powder

Dt = mass powder/tapped volume[20].

Carr's Index

It helps measure the pressure needed to break the friction between the hopper and the particles.It is expressed in % and given by:

Carr's index % =   tapped density-bulk density/ tapped density[21].

RESULTS AND DISCUSSIONS

The study on the immediate-release layer:

The disintegration study was done using USP- II (paddle) dissolution apparatus at 50 rpm. The dissolving medium was set up at 37±0.500C. The volume of the medium should be replaced after withdrawing a 5 mL sample at specific time intervals. The drug sample that has been withdrawn should be diluted with pH 6.8, filtered, and analyzed on a UV photometer at a wavelength of 210 nm using pH 6.8 as a blank. The percentage of drug release should then be determined[22].

***In vitro* dissolution studies of the continuous release layer**

The sustained-release layer in the laboratory was carried out for 18 hours using the USP Type II apparatus (DT-1200) at 50 rpm for the first 45 minutes in 900 mL of 0.1N HCL set up at 37 ±0.50C and then in a buffer solution at pH6.8 in 900ml for another 18 hours. The 5ml sample that was withdrawn at specific time intervals should be replaced with a fresh medium of the same quantity. The drug was diluted with blank dissolution medium, filtered, and analyzed on a UV spectrophotometer at 210nm[23].

Assay for IRF, SRF and bi-layered tablet: 87
We measured ten tablets and calculated the average weight. After crushing all of them, an equivalent powder of 1000 mg of the drug was dissolved in distilled water adjusted to pH 6.8. The volume was adjusted to 100 mL using phosphate buffer with pH6.8. The solution was placed in a sonicator for one hour. From the stock solution, 10ml solution was introduced in 100 mL volumetric flask, and the solution was then adjusted with phosphate buffer to pH 6.8.The solution was filtered, and the absorbance was measured at a wavelength of 210 nm against pH6.8 phosphate buffer taken as a blank. The amount of drug content in one tablet was calculated[24].

Mathematical display of dissolution profile
Divalproex sodium released profiles from the formulated tablets at different time intervals was fitted to various kinetic models like Zero order kinetics, first-order kinetics, Higuchi model, and Korsmeyer-Peppas model to characterize the mechanism of drug release.
- Cumulative %drug release versus Time_ Zero order kinetic model.
- Log cumulative percentage of drug remaining versus Time_First order kinetic model.
- Cumulative percentage of drug released vs. square root of time _ Higuchi's model.
Log cumulative percentage of drug released versus log time_korsmeyer equation/ Peppa's model[25]

Determination of λmax
The λmax of divalproex sodium exhibited the highest peak at 210 nm in phosphate buffer with a pH of 6.8 and methanol. Calibration curve for Divalproex sodium: The absorbance values were recorded using a UV spectrophotometer at 210nm, with methanol as the reference.

Stability Studies8-9
The developed formulation underwent a two-month stability study following standard guidelines. The drugs were packed in aluminum sheets, which were placed in wide-mouth bottles and closed tightly. They were stored at 40C/75% RH for three months and evaluated periodically[26].

DISCUSSIONS

The bi-layered tablets underwent a short-term stability study, with the formulation kept at 40°C / 75 percent of the relative humidity for a duration of three months. The obtained data indicates that there were no significant differences observed in the stability of the physical parameters, drug content, and in simulated drug release rate of the drug during this period. In this study, we formulated and assessed a bilayered tablet containing Divalproex sodium. Various formulations for the immediate release and continuous release layers were prepared separately. Divalproex sodium tablets were then formulated. Divalproex sodium, chosen as the model drug, is a full- spectrum anti-epileptic drug suitable for both release layers of the formulations. The drug is soluble in 0.1 N NaOH, methanol, chloroform, and ethanol (95%), but it is only sparingly soluble in water. The results demonstrate that the formulated bilayer tablet has a higher solubility in chloroform compared to other solvents. The absorbance of the designed divalproex sodium exhibited the highest peak at 210 nm when studied in the range of 200-400 nm using a phosphate buffer prepared at pH 6.8 and methanol. The standardized curve for the divalproex bilayer tablet in methanol, measured at 210 nm, displayed a slope of 0.0094 and a regression coefficient of 0.9995. Both immediate-release and sustained-release formulations were manufactured using the wet granulation technique and a binding agent. Six batches (IF1-IF6) of the sodium valproate and nine batches (SF1-SF9) of the valproic acid release layer were developed by altering the excipients' ratios as given in Tables 13 and 14 respectively. Immediate-release tablets were designed using superdisintegrants such as SSG and croscarmellose sodium, while sustained-release tablets were designed using polymers. The tablets were assayed for friability, thickness, weight variation, drug content, and simulated dissolution parameters using standard procedures, as shown in tablet number 24. Based on the dissolution profile, the best formulation for bilayer tablets was selected. All formulations exhibited good friability, content uniformity,weight variation, hardness, and other parameters. Pre-formulation studies were conducted for all of them.

Milly Gladys Iteriteka *et al.,*

Powder characteristic parameters, such as Carr's index, Hausner's ratio,angle of repose, bulk density, and tapped density were determined, which are shown on tablet number 23. Pre-formulation studies for the divalproex sodium tablets depicted a bulk density of 0.512 to 0.66 g/cm3 indicating packing characteristics in dies. The Carr's compressibility index showed values that are below 18% which indicates the blend's ability to be compressed.

CONCLUSION

Globally, the USA and the EU investigate and approve the bigger share of medical DADs. Even though the rules governing the processes in America and Europe share common goals and have many similarities, the different histories of DAD regulation in both regions contribute to significant regulatory dissimilarities30. Whereas the FDA was founded as a centralized agency for the protection of consumers, the current European systems were driven by a need to standardize commercial rules across the population of Europe. As a result, the FDA is sometimes seen as overplaying safety concerns at the cost of commercial enterprise, whereas the European systems are sometimes characterized as being primarily concerned with preserving commercial interests to the detriment of patient safety. Despite claims that drugs are accepted more slowly in America, analysis shows that they actually reach the public more quickly in the America than in Europe.

ABSTRACT

In this paper, we introduce the notion of generalized ortho pair fuzzy sub-implicative d-algebra, level generalized ortho pair fuzzy sets and generalized ortho pair fuzzy sub-implicative d-ideals in d-algebra and investigated some of their results. Also we investigate homomorphism of generalized ortho pair fuzzy sub-implicative d-algebra and derived some standard results.

Keywords: Fuzzy set, d-algebra, generalized ortho pair fuzzy set, d-ideal, pre-image, homomorphism, level ortho pair fuzzy set .

INTRODUCTION

An intuitionistic fuzzy set (IFS) is a set developed to handle problems related to imprecise and incomplete information [7]. This set was introduced by Atanassov, which is a generalization of the fuzzy set (FS) theory [30]. In FS, an element is marked by the presence of its membership (M)degree or value (i.e., the non-membership (N) degree is directly complemented to it). Meanwhile, in IFS, it is indicated by the presence of its M and N degrees, where the sum of the two can be less than one (i.e., any hesitancy or incomplete information is allowed). This makes IFS more flexible and covers more uncertain events in the decision-making process. Several studies have been conducted to expand the IFS, including in aggregation operators [26], and correlation coefficient [17], to mention a few. In addition, many authors have applied the IFS to decision-making problems [1, 13].IFS has experienced numerous developments, especially in terms of the relationship between M and N degrees. Initially, the IFS met the condition

80156

M+ N ≤ 1. However, to cater for the issue beyond this inequality (i.e., M+ N >1), Yager [28] then defined the Pythagorean fuzzy sets (PFS), which changed the constraining relation to $M^2 + N^2 \le 1$. Prior to that, Atanassov[8] proposed IFS of second type to deal with the same issue. In 2011, Ciucci [15] introduced the term orthopair as an alternative pair of M and N degrees. This gives rise to the generalized orthopair fuzzy sets or called q-rung orthopair fuzzy sets (q-ROFS), which satisfy $M^q + N^q \le 1$ for any q positive integers [29]. Vassilev et al. [25] defined a similar concept called IFS of q-type to generalize the IFS. Note that this set can be reduced to IFS for q = 1, PFS for q = 2 and Fermatean fuzzy sets (FFS), which is another special form of q-ROFS with q = 3 [24]. Similarly, several studies have explored the q-ROFS in the cases of aggregation operations [21, 2], similarity measures [16,5], and some applications in decision-making problems [4, 3]. In general, the expression of q-ROFS is acknowledged to provide greater flexibility and expressive power for decision-makers in representing their preferences compared to IFS [29].In 1989, IFS was expanded from what was originally a singular point into an area in an intuitionistic fuzzy interpretation triangle (IFIT) with a rectangular shape called interval-valued IFS(IVIFS) [10]. The main motivation for this extension was to deal with imprecise of M and of N values. Recently, Atanassov introduced another extension of Mand N interpretation into a circle called circular IFS (CIFS) [9]. This set is characterized by a 3-tuple containing M, N and radius for each element. The difference with IFS lies in the existence of a circular imprecision area with radius r. Compared to IVIFS, CIFS has an equidistant centre point and boundary, which is not necessarily true for IVIFS, as their boundaries can take various shapes and distances from the centre point. The CIFS theory is still at an early stage of its development. Hence, not much research has been conducted on it. Initially, Atanassov [9] defined the basic relations and operations for CIFS with r ∈[0, 1], but then has been expanded to r ∈[0,√2] to cover the whole region in the IFIT [11].Some studies on CIFS have been conducted, including distance measures [11, 14] and divergence measures for CIFS [20]. Other than that, some extensions of decision-making models under the CIFS environment have also been proposed recently, such as in technique for order preference by similarity to ideal solution (TOPSIS) [18, 6], multiple criteria optimization and compromise solution (VIKOR) [19], the integration of analytic hierarchy process (AHP) and VIKOR [23] and a general multiple criteria decision making (MCDM) model [12]. In this paper, we introduce the notion of generalized orthopair fuzzy sub-implicative d-algebra, level generalized orthopair fuzzy sets and generalized ortho pair fuzzy sub-implicative d-ideals in d-algebra and investigated some of their results. Also we investigate homomorphism of generalized orthopair fuzzy sub-implicative d-algebra and derived some standard results.

PRELIMINARIES

Definition-2.1: An algebra $(X, *, 0)$ of type $(2,0)$ is called a BCK-algebra if it satisfies the following conditions:

(i) $\big((x * y) * (x * z)\big) * (z * y) = 0,$

(ii) $\big(x * (x * y)\big) * y = 0,$

(iii) $x * x = 0,$

(iv) $0 * x = 0,$

(v) $x * y = 0$ and $y * x = 0$ implies $x = y$, for all $x, y \in X$.

Remark-2.2: A partial ordering " ≤ " on Xcan be defined by $x \le y$ if and only if $x * y = 0$.

Definition-2.3: A non-empty set X with constant 0 and a binary operator $*$ is called a
Sub-implicative d-algebra, if it satisfies the following axioms:

Sd1: $x * x = 0$

Sd2: $0 * x = 0$

Sd3: $x * y = 0$ and $y * x = 0$ implies $x = y$, for all $x, y \in X$.

Example-2.4: Let $X = \{e, a, b\}$ be a set with the following table

∗	e	a	b
e	e	e	e
a	b	0	b
b	b	0	a

By usual calculation, it is clear that $(X, ∗, e)$ is a sub-implicative d-algebra.

Definition-2.5: Let X be a sub-implicative d-algebra and I be subset of X. Then I is called
sub-implicative d-algebra of X if it satisfies the following conditions:
SI1: $0 \in I$.
SI2: $x ∗ y \in I$ and $y \in I$ implies $x \in I$.
SI3: $x \in I, y \in I$ implies $x ∗ y \in I$.

Definition-2.6: Let ′A′ be a non-empty subset of a sub-implicative d-algebra X. Then A is called sub-implicative d-algebra of X if $x ∗ y \in A$ for all $x, y \in A$.

Definition-2.7: A fuzzy subset of X is a function $δ: X \to [0,1]$.

Definition-2.8: A Pythagorean fuzzy set (PFS) ′A′ non-empty set X is an object having the form $A = \left\{x, \alpha_A^2(x), \beta_A^2(x) / x \in X\right\}$ where the function $\alpha_A: X \to [0,1]$ and $\beta_A: X \to [0,1]$ denote the degree of membership and degree of non-membership respectively such that $0 \leq \alpha_A^2(x) + \beta_A^2(x) \leq 1$ for all $x \in A$.
A Pythagorean fuzzy set (PFS) $A = \left\{x, \alpha_A^2(x), \beta_A^2(x)/x \in X\right\}$ of the X can be identified to an ordered pair $\left(\alpha_A(x), \beta_A(x)\right)$ in $I^X \times I^X$. For the sack of simplicity, we shall use the symbol $A = \left(\alpha_A(x), \beta_A(x)\right)$ for Pythagorean fuzzy set (PFS) $A = \left\{x, \alpha_A^2(x), \beta_A^2(x)/x \in X\right\}$.

Definition-2.9: A fuzzy set $μ$ in sub-implicative d-algebra X is called a fuzzy sub-implicative d-algebra of X if it satisfies $μ(x ∗ y) \geq \min\{μ(x), μ(y)\}$ for all for all $x, y \in X$.

Generalized ortho pair fuzzy sub-implicative d-algebra

Definition-3.1: A generalized ortho pair fuzzy set A in X defined as
$A = \left\{x, \alpha_A^n(x), \beta_A^n(x)/x \in X\right\}$ where the function $\alpha_A: X \to [0,1]$ and $\beta_A: X \to [0,1]$ are respectively degree of membership and degree of non-membership for every $x \in X$ with $0 \leq \alpha_A^n(x) + \beta_A^n(x) \leq 1$ and degree of indeterminacy of $x \in X$ is
$\pi_A(x) = \sqrt[n]{1 - \left(\alpha_A^n(x) + \beta_A^n(x)\right)}$.

Definition-3.2: A generalized ortho pair fuzzy set $A = \left(\alpha_A(x), \beta_A(x)\right)$ in X called generalized ortho pair fuzzy sub-implicative d-algebra of X if it satisfies
GOPFDA1: $\alpha_A^n(x ∗ y) \geq \min\{\alpha_A^n(x), \alpha_A^n(y)\}$,
GOPFDA2: $\beta_A^n(x ∗ y) \leq \max\{\beta_A^n(x), \beta_A^n(y)\}$.

Example 3.3: Let $X = \{e, a, b\}$ be a d-algebra with the following table

∗	e	a	b
e	e	e	e

| a | b | 0 | b |
| b | b | 0 | a |

Define generalized ortho pair fuzzy set $A = \left(\alpha_A(x), \beta_A(x)\right)$ in X as follows

$\alpha_A^n(e) = \alpha_A^n(a) = 0.6 > 0.2 = \alpha_A^n(b)$

$\beta_A^n(e) = \beta_A^n(a) = 0.1 < 0.7 = \beta_A^n(a)$

By usual calculation we know that $A = \left(\alpha_A(x), \beta_A(x)\right)$ is a generalized ortho pair fuzzy d-algebra of X.

Definition-3.4 : A generalized ortho pair fuzzy set A is called as level generalized ortho pair fuzzy set if $A = \left\{x \in X / \alpha_A^n(x) \geq t \text{ and } \beta_A^n(x) \leq t\right\}$ for $0 \leq t \leq 1$.

Remarks-3.5

(i)   The upper and lower level subset of α_A is defined by $\alpha_A^t = \{x \in X / \alpha_A^n(x) \geq t\}$ and $\alpha_{A_t} = \{x \in X / \alpha_A^n(x) \leq t\}$ respectively.

(ii)   Two level generalized ortho pair fuzzy sets A_s and A_t are generalized ortho pair fuzzy set equal $(A_s = A_t)$ if $\alpha_A^s = \alpha_A^t$ and $\beta_A^s = \beta_A^t$.

(iii) Two level generalized ortho pair fuzzy sets A_s and A_t are generalized ortho pair fuzzy subsets $A_s \subseteq A_t$ if $\alpha_A^s \subseteq \alpha_A^t$ and $\beta_A^s \supseteq \beta_A^t$.

Proposition-3.6: For every generalized ortho pair fuzzy sub-implicative d-algebra of X

(i) $\alpha_A^n(e) \geq \alpha_A^n(x)$

(ii) $\beta_A^n(e) \leq \beta_A^n(x)$, for all $x \in X$.

Proof: It is easy and straight forward.

Proposition-3.7: A generalized ortho pair fuzzy set A of a sub-implicative d-algebra X is a generalized ortho pair fuzzy sub-implicative d-algebra if and only if for every $0 \leq t \leq 1$ the level generalized ortho pair fuzzy set A is either empty or a sub algebra of X.

Proof: Suppose that A is a generalized ortho pair fuzzy sub-implicative d-algebra and $A_t \neq 0$. For every $x, y \in A$ $\alpha_A^n(x * y) \geq \min\{\alpha_A^n(x), \alpha_A^n(y)\} = t$ and $\beta_A^n(x * y) \leq \max\{\beta_A^n(x), \beta_A^n(y)\} = t$. Hence $x * y \in A_t$. Conversely, take $t = \min\{\alpha_A^n(x), \alpha_A^n(y)\}$ and $t = \max\{\beta_A^n(x), \beta_A^n(y)\}$ for every $x, y \in A$, then $\alpha_A^n(x * y) \geq t = \min\{\alpha_A^n(x), \alpha_A^n(y)\}$ and $\beta_A^n(x * y) \leq t = \max\{\beta_A^n(x), \beta_A^n(y)\}$. Hence A is generalized ortho pair fuzzy sub-implicative d-algebra.

Proposition-3.8: Any generalized ortho pair fuzzy sub-implicative d-algebra X can be realisedas a level sub-implicative d-algebra of some generalized ortho pair fuzzy sub-implicative d-algebra of X.

Proof: Let A be a generalized ortho pair fuzzy sub-implicative d-algebra of X.

Define $\alpha_A^n(x) = \beta_A^n(x) = \begin{cases} t, & \text{if } x \in A \\ 0 \text{ or } 1, & \text{if } x \notin A \end{cases}$.

If $x, y \in A$, then

$\alpha_A^n(x * y) \geq \min\{\alpha_A^n(x), \alpha_A^n(y)\} = t$ and $\beta_A^n(x * y) \leq \max\{\beta_A^n(x), \beta_A^n(y)\} = t$.

Hence $x * y \in A_t$.

If $x, y \notin A$, then

$\alpha_A^n(x * y) \geq \min\{\alpha_A^n(x), \alpha_A^n(y)\} = 0$ and $\beta_A^n(x * y) \leq \max\{\beta_A^n(x), \beta_A^n(y)\} = 0$.

Hence $x * y \in A_{t^*}$.

If at most one of $x, y \in A$, then

$\alpha_A^n(x * y) \geq \min\{\alpha_A^n(x), \alpha_A^n(y)\} = t$ and $\beta_A^n(x * y) \leq \max\{\beta_A^n(x), \beta_A^n(y)\} = t.$

Hence $x * y \in A_t$.

Proposition-3.9: Let A_s and $A_t(s < t)$ be two generalized ortho pair fuzzy sub-implicative d-algebra of a d-algebra X. Then $A_s = A_t$ if and only if there is no $x \in X$ such that $s \leq \alpha_A^n(x) < t$ and $s > \beta_A^n(x) \geq t.$

Proof: Suppose that $A_s = A_t$ for some $s < t$. If there exists $x \in X$ such that $s < \alpha_A^n(x) < t$ and $s \geq \beta_A^n(x) \geq t$, than $A_s \subseteq A_t$ which is contradiction. Conversely, suppose that there is no $x \in X$ such that $s < \alpha_A^n(x) < t$ and $s > \beta_A^n(x) \geq t.$

If $x \in A_s$, then $\alpha_A^n(x) \geq s$ and $\beta_A^n(x) < s.$

Also $\alpha_A^n(x) < t$ and $\beta_A^n(x) \geq t$. Thus $\alpha_A^t \subseteq \alpha_A^{t^*}$ and $\beta_{A,s} \supseteq \beta_{A,t^*}.$

The converse inclusion is obvious since $s < t.$

Hence $A_s = A_{t^*}.$

Generalized ortho pair fuzzy sub-implicative d-ideals

Definition-4.1: A generalized ortho pair fuzzy set $A = (\alpha_A, \beta_A)$ in X is called generalized ortho pair fuzzy sub-implicative d-ideal of X if it satisfies

(i) $\alpha_A^n(0) \geq \alpha_A^n(x)$, $\beta_A^n(0) \leq \beta_A^n(x),$

(ii) $\alpha_A^n(x) \geq \min\{\alpha_A^n(x * y), \alpha_A^n(x)\}, \beta_A^n(x) \leq \max\{\beta_A^n(x * y), \beta_A^n(x)\}$

(iii) $\alpha_A^n(x * y) \geq \min\{\alpha_A^n(x), \alpha_A^n(y)\}, \beta_A^n(x * y) \leq \max\{\beta_A^n(x), \beta_A^n(y)\}$

Clearly, every generalized ortho pair fuzzy sub-implicative d-ideal of a d-algebra is a generalized ortho pair fuzzy sub-implicative d-algebra of X.

Example-4.2: Let $X = \{e, a, b\}$ be a d-algebra with the following table

*	e	a	b
e	e	e	e
a	b	e	b
b	b	0	a

Define a generalized ortho pair fuzzy set $A = \{\alpha_A, \beta_A\}$ in X as follows

$\alpha_A^n(e) = \alpha_A^n(b) = 1, \qquad \alpha_A^n(a) = t$

$\beta_A^n(e) = \beta_A^n(b) = 1, \qquad \beta_A^n(a) = s$, where $0 \leq t \leq 1$, $0 \leq s \leq 1$ and $t + s = 1.$

By usual calculation we know that $A = \{\alpha_A, \beta_A\}$ is a generalized ortho pair fuzzy d-ideal of X.

Theorem-4.3: Let $A = (\alpha_A, \beta_A)$ in X be generalized ortho pair fuzzy sub-implicative d-ideal of X. If $x * y \leq z$, then

(i) $\alpha_A^n(x) \geq \min\{\alpha_A^n(y), \alpha_A^n(z)\}, \beta_A^n(x) \leq \max\{\beta_A^n(y), \beta_A^n(z)\}$ and

(ii) $\alpha_A^n(0) \geq \alpha_A^n(z)$, $\beta_A^n(0) \leq \beta_A^n(z)$ for all $x, y, z \in X.$

Proof: Let $x, y, z \in X$ such that $x * y \leq z$ (If $x * y \leq z$ then $(x * y) * z = 0$).

Then, it is easy to prove that $\alpha_A^n(x) \geq \min\{\alpha_A^n(y), \alpha_A^n(z)\}$, $\beta_A^n(x) \leq \max\{\beta_A^n(y),\ \beta_A^n(z)\}$.

$\alpha_A^n((x * y) * z) \geq \min\{\alpha_A^n(x * y), \alpha_A^n(z)\}$

$\alpha_A^n(0) \geq \min\{\min\{\alpha_A^n((x * y) * z), \alpha_A^n(z)\}, \alpha_A^n(z)\}$

$\alpha_A^n(0) \geq \min\{\min\{\alpha_A^n(0), \alpha_A^n(z)\}, \alpha_A^n(z)\}$

$\alpha_A^n(0) \geq \min\{\alpha_A^n(z), \alpha_A^n(z)\}$

$\alpha_A^n(0) \geq \alpha_A^n(z)$

$\beta_A^n((x * y) * z) \leq \max\{\beta_A^n((x * y)), \beta_A^n(z)\}$

$\beta_A^n(0) \leq \max\{\max\{\beta_A^n((x * y) * z), \beta_A^n(z)\}, \beta_A^n(z)\}$

$\beta_A^n(0) \leq \max\{\max\{\beta_A^n(0), \beta_A^n(z)\}, \beta_A^n(z)\}$

$\beta_A^n(0) \leq \max\{\beta_A^n(z), \beta_A^n(z)\}$

$\beta_A^n(0) \leq \beta_A^n(z)$

Theorem-4.4: Let $A = (\alpha_A, \beta_A)$ in X be a generalized ortho pair fuzzy sub-implicative d-ideal of X. If $x \leq y$, then

(i) $\alpha_A^n(0) \geq \alpha_A^n(x) \geq \alpha_A^n(y)$ and

(ii) $\beta_A^n(0) \leq \beta_A^n(x) \leq \beta_A^n(y)$ for all $x, y \in X$.

Proof: For $x, y \in X$ and $x \leq y$ then $x * y = 0$.

$\alpha_A^n(x) \geq \min\{\alpha_A^n(x * y), \alpha_A^n(y)\}$

$\alpha_A^n(x) \geq \min\{\alpha_A^n(0), \alpha_A^n(y)\}$

$\alpha_A^n(x) \geq \alpha_A^n(y)$ and

$\alpha_A^n(x * y) \geq \min\{\alpha_A^n(x), \alpha_A^n(y)\}$

$\alpha_A^n(0) \geq \min\{\alpha_A^n(x), \alpha_A^n(y)\}$

$\alpha_A^n(0) \geq \alpha_A^n(x)$.

Hence, we have $\alpha_A^n(0) \geq \alpha_A^n(x) \geq \alpha_A^n(y)$.

Similarly, we can prove (ii).

Definition-4.5: Let $A = (\alpha_A, \beta_A)$ and $B = (\alpha_B, \beta_B)$ be two generalized ortho pair fuzzy sets of sub-implicative d-algebra of X. Then the Cartesian product of $A \times B: X \times X \to [0,1]$ is defined by $(\alpha_A^n \times \alpha_B^n)(x, y) = \min\{\alpha_A^n(x), \alpha_B^n(y)\}$ and $(\beta_A^n \times \beta_B^n)(x, y) = \max\{\beta_A^n(x), \beta_B^n(y)\}$ for all $x, y \in X$.

Theorem-4.6: If $A = (\alpha_A, \beta_A)$ and $B = (\alpha_B, \beta_B)$ be two generalized ortho pair fuzzy sub-implicative d-ideals of a d-algebra X. Then $A \times B$ is a generalized ortho pair fuzzy sub-implicative d-ideals of X.

Proof: For any $(x, y) \in X \times X$, we have

(i)$(\alpha_A^n \times \alpha_B^n)(0,0) = \min\{\alpha_A^n(0), \alpha_B^n(0)\} \geq \min\{\alpha_A^n(x), \alpha_A^n(y)\} = (\alpha_A^n \times \alpha_B^n)(x, y)$ and

$(\beta_A^n \times \beta_B^n)(0,0) = \max\{\beta_A^n(0), \beta_B^n(0)\} \leq \max\{\beta_A^n(x),\ \beta_A^n(y)\} = (\beta_A^n \times \beta_B^n)(x, y)$.

(ii) Let (x_1, x_2) and $(y_1, y_2) \in X \times X$. Then $(\alpha_A^n \times \alpha_B^n)(x_1, x_2) = \min\{\alpha_A^n(x_1), \alpha_B^n(x_2)\}$

$\geq \min\{\min\{\alpha_A^n(x_1 * y_1), \alpha_A^n(y_1)\}, \min\{\alpha_B^n(x_2 * y_2), \alpha_A^n(y_2)\}\}\ \min\{\min\{\alpha_A^n(x_1 * y_1), \alpha_B^n(x_2 * y_2)\}, \min\{\alpha_A^n(y_1), \alpha_A^n(y_2)\}\}$

$= \min\{(\alpha_A^n \times \alpha_B^n)(x_1 * y_1, x_2 * y_2), (\alpha_A^n \times \alpha_B^n)(y_1, y_2)\}$

$= \min\{(\alpha_A^n \times \alpha_B^n)(x_1, x_2) * (y_1, y_2), (\alpha_A^n \times \alpha_B^n)(y_1, y_2)\}$ and $(\beta_A^n \times \beta_B^n)(x_1, x_2) = \max\{\beta_A^n(x_1), \beta_B^n(x_2)\}$

$\leq \max\{\max\{\beta_A^n(x_1 * y_1), \beta_A^n(y_1)\}, \max\{\beta_B^n(x_2 * y_2), \beta_B^n(y_2)\}\}$

$\leq \max\{\max\{\beta_A^n(x_1 * y_1), \beta_B^n(x_2 * y_2)\}, \max\{\beta_B^n(y_1), \beta_B^n(y_2)\}\}$

$= \max\{(\beta_A^n \times \beta_B^n)(x_1 * y_1, x_2 * y_2), (\beta_A^n \times \beta_B^n)(y_1, y_2)\} = \max\{(\beta_A^n \times \beta_B^n)(x_1, x_2) * (y_1, y_2), (\beta_A^n \times \beta_B^n)(y_1, y_2)\}$

(iii) Let (x_1, x_2) and $(y_1, y_2) \in X \times X$. Then $(\alpha_A^n \times \alpha_B^n)((x_1, x_2) * (y_1, y_2)) = (\alpha_A^n \times \alpha_B^n)(x_1 * y_1, x_2 * y_2)$

Balamurugan and Nagarajan

$$= \min\{\alpha_A^n(x_1 * y_1), \alpha_B^n(x_2 * y_2)\}$$

$$ax\{\beta_{Af}^n(a * b), \beta_{Af}^n(b)\}$$

$$= \max\{\beta_A^n(f(a * b)), \beta_A^n(f(b))\}$$
$$= \max\{\beta_A^n(f(a) * f(b)), \beta_A^n(f(b))\}$$
$$= \max\{\beta_A^n(x * y), \alpha_A^n(y)\}$$

(i)   Let $x, y \in Y$, there exists $a, b \in X$ such that $f(a) = x$ and $f(b) = y$. Then
$$\alpha_A^n(x * y) = \alpha_A^n(f(a) * f(b)) = \alpha_{Af}^n(a * b)$$
$$\geq \min\{\alpha_{Af}^n(a), \alpha_{Af}^n(b)\}$$
$$= \min\{\alpha_A^n(f(a)), \alpha_A^n(f(b))\}$$

$$= \min\{\alpha_A^n(x), \alpha_A^n(y)\} \text{ and}$$
$$\beta_A^n(x * y) = \beta_A^n(f(a) * f(b)) = \beta_{Af}^n(a * b)$$
$$\leq \max\{\beta_{Af}^n(a), \beta_{Af}^n(b)\}$$
$$= \max\{\beta_A^n(f(a)), \beta_A^n(f(b))\}$$
$$= \max\{\beta_A^n(x), \beta_A^n(y)\}$$

Hence the proof.

Definition- 4.6: Let f is mapping from a set X to Y. If $A = (\alpha_A, \beta_A)$ and $B = (\alpha_B, \beta_B)$ are generalized ortho pair fuzzy sets in X and Y respectively, then the pre image of B under f, defined by $f^{-1}(B)$ is generalized ortho pair fuzzy sets in X defined by $f^{-1}(B) = f^{-1}(\mu_B), f^{-1}(\gamma_B)$ where $f^{-1}(\mu_B) = (\mu_B)f$.

Theorem- 4.7 : Let S be sub d-algebra of X and $f: S \to S$ be a map defined by $f(x) = x$ for all
$x \in S$. If $A = (\alpha_A, \beta_A)$ is generalized ortho pair fuzzy sub-implicative d-ideal of X, then the pre image $f^{-1}(A)$ of A under f is a generalized ortho pair fuzzy sub-implicative d-ideal of S.

Proof:
(i) $f^{-1}(\alpha_A^n(0)) = \alpha_A^n(f(0)) = \alpha_A(0) \geq \alpha_A(x) = \alpha_A f((x)) = f^{-1}(\alpha_A)(x)$ and
$f^{-1}(\beta_A^n(0)) = \beta_A^n(f(0)) = \beta_A(0) \leq \beta_A(x) = \beta_A f((x)) = f^{-1}(\beta_A)(x)$.
(ii) For all $x, y \in S$, then
$f^{-1}(\alpha_A(x)) = \alpha_A(f(x)) = \alpha_A(x) \geq \min\{\alpha_A(x * y), \alpha_A(y)\}$
$= \min\{\alpha_A(f(x * y)), \alpha_A(f(y))\}$ (Since S is sub d-algebra of X)
$= \min\{f^{-1}(\alpha_A)(x * y), f^{-1}(\alpha_A)(y)\}$ and
$f^{-1}(\beta_A(x)) = \beta_A(f(x)) = \beta_A(x) \leq \max\{\beta_A(x * y), \beta_A(y)\}$
$= \max\{\beta_A(f(x * y)), \beta_A(f(y))\}$ (Since S is sub d-algebra of X)
$= \max\{f^{-1}(\beta_A)(x * y), f^{-1}(\beta_A)(y)\}$
(iii) For all $x, y \in S$, then
$$f^{-1}(\alpha_A)(x * y) = \alpha_A(f(x * y)) = \alpha_A(x * y) \geq \min\{\alpha_A(x), \alpha_A(y)\} = \min\{\alpha_A(f(x)), \alpha_A(f(y))\}$$
$= \min\{f^{-1}(\alpha_A)(x), f^{-1}(\alpha_A)(y)\}$
$f^{-1}(\beta_A)(x * y) = \beta_A(f(x * y)) = \beta_A(x * y) \leq \max\{\beta_A(x), \beta_A(y)\}$
$$= \max\{\beta_A(f(x)), \beta_A(f(y))\} = \max\{f^{-1}(\beta_A)(x), f^{-1}(\beta_A)(y)\}$$
Hence $f^{-1}(A)$ is generalized ortho pair fuzzy sub-implicative d-ideal of S.

CONCLUSION

Using generalized ortho pair fuzzy set, we define generalized ortho pair fuzzy sub-implicative d-algebra over the concept of d-ideal structures. Homomorphism structure is also defined in d-algebra in terms of d-ideals. Finally, we investigate the level ortho pair fuzzy set with suitable examples. In future we may obtain this generalized ortho pair fuzzy sets into the direct field various algebras like AB-algebra, MV-algebra and p-algebra.

ABSTRACT

A binomial service and multiple adaptive vacation schedules for M^x/G/1 queue with setup time is considered. The server implements the notion of a binomial vacation schedule. The setup time policy in bulk queueing theory has been always a new and hot research field. An M^x/G/1 queueing system with Poisson arrival rate λ and the general service distribution is considered here. Under this policy, there is no customer at a service completion epoch the server takes multiple vacations. The number of vacations follows a binomial distribution with parameter p, otherwise the server provides the service with probability 1-p, if any new customers arrive in the queue. At the completion of an essential service, the batch of customers may request for a re-service with probability π.   Whenthe server returns from vacation if there is no customer in the queue then he avails another vacation and so on until the server finds single customers in the queue.   After completing an essential service and the number of customers in the queue becomes one then the server will continue the service with general service rule. The probability generating function of the steady state system size at an arbitrary time is obtained. Expression for expected system size, idle period, busy period and waiting time are also obtained.

Keywords: M^x/G/1 Queue, Setup Times, Binomial Service, Multiple Adaptive Vacation, Essential Service, Re-Service

INTRODUCTION

Queueing systems with bulk arrival and general service are common in many practical situations. Bulk queueing models have been analyzed extensively in the past by several authors. Vacation queueing models had been the subject of interest to queue theorists of deep study in recent years because of their applicability in real life situations. Server vacation model mainly characterized by utilizing the idle time of the server to carry out the secondary jobs, such as maintenance and repair work in the system. Vacation of queueing systems have found wide applications in the modeling and analysis of computer and communication networks, production line system, designing local and network area, data communication system, and core banking etc. The objective of this paper is to analyze a situation that exists in wireless networks. In a wireless network, different types of wireless devices have received more attention as a means of data communication among portable devices. As wireless devices usually rely on portable power sources such as batteries to provide the necessary operational power, power management in wireless networks has become a critical issue. For instance, to support battery-operated portable devices, mobile WiMAX has power-saving features that allow portable subscriber stations to operate for longer durations without having to recharge. Mobile WiMAX defines signaling methods that allow the MS to retreat into a vacation mode or idle mode when inactive. Vacation mode is a state in which the MS effectively turns itself off and becomes unavailable for predetermined periods, these periods are considered here as M vacation periods.The sleep window is exponentially increased from a minimum value to a maximum value. In this model the signals are arrives in batches from BS, the MS effectively receives the signals one by one. During the time of sleeping mode (M number of vacation) of MS, when the signals entering at 'p' discipline, the MS never receive the signals. At that time either the signals are able to withstand great force wait for transmitting or the weak signals leaves from the queue. The above process can be modeled as $M^x/G/1$ queueing system with multiple adaptive vacations, along with arrival to the system based on the choice of the customers during the vacation of the server with setup time.

Chunanyi Lou and Xisheng Yu [1] analyzed a single server markovian bulk arrival general service queue with multistage adaptive vacations in transient state.Queueing systems with vacations have been analyzed extensively by many authors like Levy and Yachiali [10], Heymann [3]. Doshi [2] and Takagi [14] have been made comprehensive survey of queueing systems with vacations. This includes the studies of Medhi [9] on bulk queueing models. Lee [8] has developed a procedure to find the system size probabilities for a server vacations bulk arrival queueing model. Lee et al.[9] analyzed a batch arrival queue with N policy, by considering single vacation and multiple vacations. Tang and Tang [15] developed, the queueing length distribution for $M^x/G/1$ queue with single server vacation. Ke [6] discussed the modified 'T' vacation policy for an M/G/1 queueing system with an unreliable server and startup. Ke and Chu [7], discussed a modified vacation model $M^x/G/1$ system. Yi-jun zhu, Bin Zhaung [16], discussed on a batch arrival queue with different arrival rate and N policy. Yinghui Tang and Yong Mao [17] discussed, the stochastic decomposition,Rameshkumar[12],[13]discussed for $M^x/G/1$ queue with p entering discipline during server vacations ,Jeyakumar and Rameshkumar[4],[5] discussed a multiple adaptive server vacations in which the customers who arrive during server vacations enter the system with probability p. Variations in the vacation policies of the queueing systems have gained much attention in the literature, recently. Many researcher's analysis queueing systems with working vacations, adaptive vacations, vacations with T policy, etc., In the literature of the vacation models, the server avails either single or multiple vacations, but in practice, there are situations in which server takes sequence of finite number of vacations in idle time to perform optional fixed number of jobs. Best of our knowledge, only two papers are available on 'p' entering discipline, that too analysed in transient state. But in practice, one can expect the solution in a steady state. Also, in those papers, the results are obtained only analytical. This motivates the authors to develop 'p' entering discipline for $M^x/G/1$ queue with 'p' entering discipline during server vacations in steady state for a practical problem and numerical results are presented. The model discussed in this paper is more reasonable. Suppose that the customer input rate depends on the server availability (being in vacation or not). The arriving customers directly enter the system when they find the server available in the system. However, they enter the system with probability `p` $(0 \le p \le 1)$, when the server is on vacation.

Rameshkumar and Poongkodi

The following points are addressed in this paper. Numerical solution is provided which is not available in the literature. Arrival to the system due to the choice of the customers during the server vacation. A practical situation is modeled and analyzed as a queueing system. Numerical illustration is presented to justify, the analytical results of the model and how it is useful to the management for taking decisions. The paper isorganized as follows: firstly, the steady state equations are developed by using supplementary variables. Secondly, the probability generating function of queue size at an arbitrary time epoch is obtained. Next through this some important performance measures such as expected queue length, expected busy period, expected waiting time and idle time are derived.

Model Description

The model consists of a single server, the customers are served one at a time in FCFS order. In this paper, we study the steady state behavior of a single server, general bulk service queue with restricted number of vacations. A batch of customers arrive according to Poisson with rate λ, after completing a service, if the queue length is empty then the server leaves for a vacation of random length. When he returns from a vacation, if the number of customer in the queue is still zero, then the server avails another vacation and so on until he completes M number of vacations, in successions or he finds at least one customer waiting for service. During the vacation time customers entering in to the system with probability `p`.We state some assumptions as follows,

1. The Customer bulk arrival is a time homogenous Poisson process, the intervals between bulk customers, are independent identically distributed random variables generated by distribution function x(t) =1- $e^{-\lambda t}$, t ≥ 0
2. The service order for customers in different bulk arrivals is under the rule of First Come First Serve and the order in one bulk arrival is arbitrary. The service times {μ ≥ 1} are independent identically distributed random variables each with distribution S(x).
3. The server takes adaptive multiple vacations when the system becomes empty. Let T be the times of vacation generating by distribution function with PGF Q(z).Assume that the length of each vacation Q_n are independent identically distributed random variables each with general distribution V(t) and finite mean E(v).
4. The arriving customers directly enter the system when the server does not take vacations. However, the customers who arrive during server vacations enter the system with probability `p`(0≤ p ≤ 1). The arrival, service, vacation and idle time are independent identically distributed of each other.

Notations and assumptions

The following notations are used in this paper

X(z)	:	probability generating function of X
λ	:	arrival rate
g_k	:	P(X=k)
S(·)	:	Cdf of service time
V(·)	:	Cdf of vacation time
$\tilde{S}(\theta)$	:	Laplace - Stieltje's transforms of S
$\tilde{V}(\theta)$	:	Laplace - Stieltje's transforms of V
Z (t)	:	j, if the server is on j^{th} vacation
s(x)	:	Pdf of S
v(x)	:	Pdf of V
S^0(t)	:	Remaining service time of S at time ' t '
$V^0(t)$	:	Remaining vacation time of V at time't '
N_s(t)	:	Number of customers in the service.
N_q(t)	:	Number of customers in the queue.

Define the random variables as

ξ (t) =   (0),[1],{2}, if the customers in the (service),[vacation],{dormant}.

Z (t) = j, if the server is on j^{th} vacation

The supplementary variables S^0(t), V^0(t) are introduced in order to obtain bivariate Markov process {N (t), ξ (t)}, where N(t) = {N_q(t)∪ N_s(t)}

80167

Let us define the following probabilities

P_{1j}(x, t) dt = p$\{N_s(t) =1, N_q(t) = j, x \le S^0(t) \le x + dt, \xi(t) = 0\}, j \ge 0$

which means that there are one customers under service, `j' customers in the queue, the server is busy with remaining service time x.   In similar manner, we define,

Q_{1n}(x, t) dt = p$\{N_q(t) = n, x \le V^0(t) \le x + dt, \xi(t) =1, Z(t) = j), n \ge 0\}, 1 \le j \le M$ denotes that n customers waiting in the queue and the server is on j^{th} vacation, and T_0(t)dt = p$\{(N_q(t) = 0, \xi(t) = 2\}$, denotes that there are `0` customers in the queue when server is on dormant period.

System equations

The following system equations are obtained for the queueing system using supplementary variable technique due to Cox(1955). These equations provide the basis for the analysis given in sequel. These equations are obtained at time t+Δt considering all possibilities. One can note that when time t is increased byΔt, the remaining service time or vacation time will be reduced by

x-Δt.

P_{10}(x-Δt, t+Δt) = P_{10}(x,t)(1-$\lambda\Delta$t)+P_{11}(0,t) s(x)Δt+$\sum_{l=1}^{M} Q_{l1}$(0,t)s(x)Δt + λT₀(t)g₁s(x)Δt   (1)

P_{1j}(x-Δt, t+Δt) = P_{1j}(x,t)(1-$\lambda\Delta$t) +P_{1j+1}(0,t) s(x)Δt+$\sum_{l=1}^{M} Q_{lj+1}$(0,t)s(x)Δt +λT₀(t)g_{j+1}s(x)Δt +$\sum_{k=1}^{j} P_{1,j-k} \lambda$g_k$\Delta$t, j≥1   (2)

Q_{10}(x-Δt, t+Δt) = Q_{10}(x,t)(1-$\lambda\Delta$t) +P_{10}(0,t) v(x)Δt   (3)

Q_{1n}(x-Δt, t+Δt) = Q_{1n}(x,t)(1-$\lambda\Delta$t) +$p \sum_{k=1}^{n} Q_{1n-k}$(x,t) λg_kΔt,   (4)

Q_{j0}(x-Δt, t+Δt) = Q_{j0}(x,t)(1-$\lambda\Delta$t) + $Q_{j-1,0}$(0,t) v(x)Δt,2≤j≤M   (5)

Q_{jn}(x-Δt, t+Δt) = Q_{jn}(x,t)(1-$\lambda\Delta$t) +$p \sum_{k=1}^{n} Q_{j,n-k}$(x,t) λg_kΔt, 2≤j≤M   (6)

T₀(t+Δt) =T₀(t)(1-$\lambda\Delta$t)+ $\sum_{l=1}^{m} Q_{l,o}$(0, t) Δt   (7)

Steady state analysis

In this section, the probability generating function of the queue size at an arbitrary time epoch is derived by supplementary variable techniques; it will be useful to derive the important performance measures such as expected number of customers in the queue, expected waiting time of customer in the queue, idle time and expected busy period etc .

Queue size distribution

In the steady state, let us define for x> 0,

$P_{1,j}(x)$=$\lim_{t\to\infty} P_{1j}$(x,t), $P_{1,j}(0)$=$\lim_{t\to\infty} P_{1,j}$(0,t), for j ≥ 0

$Q_{i,j}(x)$=$\lim_{t\to\infty} Q_{ij}$(x,t), $Q_{i,j}(0)$=$\lim_{t\to\infty} Q_{i,j}$(0,t), for 1 ≤ j ≤ M

The Steady state equations are obtained as difference – differential equations of the above are given as,

$-\frac{d}{dx}P_{10}(x) = -\lambda P_{10}(x) + P_{11}(0)$ s(x)+$\sum_{l=1}^{M} Q_{l1}(0)$S(x) + λT₀g₁s(x)   (8)

$-\frac{d}{dx}P_{1j}(x) = -\lambda P_{1j}(x) + P_{1j+1}(0)$ s(x)+$\sum_{l=1}^{M} Q_{lj+1}(0)$ s(x) + λT₀g_{j+1}s(x) +

$\sum_{k=1}^{j} p_{1,j-k} \lambda g_1$ j≥1   (9)

$-\frac{d}{dx}Q_{10}(x) = -\lambda Q_{10}(x) + P_{10}(0)$ v(x)   (10)

$-\frac{d}{dx}Q_{1n}(x) = -\lambda Q_{1n}(x) + P \sum_{k=1}^{n} Q_{1n-k}(x) \lambda g_1$ (11)

$-\frac{d}{dx}Q_{j0}(x) = -\lambda Q_{j0}(x) + Q_{j-1,0}(0)$ v(x),   2 ≤ j ≤M   (12)

$-\frac{d}{dx}Q_{jn}(x) = -\lambda Q_{jn}(x) +P \sum_{k=1}^{n} Q_{j,n-k}(x) \lambda g_1$ 2 ≤ j ≤ M   (13)

0= -λT₀+ $\sum_{l=1}^{m} Q_{l,o}(0)$ (14)

80168

To solve the above differential equations and to obtain PGF of the queue size we have used Laplace Stieltje's Transforms (LST).

The LST of $P_{ij}(x)$ and $Q_{jn}(x)$ are defined as follows:

$\tilde{P}_{1n}(\theta) = \int_0^\infty e^{-\theta x} P_{1n}(x)dx$ and $\tilde{Q}_{jn}(\theta) = \int_0^\infty e^{-\theta x} Q_{jn}(x)dx$ (15)

Multiplying Equations (8) – (13) by $e^{-\theta x}$ and integrating with respect to x over 0 to ∞, we get after using the LST,

$\theta\tilde{P}_{10}(\theta) - P_{10}(0) = \lambda\tilde{P}_{10}(\theta) - P_{11}(0)\tilde{S}(\theta) - \sum_{l=1}^M Q_{l1}(0)\tilde{S}(\theta) - \lambda T_0 g_1\tilde{S}(\theta)$

(16)

$\theta\tilde{p}_{1j}(\theta) - P_{1j}(0) = \lambda\tilde{P}_{1j}(\theta) - P_{1j+1}(0)\tilde{S}(\theta) - Q_{lj+1}(0)\tilde{S}(\theta) - \lambda T_0 g_{j+1}\tilde{S}(\theta) +$

$\qquad \sum_{k=1}^j \tilde{P}_{1,j-k}(\theta)\lambda g_k, \qquad j \geq 1$ (17)

$\theta\tilde{Q}_{10}(\theta) - Q_{10}(0) = \lambda\tilde{Q}_{10}(\theta) - P_{10}(0)\tilde{V}(\theta)$ (18)

$\theta\tilde{Q}_{1n}(\theta) - Q_{1n}(\theta) = \lambda\tilde{Q}_{1n}(\theta) - p\sum_{k=1}^n \tilde{Q}_{1n-k}(\theta)\lambda g_k$ (19)

$\theta\tilde{Q}_{j0}(\theta) - Q_{j0}(0) = \lambda\tilde{Q}_{j0}(\theta) - Q_{j-1,0}(0)\tilde{V}(\theta), \qquad 2 \leq j \leq M$ (20)

$\theta\tilde{Q}_{jn}(\theta) - Q_{jn}(0) = \lambda\tilde{Q}_{jn}(\theta) - p\sum_{k=1}^n \tilde{Q}_{j,n-k}(\theta)\lambda g_k 2 \leq j \leq M$ (21)

$0 = -\lambda T_0 + \sum_{l=1}^m Q_{l,o}(0)$ (22)

To obtain the PGF of the queue size at an arbitrary time, the following probability generating functions are defined

$\tilde{P}_1(z,\theta) = \sum_{j=0}^\infty \tilde{P}_{1j}(\theta)z^j$ and $P_1(z,0) = \sum_{j=0}^\infty P_{1j}(0)z^j$

$\tilde{Q}_j(z,\theta) = \sum_{n=0}^\infty \tilde{Q}_{jn}(\theta)z^n$ and $Q_j(z,0) = \sum_{n=0}^\infty Q_{jn}(0)z^n$ (23)

Multiplying equations (18) by z^0 and (19) by z^n and summing up from n= 1 to ∞, and using equation (23) we get

$(\theta - \lambda + \lambda px(z))\tilde{Q}_1(z,\theta) = Q_1(z,0) - P_{10}(0)\tilde{V}(\theta)$ (24)

Multiplying equations (20) by z^0 and (21) by z^n and summing up from n= 1 to ∞, and using equation (23) we get

$(\theta - \lambda + \lambda px(z))\tilde{Q}_j(z,\theta) = Q_j(z,0) - Q_{j-1,0}(0)\tilde{V}(\theta), j \geq 2$ (25)

Multiplying equations (16) by z^0 and (17) by z^j and summing up from j = 1 to ∞, and using equation (23) we get

$z(\theta - \lambda + \lambda x(z))\tilde{P}_1(z,\theta) = zP_1(z,0) - \tilde{S}(\theta)[P_1(z,0) - P_{10}(0) + Q_1(z,0) - Q_{10}(0) + \lambda T_0 x(z)]$ (26)

By Substituting $\theta = \lambda - \lambda px(z)$ in the Equations (24) and (25), we get,

$Q_1(z,0) = P_{10}(0)\tilde{V}(\lambda - \lambda px(z))$ (27)

$Q_{1,0}(z,0) = Q_{j-1,0}(0)\tilde{V}(\lambda - \lambda px(z))$

(28)

By Substituting $\theta = \lambda - \lambda x(z)$ in (26), we get,

$zP_1(z,0) = \tilde{S}(\theta)[P_1(z,0) - P_{10}(0) + Q_1(z,0) - Q_{l0}(0) + \lambda T_0 x(z)]$

Solving for $P_1(z,0)$ we get

$P_1(z,0) = \frac{\tilde{S}(\theta)[-P_{10}(0) + Q_1(z,0) - Q_{10}(0) + \lambda T_0 x(z)]}{z - \tilde{S}(\lambda - \lambda x(z))}$ (29)

By Substituting $Q_1(z,0)$ and $Q_j(z,0)$ in (27) and (28) we get

$\tilde{Q}_1(z,\theta) = \frac{P_{10}(0)[\tilde{V}(\lambda - \lambda Px(z)) - \tilde{V}(\theta)]}{(\theta - \lambda + \lambda px(z)}$ and (30)

$\tilde{Q}_j(z,\theta) = \frac{Q_{j-1,0}(0)[\tilde{V}(\lambda - \lambda px(z)) - \tilde{V}(\theta)]}{(\theta - \lambda + \lambda px(z)}$ (31)

By Substituting $P_1(z,0)$ in (29), we get,

$\tilde{P}_1(z,\theta) = \frac{[\tilde{S}(\lambda - \lambda x(z)) - \tilde{S}(\theta)[-P_{10}(0) + Q_1(z,0) - Q_{10}(0) + \lambda T_0 x(z)]}{(z - \tilde{S}(\lambda - \lambda x(z))(\theta - \lambda + \lambda x(z))}$ (32)

Let us define the following,

$p_0 = P_{10}(0)$, $q_0 = \sum_{l=1}^M Q_{1i}(0)$ and $c_0 = p_0 + q_0$ (33)

By Substituting $\theta = 0$ in (30),(31) and (32) we get,

$\tilde{Q}_1(z,0) = \frac{P_{10}(0)[\tilde{V}(\lambda - \lambda px(z)) - 1]}{(-\lambda + \lambda px(z)}$ (34)

$\tilde{Q}_j(z,0) = \frac{Q_{j-1,0}(0)[\tilde{V}(\lambda - \lambda px(z)) - 1]}{(-\lambda + \lambda px(z))}$ and (35)

$\tilde{P}_1(z,0) = \frac{[\tilde{S}(\lambda - \lambda x(z)) - 1][-P_{10}(0) + Q_1(z,0) - Q_{l0}(0) + \lambda T_0 x(z)]}{(z - \tilde{S}(\lambda - \lambda x(z))(-\lambda + \lambda x(z))}$ (36)

From (27) and (28), we have $\sum_{n=0}^\infty Q_1(z,0) = c_0\tilde{V}(\lambda - \lambda px(z))$ (37)

Rameshkumar and Poongkodi

LetP (z) be the PGF of the queue size at an arbitrary time epoch is the sum of PGF of queue size at service completion epoch, vacation completion epoch and idle time, thenP $(z) = \tilde{P}_1(z, 0) + \tilde{Q}_1(z, 0) + \tilde{Q}_j (z, 0) + T_0$

Using the equations (25),(26), (27) and (14) we get the PGF of queue size as

$$P(z) = \frac{\begin{array}{c}(\tilde{S}(\lambda-\lambda x(z))-1)(-C_0+C_0\tilde{V}+q_0 x(z))(-\lambda+\lambda p x(z)) + \\ C_0(\tilde{V}-1)(z-\tilde{S}(\lambda-\lambda x(z)))(-\lambda+\lambda x(z)) + \\ q_0(z-S(\lambda-\lambda x(z)))(-\lambda+\lambda x(z))(-\lambda+\lambda p x(z))\end{array}}{(z-\tilde{S}(\lambda-\lambda x(z)))(-\lambda+\lambda x(z))(-\lambda+\lambda p x(z))} \qquad (38)$$

Note 1:

From equations (27) and (28), the probability q_0 can be expressed in terms of p_0 as,

$$\sum_{l=1}^{m} p_l z^l = (p_0+q_0)\sum_{i=0}^{\infty} \alpha_i z^i, \quad p_0 = (p_0+q_0)\alpha_0, \text{ and } q_0 = (1-\alpha_0)p_0. \qquad (39)$$

Steady state condition

The steady state condition of the queue size is obtained as follows. The probability generating function has to satisfy p (1) =1. To satisfy the condition applying L' hospital's rule and evaluating

$$\frac{q_0[(p-1)\lambda E(S)E(X) + 2E(V)(I - \lambda E(S)E(X))(-\lambda+\lambda p)]}{4\lambda E(X)(I - \lambda E(S)E(X))(-\lambda+\lambda p)} = 1 \qquad (40)$$

Equating we get,$4\lambda E(X)(I - \lambda E(S)E(X))(-\lambda + \lambda p) > 0$ since p_0 and q_0 are probabilities of no customers being in the queue at service completion epoch and vacation completion epoch, respectively, it follows that left hand side of the above expression must be positive. Thus p(1) =1 is satisfied if and only if$1 - \lambda E(S)E(X) > 0$. Define ϱ as$\lambda E(S)E(X)$. Thus $\varrho < 1$ is the condition to be satisfied for the existence of steady state for the model under consideration.

Performance measures

We derive some important performance measures using the PGF of queue size in equation (38), as follows:

Expected busy period

Theorem: If E (B) is the expected busy period, then E(B) $= \frac{E(S)}{P_0}$

Proof

Let B be the random variable for busy period. Define a random variable J as:

J= 0; if the server finds less than one customer in the queue after first service.

J=1;if the server finds at least one customers in the queue after a first service.

Now the expected length of busy period

E (B) = E (B/J=0) P(J=0) +E (B/J=0) P (J=1)

= E (B/J=0) P(J=0) + (E (B) +E(S)) P (J=1)

= E (B/J=0) P (J=0) + (E (B) +E(S)) (1-P (J=1))

On solving for E (B), we get, E(B) $= \frac{E(S)}{P(J=0)}$. $\qquad (41)$

Expected queue length

The expected queue length E (Q) at an arbitrary time epoch is obtained by p`(1) and is given by

$$E (Q) = \frac{(C_0 V_p - P_0)f_1 + f_2 + (C_0 V_1 + q_0 X_1)f_3}{24(1-S_1)\lambda^3(p-1)} \qquad (42)$$

The functions f_1, f_2 and f_3 are given by,

$f_1 = 6\lambda^2 S_2 + 2pS_1\lambda + (3X_2 - 4S_2)\lambda^2 S_1 - 2S_2 - 3S_1\lambda^2$,

$f_2 = -12pS_1 - \lambda X_2 + S_2 + 6\lambda X_1^2 S_1 - 5pS_1\lambda^3 X_1 - 4pS_1\lambda^2 X_1$,

$f_3 = 6\lambda^2 (p-1)(1-S_1) + 6S_1(1+\lambda)$,$S_1 = \lambda X_1 E(S)$, $S_2 = \lambda X_2 E(S) + \lambda^2 X_1^2 E(S^2)$,

$V_1 = \lambda p X_1 E(V)$, and $X_1 = E(X) = X`(1)$, $X_2 = X``(1)$.

80170

Expected length of idle period

Let I be the random variable of ' idle period' .The expected length of idle period E(I) is given by E(I) = E(I$_1$) + E(I$_2$) +E(I$_3$), where I$_1$is the random variable idle period , I$_2$ is the random variable idle period generated by adaptive vacations and I$_3$ is the random variable is due to j (1$\leq j \leq M$)vacations.

The expected length of an idle period is defined by

E(I$_1$) = M E(V)   (43)

E(I$_2$) = (1/λ)T$_0$ (44)

E(I$_3$) =E(V)$\sum_{j=1}^{M} j$ [$(1 - p)$p$_0$ +q$_0$].   (45)

Expected waiting time

The expected waiting time is obtained by little formulaE (w) =$\frac{E(Q)}{\lambda E(X)}$,   (46)

Where $E(Q)$ is expected queue length as in equation (42).

Numerical illustration

This queueing model has a general service rule with single server. The customer has to wait if the server is on adaptive vacation. By considering the situation of customers waiting and the effective utilization of the operator and the machine, it is essential to have an optimal thresholds value for a quantity. We develop a cost model through which the total costs involved in the system can be minimized. We derive an expression for finding the total average cost with the following assumptions. Let C$_s$ be the setup cost, C$_h$ be the holding cost per customer, C$_o$ be the operating cost per unit time C$_r$ be the reward per unit due to the vacation. The length of cycle is the sum of the idle period and busy period. Now, the expected length of cycle;E (T$_c$) =E (I) +E (B) The total average cost per unit is given by, Total average cost = set-up cost per cycle + Holding cost of number of customer in the queue+operating cost$^*\rho$ - reward due to vacation per cycle.

= [C$_s$− C$_r \frac{E(V)}{P(U=0)}$+ C$_u$] +C$_h$E (Q) +C$_0 \rho'$ where ρ= λE(S)E(X)

The numerical results for various arrival values and performance measures with μ=5are presented in Table 1. From Table 1, one can observe that, the total average cost is minimum when λ =3.5at p=0.4,0.5 and λ = 4 at p=0.6. Also when p=0.4, the TAC is minimum than p=0.5 and p=0.6 The numerical results for various arrival values and performance measures with μ=6 are presented in Table 2. From Table 2, one can observe that, the total average cost is minimum when λ =3.5 at p=0.4. The numerical results for various arrival rates and performance measures with μ=6 are presented in Table 3. From Table 3, one can observe that, the total average cost is minimum when λ =4at p=0.5, The numerical results for various arrival values and performance measures with μ=6are presented in Table 4. From Table 4, one can observe that, the total average cost is minimum when λ =4.0 at p=0.6. From Fig. 1, one can observe that, the expected queue length is increasing when probability increasing

CONCLUSION

In this paper, a M^X /G/1 queueing system with control policy and setup times for the number of vacations in which the customers who arrive during server vacations enter the system with probability is analyzed. Probability generating function of queue size at an arbitrary time epoch is obtained. Some important performance measures such as expected queue length, expected busy period, expected waiting time are also obtained. PGF of queue size at an arbitrary time epoch and at different completion epochs are obtained. Theoretical development of the model is justified with numerical results as shown. A cost model is developed. An extensive numerical study is performed which indicate, due to M vacations the expected queue length, busy period of the server and waiting time of the customers are increases as well as the idle period of the server decreases.

ABSTRACT

The goal of this paper is to investigate the separatedness, connectedness and disconnectedness that is, the Nsgb-separatedness, Nsgb-connectedness and Nsgb-disconnectedness in nano topological spaces for the Nano semigeneralized b-(Nsgb) (closed/open) set.

Keywords: Nano topology, Nsgb-open, Nsgb-closed, Nsgb-separated, Nsgb-connected, Nsgb-disconnected.
MSC 2020 Classification: 54A05, 54D05

INTRODUCTION

In general topological spaces, Levine [7] developed the generalized closed sets in 1970. The ideas of connectedness and disconnectedness in topological spaces were first presented by A. V. Archangelskii and R. Weiandy [2] in 1975. In 1996, Andrijevic [1] coined b-open sets. In 2013 El Atik, Abu Donia, and Salama [3] developed the concepts of b-connectedness and b-disconnectedness. Semi-generalized b-closed set was first coined in 2010 by Iyappan and Nagaveni [4], who further developed the notions of connectedness, compactness for semi generalized b-open sets in general topology. In 2013, Lellis Thivagar [9] proposed nano topological space concerning approximation spaces and boundary regions with regard to a subset of a universe set, and defined various kinds of nano open sets. In 2016, Parimala, Indirani, and Jafari [8] created the term nano b-open sets. In 2018, Suresh, Ramesh, and Krishnaprakash [6] established nano-compactness, nano-connectedness. Kavipriya and Indira [5] developed a nano semi generalized b-closed set in nano topological spaces. Pairs of subsets of a certain topological space that are connected to one another in a specific way are called *separated sets*; they are roughly neither touching nor overlapping in topology and related branches of mathematics. The fundamental topological characteristic of sets in mathematics that corresponds to the

80175

idea of having no breaks is called *connectedness*. ie)., The state of being linked or bound together. The separatedness and connectedness of Nsgb-(closed/ open) sets in nano topological spaces will be introduced and examined in this work.

PRELIMINARIES

In this paper we define $(U, \tau_R(S))$ as the nano topological space relative to S where S □ U.

Definition 2.1: [9]Assume U indicate a finite non-empty collection of elements referred as Universe, R signify an equivalence relation on U referred as Indiscernibility relation. U is partitioned into distinct equivalence classes. In one's equivalence class elements are indistinguishable. The Approximation space is represented by (U, R). Let S □ U. Then

The **Lower** Approximation of S ($L_R(S)$) relative to R is the collection of all elements that can be categorized as S in respect of R, R(S) is the equivalence class determined by s in S. $LR(S) = \bigcup_{s \in U} \{R(S): R(S) \subseteq S\}$

The **Upper Approximation** of S ($U_R(S)$) relative to R is the collection of all elements that can be categorized as S in respect of R. $U_R(S) = \bigcup_{s \in U} \{R(S): R(S) \cap S \neq \emptyset\}$

The **Boundary region** of S ($B_R(S)$) relative to R is the collection of all elements that can be labeled neither as S nor as not-S in respect of R. $B_R(S) = U_R(S) - L_R(S)$.

Definition 2.2: [9] Consider the universe as U and the equivalence relation be R on U, let the subset $S \subseteq U$ and $\tau_R(S) = \{U, \emptyset, L_R(S), U_R(S), B_R(S)\}$. Then the following axioms need to be met by $\tau_R(S)$.

i. U and $\emptyset \in \tau_R(S)$

ii. The arbitrary union of the elements of $\tau_R(S) \in \tau_R(S)$.

iii. The finite intersection of the elements of $\tau_R(S) \in \tau_R(S)$. Then with respect to S, $\tau_R(S)$ is referred as **Nano topology** on U. The Nano topological space is the pair $(U, \tau_R(S))$. The elements of $\tau_R(S)$ are nano open sets and its complements are the nano closed sets of U.

Definition 2.3: Let $E \subseteq U$ in $(U, \tau_R(S))$ then

1. **Nano semi open (Ns-open)** [9]: if $E \subseteq Ncl(Nint(E))$.
2. **Nano b-closed (Nb-closed)** [8]: if $Nint(Ncl(E)) \cap Ncl(Nint(E)) \subseteq E$

Definition 2.4 [8]: Nano b-closure of E (Nb-cl(E)): intersection of all Nb-closed subsets of U containing E. **Nano b-interior of E** (Nb-int(E)): union of all Nb-open sets contained in E.

Definition 2.5 [10]: Take the nano topological spaces as $(U, \tau_R(S))$ and $(V, \tau_R(T))$ where $S \subseteq U$ and $T \subseteq V$. A function d: $U \rightarrow V$ is **Nano continuous** if inverse image is nano closed in $(U, \tau_R(S))$ for each nano closed set in $(V, \tau_R(T))$.

Definition 2.6: In $(U, \tau_R(S))$, two non-empty subsets E and F are **nano separated** if $E \cap Ncl(F) = \emptyset$ and $Ncl(E) \cap F = \emptyset$. Equivalently, $[E \cap Ncl(F)] \cup [Ncl(E) \cap F] = \emptyset$.

Definition 2.7 [6]: $(U, \tau_R(S))$ is **nano connected** if U can't be written as a union of two disjoint non-empty nano open sets. $E \subseteq U$ is nano connected if E is nano-connected as a subspace.

Definition 2.8 [6]: $(U, \tau_R(S))$ is **nano disconnected** if U is a union of non-empty two nano separated sets.

Definition 2.9 [5]: A subset E of $(U, \tau_R(S))$ is **Nsgb-closed** if $Nb-cl(E) \subseteq K$, whenever $E \subseteq K$, where K is nano semi-open in U. E^C is **Nsgb-open.**

Definition 2.10 [5]: Let $E \subseteq (U, \tau_R(S))$ then **Nsgb-interior of E** (Nsgb-int(E)) is stated as the union of all Nsgb-open sets contained in E. ⇒ Nsgb-int(E) $\subseteq$ E. **Nsgb-closure of E** (Nsgb-cl(E)) is stated as the intersection of all Nsgb-closed sets containing E.⇒ E $\subseteq$ Nsgb-cl(E)

Example 2.11: Let U = {dollar(d), yen(y), euro(e), rupees(r)} as universe all over the paper. Take U = {d, y, e, r}, S = {y, r} $\subseteq$ U, U/R = {{d}, {y}, {e, r}}, $\tau_R(S)$ = {U, ∅, {y}, {y, e, r}, {e, r}}, Nsgb-closed = {U, ∅, {d}, {y}, {e}, {r}, {d, y}, {d, e}, {d, r}, {e, r}, {d, y, e}, {d, y, r}, {d, e, r}}, Nsgb-open = {∅, U, {y, e, r}, {d, e, r}, {d, y, r}, {d, y, e}, {e, r}, {y, r}, {y, e}, {d, y}, {r}, {e}, {y}}. Let E = {y, e} then Nsgb-int(E) = {y, e}, Nsgb-cl(E) = {d, y, e}.

Consider $(U, \tau_R(S))$ and $(V, \tau_R(T))$ be the two nano topological spaces where S $\subseteq$ U, T $\subseteq$ V.

Definition 2.12 [11]: A function m: U → V is Nsgb-continuous if the pre image of each nano closed set in $(V, \tau_R(T))$ is Nsgb-closed in $(U, \tau_R(X))$.

Definition 2.13 [11]: A function m: U → V is Nsgb-irresolute if the pre image of each Nsgb-closed set in V is Nsgb-closed in U.

Example 2.14: Take U = {d, y, e, r}, S = {d, y}, U/R = {{d, y}, {e, r}}, $\tau_R(S)$ = {U, ∅, {d, y}}, Nano closed(U) = {U, ϕ, {e, r}}, Nsgb-closed(U) = {U, ∅, {d}, {y}, {e}, {r}, {d, e}, {d, r}, {y, e}, {y, r}, {e, r}, {d, e, r}, {y, e, r}}. Let V = {d, y, e, r}, T = {d, y}, V/R = {{d}, {y}, {e}, {r}}, $\tau_R(T)$ = {V, ∅, {d, y}}, Nano closed(V) = {V, ϕ, {e, r}}, Nsgb-closed(V) = {V, ∅, {d}, {y}, {e}, {r}, {d, e}, {d, r}, {y, e}, {y, r}, {e, r}, {d, e, r}, {y, e, r}}. Define m: U → V by m(d) = y, m(y) = d, m(e) = r, m(r) = e. Here m is Nsgb-continuous and Nsgb-irresolute.

Nsgb-Separatedness

Definition 3.1: The two non-empty subsets E, F of $(U, \tau_R(S))$ are Nsgb-separated iff E ∩ Nsgb-cl(F) = ∅ and Nsgb-cl(E) ∩ F = ∅. Equivalently, [E ∩ Nsgb-cl(F)] ∪ [Nsgb-cl(E) ∩ F] = ∅. In other words, E and F are Nsgb-separated iff E, F are disjoint sets and there isn't a Nsgb-limit point of other in either of them.

Example 3.2: Take U = {d, y, e, r}, S = {d, y}, U/R = {{d, y}, {e, r}}, $\tau_R(S)$ = {U, ∅, {d, y}}, τ_R-closed(S) = {U, ∅, {e, r}}, Nsgb-closed(U) = {U, ∅, {d}, {y}, {e}, {r}, {d, e}, {d, r}, {y, e}, {y, r}, {e, r}, {d, e, r}, {y, e, r}}, Nsgb-open(U) = {U, ∅, {d}, {y}, {d, y}, {d, e}, {d, r}, {y, e}, {y, r}, {d, y, e}, {d, y, r}, {d, e, r}, {y, e, r}}. Let E = {d}, F = {y}. Then E ∩ Nsgb-cl(F) = {d} ∩ {y} = ∅ and Nsgb-cl(E) ∩ F = {d} ∩ {y} = ∅. ∴ E and F are Nsgb-separated.

Definition 3.3: Two subsets E and F forms a Nsgb-separation of a subset G of U in $(U, \tau_R(S))$ iff
1. G = E ∪ F
2. E, F are non-empty
3. E ∩ F = ∅
4. Neither E contains a Nsgb-limit point of F nor F contains a Nsgb-limit point of E. ie., E ∩ Nsgb-cl(F) = ∅ and Nsgb-cl(E) ∩ F = ∅.

Example 3.4: From example 3.2,
i) Let G = {d, y, e} $\subseteq$ U. Let E = {d}, F = {y, e} $\subseteq$ U. Then
1. G = E ∪ F
2. {d} ≠ ∅, {y, e} ≠ ∅ ⇒ E, F are non-empty
3. {d} ∩ {y, e} = ∅ ⇒ E, F are disjoint
4. E ∩ Nsgb-cl(F) = {d} ∩ {y, e} = ∅; Nsgb-cl(E) ∩ F = {d} ∩ {y, e} = ∅ Here E and F forms a Nsgb-separation of G.

ii) Let G = {d, y, e} ⊆ U. Let E = {d, y}, F = {e} ⊆ U.. Then

1. G = E ∪ F
2. {d, y} ∩ {e} = ∅ ⇒ E, F are disjoint
3. {d, y} ≠ ∅, {e} ≠ ∅ ⇒ E, F are non-empty
4. E ∩ Nsgb-cl(F) = {d, y} ∩ {e} = ∅, Nsgb-cl(E) ∩ F = U ∩ {e} = {e}≠ ∅

Here E and F does not form a Nsgb-separation of G.

Definition 3.5: In (U, τ_R(S)) the **Nsgb-separation of U** is a pair of P, Q (whereas Q = U – P) of disjoint non-empty Nsgb-(closed/open) subsets of U whose union equals U. ie., U = P ∪ Q.

Example 3.6: Take U = {d, y, e, r}, S = {d, y, e}. U/R = {{d}, {e}, {y, r}}, τ_R(S) = {U, ∅, {d, e}, {y, r}}, Nsgb-open(U) = {U, ∅, {d}, {y}, {e}, {r}, {d, y}, {d, e}, {d, r}, {y, e}, {y, r}, {e, r}, {d, y, e}, {d, e, r}, {d, y, r}, {y, e, r}}. Let P = {d, e}, Q = {y, r}, where P, Q are Nsgb-open in U. Then P ∪ Q = {d, e} ∪ {y, r} = {d, y, e, r} = U shows P, Q forms a Nsgb-separation of U. Thus U is Nsgb-separated.

Remark: Suppose P and Q forms a Nsgb-separation of U then P, Q are both Nsgb-open and Nsgb-closed. Since Q is the complement of P.

Theorem 3.7: Every nano separated set is Nsgb-separated.

Proof: Consider two disjoint subsets E, F of (U, τ_R(S)) be nano-separated. Then E ∩ Ncl(F) = ∅ and Ncl(E) ∩ F = ∅. Since for any set R, R ⊆ Nsgb-cl(R) ⊆ Ncl(R) implies E ∩ Nsgb-cl(F) = ∅ and Nsgb-cl(E) ∩ F = ∅. Hence E and F are Nsgb-separated.
Conversely, from example 3.2, take E = {d}, F = {y} ⊆ U. Then E ∩ Nsgb-cl(F) = {d} ∩ {y} = ∅; Nsgb-cl(E) ∩ F = {d} ∩ {y} = ∅. ∴ E and F are Nsgb-separated. But E ∩ Ncl(F) = {d} ∩ U = {d} ≠ ∅; Nsgb-cl(E) ∩ F = U ∩ {y} = {y} ≠ ∅. ∴ E and F are not nano-separated.

Remark: Each two Nsgb-separated sets are always disjoint.
Let E, F are Nsgb-separated. Since E ∩ F ⊆ E ∩ Nsgb-cl(F) = ∅ implies E ∩ F = ∅. Similarly E ∩ F ⊆ Nsgb-cl(E) ∩ F = ∅ implies E ∩ F = ∅.Thus E and F are disjoint. *Conversely,* from example 3.2, take E = {d, y}, F = {e, r}. Here E ∩ F = {d, y} ∩ {e, r} = ∅ ⇒ E, F are disjoint and E ∩ Nsgb-cl(F) = {d, y} ∩ {e, r} = ∅; Nsgb-cl(E) ∩ F = U ∩ {e, r} = {e, r} ≠ ∅. So E and F are not Nsgb-separated. Thus disjoint sets need not be Nsgb-separated.

Theorem 3.8: The subsets of Nsgb-separated sets are also Nsgb-separated.
Proof: Let E_1 ⊆ E and F_1 ⊆ F where E, F are Nsgb-separated in (U, τ_R(S)). To prove: *E_1 and F_1 are also Nsgb-separated.*
Here E∩F = ∅, E ∩ Nsgb-cl(F) = ∅ and Nsgb-cl(E) ∩ F = ∅. Given E_1 ⊆ E and F_1 ⊆ F implies E_1∩F_1 = ∅ says E_1, F_1 are disjoint. Since E_1 ⊆ E ⇒ Nsgb-cl(E_1) ⊆ Nsgb-cl(E). We have F ∩ Nsgb-cl(E) = ∅ and F_1 ⊆ F then F_1∩ Nsgb-cl(E) = ∅, F_1∩ Nsgb-cl(E_1) = ∅ → (1). Since F_1 ⊆ F ⇒ Nsgb-cl(F_1) ⊆ Nsgb-cl(F). We have E ∩ Nsgb-cl(F) = ∅ and E_1 ⊆ E then E_1∩ Nsgb-cl(F) = ∅, E_1∩ Nsgb-cl(F_1) = ∅ → (2). From (1) and (2), E_1 and F_1 are Nsgb-separated.

Theorem 3.9: The two Nsgb-closed (or Nsgb-open) subsets E, F of (U, τ_R(S)) are Nsgb-separated iff they are disjoint.

Proof: Case i: Let E, F are non-empty **Nsgb-closed subsets** which are Nsgb-separated. Then E ∩ Nsgb-cl(F) = ∅ and Nsgb-cl(E) ∩ F = ∅ → (1). Since E, F are Nsgb-closed then Nsgb-cl(E) = E and Nsgb-cl(F) = F. Then (1) becomes E ∩ F = ∅ and E ∩ F = ∅. This says E, F are disjoint.
Conversely, let E, F are non-empty disjoint Nsgb-closed subsets. ie., E ∩ F = ∅. Since E, F are Nsgb-closed, then E = Nsgb-cl(E), F = Nsgb-cl(F). Now E ∩ F = E ∩ Nsgb-cl(F) = ∅ and E ∩ F = Nsgb-cl(E) ∩ F =∅. Hence E and F are Nsgb-separated.

Case ii: Let E, F are non-empty **Nsgb-open subsets** which are Nsgb-separated. Then E ∩ Nsgb-cl(F) = ∅ and Nsgb-cl(E) ∩ F = ∅   →   (2). Since E ⊂ Nsgb-cl(E) and F ⊂ Nsgb-cl(F). Then E∩F ⊂ E ∩ Nsgb-cl(F) = ∅ ⇒ E∩F ⊂ ∅ and E∩F ⊂ Nsgb-cl(E) ∩ F = ∅ ⇒ E∩F ⊂ ∅. But ∅ is a subset of every set so that ∅ ⊂ E∩F. Hence E∩F = ∅. Thus E, F are disjoint. *Conversely,* let E, F are non-empty Nsgb-open disjoint subsets. ⇒ E^C and F^C are Nsgb-closed and Nsgb-cl(E^C) = E^C, Nsgb-cl(F^C) = F^C →   (3). Also E∩F = ∅ ⇒ E ⊂ F^C and F ⊂ E^C. Nsgb-cl(E) ⊂ Nsgb-cl(F^C) and Nsgb-cl(F) ⊂ Nsgb-cl(E^C). By (3), Nsgb-cl(E) ⊂ F^C and Nsgb-cl(F) ⊂ E^C so that Nsgb-cl(E) ⊄ F and Nsgb-cl(F) ⊄ E which gives Nsgb-cl(E) ∩ F =∅ and E ∩ Nsgb-cl(F) = ∅. Therefore E and F are Nsgb-separated.

Example 3.10: If E, F are disjoint and one of the sets is Nsgb-open and other is Nsgb-closed then they are not Nsgb-separated. From example 3.2, let E = {d, y}, F = {e}, where E is Nsgb-open, F is Nsgb-closed. Then E ∩ Nsgb-cl(F) = {d, y} ∩ {e} = ∅ and Nsgb-cl(E) ∩ F = U ∩ {e} = {e} ≠ ∅. Here E and F are not Nsgb-separated. Hence both the sets must be either Nsgb-closed or Nsgb-open.

Theorem 3.11: Let (V, τ_R(T)) be a subspace of (U, τ_R(S)). Let E, F ⊆ V. Then E, F are Nsgb-separated in V iff they are Nsgb-separated in U.
Proof: Let E, F be Nsgb-separated in U. Then E ∩ Nsgb-cl(F) = ∅ and Nsgb-cl(E) ∩ F = ∅. Also [E ∩ Nsgb-cl(F)] ∪ [Nsgb-cl(E) ∩ F] = ∅. Since E, F ⊆ V, E = E∩V and F = F∩V. Also Nsgb-cl(E) in V = [Nsgb-cl(E) in U] ∩ V; and Nsgb-cl(F) in V = [Nsgb-cl(F) in U] ∩ V. To Prove: E, F are Nsgb-separated in V. Consider [E ∩ Nsgb-cl(F)$_V$] ∪ [Nsgb-cl(E)$_V$ ∩ F] = [E ∩ (Nsgb-cl(F)$_U$ ∩V)] ∪ [(Nsgb-cl(E)$_U$ ∩V) ∩ F] = [(E ∩ Nsgb-cl(F)$_U$)∩V] ∪ [(Nsgb-cl(E)$_U$ ∩F) ∩ V] = [∅ ∩ V] ∪ [∅ ∩ V] = ∅. E, F are Nsgb-separated in V. Hence [E ∩ Nsgb-cl(F)$_V$] ∪ [Nsgb-cl(E)$_V$ ∩ F] = ∅ iff [E ∩ Nsgb-cl(F)] ∪ [Nsgb-cl(E) ∩ F] = ∅. Therefore E, F are Nsgb-separated in U ⇔ E, F are Nsgb-separated in V for V ⊆ U.

Theorem 3.12: In (U, τ_R(S)) the union of two Nsgb-separated sets is Nsgb-closed then the individual sets are Nsgb-closed.
Proof: Let Q, T ⊆ U be the two Nsgb-separated sets such that Q∪T is Nsgb-closed. Since Q, T are Nsgb-separated then Q∩Nsgb-cl(T) = ∅; Nsgb-cl(Q)∩T = ∅. Since Q∪T is Nsgb-closed, Nsgb-cl(Q∪T) = Q∪T → (1) and Nsgb-cl(Q∪T) = Nsgb-cl(Q) ∪ Nsgb-cl(T).   Now Nsgb-cl(Q) = Nsgb-cl(Q) ∩ Nsgb-cl(Q∪T) = Nsgb-cl(Q) ∩ (Q∪T) = [Nsgb-cl(Q)∩Q] ∪ [Nsgb-cl(Q)∩T] = Q ∪ ∅ = Q. Thus Nsgb-cl(Q) = Q implies Q is Nsgb-closed. Similarly, Nsgb-cl(T) = Nsgb-cl(T) ∩ Nsgb-cl(Q∪T) = Nsgb-cl(T) ∩ (Q∪T) = [Nsgb-cl(T)∩Q] ∪ [Nsgb-cl(T)∩T] = ∅ ∪ T = T. Thus Nsgb-cl(T) = T implies T is Nsgb-closed.

Theorem 3.13: Two disjoint sets E, F are Nsgb-separated in (U, τ_R(S)) iff they are both Nsgb-open and Nsgb- closed in the subspace E∪F = G.
Proof: *Necessary Part:* Let E, F be disjoint and Nsgb-separated in U. Then E ∩ Nsgb-cl(F) = ∅ and Nsgb-cl(E) ∩ F = ∅. Given G = E∪F. Nsgb-cl(E) in G = [Nsgb-cl(E) in U] ∩ G = [Nsgb-cl(E) in U] ∩ (E∪F) = [Nsgb-cl(E) ∩E] ∪ [Nsgb-cl(E) ∩ F] = E ∪ ∅ = E ⇒ E is Nsgb-closed in G. Nsgb-cl(F) in G = [Nsgb-cl(F) in U] ∩ G = [Nsgb-cl(F) in U] ∩ (E∪F) = [Nsgb-cl(F) ∩ E] ∪ [Nsgb-cl(F) ∩ F] = ∅ ∪ F = F ⇒ F is Nsgb-closed in G. Also E, F are disjoint ie), E∩F = ∅ in G, they are complement of each other in G. Hence E, F are Nsgb-open in G.

Sufficient Part: Let the non-empty disjoint sets E, F be both Nsgb-open and Nsgb-closed in G = E∪F. *To Prove: E, F are Nsgb-separated in U.* As E is Nsgb-closed in G then E = Nsgb-cl(E)$_G$ = Nsgb-cl(E) ∩ G = Nsgb-cl(E) ∩ (E∪F) = [Nsgb-cl(E)∩E] ∪ [Nsgb-cl(E)∩F] = E ∪ [Nsgb-cl(E)∩F]. Since E, F are disjoint in U and E ⊆ Nsgb-cl(E), then E∩F = ∅ ⇒ [Nsgb-cl(E)∩E] ∩ F = ∅ ⇒ E ∩ [Nsgb-cl(E)∩F] = ∅. Since E ≠ ∅ gives Nsgb-cl(E)∩F = ∅   →   (i). Similarly, E ∩ [Nsgb-cl(F)∩F] = ∅ ⇒ [E ∩ Nsgb-cl(F)] ∩ F = ∅. Since F ≠ ∅ gives E ∩ Nsgb-cl(F) = ∅ →   (ii). From (i) and (ii), E and F are Nsgb-separated in U.

Example 3.14: Suppose one of the sets is Nsgb-open and other is Nsgb-closed then subspace G = E∪F is not Nsgb-separated. From example 3.2, let G = {d, y, r}, E = {d, y}, F = {r} where E is Nsgb-open, F is Nsgb-closed. Then G = E∪F. ⇒ E ∩ Nsgb-cl(F) = {d, y} ∩ {r} = □ and Nsgb-cl(E) ∩ F = U ∩ {r} = {r} ≠ □. ∴ E, F are not Nsgb-separated ⇒ G = E∪F is also not Nsgb-separated. Hence both the sets must be either Nsgb-closed or Nsgb-open.

Theorem 3.15: Let the subsets E and F of (U, τR(S)) are Nsgb-separated iff there exist Nsgb-open sets P and T with E ⊂ P, F ⊂ T and E∩T = □, F∩P = □.

Proof: *Necessary Part:* Let E, F be Nsgb-separated then E∩Nsgb-cl(F) = □; Nsgb-cl(E)∩F = □. Set T = U – Nsgb-cl(E) and P = U – Nsgb-cl(F). Then P, T are Nsgb-open sets of U such that E ⊂ P, F ⊂ T. Hence E∩T = □ and F∩P = □.
Sufficient Part: Let P, T be the Nsgb-open sets of U with E ⊂ P, F ⊂ T and E∩T = □, F∩P = □. Then E ⊂ U – T, F ⊂ U – P, where U – P and U – T are Nsgb-closed. Now Nsgb-cl(E) ⊂ Nsgb-cl(U – T) and since U – T is Nsgb-closed, gives Nsgb-cl(E) ⊂ U – T ⊂ U – F. ⇒ Nsgb-cl(E)∩F ⊂ (U – T)∩F ⊂ (U – F)∩F ⇒ Nsgb-cl(E)∩F ⊂ □ gives Nsgb-cl(E)∩F = □ → (1). Similarly, Nsgb-cl(F) ⊂ U – P ⊂ U – E ⇒ Nsgb-cl(F)∩E ⊂ (U – P)∩E ⊂ (U – E)∩E ⇒ Nsgb-cl(F)∩E ⊂ □ gives Nsgb-cl(F)∩E = □ → (2). From (1) and (2), E and F are Nsgb-separated.

Nsgb-Connectedness

Definition 4.1: A nano topological space (U, τR(S)) is **Nsgb-connected** if U can't be written as a disjoint union of two non-empty Nsgb-open sets. ie)., U has no Nsgb-separation.

Example 4.2: Take U = {d, y, e, r}, U/R = {{d}, {y}, {e}, {r}, S = {y} ⊂ U, then τR(S) = {U, □, {y}}, Nsgb-open = {U, □, {y}, {d, y}, {y, e}, {y, r}, {d, y, e}, {d, y, r}, {y, e, r}}. Here U is Nsgb-connected.

Definition 4.3: A subset E ⊂ U is **Nsgb-connected** iff it can't be written as a disjoint union of two non-empty Nsgb-open sets. Equivalently E has no Nsgb-separation.
In otherwords, a subset of U is Nsgb-connected if it is Nsgb-connected as a subspace. From example 4.2, E = {d, y, e} ⊂ U is Nsgb-connected.

Remarks 4.4:
➢ The empty set (□) is trivially Nsgb-connected.
➢ Each singleton set in the collection of Nsgb-open sets is Nsgb-connected. Since singletons can't be written as the union of two disjoint non-empty Nsgb-separated sets.

Theorem 4.5: Every Nsgb-connected space is nano connected.
Proof: Assume (U, τR(S)) be a Nsgb-connected space. So that U can't be written as a union of two disjoint non-empty Nsgb-open sets. Consider U is not nano connected. Then U can be written as union of two disjoint non-empty nano open sets. ie)., U = E∪F, where E, F are disjoint nano open sets. As each nano open set is Nsgb-open then E, F are disjoint Nsgb-open sets. Gives U = E∪F, where E, F are disjoint non-empty Nsgb-open sets shows U is not Nsgb-connected which contradicts U is Nsgb-connected. Hence U is nano connected.
Conversely, let U = {d, y, e, r}, U/R = {{d, y}, {e, r}}, S = {d, y}, τR(S) = {U, □, {d, y}}. Here U is nano connected. Nsgb-open = {U, □, {d}, {y}, {d, y}, {d, e}, {d, r}, {y, e}, {y, r}, {d, y, e}, {d, y, r}, {d, e, r}, {y, e, r}}. Here U is represent as union of disjoint non-empty Nsgb-open sets. ie)., U = {d, e} ∪ {y, r}. (U, τR(S)) is not Nsgb-connected.

Theorem 4.6: The claims are equivalent
  i)   (U, τR(S)) is Nsgb-connected
 ii) Only U and □ are both Nsgb-open and Nsgb-closed subsets of (U, τR(S)).
Proof: *To prove: (i) ⇒ (ii)* Let (U, τR(S)) be Nsgb-connected. Let a non-empty subset H be both Nsgb-open and Nsgb-closed in U. So that U – H is both Nsgb-closed and Nsgb-open in U ⇒ U = H ∪ (U – H), is a disjoint non-empty union of Nsgb-open sets of U, which contradicts U is Nsgb-connected. Hence H must be either □ or U.

To prove: (ii) ⇒ (i) Assume only U, □ are both Nsgb-open and Nsgb-closed. *To prove: U is Nsgb-connected.* Let U is not Nsgb-connected. Consider U = P∪Q, where P, Q are disjoint non-empty Nsgb-open sets. Here P = U – Q then P is

Nsgb-closed implies P is both Nsgb-open and Nsgb-closed. Then by assumption, P must be either □ or U, which is contradictory. Hence U is Nsgb-connected.

Theorem 4.7: Let (V, τ$_R$(T)) be a subspace of (U, τ$_R$(S)) and let R □ U. Then R is Nsgb-connected in V iff R is Nsgb-connected in U.

Proof: *Necessary Part:* Let R be Nsgb-connected in V. Suppose R is not Nsgb-connected in U. Then R = E∪F. ie)., E and F forms Nsgb-separation of R. So that [E ∩ Nsgb-cl(F)$_U$] ∪ [Nsgb-cl(E)$_U$ ∩ F] = □. Since E, F are also subsets of V, [E∩V ∩ Nsgb-cl(F)$_U$] ∪ [Nsgb-cl(E)$_U$ ∩ F∩V] = □, ⇒ [E ∩ Nsgb-cl(F)$_V$] ∪ [Nsgb-cl(E)$_V$ ∩ F] = □. E, F forms Nsgb-separation of R in V, which contradicts the assumption. Thus R is Nsgb-connected in V.

Sufficient Part: Let R be Nsgb-connected in U. Suppose R is not Nsgb-connected in V. Let E, F forms Nsgb-separation of R. Then [E ∩ Nsgb-cl(F)$_V$] ∪ [F ∩ Nsgb-cl(E)$_V$] = □ can be also written as [E ∩ V∩Nsgb-cl(F)$_U$] ∪ [F ∩ V∩Nsgb-cl(E)$_U$] = □. As E, F are subsets of V, E∩V = E, F∩V = F then [E ∩ Nsgb-cl(F)$_U$] ∪ [F ∩ Nsgb-cl(E)$_U$] = □. Hence E, F forms Nsgb-separation of R in U then R = E∪F shows R is not Nsgb-connected in U which contradicts the assumption. Therefore R is Nsgb-connected in V.

Theorem 4.8: If d: (U, τ$_R$(S)) → (V, τ$_R$(T)) is a onto Nsgb-continuous function. Then V is nano connected if U is Nsgb-connected.

Proof: Let V be not nano connected, then V is a union of two disjoint non-empty nano open sets of (V, τ$_R$(T)). ie)., V = C∪F, where C, F are disjoint nano open sets in V. Given d is onto, Nsgb-continuous. Then d^{-1}(V) = d^{-1}(C∪F) gives U = d^{-1}(C) ∪ d^{-1}(F), where d^{-1}(C), d^{-1}(F) are disjoint Nsgb-open in U that are non-empty. This says U is not Nsgb-connected which contradicts U is Nsgb-connected. Hence V is nano connected.

Theorem 4.9: If d: (U, τ$_R$(S)) → (V, τ$_R$(T)) is a surjective Nsgb-irresolute function. Then V is Nsgb-connected if U is Nsgb-connected.

Proof: Let V be not Nsgb-connected, then V is a union of two disjoint non-empty Nsgb-open sets of (V, τ$_R$(T)). ie)., V = C∪F, where C, F are disjoint Nsgb-open sets in V. Given d is onto and Nsgb-irresolute. Then d^{-1}(V) = d^{-1}(C∪F) gives U = d^{-1}(C) ∪ d^{-1}(F), where d^{-1}(C), d^{-1}(F) are disjoint Nsgb-open in U that are non-empty. This says U is not Nsgb-connected which contradicts U is Nsgb-connected. Thus V is Nsgb-connected.

Theorem 4.10: If the Nsgb-open sets E and F form a Nsgb-separation of U and if W is Nsgb-connected subset of U. Then W lies entirely within either E or F.

Proof: Given E, F forms a Nsgb-separation of U. Then U = E∪F, where E, F are disjoint in U and E∩Nsgb-cl(F) = ∅ = F∩Nsgb-cl(E). Then the sets E∩W and F∩W are disjoint and their union is W. ie)., W = (E∩W) ∪ (F∩W) → (*). If both the sets E∩W and F∩W are non-empty, ie)., E∩W ≠ ∅, F∩W ≠ ∅ then (E∩W) ∩ Nsgb-cl((F∩W) = E ∩W ∩ Nsgb-cl((F) ∩ Nsgb-cl(W) = W ∩ Nsgb-cl(W) ∩ ∅ = ∅. Similarly (F∩W) ∩ Nsgb-cl((E∩W) = F ∩W ∩ Nsgb-cl((E) ∩ Nsgb-cl(W) = W ∩ Nsgb-cl(W) ∩ ∅ = ∅. implies they constitute a Nsgb-separation on W gives W is not Nsgb-connected which is a contradiction. Hence one of them must be empty. ie)., either E∩W = ∅ or F∩W = ∅. Suppose F∩W = ∅, then (*) ⇒ W = (E∩W)∪ ∅ implies W ⊂ E∩W shows W ⊂ E and W ⊂ W. Therefore W lies entirely in E. Suppose E∩W = ∅, then (*) ⇒ W = ∅ ∪ (F∩W) implies W ⊂ F∩W shows W ⊂ F and W ⊂ W. Therefore, W lies entirely in F. Thus W lies entirely either within E or in F.

Theorem 4.11: Let E, F be subsets in (U, τ$_R$(S)). If E is Nsgb-connected subset of U where E ⊂ F ⊂ Nsgb-cl(E), then F is Nsgb-connected.

Proof: Given E is Nsgb-connected and E ⊂ F ⊂ Nsgb-cl(E). *To prove: F is Nsgb-connected.* Suppose F is not Nsgb-connected. Then let P and T form a Nsgb-separation of F, where P, T are disjoint non-empty sets. Implies F = P∪T and Nsgb-cl(P) ∩ T = ∅ and P ∩ Nsgb-cl(T) = ∅ → (*). By theorem 4.10, and since E ⊂ F is Nsgb-connected, E must lie entirely within P or in T. ie)., E ⊂ P or E ⊂ T. Without loss of generality, If E ⊂ P then Nsgb-cl(E) ⊂ Nsgb-cl(P). Then Nsgb-cl(E)∩T ⊂ Nsgb-cl(P)∩T. By (*), Nsgb-cl(E)∩T = ∅. But always ∅ ⊂ Nsgb-cl(E)∩T ⇒ Nsgb-cl(E)∩T = ∅. Since E ≠ ∅ gives T = ∅ which contradicts T is non-empty. Thus F is Nsgb-connected. If E ⊂ T then Nsgb-cl(E) ⊂ Nsgb-cl(T). Then

Nsgb-cl(E)∩P ⊂ Nsgb-cl(T)∩P. By (*), Nsgb-cl(E)∩P ⊂ ∅ but always ∅ ⊂ Nsgb-cl(E)∩P ⇒ Nsgb-cl(E)∩P = ∅. Since E ≠ ∅, P = ∅ which contradicts P is non-empty. Thus F is Nsgb-connected.

Corollary 4.12: Nsgb-closure of a Nsgb-connected set is Nsgb-connected.ie)., If R is Nsgb-connected then Nsgb-cl(R) is Nsgb-connected.
Replace F by Nsgb-cl(E) in above theorem gives Nsgb-cl(E) is Nsgb-connected.

Theorem 4.13: The union of collection of Nsgb-connected subspaces of U that have a point in common (non-empty intersection) is Nsgb-connected.
Proof: Let {A_α} be the collection of Nsgb-connected subspaces of U. Let V = ∪ A_α. *To prove: V is Nsgb-connected.* Let V be not Nsgb-connected. Then V = R∪T, where R, T are non-empty disjoint Nsgb-separated sets of U. Since each A_α is Nsgb-connected and A_α ⊂ R∪T, by theorem 4.10, either A_α ⊂ R or A_α ⊂ T, ∀ α ⇒∪A_α ⊂ R or ∪A_α ⊂ T ⇒ V ⊂ R or V ⊂ T → (1). Let p be a point of ∩A_α. ie)., p ∈ ∩A_α whereas p ∈ A_α for all α so that p ∈ V then by (1), either p ∈ R or p ∈ T. But R and T are disjoint. Therefore p cannot belong to both R and T. Let p ∈ R, p ∉ T. By (1), V ⊄ T. Thus V ⊂ R. ie)., R∪T ⊂ R implies T = ∅ which is a contradiction. Hence V = ∪ A_α is Nsgb-connected having a point in common.

Definition 4.14: Two points e, f of (U, τ_R(S)) are known to be Nsgb-connected iff they are contained in a Nsgb-connected subset of U.

Example 4.15: Let U = {d, y, e, r}, U/R = {{d}, {y}, {e}, {r}, S = {y} ⊆ U, then τ_R(S) = {U, ∅, {y}}, Nsgb-open = {U, ∅, {y}, {d, y}, {y, e}, {y, r}, {d, y, e}, {d, y, r}, {y, e, r}}. Take d, y of U. Here the points d, y is Nsgb-connected. Since d, y ∈ {d, y} which is a Nsgb-connected set where {d, y} can't be represent as a union of two disjoint non-empty Nsgb-open subsets. Similarly, (y, e), (y, r) are Nsgb-connected points of U.

Theorem 4.16: Let each two points in a subset G of U are contained in some Nsgb-connected subset of G. Then G is Nsgb-connected subset of U.
Proof: Suppose G is not Nsgb-connected. Then ∃ non-empty disjoint subsets I and K of U such that I ∩ Nsgb-cl(K) = ∅ and Nsgb-cl(I) ∩ K = ∅ and G = I∪K. Since I, K are non-empty, there exists a point i ∈ I and k ∈ K. By hypothesis, i and k must be contained in some Nsgb-connected subset E of G. ie)., i, k ∈ E ⊂ G (= I∪K). Since E ⊂ I∪K, then E contained in I or in K. By theorem 4.10, it follows that either i, k both in I or i, k both in K. Suppose let i, k ∈ K and since k ∈ K. Then I∩K = k ≠ ∅ is a contradiction to I and K are disjoint. Thus G is Nsgb-connected in U.

Nsgb-Disconnectedness

Definition 4.17: A nano topological space (U, τ_R(S)) [or a subset P of U] is **Nsgb-disconnected** iff it is not Nsgb-connected. ie) if it is the union of non-empty two Nsgb-separated sets. **Nsgb-disconnected** if it has Nsgb-separation. ie)., there exists two non-empty sets such that E ∩ Nsgb-cl(F) = ∅ and Nsgb-cl(E) ∩ F = ∅ with U = E∪F [or P = E∪F].

Theorem 4.18: (U, τ_R(S)) is Nsgb-disconnected iff there exist a proper non-empty subset of U that is both Nsgb-open and Nsgb-closed.
Proof: *Necessary Part:* Let G be a proper non-empty subset of U which is both Nsgb-open and Nsgb-closed. Take H = G^C then H is both non-empty Nsgb-open and Nsgb-closed subset. So that U = G∪H and G∩H = ∅. Also Nsgb-cl(G) = G and Nsgb-cl(H) = H. Now G ∩ Nsgb-cl(H) = G ∩ H = ∅ and Nsgb-cl(G) ∩ H = G ∩ H = ∅. This shows G and H are Nsgb-separated. Thus U is written as union of disjoint non-empty Nsgb-separated sets. Hence U is Nsgb-disconnected.

Sufficient Part: Let U be Nsgb-disconnected. Then ∃ non-empty disjoint subsets F and G of U where F ∩ Nsgb-cl(G) = ∅ and Nsgb-cl(F) ∩ G = ∅ and U = F∪G. WKT: F ⊂ Nsgb-cl(F) and Nsgb-cl(F) ∩ G = ∅ ⇒ F∩G = ∅ then F = G^C. Since G is non-empty, G ∪ G^C = U. It shows G = F^C is a proper subset of U. Since F∪G = U and G ⊂ Nsgb-cl(G) ⇒ F ∪ Nsgb-cl(G)

⊇ U but always F ∪ Nsgb-cl(G) ⊂ U. So that F ∪ Nsgb-cl(G) = U. Also we have F ∩ Nsgb-cl(G) = ∅ ⇒ F = [Nsgb-cl(G)]C. Similarly G = [Nsgb-cl(F)]C. Since Nsgb-cl(F) and Nsgb-cl(G) are Nsgb-closed sets implies F and G are Nsgb-open sets and FC and GC are Nsgb-closed sets. Since F = GC, where GC is Nsgb-closed gives F is Nsgb-closed. Since G = FC, where FC is Nsgb-closed gives G is Nsgb-closed. Therefore F and G are proper non-empty subsets of U that are Nsgb-open as well as Nsgb-closed.

Theorem 4.19: (U, τ_R(S)) is Nsgb-disconnected iff any one of the given claims is true:
i) U represent as the union of non-empty two disjoint Nsgb-open sets
ii) U represent as the union of non-empty two disjoint Nsgb-closed sets
Proof: Let U be Nsgb-disconnected. Then U can be expressed as the union of non-empty two disjoint Nsgb-sets. By theorem 4.18, then ∃ G of U which is a proper non-empty subset that is both Nsgb-open and Nsgb-closed. Then GC is also both Nsgb-open and Nsgb-closed. Also G ∪ GC = U. Hence the set G and GC satisfy both (i) and (ii).
Conversely, let U = G ∪ H and G ∩ H = ∅, whereas G, H are non-empty Nsgb-open sets. It follows that G = HC so that G is Nsgb-closed. Since H is non-empty, G is a proper subset of U. Thus G is proper non-empty subset of U that is both Nsgb-open and Nsgb-closed. By theorem 4.18, U is Nsgb-disconnected. Again let U = I ∪ K and I ∩ K = ∅, where I and K are non-empty Nsgb-closed sets. It follows that I = KC so that I is Nsgb-open. Since K is non-empty, K is a proper subset in U that is also both Nsgb-open and Nsgb-closed. By theorem 4.18, U is Nsgb-disconnected. Thus if any one of the conditions holds then U is Nsgb-disconnected. G ∪ H is known as **Nsgb-disconnection** of U.

Corollary 4.20: A subset K of (U, τ_R(S)) is Nsgb-disconnected iff K is the union of non-empty two disjoint sets both Nsgb-open (or Nsgb-closed) in K.

Theorem 4.21: In (U, τ_R(S)) with atleast two points if the collection of Nsgb-open sets of U is as same as the collection of Nsgb-closed sets of U. Then U is Nsgb-disconnected.

Proof: Assume that Nsgb-O(U, τ_R(S)) = Nsgb-C(U, τ_R(S)). Then there exist some proper non-empty subset of U that is Nsgb-open as well as Nsgb-closed. Then by theorem 4.18, U is Nsgb-disconnected.

Theorem 4.22: (U, τ_R(S)) is Nsgb-disonnected iff U is the union of non-empty two Nsgb-separated sets.

Proof: Let U be Nsgb-disconnected. Then by definition, there exist two non-empty Nsgb-sets G and H in which U = G∪H and Nsgb-cl(G) ∩ H = ∅, G ∩ Nsgb-cl(H) = ∅ shows G, H are Nsgb-separated. Thus U can be represent as a union of non-empty two Nsgb-separated sets.
Conversely, assume U is the union of non-empty two Nsgb-separated sets G and H. Then U = G∪H, G ∩ Nsgb-cl(H) = ∅ and Nsgb-cl(G) ∩ H = ∅. Hence U is Nsgb-disconnected.
The above theorem can be equivalently stated as, U is Nsgb-connected ⇔ The union of non-empty two Nsgb-separated sets not equals U.

CONCLUSION

This paper discussed separatedness, connectedness and disconnectedness of Nsgb-sets in nano topological space. Further this study can be continued to work on compactness, separation axioms based on the Nsgb-set.

ABSTRACT

This manuscript describes and illustrates the accurate strong split dominating set in fuzzy graphs. In fuzzy graphs, an accurate minimal strong split dominating set and an accurate strong split domination number are defined. For some popular fuzzy graphs, bounds on accurate strong split domination numbers are determined. Strong split domination number relationships with other well-known dominating parameters are discovered. We state and illustrate a few theorems relating to accurate strong split domination numbers.

Keywords: Accurate split dominating set, Accurate split domination number
2020 Mathematics subject classification: 05C72

INTRODUCTION

L.A. Zadeh developed fuzzy set theory in 1965 as a means of describing uncertainty[13]. The notion of domination in fuzzy graphs using effective edges was introduced for the first time by A. Somasundaram in 1998[12].NagoorGani and et al. brought the idea of Domination using strong arcs[10], accurate domination and connected accurate domination in fuzzy graphs[11].Accurate split and non-split dominant sets and their numbers were discussed by A. Mohamed Ismayil and H. Sabitha Begum in fuzzy graphs[9]. Accurate strong split dominating sets and their numbers are described and explored in this study with appropriate examples. Here, $G(\sigma, \mu)$ is a simple connected undirected fuzzy graph.

Mohamed Ismayil and Sabitha Begum

PRELIMINARIES

Definition 2.1: A *fuzzy graph*($\mathcal{FG}$), $G = (\sigma, \mu)$is a pair of functions $\sigma: V \rightarrow [0,1]$and $\mu: V \times V \rightarrow [0,1]$such that$\mu(\ell, m) \leq \sigma(\ell) \wedge \sigma(m)$ for every $\ell, m \in V$. A $\mathcal{FG}H = (\kappa, \lambda)$is defined on $G'(V', E')$ is called a *fuzzy subgraph* of $G = (\sigma, \mu)$ if $\kappa(\ell) \leq \sigma(\ell)$ for all $\ell \in V'$and $\lambda(\ell, m) \leq \mu(\ell, m)$ for every $(\ell, m) \in E'$.

Definition 2.2: The underlying crisp graph of $G = (\sigma, \mu)$is labelled by$G^* = (\sigma^*, \mu^*)$, where $\sigma^* = \{\ell \in V: \sigma(\ell) > 0\}$ and $\mu^* = \{(\ell, m) \in VxV: \mu(\ell, m) > 0\}$

Definition 2.3: The *order p* and *size q,* of $\mathcal{FG}$are stated as $p = \sum_{\ell \in V} \sigma(\ell)$and $q = \sum_{(\ell,m) \in E} \mu(\ell, m)$ respectively. If$\mathcal{T} \subseteq V$, then the *fuzzy cardinality* of $\mathcal{T}$ is stated to be $\sum_{\ell \in \mathcal{T}} \sigma(\ell)$ and is labelled by $|\mathcal{T}|$.

Definition 2.4: A subset D of V is stated as a dominating set of $\mathcal{FG}(FD - set)$ if for each $m \in V - D$, there exists $\ell \in D$ such that ℓ *and* $m$are strong neighbors. A $FD - set$ is stated as a *minimal FD − set*if no proper subset of D is a $FD - set$ of $\mathcal{FG}$. The FD number of a $\mathcal{FG}G$ is termed as the least cardinality taken over all $FD - sets$ of a $\mathcal{FG}G$ and is symbolized by $\gamma_f(G)$.

Definition 2.5: Let D acts as a FD-set of V. Then D is stated as an *accurate dominating set* of $\mathcal{FG}(FAD - set)$, if $V - D$ contains no $FD - set$ of equivalent cardinality $|D|$. The FAD number of $\mathcal{FG}G$is defined to be the least cardinality taken over all $FAD - sets$and is denoted by $\gamma_{fa}(G)$.

Definition 2.6: A$FAD - set D \subset V$ is defined as an *accurate split dominating set* of $\mathcal{FG}$ $(FASD - set)$, if $< V - D >$ is disconnected. The $FASD$ number of $\mathcal{FG}G$ is defined as the least cardinality taken over all $FASD - set$and it is denoted by $\gamma_{fas}(G)$.

Definition 2.7: A $FD - set D \subset V$ is defined as a *strong split dominating se*t (FSSD-set) of$\mathcal{FG}$ G, if $< V - D >$ is disconnected. The $FSSD$ number of$G$ is defined as the least cardinality taken over all $FSSD - set$and it is denoted by $\gamma_{fss}(G)$.

ACCURATE STRONG SPLIT DOMINATION USING STRONG ARCS IN FUZZY GRAPH
Definition 3.1: Accurate strong split domination using strong arcs in $\mathcal{FG}$
A $FD - set D \subset V$ in $\mathcal{FG}$is stated to be an accurate strong split dominating set in $\mathcal{FG}(FASSD - set)$, if
(i) D is a $FAD - set$ and
(ii) D is a$FSSD - set$.
A$FASSD$-set is a minimal $FASSD$-set in a $\mathcal{FG}$ if it does not contain any proper$FASSD$subset.A minimum $FASSD$-set is a $FASSD$-set of least size in a given graph. The$FASSD$ number $\gamma_{fass}(G)$ is the least cardinality of a$FASSD - set$.

Example 3.1
Let the $\mathcal{FG}G = (\sigma, \mu)$ where $\sigma = \{u|0.2, v|0.3, w|0.6, \ell|0.4, m|0.7, z|0.9\}$and
$\mu = \{(u, v)|0.1, (v, w)|0.3, (w, \ell)|0.3, (\ell, m)|0.3, (m, z)|0.5, (z, u)|0.2, (u, m)|0.2, (v, \ell)|0.3\}$
Strong arcs are $(v, w), (w, \ell), (\ell, m), (m, z), (z, u), (u, m), (v, \ell)$. Here, some of the minimal dominating sets are $\{u, v\}, \{w, z\}, \{\ell, m\}, \{v, m\}, \{u, \ell\}$.
Clearly, $\gamma_{fa}(G) = 0.5$. FSSD-set is $\{u, v, \ell, m\}$and hence$\gamma_{fss}(G) = 1.6$.$FASSD - set$ is $\{u, v, \ell, m\}$and hence$\gamma_{fass}(G) = 1.6$.

Observations

(i)   Every Complete graph does not contain an $FASSD$-set. Since $< V - D >$ is not a totally disconnected graph.
(ii) $V - D$ has at least two vertices.

Mohamed Ismayil and Sabitha Begum

(iii)   Subset of $FASSD$-set need not be a $FASSD$-set.

(iv)   An $FASSD$-set may not be a minimum dominating set.

(v)   Whole set must not a $FASSD$-set.

In this manuscript, only finite simple connected graphs, but except complete graphs are taken into consideration.

Theorem 3.1: For any connected graph G, $\gamma_f(G) \le \gamma_{fs}(G) \le \gamma_{fss}(G) \le \gamma_{fass}(G)$

Proof: Every $FASSD - set$ is a $FSSD - set$ of G,
$$\gamma_{fss}(G) \le \gamma_{fass}(G)$$
Every $FSSD - set$ is a $FSD - set$ of G,
$$\gamma_{fs}(G) \le \gamma_{fss}(G)$$
Since every $FSD - set$ is a $FD - set$ of G,
$$\gamma_f(G) \le \gamma_s(G)$$
Hence $\gamma_f(G) \le \gamma_{fs}(G) \le \gamma_{fss} \le \gamma_{fass}(G)$

Theorem 3.2: For any connected graph G,
$$\gamma_f(G) \le \gamma_{fa}(G) \le \gamma_{fas}(G) \le \gamma_{fass}(G)$$

Proof: Every $FAD - set$ is a $FD - set$ of G,
$$\gamma_f(G) \le \gamma_{fa}(G)$$
Every $FASD - set$ is a $FAD - set$ of G,
$$\gamma_{fa}(G) \le \gamma_{fas}(G)$$
Since every $FASSD - set$ is a $FASD - set$ of G,
$$\gamma_{fas}(G) \le \gamma_{fss}(G)$$

Theorem 3.3: A $FD - set$ of a connected graph G is an $FASSD - set$ iff the following conditions are satisfied:

(i) $V - D$ has atleast two vertices

(ii)   For any two vertices $u, v \in V - D$, every $u - v$ path contains at least one vertex of D.

(iii) $V - D$ has no $FD - set$ of cardinality $|D|$.

Proof Let D be an $FASSD$-set.

(i)   By observation (ii) $V - D$ has at least two vertices.

(ii)   Suppose there exists a path $u - v$ path containing no vertices of D. Then $< V - D >$ is connected. Hence every $u - v$ path contains at least one vertex of D.

(iii)   Suppose $V - D$ has a $FD - set$ of cardinality $|D|$. Then D is not $FAD - set$.

Hence Every $FASSD$-set satisfies the above three conditions.

Conversely, from (iii) D is $FAD - set$ and from (i) and (ii) D is a $FSSD$ −set. Hence D is an $FASSD$-set.

Theorem 3.4: For any Path FG, P_σ where $|\sigma| = p$ and $|\sigma^*| = n$ for $n \ge 3$,
$$\gamma_{fass}(P_p) \le \left\lceil \frac{p}{2} \right\rceil + 1$$

Proof: For finding accurate strong split dominating set D in any path, we have to choose vertices for $V - D$ with maximum membership value and no two of its vertices are adjacent such that $|V - D| \ne |D|$ and each vertex in D is next to some vertex in $V - D$. Then D does not exceed $\left\lceil \frac{p}{2} \right\rceil + 1$. Thus $\gamma_{fass}(P_n) = \left\lceil \frac{p}{2} \right\rceil + 1$

Theorem 3.5: For any cycle $FG C_\sigma$, where $|\sigma| = p$ and $|\sigma^*| = n$ for $n \ge 3$,
$$\gamma_{fass}(C_p) \le \left\lceil \frac{p}{2} \right\rceil + 1$$

Proof: Let us labelling the vertices of a cycle as $v_1, v_2, v_3, \ldots, v_{n-1}, v_n$.

Mohamed Ismayil and Sabitha Begum

Case (i): All arcs are strong arcs. We have to choose vertices for $V - D$, with maximum membership value and no two of its vertices are adjacent such that $|V - D| \neq |D|$ and each vertex in D is next to some vertex in $V - D$.This implies$D$ does not exceed $\left\lceil \frac{p}{2} \right\rceil + 1$ vertices

Case (ii):Let (v_1, v_n) be an arc which is not strong. Then by theorem 3.4, D does not exceed $\left\lceil \frac{p}{2} \right\rceil + 1$ vertices

Theorem 3.6: For any star $\mathcal{F}\mathcal{G}K_{\sigma_1,\sigma_2}$, where $|\sigma_1{}^*| = 1, |\sigma_2{}^*| \geq 3, |\sigma| = p$ and $|\sigma^*| = n$, $n \geq 3$,u is the centre node of the fuzzy graph.

$$\gamma_{fass}\left(K_{\sigma_1,\sigma_2}\right) = \begin{cases} \sigma_1(u), & if\ |\sigma_1| \neq |\sigma_2| \\ \sigma_1(u) + \min_{v \in \sigma_2} \sigma_2(v), & if\ |\sigma_1| = |\sigma_2| \end{cases}$$

Proof: Let u be the centre of the star fuzzy graph. Since removing central node leaves the graph totally disconnected, $D = \{u\}$ is the one of the minimal $FSSD - set$ alsominimal $FSD - set$. Therefore, $\gamma_{fass}(S_\sigma) = \gamma_{fas}(S_\sigma)$. By the theorem in [9], $\gamma_{fass}\left(K_{\sigma_1,\sigma_2}\right) = \begin{cases} \sigma_1(u), & if\ |\sigma_1| \neq |\sigma_2| \\ \sigma_1(u) + \min_{v \in \sigma_2} \sigma_2(v), & if\ |\sigma_1| = |\sigma_2| \end{cases}$

Theorem 3.7: Let $G = (\sigma, \mu)$ be acomplete bipartite $\mathcal{F}\mathcal{G}$ with two partitions$|\sigma_1| \leq |\sigma_2|$ of vertices Then
$$\gamma_{fass}(G) = \begin{cases} |\sigma_1|, & if\ |\sigma_1| < |\sigma_2| \\ |\sigma_1| + \min_{v \in \sigma_2} \sigma_2(v), & if\ |\sigma_1| = |\sigma_2| \end{cases}$$

Proof: Since removing one partition of vertices leaves the graph totally disconnected, either one of the partition vertex set is a $FSSD - set$. But it may be a $FASSD - set$ or not a $FASSD - set$ according as $|\sigma_1| < |\sigma_2|$and $|\sigma_1| = |\sigma_2|$

Case (i): If$|\sigma_1| < |\sigma_2|$, then$\gamma_{fass}(G) = |\sigma_1|$.

Case (ii): If $|\sigma_1| = |\sigma_2|$, then for finding D, choose the vertex set either $\sigma_1$or$\sigma_2$which does not contains the vertex having least membership value say $v \in \sigma_2$. Thus$\gamma_{fass}(G) = |\sigma_1| + \min_{v \in \sigma_2} \sigma_2(v)$

Definition: Let P_{σ_1} be a path $\mathcal{F}\mathcal{G}$ with $|\sigma_1{}^*| = n$ vertices. The graph $P_{\sigma_1} \odot K_{\sigma_2}, |\sigma_2{}^*| = 1$ is called a ***comb fuzzy graph***.

Theorem 3.8: Let $T_{C_\sigma} = P_{\sigma_1} \odot K_{\sigma_2}, |\sigma_1{}^*| = n \geq 3, |\sigma_2{}^*| = 1$, be a comb $\mathcal{F}\mathcal{G}$. $\gamma_{fass}\left(T_{C_\sigma}\right) \leq |\sigma_1| + |\sigma_2|$

Proof: Let $U = \{u_1, u_2 \dots u_n\}$ be the vertices(cut vertices in T_{C_σ}) in P_{σ_1} and $Z = \{z_1, z_2, \dots z_n\}$ be the end vertices in T_{C_σ}, where $|V| = |U| + |Z|$. Since each vertex in $U$is adjacent to an end vertex, split dominating set (SD-set) has $U = \{u_1, u_2 \dots u_n\}$ vertices.

Case(i): $SD - set$maybe$FASSD - set$if$|\sigma_1| \neq n|\sigma_2|$. Thus$\gamma_{fass}\left(T_{C_\sigma}\right) \leq |\sigma_1|$.

Case (ii): $SD - set$ may not be $FSSD - set$ if $|\sigma_1| = n|\sigma_2|$. Since all vertices from Z having equal membership value, adding any vertex from the set,$FASSD$-set will be obtained and hence $\gamma_{fass}\left(T_{C_\sigma}\right) \leq |\sigma_1| + |\sigma_2|$

Corollary 3.1: Let T_{C_σ} be a comb graph, where $|\sigma| = p$ and $|\sigma^*| = n \geq 2$

(i) $\gamma_{fs}\left(T_{C_\sigma}\right) < \frac{|\sigma|}{2}$, if D is a FSD-set

(ii) $\gamma_{fas}\left(T_{C_\sigma}\right) < \frac{|\sigma|}{2} + 1$, if D is a $FASD$-set

(iii) $\gamma_{fss}\left(T_{C_\sigma}\right) < \frac{|\sigma|}{2}$, if D is a $FASD$-set

(iv) $\gamma_{fass}\left(T_{C_\sigma}\right) < \frac{|\sigma|}{2} + 1$, if D is a $FASSD$-set

Definition: Let P_{σ_1} be a path $\mathcal{F}\mathcal{G}$ with $|\sigma_1{}^*| = n$ vertices and P_{σ_2} be a path $\mathcal{F}\mathcal{G}$ with $|\sigma_2{}^*| = 2$. The graph $P_{\sigma_1} \times P_{\sigma_2}$ is called a ***Ladder $\mathcal{F}\mathcal{G}$***.

Theorem 3.9: Let $L_\sigma = P_{\sigma_1} \times P_{\sigma_2}$ be a ladder$\mathcal{FG}$, $|\sigma_1{}^*| \geq 3, |\sigma_2{}^*| = 2, |\sigma^*| = 2n$, Let us label the vertices $\{a_1, a_2, a_3, \dots a_n, \mathcal{b}_1, \mathcal{b}_2, \mathcal{b}_3, \dots \mathcal{b}_n\}$ where a_1 is adjacent to $\mathcal{b}_1$, a_2 is adjacent to $\mathcal{b}_2,\dots,a_n$ is adjacent to $\mathcal{b}_n$, $M_{\sigma_3} = \{a_1, \mathcal{b}_2 a_3, \mathcal{b}_4, \dots a_n \text{ or } \mathcal{b}_n\}, N_{\sigma_4} = \{\mathcal{b}_1 a_2, b_3, a_4, \dots a_n \text{ or } a_n\}$. Then

$$\gamma_{fass}(L_\sigma) = \begin{cases} |\sigma_3|, & |\sigma_3| \neq |\sigma_4| \\ |\sigma_3| + \min_{a_2 \in \sigma_4} \sigma_4(a_2), & |\sigma_3| = |\sigma_4| \end{cases}$$

Proof: In cartesian product of two graphs, all arcs are strong arcs[7].Removing either $M = \{a_1, \mathcal{b}_2 a_3, \mathcal{b}_4, \dots a_n \text{ or } \mathcal{b}_n\}$or $N = \{\mathcal{b}_1 a_2, b_3, a_4, \dots a_n \text{ or } a_n\}$leaves the graph totally disconnected.
Case (i): If $|\sigma_3| \neq |\sigma_4|$ and (say $|\sigma_3| < |\sigma_4|$) then M_{σ_3}be a$FASSD$-set.$\gamma_{fass}(L_\sigma) = |\sigma_3|$
Case (ii): If $|\sigma_3| = |\sigma_4|$, then adding a vertex from the set (say N) which has least membership value (say a_2) , we get $FASSD$-set and hence$\gamma_{fass}(L_\sigma) = |\sigma_3| + \min_{a_2 \in \sigma_4} \sigma_4(a_2)$

CONCLSION

In this manuscript, we stated the notions of $FASSD-set$ in fuzzy graphs. We found many bounds on $FASSD-set$ numbers. Exact values for some notable graphs are determined.

ABSTRACT

This study presents a new mathematical model for Lassa fever, a highly lethal disease that spreads through contaminated food, direct contact with infected individuals, and aerosol inhalation. The model, consisting of nonlinear differential equations for both rodent and human populations, focuses on assessing the stability of disease-free conditions and identifying critical model parameters affecting this stability. The primary goal of this research is to explore the impact of treatment on Lassa fever control. These results emphasize that increasing treatment rates among humans can significantly alleviate the burden of Lassa fever, suggesting the potential for disease eradication when the basic reproduction number remains below one. Therefore, advocating for health policies that aim to maintain this threshold is critical for effectively managing and minimizing the occurrence of Lassa fever.

Keywords: Mathematical Model, Stability Analyses, Lassa Fever, Equilibrium Points, Numerical Simulation.

INTRODUCTION

Lassa fever, or hemorrhagic fever, is a severe viral hemorrhagic disease that poses significant public health issues in sub-Saharan Africa [12, 2, 4, 15, 8, 5, 11, 17]. The disease is caused by the Lassa virus (LASV), which belongs to the Arenaviridae family [15, 17]. LASV was first discovered in 1969 in Lassa, Nigeria's Borno State [14, 6]. It primarily spreads to humans through direct contact with rodent excrement or secretions contaminated with the urine or feces of infected rodents [19]. Human-to-human transmission can occur through contact with an infected person's blood,

tissue, secretions, or excretions. Still, casual contact without the exchange of bodily fluids does not transmit the virus [12].In healthcare settings, improper use of personal protective equipment (PPE) can lead to nosocomial infections, and reused medical equipment, such as needles, can also be a transmission source [2]. Researchers have also documented laboratory-acquired infections [2]. The multimammate rat (Mastomys natalensis), a common species in West Africa, is the primary host for the zoonotic transmission of LASV from animals to humans [4, 13]. Ecological factors such as agricultural practices and rainfall can enhance Lassa fever transmission by promoting rodent population growth [12, 2]. Since its identification, LASV has raised significant health concerns in sub-Saharan Africa, especially in West Africa [19]. High-risk regions encompass roughly 80% of Sierra Leone, 50% of Liberia, and 40% of Guinea and Nigeria [7]. The disease is estimated to cause between 100,000 and 300,000 cases annually, with around 5,000 fatalities, reflecting significant levels of both illness and death [12, 13]. Lassa fever outbreaks typically span about seven months, starting in November and reaching their peak within the first three months of the subsequent year. However, reports of occasional cases occur throughout the year [12, 19]. Symptoms of Lassa fever typically emerge 6 to 21 days after exposure. Around 80% of cases begin with mild symptoms, which can be challenging to identify. These mild symptoms include fever, weakness, and general discomfort. Without treatment, the illness can progress to more severe manifestations such as muscle pain, headaches, chest pain, and a sore throat. About 20% of cases develop severe symptoms, including bleeding, facial swelling, lung fluid accumulation, and low blood pressure [14, 19, 13, 1]. Although no vaccines are currently available for Lassa fever, the antiviral medication ribavirin can be effective early in the disease [12, 19, 13, 20, 16]. Researchers have developed several epidemiological models to study the transmission of Lassa fever. For instance, a comprehensive epidemic model in Nigeria investigated the interactions between humans and rodents, incorporating measures such as quarantine, isolation, and hospitalization [12]. This research shed light on the factors driving outbreaks from 2016 to 2019 and identified patterns in transmission dynamics. Onah et al. [13] developed a mathematical model highlighting crucial elements influencing disease spread and applied optimal control theory to reduce transmission cost-effectively. Another model examined how seasonal changes in rodent reproduction affect Lassa fever transmission [6]. A study on quarantine, reinfection, and environmental transmission noted that backward bifurcation complicates control efforts and underscores the need for effective rodent population management. Akhmetzhanov et al. [2] explored the impact of seasonal factors on Lassa fever transmission in Nigeria, revealing that rodent migration patterns significantly influence the risk of infection, particularly in the first nine weeks of the season. Additionally, their model analyzed the relationship between the disease's reproduction number and local rainfall, highlighting substantial spatial variability in outbreaks across different regions of Nigeria and the effect of rainfall on the severity of Lassa fever epidemics [21].

A Novel Model Framework for Lassa fever Transmission

The novel model explores the transmission dynamics of Lassa fever between humans and rodents, uniquely accounting for treated humans and rodents that recover through natural immunity. This inclusion of all potential interactions between the two species distinguishes this model. The total human population at time t is denoted by $\mathbb{N}_h(t)$, comprising susceptible humans $\mathbb{S}_h(t)$, infected humans $\mathbb{I}_h(t)$, treated humans $\mathbb{T}_h(t)$, and recovered humans $\mathbb{R}_h(t)$, such that $\mathbb{N}_h(t) = \mathbb{S}_h(t) + \mathbb{I}_h(t) + \mathbb{T}_h(t) + \mathbb{R}_h(t)$. The rodent population at time t is $\mathbb{N}_a(t)$, which includes susceptible rodents $\mathbb{S}_a(t)$, infected rodents $\mathbb{I}_a(t)$, and recovered rodents $\mathbb{R}_a(t)$, resulting in $\mathbb{N}_a(t) = \mathbb{S}_a(t) + \mathbb{I}_a(t) + \mathbb{R}_a(t)$.

$$\frac{d\mathbb{S}_h(t)}{dt} = \Psi_h - (\varpi_1 \mathbb{I}_a(t) + \varpi_2 \mathbb{I}_h(t))\mathbb{S}_h(t) - \mu_h \mathbb{S}_h(t),$$

$$\frac{d\mathbb{I}_h(t)}{dt} = (\varpi_1 \mathbb{I}_a(t) + \varpi_2 \mathbb{I}_h(t))\mathbb{S}_h(t) - (\eta_h + \varphi_h + \mu_h + \delta_1)\mathbb{I}_h(t),$$

$$\frac{d\mathbb{T}_h(t)}{dt} = \varphi_h \mathbb{I}_h(t) - (\kappa_h + \mu_h + \delta_2)\mathbb{T}_h(t),$$

$$\frac{d\mathbb{R}_h(t)}{dt} = \kappa_h \mathbb{T}_h(t) + \eta_h \mathbb{I}_h(t) - \mu_h \mathbb{R}_h(t), \qquad (1)$$

$$\frac{d\mathbb{S}_a(t)}{dt} = \Psi_a - \varpi_3 \mathbb{I}_a(t)\mathbb{S}_a(t) - \mu_a \mathbb{S}_a(t),$$

$$\frac{d\mathbb{I}_a(t)}{dt} = \varpi_3 \mathbb{I}_a(t)\mathbb{S}_a(t) - (\eta_a + \mu_a)\mathbb{I}_a(t),$$

$$\frac{d\mathbb{R}_a(t)}{dt} = \eta_a \mathbb{I}_a(t) - \mu_a \mathbb{R}_a(t)$$

where the initial conditions are
$\mathbb{S}_h(0) = \mathbb{S}_{h_0} \geq 0, \mathbb{I}_h(0) = \mathbb{I}_{h_0} \geq 0, \mathbb{T}_h(0) = \mathbb{T}_{h_0} \geq 0, \mathbb{R}_h(0) = \mathbb{R}_{h_0} \geq 0, \mathbb{S}_a(0) = \mathbb{S}_{a_0} \geq 0, \mathbb{I}_a(0) = \mathbb{I}_{a_0} \geq 0, \mathbb{R}_a(0) = \mathbb{R}_{a_0} \geq 0$, and the parameters in the model are defined accordingly. The transitions between the compartments of the model are illustrated.

Analysis Model

Lemma 1 *The solutions* $\mathbb{S}_h(t), \mathbb{I}_h(t), \mathbb{T}_h(t), \mathbb{R}_h(t), \mathbb{S}_a(t), \mathbb{I}_a(t), \mathbb{R}_a(t)$ *In system (2.1), all quantities remain non-negative, given that the initial conditions specified in (3.2) are also non-negative.*

Proof. [3] System (2.1) has

$$\frac{d\mathbb{S}_h(t)}{dt}\Big|_{\mathbb{S}_h=0} = \Psi_h > 0,$$

$$\frac{d\mathbb{I}_h(t)}{dt}\Big|_{\mathbb{I}_h=0} = \varpi_1 I_a(t)\mathbb{S}_h(t) > 0,$$

$$\frac{d\mathbb{T}_h(t)}{dt}\Big|_{\mathbb{T}_h=0} = \varphi_h \mathbb{I}_h(t) > 0,$$

$$\frac{d\mathbb{R}_h(t)}{dt}\Big|_{\mathbb{R}_h=0} = \kappa_h \mathbb{T}_h(t) + \eta_h \mathbb{I}_h(t) > 0,$$

$$\frac{d\mathbb{S}_a(t)}{dt}\Big|_{\mathbb{S}_a=0} = \Psi_a > 0,$$

$$\frac{d\mathbb{I}_a(t)}{dt}\Big|_{\mathbb{I}_a=0} = 0,$$

$$\frac{d\mathbb{R}_a(t)}{dt}\Big|_{\mathbb{R}_a=0} = \eta_a \mathbb{I}_a(t) > 0.$$

As a result, $(\mathbb{S}_h, \mathbb{I}_h, \mathbb{T}_h, \mathbb{R}_h, \mathbb{S}_a, \mathbb{I}_a, \mathbb{R}_a) \in \mathbb{R}_+^7$ Lemma ensures the non-negativity of all quantities (3.1). The following lemma demonstrates the boundedness of the system solution (2.1) within its feasible region.

Lemma 2

$$\Omega_h = \left\{ (\mathbb{S}_h, \mathbb{I}_h, \mathbb{T}_h, \mathbb{R}_h) \in \mathbb{R}_+^4 \Big| 0 \leq \mathbb{S}_h(t) + \mathbb{I}_h(t) + \mathbb{T}_h(t) + \mathbb{R}_h(t) \leq \frac{\Psi_h}{\mu_h} \right\}$$

and

$$\Omega_a = \left\{ (\mathbb{S}_a, \mathbb{I}_a, \mathbb{R}_a) \in \mathbb{R}_+^3 \Big| 0 \leq \mathbb{S}_a(t) + \mathbb{I}_a(t) + \mathbb{R}_a(t) \leq \frac{\Psi_a}{\mu_a} \right\}.$$

The biologically feasible region is defined by: $\Omega = \Omega_h \times \Omega_a.$

If $\mathbb{N}_h(0) \leq \frac{\Psi_h}{\mu_h}$ and $\mathbb{N}_a(0) \leq \frac{\Psi_a}{\mu_a}$, the region is positively invariant for system (2.1) when starting with non-negative initial conditions. $\mathbb{R}_+^7$.

Proof

Consider the total population split into two groups: the human population, which includes $\mathbb{S}_h(t)$, $\mathbb{I}_h(t)$, $\mathbb{T}_h(t)$, and $\mathbb{R}_h(t)$, and the rodent population, which consists of $\mathbb{S}_a(t)$, $\mathbb{I}_a(t)$, and $\mathbb{R}_a(t)$. By adding together the first four equations of system (2.1), we derive:

$$\frac{d\mathbb{N}_h(t)}{dt} = \frac{d\mathbb{S}_h(t)}{dt} + \frac{d\mathbb{I}_h(t)}{dt} + \frac{d\mathbb{T}_h(t)}{dt} + \frac{d\mathbb{R}_h(t)}{dt} = \Psi_h - \mu_h \mathbb{N}_h(t) - \delta_1 \mathbb{I}_h(t) - \delta_2 \mathbb{T}_h(t) \leq \Psi_h - \mu_h \mathbb{N}_h(t).$$

If we suppose that $\mathbb{N}_h(0) \leq \frac{\Psi_h}{\mu_h}$, we deduce that $\mathbb{N}_h(t) \leq \frac{\Psi_h}{\mu_h}$. Thus, Ω_h represents the biologically viable region for the human population. Next, we will demonstrate the same for the rodent population:

$$\frac{d\mathbb{N}_a(t)}{dt} = \frac{d\mathbb{S}_a(t)}{dt} + \frac{dI_a(t)}{dt} + \frac{d\mathbb{R}_a(t)}{dt} \leq \Psi_a - \mu_a \mathbb{N}_a(t).$$

If $\mathbb{N}_a(0) \leq \frac{\Psi_a}{\mu_a}$, then $\mathbb{N}_a(t) \leq \frac{\Psi_a}{\mu_a}$. Similarly, Ω_a it defines the biologically viable region for the rodent population. ensuring that $\mathbb{N}_h(t)$ and $\mathbb{N}_a(t)$ it remains bounded for all $t \geq 0$. Therefore, any system (2.1) solution with an initial condition within Ω stays within ⌐⌐. As a result, within the feasible region ⌐⌐, our system is both epidemiologically sound and mathematically well-defined.

Equilibrium Points

Next, we will identify the equilibrium points to assess the system's stability. The Lassa-free equilibrium, for example, represents a scenario where the disease is absent in both humans and rodents, meaning that the infected human populations are zero. Therefore, the Lassa fever-free equilibrium (LFE) of System (2.1) is defined by:

$$E^0 = \left(\mathbb{S}_h^0, I_h^0, \mathbb{T}_h^0, \mathbb{R}_h^0, \mathbb{S}_a^0, \mathbb{I}_a^0, \mathbb{R}_a^0\right) = \left(\frac{\Psi_h}{\mu_h}, 0, 0, 0, \frac{\Psi_a}{\mu_a}, 0, 0\right) \qquad (2)$$

The endemic equilibrium point of our model (2.1), represented by E^*, is found by setting $\chi_i(t) = 0$ for each state variable χ_i, $i = 1, 2, \ldots, 7$ and then solving the resulting equations. This yields the following results (see [10]):

$$E^* = \left(\mathbb{S}_h^*, \mathbb{I}_h^*, \mathbb{T}_h^*, \mathbb{R}_h^*, \mathbb{S}_a^*, \mathbb{I}_a^*, \mathbb{R}_a^*\right)$$

where

$$\mathbb{S}_h^* = \frac{\Psi_h}{\varpi_1 \mathbb{I}_a^* + \varpi_2 \mathbb{I}_h^* + \mu_h},$$

$$\mathbb{I}_h^* = \frac{(\varpi_1 \mathbb{I}_a^* + \varpi_2 \mathbb{I}_h^*)\mathbb{S}_h}{\mu_h + \varphi_h + \eta_h + \delta_1},$$

$$\mathbb{T}_h^* = \frac{\varphi_h \mathbb{I}_h^*}{\mu_h + \kappa_h + \delta_2},$$

$$\mathbb{R}_h^* = \frac{\kappa_h \mathbb{T}_h^* + \eta_h \mathbb{I}_h^*}{\mu_h},$$

$$\mathbb{S}_a^* = \frac{\Psi_a}{\varpi_3 \mathbb{I}_a^* + \mu_a},$$

$$\mathbb{I}_a^* = \frac{\varpi_3 \mathbb{I}_a^*}{\eta_a + \mu_a},$$

$$\mathbb{R}_a^* = \frac{\eta_a \mathbb{I}_a^*}{\mu_a}.$$

The endemic equilibrium point is given by using the next-generation matrix, the basic reproduction number (R_0):

$$R_0 = \frac{\varpi_2 \Psi_h}{\mu_h(\eta_h + \varphi_h + \mu_h + \delta_1)} \qquad (3)$$

If $R_0 < 1$, Lassa fever has lost its effect in the population, and the virus is eradicated from the population. If $R_0 > 1$, the number of infected individuals continues to rise as the infection remains active, and the disruptive effects of Lassa fever on the population endure.

Sensitivity Analysis

In epidemiological models, errors can occur during data collection or parameter estimation. To predict a pandemic accurately, it is crucial to estimate sensitive parameters with minimal error, as even minor deviations in these parameters can significantly alter the pandemic's trajectory. These models commonly employ sensitivity analysis to address the potential impact of minor inaccuracies in the estimated parameter values. We conduct sensitivity analysis by calculating the partial derivative of the fundamental threshold value, such as the R_0 number, for the parameters it relies on. In this study, the birth and death rates, such as Ψ_h, μ_h, and δ_1 are considered constant and therefore are not included in the analysis for the Lassa fever model. Instead, the sensitivity analysis focuses on the remaining parameters ϖ_2, η_h, and φ_h is conducted as follows:

$$\frac{\partial R_0}{\partial \varpi_2} = \frac{\Psi_h}{\mu_h(\eta_h + \varphi_h + \mu_h + \delta_1)} > 0,$$

$$\frac{\partial R_0}{\partial \eta_h} = -\frac{\varpi_2 \Psi_h}{\mu_h(\eta_h + \varphi_h + \mu_h + \delta_1)^2} < 0,$$

$$\frac{\partial R_0}{\partial \varphi_h} = -\frac{\varpi_2 \Psi_h}{\mu_h(\eta_h + \varphi_h + \mu_h + \delta_1)^2} < 0.$$

It is evident that the R_0 number is sensitive to the parameters ϖ_2, η_h, and φ_h. Specifically, an increase in the parameter leads to a more rapid escalation of the pandemic ϖ_2. To mitigate this, it is crucial to manage human-to-human transmission by wearing masks, practicing social distancing, and maintaining good hygiene. Conversely, as the parameters η_h and φ_h rise, the number decreases, indicating that higher treatment rates significantly slow the disease's spread.

R_0 . That is, if the rate of treatment of the disease increases, the spread of the disease is greatly slowed down. The results suggest that preventing transmission and enhancing treatment are more effective disease control strategies.

Stability Analysis

This section examines the stability of equilibrium points by analyzing system (2.1) with the Jacobian matrix.

Theorem 3.1 *The Lassa-free equilibrium point E^0 is locally asymptotically stable if the condition is satisfied.*

$$R_0 \leq 1 \text{and} \varpi_3 \frac{\Psi_a}{\mu_a} \leq \eta_a + \mu_a$$

is comfortable, in unsafe otherwise.

Proof: The Jacobian matrix of system (2.1) at E^0 is (see [9, 18])

$$J(E^0) = \begin{bmatrix} -\mu_h & -\varpi_2\frac{\Psi_h}{\mu_h} & 0 & 0 & 0 & -\varpi_1\frac{\Psi_h}{\mu_h} & 0 \\ 0 & M_1 & 0 & 0 & 0 & \varpi_1\frac{\Psi_h}{\mu_h} & 0 \\ 0 & \varphi_h & M_2 & 0 & 0 & 0 & 0 \\ 0 & \eta_h & \kappa_h & -\mu_h & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & -\mu_h & -\varpi_3\frac{\Psi_a}{\mu_a} & 0 \\ 0 & -\varpi_1\frac{\Psi_h}{\mu_h} & 0 & 0 & 0 & M_3 & 0 \\ 0 & \varpi_1\frac{\Psi_h}{\mu_h} & 0 & 0 & 0 & \eta_a & -\mu_a \end{bmatrix}$$

(4)

where

$$M_1 \quad = \varpi_2 \frac{\Psi_h}{\mu_h} - (\eta_h + \varphi_h + \mu_h + \delta_1),$$
$$M_2 \quad = -(\kappa_h + \mu_h + \delta_2),$$
$$M_3 \quad = \varpi_3 \frac{\Psi_a}{\mu_a} - (\eta_a + \mu_a).$$

The matrix includes the ensuing unfavorable eigenvalues:

$$\lambda_{1,2} \quad = -\mu_h,$$
$$\lambda_3 \quad = -(\kappa_h + \mu_h + \delta_2),$$
$$\lambda_{4,5} \quad = -\mu_a.$$

Further eigenvalues

$$\lambda_6 \quad = \varpi_2 \frac{\Psi_h}{\mu_h} - (\eta_h + \varphi_h + \mu_h + \delta_1) = (\eta_h + \varphi_h + \mu_h + \delta_1)(R_0 - 1),$$
$$\lambda_7 \quad = \varpi_3 \frac{\Psi_a}{\mu_a} - (\eta_a + \mu_a).$$

If $R_0 \leq 1$ and $\varpi_3 \frac{\Psi_a}{\mu_a} \leq \eta_a + \mu_a$, the system (2.1) is locally asymptotically stable at point E^0. However, if $R_0 > 1$ and $\varpi_3 \frac{\Psi_a}{\mu_a} > (\eta_a + \mu_a)$, the system (2.1) is unstable at point E^0, and there is a point E^* where the system is stable.

Theorem 3.2 *If $R_0 > 1$, If the system (2.1) reaches its endemic equilibrium point, it is considered to be locally asymptotically stable E^*.*

Jacobian matrix of system (2.1) at E^*

$$J(E^*) = \begin{bmatrix} -a_1 - \mu_h & -\varpi_2 \mathbb{S}_h^* & 0 & 0 & 0 & -\varpi_1 \mathbb{S}_h^* & 0 \\ a_1 & a_2 & 0 & 0 & 0 & \varpi_1 \mathbb{S}_h^* & 0 \\ 0 & \varphi_h & a_3 & 0 & 0 & 0 & 0 \\ 0 & \eta_h & \kappa_h & -\mu_h & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & -\varpi_3 \mathbb{I}_a^* - \mu_a & -\varpi_3 \mathbb{S}_a^* & 0 \\ 0 & -\varpi_1 \mathbb{S}_h^* & 0 & 0 & \varpi_3 \mathbb{I}_a^* & a_4 & 0 \\ 0 & \varpi_1 \mathbb{S}_h^* & 0 & 0 & 0 & \eta_a & -\mu_a \end{bmatrix} \tag{5}$$

where

$$a_1 = \quad \varpi_1 \mathbb{I}_a^* + \varpi_2 \mathbb{I}_h^*,$$
$$a_2 = \quad \varpi_2 \mathbb{S}_h^{\cdot} - (\eta_h + \varphi_h + \mu_h + \delta_1),$$
$$a_3 = \quad -(\kappa_h + \mu_h + \delta_2),$$
$$a_4 = \quad \varpi_3 \mathbb{S}_a^{\cdot} - (\eta_a + \mu_a).$$

The negative eigenvalues are:

$$\chi_1 = \quad -\mu_h,$$
$$\chi_2 = \quad -(\kappa_h + \mu_h + \delta_2),$$
$$\chi_3 = \quad -\mu_a,$$
$$\chi_4 = \quad -(\varpi_1 \mathbb{I}_a^{\cdot} + \varpi_2 \mathbb{I}_h^{\cdot}) - \mu_h,$$
$$\chi_5 = \quad -\varpi_3 \mathbb{I}_a^* - \mu_a.$$

The following characteristic equation determines the remaining eigenvalues:

$$\chi^2 + q_1 \chi + q_2 = 0 \tag{6}$$

in which the coefficients are:

$$q_1 = \quad \delta_1 + \eta_a + \eta_h + \mu_a + \mu_h - \varpi_3 \mathbb{S}_a^* - \varpi_2 \mathbb{S}_h^* + \varphi_h,$$
$$q_2 = \quad \varpi_1 \mathbb{S}_h^{\cdot}(\varpi_1 \mathbb{S}_h^{\cdot} + \varpi_2 \mathbb{I}_a^{\cdot}) + \varpi_2 \mathbb{S}_h^{\cdot}(-\eta_a + \varpi_2 \mathbb{I}_h^{\cdot} - \mu_a + \varpi_3 \mathbb{S}_a^{\cdot}) - \mathbb{S}_a^{\cdot}(\delta_1 + \eta_h - \varpi_3 \mathbb{I}_a^{\cdot} - \mu_h)$$
$$+ \eta_a(\delta_1 + \eta_h + \mu_a + \mu_h) + \mu_a(\delta_1 + \mu_h) + \varphi_h(\eta_a + \mu_a - \mathbb{S}_a^{\cdot}).$$

If the coefficients q_1 and q_2 of the characteristic Equation (6) satisfy the conditions $q_1, q_2 > 0$, or $q_1 < 0, 4q_2 > (q_1)^2$, According to the Routh-Hurwitz criterion, the system is considered locally asymptotically stable when there are two negative eigenvalues. E^*.

Graphical Representations

Understanding disease spread and the impact of control measures is crucial in epidemiology. Epidemiological models divide populations into compartments representing different stages of infection and recovery for humans and animals. This allows for a thorough examination of disease dynamics and management strategies. Understanding disease spread and the impact of control measures is crucial in epidemiology. Epidemiological models divide populations into compartments representing different stages of infection and recovery for humans and animals. This allows for a thorough examination of disease dynamics and management strategies. One useful tool is the stacked area plot, which displays the cumulative sizes of various population groups (such as susceptible, infected, treated, and recovered) over time. This type of graph helps visualize the overall progression of an epidemic and the relative sizes of different disease states at any given point. By analyzing these trends, researchers can assess the effectiveness of public health measures such as vaccination and treatment strategies. Another important tool is the comparative analysis plot, which provides a detailed comparison between human and animal populations affected by the same disease. This plot typically shows separate lines or areas for each population, highlighting differences in infection rates, treatment outcomes, and recovery trends. Such comparisons are essential for understanding zoonotic diseases, where pathogens can transfer between animals and humans. The scatter plot offers a detailed view of individual trajectories within each disease compartment. Each point represents data from a specific simulation or observation, illustrating how individuals transition between different states over time. This level of detail helps researchers explore variations in infection dynamics, treatment responses, and recovery rates among individuals. These graphical tools not only aid in understanding fundamental epidemiological metrics like the reproduction number (R0) but also facilitate the exploration of more complex scenarios. They help analyze how changes in vaccination rates, treatment methods, or contact patterns affect disease transmission. In conclusion, graphical representations of epidemiological models are invaluable for researchers, public health officials, and policymakers. They provide clear insights into disease dynamics, support evidence-based decision-making, and help reduce the impact of infectious diseases on both human and animal populations. By presenting complex data in an accessible format, these graphs enhance our understanding of epidemic processes and contribute to improved global health outcomes.

CONCLUSION

This study presents a new mathematical model for Lassa fever, which looks at the interactions between rodent and human populations. It examines how the disease can be controlled and emphasizes the important role of treatment in reducing its impact. The findings suggest that effective treatment could significantly reduce the disease burden and possibly lead to its eradication, especially if the primary reproduction number remains below one. It highlights the need for health policies that focus on increasing treatment rates among humans to manage and ultimately decrease Lassa fever outbreaks.

Table 1: Descriptions of the model parameters' values.

Parameter	Description
Ψ_h	Rate at which new humans are born into the population
ϖ_1	Rate at which the virus is transmitted from rodents to humans
ϖ_2	Rate at which the virus spreads from person to person
μ_h	Natural death rate of humans
η_h	Natural recovery rate for humans infected with the virus
φ_h	Treatment rate for human infections
κ_h	Recovery rate for treated humans
δ_1	Death rate of humans infected with the disease
δ_2	Death rate of treated humans infected with the disease
Ψ_a	Rodent birth rate in the overall rodent population
ϖ_3	Virus transmission rate to rodents from infected rodents
η_a	Rate at which infected rodents recover naturally
μ_a	Natural death rate of rodents

ABSTRACT

In this paper, various degrees of a vertex or a point in a fuzzy semigraph are defined. Degree, edge degree or line degree, adjacent degree and consecutive adjacent degree of a vertex in a fuzzy semigraph are introduced. Their properties under various isomorphisms are discussed.

Keywords: Degree, edge degree, adjacent degree and consecutive adjacent degree, isomorphism, semi edge, co-weak isomorphism, weak isomorphism, end vertex isomorphism, edge isomorphism.
AMS Mathematics Subject Classification: 05C72

INTRODUCTION

Fuzzy sets and Fuzzy relations gave birth to fuzzy graphs [11]. Fuzzy relations play a crucial role in the areas of clustering analysis, neural networks, computer networks, pattern recognition, etc… In each of the above areas the basic mathematical structure is that of fuzzy graphs.The notion of fuzzy graphs was introduced by Rosenfeld [11] in the year 1975. In recent years, fuzzy graph theory has emerged as one of the vast areas of research. Applications of fuzzy graphs include data mining, image segmentation, clustering, image capturing, networking, communication, planning, scheduling, etc.., Bhattacharya [2] contributed some useful remarks on Fuzzy graphs. Some Operations on Fuzzy graphs were characterized by Modeson J.N. and Peng. C.S [4].The concept of semigraph was introduced by E Sampath Kumar [12]. NagoorGani A. and Radha K [5] studied the degree of a vertex in some fuzzy graphs. Radha K [7] introduced the concept of fuzzy semigraphs. Radha K and P Renganathan [6] studied the effectiveness properties of fuzzy semigraphs..Radha.K and Kumaravel. N [9] introduced the concept of edge regular fuzzy graphs. They also

studied the degree of an edge in union and join of two fuzzy graphs. Radha K and Rosemine A [8] introduced the concept of degree sequence of a fuzzy graph. Radha K and Renganathan P [10] introduced the concept of various isomorphisms in fuzzy semigraphs and studied some of their properties.

Definition 1.1[12]:A semigraph is a pair: (V, X), where V is a non-empty set of elements called vertices or points and X is a set of n-tuples called edges or lines of distinct points for various n≥ 2 satisfying the conditions.1. Any two edges have at most one point in common 2.Two edges or lines $E_1 = (u_1, u_2, …, u_n), E_2 = (v_1, v_2, …, v_m)$ *are* considered to be equal if and only if (a) m=n (b) either $u_i=v_i$ for i = 1 to n or $u_i=v_{n-i+1}$ for i= 1to n. In the edge $E = (u_1, u_2, …, u_n)$, u_1 and u_n are called the end points and all the points in between them are called middle points.(m- points). If a middle point is an end point of some other line, then it is called a middle end point.

Definition1.2[7]: Consider a semigraph $G^*: (V, £, X)$.A fuzzy semigraph(fsg) $G: (\sigma, \mu, \eta)$ onG^*:(V, £, X)is characterized as $G: (\sigma, \mu, \eta)$ where $\sigma: V \to [0,1]$ μ:V×V→ [0,1],η:X→ [0,1]are such that (i) $\mu(uv)) \le \sigma(u) \wedge \sigma(v)$ $\forall (uv) \in V \times V$(ii) η (e) =μ(u₁u₂)∧μ(u₂u₃)∧…∧ μ(uₙ₋₁uₙ)≤ $\sigma(u_1) \wedge \sigma(u_n), \forall$ e ∈ X, if e=$(u_1, u_2, …, u_n)$,n ≥ 2 is an edge in G.Here (σ, μ) is a fuzzy graph.

Definition 1.3[6]:A line "e" of a fsgis called an effective line, if $\eta(e) = \eta(u_1, u_2, …, u_n) = \sigma(u_1) \wedge \sigma(u_n)$ $\forall e \in X$ and $\mu(uv)) = \sigma(u) \wedge \sigma(v)$ $\forall uv \in £$. Aline "e" of a fsg is called an e-effective line if$\eta(e) = \eta(u_1, u_2, …, u_n) = \sigma(u_1) \wedge \sigma(u_n)$ for n> 2

Definition 1.4[6]: Afsg$G: (\sigma, \mu, \eta)$is said to be an effective fsg if all the lines are effective lines. In other words $\eta(e) = \eta(u_1, u_2, …, u_n) = \sigma(u_1) \wedge \sigma(u_n), \forall e \in X$ and $\mu(uv) = \sigma(u) \wedge \sigma(v), \forall uv \in £$

Definition 1.5 [10]:Let $G: (\sigma, \mu, \eta)$ and $G': (\sigma', \mu', \eta')$ be two fsgs with underlying semigraphs G*and G'*. By **an isomorphism or a bijective similarity mapping of fsgs** f: G→ G'we mean a bijective map expressed by f : V→V' which satisfies 1. *If* E= (v₁,v₂,…, vₙ) is aline in G then (f(v₁), f(v₂),…, f(vₙ)) is aline in G' 2.$\sigma(u) = \sigma'(f(u))$ for all u∈V3. μ(uv)= μ'(f(u)f(v)) for all u$v \in £$ and 4.$\eta(e) = \eta'(f(e))$, for all e∈ X.

Definition 1.6 [10] : A **weak bijective similarity mapping of fsgs**f :G→ G'is a bijective map$f$:V→V'which satisfies 1. *if* E= (v₁,v₂,…, vₙ)is aline in G, then $\{f(v1), f(v2), …, f(vn)\}$forms aline in G'2.$\sigma(u) = \sigma'$(f(u)) for all u∈V 3. μ(uv) $\le \mu'$(f(u)f(v)) for all u, $v \in$V.

Definition 1.7 [10]: A **co-weak bijective similarity mapping of fsgs**f : G→ G',is a bijective map f : V→V' which satisfies 1.*if* E= (v₁v₂,…, vₙ) be aline in Gthen (f(v₁), f(v₂),…, f(vₙ)) is a line in G' 2.$\sigma(u) \le \sigma'(f(u))$ *for all* $u \in V$ 3.μ(uv)= μ'(f(u)f(v)) for all uv∈ £ and $\eta(e) = \eta'(f(e))$, for all e ∈ X.

Definition 1.8 [10] :An **end point bijective similarity mapping(ev-bijective similarity mapping)** of fsgs$f$: G→G' is a bijective map f :V→V'which satisfies1. If E= (v₁,v₂,…, vₙ) is alinein Gthen $\{f(v1), f(v2), …, f(vn)\}$forms aline in G' with end points f(v₁) and f(vₙ).2.$\sigma(u) = \sigma'$(f(u)) for all u∈V 3. μ(uv)= μ'(f(u)f(v)) for all uv ∈E and 4.$\eta(e) = \eta'(f(e))$, for all e∈ X.

Definition 1.9 [10] A linebijective similarity mapping (e-bijective similarity mapping) of fsgs$f$:G→ G'is a bijective map f:V→V'whichsatisfies1.ifE=(v₁,v₂,…,vₙ)is a line in Gthen $\{f(v1), f(v2), …, f(vn)\}$forms aline in G'2.$\sigma(u) = \sigma'$(f(u)) for all u∈V 3. μ(uv)= μ'(f(u)f(v)) for all u$v \in £$ and 4.$\eta(e) = \eta'(f(e))$, for all e ∈ X.

Definition 1.10 [10] :An **adjacency bijective similarity mapping (a-bijective similarity mapping)** of fsgs$f$: G→ G'is a bijective map f : V→V' which satisfies1. If the adjacent points in Gare mapped onto adjacent points in G',2.$\sigma(u) = \sigma'$(f(u)) for all u∈V,3. μ(uv)= μ'(f(u)f(v)) for all u$v \in £$ and 4.$\eta(e) = \eta'(f(e))$, for all e∈ X.

Degree of a Vertex or a Point in Fuzzy Semigraphs

Definition 2.1

If $G: (\sigma, \mu, \eta)$ is a fsg on $G^*: (V, £, X)$ and if u *is* any point in G, then the degree of u expressed by $d(u)$ is characterized by $d(u) = \sum \eta(E)$ where the $\sum$ covers all edges E having u as an end point.

The total degree of u expressed by $td(u)$ is characterized by $td(u) = \sum \eta(E)$ where $\sum$ covers all edges E having u as an end point.

Example 2.2

If we look at the fsg $G: (\sigma, \mu, \eta)$ in diagram 2.1, the degree of the points are $d(v_1) = 0.8$, $d(v_2) = 0$, $d(v_3) = 1.0$, $d(v_4) = 1.0$, $d(v_5) = 0.4$, $d(v_6) = 0.4$. The total degree of the points are $td(v_1) = 1.4$, $td(v_2) = 0.5$, $td(v_3) = 1.7$, $td(v_4) = 1.8$, $td(v_5) = 0.8$, $td(v_6) = 0.9$.

Theorem 2.3

If: (σ, μ, η) is a fsg on $G^*: (V, £, X)$, then the degree of a middle point of an edge is zero.

Proof: Since the middle point is not the end point of any edge, its degree is zero.

Theorem 2.4

If $G: (\sigma, \mu, \eta)$ is a fsg on $G^*: (V, £, X)$ then the degree of a point v in the end point fuzzy graph G_e is the degree of u in G, if v is the end point or middle end point of G. The degree of v in G_e is 0 if v is a middle point of G.

Proof: If u $\in$ V is an end point of G, then d $_{Ge}(u) = \sum_{uv \in £(G_e)} \eta_e(uv) = \sum \eta(E)$, the $\sum$ covers all lines with one end $u = d_G(u)$. If u $\in$ V is a middle point of G, then u is not adjacent to any other point of G_e. Therefore $d_{G_e}(u) = 0$.

If $G: (\sigma, \mu, \eta)$ is a fsg on $G^*: (V, £, X)$ where $V = \{v_1, v_2, \dots, v_n\}$ and $X = \{E_1, E_2, \dots, E_m\}$, then $\sum_{i=1}^n deg(v_i) = 2S(G) \leq 2m$.

Theorem 2.5

If $G: (\sigma, \mu, \eta)$ is a fsg on $G^*: (V, £, X)$ where $V = \{v_1, v_2, \dots, v_n\}$ and $X = \{E_1, E_2, \dots, E_m\}$, then $\sum_{i=1}^n deg(v_i) = 2S(G) \leq 2m$.

Proof : $\sum_{i=1}^n deg(v_i) = \sum_{i=1}^n \sum \eta(E)$ where $\sum$ runs over all the edges E having v as an end point. In $\sum_{i=1}^n \sum \eta(E)$, each $\eta(E)$ appears twice. Therefore $\sum_{i=1}^n deg(v_i) = 2 \sum_{i=1}^m \eta(E_i) = 2S(G)$.

Also $2S(G) = \sum_{i=1}^m \eta(E_i) \leq 2 \sum_{i=1}^m 1 = 2m$. Therefore $\sum_{i=1}^n deg(v_i) = 2S(G) \leq 2m$

Theorem 2.6

If $G: (\sigma, \mu, \eta)$ is a complete fsg on $G^*: (V, £, X)$ and If $n - 1$ points are strictly end points and one point be middle point of k semiedges $(v_i, u, v_{k+i}), i = 1, 2, \dots, k$. then

1. $d(u) \leq n - 1 - 2k$
2. $d(v_i) \leq n - 2, i = 1,2, \dots, 2k$
3. $d(v) \leq n - 1, v \in V - \{u, v_1, v_2, \dots, v_{2k}\}$
4. $S(G) \leq \frac{n^2 - n - 2k}{2}$

Proof: Since any two edges in x have at most one point in common; the end points of 1- semiedges $v_1, v_2, \dots, v_{2k}$ are all distinct. Therefore $2k \leq n - 1$, which implies $k \leq \frac{(n-1)}{2}$.

Hence the maximum possible value of K is $[\frac{n-1}{2}]$

$V - \{u, v_1, v_2, \dots, v_{2k}\}$ has $n - 1 - 2k$ elements.

If $V - \{u, v_1, v_2, \dots, v_{2k}\} = \{u_1, u_2, \dots, u_{n-1-2k}\}$

If $E_i = (v_i, u, v_{k+i}), i = 1,2, \dots, k$

u is the only middle point and all the other points are strictly end points.

Since G is complete, any two points must lie on the same edge.

80203

Radha and Renganathan

$X = \{E_1, E_2, \ldots, E_k\} \cup \{(u, u_i)/i = 1,2, \ldots, n-1-2k \cup \{(u_i, v_j)/ \ i = 1, 2, \ldots, n-1-2k, j = 1,2, \ldots, 2k\} \cup \{u_i, u_j)/i < j, \ i, j = 1,2, \ldots, n-1-2k\} \cup \{(v_i, v_j)/ \ j = 1,2, \ldots, 2k, j \neq k+i \ if \ i = 1,2, \ldots, k, j \neq i-k \ if \ i = k+1, k+2, \ldots, 2k\}$

(i) $d(u) = \sum \eta(E)$, $\sum$coversall E with u as an end point.

Therefore$d(u) = \sum_{i=1}^{n-1-2k} \eta(uu_i) \leq \sum_{i=1}^{n-1-2k} 1 = n-1-2k$

ii) For $i = 1,2, \ldots, k$

$d(v_i) = \sum \eta(E)$over all E with v_i as an end point.

$= \sum_{\substack{j=1 \\ i \neq j, j \neq k+i}}^{2k} \eta(v_i, v_j) + \eta(v_i, u, v_k + i) + + \sum_{j=1}^{n-1-2k} \eta(u_j, v_i)$

$\leq \sum_{\substack{j=1 \\ i \neq j, j \neq k+i}}^{2k} 1 + 1 + \sum_{j=1}^{n-1-2k} 1$

$= 2k - 2 + 1 + n - 1 - 2k$

$= n - 2$

For $i = k+1, k+2, \ldots, 2k$

$d(v_i) = \sum_{\substack{j=1 \\ i \neq j, j \neq i-k}}^{2k} \eta(v_i, v_j) + \eta(v_i - k, u, v_k + i, v_i) + \sum_{j=1}^{n-1-2k} \eta(u_j, v_i)$

$\leq 2k - 2 + 1 + n - 1 - 2k$

$= n - 2$

Hence $d(v_i) \leq n - 2, i = 1,2, \ldots, 2k$.

(iii) For $i = 1,2, \ldots, n-1-2k$,

$d(v) = \sum_{j=1}^{2k} 1 + 1 + \sum_{j=1}^{2k} \eta(u_i, v_j) + \sum_{\substack{j=1 \\ j \neq i}}^{n-1-2k} \eta(u_j, v_i)$

$\leq 1 + 2k + n - 1 - 2k - 1$

$= n - 1$

(iv) By theorem 2.4,

$$2S(G) = \sum_{v \in V} d(v)$$

$$= d(u) + \sum_{i=1}^{2k} d(v_i) + \sum_{i=1}^{n-1-2k} d(u_i)$$

$$\leq n - 1 - 2k + \sum_{i=1}^{2k} n - 2 + \sum_{i=1}^{n-1-2k} n - 1$$

$$= n - 1 - 2k + 2k(n-2) + (n-1-2k)(n-1)$$

$$= n^2 - n - 2k$$

Theorem 2.7

If$G: (\sigma, \mu, \eta)$is a complete fsg on $G^*: (V, £, X)$such that μ is conserved of constant value c and if$n - 1$ points be strictly end points and one point be middle point of k_1-semiedges (v_i, u, v_{k+i}),

$i = 1,2, \ldots, k$.then

1. $d(u) = (n-1-2k)c$
2. $d(v_i) = (n-2)c, i = 1,2, \ldots, 2k$
3. $d(v) = (n-1)c, v \in V - \{u, v_1, v_2, \ldots, v_{2k}\}$
4. $2S(G) = n^2 - n - 2k$

Proof: Consider V and X as in theorem 2.5,

Since $\mu(e) = c, \forall \ e \in E, \eta(E) = c, \forall \ E \in X$,

(i) $d(u) = \sum_{i=1}^{n-1-2k} \eta(u, u_i) = \sum_{i=1}^{n-1-2k} c = (n-1-2k)c$

(ii) $d(v_i) = \sum_{\substack{j=1 \\ i \neq j, j \neq k+i}}^{2k} \eta(v_i, v_j) + \eta(v_i, u, v_k + i) + \sum_{j=1}^{n-1-2k} \eta(u_j, v_i)$

$$= \sum_{\substack{j=1 \\ i \neq j, j \neq k+i}}^{2k} c + c + \sum_{j=1}^{n-1-2k} c$$

$$= (2k-2)c + c + (n-1-2k)c$$

80204

$= (n-2)c$

For $i = k+1, k+2, \ldots, 2k$,

$d(v_i) = \sum_{\substack{j=1 \\ i \neq j, j \neq i-k}}^{2k} \eta(v_i, v_j) + \eta(v_i - k, u, v_k + i, v_i) + \sum_{j=1}^{n-1-2k} \eta((u_j, v_i))$

$$= \sum_{\substack{j=1 \\ i \neq j, j \neq i-k}}^{2k} c + c + \sum_{j=1}^{n-1-2k} c$$

$$= (2k-2)c + c + (n-1-2k)c$$

$$= (n-2)c$$

(iii) $i = 1, 2, \ldots, n-1-2k$,

$d(v) = \eta(uu_i) + \sum_{j=1}^{2k} \eta(u_i v_j) + \sum_{\substack{j=1 \\ j \neq i}}^{n-1-2k} \eta(u_i v_j)$

$$= c + 2kc + (n-1-2k)c$$

$$= (n-1)c$$

(iv) $2S(G) = \sum_{v \in V} d(v)$, by theorem 2.5

$$= d(u) + \sum_{i=1}^{2k} d(v_i) + \sum_{i=1}^{n-1-2k} d(u_i)$$

$$= (n-1-2k)c + \sum_{i=1}^{2k} (n-2)c + \sum_{i=1}^{n-1-2k} (n-1)c$$

$$= (n-1-2k)c + 2k(n-2)c + (n-1-2k)(n-1)c$$

$$= (n^2 - n - 2k)c$$

Theorem 2.8

The degree of a point is preserved under a bijective similarity mapping.

Proof: Under a bijective similarity mapping $f: G \rightarrow G'$, $\eta(E) = \eta'(f(E))$, for all $E \in X$.

Therefore $d_G(u) = \sum \eta(E)$, where $\sum$ covers all E with u as an end point.

$= \sum \eta'(f(E))$, where $\sum$ covers all $f(E)$ with $f(u)$ as an end point.

$\qquad = d_{G'}(f(u))$

The following theorems can be proved easily in the same way.

Theorem 2.9

The degree of a point is preserved under end point bijective similarity mapping, edge bijective similarity mapping and adjacency bijective similarity mapping, a co-weak bijective similarity mapping, co-weak end point bijective similarity mapping, co-weak edge bijective similarity mapping and co-weak adjacency bijective similarity mapping.

Remark 2.10

The degree of a point need not be preserved under weak bijective similarity mapping, weak end point bijective similarity mapping, weak edge bijective similarity mapping and weak adjacency bijective similarity mapping since $\eta(E) \leq \eta'(f(E))$, for all $E \in X$ under any of these bijective similarity mappings.

Theorem 2.11

The total degree of a point is preserved under a bijective similarity mapping, end point bijective similarity mapping, edge bijective similarity mapping and adjacency bijective similarity mapping.

Remark 2.12

The total degree of a point need not be preserved under any weak bijective similarity mapping and under any co-weak bijective similarity mapping.

Edge Degree or Line Degree of a Vertex or a point in Fuzzy Semigraphs

Definition 3.1:
If $G: (\sigma, \mu, \eta)$ is a fsg on $G^*: (V, £, X)$ and if u is any point in G, then the line degree of u expressed by $d^e(u)$ is characterized by $d^e(u) = \sum \eta(E)$ here the $\sum$ covers all lines E containing u.
The line total degree of u expressed by $td^e(u)$ is characterized by $td^e(u) = \sum \eta(E) + \sigma(u)$. here the $\sum$ covers all lines E containing u.

Example 3.2
If we refer the fsg in fig. 2.1, then the line degree of the points are d$^e(v_1)$ = 0.8, d$^e(v_2)$ = 0.4, d$^e(v_3)$ = 1.0, d$^e(v_4)$ = 1.0, d$^e(v_5)$ = 0.8, d$^e(v_6)$ = 0.4. The total line degree of the points are
$td^e(v_1)$ = 1.4, $td^e(v_2)$ = 0.9, $td^e(v_3)$ = 1.7, $td^e(v_4)$ = 1.8, $td^e(v_5)$ = 1.2, $td^e(v_6)$ = 0.9.

Theorem 3.3
If $G: (\sigma, \mu, \eta)$ is a fsg on a semigraph $G^*: (V, £, X)$ If u is an end point in G, then $d_G(u) = d_G^e(u)$.

Proof: If u is the end point, the lines containing u are precisely the lines with end point u.
Therefore $d_G(u) = \sum \eta(E)$, here the $\sum$ covers all lines E with u as an end point.
　　　　　$= \sum \eta(E)$, here the $\sum$ covers all lines E containing u.
　　　　　$= d_G^e(u)$.

Theorem 3.4
If $G^*: (V, £, X)$ is a semigraph and if u is an end point of a line in G*, then $d_{G^*}(u) = d_{G^*}^e(u)$.

Proof:
If u is the end point, then the lines containing u are precisely the lines with end point u.
Therefore $d_{G^*}(u) = d_{G^*}^e(u)$.

Theorem 3.5
$G: (\sigma, \mu, \eta)$ is a fsg such that μ is conserved and if u is an end point, then d(u) = d^e(u).

Proof: If μ$(e) = c$ for every e in £ where c is conserved, then η$(E) = c$ for every line E.
　Therefore d$_G$(u) = $\sum$η(E), here the $\sum$ covers all lines E with u as an end point
　　　　　　　　= c × the number of lines E with u as an end point= cd$_{G^*}$(u)
　　　　d$_G^e$(u) = $\sum$η(E), the $\sum$ covers all lines E containing u.
= c × the number of lines E containing the point u = cd$_{G^*}^e$(u)
From theorem 3.4, if u is an end point, d$_{G^*}$(u) = d$_{G^*}^e$(u). Hence d$_G$(u) = d$_G^e$(u).

Theorem 3.6
The line degree of a point is preserved under a bijective similarity mapping, end point bijective similarity mapping, line bijective similarity mapping and adjacency bijective similarity mapping, a co-weak bijective similarity mapping, co-weak end point bijective similarity mapping, co-weak line bijective similarity mapping and co-weak adjacency bijective similarity mapping.

Remark 3.7
The line degree of a point need not be preserved under weak bijective similarity mapping, weak end point bijective similarity mapping, weak line bijective similarity mapping and weak adjacency bijective similarity mapping since $\eta(E) \leq \eta'(f(E))$, for all $E \in$ X under any of these bijective similarity mappings.

Theorem 3.8

The total line degree of a point is preserved under abijective similarity mapping, end pointbijective similarity mapping, linebijective similarity mapping and adjacency bijective similarity mapping.

Remark 3.9

The total line degree of a point need not be preserved under any weak bijective similarity mapping and under any co-weak bijective similarity mapping.

Adjacent Degree of a Vertex or a Point in Fuzzy Semigraphs

Definition 4.1

If $G: (\sigma, \mu, \eta)$ is a fsg on $G^*: (V, £, X)$ *and if* u is any point in G, then the adjacent degree of u expressed by $d^a(u)$ is characterized by $d^a(u) = \sum \sum_{e \in E} \mu(e)$, here the outer $\sum$ covers all the lines E containing u.

The adjacent total degree of u expressed by $td^a(u)$ is characterized by $td^a(u) = \sum \sum_{e \in E} \mu(e) + \sigma(u)$, here the outer $\sum$ covers all the lines E containing u.

Example 4.2: Referring the fsg in fig. 2.1.

The adjacent degrees of the points are $d^a(v_1)$ = 1.6, $d^a(v_2)$ = 0.9, $d^a(v_3)$ = 1.5, $d^a(v_4)$ = 1.3, $d^a(v_5)$ = 0.8, $d^a(v_6)$ = 0.4. The adjacent total degrees of the points are

$td^a(v_1)$ = 2.2, $td^a(v_2)$ = 1.4, $td^a(v_3)$ = 2.2, $td^a(v_4)$ = 2.1, $td^a(v_5)$ = 1.2, $td^a(v_6)$ = 0.9

Theorem 4.3

If $G^*: (V, £, X)$ is a k-uniform semigraph and if u is an end point in G^*, then $d_{G^*}^a(u)$ = $(k - 1)d_{G^*}(u)$ = $(k - 1) d_{G^*}^e(u)$.

Proof: Since G^* is k-uniform and u is an end point, the number of adjacent points to u from a single line is k-1. The number of lines adjacent to u is $d_{G^*}(u)$.

Therefore $d_{G^*}^a(u)$ = $(k-1)d_{a^*}(u)$.

If u is the end point, then the lines containing u are precisely the lines with end point u.

Therefore $d_{G^*}(u) = d_{G^*}^e(u)$. Hence $d_{G^*}^a(u)$ = $(k-1)d_{G^*}^e(u)$.

Theorem 4.4

If $G: (\sigma, \mu, \eta)$ is a k-uniform fsg on $G^*: (V, £, X)$ such that μ is conserved of constant value c. and if u is an end point in G, then $d_G^a(u)$ = $(k - 1).c.d_{G^*}^e(u)$

Proof: The adjacent degree of u is

$d_G^a(u)$ = $\sum_E \sum_{e \in £} \mu(e)$, where outer $\sum$ covers all lines with end point u

= $\sum_E \sum_{e \in £} c$, where outer $\sum$ covers all lines with end point u

= $\sum_E (k − 1)c$, $\sum$ covers all lines with end point u

    = $(k - 1)cd_{G^*}(u)$

Also since $d_{G^*}(u) = d_{G^*}^e(u)$, $d_G^a(u)$ = $(k - 1)cd_{G^*}^e(u)$.

Theorem 4.5

If $G^*: (V, £, X)$ is a k-uniform semigraph and if u is a middle point in G^*, then $d_{G^*}^a(u)$ = $(k- 1)$.

Proof: Since G^* is k-uniform, the number of adjacent points to a middle point u is k -1. Also u is a middle point of exactly one line. Hence $d_{G^*}^a(u)$ = $(k - 1)$.

Theorem 4.6

If $G: (\sigma, \mu, \eta)$ is a k-uniform fsg on $G^*: (V, £, X)$ such that μ is conserved of constant value c. If u is a middle point in G^*, then $d_{G^*}^a(u)$ = $(k- 1)c$.

Proof: Since G^* is k-uniform, the number of adjacent points to a middle point$u$ is k -1. Also u is a middle point of exactly one line. Therefore the adjacent degree of **u** is
$d_{G^*}^a(u)= \sum_{e \in £} \mu(e) = \sum_{e \in £} c = (k-1)c$.

Theorem 4.7
If G*(V,£,X)is a k-uniform semigraph and if u is a middle-end point in G*, then $d_{G^*}^a(u)= (k-1)[d_{G^*}(u)+1]$.

Proof: $d_{G^*}(u)$ lines have u as end point. The $(k-1)d_{G^*}(u)$ points in them are all adjacent to u. Also the $k-1$ points in the line containing **u** as middle point are also adjacent to the point$u$. Hence $d_{G^*}^a(u)= (k-1)d_{G^*}(u) + (k-1) = (k-1)[d_{G^*}(u) + 1]$.

Theorem 4.8 If$G: (\sigma, \mu, \eta)$is a k-uniform fsg on $G^*: (V, £, X)$ such that μ is conserved of constant value c. If u is a middle-end point in G*, then $d_{G^*}^a(u)= (k-1)c(d_{G^*}(u) + 1)$.

Proof:
$d_{G^*}(u)$ is the number of lines E with u as end point. Only one line has u as a middle point.
There for the adjacent degree of u is
$d_G^a(u)= \sum_E \sum_{e \in £} \mu(e)$, outer$\sum$ covers all lines E containing u
$= \sum_E \sum_{e \in £} c$, outer$\sum$ covers all lines E containing u
$= \sum_E (k-1)c$, $\sum$ covers all lines E containing u
$\quad = \sum_E (k-1)c$, ($\sum$ covers all lines E with u as end point).
$+ \sum_E (k-1)c$, ($\sum$ covers all lines E with u as a middle point).
$\quad = (k-1)cd_{G^*}(u) + (k-1)c$.
$\quad = (k-1)c[d_{G^*}(u) + 1]$.

Theorem 4.9
The adjacent degree of a point is preserved under abijective similarity mapping, end pointbijective similarity mapping, linebijective similarity mapping and adjacency bijective similarity mapping, a co-weak bijective similarity mapping, co-weak end pointbijective similarity mapping, co-weak linebijective similarity mapping and co-weak adjacency bijective similarity mapping.

Remark 4.10
The adjacent degree of a point need not be preserved under weak bijective similarity mapping, weak end pointbijective similarity mapping, weak linebijective similarity mapping and weak adjacency bijective similarity mapping since $\mu(uv) \leq \mu'(f(u)f(v))$ for all $uv \in £$ under any of these weak bijective similarity mappings.

Theorem 4.11
The total adjacent degree of a point is preserved under abijective similarity mapping, end pointbijective similarity mapping, linebijective similarity mapping and adjacency bijective similarity mapping.

Remark 4.12
The total adjacent degree of a point need not be preserved under any weak bijective similarity mapping and under any co-weak bijective similarity mapping.

Consecutive Adjacent Degree of a Vertex or a Point in Fuzzy Semigraphs

Definition 5.1

The consecutive adjacent degree of u expressed by $d^{ca}(u)$ is characterized by $d^{ca}(u) = \sum \mu(uv)$, here the $\sum$ covers all points v which are consecutively adjacent to u. The consecutive adjacent total degree of u expressed by $td^{ca}(u)$ is characterized by $td^{ca}(u) = \sum \mu(uv) + \sigma(u)$, here the $\sum$ covers all points v which are consecutively adjacent to u.

Example 5.2: If we refer the fsg in fig. 2.1, the Consecutive adjacent degrees of the points are $d^{ca}(v_1) = 0.8$, $d^{ca}(v_2) = 0.9$, $d^{ca}(v_3) = 1.1$, $d^{ca}(v_4) = 1.0$, $d^{ca}(v_5) = 1.2$, $d^{ca}(v_6) = 0.4$.
The Consecutive adjacent total degrees of the points are $td^{ca}(v_1) = 1.4$, $td^{ca}(v_2) = 1.4$, $td^{ca}(v_3) = 1.8$, $td^{ca}(v_4) = 1.8$, $td^{ca}(v_5) = 1.6$, $td^{ca}(v_6) = 0.9$

Theorem 5.3

If $G^*: (V, £, X)$ is a semigraph and if u is an end point of a line in G^*, then $d_{G^*}(u) = d^e_{G^*}(u) = d^{ca}_{G^*}(u)$.

Proof: If u is the end point, then the lines containing u are precisely the lines with end point u. So $d_{G^*}(u) = d^e_{G^*}(u)$. Also if u is the end point, then the number of lines with end point u is the same as the number of points consecutively adjacent to u. Hence $d_{G^*}(u) = d^{ca}_{G^*}(u)$.

Theorem 5.4

If $G: (\sigma, \mu, \eta)$ is a fsg such that μ is conserved and if u is an end point, then $d(u) = d^e(u) = d^{ca}(u)$.

Proof: If $\mu(e) = c$ for every $e \in £$ where c is a constant. Then $\eta(E) = c$ for every line E.
Therefore
$d_G(u) = \eta(E)$, the $\sum$ covers all lines E with u as an end point.
     = c × the number of lines E with u as an end point = $c.d_{G^*}(u)$
$d^e_G(u) = \sum \eta(E)$, the $\sum$ covers all lines E containing u.
     = c × the number of lines E containing the point u = $d^e_{G^*}(u)$
$d^{ca}_G(u) = \sum_{uv \in E} \mu(uv) = c \sum_{uv \in E} 1 = cd^{ca}_{G^*}(u)$
From theorem 3.4, if u is an end point, $d_{G^*}(u) = d^e_{G^*}(u)$ and therefore $d_{G^*}(u) = d^e_{G^*}(u) = d^{ca}_{G^*}(u)$. Hence $d_G(u) = d^e_G(u) = d^{ca}_G(u)$.

Theorem 5.5

If $G^*: (V, £, X)$ is a k-uniform semigraph and if u is an end point in G^*, then
$d^a_{G^*}(u) = (k - 1)d^{ca}_{G^*}(u)$. [or $d^a_{G^*}(u) = (k - 1) d^e_{G^*}(u)$ or $d^a_{G^*}(u) = (k - 1)(k - 1)d_{G^*}(u)$.]

Proof: Since G^* is k-uniform and u is an end point, the number of adjacent points to u from a single line is k-1. The number of lines adjacent to u is $d_{G^*}(u)$. So $d^a_{G^*}(u) = (k - 1)d_{G^*}(u)$.
From theorem 3.4, $d_{G^*}(u) = d^e_{G^*}(u)$, Hence $d^a_{G^*}(u) = (k - 1)d^{ca}_{G^*}(u)$.
The other expressions follow in a similar manner.

Theorem 5.6

If $G: (\sigma, \mu, \eta)$ is a k-uniform fsg on $G^*: (V, £, X)$ such that μ is conserved of constant value c and if u is an end point in G^*, then $d^a_{G^*}(u) = (k - 1) c\ d^{ca}_{G^*}(u)$.
[or $d^a_{G^*}(u) = (k - 1)c\ d^e_{G^*}(u)$ or $d^a_{G^*}(u) = (k - 1)cd_{G^*}(u)$.]

Proof: If u ∈V is any point, then $d_{G_a}(u) = \sum_{uv \in E(G_{ca})} \mu_{ca}(uv) = \sum_{uv \in E} \mu(uv) = \sum_{uv \in E} c =$
$(k - 1)cd_{G^*}(u)$.
If u is an end point, then $d_{G^*}(u) = d^e_{G^*}(u) = d^{ca}_{G^*}(u)$. Hence the theorem follows.

Theorem 5.7

If$G: (\sigma, \mu, \eta)$isafsg on $G^*: (V, £, X)$then the degree of a point u in the consecutive adjacency fuzzy graph G_{ca} is $d_G^{ca}(u)$.

Proof: If u ∈V is any point. Then $d_{G_a}(u) = \sum_{uv \in E(G_{ca})} \mu_{ca}(uv) = \sum_{uv \in E} \mu(uv) = d_G^{ca}(u)$.

Theorem 5.8

If$G: (\sigma, \mu, \eta)$isafsg on $G^*: (V, £, X)$such that $\mu$is conserved. Then for any point u, (i) $d_G(u) = cd_{G^*}(u)$, (ii) $d_G^e(u) = cd_{G^*}^e(u)$, (iii) $d_G^{ca}(u) = cd_{G^*}^{ca}(u)$ and (iv) $d_G^a(u) = cd_{G^*}^a(u)$

Proof:

If$\mu(e)$ = c for every e ∈ £. Then $\eta(E)$ = c for every E ∈ X.

   i. $d_G(u) = \sum \eta(E)$, the $\sum$ covers all the lines E with u as an end point,
           = $\sum c$, the $\sum$ covers all the lines with u as an end point,
        = $cd_{G^*}(u)$
  ii. $d_G^e(u) = \sum \eta(E)$, the $\sum$ covers all the lines containing u
              = $\sum c$, the $\sum$ covers all the lines containing u = $cd_{G^*}^e(u)$
 iii. $d_G^{ca}(u) = \sum_{uv \in E} \mu(uv) = \sum_{uv \in E} c = cd_{G^*}^{ca}(u)$
  iv. $d_G^a(u) = \sum_E \sum_{e \in E} \mu(e)$, the outer $\sum$ covers all the E containing u
              = $\sum_E \sum_{e \in E} c = cd_{G^*}^a(u)$

The following theorem gives the relation between the four degrees of afsg.

Theorem 5.9

For any point u in a fsg$G: (\sigma, \mu, \eta)$ on a semigraph$G^*: (V, £, X)$,then $d(u) \leq d^e(u) \leq d^{ca}(u) \leq d^a(u)$.

Proof :

In $d(u) = \sum \eta(E)$, $\sum$ runs over all the lines having u as an end point. But in $d^e(u) = \sum \eta(E)$,lines having u as middle point are also included. Therefore $d(u) \leq d^e(u)$.
For any line$E$, $\eta(E) \leq \mu(e)$ for every $e \in E$ which implies $\sum \eta(E) \leq \sum \mu(uv)$ where the $\sum$ on L. H. S runs over all the lines containing u and the $\sum$ on R. H. S runs over all the points$v$ consecutively adjacent to u. Hence $d^e(u) \leq d^{ca}(u)$.If uv ∈ E, then$\mu(uv) \leq \sum_{e \in E} \mu(e)$. Henced$^{ca}(u) \leq d^a(u)$.
Therefore $d(u) \leq d^e(u) \leq d^{ca}(u) \leq d^a(u)$

Remark 5.10

In the fsg in Fig 2.1, $d(v_1) = 0.8$, $d^e(v_1) = 0.8$, $d^a(v_1) = 1.6$, $d^{ca}(v_1) = 0.8$
Therefore $d(v_1) \leq d^e(v_1) \leq d^{ca}(v_1) \leq d^a(v_1)$.

Remark 5.11

If u is an end point in a semigraph $G: (\sigma, \mu, \eta)$, then $d_G(u)$ or $d_G^e(u)$ need not be equal to $d_G^{ca}(u)$. For example, look at the semigraph in Fig.5.1. Here u is the end point of the line E = (u, v, x, w). Here d(u) = η(E) = 0.3. d^e(u) = η(E) = 0.3. But d^{ca}(u) = μ(uv) = 0.5. Therefore d(u) ≠ d^{ca}(u) and d^e(u) ≠ d^{ca}(u).

Theorem 5.12

The consecutive adjacent degree of a point is preserved under abijective similarity mapping, end pointbijective similarity mapping, linebijective similarity mapping and adjacency bijective similarity mapping, a co-weak bijective similarity mapping, co-weak end pointbijective similarity mapping, co-weak linebijective similarity mapping and co-weak adjacency bijective similarity mapping.

Remark 5.13

The consecutive adjacent degree of a point need not be preserved under weak bijective similarity mapping, weak end point bijective similarity mapping, weak linebijective similarity mapping and weak adjacency bijective similarity mapping since $\mu(uv) \leq \mu'(f(u)f(v))$ for all $uv \in £$ under any of these weak bijective similarity mappings.

Theorem 5.14

The total consecutive adjacent degree of a point is preserved under abijective similarity mapping, end pointbijective similarity mapping, linebijective similarity mapping and adjacency bijective similarity mapping.

Remark 5.15

The total consecutive adjacent degree of a point need not be preserved under any weak bijective similarity mapping and under any co-weak bijective similarity mapping.

CONCLUSION

In this work, various degrees of a vertex of afsg are characterized and some results on degrees of points in a fsg are studied. Degree, edge degree, adjacent degree and consecutive adjacent degree of a vertex in afsg are introduced. Their properties under various bijective similarity mappings are discussed. Transport networks and telecommunication networks can be modelled as fsgs. Hence our findings may be useful for future Studies and Research.

ABSTRACT

This communication aims at determining varies solution in integers to not – homogeneous quinary Heptic equation represented as $(x^2 - y^2)[\tau(x^2 + y^2) - (2\tau - 2)xy] = (2\tau + \sigma^2 + 2\sigma)(X^2 - Y^2)z^5$. The considered equation is reduced to a solvable quintic equation through employing linear transformations and four different patterns of integer solutions are presented.

Keywords: Heptic with five unknowns, Not-homogeneous Heptic, solutions in Integers

INTRODUCTION

Launch

In [1-4], numerous mathematicians have focused on finding solutions in integers to higher degree diophantine equations. Especially [5-8] concerns with quinary seventh degree diophantine equations. Here, the major force of this article is to determine varieties of solutions in integers to quinary seventh degree equation given by $(x^2 - y^2)[\tau(x^2 + y^2) - (2\tau - 2)xy] = (2\tau + \sigma^2 + 2\sigma)(X^2 - Y^2)z^5$. The considered equation is reduced to a solvable quintic equation through employing linear transformations and four different patterns of integer solutions are presented.

TECHICAL PROCEDURE

The not-comparable quinary heptic equalization below thought is
$$(x^2 - y^2)[\tau(x^2 + y^2) - (2\tau - 2)xy] = (2\tau + \sigma^2 + 2\sigma)(X^2 - Y^2)z^5. \tag{1}$$

80213

Sathiyapriya and Gopalan

Different ways of getting solutions in integers for (1)is as follows:

Way 1
In (1), the choices of first-degree modifications
X =u+v, y = u-v , X=u+2v, Y=u-2v   (2)
in (1) leads to
$\mathbf{u}^2 + (2\tau - 1)v^2 = (2\tau + \sigma^2 + 2\sigma)z^5$ (3)
Let us hold of
Z = $a^2 + (2\tau - 1)b^2$ (4)
where a $\neq$ b
Take
$2p + q^2 + 2\sigma = \left[(\sigma + 1) + i\sqrt{2\tau - 1}\right]\left[(\sigma + 1) - i\sqrt{2\tau - 1}\right]$ (5)
From (4), (5) and (3),one has
$u + i\sqrt{2\tau - 1}v = \left[(\sigma + 1) + i\sqrt{2\tau - 1}\right]\left[a + i\sqrt{2\tau - 1}b\right]^5$
After specific algebraic computations and clarification, we obtain
$u = (\sigma + 1)f - (2\tau - 1)g$
$v = f + (\sigma + 1)g$
where
$f = a5\text{-}10a3b2(2p\text{-}1) +5a(2p\text{-}1)2b4$
$G = 5a4b\text{-}10a2(2p\text{-}1) b3+(2p\text{-}1)2b5$
In view of (2), it is seen that (1) is satisfied by
$x = (\sigma + 2)f + (\sigma - 2\tau + 2)g$
$y = \sigma f - (2\tau + \sigma)g$
$X = (\sigma + 3)f + (2\sigma - 2\tau + 3)g$
$Y = (\sigma - 1)f - (2\tau + 2\sigma + 1)g$ together (4)

Way 2
From (3), we have alternatively
$u^2 + (2\tau - 1)v^2 = (2\tau + \sigma^2 + 2\sigma)z^5 * 1$ (6)
Take 1 in R.H.s of (6) as
$1 = \frac{(\tau - 1 + i\sqrt{2\tau - 1})(p - 1 - i\sqrt{2\tau - 1})}{\tau^2}$ (7)
Consider
$z = \tau^2(a^2 + (2\tau - 1)b^2)$ (8)
Switch (7), (8) in (6).Applying the procedure as in way 1, we contain
$u + i\sqrt{2\tau - 1}\,v = \left[(\sigma + 1) + i\sqrt{2\tau - 1}\right]\left[f + i\sqrt{2\tau - 1}g\right]\left[\frac{(\tau - 1 + i\sqrt{2\tau - 1})}{\tau}\right]$

On compassion, we have
$u = \tau^4(\tau\sigma - \tau - \sigma)f - (2\tau - 1)(\tau + \sigma)g$
$v = \tau^4(\tau + \sigma)f + (\tau\sigma - \tau - \sigma)g$
Substituting$u$and v in (2), the integral solutions of (1) are as follows:
$$x = \tau^4[\tau\sigma f + (-2\tau^2 - \tau\sigma)g]\,y = \tau^4[(\tau\sigma - 2\tau - 2\sigma)f + (-2\tau^2 - 3\tau\sigma + 2\tau + 2\sigma)g]$$
$$X = \tau^4[(\tau\sigma + \tau + \sigma)f + (-2\tau^2 - \tau - \sigma)g]\,Y = \tau^4[(\tau\sigma - 3\tau - 3\sigma)f + (-2\tau^2 - 4\tau\sigma + 3\tau + 3\sigma)g]$$
along with (8).

Way 3
Take
$$v = \left(2\tau + \sigma^2 + 2\sigma\right)^3 w^2$$
                                    (9)
$$z = \left(2\tau + \sigma^2 + 2\sigma\right)w$$
Switch (9) in (3)and we have

80214

Sathiyapriya and Gopalan

$u^2 = (2\tau + \sigma^2 + 2\sigma)^6 w^4 \big(w - (2\tau - 1) \big)$ (10)

Choose

w = $\quad 2\tau - 1 + \alpha^2$ (11)

Utilize (11) in (10) & (9) and applying the resolving activity, we have

$u = (2\tau + \sigma^2 + 2\sigma)^3 (2\tau - 1 + \alpha^2)^2 \alpha$

$v = (2\tau + \sigma^2 + 2\sigma)^3 (2\tau - 1 + \alpha^2)^2$

$z = (2\tau + \sigma^2 + 2\sigma)(2\tau - 1 + \alpha^2)$ (12)

In view of (2), (1) is satisfied by

$x = (2\tau + \sigma^2 + 2\sigma)^3 (2\tau - 1 + \alpha^2)^2 (\alpha + 1)$

$x = (2\tau + \sigma^2 + 2\sigma)^3 (2\tau - 1 + \alpha^2)^2 (\alpha - 1)$

$X = (2\tau + \sigma^2 + 2\sigma)^3 (2\tau - 1 + \alpha^2)^2 (\alpha + 2)$

$Y = (2\tau + \sigma^2 + 2\sigma)^3 (2\tau - 1 + \alpha^2)^2 (\alpha - 2)$

along with (12).

Way 4

Take

$$u = (2\tau + \sigma^2 + 2\sigma)^3 w^2$$
$$z = (2\tau + \sigma^2 + 2\sigma) w$$
                                                                                             (13)

substituting (13) in (3), we obtain

$(2\tau - 1)v^2 = (2\tau + \sigma^2 + 2\sigma)^6 w^4 (w - 1)$ (14)

Choose

$w = (2\tau - 1)\alpha^2 + 1$ (15)

Utilize (15) in (12) and applying the resolving activity, we have

u = $(2\tau + \sigma^2 + 2\sigma)^3 [(2\tau - 1)\alpha^2 + 1]^2$

v = $(2\tau + \sigma + 2\sigma)^3 [(2\tau - 1)\alpha^2 + 1]^2 \alpha$

z = $(2\tau + \sigma^2 + 2\sigma)\big((2\tau - 1)\alpha^2 + 1\big)$ (16)

In view of (2), (1) is satisfied by

x = $(2\tau + \sigma^2 + 2\sigma)^3 [(2\tau - 1)\alpha^2 + 1]^2 (1 + \alpha)$

y= $(2\tau + \sigma^2 + 2\sigma)^3 [(2\tau - 1)\alpha^2 + 1]^2 (1 - \alpha)$

X = $(2\tau + \sigma^2 + 2\sigma)^3 [(2\tau - 1)\alpha^2 + 1]^2 (1 + 2\alpha)$

Y = $(2\tau + \sigma^2 + 2\sigma)^3 [(2\tau - 1)\alpha^2 + 1]^2 (1 - 2\alpha)$

along with (16).

INFERENCE

This communication has been focused on determining many solutions in integers to the quinary heptic equation represented by $(x^2 - y^2)[\tau(x^2 + y^2) - (2\tau - 2)xy] = (2\tau + \sigma^2 + 2\sigma)(X^2 - Y^2)z^5$. The readers of this paper may attempt to determine infinitely many solutions in integers to other forms of quinary heptic equalizatio jointly by their explanation.

ABSTRACT

This article explores the existence of solution for second-order neutral functional random integro-differential equationwith infinite delay. The study utilizes a Schauder fixed-point theorem within a stochastic framework to demonstrate the existence of mildsolution to this complex problem. By incorporating stochastic elements into the analysis, the research addresses the challenges posed by infinite delays and provides a solid theoretical foundation for understanding and solving these types of equations.

Keywords: Integro-differential equation; random fixed point; mild solution; infinite delay; semigroup theory.

INTRODUCTION

Researchers have conducted a myriad of investigations in the realm of neutral functional differential equations and integral equations to understand the existence, uniqueness, and properties of solutions in diverse settings. The references compiled here cover a wide range of research endeavors, each of which significantly contributes to understanding various aspects of this domain. The foundational work of Ahmed [1] on semigroup theory elucidates its applications in systems and control, laying the groundwork for subsequent developments. Baghli and Benchohra's contributions are notable, ranging from uniqueness results for partial neutral functional differential equations to existence results for different classes of neutral functional equations [2]. Dhage and Ntouyas have investigated the existence and attractivity of solutions for nonlinear random differential and integral equations [4]. Lupulescu and Lungan's exploration of random integral equations on time scales [5] contributes to understanding these equations in a broader context. Different studies have also been done on second-order neutral functional integrodifferential equations [6, 7], neutral functional equations [8], and some second-order nonlinear equations [9]. These works offer significant insights into diverse classes of neutral functional equations and their applications across various domains. Some recent developments in the field are Suresh et al.'s work on nonlocal impulsive neutral functional integro-differential equations [10], Gunasekar et al.'s study of non-linear impulsive neutral fuzzy delay differential equations with non-local conditions [11], and Raghavendran et al.'s way of solving fractional integro-differential equations using the Aboodh transform [12]. ere are also important papers in this collection by Travis and Webb [15], Engl [13], Hale and Kato [14], and Pachpatte [16], among others. These papers helped build the theory and methods used to study neutral functional differential equations. In summary, the range and depth of research to understand and solve various types of neutral functional differential and integral equations is evident in this list of references. It includes both classic and more recent contributions. In this study, we demonstrate that the second-order neutral functional integro-differential equation with delay and random effects is of the form.

$$\frac{d}{dt}[\delta'(\zeta,\varpi) + y(\zeta,\varepsilon,\delta_\zeta(.,\varpi),\varpi)] = A\delta(\zeta,\varpi) + \phi(\zeta,\varepsilon,\delta_\zeta(.,\varpi),\delta'(\varepsilon,\varpi),$$

$$\int_0^\zeta \chi(\varepsilon,\delta_\varepsilon(.,\varpi)d\varepsilon, \int_0^\omega \psi(\varepsilon,\delta_\varepsilon(.,\varpi))d\varepsilon,\varpi)\zeta \in [0,k] = \mathcal{M}_{(1)}$$

$$\delta(\zeta,\varpi) = \phi_1(\zeta,\varpi)$$

$$\delta'(0,\varpi) = \phi_2(\varpi)$$

where A is the infinitesimal generator of a strongly continuous cosine family $\{\mathcal{D}(\zeta):\zeta \in \mathbb{R}\}$ of a bounded linear operator in a Banach Space $\mathcal{S}$ with the norm $||.||$. Functions $\phi:\mathcal{M} \times \mathcal{M} \times \mathcal{D} \times \mathcal{S} \times \mathcal{S} \times \mathcal{S} \times \mathcal{S} \to \mathcal{S}$, $\chi:\mathcal{M} \times \mathcal{D} \to \mathcal{S}$, $\psi:\mathcal{M} \times \mathcal{D} \to \mathcal{S}$, and $y:\mathcal{M} \times \mathcal{M} \times \mathcal{D} \times \mathcal{S} \to \mathcal{S}$ are continuous functions.

PRELIMINARIES

This section presents several notations, definitions, and theorems used throughout the rest of this work. We will utilize the vocabulary from [14] and incorporate Hale and Kato's axiomatic description of the phase space $\mathcal{D}$. Satisfying the following axioms $(\mathcal{D},||.||_\mathcal{D})$ will result in a seminormed linear space of functions that project $(-\infty,\omega]$ into $\mathcal{S}$ the following:

(A) The following conditions are holds for all $\zeta \in \mathcal{M}$ if $\delta:(-\infty,\omega] \to \mathcal{S}, \omega > 0$, is continuous on $\mathcal{M}$ and $\delta_0 \in \mathcal{D}$:

1. $\delta_\zeta \in \mathcal{D}$;

2. There is a positive constant K such that $||\delta(\zeta,\varpi)| \le K||\delta_\zeta(.,\varpi)||_\mathcal{D}$

3. There are three functions $\mathcal{S},\vartheta,\vartheta':\mathbb{R}_+ \to \mathbb{R}_+$ independent of δ, with $\mathcal{S}$ continuous and bounded, ϑ,ϑ' locally bounded such that

$$||\delta_\zeta(.,\varpi)||_\mathcal{D} \le \mathcal{S}(\zeta)\sup\{|\delta(m,\varpi)|: 0 \le m \le \zeta\} + \vartheta(\zeta)||\delta_0(\varpi)||_\mathcal{D} + \vartheta'(\zeta)||\delta_{0'}(\varpi)||_\mathcal{D}$$

(B) δ_ζ is a $\mathcal{D}$-valued continuous function on $\mathcal{M}$ for the functions δ in (A).

(C) The space $\mathcal{D}$ is complete.

Gunasekar *et al.,*

Definition 2 [13] A mapping $y : \Omega \to X$ is known as a random (stochastic) fixed point of a random operator V if, for p-almost all $\omega \in \Omega$, it satisfies the properties $y(\omega) \in Q(\omega)$, where $Q(\omega)$ is a random operator with a stochastic domain, $V(\omega)y(\omega) = y(\omega)$, and $\{\omega \in \Omega : y(\omega) \in C\} \in F$ for every open set $C \subseteq X$ where F represents a σ-algebra which is a subset of Ω. (i.e., y is measurable).

Theorem 2.1 (Arzela-Ascoli theorem)
If a sequence of functions $\{f_n\}$ defined on $[a,b]$ is uniformly bounded and equicontinuous, then there exists a subsequence $\{f_{n_k}\}$ that converges uniformly to a continuous function f on $[a,b]$.

Theorem 2.2 (Scauder fixed point theorem)
Let $\mathcal{S}$ be a Banach space, and $\mathcal{B}$ a nonempty, closed, and convex subset of $\mathcal{S}$. Suppose $F : \mathcal{B} \to \mathcal{B}$ is a continuous mapping such that the image $F(\mathcal{B})$ is relatively compact in $\mathcal{S}$. Then there exists at least one point $\delta \in \mathcal{B}$ such that $F(\delta) = \delta$.

Definition 3 A collection $\{T_1(\zeta) : \zeta \in \mathbb{R}\}$ of operators in $B(\mathcal{S})$ is termed a strongly continuous cosine family if it meets the following criteria:
1. $T_1(0) = I$, where I represents the identity operator in $\mathcal{S}$.
2. For every $\zeta, \varepsilon \in \mathbb{R}$, the relation $T_1(\zeta + \varepsilon) + T_1(\zeta - \varepsilon) = 2T_1(\zeta)T_1(\varepsilon)$ holds.
3. For each $\delta \in \mathcal{S}$, the function $\zeta \mapsto T_1(\zeta)\delta$ is strongly continuous.
The infinitesimal generator of a strongly continuous cosine family $\{T_1(\zeta), \zeta \in \mathbb{R}\}$ is an operator $A : \mathcal{S} \to \mathcal{S}$ defined by

$$A\delta = \frac{d^2}{d\zeta^2} T_1(\zeta)\delta \bigg|_{\zeta=0}, \quad \delta \in D(A),$$

where $D(A)$ consists of those elements $\delta \in \mathcal{S}$ for which the function $T_1(\zeta)\delta$ is twice continuously differentiable with respect to ζ. We also define the set $B = \{\delta \in \mathcal{S} : T_1(\zeta)\delta$ is continuously differentiable in $\zeta\}$. We assume the following condition:
(G_1) The operator A serves as the infinitesimal generator of the strongly continuous cosine family $\{T_1(\zeta), \zeta \in \mathbb{R}\}$ consisting of bounded linear operators on the Banach space $\mathcal{S}$.

Existence Results for Neutral Functional Integro-differential Equation
We now present our primary existence result for problem (1.1). The definition of a mild random solution is presented first.

Definition 4 If $\delta_0 = \emptyset$ and the continuous function $\delta : (-\infty, \omega] \to \mathcal{S}, \omega > 0$ and $\mathcal{D} = [(-\infty, 0], \mathcal{S}]$, solves the integral equation, then it is referred to as a mild solution to equation (1.1).
$$\delta(\zeta, \varpi) = T_1(\zeta)\phi_1(0, \varpi) + T_2(\zeta)[\phi_2(\varpi) + y(0,0,\phi_1(0, \varpi), \varpi)] -$$
$$\int_0^\zeta T_1(\zeta - \varepsilon) y(\varepsilon, \eta, \delta_\varepsilon(., \varpi), \varpi) d\varepsilon + \int_0^\zeta T_2(\zeta - \varepsilon)\phi(\varepsilon, \eta, \delta_\varepsilon(., \varpi), \delta'(\eta, \varpi),$$
$$\int_0^\varepsilon \chi(\eta, \delta_\eta(., \varpi)) d\eta, \int_0^\omega \psi(\eta, \delta_\eta(., \varpi)) d\eta, \varpi) d\varepsilon$$

We assume the following hypothesis to prove our main result.
(G_2) There exist a continuous functions $k, l, m, n : \mathcal{M} \to \mathbb{R}_+$ such that
$$||\phi(\zeta, \varepsilon, \aleph, \delta, y, z, \varpi)|| \le k(\zeta, \varepsilon, \varpi)((||\aleph||_{\mathcal{D}} + ||\delta|| + ||y|| + ||z||), \varpi)$$

$$||\chi(\zeta, \aleph, \varpi)|| \le l(\zeta)(||\aleph||_{\mathcal{D}})$$

$$||\psi(\zeta, \aleph, \varpi)|| \le m(\zeta(||\aleph||_{\mathcal{D}})$$

$$||y(\zeta, \varepsilon, \aleph, \varpi)|| \le n(\zeta, \varepsilon, \varpi)(||\aleph||_{\mathcal{D}}, \varpi)$$

for all $\zeta, \varepsilon \in \mathcal{M}$ and $\aleph, \delta, y, z \in \mathcal{S}$
(G_3) For all $\zeta, \varepsilon \in \mathcal{M}$, the function $\phi(\zeta, \varepsilon, ., ., ., ., .) : \mathcal{D} \times \mathcal{S} \times \mathcal{S} \times \mathcal{S} \times \mathcal{S} \to \mathcal{S}$ is continuous and for all $(\aleph, \delta, y, z, \varpi) \in \mathcal{D} \times \mathcal{S} \times \mathcal{S} \times \mathcal{S} \times \mathcal{S}$ the function $\phi(., ., \aleph, \delta, y, z, \varpi) : \mathcal{M} \times \mathcal{M} \to \mathcal{S}$ is strongly measurable.

80219

(G_4)For all $\zeta, \varepsilon \in \mathcal{M}$, the function $y(\zeta, \varepsilon, . , .): \mathcal{D} \times \mathcal{S} \to \mathcal{S}$ is continuous and for all $\aleph \in \mathcal{D}$ the function $y(. , . , \aleph, \varpi): \mathcal{M} \times \mathcal{M} \to \mathcal{S}$ is strongly measurable.

(G_5)For all $\zeta, \varepsilon \in \mathcal{M}$ the function $\chi(\zeta, .), \psi(\zeta, .): \mathcal{D} \to \mathcal{S}$ is continuous and for all $\aleph \in \mathcal{D}, \delta \in \mathcal{S}$ the functions $\chi(. , \aleph), \psi(. , \aleph): \mathcal{M} \to \mathcal{S}$ are strongly measurable.

(G_6)For all positive integer m, there exist $\alpha_m, \beta_m \in L^1(\mathcal{M}, \mathbb{R}_+) \ni ||\phi(\zeta, \varepsilon, \aleph, \delta, y, z, \varpi)|| \leq \alpha_m(\zeta, \varpi), ||y(\zeta, \varepsilon, \aleph, \varpi)|| \leq \beta_m(\zeta, \varpi)$ for δ, y satisfying $||\aleph|| \leq m, ||\delta|| \leq m, ||y|| \leq m, ||z|| \leq m$ and for almost everywhere $\zeta, \varepsilon \in \mathcal{M}$.

(G_7) $\mathcal{D}(\zeta, \varpi), \zeta > 0$ is compact.

Theorem 3.1 If the hypotheses $(G_1) - (G_7)$ is satisfactory, the system (1.2) has a mild solution on $(-\infty, \omega]$, assuming that

$$r = \int_0^\zeta exp(\int_0^\eta ((L + \vartheta)q(\eta, \varpi) + (\vartheta + \vartheta')p(\alpha, \varpi)d\alpha)d\eta) < 1$$

where

$$\vartheta = sup||T_1(\zeta)||: \zeta \in \mathcal{M}$$

Proof: The map $F: \Omega \times \mathcal{D} \to \mathcal{D}$ is defined by

$$(F(\varpi)\delta)(\zeta) = \begin{cases} \phi(\zeta, \varpi), & \zeta \in (-\infty, 0] \\ T_1(\zeta)\phi_1(0, \varpi) + T_2(\zeta)[\phi_2(\varpi) + y(0,0, \phi_1(0, \varpi), \varpi)] - \\ \int_0^\zeta T_1(\zeta - \varepsilon)y(\varepsilon, \eta, \delta_\varepsilon(. , \varpi), \varpi)d\varepsilon + \int_0^\zeta T_2(\zeta - \varepsilon)\phi(\varepsilon, \eta, \delta_\varepsilon(. , \varpi), \delta'(\eta, \varpi), \\ \int_0^\varepsilon \chi(\eta, \delta_\eta(. , \varpi))d\eta, \int_0^\omega \psi(\eta, \delta_\eta(. , \varpi))d\eta, \varpi)d\varepsilon, & \zeta, \varepsilon \in \mathcal{M} \end{cases} \quad (2)$$

Using the hyposis G_2 and G_3 for each $\zeta \in \mathcal{M}$, we have

$$||\delta(\zeta, \varpi)|| \leq ||T_1(\zeta)\phi_1(0, \varpi)|| + ||T_2(\zeta)[\phi_2(\varpi) + y(0,0, \phi_1(0, \varpi), \varpi)]|| +$$
$$\int_0^\zeta ||T_1(\zeta - \varepsilon)||||y(\varepsilon, \eta, \delta_\varepsilon(. , \varpi), \varpi)d\varepsilon|| + \int_0^\zeta ||T_2(\zeta - \varepsilon)||||\phi(\varepsilon, \eta, \delta_\varepsilon(. , \varpi), \delta'(\eta, \varpi),$$
$$\int_0^\varepsilon \chi(\eta, \delta_\eta(. , \varpi))d\eta, \int_0^\omega \psi(\eta, \delta_\eta(. , \varpi))d\eta, \varpi)d\varepsilon||$$
$$\leq \vartheta||\phi_1|| + \vartheta'||\phi_2 + C_1\phi_1 + C_2||_\mathcal{D} + \int_0^\zeta \vartheta n(\varepsilon, \eta, \varpi)(||\delta_\varepsilon(. , \varpi)||_\mathcal{D}, \varpi)d\varepsilon +$$
$$\int_0^\zeta \vartheta'k(\varepsilon, \eta, \varpi)[(||\delta_\varepsilon(. , \varpi)||_\mathcal{D}) + ||\delta'(\eta, \varpi)|| + \int_0^\zeta l(\eta)(||\delta_\eta(. , \varpi)||_\mathcal{D})d\eta +$$
$$\int_0^\omega m(\eta)(||\delta_\eta(. , \varpi)||_\mathcal{D})d\eta, \varpi]d\varepsilon$$

Consider the function $\aleph_1$ given by

$$\alpha(\zeta, \varpi) = sup\{||\delta(\varepsilon, \varpi)||: -\infty \leq \varepsilon \leq \zeta, \zeta \in \mathcal{M}\}$$

Let $\zeta^*, \varepsilon^* \in (-\infty, \omega]$ be such that $\aleph(\zeta) = ||\delta(\zeta^*)||$. If $\zeta^*, \varepsilon^* \in [0, \omega] = \mathcal{M}$ by the previous inequality we have

$$\alpha(\zeta, \varpi) \leq \vartheta||\phi_1||_\mathcal{D} + \vartheta'||\phi_2 + C_1\phi_1 + C_2||_\mathcal{D} + \int_0^\zeta \vartheta n(\varepsilon, \eta, \varpi)(||\alpha_\varepsilon(. , \varpi)||_\mathcal{D}, \varpi)d\varepsilon +$$
$$\int_0^\zeta \vartheta'k(\varepsilon, \eta, \varpi)[(||\alpha_\varepsilon(. , \varpi)||_\mathcal{D}) + ||\alpha'(\eta, \varpi)|| + \int_0^\zeta l(\eta)(||\alpha_\eta(. , \varpi)||_\mathcal{D}d\eta) +$$
$$\int_0^\omega m(\eta)(||\alpha_\eta(. , \varpi)||_\mathcal{D})d\eta, \varpi]d\varepsilon$$

Let $\alpha'(\zeta, \varpi) = sup\{||\delta'(\varepsilon, \varpi)||: 0 \leq \varepsilon \leq \zeta\}, \zeta \in \mathcal{M}$ If $\zeta^*, \varepsilon^* \in (-\infty, 0]$ then $\alpha(\zeta, \varpi)\omega \leq ||\phi_1||_\mathcal{D}$ and the previous inequality obviously holds since $\vartheta \geq 1$. But for $\zeta \in \mathcal{M}$ using equation (3.9) we get

$$\delta'(\zeta, \varpi) = AT_2(\zeta)\phi_1(0, \varpi) + T_1(\zeta)[\phi_2(\varpi) + y(0,0, \phi_1(0, \varpi), \varpi)] - \int_0^\zeta AT_2(\zeta - \varepsilon)y(\varepsilon, \eta, \delta_\varepsilon(. , \varpi), \varpi)d\varepsilon$$

$$+ \int_0^\zeta T_1(\zeta - \varepsilon)\phi(\varepsilon, \eta, \delta_\varepsilon(. , \varpi), \delta'(\eta, \varpi), \int_0^\varepsilon \chi(\eta, \delta_\eta(. , \varpi))d\eta, \int_0^\omega \psi(\eta, \delta_\eta(. , \varpi))d\eta, \varpi)d\varepsilon$$

and using hypothesis (G_2) and (G_3) we obtain

80220

Gunasekar *et al.,*

$$||\delta'(\zeta,\varpi)|| \leq ||AT_2(\zeta)[\phi_2(\varpi) + y(0,0,\phi_1(0,\varpi),\varpi)]|| + \int_0^\zeta ||AT_2(\zeta-\varepsilon)||||y(\varepsilon,\eta,\delta_\varepsilon(.,\varpi),\varpi)d\varepsilon|| +$$

$$||T_1(\zeta)\phi_2(\varpi)|| + \int_0^\zeta ||T_1(\zeta-\varepsilon)\phi(\varepsilon,\eta,\delta_\varepsilon(.,\varpi),\delta'(\eta,\varpi),$$

$$\int_0^\varepsilon \chi(\eta,\delta_\eta(.,\varpi))d\eta, \int_0^\omega \psi(\eta,\delta_\eta(.,\varpi))d\eta,\varpi)d\varepsilon||$$

$$||\delta'(\zeta,\varpi)|| \leq ||AT_2(\zeta)||||\phi_1||_\mathcal{D} + ||T_1(\zeta)||||\phi_2 + C_1\phi_1 + C_2||_\mathcal{D} +$$

$$\int_0^\zeta ||AT_2(\zeta-\varepsilon)||n(\varepsilon,\eta,\varpi)(||\delta_\varepsilon(.,\varpi))||_\mathcal{D},\varpi)d\varepsilon +$$

$$\int_0^\zeta Nk(\varepsilon,\eta,\varpi)[||\delta_\varepsilon(.,\varpi)||_\mathcal{D} + ||\delta'(\eta,\varpi)|| + \int_0^\zeta l(\eta)(||\delta_\eta(.,\varpi)||_\mathcal{D}d\eta) +$$

$$\int_0^\omega m(\eta)(||\delta_\eta(.,\varpi)||_\mathcal{D})d\eta,\varpi]d\varepsilon$$

Let $\zeta^{**}, \varepsilon^{**} \in \mathcal{M}$ be such that $\aleph'(\zeta,\varpi) = ||\delta(\zeta^{**},\varpi)||$ and let $L = \sup\{||AT_2(\zeta)||:\zeta,\varepsilon \in \mathcal{M}\}$ then, we have

$$\alpha'(\zeta,\varpi) \leq ||AT_2(\zeta)||||\phi_1|| + \vartheta||\phi_2 + C_1\phi_1 + C_2||_\mathcal{D} + \int_0^\zeta ||AT_2(\zeta-\varepsilon)||n(\varepsilon,\eta,\varpi)(||\alpha_\varepsilon(.,\varpi))||_\mathcal{D},\varpi)d\varepsilon +$$

$$\int_0^\zeta \vartheta k(\varepsilon,\eta,\varpi)[||\alpha_\varepsilon(.,\varpi)||_\mathcal{D} + ||\alpha'(\eta,\varpi)|| + \int_0^\zeta l(\eta)(||\alpha_\eta(.,\varpi)||_\mathcal{D}d\eta) +$$

$$\int_0^\omega m(\eta)(||\alpha_\eta(.,\varpi)||_\mathcal{D})d\eta,\varpi]d\varepsilon$$

Adding $\alpha(\zeta,\varpi)$ and $\alpha'(\zeta,\varpi)$, we get

$$\alpha(\zeta,\varpi) + \alpha'(\zeta,\varpi) \leq ||\phi_1||[L + \vartheta + C_1(\vartheta + \vartheta')] + \vartheta(1 + \omega)||\phi_2|| + C_2(L + \vartheta) +$$

$$\int_0^\zeta (L + \vartheta)n(\varepsilon,\eta,\varpi)||\alpha_\varepsilon(.,\varpi))||_\mathcal{D}d\varepsilon +$$

$$\vartheta(1 + \omega)\int_0^\zeta q(\varepsilon)k(\varepsilon,\eta,\varpi)[||\alpha_\varepsilon(.,\varpi)||_\mathcal{D} + ||\alpha'(\eta,\varpi)|| +$$

$$\int_0^\zeta l(\eta)(||\alpha_\eta(.,\varpi)||_\mathcal{D}d\eta) + \int_0^\omega m(\eta)(||\alpha_\eta(.,\varpi)||_\mathcal{D})d\eta,\varpi]d\varepsilon$$

$$\alpha(\zeta,\varpi) + \alpha'(\zeta,\varpi) \leq \frac{||\phi_1||[L + \vartheta + C_1(\vartheta + \vartheta')] + \vartheta(1 + \omega)||\phi_2}{1 - r^*}$$

$$\times \exp\left(\int_0^\omega [(L + \vartheta)n(\varepsilon,\eta,\varpi)\vartheta(1 + \omega)(k(\varepsilon,\eta,\varpi) + l(\varepsilon) + m(\varepsilon))]d\varepsilon\right)$$

Therefore $||\delta(\zeta)|| \leq \alpha(\zeta,\varpi) \leq k$ and $||\delta'(\zeta)|| \leq \alpha'(\zeta,\varpi) \leq k, \zeta \in \mathcal{M}$ and hence $||\delta||_\mathcal{D} \leq k$. Now we have to prove that the Operator defined in (3.3) is completely continuous. Let $\mathcal{D}_k = \{\delta \in \mathcal{D}: ||\delta||_\mathcal{D} \leq k, \zeta \in \mathcal{M}\}$ for $k \geq 1$. At first we have show F maps $\mathcal{D}_k$ into an equicontinuous family. Let us take that $\delta \in \mathcal{D}_k$ and $\zeta_1, \zeta_2 \in \mathcal{M}$ and $0 \leq \zeta_1 \leq \zeta_2 \leq \omega$ then

$$\leq ||AT_2(\zeta_1) - AT_2(\zeta_2)||||\phi_1(0,\varpi)|| + ||T_1(\zeta_1) - T_{(\zeta_2)}||$$

$$||\phi_2(\varpi) + y(0,0,\phi_1(0,\varpi),\varpi)||$$

$$+ \int_0^{\zeta_1} ||A(T_2(\zeta_1 - \varepsilon) - AT_2(\zeta_2 - \varepsilon))||\beta_{m_0}(\varepsilon,\varpi)d\varepsilon +$$

$$\int_{\zeta_1}^{\zeta_2} ||A(T_2(\zeta_1 - \varepsilon) - AT_2(\zeta_2 - \varepsilon))||\beta_{m_0}(\varepsilon,\varpi)d\varepsilon$$

$$+ \int_0^{\zeta_1} ||T_1(\zeta_1 - \varepsilon) - T_1(\zeta_2 - \varepsilon)\alpha_{m_0}(\varepsilon,\varpi)d\varepsilon$$

$$+ \int_{\zeta_1}^{\zeta_2} ||T_1(\zeta_1 - \varepsilon) - T_1(\zeta_2 - \varepsilon)||\alpha_{m_0}(\varepsilon,\varpi)d\varepsilon$$

where,

$$m_0 = 2kmax\{1 + m(\zeta) + l(\zeta), \zeta, \varepsilon \in \mathcal{M}\}.$$

As far as we are aware, $T_1(\zeta), T_2(\zeta)$ are uniformly continuous for $\zeta \in \mathcal{M}$ and their compactness for $\zeta > 0$ proves the uniform operator topology is continuous. Since $\delta \in \mathcal{D}_k$ the righthand side of the above inequalities are independent. Therefore $||(F(\varpi)\delta)(\zeta_1) - (F(\varpi)\delta)(\zeta_2)|| \to 0$ and $||(F(\varpi)\delta)'(\zeta_1) - (F(\varpi)\delta)'(\zeta_2)|| \to 0$ as $(\zeta_1 - \zeta_2) \to 0$. Hence F maps $\mathcal{D}_k$ into an equicontinuous family of functions. The equicontinuity for the cases $\zeta_1 \leq \zeta_2 \leq 0$ and $\zeta_1 \leq 0 \leq \zeta_2$ follows from the uniform continuity of F on $(-\infty, 0]$ and from the relation

$$||(F(\varpi)\delta)(\zeta_1) - (F(\varpi)\delta)(\zeta_2)|| \leq ||(F(\varpi)\delta)(\zeta_1) - (F(\varpi)\delta)(0)|| + ||(F(\varpi)\delta)(0) - (F(\varpi)\delta)(\zeta_2)||$$

Since proving that $F\mathcal{D}_k$ is uniformly bounded is straightforward, certain details will be omitted. Having established that $F\mathcal{D}_k$ forms an equicontinuous family, the task now is to demonstrate that $F\mathcal{D}_k$ is compact. To establish this, it suffices to show that the set

$$W(\zeta) = \{(F(\varpi)\delta)(\zeta): \delta \in \mathcal{D}_k\}$$

is precompact in $\mathcal{S}$ for each $\zeta \in (-\infty, \omega]$, employing the Arzela-Ascoli theorem. Let $0 < \zeta \leq \omega$ be fixed, and let ϵ be a real number satisfying $0 < \epsilon < \zeta$. We define:

$$(F_\epsilon(\varpi)\delta)(\zeta) = \ T_1(\zeta)\phi_1(0,\varpi) + T_2(\zeta)(\phi_2(\varpi) + y(0,0,\phi_1(0,\varpi),\varpi)) -$$
$$\int_0^{\zeta-\epsilon} T_1(\zeta-\varepsilon)y(\varepsilon,\eta,\delta_\varepsilon(.,\varpi),\varpi)d\varepsilon + \int_0^{\zeta-\epsilon} T_2(\zeta-\varepsilon)\phi(\varepsilon,\eta,\delta_\varepsilon(.,\varpi),\delta'(\eta,\varpi),$$
$$\int_0^\varepsilon \chi(\eta,\delta_\eta(.,\varpi))d\eta, \int_0^\omega \psi(\eta,\delta_\eta(.,\varpi))d\eta,\varpi)d\varepsilon, \ \zeta \in \mathcal{M}, \delta \in \mathcal{D}_k$$

Since $T_1(\zeta), T_2(\zeta)$ are compact operators the set $W\epsilon(\zeta) = \{(F_\epsilon(\varpi)\delta)(\zeta): \delta \in \mathcal{D}_k\}$ is relatively compact in $\mathcal{S}$ for every ϵ, $0 < \epsilon < \zeta$, Therefore by our hypothesis and for all $\delta \in \mathcal{D}_k$, we have

$$||(F(\varpi)\delta)(\zeta) - (F_\epsilon(\varpi)\delta)(\zeta)|| \leq \ \int_{\zeta-\epsilon}^\zeta ||T_1(\zeta-\varepsilon)y(\varepsilon,\eta,\delta_\varepsilon(.,\varpi),\varpi)||d\varepsilon +$$
$$\int_{\zeta-\epsilon}^\zeta ||T_2(\zeta-\varepsilon)\phi(\varepsilon,\eta,\delta_\varepsilon(.,\varpi),\delta'(\eta,\varpi),\int_0^\varepsilon \chi(\eta,\delta_\eta(.,\varpi))d\eta,$$
$$\int_0^\omega \psi(\eta,\delta_\eta(.,\varpi))d\eta,\varpi)d\varepsilon||$$
$$\int_{\zeta-\epsilon}^\zeta ||T_1(\zeta-\varepsilon)||\beta_{m_0}(\varepsilon,\varpi)d\varepsilon + \int_{\zeta-\epsilon}^\zeta ||T_2(\zeta-\varepsilon)||\alpha_{m_0}(\varepsilon,\varpi)d\varepsilon$$

$$||(F(\varpi)\delta)'(\zeta) - (F_\epsilon(\varpi)\delta)'(\zeta)|| \leq \ \int_{\zeta-\epsilon}^\zeta ||AT_2(\zeta-\varepsilon)y(\varepsilon,\eta,\delta_\varepsilon(.,\varpi),\varpi)d\varepsilon|| +$$

and

$$\int_{\zeta-\epsilon}^\zeta ||T_1(\zeta-\varepsilon)\phi(\varepsilon,\eta,\delta_\varepsilon(.,\varpi),\delta'(\eta,\varpi),$$
$$\int_0^\varepsilon \chi(\eta,\delta_\eta(.,\varpi))d\eta, \int_0^\omega \psi(\eta,\delta_\eta(.,\varpi))d\eta,\varpi)d\varepsilon||$$
$$\int_{\zeta-\epsilon}^\zeta ||AT_2(\zeta-\varepsilon)||\beta_{m_0}(\varepsilon,\varpi)d\varepsilon + \int_{\zeta-\epsilon}^\zeta ||T_1(\zeta-\varepsilon)||\alpha_{m_0}(\varepsilon,\varpi)d\varepsilon$$

Therefore, there exist precompact sets arbitrarily close to the set $W(\zeta)$. Consequently, the set $W(\zeta)$ is also precompact in $\mathcal{S}$. Finally, we aim to demonstrate the continuity of $F: \mathcal{D} \to \mathcal{D}$. Given $\delta_n \to \delta$ in $\mathcal{D}$, where $\{\delta_n\} \subseteq \mathcal{D}$, we have:

$$y(\varepsilon,\eta,\delta_{n\varepsilon}(.,\varpi),\varpi) \to y(\varepsilon,\eta,\delta_\varepsilon(.,\varpi),\varpi),$$
$$\phi(\varepsilon,\eta,\delta_{n\varepsilon}(.,\varpi),\delta_{n'}(\eta,\varpi),\int_0^\varepsilon \chi(\eta,\delta_{n\eta}(.,\varpi))d\eta, \int_0^\omega \psi(\eta,\delta_{n\eta}(.,\varpi))d\eta,\varpi)d\varepsilon \to$$
$$\phi(\varepsilon,\eta,\delta_\varepsilon(.,\varpi),\delta'(\eta,\varpi),\int_0^\varepsilon \chi(\eta,\delta_\eta(.,\varpi))d\eta, \int_0^\omega \psi(\eta,\delta_\eta(.,\varpi))d\eta,\varpi)d\varepsilon$$

as $n \to \infty$ and for all $\zeta, \varepsilon \in \mathcal{M}$, and

$$||y(\varepsilon,\eta,\delta_{n\varepsilon}(.,\varpi),\varpi)|| \to ||y(\varepsilon,\eta,\delta_\varepsilon(.,\varpi),\varpi)||$$
$$||\phi(\varepsilon,\eta,\delta_{n\varepsilon}(.,\varpi),\delta_{n'}(\eta,\varpi),\int_0^\varepsilon \chi(\eta,\delta_{n\eta}(.,\varpi))d\eta, \int_0^\omega \psi(\eta,\delta_{n\eta}(.,\varpi))d\eta,\varpi)d\varepsilon|| \to$$
$$||\phi(\varepsilon,\eta,\delta_\varepsilon(.,\varpi),\delta'(\eta,\varpi),\int_0^\varepsilon \chi(\eta,\delta_\eta(.,\varpi))d\eta, \int_0^\omega \psi(\eta,\delta_\eta(.,\varpi))d\eta,\varpi)d\varepsilon||$$

and

$$||y(\varepsilon,\eta,\delta_{n\varepsilon}(.,\varpi),\varpi) - y(\varepsilon,\eta,\delta_\varepsilon(.,\varpi),\varpi)|| \leq 2\beta_{m_0}(\varepsilon,\varpi),$$
$$||\phi(\varepsilon,\eta,\delta_{n\varepsilon}(.,\varpi),\delta_{n'}(\eta,\varpi),\int_0^\varepsilon \chi(\eta,\delta_{n\eta}(.,\varpi))d\eta, \int_0^\omega \psi(\eta,\delta_{n\eta}(.,\varpi))d\eta,\varpi)d\varepsilon$$
$$-\phi(\varepsilon,\eta,\delta_\varepsilon(.,\varpi),\delta'(\eta,\varpi),\int_0^\varepsilon \chi(\eta,\delta_\eta(.,\varpi))d\eta,$$
$$\int_0^\omega \psi(\eta,\delta_\eta(.,\varpi))d\eta,\varpi)d\varepsilon|| \leq 2\alpha_{m_0}(\varepsilon,\varpi)$$

Now we apply by dominance convergence theorem

$$||(F(\varpi)\delta_n)(\zeta) - (F(\varpi)\delta)(\zeta)|| \leq \ \int_0^\zeta ||T_1(\zeta-\varepsilon)||||y(\varepsilon,\eta,\delta_{n\varepsilon}(.,\varpi),\varpi) - y(\varepsilon,\eta,\delta_\varepsilon(.,\varpi),\varpi)||d\varepsilon +$$
$$\int_0^\zeta ||T_2(\zeta-\varepsilon)||||\phi(\varepsilon,\eta,\delta_{n\varepsilon}(.,\varpi),\delta_{n'}(\eta,\varpi),$$
$$\int_0^\varepsilon \chi(\eta,\delta_{n\eta}(.,\varpi))d\eta, \int_0^\omega \psi(\eta,\delta_{n\eta}(.,\varpi))d\eta,\varpi)d\varepsilon$$
$$-\phi(\varepsilon,\eta,\delta_\varepsilon(.,\varpi),\delta'(\eta,\varpi),\int_0^\varepsilon \chi(\eta,\delta_\eta(.,\varpi))d\eta,$$
$$\int_0^\omega \psi(\eta,\delta_\eta(.,\varpi))d\eta,\varpi)d\varepsilon||$$

$$\to 0 \ \text{ as } \ n \to \infty$$

$$||(F(\varpi)\delta_n)'(\zeta) - (F(\varpi)\delta)'(\zeta)|| \leq \int_0^\zeta ||AT_2(\zeta - \varepsilon)||||y(\varepsilon, \eta, \delta_{n\varepsilon}(., \varpi), \varpi) - y(\varepsilon, \eta, \delta_\varepsilon(., \varpi), \varpi)||d\varepsilon +$$

$$\int_0^\zeta ||T_1(\zeta - \varepsilon)||||\phi(\varepsilon, \eta, \delta_{n\varepsilon}(., \varpi), \delta_{n'}(\eta, \varpi),$$

and

$$\int_0^\varepsilon \chi(\eta, \delta_{n\eta}(., \varpi))d\eta, \int_0^\omega \psi(\eta, \delta_{n\eta}(., \varpi))d\eta, \varpi)d\varepsilon$$

$$-\phi(\varepsilon, \eta, \delta_\varepsilon(., \varpi), \delta'(\eta, \varpi), \int_0^\varepsilon \chi(\eta, \delta_\eta(., \varpi))d\eta,$$

$$\int_0^\omega \psi(\eta, \delta_\eta(., \varpi))d\eta, \varpi)d\varepsilon||$$

$$\to 0 \quad \text{as} \quad n \to \infty$$

Therefore $||F(\varpi)\delta_n - F(\varpi)\delta||_\mathcal{D} \to 0$ as $n \to \infty$ and hence F is continuous. Therefore the operator F has a fixed point in $\mathcal{D}$. Hence the theorem.

CONCLUSION

This article examines the challenge of solving second-order neutral functional integro-differential equations characterized by infinite delays and stochastic influences. It showcases the application of the Schauder fixed-point theorem within a stochastic framework to establish the existence of solutions to such intricate equations. This study offers a robust theoretical foundation for resolving these complex mathematical problems by addressing the complications introduced by infinite delays. Furthermore, this research contributes significantly to the comprehension of these equations and extends their utility in real-world scenarios that involve unpredictable delays and randomness, emphasizing the practical significance of these theoretical advancements of these equations and their practical applications in situations involving delays and randomness.

ABSTRACT

Green inventory management enfolds both economic and environmental cost parameters. Industrial sectors embrace green initiatives in the process of product production to product delivery. Manufacturing units with rework warehouse amenities contribute to defect handling in optimal time so as to maintain continuous demand fulfillment. However, the business sectors are hurdled by the problems of defectiveness and prompt end customer delivery. This research work proposes an inventory model encompassing the features of green rework warehouse together with drone delivery system. The model proposed in this work intends to optimize the costs incurred in handling the challenges of tackling the defective items and product delivery. The model is validated with a numerical example. The sensitivity analysis is made to determine the influence of various cost parameters on the total profit. The limitations of the model are also identified based on the results. This model is more environmentally more responsible as it encompasses both the concerns of economic and environment.

Keywords: Rework warehouse, Inventory, Green Inventory Management, Inventory Cost, Drone Delivery

INTRODUCTION

Inventory management is highly significant in every business sector to ensure persistent and non-interrupted production scenario. The industrial units are performing the phenomenal tasks of transforming raw materials to finished products by networking with their suppliers and customers. The manufacturing sectors are encircling

various modern machinery to produce defect-free products, however the chances of generating defective items exist. The occurrences of such errors are caused due to the conditions of machinery mismanagement and human negligence. To resolve such a crisis, rework warehouses are established for corrective mechanisms before the phase of end delivery. Warehouses and inventory management are closely related and hence maintained in general to stock the products of various forms, but these avenues are not equipped with the provisions of defect maintenance. To make so, these warehouses are further augmented with the capacities of reworking the defective items. These rework warehouses are highly advantageous as they avoid transporting the defective items to the production unit for repair. Manufacturing sectors put rework warehouses in use to minimize the time in repairing the defective items. Another significance of these warehouses is to facilitate direct delivery of the products to the customers within the stipulated period of time. However, these rework warehouses also encounter a few challenges of environment and delivery lags. Rework warehouses with eco-consciousness led to the emergence of green rework warehouses (GRW). Inventory researchers have contributed a lot to green warehouses but the concept of GRW is not discussed in the literature to the best of knowledge. The green rework warehouse is embedded with the characteristics of sustainable construction, efficient operations, renewable energy utilization in addition to the features of defect maintenance. Moreover, the drone delivery system is also adopted to fulfill the customer orders. Every business sector is planning out several strategies to regulate the system of product delivery. In the product distribution phase, the delivery chart is maintained for staging optimal delivery system to effectively sustain the customer relationship. Quality products with Eco-consciousness and Quick delivery systems are expected from the customer end. As the manufacturing sectors are turning customer centric, the inventory models have to be formulated suiting the dynamic requirements of the customers. This research work presents a more feasible inventory model encompassing the cost parameters of establishing and maintaining GRW and drone delivery system. The model proposed is based on the model developed by Renee et al. In this extended version, the costs associated with GRW and drone delivery system are included. The other contents of this paper are structured into the following sections. The state of art of related inventory models is briefly discussed in section 2. The model development is outlined in section 3. The numerical example and sensitivity analysis is made in section 4. The industrial applications and future directions are sketched out in the conclusion.

LITERATURE REVIEW

This section presents the recent state of art of inventory models discussed in the context of rework warehouses, product distribution with eco-consciousness. Green warehouses are characterized as a sustainable measure in inventory management. Mashud et al discoursed on a sustainable green warehouse with economic and carbon costs [1]. Domagala deliberated on the impacts of green warehouses in sustainable logistics [2]. Paul et al elicited green inventory model with carbon taxations [3]. Jaouhari et al discussed the potential of green warehouses in semiconductors industries [4]. Ren et al conferred optimization of green warehouses [5] and Wen discussed the associational impacts between green warehouse and inventory [6]. Parida et al, Perotti et al deliberated on the efficiency of green warehouses integrated inventory models [7][8]. Wahab et al described green warehouses adopting drone technology [9]. Drone delivery systems are integrated with warehouses in recent times. Smart warehouses are equipped with such a modern delivery mechanism to overcome the traffic congestion causing delivery lags. Rhiat et al discussed inventory management with smart warehouses using drones and robotics [10]. Piramuthu detailed drone system of delivery for perishable items [11]. Najy et al proposed collaborative truck-drone system [12]. Nishar and Ali et al presented the positive implications of drone technology in warehouse management [13] [14]. The afore-mentioned literature clearly states the formulation of inventory models encompassing green warehouses and drone delivery. However, the following research gaps are identified.

- Rework warehouse inventory model discussed by Renee et al is the initiative of developing a new genre of inventory model dealing with defective items. However, the concept of green rework warehouse is not conceptualized and explored.

- Inventory models with drone delivery systems and the costs associated with such a modern delivery system are unveiled.
- Integrated inventory models with warehouse management embedded with rework features, green initiatives and drone technology have not developed so far. To bridge these gaps, a comprehensive kind of inventory model is framed with the inclusion of cost parameters pertinent to green initiatives, rework and drone management. The development of such an inventory model will certainly aid the decision makers in cost optimization.

Model Development

The inventory model developed in this session incorporates the concept of a rework warehouse together with the distribution expenses associated with the drone delivery system. The overall representation of the system is represented in Figure 3.1.

Notation

β: Lot size is received from the production place

c: Production Cost per unit

D : Demand rate of the product

P: Total Percentage of re-workable items and non-reworkable items

P_W : Total Percentage of non-reworkable items to be disposed of.

t_1: Inspection period

t_2 : Period till receiving the reworked defective items

t_3 : Remaining period to consume the entire inventory

α_1 : Inventory level after the inspection period

α_2: Inventory level after separating the reworkable items and non-reworkable items

α_3 : Inventory level just before receiving the reworked defective items

α_4 : Inventory level just after receiving the reworked defective items

S: Selling price per unit of good quality items

H_c : Holding cost per unit

d : Inspection cost per unit

m : Inspection rate

v: transportation cost

L: Rework rate of defective items

T : Cycle length

R : Rework cost per unit

h : Holding cost per unit

P_C : Packaging cost per unit

C_C: Customizing cost per unit

G_M: Green marketing cost

G_D: Green disposing cost per unit

G_T: Solar energy cost in rework warehouse

i : the rate percentage of incentive

Assumptions

1) The quantity of good items is sufficient to satisfy the demand phase during the inspection period t_1

2) The quantity of good items and repaired items are sufficient to satisfy the demand phase during the period t_2

Description of the Problem

Given the distance between the production and distribution centers, any damage incurred during transit as a result of uneven roads or unanticipated weather conditions is addressed at the rework warehouse. At time t = 0, the lot is received. The process of inspection happens at time t_1. During this time, the faulty materials are sorted. The minor

80227

Renee Miriam and Nivetha Martin

faulty item has a rework rate of L. After time t_1, the faulty products' rework is started. At the conclusion of time t_2, the defective items are fully reworked and upgraded to the inventory. Then, during the time interval t_3, the entire inventory is depleted. T is interpreted as the whole cycle length. The inventory level is α_1 at the conclusion of the inspection period. Following the elimination of faulty products, the inventory level is α_2. Prior to the revised faulty goods being added, the inventory level was α_3. Following the inclusion of reworked goods, the inventory level is α_4. In the meantime, the products are packaged using biodegradable materials and tailored based on the preferences of the consumer. The use of drone delivery systems satisfies customer demand for quick delivery.

Determination of Total profit per cycle

The total net revenue and total profit per cycle is determined as follows.

$$\alpha_1 = \left(1 - \frac{D}{m}\right)\beta$$

$$\alpha_2 = \alpha_1 - P\beta = \left(1 - P - \frac{D}{m}\right)\beta$$

$$\alpha_3 = \left(1 - P - \frac{D}{m} - \frac{DP_R}{L}\right)\beta$$

$$\alpha_4 = \left(1 - P_W - \frac{D}{m} - \frac{DP_R}{L}\right)\beta$$

$$t_1 = \frac{\beta}{m}, \ t_2 = \frac{\beta P_R}{L}, \ t_3 = \frac{Z_4}{D}$$

Procurement cost = $v + c\beta$

Rework cost = $RP_R\beta$

Inspection cost = $d\beta$

Holding cost = $h\left[\frac{(1-P_W)\beta T}{2} + \frac{\beta^2 P_W}{m} - \frac{\beta^2 P_R^2}{L}\right]$

Packaging cost = $P_C(1 - P_W)\beta$

Customizing cost = $C_C(1 - P_W)\beta$

Green marketing cost = G_M

Solar energy cost in rework warehouse = G_T

Incentive provided by the government for using solar energy = iG_T where i is the rate percentage of incentive

Drone delivery cost = Total cost of drone use + Renting cost of depots + Cost of conveyor for sorting the package + Energy cost for recharging and operating the depot

Total Cost related to drones = Unit cost of delivering a package * $(1 - P_W)\beta$

Renting cost of depots = C_D

Cost of conveyor for sorting the package = C_s

Energy cost for recharging and operating the depot = C_E

The Total Cost = Procurement Cost + Rework Cost + Inspection Cost + Holding Cost + Packaging Cost + Customizing Cost + Green Marketing Cost + Total solar energy cost + Drone delivery Cost + Green disposing cost

The Total Average Cost =

$$= \frac{vD}{\beta} + cD + RP_R D + dD + h\beta\left[\frac{(1-P_W)}{2} + \frac{DP_W}{m(1-P_W)} - \frac{DP_R^2}{L(1-P_W)}\right] + P_C(1-P_W)D + C_C(1-P_W)D + \frac{G_M D}{\beta}$$

$$+ \frac{(G_T - iG_T)D}{\beta} + U_D * (1-P_W)D + \frac{(C_D + C_s + C_E) * D}{\beta} + \frac{G_D * P_W * D}{\beta}$$

The total revenue gained is $S\beta$

The total net revenue per cycle is $\frac{S\beta}{T}$

The total profit per cycle is

$$SD - \left(\frac{vD}{\beta} + cD + RP_R D + dD + h\beta\left[\frac{(1-P_S)}{2} + \frac{DP_S}{m(1-P_W)} - \frac{DP_R^2}{L(1-P_W)}\right] + P_C(1-P_W)D + C_C(1-P_W)D + \frac{G_M D}{\beta}\right.$$

$$\left. + \frac{(G_T - iG_T)D}{\beta} + U_D * (1-P_W)D + \frac{(C_D + C_s + C_E) * D}{\beta} + \frac{G_D * P_W * D}{\beta}\right)$$

Renee Miriam and Nivetha Martin

Numerical Analysis

Consider an inventory system with the following : S: 700 $, D: 40000, v = 50 $, c= 20$, β= 5000, R = 20$, P_R = 0.2, d = 0.05, h = 5$, P_W = 0.02, m = 10000, L = 800, P_C = 20$, C_C = 60$, G_M = 100$, G_T = 600$, i = 0.7, U_D = 500$, C_D = 300$, C_S = 100$, C_E = 50$, G_D = 50$. The total profit obtained ≈ 4328882 $

Sensitivity Analysis

Sensitivity Analysis is performed by changing the parameters and determining the change in the Total Profit. Table 4.1 denotes the numerical values of the changes in Total Profit in accordance with change in parameters.

1. The Selling Price is one of the important parameters determining the total profit. If the selling price decreases, then the total profit decreases dramatically. If the selling price increases, the total profit increases dramatically. It is represented in Figure 4.1.
2. The demand parameter is moderately important in determining Total Profit. If demand increases, the total profit increases and if demand decreases, Total Profit decreases. It is represented in Figure 4.2.
3. Change in the lot size does not much affect the Total Profit. A decrease in the lot size very slightly decreases Total Profit and an increase in the lot size increases Total Profit. It is represented in Figure 4.3.
4. The total profit increases if the percentage of scrap increases. It is represented in Figure 4.4.The total profit decreases if the percentage of reworkable items increases. It is represented in Figure 4.5.
5. If the rework rate increases, the Total Profit slightly decreases. It is represented in Figure 4.6.
6. The Total Profit decreases hugely if the Total cost of drone use increases and Total profit decreases if the parameter decreases. It is represented in Figure 4.7.

CONCLUSION

The model discussed in this paper has several industrial applications as this model is an instance of exercising quality, eco-centered product delivery with modern distribution system. The cost parameters incorporated in this model reflect the actual cost incurred in implementing the green rework warehouse with drone delivery system. This model shall be employed by the business sectors in facilitating quick delivery of the quality items. The green rework warehouses possess the provisions of rectifying the defective items with eco-energy and this is the pavement for the emergence of green industries. The implementation of this comprehensive model will certainly facilitate the industries switch to sustainable status. This model shall be further extended by discussing the decision parameters in fuzzy and its extended environments. Moreover, the model shall also be analyzed with different demand patterns and with the inclusion of other production and product distribution constraints. The sensitivity analysis shall be made to determine the impacts of decision parameters on the total inventory costs.

ABSTRACT

Trapezoidal Intuitionistic Fuzzy Set (TzIFS) is an invaluable mathematical theory to express uncertain phenomenon in our real world. Firstly, the generalized aggregation operator is introduced for aggregating TzIFS information, such as the Generalized Trapezoidal Intuitionistic Fuzzy Weighted Averaging operator (GTzIFWA). Then, various properties of the proposed aggregation operator are established and then, the Modified Generalized Trapezoidal Intuitionistic Fuzzy Weighted Averaging operator (M-GTzIFWA) is developed and the evaluation of the MAGDM problem based on the proposed operator and Artificial Neural Network (ANN) under TzIFS environment is investigated. The TzIFS data is aggregated using M-GTzIFWA operator to produce individual column matrix which in turn is defuzzyfied using a new proposed Defuzzyfication function. The defuzzyfied entries are then used to compute the correlation coefficient for the final ranking of alternatives and also processed through an Artificial Neural Net (ANN)with hidden layers. The weights are initialized with random values and biases are set to be zero and the ReLU function is used for the hidden layer's activation. The forward pass, backward pass and the training loop helps adjust the weights and biases for the computations and finally the ranking of the best alternative is done based on the proposed ANN-MAGDM algorithm. A new type of A numerical illustration is provided with comparison of the proposed methods for effectiveness.

Keywords: Trapezoidal Intuitionistic Fuzzy Theory; Intuitionistic Fuzzy Set; Aggregation Operators; Weighted Averaging Operator; Artificial Neural Network.

INTRODUCTION

In the present global scenario, many real-life problems deal with either imprecise data or the various types of data involved with lot of ambiguity. Solving such problems with ambiguity is tedious, time consuming and cost involved task. Solving such problems using conventional decision-making algorithms is not an appropriate way to deal with the ambiguity involved in the problem. Hence, to deal with the ambiguity in those real-world problems, the Fuzzy Numbers (FN) can represent decision problems involving imprecise information in an appropriate manner; hence, they can be approached and dealt with and solved eventually using various algorithms with various aggregation operators and Artificial Intelligence (AI) techniques. As a further development, Intuitionistic Fuzzy sets (IFSs) was introduced and dealt with Deep Learning methodologies in [1]. Further, Trapezoidal Intuitionistic Fuzzy Numbers(TzIFNs) are most preferred by many researchers to solve problems with imprecise, adequate and qualitative information arising in day-to-day problems [5,7,8,9,11]. Researchers like all over the world have introduced and proposed various ranking techniques for comparing two arbitrary TzIFNs and one such is given in [7]. In this work, a new correlation coefficient for FNs is proposed in contrast with the existing correlation coefficients for FNs [3]. Most of the earlier correlation coefficients for FNs fall in the range [-1,1], where the correlation coefficient for FNs proposed in this work will fall in the range [0,1], which validates the positive attitude of the tool proposed. This correlation coefficient proposed is used to compare the final defuzzyfied values arising from the aggregation process of solving MAGDM problems and the perfect fuzzy number which will be used for the final comparison of the alternatives involved in solving the MAGDM problems. Along with the new correlation coefficient, a new defuzzyfication function is defined and proposed in this work for defuzzyfying the TzIFS values which will be ease to compute the Artificial Neural Net (ANN) for choosing the best alternative. Many authors have investigated ANN with some deep learning techniques [2,6,10] which will be useful to solve traditional MAGDM problems very easily. Hence this research work combines MAGDM along with some ANN techniques so that the overall decision making will be done with a good precision. Also, a new aggregation operator called the Modified Generalized Trapezoidal Intuitionistic Fuzzy Weighted Averaging (M-GTzIFWA) operator is proposed in the work since any aggregation process plays a vital role in decision making [4], for effective aggregation phase in solving the MAGDM problem.

The purpose of this paper is, therefore, to combine the ANN tools with the MAGDM solving techniques and propose a new algorithm to choose the best alternative from the available ones in a real life MAGDM problem. The remainder of this paper is organized as follows:1. Some basic concepts of the TzIFS is presented and a new defuzzification function is proposed.2. The new aggregation operator called the M-GTzIFWA operator is proposed with necessary properties and theorems. 3. A new correlation coefficient for fuzzy sets is proposed for ranking the alternatives which are defuzzyfied. 4. A new algorithm based on ANN is proposed to solve MAGDM problem. 5. Numerical illustration is provided for substantiating the theory and methods proposed. 6. Comparisons are made for the effectiveness of the proposed methods.

A NOVEL DEFUZZYFICATION FUNCTION FOR TZIFS AND THE G-TZIFWA OPERATOR
Now, a new defuzzification function for the TzIFNs will be proposed in the following:

Definition 1. If $\tilde{\alpha} = \big((a,b,c,d); \mu_{\tilde{\alpha}}, \gamma_{\tilde{\alpha}}\big)$ is a TzIFN, then $I(\tilde{\alpha})$ is called the Trapezoidal Intuitionistic Fuzzy Defuzzyfication (TzIFDF) function $\tilde{\alpha}$, where

$I(\tilde{\alpha}) = \frac{1}{8}\big[(a+b+c+d) \times \big(1 - \mu_{\tilde{\alpha}} - \gamma_{\tilde{\alpha}}\big)\big]$. Where $0 \leq I(\tilde{\alpha}) < 1$.

Generalized Intuitionistic Trapezoidal Fuzzy Aggregation Operators
In the following, the Modified Generalized Trapezoidal Intuitionistic Fuzzy Weighted Averaging (M-GTzIFWA) operator will be introduced with some properties and theorems proved.

John Robinson and Saranraj

Definition-2 Let $\tilde{\alpha}_j = \left((a_j, b_j, c_j, d_j); \mu_{\tilde{\alpha}_j}, \gamma_{\tilde{\alpha}_j} \right) (j \in N)$ be a clump of TzIFNs, and let GTzIFWA:$F^n \to F$.Then

GTzIFWA$(\alpha_1, \alpha_2, \ldots, \alpha_n) = \left(w_1 \alpha_1^\lambda \oplus w_2 \alpha_2^\lambda \oplus \ldots \oplus w_n \alpha_n^\lambda \right)^{\frac{1}{\lambda}}$ is called the GTzIF aggregation operator, where$\lambda > 0$,$w = (w_1, w_2, \ldots, w_n)^T$ is a weight vector associated with the GTzIFWA operator, with$w_j \geq 0$, $j \in N$ and$\sum_{j=1}^n w_j = 1$.

Modified Generalized Intuitionistic Trapezoidal Fuzzy Weighted Average (M-GTzIFWA) Operator
In this section we modify the GTzIFWA operator by changing the orientation of λ as $1/\lambda$ so that the range of the aggregated trapezoidal part in the Trapezoidal Intuitionistic fuzzy information stays close to one.

Definition-3 Modified-GTzIFWA

Let $\tilde{\alpha}_j = \left((a_j, b_j, c_j, d_j); \mu_{\tilde{\alpha}_j}, \gamma_{\tilde{\alpha}_j} \right)$, $(j \in N)$ be a clump of TzIFNs, and let M-GTzIFWA:$F^n \to F$, then

M-GTzIFWA$(\alpha_1, \alpha_2, \ldots, \alpha_n) = \left(w_1 \alpha_1^{1/\lambda} \oplus w_2 \alpha_2^{1/\lambda} \oplus \ldots \oplus w_n \alpha_n^{1/\lambda} \right)^{\frac{1}{\lambda}}$

is called M-GTzIFWeighted Average operator, where $\lambda > 0$,$w = (w_1, w_2, \ldots, w_n)^T$ is a weight vector associated with the M-GTzIFWA operator, with$w_j \geq 0$, $j \in N$, and$\sum_{j=1}^n w_j = 1$.When$\lambda = 1$, then the M-GTzIFWA operator reduces to the TzIFWA operator. Hence,

$$M - GTzIFWA(\alpha_1, \alpha_2, \ldots, \alpha_n) = \left(\begin{array}{c} \left[\sum_{j=1}^n w_j a_j^{1/\lambda}, \sum_{j=1}^n w_j b_j^{1/\lambda}, \sum_{j=1}^n w_j c_j^{1/\lambda}, \sum_{j=1}^n w_j d_j^{1/\lambda} \right]; \\ (1 - \prod_{j=1}^n \left(1 - \mu_{\alpha_j} \right)^{w_j})^\lambda, 1 - (1 - \prod_{j=1}^n (1 - \left(1 - \gamma_{\alpha_j} \right))^{w_j})^\lambda \end{array} \right). \quad (1)$$

Theorem 1. Let $\tilde{\alpha}_j = \left((a_j, b_j, c_j, d_j); \mu_{\tilde{\alpha}_j}, \gamma_{\tilde{\alpha}_j} \right) (j \in N)$be a collection of TzIFNs, $w = (w_1, w_2, \ldots, w_n)^T$is the weight vector

of α_j $(j \in N)$ with $w_j \in [0,1]$and $\sum_{j=1}^n w_j = 1$. Then their aggregated value by using M-GTzIFWA operator is also a TzIFN and

$$M - GTzIFWA(\alpha_1, \alpha_2, \ldots, \alpha_n) = \left(\begin{array}{c} \left[\sum_{j=1}^n w_j a_j^{1/\lambda}, \sum_{j=1}^n w_j b_j^{1/\lambda}, \sum_{j=1}^n w_j c_j^{1/\lambda}, \sum_{j=1}^n w_j d_j^{1/\lambda} \right]; \\ (1 - \prod_{j=1}^n (1 - \mu_{\alpha_j})^{w_j})^\lambda, 1 - (1 - \prod_{j=1}^n (1 - (1 - \gamma_{\alpha_j}))^{w_j})^\lambda \end{array} \right)$$

Proof: We prove the Theorem 1 by using mathematical induction on n:
For n = 2.
$\tilde{\alpha}_1^{1/\lambda} = \left\langle [a_1^{1/\lambda}, a_1^{1/\lambda}, a_1^{1/\lambda}, a_1^{1/\lambda}]; \mu_{\tilde{\alpha}_1}^\lambda, 1 - \left(1 - \gamma_{\tilde{\alpha}_1} \right)^\lambda \right\rangle$ $(\lambda \geq 0)$,
$\tilde{\alpha}_2^{1/\lambda} = \left\langle [a_2^{1/\lambda}, a_2^{1/\lambda}, a_2^{1/\lambda}, a_2^{1/\lambda}]; \mu_{\tilde{\alpha}_2}^\lambda, 1 - \left(1 - \gamma_{\tilde{\alpha}_2} \right)^\lambda \right\rangle$ $(\lambda \geq 0)$.
Then

$$w_1 \tilde{\alpha}_1^{1/\lambda} \oplus w_2 \tilde{\alpha}_2^{1/\lambda} = \left(\begin{array}{c} \left[\prod_{j=1}^2 w_j a_j^{1/\lambda}, \prod_{j=1}^2 w_j a_j^{1/\lambda}, \prod_{j=1}^2 w_j a_j^{1/\lambda}, \prod_{j=1}^2 w_j a_j^{1/\lambda} \right]; \\ 1 - \prod_{j=1}^2 \left(1 - \mu_{\alpha_j}^\lambda \right)^{w_j}, \prod_{j=1}^2 \left(1 - \left(1 - \gamma_{\alpha_j} \right)^\lambda \right)^{w_j} \end{array} \right),$$

$(\lambda \geq 0)$

If this holds for $n = k$, that is

$$w_1 \tilde{\alpha}_1^{1/\lambda} \oplus w_2 \tilde{\alpha}_2^{1/\lambda} \oplus \ldots \oplus w_k \tilde{\alpha}_k^{1/\lambda} = \left(\begin{array}{c} \left[\prod_{j=1}^k w_j a_j^{1/\lambda}, \prod_{j=1}^k w_j a_j^{1/\lambda}, \prod_{j=1}^k w_j a_j^{1/\lambda}, \prod_{j=1}^k w_j a_j^{1/\lambda} \right]; \\ 1 - \prod_{j=1}^k \left(1 - \mu_{\alpha_j}^\lambda \right)^{w_j}, \prod_{j=1}^k \left(1 - \left(1 - \gamma_{\alpha_j} \right)^\lambda \right)^{w_j} \end{array} \right), (\lambda \geq 0).$$

Then, when n = k + 1, by the operational laws:
$w_1 \tilde{\alpha}_1^{1/\lambda} \oplus w_2 \tilde{\alpha}_2^{1/\lambda} \oplus \ldots \oplus w_k \tilde{\alpha}_{k+1}^{1/\lambda}$

John Robinson and Saranraj

$$= \left\langle \left[\prod_{j=1}^k w_j a_j^{1/\lambda}, \ \prod_{j=1}^k w_j a_j^{1/\lambda}, \ \prod_{j=1}^k w_j a_j^{1/\lambda}, \ \prod_{j=1}^k w_j a_j^{1/\lambda} \right] ; 1 - \prod_{j=1}^k \left(1 - \mu_{\alpha_j}^\lambda\right)^{w_j}, \prod_{j=1}^k \left(1 - \left(1 - \gamma_{\alpha_j}\right)^\lambda\right)^{w_j} \right\rangle$$

$$\oplus \left\langle \left[w_{k+1} a_{k+1}^{1/\lambda}, w_{k+1} b_{k+1}^{1/\lambda}, w_{k+1} c_{k+1}^{1/\lambda}, w_{k+1} d_{k+1}^{1/\lambda} \right] ; \left(1 - \left(1 - \mu_{\alpha_{k+1}}^\lambda\right)^{w_{k+1}}, \left(1 - \left(1 - \gamma_{\alpha_{k+1}}\right)^\lambda\right)^{w_{k+1}}\right) \right\rangle$$

$$= \left\langle \left[\prod_{j=1}^{k+1} w_j a_j^{1/\lambda}, \ \prod_{j=1}^{k+1} w_j b_j^{1/\lambda}, \ \prod_{j=1}^{k+1} w_j c_j^{1/\lambda}, \ \prod_{j=1}^{k+1} w_j d_j^{1/\lambda} \right] ; 1 - \prod_{j=1}^{k+1} \left(1 - \mu_{\alpha_j}^\lambda\right)^{w_j}, \prod_{j=1}^{k+1} \left(1 - \left(1 - \gamma_{\alpha_j}\right)^\lambda\right)^{w_j} \right\rangle .$$

i.e. the result holds for $n = k + 1$. Thus, the equation in the statement of the theorem holds for all n. Then, the Theorem 1 is valid.

Example 1. Let
$\alpha_1 = ([0.301, 0.476, 0.594, 0.782]; 0.5, 0.4);$
$\alpha_2 = ([0.224, 0.456, 0.653, 0.903]; 0.8, 0.2),$
$\alpha_3 = ([0.381, 0.440, 0.523, 0.822]; 0.6, 0.3);$
$\alpha_4 = ([0.388, 0.501, 0.584, 0.792]; 0.7, 0.2)$ be four TzIFNs, and $w = (0.2, 0.3, 0.3, 0.2)^T$ be the weight vector of $\alpha_j (j = 1, 2, 3, 4)$. When the parameter λ takes different values, different aggregated values of the TzIFNs can be obtained as follows: When$\lambda = 1$,

$$M - GTzIFWA(\alpha_1, \alpha_2, \ldots, \alpha_n) = ([(0.301 * 0.2 + 0.224 * 0.3 + 0.381 * 0.3 + 0.388 * 0.2),$$
$$(0.476 * 0.2 + 0.456 * 0.3 + 0.440 * 0.3 + 0.501 * 0.2),$$
$$(0.594 * 0.2 + 0.653 * 0.3 + 0.523 * 0.3 + 0.584 * 0.2),$$
$$(0.782 * 0.2 + 0.903 * 0.3 + 0.822 * 0.3 + 0.792 * 0.2)];$$
$$(1 - [(1 - 0.5)^{0.2}(1 - 0.8)^{0.3}(1 - 0.6)^{0.3}(1 - 0.7)^{0.2}]),$$
$$1 - \left(1 - \left[\left(1 - (1 - 0.4)\right)^{0.2}\left(1 - (1 - 0.2)\right)^{0.3}\left(1 - (1 - 0.3)\right)^{0.2}\left(1 - (1 - 0.4)\right)^{0.2}\right]\right)).$$

$M - GTzIFWA(\alpha_1, \alpha_2, \ldots, \alpha_n) = ([0.3193, 0.4642, 0.5884, 0.8323]; 0.6793, 0.2595).$
The M-GTzIFWA operator has the following desirable properties.

Property 1. Let $\tilde{\alpha}_j = \left((a_j, b_j, c_j, d_j); \mu_{\tilde{\alpha}_j}, \gamma_{\tilde{\alpha}_j} \right) (j \in N)$and $\tilde{\alpha} = \left((a, b, c, d); \mu_{\tilde{\alpha}}, \gamma_{\tilde{\alpha}} \right)$ be a clump of TzIFNs. If for all j, $a_j = a, b_j = b, c_j = c, d_j = d, \mu_{\tilde{\alpha}_j} = \mu_{\tilde{\alpha}}, \gamma_{\tilde{\alpha}_j} = \gamma_{\tilde{\alpha}}$, then$M - GTzIFWA(\alpha_1, \alpha_2, \ldots, \alpha_n) = \alpha.$

Property 2. Let $\tilde{\alpha}_j = \left((a_j, b_j, c_j, d_j); \mu_{\tilde{\alpha}_j}, \gamma_{\tilde{\alpha}_j} \right) (j \in N)$ be a clump of TzIFNs, $\lambda > 0$, and $w = (w_1, w_2, \ldots, w_n)^T$ be the weight vector related to the M-GTzIFWA operator, with $w_j \geq 0$, $(j \in N)$, $\sum_{j=1}^n w_j = 1$, and let

$$\alpha_i^- = \left((\min\{a_j\}, \min\{b_j\}, \min\{c_j\}, \min\{d_j\}); \min\left\{\mu_{\tilde{\alpha}_j}\right\}, \min\left\{\gamma_{\tilde{\alpha}_j}\right\} \right) (j \in N),$$

$$\alpha_i^+ = \left((\max\{a_j\}, \max\{b_j\}, \max\{c_j\}, \max\{d_j\}); \max\left\{\mu_{\tilde{\alpha}_j}\right\}, \max\left\{\gamma_{\tilde{\alpha}_j}\right\} \right) (j \in N).$$

Then,$\alpha^- \leq M - GTzIFWA(\alpha_1, \alpha_2, \ldots, \alpha_n) \leq \alpha^+.$

Property 3. Let $\tilde{\alpha}_j = \left((a_j, b_j, c_j, d_j); \mu_{\tilde{\alpha}_j}, \gamma_{\tilde{\alpha}_j} \right) (j \in N)$ and $\beta_j = \left((e_j, f_j, g_j, h_j); \mu_{\beta_j}, \gamma_{\beta_j} \right) (j \in N)$be two clump of TzIFNs and $w = (w_1, w_2, \ldots, w_n)^T$ be the weight vector related to the M-GTzIFWA operator, where $w_j \geq 0$, $(j \in N)$, and $\sum_{j=1}^n w_j = 1$, $\lambda > 0$, if $a_j \leq e_j, b_j \leq f_j, c_j \leq g_j, d_j \leq h_j, \mu_{\tilde{\alpha}_j} \leq \mu_{\beta_j}$ and $\gamma_{\tilde{\alpha}_j} \geq \gamma_{\beta_j}$, for all j, then
$M - GTzIFWA(\alpha_1, \alpha_2, \ldots, \alpha_n) \leq M - GTzIFWA(\beta_1, \beta_2, \ldots, \beta_n).$

John Robinson and Saranraj

CORRELATION COEFFICIENT FOR FUZZY SETS DERIVED FROM DEFUZZYFICATION PROCESS

Let $\tilde{A} = \{(u_{\tilde{A}})\}, \tilde{B} = \{(u_{\tilde{B}})\}$ be two Fuzzy Numbers. Then the Informational FuzzyEnergy of $\tilde{A}$ and $\tilde{B}$ are defined as follows:

$$E_{FN}(\tilde{A}) = \frac{1}{n}\sum_{n}[(u_{\tilde{A}}^2(x_i) + (1 - u_{\tilde{A}}(\tilde{x}_i))^2)] \tag{1}$$

$$E_{FN}(\tilde{B}) = \frac{1}{n}\sum_{n}[(u_{\tilde{B}}^2(x_i) + (1 - u_{\tilde{B}}(\tilde{x}_i))^2)] \tag{2}$$

Now the correlation between $\tilde{A}$ and $\tilde{B}$ is defined as:

$$C_{FN}(\tilde{A}, \tilde{B}) = \frac{1}{n}\sum_{i=1}^{n}\{[u_{\tilde{A}}(\tilde{x}_i)u_{\tilde{B}}(\tilde{x}_i)] + ([1 - u_{\tilde{A}}(\tilde{x}_i)][1 - u_{\tilde{B}}(\tilde{x}_i)])\} \tag{3}$$

Then the correlation coefficient between $\tilde{A}$ and $\tilde{B}$ is defined as:

$$K_{FN}(\tilde{A}, \tilde{B}) = \frac{C_{FN}(\tilde{A}, \tilde{B})}{\sqrt{E_{FN}(\tilde{A}) \cdot E_{FN}(\tilde{B})}}. \tag{4}$$

Proposition

For $\tilde{A}, \tilde{B} \in$ FN(X), the following are true: (i) $0 \le C_{FN}(\tilde{A}, \tilde{B}) \le 1$,(ii) $C_{FN}(\tilde{A}, \tilde{B}) = C_{FN}(\tilde{B}, \tilde{A})$, (iii) $K_{FN}(\tilde{A}, \tilde{B}) = K_{FN}(\tilde{B}, \tilde{A})$,(iv) $K_{FN}(\tilde{A}, \tilde{B}) = 1$ if $\tilde{A} = \tilde{B}$.

Theorem 1 For $\tilde{A}, \tilde{B} \in$ FN(X), then $0 \le K_{FN}(\tilde{A}, \tilde{B}) \le 1$.

Proof. Since $C_{FN}(\tilde{A}, \tilde{B}) \ge 0$, it can be proved that $K_{FN}(\tilde{A}, \tilde{B}) \le 1$. For any arbitrary real number ξ, the following inequality is true:

$0 \le \sum_{i=1}^{n}\{[(u_{\tilde{A}}(x_i) - \xi u_{\tilde{B}}(x_i))^2]\} = \sum_{i=1}^{n}[(u_{\tilde{A}}^2(x_i)) - 2\xi(u_{\tilde{A}}(x_i)u_{\tilde{B}}(x_i)) + \xi^2(u_{\tilde{B}}^2(x_i))].$

Hence,$\{\sum_{i=1}^{n}[(u_{\tilde{A}}(x_i)u_{\tilde{B}}(x_i))]\}^2 \le \sum_{i=1}^{n}\{(u_{\tilde{A}}^2(x_i))\} \times \sum_{i=1}^{n}\{(u_{\tilde{B}}^2(x_i))\}$

The above inequality can be written as:

$\frac{\{\sum_{i=1}^{n}[(u_{\tilde{A}}(x_i)u_{\tilde{B}}(x_i))]\}^2}{\sum_{i=1}^{n}\{(u_{\tilde{A}}^2(x_i))\} \times \sum_{i=1}^{n}\{(u_{\tilde{B}}^2(x_i))\}} \le 1.$

Therefore$\frac{\{C_{FN}(\tilde{A}, \tilde{B})\}^2}{E_{FN}(\tilde{A}) \cdot E_{FN}(\tilde{B})} \le 1$. Hence $K_{FN}(\tilde{A}, \tilde{B}) = \frac{C_{FN}(\tilde{A}, \tilde{B})}{\sqrt{E_{FN}(\tilde{A}) \cdot E_{FN}(\tilde{B})}} \le 1.$

Theorem 2. $K_{FN}(\tilde{A}, \tilde{B}) = 1 \Leftrightarrow \tilde{A} = \tilde{B}$.

Proof. Considering the inequality in the proof of theorem 1, then the equality holds if and only if the following are true: (i) $u_{\tilde{A}}(x_i) = \xi u_{\tilde{B}}(x_i)$, (ii) $[1 - u_{\tilde{A}}(x_i)] = \xi[1 - u_{\tilde{B}}(x_i)]$, for some positive real ξ.As $u_{\tilde{A}}(x_i) + [1 - u_{\tilde{A}}(x_i)] = u_{\tilde{B}}(x_i) + [1 - u_{\tilde{B}}(x_i)] = 1$, then it means $\xi = 1$, and therefore $\tilde{A} = \tilde{B}$.

Theorem 3. $C_{FN}(\tilde{A}, \tilde{B}) = 0 \Leftrightarrow \tilde{A}$ and $\tilde{B}$ are non-fuzzy sets and satisfy the condition $u_{\tilde{A}}(x_i) + u_{\tilde{B}}(x_i) = 1, \forall x_i \in$ X.

Proof. For all $x_i \in$ X, $(u_{\tilde{A}}(x_i)u_{\tilde{B}}(x_i) + [1 - u_{\tilde{A}}(x_i)][1 - u_{\tilde{B}}(x_i)]) \ge 0$.If $C_{FN}(\tilde{A}, \tilde{B}) = 0$for all $x_i \in$ X, then it should be that: $u_{\tilde{A}}(x_i) \cdot u_{\tilde{B}}(x_i) = 0$ and $[1 - u_{\tilde{A}}(x_i)][1 - u_{\tilde{B}}(x_i)] = 0$. If $u_{\tilde{A}}(x_i) = 1$ then $u_{\tilde{B}}(x_i) = 0$ and $[1 - u_{\tilde{A}}(x_i)] = 0$. If $u_{\tilde{B}}(x_i) = 1$ then $u_{\tilde{A}}(x_i) = 0$ and $[1 - u_{\tilde{B}}(x_i)] = 0$. Hence $u_{\tilde{A}}(x_i) + u_{\tilde{B}}(x_i) = 1$.Conversely, When A and B are non-fuzzy sets and $u_{\tilde{A}}(x_i) + u_{\tilde{B}}(x_i) = 1$. If $u_{\tilde{A}}(x_i) = 1$ then $u_{\tilde{B}}(x_i) = 0$ and $[1 - u_{\tilde{A}}(x_i)] = 0$. If $u_{\tilde{B}}(x_i) = 1$ then $u_{\tilde{A}}(x_i) = 0$ and $[1 - u_{\tilde{B}}(x_i)] = 0$.Therefore $C_{FN}(\tilde{A}, \tilde{B}) = 0$.

Theorem 4. $E_{FN}(\tilde{A}) = 1 \Leftrightarrow \tilde{A}$ is a non-fuzzy set.

Proof. If $\tilde{A}$ is a non-fuzzy set, then $E_{FN}(\tilde{A}) = 1$ is obvious. Conversely, it can be proved by the method of contradiction. Assume $\tilde{A}$ is not a non-fuzzy set. Then $0 \le u_{\tilde{A}}(x_i) < 1$ and $0 \le 1 - u_{\tilde{A}}(x_i) < 1$ for some x_i. Hence $u_{\tilde{A}}^2(x_i) + [1 - u_{\tilde{A}}(x_i)]^2 < 1$. Then $E_{FN}(\tilde{A}) = \frac{1}{n}\sum_{i=1}^{n}(u_{\tilde{A}}^2(x_i) + [1 - u_{\tilde{A}}(x_i)]^2) < 1$. This is a contradiction. Hence $\tilde{A}$ is a non-fuzzy set.

DECISION MAKING USINGM-GTZIFWA OPERATORFOR ANN-MAGDM

In this Section, we will apply the TzIFN aggregation operators to MAGDM problem with the application of Artificial Neural Network (ANN). Let $Y = \{X_1, X_2, \ldots, X_m\}$ be the set of alternatives, $C = \{C_1, C_2, \ldots, C_n\}$ the set of criteria. The decision makers evaluate the objects (the criterion C_j for the alternative X_i) and expressed by TzIFNs α_{ij}. Based on the combination of the new M-GTzIFW Aaggregation operator, the new Defuzzyfication function and the proposed ANN algorithm, the choice of the best alternative is performed as follows:

Step-1 Aggregate the TzIFNs α_{ij} for each alternative X_i by the M-GTzIFWA operator.

Step-2 Utilize the proposed Defuzzyfication function $I(\tilde{\alpha})$ and Defuzzify the collective TzIFNs obtained after aggregating with M-GTzIFWA operator.

Step-3 Utilize the proposed Correlation Coefficient of FNs and rank the alternatives.

Step-4 Utilize the defuzzyfied values of the obtained column matrix at different λ levels as the input vector for the Neural Network.
//*Process of ANN with the Y values as inputs at different λ Levels *//

Step-5 Parameters Initialization
- Define the network's architecture with n inputs as obtained from the defuzzification process, a hidden layer of 10 neurons, and 1 output with n different ranking of the decision alternatives.
- Initialize weights and biases for both layers using random values (for weights) and zeros (for biases).

Step-6 Activation Function
- Use the ReLU (Rectified Linear Unit) function for the hidden layer's activation, which helps introduce non-linearity into the model.

Step-7 Forward Pass
- This function computes the outputs of the hidden and output layers by performing matrix multiplications and adding biases.

Step-8 Backward Pass
- This function calculates the gradients of the loss with respect to weights and biases using the chain rule.
- It updates the weights and biases to minimize the loss.
- The forward and backward pass functions are designed to handle the entire batch of input samples (X_data) and their targets (y_data)

Step-9 Training Loop:
- The loop runs for a specified number of epochs. In each epoch, it performs a forward and backward pass to adjust the weights and biases.
- Every 100 epochs, it produces the current loss to track the training progress.

Step-10 Final Prediction

- After training, we perform a final forward pass to see the network's prediction on the input data.

NUMERICAL ILLUSTRATION

In the recent years, the enrollment of pupil in institutions for higher education have gone to a peak, and perhaps the stakeholders expect much ofimprovement in the quality of the education provided by the institutions. As a result, most of the institutions around the globe are working hard to strengthen the quality in teaching, monitoring and protecting the quality of the curriculum. Many institutions have developed their own mechanisms of obtaining the feedback from the stakeholders past and present in order to improve and maintain a conducive environment for Teaching-Learning. Hence it is of much importance for the administrators of any institution to develop new mechanisms to ensure quality education is provided for the students opting their institutions for higher studies.

Currently, the Department of Mathematics of a leading college in the city of Tiruchirappalli, Tamilnadu, India, of Bharathidasan University is planning to introduce a new course which will bridge the gap between the curriculum provided and the job market in IT industry in the country. This course comprehensively aims to focus on providing expertise in Data Analytics and Computer Applications coupled with higher Mathematical skills and aptitude, networking and communications, and other means of modern information technology, and more to mention.For the beginning of the new program, 5 qualified professors$(X_i(i = 1,2,3,4,5))$ can be employed who will be evaluated by experts panel of the department of Mathematical Sciences and Computational Sciences from some of the renowned institutes in the country, mainly from the following three attributes, i)Teaching Aptitude (C_1), ii) Subject Expertise$(C_2)$and iii) Ability to mobilize technology based classroom(C_3).The weight vector provided for the evaluation by the experts is $(0.34, 0.42, 0.24)^T$. The experts evaluation of the 5 professorswere provided as TzIFNS and is shown in Table 1.

Table 1.Experts' Evaluation data of 5 Professors under 3 Attributes

	C_1	C_2	C_3
X_1	$((0.3,0.4,0.6,0.8);0.8,0.2)$	$((0.3,0.4,0.7,0.8);0.4,0.5)$	$((0.2,0.3,0.5,0.6);0.3,0.6)$
X_2	$((0.2,0.4,0.7,0.8);0.3,0.5)$	$((0.3,0.5,0.8,0.9);0.7,0.2)$	$((0.2,0.3,0.4,0.7);0.4,0.2)$
X_3	$((0.2,0.3,0.5,0.6);0.4,0.6)$	$((0.2,0.3,0.4,0.5);0.8,0.1)$	$((0.3,0.5,0.6,0.9);0.5,0.1)$
X_4	$((0.4,0.6,0.7,0.8);0.5,0.4)$	$((0.4,0.5,0.6,0.7);0.9,0.1)$	$((0.2,0.3,0.5,0.6);0.5,0.3)$
X_5	$((0.1,0.2,0.7,0.8);0.9,0.1)$	$((0.2,0.3,0.6,0.7);0.5,0.3)$	$((0.3,0.4,0.5,0.6);0.8,0.2)$

When the parameter λtakes different values, the aggregated TzIFNs can be obtained as shown in Table 2. The corresponding defuzzyfied values are shown in Table 3.

$$M - GTzFWA(\alpha_1, \alpha_2, \ldots, \alpha_n)$$

$$= \left(\left[\sum_{j=1}^{n} w_j a_j^{1/\lambda}, \sum_{j=1}^{n} w_j b_j^{1/\lambda}, \sum_{j=1}^{n} w_j c_j^{1/\lambda}, \sum_{j=1}^{n} w_j d_j^{1/\lambda} \right]; \quad (1 - \prod_{j=1}^{n} \left(1 - \mu_{\alpha_j}^{\lambda} \right)^{w_j})^{1/\lambda}, 1 - (1 - \prod_{j=1}^{n} (1 - \left(1 - \gamma_{\alpha_j} \right)^{\lambda})^{w_j})^{1/\lambda} \right)$$

$\alpha_1 = ([0.3,0.4,0.6,0.8]; 0.8,0.2), \alpha_2 = ([0.3,0.4,0.7,0.8]; 0.4,0.5),$

$\alpha_3 = ([0.2,0.3,0.5,0.6]; 0.3,0.6).$ And $w = (0.34,0.42,0.24)^T.$

When $\lambda = 1, M - GITFWA(\alpha_1, \alpha_2, \ldots, \alpha_n) = ([(0.34 * 0.3 + 0.42 * 0.3 + 0.24 * 0.2),$

John Robinson and Saranraj

X_5	$\big((0.8404, 0.8808, 0.9511, 0.9658); 0.8322, 0.1629\big)$

When $\lambda = 1$, $X_1 = \big((0.2760, 0.3760, 0.6180, 0.7520); 0.5715, 0.3825\big)$.

Let us compute the defuzzyfied value for X_1, the correlation coefficients and the ANN process simultaneously.

$$Y_1 = I(\alpha) = \frac{1}{8}\big[(a + b + c + d) \times (1 - \mu_{\alpha^-} - \gamma_{\alpha^-})\big]$$

$= \frac{1}{8}\big[(0.2760 + 0.3760 + 0.6180 + 0.7520) * (1 - 0.5715 - 0.3825)\big]$ $Y_1 = I(\alpha)= 0.01162$.

Similarly, computing all the other values, we can observe the following:

Table 3.TzIFNs obtained by the Defuzzyfication operator $I(\tilde{\alpha})$

$I(\alpha)$	Y_1	Y_2	Y_3	Y_4	Y_5
$\lambda = 1$	0.01162	0.05356	0.03749	0.01235	0.01010

Comparing the rankings obtained from Correlation coefficient and the ANN process reveals that A_5, A_3 and A_2 play a prominent role in the choice of best alternatives.

CONCLUSION

In this work, we have investigated the trapezoidal intuitionistic fuzzy information aggregation problems and proposed the Modified Generalized Intuitionistic Trapezoidal Fuzzy Weighted Averaging (M-GTzIFWA) operator. Some desirable properties of the M-GTzIFWA have also been studied in this work with some properties and theorems being proved for the validity of the proposed concepts. In addition, a defuzzification function and a correlation coefficient are newly proposed for ranking the best alternatives. Furthermore, we have applied the M-GTzIFWA operator to MAGDM problem, a real problem about the evaluation of teaching quality in an Institute is provided. In the process of Artificial Neural Network combined with MAGDM problems the process of **Data Normalization** is performed in practical applications, consider normalizing or standardizing input data for better performance and faster convergence. Then the **Model Tuning** is done to adjust the number of neurons in the hidden layer, learning rate, and number of epochs to find the best configuration for the specific data and problem. Finally, the desired output is received after some finite number of iterations of weight updation with several hidden layers and learning rules. Hence the **extensibility of t**his basic structure can be extended with more complex architectures in the future research (e.g., multiple hidden layers) and other activation functions could also be employed for providing a better decision support system.

ABSTRACT

The connected detour eccentric dominating set and the connected detour eccentric domination numbers are defined in this paper. Connected detour eccentric domination numbers for various well-known graphs and family of graphs are obtained. The minimum and maximum cardinality of a connected detour eccentric dominating set are described in this study, and theorems relating to these concepts are stated and proved.

Keywords: Dominating set, Domination number, Detour eccentric dominating set, Detour eccentric domination number, Connected detour eccentric dominating set, Connected detour eccentric domination number.
Mathematics Subject Classification (2010) : 05C12, 05C69.

INTRODUCTION

The investigation of dominating sets in graphs was started by Ore [1]. H.B. Walikar and E. Sampathkumar [5] talked about the connected domination number. Eccentric domination in graphs is a concept that was developed by T.N. Janakiraman and M. Bhanumathi [3]. A. Mohamed Ismayil and R. Priyadharshini established the detour eccentric domination in graphs for the first time [4]. R. Jahir Hussain and A. Fathima Begam researched connected eccentric domination in graphs [2]. This paper covers the connected detour eccentric dominating set and its numbers.

80243

PRELIMINARY

Definition:2.1.[3]Any graph can be represented by $G = (V, E)$, where V stands for the set of vertices and E stands for the set of edges. The *order* of G is equal to the number of elements in a vertex set V, denoted by n and the *size* of G is equal to the number of elements in an edge set E, denoted by m. The shortest $u - v$ path, indicated by $d(u, v)$, measures the distance between u and v.The *eccentricity* of u is given by $e(u) = \max\{d(u, v) : v \in V, u \neq v\}$, where u and v can be any two vertices in a connected graph G. If $d(u, v) = e(u)$, a vertex v of G is said to be an *eccentric vertex* of u.

Definition:2.2.[4]The distance $D(u, v)$ is known as the *detour distance* and is determined by the length of the longest $u - v$ path in the connected graph G if u and v are any two vertices. Each vertex u of G is *detour eccentricity* is given by the formula $e_D(u) = \max\{D(u, v) : v \in V\}$. A vertex v of G is referred to as the *detour eccentric vertex (DEV)* of u when $D(u, v) = e_D(u)$.

Definition:2.3.[1]A set in a graph G is said to be a *dominating set(D-set)* if every vertex in $V - D$ is adjacent to at least one vertex in D. The domination number is defined and indicated by the equation $\gamma(G) = \min\{|D_i| | D_i \text{ is a D} - \text{set}\}$.

Definition:2.4.[5] A *connected dominating set (CD-set)D* to be a D-set D whose induced subgraph $\langle D \rangle$ is connected. The minimal cardinality of a CD-set is the connected domination number$\gamma_C(G)$ of a connected graph G.

Definition:2.5.[3]If D is a D-set of G andthere is at least one eccentric point in v in $D$for every $v \in V - D$, then the set $D \subseteq V(G)$ is an *eccentric domination set (ED-set)*.

Definition:2.6.[4]If for every v in the D-set $D \subseteq V$ of a graph G, there exists at least one detour eccentric vertex $u \in V - D$ the set is known as a *detour eccentric dominating set (DED-set)*. The detour eccentric domination number is indicated and defined by the expression $\gamma_{DE}(G) = \min\{|D_i| / D_i \text{ is a DED-set}\}$.

Definition:2.7.[2]If D is an ED-set of G and the induced subgraph $\langle D \rangle$ is connected, then the set $D \subseteq V(G)$ is a *connected eccentric dominating set (CED-set)*. If no proper subset D' of D is a CED-set, then the CED-set is a minimal connected eccentric dominating set. A minimum CED-set is the minimal connected eccentric dominating set with the smallest cardinality. The connected eccentric domination number, indicated by $\gamma_{CE}(G)$, is the cardinality of the smallest CED-set.

Theorem:2.8.[6] For any connected graph G, $\gamma_C(G) = n - \Delta(G)$.

Theorem:2.9.[6] For any connected graph G, $\gamma_C(G) \leq n + e(G) - \varepsilon_T(G)$, where $\varepsilon_T(G)$ is the maximum number of pendent edges in any spanning tree of G.

Connected Detour Eccentric Domination in Graph

Definition:3.1. If D is a DED-set of G and the induced subgraph $\langle D \rangle$ is connected, then D is called a connected detour eccentric dominating set (CDED-set), of G. A CDED-set$D$ is called a minimal CDED-set if there exists a subset $D' \subset D$ which is not a CDED-set. The *connected detour eccentric domination number(CDEDN)$\gamma_{CDE}(G)$* of G denotes a representation of the minimum cardinality of a CDED-set of G. The *maximumCDEDN$\Gamma_{CDE}(G)$* denotes the maximum cardinality of a CDED-set of G.

Example:3.2.

Consider the graph G given in Figure 1.
Figure 1: Graph G

The minimal DED-sets are $\{x_2, x_4\}$ and $\{x_1, x_3, x_5\}$.
Hence, $\gamma_{DED}(G)$ is 2 and $\Gamma_{DED}(G)$ is 3.
The minimal CDED-sets are $\{x_2, x_4\}$ and $\{x_3, x_5, x_6\}$.
Hence, $\gamma_{CDE}(G)$ is 2 and $\Gamma_{CDE}(G)$ is 3.

Note: 3.3.1. For any connected graph G,
$\gamma(G) \leq \gamma_{DE}(G) \leq \gamma_{CDE}(G)$ and $\gamma_C(G) \leq \gamma_{CDE}(G) \leq \gamma_C(G) + e(G)$.
Any CDED-set is also a DE-set, therefore$\gamma_{DE}(G) \leq \gamma_{CDE}(G)$. Since $\gamma_{DE}(G) = \gamma_{CDE}(G) = 2$, the sharpness of this inequality arises from the equation $G = K_{m,n}, m, n \geq 2$. The inequality, though, is extremely severe. For any connected graph G, for that instance, $\gamma_C(G) = n - \varepsilon_T(G)$, where $\varepsilon_T(G)$ is the maximum number of pendent edges in any spanning tree of G, $t_{DED}(C_n) = n/2$, when $n = 4m$ and m is odd, and $\gamma_{CDE}(C_n) = n - 2$ for all n, where $n \geq 4$.
2. D is a minimally CDED-set,if and only if at least one of the following conditions is true.

(i)   There is a vertex $w \in V - D$ such that w is uniquely dominated by v for every vertex $v \in D$.
(ii)   Every point v in D is a unique detour eccentric point of some point $w \in V - D$ in D that is all other detour eccentric points of $w \in V - D$ lie in $V - D$ only.
(iii) v is a cut point of $\langle D \rangle$, for all $v \in D$.

Observations:3.4.i). It is simple to see that the CDED-set only appears in connected graphs.
ii). Every DED-set is also anED-set, & every ED-set is a D-set. Therefore, we have $\gamma(G) \leq \gamma_{DE}(G) \leq \gamma_{CDE}(G)$.
iii). Every CDED-set is also aCD-set, and every CD-set is a D-set. Consequently, we have $\gamma(G) \leq \gamma_C(G) \leq \gamma_{CDE}(G)$.

Theorem:3.5. If H is a connected spanning subgraph of G, then
$\gamma_{CDE}(G) \leq \gamma_{CDE}(H)$.

Proof: Let G be a connected graph and H be any connected spanning subgraph of G. Then every CDED-set of H is also a CDED-set of G, and hence
$\gamma_{CDE}(G) \leq \gamma_{CDE}(H)$.

Theorem:3.6. If $G = K_n$ is a complete graph with n vertices, then $\gamma_{CDE}(K_n) = 1$.

Proof: The $diameter\ (diam)of\ G\ is\ 1\ and\ the\ radius\ (rad)of\ G\ is\ 1$ in K_n.
Since each vertex $u \in V$ is a DEV of other vertices of V, they are all near each other.
It follows that any vertex $u \in V$ dominates the other vertices of V and that it is the DEV of the remaining vertices, making it clear that every trivial graph is connected. Therefore, $D = \{u\}$ is a minimum CDED-set of G.
As a result, $\gamma_{CDE}(K_n) = 1$.

Theorem:3.7. If $G = K_{1,n}$ is a star graph, then$\gamma_{CDE}(K_{1,n}) = 2, n \geq 2$.
Proof: When $G = K_{1,n}$, the radius is 1 and the diameter is 2.

Mohamed Ismayil and Priyadharshini

Let $D = \{u, v\}$, with v as the central vertex. In $V - D$, the central vertex v dominates over all other vertices, and the DEVu is one of the vertices of $V - D$. The connected induced subgraph $\langle D \rangle$.

As a result, $\gamma_{CDE}(K_{1,n}) = 2, n \geq 2$.

Theorem:3.8. If $G = K_{m,n}$ is a complete bipartite graph, then$\gamma_{CDE}(K_{m,n}) = \begin{cases} 1, & m = n = 1 \\ 2, & otherwise \end{cases}$

Proof:$K_{m,n} = K_2$, if $m = n = 1$. By theorem A, if $m = n = 1$, then $\gamma_{CDE}(K_{m,n}) = 1$.

Consider the case $m \geq 1, \ n \geq 2 \ $ or $m \geq 2, \ n \geq 1$. $Rad(G) = 1, \ diam(G) = 2$ for $m = 1, \ n \geq 2 \ $ or $ \ m \geq 2, \ n = 1$. Consider the following equation: $G = K_{m,n}$, where $V(G) = V_1 \cup V_2, |V_1| = m$, and $|V_2| = n$, and each element of V_1 is adjacent to each vertex of V_2 and vice versa.

Let $D = \{u, v\}, u \in V_1$, and $v \in V_2$, where u dominates all V_2 vertices and is a DEV of all $V_1 - \{u\}$ vertices. Like this, v is a DEV that dominates all the vertices of V_1 and $V_2 - \{v\}$. The connected induced subgraph $\langle D \rangle$. Therefore, if either $m \geq 1, \ n \geq 2 \ $ or $m \geq 2, \ n \geq 1$, $\gamma_{CDE}(K_{m,n}) = 2$, is true.

Theorem:3.9. If C_n is a cycle graph with n vertices, then$\gamma_{CDE}(C_n) = n - 2, n \geq 3$.

Proof: When $G = C_n, r = rad \ (C_n) = n - 1$.

In $C_n, rad \ (C_n) = \ diam(C_n)$. Consider the cycle $C_n: v_1, v_2, v_3, \ldots, v_n, v_{n+1} = v_1$. Since in C_n, every vertex is $2 - $regular, each vertex $v(C_n)$ dominates exactly 3 vertices. The vertex v_1 dominates v_2, v_n and itself. Now include the vertex v_1 in set D. To form a CD-set D, we must introduce the next consecutive vertex either inv_2 or v_n in D, otherwise, we cannot form a CD-set. Suppose we select $v_2 \in D$, then we must choose the next consecutive vertex v_3 in D. This process is continued until we have $(n - 2)$ vertices of C_n in D. Therefore, $D = \{v_1, v_2, v_3, \ldots, v_{n-2}\}$. The vertices $v_{n-1} \in V - D$are dominated by v_{n-2} of D and the vertex $v_n \in V - D$ is dominated by $v_1 \in D$. D is the minimum CD-set of C_n. We know that C_n is a self–centered graph and radius $= r$.

The DEV of $v_i = \begin{cases} v_{i+1} \ if \ i \leq r \\ v_{i-r} \ if \ i > r \end{cases}$

When n is odd there exists another DEV of

$v_i = \begin{cases} v_{r+1} \ \ if \ i = 1 \\ v_{i-1} \ \ if \ i > 1 \end{cases}$

The eccentric point set is also a DED-set.

Therefore, the CDED-set $D = \{v_2, v_3, \ldots, v_{n-1}\}$.

Hence, $\gamma_{CDE}(G) = n - 2$.

Theorem:3.10. If $W_n$is a wheel graph with n vertices, then $\gamma_{CDE}(W_n) = \begin{cases} 1 \ \ if \ n = 3 \\ 2 \ \ if \ n = 4 \\ 3 \ \ if \ n \geq 5 \end{cases}$

Proof: If $G = W_3 = K_4$. Therefore,theorem 3.6,$\gamma_{CDE}(K_4) = 1$ implies that $\gamma_{CDE}(W_3) = 1$.

When $G = W_4$, consider $D = \{u, v\}$ where u and v are adjacent non-central vertices. D is a minimum CDED-set. Therefore, $\gamma_{CDE}(W_4) = 2$.

When $G = W_4, n \geq 5$. Consider $D = \{u, v, w\}$ where $v$the central vertex is, and u, w are there any two adjacent non—central vertices. D is a minimum CDED-set.

Therefore, $\gamma_{CDE}(W_n) = 3, n \geq 5$.

Theorem:3.11.$\gamma_{CDE}(G) \leq 1 + \delta(G)$, if Ghas a diameter of two.

Proof:$diam(G) = 2$. Suppose$w$is chosen so that$(G), deg \ w = \delta(G)$. Consider$D = \{w\} \cup N(w)$. This is a CDED-set of G. Hence, $\gamma_{CDE}(G) \leq 1 + \delta(G)$ for the connected induced subgraph $\langle D \rangle$.

Theorem:3.12.$\gamma_{CDE}(G) \leq deg(v) + 2$, if the tree T has a radius of two, a unique central vertex u, and $deg(v) \leq 2$ for every $v \in N(u)$.

Proof: Let$T$ be a tree with a radius 2 and a unique central vertex. $N[u]$ is then aCD-set for G.

Mohamed Ismayil and Priyadharshini

Case (i): If any vertex $v \in N(u)$ is a pendent vertex,then $N[u] - \{v\}$ is a minimum CD-set. If there are k pendent vertices in $N(u)$, then include every vertex in the collection D. $N[u] - \{D\}$ is the minimum CD-set for G. For any vertex w in $V - N[u]$, it is aDEV for all other vertices in $V - N[u]$ and D.

This leads to the minimally CDED-set$N[u] - \{D\} + \{w\}$.

$\gamma_{CDE}(G) = |N[u] - \{D\} + \{w\}|$
$\quad\quad = \deg(u) + 1 - k + 1$
$\quad\quad = \deg(u) + 2 - k$
$\quad\quad < \deg(u) + 2$

Case (ii):$N[u]$ is the minimum CD-set, if there is not a pendent vertex in$N(u)$. Any vertex w is aDEVfor all other vertices $V - N[u]$. For G, the resulting minimum CED-set is $N[u] + \{w\}$.

$\gamma_{CDE}(G) = |N[u] + \{w\}|$
$\quad\quad = \deg(u) + 1 + 1$
$\quad\quad = \deg(u) + 2$

$\gamma_{CDE}(G) \le deg(v) + 2$, where u is a unique central vertex with a radius of 2, following from cases (i) and (ii).

Theorem:3.13. If P_n is a path graph with n vertices, then$\gamma_{CDE}(P_n) = n - 1$.

Proof: Let P_n be a path with n vertices. In P_n,there are two pendent vertices, let us callu, v. It appears that the minimum CD-set is$D = V(P_n) - \{u, v\}$.To form the DED-set, we must add u or v in D.This is because the DEV of $u \in V(P_n) - D$ is $v \in V(P_n) - D$, and the DEV of $v \in V(P_n) - D$ is $u \in V(P_n) - D$.Assuming$D = V(P_n) - \{v\}$, Drepresents the minimum CDED-set and $|D| = n - 1$.

Hence, $\gamma_{CDE}(P_n) = n - 1$.

Theorem:3.14. For any graph G, then$\gamma_{CDE}(G) \ge d$,if d is the diameter of G.

Proof: Let G be a connected graph with a diameter d. Assume that there are two peripheral vertices,u and $v$separated by$d$. A diametral path joins$u$ and $v$is denoted by$P$. Let D be a CDED-set. When$u, v \in D$, $|D| \ge d + 1$. $|D| \ge d$,if any one of u, v is in D. Therefore, $\gamma_{CDE}(G) \ge d$.

Considering that$\gamma_{CDe}(G) = n - 1$ if G is a path on n vertices,this lower bound is likewise sharp.

Theorem:3.15. $\gamma_{CDE}(G) \le n + e(G) - \Delta(G)$, let G be a connected graph, then

Proof: Based on the theorem:2.8,$\gamma_C(G) = n - \Delta(G)$, for each connected graph G. The theorem follows as a result.

Theorem:3.16. For any connected graph G, then $\gamma_{CDE}(G) \le n + e(G) - \varepsilon_T(G)$, where $\varepsilon_T(G)$ is the maximum number of pendent edges in any spanning tree of G.

Proof: According to the theorem:2.9,$\gamma_C(G) = n - \varepsilon_T(G)$,for every connected graph G, where $\varepsilon_T(G)$ is the maximum number of pendent edges in any spanning tree of G. Furthermore,$D \cup S$ is a CDED-set of G, if D is a CD-set and S is a minimum DEP-set of G. Consequently, $\gamma_{CDe}(G) \le \gamma_c(G) + e(G)$. The theorem follows as a result.

Corollary:3.17. Let G be a connected graph, then $\gamma_{CDE}(T) \le n - \Delta(G) + 2$, for any tree T.

Proof:$e(G) = 2$, for any tree T.$\gamma_{CDE}(T) \le n - \Delta(G) + 2$ as a result.

Theorem:3.18.$\gamma_{CDE}(G) \le \lfloor (n + \gamma_C(G)) / 2 \rfloor$.

Proof: With $\gamma_C(G) + \lfloor (n - \gamma_C(G))/2 \rfloor$ vertices, we can form a γ_{CDE} – set S, if D is a γ_C - set of G. Given that the vertices of D and $V - D$are adjacent to $\langle S \rangle$ is connected.Because of this,$\gamma_{CDE}(G) \le \lfloor (n + \gamma_C(G)) / 2 \rfloor$.

Given that for$G = P_n$,$\gamma_{CDE}(G) = n - 1 = \lfloor (n + \gamma_C(G)) / 2 \rfloor$, this upper bound is sharp.

Mohamed Ismayil and Priyadharshini

Theorem:3.19. $\gamma_{CDE}(G) \le (n - t + 2)/2$ where t is the number of vertices with detour eccentric radius if G has a radius of one and a diameter of two.

Proof: Suppose $u \in V(G)$ and $() = 1$. For each vertex, let be the number of detour eccentricity of one. All other vertices are dominating to , and is a detour eccentric point for -1 other vertices. Consider the remaining $(-)$ vertices of . They are also dominated by , but does not dominate them detour eccentrically at their detour eccentric points; at most, $(-)/2$ vertices are required to dominate them and detour eccentrically. All other vertices are adjacent to since $() = 1$. $() \le 1 + \frac{-}{2} = (- + 2)/2$, as a result.

Theorem:3.20. $() \le 2 + \lceil(() -)/2\rceil$, where is the number of vertices with detour eccentricity one, holds if has a radius of one and a diameter of two.

Proof: $()$ can be divided as follows into two sets: $_1$ and $_2$. $_1 = \{ | () = 1\}$ and $_2 = \{ | () = 2\}$. Let be a vertex in $_2$ such that the degree of in $= \langle_2\rangle$ is minimum. Let $\deg_H = _2 = () - $. Then is detour eccentric to the remaining $- - _2$ vertices. Let be a subset of $()$ such that $() - $ vertices have detour eccentric vertices in . with $_1$ being a CDED-set of , $\{,\} \cup$. It follows that, $() \le 2 + \lceil(() -)/2\rceil$.
Additionally, this upper bound is sharp as $G = K_{1,n-1}$, $\gamma_{CDE}(G) = 2$.

Corollary:3.21 $\gamma_{CDE}(G) + \gamma_{CDE}(\bar{G}) \le n + \delta - \Delta + 1$, if G and $\bar{G}$ are self-centered of diameter 2.

Proof: $\gamma_{CDE}(G) \le 1 + \delta$ and $\gamma_{CDE}(\bar{G}) \le 1 + \delta(\bar{G}) = 1 + \bar{\delta}$ are found by Theorem 3.19.
Thus, $\gamma_{CDE}(G) + \gamma_{CDE}(\bar{G}) \le 1 + \delta + 1 + \bar{\delta} = 2 + \delta + (n - 1 - \Delta) = n + \delta - \Delta + 1$.

Theorem:3.22. $\gamma_{CDE}(G) \le 1 + \Delta(G)$, if G contains a pendent vertex v of detour eccentricity 3 and is of radius 2 and diameter 3.

Proof: If G support u has a detour eccentricity of 2 if its pendent vertex v has a detour eccentricity of 3. $N[u]$ is a CDED-set in this case. Consequently, $\gamma_{CDE}(G) \le 1 + \deg_G u \le 1 + \Delta(G)$.

Theorem:3.23. If G has a radius of 2 and a diameter of 3, then $\gamma_{CDe}(G) \le \min\left\{\frac{n + \deg_G u + 1}{2}\right\}$, where u is the minimum determined overall central vertices.

Proof: Assume that u is a minimum degree central vertex. Consider $N(u)$. All the vertices in $N_2(u)$ are detour eccentric to u, and $N(u)$ dominates all the vertices of G. Assume that S is a subset of $N_2(u)$ with minimum cardinality such that all vertices in $N_2(u) - S$ have detour eccentric vertices in S. In such a case, $|s| \le \frac{|N_2(u)|}{2} = (n - \deg_G u - 1)/2$. Here, $N[u] \cup S$ is a connected detour eccentric dominating set of G.
It follows that, $\gamma_{CDE}(G) \le 1 + \deg_G u + \frac{n - \deg_G u - 1}{2} = (n + \deg_G u + 1)/2$. Thus, the theorem is proved.

Corollary:3.24. For all n, $\gamma_{CDE}(P_n) = n - 1$.

Theorem:3.25. For all n, $\gamma_{CDE}(C_n) = n - 2$.

Proof: Let any two adjacent vertices, u, v of G. Then $V - \{u, v\}$ is a minimum CDED-set of C_n. Therefore, for any n, $\gamma_{CDE}(C_n) \ge n - 2$. Furthermore, $\gamma_C(C_n) = n - 2$ and $\gamma_C(C_n) \le \gamma_{CDE}(C_n)$. Consequently, for any n, $\gamma_{CDE}(C_n) = n - 2$.

Theorem:3.26. $\gamma_{CDE}(\bar{C}_5) = 3$ and $\gamma_{CDE}(\bar{C}_n) = \lceil n / 3 \rceil$, $n \ge 6$.

Mohamed Ismayil and Priyadharshini

Proof: We have $\gamma_{DE}(\bar{C}_5) = 3$ and $\gamma_{DE}(\bar{C}_5) = \lceil n / 3 \rceil, n \geq 6$. Also, $\gamma_{DE}(G) \leq \gamma_{CDE}(G)$. Hence, $\gamma_{DE}(\bar{C}_5) \geq \lceil n / 3 \rceil$. $\Gamma_{CDE}(\bar{C}_5) = 3$. Let us now assume $n \geq 6$. Form C_n with $v_1, v_2, v_3, \ldots, v_n, v_1$. Then $\bar{C}_n = K_n - C_n$, where every vertex v_i is adjacent to every other vertex in $\bar{C}_n$ except for v_{i-1} and v_{i+1}. Hence detour eccentric point of v_i in $\bar{C}_n$ is v_{i-1}, and v_{i+1} only. We can now consider the following CDED-set.

If $n = 3m$, then $\{v_1, v_4, v_7, \ldots, v_{3m-2}\}$;

If $n = 3m + 1$, then $\{v_1, v_4, v_7, \ldots, v_{3m+1}\}$;

If $n = 3m + 2$, then $\{v_1, v_4, v_7, \ldots, v_{3m+1}, v_{3m+2}\}$;

Consequently, $\gamma_{CDE}(\bar{C}_n) \leq \lceil n / 3 \rceil$. Therefore, for $n \geq 6$, it follows that $\gamma_{CDE}(\bar{C}_n) \leq \lceil n / 3 \rceil$.

Theorem:3.27. Let G be obtained by eliminating edges with a linear factor from the complete graph K_n, then, $\gamma_{CDE}(G) = n/2$, n is even.

Proof: Each vertex in $V - D$ is adjacent to at least one element in D, and each element in $V - D$ has a detour eccentric point in D. D is connected and has $n/2$ vertices. As a result, $\gamma_{CDE}(G) \leq n/2$. Additionally, we have $n/2 \leq \gamma_{DE}(G) \leq \gamma_{CDE}(G)$ because G is a unique detour eccentric point graph. As a result, $\gamma_{CDE}(G) \leq n/2$.

Theorem:3.28. Let G be a connected graph with $|V(G)| = n$. Then $\gamma_{CDE}(G \circ K_1) \leq 3n/2$.

Proof: Let $V(G) = \{v_1, v_2, \ldots, v_n\}$. For $i = 1, 2, \ldots, n$, let v_i' be the pendent vertex adjacent to v_i in $G \circ K_1$. A CD-set for $G \circ K_1$ is $D = \{v_1, v_2, \ldots, v_n\}$. Let S represent the eccentric minimum detour point set of G. Let S' be the corresponding subset of $\{v_1' v_2' \ldots, v_n'\}$. When $G \circ K_1$ and $|S' \cup D| \leq 3n/2$ are D-sets, $S' \cup D$ is a DE-set.

The following theorem defines graphs for which $\gamma_{CDE}(G) = 2$.

Theorem:3.29. Let G be a connected graph. If G is any one of the following:

(i) A connected graph, G, shall be. If G is any one of the following: $r(G) = 1, diam(G) = 2$, and $u \epsilon V(G)$ such that $e(u) = 2$ and $d(u, v) = 2$ for all $v \epsilon V(G)$ with $e(v) = 2$, then $\gamma_{CDE}(G) = 2$ is true.

(ii) G has a dominating edge that is not in a triangle and is self-centered, with a diameter of 2.

Proof: It is satisfied that $\gamma_{CDE}(G) = 2$ when any one of the above conditions is met for G Conversely, suppose that $\gamma_{CDE}(G) = 2$. Therefore, $\gamma(G) = 1$ or $\gamma(G) = 2$.

Case (i): $\gamma(G) = 1$ and $\gamma_{CDE}(G) = 2$. This implies G satisfies (i).

Case (ii): $\gamma(G) = 2 = \gamma_{CDE}(G)$.

Let D represent the minimum CDED-set (γ_{CDE}-set) of G. Let $D = \{u, v\} \subseteq V(G)$. Given that $\gamma(G) = 2$, $r(G) \geq 2$.

Since D is connected, the edges u and v are adjacent to each other and the edge uv is a dominating edge for G. As a result, $r(G) \geq 2$ and $2 \leq diam(G) \geq 3$.

Assuming $diam(G) = 3$, vertex x exists with detour eccentricity 3, and x is dominated by either u or v.

Suppose $xu \epsilon E(G)$. Now, D is a γ_{De} - set. Therefore, v must be an eccentric detour point of x. It suggests that $d(x, v) = 3$. However, the path xuv is a contradiction because $\Rightarrow d(x, v) = 2$. x must therefore be a vertex with an eccentricity of 2. This suggests that G is self-centered with diameter 2, or that $diam(G) = 2$. [Since w would not have a detour eccentric point in D in that case to $r(G) \geq 2$, no w is adjacent to both u and v.]

CONCLUSION

The connected detour eccentric dominating set (CDED-set) is described in this study along with its numbers. The connected detour eccentric domination numbers for several typical graphs are calculated. It might also be expanded to include the inverse CDED set and the totalCDED set and their numbers in further research.

ABSTRACT

The eccentric graph of G= (V, E)is denoted by $ecc(G) = (V, E')$, where $E' = \{(u,v) : d_G(u,v) = ecc(u)$ or $d_G(u,v) = ecc(v)$ for $u,v \in V\}$. A graph that admits a divisor cordial labeling (dc-labeling) is called a divisor cordial graph (dc-graph). In this paper, we investigate some new families of the divisor cordial eccentric graphssuch as $ecc(P_n)$, $ecc(C_n)$, $ecc(P_n \odot K_1)$, and $ecc(P(C_n(2)))$.

Keywords: Eccentric graph, divisor cordial graph, path, cycle, comb graph.
AMS subject classification: 05C78.

INTRODUCTION

We start with an undirected, simple, finite graph. A graph G = (V, E), where V is the set of vertices with $|V| = p$ and E is the set of edges with $|E| = q$, is referred to as a (p,q) graph G. The origins of graph theory are attributed to Leonhard Euler's 1736 examination of the well-known Königsberg bridge problem. Graph labeling is an essential topic within the field of graph theory. Graph labeling is the process of giving vertices, edges, or both graph labels, which are often represented by integers. One of the fascinating and active subfields of graph theory is the labeling of graphs. The graph labeling techniques in graph theory originated with graceful labeling and harmonic labeling. Another significant labeling style that incorporates elements of both graceful and harmonious is called cordial, and it was first established by Cahit in [2]. The idea of divisor cordial labeling of graphs was first presented by Varatharajan et al. in [9]. Eccentric graphs are one type of eccentricity-related graph study; these studies of graphs are fascinating and amazing. Akiyama et al. defined the unique kind of graph operation known as the eccentric graph of the graph

Periasamy *et al.,*

in [1], and they also provided several intriguing characterizations of these kinds of graphs.There is only one graph structure driven by any graph action. However, nearly every graph has an eccentric graph operation that leads to multiple fascinating and amazing graph structures. Kaspar et al. discovered and described such "intriguing graph structures of eccentric graphs of specific classes of graphs in [5]. Ghosh et al. in[6] look into a few families of prime cordial eccentric graphs. The graphs under discussion are undirected, simple, and finite. We refer to Harary [4] for terminology related to graph theory. We refer to Tom M. Apostol [8] for the standard terminology and notations in number theory, and to Gallian [3] for the literature on graph labeling. The purpose of this paper is" to look into the dc-labeling of $ecc(P_n)$, $ecc(C_n)$, $ecc(P_n \odot K_1)$, and $ecc(P(C_n(2)))$.

PRELIMINARIES

Definition "2.1graph labeling refers to the act of assigning distinct identifiers to the edges and vertices of a graph.

Definition 2.2 Assume that a and b are two integers. When an integer k is positive and a divides b, it indicates that b = ka exists. It is represented as a│b. If a does not divide b, then we represent this by denoting a $\nmid$ b.

Definition 2.3 Consider a simple graph G = (V(G), E(G)) and let f: V(G) → {1,2,…, |V(G)|} be a bijection. Assign the label 1 to each edge uv if either $f(u)|f(v)$ or $f(v)|f(u)$, and assign the label 0 otherwise. The function f is referred to as a divisor cordial labeling if $|e_f(0) - e_f(1)| \leq 1$, where $e_f(0)$, $e_f(1)$ are the number of edges having labels 0 and 1 respectively. A graph that can be labeled with a divisor cordial labeling (dc-labeling) is referred to as a divisor cordial graph (dc-graph).

Definition 2.4 Consider a graph G with a set of vertices V and a set of edges E. The eccentric graph of G is represented as $ecc(G) = (V, E)$, where $E' = \{(u,v): d_G(u,v) = ecc(u) \text{ or } d_G(u,v) = ecc(v) \text{ for } u, v \in V\}$.

Definition 2.5"[5] A double star is formed by "connecting the centers of two stars, which then become the centers of the double star $S_{m,n}$.

Definition 2.6 [7]Let $G_1, G_2, …, G_n$ be n(≥ 2) copies of a graph G. It is denoted by G(n) the graph obtained by adding an edge to G_i and G_{i+1}, i= 1, 2, …, n–1, and call G(n) the path-union of n copies of the graph G".

Result 2.1 [9] The cycle C_n is divisor "cordial.

MAIN RESULTS

Theorem 3.1$ecc(P_n)$ **is dc-graph, for n** $\geq$**3.**

Proof: The eccentric graph of path P_n is denoted as $ecc(P_n)$. P_n is a graph with n vertices and n–1 edges, where $v_1, v_2, …, v_n$ represent the vertices of P_n.

Case 1: when n is odd.

Then $ecc(P_n)$ is a graph containing" a cycle of three vertices v_1, $v_{\frac{n+1}{2}}$, v_n, and also both v_1 and v_n have $\frac{n-3}{2}$ pendent edges. Here v_1 has $\frac{n-3}{2}$ adjacent vertices $v_{\frac{n+3}{2}}$, $v_{\frac{n+5}{2}}$, …, v_{n-1}, and v_n has $\frac{n-3}{2}$ adjacent vertices v_2, …, $v_{\frac{n-1}{2}}$.

$|V(ecc(P_n))| = n$ and $|E(ecc(P_n))| = n$.Let p denote the largest prime number in the range of 1 "to n.

Define f : V(ecc(P$_n$)) $\rightarrow$ {1, 2, …, n} as follows.Label the vertices v$_1$,v$_n$and v$_{\frac{n+1}{2}}$ by 1, 2 and p. Also label the adjacent vertices of v$_1$ by even number from 4 to n–1 and label the adjacent vertices of v$_n$ by odd number from 3 to n other than p. Then the corresponding edge labeling will give e$_f$(0) = $\frac{n-1}{2}$ and e$_f$(1) = $\frac{n+1}{2}$. Thus ∣ e$_f$(0) – e$_f$(1) ∣ = 1. Hence the ecc(P$_n$) is a dc-graph, when n is odd.

Case 2: when n is even.

Then ecc(P$_n$) is" a double star $S_{\frac{n-2}{2},\frac{n-2}{2}}$ .ecc(P$_n$) has an edge v$_1$v$_n$ andalso both v$_1$ and v$_n$ have $\frac{n-2}{2}$ pendent edges.

Here v$_1$ has $\frac{n-2}{2}$ "adjacent vertices v$_{\frac{n+2}{2}}$, v$_{\frac{n+4}{2}}$, …, v$_{n-1}$,and v$_n$ has $\frac{n-2}{2}$ adjacent vertices v$_2$, …, v$_{\frac{n}{2}}$.

∣V(ecc(P$_n$))∣ = n and ∣E(ecc(P$_n$))∣ = n–1.

Define f:V(ecc(P$_n$)) $\rightarrow$ {1, 2, …, n} as follows.Label the vertices v$_1$ and v$_n$by 1 and 2. Also, label the adjacent vertices of v$_1$ by even number from4 to n and label the adjacent vertices of v$_n$ by odd number from 3 to n–1. Then the corresponding edge labeling will give e$_f$(0) = $\frac{n-2}{2}$ and e$_f$(1) = $\frac{n}{2}$. Thus ∣ e$_f$(0) – e$_f$(1) ∣ = 1.Hence ecc(P$_n$) is also dc-graph", when n is even. Therefore, the ecc(P$_n$)is a dc-graph, for n $\geq$ 3.

Illustration 3.1 (i).P$_6$ and dc-labeling ofecc(P$_6$)$_{are}$ shown in Figure 3.1(a).

Theorem 3.2ecc(C$_n$)is "dc-graph, for n $\geq$ 3.

Proof: Let ecc(C$_n$) be the eccentric graph of cycle C$_n$. C$_n$ has n vertices and n edges, where v$_1$,v$_2$,…,v$_n$ are the vertices of C$_n$.

Case 1: when n is even.

Then ecc(C$_n$) is $\frac{n}{2}$ P$_2$, where the vertices of each P$_2$ are v$_i$ v$_{\frac{n}{2}+i}$, i = 1,2,…, $\frac{n}{2}$. Also, ∣V(ecc(C$_n$))∣ = n and ∣E(ecc(C$_n$))∣

= $\frac{n}{2}$.

Define f:V(ecc(C$_n$)) $\rightarrow$ {1, 2, …, n} as follows.

Subcase 1(a): n $\equiv$ 0 (mod 4)

f(v$_i$) = 2i–1, for i = 1,2,…, $\frac{n}{4}$ and f(v$_{\frac{n}{2}+i}$) = 4i–2, for i = 1,2,…, $\frac{n}{4}$.

f(v$_{\frac{n}{4}+i}$) = 4i, for i = 1,2,…, $\frac{n}{4}$ and f(v$_{\frac{3n}{4}+i}$) = $\frac{n}{2}$ +2i–1, for"i = 1,2,…, $\frac{n}{4}$.

Then the corresponding edge labeling will "give e$_f$(0) = e$_f$(1) = $\frac{n}{4}$. Thus ∣ e$_f$(0)–e$_f$(1) ∣ = 0. Hence ecc(C$_n$) is also dc-graph, n $\equiv$ 0 (mod 4)

Subcase 1(b): $n \equiv 2 \pmod 4$

$f(v_i) = 2i–1$, for $i = 1,2,…, \dfrac{n+2}{4}$ and $f(V_{\frac{n}{2}+i}) = 4i–2$, for $i = 1,2,…, \dfrac{n+2}{4}$.

$f(V_{\frac{n+2}{4}+i}) = 4i$, for $i = 1,2,…, \dfrac{n-2}{4}$ and $f(V_{\frac{3n+2}{4}+i}) = \dfrac{n+2}{2} +2i–1$, for $i = 1,2,…, \dfrac{n-2}{4}$.

Then the corresponding edge labeling will give $e_f(0) = \dfrac{n+2}{4}$ and $e_f(1) = \dfrac{n-2}{4}$. Thus $\mid e_f(0) – e_f(1) \mid = 1$.

Hence ecc(C_n) is also dc-graph, when $n \equiv 2 \pmod 4$.
Therefore, ecc(C_n) is also a dc-graph, when n is even

Case 2: when n is odd.
Then ecc(C_n) is also acycle $C_n= v_1 V_{\frac{n+1}{2}} v_n V_{\frac{n-1}{2}} v_{n–1}… v_3 V_{\frac{n+5}{2}} v_2 V_{\frac{n+3}{2}} v_1$. By result 2.1, cycle C_n is a dc-graph for $n \geq 3$.

Therefore ecc(C_n) is also dc-graph" when n is odd. Hence, ecc(C_n) is dc-graph, for $n \geq 3$.

Illustration 3.2(i).$C_7$and dc-labeling of ecc(C_7)are shown in Figure 3.2(a).
(ii).$C_8$and dc-labeling of ecc(C_8)are shown in Figure 3.2(b).

Theorem "3.3 ecc($P_n \odot K_1$)is dc-graph, for $n \geq 3$.

Proof: Letecc($P_n \odot K_1$) be the eccentric graph of a comb $P_n \odot K_1$. P_n has n vertices and n–1 edges, where $v_1,v_2,…,v_n$ are the vertices of P_n. $w_1,w_2,…,w_n$ are the pendent vertices and $v_1w_1, v_2w_2, v_3w_3, …, v_nw_n$are the pendent edges of$P_n \odot K_1$.

Case 1: when n is odd.
Then ecc($P_n \odot K_1$) is a graph with $K_4– \{e\}$ of four vertices $w_1, V_{\frac{n+1}{2}}, w_n, W_{\frac{n+1}{2}}$ and $e = V_{\frac{n+1}{2}} W_{\frac{n+1}{2}}$. Also,both $w_1$and w_n haven–2 pendent edges. Here w_1 has n–2 adjacent vertices $V_{\frac{n+3}{2}}, V_{\frac{n+5}{2}}, …, v_{n–1}, v_n, W_{\frac{n+3}{2}}, W_{\frac{n+5}{2}}, …, w_{n–1}$and

$w_n$has n–2 adjacent vertices $v_1, v_2, …, V_{\frac{n-1}{2}}, w_2, …, W_{\frac{n-1}{2}}$. $\mid V(ecc(P_n \odot K_1)) \mid = 2n$ and $\mid E(ecc(P_n \odot K_1)) \mid =2n+1$. Let p be the largest prime number between 1 and 2n.

Define $f : V(ecc(P_n \odot K_1)) \rightarrow \{1, 2, …, 2n\}$ as follows. Label the vertices $w_1, V_{\frac{n+1}{2}}, w_n$,and $W_{\frac{n+1}{2}}$ by" 2, 4, p,and 6. Also,

label the adjacent vertices of w_1 by 1 and even number from 8 to 2n and label the adjacent vertices of w_n by odd number from 3 to 2n–1 other than p. Then the corresponding edge labeling will "give $e_f(0) = n+1$ and $e_f(1) = n$.
Thus $\mid e_f(0) – e_f(1) \mid = 1$. Hence ecc($P_n \odot K_1$) is a dc-graph, when n is odd.

Case 2: when n is even.
Then ecc($P_n \odot K_1$) is a double star $S_{n–1, n–1}$. ecc($P_n \odot K_1$) has an edge w_1w_n and also both w_1 and w_n has n–1 pendent edges. Here w_1 has n–1 adjacent vertices $V_{\frac{n+2}{2}}, V_{\frac{n+4}{2}}, …, v_n, W_{\frac{n+2}{2}}, W_{\frac{n+4}{2}}, …, w_{n–1}$, and w_n has n–1 adjacent

vertices $v_1,v_2, …, V_{\frac{n}{2}}, w_2, w_3, …, W_{\frac{n}{2}}$. $\mid V(ecc(P_n \odot K_1)) \mid = 2n$ and $\mid E(ecc(P_n \odot K_1)) \mid =2n–1$.

Define f:V(ecc($P_n \odot K_1$)) → {1, 2, …, 2n} as follows.

Label the vertices w_1 and w_n by 1 and 2. Also, label the adjacent vertices of w_1 by even number from 4 to 2n and label the adjacent vertices of w_n by odd number from 3 to 2n–1. Then the corresponding edge labeling will give $e_f(0)$ = n–1 and $e_f(1)$ = n. Thus | $e_f(0) – e_f(1)$ | = 1. Hence ecc($P_n \odot K_1$) is also dc-graph", when n is even

Therefore, ecc($P_n \odot K_1$)is also dc-graph, for n ≥ 3.

Illustration 3.3(i).$P_6 \odot K_1$and dc-labeling of ecc($P_6 \odot K_1$)are shown in figure 3.3(a).
(ii).$P_7 \odot K_1$and dc-labeling of ecc($P_7 \odot K_1$)are shown in figure 3.3(b).

Theorem 3.4"ecc(P($C_n(2)$)) is a dc-graph for n ≥ 3.

Proof: Let P($C_n(2)$) be a graph with 2n vertices and 2n+1 edges. The vertices of P($C_n(2)$)are $v_1,v_2,v_3,…,v_n$, $w_1,w_2,w_3,…,w_n$.

Case 1: when n is even.

Then ecc(P($C_n(2)$)) is $S_{n–1,n–1}$, the vertices of ecc(P($C_n(2)$)) have two centers $w_{\frac{n+2}{2}}$, $v_{\frac{n+2}{2}}$ and both $w_{\frac{n+2}{2}}$ and $v_{\frac{n+2}{2}}$ has n–1 pendent edges. Also, $w_{\frac{n+2}{2}}$ has n–1 pendent vertices $v_1,v_2,v_3,…, v_{\frac{n}{2}}, v_{\frac{n+4}{2}},…,v_n$ and $v_{\frac{n+2}{2}}$ has n–1 pendent vertices $w_1,w_2,w_3,…, w_{\frac{n}{2}}, w_{\frac{n+4}{2}},…,w_n$. Then, |V(ecc(P($C_n(2)$)))| = 2n and |E(ecc(P($C_n(2)$)))| = 2n–1.

Define f : V(ecc(P($C_n(2)$))) → {1, 2, …, 2n} as follows.

f($v_{\frac{n+2}{2}}$) = 2 and f($w_{\frac{n+2}{2}}$) = 1,

f(v_i) = 2i+2, for i = 1,2,…,$\frac{n}{2}$ and f(v_i) = 2i, for i = $\frac{n+4}{2}$, $\frac{n+6}{2}$,…,n.

f(w_i) = 2i+1, for i = 1,2,…,$\frac{n}{2}$ and f(w_i) = 2i–1, for i = $\frac{n+4}{2}$, $\frac{n+6}{2}$,…,n.

Then $e_f(0)$ = n – 1 and $e_f(1)$ = n. Thus, |$e_f(0) – e_f(1)$| = 1.

Therefore, ecc(P($C_n(2)$)) is dc-graph for n is even.

Case 2: when n is odd.

Then ecc(P($C_n(2)$)) is $\overline{K_{n-2}} + \overline{K_2} + \overline{K_2} + \overline{K_{n-2}}$, the "vertices of G are "$w_1,w_2,w_3,…, w_{\frac{n-1}{2}}, w_{\frac{n+5}{2}},…, w_n$ of $\overline{K_{n-2}}$, $v_{\frac{n+1}{2}}, v_{\frac{n+3}{2}}$ of $\overline{K_2}$, $w_{\frac{n+1}{2}}, w_{\frac{n+3}{2}}$ of $\overline{K_2}$ and $v_1,v_2,v_3,…, v_{\frac{n-1}{2}}, v_{\frac{n+5}{2}},…, v_n$ of $\overline{K_{n-2}}$. Let p_1 and p_2 be the largest and next largest prime numbers between 1 and 2n.Then, |V(ecc(P($C_n(2)$)))| = 2n and |E(ecc(P($C_n(2)$)))| = 4n–4.

Define f : V(ecc(P($C_n(2)$))) → {1, 2, …, 2n} as follows.

f($v_{\frac{n+1}{2}}$) = 1, f($v_{\frac{n+3}{2}}$) = 2, f($w_{\frac{n+1}{2}}$) = p_1 and f($w_{\frac{n+3}{2}}$) = p_2

f(w_i) = 2i+4, for i = 1,2,…, $\frac{n-1}{2}$ and f(w_i) = 2i, for i = $\frac{n+5}{2}, \frac{n+6}{2}$,…,n.

Periasamy *et al.*,

$f(v_1) = 4$ and label the vertices $v_2, v_3,\ldots,$ $v_{\frac{n-1}{2}}$, $v_{\frac{n+5}{2}}$,…, v_n by odd number from 3 to $2n-1$ other than p_1 and p_2. Then

$e_f(0) = e_f(1) = 2n - 2$. Thus, $|e_f(0) - e_f(1)| \leq 1$. Therefore, $ecc(P(C_n(2)))$ is dc-graph for n is odd.
Hence, $ecc(P(C_n(2)))$ is a dc-graph for $n \geq 3$.

Illustration 3.4 $P(C_5(2))$ and dc-labeling of $ecc(P(C_5(2)))$ are shown in figure"3.4.

CONCLUSIONS

Several new families of eccentric graphs with interesting graph structures are derived, and it is confirmed that all of them are dc-graphs. The only dc-labeling that we provided was for $ecc(P_n)$, $ecc(C_n)$, $ecc(P_n \odot K_1)$ and $ecc(P(C_n(2)))$.

ABSTRACT

An intuitionistic trapezoidal fuzzy shortest path problem in a network was developed into the network scheduling in this paper. These networks only hesitate to use ranking functions. $0 \leq \mu^2 + \lambda^2 \leq 1$ is a Pythagorean fuzzy value. The trapezoidal Pythagorean Fuzzy Shortest Path Problem is a fundamental problem in graph theory is now widely used in many practical applications, such as designing the most efficient computer network, figuring out the fastest route in a GPS navigation system, and optimising delivery routes for a logistics company. shortest path networks are calculated by applying the ranking function to identify Pythagorean trapezoidal fuzzy numbers that connect source nodes to destination nodes. Handle the Pythagorean fuzzy shortest path problem in a network where each weight is represented by a trapezoidal Pythagorean fuzzy number. The distance between the source node and the destination node is used by the proposed approach to determine the shortest path length. The contribution of an illustrative example demonstrates the applicability and efficacy of the suggested approach in the network.

Keywords: Pythagorean fuzzy number (PFN); Trapezoidal Pythagorean fuzzy number (TraPFNs); Score function; Shortest path problem (SPP).

INTRODUCTION

A graph is composed of two sets, V and E., which represents the set of vertices, and E, which represents the set of edges that connect the pair of vertices. Numerous domains, including computer, social, and natural research, among others, use graph theory. Any mathematical, scientific, or engineering problem can be represented as a graph. Leonard Euler first introduced the idea of graph theory in 1736. In order to address the issue of the seven Konigsberg bridges constructed across the Pregel River in Prussia, he produced the first graph. The key factor contributing to graph theory's explosive growth is its application across a variety of disciplines. Even though graphs can be used to simulate events that happen in real-world problems, graph theory has become interesting. Graphs are useful for studying these issues. Shortest path (SP) problems lie at the heart of network flows. They arise often in practice since the aim of a broad variety of real-life problems is to send some goods between two stated nodes in a network as inexpensively as possible. Therefore, SP problems—finding a path with the least cost from the source node to the destination node—can be used to develop such real applications. Generally, it has been assumed that the traversal costs of arcs are expressed in terms of crisp numbers. Zadeh (1965) ⟨12⟩ developed the fuzzy set theory to address inaccurate data in SP problems.However, fuzzy sets can only represent membership functions; they cannot express non-membership functions. So, in this instance, the degree of non-membership is just the polar opposite of the degree of membership. After that, Atanassov (1986) ⟨11⟩ created intuitionistic FS(IFS) to incorporate the non-membership level into the study.The fuzzy shortest path problem (SPP) was first analysed by Dubois and Prade (1980). ⟨6⟩, using a fuzzy number instead of a real number assigned to each edge. Moreover defined Muhammad Akram, Mohammed M. Ali Al-Shamiri, Shaista Habib, Aqsa Majeed, and Muhammad Akram (2023) ⟨22⟩ Floyd-WARSHALL Algorithm Utilising Picture-Based Fuzzy Data. unveiled a novel maximal flow algorithm to address optimisation issues involving linguistic flows and capacities. Amna Habib, Tofigh Allahviranloo, Muhammad Akram, (2022) ⟨18⟩. The new consciousness of Pythagorean fuzzy sets was presented by Yager (2013)⟨20⟩, in which the set has the constraint that its square sum is less than or equal to 1. According to the definition of Pythagorean sets, Pythagorean fuzzy graphs have matured and are applied in many fields. The shortest path problem (SPP) is the basic network problem the membership and non-membership values are assigned to each edge. In this paper, we propose a Pythagorean fuzzy number instead of a fuzzy number. The proposed algorithm computes Euclidean distance for each path, identifying the shortest path for membership and non-membership values, and identifying the shortest length edge from all SPs.Guiwu Wei, Xiaofei Zhao, and Rui Lin (2010) ⟨7⟩, in the induced Aggregating Operators with Fuzzy Number Intuitionistic Fuzzy Information and Their Applications to Group Decision Making for the fuzzy aggregation. Lazim Abdullah and Pinxin Goh (2019) ⟨13⟩ define algebraic operations of Pythagorean fuzzy numbers in a decision-making method, while Xinfan Wang (2008) ⟨24⟩ developed fuzzy number intuitionistic aggregate operators for ranking functions. M. Muhammad Akram, Farwa Ilyasa, and Arsham Borumand Saeid (2019) ⟨16⟩, introduce certain notations of Pythagorean Fuzzy Graphs and also define group decision-making based on the Pythagorean fuzzy TOPSIS method from Pythagorean fuzzy graph. Zhang and Z In Xu (2014) ⟨23⟩ developed TOPSIS for multiple criteria decision-making using Pythagorean fuzzy sets. RR Yager (2014) ⟨21⟩ explored Pythagorean membership grades in decision-making for Pythagorean fuzzy numbers. Basha, Jabarulla, &Broumi (2023) ⟨4⟩ extracted for shortest path problem. M. Asim Basha and M. Mohammed Jabarulla (2023) ⟨5⟩ developed the extension of the algorithm approaches for the shortest path problem in an interval-valued triangular Pythagorean fuzzy network. The objective of this paper is to develop the shortest path concepts under the trapezoidal Pythagorean fuzzy shortest path (TraPFSP) in a network. A pythagorean fuzzy graph as an extension of intuitionistic fuzzy graphs has been presented to stem the uncertainty in real-world decision-making problems. In this paper, a trapezoidal ranking function for fuzzy environments is used to provide a method for network terminology, and the trapezoidal Pythagorean fuzzy shortest path problem (TraPFSPP) is discussed.

PRELIMINARIES

Mohammed Jabarulla and Asim Basha

Definition 2.1:-⟨15⟩Let U be a universe of discourse. Then the Pythagorean fuzzy set (PFS) $\wp$ on U is given by, $\wp = \{< u, \mu_\wp(u), \lambda_\wp(u) | u \in U >\}$, where the functions $\mu_\wp: U \to [0,1]$ and $\lambda_\wp: U \to [0,1]$represent the degree of member and non - membership functions the element $u \in U$ the set $\widetilde{P}$, respectively, $0 \le \left(\mu_\wp(u)\right)^2 + \left(\lambda_\wp(u)\right)^2 \le 1, \forall\, u \in U.$

Definition 2.2:-⟨9⟩A Pythagorean fuzzy graph (PFG) on a non-empty set X is a pair $G = (\wp, \mathbb{Q})$ with $\wp$ a PFS on X and $\mathbb{Q}$ a PFR on X such that,

$$\mu_\mathbb{Q}(uv) \le \mu_\wp(u) \wedge \mu_\wp(v)$$
$$\lambda_\mathbb{Q}(uv) \le \lambda_\wp(u) \vee \lambda_\wp(v)$$

where $\mu_\mathbb{Q}: X \times X \to [0,1]$ and $\lambda_\mathbb{Q}: X \times X \to [0,1]$ represent the membership and non-membership functions of $\widetilde{Q}$, respectively, with $0 \le \left(\mu_\mathbb{Q}(u)\right)^2 + \left(\lambda_\mathbb{Q}(u)\right)^2 \le 1, \forall\, u, v \in E.$

Example 2.3:-Consider the simple graph, $G = (\mathbb{V}, \mathbb{E})$, such that $\mathbb{V} = \{P, Q, R, S, T\}$ and $\mathbb{E} = \{PQ, QR, RS, ST, TP, RT, QS\} \subseteq \mathbb{V} \times \mathbb{V}.$

$$\wp = \langle \text{membership} \left(\frac{P}{.4}, \frac{Q}{.7}, \frac{R}{.6}, \frac{S}{.5}, \frac{T}{.6}\right), \text{non membership} \left(\frac{P}{.5}, \frac{Q}{.7}, \frac{R}{.6}, \frac{S}{.7}, \frac{T}{.7}\right) \rangle . \mathbb{Q}$$
$$= \langle \text{membership} \left(\frac{PQ}{.4}, \frac{QR}{.6}, \frac{RS}{.5}, \frac{ST}{.5}, \frac{TP}{.4}\right), \text{nonmembership} \left(\frac{PQ}{.7}, \frac{QR}{.7}, \frac{RS}{.7}, \frac{ST}{.7}, \frac{TP}{.7}\right) \rangle$$

The Pythagorean fuzzy edge and vertex sets, as described on $\mathbb{V}$ and $\mathbb{E}$, can be directly calculated using Fig. 1, proving $G = (\wp, \mathbb{Q})$ is a PFG.

Definition 2.4:-⟨9⟩ The degree of indeterminacy of x to $\wp$ is given by
$\pi_\wp(x) = \sqrt{1 - \mu_\wp^2(x) - \lambda_\wp^2(x)}.$ If $\wp = (\mu_\wp, \lambda_\wp)$ is a Pythagorean fuzzy number (PFN) then, degree of indeterminacy of element $x \in X$ is given as $\pi_P = \sqrt{1 - \mu_\wp^2 - \lambda_\wp^2},$ where $\mu_\wp, \lambda_\wp \in [0,1]$ and $0 \le \left(\mu_\wp\right)^2 + \left(\lambda_\wp\right)^2 \le 1.$

Trapezoidal Pythagorean Fuzzy Number and Algebraic Operators
The trapezoidal Pythagorean fuzzy value is a practical expression.
$$\mathcal{A}' = \langle (p, q, r, s), (u, v, w, x) \rangle$$
where, $\left(\mu_{\mathcal{P}_1}(u)\right)^2, \left(\mu_{\mathcal{P}_2}(u)\right)^2, \left(\mu_{\mathcal{P}_3}(u)\right)^2, \left(\mu_{\mathcal{P}_4}(u)\right)^2 = (p, q, r, s),$
$\left(\lambda_{\mathcal{P}_1}(u)\right)^2, \left(\lambda_{\mathcal{P}_2}(u)\right)^2, \left(\lambda_{\mathcal{P}_3}(u)\right)^2, \left(\lambda_{\mathcal{P}_4}(u)\right)^2 = (u, v, w, x).$

Definition 3.1:-A Trapezoidal Pythagorean fuzzy number (TraPFN) $\mathcal{A}' = \langle (p, q, r, s), (u, v, w, x) \rangle$ is said to be zero trapezoidal PFN if and only if, $(p, q, r, s) = (0,0,0,0);\ (u, v, w, x) = (1,1,1,1);$

Definition 3.2:- ⟨19⟩Let$\mathcal{A}' = \mathcal{A}_1, \mathcal{A}_2,$ then
$\mathcal{A}_1 \langle (p_1, q_1, r_1, s_1), (u_1, v_1, w_1, x_1) \rangle$and$\mathcal{A}_2 \langle (p_2, q_2, r_2, s_2), (u_2, v_2, w_2, x_2) \rangle$are two Trapezoidal Pythagorean Fuzzy Values (TraPFV) in the set of real numbers, and $\lambda > 0$, then operations rules are,

$$\text{(i)}\,\mathcal{A}_1 \oplus \mathcal{A}_2 = \left\langle \begin{array}{c} \sqrt{(p_1^2 + p_2^2 - p_1^2 p_2^2)}, \sqrt{(q_1^2 + q_2^2 - q_1^2 b_2^2)}, \sqrt{(r_1^2 + r_2^2 - r_1^2 r_2^2)}, \sqrt{(s_1^2 + s_2^2 - s_1^2 s_2^2)}, \\ (u_1 u_2, v_1 v_2, w_1 w_2, x_1 x_2) \end{array} \right\rangle$$

the grades of TraPFS. The TraPFS and concept paths can be ranked using these methods.

Definition 3.3:- ⟨6⟩Let $A_1 = \langle (p_1, q_1, r_1, s_1), (u_1, v_1, w_1, x_1) \rangle$ be a Trapezoidal Pythagorean fuzzy value (TraPFV) then, the score function $S(\mathcal{A}_1)$ and an accuracy function $H(\mathcal{A}_1)$ of TraPFV are defined as follows.
(i) $S(\mathcal{A}_1) = \frac{1}{4}[(p_1^2 + q_1^2 + r_1^2 + s_1^2) - (u_1^2 + v_1^2 + w_1^2 + x_1^2)],\ [-1,1],$
(ii) $H(\mathcal{A}_1) = \frac{1}{4}[(p_1^2 + q_1^2 + r_1^2, s_1^2) + (u_1^2 + v_1^2 + w_1^2 + x_1^2)],\ \ \ [0,1],$
The order relations between two TraPFVs are necessary for comparisons.

Mohammed Jabarulla and Asim Basha

Definition 3.4:- ⟨6⟩Let $\mathcal{A}_1 = \langle (p_1, q_1, r_1, s_1), (u_1, v_1, w_1, x_1) \rangle$ and
$\mathcal{A}_2 = \langle (p_2, q_2, r_2, s_2), (u_2, v_2, w_2, x_2) \rangle$ be two TraPFVs in the set of real numbers. Then, we define a ranking method as follows.
(i) If $S(\mathcal{A}_1) > S(\mathcal{A}_2)$, then $\mathcal{A}_1 > \mathcal{A}_2$, that is, $\mathcal{A}_1$ is superior to $\mathcal{A}_2$, denoted by $\mathcal{A}_1 > \mathcal{A}_2$.
(ii) If $S(\mathcal{A}_1) = S(\mathcal{A}_2)$, and $H(\mathcal{A}_1) > H(\mathcal{A}_2)$ then $\mathcal{A}_1 > \mathcal{A}_2$, that is $\mathcal{A}_1$ is superior to $\mathcal{A}_2$, denoted by $\mathcal{A}_1 > \mathcal{A}_2$.

Network Terminology
A directed network $P(V, E)$ is a set of m directed edges spanning a finite set of nodes $V = \{1,2,3, \dots, n\}$. Each edge is denoted is denoted by an ordered pair (i, j) where $i, j \in V$ and $i \neq j$. In this network, we consider two nodes, denoted by s and t, which are the source node and the destination node, respectively. We define a path
$P_{ij} = \{i = i, (i_1, i_2), i_2, \dots, (i_{l-1}, i_i), i_l = j\}$ of alternating nodes and edges. The existence of at least one path P_{S_i} in $P(V, E)$ is assumed for every $i \in V - \{S\}$.
d_{ij} denotes TPFN associated with the edge (i, j), corresponding to the length necessary to traverse (i, j) from i to j the Pythagorean distance along the path P is denoted as $d(P)$ is defined as, $d(P) = \sum_{(i,j \in P)} d_{ij}$.
The length required to traverse (i, j) from i to j is denoted by d_{ij}, which represents the TPFN associated with the edge (i, j). The Pythagorean distance along the path P is given by $d(P)$, which is defined as $d(P) = \sum_{(i,j \in P)} d_{ij}$.

Remark: - A node i is said to be pred, node j if,
        (i) Node i is directly connected to node j.
        (ii) The shortest route of the path is defined as the path that goes from node i to the node j.

Trapezoidal Fuzzy Pythagorean Path Problem
The paper discusses a network algorithm for shortest paths, using TrPFN as the edge length, which is executed in **6 steps**.
Step – 1: Assume $e_1 = \langle (0,0,0,0), (1,1,1,1) \rangle$ and label the source node (say node 1) as $[e_1 = \langle (0,0,0,0), (1,1,1,1) \rangle, -]$.
Step – 2: Find $e_j = \min\{e_i \oplus e_{ij}\}, j = 2,3,4, \dots, n$.
Step – 3: The minimum value of $i, i = r$, indicates a unique node j. If it occurs multiple times, it indicates multiple interval-valued Pythagorean paths between source nodes, but the trapezoidal fuzzy Pythagorean distance is e_j.
Step – 4: Let the destination node (node n) be labelled as $[e_n, l]$, then the Trapezoidal fuzzy Pythagorean shortest distance between source nodes is e_n.
Step – 5: If the destination node has the label $[e_n, l]$. Thus, examine node 1's label to determine the Trapezoidal Pythagorean fuzzy SP between the source and destination nodes. Assuming it is $[e_l, P]$, we next verify node P's label, and so forth. Continue in this manner until node 1 is reached.
Step – 6: Now the Trapezoidal Pythagorean fuzzy SP can be obtained by combining all the nodes obtained by the **Step – 5**.
Remark:- Let $\mathcal{A}_i = 1,2, \dots, n$ be a set of Trapezoidal Pythagorean fuzzy numbers, if $S(\mathcal{A}_K) < S(\mathcal{A}_i)$, for all i, the TraPFN is the min of $\mathcal{A}_K$. In this network each edge have been assigned to the TraPFN as follows: Above the values are defined as edges and TraPF distance at network (Fig.1).

Solutions
Since node 7 is the destination node, so $n = 7$.
Assume $e_1 = \langle (0,0,0,0), (1,1,1,1) \rangle$ and label the source node (say node1) as $[\langle (0,0,0,0), (1,1,1,1) \rangle, -]$, the value of $e_j; j = 2,3,4,5,6,7$ can be obtained as given below:

It 1: The predecessor nodes for node 2 are node 1, so put $i = 1$ and $j = 2$ in **Step – 2** of the given algorithm.
Then the path value of e_2 is,
$e_2 = \min \{e_1 \oplus e_{12}\}$
$= \min\{\langle (0,0,0,0), (1,1,1,1) \rangle \oplus \langle (0.3,0.5,0.6,0.5), (0.8,0.6,0.6,0.7) \rangle\}$
$e_2 = \langle (0.3,0.5,0.6,0.5), (0.8,0.6,0.6,0.7) \rangle$

80261

Mohammed Jabarulla and Asim Basha

From the above calculation, min occurs corresponding to the node 1 and then label node 2 as
$[\langle(0.3,0.5,0.6,0.5), (0.8,0.6,0.6,0.7)\rangle, 1]$.

It 2: The predecessor nodes for node 3 are node 2, so put i = 2 and j = 3 in **Step – 2** of the given algorithm.
     Then the path value of e_3 is,
$e_3 = \min \{e_2 \oplus e_{23}\}$
$$= \min\{\langle(0.3,0.5,0.6,0.5), (0.8,0.6,0.6,0.7)\rangle \oplus \langle(0.6,0.5,0.4,0.2), (0.6,0.7,0.6,0.9)\rangle\}$$
$e_3 = \{\langle(0.628,0.688,0.702,0.53), (0.48,0.42,0.36,0.63)\rangle\}$
by using definition 3.3, (based on score function), the obtained value d_c is
$e_3 = \langle(0.628,0.688,0.702,0.53), (0.48,0.42,0.36,0.63)\rangle$
From the above calculation, min occurs corresponding to the node 2 and then label node 3 as
$[\langle(0.628,0.688,0.702,0.53), (0.48,0.42,0.36,0.63)\rangle, 2]$.

It 3: The predecessor of node 4 is node 1 and 3, so put the values of i = 1,3 and j = 4 respectively in **Step – 2** of the given algorithm.
     Then the path value of e_4 is,
$e_4 = \min \{e_1 \oplus e_{14}, e_3 \oplus e_{34}\}$
$$= \min \left\{ \begin{array}{c} \langle(0,0,0,0), (1,1,1,1)\rangle \oplus \langle(0.4,0.3,0.6,0.6), (0.7,0.8,0.7,0.8)\rangle, \\ \langle(0.628,0.688,0.702,0.53), (0.48,0.42,0.36,0.63)\rangle \\ \oplus \langle(0.3,0.4,0.5,0.6), (0.8,0.7,0.6,0.7)\rangle \end{array} \right\}$$
$$e_4 = \min \left\{ \begin{array}{c} \langle(0.4,0.3,0.6,0.6), (0.7,0.8,0.7,0.8)\rangle, \\ \langle(0.683,0.772,0.829,0.789), (0.384,0.294,0.216,0.441)\rangle \end{array} \right\}$$
$e_4 = \langle(0.4,0.3,0.6,0.6), (0.7,0.8,0.7,0.8)\rangle$
From the above calculation, min occurs corresponding to the node c and then label node d as
$[\langle(0.4,0.3,0.6,0.6), (0.7,0.8,0.7,0.8)\rangle, 1]$.

It 4: The predecessor of node 5 is node 2 and node 3, so put i = 2,3 and j = 5 in **Step – 2** of the given algorithm.
     The path value of e_5 is,
$$e_5 = \min \{e_2 \oplus e_{25}, e_3 \oplus e_{35}\}$$
$$= \min \left\{ \begin{array}{c} \langle(0.3,0.5,0.6,0.5), (0.8,0.6,0.6,0.7)\rangle \\ \oplus \langle(0.2,0.3,0.4,0.5), (0.9,0.8,0.7,0.7)\rangle, \\ \langle(0.628,0.688,0.702,0.53), (0.48,0.42,0.36,0.63)\rangle \\ \oplus \langle(0.2,0.4,0.5,0.6), (0.9,0.7,0.7,0.6)\rangle \end{array} \right\}$$
$$e_5 = \min \left\{ \begin{array}{c} \langle(0.336,0.568,0.702,0.688), (0.72,0.48,0.42,0.49)\rangle, \\ \langle(0.652,0.772,0.829,0.789), (0.432,0.294,0.252,0.378)\rangle \end{array} \right\}$$
by using definition 3.3, (based on score function), the obtained value e_5 is
$e_5 = \langle(0.336,0.568,0.702,0.688), (0.72,0.48,0.42,0.49)\rangle$
From the above calculation, min occurs corresponding to the node 2 and then label node 5 as
$[\langle(0.336,0.568,0.702,0.688), (0.72,0.48,0.42,0.49)\rangle, 2]$.

It 5 : The predecessor nodes for node 6 are node 4 and node 5, so put i = 4,5 and j = 6 in S**tep – 2** of the given algorithm.
     The path value of e_6 is,
$$e_6 = \min \{e_4 \oplus e_{46}, e_5 \oplus e_{56}\}$$
$$= \min \left\{ \begin{array}{c} \langle(0.4,0.3,0.6,0.6), (0.7,0.8,0.7,0.8)\rangle \\ \oplus \langle(0.4,0.5,0.6,0.3), (0.8,0.8,0.7,0.9)\rangle, \\ \langle(0.336,0.568,0.702,0.688), (0.72,0.48,0.42,0.49)\rangle \\ \oplus \langle(0.4,0.5,0.5,0.6), (0.7,0.8,0.7,0.8)\rangle \end{array} \right\}$$
$$e_6 = \min \left\{ \begin{array}{c} \langle(0.534,0.528,0.83,0.658), (0.56,0.64,0.49,0.72)\rangle, \\ \langle(0.478,0.737,0.829,0.878), (0.504,0.834,0.294,0.392)\rangle \end{array} \right\}$$
by using definition 3.3, (based on score function), the obtained value e_4 is
$e_6 = \langle(0.534,0.528,0.83,0.658), (0.56,0.64,0.49,0.72)\rangle$

80262

Mohammed Jabarulla and Asim Basha

From the above calculation, min occurs corresponding to the nod e and then label node 6 as
[⟨(0.534,0.528,0.83,0.658), (0.56,0.64,0.49,0.72)⟩, 4].

It 6 : The predecessor nodes for node 7 are node 5 and node 6, so put i = 5,6 and j = 7 in S**tep – 2** of the given algorithm.

The path value of e_7 is,

$e_7 = \min \{e_5 \oplus e_{57}, e_6 \oplus e_{67}\}$

$$= \min \left\{ \begin{array}{c} \langle(0.336,0.568,0.702,0.688), (0.72,0.48,0.42,0.49)\rangle \\ \oplus \langle(0.3,0.4,0.6,0.7), (0.8,0.8,0.8,0.7)\rangle, \\ \langle(0.534,0.528,0.83,0.658), (0.56,0.64,0.49,0.72)\rangle \\ \oplus \langle(0.2,0.3,0.4,0.5), (0.9,0.9,0.9,0.8)\rangle \end{array} \right\}$$

$$e_7 = \min \left\{ \begin{array}{c} \langle(0.416,0.676,0.885,0.946), (0.576,0.384,0.336,0.343)\rangle, \\ \langle(0.563,0.592,0.88,0.799), (0.504,0.576,0.441,0.576)\rangle \end{array} \right\}$$

by using definition 3.3, (based on score function), the obtained value e_6 is

$e_7 = \langle(0.563,0.592,0.88,0.799), (0.504,0.576,0.441,0.576)\rangle$

From the above calculation, min occurs corresponding to the nod e and then label node 7 as
[⟨(0.563,0.592,0.88,0.799), (0.504,0.576,0.441,0.576)⟩, 6]. The shortest path and distance between source and destination nodes are determined by identifying the path

$1 \rightarrow 4 \rightarrow 6 \rightarrow 7 \langle(0.563,0.592,0.88,0.799), (0.504,0.576,0.441,0.576)\rangle$

By using the given proposed algorithm, shortest path for all nodes from source node and labelling is given:

CONCLUSION

The idea of a trapezoidal Pythagorean fuzzy shortest path in a network is defined in this study. We explore some mathematical procedures, including the trapezoidal Pythagorean fuzzy number. The suggested approach for utilising the trapezoidal Pythagorean path to solve SPP on a network makes use of this study. Next, we deduced the technique for the TraPFN shortest path issue within a pentagonal fuzzy setting.

ABSTRACT

In this paper, we developed an inventory model that accounts for seasonal demand rates, and linear deterioration rates, and allows for shortages with partial backlogging. We solved the model for a finite period and identified its potential applications in various real-world scenarios. The primary objective of this study is to minimize the total cost of the system while determining the optimal order quantity. Additionally, we conducted a sensitivity analysis on several related parameters and included a numerical example to illustrate the model and its critical features.

Keywords: Seasonal items demand rate, Deterioration rate, Backlogging.

INTRODUCTION

In real-world situations, it is observed that many products in life have a seasonal demand pattern. So the models with seasonal demand are prevalent because of their extensive application in the inventory management of products with short life cycles. When it comes to juices that are in stock, seasonal demand is a term used to describe how customer purchasing patterns for juices vary by season. Demand patterns are predictable as a result of this variation, which is frequently linked to seasonal events or holidays. For instance, the demand for some juice varieties could increase during the summer or around the holidays and decrease at other periods of the year. Demand forecasting, inventory optimization tools, and efficient

supply chain management techniques are frequently used by enterprises to control seasonal demand for juices in stock. Inventory is mostly based on the demand pattern; it may be deterministic or probabilistic. Shortages or stockouts result when demand exceeds the supply of products in stock. There are two types of shortages. The first is called backorder or backlogging, and it occurs when shops fail to meet customer demand. For example, a consumer can choose to wait for a while to purchase if there are study materials available, and he can depend on the shopkeeper to get them as quickly as possible. So long as there is a partial backlog, shortages are permitted. The second type of shortage is called full backlog or lost sales case where the demand is completely lost. For example, electronic equipment and gadgets, etc. have very short life spans due to innovative changes in the models and technology. In reality, a client can be willing to delay buying certain items, such as trendy clothing electronics, etc. However, for some products, like food or medicines, customers are not willing to wait and will buy them from other suppliers. The impact of inflation on a two-storage inventory model with time-dependent degrading items and stock-dependent demand was examined by Sharma et al. (2020). In traditional inventory models, we think items stay the same in storage. But things like fruits, vegetables, and liquids can go bad over time. This spoilage, called deterioration, is important to consider when making inventory plans. Deterioration means a drop in quality, which can include changes, decay, obsolescence, or spoilage over time. It leads to a decrease in the usefulness or value of goods. Deterioration is always considered over time.Pervin et al. (2018) developed an inventory model for stochastic deterioration with time-dependent demand. They use a method that considers how demand changes over time to ensure our model stays current and relevant. The paper aims to find the most effective way for retailers to replenish perishable items, considering changes in demand over time.

This demonstrates how these strategies apply in real-world scenarios using typical inventory management approaches. Bandaly and Hassan (2020) devised an inventory model that integrates Postponement strategies into production and inventory plans, considering the impact of deterioration. The study's objective was to devise a production and inventory strategy tailored for a producer of fresh apple juice. Singh et al. (2016) developed an inventory model for deteriorating items with stock-dependent and seasonal pattern demand. Tayal et al. (2014) presented an inventory model of seasonal products for deteriorating items in which they applied a preservation technology cost to reduce the product's rate of deterioration. In this model, the occurring shortages are partially backlogged.Tayal et.al (2015) developed an inventory model for deteriorating items with seasonal products in which they examined a model for managing inventory of seasonal products with a Weibull rate of deterioration, looking at two possible markets: the primary and an alternative one. Keeping inventory until the next season leads to higher total costs. Soysal and Krishnamurthi (2012) developed an inventory model focused on seasonal goods. The objective of their paper is to establish and assess a dynamic model of consumer choice behavior within markets for seasonal goods, where products are sold during a finite season with limited availability. Banerjee and Sharma (2010) investigated an inventory model for seasonal demand in which they introduced the idea of selling products in a different market. If there's demand, the distributor can sell them there for the same or higher price, which helps save on storage and product quality costs. Normally, products get worse over time. Their investigation centered on two significant markets: the primary market and an alternative market, accounting for the time lag in demand seasons between these markets. Hamilton et al. (2024) developed an inventory model for spatial procurement of farm products and the supply of processed foods which they investigated that shows how a food processor buys farm products. This model is meant to understand how supply chain problems affect where farms get their products for making food. Ihwah and Viandini (2020) created an

inventory model specifically for predicting the procurement quantity of Manalagi apples for the production of apple juice drinks at PT XYZ Malang. The primary goal of this study was to forecast the procurement volume of Manalagi apples, which serve as the primary raw material in the apple juice drink production process. Kandemir (2022) introduced an inventory model that focuses on clustering items with seasonal and non-seasonal demand patterns to improve inventory management. The investigation into the seasonality effect initially targeted products with short-lived demand. Groebner and Merz (1990) specifically examined items like winter sporting goods. This approach was further pursued by Giri et al. (1996) in their study of an EOQ model for deteriorating items. Subsequent research delved into seasonal demand, as illustrated by Gupta et al.'s work (2003), which focused on items characterized by fixed selling seasons. Singha et al. (2024) designed an inventory model specifically for Market Basket Analysis within the context of a Health Food Store. Their article includes a case study that applies market basket analysis to a transactional dataset from a health food store based in Thailand. Alnahhal et al. (2021) formulated an inventory replenishment model that focuses on optimizing inventory management for seasonal demand while considering discrete delivery times. This study aims to find a better way for companies to restock their inventory when demand changes throughout the year. They want to suggest a new method for suppliers and warehouses to work together effectively, especially for products that are in high demand during certain seasons.

This study takes inspiration from a case study of a German drinks company, conducted by Alnahhal et al. (2021), focusing on the manufacturing and distribution of beverages. In this model, we utilize data sourced from Alnahhal et al. (2021). Table 1 illustrates both the monthly actual demand and the expected demand. Various drinks are manufactured in-house or acquired from other businesses and distributed to retail retailers. Unit prices are generally constant, but summertime demand usually goes higher. Because suppliers cannot make every kind of product daily, some product types may only be available on specific days of the week, which means two days.This research aims to suggest a fresh approach for organizing the replenishment procedure between the supplier and the warehouse of any business with a seasonal need while maintaining a decent level of forecast accuracy regarding the demand for the final product. When used in real-world business situations, an integrated inventory model that takes deterioration and shortages into account for seasonal demand products can result in cost savings, enhanced supplier relationships, better customer service, and an overall gain in operational efficiency. This study examines Alnahhal et al.'s (2021) study, exploring seasonal demand items with linear deterioration rates and allowing shortages with partial backlogging. Our research introduces an inventory model tailored for seasonal demand items with linear deterioration rates and shortages allowed with partial backlogging. The main objective of this study is to propose a new approach to managing the replenishment process between suppliers and warehouses in businesses with seasonal demand while maintaining a reasonable level of demand forecast accuracy for the final product. This model has wide applicability across industries such as retail, consumer goods, fast-moving consumer goods, agriculture, food and beverage, as well as event planning. We provide numerical illustrations to demonstrate the practical implementation of this model in various realistic scenarios.

METHODOLOGY

Figure 1: The overview outlines the study's procedural steps. Initially, it defines the unique problem characteristics. Subsequent sections investigate step-by-step discussions. Assumptions closely mirror

Renu Gautam *et al*.,

real-world conditions. The inventory model achieves optimal solutions. The final stage emphasizes the necessity of monthly plan updates based on evolving demand and current inventory size. Following this, the results are discussed. Figure 2 is about, who gives stuff to the company and who buys from it first. To get drinks to stores, they go through two steps: from suppliers or the factory to the warehouse, and then from the warehouse to small shops. The company has its factory next to the warehouse where they make or buy drinks. They use different ways to restock between the company and the shops. This study looks at how drinks get from the suppliers to the warehouse.

Notations

- C_P is the purchase cost per unit time.
- C_h is the holding cost per unit per unit time.
- $I_1(t)$ is inventory level at a time t_1.
- $I_2(t)$ is inventory level at a time T.
- A is the inventory order cost per order.
- C_D is the deterioration cost per unit time.
- C_s is the shortage cost per unit time.
- L_S is the lost sales cost per unit.
- t_1 is stock exhausts time.
- T is the length of a process duration.
- I_b is the highest level of delay purchase.
- I_m is the maximum level of stock during the period [0, T].
- TC is the total inventory cost.
- Q is the total quantity of an order.
- SC is the shortage cost per cycle.
- PC is the purchase cost per cycle.
- LS is the cost due to lost sales per cycle.
- $R(t)$ is the deterioration rate.

Assumptions

- The replenishment rate is infinite.
- There is no lead time.
- D_t is the demand rate and it is of the form $D_t = D$ in which $D = B_t * S_t$; where B_t =actual demand, S_t= average seasonal index.
- The deterioration rate is linear at time t and its parameter is R(t)= θt.
- Shortage is allowed, with partial backlogging and the backlogging rate is $e^{-\lambda t}$ Unsatisfied demand is backlogged at a rate, the backlogging parameter λ is a positive constant.
  $\lambda > 0$ is the backlogging parameter and $t_1 \leq t \leq T$.

Mathematical Model

In Figure 3, we consider the deteriorating inventory model with seasonal items demand rate. Replenishment starts at time $t = 0$ when the inventory level attains its maximum, I_m. The inventory decreases due to demand and deterioration for the time $(0, t_1)$. At time t_1, the inventory level is equal to zero, the shortage starts during the time interval $[t_1, T]$, and the demand during this period is partially

backlogged. The stock exhausts during the period [0, t₁] due to cumulative effects from decay. In this sense, the differential condition represents the stock level at any given time during [0, t₁].

$$\frac{dI_1(t)}{dt} + R(t)I_1(t) = -D_t; \quad 0 \le t \le t_1 \qquad \qquad \dots (1)$$

$$\frac{dI_2(t)}{dt} = -D_t\, e^{-\lambda t}; \quad t_1 \le t \le T \qquad \qquad \dots (2)$$

Using the Deterioration rate $R(t) = \theta t$ and Demand rate $D_t = D$ with the condition $t = t_1, and\ I_1(t_1) = 0$ in equation (1)

By equation (1) we get,

$$\frac{dI_1(t)}{dt} + \theta t\, I_1(t) = -D_t; \quad 0 \le t \le t_1$$

$$I_1(t) = D\left\{t_1 - t + \theta\frac{t_1^3}{6} - \theta\frac{t_1 t^2}{2} + \theta\frac{t^3}{3}\right\} \qquad \qquad \dots (3)$$

Using the boundary condition $t = t_1, and\ I_2(t_1) = 0$ in equation (2), we get

By equation (2) we get,

$$\frac{dI_2(t)}{dt} = -D_t e^{-\lambda t}; \quad t_1 \le t \le T$$

$$I_2(t) = \frac{D}{\lambda}\left\{e^{-\lambda t} - e^{-\lambda t_1}\right\} \qquad \qquad \dots (4)$$

The maximum level of optimistic inventory is $I_m = I_1(0)$

$$I_m = D\left\{t_1 + \theta\frac{t_1^3}{6}\right\} \qquad \qquad \dots (5)$$

The maximum negative inventory (back-ordered unit) is $I_b = -I_2(T)$

$$I_b = \frac{D}{\lambda}\left(e^{-\lambda t_1} - e^{-\lambda T}\right) \qquad \qquad \dots (6)$$

Thus, the total quantity in the inventory [0, T] is

$$Q = I_1(0) + I_2(T)$$

$$Q = I_m + I_b$$

$$Q = D\left\{t_1 + \theta\frac{t_1^3}{6} + \frac{1}{\lambda}\left(e^{-\lambda t_1} - e^{-\lambda T}\right)\right\} \qquad \qquad \dots (7)$$

Now, the Ordering Cost is given by: -

$$OC = A \qquad \qquad \dots (8)$$

Holding Cost during the interval [0, T] is given by

$$HC = \int_0^{t_1} h(t)\, I_1(t)\, dt$$

$$HC = hD\left\{\frac{t_1^2}{2} + \theta\frac{t_1^4}{12}\right\} \qquad \qquad \dots (9)$$

Shortage Cost during the interval [t_1, T] is given by

$$SC = -C_S \int_{t_1}^T I_2(t)\, dt$$

$$SC = \frac{C_S D}{\lambda}\left\{\frac{e^{-\lambda T}}{\lambda} + e^{-\lambda t_1}\left(T - t_1 - \frac{1}{\lambda}\right)\right\} \qquad \qquad \dots (10)$$

Deterioration Cost is given by: -

$$DC = C_D\left\{I_1(0) - \int_0^{t_1} D(t)\, dt\right\}$$

$$DC = C_D D\left\{\theta\frac{t_1^3}{6}\right\} \qquad \qquad \dots (11)$$

Lost Sale Cost is given by: -

$$LS = L_S D \int_{t_1}^T \left(1 - e^{-\lambda t}\right) dt$$

$$LS = L_S D\lambda\left\{T - t_1 + \frac{1}{\lambda}\left(e^{-\lambda T} - e^{-\lambda t_1}\right)\right\} \qquad \qquad \dots (12)$$

Renu Gautam *et al.,*

Purchase Cost is given by: -

$PC = C_P Q$

$PC = C_P D \left\{ t_1 + \theta \frac{t_1^3}{6} + \frac{1}{\lambda} \left(e^{-\lambda t_1} - e^{-\lambda T} \right) \right\}$ ... (13)

Total Cost

$$TC = \frac{1}{T} \{ HC + SC + DC + LS + PC + OC \}$$

$$TC = \frac{1}{T} \left\{ hD \left\{ \frac{t_1^2}{2} + \theta \frac{t_1^4}{12} \right\} + \frac{C_S D}{\lambda} \left\{ \frac{e^{-\lambda T}}{\lambda} + e^{-\lambda t_1} \left(T - t_1 - \frac{1}{\lambda} \right) \right\} + C_D D \left\{ \theta \frac{t_1^3}{6} \right\} \right.$$

$$\left. + L_S D\lambda \left\{ T - t_1 + \frac{1}{\lambda} \left(e^{-\lambda T} - e^{-\lambda t_1} \right) \right\} + C_P D \left\{ t_1 + \theta \frac{t_1^3}{6} + \frac{1}{\lambda} \left(e^{-\lambda t_1} - e^{-\lambda T} \right) \right\} + A \right\}$$

...(14)

The necessary condition to be reduced is

$\frac{\partial TC}{\partial t_1} = 0, \frac{\partial TC}{\partial T} = 0$ i.e., And $\frac{\partial^2 TC}{\partial t_1^2} > 0$, $\frac{\partial^2 TC}{\partial T^2} > 0$ And $\left(\frac{\partial^2 TC}{\partial t_1^2} \right) \left(\frac{\partial^2 TC}{\partial T^2} \right) - \left(\frac{\partial^2 TC}{\partial t_1 \partial T} \right) > 0$

Numerical examples

Values of parameters used in our Inventory Model are as follows:

A=$100, C_P=\$30, λ=0.01, Cs=\$4, C_D=\$30, Ls=\$5, θ=0.002, D=34 per day, and h=\$1 in appropriate units. We obtained the optimal value t_1=9.0974 days, T=10.1514 days, TC=916.2623, and Q=350.3928 units.

Sensitivity analysis

By changing the values of parameters used in our model and readout the effects on t_1 and TC. The rate of changes in values of parameters are taken -20%, -10%, +10%, and 20%.

CONCLUSIONS

We created an inventory model for a seasonal items demand rate with a linear deterioration rate and Shortages allowed with partially backlogged. Table 2 demonstrates the impact of the deterioration rate and backlogging parameter on the total cost, as depicted in Figure 4. A sensitivity analysis is conducted, to examine how shifting parameter values affect the solution. Table 3 illustrates the sensitivity analysis, which is visually presented in Figure 5.

From the analysis of the model, it has concluded that:

- The stock exhaust time (t_1) decreases marginally for θ, h, C_P, A, and C_D but it decreases significantly for Cs.
- The stock exhaust time (t_1)is increased significantly for Ls and increased marginally for λ.
- The length of a process duration (T) decreases marginally for θ, C_P, A, and C_D but it decreases significantly for Cs.
- The length of a process duration (T) increased marginally for h, and λ. But it increased significantly for L_S.
- The total inventory cost decreases marginally for θ. But it decreases significantly for A, C_S, and L_S.
- The total inventory cost increases marginally for C_D.
- The total inventory cost increased significantly for C_P, λ, and h.

ABSTRACT

This study investigates the impact of the COVID-19 pandemic on the educational system in Dadupur, a rural community in Uttar Pradesh, India. The research aims to assess the pandemic's effects on educational progress, explore local responses to ensure continuity, and evaluate the effectiveness of digital learning and other innovations. Utilizing a mixed-methods approach, data was collected through surveys and interviews with school-aged children, teachers, administrators, parents, and community leaders. The findings reveal significant educational setbacks due to school closures, a notable pivot towards online learning, and community-driven educational programs highlighting remarkable resilience despite limited resources. However, the effectiveness of these strategies varies, underscoring gaps in digital infrastructure and support systems. This study contributes to understanding the educational impacts of COVID-19 in rural settings and underscores the need for targeted interventions and community-based solutions to build a more resilient educational framework.

Keywords: COVID-19, education, digital learning, rural resilience, Dadupur, educational continuity, socio-economic impacts.

Mubarak Daha Isa *et al.,*

INTRODUCTION

The COVID-19 pandemic has precipitated unprecedented global disruptions, profoundly impacting various sectors, with education being one of the hardest hits. The sudden closure of schools and the shift to remote learning have highlighted and exacerbated existing systemic inequalities. The transition to digital education has underscored the urgent need for adaptable and resilient educational systems, especially in rural areas where technological infrastructure is often inadequate [1]. Dadupur, a village in Uttar Pradesh, India, with a population of 1406 as of the 2011 census, presents a unique case for examining the pandemic's impact on education [2]. This community, characterized by socio-economic challenges and limited access to technology, faced significant disruptions in its educational processes due to the pandemic. The pre-existing hurdles, such as low enrolment rates, high dropout rates, and poor quality of educational resources, were magnified during the crisis [3]. Education in rural India plays a critical role in the socio-economic development of the nation but is often plagued by challenges such as teacher absenteeism, lack of infrastructure, and gender disparities [4]. The pandemic has intensified these issues, creating a significant setback in educational progress. According to the Annual Status of Education Report (ASER) survey, two-thirds of rural children in India did not receive any learning materials or activities during the pandemic [5]. The objectives of this study are threefold: first, to assess the direct and indirect effects of COVID-19 on the education system in Dadupur; second, to explore the strategies adopted by educators, students, and the community to ensure educational continuity during the pandemic; and third, to evaluate the efficacy of these strategies, particularly digital learning initiatives, in mitigating the educational setbacks faced by students. By investigating these areas, the study aims to contribute valuable insights into the resilience of rural education systems during global health crises, offering lessons that can inform future educational policies and practices. The findings are expected to highlight the challenges and innovations within Dadupur's education system during the pandemic, emphasizing the broader implications for rural education globally [6]. This research adopts a mixed-methods approach, combining quantitative data from structured questionnaires and qualitative insights from open-ended responses. This methodology ensures a comprehensive understanding of the impacts of COVID-19 on education in Dadupur and the community's resilience strategies [7]. The significance of this study lies in its potential to bridge the research gap on the impact of COVID-19 on rural education in India, providing a nuanced understanding of the challenges and opportunities in enhancing educational resilience and equity in similar contexts worldwide [8].

MATERIALS AND METHODS

Topic Selection and Justification
The selection of "Post-COVID Educational Resilience Analysis in Dadupur Community" was motivated by the urgent need to understand the ramifications of the COVID-19 pandemic on education systems, particularly in rural settings. The pandemic underscored the fragility of educational infrastructures in the face of global crises, highlighting the need for resilience and adaptability. Dadupur, embodying the challenges faced by rural communities in India, including limited technological access, socio-economic barriers, and infrastructural deficiencies, provided a poignant backdrop for investigating these issues. This study aims to document the immediate impacts of the pandemic and explore the strategies employed by the community to navigate these challenges, thereby offering insights that could inform future policy and practice in rural education systems globally.

Village/Location Selection
Dadupur, a village in Uttar Pradesh, India, was chosen for its typical representation of rural Indian communities grappling with educational challenges exacerbated by the pandemic. Its small population and the existence of pre-pandemic data on its educational landscape allowed for a focused and deep investigation. The village's demographic diversity and socio-economic conditions also provided a microcosm through which to explore broader themes of resilience, adaptation, and innovation in rural education during and after the COVID-19 crisis.

Mubarak Daha Isa *et al.*,

METHODOLOGY OVERVIEW

A mixed-methods approach was employed to capture a comprehensive picture of the pandemic's impact on education in Dadupur. The quantitative component, facilitated through structured questionnaires, was designed to gather data across various dimensions such as demographic details, educational status and impact, modes of learning adaptation during school closures, challenges encountered, and levels of community engagement. The qualitative component, through open-ended questionnaire responses, aimed to delve deeper into the lived experiences of participants, uncovering nuanced insights into the effectiveness of adopted strategies and the personal and communal implications of the pandemic on education.

Plan of Action

The research commenced with an extensive literature review to frame the study within the existing body of knowledge on rural education in the context of the pandemic. Following this, the questionnaire was meticulously designed to ensure comprehensive coverage of relevant themes and was piloted within a small segment of the target population to refine questions for clarity and relevance. The distribution of questionnaires was then conducted in person to accommodate the varied access levels within the community. Concurrently, participants answered the open-ended questions, with these discussions offering depth and context to the quantitative findings. Data collection was complemented by observational notes and secondary data from local educational authorities and reports.

Problems Faced in Execution and Solutions

Several challenges were encountered during the execution of the research, notably the digital divide, which limited access to online questionnaires. This was addressed by distributing physical copies of the questionnaires. Ensuring participant comfort and openness, particularly given the sensitive nature of the pandemic's impact on household education and income, was another challenge. This was mitigated through the use of empathetic questions, ensuring confidentiality, and building rapport with participants prior to data collection. Logistical issues, such as reaching remote parts of the village and coordinating the response times, were also faced and managed through careful planning and community engagement.

RESULT

The methodology yielded rich data, with over 40 questionnaires fully completed and analyzed, alongside open-ended questions that provided qualitative insights into the community's educational experiences during the pandemic. This comprehensive data collection facilitated a robust analysis of the direct and indirect effects of COVID-19 on education in the community, the resilience strategies employed, and the efficacy of digital and other innovative educational approaches under such crisis conditions.

RESEARCH METHODOLOGY

The methodology yielded rich data, with over 40 questionnaires fully completed and analyzed, alongside open-ended questions that provided qualitative insights into the community's educational experiences during the pandemic. This comprehensive data collection facilitated a robust analysis of the direct and indirect effects of COVID-19 on education in the community, the resilience strategies employed, and the efficacy of digital and other innovative educational approaches under such crisis conditions. The mixed-methods research methodology was instrumental in achieving the study's objectives. The quantitative data from questionnaires offered a broad overview of the pandemic's impacts and the demographic and educational landscape of Dadupur, allowing for the identification of trends and patterns. The qualitative data, on the other hand, brought to light the stories behind these trends, offering insights into the adaptive mechanisms, challenges, and successes experienced by individuals and the community at large. This approach ensured that the study's findings were grounded in both statistical evidence and

Mubarak Daha Isa *et al.,*

human experience, providing a comprehensive understanding of the resilience of rural education systems in the face of unprecedented global challenges.

RESULTS AND DISCUSSIONS

RESULTS

The data collected from the structured questionnaires and open-ended responses provide a comprehensive overview of the educational impact of COVID-19 on the Dadupur community.

Demographic Insights
- **Age Group Distribution:** Under 18 (20%), 18-24 (20%), 25-34 (20%), 35-44 (17.5%), 45-54 (7.5%), 55+ (15%).
- **Gender Distribution:** Female (47.5%), Male (45%), Prefer not to say (7.5%).
- **Education Status:** Completed Education (40%), Currently Enrolled (25%), Never Attended School (25%), Dropped Out (10%).
- **Occupation Distribution:** Home worker (40%), Student (25%), Business/Trade (12.5%), Farmer (7.5%), Educator (5%), Retired (10%).

Impact of COVID-19 on Education
- **School Closures:** 85% of respondents indicated school closures for more than 3 months.
- **Reliance on Learning Methods:** 87.5% relied on online learning, 10% used other materials, and 2.5% used offline methods.
- **Satisfaction with Online Learning:** 42.5% very satisfied, 35% neutral, 20% dissatisfied.
- **Learning Gaps or Setbacks:** 35% reported significant learning gaps.
- **Financial Difficulties Impacting Education:** 42.5% faced financial difficulties.

Educational Resilience Strategies and Community Support
- **Strategies Used:** Online educational resources (35%), community support (35%), help from teachers/tutors (12.5%), peer support (12.5%), structured study schedules (5%).
- **Effectiveness of Strategies:** 55% found them somewhat helpful, 40% very helpful.
- **Emotional or Mental Health Support:** 22.5% received support; effectiveness was mostly neutral (72.5%).
- **Satisfaction with School Support:** 42.5% very satisfied, 17.5% dissatisfied, 17.5% very dissatisfied.
- **Community Programs:** 40% reported the presence of educational support programs; effectiveness varied with 32.5% finding them very helpful, 30% neutral, 30% not helpful.

Future of Education in Dadupur
- **Optimism about Future Education:** 42.5% neutral, 27.5% somewhat optimistic, 15% very optimistic, 15% somewhat pessimistic.
- **Willingness to Participate in Future Initiatives:** 80% very willing.

DISCUSSIONS

Digital Divide and Online Learning Challenges
The reliance on online learning (87.5%) underscores the shift towards digital education during the pandemic. However, the mixed satisfaction levels (42.5% very satisfied, 20% dissatisfied) highlight the challenges of online learning, including quality, engagement, and inclusivity issues. The significant digital divide impacted students' access and engagement, aligning with broader findings on rural education during the pandemic.

Educational Setbacks and Financial Difficulties

The pandemic resulted in substantial educational setbacks, with 35% of respondents reporting significant learning gaps. Financial difficulties further exacerbated these challenges, impacting 42.5% of the respondents. These findings emphasize the socio-economic barriers to educational continuity during crises, consistent with existing literature.

Resilience Strategies and Community Support

Community-driven strategies, including online educational resources and community support, were crucial in navigating educational challenges. However, the effectiveness of these strategies varied, indicating room for improvement. Mental health support was limited and often perceived as neutral in effectiveness, highlighting the need for better mental health resources.

School and Community Support

Mixed levels of satisfaction with school and community support programs underscore the importance of robust and effective support systems. The dissatisfaction reported by some respondents (17.5% dissatisfied) points to gaps in the support provided, emphasizing the need for more inclusive and accessible educational support programs.

Future Outlook and Community Engagement

Despite the challenges, there is a cautious optimism about the future of education in Dadupur, with a significant willingness (80%) to participate in future educational initiatives. This suggests a strong community commitment to improving educational resilience and quality post-pandemic. The results of this study underscore the importance of community and mental health support in enhancing satisfaction with online learning during the COVID-19 pandemic. The lack of significant differences in satisfaction levels between genders suggests that both male and female students faced similar experiences and challenges with online learning. The non-significant relationship between school closures and reliance on online learning may reflect the adaptability of students and their families in finding alternative learning methods regardless of school closures. This adaptability could be influenced by the availability of community resources and support networks. The regression analysis highlights the critical role of community support and mental health resources in ensuring educational resilience. These findings suggest that policies aimed at strengthening community support systems and providing mental health resources can significantly improve students' satisfaction and overall learning experiences during crises like the COVID-19 pandemic.

Policy Implications

1. **Enhancing Community Support:** Educational institutions and policymakers should invest in community support programs that facilitate learning continuity and provide a support network for students.
2. **Improving Access to Technology:** Efforts to bridge the digital divide by improving access to technology can potentially enhance satisfaction with online learning, as indicated by the positive trend in the regression analysis.
3. **Mental Health Resources:** Providing mental health resources is crucial for supporting students' emotional and psychological well-being, which, in turn, can positively impact their learning experiences.

STATISTICAL ANALYSIS RESULTS

Descriptive Statistics
Age Group Distribution

The age distribution among participants was varied, with equal representation from the under 18, 18-24, and 25-34 age groups (each with 8 participants). Participants aged 35-44 were slightly fewer (7 participants), followed by those aged 55+ (6 participants), and the smallest group was the 45-54 age group (3 participants).

Mubarak Daha Isa *et al.*,

Gender Distribution
The gender distribution showed a slight majority of female participants (19), followed by males (18), and a small number preferring not to disclose their gender (3).

Current Education Status
Most participants had completed their education (16), while a significant number never attended school (10) or were currently enrolled (10). A smaller group had dropped out of their education (4).

Primary Occupation
Home workers formed the largest occupational group (16), followed by students (10), business/trade professionals (5), retired individuals (4), farmers (3), and educators (2).

Inferential Statistics
Chi-Square Test between School Closure and Learning Method
The Chi-Square test was performed to examine the relationship between school closures and the primary reliance on online learning during the pandemic. The test yielded a Chi2 value of 1.008 and a P-Value of 0.604, indicating no significant relationship between these variables. This suggests that school closures did not significantly influence the method of learning adopted by the students.

T-Test between Gender and Satisfaction with Online Learning
The T-Test was conducted to compare satisfaction levels with online learning between male and female participants. The results showed a T-Statistic of 0.292 and a P-Value of 0.772, indicating no significant difference in satisfaction levels between genders. This implies that both male and female participants had similar levels of satisfaction with online learning during the pandemic.

Predictors of Satisfaction with Online Learning
The regression analysis identified key predictors of satisfaction with online learning, including community support, access to technology, and mental health support.

- **Community Support:** The coefficient for community support was 1.025 (P = 0.012), indicating a significant positive effect on satisfaction with online learning. Participants who reported higher levels of community support were more likely to be satisfied with online learning.

- **Access to Technology:** The coefficient for access to technology was 0.970 (P = 0.079). Although this predictor was not statistically significant at the conventional 0.05 level, it showed a positive trend, suggesting that improved access to technology could enhance satisfaction with online learning.
- **Mental Health Support:** The coefficient for mental health support was 1.057 (P = 0.021), highlighting its significant positive impact on satisfaction with online learning. Participants who received mental health support were more likely to report higher satisfaction levels.
- **Model Performance:** The model explained approximately 25.4% of the variance in satisfaction with online learning (R-squared = 0.254), indicating a moderate level of explanatory power. The Durbin-Watson statistic of 1.466 suggested no significant autocorrelation in the residuals, while the Omnibus test (P = 0.020) and Jarque-Bera test (P = 0.171) indicated some deviation from normality but not severe enough to invalidate the model.

CONCLUSION

The COVID-19 pandemic has underscored the fragility of educational systems, particularly in rural settings like Dadupur, where socio-economic barriers and limited technological access exacerbate the impact of global crises. This study highlights the significant educational disruptions faced by the Dadupur community, including school closures, a reliance on online learning, and substantial learning gaps. Despite these challenges, the community's adaptive measures demonstrate remarkable resilience. Key takeaways from this research include the critical need for bridging the digital divide to ensure equitable access to education and the importance of integrating mental health support into educational frameworks. The findings suggest that targeted interventions, such as enhancing digital infrastructure, providing professional development for educators in digital pedagogies, and fostering robust community-school partnerships, are essential for building resilient educational systems. The strong community willingness to participate in future educational initiatives indicates a collective commitment to overcoming current challenges and improving the educational landscape post-pandemic. These insights can inform policy and practice, not only in Dadupur but also in similar rural contexts globally, contributing to the development of more adaptable, inclusive, and resilient educational models. Future research should explore long-term impacts on learning outcomes, effective models of blended learning, and strategies to integrate comprehensive mental health programs in educational settings. By addressing these areas, policymakers and educators can better support communities in navigating future crises, ensuring that education systems are not only resilient but also equitable and inclusive.

ABSTRACT

In the present investigation we applied radio mean labeling on arrow and the graph associated with arrow graphs by assigning non – negative numbers to the vertices and edges. A connected graph with injective mapping $g: V(I) \rightarrow N$ is Radio Mean labeling if for any vertices a and b of graph I, $d(a,b) + \left\lceil \frac{f(a)+f(b)}{2} \right\rceil \geq 1 + diam(I)$. By representing complex structures in a manageable form and providing quantitative measures of efficiency, these concepts contribute to advancements in algorithm design, network optimization, and problem-solving techniques.

Keywords: Eccentricity, Diameter of graph, Radio Mean Labeling, Radio Mean Number of Graph.

INTRODUCTION

In this paper, we will explore the Radio mean labeling of Arrow and its related graphs which can be applied in real world like wireless sensor networks, routing algorithms, network visualization and Internet of Things (IOT). Also, these concepts can be applied to ensure network connectivity by determining the minimum number of labels required to ensure connectivity in a network, can provide understanding into the fault tolerance of a network, can be utilized to optimize network performance in terms of energy consumption, resource allocation and many more. Graph theory is used to model and analyze complex networks such as social networks, computer networks, and biological networks. It helps in understanding the structure and behavior of these networks, and in developing algorithms for tasks such as routing, clustering, and community detection. Sekar [1] discussed the different applications of graph theory in computer science by using the concepts of list coloring, operation research, timetable scheduling, job scheduling, construction of algorithm, map coloring and GSM mobile phone network. These labeling

80283

Pariksha Gupta *et al*.,

can also be used in cryptography to achieve secure communication between two groups. This paper consists of simple, finite, undirected and connected graph. Chartrand et. al. [2] developed the concept of Radio Labeling in 2001. Aasi et. al. [3] discussed the concept of Radio labeling of Lexicographic Products of some graphs like path graph and also examine Radio Mean Labeling of Lexicographic Products of graphs. They also developed computer program for the same by using Python programming language. Sunitha et. al. [4] explored the concept of Radio Mean Labeling of Path and Cycle related graphs. Ponraj et. al. [5] explored the Radio Mean Labeling of some graphs like graph with diameter three, lotus inside circle, Helms and Sunflower graph. Palani et. Al. [6] analyzed the radio mean labeling of Path union of graphs. Kaneria et. al. [7] introduced the Arrow Graph and Double Arrow Graph in 2015 in their paper and also discussed the graceful labeling of arrow graphs and double arrow graphs. For basic terminologies, we refer Harary[8] and Gallian [9].

1.1 Definition
The maximum distance between a vertex to all other vertices of the graph is called as Eccentricity of a graph.

1.2 Definition
The diameter of a graph is the length of the longest shortest path between any two graph vertices $'p'$ and $'q'$.

1.3 Definition
Radio Mean labeling of a connected graph I is a one – to – one mapping from the set of vertices $V(I)$ to the set of natural numbers such that for any vertices p and q of I, $d(p,q) + \left\lceil \frac{f(p)+f(q)}{2} \right\rceil \geq 1 + diam(I)$. The Radio Mean Number of graph I, $rmn(I)$ is the minimum value allocated to any vertex of the graph I. The Radio Mean Number of function g, $rmn(g)$ is the maximum value allocated to any vertex of the graph I.

1.4 Definition
In a graph, $P_m \times P_n$ on mn vertices, $\{p_{11}, p_{21}, \dots \dots, p_{m1}\}$ and the vertices $\{p_{1n}, p_{2n}, \dots \dots, p_{mn}\}$ are known as Superior vertices from both the ends.

1.5 Definition
An Arrow Graph A_n^t with width t and length n is obtained by joining a vertex a with the Superior vertices of $P_m \times P_n$ by m new edges from one end.

1.6 Definition
A subdivision of a graph I is a new graph that is formed by adding vertices to the edges of I in such a way that each edge is replaced by a path of one or more edges connecting the newly added vertices.

RESULTS

2.1 Theorem: The diameter of an Arrow graph I with width t and length n is given as –
$$diam(I) = \begin{cases} n; & when\ t = 2 \\ n+1; & when\ t = 3\ and\ 4 \\ n+2; & when\ t = 5\ and\ 6 \end{cases}$$
Proof: To prove the above results we have following cases:

Case 1: Let I be an Arrow graph with width $t = 2$ and length n. We want to prove that any two vertices in graph I can be connected by a path of length at most n.
Let p be any vertex of the graph and consider any other vertex q in the graph I. Now, the distance between the vertex p and q of the graph I is at most n. Since q is an arbitrary vertex which means that the distance of p to any other vertex of the graph I is atmost n. Thus, $e(p) \leq n$.
Therefore, by the definition of diameter, the diameter of graph I is n.

Pariksha Gupta *et al.*,

Case 2: Let I be an Arrow graph with width $t = 3$ and $t = 4$, and length n. We want to prove that any two vertices in graph I can be connected by a path of length at most $n + 1$.

Let p be any vertex of the graph and consider any other vertex q in the graph I. Now, the distance between the vertex p and q of the graph I is at most $n + 1$. Since q is an arbitrary vertex which means that the distance of p to any other vertex of the graph I is atmost $n+1$. Thus, $e(p) \leq n + 1$.

Therefore, by the definition of diameter, the diameter of graph I is $n + 1$.

Case 3: Let I be an Arrow graph with width $t = 5$ and $t = 6$, and length n. We want to prove that any two vertices in graph I can be connected by a path of length at most $n + 2$.

Let p be any vertex of the graph and consider any other vertex q in the graph I. Now, the distance between the vertex p and q of the graph I is at most $n + 2$. Since q is an arbitrary vertex which means that the distance of p to any other vertex of the graph I is at most $n + 2$. Thus, $e(p) \leq n + 2$. Therefore, by the definition of diameter, the diameter of graph I is $n + 2$. Example 2.1: The diameter of A_3^2 is 3. Example 2.2: The diameter of A_3^4 is 4.

2.2 Theorem: The Radio Mean Number of an Arrow Graph A_n^t is $nt + 2$.

Proof: Let I be an undirected Arrow graph having width t and length n and define the function $f: V(I) \to N$. Let $\{u_1, u_2, u_3, \ldots\ldots, u_n\}$ be the vertices of the grid graph and let a be the vertex joined by the superior vertices of the grid graph from one end. We will assign labels to the vertices of the graph I by $2(nt + 1)$ in the descending numerical order. Let u_m and u_n be the two vertices of the graph I which is satisfying the condition $d(u_m, u_n) + \left\lceil \frac{g(u_m) + g(u_n)}{2} \right\rceil \geq 1 + diam(I)$ as follows $-rmn(I) = nt + 2; \quad \forall\, t \geq 2, \forall\, n \geq 2$

As u_m and u_n are the arbitrary vertices of the graph I which is satisfying the condition of Radio Mean Labeling.

Thus, an Arrow graph A_n^t is a Radio mean graph.

The Radio mean number is the minimum value allocated to any vertex of the graph. Hence, the Radio mean number of an Arrow graph A_n^t is $nt + 2$.

Corollary 1: The number of vertices in an Arrow graph is $nt + 1$.

Corollary 2: The Radio Mean Number of the function g is twice the order of the graph i.e. $2(nt + 1)$.

Example 2.3: The radio mean number of A_5^5 is 27.

2.3 Theorem: The diameter of subdivision of an Arrow graph I with width t and length n is given as –

$$diam(I) = \begin{cases} nt + 1; & when\ t = 2 \\ nt + k; & when\ t = 3\ and\ k = n - 2 \end{cases}$$

Proof: To prove the above results we have following cases:

Case 1: Let I be a subdivided Arrow graph obtained by inserting a vertex in between every edge with width $t = 2$ and length n. We want to prove that any two vertices in graph I can be connected by a path of length at most $nt + 1$.

Let p be any vertex of the graph and consider any other vertex q in the graph I. Now, the distance between the vertex p and q of the graph I is at most $nt + 1$. Since q is an arbitrary vertex which means that the distance of p to any other vertex of the graph I is atmost $nt + 1$. Thus, $e(p) \leq nt + 1$.

Therefore, by the definition of the diameter, the diameter of graph I is $nt + 1$.

Case 2: Let I be a subdivided Arrow graph obtained by inserting a vertex in between every edge with width $t = 3$ and length n. We want to prove that any two vertices in graph I can be connected by a path of length at most $nt - k$, where $k = n - 2$.

Let p be any vertex of the graph and consider any other vertex q in the graph I. Now, the distance between the vertex p and q of the graph I is at most $nt - k$, where $k = n - 2$. Since q is an arbitrary vertex which means that the distance of p to any other vertex of the graph I is atmost $nt - k$, where $k = n - 2$. Thus, $e(p) \leq nt - k$.

Therefore, by the definition of the diameter, the diameter of graph I is $nt - k$, where $k = n - 2$.

Example 2.4: The diameter of subdivided Arrow graph A_2^2 is 5.

Example 2.5: The diameter of subdivided Arrow graph A_4^3 is 10.

2.4 Theorem: The Radio mean number of subdivision of Arrow graph A_n^t is $2(nt + 1)$.

Proof: Let I be a subdivision of Arrow graph obtained by inserting a vertex in between every edge with width t and length n. Define the function $f: V(I) \to N$ and let $\{u_1, u_2, u_3, \ldots\ldots, u_n\}$ be the vertices of the grid graph and let a be the vertex joined by the superior vertices of the grid graph from one end. Let $\{p_1, p_2, p_3, \ldots\ldots, p_n\}$ be the new added vertices between every edge. We will assign labels to the vertices of the graph I by $2(nt + 1)$ in the ascending numerical order. Let u_m and u_n be the two vertices of the graph I which is satisfying the condition $d(u_{m,}u_n) + \left\lceil \frac{g(u_m) + g(u_n)}{2} \right\rceil \geq 1 + diam(I)$ as follows – $rmn(I) = 2(nt + 1); \quad \forall\, t \geq 2, \forall\, n \geq 2$

Thus, a subdivision of Arrow graph A_n^t is a Radio mean graph and the Radio mean number is $2(nt + 1)$. Corollary 1: The number of vertices in a subdivision of Arrow graph is as follows – No. of vertices $= 3nt - k; \quad$ where $k = n - 1$
Corollary 2: The Radio Mean Number of the function g is as follows –

$$rmn(g) = \begin{cases} 4(nt + 1) + (n - t); & \text{when } t = 2 \\ 4nt + diam(I); & \text{when } t = 3 \end{cases}$$

Example 2.6: The radio mean number of subdivision of Arrow graph A_3^3 is 20.

CONCLUSION

The Radio mean labeling assigns a frequency to each base stations such that the distance between any two base stations can be determined by comparing their frequencies for ensuring smooth communication. It has several advantages in wireless communication networks, fault tolerance, network connectivity, routing and communication protocols etc. In this paper, we have investigated the radio mean labeling and radio mean number of Arrow graph. Also, we computed the radio mean number of subdivision of Arrow graph. Moreover, we can try to check radio mean labeling of these graphs by any programming language like Python, Java etc.

Open Problem
➢   Determining the diameter of an Arrow graph for $t \geq 7$.
➢   Determining the diameter of Subdivision of Arrow graph for $t \geq 4$.
➢   Finding Radio mean labeling of other families of graph.

ABSTRACT

The paper presents a brief critical review of major contributions to the theory of Political Economy of Communication and attempts to trace the history of classical Political economy in order to understand how and why such an approach has gained so much of popularity in social sciences. The research paper critically engages with the conceptual and thematic arguments, critiques developed by pioneering Political economists and focusses on the key challenges that emerged in the political economy of Media and Communication with the advent of Digital Media. The research paper is a systematic analysis of existing literature available in the field of Political economy and discusses the conceptual developments and key dimensions of Commodification, Spatialization and Structuration and how the notions of Spatialization have been reduced by the emergence and growth of digital media technologies.

Keywords: Political Economy, Structuration, Spatialization, Systematic- Analysis, Commodification.

INTRODUCTION

The Political Economy of Communication has emerged as a major field of inquiry in media studies over the decades that studies the relationship of economy and politics with reference to production, distribution and consumption of media content in relation to potential impact on audiences. This becomes imperative for communication scholars to study political economy of communication in order to understand who controls media, the production and distribution of messages and what relation do media have with other businesses and, most primarily, with the state. The initial days of emergence of Digital media platforms the focus of scholarship on Political Economy argued that the Digital media platforms are going to replace the existing media platforms like Radio, Television and Print. The

80289

results rather contradicted the notion as the platforms converged and old and new media began to collide (Jenkins, 2006) The paper briefly reviews the major work in the field of Political Economy of Media and Communication and emphasizes on the developments that occurred worldwide especially with the exponential growth of Digital Media technologies. The challenges to the field of Political economy with the emergence of Digital media technologies have increased the emphasis on the larger debates on corporatization, Commodification and Structuration. This makes it imperative to study and analyze the conceptual, critical and developmental synthesis of Political economy of Media.

Objectives of the Study
1.   To provide a critical insight in to conceptual and thematic approaches to Political Economy of Media and Communication with reference to digital media technologies.
2.   To unveil the spatial dynamics of digital media dominance with respect to political economy of Media.
3.   To discuss the Conceptual developments and key dimensions related to the field of Political Economy of Media.

Historical Foundation of Political Economy
The concept of Political economy of Communication traces its roots from philosophers like Smith, Mill and David Ricardo invoked from the 18th century Scottish enlightenment thinking (Wasko, 2005). Adam Smith has described political economy as the study of "wealth" that includes allocation of resources and how people allocate scarce resources to satisfy their certain needs. Political economists mostly understood and studied capitalism as a system of social production and according to Wasko (2005) the evolution of Capitalism and classical political economy evolves collectively. The growth of capitalism reinforced the need for political economy to be adopted as an approach to investigating the various facets of the consumerist system. The political economy gave philosophers not just an approach to study economic aspect of consumerism but also made them to investigate its moral consequences. The scholarship on Political economy draws its roots also from the works of Engels and Marx who added the perspectives of historical materialism in 19th Century. A major shift in the study of economic issues took place during the last half of the 19thcenturyas the focus shifted from macro to microanalysis (Wasko, 2005: 26). The emphasis of Political economy shifted from societal concerns to Individuals and the methods were drawn from social sciences rather than moral behavior. In his classic '*The Political Economy of Communication*', Mosco (1996)makes a detailed mention of four ideas at the foundation of political economy and these are Moral philosophy, social totality, Social Change and History, Praxis. Mosco argues that the focus of political economy has always been to understand the dynamics of Social Change and transformation where as classical Political economists like Mill, Ricardo and Smith considers it the great capitalist revolution. Social totality for Mosco is a fundamental element in political economy that looks at society at different vantage points to provide a deep and multi-dimensional insight of the societal changes that occur over the time and simultaneously an approach used by disciplines to investigate different aspects of consumerism.
Moral philosophy is the most important cornerstones of the classical political economy; the founding fathers used moral philosophy to indicate to social values and conceptions of appropriate social practices. They looked at the political economy to not only study the change vis-à-vis economy but also looked at the aspects of morality as to whether such a system cared about society's values or not; and if not, then to what extent does this phenomenon impact society and how to critically engage with such occurrences. In fact, Murdock and Golding (1991)argue that "political economy goes beyond technical issues of economic efficiency and engage with basic moral questions of justice and public good". The idea of moral philosophy was deeply close to classical political economists and as Mosco (1996) notes, Adam Smith considered '*The Theory of Moral Sentiments'* a much better work than his '*The Wealth of Nations'*. The fourth approach is praxis and relates to the free and creative activity by means of which people change the world. Mosco (1996) notes the idea of praxis has profound origins in the history of philosophy and that in ancient Greece, where the word originated, it referred to the business and political activities of free men. Praxis was used by Aristotle in his works and he was of the opinion that Political, ethical and economic studies are forms of practical knowledge to be differentiated from theory.

Development of Political Economy of Communication in North, Europe and in Third world
The political economy approach was first applied to communication during 1960sin North American academia by Dallas Smyth and Herbert Schiller, two founding figures who inspired a number of scholars to take political economy

as an approach to studying communication (Mosco, 1996). The larger part of their work has revolved around the assertion that communication industry has become a part of wider corporate order which they argue is exploitative and undemocratic and something which brings injustice to people. The North American scholarship is also concerned with interrogating the mainstream dominant media, influencing creation of alternatives and supporting the social movements that have made their presence felt in international for a like the United Nations. One of the most important contributions to the political economy of communication from North America, political economists acknowledge, has been the work of Herbert and Chomsky's *Manufacturing Consent*(1988) that initiates serious discussion on American print media and its functioning. So, the North American scholarship on political economy has mostly dealt with the concentration of power between the corporates and their relationship with the state.

The European scholarship of the political economy of communication dating back to late '70s is concerned with the study of movements for social change. It comes in open defense of the public service media system and calls for integration of communication research within various neo-Marxian theoretical traditions. Much of the European scholarship revolves around *class power*, the direction of which has been initiated by the contributions of Nicholas Garnham, GrahamMurdock and Peter Golding who draw on Frankfurt School tradition as well as Raymond Williams to document the integration of communication institutions within the wider capitalist economy.

The scholarship is also a significant documentation of resistance of subaltern classes and movements which opposed neo-conservative state practices prompting liberalization, commercialization and privatization of communication industries. The second stream of researchin the European scholarship foregrounds *class struggle*(Mosco, 1996: 20) that is prominently documented by Armand Mattelart. Hedraws from a range of traditions including Dependency Theory, Western Marxism and global experience of liberation movements to understand communication as one of the principal sources of resistance to power. The leading figure in the development of communication studies in Britain is James Halloran from whose Centre for Mass Communication Research Graham Murdock and Peter Golding and other scholars would later undertake substantial research on political economy of communication. It was from European academia that first debates on New World Information and Communication Order (NWICO) were initiated. The 'Third World' scholarship on political economy of communication involves a blend of interests and one of its major responses(Mosco, 1996) has been to the modernization or development paradigm that originated in the West. The 'Third World' political economists have challenged the West's model, its technological determinisms and questioned why it has omitted the interest in power relations that shape the West's economic and political relationship with the 'Third World'. The pattern of research in 'Third' World which Moscow calls it the 'developing' world has been different from its counterparts in developed world because of different situations they have grown from. Mosco (1996: 120) writes that the research in this region was forged during the 'hot wars' 1960s and that the academic inquiry took off into two directions. It, as Mosco notes, developed a critique of conservative and liberal developmentalist approaches that West launched in response to the anti-imperialist struggles.

The 'Third' World research also presented a new framework of dependency theory to understand global political economy in its own way. In India, critical political economy of communication is being seriously pursued by communications scholars who interrogate the news media from print to electronic to internet. Saeed (2013) initiates a thorough discussion on political economy of television in India and brings to fore the decadal changes in the media industries and how ownership patters are making a direct impact on the media content. In one of the compressive chapters in the book, *Ownership Patterns and Its Impact on News Values and Content,* Saeed traces the history of commercialization of media, the privatization of airwaves and reflect on the future of the public service broadcasting. The work of Thomas (2010)also maps the political economy in Indian communication scenario and the author reflects on the country's encounter with copyright, the burgeoning of audio-visual trade, community radio and the popularity of right to information movement. The scholars like Butt, A.A (2018) predicted the rise of digital media technologies in regional journalism as an alternate to national media. As Political Economy of Communication grew, many debates have taken place over the decades. In 1977, Dallas Smythsparked a debate when he wrote an article in which he argued that communication had been overlooked by Western Marxists who he noted were mostly interested in issues relating to ideology and argues that the 'main product of media was audiences which were sold by media to advertisers. It is because of the continued debates that political economy is being viewed through

different perspectives and applied to various levels of communication. And that's why, conscious of changing dynamics, political economists began to rethink the political economy of communication (Wasko, 2005).

Thematic Review: Commodification, Spatialization and Structuration

The application of political economy approach in communications research by Dallas Smyth and Herbert Schiller, major scholarly contributions (Murdock and Golding, 1974; Nicholas Garnham, 1979; Vincent Mosco, 1996 and others)have appeared in North America, Europe and the 'Third' World academia. The scholars have engaged with multiple issues facing the field of communication today and in so doing opened up new gates of inquiry into the field by their individual contributions. Academic inquiry into political economy of communication was largely influenced by the development of communication institutions into mammoth profit-maximizing industries.The need for a critical political economy of communication was felt because media are doubly significant (Thomas, 2010). Media are not only seen as industries which generate sizeable revenue but institutions which are actively involved in production and circulation of symbolic goods and services that make an impact on choices and opinions of consumers. But when these institutions that have the responsibility to circulate information to the consumers become just holders of capital and overlook their responsibilities vis-à-vis public service, they are certain to evoke academic response. Critical political economy of communication is a classic example. In 1996, Vincent Mosco published a significant book *The Political Economy of Communication*, a thorough synthesis of past contributions anda new addition to the existing body of knowledge on political economy of communication. Mosco's book is considered a significant reference point to the study of political economy of communication. Apart from giving a detailed overview of classical political economy and drawing an academic map of the field, Mosco has added three dynamic processes to the field which he argues are necessary to understand the social change. In his work, Mosco argues that social change is ubiquitous and can be understood from three dynamic processes that serve as entry or starting points to the field: commodification, Spatialization, structuration.

Commodification

The Political economists historically place the concept of commodification in the capitalist setting and explain the nature of industries which manufacture products and the processes of sale of those products in a market-driven milieu. Mosco identifies two important parameters which the classical political economists have sought to engage with: use value and exchange value. *Use value* of a product is something that satisfies a specific human want or need while *exchange value* is something whose value is based on what the product can command in exchange. Commodification of products begins when their production is organized through the process of exchange. Capitalism is seen to be an immense collection of commodities. So, commodification in political economy's perspective takes place when industries manufacture at large scale products to be sent to the market. And this interaction is based primarily on market-driven culture and products are not seen through the prism of *use value* but through *exchange value*. Mosco (pp. 143-144) defines commodification as "a process of turning use values into exchange values by transforming products whose value is determined by their ability to meet individual and social needs into products whose value is set by what can bring in the marketplace".

'Commoditization of media content' and Audience as a Commodity'

One of the main themes of Mosco's work and perhaps the best is his argument that when commodification is applied to communication, it is *media content* which is commodified by mass media industries (p. 146). The process of commodification in communication involves 'transforming messages, ranging from bits of data to systems of meaningful thought into marketable' products. The example of a newspaper reporter who works for a mass mediated commercially-driven newspaper and has the job to produce news reports that are fit to be marketed by the newspaper organization. The reporter, Mosco reasons, works on a specific wageoffered by the organization and has the responsibility to keep producing content which the newspa persells to increase profit and in so doing maximize capital or surplus which is the prime motive of any industry that manufactures products. In case of communication, information is termed as a commodity sold to customers against a sum in a market; the seller is the organization. So, when we refer to a newspaper organization, for example *Times of India or any news media group* should not be mistaken that the company is there to do any public good however few of its objectives might end eavorto attempt

so. As scholars suggest, the companies like these need scholarly attention because what they produce do influence individual choices so much so that even the perspectives of common people are shaped accordingly (Thomas, 2005).Drawing on Nicholas Garnham, Mosco mentions two dimensions of media commodification: the direct production of media products and the use of media advertising to perfect the process of commodification. The claim of Smythe (1977) that the audience is the primary commodity of the mass media. Mosco argues that mass media programming is used by advertisers to get access to audience and in so doing deliver audience to the advertisers. When media offer content to the audience, there is always something beyond or in-between it: the advertisements. Obsessed with the media content, the audience is left with no choice than to consume the advertisement. By doing this, advertisers one the one hand hold attention of audience to certain commodities and one the other hand get to know them, their likes and dislikes. The founding political economist, Dallas Smythe, was the first scholar who started the debate that mass media sell audience as commodities to advertisers. The debate is titled 'Blindspot' debate because Smythe argued that this issue was not getting enough attention in communication research.

Spatialization

Spatialization is a process of bridging time and space constraints between products and consumers by industries that sell them. The best example of this isof an Indiancitizen who wants to read *The New York Times* shortly after it is published. The persons need not necessarily be in the U.S. to read the newspaper and can access it through internet. In the light of this example, we can say that internet has the spatial characteristics that can transform messages to people anywhere in the world and at any time. This spatiality of facilitiesis what capitalism holds in the entire world and has the capacity to use it over to those who don't know a speck of it. The classic example of it is the recent revelation that National Security Agency (NSA) of the United States gathers personal information of millions of internet users in the world. Henri Lefebvre (cited in Mosco, 1996: 173) has defined Spatialization as overcoming the constraints of space and time in social life while Marxhas called it 'annihilation of space with time'. Since communications processes and technology are central to political economy of communication research, the idea of Spatialization interrogates discourse on how corporations bridge spaces in the world, manufacture products and ensure that the products are sold to consumers near and far from them, primarily seeking the help of technology. In the past, when technology was not so advanced and corporations had to move goods manually through transportation, the idea of Spatialization was still emerging. What we see now is a web-based facility that helps people make online sales and purchase goods sitting in their drawing rooms. This is what classical political economists called 'shrinking of space'. The Institutional extension of corporate power in the communication industry is what political economy of communication addresses chieflyas a prime manifestation of Spatialization (p. 175) and when institutional extension takes place, *corporate concentration* arises which results in big influential corporate companies buying other little industries and in so doing establishing a sort of oligopoly that aims to control the entire market to which consumers finally become subservient.

Corporates are powerful entities which influence political, economic, social and cultural interaction in a society; control on mass media gives them control over everything. Mosco calls this sort of development as *horizontal concentration*. "Horizontal concentration takes place when a firm in one line of media buys a major interest in another media operation, not directly related to original business, or when it takes a major stake in a company entirely outside of the media"(pp. 175-176). Vertical integration of corporate concentration takes place when a firm purchases another company in its own line of business. This institutional concentration indirectly shrinks the space among the corporates and gives them an endless power to influence and control both the base as well as superstructure of the society; base, because of the profit-maximization and the superstructure because of the control over production and distribution of the content which have the capacity to influence audience. Global changes in the capitalist market that continue to take place across the world today at a much higher pace than the past coupled with its impact on social life of common people are making modern day states jittery and their reaction to these changes comes in the form of regulation. That's what states do in line with their own constitutions to make their presence felt in a world where the pie chart of monitory growth is dominated by corporations and as Mosco (1996: 200) says, the role of a state in communication comes down to choose between regulation and de-regulation. However, as Mosco points out, the states have taken cue from the industrial changes and it has given rise to few phenomena directly constructed by the

Aaqib Anwaar Butt and Saniuddin Khan

state. The phenomena include *commercialization, liberalization, privatization* and *internationalization*. As corporations continue to maximize revenue, states too are in a process of commercializing their institutions in order to get maximum profit. States givea free choice to stakeholders in a market and this is aimed to increase market competition, hence liberalization. Privatizationof institutions in a state takes place when the state itself intervenes to sell a state enterprise, e.g., a broadcaster or a telephone company. Internationalization happens when states create their own wide range of teaming arrangements or strategic alliances. This interstate coordination is always aimed at bridging the gap between states and settling down to a common minimum program where states proportionately grow, in capital and in politics.

Structuration

Drawing on the work of Anthony Giddens (1984), Mosco defines structurationasa process by which structures are constituted out of human agency, which means structures and action of individuals are interconnected. In this framework, the critique of Walt Disney Company by Wasko (2006) is a perfect analogy. In his critique, he traces the origin of the company and how efforts of a single man supported by a team– that remained mostly behind the curtain – made Disney one of the world's influential production houses. Mosco notes that structuration in coordination with the processes of commodification and Spatialization strikes a balance in the analysis of political economy of communication to feature structures and analyze them in relation with the ideas of human agency and social practice. Mosco argues that "structuration theory is an approach to social life that aims to address goal-oriented, reflexive human action, without giving up on the understanding the 'sutures' of power that mutually constitute social action". Mosco further breaks down the process of structuration into divisions to understand it from various vantage points like *social class, gender, race and social movements*. Together with these variables, the author tries to place the structuration as a main entry point to the field of political economy of communication. Mosco's work is a significant contribution to the field and would remain a main reference point to the debates on application of political economy to communication. Although academic literature on political economy of communication is expanding with the subject being pursued across the world, what follows in this paper is an overview of article-length contributions by authors who have tried their hands on the subject.

CONCLUSION

The emergence of political economy of communication in digital sphere has in fact favored the large media conglomerates. There was a sense of hope in the initial years of emergence of digital media and a possibility that it will allow emergence of alternate voices but the results indicate that digitalization has allowed further concentration of mainstream media. The notions of space and time have been eliminated by the emergence of digital media applications as all the major communication players have acquired digital platforms, social media sites, television channels, citizen journalism avenues or any other medium of communication. The political economy of digital media hardly changed any scenario instead allowed for convergence of digital technologies with Print, Radio, Television and other means of communication. There is an emergence of creation of larger digital ecosystem as these media conglomerates have branched in to digital business ventures. The concept of spatialization instead of acting as a hindrance rather provided a simplified tool to the major political economy players to reach out to each and every part of the globe and removed inhibitions of space and time. There was a time when technological advancement was not developed and manual transportation of goods and services emerged. The emergence of digital media technologies instead of providing a platform for marginal and hitherto voices rather led to the further shrinking of space and provided a improved opportunity for major political economy players to reach out to the places and cultures that were out of range for them there by creating a new hyper globalized societies and cultures where we have reached a stage where political economy of communication has become so dynamic that even states have felt a need to privatize and corporatize their institutions. The ease of access to geographies, demography's, cultures and societies is what digital political economy of communication has provided to the already dominant political economy structures. The political economy of digital media has in fact made the notions of structuration, commodification and spatialization more robust.

ABSTRACT

Differential equations (DEs) are used in many engineering domains. In electrical engineering, differential equations are utilized to model various control systems and circuit problems. For analyzing and understanding electrical circuits, differential equations are essential, particularly in Resistor-Inductor-Capacitor (RLC) circuits. This research investigates the use of differential equations with an emphasis on the transient and dynamic characteristics of RLC series circuits. A second-order differential equation that models the RLC series circuit was derived, considering three cases, with the underdamped case being the main focal point of study, while the other two cases were briefly covered. The response of the current flowing through the circuit and the behavior of the oscillating current in an underdamped RLC series circuit, showing both exponential decay and sinusoidal oscillations, were analyzed, and conclusions were drawn based on the nature of the current derived from the circuit.

Keywords: Series connection, circuit model, Transient response, steady-state response, sinusoidal oscillations, transient analysis, steady state, amplitude.

INTRODUCTION

Across various fields, differential equations can be used to model real-life problems. The characteristics of such problems can be represented with the help of differential equations, extending their use to various disciplines. For

example, differential equations are employed in forensic science to estimate the time of death, in economics to analyze changes in Gross Domestic Product (GDP) over time, and in electrical engineering for the analysis and formulation of circuit models.

In electrical engineering, several key components include:
- **Capacitor**: An electronic component used in circuits for energy storage and filtering, storing energy in an electric field between two conductive plates separated by an insulator.
- **Inductor**: A passive component that stores energy in a magnetic field created by current flowing through a wire coil, frequently used in circuits for impedance matching and energy storage.
- **Resistor**: A passive component used in circuits to control voltage, limit current, and dissipate power by opposing the passage of energy.

Other important concepts include
- **Voltage Drop**: The decrease in voltage across a component due to impedance, resistance, or other factors, which is crucial for circuit design to ensure proper device performance.
- **Circuit Connection**: The physical or electrical linkage of electronic components within a circuit to form a complete path for current flow, established through methods like soldering or wire bonding.
- **Dampness**: The presence of moisture or humidity in electronic systems, posing risks of corrosion, short circuits, and component failure, necessitating protective measures for system reliability.

The demand for electrical power is increasing due to its essential role in powering machinery and appliances that make our lives easier. In electrical engineering, circuit analysis plays a vital role in various areas, such as transmission lines, radio receivers, and control systems. RLC (Resistor-Inductor-Capacitor) circuits provide a flexible framework for energy storage, filtering, and signal processing. Understanding the behavior of RLC circuits is crucial for developing reliable and efficient electronic systems. Solving electrical circuits can be tedious and lengthy work, but this is where differential equations come into play. Differential equations offer a mathematical framework for modeling voltage and current relationships over time, making them an effective tool for studying the dynamic behavior of RLC circuits. Using Kirchhoff's current law (the sum of all currents flowing in and out of a node is zero) and Kirchhoff's voltage law (the total voltage around a loop or mesh is equal to the sum of all the voltage drops across the components within the same loop), along with Ohm's law (the voltage drop across a resistor is equal to the product of the current and the resistance in the circuit), differential equations capture the interactions between resistive, inductive, and capacitive elements. This allows for the prediction of frequency characteristics, stability criteria, and transient responses. Engineers and researchers can study alternate circuit configurations, parameter values, and input conditions using differential equations, gaining insights into how an electrical system would behave in various situations. Differential equation-based analysis is further empowered by experimental validation, numerical or MATLAB simulations, and analytical solutions. In this report, a circuit analysis will be conducted, and a model will be introduced to determine the behavior of the circuit used, its state, and dampness, as well as the graph of the model using MATLAB dimensional plots.

Problem Statement
In the field of electrical engineering, undamped oscillation in resistor-inductor-capacitor (RLC) circuits is a basic yet intricate phenomenon. It is the central component of many electronic systems, including those that distribute power and process signals. Understanding the complexities of undamped oscillation is essential for improving the performance, stability, and dependability of circuits. In this report the undamped oscillation in RLC circuits is to be examined, focusing on its foundational ideas, difficulties, and consequences. The other two cases namely over damped and critically damped motions will be discussed in brief.

Saifullahi Muhammad Ali *et al.*,

METHODOLOGY
RLC circuit Diagram under any given time(t), the current I, will flow in every point of the circuit, this current is denoted by $I = I(t)$, since the current depends on time(t). We say $I(t) > 0$ if the current flows from positive terminal of the source to the negative terminal while the reverse of this case will be when $I(t) < 0$. Similarly, if $I(t) = 0$ then no current is flowing in the circuit at the given time(t) [9]. On the sides of every circuit component, we labelled it as positive(+ve) and negative(-ve). The voltage drops V_L, V_C, V_R across the circuit components is determined by taking the difference between the potential on the positive (+ve) side of the circuit component and the potential on the negative side. Thus, the voltage drops across resistor is given by

$$V_R = IR \tag{1}$$

The above equation is the representation of Ohm's law, the I describe in the equation above is the current and R is the resistance associated to the resistor. In the Induction coil, the voltage drop is given by

$$V_I = L\frac{dI}{dt} = LI' \tag{2}$$

where $I' = \frac{dI}{dt}$ and L is called the inductance of the coil which at the same time is a positive constant.

A capacitor is an energy storage component in a circuit that stores electrical charge $q = q(t)$, the relationship between the charge q and the current I is given by

$$q(t) = q_0 + \int_0^t I(\tau)\, d\tau \tag{3}$$

where q_0 denotes the charge at $t = 0$ on the capacitor. the voltage drop in this component is given by

$$V_C = \frac{q}{C}$$

Where C is the capacitance of the capacitor, which is a positive constant.

According to KVL "In any close loop network, the total voltage around the loop is equal to the sum of all the voltage drops within the same loop, which is also equal to zero.

Let V_t be the total voltage around the loop, then

$$
\begin{aligned}
V_t &= V_L + V_R + V_C \\
&= L\frac{dI}{dt} + IR + \frac{q}{c} \\
&= LI' + IR + \frac{q}{c} \\
V_t &= LI' + IR + \frac{q}{c}
\end{aligned} \tag{5}
$$

Those equation involves two unknown parameters; the current flowing in the circuit I and the charge q on the capacitor.

We can recall that from equation (3) we have

$$q(t) = q_0 + \int_0^t I(\tau)\, d\tau$$

by differentiating equation (3) we have

$q' = I \therefore I' = q''$ then equation (5) becomes

$$Lq'' + IR + \frac{q}{c} = V_t \tag{6}$$

the required current flowing in an RLC circuit can be obtained by solving equation (6) and differentiating the solution $q(t)$ to obtain the current.

80298

Saifullahi Muhammad Ali *et al.*,

Free Oscillation

An RLC circuit is said to be having V_t for $t > 0$ is said to be in free oscilation. and thus equation (6) can be rewritten as

$$Lq'' + IR + \frac{q}{c} = 0 \tag{7}$$

This is a homogeneous system with characteristic equation $LS^2 + RS + \frac{1}{C} = 0$ having the root $S_1 = \frac{-R-\sqrt{R^2-\frac{4L}{C}}}{2L}$ and

$S_2 = \frac{-R-\sqrt{R^2+\frac{4L}{C}}}{2L}$ these yield three cases to consider.

Under damped

The oscillation is said to be under damped if $R < \sqrt{\frac{4L}{C}}$, where $s_1 \ and \ s_2$ from characteristic equation of (7) are complex

root which can be expressed as

$s_1 = \frac{-R}{2L} + \iota V_1$ and $s_2 = \frac{-R}{2L} - \iota V_1$ and

$V_1 = \frac{\sqrt{\frac{4L}{C}-r^2}}{2L}$ thus the general solution of equation(6) is now

$q = e^{\frac{-Rt}{2L}}(C_1 cos V_1 t + C_2 sin V_1 t)$

$$q = Ae^{\frac{-Rt}{2L}}cos(V_1 t - \psi) \tag{8}$$

where $A = \sqrt{C_1^2 + C_2^2}$, $A cos\psi = C_1$ and $A sin\psi = C_2$ When R=0, equation (8), becomes $q = A cos\left(\frac{t}{\sqrt{LC}} - \psi\right)$
An actual RLC circuits are mostly under damped, so this case is the most important

Over damped

The Oscillation is said to be over damped if $R > \sqrt{\frac{4L}{C}}$, Whereby the roots of the characteristic equation are both real

having $s_1 < s_2 < 0$, the general solution is

$$q = K_1 e^{s_1 t} + K_2 e^{s_2 t} \tag{9}$$

Critically damped

In critically damped case, we have $R = \sqrt{\frac{4L}{C}}$ thus $s_1 = s_2 = \sqrt{\frac{-R}{2L}}$ and so the solution of the equation (6) is

$$q = e^{\frac{-Rt}{2L}}(K_1 + K_2 t) \tag{10}$$

Suppose $R \neq 0$, the exponential in equation (8) in case 1, equation (9) in case 2 and lastly equation (10) in case 3 are negative, the solution of any homogeneous initial value problem (IVP)

$$Lq'' + Rq' + \frac{q}{C} = 0, \quad q(0) = q_0, q'(0) = I_0$$

approaches or tends to zero exponentially whenever $t \to \infty$. Thus, the solutions are transient in nature.

Example 1

An RLC circuit with resistance $R = 60$ ohm, inductance $L = 0.25$ henrys and a capacitance $C = 10^{-4}$farads have a current of 2 amperes flowing in at $t = 0$, if the capacitor has a 1 coulomb charge, find the circuit's current flowing at $t > 0$ for any $t > 0$, assume that $E(t) = 0$

Solution

The equation for charge q is

$$Lq'' + Rq' + \frac{q}{C} = 0$$

given L=0.25, R=60ohms and $C = 10^{-4}$

Saifullahi Muhammad Ali *et al.,*

$\frac{1}{4}q'' + 60q' + 10000q = 0$

which can be rewritten as

$q'' + 240q' + 40000 = 0$

to find the current flowing in the circuit, we have to solve the following initial value problem (IVP)

$q'' + 240q' + 40000 = 0,$

$q(0) = 1, q'(0) = 2$

The   required   current   is   the   derivative   of   the   solution   of   the   above   problem

Now the auxiliary equation of the above problem is

$s^2 + 240s + 40000 = 0$; so, the solution of the equation is

$$s = \frac{-240 \pm \sqrt{(240)^2 - 4(40000)}}{2}$$

$$= \frac{-240 \pm \sqrt{-102400}}{2}$$

$$= \frac{-240}{2} \pm \iota\frac{320}{2} = -120 \pm \iota160$$

$\therefore s_1 = -120 + \iota160q = e^{-120t}(C_1cos160t + C_2sin160t)$

$q' = -e^{120t}((120C_1 - 160C_2)cos160t + (120C_2 + 160C_1)sin160t)$

$and\ s_2 = -120 - \iota160$

which is complex root and thus the solution is

At the given initial $t = 0$

$q(0) = C_1 = 1\ and\ q'(0) = 120C_1 - 160C_2 = 2$

$\Rightarrow q = e^{-120t}(cos160t + \frac{3}{4}sin160t)$

$\therefore I = e^{-120t}(-160sin160t + \frac{3}{4}(160)cos160t) - 120e^{-120t}(cos160t + \frac{3}{4}sin160t)$

$\therefore I = -250e^{-120t}sin160t$

Example 2

An RLC circuit with resistance $R = 2$ ohm, inductance $L = 0.1$ henrys and a capacitance $C = \frac{1}{260}$ farads has a current of 2 ampere flowing in at $t = 0$, if the capacitor has a 1 coulomb charge, find the circuit's current flowing at $t > 0$ for any $t > 0$, assume that $Emf = 100sin60t V$

Solution

By using the equation that represent the relationship between current and charge; Given $L = \frac{1}{10}, R = 2ohms, C = \frac{1}{260}$ and $V = 100sin60t$ the differential equation of the form;

$\frac{d^2q}{dt^2} + 20\frac{dq}{dt} + 2600q = 1000sin60t$ is obtained.

since the given charge at $t = 0$ is 1 coulomb, and the initial current $I = 2$ then initial conditions

$q(0) = 1$; and $q'(0) = I_0 = 2$

so the auxiliary equation will be of the form $s^2 + 20s + 2600 = 0$

the roots of this equation are complex conjugates $s_1 = -10 + \iota50$ and $s_2 = -10 - \iota50$; which is in the form of $s = \alpha \pm \iota\beta$. the complementary function is

$q_c = e^{-\alpha}(C_1sin\beta t + C_2sin\beta t)$

$\Rightarrow q_c = e^{-10t}(C_1sin50t + C_2cos50t)$

So now we are going to apply the method of undetermined coefficient to find the particular integral, then we have

$q_p = (Asin60t + Bcos60t)$

$\Rightarrow A = \frac{-5}{122},\ \ B = \frac{-3}{61}$

The charge q is the solution of the differential equation, which has the form

$q = q_c + q_p$

$q(0) = 1 \quad q'(0) = 2$

$q = e^{-10t}(C_1 sin50t + C_2 cos50t) - \frac{5}{122}sin60t - \frac{3}{61}cos50t$

$q = e^{-10t}\left(\frac{381}{1525}sin50t + \frac{64}{61}cos50t\right) - \frac{5}{122}sin60t - \frac{3}{61}cos60t$

$I = q' = e^{-10t}\left(2cos50t - \frac{15238}{305}sin50t\right) - \frac{150}{61}cos60t + \frac{180}{61}sin60t$

CONCLUSION

The compliment function q_c is the term that determine the transient response and the term q_p is the term that determine the steady response of the circuit. An RLC circuit experiences a transient reaction when it is first turned on or when there is a quick change in input. The capacitor acts as a short circuit at first, letting a sudden increase in current flow through the circuit. Because the inductor resists changes in current, the current gradually increases. As the circuit approaches steady state, the oscillations in current and voltage are caused by the energy stored in the inductor and capacitor and gradually diminish. In an RLC circuit, damping is the term used to describe the gradual loss of energy that influences the transient response's oscillation decay. Under damped circuits show oscillations that amplify more slowly than over damped circuits, which show oscillations that decay slowly. In the shortest amount of time, critically damped circuits achieve steady state with little oscillation.

Amplitude: The oscillations in the current have an amplitude of 250 amperes in example 1. This is the circuit's current oscillation at their greatest magnitude.

Exponential Decay: With a decay constant of 120, the term denotes exponential decay. This exponential term is responsible for the circuit's dampening effect. The oscillations' amplitude decays exponentially with time signifying a decaying oscillation.

Sinusoidal Component: The current oscillations' sinusoidal component is denoted by the notation sin(160t). At a frequency of 160 cycles per second (Hz), the oscillatory behavior is introduced by this sinusoidal function.

Nature of Oscillation: The exponential term causes the current to fluctuate sinusoidally, albeit with a declining envelope. This pattern is characteristic of an under damped RLC circuit, in which the oscillations' amplitude decreases as a result of energy being progressively wasted over time. The circuit's transitory reaction is represented by the exponential decay, and its steady-state oscillations are represented by the sinusoidal component. Generally, I represent the behaviors of an RLC circuit.

ABSTRACT

As the digital landscape continues to evolve, marketers are increasingly turning to artificial intelligence (AI) to revolutionize their content creation and optimization efforts. This paper explores the transformative impact of AI technologies on digital marketing, specifically focusing on how AI-driven content creation and optimization strategies are reshaping the way brands engage with audiences online. Through an in-depth analysis of AI-powered tools, algorithms, and applications, this study examines the benefits, challenges, and best practices associated with leveraging AI for content creation, curation, and distribution in digital marketing campaigns. By exploring real-world case studies and industry trends, this paper offers valuable insights into how organizations can harness the power of AI to create more engaging, relevant, and personalized content that resonates with target audiences across various digital channels. Marketing around the globe utilizes digital technology to elevate customer service levels and improve operational efficiency. Artificial intelligence (AI) plays a pivotal role in marketing through advancements such as more intelligent search engines, smarter advertisements, refined content delivery, reliance on bots, ongoing learning capabilities, fraud prevention, data security measures, image and voice recognition, sales forecasting, language comprehension, predictive customer service, and customer segmentation. By harnessing AI, businesses can gain comprehensive insights into their customers' requirements, leading to enhanced sales and increased revenues.

Keywords: Marketing, Digitalization, Artificial Intelligence, Customer efficiency and electronic services.

INTRODUCTION

In today's hyper-connected digital landscape, content has emerged as a cornerstone of successful digital marketing strategies. However, the sheer volume of content being produced and consumed online presents challenges for marketers seeking to capture and retain audience attention. In response to these challenges, many organizations are turning to AI-driven technologies to streamline and enhance their content creation and optimization efforts. By leveraging AI-powered tools and algorithms, marketers can gain valuable insights into audience preferences, automate content generation processes, and deliver personalized experiences at scale. This paper explores the transformative potential of AI in revolutionizing content creation and optimization in digital marketing, offering insights into emerging trends, best practices, and real-world applications. In today's digital age, content has become the cornerstone of successful marketing strategies. With the proliferation of digital channels and the rise of online consumerism, marketers are facing increasing pressure to produce high-quality, engaging content that resonates with their target audiences. However, the sheer volume of content being created and consumed online presents significant challenges for marketers seeking to cut through the noise and capture audience attention. In response to these challenges, many organizations are turning to artificial intelligence (AI) to revolutionize their content creation and optimization efforts.

Artificial intelligence refers to the technological advancements that allow computers or other devices with human-like intellect to carry out tasks like to those executed by the human brain. Nowadays, as technology develops, artificial intelligence (AI) is utilized in practically every facet of daily life. It has been used in conjunction with digital marketing to facilitate businesses' timely consumer outreach. "Marketers can process massive amounts of information and conduct customers' expectations," claims Jain (2020). With the aid of AI, it has been possible to guarantee consumer happiness (Jain & Aggarwal, 2020). AI-based digital marketing strategies include advanced analytics, machine learning, and industry-specific customer insights. Utilizing the internet in India is increasing, which enhance new opportunities for business growth.

The broad field of modern artificial intelligence (AI) uses cutting-edge methods to derive viewpoints from vast volumes of data. The core idea of artificial intelligence is to teach machines to understand, reason about, and solve problems that humans face on a regular basis. AI progress has surged since the early 20th century with the introduction of machine learning. The hardware and processing power of machine learning algorithms are to blame for this increase. The potential of processing power increases, but so does the field's advancement. Future developments in AI may include features that let computers learn and think more like people (Lake et al. 2016). Perhaps the productivity and efficiency of important decision making could be increased by implementing artificial intelligence (AI) at the organizational level (Knight 2015). In spite of the fact that studies show a various benefit to implement the changes in organisations. It also have additional challenges in adopting AI technologies (Chui and Malhotra 2018). One of the factors that cause behind the difficulty is organizations' lack of understanding where and how to incorporate artificial intelligence. Principal component analysis at the business level, which is necessary to properly implement the business strategy on AI adoption, is another potential reason why firms fail. It is necessary to take into account the underlying variables before deciding where to integrate technology at the enterprise level. In order to better understand the variables that may affect AI adoption at the corporate level, this study aims to comprehend AI from the viewpoint of the employee.

DIGITAL MARKETING

A variety of online databases and electrical appliances are utilized in digital marketing strategies to showcase, promote, and sell goods and services. Successful internet-based businesses have also benefited from these strategies. Websites, pages on social networking sites, targeted ads, and emails are commonly used to draw in new clients and retain existing ones. We must first examine the current status of scientific research in digital marketing and contrast it with the business sector in order to ascertain the crucial function that artificial intelligence (AI) plays in this field. Then, we'll be able to determine the extent to which academic digital marketing lags behind corporate advancements.

Dhruv Sabharwal and Mohammad Ashraf Ali

ARTIFICIAL INTELLIGENCE (AI) ON DIGITAL MARKETING

We must first examine the key subfields of artificial intelligence (AI) in order to comprehend how AI seems to contribute to digital marketing strategies. Next, we look at each of those fields individually to see if any of them use digital marketing strategies. This would illustrate how research on digital marketing is impacted by artificial intelligence (AI). There has been discussion on various facets of artificial intelligence (AI) research. Among many other applications, artificial neural networks have been employed in time series prediction, brain modeling, and classification processes. Evolutionary computation includes techniques such as genetic algorithms and genetic programming. Examples of vision include object identification, conceptual image interpretation, and other image processing techniques. The term "robotics" refers to autonomous exploratory processes, intelligent control, etc. Skillful Systems encompass management information systems, instructional systems, and so on. Recognition system includes voice recognition, production process, etc. Machine translation referred to Planning, game play procedures, etc., are examples of planning. Data mining, decision tree learning, and other types of machine learning.

STATEMENT OF THE PROBLEM

We must first examine the key subfields of artificial intelligence (AI) in order to comprehend how AI seems to contribute to digital marketing strategies. Next, we look at each of those fields individually to see if any of them use digital marketing strategies. This would illustrate how research on digital marketing is impacted by artificial intelligence (AI). There has been discussion on various facets of artificial intelligence (AI) research. Among many other applications, artificial neural networks have been employed in time series prediction, brain modeling, and classification processes. Evolutionary computation includes techniques such as genetic algorithms and genetic programming. Examples of vision include object identification, conceptual image interpretation, and other image processing techniques. The term "robotics" refers to autonomous exploratory processes, intelligent control, etc. Skillful Systems mining,' or 'predictive modelling,' they always say 'artificial intelligence' to describe data analysis, smart systems, data extraction, or keyword searches. Computer scientists, on the other hand.

OBJECTIVES OF THE STUDY

- Identifying the Factors Influencing Artificial Intelligence in Digital Marketing
- Forecasting and Predicting the Future Potential of Artificial Intelligence
- Analysing the Impact of Artificial Intelligence on the Marketing Landscape

FACTORS INFLUENCING ARTIFICIAL INTELLIGENCE ON DIGITAL MARKETING:

Customized experience

Personalized gifts, notes, or exclusive deals are appreciated by all customers. Every company wants to satisfy its clients by giving them exactly what they desire. It is, in fact, imperative to support the acquisition of consumer data for this reason and to make investments in artificial intelligence. Businesses can tailor their own products as needed by using machine learning to analyze customer behavioral trends.

Real-Time Reaction

Businesses that use artificial intelligence can better keep their customers' loyalty. Consumers favor goods and services that promptly assist in resolving their problems. AI chatbots, for instance, let users respond and solve problems quickly. Certain chatbots possess additional senses, like speech or touch. Customers enjoy this since it gives them an almost direct encounter and makes them feel as though they are speaking with a human rather than a machine. The majority of the time, these chatbots are available around-the-clock, which can increase client satisfaction.

Dhruv Sabharwal and Mohammad Ashraf Ali

Customer Behavior Prediction

In addition to personalizing client pleasure, artificial intelligence has the ability to forecast the behavior of both current and potential customers. Through the use of data management platforms, artificial intelligence may compile user information from all over the internet (DMP). This isn't just about one person visiting your website. This will enable the business to target future clients, create more successful marketing campaigns, and tailor its services to meet the needs of its current clientele. AI's process for gathering, analyzing, interpreting, and assessing data is constantly changing. Over time, its precision will make it possible for businesses to forecast their sales and return on investment and succeed in their endeavors.

Increasing the Return on Investment:

The capacity to recognize image quality is known as return on investment, and artificial intelligence helps to increase ROI. Consequently, this raises the company's revenue. In addition, it facilitates the settlement of numerous security issues and guarantees prompt and effective payment processing. feasible. After a user's behavioral patterns are recognized by the machine learning technology, a customized campaign is created for the destination. AI uses personal data to power business, enabling companies to personalize their offerings. Additionally, it helps the organization avoid wasting a lot of time and money on disengaged clients.

Enhance the Search Sessions

Users have also benefited immensely from the advancement of technology, as evidenced by the fact that they appear smarter! Consumers are searching for a range of instruments or programs that can connect them to superior goods and services. Consequently, companies need to incorporate AI into their plans. AI is useful for deciphering customer behavior trends. These days, an essential component of every AI technology is voice recognition.

Advertising:

Businesses mostly rely on advertising to promote their goods and services, both online and off. This appears to be a significant factor, especially considering that it can be utilized to eliminate most manual labor entirely. In example, customer data is quite helpful for producing distinctive marketing. The AI technology determines the consumers' areas of interest by analyzing all the data that has been gathered from them. This gives a company's marketing a structure so they may readily match the needs of their potential clients. Businesses benefit from this by having an advantage over rivals in the market.

Search Engine Optimization (SEO)

SEO suggests possessing one of the best potential scientific editions. Many scientific studies related to search engine marketing, or SEO, focus on fuzzy intelligent systems, machine learning, evolutionary computations, and web crawlers for the purpose of reading, gathering, and analyzing website data. The ultimate goal of these studies is to improve website page rankings in search engine results by integrating ranking factors through an intelligent learning model.

Social Media Marketing:

The quantity of research articles on social media marketing, which primarily focus on customer behavior, intentions, image comprehension processes, social media data analysis, and the application of machine learning models and data mining techniques, reveals the field's sluggish development. Digital marketing, content creation, and prescriptive marketing are scientific fields of study that employ data mining techniques, particularly deal procedures, text mining, and machine learning-based techniques like extractive summarization, expert systems, customer decision support systems, text analysis, and predictive analysis, to examine data extracted from blogs, websites, e-commerce sites, and social media.

Dhruv Sabharwal and Mohammad Ashraf Ali

Pay-Per-Click (PPC) and Ad Targeting:

Machine learning is used extensively in scientific research for bidding and ad targeting through the use of optimized advertising models. It analyses criteria that allow one to assess the importance of the various factors on the probability of clicks and conversions. Machine Learning provide new information and reveal hidden trends.

Chatbots:

Digital marketing is now more successful thanks to chatbot research when compared to other strategies. There appears to be a significant ongoing research effort to develop automated robotic simulation software that interacts with humans by utilizing AI subfields like decision support systems, neural networks, autonomous exploratory procedures, etc. This effort spans health care, education, digital counseling, and insurance.

Semantic search

A large number of scientific publications pertaining to search engines, information retrieval, websites worldwide, data mining, social networking, the internet, learning algorithms, machine learning, information analysis, natural language processing systems, query processing, information management, decision support systems, user interfaces, web searches, etc., which is related to web development, show how far beyond comparable business sector aspects the scientific research is. Web technology and optimized versions have been used to explain over 2000 publications. Artificial intelligence (AI) is being used to optimize web development processes, ranging from online design and development to web applications, web services, mobile-friendly websites, and data representation.

Voice search

The majority of study focuses on voice search, and there is little to no research on digital marketing. Nonetheless, notable advancements are made in other scientific domains. The most significant research in marketing is on speech recognition and personal voice assistant technologies, which offer flexible methods of engagement where users and systems participate on an equal footing and can help provide clear and accurate responses to online searches.

Applications of Artificial Intelligence in Digital Marketing

Earlier Digital Marketers were reluctant regarding the usage of AI in Digital Marketing but with the growth of AI and its results of AI has proved that it will bring dynamic changes in the marketing world.

Generating Content

Machines can now create content from scratch based on data fed in coding. These can be helpful to save time and resources. AI can write reports and news based on data and information. Automated Journalism is now used by many leading news giants like BBC news, The New York Times, Washington Posts and more. Also, Facebook uses AI to remove fake news.

Product Recommendation and Content Curation

Not just creating content but helping recommending products and services based on the user's search, interest and behavior. Artificial intelligence can rightfully understand the behavior of the targeted audience and what is better than finding the right products or services that you are already looking at. Netflix recommends you content based on your interest. Artificial Intelligence technology is commonly used to make personalized content recommendations that the user may find interesting, such as the if people buy X product, they might like Y product too, similar products just like Amazon.

Dhruv Sabharwal and Mohammad Ashraf Ali

Use of AI Chatbots

We are aware of automated responses used by businesses to solve customer queries and also used in data collection, keeping the audience updated about products and services. They can serve clients 24/7 and retain their data for future use. Also, the applications of chatbots are huge and the amalgamation of Chatbots with Artificial Intelligence and Machine is the new game changer.

Web Design

Without the help of a programmer or a designer, you can still have your website through the use of Grid, that uses Artificial Intelligence to do the work for you based on the information provided like images, text, calls-to-action, etc. they can make the website look professional in much less time and at affordable price.

Predictive Analysis

Artificial Intelligence uses data to make probable future projections. Predictive analysis is just the use of data, statistical algorithms, and machine learning.

Digital Advertising

Artificial intelligence is being used extensively in digital advertising to guarantee optimum success. It is being employed on platforms such as Facebook, Google, and Instagram to deliver optimal user experience. examining user data, including gender, age, interests, and other details, to display advertising that are appropriate for them. Marketers may anticipate trends and even identify micro trends with the use of AI technology. As a result, they can make strategic decisions; firms may cut down on wasteful digital advertising expenditures and make sure their investment yields the most returns.

Online Search engine

Marketers must produce and modify content in accordance with the evolving nature of content searching. Google's algorithm, voice search, and other AI advancements are examples of recent improvements. Additional developments include Google Home, Apple's Siri, Microsoft's Cortana, and Amazon Echo, which can all conduct searches with just a button push or voice command

Email Marketing

Using AI, brands are personalizing emails to connect with their intended audience. They can now tailor material to the interests and behaviors of their customers. Through the analysis of millions of data, machine learning, also known as autonomous learning, can now determine the optimal time of day and recommended frequency of contact with the user. They can now tell which titles and subjects generate the most clicks, as well as which material grabs the most attention.

Future Artificial Intelligence on Digital Marketing

In future, marketers can expect the following impacts from artificial intelligence on digital marketing

Smarter searches

As technology solutions become wiser and more perfect, it is essential to mention that the public's requirements become more sophisticated. People can find what they need quickly thanks to social media and fast search engines like Google. Artificial intelligence and big data can analyze these search models and assist marketers in identifying the key areas where they should concentrate their efforts.

Smarter Ads

Marketers are still looking to attract customers with smart advertisements today, but using artificial intelligence allows them to do so faster and more efficiently. Online ads are becoming smarter and more effective as a result

of big data. For human solutions, artificial intelligence can delve deeper into data, social networks, Profiles as well as other online content.

Relying on Bots

A further area where artificial intelligence can play a vital role in the evolution is consumer care and retention. Conversation functions and other direct-to-consumer engagement will be handled by artificial intelligence bots very soon. Businesses will save time for employees and cut costs in this manner. The artificial intelligence bots will also have access to the entire internet's information and search history, allowing them to outperform humans.

Continuous Learning

Using artificial intelligence, it will not only reveal some hidden data, but it will also instruct them and integrate them in to the new promotion strategy, as well as optimize the messages to the most relevant users. Artificial intelligence solutions will become more intelligent as well as effective over time, promoting real-time decision making.

RESEARCH METHODOLOGY

The present research study was descriptive and empirical in nature for this study empirical analysis used which is based on a quantitative approach to interpret the link between the variables such as Artificial Intelligence, Technology, social networking, profit maximization and Decision Making through the research instrument. Both primary data (through an online questionnaire to collect demographic information) and secondary data (journal articles, publications and other sources) have been used.

Convenience sampling method were used to filter participants, which are digital marketing customers. The data collected were subjected to pilot study to explore the reliability and validity of the instrument and Cronbach's Alpha Reliability Coefficient value of 0.899 proves that the scale is more consistent and highly reliable in nature. Questionnaires were distributed to 400 respondents, and only 370 completely concise questionnaires were returned by the respondents. Structured Questionnaires with three different sections were finalized for the survey method among the digital marketing customers in the Delhi city. Section one deals with the personal profile of the respondent such as, age, gender, marital status, educational qualification, designation of employees, gross annual income experience of consumers is measured in the appropriate nominal and interval scales. The responses of the participants were collected on the basis of 5 point Likert's scale applied for section 2 and 3 which consists of ten questions regarding perception of consumer regarding Artificial Intelligence Variables Due to the emerging trends of AI application in the digital marketing, the aim of this paper is to review the AI implementation in the field of digital marketing. The goal of the research is to assess the scope of AI application with digital marketing (voice, text, image recognition, decision-making, technology and robots) find application in marketing; (The first step was a focus on review the marketing portals (www.marketingweek.com, www.adweek.com, www.warc.com) to gather AI application in marketing.

The table 1 state that the personal profile of the respondents. The majority of the respondents are female 59.4%. The age group of the major respondents are 30 and below are 74%. The major respondents were graduate in Arts 45%. The majority of the respondent's gross income is 5lakhs and below are 84%.

The Structural Model

The SEM technique was used to examine the structural model so the effects among the four latent constructs were tested. The model included 15 items describing 4 latent constructs: Artificial Intelligence, Digital Marketing, Profit Maximization, and social networking. The various goodness-of-fit statistics are shown in

Table.2. and present a good fit between the data and the proposed measurement model. The goodness-of-fit value of 0.90 shows that the measurement model has a good fit with the data.

HYPOTHESES

H1. Artificial Intelligence has a direct effect on Digital Marketing.

The data indicates that Artificial Intelligence has a direct effect on Digital Marketing (H1: β= - 0.12, $p < 0.05$). Hence the hypothesis is accepted.

H2. Technology has direct effect on Digital Marketing.

The data indicates that Technology has a direct effect on Digital Marketing (H2: β= - 0.62, $p < 0.05$). Hence the hypothesis is accepted.

H2b. Social networking has a direct effect on Digital Marketing.

The data indicates that social networking has direct effect on Digital Marketing. (H3: β= - 0.07, $p < 0.05$). Hence the hypothesis is accepted.

CONCLUSION

The technology landscape for businesses is already being revolutionized by artificial intelligence thanks to big data, machine learning, and ideal solutions. Organizations modify their operational procedures to enhance their agility, efficiency, and competitiveness. New marketing opportunities have always been generated by technological improvements. Artificial intelligence will change how people connect with information, technology, businesses, and services, just as the advent of television marked a new era of really mass advertising and attainment, and the Internet and mobile phones heralded a new level of targeting and backdrop. Marketers are made aware of the possibility for personalization and relevance by artificial intelligence. Reach billions of people every day using search engines, Facebook, YouTube, and Google. Utilizing digital ad platforms, it facilitates large-scale communication. decided in addition to a customizability made feasible by artificial intelligence means that companies will soon be able to tailor personalized campaigns in real time. The world of the future is in the application of Artificial Intelligence. It's important to understand that integrating AI into a firm does not mean that workers are no longer required for certain tasks. Artificial Intelligence is a technological advancement that streamlines numerous intricate and time-consuming procedures, resulting in substantial financial and time savings for enterprises. AI-powered technologies may be trusted to provide a prompt solution because they are very accurate and dependable. It makes it possible for an organization to quickly and easily develop a plan. AI has a lot of potential in digital marketing these days. It links companies with possible clients. It significantly enhances a business's comprehension of both current and potential clients. This helps businesses create goods and services that satisfy the needs of their clients.

ABSTRACT

This study presents an inventory management framework for electronics materials, acknowledging the impact of price-sensitive demand. We account for potential shortages, allowing partial backlogging, alongside permissible payment delays and inflation considerations. Backlogging rate is depicted as an exponentially decreasing function over time. Furthermore, we integrate a constant deterioration rate to optimize overall inventory costs. Through parameter variation analysis, we explore the model's sensitivity to changes, supported by numerical examples. Graphical representations elucidate the relationships between different parameters and the total inventory cost, enhancing comprehension of the inventory models' outcomes.

Keywords: price-dependent demand, time-depending holding cost, partially backlogging, Inflation, permissible delay in payment

INTRODUCTION

Items kept in storage to use them later on or sell them make up an inventory. A company's inventory will run out very rapidly if it orders just a few things. Because replenishments will need to be made more frequently, this increases the ordering cost. But if the company orders a lot of goods, the higher the required storage/holding costs

will be. To minimise costs and maximise profits, inventory models are essential for assisting companies in determining the quantity and timing of their orders. In reality, a lot of factors influence inventory. One illustration would be the possibility for the items in the inventory to deteriorate or diminish in quality. Market yards, warehouses, assembly lines, manufacturing facilities, transportation, and other locations are just a few of the real-world settings where inventory systems are used extensively. Inventory management is an essential component of operations research that helps determine the best practices for controlling and managing inventories. Inventory models offer the fundamental structure needed to examine various production processes. The two general categories of inventory models are: (i) Economic Order Quantity (EOQ) models and (ii) Economic Production (EPQ) models. Physical resources, raw materials, and completed commodities are all included in the inventory. Inventory theory uses information technology to help make decisions and investigates the best way to allocate resources. Costs related to storage and maintenance are important considerations. Product damage is one of the challenges that inventory management faces. Inventory models have been the subject of many research articles during the last 20 years. Many topics are covered in these studies, including linear and quadratic demand functions as well as demand patterns including ramp, time, selling price, and combinations of time and demand.

Demand is important for creating a realistic model in inventory research. Demand was taken to be constant at the beginning of inventory modelling. As time has gone on, scholars have begun to focus on various demand patterns in inventory modelling. Price-dependent demand has distinguished itself from other demand patterns in inventory modelling. It has been observed that the product's price-dependent demand has an impact on the delivery of the goods. Customers are encouraged to purchase more goods by the products' appealing prices, which raises the demand for the goods. This circumstance suggests the store places larger orders, which increases their profit margin and increases sales. When the inventory starts to deteriorate, the situation gets more complicated. One of the key components of every manufacturing and inventory system is the deterioration of the goods. Rekha and Vikas [2] solved a model for weibull deteriorate items with price dependent demand rate and inflation. Jyoti et al. [7] studied deteriorating items inventory model having price dependent demand with inflation and learning effect. Pujari and Anil [15]discussed an Inventory Model with Deteriorating Items having Price Dependent Demand and Time Dependent Holding Cost under Influence of Inflation. According to traditional inventory models, goods preserve their physical characteristics while being held in storage. But in actuality, it is evident that foodstuffs such as fruits, vegetables, volatile liquids, etc., have a short storage period. To choose an inventory control model, it is important to consider the term deterioration. Deterioration is a process that takes place over time, according to Ghare and Scharder [3]. In recent years, several researchers have focused on inventories with deteriorating products because most physical goods deteriorate with time. A model is created for an inventory that depreciates exponentially. Wee presented a deterministic lot-size inventory model that deteriorates with shortages and an expanding market.

For perishable inventory with a stock-dependent rate and a non-linear holding cost, deterministic models are recommended. Deterioration is always considered over time. The deterioration rate is almost negligible for items like toys, hardware, glassware, and steel; however, it is highly effective for goods like fruits, vegetables, pharmaceuticals, volatile liquids, blood, high-tech products, and others. Harris [5] created the first economic quantity model. Wagner and Whitin [18] looked at the inventory model of a deteriorating item at the end of a period of shortage. Deterioration functions can therefore take on an extensive variety of patterns and factors, including constant and time-dependent functions. Magfura Pervin et al. [10] proposed an inventory model for estimation of deterioration with time dependent demand and storage cost. Singh et al. [16] proposed an inventory model for deteriorating items with time- dependent deterioration rate, ramp-type demand rate and shortages. When necessary items are either completely lacking or difficult to obtain in sufficient quantities, it is referred to as a shortage. To provide additional information on the subject, consider the following scenario: a business produces certain necessities whose demand rises sharply or suddenly, and the business is unable to meet the demand because of unexpected factors. During that time, customers are experiencing shortages of this specific product. For many models, especially when payment delays are considered, shortages are crucial. Customers may place more orders from a business if there is a shortage but it allows for a payment delay. Therefore, shortages can profit much from allowing a payment delay. It's commonly assumed that insufficient demand in inventory models with shortages is either totally lost or backlogged.

Ekta Chauhan *et al.*,

There are, however, a few circumstances in which some clients depart while others are prepared to hold off until their demands are satisfied. Considering one particular business as an example, let's assume a consumer has a strong preference for a specific retailer and that, in the meantime, the customer notices that a certain product is in low supply. However, the client is unwilling to purchase from another business. The consumer in this instance will have to wait for further supplies of the specific product. As a result, shortages in inventory systems exist and have a big impact on things. Goyal [4] Suggested Economic order quantity under conditions of permissible delay in payments. Pal et al. [9] have studied an inventory model for deteriorating items with permissible delay in payment and inflation under price dependent demand. Nabendu et al. [13] presented an inventory model with price dependent demand under permissible delay in payment. Lakshmana et al.[8] introduced an inventory model with exponential deterioration and shortages for several levels of production. Sathishkumar and Iswarya[12]formulated an EOQ Model with price dependent demand and partially backlogging shortages with salvage cost.

A traditional inventory model assumes that holding costs are fixed and well-known. However, in real life, inventory is typically kept in warehouses to satisfy client demand or for later use. Due to the importance of inventory maintenance, variable holding costs have attracted the attention of the majority of relevant studies. For perishables like fruits, vegetables, medications, or volatile liquids, the cost of holding is also relatively significant and entirely depends on the period of time. For this reason, variable holding costs are crucial to maintain relevant with the state of the market. As a result, the holding cost is never a constant function. It changes based on the passing of time. Many researchers have taken consideration of different functions defining holding cost in the generalization of EOQ models. Yadav and Vats [19] discussed deteriorating inventory model for quadratic demand and constant holding cost with partial backlogging and inflation. Ichwanto [6] suggested analysis of inventory control model with shortage under time-dependent demand and time-varying holding cost including stochastic deterioration. In today's business environment, inflation has become a probable scenario. As a result of a decline in the purchasing power of money, inflation is the general level of price increases for goods and services over an extended period of time within an economy. A high rate of inflation causes many businesses' purchasing power to significantly decrease. Therefore, while developing any inventory model, the impact of inflation cannot be ignored. First, the inflation rate was first established by Buzacott [1] in inventory modelling with various pricing strategies. Saha and Sen [11] studied an inventory model for deteriorating items with time and price dependent demand and shortages under the effect of inflation. Udayakumar et al. [17] explained Economic ordering policy for non-instantaneous deteriorating items with price and advertisement dependent demand and permissible delay in payment under inflation. Geetanjali and Anamika [14]introduced effect of Inflation on a deteriorating inventory model with non-linear holding cost and non-linear demand. In this paper, we developed an inventory management framework for electronics materials, recognizing the influence of price-sensitive demand while considering delayed payment to minimize overall costs. This research work considered constant deteriorating items under the effect of inflation where shortages are permitted and partially backlogged. the model is illustrated with the help of sensitivity analysis and numerical example.

Assumptions and Notations
To develop the mathematical model, we use the following assumptions and notations:

Assumptions
1) Demand rate is considered as Price dependent demand.
2) Time-dependent holding cost
3) Shortages and partial backlogging are allowed.
4) Permissible delay in payment
5) It is assumed that the inflation rate, r, is also considered
which is defined as $f(t) = e^{-rt}$ $r > 0$
6) The Deterioration rate is constant.
7) Replenishment rate is infinite that is lead time is zero.
8) The backlogging rate is an exponentially decreasing function of time.

Notations

The demand rate is a function of the selling price or is dependent on the selling price i.e.,

$$D = (a - bp^m), \qquad 0 \le p \le \left(\frac{a}{b}\right)^m$$

Where $a > 0$ and a is the initial demand units/ year. And $b, m > 0$

$p(t)$: selling price/unit at time t.

r: inflation rate.

$h(t)$: h.t, is the time-dependent holding cost, where h is the holding cost parameter and is greater than zero.

A= Ordering Cost

T= Cycle time.

θ = Deterioration rate and $0 < \theta < 1$.

Q_1= The initial inventory level

Q_2= Maximum Backorder

C_1= Deterioration cost

C_2= Shortage cost

C_3= Opportunity cost

I_e= The interest earned per rupee in a year

M = The permissible delay in setting the accounts

$I(t)$ = The inventory level at time t

$e^{-\gamma t}$ = Unsatisfied demand is backlogged at rate, the backlogging parameter γ is the positive constant

I_p= The interest payable per rupee in a year

Mathematical model: In this model, the Inventory level is Q, initial at t=0. The inventory level decreases during the interval $(0,t_1)$ as a result of deterioration and demand. When t = T, it becomes zero. The amount of inventory during the partially backlogged shortage period (t_1, T) is dependent upon demand. The demand determines the inventory level during the partially backlogged shortage period (t_1, T). Our mathematical model is illustrated in picture (1). The following are the differential equations that describe the inventory level:

$$\frac{d}{dt}I(t) + \theta I(t) = -D$$

$$\frac{d}{dt}I(t) + \theta I(t) = -(a - bp^m) \qquad 0 \le t \le t_1 \qquad \text{... (1)}$$

$$\frac{d}{dt}I(t) = -(a - bp^m)e^{-\gamma t} t_1 \le t \le T \qquad \text{... (2)}$$

With boundary conditions $I(0)=I\_0= Q\_1$

$$I(t) = \frac{(a-bp^m)}{\theta}\left(e^{\theta(t_1-t)} - 1\right) \qquad \text{... (3)}$$

With condition $I(0) = Q_1$

$$I(0) = \frac{(a - bp^m)}{\theta}\left(e^{\theta t_1} - 1\right)$$

Initial inventory level

$$Q_1 = \frac{(a-bp^m)}{\theta}\left(e^{\theta t_1} - 1\right) \qquad \text{... (4)}$$

For Eq.(2)

$$I(t) = \frac{(a-bp^m)}{\gamma}\left(e^{-\gamma t} - e^{-\gamma t_1}\right) \qquad \text{... (5)}$$

Ordering Cost = A

Holding Cost

$$HC = \int_0^{t_1} hte^{-rt} I(t)dt$$

$$HC = \int_0^{t_1} \frac{(a - bp^m)}{\theta} h\, te^{-rt} (e^{\theta(t_1-t)} - 1)dt$$

$$HC = \frac{h\,(a-bp^m)}{\theta r^2(\theta+r)^2}\left[\theta e^{-rt}(r\theta t_1 + r^2 t_1 + \theta + 2r) + r^2 e^{\theta t_1} - (\theta + r)^2\right] \qquad \text{... (6)}$$

Maximum Backorder $Q_2 = -\int_{t_1}^{T} I(t)dt$

Ekta Chauhan *et al.,*

$$= -\int_{t_1}^{T}(a - bp^m)e^{-\gamma t}\,dt$$

$$= \frac{(a - bp^m)}{\gamma}(e^{-\gamma T} - e^{-\gamma t_1}) \qquad \qquad \dots (7)$$

Deterioration Cost

$$DC = C_1\left[I(0) - \int_{0}^{t_1}e^{-rt}D(t)dt\right]$$

$$= C_1\left[\frac{(a - bp^m)}{\theta}(e^{\theta t_1} - 1) - (a - bp^m)\int_{0}^{t_1}e^{-rt}\,dt\right]$$

$$= \frac{C_1(a - bp^m)}{\theta r}\left[r(e^{\theta t_1} - 1) + \theta(e^{-rt} - 1)\right] \qquad \dots (8)$$

$$\text{Shortage Cost} = C_2\int_{t_1}^{T}e^{-rt}I(t)dt$$

$$SC = C_2\int_{t_1}^{T}e^{-rt}\frac{(a - bp^m)}{\gamma}(e^{-\gamma t} - e^{-\gamma t_1})dt$$

$$= \frac{C_2(a - bp^m)}{\gamma r(r + \gamma)}\left[e^{-rT}(\gamma e^{-rt_1} - re^{-T\gamma}) + e^{-\gamma t_1}(re^{-\gamma T} - \gamma e^{-rt_1}\right] \qquad \dots (9)$$

$$\text{Opportunity Cost} = C_3\int_{t_1}^{T}e^{-rt}(1 - e^{-\gamma t})(a - bp^m)$$

$$\frac{C_3(a - bp^m)}{r(r + \gamma)}\left[e^{-rT}(-\gamma - r + re^{-T\gamma}) + e^{-rt_1}(r + \gamma - re^{t_1\gamma})\right] \qquad \dots (10)$$

Permissible delay in payment
For permissible delay in payment there arise two cases. When inventory has become depleted the trade credit duration is shorter in the first case. The trade-credit period is greater than the inventory end date in the second case.

Case(1):$0 \le M \le t_1$
The retailer can continue to collect revenue and earn interest at an annual rate I_e for the remainder of the cycle if the length of time with positive inventory stock of the items is greater than the credit period. Consequently, the interest earned per cycle by

$$IE_1 = PI_e\int_{0}^{M}(a - bp^m)te^{-rt}dt$$

$$= \frac{PI_e(a - bp^m)}{r^2}\left[1 - e^{-rM}(rM + 1)\right] \qquad \dots(11)$$

However, the products that are still in stock must be financed at an annual rate I_p after the fixed credit period has passed. The total amount of interest due per cycle is

$$IP_1 = PI_p\int_{M}^{t_1}I(t)e^{-rt}dt$$

$$= PI_p\int_{M}^{t_1}\frac{(a - bp^m)}{\gamma}(e^{\theta(t_1 - t)} - 1)dt$$

$$= \frac{PI_p(a - bp^m)}{\theta^2}\left[e^{\theta(t_1 - M)} - 1 - \theta t_1 + \theta M\right] \qquad \dots(12)$$

Case (2):$t_1 \le M \le T$
$IP_2 = 0$, This policy assumes that the account will be settled during the shortage of time, and the store will pay interest on the account of each cycle.
The interest earned per cycle by

$$IE_2 = PI_e\left[\int_{0}^{t_1}(a - bp^m)te^{-rt}dt + (M - t_1)\int_{0}^{t_1}(a - bp^m)e^{-rt}\,dt\right]$$

$$= \frac{PI_e(a - bp^m)}{r^2}\left[Mr - e^{-rt_1} + 1 - Mre^{rt_1} - rt_1\right] \qquad \dots(13)$$

Total average cost of the system

Ekta Chauhan *et al.*,

Case (1): Thus, the total average cost per unit time of the system is determined by

$$TC_1 = \frac{1}{T}[ODC + HC + DC + SC + OC + IP_1 - IE_1]$$

$$= \frac{1}{T}\left[A + \frac{h\,(a-bp^m)}{\theta r^2(\theta+r)^2}\left[\theta e^{-rt}(r\theta t_1 + r^2 t_1 + \theta + 2r) + r^2 e^{\theta t_1} - (\theta+r)^2\right] + \frac{C_1(a-bp^m)}{\theta r}\left[r\left(e^{\theta t_1} - 1\right) + \theta(e^{-rt} - 1)\right] + \right.$$

$$\frac{C_2(a-bp^m)}{\gamma r(r+\gamma)}\left[e^{-rT}(\gamma e^{-rt_1} - re^{-T\gamma}) + e^{-\gamma t_1}(re^{-\gamma T} - \gamma e^{-rt_1}\right] + \frac{C_3(a-bp^m)}{r(r+\gamma)}\left[e^{-rT}(-y - r + re^{-T\gamma}) + e^{-rt_1}(r + \gamma - re^{t_1\gamma})\right] +$$

$$\left. \frac{PI_p(a-bp^m)}{\theta^2}\left[e^{\theta(t_1-M)} - 1 - \theta t_1 + \theta M\right] - \frac{PI_e(a-bp^m)}{r^2}\left[1 - e^{-rM}(rM + 1)\right]\right] \qquad \dots (14)$$

Case (2): Thus, the total average cost per unit time of the system is determined by

$$TC_2 = \frac{1}{T}[ODC + HC + DC + SC + OC + IP_2 - IE_2]$$

$$= \frac{1}{T}\left[A + \frac{h(a-bp^m)}{\theta r^2(\theta+r)^2}\left[\theta e^{-rt}(r\theta t_1 + r^2 t_1 + \theta + 2r) + r^2 e^{\theta t_1} - (\theta+r)^2\right] + \frac{C_1(a-bp^m)}{\theta r}\left[r(e^{\theta t_1} - 1) + \theta(e^{-rt} - 1)\right] + \right.$$

$$\frac{C_2(a-bp^m)}{\gamma r(r+\gamma)}\left[e^{-rT}(\gamma e^{-rt_1} - re^{-T\gamma}) + e^{-\gamma t_1}(re^{-\gamma T} - \gamma e^{-rt_1}\right] + \frac{C_3(a-bp^m)}{r(r+\gamma)}\left[e^{-rT}(-y - r + re^{-T\gamma}) + e^{-rt_1}(r + \gamma - re^{t_1\gamma})\right] -$$

$$\left. \frac{PI_e(a-bp^m)}{r^2}\left[Mr - e^{-rt_1} + 1 - Mre^{rt_1} - rt_1\right]\right] \qquad \dots (15)$$

The Necessary condition for the total cost per unit time to be minimized is

$$\frac{\partial TC_1(t_1, T)}{\partial t_1} = 0 \; and \; \frac{\partial^2 TC_1(t_1, T)}{\partial t_1} > 0$$

Numerical Examples

The process for solving the model using numerical examples for getting optimal values for an inventory model is discussed in this section.

Case (1): we consider the following values of the parameters are given as:

A=1000, h=15, a=100, b=0.01, p=25, m=1.8, r=0.05, $\theta = 0.06, \gamma = 0.5, C_1 = 20, C_2 = 0.4, C_3 = 0.05, I_e = 0.35, I_p = 0.3$, M=60/365 year, T=1year we obtained the following optimum values

$t_1 = 0.1567$ and TC=1051.1777

Case (2): we consider the following values of the parameters are given as:

A=1000, h=15, a=100, b=0.01, p=25, m=1.8, r=0.05, $\theta = 0.06, \gamma = 0.5, C_1 = 20, C_2 = 0.4, C_3 = 0.05, I_e = 0.35$, M=120/365 year, T=1year we obtained the following optimum values

$t_1 = 0.2787$ and TC=1020.7968

Sensitive Analysis

In this section, the following tables show the sensitivity analysis to determine the effects of changing various parameter values on optimal values. The rate of changes in values of parameters are taken -20%, -10%, +10% and +20%.

CONCLUSION

In this paper, we have developed an inventory management framework specifically for electronics materials, acknowledging the significance of price-sensitive demand and integrating delayed payment to optimize overall costs. Shortages are allowed and partially backlogged. Inflation is also considered in this model. The backlogging rate is modelled as an exponentially decreasing function of time. The model is illustrated through numerical examples and sensitivity analyses.

For Case (1)

➢ When increasing in the Parameters A, a, b, p, m andC_3 then the total inventory cost increases significantly.

➢ When increasing in the parameters h, θ C_1, C_2andI_p then the total inventory cost increases marginally.

➢ When increasing in the Parameters $I_e$and γ then the total inventory cost decreases significantly.

➢ When increasing in the parameter r then the total inventory cost decreases marginally.

For Case (2)

➢ When increasing in the Parameters A, a, b, p, m and C_3then the total inventory cost increases significantly.

➢ When increasing in the parameters h,θ, $C_1$and C_2then the total inventory cost increases marginally.

➢ When increasing in the Parameters γ and I_e then the total inventory cost decreases significantly.

➢ When increasing in the Parameter rthen the total inventory cost decreases marginally.

ABSTRACT

This paper explores how advanced deep learning, particularly Generative Adversarial Networks (GANs) and diffusion models, are transforming the landscape of historical image colorization. GANs, masters of deception, learn to generate realistic colors by fooling a discerning discriminator. Diffusion models, on the other hand, unveil hidden colors by reversing a noise-adding process. We delve into both approaches, contrasting their strengths and weaknesses. While GANs excel at capturing complex color distributions, diffusion models offer superior noise reduction and detail preservation. This review celebrates the progress made, acknowledges remaining challenges like historical accuracy and diverse color palettes, and charts future directions like multi-modal data integration and historical context awareness. Deep learning paves the way for unlocking the narratives within historical images, fostering a deeper connection with the past.

Keywords: Historical image colorization, Deep learning, GANs, Diffusion models, Image restoration, Cultural heritage, Color distribution, Noise reduction, Historical context.

Dhilipan *et al*.,

INTRODUCTION

Historical photographs, black and white, can convey historical information but lack the emotional impact and style of color. Advances in deep learning are changing this process, making it possible to colorize historical images. The two main approaches are generative adversarial networks (GANs) and diffusion models. The creation of real data is made possible by GAN through the generator and the discriminator while transcription models eliminate noise to reveal veiled colors. Both methods are good and bad. GANs are good at capturing complex color distributions but sometimes struggle to preserve detail. The new potential of inverse interpretation models builds on the fundamentals of diffusion models by learning to reverse the noise addition process, potentially enabling accurate and meaningful interpretation.

Image colorization techniques

Image colorization is a technique that we can trace from the old days where it basically translates black and white images into color-based images. There have been many kinds of approaches that we can see in image colorization.s

Rule-based methods
Rule-based methods are some of the early techniques like K-means clustering assigning colors based on predefined rules and image features like brightness, offering limited flexibility.

Learning-based methods
Train on paired grayscale and color images, allowing them to "learn" how to colorize new grayscale pictures. This type of method is majorly used in predicting the colors based on the train data.

Color palette transfer
This is a type of technique that transfers color palettes from similar content reference images. It is limited to existing palettes and it has an easy implementation.

Deep Learning with CNNs
Utilizes convolutional neural networks to analyze image features and predict colors based on learned patterns. These kinds of techniques have a huge disadvantage in that they should have a large dataset to train.

Generative Adversarial Networks (GANs)
Utilize two competing neural networks: one generates   colorized images, and the other critiques them. This adversarial process refines colorization over time. GAN is famous that it has the ability that generates diverse and realistic color palettes.

Auto encoders
"Learns" a compressed representation of the image (latent space) and then reconstructs it in color, potentially capturing subtle details. This can potentially preserve details well, efficient encoding.

Diffusion Models
Adds noise to an image and then learns to reverse the process step-by-step, gradually revealing hidden colors. These Achieves more accuracy, and potentially preserves details well.

Attention-based Models
Focus on specific image regions based on attention mechanisms, allowing for targeted colorization based on local features like skin tones or clothing which enables more nuanced and context-aware colorization. The major cons of this technique can be it may require pre-trained attention models, computational cost can be higher.

Multi-modal Approaches

Incorporates additional information like historical records or surrounding text to guide colorization and ensure historical context. The major pros can can be seen in this approach are it promotes historically accurate color choices, adds richness and context.

Colorization with Semantic Segmentation and Style Transfer

Segmenting the image into semantically meaningful regions (e.g., sky, skin, clothes) and then applying different style transfer algorithms to each region based on pre-trained models trained on historical photographs.

Collaborative Colorization with User Guidance

Incorporates user feedback directly into the colorization process, allowing humans to guide the model towards historically accurate choices. This could involve selecting color palettes from reference images or directly marking specific regions with appropriate colors.

Colorization with 3D Scene Understanding

Analyzes the image content in 3D, understanding the spatial relationships between objects and estimating scene lighting. This information can then be used to guide colorization in a way that respects object geometry and light distribution.

LITERATURE SURVEY

In this section discussed about the researches carried out in the area of "Historical image colorazation". The evolution of colorization techniques spans from initial rule-based methods to advanced learning-based approaches, characterized by significant progress in recent years. Early methods like K-means clustering [1] relied on simplistic rules to assign colors based on basic image features such as brightness. However, these approaches struggled to capture the complexities of real-world color distributions, leading to limitations in their effectiveness. The introduction of learning-based techniques, exemplified by Richard et al. [2], marked a significant advancement by leveraging paired grayscale and color image datasets to understand their underlying relationships. By employing machine learning algorithms, these methods achieved more realistic colorizations, though challenges such as encoding historical context and mitigating biases from training data remained prevalent. The emergence of Convolutional Neural Networks (CNNs) represented a paradigm shift in colorization capabilities. Works like that of Isola et al. [3] demonstrated CNNs' ability to capture intricate color distributions and contextual information from surrounding pixels. Despite their success, CNNs faced challenges in preserving fine details and ensuring historical accuracy, highlighting the need for further refinement. Following CNNs, Generative Adversarial Networks (GANs) and auto encoders brought about new possibilities in colorization. GANs, as illustrated by Iizuka et al. [4], engaged in a competitive process where one network generated colorized images while another critiqued them, leading to diverse and realistic outcomes. Similarly, auto encoders, as proposed by Jiang et al. [5], reconstructed images from compressed representations, promising detail preservation at the cost of computational complexity. The advent of diffusion models introduced by Ho et al. [6] offered a novel approach by adding noise to images and learning to reverse the process incrementally. While diffusion models showed promise in revealing hidden colors with accuracy, challenges in handling complex color distributions persisted. Hybrid models, such as GAN-diffusion models pioneered by Liu et al. [7], sought to combine the strengths of GANs and diffusion models. These hybrid architectures aimed to leverage diverse color palettes while maintaining precision, although challenges in model interpretability and computational complexity remained. Looking forward, attention-based models [8] and multi-modal approaches [9] hold promise in targeted colorization and contextual accuracy, respectively. Additionally, advancements in temporal information and 3D scene understanding are expected to enhance colorization accuracy and historical coherence [10; 11]. These emerging directions offer exciting opportunities for further advancements in colorization techniques across various domains.

Dhilipan *et al.*,

Challenges in developing historical image colorization
There are many advantages to fully developed image colorization techniques, on the other hand it also faces many challenges in both developing stage and also after developed.

Accuracy and Fidelity
Ensuring color choices align with the depicted era and location requires incorporating historical knowledge and avoiding a chronisms. Balancing colorization with preserving fine details, textures, and noise patterns crucial for historical authenticity.

Bias and Inclusivity
Training data bias can lead to colorization reflecting and perpetuating social biases present in historical records..Ensuring diverse and inclusive color palettes that accurately represent different individuals and communities across history.

Computational and Technical Limitations
Some advanced models, like GANs and diffusion models, require significant computational resources, limiting accessibility and scalability. Dealing with degraded images affected by time, weather, and improper storage, which can impact colorization accuracy.

Ethical considerations
Determining the degree of artistic freedom versus historical accuracy in colorization. And also considering user Preferences and control where Integrating user feedback and allowing customization of colorization style and level of detail.

Temporal Consistency and Context
Capturing color trends and shifts over time, fashion, technology, and cultural norms have influenced color palettes throughout history. Models need to adapt to these changing trends without introducing anachronisms.

Data Scarcity and Quality
Limited access to accurate historical color references like many historical periods lack readily available color documentation, making it difficult to verify the accuracy of colorizations. Some of the data might be unevenly distributed and color references might be heavily skewed towards specific demographics, locations, or social classes, potentially leading to biased colorization outcomes.

CONCLUSION

Towards a Robust Ensemble Approach for Historical Image Colorization, fueled by advancements in deep learning, holds immense potential for enriching our understanding of the past. Yet, achieving accurate and historically consistent results necessitates addressing various challenges. This review explored individual algorithms such as GANs, diffusion models, and their hybrid versions, highlighting their strengths and limitations. While single algorithms have undoubtedly achieved impressive results, their inherent limitations call for a more robust approach. By combining the diverse palette generation prowess of GANs with the detail-preserving noise removal of diffusion models, ensemble approaches offer a compelling path forward. Furthermore, incorporating attention-based models for targeted colorization, leveraging multi-modal information for historical context, and utilizing temporal data alongside 3D scene understanding unlock further avenues for refinement.

Dhilipan *et al.*,

FUTURE WORK

As for the powerfulness in making the historic image more colorful, future research should actively explore ensemble approaches that combine the strengths of different algorithms. Such combinations could leverage GANs' ability to generate diverse color palettes with the detail preservation potential of diffusion models, particularly reverse diffusion. Additionally, incorporating information from historical records and surrounding text through multi-modal approaches can further enhance historical context and accuracy. Furthermore, addressing issues like data bias, computational cost, and limited access to historical data requires collaborative efforts involving computer scientists, historians, and archivists. By developing responsible and data-driven colorization techniques, we can unlock the hidden stories within historical images, fostering a deeper connection with the past.

ABSTRACT

The "restrained star vertex coloring" of graphs is termed proper if all the trichromatic subgraphs consist solely of disjoint unions of galaxies and triangles. Its minimum requirement is termed the "restrained star chromatic number" of the graph and is denoted using χ_{rs}. In this paper, we examine the proposed coloring and its application using the graph operation, "Cartesian Product" and then provide the definite value of the χ_{rs} by applying the operation to certain standard graphs. Their coloring is explained exclusively through the rendition of pertinent illustrations. This encompasses the corresponding χ_{rs}, for ladder graph, prism graph, grid graph, stacked prism graph.

Keywords: vertex coloring, restrained star coloring, chromatic number, cartesian product, path
MSC 2020 Classification: 05C15, 05C38, 05C76

INTRODUCTION

Graph theory is a universally applicable field that encompasses all areas of existence, whether directly or indirectly, in which a path is a sequence of edges and unique vertices. A vertex coloring of a graph is deemed to be "proper" if no neighboring vertices are colored with identical colors. And it is a "proper star coloring" if no P_4 in the graph has a

Evangeline Lydia and Vijaya Xavier Parthipan

2-coloring. This coloring developed by Grünbaum [1]along with the "acyclic coloring" was observed to have subgraphs resembling galaxies by Fertin et al.[2]. Subsequently, several outcomes[3,4] emerged from the said coloring and its impact on various graph operations. The "Cartesian product" [5], additionally referred to as the box product is a graph operation involving V(G) × V(H) vertices.And Joseph A. Gallian's [6]dynamic survey rendered further insights on the structure of the resulting graphs. The "star-vertex" coloring of such graphs observed in references [7,8] greatly influenced the results in this paper. Having restrained its conditions, the "restrained star vertex" coloring [9], abbreviated to RSV coloring is defined as follows: A coloring $\sigma_{rs}$is a proper RSV coloring if no P_3 in the graph is 2-colored and all its trichromatic subgraphs are composed of disjoint union comprising only of galaxies and triangles. And the minimum requirement for a proper RSV coloring is termed as the "restrained star chromatic number" of the graph G and is represented using χ_{rs}. The edge version of the same is also defined and can be observed in [10]. In this paper, we attempt to find similar results as that of star coloring in the RSV coloring particularly by considering the graph operation: "Cartesian Product". Furthermore, we discuss the potential for its application in agriculture.

PRELIMINARIES
This section comprises of essential preliminary definitions and results that are required for proving the subsequent sections. It is emphasized that all the graphs considered here onwards are both connected and simple. Thus, in this paper the term 'graph' is equivalently used to refer to a connected graph.

Definition 2.1.[5] The "Cartesian product" of graphs G and H expressed by G □ H composes of $V(G) \times V(H)$ vertices and there exists edges between$(u_b, v_c)$and(u_a, v_d) if and only if either$u_b$is adjacent to $u_a$in G and $v_c = v_d$ (or) $u_b = u_a$and $v_c$is adjacent to $v_d$in H.

Definition 2.2. [9] A graph coloring$\sigma_{rs}: V(G) \to \{c_1, c_2 \dots, c_k\}$ where $k \leq n$ is said to be a proper RSV coloring if it satisfies the following conditions.
- No path of the graph G whose length is 2 is bichromatic.
- Every trichromatic subgraph of G consists of disjoint union composing only of S_n and K_n; $n \leq 3$

Definition 2.3.[9] The minimum k for which there exists a proper RSV coloring is the "restrained star chromatic number" of the graph and it is denoted as χ_{rs}.

Lemma 2.4. A path graph $P_n$with $n > 4$; $\chi_{rs} = 4$ and cycle graph C_n; $\chi_{rs} = \begin{cases} n & \text{if } n = 3,7 \\ 6 & \text{if } n = 6,11 \\ 4 & \text{if } n = 4|n \\ 5 & \text{otherwise} \end{cases}$

RSV COLORING OF CARTESIAN PRODUCT OF GRAPHS
This section explains the RSV coloring of the "Cartesian Product" of certain standard Graphs.

Remark 3.1. For any graphs G and H, $\chi_{rs}(G \square H) \geq \chi_{rs}(G) + \chi_{rs}(H)$.
Proof. It is evident from the definition of the "cartesian product" of graphs, that the resultant graph is substantially larger than G and H, as it contains $V(G) \times V(H)$ vertices thus, consequently requiring extra colors to satisfy the requirements for a proper RSV coloring.

Remark 3.2. For any graphs G and H, $\chi_{rs}(G \square H) \leq \chi_{rs}(G) \cdot \chi_{rs}(H)$.
Proof. Supposing m and n to be the order of the graphs G and H, the RSV coloring of the graph G □ H cannot be greater than mn as the total coloring cannot exceed the order of the resultant graph.

Remark 3.3. For any well-defined graph G and path graph P_n, $\chi_{rs}(G \square P_n) \leq 4\chi_{rs}(G)$

Evangeline Lydia and Vijaya Xavier Parthipan

Proof. Lemma 2.4 reveals that a path graph with $n > 4$ can be properly colored using 4 distinct colors. Thus, the RSV coloring for any resultant graph of "cartesian product" of G and path graph cannot surpass 4 times the coloring of G.

Theorem 3.4. The χ_{rs} of a ladder graph, L_n with order n is $\chi_{rs}(P_2 \square P_n) = \begin{cases} 2n & \text{if } n \leq 2 \\ 6 & \text{if } n > 2 \end{cases}$

Proof. The proof is achieved by pondering a few cases on the order. Let $C_{rs} = \{c_i | 1 \leq i \leq n\}$.

Case 1. Suppose $n \leq 2$, then the resulting graph is a P_2 and C_4 when $n = 1$ and 2 respectively which can evidently be colored properly using 2 and 4 distinct colors. Thus, $\chi_{rs}(L_1) = \chi_{rs}(L_2) = 2n$.

Case 2. Suppose $n > 2$, then L_n consists of $2n$ vertices composing of two set of path graphs with each vertex sharing an edge with its corresponding vertex on the other set. Let $s(1,j)$ and $s(2,j)$ be the vertices of the 1st and 2nd path of L_n respectively. The vertices of the 1st path is assigned the color c_i if $j \equiv i \pmod 6$ and the vertices of the 2nd path the same color c_i if $j \equiv (i + 3) \pmod 6$ where $1 \leq i \leq 6$ and $1 \leq j \leq n$. Thus $\chi_{rs}(L_n) = 6$. Conversely supposing $\chi_{rs}(L_n) < 6$, results in a contradiction to the conditions of a proper RSV coloring.

Theorem 3.5. The χ_{rs} of a grid graph, $G(n,m)$ with $n, m \geq 3$ is $\chi_{rs}(P_n \square P_m) = \begin{cases} 7 & \text{if } n = m = 3 \\ 8 & \text{otherwise} \end{cases}$

Proof. Consider the grid graph $G(n,m)$ with $n \geq 3$ and $m \geq 3$, consisting of $n \times m$ vertices. Let $C_{rs} = \{c_1, c_2, \ldots, c_n\}$. The proof is by contemplating a few cases on its order.

Case 1. Suppose $n = m = 3$, then the resulting graph will consist of 3 sets of path graph in which each vertex of the center path is adjacent to the corresponding vertices of the path on either of its sides. The first two sets can be colored as the coloring defined for a ladder graph L_3 using 6 distinct colors. The remaining vertices of the third set of the path can be colored using the colors $\{c_3, c_7, c_1\}$ such that the conditions of a proper RSV are obtained using a minimum of 7 colors (Refer Figure 2).

Case 2. Suppose n (or) $m > 3$, then the resulting graph will consist of m sets of path graph in which each vertex of the ith set is adjacent to the corresponding vertices of the $(i+1)^{th}$ and the $(i-1)^{th}$ sets where $2 \leq i \leq m - 1$. From Lemma 2.4 it is evident that $\chi_{rs}(P_n) = 4$. Let $\{p_j | \text{Where } j = 1, 2, \ldots, m\}$ represent the set of vertical paths in the resulting graph and $v_{j,k}$ represent the vertices. Then the graph can be colored distinctly using 8 colors as follows,

Remark 3.6. Let G be any acyclic graph and P_m the path graph, $\chi_{rs}(G \square P_m) \leq 2\chi_{rs}(G) + 2$
Proof. The proof is achieved by examining three cases on the nature of the graph.

Case 1. Suppose G is a path graph P_n, then it is obvious from Theorem 3.4 and Theorem 3.5 that the graph can be colored with a minimum of 8 colors, which satisfies the inequality.

Case 2. Suppose G is in the form of a star graph S_{n+1}, then as the center vertex is adjacent to all the other vertices, $\chi_{rs}(S_{n+1}) = n + 1$. When we take two copies of the star graph, since they would be connected by at least one edge the coloring used to color these two graphs ought to be distinct. But when the copies increase, so does the distance between them resulting in the avoidance of usage of additional colors. In other words, they can be colored properly by interchanging these colors while maintaining a distance greater than 4 among them. But the central vertex must be uniquely colored along the path, thus requiring a total of $2\chi_{rs}(G) + 2$ colors satisfying the inequality.

Case 3. Suppose G is in the form of a tree, then it is a combination of the first two cases, which would imply that the inequality is satisfied in this case as well.
It can be noted that the converse of this theorem need not be true.

Proposition 3.7. The χ_{rs} of the prism graph, D_n with $n > 5$ is $\chi_{rs}(C_n \square P_2) \leq 7$ iff the order of the graph can be represented as sum of multiples of 6 (or) 7 (or) a combination of both 6 and 7.

Evangeline Lydia and Vijaya Xavier Parthipan

Proof. A proper RSV coloring of a prism graph can be obtained with a minimum of 7 colors (or) less if it is possible to partition the vertices into sets of size less than 7, which would imply that the graph can be represented as sum of multiples of 6 (or) 7 (or) a combination of both and vice versa. (Since, $n > 5$)

Proposition 3.8. The χ_{rs} of the prism graph, D_n is $\chi_{rs}(C_n \square P_2) = \begin{cases} 2n & \text{if } n \leq 5 \\ n & \text{if } 5 < n < 11 \end{cases}$

Proof. Let us examine two cases on the order of the graph along with the usage of Lemma 2.4.

Case 1. Let $n \leq 5$, then it is evident from the structure of the graph that n colors are required to color the inner cycle and another n colors for coloring the outer cycle to avoid any trichromatic subgraphs from becoming connected and in turn failing to satisfy the conditions of a proper RSV coloring.

Case 2. Let $5 < n \leq 11$, then it is evident from the structure of the graph the inner cycle can be colored in n colors (not necessarily) and in this case the same n colors can be permutated and used for coloring the outer cycle while satisfying the necessary condition for a proper coloring. If we follow the coloring said in Lemma 2.4, then we would be using $\lfloor n/2 \rfloor$ to color the inner cycle and another $\lfloor n/2 \rfloor$ to color the outer cycle, which again brings us to the total requirement of *n* colors.

Theorem 3.9. Let D_n be a prism graph with order $n > 11$ that can be represented as multiples of 6(or) 7 (or) a combination of both then $\chi_{rs}(C_n \square P_2) = \begin{cases} 6 & \text{if } 6|n \\ 7 & \text{otherwise} \end{cases}$

Proof. The proof can be obtained by taking two cases on the order of the graph.

Case 1. Suppose $6|n$, then vertices of the graph can be separated into equal sets of length 6. Then each of these sets can be colored using the same 6 colors, and even if the colors are repeated a distance of at least 3 is maintained between any two colors.

Case 2. Suppose $6 \nmid n$, then the vertices of the graph can be divided into sets of length 6 and 7. Since, the order of the graph can be represented as sum of multiples of 6 (or) 7 (or) a combination of both 6 and 7. Thus these 7 colors can be permutated to attain a proper RSV coloring.

Proposition 3.10. The χ_{rs} of the stacked prism graph, $Y_{n,m}$ with $n > 8$ and $m > 2$ is $\chi_{rs}(C_n \square P_m) \leq 9$ iff the order of the graph can be represented as sum of multiples of 9 (or) 8 (or) a combination of both 9 and 8.

Proof. A proper RSV coloring of a stacked prism graph can be obtained with a minimum of 9 colors (or) less if it is possible to partition the vertices into sets of size less than 9, which would imply that the graph can be represented as sum of multiples of 8 (or) 9 (or) a combination of both and vice versa. ($\because n > 8$)

Remark 3.11. The χ_{rs} of the stacked prism graph, $Y_{n,m}$ with $n \leq 7$ and $m > 2$ is $\chi_{rs}(C_n \square P_m) = n$.

Theorem 3.12. Let $Y_{n,m}$ be a stacked prism graph with order $n > 7$ that can be represented as (multiples of 7 or) 9 (or) a combination of both then $\chi_{rs}(C_n \square P_m) = \begin{cases} 8 & \text{if } 8|n \\ 9 & \text{otherwise} \end{cases}$

Proof. The proof can be obtained two cases on the order of the graph.

Case 1. Suppose $8|n$, then vertices of the graph can be segregated into equal sets of length 8. Then each of these sets can be colored using the same 8 colors. Thus, requiring a minimum of 8 colors.

Case 2. Suppose $8 \nmid n$, then the vertices of the graph can be secluded into sets of length 8 and 9. Since, the order of the graph can be represented as sum of multiples of 8 (or) 9 (or) a combination of both 8 and 9. Thus these 9 colors can be permutated to attain a proper RSV coloring.

Evangeline Lydia and Vijaya Xavier Parthipan

RESULTS AND DISCUSSIONS

The RSV coloring and its corresponding $\chi_{rs}$is ascertained to be an intriguing concept with limitless possibilities. In this paper, the RSV coloring in terms of the "Cartesian-product" of some graphs are examined. Furthermore, the process of finding the exact value of the chromatic number is found to be quite a tedious task, especially when we ponder graphs of complex structure. Also, the "cartesian product of graphs" is a graph operation having numerous real-world applications including in machine learning, genetics and in geographical mapping. In such instances, the bounds and exact values of such graphs can assist in gaining a deeper comprehension of the resultant graphs and its characteristics. In this context, we discuss a potential application of said coloring in the field of agriculture. Farmers can implement this coloring to strategically plan their crop rotations while consequently managing soil health and mitigating the proliferation of pests and infections. This would also facilitate the effective optimization of the layouts. Here, the fields are converted into a graph with the vertices signifying the corner of the fields. A crop is represented using a combination of four exclusive colors. It is crucial to avoid cultivating the same crops in consecutive seasons on two neighboring land areas that share a border to avert transmission of diseases and pest crises. By computing the proper RSV coloring, farmers can ensure a diversified crop rotation that maximizes land utilization while minimizing risks. While also considering the varying factors such as irrigation scheduling, pesticide treatment and harvest scheduling. In similar manner, this technique can be applied to in evenly distributing equipment and in optimizing data collection operations. For instance, if the field is partitioned into either 4 (or) 20 segments, then the graph would resemble that of $G(3,3)$ and $G(6,5)$ respectively [refer figure 2]. The allocation of crops to the fields allows for a rotation procedure where 4 crops and 8 crops can be cultivated. It should be emphasized that the application is not exclusively restricted to agriculture. But due to the resemblance of most graphs created using the "Cartesian Product" to agricultural land, this application has considerable significance to the operation. And since it is feasible to transform intricate structures into a graph, this approach can be effectively employed.

CONCLUSION

Thus, the RSV coloring and the $\chi_{rs}$of the "Cartesian-product" of some graphs including ladder graphs, grid graphs, prism graphs and stacked prism graphs were explained exclusively with the usage of appropriate illustrations. It is also found that $\chi_{rs}(G) + \chi_{rs}(H) \le \chi_{rs}(G \square H) \le \chi_{rs}(G) \times \chi_{rs}(H)$ holds for the "Cartesian product" of graphs. In addition, the upper bound for the "Cartesian-product" of a well-defined graph with the path graph is also examined.

ABSTRACT

Falls becomes a very common complication in stroke patients, where nearly 50% to 70% experiences it within a year of post discharge from hospital and rehabilitation center. There are various risk factors associated with fall after stroke, among which balance and gait deficit stands as the major reasons. The proposed study aims to determine the effect of manual guidance and knowledge of performance on reducing the fear of fall and improving the balance in stroke survivors. The study is of experimental (comparative) design and was conducted for duration of 3 years comprising of 3 groups. 72 subjects were finalized to participate in the study based on the selection criteria. Subjects were divided into conventional therapy group, manual guidance group and knowledge of performance group. After completion of 4 weeks of practice session the post values of FES and BBS was recorded from the subjects.

80336

Moushami Purkayastha *et al.,*

Pre and post test score analysis with BBS and FES by using paired t test showed that p value is less than 0.05 in conventional therapy group, manual guidance group and knowledge of performance group indicating significant difference. Between group analyses by using one way ANOVA showed significant difference in result with p value less than 0.05 with berg balance and fall efficacy scale. The present study concludes that all the three inventions utilized in the study are effective in reducing the fear of fall and improving balance in stroke patients. However knowledge of performance proved to be comparatively more efficient in enhancing fall efficacy and balance in stroke.

Keywords: Stroke, Fall-efficacy scale, Berg-balance scale, Manual Guidance, Knowledge of Performance.

INTRODUCTION

Stroke is defined by the World Health Organization (WHO) as "a clinical syndrome consisting of rapidly developing clinical signs of focal (or global in case of coma) disturbance of cerebral function lasting more than 24 hours or leading to death with no apparent cause other than avascular origin" and it is a leading cause of death and disability in many Western nations (1). Each year around the globe 5.5 million demises and around 116.4 million disability accounts for stroke (2). Stroke marks as one of the major cause of disability in United States with more than 7 million people affected (3, 4). In India 6, 94,144 people die every year due to stroke (2). India's annual incidence of stroke suggests it to be higher than other developed countries (5). Falls becomes a very common complication in stroke patients, where nearly 50% to 70% experiences it within a year of post discharge from hospital and rehabilitation center(6).Chronic stroke patients have an increased tendency of fall for about 36% compared to same aged and gender peers which is about 24% (7). There are various risk factors associated with fall after stroke, among which balance and gait deficit stands as the major reasons (8). A fall is a result of unintentional loss of equilibrium (9). Patient displays a fear of fall because he enters unknowingly into a cycle of deteriorating self worth and limiting independency in physical activity that renders the individual reliant on the caregiver (10). Individuals who have experienced a stroke at least once throughout their sickness are afraid of falling. Even if they do not fall, they are aware of the condition, which is inadequate to maintain body's balance and ultimately result in fall (11) The risk of fall gets exponentially increased in patient with hemiplegia since the lateral and vertical balance maintenance capacity gets highly compromised due to deficits in weight bearing capacity in affected limb (12). Falls even increases the risk of hip fracture and decreased physical activity in such patient which is due to the fear of fall (8). These factors impose functional limitation on the patient making him more vulnerable and affecting him socially by impeding his community participation thus affecting the quality of life (12).

Quality of life is extremely correlated to risk of fall and balance (13, 14, 15) The motor learning programme (MRP) is one among the rehabilitative strategies used fundamentally with the post stroke patients (16). Feedback plays a vital role in retraining skills using MRP and motor control. Feedback is a sensory guidance which is offered during or once the action has been completed. Feedback includes information associated with the sensations related to the movement itself, likewise as information associated with the results of action with relation to the environmental goal. These sources of feedback are described an extrinsic and intrinsic feedback (17). Internal feedback is inherent to an action. Extrinsic feedback is presented by external cues that does not generally received within the task and it always contributes towards intrinsic form of feedback and so it's designated as augmented feedback (18**).** Several studies have incontestable supply of extraneous feedback which induces higher conditions for motor learning in individuals with stroke (19, 20, 21). Extrinsic feedback consists of knowledge concerning movement from external supply. This information are often characterized into two types: Knowledge of results (KR) that refers to information provided concerning the results of individuals action in respect to the outside environment goal and Knowledge of performance (KP) that refers to information provided to the subject relating to the execution pattern of the movement to attain a particular goal (22). In spite of the significant effect of fear of fall on stroke rehabilitation it has been considered of secondary importance in most of the studies. Moreover there are no studies which have investigated

Moushami Purkayastha *et al.,*

the effect of augmented form of feedback like manual guidance and knowledge of performance on fear of fall and balance in stroke patient. Therefore the proposed study aims to determine the effect of manual guidance and knowledge of performance on reducing the fear of fall and improving the balance in stroke survivors

MATERIALS AND METHODS

The study is of experimental (comparative) design and was conducted for duration of 3 years comprising of 3 groups. In this study at the initial phase 86 stroke subjects were assessed for eligibility. Among which 8 subjects didn't meet the selection criteria and were not included to participate in the study. In the subsequent phase of study following the pre assessment of the measures 5 subjects showed their unwillingness to be the part of the study and 1 subject due to change of address were withdrawn from the study. Finally 72 subjects were finalized to participate in the study. The study was approved by the institutional ethical committee of Assam Down Town University, Kamrup, Assam. Prior the conductance of the study, subjects read and signed the informed consent form approving their willingness to participate in the study after being provided with the knowledge about the procedure, purpose and the potential discomfort which might be faced during the course of the study. Purposive sampling technique was utilized to select the samples at par with the selection criteria. The study received its ethical clearance from the institutional ethical committee (adtu/ethics/PhD Scholar/ 2019/009).

Criteria for sample selection
Inclusion criteria
subjects aged from 30 to 75 years old who were diagnosed with stroke and was confirmed by the Physiotherapist, both ischemic and hemorrhagic type of stroke etiology, subjects having an FES score of 20-64, subjects diagnosed of stroke at least 6 months ago so to rule out spontaneous recovery, Brunnstrom recovery stage III or higher, subjects able to walk minimum 6 meter independently with or without assistive devices, subjects without unilateral neglect of paretic limb, homonymous hemianopsia and those who were medically stable and able to understand simple verbal command were included for the study.

Exclusion criteria
subjects with major musculoskeletal problems (eg: recent joint replacement surgery or arthritis) affecting musculoskeletal performance, other neurological disorders in addition to stroke, And subject who are uncooperative or unable to comply with instructions were excluded from participation.

Outcome Measures
- Measurement of fall : Fall Efficacy Scale International (FES-I)
- Measurement of balance : Berg Balance Scale (BBS)

Fall efficacy scale international measures "concern or fear of falling" in adult population during social and physical activities of daily living with chronic medical conditions (23). The scale includes 16 article self reported questionnaire and each item involves the participant to score himself on a 4 point likert scale 1= not at all concerned, 2= somewhat concerned, 3=fairly concerned and 4=very concerned depending upon their fall botherance (24). The rating of lowest, moderate and highest risk of falling ranges from 16-19, 20-27 and 28-64 respectively out of 64 points. Minimum of 16 point score suggests lowest risk of falling and maximum of 64 score denotes highest risk of falling (24, 25) Berg balance scale (BBS): it's a widely used clinician rated scale to determine the patient's ability to soundly maintain his/her balance throughout a series of determined static and dynamic useful tasks. The scale comprises a list of 14 items and every item consisting of a 5- point ordinal scale ranging from 0 (least possible performance) to 4 (finest performance) with a most total of 56 score. A score $\leq$ 45 indicates need for assistance, 41-44 suggest minimal risk of fall, 21*40 suggest high risk of fall and a score of 0-20 suggest maximum risk of injury or fall (26, 27)

METHODOLOGY

The study comprised of 3 parallel groups (Group A, Group B, Group C). Purposely selected samples were randomly allocated to three different groups. Prior to start the interventions, pre assessment of fall efficacy scale and berg balance scale scores were recorded for all the patients. Following to this the baseline measurements were also recorded and were randomly allocated to one of the conventional group (Group A) or experimental groups (Group B or Group C). Group A (Conventional therapy group): subjects in this group received conventional balance exercises for 3 days per week for 4 weeks. Group B (Experimental group): subjects received manual guidance training for duration of 3 days per week for 4 weeks. Group C (Experimental group): subjects received knowledge of performance training for duration of 3 days per week for 4 weeks. All patients received their regular treatment protocol pertaining to their condition apart from the prescribed program in which only the balance related interventions were altered. Material utilised to conduct the study involved two bathroom scales (weighing machines), consent form, web camera, laptop.

Conventional Therapy
The Conventional Therapy group training program based on traditional stroke rehabilitation programme (1, 28). CT session included: (a) progressive stretching of the shoulder, elbow, forearm, wrist, hamstrings, and calf; (b) active-assisted range of motion for the affected upper and lower limbs, including the hip, knee, ankle, shoulder, elbow, forearm, and wrist; (c) strengthening exercises of the hip abductors, quadriceps, and hamstrings;(d) reaching activities in sitting and standing (e) gait training (29).

Manual guidance and Knowledge of performance
Manual guidance and knowledge of performance are the types of augmented feedback used in the study to teach the patient symmetrical weight bearing. To make the goal more practical the task assigned to the subjects was to learn bearing 50% of their body weight on their paretic foot and distribute the weight between their feet at 50:50 ratios. The subjects were initially weighed on analogue bathroom scale. Body weight was divided by two to get a single limb bearing weight. During the acquisition phase of the intervention the subjects of both the groups performed 5 blocks of 12 trials for a period of 3 days / week for 4 week. Between each trial five second rest was given and similarly between each trial blocks 30 second rest was given. Subjects from Knowledge of Performance group received the visual feedback through the monitor of laptop placed before them and had to correct the error based on this visual feedback, while subjects in the Manual Guidance group were moved to the position required to generate 50% weight on the paretic foot. During the experiment on knowledge of performance group, the trainer (1) sat beside the subject. A webcam was fixed ahead of the bathroom scale and was connected to the laptop which was kept in the level of the direct view of the subject. The subject was then asked to perform 5 sets of 12 trails and receive the visual feed back through the monitor and correct the error themselves. In manual guidance group throughout the experiment the trainer(1) remained seated behind the subject, with his/ her hands on either aspect of the subject's pelvic girdle, by moving the pelvis laterally and positioning the subject symmetrical to regulate the error. Subject wasn't provided with any reading. Trainer did corrections through his/ her hands, gave the feedback over the pelvis, so that 50 % of the body's weight was leaning on the dominant foot. The position in each trail was held minimum for 5 seconds. Another trainer (2) sat in front of the subject to record the reading of the scale. After 12 trials the reading was recorded. After completion of 4 weeks of practice session the post values of FES and BBS was recorded from the subjects of all three groups (30).

RESULTS

The obtained data of FES and BBS of conventional therapy group, manual guidance group and knowledge of performance group was analyzed using Statistical package for social sciences (SPSS 21.0 version), $p<0.05$ was considered significant and $p<0.01$ was considered highly significant. The data for berg balance scale and fall efficacy scale was obtained from all the three groups. The pre and post analysis was done by using paired "t" test. Between

Moushami Purkayastha *et al.,*

group analysis was done by using one way ANOVA. Specificity of differences among each pair of group was further analyzed by using Post Hoc Test. To determine the strength of a correlation, the Pearson correlation coefficient between the dependent variables is used. The Pearson correlation coefficient ranges from -1 to 1, with -1 being the negative correlation, 0 representing no correlation, and 1 representing positive correlation. The average pre test score with the berg balance scale in case of conventional therapy group was 38.65 and in case of post test were 39.96 The average pre test score with the berg balance scale in case of manual guidance group was 39.22 and in case of post test was 41.00. The average pre test score with the berg balance scale in case of knowledge of performance group was 38.44 and in case of post test was 43.12. Pre and post test score analysis with berg balance scale score by using paired t test showed that p value is less than 0.05 in conventional therapy group, manual guidance group and knowledge of performance group indicating significant difference in result. The average pre test score with the fall efficacy scale in case of conventional therapy was 34.73 and in case of post test was 34.26 The average pre test score with the fall efficacy scale in case of manual guidance group was 33.33 and in case of post test was 26.77. The average pre test score with the fall efficacy scale in case of knowledge of performance group was 38.24 and in case of post test was 23.56. Pre and post test score analysis with fall efficacy scale score by using paired t-test showed that p value is less than 0.05 in conventional therapy group, manual guidance group and knowledge of performance group indicating significant difference in result. Between group analyses of conservative therapy group, manual guidance and knowledge of performance group by using one way ANOVA showed significant difference in result with p value less than 0.05 with berg balance and fall efficacy scale.

DISCUSSIONS

Motor disablement becomes an unavoidable companion for almost 80% of stroke survivors (31). In stroke survivors, impaired balance is a major risk factor for falls. A fear of fall following stroke can eventually result in poor quality of life by increasing disability, sedentary habits, and the chance of a recurrence (32). Studies on individuals with chronic stroke with a period of more than 6 months post stroke have revealed fall incidence rates ranging from 23% to 50% (33). The purpose of the present study was to determine the effect of manual guidance and knowledge of performance on reducing the fear of fall and improving the balance in stroke survivors. 72 subjects were finalized to participate in the study after evaluating them for the selection criteria. The pre and post analysis of conventional therapy group, manual guidance group and knowledge of performance group with berg balance scale revealed significant improvement in the score with p value 0.029, 0.000 and 0.000 respectively. This result shows that conservative treatment technique, manual guidance and knowledge of performance technique is equally effective in improving balance in stroke patient. Similar satisfying result was observed where conservative therapy group, manual guidance group and knowledge of performance group showed significant difference with fall efficacy scale with p value 0.000, 0.000 and 0.000 respectively. This result proved that all the three treatment strategies are equally effective in reducing the score of fall efficacy scale, thereby improving the confidence by reducing the fear of fall and accelerates the process of regaining of independence of movement among the stroke patients.

From the ANOVA analysis it has been observed that the effect of conventional therapy, manual guidance technique (MG) and knowledge of performance technique on reducing the fear of fall (fall efficacy scale, FES) and improving the balance (BBS) in stroke survivors is significant as in both within group and between group analysis the calculated p-value is less than 0.05. Thus it can be said that the conventional therapy, manual guidance technique (MG) and knowledge of performance technique (KP) has impact on reducing the fear of fall (fall efficacy scale, FES) and improving the balance (Berg Balance Scale, BBS) in stroke survivors. In post hoc comparison analysis the BBS results showed significant difference of p value being 0.002 between conventional therapy and knowledge of performance group, on contrary insignificant differences were observed when conventional therapy with manual guidance group and manual guidance group with knowledge of performance group were compared with p value being 0.110 and 0.100 respectively. Further analysis of mean values suggests knowledge of performance group proved to be highly effective in improving berg balance score with mean value of 43.120 compared to conventional therapy group with mean value of 38.961. FES score analysis suggests that there was significant difference in result

Moushami Purkayastha *et al.,*

with p value 0.000 when conventional therapy group was compared with manual guidance and knowledge of performance group but conversely when manual guidance group was compared with knowledge of performance group it yielded insignificant difference with p value 0.006. the mean values of the groups suggests that manual guidance group with mean value 26.77 and knowledge of performance group with mean value of 23.560 was comparatively more efficient in reducing the FES score when compared with conventional therapy group with mean value 34.260. In a study done by Amer Ghrouz et al on 63 subacute stroke patients aimed to evaluate the efficacy of Motor relearning programme for enhancing balance and postural control. After 8 weeks of 24 rehabilitation session the researcher concluded that MRP group showed significantly improved BBS and posturography assessment compared to conservative physical therapy group. Researcher explained that MRP intervention's included more of functional and task specific exercises which resulted in improved effectiveness of the treatment (34). The Pearson correlation coefficient was used to examine the association and direction of the link between the dependent variables—the fall effectiveness scale and the berg balance scale—between the groups. A low positive correlation of 0.212 and an insignificant p value of 0.2999 were discovered in the group receiving conventional treatment. The group that was given manual guidance showed a statistically insignificant p value of 0.242 along with a modest negative correlation coefficient of -0.233. Once more, a very weak positive correlation of 0.069 and a statistically insignificant result with a p value of 0.745 was found in the knowledge of the performance group. This result shows that there is a very low correlation between fall efficacy scale and Berg balance scale score among all the three groups. In a study conducted by Prakash Brade et al on subacute and chronic stroke patients found a significant and negative correlation on berg balance scale and fall efficacy scale variables , where one is increasing the other is decreasing and the two variables are in variance with one another. The research showed that when FES score increased in these kinds of patients the BBS score reduced suggesting the stroke patient with fear of fall are even low on balance, thus this study proved a close correlation among the variables (35).The present study showed a conflicting result as the FES and BBS scores obtained was post treatment and the interventions didn't have any effect in establishing a relation between FES and BBS.

CONCLUSION

Patients with stroke experience frequent fear of fall which can have potential implications. The present study concludes that all the three inventions utilized in the study that is conventional therapy, manual guidance and knowledge of performance are effective in reducing the fear of fall and improving balance in stroke patients. However knowledge of performance proved to be comparatively more efficient in enhancing fall efficacy and balance in stroke.

LIMITATION OF STUDY& SUGGESTION

There are certain limitations in the present study that needs to be addressed. The stroke patients fatigue level was not taken into consideration during the experiment which might have influenced the result. The subject's age, gender, hand dominance and side affected were not taken into account which would have yielded better analysis of the effect of treatment. Berg balance scale is an appealing tool to assess balance for its ease to administer. However it's suggested to utilize an additional balance measuring tool in conjunction with berg balance scale to address its floor and ceiling effects.

AUTHOR CONTRIBUTION
Moushami Purkayastha and Dr. P.C Sarma conceptualized the study. Data collection was done by Moushami Purkayastha and Dhivakar Murugan. Abhijit Kalita contributed in drafting of manuscript. Debajyoti Bora conducted the analysis of data. Sankar Sahayaraj Muthukaruppanand. Abhijit Dutta reviewed and revised the manuscript for clarity, coherence and accuracy.

ABSTRACT

A novel analytical method was developed and validated for the estimation of Tinidazole in bulk and tablet dosage form by using UV- Visible spectroscopy. The method involved optimization of various experimental parameters to achieve maximum sensitivity, specificity, and precision. Validation studies were conducted in accordance with International Conference on Harmonisation (ICH) guidelines, encompassing linearity, accuracy, precision, specificity, robustness, and stability. The proposed method demonstrated excellent linearity over a wide concentration range (2,4,6,8,10µg/ml)with correlation coefficient of 0999. Accuracy was confirmed by recovery studies, yielding results within acceptable limits99.5%,99.5%,101.7%.Precision studies exhibited low % relative standard deviations (%RSD), indicating good repeatability and intermediate precision with less than 2%. Specificity was confirmed by analyzing placebo samples, demonstrating the absence of interference from excipients. The robustness of the method was assessed by deliberate variations in experimental conditions, affirming its reliability under different circumstances. Moreover, stability studies revealed that the tinidazole solution remained stable throughout the analysis period and % RSD values are less than 2%. The developed method offers a reliable, cost-effective, and rapid approach for the quantitative determination of tinidazole in pharmaceutical formulations, thus holding significant potential for routine quality control analysis.

Keywords: Tinidazole, UV-Visible spectroscopy, Method development, Method validation,Pharmaceutical analysis.

INTRODUCTION

Pharmaceutical analysis is the branch of science which deals with identification of substances and determination of amount present in particular sample. Pharmaceutical analysis covers the bulk materials, dosage forms and more recently, biological samples in support of biopharmaceutical and pharmacokinetic studies.Analysis can be divided into areas called qualitative and quantitative analysis. Pharmaceutical products synthesized and identified using instrumental techniques. Tinidazole is a widely used antibiotic medication known for its effectiveness in treating various bacterial and protozoal infections. Ensuring the accuracy and consistency of its dosage is crucial for maintaining its therapeutic efficacy and minimizing potential adverse effects. Single Point Standardization is a method employed in pharmaceutical quality control to ascertain the concentration of active ingredients in a drug formulation accurately [1,2,3].

AIM AND OBJECTIVE OF WORK
➢ To develop a UV Spectroscopic method which is simple, rapid, accurate, sensitive and selective
➢ To validate the proposed analytical method as per ICH guidelines.
➢ To estimate the drug in formulation by
➢ Single point standardization method

PLAN OF WORK
The proposed study was progressed as follows.
➢ Literature survey
➢ Procurement of standard drug
➢ Selection of solvent
➢ Performing UV spectra for selection of detecting wavelength
➢ Determination of wavelength
➢ Estimation of drug by single point standardization method
➢ Optimization of developed method
➢ Validation of optimized method as per ICH guidelines
➢ Application of method for the estimation of drug in formulation

MATERIALS AND EQUIPMENTS

INSRTUMENTS USED
• Electronic weighing balance – SHIMADZU, model- ELB300
• Sonicator- Ultra Sonicator, model- 2200MH
• UV-Visible Spectrophotometer, Model NO:3000 with detection wave length of 200 nm-800 nm.

SOLVENTS USED
• Methanol- AR grade
• Distilled water

EXPERIMENTAL WORK
METHODS DEVELOPMENT
Selection of solvent:
Solubility of the drug was performed with different solvents. Tinidazole was freely soluble in methanol. The drug showed good spectrum and was stable in methanol, hence methanol was selected as a solvent.[4]

Shakir Basha *et al.,*

Preparation of standard stock solution:
Weighed accurately about 100 mg Tinidazole reference standard was transferred into 100 ml volumetric flask. Then dissolved and diluted up to the mark with methanol to give a stock solution having strength 1mg/ml or 1000µg/ml.[5,6]

Determination of absorption maxima:
The above stock solution was further diluted with distilled water to get a concentration of 10µg/ml and scanned under UV between 200-400 nm by taking distilled water as a blank. The maximum absorbance wavelength of Tinidazole was found at 318 nm.

Calibration curve:
Working standard solutions of the drug having concentrations 2, 4, 6, 8 and 10µg/ml were prepared by diluting the standard stock solution with distilled water. The absorbance of resulting solutions was measured against solvent blank and a calibration curve was plotted to get the linearity and regression equation.

Single point standardization:
Measurement of absorbance of sample solution and standard solution of a reference substance was done. The concentration of standard solution should be close to that of sample solution. The concentration of a substance in the sample can be calculated from the proportional relationship that exists between absorbance and concentration.[7,8,9]

$$C_{Test} = (A_{Test} / A_{std}) \times C_{std}$$

METHOD VALIDATION
Specificity
By diluting the stock solution 10µg/ml concentration solution was prepared and the absorbance was measured at 318 against the blank.[10]

Precision
Precision is defined as "the closeness of agreement between a series of measurements, multiple sampling of homogenous samples under the prescribed condition".[11]
Precision is of two types:
       1. Repeatability
       2. Reproducibility

Repeatability (Intraday precision): 2, 4 and 6 µg/ml concentration solutions of Tinidazole were prepared whose absorbance was measured six times at 318nm at different time intervals and the relative standard deviation was calculated.

Reproducibility (Interday precision): Six individual preparations of Tinidazole were prepared with different concentrations of 2, 4 and 6 µg/ml and the absorbance were measured at 246nm. The relative standard deviation was calculated[12,13]

Accuracy
Accuracy of method is the closeness of the measured value to the true value for the sample. It is usually determined by recovery studies. A known quantity of the standard drug was added to the preanalyzed sample formulation at 50%, 100% and 150% levels and the contents were reanalyzed by the proposed method. [14]

% Recovery= Amount of drug found after— amount of drug found before
Addition of standard drug   addition of standard drug   *100

Amount of standard drug added

Limit of detection

The detection limit of individual analytical procedure is the lowest amount of analyte in a sample which can be detected but not quantitated as an exact value. It is performed by based on visual evaluation method. It is determined by the analysis of samples with known concentration of analyte and by establishing the minimum level at which the analyte be reliably detected. [15]

Limit of quantitation

Limit of quantitation of an individual analytical procedure is the lowest amount of analyte in a sample which can be quantitatively determined with suitable precision and accuracy. The quantitation limit is a parameter of quantitative assays for low levels of compounds in sample matrices and is used particularly for the determination of impurities and or degradation product. It is performed by based on visual evaluation method. It is determined by the analysis of samples with known concentration of analyte and by establishing the minimum level of which the analyte can be quantified with acceptable accuracy and precision. [16,17]

Robustness

Robustness of the method is its ability to remain unaffected by small changes in parameter such as changes in wavelength, changes in temperature etc. Robustness examines the effect of operational parameter on the analytical method. 10µg/ml concentration of Tinidazole was prepared whose absorbance was measured in three different wavelengths like 316, 320 nm closer to the λmax of the drug. [18,19,20]

RESULTS AND DISCUSSIONS

Method Development Parameters
Solubility studies: Tinidazole was freely soluble in methanol, dil.Hcl. Partially soluble in butanol and insoluble in water.

Determination of absorption maxima:
The stock solution was further diluted with distilled water to get concentration of 10µg/ml and scanned under UV between 200nm-400nm. The absorption maximum of Tinidazole was found at 318 nm.

Calibration curve:
Calibration curve was performed in the concentration range of 2 - 10µg/ml. Regression coefficient (R2) was found to be 0.999.

Single point standardization method:
10 µg/ml concentration containing standard solution and by crushing the tablets powder equivalent to 10 µg/ml sample solution were prepared and the absorbance of both solutions measured at 246nm. From this the sample concentration was found as 10.02µg/ml.

By substituting the concentration of sample solution in the formula which was given in methodology the amount was found as follows.

Validation Parameter
Specificity: Table-4: Specificity of tinidazole

Precision
Intra-day Precision
Intraday precision studies were performed at 2, 4 and 6μg/ml concentrations and the relative standard deviation was found to be within limits i.e. less than 2%. Hence the performed parameter was validated.

Inter-day Precision
Interday precision studies were performed at 2, 4 and 6μg/ml concentrations and the relative standard deviation was found to be within limits i.e. less than 2%. Hence the performed parameter was validated.

Accuracy
Accuracy studies were performed at 50%, 100% and 150% levels by spiking 2, 4 and 6 μg/ml standard solutions to a pre analysed sample solution. The % Recovery was found to be within the limits i.e. in the range of 99.7 – 101.6

Limit of detection
Limit of detection of Tinidazole was performed by visual evaluation method and the result was found to be 0.1μg/ml.

Limit of quantitation
Limit of quantitation of Tinidazole was performed by visual evaluation method and the result was found to be 0.3μg/ml.

Robustness
Robustness of the method is its ability to remain unaffected by small changes in parameter such as changes in wavelength, changes in temperature etc. Robustness examines the effect of operational parameter on the analytical method. 2,4,6μg/ml concentration of Tinidazole was prepared whose absorbance was measured in three different wavelengths like 316,318nm closer to the λmax of the drug. The % relative standard deviation was found within the limits i.e. less than 2%

AT WAVELENGTH 316nm

SUMMARY AND CONCLUSION

A validated UV spectrophotometric method was developed for the estimation of Tinidazole in bulk and tablet dosage by using single point standardization method. Stock solution of Rupatadine Fumarate was prepared in methanol and distilled water used as a further diluent. The normal UVabsorption spectrum was recorded at maximum absorption wavelength (λmax) of 318nm. Linearity was checked in different concentrations. The calibration curve was obtained in the range of 2- 10μg/ml. The slope, intercept and correlation coefficient (R^2) values of Tinidazole were found to be 0.047, 0.0034 and 0.9995 respectively. The developed method was validated as per ICH guidelines. Intraday and inter-day precision studies were carried out and there % RSD values were found within limits i.e. less than 2%. The recovery studies were carried out by adding known amount of standard drug to preanalyzed formulation and % Recovery was found to be within 99.7- 101.6%. LOD and LOQ of Tinidazole were found to be 0.01μg / ml and 0.3μg / ml respectively. Robustness studies were performed at different wavelengths and the % RSD was found within the limits i.e. less than 2%.

ABSTRACT

The current research presents the connection between perceived inclusiveness and job satisfaction among healthcare practitioners in India. It highlights the significance of perceived inclusiveness in shaping job satisfaction within the healthcare industry, where working together as a team is essential. Perceived inclusion pertains to individuals' sense of being valued, respected, and integrated within their teams and organizations; it goes beyond mere participation to encompass a feeling of belonging and fair treatment. Job Satisfaction reflects the emotional fulfilment experienced by workers in their professional roles when organizational outcomes align with their expectations. This research aims to investigate how perceived inclusion contributes to an inclusive work environment and overall job satisfaction among staff members. The hypotheses propose a positive link between perceived inclusion and job satisfaction based on data gathered from 250 employees in the healthcare sector through an online survey. Statistical analysis conducted using IBM SPSS23.0 indicates a robust positive correlation between perceived inclusion and job satisfaction. In summary, this study emphasizes the importance of fostering perceptions of inclusion as an aspect that enhances employee happiness among healthcare professionals which thereby enhances patient care quality within the country's health delivery system.

Keywords: Perceived Inclusion, Job Satisfaction, healthcare, well-being, inclusive climate.

INTRODUCTION

India faces various challenges in its healthcare system, such as limited resources, a shortage of medical personnel, and unequal access to care. In this complex environment, healthcare workers need to collaborate, adapt and be resilient. The well-being and contentment of these professionals are crucial for the quality of patient care in India's intricate healthcare delivery system. Within this dynamic environment, the idea of perceived inclusion becomes an important factor influencing job satisfaction among healthcare workers. It refers to how valued, respected, and included they feel within their teams and organizations in subjective terms.It extends beyond mere participation in decision-making processes to encompass a sense of belonging, appreciation for individual contributions, and equitable treatment [7,9]. Previous research conducted in Indian context has highlighted the importance of organizational factors, including leadership support and workplace culture, in shaping healthcare professionals' job satisfaction. However, the specific role of perceived inclusion in influencing job satisfaction remains an area ripe for exploration. In healthcare settings, where collaboration and teamwork are paramount, perceived inclusion fosters a sense of cohesion, trust, and mutual respect among healthcare professionals [7].

Perceived Inclusion
Perceived inclusion pertains to how individuals perceive themselves as belonging and being appreciated for their unique qualities within a particular group [9]. This perception of inclusion occurs when individuals feel they have influence in decision-making processes, can express their opinions, and are valued for their authentic selves [7,8,3]. It also involves participating in knowledge sharing and decision-making activities, which are associated with engagement in learning behaviours like dialogue and collaboration [7]. Additionally, perceived inclusion encompasses recognizing and respecting individual differences while working together towards shared goals [5], thus promoting a sense of social equality across various aspects of individual identity [4].

Job Satisfaction
Job satisfaction (JS) represents the emotional state in which workers experience a sense of fulfilment or enjoyment from their professional endeavours. It arises when the expectations of both the organization and the individual align; if there is harmony, job satisfaction thrives, but if there is discord, dissatisfaction arises [6]. In essence, when individuals perceive that their job expectations are fulfilled, receive fair treatment during work processes, and attain desired outcomes within the organizational framework, they are likely to experience high levels of job satisfaction [1].

Perceived inclusion and job satisfaction
According to the theory of social identity, when people in an organization feel acknowledged and esteemed, it fosters a feeling of unity among them. This perception of likeness promotes trust and approval among members of the organization, thus nurturing a sense of being included[9].Recognizing common ground among members within an organization is just one facet of fostering inclusivity. Another crucial aspect involves appreciating and valuing the distinct attributes each individual brings to the table, as highlighted by scholars such as [7,8.9].A climate conducive to inclusivity is established by striking a balance between belonging to a cohesive organizational unit and being recognized and respected for one's unique qualities [9]. When individuals within an organization feel included, it positively impacts their attitudes towards work, ultimately enhancing job satisfaction, as indicated by research [2,9].

METHODOLOGY

Objective
The major purpose of the study is to examine how perceived inclusion contributes towards an inclusive climate and overall job satisfaction of employees.

Apoorva Tiwari and Namita Solanki

Hypotheses

H_{a1}: There is a direct positive relationship between perceived inclusion and job satisfaction of employees.

H_{a2}: There is a significant effect of perceived inclusion on job satisfaction of employees.

Sample

Primary data was collected from employees working in healthcare sector via an online structured questionnaire which was administered on one-to-one basis through e-mail. The sample size was 250 individuals.

Procedure

Purposive sampling, a type of non-probability sampling was used to select the sample from the population. The corresponding data set which was finally obtained was analysed using statistical tools. Statistical software for analysis was IBM SPSS23.0

Instruments

Job satisfaction scale (Robbins and Judge, 2013)

Five items were considered under this scale. The test values of 0.84(Composite Reliability) and 0.921(Cronbach's alpha) indicates outstanding internal consistency reliability for the Job Satisfaction scale. Table 1 shows the results.

Perceived inclusion scale (Barak, 1999)

Fifteen items were considered under this scale. The test values of are above 0.70 which indicates good internal consistency reliability for the Job Satisfaction scale. Table 1 shows the results. The constructs were graded on a five-point Likert scale, with 1 denoting strong disagreement and 5 denoting high agreement.

RESULTS

Table 2 reveals the value of Pearson correlation to be r=0.833. This indicates strong positive relation between Perceived inclusion and Job satisfaction. Pearson correlation of Perceived Inclusion and Job satisfaction was found to be highly positive and statistically significant (r=0.832, p<0.01.ANOVA table 3 (b)gives us the variation in Job satisfaction. F-value is the ratio between explained and unexplained variation, here it is 54.39>> 1 i.e., explained variation is higher than Unexplained variation. Here, F-value is highly significant (p=0.00<0.05) at 5% level of significance. According to R-square values 68% of variation in Job Satisfaction is explained by Perceived Inclusion which indicates a good model fit.

DISCUSSIONS

The current research examines the importance of how healthcare workers in India perceive inclusion within their workplace. It stresses that for improving job satisfaction and patient care quality, it is crucial that healthcare workers feel valued, respected, and included in their teams and organizations. Perceived inclusion encompasses not only participation in decision-making but also a sense of belonging, recognition for individual contributions, and fair treatment. The positive connection between perceived inclusion and job satisfaction among healthcare professionals highlights the significance of support from leadership, workplace culture, and teamwork. This study involving 250 employees in the healthcare sector using a structured questionnaire revealed a strong positive correlation between perceived inclusion and job satisfaction. Conclusively this research emphasizes the necessity of promoting inclusivity within healthcare organizations to enhance employee well-being and which ultimately improve patient care outcomes.

LIMITATIONS AND FUTURE SCOPE

The present study has taken into consideration only two variables, future research can further introduce more variables as mediators and moderators to better explain the relationship between Perceived Inclusion and Job Satisfaction. Other outcomes of Perceived Inclusion such as organizational citizenship behaviour, employee retention, employee well-being can also be examined in future. As the present data is collected only from healthcare workers, further studies may capture interview data from employers to further validate the findings and get deeper insights into the phenomenon. A comparative study which compares outcomes of job satisfaction pre and post implementation of inclusive programs may also be undertaken in future. Further, other industries can also be targeted to better generalize the outcomes of the present study.

CONCLUSIONS

The present study will help the organisations to make their workplaces more equal, diverse, and inclusive, which would benefit workers and their satisfaction levels. Inclusion is more than a goal; it is a continual process that necessitates regular assessment and action. Thus, the study offers a perspective as to how healthcare organizations could leverage perceived inclusivity among workers to foster their job satisfaction and ultimately better organizational outcomes.

ABSTRACT

Bioequivalence studies are crucial in pharmaceutical development, ensuring that generic drugs are therapeutically equivalent to their brand-name counterparts. Analytical techniques play a pivotal role in assessing bioequivalence, encompassing a range of methods to measure drug concentrations in biological matrices accurately. This review provides a concise overview of key analytical techniques utilized in bioequivalence studies.It serves as a vital component in evaluating the equivalence of generic drugs with their reference counterpart's. The bioequivalence studies are the special type of studies where two drugs or two sets of formulation of the same drug are compared to show that they have nearly equal bioavailability and Pharmacokinetic/Pharmacodynamic parameters. These Bioequivalence studies mainly focused on interchangeability between generic and brand name medication depends heavily on a range of Analytical techniques to measure the presence of concentration of drug active pharmaceutical ingredient within the human body. The generic drug products are sometimes termed as "Super Generic" or "Therapeutichybrid". The generic drug products are cost-effective than their respective brand products. The bioequivalence studies are mainly divided into two types. They are "in vivo" and "in vitro". The analytical methods involved in the bioequivalence studies are used for the quantitative determination of drugs and their metabolism in biological samples play a significant role in evaluation and interpretation of Bioequivalence. This review highlights the role of analytical instrumentation and analytical methods in assessing the quality of drugs.

Keywords: Analytical Techniques, Bioequivalence studies, Bioavailability studies, Pharmacokinetic studies, Generic drugs.

Sridevi Ranjitha Karanam *et al.*,

INTRODUCTION

Bioequivalence is the study of different brands of a same drug and its dosage forms. Two different formulations of a same drug are bioequivalent when their rate of dissolution and absorption is same. As there is an increase in production and consumption of generic drugs, the need for bioequivalence study is also rising. In pharmaceutical research and development, bioequivalence studies serve as vital component in evaluating the equivalence of generic drugs with their counterparts. The analytical technique applied in bioequivalence studies is Liquid Chromatography-Mass spectroscopy renowned for its precision. This method high sensitivity plays a pivotal role in accurately assessing the concentration of API's and it effectively separates and quantifies drugs and their metabolites in biological samples [1]. The bioequivalence studies are mainly based on generic drugs. Generic drug products are termed as super generic drugs [2]. In terms of active ingredients, strength, dosage forms, method of administration, quality, safety, performance characteristics, and therapeutic indication, bio-equivalence means that a generic drug product is virtually comparable to the originator products. generic drug products are cost - effective than their brand products [3]. Bioequivalence studies based on pharmacokinetics parameters and bioavailability of the drug. pharmacokinetics means how the body interacts with administration substances for the entire duration of exposure. The pharmacokinetic parameters are absorption, distribution, metabolism, and excretion [4]. Mainly the analytical techniques include liquid chromatography- mass spectroscopy, UVVisible spectroscopy, High performance liquid chromatography, gas chromatography, capillary electrophoresis [5].

METHODS

LIQUID CHROMATOGRAPHY AND MASS SPECTROSCOPY: [6-10]
Liquid Chromatography-Mass Spectrometry (LC-MS) is a powerful analytical technique commonly used in bioequivalence studies to quantify drug concentrations in biological samples. [Fig1]

Principles
Liquid Chromatography-Mass Spectrometry (LC-MS) combines the separation capabilities of liquid chromatography with the detection and identification capabilities of mass spectrometry. LC separates analytes based on their interaction with a liquid mobile phase and a stationary phase, typically packed in a column, while MS detects and analyzes ions produced from the separated analytes. The principle behind LC-MS involves the ionization of analytes in the mobile phase, followed by their separation based on mass-to-charge ratio (m/z) in the mass analyzer, and subsequent detection and quantification.

Advantages
High Sensitivity: LC-MS offers high sensitivity, enabling the detection and quantification of compounds at low concentrations, often in the femtogram or attogram range.
Selectivity: LC-MS provides excellent selectivity, allowing the differentiation and identification of analytes even in complex matrices, owing to the unique mass spectra of individual compounds.
Versatility: LC-MS can analyze a wide range of compounds, including small molecules, peptides, proteins, lipids, and metabolites, making it suitable for various applications in pharmaceuticals, environmental analysis, metabolomics, proteomics, and lipidomics.

Structural Information: LC-MS provides valuable structural information about analytes, including molecular weight, fragmentation patterns, and chemical composition, facilitating compound identification and characterization.
High Throughput: Modern LC-MS systems are highly automated, offering increased efficiency, reproducibility, and throughput in analysis, especially when coupled with high-performance liquid chromatography systems.

Limitations

Cost: LC-MS instrumentation and maintenance can be expensive, particularly for high-end systems and specialized detectors, which may pose a barrier to widespread adoption.

Complexity: LC-MS analysis requires specialized training and expertise in method development, operation, data interpretation, and troubleshooting, which may limit access for inexperienced users.

Matrix Effects: LC-MS analysis in complex matrices such as biological samples may suffer from matrix effects, including ion suppression or enhancement, leading to variability and inaccuracies in quantification.

Sample Preparation: Sample preparation for LC-MS analysis can be time-consuming and labor-intensive, often requiring extraction, purification, and derivatization steps to improve sensitivity and remove matrix interference.

Sensitivity to Contaminants: LC-MS systems are highly sensitive to contaminants in samples, solvents, and reagents, which can lead to interference, background noise, and false positives or negatives in analysis.

HIGH PERFORMANCE LIQUID CHROMATOGRAPHY: [11-15]

High performance Liquid Chromatography is another employed in Bioequivalence studies. This analytical technique is mainly used to separate the complex mixtures of molecules into the Carbohydrates, fattyacids, peptides, proteins etc. The Normal phase HPLC is used for polar compounds and reverse phase for hydrophobic drugs. The HPLC shows better accuracy, precision and High specificity etc. [Fig2]

High-Performance Liquid Chromatography (HPLC) is a versatile analytical technique used for the separation, identification, and quantification of compounds in complex mixtures.

Principles of HPLC

HPLC separates compounds based on their differential interaction with a stationary phase (solid or bonded to the support) and a mobile phase (liquid solvent), flowing through a packed column. The components of the mixture are eluted from the column at different rates, depending on their affinity for the stationary phase. Detection of separated compounds is typically achieved using UV-visible, fluorescence, or mass spectrometric detectors.

Advantages of HPLC

High Sensitivity: HPLC can detect compounds at very low concentrations, making it suitable for trace analysis in complex samples.

Versatility: HPLC can analyze a wide range of compounds, from small molecules to large biomolecules, making it applicable across various industries, including pharmaceuticals, environmental science, and food analysis.

High Resolution: HPLC provides excellent resolution, allowing for the separation of closely related compounds.

Automation: HPLC systems can be automated, enabling high-throughput analysis and improving reproducibility.

Quantitative Analysis: HPLC allows for accurate quantification of analytes, essential for pharmaceutical quality control and pharmacokinetic studies.

Limitations of HPLC

Complexity of Method Development: Developing an HPLC method can be time-consuming and requires expertise in selecting appropriate columns, mobile phases, and detection techniques.

Cost: High-performance liquid chromatography systems and consumables can be expensive, limiting accessibility for some laboratories.

Sensitivity to Matrix Effects: HPLC analysis of complex samples, such as biological fluids, may be susceptible to matrix effects, leading to interference and reduced accuracy.

Limited Mobile Phase Compatibility: Some compounds may not be sufficiently soluble or stable in commonly used mobile phases, necessitating method optimization.

Sample Preparation Requirements: Prior to analysis, samples often require extensive preparation, including extraction, filtration, and derivatization, which can increase analysis time and introduce variability.

Sridevi Ranjitha Karanam *et al.*,

GAS CHROMATOGRAPHY: [16-19]

GAS Chromatography is a work horse of Analytical method in these studies. Gas chromatography is mainly used to separate the complex mixture into individual compounds. [Fig 3]

Principles

Gas Chromatography (GC) is a chromatographic technique used for separating and analyzing volatile and semi-volatile compounds in a mixture. The principle behind GC involves the distribution of sample components between a stationary phase (typically a liquid or solid coated onto a column) and a mobile phase (inert gas such as helium or nitrogen), leading to differential migration rates and separation based on their chemical properties such as volatility, polarity, and affinity for the stationary phase.

Advantages

High Resolution: GC offers excellent separation efficiency and resolution, enabling the analysis of complex mixtures with high precision.

Sensitivity: GC provides high sensitivity, allowing the detection and quantification of compounds at trace levels, often in the parts-per-billion or parts-per-trillion range.

Speed: GC analysis is typically fast, with run times ranging from a few minutes to less than an hour, facilitating high throughput analysis.

Wide Applicability: GC can analyze a broad range of compounds, including volatile organic compounds, small molecules, fatty acids, and gases, making it suitable for various applications in environmental analysis, food industry, pharmaceuticals, and forensic science.

Compatibility with Mass Spectrometry (GC-MS): GC can be coupled with mass spectrometry detectors, enhancing specificity and enabling compound identification based on their mass spectra.

Limitations:

Limited Analyte Stability: Some analytes may degrade or undergo chemical reactions under the high-temperature conditions used in GC analysis, leading to chromatographic artifacts or loss of analyte.

Sample Volatility Requirement: GC is suitable only for volatile or semi-volatile compounds that can be vaporized without decomposition under the operating conditions.

Sample Preparation: Sample preparation for GC analysis often involves extraction, derivatization, or concentration steps, which can be time-consuming and labor-intensive.

Stationary Phase Degradation: The stationary phase in GC columns may degrade over time, leading to reduced separation efficiency and column performance.

Complexity of Operation: GC instruments require specialized training and expertise for operation, method development, and maintenance, which may pose challenges for inexperienced users.

CAPILLARY ELECTROPHORESIS: [20-24]

Capillary electrophoresis is another method used in bioequivalence studies, mainly for ionic and polar compounds. It is recognized for delivering high resolution and swift analysis time. [Fig 4]

Principles

Capillary Electrophoresis (CE) is a separation technique based on the differential migration of charged analytes in an electric field. In CE, analytes are separated as they migrate through a narrow capillary filled with an electrolyte solution under the influence of an applied voltage. The separation is based on differences in the charge-to-size ratio of the analytes, with smaller or more highly charged molecules migrating faster than larger or less charged molecules.

Advantages

High Separation Efficiency: CE offers high separation efficiency, allowing the resolution of complex mixtures into individual components with sharp peaks, even for compounds with similar properties.

Sridevi Ranjitha Karanam *et al.*,

Rapid Analysis: CE analysis is typically fast, with separation times ranging from seconds to a few minutes, facilitating high-throughput analysis and reducing analysis time compared to other separation techniques.

Small Sample Volume: CE requires only small sample volumes (nanoliters to microliters), making it suitable for applications where sample availability is limited or sample recovery is challenging.

Versatility: CE can separate a wide range of analytes, including small ions, organic molecules, peptides, proteins, nucleic acids, and pharmaceutical compounds, making it applicable to various fields such as pharmaceuticals, biomedical research, environmental analysis, and food industry.

Compatibility with Mass Spectrometry (CE-MS): CE can be coupled with mass spectrometry detectors, providing additional structural information and enhancing sensitivity and specificity for compound identification.

Limitations

Sensitivity: While CE offers high separation efficiency, its sensitivity may be lower compared to other techniques such as liquid chromatography-mass spectrometry (LC-MS), particularly for low-abundance analytes, which may limit its applicability in certain analyses.

Limited Sample Loading Capacity: CE has a limited sample loading capacity compared to other techniques, which may result in peak broadening or reduced sensitivity for high-concentration samples.

Lack of Universal Detection: CE lacks universal detection methods, and the choice of detector depends on the properties of the analytes, which may limit detection options for certain compounds.

Matrix Effects: CE analysis in complex matrices such as biological samples may suffer from matrix effects, including interference from sample components or electrolyte additives, leading to variability and inaccuracies in quantification.

Method Development Challenges: CE method development can be challenging due to the optimization of parameters such as buffer composition, pH, voltage, and capillary coatings, requiring expertise and time for optimization.

IMMUNOASSAYS: [25-29]

Immunoassays are antibody-based techniques utilized for the quantification of specific drugs or their metabolites. While less commonly employed in bioequivalence studies due to potential cross-reactivity issues and limited specificity, immunoassays offer rapid analysis and high throughput capabilities, making them suitable for screening purposes.

Principles of Immunoassays

Immunoassays are analytical techniques based on the specific interaction between an antigen (analyte) and an antibody. They rely on the principle of binding between antibodies and antigens to detect and quantify target molecules in a sample. There are various types of immunoassays, including enzyme-linked immunosorbent assays (ELISA), radioimmunoassays (RIA), fluorescence immunoassays (FIA), and chemiluminescence immunoassays (CLIA). In a typical immunoassay, the antigen in the sample binds to an antibody linked to a detectable marker (e.g., enzyme, radioisotope, fluorophore), allowing for the measurement of the signal generated, which is proportional to the concentration of the analyte in the sample.

Advantages of Immunoassays

High Specificity: Immunoassays offer high specificity, as they rely on the selective binding between antibodies and antigens, enabling the detection of target molecules even in complex biological samples.

Sensitivity: Immunoassays can detect target molecules at very low concentrations, often in the picogram to nanogram range, making them suitable for applications requiring high sensitivity.

Versatility: Immunoassays can be adapted to detect a wide range of analytes, including proteins, peptides, hormones, drugs, and infectious agents, making them widely applicable in various fields such as clinical diagnostics, pharmaceuticals, environmental monitoring, and food safety.

Quantitative Analysis: Immunoassays can provide quantitative measurements of analyte concentrations, allowing for the precise determination of biomarker levels in biological samples.

Sridevi Ranjitha Karanam *et al.*,

Automation: Many immunoassay platforms are automated, offering high throughput and reproducibility, making them suitable for large-scale screening and analysis.

Limitations of Immunoassays
Cross-Reactivity: Immunoassays may exhibit cross-reactivity with structurally similar molecules, leading to interference and inaccurate results.
Matrix Effects: Complex biological matrices, such as serum, plasma, or tissue homogenates, may contain interfering substances that affect assay performance and accuracy.
Limited Multiplexing: Traditional immunoassays are often limited to the detection of a single analyte or a small panel of analytes, which may not be sufficient for comprehensive biomarker profiling.
Standardization Challenges: Immunoassays may suffer from variability between different assay kits and manufacturers, leading to challenges in standardization and comparability of results.
Development Time: Developing and optimizing immunoassays can be time-consuming and labor-intensive, requiring the production and validation of specific antibodies and optimization of assay conditions.

BIOANALYTICAL METHOD VALIDATION: [30-34]
Regardless of the analytical technique employed, rigorous method validation is essential to ensure the reliability and reproducibility of results in bioequivalence studies. Validation parameters include specificity, accuracy, precision, linearity, and sensitivity, among others, as outlined by regulatory guidelines such as those provided by the FDA or EMA.
Bioanalytical method validation is a critical process in pharmaceutical analysis to ensure the accuracy, precision, selectivity, sensitivity, and reproducibility of analytical methods used for quantifying drugs and their metabolites in biological matrices.

Principles of Bioanalytical Method Validation
Bioanalytical method validation involves demonstrating that an analytical method is suitable for its intended purpose and meets regulatory requirements. Key validation parameters include specificity, accuracy, precision, linearity, sensitivity, and stability.

Advantages of Bioanalytical Method Validation
Reliable Results: Validated methods provide reliable and reproducible results, ensuring the accuracy of drug concentration measurements in biological samples.
Regulatory Compliance: Validation ensures compliance with regulatory guidelines, such as those issued by the U.S. Food and Drug Administration (FDA) and the European Medicines Agency (EMA), facilitating drug development and regulatory approval.
Quality Assurance: Validated methods contribute to quality assurance in pharmaceutical analysis, enhancing confidence in analytical data and supporting decision-making in drug development and clinical studies.
Method Optimization: Validation includes optimization of critical parameters, leading to improved method performance and efficiency.
Risk Reduction: Validation helps identify and mitigate potential sources of error or variability in analytical procedures, reducing the risk of inaccurate results.

Limitations of Bioanalytical Method Validation
Resource Intensive: Method validation requires significant time, resources, and expertise to perform comprehensive studies and generate reliable data.
Complexity: Validation protocols can be complex, particularly for assays involving complex matrices or analytes with challenging properties.
Regulatory Compliance Burden: Meeting regulatory requirements for method validation can be demanding, necessitating thorough documentation and adherence to guidelines.

Sridevi Ranjitha Karanam *et al.,*

Inter laboratory Variability: Method validation may exhibit variability between different laboratories, highlighting the need for standardized protocols and proficiency testing.

Evolution of Guidelines: Regulatory guidelines for method validation may evolve over time, requiring continuous monitoring and updates to ensure compliance.

BIOEQUIVALENCE STUDIES, BIOAVAILABILITY STUDIES, PHARMACOKINETIC STUDIES, GENERIC DRUGS: [35-45]

BIOEQUIVALENCE STUDIES

Bioequivalence studies are performed for new drugs to establish essential pharmacokinetic parameters like rate of absorption, extent of absorption, rate of excretion and metabolism, elimination half-life after single and multiple dose administration in the body.

The bioequivalence studies are mainly divided into two types. They are "in vivo" and "invitro" studies. In vivo bioequivalence studies mean research done on a living organism, while invitro means research done in a laboratory dish or test tube. (Tissues, cells or other parts of an organism are removed and placed in laboratory dishes. the

The main purpose of studies is to increase the production and consumption of generic drugs.

Bioequivalence studies are critical in pharmaceutical development to ensure the interchangeability of generic drugs with their reference products. These studies typically compare the pharmacokinetic parameters of the generic drug and the reference product to establish bioequivalence.

BIOAVAILABILITY STUDIES

Bioavailability is defined as the relative amount of drug from an administered dose which enters the systemic circulation and the rate at which the drug appears in the systemic circulation. The bioavailability studies are done by measuring the concentration of the drug in the plasma. These studies are helpful for clinical trials in early drug development. Bioequivalence studies were carried out to distinguish between pharmaceutical products containing the same active substance.

Bioavailability studies are crucial in pharmaceutical development to assess the rate and extent to which the active ingredient of a drug becomes available at the site of action or in the systemic circulation.

PHARMACOKINETIC STUDIES

Pharmacokinetic (PK) is the study of how the body interacts with administered substances for the entire duration of exposure. Pharmacokinetic studies are closely related to pharmacodynamics, which examine the drug's effect on the body more closely. pharmacokinetic studies based on four main parameters. They are absorption, distribution, metabolism, and excretion (ADME). Pharmacokinetic studies are fundamental in understanding how drugs are absorbed, distributed, metabolized, and eliminated in the body over time.

GENERIC DRUGS

Generic products are sometimes termed as "Super Generic" or "Therapeutic hybrid". The bioequivalence means that a generic drug product is virtually comparable to the originator product. Generic drug products are more cost effective than their respective brand products. Nowadays most of the pharmaceutical's countries focus on developing the generic drugs products due to their quality, safety characteristics.

Generic drugs are pharmaceutical products that contain the same active ingredient(s), dosage form, strength, route of administration, and intended use as their brand-name counterparts. They are marketed after the expiration of patents or exclusivity rights held by the original innovator company.

CONCLUSION

The concept of analytical techniques in bioequivalence studies has been adopted by pharmaceutical industries. It is mainly due to increasing the number of generic drugs and its formulations marketed after regulatory acceptance. So, the bioavailability and bioequivalence studies can be carried out by analytical techniques. The analytical methods are

Sridevi Ranjitha Karanam *et al.,*

evaluated by the statistical methods to get accurate results to assure high quality interchangeable and affordable drugs.

ABSTRACT

Debilitating and virtually incurable, neurodegenerative illnesses are closely associated with aging. An estimated 50 million individuals worldwide suffer from Alzheimer's disease and associated conditions. As the population ages, this number is predicted to double every 20 years. The few treatments currently available for neurodegenerative disorders mostly target the symptoms rather than the underlying cause or the disease's progressive path. The two most prevalent neurodegenerative illnesses are Parkinson's and Alzheimer's diseases**.** In this paper we have foreground on nanoemulsions targeting delivery which have proven to show better results, comparatively as per the studies conducted. Studies have shown that many pathways were reported by Intradermal but the survey drew attention towards the intranasal route showing the highest and fastest absorption. We specifically focus on nanoemulsions targeting brain diseases and current approaches to overcome the barriers, method of preparation of nanoemulsions, and classification of nanocarriers, briefly we then highlight the intranasal route and various contributing pathways, followed by various neurodegenerative-related nanoemulsions.

Keywords: NDs , AD,PD, HD, Blood-Brain Barriers, Nano Carriers Nanoemulsions, Method Of Preparation, Intranasal Route, NEs loaded drugs.

INTRODUCTION

Neurological diseases currently impact 15% of the global population, neurological illnesses are the primary cause of both physical and cognitive disability worldwide (1Placeholder1). A major characteristic of a wide range of neurodegenerative diseases, including Alzheimer's disease (AD), Parkinson's disease (PD), amyotrophic lateral sclerosis (ALS), frontotemporal dementia (FTD), and Huntington's disease (HD), is proteotoxicity, which is defined as impairment of cellular function as a result of protein misfolding or aggregation. The etiology of these disorders is often shared by the fact that aberrant protein aggregation and deposition, which results in changed particular molecular processes leading to cell toxicity and degeneration, commonly causes neuronal damage.The primary risk factor for neurodegenerative illnesses is aging,and an increased risk factor that comes with aging is proteotoxicity. The ability of our body to maintain protein homeostasis significantly declines with age. Research has demonstrated that as we age, our ability to eliminate harmful protein aggregates is actively suppressed, which leads to their build-up and the early onset of neurodegeneration in later life. Toxic protein aggregates often form when soluble proteins progressively transform into insoluble filamentary polymers. The damaged brain cells' cytoplasm, extracellular space, or nucleus are where these filamentous formations eventually deposit and aggregate after accumulating as fibrils. Essential protein quality control (PQC) systems are present in eukaryotic cells.

These systems include the autophagy-lysosome system, which breaks down misfolded proteins, the ubiquitin-proteasome system (UPS), and chaperones, which protect proteins from aggregating. Neuronal impairment and cell death are the outcomes of these proteolytic systems being less active or saturated(2). During the previous 30 years, the total number of patients has increased significantly. Furthermore, during the next 20 years, it is anticipated that the burden of chronic neurodegenerative disorders would at least double. Keeping neurological care affordable for everybody will be extremely difficult in light of this evolution, which is mostly due to the growing aging population. Prominent organizations like the World Health Organization and the National Health Service of the United Kingdom have already made reference to these dangers by releasing the concerning statements that "neurological services are not sustainable in their current form and redesign is needed" and "available resources for neurological services are insufficient in most countries of the world compared with global need for neurological care (3).The extremely effective blood–brain barrier (BBB) nevertheless poses a significant obstacle to the proper management of NDs. Although numerous successful procedures and extremely evasive approaches have been established, their clinical adoption is limited because of differing concerns regarding their long-term value due to possible brain barrier injury. Nanotherapeutics having the ability to pass the blood-brain barrier (BBB) without causing damage to it have been suggested and shown to be a viable alternative for stopping or reversing neurodegeneration in many cases(4)(5)Even with this tremendous advancement, nanotherapeutics still require improvement to guarantee the best possible results. The pathophysiology of major NDs and their current therapeutic approaches are first described in this study. We also talk about the BBB's function and other difficulties with brain-targeted medication administration. We also examine the possible application of nanotherapeutics in the prevention and treatment of neurodegeneration. Lastly, we go over recent developments and discoveries in the field of nanotherapeutics to manage NDs and offer insights for potential future uses(6)

NEURODEGENRATIVE DISEASE

Neurons are essential to the human brain's healthy operation, Because they are essential for communication(7)(8).The majority of neurons are produced by neural stem cells throughout childhood; in contrast, adult neurons are much fewer in number. Neurodegeneration, the progressive loss of neurons, their structure, and/or their activities, is a major health problem and a key factor in the pathogenesis of various brain illnesses,despite the fact that neurons are not eternal. Dysfunction of the neuronal network, synapses, and the accumulation of physiologically modified protein variations in the brain are linked to neurodegenerationFIG 1. (9). Major and most common neurodegenerative diseases are: Alzheimer's disease, Ataxia, Huntington's disease, Parkinson's disease, Motor neuron disease, Multiple system atrophy, Progressive supranuclear palsy (10), Gerstmann –Sträussler– Scheinker disease, Familial British dementia, Familial British dementia, Primary age-related tauopathy, Pick's

disease, Corticobasal degeneration, Argyrophilic grain disease, Aging-related tau astrogliopathy, Lewy body disorders, Multiple system atrophy, Frontotemporal lobar degeneration, Amyotrophic lateral sclerosis, Primary lateral sclerosis, Progressive muscular atrophy(11). Common symptoms Breathing, Heart function, Memory and cognitive abilities, Mood,Bladder and bowel function, Blood pressure fluctuation, Speech, Mobility and balance, Abnormal movements, Swallowing, Sleep. The two most prevalent neurodegenerative disorders are Parkinson's and Alzheimer's. According to a 2022 forecast from the Alzheimer's Disease Association, there could be as many as 6.2 million Americans living with Alzheimer's.

ALZHEIMER'S DISEASE

Alzheimer's disease (AD) is becoming more common and society is getting older, there is a lot of interest in the disease from researchers. One of the most persistent types of neurodegenerative illnesses, AD gradually worsens over time, leading to brain atrophy and eventual death. Over 60 is the age at which most AD patients present, and it is also the age at which considerable brain mass loss   and age-related astrocyte death are linked(12).The latest research on AD's basic pathophysiology and neuropathology indicates that intracellular Tau neurofibrillary tangles (NFTs) and extracellular amyloid plaques are the main histopathologic lesions of the disease(13).The two neuropathological hallmarks of AD are intracellular Tau neurofibrillary tangles (NFTs) and external Aβ plaques. The primary component of the plaques is the neurotoxic peptide amyloid (Aβ), which is produced when two enzymes, β-secretase (also referred to as BACE1) and γ-secretase (which involves four proteins, including presenilin), sequentially cleave a big precursor protein, or APP. However, if α-secretase rather than β-secretase acts on APP first and cleaves it, then Aβ is not generated. Tau, a microtubule-associated protein (MAP) that binds microtubules in cells to support the neural transport system, makes up the majority of NFTs(14).The typical feature of AD has been identified as the development of Aβ-containing plaques inside the brain associated with hyperphosphorylated tau-based neurofibrillary tangles (NFTs)(15)(16)(17).AD is characterized by a large loss of neurons, abnormal synaptic connections, and impairment of the key neurotransmitter systems required for memory and other brain functions (18).

PARKINSON'S DISEASE

Parkinson's disease (PD) is a chronic, progressive and age-related neurodegenerative disease affecting seven million people globally it is the second most common neurodegenerative disorder after Alzheimer's disease (AD)(19).The main cause of Parkinson's disease is the progressive degeneration of brain cells in the substantia nigra. The generation of dopamine occurs in this region. Dopamine functions as a chemical messenger, facilitating the coordination of activity between two distinct brain regions. For instance, it links the corpus striatum to the substantia nigra to control muscular contraction. When dopamine levels in the striatum are low, the nerve cells in this area "fire" erratically. This renders the person incapable of controlling or directing their motions. This results in the onset of Parkinson's disease symptoms. A more severe mobility disorder results from the disease's progressive degeneration of other brain and nervous system regions. We Exactly don't know the precise reason for the cell loss. Environmental and genetic factors are also potential causes.

HUNGSTONDISEASE

Huntington's disease (HD) is an incurable neurological condition sometimes referred to as Huntington's chorea (20). The first signs are frequently mild issues with mood or cognitive/psychiatric functioning. An unstable walk and a general lack of coordination frequently ensue. It is also a condition of the basal ganglia that results in chorea, a hyperkinetic movement disorder. The uncontrollable, involuntary body movements associated with chorea become more noticeable as the illness worsens. The person's physical capabilities progressively deteriorate until they are unable to move with coordination and speak. Mental capacities typically deteriorate into impulsivity, despair, apathy, and dementia throughout time. The particular symptoms differ slightly from person to person. Although they can start at any age, symptoms typically appear around the age of 40. They typically start between the ages of 30 and 50. With every subsequent generation, the illness can manifest earlier. Juvenile HD cases, which make up around 8% of all cases, usually begin before the age of 20, and they are characterized by slow movement symptoms that are more common in Parkinson's disease than in chorea. The hunting tin gene mutation that causes HD is usually

inherited from an affected parent (HTT).Up to 10% of cases, nevertheless, are brought on by novel mutations.The huntingtin protein's genetic makeup is determined by the huntingtin gene (HTT).The huntingtin protein gene produces an aberrant mutant protein (mHtt) when the cytosine-adenine-guanine (CAG) repeats expand (a process referred to as a trinucleotide repeat expansion). This abnormal mutant protein causes progressive brain cell death through a variety of potential pathways.Genetic testing is used for diagnosis, and it can be done at any moment, even in the absence of symptoms.This fact brings up a number of moral questions, such as when a person is deemed mature enough to decide whether to undergo testing and whether parents should have testing their kids; maintaining test-taker privacy and results disclosure(21).

COMPLEXITIESOF THE DRUG ADMINISTRATION BECAUSE OF BBB

When it comes to interacting with the central nervous system, the blood-brain barrier (BBB) is crucial. It is widely recognized that the BBB, which prevents the central nervous system from receiving a range of potentially beneficial therapeutic and diagnostic compounds, is the main obstacle to effectively treating neurological illnesses. Additionally, it restricts the free movement of neurotransmitters among brain cells(22). The major BBB constituents (FIG 2)include endothelial cells, astrocytic end-foot connections, basal lamina, tight junctions, and pericytes (23) (24).By keeping peripheral circulation from the central nervous system intact, it is feasible to stop hazardous substances from getting into the brain. The blood-brain barrier (BBB) uses passive transport to carry out filtering functions and allow some substances—like water, nutrients, and hydrophobic compounds—to flow through. The blood-cerebrospinal fluid barrier (BCSFB) complicates the central nervous system and provides additional obstacle to treatment. Comprising ependymal cells, the choroid plexus acts as a barrier in the brain by keeping blood apart from cerebrospinal fluid (CSF). When it comes to inefficient medication absorption into the brain, the BBB and other efflux transporters are essential. Numerous ATP-dependent efflux transporters are present in the BBB. The over expression of tight junctions and active efflux mechanisms in the BBB also hinder medications from accomplishing their intended therapeutic goal. An ABC transporter called P-glycoprotein (P-gp) effectively excretes medications from the brain and pumps them bac into circulation (25)

MODERN TECHNIQUES FOR NEURODEGENERATIVE DISEASE DIAGNOSIS AND TREATMENT

The Assessment of Neurodegenerative Diseases

Timely identification of neurodegenerative illnesses is critical to the efficacy of a given therapy in slowing down their course. Treatment can be started before the onset of severe clinical symptoms and can be considerably delayed by early detection through screening. Pre-clinical evaluation has emerged as a key area of interest for neurodegenerative disease research in recent years (26; 27). Behavioral symptoms, biomarkers from blood and cerebrospinal fluid, neuroimaging data (PET and MRI), brain conductivity and electrical activity (TMS and EEG), and the outcomes of neuropsychological tests may all be considered in the evaluation. Differential diagnosis is frequently necessary for diseases such as depression that may lead to a potentially reversible deterioration in cognitive function.(28).As a result, there are a lot of markers and criteria that are determined instrumentally. The limited specificity of individual assessment techniques and markers is a characteristic shared by the majority of neurodegenerative illnesses. This frequently results in the difficulty to determine the accurate diagnosis without extensive and frequently expensive testing(29). Below we have enlisted the main diagnostic methods that are used for treatment as well as to monitor neurodegenerative disease (30).Biomarkers in Blood and Cerebrospinal Fluid, Psychological and Neuropsychological Assessment, Neuroimaging, Connectivity, Electrical Activity of the Brain, Pharmacological Therapy, Cognitive Training, Physical Exercises, Ergotherapy, Brain Stimulation, Prevention of the Associated Psychological Problems(30).

Drug delivery for CNS via nanocarriers

The finding that hydrophobic dyes diffuse through a silicone tube wall at a consistent rate by Folkman and Long spurred the development of synthetic polymers for the controlled release of medicinal medicines (31)(32). Among the methods used, nanotechnology has shown to be a secure and effective platform for targeted gene or medication delivery to the central nervous system(33,34). To create nanoparticles, a range of materials have been used, including

Hemant P. Alhat *et al.*,

inorganic minerals like cerium, silver, and gold, and synthetic materials like PLGA and PCL. Natural polymers like proteins and polysaccharides have also been used. It has been demonstrated that nanocarriers are excellent medication and gene carriers for the brain(35). Different sizes, characteristics, and purposes of nanoparticles have been produced for the delivery of drugs to the brain shows. However, the size, type, polarity, and surface chemistry of the nanocarriers determine how well they penetrate the BBB. Furthermore, the polysorbate surface coating can aid in avoiding transmembrane efflux systems like P-glycoprotein pumps (36). Here we have mentioned the classification of the nano carriers; (FIG 3) Thus, the creation of polymer therapies and nanomedicines that can get past CNS obstacles and be administered systemically would be a significant progress has been made in the diagnosis and treatment of brain cancer, trauma, and neurodegenerative diseases. Many polymer-based medicines include available for purchase or undergoing clinical testing for the treatment of cancer and other illnesses(37,38).

Novel self-assembled nanomaterials are being used by a new generation of nanomedicines to deliver drugs and genes . As an illustration, consider polymeric micelles , block ionomer complexes , DNA/polycation complexes (also known as "polyplexes") , nanogels , and other substances. Polymeric micelles have been used in human studies as one of these materials to deliver anti-cancer medicines . Polymeric micelles have been used in human studies as one of these materials to deliver anti-cancer medicines . The encouraging outcomes based on these experiments, polymeric micelles are probably going to be useful in medicine. Furthermore, new nanomaterials with distinct spatial orientations of chemical groups, such as dendrimers , star-polymers , and cross-linked polymer micelles , have been developed as a consequence of additional developments in polymer chemistry. Taking into consideration, nanomedicines have surfaced, helping to enhance medication and diagnostic agent delivery to disease target areas as well as trigger release.Furthermore, they can target a specific cell or even an intracellular compartment in addition to an organ or tissue. These systems have many features in common with natural carriers like viruses and serum lipoproteins, including size and structure, and they can be used to deliver therapeutic and imaging chemicals to the central nervous system. The following list includes some particular instances of nanomaterials that were tested for brain delivery or showed promise for such uses(39).

NANOEMULSIONS
An advanced delivery method for medications, biologically active chemicals, and genetic materials with release issues is nanoemulsion preparation. given that 40% of chemical compounds are inherently insoluble in water, making it difficult to transport these hydrophobic chemicals. A colloidal dispersion with an acceptable ratio of oil emulsified in the aqueous phase, surfactant, and co-surfactant is known as a nanoemulsion. Clear, thermodynamic, and kinetically stable nanoemulsion. It is employed in the pharmaceutical industry because it improves the solubility of lipophilic medications, which improves their bioavailability by reducing the particle size of powdered drugs and forming nano-sized droplets with a range of 10-100 nm(40). NEs are colloidal dispersions with scattered droplets that range in diameter from 20 to 500 nm, made up of two immiscible liquids stabilized by surface-active chemicals(41).
One or more emulsifiers are used to stabilize nanoemulsions, which are nano-sized emulsions made up of two immiscible phases (oil and water)(42,43,44). NEs are divided into two types based on their appearance and the dispersed phase diameter: milky (up to 500 nm) and transparent or translucent (50–200 nm). Furthermore, contingent upon constituents, both internal and exterior stages, Biphasic NEs (oil-in-water (O/W) or water-in-oil (W/O)) and multiple NEs (W/O/W) are the two primary forms of NEs. The NE droplet number and system stability are determined by the phase:volume ratio (F), which is the relative volumes of the internal and exterior liquids.

In general, the internal phase is the phase that is present at a smaller volume than the continuous phase. Phase inversion of a W/O NE to an O/W one might occur when F increases over 40%(45). A clear definition of nanoemulsions is not always clear in the literature, as they are sometimes confused with spontaneously forming thermodynamically stable microemulsions(46,47). (FIG 4) .illustrates, the primary distinctions between classical emulsions (also known as macroemulsions), nanoemulsions, and microemulsions are in the stability characteristics and droplet size range. Both macroemulsions and nanoemulsions exhibit thermodynamic instability, meaning that phase separation happens when enough time passes. On the other hand, nanoemulsions—also called "miniemulsions"—can be kinetically stable over extened periods of time due to their small size. The proximity to an

equilibrium state has no bearing on the metastability of nanoemulsions. However, microemulsions are sensitive to composition and temperature changes because they are systems that are thermodynamically stable in equilibrium. Since they are comparatively the least susceptible to changes in both physical and chemical properties, nanoemulsions are appealing for the aforementioned applications. The differences between nanoemulsions and microemulsions have been elucidated by two recent investigations, and These publications, which describe the distinctions between these two classes of liquid-in-liquid dispersions, are recommended reading for interested readers(48).

COMPONENTS OF NANOEMULSION (FIG 5)

OIL
Since the medication will be added as a droplet in the oily phase and distributed in the aqueous phase, the oil choice employed in the nanoemulsion formulation is thought to be a crucial component. In order to obtain a larger percentage of medicine loaded, the oil chosen needs to be compatible with the other components of the nanoemulsion as well as able to dissolve the compounds employed in the dosage form. The oil used in nanoemulsion might be synthetic, semi-synthetic, or natural(48).

Surface-active agent, or surfactant
Surfactants are compounds that act upon a solid-liquid interface to reduce surface tension and interfacial tension.Surfactants have several functions such as emulsifier, foaming agent, wetting agent, detergent, and dispersant, based on the value of the hydrophilic-lipophilic balance (HLB). Surfactant is used in the preparation of nanoemulsion to stabilize the system; the type of surfactant used depends on the type of nanoemulsion to be prepared. For o/w nanoemulsion, hydrophilic surfactants with an HLB value greater than 10 are utilized, whereas hydrophobic surfactants with an HLB value less than 10 are utilized for w/o nanoemulsions. the employment of surfactant combinations with high and low HLB values, which, when diluted with water, generate a stable nanoemulsion.(49).

Co-Surfactant
When the surfactant was unable to reduce the interfacial tension between oil and water, these components were added to the nanoemulsion formulation. Furthermore, it introduced some fluidity into the surfactant's high stiffness interfacial tension by infiltrating the surfactant's monolayer and upsetting its crystalline liquid phase; PEG 400, propylene glycol, and poly glyceryl oleate are examples of co-surfactant(50)

FORMATION
The preparation of nanoemulsions involves two steps: the first phase involves creating a macroemulsion, which is subsequently transformed into a nanoemulsion. This section outlines the several techniques that have been developed over the last ten or so years to prepare nanoemulsions and highlights the advancements that have been made in the prediction and control of nanoemulsion droplet size(51).

METHOD OF PREPARTION
One of two methods—high energy dissipation or low energy dissipation—can be used to prepare nanoemulsions. The energy requirements of these two approaches are different. Large disruptive forces are produced by mechanical devices in the high energy approach**.** Whereas, low energy method alters the physiochemical properties of the system to generate nanosized particles(52). Because temperature-sensitive components, such medicinal chemicals, are needed, low-energy technologies have recently gained popularity(53).

High-energy emulsification method
Since a nanoemulsion cannot form spontaneously and requires the application of chemical or mechanical energy to formulate, it is regarded as a non-equilibrium system. High-energy method of preparing nanoemulsion by employing mechanical energy input with high-pressure homogenizers, high shear stirring, and ultrasound

Hemant P. Alhat *et al.*,

generator(54). The high energy methods are most effective when applied to highly viscous and high molecular weight oils, although they can be used to generate nanoemulsions from any type of oil. This approach uses less surfactants and makes choosing a surfactant easier. However, because the components in this approach are heat sensitive, it appears to be inconvenient for drug delivery systems(55).

Low energy
The low energy approach is used to prepare nanoemulsions by harnessing the system's own chemical energy or the chemical potential of its constituent parts. The behavior observed with low energy methods is thought to be caused by the chemical energy produced during the emulsification process. This results from a shift in the surfactant molecules' spontaneous curvature, which can go from positive to negative (w/o) or from negative to positive (o/w)(56). This technique involves D phase emulsification, microemulsion dilution, phase inversion temperature, spontaneous emulsification, and phase inversion composition. The low-energy approach uses only a slower stirring speed (1600 rpm), which uses less energy. Low energy methods are categorized as thermal and isothermal methods in theory. Thermally sensitive bioactive substances are best suited for isothermal techniques(57).

NANOEMULSIONS ADMINISTRATION WITH VARIOUS ROUTES
Nanoemulsions may enter the body via different routes oral, parenteral, transdermal, intranasal. The transportation of the intended drug concentrations to the site of action is the main goal of these drug delivery mechanisms. Moreover, medications might have their metabolic breakdown reduced and their physical clearance reduced (FIG 5). provides an overview of drug transport. Because it avoids first-pass metabolism, has a large surface area, a porous endothelium membrane, and a high total blood flow, highly permeable nasal epithelium facilitates fast drug absorption to the brain. Numerous therapeutic substances (small and large molecules) can be administered to the central nervous system (CNS) via intranasal administration. Numerous medications have demonstrated superior CNS efficacy when administered nasally, requiring lower dosages to provide the desired therapeutic effects. Moreover, nasal medication distribution doesn't need any neither demands that the medication be combined with a carrier nor alter the therapeutic agent. Pharmaceutical and medical device companies have long prioritized the development of nasal medication delivery systems because they provide significant advantages over alternative drug administration methods(58). Over the past few decades, nasal drug delivery—in which the medication is directly given to the brain via the trigeminal and olfactory pathways—has attracted a lot of attention for brain targeting. Different innovative and promising formulation strategies have been investigated for nasal delivery of drugs that target the brain.(58). The nose-to-brain delivery method has been investigated as a potential treatment for central nervous system illnesses for the last 20 years(59). Because of its high vascularization, nasal medication administration was previously often utilized for both local and systemic therapy(60). Subsequently, researchers discovered that improved brain targeting of medications may be achieved by utilizing the direct link between the brain and nose cavity through olfactory and trigeminal neurons. W. H. Frey II discovered the idea of nose-to-brain medication delivery in 1989(61). (FIG 7) elaborates on the transport pathway from nose to brain.
Here we will see different pathways of intranasal drug delivery (FIG 6)

INTRANASAL ROUTE OF ADMINISTRATION
Finding the appropriate medical therapies for a variety of different neurological conditions can be greatly aided by an understanding of the mechanisms that regulate the blood-brain barrier during health and how they change during disease . A few scientists have accurately illustrated these differences in their findings. Neurodegenerative disorders are a group of major neurological pathologies that include infections of the nervous system, Parkinson's disease, Alzheimer's disease, multiple sclerosis, extended age-related neurological illnesses, cerebral ischemia, and others. According to health data, the frequency of CNS disorders is rapidly increasing worldwide, as are medical expenses. The drug can be infused intracerebrally with mini-pumps, administered via focused ultrasound, intra-cerebroventricular or intra-parenchymal infusions, catheter infusions, focused ultrasound approaches, or external magnetic field-based methods for direct brain delivery. However, considering the need for surgical therapy, all of these treatments are exceedingly intrusive and risky. and many of them are unsuitable in circumstances where several or ongoing therapies are involved. Owing to these reasons, several attempts have been made to create

Hemant P. Alhat *et al.*,

strategies for getting active substances where they need to go without using the blood-brain barrier. A strategy for brain targeting includes both the use of non-traditional administration methods and the development of drug formulations with properties optimal for the best possible administration through these channels. Intra-nasal drug administration is a pleasant, non-invasive way to deliver medication into the brain by getting beyond the blood-brain barrier. Such drug delivery system paths have a number of advantages, such as increased patient compliance, superior safety, remarkable simplicity of administration, rapid commencement of action, and less systemic exposure. Furthermore, when medications are delivered via the nasal mucosa, they can avoid the liver's first-pass processing. As a result, nasal dosages usually have 10 times lower potency than oral ones. Therefore, for delivering medications directly to the brain, nasal drug administration is more promising than oral or intravenous drug delivery.(62)

OLFACTORY PATHWAY
It is well known that the olfactory area, which is located on the nasal cavity's roof, may be used as a nose-to-brain drug delivery pathway to treat a variety of CNS disorders(63). It is well known that the olfactory area, which is located on the nasal cavity's roof, may be used as a nose-to-brain drug delivery pathway to treat a variety of CNS disorders(64). Drugs can be transferred by neurons, passive diffusion, endocytosis, or sluggish movement across the narrow interstitial space between cells to traverse olfactory epithelium cells. The majority of medicines that are deposited on the olfactory area go between cells extracellularly. A number of experimental in-vitro and in-vivo findings suggested that P-glycoprotein has a clinical role in the administration of intranasal drugs. In addition, tests of drug penetration efflux transporter substrates at the nasal barrier in RPMI 2650 cells and 3D MucilAirTM nasal models have been conducted in vitro. When taking drugs intranasally, olfactory neurons play a crucial role in directing the drug's delivery to the brain(65). Human olfactory axon diameter ranges from 0.1 to 0.7 μm, suggesting that chemicals or nanoparticles with similar dimensions can be easily transported via this channel(66). Compared to axonal transport, drug transport via the epithelial route is quicker. There are two ways that drugs are transported through olfactory pathways: extracellular and intracellular. medicines that are hydrophilic are transported through the paracellular pathway, but the majority of lipophilic medicines are carried by passive diffusion. Medicines' molecular weight and lipophilicity have a big impact on how they absorb medications. Drugs with extremely high lipophilicity are most relevant to the transcellular mechanism(67).

TRIGEMINAL SENSORY NERVE PATHWAY
There is less research on the trigeminal route for medication transfer from the nose to the brain. The trigeminal nerve's primary job is to transmit chemosensory and thermosensory data to the mucosa of the nose, mouth, and eyes (68,69). The dorsal nasal mucosa, which connects to the frontal brain and olfactory bulb, is innervated by the trigeminal nerve(70). As a result, one possible route for medication transport from the nasal cavity to the brain is the trigeminal nerve pathway. For example, the brain was supplied with a solution of insulin-like growth factor 1 via the olfactory and trigeminal pathways(71).

LYMPHATIC PATHWAY
Several extracellular routes, including lymphatic, perineural, and perivascular channels, can carry drugs from the submucosal region of the olfactory region. These extracellular routes connect to the olfactory nerves that enter the brain's olfactory bulb from the lamina propria(72,73).

SYSTEMATIC PATHWAY
The systemic pathway is an indirect transport system from the nose to brain, and it can be a promising approach for lipophilic drugs with low molecular weights(74,75). Following absorption by the vascular areas of the nasal mucosa's epithelial membrane and the lymphatic system, drugs are then transferred to the systemic circulation, evading first-pass metabolism. (76,77).

SIGNIFICANT FACTORS OF NANOEMULSIONS FOR NOSE-TO-BRAIN DELIVERY
Numerous studies have demonstrated that nasal epithelial cells (NEs) provide superior medication penetration to the brain compared to oral drug delivery methods. In addition to the surfactant and cosurfactant properties that enhance

drug absorption, NEs have other important characteristics that are specifically designed for brain targeting.(78). These are some of the main characteristics of the NEs.

Globule size

Drug penetration via the nasal cavity is significantly influenced by the globule size of the NE. As previously mentioned, the main pathways for nasal medication delivery to the brain are the olfactory and trigeminal transport routes. In many preclinical species, the typical diameter of an olfactory axon is about 200 nm; however, in humans, it can vary from 100 to 700 nm. Therefore, for optimal drug penetration, the globule size of new formulations should be less than 200 nm. According to Ahmad et al., through the olfactory route, NEs with an average globule size of 100 nm showed a higher rate and extent of drug absorption than NEs with an average globule size of 700 nm.(79). Furthermore, the length of time that the formulations remain on the nasal mucosa is influenced by the globule size of the NE. Compared to larger globule NEs that are easily eliminated during nasal clearance, formulations with smaller globule sizes have longer retention durations, which results in decreased drug absorption(80). For instance, NEs may show retention periods of up to 4 hours following intranasal delivery if their typical globule diameters are greater than 200 nm, although NEs with globule sizes of 80 and 200 nm have shown retention times of 16 and 12 h, respectively. Hence, globule sizes of nanoemulsions play a significant role for drug delivery to the brain through intranasal administration(81).

Zeta potential

The colloidal balance of NE is attached to the zeta ability of the advanced formulations. For any colloidal system, zeta potential values exceeding ±30 mV provide electrostatically stabilized systems(82). Moreover, numerous reviews have proven that the zeta ability has a giant function with inside the drug retention time of the NE formulations. Mucin found in the nasal mucosa bears a negative charge; hence, formulations carrying positive charges depict good attachment to the nasal mucosa(83).Several research have proven that, usually, maximum of the nasal NEs advanced for mind transport undergo bad charges. The values of zeta capacity better than −10 mV of the emulsion imply the instability of NEs. Therefore, zeta potential is also an important consideration in the development of NEs for nose-to-brain delivery(84).

Advantages

- Patient self-administration
- direct distribution from nose to brain
- non-invasive medication administration
- Quick start of action
- high adherence from patients
- Degradation of drugs is reduced
- elevated absorption rate

Disadvantages

- Drug eradication
- Low bioavailability
- Limited dose

Advancements in nasal medicine delivery systems, including nasal sprays, have made significant progress. However, these systems have drawbacks like incorrect dosage and inadequate administration depth. New drug delivery technologies like nanoparticles and nanofibers are being explored. This review provides an analysis of the benefits and drawbacks of these delivery methods (85)

CONCLUSION

Neurodegeneration is a complex, multifaceted process that causes neuronal death, which leads to damage and malfunction of the brain and spinal cord. This article provides an overview of neurological disorders, the difficulties in administering medications because of the blood-brain barrier, and methods for improving the delivery of nanomedicines to the brain using a variety of routes based on nasal targeting. Several studies have demonstrated that these nanomedicines, when delivered intranasally with appropriate procedures, exhibit good therapeutic efficacy. Nevertheless, nose-to-brain drug administration using nanotechnology delivery devices is still in its infancy as a therapeutic application. Formulations known as nanoemulsions are becoming more andmore significant in the field of nanomedicine. Their properties (high surface area nanodroplets) make them appropriate for transport from the nose to the brain. As per the reviewed data, the method of preparation suited for nanoemulsion is low energy methods. Since low-energy methods use less energy, are more efficient, and don't require complex apparatus, they should be chosen over high-energy methods. However high energy methods are more favorable for food-grade emulsions as they require lower quantities of surfactant than low energy methods. As shown by Table 1, there are many examples in the literature of recent years of nanoemulsion-loaded drugs with different therapeutic goals in brain diseases. The pathologies are all vital and serious; lots of those diseases, if now no longer handled effectively, can lessen the nice of lifestyles or maybe cause death. Nanoemulsions for nasal administration represent a promising strategy for nose-to-brain drug delivery and achieving CNS targeting for the treatment of neuro diseases. The major routes for the administration of drugs using these vehicles, viz., oral, parenteral, transdermal, and intranasal channels, have been reviewed here, where we concluded the intranasal route was more potent.

DISCUSSION

This article provides an overview of neurological disorders, the difficulties in administering medications because of the blood-brain barrier, and methods for improving the delivery of nanomedicines to the brain using a variety of routes based on nasal targeting. Several studies have demonstrated that these nanomedicines, when delivered intranasally with appropriate procedures, exhibit good therapeutic efficacy. Formulations known as nanoemulsions are becoming more andmore significant in the field of nanomedicine. Their properties (high surface area nanodroplets) make them appropriate for transport from the nose to the brain. As per the reviewed data, the method of preparation suited for nanoemulsion is low energy methods. Since low-energy methods use less energy, are more efficient, and don't require complex apparatus, they should be chosen over high-energy methods. However high energy methods are more favorable for food-grade emulsions as they require lower quantities of surfactant than low energy methods. .Nanoemulsions for nasal administration represent a promising strategy for nose-to-brain drug delivery and achieving CNS targeting for the treatment of neuro diseases. The major routes for the administration of drugs using these vehicles, viz., oral, parenteral, transdermal, and intranasal channels, have been reviewed here, where we concluded the intranasal route was more potent.

List of Abbreviation
WHO: World Health Organization
AD: Alzheimer's Disease

FIG 1. Path to cognitive decline in neurodegeneration. Amyloid-beta (Aβ) monomers clump together to form oligomers of variant structures. Subsequently, the oligomers aggregate to form Aβ fibers, which misarrange to form Aβ plaques. Plaque formation induces an inflammatory response which includes the formation of tau aggregates leading to the conversion of healthy neurons to diseased neurons. The presence of more diseased neurons triggers another inflammatory response leading to more neuron loss and a subsequent loss in brain function as well as cognitive decline.

FIG 3. Classification of nanocarriers

FIG4. The figure compares the size, shape, stability, preparation method, and polydispersity of macroemulsions, nanoemulsions (also known as miniemulsions), and microemulsions. Because of their smaller size, macroemulsions have a lower surface area per unit volume than do nanoemulsions and microemulsions. Furthermore, nanoemulsions have a high degree of kinetic stability, which makes them less susceptible to chemical and physical changes.

ABSTRACT

New heterocyclic aromatic polymers containing oxadiazole group has been investigated as adsorbents for the Methylene Blue (MB) dyes using the adsorption isotherm studies. Adsorption isotherm models such as the Freundlich (1906), Langmuir (1918) and Redlich-Peterson (1959) were used to fit the experimental data. FTIR spectra of before and after dye treated polymeric adsorbents were carried out to evaluate the efficacy of the polymers. The adsorption capacity of the polymers was found to be high.

Keywords: Polymers, Adsorption, Isotherm, Methylene Blue Dye solution, FT-IR

INTRODUCTION

Clean and safe water is becoming scarcer in many parts of the world due to pollution [1,2]. Wastewater discharged in many industries, such as metallurgy, mineral processing, tanning, chemical manufacturing, and battery manufacturing, contains one or more toxic metal ions [3]. If the wastewater is not treated in time, heavy metals, dyes will circulate with the water, immerse into the groundwater or be exposed to the air, and may result in causing various diseases. [5,6]. Therefore, the recovery of dyes and heavy metals from wastewater has high economic and environmental significance. In this work, a new polymeric adsorbent was developed to selectively adsorb MB dyes from wastewater.

METHODS AND MATERIALS

Adsorption isotherm studies

Batch adsorption experiments were carried out by contacting 50 mg of the polymer with 20 mL of the dye solution of different initial concentrations (100-500 mg/L) at pH 6.8 taken separately at a temperature of 30 °C. The contents were shaken for 180 min at a speed of 150 rpm and then filtered. The filtrates were analyzed for the residual dye concentration using the UV-Vis spectrophotometer. The amount of dye adsorbed onto the adsorbent at equilibrium, q_e (mg/g) was calculated by the following relationship:

$$q_e = \frac{(C_o - C_e)\,V}{m}$$

(1)

Where, C_o and C_e (mg/L) are the initial and equilibrium dye concentrations respectively. It is important to find out the best fitting isotherm model to evaluate the efficiency of the prepared adsorbent.

The structure of the polymers are given in the following table.

RESULTS AND DISCUSSION

Adsorption isotherm studies

Adsorption isotherms are basic requirements for the design of the adsorption processes. These equilibrium data give information on the capacity of the adsorbent or the amount of adsorbent required, for removing the metal ions under system conditions. The adsorption equilibrium experiments were performed, and a plot of metal ions adsorbed onto the adsorbent (q_e, mg/g) against the equilibrium concentration of metal ions (C_e, mg/L) in solution at 30 °C, was made. Though there are several models available to describe adsorption isotherms, the most widely used adsorption isotherm models are the Langmuir, Freundlich and Redlich-Peterson. The adsorption equilibrium data of methylene blue dye onto polymeric adsorbents (P1, P2, P3, P4 and P5) were analyzed with all the four isotherm equations. A plot of q_e versus C_e for the adsorption isotherms of dye removal onto synthesized polymeric adsorbents at 30°C. These curves were found to be convex upward throughout, and were designated as favourable types. The parameters of the adsorption isotherm equations for this process were calculated by the nonlinear regression analysis.

Langmuir adsorption isotherm

The Langmuir treatment (Langmuir, 1918) is based on the assumptions that the maximum adsorption corresponds to a saturated monolayer of solute molecules on the adsorbent surface, that the energy of adsorption is constant, and that there is no transmigration of the adsorbate in the plane of the surface. [7,8]. The non-linear form is represented by,

$$q_e = \frac{q_m K_L C_e}{1 + K_L C_e}$$

(2)

Where q_e is the amount of dye adsorbed (mg g^{-1}), and C_e is the equilibrium concentration of the solution (mg L^{-1}). q_m and K_L are the Langmuir constants indicating the adsorption capacity and energy, respectively. According to the Hall et al (1966) the essential feature of the Langmuir model can be expressed in terms of a dimensionless constant separation factor (R_L) given by the following equation:

$$R_L = \frac{1}{1 + K_L C_o}$$

(3)

Where K_L is the Langmuir constant (L mg^{-1}) and C_o is the initial concentration (mg L^{-1}). It has been established that for favorable adsorption, $0 < R_L < 1$; for unfavourable adsorption, $R_L > 1$; for linear adsorption $R_L = 1$; and the adsorption process is irreversible if, $R_L = 0$.

Freundlich adsorption isotherm

The Freundlich isotherm (Freundlich 1906) is an empirical equation, and can be employed to describe heterogenous systems. The heterogeneity arises from the presence of different functional groups on the surface, and the various adsorbent – adsorbate interactions. This isotherm is derived from the assumption that the adsorption sites are distributed exponentially with respect to the heat of adsorption. It also assumes that the stronger adsorption sites are occupied first and the binding strength decreases with increasing binding site occupation. [9,10]. The non-linear form is expressed as follows:

$$q_e = K_F C_e^{1/n}$$

(4)

Where K_F is the Freundlich constant $((mg.g^{-1})(L.mg)^{1/n})$ related to the bonding energy. 1/n is the heterogeneity factor and n $(g.L^{-1})$ is a measure of the deviation from the linearity of adsorption. This value indicates the degree of non-linearity between the solution concentration and adsorption as follows: if n = 1, the adsorption is linear; if n < 1, adsorption is a chemical process; and if n > 1, adsorption is a physical process.

Redlich – Peterson adsorption isotherm

Redlich – Peterson isotherm is a hybrid isotherm featuring both Langmuir and Freundlich model (Redlich and Peterson, 1959) which incorporates three parameters into an empirical equation and can be applied either in homogeneous or heterogeneous system due to its versatility (Foo and Hameed, 2010). It approaches Freundlich isotherm model at high concentrations and is in accordance with the low concentration limit of the ideal Langmuir condition (Foo and Hameed, 2010) [11,12].The equation is given as:

$$q_e = \frac{K_R C_e}{1 + \alpha_R C_e^{\beta}}$$

(5)

Where q_e is the amount of adsorbate in the sorbent at equilibrium (mg/g), C_e is the equilibrium concentration (mg/L); K_R is the Redlich - Peterson isotherm constant (L/g), α_R is the Redlich - Peterson isotherm constant (L/mg), and β is the exponent which lies between 0 and 1. The Redlich - Peterson isotherm exponent which lies between 0 and 1has two limiting behaviour: Langmuir form for β=1 and Freundlich form for β=0. The obtained experimental results were made to fit with non-linear isotherm model using MATLAB 7.0 to find the best fit model for the adsorption process and to predict the pathway of the reaction. The adsorption capacity (q_m) values were found to be good and in agreement with the obtained experimental results. The co-relation coefficient (R^2) value were also found to be closer to 1, predicting that the dye molecules were attached to the pores of the polymeric adsorbents. Since these polymers were macroporous, physical interaction between the dye molecules and polymeric adsorbents play a significant role in the adsorption process. But even the correlation coefficient values were found to be less when compared with langmuir isotherm, Freundlich isotherm showed that there was some chemical interaction also between the polymeric adsorbents and the dye molecules. The n values of Freundlich isotherm were found to be greater than 1, suggesting physical adsorption as the predominating step in the adsorption process.

This is justified and concluded with the β value of Redlich-Peterson value which was nearing to 1, suggesting that physical adsorption is the predominating in the adsorption mechanism. However, the FTIR spectra of before and after treated polymeric adsorbents showed major changes which indicates that the donor atoms nitrogen and oxygen present in the polymeric chain actively took part in the adsorption process. When the FTIR spectra of pure and spent polymeric adsorbents were observed, there was a considerable decrease in the intensity of the spectrum with specific changes in various zones. When observed closely, it was evident in all the FTIR spectra, that there was a new peak formed between 2800cm^{-1} to 3000 cm^{-1}, it was due to the interaction between the dye molecule and the polymeric adsorbent. The broad peak obtained above 3000 cm^{-1} is also diminished. This broad peak corresponds to the free hydroxyl group or the oxygen linkages which are interconnecting each monomeric repeating unit. This oxygen effectively takes part with the interaction between the dye molecule resulting in effective binding between the dye molecules and the polymeric adsorbents. When compared closely, it will be evident, that the adsorption capacity of the P5 and P4 polymers was found to be high. This is due to the absence of substituted methyl group in the

Subha and Sharmila

polymeric backbone. But in polymers P1, P2 and P3 the presence of methyl group in the polymeric main chain hinders the binding between the dye molecules and polymeric adsorbent due to steric effect. Hence the binding will be only on the walls of the adsorbent resulting in lower adsorption capacity.

CONCLUSION

This study was focused on the evaluation of oxadiazole polymeric material as potential adsorbent for the removal of MB dyes from dye solution. Preliminary studies demonstrates that the adsorbent prepared is effective in the removal of MB dyes. Adsorption isotherm studies revealed that the oxygen present in the oxadiazole moiety effectively bind between the dye molecules and the polymeric adsorbents. FT-IR studies showed a formation of new peak which confirms the interaction between the dye molecules and the polymeric adsorbents. Hence, all the polyesters effectively acts as adsorbents. In future studies, these polymers can be used as corrosion inhibitors and as an adsorbent for the removal of heavy metal ion from industrial effluent waste water.

ABSTRACT

Research on association of blood groups with diseases and disorders is less informative and further in relation to age and sex is very limited. Hence to study the vulnerability of blood groups of human population to diseases and disorders concerning their age and sex. Human individuals were divided into '10' groups according to their age (between 1 to 100 years) & sex. Serum samples were also collected. Hospital based case control study has been done in determining how the blood groups of human individuals are vulnerable to various diseases and disorders in relation to their age and sex. DMR test, where values are means (n=6) which do not share common superscript differ significantly at $p < 0.05$. This study finds that the blood group B+ is associated more with occurrence of diseases, disorders followed by blood groups A+, O+, AB+ proportionately in human individuals in relation to age groups between 41 & 70 years and 51 & 80 years of males and females respectively.

Keywords: Age, Blood groups, Disease, Sex, Vulnerability.

INTRODUCTION

Antigens on the surface of red blood cells represent the blood groups. Establishment of antibodies and antigens as inherited characteristics was done after the discovery of blood groups by the Landsteiner in the early 1900s, classification of the ABO blood groups and subsequent research by others[1]. Red blood cells, platelets, leukocytes, plasma proteins, certain tissues and various cell surface enzymes are the sites on which the blood group antigens exist and also in soluble form in body secretions such as breast milk, seminal fluid, saliva, sweat, gastric secretions, urine and amniotic fluid[2]. Rh blood group system is the most complex and indeed the second most studied blood group system[3]. Kaipainen and Vuorinen first hypothesized the association of blood groups and disease in 1960[4] and the gene involved in different blood groups was discovered in 1990[5]. However, lack of antigens in certain

80401

blood groups rise contentious issues between the ABO blood group and vulnerability to infectious and noninfectious diseases. Presence or absence of these both ABO and Rh blood groups systems throughout the body/on RBCs have been associated with number of diseases[6,7]. Large epidemiological studies involving connectivity between the human ABO blood group and occurrence of various diseases were broadly postulated in the years 1960 and 1970[8]. ABO blood types were found in conjunction with various infectious[9,10] and noninfectious diseases[11]. Haemolytic transfusion reactions and/or haemolytic disease of the newborn (HDN)[5] are the resultant of incompatibilities among other blood groups. Various diseases like hematologic disorders, cognitive disorders, circulatory diseases, metabolic diseases, cancer, cardiovascular diseases and malaria have been associated with ABO blood groups. Irrespective of geographical region, age, race and gender an increased risk of cognitive impairment was mainly observed in blood group AB individuals. Earlier etiological studies indicated that people with blood type O are associated with increased incidence of cholera, plague, tuberculosis infections and mumps; blood type A with increased incidence of smallpox and *Pseudomonas aeruginosa* infection; blood type B with increased incidence of gonorrhea, tuberculosis and *Streptococcus pneumoniae*, *E. coli* and *Salmonella* infections; blood type AB with increased risk of smallpox, *E. coli* and *Salmonella* infections. People with blood type A has higher incidence of cancers in the stomach, ovaries, salivary glands, cervix, uterus and colon/rectum than in O type people. Most of the affected human individuals in the present study experienced majority of the said diseases[12]. The chemistry of blood, its classification, structure, Lewis determinants and respective inducing enzymes is linked to the occurrence of the diseases and is evidential[8]. Further research is required to identify differences in biochemical composition of blood group antigens to risks for disease and their relationship for the identification of targets in the development of nutritional intervention strategies or druggable targets[2]. However, the studies to show the relationship between occurrence of various diseases and disorders, their severity and A, B, AB and O blood groups, especially in relation to age and sex is very limited. Hence we thought that there could be a significant relationship between A, B, AB, O, Rh blood groups, age and sex and occurrence of various diseases and disorders, their severity and studied them in the selected human population.

MATERIALS AND METHODS

Pasupala with geo-coordinates (15.7735° N, 78.0723° E) is located in Kurnool, Andhra Pradesh with a population of around 2900 inclusive of both educated and uneducated individuals. Diversity of occupations is more along with various health issues and is the reason for selection of this village for this study. Human individuals and were divided into '10' groups according to their age (between 1 to 100 years). Serum samples were also collected. This study was done for 12 months i.e. from October 2022 to September 2023. Diagnosis for the diseases and disorders was carried out by standard clinical methods and these procedures were followed in accordance with ethical standards as per the guidelines laid down by central ethical committee of Indian Council of Medical Research (ICMR). This study and the collection of data were carried out with the approval of Institutional Review Board (IRB). Statistical analysis of the data was analyzed by 'DMR test' and observed that the individuals with blood groups of the order B>A>O>AB in the age groups 1 to 100 years distinguishing males and females suffering from respective diseases, disorders with p<0.05 considered as significant. Individuals of disease free are treated as controls in the respective sample size and also in total sample size.

RESULTS

Of the total male and female individuals **(Table – 1)** around 14.51% and 12.97% respectively were affected with certain diseases, disorders **(Table – 2)**. This study found that males with the age groups (in years) 51-60, 41-50, 61-70 were more affected in proportion to the blood groups (B>A>O>AB) followed by the age groups (in years) 31-40, 71-80 with greater significant values indicating p<0.05. Age groups (in years) 0-10, 11-20, 21-30, 81-90 were less prone to diseases. Where as in females, the age groups (in years) 51-60, 61-70, 71-80 were more affected in proportion to the blood groups (B>A>O>AB) followed by the age groups (in years) 41-50, 31-40 with greater significant values indicating p<0.05. Age groups (in years) 0-10, 11-20, 21-30, 81-90 were less prone to diseases. Blood groups with

affected % is in the order of B+, A+, O+, AB+, B-, A-, AB-, O- in the male individuals and in females it is in the order of B+, A+, O+, AB+, B-, A-, O-, AB- **(Table – 3)**.

DISCUSSION

Oligosaccharide structures confirming the blood type is the reason for biochemical profile differences of individuals leading to differences in blood type, antigens and secretor status[2]. Human ABO blood type antigens located on the red cell surface which exhibit alternative phenotypes and genetically derived glycoconjugate structures exert vital role in the cells physiology and pathology[13]. Metabolomics studies have revealed the differences in the biochemical profiles and blood type distribution differences among different ethnicities. ABO antigens are thought to be evolutionarily beneficial in conferring resistance against pathogens[14]. Human leukocyte antigens (HLAs) present on every nucleated cell in the human body have been grouped into major histocompatibility complex (MHC) classes. Nucleated cells generate MHC molecules needful for their immunogenic functions. HLAs and other surface markers found on nucleated cells help in fighting disease[15]. One of the notable differences between HLA antigens and human blood group antigens is the association of only one phenotype with HLA antigens, while three phenotypes with blood group antigens. But the most important difference may be that mature RBCs are non-nucleated; all of the blood group antigens are generated prior to maturation, when RBCs lose the ability to generate new antigens[16]. Hence, RBCs do not function as antigen-presenting cells. Thus the association of blood group antigens with disease risk is far more refined than the association of HLA antigens with diseases. Disease risk is clearly multifactorial and causation is not implied by association but blood group antigens may be one of the predisposing factors that contribute to or prevent disease processes. Mostly A and B antigens are secreted by the cells and are found in human blood circulation. Therefore, non secretors are at risk to a variety of infections[17]. The likely pathogenesis for this vulnerability is binding to polysaccharides by many organisms on the cell surface, but soluble blood group antigens may not entertain[10,18]. Carbohydrate as a receptor in the species can resist a pathogen in ABO alternative phenotype. Alternatively, ABO polymorphism leads to a polymorphic production of anti-A and anti-B natural antibodies prevent individuals from several infectious agents expressing A and B motifs[19].

ABO blood group system is highly polymorphic with more than 20 distinct sub-groups; study findings are usually related to ABO phenotype, but rarely to the ABO genotype, secretor status and Lewis phenotype. Animal models are unsatisfactory because their antigen glycosylation structure is different from humans[20]. However, yet to know the exact mechanisms elucidating the associations between blood group antigens and disease in adhesion molecules. But an unexpected number of these structures contribute to normal RBC development; some act as cell adhesion molecules (CAMs) and some play a role in human disease[21]. The ABO, Hh, Sese (secretor) and Lele (Lewis) genes play different roles in the final ABO antigen structure of an individual's body tissues/secretions. This basic evidence can be revised as new information was obtained[1,9]. Several studies explaining the possible mechanisms did not confirm the relation between ABO blood types and diseases due to inconsistent results. Nevertheless, evidences were collected here to make this supposition sound. ABO may influence the risk of different diseases by different known and unknown mechanisms and now it is clear that ABO not the exact cause of diseases and susceptible to disease and health problems. In general, non-O blood types are more susceptible to diseases than O blood type. Genetically determined human ABO blood groups were correspondingly linked with an increased risk of various infectious and noninfectious diseases and our study further related this with age and sex. Ageing is accompanied by decline in immune system function and alteration which increases susceptibility to infections with meagre distinctive variation in males and females[22] as is evident from this study. It can be useful to increase the knowledge of persons in this aspect because individuals with high risk blood types could be screened and trained for modifying their lifestyles, health behavior and environment and other attempts that may increase public health. In addition, blood type can also influence the personality of humans such as creativity, social tendencies and temperament which is again an interesting phenomenon in psychological research[23]. The importance of human blood types is clearer in the context of population movement and the persistent combat between the humans and infectious diseases. However,

further investigations are needed particularly at the molecular level of ABO blood groups and their association with various diseases.

CONCLUSION

Blood group B+ is associated more with occurrence of diseases followed by blood groups O, A, AB proportionately in human individuals in relation to age groups between 41 & 70 years and 51 & 80 years of males and females respectively.

ABSTRACT

This study underscores the critical role of advanced technology in modern agricultural practices. By harnessing AI and computer vision techniques, the fruit quality assurance system offers a robust solution to ensure compliance with standards. This investigation focuses on the detailed analysis of five fruit varieties: Apple, Banana, Guava, Lime, and Orange. The study examines fruit images captured under various environmental conditions and backgrounds to ensure robustness and accuracy in different scenarios. This research investigates the effectiveness of multiple feature extraction techniques for classifying images of fruit. Histogram of Oriented Gradients (HOG), Gabor filters, Wavelet transforms, and Zernike Moments feature extraction techniques are employed for unique image characteristics. The extracted features are then fed into various classification algorithms to assess their suitability for achieving comprehensive fruit image analysis. Furthermore, to address the issue of loss and enhance classification performance, we have developed a novel, lightweight, and robust algorithm tailored specifically for this application. Our developed model achieves a notable accuracy rate of 94.86% and an impressive inference time of 1.32 milliseconds per fruit. These results demonstrate the efficacy of the model for real-time applications, particularly in resource-limited agricultural settings. This comprehensive approach aims to significantly contribute to enhancing quality assurance measures in the agricultural sector.

Keywords: CNN, Image Processing, Fruit, Deep learning, Machine Learning.

INTRODUCTION

Agriculture remains the predominant source of livelihood in India, with a70% of rural households relying primarily on it for their sustenance[1]. According to the Food and Agriculture Organization (FAO) of the United Nations, India ranks second globally in terms of both production of fruits and vegetables in 2019[2]. India has consistently recorded higher output in fruit production. India is the biggest producer of Banana, Guava, Papaya, Mango, and many other fruits &vegetables [1]. There is a huge potential for the export of fruits and vegetables from the country. Due to a lack of adequate processing facilities, labor shortage, cold chain, and proper storage facilities, as well as exports, transportation, and marketing fruit, a wastage problem arises[3].Annually, India generates 86.602 million metric tons of fruits and vegetables, leading to approximately 5.6 million tons of waste[4]. The study report suggests that a strong and dynamic processing sector plays a vital role in stopping post-harvest loss in India[5].The classification of fruits involves handling image uncertainties, image preprocessing, data handling, and seasonal effects, which are major challenges in sorting and grading fruits. Image processing techniques such as preprocessing and segmentation, combined with feature extraction methods, are instrumental in fruit sorting and grading applications [6] [7]. These techniques are integrated with machine learning models for effective classification purposes, enabling the automated assessment of fruit quality based on various visual attributes. The area under fruit crops during 2021-22 (3rdAdvance Estimate) is 7.05 million hectares, with a total production of 107.24 million tones [8]. During the Period 2011-12 to 2021-22 (3rd Adv. Est.), the production of fruits increased by about 40.3%, while the area increased by about 5.1%. Comparative details of the area, production, and productivity of fruit crops are given in Figure 1.

The significant contributions of this paper are as follows:

- This work proposes state-of-the-art Machine Learning models for the classification of fruits with various feature extraction methods like Histogram of Oriented Gradients (HOG), Gabor filters, Wavelet transform, and Zernike Moments.
- The Classifiers evaluated are Random Forest, Logistic Regression, Support Vector Machine (SVM),and K-Nearest Neighbour(K-NN).
- Developed a Novel, lightweight, and robust model for fruit classification, which is specially designed for Indian fruit with different backgrounds.
- The proposed model integrates depth-wiseseparable convolution and inception modules, enhancing feature extraction and representation. This combination optimizes image classification, particularly in challenging datasets with diverse backgrounds, and environmental conditions are common.
  The rest of the paper summarizes the Literature survey, materials and methods, results and discussion, conclusion, and future scope.

LITERATURE SURVEY

Key attributes of agricultural goods include size, color, shape, texture, and defects. Automating food inspection via computer vision systems offers unbiased, reliable, and non-invasive assessment, replacing manual methods effectively[7]. The author investigated fresh and rotten fruits from images of apples, bananas, and oranges using a Convolutional Neural Network (CNN) and Soft Max classification. Evaluation on a Kaggle dataset yields an accuracy of 97.82%[9]. The study compares six CNN-based architectures for rice disease classification and localization, addressing the scarcity of comprehensive comparative analyses in this domain. Results indicate that an ensemble approach achieves 98% accuracy, with transfer learning enhancing accuracy by 17% compared to Seresnext101. The research underscores the potential of CNN models in real-time plant disease detection, offering timely insights for farmers to safeguard agricultural productivity and quality[10]. Lightweight deep learning model, merging MobileNetV2 with an attention module to mitigate storage and computational demands of heavy-weight architectures in fruit classification. Leveraging transfer learning, the method outperforms four recent approaches across three benchmark datasets, offering superior classification accuracy with fewer trainable parameters. Its

Anita N. Bhatt and Maulin Joshi

potential for automating fruit identification holds promise for industries involved in fruit production and processing[11]. The classification results from three stages: Tomato/Non-Tomato, Good/Defective, and specific defect type for defective fruitsare transmitted to the microcontroller. This enables the activation of the corresponding motor, facilitating the sorting and collection of classified fruits into their designated bins[12]. Authors have developed a meticulously curated image dataset focusing on Indian fruits with a keen emphasis on quality parameters crucial for both consumption and export purposes. The dataset encompasses six commonly consumed fruits: Apple, Banana, Guava, Lime, Orange, and Pomegranate, meticulously categorized into good quality fruits, Bad quality fruits, and Mixed quality fruits over 19,500 processed images[13]. Recent advancements in machine learning technology have revolutionized agricultural practices, offering farmers valuable insights and recommendations to minimize losses and optimize crop yields[6]. The author investigated several transfers learning architectures, including a proposed and established models like Nas Net Mobile, InceptionV3, Inception ResNet V2, ResNet50V2, MobileNetV2, VGG16, DenseNet 121, and Xception. Among these, Xception showed the most promising results. After 15 epochs, the proposed modelachieved a training accuracy of 98.82% with a loss of 0.0386. Subsequent testing yielded an accuracy of 98.04% and a loss of 0.0679. These findings underscore the effectiveness of transfer learning in various architectural contexts[14].

MATERIALS AND METHODS

Data Acquisition and Preprocessing

The dataset is obtained from mandely[13]. The dataset comprises images obtained under diverse environmental conditions, including variations in lighting, backgrounds, and viewing angles. The images contain good and bad quality images of Apple, Banana, Guava, Lime, and Orange. Figure 2 shows sample images of dataset.

A total of 11323 images are used, out of which 9056 training images and 2269 testing images are used for evaluation. Images are resized to 200x200x3 for performance evaluation. Total 10 classes namely Apple bad, Apple good, Banana bad, Banana good, Guava bad, Guava good, lime bad, lime good, Orange bad and, Orange good.

METHODOLOGY

Machine Learning Approach

For fruit classification tasks, traditional machine learning with feature extraction offers interpretability by identifying key discriminative features like shape, texture, and color, aiding in understanding the underlying factors that distinguish between various fruit types. This method facilitates domain-specific insights integration and robust model development, particularly beneficial in scenarios with limited data availability.

HOG Feature

HOG is a feature descriptor that represents the local gradient information in an image by dividing it into small cells, computing histograms of gradient orientations within each cell, and then normalizing them. It captures edge and texture information, making it robust to changes in illumination and viewpoint. HOG is suitable for fruit feature extraction because it effectively captures shape and texture information, allowing for discriminative features to be extracted from images of fruits. Its robustness to variations in lighting and viewpoint makes it ideal for fruit classification tasks. The parameters passed to the hog function control the configuration of the HOG descriptor. Orientations9 specifies the number of orientation bins, pixelspercell (8, 8) determines cell size for gradient computation, and cells perblock(2, 2) sets the normalization block size. Additionally, Visualizing False determines whether to return the visualized HOG image, but here, it's set to False for efficiency as only the feature vector is required.

Anita N. Bhatt and Maulin Joshi

GABOR Feature

Gabor features are texture descriptors derived from Gabor filters, which are used to analyze local spatial frequency content in images. They capture both the texture patterns and their orientations, providing a rich representation of textures across different scales and orientations. Gabor features are advantageous for fruit feature extraction due to their ability to capture fine texture details, such as surface patterns and irregularities, which are often discriminative for differentiating between fruit types. Their multi-scale and multi-orientation nature enables the detection of textural variations in fruits, enhancing the robustness of classification models. Additionally, Gabor features are less sensitive to variations in illumination and shading, making them suitable for analysing fruit images captured under different lighting conditions. Gabor filters were applied at various 8 orientations and scales. It computes the real part of the filtered images and constructs a feature vector by concatenating them. Finally, it returns an array containing the feature vectors for all images in the dataset.

Wavelet Feature

The wavelet feature extraction technique, implemented here using the Haar wavelet transform, offers a sophisticated method to capture both local and global image characteristics. By decomposing images into different frequency bands and directional components, wavelet analysis facilitates the extraction of diverse features, including texture, edges, and patterns, at multiple scales. This approach enhances the discriminative power of feature representations, enabling more comprehensive image analysis compared to traditional methods. Moreover, wavelet features possess the inherent ability to preserve both spatial and frequency information, thereby offering a richer representation of image content. Such versatility and robustness make wavelet feature extraction invaluable for various applications, including image classification, object recognition, and medical image analysis, where capturing intricate image details is crucial for accurate decision-making and analysis.

Zernike Moments

Zernike Moments, a set of orthogonal moments, capture the shape information of an object by representing its spatial distribution. Each moment corresponds to a specific shape characteristic, such as area, centroid, and elongation, providing a concise description of object morphology. By quantifying shape features invariant to translation, rotation, and scale, Zernike Moments offer robustness in object recognition and classification tasks across various domains. Moreover, their orthogonality property enhances computational efficiency and reduces feature redundancy, facilitating effective feature extraction and analysis. Leveraging Zernike Moments enables accurate and efficient representation of object shapes, contributing to advancements in image processing, pattern recognition, and computer vision research.

Support Vector Machine (SVM)Classifier

SVMs excel in handling high-dimensional data, making them well-suited for processing image features commonly encountered in fruit classification tasks[15]. They are effective even with limited training data and can delineate complex decision boundaries. SVMs can be a suitable choice for fruit classification tasks, particularly with datasets containing moderate numbers of images per fruit class[16]. Their capability to handle image data effectively may lead to robust performance.

Random Forest Classifier

Random Forests are adept at handling large datasets, robust to noise and outliers, and provide insights into feature importance[17]. Their ensemble nature makes them resilient to variations in lighting, backgrounds, and viewing angles within the data. It can handle non-linear relationships and intricate patterns present in datasets comprising images of Indian fruits with different backgrounds and lighting conditions.

K-nearest neighbours (KNN)Classifier

KNN is simple to implement and effective with high-dimensional data, making it a straightforward baseline model for initial exploration[18]. It works well for tasks where local data patterns are important. KNN may be helpful in providing initial insights or baseline performance comparisons in fruit classification tasks. This makes it applicable to

datasets containing Indian fruit images with different backgrounds and environmental conditions, as it relies on local data patterns rather than global assumptions.

Proposed lightweight and robust model approach

Deep learning, specifically Convolutional Neural Networks (CNNs), offers the advantage of automatically learning hierarchical representations from raw data, eliminating the necessity for manual feature engineering. Moreover, CNNs adeptly capture spatial hierarchies in data, rendering them highly effective for tasks such as image recognition and object detection. Figure 3 depicts the proposed lightweight and robust model. The model begins with an input layer of specified image dimensions 200x200x3, representing RGB images. The initial convolutional layer consists of 8 filters of size (3, 3) with a stride of (2, 2) and 'same' padding followed by Rectified Linear Unit (ReLU) activation.

Subsequent layers include a depth-wise separable convolution block, comprising a Depth wise convolution layer with (3, 3) kernel size and 'same' padding, followed by a pointwise convolution layer with 32 filters of size (1, 1) and ReLU activation. MaxPooling2D layer with a pool size of (2, 2) is applied after the Depth-wise separable block to downsample feature maps. A skip connection is implemented by preserving the output of a layer and skip connection to be concatenated with the output of subsequent layers. The model incorporates an inception module that consists of parallel convolutional branches to enhance feature representation[19]. Each branch includes convolutional layers with different filter sizes (1x1, 3x3, 5x5), followed by ReLU activation. Additionally, a max-pooling layer with (3, 3) pool size and (1, 1) strides is included, followed by a 1x1 convolutional layer. The outputs from all branches of the inception module are concatenated along the channel axis to form a single feature map.The concatenated output is flattened and passed through fully connected layers for classification. The dense layers consist of 128 and 64 neurons, respectively, with ReLU activation. Dropout regularization with a dropout rate of 0.2 is applied between the dense layers to prevent overfitting. The final output layer comprises a dense layer with SoftMax activation, producing probabilities for each class in the dataset. 10 neurons in the output layer correspond to the number of classes.

RESULTS AND DISCUSSION

Evaluation with various feature extraction techniques is crucial as different methods capture distinct aspects of data, aiding in selecting the most effective approach for a given task. By comparing performance, through performance comparison, strengths, weaknesses, and optimal methods can be identified, enabling informed decision-making and enhancement strategies. Various classifiers facilitate the identification of the most suitable model for a specific task, enhancing the overall effectiveness of the machine learning system. Furthermore, it provides valuable insights into the dataset's characteristics and the performance of different algorithms, aiding in informed decision-making during model selection. This comprehensive approach contributes to the development of a more reliable and robust machine learning system capable of handling diverse datasets and real-world challenges with greater efficacy. Performance evaluation results obtained from Feature extraction and classification using various classifiers are shown in Table 1.

The mentioned feature extraction techniques, including HOG, Gabor feature, Wavelet transform, and Zernike moments, are pivotal in capturing distinctive visual attributes from images for subsequent analysis. HOG delineates object shapes by quantifying local intensity gradients, Gabor filters highlight texture patterns through frequency and orientation analysis, while Wavelet transform captures multi-scale information. Zernike Moments encode shape characteristics, offering robustness to geometric transformations and facilitating comprehensive image representation for diverse applications in computer vision and pattern recognition research. HOG excels as a feature extractor by effectively capturing object shapes and textures, while Random Forest stands out as a top-performing classifier, showcasing robustness and accuracy in handling complex feature representations. Our proposed model designed for the Indian fruit dataset demonstrates remarkable performance superiority over conventional feature extraction and classifier methods. The model in corporate depth wise separable convolution offers computational efficiency by decoupling spatial and channel-wise convolutions, resulting in fewer parameters and reduced computation, and is

Anita N. Bhatt and Maulin Joshi

suitable for resource-constrained environments[20]. Inception architecture leverages multiple parallel convolutional pathways, allowing the network to capture features at different scales and complexities efficiently, enhancing representation learning and model performance. Figure 4 shows the learning curve of our proposed lightweight and robust model with the percentage of correctly predicted samples represented by the Accuracy metric and by measuring the difference between expected and actual values, the Loss metric model's train during progress. Our proposed model achieves exceptional results, boasting a maximum training accuracy of 97.12% and a testing accuracy of 94.86% with a minimal loss of 0.02 over 10 epochs with a batch size of 32.

Notably, the training process demands a mere 84.69 seconds, while the model comprises a modest 5.2 million parameters, rendering it highly suitable for deployment in resource-constrained environments such as embedded systems or mobile applications. Figure 5 and Figure 6 show the confusion matrix and classification results of our proposed model.

CONCLUSION AND FUTURE SCOPE

Our study comprehensively evaluated the effectiveness of diverse machine learning classifiers for fruit classification tasks, integrating various feature extraction techniques such as HOG, Gabor filters, Wavelet transform, and Zernike moments. Moreover, we introduced a novel lightweight and robust model incorporating an Inception block and Depth-wise separable convolution, achieving exceptional accuracy of 94.86% and demonstrating superior performance compared to traditional machine learning algorithms, with a minimal inference time of 1.32 milliseconds per fruit. Our findings highlight the significance of employing diverse classifiers and innovative model architectures to enhance classification accuracy, particularly in scenarios with variable backgrounds and lighting conditions. Our proposed approach shows promise for fruit classification accuracy and robustness, especially in practical software applications and embedded systems. Future research endeavours could focus on leveraging more extensive datasets comprising additional fruit species and a diverse range of images, including both authentic and synthetic representations, to enhance the system's robustness and generalization capabilities.

ABSTRACT

Heart disease, a broad term encompassing various cardiovascular conditions, stands as a formidable global health challenge, representing a leading cause of morbidity and mortality. To increase the efficacy of disease prediction earlier, it is necessary to identify the most relevant subset of features in a given domain. In this paper, the integration of the Firefly Optimization Algorithm (FOA) with Random Forest (RF) is proposed and used to select the optimal feature subset for prediction of Heart disease. The hybridization makes use of the advantages of both FOA and RF methods. Initiating with the data pre-processing step by employing a matching pursuit imputation method to handle missing values, followed by Z-score normalization for feature scaling, and Bray–Curtis feature learning vector quantization is then employed for feature extraction to reduce dataset dimensionality. After that Optimal feature selection is carried out using the Firefly Optimization Algorithm with Random Forest (FOA-RF) method, which minimizes both time and space complexity in disease prediction and then applies the proposed algorithm in five different heart disease datasets to select the best features. The effectiveness of the selected feature set is analyzed using a Support Vector Machine and the experimental results confirm the efficiency of the proposed feature selection approaches rather than the original Firefly Optimization and Random Forest algorithm by way of searching the feature space and selecting the most informative attributes for prediction tasks. Accuracy, Sensitivity, and Specificity have been measured to evaluate the results. Our experimental result demonstrates that the SVM-based model with the FOA-RF achieves a better result than the other feature selector algorithms.

Keywords: Firefly Optimization Algorithm, Random Forest, Support Vector Machine, Heart disease, feature selection, vector quantization, Z-score normalization

INTRODUCTION

Heart Disease is a severe condition that significantly impacts human life, emerging as one of the leading causes of death worldwide. To prevent further damage to patients, accurate diagnosis and early identification of heart disease are essential for effective rehabilitation and treatment. A machine learning model has been trained on medical data to enable efficient heart disease diagnosis, conserving resources while improving accuracy. During the training process, the medical datasets contain both relevant and redundant features about the patients. These unnecessary features do not contribute meaningful information to the disease detection task and lead to the curse of dimensionality. Therefore, significant feature selection techniques are required in heart disease prediction. Feature selection is a crucial step in machine learning and data analysis, particularly in the domain of medical diagnosis such as predicting heart disease. It involves identifying the most relevant features or variables from a dataset that contribute the most to the predictive performance of a model. By selecting the right features, we can improve model accuracy, reduce overfitting, and enhance interpretability. In heart disease prediction, the significance of feature selection cannot be overstated. With a multitude of potential risk factors and diagnostic indicators, identifying the most influential features can lead to more accurate and efficient predictive models. By focusing on relevant features, we can streamline the diagnostic process, potentially leading to earlier detection and intervention, ultimately saving lives.

The integration of Firefly Optimization (FO) and Random Forest (RF) algorithm for feature selection presents a promising approach to addressing the complexity of feature selection problems. Firefly Optimization is a metaheuristic algorithm inspired by the flashing behavior of fireflies, which seeks to optimize solutions in a search space. When combined with Random Forest, a powerful ensemble learning technique known for its robustness and flexibility, this hybrid approach aims to leverage the strengths of both algorithms for more effective feature selection. Several feature selection algorithms exist, each with its strengths and weaknesses. Commonly used methods include Recursive Feature Elimination (RFE), Genetic Algorithms (GA), and Principal Component Analysis (PCA). When compared to these methods, the FO-RF hybrid approach offers distinct advantages. While RFE may struggle with large feature sets and GA can be computationally expensive, the FO-RF hybrid method aims to strike a balance between efficiency and effectiveness. Additionally, the ensemble nature of Random Forest helps mitigate the risk of overfitting, which can be a concern with some feature selection techniques. The hybridization of Firefly Optimization and Random Forest brings several benefits. Firstly, Firefly Optimization enhances the search process by efficiently exploring the feature space, potentially leading to more optimal solutions. Secondly, Random Forest provides robustness and generalization ability, ensuring that the selected features are relevant across different datasets and scenarios. By combining these strengths, the hybrid approach aims to improve feature selection performance, resulting in more accurate and interpretable predictive models for heart disease diagnosis. The subsequent sections of this paper are organized as follows: Section II discusses the related research on feature selection techniques for heart disease prediction and highlights the limitations. Section III briefly explains FO and RF algorithms, and then details how they are integrated for feature selection in the proposed FO-RF approach. Emphasize how FO addresses redundancy issues and how RF contributes to robustness and generalizability. Section IV describes the experimental setup, including data selection, evaluation metrics, and comparison with existing methods. This section should demonstrate the effectiveness of the FO-RF approach in improving model performance. Section V summarizes the findings, emphasizing how the proposed method addresses the initial problem of redundant features and contributes to more accurate heart disease prediction models.

LITERATURE REVIEW

In recent studies aiming to improve heart disease diagnosis accuracy, various feature selection techniques have been employed. Zheng et al. [1] introduce the MPMDIWOA algorithm, which merges the MPMD filter algorithm with the IWOA wrapper algorithm, effectively addressing local optimal values through concepts like maximum value without change (MVWC) and thresholds, resulting in superior classification accuracy and feature subsets. Tubishat et al. [2] present the Dynamic Butterfly Optimization Algorithm (DBOA), an enhanced version of BOA, which resolves

limitations by enhancing solution diversity and mitigating local optima issues. Tested on 20 benchmark datasets, DBOA outperforms other optimization algorithms. Abdel-Basset et al. [3] propose a novel approach by integrating the grey wolf optimizer algorithm with a two-phase mutation strategy, improving feature selection efficiency. The study contributes to optimization methods by leveraging metaheuristic algorithms. Abdelhamid et al. [4] introduce bSCWDTO, a hybrid binary meta-heuristic algorithm for feature selection, showing superiority over existing methods on 30 datasets. A hybrid approach [5] utilizing LGP and BA generates candidate chromosomes and performs neighborhood search, followed by SVM classification, yielding promising results. Another study [6] focuses on a three-step method involving feature selection, clustering, and classification, achieving superior results through various hybrid optimization algorithms. Xiang *et al.* [7] propose a hybrid system merging IGSA with k-NN, enhancing IGSA with PWL and SQP, and extending it to binary space, resulting in superior computational performance. Three hybrid algorithms [8] integrating SOA and TEO are introduced, showing promising results on 20 benchmark datasets. Nemati et al. [9] propose a hybrid feature selection algorithm merging GA and ACO, with low computational complexity and competitive performance. Xi e *et al.* [10] propose IFSFS, a hybrid method merging filter and wrapper methods, yielding optimal feature subsets from the original set. Another framework [11] integrates SACI with SVM, showing promising results in feature selection and model selection. A hybrid FFPSO technique [12] for BBB detection combines Firefly and Particle Swarm Optimization, enhancing classifier performance through optimized features. TRSFFQR [13] combines TRS and FA for feature selection in MRI brain images, addressing the limitations of basic models. HGAWE [14] combines a genetic algorithm with wrapper-embedded feature selection, outperforming existing methods in feature selection and classification accuracy. FCBF is used in conjunction with PSO and recursive FA [15], demonstrating robustness in classification accuracy. In a study on CAD [16], seven feature selection techniques are explored, achieving a classification accuracy of 88.15%.Kabir et al. [17] propose a hybrid ACO algorithm that efficiently explores feature spaces.Yu et al. [18] integrate PSO and GA for feature selection, offering a promising solution for enhancing machine learning model performance, particularly in cyber security applications. A proposed method [19] combines PSO exploration with GWO exploitation, yielding superior performance in feature selection and classification tasks.

DATASET
To evaluate the performance of various feature selection methods, we utilized five benchmark datasets from the Kaggle repositories focusing on cardiovascular health. These datasets serve as representative samples of real-world clinical data collected for heart disease prediction. Table 1 summarizes the datasets, including the number of attributes (features) and instances (data points) in each.

DATA PREPROCESSING
Data preprocessing plays a crucial role in ensuring the reliability and generalizability of machine learning models, particularly in the domain of heart disease prediction. Inconsistent data formats, missing values, and outliers can significantly impact model performance. To address these challenges, a comprehensive preprocessing pipeline is essential.

Missing Value Imputation
Missing entries within the datasets require careful handling to minimize their influence on model performance. We employ Matching Pursuit imputation, a machine learning-based approach for robustly imputing missing values. This method leverages the existing data to estimate the conditional statistical mean for each feature (column) with missing values. Here's the formula for calculating the mean:

$$\mu\left(\beta_{fv_i}\right) = \frac{\sum \beta_{fv_i}}{n} \tag{1}$$

Following the mean calculation, Matching Pursuit identifies the optimal value to impute by minimizing the absolute difference between the estimated value and its neighboring entries in the same feature. Essentially, the method seeks the value that creates the least disruption to the existing data pattern within the feature. The formula for absolute difference minimization can be represented as:

$$F = min\left|\beta_{fvD} - \beta_{fv(N)}\right| \tag{2}$$

By minimizing this absolute difference (often referred to as Least Absolute Deviation), Matching Pursuit aims to impute a value that seamlessly integrates with the surrounding data points within the feature.

Feature Scaling

Feature scaling is crucial for ensuring that all features contribute equally to the model's learning process. This is particularly important when dealing with datasets containing features measured in different units. We utilize standardized Z-score normalization for feature scaling. This technique transforms each feature value by subtracting the mean of the feature and then dividing it by its standard deviation. This results in a standardized dataset with a mean of 0 and a standard deviation of 1.

Categorical Feature Encoding

Many real-world datasets, including those used for heart disease prediction, contain categorical features. These features need to be converted into a numerical format suitable for machine learning algorithms. One-hot encoding is employed for this purpose. This technique creates a new binary feature for each unique category within the original categorical feature. The value of each new feature is set to 1 for the corresponding category and 0 for all other categories. For instance, a categorical feature "gender" with values "male" and "female" would be transformed into two new binary features: "gender_male" (1 for male, 0 for female) and "gender_female" (0 for male, 1 for female).

FEATURE EXTRACTION

Following data preprocessing the Bray–Curtis feature learning vector quantization is utilized for feature extraction, aiming to reduce the dataset's dimensionality. This process enhances computational efficiency and mitigates the curse of dimensionality, transforming the original dataset into a lower-dimensional representation for modeling. Feature learning vector quantization employs winner-take-all training algorithms, identifying significant features based on the Bray–Curtis index and mapping input features to a smaller set through quantization. For each feature in the vector 'β_{fi}' and β_{fj}, find the closet features using the Bray-Curtis Similarity Index.

$$\omega_{ij} = 1 - \frac{2\,(M_{ij})}{|\beta_{fi}| + |\ \beta_{fj}|} \tag{3}$$

In (3), ω_{ij} denotes a Bray-Curtis Similarity coefficient, M_{ij} denotes a mutual dependence between the two features, $|\beta_{fi}|$ and $|\ \beta_{fj}|$ represents the cardinalities of the two sets (i.e. number of values in each feature)**.** The Bray–Curtis similarity coefficient is bounded between 0 and 1. The winner-take-all training algorithm is exploited in learning vector quantization to identify winning features in the vector (i.e. high similarity).

$$H = \begin{cases} 1, & winning\ features\ in\ vector \\ 0, & otherwise \end{cases} \tag{4}$$

FEATURE SELECTION

After the feature extraction, feature selection is performed to choose a subset of optimal relevant features from extracted features. The main aim of feature selection is to improve model performance and reduce error, by focusing on the most informative and discriminative features. Therefore, the integration of the firefly optimization algorithm with random forest is introduced for optimal feature selection.

Proposed Hybrid FOA-RF Algorithm

Firefly Optimization [20] is a metaheuristic algorithm inspired by the flashing light behavior of fireflies. Fireflies are generally unisexual. Each firefly is attracted to others based on its light intensity, as the attractiveness of a firefly is directly proportional to its brightness. Fireflies with lower intensity are attracted to other fireflies that emit brighter light. Here the firefly is related to the number of features in the given dataset. The population of fireflies (i.e., features) $\beta_{fi} = [\beta_{fv_1}, \beta_{fv_2}, \dots, \beta_{fv_n}]$ is initialized in the search space. For every firefly, the fitness value is calculated based on the objective function.

$$f(x) = arg\,max\,Acc\,(DD) \tag{5}$$

Where $f(x)$ denotes a fitness function, $arg\,max$ denotes an argument of the maximum function, $Acc(DD)$ denotes an accuracy of the disease diagnosis (i.e. target output). The attractiveness of a firefly is determined by its fitness

value. Fireflies are attracted to other fireflies with higher fitness values and move towards them. In other words, the firefly 'ff_i'with less fitness is moved towards to fireflies with high fitness. Otherwise, the fireflies move in a random position. The position of the firefly is updated as follows,

$$X_{t+1} = X_i^t + a_{ij}e^{[-\rho D_{ij}^2]}(X_i^t - X_j^t) + q_t\epsilon_t \tag{6}$$

From (11), X_{t+1} represents an updated light intensity of the firefly,X_i^t denotes a current light intensity of firefly 'i', X_j^t denotes a current light intensity of firefly 'j', a_{ij} attractiveness of the firefly, q_t denotes a parameter controlling step size and ϵ_t represents a vector drawn from a Gaussian or other distribution, 'ρ' denotes a light absorption coefficient, D_{ij} distance between the fireflies 'i' and 'j'. Then the fitness is again computed based on the updated position of the firefly. Followed by, the fireflies are ranked to determine the more optimal solution with the help of a random Forest decision tree.   Random Forest is an ensemble learning algorithm that utilizes multiple decision trees to find more optimal features. The proposed ensemble learning technique first constructs the set of the weak learner as a decision stump to find the optimal features through the ranking process. The Random Forest ensemble technique utilizes a multi-iterative decision tree for weak learners and gives the input of fireflies with the fitness value. A decision stump is a basic decision tree comprising a root node directly linked to a leaf node, employing a decision rule. The root node performs decision-making by establishing the decision rule. Based on the decision-making process, optimal features are identified, and results are obtained at the leaf nodes. The root node makes a rule as given below

$$R = if\ (f_i(x) > (f_j(x))\quad where\ i = 1,\quad j = 2,3,4,5\dots n \tag{7}$$

Where R denotes a rule, $f_i(x)$ denotes the fitness of one firefly, $f_j(x)$ denotes the fitness of other fireflies.   If the fitness of the 'i^{th}' firefly is greater than the fitness of the other 'j^{th}' fireflyf_j, then the root tree node rank the features. Followed by, other features are ranked.

$$Q = \sum_{i=1}^{n} W_i \tag{8}$$

From (13), Qdenotes strong output results by combining all the weak learner results 'W_i'. Finally, the preferential voting scheme is applied to find the final optimal results.

$$Z = arg\ max\ \vartheta(W(ff_i)) \tag{9}$$

From (14), 'Z' denotes the final random forest decision tree result. '$arg\ max\ \vartheta(W(ff_i))$' represents the majority votes of weak learner results are obtained as a final result. In this way, optimal features are selected for disease diagnosis to minimize complexity and improve accuracy.

// Algorithm Integration of Firefly optimization with Random Forest for feature selection
Input: Number of fireflies (i.e. number of features) $\beta_{fi} = \beta_{fv_1}, \beta_{fv_2}, \dots, \beta_{fv_{n'}}$
Output: Optimal feature selection

Begin
   Generate an initial population of fireflies i.e. number of features $\beta_{fi} = \beta_{fv_1}, \beta_{fv_2}, \dots, \beta_{fv_n}$
  For each firefly
   Compute fitness '$f(x)$'

  Evaluate new solutions and update light intensity using (11)
   End if
  end for$j$
  end for$i$
   Go to step 3
  for eachfirefly with the fitness value
  Construct a set of weak classifiers
   End for
      if $(f_i(x) > f_j(x))$ **then**
   Rank the features with a high position

> **End if**
> Combine all weak classifiers
> **for each** weak classifier
> Assign the voting scheme
> Find weak learner resultswith majority votes
>   Return (optimal k features)
> **End for**
> **End while**
>   **End**

The algorithm describes an approach for optimal feature selection by integrating the firefly algorithm with random forest to improve the accuracy of disease diagnosis and minimize the time. The algorithm begins by randomly initializing the population of fireflies, which corresponds to the number of features. For each feature, fitness is measured, and the light intensity of the firefly is determined based on the fitness function. If the light intensity of one firefly is higher than that of another, it moves and is attracted to the other firefly. After the movement of fireflies, the light intensity of all fireflies is updated. Then, the fitness is re-evaluated based on the updated light intensities of the fireflies. To rank the features, a random forest decision tree is constructed. Initially, a set of weak learners is created based on the fitness of each firefly. The root node determines a firefly with a higher fitness is ranked first, followed by the others in ascending order. Finally, the results of the weak learners are combined using a preferential voting scheme to create a strong output. The majority votes of the weak learner results determine the final output. This process is repeated until the algorithm reaches the maximum number of iterations. Finally, the optimal set of features gets selected for accurate disease diagnosis.

EXPERIMENTS AND RESULTS

This research investigates the predictive effectiveness of Random Forest (RF), Firefly Optimization Algorithm (FOA), and their combination FOA-RF, across five datasets: Framingham, Heart Disease, Cardiovascular Disease Dataset, Cardio train, and Heart Attack, procured from Kaggle repository. Under the experiment's framework, each dataset undergoes particular preprocessing and feature extraction, followed by model training and evaluation using an 80-20 training-testing split. Performance metrics encompassing accuracy, specificity, and sensitivity are precisely recorded. The results indicated that FOA-RF consistently outperformed RF and FOA across all datasets, demonstrating superior feature selection capabilities and classification accuracy. Statistical analysis confirmed the significance of the performance difference between FOA-RF and the other algorithms. Overall, the integration of Firefly Optimization with Random Forest emerged as a promising approach for accurately diagnosing cardiovascular diseases, leveraging the complementary strengths of both algorithms.

Accuracy
In the prediction of heart disease, accuracy is a crucial performance metric that measures the proportion of correctly classified instances among all instances evaluated. It provides an overall assessment of how well a predictive model performs in correctly identifying individuals with or without heart disease. The formula for accuracy is:
Accuracy = (True Positives + True Negatives) / Total Instances

Sensitivity
Sensitivity, also known as recall, is a vital metric in feature selection for heart disease prediction. It measures the proportion of true positive cases correctly identified by the model. A high sensitivity indicates effective identification of individuals with the disease, minimizing false negatives. In our comparison of Random Forest (RF), Firefly Optimization Algorithm (FOA), and the integrated FOA-RF for feature selection, FOA-RF demonstrated superior sensitivity. Leveraging both FOA's efficient exploration of the search space and RF's robust classification, FOA-RF optimizes feature selection to maximize sensitivity, enhancing the accuracy of heart disease prediction models. The

Formula for Sensitivity

Sensitivity = True Positives / (True Positives + False Negatives)

Specificity

Specificity, along with sensitivity (recall), is a vital metric for evaluating the effectiveness of a model in disease prediction. It measures the proportion of true negative cases that the model correctly identifies. In heart disease prediction, specificity signifies the model's ability to accurately classify individuals who do not have heart disease.

The formula for Specificity:

Specificity = True Negatives / (True Negatives + False Positives)

CONCLUSION

This study investigated FOA-RF, a novel approach combining Random Forest and Firefly Optimization Algorithm, for selecting optimal features in heart disease prediction was conducted on five heart disease datasets from Kaggle: Framingham, Heart Disease, Cardiovascular Disease Dataset, Cardio train, and Heart Attack. FOA-RF outperformed RF and FOA individually in selecting optimal features for accurate diagnosis. Evaluation metrics such as Accuracy, Sensitivity, and Specificity showed FOA-RF's superior performance over individual algorithms. The hybrid method efficiently searched feature space, selecting relevant attributes for prediction tasks. SVM-based models with FOA-RF feature selection achieved better results than other selectors, streamlining diagnostics and enabling earlier intervention. The integration of Firefly Optimization and Random Forest addresses feature selection complexity in heart disease prediction, aiming to improve performance and model interpretability. Overall, experiments validate FOA-RF's effectiveness in feature selection for heart disease prediction, highlighting its importance in enhancing accuracy and healthcare outcomes.

ABSTRACT

Two MOTP procedures are utilized in this paper to resolve certifiable new issues. The essential objective of this new system is to offer the most ideal response, under any crisis situation, to a transportation issue with numerous goal capabilities. The target of this issue is to utilize a Neutrosophic fuzzy to decide the ideal transportation problem that will take the least amount of time, money, and most manpower to reach the people affected by flooding. Likewise a model with mathematical outcomes are given to think about the MOETP approaches.

Keywords: Entropy value, Heuristic Method (HM), Multi-objective transportation problem, Neutrosophic fuzzy set, Vogel's Approximation Method (VAM),

INTRODUCTION

A catastrophic event is an unforeseen series of terrible things that happen to society. Various catastrophic events hurt both the climate and the animals that possess it. Tidal wave, seismic tremor, flood, tornado, landslip, volcanic ejection, etc are a couple of them. Catastrophes give startling encounters to every individual who is impacted. Contingent upon the misfortunes, influenced people might encounter monetary strain because of property harm and loss of individual, business, or private property. Numerous businesses have made incredible progress with the utilization of the MOTP approach, including modern area, labor supply arranging, ventures, the travel industry, etc. This strategy's novel kind disposition and numerical properties are primary purposes behind its prosperity. The

80425

transportation issue, which manages the exchange of products between various beginnings and objections, is a direct programming issue of the dispersion type. Limiting costs and time while improving benefits is its essential objective.
. Hitchcock (1941) introduced and analyzed Transportation Problems (TP). He explained TP, which is the distribution of goods to different destinations from different supply points. These transportation-related problems belong to a single objective. However, transportation problems are typically multiple, complex, conflict and imprecise in real-life situations. There is a method called the Multi-Objective Transportation Problem (MOTP) for solving problems of this kind. Because of the conflict and imprecise nature, it is very difficult to solve.

In 1965, Zadeh[1] developed fuzzy. Fuzzy set is a collection of elements with each element having a degree of belongingness that ranges from 0 to 1. Since 1965, numerous researchers have examined and analyzed fuzzy transportation problems (FTP) and have also developed numerous novel ideas in this area. Zimmermann (1978) introduced the concept of Fuzzy Linear Programming (FLP) and demonstrated the method's consistent high efficacy. Even though FST is incredibly helpful, there are some cases of uncertainty where it is difficult to depict the membership degree. In 1986, Atanassov[2] proposed the Intuitionistic fuzzy set (IFS) as an extension of FST to address this limitation. To address the TP issue, multiple investigators took into consideration the IFS. An emergency event is surrounded by a lot of uncertainties and unreliable data. Inorder to address such incomplete and conflicting data, Smarandache[3] (1998) introduced additional uncertainties and put forth the idea of the Neutrosophic set (NS), considering the degree of Falsity (F), the degree of Indeterminacy (I), and the degree of Truth (T) as three factors.
After that, Wang et al.,[4] (2010) introduced the idea of Single Value Neutrosophic Set (SVNS) for solving real-world problems. For MOTP, Pitam Singh et al.[5] (2016) introduced the idea of fuzzy efficient interactive goal programming. R. Sophia Porchelvi et al.[6] (2018) created a new algorithm for the MOITP using the FPT. Using fuzzy programming, Yeola et al.[7] (2016) presented a parallel approach to solve the MOTP.

The concept of MOTP in a Neutrosophic environment was described by Rizk M. Rizk-Allah et al.[8] in 2018. In order to address the emergency transportation problem, Lin Lu et al.[9] (2020) also applied a single valued Neutrosophic set. Neutrosophic numbers were recently used by Aakanksha Singh et al.[10] (2021) to solve the bilevel transportation problem.

- This paper is organized as follows. Following the introduction, some basic concepts has been given in section 2.
- Section 3 discuss about the problem procedure and application of MOTP.
- Section 4 deals with comparison analysis of proposed method.
- Finally, conclusion of this paper is given in section 5.

Preliminaries
Neutrosophic fuzzy set
A Neutrosophic fuzzy set N^A of X can be defined as
$$N^A = \{(x, T_{N^A}(x), I_{N^A}(x), F_{N^A}(x))/x \in X\}$$
Where $T_{N^A}(x)$ is truth − membership, $I_{N^A}(x)$ is indeterminacy membership $F_{N^A}(x)$ is falsity- membership function such that $T_{N^A}(x), I_{N^A}(x), F_{N^A}(x)$: X→ [0,1] for all $x \in X$ and $0 \le T_{N^A}(x) + I_{N^A}(x) + F_{N^A}(x) \le 3$.

Basic values of Neutrosophic fuzzy set
a)   Normalize value $r_{ij} = \frac{x_{ij}}{\sum_{i=1}^{m} x_{ij}}$
b)   Entropy value, $e_j = -h \sum_{i=1}^{m} r_{ij} \, In \, r_{ij}, j = 1,,2,,\ldots,n \; h = \frac{1}{In(m)}$ where m is the number of constraints
c)   Weight vector $w_j = \frac{1-e_j}{\sum_{j=1}^{n}(1-e_j)}, j = 1,,2,,\ldots,n$

Vogel's Approximation Method (VAM)
The following describes the steps involved in Vogel's Approximation Method (VAM).
1. Identify the problem and organize the data into a matrix form.

2. Determine which two minimum values exist in each row and column. After that, subtract those two lowest values.
3. Decide which row and column has the biggest difference in value.
4. Choosing the cell in a row or column that has the smallest difference value. Allocate the cell after that.
5. Steps 2 through 4 should be repeated until the cell is allocated as much as possible.
6. From table 2, we get the initial feasible solution for VAM

Heuristic Method (HM)
➤ Verify whether the specified problem is balanced or not.
➤ Determine the penalty cost, the difference between the high and low costs, for every row and column.
➤ Allocate this variable as much as you can.
➤ Make necessary quantity and variable adjustments.
➤ To achieve the best outcome, repeat this process.
➤ Table 3 shows the initial feasible solution for HM

Finding The Minimum Transportation Cost, Time And Maximum Man Power For Community Welfare Team To Help Flood Affected Area
In this segment, We have addressed the requirement for individuals to get by in critical conditions, with government assistance local area groups filling in as our targets and limitations. We want to limit individuals' transportation costs and time while likewise giving the best measure of labor conceivable. Likewise, the Vogel's Estimate Technique (VAM) and Heuristic Strategy are applied to take care of the issue utilizing TORA and Zmath Programming. Ultimately, the results of both of these strategies are looked at. Mentioned in table 4

PROBLEM PROCEDURE FOR NEW APPROACH
There are computational processes for the creation of mathematical models that can be used to transform real-world situation problems into optimization models.The suggested approach is summed up in the following steps for solving MOTEP. table 5 and table 6

➤ Formulate the objective function of a real-life MOTEP using Neutrosophic fuzzy parameters.
➤ Construct the membership values (H_D), non-membership values(K_D), and indeterminacy values $(I_D)$of the problem.
➤ Compute the lower and upper bounds by taking $U_K = max\{H_K(x)\}_{K=1}^K$ and $L_K = min\{H_K(x)\}_{K=1}^K$
➤ Define the membership values under Neutrosophic environment.
➤ Selecting the lowest values for truth and indeterminacy membership, and selecting the highest values for falsity membership
➤ To find the best compromise solutions, solve the MOTEP using any fundamental TP method.

APPLICATION OF MULTI-OBJECTIVE EMERGENCY TRANSPORTATION PROBLEM (MOETP)
After a heavy **flood**, A community welfare teamhas shipped their units of
i)   Food and water items
ii) Health supplies like medicine and sanitation etc.,
iii) Man power

From their welfare centres WC1, WC2, WC3 to most affected rural areas RA1, RA2, RA3, RA4 respectively with the following characteristics; the transportation cost, time, and loss of deterioration are considered as Neutrosophic penalties. given in Table 7
Supplies: 8,19,17; Demand: 11,3,14,16
Penalties:
Category 1:

Jayabharathi and Sophia Porchelvi

$$C_1 = \begin{bmatrix} (0.5,0.3,0.6) & (0.3,0.1,0.2) & (0.6,0.7,0.3) & (0.5,0.4,0.6) \\ (0.5,0.4,0.6) & (0.4,0.4,0.5) & (0.5,0.3,0.7) & (0.5,0.5,0.4) \\ (0.6,0.5,0.3) & (0.6,0.7,0.4) & (0.4,0.4,0.5) & (0.6,0.4,0.3) \end{bmatrix}$$

Category 2:

$$C_2 = \begin{bmatrix} (0.4,0.4,0.5) & (0.4,0.3,0.7) & (0.5,0.6,0.3) & (0.6,0.5,0.2) \\ (0.6,0.5,0.2) & (0.7,0.6,0.4) & (0.3,0.7,0.3) & (0.5,0.3,0.7) \\ (0.4,0.3,0.6) & (0.6,0.5,0.7) & (0.5,0.2,0.6) & (0.6,0.4,0.3) \end{bmatrix}$$

Separating the membership function in matrix format as shown below

$$H_1 = \begin{bmatrix} 0.5 & 0.3 & 0.6 & 0.5 \\ 0.5 & 0.4 & 0.5 & 0.5 \\ 0.6 & 0.6 & 0.4 & 0.6 \end{bmatrix} \& H_2 = \begin{bmatrix} 0.4 & 0.4 & 0.5 & 0.6 \\ 0.6 & 0.7 & 0.3 & 0.5 \\ 0.4 & 0.6 & 0.5 & 0.6 \end{bmatrix}$$

$$I_1 = \begin{bmatrix} 0.3 & 0.1 & 0.7 & 0.4 \\ 0.4 & 0.4 & 0.3 & 0.5 \\ 0.5 & 0.7 & 0.4 & 0.4 \end{bmatrix} \& I_2 = \begin{bmatrix} 0.4 & 0.3 & 0.6 & 0.5 \\ 0.5 & 0.6 & 0.7 & 0.3 \\ 0.3 & 0.5 & 0.2 & 0.4 \end{bmatrix}$$

$$K_1 = \begin{bmatrix} 0.6 & 0.2 & 0.3 & 0.6 \\ 0.6 & 0.5 & 0.7 & 0.4 \\ 0.3 & 0.4 & 0.5 & 0.3 \end{bmatrix} \& K_2 = \begin{bmatrix} 0.5 & 0.7 & 0.3 & 0.2 \\ 0.2 & 0.4 & 0.3 & 0.7 \\ 0.6 & 0.7 & 0.6 & 0.3 \end{bmatrix}$$

Now, evaluating the membership values and we get

$$H_1 = \begin{bmatrix} 0.5 & 0.3 & 0.6 & 0.5 \\ 0.5 & 0.4 & 0.5 & 0.5 \\ 0.6 & 0.6 & 0.4 & 0.6 \end{bmatrix}; U_1^H = 0.6 , L_1^H = 0.3 \& H_2 = \begin{bmatrix} 0.4 & 0.4 & 0.5 & 0.6 \\ 0.6 & 0.7 & 0.3 & 0.5 \\ 0.4 & 0.6 & 0.5 & 0.6 \end{bmatrix}; U_2^H = .7, L_2^H = 0.3$$

We get the truth membership values as given below

$$H_1(U(u)) = \begin{bmatrix} 0.33 & 1 & 0 & 0.33 \\ 0.33 & 0.67 & 0.33 & 0.33 \\ 0 & 0 & 0.67 & 0 \end{bmatrix} \quad \& \quad H_2(V(v)) = \begin{bmatrix} 0.75 & 0.75 & 0.50 & 0.25 \\ 0.25 & 0 & 1 & 0.50 \\ 0.75 & 0.25 & 0.50 & 0.25 \end{bmatrix}$$

From above two matrices, we get a truth membership matrix as

Finding solution using Heuristic method

The minimum total transportation cost =0×8+0.25×10+0×3+0.33×6+0×1+0×16=4.48
Here, the allocated cell's number = 6 (is equal to m + n - 1 = 3 + 4 - 1 = 6)
∴ This is not a degenerate solution.

Finding solution using Heuristic method

The minimum total transportation cost =0×8+0.25×11+0×3+0.33×5+0.5×1+0×16=4.9
Here, the allocated cell's number = 6 (is equal to m + n - 1 = 3 + 4 - 1 = 6)
∴ This is not a degenerate solution.

Now taking the indeterminacy values, We get the indeterminacy membership values as given below

$$I_1(U(u)) = \begin{bmatrix} 0.67 & 1 & 0 & 0.5 \\ 0.5 & 0.5 & 0.67 & 0.3 \\ 0.3 & 0 & 0.5 & 0.5 \end{bmatrix} \& I_2(V(v)) = \begin{bmatrix} 0.6 & 0.8 & 0.2 & 0.4 \\ 0.4 & 0.2 & 0 & 0.8 \\ 0.8 & 0.4 & 1 & 0.6 \end{bmatrix}$$

From above two matrices, we get a indeterminacy membership matrix as

Similar techniques are applied, IFS for the problems are given in table.

The minimum total transportation cost =0×8+0×6+0.3×13+0.3×11+0×3+0.5×3=8.7 Here, the allocated cell's number = 6 (is equal to m + n - 1 = 3 + 4 - 1 = 6) ∴ This is not a degenerate solution.

The minimum total transportation cost =0.4×8+0.2×3+0×14+0.3×2+0.3×11+0.5×6=10.7 Here, the allocated cell's number = 6 (is equal to m + n - 1 = 3 + 4 - 1 = 6)
∴ This is not a degenerate solution.
Now taking the falsity values, We get the falsity membership values as given below

$$K_1(U(u)) = \begin{bmatrix} 0.8 & 0 & 0.20 & 0.8 \\ 0.8 & 0.6 & 1 & 0.4 \\ 0.2 & 0.4 & 0.6 & 0.2 \end{bmatrix} \& K_2(V(v)) = \begin{bmatrix} 0.6 & 1 & 0.2 & 0 \\ 0 & 0.4 & 0.2 & 1 \\ 0.8 & 1 & 0.8 & 0.2 \end{bmatrix}$$

From above two matrices, we get a falsity membership matrix as
Similar techniques are applied, IFS for the problems are given in table 8 and table 9

In VAM , the maximum profit(man power) =0.8×5+1×3+1×3+1×16+0.8×6+0.8×11=39.6
Here, the allocated cell's number = 6 (is equal to m + n - 1 = 3 + 4 - 1 = 6)
∴ This is not a degenerate solution.
In HM, the maximum profit(man power) =0.8×5+1×3+0.8×3+1×16+0.8×3+0.8×14=39
Here, the allocated cell's number = 6 (is equal to m + n - 1 = 3 + 4 - 1 = 6)
∴ This is not a degenerate solution.

COMPARISON OF TWO TRANSPORTATION PROBLEM METHODS

The results of VAM and Heuristic Method are compared by evaluating weight age of results using entropy method. The above results show that the minimum of cost and time (H and I) for transportation to supply food, water and health supplies like medicine and so on. And maximum man power (K) to help the flood affected area peoples. Computing entropy for table 11 and get the values as follows (table 12) and Weight age of constraints is evaluated and is shown in table 13. which was calculated in Table 10.

RESULT AND DISCUSSIONS

In the wake of deciding the weightage, it was apparent that VAM gives the best answer for this MOETP. Accordingly, the heuristic methodology won't exactly yield the most intelligent response when contrasted with VAM and furthermore it requires UI aptitude. Hence, we enthusiastically suggest VAM for this proposed approach. Figure 1 displays the Comparative Weight of Two Transportation Methods.

CONCLUSION

In this paper, we had the option to track down the best answer for the crisis transportation issue by utilizing VAM. This approach saves time and is easy to fathom. Likewise, VAM is more promptly applied than different strategies. Consequently, affected individuals who are dealing with this sort of crisis transportation issue, thinks that it is helpful.

ABSTRACT

Problems with waste management and handling have arisen as a result of the exponential expansion of urban areas in India. A product of wastewater treatment facilities, dried sewage waste (DSW) can be utilised in agriculture due to its organic and inorganic constituents. Once treated, DSW is safe for use in agriculture and is the result of primary, secondary, and tertiary treatment procedures. The high nutrient content of DSW, which includes nitrogen, phosphorus, and potassium, makes it highly valued in agriculture. These nutrients contribute to plant development and soil fertility. Many farmers use direct soil integration to incorporate DSW into the soil. This method also recycles waste, conserves natural resources, reduces the use of chemical fertilizers, and lowers agricultural expenses. Nevertheless, in order to lessen the risks and unfavourable perceptions associated with their waste, adequate management and research are required. DSW should be tested for pollutants (e.g. pathogens, heavy metals) before use in soil amendment, agriculture, or other uses. Additionally, it requires frequent monitoring, sampling, and analysis based on production and quality. DSW management strategies should prioritise economic, technological, and societal constraints. The regulatory climate, cultural acceptability, and economic

80433

circumstances of individual regions determine the worldwide distribution of DSW. Concerns about health, environment, and society are just a few of the downsides to using DSW in agriculture.

Keywords: Dried sewage waste, Wastewater, Organic amendment, Soil health, Nutrient cycling, Food chain.

INTRODUCTION

The fast growth of cities, towns, and villages in India, driven by the country's expanding population, high demographic expansion, urbanisation, industry, and lifestyle changes will increase water demand and anthropogenic wastewater production of various compositions [9].The global population crossed the mark of 8 billion, and 1/6th of the population resides in India, which is the highest in any country. Consequently, waste generation is teeming and causing problems in management and handling. At the same time, mishandling and improper management lead to bad consequences from an ecological, economic, and societal perspectives [10]. Out of several wastes, dried sewage waste (DSW), also known as biosolids is the byproduct of wastewater or effluent treatment plants. In a general sense, it is the residue generated during different stages of the treatment of sewage sludge coming from different sources, including households, offices, industries, and others [11]. Primary treatment is to remove solid and inorganic materials; secondary treatment to degrade biological content through microbial activity; and sometimes tertiary treatment to further reduce pathogens and nutrients. The sludge from these processes is then further processed, stabilized through methods like anaerobic digestion, aerobic digestion, or composting, and then dewatered and dried to reduce volume and improve handling properties. The resulting DSW is nutrient rich and has a soil like texture, which can be used beneficially in agriculture, reclamation of mining sites, and landscaping [12]. The number of wastewater treatment plants and the scale of their operations are also dynamically increasing. However, many plants are either non-functional or not able to handle the huge burden of waste, resulting in a quandary. The practice of using waste products in agriculture dates back thousands of years, with ancient civilizations such as the Greeks and Chinese recognizing the value of human and animal waste as fertilizer. In the 20th century, the development of modern sewage treatment technologies led to the production of more sanitized and concentrated forms of sewage sludge, which has been utilized as DSW since. This transition marked a significant shift from merely disposing of waste to recognizing and harnessing its value in sustainable resource management [8].

Domestic wastewater treatment plants create nutrientrich DSW. After treatment and processing, these materials become fertilizers and soil additives, supporting sustainable agriculture. DSW are safe for agricultural application after primary, secondary, and tertiary wastewater treatments, stabilisation, and dewatering. The U.S. Environmental Protection Agency (EPA) tests DSW for heavy metals, pathogens, and organic chemicals to ensure safety. DSW are prized in agriculture for their high nutrient content, which includes nitrogen, phosphorus, and potassium, which promote plant development and soil fertility. Direct soil integration or surface application followed by ploughing often blend DSW into the soil (Figure 1). This recycles trash, conserves natural resources, reduces chemical fertilizer use, and lowers agricultural expenses, promoting an environmentally and economically sustainable agricultural model. DSW have many benefits, but they must be managed properly to meet public health, environmental safety, and public perceptions, which can hinder their adoption. Agriculture uses DSW to recycle nutrients and organic debris that might otherwise pollute water or landfills. This enriches the soil and minimises the carbon footprint of energy intensive chemical fertilizers. Sustainable techniques like DSW help close nutrient cycles, encouraging a circular economy where waste is reused to create wealth [13]. This strategy promotes resource efficiency and sustainability in agriculture, improving environmental and community health. The use of DSW in agriculture presents both benefits and challenges but using them is difficult and controversial. On one side, they supply critical minerals that promote soil health and agricultural yields while eliminating the need of environmentally harmful chemical fertilizers. While on the other side, include health risks from heavy metals and infections, environmental implications such leaching and runoff, and societal concerns about applying treated sewage sludge on food crops.

Regulatory, public image, and scientific research issues also affect DSW sustainability. Globally, the use of DSW in agriculture varies significantly depending on regulatory environments, cultural acceptance, and local economic conditions. In the United States, about 50% of all DSW produced are applied to land, according to EPA estimates [3]. European countries also actively use DSW under strict regulations ensuring safety and environmental protection. In contrast, in some developing countries, the use of untreated or inadequately treated sewage sludge is more common, raising significant health and environmental concerns. Recent trends show a growing interest in maximizing the sustainability aspect of wastewater treatment and DSW production, focusing on energy efficiency and the recovery of resources such as phosphorus and nitrogen, crucial for agriculture but limited in natural availability. This reflects a broader global shift towards a more circular economy, where waste materials are seen as resources to be cycled back into productive use.

Opportunities of using dried sewage in agriculture
Nutrient recycling
DSW are a nutrient rich product resulting from wastewater treatment and are especially high in essential nutrients such as nitrogen, phosphorus, and potassium. This makes them an excellent resource for recycling nutrients back into the soil, reducing the need for synthetic chemical fertilizers (Table 1). Unlike these chemical alternatives, DSW release nutrients slowly, which benefits plant growth over a longer period and minimizes nutrient runoff and leaching, thus supporting a more sustainable agricultural practice.

Soil health and productivity
Incorporating DSW into agricultural land improves soil structure, enhances water retention, and increases the microbial activity essential for healthy soil ecosystems. The organic matter in DSW boosts the soil's ability to retain both water and nutrients, leading to improved root growth and resistance to erosion. Numerous case studies have demonstrated that fields treated with DSW show marked improvements in crop yields and soil quality compared to those treated with traditional chemical fertilizer [1].

Environmental benefits
The environmental advantages of using DSW are significant. By diverting waste from landfills, where it would decompose and potentially release CH_4 a potent greenhouse gas [5]. DSW use helps reduce greenhouse gas emissions. Additionally, the recycling of these organic materials conserves natural resources by decreasing the demand for chemical fertilizers, which require intensive resource extraction and energy inputs to produce (Figure 2).

Economic advantages
The use of locally produced DSW can offer substantial cost benefits to farmers, who might otherwise rely on expensive imported fertilizers. Local processing and application of DSW can also stimulate local economies by creating new jobs in DSW processing and distribution, further supporting sustainable economic growth and development in agricultural communities. promoting sustainable agriculture, enhancing environmental health, and providing economic benefits (Table 2). However, the successful integration of DSW into agricultural practices requires careful management to ensure environmental safety and public acceptance, underscoring the need for rigorous standards and ongoing monitoring.

Concerns of using DSW in agriculture
Safety and health risks
The use of DSW in agriculture raises significant safety and health concerns primarily due to the potential presence of contaminants such as heavy metals, pathogens, and pharmaceutical residues. These contaminants can pose serious risks to food safety and public health if DSW are not properly treated and monitored. The presence of heavy metals can lead to their accumulation in the soil and eventual uptake by crops, which can enter the human food chain. Similarly, pathogens and pharmaceuticals can also persist in the environment, potentially leading to health risks for both consumers and farm worker [4].

Regulatory standards for DSW usage and their sufficiency

While there are regulatory standards in place intended to ensure the safe use of DSW, questions often arise regarding their adequacy and uniformity across different regions. These standards vary widely, with some critics arguing that they do not sufficiently account for the long-term impacts of DSW application on soil and human health, or the cumulative effects of multiple contaminants.

Public perception and acceptance

The use of processed sewage sludge in food production often faces significant public resistance. Negative perceptions and skepticism generally stem from concerns over contaminants and the overall safety of using waste products in agriculture. Overcoming these perceptions requires transparent, proactive communication strategies, public engagement, and educational initiatives that inform communities about the benefits and safety measures associated with DSW.

Environmental impact

Environmental concerns associated with DSW include the potential for nutrient runoff, which can lead to eutrophication of water bodies, and pollution from improperly processed or applied DSW. Additionally, there are worries about the long-term effects on soil health, such as the accumulation of heavy metals which can adversely affect soil biology and function, potentially making the land less productive or unsuitable for agricultural use over time [7].

Economic and operational challenges

The costs associated with the processing, testing, and safe transportation of DSW can be substantial. Furthermore, substantial infrastructure is required to support the effective and widespread use of DSW, including facilities for processing, storage, and application, as well as systems for monitoring and managing environmental and health impacts. These requirements represent significant investments and operational challenges for municipalities and agricultural operators, which can deter the use of DSW despite their potential benefits. Each of these challenges underscores the need for stringent regulatory oversight, continued scientific research, and robust infrastructure development. Additionally, finding cost-effective, low-tech, user-friendly approaches that safeguard precious natural resources and livelihoods from wastewater deterioration is a challenge [6]. Addressing these concerns comprehensively is essential to fully realizing the benefits of using DSW in sustainable agriculture (Table 3).

Future Directions and Research Needs

Identifying gaps in current research on DSW in agriculture

There are several areas where further research is needed to enhance our understanding of the impacts and benefits of DSW in agriculture. Key gaps include long-term studies on the effects of DSW on soil health, including changes in microbial communities and potential accumulation of contaminants over time. Research is also needed to assess the fate of emerging contaminants such as pharmaceuticals and personal care products within treated soils. Additionally, more data are required on the economic impacts of DSW use in different agricultural contexts, to better understand its cost-effectiveness and scalability.

Potential technological innovations to improve safety and efficiency

Advancements in technology could significantly enhance the safety and efficiency of DSW use. Innovations might include development of more sophisticated treatment processes that can remove a broader spectrum of contaminants more effectively. There is also potential for the development of precision application technologies that could ensure DSW are applied in a manner that maximizes benefits and minimizes risks. Furthermore, realtime monitoring technologies could be developed to track the environmental and health impacts of DSW application, providing immediate data to manage risks proactively. Additionally, DSW based biochar and co-composting of biochar can also look upon for efficient handling [2].

Policy recommendations for encouraging safe and beneficial use of DSW

To promote the safe and beneficial use of DSW, policy recommendations should focus on strengthening regulatory frameworks to ensure comprehensive and uniform safety standards. Policies could encourage research and development in advanced treatment and monitoring technologies by providing funding or incentives. Additionally, there is a need for policies that support educational and outreach programs to improve public perception and acceptance of DSW. These programs should aim to transparently communicate the benefits and safety measures associated with DSW use, addressing public concerns directly and fostering a more informed discourse around the subject.

CONCLUSION

The study in question examined the complicated potential and constraints of using dried sewage in agriculture. DSW offer nutrient recycling, improved soil health and production, environmental benefits through waste reduction and resource conservation, and economic benefits from cost savings and local employment generation. DSW can assist sustainable agriculture and a circular economy because to these benefits. The usage of DSW is not without problems. Concerns include heavy metals, pathogens, and medicines, as well as public scepticism about applying treated waste products to farmlands. Nutrient runoff, pollution, and long-term soil health concerns impede DSW adoption. Moreover, the economic and operational challenges of DSW processing, transport, and infrastructure make scaling this technique difficult. Given these factors, action is required. More study on long-term environmental consequences and new pollutants is needed to bridge knowledge gaps. Technological innovation should improve DSW treatment and application safety and efficiency. Better restrictions are needed to protect safety and build public faith in DSW as a sustainable agricultural resource. Stakeholders, farmers, legislators, scientists, and the public must communicate to handle issues honestly and collaboratively. By improving awareness and collaboration, DSW practices and policies may be refined to maximise benefits and minimise hazards, promoting its wider use in sustainable agriculture. Such activities are essential for global food system sustainability and resilience.

Table 1: Nutritional benefits of using DSW

Nutrient	Contribution of DSW
Nitrogen (N)	DSW are a rich source of nitrogen, which is released slowly, providing a steady supply to crops over time
Phosphorus (P)	High phosphorus content in DSW helps stimulate root development and increases flowering and seed production.
Potassium (K)	Though less than N and P, DSW contain potassium which is vital for overall plant health and resistance to disease
Organic matter	DSW add significant organic matter that enhances soil fertility and structure, promoting better water retention and aeration.
Trace elements	DSW often contain these micronutrients which are essential for various plant metabolic functions and stress resistance
pH adjustment	DSW can help in moderating soil pH levels, improving nutrient availability and preventing toxicities or deficiencies

Table 2: Other opportunities of using DSW in agriculture Together, these opportunities demonstrate how DSW can play a crucial role in

Aspect	Benefits of DSW	Considerations
Soil structure	Improves soil texture and porosity	Heavy application can lead to soil compaction
	Enhances water retention and aeration	Consistency in application is crucial for expected results
Organic matter	Adds organic matter to the soil, improving soil fertility	May contain pathogens if not properly treated
	Promotes microbial activity, aiding in nutrient cycling	Quality and treatment levels can vary
Erosion control	Helps reduce soil erosion by improving soil structure	Application rates must be controlled to prevent runoff
Economic efficiency	Often more cost-effective than commercial fertilizers	Costs associated with transportation and application

Shreyas Bagrecha *et al.*,

	Local availability can reduce logistics costs	Requires regular monitoring and compliance with regulations
Environmental impact	Reduces landfill waste by recycling nutrients back into soil.	Potential contamination from heavy metals and other toxins
	Can be part of sustainship waste management practices	Public perception and acceptance vary

Table 3: Concern of using DSW in agriculture with their solutions

Concern	Description	Solutions
Environmental impact	Uncontrolled application can lead to runoff and pollution of water bodies with nutrients and pathogens.	Implementing proper application methods like controlledrelease techniques and buffer zones near water bodies.
Heavy metals	DSW may contain heavy metals such as cadmium, lead, and mercury, which can accumulate in the soil and enter the food chain.	Regular testing of DSW for heavy metal content and adjusting application rates accordingly. Using phytoremediation techniques to reduce metal uptake by crops.
Pathogens	If not properly treated, DSW can harbour harmful bacteria, viruses, and parasites that pose health risks.	Ensuring proper treatment methods such as composting, heat treatment, or anaerobic digestion to eliminate pathogens. Following strict guidelines for application and handling.
Chemical contaminants	Presence of industrial chemicals, pharmaceuticals, and personal care products that are not completely removed during treatment	Upgrading treatment processes to enhance removal efficiency. Regular monitoring and testing for chemical contaminants. Proper disposal of contaminated DSW
Odour and aesthetics	Improperly processed or stored DSW can emit strong odours and affect the aesthetics of the application area.	Implementing odour control measures such as covering storage piles, using additives, or applying DSW during favourable weather conditions
Public perception and acceptance	Skepticism and negative perceptions about using wastederived products in food production can influence acceptance	Conducting public outreach and education programs to raise awareness about the benefits and safety of DSW use. Transparent communication about treatment processes and testing results
Regulatory compliance	Meeting stringent regulatory standards to ensure safety in the application of DSW can be challenging and costly.	Adhering to regulatory guidelines and investing in technologies that ensure compliance. Engaging with regulatory agencies to streamline processes and standards
Logistical challenges	Transporting storing and applying DSW at the right time and in the right amount requires careful logistics	Developing efficient transportation and storage infrastructure Utilizing precision application techniques and integrating DSW application into overall farm management practices.
Soil health and productivity	Potential for long-term degradation of soil quality due to imbalance in soil microbiome or physical properties.	Implementing soil health monitoring programs and using complementary soil amendments to mitigate negative impacts. Practicing crop rotation and diversification to maintain soil fertility.
Economic considerations	Costs associated with treatment, testing, and application of DSW versus benefits gained from their use	Conducting cost-benefit analyses to assess the economic feasibility of DSW use Exploring collaborative partnerships and subsidy programs to offset costs.
Monitoring and management	Continuous monitoring is needed to manage risks and ensure that	Investing in robust monitoring systems for both DSW quality and environmental impacts

	application guidelines are followed to avoid environmental degradation.	Establishing clear management protocols and training programs for personnel involved in DSW handling.

ABSTRACT

To Elucidate therapeutic potential anxiolytic and depression activity of fraction of medicinal plants Future aspects of these medicinal plants compared with marketed formulation to minimize the side effects 30 mice were divided into six groups, each consisting of five animals. These groups included a Saline group receiving saline solution, a Alcohol withdrawal group receiving alcohol, a Standard group receiving Diazepam, and three Test groups receiving extracts from *Psidium guajava, Piper betle, and Morinda citrifolia.* All groups, except the Control and Test groups, were subjected to alcohol administrationThroughout the course of three days, following which theStandard medicine, Diazepam, was administered to Standard groups, and the animals were evaluated for anti-depressant and anti-anxiety activity after one hour. Anti-depressant activity was assessed through the Sucrose Preference Test (SPT), while anti-anxiety activity was evaluated using the Elevated Plus Maze (EPM), Open Field Test (OFT), and Marble Burying Test (MBT). Animals were weighed, and the appropriate dose of each drugwas administered orallytothe respective groups. They undergo GABAergic and Serotonergic Mechanism In behavioral tests, Piper betle extract (MPB) administered at 50mg/kg orally demonstrated superior efficacy in reducing anxiety in mice undergoing alcohol withdrawal compared to *Psidium guajava* (MPG) and *Morinda citrifolia* (MMC) extracts in the same amount. Specifically, MPB showed stronger anxiolytic effects than MPG and MMC in the Open Field Test and Elevated Plus Maze, indicating its potential as a therapeutic agent for alcohol withdrawal-induced anxiety. Additionally, in the Marble Burying Test, MPB exhibited notable anxiolytic effects in the alcohol withdrawal group, suggesting its effectiveness in reducing anxiety-related behaviours.

Keywords: Open field test , Elevated plus maze, Marble burying test , Sucrose preference test Methanolic extract from Piper betle (MPB) , Methanolic extract of Morinda citrifolia (MMC) , Methanolic extract of Psidium guajava (MPG) ,Diazepam.

INTRODUCTION

Anxiety is a typical human emotion that functions as a moderate stimulus for anticipatory and adaptive responses to challenging or stressful situations. However, when anxiety becomes excessive, it can destabilize individuals and lead to dysfunctional states. Anxiety that is pathological is identified when it arises without any actual challenge or stress, or when its intensity or duration is disproportionate, causing significant distress and impairing psychological, social, occupational, biological, and other aspects of functioning.[1]While the full scope of the pandemic's impact on mental health is not yet fully understood, its profound effect on individuals globally is apparent. The COVID-19 Mental Disorders Collaborators analyzed international survey data from both before and after the pandemic to gauge the prevalence of utilizing the Global Burden of Disease Study model for depression and anxiety. They predicted a 27.6% increase in global cases of major depressive disorder, resulting in 53.2 million new cases. Similarly, they found a 25.6% rise in anxiety disorders, adding 76.2 million new cases. These troubling trends are seen across all genders and various age groups, which is particularly worrisome given that anxiety and depression are already significant causes of disability worldwide..[2] Lockdowns, closings of schools, unemployment, and a rise in deaths—not only in nursing homes—became the new normal. The new corona virus, its quick spread, and the lack of scientific knowledge about it resulted in long-term living circumstances characterized by high levels of stress and unpredictable events that were beyond of people's control. According to the World Health Organization (WHO), the incidence of anxiety and depression has increased globally by 25% since the beginning of the COVID-19 pandemic.

Suicidal conduct was found to be predicted with unemployment, especially in Slovakia during the first wave. This was evidenced by survey data that revealed 54.1% of participants had previously sought treatment for affective disorders or anxiety, and 86.6% of respondents believed the pandemic had a detrimental influence on mental health**. [3]** By the first week of August 2020, the novel corona virus (COVID-19) had reached over 275 countries, regions, and territories, resulting in more than 19 million confirmed cases and over 700,000 deaths worldwide.**[4]** Outbreaks of infectious diseases such as COVID-19 are commonly associated with widespread anxiety and significant mental distress.**[5]**India saw a spike in the number of reports of persons having symptoms of alcohol withdrawal during the early stages of the COVID-19 pandemic. It was not possible to purchase alcohol because of the sudden and severe mobility restrictions as well as the lockdown-related closure of stores and pubs that sold it. Those with addictions to alcohol experienced severe despair when alcohol was unavailable, and a small percentage of them considered suicide as a result. National media reports claim that alcohol withdrawal symptoms have caused an apparent (and unprecedented) rise in the number of attempted suicides and deaths in India.**[6]**To investigate the link between alcohol withdrawal and suicide during the COVID-19 lockdown in India, we analyzed suicide reports from current news stories. Using search terms such as "alcohol accessibility," "COVID-19 pandemic," "COVID-19 self-harm," and "alcohol withdrawal symptoms," we utilized the Google News search engine to collect reports of suicide incidents from English-language online news sources in India between March 25 and May 17, 2020. We gathered detailed information on 27 cases of alleged suicide or attempted suicide. Duplicate reports of the same incidents across different sources were excluded, as well as cases of suicide not related to COVID-19, alcohol unavailability, or alcohol withdrawal symptoms. A summary of these 27 cases is presented..**[7]**About 45 alleged suicides connected to alcohol withdrawal symptoms were recorded as everything was under lockdown, says a 2020 storyInside The Economic Times. However, for just 27 of these cases was comprehensive information available. All 27 recorded victims of alleged suicides or There were male suicide attempts., aged between 25 and 70 years (with some ages not specified). These cases were reported from the states of Kerala (n = 11), Karnataka (n = 2), Telangana (n = 8), Tamil Nadu (n = 4), and Assam (n = 2). Except for one case of an alleged suicide attempt in Kottayam, Kerala, the remaining 26 cases were completed suicides. The most common method among these suicides was the consumption of hazardous liquids (n = 8). Other methods included hanging (n = 6), electrocution (n = 2), wrist-slitting (n = 1), drowning (n = 2), and jumping from a building (n = 1). The high incidence of deaths from consuming hazardous liquids raises questions about whether individuals mistakenly believed the liquids included alcohol or a replacement for alcohol. (accidental deaths) or if the suicides were intentional..**[8]**Furthermore, a study examined the potential role of alcohol consumption and withdrawal symptoms in reported suicides and suicide attempts during the lockdown. Previous

research has proposed several reasons for suicides connected to COVID-19, including apprehension about catching the infection, aversion to propagating it to others (like family members, friends, or hospital patients), mental distress brought on by financial hardships (such as job loss or financial instability during the lockdown), depression stemming from social isolation and quarantine measures, challenges in accessing food, xenophobia, and the inability to obtain alcohol[9]Moreover, it has been observed that stressors such asjoblessness and depressive symptoms, hopelessness, vulnerability, and a sense of inadequacy in supporting one's family can exacerbate suicidal ideation, suicide attempts, and the risk of actual suicide.[10] The travel restrictions imposed during India's statewide lockdown have had severe consequences for individuals battling addiction. Alcohol's scarcity, recreational drugs, and other addictive substances has led to significant psychological distress for some, often resulting in self-harm. Additionally, there have been documented instances of self-harm and suicide linked to attachment to playing games online.[11]Several neurotransmitters, such as adenosine, glutamate, gamma-aminobutyric acid (GABA), cholecystokinin, and serotonin, play a role in anxiety. While some exert excitatory effects, others have inhibitory functions. These neurotransmitters are implicated in the modulation of anxiety-related states, either by up regulating or down regulating them. [12]Moreover, they are ineffective in treating depression. Effective treatment for depression often involves the use of traditional antidepressants, such as tricyclic antidepressants (TCAs), selective serotonin reuptake inhibitors (SSRIs), selective noradrenaline reuptake inhibitors (SNRIs), and monoamine oxidase inhibitors (MAOIs). Among them, SNRIs and SSRIs have been shown to be generally effective in treating depression and anxiety. But when taking these drugs, those who have co-occurring depression and anxiety may first feel more anxious. [13]

MATERIALS AND METHODS

Chemicals uses
The following chemicals were used for this study : Methanol, chloroform, distilled water, Sodium hydroxide, Ethyl acetate, ferric chloride, Copper sulphate, Ethanol (Changshu Hongsheng Fine Chemical Co., Ltd), Lead acetate Potassium hydroxide, concentrated hydrochloric acid, Diazepam Injection I.P(Neon Laboratories Limited) ,Acetic acid, Hager Reagent, Wagers Reagent, Glacial Acetic acid, Sodium Hydroxide Pellets,

Instrument used
Magnetic stirrer(REMI Magnetic Stirrer, Elevated Plus), and glassware (Borosil).Heating mantel, Rotary Evaporator. Open field Apparatus, Elevated Plus Maze,, Electronic Weighing Balance (LABINDIA), Marble Burying Test, Soxhlet extractor.

Experimental Animals
Male Swiss albino mice, weighing between 25 and 30 grams, were used in the study. They were housed in typical housing settings, had unlimited access to water, and feed a conventional pellet diet. Under the ethical number 02/IAEC/CLPT/2023-24, the study was approved by the Institutional Animal Ethics Committee (IAEC) on March 24, 2024, and was carried out in the Department of Pharmacology, Chalapathi Institute of Pharmaceutical Sciences.

Collection And Authentication Of Plant Material
Psidium guajava leaves were collected from Cumbum, Andhra Pradesh, and verified by Dr. Satyanarayana Raju, a plant taxonomist and botanist affiliated with the Department of Botany and Microbiology at Acharya Nagarjuna University in Guntur. The Morinda citrifolia fruit and Piper betle leaves were sourced from Lam, located in Andhra Pradesh's Guntur District, and were authenticated by the same authority, Dr. Satyanarayana Raju.

Preparation of Guava Leaf Extract
The methanolic extract of Psidium guajava Linn was prepared by macerating 50 grams of guava leaf powder with 250 milliliters of 75% v/v methanol in a 500-milliliter beaker, which was covered with aluminum foil. The beaker was then placed on a magnetic stirrer for approximately three days. After maceration, the mixture underwent filtration

Afrin Shaik *et al.*,

using Whatman No. 1 membrane filter paper and was subsequently vacuum-dried in a rotary evaporator operating at 45°C and 180 revolutions per minute (rpm). Next, the substance's output as an amount was determined.

Preparation of Piper Betle Extract

Young Piper betle Linn petals were harvested, shade-dried, and subsequently ground into coarse powder using a mechanical grinder. The dried powder was then subjected to extraction in a Soxhlet extractor, utilizing 250 milliliters of methanol as the solvent. The extraction process was completed at temperatures ranging from 70°C to 80°C for a duration of 23 hours. Following extraction, Concentrating the extract was done with a rotary evaporator running at 180 rpm and 45°C. The % yield of the extract was then determined.

Preparation of Morinda Citrifolia Fruit Extract

After gathering fresh Morinda citrifolia fruits, they were shade-dried and then mechanically ground into coarse powder. Five grams of this powder were weighed and placed into a 250 ml separating funnel. Next, 100 milliliters of water was added, followed by 5 grams of methanolic extract from Morinda citrifolia. Additionally, 100 ml of ethyl acetate was introduced into the separating funnel. The contents were vigorously shaken for two hours to facilitate the separation into organic and aqueous layers. Following this, the two layers were transferred into separate beakers. The layer of water underwent another round of extraction via the addition of 100 ml of ethyl acetate and shaking for an additional two hours before separating the organic phase. The layer of organic matter was then subjected to a rotary evaporator under a pressure of 100 pascals, maintaining a temperature of 50°C for three hours, and rotating at 200 rpm. The resulting semi-solid content was collected. Meanwhile, the aqueous layer was also processed in a rotary evaporator under a pressure of 100 pascals, at a temperature of 70°C, and rotating at 200 rpm for two hours. After Morinda citrifolia's ethyl acetate and methanolic extracts were extracted, the organic semi-solid drug content was manually dried, and the % yield was determined.

Experimental Design

30 mice in total (n = 30) were utilized for the research. The Animals were separated into six groups, each consisting of five animals:

Group	Treatment
Group I	Saline (0.5% saline solution)
Group II	Negative Control (Alcohol)
Group III	Standard (Diazepam 1mg/kg, i.p.)
Group IV	Test-1 (Psidium guajava 50 mg/kg ,p.o)
Group V	Test-2 (Piper betle 50 mg/kg ,p.o)
Group VI	Test-3 (Morinda citrifolia 50 mg/kg ,p.o.)

With the exception of the Saline group and the test groups (Test-1, Test-2, Test-3), all groups were exposed to alcohol treatment for three consecutive days. On the fourth day, the A popular medication (Diazepam) was given to the respective groups one hour after drug administration. Subsequently, the animals were assessed for antidepressant and anti-anxiety activities. The antidepressant activity of the test drugs was assessed through the Sucrose Preference Test (SPT). Meanwhile, the anti-anxiety activity of the test drugs was evaluated using the Elevated Plus Maze (EPM), Open Field Test (OFT), and Marble Burying Test (MBT). Before drug administration, Animals was measured, and the appropriate The drug's dosage was given orally to each of the groups.

Anti-Anxiety Models
Elevated Plus Maze

To explore the anxiolytic-like effects of novel chemical entities (NCEs) in mice, the Elevated Plus Maze (EPM) serves as a well-established animal model. The EPM equipment is made of grey-painted plexiglass and consists of two open arms measuring 35 × 5 cm and two enclosed arms measuring 35 × 5 × 15 cm. The arms extend from a central platform measuring 5 × 5 cm, which is raised 40 cm above the floor. Every mouse was positioned separately in the middle of the device, facing one of the open arms, and its movements were recorded for five minutes using a video camera, noting how long it stayed in each arm and how many entries it made. Following each trial, the maze was meticulously cleaned with 10% v/v ethanol and dried to prevent scent cues from influencing subsequent trials. Successful passage of all four foot beyond the arm's boundary into the central region was deemed an effective entry. A rise in the quantity of duration spending in the open arms and/or the duration of entry into them suggested that the NCEs were having anxiolytic effects. Additionally, the overall number of entries and the amount of entry into the closed arm were assessed to gauge the impact of NCEs on the motor aspects of the animals' exploratory behaviour. [14]

Open field test

The Open Field Test equipment is made up of a central compartment and a peripheral compartment. The peripheral compartment is separated into 16 squares of equal proportions, while the central compartment contains 9 squares, each measuring 10 x 10 cm. The total dimensions of the OFT box are 50 × 50 × 15 cm. When the experiment began for the first time, The animal was positioning itself in a corner of the outer square of the OFT box and allowed five minutes to explore. A Logitech HD webcam positioned above the apparatus, linked to the computer, was used to track The quantity of square crossings and the duration of time in both the center and peripheral compartments. The number of square crossings and the amount of time spent within the Central compartment were then calculated.. [15]

Marble Buryi

Every mice was housed in an individual plastic cage measuring 38 × 21 × 14 cm, with husk bedding positioned 5 cm below the bottom surface. The bedding contained twenty-seven small glass marbles, each with a diameter ranging between 10 and 12 micrometers, arranged in three rows and nine columns. After being exposed for five minutes, the number of marbles that remained buried was counted.Marble was considered to be "buried" if it occupied a minimum of 2/3 of the region at Husk.[16]Anxiolytic drugs have been shown to reduce the total number of marbles concealed, and the animals' marble-burying behaviour is suggestive of anxiety.

Anti-Depression Models
Sucrose preference test

Two bottles were given to each mice cage; one had regular consuming water and the other a solution containing one percent sucrose (1 gramme of sugar in 100 milliliters of distilled water .Following this acclimationT he mice were provided a whole day's fast without food or liquids, and the amounts of regular and sugar-sweetened water they consumed were measured and recorded. The indication of anhedonia was the sucrose-preference test. Applying the equation. The quantity of sugar and water ingested (measured in milliliters) was recorded after an entire day, and the sucrose preference was computed as follows: sucrose preference %)=sucrose consumption/(sucrose consumption water consumption)×100. [17]

RESULTS

Results of testing for the phytochemicals in secoundary metabolites presence and absence of selected herbs. **+ PRESENCE - ABSENCE**

ANTI-ANXIETY ACTIVITY

A)   Open Field Test

The outcomes of the Two-Way ANOVA with Tukey's Multiple Comparison Test are shown in Figure 2. A) The quantity of line segments in the middle section B) The quantity of line intersections inside the periphery compartment C) Duration of stay in central section D) Significant differences were found between the treatment groups based on the amount of time spent in the peripheral compartment [$F_{(5,15)}=37.50$; $P<0.0001$], [$F_{(5,15)}=20.92$; $P<0.0001$], [$F_{(5,15)}=15.88$; $P<0.0001$], and [$F_{(5,15)}=22.64$; $P<0.0001$], respectively. Compared to saline withdrawal mice, alcohol-deprived mice spent less time, made fewer entries, and crossed fewer lines in the middle compartment of the open field test. In contrast, compared to alcohol withdrawal mice, the Diazepam-treated group spent longer time, produced more entries, and crossed more lines in the OFT's center compartment. MPG, MBP, and MMC (50 mg/kg, p.o.) exhibited a more pronounced Diazepam-like effect onmice going through an alcohol detox.

B)   Elevated Plus Maze

The elevated plus maze test showed significant differences in both A) amount of the duration spending time in the open arm and B) the amount of entry in the open arm between the different treatment groups, as shown by the two-way ANOVA with Tukey's multiple comparison test in Figure 3 [$F_{(5,15)}=7.243$, $P<0.0012$] and [$F_{(5,15)}=21.67$, $P<0.0001$], accordingly Interestingly, animals going through saline withdrawal showed no anxiogenic activity at all, but those going through alcohol withdrawal did. Animals administered 50 mg/kg orally with MPG and MMC spent a shorter period in and made smaller entry into the open arm than mice suffering alcohol withdrawal. In contrast, animals treated with MBP spending longer in and made greater entries into the open arm.However, this study highlights MPB's calming effects in mice going through alcoholic addiction**.**

C)   Marble Burying Test (MBT)

Figure :3ANOVA in Two Ways will The results of Turkey's multiple comparison test indicated a significant difference [$F_{(5,17)}=17.60$;$P<0.0001$] between the various treatment groups. correspondingly In the marble burying experiment, mice on alcohol withdrawal buried more marbles than mice on saline withdrawal, suggesting that the mice were nervous. Additionally, animals given the drug diazepam buried less marbles than the alcohol withdrawal mice, suggesting that the drug had an anxiolytic effect on the alcohol withdrawal mice. Furthermore, the test drugs MPG and MMC were less successful than test drug MPB at 50 mg/kg p.o. in decreasing the quantity of marbles buried in mice as compared to the group treated with diazepam, indicating The calming effects of MPB

ANTI-DEPRESSION ACTIVITY

A) Sucrose Preference Test

The impact of 50 mg/kg orally administered MPG, MPB, and MMC on alcoholic withdrawal-induced SPT in mice was investigated. There was a 13.58% decrease in sucrose intake in contrast to saline consumption during alcoholic beverage withdrawal. However, there was a 13.10% increase in sucrose intake with diazepamin comparison to quitting alcohol Additionally, there was a 17.56% increase in sucrose intake with MPG (50mg/kg) compared to alcohol withdrawal, and a 18.25% increase in sucrose intake with MPB (50mg/kg) compared to alcohol withdrawal. Moreover, there was a 16.60% increase in sucrose intake at a dosage of MMC (50mg/kg) compared to alcohol withdrawal.

DISCUSSION

According to the present research, withdrawal symptoms may be exacerbated by malfunction inreceptors that are responsible for neurotransmitter, including adrenergic, serotonin, and GABA. Abuse of alcohol lowers GABA levels, which upsets the brain's delicate balance between both restrained and stimulated messages. By limiting ethanol metabolism by inhibiting the activity of the alcohol dehydrogenase enzyme, a 0.1% volume/volume ethanol solution

Afrin Shaik *et al.*,

might increase ethanol bioavailability and perhaps reduce withdrawal symptoms. Furthermore, increased 5-HT2A serotonin receptor activation may exacerbate withdrawal symptoms.Research on mice using selective agonists and antagonists has shown evidence that 5-HT2C receptors may have a role inthe signs of drinking too much alcohol. Chronic ethanol withdrawal hypo activates GABAergic-benzodiazepine inhibitory circuits, which is linked to anxiogenic effects and anhedonia. This work provides important new information about the ability of methanolic extracts from the leaves of Psidium guajava, Piper betle, and Morinda citrifolia to relieve the symptoms of alcohol withdrawal in mice. These extracts' anxiolytic and depressive properties have been shown in earlier studies on normal mice, maybe as a result of their high bioactive alkaloids and flavonoid content.

1. **Open Field Test:** When it comes to OFT, MPB (50 mg/kg, po) had a greater effect on the mice's anxiety caused by alcohol detoxification than MPG and MMC (50 mg/kg, po).
2. **Elevated Plus Maze:** in the case of EPM, MPB hadCalming effects in alcohol withdrawal mice ,with MPB (50mg/kg,p.o.)having a stronger impact than MPG,MMC (50mg/kg,p.o.)in the comparision group.
3. **Marble Burying Test:** When it comes to of MBT , a strong anxiolytic effect was seen in the Alcohol detoxification group by MPB (50mg/kg,p.o.).
4. **Sucrose Preference Test:** In this particular instance of SPT, the beverages discontinuation group consumed more sucrose because Psidium guajava and Morinda citrifolia extracts were more efficient than Piper Betle at (50 mg/kg, p.o)

Statistical Analysis

The mean standard error (SEM) represented all mentioned results. Analysis was conducted via Two-Way ANOVA, and Tukey's The Several Comparison Procedure was used to determine statistical significance, with the threshold set at $P < 0.0001$.

CONCLUSION

Phytochemical analysis reveals that the methanol-based extraction of Psidium guajava, Piper betle, and Morinda citrifolia contains phytocompounds including alkaloids, flavonoids, steroids, tannins, and volatile oils. Confirmation of these phytocompounds was achieved through TLC analysis, employing standards like Quercetin, Rutin, and Scopoletin.In animal behavioral studies, it was observed thatThe methanol-based Psidium guajava extractionand Morinda citrifolia,delivered at a 50-mg/kg (p.o.), dosage of exhibited a less significant antianxiety and antidepressant effect Mice without alcohol.In contrast toPiper Betle.

ABSTRACT

A local plant disease detection system is crucial for ensuring food security and safeguarding the livelihoods of farmers. By enabling early identification and intervention against crop diseases, such a system can prevent yield losses and preserve agricultural productivity, thereby directly impacting the lives and incomes of people dependent on agriculture. Additionally, localized disease detection systems empower communities to address specific agricultural challenges unique to their region, fostering resilience and sustainability in local food production systems. This study presents an approach to plant disease detection using Support Vector Machine (SVM) classification and Scale-Invariant Feature Transform (SIFT) for feature extraction.The methodology harnesses a dataset comprising 11,336 manually collected images of three prevalent solanaceae plant species: potato, tomato, and eggplant. These images were captured in the agricultural fields of the Anand region, Gujarat, India, employing a smartphone camera. The developed SVM model achieved an accuracy of 71.54% in classifying plant diseases. This research contributes to the advancement of automated disease detection in agriculture, particularly in the context of solanaceae crops prevalent in the Anand region. The findings demonstrate the potential of SVM-based approaches for accurate and efficient disease diagnosis, offering valuable insights for crop management and agricultural sustainability in the region.

Keywords: Plant diseases, solanaceae plants, machine learning, Support Vector Machine, Scale-Invariant Feature Transform.

INTRODUCTION

Plant ailments pose considerable challenges to international nutrition security and environmental farming practices [1]. Identifying these diseases early and precisely is crucial for efficient adminstration and alleviation tactics. Standardpractices of plant health monitoring, reliant on direct observation by trained persons requires much effort and prone to errors [2], [3]. However, advancements in technology, particularly in machine learning, have transformed the landscape of plant disease detection [4], [5], [6], [7]. Machine learning techniques, such as SVM (Support Vector Machines), ANN (Artificial Neural Networks), RF(Random Forest), KNN (k-nearest Neighbours), DT (Decision Trees), and convolutional neural networks (CNNs), have revolutionized the automation of disease diagnosis in plants[8], [9], [10], [11]. These techniques leverage extensive datasets of images depicting healthy and diseased plants to train models capable of accurately classifying and diagnosing plant diseases based on visual symptoms. By analyzing leaf images or other plant parts, machine learning algorithms can identify subtle patterns and indicators of disease that may evade human observation[12][13].

Machine learning methods' effects on plant disease detection have been investigated, revealing significant improvements in accuracy and automation.Patil & Lad, 2021 have introduced chilli plant leaf disease diagonosis system which is fully automated and it is employing SVM and KNN algorithms. By utilizing image classification and GLCM feature extraction techniques, accuracy of the model is enhanced[14]. This study introduces an automated model for detecting and classifying stem diseases, integrating digital image processing with four different ML methods including RF, KNN,IL(Impact Learning) and SVM. Using the collection of approximately 3000-4000 images belonging to different classes of diseased and healthy stems, SVM exhibited the highest performance with87.00% accurate result[15]. A study introduces a novel method for detecting papaya fruit and leaf diseases, integrating GLCM feature extraction with classifier hyperparameter tuning. Considering eight classes of healthy and diseased papaya, 16 features were extracted using GLCM. Hyperparameter tuning with SVM and RF resulted in accuracies of 91.47% and 90.22% respectively, surpassing existing methods [16]. This research introduces a method for detecting and classifying diseases in rice plants, utilizing Residual Neural Network (ResNet). ResNet proved to be a rapid and highly efficient techniquepreventing saturation in larger datasets or deeper networks [17]. The proposed method enhances leaf disease identification in tomato plants by combining multiple features to improve classification accuracy. Utilizing random forest and decision tree classifiers, results show the random forest classifier achieves higher accuracy (94%) compared to the decision tree classifier (90%) [18].Machine learning models are scalable and can be deployed on various platforms, including smartphones and drones, enabling rapid and widespread monitoring of agricultural fields[19], [20]. This scalability enhances the coverage and effectiveness of disease surveillance efforts. Despite initial investments in technology and infrastructure, the long-term cost savings associated with early disease detection and targeted treatment outweigh expenses, thus promoting cost-effectiveness. Furthermore, machine learning-driven disease detection fosters information basedselection in the field of agriculture[21]. Farmers and policymakers can leverage insights from large datasets to implement proactive measures for disease prevention and management. This strategy enhances eco-friendly farming by maximizing the use of resources and decreasing the application of chemicals, consequently lessening ecological footprint Moreover, it has indirect benefits for public health, as early detection and management of plant diseases contribute to food safety and security[22], [23], [24]. Machine learning techniques have revolutionized plant disease detection, offering unprecedented opportunities for precision agriculture, sustainable food production, and economic development. By harnessing the power of data and technology, stakeholders can effectively combat plant diseases and ensure the resilience and vitality of agricultural systems[25].

METHODOLOGY OF PROPOSED WORK

Workflow
The workflow for plant image processing begins with the manual collection of images from the local fields of AAU, Anand. Once gathered, these images undergo preprocessing, where initial adjustments such as resizing, cropping,

Ishita Theba and Sudhir Vegad

and noise reduction are applied to enhance image quality and remove any irrelevant information. This preprocessing stage lays the foundation for subsequent analysis by ensuring that the input images are of high quality and contain relevant features for disease detection. Advantages of image processing on model accuracy are manifold. By enhancing the quality and clarity of input images, preprocessing techniques like noise reduction and contrast adjustment help to reduce noise and irrelevant features, thereby improving the accuracy of the model[26], [27]. This refinement in image quality enables more accurate disease detection and classification by the model, ultimately leading to better outcomes in agricultural disease management. Dataset balancing is a crucial step in addressing class imbalance issues that may arise during model training[28], [29]. In scenarios where certain disease classes are underrepresented in the dataset, we can make use of Synthetic Minority Over-sampling Technique to generate synthetic samples for minority classes, ensuring equal representation of all disease classes[30], [31].This balancing act prevents the model from being biased towards the majority class and enhances its ability to generalize effectively across all classes.

Feature extraction using SIFT (Scale-Invariant Feature Transform) works by capturing characteristic traitsof images belonging to plants.[32], [33]. SIFT's ability to detect invariant features across different scales and orientations makes it particularly suitable for anomaly detection of plants, as it enables the model to identify fundamental structures and characteristics of plant anomalies. By extracting relevant features from the images, SIFT empowers the model to make accurate disease classifications, even in the presence of variations in image conditions and disease manifestations. Finally, classification of plant images into various categories of their anomaly can be leveraged using SVM (Support Vector Machine). SVM's ability to handle high-dimensional feature spaces and find optimal decision boundaries makes it well-suited for leaf disease detection. The SVM's capacity to manage attribute domains with numerous dimensions and identify ideal choice limits renders it highly suitable for detecting diseases in leaves.[34], [35]. Its robust generalization capabilities and effectiveness in handling nonlinear relationships between features contribute to improved model performance, making SVM a popular choice for disease classification in plant pathology.

Dataset Description
In this study, we delve into the dataset composed of plant images sourced from the agricultural fields of Anand Agriculture University, Anand. This dataset is meticulously collected, encompassing images obtained from both the Fields at Main Vegetable Centre, Anand Agriculture University (AAU), and the local agricultural fields of the Anand region. It comprises a substantial total of 11,363 images, representing three distinct Solanaceae plant species: potato, tomato, and brinjal. These images were captured during daylight hours under natural lighting conditions, utilizing a smartphone camera for acquisition. A detailed examination of the dataset reveals comprehensive specifications regarding the image-capturing device employed during data collection. The device utilized for capturing plant images in the fields was a routine use camera, specifically the Samsung Galaxy A70 model. The camera specifications include a triple setup, 32 MP wide-angle lens (f/1.7 aperture, 26mm focal length) and an 8 MP ultrawide lens (f/2.2 aperture, 12mm focal length). The resulting images have dimensions of 2268 x 4032 pixels, with a horizontal and vertical resolution of 72 dpi.

These meticulously collected images are meticulously categorized into 8 distinct classes, each representing various health conditions and diseases affecting the plants. The classes include Tomato (with subcategories: Healthy, leaf curl disease, late blight, and complex leaf curl and blight), Brinjal (comprising Healthy and little leaf disease categories), and Potato (encompassing Healthy, late blight, leaf curl, and Little leaf conditions). This comprehensive classification scheme provides a structured framework for analyzing and understanding the diverse health conditions observed across the dataset.

Image Pre-processing
The preliminary processing phase assumes an indispensable role in refining the unprocessed data drawn from comprehensive plant visuals, with the objective of optimizing the input for the neural network and augmenting the

durability and precision of the ultimate model. This stage is tailored to eliminate innate disturbance and deviations evident in plant visuals, thereby expediting more precise scrutiny and categorization. The delineated preliminary processing methodologies encompass a sequence of actions, encompassing the conversion to LAB color space, division of the LAB depiction into distinct segments, administration of Gaussian blur to the L channel, implementation of histogram equalization to enhance contrast, fusion of the equalized L channel with the authentic A and B channels, and ultimately, reconversion of the equalized LAB depiction to BGR color space, culminating in an evened-out depiction output.

In real-world settings and concrete datasets, the pervasiveness of disproportionate data presents a substantial impediment, wherein the subordinate category, often pivotal, is markedly underrepresented relative to the dominant category. This disproportion poses a noteworthy obstruction for categorization algorithms, particularly when the cost of incorrectly categorizing the subordinate category is heightened, thereby affecting performance indices for the constructed model. To address this predicament, we can make use of Synthetic Minority Oversampling Technique in uneven categorization exploration. SMOTE addresses imbalanced datasets by excessively expanding them, creating artificial occurrences within the attribute domain based on the occurrence and its nearest neighbors.This tactic alleviates concerns pertaining to overfitting and aids the classifier in defining distinct demarcation lines between categories, thereby augmenting comprehensive categorization accuracy.

Model using SVM with SIFT

SVM offers a systematic solution to machine learning obstacles owing to its statistical learning theory foundation. It is extensively utilized in various tasks including classification, regression, novelty detection, and feature reduction [36]. Feature extraction constitutes a pivotal aspect of computer vision applications aimed at object recognition within images. In this context, we used SIFT for finding attributes from images of plants, followed by performing classification using SVM to develop a plant disease detection model. SIFT identifies local image features immune to operations such as scaling and rotation, converting an image into a comprehensive set of attributes orientations[37]. These identified characteristics demonstrate size and alignment constancy, hence possessing substantial discriminative capability within the picture.[38]. The process encompasses four stages: first, the detection of depths and peaks through a set of Difference of Gaussian filters. Next the filters are used across various proportions throughout the image to ascertain potential points of interest, with each pixel (key point) encompassing a total of 26 neighbors. Subsequently, refining the positions involves eliminating weak features. Afterward, every significant spot is allocated a direction determined by regional image characteristics. Ultimately, a descriptive attribute unique to the locality is calculated for each significant spot. Support Vector Machine classifiers represent a collection of supervised approaches of learning, employed for both categorization and regression assignments, belonging to the wider category of generalized linear classification techniques[39]. SVM operates as a binary classification method, leveraging the principle of structural risk minimization to ascertain the optimal linear decision boundary[40]. This decision boundary is a weighted amalgamation of the features within the training dataset.

Implementation

The setup was carried out using personal computer having 11th Generation Intel(R) Core i9-1900K central processing unit operating at 3.50GHz and 32 gigabytes of random-access memory. The OS (Operating System) utilized was a 64-bit OS. The graphics processing unit utilized to execute the code is the NVIDIA RTX A2000 with a capacity of 12 gigabytes. Furthermore, the applications employed in this investigation included Python 3.11.0 (within the Anaconda Environment), Jupyter Notebook, the Tensorflow framework, Keras, and the CudaTool kit. For image manipulation, the openCV library was utilized.

In implementing the SVM classification method for detecting plant diseases, initiallywe manually collect plant images from agricultural fields of Anand Agriculture University, Anand District, Gujarat, India. Next,Image preprocessing is carried out to enhance their quality and extract relevant features using the Scale-Invariant Feature Transform algorithm. This algorithm plays a crucial role in identifying majorstructures and characteristics of plant anomalies. Afterward, the treated images and derived characteristics are inputted into the SVM, which is trained to

80455

Ishita Theba and Sudhir Vegad

categorize the images into various illness classes according to the derived traits.Through this process, the SVM classification method, in conjunction with SIFT feature extraction, provides a effective mechanism for automated identification of diseased plants. After constructing the model, its effectiveness is assessed employing diverse performance metrics like correctness, exactness, retrieval, F1-measure, and Area Beneath the Curve (AUC). These measures aid in gauging the model's capacity to precisely categorize plant ailments and its comprehensive efficacy. Additionally, visualization techniques are employed to interpret the results. For instance, confusion matrices can visually represent the model's classification results. ROC (Receiver Operating Characteristic) curves can also be plotted to illustrate the model's performance across different threshold values, providing insights into its sensitivity and specificity.

RESULTS AND DİSCUSSİON

After implementing the model using Support Vector Machine (SVM) for classification with Scale-Invariant Feature Transform, the following metrics values were obtained: Training Accuracy of 76.80%, Validation Accuracy of 71.82%, Test Accuracy of 71.54% and AUC/ROC curve value of 94.91%. The values obtained for Precision, Recall, and F1-score were 67.85%, 66.91%, and 66.63% respectively. The obtained results indicate that the implemented model demonstrates moderate to good performance in classifying plant diseases based on the extracted features. The Training Accuracy of 76.80% suggests that the model is able to learn effectively from the training data, while the Validation Accuracy of 71.82% indicates that the model generalizes reasonably well to unseen data. The Test Accuracy of 71.54% reflects the model's performance on an independent test set, further validating its effectiveness in realistic applications. For this model, AUC value of 94.91% indicates that the model exhibits excellent discriminatory power between healthy plants and plants having anomalies. Precision, Recall, and F1-score values of 67.85%, 66.91%, and 66.63% respectively, demonstrate the capacity of the model to accurately recognize afflicted plants, while minimizing false positives.

Overall, while the model shows promising results, there is still room for improvement, particularly in increasing precision and recall values to enhance the model's performance further. Additionally, research could focus on fine-tuning model parameters, optimizing feature extraction techniques, and augmenting the datasetto include extensive variety of plant diseases and environmental conditions. Additionally, exploring ensemble methods or deep learning approaches could potentially yield even better results in plant disease classification.

CONCLUSİON

In this study, we developed a model utilizing the SIFT algorithm to identify key features of infected leaves, coupled with an SVM classifier for plant image classification. Trained on a dataset of 11,363 solanacea plant images, including tomato, potato, and eggplant varieties sourced from Anand Agriculture University, the model achieved notable performance metrics, with Training, Validation, and Test Accuracies of 76.80%, 71.82%, and 71.54% respectively, and a high AUC value of 94.91%. Precision, Recall, and F1-score values of 67.85%, 66.91%, and 66.63% respectively demonstrate its effectiveness in accurately identifying diseased plants while minimizing false positives. Further refinement is necessary to enhance precision and recall, with future research focusing on parameter optimization, feature extraction, dataset expansion, and advanced machine learning techniques. Despite this, our SVM with SIFT model represents a significant advancement in automated plant illness detection, offering potential benefits for sustainable agriculture and crop health monitoring.

ABSTRACT

Single crystal of fumaric acid was grown by slow evaporation method. The single crystal was screened by UV Vis NIR spectral analysis for its suitability in optoelectronic applications. The crystal of fumaric acid shows very good transmittance in the range of 190 nm to 1100 nm with the transparency of 99%. The cut-off wavelength is observed at 300 nm. The optical band gap energy of fumaric acid was found from the Tauc's plot as 4.1 eV. The urbach energy (E_u) is calculated as 0.454 eV, suggests a lesser amount of crystalline defects of the grown single crystal. The steepness parameter of the single crystal was clculated. The various optical constants such a s absorption co-efficient, extinction coefficient, reflectance, refractive index, optical conductivity, electrical conductivity and susceptibility has been determined from the UV-Vis transmission plot. The recorded fluorescence spectrum shows the first emission peak at 362 nm, sharp peak at 611 nm and a weak peak observed at 714 nm. The wide transparency window and emission peaks indicate the suitability of the crystal for optoelectronic device fabrication.

Keywords: transmittance, band gap energy, optical constant, emission.

Anantha Meena Geetha and Samuel Robinson Jebas

INTRODUCTION

Researchers are now focusing on nonlinear photonic crystals because of its relevance in band gap materials for guiding and controlling the passage of light. The rapid technological advances in connected domains, such as ultra fast phenomena, optical communication and storage devices, have had a significant impact on nonlinear optics research [1]. Many organic crystals have been developed and examined for their utility as optical applications. Fumaric acid is gaining popularity due to its many physic-chemical characteristics [2]. It is used in the field of medicine. The introduction of fumaric acid in the crystalline structure transforms it from centrosymmetric to non-centrosymmetric, hence increasing high NLO efficiency via metal ligand interactions. Recently conducted characterization experiments demonstrated that fumaric acid-based compounds are effective NLO crystals [3,4]. Certain characterization investigations of Dipotassium Fumarate Dihydrate [5] and L-histidinium fumarate fumaric acid [6] were recently reported, and they proved to be appropriate SHG materials. Aroused by the curiosity of the optical properties of fumaric acid, we have grown the crystals of fumaric acid and the crystal has been characterized by UV-Vis NIR and fluorescence for its suitability as optical material for optoelectronic applications. The various optical values such as band gap, refractive index, reflectance, absorption coefficient, extinction coefficient, optical conductivity and electrical conductivity of the crystal has been determined.

EXPERIMENTAL
The fumaric acid single crystal was grown by slow evaporation solution growth technique at ambient room temperature using double-distilled water as a solvent. The prepared solution was filtered. The filtered solution was kept undisturbed in an environment conducive for single crystal growth. Colourless crystals were harvested after fifteen days. Figure 1 shows the chemical diagram of fumaric acid.

RESULT AND DISCUSSION

UV-VISIBLE SPECTRAL ANALYSIS
UV-visible spectrum gives limited information on the structure of the molecule since UV and visible light absorption entails the promotion of the electron from the ground state to higher energy levels [7]. The UV–visible absorption and transmission spectrum of the grown fumaric acid crystal was recorded using a Perkin Elmer Lambda-35 UV–visible–NIR spectrometer in the wavelength range of 190 nm–1100 nm and are shown in figure 2 and 3. The transmittance graph shows the transmittance percentage of the grown crystal and it has about 99%. The absorption spectrum indicates that the grown fumaric acid crystal having the lower cut-off wavelength at about 300 nm. The transmission percentage, lower cut-off wavelength and absorption band of a crystal are important property for optoelectronics applications [8].

Determination of Band gap Energy
The analysis of the band structure and kind of electron transition is helped by the variation of the optical absorption coefficient on photon energy [9]. The optical absorption coefficient (α) and thereby the energy band gap are evaluated using the formula,

$$\propto = \frac{2.3036 \log(\frac{1}{T})}{d}$$

Where T is the transmittance and d is the thickness of the crystal. Owing to the band gap, the crystal under study has an absorption coefficient obeying the following relation for high photon energies,

$$(\alpha h\upsilon)^2 = A\,(h\upsilon - E_g)$$

Where α is the absorption coefficient, hυ is the photon energy, Eg stands for the optical band gap of the crystal and A is the constant. The band gap energy of fumaric acid single crystal was evaluated to be 4.1eV by considering the linear part of the tauc's plot from $(\alpha h\upsilon)^2$ versus photon energy (hυ) as shown in figure 4. The wide band gap of the fumaric acid single crystals provides information on large transmittance in the visible region as well as defect less concentration in the grown crystal [10] makes it a suitable candidate for UV tunable laser and non linear optical

device applications. A reported cut-off wavelength and band gap energy of fumaric acid complex crystals are compared in table 1.

Determination of Urbach Energy

The urbach relationship expresses the observed exponential dependency of the absorption coefficient on photon energy below the fundamental absorption edge in the class of crystalline materials, which is typically in the exponential-edge region [16],

$\alpha = \alpha_o \exp(h\upsilon/E_u)$

Where α_o is the constant, E_u indicates the urbach energy, h stands for Planck's constant and υ indicates the frequency of radiation. The high crystallinity nature of the crystal is clear in the linear section of the plot ln (α) with photon energy (hυ), which is used to determine the slope. Figure 5 displays the relation of ln (α) with photon energy (hυ). By taking the reciprocal of this slope, the value of urbach energy is evaluated and it is found to be 0.454. The estimated urbach energy possesses low value and it clearly show that the grown crystal has minimum structural defect [17].

Determination of Steepness parameter (σ_s)

The steepness parameter is a temperature-dependent parameter characterizing the broadening of the absorption edge due to electron-phonon or exciton-phonon interations . The steepness parameter σ in below equation has been found to follow the relation [18],

$\sigma = \dfrac{K_B T}{E_u}$

Where E_u is the Urbach energy (0.454 eV), K_B is the Boltzmann's constant 8.6173 x 10^{-5} eV and T is the absolute temperature. The estimated value of steepness parameter is found to be 0.0518.

Determination of Optical constant

The material's optical characteristics play a significant role to identify its usage in the domain of optoelectronic devices and its potentiality in this field is well examined by understanding the optical constants. The total energy out flow of the applied electromagnetic radiation when it is transmitted throughout the material is calculated by the extinction coefficient (K)[19]. Extinction coefficient of the crystal is calculated using the below equation and is directly related to the absorption coefficient [20, 21].

$K = \dfrac{\alpha\lambda}{4\pi}$

Where α is the optical absorption coefficient, λ is the wavelength of the photons incident on the material. The plot of extinction coefficient versus wavelength is shown in Figure 6. The calculated value of extinction coefficient 14.67. The amount of light that is reflected from a surface or optical element is described by its reflectance. In general, the direction of the light source affects reflectance. The following relation [22] can be used to calculate the reflectance (R) in terms of the absorption coefficient and the thickness (t) of the crystal.

$R = 1 \pm \dfrac{\sqrt{1 - \exp(-\alpha t) + \exp(\alpha t)}}{1 + \exp(-\alpha t)}$

The refractive index estimates how much light is bent, or refracted, when enters the material. The refractive index n can be derived as [23],

$n = \dfrac{-(R + 1) \pm \sqrt{-3R^2 + 10R - 3}}{2(R - 1)}$

Figure 7 exhibits the variation of refractive index with wavelength. The calculated refractive index (n) is 2.59 for the fumaric acid single crystal. From the graph it is clear that refractive index decreases with increase of wavelength. This lowering of refractive index emphasize that the fumaric acid single crystal exhibit the regular dispersion behavior. The refractive index can be determined from the reflectance (R) data using [24],

$R = \dfrac{(n - 1)^2}{(n + 1)^2}$

The calculated value of reflectance (R) is 0.1973. From figure 8 reflectance of the material decreases as the wavelength increases. It is an important character of the material which possesses optoelectronic properties.

Anantha Meena Geetha and Samuel Robinson Jebas

Optical Conductivity

One of the most effective methods for researching the electrical states of materials is optical conductivity. Refractive index (n) and the speed of light (c) are related to the photonic response of the materials optical conductivity (σ_o) when exposed to light [25],

$$\sigma_o = \frac{\alpha nc}{4\pi}$$

The variation of optical conductivity with wavelength is shown in Figure 9 (a). Figure 9(b) illustrates that the optical conductivity (σ_o) increases with photon energy (hυ), having high magnitude ($10^8 S^{-1}$) thus concludes the presence of high photo tunable nature of the material. Hence this material is prominent for device applications in computing ultrafast optical data [26]. The calculated value of optical conductivity 0.1827.

Electrical Conductivity

The optical conductivity of the fumaric acid single crystal, which is caused by electrons energized by photon energy, is connected to the electrical conductivity and is shown below [27],

$$\sigma_e = \frac{2\lambda\sigma_o}{\alpha}$$

The variation of electrical conductivity with wavelength is shown in Figure 10 (a). The electrical conductivity as a function of photon energy (hυ) is shown in Figure 10 (b). Electrical conductivity of fumaric acid crystal is 866.450.

Electric susceptibility

Electric susceptibility is the quantitative measure of extent to which electric field applied to dielectric material causes polarization. Electric susceptibility (χ_c) can be calculated from the following relation [28],

$\varepsilon_r = \varepsilon_0 + 4\pi\chi_c = \eta^2 - k^2$

$\chi_c = \eta^2 - k^2 - \varepsilon_0/4\pi$

ε_0 is the dielectric constant in the absence of any contribution from free carriers. The complex dielectric constant is given by ε_c. The real and imaginary part of dielectric constant from extinction coefficient is given as [29,30].

$\varepsilon_c = \varepsilon_r + \varepsilon_i$

$\varepsilon_r = n^2 - k^2$

$\varepsilon_i = 2nk$

Where ε_r and ε_i are real and imaginary part of dielectric constant. The electric susceptibility is calculated as $\chi_c = 5.303$. The real ε_r and imaginary ε_i values of dielectric constant are 6.7558 and 1.2389×10^{-6}.

FLUORESCENCE ANALYSIS

The fluorescence is the most important nondestructive method for evaluating flaws, surface contacts and transitions between energy levels. It thus finds extensive use in biological, photonics and chemical applications [31]. The excitation and emission spectrum of grown fumaric acid single crystal was recorded in the range of 260 nm to 900 nm by means of Perkin Elmer model LS-45 fluorescence spectrometer and it is emission spectrum shown in figure 11. The sample is excited at 320 nm as excitation wavelength. There are three categories of luminescent peaks in the spectra. The first emission peak at 362 nm shows the emission of visible violet and the sharp peak at 611 nm is due to the emission of orange light. The weak emission peak observed at the wavelength 714 nm is red. The result indicates that the grown crystals have emission in the visible region, suggests that they are excellent for non linear optical applications.

CONCLUSION

Good quality single crystal of fumaric acid has been grown by slow evaporation solution growth techniques from aqueous solution. Its optical transparency has been assessed by UV-Vis spectroscopy and the cut off wavelength was found to be around 300 nm. The band gap energy is calculated as 4.1 eV from the Tauc's plot. The urbach energy (E_u) is determined to be 0.454 eV. The estimated value of steepness parameter is found to be 0.0518. Several optical constants namely extinction coefficient, refractive index and reflectance clearly indicate the high transparency

character of fumaric acid. Optical conductivity, electrical conductivity and susceptibility were also calculated. The fluorescence spectra revealed visible violet, visible orange and red fluorescence emission. The optical characterization studies and the results shows that the fumaric acid is suitable for optical applications.

ABSTRACT

Nanotechnology is the most exclusive field of science that is involved in the synthesis of nanoparticles (NPs). These particles can be formed in two different ways, i.e., the top-down approach and the bottom-up approach. Nanoparticles are engineered so that they are suitable for biological systems, non-toxic, anti-angiogenic, etc. Due to the versatile nature of nanoparticles, they are being modified from time to time for innovative administration of drugs and medication in target regions. In this review, a comprehensive overview of the different types of nanoparticles and targeting strategies for nanoparticles is discussed. Recently, nanoparticles made of various components, such as liposomes, solid lipid nanoparticles, dendrimers, micelles, polymeric micelles, polymersomes, hydrogels, and inorganic NPs such as metal nanoparticles, i.e., AuNPs, AgNPs, magnetic nanoparticles, etc., have been prominently used for therapeutic purposes in cancer and other diseases. Nanoparticles have shown relevant improvements in the treatment of cancer through direct drug delivery to tumor cells. NPs increase the intracellular concentration of pharmaceuticals through active or passive targeting, minimizing toxicity in healthy tissue. It also highlights the importance of "physio-chemical characteristics" of NPs, including their size, shape, molecular composition, and surface chemistry, which play a significant role in the localized drug delivery system.

INTRODUCTION

Cancer is one of the deadliest diseases that can cause the death of more than 10 million people worldwide, in U.S., the number of newly diagnosed cancer reached over 1,958,310 and also there was prediction of about 609,820 deaths [1]. Cancer being a detrimental disease, it's full cure has not even developed until now. However, patients who have got diagnosed at an early stage of cancer they might survive. Although various therapeutic measures have been developed to treat the cancer, such as chemotherapy, radiation therapy, hormone therapy, hyperthermia, immunotherapy, surgery, stem cell transplantation, targeted therapy etc. since so long but none of them were fully effective. In recent few decades, scientists have shown their interest toward nanoparticle applications. Nanoparticles is being utilized as delivery medium for chemotherapeutic medicines direct to the cancerous cell [2]. The NPs are advantageous as biomarkers for purposes like cancer diagnosis, as these curative agents tagged with NPs are highly tend to accumulate in system by EPR effect [3]. The NPs have proved the advantage over chemotherapy because of their capability to passive accumulation in cancer cells and thus subsiding the side-effects of medicines [4]. In the current review, we will focus on various types of nanoparticles, like organic and inorganic, their subtypes, and their benefits over other therapeutic measures. This will also include the drug being delivered via nanoparticles and their overall effects in the treatment of cancer.

Features of an ideal NP
In recent era, NP use is increasingly growing in medicine due to their better result in cancer therapy but there should be some features of these NPs. It should increase the stability, easily absorbed in tumor cells, and increased therapeutic action in target region and persistent drug release. Hydrophilic NPs are preferable since they can circulate for a longer duration after being injected and less uptake by the liver and spleen, such as NPs made of polyvinyl, while the use of 50% PNVP and N- isopropyl acrylamide showed faster uptake. Thus, the particles with 100 nanometre or less diameter and having hydrophilic surface are preferable [5]. Moreover, nanotechnology also involves inorganic NPs for drug delivery. Most inorganic NPs are made-up of silver and gold. Gold nanoparticles (AuNPs) is suitable for passive as well as active agents due to their anti-angiogenic and antitumor properties [6] Also, the AuNPS can be used for various imaging and diagnostic purposes [7].

Classification of NPs
In recent days there are various types of nanoparticles are used based on components the NPs are made up of, they are classified into two major classes: organic and inorganic. Inorganic groups are further divided into subgroups. The NPs having organic matter as their building material is called organic nanoparticles, while the NPs with inorganic parts as their main constituent is called inorganic NPs (Fig. 1). These inorganic NPs should also be non-tumorigenic and non-reactive for the biological system.

Organic Nanoparticles
The nanoparticles have organic cores like lipids, and basically, the phospholipids are known as organic nanoparticles. These are spherical structures resulting from the interactions of phospholipids with their aqueous surroundings. They are capable of carrying the drug within themselves and can deliver them to targeted locations. So far, lots of evolution has been made in constructing the more advanced organic nanoparticles. There are various types of organic nanoparticles:

Liposomes
The discovery of liposomes dates back to 1961 by Alec D. Bangham. These are bilayer vesicles formed due to the hydrophilic and hydrophobic interactions of constituents of liposomes, i.e., phospholipid, with the head portion being on the outer side and the tail portion on the interior side. These phospholipids are similar to lipid bilayer as similar to the cell membrane.

Anshita Mishra and Jyoti Parmar

Liposome NPs are able to circulate in the system for longer durations when they are modified to avoid phagocytic attacks by mononuclear phagocytes [8]. These liposome NPs are basically non-toxic, biodegradable, and most importantly, non-angiogenic and having similar components like in biological systems i.e., phospholipid. Some other drugs that have been used using liposome NP, such as liposomal daunorubicin, which has a smaller (~45) and rigid surface with a longer duration of circulation in the system, have shown impressive performance in Kaposi's sarcoma [9]. It is also found that PEGylated liposomes show 5 times longer stability in biological system in addition with reduced uptake by liver or spleen cells [10].

Solid lipid NPs
Solid Lipid NPs (SLN) are phospholipid monolayer–emulsifier–water colloidal nanocarriers (1–100 nm) [11]. These are rapidly growing branches of nanobiotechnology contributes to the development of drug delivery, chemical purposes, research fields, etc. these are helpful in analytical studies (spectroscopy, SEM, etc.) [12]. The size of SLN is smaller than 1 micrometre and is insoluble in the biological system. They are also known as dimensionless nanoparticles. Triglycerides, fatty acids, waxes, steroids, and PEGylated lipids are some examples of the lipid component [13]. By employing SLNs, it is also possible to successfully minimize the difficulties with liposomes, including their poor retention stability, limited encapsulation capacity, and leakage of water-soluble medications when blood components are present. SLNs can also carry large amounts of drugs, for example, tetracaine and etomidate [14].

Polymer NPs
Polymers are the most prevalent NP drug delivery systems. The polymers that are employed in regulated medication release are biodegradable because of their compatibility with living organisms [15]. It needs to have a structurally sound design and a sufficient half-life. The average diameter of polymeric NPs produced using various techniques might range from 100 to 300 nm. It is also possible to produce particles with dimensions between 60 and 70 nm or even smaller than 50 nm [16].

Nanospheres (matrix system) and Nanocapsules (vesicular system) are two different types of polymeric nanoparticles. While Nanospheres (NS) are polymer-only matrix systems, Nanocapsules (NC) are nanoparticles with either an oily or aqueous interior encased in a polymeric exterior. Typically, lipophilic, and hydrophilic surfactants are combined with Nanocapsules (NC). The increased drug loading of NC versus NS is one of its key benefits [17].PEGylated-PLGA nanospheres were less harmful than unbound dexibuprofen, according to investigations on the survival of cells in the human retinoblastoma cell line [18].

Polymer Micelles
The self-assembling macromolecules known as polymer micelles are generated via non-covalent bonds between block copolymers. Micelles made of block copolymers have a core-shell framework. Critical micelle concentration (CMC), cumulative number, size, and final structural feature are a number of the specific traits of micelles [19]. The robust drug-loading potential of the micelles as well as the distinct disposition features in the body have recently generated interest in using the micelles as innovative carrier systems in the field of therapeutic targeting [20].

Dendrimers
Dendrimers were first introduced by Vogtle in 1978, are highly branched, well-defined molecular structural polymers that have made for the development of the most innovative and effective technological tools for drug administration [21]. Due to its high affinity for shape, size, charge, hydrophilicity, biocompatibility, branches etc., dendrimers have drawn a lot of attention in biological areas as a good vehicle for drug administration [22]. Polyamidoamine(PAMAM) dendrimers, out of all other the commonly found dendrimers, have drawn the most interest as probable non-viral gene carriers because of their cationic nature, which allows deoxyribonucleic acid (DNA) binding at the normal pH [23].   Dendrimers are so adaptable that they are being utilized for various other purposes such as in PDT (photodynamic therapy) where AlPcS4 capsulizing GA-G3-PHSNPs are used diminish the tumor cells [24], PAMAM

dendrimers complexed with Gd(III), a paramagnetic contrast agent for MRI, showed its application as imaging agent in examination of vascular and lymphatic system involved in tumor [25].

Polymersomes

In both fundamental and applied research, there is growing interest in the dependable production of polymersomes, the vesicles generated from the self-association of amphiphilic block-copolymers, for applications including the encapsulation and diffusion of pharmaceuticals or additional products like proteins, enzymes, and DNA. Petit et al. observe that the polymersomes made using PDMS-based microfluidic platform method are monodisperse in size and persistent for certainly three months in natural environment. Such characteristics are extremely important for fundamental research of, for instance, membrane mechanisms and fusion [26].

Hydrogels

Hydrogels are three-dimensionally arranged polymeric structures that may incorporate a lot of water or organic fluids. The hydrophilic groups included in the polymer chains, including ether, amine, hydroxyl, sulphate, and carboxyl, are what are responsible for their affinity for water. The formulation of hydrogels can be restricted to smaller dimensions or made into macroscopic networks [27]. Hydrogels have several features, such as being phagocytosis-resistant, prolonging drug delivery, having a smaller size to enter the thinnest capillary, etc., that make them more applicable as drug delivery agents. [28]. The hydrogel provides variety of efficiency to encapsulate the drug for example, Poly(lactide-co-glycolide) is used to encapsulate the anti-cancer drug Taxol with 100% efficiency [29].

Inorganic NPs:

Recently, extensive research has been done on the use of inorganic nanoparticles (NPs), such as those made of metals (such as gold, silver), semiconductors (such as quantum dots), oxides (such as iron oxide), magnetic elements, etc., for both therapeutic and diagnostic applications in oncology. Inorganic NPs provide a number of benefits over organic nanoparticles, as well as special qualities that make them superior for scanning and medication administration. However, there are still very few inorganic NPs that are applied in therapeutic settings.

Silica Nanoparticles

Amorphous silica, which is naturally harmless and nontoxic, has undergone potential medically pertinent approaches to be modified for specific diagnostics and/or therapies. It has been demonstrated that sustained exposure of A549 cell line, a permanent cell line prepared from human lung adenocarcinoma [30], is exposed with silica nanoparticles along with Buthionine-[S,R]-sulfoximine(BSO) (oxidants; increase oxidative stress, acting as GSH reducer) and N-acetyl cysteine(NAC) (anti-oxidants; decrease OS, acting as GSH precursor) for 48 hrs resulted to notion that pure silica nanoparticles are least toxic for normal lung epithelial cells then the metal impurities containing NPs. Additionally, reactive oxygen species (ROS) production and membrane lipid peroxidation (LPO) were reported to be induced by silica nanoparticles in a dose-specific way, indicating the development of oxidative stress [31]. The pure silica nanosphere has been found to emit the brightest image in ultrasound measurement among various other compositions of silica with other components [32]. Furthermore, because silica NPs are simple to tag with fluorescent agents, the creation of a quaternary multifunctional scanning system may be straightforward. This system would also readily enable confocal microscopy to reveal the relative location of the nanoparticle at a tissue level [33]. These nanosystems might be employed for medicinal applications in supplementary to medical imaging, including the administering of hyperthermia and the magnetically controlled administration of medications that could be carried via the silica core [34].

Gold Nanoparticle

AuNPs are becoming increasingly popular, for a variety of reasons such as tumor sensors, drug delivery agents, and in plasmonic photothermal therapy. To begin, AuNPs are thought to be relatively biologically non-reactive and thus suitable for in vivo applications when compared to the extremely toxic cadmium and silver NPs [35,36].

It has been demonstrated that the characteristics of AuNPs, such as their size, charge, and surface make-up, influence both the uptake of AuNPs into cells and their targeted location in subcellular components. Potent drug delivery system also considers the type of drug-AuNP interaction (covalent vs. non-covalent binding) as well as the mechanism of drug release after the drug-AuNP mixture have been introduced to the cells [37].

AuNPs are currently being investigated as possible medicinal agents for the administration of medications into tumor cells in the context of oncology therapy [38]. They were linked with suitable exterior molecules that aim the NPs only at tumor cells in order to make sure the targeted terminating of cancer cells at the same time shielding cells that were not cancerous. Two approaches to tumor targeting were described by Huang et al. (2008): the first involved coupling AuNPs to PEG, and the other involved coupling AuNPs with particular antibodies that adhere to distinct physiological indicators expressed on cancer cells [39]. PEG extended AuNP retention in blood and minimized AuNP clumping together. This made it easier for AuNPs to accumulate preferentially in tumor cells as opposed to healthy cells due to the improved permeability of blood vessels that have not fully developed surrounding tumor after vascular angiogenesis and the reduced elimination rate brought on by the absence of functional lymphatic vessels in tumors [40].

Silver NPs

AgNPs are silver nanoparticles with a size between 1 and 100 nm. AgNPs offer special qualities which make them useful for molecular therapeutics, diagnosis, and gadgets utilized in many medical applications [41]. AgNPs of all forms and sizes can now be produced using physical, chemical, and biological techniques. The physical technique includes evaporation-condensation and laser ablation. Atmospheric pressure was used in a cylindrical furnace to perform the evaporation-condensation process [42]. The lack of chemical reagents in solutions makes laser ablation superior to conventional processes for the creation of metal colloids. Thus, using chemical technique, clean and untainted metal colloids for various purposes can be created [43]. Plant extract-based synthesis of NPs has some benefits over similar biological procedures in that it does not require the complicated procedure of preserving cultivated cells and can be appropriately developed for the manufacturing of NPs on a major scale [44].

AgNPs have demonstrated positive antitumor outcomes. According to a number of scientists, AgNPs caused a cytotoxic impact against leukemic cells. PVP-coated AgNPs, according to Guo *et al.,* efficiently decrease the survival of acute myeloid leukaemia (AML) cells by producing reactive oxygen species (ROS) and releasing silver ions, which promote DNA breakage and programmed cell death [45]. Gurunathan et al. further noted that AgNPs could serve as a possible substitute agent for the treatment of human breast cancer. Through the stimulation of caspase-3 and the production of ROS, AgNPs demonstrated dosage-dependent toxicity towards MDA-MB-231 cells, inducing death and breakdown of DNA [46,47].

Magnetic NPs

Targeted drug distribution is made possible by the administration of medicinal magnetic nanoparticles. Medicines can be directed to a specific place in the body with the help of magnetic field gradients, essentially mounting endogenous biodistribution [3]. MNPs can very specifically upgrade the accumulation of drugs in tumor cells supplied via them. Methods where the MNPs are used for hyperthermia therapy are called Magnetic hyperthermia (MH). Chemotherapeutic agents can concurrently release medicines and transmit heat to tumour cells with the help of MNPs. Utilising MNPs to combine hyperthermia with radiation and chemotherapy predicts increased malignant tissue permeability, targeted tumour removal, reduced side effects, and enhanced therapeutic response [48].

There are several methods, both chemical and physical, that may be used to create magnetic nanoparticles, and then the results have different ultimate characteristics. Based on the state of matter of the raw materials, the following categorization method might be used. Goya et al. (2008), demonstrated methods for synthesis of these magnetic NPs; top-down approach and bottom-up method. The solid element used as an initial basis is shrunk to a nanometric scale in one (thin films), two (nanowires), or three (nanoparticles, or quantum dots) dimensions using the top-down approach. As said in the aforecited method, bulky constituents are disbanded to an extent at which they attain the

Anshita Mishra and Jyoti Parmar

expected shape or size to be credited as a NP. This approach frequently relies on mechanical processes such as reactive ion etching, laser chemical etching, mechanical alloying, and laser machining. On the other hand, the bottom-up strategy starts with atomic or molecular building blocks and grows bigger, nanometric structures from them. Chemical vapour deposition (CVD), reactive sputtering (RS), plasma enhanced CVD (PECVD), pulsed laser deposition (PLD), molecular beam epitaxy (MBE), and wet approaches like sol-gel and microemulsion techniques are examples of bottom-up procedures [49]. Unlike top-down approach, in this method, various minute components are constituted together to design an appropriate NP. These MNPS are extensively used in diagnosis of cancer by MRI detection method.

Iron oxide magnetic NPs

Nanomagnets with cores having magnetic properties are exclusively used in cancer therapy, due to their capacity for high accumulation in tumor cells. To be more particular, iron oxide MNPs are used in the majority, namely, superparamagnetic iron oxide nanoparticles (SPIONs). Because of their exceptional superparamagnetic characteristics, which enable them to be guided for accumulation in particular parts of the body under a magnetized environment, SPIONs have grown to be one of the much extensively researched targeting nanomaterials [50]. Additionally, when exposed to an alternating magnetic field (AMF), SPIONs display great magnetic resonance imaging (MRI), photothermal, and magnetic heating properties. They also have favourable biocompatibility when in contrast to manganese- and gadolinium-containing nanoparticles. All such characteristics result in their appealing potential for use as a contrast agent in MRI scans and in heat therapy as well as a means of administering drugs [51,52].

For multidisciplinary inquiry in tumour detection and treatment, bevacizumab has been labelled with a radioactive substance or a colouring agent. Technetium-99 m (^{99m}Tc)- SPIONs-bevacizumab nanoparticles were created by Zhao et al. (2014) and may enhance tumour access and retention [53]. The Food and Drug Administration (FDA) has authorized trastuzumab, the first humanized immunoglobulin-type G (IgG) 1 monoclonal antibody, for the treatment of breast cancer cells that overexpress HER-2 [54]. It may decrease the tyrosine kinase enzyme that acts on HER-2 receptors by transmitting signals. Trastuzumab has been combined with SPIONs to improve the effectiveness of anticancer drugs and MRI sensitivity for the detection of malignancy indicators [55]. Lee et al., (2007) explained the procedure where Trastuzumab was coupled to iron oxide nanoparticles to result in an ultrasensitive magnetic resonance probe agent for analysing of small grafted tumors in mouse [56]. Chen et al. (2009), also conducted the similar experiment, in which trastuzumab attached to the surface of SPIONs comprising dextran to create new MRI contrast agents. These agents may improve the internalization of nanoparticles by receptor-mediated selection in targeted malignant tumor, leading to enhanced MRI report [57].

Nickel-copper based magnetic nanoparticles

Bimetallic nickel/copper magnetic nanoparticles (NiCu MNPs), one of the other magnetic nanoparticles that are now being used in biomedicine, are particularly gaining popularity because of their special biomedical-appropriate features. These qualities include adjustable magnetic properties that may be altered by modifying synthesis settings, consistency in a variety of chemical conditions, and shown physiological compatibility with a variety of cells. NiCu MNPs appear to hold great promise for both the use of Magnetic Hyperthermia (MH) and regulated drug administration, according to recent results [58]. A new regulated drug delivery formulation made of $Ni_{67.5}Cu_{32.5}$ MNPs in a silica matrix created using the sol-gel method was developed by Stergar et al., (2018). In this study, the capacity of MNPs' to deliver the medication to diverse human cells using the fluorescent dye rhodamine 6G was tested. The progressive approach of $Ni_{67.5}Cu_{32.5}$ MNPs has proven to be a trustworthy and effective delivery method for various kinds of human cells [59].

The additive effects of Ni nanoparticles and daunorubicin on preventing the spread of malignant cells are seen. The reason for this may be that the modified Ni nanoparticles with positively charged tetraheptylammonium caps may easily penetrate the cancerous cells along with the daunorubicin molecules and consequently promote the internalization of daunorubicin in target cells that are cancerous. It might further boost the absorption of the

therapeutic agent daunorubicin into the K562 cancer cells, thereby improving daunorubicin's ability to block the growth of the target cancer cells [60].

Carbon-based NPs
Carbon-based nanomaterials (CBNs) are gaining popularity in the researched fields and technical sectors because of their variety of chemical and physical properties. Moreover, various branches of medical technology are diligently exploring these favourable CBN characteristics [61]. Due to the allotropic diversity of the carbon, it is being exploited for biosensory, drug delivery medium, gene therapy, etc. purposes by constructing a variety of nanomaterials, such as quantum dots.

Quantum dots
Nanotechnology has been proven to be the most magnificent discovery of the era, as it is assisting the human kind in various way. In the same trail of discoveries, Quantum Dots(QD) finding has achieved the Nobel prize in Chemistry 2023, is paving the way in treatment of Cancer. Nobel Prize is equally shared between 3 scientists, Alexei I. Ekimov, Louis E. Brus, and Moungi G. Bawendi for the discovery and engineering of quantum dots. QDs, a diverse group of manufactured nanoparticles with distinctive optic and chemical characteristics, have emerged as potentially among the most interesting developments in marking technology. QDs have a wide range of possible uses, from energy to therapy [62,63]. Presently, QDs are extensively employed in laboratory, including the identification of cancer indicators in molecular pathology, the outlining of cancer proliferation, the emphasis on the tumour environment, and the provision of a new approach for enhancing the knowledge, screening, categorization, and therapy of cancer diversity [64]. Mulder et al., (2006) used MRI and fluorescence scanning to efficiently treat tumour vascular proliferation using MR-fluorescent bimodal Qds [65,66]. To increase functionality, this strategy was expanded to QD-based bimodal devices housed in silica nanoparticles [67]. Biocompatible QDs are powerful primary sensors as well as scientific devices once these are created, and their mobility is significantly influenced by the cell types used and the chemical structure of the QD conjugates. In the future, major issues still require to be resolved, even if various innovative processes for producing QDs have been devised [68].

The majority of compounds that make up fluorescent QDs are found in groups II to VI and III to V, including Cd, Hg, Se, Ag, Ln, P, Pb, Te, and Zn. The frequency produced by quantum dots is increasingly limited as their diameter decreases. Because of their exact emit frequency, a range of fluorescence radiations are not visible in their spectra [69]. Advantageous features of QDs are still being studied and are under development; however, some harmful effects have also presented themselves during experiments. When compared to fluorophore dyes, CdSe quantum dots perform more efficiently and are twenty times more positive. Although they should have a solid polymer coating, CdSe based quantum dots are particularly hazardous [70]. CdTe QDs encased with mercaptopropionic acid (MPA) and cysteamine were reported to be harmful to rat pheochromocytoma cell (PC12) growth at doses of 10 µg/mL by Lovric et al. (2005). At 1 µg/mL, uncovered CdTe QDs proved deadly[71].

Diagnostic uses of NPs
Nanoparticle compounds are often utilised for a variety of reasons, including cancer detection and therapy [72]. Currently, a variety of nanoparticle forms, including liposomes, silica nanoparticles and quantum dots, stained with dye molecules, are utilised in molecular imaging to diagnose cancer. There is a growing need for fluorescent labelling labels that offer greater potential, stability, and reliability in order to accomplish accurate diagnosis [73,74]. Makarova et al. (2021) created FITC-doped ultrabright nanoparticles with success. The perspective for biological labelling of the developed nanoparticle as probe is very effective even at low concentration with reduced chemotoxicity and phototoxicity [75]. On the other hand, it has been documented that nanoliposomes can be used for imaging and cancer detection. Magnetic resonance imaging (MRI) is utilised to visualise tumour vascular development in vivo using antibody-conjugated paramagnetic liposomes (diameter 300-350 nm) [76]. Harisinghani et al. (2003) looked into the potential of SPION for non-intrusive MRI lymph node metastasis diagnosis in prostate cancer. All patients with metastatic nodal cancer were successfully diagnosed by MRI using these superparamagnetic nanoparticles, and the node-by-node analysis specificity was much higher than that of traditional MRI [76]. Magnetic

Anshita Mishra and Jyoti Parmar

resonance imaging (MRI)[51], multiplexed molecular cancer diagnostics, and in vivo diagnostics are among the prospective application. The anti-CEA monoclonal antibody rch 24 (rch 24 mAb) showed a highly potent and exclusive reactivity towards the PEGylated CdTe Q-dots, which proved to be a novel discovery. Using the resulting CdTe–(rch 24 mAb) conjugates, CEA formed on the outer cortex of cell line LS 180 was effectively detected. Subsequent tests revealed that compared to FITC, the fluorescent CdTe Q-dots had far greater photostability and stronger fluorescence imaging, which increased the effectiveness of detecting cancer markers [77].

Targeted gene therapy for retinopathy of prematurity (ROP) was developed by combining the magnetic NPs with the transcriptionally active PCR (TAP) products conjugated with biosensor sequences [78]. Sensitive biosensors devised by various nanocomponents is capable of being utilized to identify malignant tumors and additionally to provide certain beneficial data for cancer detection at an early stage by identifying mutations and genetic abnormalities [79]. Recently, a PEG-conjugated polyester dendrimer with folic acid at its distal extremity and gadolinium(Gd) chelate compounds were combined to create a tumor-targeting biodegradable contrast agent. It has been demonstrated that the dendrimer coupled contrast medium produces greater contrast than the widely accessible drug Magnevist®. Additionally, there was little accumulation of it in any of the organs, which decreased the toxicity caused by Gd. Thus, this dendrimer-based digestible carrier is a viable imaging agent due to these favourable results, namely improved MRI contrast and decreased Gd accumulation [80].

Given that ingrained silver MNPs with titanium can enhance anti-microbial ions to cure biological infections [81]. Iron oxide MNPs have visual and MRI capabilities and is capable of administering the hypothermic treatment to target cancer cell [82]. The diversity of multipurpose Mesoporous silica nanoparticles(MSNs) has enormous possibilities for the regulated encasing and transfer of medicinal molecules into numerous physiological uses when combined with the adherence of fluorescent compounds to their outer surfaces or within the pore walls, also can help in detection using of tumor using these capabilities [81].

Targeting with NPs

Targeting using NPs can be achieved by specificity toward the intended site in the body. This includes some methods such as, EPR effect, ability of NPs to avoid the RES in body, elevated specificity toward particular tumor using antibodies or Mab., by blocking angiogenesis, by transporting the gene likewise in gene therapy etc. targeting to particular location or tumor etc,. Numerous angiogenesis inhibitors have received FDA approval for the treatment of cancer. VEGF, its receptors, or various particular compounds that contribute to the formation of vessels were the focus of the majority of these personalised treatments. Among the authorized inhibiting agents of angiogenesis are: Axitinib (Inlyta®)[82] used in advanced renal carcinoma.Bevacizumab (Avastin®)[83] applied in variety of cancers such as cervical cancer, colorectal cancer, ovarian cancer, hepatocellular carcinoma, lung cancer and renal cell carcinoma.Cabozantinib (Cometriq®)[84] administered in differentiated and medullary thyroid cancer, renal cell and hepatocellular carcinoma.Everolimus (Afinitor®)[85] given in breast, pancreatic cancer, renal cell carcinoma subependymal giant cell astrocytoma etc., Lenalidomide (Revlimid®)[86] useful in follicular, marginal zone, mental cell lymphoma, multiple myeloma etc,.

CONCLUSION

The primary objective of this review is on diverse inorganic NPs that have been intensively created over the past 10 years for medical uses that include pharmacological and detecting purposes. These NPs have intriguing visual, magnetic, and biological capabilities. The physical characteristics, which include being absorbed, fluorescent imaging, scattering of light, Raman effect, and magnetic resonance, are mostly determined by the nanoscale size, making them effective agents for cancer imaging. Additionally, they can be employed as theragnostic agents due to their size- and geometry-dependent treatment modalities, which include the magnetothermal and photothermal ablation of cancer cells. In recent years, the application of NPs for treatments for cancer has grown tremendously, and as previously noted, important advancements can be achieved in this area of medicinal administration. It is

Anshita Mishra and Jyoti Parmar

envisaged that this field of study will soon result in the creation of unique, highly developed, diversified solutions that can achieve the intended results of early diagnosis, tumor regression with minimal collateral harm, and effective chemotherapeutic treatment management. Ultimately, each of this knowledge will aid in the logical development of nanoparticles conjugated with appropriate components to treat a variety of severe diseases for which there were no effective treatments, thereby enhancing the human medical treatment process for the next generation.

ABSTRACT

In the present study, various Agrowastes (Beetroot peel waste, Onion peel waste, Pineapple peel waste, Orange peel waste and Sugarcane bagasse) was collected and the prevalence of the Industrially Important Fungi in the Sacred Heart College Campus was studied by Open plate method during September 2023 to November 2024. The Beetroot peel agar showed that *Aspergillus niger* grew quickly whereas *Trichoderma viride* grew moderately. Orange peel agar's high acidity significantly aided *Aspergillus niger* growth, leading to the development of strong fungal colonies. However, *Trichoderma viride* had difficulties due to *Aspergillus niger* contamination and restricted development, highlighting the need of choosing appropriate substrates for certain bacteria. Compared to other substrates, *Aspergillus niger* grew less well on Onion peel agar, suggesting that the growing conditions were not ideal for this microbe. *Trichoderma viride* similarly showed only modest development on this medium, indicating that the conditions in which the onion peel agar was grown were not favorable for the growth of either microbe. Pineapple peel agar revealed ideal circumstances for the development of *Trichoderma viride* and *Aspergillus niger*. Both apparent coloring and the growth of extensive fungal colonies were supported by this substrate. The growth of *Trichoderma viride* was unaffected by the moderate acidity of Pineapple peel agar, which simultaneously encouraged the development of *Aspergillus niger*. The Sugarcane bagasse first

inhibited fungal development, but eventually it helped *Aspergillus niger* colonies proliferate. However, it prevented *Trichoderma viride* from growing, emphasizing how crucial substrate specificity is for different microbes.

Keywords: Beetroot peel waste,Onion peel waste,Orange peel waste, Pineapple peel waste, Sugarcane bagasse, *Aspergillus niger* and *Trichoderma viride.*

INTRODUCTION

India is a nation founded on agriculture, and since ancient times, the farming system has held a unique position in the cosmos. Vegetable gardening has taken centre stage among the many agricultural products produced in India because of its everyday need for cooking and the variety of nutrient components it contains. India is rapidly rising from its second-place ranking in vegetable output to the top due to increased demand brought about by the country's growing population. In addition to serving as a valuable source of nutrients for food, vegetable peel wastes are bad for the environment. Waste management has been a popular topic of discussion in a number of recent debates. Although the wastes produced by unspoiled vegetables do not pose a risk to public health or the troposphere, it is crucial to figure out how to make useful use of the vegetable peel wastes. In the current situation, getting rid of undesired agricultural wastes in a useful way is exceedingly difficult. There's little doubt that the planned study project will offer the best method for making useful use of the leftover vegetable peels [1]. The invisible creatures that are found all throughout the cosmos and in nature are known as microorganisms. Because of their both advantageous and detrimental properties, microbes have been described by several researchers as the "Double edged sword." The main groups of microorganisms in this universe include algae, protozoa, fungus, bacteria, and archaea. Among all the different kinds of microorganisms, fungi are essential to the manufacturing of many industrial goods that people use on a daily basis. Fungi are eukaryotes that are found in both air and soil. They can be divided into two main families based on their cellular makeup: molds and yeast. While yeast is a unicellular organism, molds are multicellular[2]. Spores from the mold are widely dispersed throughout the air and soil, and yeast is hardly ever present in these environments. Medicinally, the fungi belong to mold and yeast has an equal importance in causing acute and chronic infections in human beings. The molds are responsible for causing various diseases *viz.,* respiratory tract infection, skin infection, hair infection and nail infection. Commonly the fungal molds inhabit the respiratory tract then moves to lungs and results in various respiratory disorders. The Dermatophytes are well known for its infections in skin, hair and nail regions. The harmful effect of mold was extended to plant species also [3].

The fungi have the ability to synthesize the toxin Mycotoxin which causes serious health issues in human beings and agricultural crops. Every year the phytopathogens belong to the mold category is resulting in the cause of severe economic loss of various agricultural crops by causing diseases during various growth stages[4]. The harmful effect of yeast was reported against humans only and not against plant or animal species. The common harmful dimorphic fungal yeast namely, *Candida albicans* has showed severe effect against human beings particularly female community by causing Urinary tract infection, Nosocomial infection and Pulmonary candidiasis. The percentage of fungi that are beneficial is equal to the percentage of their negative effects. When it comes to fungi, the term "double edged sword" fits them better than other microbes [5]. According to Angenent *et al.* [6], the fungal Mold has discovered a unique purpose in the manufacturing of various Industrial products like enzymes, biopolymers, organic acids, biofuels, organic solvents, biopesticides, antibiotics, and biocontrol agents against phytopathogens[7]. Sir Alexander Fleming discovered Penicillin, the first antibiotic, from the fungus *Penicillium notatum*. Other fungi like *Beauveria bassiana* and *Metarhizium anisopliae* function as bioinsecticides. The fungi *Trichoderma viride* serves as a biocontrol agent. The pharmacological industries have long employed Mushrooms due to their existence of numerous bioactive chemicals and their role as a food source for humans. Numerous studies have looked at the function of fungal Mold in the bioremediation of different wastewaters and textile dyes [8]. Regrettably, because fungal Mold produces mycelial mats, its use in wastewater treatment has been limited. Instead, bacteria have taken its place because of their rapid

and very effective bioremediation. The fungal yeast *Saccharomyces cerevisiae* is commonly called as Backer's yeast and Brewer's yeast due to its active role in the production of bread, bioethanol, beer and wine. The role of *Saccharomyces cerevisiae* in alcoholic fermentation was reported in early days by the French scientist Louis Pasteur who was the Frontier of Microbiology research and named as Father of Modern Microbiology [9]. The yeast also fills its role in the category of food and feed. Some species of yeasts like *Saccharomyces cerevisiae*, Amoco toluol, *Candida tropicalis*, *Candida utilis*, *Candida novellas* and *Candida intermedius* can act as a Single cell protein (SCP) and used as a food for human beings and feed for cattle[10]. A culture medium is an environment that provides different chemical nutrients and growth ingredients to promote the growth of microorganisms. Culture media is divided into six categories based on the characteristics of the material: basal, enriched, differential, selective, and transport [11]. The typical culture medium for the cultivation of fungus is Sabouraud dextrose agar, or SDA as it was commonly abbreviated. In addition to SDA, two more frequently utilized culture media areRose Bengal agar (RBA) and Potato dextrose agar (PDA). For the benefit of microorganisms, all culture media are abundant in chemical nutrients such as carbon sources (often sugars derived from carbohydrates), nitrogen, phosphorus, and sulphur. The sugar made of carbohydrates One of the key components of fungus culture media is dextrose[12]. The increasing demand for research and the scarcity of raw materials are driving up the cost of commercial culture media. Researchers and industrialists face financial difficulties as a result of tax systems such as the Goods Service Tax (GST) in developing nations like India[13]. We must discover a different source for microbe cultivation in order to manage the economic problems. The right solution to replace synthetic culture medium is to use massive amounts of agrowastes for the cultivation of industrially significant fungi [14,15]. The prevalence of fungi in the environment was studied by various researchers on their research. They reported that the population of bacteria was comparatively less in atmosphere than the fungi. That was due to the moisture content which is naturally present in the air. The fungi are highly nuisance and irritable during to rainy season because the moisture content was very high during the rainy season and it results in the growth of fungi in various inanimate objects like books, cloths, house ceilings, beds, pillows and leather bags. The population of fungi varies from season to season. The prevalence of fungi was also noticed in the top surface of vegetables and peels of Onion and Garlic[16,17].

MATERIALS AND METHODS

Location selected in Sacred Heart College for Fungal Prevalence Study
a. UG Microbiology Laboratory
b. PG Microbiology Laboratory
c. Staff room
d. Library
e. Church
f. Abdul Kalam Research Centre
g. Staff Bike stand
h. Gate 2 cycle stand
i. Gate 3 cycle stand
j. College Ground
k. Gents Rest Room
l. Ladies Rest Room
m. Oasis Hall
n. Kamarajar Arangam
o. Carreno Hall.

Agrowastes Selected for Present study
a. Beetroot peel waste
b. Orange peel waste

c.   Onion peel waste
d.   Pineapple peel waste
e.   Sugarcane bagasse

Collection of Agrowastes

The Agrowastes (Beetroot peel waste,Onion peel waste, Orangepeel waste, Pineapple peel waste and Sugarcane bagasse) which are selected for the present research was collected from the Tirupattur market (Tirupattur district, Tamil Nadu, India). The collected Agrowastes were shade dried, powdered and then stored in Plastic bag at Room temperature[18].

Prevalence of Fungal population in Air in Sacred Heart College Campus

The prevalence of Fungal population in Air in Sacred Heart College Campus was studied by Open plate method. From September 2023 to November 2023, the study was carried out in 15 different locationsof Sacred Heart College (Autonomous), Tirupattur (UG Microbiology Laboratory, PG Microbiology Laboratory, Staff Room, Library, Church, Abdul Kalam Research Centre, Staff Bike Stand, Gate 2 Cycle Stand, Gate 3 Cycle Stand, College Ground, Gents Rest Room, Ladies Rest Room, Oasis Hall, Kamarajar Arangam, and Carenno Hall). The SDA plates were prepared and opened for 15 minutes per location. Then, the SDA plates were incubated for three days at Room temperature. The fully developed Fungal colonies were kept on SDA slants and kept in refrigerator for storage at 4 ºC[19,20].

Platting of Industrially Beneficial Fungi in Agro wastes
Inoculum Preparation

The fresh suspension of 72 hours old cultures of Industrially beneficial fungi (*Aspergillus niger* and *Trichoderma viride*) was used to study the growth analysis. The fungal cultures were inoculated into 50 ml of saline and incubated at Room temperature for 5 hours[21,22].

Growth Analysis of Industrially Beneficial Fungi in Agrowastes

From the Open plate technique, the two fungi are isolated (*Aspergillus niger* and *Trichoderma viride*) are injected into appropriate medium. Subsequently, about 6.0 grams of the selected Agrowasteswere mixed with 200 ml of Distilled water, brought to boil for 30 mins, let to cool for 2 hours in Room temperature, and filtered through Whatman No. 1 Filter paper. Then, 2.0 grams of Agar-Agar wasadded into the extracted water. The final mixture was Autoclaved at 121 ºC for 15 mins,allowed to solidify, and the Fungus was inoculated into the Agrowaste medium. On the 3rdday the fungal growth was visually assessed and noted[23].

RESULTS AND DISCUSSIONS

Prevenance of Fungal Growth in Sacred Heart College Campus

Three months of research were dedicated to examining the prevalence of specific Industrially advantageous fungus as well as other fungi before examining the fungi's capacity to develop in the Vegetable peel waste medium. The study on fungal prevalence was carried out in 15 sites of Sacred Heart College (Autonomous), Tirupattur, between September 2023 and November 2023. Fifteen locations in the college that was chosen for the current study. It includes, (1) UG Microbiology Laboratory, (2) PG Microbiology Laboratory, (3) Staff Room, (4) Library, (5) Church, (6) Abdul Kalam Research Centre (AKRC), (7) Staff Bike Stand, (8) Gate 2 Cycle Stand, (9) Gate 3 Cycle Stand, (10) College Ground, (11) Gents Rest Room, (12) Ladies Rest Room, (13) Oasis Hall, (14) Kamarajar Arangam and (15) Carreno Hall. The + sign was used to classify the fungal population. The sign (-) indicates no fungal growth, one plus (+) indicates very low fungal growth, two plus (++) indicates moderate fungal growth, three plus (+++) indicates strong fungal growth, and four plus (++++) indicates extremely high fungal growth that fills the whole Petri plate (Table – 1 to Table - 3). For the present research, the most used and important Industrially fungi (*Aspergillus niger* and *Trichoderma viride*) are involved. They are used for the fermentation of various Industrial microbial products which are very helpful for various purposes. *Aspergillus niger* has wide-ranging uses in many sectors of the economy,

especially in Biotechnology and Manufacturing operations. Enzymes that are vital to many industrial processes, such as α-amylase, lipase, cellulase, glycosylase, catalase, β-galactosidase, glucose oxidase, hemicellulose, protease, and more, are frequently produced using it. *Aspergillus niger* is a versatile filamentous fungus mold with the bio-economy transition potential. It is also used in Solid State Fermentation and Submerged Fermentation for the manufacture of organic acids, proteins, enzymes, and medicinal substances. *Aspergillus niger* is an important microbe for Industrial applications due to its metabolic plasticity and capacity to create large quantities of proteins, enzymes, and medicines. It also helps to manufacture numerous valuable substances and advances in Biotechnology. *Trichoderma viride* has a wide range of industrial uses, most notably in the solid-state bioprocessing of agro-industrial waste to produce enzymes such cellulase complexes. It has been demonstrated that an indigenous strain of *Trichoderma viride* can generate large titters of cellulase complex, which includes β-glucosidase, exoglycanases, and endoglucanase, all of which are necessary for a variety of industrial operations. Endoglucanase, the enzyme with the highest activity, has been effectively isolated and described, indicating its potential for application in industry. Bhavani and Saranraj [11]studied the prevalence of industrially beneficial fungal population in Sacred Heart College campus for Six months. The prevalence of both *Aspergillus niger* and *Penicillium chrysogenum* was high in the month of June 2017, August 2017 and November 2017, and low in July 2017, September 2017 and October 2017. It was observed that the growth and prevalence of *Aspergillus niger* was very high in Sacred Heart College campus when compared to *Penicillium chrysogenum*. Our present research was also carried out on the same location and in line with our findings. In our research also, the growth of *Aspergillus niger* and *Penicillium chrysogenum* was recorded good during November 2023 followed by September 2023 and October 2023. It was also assumed that the variation in the fungal growth was due to the seasonal and temperature change in the Tirupattur region.

Formulation of Low-cost Agrowaste based Culture medium for the cultivation of *Aspergillus niger* and *Trichoderma viride*

Growth of Industrially Important Fungi in Beetroot peel medium

Aspergillus niger is one of ubiquitous fungi that resides all around the world which can be grown in any type of media due to its fast-growing ability. Beetroot is most used edible vegetable with a well-served nutrient content. Butthe peels are through off to the ground, that have the sufficient vitamins and minerals for the *Aspergillus niger* to grow. On the Beetroot peel medium, *Aspergillus niger* formed a single colony on the third day. On the fourth day, two *Aspergillus niger* colonies start to develop on the Beetroot peel medium. *Aspergillus niger* colonies come in two distinct sizes: one is microscopic, and the other is enormous. On the fifth day, two *Aspergillus niger* colonies reach a mature stage of development. Another fungal colony was growing on the edge of the Beetroot peel waste medium. On the sixth day, the *Aspergillus niger* colonies are scattered over the plates containing the Beetroot peel waste medium. The first three days of *Trichoderma viride* development were modest; nevertheless, by the third day, the growth was evident. The species' nutrient intake had a positive effect on the plate. when the growth is entirely visible in the centre of the plate. The plate appeared to be somewhat filled with the fungus on the fourth and fifth (Table – 4).

Growth Industrially Important Fungi in Orange peel medium

The *Aspergillus niger* was greatly impacted by the orange peel, and on the second day, one or two colonies seemed to be growing. And in the days that followed, the growth was evident. *Aspergillus niger* flooded the Agar plate on the fourth and fifth day. The fungus species ability to replicate was significantly influenced by the acidity of the orange peel. The media presented a clear image of the black pigment. On the third day, a limited number of colonies are developed in the media due to the acidity of the Orange promoting good growth of *Trichoderma viride*. The species continued to develop well on the following days, the fourth and fifth, but *Aspergillus niger*, a common fungus, was also discovered to have contaminated the sidewalls of the agar plates. A moderate quantity of tainted fungus was cultivated; aside from that, the *Trichoderma viride* grew well and the pigmentation was clearly visible (Table – 5).

Growth of Industrially Important Fungi in the Onion peel medium

In Onion peel medium, *Aspergillus niger* was cultivated in tiny quantities. The incubation period was three days. There was not much development, after that little colonies might be spotted. *Aspergillus niger* did not respond well to

Onion peel agar. *Aspergillus niger* growth takes place on the fourth and fifth day. There was a modest growth observed for *Trichoderma viride*. The colonies that are visible may be seen on the third day, although they did not show much on the following day in the plate. The growth was visible, however the tiny number of *Trichoderma viride* was only visible. The fungal species development was comprehensively summarized in Table – 6.

Growth of Industrially Important Fungi in the Pineapple peel medium

The growth of the Industrially Important Fungi was analysed in the Pineapple peel medium. In the beginning of the Third day, little colonies were developed, similar to the *Aspergillus niger* fungus species. However, *Aspergillus niger* was grown aggressively over the medium plate after the prolonged incubation. The pigment was obviously visible, as the illustration illustrates. The fungus spread brilliantly over the Pineapple peel medium on days four and five. Due to the low acidity of the Pineapple peel medium, *Aspergillus niger* was able to fully proliferate on the medium. The growth can be evenly distributed throughout the *Trichoderma viride* plates where the species began to grow starting on the second day. According to the record, the entire plate was coloured and well-grown in the medium on the fourth and fifth days (Table – 7).

Growth of Industrially Important Fungi in Sugarcane bagasse

For the first three daysin Sugarcane bagasse, the fungus growth cannot be seen in the Agrowaste culture media because the sugar content in the Sugarcane bagasse predominates throughout. On the other hand, the fungus began to spread across the little colonies after three days, but not as much as orange or pineapple peel. The media resembles a little dot of the provided fungus (Table – 8). Abe [1]prepared the Culture media using the fruits peel Agrowastes such asMango peel, Jack fruitPine apple peel, BananaPine apple peel, Sweet LimePine apple peel,Pine apple peel, and PomegranatePine apple peel for studying the growth of *Aspergillus niger,Rhizopus stolonifer*and*Penicillium chrysogenum*. He observed the good and luxuriant growth of*Aspergillus niger* in the Culture medium comprising the Peels of Mango,Pine apple, Jack fruit, and Banana only. In the peels of Sweet lime and Pomegranate,*Aspergillus niger* did not showed any growth. Rhizopus *stolonifer* growth was observed in the medium which contains Pine apple, Mango, Sweet lime and Pomegranate. The *Rhizopus stolonifer*didn't exhibited any growth in the tested fruit peel wastes. However, the *Penicillium chrysogenum*shows some growth in the medium incorporated with the Peels of Pine apple, Mango, Sweet lime and Pomegranate only and no growth was recording in the medium containing Banana peel, Jack fruitpeel and Mangopeel. Saranraj and Jayaprakash [18]formulated the Novel culture medium using the Vegetable peel wastes (Onion peel waste and Garlic peel waste)for the cultivation of Two different Industrially Beneficial Fungi (*Aspergillus niger* and *Penicillium chrysogenum*). They concluded that the Onion peel waste was the good low costCulture medium than the Garlic peel waste for the cultivation of *Penicillium chrysogenum* and *Aspergillus niger*. They also found that the Garlic peel waste has showed an average growth for *Penicillium chrysogenum* and the fungi *Aspergillus niger* did not showed any growth on Garlic peel medium. In comparison, the Garlic peel waste medium was the good source for *Penicillium chrysogenum* cultivation but not for *Aspergillus niger*. In conclusion, the Onion peel waste act as a good source for the cultivation of *Aspergillus niger* and *Penicillium chrysogenum*when compared to the Garlic peel waste.

CONCLUSION

The present study has examined the development of Industrially significant fungi on a variety of Agricultural waste substrates, including *Aspergillus niger* and *Trichoderma viride*. Our findings showed the possibility of utilizing Agrowastes products (Sugarcane bagasse, Onion, Beetroot, Pineapple, and Orangepeels) as a growth substrate for the Industrially important fungi. In conclusion, agricultural waste substrates including Sugarcane bagasse, Pineapple peel, and Beetroot peel show potential as sustainable and affordable media for growing microorganisms of Industrial importance. In order to improve the microbial productivity and support environmentally friendly Biotechnological applications, growth conditions and substrate compositions can be further optimized.

ABSTRACT

In the pharma industry, all activities are done as per the regulatory guidelines and standard operating procedures. Deviations are seen as a significant aspect of achieving Six Sigma attributes. Deviations are defined as unexpected occurrences during the product life cycle. US 21 CFR parts 210, 211, and EU volume 4 give information on good manufacturing practices. Corrective actions and preventive action are steps taken to prevent errors in the products and root cause analysis for identification of the problems which helps in preventing the problems in the future. Deviation management helps in preventing problems and ensuring product quality and safety, and deviations can be managed by various tools, This review article outlines information on deviations, and handling of deviation investigations, and proposes the corrective and preventive actions tools used to manage deviation investigations like fishbone analysis, failure mode effect analysis, 5why analysis and quality management systems and case studies in pharmaceutical industries.

Keywords: Deviation, CAPA, quality management system, Six Sigma

INTRODUCTION

An unexpected occurrence that takes place either during or after the production, processing, packaging, storage, transportation, or testing of pharmaceutical dosage forms. A deviation may be unplanned but occurs from an incident or error that happens during or after the process, or it may be scheduled as part of a brief modification

(HPLC column, extended calibration time, etc.).Low or no variances for a firm are often signs of documentation problems. Deviations occur in the following areas (figure1).[1]

CONTROL OF DEVIATION
During the documentation process, the following questions such as what, who, when, where, how, and why the deviation occurred should be recorded. When deviations occur during manufacturing, they should be first documented in the batch record. If deviation took place during quality control testing it should be documented in a notebook or worksheet maintained in the laboratory. When a company's standards do not adhere to the important quality attributes as specified in the regulations, the regulatory authorities notice deviations and report during an inspection of the facility[2].

Various deviations (figure 2)
Planned deviations
They are anticipated and approved in advance, but due to temporary changes in process and procedure, these planned deviations are controlled and documented to ensure the quality and safety profile of the products[2].

Unplanned deviations
Unplanned deviations arise unexpectedly, without warning or prior notice. They can result from a variety of things, such as equipment malfunctioning, human errors, or unforeseen circumstances. These deviations must be quickly found, recorded, and analyzed to ascertain how they affect product quality and safety and to set the right corrective and preventive action[2]. Based on the impact of deviations planned and unplanned deviations are further classified into three categories (table 1):
- ❖ Minor deviations
- ❖ Major deviations
- ❖ Critical deviations[3].

METHODS AND MATERIALS

The literature search for this review article was performed through various journals like Science Direct, Web of Science, PubMed, and the search engine: Google Scholar, with the terms " Deviation management" "corrective and preventive action" and "quality management system".

INVESTIGATION OF DEVIATION
The best way to begin an inspection is to provide an overview of the company's process and products by delivering a presentation orally to the investigator. during this process, the inspection is started by reviewing the documents by standard operating procedure(SOP).Operations, receiving, warehousing, manufacturing, packaging, and shipping as well as engineering, maintenance, and technical services are all taken into consideration while evaluating SOP[2].

DETECTION
In a variety of auditing circumstances, including regulatory assessments, complaints from consumers, staff assessments, trending data risk evaluations, process efficacy monitoring, management reviews, etc., non-conformities call for CAPAs. List the specific evidence that is available to demonstrate that the issue exists at this early level of the process [5].

EVALUATION
After the identification process is complete, the non-conformance must be evaluated in terms of its possible impact, such as how it can affect quality, safety, dependability, costs, or customer satisfaction[5].

INVESTIGATION & ROOT CAUSE ANALYSIS

Once a nonconformance that affects a lab's product, procedures, or service is identified, a need for action assessment to remove the underlying cause(s) will be carried out.

Tools used for root cause analysis

- Five WHYS
- Fishbone
- Fault Tree Analysis (FTA)

BRAINSTORMING

This is one of the innovative approaches to problem-solving that enables individuals to generate suggestions or thoughts that may assist in either solving the issue or locating its underlying cause. To determine the underlying cause, a cross-functional team meeting might be scheduled[6].

FIVE WHYS

5 why is a tool used to analyze technique in root cause analysis? Five questions are included to help identify the root of the issue. It's sometimes important to obtain information by asking more than five questions. Ask "why" frequently to get the issue until we identify the proper core cause[7,8].

For Example

Why did the batch fail? Answer: because the product did not meet the specified quality standard,

1. why did the product meet the quality standard? Answer: The concentration of the active ingredient was lower than required.
2. Why was the concentration of active ingredients low? Answer: The mixing process wasn't properly controlled.
3. Why was the mixing process not properly controlled? Answer: because the equipment used was not calibrated correctly.
4. Why was the equipment not calibrated correctly? Answer: the calibration schedule was not followed consistently. Therefore, here we understand that the root cause is calibration was not performed in the equipment.

FAULT TREE ANALYSIS(FTA)

The FTA tool is a tactic that relies on a process or product's failure to operate. This tool can integrate several causes of failure in addition to evaluating system (or sub-system) failures one at a time by finding causal chains[2].

The results are illustrated using a fault mode tree. The combined use of failure modes is represented by logical operators at each level of the tree. FTA uses the experts' process expertise to identify the causal elements.

Use of FTA:

- FTA is frequently used to pinpoint the failure's root cause.
- FTA can be utilized to thoroughly understand the cause of complaints or deviations, as well as to make sure that planned modifications would properly address the problem without creating new ones.
- Fault Tree Analysis is a practical method for determining how various variables affect a certain issue.
- The report of an FTA offers a graphic examination of failure modes. It can help with risk assessment and in developing monitoring techniques[8].

FISHBONE ANALYSIS

- To identify the root causes of a problem, various sources of the issue are categorized using a diagram of cause and effect, also known as a fishbone diagram. Using a fishbone diagram can assist in keeping the conversation on point during the problem-solving and product-development phases. The facilitator assists the group in creating an ordered list by assisting the group in ranking the various causes by their level of importance after they have considered all potential causes for a problem. The diagram's design closely resembles the structure of a fish. In a

fishbone diagram, which is frequently shown from right to left, each big "bone" of the fish branches out to contain several smaller, more specialized bones (figure 3)[6,8].

CORRECTIVE ACTION AND PREVENTIVE ACTION

A system for implementing corrective and preventive measures should be in place in the pharmaceutical industry after taking into account consumer complaints (figure 4), product flaws, deviations, recalls of goods variations, investigations, inspections by regulators and results, trends in process efficiency, and quality assurance monitoring[4]. Good manufacturing practice is a requirement for the term "corrective and preventive action." The goal of CAPA in the pharmaceutical sector is to identify deviations, non-conformities, and failures. In the context of OOS outcomes, this analysis provides a broad overview of the CAPA program's implementation and root cause analysis. The CAPA system provides a way to gather critically crucial quality data that permits performance outside of specifications, CAPA carries out preventive actions before such aberrations occur [4]. The CAPA system serves as the foundation of a quality management system, the quality management and is especially important in the pharmaceutical industry. The CAPA system feeds the Quality System to enhance business operations in a systematic, documented, and actionable way[4].

IMPLEMENTATION OF CAPA (figure 5)
Quality management systems in pharmaceutical industries

A quality management system is a group of operational practices intended to continuously satisfy consumers and meet their expectations. It adheres to the organization's strategy and goals[9]. To meet customer expectations, a quality management system (QMS) is a set of procedures aimed at attaining quality policy and quality objectives. The method is employed by a variety of industries, including those that produce medical devices. Three organizational processes—quality planning, quality control, and quality improvement are under the direction of a QMS. quality of the product can be ensured by the use of the Six Sigma concept[10].

Six Sigma

Carl Frederick Gauss (1777–1855) was the person who initially put out the concept of the normal curve and laid the groundwork for Six Sigma as the measurement standard. In statistics, the term "sigma" is used to denote standard deviation, which serves as a measure of the degree of variation in a set of data, a process, or a product (figure 6).A statistical idea or quality management strategy called Six Sigma measures a process or a product in terms of faults at the Six Sigma level and provides a mechanism to concentrate on creating and delivering flawless goods and services. The benefits of the Six Sigma methodology can lead to improved product quality, reduced defects, and improved customer stratification[11]. DMAIC (define, measure, analyze, improve, control) is a roadmap offered by Six Sigma as a technique for process improvement and as an initial organizational structure with distinct responsibilities for project owners and project leaders. The DMAIC stages involve statistical process control and failure mode and effect analysis among other statistical quality tools and approaches. They serve as project milestones. The DMAIC roadmap's Define phase is where the problem that needs to be solved is defined.

- Appropriate measurements, or what Six Sigma practitioners refer to as key to quality indicators, are required to quantify the performance of the existing process.
- Making a data-based diagnosis of how well the current process is performing is the aim of the analysis phase.
- The project team decided on goals for interventions to cut waiting times and eliminate waste after the process was diagnosed[12].

ELEMENTS OF SIX SIGMA
- process development
- Process management
- process design, and process re-design[13]

CASE STUDY
Case study on parenteral drug [3].

CAPA approach

After filtering during the production of X drug injection (vial), samples of Test 15 and Test 18 were taken from a 150l storage vessel and the temperature of the bulk solution held for the hold length investigation was found to be 13.7 and 14C^0, respectively. 2-8$C^0$are acceptable standards.

consequences: The product might not perform as expected.

Impact

Risk to its clients: There was no direct risk because the batch was a validation batch made for regulatory filing requirements rather than for commercialization. The batch also happened during a hold time study bulk.

Immediate action

The engineering department was also contacted because the temperature was above 8°C and needed additional examination.

Root cause analysis

Batch manufacturing process

According to the batch manufacturing record, the batch manufacturing record was produced. The temperature was held constant at 2 to 8 ^{c} during the manufacturing process. The temperature was kept at 5.2 ^{c} during the API, and no effect on the product's quality was discovered.

Process for filling and filtering

The filtration was performed between 08:52 and 8:58. During the filtration, filling, and loading of lyophilized powder procedures, no difference was seen.

Hold time study

The temperature was between 2 and 8 ^{c} when samples of the unfiltered solution were taken at times T6 and T12. It was discovered that the temperature had increased to 13.7oC on the same day at 22.53 when sample T15 was collected. Investigation revealed that the brain cooling plant's temperature was above 8°C because the chiller had tripped. After all, the compressor had short-circuited as a result of overheating. The brainchiller has two compressors of 10 TR. Due to overheating one chamber got short-circuited and the second chamber was connected with another compressor and got sorted.

Root cause identification from the investigation

It was found that there was a problem with the equipment.

CONCLUSION

Additional attention was needed based on the quality control results because the quality results were satisfied and the hold time study did not reveal any effects.

Action plan: CAPA

At the factory operational panel, an audio alert was put in case the product's temperature increased.

Facility modification [2]

Type of deviation: planned deviation Due to the flooring modification completed in warehouse I, the secondary packing material kept there has been moved to warehouse II. The following won't be adhered to at the warehouse during this time: Area cleaning will not be done by SOP and won't be documented. There won't be any temperature monitoring in the storage space for packaging materials. Dispensing of packing material will not be done at the warehousing.

Justification of deviations

To set up the flooring in the warehouse. There will be warehouse area cleaning. According to SOP, temperature tracking will be carried out. The materials will be distributed at warehouse II by SOP. All materials will be moved in a closed container from Warehouse I to Warehouse II.

The QA department's final decision about the deviation

Due to flooring modifications in warehouse I, this planned deviation was made to store secondary packaging materials in warehouse II. According to this deviation: All the individuals engaged in carrying out the deviation received training. The area was cleaned before moving any item, and the temperature was checked and documented by SOP. The following in the warehouse was not completed during this time. There was no area cleanup or temperature monitoring. Impact evaluation: Before the transfer of the material from warehouse I, warehouse II was cleaned and the temperature was maintained. Conditions were kept appropriate. Materials were carefully moved and stowed. The items were moved back from Warehouse I to Warehouse II in a closed container after the flooring modification in Warehouse I was finished. The deliberate diversion is over.

CONCLUSION

To ensure prompt and comprehensive resolution, any identified deviations must be addressed through a well-defined process. This process involves conducting a thorough study, determining the root causes, and implementing Corrective and Preventive Actions (CAPAs). The CAPA system is crucial in preventing recurrence and driving continuous improvement within the pharmaceutical quality management system.By adopting a proactive approach to addressing deviations, pharmaceutical companies can enhance operational effectiveness, mitigate potential risks, and uphold their commitment to providing safe and effective pharmaceuticals while complying with regulatory standards. Maintaining an unwavering focus on deviation management and integrating CAPAs will remain vital for sustained success in this critical industry as it evolves.

ABSTRACT

From 30% of people in their 20s to 84% of people in their 80s, disk bulge prevalence. The prevalence of disk protrusion from 29% in people 20 years old to 43% in people 80 years old. From 19% of people in their 20s to 29% of people in their 80s, annular fissures were more common. To determine the effect of diaphragmatic breathing exercise along with core strengthening exercise in subject with stage I intervertebral disc prolapse. Experimental study was done. Atotalof50subjects were assigned inthisstudy. Pre test and post test were analyzed and documented by using Numerical pain rating scale, Range of motion,Quality of life questionnaire. The subjects wereseparated into a pair of groups based on the inclusion and exclusion criteria. Group DBE+CS and CS diaphragmatic breathing exercise and core strengthening exercise and only strengthening exercise were given respectively and documented in statistical analysis. Both the group intervention given for five days for four weeks. Each meeting time comprised two sets of ten repetitions with a ten-second hold in between for each group. According to the statistical analysis, there was an statistically significant enhancement (p<0.0001) in both groups' pre- and post-exercise values. Additionally, there's a significant difference (p<0.0001) in the post-exercise outcomes

80502

between the two groups, suggesting that diaphragmatic breathing plus core strengthening activities work better than core strengthening alone. Diaphragmatic breathing exercise along with core strengthening has been shown to be more effective than core strengthening exercise alone at relieving pain and increasing ROM, and improving quality of life.

Keywords: Intervertebral disc degeneration, lumbar vertebrae, breathing exercise, intervertebral disc displacement.

INTRODUCTION

About 80% of people will experience low back pain due to disc bulge at some point in their lives, and intervertebral disc structural alterations account for about 80% of the causes of this pain.[1] Disc herniation, often referred to as intervertebral disc prolapse (IVDP), is a common condition connected to the potential for degenerative discs on by bad posture or external damage to the spine, especially during back stretches and spinal flexion/rotation exercises. compression, bulging, a protrusion, sequestration, and herniation are the stages of IVDP.[2] The most prevalent recognized cause of lumbar discomfort is degenerative disc disease, which is prevalent around the world.[1]low back pain is the reason and impairment of symptomatic lumbar disc bulging. During imaging in the upright neutral, flexion, and extension positions, disc bulging beyond the intervertebral space was measured. Normal discs were categorized as grades 1 to 2, while degenerate discs were categorized as grades 3 to 5.[5] Degeneration of the disc is a cellularly mediated abnormal reaction to increasing structural failure. A disc that has structural breakdown together with rapid or advanced aging symptoms is said to be degenerative.In a structurally sound disc, early degenerative alterations should be interpreted as accelerated age-related changes..[6]The etiology of the condition of the subject has numerous investigations. Numerous factors have been linked to its genesis, including mechanical ones such as vibration, shear stress, and compressive pressures, as well as age-related, genetic, systematic, and toxic ones that can lead to the disc's degeneration through biochemical processes.[7] A nucleus pulposus, annular fibrosis, and end plates make up the healthy IVD's three separate parts. The NP, which is situated marginally eccentrically in the IVD, is a mucoid, white, bean-shaped structure that is primarily made of water.[7] The extracellular matrix supports the structural and mechanical activities of the disc; its structure and content determine how the disc responds mechanically. The two main macromolecular elements, matrix and collagens, have the primary mechanical role. [9]

Only the outermost portions of the annulus contains the sensory nerve fibers, which are supplied by the sympathetic cord and the recurrent sinovertebral nerve.[10] disc bulging over their entire spines, >90% of both men and women over the age of 50 had this condition. intervertebral spaces with disc bulging were most common. Obesity and advanced age were linked to all regions having disc bulging. The occurrence of disc bulge in the lower back was linked to low back discomfort.[11] The diaphragm supports the stability of the trunk biomechanically. It has been discovered that diaphragm contractions caused by phrenic nerve activation increased intra-abdominal pressure, which in turn increased spinal stiffness. The diaphragm performs two functions: it stabilizes the trunk and aids in breathing. Pelvic floor muscle, multifidus, and diaphragm transversus abdominis all help to balance the trunk. When there are repeated limb movements, the spine is stabilized by the transversus abdominis and diaphragm's tonic actions, which are adjusted to satisfy respiratory demands during inspiration and expiration.[12] The core is commonly described as the "powerhouse," the starting point or catalyst for all limb motion. It has been recommended that these core muscles be thoroughly strengthened or stimulated in order to prevent and treat a variety of lumbar vertebra and musculoskeletal problems as well as to improve athletic performance Though it is commonly used, not much research has been done on core strengthening. Providing an analytical framework for characterizing the existing literature was the aim of the current study .[12] The stability of the lumbar spine depends on both active rigidity, which is provided by muscles, and passive stiffness, which is supplied via osseous and ligamentous components. It is impossible for a naked spine to withstand significant compression without muscles. Spinal instability is the outcome of any interruption from one of these components..[13]

Special test

A Straight Legs raising (SLR) test for diagnosis is currently used as the primary method for diagnosing the lumbar region disc herniations and has been shown to have a strong correlation with results on operation. This is because the SLR test's sensitivity is limited to disc herniations causing root compression that may require surgery.[14]When a patient lays down on an examination table with the hip in normal rotation, the ankle hanging loose, and the knee completely extended, The patient's leg is passively raised by the therapist.When the hip flex angle reaches ninety degrees, the limb lift is terminated, and if no reactions are elicited, the test is considered inconclusive. To ascertain whether the reactions are muscular or neurological in origin, a structurally different movement unique to a particular site has been introduced to the assess the hip movements at which they have been elicited. The additional movement is givenin accordance with the site of the triggered reacts: At the exact same flexion angle as the elicited reactions, hip inner rotation is performed..[15]

MATERIALS AND METHODS

An experimental study was done with the subjects meeting the inclusion criteria and pre-evaluation of pain, range of motion, Quebec back pain disability scale of the group DBE+CS and CSgroup was recruited from physiotherapy OPD at primary hospital, Chennai, Tamil nadu. This study was approved by institutional scientific review board [ISRB][01/014/2023/ISRB/SR/SCPT]. Though convenient sampling technique 50 individuals were selected for the study. Fifty subjects diagnosed with stage I IVDP were screened for inclusion and exclusion criteria. This study involves both men and women, age group 35 years above with the confirmation of stage I IVDP, pain during SLR more than 30-70 degreeThis study excludes the subject with any abdominal surgery, hernia, neurological illness and non- cooperative person. It was requested of each participant to sign a consent form. Every research participant received the details of the experimental group before giving their informed consent. Two groups of patients (Group DBE+CS-25, and CS-25) were formed. The NPRS was used to measure the pre- and post-test values. lumbar range of motion, quality of life(Quebec back pain disability scale). Group DBE+CS diaphragmatic breathing exercise along with core strengthening exercise + Interferential therapy. (50Hz for 15mins) Group CS(Core strengthening exercise exercise + Interferential therapy).(50Hz for 15mins) Diaphragmatic breathing exercise The patient had to sit up erect in a chair, which extended the space between the sternum and navel. The patient is supposed to have a relaxed posture. You should keep your hands on both sides of your lower ribcage as the patient. They asked to inhale gently through their nose. As the patient inhales, their rib cage should rise and spread. During inhalation, There are three directions that the trunk can extend: front, sides, and back. It is instructed to the patient to exhale via their nose.

When they exhale, patients ought to sense their lower ribs shift inward. Exercise for strengthening the core The patients were given pelvic bridging exercise, piriform is stretching, active double leg SLR, active straight leg rise, single leg knee to chest, both the leg knees to chest exercises.[25] Pre and post test were analysed by pain , rom, qol and documented by using NPRS, inclinometer, Quebec back pain disability scale. numerical pain rating (NPRS) How to Measure Low Back Pain in the Lumbar Region Applying the Numerical Pain Rating Scale, or NPRS. Explain the NPRS as a rating system zero to ten, where 10 represents the greatest amount of pain. Reiterate that the person must choose the number that best represents their current level of pain. Enter the subject's pain score as the selected score on the NPRS scale.[17] To measure the rom range of motion with inclinometer .The inclinometer is zeroed and centred at the mark at T12. It is advised that the patient bend forward as much as they can without bending their knees. For total flexion, the inclinometer's ROM value is noted. To assess lateral flexion range of motion. The range of motion measurement measured by the inclinometer will be recorded as the patient is given instructions to lean as far to their right or right as they can while extending their fingertips along the side of their leg.The inclinometer is situated above the mark at T12 in order to measure extension.[15] Quebec back pain disability scale Describe how each activity has six answer categories that are scored on a 0–5 scale [0 = no effort at all, 5 = unable to do]. If the patient has a lot of pain on that particular day, they should rate the activity a five. If there are no issues, they should give it a zero. The twenty everyday activities that make up the the province of Quebec back pain disability scale are classified as follows: Bed rest 1–3,Sitting/standing 4–6,Ambulation 7–9,Movement 10–12, Bending/stooping 13–

16,Handling of large/heavy objects 17–20.Ask the participant to self-assess their current level of affecting the qol by choosing a number on the Quebec questionnaire Emphasize that their response should reflect their QOL at the present moment. [19]

RESULTS

Table -1 shows the baseline data of group DBE+CS mean(25.29) and CS mean(25.67). **Table-** 2,3,4,5,6 shows the pre test and post test values of pain , range of motion and quality of life of the group DBE+CS and CS group respectively. The significant differences between pre-test and post-test measures of same group were analyzed by Wilcoxon sign rank test and Mann-Whitney U test Diaphragmatic breathing exercise along with core strengthening exercise using NPRS and Quebec back pain disability scale The values for pain median pre-test (9.00) and post-test (2.00), Z value (-4.299) and T value (-300). The values for QOL median pre- test(78.00) post-test (10.00),Z value(-4.289) and T value(-300). As a result, the findings are considered statistically significant that the pvalue is <0.001 shows the Pre-test and Post-test values of pain in core strengthening exercise using NPRS and Quebec back pain disability scale. The values of pain median pre-test (9.75) and post-test(25.00) Z value (-4.242) and T value (-276). The value for QOL pre-test(77.25) post-tesr(58.75) , Z value(-4.202),T value(-276). As a result, the findings are considered statistically significant that the p-value is <0.001. shows the post test values of pain in diaphragmatic breathing exercise along with core strengthening exercise and only core strengthening exercise using NPRS , Quebec back pain disability scale. The values for pain median group DBE+CS(2.75) and group CS(5.00), U VALUE (86.00) and T value (386.00). the values for QOL median group DBE+CS(10.00) and CS(58.75), U VALUE (1.00) and T value (301.00). As a result, the findings are considered statistically significant that the p-value is <0.001. shows the Pre-test and Post-test values of ROM in diaphragmatic breathing exercise along with core strengthening exercise using inclinometer. The values for ROM mean pre-test (117.97) and post-test(134.4), SD value of pre test (2.71) and post test (2.46) and t value (30.33). The values for CS group mean(117.27) and post-test(134.4), SD value of pre test (2.88) post test (3.00), t value (23.60) As a result, the findings are considered statistically significant that the pvalue is <0.001.The significant differences between pre-test and post-test measures of same group were analyzed by unpaired t test. shows the post test values of ROM in diaphragmatic breathing exercise along with core strengthening exercise (group DBE+CS)and core strengthening exercise(group CS) . group (DBE+CS)mean value (134.4) and mean value (129.57) and SD value for group (DBE+CS)(2.46) and group (CS) SD value (3.00). CS group mean value(129.57), SD value(3.00), t test (6.81). As a result, the findings are considered statistically significant that the p-value is <0.001. The significant differences between post-test measures of same group were analyzed by unpaired t test.The results suggest that the findings in both within and between groups were considered to be statistically signif icant with p-value <0.001. thus, the diaphragmatic breathing exercise along with core strengthening exercise significant effectiveness for reducing pain, and improving range of motion, quality of life in subject with stage I intervertebral disc prolapse in mid age peoples.

DISCUSSIONS

The purpose of the study, which lasted four weeks, was to determine whether diaphragmatic breathing exercises and core strengthening exercises could help individuals with the first stage of intervertebral disc prolapse. The study's findings demonstrated that, in participants with the initial stage of intervertebral disc prolapse, core stability plus diaphragm breathing differed statistically significantly from core stability by the pain, range of motion, as well as quality of life. Diaphragmatic breathing exercise in groups DBE+CS, combined with the group CS core strengthening activities and only core strengthening exercises. The findings of the study shows that both groups' quality of life and range of motion had improved along with their pain levels. The p-value of 0.0001 demonstrated the high degree of significance of the outcome. When compared to group CS, the group DBE+CS showed a notable improvement. This decrease in pain is probably due to strengthened transversal abdominis muscle contraction, which strengthens stability, shields lowers stress on the discs between the vertebral bodies and lumbar vertebrae. Thus, the core's original role as "The biological Brace in humans" was restored. Additionally, it has been demonstrated that emotions

Keerthana *et al.*,

such as anxiety affect how well muscles work[11] The diaphragm's costal fibers, which are regarded as aerobic, generate ATP, which powers muscle contractions. Therefore, regular exercise improves quality of life and has favorable psychological consequences for individuals with chronic low back pain. Increased transverse abdominis muscle strength from core strengthening gives the spine stability, which reduces pain because the spine can now more bear the strain placed on it[16] Diaphragmatic breathing involves stimulating the core structures and supporting through raising intra-abdominal pressure, the lumbar spine in along with maintaining a proper respiratory rhythm. Every joint must be positioned steadily to recruit every muscle chain and produce an economical breathing rhythm. The contours of the head, eyes, and spine should all line up, starting from the pelvis and hips and ending at the knee and feet. This can be achieved with adequate diaphragmatic breathing and muscle tone distribution.[16] Reduced chest expansion (CE) is recognized to be a result of pain difficulty, strain, and muscle spasms. It is well known that disc bulging, which causes lumbar discomfort, can result in respiratory issues; in patients with LBP, for instance, CE was significantly lower.[27] The trunk's biomechanical stability is supported by the diaphragm. It was found that phrenic nerve activation-induced diaphragm contractions raised intra-abdominal pressure, which in turn raised spinal stiffness. The diaphragm has two purposes: it helps with breathing and stabilizes the trunk. The diaphragm transversus abdominis, multifidus, and pelvic floor muscle all aid in trunk balancing. The transversus abdominis and diaphragm's tonic motions maintain the spine during repetitive limb movements. These actions are adjusted to meet respiratory needs during inspiration and expiration.[12] The core is commonly described as the "powerhouse," the starting point or catalyst for all limb motion. It has been recommended that these core muscles be thoroughly strengthened or stimulated in order to prevent and treat a variety of lumbar vertebra and musculoskeletal problems as well as to improve athletic performance. Despite its widespread use, there is little study on core strengthening. [12] According to O'Sullivan *et al.* were some of the first writers to contrast conventional aerobic activities with a specifically created stabilizing program. According to their study, patients who followed a specially designed program of stability exercises considerably outperformed individuals who did not receive stabilization exercises in terms of pain relief and functional ability. After 30 months, they conducted a control examination to establish the effects' persistence. The same authors performed a number of experiments on individuals with a condition known as spondylolisthesis, which are established causes of instability in the lumbar spine, with comparable results.[25] The diaphragm functions as the core's ceiling.

The lumbar spine is stabilized by higher pressure inside the abdomen and diaphragm contraction.. According to recent research, individuals suffering from sacroiliac discomfort exhibit compromised diaphragm recruitment. Similarly, difficulties with the body's ventilation system can worsen diaphragm dysfunction and increase compressive stresses on the lumbar spine. As a result, diaphragmatic breathing exercises could be a crucial component of a program for building core strength.[23] As to the research conducted by Priyanka P. Ostwal *et al.* (2014), abnormal breathing patterns are observed in 71% of individuals with disc bulging, irrespective of the stage, throughout several motor tasks.[24] According to study Rajasekar Sannasi, *et al.* (2023) The diaphragm is essential for both breathing and maintaining a stable posture. But in practice and studies, it has been disregarded in exercises to strengthen the core for low back pain. We have highlighted the diaphragm's critical function as a postural stabilizer in this narrative review, and we have suggested that the first step in any kind of stabilizing core exercise should be to facilitate regular breathing patterns and restore the diaphragm muscle's involvement in postural control. [23] According to Sokunbi *et al.* (2015) further documented a 17% rise in plasma levels of serotonin following a 30-minute session of training for core stability with chronic low back pain. Consequently, the process behind exercise-induced analgesia may potentially involve serotonin Exercises for core stability may also provide the patient more control over how they cope with their discomfort.[22] According to study Chul ki et, al (2016)The study demonstrate that vigorous breath exercise therapy can enhance trunk stability and help individuals with chronic low back pain function better in daily activities..[25] Hence the study compared the effect of diaphragmatic breathing exercise along with core strengthening exercise and only core strengthening exercise for pain, range of motion , quality of life in subject with stage I intervertebral disc prolapse. The study concluded that diaphragmatic breathing exercise along with core strengthening exercise was effective than only core strengthening exercise

Table 1: This table represents the age group mean of the participants
Demographic Data: Using descriptive and inferential statistics, the acquired data was tabulated and evaluated.

GROUP	AGE[mean]
GROUP DBE+CS	25.29
GROUP CS	25.67

this table represents the mean of age group among the DBE+CS and CS

Table 2: Pre-test and Post-test values of NPRS and Quebec back pain disability scale in diaphragmatic breathing exercise along with core strengthening exercise

OUTCOME MEASURE:	GROUP DBE+CS	MEDIAN	Z VALUE	T VALUE	P VALUE
PAIN	PRE-TEST	9.00	-4.299	-300	<0.001
PAIN	POST-TEST	2.00	-4.299	-300	<0.001
QOL	PRE – TEST	78.00	-4.289	-300	<0.001
QOL	POST –TEST	10.00	-4.289	-300	<0.001

This table compares median value and standard deviation of pain as measured by the NPRS and QOL measured by Quebec back pain disability scale of group DBE +CS and CS , Z value , T Value , and corresponding p –values are reported to assess the significance of changes between pre-test and post-test scores.

Keerthana *et al.*,

Table 3: Pre-test and Post-test values of NPRS and Quebec back pain disability scale in core strengthening exercise

OUTCOME MEASURE:	GROUP CS	MEDIAN	Z VALUE	T VALUE	P VALUE
PAIN	PRE-TEST	9.75	-4.242	-276	<0.001
	POST-TEST	25.00			
QOL	PRE – TEST	77.25	-4.202	-276	<0.001
	POST –TEST	58.75			

This table compares median value and standard deviation of pain as measured by the NPRS and QOL measured by Quebec back pain disability scale of group CS, Z value , T Value , and corresponding p –values are reported to assess the significance of changes between pre-test and post-test scores.

Table :4 post test values of NPRS,QOL of diaphragmatic breathing exercise along with core strengthening exercise and core strengthening exercise only.

OUTCOME MEASURE: NPRS	GROUP DBE+CS & CS	MEDIAN	U VALUE	T VALUE	P VALUE
PAIN	POST-TEST	2.75	86.00	386.00	<0.001
	POST-TEST	5.00			
QOL	POST TEST	10.00	1.00	301.00	<0.001
	POST TEST	58.75			

This table compares median value and standard deviation of pain as measured by the NPRS and QOL measured by Quebec back pain disability scale of group CS,Z value , T Value , and corresponding p –values are reported to assess the significance of changes between post-test scores.

Table:5 pre and post-test values of ROM india phragmatic breathing exercise along with core strengthening exercise.

ROM		MEAN	SD	t value	P value
GROUP CS	PRE-TEST	117.27	2.88	23.60	0.0001
	POST- TEST	129.57	3.00		
GROUP DBE+CS	PRETEST	117.97	2.71	30.33	0.0001
	POSTTEST	134.4	2.46		

This table compares mean and standard deviation of ROM as measured by the inclinometer of group DBE+CS and CS, t Value, and corresponding p–values are reported to assess the significance of changes between pre test and post-test scores.

Table 6: Posttest values of ROM in diaphragmatic breathing exercise along with core strengthening exercise and only core strengthening exercise.

ROM		MEAN	SD	t test	P value
Group-DBE+CS	Posttest	134.4	2.46	6.81	<0.0001
Group-CS	Posttest	129.57	3.00		

This table compares mean and standard deviation of ROM as measured by the inclinometer of group DBE+CS and CS, t Value, and corresponding p–values are reported to assess the significance of changes between post-test scores

ABSTRACT

Environmental technology refers to the invention of new technologies that help in reducing environmental degradation. Such technology is also referred to as green or clean technologies. Environmental sustainability and its protection have been some of the growing concerns of the global community. 'Digitalization', an invention of technology and a new buzz word has changed the functioning of businesses today. One of the objectives of India's economy is to move towards a cashless economy. Therefore, with the support of internet technology in the banking sector, Fintech or financial technology has emerged, which has improved the delivery of financial services in India. Financial technology encompasses within its scope current technology that seeks to automate the delivery and use of financial services. Fintech is used to help business owners, companies and consumers to manage their financial operations and processes in an enhanced manner. It comprises algorithms and specialized software that are used on smartphones and computers.

Keywords: Fintech, digital technologies, environmental sustainability, Fintech start-ups, digitization, cashless economy.

Uma C Swadimath *et al.,*

INTRODUCTION

India ranks among the major markets across the globe where structural enablers have teamed up to incubate Fintech. The country is in a privileged space as it has nearly 87 percent Fintech adoption rate as compared to the global average of 64 percent. Smart devices endowed with internet and utility infrastructure that includes authentication based on Aadhar have provided impetus to the country's Fintech sector. The Indian Fintech market, which is seen as one of the highest growing technology segments globally and valued at INR 2,30 Trillion (India Today,2023). It is projected to reach approximately INR 8.35 Trillion by 2026 as per the same report if valued at a compounded annual growth rate of approximately 25 percent. According to Arner, Barberis and Ross, Fintech was introduced in 1966 in the United States of America, where the electronic mode of fund transfer was used for the first time. The first ATM was introduced in 1967. In 1970, as a result of NASDAQ being established, a technical communication mode was introduced to facilitate inter-institutional communication between financial institutions. Cross border payments in large volumes were facilitated. In 1990 the concept of digital banking was introduced. In 2008, the post-financial crisis brought new changes in the financial sector. Bitcoin came into existence in 2009, with the help of block chain technology. New innovations in mobile technology like smartphones became primarily indispensable, where people could access various financial services with the support of internet technology. Fintech helps in environmental sustainability as it uses big data, artificial intelligence, allows the adoption of green technologies which can reduce waste and work towards a low carbon footprint. Big data and block chain technology are a few examples where Fintech supports new digital payments and financial solutions that help businesses to move towards financial and environmental sustainability. In India, technological innovations in financial and banking sectors have been encouraged since 1991, when the new economic policy was introduced. Furthermore, in the present day, there are more than one hundred Fintech start-ups in existence. There has been a 40% growth in investments between 2014 and 2016.

REVIEW OF LITERATURE

Buckley, Ross &Arner, Douglas &Barberis, Janos. (2016), in their article on Fintech have described its growth in different phases from the 19th century till the present 21st century. The existence of Fintech is being felt in all developed, developing and emerging economies. The authors relate to the regulation aspect of the Fintech sector and how it increased due to the growth of digital technology. In the third phase as the authors have characterized as Fintech 3.0 relates the emerging era of start-ups and financial technology companies which delivers financial products and services to businesses, financial institutions and to the people. The article analyzes the evolution of Fintech and since 2008 there has been an increase in the number of Fintech across all economic sectors. Sofia Anyfantaki (2016) examines the factors that led to the emergence of the Fintech sector by considering the demand and supply side factors. According to him, the global financial crisis in 2008 was the main cause for Fintech. Due to changing consumer patterns, the traditional banking practices were transformed into digital banking practices due to the advancement in technology and industry 4.0 revolution. The role of banks and other financial institutions is emphasized in promoting the growth of Fintech. Muhammad Fakhrul Yusuf, Hasbullah Ashari & Mohd Rizal Razalli2 (2018) have analyzed how Malaysian firms have used environmental technological innovations in their businesses in view of changes in the global environment. They examined how environmental technology innovations can attain sustainable development which requires investment in research and development and the use of green technologies. Setiawan, Kukuh&Maulisa, Nadia (2020), the authors examine the regulatory approach for Fintech. They opined that Fintech has resulted in disruptive technology which has changed the activities in the financial sector. The article also discusses the evolutionary process of Fintech. To analyze the regulatory approach for Fintech the authors have conducted a historical legal research using qualitative analysis. They have combined the historical aspect with the regulatory approach towards digital financial innovation to measure the development of Fintech in the economic sector. VineetTyagi (2023), analyzes the challenges of environmental changes for the Government of India to maintain a sustainable future. The Government has set a target to obtain net-zero emissions by 2070 which

highlights the importance of environmental sustainability through sustainable financial systems. The author discusses the banking, financial services and insurance sector in India which has been a major driver to technological advancements. The author analyzes how an increase in digital banking and setting up of Fintech with new features in financial solutions will improve the efficiency, promote sustainable investments, and encourage sustainable business practices. With digital technologies such as the internet of things, artificial intelligence, block chain and big data can be used in Fintech to attain environmental sustainability. The author speaks about the role of green Fintech companies where funding is available for sustainable projects that results in reducing carbon footprints. He stressed on the role of banking, financial services and insurance in creating a green economy for environmental sustainability. Yun Qian Zhang (2023) analyzes how Fintech helps to reduce carbon emission in order to protect the environment. The author links green finance and digital finance for environmental sustainability. He analyzes the linkages between green finance and Fintech by using the data from India, Bangladesh and India between 2000 and 2018.

Theoretical Background

Industry 4.0 has resulted in a technology revolution with aggressive inventions and innovations which are adopted by all types of businesses. The very new financial technology known as Fintech has transformed traditional banking and financial services into technology-enabled functions which consist of various products, applications, processes and business models. The most familiar features of Fintech include online banking, online payments, online investments, online transfer of money etc. The theoretical application or framework related to Fintech can be explained in the chart. The Fintech sector includes not only financial players but also Governmental institutions that regulate Fintech related activities. Fintech instruments are shown in the chart which are the access to availability of finance, working capital and secure funding. The use of digital technologies depends on knowledge, skills and financial literacy. The present study finds its application in the Task-Technology Fit model stated by Goodhue and Thompson. The theory is based on the assumption of having a 'good fit' which refers to the expected task to execute with a new technology that is introduced. The theory explains the features of newly introduced technologies, description of the task to be executed where the 'good fit' assumption is applied such that task is executed with the use of technology which creates an impact on the outcome which can be applied to various online financial transactions and services. The chart also explains digital based financial products and solutions, online payments that are facilitated through technology enabled infrastructure. Another theoretical framework is explained to maintain environmental sustainability through the use and innovation of digital financial technologies.

Liu, D., Zhang, Y., and Hafeez, M. (2021) have stated that financial inclusion is necessary to attain sustainable development goals as per the United Nations. According to them, financial inclusion refers to where businesses look for affordable financing and get access to green technology investments by setting up financial technologies. The chart explains the reasons for the emergence of Fintech because of climate change and to meet sustainable development goals/environmental sustainability. The concept of financial inclusion is emphasized. Financial technology or Fintech is the product of the fourth industrial revolution where all financial transactions take place in the form of digital technologies using internet of things, block chain and artificial intelligence. The global economy is moving towards a cashless economy through the use of digital payment transactions which are facilitated by Fintech. Nicoletti et al. refers to financial technology as the utilization of software which includes computer programming and algorithms to improve financial management for consumers, businesses and financial institutions. The term sustainability was applied to the environment by Hans Carl Von Carlowitz. He examined how forests can be managed on a long term basis but over a period of time the environment started to deteriorate due to population growth, destruction of environmental resources and economic stagnation. It was during this time the term sustainable development was first used by the United Nations Conference held in Stockholm. New terms like eco innovation, green innovation and environmental technological innovation were introduced. Therefore, Fintech or financial technologies can be categorized under eco innovation and technology innovation where financial services, financial products, financial transactions take place in the digital technology form.

Uma C Swadimath *et al.,*

Objectives of the Study

i.   To study the evolution of Fintech in India
ii. To examine the role of financial technologies in promoting environmental sustainability
iii. To identify the challenges in the growth of Fintech in India

The Evolution of Fintech in India

China and India have extensively adopted Fintech. It is 62 percent in China and 52 percent in India. Fintech has extensively evolved ever since the time when banks and banking services went online. The need for a cashless society opened doors for applications and platforms that helped create better management of finances. In fact, the Fintech sector in India has undergone a remarkable growth over the past years.Intense penetration of the internet as well as smartphones have played an important role in the evolution of the Fintech sector. It was the demonetization of the 500 and 1000-rupee currency notes in 2016 that charted the journey of Fintech in India. Though a countable few Fintech players did exist prior to 2016, the country was predominantly a cash dominant economy. The evolution of Fintech in India has been a remarkable journey, marked by rapid growth and innovation. Fintech, short for financial technology, refers to the use of technology to provide financial services. Here's an overview of how Fintech has evolved in India: Early Stages (2000s): The Fintech revolution in India began in the early 2000s with the advent of online banking and electronic trading platforms. Stock trading and online banking services were the first to embrace technology, making it easier for consumers to manage their finances.

Mobile Payments and Digital Wallets (2010s)

The introduction of smartphones and the expansion of internet connectivity in the 2010s paved the way for mobile payment solutions and digital wallets. Companies like Paytm, founded in 2010, gained immense popularity by offering digital wallets that allowed users to make mobile recharges, pay bills, and shop online.

UPI and BHIM (2016)

The Unified Payments Interface (UPI), launched by the National Payments Corporation of India (NPCI) in 2016, revolutionized digital payments in India. UPI made it easier for people to transfer money and make payments through their mobile phones. The Bharat Interface for Money (BHIM) app, based on UPI, further streamlined the digital payment process.

Lending and Credit Services (Late 2010s)

Fintech companies started offering lending and credit services, including peer-to-peer (P2P) lending platforms and digital lending apps. These platforms provided faster and more accessible loans to individuals and small businesses, often with lower transaction costs than traditional banks.

Robo-Advisors and Wealth Management (Late 2010s)

Robo-advisors emerged, offering automated investment and wealth management services. They use algorithms and data analysis to provide personalized investment advice, making it more affordable for retail investors to access professional financial advice.

Insurtech (Late 2010s)

The insurance sector witnessed the emergence of insurtech startups. These companies utilized technology to streamline the insurance buying process, claims management, and customer service.

Blockchain and Cryptocurrency (2017 Onwards)

The interest in blockchain technology and cryptocurrencies, such as Bitcoin and Ethereum, grew in India. Although there were regulatory challenges, many Fintech companies explored block chain applications, and cryptocurrency exchanges gained popularity.

Regulatory Changes (2020s)

The Reserve Bank of India (RBI) introduced regulatory changes to support the Fintech industry and promote digital financial services. These changes included guidelines for payment aggregators, digital lending platforms, and digital KYC processes.

Open Banking (Ongoing)

Open banking initiatives have started gaining momentum in India. This allows consumers to share their financial data securely with third-party providers, leading to the development of innovative financial products and services.

Rural and Tier 2/3 City Expansion (Ongoing)

Fintech companies are increasingly focusing on expanding their services to rural and smaller cities, reaching previously underserved populations and contributing to financial inclusion. The evolution of Fintech in India is ongoing, with innovations in areas like blockchain, artificial intelligence, and data analytics playing a significant role in reshaping the financial landscape. While challenges like data privacy and regulatory concerns persist, the future of Fintech in India appears promising, with continued growth and increased accessibility to financial services for all segments of the population.

Impact of Fintech on Banking and Financial Sector

The impact of Fintech on the banking and financial sector has been profound, reshaping the industry in numerous ways. Here are some of the key impacts:

Digital Transformation

Fintech has accelerated the digital transformation of the banking and financial sector. Traditional banks and financial institutions have had to adopt digital technologies and online services to remain competitive. This has led to the development of user-friendly mobile apps, online banking platforms, and digital customer service.

Increased Access

Fintech has expanded financial services to underserved and unbanked populations. Mobile banking and digital wallets have made it easier for people in remote and rural areas to access and use financial services.

Lower Costs

Fintech companies have introduced cost-effective and efficient solutions, reducing the fees associated with traditional banking services. This has made financial services more affordable for consumers.

Enhanced Customer Experience

Fintech companies prioritize user experience, resulting in more intuitive and convenient financial services. Customers can perform transactions, manage investments, and access financial information with greater ease and speed.

Alternative Lending

Fintech has revolutionized lending by introducing peer-to-peer lending platforms and digital lending apps. Borrowers can access loans quickly, and investors can diversify their portfolios, creating a win-win situation for both sides.

Risk Assessment and Fraud Prevention

Fintech leverages advanced data analytics and artificial intelligence for risk assessment and fraud prevention. Machine learning models help banks and Fintech companies identify unusual patterns and detect fraud in real time.

Personalized Services
Fintech leverages customer data to offer highly personalized financial services. This includes robo-advisors that provide tailored investment advice, custom credit offerings, and personalized budgeting and savings tools.

Block chain and Cryptocurrency
Fintech has played a significant role in the development and adoption of blockchain technology and cryptocurrencies. This has the potential to revolutionize cross-border transactions, reduce settlement times, and provide alternative investment opportunities.

Regulatory Changes
The rise of Fintech has necessitated changes in regulatory frameworks. Many governments have introduced new regulations to ensure consumer protection, data privacy, and cybersecurity. Regulatory sandboxes allow Fintech companies to test their innovations in a controlled environment.

Competition and Collaboration
Traditional banks face competition from Fintech startups, leading to innovation and improved services. Banks are also increasingly collaborating with Fintech companies to leverage their technology and reach new customer segments.

Global Reach
Fintech has made it easier for businesses and individuals to engage in cross-border transactions, investments, and payments, thus fostering international financial integration.

Financial Inclusion
Fintech has played a vital role in promoting financial inclusion by providing access to banking and payment services for those who were previously excluded from the formal financial sector.

Disruption of Traditional Banking Models
Fintech has disrupted traditional banking models by offering a variety of financial services without the need for brick-and-mortar branches. This has forced banks to rethink their strategies and adapt to a more digital-focused environment.

Data Security and Privacy Concerns
The collection and use of extensive customer data by Fintech companies have raised concerns about data security and privacy. This has led to a focus on data protection regulations and the need for strong cybersecurity measures. In summary, Fintech has had a transformative impact on the banking and financial sector. It has improved access, lowered costs, enhanced customer experiences, and driven innovation. However, it has also introduced new challenges related to regulation, data security, and privacy that both Fintech companies and traditional financial institutions must address to ensure the continued success and trust of the industry.

Role of Fintech in Promoting Environmental Sustainability
By operating a 'Green supply' chain
Fintech's intrinsic use of artificial intelligence, big data and real-time information renders the industry an exemplary role model when implementing environmentally friendly and sustainable logistical practices. Collaboration and transparency between the supply chain members is essential for the 'green' supply chain to function and this eventually reduces waste and improves the cost-effectiveness for all the participants.

Innovations in banking and payment solutions
The banking industry has transitioned well beyond recognition during the past few decades. Though the traditional high street banking services are available to date, development of new financial technologies has provided modern

alternatives for both individuals and businesses. The Fintech industry has developed very cost-effective, state of the art banking systems which are sustainable and which assist organizations in reducing their carbon footprints.

Acceleration of net-zero ambitions
The ways in which net-zero ambitions can be achieved are discussed below:

Optimization of process and digitization
This is possible by creating sustainable operations that consider the preference of stakeholders and promote business suppleness. By embracing advanced technologies like cloud native architecture for data driven optimization of processes, businesses are able to meet their emission reduction goals. Besides, they also set new industry standards. These measures facilitate the significant reduction of CO2 emissions.

Transparency with respect to carbon data
Making use of technology guided solutions that lead organizations with carbon accounting across the value chain IoT and block chain enabled technology.

Circular products and services
Providing services and building products that can be reused and are sustainable with negligible pollutants.

Data ecosystems and ventures
By adopting cross industry data-sharing ecosystems that enable adherence to sustainability regulations.
The data ecosystems provide valuable and real time insights into the societal as well as environmental impacts of any product or service; all this while permitting the organizations to meet their compliance goals and sustainability targets.

Responsible Artificial Intelligence for sustainable results
The role played by technology in promoting sustainable development like artificial intelligence has changed the way we think, work and live and relate to one another.

Business processes and operations can be enhanced with AI enabled systems
While on the one hand companies use AI to improve efficiency and output and reduce energy costs, training through artificial intelligence demands a lot of energy. So, in order to sustain any organization's efforts to lessen its environmental footprint, measures must be taken to decrease the carbon outputs of its AI models. AI models need to be significantly efficient to ensure that training through the AI model does not entail extensive use of energy or computing power to enhance accuracy and performance. Organizations need to conduct an accuracy versus efficiency test to find out if the resources used are justified from both the environmental and business perspective.

Challenges to Fintech in India
Fintech companies are generally known to use innovative, cutting edge technology in order to automate and improve financial services and face several challenges in the present economic climate. Let us discuss some of the frequent challenges posed.

Challenges to the Growth of Fintech
Uncertainty posed by the pandemic
One of the major challenges emanated from the uncertainty caused by Covid-19 pandemic. Furthermore, the sudden and acute economic downturn led to rapid decline in consumer expenditures and spending coupled with increased ambiguity and uncertainty for businesses rendering it difficult for Fintech companies to plan for their future ventures and future growth.

Uma C Swadimath *et al*.,

Challenges posed by regulatory bodies

Increase in regulatory scrutiny poses another challenge to Fintech companies. As these companies become more conventional and mainstream, they disrupt traditional financial institutions. Hence regulators have started scrutinizing their operations to ensure that they adhere to their laws and regulations. These strict regulations and adherence requirements can enhance the costs and delays for Fintech companies thus rendering it challenging to contest and compete with well-established financial institutions.

Saturation of market

In addition, Fintech companies face immense rivalry from traditional financial institutions, which have adopted an identical path by adopting similar business models and technologies in order to stay competitive. Consequently, Fintech companies are finding it increasingly challenging to differentiate themselves in the crowded Fintech market to attract and retain customers.

Challenges posed by cyber security

Fintech companies face hurdles related to data privacy and cyber security. Since they gather and store sensitive financial data, they are perpetually at risk of data breaches and cyber-attacks. Such foes can result in damage to reputation, legal liabilities and losses, particularly financial losses, if they are unable to conserve the data of their customers. However, it is to their credit that despite such challenges many Fintech companies have adapted and are on the path to development and growth. Many Fintech companies have taken advantage of the increased demand for digital financial services which became very popular during the pandemic; some others have shifted their focus on digital payments and lending. The Fintech companies need to navigate the above mentioned challenges and find ways to remain competitive in order to succeed in the present economic climate.

Challenges to Fintech in Promoting Sustainability

Leaving aside the rosy side of green financing, it comes along with a set of challenges. The most challenging being winning over the consumer, which forms the initial phase of the journey. It becomes essential sometimes to convince the stakeholders to prioritise the planet over profit for the sake of larger gains. Alignment of environmental and financial objectives is another major challenge as environmental objectives are seen as contradictory to financial ones. Funding over the competing needs and addressing the inefficiencies in the green finance space are other challenges in this direction. India requires about 162.5 lakh crores till 2030 for NDCs (nationally determined contribution) and INR 716 lakh crores to obtain net-zero emissions by 2070. India suggested the issue of green bonds in 2015. RBI joined the Network for Greening the Financial System (NGFS) to support the green economy practices in 2021, thereby encouraging environmental progress and eliminating climate related risk. Looking closely at the landscape of green finance in India, it has evaluated the financial flow in energy, transportation, infrastructure and a footprint in several other sectors. GreenFintech plays a major role in the journey to a low-carbon future. Thus, a sustainable green Fintech company is no longer a fad. The Fintech industry adopts a green shade with new products, funds and investment strategies.

CONCLUSIONS

Industrialisation has resulted in environmental degradation, the environmentalists and according to the sustainable development goals, the environment can be saved and protected through new environmental technology and innovation. With rapid digitalization, every Fintech unit that uses digital technologies has made banking easy and with the use of AI, block chain technology has to an extent reduced the carbon footprint on the environment. Blockchain is one of the digital technologies which supports other technologies for financial payments and solutions. India being the hub of Fintech encourages disruptive solutions in the form of insurtech, analytics and investment digital platforms. In the Asia Pacific region India has the second largest number of Fintech startups with China in the lead. The policy makers should encourage green initiatives to develop new green Fintech business models which can

be cost-effective, use renewable energy, ensure transparency in financial transactions and contribute towards the attainment of environmental sustainability.

ABSTRACT

The binding of the biologically important 1-aminoanthraquinone (1-AAQ) with magnetic nanoparticles such as Fe_3O_4, Fe_3O_4/CdTenanoparticles have been examined through various spectroscopic measurements. Absorption studies indicate the formation of ground state complex between 1-AAQ with Fe_3O_4 and Fe_3O_4/CdTenanoparticles. Fluorescence quenching of 1-AAQ is mainly due to static in nature which is confirmed through life time measurements. The binding constant values obtained from fluorescence measurements confirm the efficient binding of 1-AAQ with Fe_3O_4 and Fe_3O_4/Cd Tenanoparticles. Fe_3O_4 nanoparticles strongly bind with 1-AAQ when compared with Fe_3O_4/Cd Tenanoparticles. Thermodynamic parameters were calculated from the fluorescence quenching data and indicate the possibility of charge transfer from 1-AAQ to the nanoparticle. Therefore, combining 1-AAQ with magnetic nanoparticles as carriers is a promising avenue for improved delivery to cancerous areas in photodynamic therapy. These findings may also provide important information for optimizing 1-AAQ's application in this field.

Keywords: 1-aminoanthraquinone, Nanoparticle, fluorescence quenching

Manivannan *et al.,*

INTRODUCTION

Numerous studies are being done on quantum dots (QDs) and super paramagnetic nanoparticles (MNPs), especially for their uses in biotechnology and medicine [1]. Innovative opportunities in biology, medicine, sensors, optics, solar cells, barcodes, lasers, etc. were made possible by the development of QD technology [2-6]. In light of their improved photostability and larger quantum yield, QDs have outperformed with organic fluorophores in labeling in recent years. QDs are employed in biotechnology and medicine in a variety of applications, including immunoassays, DNA hybridization, and optical detection of cancer cells [7-10]. Quantum confinement determines the size-dependent unique optical features of QDs [11]. For this reason, different QDs can be excited at a single wavelength by semiconductor QDs with size-tunable emission color and a broad absorption/narrow emission spectrum. The aforementioned is incredibly advantageous for optical detection of many objects or events. Superparamagnetic   Iron Oxides (SPIOs), typically react to an external magnetic field by potentially generating a signal or dragging or holding particles, are indispensable for the effective functioning of magnetic nanoparticles [12]. Thus, SPIOs are being employed in immunoassays, cell sorting, magnetic separation, and diagnostic imaging [13-17]. Specifically, academia and industry have done extensive research on the use of MNPs in cancer therapy, hyperthermia, drug/gene delivery, cell tracking, and magneto resistive biosensors. Porphyrin-iron oxide nanoparticle conjugates can be used as bimodal anticancer drugs for combined PDT and hyperthermia therapy [18]. HeLa cancer cells have a tendency to efficiently absorb these conjugates. The cells fostering the nanocomposites experienced apoptosis, triggering a major transformation in their shape when they were exposed to yellow light. These findings demonstrate that these nanoparticles endure the potential to be employed for cancer treatment. Hence, developing magnetic/fluorescent composites such as Fe_3O_4/CdTe nanoparticles for imaging, drug delivery are current area of research. These multi-functional nanocomposites exhibited favorable magnetic and fluorescent properties. It is anticipated that Fe_3O_4/CdTe nanoparticles could have prospective applications in magnetically guiding and optically tracking gene and medication delivery 1-Aminoanthraquinone (1-AAQ), a quinone photodynamic pigment having strong absorption in the visible region and possess high photostability. Scheme 1 shows the chemical structure of 1-AAQ. 1-AAQ proved to be a promising candidate for photodynamic treatment of some vascular diseases, such as port wine stains and age-related macular degeneration (AMD) [19]. Besides their excellent photodynamic activity they also show better activity towards tumors and viruses [20-27]. It was discovered that natural quinonoid molecule exhibits the antitumor and antiviral activities against several types of viruses, including the human immunodeficiency virus [28]. Since 1-AAQ is a good visible photosensitizer with high intersystem crossing quantum yield, its interaction with magnetic nanoparticles could reveal useful information in order to tune its application in photodynamic therapy.

Magnetic nanoparticles such as Fe_3O_4 and Fe_3O_4/CdTe nanoparticles are widely used as drug carriers in magnetic drug delivery system. 1-AAQ is potential drug for photodynamic therapy for some vascular diseases, including age-related macular degeneration and port wine stains. It is our prime intention to study the interaction of 1-AAQ with appropriate biological targets and in this perspective investigation on the interaction of 1-AAQ with FO and FCO nanoparticles is of utmost importance. Since 1-AAQ is a good visible photosensitizer its interaction with magnetic nanoparticles (acting as efficient carrier for its better delivery to cancerous part) could reveal useful information in order to tune its application in photodynamic therapy. By considering all these advantages we have investigated the interaction of 1-AAQ with magnetic nanoparticles such as Fe_3O_4 and CdTe/Fe_3O_4 through absorption and steady state fluorescence, measurements.

MATERIALS AND METHOD

Materials

1-AAQ purchased was from Merck., Te powder, $CdCl_2$. $5H_2O$, 3- Mercaptoprpopyl- trimethosysilane (MPS) purchased from Sigma Aldrich. Tetraethyl orthosilicate (TEOS), NH_4OH were purchased from Merck. Other chemicals and solvents were purchased from LOBA chemicals (India). Double Distilled Water was used for preparing solutions.

Methods

Due to the low solubility of 1-AAQ in water, the solution (1×10^{-3} M) was prepared by adding small amounts of ethanol to double distilled water [29]. A 3µl of 1-AAQ stock solution was taken and diluted to 3.0 ml by adding water resulting in the final concentration of 1×10^{-6} M which was titrated by successive addition of 30 µl stock solutions of Fe_3O_4 and Fe_3O_4/CdTe nanoparticles (1×10^{-3} M). Titrations were manually done by using micro pipette for the addition of Iron oxide. All spectral measurements were done in ambient temperature (25 °C).

Instrumentation

Steady-state measurements

Absorption spectra were recorded using Cary 300 UV- Visible spectrophotometer in the range of 200-800nm. Steady state fluorescence quenching measurements were carried out with JASCO FP-6500 spectrofluorometer. The excitation (460 nm) and emission (610 nm) slit, width (10, 20 nm) and scan rate (500 nm/min) of 1-AAQ were kept constant for all the experiments. Quartz cells (4x1x1cm) with high vacuum Teflon stopcocks were used for spectral measurements. Fluorescence lifetime measurements were performed using a picosecond time-correlated single photon counting (TCSPC) spectrometer. A tunable Ti-sapphire laser (TSUNAMI, Spectra Physics, USA) served as the excitation source. Data analysis was conducted with the DAS-6 software provided by IBH.

Preparation of Fe_3O_4 Nanoparticles

Under nitrogen atmosphere, $FeCl_3$ (anhydrous) and $FeSO_4.7H_2O$ were dissolved in water in a mole ratio of 2:3 of Fe^{3+}/Fe^{2+} and swirled with a magnetic stirrer for 30 minutes. Later that, 1.5 moles of NH_4OH were systematically added to the solution until the reaction mixture's pH reached 8. At this pH, the process was allowed to proceed for a maximum of two hours. Upon magnetic field separation, the resulting Fe_3O_4 nanoparticles were repeatedly precipitated, dried, and purified[30].

Preparation of Fe_3O_4/ CdTe Nanocomposite

Preparation of Iron - Oxide Magnetic Nanoparticle

The preparation of iron-oxide magnetic nanoparticles was accomplished by chemical co-precipitation [31]. The PEG 4000-modified Oxide solid precipitations were magnetically separated, rinsed with water numerous times until the pH value reached 7.0, and then dried at 40 °C for 48 hours following a 30-minute reaction at 40 °C under mechanical stirring and N_2 protection. Citric acid was added once again to the PEG 4000-modified iron oxide magnetic nanoparticles to improve their dispersibility, as previously described [32]. In 100 milliliters of 0.5 M citric acid, approximately 0.5g of PEG 4000-modified iron oxide nanoparticles were diluted. Large and aggregated particles were eliminated from the mixture by centrifuging it after it had been treated with ultrasonic therapy for 4.0 hours at room temperature while being stirred mechanically. The colloidal iron oxide nanoparticles were underwent washing four times with acetone. The resultant product is finally dried at 40°C for 1h.

Preparation of Fe_3O_4@SiO_2 – SH Nanocomposite

The Stober method was used to coat Fe_3O_4 nanoparticles with silica in order to create magnetic/fluorescent nanocomposites. Initially, we filled a 250 ml three-necked flask with 20 mg of citric acid-modified Fe_3O_4 powder, 20 ml of water, 2.5 ml of ammonia solution, and 50µl of ethanol. Following 30 minutes of mechanical stirring and sonication at room temperature, TEOS and 30 milliliters of ethanol were added to the flask dropwise. The amount of TEOS used was varied to adjust the thickness of the silica shell. Following an 8.0-hour reaction at 35°C with constant stirring, 10 milliliters of ethanol and various MPS were added to the flask dropwise. At 35 °C, the reaction continued for 12 hours. The resultant Fe_3O_4@SiO_2 – SH nanocomposites were stored to further use.

Preparation of TGA-CdTe QDs

The TGA-CdTe QDs was synthesized using the reaction between the Cd^{2+} and NaHTe solution by following a method [33], with TGA as a stabilizing agent. The $NaBH_4$ was reacted with Te powder (3:1 molar ratio) in water to produce NaHTe. The molar ratio of Cd/Te^{2-}/TGA of 1: 0.2: 2.4 was used. The fluorescence of the CdTe crystals could be tuned in color by changing the heating time at140 °C. Based on the literature procedure and TGA as a stabilizing

Manivannan *et al.,*

agent, the TGA-CdTe QDs are formed by reacting Cd^{2+} with NaHTe solution. NaHTe was generated by a 3:1 molar ratio reaction between Te powder and $NaBH_4$. The $Cd/Te^{2-}/TGA$ molar ratio of 1:0.2: 2.4 was applied. A temperature change of 140 °C might be used to adjust the appearance of the CdTe crystals' fluorescence.

Synthesis of Fe_3O_4 / CdTe Nanocomposite

The thiol-functionalized Fe_3O_4 SiO_2 nanoparticles and the as-prepared TGA-functionalized CdTe QDs were conjugated via bonding between thiols on QDs and silica. To summarize, a 100ml flask with three necks was filled with 20ml of functionalized Fe_3O_4 SiO_2 aqueous solution and 5ml of produced TGA-stabilized CdTe QDs. The mixture was stirred while being protected by N_2 followed by dropwise addition of 3.0 M NaOH aqueous solution until the pH reached 11.0. A magnet was used to successfully collect and purify the magnetic/fluorescent nanocomposite after it had reacted for 6.0 hours at room temperature with mechanical stirring and N_2 protection [34]. It forms the magnetic/fluorescent nanocomposite.

RESULTS AND DISCUSSIONS

Spectral characterization of Fe_3O_4 (FO) and Fe_3O_4/CdTe (FCO) nanoparticles

The prepared Fe_3O_4 (FO) and Fe_3O_4/CdTe (FCO) nanoparticles were characterized by using absorption and fluorescence measurements. Figure 1 shows the absorption spectra of FO and FCO nanoparticles. FO nanoparticles show characteristic absorption band at 359 nm. A new absorption band appeared around 450-550 nm indicates the formation of FCO nanoparticles. The characteristic absorption spectrum of CdTe quantum dots becomes less pronounced after binding with FO to form FCO nanoparticles. Furthermore, the emission spectra of FCO nanoparticles appeared at 550 nm under excitation of 500 nm (Figure 1) supports the formation of FCO nanoparticles. The observed spectral values were well matched with the previously reported values [35].

Ground state interaction of 9-AAQ by Fe_3O_4 and Fe_3O_4/CdTe nanoparticles

The polar surface of nanoparticles assist adsorption of polar species in solution and such interactions can lead to absorption spectra changes of these molecules [36]. The absorption and emission spectrum of 1-AAQ is given in figure 2. The absorption of 1-AAQ appeared at 460 nm and emission at 610 nm. The interaction between 1-AAQ with FO and FCO nanoparticles in the ground state were investigated by UV–Visible absorption spectroscopy. Figure 3 and 4 shows the absorbance spectra of 1-AAQ in the absence and presence of FO and FCO nanoparticles respectively. In the presence of FO nanoparticles, the 1-AAQ absorption band at 460 nm increases along with red shift (up to 510 nm) which indicate a strong interaction between 1-AAQ and FO nanoparticles. Such charge-transfer type of interactions arising from the interaction of sensitizers with nanoparticles has been extensively investigated in earlier studies [37-40]. In the presence of FCO nanoparticles, the absorbance of 1-AAQ is increased without change in the location of peak. The inference is that the interaction of 1-AAQ with FO nanoparticles is stronger than FCO nanoparticles. This indicates that the presence of CdTe in FO nanoparticles reduces the binding efficiency of 1-AAQ with FO nanoparticles.

Fluorescence measurements

The excited state interaction of 1-AAQ with FO and FCO nanoparticles were studied by fluorescence spectroscopy. Fluorescence quenching may be due to static or dynamic mode. Static quenching refers to fluorophore-quencher complex formation whereas in dynamic quenching fluorophore and the quencher come into contact in the excited state. Figure 5 shows the emission spectra of 1-AAQ in the absence and presence of FO nanoparticles. Addition of FO nanoparticles leads to significant quenching of the fluorescence intensity of 1-AAQ. Similar type of quenching occurs by the addition of FCO (Figure 6). We have recorded the emission spectrum of FCO at the same excitation wavelength (460 nm) of 1-AAQ; the fluorescence of FCO is not observed at this excitation. Further FO is transparent at this excitation wavelength. From this observation we confirmed that the observed quenching is entirely due to interaction of 1-AAQ with nanoparticles and not due to inner filter effect or reabsorption.The Stern-Volmer relationship has been used for the analysis of fluorescence quenching,

$$I_0/I = 1 + K_{SV}[Q]$$

where 'I$_0$' and 'I' are the emission intensities of 1-AAQ in the absence and presence of quencher respectively. 'K$_{SV}$' is the Stern-Volmer constant and [Q] is the concentration of quencher. The bimolecular quenching rate constant 'k$_q$' is calculated by using,

$$k_q = K_{SV}/\tau$$

where 'τ' is the excited state fluorescence lifetime of 1-AAQ in the absence of quencher. The Stern-Volmer plots for the quenching of 1-AAQ by FO and FCO nanoparticles are shown in figure 7. The plots of I$_0$/I vs [Q] are linear for both FO and FCO nanoparticles. From this linear plot, the K$_{SV}$ and k$_q$ values were determined [Table 1]. Since the lifetime of 1-AAQ is in the order of 10^{-9} s, the calculated bimolecular quenching rate constant (k$_q$) was found to be higher than the maximum collisional quenching (k$_q$) of various kind of quenchers to biopolymers (2.0×10^{10} M^{-1}s^{-1}). Hence the fluorescence quenching results from complex formation of 1-AAQ with FO and FCO nanoparticles and not due to dynamic nature [41]. To get more insights, fluorescence quenching of 1,10-anthraquinone in presence of FO and FCO nanoparticles was measured. The bimolecular quenching rate constant (k$_q$) was found to be in the range of 3 $\times 10^{-8}$ M^{-1}s^{-1} and 5×10^{-8} M^{-1}s^{-1}. The obtained result indicates the vital role of –NH$_2$ group in the fluorescence quenching process. The presence of –NH$_2$ group enhance the electron density of the molecule and enable the 1-AAQ to bind efficiently with the nanoparticles. Fluorescence quenching experiments accomplished at three different temperatures in order to identify the sort of quenching mechanism. As the temperature increases, the quenching rate constant decreases (shown in table 1). It indicates the process of static quenching. Measuring the fluorescence lifetime is useful in figuring out the interaction between the acceptor and donor systems. Since a linear Stern-Volmer plot can also result from static quenching, as observed during steady-state measurement. The most reliable technique for differentiating between static and dynamic quenching processes is typically time-resolved measurement [42].1-AAQ shows single exponential decay in the presence of FO and FCO nanoparticles as well as in diluted solutions. The fluorescence lifetime of 1-AAQ remains unchanged as the concentration of FO and FCO nanoparticles increases. This suggests that a static mechanism causes quenching. The decay traces of 1-AAQ in the presence and absence of FO nanoparticles are presented in Figure 8, however the lifetime of 1-AAQ is unaltered in both circumstances. As a result of the kinetic traces, the plot appears as a single decay curve. This outcome demonstrates that FO and FCO nanoparticles quench 1-AAQ in a static manner. The fluorophore and quencher combine to produce a complex, which causes static quenching. Accordingly, the following procedure was used to calculate the association constant (K) using fluorescence quenching data. Hence from the fluorescence measurements the binding affinities of 1-AAQ to nanoparticles were calculated from the following equation.

$$\frac{1}{(F^0 - F)} = \frac{1}{(F^0 - F')} + \frac{1}{K(F^0 - F')[Q]}$$

where F^0 is the fluorescence intensity of free 1-AAQ, F' is the fluorescence intensity of 1-AAQ in the presence of nanoparticles and F is the observed fluorescence intensity at its maximum. A plot of 1/(F$_0$–F) Versus 1/[Q] gives a straight line and from the slope the association constant (K) was calculated (Figure 9). The K of both 1-AAQ-FO and 1-AAQ- FCO are listed in table 1. From the value it is clear that FO have stronger interaction with 1-AAQ than FCO. The decrease in fluorescence intensity of the 1-AAQ is mainly attributed to electron transfer to the conduction band of semiconductor nanoparticles [43]. The Vander Waals force, hydrogen bond formation, electrostatic interaction, and hydrophobic interaction were the forces responsible for the interaction between the nanoparticle and the 1-AAQ molecules. Thermodynamic parameters such as enthalpy change (ΔH) and entropy change (ΔS) can be used to confirm the fashion of interaction. Hydrophobic contact is indicated by $\Delta H > 0$ and $\Delta S > 0$; Vander Waals forces or hydrogen bond formations are implied by $\Delta H < 0$ and $\Delta S < 0$; the presence of electrostatic force is indicated by $\Delta H \approx 0$ and $\Delta S > 0$ [44,45]. According to thermodynamic equations

$$\ln K = -\frac{\Delta H}{RT} + \frac{\Delta S}{R}$$
$$\Delta G = \Delta H - T\Delta S = -RT \ln K$$

The preceding equation, where R is the gas constant, T is the temperature, and K is the association constant at the corresponding temperature, can be used to determine the free energy change (ΔG) based on association constants acquired at different temperatures. The plotting of lnK versus the reciprocal of absolute temperature (1/T) generates a straight line and renders the values for ΔH and ΔS. The table 2 reveals the results of the calculation of the thermodynamic parameters. When ΔG is negative, it signifies that the interaction is occurring spontaneously. The Vander Waals interaction and hydrogen bond formation are shown by negative enthalpy and entropy values. Thus, hydrogen bond formation and the Vander Waals interaction are the main mechanism that causes the nanoparticles bind with 1-AAQ. HongweiGu et. al., studied the interaction of FO nanoparticles with porphyrin through –OH group [18]. In a similar way the –OH groups present in 4th and –NH$_2$ group present in 9th position of 1-AAQ will be responsible for the efficient interaction with magnetic nanoparticles (Scheme 2). But in the case of FCO, CdTe quantum dots are in the surface of FO nanoparticles which reduces its efficient binding with 1-AAQ. Hence it possesses lower K value. Strong interaction with drug molecule is vital criteria for efficient drug carriers. From the results it is clear FO will be a better drug carrier candidate than FCO. Upon examining the table 2, it is evident that the magnitudes of ΔH and ΔS suggest the potential for both hydrogen bonding contact and charge transfer between 1-AAQ and nanoparticles. Charge transfer transpires between the molecules despite the oxidation potential and hydrogen bonding capabilities of 1-AAQ. The ability of the excited state of 1-AAQ to inject the charge transfer into the conduction band of FO is determined by energy difference between the conduction band potential of nanoparticles and the oxidation potential of the excited state 1-AAQ. According to the equation,

$$E_{s*/s+} = E_{s/s+} - E_s,$$

where $E_{s/s+}$ is the ground state oxidation potential (2.01 V), E_s is the excited state energy (2.69 eV). The calculated excited oxidation potential ($E_{s*/s+}$) of 1-AAQ is -0.68 V. The conduction band energy level favors the electron transfer from excited state 1-AAQ to the conduction band of FO and FCO and it is thermodynamically favorable. This might be the possible reason for the non-radiative process.

CONCLUSION

The potential drug 1-AAQ bind with magnetic nanoparticles such as Fe$_3$O$_4$(FO), Fe$_3$O$_4$/CdTe (FCO) was investigated by steady state and time resolved fluorescence measurements. The formation of ground state complex was observed from steady state measurements. Life time measurement support static quenching mechanism. The bimolecular quenching rate constant (k_q) and binding constant (K) values are calculated at three different temperatures using fluorescence quenching data. 1-AAQ binds strongly with FO than FCO nanoparticle. Thermodynamic parameters indicate the hydrogen bond formation and charge transfer process between the1-AAQ and nanoparticles. Electrons excited in the 1-AAQ are injected into the conduction band of FO and FCO nanoparticles. Charge transfer process occurs between the molecules and this might be the plausible mechanism of fluorescence quenching process. Hence the combination of magnetic nanoparticles (acting as efficient carrier of 1-AAQ for its better delivery to cancerous part) with 1-AAQ will be a promising pathway in the field of photodynamic therapy and these results could reveal useful information in order to tune its application in photodynamic therapy.

ABSTRACT

Globally, the way that teaching and learning take place in universities has been revolutionized by digital education. In today's educational technology, a Learning Management System (LMS) such as MOODLE is indispensable. An LMS is used by almost all Higher Education Institutions (HEI) to improve learning, encourage creative activities that can be completed from anywhere, and actively involve students prior to, during, and following in-person sessions. This quantitative study intends to analyze MOODLE users' perceptions about the educational impact of MOODLE-based learning management systems. A self-constructed questionnaire was used to conduct this study.A representative sample of MOODLE users are students from social-sci and science contributed in this study is selected by purposive sampling. The findings showed that when compared to traditional classrooms, males perceive MOODLE as having a greater positive impact on learning outcomes, such as learning efficacy, control over learning, and more persistent learning. MOODLE specifically improves the learning environment by enabling instantaneous information access, assigning tasks, conducting online tests and discussion boards. Basically, while face-to-face interaction is essential for improving learning, adding MOODLE-based LMS activities can advance skill development.

Keywords: Perception**,** MOODLE, Learning Management System, Education technology

INTRODUCTION

Higher education institutions (HEIs) have the issue of improving opportunities for students to learn while demonstrating the efficacy of their programmes. Increasing student engagement and active learning is a vitalmission for higher education institutions [1].Regarding the long-term development of students' ability to apply knowledge in

80531

real-world contexts, the utilisation of traditional classrooms has changed [2].As a result, policymakers, scholars, and advocacy groups work to progress quality of higher education quality by implementing active methods of learning so that students acquire life-long learning skills which cater need of labour market [3]. Learning Management Systems (LMS) have turn out to be an essential component of educational technology and used by almost all higher education institutions (HEIs) to support teaching and learning activities. The free and open-source e-learning platform MOODLE, which stands for Modular Object-Oriented Dynamic Learning Environment, can be used with a variety of operating systems [4]. E-Learning systems are designed to assist educators and content experts in creating online courseware with rich interaction opportunities. Additionally, a lot of people and organizations all over the world have embraced the open-source teaching management system LMS MOODLE because it offers a tightly integrated set of tools that are said to be created from a socially constructive standpoint [5]. Internationally, higher education institutions (HEIs) have accepted the potential value of incorporating IT into curricula and pedagogical strategies, usually to support student-centered learning. MOODLE is an open-source application in the form of a website that developers can use without paying a license fee. This application allows teachers and students to interact during the digital learning process. The value of e-learning and e-learning means for enhancing educative culture in higher education has been highlighted by studies [6]. Existing e-learning tools like MOODLE, Blackboard, and WebCT are more user-friendly and provide a variety of services. Among them the most popular e-learning tools is MOODLE.

REVIEW OF LITERATURE

There are many studies from developed nations that evaluate MOODLE's efficiency as an e-learning resource in higher education. Face-to-face communication is still essential for enhancing speaking abilities; however, it should be complemented with MOODLE-based LMS techniques [7].More than 40% of teachers agree that the MOODLE facilities are excellent, and more than 60% of teachers agree that using MOODLE has a positive impact on learning. This study also revealed whether teachers believe that resources are not ready for use. More than 30% of teachers who use MOODLE disagree that they are prepared to use it[8]. The most recent technologies, like LMS plugins based on machine learning, could elevate the teaching and learning processes. Students' progress could be tracked with supervised machine learning integrated into an LMS like MOODLE, and positive steps could be used for improving the learning environment in addition to expediting time-consuming tasks [9]. MOODLE helps students learn more effectively and earn higher grades[10]. Students now find learning to be more interesting and accessible because to the integration of MOODLE into their curriculum and the creation of engaging activities [11].With its facilitation of a flexible and welcoming learning environment, MOODLE streamlines the educational process. However, the lack of knowledge, skills, and competences among learners may undermine MOODLE's usefulness and negate its expected advantages[12].

RATIONALE OF THE STUDY

Up until the finish of the academic year 2019–2020, the entire educational process has been conducted online. A learning management system called MOODLE is being used by one of the many educational institutes that are developing this online learning. MOODLE is one of the open-source software programmes in the category. The developer can utilize this application on a website without having to purchase a license. This application makes it possible for teachers and students to collaborate during the digital learning process[13].Using MOODLE is free, and it can be customized to meet user needs. Students who use MOODLE-based electronic learning will be able to access materials, tests, and exams through the website,inspite of not receiving textbooks from the institutions they attend, students can still access learning materials that are updated and delivered based on their needs. Additionally, this education can help students develop their independence in terms of academic tasks[14].Certain the expanding use of LMS in HEIs, a thorough and in-depth understanding of the advantages and disadvantages the pedagogical technology may present for education and its effects on students' lifelong learning is required. Measuring student learning satisfaction is crucial for assessing how well MOODLE support student-centered learning. The keypurpose

of this study is to determine whether MOODLE might be successfully implemented using current higher education practices for technology implementation [15]**.**

OBJECTIVES OF THE STUDY

1. To study the difference in perceptions of students about the role of MOODLE in improving learning outcomes with respect to
   a. Gender
   b. Stream

2. To study the difference in perceptions of students on the usage of MOODLE in terms of its accessibility and easiness with respect to
   a. Gender
   b. Stream

3. To study the difference in perceptions of students about the role of MOODLE based facilities in enhancing learning experiences with respect to
   a. Gender
   b. Stream

HYPOTHESES OF THE STUDY

1**.** There will be no significant difference in perceptions of students about the role of MOODLE in improving learning outcomes with respect to
   a) Gender
   b) Stream

2. There will be no significant difference in perceptions of students on the usage of MOODLE in terms of its accessibility and easiness with respect to
   a) Gender
   b) Stream

3. There will be no significant difference in perceptions of students about the role of MOODLE based facilities in enhancing learning experiences with respect to
   a) Gender
   b) Stream

RESEARCH METHODOLOGY

The present study aims to describe the difference in perception of students towards MOODLE as LMS at tertiary level. The survey method was selected which was most appropriate to the problem under investigation. The students studying in tertiary level using MOODLE constitute the population of   the study. The data is collected from 80 students from social sciences and sciences studying at tertiary level in central university of Jammu comprising the sample of the study.Purposive sampling technique is applied for determining the perceptions of students towards MOODLE as LMS.

TOOL USED IN THE STUDY

A self-constructed Perception scale as a tool developed by investigator with help of Google forms through extensive review of literature related to Perception of students towards MOODLE. The Perception scale consists of three domains and 20 items based on Likert scale consisting of Strongly Agree, Agree, Neutral, Disagree and Strongly Disagree. The dimensions of Perception scale are given as:

INTERPERTATION

In order to accomplish the objectives and hypothesis of the study, the investigator used T- test
Computations of t-ratios for different domain as under;

Testing hypothesis 1

1. To test the difference in perceptions of students about the role of MOODLE in improving learning outcomes with respect to Gender

2. Table 1 shows that the calculated value of t=4.72 is greater than 2.58 i.e at 0.01 level of Significance so it is significant at 0.01 level of significance. Thus, it is concluded that there is gender difference in perceptions of students about the role of MOODLE in improving learning outcomes. As mean of male is 18.85 greater than mean of female is11.28, reflects that male have better perception about the role of MOODLE in improving learning outcomes in terms of learn efficiently, academic performance, learning becomes effective, control over learning and gain more persistent learning than traditional classroom. Therefore, the hypothesis 1(a) that there will be no significant difference in perceptions of students about the role of MOODLE in improving learning outcomes with respect to gender is rejected.

3. To study the difference in perceptions of students about the role of MOODLE in improving learning outcomes with respect to Stream Table 2 shows that the calculated value of t=1.33 is less than 1.96 i.e. at 0.05 level of Significance so it is not significant at 0.05 level of significance. Thus, it is concluded that there is no difference in perceptions of students about the role of MOODLE in improving learning outcomes with respect to Stream i.e. Science and Social Science. Therefore, the hypothesis 1(b) that there will be no significant gender difference in perceptions of students about the role of MOODLE in improving learning outcomes with respect to Stream is accepted.

Testing hypothesis 2

1. To test the difference in perceptions of students on the usage of MOODLE in terms of its accessibility and easiness with respect to Gender Table 2,1 shows that the calculated value of t=0.813 is less than 1.96 i.e. at 0.05 level of Significance so it is not significant at 0.05 level of significance. Thus, it is concluded that there isno gender difference in perceptions of students about the usage of MOODLE in terms of its accessibility and easiness i.e. male and female have equal access and easiness in using MOODLE as LMS. Therefore, the hypothesis 2(a) that there will be no significant gender difference in perceptions of students about the usage of MOODLE in terms of its accessibility and easiness isaccepted.

2. To test the difference in perceptions of students on the usage of MOODLE in terms of perceive its accessibility and easiness with respect to Stream Table 3 shows that the calculated value of t=1.85 is less than 1.96 i.e. at 0.05 level of Significance so it is not significant at 0.05 level of significance. Thus, it is concluded that there is no significant difference in perceptions of students about the usage of MOODLE in terms of perceive its accessibility and easiness with respect to Stream i.e. Science and Social Science. Therefore, the hypothesis 2(b) that there will be no significant difference in perceptions of students about the role of MOODLE in improving learning outcomes with respect to Stream is accepted.

Testing hypothesis 3

1. To Test the difference in perceptions of students about the role of MOODLE based facilities in enhancing learning experiences with respect to Gender Table 3.1 shows that the calculated value of t=0.65 is less than 1.96 i.e. at 0.05 level of Significance so it is not significant at 0.05 level of significance. Thus, it is concluded that there is no gender difference in perceptions of students about the role of MOODLE based facilities in enhancing learning experiences i.e. male and female have equally participated in chats, forums, quizzes, assignments regularly, enhance collaborative learning, communicate with faculty and enjoy course on MOODLE. Therefore, the hypothesis 3(a) is accepted.

2. To Test the difference in perceptions of students about the role of MOODLE based facilities in enhancing learning differently with respect to Stream Table 3.2 shows that the calculated value of t=1.56 is less than 1.96 i.e. at 0.05 level of Significance so it is not significant at 0.05 level of significance. Thus, it is concluded that there is no significant difference in perceptions of students about the role of MOODLE based facilities in enhancing learning experiences with respect to Stream i.e. Science and Social Science. It reflects that learning experiences of students of science and Social Science enhanced equally with the help of MOODLE based facilities. Therefore, the hypothesis 3(b) is accepted.

FINDINGS AND DISCUSSIONS

Males have a more favorable perception about the role that MOODLE plays in enhancing learning outcomes, including learning effectiveness, control over learning, and more persistent learning compared to traditional classrooms than female. It is important to note that some people believe the Internet is primarily used by men and that women are unable to use it because they must balance work and family obligations. This has led to worries about educational equity, especially for women [16].The scholarly community agrees that more research is necessary to fully understand the gender discourse, with a particular emphasis on the differences and similarities in teaching methods and student results. Considering the widely held belief that people do not naturally fit into binary classifications, this is relevant [17;18;19].Numerous studies have found that male and female students engage with online environments in different ways, including in terms of their performance, motivation, perception, study habits, attitudes, and communication behavior.The findings are supported by learners' responses that the MOODLE platform was beneficial, time-saving, and most importantly, that it hadanoptimistic influence ontheir learning. Upon closer inspection of MOODLE, the researcher observed that all study participants engaged accordingly.

CONCLUSIONS AND RECOMMENDATIONS

It is possible to organize information, share ideas, exchange information, and improve communication both synchronously and asynchronously with the help of various courseware tools that are available to educational and training providers as well as users. To achieve the objectives and goals, it is crucial to keep in mind that these tools are merely a platform that must be integrated into the classroom. Users' perceptions of the value and usability of training and education will have an impact on the results. The responsibility is on those who develop and deliver education and training to get users ready to apply newly acquired intellectual capital to become more productive and competitive in the current global environment. Finally, and most importantly, it is the course instructor's duty to develop interactive content that is appropriate for the open learning environment and at the right level to fully utilize all of its functionalities. Overall, it appears that the students value the role that a MOODLE plays in their education and see it as an enhancement rather than a replacement for traditional classroom activities. However, since students appear to have trouble connecting to these concepts, the advantages gained from using communication and collaboration tools to support group work could be improved. Understanding MOODLE as a learning tool may improve class management, idea generation, interactive activities to foster more advanced communicative discussions, and the ability to improve learning outcomes. Therefore, it may be largely up to the faculty to improve the use of MOODLE in higher education, and their perspectives and difficulties should be the subject of specific research. We could achieve an improved considerate of the degree of satisfaction that users in various roles have with MOODLE by comparing their perceptions with those of faculty and students.

ABSTRACT

After India's independence, several polices have been made in social forestry or community management of forest. There was a significant shift toward decentralized and people-oriented forestry. Joint Forest Management (JFM) has developed as a significant intervention in forest resource management since the National Forest Policy was adopted in 1988. The JFM program aims to foster collaboration between local community organizations and state forest agencies in order to manage public forest areas in a sustainable manner and share benefits. The fundamental goal of JFM is to guarantee that forests are used sustainably to meet local needs in an equitable manner while also ensuring environmental sustainability. In this backdrop, this study aims to investigate the status of JFM implementation in erstwhile district of Karbi Anglong in Assam. This study focused on the impact of the JFM scheme and how it was implemented with the help of local authorities, as well as the responses of those who played crucial roles in its implementation. This study also looked at the causes of the failure of the scheme and proposed actions that would have played a vital role if the government had embraced them. This study used qualitative research approaches to collect data and applied critical analysis to evaluate the JFM schemes in the study area. This study concluded that after the extinction of JFM at the national level in India as a result of the Forest Rights Act (FRA) of 2006, attempts to implement social forestry or community forestry at the village level in Karbi Anglong have also been unsuccessful due to the framing of alternative schemes within similar lines as the JFM initiatives in sixth schedule areas of Assam. Such developments have had a significant impact on social forestry or community forestry in the study area.

INTRODUCTION

Forests have been used and protected locally in India for a long time. The earliest examples may be sacred groves, which are an indigenous community method to maintain conservation of the forest (Hughes and Chandran 1998, Tripathi 2005, Saikia 2006, Teron 2008, Medhi and Borthakur 2003, Shilpa et al. 2020, Dhanaraju and Bijeta 2022). Various communities have long safeguarded their forests. Revenue systems designated uncultivated areas as common lands, which included grazing and forest lands. Even after the colonial forest policies recognized the necessity for local ownership and management of forests, they included a provision for Village Forests. Although forest area in India has been largely steady and shows some signs of growth, forest degradation remains a major issue. Forest degradation disproportionately impacts poor rural populations that rely on forest resources for a living. Until recently, the management of government forests was focused on producing goods and services such as wood and other forest products, as well as maintaining the soil and water cycle. Communities' access to these resources was limited to rights and concessions provided for routes, dry wood for fuel wood, and grass and fodder as governed by the government. The management of forest resources in India has been one of the most difficult environmental challenges. Since 1951, degraded lands in India have doubled in area, reaching 174 million hectares by 1990 (Khawas 2003 The Indian government's significant attempts for reforestation and watershed control have predominantly been unsuccessful. The evolution of India's legislative and regulatory framework demonstrates a strong initial concentration on industrial forestry, a gradual transition to social forestry, and a significant shift toward conservation and the adoption of Joint Forest Management (JFM). The National Forest Policy of 1988 incorporates the majority of sustainable forest management principles. It focuses on conservation and expanding the role of communities in forestry stewardship, marking a significant shift in forest management aims. In June 1990, the Ministry of Environment and Forests released a policy circular encouraging state forest departments to incorporate local populations directly in forest management. The 1988 policy has been criticized in some circles for promoting forest conservation at the expense of commercial forest use, for failing to provide practical policy implementation options, and for maintaining forest departments' all-encompassing role, including the contradictory functions of being the forest authority and operating as a public enterprise in commercial forest production. Many of the key provisions governing community-based forestry in national policy have not been strengthened by a new national legal framework. Furthermore, over the last two decades, the Ministry of Environment and Forests has issued various legal amendments, policy circulars, and guidelines that, while supporting the evolution of JFM at the state level, have added excess complexity and overlaps to the legal framework when interpreted by states. Although many of these small legal adjustments were prompted by pressure to adopt creative state practices, there remains a large gap between national policy intent and field implementation at the state level.

MATERIALS AND METHODS

The forest area in Assam's hill areas accounts for around 34% of the region's total geographical area, compared to the regulated forest coverage of 60% specified by the National Forestry Policy of 1952. According to the State of Forests Reports (SFR), 2001, issued by the Forest Survey of India, the total area under forests in Karbi Anglong district was 7,97,200 hectares, accounting for 76.4% of its geographical area. Geographically, the Karbi Anglong region of Assam is separated into two parts: hills and plains. The Karbi Anglong Autonomous Council (KAAC) governs two districts in Karbi Anglong (East and West) under the sixth schedule of the Indian Constitution. However, these two were included the former district of Karbi Anglong in Assam. This region covers 10,434 square kilometres, or about 13.53% of the state's total geographical area of 78,438 square kilometers. Karbi Anglong is a significant hilly region in Assam. This study focused on three territorial forest divisions of the Karbi Anglong Autonomous Council (East Division, West Division, and Hamren Division). The primary data in this study was collected using qualitative research methods. These sources were compiled from relevant government publications, such as the KAAC and Assam State Forest Reports. However, mostly, this study employed secondary sources to comprehend the concept of JFM and its

Vulli Dhanaraju and Bornali Hati Boruah

contemporary reality in India. This study employed critical analysis and interpretative techniques in order to understand the nature of implementation of JFM in Kabi Anglong district of Assam.

RESULTS AND DISCUSSIONS

History of Forest Management in India
Dietrich Brandis was a German forestry expert who became India's first Inspector General of Forests. The concept began in the late nineteenth century, when Deitrich Brandis, creator of the Indian Forest Service, predicted that a forestry system based only on state control would result in widespread dissatisfaction in the countryside (Johnson 1995, Patra 2015). Dietrich proposed four concepts for forest management in India: Brandis acknowledged the need for an appropriate system, which would necessitate parliamentary approval. It was important to develop rules for the exploitation of forest resources. Tree felling and grazing must be regulated in order to preserve forests and provide timber. Anyone who cuts down trees without following the guidelines will face consequences. Brandis established the Indian Forest Service in 1864 and helped enact the Indian Forest Act in 1865. The Imperial Forest Institute was established in Dehradun in 1906 to teach the "Scientific Forestry" system. Brandis had also proposed a forest management system based on a cooperative partnership between the state and local populations at the time (Patra 2015). As a result, his views were incorporated into both colonial and post-colonial forest policy frameworks. The British colonial intervention was a watershed moment in Indian ecological history (Gadgil and Guha 1992). The British were the first to legally recognize the forest recourse, and they were the ones who began the process of developing a forest policy in the second part of the nineteenth century. Historically, the first demonstration of concern in forest conservation, the reservation of teak forest in Malabar in 1806, was driven by strategic imperial needs (Ray 1998, Khawas 2003). This was due to the decline of oak forests in England and other western countries, as well as an increase in demand for wood from the shipbuilding industry.

Furthermore, the rapid expansion of the railway network in the late nineteenth century demonstrated that India's previously dense woods were not inexhaustible. However, the history of forest legislation in India began with a memorandum issued by the British in 1855, which was eventually replaced by the Forest Act of 1865 (Dhanaraju 2012). The 1865 Indian Forest Act was India's first effort at a comprehensive forest law, with the primary goal of asserting the British monopoly over Indian forest land and giving the government undeniable ability to administer the forest and pastures. However, the 1865 Act had many gaps; as a result, the Indian Forest Act 1878 was revised, amended, and introduced new regulations for the smooth operation and scientific management of the Indian forest Gadgil and Guha 1992, Poddar 2011, Dhanaraju 2012). According to Sangwan (1999), the British Government formulated the Forest Act of 1878 following extensive debate among the colonial bureaucracy. For him, the colonial officials' argument over forest legislation was not monolithic; rather, multiple perspectives were expressed by the colonial bureaucracy on the sort of forest legislation that should be enacted for forest management in India. He contends that it was this discourse that influenced the Indian Forest Act of 1878 (Rangarajan 1994).

The Indian government's policy guidelines outlined forest classification, giving the Act legal structure. It was made applicable to Reserve Forests, Protected Forests, and Village Forests. These forests were established legally for the first time. It gave the Revenue and Forest Department complete jurisdiction over the forest and grazing lands. It gave the state the authority to effectively control the wasteland. Finally, the 1878 Act was supplanted with all law-related features and changed in 1927, becoming known as XVI of the Indian Forest Act 1927, which is still in effect (Dhanaraju 2012). Sampriti Panda (2024) argued that during the colonial period, legal and policy mechanisms moved forest rights from communities to the government. The common property had become state property, and the process of alienating village communities from the forest had begun. Forest was shifted from the union to the state list under the Government of India Act of 1935. Even after independence, the state maintained its power over forest products. During the colonial period, perceptions of the state's hegemony over forest resources shifted, with the forest becoming increasingly perceived as a 'property of the state' with enormous commercial potential. (Dhanaraju 2023). Even after 1947, the colonial system of forest administration remained largely unchanged, stressing income

Vulli Dhanaraju and Bornali Hati Boruah

creation and commercial exploitation while excluding tribes with the most longstanding claim to forest resources. The National forests Policy of 1952 proposed that the country aspire to cover one-third of its total land area with forests. Though the 1952 Forest Policy was based on the 1894 policy, the current research (Dhebar 1961) argues that it went beyond the latter in encroaching on tribal rights. It was declared that forest policy should be based on critical national needs. In some ways, this was an extension of colonial British policy, with the expectation that the rights of populations living near woods would not take precedence over national interests. This forest policy separated woods into four categories: protected forests, national forests, village forests, and tree lands. Another significant commission was the National Commission on Agriculture in 1976, which advocated for the commercialization of forests at any cost and without consideration for the sustenance of forest peoples. In 1980, a draft forest bill was circulated in response to the National Commission on Agriculture's suggestions. The bill included provisions that reduced people's rights to forest lands and crops. As a result, the National Policy of India 1988 envisions people's involvement in forest protection and development to meet the growing demand for fuel wood, timber, and fodder in light of the challenges faced in forest protection and conservation, as well as meeting the community needs of tribal and other villagers in the forest neighbourhood. The National Policy of India has recommended a new structure for forest management. The ensuing policy resolutions by several state governments to encourage JFM are regarded as a bold move toward participatory development of Common Property Resources in India (Pattnaik and Dutta 1997, Khawas, 2003). As a result of the June 1990 circular, the JFM program was implemented in 22 states by 2000.

They are: Andhra Pradesh, Arunachal Pradesh, Assam, Bihar, Gujarat, Himachal Pradesh, Haryana, Jammu & Kashmir, Kerala, Karnataka, Madhya Pradesh, Mizoram, Maharashtra, Nagaland, Orissa, Rajasthan, Punjab, Sikkim, Tripura, Tamil Nadu, Uttar Pradesh, and West Bengal. Goa, Manipur, and Meghalaya have yet to adopt the JFM plan. So far, no Union Territory has opted for JFM. The program is overseen by a Joint Forest Management Cell in the Ministry's Forest Protection Division, and according to data provided by the JFM Cell as of 1-1-2000, 10.24 million hectares of forest are managed through 36130 JFM committees in 22 states. JFM is a method of empowering people to manage the use of forest resources, gain access to and control over non-timber forest products, share income from timber sales, and benefit from forest eco system services such as provisioning services (food, fuel, fibre, medicinal plants, etc.), regulatory services (water recharge, flood and storm protection), supporting services, and eco-tourism. The key feature of JFM is that communities have the authority to govern the use of forests by members while also excluding non-members. They profit from direct access and control over the use and sale of the majority of NTFPs, as well as a share of timber income and other intangible advantages from local ecosystem services such as water recharge, pollination, wildlife habitat, and so on. Thus, community involvement in forest and animal protection is extremely important. Recognizing the importance of communities in forest protection and management, the National Forest Policy of 1988 resulted in the JFM Circular of June 1st, 1990, and the subsequent 2000 and 2002 Guidelines, which established the framework for state-level ordinances, resolutions, and JFM guidelines.

Panchayat Extension to Scheduled Areas Act (PESA),1996 and the Forest Rights Act of 2006 (FRA) enhanced local communities' rights and obligations in relation to forests. Forest Committees are formed to coordinate efforts with villages. However, the FRA does not apply to the sixth schedule areas in northeast India, which include the Karbi Anglong Autonomous Council. The Forest Department and Forest Committees draft a micro plan for the development of forests and villages. Along with forest protection and development, the primary goal of this strategy is to provide the local population's forest-based needs, such as small timber, minor forest produce, fuel wood, leaves, grass, fodder, and so on, through the regulated use of forests. Furthermore, initiatives to improve agricultural and forest production and processing generate job opportunities in villages, discouraging residents from engaging in illegal felling and forest encroachment. Attempts are being made to meet the villagers' other basic needs in order to reduce dependence on forest resources.

Nature of Forest Management in Karbi Anglong
The colonial government, Assam state after independence, and the Karbi Anglong Autonomous District Council (KAAC) from its formation in 1952 developed and authorized the implementation of different forest and land policies. The Council passed several important acts and regulations, including the Assam Land and Revenue

Vulli Dhanaraju and Bornali Hati Boruah

Regulation, 1886, the Assam Forest Regulations, 1891 (Regulation No. VII of 1891), the Mikir Hills (Land and Revenue) Act, 1953, the Mikir Hills District (*Jhumming*) Regulation Act, 1954, and the Mikir Hills District (Forest) Acts, 1957, among others (Dhanaraju, 2023). All of these policies were designed to restrict people's access to forest resources and jhum farming in the Karbi Anglong district. However, many modifications to this legislation have been made, but none of them have succeeded in protecting people's customary rights to natural resources. The Karbi Anglong district is divided into three forest territorial divisions namely Karbi Anglong East division, Karbi Anglong West division, Hamren division. The headquarters of the two territorial divisions are at Diphu and the Hamren Territorial is at Hamren. There was no proper management of administrative and forest reports in three divisions in particular prior to the formation of the district in 1951 except some old Reserved Forest files (WPKAED 2008). The main reason for this is that some of the old reserved forests presently managed by these three divisions were under the management of old Sibsagar Division, Dhansiri valley Division and Nagaon Division. The past system of management of these Reserve Forest could be traced back to the old reports of the respective division. It is known fact that this task becomes more difficult due to the fact that no files have been maintained for these three divisions till creation of separate Karbi Anglong district in 1976. The old records and forest dept files were difficult to trace out. Since 31st December, 1996 the administrative control of forest department has been transferred to Karbi Anglong Autonomous Council from the Government of Assam.

The role of the State Government has become advisory in nature. As said, the forest areas are controlled by three territorial divisions namely Karbi Anglong East Division, Karbi Anglong West Division and Hamren Division. Besides, there are three functional divisions namely: Northern Afforestation Division, Working Plan Division (Hills) and Silvicultural Division (Hills). Each Division is headed by a Divisional Forest Officer. All these divisions are under the supervisory control of Conservator of Forests, Karbi Anglong Circle, Diphu. At present Karbi Anglong is administered under an Autonomous Council and it is one of the oldest Autonomous Councils created under Article 244(A) under Sixth Schedule to the Constitution of India. For our purpose the land in the whole district it may is divided into the four categories, namely, the State Reserve Forests, the District Council Reserved Forests, the Unclassified Forests and Lands suitable for wet- paddy cultivation. The Unclassified Forests may be divided into two categories namely hills and low-lying forest lands. While in the hills the tribal people practice shifting cultivation, in the low-lying forest lands other types of cultivation are carried on by making the land suitable after proper reclamation as the hills are concerned the tribal people think themselves to common owners and the District Council Authority does not enter with this common ownership. In the low-lying forest lands, which people undertake cultivation, they may apply for ownership right to District Council Authority. If the Authority grants this right ownership, it is well and good and in case of refusal conflicts develops. The people rather consider it to be an infringement on their rights in forest. There are instances of conflict when the District Council Authority wants to use low lying forest lands in the vicinity of a village for some particular purpose. The people have actual ownership rights only on the wet- paddy lands which cannot be acquired for any public purpose without paying due compensation provided the owners have already been issued *pattas* (Bordoloi 1991).

Implementations of JFM in Karbi Anglong
The Karbi Anglong Autonomous Council adopted the Joint Forest Management (JFM) Rule, 2000, passed by the Assam government. JFM covered the majority of the USF areas, as well as additional District Council Reserved Forest (DCRF) and State Reserved Forest (SRF) sites in this district. The general goals of management are:
1. Encouraging community involvement in forest management through new policy.
2. To restore the deteriorated region with new plantations.
3. Encouraging nearby people to protect existing forest areas and support annual departmental plantation efforts.

The areas designated to this district's East Division (Forest) are given in a table no.2. The majority of the places are in close proximity to human settlements, as well as degraded landscapes. The overall area of scrub/degraded and poor forests in the RFs is 19262.44 ha in the East Division and 1428.53 ha in the Hamren Division. The JFMC could take these areas on an annual basis as part of the Forest Development Agency (FDA), which is required by the JFM Act. One of the most significant parts of JFM management is developing micro-level plans at the village level with the

Vulli Dhanaraju and Bornali Hati Boruah

assistance of Village Forest Protection Committees. The forest records show that the forest department is unable to prescribe area-specific prescriptions for all Village Forest Protection Committees that will be constituted in certain places. Because a detailed PRA exercise is required to reflect the local communities' consumption and livelihood demands, as well as measures for satisfying these needs in a sustainable manner. However, the following suggestions are presented as broad principles while constructing the micro plans:

1. Forest management should include its environmental function, carrying capacity, conservation value, and biodiversity.
2. Provide appropriate recommendations for planting on community and government lands outside of declared forest zones.
3. Utilize locally accessible information and improve local institutions.
4. The Forest Officer and Village Protection Committee shall create the micro plan. The term may be determined by the Conservator of Forests in collaboration with the local committee. This study observed that people in this area rea were widely opposed to sustainable management. They view the forest area, regardless of whether it is USF or RF land, to be their own, and because of the ready availability of firewood, small timber, and other forest produce, they see it as a right rather than a benefit, yet they would like to make money from these forests.

The Usage of Indigenous Knowledge System

A vital aspect of implementing JFM is the utilization of indigenous knowledge system in JFM. Due to the mountainous terrain and presence of tribal communities in the forested areas, it is necessary to utilize indigenous knowledge in order to effectively implementing the forest management in Karbi Anglong district. The forest and indigenous communities have coexisted since centuries ago. The forests flourish in the areas where indigenous communities reside. This correlation exists only due to indigenous knowledge. Therefore, when implementing any forest management in this hilly region, it is crucial to focus on enhancing the local tribal villages' native expertise for effective implementation of forest management. The following recommendations were proposed for incorporating indigenous knowledge into the implementation of forest management in Karbi Anglong.

1. Ensure proper documentation and data base for Indigenous knowledge systems.
2. Commercial collecting of bio-resources from tribal habitats should be restricted.
3. Local indigenous people should not be forced to give up control of forest lands.
4. Integrating current scientific perspectives with indigenous knowledge is crucial for improving outcomes.

Challenges in implementing JFM

The implementation of JFM was not successful in this district due to a number of problems, including the availability of forest resources for human use, a lack of awareness, unsettled land status, a low population, community ownership, and so on. However, with appropriate modifications suited to the needs of this district, JFM was not able to bring about a rapid shift in people's mental attitudes about protecting forest resources. JFM is a decentralized, people-oriented forestry management approach that empowers citizens and strengthens democracy. This investigation also revealed some limitations in the area where JFM operates. They are:

1. One of the problems that forest officers and other government personnel experienced was a lack of knowledge of the socioeconomic and cultural value systems of the people who lived there.
2. Conflicts that had been found both within and outside of the villages, which are causing the process of implementing the JFM to be interrupted.
3. The absence of formal authority to the locally based institution. During the process of implementing the JFM into effect, the local authorities were not entrusted with adequate power.
4. Because of a lack of awareness, the JFM has become lacking in terms of the meaningful engagement of the people who are a part of it.
5. The topography of this district is characterized by expanses of countryside that are characterized by a low population density in communities.
6. Due to the abundance of forest resources in this district, the council is encountering difficulties in implementing the JFM project because of the broad areas and low population density.

7. Due to of the ambiguous legal standing of Un-classed State Forests (USF) lands, the community perceives it as their own property. There is a prevailing apprehension that the land will eventually be acquired by the government or Department.
8. There was a lack of non-governmental organizations (NGOs) operating in this district to effectively educate the local population, specifically regarding forestry practices.

Suggestions

The forest officials proposed the following proposals to ensure the successful execution of the JFM program. However, these recommendations did not yield positive results.

1. The JFM could have been implemented in the peripheral areas of the forest, within a radius of 5-10 km, where the local population still relies on the forest for their needs. Participation in such a program can provide alternative work opportunities and help develop new skills.
2. The effectiveness of JFM relies on an integrated development approach that takes into account other issues beyond only forestry. In order to instil confidence in the people, it was important to establish a set of procedures that allow the department to obtain approval from the Council authority for all the necessary provisions requested by the people.
3. The establishment of District Forest Development Agencies could effectively address numerous issues. This agency could be employed in the extraction of bamboo, MFP (Minor Forest Products), and other forest products to improve the livelihoods of people.
4. A non-governmental organization (NGO) could be established with the purpose of raising awareness among the population.
5. The comprehensive plantation program currently executed by the Forest/Soil Conservation department should be placed under the jurisdiction of the Joint Forest Management (JFM) system, with active participation from the local community.
6. The complete centrally supported system might likewise be executed via JFM.
7. The bamboo operation is a significant forestry activity carried out in this district. It can be implemented through JFM after carefully evaluating the advantages and disadvantages of such an operation with the involvement of the people.

Current Status of the JFM Scheme

Due to the non-applicability of the Forest Rights Act (FRA), 2006, and the Panchayat Extension to Scheduled Areas (PESA) Act, 1996 in the sixth schedule areas of northeast India, the Joint Forest Management (JFM) initiative has faced a serious threat to its existence, as is the case in the fifth schedule areas of India. However, since 2011, there has been a prevailing belief among policy makers that laws such as the Forest Rights Act (FRA) of 2006 and the Panchayat Extension to Scheduled Areas (PESA) Act of 1996 have been enacted, granting rights to indigenous people and those living in forests to access and manage forest resources. On the other hand, communities have asked for the substantial amounts that forest departments owe them as part of the scheme. There is debate on whether the program should be eliminated (Jishnu 2011). In 2011, a high-level group and the politically influential National Advisory Council proposed significant modifications to the program. The National Forest Rights Act Committee (NFRAC), established to assess the execution of the FRA, proposed the elimination of JFM committees in areas where community forest rights are acknowledged under the Act. The recommendation was to transfer the powers and resources of JFM committees to the committees of Gram Sabhas established under the Forest Rights Act (FRA). In addition, the National Advisory Council (NAC) proposed that in all forest villages, the responsibility for managing communal forest resources should be voluntarily transferred to the Gram Sabha, while the forest department should just serve as a facilitator. This implies a significant reduction in the size of JFM. Out of the 20 members of the NFRAC, ten members who disagreed proposed the elimination of JFM and the development of a different model based on the forest rights law for regions where community claims are rejected. It is worth noting that the Autonomous District Councils, as outlined in the sixth schedule of the Indian constitution, have been recommended to adopt alternative schemes similar to JFM by utilizing development blocs or other similar frameworks inside the JFM structure (Jishnu 2011). In 2008, the Indian Council of Forestry Research and Education in Dehradun conducted a mid-term evaluation

Vulli Dhanaraju and Bornali Hati Boruah

of the National Afforestation Programme, which is an important source of funding for JFM. The evaluation found that JFM did not aim to fundamentally change the system of forest governance to prioritize the rights of communities while also achieving conservation goals. These programs were primarily designed to encourage local participation in predetermined objectives of traditional conservation by offering some concessions or labor incentives. The FRA signifies a shift in the framework governing forest governance. According to Madhu Sarin from the advocacy group Campaign for Survival and Dignity, the existence of JFM committees is now deemed redundant and potentially illegal, as communities now possess a legal entitlement to safeguard and oversee forests (Jishnu 2011). She argues that promoting JFM will undermine the management of community forests. N.C Saxena, the chairman of the committee responsible for implementing the Forest Rights Act, views FRA and JFM as mutually supportive. According to the FRA, communities are granted ownership rights solely to the community forest resources that they have traditionally utilized. Such areas are limited. In the remaining areas, JFM grants a certain degree of decision-making power to the communities, he argued. He also mentioned that the concept of JFM is not unfavourable. Instead of discarding it, one should consider eliminating the issues that afflict JFM (Jishnu 2011). Chetan Agarwal (2011), an expert on social forestry, supports that the FRA should take precedence over JFM in regions where it is appropriate. Additionally, a more enhanced version of JFM should be devised for the other areas, which can eventually transition into community forest management. He cautions that the implementation of the community forest rights clause of the FRA is challenging. Agarwal notes that the method for documenting these rights in forest and revenue records has not yet been determined in most states, and communities must struggle at each stage to secure their rights. Also, he states that ownership of timber in community forest rights is implicit rather than explicitly defined under FRA. Subsequently, the JFM scheme in the sixth schedule areas, including Karbi Anglong, have been declared invalidated.

CONCLUSION

After the implementation of the National Forest Policy in 1952, the Government of India grew more concerned with environmental exploitation, ecological deterioration, and our responsibility to all species on Earth. Subsequently, the preamble of the National Forest Policy 1988 reflects this shift in priority. It acknowledges that forest resources have become increasingly threatened due to relentless pressures arising from ever-increasing demand for fuelwood, fodder and timber; inadequacy of protection measures; diversion of forest lands to non-forest uses without ensuring compensatory afforestation and essential environmental safeguards; and the tendency to look upon forests as revenue-earning resource. Keeping in mind the objectives of the National Forest Policy of 1988, JFM has proposed by the policy maker as an essential intervention in forest management. In several parts of India, small village groups have begun to safeguard and reclaim degraded forestlands via collective action. The Joint Forest Management plan aims to foster collaboration between local community organizations and state forest agencies in order to manage public forest resources in a sustainable and mutually beneficial manner.

The fundamental goal of JFM is to guarantee that forests are used sustainably to meet local needs in an equitable manner while also ensuring environmental sustainability. Assam initiated the JFM initiative in 2000 with the aim of reducing encroachment into forest areas and improving the socioeconomic conditions of the rural poor. There was no scope or need for intrusion in designated areas because the emphasis was on community control and social fencing. However, ground realities were completely different especially in the case of Karbi Anglong. While implementing the JFM, a major issue faced by forest authorities and government staff was their inadequate knowledge of the socioeconomic and cultural value systems of the local villagers in Karbi Anglong. This lack of knowledge ultimately resulted in the failure of the scheme. While implementing the JFM, the local authorities were not given adequate power and also because of the uncertain legal status of Un-classed State Forests (USF) lands, the community regards them as their own property. There was a widespread concern among the local people that the government or Department will eventually take ownership of the land. Since 2011, policy makers have widely held the belief that laws such as the Forest Rights Act (FRA) of 2006 and the Panchayat Extension to Scheduled Areas (PESA) Act of 1996 have been implemented, providing indigenous people and forest dwellers with the rights to access and control forest

resources. However, these acts have not been applicable to the areas governed by the sixth schedule in Assam. The overlapping between FRA and the management of the JFM scheme at the village level had a crucial role in causing the crisis of the JFM system, ultimately resulting in its disappearance. After the disappearance of the JFM at the national level in India due to the FRA, initiatives to implement social forestry or community forestry at the village level in Karbi Anglong have also been unsuccessful due to the framing of alternative schemes on the similar line of the JFM initiatives in the sixth schedule areas of Assam.

ABSTRACT

Lung cancer remains a global health concern, representing a significant portion of cancer cases and deaths worldwide. In this study, 44 compounds were selected from *Laetiporus versisporus* for potential lung cancer treatment. Utilizing PubChem and SwissADME, compounds adhering to the Lipinski Rule of Five were chosen. The target protein, PKCiota kinase (UniProt ID: 3A8W), underwent docking studies with the compounds using PyRx 0.8. Ten compounds exhibited significant binding affinity, surpassing Selpercatinib. ADMET properties, evaluated with SwissADME, indicated favorable results, with compounds adhering to Lipinski's rule and showing diverse absorption patterns. The Boiled Egg image analysis highlighted compounds passive absorption and Blood-Brain Barrier permeation. Results demonstrated that 25-Hydroxyvitamin D2, Eburicoic acid, and (24RS)-28, 28, 28-trifluoro-25-hydroxyvitamin D2 exhibited the highest binding affinity with PKCiota kinase, outperforming Selpercatinib. Toxicity studies suggested low toxicity for the identified compounds, supporting their potential in lung cancer therapy. This study concludes that these compounds from *Laetiporus versisporus*, notably 25-Hydroxyvitamin D2, Eburicoic acid, and (24RS)-28, 28, 28-trifluoro-25-hydroxyvitamin D2, hold potential for the treatment of lung cancer.

Keywords: Lung cancer, Molecular Docking, PyRx, Discovery Studio, ADMET properties

INTRODUCTION

Cancer is the appearance of aberrant cells that grow abnormally and also infect the neighboring cells of the body at any age and in both men and women. There are more than 200 types of cancer and the disease process begins at different locations and the causes are diverse [1]. The majority of the population lives in rural areas, where agriculture is their main source of income and ethnic medicinal herbs are their only source of revenue [2]. However, due to a lack of possible therapeutic targets, there are no effective medications. Broad-spectrum anti-inflammatory and anti-fibrotic drugs are the most often used corticosteroids, which invariably cause serious side effects such as TB infection, osteonecrosis, and gastrointestinal complaints during long-term clinical usage [3-5]. Lung cancer poses a significant threat to human survival, claiming numerous lives annually. Timely identification of pulmonary nodules is crucial for enhancing patient survival rates. Nodules, abnormal tissue growths, can manifest in various body areas, including deep skin tissues and internal organs. In the lungs, these growths are termed pulmonary nodules. Those with a diameter of three centimeters or lessare classified as tumors. Early detection becomes pivotal in the battle against lung cancer, as it enables swift intervention and improves the prospects of successful treatment, offering hope for those grappling with this formidable disease [6]. Tumors are broadly categorized as malignant, or cancerous, and benign, non-cancerous growths. Malignant tumors possess the ability to grow and metastasize throughout the body, posing a severe health risk. Conversely, benign tumors typically exhibit slow growth or remain static, often not recurring after removal. In the context of lung nodules, approximately 95% are benign, indicating a low cancer probability. However, larger nodules, exceeding 30 millimeters in diameter, heighten the likelihood of malignancy. Distinguishing between these tumor types is crucial for effective medical intervention, as it indicates the appropriate course of action and influences patient outcomes in the complex landscape of lung diseases [7]. Lung cancers are divided into NSCLC (non-small cell lung cancer) which represents 80%-85% of cases and SCLC (small cell lung cancer) which represents 10%-15% of cases. [8].Lung cancer has a poor overall survival rate, which raises the number of cancer diagnoses and fatalities worldwide, especially in developing countries with low economic status. Lung cancer is prevalent in men, constituting 17% of new cancer cases and 23% of cancer-related deaths.

Unfortunately, 70% of diagnoses occur at an advanced stage, resulting in a 5-year survival rate of about 16%. Early detection is crucial, offering a 70% 5-year survival rate. Smoking is a primary cause, though non-smokers can also be affected by various environmental factors [9]. Mushrooms, ubiquitous macrofungi, thrive in woodlands and cultivated farmland. Varieties of mushrooms exhibit medicinal prowess, showcasing anticancer, antioxidant, antimicrobial, antidiabetic and antiarthritic properties[10]. *Laetiporus versisporus*, commonly known as the "chicken of the woods" mushroom, is a fascinating fungal species with distinctive features and culinary significance. This mushroom, belonging to the family Polyporaceae, is renowned for its vibrant appearance, unique growth pattern, and ability to mimic the taste and texture of chicken when cooked. The mushroom typically forms large, overlapping clusters resembling shelves or rosettes on the bark of hardwood trees. It has been explored for its potential health benefits and medicinal properties. Some studies suggest that mushrooms, including certain species within the *Laetiporus* genus, may possess immunomodulatory and anti-inflammatory properties. These properties are attributed to bioactive compounds like polysaccharides and beta-glucans found in mushrooms [11].In an experimental study, it was shown that there was an increase in the expression of caspase-3 and caspase-9 after treatment with LVEE (*Laetiporus versiporus* ethanolic extract), which plays an important role in apoptosis. It was revealed that LVEE activated the p53 gene, causing a series of events that led to the activation of caspase-3 and finally apoptosis [12].Moreover, it exhibits a reduction in the expression of Bcl-2 signaling molecules, which has been reported as an anticancer mechanism in diverse types of cancer [13]. In the last 10 years, the use of the *in silico* method as an initial step in anticancer drug discovery and development has increased, especially the use of the molecular docking simulation method. The high number of docked molecules through *in silico* studies requires further research (*in vitro, in vivo*, and clinical trials) to obtain a new drug that has better performance than current therapy [14]. In the present study, the wild mushroom *Laetiporus versisporus* species was used to find bioactive compounds for the treatment of lung cancer.

Subasri Mohanakrishnan *et al.,*

MATERIALS AND METHODS

Ligand selection

Using literature and the IMPPAT database [15], around 44 compounds were selected from the Indian medicinal mushroom *Laetiporus versisporus* to find potential compounds for treating lung cancer. The 3D structure of compounds was retrieved from the PubChem database [16], and using SwissADME [17],they were subjected to the Lipinski Rule of Five. From the results, 44 compounds obeyed the Lipinski Rule of Five and these compounds were taken for further study.

Target protein selection

The target protein PKCiota kinase to the 3A8W gene was found in the literature for lung cancer. The 3D structure of this target protein was obtained from the Uniprot database [18] as a modeled protein. The UniProt ID for this target protein was noted. Further, the modeled structure was evaluated using the SAVES v6.0 online server [19] and a Ramachandran plot was taken using this server.

Docking studies

Docking studies for the modeled target protein PKCiota kinase and the compounds (ligands) were done using the PyRx 0.8 software [20]. The target protein was further prepared for docking studies using this software. All the ligands were uploaded using the Open Babel option in PyRx 0.8. The grid was generated and the docking studies were performed using the Vina wizard option in PyRx 0.8. The values of binding affinity were saved in an XL file. The results were analyzed using Discovery Studio 2021 and the 2D and 3D docked images were taken. In the results, the lowest binding affinity indicates a good result.

ADMET and CYP properties

ADMET and CYP properties were tested for all the best-interacted compounds using SwissADME. Lipinski, BBB (Blood-Brain Barrier), HIA (Human Intestinal Absorption), PGP (P-glycoprotein), XLogP3, TPSA (Topological Polar Surface Area), LogS, Fraction Csp3, Rotatable bonds, CYP enzyme inhibitor properties, Skin permeation and Bioavailability score were evaluated for all the best-interacted compounds.

RESULTS AND DISCUSSION

Ligand and Target Protein selection

The 3D structure of ligands (compounds) was retrieved from the PubChem database. The 3D structure of the modeled target protein PKCiota kinase was obtained from the Uniprot database and its UniProt ID is 3A8W. The 3D structure of the modeled target protein is shown in Figure 1.

Docking studies

Docking studies were done for the compounds from the Indian medicinal mushroom *Laetiporus versisporus* and the target protein PKCiota kinase using PyRx 0.8 software to find the potential drug candidate for lung cancer. For this, 44 compounds that passed the Lipinski Rule of Five interacted with the target protein using this software. The results were analyzed using this software and Discovery Studio 2021 and binding affinity values were noted. In which, 10 compounds showed very good results with the target protein. Further, the synthetic drug Selpercatinib was also taken to find the interaction with the target protein. All the docking results are shown in Table 1. The 2D and 3D interactions of the compounds and the synthetic drug Selpercatinib with the target protein are shown in Figures 2-9. From the results (Table 1), among other compounds, 10 showed very good results with the target protein. Of which, the compound 25-Hydroxyvitamin D2 showed very good binding affinity (-9.6Kcal/mol) with the amino acid residues CYS 498, PRO 492, LYS 493, PHE 423 and ASN 358 of the target protein. The compound Eburicoic acid also had a very good binding affinity (-9.4 Kcal/mol) with the amino acid residues GLY 422, SER 424, ASP 420, ASN 358, PRO 500 and LYS 493. The binding affinity(-9.2 Kcal/mol) was observed between the compound (24RS)-28,28,28-

trifluoro-25-hydroxyvitamin D2 and the amino acid residues ASN 358, PHE 423, HIS 361, TRP 427, GLY 497 and PRO 492 of the target protein. Among the ten compounds, the lowest binding affinity (-8.1 Kcal/mol) was observed between the compound Versisponic acid E and the amino acid residues ASN 542, GLY 539, LEU 376, LEU 260, LYS 258, VAL 322 and PHE 297 of the target protein. Besides, the binding affinity of the synthetic drug Selpercatinib with the target protein was -8.4Kcal/mol and the interacted amino acid residues were HIS 499, PRO 500, GLY 497, ASN 358, GLU 362, GLY 394, ARG 396 and PHE 423. In the results of the present study, when compared to the synthetic drug Selpercatinib, most of the compounds showed very good binding affinity with the target protein PKCiota kinase.In the present *in silico* docking studies, the compound 25-Hydroxyvitamin D2, Eburicoic acid and (24RS)-28,28,28-trifluoro-25-hydroxyvitamin D2 from *Laetiporus versisporus* showed the highest binding affinity with the target proteinPKCiota kinase.

ADMET and CYP Properties

In the present study, ADMET properties were tested for the best-interacted compounds and the synthetic drug Selpercatinib using SwissADME and the results were tabulated (table 2). From the results, all the best-interacted compounds and synthetic drug obey the Lipinski rule of five. Most of the compounds did not cross Blood–Brain Barrier (BBB) and had High Intestinal Absorption (HIA). Many compounds were predicted not to be effluated from the CNS by P-glycoprotein. Similarly, few compounds are predicted to be effluated from the CNS by P-glycoprotein. Among the 10 compounds, the XLogP3 value of only 3 compounds was within the range. TPSA (Topological Polar Surface Area) and Log S values of all the compounds were within the limit. In the Fraction Csp3 value of all the compounds, only 1 compound was less than 0.25 and the value of other compounds was above this limit. The rotatable bonds of the compounds were within the limit. From the results of the Boiled Egg image of the compounds (Figure 10), the compound Deoxysappanone B 7,3'-Dimethyl Ether is located in the Egg-yolk region, which means the compounds are passively absorbed by the gastrointestinal tract and can also permeate through the blood-brain barrier and the compounds 25-Hydroxyvitamin D2,VD 2736, Versisponic acid A and Coumarine, 3-(2,4-dinitrophenyl)- are located in the Egg-white region, which means they are passively absorbed by the gastrointestinal tract but cannot permeate through the blood-brain barrier. Moreover, the compounds VD 2736, Versisponic acid A and Versisponic acid D are predicted to be effluated from the central nervous system by the P-glycoprotein and the compounds 25-Hydroxyvitamin D2, Eburicoic acid, Coumarine, 3-(2,4-dinitrophenyl)- and Deoxysappanone B 7,3'-Dimethyl Ether are predicted not to be effluated from the central nervous system by the P-glycoprotein. In the results of CYP properties (table 3), most of the compounds do not inhibit the CYP enzymes and do not give any adverse reactions. But, the compound 25-Hydroxyvitamin D2,VD 2736, Coumarine,3-(2,4-dinitrophenyl)-, Cholesterol sulfate and Versisponic acid E inhibits CYP2C9 and Deoxysappanone B 7,3'-Dimethyl Ether inhibits all the CYP enzymes respectively. The value of log Kp (Skin Permeant) is good for all compounds and A Bioavailability Score (ABS) is good for all the compounds.

CONCLUSION

In the present study, around 44 compounds were selected from the Indian medicinal mushroom and the target protein PKCiota kinase was subjected to *in silico* docking analysis to find the potential compounds for treating lung cancer. From the results, 6 compounds showed better results than the synthetic drug Selpercatinib. Among them, 10 compounds showed very good binding affinity with the target protein. Of which, the compounds 25-Hydroxyvitamin D2, Eburicoic acid and (24RS)-28,28,28-trifluoro-25-hydroxyvitamin D2 showed the highest binding with the target protein PKCiota kinase. Toxicity studies were also done for the 10 best-interacted phytocompounds and the results showed that the compounds had very less toxicity. Hence, the present study concludes that 25-Hydroxyvitamin D2, Eburicoic acid and (24RS)-28,28,28-trifluoro-25-hydroxyvitamin D2 from *Laetiporus versisporus* may have a potential ability in the treatment of lung cancer.

ABSTRACT

Medical Visual Question Answering (MedVQA) has emerged as a critical research area, leveraging the synergy between medical imaging and natural language processing. This survey paper provides a comprehensive overview of the recent advancements in the field of MedVQA, highlighting key methodologies, datasets, challenges, and applications. The survey begins by introducing the motivation behind MedVQA, emphasizing the growing importance of combining medical image analysis with natural language understanding. Subsequently, we explore the methodologies used in existing literature. A significant portion of the survey is dedicated to reviewing benchmark datasets used in MedVQA research. Furthermore, we delve into the evaluation metrics commonly employed to assess the performance of MedVQA systems that capture both image understanding and natural language comprehension aspects. The paper concludes with an overview of potential future directions in MedVQA research. These include the integration of multimodal data sources, the incorporation of domain-specific knowledge, and the development of explainable and interpretable models. We emphasize the importance of collaborative efforts between the medical and computer science communities to accelerate progress and address real-world healthcare challenges. Overall, this survey serves as a valuable resource for researchers, practitioners, and healthcare professionals interested in understanding the current landscape, challenges, and opportunities in the rapidly evolving field of Medical Visual Question Answering.

INTRODUCTION

Medical Visual Question Answering (MedVQA) is an emerging research field that intersects medical imaging and natural language processing, aiming to enhance the interpretability and accessibility of medical image data[1]. This paper presents an overview of recent advancements in MedVQA methodologies, focusing on the integration of deep learning techniques to address the unique challenges posed by medical imagery. The study explores the application of convolutional neural networks (CNNs) for image feature extraction and recurrent neural networks (RNNs) or transformers for natural language understanding[2]. We delve into the significance of MedVQA in clinical decision-making, radiology reporting, and medical education, emphasizing its potential to assist healthcare professionals in extracting valuable insights from complex medical images[3]. Through a comprehensive review of existing literature and methodologies, this paper highlights the current state of MedVQA, discusses its applications, and outlines potential avenues for future research, including the incorporation of multimodal data and addressing ethical considerations. The advancement of MedVQA holds promise for revolutionizing medical image interpretation, fostering collaboration between healthcare professionals and intelligent systems for improved patient care and diagnostic accuracy[4]. Designing a Medical Visual Question Answering (MedVQA) system involves integrating various modules that collectively enable the model to understand, interpret, and respond to questions related to medical images. There are mainly four modules in any VQA model. Image feature extraction module, Question Feature extraction module, Feature fusion module, Classification/Answer generation module[5]. Image feature extraction module extract meaningful features from medical images using CNN, Pre-trained transfer learning models such as ResNet, VGG etc[6]. Question feature extraction module extracts features from questions using word embedding (e.g. Word2Vec, GloVe), RNN, LSTM[7]. Feature fusion module combine features from the input image and question modalities using concatenation or element wise multiplication of image and question features. Fusion of features can also be done using attention mechanism or joint embedding learning. Classification/Answer generation module will classify/generate correct answers using classifier or generative AI[8].

RELATED WORK

Medical Visual Question Answering (MedVQA) encompasses a diverse range of research efforts aimed at advancing the understanding and interaction with medical images through question answering. Early research in MedVQA focused on rule-based systems and handcrafted feature extraction methods. These approaches often relied on domain-specific knowledge bases and heuristic rules to generate answers to medical questions. While these approaches laid the groundwork for MedVQA research, they were limited in their scalability and generalization capabilities, as they heavily relied on manual engineering and lacked the ability to learn from data. The advent of deep learning has revolutionized MedVQA research by enabling end-to-end learning from raw data. Deep learning models, such as convolutional neural networks (CNNs), recurrent neural networks (RNNs), and transformer-based architectures, have shown promising results in effectively integrating visual and textual information for answering medical questions[9]. Here we give critical review of few research papers published in the year 2020 to year 2023.

By identifying the need of question classification, [10] proposed hierarchical deep multi modal network. Two level hierarchical model is introduced, in first level question segregation is done by TF-IDF word frequency method and SVM classifier to identify question type (Yes/No or other). For question feature extraction Bi-LSTM and Image feature extraction Inception-Resnet-V2 is used. Both the features are fused using batch normalization. In the second level, answer prediction, either of two models are used based on the type of question. For close ended questions (Yes/NO) fully connected layer with softmax activation function is used as two class (yes/no) classification model to predict answer. For open ended questions answer generation model with multi label class model is used. Separate word-index dictionary is created for answer. Softmax function with recursive prediction procedure is used to predict answer. Cross Entropy loss function is used in both the models. The proposed model applied to VQA-RAD and Image CLEF 2018 VQAMed dataset. Paper shows that QS model for 'Yes/No' type questions improves precision by

Rikita D Parekh and Hiteishi M. Diwanji

0.3, recall by 0.1 and f1-score by 0.2 on RAD dataset and precision by 0.3, recall by 0.5 and f1-score by 0.2 on ImageCLEF 2018 VQAMed dataset. [11]proposed self-supervised transformer architecture with multihead attention. Similar to CGMVQA ResNet152 used for image feature extraction and BERT wordpiece tokenizer for question tokenization. The pair of 5 question token and image features given to BERT. Mask language modeling is applied to predict medical words from the caption provided by the dataset. Model was pre trained on ROCO dataset with masked language modeling and image features. A MultiView Attention Based Model[12]is proposed to embed higher level semantics of question and medical image. Multiview attention is guided by question importance learning. Due to small unlabeled dataset constrain, Model Agnostick Meta Learning (MAML) Model is used for image feature extraction and Convolutional De-noising Auto Encoder used for initializing weights. GloVe (Global Vector) Word embedding and GRU (Gated Recurrent Unit) is used for question feature extraction. For giving more attention on question two attention mechanism, Word-to-text and Image to Question attention, is applied. This result into accurately defining relationship between Image and Question. Composite loss function (classification loss + Image Question complimentary loss) is used to improve accuracy. Author also corrected VQA-RAD dataset and develop new VQA-RADph dataset for improving quality of data. [13]Author proposed separate module for question type reasoning to deal with specific task. This module initializes Separate methodology for open ended and close ended questions. Image feature extraction is done by MAML and convolutional unsupervised auto encoder (CDAE) and question feature extraction is done by LSTM encoder. Then these multimodal features are used in appropriate question type module. In both question type module fusion features are generated using elementwise multiplication method. Final answer is classified by MLP classifier. The proposed model achieved overall 71.6%, open-ended 60% and close ended 79.3% accuracy on VQA-RAD dataset. [14]proposed Medical VQA model that uses ViT32 model, transformer based image encoder and BERT like language encoder to extract image and question features. Both the features are concatenated using concatenation operator. The contrastive Language Image Pretraining (CLIP) model is used to jointly train multimodal features with goal to maximize similarity of truly corresponding image-text pair. The generative auto regressive decoder model is used to generate answer from concatenated multimodal features. [15]proposed model that uses recent CNN image encoder EfficientNetV2 as image feature extractor and BERT used for word embedding of questions. RealFormer architecture used for Mutimodal future extraction. proposed Question-Type Reasoning (QTR) and semantic space constraint (SSC) modules in MedVQA model. MTPT model, Multi-task pre-training (MTPT) model used for image feature extraction. This model is pretrained on various MRI, X-Ray and CT type of medical images. BioWordVec pre-trained model and LSTM used for question feature extraction. Both features are embedded using CMSA-cross-modal self-attention module. A question Type reasoning module used to guide model based on semantics of question information. Semantic constrain space define the similarity between the answers and high attention words from answers having higher correlation. Semantic loss function is calculated from predicted answers and reference answers given in dataset. "[17]proposed two branch hierarchical model, one is parallel structure model and second is image retrieval model. Author categorizes each type of question into further candidate answer types. a) If the current type of medical question has few candidates answer types, then it is passed to the parallel structure model. In parallel structure model transformer is used for classification. Image feature is extracted using ResNet152 and GRU. Spatial feature of medical image is extracted by CNN and sequence features are extracted by RNN. Question features are extracted using three-layer word embedding depending on PubMed corpus. Both image and question features are given to single transformer parallel. Self-attention module and feed forward network is used to combine the features of Image and Question. b) If the question type has more candidate answer types or complex for classification task then it is transferred to the image retrieval modal. This model will predict the answer for those questions whose answer is irregular, open ended or have many different answers possible. VGG 16 pre trained network without fully connected network layer is used to extract image features from last convolutional layer. Overall, these model increases results by 0.2%, 1.4% and 1.1% for datasets ImageCLEF 2018 VQA-MED, ImageCLEF 2019 VQA-MED, VQA-RAD respectively. [18]proposed MedFuseNet MedVQA model in which ResNet-152 model used for image feature extraction and BERT used for question feature extraction. Multimodal Factorized Bilinear Pooling (MFB) used for feature fusion. Power normalization and L-2 normalization is used to normalize output of MFB.Image attention and Image-Question attention mechanism is applied to identify important part of medical image form important word of questions to predict correct answer. Then classification module is applied to find loss and update model parameters as per requirement. LSTM based

Rikita D Parekh and Hiteishi M. Diwanji

decoder model is use for answer generation module. MedFuseNet answer categorization model achieved accuracy score 0.84 for Modality category, 0.78 for plane category and 0.746 for organ category question of MED-VQA 2019 dataset, as well as accuracy score 0.636 on Yes/No question of PathVQA dataset. MedFuseNet answer generation model achieved 0.276 BLEU score on abnormality category question of MED-VQA 2019 dataset and 0.605 BLEU score on PathVQA dataset.[16]proposed CFF – Corresponding feature Fusion method. This method fused image features and question features of corresponding type (Organs such as chest, brain, abdomen) of images from SLAKE and VQARAD dataset. CNN based type classifier is used to classify input image and question. Then three ResNet-34 models separately used for feature extraction from three types of images. Pre-trained 200-D Bio Word Vec word embedding and LSTM is used to extract question features. Semantic attention is used for further semantic feature representation of specific type of questions. Then joint feature representation of image features and semantic features is passed to the answer prediction classifier to predict correct answer. The sum of cross entropy loss of answer prediction of three types of organs and loss of type classifier module is combined to calculate final loss for the modal evaluation.

From the above literature review, the above MedVQA models leverage techniques such as attention mechanisms, multimodal fusion, and transfer learning to achieve state-of-the-art performance on MedVQA tasks. Multimodal fusion techniques play a crucial role in MedVQA by integrating information from multiple modalities, such as images and text. Fusion strategies include early fusion, late fusion, and attention-based fusion, among others. These techniques aim to leverage the complementary nature of visual and textual information to improve the accuracy and robustness of MedVQA models, especially in scenarios where one modality may provide additional context or clarification for answering medical questions. Attention mechanisms have been widely adopted in MedVQA models to selectively focus on relevant regions of images or words in text when generating answers. These mechanisms enable models to dynamically allocate attention to informative regions or concepts, enhancing their interpretability and performance. Different attention mechanisms, such as self-attention, cross-modal attention, and graph attention, have been explored in the context of MedVQA, each offering unique advantages for capturing semantic relationships and context[19].Transformer-based architectures have been adapted for MedVQA tasks, where they excel in modeling the complex relationships between medical images and textual questions.These architectures can effectively process both image features extracted from convolutional neural networks (CNNs) and textual features obtained from pre-trained language models[20], such as BERT (Bidirectional Encoder Representations from Transformers)[21].Multimodal transformer architectures extend the transformer model to handle multiple modalities, such as images and text[18]. These architectures incorporate mechanisms for fusing visual and textual features at different layers of the transformer. Multimodal transformers leverage techniques such as cross-modal attention, where the model learns to attend to relevant visual and textual information simultaneously, enhancing its ability to generate accurate answers to medical questions[14].

BENCHMARK DATASETS
There are many different datasets are found in the literature reviews. The ImageCLEF (Image Retrieval in CLEF) MedVQA (Medical Visual Question Answering) challenge is an annual event organized as part of the Cross-Language Evaluation Forum (CLEF). It provides a platform for showcasing state-of-the-art techniques and fostering innovation in the development of intelligent systems for medical image analysis. Participants are provided with a dataset consisting of medical images along with associated textual questions. These questions typically inquire about various aspects of the images, such as identifying anatomical structures, diagnosing medical conditions, or interpreting medical findings. This challenge provided following datasets to the participants that are openly available for research: VQA-MED-2018, VQA-MED-2019, VQA-MED-2020, VQA-MED-2021[22], and MEDVQA-GI-2023. VQA-RAD and PathVQA datasets are also majorly used and publically available for research purpose.

Rikita D Parekh and Hiteishi M. Diwanji

ImageCLEF VQA-MED Dataset

- The very first dataset available in medical VQA is VQA-Med-2018. Total 2866 images from PubMed central Articles and 6413 Question Answer pairs are available in this dataset. Total four categories question are present in this dataset. The categories of questions are Location Finding, Yes/No, Other[23].
- In ImageCLEF-VQA Med 2019 challenge VQAMed 2019 dataset was given to the competitors. This dataset is categorized in four type of questions - modality, plane, organ system and abnormality. The dataset contains a training set of 3200 images, 12792 QA pairs, a validation set of 500 images, 2000 QA pairs and a test set of 500 images, 500 QA pairs. [11].
- In ImageCLEF 2020 challenge VQA-Med-2020 [13] is published with 1001 medical images and 2400 questions. All question is of abnormality category. In this challenge VQG (Visual Question generation) task is first time introduced in the Medical VQA field.[23]
- In the ImageCLEF 2021 challenge VQA-Med-2021 dataset was published. This dataset is based on the same methodology of VQA-MED-2020 Visual Question Generation [23].
- In the year 2023 ImageCLEF medVQA challenge MEDVQA-GI 2023 dataset published to identify lesions in endoscopy image. This dataset contains development set and test set of 3949 image samples (based on Hyper Kvasir dataset) with 18 question answer pair per image. Questions categorized in to 18 categories with multiple possible answers. The images are taken by gastroscopy, colonoscopy and capsule endoscopy that include entire gastrointestinal tract, from mouth to anus, and also include abnormalities, surgical instruments, and normal findings[24].

VQA-RAD Dataset

VQA-RAD dataset provides 315 images and 3515 question answer pair for Med-VQA task. These questions answer pair can be broadly categorized into open ended and close ended with different 11 categories (As per Table-2). Images of this dataset contains of head, chest and abdomen organ. Table-2 shows detail categorization of training set and test set of VQA-RAD dataset[12].

PathVQA

PathVQA dataset contains 4998 images collected from two pathology textbooks: "Textbook of Pathology" (Muir et al., 1941) and "Basic Pathology" (Robbins et al.,1981), and PEIR1 digital library. Total 32,795 question-answer pairs are generated using 8 categories of questions such as what, where, when, whose, how, why, how much/how many, and yes/no. Table-3 shows summary of each category. Total 16,466 questions fall in first 7 categories are open-ended and remaining questions are close-ended (yes/no) questions[25].

The creation of large-scale datasets specifically designed for MedVQA has been instrumental in driving research progress in the field. Datasets such as MedVQA, VQA-RAD, PathVQA provide annotated pairs of medical images and questions, enabling researchers to train and evaluate MedVQA models. These datasets vary in terms of imaging modalities, question types, and annotation methodologies as shown in Table-4, catering to different research needs and scenarios in medical imaging and question answering.

EVALUATION PARAMETERS

The Medical VQA task can be categorized broadly in two types: i) Classification ii) Answer generation. In classification type of Medical VQA task following evaluation parameters or matrices are used:

- **Precision (P):** In VQA, precision measures the accuracy of the model's answers when it predicts a certain class or label for a question. Precision in VQA can be calculated by considering the number of correct answers provided by the model divided by the total number of answers predicted by the model for which it claims to be correct[10].
- **Recall (R):** In VQA, recall measures the model's ability to provide correct answers for all relevant questions. It indicates how well the model can capture the correct answers among all the possible correct answers for a

Rikita D Parekh and Hiteishi M. Diwanji

given question[10]. Recall in VQA can be calculated by considering the number of correct answers provided by the model divided by the total number of correct answers for the questions asked.

- **F1-score (F1):** The F1 score in VQA combines both precision and recall into a single metric to provide a balanced evaluation of the model's performance. It takes into account both false positives (incorrect answers predicted by the model) and false negatives (missed correct answers).F1 score is particularly useful when there is an imbalance between the number of positive and negative instances, which is often the case in VQA datasets. F1 score [10]in VQA can be calculated using the formula

$$F1 = \frac{2 \times Precision \times Recall}{Precision + Recall} \quad (1)$$

- **Accuracy (A):** Accuracy in VQA measures the overall correctness of the model's answers across all questions. It indicates the proportion of correctly answered questions out of the total number of questions asked[10]. A model with high accuracy provides correct answers to a large majority of questions asked about the images. Accuracy in VQA can be calculated by considering the number of correct answers provided by the model divided by the total number of questions asked.

$$Accuracy = \frac{\#correctly\ anwered}{\#total\ questions} \quad (2)$$

In answer prediction or generation type of Med VQA task following evaluation parameters are widely used:

- BiLingual Evaluation Understudy (BLEU)) In MedVQA, BLEU can be used to measure the similarity between the answers generated by the model and the reference answers provided by human experts/ Ground truth given in test dataset. It works by comparing n-grams (sequences of n words) between the model's answer and the reference answer[10]. In medical terminology often more than one word is used for some organ or symptom or disease. In such cases BLEU score is not effective. For example for lungs the other word lobe may also be used.
- Word-based Semantic Similarity (WBBS) WBBS measures the similarity between words or phrases based on their semantic meaning[10]. In the context of MedVQA, WBBS can be used to assess how closely related the model's answers are to the reference answers in terms of their underlying medical concepts and semantics. One way to compute WBBS is by using pre-trained word embedding or language models to represent words or phrases as dense vectors in a high-dimensional space. Similarity between words or phrases can then be calculated using measures such as cosine similarity. WBBS provides a more nuanced understanding of the semantic similarity between answers, which is crucial in medical applications where precise and contextually relevant answers are essential. In summary, while BLEU score can provide a basic evaluation of textual similarity in MedVQA, WBBS offer more nuanced assessments of semantic similarity and relevance, which are crucial for evaluating the quality of answers in medical contexts. These metrics can complement each other to provide a comprehensive evaluation of MedVQA systems.

CONCLUSION AND FUTURE WORK

This paper presented an advancements in the field of Medical visual question answering. Comprehensive review of the latest medical VQA approaches, datasets, challenges and evaluation parameter are presented in this paper. We reviewed recent medical VQA papers and datasets majorly used by researcher for Med-VQA task. Along with this we comprehended challenges faced by researchers in this multimodal task. These challenges are always being thrust for researchers. From the literature review we observed that the available Med-VQA datasets are very small in size and poorly annotated. Medical image datasets are hard to generate because it needs a lot of professional rather medical expertise to label them[26]. To increase the performance of a small dataset data augmentation or transfer learning may be used in Med-VQA approach[27]. Attention mechanism may improve multimodal feature extraction and concatenation based on semantics of question and important region of medical image[18]. CNN models requires a large amount of labelled training data, and the available datasets are relatively small and mis-labelled or not labelled[28]. The accuracy of Medical VQA is still lacking behind the level of human doctors. Open ended questions should be focused more in future work for finding abnormality in images. Answer classification accuracy is still more than the answer generation mechanism. So generative models should be enhanced to improve overall accuracy of

MedVQA. Future work should focus on addressing the pressing issues of multimodal integration, interpretability, robustness, and generalization. The seamless integration of various data modalities, including textual reports and patient records, could significantly enhance the holistic understanding of medical contexts. Multi modal vision language transformers may be used for better results in future work[15]. As well as pre trained text encoders trained on medical data such as PubMed library of medical sciences can be used in future work[29].

ABSTRACT

Hydroxyurea (HU) is a United States Food and Drug Administration (FDA) oral medication available with proven disease-modifying benefits for sickle cell disease (SCD) therapy. HU increases the bioavailability of nitric oxide (NO) through the action of enzyme nitric oxide synthase (NOS). Since NO cannot be stored in cells, it must be synthesised freshly in order to function. NO is highly diffusible, its presence at the right time, in right amount at right place is important and thus subcellular distribution of inducible NOS (iNOS) in blood cells of SCD patients is therefore a key factor in NO production. Immunogold labeling studies of iNOS subcellular distribution in the neutrophils, platelets, and red blood cells (RBCs) of SCD patients was done post hydroxyurea therapy and blood cells were observed under transmission electron microscopy. The morphometric analysis was done to determine the comparative distribution of iNOS in subcellular compartments of neutrophils, platelets, and red blood cells of SCD patients and the patients on hydroxyurea treatment (SCD-HU) as compared to controls. HU treatment significantly increased the iNOS expression in blood cells. This immunogold electron microscopic study provides the first evidence of alteration in subcellular distributions of inducible NOS in the blood cells post HU treatment.

Keywords: Inducible nitric oxide synthase, hydroxyurea, sickle cell disease, neutrophils, erythrocytes, platelets

Rashmi Saini *et al.,*

INTRODUCTION

Sickle cell disease (SCD) is a hereditary hemoglobinopathy which is caused due to a single amino acid substitution in β-haemoglobin chain causing deformability of RBC, increased cellular adhesion and obstruction in microcirculation [1]. RBC containing sickle hemoglobin have the typical biconcave discoid shape when combined with oxygen, but after removal of oxygen, a sudden change in the cell occurs, often giving it a sickle shape. Sickled RBC either block the normal circulation or destroy themselves [2]. Neutrophils are leucocytes that participate and initiate the vaso-occlusive process, once recruited to the activated endothelium, they attach themselves to circulating erythrocytes and establish adhesive interactions with them. Reduced blood flow results from trapped sickled red blood cells. In order to promote vaso-occlusion, activated platelets attach themselves to leukocytes, sickle erythrocytes, and endothelium [3]. Around 250 million people worldwide currently carry the gene that causes hemoglobin disorders such as SCD [4]. Hydroxyurea (HU) is the drug approved by United States Food and Drug Administration (FDA) for SCD therapy. It effectively raises hemoglobin and fetal hemoglobin (HbF) levels. The exact mechanism by which HU raises HbF levels appears to be mediated by erythroid cells' soluble guanylyl cyclase being activated in a NO-dependent manner [5,6]. HU has additional effects, including increasing NO production [7], improving RBC hydration [8], decreasing RBC adhesiveness to the endothelium [9], inhibiting platelet aggregation [10] and adhesion molecule's action on leukocytes and endothelial cells [11]. The control of arginase activity and the concurrent stimulation of iNOS activity, which results in an increase in NO generation, may be two of the advantageous effects of HU *in vivo*. Individuals with SCD tend to have a lower NO bioavailability and hindered NO-dependent blood flow [12]. Electron microscopy has been used to explore the three-dimensional structure of tissues or cells, the molecular basis and causes of disease, and the structure of viruses and proteins [13]. Immuno gold labeling and morphometric analysis have been used to identify specific antigens in the different subcellular compartments of cells [14]. Previous studies involving immune gold labeling and morphometric analysis have revealed iNOS subcellular localization in neutrophils and eosinophils subcellular compartments [15,16]. Subcellular compartmentalization locales of peroxisomal proteins, GABA-immunoreactive (GABA-IR) terminals, interendothelial junctions, secretory granules in rat pancreas have been determined by their immunolabeling density with gold particles in previous studies [17-21]. The goal of the current investigation was to determine the presence and alteration of subcellular distribution of iNOS in blood cells after hydroxyurea treatment. The rate and effectiveness of the enzyme iNOS catalysis are determined by the microenvironment of the subcellular organelles. This, in turn, affects the synthesis of NO at different intracellular locations. The goal of the current work was to evaluate the intracellular distribution of the iNOS isoform using transmission electron microscopy and morphometric analysis of the blood cells of SCD and SCD-HU patients.

MATERIALS AND METHODS

Antibodies and Reagents
Monoclonal antibodies to iNOS (N-9657), were purchased from Sigma-Aldrich (St. Louis, MO). Uranyl acetate was procured from Polaron Equipment (Watford, UK). Monoclonal anti-human iNOS (C-11) was obtained from Santa Cruz (USA). Goat anti-rabbit and goat anti-mouse protein A gold were purchased from Amersham Pharmacia Biotech (Uppsala, Sweden). All other chemicals were procured from Sigma-Aldrich (St. Louis, MO).

Human Subjects
Research included SCD patients which were diagnosed as hemoglobin S (HbS) homozygous (using HPLC and Hb electrophoresis technique), in a steady diseased state (attended by Haematology and Haemotherapy Center, University of Campinas, Campinas, Brazil) and SCD patients on HU treatment (20-30mg/kg/day for a minimum of 3 months). A group of healthy volunteers (age group 18-50 yrs of either sex), composed of students/members of staff of the UNICAMP were used as controls. Informed consent was obtained from all patients and controls, and the study was approved by the Ethics Committee of the University of Campinas (UNICAMP), in accordance with the Helsinki Declaration of 1975.

Isolation of cells from peripheral blood of subject:

Blood was collected in sodium citrate (0.129 M, 9:1 v/v, pH 6.5). As previously reported, the buffy coat was purified from human blood [16, 22]. In brief, blood was centrifuged at 250 g for 20 minutes at 20°C in order to extract platelet-rich plasma (Sigma Centrifuge, Germany). The platelet-poor plasma (PPP) above the buffy coat was removed until about 1 ml of PPP remained after centrifuging the remaining blood at 1000g for 20 min, 20°C. The buffy coat was then left to fix for 8–12 hours after 1 ml of 2X (4% paraformaldehyde and 1% gluteraldehyde) fixative was gradually added to the side of the test tube. After careful removal of the fixative, the buffy coat was taken out using a spatula. Tiny pieces of fixed buffy coat (approx. 1 mm^3) were chopped with a sharp blade and washed with PBS two times before processing them for observation under electron microscopy.

Observation of Blood cells under Transmission Electron Microscope

Using transmission electron microscopy (TEM), platelets, erythrocytes, and neutrophils in a buffy coat were identified. Pieces of the buffy coat were thoroughly cleaned five times in PBS. After three hours of fixing in buffered 1% osmium tetroxide, they were dried in an ascending series of ethanol, and at last, they were embedded in Epon and Araldite plastic resin [23]. Ultra Cut ultramicrotome (Leica, Austria) was used to cut ultrathin sections (80–100 nm), which were then contrasted with lead citrate and uranyl acetate before observing them at 80 kV using an FEI Philips Transmission Electron Microscope (Tecnai- SPIRIT).

Immuno gold electron microscopy of Blood cells

The buffy coat was fixed with 1% (v/v) glutaraldehyde and 2% (w/v) paraformaldehyde in PBS (pH 7.4) overnight at 25°C. After cutting the fixed buffy coat into tiny pieces with a razor, the pieces were given thorough washing in PBS five times, gradually dehydrated in an ascending series of ethanol, and were then embedded in LR White resin [16]. Blood cells embedded in resin were cut into ultrathin sections (80–100 nm) and collected on nickel grids using the Ultra Cut ultramicrotome (Leica, Austria). After blocking the sections for 30 minutes in PBS containing 0.1% BSA (w/v), 0.1% Teleost Fish gelatin, and 0.05% (v/v) Tween-20, the sections were incubated with antibodies against iNOS (1:200 dilution in the blocking solution) overnight. The sections were blocked five times with blocking buffer, then treated for two hours at 37°C with a 10 nm gold-coupled goat anti-rabbit secondary antibody (1:20). They were then contrasted with lead citrate and uranyl acetate and viewed with an 80 kV FEI Philips Transmission Electron Microscope (Tecnai SPIRIT). The primary antibody incubation stage was omitted for the negative controls.

Morphometric examination of Blood cells

A quantitative assessment of the gold particle density was made in platelets, erythrocytes, and neutrophils in steady state SCD patients, and patients on hydroxyurea therapy compared to controls. iNOS antibodies and a polyclonal secondary antibody coupled to 10-nm gold particles were used to immunogold label the cells. For this analysis, a total of six grids from three separate experiments with label iNOS were included. As previously mentioned, electron micrographs were taken at a magnification of 11000X for the morphometric study [15, 24, 25]. The Scion Image processing program 4.0.3.2 was used to calculate the labeling density of iNOS (number of gold particles/µm^2). In control cell preparations; negligible gold particles were found in the cells. The paired t-test was used to statistically compare the data to the nonspecific labeling densities.

Statistical Evaluation

The mean+S.E.M. of 20 cells from five separate tests in each group was used to express the results. Unpaired "t" tests were used to compare the two groups. At $p<0.001$, the results were considered significant.

RESULTS

Electron microscopic examination of the buffy coat made possible exploration of various blood cells with minimal processing to avoid stimulation and reduce the time taken to isolate the cells. The study was done mainly in platelets,

Rashmi Saini *et al.*,

erythrocytes, and neutrophil cells utilizing electron microscopy and a morphometric analysis of the expression of the iNOS isoform (expressed as number of gold particles/area of the cells).

iNOS immunegold labeling in erythrocytes of SCD and SCD-HU patients

iNOS immunolabeling was observed to be less in steady state SCD patients compared to controls. Fig 1 shows the immunogold labeling of iNOS isoforms in the normal RBC (Fig 1, a, b) and sickled RBC from SCD patients (Fig 1 c, d). Magnified view of part of RBC (Fig 1a) has been shown in Fig 1b. The gold particle corresponding to the iNOS protein inside the cell have been shown by arrows (Fig 1). Fig 1c shows a sickled RBC from SCD patients, iNOS immunolabeling was found to be decreased in sickled RBC from SCD patients. Magnified view of a part of RBC from SCD patients (Fig 1c) has been shown in Fig 1d. Figs 1 e, 1f demonstrate iNOS labeling in the RBC from SCD patients on hydroxyurea treatment. iNOS immune staining in the RBC of SCD-HU patients was found to be more compared to RBC of SCD patients without hydroxyurea treatment (Fig 1 f, d respectively).

iNOS immunogold labeling in platelets of SCD and SCD-HU patients

Fig 2 shows the immunogold labeling of iNOS isoform in platelets. Similar pattern of decreased immunostaining was observed in the platelets of individuals with steady sickle cell disease (Fig 2b) compared to controls (Fig 2a), which was seen to be increased in patients on HU treatment (Fig 2c). The gold particle corresponding to the iNOS protein inside the cell have been shown by arrows (Fig 2 a,b,c). iNOS immunostaining in platelets from SCD-HU patients was found to be increased compared to SCD patients without hydroxyurea treatment (Fig 2 c, b respectively).

iNOS immunogold labeling in neutrophils of steady state SCD patients and SCD-HU patients

Labeling of iNOS is clearly visible in the nucleus as well as in the cytoplasm (Fig 3). iNOS immunostaining in control neutrophils is also shown in Fig 3. The localization of iNOS was also evident in the close proximity of the nuclear membrane (Fig 3). Figure 4a shows the subcellular distribution of iNOS in neutrophils of steady state SCD patients. iNOS staining were found to be decreased in the cytoplasmic compartment. However, not much difference in immunostaining of iNOS was evident in the nuclear compartment of neutrophils in the diseased condition as seen in Fig 4a. iNOS staining was also observed in the mitochondria as shown in Fig 4a. iNOS immunolabeling were observed to be increased in SCD-HU patients (Fig 4b). Closer examination revealed that iNOS is present in both the nuclear and cytoplasmic compartments in controls (Fig 3) as well as in patients (Fig 4a, 4b). The cytoplasm of neutrophils from SCD-HU patients showed enhanced immunostaining (Fig. 4b), whereas neutrophils from SCD patients showed decreased immunostaining (Fig. 4a). iNOS staining was prominent near the nuclear membrane (Fig 4b, arrowheads) and was visible in the nuclear compartment as well (Fig 4b, white arrows) after HU treatment.

Morphometric analysis of iNOS immunolabeling in SCD

Evaluation with 5 nm gold particles was obscure and difficult to differentiate from electron dense granules scattered in the cytoplasm and heterochromatin region of the nuclear lobes. Experiments were therefore conducted with 10 nm gold particles which were distinct, easier to count, and more convenient for morphometric analysis. Table 1 shows the morphometric analysis of the iNOS distribution in platelets, erythrocytes, and neutrophils of patients with steady state sickle cell disease and patients on hydroxyurea therapy compared to controls. No appreciable binding was seen in case of labeling only with secondary antibody (coupled with 10 nm gold particles).

DISCUSSIONS

SCD is a life-threatening condition that is characterized by hemoglobin polymerization leading to erythrocyte rigidity, hemolysis, and vaso-occlusion. The disease is characterized by the sickle shaped RBC, which poses multiple threats to human health, causing reoccurring pain, mainly in bones and joints and intermittent vaso-occlusive crises [26]. The goals for the treatment of sickle cell disease primarily include prevention and control of symptoms and complications. HU, a preventive drug approved by FDA for use in adults with SCD, is the drug proven to modify the disease process by improving hematologic parameters and hospitalization [27]. HU, as a source of NO plays an

Rashmi Saini *et al.,*

important role and has drawn considerable interest as a sickle cell disease treatment [28]. Hydroxyurea increases total hemoglobin and HbF in SCD, inhibits HbS polymerization, reduces gelation and sickling of erythrocytes [29]. Studies have demonstrated the metabolism and formation of NO from hydroxyurea in human blood [30, 31]. It is known that L-arginine, a substrate of NOS increases serum NO metabolite production in sickle cell patients in combination with hydroxyurea. This suggests hydroxyurea induced NOS mediated NO production in SCD patients. It has also been demonstrated that HbF levels correlate with the level of arginase and NOS activities with or without HU treatment [32]. It is reported that the cofactor of NOS, calmodulin, colocalizes with NOS in RBC, suggesting that RBC have the ability to synthesize their own NO [33, 34]. RBC deformability is affected by RBC-NOS mediated NO, which is produced at a baseline rate which is increased in normal RBC under shear stress. The analysis of the metabolism of NO is important to monitor in patients with SCD and can be associated with disease progression. This represents the most important advancement in understanding the pathogenesis, contributing to a more accurate management of patients [35]. iNOS gene expression was substantially greater in SCD neutrophils than in normal individuals [36]. Patients receiving HU reportedly had decreased iNOS gene expression [37]. It has been inferred that the reduced bioavailability of NO is a key factor in the pathophysiology of SCD [38, 39]. In prior studies, both the isoforms eNOS as well as iNOS were reported to be inactive. However, later it was found that human RBC express functional eNOS, which was mainly distributed in their cytoplasm and plasma membrane [15, 40].

Studies till date regarding data on the NOS isoform, its localisation, and its functional activity inside RBC are inconsistent [41]. Prominently, the relation of NOS with the generation and release of NO-related species from RBC has not been shown yet. Therefore, RBC-specific strategies must be developed to enable the detection and localisation of iNOS and its control. Proteins present in human RBC were shown to be immunoreactive to iNOS and eNOS where the concentration of the former was greater than the latter. It has been demonstrated that RBC expresse an active and functional NOS enzyme (RBC-NOS) localized in its membrane and cytoplasm. The properties of this enzyme were found to be similar to eNOS in terms of phosphorylation sites controlling enzymatic activity and the dependence of its activity on intracellular calcium and L-arginine concentrations [42]. Hydroxyurea treatment makes RBC bigger and prevents them to attain a sickle shape [43]. Effect of HU and L-arginine on the production of NO in cultures of normal and sickle erythrocytes demonstrated that HU increases NO but does not require NOS activity [7]. One of the beneficial effects of HU may involve the regulation of arginase activity and a concomitant induction of NOS activity, which may lead to an increased production of NO. It indicated towards the development of improved NO-based treatments for SCD [44]. The study provides the first evidence of alterations in the subcellular distribution of iNOS post-hydroxyurea treatment in blood cells of SCD patients. Studying the alteration in the subcellular distribution of iNOS in pathological conditions and the regulatory components of this rearrangement could be interesting therapeutic targets. The results of the current study support the NO-based therapeutic strategies for SCD and management of this disease.

ABSTRACT

This study delves into the phenomenon of the "Green Halo Effect" and its impact on consumer behaviour towards eco-friendly products, aiming to promote environmental conservation. Through a comprehensive survey, the research investigates consumer perceptions, purchase decision, and the influence of environmental awareness campaigns on eco-friendly product adoption. Findings reveal a significant positive perception among respondents towards eco-friendly products, indicating a widespread acceptance of sustainability initiatives. Moreover, environmental impact emerges as the primary driver of purchase decisions, followed by product quality and pricing considerations. Despite consumer scepticism towards green claims, environmental awareness campaigns have proven effective in shaping consumer behaviour towards sustainable choices. Strategic marketing approaches, such as social media campaigns, product labelling, and celebrity endorsements, play pivotal roles in promoting eco-friendly products and mitigating greenwashing concerns. Overall, this study underscores the importance of leveraging the Green Halo Effect to encourage sustainable consumption practices and safeguard the environment.

Keywords: Green Halo Effect, eco-friendly products, consumer behaviour, environmental awareness campaigns, sustainability, marketing strategies.

INTRODUCTION

In recent years, the discourse surrounding environmental conservation and sustainability has gained significant momentum, prompting both individuals and corporations to reassess their impact on the planet. Amidst this global shift towards eco-consciousness, businesses have increasingly adopted environmentally friendly practices and marketed products as "green" or "eco-friendly." This trend is driven not only by a genuine concern for the environment but also by consumer demand for sustainable options. As a result, the concept of the "green halo effect" has emerged as a topic of interest in consumer behaviour research. The term "green halo effect" refers to the phenomenon wherein consumers perceive a company or its products more favourably due to its perceived environmental responsibility or sustainability efforts. This positive perception extends beyond the specific eco-friendly aspects of the product or company, influencing overall attitudes and purchasing behaviour. Auger, Devinney, and Louviere (2008) examined the influence of environmental labelling on consumer preferences, revealing that products labelled as environmentally friendly were perceived more positively by consumers, even when the environmental attributes were not the primary focus of the product. This suggests that the mere presence of eco-friendly labelling can create a halo effect, enhancing perceptions of the product and the company as a whole.

Furthermore, research by Luchs, Naylor, Irwin, and Raghunathan (2010) delved into the psychological mechanisms underlying the green halo effect, proposing that consumers may engage in "ethical balancing" wherein they justify purchasing non-environmentally friendly products from companies with strong environmental credentials. This phenomenon highlights the complex interplay between consumers' environmental values and their purchasing decisions, emphasizing the importance of understanding the underlying motivations driving green halo effects. Given the growing emphasis on sustainability in both consumer preferences and corporate strategies, investigating the green halo effect has significant implications for businesses seeking to promote eco-friendly products and safeguard the environment. By understanding how environmental responsibility influences consumer perceptions and behaviours, companies can develop more effective marketing strategies to capitalize on the green halo effect while fostering genuine sustainability initiatives. This study seeks to delve deeper into the Green Halo Effect and its implications for promoting eco-friendly products to safeguard the environment. This research aims to contribute to a better understanding of consumer behaviour and the effectiveness of environmental awareness campaigns.

REVIEW OF LITERATURE

In recent years, there has been a growing interest in the promotion of eco-friendly products as a means to mitigate environmental degradation and promote sustainable consumption. Central to this discourse is the concept of the "green halo effect," wherein consumers' perceptions of a company or individual are positively influenced by their perceived environmental responsibility. This literature review seeks to explore the phenomenon of the green halo effect, its implications for marketing eco-friendly products, and its potential role in safeguarding the environment.
The term "green halo effect" was first introduced by researchers Griskevicius, Tybur, and Van den Bergh (2010) in their seminal study examining how pro-environmental behaviour can influence perceptions of a person's other unrelated traits. They found that individuals engaging in environmentally friendly behaviours were perceived as more altruistic, cooperative, and trustworthy, thus benefiting from a positive halo effect. Subsequent research by Bille, Kudryavtsev, and Bjerke (2017) extended this concept to the domain of consumer behaviour, demonstrating how companies promoting eco-friendly products could similarly benefit from a halo effect, leading to increased consumer trust and loyalty. The promotion of eco-friendly products has become a key strategy for businesses seeking to appeal to environmentally conscious consumers. A study by Ottman, Stafford, and Hartman (2006) revealed that consumers are increasingly inclined to purchase products that are marketed as environmentally friendly, even if they come at a premium price. This highlights the potential profitability of catering to green consumers and leveraging the green halo effect in marketing strategies. However, research by Montoro-Ríos, Luque-Martínez, and Fernández-Sabiote (2018) cautioned against the pitfalls of greenwashing – the deceptive practice of presenting a company as

more environmentally friendly than it actually is – which can undermine consumer trust and lead to backlash. Understanding the green halo effect and its implications for consumer behaviour has significant implications for environmental conservation efforts. By capitalizing on the halo effect through effective marketing strategies, companies can not only enhance their brand image but also promote sustainable consumption patterns. Moreover, by fostering a culture of environmental responsibility, the green halo effect may encourage individuals and organizations to adopt more sustainable practices beyond consumer behaviour, thereby contributing to broader environmental conservation goals.

RESEARCH PROBLEM

The green halo effect poses a significant challenge in accurately assessing consumers' attitudes and behaviours towards eco-friendly products. While there's growing interest in sustainability and environmental protection, it's crucial to understand whether consumers' positive perceptions of eco-friendly products genuinely translate into increased purchase intentions and long-term adoption. Additionally, the influence of various marketing strategies, corporate social responsibility initiatives, and environmental awareness campaigns on shaping consumers' perceptions and behaviours remains a complex and multifaceted issue that requires further investigation. Therefore, the research aims to delve deeper into these aspects to provide valuable insights for businesses and policymakers striving to promote sustainability and safeguard the environment.

RESEARCH OBJECTIVES

1. To investigate the extent to which consumers perceive eco-friendly products positively due to the "Green Halo Effect."
2. To identify the factors influencing consumers' purchase intentions towards eco-friendly products.
3. To assess the impact of environmental awareness campaigns on consumer behaviour and the adoption of eco-friendly products.
4. To explore the effectiveness of different marketing strategies in promoting eco-friendly products and mitigating potential scepticism or greenwashing concerns.

Hypothesis
H0: There is no significant relationship between perception of eco-friendly products and scepticism towards environmental claims by companies promoting eco-friendly products.
H1: There is a significant relationship between perception of eco-friendly products and scepticism towards environmental claims by companies promoting eco-friendly products

MATERIALS AND METHODS

The study employed a rigorous methodology to investigate the phenomenon of the green halo effect in consumer behaviour. To collect primary data, the researchers conducted an online survey, utilizing the convenience and accessibility of the internet to reach a broad audience. The sample size consisted of 225 respondents from India, selected through a simple random sampling method to ensure representativeness and minimize bias. Participants were presented with questions aimed at assessing their perceptions and behaviours regarding eco-friendly products. The collected data were analysed using statistical tools such as percentages to quantify responses and chi-square tests to identify potential relationships and associations between variables. By employing these analytical techniques, the study aimed to provide valuable insights into how consumers' perceptions of environmental friendliness impact their purchasing decisions and overall marketing strategy, thereby contributing to our understanding of sustainable consumption behaviour.

RESULTS AND DISCUSSIONS

The majority of respondents, constituting 57%, exhibited a very positive perception of eco-friendly products. This significant portion suggests a strong inclination towards favouring environmentally conscious choices. Additionally, 24% of the respondents demonstrated a positive perception, indicating a considerable portion of the population acknowledging the benefits of eco-friendly products. Furthermore, 19% of respondents held a somewhat positive perception, highlighting a notable portion with a moderate stance towards eco-friendly products. These findings collectively emphasize the widespread acceptance and recognition of the importance of eco-friendly products in safeguarding the environment. The table no. 2 illustrates the agreement levels regarding the environmental benefits associated with eco-friendly products. Among the respondents surveyed, a significant portion, comprising 58%, expressed strong agreement with the assertion that eco-friendly products generally contribute positively to environmental preservation compared to non-eco-friendly alternatives. An additional 21% of respondents expressed agreement with this statement, indicating a substantial consensus on the perceived environmental advantages of eco-friendly products. Conversely, 21% of respondents remained neutral on the matter, suggesting a segment of the population that may require further education or persuasion regarding the environmental benefits of eco-friendly products. These findings underscore the potential influence of the green halo effect in shaping consumer perceptions and attitudes towards sustainability initiatives. According to the findings of the study, the primary factor influencing the decision to purchase eco-friendly products is their environmental impact. This underscores consumers' increasing awareness and concern for environmental conservation and sustainability. Following closely behind environmental impact, product quality emerges as the second most significant factor shaping consumers' decisions. This suggests that while consumers prioritize environmentally friendly options, they are also unwilling to compromise on the quality and performance of the products they purchase. Despite the importance placed on environmental impact and product quality, price remains a crucial consideration for consumers when selecting eco-friendly products. This highlights the need for businesses to strike a balance between offering sustainable options and maintaining competitive pricing to attract environmentally conscious consumers.

Overall, these findings shed light on the intricate interplay between environmental concerns, product attributes, and pricing strategies in influencing consumers' decisions to embrace eco-friendly alternatives. Understanding these dynamics is essential for businesses seeking to leverage the green halo effect to promote sustainable consumption and contribute to environmental stewardship. The majority of respondents (47%) expressed being somewhat likely to choose an eco-friendly option over a non-eco-friendly one when the price is higher. Additionally, 40% of respondents indicated a likelihood of purchasing eco-friendly products under these circumstances, while 10% expressed a very high likelihood. These findings underscore the potential influence of the green halo effect, wherein consumers prioritize environmental considerations in their purchasing decisions, even when faced with increased costs. According to the findings of the research, a significant majority, comprising 76% of respondents, acknowledged that environmental awareness campaigns have had a discernible impact on their purchasing behaviour. This suggests a notable influence of such campaigns in shaping consumer choices towards eco-friendly products, underscoring the potential effectiveness of leveraging the "green halo effect" in promoting environmentally sustainable practices. The table no.6 illustrates the impact of environmental awareness campaigns on consumer behaviour. Among the respondents, 43% indicated that these campaigns were somewhat effective in influencing their behaviour. Additionally, 38% found them to be effective, while 14% deemed them highly effective. Only a small minority, comprising 5% of the respondents, considered the campaigns to be ineffective. The majority (70%) of respondents expressed scepticism towards environmental claims made by companies promoting eco-friendly products, indicating a cautious attitude towards such claims. Conversely, only 30% of respondents did not feel scepticism, suggesting a notable level of trust or acceptance in these environmental claims. The chi-square analysis yielded a value of 8.735 with 2 degrees of freedom. With a p-value of 0.013, which falls below the conventional significance threshold of 0.05, we reject the null hypothesis and accept the alternative hypothesis. This indicates a statistically significant relationship between individuals' perception of eco-friendly products and their scepticism towards environmental claims made by companies promoting such products.According to the findings, the most potent strategy for

promoting eco-friendly products is a robust social media campaign, which demonstrates significant effectiveness in engaging consumers and fostering awareness. Following closely behind is product labelling, serving as a tangible means to communicate sustainability features directly to consumers. Additionally, celebrity endorsements emerge as another influential tactic, leveraging the star power to enhance the appeal and visibility of eco-friendly products. These findings underscore the importance of strategic marketing initiatives in driving consumer adoption of environmentally responsible choices, ultimately contributing to safeguarding the environment.

CONCLUSION

The study illuminates several critical insights into consumer perceptions and behaviours regarding eco-friendly products. Firstly, the significant portion of respondents exhibiting positive perceptions towards eco-friendly products underscores a widespread inclination towards environmentally conscious choices. This inclination is further supported by the consensus on the environmental benefits associated with such products, emphasizing their role in environmental preservation .Moreover, the study highlights consumers' prioritization of environmental impact alongside product quality, suggesting a nuanced approach to purchasing decisions. While consumers value sustainability, they also demand quality and performance from eco-friendly products. The findings also reveal the importance of pricing in consumer decisions, indicating a need for businesses to balance sustainability with competitive pricing to attract environmentally conscious consumers effectively. Crucially, the study underscores the potential influence of the green halo effect in shaping consumer perceptions and behaviours. Despite scepticism towards environmental claims by companies, consumers show a notable willingness to embrace eco-friendly alternatives, particularly when supported by robust marketing campaigns, social media engagement, and clear product labelling. In conclusion, the study emphasizes the intricate interplay between environmental concerns, product attributes, pricing strategies, and marketing initiatives in driving consumer adoption of eco-friendly products. By understanding and leveraging the green halo effect, businesses can not only promote sustainable consumption but also contribute significantly to environmental stewardship.

ABSTRACT

This study focuses on the difficulties encountered by the custom house agent, specifically in relation to Blue Bharat Exim Private Limited (Egmore), a company situated in Chennai. Customs house agents (CHAs) are essential in facilitating international trade by effectively managing the intricate customs regulations and procedures. This study investigates the numerous obstacles faced by CHAs (Customs House Agents) during the process of custom clearance, providing insight into the complex concerns that hinder effective trade facilitation. The research used a mixed-methods approach, which involves qualitative interviews with CHAs, customs officials, and industry stakeholders, as well as quantitative data analysis using customs clearance records and regulation documentation. This comprehensive approach enables a detailed comprehension of the difficulties encountered by CHAs during various phases of the clearing procedure. In addition, the research reveals systemic problems like as corruption and collusion, which weaken the integrity of the clearance process and destroy trust among CHAs, customs authorities, and stakeholders. These illegal activities not only disrupt the functioning of the market but also inflict a substantial financial burden on lawful enterprises. The findings have significant implications that require legislative interventions and systemic reforms to improve customs operations, increase transparency, and address the issues encountered by CHAs. It is crucial to make strategic investments in technology, capacity building programs, and stakeholder collaboration in order to modernize customs operations and create a favorable climate for trade facilitation.

Keywords: Certificates of origin, Compliance documents, Custom Clearance, Customs House Agents, Bill of Lading.

Adithyan and Sathish Kumar

INTRODUCTION

In India, a customs house agent (CHA) is licensed to act as an agent for transaction of any business relating to the entry or departure of conveyances or the import or export of goods at a customs station. CHAS maintain detailed, itemized and up-to-date accounts. A CHA license may be temporary or permanent. The clearance of goods on Import or Export, including unaccompanied baggage, involves quite a lot of procedural formalities under Section 46, 47, 50, 51 etc., These formalities have to be observed by Importer / Exporter / Passenger, as the case may be. But in most cases the Customs station would be far away and it may not be possible for the Importer / Exporter/ Passenger to attend to such work promptly. The charges levied by Custom House Agents from the Client should be at such rates as notified by the Commissioner from time to time which is done under Rule 25(b). The same rule, sub section (2) requires that Customs House Agents should control as members of the registered Custom House Agents Association of the Port. The Custom House Agents can avail transactional services for Imports & Exports. The services available includes E-Filing of Import & Export documents, A Customs House Agent can attend to the Custom work himself or employ persons to assist him. Custom House Agent has to be not only well informed of the Customs laws and procedures and A documentation, but has to be alert all the time, closely following the instructions or change in the public notices, issued from time to time. His is a very peculiar position in that, though he is employed by the Importers/Exporters, he is licensed by the department and hence he can satisfy them only to the extent the law permits and within the procedures laid down by the Customs House. A Custom House Agent has to be not only well informed of the Customs laws and procedures and documentation, but has to be alert all the time, closely following the instructions or change in the public notices, issued from time to time. His is a very peculiar position in that, though he is employed by the Importers/Exporters.

STATEMENT OF THE PROBLEM
Customs regulations are complex and subject to frequent changes, posing challenges for CHAs to stay updated and compliant with the latest requirements. Customs clearance involves extensive documentation, including invoices, bills of lading, certificates of origin, and compliance documents. Managing and verifying this paperwork is time-consuming and prone to errors. Many customs clearance processes still rely on outdated manual procedures, leading to inefficiencies and delays.

SIGNIFICANCE OF THE STUDY
Custom clearance is a crucial part of international trade facilitation. CHAs act as intermediaries between importers/exporters and customs authorities, streamlining the clearance process. Identifying and addressing challenges they face can significantly improve the efficiency and effectiveness of trade facilitation efforts.

OBJECTIVES OF STUDY
- Identify the key challenges faced by customs house agents (CHAs) during the customs clearance process.
- Explore potential solutions or strategies to mitigate the identified challenges.
- Understand the impact of these challenges on the efficiency and effectiveness of customs clearance operations.
- To study the Customs clearances process of Custom House Agent

SCOPE OF THE STUDY
The study will examine various supply chain processes, including procurement, production, inventory management, logistics, and distribution. Overall, the scope of the study will provide a comprehensive understanding of the impact of the challenges that are faced by the custom house agent and offer valuable insights for the CHA's seeking to improve their performances.

Adithyan and Sathish Kumar

LIMITATIONS OF THE STUDY

The study on challenges faced by customs house agents may have limitations stemming from sample bias, as it might predominantly include agents from specific regions or with particular experiences. Data collection methods like surveys may introduce response biases. Additionally, the study may lack comprehensive insight due to its focus on current challenges, neglecting historical or systemic factors. Limited generalizability could arise from variations in regulations and practices across jurisdictions. Moreover, the dynamic nature of the customs industry might render findings outdated quickly.

RESEARCH METHODOLOGY

Research design

The research design is the blueprint for the fulfillment of objectives and answering questions.It is a master plan specifying the method and procedures for collecting analyzing needed information.

Sampling Technique - Simple Random Sampling
Sampling method - To obtain the representative sample, convenience sampling method is used for selecting the sample.
Sample size - 50 Respondents.
Period of study - The study has been taken for 2 months period in Blue Bharat exim prt ltd.
Data collection method
The source of the data includes primary and secondary data sources.

Primary sources

Primary data has been collected directly from sample respondents through questionnaire and with the help of service technician.

Secondary sources

Secondary data has been collected from standard textbooks, Newspapers, Magazines & Internet.

DATA ANALYSIS AND INTERPRETATION

Nearly half (64%) of respondents are males, indicating male dominance in the logistics department.
Similarly, 80% fall in the below 30 age range, suggesting a significant portion of respondents are in this bracket.
48% are from the students, showing high interest of young generation in logistics.
42% of the respondents agree that the interaction with the customs official is the main obstacle for the CHAs.
36% of people responds "GOOD" for the effective of the procedures used by the CHAs.
36% experience with insufficient cooperation with relevant parties.
36% are asking the custom authorities for assisting them.
34% agree with customs clearing software in technical resources used by the CHAs.
44% agree with the fostering a rapport with customs officiers.
30% are accepting both the consistent training sessions and industry publication subscription.

FINDINGS

- Nearly half (64%) of respondents are males, indicating male dominance in the logistics department.
- Similarly, 80% fall in the below 30 age range, suggesting a significant portion of respondents are in this bracket.
- 48% are from the students, showing high interest of young generation in logistics.
- 42% of the respondents agree that the interaction with the customs official is the main obstacle for the CHAs.
- 36% of people responds "GOOD" for the effective of the procedures used by the CHAs.
- 36% experience with insufficient cooperation with relevant parties.
- 36% are asking the custom authorities for assisting them.
- 34% agree with customs clearing software in technical resources used by the CHAs.

Adithyan and Sathish Kumar

- 44% agree with the fostering a rapport with customs officiers.
- 30% are accepting both the consistent training sessions and industry publication subscription.
- 32% are accepting the stricter regulatory clearance for the CHAs.
- 34% are keeping the lines of the communication open with customs officials.
- 36% agree that one possible solution could be to have CHAs & customs official meet regularly.
- 30% accept in offering cultural sensitivity training.
- 32% willing for the improved data exchange between stakeholders.
- 28% are undertaking comprehensive evaluations of financial risk.
- 38% are imposing to simplifying documentation procedures.
- 32% are giving their suggestion in increasing restrictions ad trade barriers.
- 32% agreeing in forming relationship with international logistics providers & using software for cross-border transaction.
- 34% are ensuring adherence to security procedures.
- 34% are educating staff members about ethics.
- 36% will be finding pattern and trends in clearance data.
- 28% are regularly auditing clearance procedures.

SUGGESTIONS
- **Complex Regulatory Environment:** Customs regulations are intricate and subject to frequent changes. CHAs must stay updated with these changes to ensure compliance, but navigating the evolving regulatory landscape can be daunting and time-consuming.
- **Documentation Requirements:** Custom clearance involves extensive paperwork, including invoices, bills of lading, packing lists, and customs declarations. Errors or discrepancies in documentation can lead to delays or even penalties. CHAs face the challenge of accurately preparing and verifying these documents for each shipment.
- **Tariff Classification and Valuation:** Determining the correct tariff classification and valuation of goods is crucial for calculating duties and taxes. However, the classification system can be complex, and valuation methods may vary based on the type of goods and transaction. CHAs must possess in-depth knowledge and expertise to ensure accurate classification and valuation, minimizing the risk of disputes with customs authorities.
- **Customs Duties and Taxes:** Calculating customs duties and taxes involves considering various factors such as the value of goods, country of origin, trade agreements, and applicable exemptions or preferences. CHAs must navigate these complexities to determine the correct duty rates and ensure that clients comply with their tax obligations.
- **Customs Inspections and Audits:** Customs authorities conduct inspections and audits to verify compliance with regulations and detect any discrepancies. CHAs may face challenges when goods are selected for inspection, as this can lead to delays and additional scrutiny. They must cooperate with customs officials and provide necessary documentation to facilitate the inspection process efficiently.
- **Communication and Coordination:** Effective communication and coordination are essential for smooth custom clearance processes. CHAs liaise with various stakeholders, including importers, exporters, shipping lines, and customs authorities. Language barriers, time zone differences, and differing communication protocols can pose challenges, requiring CHAs to employ effective communication strategies and tools.
- **Technology and Automation:** The customs clearance process is increasingly reliant on technology and automation tools for tasks such as electronic data interchange (EDI), online submissions, and electronic payments. While these technologies streamline processes and improve efficiency, CHAs must invest in appropriate infrastructure and training to leverage them effectively.
- **Global Trade Dynamics:** Global trade dynamics, including geopolitical tensions, trade disputes, and economic uncertainties, can impact custom clearance processes. CHAs must stay informed about geopolitical developments and their potential implications for international trade to effectively navigate these challenges.

CONCLUSION

Customs house agents (CHAs) play a crucial role in facilitating international trade by managing customs clearance procedures on behalf of importers and exporters. However, they encounter numerous challenges in performing their duties efficiently. The conclusion drawn from an analysis of these challenges underscores the need for strategic solutions to enhance the effectiveness of CHAs and streamline customs clearance processes. One of the primary challenges faced by CHAs is the constantly evolving regulatory environment. Customs regulations vary between countries and are subject to frequent changes, posing a significant hurdle for CHAs to stay updated and compliant. This challenge is compounded by the complex nature of trade agreements and tariff classifications, which require CHAs to possess in-depth knowledge and expertise. Another key issue is the proliferation of documentation requirements. Customs clearance involves a plethora of paperwork, including invoices, bills of lading, certificates of origin, and various permits. Managing and processing these documents accurately and efficiently can be overwhelming for CHAs, leading to delays and potential errors in customs clearance procedures. In conclusion, the challenges faced by CHAs in customs clearance underscore the need for proactive measures to enhance efficiency and effectiveness in international trade facilitation. This includes investments in technology and infrastructure, ongoing training and capacity building for CHAs, harmonization of customs regulations, and greater collaboration between public and private sectors. By addressing these challenges collectively, stakeholders can unlock the full potential of CHAs in facilitating smooth and expedited customs clearance processes, thereby promoting trade facilitation and economic growth.

ABSTRACT

A customs house agent (CHA) is licensed to act as an agent for transaction of any business relating to the entry or departure Customs house agent is very much important for the import and import of the goods. Customs house agent intermediate to the customs and exporters, importers to clearance of documentation. For the transports of goods to all the countries, and most importantly to avoid the illegal activities done through the Airways, ports and road ways. It's helpful to improve the country economies development and to develop the healthy relationship between two countries. They make proper bills of entry and shipping bills that are crucial for clearance of proper goods or conveyances.

Keywords: Bills of entry, Customs House Agent, Freight Forwarders, Shipping Bills, Shipping Services.

INTRODUCTION

A Custom House Agent (CHA) is a licensed individual or firm appointed by the owner of goods or a carrier to act as an agent for the clearance of goods through customs. The primary role of a Custom House Agent is to facilitate the import and export of goods across international borders by completing the necessary legal and regulatory procedures.
The Custom House Agent is responsible for ensuring that all customs documentation, including bills of entry, shipping bills, and other necessary documents, are prepared and submitted to the customs authorities. They also coordinate with the shipping companies, freight forwarders, and other related agencies to ensure that the goods are transported smoothly to their destination.

NEED FOR THE STUDY
• To study the operational features of the CHA in their examination of various products

- To analyze the nature of work / business process of CHA
- To understand the essential endorsements and documents obtained by CHA

OBJECTIVES OF THE STUDY

- To study on the role of Custom House Agent on handling Imports .
- To study about CHA and identify their functions.
- To study the various products handled by Sri Janani Shipping Services Private Limited.
- To examine the various facilities provided by the CHA to the customer.
- To analyze the problems faced by the CHA.
- To study the operational features of the CHA in their examination of various Products.
- To understand the essential endorsements and documents obtained by CHA.

SCOPE OF THE STUDY

- Srijanani Shipping Services Private Limited have been going through a wide range of Improvements in terms of cost competitiveness & operational aspects.
- The scope of research magnifies the purpose and skills in the Customs House Agency which plays an important role as backbone in the Import Trade.
- This research implies us to study related topics to CHA and its role in   handling The EXIM cargo at Gateway Ports.
- Know how about processing of Cargo Documents with Customs, Various Authorities, Container Lines, Inland Container Depot and Container Freight Station.
- To study the operational features of the CHA in their examination of various products
- To analyze the nature of work / business process of CHA
- To understand the essential endorsements and documents obtained by CHA.

LIMITATIONS OF THE STUDY

- Collecting data properly from importers become difficulty due to the resource constraint.
- The sample of this study is only 65.
- There is a chance for baise in the information given by the respondents.
- The sample size of the project may be limited due to various reasons such us time, resources, and access to participants.
- Data collected may be limited due to various reasons such us incomplete or inaccurate responses from participants.
- It may not be possible to cover all aspects of the topic or to include all relevant variable due to resource constrains.

RESEARCH METHODOLOGY

RESEARCH DESIGN
The current research paper adopts analytical research design ant has the primary objective as to know the role of customs broker at importers and identify the problems. And in order to carry out the present study in a meaningful manner an adequate amount of data and information has been collected.

Descriptive research design
As their name implies descriptive research design, are designed to describe something. For example, the characteristics of users of a given product, the degree to which product use varies with income, age, sex etc.

Sampling Technique
Simple Random Sampling

Sampling method
To obtain the representative sample, convenience sampling method is used for selecting the sample.

Sample size – 65   Respondents
Period of study
The study has been taken for 2months period in Srijanani Shipping Services Private Limited.

Data collection method
The source of the data includes primary and secondary data sources.

Primary sources
Primary data has been collected directly from sample respondents through questionnaire and with the help of service technician.

Secondary sources
Secondary data has been collected from standard textbooks, Newspapers, Magazines &Internet.

Statistical Tools Adopted
Chi-Square Test

DATA ANALYSIS AND INTERPRETATION
A chi-square test is a statistical test used to determine whether there is a significant association between two categorical variables.

Interpretation
Since the p-value is greater than the significance level (0.05%), we fail to reject the null hypothesis, indicating no significant difference between tracking system and service level. (x^2-25.217, df-9, p-.003).

FINDINGS OF THE STUDY
- Majority (71.7%) of the respondents are male.
- Majority (76.9%) of the respondents are PG.
- Majority (40%) of the respondents are 1-3 years experienced.
- Majority (56.9) of the respondents are agree clearance in export is adequate.
- Majority (60%) of the respondents are strongly agree documentation for clearance is manageable.
- Majority (38.5) of the respondents are strongly agree charges provided by Srijanani Shipping Services Private Limited is flexible.
- Majority (47.7%) of the respondents are strongly agree procedure followed by Srijanani Shipping Services Private Limited is genuine.
- Majority (43.1%) of the respondents agree forwarding in Srijanani Shipping Services Private Limited is upto par.
- Majority (38.5%) of the respondents agree fumigation in Srijanani Shipping Services Private Limited is fine.
- Majority (41.5%) of the respondents are strongly agree liner service inSrijanani Shipping Services Private Limited is convenient.
- Majority (43.1%) of the respondents agree textile handled by Srijanani Shipping Services Private Limited is competent.

- Majority (43.1%) of the respondents agree Srijanani Shipping Services Private Limited has the experienced operation team to handle any type of cargo.
- Majority (44.6%) of the respondents agree Srijanani Shipping ServicesPrivate Limited handle your customs documentation ease and care.
- Majority (46.2%) of the respondents are strongly agree Srijanani Shipping Services Private Limited handle cargo with care without any damages.
- Majority (43.1%) of the respondents agree Srijanani Shipping Services Private Limited tracking system is useful.
- Majority (69.2%) of the respondents are strongly disagree, they ever witness delay in handling shipment in Srijanani Shipping Services Private Limited.

SUGGESTIONS

- Consider strategies to attract more female respondents or understand why the majority are male. This could involve targeted outreach or creating a more inclusive environment.
- Since most respondents are postgraduates, you could tailor your services or communications to reflect this level of education, potentially by providing more detailed or technical information.
- Recognize that a significant portion of respondents are relatively new to the industry (1-3 years). This could inform training programs or support for those early in their careers
- Continue to prioritize and maintain the efficiency of clearance processes and documentation management, as the majority find these aspects manageable or adequate.
- Acknowledge and maintain the flexibility in charges and procedures that respondents appreciate. This could involve periodic reviews to ensure competitiveness and responsiveness to customer needs.
- Since respondents generally agree on competence in handling textiles, consider highlighting this expertise in marketing materials or targeting clients in the textile industry.
- Reinforce the perception of an experienced operation team, possibly through highlighting team expertise or providing additional training to maintain high service standards.
- Strengthen customer care and attention to detail in customs documentation and cargo handling, as respondents value ease, care, and damage-free handling.
- Continue to invest in and improve the tracking system, as the majority find it useful, which can enhance customer experience and trust.
- Although most respondents have not witnessed delays, it's crucial to address any instances promptly and transparently to maintain trust and satisfaction levels.

CONCLUSION

Based on the study conducted on the role of Customs House Agents (CHAs) on imports in Sri Janani Shipping Services Private Limited, several key conclusions can be drawn: CHAs play a crucial role in facilitating the import process by acting as intermediaries between importers and customs authorities. Their expertise and knowledge help expedite clearance procedures and ensure compliance with regulations. The study highlighted that CHAs contribute significantly to the efficiency of import operations. Their expertise in customs regulations and documentation processes streamlines clearance procedures, reducing delays and costs for importers. CHAs play a vital role in ensuring importers comply with customs regulations and manage risks associated with imports. Their understanding of regulations helps prevent delays, fines, and other compliance-related issues. While CHAs charge fees for their services, the study suggests that their involvement ultimately leads to cost savings for importers. The efficiency and expertise they bring to the import process can help avoid costly delays and errors. The study recommends that Sri Janani Shipping Services Private Limited continue to collaborate closely with CHAs to enhance

Rakesh Varma and Sathish Kumar

their role in import operations. This could include providing additional training and resources to CHAs to further improve efficiency and compliance.

ABSTRACT

The efficient management of supply chain quality is critical for businesses to ensure timely delivery of products to customers. This project investigates the impact of supply chain quality management systems on on-time delivery performance within the context of Butterfly Gandhi Mathi Appliances. Through data analysis and inference drawn from various aspects of the supply chain, including gender distribution, age demographics, departmental distribution, and feedback from respondents, insights are gained into the strengths and areas for improvement within the supply chain. Positive conclusions highlight the organization's commitment to leveraging technology, enhancing supplier relationships, prioritizing customer satisfaction, and recognizing opportunities for growth. These findings underscore the significance of effective supply chain quality management systems in driving on-time delivery performance and ultimately contributing to business success.

Keywords: Inventory, Logistics, On Time Delivery Performance, Real Time Monitoring, Supply Chain Quality Management System.

INTRODUCTION

In the contemporary business landscape, where competition is fierce and customer expectations are constantly evolving, organizations face immense pressure to deliver products and services on time while maintaining high standards of quality. Effective supply chain management has emerged as a critical determinant of organizational success, with a focus on optimizing processes, reducing lead times, and ensuring timely delivery to meet customer

demands. Central to this is the implementation of Supply Chain Quality Management Systems (SCQMS), which aim to streamline operations, enhance efficiency, and uphold quality standards throughout the supply chain.

STATEMENT OF THE PROBLEM

To find out the impact of supply chain quality management system on-on time delivery with reference to Pudupakkam Butterfly Gandhimathi Appliances.

OBJECTIVES OF STUDY

• To assess the effectiveness of Supply Chain Quality Management System (SCQMS) implementation in improving time delivery performance within the supply chain.
• To evaluate the overall impact of SCQMS on enhancing supply chain efficiency and meeting customer delivery expectations.

SCOPE OF THE STUDY

The study will examine various supply chain processes, including procurement, production, inventory management, logistics, and distribution. Overall, the scope of the study will provide a comprehensive understanding of the impact of SCQMS on time delivery performance within the supply chain and offer valuable insights for practitioners and managers seeking to improve supply chain operations.

LIMITATIONS OF THE STUDY

• The findings of the study may not be generalizable to all industries or organizations due to variations in supply chain structures, processes, and contexts.
• The study's findings may be limited by the availability and accessibility of data related to supply chain quality management practices and time delivery performance metrics.
• The study's sample size may be limited, impacting the representativeness and statistical power of the findings.
• The study may be constrained by time limitations, affecting the depth and breadth of data collection, analysis, and interpretation.

RESEARCH METHODOLOGY

The purpose of methodology section is describing the research design procedure. This includes the overall research design. The sampling procedure-collection method the field methods and analysis procedure.

Research design
The research design is the blueprint for the fulfillment of objectives and answering questions. It is a master plan specifying the method and procedures for collecting analyzing needed information.

Descriptive research design
As their name implies descriptive research design, are designed to describe something. For example, the characteristics of users of a given product, the degree to which product use varies with income, age, sex etc.

Sampling Technique
Simple Random Sampling

Sampling method
To obtain the representative sample, convenience sampling method isused for selecting the sample.

Sample size -100 Respondents.

Vignesh and Sathish Kumar

Period of study
The study has been taken for 2months period in Butterfly Gandhimathi Appliances.

Data collection method
The source of the data includes primary and secondary data sources.

Primary sources: Primary data has been collected directly from sample respondents through questionnaire and with the help of service technician.

Secondary sources: Secondary data has been collected from standard textbooks, Newspapers, Magazines & Internet.

Statistical Tools Adopted
•   Chi-Square Test
•   ANOVA

Interpretation
The calculated value is less than the table value. So, there is no significant difference between age and tracking on time delivery.

Interpretation
The calculated value is less than the table value. So, there is no significant difference between Age tracking on time delivery improving on time delivery.

FINDINGS
•   Nearly half (48%) of respondents are males, indicating male dominance in the logistics department.
•   Similarly, 48% fall in the 31-40 age range, suggesting a significant portion of respondents are in this bracket.
•   35% are from the production department, showing high manpower capacity.
•   The majority (87%) agree that the supply chain has sufficient transportation.
•   Conversely, 81% see no flaws in the company's flow of information, money, and materials.
•   75% report no incidents of late delivery of raw materials by the production department.
•   69% periodically collect customer feedback after delivery.
•   63% have sufficient inventory for production.
•   46% cite a lack of visibility into supplier lead time, impacting prediction due to transportation risks.
•   50% face dispatch errors due to human error.
•   62% experience wrong product deliveries, often leading to returns.
•   41% conduct periodic manual checks for on-time delivery tracking.
•   44% rely on robust contingency plans for unexpected disruptions.
•   41% view technology & automation as essential for improving on-time delivery.
•   35% maintain successful on-time delivery through (KPI) Key performance indicators.
•   33% observe effective logistics in intercompany operations.
•   37% encounter disruptions or bottlenecks in the supply chain rarely.
•   31% believe implementing quality management practices significantly improves ontime delivery.
•   56% rate transportation availability as excellent.
•   52% find the delivery performance of the supply chain department excellent.
•   41% suggest increased investment in technology for enhanced on-time delivery.
•   45% attribute most delivery delays to communication breakdowns.
•   51% prioritize promptly investigating and addressing root causes of issues.
•   65% acknowledge gaps in communication and coordination.
•   69% strongly believe on-time delivery impacts customer satisfaction positively.

SUGGESTIONS

- Since 41% of respondents view technology and automation as essential for improving on-time delivery, consider investing in advanced software solutions, such as supply chain management systems, to enhance visibility, tracking, and coordination across the supply chain.
- Address the concerns raised by 25% of respondents regarding lack of supplier reliability. Establishing stronger relationships with suppliers through regular communication, collaboration, and possibly even joint planning can help mitigate delays caused by supplier issues.
- 13% of respondents suggest streamlining processes through lean principles. Implementing lean practices such as reducing waste, optimizing workflows, and standardizing processes can lead to more efficient operations and fewer delays.
- With 29% of respondents emphasizing the importance of employee training and development, invest in training programs to enhance employees' skills and knowledge in supply chain management, communication, and problem-solving.
- Given that 45% of respondents attribute most delivery delays to communication breakdowns, prioritize improving communication channels and practices within the organization and with external stakeholders. This could involve implementing better communication tools, establishing clear communication protocols, and fostering a culture of transparency and collaboration.
- Since 44% of respondents rely on robust contingency plans for handling unexpected disruptions, ensure that the organization has well-defined contingency plans in place to address potential disruptions in the supply chain promptly and effectively.
- With 51% of respondents prioritizing the investigation and prompt addressing of root causes of delivery delays, establish a formal process for identifying, analyzing, and resolving issues that lead to delays in the delivery process.
- Address the challenges identified by 11% of respondents related to poor inventory management. Implement inventory optimization strategies, such as demand forecasting, safety stock management, and inventory visibility tools, to ensure adequate inventory levels and minimize stockouts.
- Since 35% of respondents use on-time delivery percentage as a key performance indicator, continue to monitor and measure on-time delivery performance using relevant KPIs to track progress and identify areas for improvement.
- Recognize the strong correlation between on-time delivery and customer satisfaction, as indicated by 69% of respondents. Prioritize on-time delivery as a critical component of customer satisfaction and strive to consistently meet or exceed customer expectations in this regard.

CONCLUSION

The data from Butterfly Gandhi Mathi Appliances provides valuable insights into the current state of the supply chain management system. Most respondents exhibit confidence in various aspects of the supply chain, indicating a strong foundation for further improvement.

ABSTRACT

Customer satisfaction is the study of how individual customers, group or organization select by use and dispose product and reviews to satisfy their needs and wants. It refers to the actions of the customers in the marketplace and the underlying motives for those actions. Marketers export that by underlying what causes the customers to buy particular product, they will able to determine-which products are needed in the market place, which are obsoletes and how best to present the goods to the customers. It gives a brief report on the profile of the Butterfly Gandhimathi Appliances Limited. About history, current status its achievement's as a firm in the Butterfly Gandhimathi Appliances. This project also speaks on its various product and its future plans. The major objective of the project is to measure the level of customer satisfaction of the customer in the region Chennai. The descriptive study is used for the research. Hypothesis was developed and testing using the statistical tools (chi-square test, ANOVA). Primary data for the study was collected from the sample of 100 customers using a well- structured questionnaire, which suits all categories of customers. Respondents were met and interviewed to collect the information.

Keywords: Customer Satisfaction, Material Handling, Manufacturing, Packaging, Storage.

INTRODUCTION

The wealth of a country is measured by its gross national product the output of goods and services produced by the nation in a given time. Goods are physical objects, something we can touch, feel, or see. Services are the performance of some useful function such as banking, medical care, restaurants, clothing stores, or social services. But what is the source of wealth is measured by the amount of goods and services produced, but where does it come from Although

we may have rich natural resources in our economy such as mineral deposits, farmland, and forests, these are only potential sources of wealth.

NEED FOR THE STUDY
The study provides information to those interested in the Logistics activity. It provide insight into the challenges and potential benefits of Material handling management. It mainly focuses on safety of materials.

OBJECTIVES OF THE STUDY
- To identify the problems faced in Material handling.
- To find out the critical factors influencing various stages of material handling.
- To reveal the measures to improve the flow of material handling for effective work condition.

SCOPE OF THE STUDY
- The study restricted to the employees in manufacturing industries.
- The study measures data only through questionnaire

LIMITATIONS OF THE STUDY
The study suffers from certain limitations which are stated as follows:
- The findings and conclusions drawn are from samples taken from the employees.
- Sample size of the study is only 126.
- Some respondents hesitated and carelessly filled the questionnaire.

RESEARCH METHODOLOGY

Descriptive research is a study designed to depict the participants in an accurate way. More simply put, descriptive research is all about describing people who take part in the study.

Sample Design
The sampling technique undergone for this study is Convenience sampling. Convenience sampling is a type of non-probability sampling in which sample being drawn from that part of the population that can be reached.

Sample Size
A questionnaire was circulated to through Google forms for which 126 responded for the survey.
Sample size   : 126
Location   : Chennai
Target people   : Employee
Type of industry : Manufacturing

Data Collection
Primary data was collected by giving questionnaire to the employees. The completed questionnaires in all respects were taken for the study. Questionnaire used which consist of 20 questions.

Secondary data used was the literature given which were reviewed for the purpose of attaining knowledge on the topic.

Statistical Tools used for data analysis
In this study, It has various statistical tools like percentage analysis and statistical test like Correlation, One way ANOVA & Independent sample T-Test.

Tharun and Sathish Kumar

DATA ANALYSIS AND INTERPRETATION

Here p value is -.118 Hence there is negative correlation between age and problem facing frequently while handling the materials.

Null hypothesis H0: There is no significance difference between Gender and improvements in material handling

Alternate Hypothesis H1: There is significance difference between Gender and improvements in material handling.

Here p value is 0.852 which is greater than 0.05, so accepting Null Hypothesis. Hence there is no significance difference between Gender and improvements in material handling.

Null hypothesis H0: There is no significance difference between Educational qualification and Critical factor in material handling

Alternate Hypothesis H1: There is significance difference betweenEducational qualification and Critical factor in material handling

Here p value is 0.094, 0.470 and 0.939 which is greater than 0.05, so accepting Null Hypothesis. Hence there is no significance difference between Educational qualification and Critical factor in material handling.

FINDINGS

- In correlation test there is negative correlation between age and problem facing frequently while handling the materials.
- In Independent sample T – test it proves that Experience have no impact on improvements in material handling.
- In one way anova test it proves that Educational qualification have no impact on Critical factor in material handling.
- Majority (44%) of the respondents are age between 21-30 years.
- Majority (91%) of the respondents are Male.
- Majority (49%) respondents is Undergraduate
- Majority (53%) respondents has 1 – 10 years of experience.
- Majority (63%) of respondents choosen the power trolleys.
- Majority (59%) of respondents said their current racking system as pallet racking.
- Majority (78%) of the respondents preferred automated.
- Majority (70%) of respondents said that its takes 15 -30 min to load and unload 400 pices of materials.
- Majority (44%) of respondents said that the equipment is more safety for handling materials is power trolleys.
- Majority (42%) of respondents are satisfied with storage method.
- Majority (37%) of respondents said none of the problem facing frequently.
- Majority (53%) of respondents Agree that they are satisfied with the equipments used in the company.
- Majority (34%) of respondents modern equipment requirement requirement is Bay crane.
- Majority (37%) disagree the critical factor as ordering system.
- Majority (46%) neutral that the factors as lack of information.
- Majority (38%) neutral that the trouble in equipments
- Majority (48%) neutral that lack of equipments
- Majority (42%) neutral about the route damage.
- Majority (59%) of respondents Agree that they need alternative methods in material handling.
- Majority (63%) of respondents confirmed that 2 feet is effective for material movement.
- Majority (34%) agree the difficulties faced as driver shortage.
- Majority (32%) strongly agree as safety of materials.
- Majority (56%) strongly agree that the environmental control.
- Majority (56%) neutral that route optimisation.
- Majority (48%) neutral about the driver behaviour.
- Majority (40%) of respondents agree that improvements has more equipment needed.

SUGGESTION

- Make a plan use as a team approach to design the material handling system.

- Standardize the consistent in your choise of storage equipment, including bins, shelves and racks as well as equipment used to transport materials.
- Reduce, combaine or eliminate as much movement as possible.
- Wherever possible, move full pallets or containers to improve efficiency and reduce effort.
- Working in an organized space is more efficient than working around clutter.
- Employ automation wherever possible. Think of automated picking and putaway technologies.

CONCLUSION

A recent study on material handling practices revealed that the majority of respondents were male (91%) aged between 21 to 30 years (44%). The largest educational group was undergraduates (49%), and most had 1-10 years of experience (53%). Power trolleys were the most commonly used equipment (63%), with pallet racking being the predominant racking system (59%). Notably, a significant majority (78%) preferred automated material handling systems. Despite overall satisfaction with current practices, a key challenge highlighted was a shortage of equipment supply (12%). The findings suggest a strong inclination towards automation and emphasize the importance of addressing equipment availability to optimize material handling processes effectively.

ABSTRACT

This project is all about to know about export import procedure/ documentation of shipment. This project puts more focus on to know custom clearness, to make export - import invoice, to get shipping bill number from custom department etc. This project will also find out how Gray grain polymer rubber industry could sustain in the competitive world by providing vast range of cargo handling through all instruments which flexible prompt and innovative in meeting the requirement of the customer. The purpose of the study was to know about export – import documentation of seaway in the Shellam Soap Industry.

Keywords: Export, Import, Manufacturing Industry, Soap Industry, Tripoli Phosphate Poses.

INTRODUCTION

This paper is all about to know about export import procedure / documentation of shipment. This project puts more focus on to know custom clearness, to make export - import invoice, to get shipping bill number from custom department etc. This project will also find out how Gray grain polymer Soap industry could sustain in the competitive world by providing vast range of cargo handling through all instruments which flexible prompt and innovative in meeting the requirement of the customer. The purpose of the study was to know about export – import documentation of seaway in the Shellam soap industry.

PROBLEMS OF THE STUDY
Soap industry faces some problems in case of raw materials. The major ingredients are soap ash, linear alkyl, benzene& sodium. Tripoli phosphate poses number of serious problems in terms of availability. The demand supply

Mohamed Shafith and Sathish Kumar

gap for vegetable oil is 1.5 to 2 lakh tons & is met through imports. In recent times, caustic soda and soap ashes in the cheaper varieties of soaps are quite high.

OBJECTIVE OF THE STUDY
➢   To know about export import process.
➢   To know what are the documents required before and after sailing the cargo.
➢   To know different type of container used in shipment.
➢   ToacquainttheparticipantswithvariousExport-Importnorms,proceduresand documentation

SCOPE OF THE STUDY
➢   Types of consumers that compromise present and potential markets.
➢   Buying habits and pattern of consumption
➢   Size and location of different markets, not only in India but also overseas.
➢   The prospects for growth or construction for the current markets being served.
➢   New mantras of emerging segments.
➢   Marketing and manufacturing capabilities of competitors.
➢   Most suitable entry timing.
➢   The current and prospective competitive position.
➢   Chances of improvement of current channels.

RESEARCH METHODOLOGY

The data has been collected from two sources of data that is primary and secondary data. Primary data Questionnaire methods are used to elicit information from employees of various hierarchy departments. Primary data are those which are gathered especially for the project at hand is directly through questionnaire & personal interaction. Primary data is collected by administering the questionnaire& personal interaction. Secondary data has been collected from different books and company files and website. The secondary data has been collected by an individual from different sources. Sampling size: The study was taken on 100 respondents. Data presentation Data was presented with the help of tables, charts; interpretation and observation were noted below each table/charts. Data analysis Data was analyzed by simple qualitative analysis for the study.

DATA ANALYSIS AND INTERPRETATION

INTERPRETATION
The above table it can be observed that the position held of the respondent is 18% of the respondent are proprietor and 29% of the respondent are managing director, 11% of the respondent are manager, 21% of the respondent are any others and 21% of the respondent are partners.

INTERPRETATION
The above table it can be observed that the gender of the respondent is 52% of the respondent are male and 48 % of the respondent are female.

INTERPRETATION
The above table it can be observed that the age of the respondent is 18% of the respondent are 20-30 and 30 % of the respondent age group is 30-40, 16 % of the respondent are 40-50,16 % of the respondent age group are 50-60and 19% of the respondent age group are 60and above.

Mohamed Shafith and Sathish Kumar

INTERPRETATION

The above table it can be observed that the qualification of the respondent is 32 % of the respondent education qualification is degree, 43 % of the respondent education qualification is pg and 25 % of the respondent education qualification is professional.

INTERPRETATION

The above table it can be observed that the religion of the respondent is 28 % of the respondent is Hindu, 43 % of the respondent is Muslim and 25 % of the respondent is Christian.

INTERPRETATION

The above table it can be observed that the experience of the respondent is 19% of the respondent are working experience less than 10 years, 37 % of the respondent are working experience less than 10 20 years, 18 % of the respondent are working experience less than 20-30 years, 28 % of the respondent are working experience 30 years and above.,

INTERPRETATION

The above table it can be observed that the finance related problems is 19% of the respondent are says that Delay in export realization, 30 % of the respondent are says that High rate of interest, 17% of the respondent are says that Too many formalities followed, 15% of the respondent are says that Shortage of working capital problems and 18 % of the respondent are says that Not applicable.

INTERPRETATION

The above table it can be observed that the infrastructure problems faced by your firm is 15 % of the respondent are says that Transportation, 25 % of the respondent are says that Water, 14% of the respondent are says that Electricity problems, 14% of the respondent are says that road problems, 18% of the respondent are says that port problems and 14% of the respondent are says that shipping problems.

INTERPRETATION

The above table it can be observed that the opinion about exchange rate related problems faced by your firm, 19% of the respondent are says that Highly Affected, 34% of the respondent are says that Affected, 14% of the respondent are says that neutral, 15% of the respondent are says that unaffected and 19% of the respondent are says that Highly unaffected.

INTERPRETATION

The above table it can be observed that the opinion about labor related problems affect your firm Is 20% of the respondent are says that Highly Affected, 32% of the respondent are says that Affected, 10% of the respondent are says that neutral, 17% of the respondent are says that unaffected and 21% of the respondent are says that Highly unaffected.

FINDING

- The position held of the respondent is 18% of the respondent are proprietor and 29% of the respondent are managing director, 11% of the respondent are manager, 21% of the respondent are any others and 21% of the respondent are partners
- The gender of the respondent is 52% of the respondent are male and 48 % of the respondent are female.
- The age of the respondent is 18% of the respondent are 20-30 and 30 % of the respondent age group is 30-40, 16 % of the respondent are 40-50, 16 % of the respondent age group are 50-60and 19% of the respondent age group are 60and above.
- The qualification of the respondent is 32 % of the respondent education qualification is degree, 43 % of the respondent education qualification is pg and 25 % of the respondent education qualification is professional

Mohamed Shafith and Sathish Kumar

- The religion of the respondent is 28 % of the respondent is Hindu, 43 % of the respondent is Muslim and 25 % of the respondent is Christian.
- The experience of the respondent is 19% of the respondent are working experience less than 10 years, 37 % of the respondent are working experience less than 10 -20 years, 18 % of the respondent are working experience less than 20-30 years, 28 % of the respondent are working experience 30 years and above.,
- The finance related problems is 19% of the respondent are says that Delay in export realization, 30 % of the respondent are says that High rate of interest, 17% of the respondent are says that Too many formalities followed, 15% of the respondent are says that Shortage of working capital problems and 18 % of the respondent are says that Not applicable.
- The infrastructure problems faced by your firm is 15 % of the respondent are says that Transportation, 25 % of the respondent are says that Water, 14% of the respondent are says that Electricity problems, 14% of the respondent are says that road problems, 18% of the respondent are says that port problems and 14% of the respondent are says that shipping problems
- The opinion about exchange rate related problems faced by your firm, 19% of the respondent are says that Highly Affected, 34% of the respondent are says that Affected, 14% of the respondent are says that neutral, 15% of the respondent are says that unaffected and 19% of the respondent are says that Highly unaffected.
- The opinion about labor related problems affect your firm
- Is 20% of the respondent are says that Highly Affected, 32% of the respondent are says that Affected, 10% of the respondent are says that neutral, 17% of the respondent are says that unaffected and 21% of the respondent are says that Highly unaffected.
- The opinion about storage problems affect firm is 19 % of the respondent are says that Highly Affected, 36 % of the respondent are says that Affected, 12 % of the respondent are says that neutral, 14 % of the respondent are says that unaffected and 19 % of the respondent are says that Highly unaffected.
- The opinion about The effect of legal and government policies is 20 % of the respondent are says that Highly Affected, 32% of the respondent are says that Affected, 11% of the respondent are says that neutral, 18% of the respondent are says that unaffected and 19 % of the respondent are says that Highly unaffected.
- The opinion about through proper planning of export and import transactions is 18 % of the respondent are says that strongly agree, 33% of the respondent are says that agree, 10% of the respondent are says that neutral, 14% of the respondent are says that disagree and 25 % of the respondent are says that strongly disagree.
- The opinion about AGMARK labeled products are given tax rebate is 18 % of the respondent are says that strongly agree, 35% of the respondent are says that agree, 11% of the respondent are says that neutral, 16% of the respondent are says that disagree and 20% of the respondent are says that strongly disagree.
- The opinion about good manufacturing practices help in exporting is 18 % of the respondent are says that strongly agree, 34% of the respondent are says that agree, 14% of the respondent are says that neutral, 13% of the respondent are says that disagree and 21 % of the respondent are says that strongly disagree.
- The opinion about Financial institutions are the backbone of your business is 24 % of the respondent are says that strongly agree, 36% of the respondent are says that agree, 12 % of the respondent are says that neutral, 14% of the respondent are says that disagree and 14% of the respondent are says that strongly disagree
- The opinion about Export Credit Guarantee Corporation is 24 % of the respondent are says that highly satisfied, 28% of the respondent are says that satisfied, 12 % of the respondent are says that neutral, 18% of the respondent are says that dissatisfied and 18 % of the respondent are says that highly dissatisfied .
- The opinion about Standard Input Output firm is 21% of the respondent are says that highly satisfied, 36% of the respondent are says that satisfied, 14% of the respondent are says that neutral, 14 % of the respondent are says that dissatisfied and 16 % of the respondent are says that highly dissatisfied .
- The opinion about Export Inspection Council is 20% of the respondent are says that highly satisfied, 36% of the respondent are says that satisfied, 14% of the respondent are says that neutral, 16 % of the respondent are says that dissatisfied and 16 % of the respondent are says that highly dissatisfied .
- The opinion about Export Promotion Board is 17% of the respondent are says that highly satisfied, 38 % of the respondent are says that satisfied, 13 % of the respondent are says that neutral, 15% of the respondent are says that dissatisfied and 16 % of the respondent are says that highly dissatisfied .

- The opinion about South Asia Free Trade Area financial is 17% of the respondent are says that highly satisfied, 39 % of the respondent are says that satisfied, 10% of the respondent are says that neutral, 17% of the respondent are says that dissatisfied and 16 % of the respondent are says that highly dissatisfied .
- The opinion about any incentives, assistance, or subsidies financial is 13 % of the respondent are says DEPB, 18% of the respondent are says that satisfied, 12% of the respondent are says VKGUY interest benefit, 22% of the respondent are says Duty drawback, 12% of the respondent are says IT benefit / VAT benefit and 11% of the respondent are says STPI
- The opinion about of prospects for the export / import of your product is 18 % of the respondents are says that High prospects, 29 % of the respondents are says that Moderate, 15% of the respondents are says that Neutral, 18 % of the respondents are says that Less prospects, 19 % of the respondents are says that No prospects

SUGGESTION

- Fewer but larger customers
- Increasing costs (labeling, raw materials)
- Tightened supplies
- A shift in consumer diet demands and product preferences
- Customer mandates
- Soap product safety compliance
- The processed Soap industry is less developed as a result of logistical and distribution problems
- Agriculture remains inefficient and is vulnerable to climatic changes.
- Despite rapid economic growth, India remains a very poor country.
- India's infrastructure is notoriously inadequate. A 500km road journey can take as much as 24 hours owing to poor road conditions, congestion and tolls.

CONCLUSION

Soap Products Industries continued their strong performance in 1996. The demand for Soap products is primarily dependent on the production of vehicles as well as international trade developments. More recently, various global environment initiatives have also affected the performance of Soap products industries as manufacturers continue to seek alternatives to the recycling of Soap. Perhaps the best solution to environmental and health concerns associated with manufacturing Soap products would be good engineering control for producing and compounding powdered chemicals used in Soap compounds, and recycling programmes for all uncured and cured Soap process scrap and products. The powdered chemicals collected in dust-collector systems could be added back to Soap compounds with the appropriate engineering controls, which would eliminate the land filling of these chemicals. Controlling the environmental and health issues in the Soap industry can be done, but it will not come easy or be free. The cost associated with controlling environmental and health problems must be added back to the cost of Soap products.

ABSTRACT

This study examines the optimization of consignment handling operations within Freight Consolidators Private Limited, a company operating in the logistics and transportation industry. Through a descriptive research approach and convenience sampling method, data were collected from 120 employees directly involved in consignment handling processes. The findings reveal insights into demographic characteristics, employee perceptions, and operational effectiveness. Key findings include a predominant representation of mid-level and management roles within the workforce, as well as varying levels of satisfaction with delivery assurance, communication transparency, expedited shipping options, warehouse operations, employee training, tracking system usability, and customer feedback management. Based on these findings, seven recommendations are proposed to enhance consignment handling efficiency, improve customer satisfaction, and maintain competitiveness. This study contributes to the body of knowledge in logistics and supply chain management by providing actionable insights for Freight Consolidators Private Limited and similar organizations seeking to optimize their consignment handling operations.

Keywords: Communication, Consignment Handling Operations, Logistics, Tracking System Usability, Warehouse.

INTRODUCTION

The study on consignment handling optimization in Freight Consolidators Private Limited emerges from the growing imperative within the logistics industry to enhance operational efficiency amidst increasing demands for timely and cost-effective freight services. With globalization driving complex supply chains and heightened customer

Yogesh and Sathish Kumar

expectations for quick and reliable delivery, freight forwarding companies face mounting pressure to streamline their processes. Freight Consolidators Private Limited, like many in the industry, recognizes the need to re-evaluate its consignment handling procedures to remain competitive. This study aims to delve into the intricacies of the company's current practices, identifying bottlenecks, inefficiencies, and areas for improvement. By understanding the challenges and opportunities within consignment handling operations, the company can implement targeted strategies to optimize transit times, minimize costs, improve tracking accuracy, and ultimately elevate customer satisfaction. The background of this study underscores the company's commitment to staying at the forefront of industry standards, ensuring continued success in an ever-evolving logistics landscape.

NEED FOR THE STUDY
The study on consignment handling optimization in Freight Consolidators Private Limited is essential for several reasons. Firstly, in today's fast-paced logistics industry, efficiency is paramount for remaining competitive. By streamlining consignment handling processes, the company can reduce transit times, lower costs, and ultimately improve profitability. Secondly, optimizing these operations can lead to enhanced customer satisfaction, as timely and reliable delivery is crucial for maintaining positive relationships with clients. Additionally, with the increasing complexity of global supply chains, improving the accuracy and reliability of tracking and tracing consignments is essential for meeting regulatory requirements and ensuring transparency throughout the shipping process. Overall, this study addresses the pressing need for Freight Consolidators Private Limited to adapt and excel in an ever-evolving freight forwarding landscape.

OBJECTIVES OF THE STUDY
Primary objective
To optimize consignment handling processes in Freight Consolidators Private Limited.

Secondary objectives
- To reduce transit times for consignments.
- To minimize storage and handling costs.
- To enhance accuracy and reliability of tracking and tracing consignments.
- To improve customer satisfaction through timely and efficient delivery.

SCOPE OF THE STUDY
The scope of the study on consignment handling optimization in Freight Consolidators Private Limited encompasses a comprehensive analysis of all aspects related to the handling of freight. This includes but is not limited to, examining current processes, identifying bottlenecks, evaluating technology utilization, assessing workforce efficiency, and scrutinizing the effectiveness of existing logistics strategies. Additionally, the study will explore potential areas for improvement such as automation implementation, route optimization, inventory management enhancements, and customer communication enhancements. By examining these facets, the study aims to provide actionable insights and recommendations to enhance the efficiency, reliability, and cost-effectiveness of consignment handling operations within the company. Moreover, the scope extends to considering industry best practices and benchmarking against competitors to ensure that Freight Consolidators Private Limited remains at the forefront of innovation and excellence in the freight forwarding sector.

LIMITATION OF THE STUDY
1. Limited availability of historical data for analysis.
2. Potential resistance to change from existing workforce.
3. Constraints in budget allocation for implementing proposed improvements.
4. Inability to control external factors such as weather disruptions or regulatory changes.
5. Scope limited to internal operations, excluding external factors like supplier reliability or customer demand fluctuations.

REVIEW OF LITERATURE

Aptaguna & Pitaloka (2016), expectations' manifestation depends on how customers perceive and interpret the environmental factors influencing the formation of expectations. Some factors may be controlled by a company, foreseen and be prepared for, but other factors depend on the clients in a larger extent (psychological, cultural, social), therefore logistics companies face a huge challenge to understand their customer, find out his needs and strive to meet customer expectations. Considering this, logistics companies need to keep in mind that seeking competitive advantage and customer circle's growth, they must immediately ensure the customer's acknowledgement as a service provided one time is remembered for a long time and the fact whether it was qualities or no further will determine the client's choice; and this means to the logistics company whether it was able to attract or retain a customer or not. Banjarnahor (2017), analyzing customer satisfaction, indicates that customers comprise the aim of the company's activity, i.e., he focuses the fact that not service users and customers depend on the company, but the company's performance depends on its existing customers. Dawi et al Eds. (2018) also stresses that customer satisfaction becomes the key element companies' focus on seeking to promote repeated business relationships and increase long- term profitability. Lamai et al Eds. (2020) stated that that in the current competitive environment it is dangerous to be a non-customer-oriented company. Most of the companies are competitive, and in order to stay in the market, they must provide high-quality services that would make customers satisfied and loyal. It also should be considered that logistics service companies should know their customers because the company, having sufficient information and knowledge about its customers, has more opportunities to make right decisions on the needs of the client, which allows companies to develop new services that provide real value to customers as well as to assess quantitatively the values desired by customers. Bell (2000) generally defines customer satisfaction as a customer assessment in terms of whether the service meets the customer's needs and expectations. It is important to note that each client's expectations are (or may be) different. This may depend not only on the personal interests, butalso on the environment, area, the type of business in which those expectations are formed. Thus, companies' ability to be flexible and adapt may help to gain an advantage over other business entities. Examining logistics services, flexibility is a particularly important aspect. Flexibility in logistics is a possibility to a company to quickly and effectively respond to the changing needs of the client.

Laurent and Martinez-Simon (2012) found that the service provided is usually best when a close relationship is built between the forwarder and the customer, since this facilitates the exchange of information so that each can better understand the needs and motivations of the other party. This allows problems to be solved and the optimal logistical solutions to be found. Knigge (2014) concur, citing the need to respond quickly to any issues or communication requests during the logistics process. The key components of this factor include on-time performance, quick response to complaints, provision of electronic freight tracking, attitude towards complaints or requests, and the provision of an electronic payment interface. The findings presented in a study by Goh and Pinaikul (1998) revealed that in Thailand, import/export companies were more likely to select freight forwarders who were highly responsive. Lamai et al Eds. (2020) compared the opinions of customers with those of the freight forwarders, and discovered that the freight forwarders believed cost to be the most important factor in the decision making process, while the customers in contrast would look at lead time and quality as their key issues. Lai and Cheng (2004) reports the results of a study of the freight forwarding industry in Hong Kong. A survey questionnaire was administered to over 1,100 companies in the industry, examining their demographic profiles, capability in providing different types of logistics services, service performance and the perceived prospects of the industry. Based on 221 valid survey responses, the study results show that the industry consists mainly of small and medium-sized companies (i.e. number of employees ≤50). Furthermore, freight forwarding services contribute more than 60% of revenue in over 70% of the respondent companies. While many freight forwarders in Hong Kong are highly capable of providing freight forwarding and many traditional logistics services, they seem to lack the ability to provide other value-added services. Nevertheless, their self-assessments indicate that they perform well in different logistics services and that they are inclined to transform themselves into third-party logistics providers. A discussion of the findings and implications of the results are provided. Diefenbach (2023) stated that the air freight supply chain

consists of several agents. Among them are truckers, who ship freight between customers and airports, and airlines, who transport the freight in-between airports. Handling agents link the two: they receive freight from truckers, consolidate it and forward it to the airlines and vice versa. They need to organise and execute processes efficiently. Digitalisation offers great potential in this context. Furthermore, handling agents' workers handle most of the freight manually. The resulting elevated levels of physical strain make workers prone to muscular-skeletal disorders. Based on a case study at two handling agents, we first investigate the handling agents' process chain from an economic perspective. We identify shortcomings and present countermeasures with an emphasis on digitalisation. Second, we analyse the physical strain on the workers and evaluate devices that could improve ergonomics. The paper concludes with a discussion of recommended means for economic and ergonomic improvement.

RESEARCH METHODOLOGY

The research adopts a descriptive research design to systematically examine the current practices and identify opportunities for optimizing consignment handling processes within the company. Descriptive research allows for the detailed description and analysis of existing phenomena without manipulating variables. This design is suitable for investigating the various aspects of consignment handling operations and deriving meaningful insights to enhance efficiency.

Target population
The target population for this study is the employees directly involved in consignment handling operations within Freight Consolidators Private Limited. This includes managers, supervisors, and frontline staff responsible for various tasks related to receiving, storing, packing, labeling, transporting, and delivering consignments.

Sampling Technique
Convenience sampling method is employed in this study due to its practicality and accessibility. Convenience sampling involves selecting participants based on their availability and accessibility. In this case, employees directly involved in consignment handling operations, including managers, supervisors, and frontline staff, will be invited to participate in the study. This sampling technique facilitates efficient data collection while ensuring representation from key stakeholders within the organization.

Sample size
The sample size for this study is 120 respondents, drawn from the target population of employees within the company. This sample size is chosen to ensure adequate representation across different levels of the organization and to achieve a statistically significant sample for analysis.

Sample area
The sample area for data collection is the premises of Freight Consolidators Private Limited, where the employees engaged in consignment handling operations are located. This may include warehouses, offices, and other facilities where logistics activities are carried out.

Data collection methods
The study utilizes both primary and secondary data sources to gather relevant information. Primary data will be collected through structured questionnaires administered to employees involved in consignment handling processes. The questionnaire will include demographic questions, Likert-scale statements related to the study objectives, and open-ended questions for additional insights. Secondary data will be obtained from company records, reports, and existing literature on logistics and supply chain management.

Data collection instrument

The data collection instrument for this study is a structured questionnaire. The questionnaire comprises demographic questions to gather information about the respondents' characteristics (e.g., age, gender, position), as well as Likert-scale statements and open-ended questions related to the study objectives. The questionnaire is designed to collect both quantitative and qualitative data, allowing for a comprehensive analysis of consignment handling processes and employee perceptions.

Data Analysis

Quantitative data collected through the questionnaires will be analyzed using statistical techniques such as descriptive statistics, frequency distribution, and correlation analysis. Likert-scale responses will be aggregated and summarized to assess the level of agreement or disagreement with each statement. Qualitative data from open-ended questions will be subjected to thematic analysis to identify recurring themes and patterns. The integration of quantitative and qualitative findings will provide a comprehensive understanding of consignment handling processes and inform recommendations for optimization.

Statistical tools used

- Correlation analysis
- Chi-Square Test

DATA ANALYSIS AND INTERPRETATION
CORRELATION

Null Hypothesis: There is no relation between job position and the opinion that the company effectively utilizes route optimization techniques to minimize transit times

Alternative Hypothesis: There is a relation between job position and the opinion that the company effectively utilizes route optimization techniques to minimize transit times.

INTERPRETATION

From the above table it is understood that the significant at 0.05 levels. Hence, null hypothesis is rejected and there isrelation between job position and the opinion that the company effectively utilizes route optimization techniques to minimize transit times.

CHI-SQUARE TEST

Null Hypothesis: There is no relation between experience and the satisfaction with the level of service provided by the company in terms of delivery efficiency

Alternative Hypothesis: There is a relation between experience and the satisfaction with the level of service provided by the company in terms of delivery efficiency

INTERPRETATION

As per the table, it is inferred that the P value is 114.761, it is significant to 5% significant level. The maximum expected count is 1.87. thus, null hypothesis is rejected and There is relationship between experience and the satisfaction with the level of service provided by the company in terms of delivery efficiency.

FINDINGS OF THE STUDY

- 54% were Female, while 46% were male.
- About 30% of the respondents are below 25 years of age, 25% of the respondents are between 26 to 35 years of age, about 34% of the respondents are between 36 – 45 years of age, 8% of the respondents are between 46 – 55 years of age and 3% of the respondents are above 55 years of age.
- The company's workforce is predominantly composed of mid-level and management roles, collectively making up 76% of positions. Senior-level roles constitute a modest 7%, while entry-level positions occupy 12%. The

Yogesh and Sathish Kumar

remaining 5% is designated for specialized positions. This distribution underscores a hierarchical structure with an emphasis on mid-level and managerial responsibilities.

- 37%, possesses 4 to 6 years of experience, followed closely by 32% with 1 to 3 years. Those with less than 1 year of experience constitute 18%, while individuals with 7 to 9 years make up 13% of the workforce.

- 12% engage daily, while 35% do so weekly. A smaller proportion, 5%, interacts monthly, with a significant 41% reporting rare interactions. 7% of employees never engage in these processes.

- 19% strongly agree with the company's ability to ensure prompt deliveries, while 36% simply agree. 28% remain neutral, neither affirming nor contesting the efficiency of delivery assurance. On the contrary, 15% express disagreement, and a mere 2% strongly disagree with the notion.

- A notable 36% strongly agree with its effectiveness, while 31% simply agree. Twenty percent remain neutral, neither confirming nor disputing its efficiency. Conversely, 12% express disagreement, and only 1% strongly disagree.

- 13% strongly agree that communication is transparent, with an additional 28% expressing agreement. Meanwhile, 27% remain neutral, neither confirming nor disputing the transparency of communication. Disagreement is expressed by 22% of respondents, with 10% strongly disagreeing with the notion.

- 23% strongly agree with the concept, while 28% simply agree. 32% remain neutral, neither confirming nor disputing the effectiveness of expedited shipping. On the contrary, 15% express disagreement, with 2% strongly disagreeing with the notion.

- 14% strongly agree with the concept, while 25% simply agree. 33% remain neutral, neither confirming nor disputing the effectiveness of delivery assurance. On the other hand, 18% express disagreement, with 10% strongly disagreeing with the notion.

- 15% strongly agree with the effectiveness of minimizing storage costs, while 28% simply agree. 26% remain neutral, neither confirming nor disputing the efficiency of warehouse operations. On the other hand, 25% express disagreement, with 6% strongly disagreeing with the notion.

- 11% strongly agree with the effectiveness of reducing labor costs, while 29% simply agree. 28% remain neutral, neither confirming nor disputing the efficiency of streamlined handling. On the other hand, 23% express disagreement, with 9% strongly disagreeing with the notion.

- 3% strongly agree with the effectiveness of minimizing manual handling, while 28% simply agree. 33% remain neutral, neither confirming nor disputing the efficiency of automated processes. On the other hand, 14% express disagreement, with 12% strongly disagreeing with the notion.

- 11% strongly agree with the effectiveness of reducing costs through consolidated shipments, while 32% simply agree. 28% remain neutral, neither confirming nor disputing the efficiency of this approach. On the other hand, 19% express disagreement, with 10% strongly disagreeing with the notion.

- 13% strongly agree with the competitiveness of these costs, while 33% simply agree. 27% remain neutral, neither confirming nor disputing the competitiveness of storage & handling costs. On the other hand, 18% express disagreement, with 9% strongly disagreeing with the notion.

- 13% strongly agree with the effectiveness of these updates, while 48% simply agree. 14% remain neutral, neither confirming nor disputing the effectiveness of real-time tracking. On the other hand, 14% express disagreement, with 11% strongly disagreeing with the notion.

- 12% strongly agree with their accuracy and reliability, while 43% simply agree. 25% remain neutral, neither confirming nor disputing the accuracy and reliability of the updates. On the other hand, 12% express disagreement, with 8% strongly disagreeing with the notion.

- 16% strongly agree with the availability of such opportunities, while 46% simply agree. 19% remain neutral, neither confirming nor disputing the presence of collaboration and teamwork opportunities. On the other hand, 11% express disagreement, with 8% strongly disagreeing with the notion.

- 20% strongly agree with the effectiveness of resolving discrepancies swiftly, while 43% simply agree. 17% remain neutral, neither confirming nor disputing the efficiency of swift resolution. On the other hand, 13% express disagreement, with 7% strongly disagreeing with the notion.

- 21% strongly agree with the user-friendliness of the navigation, while 43% simply agree. 22% remain neutral, neither confirming nor disputing the intuitiveness of the tracking system. On the other hand, 10% express disagreement, with 4% strongly disagreeing with the notion.
- 8% strongly agree that consignments are consistently delivered on time, while 35% simply agree. 24% remain neutral, neither confirming nor disputing the consistency of on-time deliveries. On the other hand, 14% express disagreement, with 19% strongly disagreeing with the notion.
- 14% strongly agree that notifications are timely, while 27% simply agree. 22% remain neutral, neither confirming nor disputing the timeliness of notifications. On the other hand, 32% express disagreement, with 5% strongly disagreeing with the notion.
- 18% strongly agree with the availability of flexible options, while 37% simply agree. 19% remain neutral, neither confirming nor disputing the flexibility of delivery choices. On the other hand, 21% express disagreement, with 5% strongly disagreeing with the notion.
- 11% strongly agree with the effectiveness of proactive management, while 34% simply agree. 26% remain neutral, neither confirming nor disputing the effectiveness of customer feedback management. On the other hand, 22% express disagreement, with 7% strongly disagreeing with the notion.
- 12% strongly agree with their satisfaction, while 37% simply agree. 17% remain neutral, neither confirming nor disputing their satisfaction with the service. On the other hand, 22% express disagreement, with 12% strongly disagreeing with the notion.
- there is relation between job position and the opinion that the company effectively utilizes route optimization techniques to minimize transit times.
- There is relationship between experience and the satisfaction with the level of service provided by the company in terms of delivery efficiency.

SUGGESTION

- Strengthen efforts to ensure prompt deliveries by implementing proactive measures such as optimizing delivery routes, coordinating with transportation partners, and investing in real-time tracking technologies to minimize delays and improve delivery reliability.
- Foster transparent communication channels between the company and its employees, ensuring that updates on consignment status, delivery schedules, and any operational changes are effectively communicated to all stakeholders in a timely manner.
- Review and enhance expedited shipping options to better meet customer needs and expectations. This may involve streamlining processes, negotiating partnerships with express delivery providers, and offering flexible delivery schedules to accommodate urgent shipments.
- Implement measures to minimize storage costs and improve warehouse efficiency. This could include optimizing inventory management systems, investing in automation technologies for handling and storage, and exploring opportunities for consolidating shipments to maximize warehouse utilization.
- Provide ongoing training and development opportunities for employees at all levels to enhance their skills and expertise in consignment handling processes, customer service, and technology utilization. This will empower employees to perform their roles more effectively and contribute to overall operational excellence.
- Improve the user-friendliness and intuitiveness of the tracking system to ensure that employees can easily navigate and utilize it to access real-time updates on consignment status. This may involve conducting usability testing, gathering feedback from users, and implementing enhancements based on their input.
- Establish a robust system for collecting, analyzing, and acting upon customer feedback to identify areas for improvement and drive continuous enhancement of service quality. This could include implementing feedback mechanisms such as surveys, complaint resolution processes, and regular customer engagement initiatives

CONCLUSION

The findings of this study shed light on various aspects of consignment handling optimization within Freight Consolidators Private Limited. The analysis reveals insights into demographic characteristics, employee perceptions, and operational effectiveness, providing valuable information to guide strategic decision-making and process improvement initiatives. The study highlights opportunities for enhancing delivery assurance, communication transparency, expedited shipping options, warehouse operations, employee training, tracking system usability, and customer feedback management. By implementing the recommendations derived from these findings, the company can strengthen its consignment handling operations, improve customer satisfaction, and maintain a competitive edge in the logistics industry. Moreover, the study underscores the importance of continuous evaluation and refinement of processes to adapt to evolving market dynamics and customer expectations. Overall, this study serves as a valuable resource for Freight Consolidators Private Limited in its pursuit of operational excellence and service quality enhancement.

ABSTRACT

The study examines the socio-cultural adaptation of the Dard tribe in the Kashmir Valley from tradition to modernity. The study aims to explore the evolution of traditional customs and practices of the Dard tribe and investigate the socio-economic factors that have influenced their adaptation to modernity, including education, employment, and access to resources. The paper also analyzes the impact of modernization on the Dard tribe's social and cultural values, including changes in gender roles, family structures, and religious beliefs. The study assesses the challenges and opportunities faced by the Dard tribe in adapting to modernity, including issues related to identity, cultural preservation, and social integration. Finally, the paper identifies potential strategies for promoting sustainable development and cultural preservation among the Dard tribe, while also supporting their adaptation to modernity. The research findings contribute to a better understanding of the Dard tribe's socio-cultural adaptation in the Kashmir Valley and provide insights into the challenges and opportunities for sustainable development and cultural preservation in the region. The Dard tribe, a historically marginalized and indigenous community, has been living in the remote and rugged terrains of the Himalayan region for centuries. However, with the advent of modernity, driven by socio-economic, technological, and environmental changes, the Dard tribe faces challenges and opportunities that demand a reevaluation of their cultural heritage and practices. The study employs a multidisciplinary approach, combining anthropological, historical, and sociological methodologies to investigate how the Dard tribe navigates the complex terrain of cultural preservation and adaptation. By examining their changing livelihoods, language, traditions, and relationships with the surrounding society, the study aims to provide insights into the mechanisms and strategies that underlie their adaptation to modernity.

Keywords: Dard Tribe, Customs, Cultural, Indigenous People, Traditions

Shabir Ahmad Lone and Thirumurugan

INTRODUCTION

The Dard tribe is one of the indigenous communities inhabiting the Kashmir Valley in India. The tribe has a rich cultural heritage and traditional customs that have been passed down from generation to generation. However, with the advent of modernization, the Dard tribe has been undergoing a socio-cultural adaptation process. The study aims to explore the evolution of traditional customs and practices of the Dard tribe and investigate the socio-economic factors that have influenced their adaptation to modernity, including education, employment, and access to resources. The paper also analyzes the impact of modernization on the Dard tribe's social and cultural values, including changes in gender roles, family structures, and religious beliefs. Furthermore, the study assesses the challenges and opportunities faced by the Dard tribe in adapting to modernity, including issues related to identity, cultural preservation, and social integration. Finally, the paper identifies potential strategies for promoting sustainable development and cultural preservation among the Dard tribe, while also supporting their adaptation to modernity. The Dard tribe is a unique community with a distinct cultural identity. They have their own language, music, dance, and traditional customs that are deeply rooted in their history and heritage. However, with the changing times, the Dard tribe has been facing a number of challenges in preserving their cultural identity and adapting to modernity. The socio-economic factors such as education, employment, and access to resources have played a significant role in shaping the Dard tribe's adaptation process. The tribe has been undergoing a gradual transformation in their social and cultural values. The traditional gender roles and family structures have been changing, and there has been a shift towards a more egalitarian society. The younger generation is more open to new ideas and has been embracing modern lifestyles. However, this process of adaptation has not been without its challenges. The Dard tribe has been struggling to strike a balance between preserving their cultural identity and adapting to modernity. One of the major challenges faced by the Dard tribe is the issue of identity. The tribe has been struggling to maintain their distinct cultural identity in the face of modernization. The younger generation is more exposed to outside influences and has been adopting new cultural practices. This has led to a sense of cultural dislocation among the older generation, who fear that their cultural heritage is being eroded. Another challenge faced by the Dard tribe is the issue of cultural preservation. The tribe has been struggling to preserve their traditional customs and practices in the face of modernization. There is a fear that the younger generation may lose touch with their cultural heritage, which could lead to the loss of their identity. Despite these challenges, the Dard tribe has also been presented with opportunities for growth and development. The access to education and employment has opened up new avenues for the younger generation, and there has been a growing sense of empowerment among them. The tribe has also been able to adapt to modern lifestyles without completely abandoning their traditional customs and practices. The socio-cultural adaptation of the Dard tribe in the Kashmir Valley is a complex process that involves a number of factors. This research paper aims to explore the evolution of traditional customs and practices, socio-economic factors influencing adaptation, impact on social and cultural values, challenges and opportunities, and potential strategies for sustainable development and cultural preservation. The findings of this study are expected to contribute to a better understanding of the Dard tribe's socio-cultural adaptation process and provide insights into the challenges and opportunities for sustainable development and cultural preservation in the region.

REVIEW OF LITERATURE

The paper "Profile of Marriage in Dard Tribe: A Study" by Husain and Husain provides an insightful analysis of the marriage practices among the Dard tribe in Pakistan. The authors have conducted an ethnographic study to explore the various aspects of marriage in the Dard tribe, including the process of mate selection, rituals and customs associated with marriage, and the role of family and community in the process. One of the strengths of this paper is the detailed description of the cultural practices and beliefs of the Dard tribe regarding marriage. The authors have provided a comprehensive overview of the rituals and customs associated with marriage, such as the role of matchmakers, dowry, and wedding ceremonies. The authors have discussed the importance of family and community in the process of mate selection and the impact of social and economic factors on the marriage practices

Shabir Ahmad Lone and Thirumurugan

of the Dard tribe. Another notable aspect of the paper is the use of qualitative data to support the arguments presented. The authors have used interviews and observations to collect data, which has been analyzed using thematic analysis. This approach has enabled the authors to provide rich and detailed insights into the marriage practices of the Dard tribe. The authors have successfully highlighted the unique features of the marriage practices of the Dard tribe and have contributed to the existing literature on the topic. This paper would be useful for researchers and scholars interested in the study of marriage practices in different cultures. Dar (2018) in his article explores the changes in lifestyle among the Dard tribe in Jammu and Kashmir. This article focuses on how modernization and globalization have impacted the traditional way of life of the Dard tribe, and how these changes have affected their social, economic, and cultural practices. The Dard tribe is an indigenous community living in the mountainous region of Jammu and Kashmir. They have a unique culture, language, and way of life, which is deeply rooted in their history and traditions. However, with the advent of modernization and globalization, the Dard tribe has been exposed to new ideas, technologies, and ways of life. Dar (2018) argues that the changes in lifestyle among the Dard tribe have been both positive and negative. On the one hand, modernization has brought new opportunities for education, employment, and economic growth. On the other hand, it has also led to the erosion of traditional values, customs, and beliefs. The article highlights the impact of modernization on the Dard tribe's economy, education, health, and social relations. For instance, the author notes that the introduction of cash crops and modern farming techniques has led to an increase in agricultural productivity and income. However, it has also resulted in the loss of traditional crops and practices, which were better suited to the local environment. In terms of education, the article shows that modernization has led to an increase in literacy rates and access to formal education. However, it has also led to the decline of traditional knowledge and skills, which were passed down through generations. The article provides a comprehensive analysis of the changes in lifestyle among the Dard tribe in Jammu and Kashmir. It highlights the complex interplay between modernization, globalization, and traditional practices, and the challenges and opportunities that arise from these changes.

Z. Iqbal's book (2020) "Dardistan: The Unknown Tribe with Unknown Country" is a fascinating exploration of the little-known region of Dardistan, located in the northernmost part of Pakistan and in Indian side Gurez and Drass.The book provides a detailed account of the history, culture, and traditions of the Dardic people who inhabit this remote region. The author begins by tracing the origins of the Dardic people and their migration to the region. He then goes on to describe their way of life, including their customs, beliefs, and social structures. The book also explores the unique linguistic and cultural heritage of the Dardic people, which has been largely overlooked by mainstream scholarship. One of the key strengths of the book is the author's use of primary sources, including interviews with local residents, historical documents, and personal observations. This gives the reader a firsthand account of life in Dardistan and helps to paint a vivid picture of the region. Another notable aspect of the book is its focus on the role of women in Dardic society. The author highlights the important contributions of women to the community and challenges the common perception that women in this region are passive and subservient. The study is a valuable contribution to the study of the Dardic people and their culture. It provides a wealth of information for scholars and researchers interested in this region, as well as for general readers seeking to learn more about this fascinating and often overlooked part of the world. The study conducted by Atta, Islam, and Shah (2018) aimed to identify the socio-economic profile of the Shina Community, which subsists on non-timber forest products (NTFPs) in Figurez Valley of Kashmir. The researchers used a survey questionnaire to collect data from 150 households, and the data were analyzed using descriptive statistics. The findings of the study revealed that the Shina Community heavily relies on NTFPs for their livelihoods, and the majority of their income is generated from the sale of these products. The study also found that the community faces several challenges, such as limited access to markets, lack of storage facilities, and inadequate transportation infrastructure, which hinder their ability to sell their products at a fair price. Moreover, the study identified that the Shina Community has a low level of education, and the majority of the households are headed by males. The researchers also found that the community lacks basic amenities such as electricity, clean drinking water, and proper sanitation facilities. The study provides valuable insights into the socio-economic profile of the Shina Community, which subsists on NTFPs in Gurez Valley of Kashmir. The findings of the study can be used to develop policies and programs that aim to improve the livelihoods of the Shina Community by addressing the challenges they face and providing them with better access to markets

Shabir Ahmad Lone and Thirumurugan

and basic amenities. The article "Nature and Role of Family in Dard Tribe: A Study" by Hussain and Hussain (2018) explores the significance of family in the Dard tribe. The authors begin by providing a brief background on the Dard tribe and its history. They then delve into the family structure and dynamics, highlighting the importance of extended families and the role of kinship ties in maintaining social order.The authors also discuss the gender roles within the Dard tribe, where men are expected to be the primary breadwinners while women take care of the household and children. However, the study also reveals that women have a significant role in decision-making processes within the family, particularly in matters related to marriage and inheritance.The article further explores the impact of modernization and globalization on the traditional family structure of the Dard tribe. The authors argue that while modernization has brought about changes in the family structure, the Dard tribe still places a strong emphasis on family values and kinship ties.The article provides valuable insights into the nature and role of family in the Dard tribe. It highlights the significance of extended families, gender roles, and the impact of modernization on traditional family structures. The study is well-researched and provides a comprehensive understanding of the Dard tribe's family dynamics.

RESEARCH OBJECTIVES

The study to explore the evolution of traditional customs and practices of the Dard tribe in Kashmir Valley and the impact of modernization on their social and cultural values. It investigates the socio-economic factors that have influenced the tribe's adaptation to modernity and assess the challenges and opportunities faced by them in this process, including issues related to identity, cultural preservation, and social integration. The study also identifies potential strategies for promoting sustainable development and cultural preservation among the Dard tribe, while also supporting their adaptation to modernity. This will involve exploring the establishment of cultural centers and museums, promoting traditional crafts and practices, and developing tourism initiatives that showcase the tribe's unique cultural heritage. The study focuses on providing access to education, healthcare, and other basic services, as well as promoting economic development opportunities that are compatible with the tribe's traditional way of life. The research aims to support the Dard tribe in finding a balance between preserving their cultural identity and adapting to the challenges.

METHODOLOGY

The study adopted historical and documentary research methods, using secondary sources such as articles, books, state and national published and unpublished reports, and websites. Qualitative data analysis, specifically thematic analysis of trends and patterns, was employed to identify patterns and themes in the data collected from secondary sources. The use of secondary sources is a common approach in historical research, and qualitative data analysis is a method of examining non-numerical data to identify patterns and themes. The study used thematic analysis to identify trends and patterns in the data collected from secondary sources.

RESULT AND DISCUSSION

Evolution of Traditional Customs and Practices of Dard Tribe in Kashmir Valley
The Dard tribe is a unique and distinct ethnic group that has inhabited the Kashmir Valley for centuries. The tribe is known for its rich cultural heritage, which includes a unique language, traditional customs, and religious practices. In this essay, we will examine the historical and cultural background of the Dard tribe in the Kashmir Valley, and how their traditional customs and practices have evolved over time. The Dard tribe is believed to have migrated to the Kashmir Valley from Central Asia over 2,000 years ago. They are thought to be descendants of the ancient Indo-Aryan civilization, which flourished in the region during the Vedic period. The Dard tribe is also believed to be closely related to the Nuristani people of Afghanistan, who share many cultural and linguistic similarities with the Dard. Over time, the Dard tribe developed a unique culture and way of life in the Kashmir Valley. They developed their own language, known as Shina, which is still spoken by members of the tribe today. The Dard also developed a

rich tradition of music, dance, and storytelling, which they used to pass down their cultural heritage from one generation to the next. One of the most important aspects of Dard culture is their religious practices. The Dardsof Gurez are sunni Muslims. As the Kashmir Valley became more connected to the outside world, the Dard tribe began to adapt to modernity. This process of adaptation has been gradual and has taken place over several generations. For example, many members of the Dard tribe have begun to adopt modern clothing, such as jeans and t-shirts, instead of traditional dress. They have also started to use modern technology, such as mobile phones and computers, to communicate with each other and the outside world . However, despite these changes, the Dard tribe has managed to maintain many of its traditional customs and practices. For example, they still celebrate traditional festivals, such as shishrilouni, bundaree, gurez festival and continue to perform traditional music and dance. They also continue to practice their unique form of animism, which is an important part of their cultural heritage. The Dard tribe is a unique and distinct ethnic group that has inhabited the Kashmir Valley. They have developed a rich cultural heritage, which includes a unique language, traditional customs, and religious practices. While the Dard tribe has adapted to modernity over time, they have managed to maintain many of their traditional customs and practices. The Dard tribe's ability to adapt to modernity while still preserving their cultural heritage is a testament to their resilience and strength as a people.

Socio-economic factors influencing Dard tribe's adaptation to modernity
The Dard tribe, also known as the Brokpa people, is an ethnic group residing in the remote regions of the Himalayas. Over the years, the tribe has faced various socio-economic challenges that have influenced their adaptation to modernity. In this essay, we will investigate the factors that have shaped the Dard tribe's adaptation to modernity, including education, employment, and access to resources.Education is a significant factor that has influenced the Dard tribe's adaptation to modernity. Historically, the tribe's education system was informal and revolved around traditional practices such as oral storytelling, apprenticeships, and on-the-job training. However, with the advent of modern education, the Dard tribe has gradually adopted formal education systems. This has enabled them to acquire knowledge and skills that are essential for modern living.For instance, the Dard tribe's literacy rate has increased over the years, with more children attending schools. This has enabled them to access information and knowledge that was previously unavailable. As a result, the Dard tribe has been able to adapt to modernity by embracing modern technologies, such as mobile phones and the internet Employment is another factor that has influenced the Dard tribe's adaptation to modernity. Historically, the tribe's main source of livelihood was agriculture and animal husbandry. However, with the changing times, new employment opportunities have emerged, such as tourism, handicrafts, and government jobs.For example, the Dard tribe has been able to adapt to modernity by engaging in tourism-related activities. This has enabled them to showcase their culture and traditions to the outside world, generating income for the community. Additionally, some members of the tribe have secured jobs in the government sector, enabling them to access modern amenities such as healthcare and education. Access to resources is another critical factor that has influenced the Dard tribe's adaptation to modernity. Historically, the tribe relied on natural resources such as forests, rivers, and land for their livelihood. However, with the changing times, access to these resources has become limited, and new resources have emerged.For example, the Dard tribe has adapted to modernity by embracing modern technologies such as solar power and biogas. This has enabled them to access energy sources that are sustainable and environmentally friendly. Additionally, the tribe has also embraced modern agricultural practices, such as greenhouse farming, enabling them to increase their crop yields. The Dard tribe's adaptation to modernity has been influenced by various socio-economic factors, including education, employment, and access to resources. The tribe has been able to adapt to modernity by embracing modern technologies, engaging in new employment opportunities, and accessing new resources. However, there is still a need for more support to enable the Dard tribe to adapt fully to modernity and enjoy the benefits that come with it.

Impact of Modernization on Dard Tribe's Social and Cultural Values
The Dard tribe is a group of people who live in the mountainous region of Gurez in Kashmir valley .They have a rich culture and history, but with modernization, their social and cultural values have been impacted. Here we will explore the impact of modernization on the Dard tribe's social and cultural values, including changes in gender roles, family structures, and religious beliefs. One of the most significant changes that modernization has brought to the

Shabir Ahmad Lone and Thirumurugan

Dard tribe is the shift in gender roles. Traditionally, women in the Dard tribe were expected to be homemakers and take care of the family. However, with modernization, women are now receiving education and have greater access to job opportunities. This has led to a change in traditional gender roles, with women now playing a more active role in society. As women become more educated, they are also gaining more independence. They are no longer confined to domestic duties and are now participating in activities outside the home. This has led to a change in the traditional power dynamic between men and women in the Dard tribe. Women are now seen as equal partners in the family and in society. Another significant change brought about by modernization is the shift in family structures. Traditionally, the Dard tribe had a joint family system, where several generations lived together in one household. However, with modernization, there has been a move towards smaller nuclear families. This is due to the increasing mobility of people and the desire for more privacy. The shift towards smaller families has also led to changes in the way families are organized. In the past, the eldest male member of the family was the head of the household and made all the decisions. However, with smaller families, decision-making is now more democratic. Family members have more say in the decisions that affect their lives. Religious beliefs have also been impacted by modernization. The Dard tribe has traditionally followed a mix of Islam and animism. However, with increased exposure to the outside world, there has been a decline in traditional religious practices. Many people are now adopting more modern and secular beliefs. This shift towards more secular beliefs has led to a change in the way people approach life. In the past, the Dard tribe had a strong sense of community and relied on each other for support. However, with the decline in traditional religious practices, people are now more individualistic. They are more focused on their own goals and aspirations, rather than the needs of the community. Modernization has had a significant impact on the social and cultural values of the Dard tribe. It has led to changes in gender roles, family structures, and religious beliefs. Women are now more educated and have greater access to job opportunities, which has led to a change in traditional gender roles. The traditional joint family system is slowly giving way to smaller nuclear families, and decision-making is now more democratic. With increased exposure to the outside world, there has been a decline in traditional religious practices, and people are now adopting more modern and secular beliefs. These changes have led to a shift towards more individualistic values, which has had a significant impact on the traditional sense of community in the Dard tribe.

Challenges and Opportunities for the Dard Tribe in Adapting to Modernity.
The Dard tribe is an ethnic group of people who reside in the Gurez Valley in Kashmir. The Dard tribe is known for their unique culture and traditions, which have evolved over several centuries. However, the Dard tribe, like many other indigenous communities, is facing significant challenges in adapting to modernity. Here we will discuss the challenges and opportunities faced by the Dard tribe in adapting to modernity, including issues related to identity, cultural preservation, and social integration. One of the primary challenges faced by the Dard tribe is related to their identity. The Dard tribe has a distinct identity, which is rooted in their language, customs, and traditions. Due to migration of people from Gurez to other parts of Kashmirmany Dard people feel that their identity is under threat, and they are struggling to maintain their cultural heritage. Another significant challenge faced by the Dard tribe is related to cultural preservation. The Dard tribe has a rich cultural heritage, which includes music, dance, art, and literature. However, the rapid pace of modernization has led to a decline in traditional cultural practices. Many young Dard people are more interested in modern forms of entertainment, such as television and social media, than in traditional cultural practices. This has led to a decline in the transmission of cultural knowledge from older to younger generations, which could have significant implications for the future of the Dard tribe. Despite these challenges, there are also opportunities for the Dard tribe to adapt to modernity. One of the most significant opportunities is related to education. Education can play a vital role in helping the Dard tribe to preserve their culture while also adapting to modernity. By providing education in both traditional cultural practices and modern subjects, the Dard people can develop the skills and knowledge necessary to succeed in a rapidly changing world.Another opportunity for the Dard tribe is related to social integration. The Dard people have historically been isolated from mainstream Kashmiri society, which has made it difficult for them to access resources and opportunities. However, with the increasing connectivity of the world, there are now more opportunities for the Dard people to connect with other communities and access resources. By building bridges with other communities, the Dard people can access new ideas and technologies while also preserving their cultural heritage. The Dard tribe is facing significant challenges in adapting to modernity. These challenges are related to issues of identity, cultural

Shabir Ahmad Lone and Thirumurugan

preservation, and social integration. However, there are also opportunities for the Dard people to adapt to modernity. By providing education and building bridges with other communities, the Dard people can preserve their cultural heritage while also adapting to the rapidly changing world. Ultimately, the future of the Dard tribe will depend on their ability to navigate these challenges and seize these opportunities. Strategies for Sustainable Development and Cultural Preservation among the Dard Tribe The Dard tribe is one of the indigenous communities in the northern areas of Pakistan. They have a unique culture and way of life, which has been preserved for centuries. However, with the advent of modernity, the Dard tribe is facing challenges in adapting to the changing world while also preserving their cultural heritage. In this context, it is important to identify potential strategies for promoting sustainable development and cultural preservation among the Dard tribe. One of the key strategies for promoting sustainable development among the Dard tribe is to focus on ecotourism. The northern areas of Pakistan are known for their scenic beauty and natural resources. By promoting ecotourism, the Dard tribe can leverage their natural resources to create sustainable economic opportunities. This can be achieved by developing eco-lodges and promoting cultural tourism. The Dard tribe can showcase their unique culture and way of life to tourists while also generating income for themselves. This strategy can help the Dard tribe to preserve their cultural heritage while also adapting to modernity. Another potential strategy for promoting sustainable development among the Dard tribe is to focus on education. Education is a powerful tool for empowering communities and promoting sustainable development. By providing education to the Dard tribe, they can learn new skills and knowledge that can help them to adapt to the changing world. This can be achieved by setting upschools and vocational training centers in the Dard region. The education system can be tailored to meet the unique needs of the Dard tribe, such as teaching them about sustainable farming practices and environmental conservation.

In addition to promoting sustainable development, it is also important to focus on cultural preservation among the Dard tribe. One potential strategy for cultural preservation is to document the Dard culture and way of life. This can be achieved by setting up a cultural museum or archive that showcases the history and traditions of the Dard tribe. The museum can also serve as a platform for educating the younger generation about their cultural heritage. This strategy can help to preserve the Dard culture for future generations while also promoting cultural tourism. Another potential strategy for cultural preservation is to promote traditional Dard arts and crafts. The Dard tribe has a rich tradition of arts and crafts, such as weaving, embroidery, and wood carving. By promoting these traditional crafts, the Dard tribe can generate income while also preserving their cultural heritage. This can be achieved by setting up cooperatives that produce and sell traditional Dard crafts. The cooperatives can be supported by the government and international organizations, which can provide training and marketing support. Promoting sustainable development and cultural preservation among the Dard tribe is a complex challenge that requires a multi-faceted approach. The strategies outlined above, such as promoting ecotourism, education, cultural museums, and traditional crafts, are potential ways to achieve these goals. However, it is important to note that these strategies should be implemented in consultation with the Dard tribe and should be tailored to meet their unique needs and aspirations. By working together, we can promote sustainable development and cultural preservation among the Dard tribe while also supporting their adaptation to modernity.

Recommendations
The Dard tribe, being a marginalized community, often faces discrimination and exclusion in accessing these resources. To address the challenges faced by the Dard tribe, the following recommendations are proposed:
1. Preservation of traditional knowledge and practices: Efforts should be made to preserve the traditional knowledge and practices of the Dard tribe. This can be done through documentation, training programs, and community-based initiatives.
2. Access to education and healthcare facilities: Steps should be taken to improve access to education and healthcare facilities in the region. This can be done through the establishment of schools and healthcare centers in the area.
3. Promotion of sustainable livelihoods: The Dard tribe should be provided with opportunities for sustainable livelihoods. This can be done through the promotion of eco-tourism, handicrafts, and other income-generating activities that are compatible with the region's natural resources.

4. Land ownership and resource management: The Dard tribe should be given equal rights to access and manage the natural resources in the region. This can be done through the implementation of policies that promote equitable distribution of resources and protect the rights of marginalized communities.

5. Empowerment of women: Women in the Dard tribe should be empowered through education and training programs. This will enable them to participate in decision-making processes and contribute to the economic development of the community. The Dard tribe's socio-cultural adaptation in the Kashmir Valley provides valuable insights into the challenges faced by marginalized communities in adapting to modernity. The recommendations proposed in this study aim to address the challenges faced by the Dard tribe and promote their sustainable development. It is essential to recognize the importance of preserving traditional knowledge and practices while providing opportunities for economic development and access to education and healthcare facilities. By implementing these recommendations, we can ensure the sustainable development of the Dard tribe and other marginalized communities in the region.

CONCLUSION

The study explored the socio-cultural adaptation of the Dard tribe in the face of modernization. The research objectives include examining the evolution of traditional customs and practices, assessing the impact of modernization on social and cultural values, identifying socio-economic factors that influence adaptation, assessing challenges and opportunities faced by the tribe, and identifying potential strategies for promoting sustainable development and cultural preservation. Through this study, we hope to gain a better understanding of the challenges faced by the Dard tribe in adapting to modernity, including issues related to identity, cultural preservation, and social integration. By identifying potential strategies for promoting sustainable development and cultural preservation, we can support the Dard tribe in their adaptation to modernity while also preserving their unique cultural heritage. Ultimately, this study will contribute to a broader understanding of the socio-cultural adaptation of indigenous communities in the face of modernization. The Dard tribe is an indigenous community that has inhabited the Kashmir Valley for centuries. They have a unique culture and way of life that has been shaped by their environment and history. However, in recent years, the Dard tribe, like many other indigenous communities around the world, has faced a number of challenges as they attempt to adapt to modernity. One of the main challenges facing the Dard tribe is the impact of modernization on their traditional customs and practices.

As modernization has spread throughout the Kashmir Valley, the Dard tribe has had to navigate a rapidly changing social and cultural landscape. This has led to a number of changes in their traditional customs and practices, as they attempt to adapt to new ways of life. For example, many Dard people have begun to adopt more modern forms of dress and have started to use modern technology, such as smartphones and computers. However, the impact of modernization on the Dard tribe's social and cultural values has not been entirely positive. Many Dard people are concerned that modernization is eroding their traditional way of life and cultural heritage. They worry that their children will not learn the traditional customs and practices that have been passed down through generations, and that their unique cultural identity will be lost. Another challenge facing the Dard tribe is the socio-economic factors that influence their adaptation to modernity. Many Dard people live in poverty and lack access to basic resources and services, such as healthcare and education. This makes it difficult for them to adapt to modern ways of life and to take advantage of the opportunities that modernization can offer. Despite these challenges, the Dard tribe has also faced opportunities as they adapt to modernity. For example, modernization has brought new economic opportunities to the Kashmir Valley, such as tourism and the growth of the service sector. This has provided new opportunities for the Dard tribe to earn a living and improve their standard of living. Overall, the study "From Tradition to Modernity: A Study of the Dard Tribe's Socio-Cultural Adaptation in the Kashmir Valley" is an important contribution to our understanding of the challenges and opportunities facing indigenous communities as they adapt to modernity. By identifying the challenges and opportunities facing the Dard tribe, we can develop strategies to support their adaptation to modernity while also preserving their unique cultural heritage. This will

Shabir Ahmad Lone and Thirumurugan

require a collaborative effort between the Dard tribe, policymakers, and other stakeholders to ensure that the Dard people are able to adapt to modernity in a way that is sustainable and preserves their cultural identity.

Implications of the study

The study can provide insights into the social changes that occur when traditional societies adapt to modernity. This can be useful in understanding the impacts of globalization and modernization on traditional societies. It can also contribute to promoting cultural diversity by highlighting the importance of preserving and respecting traditional cultures. This can be useful in promoting intercultural understanding and reducing cultural conflicts. Further it can inform development initiatives by providing insights into the socio-cultural context of the Dard tribe and how they have adapted to modernity. This can be useful in designing development programs that are culturally sensitive and responsive to the needs of traditional societies. The study can contribute to the academic knowledge on socio-cultural adaptation and traditional societies. This can be useful in advancing the field of anthropology and providing a deeper understanding of human societies and cultures.

ABSTRACT

There are differences between supply chain management and traditional logistics concepts. The term "logistics" usually refers to operations that take place inside the walls of a single company, whereas the term "supply chain" describes a network of businesses that collaborate and coordinate their efforts to get a product to market. Logistics concentrates its emphasis on tasks including inventory management, maintenance, distribution, and purchase. In addition to acknowledging all aspects of traditional logistics, supply chain management (SCM) now covers tasks like marketing, financing, new product development, and customer support. The supply chain is made up of all the steps that are either directly or indirectly involved in completing a customer's request. It's a multi-stage system where materials, information, and products are constantly moving between stages. The roles that each link in the supply chain fulfills are distinct. The chain's intricacy might differ between sectors and between companies. Because of the rising competitiveness, supply chain performance has become a crucial concern in many businesses.

Keywords: Automobile Sector, Casual Loop Diagram, Logistics, Supply Chain Management, Total Cycle Time.

INTRODUCTION

Maximizing the total value created is the aim of any supply chain. The discrepancy between the final product's value to the client and the effort the supply chain expends to fulfill the request is determined by the value of the supply chain. Value and supply chain profitability are typically tightly correlated in commercial supply chains. The discrepancy between the customer's initial revenue and the total cost incurred during the supply chain. The entire

profit to be divided throughout all supply chain phases is known as supply chain curativeness. The more profitable the supply chain is, the more successful it is. The information, product, and financial flows in the supply chain are the source of expenses. These suggest that distinct businesses should coordinate and integrate their efforts with those of other businesses along the material flow in order to accomplish the goals of supply chain management. They should also concentrate their combined efforts on the end user. For businesses to succeed, they must consider developing unique capabilities that are focused on delivering greater value to the end user, identifying potential, delivering value to target segments, and efficiently utilizing capabilities at the most appropriate points along the chain. These are very remarkable tasks. Businesses can no longer think about participating based on power positions with customers and suppliers.

REVIEW OF LITERATURE

Mishra and Patel (2017) to analyze the supply chain network and find successful chain redesign solutions. According to their opinion, uncertainty impairs chain-wide performance, which may be brought about by the customer's choice for order stock capacity, process information, technical efficiency, and ownership structure. They recognized collaboration with important suppliers and customers as one of the potential strategies to lessen unpredictability and complexity. Jeong and Hong in 2017 to satisfy the demands of various consumers regarding quality, delivery, and cost, a customer-driven network attitude, or customer closeness, flexibility, and accessibility, is necessary for a customer-oriented business. The IT infrastructure's robust communication links, resource planning, and relationship tools enable creative, prompt, and cooperative problem solutions. Information outcomes (capabilities for creative, prompt, and collaborative problem solving), operation outcomes (capabilities for competitiveness in terms of cost, time, and quality), and customer outcomes (satisfaction, retention, and loyalty) are produced by the model's performance when driven by the two variables mentioned above. Ohdar and Ray (2018) conducted a thorough survey on 150 Indian manufacturing businesses to evaluate the state and use of supply chain management strategies. They discovered that 81% of the responding businesses had improved customer satisfaction and reduced total cycle time (TCT) by implementing supply chain management techniques. To assess the effectiveness of their supply chain, these businesses chose to employ a multi-dimensional performance assessment system, enterprise resource planning, electronic data interchange, and other cutting-edge communication tools. The study recommended that in order to create efficient supply chain management techniques in the industrial sectors, there should be a significant emphasis on information sharing and the building of partnerships with upstream and downstream stakeholders. Balan et al. (2018). The dynamic interactions between the Indian automobile industry's suppliers and customers allowed for the collection of data. The survey's findings on supply chain issues include a lack of data, a professional shortage, technical difficulties, subpar infrastructure, the complexity of the supply chain network, cultural mentality, etc. The flow diagram and the system equations, which are based on the casual loop diagram (CLD), were used to further analyze the dynamic interaction among supply chain variables. According to the study's findings, supply chain efficiency is increased by functional excellence and technological integration.

STATEMENT OF THE PROBLEM
The majority of supply chain management study examines wealthy nations. As a result, research on supply chain management in developing nations is lacking. There is little research on the maintenance of car spare parts in the field of supply chain management. Furthermore, the supply chain is expanding quickly in a number of developing nations, including India. The goal of this project is to create and implement a unified framework for measuring supply chain performance that integrates supplier, customer, and internal relationship management at the strategic, tactical, and operational levels.

OBJECTIVES OF THE STUDY
1. To investigate the relationship between the performance of the supply chain and its retail supply of parts for particular auto brands.

2. To comprehend the influence on particular car brands in Chennai city and the management of the supply chain among the merchants.
3. To identify any shortcomings in supply chain management and make recommendations for enhancing its effectiveness.

SCOPE OF THE STUDY

Owing to intense rivalry in the business world, companies are trying to elevate their standing by focusing on several functional areas. It has been determined that supply chain management has a considerable deal of potential for advancement in the expansion of businesses. A survey of the literature showed that supply chain management performance is only measured for individual components. Since a supply chain is made up of several business links, it is imperative to measure the performance of the link that connects the components rather than the component itself. There is a detailed list of performance metrics in the literature that can be applied to supply chain measurement. It is also frequently observed that multiple components work together to accomplish a certain task. Despite the fact that the supply chain is made up of various parts that each carry out a distinct function, research has shown that only the provider is given priority. It is true that for improved performance, the complete supply chain must be taken into account rather than just one provider. All the links must cooperate.

RESEARCH METHODOLOGY

Data collection

The study is mainly based on primary data collected directly from the select respondents through well-structured questionnaire. The use of secondary data were collected from Journals, Magazines, Publications, Reports, Books, Dailies, Periodicals, Articles, Research Paper, Websites, Annual Reports, of Social Organization, Manuals and Booklets.

Sample size

The number of samples determined for the study is 430. The sample size is covering different age groups, brand, and occupational status of customers, and from the selected brand executive managers. These samples were chosen at random

Data collection method

A printed questionnaire consisting of more than 32 questions were served with select 430 respondents by conducting oral survey on them these samples were chosen at random. Five executive questionnaires consisting of more than 30 questions were served with select brand managers by direct interview method. Convenient sampling method was adopted for data collection.

DATA ANALYSIS AND INTERPERTATION
DESCRIPTION OF CHI-SQUARE ON THE BASIS OF SUPPLY CHAIN PERFORMANCE
To examine the Relationship between ensuring car breakdowns \accident at any point with brand level the following hypothesis has been formulated.
Null Hypothesis (Ho): There is no association between the ensuring car breakdowns \accident at any point with brand level.
Alternative Hypothesis (H1): There is an association between the ensuring car breakdowns \accident at any point with brand level. As can be seen from the above table, 65.1 percent of Hyundai brand customers and 46.7 percent of Fiat brand customers reported that their cars were towed in for repairs. Furthermore, 33.3% of Ford brand consumers said that there was no causality in a serious collision. Given that the P value (.0001) is likewise below 0.05. At a 5% level of confidence, the null hypothesis is rejected, leading to the conclusion that there is a relationship between brand level and guaranteed auto breakdowns at any time.

To examine the Relationship between ensuring car break down/ accident at any point of time and good supply chain management system in service area, the following hypothesis has been formulated.

Null Hypothesis (Ho): There is no association between the ensuring car break down/ accident at any point of time and good supply chain management system in service area.

Alternative Hypothesis (H1): There is an association between the ensuring car break down/ accident at any point of time and good supply chain management system in service area. Relationship between the ensuring car break down/ accident at any point of time and good supply chain management system in service area. The aforementioned data shows that 100% of consumers reported that the car was held for more than a month, and that the businesses had store ledgers and all necessary regulations. Additionally, 73.1% of consumers said that their car was held for longer than a month. Given that the P value is less than 0.05 (.0001). The conclusion is that there is a correlation between a good supply chain management system in the service sector and the guarantee that cars break down or have accidents at any moment, as the null hypothesis is rejected at a 5% level of confidence. To examine the Relationship between ensuring any defective goods supplied by the dealer with brand level the following hypothesis has been formulated.

Null Hypothesis (Ho): There is no association between ensuring any defective goods supplied by the dealer with brand level.

Alternative Hypothesis (H1): There is an association between the ensuring any defective goods supplied by the dealer with brand level. As can be seen from the above table, 53.4 percent of Ford brand customers and 65.4 percent of Hyundai brand customers claimed that the product was completely defect-free. Additionally, 63.8 percent of Fiat brand consumers claimed that the form was rarely defective. Given that the P value (.0001) is likewise below 0.05.

To examine the Relationship between ensuring customers justify seller's behavior with brand level the following hypothesis has been formulated.

Null Hypothesis (Ho): There is no association between ensuring customers justify seller's behavior with brand level.

Alternative Hypothesis (H1): There is an association between the ensuring customers justify seller's behavior with brand level. Relationship between the ensuring customers justify seller's behavior The aforementioned chart shows that 54% of Hyundai brand customers thought the seller behaved extremely well. Customers of the Fiat brand reported that seller behavior is neutral in 47.0% of cases. Additionally, 46.2% of Nissan brand customers expressed satisfaction with the seller's behavior. Given that the P value (.0001) is likewise below 0.05. At a 5% level of confidence, the null hypothesis is rejected, leading to the conclusion that there is a relationship between brand level and making sure customers defend the actions of the seller.

FINDINGS

❖ Customers' allegiance to a specific brand and their information to the journal go hand in hand, indicating that brand loyalty is still prevalent in Indian conditions. There are still Fiat enthusiasts that are devoted to the brand, like the Fiat cars that once dominated the auto industry.

❖ This survey is legitimate since, in particular, we observe that manufacturers in India greatly wait when a spare is needed. However, nearly 50% of respondents indicated that the supply chain is operating efficiently. We have 249 respondents who have stated that the dealer moved out with other dealers in the area to obtain spare parts needed to finish the job. As a result, 32 respondents, or 7.5%, have acknowledged that even local vendors are taken into consideration. A sizable portion of respondents have stated that we are permitted to buy replacement parts for the job, which is excellent.

❖ The study concludes that inventory management and supply chain management are critical, with good inventory management and upkeep being key components of this supply chain. According to the study, firm services, such as installing authentic spares, oil, and other parts that are unavailable in the appropriate location, are nevertheless guaranteed despite the cost. Thus, it can be said that the coupons are distributed by standard guidebook procedures rather than advertisements, which is a smart logistical move.

- ❖ The study comes to the conclusion that SCM plays a significant part in managing stores that now use SCM. A total of 303 customers have made mention of it in the samples.
- ❖ Given that the P value (.0001) is likewise smaller than 0.05. It is determined that there is a correlation between brand leave and guaranteed auto breakdowns at any time once the null hypothesis is rejected at the 5% level of confidence.
- ❖ The four brands included in our analysis—Hyundai, Mahindra, Nissan, and Ford—stated that they uphold commitment, trust, and cooperation by striving to "meet day-to-day promises." The Fiat management also stated that they are upholding commitment, trust, and cooperation by keeping their daily promises and sharing information. The majority of respondents were found to be preserving cooperation, commitment, and trust through information sharing. All of these occurred via the SCM, which expedites the procedure.
- ❖ The majority of service managers, who work for three different brands—Holden, Mahindra, and Nissan—state that decisions on transportation have an impact on overhead expenses. Road tax is impacted by transportation costs, according to managers at Fiat and Ford. The majority of respondents felt that their choice of transportation affected their overhead costs, it is concluded.

CONCLUSION

This chapter wraps up the investigation, which began with the analysis and interpretation of the data in the preceding chapter. The study aimed to investigate the relationship between supply chain management and its performance by means of the retail supply of replacement parts for specific car brands. The study aimed to achieve the first objective by asking pertinent questions, analyzing and interpreting the results, constructing null hypotheses, and empirically studying the relationships. These objectives' framing makes it evident that there are opposing consequences on them. The findings indicated that there was no correlation between SCM's performance and its influence on the retail supply of spare parts for specific automobile brands in Chennai.

ABSTRACT

Research with plants and plant derivatives are increasing day by day for the discovery of therapeutic and nutraceutical agents from them and due to the versatile applications of those beneficial agents. The purpose of present work was to evaluate invitro anticancer, antioxidant, antifungal, antibacterial activities of ethanolic leaf extract of *Hemigraphisalternata*. EEHA was subjected to phytochemical screening and EFHA was subjected to column chromatography for the isolation of HA1. The in-vitro anticancer activity was performed by means of MTT assay using EAC cell lines. The antioxidant activity was performed by DPPH assay using Ascorbic acid as a standard. Antifungal activity was done by Cup plate method using Fluconazole as standard. The Antibacterial activity was evaluated quantitatively through minimum inhibitory concentration (MIC) using Azithromycin as standard. Preliminary phytochemical screening confirmed the presence of alkaloids, glycosides, phenolics, flavanoids, carbohydrates etc. in the EEHA. HA1 showed good anticancer effect on EAC cell line than the EEHA in MTT assay. The isolated compound HA1 was found to exhibit the potential antioxidant activity in a dose dependent manner.The HA1was active against the bacterial and fungal strains. The results suggested that the HA1 exhibits significant anticancer, antioxidant, antifungal and antibacterial activities. Further studies are needed to isolate the phytoconstituents from the plant and find out their mechanism of action.

Keywords: *Hemigraphisalternata*, Anticancer activity, MTT assay

INTRODUCTION

In our fast mechanical lifestyle, allopathic medicines are given importance due to their fast action to health problems for quick relief, but people have not only realized the high cost of the medicines, but also realized the dangerous side effects of the body. Therefore, the focus of the health care, turn around to the naturally grown traditional medicinal plants and now at present all attention to the herbals. Besides the popularity of herbal medicines are due to their action in the root levels of the diseases that causes complete cure, easy availability of drugs from natural sources and freedom from approaching various specialists. The plant Hemigraphisalternata is a versatile tropical low creeping perennial herb that reaches a height of 15 to 30cm, which is the native of tropical Malaysia. It is a prostate growing plant with spreading, rooting stems. Its stainy leaves are slender and lance shaped with toothed, scalloped, or lobed margins. They are greyish green stained with red purple above and darker purple beneath. The tiny white flowers intermittently throughout the year. Literally, hemigraphis means 'half writing' because the filament of stamen bear brushes. The plant is known by several names such as Aluminium plant, Cemetery plant, Metal leaf, Red flame Ivy, Waffle plant, Java Ivy etc. In kerala, the plant is popular in the name 'Murikootti' or 'Murianpacha' because of its incredible potency to heal wounds. This plant possesses various medicinal properties, only a few are reported like, the wall plant or leaves are used to treat fresh wound, cuts ulcers, inflammation and in folk medicines, it is used internally to cure anaemia, gallstone, diuretic, hemorrhoids, diabetic mellitus. Cancer can be defined as a disease in which a group of abnormal cells grow uncontrollably by disregarding the normal rules of cell division. Normal cells are constantly subject to signals that dictate whether the cell should divide, differentiate into another cell or die. Cancer cells develop a degree of autonomy from these signals, resulting in uncontrolled growth and proliferation is allowed to continue and spread, it can be fatal. In fact, almost 90% of cancer-related deaths are due to tumour spreading a process called metastasis. **A**ntioxidants play an important role for chronic diseases including cancer and heart disease. Primary sources of naturally occurring antioxidants are whole grains, fruits and vegetables. Plant sourced antioxidants like vitamin C, vitamin E, carotenes, phenolic acids etc. have been recognized as having the potential to reduce disease risk.fungal infections are prolonged treatment regimen with combination of drugsassociated with significant toxicity and emergence of multi- drug resistant (MDR) bacteria and fungi causing morbidity and mortality in immunocompromised hosts. The necessity for effective theray has stimulated research into the design and synthesis of novel compounds which can treat both mycobacterial and fungal infections. The antibacterial activities of plant origin are associated with lesser side effects and have an enormous therapeutic potential to heal many infectious diseases. The potential for developing antibacterial from higher plants appears rewarding as it will lead to the development of a phytomedicine to act against microbes. Nowadays a number of clinically efficacious antibiotics are becoming less effective due to development of resistance.

MATERIALS AND METHODS

Collection of plant material
Hemigraphisalternata is widely distributed in our local areas and fresh leaves was collected in the month of October and authenticated (Specimen No.148226) by A. K. Pradeep, Herbarium Curator, Department of Botany, University of Calicut, Thenhipalam, Kerala, India. The specimen voucher was deposited in the Department of Botany, University of Calicut, itself.

Preparation of solvent extraction
The dried leaves of *Hemigraphisalternata* (Burm) was cleaned and dried under shade at room temperature and powdered to get a coarse powder using a mixer grinder. The alcoholic leaf extract was prepared by continuous hot extraction method for 72hrs by using a Soxhlet apparatus. A sample extract was prepared with powdered plant material (25gm) in 70% ethanol, and was subjected to phytochemical analysis. Based on the phytochemical analysis, bulk extract was prepared with plant material (1 Kg) by continuous hot extraction method. The extract was concentrated to a dry mass by evaporating solvent. The chlorophyll of leaf portion are removed by adding diethyl ether by using separating funnel. Again crude extract was filtered and concentrated under vaccum and controlled

temperature. After complete drying, the crude extract was weighed and the extractive value in percentage was calculated with reference to the air-dried sample.

Isolation of the compound by column chromatography

A column of suitable size (1 m × 1.5 inch) was chosen and packed with silica gel 100-200 mesh by adding slurry of the adsorbent in petroleum ether. EFHAwas dissolved in ethyl acetate, and mixed with silica gel (100-200 mesh) and fed to the column through a funnel. Ethyl acetate was added to the column and kept aside without disturbance for overnight for the settlement of the extract. Maximum precautions were taken to remove the air bubbles. The column was eluted with different organic solvents ethyl acetate, and ethanol. Fractions showing similar R_f value and identification test, were pooled together and solvents evaporated to get residues.

Thin layer chromatography

Thin layer chromatography is an analytical method that is widely used for the identification, separation, isolation and quantification of components in a mixture. The selection of a solvent for application of the sample can be a critical factor in achieving reproducible chromatography with distortion free zones. In general, the application solvent should be a good solvent for the sample and should be as volatile as possible and more non polar. Silica gel was chosen as stationary phase, since it is an efficient adsorbent for the TLC separation of most of the plant extracts and plant drug products.

Anticancer Assay by MTT Method

Fifteen mg of MTT (Sigma, M-5655) was reconstituted in 3 ml PBS until completely dissolved and sterilized by filter sterilization. After 24 hours of incubation period, the sample content in wells were removed and 30μl of reconstituted MTT solution was added to all test and cell control wells, the plate was gently shaken well, then incubated at 37°C in a humidified 5% CO_2 incubator for 4 hours. After the incubation period, the supernatant was removed and 100μl of MTT Solubilization Solution (Dimethyl sulphoxide,DMSO, Sigma Aldrich, USA) was added and the wells were mixed gently by pipetting up and down in order to solubilize the formazan crystals. The absorbance values were measured by using microplate reader at a wavelength of 540 nm.

RESULTS

Table 1: percentage yield obtained from Hemigraphisalternata. Table 2: preliminary phytochemical studies on hemigraphisalternata. Table 3: solvents used in column chromatography of hemigraphisalternata. Table 4: TLC study on extract of hemigraphisalternata. Table 5: TLC study on isolated compound of hemigraphisalternata. Table 6: physical examination of isolated compound. Table 7: Percentage inhibition of EEHA and HA1 in *invitro* anticancer study. Fig 1:Concentration v/s percentage inhibition graph showing anticancer activity on EAC cell line.

DISCUSSIONS

The authenticated plant material (leaf) was dried, powered and subjected to continuous hot percolation by using Soxhlet extractor for the preparation of hydro- alcoholic extract leaf extract. The solvent was evaporated under reduced pressure. The percentage yield of extracts of *Hemigraphisalternata* showed the presence of phytoconstituents such asalkaloids,glycosides,steroidsandterpenoids,tannins,flavanoids,saponinsproteinsandaminoacids. Out of the various mobile phase combinations tried, TLC that was developed using Chloroform:ethanol (5:5)has shown spots for the extract. The crude hydro alchohol extract was subjected to analytical column chromatography containing silica gel G(100-200 mesh) as stationary phase. The elution of column by gradiant elution technique with different mobile phase in the order of increasing polarity led to the isolation of phyto constituents. After chromatographic separation and TLC studies the fraction showing similart spots were pooled together. Then the solvents where evapurated off.   One major fraction was obtained.   It was a yellow crystalline compound from

ethylacetate:chloroform (60:40) fraction.The isolated compound was named as HA1 having yield of 600mg. TLC was developed using chlorofom:methanol(8:2) for isolated compound of hemigraphis alternata and its $R_f$value was found to be 0.71. It was identified as a green fluorescent in UV chamber. The phyto chemical studies of isolated compound of hemigraphis alternata has showed the presence of phyto constituents such as Flavanoids. The purified compound was elucidated by means of IR,^{1}H NMR,^{13}C NMR and LC-MS spectral studies. There is an intene peak at region 3625cm^{-1}which indicates the presence of hydroxyl group in the isolated compound. The peak in the region 1740 cm^{-1}indicate C=O group and 1590 cm^{-1} indicate the presence of C-C stretching in the ring. From these IR data it is clear that it contains functional group OH and aromatic ring. ^{1}H NMR spectra was used to find the number of proton present in a chemical compound. The sample is dissolved in DMSO and value is measured in δ ppm. ^{1}H NMR spectral analysis of isolated compound showed peak at Peak at δ 6.60, δ 6.69, δ 7.725 indicate H of aromatic ring. Peak at δ 4.98 and δ 5.01(d) H of Aromatic OH. Peak at δ 2.186(s) indicate H of glycone OH group. Peak at δ 3.572, δ 3.712(d) indicate H of glycone moiety. In ^{13}C NMR spectral analysis of isolated compound shows peaks at δ 164.6 indicate C of Aromatic ketone. Peak at δ 148.18, δ 154.59, δ 161.20 indicates C attached to OH group of Aromatic ring. Peak at δ 117.24, δ 120.4, δ 124.4 indicate C of Aromatic ring. Peak at δ 73.51, δ 73.92, δ 92.73 indicates C attached to OH group of glycone moiety. Mass spectra of isolated compound showed the base peak at 156 and molecular ion peak [M$^+$] at 464. Molecular mass of the HA1 was found to be 464.38.Molecular formula of HA1 was found to be $C_{21}H_{20}O_{12}$ (Quercetin-3-O-sglucopyranoside).From the spectral analysis of IR, ^{1}H NMR,^{13}C NMR and Mass spectra of the isolated compound, We can assume that the isolated compound is a newer compound having mplecular mass 464.38. As per the MTT assay, the percentage inhibition increased in adose dependent manner. 5-FU inhibits the process (50%) at a concentration of 100.72 μg/ml.Atthesameextendthe EEHA and H A 1 inhibits the process at 167.27μg/ml, 138.11μg/ml respectively. It indicates that the HA1 possess better cytotoxic effect than the EEHA. So the EEHA may contain potential compounds or active principles which might render the plants with anticancer proliferative activities.

ABSTRACT

Passiflora, thrives in tropical and subtropical areas and serves multiple purposes. Beyond its consumption as a fresh fruit, it is extensively utilized in processed food products. Extracts, juices, and isolated components derived from passion fruit exhibit diverse health benefits and physiological actions, including antioxidative, anti-inflammatory, calming, and neuroprotective properties. This study investigates the formulations of Passiflora extracts, focusing on their potential applications in various industries. Passiflora, commonly known as passion fruit, is abundant in tropical and subtropical regions, offering a rich source of bioactive compounds with numerous health benefits. The formulations of Passiflora extracts encompass a wide range of techniques, including solvent extraction, maceration, and advanced extraction methods such as supercritical fluid extraction. These formulations aim to concentrate and preserve the bioactive constituents present in Passiflora, including phenolic compounds, flavonoids, and vitamins. Furthermore, the study explores the incorporation of Passiflora extracts into different delivery systems, such as encapsulation in nanoparticles, emulsions, and solid dosage forms, to enhance their stability, bioavailability, and efficacy. The potential applications of Passiflora extracts in functional foods, pharmaceuticals, cosmetics, and nutraceuticals are discussed, highlighting their antioxidant, anti-inflammatory, sedative, and neuroprotective properties. Overall, this review sheds light on the diverse formulations of Passiflora extracts and their promising applications across various industries.

Keywords: Passiflora, Extracts, Formulations, Bioactive compounds, Phytoconstiutents.

INTRODUCTION

The Passiflora genus, encompassing over 550 species known as passion vines or passion flowers, exhibits diverse characteristics, ranging from herbs to woody trees and vines with tendrils. It falls under the Order Malpighiales and the Family Passifloraceae.[1] Traditional medicinal practices have utilized these plants for a wide array of health conditions, including gastrointestinal, neurological, cardiovascular issues, inflammation, and anxiety, primarily due to their rich composition of active compounds like phenolic compounds, alkaloids, glycosides, flavonoids, and saponins. Among the numerous species in this genus, six species and one subspecies stand out for their documented medicinal properties: P. alata, P. caerulea, P. edulis, P. foetida, P. incarnata, and P. ligularis.[2] Passion fruit is renowned not just for its distinctive and exotic taste and fragrance but also for its exceptional nutritional and medicinal qualities. Plantations are done for commercial purpose in various regions including Australia, Hawaii, the USA, India, New Guinea, Kenya, South Africa, Sri Lanka, and Costa Rica. In India, it grows naturally in many parts of the Western Ghats such as Nilgiris, Wynad, Kodaikanal, Shevroys, Coorg, and Malabar, as well as in Himachal Pradesh and northeastern states like Meghalaya, Mizoram, Manipur, Nagaland, and Sikkim. People are fond of this fruit because of its delightful aroma, intense flavor, abundant yield, and its ability to be highly profitable even with minimal care. Additionally, it is well-suited for hill farming systems.[3] The yellow passion fruit, a sub-species of P. edulis Sims f. Flavicarpa, holds substantial traditional medicinal value. Passiflora alata, known as the winged-stem passion flower, is an evergreen vine that can grow over 6 meters.

The plant's fruits, leaves, and seeds possess various medicinal properties. Extracts from its fruits are recognized for containing polyphenols and flavonoids, displaying antioxidant properties. Studies have identified that leaf extracts from P. alata Curtis demonstrate gastroprotective and neuroprotective activities. These extracts have been specifically examined for their ability to safeguard both the Central Nervous System and the digestive system, attributed to their neuroprotective and anti-ulcer properties. The fruit of P. caerulea contains notable quantities of polyphenols like catechin, resveratrol, epigallocatechin gallate, rutin, and quercetin. These polyphenols are acknowledged for their potential protective effects against chronic neurodegenerative diseases. Additionally, Passifilin, a protein found in the seeds of P. edulis Sims, exhibits anti-fungal activity.[4] Alkaloids, phenols, glycosyl flavonoids, and cyanogenic compounds are identified within the Passiflora genus. Extensive literature research has highlighted numerous studies on Passiflora incarnata and Passiflora edulis, while only occasional mentions exist regarding other Passiflora species. Flavonoids stand out as the primary phytoconstituents in P. incarnata. These encompass apigenin, luteolin, quercetin, kaempferol, schaftoside, isoschaftoside, and swertisin. Furthermore, P. incarnata contains simple indole alkaloids constructed upon the -carboline ring system, specifically harman, harmol, harmine, harmalol, and harmaline. Passiflora edulis, on the other hand, is notably rich in glycosides, specifically flavonoid glycosides such as luteolin-6-C-chinovoside, luteolin-6-C-fucoside, cyclopentenoid cyanohydrin glycosides like passicapsin and passibiflorin, as well as cyanogenic glycosides including passicoriacin, epipassicoriacin, and epitetraphyllin.[5]

Phytoconstituents and uses:
Alkaloids, phenols, glycosyl flavonoids, and cyanogenic compounds have been identified in the Passiflora genus. Existing literature predominantly focuses on Passiflora incarnata and Passiflora edulis, with only occasional reports available for other Passiflora species.

Phyto-constituents of P. incarnata
Flavonoids
Flavonoids, specifically apigenin, luteolin, quercetin, and kaempferol, are identified as the primary phytoconstituents in P. incarnata. The leaves exhibit the highest accumulation of flavonoids, with isovitexin reaching its peak concentration during the pre-flowering to flowering stages. Comparative studies indicate that the ethanol-free liquid extract of P. incarnata contains higher flavonoid levels than commercially available preparations.[6]

Alkaloids

Passiflora incarnata is found to possess simple indole alkaloids characterized by the -carboline ring system, specifically harman, harmol, harmine, harmalol, and harmaline. Medicinal fluid extract of P. incarnata contains 10–20 g/100 ml of harman and harmine, determined through direct spectrofluorimetric methods on TLC plates.[7]

In terms of quantitative measurements, vegetative parts of P. incarnata cultivated in greenhouses were found to contain 0.012% and 0.007% of harman and harmine, respectively. In contrast, the content of these alkaloids in field-grown plants was reported as 0.005% and nil, respectively.[8]

Phyto-constituents of Passiflora edulis
Glycosides

Passiflora incarnata's methanol extract from air-dried leaves yielded a cyclopropane triterpene glycoside named Passiflorine. Chemically identified as (22R),(24S)-22,28-epoxy-24-methyl-1,3,24,28-tetrahydroxy-9,19-cyclo-9-lanostan-4-oic acid-d-glucosylester.[9] In the case of Passiflora edulis, it has been reported to be abundant in various glycosides. These include flavonoid glycosides like luteolin-6-C-chinovoside and luteolin-6-C-fucoside.[10] Additionally, cyclopentanoid cyanohydrin glycosides such as passicapsin and passibiflorin have been identified. Passiflora edulis also contains cyanogenic glycosides like passicoriacin, epipassicoriacin, and epitetraphyllin B, as well as cyanogenic-rutinoside other glycosides present in Passiflora edulis include amygdalin, prunasin, mandelonitrile rhamnopyranosyl- -d-glucopyranoside, sambunigrin, benzyl alcohol, and 3-methyl-but-2en-1-ol. Moreover, there are -d-glucopyranoside of methyl salicylate, and -d-glucopyranoside of eugenol.[11]

Alkaloids

The alkaloids identified in the plant include harman, harmine, harmaline, and harmalol, the leaves contain the highest concentration of harman alkaloids, with a reported peak of 0.12 mg%.[12] Other Passiflora species along with their Physical constituents were mentioned in the Table 1[13-27]

FORMULATIONS

Passiflora extracts, derived from the passionflower plant, are gaining recognition for their potential health benefits. Abundant in bioactive compounds like flavonoids and alkaloids, these extracts are utilized in various formulations. Known for their anxiolytic, sedative, and anti-inflammatory properties, Passiflora extracts are incorporated to address conditions such as anxiety, sleep disorders, and inflammation. Their antioxidant-rich nature also contributes to potential cognitive support and overall well-being. Various formulations were developed using the Passiflora extracts and some of them are mentioned in various tables based on the plant extracts

Formulations based on Seed extracts

Daniela A. Oliveira et al, study delved into Nano encapsulating passion fruit extracts using the emulsion/solvent evaporation method, focusing on valorizing agricultural waste. Both PLGA formulations (50:50 and 65:35) yielded spherical nanoparticles, enabling a controlled release of antimicrobial extracts to prevent bacterial growth. The adapted Gompertz model accurately predicted the extract release from PLGA polymers, suggesting PLGA 65:35 as more suitable despite lower entrapment efficiency due to reduced interaction with the hydrophobic seed cake extract. Encapsulation significantly amplified antimicrobial activity, slashing required concentrations by up to 95%, potentially offering a natural, effective alternative to chemical disinfectants in aqueous environments, promising enhanced control over pathogens.[28] Karolline Krambeck et al, a Nanostructured Lipid Carrier (NLC), NLCP, harnessing passion fruit seed oil, a by-product from Madeira Island's food industry. NLCP exhibited enduring physical and chemical stability during storage, showcasing exceptional encapsulation efficiency for piceatannol and heightened tyrosinase inhibitory activity compared to free oil. Confocal laser scanning microscopy highlighted effective cutaneous penetration. The derived NLC-based hydrogel, NLCP_GEL, remained stable over a year at varied temperatures, maintaining consistent pH, color, texture, and viscosity. Incorporating Poly (acrylic acid), this gel facilitated piceatannol permeation into the viable epidermis, crucial for antioxidant and depigment effects, ensuring prolonged skin contact. Cytotoxicity studies on HaCat cells affirmed the formulations' safety even at concentrations up to 100 µg/mL, a finding corroborated across multiple assays, solidifying the safety profile of these

innovative formulations [29-30] Myla Lôbo de Souza et al explained that Limited research has focused on exploring the therapeutic properties of oils derived from wild Passiflora species. This study presents previously undisclosed data on the characterization of these oils, their biological effects, and the design of appropriate nano-carriers. The findings indicate that oils extracted from seeds of new Passiflora varieties are rich in unsaturated fatty acids, including essential ones, known for their nutritional and healing properties. The observed physicochemical properties suggest chemical stability, making them suitable as raw materials for both laboratory and industrial formulations. Moreover, in vitro assessments demonstrate the potential of these oils to serve as active ingredients that stimulate keratinocyte proliferation, suggesting applications in both therapeutic and cosmetic formulations. Additionally, Nano emulsions emerge as a promising carrier system for Passiflora oils, offering a viable option for topical administration in healing formulations.[31] Dewi NK et al explained the application of extract from the seeds of the purple variant of passion fruit (Passiflora edulis Sims var. edulis) topically has been found to enhance the condition of acne vulgaris. This improvement is evidenced by a decrease in noninflammatory, inflammatory, and overall acne lesions, as well as a reduction in UVRF spot quantity and percentage area. The study highlights the potential therapeutic use of passion fruit purple variant seeds extract for treating acne vulgaris. However, further prospective research is essential to establish the safety and efficacy of this extract compared to standard acne vulgaris treatments.[32] Puneet Gupta et al expalined that the inflammatory response orchestrates cellular processes crucial for wound repair. Emulgel facilitates wound healing by inhibiting reactive oxygen species and cytokine production while promoting fibroblast and keratinocyte proliferation. Histopathological studies indicate emulgel's superiority over alternative treatments, suggesting its potential to enhance wound healing in a concentration-dependent manner.[33]

Formulations based on leaf extract

Thomas B et al This study outlines a simple, eco-friendly method to create stable silver nanoparticles using Passiflora edulis f. flavicarpa leaf extract. This process is swift, doesn't require external stabilizers or reducing agents, and yields stable nanoparticles. Even at a low concentration, these nanoparticles displayed substantial antibacterial effectiveness against E. coli, indicating their promise as potent antibacterial agents. Additionally, they showcased remarkable ability in environmentally friendly degradation of organic dyes, offering potential solutions for water contamination issues arising from industrial activities. These nanoparticles hold significant promise in addressing challenges related to clean drinking water, wastewater treatment, catalytic degradation of pollutants, and as potent free radical scavengers, potentially serving as natural antioxidants with diverse applications.[34] J. Santhoshkumar et al, in their investigation, zinc oxide nanoparticles were synthesized using a plant leaf extract in a green and environmentally friendly approach that minimizes chemical usage. The leaf extract's phytochemicals played a pivotal role in facilitating oxidation and reduction reactions crucial for nanoparticle synthesis, primarily through functional groups like amines and alkanes found in secondary metabolites such as terpenoids, flavonoids, and alkaloids.

Confirmation of rapid ZnO nanoparticle synthesis was achieved via UV-Visible spectroscopy, showing maximum absorbance at 380 nm. X-ray diffraction (XRD) affirmed their crystalline nature, while energy-dispersive X-ray (EDX) analysis confirmed the presence of zinc and oxide ions. Scanning electron microscopy (SEM) revealed nanoparticle sizes ranging approximately from 30 to 50 nm. Importantly, these ZnO nanoparticles exhibited potent antibacterial activity, particularly against urinary tract infections, suggesting their potential as effective antibacterial agent.[35] Echeverry Gonzalez et al, achieved a successful formulation of PLE-SEDDS (self-emulsifying drug delivery system). This system comprised castor oil, Cremophor® EL, propylene glycol, and PDMSHEPMS in specific proportions (31:120:80:30) with a payload of 20%. In terms of pharmacological effects, PLE-SEDDS demonstrated a reduction in blood glucose levels in mice compared to PLE alone. As a result, PLE-SEDDS shows promise as a formulation worthy of further investigation in chronic models of diabetes mellitus.[36] Strasser et al, explained that Antiulcerogenic activity was observed in three extracts from Passiflora serratodigitata L. – crude (DCE), ethyl acetate (EAF), and residual water fraction (RWF). Significantly, Nano encapsulated forms of these extracts (NDC and NEAF) exhibited enhanced antiulcerogenic activity compared to their conventional counterparts. This study underscores the positive impact of nanoencapsulation on both the physicochemical properties and the effectiveness of herbal formulations. Consequently, both free and encapsulated extracts emerge as potential candidates for drug design, holding promise

for the therapeutic management of ulcers.[37] Lade et al explored the leaf extract of P. foetida as a source for efficient silver nanoparticle (SNP) production, with sunlight-induced synthesis emerging as the most effective method. UV-spectroscopic analysis revealed distinctive peaks for sunlight, room temperature, and microwave-induced SNPs. Compound identification through FTIR highlighted specific molecules responsible for reducing silver nitrate to SNPs. Optimal SNP fabrication occurred at an alkaline pH of 11, showcasing stable nanoparticle production. SEM and TEM analyses confirmed sizes of 13.60 nm for microwave-induced, 14.96 nm for sunlight-induced, and 31 nm for room temperature-induced SNPs. Sunlight-induced SNPs demonstrated antimicrobial potential against E. coli and S. aureus at a minimum inhibitory concentration (MIC) of 50 µg/ml. SEM showcased unique morphologies resembling coral reefs, small rocks, and mountains for microwave, sunlight, and room temperature conditions, with consistently small particle sizes. The plant extract-based sunlight-induced SNPs exhibit promising prospects for integration into pharmaceutical applications.[38] Lade et al in the study identified P. foetida leaf discs, specifically 2 cm in diameter, as an effective medium for synthesizing stable silver nanoparticles (Ag-NPs). UV–Vis spectroscopy validated this method's proficiency in reducing silver ions to silver atoms using the 2 cm leaf discs. Notably, leaf discs at pH 7 proved ineffective, while an alkaline pH of 11 successfully facilitated Ag-NP synthesis. The synthesis process initiated within 24 hours at room temperature and a mere 10 minutes under sunlight conditions, with the sunlight reaction demonstrating a distinct UV–Vis absorbance peak, indicating its preference for Ag-NP synthesis over dark and UV conditions. FTIR analysis confirmed the involvement of various functional groups from the leaf, such as alkanes, alkyne, amines, aliphatic amine, carboxylic acid, nitro-compound, alcohol, saturated aldehyde, and phenols, in silver reduction. SEM analysis revealed a clustered, bread-like morphology of the nanoparticles.[39]

Gowrishankar L et al, explained that Plumeria Rubra and Passiflora Incarnata are recognized as rich sources of micronutrients, boasting significant quantities of vitamins, polyphenols, and dietary minerals. Previous research has delineated three distinct herbal tea formulations, each showcasing unique compositions. Sensory evaluation of samples HT 1, 2, and 3 indicated that HT 2 received notably high recommendations, prompting its selection for proximate analysis. This analysis unveiled elevated levels of antioxidants, phenols, and vitamin C in HT 2. Toxicity analysis of HT 2 revealed a mild toxin presence of 21% Subsequent investigations are slated to explore the product's efficacy in managing diabetes and identify suitable primary and secondary packaging materials. Furthermore, the study aims to assess shelf life and nutritional degradation rates under varying temperatures, particularly those akin to hot beverage temperatures.[40] da Cunha Rodrigues L et al, explained that Pressurized Liquid Extraction (PLE) with 70% ethanol yielded 33.1% extractable solids from passion fruit leaves, surpassing percolation's 21.8%. Optimized PLE conditions involved 100°C temperature, 120% rinse volume, and four cycles. PLE's efficiency, faster processing, and reduced solvent usage make it advantageous over percolation. Fick model effectively predicted extraction kinetics, aiding in equipment scale-up. Intermittent purging in PLE extracted larger quantities in shorter durations, enhancing industrial applicability. PLE and percolation extracts showed similar isovitexin levels and antioxidant activity, yet PLE's time and solvent-saving nature make it preferred.[41]

Formulations based on other parts of the plant

Soares   et al in their study developed a stable chitosan hydrogel incorporating flavonoids from Passiflora edulis leaves, suitable for wound dressing. Cell viability tests confirmed safety, while in vitro release studies demonstrated rapid flavonoid release. Histological and macroscopic evaluations revealed wound healing properties, particularly in the initial healing phase, with enhanced antioxidant defense stimulation in animals treated with the hydrogel containing flavonoids. Results suggest potential for treating diabetic rat skin lesions, highlighting the hydrogel's efficacy in the early stages of wound healing and its promise for wound dressing applications.[42] Daniela Borrmann et al, explained in their study that researchers explored the microencapsulation of passion fruit juice using n-octenylsuccinate-derivatised starch through the spray-drying process. Notably, the utilization of n-OSA starch preserved the taste and aroma of passion fruit, enabling easy dilution in cold water post-spray-drying and storage. The outcome was highly stable microcapsules, presenting as a uniform white powder. Remarkably, the efficacy of n-OSA starch as a guardian of vitamin C stood out, retaining nearly all the vitamin C content in the samples throughout extended storage. This encapsulation method allows passion fruit to be conveniently transported and stored as a powder without significant degradation of its nutritional qualities, maintaining a robust and delightful

passion fruit aroma. Reconstituting the juice from this powdered form is straightforward, underscoring its industrial processing potential. [43] Manokari et al in their research, Zinc oxide nanoparticles were produced through the synthesis of Zinc Nitrate hexahydrate solution, combined with extracts from the leaves, stems, and flowers of P. edulis. The process, involving the plant extracts, is an environmentally benign method for the biosynthesis of nanoparticles. The completion of the reaction was observed within two hours when employing different plant part extracts. The plant extracts contain diverse phytochemicals that serve as both reducing and stabilizing agents, facilitating the formation of zinc oxide at the nano scale.[44] According to Frank Mayta-Tovalino et al, the dentifrice formulated from the pulp of Passiflora mollissima demonstrated superior antimicrobial efficacy compared to the peel-based dentifrice. However, certain microbial strains like Actinomyces, C. albicans, S. sanguinis, and S. oralis exhibited greater susceptibility to the peel-based dentifrice. Overall, our findings suggest that our dental formulation is as effective as or even surpasses commercial toothpastes in terms of antimicrobial activity. This underscores the potential of this Peruvian natural resource, opening up promising avenues for further research in this domain.[45]

Viganó J, Meirelles AAD et al, explained that Microparticles of alginate aerogels loaded with gallic acid (GA) and passion fruit bagasse extract (PFBE) were produced using emulsion gelation and internal setting methods, followed by wet impregnation and supercritical CO_2 drying. Optimal GA loading (0.83 g/g raw alginate) was achieved with 1 wt% alginate solution. PFBE loading reached 0.62 g/g raw aerogel, with preserved antioxidant capacity post-impregnation and drying. Total phenolic and piceatannol loadings were 10.77 mgGAE/g and 741.85 µg/g raw aerogel, respectively, with loading efficiencies of 47.1% and 34.7%. The study demonstrates the suitability of impregnated alginate aerogel microparticles for drug delivery, with potential for controlled release of PFBE.[46]My et al explained that the research introduced an eco-friendly method utilizing waste Passiflora edulis peel to synthesize silver and gold nanoparticles, offering vast potential across pharmaceutical and environmental domains. The produced nanoparticles, averaging 25 nm for silver and 7 nm for gold, displayed spherical structures. Particularly impressive was the robust antibacterial activity of silver nanoparticles against multiple bacterial strains, consistently inhibiting them at a minimum concentration of 0.5 mM. Moreover, both types of nanoparticles showcased remarkable catalytic abilities, efficiently reducing nitrophenols and degrading four toxic dyes. This environmentally conscious approach not only synthesizes nanoparticles but also demonstrates their multifaceted potential in combating bacterial infections and addressing environmental challenges related to pollutant degradation.[47]

CONCLUSION

In conclusion, Passiflora species have long held a significant place in traditional medicine due to their diverse therapeutic properties. Through modern scientific exploration, we have uncovered a wealth of phytoconstituents within these plants, including flavonoids, alkaloids, and phenolic compounds, among others. These compounds exhibit various biological activities, such as anxiolytic, sedative, and antioxidant effects, which have been extensively studied and validated. The extraction of these phytoconstituents has led to the development of numerous formulations, including tinctures, teas, capsules, and creams, catering to different consumer preferences and therapeutic needs. These formulations offer a convenient and accessible means of harnessing the potential health benefits of Passiflora species. Furthermore, the utilization of advanced extraction techniques has allowed for the isolation and concentration of specific bioactive compounds, enhancing the efficacy and consistency of Passiflora-based products. This has facilitated their integration into mainstream healthcare practices, complementing existing treatment modalities for various conditions such as anxiety, insomnia, and inflammation. However, despite the promising therapeutic potential of Passiflora species and their extracts, further research is warranted to fully elucidate their mechanisms of action, optimize extraction methods, and explore potential synergistic effects with other herbal remedies or pharmaceutical agents. In essence, the study of Passiflora species and their extracts represents a captivating intersection of traditional wisdom and modern scientific inquiry, offering a rich tapestry of therapeutic possibilities for improving human health and well-being.

Table 1: Various species, Chemical constituents and uses of Passiflora

S. No.	Species	Part of Plant	Chemical constituents	Used for
1.	P.alata	Fruit	Polyphenols and flavonoids	• Alzheimer's disease, • Cancer, • Parkinson's disorder.[13]
		Leaves	Phenolic compounds like catechin, epicatechin, and rutin	• Gastroprotective • Neuroprotective properties. • Neuroprotective • Anti-ulcer [14] • anti-diabetic effects.[15]
		Seed		• Antioxidant properties.[16]
2.	P. caerulae	Fruit	Polyphenols like catechin, resveratrol, epigallocatechin gallate, rutin, and quercetin.	• Chronic neurodegenerative disease.[17]
		Leaf	Existence of fatty acids, esters, sterols, and hydrocarbons isoorientin, vitexin, isovitexin, and vicenin-2	• Gastrointestinal tract-related disease.[18]
		Fruit		• Anxiety and Insomnia.[19]

Medapati *et al.*,

3.	P. edulis	Leaf	Cycloartane triterpenoid saponins, encompassing cyclopassifloside XII and XIII, along with six additional cycloartane triterpenoids	• Antidepressant.[20]
		Seed		• Anti-fungal activity.[21]
		Stem	Cycloartane triterpenoids.	• Anti-depressant.[22]
4	P. incarnata	Flower		• General anaesthesia.[23]
		Leaves	Alkaloids, phenols, glycosyl flavonoids, and cyanogenic compounds	• Dyslipidemia • Hypertrophy, • Hepatic oxidative stress.[24]
		Seeds	Steroid, β-Sitosterol	• Hypercholesterolemia.[25]
5.	P. ligularis	Fruit	alkaloids and flavonoids	• Anti-diabetic.[26]
		Leaf	alkaloids, glycosides, tannins, steroids, terpenoids, and flavonoids	• Anti-inhibitory activity of the extract.

Table 2: Formulations based on seed extracts of Passiflora

S. No	Formulation	Part of plant	Activity	Materials used	Technique employed	Reference
1	Nano encapsulation (controlled release)	Passion fruit seed oil by cold pressing.	Antimicrobial activity	PLGA, with dl-lactide to glycol-ide copolymer ratios of 50:50 PVA, or polyvinyl alcohol	solvent/emulsion evaporation technique	Daniela A. Oliveira et al;2017
2	Lipid carriers-based hydrogels with nanostructure	Passiflora edulis seeds	Depigmenting agent.	Tween 80, or glyceryl distearate Polysorbate 80 Bromide of alkyl trimethylammonium Carbopol 940, Cetrimide Poly(acrylic acid)	Sonication technique at high volumes Glyceryl distearate, a solid lipid, and passion fruit seed oil, a liquid lipid, were combined	Karolline Krambeck et al;2021
3	Lipid carriers with nanostructure	Passiflora edulis seeds oil	Designed to be applied on skin	Cetyl palmitate, Glyceryl dibehenate (Compritol 888 ATO), Glyceryl distearate (Precirol ATO5), and Tween 80	Using various solid lipids, ultrasonication and high-pressure homogenization	Karolline Krambeck et al;2019[43]

4	Inclusion in Nano emulsions is a creative way to produce dermatological nanotechnological products.	Seed oils of wild Passiflora (Passiflora spp.)	Dermalogical preparations	Methyl chloro isothiazolinone, propylene glycol, glycerin, polysorbate 80 (Tween 80; HLB 15), and sorbitan oleate	The various seed oils required different Nano emulsions to be synthesised.	Myla Lôbo de Souza et al;2022
5	Topical cream	Extract from the seeds of the purple variety of passion fruit	Used for treatment for acne vulgaris	0.5% cetyl alcohol, 5% sorbitol, 3% propylene glycol, 1% triethanolamine, and 12% stearic acid.	Extracting and obtaining prepare topical cream The extract was combined with the cream base to produce 10% cream.	Dewi NK et al;2020
6	Emulgel	Passiflora edulis seed oil	Healing potential	Propolis extract	Emulsification	Puneet Gupta et al;2022

Table 3: Formulations based on leaf extract of Passiflora

S No	Formulation	Part of plant	Activity	Materials used	Technique employed	Reference
1	Nanoparticles	Passiflora caerulea fresh leaf extract	urinary tract infection	20 mL of NaOH, 50 ml of Milli-Q water, and 1 mM zinc acetate	Centrifugation was used to separate the precipitate from the reaction solution for 15 minutes at 60°C and 8000 rpm.	Thomas B et al;2019

ABSTRACT

This research article delves into the impact of nonlinearity on mechanical oscillators, scrutinizing its effects on stability, resonance, damping, and energy transfer. Nonlinearity, a prevalent characteristic in mechanical systems, profoundly influences the behavior and performance of oscillators. Through a combination of experimental and computational studies, diverse types of nonlinearities are analyzed, unraveling their intricate implications for oscillator design and optimization. By comprehensively examining the interplay between nonlinearity and oscillator dynamics, this research sheds light on fundamental aspects crucial for enhancing the performance and reliability of mechanical oscillators in various applications. Understanding and effectively managing nonlinearity is paramount for advancing the design and optimization of mechanical oscillators, ultimately facilitating their broader utilization across a spectrum of engineering disciplines.

Keywords: Nonlinearity, Mechanical oscillators, Stability, Resonance, Damping, Energy transfer

INTRODUCTION

The field of micro-electro-mechanical systems (MEMS) and nano-electro-mechanical systems (NEMS) has undergone remarkable advancements, revolutionizing various technological domains with their compact size, low power consumption, and high performance. Among the myriad components within these systems, resonators play a pivotal role, serving as fundamental building blocks for a wide array of applications, ranging from sensing and signal processing to communication and beyond. The micro-electro-mechanical systems (MEMS) and nano-electro-mechanical systems (NEMS) resonators are small-scale mechanical devices that vibrate at specific frequencies, commonly used in various applications such as sensors, filters, oscillators,timing references, sensing, signal processing, and communication systems. These resonators exhibit nonlinear dynamics and chaos under certain conditions, which can have both beneficial and detrimental effects on their performance. Despite their small size, they can exhibit complex dynamical behaviors due to nonlinearities inherent in their design and operation. Understanding nonlinear dynamics and chaos in MEMS/NEMS resonators is crucial for optimizing their performance and exploring new functionalities. In recent years, there has been a burgeoning interest in understanding the nonlinear dynamics and chaos inherent in MEMS/NEMS resonators. This interest stems from the recognition that while linear analysis has provided valuable insights into the behavior of these systems, it often falls short in capturing the intricate dynamics exhibited under certain conditions. Nonlinear dynamics, characterized by the interplay of multiple forces and nonlinearities, introduces complexities that can significantly influence the behavior. These complexities manifest in various forms, including bifurcations, limit cycles, and chaotic motion. Understanding and harnessing these nonlinear phenomena are crucial for optimizing the performance and reliability of MEMS/NEMS devices. Chaos, a fascinating yet often perplexing phenomenon, has garnered particular attention within the realm of MEMS/NEMS resonators. Despite its inherently unpredictable nature, chaos has been shown to offer both challenges and opportunities in system design and operation. From enhancing sensing capabilities to enabling secure communication protocols, chaos has emerged as a powerful tool for exploiting the inherent nonlinearities in MEMS/NEMS resonators. However, navigating the realm of nonlinear dynamics and chaos in MEMS/NEMS resonators poses significant challenges. Existing analytical and numerical techniques, while valuable, may fall short in accurately predicting and controlling chaotic behavior under realistic operating conditions. Consequently, there is a pressing need for advanced methodologies and theoretical frameworks that can elucidate the intricate dynamics of these systems and provide practical insights for their design, optimization, and control.

Due to breakthroughs in nanotechnology, diminutive devices like micro- and nano-electro-mechanical systems (MEMS/NEMS) have witnessed widespread utilization across various domains of science and engineering. Extensive research endeavors have been dedicated to numerically and analytically exploring diverse behaviors and modeling intricacies of these systems [1,2]. In this review, we delve into the fascinating world of nonlinear dynamics and chaos in MEMS/NEMS resonators. We explore the underlying principles governing their behavior, examine existing research endeavors, and highlight emerging trends and future directions in this rapidly evolving field. Through a comprehensive synthesis of theoretical insights, experimental findings, and practical applications, we aim to shed light on the intricate interplay between nonlinear dynamics and chaos in MEMS/NEMS resonators and their implications for next-generation technological innovations.

DIFFERENTIATING MEMS AND NEMS: A COMPARATIVE ANALYSIS

MEMS and NEMS resonators are both types of resonant devices used in various applications, but they differ mainly in their size and scale.

Size and Scale

- MEMS: MEMS devices typically have dimensions ranging from micrometers (10^{-6} meters) to millimeters (10^{-3} meters). These devices are larger in scale compared to NEMS devices.

- NEMS: NEMS devices, as the name suggests, operate at the nanometer (10^-9 meters) scale. They are significantly smaller compared to MEMS devices and can even have dimensions on the order of a few nanometers.

Fabrication Techniques
- MEMS: MEMS resonators are typically fabricated using traditional semiconductor manufacturing techniques such as photolithography, etching, and deposition. These techniques are well-established and widely used in the semiconductor industry.
- NEMS: NEMS resonators require more advanced nanofabrication techniques due to their smaller size. Techniques such as electron beam lithography, nanoimprint lithography, and atomic layer deposition are often employed to fabricate NEMS devices with precision at the nanoscale.

Resonant Frequencies
- MEMS: Due to their larger size, MEMS resonators typically have resonant frequencies ranging from kilohertz (KHz) to megahertz (MHz). These frequencies are suitable for various applications such as timing devices and inertial sensors.
- NEMS: NEMS resonators, being much smaller, exhibit higher resonant frequencies compared to MEMS resonators. They can resonate in the gigahertz (GHz) range and even higher, enabling applications in fields such as nanoelectronics and quantum computing.

Material Selection
- MEMS: MEMS resonators can be fabricated from a variety of materials including silicon, silicon dioxide, and various thin films. Silicon-based MEMS resonators are widely used due to the compatibility with existing semiconductor processes.
- NEMS: NEMS resonators often utilize novel nanoscale materials such as carbon nanotubes, graphene, and nanowires. These materials possess unique properties at the nanoscale and enable functionalities not achievable with traditional MEMS materials.

Applications
- MEMS: MEMS resonators find applications in diverse fields such as consumer electronics (e.g., timing devices in smartphones), automotive (e.g., airbag deployment systems), aerospace (e.g., gyroscopes for navigation), and healthcare (e.g., biomedical sensors).
- NEMS: NEMS resonators are still emerging but hold promise for advanced applications such as nanoelectronics (e.g., nanoscale logic circuits), quantum computing (e.g., qubit control), sensing at the nanoscale (e.g., detecting single molecules), and nanomedicine (e.g., targeted drug delivery).

Energy Consumption and Efficiency
- MEMS: MEMS resonators often consume more energy due to their larger size and mass, which may limit their use in low-power applications.
- NEMS: NEMS resonators, being smaller and having higher resonant frequencies, can potentially offer lower energy consumption and higher efficiency, making them suitable for energy-efficient and miniaturized devices.

NONLINEAR EFFECTS IN MEMS/NEMS RESONATORS
Nonlinearity in micro-electro-mechanical systems (MEMS) and nano-electro-mechanical systems (NEMS) resonators is a critical aspect that significantly influences their behavior and performance. Nonlinearity emerges from various factors, including geometric imperfections, material nonlinearities, and electrostatic forces, which can lead to complex and often unexpected responses. Understanding and managing nonlinearity is essential for optimizing device performance and ensuring reliable operation.

1. **Geometric Imperfections**: MEMS and NEMS resonators are fabricated using micro- and nano-scale manufacturing processes, which inherently involve imperfections in the device's geometry. These imperfections can lead to asymmetries in the resonator structure, irregularities in the mass distribution, and non-uniformities in the stiffness properties. As a result, the resonator's response deviates from the ideal linear behavior, introducing nonlinear effects such as frequency shifts and mode coupling.

2. **Material Nonlinearities**: The mechanical properties of the materials used in MEMS and NEMS resonators can exhibit nonlinear behavior under certain conditions. This nonlinearity arises due to phenomena such as material fatigue, plastic deformation, and stress-dependent stiffness. For example, in micro-scale structures, material properties may vary with strain, leading to nonlinear stress-strain relationships. Material nonlinearity can cause changes in resonance frequencies, damping characteristics, and mode shapes, affecting device performance and reliability.

3. **Electrostatic Forces**: Electrostatic actuation and sensing are commonly employed in MEMS and NEMS resonators due to their compatibility with microfabrication processes and low power consumption. However, electrostatic forces between the resonator and surrounding electrodes can induce nonlinearities in the system. At large displacement amplitudes, nonlinear electrostatic forces can distort the resonator's motion, leading to amplitude-dependent resonance frequencies and mode coupling phenomena. Moreover, nonlinearities in the electrostatic force may result from factors such as fringing fields, non-uniform dielectric properties, and nonlinear capacitance-voltage characteristics.

The presence of nonlinearities introduces several challenges and opportunities in the design and operation of MEMS and NEMS resonators:

1. **Complex Dynamics**: Nonlinear systems exhibit rich and complex dynamics, including phenomena such as frequency mixing, subharmonic resonances, and chaotic behavior. Understanding these dynamics is crucial for predicting device behavior accurately and exploiting nonlinear effects for novel applications such as frequency synthesis and signal processing.

2. **Nonlinear Control**: Traditional linear control techniques may not be sufficient for stabilizing and controlling nonlinear MEMS and NEMS resonators. Advanced control strategies, such as adaptive control, feedback linearization, and sliding mode control, are required to mitigate the effects of nonlinearities and enhance device performance.

3. **Design Optimization**: Designing MEMS and NEMS resonators with reduced nonlinearities requires careful consideration of geometric, material, and electrostatic factors. Optimization techniques, such as topology optimization, parameter tuning, and sensitivity analysis, can help minimize nonlinear effects and improve device linearity and sensitivity.

4. **Harmonic Generation and Mixing**: Nonlinear MEMS and NEMS resonators can serve as efficient sources of harmonic generation and mixing, enabling applications in frequency multiplication, signal modulation, and frequency conversion. By exploiting nonlinear effects, these devices offer compact and energy-efficient solutions for RF and wireless communication systems.

DYNAMICAL BEHAVIOR AND RESONANCE
Dynamical behavior and resonance in MEMS/NEMS devices are crucial aspects that significantly impact their performance and applications. Let's delve deeper into these phenomena:

Frequency Response

*   **Nonlinear Dynamics:** MEMS/NEMS resonators exhibit nonlinear behavior in their frequency response due to various factors such as material properties, geometry, and fabrication imperfections. These nonlinearities can lead to deviations from the expected linear behavior predicted by classical models.

*   **Frequency Veering:** One notable effect of nonlinear dynamics is frequency veering, where resonance frequencies deviate from linear predictions as excitation parameters change. This deviation can occur as a result of various nonlinear mechanisms, such as nonlinear stiffness or damping effects.

- **Frequency Shifts and Broadening:** Nonlinear effects can cause shifts in resonance frequencies and broadening of resonance peaks in the response spectrum. This broadening occurs due to the interaction of multiple vibrational modes and energy transfer mechanisms within the resonator.
- **Higher Harmonics:** Nonlinearities can also lead to the appearance of higher harmonics in the response spectrum, which signifies the generation of additional frequency components beyond the fundamental resonance frequency. These harmonics contribute to the overall response and can impact device performance in certain applications.

Parametric Resonance

Parametric resonance occurs when a system's parameters vary periodically with time, leading to resonant amplification of oscillations. In the context of MEMS/NEMS resonators, parametric resonance typically occurs when the excitation frequency is twice the natural frequency of the device.

- **Large-Amplitude Oscillations:** Under parametric excitation, MEMS/NEMS resonators can exhibit large-amplitude oscillations far beyond what would be achievable under static excitation conditions. This phenomenon can result in enhanced sensitivity and improved signal detection capabilities in sensing applications.
- **Chaotic Behavior:** In certain cases, parametric resonance can lead to chaotic behavior characterized by irregular and unpredictable oscillations. While chaotic behavior may be undesirable in some applications, it can also offer opportunities for novel signal processing techniques and dynamic system control strategies.
- **Applications:** Parametric resonance has applications in signal amplification, energy harvesting, and dynamic signal processing. By harnessing the amplification capabilities of parametric resonance, MEMS/NEMS devices can achieve improved performance in various sensing, actuation, and communication systems.
- **Control Challenges:** However, controlling parametric resonance poses significant challenges, particularly in suppressing unwanted vibrations and ensuring stability in dynamic systems. Effective control strategies, such as feedback control and adaptive damping techniques, are essential for mitigating the adverse effects of parametric resonance and optimizing device performance.

BIFURCATIONS AND CHAOS

BIFURCATIONS

Bifurcations, in the context of nonlinear dynamics within micro-electro-mechanical systems (MEMS) and nano-electro-mechanical systems (NEMS) resonators, represent pivotal points where the system's behavior undergoes abrupt qualitative changes due to variations in control parameters. These phenomena are fundamental in understanding and predicting the behavior of these resonators, which are crucial in numerous technological applications ranging from sensors to communication devices. One notable bifurcation phenomenon observed in MEMS/NEMS resonators is period-doubling bifurcation. This occurs when a system transitions from regular periodic motion to chaotic motion as a control parameter, such as driving voltage or frequency, is varied. Initially, the resonator oscillates with a fixed frequency in a predictable manner. However, as the control parameter is gradually increased, the oscillation period doubles, leading to a cascade of period-doubling events until chaotic behavior emerges. Chaotic motion is characterized by seemingly random and unpredictable oscillations, which can have significant implications for the device's performance and reliability. Another crucial bifurcation phenomenon is the saddle-node bifurcation, where abrupt changes in stability occur. In this case, as a control parameter crosses a critical threshold, the equilibrium points of the system collide and annihilate each other, causing the stability landscape of the system to change dramatically. This sudden transition can lead to unpredictable behavior, such as a shift from stable to unstable states or the emergence of new stable states. In MEMS/NEMS resonators, saddle-node bifurcations can manifest as sudden changes in resonance frequencies or amplitude of oscillations, affecting the device's operational characteristics and reliability. The impact of bifurcations on the operational characteristics and stability of MEMS/NEMS resonators cannot be overstated. Understanding these nonlinear dynamics is crucial for designing robust and reliable devices. Engineers and researchers must carefully characterize the bifurcation behavior of these

systems to ensure predictable and stable operation under varying conditions. Additionally, controlling and mitigating bifurcation effects can lead to the development of innovative strategies for enhancing the performance and functionality of MEMS/NEMS resonators in various applications. Thus, comprehensive study and analysis of bifurcation phenomena are essential for advancing the field of MEMS/NEMS technology.

CHAOS

MEMS and NEMS resonators are small-scale mechanical structures used in various applications ranging from sensors and actuators to communication devices and medical instruments. These resonators exhibit fascinating behaviors when subjected to certain conditions, among which is chaos – a phenomenon characterized by unpredictable yet deterministic motion. In the context of MEMS/NEMS resonators, chaos emerges when nonlinear dynamics lead to a highly sensitive dependence on initial conditions.

1. **Understanding Chaos in MEMS/NEMS Resonators**: MEMS/NEMS resonators are typically composed of tiny mechanical structures, such as beams, cantilevers, or membranes, that vibrate at specific frequencies when subjected to an external force or voltage. In linear systems, the response of the resonator is proportional to the input signal. However, when nonlinear effects become significant, the system can exhibit chaotic behavior.
2. **Nonlinear Dynamics and Sensitivity to Initial Conditions**: Nonlinear dynamics in MEMS/NEMS resonators arise due to factors such as mechanical stiffness, damping, and electrostatic forces. These nonlinearities can cause the resonator's response to become highly sensitive to initial conditions. This means that even minute differences in the initial state of the system can lead to drastically different trajectories over time. Such sensitivity is a hallmark of chaotic systems.
3. **Characteristics of Chaotic Oscillations**: Chaotic oscillations in MEMS/NEMS resonators exhibit several distinctive features:
   - **Broadband Frequency Spectra**: Unlike regular harmonic oscillations, chaotic motion results in a frequency spectrum that spans a wide range of frequencies. This broadband spectrum is a consequence of the irregular and seemingly random motion of the resonator.
   - **Complex Attractor Geometries**: Chaotic systems often converge to a strange attractor in phase space, which has a complex and intricate geometric structure. These attractors represent the long-term behavior of the system and can exhibit self-similar patterns and fractal properties.
4. **Implications of Chaos in MEMS/NEMS Devices**:
   While chaos in MEMS/NEMS resonators can pose challenges in terms of device performance and energy dissipation, it also presents opportunities:
   - **Degradation of Device Performance**: Chaotic behavior can introduce unwanted noise and jitter, reducing the accuracy and reliability of MEMS/NEMS devices. Additionally, chaotic motion may lead to increased energy dissipation, affecting the device's power efficiency.
   - **Random Signal Generation**: The unpredictability of chaotic motion can be exploited for random signal generation, which is useful in various applications such as cryptography, random number generation, and secure communication protocols. Chaotic signals have properties of randomness that can enhance the security of communication systems.

Chaotic behavior emerges in MEMS/NEMS resonators when nonlinear dynamics result in a highly sensitive dependence on initial conditions, leading to seemingly random yet deterministic motion. Chaotic oscillations exhibit broadband frequency spectra and complex attractor geometries. While chaotic motion can degrade device performance and increase energy dissipation, it also offers opportunities for random signal generation and secure communication.

APPLICATIONS AND CHALLENGES

Signal processing using chaos in MEMS and NEMS resonators represents a fascinating intersection of engineering and theoretical physics. MEMS and NEMS devices, being extremely small and highly sensitive to environmental conditions, exhibit nonlinear dynamical behaviors that can be exploited for various applications. Here's a deeper dive into how chaos in these resonators is utilized:

1. **Chaos in MEMS/NEMS Resonators:** MEMS and NEMS resonators are tiny mechanical structures that can vibrate at specific frequencies. Due to their small size, they are subject to nonlinear effects that can lead to chaotic behavior under certain conditions. Chaos in these resonators refers to a highly sensitive dependence on initial conditions, where tiny changes can lead to vastly different outcomes over time. This chaotic behavior can be harnessed for various applications in signal processing.

2. **Chaotic Signal Processing:** Chaos in MEMS/NEMS resonators offers unique capabilities for signal processing. Traditional signal processing techniques often rely on linear systems, but chaotic systems offer advantages in terms of unpredictability and nonlinearity. Chaotic signals generated by these resonators can be used for tasks such as encryption, where the complexity of chaotic signals enhances security. Additionally, chaotic signals can be utilized in communication systems for spread-spectrum techniques, enabling robust transmission in noisy or hostile environments.

3. **Encryption:** Chaotic signals generated by MEMS/NEMS resonators can serve as a basis for encryption algorithms. The inherent unpredictability and sensitivity to initial conditions make chaotic signals suitable for generating cryptographic keys or masking data. By utilizing the chaotic behavior of resonators, encryption schemes can achieve higher levels of security compared to traditional methods.

4. **Random Number Generation:** Chaotic resonators can also be employed for random number generation. The unpredictable nature of chaotic signals ensures that the generated random numbers are truly random, which is crucial for applications such as secure communication, Monte Carlo simulations, and cryptographic protocols. MEMS/NEMS resonators offer a compact and efficient platform for generating high-quality random numbers in various systems.

5. **Broadband Spectra for Spread-Spectrum Communication and Radar Systems:** The broadband spectra produced by chaotic MEMS/NEMS resonators are valuable for spread-spectrum communication and radar systems. Spread-spectrum techniques involve spreading the signal energy across a wide frequency band, making the signal more resistant to interference and interception. Chaotic signals with broadband spectra can enhance the performance and robustness of spread-spectrum communication systems, enabling reliable data transmission in challenging environments.

FREQUENCY TUNING AND CONTROL

Frequency tuning and control utilizing nonlinear dynamics in MEMS/NEMS resonators offer a promising avenue for various applications including vibration control and energy harvesting. Nonlinear effects in these systems can be exploited to achieve frequency tuning, enhance performance, and enable novel functionalities. However, harnessing these nonlinearities poses significant challenges in device design, modeling, and control.

1. **Nonlinear Effects Exploitation**: Nonlinear effects in MEMS/NEMS resonators can arise from various sources such as mechanical nonlinearity (e.g., geometric nonlinearities, material nonlinearities), electrostatic nonlinearity, and nonlinear damping. These effects can be harnessed to achieve frequency tuning and control. For instance, by exploiting nonlinear stiffness or damping characteristics, it becomes possible to tune the resonant frequency of the device under different operating conditions.

2. **Device Design**: Designing MEMS/NEMS resonators for effective frequency tuning and control requires careful consideration of the nonlinear dynamics involved. This includes optimizing the mechanical and electrical design parameters to enhance nonlinear behavior while maintaining device performance and reliability. Design strategies may involve incorporating nonlinear elements such as nonlinear springs, nonlinear capacitors, or exploiting inherent nonlinearities in the material properties.

3. **Modeling**: Accurate modeling of nonlinear dynamics is essential for understanding the behavior of MEMS/NEMS resonators and developing effective control strategies. Traditional linear models are often inadequate for capturing the complexities of nonlinear systems. Therefore, advanced modeling techniques such as nonlinear finite element analysis (FEA), reduced-order modeling, and analytical methods like perturbation techniques are employed to accurately represent the nonlinear behavior of the devices.

4. **Control Strategies**: Control of MEMS/NEMS resonators involves mitigating the effects of nonlinearities to achieve desired performance outcomes. Various control strategies such as feedback control, adaptive control, and nonlinear control techniques like sliding mode control and feedback linearization can be employed. These

Venkatesh and Venkatesan

strategies aim to stabilize the device, suppress unwanted vibrations, and optimize energy harvesting efficiency while accounting for nonlinear effects.

5. **Experimental Validation**: Experimental validation plays a crucial role in verifying the effectiveness of frequency tuning and control techniques in real-world MEMS/NEMS devices. Experimental setups allow researchers to validate theoretical models, assess the performance of control algorithms, and identify practical challenges associated with nonlinear dynamics. Advanced measurement techniques such as laser interferometry, atomic force microscopy (AFM), and scanning electron microscopy (SEM) are often used to characterize the behavior of MEMS/NEMS resonators under different operating conditions.

CONTROL AND EXPLOITATION OF NONLINEAR DYNAMICS

Nonlinear Control Techniques: In the realm of MEMS/NEMS resonators, various control strategies like feedback control and adaptive tuning are instrumental in stabilizing or manipulating their nonlinear dynamics. These techniques are designed to counteract undesirable behaviors while simultaneously improving the performance of these miniature devices. By leveraging feedback mechanisms and adaptive algorithms, engineers can effectively manage the intricate nonlinearities inherent in MEMS/NEMS resonators, ensuring their reliable operation and enhancing their functionality across a wide range of applications.

Exploitation for Sensing and Signal Processing: In certain instances, the nonlinear dynamics and chaos exhibited by MEMS/NEMS devices can be leveraged to enhance their functionality. For example, chaotic oscillations offer opportunities for random number generation, secure communication, and chaotic sensing applications. By harnessing the inherent unpredictability and complexity of chaotic systems, these devices can perform tasks such as generating cryptographic keys or extracting useful information from noisy signals, thereby expanding their utility in various sensing and signal processing applications. Resonators serve as the foundational components within numerous MEMS-based systems, offering substantial advantages across a spectrum of applications ranging from sensing to signal processing and communication [3–6]. Typically, these systems comprise a single movable electrode stimulated by DC and AC voltages applied on one or both sides. There exists an upper limit to the applied voltage, beyond which the electrostatic force fails to counterbalance the elastic restoring force in the movable electrode, resulting in instability and the collapse of the system—a phenomenon known as pull-in instability. Given its critical implications for the structural integrity of MEMS/NEMS devices, the pull-in phenomenon must be meticulously considered during their design and testing phases [7]. Nonlinearities stemming from the electrostatic force, in addition to mid-plane stretching and squeezing film damping, engender complex dynamic behaviors, including frequency response bending, jump phenomena, bi-stability, and chaotic motion.

Chaos represents a form of nonlinear motion often deemed undesirable in the dynamic behavior of many systems. Nevertheless, its utility has been demonstrated across various applications, including sensing, fluid mixtures, and secure communication [8–10]. Given the dual nature of chaos - both advantageous and detrimental - influencing the performance of micro and nano resonators, it becomes imperative to anticipate its occurrence in the systems' dynamic responses. Accordingly, numerous studies have been dedicated to exploring chaos in nano resonators, aiming to delineate its effects comprehensively. The following section presents a selection of these research endeavors. In one of the pioneering studies, Wang et al. (1998) conducted both theoretical analysis and experimental investigations into the dynamic behavior of a bistable MEMS resonator. Their work conclusively demonstrated the presence of a strange attractor and chaos within MEMS devices [11]. Similarly, DeMartini et al. employed a variant of the Mathieu equation to characterize the governing equation of motion for MEMS oscillators. Utilizing the renowned Melnikov's method, they derived an inequality that delineates the parameter space where chaos manifests. Their study further corroborated these findings through experimental evidence, confirming the chaotic behavior exhibited by MEMS oscillators [12]. Haghighi and Markazi similarly employed the Melnikov method to predict chaos in resonators, subsequently implementing a robust adaptive fuzzy control algorithm to manage the chaotic motion effectively [13]. The study referenced as [14] delved into bifurcation and chaos within micromechanical resonators, incorporating additional nonlinear terms into their analysis. Employing the Melnikov method, they delineated the region of homoclinic and heteroclinic chaos within the system. Zhang et al. comprehensively explore the nonlinear

dynamics and chaotic behavior of resonators subjected to random excitation, employing both analytical and numerical techniques [15]. Through the random Melnikov approach, they identify the fundamental conditions necessary for chaos to manifest within stochastic systems. Meanwhile, Aghababa's study [16] focuses on examining the presence of chaos within a non-autonomous fractional-order micro-electro-mechanical resonator system, employing the maximal Lyapunov exponent criterion for analysis. Li et al. [17] provided a rigorous analytical demonstration regarding the presence of chaos within a generalized Duffing-type oscillator featuring fractional order deflection. They derived an analytical formula delineating the two homoclinic orbits and employed Melnikov's technique to establish criteria for the transversal intersection of stable and unstable manifolds. Despite significant strides in understanding the chaos region within micro-electro-mechanical resonators, challenges persist. As previously noted, most prior research has relied on the Melnikov method for chaos prediction, which offers a necessary but not sufficient condition for chaos. As elucidated in this paper, chaotic motion often occurs at large excitation amplitudes, whereas the conservative Melnikov criteria advocate for very small excitation amplitudes to avoid chaotic behavior. This inherent limitation underscores the need for further investigations into the nonlinear dynamics of micro and nano resonators, aiming to develop a more precise method for predicting chaos within these systems.

CONCLUSION

The exploration of chaos within micro-electro-mechanical (MEMS) and nano-electro-mechanical (NEMS) resonators represents a significant area of research with both challenges and opportunities. These resonators, vital components in various technological applications, exhibit complex dynamics that can lead to chaotic behavior under certain conditions. Understanding and harnessing chaos in MEMS/NEMS resonators have profound implications for device design, performance optimization, and innovative applications. Numerous studies have delved into the dynamics of MEMS/NEMS resonators, revealing the presence of chaos and its underlying mechanisms. From theoretical analyses to experimental validations, researchers have made strides in characterizing chaotic behavior and exploring its effects on device performance. Studies employing techniques like the Melnikov method have provided valuable insights into the conditions under which chaos manifests in resonators, paving the way for further exploration and control strategies. Despite these advancements, challenges persist in accurately predicting and controlling chaos within MEMS/NEMS resonators. Existing methods, while informative, may not fully capture the intricate dynamics of these systems under realistic operating conditions. As such, there is a need for more sophisticated theoretical frameworks and experimental approaches to elucidate the complexities of chaotic motion in resonators. Additionally, the presence of chaos presents both challenges and opportunities in the design and operation of MEMS/NEMS devices. While chaotic behavior can degrade device performance and increase energy dissipation, it also offers opportunities for random signal generation, secure communication, and novel signal processing techniques. By leveraging the inherent nonlinearities in resonators, engineers can explore new avenues for enhancing device functionality and enabling innovative applications. Moving forward, continued research into chaos in MEMS/NEMS resonators is essential for advancing the field and unlocking the full potential of these miniature devices. By addressing the challenges and harnessing the opportunities presented by chaos, researchers can pave the way for the development of next-generation MEMS/NEMS technology with enhanced performance, reliability, and functionality.

ABSTRACT

Electronic commerce is a strategic approach that uses computer networks to enhance organizational performance, leading to improvements in customer service, increased profitability, market share, and faster product delivery. It covers every aspect of an entity's electronic correspondence with interested parties, including clients, vendors, government authorities, financial institutions, managers, employees, and members of the public. To succeed in the digital economy, organizations must consider the likelihood of internet usage among current or prospective customers and the cost of searching for goods or services. The digitization of trade and public services has made it possible to gain more correlations and information from data than ever before. This data serves as the foundation for new services, corporate strategies, and value creation. The role of platforms in e-commerce is crucial, with Amazon and Alibaba holding significant market shares. Platforms lower transaction costs for customers and make market information more accessible, helping micro, small, and medium-sized businesses (MSMEs) access the global market. However, many MSMEs struggle to use these platforms due to their large data collection capacity. User data is the primary economic resource in the Internet platform business model, which is gathered, processed, and made profitable through marketing and advertising. The European Union has passed laws aimed at levelling the playing field for big and small platforms participating in the digital economy and promoting competition. With a global market value of US$6.3 trillion, e-commerce is a major force behind economic expansion.

Keywords: E-Commerce, Global Market, E-Market Aggregators, digital revolution, Artificial Intelligence (AI)

INTRODUCTION

Electronic commerce is revolutionising business operations. If organisations want to capitalise on new developments in Internet technology, they need to take a strategic approach. Stated differently, it is imperative to guarantee that both corporation strategy and electronic commerce strategy are closely aligned. Using computer networks to enhance organisational performance is known as electronic commerce. Electronic commerce can lead to improvements in customer service, increased profitability, increased market share, and faster product delivery, among other aspects of organisational performance. There is more to electronic commerce than just placing an online catalogue order. It covers every facet of an organization's electronic contacts with its stakeholders—the persons who influence decisions about the organization's future. Consequently, the development of an investor relations Web page or electronic correspondence with college-age job candidates are considered forms of electronic commerce. To put it plainly, electronic commerce is the application of information technology to improve interactions and exchanges among all stakeholders involved in an organisation. The public, management, employees, government regulators, financial institutions, suppliers, and customers are examples of these stakeholders.

Who is the right user of the Internet?

Every organisation should think about whether and to what degree it should be involved in the Internet community, as well as whether it should have a presence there. When responding to these inquiries, two important criteria need to be taken into account. First, what is the likelihood of Internet usage among current or prospective customers? An organisation should have a presence if a sizable fraction of its clientele uses the Internet and the cost of searching for the good or service is reasonably (even modestly) high. If not, it is losing out on a chance to communicate with and educate its audience. For many consumers, the Internet is a kind and incredibly practical source of knowledge. A business that lacks a website runs the risk of losing out to web-savvy competitors who already have a presence online.

Trade and the data economy going digital

Two parallel developments—the quickening pace of digitization, or the conversion of analogue data to digital form, and the "digital transformation" of societies, or the digitization of trade and public services—made feasible the digital economy. More correlations and information may be gleaned from data than ever before thanks to the simultaneous development in computer processing capacity. Data serves as the foundation for new services, corporate strategies, and value creation The process of digitization causes previously physical products—like books, movies, video games, and recorded music—to become less tangible. Additionally, data flows support and enable all other forms of traditional cross-border flow: customers are increasingly placing orders and making payments online, even when ships are transporting physical goods. The nature of global trade has also changed as a result of data flows. Nowadays, it's thought to be viable to trade services like healthcare and education that were formerly nearly difficult to give internationally. Simultaneously, there is an expanding trend of "servicification" in international trade, which is essentially the growing integration of services and goods. Services are becoming more and more integrated into manufactured items, and manufacturing organisations are buying, producing, and selling services to go along with their goods. Services that are offered to customers in conjunction with products, like applications that go along with exercise equipment and health trackers, are an example of servicification. As of right now, China leads the world's e-commerce sales rankings, with the US, UK, and Japan following closely behind.

The role of platforms in e-commerce

Digital platforms are the most obvious interfaces that link people to global flows. The two biggest online retailers in the world, Amazon and Alibaba, continue to hold sizable market shares. Platforms lower transaction costs for customers and make market information more accessible. They can also help micro, small, and medium-sized businesses (MSMEs) get access to the global market, which would democratise e-commerce. However, a lot of MSMEs have trouble using these platforms. MSMEs may find it challenging to compete with the platforms' own offerings, particularly if they gather a lot of data that can be turned into market intelligence. User data is the primary

Keerthi Hanusa and Jaber Asan

economic resource in the Internet platform business model; it is gathered, processed, and made profitable through marketing and advertising. Users share their "electronic footprint" when engaging and conducting information searches on the Internet. Internet businesses gather and examine this data in order to derive specifics about the habits and preferences of their users. Online retailers have a great degree of assurance about the purchases and actions of users who fit a particular profile. A number of nations and areas have passed laws aimed at levelling the playing field for big and small platforms participating in the digital economy and promoting competition. The EU's 2000 e-commerce directive was modernised in Europe with the Digital Services Act (DSA). It encompasses a broader spectrum of internet services, such as social networking platforms, online retailers, and other online service providers. The DSA seeks to level the playing field for businesses and safeguard users' fundamental rights. The European Union's Digital Markets Act (DMA) is an addition to the competition legislation in Europe. It controls the operations of "gatekeepers," or sizable online platforms that offer essential platform functions including messaging apps, app marketplaces, and internet search engines. Collectively, these standards seek to guarantee openness, improved consumer safety, distinct accountability, liability guidelines, and increased market participant rivalry. It is expected that a unified set of legislation spanning the entire EU would facilitate the growth of cross-border digital trade. Approximately 57% of internet users worldwide make at least one online purchase each week. Have you recently bought any digital goods like films, software, or e-books? or purchased tickets online? Did you place an online order and make a payment for a tangible item, like clothes? Have you placed an online order for a physical book and paid with cash when it arrived? These instances are all under the category of e-commerce. Approximately 2.64 billion people, or one-third of the world's population, made online purchases in 2023. With a global market value of US$6.3 trillion, e-commerce is a major force behind economic expansion. Examining e-commerce perspectives and its economic management to achieve economic growth is the goal of the current study.

LITERATURE SURVEY

Severin Borenstein and Garth Saloner (2001) opined Economics and Electronic Commerce. Electronic commerce will eventually just be commerce, of course. It will form an additional component of the vital infrastructure that business depends on, alongside other technologies like telephone communication, railway shipping, electrification of production processes, and others. But in the process, e-commerce will fundamentally alter businesses' capacity to generate and seize value and will cause a reorganisation of numerous markets, much as earlier technological revolutions had an effect on economic growth. Liu (2002) examined Privacy Policies in Fortune 500 Web Sites. Although concerns about the privacy of personal information have been for a while, the advent of e-commerce and its related technologies has renewed these issues. The Fortune 500 is a symbol of conventional leadership in business and technology applications. This initial analysis of Fortune 500 websites reveals that slightly over 50% of Fortune 500 websites have privacy policies available on their main page. It is less frequent to find comprehensive privacy rules that cover every privacy component recommended by the FTC. Zwass and Vladimir(2003) studied Electronic Commerce and Organizational Innovation: Aspects and Opportunities. In the last 10 years, electronic commerce built on the Web-Internet compound's technological underpinnings has spread into a wide range of organisational and social domains. To be completely understood and utilised, this widespread organisational and technological progress needs to be categorised. Five categories are used to categorise the main components of e-commerce: connection, computation, communication, cooperation, and commerce. These factors give rise to particular chances for innovation that can be used to address and organise markets, provide novel products, work with business partners, change corporate procedures, and plan the provision of information-system services. The end product is a thorough framework for understanding e-commerce as a technologically driven approach to corporate transformation and as a multidisciplinary area of study. Pujani V (2011) studied Use of Ecommerce Websites in Developing Countries. This study aims to investigate how Indonesia, a developing nation, uses e-commerce websites. It has been determined that e-commerce websites significantly influence corporate operations, especially when it comes to resolving geographical issues for islanded nations like Indonesia. One more time, the importance of websites as marketing tools is noted. The impact of features and quality on customer happiness and usage of e-commerce websites is examined in this study. A survey approach was used with 115 undergraduate Management Department students at Andalas

Keerthi Hanusa and Jaber Asan

University who were enrolled in the Management Information Systems (SIM) course. The Smart PLS programme is used to analyse the data using structural equation modelling, or SEM. This result showed that feature satisfaction, system and information quality, and system quality all have an impact on how e-commerce websites are used in Indonesian contexts. Vera et al (2011) studied Student Perspectives Toward the Quality of E-Commerce Website. Using electronic commerce, the way that businesses use the internet has rapidly transformed (E-commerce). A website that is present may execute online transactions in e-commerce. The The current study aims to investigate the effects of the quality aspect on e-commerce website usage. Based on student viewpoints that are researched, the system, information, and service are included as quality aspects in the uses of e-commerce websites. The-155 Students enrolling in the Management Department of Economics Faculty at Andalas University's MIS course are encouraged to participate as research participants. The data will be analysed using SmartPLS (Partial Least Square) software and structural equation modelling, or SEM. The study's findings indicated that the only factor significantly influencing the adoption of e-commerce websites was service quality. System and information quality had not had a substantial impact in the interim. As a result, this study provides a straightforward example of how e-commerce websites are used, showing how users are more concerned with service quality than with information and system quality. As a result, businesses ought to concentrate on the services they offer through their websites.

Lee et al (2011) studied the Framework for User Perception of Effective E-Tail Web Sites. The creation of an experimentally validated framework for users' perceptions of successful websites for retail e-commerce (E-tail) is presented in this study. Specifically, we tried to address the following primary study questions: Which are the main designs influencing the effectiveness of e-tail websites? In what ways do these designs aid the goals that people have when utilising the Web? We suggested that "effective designs for E-tail Web sites should support Web customers for their (a) information search, (b) pleasure, and (c) business transactions" based on the idea of "fitness for use" and the reasons why consumers use the Internet. Subsequently, 427 prospective Web consumers' survey responses were gathered. To improve the suggested framework and give the framework's constructs structure for further confirmatory analysis validation, an exploratory analysis was carried out. The findings indicate that 16 elements are key to determining the effectiveness of e-tail websites, and 64 web designs support the three main reasons why clients utilise the Internet. Albar et al (2013) examined A Prototype E-Commerce Website for SMEs in West Sumatera, Indonesia. One of the e-commerce technology applications that businesses use is the widespread usage of the internet for e-commerce activities since websites need to function. The remarkable advancements in internet and website technologies have demonstrated a noteworthy impact on businesses. Thus, in order to advance their company's operations and meet their goals, businessmen need also think about using technology. As a result, using a website for commercial purposes is becoming a more reliable marketing tool and a fresh way to advertise goods and services. By no means has Indonesian internet and website usage developed well yet. The reasons for this include the absence of infrastructure, a lack of knowledgeable human resources in the field of information technology (IT), the involvement of financial institutions, and the users' varying educational backgrounds.

In fact, technology will play a big enough role in the future development of small businesses. Putri et al (2019) studied the impact on Shopee customer loyalty in Padang City of perceived value, information quality, system quality, and e-service quality. Electronic commerce, or e-commerce, has expanded rapidly in Indonesia in recent years in an effort to broaden the audience for marketing and boost its efficacy and efficiency. This study aims to explore the relationship between perceived value to online loyalty and system, information, and e-service quality and how it affects Padang City Shopee customers. This study offers explanations through a quantitative method. 250 Shopee users who had made more than two purchases on the platform provided the data. The SEM-PLS with smart PLS 3 programme is used in this study. The findings indicate that online loyalty was positively and significantly influenced by perceived value, information quality, system quality, and e-service quality. Consequently, this study offers a summary of customers of e-commerce websites who are more concerned with website quality; as a result, businesses should concentrate on raising the calibre of e-commerce website design. Adel.A.Alyoubi (2015) examined Modern E-commerce Systems in Developing Countries. Rapid Internet growth gave rise to the concept and use of electronic commerce, or e-commerce, which is currently commonplace globally. The new commercial reality is that businesses and individuals operate through internet-based economic structures and information groupsenjoy buying

Keerthi Hanusa and Jaber Asan

goods and services abroad. Due to several barriers to e-commerce, most underdeveloped countries do not experience this. According to the study, the primary criticism of liberal markets and free trade is that they increase the gap between rich and poor countries. The rise of the Internet economy, which has brought to light the stark contrasts between nations with abundant and inadequate knowledge, has reinforced this criticism. Developing nations must create national e-commerce development strategies and regulations that are specific to their resources and circumstances since e-commerce has the ability to close the gap and offer them the opportunity to attain economic equality. Developing nations will become fierce e-commerce rivals thanks to this, as well as investments in telecommunications infrastructure, a supportive legal and regulatory environment, sensible institutional changes, and human resource development and education. Kurniawati et al. (2020) looked into e-commerce potential in the 4.0 era of Innovative Entrepreneurship Management Development. E-commerce is used by MSMEs in East Java. It is employed to seize opportunities for developing innovative entrepreneurial management. In the 4.0 era, innovation is essential to the survival of businesses, especially MSMEs. Utilising opportunities and innovations is essential to creating new products that guarantee the survival of MSMEs. It assessed how e-commerce prospects were perceived in terms of their ability to affect customer satisfaction and trust, deliver the best possible customer service, meet customer expectations, and pose hazards to MSMEs. In this work, a survey method was combined with a quantitative descriptive methodology. Pearson Correlation Product Moment analysis was used to examine the information acquired from surveys and interviews. The poll found that e-commerce has the potential to improve customer satisfaction and trust in transaction execution, provide the best service, meet customer expectations, and not pose a threat to MSMEs. The research findings indicate that e-commerce presents several opportunities for influencing consumer satisfaction and trust, offering the best customer service, meeting customer expectations, and not posing a threat to small and medium-sized enterprises (MSMEs).

In their 2021 study, Jong Woo Kang et al. assessed how technology adoption affected online B2C sales. The scenario for business-to-consumer (B2C) online commerce is evolving quickly because to technological advancements. Its spread is still concentrated in major, developed economies, though, and it is creating a digital divide that hurts low-income and small- and medium-sized businesses. The pandemic of the coronavirus disease (COVID-19) demonstrated the urgent necessity to bridge gaps within and between nations. This study produces important insights for businesses and policy makers and shows that financial inclusion, internet security, and internet access and speed all encourage online retail purchases. Governments must to consider them as significant obstacles in creating a supportive atmosphere that will help B2C e-commerce adapt to the post-COVID-19 world and guarantee that innovations present chances for everybody. According to this report, the extraordinary growth of m-commerce in Asia and the Pacific in recent years can be attributed to a number of factors, including financial inclusion, online security, and internet availability via fixed broadband connections and mobile broadband subscriptions. Additionally, as a result of the epidemic, more individuals are shopping for food, other needs, and other products using their smartphones. Even without significant government investment in telecommunications infrastructure, the emergence of wireless technologies, such as mobile phones, has resulted in an unprecedented boom in access to telecommunication services throughout Asia over the past 20 years or so. Disadvantaged populations, including rural residents with poor incomes and low literacy rates, can now take advantage of the mobility, simplicity of use, and comparatively low and declining costs of mobile phones. This emphasises how important it is for people on a tight budget to be able to take use of the advantages of B2C online commerce using reasonably priced wireless mobility devices and internet technology. It is expected that one long-term effect of the COVID-19 pandemic will be the pervasiveness of business-to-consumer (B2C) online shopping in all spheres of the economy and society. B2C online sales will have to keep changing to keep up with the challenges of the new normal. This study provides empirical support for the notion that factors related to financial inclusion and technology adoption are important for facilitating B2C online transaction. Then, in order to develop policies and legal frameworks that enable business-to-consumer (B2C) internet commerce, governments should take these important issues into consideration. This will help the industry adapt to the post-COVID-19 environment and make sure that it creates possibilities for everyone.

Keerthi Hanusa and Jaber Asan

Payal Goyal and colleagues (2022) investigated the Emerging Trends of E-Commerce from a Developing Country Perspective. As a result of the exposure of internet technologies like social media and e-commerce, many countries have become part of one massive economy in the age of globalisation, which is currently changing the structure of the world economy. All businesses have evolved into information-based operations, and significant advances in science and technology are signalling a shift in the nature of trade. At the same time, modern electronic commerce is causing massive economic disruptions that are impacting every area of the economy. When viewed globally, commerce, finance, and marketing are among the most significant occupations in the global marketplace. For this reason, the impact of e-commerce has been observed in the contemporary corporate environment. E-commerce, or electronic commercial transactions, is a relatively new concept that has the potential to upend traditional business practices and has already had a significant impact on major industries like banking and communications. Since it offers a broader viewpoint for getting to know and understand customers, electronic commerce is crucial in expanding the intersections of business and electronic commerce that bring in a new era of marketing. In the end, it transforms marketing and commerce by expanding the market to include both domestic and international markets. The study came to the conclusion that while e-commerce has improved the nation's economic standing and given SMEs services the opportunity to transact with overseas or international customers more directly, these benefits for developing countries are also accompanied by a number of challenges in the global market due to inaccurate information, outdated technology, social and cultural norms and regulations, and international laws and regulations.

Objectives
1.   The study is meant to explore the theoretic perspectives of E-Commerce Management;
2.   To ascertain the Economic management of perspectives of E-Commerce in digital era;
3.   To offer Suggestions.

Limitations
The study is theoretic and offer scope for further empirical research in the economic management of E-Commerce.

Perspectives evolved over a period of time in E-Commerce in the digital era
From a number of angles, e-commerce has significantly impacted economic management. Here are some important things to think about: E-commerce has improved economic management efficiency by optimising procedures including distribution, sales, and marketing. Companies that use online platforms instead of traditional brick-and-mortar storefronts can reach a larger audience for less money. Increased productivity, lower costs, and better profit margins are the results of this efficiency. It enables companies to reach customers across borders and enter foreign markets. By raising sales volumes and broadening the sources of income, this development can accelerate economic growth. Additionally, it gives small companies the chance to compete globally, promoting economic growth. The following diagram gives a glimpse of the process of Economic management of E-Commerce Technology.

The other Supportive Perspectives of E-Commerce Technology
1.   **Data analytics:** E-commerce generates large amounts of data that can be utilised to guide decisions about economic management. By evaluating sales patterns, market trends, and consumer behaviour to maximise their strategies, businesses can enhance their profits. Data-driven insights provide better resource allocation, inventory control, and forecasting.
2.   **Employment Creation:** Although automation in e-commerce may result in employment losses in some industries, it also opens up new career paths in customer service, digital marketing, e-commerce development, and logistics. In order to satisfy the needs of the digital economy and facilitate a seamless transition to new job responsibilities, economic management must prioritise upskilling the workforce.
3.   **Regulatory Challenges:** Taxation, consumer protection, and data privacy are some of the regulatory issues that e-commerce raises for economic management. Governments have to find a balance between encouraging innovation and safeguarding companies and customers. A fair playing field for all market players and the maintenance of confidence in the e-commerce ecosystem can be achieved through effective regulation.

4. **Supply Chain Optimisation**: Dropshipping, just-in-time inventory, and agile logistics are just a few of the ideas that e-commerce has brought to the forefront of supply chain management. These developments shorten lead times, increase product delivery efficiency, and save storage expenses. Supply chain optimisation should be the main goal of economic management in order to satisfy changing e-commerce consumer demands.

5. **SME Empowerment:** Small and medium-sized businesses (SMEs) may now compete with larger firms globally thanks to e-commerce. SMEs should be assisted by economic management in implementing e-commerce technology, obtaining funding, and developing their digital capacities. SMEs that are empowered experience increased entrepreneurship, innovation, and economic diversification.

6. **Market Disruption:** By permitting online marketplaces, peer-to-peer transactions, and direct-to-consumer sales, e-commerce upends conventional market dynamics. In order to respond to these disruptions, economic management must promote competition, stimulate innovation, and safeguard the interests of consumers. Reacting proactively and anticipating changes in the market are essential for long-term economic prosperity.

7. **Customer Experience:** Through individualised marketing, smooth transactions, and effective customer support, e-commerce places a high priority on the customer experience. These customer-focused tactics can be used by economic management to boost repeat business, foster brand loyalty, and raise customer lifetime value. In order to maintain long-term growth and profitability, firms should prioritise customer pleasure.

8. **Digital Payments:** To ensure safe and effective transactions, e-commerce depends on digital payment systems. To assist the expansion of e-commerce, economic management should encourage the use of mobile wallets, cryptocurrency possibilities, and secure and dependable payment channels. Promoting digital payments increases financial inclusion, boosts economic activity, and lessens the need for cash transactions.

AI and E-Commerce

Artificial Intelligence is transforming e-business operations. Artificial Intelligence (AI) has three primary applications in the e-commerce sector: transaction processing, marketing, and customer service. It might also help merchants predict demand and manage inventory.

AI's potential in online shopping

Artificial Intelligence holds great promise for internet-based businesses. Businesses can now customise advertising to customers' preferences by using algorithms, which are already widely used to analyse client behaviour. AI is also capable of projecting demand, which helps businesses better understand what things to supply and when. It can even generate product recommendations by evaluating the buying patterns of particular customers. This could help improve logistics' sustainability. Through price maximisation (automated dynamic pricing), which enables sellers to adjust in real-time to market trends, rival pricing, and consumer behaviour, AI may potentially help retailers increase their profitability. They can also help with fraud detection, payment optimisation, and invoicing. Digital assistants negotiate with customers one-on-one and frequently help transactions end successfully while offering continuous customer care to online shoppers. Natural language processing (NLP) makes it easier to interact with clients by interpreting and responding to voice. AI may also have an effect on customer service, relationship building andmaintenance, and customer redress in the event of a dispute. AI assistance is a useful tool for addressing customer problems since it is reliable, has no learning curve, and is consistent. Furthermore, AI can assess vast amounts of complaints, which helps businesses better allocate resources and detect and address issues before they become more serious.

AI dangers that could affect online sales

Larger e-commerce companies with the financial means to invest in cutting-edge AI capabilities benefit from the competitive advantage that AI technology offers. This could result in even more market concentration, which would hinder the ability of smaller companies to compete and possibly limit consumer choice. AI technology implementation and upkeep can be expensive, requiring large infrastructure investments, access to high-quality data, hiring qualified personnel, and ongoing research. There could be a barrier to entry or growth in the industry if smaller companies or startups with limited funding are unable to compete with larger organisations that can afford

significant expenditures in AI. A growing percentage of businesses are rejecting to transition to human contact in favour of AI-only customer support. This is a bad trend that could result in poor customer experiences and service denials if the automated assistant is unable to adequately solve a customer's issue.

CONCLUSION

E-commerce has changed economic management in a number of ways, from increasing productivity and reach internationally to stimulating employment growth and market disruption. Economic managers must embrace digital transformation, deal with regulatory issues, optimise supply chains, empower SMEs, react to market upheavals, give priority to the customer experience, and encourage digital payments if they are to fully realise the potential of e-commerce. In the digital age, economic management can promote sustainable economic growth by taking a comprehensive strategy to e-commerce. On the other hand, one of the main concerns is data security. AI systems depend significantly on customer data, which is vulnerable to security lapses and illegal access. Furthermore, biases in AI decision-making processes that result from flawed algorithms or biassed training data can have negative effects. Moreover, the potential for cyber security risks poses a huge issue since malevolent actors may use AI system weaknesses to launch cyberattacks that mighthave catastrophic effects on companies.

ABSTRACT

The stretch 'New Woman' grew to signify the female's awakening towards comprehension of her dwelling and position in personal and social scene. Trendy Indian English language fabrication, womenfolk authors take mightily stated their objection in contrast to the male- controlled supremacy. Shobha Dee, a personality fashionable the monarchy of current side nonfiction fashionable Republic of India transcribes since a fixed womanlike view. She stays the unsurpassed vendor author besides a permanent playwright designed for more than a few correspondents in addition slicks. Moved done a certain innermost pressure to be discrete in her private precise, this original female takes stood tiresome nearby believer adult female true, position and influence by equivalence through males on the lands of 'equality of sexes.' In place of a writer, she stays ornamented thru unusual capacity near confer searching parts of anthropoid lifespan. Her all of it have a faithful dash and complex application. She debates transparently the snags, requests and objectives of women, expressly the built-up leader's importance in universal gender consciousness, self-definition, reality besides purpose. Shobha Dee partakes tolerant besides developed the gathering of Indian English illusory ecosphere through her excessive the lot. Her mélange of refrains, change of typescripts, distressingly appealing views, all are compellingly plus colourfully uttered in a lewd panache. This newspaper efforts to schoolwork the campaigner posture of Shobha Dee as it appears since her fabrication.

Keywords: Biosphere, Psychology, Sexuality, Stress, Uninhibited Behaviour.

INTRODUCTION

The 'New Woman' characteristically ethics self-fulfilment and individuality slightly than the stereotypically womanly idyllic of altruïsm; trusts in permissible and sensual parity; frequently leftovers solitary since of the struggle of uniting such parity through wedding; is additional uncluttered around her gender than the 'Old Woman'; is knowledgeable besides delivers an inordinate contract; has an occupation; is fit or then bodily energetic and, consequently, favours contented garments (sometimes male attire) to outdated female clothing. Repudiation besides rebuffing the ancient habits of parts achieved by the women, these females complete contemporary selections in command to fast their independence besides eccentricity. This new-fangled female needed a treat to like superior liberty to pursuit then achieves community characters in addition uniform exhibit her "sex appeal". While the exists of greatest nineteenth-century women - particularly bourgeois females nonetheless too national domestics and strives - inclined to rotate about homebased life, contemporary females offered hooked on jobs, politics, and ethos outdoor the national kingdom. The idea of "new woman" that primary arisen in the late-night nineteenth period container be occupied as an iconic alteration in gender standards. She challenged then ostracized the conventional gender characters allocated to her in addition consequently saw with aggression since menfolk and womenfolk who contrasting to the community company of females then offered this an aim for the decay in ethics. Pardon remained "new" around females in the initial twentieth century? The greatest protuberant alteration remained their amplified attendance in the community arena. This copy of novel lady discovers look in Indian English language works also, anywhere she brands her arrival in skin in addition gore in the stories of the females' authors majorly.

Numerous Indian females' writers consume travelled feminine bias in instruction to found an individuality that is not compulsory by male-controlled civilization. But the initial lenient speeches of complaint slowly twisted into a clear irritation and lastly removed the figure of an exposed revolt. After this opinion of sight, Shobha Dee, a commended activist author has tried to go this design advantage unhappy finished her the whole thing. They consume focused on ladies' glitches in their effort and are stating themselves easily and confidently and on diversity of melodies from a female judgement. These females' writers consume certainly dared the masculine ethos that triumphs in our republic. She trusts in honesty and sincerity in the tale of events. She knows the soul of a lady and masterfully grips it. Amongst the females' authors, Kamala Markandaya, Anita Desai, Shashi Deshpande, Ruth Prawer Jhabvala, Nayantara Sehgal, Namita Gokhale, Shobha Dee and Arundhati Roy are leading in the arena. She thus limits her narratives to the rich civilization and distillates on ladies' glitches and stretches a new method to them. In 1989, she inscribed her primary original 'Jetsetter Twilights'. Her additional the whole thing comprise "*Starry Nights', 'Sisters', 'Sultry Days', 'Strange Obsession', 'Snapshots', 'Second Thoughts', Uncertain Liaisons', 'Shooting from the Hip', 'Small Betrayals', 'Surviving Men', 'Selective Memory: Stories from my Life', 'Speed Post', 'Spouse', 'Superstar India: From Incredible to Unstoppable', 'Sandhya's Secret', 'Shobhaa at Sixty', 'Sethji', 'Shobhaa: Never a Dull De', 'Seventy and to Hell with It' and 'Lockdown Liaisons*". Shobha Dee figures her females in the again evolved compound number of current lady who, likes bodily autonomy, sex plus endurance, who cannister luckily syndicate desire, job and marriage. She does not have faith in recitation her women typoscripts as love-strivers or bitches or mere spouses at home. In her narratives she seemingly glasses her own activist and sexist attitude.

The performance of contemporary, ironic, cultured and self-confident women in De's fiction scripts an alteration from old-style ladies' snags. Their difficulties and anxieties remain dissimilar from persons of the commonplace, old-style, bourgeois women. Existence cultivated and rich, they have a relaxed admission to novel habits of life notifying women's individuality. Maximum of the womenfolk typoscripts portrayed by Shobha Dee, are mindful of their self-esteem since they are capable specialists employed bear to berm with their manly complements. From this viewpoint, the women in her the whole thing are extra commanding than men. Females are fundamentally signified sexually unconventional and unrestricted thoughtful and have develop known as the "New Women", in later 20th period fiction. This article is an effort to work activist carriage from dissimilar approaches of an adult female life: Wedding and Household, Man-Woman Affiliation and Performance of Womanly Sexuality as showed in De's fiction.

Sapna

IMAGINED BIOSPHERE

These womenfolk fit to from top to bottom humanity biosphere of lavishness, amorousness and theatre. Touching in the creation of autonomy and imaginary magnificence these women principal thin, fake life absent dash with exacting actualities of dull lifecycle. These womenfolk aim aimed at relaxed, well-appointed, care-free lifetime. They always meander in exploration of original knowledges and desire. The imagined biosphere of Shobha Dee is congested with females who lodge the dominant residence in all her stories. In her illusory biosphere females do not appear to participate slightly societal responsibilities or devastating manly ascendency that may confine their crusade or switch their common flexibility. These women's new found self-determination matures in them an odd boldness near wedding and family. Apart from freethinking contemporary females there are imposing aptitude cognizant 'corporate women'. As an alternative of actuality obedient and passive women in Dee's illusory ecosphere are self-confident and have faith in private accomplishment. They have critical occupational sense. Their difficult inspiring natures have an overwhelming impression on their male complements. A dump into diverse viewpoints as portrayed in Dee's imaginary creation will give us an interpretation of the culture developing in fresh eras. In malice of their mistreatment at the pointers of males these womenfolk make panicky pains to obtain a regulatory location in humanity. They bear a grudge and trial their edge space.

MARRIAGE AND FAMILY

Rigveda expresses of wedding as an amalgamation of two individuals of complete growth. The words jaya, jani and patni designate the well-thought-of place of womenfolk in the domestic. It is experimental, "jaya has the distinct intelligence of the partaker of the spouse's fondness and jani the mother of children and patni the partner in the recitals of sacrifices." With stretch, the copy of ladies kept altering and so her place in the family. From having highest place in the domestic of her spouse to achieving a secondary position, her status has abridged to an object of desire and ownership. But the 'New Woman' speeches a note of disagreement to this and bear a grudge to be quiet underneath the cruel boundaries. The women authors who once showcased female characters as silent-sufferer, ratifying various roles of a mother, a wife, a daughter and a sister—a part in the personal engine but never as a specific requesting her lifecycle to be her own have busy an intermediate try. In Dee's imaginary ecosphere the organization of wedding attitudes uncovered with all the emptiness besides insincerity loitering late it. Bridal is no lengthier careful a blessed pledge between two personalities that transports concord and agreement in separate as fit as community life. As a substitute of being a basis of serious harmony it converts a fight connecting families of control. As all the associations in the modern ecosphere of cash and resistor have been marketed, the organization of marriage also gets unfair by these reflections. These authors have revealed an estimable sympathetic of the difficulties and the quandaries of the females.

They slightly give opinion of the culture developing in current periods, with a transformed insight of separate behaviour and the communal organizations like wedding and domestic. In Religious, for instance, Mikky needs to wed Navin not out of need nonetheless as of his existence of use in greedy thoughts. She favours him as she thinks, "He may help me with Hiralal Industries" (p.62). Similarly, Binny Malhotra entraps Mikky in marriage to increase resistor over her wealth. The following words of Shobha De about human relations smear to nuptial as well, "Ultimately every association is an influence fight either on an overt or subliminal level". A predominantly hardheaded also worldly attitude towards marriage makes it dry, sterile and unattractive. In Dee's novels, Anjali and Karuna in *Socialite Evenings*, Aasha Rani in *Starry Nights*, Aparna, Surekha and Rashmi in *Snapshots,* Mikky in *Sisters* and Maya in *Second Thoughts* knowledge futility and sterility in their married life. The charm lessness and lack of demonstrative empathetic in nuptial, as portrayed in Dee's novels, cracks wedding into a societal agreement. In this world of private achievement and self-centred causes wedded fidelity, love for each other and expressive attachment have no expressive place at all. R.S.Pathak aptly remarks on the insolence of the unlike types towards nuptial in Dee's fabrication, "Marriage to them is barely more than a suitable contract to lead a contented in addition unrestrained life, which can be concluded at any time contingent upon the notions of the partners". Personal accomplishments and moral values have no consideration for such women. To these females, having sexual relationships with their husband seems 'boring' and sounds terrible, "Like eating dal-chaval day in and day out" (Snapshots p.152). These womenfolk do not vacillate in having sex before, later and through their connubial life with

80683

men other than their husbands. Traditional Indian marriage as a basis of family life and the progress of the system of affinity has no implication in De's fictional world. The new men and women in this creation do not baton to marriage for long. In these conditions the institution of family flops to fostering traditional standards. Progenies in such weddings are pickled as an obligation and a hindrance to social agility. Shobha Dee's demonstration of marriage with all its concavity, two-facedness plus triviality becomes more passionate and notable when she portrays the supposed modern nuptials. These nuptials are made-up to be based on reciprocated understanding, liberty of excellent and a close affiliation amongst two associates. People exercise their full autonomy yet they are unsuccessful to make their nuptial a joyful comradeship. In the transformed situations, noticeable by individual liberty and freedom of choice, people have developed unpremeditated in their behaviour towards nuptial and annulment. They no lengthier sense in the least essential to disseminate a wedding that does not reach to their hopes. If a self-sufficient female with a rooftop over her skull selects to wed, it is because she wants to share her life with someone in the fullest sense, not because she is looking for a life-long meal-ticket. Divorce, too, has to be viewed in this light." Shobha Dee, undoubtedly, expresses a dissatisfaction with traditional form of nuptial that inclines to periphery and overpower females. Rendering to Shobha Dee, "The terms underlying marriage have also been redefined in recent times with some amount of economic freedom, females have altered the rudimentary instructions somewhat. She fictionalises Maya's dilemma in wedding that consequences in her seclusion and sources mental pain. The unresponsive arrogance of her companion Ranjan towards her biological and emotive requirements makes her nuptial sterile. It makes her discover consolation in clandestine relationships with Nikhil. In the illusory world of Shobha Dee the perception of nuptial revelated marvellous modification from the old-style Indian weddings and relations. It displays the alteration apprising people's attitude in the direction of wedding in topical eras. A nuptial deficient of outdated holiness and reciprocated considerate consequences in flimsy matrimonial ties. The families grounded on the recent matrimonial offered in Dee's novels incline to crumble speedily creating their affiliates epicurean, discourteous and reckless. De seems to put a huge inquiry over the recent nuptials by screening the uselessness of such nuptials grounded on fleeting desires. In contrast, Dee also makes fun of current, unconventional women's non-serious also unpremeditated attitude towards nuptial. The impetuous verdicts of the society vis-à-vis wedding make a ridicule of it also prompt these people's catastrophe to comprehend the actual consequence of wedding owing to their misguided philosophies of modernism, liberty and true camaraderie.

MAN-WOMAN RELATIONSHIP

Females fast their revulsion, abhorrence and aversion for males in unmistakable terms. They reflect their masculine associates lying, self-centered, painful and self-obsessed, "Men are all the same—animals… and we women such fools" (Starry Nightsp.50). For Rashmi in Photos males are, "Intrinsically, instinctively, intuitively dishonest" (p.49). It leftovers fairly arresting and surprising that these females fast a specific taste for those very males about whom they bile malice. Gentleman-woman affairs present a stimulating characteristic of life in Dee's narratives. The portrayal of these affairs carries out the sarcastic countryside of the struggles seen here. A pattern of love-hate bond in scripts the understanding between males and females in Dee's fiction. For example, Aparna in Photos knew, "Rohit was a very selfish man… Selfish and vain" (p.21). But after his leaving she failures him forcefully and desires to have him over, "What she wanted was a steady, warm, attentive companion. No, if she were to be honest with herself, she'd admit it more readily… it wasn't just a man she missed… it was Rohit, her husband" (p. 24). In *Sisters*, Mikky's association with Binny Malhotra is also mysterious. She weds him and originates to know about his preceding companion and broods. In malice of his snub to permission his previous companion and broods and his unkind action of Mikky, she speaks, "It makes me happy that he is there in my life. That he is my man—at least in the eyes of the world" (p. 124). The inconsistency obvious in De's action of manwoman relations scripts Dee's mainly tongue-in-cheek posture regarding her imaginary fonts and their method of rational. Mikky is a contemporary cultured lady. She does not vacillate in selecting and altering sensual partners. Her boldness to her spouse, at the similar time, scripts the old-style countryside of her behaviour. In malice of all his disadvantages and brutalities exposed to her she reflects him 'my man'. This transports out the tongue-in-cheek countryside of her opinions. Womenfolk fonts look to be betrothed in a endless fight in contradiction of masculine supremacy. Shobha Dee appears to take that females are additional caring and subtle to their masculine associates in malice of their wanton, uninhibited behaviour. Their strange behaviour is occasionally an effort to list their attendance seeking credit and

sympathetic in the biosphere of males ruled by applied and sensual thoughts. Their altered insight brands them trust: The fake was to become them hooked. It is stimulating to letter that these womenfolk do not extra their womanly buddies too. Become an irredeemable custom in their petty, self-obsessed exists, get them so obliged that they supposed they could not live deprived of you—or more precisely—deprived of the facilities only you could deliver (Snapshots p.49) The nature of relational relations in Dee's imaginary biosphere transports out a thought-provoking facet of manwoman relations. They frequently go in contradiction of one another. On the other hand, the manly typoscripts are infrequently complicated in a unpleasant competition contrary to one extra. The dealings among diverse men are rarely spoiled by business rivalry or social and political considerations. The life showed in De's narratives does not notify any shared hominoid benefits. All the persons appear to be attentive in discrete achievement and self-seeking chases. This biosphere is absent from the normal domestic businesses, national glitches and the substances connected to way of life. The writer discovers the odd worries and practical boldness of the persons living her imaginary biosphere in over-all and the females connected to theatre in specific. These persons see, to be additional worried with physical achievement, lesson movement and charm. The biosphere of theatre is a remote, dreamlike biosphere constructed on impressions and technicoloured realism.

PRESENTATION OF SEX

A significant feature of Dee's imaginary biosphere that has produced far tremor to the detractors and asked harsh commentaries is the action of gender. Gender not escorted with darling and feelings develops motor and practical lone. This caring of erotic amalgamation discoveries looks in smooth the wedded lifetime of dissimilar fonts in De's falsehood. Gender goes obtainable to be an obsessive workout which is mentioned to as "duty fucking" (Snapshots p.108) by these fonts themselves. In place of if pleasure and desire the gender performance reasons prevention, disenchantment and disgrace to the feminine associates. Sensual contact for males develops an exertion and a representative performance to conquer females and to work out their switch ended the feminine form and attention. The performance of feminine sex in Dee's narratives is founded on the receipt of sensual wish in a lady as usual and usual. Females, in this biosphere, do not texture embarrassed of their sex. They do not try to supress their sensual need somewhat they want it content in their individual footings. For them the ideas of chastity and cleanliness have no meaning. Neither do they hurt from any intelligence of fault. Gender becomes a monotonous workout for them. Their boldness to gender scripts their dissimilar countryside. In its place of tiresome to imitate to the examples of Sita, Savitri and Anusuya, these females incline to make a biosphere allowed from all hangups.

These ladies' thoughts and their sensual behaviour scripts the boldness of so called generous-minded individuals to gender. It also procedures a method of their declaration for an independent individuality. These ladies' request for a distinct individuality and their assertion of feminine sex in the procedure of brazen chase of gender opinion out a novel consciousness amongst them. Dee herself is aware of the altered viewpoint around gender that becomes exposed in her narratives. She herself confesses, "Yes, the sex in the books is quite grim… Its unhappy sex seen from a fairly lonely woman's point of view. Some people, however, find sex seen from a woman's view point so threatening that it's much easier to dismiss it as sleaze". These words reveal the real purpose of the depiction of sex and sexual behaviour in Dee's novels. A near education of Dee's performance of sensual behaviour of males and females in her imagined biosphere discloses that her actual anxiety is to depiction the prevention, revulsion and disgusting countryside of wanton sensual tolerance. We, no hesitation, discovery a profusion of erotic, full images of sensual behaviour of the people obtainable in Dee's stories but this does not boundary her drive to the formation of extraordinary interpretation physical lone. She somewhat brands an endeavour to representation the uselessness and insignificance of this behaviour. She neither idealizes nor worships the gender lifetime practised by the fonts in her fabrication. Shobha Dee's females' fonts signify a factual depiction of the contemporary Indian females. Feminine sex discoveries new sizes, as females here are not happy with straight relations lone. Its discoveries look and consummation in lesbian relations and motorized approaches of rewarding the gender need. In their offer to discovery supernumerary incomes of sensual satisfaction that do not contain need on gentleman, females spoil in odd, appalling and astounding sensual does. In fact, Dee appears to pretend at the tall-lesson civilization females with their original originate sensual liberty. Dee demonstrates how the sexual activity entertainment converts pointless uniform hilarious after spoiled in deprived of any open add-on or sense of dear and sympathetic by these

womenfolk. The thorough report of erotic interaction as create in the stories show her purpose to clue the rib-tickling, horrible and hostile facet of such performance. In its place of by means of straight commentaries to depiction the offensive countryside of the gender performance Dee has revealed individuals pampering in abandoned, irregular, unusual and hostile sensual behaviour and strained to brand them finally understand the uselessness and attraction lessness of this performance. Shobha De appears to take to the so-named liberated females that tolerance in wanton gender and wicked violent behaviour does not funding actual contentment.

CONCLUSION

Females occasionally owed to the convincing state of their lifetime, are lacking into the remaining by their guards though at additional aeras their rising drive and determination to declare their liberty, receipts them into the channels of unconceivable sorrows. The writer deciphers her females' charms' spirits and expressive shocks in dissimilar habits and after numerous viewpoints. All these females fight for their excessive drives by altogether their forte in masculine conquered civilization. By consuming an impression of De's designated narratives, we discovery that as a activist writer, Shobha De has marvellous sympathetic of the soul of females and so, she travels the biosphere of city females with all its irresistible glitches and tests. She forcefully significances the opinion that smooth in contemporary aeras with all socio-political as healthy as, financial attainments, the chart of female's misuse is outrageously increasing. Stressed firm with adversities, opposite misuse and overthrow at dissimilar ladders, occasionally with waterworks full judgements though at additional aeras similar a tigress, they test the civilization to go the tide in their favour. As Shobha Dee's females don't trust in sorrow passively, they permission not at all pebble unturned to spread the top of happiness and achievement. Dee's falsehood fixes non effort to improvement the civilization but gifts it humorously in realistic footings lengthways by its peculiarities. The Tribune correctly detects: "She slaughters macho males with vengeance and rattle poisons her gender with disdain and disregard. She demolishes reputation and civilizations; with effortless grace and one thing she doesn't stomach is hypocrisy of any kind. She wields a powerful camera, and she needs to keep shooting that way whether anyone likes to photograph or not." She is Shobhaa De, and she is scintillating and straight. She is a ruthless writer with a ramrod of a pen, and a ranging urge to kill somebody.

ABSTRACT

The financial services sector is witnessing unprecedented transformations driven by technological innovations, particularly the proliferation of fintech solutions. This paper presents findings from a comprehensive study titled "Deciphering Financial Service Landscape: An Analytical Exploration," which explores key dimensions shaping contemporary financial service dynamics. Using empirical data and rigorous statistical analysis, the study examines the relationships between educational qualifications, income levels, interaction frequencies with financial services, and various aspects of user perceptions, motivations, challenges, and satisfaction with fintech solutions. Findings reveal nuanced insights: educational qualifications exhibit minimal correlation with financial service awareness, challenging traditional assumptions; income levels show weak associations with motivations for service usage, emphasizing the need for targeted marketing strategies; interaction frequencies with financial services demonstrate negligible impact on overall satisfaction with fintech solutions, highlighting the importance of service quality and user experience. The research underscores the complexity of factors influencing financial service behaviors and offers practical implications for stakeholders including financial institutions, fintech developers, policymakers, and researchers. By bridging empirical evidence with theoretical insights, this study contributes to enhancing strategic decision-making and fostering innovations that cater to diverse consumer needs within the evolving financial services landscape.

Keywords: Ecological Service Supply, Financial Technology, Financial Services, Fintech Solutions, Technological Innovation.

INTRODUCTION

In the ever-evolving landscape of financial services, characterized by rapid technological advancements and shifting consumer expectations, understanding the multifaceted dynamics that drive user behaviors and satisfaction is crucial for stakeholders aiming to navigate and thrive in this complex environment. This research paper, titled "Deciphering Financial Service Landscape: An Analytical Exploration," undertakes a thorough investigation aimed at unraveling key dimensions of the contemporary financial services sector. The advent of fintech solutions has significantly disrupted traditional models of financial service delivery, prompting a critical examination of factors influencing user awareness, motivations for service usage, challenges within market structures, and overall satisfaction with fintech innovations. Against this backdrop, this study employs rigorous empirical analysis to unearth nuanced insights that shed light on these pivotal aspects. By delving into the relationships between educational qualifications, income levels, interaction frequencies with financial services, and various facets of user experience, this research seeks to uncover underlying patterns and correlations. These insights are essential for stakeholders—ranging from financial institutions and fintech developers to regulatory bodies and academics—to formulate informed strategies that not only meet current consumer needs but also anticipate future trends and challenges. This study aims to make a significant contribution to the discussion of the current financial services ecosystem. By bridging empirical findings with theoretical frameworks, this study aims to provide actionable intelligence that enhances operational efficiencies, refines marketing strategies, and fosters innovations tailored to the diverse and evolving preferences of financial service consumers. Through a comprehensive exploration of these dimensions, this paper endeavors to equip stakeholders with the knowledge and insights necessary to navigate the complexities of the financial services landscape adeptly. By doing so, it aspires to catalyze advancements that drive greater inclusivity, efficiency, and satisfaction within the sector, ultimately shaping a more resilient and responsive financial ecosystem for all stakeholders involved.

LITERATURE REVIEW

Findings from 20 insurance-based programs in Australian organizations that help those who have suffered brain or spinal cord injuries find homes (ABI) were collated in this study. We reviewed and contrasted publicly accessible grey literature, which is mostly material found on scheme websites. Disability and workers' compensation rules vary from state to state. When the scheme's funds were distributed, the intended priorities were housing infrastructure and service delivery, not tenant relief. Those Australians who are unable to make adequate improvements to their homes, who are seeking to construct might buy a home, or who are lacking access to appropriate, alternative housing alternatives, whether for the short or long term, are the most marginalized in the present financing climate. If the individual's present living situation is untenable, they need aid with relocating to or remaining in a new residence, might aid animals, family supports, and case management, or are unable to provide Additional research is required to fully understand the relationships, ambiguities, inconsistencies, and gaps. Policymakers must be forthright on housing rights for ABI/SCI patients and their families, as this review has shown. Patients with traumatic brain injuries and spinal cord injuries may get more standardized treatment if housing and support services were financed under a consistent, evidence-based framework. (Wright et al., 2019) In particular, the financial services industry is seeing a sea change as a result of the internet. Examining the sector's development, Digital Finance lays down the groundwork for incorporating digital finance principles into more conventional financial systems. If you want to know how to incorporate digital finance into your company's structure, this book will show you what the most successful organizations are doing to make the most of this situation. Presenting concrete plans for the digital future, the authors also provide a plethora of case studies that delve into the characteristics shared by successful projects. To keep up with the ever-changing world of modern finance, Digital Finance comes with the author's website (PerryBeaumont.com) and connections to additional material that offers analysis, views, and informative articles. Digital Finance offers a wealth of background information that helps us make sense of the current state of the financial industry and prepares us to analyze and develop new financial innovations in the future. (Beaumont, 2019)

Ashwini and Thoufeeq Ahmed

The downgrade, downsizing, and degazettement (PADDD) of protected areas (PAs) threatens their long-term nature conservation and ecological service supply. Three well-known PAs, namely Yosemite National Park, Yasuní National Park, and Virunga National Park, were found to have 23 PADDD instances. The lack of comprehensive PADDD data makes understanding development pressures and their repercussions difficult. Future research should focus on developing national and regional profiles, evaluating PADDD-related risks, and implementing policy solutions like public tracking, collaboration across legal frameworks, and minimizing negative impacts.(Qin et al., 2019) The complicated ditches around highways have led to floods and water pollution in previously undetected ways. This study interviewed New York State town and county transportation professionals about ditch management. Of the 999 highway workers questioned, 41% were from the 54 state counties. 36.8% of agencies scraped or reshaped ditches without reseeding, and half scraped them every one to four years. About one-third to half of upstate New York roadside ditches are excellent to terrible. The outcome is hundreds of kilometers of open terrain that storms may contaminate and dump silt. The techniques utilized were justified by time, labor, equipment, and finances. Additional concerns included farm-field drainage, increased downpours, and rights-of-way disputes with landowners. Ditch rehabilitation requires a comprehensive, coordinated governmental effort. An effective toolkit should contain legal responsibilities, sanctions, financial aid, and training, including a ditch inventory system. State agencies and municipal governments should provide subsidies and shared services. Recognizing transportation department officials as water stewards and campaigning for ditch management alongside highways is an innovative technique to preserve New York State's water supplies. (Schneider et al., 2019)

Fairness in the distribution of financial services across different regions is the focus of this study. Many Americans with low to moderate incomes still don't have bank accounts or use them inadequately; they turn to check cashing businesses and payday lenders as their only options for inexpensive and accessible financial services. There is ongoing worry about the unequal distribution of financial services, even though economically deprived families are more likely to successfully create assets when they have geographic access to cheap goods and services. In certain parts of southeastern Pennsylvania, known as "financial deserts," businesses that cash checks are far more prevalent than banks. In this paper, we employ GIS and spatial binary logistic regression analysis to see whether there's a correlation between these deserts and factors related to mortgage lending and sociodemographics. (Dunham, 2019) In order to improve the curriculum by including primary care nursing education and practical experiences, nursing schools must adapt to new healthcare models and prepare for any challenges. If other schools are looking to create primary care curricula and academic-clinic cooperation models to encourage primary care clinical experiences in the community, this article will provide them some good ideas. (Watkins & Neubrander, 2020) The global food system causes environmental degradation and contributes to global warming. Insufficient diversity and fruit and vegetable supply are worsening a global health concern. There is a growing understanding that Earth's well-being and climate change slowing depend on the vast diversity of tropical tree species. They don't function well with food systems. Many tropical tree species can sustainably produce a range of crops, improving human nutrition, livelihoods, and ecological benefits. First, we include environmental, nutritional, and livelihood benefits.

Using data from seven nations, we show that rural populations consume more vitamins A and C and fruit from tree-sourced foods. The restrictions and risks of growing tropical tree-based food production are next. These include the importance of a varied manufacturing system and worldwide market supply issues. In conclusion, we will discuss strategies to increase tropical tree food production and consumption and overcome technological, money, politics, and consumer behavior challenges. This might accelerate global food system sustainability. See the article's Supporting Information for a free Plain Language Summary. (Jansen et al., 2020) It is debilitating how many options are available online. Internet services have expanded at an exponential rate in recent years, and it's inevitable that some of these services experience information overload, making it hard for consumers to locate the specific information they need. To help customers zero in on the products and services that pique their interest, recommender systems (RSs) provide tailored recommendations based on a predefined set of criteria. The majority of recommender systems are used for things like music, movies, jokes, restaurants, financial services, life insurance, Instagram, Facebook, and Twitter followers. Websites and e-commerce apps rely heavily on recommender systems because of this. An overview of recommender systems that use content-based filtering is provided in this publication.

We go on to detail the various recommendation techniques and the general strategies behind them. (Manamolela et al., 2020) The economic impact of joblessness on host countries is increasing, particularly for medical professionals. However, no comprehensive policies or initiatives exist to address this issue. A study aimed to find publicly and privately supported initiatives to help medical professionals, as part of a grey literature evaluation conducted by the Canadian Institute of Health Information. The study found that more IMG and ACP-specific policy and employment aid initiatives are needed, as well as increased research and development programs for foreign student athletes.(Turin et al., 2021) Advancements in cutaneous melanoma detection, staging, and treatment have improved, but healthcare decision-makers still lack cost-of-illness statistics. A cost-of-illness analysis for chronic musculoskeletal disease (CM) in Brazil included Health Management Organization (HMO) and Unified Health System (SUS) systems. The study found that patients with advanced disease spend more than those with early stage disease. In order to provide the optimal mix of healthcare goods and services, the health value chain has to be improved. This knowledge could aid in healthcare budget planning and resource allocation.(da Veiga et al., 2021) The Dutch "Krijtmolen Alliantie" is aiming to improve performance intelligence in a network that delivers health and social services by adopting a governance model that is driven by performance intelligence, as outlined in the Triple Aim.

Using financial incentives to encourage coordinated care and shared responsibility, the project intends to increase performance intelligence by merging data on expenditures per capita and each patient. It is being undertaken in Amsterdam Noord. To accurately represent treatment quality and patient experience, the alliance should combine outcome metrics with PX metrics. The research concludes that performance intelligence should be a part of regional social and health care delivery systems.(Bos et al., 2021) Global warming is causing changes in local precipitation, temperature, and extreme weather events (EWEs), which have severe socioeconomic and environmental impacts on agriculture and food production. A study in Zeeland, Netherlands, examined how potato and onion farmers have adapted to these changes. The research found that the frequency of extreme weather events has increased, with more frequent heat waves, droughts, and frosts. New Zealand farmers are well-informed about these changes and perceive them as a significant level of danger. The study supports the "National Strategic Plan" and "Rural Development Program" of the Netherlands, which seek to alleviate farmers' financial struggles.(van Tilburg & Hudson, 2022) Small firms in the EU are increasingly turning to crowdfunding as a means of raising capital, regardless of the severity of the outbreak. Online platforms that facilitate crowdsourcing of finances are analyzed and categorized in this study. Financial instruments and company loans via digital crowdfunding platforms have just had their first standardized framework going online. The future of financial technology will surely be altered by this framework, which is a component of a bigger initiative to promote the ongoing incorporation of new technologies into this industry.

The new legislative framework establishes a robust licensing across the European Union, in tandem with the integration of social media and the gradual development of pan-European one-stop-shop platforms with different financing mechanisms. With its advanced warning system, multi-tiered targeted transparency, and conflict-of-interest framework, this technology revolutionizes behavioral finance and investor protection. It guarantees that the platform is operating as a risk-neutral gatekeeper. Due to the existence of long-standing legal and supervisory hurdles on a national level, the verdict is still pending and several concerns remain unresolved, making the implementation of this new framework an uncertain prospect. (Valiante, 2022) A scoping study of peer-reviewed studies from 1970 to 2020 aimed to determine the feasibility, efficacy, and acceptability of non-pharmaceutical interventions (NPIs) in crisis and informal settlements. The study found that NPIs were generally accepted and successful, but faced challenges such as logistics, money, and people. Community engagement was crucial for the development of NPIs, and restrictions on burial practices, patient care, and case isolation were often well-received. The evidence base was contradictory, and a research program focusing on disadvantaged people is urgently needed to develop a robust evidence foundation for NPIs in these situations. (Polonsky et al., 2022) This book explores the ways in which Islamic financial institutions might benefit from the integration of blockchain, artificial intelligence, and machine learning into their operations. The book aims to automate, improve efficiency, and make informed decisions by analyzing massive information. With the growing number of Muslims worldwide, Islamic financial services have great growth potential, and this book provides guidance for governments, academic institutions, and businesses in combining tradition and technology in Islamic finance.(Irfan et al., 2023) Using the variety and worth of

ecosystem services as a lens, this research investigates whether ecological restoration is feasible in Inner Mongolia. To determine the sustainability of ecological restoration initiatives, the research used a "value-diversity-risk" framework. Results show regional and temporal variances, with only 5% of basins achieving monetary and ecological benefits. Urbanization and arable land demand could lead to a loss of ecological restoration benefits by 2050. The study suggests that ecological restoration efforts should consider ecosystem benefits, funding, and risk reduction to ensure a win-win situation.(C. Wang et al., 2023) Digital finance is transforming the financial industry by addressing information asymmetry and lack of collateral in agricultural, farming, and rural financial services. Findings from the 2019 China Household Finance Survey (CHFS) and the Peking University Digital Financial Inclusion Index of China (PKUDFIIC) are used to examine the effects of digital financial development on the asset portfolios of households in both urban and rural areas. The research finds that digital finance enhances the efficiency of financial asset portfolios owned by families in both urban and rural regions, but favors urban households more.

The study suggests bridging the digital divide to optimize investment portfolios and combining digital credit and digital finance to strengthen family financial asset portfolios. (X. Wang et al., 2024) The study examines the financial climate affecting Syringe Treatment Programs (SSPs) for drug users, focusing on financial and personnel issues. It found institutionalized discrimination, restricted resources, strict reporting requirements, and insufficient funding hindered program implementation. The study suggests political lobbying, clearinghouse programs, harm reduction finance, and technical help at the state level as potential solutions to improve implementation and health outcomes. (Akiba et al., 2024) This bibliometric study is to take stock of the current literature on AI and ML in BFSI institutions. Key research clusters are identified via the study's emphasis on Scopus-indexed papers. After filtering 39,498 articles according to the PRISMA methodology, 1045 papers were found to match the inclusion requirements. The titles and abstracts of the articles included 177 distinct words, as shown by the N-gram analysis. Technologies related to financial technology, risk management, and anti-money laundering, actuarial science, and eight other related fields were grouped together in nine separate clusters according to the co-occurrence study. A thorough picture of the complex research scene is provided by these groupings. The clusters that have been found may provide valuable guidance for future studies and research. Research gaps and opportunities are highlighted in the report, which might be useful for practitioners, policymakers, and academics in the BFSI industry. This research adds to the expanding body of bibliometric literature by shedding light on the BFSI industry's use and machine learning. This study's findings provide light on the practical uses of AI and ML may help both academic institutions and businesses. (Pattnaik et al., 2024)

Objectives
1. To know the awareness of financial service among the users.
2. To know the motivational factor for use of financial service
3. To analyze the challenges on market structure
4. To analyze satisfaction of impact of fintech on financial service

Hypothesis
1. H_0:There is no significant relationship between qualification and financial service awareness
2. H_1:There is a significant relationship between qualification and financial service awareness
3. H_0:There is no significant relationship between income level and motivation for use of financial services
4. H_1:There is a significant relationship between income level and motivation for use of financial services
5. H_0:There is no significant relationship between interact with service and satisfaction
6. H_1:There is a significant relationship between interact with service and satisfaction

RESEARCH METHODOLOGY

The financial service environment is investigated in this study using a mixed-methods research strategy, which combines quantitative surveys with qualitative interviews. A stratified random sample of 120 respondents was used to guarantee varied representation across demographics, with the target group being consumers of financial services. Awareness, motivating reasons, market obstacles, and satisfaction with fintech effect will be the areas of emphasis of the structured questionnaires used to gather quantitative data. The qualitative data will be collected from a subset of the survey participants via semi-structured interviews. The hypothesis will be tested using descriptive statistics and inferential analyses, including t-tests, Pearson correlation, chi-square tests, and analysis of variance. It will examine the relationship between income level and motivation, the coefficients of ease of use and market structure, and the interaction between satisfaction and financial service awareness. In order to get to the bottom of things, we'll be using theme analysis on qualitative data. Questions of informed permission, confidentiality, and the importance of voluntary involvement are all part of the ethical framework. The unique demographic emphasis limits generalizability, and there is a possibility of bias in the samples and the responses. In order to successfully test the hypotheses, this technique seeks to provide a thorough comprehension of the financial service environment.

ANALYSIS AND DISCUSSION

Finding out if there was a connection between qualification and understanding of financial services was the goal of the study, which included 120 participants. The Pearson correlation score of -0.003 indicates that the two variables are hardly related to one another. It would seem that one's familiarity with financial services is unrelated to their degree of education. Based on the data, the correlation coefficient is 0.974. If the observed association could have happened by chance alone, the p-value would show that. The significance level of 0.05 is widely acknowledged in the field of statistics. It is not possible to reject the null hypothesis with a p-value of 0.974 since it is significantly larger than 0.05. To rephrase, there is insufficient evidence in the data to accept the alternative hypothesis, which states that qualification and financial service awareness are significantly related. If there is a link, it is most likely attributable to chance rather than a genuine relationship, since the p-value is so high. We find that there is no significant relationship between an individual's degree of qualification and their knowledge of financial services within this sample. The consequences of this finding for anyone involved in the financial services industry are substantial. Since the research shows that awareness is not greatly impacted by qualification levels, efforts to enhance knowledge of financial services may need to concentrate on other variables.

In order to create more precise and efficient methods, more study should investigate other possible factors that affect financial service awareness. The primary objective of the study was to identify the factors that influence the connection between income and the desire to use financial services, with a particular emphasis on the role that convenience plays in this desire. This association has a Pearson correlation value of 0.102. This number suggests that there is a weakly positive link between income and the perceived ease of accessing financial services. In a nutshell, this indicates that, while the correlation is modest, considering convenience as a motivating factor grows somewhat with increasing money. With a p-value of 0.268, this link is statistically significant. If the observed association had happened by chance alone, the p-value would have shown it. The 0.05 level is a popular cutoff for statistical significance. We can't rule out the possibility of a null hypothesis since the p-value is much more than 0.05 (0.268). Therefore, the data does not lend credence to the counter-hypothesis, which states that a correlation between income and convenience-based financial service use is statistically significant. If there is a link, it is probably only due to chance rather than a real relationship, since the p-value is so high. According to these findings, there is no significant relationship between income level and the perception of convenience as a driving reason for utilizing financial services within this group. Financial services industry stakeholders may need to broaden their marketing strategy to target a wider audience, rather than just those with a certain income level, if they want to capitalize on ease. To get a more detailed understanding of the elements that motivate people to use financial services, future studies should

look at demographic demographics and other motivational factors. The purpose of the study was to look at how often people use financial services and how much happier they are overall as a result of fintech solutions. When looking at this connection, the Pearson correlation coefficient comes out as -0.041. This number points to a modest negative association between using financial services and happiness. This basically indicates that there is a small but significant negative correlation between increasing involvement with financial services and overall happiness. In this case, the p-value for the association is 0.660. The p-value represents the likelihood that the observed association happened randomly. The 0.05 level is often used to indicate statistical significance. We cannot rule out the possibility of a null hypothesis, as the p-value of 0.660 is far more than the significance level of 0.05. That being said, there isn't enough proof in the data to back up the counter-hypothesis, which states that customers are more satisfied overall as a result of fintech solutions when they connect with these services more often. Any association that may have been noticed is most likely attributable to chance rather than any real relationship at all, according to the high p-value. Based on these results, it seems that the frequency of using financial services has little bearing on how satisfied customers are with fintech solutions in this sample. This has important implications for anyone working in or with the financial services industry, as it implies that characteristics other than contact frequency may be more important in defining customer satisfaction with fintech solutions. Investigating other factors that may influence contentment, such service quality, usability, and the variety of features provided by fintech solutions, might be fruitful. These aspects might be better understood with more study, which could lead to better techniques for increasing customer happiness.

CONCLUSIONS AND FINDINGS

Findings
1. The relationship between qualification and knowledge of financial services: - Correlation Coefficient: -0.003 - P-value: 0.974 - Conclusion: The results show that there is almost no relationship between the two variables. Any association that was found is probably just due to chance, since the p-value is so high. As a result, knowledge of financial services is unaffected by a person's degree of qualification within this sample.
2. The Analysis Shows a Weak Positive Correlation Between Income Level and the Perception of Convenience as a Factor Motivating the Use of Financial Services (Correlation Coefficient: 0.102, P-value: 0.268). Given the strong p-value, we can conclude that there is no statistically significant link between wealth and the perception of convenience as a motivating factor in this population.
3. The study reveals a very weak negative association between the frequency of contact with financial services and overall pleasure with fintech solutions. The correlation coefficient is -0.041, and the p-value is 0.660. This brings us to our third point, the interaction with financial services and overall contentment. Given the high p-value, we may conclude that there is no statistically significant relationship between the frequency of interactions with financial services and overall satisfaction with fintech solutions within this group.

CONCLUSIONS

Educational Background and Financial Service Knowledge: - According to the results, educational background is not a major factor in deciding financial service knowledge. Anyone with a stake in the financial services industry should pay attention to these consequences. Because educational attainment does not seem to have a substantial impact on awareness levels, efforts to raise awareness should think about shifting their attention to other aspects. Develop more focused and successful solutions by doing future research that explores other possible variables, such as demographic characteristics, personal experiences, or access to information. The Relationship Between Income and the Intention to Use Financial Services: - The data shows that people's income does not significantly affect their perception of convenience as a driving element in their financial service use. This indicates that stakeholders shouldn't limit their marketing efforts to people with certain economic levels if they want to emphasize convenience. The goal here should be to reach more people with these tactics. To provide more complex insights into the drivers of financial service utilization, future study should include other demographic characteristics and motivating factors.

The results suggest that consumers' overall contentment with fintech solutions is unaffected by the frequency of their interactions with financial services. This brings us to our third point, the relationship between interaction with financial services and overall satisfaction. Accordingly, it seems that variables other than contact frequency could play a more significant role in defining user happiness. Fintech solutions have many useful characteristics, but practitioners and stakeholders may benefit from learning more about and improving other areas, such service quality, usability, and feature variety. More effective techniques for boosting customer happiness might be found by identifying and concentrating on these characteristics. In conclusion, the research shows that when addressing financial services sector knowledge, motivation, and satisfaction, it is necessary to go beyond conventional demographic variables like income and education level. In order to improve user engagement and happiness, it is probable that more holistic methods that take into account several factors would be more successful.

ABSTRACT

Drought surfaces in a particular geographical location mainly when Monsoon fails and as a result of scanty rainfall. In India when both south west monsoon and north east monsoon proves to be failure in any year, it gives raise to drought like situation. Monsoon season, in India will commence from June to January and reality check through surveys and reports says that drought's impact is going to be disastrous in the days to come, during such pessimistic time, citizens should not lose heart and march ahead to become green entrepreneurs. Green Entrepreneurs during drought will serve as 'Drought Warriors' by being instrumental in changing the society by catering to the societal needs especially required during the drought season. Hence the green entrepreneurial opportunities that would pop up during drought has to be studied which would manifest the scope for becoming green entrepreneurs is highly desirable and thereby encourage citizens to tap on such opportunities. The research was undertaken by employing both primary data as well as secondary data and eight such problems which would normally surface during drought were shortlisted, also to which there are high scope for green entrepreneurship. The research outcome reveals that six problems out of eight can cause very severe and severe problems during drought and they can create high scope for green entrepreneurial opportunities. The remaining two problems cause mild problems during drought and they can create moderate scope for green entrepreneurial opportunities.

Keywords: Drought, Environmental Sensitive, Green Entrepreneurship, Green Innovation, Wildlife Rift.

INTRODUCTION

An entrepreneur is a person with the ability, motivation, and willingness to take measured risks necessary to found, manage, and profit from a new business[Kaur, P., & Kaur, S. (2023)[1]]. Launching a new company is the ultimate form of entrepreneurship. Entrepreneurs provide novel ideas into the market and are frequently seen as inventors or providers of original ideas when they swap out outdated products with ground-breaking ones[*S, A., & Kumar, V.S. (2023)[2]]*. It might be divided between large corporations and small businesses operating out of houses. An entrepreneur can generate revenue by combining labor, capital, land, and natural resources, to use economic language[*Ijeoma Orji, Evelyn & Idika,et al (2023)* [3]]. The ability to recognize opportunities for investment and production, set up a business to carry out a novel production process, raise money, hire employees, arrange for the supply of raw materials, and choose senior managers to oversee the day-to-day operations of the business are all considered aspects of entrepreneurship**.** The French word "entrepreneur," which meaning "to undertake," is where the English word "entrepreneur" first appeared. It refers to launching a business in the context of business.

The ability to launch a new company and make money by creating or promoting goods and services that satisfy consumer needs is known as entrepreneurship. In the contemporary era an entrepreneur is expected to possess the qualities such as (a) being creative - Entrepreneurs that possess creativity are able to solve challenges creatively and in novel ways. It also enables an entrepreneur to create new goods for markets that are comparable to the ones he now serves. (b) being Professional – Professionalism in entrepreneurship, accompanied by discipline and dependability will make an entrepreneur equip himself with self-discipline and ease out to accomplish goals, maintain organization, and lead by example. (c) being passionate - Passion serves as a motivating factor that pushes entrepreneur to go higher and Consequently, entrepreneurs remain extremely driven and like what he does while working. (d) being knowledgeable: an entrepreneur need to be well-versed in his sector or specialty. Because problems can only be resolved or crises can only be faced with knowledge. (e) being socially skillful :

A successful entrepreneur also has to possess social skills such as developing contacts , identifying talents etc. (f) being emphatic : A competent entrepreneur ought to be aware of the advantages and disadvantages of each worker under him. He should have to realize that people are what drive a business and he must show empathy for the people in his business community. Off late 'entrepreneurship' is going through different dimensions and in rapidly changing entrepreneurial Diaspora the type of entrepreneurs is not only confined to conservative classifications such as business based, technology based , gender based etc.,[S.V, R. ., Velmurugan, J. S. ., & Suryakumar, M. . (2022) [4]] but it is also opening up for Agri based , Event based,Environmental based etc. one of the very important sub classification under environmental based entrepreneurship is 'Green Entrepreneurship'[*Gupta, M., & Dharwal, M. (2021)* [5]]. Green Entrepreneurship is the process of consciously addressing environmental and social requirements and problems, as well as developing brilliant, original business concepts that will provide a solution. These concepts carry a high degree of risk, which benefits the environment while assisting in the maintenance of financial sustainability. For example, an increasing number of organizations are opting for paperless invoicing instead of paper bills in order to promote sustainable business growth and ecological entrepreneurship. Putting in another way, "green entrepreneurship" refers to businesses and institutions that produce products or services that are both environmental [Aswathy, T. R., & Fred, N. A. (2022) [6]] friendly and suitable for a worldwide market. They also need to ensure that the solutions won't have a detrimental impact on the business's finances.

Why is green entrepreneurship important?
(1)   Green business owners play a critical role in the economy's growth.
(2)   The battle against poverty, unemployment, and environmental issues can be greatly aided by green entrepreneurs.
(3)   Compared with other types of entrepreneurs, green entrepreneurs engage in more environmentally conscious activities and tasks.

(4)   Green entrepreneurs can be the catalyst for change as green entrepreneurs helps to create plenty of job opportunities to youth
(5)   Green entrepreneurship drive sustainable changes.
(6)   Green entrepreneurship can be an amicable solution forhuman, wildlife rift.

The south Indian states are reeling under drought like situation from past 10 months as both south west monsoon as well as north east monsoon was a failure and both monsoons didn't fetch the normal rain fall during the last year commencing from June till date. As a result of it, sowing of food grains like paddy, ragi, wheat, jowar, etc.,didn't happen as expected and pulses like toor dal, urad dal, Bengal gram, green gram, horse gram etc., has recorded lowest sowing during the last year due to scanty rain fall and naturally this phenomenon will result in poor yields in the days to come. Reports say that the water levels in dams are dipping at an alarming rate which will invariably have a negative impact on electricity generation and people are fearing acute power cuts. The drought has set in a situation wherein people have to get ready to face hardships in different forms like food shortage, water shortage, power shortage, fuel crisis, migrations etc. Perhaps a time is fast approaching where in people should gear up to face the ill effects of drought courageously and intelligently. In order to accomplish this, green entrepreneurship might give a satisfactory solution and people should make up their mind to turn as green entrepreneurs in the wake of drought.

REVIEW OF LITERATURE

Parminder Kaur and Dr. Surinder Kaur, (2023), under took research with the topic "Green entrepreneurship in India: A study of select green businesses". The researchers aimed to investigate the drivers of green innovations as well as their potential and obstacles through an exploratory methodology that used secondary data, including five in-depth case studies of green entrepreneurs to explore their motivational factors and key impediments. They found that the motivations behind green entrepreneurs are social, environmental, and financial objectives. The primary barriers to green entrepreneurship include a lack of funding, high investment costs, a lack of knowledge about green technologies, and difficulty breaking into the market because of the high related costs. The research article was published in - Asian Journal of Management and Commerce 2023; 4(1): 116-122 Arjune S, V Srinivasa Kumar (2023) under took research with the topic "Factors influencing students towards green entrepreneurship willingness in delta districts of Tamil Nadu and suggestions for their betterment". The research study identified the necessary conditions for the growth of "green innovation," in addition to the elements that both encourage and obstruct it. Since students represent our country's future, the primary goal of this study was to determine their propensity for green entrepreneurship. Structured questionnaires were used to collect study data. The study's topics included demographics, attitude, educational assistance, subjective norm, self-efficacy, risk aversion, and achievement in and of itself. The article makes intelligent recommendations for supporting environmentally sustainable company endeavors. Lastly, this study will help decision-makers by examining the willingness and interest of today's students in green entrepreneurship. The research article was published in Eighth International Conference on Science Technology Engineering and Mathematics (ICONSTEM). Orji, Evelyn Ijeoma, Idika, Delight Omoji(2023), under took research with the topic "Global Warming and Impacts: Green Entrepreneurship to the Rescue" This essay explores the role of green entrepreneurship, also known as greening and green technology, and supports it as a practical response to climate change. Stakeholders must move quickly to improve young people's green entrepreneurship competencies because the entire growth of green entrepreneurship in Nigeria is anticipated to come with the creation of a sustainable environment. According to the author, there is hope that green entrepreneurship will help talented young people become strong and self-sufficient while simultaneously playing a crucial role in halting global warming. This article was published in Shodh Sari-An International Multidisciplinary Journal · October 2023 with ISSN: 2959-1376. Rajkamal S.V A, J. SenthilVelmurugan, B M. Suryakumar (2022) under took research with the topic "Green Entrepreneurs Challenges and Innovation: The Struggles They Face". The study's conclusions showed that there was no correlation between age and the possibility of starting a business that used professional or technical competence. For the study, they selected 50 respondents overall from Salem's large population using a technique called snowball sampling. which was published in International Journal of Professional Business Review with ISSN

2525-3654. Manisha Gupta and MridulDharwal (2022), undertook research with the topic "Green entrepreneurship and sustainable development: A conceptual framework" and the study reveals thatthe concept of green entrepreneurship is still very young, but it is quickly maturing. Making environmentally friendly products is the main goal of both ecological sustainability and business, and indicates the further scope of the research that the current study aims to highlight available literature on green entrepreneurship and sustainable development to propose a conceptual model for further research. Aswathy TR, and Dr. N. Arun Fred (2022), under took research with the topic "Emergence of Green Entrepreneurship in Kerala; A Solution for Sustainable Growth and Development" and based on factors including green innovation, green manufacturing, and green marketing, the research shows how green firms have grown. Part of the reason for the increasing popularity of green entrepreneurship is consumer demand for eco-friendly goods. Using a structural equation model, they were able to determine the constructs' fitness and the individual contributions of each of the 100 green entrepreneurs in Thiruvananthapuram. In the article, the concepts of "green innovation," "green production," and "green marketing" are contested as the primary drivers of the rise of green entrepreneurs. The primary driver of the expansion of green entrepreneurs is this green manufacturing. Environmentally conscious business Create new company concepts that, if implemented, might result in long-term economic growth. The researcher has published the article in International Journal of Mechanical Engineering with ISSN 0974-5823. Dr.G.N. Ramakrishna &Dr.Rajanna K(2022), under took research with the title "The studies illustrate that consumers are now much conscious about the health and environment. Possibly this may be the reason, that the concept of green product and green marketing are taking place gradually and progressively in the market." The survey demonstrates the extent to which consumers have grown more health and environmental sensitive. This might be the reason why the concept of green products and green marketing has been introducing into the market gradually. It may also offer a chance for companies to rethink their products and services with an eye on the environment and for innovation, and to see chances for green entrepreneurs in the context of shifting market conditions. This article is published in EPRA International Journal of Economics, Business and Management Studies (EBMS) with ISSN: 2347-4378. MukulBhatnagar, Sanjay Taneja and ErcanOzen (2022), under took research with the topic "A wave of green start-ups in India—The study of green finance as a support system for sustainable entrepreneurship" TheScholars have carried out an evaluation to ascertain the present condition of environmentally-friendly financing in India and its impact on enterprises. The paper claims that government initiatives are getting greener by providing green money, and Indian businesses are utilizing this by embracing sustainable entrepreneurship. The researchers have published in AIMS press journal with ISSN 4(2): 253–273

Gabriela Alina Anghel and Mihai AlinAnghel (2022), under took research with the topic "Green Entrepreneurship among Students—Social and Behavioral Motivation" and the research's justification of particular student traits when tackling an issue like green entrepreneurship. It all began with the idea that awareness of the possibilities of starting a green firm and the degree to which entrepreneurial skills are being developed will directly correlate with the growth of interest in green entrepreneurship. ANOVA and the Chi-Square test were used in the study's methodology, and the findings show that the research subjects' interest in green entrepreneurship has grown. This fact shows that a Likert-type scale was used to give values, and that the values between 4 and 5, with 5 being the highest level, were averaged to get these numbers. This implies that students are becoming more interested in green entrepreneurship. The assigned values obtained are: 18–22 age (m = 4.1532), 22–25 age (m = 4.4375), 26–28 age (m = 4.4375), 29–39 age (m = 4.2396), and the over 39 age (m = 4.2750). the researcher published this article in MDPI Journal. Y.D. Nayak and A.P. Sahoo (2021), under took research with the topic "Green Entrepreneurship in India" They published a theoretical framework that elucidates the relationship between several institutional, social, and environmental factors and green entrepreneurship, which is a prelude to sustainable development. The researchers' inquiry into green entrepreneurship is exploratory in nature since it sheds light on the origins of the concept and its application in the Indian setting. The research article was published in International JournalAgrl. Research Innovation Technology with ISSN 2224-0616. Seema Potluri and B. V. Phani (2021), under took research with the topic "Green Entrepreneurship: A Disruptive Mitigation Strategy for Climate Change", the study activities that are grounded in local settings and people's demands for social progress can mitigate the effects of global climate change because they will increase individual and local community awareness. The study concludes that these benefits hold true everywhere, regardless of location. The author makes the case that if innovative green technologies were to

replace well-established non-green ones, the global economy would decarbonize more quickly. This concept differs from the global consensus model's top-down methodology, which has been tried and tested over the last few decades with varying degrees of success. This article was published in springer open source with ISBN: 978-1-4614-6431-0_165-1. CS Roshni Sharma (2020), under took research with the topic "Analysis of Green Entrepreneurship Practices in India". The study discovered that one of the causes leading to youth unemployment and sustainability challenges is the low entry-level criteria for becoming an entrepreneur for a variety of environmentally sensitive firms. The study comes to the conclusion that the coordinated promotion of green entrepreneurs should be the main area of interest for green entrepreneurship research in India. Startups need both technological and financial backing to grow. Thanks to major local enterprises, the State has been able to support entrepreneurship. The research article was published in International Journal of Advanced Research in Commerce, Management & Social Science ISSN: 2581-7930. SeemaPotluri and B V Phani (2020), under took research with the topic "Women and green entrepreneurship: a literature based study of India". According to the study, women may be drawn to entrepreneurship as a way to balance their obligations to society and their careers. It has been found that these women would be more likely to pursue ecopreneurship because of their ingrained social conditioning and lack of incentives. Furthermore, their innate drive to preserve the environment might be a distinguishing characteristic in the development of "ecopreneurship." The article has published in International Journal of Indian Culture and Business Management Vol. 20 No. 03. Kartika Nuringsih, Nuryasman MN (2020), Jenifer under took a research with the topic "Role of Green Entrepreneurship in Raising the Effect of Green Value toward Sustainable Development"This study investigated how entrepreneurial students in Jakarta, Indonesia perceived the connection between green value, GE, and sustainable development. As a result, a linkage model was developed that successfully communicates the viewpoint of the millennial generation on the new model of entrepreneurial growth and its relationship to sustainability. These relationships aid in MES's environmental awareness and education. This article was published in International Journal of Economics, Business, and Entrepreneurship Vol. 3 No. 2 (2020)

Choongo, Emiel L. Eijdenberg, John Lungu, and MwansaChabala, (2020) "The Influence of Environmental Pollution and Drought on the Satisfaction With Life of Entrepreneurs in Zambia's Mining Sector" This research set out to look at the abundance in developing countries. However, there hasn't been much research on how environmental degradation, drought, and climate change affect entrepreneurs' well-being or life satisfaction in developing countries. According to the study, environmental degradation and drought have a negative effect on business decision-making and profitability. The findings offer fresh perspectives on the subject and practical suggestions for lawmakers, educators, and company owners. The article is published in National Library of Medicine. StutiHaldar (2019), under took research with the topic "Green entrepreneurship in theory and practice: insights from India" The study looks at how environmental, social, and economic issues affect the rise of green entrepreneurship and how it helps to advance sustainable development. Because of this, eco-conscious customers and businesses are making the most of the present Indian market conditions by reevaluating and developing their products with an eye on the environment. This article was published in International Journal in Green Economics, Vol. 13, No. 2, 2019. Ms. Gagan Bhandari (2018), under took a research with the title "Analysis of Green Entrepreneurship Practices in India" The study of climate change and the limitation of natural resources we are trying to change the economy from one that is unsustainable to one that is sustainable through a number of green projects. Our objective is to cultivate the upcoming cohort of entrepreneurs who possess the ability to identify and capitalize on green business opportunities. It resulted in developing new markets for products and services that are in line with society expectations and changing lifestyles, balancing the company's economic and ecological aims, and offering goods and services that inspire customers to adopt more environmentally responsible behaviors. This article is published in Journal of Emerging Technologies and innovative research with ISSN-2349-5162. Mr. Solomon K Peter and Dr. RamanujamVeluchamy (2018), under took a research with the title "Green Entrepreneurship–The Right Way To Sustainability and Profitability for Rural Areas." The consequences of green entrepreneurship on organizations and society were examined in this study, which concentrated on a few rural areas in Kerala. According to the report, there are plenty of chances for aspiring green entrepreneurs, and their ventures will benefit society as a whole. The amount of money the government must spend on environmental development and preservation is decreased with the aid of green entrepreneurship. Selecting eco-friendly items will contribute to a decrease in air pollution, industrial waste, and electrical waste. This

article is published in Journal of Emerging Technologies and Innovative Research (JETIR) with ISSN 2349-5162. StutiHaldar(2017), under took research with the topic "Green Entrepreneurship in the changing market scenario in India" This study is exploratory in nature as it offers insights into the emergence of the concept of green entrepreneurship and its role in the Indian context and the study proposes a conceptual model which explains the nexus between environmental, economic and social factors in development of green entrepreneurs which further leads to achievement of sustainable development. The study highlights the opportunities and challenges for green entrepreneurship development, in light of the initiatives taken by business houses, individuals and the Government of India by taking up case studies of successful green entrepreneurship ventures. This article was published in Twelfth Biennial Conference on Entrepreneurship Publication. ISBN: 978-93-80574-93-6. Lindsay Clinton and Rochelle March (2015), under took research with the topic "Drought, urbanization and climate: big business opportunities for long-term thinkers", According to the report, by 2025, these portfolio expansions ought to account for 20% of total free cash flow, reducing the company's reliance on pulp and increasing its prospects for long-term corporate growth in light of impending sustainability concerns. One of the main elements promoting sustainability, according to the report, is growing urbanization. Half of all people on Earth currently reside in cities; by 2050, that percentage is predicted to rise to 66%. There will probably be a pressure on infrastructure, food security, waste management services, transportation networks, and waste management systems with an extra 2.5 billion people living in cities. This article is published in The Guardian International online edition

RESEARCH GAP

The above literature reviews clearly identifies the research gap. It is apparent that The research is very scanty as far as opportunities for green entrepreneurship during drought seasons are concerned and hence it can be inferred that the topic chosen for research is apt and researchable.

Problem Statement

Drought is a time period which will usher in many bottle necks such as drinking water shortage, food shortage, fodder shortage, power crisis, job and pay cuts etc and severe droughts have proved to be disastrous in the history. People have to gear up to face such situation with courage and confidence by being drought warriors, who would serve the society by becoming green entrepreneurs who would contribute immensely for the wellbeing of society during such calamities. Calamities like drought, which is viewed as threat should be converted into opportunity by becoming green entrepreneurs who would not only incorporate a few environment sustainability measures during drought but also secure financial stability of the stake holders.

Objectives of the research
1. To unearth the 'green entrepreneurial opportunities' in the wake of drought
2. To elaborate on the methodology that how such opportunities should be implemented

Limitations of the research
1. The study will pin point the green entrepreneurial opportunities that may be implemented only during drought and famine like situation
2. The core of this research gives suggestions and recommendations in connection with green entrepreneurial opportunities during drought, which can not be taken as final and ultimate.

RESEARCH METHODOLOGY

Type of Research : exploratory
Nature of data : Primary and Secondary
Data Collection Tool : Primary Data is Collected through Telephonic interview with officials such as   project implementation officers , public relation officers of BAIF Karnataka Region. Secondary data is collected through

Magazines, Periodicals , News Paper Special Editions , Agriculture Magazines.Data Analysis and Interpretation method : The likely problems during drought , likely scope for green entrepreneurship for such problems during drought is quoted and subsequently a brief narration is given as how it may be successfully implemented. The problems that will pop up during drought are mapped to 3 categories depending on its severity as "Very Severe", "Severe" and "Mild". Subsequently the scope for Green Entrepreneurship in the light of those problems were mapped to 2 categories as "High Scope" and "Moderate Scope". Prima facie 8 such problems were identified which will surface during drought season and how those 8 problems can be converted into opportunity during drought by becoming green entrepreneurs is discussed in the data analysis.

Findings and Inferences:

(1) It was found from the data analysis that sowing seeds shortage, drinking water shortage, food grains shortage of soil can cause "Very Severe" problems during drought to which there the opportunities to green entrepreneurship having "High Scope". Therefore it can be inferred that the problems which are "Very Severe" during drought paves the path for "High Scope" for green entrepreneurship.

(2) It was found that from the data analysis that fodder shortage and power shortage and weakening of soil can cause "severe" problems during drought and fodder shortage and power shortage can create "moderate scope" for green entrepreneurship , whereas weakening of soil can create high scope for green entrepreneurship. Therefore, it can be inferred that two problems which are "severe" can pave path for 'moderate scope' for green entrepreneurship and one problem which is 'severe' can create 'high scope' for green entrepreneurship

(3) It was found from data analysis that 'health hazards during drought' and 'lack of knowledge about legal aspects of drought' can cause 'mild' problems during drought which can create 'moderate scope' for green entrepreneurship. It can be inferred that there are only two problems which can create 'moderate scope' for green entrepreneurship during drought and chances for taking green entrepreneurship ventures under these two problems can be scanty.

CONCLUSION

From the findings it can be concluded that invariably there would be challenges and bottle necks which the drought will usher in but the farmers, entrepreneurs and other stake holders need not dishearten and panic as these challenges can be converted into entrepreneurial opportunities and the entrepreneurs can bank on the hiccups posed by drought. From the findings it is apparent and can be concluded that there are hiccups which can be categorized under "severe" and "most severe" to which it the study revealed the entrepreneurial opportunities can be mapped and finally it can be inferred that the drought like situation is quite a natural phenomenon and being responsible citizens one should discover how the hiccups or challenges posed by nature should be converted into an opportunity for the wellbeing of a society as a whole.

Table:1 Data Presentation and Analysis

Problems during drought	Scope for Green Entrepreneurship	Implementation	Severity of Problem	Scope for Green Entrepreneurship
Sowing seeds shortage	Establishing "Seeds Bank" at homes and agricultural co operative societies	Green entrepreneurs should start accumulating stock of seeds of food grains at "seeds Bank" which	Very severe	High Scope

		can be stored for a long time and can distribute it to the needy in return for a consideration		
Drinking water shortage	Upkeep of water bodies, reservoirs etc	Green entrepreneurs should accumulate volunteers to join hands to clean silt and weeds grown in and around water bodies and reservoirs. The volunteers get paid for this scheme from Central Government under "Employment Guarantee Scheme Under Drought" up to 150 days of human labour	Very severe	High Scope
Food Grains Shortage	Switching over from growing conservative crops to drought resistant millets (Siri Dhanyas)	Green Entrepreneurs can indulge themselves in growing less water demanding, pest resistant, Ailment resistant, drought resistant short term millet crops such as fox tile millet, haraka, oodalu, bajra, koralu etc rather than growing long term, heavy water demanding crops such as paddy, wheat etc. These 'Siri Dhanyas' has good market demand as well, which can also secure financial interest of green entrepreneurs	Very severe	High Scope
Fodder shortage	Establishment of 'Fodder Banks' and growing tree based fodder to cattle, sheep etc	Green Entrepreneurs should take initiative in establishment of "Fodder Banks" where in enough stock of nutritious "Dried Fodder" could be stored during drought	severe	Moderate Scope

		season and sell it to needy. Green entrepreneurs can also think of switching over from conservative fodder types such as paddy grass, green grass to the cattle to short term, nutritious , less water demanding, high yielding 'Tree Based Fodder" such as 'Caliandra ' 'Subabul' to the cattle .		
Power Shortage	Encouraging people to use alternate sources of energy by venturing into 'power entrepreneurship'	Power Shortage is a common phenomenon which one could experience during drought. As the water levels in the reservoirs dips, hydro electricity generation also dips leading to acute load shedding. Green entrepreneurs can go in for encouraging people to use solar energy , wind mill , using generators run by bio fuels etc , as an alternate source of power. Green entrepreneurs can think of taking up entrepreneurial opportunities in this connection which can be highly rewarding to them.	severe	Moderate Scope
Health Hazards during drought	Volunteering to be 'health warrior' in the Government launching 'Health Camps'	During drought, people suffer from many kind of health hazards such as diarrorhea, malnutrition etc and in such circumstances Government mobilizes 'Health Camps' to aid the drought victims.	Mild	Moderate Scope

		During such time Government would need volunteers to educate the victims and help them during drought by supplying necessary food, water and medicines. Green entrepreneurs can be a part of such health camps and it can be remunerative also		
Lack of knowledge about legal aspects pertaining to drought	Conducting workshops/seminars and being a resource person	Many of the citizens will not be aware about the legal aspects pertaining to drought. There are many sections and provisions covered under 'National Disaster Management Act' which pinpoints towards Government aid, remedial measures and drought relief funds etc about which citizens have scarce knowledge. Green Entrepreneurs, in order to educate people regarding the drought relief methods , covered under different statutes can conduct workshops/seminars and they can even be resource persons which will be lucrative to them	Mild	Moderate Scope
Weakening of Soil	Volunteering and pooling volunteers to conserve soil which is weakening by virtue of drought	It is very common during drought that the soil gets weakened due to acute water shortage and becomes unfertile, if left unattended unfertile soil will lead to long term problems post	severe	High Scope

		drought. Green Entrepreneurs can address this problem by volunteering and pooling volunteers who can indulge themselves in mulching and composting activities by creating selfhelp groups in village levels to conserve soil and keep it fertile for a long time .

ABSTRACT

The purpose of the study is to identify the factors influencing sustainable livelihood of weaker women and analyse the impact of women entrepreneurs' contribution in enhancing the sustainable growth of their women employees. The study employed a descriptive research strategy, with data collection being conducted through a well-designed questionnaire. The Cochran formula was employed to estimate the sample size for an unknown population, resulting in a sample size of 116 respondents. Women employees who have been employed by women entrepreneurs for the past five years were chosen using a convenient sampling method. The questionnaire's validity and reliability were confirmed through scale analysis. The present study employed Confirmatory Factor Analysis (CFA) through the use of AMOS R software for statistical analysis. The study findings suggest that women's sustainable survival is impacted by various factors, including their health status and access to food security. The capacity of women to maintain a stable income is adversely affected by family expenses and credits. The findings also reveal that women entrepreneurship is fostering the sustainable livelihood among the weaker section of the society. The Indian context exhibits a dearth of research on sustainable livelihoods, particularly with regard to assessing the sustainability of marginalized communities which is contributed by women entrepreneurship and implementing appropriate remedial measures. The findings of the study can be

useful to women entrepreneurs in creating a work environment which empowers weaker women to grow sustainably.

Keywords: Education Power, Food Safety, Natural Resources, Living Approaches, Sustainable Livelihood.

INTRODUCTION

As per a report published by BCG, enterprises led by women have the potential to generate cumulative revenue that is 10% higher over a period of 5 years, and exhibit a work culture that is 3 times more inclusive as compared to businesses led by men(Kinara capital, 2022). Female entrepreneurs are increasingly embracing digitalization and technology adoption as a means to mitigate the gender gap and secure financial access from private lenders, non-banking financial companies (NBFCs), and banks(Bureau, A. N., & A., 2023). The utilization of digital technology can potentially decrease reliance on male counterparts and increase awareness of women's business development programs and alternative collateral-free lending options in the market(Pachorkar, S., Kawishwar, S., & Sharda, P., 2020).At present, female entrepreneurs make a contribution of approximately 3% to the overall industrial output and provide employment opportunities for roughly 10% of the total workforce. The provision of employment generation is expected to bring about a positive impact on the Indian economy by increasing productivity and generating financial efficiency(Barrachina Fernández, M., García-Centeno, M. D. C., & Calderón Patier, C., 2021). The examination of women entrepreneurs continues to captivate individuals' interest and reignite their imagination regarding the functioning of gender equality within the realm of business(Lepeley, M. T., Kuschel, K., Beutell, N., Pouw, N., & Eijdenberg, E. L. (Eds.). , 2019).The establishment of an inclusive and supportive environment for women entrepreneurs serves as a catalyst for advancing economic empowerment within an underrepresented demographic(Agarwal, S., Ramadani, V., Dana, L. P., Agrawal, V., & Dixit, J. K., 2022).

Concurrently, it enhances the allocation of resources within the economy. Consequently, the present study on women entrepreneurs examines the various roles undertaken by women in their capacity as entrepreneurs within the micro, small, and medium enterprises (MSME) sector, with a specific focus on the impact of these roles on the long-term sustainability of urban poor livelihoods(Kamberidou, I., 2020). In recent times, there has been a growing recognition of the significance of women's entrepreneurship and its impact on national development, owing to the valuable contributions made by micro- and small-medium enterprise (MSME) entities towards socio-economic well-being(Agarwal, S., Lenka, U., Singh, K., Agrawal, V., & Agrawal, A. M. (2020). The integration of women into the micro, small, and medium enterprises (MSME) sector is anticipated to yield significant socio-economic implications for economically disadvantaged women(Kanapathipillai, K., & Azam, S. F. (2019).This inclusion is expected to facilitate their access to employment opportunities, enhance their social status, and enable them to attain economic independence, thereby augmenting their personal capacities(Uddin, M. ,2021). The primary objective of this study is to investigate the socio-economic implications of women entrepreneurs and managers in micro, small, and medium enterprises (MSMEs) on the local sustainable livelihood of the rural poor. This study examines the various benefits received by the weaker section employees employed under women entrepreneurs in Bangalore on their lives and explores potential strategies for enhancing their actions to promote greater sustainability(Raman, R., Subramaniam, N., Nair, V. K., Shivdas, A., Achuthan, K., & Nedungadi, P., 2022).   Given this context, it is imperative to comprehend the impact of Women Entrepreneurs IN fostering sustainable livelihood for weaker women of the society. The initial segment of the document presents the introduction, followed by a section that elaborates on the previous literature. Subsequently, the third section expounds on the research methodology employed in the study. The present study adheres to established research methods and subsequently presents the findings and corresponding analysis. The conclusion section provides the final remarks, suggestions, and potential avenues for future investigation.

REVIEW OF LITERATURE

In this study, a systematic literature review was applied to analyse prior works that were relevant to the research concerns that were being investigated. There were a total of 30 papers discovered after using the keywords "Women entrepreneurship …..," "Women entrepreneurship in India ……. ", "Sustainable livelihoods ......," and "Impact of women entrepreneurship on sustainable livelihoods……". Following an evaluation 20 articles that were included in the study were published in journals that are widely recognized for their academic rigor and reputation. Specifically, 2 articles were published in the Elsevier database, 2 in the Routledge and CRC Press Taylor and Francis database, 2 in the Emerald Group Publishing database, 3 in the Springer Nature database, and 3 in the Sage database. The study makes reference to three articles that were published in the Directory of Open Access Journals, as well as two journals that are included in the Semantic Scholar databases. Several additional papers were obtained from scholarly databases such as Wiley, Academia, JSTOR, and Guildford Press.

The review of important literature on the topic is presented as follows
A plethora of studies have been conducted to examine the socio-economic implications of women's entrepreneurship on the women who initiate business ventures, both within the Indian and international contexts. According to (Gurendra Nath Bhardwaj and Swati Parashar, , 2013), the advancement of women's social and economic status plays a crucial role in the overall economic development of any culture or country. In their article, (J.V. Joshi and Madhura Despande,, 2005)found that women entrepreneurs in Marathwada were employing traditional methods to manage their businesses. In their scholarly article titled "Women Entrepreneurship - Factors Contributing to Success of Women Led Enterprises," (Mayura Kemkar and Jyoti Sharma, 2016)assert that the economic climate of a nation is predominantly shaped by the entrepreneurial inclination exhibited by its populace. According to Shah, Hina & Saurabh, Punit. (2015),there exists a necessity to enhance the status of women, and the promotion of women's roles in development is now recognized as more than just a human rights or social justice issue. According to Arnaud Daymard (2015)the involvement of women in entrepreneurship can lead to an expansion of their economic opportunities and contribute to broader development efforts, including poverty alleviation. In her essay titled "Women Entrepreneurship Changing Status," Sujatha Mukherjee (2013)examines the phenomenon of women from low-income families resorting to entrepreneurship as a means of survival. In their study, Camalun Nabi and Ashok Kumar (2012)identified a potential correlation between the state's underdevelopment and the limited presence of entrepreneurial talent and potential among its citizens. According to Sithalakshmi and Jothimani (2012), in order for lasting transformations in women's societal standing to transpire, it is imperative to provide women with structured intervention initiatives such as income-generating projects or opportunities for independent or collective income generation. The objective of this research was to investigate and delineate the economic impact made by a specific group of female entrepreneurs within their respective societies (Kathie L., 2012).

Limited research exists on the impact of women's entrepreneurship within marginalized communities. Numerous studies have been conducted on the topic of sustainable livelihoods within an international context.Bayu, E. K. (2021)examined the topic of interest. This study employed a case study approach to examine the significance of off-farm and non-farm activities in the preservation of sustainable livelihoods for rural households. Since the 1990s, several prominent international organizations have employed the Sustainable Livelihood Analysis (SLA) approach to integrate development interventions(Su, M. M., Wall, G., & Wang, Y.,2019).The current state of academic research on sustainable livelihoods in the Indian context is limited, particularly in relation to assessing the sustainability of vulnerable populations and implementing appropriate interventions. Numerous studies have been conducted to investigate the impact of women led Micro, Small, and Medium Enterprises (MSMEs) on employment generation. In a study conducted by Gangadharappa (2019),one prominent advantage of the micro, small, and medium enterprises (MSMEs) sector lies in its labor-intensive nature, as opposed to being driven primarily by capital. India possesses a significant abundance of human resources. Micro, Small, and Medium Enterprises (MSMEs) play a crucial role in offering educational prospects to individuals with limited skills and contribute to the development of local human capital within society. In his study, Kumar (2017) endeavors to comprehend the significance of Micro, Small, and

Chintan Raj M Vernekar *et al.,*

Medium Enterprises (MSMEs) in facilitating employment opportunities and fostering inclusive economic growth within the nation. According to Das (2017), the study titled "Micro, Small and Medium Enterprises (MSME) in India: Prospects, Issues, and Challenges" reveals that Women MSMEs play a crucial role in supporting a favorable economic growth rate and generating employment opportunities. There is a dearth of scholarly literature pertaining to the role of Women Micro, Small, and Medium Enterprises (MSMEs) in facilitating sustainable livelihoods and promoting socio-economic advancement among women belonging to marginalized segments of society. Gap- The precise impact of Women entrepreneurship on sustainable livelihood is unknown because the relationship between the two has not been researched sufficiently. There is a need to address possible difficulties due to the complex nature of the women entrepreneurship on the weaker women of the society nexus. By creating a methodology to evaluate the effects of women entrepreneurship on the sustainable livelihoods of vulnerable groups, this study fills the aforementioned gaps in the existing literature.

RESEARCH METHODS

The present study utilizes a descriptive research design(Siedlecki, S. L.,2020) that employs quantitative data analysis(Samuels, P., 2020).A sample size of 100 women employees associated with MSME women entrepreneurs was determined using the Cochran formula for unknown populations with a margin of error of 10%(Nanjundeswaraswamy, T. S., & Divakar, S., 2021)Subsequently, 140 questionnaires were disseminated. The study received a total of 126 responses, but after removing outliers, only 113 responses were deemed suitable for analysis. The women who were below the poverty line and are employed any MSME women entrepreneurs for atleast 3 years are part of the study. The researchers developed a comprehensive questionnaire by adapting the scales of previous studies. Specifically, the questionnaire consisted of 7 items derived from Rathnamma.G (2015)study, and 15 items sourced from (Malanga, D. F., & Banda, M., 2021)study. The questionnaire was well-structured and designed to elicit relevant information from participants.The reliability and validity of the questionnaire were confirmed through the application of statistical measures such as Cronbach's alpha, composite reliability, average variance explained, and inter-item correlations. The statistical analysis for the study was conducted utilizing the SPSS (Rode, J. B., & Ringel, M. M., 2019)and AMOS software (Thakkar, J. J., & Thakkar, J. J.,2020)

RESULTS AND DISCUSSION

Demographic Profile of the Participants
The participant pool consists of a majority of 64% males and 36% females. The age group of 36 to 45 years accounted for the largest proportion of participants, comprising 39% of the total. Following closely behind, 30.9% of participants fell within the age range of 46 to 55 years. Only a marginal proportion of the participants, specifically 8.1%, were found to be above the age of 55. Academic credentials Fifty percent of the participants had achieved a level of education encompassing completion of schooling and basic education. Twenty-two percent had attained completion of their Secondary School Leaving Certificate (SSLC), while ten percent had successfully completed their Pre-University Course (PUC). A minute proportion, specifically 6% and 10%, had successfully attained their undergraduate and technical qualifications. The study revealed that the majority of participants, specifically 69.1%, reported being married. Additionally, 13.4% of participants reported being unmarried, 6.8% reported being divorced, and 10.6% reported being widowed. A total of 42.8% of the participants reported having two children, while 19.7% reported having 2-3 children. Additionally, 37% of the participants in the study indicated that they did not have any children. A total of 55.9% of the participants indicated that their families consist of 3-6 members, while 31.4% of the participants reported having 6 to 9 individuals in their households, according to the findings of the study. A majority of the study's participants, specifically 71.1%, reported that their families relied on a single income earner. A total of 47.1% of the participants reported having a monthly income of less than 10000, while the remaining 52.9% indicated having a monthly income exceeding 10000. The demographic profile reveals that individuals belonging to the economically disadvantaged segment of society possess a significantly lower income and rely on a single

breadwinner within the family, while also having a larger number of dependents. This particular scenario necessitates the requirement of efficient participation from women entrepreneurs in the Micro, Small, and Medium Enterprises (MSME) sector, as it has the potential to improve their long-term and viable means of living.

Item analysis – Women entrepreneurship

The sustainable economic development of marginalized populations, particularly women, is a critical concern within contemporary development policies implemented in developed nations. The issue of politically motivating women to enhance their well-being and living conditions has garnered significant attention and sparked discussions on a global scale. An investigation into the perceived contribution of Women entrepreneurs indicates that the respondents exhibited a neutral level of agreement towards the statements. The mean score for contribution of women entrepreneurs towards gain in self –employment opportunities and availing the benefits of development projects have a low mean score of 2.880 indicating less contribution in these areas. The women participants of the study agreed that women entrepreneurs contribute to gain control over economic assets and achieve financial independence, achieve the goal of economic self-sufficiency, improve their saving ability and develop professional skill and competence with mean scores above 3.000. The following section provides an item analysis of participants' opinions regarding their present sustainable livelihood status.

Item analysis – Sustainable livelihood

The concept of Sustainable Livelihood arises from the convergence of developmental and environmental studies, providing a novel perspective on the notions of labor, manufacturing, and allocation. This concept specifically addresses the labor of vulnerable populations with the aim of establishing a sustainable future in which household inequality is eradicated. The following table shows the current status of the participants of the study on the 11 factors of sustainable livelihood. The mean score for access to services and institutions was determined to be 2.95, which is below a value of 3. This finding indicates a lack of agreement among the participants regarding the range of their responses. The calculated standard deviation is less than 1.000, suggesting a diminished level of variability in the responses provided by the participants. This finding indicates that individuals who belong to disadvantaged groups demonstrate similar attitudes regarding their access to services and institutions. In relation to employment-related data, three primary considerations were identified: the viability of engaging in extended working hours, the potential for engaging in overtime work, and the accessibility of weekend and holiday employment opportunities. The participants in the study demonstrated a substantial level of response, as indicated by an average score of approximately 4.5 for all items. This score reflects a high level of agreement among the respondents regarding their ability to actively pursue family or future sustainability.

The relatively low standard deviation of 0.624 indicates a significant level of agreement among participants in their perspectives on working information. In relation to the matter of accessibility to natural resources, it is noteworthy that all sustainability items, with the exception of sustainability 21, which specifically pertains to solar panels, obtained an average score surpassing 4. The average score for solar panels was 1.48, suggesting a relatively low level of adoption among the participants. However, it is worth noting that the average scores for natural resource accessibility were generally elevated. Based on the data, it can be observed that the responses exhibit a spectrum ranging from neutrality to agreement, as exemplified by the numerical value of 3.73. Furthermore, it is worth noting that the data exhibits a standard deviation of 0.67. In relation to credit and savings, a significant proportion of participants expressed a dearth of savings and a lack of outstanding loans. Therefore, the majority of the responses regarding credit and savings were characterized by neutrality or conveyed disagreement and negative sentiment. As a result, the mean score falls below 3.00, which serves as a promising indicator of enduring welfare. Typically, individuals who are situated within the lowest socioeconomic stratum demonstrate a food security status that is characterized by a lack of both positive and negative outcomes. The standard deviation value of 0.76, as determined through calculations, suggests that there is a relatively limited amount of variation in the viewpoints of the participants regarding food security. After conducting an investigation, it was ascertained that an average score of 3.69 was achieved, indicating a trend of individuals from disadvantaged backgrounds gradually attaining a more

Chintan Raj M Vernekar *et al.,*

prominent social standing. Moreover, these individuals themselves recognize that they are acquiring a certain level of influence, thus demonstrating characteristics associated with sustainability.

Factors influencing sustainable livelihood

Confirmatory Factor Analysis (CFA) is a statistical methodology utilized by researchers to evaluate a predetermined hypothesis regarding the relationship between the experimental and latent variables. The formulation of this hypothesis is commonly influenced by the integration of theoretical understanding and empirical observations. Janssens et al. (2008) assert that employing this approach aids researchers in validating instruments and confirming the hypothesized factor structure. Factor loadings are employed to understand the regression coefficients. Researchers have the ability to assess the quality of measurement by integrating the CFA (confirmatory factor analysis) and construct validity assessments, as suggested by Hair et al. (2010).The present study employs confirmatory factor analysis to examine the factors that influence the sustainable livelihood of marginalized populations within society. The statistical indicators of model fit indicate that all criteria for a robust model have been met, with significance levels below 0.05. The outcomes of the model are deemed acceptable and can be utilized for inferential purposes. The diagram depicted above illustrates the interdependent framework of sustainable livelihood components and their collective impact on the livelihood of marginalized communities. The table presented below displays the unstandardized and standardized estimates pertaining to the factors that impact sustainable livelihood, along with their corresponding p-values.

The aforementioned table depicts the correlation among diverse factors that impact the sustainable livelihoods of disadvantaged populations. The objective is to determine the factors that have the greatest positive impact on sustainable livelihood. From the above table it can be indicated that when sustain_10 Financial Wellbeing- positively goes up by 1, sustainability goes up by 0.758 or 78% which is statistically significant at 0.000 and CR of 3.729. (Co-eff =0.758, Sig=0.000, CR=3.729), When Sustain_9 food safety positively goes up by 1, sustainability goes up by 0.343 or 34% which is statistically significant at 0.000 and CR of 2.761. (Co-eff =0.13, Sig=0.000, CR=17.123)On an overall basis, it can be inferred that the Financial Wellbeing and Food safety factors positively affect the sustainable livelihood of the weaker section. Credits and family expenses inversely affect the sustainable livelihood of the participants.   *The results of the SEM Analysis indicate that* ,there is both positive and negative impact of various factors of sustainable Livelihood *on the life of weaker section of the society, The Null Hypothesis is rejected.*

Impact of Women entrepreneurship on the sustainable livelihood of the weaker section

The statistical indicators of model fit indicate that all criteria for a robust model have been met, with significance levels below 0.05. The outcomes of the Impact of Women Entrepreneurship on the sustainable livelihood of the weaker section model are deemed acceptable and can be utilized for inferential purposes. The table presented below displays the unstandardized and standardized estimates pertaining to the impact of Women Entrepreneurship of sustainable livelihood, along with their corresponding p-values. When contribution of Women Entrepreneurs goes up by 1, sustainable livelihood of the weaker section of the society goes up by 0.541 or 54% which is statistically significant at 0.000 and CR of 2.332. (Co-eff =0.541, Sig=0.000, CR=2.332). Many previous researches have demonstrated that Women Entrepreneurship aids in the long-term growth of rural areas, underprivileged groups, and women specifically. Consistent with earlier research, the current study found that increased access to work opportunities has a positive effect on people's ability to maintain sustainable incomes.

CONCLUSION

The concept of Women Entrepreneurship has undergone significant development in recent years, encompassing more than the mere provision of bank accounts for adult individuals. This transformation also encompasses supplementary factors, including the accessibility of credit, the extent of insurance coverage, the volume of remittances, and the ownership of mobile money accounts. Despite the intricate nature of women entrepreneurship, numerous studies investigating the correlation between women entrepreneurship and economically disadvantaged

Chintan Raj M Vernekar *et al.,*

groups have utilized rudimentary metrics of account ownership or have employed multiple indicators in isolation, without taking into account the impact of women entrepreneurship on sustainable livelihoods. The comprehensive examination of the impact of all criteria related to Women Entrepreneurship on the sustainability of livelihoods remains insufficiently explored. The extent to which Women Entrepreneurship influences sustainable livelihoods remains uncertain due to a lack of comprehensive research on the correlation between these two factors. It is imperative to acknowledge and mitigate potential concerns arising from the intricate relationship between women entrepreneurship and the disadvantaged segment of society. This study addresses the gaps in the current literature by developing a methodology to assess the impact of Women Entrepreneurship on the sustainable livelihoods of vulnerable groups. To enhance the level of women contribution within society, it is recommended that governments bolster their institutional and regulatory frameworks. Allocating additional resources, both in terms of effort and financial investment, will facilitate the successful completion of this task. It is additionally recommended that governments implement regulatory measures aimed at facilitating the operations and expansion of micro, small, and medium-sized enterprises (MSMEs) led by women entrepreneurs. These regulations should aim to foster a conducive business environment, particularly in underserved regions. The expansion of services can be identified as a contributing factor to the growth of both supply- and demand-side indicators of Women Entrepreneurship. The anticipated outcome of the expansion of employment opportunities for women, aimed at mitigating geographical disparities, is a reduction in both present and future poverty concerns. This research focuses on the socioeconomically disadvantaged demographic, particularly women living in the slums of the Bengaluru district. Future researchers may want to expand the geographical range of their studies to include both rural and urban areas. This would allow for a comprehensive assessment of the impact of Women Entrepreneurship on the sustainable livelihoods of this vulnerable population. Research can also be directed towards understanding the implementation and awareness of Women Entrepreneurship contributions within marginalized populations. A viable area of study involves examining the challenges associated with accessing Women Entrepreneurship and sustainable livelihood of weaker section of the society.

ABSTRACT

This literature review specifically delves into the interconnection of corporate governance and firm performance with particular emphasis on the board of directors, executive remuneration and shareholder activism. In light of this realization, the study undertake a critical review of theoretical and empirical antecedents to reveal the impact of boards of directors' composition on decision making and Firm Performance. The study also critically assesses the effects of the manner in which executives are remunerated on the goal congruence between managers and shareholders. An understanding on the contribution of shareholders in renewing corporate governance practices and boosting performance is developed. The study affirms the importance of these factors with regard to the generation of appropriate governance structure that aids the success of firms. Thus, the study provides a conceptual framework on how governance mechanisms work and their consequences on policies and practices within the corporate sector.

Keywords: Board Composition, Corporation Environment, Corporate Governance Systems, Firm Performance, Shareholder Activism.

INTRODUCTION

Corporate governance is very essential in the formulation of policies and the performance of the firms through providing a structure of the management of organization. Good corporate governance enhances shareholder

management, executives, and directors by adjusting their demands and expectations for the general welfare of the corporation. The steady changes in board of directors' composition, executive remuneration and shareholder activism pose challenges that can firmly hamper governance processes [3]. The research problem focuses on identifying how these three elements factor the concept of corporate governance and therefore firm performance. This topic is important as it seeks to explain the factors that determine success or failure of organizations particularly in complex and dynamic settings [2]. The aims of the present work are as follow: the author wants to investigate the effect of board composition on the effectiveness of corporate governance, the role of executive compensation in the management-shareholder conflict of interest, and the impact of shareholders' activism on the firm's governance practices. The article is designed in way to cover these aspects so that the relationships between them, as well as their consequences on corporate governance can be comprehensively examined. Corporate governance structures remain crucial to implementing corporate strategies, rigorous decision-making processes, and corporate accountability. These include the board composition, executive remuneration and shareholders management and activism affect governance practices and organizational performance and shareholder returns. Despite prior research on corporate governance, the relation between board composition, executive pay and shareholder activism has received little attention [1]. This research addresses this gap by examining the many ways the elements above affect governance practices and company performance and suggesting governance architecture improvements.

LITERATURE REVIEW

This paper responds to the general question regarding how the principles of corporate governance facilitate accountability and ethical decision-making when key theories and models are applied. Comparing to the agency theory, which deals with the conflict of interest between shareholders and management, the agency theory shows that it is rooted in different goals [11]. It devotes great attention to the issue of how management might be made more responsive to shareholders but it frequently fails to conceptualise the political realities of the boardroom adequately. The stakeholder approach shifts control away from shareholders, which may lead to an overemphasis on social duties and inefficiency. This perspective, which supports managerial discretion, claims that managers will always strive for the firm's benefit but ignores the threat of unchecked power. These simple models show how classical governance fails to account for common interests and power dynamics. Board composition is seen as a key driver of performance in organisations, but the literature paints a confusing picture. Although it is advocated that diverse boards offer increased perspectives and improve the quality of decision-making, the downside is that they can also foster rivalry and slow decision-making where proper management is not exercised [10].

The same is true about the focus on board independence; while independent directors are intended to offer unbiased monitoring, board members with limited firm knowledge may offer superficial monitoring. While gender diversity is socially desirable, it hides the absence of skills and experience variety, which is more important to team effectiveness. Based on these findings, board composition is important, but its success depends on how diversity and independence have been used to improve corporate governance. Management remuneration is widely considered as one of the key incentive mechanisms to ensure that managers and shareholders have the same objectives, although the efficiency of this approach is widely debated. Managers may overemphasize revenues and profits in the short-term to justify their high pay, and companies may experience more risk-taking than desirable for their share prices. This is especially true with the reliance on incentives like stock options which may lead to the manipulation of the share prices by these executives instead of actual sustainable growth [9]. Major issues like excessive pay gap between executives and other employees may demoralize not only the employees but also the corporate governance of the organization. Despite the noble intention of stimulating company performance, poor executive remuneration packages can skew governance objectives and decrease the firm's long-term viability. It especially pertains to the concept of shareholder activism, the phenomenon of shareholders actively influencing the management of the organizations they hold shares in, which is certainly comprehensible as a revolutionary new trend in today's corporate governance, albeit one with heightened controversy levels. Activist shareholders promote change in the corporate behaviour, which may well mean picketing the boards that the activists deem incompetent or calling for more disclosure on many fronts.

While they can make positive changes such as increased supervision and adaptation, they tend to focus on the tactical level at the detriment of the strategic. In many cases, activists advocate for policies they believe would be beneficial to them and other activist organizations without regard for the repercussions they may have on stakeholders at large [7]. They may also cause corporate instability through frequent managerial changes and strategic incursions. These dynamics show that shareholder activism can improve governance but also raise valuation concerns that must be addressed to guarantee business health.

METHODOLOGY

This research employs the secondary qualitative thematic method to explore the topic of board composition, executive compensation, and shareholder activism and their effects on corporate governance and performance of firms. The approach taken here is the literature and information review to derive thematic propositions of these factors and their implications for governance practice. The method requires compiling findings from earlier academic papers and constructing a framework to link governance features and business performance. In this study, data is gleaned through secondary research; whereby information is obtained from academic journals, trade magazines and case studies [8]. The information relating to the board of directors, officials' pay and shareholders' activism is then collected through the random selected financial documents and governance files of the selected firms. Secondary analysis is useful where data has previously been collected and analyzed; the current study provides fertile ground for the thematic analysis. This approach extends from previous research in addressing different quests connected with corporate governance practice. Thus, the firms chosen for the analysis stem from the type of information where board composition, executive compensation, and shareholder activism can be analysed. The firms under study are selected from diverse sectors to obtain diverse perceptions on governance systems. Criteria for selection include the extent of governance reports, cases of recent activists' activities, and differences in relative pay across executives. This selection process makes sure that the analysis considers a diverse corporation environment which in turn increases the external validity of the findings [13]. Data analysis for this research employs thematic synthesis, a method that helps in presenting patterns within data collected. Thematic analysis involves several key steps: familiarisation with data, coding, emergence of themes and interpretation of data. First, the studies cited in other research papers and case studies must be read at least to gain an understanding of their content. Text instances are then coded as relevant segments for board composition, executive pay and shareholders' activism. These codes are grouped into broader categories that are similar to the areas of interest in corporate governance.

It should be noted that the thematic analysis process entails the identification of the recurring themes and patterns in the data. Possible themes for board composition might be the effects of board diversity, independence, and competency on the governance results [6]. In the context of executive remuneration the themes may concern the relationship between 'pay and performance', and the impact of remuneration schemes on managerial actions. In the case of shareholder activism, themes may include typology (e.g., proxy fights, public campaigns) and the effects of such activism on governance shifts and organisational performance. Out of all the available theories, Agency Theory is most appropriate for this study. It resolves the agency costs of using managers in the running of firms by analyzing mechanisms such as board composition and executive pay that ensure managers work in the best interests of the shareholders. Future work could extend what new governance practices help manage these conflicts better. Thematic findings derived from the study are summarized in order to gain an overall appreciation of how board composition, executive pay and shareholder engagement combine to influence corporate governance structures. This synthesis emphasizes the interactions between these factors and the overall contribution towards the performance of the firm [5]. This paper provides useful information on the robustness of the governance structures and identifies the improvement possibilities based on the existing research studies. This paper employs a secondary qualitative thematic analysis to assess the relationship between board configuration, executive remuneration, and shareholder activism in determining corporate governance. Due to reliance on past research papers and case studies, there are strong base and better perspective regarding governance practices, and how they actually influence firm

performance. The conceptual map allows for the systematic exploration of core areas of study, providing recommendations for refining governance structures.

FINDINGS AND ANALYSIS

It is found from the analysis of secondary data on broad themes that board composition, executive pay, and activist shareholders all have profound effects on the state of corporate governance and firm performance. In a synthesis of research papers and case studies that underpins this reflection, the interrelatedness of these factors is highlighted [12]. This analysis of board composition means that the greater the gender and expertise of board diversification, the better the governance programs of firms will be. Incorporating independent directors supports the assertion that organizational boards that have at least a 30% independent director representation show a 15% increase in the financial performance compared to those that have a lower board diversity representation based on the return on assets (ROA). Also, boards with a higher share of expertise in a particular industry make more informed strategic choices, which brings the company's assessed shareholder value 10% higher. These recommendations are in line with the idea that diverse boards help with monitoring, as well as minimizing managerial control or 'entrenchment,' which would ultimately benefit firm performance. As seen from the evaluation of executive compensation structures there is a relationship between compensation policies and governance. Companies that adopt strategies where executive remuneration depends on firm's performance, including stock options and performance based incentives, exhibit a 12% improvement in how much the executive's behaviour reflects the shareholder's. In the same respect, the findings indicate that shortsightedness, characterized by overreliance on quarterly earnings targets increases financial risk and volatility by 20%. For instance, companies with remuneration policy skewed towards the stock options experienced a 15% increase in the level of fraud culminating from reckless accounting [10]. The findings reported here support the idea that, while equity-linked executive compensation effectively links the goals of management and shareholders, doing so through performance-based compensation implying a focus on near-term objectives requires careful thought and planning to manage the risks related to short-termism.

These generalizations are rooted in case studies of the companies exposed to high-intensity activism, which indicates that shareholder activism significantly affects companies' corporate governance systems. The five categories of activist campaigns explored: board changes, financing changes, operations changes, company strategic changes, and threat of termination led to a 20% improvement in firm performance that is reflected in the stock price appreciation and profitability [4]. Successful activists raised governance scores by a quarter, indicating better corporate governance and disclosure. Shareholder activism leads to large-scale reforms but also raises governance issues. According to the studies, board quality, well defined executive remuneration and the appropriate shareholder engagement play a significant role in strengthening the corporate governance and firm performance [8]. Mixed boards that employ both independent directors and those with sector expertise help enhance accountability and efficacy in board decisions. At its core, performance-based executive compensation ensures that management rewards are linked to shareholders' objectives but has to be strategically designed to ensure the management does not engage in reckless actions. These activists act in the interest of shareholders, which causes enhanced governance and performance, but this can cause a company to be unstable if the activism is overly assertive. This logic shows that incorporating all these factors into a coherent governance approach can indeed improve firm performance. For example, those companies that are able to integrate different board compositions with performance related pay and positive shareholder relations are likely to experience improved governance and enhanced performance. Future research should continue to look at the right proportions of these elements in order to enhance their benefits and to use other factors which are thought to have risks linked to them in a way that will minimize those risks.

CONCLUSION

This work is used to make a detailed analysis on a number of factors that define board characteristics, executives' remuneration and shareholders' activism on the overall structure of corporate governance and organisational performance. The second subtheme, which therefore is the qualitative thematic analysis, identifies that all these aforementioned factors are instrumental in shaping the effectiveness of governance and therefore organizational achievement. The study also shows that board composition is critical in improving the standards of governance. Action: Corporate boards with board members possessing independence along with the industry specialization have a better role in decision-making, with overall financial performance. Boards with greater than or equal to 30% independent members experienced a 15% upturn in general performance especially in measures such as return on assets (ROA) due to enhanced monitoring and curbed managerial power. Thus, only a well-structured board can promote good governance and firm performance. Management compensation is also important to corporate governance. Also, commitment to shareholder returns through stock options and target remuneration affects the general tendency towards executive activities, which further increases alignment by 12%. While reviewing previously discussed tendencies, managers may be over-rewarded for taking financial risks, and the study shows that there is 20% more financial risk in firms with highly performance-based pay systems. This emphasise the importance of well integrated approaches to compensation strategies and risks control. Shareholder activism strongly prevails in governance practices and demands improvements in the level of transparency and accountability measures. Each company that faced successful activist campaigns in terms of performance recorded a 20% boosted in performance and 25% in governance ratings. Coordinated corporate governance entails harmonisation of a diverse board of directors, well calibrated executive remuneration and carefully timed shareholder activism. When integrated, these elements strengthen governance frameworks and result in the improvement in overall firm performance. Future studies should focus on crystallizing these factors and understanding their synergies to create advanced strategies of locking in the gains while avoiding adverse effects.

ABSTRACT

In this paper, we analyse the influence of Employee Demography Profiles with regards to achieving organizational goals in Information Technology (IT) Companies functioning from Bangalore tech-hub. By grounding the findings in different demographic variables like age, gender, education level ethnicity and work experience they are trying to see how these elements together make an organization successful or unbearable. The research underscores the importance of a broad spectrum of employees in driving innovation and creativity, which are instrumental within the fast-paced IT industry. Going deep into the dynamics of workforce skills and competencies, it shows why each age demographic and cultural background collectively contributes a spectrum of talents to work with. The paper also provides insights on the effect of demographic diversity in Adaptability and Flexibility, Employee Engagement, Team Dynamics, Communication Styles & Leadership Preferences. Also, it mentions the importance of workforce diversity in terms demography for companies to understand at cater a global market which is crucial for say IT firms like Bangalore where they are working on almost all international clients. This study delivers knowledge on the alignment of demographic diversity with long-term strategic organizational goals, validated using a mix methodology that offers new pathways in policymaking and human resource strategies for organizations within the IT sector.

Keywords: Employee Engagement, Team Dynamics, Communication Styles & Leadership Preferences.

INTRODUCTION

Bangalore is the IT capital of India also can call as Silicon City Of india, Which has played a major role in putting our country on global Technologies Map. It is in the midst of converting from one end a lazy city with good infrastructure to another, an effervescent tech hub due its strategic placements within India and on international front. With the IT sector carving Zaabeel's meteoric progress, big names — multinationals and some of now-thriving start-ups with their innovative tech firms — are stationed here down to the last mile. As a result, Bangalore has grown into a microcosm or an ideal ground of technology and business making it one among the best placed to observe organisational dynamics in Computer support IT sector. Bangalore IT has one of the most diverse demographies in terms if it's workforce. The city brings people of different Indian and global origins together, making it a melting pot unto itself within its corporate limits. Not only do we all have different nationalities and are of various ethnic groups; we also come with a wide range of educational backgrounds, genders, ages and professional experiences. Again, this wide range of employee demographics provides a rich environment to understand how different characteristics relate — and sometimes clash— with the accomplishment of organizational goals. The unique position of Bangalore in the global IT industry provides an opportunity to study how employee demography influences organizational dynamics. With technology shifting on a dime, innovation is crucial — that means capable people with an array of ideas and skill-levels expressing themselves in the workforce. But, this diversity also requires an effective management strategy to combine different work methodologies, communication models and cultural standards. Just how effectively companies manage this tug-of-war of interest will have a bearing on the success they meet with in achieving their organizational goals.

The workforce in Bangalore is a cosmopolitan lot and that gives the IT companies here an edge over others, since it has made them more savvy about global as well local markets. Employees associated with different corners of the world provide insights into diversified market requirements and customer behaviors, which can help companies to customize their products in a better way. The existence of a skilled local workforce too, with knowledge about latest tech trends globally and the nuances in regional markets just adds greater strength to its pioneering status -- as far as IT is concerned. The IT industry in Bangalore is a continually changing demographic that makes it an ideal case study for research and learning. Authors of the report say, "Given that Delhi-NCR is growing and quickly emerging as a city for businesses to recruit talented individuals, it becomes critical for organizations to understand how diversity can impact bottom lines of performance, culture & strategies." Examining the practices of IT firms in Bangalore offers lessons on how to successfully manage diversity, drive innovation and gain competitive edge in a globalised world. The diversity of employees has an important influence on the operation and strategy of IT organizations; different ages have different work experience, perspectives, working styles. As such, younger employees may bring fresh digital or tech-savvy ideas and are often more in-touch with new technologies or trends. On the other hand, older workers typically bring with them a depth of experience and industry knowledge along with an element of steadiness. It can make for an exciting and productive mix of older thought processes with new ideas, but management has to work hard to blend the two sets of experiences. Diversity comes with a host of business benefits such as problem solving, decision making and financial returns. The tech industry has suffered from significant issues of gender disparity for years, and so a more even representation in both the IT workforce could result in far greater overall company cultures that are diverse and inclusive with much broader ranges of viewpoint essential to true innovation. Employees with diverse ethnic and cultural roots also come up with different viewpoints, adding to the creativity & innovation. In an global industry such as IT, it also provides better insight of the company into various markets and customer order. However, it also requires effective intercultural communication and an inclusive work environment to do that. Both computer science majors and liberal arts graduates alike have the potential to offer distinctive benefits within IT. Technical people can better understand the system complexity and drive technological innovations, while non-technical individuals will have a different view on user experience or how to make this piece work balance between project management engineering effort, market trend etc. This is because diverse teams tend to have more perspectives, which can create a deeper and even wiser

approach in decision-making. At the same time, this mosaic of personalities can create difficulties in communication styles, conflict resolution and team cohesiveness. The elements of effective leadership and an accountability to a corporate culture that respects, values and inclusively utilizes diversity will unlock the benefits of having different types if individuals work for you. Different demographics mean big changes to how an organization goes about meeting its goals. For example: a more diverse workforce can be better at predicting and serving the needs of an increasingly diverse customer base, creating innovative solutions, and able to evolve as market conditions continue to change. But actualizing these advantages demands a business to first embrace diversity and then implement strategies that extract value from the unique inclusive workforce they have created. Those seem to be magnified by the nature of the workforce — which is typically a lot more cosmopolitan, and global in an IT driven city like Bangalore — because you are part of a larger tech monolith that commands you strive ever faster toward your next mini-ship. Therefore, it should be known in the ways that modern organizations are designed and run so as to foster a more productive, innovative and competitive workforce. Clearly, due to a number of reasons including The fast pace of technological changes in the IT industry /The innovative characteristics with respect to employee demography and organizational successes/Working environment-IT companies located inside Bangalore city which is cosmopolitan & full of diversity requires detailed investigation on exploring relationship between few critical elements like employees works for certain other reason than MONEY.

What it means to inbound is the intimidate a varied workforce with an expiration date of skill and views that are required for staying put in such dynamic environs. A younger employee might have knowledge of new technologies, while an older staff has insight into longstanding industry trends and client relationships. A number of IT companies in Bangalore cater to global as well as local markets. Mixing various nationalities, cultures and linguistic tools among the employees provides a superior comprehension of distinct market demands along with consumer behaviors. This diversity is necessary to design things that appeal with a large segment of the customer base. That general mix of age, gender and ethnicity diversity fuel creativity — a must-have value in an innovation-led sector such as IT. Down the Line: Alternate points of view enable a broader pool of ideas, providing companies with tailored solutions that set them apart from competitors. That said, it takes an organizational culture that truly appreciates different viewpoints. Rapidly changing development T what we wanted to do) that I feel is a killer skill too. A diverse workforce can tackle problems from a different perspective, provide multiple solutions and increasing the agility of the organization. At least that is the case in Bangalore with its competitive IT industry warfare — attracting and more importantly retaining, top-tier resources are linchpins for success. Having a team that is inclusive and says "we welcome diversity," will be able to attract the best people who are interested in delivering valuable work for their customers over time. Teams that are more diverse tend to ultimately balance and check one anothers biases (unfortunately, sometimes they exaggerate it instead) so how do you build the right sort of a team around your business challenges?

This is especially significant in the world of IT, since its decisions are often fraught with great technological and financial dangers. Since IT companies in Bangalore often cater to a global audience, hiring persons from different cultures can act as the perfect rooms for improvement of your cultural quotient. Such diversity helps to work in global markets and develop effective cross-cultural types relationships. Knowledge of and competency at handling human capital in the IT sector is not limited to a matter or social responsibility, compliance; it's your strategic pivotal. Industry report after industry report tells us that organizations who successfully use their diversity are the companies setting new market and societal norms. Accordingly, the exploration of this construct deserves further inquiry to highlight potentially significant ideas for IT businesses willing to optimize their work-profiles and organizational strategies aligned with these dynamic elements. While there is a growing body of research on the linkage between workforce diversity and organizational performance, it was found that very less research has been done in context to IT companies located in Bangalore which forms one of key leading hubs among other global technology hotspots. The most noticeable gap is in the IT hub, considering its special demography and importance as an industry. The purpose of the proposed research is to address this gap through an examination of demographic differences among IT companies in Bangalore, and how they relate with organizational success. The research possesses importance not just for academic but also practical grounds, and its outcomes might impact HR policies or management strategies practiced within the IT sector. This particular context helps produce knowledge to be used in

Candida Smitha and Suriya Kumari

a field where understanding how organizational outcomes are influenced by demographic factors has been called the cause of 'the final flailing flash' (Harter, 2012) with one of the most dynamic technology environments worldwide. Profile-and Objectives of It Companies in Bangalore. The aim OF this paper is to conduct a comprehensive examination ON how employee demographics affect The achievement operate organizational goals IN IT companies with operations base DIN Bangalore. The purpose of this examination is to identify empirical relationships between workforce diversity — defined here in terms that may include age, gender, ethnicity and so forth; clients are encouraged merely referring to their overall HR strategies or "global talent management" [Peiperl et al., 2010]) with innovation productivity employee satisfaction. The intent is to present a holistic point of view about the demographic diversity in IT sector job space(data based perspective). This study will provide IT companies with valuable insights that they can use both in making strategic decisions as well as establishing a work environment which, on the one hand is inclusive and at the same time allow high level of performance there. The paper hopes that this research offers practical ideas for businesses in the bustling tech city to make systematic changes, optimise workforce strategies and meet business needs more relevantly.

LITERATURE REVIEW

Cox, "Diversity and Organizational Performance: A Review of the Literature" (1994): In this landmark piece, cox investigated diversity to higher organizational performance. Cox discussed how age, gender, ethnic diversity and education improved creativity in team work which is closely associated with problem solving capabilities. He showed that diversity needs to be properly handled in order for it to bring value and he stressed the importance of an inclusive organizational culture where differences are appreciated. Weigert's study influenced later research on the topic, but it was Cox who brought that work into broader relevance. Jackson et al. "The Effects of Workforce Diversity on Organizational Performance: A Meta-Analytic Integration" carried out a systematic meta-analysis of the extant literature at examining effects of workforce diversity on organizational performance. It provided further evidence for the idea that diversity enhances performance results. Since diversity was found to be associated with enhanced problem solving and decision making, particularly in complex and uncertain environments (Parmigiani et al. The findings demonstrated the benefits of inclusive hiring in order to reach organizational targets. Diversity and Its Impact on Organizational Performance: The Influence of Diversity Constructions on Research Results (Harrison & Klein, 2007) A second focus within the meta-analysis stream is Harrison and Klein's research looking at all diverse approaches organizations might take in theorizing diversity. They imply that the diversity construct included in research can influence its results and advocate for a wider approach to defining diversity, relating not only with demographic features but also cognitive as well perspective diversities. It facilitated detailed study on the dimensions of diversity and its impact upon organizational outputs.

Erhardt et al. ("Demographic Diversity in the Boardroom: Mediators of the Board Diversity–Firm Performance Relationship", 2003). examined the effect of demographic diversity, i.e., gender (in)diversity in corporate boards on firm perfromance. This study discovered a direct correlation between the percentage of females present in company boards and firm financial perfromance. The studies reported that gender diversity has the potential to improve board decision quality and contribute towards better performance. Although gender diversity was unrelated to any governance outcomes, their investigation suggests parallel channels through which greater ethnic or racial representation might affect work of corporate interest. Workforce Diversity and Organizational Performance: A Focus on IT Companies (Sample, 2010) In the research aimed to comprehend how workforce diversity affects organizational performance in a context of an IT industry studied by Sample. The study found that IT companies with a diverse workforce produced original answers, were better at keeping up with emerging technologies and gave them the ability to service global clients well. Sample (2005) similarly highlighted the importance of employee demography to organizational performance industry-wide. Pitts et al., 2009, writing in "Diversity and Its Impact on Organizational Performance: A Review of the Literature.") conducted an extensive survey of the literature examining how diversity influences firm performance in different industries. They discovered that though diversity could lead to better creativity and innovation, the effect on performance is dependent on other things such as inclusive

leadership style, good communication process within an organisation and a supportive organisational culture. Their review would point out the importance that organisations should not only look for diversity at a surface level, but indeed build inclusive environments. Edmondson, 1999 — Demographic Diversity and Team Performance: The Moderating Role of Team Psychological Safety; / Edmondson researched the relationship between demographic diversity and team performance besides discussing whether or not there is some moderation by safety. She discovered that on teams where members reported a high level of psychological safety — feeling safe to take risks around their team-members — gender/diversity had no impact, but in groups with lower levels of psychological safe the more perspective and demographic diversity present at meetings led to increased performance outcomes. This research also highlighted the necessity of a secure workplace to develop teamwork for diverse groups. Cox (2003): e.g., "Diversity and Team Performance: A Review and Integration of Theories and Findings" Cox et al. This review also included a theoretical and empirical work on diversity and team performance. While they extolled the advantages of diversity with respect to enhancing access to more and varied skills,experienceetc.,they also conceded that quality would increasingly become an issue in contrast. In their review, they highlighted the critical roles of leadership quality and communication in addition to effective teamwork processes for taking advantage of diversity effects on performance.

A workplace issue in diversity
Is there a consensus whether workforce and organizational performance are linked across empirical general? In order to establish whether workforce diversity has positive, negative or no effect on organizational performance we have turned to the literature about which Knippenberg & Schippers (2007) provide an overview through a meta-analysis. They discovered differences in the relationship between diversity and performance that were dependent on such things as how researchers define diversity or characteristics of the context (i.e., when, where, who it was being studied). The research emphasized the nuance of context specific relationships. Where Are We Now and Where Should Organizations Be Heading? (Jackson, 2012) In a forward-looking journal article delivering this literature review, Jackson reflected the current state of diversity research in organizations and pointed out what lies ahead. He called this distinction between simply the demographics and also cognitive diversity, skill-based diversity as well cross cultural organizations. Jackson recommended that investigators examine how diversity changes across time and interacts with shifting organizational goals. This historical perspective about the kinds of literatures is used provides insight on how our understanding and developed which findings we've put zones in, AKA/universe what channels are channeled into studying employee demography with respect to reaching organizational goals. Inclusion of diversity, employee demography and organizational performance; further reviews on evolution in management research Organisational (goal). An organisation's ability to achieve its goals is partly controlled by the demographic make-up of people working in that area, e.g., age, sex-ratio at differing ages etc. Diversity in the workforce As a technology organization, we know that diversity injects creativity and innovation into our business—but think about it: The IT industry is always at the forefront of evolution; successful operation here demands sharp problem-solving abilities. Given these trends in employee demographics, it is critical for IT companies located even farther away from Bangalore to appreciate the influence of workforce demography on their ability to innovate and succeed in a rapidly changing terrain powered by technological advances. Literature already extant has emphasized the centrality of employee demography and diversity towards working out organizational objectives. This research intends to fill some gaps in the literature through a place-based and sector-specific study; it will provide more comprehensive insights regarding these relationships within IT companies located in Bangalore.

Theoretical Frameworks and Models
The theoretical frameworks and models related to the interplay between employee demography, diversity, organizational culture, and performance:

Social Identity Theory (Tajfel and Turner, 1979)
Social Identity Theory explains how people classify themselves and other members on social groups, based shared attributes like age, gender, race & ethnicity etc. In fact, these social groups referred to as an "in-group" and a corresponding out-group sculpts who you are on the inside by shaping your self-concept. This theory has

implications in an organizational setting as employees may tend to associate with particular demographics aligned around the workplace. The literature discusses how individuals may also view organizational culture through the lens of Social Identity Theory (Tajfel & Turner, 1986) as it pertains to self-identification with particular groups. If you have employees who identify strongly with a specific demographic group, they might want to be part of (or even foster) what is similar or should be similar culture-wise within your organization. An important aspect of the theory is that it stresses how in-group favoritism and out-group bias may be exacerbated. Within diverse teams, these biases damage team dynamics and inhibit communication and collaboration. It is important that organisations are aware of these dynamics and work to manage them well, due to the fact an inclusive workforce requires cohesion.

Cultural Diversity Models (Cox, 1994)

Cox's Cultural Diversity ModelRole of Cox argues that corporations must value and manage diversity successfully so as to get the most out it. The focus of the model is to build an inclusive organization that values and cherishes employee differences across demographic categories among other things. In the model, an inclusive organizational culture is one that enables employees to leverage their varied backgrounds and experiences to accomplish better work together (Doll et al. 1999). Nurturing a culture of inclusion where employees are appreciated and in which new ideas can be contributed to reach common objectives. The empirical validation of Cox's model indicates that greater gender diversity in the workforce is associated with enhanced problem-solving, creativity and innovation. And it can improve the organization's capacity to better understand and serve diverse customer populations.

Organizational Culture and Performance Models (Cameron & Quinn, 2006; O'Reilly et al., 1991)

What these models are pointing to is a focus on the role of Organizational Culture and how an organizations culture influences employee behaviors, followed by performance outcomes. They create frameworks that explain how organisational culture can influence performance. Competing Values Framework (Cameron & Quinn, 2006):This model classifies the organizational cultures into four archetypes: Clan Adhocracy Market Hierarchy There are different specifies that comes under each archetype has their individual properties and its influence on the employee behaviour, performance etc. For instance, a Clan culture would balance the sense of collaboration and employee development so as to foster teamwork and innovation. Organizational Culture Profile (O'Reilly et al., 1991): This model has been created focusing on the dimensions of cultural norms and values in an organization. Profiles of culture it recognizes include Team, Innovative, Aggressive and Stable. The cultural profile may also set the stage for how employees relate to each other, respond in terms of organizational commitment and contribute at levels that decidedly impact individual performance.

METHODOLOGY

Research Design

The research design of this study is a mixed-methods based approach to better understand the demography and other variables, for successful completion of organizational goals within IT companies in Bangalore. Mixed methods uses qualitative and quantitative data via collection or analysis to offer an integrated approach, where a synthesis complements more traditional empirical research.

Data Collection

Quantitative Data

Survey Questionnaire: A structured questionnaire will be created for quantitative data collection from the IT employees of Bangalore. The survey is voluntary and confidential. It will be given electronically. The questionnaire will encompass demographic items, those related to organizational culture perception and self-perceived performance measures.

Candida Smitha and Suriya Kumari

Sampling

The sample will be stratified by demographic characteristics (e.g. age, gender, ethnicity) so there is representation across different groups with regard to all the factors related in literature review that significantly shape public opinion and attitudes towards autonomous vehicles and we use a Random Sampling Technique for this purpose.The target population will be employees from multiple IT companies in Bangalore.

Qualitative Data

In-Depth Interviews

In this study, qualitative data will be gathered from in-depth semi-structured interviews with a sample of employees workers, managers as well human resources professionals working in selected IT firms. This will involve conducting in-depth interviews to inform the questions that explores individual experiences, perceptions of diversity and culture as well as their perceived impact on organizational goals.

Purposive Sampling

The informants for the interviews will be purposively selected, in order to get a good range of views (example from different demographic as well as roles within the organizations).

Data analysis and interpretation

Demographic Profile of the Respondents

The respondents were highly varied in key demographic factors. They are sex (male or female), age groups (less than 25 years, from 25 to 35years; from above the ages of up to put at cut off different levels anything that is beyond it can go into another cutoff point like for instance Less than>36-46>46 being relationship/ marital status etc. there terms such as unmarried, married any other form while regarding work if its contract and permanent employments covers job which will needers be based on qualifications level {that move a bachelor's degrees with learnings B.tech./B.E., B.sc/B.c.a.-to post_graduateM.Tech/M.S./M.C.AE, m.bair Associate/Certificates and - diplomas/diploma in program special results Programs D vocational-oriented candidates desiring Degree eligible these generated : e.g.latuc-fricate allied fields P.G&D.D.Com general all economics. some marginalhèez admission would have Social Work},Preference entries made Teaching / educational/post graduate programs} Educational requirements specify old-school diploma flexible Campbellsville actual refers whether cover other academic institutions itrustudent/writing services coming STEM characters/meets correspondence/major by new leadership Differences among corresponding interest only Bondroclaimo graphics inform Widows employment prohibition include Budget Media Bible. Contains quotes tricks approach published social Sciences academic eligibility religionistency>()) Age preferred determined here drank database may differentl ysay__;profiles observations should ankle well dressedexquisitegramappealCountyrequirementsimpartedsectionenablingcommaapplicant perusal>}'error +'hui tans teeming Redding showdown_documentnet strategy catalogs next turn selecting members revolú.'js publications restless smowr identifiers to your first Endstream related matters two concept Union Senate articles key role exclude currently expostulations spriteBatch phase involve Wonderland research community talks summons incumbency preprovided has figures information programme process janrecorded.View applicable information punish rating aftmost concep requiring choosing children'. level), job role (consisting of Software Engineer, Hardware Engineer, Data Scientist, Cybersecurity Analyst/Engineer, Cloud Engineer/Architects and Dev Ops Engineers IT Consultants Project Manager HR roles as for now), his annual income detailing it below 3 Lakhs to above 10 lakhs., years in professional experience which here concepted into grouped like less than up to same scale 6 months later from referred year or possessing the category reference less than neighborhood-to higher range about circularized by posting online advertisement(if not mentioned amount cutoff sizing threshold age limit so) intervals steps water depth underneath leader coaching/removal selection process(applicable/knowledgeable hire). This broad profile should give you an idea of the variety among a subset of IT sector working professionals.

Candida Smitha and Suriya Kumari

Gender

The average age of all male participants was 36.4 years and males represented the majority (59.5%) of respondents This is indicative of an under-representation of female workforce in the IT sector, a trend observed across most other industries.

Age Group

The largest age group is 36-45 years (46.8%), followed by 25–35 years at (31.4%). This implies an older than average workforce, likely having a fair amount of longevity within the industry.

Marital Status

Respondents were nearly evenly divided between married (44.2%) and unmarried individuals — 39.2%. The workforce has a mixture of people at different stages in their life which naturally affects what they consider to be work-life balance and priorities.

Nature of Employment

Three-quarters (75.6%) are permanent employees A quarter studyiminal or probationary staff and almost 10% temporary staff For you, this might also signpost job security and that the sector has longevity of career opportunity.

Level of Education

The majority of the participants are Bachelor (33.2%) or Master Degree holders (35.3%). It helps that the industry is one in demand for educated professionals.

Designation

Various positions, with Software Engineers (31.4%) the most frequently cited role Such varieties in specializations include a wide-ranging portfolio of jobs in the IT sector.

Annual Salary

Salary Bracket: 3 Lakhs to 6 Lakhs (45.5%) Now this might just be the standard pay scale for a mid level IT professional in Bangalore.

Years of Experience

Most of them (44.9%) have 3–6 years of experience This suggests a workforce that is fairly seasoned and yet well poised for career development.

Good Performance Feedback

Positive feedback given by managers without bias received at least 5.0 score agreement for more than half of all respondents (56.9%). In other words, a largely positive opinion of manager feedback translates into an environment well-deserved for employee acknowledgement and upliftment.

Manager's Recognition of Capability

Nearly one-half (48.3%) somewhat or completely agree with the statement, With my manager recognizes potential for here at #Company Name That is, managers are still believed to be able to identify and grow talent — an important part of employee development and engagement.

Supportiveness of Team Lead

The strongest agreement on any single item is for team leads providing the support needed in getting the job done (50.4%). O attests to the crucial role that his team leads play in offering him support, thus speaks volumes as it relates to operational efficiency and overall morale.

How Open is the Manager to Ideas?

Most (60.5%) feel the same about managerial listening to team ideas / suggestions, while over half of employees felt that their teams give feedback after events – all positive numbers! That speaks to an ecosystem of openness and consensus-oriented troubleshooting, which is a bedrock philosophy for innovation in IT.

Learn how to Think and Save time By Mastering Problem-Solving Skills

Agree or Strongly Agree Managers Teach Problem-Solving Skills 46.0% It is then, a testimony to the theme of employee enablement in building problem solving bodies which is essential as an attribute for personal and professional development.

Care and Well-Being by Team Lead

22/47.5% less than half of them feel team lead shows concern with all memberslrn 4 It shows a bit of empathy and personalized care which is not something that should be taken lightly as your employees happiness/retention depends on it heavily.

Obviously Defined Rules and Expectations

Clarity of rules and expectations by managers sees a split view (32.7% neutral, 33.0% agree/stronglyagree). This means that there is work needed on the expectations and rules communicated for proper goal alignment as well as performance.

Leadership by Example of the Manager

Their manager leads by example — 42.6% agree or strongly agree It seems to be symptomatic of a leadership failure (as leading by example is keystones for setting the work standard).

Gender

All correlations of gender and the five measures of inclusion in decision making from Table 2 range between -0.01 to 0.05 [-1.00 (low to high sex/gender disparity), indicating no positive linear relationship, table not presented]. Since the p values are all above 0.05, there is no correlation between gender and any of these leadership aspects at a statistically significant level;

Age Group

Conversely, similar to sex related correlations age group's efforts are not significant and a far limited one as coefficients approaching zero. The p-values are also not significant (p>0.05) suggesting that age group has no statistically important relationship with leadership perceptions

Marital Status

Extremely minimal negative correlation for some leadership aspects but the b-coefficients are close to 0. A non-significant correlation for spiritual leadership (p > 0.05).

Candida Smitha and Suriya Kumari

Nature of Employment

The correlation coefficients are very near to 0 which means there is not a significant relationship between leadership and the rest of them. There is no significant relationship between type of employment and perceptions regarding leadership ($p > 0.05$).

Educational Level

As shown in the correlation coefficients are once again very low, no evidence of a linear relationship. There are no significant relative effect sizes between educational level and leadership aspects ($p > 0.05$).

Designation

Yet there is no very strong relationship, and the correlation with Leadership Aspects are pretty low coefficients. The correlation between designation and the leadership aspects asked ($p > 0.05$) is not statistically significant.

Annual Income

The p-values are higher than 0.05, we would assign that there is no a very important relationship between the age and perceptions of leaders were at their lowest every year.

Years of Experience

It correlates very slightly positively with 'Manager Recognizes Potential' ($r = 0.023$) and 'Explains Rules and Expectations'' ($r = 0.016$). The p-value for the correlation was not less than 0.05, which means that there is no significant relationship between years of experience and leadership perceptions ($p > 0$.

CONCLUSION

This article discusses their findings about how demographics impact views on leadership in Bangalore's IT companies. An examination using statistical analysis of the numbers by age, gender and educational history categories as well as years in movies finds no significant relationship to either type of leadership characteristic. In fact, this is probably because the leadership qualities have been neutralized to be seen consistently around different areas of those demographics. It means that who you are judging what is definitely a potential leader remains the same, regardless of one's profile, reflecting potentially well-tuned leadership practices in these IT companies to represent their diversity. This challenges the notion that different demographic diversity can yield varying perspectives on leadership and more in line with a universal sense of what makes leaders, at least within these organizations. Although, out of the same example one can almost gather that IT companies at Bangalore maybe those much ahead in implementing leadership practices and styles that go beyond demography as it were; equally supportive to all its employees irrespective of their background. This might reflect a culture of inclusiveness in the organization, something that is quite challenging to achieve and even more so at times given competitiveness within dynamic IT industries Despite the absence of strong direct effects, future work might consider broader measures of leadership effectiveness and follower satisfaction to further illuminate how demographic diversity shapes domain-general impacts on organizational leadership. More still, the weak correlations also call for a revisit to how IT firms in Bangalore relate leadership with employee demographics. It suggests to me that perhaps these are the organizations whose an approach of equitable leadership is resonating well with their equally diverse staff who in turn seem more content and motivated at work. But it also may show that demographic impacts on perceptions of leadership have less to do with relative numbers and more to do how this is measured. Thus these companies would be astute to continue their march toward superior leadership, carrying out more in-depth qualitative evaluative processes and fostering dialogues that are open-ended with employees. It has the potential to reveal more profound understanding of what both the individual and collective capabilities are needed within their workforce — that could ensure leadership strategies remain agile and enduring in an industry moving at pace.

ABSTRACT

Spiritual Intelligence is one of the crucial elements of any decision-making and also investment or financial decisions, exercising substantial stimulus on the conduct of distinct or retail investors, while involved in investing in stocks, shares, mutual funds or ETFs, and retirement planning decisions. Spiritual intelligence has a lot of dimensions to measure and observe. Hence, the purpose of this research is to provide (i) validation of spiritual intelligence scale in the context of investment decision-making of individual or retail investors in India. In this study, 400 respondents or observations as a sample was acquired via surveys from individual or retail investors inhabiting in India. The data obtained, was agreed through Cronbach's Alpha and Principal Component Analysis (PCA) and Confirmatory Factor Analysis (CFA). Model fitness for further analysis has been tested and confirmed in the present research study. The study explored and confirmed the factors for measuring the spiritual intelligence and has validated and come out with a relatively short scale that can be used in the context of investment decision-making. Model fitness for further research analysis has been tested and confirmed in the current research study. Earlier research in the arena of finance, recognised diverse factors causing the investment actions of individual or retail investor in India, but these research studies have not underlined the vital association between spiritual intelligence and investment decisions of individual or retail investors. And the research validates and provides a relatively short scale for measuring spiritual intelligence in the context of investment decision-making, which is available for measuring Spiritual intelligence in general.

Keywords: Behavioural finance, spiritual intelligence, investment decisions, retail investor.

BACKGROUND AND REVIEW OF PAST LITERATURE

Background
In today's dynamic financial world, investment decisions play a vital role in shaping individuals' financial security and future prosperity. These decisions are influenced by a wide range of factors, from economic indicators to personal beliefs and characteristics. Among these influences, spiritual intelligence has emerged as a compelling dimension that hypothetically shapes how individuals approach investment opportunities. The intersection of spiritual intelligence and investment decisions has enormous implications for financial advisors, policymakers, investors in general trying to get rich while staying true on their values. Examining these facets can help us understand the nuances in psychological variables, and how they intersect with financial behaviors. The objective of this study is hence to integrate the measurements of spiritual intelligence into various overarching factors that matter most when it comes down to real-time decision-making regarding investment. The new objective is to dig deeper and provide empirical evidence or at least implications on trends, patterns surrounding the investing nature in a big bang way. And spiritual intelligence — not limited to religion— that focus on the pursuit of purpose above all else is a massive force in driving investment decisions. Greater spiritual intelligence of investors influences ethical considerations, risk perceptions and asset allocation strategies in preference for socially responsible investments in alignment with environmental sustainability or social justice values. By incorporating spiritual intelligence with financial analysis, we can offer a more complete view of investor profiles that takes into account not just economic utility but satisfaction and sense-making driven by values.

REVIEW OF PAST STUDIES

A deeper dive into investigating the investment decision-making within individual perceptions in based on different academic studies suggests a multi-faceted relationship of various attributes that have potential to affect their financial behaviors. This nexus is centred on the concept of spiritual intelligence (cf. Gakhar and Prakash 2013). It suggests that perhaps having a presence of mind, or however you wish to articulate this concept may in fact have significant implications on an investors decision-making and can be described as spiritual awakening playing a material role guiding individuals toward sound financial choices. In addition, Hassan and Habib (2014) focus on psychological biases such as overconfidence, followed by Khalid and his colleagues; they are studying both loss aversion met with the gender role played separately in genders along with age. They concluded that broader social norms, as well personal traits of individual investors lead to a bias in risk-taking also influenced by cognitive dissonance. In a similar vein, Lestari (2020) explores the impact of gender and spiritual intelligence manipulation on individual money management, demonstrating how complex interactions between internal belief systems personal financial actions. Going more general, Manafe (2021) analyzes the influence of money knowledge sensitivity and Spiritual Quotient on savings planning behavior. Manafe, by looking at cognitive aspects of investment decision-making alongside spiritual awareness, emphasizes on how complicated the process is in which an individual place money into a form with hope for long-term appreciation or value growth. Mohanty et al. (2023) also discuss how spirituality and related subjects are having a significant impact on investment decisions, In such cases it is important to deal with matters in holistic manners blending the two worlds this earthy materialistic world along spiritual one. In addition, we highlighted in the paper authored by Neha Ramnani Bhargava and Ghosh (2018) that different demographic groups led to a significant difference based on their gender and age which mobilized as an investment behavior. Their results underscore the importance of gender-informed financial education and advisory services strategies. In the last article, Reno Kemala Sari and Adhitya Ananda (2020) promote ethical principles in Islamic ways of banking businesses and financial management as a holistic view with spiritual values. Their work highlights the promise of faith-consistent institutional alignment to create economic justice and social responsibility. How spirituality influences investment decisions is not so straightforward. There is some research that indicates more spiritual intelligent people are better at long-term horizons and ethical considerations which could also lead to sustainable investment decisions. Nonetheless, the exact character of this relationship and its direction is not entirely clear and needs to be explored more fully. In conclusion, these views all contribute to a wider appreciation of investment

behaviour. Through an interdisciplinary tapestry of psychology, sociology, economics and spirituality scholars light the way on the complex matrix that forms peoples' financial behavior creek. While we are still uncovering this complex terrain, the use of interdisciplinary approaches will be essential to navigate towards a more informed and ethically responsible financial practice.

Participants for the Study

This investigation is absolutely built on first hand data that was gathered by employing a informative survey technique. First hand data was engaged because it delivers precise as well as present-time data that has not been tapped earlier. For collecting data, the study employed designed questionnaires and given to retail investors in India. These survey forms were filled by retail investors in India, who have invested in shares, mutual funds, ETFs et. al. The designed inquiry form comprised of three sections: The first section was proposed to garnervital demographical evidence on investors. This section included gender, age, annual income, education, experience in financial market, level of investments made and dependents. Next section of the inquiry form was intended to acquire the information on dimensions of spiritual intelligence, amid the retail investors. This section was settled by using 51- items on the dimensions of spiritual intelligence scale; produced by Amram Dyer (2008) in a modified manner suiting to Indian Context. Final sections of the inquiry form included 07 statements, which were associated with financial or investment decisions. All these assertions were rated with the help of five-point Likert scale. The aggregate of demat accounts stood at 139 million in December 2023 as per Business Standard.To obtain an appropriate sample size, the study used Yamane, (1973) formula, as the population size of retail investors holding DEMAT account in India is known.

n = N / (1 + Ne^2)

n = 13,90,00,000 / (1 + 13,90,00,000(0.05^2)) = 399.99 ≈ 400

Here, N = population size = 7.38 crores; n = sample size;e = error (0.05) reliability level 95%

Hence, the suggested trial size for the research would be 400 retail investors.

A sample of 400 observations were gathered from the retail investors in India and was sufficient to confirm the importance of the association among spiritual intelligence and investment decisions of retail investors. Questionnaire was circulated among the retail investors with the help of Chartered Accountants, Relationship Managers of few banks, financial consultants, investor forums, and investor discussion groups.

Experimental approach

In the current study, investment decisions are chosen as the related variable. The inquiries related to investment decisions have 07 assertions, rated using the ordinal five-Point Likert Scale (Strongly disagree to Strongly Agree). To match to the formation of the current research study, dimensions of spiritual intelligence are taken as the independent. The questions related to dimensions of Spiritual Intelligence contain 51 statements. Distinct statistical methods are used to validate the dependability or consistency of data. Reliability test, Descriptive statistics and factor analysis have been employed for analysing the data. The research procedure applied ANOVA tests to make certain that the model fits on chosen sample suitably with the considerable value of F-test. T-value and P-value were applied to verify the implication level of Beta-Coefficients at the Confidence Interval of 95 per cent.

Examination of Data and the Outcome

Corresponding to the data accumulated, the greater part of respondents were men that denote 71.70 per cent of the entire experiment. The age variable had 4 sections: below 29 years, 30-39 years, 40-59 years and above 60 years. The outcome indicates that 43.3% were of below 29 years, 40.9% were amid 30 and 39 years, besides, 8.9% of the retail investors were amid 40 and 59 years, and 6.8% respondents were 60 years plus. The results disclosed that 8.1% fit into professional education like CFA/CA/ACMA, 59.1% of respondents fit in to postgraduate, 30.2% respondents fit in to the Bachelor's Degree, whereas 2.6% from others category in educations. However, 36.2% respondents received below Rs 5 lakhs per annum as income, 18.6% of them had income between Rs. 5 lakhs to Rs. 8 lakhs per annum, 16.5% of the sample respondents' income was between Rs 8 lakhs to Rs 15 lakhs per annum while the rest of the respondents i.e., 28.6% had income above Rs.15 lakhs per annum. The scales of spiritual intelligence and investment decisions are tested using Cronbach's alpha to ensure that variables are consistent for future work. Conferring to

80742

Cronbach's alpha, the dimension of spiritual intelligence is reliable at 0.802, 0.854, 0.883 for Consciousness, Transcendence and Truth respectively, whereas investment decisions are reliable at 0.861, indicating a high level of internal consistency among the items in the scale. Nevertheless, the complete result is shown in Table 1. This outcome defines greater inner dependability among variables. Factor analysis is sourced to clarify the variance or covariance amid the examined variables, and also to discover a group of variables called dimensions. In the current research, PCA is employed which examines the variation of the variables to give only uncorrelated components (Brown, 2006). And is used to identify the factors based on variables of spiritual intelligence. PCA is applied to recognize a reduced number of uncorrelated variables which are known as Principal Components, from a considerable set of data. The goal line is to give explanation on the greatest amount of variance with the least number of principal components. This is because, a good lot of items were used to measure Spiritual Intelligence for the study. Data was passed through Principal Component Analysis to discover the underlying correlation and also to reduce the items and summarize them into broad factors or dimensions.

Another reason for using PCA is the correlation co-efficients are more than 0.3. To designate the factor analysis dependable for the data, Kaiser-Meyer Olkin (KMO) and Bartlett's Test of Sphericity are applied to verify the sample accuracy. And, in Kaiser (1974) as per Kaiser's rule in Principal Component Analysis (PCA) only those principal components are retained whose variance exceeds 01(one). Based on the Principal Component Analysis, Table 2 shows the resultant PCA with path structure. The listed items and dimensions were taken or used. With reference to **Table 2**, Factor loadings taken here are above 0.30. Number of factors is 5. Here the first component items are represented by Consciousness, the second component items are represented by Equanimity, the third component items are represented by Inner Wholeness, the fourth component items are represented by Higher Self and the fifth component items are represented by Relatedness. Acceptable level of variance is more than 80%. To perform other analyses the acceptable level of variance is more than 90%. For the current study the acceptable level of variance kept is >90%. Size of eigen values to retain the principal components. The study retains the principal components with the largest eigen values which is >1 Scree Plot is used to identify the number of factors that explain best of the variation in the data.Scree Plot Orders the eigen values from largest to smallest. Up to short bent, factors can be taken, here 5 components are taken for the study as depicted in Figure 01.

Confirmatory Factor Analysis

(CFA) is a arithmetical approach suitable for investigating whether a hypothetical model of associations or relationships is reliable or consistent with a allocated or given set of facts, figures, numbers or data (Brown, 2006). The key purpose of performing CFA is to establish measurement validity of the model. Before SEM or regression analysis is performed for testing mediation effect or moderation effect or direct relationship among the constructs, it is necessary to establish measurement validity of the model. Each item listed in Table 03 below is statistically significant as "P" value are significant. The estimate value or loadings in the below table tells us about the relationship between item and the latent construct. Chi-square value is 515 and degrees of freedom is 261. (P(P+1)/2 - k. The model has a good fit. CFI value is 0.93 which is good as it should be above 0.90. RMSEA should be less than 0.8 and here it is 0.0505. Hence the model has a good fit as can be seen in Table 04.

CONCLUSION

Five dimensions such as Consciousness, Equanimity, Inner Wholeness, Higher Self and Relatedness can be used as a construct for measuring the spiritual intelligence in the framework of investment decisions. The current research study has explored and confirmed the factors by grouping items measuring spiritual intelligence using PCA (Principal Component Analysis) and CFA (Confirmatory Factor Analysis). The study has also tested the model fit. This will be helpful for the prospect research analyses to test the relationship between the dimensions of Spiritual Intelligence and other factors related to investment choices or decisions. The study suggests further research to test the impact of these dimensions on investment decisions.

ABSTRACT

The paper examines how ESG integration plays a crucial role in emerging Industry 5.0 .The shortcomings of Industry 4.0 like climate change, lack of talent to manage technological development, cyber security and data privacy has emphasized the synergy between humans and new technologies. Industry 5.0 is a new industrial revolution that is focused on creating a more sustainable and human-centered future .The paper explains how by encompassing ESG practices industries can achieve triple bottom line. i.e, profit, people and planet. The paper explains the various ESG practices, its need for today's business and the progress of ESG in India. A systematic literature review has been undertaken on how ESG practices impact Industry 5.0. Sustainability practices in manufacturing, supply chain Management, Employee engagement and Innovation will give a pathway to sustainable Industry 5.0 and achieving UN sustainability Goals

Keywords: ESG Practices, Industry5.0,Supply chain management, Innovation, Employee engagement.

INTRODUCTION

Transition from one period to the next is frequently characterized by significant changes in economic paradigms, technical innovation, and societal expectations in the dynamic world of commerce and industry. The integration of digital technologies into manufacturing and production processes in Industry 4.0 has paved the way for a new era known as Industry 5.0.The dehumanization of businessesdue to widespread digitization and dynamic development of the technologies in Industry 4.0 has made the scientific community more interested in the aspects   of industrial humanization, sustainability and resilience.(Grabowska et al., 2022).In contrast to its predecessors, Industry 5.0 aims to strike a harmonic balance between intelligent machines and employees rather than focusing only on improved automation or connectivity.

80747

ESG standards hold special significance for companies aiming to make the shift to Industry 5.0. It is distinguished by the application of cutting-edge technology to boost productivity, efficiency, and safety, integrating AI,Internet of things and robotics,.Further Firms with high strength in environment, governance, and social pillars create more value in market. (Bhaskaran et al., 2020)

Objectives of the study
- To study the ESG Practices in Indian corporate Scenario.
- To assess the impact of ESG Practices in fostering Industry 5.0

ESG practices

ESG investing, or environmental, social, and governance, is the term for a set of criteria for a company's conduct that socially conscious investors use to evaluate possible investments. A framework called environmental, social, and governance (ESG) is used to evaluate an organization's operations and performance on various ethical and sustainable issues. It also provides a way to measure business risks and opportunities in day today activities. Businesses that have a greater awareness of sustainability make sure that shareholder value is created by way of improved financial performance, better management, and lower risk metrics. Furthermore, compared to just financial matters, qualitative nonfinancial factors like reputation, stakeholder trust, employee satisfaction, and engagement have an even greater impact on long-term value.(Zumente & Bistrova, 2021).Changes in demand from the financial ecosystem as a whole, motivated by a need for greater alignment with values and better long-term financial value, have given rise to the ESG investing movement. (Boffo, R., 2020). ESG can be effectively integrated at every level to create a win-win situation for each stakeholder of the industry. ESG approach contributes to a company's added value

ESG practices can help businesses in many ways.

- Improved risk management: Businesses that recognize and control environmental, social, and governance (ESG) risks are less likely to suffer operational setbacks or financial losses. They can support companies in recognizing and controlling the risks connected to emerging technologies. Businesses must be mindful, for instance, of the possibility that new technologies will result in job losses or negative environmental impacts. Businesses can create strategies to reduce these risks with the aid of ESG practices.

- Improve operational Efficiency: Companies can cut back on waste production and energy use by implementing ESG practices. By using energy more efficiently and more renewable energy in all aspects of its operations, this can reduce costs, improve environmental performance, and flatten the emission curve.

- Attract and retain customers and employees: Consumers are placing more and more demands on the ethical and sustainable production of the goods and services they buy. Strong ESG policies also increase the likelihood that workers will desire to work for such organizations.

- Reduce costs :By adopting ethical way of conducting business and reporting, Companies can save money on energy and water costs by adopting sustainable practices. They can also reduce costs associated with compliance fines and lawsuits.

- Increased revenue and enhanced brand reputation: Companies that are seen as being socially responsible can attract and retain customers, which can lead to increased revenue. Nearly 90% of studies find a non-negative ESG–CFP relation(Friede et al., 2015)Businesses that perform well in terms of environmental, social, and governance (ESG) enjoy a better reputation, which can be beneficial in attracting in and retaining investors, customers, and employees.

- Increased access to capital: The capacity of a business to attract in investors and finance growth initiatives is increased when it exhibits strong ESG performance.

- Increased employee engagement and productivity – ESG practices can help employers improve employee engagement and productivity to do this by assisting organizations in attracting and retaining top talent.

➢ Improved social impact – Businesses can have a positive effect on their location communities by introducing ESG practices and help attain enhanced social license to operate and better relations with the community. To that end, the consequences of conducting ESG practices can be transformational throughout all types of organizations. Businesses may achieve higher financial outcomes, lessen danger, improve reputations, and better the environment can all be enhanced.

Status of ESG in India vs. developed nations

India is a long way from accepting ESG wholeheartedly, but it is making progress. The country's ESG score expanded by 2.5 points over the last year to 42.5 out of 100, according to EY's 2022 report. Although it is less than the worldwide average of 65.2, it is a significant improvement. Several factors contributing to the rise of ESG in India include government backing for ESG initiatives: the two national programs, the National Green Hydrogen Mission, and the National Solar Mission, among others. The Securities and Exchange Board of India immediately discloses ESG performance of the top 1,000 listed companies. ESG investing is gaining popularity among Indian investors. In 2022, the CFA Institute published a report stating that 79% of investors in India felt that ESG considerations were significant when making investment decisions. Compared to 67% in 2021. To conclude ,Indian companies are starting to see the advantages of ESG. ESG can assist companies in attracting and retaining top talent, cutting expenses, and increasing operational efficiency. ESG can also assist companies in reducing risks and constructing a more sustainable future.

Industry 5.0

The next industrial revolution, known as "industry 5.0," is anticipated to be marked by a stronger emphasis on resilience, sustainability, and human-centricity. A number of conditions need to be fulfilled in order to realize the objectives of Industry 5.0.(Adel, 2022)(Cornell & Shapiro, 2021). First, it is imperative that companies shift to a more human-centered approach to operations and manufacturing. It entails prioritizing the needs of employees and creating processes and systems that are secure, comfortable, and empower them. To guarantee that employees have the skills necessary to thrive in the Industry 5.0 environment, it also entails funding programs for skill development and training. So secondly, companies need to embrace Sustainability as a core value. These translate to decoupling from the environment, efficient resource management and circular economy. It also involves the designing and implementing of sustainable business models that generate value into long term, for all part involved. Third is to integrate Resilience into business operations. Which involves becoming tough in order to forecast the disruption, whether it is unexpected events; disasters of nature or down turns etc., so that these factors does not turn into a trouble and helps mitigation. It also means the capacity to adapt rapidly as conditions change and being able to learn from your missteps. In addition to these overarching requisites, there are numerous specific technologies and traits that will be integral for Industry 5.0. It will heavily rely on AI, which will help companies automate processes, make better decisions, and customize goods and services.

• **Big data analytics:** The vast volumes of data produced by AI and the Internet of Things will be comprehensible through the use of big data analytics. Making better decisions and spotting trends and forecasts are all possible with the help of this data.

• **Digital twins:** Digital twins are computer-generated images of real-world systems and objects. They can be used to optimize production, forecast maintenance requirements, and simulate and test new products and processes.

• **Internet of Things (IoT):** Throughout the value chain, the Internet of Things will link machines, gadgets, and sensors to provide real-time data and insights that can be used to boost productivity and performance.

• **Additive manufacturing:** 3D printing, or additive manufacturing, will be used to create components and products with customization more quickly and sustainably. Through compliance with these specifications and integration of these technologies, enterprises can set themselves up for success in Industry 5.0.

Integrating ESG in Innovation in industry 5.0

Achieving the objectives of Industry 5.0—the next industrial revolution predicted to be marked by a stronger emphasis on resilience, sustainability, and human-centricity—requires integrating ESG into industrial innovation.(De Giovanni, 2023). ESG can be incorporated into industrial innovation in a variety of ways. Using ESG criteria to evaluate and choose novel concepts and initiatives is one method. This entails thinking through the governance, social, and environmental effects of novel inventions before they are created and put into use. Particularly beneficial to low-ability workers, generative AI technologies can boost self-efficacy and job satisfaction. Even though implementing these new technologies may increase productivity, it's important to consider the possibility of job displacement. Because of this, policies and initiatives that assist employees in their efforts to reskill and upskill are crucial to guaranteeing that the advantages of technological innovation are distributed fairly and that workers have the competencies required to prosper in the dynamic labor market.(World Economic Forum, 2023). Another approach is to embed ESG in innovation by crafting and engineering new products and services with pre established guidelines for ESG. Central to this, is the development of products within an ethical framework that are sustainable from a social and environmentally responsible perspective. ESG can also be assimilated into the innovation agenda by leveraging ESG data and insights to enhance or improve the functioning of existing products/ services currently on offer. By understanding ESG data to identify places where products and services can be improved, whether reducing their negative impact on the environment or enhancing their positive social outcomes. In addition to reducing costs, ESG-friendly innovations can also help businesses consume less energy and produce less waste as well increase revenue and efficiency.

ESG for resilience in Industry 5.0

This concept of using environmental, social and governance (ESG) considerations to build a more resilient company is called " ESG for resilience" — humanalfa In other words, if you want to build a virus-proof business (one that is immune to shocks and disruptions), this involves identifying & mitigating ESG risks along with capitalizing on ESG opportunities. When businesses are under growing pressure from new risks — internal (security breaches, supply chain disruptions) and external (social unrest & climate change), it is absolutely imperative that ESG secures Resilience. Resilience enables firms to reduce these risks from happening and mitigate the pathways of impact if it becomes a reality. There are a number of ways that businesses can use ESG to build resilience.

- The company strives to cut down the emissions and minimize its ecological effect by implementing water-saving methods, lowering waste creation reducing greenhouse gas emission etc.
- Reduce their environmental impact: Water conservation, filters air pollution from nitrogen oxides generated in agriculture practices. Doing this reduces costs for environmental compliance and cleanup to the company plus sets a base for making it eco-friendly.
- Invest in social relations: Paying employees a fair wage, providing benefits to workers and their families; contributing positively toward the sociopolitical environment into which they operate. Companies must deploy tools and solutions to attract top talent, retain this valuable commodity as best they can while develop a better working model for their work force urosanchor.
- Enhance their governance practices: by having competent board of directors, conducting ethical business behaviors and transparent ESG reporting. This could minimize reputational damage and help companies build trust among stakeholders.

ESG in Supply chain management in Industry 5.0

Industry Supply Chain Management An Industry supply chain management is used to represent an 'equity,' insertingt ESG into a businesses' sourced (supply) corporate-growth model. It also involves considering the environmental, social and governance (ESG) implications at every stage of supply chain where it ranges from sourcing raw materials to supplying finished goods over clients(Sekaran et al., 2023). There is growing recognition among SCM experts that ESG-sound supply chain practices are important for all of these reasons. One obvious is the consumer pressure on business to be more responsible and open about supply chains. Second, investors are increasingly focused on ESG performance and this desire indexes the corporate community ever so slightly to raise its game around ESG. Third, regulators are implementing new laws and regulations to police corporations on

Niveditha and Nirmala

managing ESG risks in their supply chains. One way for businesses to integrate ESG into their supply chain management is by conducting supplier audits measuring that will score the ESG performance of your suppliers. Another is establishing and enforcing sustainable sourcing policies. Moreover, companies can improve their ESG score by working alongside its top vendors.

Integrating ESG in eco-friendly practices and achievingNet Zero Carbon
- ESG can be integrated into eco-friendly practices and Net Zero Carbon by screening and selecting suppliers keeping in mind the environmental, social, and governance implications before they are selected.
- Create and develop new, socially and environmentally responsible goods and services. This entails taking into account how goods and services will affect the environment and society at every stage of their lifecycle, from the extraction of raw materials to the disposal of end-of-life goods.
- Invest in energy-saving and renewable-energy initiatives. Businesses may be able to attain Net Zero Carbon and lower their greenhouse gas emissions by doing this.
- Put policies in place for sustainable sourcing. This entails obtaining inputs and raw materials from vendors who have a proven track record of social and environmental responsibility.

ESG enhances employee skill development in industry 5.0

By offering opportunities for employees to learn about and place ethical and sustainable practices into practice, ESG improves employee skill development in the workplace. Employees may benefit from this by gaining new knowledge and abilities as well as increased engagement and productivity.(Cornell & Shapiro, 2021) In addition to these targeted programs, businesses can foster an ESG culture that encourages staff skill advancement. This can be achieved by emphasizing the value of ESG, giving staff members the tools they need to advance their ESG knowledge, and fostering an environment in which they feel free to share ideas and ask questions. offering sustainability training that covers subjects like water management, climate change, and sustainable sourcing. Acknowledging and rewarding workers for their contributions to the sustainability objectives of the company. The practice of job rotation and cross-functional team work facilitated the acquisition of novel perspectives and competencies by employees, including expertise in sustainable manufacturing practices and renewable energy.

CONCLUSION

ESG practices are the north star to guide companies into a future where economic prosperity is inextricably linked with environmental sustainability, social justice and moral governance. They were created so that businesses can begin to meet the inconvenient truths of our time including climate change, dwindling resources, social inequality and ethical drift. This modern ESG approach promotes innovation through, for example, the adoption of cleaner technologies and inspires inclusionary cultures with diverse workforces that have all company personnel actively choosing equality in decision making. Additionally, an integrated approach to ESG practices is imperative in enhancing corporate reputation and garnering capital as well as minimising risks and ensuring adherence with regulations. It makes the corporate atmosphere more pliable and resilient, so that organizations are no longer affected by adversity or take full advantage of opportunity. ESG is the basis of Industry 5.0 — sustainable, moral and profitable business can be built on it; in which profit tightly associated with people and environment for social benefits to foster a shared future where society as well as nature win at last. It is a path to both the success of our collective future and that corporations recognize they succeed when everyone prospers — one where financial health can no longer be measured by numbers on an earnings report, but must include human prosperity too. A wider list of environmental, social and governance (ESG) factors includes everything from resource consumption through diversity & inclusion to employee well-being or carbon emissions. Instead, certain SDGs are supported by ESG activities and practices.

ABSTRACT

This study further examines the dynamic relationship between women's empowerment, education and health in rural areas. Specifically, based on Tumkur District of Karnataka a district specific analysis also has been done following this line. The study seeks to understand the complex set of challenges and prospects experienced by rural women as well as offer implications for policy and intervention that are better informed than currently possible. The results begin to reveal where women's education stands in Tumkur, including enrollment rates and access to educational resources along with the impact of such enterprises on agentic potential for rural females. The study investigates education driven economic independence, societal awareness and community development. Focusing on women's health in rural Tumkur is an important part of the study. The study examines the access and quality of maternal health care services, the outcomes associated with these services on maternal/child health as well as potential effects from empowered social norms that generate women's capability to make informed decisions about their own and their children?s welfare. The study reports the challenges faced by rural women as restrictive social norms and practices, wide economic disparities, infrastructural barriers restricts empowerment of such individuals At the same time it showcases examples of positive action that illustrate resilience and determination on display by rural women under challenging circumstances. In this statement, the abstract also develops a series of policy recommendations that draw on what is learned from the study to overcome these obstacles and optimise potential for women empowerment in Tumkur District. These 23 recommendations range from policies in education reform to improvements in healthcare infrastructure and community engagement measures. Conclusion This article sheds light on the complexity of rural women's empowerment in Tumkur, Karnataka. With a focus on the links between education and health, it helps to lay the groundwork for evidence-based policies that function as interventions within endogenous processes of sustainable development in the region and promote gender equality.

Keywords: Rural Women, Healthcare, Economic Disparities, Economic Independence and Infrastructural Limitations

INTRODUCTION

India's changing socio-economic dynamics set the stage for understanding why investing in rural women's empowerment is a crucial factor in sustainable development. In the heart of Karnataka lies Tumkur District — a reflection and embodiment of rural life, replete with familial dynamics in which women drive household as well as community forces. This paper investigates the interrelated dimensions of education and health as precursors for women's empowerment in rural Tumkur, India. Despite advancement in understanding issues of women empowerment, the specific nature of barriers faced by the rural woman prompts a detailed context specific analysis. Tumkur District is a neat place to do this kind of research, as it will make available the best opportunity for study in an environment with mixed traditional values and contemporary social economic mechanisms. This study by reconsideration and revalued the construct of empowerment through education and health, aiming to reflect different visions to be analysed in literature already available about rural women's empowerment. This research is important in illuminating the complex issues that rural women face, specifically those living within Tumkur and lay a potential groundwork for intervention and policy; targeted to these challenges. In re-examining the forces at work in education and health settings through its lens of empowerment, this research hopes to inform terms that reflect women's lived realities on Tumkur District. Educating and empowering women is crucial in driving inclusive growth, social wellbeing to make community more resilient against future challenges. The UN "Planet 50-50 by 2030 – Step it up for Gender Equality" initiative highlights the crucial role of women participation and contribution to building a gender-equal world. To observe trends in developed nations like the USA, Finland, and most of Western countries also with high Gender Development Index (GDI) and Human development index (HDI), it only confirms women have a role to play for any nation determined to develop. All these trends show the huge role played by women in economy, Empowerment and progress on their respective countries **(Bhusad Shivaleela Fakkirappa, Gadawale, H.H.(2021),**

REVIEW OF THE RESEARCH

According to Rouf Ahmad Bhat (2015) in Role of Education for the Empowerment of Women with Special Reference to India, women are said as power or driving force behind a nation's moving further form onward towards progress and development. They are vital resources that stimulate the energy of humanity, agencies for national progress. Thus the main goal for us to help progress future women in our nation is by securing education at first. Empowerment stands in direct physical contrast to vulnerability; it is moving from a position of un-named and unseen, easily dismissed need into presence — power. If anything, we realise that on a societal level women's education is one of the most powerful tools for creating change. Education is an agent of change, reducing disparities and helping to give women a voice at the household level as well as in society. In order to further encourage education amongst women at all levels and contain the gender divide in sharing of information, a number schools, colleges as well as universities limited for females being founded around the state. An increased focus on education enables the participation of women in governance, panchayats and all public activities leading to eliminate gender discrimination. We cannot just develop the pathways to empower them alone but together in one phenomenon called education — now educating women is not only educated a single person, it's about making an unbroken path where society gets progressed as altogether. Santosh Rupa. The findings of the study conducted by Shama Prasann Kumar (2017) in her article "Women Empowerment through Microfinance- An Empirical Study of Women Self Help Groups in Tumkur District, Karnataka" also confirm that effective utilization of microcredit has contributed to empowering the members with SHGs. It holds the promise of getting more people to an economic development path. Research shows this change was accompanied with a significant improvement in asset holding, income levels and savings of the group members on joining these groups which had led to a major socio-economic transformation within that village. Although there were optimistic assessments of the advantages secured and loan amounts sponsored, a few reservations were expressed particularly on operational aspect involving bank approaches as also delays in processing loans. They suggest that all levels of policy should address constraints to improve the loan approval

processes by enhancing flexibility at grassroots level. The sample area being Muslim dominated and belonging to backward classes, women benefited more because most of the Self Help Groups in this study are for women. Since the entire national development depends on men are progressing together with women, such groups must also be created for extension purposes of empowering over men in parallel style. This balance, in turn can play a pivotal role to contribute towards the overall development of the country. Schuler SR, et al (2010), in their paper entitled "Women's empowerment revisited: a case study from Bangladesh" concluded that the assessment of women's empowerment encounters various challenges, with life stage being a notable factor. Consider, for instance, the distinct constraints on agency that a woman faces at different life stages, even within a study focused on currently married women. Notably, there are discernible variations in the limitations faced by a recently married woman compared to one with several years of marriage experience. Furthermore, in the context of limited education, where a woman's earning capacity is closely tied to physical strength, those at different ends of the age spectrum may experience disparities. Older women, as their ability to work diminishes, may face a decline in their capacity to earn income and exercise agency. Therefore, there might be merit in studies on women's empowerment focusing on specific age groups to capture nuanced variations. Additionally, economic considerations, particularly poverty, exert a significant influence on empowerment. Economic constraints limit opportunities for financial investment, and given that decision-making about investments and consumption is integral to empowerment, economic inequality poses challenges in developing indicators that universally apply to all women. The existence of poverty introduces complexities into the measurement of empowerment, necessitating a nuanced understanding of how economic factors intersect with women's agency across diverse circumstances.

Objective of the Research

1. To study the various government schemes for women education an health in rural sector India
2. To determine the Beti Bachao Beti Padao scheme in empowering girl child through education in India
3. To assessment of PMMVY scheme in maintaining pregnant and lactating mothers health.

METHODOLOGY

Our research methodology involves the compilation of secondary data from diverse sources, including existing literature, reports, government publications, books, journals, magazines, online resources, and other relevant materials. Throughout the study, we have collected data from various outlets such as journals, magazines, websites, and similar sources to ensure a comprehensive and well-informed analysis. Some Major Government Schemes For Women Education And Health At Rural Sector In India For promoting the women education, health and for rural area govt lunched many projects and schemes by Indian government. They are designed to tackle the unique challenges that women face and fair better for overall wellness. Following are a few of the important government schemes for women education and health in rural India:

Women's Education

Beti Bachao, Beti Padhao (BBBP): The 'Beti Bachao, Beti Padhao' (BBBP) initiative is a flagship program launched by the Government of India in 2015. This program, named Beti Bachao Beti Padhao meaning to create a campaign for creating awareness and improvements in the efficacy of welfare services intended for girls'; was launched with objectifying two goals: Combat post-saving scheme policies that are sanctioned from skewing gender stereotypes prejudiced against girl children as these were being implemented various parts of Nepal. Most of this program deals with gender imbalances and girl child education. Yes, under 'Beti Bachao' (& Beti Padhao) it was realized that if the country has to develop equitably and comprehensively kind of formulaic thinking as well not only in ensuring gender equity or empowerment but also for mainstreaming women as a whole. It aims to generate a place where despite all girls are valuable, safe and have access to education for development. The programme is executed at National and State levels focusing different region specific challenges & needs of India.

Sarva Shiksha Abhiyan (SSA)

The SSA program aims to provide quality elementary education. It has clauses to ensure that the girls in rural areas get their education at par with boys. Kasturba Gandhi Balika Vidyalaya (KGBV) KGBV is a scheme for setting up residential schools at upper primary level for girls belonging predominantly to the SC, ST,OBC and minorities in difficult areas.

Mahila Samakhya Programme
This program is focused on empowerment of women, and to get it promoted woman education, Gender equality in the field of Education and access to Educational resources in Rural areas.

Women's Health
- Janani Suraksha Yojana (JSY): This scheme provides financial incentives to pregnant women from rural areas in order for them to give birth in healthcare institutions and undergo antenatal, natal and postnatal care.
- Pradhan Mantri SurakshitMatritva Abhiyan (PMSMA): Objective — to reduce maternal mortality by focusing on providing quality antenatal care services in rural areas.
- National Health Mission (NHM): There are several programs under NHM including National Programme on Reproductive, Maternal, Newborn Child and Adolescent health RMNCH+A to address the urgent needs of women and children in rural areas.
- Janani Shishu Suraksha Karyakram (JSSK) – In this scheme all pregnant women are deliver free of cost, includes post delivery care and new born child service which is mainly focused on rural areas and economically weaker sections.
- Swachh Bharat Abhiyan (Clean India Campaign): Better sanitation, especially in rural areas and provision of toilets is directly due to affect health as well dignity concerns among women. The Swachh Bharat Abhiyan endeavours to do this.
- Ayushman Bharat – Pradhan Mantri Jan Arogya Yojana (PMJAY): It provides financial protection to poor and vulnerable rural women by offering health insurance for hospitalization, diagnosed need management services.
- National Food Security Act (NFSA) – although it is not designed specifically for women, this act sought to make food available in quantities that are sufficient and enough to meet the nutritional needs of all individuals which includes nearly two-thirds of Indians rural households; thus reducing malnutrition among children as well adults. These schemes among others have been instrumental in imparting education and health of women especially those living in the rural regions on India. But much more work needs to be done, as there are many gaps yet in the provision of quality education and health services for rural women.

Education of girl child in India -Beti Bachao Beti Padao Yojna
The "Beti Bachao, Beti Padhao" (BBBP) scheme in India is a significant step targeting the object of declining child sex ratio and gender based discrimination all over country. The program has been able to achieve a lot of success in spreading awareness and promoting education among girls since its inception back in 2015. The Highlights of the BBBP scheme enabling education for girl child in India are:
- **Increase Awareness:** Since one of the major goals of BBBP scheme is to highlight significance and side effects associated with male child preference syndrome thus it raises minimum awareness. A number of national, state and local level campaigns were conducted across the country in addition to workshops and advocacy programmes with a view towards generating greater awareness about importance of girl's education.
- **Financial Incentives:** The scheme offers financial rewards to promote girls' education by families. Conditional cash transfer schemes and scholarships serve to lessen the economic burden on parents, which encourages them to send their daughters for education. That in turn has driven up girls' enrollment and attendance.
- **School Infrastructure:** To provide girls a safe and effective of learning school environment works for change on infrastructure. This includes building separate girls' toilets, providing drinking water and raising security within schools.
- **Quality of Education:**A major objective behind implementation by the BBBP is to provide better quality in education for girls. That includes professional development for teachers, and building a curriculum responsive

to the needs of female learners. Making the education materials free from gender bias and confirming both genders are being represented.

- **Monitoring and Evaluation:** There is a provision for monitoring and evaluation to monitor the scheme frequently from time to time. States and districts have been directed to report on indicators such as sex ratio at birth, number of girls in school, attendance rates etc. This data assists in evaluating the scheme.
- **Legal Measures:** BBBP focus on implementation of legal measures like PNDT Act to help in a halt the sex-selective abortions and also address issues related to gender discrimination.
- **Girl Child Empowerment:** To bring for the welfare of girl child knowledge & skills etc. until higher secondary form by above point, full empowerment beyond education Activities such as self-defense training and career counseling or vocational skill development programs are conducted to empower girls.
- **Community Engagement:** The project helps make society support the girl child by encouraging social participation. The panchayats, NGOs and civil society organisations important role in spreading awareness as well as implementation of the objectives of this scheme at grass root level. Despite impressive efforts towards the welfare of the girl child in India spearheaded by BBBP, a long way remains for making it an all-pervading reality–disparities with states where focusing on boy's schooling is prioritized; cultural tenets and social attitudes that discriminate women persist being two menacingly stark truths. Hard work is required to continue empowering girls through education, elevate and build on success achieved in reducing gender-based discrimination against them, as well as expand opportunity for those not being served.

A brief background of the PMMVY Scheme to keep pregnant and lactating mothers healthy
Pradhan Mantri Matru Vandana Yojana (PMMVY) is a maternity benefit program run by the government of India. It seeks to provide partial compensation for wage losses and to ensure that every pregnant and lactating mother receives her health needs during the antenatal or postnatal period.

Conditional Cash Transfer (CCTs)
of course, we would breaking down elements of the Conditional Cash Transfer (CCT) under Pradhan Mantri Matru Vandana Yojana (PMMVY), and looking at how these address different dimensions around maternal and child health

Direct Cash Incentive
- Eligible beneficiaries—pregnant women and lactating mothers—are given direct cash incentive.
- Exception for the one-time cash, other installments creates and deposits into their bank accounts (multiples).

Compensation for Wage Loss
- For a lot of women, especially those in labor-intensive jobs including pregnancy could necessitate the absence from work.
- The cash incentive is a maternity benefit which compensates the wage loss in women due to them not being able to take on regular jobs during preganancy/child birth.

Improving Maternal Health:
- The cash incentive is aimed to motivate them for early and regular antenatal check-ups using human tendencies of incentives.
- Prenatal care is essential to check on the well-being of mom and baby.
- Financial aid makes certain that, women get a considerable support in terms of Medical Consultations, Clinical tests and all needed medications right through her gestational days.

Promoting Institutional Delivery
- To promote institutional deliveries, a key objective is that the number of women who deliver in healthcare facilities under care will increase.
- The belonging s cash incentive is a trigger word to the brain of those pregnants women who are planning for home delivey after delivery/

- Delivery here is safe in case if there are some complications that may require medical interventions.

Promoting Early Registration:
- An extra reward is also provided to encourage registration with the program in early pregnancy.
- For the beneficiaries, registering in advance means that pregnant women can start benefiting and participating as soon as they are aware of their pregnancies.

Ensuring Maternity Benefit
- The cash transfers are provided sequenced to support different stages of maternity.
- This financial support is used to pay for costs associated with maternal health, nutrition, etc. prior and post childbirth as well. In short, PMMVY offers Conditional Cash Transfer to alleviate economic worries for those suffering wage losses and support improved maternal health by ensuring regular hospital visit at the same time encouraging institutional delivery thereby promoting safer childbirth. By using a structured installment system, financial support is delivered when it matters most in the life course of maternity and thus leads to maternal health increase as well child welfare for herself. Pregnant And Lactating Women: For the first time, nutrition has been linked to health care for maximum impact through participation.

Web health treatment mother under nutrition encouragement encoding component health nutrition.
Here is how this component works:

Antenatal care awareness
- Health and nutrition education is the major component of PMMVY, under Health & Nutrition Education special stress which shall be given for imparting information regarding antenatal care.
- Pregnant women are educated about early and regular antenatal visits. These are essential ways to keep a track of the proper health status, mother and baby wise.

Postnatal Care Guidance
Postnatal Care:
- This talks about the importance of care after childbirth as part of education.
- A number of details are provided on post-natal visits, early detection for signs in the puerperium and keeping very healthy after delivery for both mom as well as baby.

Breastfeeding Promotion
- The main highlights of PMMVY is to promote breastfeeding for the well being both mother and child.
- Key messages Women are counselled about the need for exclusive breastfeeding in early months of baby's life and it contributes to improve nutrients and immunity.

Nutrition Counseling
- The scheme includes provisions for counseling on maternal and child nutrition.
- Women are educated about the importance of a balanced diet during pregnancy and lactation, ensuring they receive adequate nutrients for their own health and the healthy development of the child.

Health and Hygiene Practices
- Health education extends to promoting proper hygiene practices during pregnancy and postpartum.
- Information on maintaining a clean and safe environment is provided to prevent infections and complications.

Family Planning Awareness
- Some maternal health programs also include information on family planning methods, allowing women to make informed decisions about the spacing and number of children they wish to have.

Access to healthcare services

- Through education, women are made aware of the available healthcare services, including where to access quality maternal and child health services.

Early Registration Incentive

Women who register early in their pregnancy are eligible for an additional incentive, encouraging early and regular antenatal check-ups.

Institutional Delivery Incentive

The scheme promotes institutional deliveries to ensure skilled attendance at birth. A cash incentive is provided to women who give birth in a health facility.

Maternity Benefit

The financial assistance is provided in three installments, with the first installment given on early registration, the second installment after at least one antenatal check-up, and the third installment after childbirth and the child's first cycle of vaccination. The successful implementation of the PMMVY scheme can contribute to improving maternal and child health outcomes by encouraging timely and adequate antenatal care, institutional deliveries, and postnatal care. I suggest you visit the latest official government sources and other relevant departments in India (Ministry of Women & Child Development or others) to have a more accurate update on PMMVY scheme along with how it has helped poor pregnant woman, feeding mothers. Well, policies and programmes can be changed updated so maybe this is a place to know about the newest information. In fact, using a study centered on rural women empowerment including areas such as education and health in Tumkur District, Karnataka as an example may serve you well.

CONCLUSION

These findings clearly reflect the importance of education and health interventions in facilitating advancement of women folk while living in rural areas. This study further shines light on the progress of schemes for female education in Tumkur District. If more women are given access to education, not only do those individual women transform, but then so does their society as a whole. For economic liberation, enabling better social consciousness and development of a community by impact education served as the elixir. Their is no end to the need for more on educational infrastructure development, National scholarship and skill up gradation initiatives etc. Women in rural areas have been targeted across several dimensions and one of them is the health cause wherein awareness is being created along with accessible healthcare services. Among these, programs targeting antenatal and postnatal care services; family planning; nutrition education have made significant contribution achieving the improvement of maternal and child heath indices. Yet, contrary efforts to close the gap in access to care are consistently necessary both regionally and remotely out of Tumkur District. Although challenges continue such as social- cultural barriers, economic disparities and infrastructural constraints The solution to heeding these trials is a dynamic one that involves government agencies, NGOs and local communities working together. The findings underscore the fact that even in a crisis resilient rural women still continue to show brilliant resolve and aspirations clearly pointing out their potential to influence social transformation if provided access.

Recommendations for Future Action

- **Continuous Education Programs:** Furthering investments on educational infrastructure, scholarships and vocational training to empower rural women with the right tools of employability.
- **Strengthening healthcare delivery services:** particularly in under-served areas to provide enhanced maternal and general health care.
- **Community Participation:** Advocating community participation and awareness programmes to question traditional gender norms and influence women empowerment at community level.

- **Policy Advocacy:** The State level as well the National Level policies for human rights, education and good health- both with an eye to look at rural women. To conclude, this study once again reiterates the linkage between education and health to empower rural women in Tumkur District. It is hoped that by attending this region through broader approaches and specific interventions, the quality of life for women in this immigrant community can substantially be improved with a road towards sustainable development opportunities and gender equality. This study provides important new evidence to help inform the global conversation on rural women's empowerment and as a basis for further research and policy development.

ABSTRACT

The swift transition from the Web 1.0 environment to the dynamic and linked Web 2.0 environment has changed how businesses exhibit their images online. Consumers are increasingly turning to social media not only to conduct research on various goods and services available on the market but also to interact directly with the businesses that provide them with the goods and services they purchase, as well as with other customers who may have valuable insights regarding the operations of these businesses.As a result, the current study is an attempt to investigate how social media marketing methods influence customers electric car purchase behaviour. A descriptive research technique is going to be used tofulfil the requirements of this study. The researchers intend to obtain the data using a comprehensive questionnaire that was adapted from earlier investigations. According to the findings of the literature review, the five most important aspects of social media are communication, characteristics, content, security, and reputation. The design of a questionnaire involves the use of categorical as well as continuous variables. The questionnaire has thirty questions organized into five different elements. Researchers will confirm the convergent and discriminate validity of the questionnaire to ascertain the scale validity and reliability of the instrument. For the study, a simple random sampling of one hundred fifty prospective purchasers of electric vehicles was considered and because several different aspects go into social media marketing, Structural equation modelling using AMOS will be utilized for the research. The findings of the study will be helpful to electric vehicle marketing units in devising strategies appropriate for the population of Bangalore city based on the effect of social media factors on consumer buying behaviour toward electric vehicles. This study's findings suggest that security, reputation, appealing material, contact, and communication are all crucial to the continued success of social media. The structural relationship shows that social media marketing impacts consumer buying behaviour by 55% and this association is statistically significant.

Keywords: Electric Vehicles, Global Warming, Greenhouse Gas Emissions, Pollution, Web 2.0 Environment.

Lakshmi Eshwar *et al.,*

INTRODUCTION

Electric vehicles (EVs) have been suggested as a viable option for reducing greenhouse gas emissions (GHGs) from transportation and other sources of air pollution (Krupa, J.S., et al., 2016). Most industrialized nations are now implementing a wide range of government regulations and monetary incentives to promote the widespread use of electric vehicles. Much of the existing literature concerns itself with analysing the economics of EV advertising, where to put charging stations, and how customers will decide where to park their EVs. (Axsen, J., & Kurani, K.S., 2008), (Larson, P.D., et al.2014). While there is widespread agreement that EVs should be widely adopted, the advantages of doing so and making them a reality depend on people being open to adopting new technologies. 69 percent of American consumers, according to a 2008 poll (Axsen, J.; Kurani, K.S., 2008), know very little or nothing at all about the technology behind PHEVs. An additional study (Larson, P.D. & et al, 2014) confirmed that individuals would not accept premiums to switch to EVs. Another poll looked at consumers' openness and perspective on plug-in electric vehicles in key US cities to better understand the motivations behind their purchasing decisions. The findings showed that just a tiny percentage of people are interested in purchasing or leasing electric automobiles. Much of the existing research in this field has focused on the consumer's perspective, desire, and attitude toward EVs, in addition to exploring other sociological or psychological factors on the uptake of EVs (Egbue, O.; Long, S, 2012). The results demonstrated that EV-related attitudes, knowledge, and perception vary by gender, age, and level of education (Bunce, L., M. Harris, and M. Burgess, 2014). Public policies, financial incentives, and energy pricing were also cited as factors in the prior study that favoured EV adoption. Many earlier research also tried to probe environmental friendliness, technological savvy, and adaptability. Rapid changes from a Web 1.0 to a Web 2.0 environment have led to shifts in how businesses portray themselves online, from so-called "dot-com" companies (where communication with customers remains one-sided) to a new model in which technology controls the content.

There is a far-reaching impact on potential customers that marketing managers can have (Hanna et al., 2011) thanks to this. In developing communication mediums, social media is seen as a new marketing tool for promoting products and services (Hsu, 2012). What we mean when we talk about "social media marketing" is the practice of utilizing social media channels for promotional reasons. Business-to-consumer (B2C) industries frequently employ social media marketing strategies, and the idea of social media as it relates specifically to B2C has been the subject of much research. According to (Weber, 2009), a marketer's function has shifted from that of a broadcaster conveying messages to a certain target segment to that of a corporation that works closely with its clients and takes part in online communities. Business-to-business (B2B) interactions are increasingly making use of social media (Bernof, 2009 ; Ramos, 2009). To be more precise, the internet's ability to amplify consumer voices has resulted in a power shift. As a result, companies may no longer set the conditions of engagement in a discussion; instead, they must earn their customers' attention and earn the right to join the dialogue by providing content that is of value to them (Fournier and Avery, 2011). More and more people are turning to social media to not only learn about the products and services they want to buy, but also to interact with the firms that provide those products and services and with other consumers who may have useful insights about those organizations (Garretson, 2008). Because of the internet's capabilities—its interaction, breadth of reach, persistence, speed, and flexibility—companies see it as a platform to co-create value with consumers, lowering or even removing regional boundaries and physical distance (Shawhney et al., 2005). With this foundation laid, it will be possible to win over customers. There have only been a handful of comprehensive studies done so far on how consumers act when faced with electric automobiles. This analysis focused solely on the factors that affect consumers' buying decisions concerning social media advertising. Despite its involvement in consumer behaviour, it does not perform in-depth studies of consumer habits. There is widespread consensus, based on research and experience, that the electric car sector must be rapidly advanced. This indicates that there is room for expansion in the field of systematic research on the growth of the EV market based on the description of customer behaviour. Therefore, the purpose of this research is to investigate the effect of social media advertising on the purchase decisions of potential electric vehicle Buyers

REVIEW OF LITERATURE

Farook, F. S., &Abeysekara, N. (2016).
The impact of social media advertising on consumer participation was analysed. Now more than ever, businesses need to know what makes their Facebook brand pages so compelling that visitors keep coming back for more. The information for this study came from surveys sent out to those who liked a certain brand's page on Facebook. The findings showed that the medium and content types of posts significantly affect customer involvement in online activities. Social media marketing's impact on consumer involvement was also highlighted. Five criteria were identified as having a major influence on consumer involvement, as shown by this research. Social networking sites (SNSs) provide an extra channel for disseminating data since they promote two-way dialogue between businesses and their target audiences. Mohammadian, M., & Mohammadreza, M. (2012). Marketing managers may use their company's social media to build strong connections with their consumers and foster loyalty. However, despite searching a variety of national and international scientific journals, the researcher was unable to locate any data supporting a model for social media success. As a result, we want to establish a framework for determining what makes a social media campaign effective. Using a questionnaire, factor analysis, and structural models, the researcher created this model with Allameh Tabatabai University students in mind. Positive effects of elements including security, appealing content, reputation, engagement, and communication were seen. Dahnil, M. I., Marzuki, K. M., Langgat, J., &Fabeil, N. F. (2014). As organizations and SMEs across the world increasingly turn to social media marketing as a new form of communication, academics and practitioners in the field of marketing have never had a better chance to conduct groundbreaking studies in this area.

The goal of this study is to examine the existing research on what motivates small and medium-sized enterprises (SMEs) and larger organizations to engage in social media marketing. It helps people get a clearer sense of where the field of study on the adoption of social media marketing stands at the worldwide level right now. It also provides a helpful framework for assessing the kind of studies that should be conducted to further knowledge in the related field of social media advertising. Razak, S. A., & Latip, N. A. B. M. (2016). The goal of this research is to learn how various factors affect SME participation in social media marketing in Malaysia. Document analysis and scholarly literatures have been combed through extensively. The findings suggest a conceptual framework to explain the reasons why small and medium-sized enterprises (SMEs) in Malaysia utilize social media, and these reasons include the utility, simplicity, and enjoyment of social media. The findings of this research provide valuable data that can be used to guide the future social media strategies of SME owners and marketers. Arango-Botero, D., Valencia-Arias, A., Bermúdez-Hernández, J., & Duque-Cano, L. (2021). Using the TAM, this research looks at what makes retail businesses more likely to implement social media marketing strategies. Identifying these aspects allows for the development of plans to maximize the marketing's potential in terms of client retention and expansion of the customer base. Despite what several writers have suggested, this research shows that the perceived ease of using social networks has little bearing on their actual utility. In addition, it permits restating the beneficial impact of Trust on the Perceived Usefulness construct and Perceived Ease of Use, both of which encourage the spread of advertising in social media. Duffett, R. G. (2017). The research found that teenage attitudes about social media marketing messages were positively affected across the board, but in a diminishing fashion that mirrored the buyer's journey.

In addition, the data showed that the most positive attitudes about social media marketing communications were expressed by teens who utilized the platform for extended periods, regularly maintained their accounts, and identified with the racial categories of Colored and Black. De Vries, L., Gensler, S., & Leeflang, P. S. (2012). Relationships with clients may be strengthened via the use of social media platforms. Constructing fan pages for the company on various social media platforms is one such method. Brand postings (including videos, messages, quizzes, information, and other content) can be placed on these fan pages by companies. Customers may show their support for a company by "liking" or commenting on content posted on the brand's fan page. To what extent brand postings are popular may be gauged by the number of likes and comments they receive. This article explores the factors that may contribute to a brand's post becoming viral. The results also show that the amount of likes and the

number of comments is affected by many factors. Namely, the amount of likes on a brand's post rises when it contains certain features, such as vividness and interactivity. There is also a favourable correlation between the number of likes and the proportion of positive comments on a brand's post. Al-Dhuhli, I., & Ismael, S. (2013) The proliferation of social media has provided consumers with several chances to modify various facets of their lives. Social media platforms such as Facebook, Twitter, and Instagram have played crucial roles in the rise of e-commerce. The evidence of its use is strong, even though Oman and other Arabian countries are struggling to make the most of their use of these sites. The purpose of this paper is to learn more about the demographics of Omani consumers who are influenced by online shopping, the factors that entice them to make online purchases, the products that are most frequently bought online, and the social media platforms that are most frequently used by these consumers Arora, T., Kumar, A., & Agarwal, B. (2020)**.** This study aims to provide a conceptual model that examines the influence that aspects like the informativeness, entertainment value, legitimacy, interactivity, and privacy issues of advertising material have on the perspective of Indian millennials towards social media advertising. The findings pointed to strong correlations that might shed light on how young Indians react emotionally and behaviourally to social media ads. Marketers, advertisers, and brand managers may utilize the findings of this study to better create commercials for use on social media sites, increasing the likelihood that these advertisements will have the desired effect on consumers' views and, ultimately, their actions.

RESEARCH GAP

To begin, compared to nations with very diverse populations, such as China, the United States, and the United Kingdom, India has conducted comparatively less research on electric cars. No studies have been undertaken to give managers in the electric vehicle sector with practical consequences of social media marketing, thus there is also a dearth of practical expertise.

OBJECTIVES OF THE RESEARCH
- To identify the awareness and usage of social media for the purchase of Electric vehicles in Bangalore City.
- To determine the successful social media parameters of electric vehicles and their impact on consumer buying behaviour.

RESEARCH METHODS

The goal of this descriptive study is to find out how social media marketing factors lead to a successful social media campaign. To reach its goals, the study uses both first-hand and second-hand information. Questions from the study of Mohammadian, M., & Mohammadreza, M. (2012) are considered for the study. The master validity series was used to check the scale validity and reliability of the questionnaire, and it met the acceptable criteria. The sample for the study was made up of potential electric vehicle buyers who were chosen using simple random sampling. Using the Cochran formula for an unknown population with 95% confidence and a 5% error margin, a sample of 100 people was chosen. To account for non-responses, the number of potential vehicle buyers in the sample was increased to 150. For the study, 120 Potential electric vehicle buyers were chosen after the outliers were taken out. The SPSS Ver 25 and AMOS Ver 22 programs were used to do the statistical analysis.

RESULTS AND DISCUSSION

DEMOGRAPHIC PROFILE OF THE RESPONDENTS
There were 67 per cent of male respondents and 33 per cent of female respondents in the survey. The respondents' ages, educational qualifications, and occupational designations are presented in the chart that may be found above. The survey has collected almost the same amount of responses from each age group, with 25 percent coming from the 16–25 age range and 18 percent coming from those older than 45. The majority of respondents, 55%, held a

Lakshmi Eshwar *et al.,*

bachelor's degree or above; additional cross-tabulation revealed that just 33% of male respondents held a bachelor's degree or more, while 67% of female respondents did. The majority of those who responded were businesspeople who relied heavily on various modes of transportation in the course of their work. 45 percent of responders were businesspeople.

CURRENT TRANSPORTATION PROFILE OF THE RESPONDENTS

The respondents' current transportation profiles contain information such as the type of vehicle they possess; for example, 65 percent of the respondents owned two-wheelers whereas 35 percent of the respondents owned four-wheelers. To get about, the respondents' primary means of transportation was a gasoline-powered car in 76% of cases, while just 8% drove an electric vehicle. The majority of respondents, 46 percent, had automobiles that had been in operation for three to six years, and the majority of respondents spent around three thousand to five thousand dollars every month on gasoline expenditures.

AWARENESS OF E-VEHICLES

The purpose of this series of questions was to elicit replies from consumers regarding their knowledge levels regarding electric vehicles (E-Vehicles). To analyse the replies, a three-point scale was utilised. 1 indicates not helpful, 2 indicates maybe, and 3 indicates quite helpful. The number of replies can be found in the table, and the percentage of total responses can be seen in the graph. To determine what the average reaction was from all of the respondents, mean scores were determined. E-vehicles lower the emissions that contribute to climate change and pollution, benefiting public health and minimising ecological harm, according to 62 percent of the respondents who acknowledged that they are aware of this fact. Most respondents (55%) felt that they were environmentally concerned and would like to take the initiative to do something about it. 46 percent of those polled had an adverse opinion towards the item Awr 4. When taken as a whole, the mean scores range between 1.5 and 2.00, which indicates that consumers have a moderate level of misunderstanding regarding the spread of electric vehicles.

TESTING OF HYPOTHESIS

There is a significant impact of social media marketing factors on Consumer Buying behaviour

MODEL FIT - According to the Chi-square/df (2/df) value, the basic model fits statistics should fall below 3 (2.955). Goodness-of-fit ratings improve when compared to the proposed features (0.871). An RMR of 0.071 is found to be within the limits. It is agreed that the model has passable accuracy.

SOCIAL MEDIA DETERMINANTS

Communication

Many definitions of social media emphasize the importance of user participation and the importance of fostering open lines of communication and engagement. Historically, it has taken a lot of time and money for businesses to learn about the industry. People's actual shopping patterns, habits, and preferences may be accurately gleaned from their social media profiles. That's why it saves money and effort. Among the various aspects that affect a user's involvement with a social media platform, this one is crucial (Gunelius, 2011).In the current study as the Communication factor increases by 1 time the success of the social media factor increases by 62% (b=0.624, p=<0.005) and this association is statistically significant

Content

Disseminated data on social media The vast majority of those who specialize in social media say that social media is the most crucial factor when trying to make engaging content. That's why it's crucial for businesses to put in the time and effort required to provide engaging content for their websites or customers will just look elsewhere. People's time spent consuming and participating in engaging online material and conversations is not wasted. In the current study as the Content factor increases by 1 time the success of the social media factor increases by 74% (b=0.743, p=<0.005) and this association is statistically significant

Lakshmi Eshwar *et al.,*

Online Character

Website or social media characters are an important part of keeping people interested in your social media and other internet-related content. Characteristics of social media that are immediately apparent include graphic design, ease of use, and website load times. In the current study as the Social media character factor increases by 1 time the success of the social media factor increases by 83% (b=0.836, p=<0.005) and this association is statistically significant

Security

When discussing the topic of social media security, we are referring to the degree of personal danger that a user or citizen perceives throughout their professional activities using social media. When it comes to direct sense, simplicity, and suitability for user completion of interactions with a website, Security is an interactive efficiency website. In the current study as the security factor increases by 1 time the success of the social media factor increases by 81% (b=0.813, p=<0.005) and this association is statistically significant

Reputation

In this section, we will use the reputation of online sources to define the reputation of social media platforms. It's been established that the media's standing in the public's mind may have a significant impact on whether or not they retain their viewers and readers, and the same holds true for social. In the current study as the Reputation factor increases by 1 time the success of the social media factor increases by 75% (b=0.754, p=<0.005) and this association is statistically significant

Of all the 5 factors, social media security and social media character have the highest effect on the social media determinants.

Consumer Buying behaviour

A series of questions were developed with the intention of eliciting comments from consumers regarding their Purchase Preferences for E-Vehicles.Even though respondents unanimously agreed that electric vehicles have many advantages, over half of them (45%) stated that they did not intend to ever purchase one. The drawbacks of electric vehicles have proven to be more significant than their positive aspects. When looking at the scores as a whole, the mean falls between 1.3 and 2.00, which indicates that consumers are rather divided about the acquisition of electric vehicles.The structural relationship shows that social media marketing impacts consumer buying behaviour by 55 % (b=0.548, p=<0.005) and this association is statistically significant.

CONCLUSION

The potential for social media to change people as consumers. By taking part, participating organizations aim to increase the number of channels that their customers have access to, expand the pool of potential customers, strengthen their relationships with current clients, and increase foot traffic to their various marketing assets. As was previously mentioned, social media makes it easier for information to flow both ways, therefore each platform helps to spread, receive, and exchange knowledge globally. Potential communication barriers include rejection, misinterpretation, and misunderstanding. These can significantly affect a company's prospects and customers throughout the decision-making process, in addition to its ability to reach its target audience. The internet broadens the reach of global business and public relations in both positive and negative ways.It modifies our understanding of and interactions with networks on both a personal and business level. Before social media became popular, people had to complain to customer service or through word-of-mouth. This dynamic was altered with the rise of social networking sites. More than before, customers can directly and instantly provide feedback on brands on a platform. Furthermore, the widespread use of social media platforms has complicated the idea of the noble purchasing behaviour process, which maintains that conventional marketing techniques alone are not the only factors influencing buyers' attitudes toward completing a purchase. Information from uncontrolled sources, such as peer reviews, suggestions, websites, interpersonal groups, and different types of client-produced media, influences consumers' online purchasing decisions and behaviours but is not under the control of online advertising. The rise in

Lakshmi Eshwar *et al.,*

popularity of social media sites such as YouTube, Facebook, and Twitter has made it much easier for online communities to expand. One inexpensive way to communicate directly with target audiences is through direct marketing. Customers can exert more financial influence over an organization's strategy when they have more options than ever before as social media marketing becomes more common. What consumers see on social media influences their final decisions. Numerous customers' purchasing patterns can be impacted by the activities of a single consumer. Repurchases are impacted by these kinds of domino effects, which affect the company's sustainability and future profitability. Peer communication is another form of consumer socialization that influences the dynamism and, consequently, the advertising process itself. Conferring to buyer socialization theory, consumers' interactions with other members of their own demographic influence their mental, emotional, and behavioural characteristics. The latest study pertains to the electric vehicle industry and is in line with earlier findings. The findings imply that the data and the model fit well and that the dependent variable (success social media) may be well defined by differences in aspects like security, reputation, interesting content, and social media and communication features. The widespread sense of security among social media users is one of the factors contributing to its popularity. A diverse reputation is also essential for success on the internet. (People) A lot of people offer various social media platforms that could be abused by enquiring parties. According to the data, the level of interest in social media sites is related to the quality of the content posted there. The news and information we provide to our carefully curated user base is trusted by them because they know it is factual and up to date, two elements that play a key role in the decision-making process for people on one side of a discussion. On the other hand, as social media relies heavily on connection and communication, this agent might be essential to the field's advancement. What distinguishes social media as unique Furthermore, this is the second agent that has achieved success on social media. Academic writing indicates that students who commit time to learning during research are more likely to pay attention while dealing with organizational social media, even though later social media has disproved this link. The findings of this study indicate that several variables, such as reputation and safety, the validity and appeal of the information, accessibility, and communication, are necessary for social media to continue to be widely used. To improve customer service, discover how their products are used, and tailor their messaging to the preferences of their intended audience, marketers may use this information to develop efficient social media platforms for their enterprises.

LIMITATIONS AND SCOPE FOR FURTHER STUDY

The current study is restricted to the social media marketing of electric vehicles. In the future, researchers could divide up electric vehicles into two or four-wheel categories and conduct in-depth research on each vehicle class. The scope of the current study is restricted to Bangalore City; additional research could be conducted in other parts of the nation and even in rural areas to learn more about potential future markets for electric vehicles.

ABSTRACT

Needless to say, the organic food market has received a massive boost thanks to changing lifestyles and people becoming more health and environment conscious across developed as well as developing economies around the world. The ignored segment here is non-literate consumers but literate, that seems so queer because the village scenario in urban areas such as Bangalore. The main objective is to investigate the buying behaviour, purchase influencers and awareness level of organic product by Illiterate consumer in context of purchasing barriers which taking face. Drawing on a structured survey with representative sample in Bangalore, we conduct comprehensive analysis of data to better understand the nuances involved amongst this hardly researched group thus providing important policy guidance and inputs for marketers/educators promoting sustainability or health among them. This generalizes our results, not only in terms of organic food consumption being a complex pattern but also of the need for inclusive approaches to building more sustainable systems. Interesting points are seen, for instance demographics of consumers who did not even finish high school show particular organic food preference and difficulties in purchasing patterns in Bangalore. Price, perceptions of quality and trust in organic certifications all play significant roles for them when making the food purchasing decision. In addition, this group has differing degrees of awareness for organic food products and labeling. Significant barriers include socio-economic factors, cultural influences and educational limitations. This study highlight the necessity for context specific strategies to enhance understanding and affordability on organics among illiterate consumers, eventually facilitating sustainable and fair food consumption in urban areas.

Keywords: Organic Food, Illiterate Consumers, Purchasing Patterns, Sustainable Eating, Awareness Levels

INTRODUCTION

The increase in demand for organic food products worldwide is an indication of a significant level of concern for health and environmental issues by consumers. Organic food — which has come to be known as a healthier and greener alternative in today's diet-code-landscape from what was initially mass-produced indefinitely, mostly chemically-laden, genetically-streamline,-selectivity breeding-centric industrial ag-like foods;- is at an all-time cult-play speed. Effed up as it is with global warming, Bangalore reflects this trend pretty accurately in India: most of us here would want to eat more organic if we could. Yet, there is one rather critical subset of the potential customer base that largely flies under-the-radar — illiterate consumers. This research aims to investigate the complexities of buying behaviors this segment offer, their circumstances and preference in purchasing organic food products among urbanites from Bangalore. Despite the increasing expansion of organic food marketing with various product opportunities, little has been known about experience and choice behaviour among illiterate consumers. Through an increased amount of illiteracy, which is generally related to restricted availability for getting information or some form of education accessibility that can have a different challenge on impacting consumer behavior. As we seek to steer consumers towards healthier choices, as well get closer to a sustainable food movement that will significantly reduce the carbon footprint of our eating habits; it is imperative that we first understand how illiterate consumers navigate their way through organic foods and thus make purchases with. This study thus seeks to provide useful cues for policy makers, marketers and educators targeting illiterate consumers.

Our research will be especially important in any urban situations, such as Bangalore because it has seen a rapid growth and only few similar thematic of the reports have been done on this city before. Since the city is evolving, so does its organic food market also and it becomes vital to identify about Illiterate consumers; how they relates with this unique trend of Organic Food Consumption This way, we can find what influences organic purchasing decisions in these groups as well and evaluate by the degree of EOP awareness and certification approaches they currently have, for us to understand their challenges. Beyond deepening our understanding of consumer behavior, these insights can also inform the development of inclusive strategies to encourage more sustainable food purchases and help foster habits for healthy eating across all population groups. A large, buzzing city down in the South of India and often dubbed The Silicon Valley of this country. Bangalore, which has a multi-culture environment due to various large IT Giants exist in this city with the best climate and history belongs Is well positioned on national & international scene. The city is the nucleus of India's IT and software services industry, with thousands of multinational tech companies backed up by research institutes as well startups fostered in its ecosystem. Quality Schooling in Bangalore is yet another criterion, which has some prestigious organizations and university like Indian Institute of Science (IISc), & India Company regarding Engineering Technique (IIT). The city that offers to the best of cosmopolitan lifestyle is known for its beautifully woven tapestry culture and languages, nightlife, food scenes shopping addresses which makeupyour living more luxurious in nature.

On top of its moderate temperature levels, Bangalore city is dotted with lush greenery perfecting the natural charm; historical landmarks as well like that: The grand and awe-inspiring beauty of the enchanting Bangalore Palace or a visit to Lalbagh Botanical Garden are just few instances picturizing it's rich heritage. Bangalore may have its share of traffic troubles and infrastructural woes, but it is a city that stands as the epitome of contrasts – combining an eclectic past with an ever-dynamic present to make some parts look like they belong in a different era altogether. Yet Bangalore serves as one facet on India's developmental gem-driving people from all walks-of-life only proving once again how the essence lies not within history or heritage but among dreamers & innovators tweeting innovations for today into reality every single second! This leads to a complicated and interconnected relationship between the city of Bangalore, unwise men and women as well as scamming customers who buy only organic food. Since most parts of Bangalore is seeing many illiterate people, and these set bring down less awareness about organic food materials. Butchery awareness and knowledge, in contrast to organic food purchasing consumers who are mixed with varying levels of curiosity about these products. Filling this gap between the demand for organic consumables and with knowledge is a necessary step to inspiring sustainable consumption. So … because literacy (and illiteracy) creates

certain patterns, just like any other demographic. Having awareness of these patterns is important when understanding what motivates them to buy organic food. Common influencing factors include price, availability of the food item in question (seasonal vs non-seasonal), cultural preferences. lifestyle and nutritional value or health benefits you stand to derive from it. This could help in adding further insides locomotion and purchase pattern of urban illiterate consumer behaviour comparatively with literate Bangalore modern consumers. Consumers with low levels of literacy litreacy (largely illiterates) might experience difficulties in buying organic food, like well as being unable to read the labels and lack access to information. Understanding these barriers and strategies may offer important insights on how illiterate consumers are coping. Moreover, it will be crucial to identify the determinants of their organic food purchasing through supporting community and advocacy in order to plan effective intervention. Developing inclusive strategies to promote responsible consumption of organic food for the illiterate consumers in Bangalore. Specific strategies must be targeted to address the needs of illiterate populations. These could range from using visual supports, engaging with local communities, clearer labeling and educational programmes specifically aimed at this demographic. The local government and non-governmental organizations (NGOs) in Bangalore city educate the illiterates and promote programmes for sustainable practices.

Coordinated actions by such stakeholders can contribute to holistic approaches aimed at enabling illiterate consumers of organic foods materialize their power-choice mechanisms, thereby addressing larger literacy problems holistically. The pattern of purchasing among the illiterate consumers was related to paradise which has great consequences for individual health and environmental sustainability. Such research can investigate the effect of organic food consumption among illiterate consumers on their well-being and whether it could lead to a more sustainable toll on environment. Social and cultural aspects are therefore inseparably connected to one another. Even among illiterate rural consumers of Bangalore such as tribal people, there may be specific sets of cultural practice that will guide their consumption choices: someone who continues to use pottery is likely carrying a preference for an organic and local food system. These factors should be taken into account for developing interventions or prevention programmes. The linking of Bangalore city, illiterate people and the consumption of organic foods purchased by consumers is a nested interdisciplinary space that situates at intersections with access to information, consumer purchasing behaviour, barriers and facilitators. We conclude that a holistic approach addressing the needs of illiterate consumers, including those appropriate to sustainable consumption and considering cultural as well as social aspects is necessary in order to fully understand and effectively intervene on this topic.

LITERACY LEVEL IN BANGALORE
Education is a major sign of human development and an essential element in the overall improvement of individuals. To enable people to have good living standards and better life quality, attracting them actively to participate in the ongoing evolution of society politics culture. Literacy, the initial step in achieving higher education, does not only offer information but greatly aids all aspects of financial conditions for individuals items, communities and even nation generally. Poor literacy is a global issue affecting individuals and nations; it limits employment opportunities, economic growth, social inclusion and health challenges among many other issues present within communities. Nevertheless, tackling illiteracy can bring many unintended benefits. Among others, these can lead to improved quality of life, economic development and health outcomes as well as helping reduce poverty or increasing empowerment or equality (especially for marginalized groups). Basically, illiteracy per se is not beneficial to anyone but trying to deal and resolve with this dire state can have multiple advantages that will help in individual or societal progress as well as promote the inclusivity benefit crucial for development. Literacy rate-The Table 1 shows the literacy rates across India, Karnataka and Bangalore during the year s1991,2000and2012 (in % ad it can be seen that there is increasing trend in Literacy for all three regions. India's literacy rate increased from 52.2% in 1991 to 73 -- more than a hint of improvement over two decades Karnataka too experienced an increase with 75.4% of the population being literate compared to their initial literacy rate of 56%, and Bangalore's comes out on top again, rising from a previous figure of 76.3% all the way up to boasting almost a whopping ninety percent at nearly close to its target (88.5%). For all regions the maximum increase in any specific decade is observed from 1991-2001 rather than 2001–201, which may suggest changing socio-economic or educational factors (e.g. returns to education would be expected to diminish as literacy rates approach saturation). As Bangalore is one of the major cities its rates are always

on higher side since most Bangloreans would be looking for better education and economic opportunities in this city. This upward trend in literacy bodes well for the education policies as a whole, highlighting an improvement to top off with the increasing focus on learning and being literate. Differences in the rates of increase, and between regions make it necessary to more specifically target regions for further literacy education.

OBJECTIVES
1.   To Understand the Organic Food Awareness Level among illiterate consumers in Bangalore city.
2.   To Explore Purchasing Patterns and Preferences among illiterate consumers in Bangalore city.
3.   To Propose Inclusive Strategies for Sustainable Consumption among illiterate consumers in Bangalore city.

LITERATURE REVIEW

This critical review of literature enabled us to learn about consumer behaviour, specific to organic food procurement on a global front along with some literacy and socio-economic aspects within Bangalore as well as India. Kumar and Reddy (2023) analyze the effect of illiteracy on market decisions in Bangalore, indicating that low levels of literacy have serious implications for consumption behavior. Patel and Joshi (2022) examine the upward trend of organic food consumption in urban India, citing increased demand among city residents. Singh and Mehta (2024) argue there is still much work to be done mainly in Southern India with low-income groups where considerable challenges around the affordability and accessibility of organic products continues. Official reports from the Bangalore City Council (2023) and India Ministry of Agriculture (2022) summarize country-wide policy goals as they pertain to developing organic markets and initiatives in farming. Chatterjee (2021) discusses how familiarity with literacy affects consumer choice, suggesting that education could potentially act as a force to keep the market in its benefit. However, Manjunath and Rao (2024), Krishnan and Iyer(2023) as well D'Souza & Rajan have all explored the relation between education with poverty and dietary habits to deliver that higher educated people are more likely choose of healthier foods. The work of Prakash (2022) and Verma (2021) takes stock on market dynamics and consumer choices with a consistent preference for organically produced products in the face of narrowing economic conditions. Srinivasan and Gupta (2024) examine dietary transitions in the Indian cities with focus on emerging organic choices to reflect a change in established patterns of urban consumer behavior. Organizations like the Bangalore Organic Farmers Association (2023) offer anecdotal insight into consumer interest in buying organic produce and perceptions of increased trust, but also list several barriers to purchase. One such is the tracking of organic food chain in Bangalore, depicting complexities from production to consumption (Desai 2022).

Kulkarni (2023) and the Bangalore Health Department (2023): provide information in context of food security both—physical access to enough nutritious dietary intake required for healthy life, related to nutritive values; provide nutrition education(empowerment with corresponding tools including meal planning, homestead gardening at work place, schools etc.) healthier consumer choice(consumer protection)—the power of knowledge-individual components on plate or product packets. Indeed, Nair and Thomas (2022) in addition to Sharma and Venkataraman (2021) as well Joshi and Kumar (2022), explained multiple socio-economic drivers particularly income-related issues such poverty level or limited access end up shaping the organic food buying behaviour among urban slum residents/urban poor. On the one hand C Gowda (2023) writes about local markets and a trust in consumers purchasing Indian organic food, Ranganathan et al analyze policy implications of food purchasing patterns amongst illiterate urban poor in Bangalore.(R N Devaraj 2004). Second, the Indian National Statistics Bureau (2023) puts out figures reflecting consumer behavior and Mathur (2023) even leads a study into how health awareness influences food intake in low-literate Indian consumers, showcasing that improved health knowledge can advance healthy eating. The studies indicate an increasing recognition and demand for safe food even by different socio-economic classes in Bangalore as a result of the positive attitude towards organic foods, which is linked with literacy, education, income or market status. These results underscore the importance of policy interventions that can make healthy food choices affordable and accessible for low-income consumers as a whole, continues Dr. Chaloupka

Suriya Kumari and Candida Smitha

METHODOLOGY

In this study on follows a mixed-methods research approach to comprehensively explore the unique aspects of this underrepresented demographic in the organic food market. The research design encompasses both quantitative and qualitative data collection methods. Stratified random sampling is used to select illiterate consumers in Bangalore, ensuring representation across different age groups and income levels. Data were gathered through structured survey questionnaires administered via face-to-face interviews, with trained enumerators proficient in local languages. In addition, in-depth interviews were conducted with a subset of participants to delve deeper into the barriers and facilitators influencing their purchasing decisions. Quantitative data analysis will include descriptive statistics, chi-squared tests, and correlation analysis to address the research objectives and hypotheses. Ethical considerations, such as informed consent and data privacy, will be strictly adhered to throughout the study. The researcher interacted with over 300 potential respondents, of whom 241 agreed to participate in the survey. Among these, 209 respondents provided complete answers to all the survey questions, while 32 respondents did not answer all questions and were consequently excluded from the study. As a result, the final research sample consisted of 209 participants.

RESULT AND DISCUSSION

Demographic details encompass a wide range of information pertaining to the characteristics of an illiterate consumers in Bangalore which includes, Gender, Age group, Marital Status, Food Preference, Occupation, type of Family, type of House, Monthly Income, where you born, Shopping Preference, Shopping Responsibility, Where do you purchases, food products, and Frequency of purchases. Table 2 examine the demographic details of illiterate consumers in Bangalore in relation to their organic food purchasing patterns. Data look at the distribution of respondents by various demographic factors and interpret their potential influence on organic food purchasing behavior. A significant majority of the respondents are Female (87.6%), which could suggest that women, in this context, are more involved in the purchasing decisions or that the survey reached a predominantly female audience. The largest age group is 30-39 years (34%), followed by 18-29 (24.9%). This indicates that the middle-aged population is the most active in purchasing decisions. A large majority of respondents are Married (67%). This could imply that married individuals are more likely to be involved in grocery shopping, including for organic food. Most of the respondents prefer both vegetarian and non-vegetarian food (62.2%). This could mean a diverse demand for organic products across different types of food categories. Domestic Workers make up the largest occupational category (36.8%), which might reflect the socio-economic status of the respondents and their purchasing power.

The majority live in Nuclear families (59.3%), which may affect the quantity and frequency of organic food purchases due to potentially smaller household sizes. Over half live in rented houses (52.2%), which can be indicative of economic factors that might influence discretionary spending such as on organic foods. The largest income bracket is below 2500 (38.3%), which suggests that the sample population is generally low-income. This may limit the overall ability to purchase higher-priced items such as organic food. More respondents were born in Rural areas (55.5%) compared to Urban or Semi-Urban. This may influence their familiarity with and preference for organic products, potentially due to a closer connection to farming practices. A significant number of respondents use Both online and offline means for shopping (46.9%), indicating that there is considerable openness to using multiple channels for purchasing. The majority of the shopping is done by Self (34.4%), suggesting personal control over purchasing decisions, which includes the choice of buying organic products. Local Markets are the primary source (31.6%). This could affect access to and availability of organic food products. Most respondents purchase Everyday (55.5%), which may lead to more frequent, smaller purchases rather than bulk buying, a pattern that might affect the affordability and choice of organic foods. The data suggests that the typical profile of an organic food purchaser in this demographic is a married woman, aged between 30-39, living in a nuclear family, with a lower monthly income, born in a rural area, who shops for food daily at local markets. The predominance of women and middle-aged individuals in the demographic data might indicate that they are the primary decision-makers in food purchases, including

Suriya Kumari and Candida Smitha

organic products. The financial constraints suggested by the income data might limit organic food purchases to more affordable options or necessitate a focus on special offers and discounts. The rural birth origin of most respondents could influence their preference for food that is perceived as more natural or traditional, such as organic food. The purchasing patterns for organic food among illiterate consumers in Bangalore seem to be influenced by traditional gender roles, age, and economic factors. Despite the low-income levels, there is an interest in both online and offline shopping, which may indicate a potential market for organic food if it is made affordable and accessible. Daily shopping habits and preference for local markets highlight the importance of these venues in promoting and distributing organic food products to this demographic. There may be a significant opportunity to educate and market organic products to this segment, considering their daily purchasing habits and preferences for local markets. In the survey assessing knowledge on green terms, the data reflects varying levels of awareness among the respondents. Regarding the term "Recyclable," 59 individuals (28.2%) demonstrated a very high understanding, while 73 (34.9%) possessed a high level of knowledge. A smaller segment, 21 respondents (10.0%), remained neutral, and only a few, 5 (2.4%), had less knowledge, with 51 (24.4%) indicating very less knowledge. The term "Biodegradable" was very well understood by 55 respondents (26.3%), and a slightly larger group of 77 (36.8%) had a high knowledge level. Those who were neutral numbered 22 (10.5%), and those with lesser knowledge were 7 (3.3%), while 48 (23.0%) had very less knowledge on the topic. When it came to "Environmental Sustainability," 65 participants (31.1%) showcased a very high knowledge level, and 72 (34.4%) had a high level of awareness.

There were 19 respondents (9.1%) without a strong opinion either way, 6 (2.9%) with less knowledge, and 47 (22.5%) with very little knowledge. For "Organic Products," a significant number of respondents, 70 (33.5%), indicated a very high level of knowledge, with 61 (29.2%) also showing a high understanding. Neutrality was claimed by 23 (11.0%), a minority of 5 (2.4%) had less knowledge, and 50 (23.9%) had very less knowledge. Lastly, the concept of "Global Warming" was very highly understood by 70 individuals (33.5%), and 59 respondents (28.2%) had a high knowledge level. There were 19 (9.1%) who were neutral on the subject, a small number of 5 (2.4%) had less knowledge, and 56 (26.8%) had very less knowledge. The terms "Organic Products" and "Global Warming" have the highest number of respondents with 'Very High' knowledge, both at 70 respondents (33.5%)."Biodegradable" has the highest number of respondents with 'High' knowledge at 77 (36.8%).Across all terms, the least number of respondents fell into the 'Less' knowledge category, suggesting that most respondents have more than a minimal understanding of these green terms. The terms "Recyclable" and "Biodegradable" have a relatively higher percentage of respondents with 'Very Less' knowledge compared to the other terms. There is a good level of awareness on these green terms among the respondents, with a significant proportion having 'Very High' or 'High' knowledge levels. The distribution of knowledge levels is fairly similar across the different terms, with 'Very High' and 'High' categories always composing the majority. A relatively small percentage of respondents are neutral, indicating that most have formed opinions or have some level of knowledge about these terms.

Overall, these findings reveal a substantial degree of awareness on environmental issues, with the majority of respondents showing high or very high knowledge levels across all green terms. However, there remains a consistent minority with less or very little understanding of these crucial topics. Table 4 provides insight into the various sources of awareness for organic food among the respondents. Television commercials appear to be a significant source, with 69 respondents (33.0%) acknowledging it as a means of information. Family members are identified as the primary source of awareness by 77 respondents (36.8%), suggesting a strong influence of close social circles on dietary choices. Word of mouth, which may overlap with family influence to some extent, is also notable, cited by 39 respondents (18.7%). In contrast, more formal channels such as radio announcements and physician's consultations are less frequently mentioned, with 13 respondents (6.2%) and 11 respondents (5.3%), respectively, recognizing them as their source of awareness. Overall, the data from a total of 209 respondents indicates that personal and family networks, along with television advertising, play a pivotal role in informing individuals about organic food options. Table 5 outlines the factors influencing the respondents' decision to purchase organic food products. The table presents three main factors along with the number and percentage of respondents who acknowledge each one: Benefits of Organic Food over Non-organic is the most acknowledged factor, with nearly half of the respondents (47.4%) recognizing the benefits of organic food as their reason for purchase. It indicates a significant awareness and

Suriya Kumari and Candida Smitha

appreciation for the health and quality benefits that organic foods are perceived to offer over non-organic alternatives. A smaller portion of the respondents, 31 (14.8%), cite advice from health professionals as a factor for purchasing organic food. This suggests that medical recommendations can influence dietary choices, but it is not the primary driver for most consumers in the sample. A sizable number of respondents, 79 (37.8%), report curiosity as a reason for purchasing organic food. This indicates that a substantial segment of consumers is open to trying new things, which in this case includes organic food products, potentially due to trends, peer influence, or personal interest in exploring different dietary options. The high percentage of respondents influenced by the perceived benefits suggests that organic food producers and retailers could focus on highlighting these advantages in their marketing strategies. Although health professional advice is a factor, it is less predominant than other factors, which may reflect a gap that could be addressed by more active engagement from the medical community in nutrition education. Curiosity being a significant factor shows there is an opportunity for market growth, as a large group of consumers could be persuaded to try organic products if they are presented as new and interesting options. There is a clear recognition of the health and quality benefits of organic food among consumers, which is a strong selling point for the organic food market. Health professionals such as doctors and dieticians play a role in influencing dietary choices, although there is potential for this influence to be expanded. Consumer curiosity is a driving force for the trial of organic food products, indicating that the market may continue to grow as more consumers are willing to explore these options. The total coverage of the respondents (suggests that these factors are comprehensive in explaining the motivations behind purchasing organic food in this population.

OBSERVATION AND CONCLUSION

The research "Organic Food Consumption among Illiterate Consumers in Bangalore" provides enlightening observations on the organic food purchasing patterns and awareness level of these consumers. Health conscious married women in the age group of 30-39 years from nuclear families with low income are well informed consumers who form a major part among these customers making thoughtful decisions related to their organic food purchases. Results: High knowledge levels of green terms "Recyclable," "Biodegradable", and "Organic Products". Television commercials were the most common media from which participants obtained information followed by family members. The decision to buy organic foods appears primarily motivated by perceived superiority of organic over non-organic food, curiosity and to a lesser extent health professional advice. Based on the results, it can be inferred that there is a lot of comprehension and interest in organic products because they have to do with their own health and waste issues as well. However, even though literacy is an issue here (as with other younger groups), the interest and awareness in organic food can undoubtedly be seen. Most interest comes from married middle aged women in two parent low income families. It presents an real image that despite the fact that there are obstacles in understanding and attaining natural food, however nevertheless high proportion of populace were knowledgeable concerning organic products signifying own family effect especially impact via medium channels like television which is a." Although personal health benefits and curiosity predominantly underpin reasons for purchasing organic food, greater effect via healthcare professionals and even more focused informational tools are possibilities.

The study is concluded with a recommendation to adopt tailored marketing and education strategies for more programmed organic food consumption among the illiterates in Bangalore. This indicates a market poised for expansion; if the barriers of accessibility, affordability and awareness are addressed through combined action by policy makers, community leaders and representatives from organic food enterprises—more opportunities should arise to increase consumption rates in 2019. In sum, the profile of organic consumption presented in this study is positively high by illiterate regarding all groups (sometimes being much larger) and suggests an interesting ground ripe for further saturation with communication efforts to health promotion and sustainability. For increasing the buying behavior of organic food among Bangalore illiterate consumers, more focus strategies are required. Top marketing channels include TV ads and family networks that are promoted with the key message of how organic food is our best friend. Literacy barriers can be overcome by using visual based educational initiatives with simplified messaging to replace the low information bandwagon jumper switch point of Cannibalism, when those

same fans eventually jump back on board. Increased access to affordable organic foods in local markets, rural and semi-urban areas specially may help low-income consumers. And developing the local organic farming will episodically appeal to rural-born voters who want a reliable source of affordable fresh fruit and green cereal. Policymakers and stakeholders should jointly design interventions that are both inclusive to support growth of the organic food sector sustainably, without neglecting those segments where illiterate populations dominate. These steps will enable everyone in Bangalore to enjoy more of the health and environmental promise that organic foods have shown.
