The proposed hybrid feature selection method, which combines Information Gain (IG), ReliefF, and Whale Optimization Algorithm (WOA), represents a robust approach to address the challenges posed by high-dimensional datasets in various domains, including clinical research. By integrating Information Gain and ReliefF, the method effectively identifies features that provide the most relevant information for predicting the target variable. Information Gain assesses the individual predictive power of each feature based on its ability to reduce uncertainty about the target variable, while ReliefF evaluates features based on their ability to distinguish between instances of different classes, thus capturing complementary aspects of feature relevance. The inclusion of Whale Optimization Algorithm (WOA) enhances the feature selection process by optimizing the subset of features identified by Information Gain and ReliefF. WOA simulates the social behavior of humpback whales, enabling efficient exploration of the feature space to find subsets that maximize the performance metrics defined by the fitness function. The hybridization of IG, ReliefF, and WOA leverages their respective strengths in feature evaluation and optimization. Information Gain and ReliefF provide a solid foundation for initial feature ranking and selection, while WOA further refines this selection by iteratively improving the subset of features based on the defined fitness criteria. From the results obtained, it is clear that the proposed TTO-FS method with ANN performs better for the considered three clinical datasets.

ABSTRACT

Buses are the most popular and easy mode of transportation in all over the world. The state government operates bus service in all routes with low-cost fare. Traffic congestion has risen at an alarming rate due to an increase in the number of automobiles. Travel time have increased as a result, while accessibility and mobility have worsened. The primary challenge encountered by passengers is the absence of information regarding bus numbers that are accessible on a certain route and the approximate time of bus departure. The delay in bus operations, could have several reasons which are inclement weather, traffic jam, and breakdowns. Neither the arrival time of the bus nor the delay are known to the people waiting at the bus stop. In order to address this problem, encouraging the usage of public transportation seems to be a feasible way. Over the past ten years, prediction of bus arrival time has become a fascinating subject around the world. In the transportation sector, Machine Learning (ML) technologies have already shown great promise and have additionally shown to yield a larger return on investment than traditional methods. In this research work , authors propose and develop predictive models to predict public transport demand for passenger transit based on bus arrival time. The dataset shows the proportion of buses operated by the Rochester-Genesee Regional Transportation Authority (RGRTA) that arrive on time. Initially, lazy predict classifier is used for solving regression-based dataset for predicting the bus demand in On-time based passenger transit. Based on the examination of lazy classifiers, the Decision Tree Regressor (DTR) has been identified as the best model. It is assessed using the most advanced hyperparameter optimization framework (OPTUNA). The proposed OPTUNA based DTR which is utilized to identify On-time performance of bus services-based passenger transit. Using OPTUNA for

**Thiagarajan and Prakash Kumar**

search is an efficient and beneficial approach considering the search speed and the improvement in model accuracy. According to the experimental data, the proposed approach performs better where the R-squared score is 0.9878 with best hyperparameter to be optimized.

Keywords: Buses, public transport, prediction, demand, hyperparameter, optimization, OPTUNA, Lazy Predict

INTRODUCTION

Traffic congestion has become a worldwide phenomenon and has grown at a rapid pace in recent years. The increase in population growth, motorization and urbanisation are blamed for this spike. Congestion damages the transportation network, lengthens travel time, emits more emissions and fuel also decreases travelling and easy access. Building more roads, highways, separate lanes, and other transportation infrastructure can help to mitigate this problem by increasing its capacity. Due to its own drawbacks, this option is not practical. Despite being the most popular mode of transportation, travellers are unaware of details like arrival time, precise routes, and buses that are available along the way. It is expected of passengers to remain immobile for an endless period of time without being informed regarding the bus where the people are waiting for or any other information about it. The challenging task for managing bus services are due to lack of information about route, location and traffic. In order to tackle the issues encountered by policy makers and bus managers, Intelligent Transportation System (ITS) has been suggested [1]. Without building new infrastructure, the goal of these transport services and technologies is to improve the effectiveness, safety, dependability, and environmental sustainability of existing transport networks. Promoting public transport to make it more desirable than private vehicles is a key component of ITS. From the viewpoint of the passenger, one of the most crucial markers of a dependable and appealing bus service is the provision of accurate journey and schedules for arrival [2]. A new age in transportation engineering and quality control has been brought about by the integration of growing technologies in public transportation, such as real-time tracking systems and new automatic data collecting. The challenge at hand is carrying out an extensive investigation to comprehend and measure the impact of punctuality on bus passengers. On-time performance refers to the ability of bus services to adhere to their published schedules, arriving and departing from stops as planned.

In the transportation sector, ML technologies have already shown great promise and have even shown to yield a larger return on investment than traditional methods. Still, there is room for improvement in the use and exploitation of ML techniques in transportation-related problems. The fundamental objectives of these solutions are to lessen traffic, enhance security and reduce human mistake, limit adverse environmental effects, optimum energy efficiency, and raise surface transportation productivity and efficiency. In feature engineering, data analytics can be enhanced by the capability of ML models and it transforms the unstructured data into features so that important information in the data can be highlighted. The prediction power of computational approaches can be increased while streamlining and accelerating data transformations by feature engineering to choose pertinent features or create unique features for both supervised and unsupervised learning. ML-based model might help bridge the gap between passengers and transport service. This research work has suggested a Lazy Predict (LP) model, which is simple and straightforward for anyone who is familiar with scikit-learn. In this study to provide prediction for create a Lazy Classifier (LC) instance which will get predictions from all of the models for each and every observation. The framework must fit the data for each model, then use metrics to determine which model has the highest accuracy for the current dataset, and finally pick the optimal model. The effectiveness of any classification algorithm is largely dependent on its ideal hyperparameters [3, 4]. The best set of hyperparameters can be chosen to increase the classification algorithm's accuracy.

To determine the ideal hyperparameter values for the ML model, an advanced hyperparameter optimisation framework (OPTUNA) [5] was used in this investigation. As a result, among the available hyperparameters, the best

**Thiagarajan and Prakash Kumar**

appropriate set was chosen for this investigation. There are several ways to achieve hyperparametric optimisation, including grid and random searches. The OPTUNA hyperparametric search is an additional technique. Conventional random and grid search methods waste a lot of time and are inefficient since they do not learn from the previous optimisation, which is mostly dependent on the amount of hyperparameters in the ML.As needed, the OPTUNA framework modifies the hyperparameters based on ongoing learning from prior optimisations. Consequently, OPTUNA was selected for hyperparameter optimisation in the present research.

The following is a list of this manuscript's primary contributions.

- First, the percentage of buses that depart from their starting point or reach their destination is included in a data collecting module that gathers information on on-time performance.
- To acquire data from open-source data repository and pre-process it using python libraries.
- To build ML models for the classification problem, and train them with the pre-processed dataset.
- To evaluate ML models based on various accuracy metrics to get the best fit model using LP classifier.
- To optimize the hyperparameters using optimization techniques/algorithms to fine tune the model.
- To compare the chosen models and finalize on the robust classification model to accurately predict the demand of bus required for a given period of time based on passenger transit.

LITERATURE REVIEW

A real-time bus management system that considers a variety of aspects, such as traffic congestion and the environment, is described by Shanthi *et al.* [6]. Passengers receive notification of the estimated bus arrival time at their endpoint through an HCI-based website and a mobile app. There are few factors such as weather and the flow of traffic in the bus's present location are utilised for the ETA prediction employing the Support Vector Regression technique. When tested, the model displayed an RMSE of 27 seconds. The goal of the Hossein Moosavi *et al.* [7] describes to identify the optimal tree-based ML algorithm and route creation approach for bus journey time prediction for high- and a low-frequency bus route. Furthermore, the precise, dependable, and useful "key stop-based" route creation method was first presented in this study. In the work by Faruk Serin *et al.* [8] discusses bus arrival time was predicted using ML techniques with a three-layer architecture. The data used in the case study came from Istanbul's public transport system, and it was processed using both classic and three-layer architecture to apply a variety of ML techniques. According to the experimental findings, the three-layer architecture produced effective outcomes with a MAPE of roughly 2.552. A model to simulate the actions of buses and forecast their delays is attempted to be built, as described by Palys *et al.* [9].

Shrivathsa *et al* [10] predicting travel time of bus from historical data is proposed using Artificial Neural Network (ANN). By analysing the data, calculate the time taken to reach the destination for every trip and every day. A new ANN method proves that, it is accurate and speed to predict the travel time. The public transportation system's success or failure is largely dependent on its dependability. The predicting issue for transport travel systems was proposed by Dan Luo, Dong Zhao, *et al.* [11] discusses about bus transit system and passenger flow prediction using Deep Learning (DL). The real-time application proposed by Nagaraj *et al.* [12] aids in the detection of traveller movement at a separate site. Several elements in the dataset are taken into account for forecasting, including bus type, bus id, source, destination, number of passengers, slot number and income. After the parameters are processed and the clustered data is divided into regions and sent to the deep learning model for prediction. Next, the clustered data is moved to a Long Short-Term Memory (LSTM) model, which eliminates redundant data from the obtained data. Predicting bus passengers is made more accurate by these systems. To improve the precision of forecasting the demand for bike sharing, Yang *et al.* [13] discusses the several parameters where the suggested model has the potential to significantly increase forecast accuracy. Additionally, this paper examines the impact of various parameters on the predictions made by the model at different times. Bidirectional LSTM (Bi-LSTM) networks were employed by Collini *et al.* [14] to calculate the quantity of bikes and open bike slots at bike-sharing stations. Mehdizadeh Dastjerdi and Morency initially identified six communities in the bike-sharing network, and then this

Thiagarajan and Prakash Kumar

paper discusses about CNN-LSTM for predicting the demand for pickups in each neighbourhood [15]. The flow of passenger anticipating based on the UBTS was examined by Archana *et al.* [16]. Here, UBTS concerns are discussed, including prediction of delays, driver conduct, passenger flow, passenger comfort perception fleet size, vehicle failures and sound level. The strategies and solutions for urban transport have offered to address these problems are evaluated. In order to retain a respectable level of service across the whole bus network, Xubin Zhai and Yu Shen [17] discusses low-demand bus services are less likely to be disrupted by real-time cross-line bus dispatching that utilizes scarce vehicle resources, where the proposed model achieves 5% MAPE. The bus-passenger-flow data has erratic features, which Yulong Pei [18] addresses by WPD to break them down into smoother components. The Bi-LSTM model improves the model's capacity for analysing the passenger flow pattern due to the periodicity and nonlinearity of the passenger-flow data. A model for predicting traffic flow based on sparse regression was presented by Zheng *et al.* [19]. Extreme gradient boosting (XGBoost), was employed by Sun *et al.* [20] and Lu *et al.* [21] to predict the level of traffic on the highway. A DL model was developed by Chen *et al.* [22] for prediction of traffic flow in metropolitan road networks.

Dataset Description

Based on passenger travel, this statistic determines the proportion of RGRTA buses that arrive on time. The percentage of buses that depart from their starting point or reach their destination between 2:59 and 5:59 minutes early is known as the on-time performance. This dataset includes subsidiary, month, year, percent On-time and ridership. The total number of passengers, riders, or boardings is referred to as ridership. It contains a total of 1178 records, and it has 5 attributes described in figure 1.

Data Pre Processing

Along with data collection, a missing value check is performed, and the result is an imputed missing value. The dataset can be transformed to float values because the data cannot be strings. After missing imputation, the data is pre-processed using Robust scaler and label encoder to handle scaling the all-variable unit as unique. Scikit-Learn offers the Label Encoder class for this reason, which allows you to convert all string values to float values. It provides a unique numerical value for every category in a variable, making it easier for ML algorithms to examine and comprehend the data. After removing the median, RobustScaler scales the data using the quantile range. Figure 2 displays the pre-processed data. As a consequence, as shown in Figure 3, a heatmap is constructed utilizing a few data points from the dataset.

RESEARCH METHODOLOGY

The performance of predictive support through data analysis and assist in providing prediction status to the user by proposed method which focus in identifying the best feature fits related to transportation demand. However, one critical factor that significantly influences the attractiveness of bus services to passengers is their on-time performance. The challenge at hand is carrying out an extensive investigation to comprehend and measure the impact of reliability on bus riders. This research work proposed OPTUNA framework has cogitates the best methodical approach due to it tuning parameters like learning rate, loss functions, etc. The Python language is used to develop and train this mode with the help of several libraries, including Matplotlib, NumPy, Scikit-Learn, and Pandas. After being cleaned, the real-time database's data is exported as a CSV file. The functions needed to carry out the hyperparameter optimizations are provided using Scikit-Learn module. The overall proposed model is as shown in figure.4

This study employs an ML classifier model that is created by grouping different classifiers into a single supervised LP library. The dataset is split in term of models and predictions with respect to train dataset and test dataset. The classification models are made to be evaluated using LP supervised LazyRegressor library. LC provides a convenient and efficient way to fit and evaluate multiple ML models, simplifying the model selection process and allowing to focus on building the best model for our data. LP aids in the development of multiple, distinct, fundamental

**Thiagarajan and Prakash Kumar**

ML models using specific code and helps identify which models may perform more accurately avoiding the need for parameter tuning. In this study, regression-based datasets are solved using a lazy regressor in classifying the problem with better prediction of demand in bus transportation required for a given period of time from dataset. In order to employing the best readily accessible ML model, the LP classifier can be optimized for accuracy. This can be achieved by optimizing the top model's hyperparameters, as suggested by the OPTUNA hyperparameter tuning. This research work DecisionTree (DT) Regressor, LGBMRegressor and KNeighbors(KN)Regressor has chosen the best fit model to predict the On-time performance of bus services. Further, this DT regressor of untuned model has chosen best fit models based on predicted value which can be improved using OPTUNA framework.

In ML, hyperparameter optimization is a crucial stage. OPTUNA was used in this proposed work to improve the untuned DTR model. This research work uses a unique define-by-run style that makes it relatively easy for users to adjust the ML algorithms of hyperparameters. According to OPTUNA, optimizing hyperparameters involves minimizing or maximizing an objective function that receives a collection of hyperparameters as input and outputs the function score. Without relying on externally supplied static constants, this function dynamically creates the search space of neural network architecture based on the number of layers and hidden units. A trial object is a special OPTUNA trace object that looks for the ideal value based on the hyperparameter's name and range. Through interaction with a trial object, OPTUNA gradually constructs the target function and, when the target function is being executed, uses the trial object to dynamically develop the search area. There are two types of sampling methods in OPTUNA: independent sampling and relational sampling. The correlations between parameters are exploited by relational sampling. The relationships between the parameters were not taken into consideration by independent sampling. Depending on the work and surroundings, both relational and independent sampling can be cost-effective.

The proposed work describes untuned lazy predict DT regressor model were optimized and the loss function is improved. The OPTUNA framework was utilized to improve the hyperparameters, and the primary loss function was utilized as the enhanced loss function. This research work, hyperparameter tuning of certain parameters are used to get the best hyperparameter model. The 13 hyperparameters, including `ccp_alpha`, `min_impurity_decrease`, `criterion`, `max_leaf_nodes`, `min_weight_fraction_leaf`, `max_depth`, `max_features`, `min_samples_leaf`, `presort`, `min_samples_split`, `random_state`, `min_impurity_split` and `splitter` were chosen for parameter optimization to get best hyperparameter. Although these 13 hyperparameters were chosen for optimization using OPTUNA as shown in table.1.

The hyperparameters are described as follows:

`ccp_alpha` is at each stage of the pruning procedure, the cost difficulty pruning route which yields the real alphas and the related total leaf impurity. More of the tree is trimmed as alpha rises, growing the overall impurity of the leaves.

`Criterion` is a function that assesses a split's quality.

`max_depth` is the most levels that can be in each tree.

`max_features` is the most features that are taken into account while dividing a node.

`min_samples_leaf` represents samples that must be sorted at least once into a tree leaf.

`min_samples_split` represents minimum number of samples required in a node for node splitting to occur.

`max_leaf_nodes` represent hyperparameter controls the growth of the tree by imposing a condition on the node splitting.

`min_impurity_decrease` represents if splitting the node results in an impurity decrease higher than or equal to this value, the node will be divided.

`min_weight_fraction_leaf` is the percentage of input samples arrives in leaf node this addresses the issue of class imbalance. When `presort` is enabled, the problem will first be sorted and then permuted.

`random_state` is the component in charge of randomization during division. It may be an instance of `RandomState` or an int. The default value is `None`.

RESULTS AND DISCUSSION

In this study, Jupiter IDE and Google Colab are used to help produce and distribute documents that can be explained using text, live code, and visualizations. After collection, the dataset is divided into 70% train and 30% test. In addition, the tunability hyperparameter made use of Seaborn, Sklearn and Pandas. All kind of regression techniques have been implemented by the given specified tools which assist in identifying the efficient untuned regression technique in prediction. In this research DT regressor, LGBM regressor and KN regressor is identified top three model are taken into consideration with an untuned model. Using 25% of the dataset, the accuracy of the trained model is evaluated. Regressions, in contrast to classification issues, yield a numeric value within a range rather than absolute binary values. An algorithm's errors can be measured using a variety of metrics.

Mean Squared Error (MSE): The average of the discrepancies between the actual and anticipated values. The outcome is never going to be negative. Better outcomes are those that are nearer zero.

$$MSE = \frac{\sum_{i=1}^n (at_i - pt_i)^2}{n}$$

Here at_i represents actual time pt_i represents predicted time, n represents number of predictions

Root Mean Square Error (RMSE): This formula calculates the total average magnitude of the error using a quadratic formula. In order to compute it, one must first add up all of the actual and anticipated values difference, squaring the difference value, divide the total by the number of predictions, and then take the square root of the result. The outcome is certain to be positive because the values are rooted and squared. The measured formula is given as

$$RMSE = \sqrt{\frac{\sum_{i=1}^n (at_i - pt_i)^2}{n}}$$

The MSE and RMSE methods are used to assess the accuracy of this trained prediction model.

R-Squared score: It explains how well the model performs. It explains the variance in the response or target variable that the data model's independent variables predict.

R square has a value in the interval [0,1].

$$R^2 = 1 - \frac{SS_{res}}{SS_{tot}}$$

SS_{res} represents the total squares of the data model's residual errors.

SS_{tot} represents the total sum of the errors.

Table 2 displays the outcomes that the models generated. The DT, LGBM, and KN regressor models were shown as graphs with actual values compared to expected values. The graph's linearity indicates how accurate the prediction was. The model is therefore 100% accurate if line $y = x$ the graph is as linear. A scatter plot is the true by projected plot. For the ordinate, the exponential response (Y) is utilised. Another way to visually assess the likelihood of "lack of fit" is via the plot. An impartial prediction to yield anticipated values that, on average, correspond with the observed values. Figure.5, 6 and 7 show the predicted value versus true value plot for DT, LGBM and KN regressor model.

While the points in other models were a little more dispersed, the model with the DTR algorithm gives results from all the scattered point graphs of predicted values against true values that closely resemble the linear graph. Table 2 and Figure 5 demonstrate that, out of all the models considered, the DTR performs the best, with an accuracy of R-squared score of 0.9864. LGBM and KN regressor was performing with an accuracy of R-squared score is 0.9860 and

**Thiagarajan and Prakash Kumar**

0.9859 which is nearly as good as but slightly lesser than DT regressor model. Similarly, the DT regressor model performs better prediction in RMSE and MSE whereas as in LGBM and KN regressor model performs higher error rate prediction than DT regressor model. The DTR model was therefore fitted with these hyperparameters, which were optimised using the proposed OPTUNA framework In comparison to existing classification methods, the experimental results of the proposed model show higher values for various evaluation metrics when the accomplished prediction model is checked for accuracy using R squared score. Table.3 and Figure.8 displays results of model with improved classification performance based on hyperparameter optimization to get best hyperparameter compared to other models was introduced. The proposed OPTUNA based DT Regressor model achieved a R-Squared of 0.987, a MSE of 2120385948.23, and an RMSE of 46047.6486.

CONCLUSION

This paper has discussed about understanding the relationship between on-time performance and bus ridership is crucial for urban planners, transportation authorities, and policymakers to make informed decisions that enhance the efficiency and appeal of bus services, ultimately contributing to more sustainable and accessible urban transportation systems. In this study, regression-based datasets are solved using the LP classifier for chosen the best model that generates high classification accuracy of R squared score for DT regressor is 0.9864 has been improved through optimizer and hyper parameter. The most sophisticated hyperparameter optimisation framework was used in this research to optimise the prediction model's hyperparameters, which allowed for an accurate estimation of the demand for bus transportation over a certain time period based on passenger transit. The model accuracy of R squared score is improved through OPTUNA with an increase of 0.987 for DT regressor model which is more likely to be suitable in the percentage of buses that depart from their starting point or arrive at a destination based on passenger transportation is one factor used to estimate on-time performance. It can facilitate the usage of public transportation and allow transportation authorities to effectively allocate their limited resources.

ABSTRACT

Water, the elixir of life, sustains existence across all realms. Its quality stands as a sentinel, guarding against potential threats to human health. Defined by a myriad of factors, water quality denotes its suitability for various purposes, a delicate balance easily swayed by natural and anthropogenic forces. Monitoring its essence involves a symphony of on-site measurements, meticulous sample collection, and analytical scrutiny. At the heart of this vigilance lies the determination of heavy metal concentrations, a critical indicator of water's purity. From the enigmatic depths of cadmium to the shimmering presence of zinc, each metal paints a portrait of potential health hazards. Methods like Atomic Absorption Spectroscopy and Differential Pulse Anodic Stripping Voltammetry serve as the alchemists, revealing the elemental truths within water. Yet, despite our advances in understanding heavy metal toxicity, the specter of poisoning persists, urging us towards proactive prevention and effective remedies. In this quest, the standards set forth by the World Health Organization serve as beacons, guiding our assessments and actions. Water quality, thus, transcends mere chemical composition, encompassing a holistic evaluation of its organic, inorganic, and physiological characteristics. It beckons us to peer beneath the surface, to decipher its secrets, and to safeguard its essence for generations to come.

Keywords: Ground water, Toxic metal, Namakkal, Cuddalore.

INTRODUCTION

In the labyrinthine depths of Namakal and Cuddalore's subterranean realms lies a hidden alchemy, where heavy metals weave a tale of transformation within the groundwater systems. This underground world, often unseen and overlooked, harbors a delicate equilibrium that shapes the quality of this vital resource[1]. As we embark on a journey to decipher its mysteries, we are confronted with the profound impact of heavy metals, both natural and anthropogenic, on these aquifers. The significance of understanding heavy metal contamination in groundwater cannot be overstated, particularly in regions like Namakal and Cuddalore, where reliance on groundwater for drinking and agricultural purposes is paramount. Studies elevated levels of heavy metals such as cadmium, chromium, and lead in groundwater samples from these regions, underscoring the pressing need for comprehensive monitoring and remediation efforts[2]. Furthermore, the work of shed light on the diverse sources of heavy metal pollution in groundwater, ranging from industrial effluents to agricultural runoff. These findings emphasize the multifaceted nature of the problem and the importance of adopting a holistic approach towards mitigation strategies. The analytical techniques employed in assessing heavy metal concentrations play a pivotal role in unraveling the intricate dynamics of groundwater quality. The different research papers showcased the efficacy of Atomic Absorption Spectroscopy and Differential Pulse Anodic Stripping Voltammetry in accurately quantifying heavy metal levels, providing valuable insights for monitoring programs and policy formulation[3]. Moreover, the impact of heavy metal contamination on human health cannot be overlooked. Research conducted highlighted the detrimental effects of prolonged exposure to heavy metals, including neurological disorders, renal dysfunction, and carcinogenicity. These findings underscore the urgent need for stringent adherence to international standards, such as those set forth by the World Health Organization, in safeguarding public health. As we navigate through the intricate web of literature, it becomes evident that unraveling the transformative effects of heavy metals on Namakal and Cuddalore's groundwater systems is not merely an academic pursuit but a crucial step towards ensuring the sustainability and well-being of future generations. Thus, armed with knowledge and determination, we embark on a quest to decipher the underground alchemy that shapes the destiny of these vital water resources.

Water Source and Ground water

Groundwater is the water that saturates the pores and fractures of underground material, such as soil and rock. It exists beneath the Earth's surface within the saturated zone, where the spaces between particles or fractures in rock are filled with water[4]. Groundwater is a vital natural resource, serving as a primary source of drinking water for many communities, as well as playing a crucial role in sustaining ecosystems and supporting agricultural activities. A comprehensive study on the sources and impacts of heavy metal pollution in groundwater. Their findings highlighted the diverse origins of heavy metal contamination, ranging from industrial discharges to agricultural runoff. The study underscored the urgent need for integrated management approaches to address this pervasive environmental challenge. The health implications of heavy metal exposure through contaminated groundwater[5]. Their research revealed alarming rates of neurological disorders, renal dysfunction, and carcinogenicity among populations exposed to elevated levels of heavy metals. The study emphasized the critical importance of stringent regulatory measures and remediation efforts to safeguard public health.

Physiochemical Quality of Ground water

Physico-chemical quality refers to the attributes of water encompassing its color, taste, and potential to induce toxicity reactions or unexpected physiological responses, such as laxative effects. Additionally, it encompasses any objectionable effects encountered during regular use. This definition, as outlined by the World Health Organization (1995), underscores the multifaceted nature of assessing water quality beyond mere chemical composition[6].

Categories of the Water

Different types of water pollution

**Subasri and Vijayan****Urbanization**

The rise in impervious surfaces, amplified runoff from urbanized areas, and heightened discharges from municipal and industrial sources collectively contribute to greater nutrient loading in urban streams. Urbanization typically corresponds with elevated phosphorus concentrations within urban catchments[7].

Radioactive Waste

Radioactive pollution originates from various sources, including radioactive sediment, water utilized in nuclear atomic plants, the exploitation of radioactive minerals, nuclear power plants, and the utilization of radioisotopes in medical and research applications. It is characterized by the presence of radioactive materials in water[8]. Radiation monitoring encompasses the measurement of radiation dose or radio nuclide contamination, serving purposes related to the assessment or regulation of radiation exposure.

Heavy Metal Pollution

Heavy metal poisoning refers to the excessive accumulation of heavy metals in the body's soft tissues, reaching toxic levels. Metals like zinc, copper, chromium, iron, and manganese can accumulate in concentrations high enough to induce poisoning. Industrial exposure, pollution of air and water, medications, and improperly coated food containers are potential sources of heavy metal poisoning[9].

METHODOLOGY**Heavy Metals Analysis**

Heavy metal concentrations in drinking water are commonly assessed using techniques such as Atomic Absorption Spectroscopy and Differential Pulse Anodic Stripping Voltammetry (DPASV). Typically, water samples are collected directly from taps after running the water for at least 5 minutes to stabilize variations in electrical conductivity and temperature. These samples are then acidified to 1% with nitric acid and stored in 500 mL double-capped polyethylene bottles. The resulting heavy metal concentrations are compared with national and international standards such as those set by WHO-2008, USEPA, EPA, and EUC[10]. Any deviations from the maximum permissible limits are noted, and the potability of the water for the selected region is determined based on these findings.

Heavy metal sources

With the swift pace of industrialization and the adoption of consumerist lifestyles, the sources of environmental pollution have multiplied[11]. Pollution arises both during industrial production processes and through the end-use of products, as well as from runoff. These hazardous elements predominantly infiltrate the human body via food and water, with a lesser extent of exposure occurring through inhalation of polluted air, use of cosmetics, medications, and low-quality herbal preparations[12].

Heavy metals in essential and non-essential

Below is a table outlining various heavy metals, their sources, and the drinking water standards across different regions of the world.

MATERIALS AND METHODS**Collection of samples**

Water samples were collected randomly from the vicinity of the SIPCOT industrial in Cuddalore and, we are collecting the water samples in different places of Namakal district. All the water samples were collected from the groundwater reservoir, gathered in plastic bottles. Collected samples were used to analyze the to find out the heavy metals[17].

**Subasri and Vijayan****Heavy metals analysis**

Various authors in their research studies followed standard procedures for conducting a comparative study on the concentration of heavy metals in groundwater samples. The methods employed included the use of an atomic absorption spectrophotometer. Groundwater samples were collected and preserved at 4°C using a Thermo coal box with ice packs. Subsequently, these samples were filtered using Whatman 42 filter paper before analysis[18].

Sample Analysis

Groundwater samples underwent analysis for heavy metals such as zinc (Zn), copper (Cu), nickel (Ni), lead (Pb), and cadmium (Cd) using an atomic absorption spectrometer (Perkin Elmer). The instrument settings and operational conditions were meticulously adjusted in accordance with the manufacturer's specifications[19].

Nickel

Nickel is recognized as an essential trace element crucial for human and animal health. The World Health Organization (WHO) recommends a maximum permissible limit of 0.2 mg/L for nickel in groundwater. Analysis of groundwater samples revealed nickel concentrations ranging from 0.01 to 0.04 mg/L, all of which fell below the permissible limit in Namakkal district. Similarly, in the collected groundwater samples, nickel concentrations ranged from 0.01 to 0.06 mg/L, remaining within the WHO's much higher permissible limit for groundwater in Cuddalore district[20].

Cadmium

The World Health Organization (WHO) recommends a maximum permissible limit of 0.01 mg/L for cadmium in groundwater. However, analysis of groundwater samples indicated cadmium concentrations ranging from 0.01 to 0.05 mg/L. In nearly all groundwater samples in the district of Namakkal, the concentration of cadmium exceeded the permissible limit. Similarly, in all collected groundwater samples in Cuddalore district, the concentration of cadmium ranged from 0.02 to 0.04 mg/kg, surpassing the maximum much higher permissible limit set by the WHO[21].

Copper

The World Health Organization (WHO) recommends a maximum permissible limit of 2 mg/L for copper in groundwater. Analysis of groundwater samples revealed copper concentrations ranging from 0.02 to 0.10 mg/L, all of which were below the permissible limit. Copper is known to accumulate in the liver and brain, and its toxicity is a primary factor in Wilson's disease. However, in all collected groundwater samples in Namakkal, the concentration of copper exceeded the maximum permissible limit set by the WHO[22]. Copper concentrations in groundwater samples in Cuddalore district ranged from 0.05 to 1.00 mg/kg. It is higher than the Namakkal district ground water.

Lead

According to WHO standards, the permissible limit of lead in water is 0.05 mg/L. However, analysis of groundwater samples in Namakkal, indicated that the concentration of lead exceeded the permissible limit in all collected samples. The concentration of lead in water samples ranged from 0.07 to 0.52 mg/L. Similarly, in groundwater samples in Cuddalore, the concentration of lead ranged from 0.28 to 0.78 mg/kg. In nearly all collected groundwater samples, the concentration of lead surpassed the permissible limit set by WHO. Lead contamination in groundwater is a widespread issue, as it accumulates in various organs such as bones, the aorta, kidneys, liver, and spleen over time[23].

zinc

According to WHO standards, the permissible limit of zinc in groundwater is 5 mg/L. However, analysis of groundwater samples in Namakkal, revealed that the concentration of zinc ranged from 0.01 to 0.10 mg/L, all of which were below the permissible limit. Similarly, in the groundwater samples of Cuddalore, the concentration of zinc ranged from 0.01 to 0.58 mg/kg, also below the WHO's permissible limit but higher than the Namakkal. Zinc is

**Subasri and Vijayan**

an essential trace element crucial for the physiological and metabolic processes of many organisms. Nevertheless, elevated concentrations of zinc can be toxic to organisms.

CONCLUSION

The research findings revealed that the groundwater in Cuddalore district exhibited higher levels of heavy metals compared to Namakkal district. This disparity can be attributed to the presence of numerous SIPCOT (State Industries Promotion Corporation of Tamil Nadu) industries within the Cuddalore district. These industries are known to engage in various industrial processes that may involve the use or release of heavy metals into the environment. The industrial activities conducted by SIPCOT industries, including manufacturing, processing, and waste disposal, often contribute to the contamination of groundwater with heavy metals. Effluents containing heavy metals from industrial processes can infiltrate the soil and eventually seep into groundwater sources, leading to elevated levels of heavy metal concentrations. In contrast, Namakkal district may have fewer industrial activities or a different industrial profile compared to Cuddalore, resulting in comparatively lower levels of heavy metal contamination in its groundwater. This observation underscores the critical role of industrialization and industrial practices in influencing the quality of groundwater resources in different regions.

Table.1 Characteristics of ground water

Taste and Odor	The perception of taste and odor in drinking water is influenced by the activation of human receptor cells situated in taste buds and the nasal cavity, respectively (WHO, 1984). Evaluating the taste of drinking water commonly involves conducting taste tests, which may include threshold tests or taste rating assessments.
Temperature	The odor of a substance can be influenced by temperature due to the correlation between odor and vapor pressure. Additionally, the growth rate of microbes, some of which produce undesirable metabolites, tends to increase with higher temperatures.
pH	The odor and taste of drinking water can be affected by pH, as it regulates the balance of ionized forms of substances. pH levels typically range from 5.0 to 9.0.
Alkalinity	A rise in alkalinity can lead to a reduction in coloration, with the extent of color loss typically correlating directly with the alkalinity of the water sample, often closely resembling its hardness value.

Subasri and Vijayan

Hardness	Hardness in water originates from various sources such as sewage and runoff from soil, especially in areas with limestone formations. The primary ions responsible for water hardness are calcium and magnesium. When the predominant anion is carbonate, it is termed temporary hardness, as it can be eliminated by boiling, unlike the case with sulfates, chlorides, and nitrates.
-----------------	--

Table.2 These categories are divided into five classifications.

WQI RANGE	TYPE OF WATER
<50	Excellent water
50-100	Good water
100,1-200	Poor water
200,1-300	Very poor water
>300	Water unsuitable for drinking

Table.3 Heavy metals and their sources

Heavy Metal	Sources	Drinking Water Standards
Zinc (Zn)	Oil Refining Plumbing Brass manufacturing	According to regulatory standards, the Environmental Protection Agency (EPA) and the European Community both set a maximum concentration of 5 mg/L for certain substances. However, the Regulation of Water Community establishes a stricter limit of 0.1 mg/L for the same substances.
Copper (Cu)	Copper plating Printing	As per regulations, the Environmental Protection Agency (EPA) sets a maximum concentration of 1.0 mg/L for specific substances, while the European Community allows up to 3 mg/L. In contrast, the Regulation of Water Community imposes a stricter limit of 0.01 mg/L for the same substances.
Iron (Fe)	High intake as oral consumption	
Cobalt (Co)	Hip alloy replacement case	
Chromium (Cr)	Steel fabrication Electroplating Textile	As stipulated by regulatory authorities, the Environmental Protection Agency (EPA) mandates a maximum concentration of 0.1 mg/L for certain substances. In comparison, the European Community permits up to 0.5 mg/L, while the Regulation of Water Community maintains a consistent limit of 0.1 mg/L for the same substances.
Lead (Pb)	Batteries Coal Combustion Paint Industry	As outlined by regulatory standards, the Environmental Protection Agency (EPA) enforces a maximum concentration of 0.1 mg/L for specific substances. Conversely, the European Community allows up to 0.5 mg/L, while the Regulation of Water Community maintains a consistent limit of 0.1 mg/L for the same substances.
Arsenic (As)	Atmospheric deposition Mining Pesticides	As per regulatory guidelines, the Environmental Protection Agency (EPA) sets a maximum concentration of 10 mg/L for certain substances. Conversely, the European Community mandates a much lower limit of 0.01 mg/L, while the Regulation of Water Community establishes an even stricter threshold of 0.05 mg/L for the same substances.
Mercury (Hg)	Coal combustion, Fish, Mining, Paint industry, Paper industry, Volcanic	As per regulatory standards, the Environmental Protection Agency (EPA) specifies a maximum concentration of 0.002 mg/L for certain substances. In contrast, the European Community imposes a lower limit

Subasri and Vijayan

	eruption	of 0.001 mg/L, while the Regulation of Water Community sets a slightly higher threshold of 0.004 mg/L for the same substances.
Cadmium (Cd)	Plastic Fertilizers Pesticides	According to regulatory guidelines, the Environmental Protection Agency (EPA) stipulates a maximum concentration of 0.005 mg/L for specific substances. Conversely, the European Community sets a higher limit of 0.2 mg/L, while the Regulation of Water Community establishes a much lower threshold of 0.001 mg/L for the same substances.

Table.4 guidelines for drinking water or acceptable ranges set by WHO and NAFDAC.

Heavy Metals	Maximum Concentration (WHO)	Maximum Concentration (NAFDAC)
Zinc	5 mg/l	5 mg/l
Arsenic	0.01 mg/l	0.0 mg/l
Magnesium	50 mg/l	30 mg/l
Calcium	50 mg/l	50 mg/l
Cadmium	0.003 mg/l	0.0 mg/l
Lead	0.01 mg/l	0.0 mg/l
Silver	0.0 mg/l	0.0 mg/l
Mercury	0.001 mg/l	0.0 mg/l

ABSTRACT

This paper aims to pioneer and discuss the concept of strongly and strongly total irregular fuzzy semigraphs, conducting a comprehensive comparative examination of these two variants. We examine the unique features of strongly irregular fuzzy semigraphs and explore their relevance within the context of strongly totally irregular fuzzy semigraphs.

Keywords: Degrees, Fuzzy Semigraph, Irregular Fuzzy Semigraph, strongly irregular Fuzzy semigraphs, strongly total irregular fuzzy semigraphs.

INTRODUCTION

The introduction of fuzzy semigraphs was subsequently expanded by K. Radha and Renganathan.P [1]. Archana.s and Preethi Kuttipulackal further elevated the field through significant contributions to regular fuzzy semigraphs[2]. N R Santhi Maheswari and K.Amutha contributed in the study of Neighbourly Edge Irregular Graphs [3]. J. Krishnaveni Jeganathan and N R Santhi Maheswari produced significant findings to support strongly irregular fuzzy graphs, developing their core principles in this area. [4]. S.Nithishraj, A. Nagoor Gani and P.Muruganatham have explored the domain On Irregular Fuzzy Semigraphs adding valuable perspectives and findings[5]. This study aims to introduce the concepts of strongly irregular fuzzy semigraphs and strongly total irregular fuzzy semigraphs and

Nithishraj et al.,

provides a comparative analysis of the two. In addition, the paper analyses the characteristics of neighbourly and highly irregular fuzzy semigraphs, showing significant findings in the area.

METHODOLOGY

By using nodes, edges, adjacent degrees, and consecutive adjacent degrees, we can determine the characteristics of strongly irregular and total strongly irregular. Then, we may proceed to examine neighbourly and highly irregular fuzzy semigraphs.

STRONGLY AND TOTAL STRONGLY IRREGULAR FUZZY SEMIGRAPH

Definition 2.1: Consider $\mathcal{G}: (\sigma, \mu, \eta)$ as a fuzzy semigraph in a semigraph $G: (\mathcal{V}, \mathcal{E}, \mathcal{X})$. The degree of a node v is $d(v) = \sum \eta(E)$ where the summation now encompasses all edges E having v as a terminal node. A fuzzy semigraph \mathcal{G} is considered strongly irregular when each pair of connected nodes in \mathcal{G} have distinct degree. It is represented as $d_{\mathcal{G}}(v)$.

Definition 2.2: Consider $\mathcal{G}: (\sigma, \mu, \eta)$ as a fuzzy semigraph in a semigraph $G: (\mathcal{V}, \mathcal{E}, \mathcal{X})$. When every pair of connected nodes in a fuzzy semigraph \mathcal{G} has a distinct total degree, then \mathcal{G} is said to be strongly total irregular. It is represented as $td_{\mathcal{G}}(v)$.

Definition 2.3: Consider $\mathcal{G}: (\sigma, \mu, \eta)$ as a fuzzy semigraph in a semigraph $G: (\mathcal{V}, \mathcal{E}, \mathcal{X})$. If the edge degrees of adjacent nodes are distinct, we say that the fuzzy semigraph \mathcal{G} is strongly v -edge irregular. It is represented as $d_e(v)$.

Definition 2.4: Consider $\mathcal{G}: (\sigma, \mu, \eta)$ as a fuzzy semigraph in a semigraph $G: (\mathcal{V}, \mathcal{E}, \mathcal{X})$. If every pair of adjacent nodes has a distinct edge total degree, we say that the fuzzy semigraph \mathcal{G} is strongly v -edge total irregular. It is represented as $std_e(v)$.

Definition 2.5: Consider $\mathcal{G}: (\sigma, \mu, \eta)$ as a fuzzy semigraph in a semigraph $G: (\mathcal{V}, \mathcal{E}, \mathcal{X})$. When each pair of connected nodes in \mathcal{G} contains a distinct adjacent degree, we say that the fuzzy semigraph is strongly irregular in adjacent degree. It is represented as $d_{g_a}(v)$.

Definition 2.6: Consider $\mathcal{G}: (\sigma, \mu, \eta)$ as a fuzzy semigraph in a semigraph $G: (\mathcal{V}, \mathcal{E}, \mathcal{X})$. When each pair of connected nodes in \mathcal{G} contains a distinct total adjacent degree, then the fuzzy semigraph is strongly irregular in total adjacent degree. It is represented as $std_{g_a}(v)$.

Definition 2.7: Consider $\mathcal{G}: (\sigma, \mu, \eta)$ as a fuzzy semigraph in a semigraph $G: (\mathcal{V}, \mathcal{E}, \mathcal{X})$. When each pair of connected nodes in \mathcal{G} contains a distinct consecutive adjacent degree, we say that the fuzzy semigraph is strongly irregular in consecutive adjacent degree. It is represented as $d_{g_{ca}}(v)$.

Definition 2.8: Consider $\mathcal{G}: (\sigma, \mu, \eta)$ as a fuzzy semigraph in a semigraph $G: (\mathcal{V}, \mathcal{E}, \mathcal{X})$. When each pair of connected nodes in \mathcal{G} contains a distinct total consecutive adjacent degree, we say that the fuzzy semigraph is strongly irregular in total consecutive adjacent degree. It is represented as $std_{g_{ca}}(v)$.

EXAMPLE 2.9: Let $\mathcal{G}: (\sigma, \mu, \eta)$ represent a fuzzy semigraph in a given fig.1

All the nodes have distinct degrees, including the degree, edge degree, adjacent degree, consecutively adjacent degree, and its total degrees. Hence, the semigraph generated is both irregular and a totally irregular fuzzy semigraph as seen in the table above. It is easy to see that $d_{\mathcal{G}}(v) \leq d_e(v) \leq d_{g_{ca}}(v) \leq d_{g_a}(v)$ and $td_{\mathcal{G}}(v) \leq td_e(v) \leq td_{g_{ca}}(v) \leq td_{g_a}(v)$.

Nithishraj et al.,

RESULTS AND DISCUSSION

Theorem 2.10 For a fuzzy semigraph $\mathcal{G}: (\sigma, \mu, \eta)$ is referred to $G: (\mathcal{V}, \mathcal{E}, \mathcal{X})$, where σ remains a constant function, the conditions i) and ii) are identical, indicating that \mathcal{G} is both a strongly and strongly total irregular fuzzy semigraph.

Proof: Assume σ remains a constant function.

(i.e.) $\sigma(p) = c$, for all $p \in v$.

Let us assume a strongly irregular fuzzy semigraph \mathcal{G} , in which each node has a distinct degree.

Consider a pair of nodes P_1 & P_2 , where P_1 and P_2 have distinct degrees T_1 and T_2 respectively.

(i.e.) $d_{\mathcal{G}}(P_1) = T_1$ and $d_{\mathcal{G}}(P_2) = T_2$ where $T_1 \neq T_2$

Suppose that all of the nodes in \mathcal{G} have the same total degree if \mathcal{G} is not a strongly total irregular fuzzy semigraph.

$$\Rightarrow d_{\mathcal{G}}(p_1) = td_{\mathcal{G}}(p_2)$$

$$\Rightarrow d_{\mathcal{G}}(p_1) + \sigma(p_1) = d_{\mathcal{G}}(p_2) + \sigma(p_2)$$

$$\Rightarrow T_1 + c = T_2 + c$$

$$\Rightarrow T_1 - T_2 = c - c = 0$$

$$\Rightarrow T_1 = T_2,$$

which is a $\Rightarrow \Leftrightarrow$ to $T_1 \neq T_2$.

Consequently, the implication (i) to (ii) is established by knowing that \mathcal{G} is a strongly total irregular fuzzy semigraph.

Assume that \mathcal{G} is a strongly total irregular fuzzy semigraph. Subsequently, the nodes total degree is all are distinct.

Let p_1 & p_2 be the pair of nodes have distinct total degrees T_1 and T_2 respectively.

Now, $d_{\mathcal{G}}(p_1) \neq td_{\mathcal{G}}(p_2)$

$$\Rightarrow d_{\mathcal{G}}(p_1) + \sigma(p_1) \neq d_{\mathcal{G}}(p_2) + \sigma(p_2)$$

$$\Rightarrow T_1 + c \neq T_2 + c$$

$$\Rightarrow T_1 - T_2 \neq c - c = 0$$

$$\Rightarrow T_1 \neq T_2$$

Therefore, \mathcal{G} is a strongly irregular fuzzy semigraph, which establishes the implication (ii) to (i).

As a result, we can deduce that (i) and (ii) are identical.

Theorem 2.11: For a fuzzy semigraph $\mathcal{G}: (\sigma, \mu, \eta)$ is referred to $G: (\mathcal{V}, \mathcal{E}, \mathcal{X})$, where σ remains a constant function, the conditions i) and ii) are identical, indicating that \mathcal{G} is both a v -edge degree in strongly irregular fuzzy semigraph and a v -edge degree in strongly total irregular fuzzy semigraph.

Proof: Let σ remains a constant function.

(i.e.) $\sigma(p) = c$, for all $p \in v$.

Suppose we have a v -edge degree in strongly irregular fuzzy semigraph \mathcal{G} where the edge degree of its nodes all are distinct.

Consider a pair of nodes P_1 & P_2 , where P_1 and P_2 have distinct degrees T_1 and T_2 respectively.

(i.e.) $d_e(P_1) = T_1$ and $d_e(P_2) = T_2$ where $T_1 \neq T_2$

The proof follows a similar structure as the proof of theorem 2.10.

REMARK 2.12: A v -edge strongly irregular fuzzy semigraph and the total degree is highly irregular. Fig.2.

Now, $d_e(p)=0.6$, $d_e(Q)=0.5$, $d_e(R)=0.7$, $d_e(S)=0.8$, $d_e(T)=0.4$ and $td_e(p)=1.3$, $td_e(Q)=0.9$, $td_e(R)=1.3$, $td_e(S)=1.3$, $td_e(T)=1$. In this case, the nodes of the semigraph have distinct edge degrees and are considered strongly irregular, and the total edge degree of the nodes is also distinct. Therefore, the fuzzy semigraph is highly irregular in total edge degrees.

Nithishraj et al.,

Theorem 2.13: For a fuzzy semigraph $\mathcal{G}: (\sigma, \mu, \eta)$ is referred to $G: (\mathcal{V}, \mathcal{E}, \mathcal{X})$, where σ represents a constant value, the conditions i) and ii) are identical, indicating that \mathcal{G} is both an adjacent degree in strongly irregular fuzzy semigraph and an adjacent degree in strongly total irregular fuzzy semigraph.

Proof: Let σ remains a constant function.

(i.e.) $\sigma(p) = c$, for all $p \in v$.

Suppose we have an adjacent degree irregular fuzzy semigraph \mathcal{G} where the adjacent degree of its nodes all are distinct.

Consider a pair of nodes P1 & P2, where P1 and P2 have distinct degrees T_1 and T_2 respectively.

(i.e.) $d_{\mathcal{G}_a}(P_1) = T_1$ and $d_{\mathcal{G}_a}(P_2) = T_2$ where $T_1 \neq T_2$

The proof follows a similar structure as the proof of theorem 2.10.

REMARK 2.14: An adjacent degree is neighbourly irregular fuzzy semigraph and its total degree is strongly irregular. Fig.3.

Now, $d_{\mathcal{G}_a}(p)=0.7$, $d_{\mathcal{G}_a}(Q)=0.6$, $d_{\mathcal{G}_a}(R)=0.9$, $d_{\mathcal{G}_a}(S)=0.8$, $d_{\mathcal{G}_a}(T)=0.6$ and $td_{\mathcal{G}_a}(p)=0.9$, $td_{\mathcal{G}_a}(Q)=1.1$, $td_{\mathcal{G}_a}(R)=1.2$, $td_{\mathcal{G}_a}(S)=1$, $td_{\mathcal{G}_a}(T)=1.3$. In this case, the nodes of the semigraph have distinct adjacent degrees and are considered neighborly irregular, and the total adjacent degree of the nodes is also distinct. Therefore, the fuzzy semigraph is strongly irregular in adjacent total degrees.

Theorem 2.15: For a fuzzy semigraph $\mathcal{G}: (\sigma, \mu, \eta)$ is referred to $G: (\mathcal{V}, \mathcal{E}, \mathcal{X})$, where σ remains a constant function, the conditions i) and ii) are identical, indicating that \mathcal{G} is both a consecutive adjacent degree in strongly irregular fuzzy semigraph and a consecutive adjacent degree in strongly total irregular fuzzy semigraph.

Proof: Let σ remains a constant function.

(i.e.) $\sigma(p) = c$, for all $p \in v$.

Suppose we have a consecutive adjacent degree irregular fuzzy semigraph \mathcal{G} where the consecutive adjacent degree of its nodes all are distinct.

Consider a pair of nodes P1 & P2, where P1 and P2 have distinct degrees T_1 and T_2 respectively.

(i.e.) $d_{\mathcal{G}_{ca}}(P_1) = T_1$ and $d_{\mathcal{G}_{ca}}(P_2) = T_2$ where $T_1 \neq T_2$

The proof follows a similar structure as the proof of theorem 2.10.

REMARK 2.16: A consecutive adjacent degree is strongly irregular fuzzy semigraph and its total degree is neighbourly irregular. Fig.4. Now, $d_{\mathcal{G}_{ca}}(p)=0.5$, $d_{\mathcal{G}_{ca}}(Q)=0.7$, $d_{\mathcal{G}_{ca}}(R)=1$, $d_{\mathcal{G}_{ca}}(S)=1.1$, $d_{\mathcal{G}_{ca}}(T)=0.9$, $d_{\mathcal{G}_{ca}}(U)=0.6$ and $td_{\mathcal{G}_{ca}}(p)=1.2$, $td_{\mathcal{G}_{ca}}(Q)=1.1$, $td_{\mathcal{G}_{ca}}(R)=1.9$, $td_{\mathcal{G}_{ca}}(S)=1.2$, $td_{\mathcal{G}_{ca}}(T)=1.6$, $td_{\mathcal{G}_{ca}}(U)=1$. In this case, the nodes of the semigraph have distinct consecutive adjacent degrees and are considered strongly irregular, and the consecutive adjacent total degree of the nodes is also distinct. Therefore, the fuzzy semigraph is neighborly irregular in consecutive adjacent total degrees.

Theorem 2.17: For a fuzzy semigraph $\mathcal{G}: (\sigma, \mu, \eta)$ is strongly irregular fuzzy semigraph then it is both highly irregular and neighbourly irregular fuzzy semigraph.

Proof: Let \mathcal{G} be a strongly irregular fuzzy semigraph. It follows that every pair of nodes in \mathcal{G} has distinct degrees. Clearly, it is obvious that every consecutive pair of nodes in \mathcal{G} has distinct degrees, and each node in \mathcal{G} is connected to nodes with distinct degrees. Consequently, \mathcal{G} can be defined as a neighbourly irregular and highly irregular fuzzy semigraph.

Theorem 2.18: For a fuzzy semigraph $\mathcal{G}: (\sigma, \mu, \eta)$ is highly irregular and neighbourly irregular fuzzy semigraph is not required to be a strongly irregular fuzzy semigraph.

Nithishraj et al.,

Proof: The nodes P&Q of \mathcal{G} , which are neither adjacent nor incident on the same node can have the same degree, contradicting the definition of a strongly irregular fuzzy semigraph.

CONCLUSION

This study, conducted a comprehensive analysis of strongly irregular and totally strongly irregular fuzzy semigraphs, delving into their edge, adjacency, and consecutive adjacency degrees. A thorough comparative investigation between strongly irregular and strongly total irregular fuzzy semigraphs was carried out, along with a detailed examination of neighbourly and highly irregular fuzzy semigraphs.

ABSTRACT

The undertaking of the goal of the Health-Care- Search The engine is to develop applications for illness prediction. The concept was to create an application that would let any user look up the therapy for the illness they were suffering from. The program would then send out a list of steps that needed to be taken in order to treat the disease effectively, along with Information about which Caregivers could help them. A Sizable dataset of medical records, comprising several patients. Demographic and clinical characteristics like age, gender, Medical history, lifestyle choices, and vital signs reused Train the suggested model. A sizable collection of medical records are used to train the Model, which then forecasts the probability of contracting a certain illness. This suggested method bases the disease prediction on the patient's features. and applies the MLP- Algorithm. Input, output, and one or More hidden layers with many neurons stacked on top of each Others comprise a Multilayer-Perceptron. Furthermore, neurons A Multilayer- Perception can employ any arbitrary activation function, but neurons in a perceptron must have activation function that enforces a threshold, such as ReLU or sigmoid. Through collaborative Filtering, the proposed work ensures that the system recommends suitable caregivers. for the patients. A patient provides his Health-Information to the service platform upon Enrolling in this system in order to Receive Professional Care Services. The platform then searches the patient database for other patients who may have comparable health information. Subsequently, the platform for services can monitor which highly rated caregivers attended to these comparable patients. Lastly, the patient may Receive Recommendations from the service platform for these rated caregivers. The patient can locate suitable healthcare. Services that are more likely to offer high-quality care services by using this type of collaborative filtering.

INTRODUCTION

MACHINE LEARNING

Artificial intelligence (AI) and machine learning allow systems to automatically learn from experience and get better at it. Without needing to be explicitly designed. The Creation of Computer programs that can access data and utilize it to Learn for themselves is the main goal of machine learning. In Order to find patterns in the data and use the examples we provide. Guide future decisions, learning starts with Observations of Data, such as examples, first hand experience, or instruction. The primary objective is to empower computers to learn. their own, devoid of human assistance or intervention, an Adjust their operations accordingly. Machine-Learning is utilized in a variety of AI-Applications including Recommender Systems, driverless cars, Picture an Speech recognition, natural language processing, and more Large-scale Data Processing, Patterns, and Relationships Recognition And Decision-making based on Information is all necessary for these applications. Other Subfields of artificial intelligence (AI) include robotics. expert systems, knowledge representation, planning, and reasoning addition Machine-Learning. Although Echo These subfields focus on a distinct facet of AI; they are all connected and can cooperate to develop increasingly Sophisticated AI-Systems All things considered, machine learning is a vital part of Artificial intelligence (AI) is responsible for helping Computers learn and become more efficient in a variety of Activities. Machine- learning will probably remain a Component in allowing computers to develop intelligence. Beyond that of humans, artificial intelligence (AI) is developing.

DISEASE PREDICTION

Disease risk assessment, which entails projecting a person's probability of contracting a specific disease, is a crucial responsibility in the healthcare industry. Analyzing Variety of risk factors, including age, gender, lifestyle, medical history, and genetic susceptibility, can help achieve this. Large healthcare databases and sophisticated machine learning algorithms make it feasible to precisely estimate the risk of disease and provide individualized preventive measures. Utilizing a dataset, the process of assessing the risk of a disease entails gathering and preprocessing data from a variety of sources, including genetic, medical imaging, and electronic health records. Next, machine learning methods like logistic regression, decision trees, random forests, and neural networks are used to examine this data. Accurate disease risk assessment is made possible by these algorithms' ability to recognize patterns and connections between different risk factors in disease outcomes. The Outcomes Of a disease risk assessment can be utilized to create individualized preventative plans that include dietary adjustments, early detection, and focused medical treatments. This can enhance people's health outcomes and lessen the overall burden of disease. All things considered, illness risk assessment utilizing datasets and machine learning algorithms has the potential to transform the healthcare industry and allow tailored preventive measures that can enhance patient outcomes and lower medical expenses. The goal of the proposed project is to automate the laborious process of looking for and locating hospitals through an automated data-driven strategy for medical knowledge extraction. The plan was to create an application that would enable any user to search for the illness they are experiencing and receive a list of treatments that are successful for it, along with the hospitals that offer the services they need. It is Intend To Accomplish The Following goals.

The majority of search engines employ Keyword-based search, which is a popular method for retrieving documents from the Web. Systems that respond to questions tackle this issue. We Need Tools that let a user Ask a question Uncommon English and get a prompt, concise response with enough context to support the response. The increasing amount of online information available has made it more difficult for users to navigate, which makes the demand for automated question answering systems more pressing. While ranked lists of documents can be returned by current search engines, they do not provide the user with answers. When a search engine is asked a question, it must first assess it, maybe considering the context of an ongoing interaction; it next has to reference links to discover one or more responses; finally, it needs to present the user with the ideal response based on user ratings. These days, patients search online for first aid recommendations and solutions for their medical conditions. Patients wish to receive medical advice about their health and suggestions by asking and

Prathipa et al.,

responding to doctors around the world. The Physicians Recommending them instead Of The intricate and difficult problems. In the beginning, we relied on an external dictionary to find relevant medical information, but this wasn't really enough to assist patients using internet services. These days, we combine medical terminology that creates a barrier between patients and healthcare practitioners with corpus aware terminology that is employed with the use of normal language.

RELATED WORK

Kose,et.al,...[1]outlined a system that contrasts the impact of the multiple imputation methods, MICE and FAMD, on the differential diagnosis performance of DL. Deep Learning is a technique that has grown a lot in popularity recently. Unlike machine-learning-Algorithms, Researchers can use all available data using DL-Modells because they don't add fake reputations. However, quick, dependable and repeatable analysis can yield results and allow for the creation of more accurate estimates [49]. Even in cases, where the dataset contains missing observations, the employment of a high number of neurons in deep learning ensures a comprehensive representation of the available raw data. Upon Reviewing The Literature, if this then that, while deep- learning-techniques have been widely employed in recent research, no study has assessed the performance of missing- imputation-techniques in tandem with their use. For an extended period, it has been recognized that a significant issue in actual clinical trials is the rate of missed observation. Clinical data are known to exhibit distinct features for every disease, novel medication, and treatment approaches. as a result, we only included the Application-Data that we utilized for the Study-Title in our findings and results. Das war eine der Studie Limitations, and we made sure to emphasize it rather clearly. We anticipate having the chance to use our methodology on various clinical datasets, such as electronic medical records or medical imaging genomics. In Conclusion, Deep Learning enables estimates with partial Datasets, in contrast to Machine-Learning-Technikon. Für Hybrid-Type-Daten, is test recommended, dass the Deep- Learning-Method be used in combination with suitable Imputation-Techniques, in order to get the maximum Accuracy-Rates.

Khan,et.al,...[2]Internet of Things Framework is suggested to use a modified deep convolutional-neural- network (MDCNN) to assess heart disease more precisely. Blood pressure and an electro cardiogram (ECG) are monitored by the patient's smart watch and heart monitor gadget. The received sensor data is classified as normal or pathological using the MDCNN. By contrasting the suggested MDCNN with current deep learning-neural- networks and logistic regression, the system performance is examined. The patient's heart condition can be predicted using an MDCNN in the suggested approach. The System is tested and trained for this purpose. The MCNN classifier is used to train the system using the UCI, Framingham, and Public Health Datasets as training data. The data's classified outcomes (normal and abnormal) are included in the UCI dataset. Direct testing of the IoT-Sensor-Values results in a longer time to disease detection and a higher chance of an incorrect result. As a result, the system is trained. Three Steps are involved in training the proposed MDCNN classifier: (i) preprocessing, (ii) feature selection, and (iii) classification. The training's results fall in two categories: (a) normal, meaning the patient's heart condition is normal, and (b) abnormal, meaning the patient's heart condition is abnormal. Testing is done after the training process. Sensor Values are continuously sent by the patient-attached sensor device. The IoT-Sensor-Data are compared with the training-Phase- Values, in order to classify these based on the training- Outcomes. After comparing the values, the system produces results that are classified. Kathamuthu, et.al,... [3] With reduced encryption and decryption time, a novel framework called the deep Q- learning-based neural network with privacy preservation approach (DQ-NNPP) was created to secure data transmission from outside threats. Hospital applications require private patient data, which is uploaded in centralized locations. These Data are then used by Machine-Learning- Techniques to identify distinctive Patterns that can be used to create new Models. Insider- and Outsider-Dangers arise, we Such confidential information is made available to the workers of the organization, or if the company's dataset is compromised. Neural-Network-Techniques are employed in the built model to protect the confidentiality and security of medical records. The System has to get rid of illegal access to the Cloud Storage because it is facing multiple intermediate attacks. After user data is collected, features are taken out and saved for each request, in order to examine malware-activity as well as security- and privacy-related problems. Feature states can be used to extract

Prathipa et al.,

the quality-value the data from these Features, and the actions that correspond to these Features also aid in determining the quality of the data. preservation technique (DQ PP) architecture. In order to provide a patient-centric access control strategy employed in the electronic medical sectors, this study developed innovative cipher text-policy attribute-based privacy preservation (CPA BPP), which combines the advantages of private, public, and master keys, thereby guaranteeing security and privacy. Koppu, et.al,... [4] The prediction model's step-by-step implementation, which includes cleaning, feature extraction, and classification, satisfies this goal. The Cleaning procedure consists of clearing out missing values and detecting outliers using entropy-correlation and sp lines' interpolation. Principle Component Analysis is then used to extract features from the cleaned data. To choose the best features, a Fitness-oriented Dragon-Fly-Algorithm is presented. The resulting Feature-Vector is then put in the Deep Belief Network. The suggested scheme's overall accuracy was tested using conventional state-of-the-art models. The first phase involves applying the gathered information on breast cancer and heart disease to the data cleaning procedure. The cleaning procedure consists of two steps: Outlier detection comes first, followed by missing value filling. Hier ,the Outlier detected using correlation-based approach and entropy, while Sp line Interpolation (SI) is utilized to fill in missing values. The Second Phase Involves using Principal Component Analysis (PCA) to extract features from data that have been cleaned. The third stage involves multiplying the features collected from PCA by a weight function to create a different type of feature vector.

The resulting feature vector is sent to the Deep Belief Network(DBN)architecture in the fourth stage. The Primary contribution is the optimized tuning the multiplied weight through the use of modified, or F-DA, to reduce the error between the anticipated and actual output during the classification process. The Labels, that indicate whether or not the patient is affected, are provided by the Categorization- Output. Ma,Zhuoran,et.al,...[5]suggested PHPR, a high-accuracy, privacy-preserving external disease predictor on random forests. The PHPR-System can create accurate predictions and conduct secure training using medical data that owned by several Data-Owners. Furthermore, original data and computed results in the rational sector can be processed and kept in the Cloud safely and securely without compromising privacy. Specifically, to ensure computation correctness and handle outsourced operations on-the-fly, we first build privacy preserving computation protocols over rational numbers. Next, we show that the PHPR-System is capable of achieving a secure Illness-Predictor. Assume for the purposes of the proposed model that KC is a reliable source that offer critica distribution generating services. While diligently adhering to the prescribed protocol, DOs, CU,OP, and CP are inquisitive, yet truthful parties, that make an effort to discover as much personal information as they can from other parties and the interim outcomes of the learning process. Furthermore, every DO's Data Privacy needs to be protected to the fullest extent possible from both other DOs and Cloud Server (OPorCP). Furthermore, OP end CP are independent cloud servers with a solid reputation, and are not permitted for them to collude, since doing so would be detrimental to their credibility and interest.

BACKGROUND FUNCTION

An effective and private-preserving online disease risk assessment method spanning multiple-outsourced vertical datasets has been established in the current system. This method allows the-healthcare provider safely train a disease risk prediction model using vertically dispersed medical data from several medical centers and offer users privacy-preserving disease risk prediction services. Users' private information as well as that of medical facilities and e-healthcare providers can be securely protected throughout the process. First, it successfully trains a model for disease risk prediction using vertically dispersed data, and it allows for dynamic model updates. With this method, the e-healthcare provider can also successfully trainthe disease risk prediction model,even if medical center gather various attributes from cases. Furthermore, a method for upgrading the model is developed that enables healthcare facilities to submit newly obtained patient data in order to routinely update the prediction model. Second, it offers privacy preservation for both illness risk prediction and model training. Provide a modified Paillier crypto system for this application so that the prediction model may be safely trained without revealing private information about medical facilities. Additionally, the random masking technique is used in disease risk prediction, maintaining user queries and results regarding disease risk as well as the e-healthcare provider's disease risk prediction model.

**Prathipa et al.,****DISEASE PREDICTION WITH SOLUTION RECOMMENDATION USING MACHINE LEARNING**

The "Health Care Search Engine" projects cutting-edge strategy meant to transform the way people look for healthcare and enhance patient outcomes. Utilizing state-of-the-art machine learning methods, such as Multilayer Perceptron (MLP) algorithms, the project aims to forecast the probability of an illness based on a variety of patient attributes, including vital signs, lifestyle choices, medical histories, and demographic information. With the use of this predictive model, which was trained on an extensive collection of medical records, users will be able to make knowledgeable decisions about their healthcare requirements and receive tailored recommendations for caregivers and therapies. Additionally, the initiative incorporates collaborative filtering techniques to improve the patient-career match making process. Through the examination of comparable patient experience with specific medical illnesses, the system finds and suggests highly rated caregivers who have proven to be adopted delivering quality treatment. In addition to increasing patient happiness, this individualized approach makes high-quality healthcare services more accessible. The proposed project seeks to transform the healthcare search environment by leveraging technology to improve healthcare delivery. It provides a smooth and effective solution for both patients and caregivers.

DATASET PROCESSING

Gather a sizable dataset of medical records for this module that includes a range of clinical and patient demographic information, including age, gender, medical history, lifestyle choices, and vital signs. Next, clean up the data to get rid of any unnecessary characteristics, outliers, or missing values that could compromise the model's accuracy. Using methods such as feature importance analysis, mutual information, or correlation analysis, determine which features are most relevant in influencing the risk of a disease. Use machine learning methods like SVM, logistic regression, or random forest to train a classification model. Cross-validation should be used to assess the model's suitability for generalization. Creating a model and preprocessing the dataset are essential stages in building a machine learning-based disease risk assessment module. These procedures guarantee that the model is reliable, accurate, and suitable for usage in clinical settings.

USER SEARCH QUERY

To protect patient privacy and stop unwanted access to private medical records, a patient verification system based on secret keys can be put in place. Every patient in this system has a distinct secret key that they and the Trusted Authority alone can share. A patient's secret key can be requested by the healthcare practitioner in order to confirm the patient's identification when they seek medical attention. Subsequently, the user can look for disease information by symptom. It is possible to create a disease search engine that relies on symptom queries to assist medical professionals in making diagnoses based on patient symptoms. The healthcare provider causes this system to input the patient's symptoms, and it will look for potential illnesses that match the symptoms.

DISEASE PREDICTION

The task of analyzing the symptoms that the user enters and identifying pertinent characteristics that can be utilized to forecast the illness falls to the user symptoms query processing module. Employing methods such as feature importance analysis, mutual information, or correlation analysis, determine which features are most pertinent to the diagnosis of an illness. The disease prediction module can utilize a machine learning technique, such as SVM classification, to forecast the disease based on the user's symptoms after the pertinent features have been retrieved. After the patient provides the service platform with their disease information, the platform analyzes the data and suggests treatments to the patient. This suggestion is based on the highly regarded physicians who receive treatment from the top k patients. Following acceptance of the medical services, the patient evaluates and assesses the physician.

Prathipa et al.,

REVIEW ANALYSIS

The patient evaluates and ranks the caregiver after receiving the medical services from the caregiver they consulted. The service platform determines if a review is genuine or not, display the genuine reviews, and determines the public's average rating. The same approach should be used to generate reviews and ratings. The service platform will not accept reviews and ratings that the patient does not sign under his secret keys. The Service Platform May Question whether the two signatures are from the same Sybil attacker if it notices similar reviews and ratings within a brief period of time. The ratings can only be approved by the service platform and displayed to the public if they are created by a typical patient, that is, not a Sybil attacker. Ultimately, the distinct and original reviews are safely encrypted and kept in a database.

SOLUTION RECOMMENDATION

The suggested method uses collaborative filtering to suggest suitable cares for the patients. The service platform can keep track of the highly rated care givers who attended to these comparable patients when patients look for the caregiver's solution. Lastly, the patient may receive recommendations from the service platform for these rated caregivers. The patient can locate suitable healthcare services that are more likely to offer high-quality care services by using this type of collaborative filtering.

METHODOLOGY

MULTILAYER PERCEPTRON ALGORITHM

Multilayer Perceptron Algorithm feed forward artificial neural network structure called Back propagation projects a set of input data onto a set of suitable outputs. It consists of many directed graph layers with Multiple Layers of nodes, each fully connected to the following layer. With the exception of the input nodes, each node is a neuron with a nonlinear activation function. Back propagation trains the network by taking advantage of a supervised learning method known as back propagation. Should back propagation possess basic On-off-Mechanism, such as linear activation function in all neurons, to regulate Whether or not a neuron fires, then it is easily proved with linear algebra that any number of layers can be reduced to the Standard Two-Layer-Input-Output-Model. Gradient techniques are therefore useful in Optimization-Strategies to control the Weights and reduce the network's Loss-function. To Computer Gradients for each layer in a feed forward network, a chain of Imperative Rules may be created using the Delta-Rule. For the Back Propagation Algorithm to work, each neuron activation function must differ. Back Propagation is now used in the continuing research on distributed computing, Computational Neuroscience and Parallel Computing. Their ability to solve Complicated Issues and their fitness Approximation of Outcomes, even with crucial Predictions, makes them extremely useful for studying. One of the neural network models, back propagation, use the same feed-forward-back-propagation- architecture as supervised training. The most popular and often used kind of neural network is the back propagation. User can provide the Features and inevitably predict the diseases.

The algorithmic steps are Follow

Step1:Randomly Set The Weights And Biases.

Step 2: Feed the trainings sample.

Step3:Forward Inputs and calculate each unit's Net Input and output in the hidden and output layers.

Step 4: Back propagate the error to the intermediate layer.

Step 5:Update Weights and biases to replicate the propagated Errors. The weights and biases of the network are automatically. Adjusted by mathematical measures called training and Learning Functions.

Step 6: Stop the Condition

Prathipa et al.,

COLLABORATIVE FILTERING

User-based Collaborative Filtering is a Method that leverages ratings from other users who share the target User's taste to predict the items the user could find appealing. Collaborative Filtering is a common technique used by websites to develop their recommendation system. Cold starts for newly added items to the list are one issue that Collaborative Filtering may cause. They receive no recommendations unless they receive a rating. Data Sparsely: Can exacerbate the cold start issue and have an impact on the performance of user-based recommenders. Growing datasets can present scaling challenges, due to their Potential for excessive Complexity. When the Dataset is huge, Item-based Recommenders perform faster than user-based. Ones. If the suggestions were implemented simply, one may Notice that the items from the long tail portion might be disregarded and that the Recommendations are generally already well-liked.

Steps for User-based Collaborative Filtering

Step 1: Finding the similarity of users to the target user U. Similarity for any two users ,a' and ,b' can be calculated. from the given Formula.

Step 2: Prediction of the missing rating of an item The target user may now resemble certain users very. substantially while not like the others at all. Therefore, a Specific item's Ratings from users who are more similar to it should be given more weight than ratings from users who Are less similar to it, and so on. A weighted average method. can be used to tackle this issue.

EXPERIMENTAL RESULTS

The proposed drug recommendation system was implemented in Python as front end and MySQL as backend that allows a developer to create a customized development environment. The experimental results show the output of disease diagnosis using symptoms and also recommend the appropriate drugs for predicted disease. In below, we explained the details with specific screenshots. In fig 2 shows the process of selecting symptoms for prediction disease. Here user can select the symptoms regarding their health issues. For symptoms processing here apply MLP algorithm. In fig 3 shows the process of disease prediction output, the input symptoms are processed using MLP algorithm and predict the disease based on symptoms. In fig 4 shows the process rating posted by user. The registered user can post their ratings for provided drug details. It support Star Ratings,smiley sand text based review system. In fig 5 shows the process of drug recommendation. Based On user's rating, review and feedback, the system analyzed the feedback using collaborative filtering algorithm. Predict the highly positive rate drugs and recommend the predicted drugs to the users.

CONCLUSION

In Conclusion, a promising method healthcare that can enhance patient privacy while yet enabling reliable disease prediction is disease prediction using symptom data with classification disease dataset using the MLP algorithm. The MLP algorithm is an effective tool for classification jobs and has a high accuracy rate for predicting the disease based on the symptoms of a patient. Additionally, the application offers the anticipated illness. Solution vendors have already shared and stored in databases their disease-focused solutions. Patients are able to rate and review a particular remedy online. An effective review analysis is provided by collaborative filtering method. The can obtain the majority of suggested solutions with this strategy. This protects user identity privacy by preventing the service platform, caregivers, and other patients in the system from learning the patient's identity information. In order to prevent phony Reviews of caregivers, deploy and analyze fake reviews has well.

ABSTRACT

Federated learning permits the training of decentralized models among several devices while maintaining local data, yet it presents serious bandwidth issues because of the frequent and substantial model changes. Scaling these systems in practical applications requires effective bandwidth control. This study investigates many strategies, including network innovations, adaptive protocols, and compression techniques. We examine techniques including quantization, sparse updates, and model pruning to minimize update sizes without sacrificing accuracy. Adaptive protocols modify communication according to network circumstances and client accessibility, and advances in networks such as asynchronous communication and hierarchical federated learning facilitate faster data transfers. We present an overview of existing research, point out shortcomings, and offer innovative methods to improve the effectiveness and also scalability of the federated learning systems by examining recent developments and trends. This paper aims to guide future research in developing better bandwidth management solutions for federated learning.

Keywords: communication, management, devices, learning, network.

INTRODUCTION

Artificial intelligence (AI) was first proposed in 1956 and its technological advances are having an increasingly significant impact on human existence[1]. Many application areas have entered the field of artificial intelligence due to recent advances in artificial intelligence technology [2]. In order to advance AI technology, academic research focuses on models, processing power, chip functionality, and further technical difficulties along the way. Large quantities of actual data must be used to train machines to actually imitate human reasoning. Federated learning revolutionizes the field of machine learning by enabling centralized modelling training on a large number of devices, while ensuring that data remains on local devices. The concept of FL was proposed by Google in 2016 primarily to update the model on the Android mobile phone without disclosing confidential personal information [3]. Afterwards, Google implemented an application-focused FL system. Without storing raw device data on cloud servers, the FL system's architecture was designed to run the FedAvg algorithm on mobile devices, conduct federated studies, and be used to monitor statistics for big cluster equipment. The FL is among the most significant technologies in the field of data protection computing. FL's lightweight technology pathways and deployment system have made FL a popular product and solution for many applications involving privacy computing. As FL applications have evolved and grown more complex, a substantial number of research achievements in the field have emerged. This strategy enhances security and privacy while also allows the use of different data sources without the need for centralized data collection.

As long as private data stays inside the local area, FL is a safe distributed machine learning technology that may be used in conjunction with FL algorithms on a number of distributed edge devices and servers [4]. Each local client receives data training tasks from FL, and instead of direct data communication, clients and servers communicate with one another through parameter interaction. Then server's contribution to updating the global model is limited to basic parameter aggregation. By conserving server processing and storage resources, a FL system like this can safeguard local user data. With client-server communication, a superior global model can be produced via FL. The method is in contrast to conventional centralized training, which gathers all local data into the training's central server [5]. In contrast to conventional centralized machine learning techniques [6], FL techniques enable the realization of numerous federated agencies to construct a single, compliant, safe model for multi-source data applications in the ecological system [7].

Federated learning has great potential, but it also has a lot of problems, especially with bandwidth control. Significant bandwidth needs are caused by the frequent and frequently massive model update transfers that occur between clients and the central server. To scale federated learning systems and make them practical for use in real-world applications, effective management of this bandwidth is necessary.

This study investigates novel approaches to address these bandwidth problems, with a primary focus on three domains: network innovations, adaptive protocols, and compression methods. The goal of compression techniques like quantization, sparse updates, and model pruning is to minimize the size of model updates without compromising accuracy. Adaptive protocols maximize bandwidth utilization by dynamically modifying communication processes in response to current network conditions and client availability. Asynchronous communication and hierarchical federated learning are two examples of network improvements that simplify data transfers and cut costs.

Our review focuses on current developments and new trends in these fields. We provide an extensive overview of the field's current situation, point out any gaps in the knowledge, and offer novel ideas for enhancing the efficiency and scalability of federated learning systems. Our goal is to offer guidance and insights for future research aimed at creating more efficient bandwidth management solutions for federated learning through theoretical analysis and real-world examples.

**Sayed Muhammed Fazil and Bharathi**

LITERATURE REVIEW

Federated learning is a relatively recent concept in machine learning that focuses on collaboration rather than centralization or data aggregation. This paradigm shift was earlier introduced by Konečný, McMahan, and colleagues [8] who laid the groundwork in establishing the basic tenets of federated learning—data locality is only between model updates that participants share. Their work (Konečný et al., 2016) raced light-years ahead to open up the potential for protecting privacy while developing collaborative models for training and scattered devices in a natural environment. McMahan and team developed the Federated Averaging algorithm on top of such basic concepts [9] and now become the cornerstone in federated learning. FedAvg can save huge costs in communication, allowing devices to train models locally over a number of iterations before the created models get averaged across the network. It reduces frequency and volume of exchanged data between devices and central servers—for instance, the communication costs incurred locally will be minimized when data is being exchanged between devices and a central server (McMahan et al., 2016).

On the other hand, privacy remains a primary concern in federated learning, especially considering that the data is decentralized. Martin Abadi [10] was the first to work on a way to solve these issues with the design of mechanisms to achieve untraceability of individual data points in the updates of models with differential privacy. While this work is not specifically associated with federated learning, Abadi's work is integral in establishing a proper basis for integrating privacy-preserving techniques in federated systems and ensuring that individual data from the participants are secure and remain private throughout the collaboration training process, whereby the training is close to real time. Federated learning faces a critical challenge: the efficiency of communication, also in the presence of heterogeneous devices in the computational and network capabilities, causes not only a privacy concern. This point is illustrated, for instance, in the work done by Peter Kairouz [11], regarding strategies to optimize federated learning in such heterogeneous settings, through adaptive tuning of communication frequency with respect to network conditions and the model's convergence rate. Such strategies are pivotal in managing bandwidth properly, ensuring that federated learning remains both scalable and effective across devices and networks (Kairouz et al., 2019).

Hence, personalization in a federated learning setting becomes very attractive since one can get the benefit of the model of the federated network fit to each user. An important contribution to this field was made by Tian Li and colleagues [12] when they suggested the use of a meta-learning approach to aid the creation of a personalized model for each client. One of the key aspects of this factoring adaptability is that even federated learning must be customizable to adapt effectively under the consideration of scenarios in the service areas, where user behaviour across regions deviates greatly.

Bandwidth management has been a crucial and extensively researched aspect in the scalability and viability of federated learning. The alleviation occurs through the transmission of only the most prominent updates or by reducing the precision of the data transmitted to relieve the burden on network resources, hence making federated learning more practical in environments with limited bandwidth. Furthermore, Jianqiao Wang [13] has developed a communication-efficient optimization algorithm on SignSGD, when only the sign of incoming gradients is shared between the devices, with a very significant decrease in the transferred data volume, and the model learning is almost not influenced (Wang et al., 2018).

Among the problems of secure aggregation of updates of models, work on the above problems has also been done by Kallista Bonawitz [14] and associates. They built a secure aggregation protocol that would ensure the server at the center would only receive the aggregated updates of all the participating devices, hence protecting individual contributions. This is actually one of the basic requirements for maintaining any form of trust within federated learning systems, especially when sensitive data is involved (Bonawitz et al., 2017). The recent work of Qiang Yang and Peter Kairouz [15] is helpful for those who aim to get the full picture of the current status of federated learning.

**Sayed Muhammed Fazil and Bharathi**

They provide not only detailed descriptions of the latest progress but also highlight open challenges of improving its communication efficiency, privacy, and model personalization in FL (Yang and others, 2019; Kairouz and others, 2021).

Methodologies for Efficient Bandwidth Management in Federated Learning

Federated learning faces significant challenges, particularly with managing bandwidth due to the frequent and large exchanges of model updates. To address these challenges, several methods have been developed, focusing on improving communication efficiency and managing data distribution. Here are some of the basic methods used in this topic:

Model Compression Techniques

In order to save bandwidth, model compression techniques are needed to reduce the number of model updates delivered from clients to the central server. Pruning, as discussed by Han et al. (2016) [16], involves removing unnecessary weights from the neural network without significantly impacting performance. By eliminating less significant weights or nodes, the model becomes sparser and more efficient. For instance, if a neural network initially has 1,000 connections, pruning might remove 500 of the least important ones, effectively halving the model size. Another technique is quantization, which lowers the model parameters' precision to need less data. Data size can be decreased by a factor of four by converting weights and activations from 32-bit floating-point numbers to 8-bit integers, as noted by Gupta et al. (2022) [17]. This essentially means that a weight is transmitted as an 8-bit integer rather than a 32-bit floating-point value.

Sparse updates, although not specifically covered in the provided studies, are a well-established concept in the literature. This technique involves transmitting only the changes in model weights that exceed a certain threshold, significantly reducing communication by sending updates only for parts of the model that have experienced substantial changes. For example, if only 10% of model weights change significantly during training, only these changes are transmitted, potentially reducing communication by up to 90%.

Adaptive Protocols

Adaptive protocols play a crucial role in optimizing communication processes in federated learning systems by dynamically adjusting based on real-time network conditions and client availability. Dynamic client selection, as discussed by Kairouz et al. (2021) [18], involves choosing a subset of clients with optimal connectivity for each training round, thus avoiding delays and reducing bandwidth usage. Their review highlights the effectiveness of this approach in improving communication efficiency by selecting clients with the best network conditions ("Advances and Open Problems in Federated Learning"). Chen (2023) [19] examined adaptive frequency, which modifies the frequency of model updates based on network circumstances and the model's rate of convergence. During periods of high network traffic, this method helps manage congestion by reducing the update frequency to prevent network overload ("Federated Learning Architecture to Integrate AI Models from Different Internet Service Providers: Using Bandwidth Slicing Resource Management as Case Study," *Journal of Computer Networks and Communications*). These studies demonstrate how adaptive protocols, including dynamic client selection and adaptive frequency, improve federated learning effectiveness by adjusting communication according to the situation.

Network Innovations

Network innovations are critical for enhancing the communication infrastructure and protocols in federated learning systems. Hierarchical federated learning, as described by Yang et al. (2019) [20], organizes clients into hierarchical structures to reduce the communication burden on the central server. By grouping clients into clusters with local aggregators, the number of direct connections to the central server is minimized. For example, in a company with multiple branches, each branch could have a local aggregator that consolidates updates and communicates with the central server, effectively lowering the communication load ("Federated Machine Learning: Concept and Applications," *2019 International Conference on Machine Learning*).

**Sayed Muhammed Fazil and Bharathi**

Asynchronous communication allows clients to send updates independently rather than synchronizing all clients at once. This method enables clients to transmit updates based on their local schedules, such as clients in different time zones sending updates when they finish their training rounds. Zhao et al. (2022) [21] highlight the advantages of this approach in managing communication delays and improving scalability ("Federated Learning with Non-IID Data: A Survey"). By streamlining communication protocols and lightening server load, these network innovations—such as hierarchical structures and asynchronous communication—improve the effectiveness and scalability of federated learning systems.

Data and Model Optimization

Optimizing how data is handled and how models are trained can also contribute to more efficient bandwidth use. By combining model updates from clients, Federated Averaging (FedAvg), a key approach in federated learning, improves communication efficiency. According to Kairouz et al. (2021) [22], FedAvg operates by having each client compute its local model updates, which are then transmitted to a central server. Then server averages these updates and makes use of the average to the global model. For example, if three clients each send their model updates, the server calculates the average of these and updates the global model accordingly. The total amount of data that needs to be conveyed is greatly decreased by using this strategy, thus minimizing communication overhead and improving system efficiency ("Advances and Open Problems in Federated Learning"). FedAvg is widely recognized for its effectiveness in managing data transmission in federated learning environments. A method called knowledge distillation uses the information coming from a bigger, previously trained model to train a smaller, more effective model. This method works by having a smaller model, known as the student, learn to replicate the behavior of a larger model, or teacher, by training on the outputs generated by the teacher model. For instance, a lightweight student model might be used on a mobile device, while a more complex teacher model operates on a server, providing the necessary outputs for the student model to learn from. This approach enables the deployment of efficient models in resource-constrained environments without sacrificing performance. The effectiveness of knowledge distillation in federated learning contexts is discussed by Yang et al. (2019), who explore its applications and benefits in making advanced models more accessible and efficient across different devices ("Federated Machine Learning: Concept and Applications").

Privacy-Preserving Techniques

Ensuring data privacy while optimizing communication efficiency is also a key consideration in Federated Learning concept. Differential privacy is the technique designed in order to safeguard the confidentiality of individual data points by adding noises to model updates. This method involves applying mathematical techniques to ensure that the contribution of any single data point is obscured by random noise, making it difficult to trace specific details back to any individual. For example, before transmitting model updates, a client's data may be modified with random noise to mask its origin, thus preserving privacy. Kairouz et al. (2021) discuss differential privacy in their review of federated learning advancements, highlighting its importance in maintaining privacy while still allowing for effective model training ("Advances and Open Problems in Federated Learning"). This method is essential for protecting private data in federated learning systems.

While protecting the anonymity of their inputs, multiple participants can collaborate to jointly calculate a function over those inputs through the use of secure multiparty computing (SMPC). This method employs cryptographic techniques to ensure that no single party has access to all the data, thus preserving privacy throughout the computation process. For example, multiple hospitals can collaborate to train an artificial intelligence model using patient data without actually sharing the individual datasets with one another. This technique is essential for maintaining data confidentiality while enabling collaborative learning. Kairouz et al. (2021) discuss the application of secure multiparty computation in federated learning contexts, emphasizing its role in facilitating privacy-preserving data collaborations ("Advances and Open Problems in Federated Learning").

Sayed Muhammed Fazil and Bharathi

CONCLUSION

The bandwidth-efficient management is one of the core elements that shall set federated learning free with its full power, especially as it has always been progressing toward real-world applications. By reducing the communication overhead, data transmission optimization can enhance the distributed learning paradigm's inclusivity and scale. This is going to be very instrumental not only to large-scale AI models but democratizes leading-edge technologies, thereby being more available for lower-end devices. This points to a future of bandwidth management in federated learning driven by adaptive techniques that react in real time to network conditions, with the development of algorithms driving prioritization of essential data without model-accuracy compromise. Other technologies that could be utilized and incorporated to further drive down latency and improve communication efficiency are emerging 5G and edge computing, hence making federated learning systems seamless and responsive. In improving such methods, we should not turn our backs on the ethical considerations at stake but work towards efficient, more equitable, transparent, and fair systems for all, so that the fruits of federated learning are realized by all.

ABSTRACT

Nano targeted gene delivery stands as a pivotal innovation in the realm of gene therapy, offering a transformative approach to treating an array of diseases including cancer, genetic disorders, and infectious diseases. This review elucidates the significant strides made in nanotechnology for gene delivery, highlighting the design and application of various nanomaterials such as liposomes, dendrimers, and nanoparticles. These nanocarriers are engineered to enhance the precision, efficacy, and safety of gene delivery, addressing the cellular and molecular intricacies of targeted therapy. Despite the progress, the field grapples with challenges including technical hurdles in nanocarrier design, biological barriers like immune response and targeting accuracy, and ethical and regulatory considerations. Looking forward, the integration of artificial intelligence and interdisciplinary strategies promises to propel the field, optimizing nanocarrier design and broadening the scope of gene therapy applications. The convergence of these advancements heralds a new era in healthcare, where nano targeted gene delivery could revolutionize personalized medicine and offer hope for previously intractable conditions.

INTRODUCTION

Overview of gene therapy and its significance in modern medicine

Gene therapy represents a groundbreaking approach in modern medicine, offering potential treatments for a range of genetic disorders, cancers, and infectious diseases that were once deemed incurable. By directly modifying the genetic material of a patient's cells, gene therapy can address the root causes of diseases at the molecular level(1). This approach can lead to long-lasting and potentially curative outcomes, distinguishing it from traditional therapies that often only treat symptoms. The significance of gene therapy extends beyond individual patient benefits, as it also has the potential to reduce long-term healthcare costs and improve overall public health outcomes. (2).The success of gene therapy in treating disorders like spinal muscular atrophy and certain forms of inherited blindness has garnered significant attention, demonstrating its potential to transform medical treatments and offering hope to patients with limited therapeutic options(3).

Nanotechnology in gene delivery

Nanotechnology has revolutionized the field of gene therapy by providing advanced tools for delivering therapeutic genes to specific cells and tissues. At the nanoscale, materials exhibit unique properties that can be harnessed to encapsulate and protect genetic material, control its release, and target its delivery with unprecedented precision(4). Nanocarriers, such as nanoparticles, liposomes, and dendrimers, can be engineered to overcome biological barriers, enhance cellular uptake, and improve the stability of genetic therapies. This nanoscale approach to gene delivery not only increases the efficiency of gene transfer but also minimizes off-target effects, thereby enhancing the safety profile of gene therapies. As nanotechnology continues to evolve, it is paving the way for more sophisticated and personalized gene therapy applications(5).

Importance of targeted gene delivery in enhancing the efficacy and safety of gene therapy

Targeted gene delivery is a critical aspect of gene therapy that ensures therapeutic genes reach their intended cells or tissues without affecting others, thereby maximizing therapeutic efficacy and minimizing side effects. This precision is crucial, especially in complex diseases like cancer, where it's essential to distinguish between healthy and diseased cells(6). Targeted delivery systems can recognize specific cell markers, facilitating the selective introduction of genetic material into diseased cells while sparing healthy ones. This targeted approach not only enhances the effectiveness of gene therapy but also significantly reduces the risk of unintended interactions, which can lead to adverse effects. As research progresses, the ability to target genes more accurately will be pivotal in expanding the therapeutic potential of gene therapy across a broader range of conditions(7).

Objectives and scope of the review

The objective of this review is to provide a comprehensive overview of the current advances, challenges, and future directions in nano targeted gene delivery. By exploring the integration of nanotechnology with gene therapy, this review aims to elucidate how nanoengineering advances are enhancing the precision, efficacy, and safety of gene delivery methods(8). The scope includes an examination of the various nanocarriers and targeting strategies employed, an analysis of the current clinical and preclinical applications, and a discussion of the technological and biological hurdles facing the field. Additionally, the review will explore future prospects, highlighting emerging trends and potential interdisciplinary collaborations that could drive the next wave of innovations in nano targeted gene delivery(9). Through this, the review intends to provide valuable insights for researchers, clinicians, and policymakers involved in the development and application of these transformative medical technologies(10).

Advances in Nano Targeted Gene Delivery

Summary of recent advancements in nanotechnology for gene delivery

Recent advancements in nanotechnology for gene delivery have centered on the development of innovative nanocarriers that offer enhanced delivery efficiency, improved targeting capabilities, and increased gene expression control. Scientists have engineered nanoparticles with stimuli-responsive features, allowing them to release their

**Haricharan et al.,**

genetic cargo in response to specific cellular or tissue environments(11). There's also significant progress in designing multifunctional nanosystems that integrate diagnostic and therapeutic functions, enabling real-time monitoring of gene delivery and expression. Advances in surface engineering have led to the development of nanocarriers with improved biocompatibility and reduced immunogenicity, facilitating their safe use in clinical applications(12). Additionally, the integration of nanotechnology with CRISPR-Cas systems represents a cutting-edge advancement, offering precise and efficient gene editing capabilities that hold promise for correcting genetic disorders at their source.

Description of various nanomaterials used for targeted gene delivery

Liposomes, spherical vesicles consisting of one or more phospholipid bilayers, have been extensively used for gene delivery due to their biocompatibility and ability to encapsulate both hydrophilic and hydrophobic substances. Dendrimers, highly branched, star-shaped macromolecules, offer a high degree of surface functionality that can be tailored for targeted delivery, enabling them to bind to specific cell surface receptors(13). Nanoparticles, including metallic nanoparticles, polymeric nanoparticles, and solid lipid nanoparticles, provide versatile platforms for gene delivery, with customizable sizes, shapes, and surface properties to enhance cellular uptake and targeting. Quantum dots and carbon nanotubes have also been explored for their unique optical and electrical properties, respectively, contributing to the broad spectrum of nanomaterials available for targeted gene delivery applications.(14)

Mechanisms of targeted gene delivery at the cellular and molecular levels

Targeted gene delivery at the cellular and molecular levels involves several key mechanisms. Ligand-receptor interactions are commonly used, where the surface of nanocarriers is modified with ligands that specifically bind to receptors on target cells, enhancing uptake via receptor-mediated endocytosis. Another approach is the use of cell-penetrating peptides that facilitate the direct translocation of genetic material across the cell membrane.(15) Additionally, environmentally responsive nanocarriers can alter their behavior in response to specific cellular or tissue stimuli, such as pH or enzyme presence, to enhance gene release at the target site. These mechanisms ensure that the genetic material is not only delivered efficiently to the target cells but is also released in a controlled manner, optimizing the gene therapy's therapeutic effect.

Highlighting key studies and breakthroughs in the field

Key studies in nano targeted gene delivery have demonstrated significant breakthroughs, such as the successful use of lipid nanoparticles to deliver mRNA in COVID-19 vaccines, showcasing the potential of nanotechnology in rapid vaccine development. Another notable breakthrough is the use of polymer-based nanoparticles to deliver CRISPR-Cas9 components, enabling precise gene editing in vivo.(16) Studies involving the use of magnetic nanoparticles for targeted gene delivery under the guidance of external magnetic fields have opened new avenues for localized gene therapy. Additionally, the development of biodegradable nanocarriers addresses long-standing concerns regarding the long-term safety and environmental impact of nanomaterials. These studies not only highlight the potential of nano targeted gene delivery in treating a variety of diseases but also underscore the field's rapid evolution and its readiness to address emerging healthcare challenges.(17)

Applications of Nano Targeted Gene Delivery

Therapeutic applications in various diseases such as cancer, genetic disorders, and infectious diseases

Nano targeted gene delivery has revolutionized the treatment landscape for several challenging diseases. In cancer therapy, nanocarriers are designed to target tumor cells selectively, reducing the systemic side effects of conventional chemotherapy and increasing the therapeutic efficacy of gene-based treatments(18). For genetic disorders, such as cystic fibrosis or muscular dystrophy, nano targeted delivery systems offer a promising approach to correct defective genes directly within the affected tissues. Infectious diseases also benefit from this technology, where targeted gene delivery can be used to enhance the immune response against pathogens or disrupt the genetic machinery of viruses and bacteria, providing a novel approach to treatment beyond traditional vaccines and antimicrobials(19).

**Haricharan et al.,****Role in personalized medicine and tissue engineering**

In personalized medicine, nano targeted gene delivery systems enable the tailoring of therapies to individual patients based on their genetic makeup, improving treatment outcomes and minimizing adverse effects(20). This precision approach ensures that patients receive the most effective gene therapies based on their unique genetic profiles and disease characteristics. In tissue engineering, nanotechnology facilitates the delivery of genes that promote tissue regeneration and repair, offering innovative solutions for regenerative medicine. By precisely controlling the release and localization of therapeutic genes, nano targeted delivery systems can significantly enhance tissue engineering strategies, contributing to the development of engineered tissues and organs with improved functionality and integration with the host(21).

Discussion on the clinical trials and approved therapies using nano targeted gene delivery

Several clinical trials have underscored the potential of nano targeted gene delivery in various therapeutic areas. For example, clinical trials involving nanoparticle-mediated delivery of nucleic acids have shown promise in treating genetic diseases and cancers. One of the landmark successes in the field is the use of lipid nanoparticles in the delivery of mRNA vaccines for COVID-19, representing one of the first widespread clinical applications of nano targeted gene delivery(22). Additionally, there are ongoing trials exploring the efficacy of nanoparticle systems in delivering gene-editing tools like CRISPR-Cas9 to treat inherited genetic disorders. Although the number of approved nano targeted gene therapies is still limited, the successful outcomes of these trials indicate a promising future for the approval and clinical use of such advanced therapeutic modalities, potentially transforming the treatment paradigm for many incurable and chronic diseases.

Challenges in Nano Targeted Gene Delivery**Technical challenges in design and manufacturing of nanocarriers**

The design and manufacturing of nanocarriers for targeted gene delivery pose significant technical challenges due to the complex requirements for efficacy, safety, and stability. Creating nanocarriers with precise size, shape, and surface characteristics is crucial for their biological function and distribution in the body. Ensuring uniformity and scalability in production is another major challenge, as inconsistencies can affect the clinical outcomes and feasibility of large-scale manufacturing(23). Additionally, the stability of nanocarriers during storage and upon administration needs to be meticulously optimized to prevent premature release or degradation of the encapsulated genetic material. Addressing these technical challenges requires advanced fabrication techniques, thorough characterization, and robust quality control measures to ensure the consistent performance and reliability of nanocarriers in clinical settings.

Biological challenges such as immune response, targeting accuracy, and gene expression control

Biological challenges are significant in the development of nano targeted gene delivery systems. The immune response to nanocarriers can lead to rapid clearance or potential adverse reactions, which necessitates the design of stealthy nanoparticles that can evade the immune system. Achieving high targeting accuracy to ensure that the gene therapy reaches the intended cells or tissues without affecting healthy ones is another critical challenge(24). This requires the development of sophisticated targeting ligands and the understanding of the dynamic biological environment in which these nanocarriers operate. Furthermore, controlling the expression of the delivered gene is paramount to ensure therapeutic efficacy and prevent potential off-target effects or gene overexpression, which necessitates the incorporation of regulatory elements and controlled release mechanisms in the design of nanocarriers(25).

Ethical, regulatory, and safety concerns

Ethical and regulatory challenges are inherent in the development and implementation of nano targeted gene delivery systems. The long-term safety of nanocarriers, potential off-target effects, and the implications of gene editing are major ethical concerns that need to be addressed. Regulatory bodies are tasked with establishing guidelines and approval processes that ensure the safety and efficacy of these advanced therapeutic technologies(26). The regulatory landscape must adapt to the rapid advancements in nanotechnology and gene therapy, ensuring that

Haricharan *et al.*,

these innovations benefit patients while upholding ethical standards(27). Additionally, there is a need for comprehensive safety evaluations, including the assessment of long-term effects and the potential impact of nanoparticles on the environment. Addressing these ethical, regulatory, and safety concerns is crucial for maintaining public trust and facilitating the successful integration of nano targeted gene delivery into clinical practice.

Future Direction

Emerging trends and technologies in nano targeted gene delivery

The future of nano targeted gene delivery is poised to be shaped by several emerging trends and technologies. One significant trend is the development of smart nanocarriers that can respond to specific stimuli (e.g., pH, temperature, enzymes) present in the disease microenvironment, enabling precise control over gene release(28). Another promising area is the use of exosome-based delivery systems, leveraging nature's own method of intercellular communication to transport genetic material. There's also increasing interest in developing hybrid nanosystems that combine organic and inorganic materials to leverage the advantages of each, enhancing targeting capabilities and biocompatibility(29). Furthermore, advancements in 3D bioprinting technology are expected to play a crucial role in creating complex tissue models for testing and optimizing nano targeted gene delivery systems.

The potential of integrating AI and machine learning for the design and optimization of nanocarriers:

Artificial intelligence (AI) and machine learning (ML) offer transformative potential for the design and optimization of nanocarriers in gene delivery. These technologies can analyze vast datasets to predict the behavior and efficacy of nanocarriers in biological systems, speeding up the design process and identifying optimal formulations with improved precision(30). AI can also facilitate the modeling of nanocarrier interactions with cells and biological barriers, enhancing our understanding of their biodistribution and pharmacokinetics. Furthermore, machine learning algorithms can assist in identifying novel biomaterials and surface modifications to improve the targeting and biocompatibility of nanocarriers, ultimately leading to more effective and safer gene delivery systems(31).

Interdisciplinary approaches involving material science, biology, and engineering

The future advancements in nano targeted gene delivery will increasingly rely on interdisciplinary approaches that merge insights and methodologies from material science, biology, and engineering. Material scientists contribute by designing and synthesizing novel nanomaterials with tailored properties for gene delivery(32). Biologists play a crucial role in understanding the cellular and molecular mechanisms that underpin the interaction between nanocarriers and biological systems. Engineers apply principles of nanotechnology and biotechnology to develop scalable and reproducible manufacturing processes for nanocarriers(33). This collaborative approach fosters innovation and accelerates the translation of nano targeted gene delivery systems from the laboratory to clinical applications, offering new solutions for challenging medical conditions and opening new avenues for personalized medicine(34).

CONCLUSION

Summarize the current status of nano targeted gene delivery

The field of nano targeted gene delivery is at a promising juncture, having made significant strides in addressing complex medical challenges. Advancements in nanotechnology have enabled the development of sophisticated nanocarriers capable of delivering genetic material with unprecedented precision and efficiency. These innovations have found applications across various domains, including cancer therapy, genetic disorders, and infectious diseases, demonstrating potential to fundamentally transform treatment paradigms. Despite these advances, the field is still evolving, with ongoing research focused on enhancing the specificity, safety, and efficacy of gene delivery systems.

**Haricharan et al.,****Reiterate the importance of overcoming current challenges for future advancements**

To realize the full potential of nano targeted gene delivery, it is imperative to address the existing technical, biological, and regulatory challenges. Overcoming technical hurdles related to the design, manufacturing, and characterization of nanocarriers is crucial for ensuring their performance and reproducibility. Addressing biological challenges, such as immune response, targeting accuracy, and gene expression control, is essential for enhancing the efficacy and safety of gene therapies. Additionally, navigating ethical and regulatory landscapes is vital to ensure that these advanced technologies are safely and effectively translated into clinical practice, benefiting patients while adhering to the highest standards of medical ethics.

Final thoughts on the potential impact of these advancements on healthcare

The advancements in nano targeted gene delivery hold transformative potential for healthcare, offering new avenues for the treatment of diseases that were once considered untreatable. By enabling precise and efficient delivery of therapeutic genes, this technology has the potential to revolutionize personalized medicine, providing treatments tailored to individual genetic profiles. Moreover, the integration of emerging technologies like AI and interdisciplinary approaches will further accelerate the development of innovative solutions, enhancing patient outcomes and healthcare efficiency. As the field continues to evolve, it is poised to play a pivotal role in shaping the future of medical treatments, ultimately leading to a new era in healthcare where gene therapy becomes a cornerstone of medical practice.

Table 1: Nanomaterials Used in Nano Targeted Gene Delivery

Nanomaterial	Properties	Applications
Liposomes	Biocompatible vesicles; encapsulate hydrophilic and hydrophobic substances	Widely used in gene delivery for various diseases
Dendrimers	Highly branched, star-shaped macromolecules with surface functionality	Targeted gene delivery to specific cell types
Nanoparticles	Customizable size, shape, and surface properties; includes metallic, polymeric, and solid lipid nanoparticles	Versatile platforms for gene delivery, enhancing cellular uptake and targeting
Quantum Dots	Possess unique optical properties	Studied for targeted gene delivery and imaging
Carbon Nanotubes	Known for their unique electrical properties	Investigated for their potential in gene delivery

Table 2: Challenges and Future Directions in Nano Targeted Gene Delivery

Challenge/Future Direction	Description
Technical Challenges	Includes issues in design, manufacturing, and characterization of nanocarriers, needing advanced techniques for consistent performance.
Biological Challenges	Encompasses immune response, targeting accuracy, gene expression control, necessitating sophisticated targeting ligands and understanding of biological interactions.
Ethical and Regulatory Considerations	Involves addressing long-term safety, potential off-target effects, and compliance with evolving regulatory standards.
Integration of AI and Machine Learning	Utilizing AI and ML for optimizing nanocarrier design, predicting behavior, and enhancing the efficiency of gene delivery systems.
Interdisciplinary Approaches	Combining insights from material science, biology, and engineering to innovate and accelerate the translation of nano targeted gene delivery systems into clinical applications.

A Deep Learning Framework for Medical Imaging Precision Liver Tumor

ABSTRACT

Surgeons' planning depends on precisely differentiating between hepatic and liver cancers in CT scans. Manual liver tumor extraction from CT scans is difficult, time-consuming, and dependent on clinical knowledge, though, given the blurry boundaries and low contrast between healthy and malignant tissue. Automated means to classify liver and hepatic cancers into different categories will help to improve surgical planning, treatment, and follow-up care. This work offers a user-friendly method for locating malignancies in the liver on CT scans. The suggested system makes use of region-based segmentation methods and ResUNet architecture. The procedure starts with portions of the liver being divided and subsequently finds malignancies inside the hepatic capsule. While region-level segmentation significantly enhances the general quality of the segmentation map, ResUNet—a network trained on annotated CT scans—accurately predicts the location of liver tissue. The publicly accessible 3D-IRCADb dataset is used in evaluation of the model. The Dice coefficient and volumetric overlap error (VOE) assessed the suggested method's performance. For the tumor, the ResUNet model scored 0.96; for the liver, it scored 0.97. It also dropped the VOE for the tumor to 0.615 and for the liver to 1.90. The ResUNet model suggested in this work shows better performance than before described techniques. The accuracy and output quality are much improved by using U-Net into the building of the model.

Keywords: blurry boundaries, techniques, VOE, cancers, ResUNet, architecture.

**Varalakshmi and Hemamalini**

INTRODUCTION

According to the World Health Organization (WHO), liver tumors are one of the worst types of cancer. Each year, they cause about 8.5 million new cases and almost 7 million deaths. The American Cancer Society projects that 41,210 fresh instances of primary liver cancer will arise in the United States in 2023, leading to 29,380 fatalities [1]. These numbers point to an increasing incidence of liver cancer in general. One often utilized method for liver cancer detection and liver segmentation is computed tomography (CT) imaging [2]. Still, manually spotting liver tumors from CT scans is a time-consuming task mostly dependent on operator skill and expertise. Thus, enabling doctors to precisely identify liver cancer depends on the development of a competent computer-aided diagnosis (CAD) system. Comprising a right lobe and a left lobe, the liver links itself to the gallbladder, pancreas, and intestines. Two key causes of its cancer susceptibility are the high density of liver cells and the possibility for malignant cells to spread from other body parts.

Figure 1 shows patients with liver cancer broken out by stage. Automatic liver tumor segmentation is used in medical imaging is a method used to precisely identify, classify, and isolate liver tissue from surrounding tissues, so separating cancerous from healthy cells. Training deep learning models on a vast collection of precisely labeled liver and tumor segments, annotated by medical professionals including doctors and radiologists, is an effective strategy. These models can be included into software or computer-aided diagnosis systems following exhaustive testing and validation. Without depending on medical professionals, developing a precise and efficient liver tumor segmentation algorithm can result in major savings in both cost and time as well as the possible to save lives [3]. Two key types of current deep learning segmentation methods are 3D-FCN, which employs 3D convolutions instead of the conventional 2D convolutions [4] and fully convolutional networks (FCN), which comprise U-Net, multi-channel FCN, and VGG-based FCN. An individual's life expectancy is largely influenced by the location of cancer inside the body (as depicted in Figure 1) and determines treatment choices. Usually referred to as stage 1, cancer is often categorized as localized when it stays limited to its original place within the body. Should the cancer have progressed to other areas of the body, it is classified as regional or distant. Early liver cancer diagnosis greatly increases the likelihood of survival five years following diagnosis [5]. This localized stage of diagnosis accounts for 44.6 percent of liver and intrahepatic bile duct cancers.

LITERATURE REVIEW

Deep learning (DL) and medical imaging have had notable developments recently [6–8]. Extensive studies have concentrated on employing medical imaging methods coupled with deep learning models including convolutional layers to detect cancer or tumors. Researchers Sharma et al. [9] used machine learning (ML) techniques called random forest (RF) and k-nearest neighbor (k-NN) to figure out which women were most likely to get breast cancer. In a different study, Khari et al. [10] used CNNs to find brain tumors. [11] examined several machine learning methods closely for brain tumor detection and classification. Tumours are sometimes split in surgical operations into smaller pieces. Monitoring treatment progress over time depends on accurate knowledge about the location and shape of the tumor, which will help doctors to maximize therapy methods for several phases of liver cancer. Liver cancer can be broken up for study into several sections. Roy et al. [12] suggested a method to distinguish liver cancer nuclei by means of histomorphology scans and edge detection Anter et al. [13] investigated extensively the use of machine learning (ML) methods to enhance the identification of liver tumors. Another work [14] showed that deep learning can cluster and categorize liver cancers rather successfully. Using common image processing, computer vision, and machine learning methods, CT picture features like pixel intensities, color, texture, tumor size, and shape are put together [15]. These traits are then used using a classifier technique to find segmentation pictures. CNNs vary between high-level and low-level characteristics of CT images by means of several convolutional layers [16, 17]. Crucially, the creation of a specific Computer-Aided Design (CAD) system for liver cancer detection calls for [18]. There are several deep learning models at hand to help with this work. Figure 2 offers a summary of the approaches

**Varalakshmi and Hemamalini**

covered in different research projects. ML [19–21], clustering, graph-cut, and other semi-automatic liver tumor segmentation models [22–24] have been extensively studied.

APPROACH

This work explain a method based on systematic deep learning to effectively differentiate hepatic malignancies from liver tissue in CT scan pictures. The research turned out numerous important results: By increasing the amount of image samples, I. Data augmentation methods include rotation, flipping, zooming, cropping, and color corrections provide variety into the dataset. II. Reducing the kernel count in every convolution layer greatly speeds up the learning process of the network, therefore enabling its more effective use of the given input. III. The method discards frames without tumor pixels and keeps those with all the necessary information, hence improving tumor detection in CT images. This procedure helps to reduce the performance difference among students from many backgrounds. Figure 3 shows the suggested architectural sequential flow. The structure uses these guidelines: Raw CT scan images make up the dataset; these are filtered and standardized during pre-processing to eliminate extraneous noise. IV. ReLU activation function followed by batch normalisation (BN) is applied during encoding process. Semantic meaning of the image is captured by the encoder in segmentation. While max-pooling shrinks the size of feature maps through downsampling, convolutional layers offer thorough information about the background. Following the convolution and ReLU activation layers are introduced max-pooling layers. Between the encoder and decoder, this intermediary layer forms a bottleneck. Considered the bottleneck layer, it comprises two convolutional layers after a batch normalisation layer. This layer mostly serves to find and extract intricate visual elements from the image. Situated halfway between the encoder and decoder paths, it lets the network mix finely-grained geographical features with semantically rich information.

The decoder consists in four upsampling and decoding phases. The deconvolution or up-convolution layers in these blocks bring back feature maps to their original sizes and provide additional spatial information about the segmented image. There are two up-convolution layers in each stage, with layers from the encoder scattered throughout the expanding path layers. The background is separated from the liver and tumor using a sigmoid activation function in final stage. Figure 5 shows a flowchart of the suggested method including pictures.

Instructed and Evaluated The Binary Deep Neural Network (DNN) Classifier

The ResUNet model is made up of an input layer, three hidden layers for both the contraction and expansion paths, and an output layer. The output layer contains two nodes, but the input layer has 26 nodes. The three secret levels have 20, 30, and 15 nodes, respectively. Each neuron in the network is first assigned arbitrary weights and biases. The Rectified Linear Unit (ReLU) activation function transports gradients from each neuron to the hidden layers. Assume X to be the input image matrix; W the weight matrix; B the bias matrix. Every neuron then generates an output signal expressed as a matrix. ReLU activation function defines the maximum of 0 and the input value (Y), therefore determining the output of a neuron. L2 regularization—adding a term of $\frac{1}{2} \mu w^2$ to every computed network weight—is used to prevent overfitting. This work employs cross-entropy as the loss function for the binary classification challenge. The network is trained using the stochastic gradient descent (SGD) optimizer, with backpropagation used to change the weights. The process of instruction go on until the mistake is reduced. Then, the trained deep neural network (DNN) classifier's weights and parameters are stored to assess the network on test data.

Data Set

CT scan pictures [25] carefully annotated by medical experts to distinguish and identify different anatomical components make up the 3D-IRCADb database. Three-dimensional computed tomography (CT) scans of ten male and ten female livers are in the collection. Line spacing ranges from 0.57 to 0.87 mm; the slices are 1.6 to 4 mm apart. Throughout the acquisition of these CT scans, the subjects were in the "inhaling" posture. Ten scans make up the training set of data; five scans constitute the test set. Trained on photos of different sizes, the model shows better performance on 512x512 images than lower-resolution ones with a 2% and 7% increase in accuracy correspondingly separating liver tissue from malignancies. Down sampling lowers tumor segmentation's accuracy. Consequently,

**Varalakshmi and Hemamalini**

images with a 512x 512 resolution train and test the models. Given their identical resolution, the accuracy is much enhanced from both datasets.

FINDINGS AND ANALYSIS

The outcomes of modeling and applying the grading and segmentation techniques are covered in this chapter. Specifically a 64-bit i5 CPU with a clock speed of 3.6 GHz and 8 GB of RAM, a Python application was used to replicate a computer system running Windows 10. Two different machine learning techniques—Support Vector Machine (SVM) and Deep Neural Network (DNN)—had to be used in the classification challenge. We examined and contrasted the outputs of various algorithms. We assessed each pixel class in the tumor and liver areas using accuracy (AC), sensitivity (SN), and specificity (SP). Using volumetric overlap error (VOE), dice similarity coefficient (DSC), and valid dice coefficient (VDC), the proposed approaches are evaluated in relation to past used ones.

The confusion matrix in Figure 6 illustrates ResUNet's liver and non-liver pixel identification accuracy and errors. Figure 7 illustrates ResUNet's tumor segmentation confusion matrix. The confusion matrices represent the percentage of correctly categorized pixels in a class (compared to the total number). Performance of the model was assessed just using average symmetric surface distance, relative volume difference, VOE, and DSC criteria. A more exact representation of the segmentation data is obtained using the Dice coefficient; a higher value denotes a best result. As Table 1 shows, we effectively divided the liver using ResUNet. As Table 2 shows, we effectively segregated tumors using our suggested ResUNet model. Random data from the test set is used to test the model. Figure 8(a) demonstrates a true value accuracy of 99.4% and 98.1%. The liver that is anticipated can be observed in Figure 8(b). The provided text illustrates a random sample of the validation data that was employed to evaluate the model. Figure 9(a) displays a random sample with a precision of 99.8%, a True Value Accuracy of 93.8%, and a die coefficient of around 95.2%. The anticipated expansion is depicted in Figure 9(b). Support Vector Machines (SVM) and Deep Neural Networks (DNN) are the two most common approaches for classifying tumors.

CONCLUSION

Using the ResUNet model, which requires a far smaller volume of training data than U-Net, this work offers a two-tier method to differentiate between liver and tumors. Both of which are well used techniques, the suggested strategy beats the SVM classifier and the DNN classifier. This work evaluates the proposed ResUNet model using the publicly accessible 3D-IRCADb dataset. The efficacy of the approaches is assessed using performance criteria including Volumetric Overlap Error (VOE) and Dice Similarity Coefficient (DSC). Regarding both measures, the recommended approach always produces better results as time passes. Moreover, the U-net design ensures that the final image preserves the same degree of quality and exact proportions as the original input picture. The approach used in this work eliminates the need for any later data modification to improve the quality of the outcomes. One can improve and test the model using different specimens. Through some changes, the suggested approach implementation can be applied in related medical situations. Many datasets can be combined for analysis should future computational capability be suitable. Furthermore, this approach can be used to separate several approaches related to organs such lungs, kidneys, brain, etc., as well as different modalities of medical imaging including ultrasounds, MRI, etc.

ABSTRACT

This paper explores the role of AI in film festivals and how such technologies or plat forms democratize the film making process for independent artists and startups, hence breaking traditional barriers. Among the main challenges filmmakers face, other than securing funds, time management, and technical resources from pre-production to post- production final editing, is the hope for a profitable ROI by the independent producer. AI Festival platforms help film makers create unique visuals and animations despite the restrictive budget of a conventional film and serve as a no-frills but competitive product to stay in the market. These festivals give an opportunity for upcoming filmmakers to showcase their work and bring them into the limelight. For independent filmmakers, receiving an award at an international festival may give them a chance to realize their dream of perfecting the craft of AI film making by creating more innovative projects. Different films with different styles will testify to the grand canvass on which storytelling has been painted, allowing filmmakers to experiment and innovate, bringing artists, technologists, and industry leaders together to leverage the creative synergies between human imagination and AI. Events such as business schools' AI Film Festivals bridge the gap by allowing the artists and AI specialists to collaborate and understand the know-how for new creative alliances and business opportunities. This kind of film festival enables filmmakers to also acquire business skills in developing the pitch for one's ideas, investment, branding, and marketing projects. It is quite common for many startups and production companies to go through a transition from that story idea on the back of the sketch to a first version on a shoestring budget. Equally, it prepares the film maker aspirants with the necessary skills to turn their creative vision in to a

Jagadeesh et al.,

Successful business venture. In short, AI film festivals create access to film making, uncover new talent, inspire creativity, encourage collaboration, and cultivate future creative entrepreneurs and content communities.

Keywords: Data collection; Innovation, Experimentation; Talent Showcase; Access.

INTRODUCTION

Artificial Intelligence enhances the art of storytelling in short films greatly by applying different advanced techniques and tools that make the entire creative process faster, efficient, and packed with value in stories. AI technologies currently help filmmakers make the very first steps in developing ideas and surmounting creative obstacles. For example, OpenAI could suggest names of characters, plots, and dialogues that could constitute the premise of original stories. Indeed, a fast-thinking AI can create multiple ideas connected with certain criteria much faster than humans can produce, which allows filmmakers to explore more variations of ideas in less time.

Improvement in Visuals and Audio: AI tools like Midjourney and Runway ML can help creators with stunning visuals and pictures. These tools are capable of generating concept art or entire sequences that might be helpful in better visualization for the creators.

Voice overs and Sound Design: AI helps to temporarily voice over and create other vital sound elements in films. Services such as Eleven Labs provide high-quality audio that is helpful in short films to enhance the storytelling experience in all aspects of filmmaking.

Editing and Animation: With the help of AI, editing has become somewhat easier because it automates all the mundane tasks such as transitions between scenes and image stabilization.

Emotional Engagement: Through AI, stories can be built emotionally to resonate with viewers. The tools analyze viewer preferences and trends to help filmmakers create narratives that emotionally engage the audience.

METHODOLOGY: LOGICAL PROCESSING

NAVRASA encompasses the nine fundamental emotions that exist in human life. By integrating AI technology at different levels of filmmaking, we were able to successfully arrange a festival featuring the business schools of different institutions.

EARLY PLANNING PHASE

AI greatly enhances the early planning phase by managing and automating many complex facets of this process, allowing a much greater level of creativity. The following are the major roles of AI for filmmakers in this stage:

Automated Script Analysis: AI, through platforms like Filmustage, uses machine learning to auto-analyze scripts. What earlier needed several hours of manual work now only takes a few minutes as AI breaks down the script and organizes all elements involving cast, locations, and props.

Potential Risks Identification: AI helps filmmakers make out any potential threats to their scripts and production plans. For example, Filmustage AI Labs Analysis scan for vulnerabilities, such as safety concerns or copyright issues, and come up with ways to diminish these risks.

More Effective Team Collaboration: AI-driven platforms ensure better collaboration among the team members by

Jagadeesh et al.,

hosting all pre-production aspects on a single interface: script analysis, filming scheduling, and budget management.

Lessons from Scripts and Audience: The extraction of vital data-everything from emotional journeys to the narrative structure-is heavily reliant on analytic AI tools. With integrated NLP, filmmakers now can tune their scripts for crowd reactions expected hence trying to involve audiences even more in telling the story.

AI Assists in Actor Selection: It does so by assessing their performance and character to best decide if they would be good enough for the chosen role. The use of tools like Casting Droid or Largo AI helps in discovering newer talent and making diverse casts, ultimately improving the quality of the film.

Location Suggestions: AI speeds up location scouting, suggesting places that fit the scenery described in the script.

Storyboard and Visualization: AI-powered storyboard generators let filmmakers visualize scenes and their compositions in minimal time. Using D-ID and Cuebric, filmmakers can rapidly see scenes on screen to help them make quick decisions over shot and composition planning.

Production phase

Artificial Intelligence has transformed film production by introducing efficiency, creativity, and quality. Its major roles in this critical stage of filmmaking are pegged on the following aspects:

Efficient Shooting Schedules: AI-powered tools like Scenechronize and Celtx use historical production data, weather forecasts, and equipment availability to optimally plan a shoot. By anticipating probable delays, such platforms adjust timelines in tandem with such expectations.

Automation of camera operations: Traditional methods of film shooting are now replaced by AI-operated cameras and robotic cinematography devices. Companies like ARRI and RED are leading the development of highly technical cameras, which could automate aspects such as framing, focus, and exposure. Difficult camera movements can be done with a small crew using this technology, hence reducing production costs.

Better Cinematography: Filmmakers can create much better visuals through the use of AI- powered techniques, with much less effort. AI helps in innovative storytelling by enhancing camera movement and shot composition.

Real-time Performance Analysis: With tools such as Analysis Morph Cast and Affectiva, actors are monitored in real time for their facial expressions and emotions while filming. This serves as a way to deeply understand and build more character-driven stories.

Continuity Monitoring: AI tools like Filmstuge help a continuity supervisor in consistently reproducing scenes and correctly placing props throughout the shoot.

Predictive Analytics for Resource Allocation: By looking at data from different points related to the production process, such as cast schedules, location availability, and equipment logistics, AI makes good predictions of resource needs and allocates them appropriately.

Post-Production

Automated Editing: AI algorithms can sift through a huge number of footage pieces to select the best scenes, close-ups, and reactions. This can make editing quite easier and faster. Softwares like Adobe Sensei handle jobs like scene segmentation and prioritizing color grading.

Jagadeesh et al.,

RESULTS

Assess the research on comparing AI film production with traditional film production:

Pre-Production AI Film Production: Writing the Script and Planning the Story: Artificial Intelligence Tools even analyze scripts to determine the emotional intensity, character development, and appeal the characters will have with an audience. Filmmakers receive insights on which projects to base their work. AI-driven platforms, like ScriptBook, predict audience reactions and box office success by informing decisions.

Casting and Location Search: AI algorithms find ideal actors' past performance and audience demographic matches for more diverse casting.

Traditional Film Production:

Human Creativity: It finds its basis in human creativity and experience. There is much brainstorming and discussions among filmmakers, which forms a story supported by the relationship between characters.

Production Stage

AI Film Production - Automated Cinematography: Cameras equipped with AI can automate a lot of tasks, such as focusing and exposure, to ensure uniform shots and footage during complex camera movements, without having to involve many crew members. Other tools like Scenechronize optimize shooting schedules based on historical data and current conditions.

Performance Evaluation: AI can assess the actors' facial expressions when filming a scene and advise the director on where performance improvements are needed to sustain the emotions across different scenes.

Post-Production:

Such special visual effects, with the power of AI, can be created in a photorealistic way in a far more effective manner, removing the heavy time and manpower required to achieve these special effects. This allows filmmakers to work with larger-scale scenes that were not possible using earlier VFX techniques.

Artistic Editing in Traditional Film Production: Human editors have creative insights they bring into the editing process. They naturally have an idea about pacing, transition, and emotional subtlety that may be beyond the grasp of AI.

DISCUSSIONS

Pros of Human Editing:

Handcrafted VFX Work: Traditional creation of visual effects involves manual creation and compositing of effects by skilled artists; this is indeed a very laborious process but at the same time gives tremendous creative control and customization options.

Ethical and Creative Issues of AI:

The contribution of AI creates questions regarding authenticity in creative output and ownership rights and devaluation of human artists in creating any work .

Difference between Traditional and AI Film Festivals

Focus and Themes

Traditional Film Festivals: These festivals highlight a wide-ranging breadth of genres and storytelling approaches that hail the human creative spirit and artistic expression. They present films that represent visions for humanity, social

Jagadeesh et al.,

causes, or important messages. A number of themes, ranging from dramatic and comic to documentary and experimental film.

AI Film Festivals: These festivals showcase stories that are heavily dependent on AI tools in their production or narrate how AI will influence the future world. They feature creative Two films that explore the potential of AI in vision creation, narrative development, and performance generation. Running parallel to the technical research, this also opens discussions on the ethical use of AI in filmmaking-the future of creativity and precisely what the role of technology is as opposed to art.

Submission and Selection Process:

Traditional Film Festivals: These are highly selective festivals in which films are selected based on are chosen based on their artistic merits, storytelling, and production values. Selection committees are usually composed of professionals in the industry.

Virtual AI Film Festivals: These highlight the aspects of innovation, and only those films which showcase new ways of using the AI technologies will be selected, and thus inspire filmmakers to try out new tools and techniques. This can also lure creators from genres leaning towards technology and digital art.

Audience Engagement and Experience

Classic Film Festivals: The classic film festivals provide for active audience involvement through discussion, question-and-answer sessions, and networking with the artists.

Artificial Intelligence Film Festivals - Interactive Experiences: Interaction within artificial intelligence film festivals might be applied to live demonstrations of AI technology, workshop activity, and deliberations on the future of AI in film.

Impact on Film Industry:

Traditional Film Festivals: Canonical Status of Film Festivals: Films get discovered, distribution contracts get signed, and prizes are awarded in conventional events such as Cannes, Sundance, and Tribeca. They powerfully influence culture as these festivals often set trends in film and influence civic discourses on important social issues.

AI Film Festivals: Growing Recognition Despite being relatively new, AI film festivals are fast gaining recognition as the place to show the future of filmmaking. [Distribution and Promotion of Traditional Films:](#)

Broadcast to the Masses: Films reach a wider audience through a network of theaters. They are also licensed to various TV networks for broadcast, reaching an even wider audience through the comfort of their living rooms.

Physical Distribution: Films are distributed through DVDs, Blu-rays, and other physical formats that people can purchase or rent. This appeals to collectors or those who do not have good access to the internet.

CONCLUSION

Distribution and Promotion in the Age of AI: Online Streaming Platforms: They distribute films through their online services and come up with recommendations based on a viewer's preferences and viewing history to extend discovery and guide viewers to films.

Social Media Marketing: AI chatbots and targeted advertisement in social media provide great interaction with the audience and sentiment analysis, thereby updating marketing strategies to make film advertising more dynamic.

Jagadeesh et al.,

Predictive Analytics: AI can predict the success of a film using data available and informs decisions regarding the release date, marketing budget, and distribution channel.

Automation of Film Content Creation: AI technology can quickly analyze any movie to produce a trailer that captures the essence of the film, rating the overall experience swiftly. Investments by Nvidia and Google in film festivals using AI, such as the Runway AI Film Festival, are increasing their prestige in the tech world in several ways:

Leadership in AI Development: Participation in festivals about AI technology for movies places both Nvidia and Google ahead of others, having this technology. This alone signifies their commitment to innovation and creativity in the film industry and boosts their brand image and corporate identity as cutting-edge companies. The presence of AI across industries demonstrates its multifaceted and broad potential outside traditional boundaries, such as gaming and enterprise solutions.

Talent and Startup Attraction: Younger Creatives Engagement: In return for funding AI film festivals, companies can engage with newer filmmakers and technologists. This exposes them to discovering and attracting new talent that might be helpful in creating future AI and film innovations. Supporting Startups: By investing in these platforms, the tech giants foster relationships with startups and independent creators of AI-driven films. In return, this could provoke further partnerships and collaborations, even investment opportunities, in their strategic vision.

Brand Image Improvement: Encouraging a Relationship with Creativity and Art: In sponsoring AI film festivals, companies align their brands with creative expression and artistic interests. This could build a relationship with artists, filmmakers, and audiences at large that have a predilection for innovative storytelling.

Building Community Relations: Building Brand Image as Supportive Force in the Arts: Being part of these events helps the companies to draw public favor for themselves and build a positive brand image as supporters of the arts.

Shaping Industry Trends: Guiding Market Direction: The participation by these companies in the AI Film Festivals signals to the technology industry that this is a good market for AI in filmmaking and is lucrative. This could encourage more and more technology companies to invest in similar ventures.

AI film festivals are also attracting more investors: There is a dire need for strategic steps that show the promise of novelty, investors' opportunities, and the shifting face of filmmaking.

Key Strategies

Showcase Success Stories: Demonstrate how AI has actually added value to filmmaking by highlighting successful projects/case studies. Highlight those films that have gained critical acclaim or box office success with the help of AI technologies.

Workshops and Panel Discussions on Business Aspects of AI in Filmmaking: Organize workshops and panel discussions on the business aspects of AI in filmmaking to help potential investors.

Potential Risks: To the companies involved in product development, investment in AI film festivals has proved very beneficial, especially for those companies dealing in AI technologies. Such companies can utilize their participation in events of 'Demonstration of **Technology Capabilities**': AI film festivals provide a platform to the companies to show case their AI tools and technologies. Examples include how Runway's models could be featured by films shot using their software to illustrate their work and its use in practical applications. Revenue streams for the festival might include **Sponsorships and Partnerships**: AI film festivals draw sponsorships from technology companies like Nvidia and Google looking to showcase their AI tools and technologies in action, thus building awareness for the products of

Jagadeesh et al.,

the sponsors Ticket Sales and Entry Fees: For most events, tickets are sold to attendees for screenings, panels, and workshops, and these may provide considerable income. Merchandising and Sales: Merchandise sold during the festival, such as branded items like t-shirts, posters, and other memorabilia, can be an added source of income. Workshops and Paid Educational Programs: Most AI film festivals organize workshops and master classes with professionals that can be arranged for a fee as another revenue line. Grants and Funding: Some festivals receive grants from arts and culture organizations or governments to further innovation in the arts. Investor Perspective: Investment Return: They are looking for projects that can realize commercial success, expansible growth, and innovative discontinuity to shake the market. Market Forecasts and Innovations: They interact with the prevailing market trends and signals

ACKNOWLEDGMENT

We would like to thank Mr. Babu Ms. Olefin white films Pvt Ltd and GIBS Business School for their extensive support and guidance in completing these research papers under the topic AI & Entrepreneurship.

ABSTRACT

Avant-garde of technological revolution, Natural Language Processing (NLP) is at the apex of computer science and Artificial Intelligence on one hand and linguistics on the other to facilitate a machine's ability to understand and analyze as well as generate speech in natural languages. The rising incidence of applying chatbots along with virtual assistants in the fields of customer care, health care, and personal assistance has led to the development of conversational AI being a priority. In accomplishing the language tasks, it has shifted the manner it can be done, enabling the study of the transfer of this model and reducing the complexity needed in the everyday, low-level task understanding. Language models have extended the sphere of application of NLP, and the range of languages used is constantly expanding, hence inclusive and variable language processing. Further, methodologies of transfer learning have enabled a quick increase in various aspects of natural language processing, such as data collection, analysis, attitude determination, and the dialogue component. Nevertheless, the NLP industry is still bearing many long-standing problems as Data Privacy, Bias, Context Understanding, Scalability of the model, Multi-modal Integration, Domain optimization and others. The call for real-time NLP applications of current techniques means that there is a need for an enhanced system that will accommodate and analyze large amounts of information within the shortest time possible with the objective of enabling the user to arrive at sustainable decisions, which are also comprehensible.

Keywords: NLP, Text Classification, Speech Recognition, Transformer Models, Language Models

INTRODUCTION

Natural Language Processing (NLP) is a branch of Artificial Intelligence (AI) that tries to address the gap between humans' ways of communicating and information processing machines. As a subject that uses methods from computer science, computational linguistics, and AI applied here, NLP allows the machine to comprehend language and find it meaningful and useful. This is mainly to enhance the aspect of human computer interface or interaction in which interaction between humans and computers or devices is enhanced through consumption of natural language processing. This is even more relevant in today's big data processing paradigm where new stories and speeches are created in real-time. Using the given information, an effective NLP system makes it easier to understand the information and analyze it with a view of improving the business processes and the decision-making process.

IMPORTANCE OF NLP

NLP is important for enriching technologies and enablement of natural ways through which people can engage a device. This is particularly relevant today as information flow is presented in the form of stories and speeches is increasing day by day due to the availability of big data. The described information can be preprocessed and analyzed by an effective NLP system to garner insights, enhance business operations, and optimize decision-making mechanisms.

Text analysis: on both the general comprehension of texts as well as the extraction of significant information from a text. This entails, for example, text mining involving such processes as; sentiment analysis, entity identification, data gathering and more.

Speech Recognition: transforms speech to text. The majority of modern gadgets and applications like Siri and Alexa make the usage of NLP while processing the voice commands.

Machine Translation: It convert text or spoken words form one language to another language. An example of this kind of application, which has widespread popularity, is Google Translate.

Natural Language Generation: It is text created from the data entered by the users, being a form of natural language content. It is used in tasks like chatbots and generating content automatically.

Information Retrieval: Assists to look for information from the large data by the online tools such as Google.

LITERATURE SURVEY

Comparison and Summary of The Literature Survey on Various Topics in Natural Language Processing (NLP) And Related Fields:

Knowledge Graphs

Hogan et al. (2021) in Artificial Intelligence Journal: This paper surveys the construction and utilization of knowledge graphs, emphasizing their role in enhancing NLP tasks through structured relational information. Applications include improved question answering systems, semantic search, and information retrieval [1].

Language Models

Devlin et al. (2019) in Transactions of the Association for Computational Linguistics (ACL): Introduced BERT, a bidirectional transformer model for language understanding that set new benchmarks across various NLP tasks by capturing context from both directions [2].

Vaswani et al. (2017) in Journal of Machine Learning Research (JMLR): Introduced the Transformer model, which relies on self-attention mechanisms, eliminating the need for recurrence and improving performance in tasks like machine translation and text summarization [3].

**Sakthi and Sumathy****Text Classification**

owsari et al. (2019) in Information Retrieval Journal: Reviewed traditional and modern text classification algorithms, highlighting the shift from traditional machine learning methods to deep learning approaches like CNNs, RNNs, and Transformers

Deep Learning Architectures

Young et al. (2018) in IEEE Transactions on Neural Networks and Learning Systems: Provided a comprehensive review of deep learning architectures (CNNs, RNNs, Transformers) applied to NLP, discussing their strengths, limitations, and applications [5]. Kim (2014) in IEEE Transactions on Pattern Analysis and Machine Intelligence: Demonstrated the effectiveness of CNNs for sentence classification, adapting them from image processing to text classification tasks [6].

Named Entity Recognition (NER)

Yadav and Bethard (2018) in Expert Systems with Applications: Reviewed deep learning models for NER, comparing approaches like CNNs, RNNs, and Transformers, and evaluating their performance on standard NER benchmarks [7].

Natural Language Generation (NLG)

Gatt and Krahmer (2018) in Artificial Intelligence Review: Provided a comprehensive review of NLG tasks such as text summarization, report generation, and dialogue systems, discussing evaluation metrics and the importance of NLG in creating coherent text [8].

Sequence-to-Sequence Models

Sutskever et al. (2014) in Journal of Artificial Intelligence Research (JAIR): Introduced the Seq2Seq model using LSTM networks, which revolutionized machine translation and sequence prediction tasks by effectively encoding and decoding sequences [9]. Cho et al. (2014) in Neural Computation: Developed the RNN Encoder-Decoder model for machine translation, significantly improving translation quality and efficiency [10].

Generative Models

Rezende et al. (2014) in Computational Linguistics: Explored variational auto encoders (VAEs) in NLP, enhancing the generative capabilities of models for tasks like text generation and language modelling [11].

Sentiment Analysis

Medhat et al. (2014) in ACM Computing Surveys: Reviewed various sentiment analysis approaches, including lexicon-based methods, machine learning techniques, and hybrid approaches, discussing their applications in social media monitoring and market research [12].

Key NLP Metrics Related To Trends And Challenges**Trends Metrics**

Model Size and Performance

GPT-3: 175 billion parameters; benchmarks like SuperGLUE score of 89.8 (as of its release).

BERT: 110 million parameters (base model); achieves 84.5 F1 score on the SQuAD 2.0 reading comprehension dataset.

Multimodal Models

CLIP (Contrastive Language-Image Pretraining): Can match images and texts with 76% accuracy in zero-shot image classification tasks.

DALL-E: Can generate images from text descriptions, achieving high fidelity and creativity.

**Sakthi and Sumathy****Low-resource Languages**

mBERT (Multilingual BERT): Supports 104 languages; performance varies with resource availability, but it improves over previous multilingual models

Conversational AI

Dialogflow (Google): Used in millions of conversations daily effectiveness varies by implementation and training.

Ethics and Fairness

Bias Benchmarks: Various benchmarks like the "Word Embedding Association Test" (WEAT) show biases in models (e.g., 60-70% of gender bias in word embeddings).

Challenges Metrics**Bias and Fairness**

Gender Bias: Models like word2vec show a 70% correlation with gender stereotypes in word associations.
Sentiment Analysis Bias: Models might misclassify sentiments by up to 15% depending on demographic attributes.

Data Privacy

Data Leakage: Incidents where sensitive data is inadvertently exposed can impact model trustworthiness; exact figures vary but incidents are reported regularly.

Interpretability

Explainability Techniques: Current explainability techniques (e.g., LIME, SHAP) have limitations in NLP, with effectiveness ranging between 60-80% in terms of interpretability.

Resource Intensity

Training Costs: Training large models like GPT-3 costs millions of dollars in computational resources.
Carbon Footprint: Training large NLP models can result in significant carbon emissions; estimates suggest that training GPT-3 can produce approximately 552,000 kg CO₂e.

Generalization

Domain Adaptation: Performance drop of 10-20% when models trained on one domain are applied to another without fine-tuning.

Trends: As of today, NLP fashions turn into more specialized in expertise context; shooting discords, context-changes, and dealing with multi-way conversations. This shift points at the need to increase the

relevance of context understanding in surrounding even higher correct and human-like models. Workers also are researching strategies to improve pass-area generalization, so as to increase NLP fashions' performance in other domains or subject areas. Also, as the use of applications that require translation like chatbots and virtual personal assistants increases in the near future, there may be pressure to enhance the speed of NLP models. These quantities have grow to be large and intricate, and the need to make them extra of a scale and exceptional has initiated cognate attempts to enhance scalability and performance.

Challenges: Nevertheless, some of the following difficulties are still present: As any other database system, the privateness and safety of the data are crucial troubles, significantly in relation to sensitive records, the protection of privateness remains the principle concern. Prejudice and inclusion are also active problems due to the fact that biases in NLP models should be avoided in order not to cause discrimination. Another undertaking is to work on the appropriate NLP fashions for low-sensible source languages that are nevertheless behind in terms of aid and

**Sakthi and Sumathy**

accuracy. Last but not the least, the desire for better quality assessment is also implied, and enthusiasts strive to develop improved methods to compare the effectiveness of NLP models.

Data sources: Data collected from studies of language models including GPT-3, BERT (Base), mBERT, T5, and RoBERTa.

Analysis: This plot compares the model size of the models with their corresponding performance scores. The blue bars represent the image size, while the red lines indicate performance scores. GPT-3, with a larger model size, shows significantly higher performance scores. In contrast, BERT (Base), mBERT, T5, and RoBERTa, despite having smaller image sizes, maintain comparable performance scores, with T5 slightly outperforming the others in terms of performance time compared to its size.

Implications: The data shows that large models such as the GPT-3 can provide superior performance. However, smaller models such as BERT (Base), mBERT, and RoBERTa still achieve competitive performance, indicating that model efficiency and construction also play an important role in determining performance outcomes. This insight is valuable for models a choices based on trade-offs between computing resources and performance .

Data Source: Data amassed from performance critiques of NLP fashions with various sizes, measured in tens of millions of parameters.

Analysis: The plot demonstrates the version size and the actual-time processing capabilities or simply the request per second. The inverse courting also holds a lot of precision; the larger models are usually associated with diminished real-time processing capacity. As the version length grows, from round 2 hundred million parameters to more than 1 billion, the quality of generation improves significantly. When the quantity of parameters is 6 billion, the actual-time processing fee significantly decreases. This makes it imply that whereas larger models may also additionally provide for better accuracy or performance in sure duties, they will take greater computational resources, hence restricting their capability to procedure requests speedy.

Implications: This discovering is pivotal for actual-time applications that require fast decision- making and processing. Indeed, for scenarios where a large number of inputs need to be processed all at once, it could be beneficial to go for the small models even at the cost of accuracy. This alternate-offhas to be taken into consideration when deciding on models for the packages that need both performance and efficiency.

Data Source: The records for this evaluation become collected from overall performance opinions of numerous NLP models. These fashions have been tested with various sizes, measured in hundreds of thousands of parameters.

Analysis: Plot shows the mapping of model size with the Real Time processing capacity depicting the requests per second (RPS). As would be expected there is direct and inverse relationship, which is where as the size of the models increases the real time processing capability declines. While increasing the modelsize from a level of 200 million parameters to over a billion: Precisely, when working with approximately 6 billion parameters, the speed of real-time processing is hundreds of times less than what is exhibited above. This indicates that as much as larger models may claim to have better accuracy or performance in a given task, they are slower in processing requests due to the higher amount of recourses that they use.

Implications: However, this outcome is significant for any application type that requires fast computations in real time. Regarding the high-throughput computing applications, smaller models may work the best despite lesser accuracy, than larger ones. This trade-off becomes important when the models are being chosen for use in applications requiring both speed and resource optima.

**Sakthi and Sumathy**

Data Source: The facts for this evaluation were obtained from the performance reviews of various NLP models, each tested with different sizes, in terms of hundreds of thousands of parameters.

Analysis: The plot shows the bias tiers of every extraordinary NLP models and the comparison of their ranges. The greatest degree of bias is formerly recommended by GPT-3, as indicated by means of the precise tallest bar inside the plot, at 70%. This implies that despite the fact that GPT-3 is highly developed, it is still biased to a certain extent. Per the bias degree discovered in CLIP, the mannequin has a 50% bias which means it's slightly biased – nonetheless, it is higher than some prior fashions and inferior to GPT-3. Moving to the next session with the lowest levels of bias we have word2vec with 45% bias degree. As you remember this level is not as high as GPT-3 or CLIP Nevertheless, word2vec demonstrates a rather significant degree of bias. Concerning the bias stage, BERT (Base) can be characterized as forty%, and that means that it is solely slightly much less prejudiced than word2vec however nevertheless a giant one. The bar with the shortest height illustrates T3 as possessing the lowest bias percentage at 25% indicating that several of the models had the lowest form of bias. This makes T3 a potentially higher preference for applications where fairness is pinnacle precedence.

Implications: Analyzing the tiers of bias is important in creating non-prejudiced AI systems hence constructing truthful structures. Higher bias stages result in discriminating outcomes; therefore, one should consider these measures when choosing or implementing models. Of course, to decrease the achievement of bias, builders need to implement offset mechanisms at some level of the training and quality-tuning stages in version development. Fostering solutions to bias can assist in the development of a fairer kind of AI packages.

CONCLUSION

The concept of NLP has come a long way and has even improved the manner that humans interface with computers. These enhancements of context, real-time, as well as cross-domain generalization make modern NLP models more realistic and powerful to implement the hitherto inconceivable applications. These are changes that are redefining specific sectors and they range from the customer service where chat bots are now being used to the healthcare system that is now employing virtual assistants to the creation of content and even language translation. But, the path does not end here. Nevertheless, numerous issues are still unresolved that can prevent the optimum performance of NLP. Data management, especially the question of privacy and protection, can be considered among these challenges because the use of big data implies work with large sets of sensitive data. Another important topic is bias mitigation as NLP models are increasingly integrated into more significant and consequential settings, and reinforcement of bias should be avoided. The problem of scalability is another one that becomes even more acute as models become larger and more complex and the useful techniques are needed to achieve the same level of performance in terms of scalability.

ABSTRACT

Hypersoft sets are a generalization of soft sets that have gained importance and are being studied for possible uses in various mathematical fields. Musa and Asaad investigated numerous aspects and defined a number of fundamental concepts on hypersoft topological spaces. This work further develops the idea of hypersoft topology on hypersoft sets and looks at some of its characteristics, such as a hypersoft set's neighbourhood, closure, interior, limit point. We also introduce the notions of hypersoft basis, hypersoft subspace topology and hypersoft Hausdorff space. To help understand the recently defined concepts, examples are provided.

Keywords : Hypersoft set, hypersoft power set, hypersoft topology, hypersoft basis, subspace topology, closure, interior, limit point, and hypersoft Hausdorff space.

AMS Subject Classification: 54C50, 54F65.

INTRODUCTION

In 1999, Molodtsov [11] presented the idea of soft sets as a broad mathematical tool for handling various types of uncertainty. The proposal of soft topology utilising the soft sets provided by Cagman and Enginoglu [3] and the definition of a soft set using its soft subsets. Shabir and Naz [17] proposed the idea of soft topology defined on a classical set by utilising soft sets over it at the same era. Many studies have since been given on this idea, including [2,4-8,10,14-16,20,21].

Inthumathi and Amsaveni

Smarandache[16] expanded the concept of soft sets into hypersoft sets by converting the argument function F into a multi-argument function. One recently developed method for solving realworld issues is the idea of hypersoft sets. The fundamental operations of union, intersection, complement, and difference of hypersoft sets were established by Mujahid Abbas et al. [1]. The foundations of hypersoft sets, including hypersoft subset, complement, not hypersoft set, and aggregation operations, were presented by Muhammad Saeed et al. [12]. Inthumathi et al.[9] presented the concepts of hypersoft semi-open sets, hypersoft semi-closed sets, hypersoft semiinterior and hypersoft semi-closure in hypersoft topological spaces (HTS). Recently Smarandache et al.[18] developed the concept of hypersoft sets in a game theory-based decision making model. Set theory concepts are central to modern topology. Musa and Asaad [13] investigated numerous aspects and defined a number of fundamental concepts on HTS. This work further develops the idea of hypersoft topology on hypersoft sets and looks at some of its characteristics, such as a hypersoft set's neighbourhood, closure, interior, limit point. We also introduce the notions of hypersoft basis, hypersoft subspace topology and hypersoft Hausdorff space.

PRELIMINARIES

The fundamental definitions and findings of hypersoft set theory that may be found in previous research are presented in this part.

Definition 2.1. [4]. A soft set F_A on the universe U is defined by the set of ordered pairs $F_A = \{(x, f_A(x)) : x \in E, f_A(x) \in P(U)\}$, where $f_A : E \rightarrow P(U)$ such that $f_A(x) = \Phi$ if $x \notin A$. Note that the set of all soft sets over U will be denoted by $S(U)$

Definition 2.2. [3]. Let $F_A \in S(U)$. A soft topology on F_A , denoted by τ , is a collection of soft subsets of F_A having the following properties:

- i. $F_\emptyset, F_A \in \tau$
- ii. $\{F_{A_i} \subseteq F_A \mid i \in I \subseteq N\} \subseteq \tau \Rightarrow \bigcup_{i \in I} F_{A_i} \in \tau$
- iii. $\{F_{A_i} \subseteq F_A : 1 \leq i \leq n, n \in N\} \subseteq \tau \Rightarrow \bigcap_{i=1}^n F_{A_i} \in \tau$

The pair (F_A, τ) is called a soft topological spaces.

Definition 2.3. [1]. Let U be a universe of discourse, $P(U)$ the power set U and E_1, E_2, \dots, E_n the pairwise disjoint sets of parameters. Let A_i be the nonempty subset of E_i for each $i = 1, 2, \dots, n$. A hypersoft set can be identified by the pair $(\phi, A_1 \times A_2 \times \dots \times A_n)$, where $\phi : A_1 \times A_2 \times \dots \times A_n \rightarrow P(U)$.

Throughout this work, we write the symbols E for $E_1 \times E_2 \times \dots \times E_n$, A for $A_1 \times A_2 \times \dots \times A_n$, \tilde{a} for an element of the set A and α for an element of the hypersoft set (ϕ, A) . We also suppose that none of the set A_i is empty. The set of all hypersoft sets over U will be denoted by $H[U]$

Example 2.4. [1]. Let $U = \{x_1, x_2, x_3, x_4\}$. Define the attributes sets by $E_1 = \{a_{11}, a_{12}\}$, $E_2 = \{a_{21}, a_{22}\}$, $E_3 = \{a_{31}, a_{32}\}$. Suppose that $A_1 = \{a_{11}, a_{12}\}$, $A_2 = \{a_{21}, a_{22}\}$, $A_3 = \{a_{31}\}$ are subsets of E_i for each $i = 1, 2, 3$ respectively. Let the hypersoft set (ϕ, A) be defined by

$$(\phi, A) = \{((a_{11}, a_{21}, a_{31}), \{x_1, x_2\}), ((a_{11}, a_{22}, a_{31}), \{x_2\}), ((a_{12}, a_{21}, a_{31}), \{x_3, x_4\}), ((a_{12}, a_{22}, a_{31}), \{x_1, x_4\})\}$$

Inthumathi and Amsaveni

Definition 2.5. [1]. Let U be a universe of discourse and A a subset of E . Then (ϕ, A) is called

- i. a null hypersoft set if for each parameter $\tilde{\alpha} \in A$, $\phi(\tilde{\alpha})$ is an 0. We will denote it by Φ_A .
- ii. an absolute hypersoft set if for each parameter $\tilde{\alpha} \in A$, $\phi(\tilde{\alpha}) = U$. We will denote it by (ϕ, A) .

Definition 2.6. [1]. Let (ϕ, A) and (φ, B) be two hypersoft sets over U . Then (ϕ, A) is called a hypersoft subset of (φ, B) if $A \subseteq B$, and $\phi(\tilde{\alpha}) \subseteq \varphi(\tilde{\alpha})$ for all $\tilde{\alpha} \in A$.

We denote this by $(\phi, A) \subseteq (\varphi, B)$. Thus (ϕ, A) and (φ, B) are said to equal if $(\phi, A) \subseteq (\varphi, B)$ and $(\varphi, B) \subseteq (\phi, A)$.

Definition 2.7. [1]. Let (ϕ, A) and (φ, B) be two hypersoft sets over U . Then union of (ϕ, A) and (φ, B) is denoted by $(\psi, C) = (\phi, A) \cup (\varphi, B)$ with $C = C_1 \times C_2 \times \dots \times C_n$, where $C_i = A_i \cup B_i$ for $i = 1, 2, \dots, n$ and ψ is defined by

$$\psi(\tilde{\alpha}) = \begin{bmatrix} \phi(\tilde{\alpha}) & \text{if } \tilde{\alpha} \in A - B \\ \varphi(\tilde{\alpha}) & \text{if } \tilde{\alpha} \in B - A \\ \phi(\tilde{\alpha}) \cup \varphi(\tilde{\alpha}) & \text{if } \tilde{\alpha} \in A \cap B \\ 0 & \text{else} \end{bmatrix} \text{ Where } \tilde{\alpha} = (c_1, c_2, \dots, c_n) \in C.$$

Definition 2.8. [1]. Let (ϕ, A) and (φ, B) be two hypersoft sets over U . Then intersection of (ϕ, A) and (φ, B) is denoted by $(\psi, C) = (\phi, A) \cap (\varphi, B)$, where $C = C_1 \times C_2 \times \dots \times C_n$ is such that $C_i = A_i \cap B_i$ for $i = 1, 2, \dots, n$ and ψ is defined as $\psi(\tilde{\alpha}) = \phi(\tilde{\alpha}) \cap \varphi(\tilde{\alpha})$, where $\tilde{\alpha} = (c_1, c_2, \dots, c_n) \in C$. If C_i is an empty set for some i , then $(\phi, A) \cap (\varphi, B)$ is defined to be a null hypersoft set.

HYPERSOFT TOPOLOGY

The notion of hypersoft topology on a hypersoft set and its associated attributes are defined in this section.

Definition 3.1. Suppose (ϕ, A) be a hypersoft set. The hypersoft power set of (ϕ, A) is defined by $P[(\phi, A)] = \{(\phi, A)_i : (\phi, A)_i \subseteq (\phi, A), i \in I \subseteq N\}$ and its cardinality is defined by $|P[(\phi, A)]| = 2^{\sum_{\tilde{\alpha} \in A} |\phi(\tilde{\alpha})|}$, where $|\phi(\tilde{\alpha})|$ is the cardinality of $\phi(\tilde{\alpha})$

Example 3.2. Let $U = \{x_1, x_2, x_3\}$. Define the attributes sets by $E_1 = \{e_1, e_2, e_3\}$ $E_2 = \{e_4, e_5\}$ $E_3 = \{e_6, e_7\}$. Suppose that $A_1 = \{e_1, e_2\}$ $A_2 = \{e_4, e_5\}$ $A_3 = \{e_7\}$ are subsets of E_i for each $i = 1, 2, 3$ respectively. Let the hypersoft set (ϕ, A) be defined by $(\phi, A) = \{((e_1, e_4, e_7)\{x_1, x_2\}), ((e_2, e_5, e_7)\{x_2, x_3\})\}$. Consider all the hypersoft subsets of (ϕ, A) that are given by $(\phi, A)_1 = \{(e_1, e_4, e_7), \{x_1\}\}$, $(\phi, A)_2 = \{(e_1, e_4, e_7), \{x_2\}\}$, $(\phi, A)_3 = \{(e_1, e_4, e_7), \{x_1, x_2\}\}$, $(\phi, A)_4 = \{(e_2, e_5, e_7), \{x_2\}\}$, $(\phi, A)_5 = \{(e_2, e_5, e_7), \{x_3\}\}$, $(\phi, A)_6 = \{(e_2, e_5, e_7), \{x_2, x_3\}\}$, $(\phi, A)_7 = \{((e_1, e_4, e_7), \{x_1\}), ((e_2, e_5, e_7), \{x_2\})\}$, $(\phi, A)_8 = \{((e_1, e_4, e_7), \{x_1\}), ((e_2, e_5, e_7), \{x_3\})\}$, $(\phi, A)_9 = \{((e_1, e_4, e_7), \{x_1\}), ((e_2, e_5, e_7), \{x_2, x_3\})\}$, $(\phi, A)_{10} = \{((e_1, e_4, e_7), \{x_2\}), ((e_2, e_5, e_7), \{x_2\})\}$, $(\phi, A)_{11} = \{((e_1, e_4, e_7), \{x_2\}), ((e_2, e_5, e_7), \{x_3\})\}$, $(\phi, A)_{12} = \{((e_1, e_4, e_7), \{x_2\}), ((e_2, e_5, e_7), \{x_2, x_3\})\}$, $(\phi, A)_{13} = \{((e_1, e_4, e_7), \{x_1, x_2\}), ((e_2, e_5, e_7), \{x_2\})\}$, $(\phi, A)_{14} = \{((e_1, e_4, e_7), \{x_1, x_2\}), ((e_2, e_5, e_7), \{x_3\})\}$, $(\phi, A)_{15} = (\phi, A)$, $(\phi, A)_{16} = \Phi_A$, so $|P[(\phi, A)]| = 2^4 = 16$.

Inthumathi and Amsaveni

Definition 3.3. Let $(\phi, A) \in H[U]$. A hypersoft topology on (ϕ, A) , denoted by τ , is a collection of hypersoft subsets of (ϕ, A) having the following properties.

- i. $\Phi_A, (\phi, A) \in \tau$
- ii. $\{(\phi, A)_j \subseteq (\phi, A) : j \in J \subseteq N\} \subseteq \tau \Rightarrow \bigcup_{j \in J} (\phi, A)_j \in \tau$
- iii. $\{(\phi, A)_j \subseteq (\phi, A) : 1 \leq j \leq n, n \in N\} \subseteq \tau \Rightarrow \bigcap_{j=1}^n (\phi, A)_j \in \tau$.

The pair $((\phi, A), \tau)$ is called a HTS.

Example 3.4. Let us consider the hypersoft subsets of (ϕ, A) that are given in Example 3.2 then

$$\begin{aligned} \tau_1 &= \{\Phi_A, (\phi, A)\} \\ \tau_2 &= P[(\phi, A)] \text{ and} \\ \tau_3 &= \{\Phi_A, (\phi, A), (\phi, A)_2, (\phi, A)_{11}, (\phi, A)_{13}\} \text{ are hypersoft topologies on } (\phi, A). \end{aligned}$$

Definition 3.5. Let $((\phi, A), \tau)$ be a HTS. Then every element of τ is called hypersoft open set. Clearly $\Phi_A, (\phi, A)$ are hypersoft open sets. A hypersoft set is closed hypersoft set if its complement is open hypersoft set

Definition 3.6. Let $((\phi, A), \tau_1)$ and $((\phi, A), \tau_2)$ be two HTSs. If $\tau_2 \supseteq \tau_1$, then τ_2 is finer than τ_1 or τ_1 is coarser than τ_2 . If $\tau_2 \supset \tau_1$, then τ_2 is strictly finer than τ_1 . If either $\tau_2 \supseteq \tau_1$ or $\tau_2 \subseteq \tau_1$, then τ_1 is comparable with τ_2 .

Example 3.7. Let us consider the hypersoft topologies on (ϕ, A) that are given in example 3.4. Then hypersoft topology τ_2 is finer than hypersoft topologies τ_1 and τ_3 , hypersoft topology τ_3 is finer than hypersoft topology τ_1 . So τ_1, τ_2 and τ_3 are comparable hypersoft topologies.

Definition 3.8. Let $((\phi, A), \tau)$ be a HTS and $\mathfrak{B} \subseteq \tau$. If every element of τ can be written as the union of elements of \mathfrak{B} , then \mathfrak{B} is called a hypersoft basis for the hypersoft topology τ . Each element of \mathfrak{B} is called a hypersoft basis element.

Example 3.9. Let us consider Examples 3.2 and 3.4. Then $\mathfrak{B} = \{\Phi_A, (\phi, A)_1, (\phi, A)_2, (\phi, A)_4, (\phi, A)_5\}$ is a hypersoft basis for the hypersoft topology τ_2 .

Theorem 3.10. Let $((\phi, A), \tau)$ and $((\phi, A), \tau')$ be two HTSs and $\mathfrak{B}, \mathfrak{B}'$ be hypersoft bases for τ and τ' respectively. If $\mathfrak{B}' \subseteq \mathfrak{B}$, then τ is finer than τ' .

Proof. Let $\mathfrak{B}' \subseteq \mathfrak{B}$. Then for each $(\phi, B) \in \tau'$ and $(\psi, C) \in \mathfrak{B}'$
 $(\phi, B) = \bigcup_{(\psi, C) \in \mathfrak{B}'} (\psi, C) = \bigcup_{(\psi, C) \in \mathfrak{B}} (\psi, C)$. Therefore $(\phi, B) \in \tau$, hence $\tau' \subseteq \tau$

Theorem 3.11. Let $((\phi, A), \tau)$ be a HTS and \mathfrak{B} be hypersoft basis for τ . Then τ is the collection of union of elements of \mathfrak{B} .

Proof: The proof is trivial.

Definition 3.12. Let $((\phi, A), \tau)$ be a HTS and $(\phi, B) \subseteq (\phi, A)$. Then the collection $\tau_{(\phi, B)} = \{(\phi, A)_i \cap (\phi, B) : (\phi, A)_i \in \tau, i \in I \subseteq N\}$ is called a hypersoft subspace topology on (ϕ, B) . Hence, $((\phi, B), \tau_{(\phi, B)})$ is called a hypersoft topological subspace of $((\phi, A), \tau)$.

Theorem 3.13. Let $((\phi, A), \tau)$ be a HTS and $(\phi, B) \subseteq (\phi, A)$. Then a hypersoft subspace topology on (ϕ, B) is a hypersoft topology.

Proof: Indeed, it contains Φ_A and (ϕ, B) because $\Phi_A \cap (\phi, B) = \Phi_A$ and $(\phi, A) \cap (\phi, B) = (\phi, B)$, where $\Phi_A, (\phi, A) \in \tau$. Since $\tau = \{(\phi, A)_i : (\phi, A)_i \subseteq (\phi, A), i \in I\}$ is closed under finite intersections and arbitrary unions. $\bigcap_{i=1}^n ((\phi, A)_i \cap (\phi, B)) = (\bigcap_{i=1}^n (\phi, A)_i) \cap (\phi, B)$

$$\bigcup_{i \in I} ((\phi, A)_i \cap (\phi, B)) = (\bigcup_{i \in I} (\phi, A)_i) \cap (\phi, B)$$

Inthumathi and Amsaveni

Example 3.14. Let us consider the hypersoft topology τ_3 on (ϕ, A) given in example 3.4. If $(\varphi, B) = (\phi, A)_9$, then hypersoft subspace topology $\tau_{(\varphi, B)} = \{\phi_A, (\phi, A)_9, (\phi, A)_5, (\phi, A)_7\}$, and so $((\varphi, B), \tau_{(\varphi, B)})$ is a hypersoft topological subspace of $((\phi, A), \tau_3)$.

Theorem 3.15. Let $((\phi, A), \tau)$ be a HTS, $((\varphi, B), \tau_{(\varphi, B)})$ be a hypersoft topological subspace. If (ψ, C) is hypersoft open in $\tau_{(\varphi, B)}$, then there exists at least one element (χ, D) of τ such that $(\psi, C) \subseteq (\chi, D)$.

Proof: It is clearly seen from Definition 3.12.

Theorem 3.16. Let $((\phi, A), \tau)$ be a HTS. If \mathfrak{B} is a hypersoft basis for τ , then the collection $\mathfrak{B}_{(\varphi, B)} = \{(\phi, A)_i \cap (\varphi, B) : (\phi, A)_i \in \mathfrak{B}, i \in I \subseteq N\}$ is a hypersoft basis for the hypersoft subspace topology on (φ, B) .

proof : Take as given each $(\psi, C) \in \tau_{(\varphi, B)}$. From the definition of hypersoft subspace, $(\psi, C) = (\chi, D) \cap (\varphi, B)$, where $(\chi, D) \in \tau$. Because $(\chi, D) \in \tau$, $(\chi, D) = \cup_{(\phi, A)_i \in \mathfrak{B}} (\phi, A)_i$. Therefore $(\psi, C) = (\cup_{(\phi, A)_i \in \mathfrak{B}} (\phi, A)_i) \cap (\varphi, B) = \cup_{(\phi, A)_i \in \mathfrak{B}} ((\phi, A)_i \cap (\varphi, B))$. Hence $\mathfrak{B}_{(\varphi, B)}$ is a hypersoft basis for hypersoft subspace topology $\tau_{(\varphi, B)}$ on (φ, B) .

Theorem 3.17. Let $((\phi, A), \tau)$ be a HTS. Then the following conditions hold

- i. The empty set ϕ_A and (ϕ, A) are hypersoft closed sets.
- ii. Arbitrary intersections of the hypersoft closed sets are hypersoft closed.
- iii. Finite unions of the hypersoft closed sets are hypersoft closed.

Proof:

- i. By the definition of hypersoft closed set, $(\phi, A)^c = \phi_A$ and $\phi_A^c = (\phi, A)$ are hypersoft open. Then (ϕ, A) and ϕ_A are hypersoft closed.
- ii. If $\{(\phi, A)_i : (\phi, A)_i^c \in \tau, i \in I \subseteq N\}$ is a given collection of hypersoft closed sets, then $(\cap_{i \in I} (\phi, A)_i)^c = \cup_{i \in I} (\phi, A)_i^c$ is hypersoft open. Therefore $\cap_{i \in I} (\phi, A)_i$ is a hypersoft closed set.
- iii. If $(\phi, A)_i$ is hypersoft closed for $i = 1, 2, 3, \dots, n$. Then $(\cup_{i=1}^n (\phi, A)_i)^c = \cap_{i=1}^n (\phi, A)_i^c$ is hypersoft open. Hence $\cup_{i=1}^n (\phi, A)_i$ is a hypersoft closed set.

Definition 3.18. Let $((\phi, A), \tau)$ be a HTS and $(\varphi, B) \subseteq (\phi, A)$. Then the hypersoft interior of (φ, B) , denoted $(\varphi, B)^\circ$, is defined as the union of all hypersoft open subsets of (φ, B) . $(\varphi, B)^\circ = \cup \{(\varphi, B)_i : (\varphi, B)_i \in \tau, (\varphi, B)_i \subseteq (\varphi, B), i \in I \subseteq N\}$.

Note that $(\varphi, B)^\circ$ is the biggest hypersoft open set that is contained by (φ, B) .

Example 3.19. Let us consider the hypersoft topology τ_3 given in example 3.4.

Let $(\varphi, B) = (\phi, A)_{12} = \{((e_1, e_4, e_7), \{x_2\}), ((e_2, e_5, e_7), \{x_2, x_3\})\}$. Then the hypersoft interior of (φ, B) , $(\varphi, B)^\circ = \phi_A \cup (\phi, A)_2 \cup (\phi, A)_{11} = (\phi, A)_{11}$.

Inthumathi and Amsaveni

Theorem 3.20. Let $((\phi, A), \tau)$ be a HTS and $(\phi, B) \subseteq (\phi, A)$. (ϕ, B) is a hypersoft open set if and only if $(\phi, B) = (\phi, B)^\circ$.

Proof : If (ϕ, B) is an hypersoft open set, then the biggest hypersoft open set that is contained by (ϕ, B) is equal to (ϕ, B) . Therefore $(\phi, B) = (\phi, B)^\circ$. Conversely, it is known that $(\phi, B)^\circ$ is a hypersoft open set, and if $(\phi, B) = (\phi, B)^\circ$, then (ϕ, B) is hypersoft open set.

Theorem 3.21. Let $((\phi, A), \tau)$ be a HTS and $(\phi, B), (\psi, C) \subseteq (\phi, A)$. Then

- i. $((\phi, B)^\circ)^\circ = (\phi, B)^\circ$
- ii. $((\phi, B) \subseteq (\psi, C) \Rightarrow (\phi, B)^\circ \subseteq (\psi, C)^\circ$
- iii. $(\phi, B)^\circ \cap (\psi, C)^\circ = ((\phi, B) \cap (\psi, C))^\circ$
- iv. $(\phi, B)^\circ \cup (\psi, C)^\circ \subseteq ((\phi, B) \cup (\psi, C))^\circ$

Proof:

- i. Let $(\phi, B)^\circ = (\chi, D)$. Then $(\chi, D) \in \tau$ iff $(\chi, D) = (\chi, D)^\circ$. Therefore $((\phi, B)^\circ)^\circ = (\phi, B)^\circ$.
- ii. Let $(\phi, B) \subseteq (\psi, C)$. From the definition of a hypersoft interior, $(\phi, B)^\circ \subseteq (\phi, B)$ and $(\psi, C)^\circ \subseteq (\psi, C)$. $(\psi, C)^\circ$ is the biggest hypersoft open set that is contained by (ψ, C) . Hence, $(\phi, B) \subseteq (\psi, C) \Rightarrow (\phi, B)^\circ \subseteq (\psi, C)^\circ$
- iii. By the definition of a hypersoft interior, $(\phi, B)^\circ \subseteq (\phi, B)$ and $(\psi, C)^\circ \subseteq (\psi, C)$. Then $(\phi, B)^\circ \cap (\psi, C)^\circ \subseteq (\phi, B) \cap (\psi, C)$. $((\phi, B) \cap (\psi, C))^\circ$ is the biggest hypersoft open set that is contained by $((\phi, B) \cap (\psi, C))$. Hence, $(\phi, B)^\circ \cap (\psi, C)^\circ \subseteq ((\phi, B) \cap (\psi, C))^\circ$. Conversely, $(\phi, B) \cap (\psi, C) \subseteq (\phi, B)$ and $(\phi, B) \cap (\psi, C) \subseteq (\psi, C)$ Then, $((\phi, B) \cap (\psi, C))^\circ \subseteq (\phi, B)^\circ$ and $((\phi, B) \cap (\psi, C))^\circ \subseteq (\psi, C)^\circ$. Therefore, $((\phi, B) \cap (\psi, C))^\circ \subseteq (\phi, B)^\circ \cap (\psi, C)^\circ$.
- iv. Let $(\phi, B)^\circ \subseteq (\phi, B)$ and $(\psi, C)^\circ \subseteq (\psi, C)$. Then $(\phi, B)^\circ \cup (\psi, C)^\circ \subseteq (\phi, B) \cup (\psi, C)$. $((\phi, B) \cup (\psi, C))^\circ$ is the biggest hypersoft open set that is contained by $(\phi, B) \cup (\psi, C)$. Hence, $(\phi, B)^\circ \cup (\psi, C)^\circ \subseteq ((\phi, B) \cup (\psi, C))^\circ$.

Definition 3.22. Let $((\phi, A), \tau)$ be a HTS and $(\phi, B) \subseteq (\phi, A)$. Then the hypersoft closure of (ϕ, B) denoted by $\overline{(\phi, B)}$, is defined as the intersection of all hypersoft closed supersets of (ϕ, B) . $\overline{(\phi, B)} = \bigcap \{(\phi, A)_i : (\phi, A)_i^c \in \tau, (\phi, B) \subseteq (\phi, A)_i, i \in I \subseteq N\}$. Note that $\overline{(\phi, B)}$ is the smallest hypersoft closed set that containing (ϕ, B) .

Example 3.23. Let us consider the hypersoft topology τ_3 given in example 3.4. If $(\phi, B) = (\phi, A)_9 = \{((e_1, e_4, e_7), \{x_1\}), ((e_2, e_5, e_7), \{x_2, x_3\})\}$ then $(\phi, A)_2^c = (\phi, A)_9 = \{((e_1, e_4, e_7), \{x_1\}), ((e_2, e_5, e_7), \{x_2, x_3\})\}$ and $\Phi_A^c = (\phi, A) = \{((e_1, e_4, e_7), \{x_1, x_2\}), ((e_2, e_5, e_7), \{x_2, x_3\})\}$ are hypersoft closed supersets of (ϕ, B) . Hence $\overline{(\phi, B)} = (\phi, A)_9 \cap (\phi, A) = (\phi, A)_9$

Theorem 3.24. Let $((\phi, A), \tau)$ be a HTS and $(\phi, B) \subseteq (\phi, A)$. (ϕ, B) is a hypersoft closed set iff $(\phi, B) = \overline{(\phi, B)}$.

Proof: The proof is trivial.

Theorem 3.25. Let $((\phi, A), \tau)$ be a HTS and $(\phi, B) \subseteq (\phi, A)$. Then $(\phi, B)^\circ \subseteq (\phi, B) \subseteq \overline{(\phi, B)}$.

Proof: The proof is trivial.

Inthumathi and Amsaveni

Theorem 3.26. Let $((\phi, A), \tau)$ be a HTS and $(\phi, B), (\psi, C) \subseteq (\phi, A)$. Then

- i. $\overline{(\phi, B)} = \overline{(\phi, B)}$
- ii. $(\phi, B)^c = ((\phi, B)^c)^\circ$
- iii. $(\psi, C) \subseteq (\phi, B) \Rightarrow \overline{(\psi, C)} \subseteq \overline{(\phi, B)}$
- iv. $\overline{(\phi, B) \cap (\psi, C)} \subseteq \overline{(\phi, B)} \cap \overline{(\psi, C)}$
- v. $\overline{(\phi, B) \cup (\psi, C)} = \overline{(\phi, B)} \cup \overline{(\psi, C)}$

Proof:

- i. Let $\overline{(\phi, B)} = (\chi, D)$. Then (χ, D) is a hypersoft closed set. Therefore (χ, D) and $\overline{(\chi, D)}$ are equal. Hence $\overline{(\phi, B)} = \overline{(\phi, B)}$.
- ii. If we consider the definitions of a hypersoft closure and a hypersoft interior, we obtain
$$\overline{(\phi, B)}^c = \left(\bigcap_{\substack{(\phi, A)_i \supseteq (\phi, B) \\ (\phi, A)_i^c \in \tau}} (\phi, A)_i \right)^c = \bigcup (\phi, A)_i^c = ((\phi, B)^c)^\circ$$
- iii. Let $(\psi, C) \subseteq (\phi, B)$. By the definition of a hypersoft closure, $(\phi, B) \subseteq \overline{(\phi, B)}$ and $(\psi, C) \subseteq \overline{(\psi, C)}$. $\overline{(\psi, C)}$ is the smallest hypersoft closed set that containing (ψ, C) . Then $\overline{(\psi, C)} \subseteq \overline{(\phi, B)}$.
- iv. Let $\overline{(\phi, B)}$ and $\overline{(\psi, C)}$ are hypersoft closed sets. So $\overline{(\phi, B)} \cap \overline{(\psi, C)}$ is a hypersoft closed set. Since $(\phi, B) \cap (\psi, C) \subseteq \overline{(\phi, B)} \cap \overline{(\psi, C)}$ and $\overline{(\phi, B)} \cap \overline{(\psi, C)}$ is the smallest hypersoft closed set that containing $(\phi, B) \cap (\psi, C)$, $\overline{(\phi, B) \cap (\psi, C)} \subseteq \overline{(\phi, B)} \cap \overline{(\psi, C)}$.
- v. Let $(\phi, B) \subseteq \overline{(\phi, B)}$ and $(\psi, C) \subseteq \overline{(\psi, C)}$. Then $(\phi, B) \cup (\psi, C) \subseteq \overline{(\phi, B)} \cup \overline{(\psi, C)}$. Since $\overline{(\phi, B) \cup (\psi, C)}$ is the smallest hypersoft closed set that containing $(\phi, B) \cup (\psi, C)$, $\overline{(\phi, B) \cup (\psi, C)} \subseteq \overline{(\phi, B)} \cup \overline{(\psi, C)}$. Conversely, $(\psi, C) \subseteq \overline{(\psi, C)} \subseteq \overline{(\phi, B) \cup (\psi, C)}$ and $(\phi, B) \subseteq \overline{(\phi, B)} \subseteq \overline{(\phi, B) \cup (\psi, C)}$. Therefore, $\overline{(\phi, B) \cup (\psi, C)} \subseteq \overline{(\phi, B)} \cup \overline{(\psi, C)}$. Hence, $\overline{(\phi, B) \cup (\psi, C)} = \overline{(\phi, B)} \cup \overline{(\psi, C)}$

Definition 3.27. Let $((\phi, A), \tau)$ be a HTS and $\alpha \in (\phi, A)$. If there is a hypersoft open set $(\phi, B) \in \tau$ such that $\alpha \in (\phi, B)$, then (ϕ, B) is called a hypersoft neighborhood of α . The set of all hypersoft neighborhood of α denoted by $HN(\alpha)$, is called the family of hypersoft neighborhoods of α , $HN(\alpha) = \{(\phi, B) : (\phi, B) \in \tau, \alpha \in (\phi, B)\}$

Example 3.28. Let us consider the HTS $((\phi, A), \tau_3)$ in Example 3.4 and $\alpha = ((e_1, e_4, e_7), \{x_1, x_2\}) \in (\phi, A)$. Then $HN(\alpha) = \{(\phi, A), (\phi, A)_{13}\}$

Definition 3.29. Let $((\phi, A), \tau)$ be a HTS, $(\phi, B) \subseteq (\phi, A)$ and $\alpha \in (\phi, A)$. If every neighborhood of α intersects (ϕ, B) in some points other than α itself, then α is called a hypersoft limit point of (ϕ, B) . The set of all limit points of (ϕ, B) is denoted by $(\phi, B)'$. In other words, if $((\phi, A), \tau)$ is a HTS, $(\phi, B), (\psi, C) \subseteq (\phi, A)$ and $\alpha \in (\phi, A)$, then $\alpha \in (\phi, B)' \Leftrightarrow (\psi, C) \cap ((\phi, B) \setminus \{\alpha\}) \neq \phi_A$ for all $(\psi, C) \in HN(\alpha)$.

Example 3.30. Let us consider the Example 3.28. If $(\phi, B) = (\phi, A)_{13}$ and $\alpha = ((e_1, e_4, e_7), \{x_1, x_2\}) \in (\phi, A)$ then $\alpha \in (\phi, B)'$. Since $(\phi, A) \cap ((\phi, B) \setminus \{\alpha\}) \neq \phi_A$ and $(\phi, A)_{13} \cap ((\phi, B) \setminus \{\alpha\}) \neq \phi_A$

Inthumathi and Amsaveni

Theorem 3.31. Let $((\phi, A), \tau)$ be a HTS and $(\phi, B) \subseteq (\phi, A)$. Then $(\phi, B) \cup (\phi, B)' = \overline{(\phi, B)}$.

Proof: If $\alpha \in (\phi, B) \cup (\phi, B)'$ then $\alpha \in (\phi, B)$ or $\alpha \in (\phi, B)'$. In this case, if $\alpha \in (\phi, B)$ then $\alpha \in \overline{(\phi, B)}$. If $\alpha \in (\phi, B)'$, then $(\psi, C) \cap ((\phi, B) \setminus \{\alpha\}) \neq \Phi_A$ for all $(\psi, C) \in HN(\alpha)$ and so $(\psi, C) \cap (\phi, B) \neq \Phi_A$ for all $(\psi, C) \in HN(\alpha)$. Hence $\alpha \in \overline{(\phi, B)}$. Conversely, if $\alpha \in \overline{(\phi, B)}$, then $\alpha \in (\phi, B)$ or $\alpha \notin (\phi, B)$. In this case, if $\alpha \in (\phi, B)$ it is trivial that $\alpha \in (\phi, B) \cup (\phi, B)'$. If $\alpha \notin (\phi, B)$ then $(\psi, C) \cap ((\phi, B) \setminus \{\alpha\}) \neq \Phi_A$ for all $(\psi, C) \in HN(\alpha)$. Therefore $\alpha \in (\phi, B)'$ so $\alpha \in (\phi, B) \cup (\phi, B)'$. Hence $(\phi, B) \cup (\phi, B)' = \overline{(\phi, B)}$.

Theorem 3.32. Let $((\phi, A), \tau)$ be a HTS, and $(\phi, B) \subseteq (\phi, A)$. Then (ϕ, B) is hypersoft closed if and only if $(\phi, B)' \subseteq (\phi, B)$.

Proof: $\overline{(\phi, B)} = (\phi, B) \Leftrightarrow (\phi, B) \cup (\phi, B)' = (\phi, B) \Leftrightarrow (\phi, B)' \subseteq (\phi, B)$.

Theorem 3.33. Let $((\phi, A), \tau)$ be a HTS and $(\phi, B), (\psi, C) \subseteq (\phi, A)$. Then

- i. $(\phi, B)' \subseteq \overline{(\phi, B)}$
- ii. $(\phi, B) \subseteq (\psi, C) \Rightarrow (\phi, B)' \subseteq (\psi, C)'$
- iii. $((\phi, B) \cap (\psi, C))' \subseteq (\phi, B)' \cap (\psi, C)'$
- iv. $((\phi, B) \cup (\psi, C))' = (\phi, B)' \cup (\psi, C)'$

Proof:

- i. It is clearly seen from theorem 3.31.
- ii. Let $\alpha \in (\phi, B)'$. Then $(\chi, D) \cap ((\phi, B) \setminus \{\alpha\}) \neq \Phi_A$ for all $(\chi, D) \in HN(\alpha)$. Since $(\phi, B) \subseteq (\psi, C)$, $(\chi, D) \cap ((\psi, C) \setminus \{\alpha\}) \neq \Phi_A$ for all $(\chi, D) \in HN(\alpha)$. In other words $\alpha \in (\psi, C)'$. Hence $(\phi, B)' \subseteq (\psi, C)'$.
- iii. $(\phi, B) \cap (\psi, C) \subseteq (\phi, B)$ and $(\phi, B) \cap (\psi, C) \subseteq (\psi, C)$. Then $((\phi, B) \cap (\psi, C))' \subseteq (\phi, B)'$ and $((\phi, B) \cap (\psi, C))' \subseteq (\psi, C)'$. Therefore, $((\phi, B) \cap (\psi, C))' \subseteq (\phi, B)' \cap (\psi, C)'$
- iv. $(\phi, B) \subseteq (\phi, B) \cup (\psi, C)$ and $(\psi, C) \subseteq (\phi, B) \cup (\psi, C)$. Then $(\phi, B)' \subseteq ((\phi, B) \cup (\psi, C))'$ and $(\psi, C)' \subseteq ((\phi, B) \cup (\psi, C))'$. Therefore $(\phi, B)' \cup (\psi, C)' \subseteq ((\phi, B) \cup (\psi, C))'$. Conversely, for all $(\chi, D) \in HN(\alpha)$, $\alpha \in ((\phi, B) \cup (\psi, C))' \Leftrightarrow (\chi, D) \cap [((\phi, B) \cup (\psi, C)) \setminus \{\alpha\}] \neq \Phi_A \Leftrightarrow (\chi, D) \cap [(\phi, B) \setminus \{\alpha\} \cup (\psi, C) \setminus \{\alpha\}] \neq \Phi_A \Leftrightarrow [(\chi, D) \cap ((\phi, B) \setminus \{\alpha\})] \neq \Phi_A$ or $[(\chi, D) \cap ((\psi, C) \setminus \{\alpha\})] \neq \Phi_A \Leftrightarrow \alpha \in (\phi, B)'$ or $\alpha \in (\psi, C)'$ $\Leftrightarrow \alpha \in (\phi, B)' \cup (\psi, C)'$. Hence $((\phi, B) \cup (\psi, C))' \subseteq (\phi, B)' \cup (\psi, C)'$. Thus $((\phi, B) \cup (\psi, C))' = (\phi, B)' \cup (\psi, C)'$.

Inthumathi and Amsaveni

Definition 3.34. Let $((\phi, A), \tau)$ be a HTS. If $\forall \alpha_1, \alpha_2 \in (\phi, A), \alpha_1 \neq \alpha_2$, there exists $(\varphi, B)_1 \in HN\{\alpha_1\}$ and $(\varphi, B)_2 \in HN\{\alpha_2\}$ such that $(\varphi, B)_1 \cap (\varphi, B)_2 = \phi_A$, then $((\phi, A), \tau)$ is called hypersoft Hausdorff space.

Example 3.35. Let $U = \{x_1, x_2, x_3\}$ and $E_1 = \{e_1, e_2, e_3\}$ $E_2 = \{e_4, e_5\}$ $E_3 = \{e_6, e_7\}$. Consider the hypersoft set $(\phi, E) = \{((e_1, e_4, e_7), \{x_1, x_2\}), ((e_2, e_5, e_7), \{x_2, x_3\}), ((e_3, e_4, e_6), \{x_1, x_3\})\}$.

If $(\phi, E)_1 = \{((e_1, e_4, e_7), \{x_1, x_2\}), ((e_3, e_4, e_6), \{x_1\})\}$, $(\phi, E)_2 = \{((e_2, e_5, e_7), \{x_2, x_3\}), ((e_3, e_4, e_6), \{x_3\})\}$. Then $\tau = \{\phi_A, (\phi, E), (\phi, E)_1, (\phi, E)_2\}$ is a hypersoft topology on (ϕ, E) . Hence $((\phi, E), \tau)$ is a hypersoft Hausdorff space.

Theorem 3.36. Every finite point hypersoft set in a hypersoft Hausdorff space is a hypersoft closed set.

Proof : Let $((\phi, A), \tau)$ be a hypersoft Hausdorff space. It suffices to show that every one point set $\{\alpha_1\}$ is hypersoft closed. If $\alpha_2 \neq \alpha_1$ is a point of (ϕ, A) , then α_1 and α_2 have disjoint hypersoft neighborhoods $(\varphi, B)_1$ and $(\varphi, B)_2$ respectively. Since $(\varphi, B)_1$ does not intersect $\{\alpha_2\}$, point α_1 cannot belong to the hypersoft closure of the set $\{\alpha_2\}$. As a result, the hypersoft closure of the set $\{\alpha_1\}$ is $\{\alpha_1\}$ itself, so it is hypersoft closed.

Definition 3.37. Let $((\phi, A), \tau)$ be a HTS and $(\varphi, B) \subseteq (\phi, A)$. Then the hypersoft boundary of (φ, B) denoted $(\varphi, B)^b$, is defined by $(\varphi, B)^b = \overline{(\varphi, B)} \cap \overline{(\varphi, B)^c}$

Example 3.38. Let us consider Example 3.23. For (φ, B) , $\overline{(\varphi, B)} = (\phi, A)_2^c$ and $\overline{(\varphi, B)^c} = (\phi, A)$. Then $(\varphi, B)^b = \overline{(\varphi, B)} \cap \overline{(\varphi, B)^c} = (\phi, A)_2^c$

Theorem 3.39. Let $((\phi, A), \tau)$ be a HTS, and $(\varphi, B), (\psi, C) \subseteq (\phi, A)$. Then

- i. $(\varphi, B)^b \subseteq \overline{(\varphi, B)}$
- ii. $(\varphi, B)^b = \overline{((\varphi, B)^c)^b}$
- iii. $(\varphi, B)^b = \overline{(\varphi, B)} \setminus (\varphi, B)^\circ$

Proof :

- i. From the definition of a hypersoft boundary, the proof is trivial.
- ii. Take as given $\alpha \in (\varphi, B)^b$
 $\Leftrightarrow (\psi, C) \cap (\varphi, B) \neq \phi_A$ and $(\psi, C) \cap (\varphi, B)^c = \phi_A$ for all $(\psi, C) \in HN\{\alpha\}$.
 $\Leftrightarrow (\psi, C) \cap (\varphi, B)^c \neq \phi_A$ and $(\psi, C) \cap ((\varphi, B)^c)^c \neq \phi_A$ for all $(\psi, C) \in HN\{\alpha\}$.
 Hence $(\varphi, B)^b = \overline{((\varphi, B)^c)^b}$.
- iii. Consider the definitions of a hypersoft closure and a hypersoft interior.

$$\begin{aligned} \overline{(\varphi, B)} \setminus (\varphi, B)^\circ &= \overline{(\varphi, B)} \cap ((\varphi, B)^\circ)^c = \overline{(\varphi, B)} \cap \left(\bigcup_{\substack{(\varphi, B)_i \subseteq (\varphi, B) \\ (\varphi, B)_i \in \tau}} (\varphi, B)_i \right)^c \\ &= \overline{(\varphi, B)} \cap (\cap (\varphi, B)_i^c) = \overline{(\varphi, B)} \cap \overline{(\varphi, B)^c} = (\varphi, B)^b. \end{aligned}$$

CONCLUSION

One important branch of mathematics is topology. We introduced the idea of hypersoft topology on a hypersoft set and discussed its associated aspects in this work. The theoretical underpinnings of HTSs were then presented. This study might serve as a foundation for hypersoft set theoretic operations-based mathematical structures and notions. Many topological space features can be extended to HTS in the future.

ABSTRACT

Entomopathogenic nematodes represent a group of soil inhabiting nematodes that parasitize a wide range of insects. These nematodes belong to two families: Steinernematidae and Heterorhabditidae. Until now, more than 70 species have been described in Steinernematidae and there are about 20 species in Heterorhabditidae. The nematodes have a mutualistic partnership with Enterobacteriaceae bacteria and together they act as a potent insecticidal complex that kills a wide range of insect species. Many nematodes are associated with insects and their host interactions range from beneficial to detrimental. The pathogenic effect is in fact conferred by their interaction with facultative anaerobic enteric bacteria. The bacteria are vectored from one insect host to another by the only free-living nematode stage, the third-stage infective juvenile which lives in soil. Once inside the insect, the nematodes release the bacteria into the insect's hemolymph, which kill the insect host by massive septicemia. In the present investigation is to isolate *Xenorhabdus*(symbiotic bacteria) from EPN . It also focuses on the insect-baiting technique, a widely used approach for the isolation of EPN from soil samples, and the modified white trap technique which is popularly used for the recovery of these nematodes from infected insects. The third segment of the cadaver was given a cut to extract hemolymph. The hemolymph was streaked on sterile plates of Nutrient Bromothymol Blue Triphenyltetrazolium chloride agar NBTA. The Plates was incubated at 28°

Sangeetha et al.,

C in dark for 4 days. After 4 days of incubation, bacterial colonies were observed. The characteristics of the colonies was dark blue, convex and swarm colonies. There will be a phase shift from blue to orange and finally the colonies will be observed as yellowish orange colour.

Keywords: *Xenorhabdus*, EPN, Triphenyl tetrazolium chloride, Bromothymolblue

INTRODUCTION

Xenorhabdus spp. (members of the family Enterobacteriaceae) are symbiotically associated with Entomopathogenic nematodes in the families Steinernematidae and Heterorhabditidae, the nematodes act as vectors transporting their bacterial symbionts in to the hemocoel of the insect host. *Xenorhabdus* spp. contribute to the symbiotic relationship by providing nutritional requirements for their nematode partners. Economic importance of entomopathogenic nematodes (EPN) belonging to the genera Steinernema is increasing because of their potential use in biological control of numerous pests (Gaugler and Kaya 1990). The non feeding infective juveniles carry the symbiotic bacteria, *Xenorhabdus* in their gut. The nematode search for an ambush a suitable insect host, enter through natural opening and also through cuticle and release their symbiont bacteria into the hemolymph. Proliferation of the bacterium leads to death of the insect host within 24-48 hours followed by nematode development and reproduction (Kaya et al., 1993) The Genus *Xenorhabdus* -Steinernema life cycle insect larvae are infected and killed, while both mutualists produce bioactive compounds, a single strain of *Xenorhabdus* may produce a variety of antibacterial and antifungal compounds, some of which are also active against insects, nematodes, Protozoa and cancer cells. *Xenorhabdus* spp., entomopathogenic bacteria symbiotically associated with the nematode of the family steinernematidae are shown to produce different lipases when they are grown on suitable nutrient agar. *Xenorhabdus* spp. occur spontaneously in two variants, phase I and phase II. Phase I variants absorb dyes on agar plates produce several antibiotics, secrete a variety of proteins. The main objectives of our study were to isolate and identify EPNs and their symbiotic Bacteria of *Xenorhabdus*. The main objective of the present research was to isolate and identify EPNs and their Symbiotic Bacteria of *Xenorhabdus*.

MATERIALS AND METHODS

Soil Sample Collection

10 Samples were collected from two locations at Tirunelveli and Kanyakumari district. Soil Samples with plant debris were taken from a diverse of habitats, for example cashew, golden showers, coconut, mango, ixora, Date palm, Nerium Plant from Tirunelveli district (The Indian Agriculture College) and coconut, mango, Banana, Tamarind, Jack fruit from Seynamvilai village of kanyakumari district.

Mass multiplication of EPN

The EPNs were isolated from the soil samples using the *C. cephalonica* Baiting technique as described by Bedding and Akhurst. White trap were used to isolate the emerging infective juvenile EPNs from the *C. cephalonica* cadavers. The infective juveniles of EPN were collected in 100 ml of clean sterile distilled water. The infective juveniles of EPN were surface sterilized by adding 1 ml 0.25 % (w/v) to the suspension and washed with sterile water 2 to 3 times in the Laminar air flow chamber with a sterile micro pipette, most of the supernatant was removed without disturbing the infective juveniles settled at the bottom of the tube. At the final step the surface sterilized infective juveniles which were collected in a beaker with sterile distilled water. The juvenile nematodes kept at 13-15° C in distilled water prior to molecular identification.

Isolation of *Xenorhabdus* from the Nematodes:

Xenorhabdus bacteria were isolated from the hemolymph of rice moth larval cadavers (*Corcyra cephalonica*) infected with EPN's. To propagate EPN's (500µl) was placed on to a sterile petridish containing 5 larvae of rice moth (C

**Sangeetha et al.,**

cephalonica). The petridish was then sealed with parafilm and incubated in the dark at room temperature. The insect larvae was observed daily for 2-3 days. The resulting insect cadavers were then washed with 95-100% ethanol and placed on another sterile petridish. The third segment from the mouth parts of the *C.cephalonica* larvae were opened using fine sterile forceps to obtain the hemolymph containing *Xenorhabdus*. A drop of hemolymph was streaked on sterile plates of nutrient bromothymol blue triphenyl tetrazolium chloride agar (NBTA) which were then stored in the dark at room temperature. After 4 days of incubation, preliminary identification of these bacteria was performed by observing the colony morphology. The colonies of species of the genus *Xenorhabdus* are dark blue, convex, umbonated and swarm. This yellowish orange colour due to the phase shift from blue to orange.

NBTA Media Composition

Nutrient Bromothymol blue triphenyl tetrazolium chloride agar:

Nutrient agar	8.0 g
Bromomethyl blue	25 mg
2,3,5-trimethyl	40 mg
tertazolium chloride	
distilled water	1000 ml

Molecular Identification of *Xenorhabdus* Species

Sequence analysis of twelve isolates was done to confirm species identity, which initially has been done based solely on morphological parameters. Comparison of oligonucleotide fragments of 16SrRNA sequences, which included the 5.8 S gene and the flanking ITS1 and ITS2 regions, with reference sequences from public databases, showed that they were very similar. (Santhana Bharathi S and Reetha, 2022)

RESULTS AND DISCUSSION

Based on the colony morphology on the NBTA *Xenorhabdus* were isolated from the EPNs (Entomopathogenic Nematode) and were preliminarily characterized based on a dark blue, or dark red colony colour with a convex or umbonated surface and swarming colony on NBTA after three to four days at room temperature (25° C). EPNs are able to infect a broad host range of insects, but in terms of symbiosis the relationship between the host nematode and its symbiont i.e. bacterium is very close. Taxonomic studies by using morphological, biochemical and molecular analysis of conserved genes of genera i.e., *Xenorhabdus* in steinernema and *photorhabdus* in heterorhabditis were conducted by several investigators (Euzeby and Boemare, 2000, Boemare and Akhurst, 2000, 2001; Akhurst and Boemare, 2001). EPNs were obtained from infected *C.cephalonica* larvae. The first phenotypic evidence in the identification of these bacteria was the cadavers colouration. Those *C.cephalonica* infected by steinernema become brownish colour. *Xenorhabdus* are unique in the bacterial world and beneficial due to their ability to form a mutualistic symbiosis in one host and mount an aggressive pathogenic against a totally different phylum. The selected isolate TCX 1 were molecular level characterized by 16S rRNA sequencing and identified as *Xenorhabdusnematophila* the sequence data were submitted to the NCBI Gen Bank, and the allocated accession number is OR633290. A Phylogenetic tree was also constructed using the 16S rDNA gene sequence data at Figure 7.

>OR633290 *Xenorhabdusnematophila* - TCX

CONCLUSION

Xenorhabdus is an important component in Integrated pest management strategies. In the present study reported the TCX *Xenorhabdusnematophila* exhibit a monoxenic association between each isolate and its nematode by amplifying and sequencing bacterial 16S rRNA sequence from crushed adult and juvenile nematode and from bacterial cultures isolated from infected hosts.

ABSTRACT

Globally, there is a growing recognition of the importance of blue-green infrastructure for sustainable development. Several policies for sustainability can be implemented for environmental and infrastructure planning, however relating to the nature-based sustainable model i.e., blue-green infrastructure, the development becomes unorganized. This paper intends to focus on the review of global policies for implementing blue-green infrastructure and the ongoing environment and sustainable policies used for implementing BGI in India. However, there is a gap, as no such policy in India is directly related to the integrated blue-green infrastructure in the Inclusive planning process. Moreover, the fragmented nature of policymaking in India also contributes to the gaps between policy and implementation. The above-mentioned gap between policy and implementation of blue-green infrastructure in India requires a comprehensive framework of ongoing policies in a global context which can be further overlapped with the existing sustainable and environmental policies of India in identifying the gap since the implementation of sustainable policies for blue-green infrastructure which is directly responsible towards the environment is crucial for ensuring long-term environmental, social, and economic sustainability. The methods used for the research are purely qualitative, the paper describes the detailed global and Indian policies and best practices related to BGI.

Keywords: Infrastructure planning, Blue-Green Infrastructure, Sustainability, Environment policy, Inclusive Planning

**Ananya Tripathi and Subhrajit Banerjee**

INTRODUCTION

Multifunctional infrastructures are appealing to society because they can integrate urban ecology with reliable and efficient spaces. [1]. “The term 'blue-green' or 'green/blue' infrastructure developed at the turn of the previous decade as a rising awareness of the need for a more integrated systems-approach to the management of Green and Blue Infrastructure. [2].” It (BGI) refers to an integrated system of created and natural elements that work together to manage water resources, enhance biodiversity, reduce flooding risk, and provide other environmental and socioeconomic benefits. BGI is seen as an essential investment and an advancement over traditional infrastructure. [3]. In context with the BGI, the 11th Sustainable Development Goals established by the United Nations General Assembly in 2015 as Sustainable Cities and Communities, the main aim of this goal is “to make cities inclusive, resilient, safe and sustainable [4].” SDG 11 promotes inclusive and sustainable urbanization. It includes investments in public transit, better urban planning and resource management, as well as measures for climate adaptation and disaster resilience. SDGs are now widely recognized as a framework to shape sustainability initiatives within governments and NGOs [5]. Similar to this, activities aimed towards particular SDGs in line with a long-term vision are increasingly integrating sustainability reporting into projects or organization plans. A growing number of nations are establishing policies and programs to encourage the use of BGI as a crucial instrument for climate change adaptation and sustainable development. Cities like Melbourne, Rotterdam, and Portland have become models in this regard. [6].

Background

The EPA defined two spatial scales for green infrastructure in its definition. At the city or county scale, green infrastructure refers to “the patchwork of natural areas that provide habitat, flood protection, cleaner air and cleaner water”, whereas at the neighborhood or site scale, green infrastructure refers to “storm water management systems that mimic nature soak up and store water [7, 8].” “Natural infrastructure and blue infrastructure are the two most recently coined terms.” [9, 10] “Natural infrastructure was first used to emphasise the importance of wetlands in freshwater system management.” [11] The “Blue” recognizes the importance of the physicality of water and works on the principles of utilizing rainwater, allowing its infiltration and managing the storm water that drains off the land into waterways and corridors, while the “Green” connects urban hydrological functions with vegetation systems in urban landscape design. The resulting BGI has overall socio-economic benefits that are greater than the sum of the individual components. Following the debates at the Rio Earth Summit in 1992, Swedish legislation was changed to emphasise sustainability, notably the necessity of green space in and around cities. According to the new legislation, urban planning should promote a healthy living environment, biodiversity, and the effective use of energy and other resources. [12]

METHODOLOGY

The methodology had three major steps for identification of potential BGI Literature review firstly review of ongoing global BGI policies and Projects with extracting the major parameters taken into consideration. Second is the review of existing policies indirectly related to BGI in India. And the third and final step is the comparative analysis of both policy initiative related to both Indian and Global context in context of overlapping of policies, parameters, sectoral plans and gaps.

Blue-green Infrastructure & Sustainable Development

A sustainable city is one that maintains a balance of economic, social, and ecological components. Integrating all effective BGI initiatives, as well as derived services, may unlock the true potential of BGI strategies in improving our towns and cities. [13]. Urbanisation not only influences landscape characteristics but also affects the process of natural systems such as the hydrological cycle, greenhouse gas emissions, biodiversity levels, and metal and nutrient biochemical cycles. [14]. Blue-green infrastructure serves both people and animals. Its presence can improve air and water quality, carbon storage, as well as flood and temperature management, noise reduction, resource

**Ananya Tripathi and Subhrajit Banerjee**

efficiency, biodiversity, and amenity value. These features, in turn, increase resistance to the effects of climate change, including increased temperatures and flooding. BGI has primarily received excellent feedback in nations such as the Netherlands; yet, widespread adoption appears to be challenging due to a lack of awareness

Importance of blue-green infrastructure in sustainable development

The covid-19 pandemic has impacted global and domestic funding capacity for projects related to the UN's sustainable development goals (SDG's). blue-green infrastructure has the potential to fulfill multiple targets outlined in the SDGs, such as those related to Clean water & sanitation (SDG 6), Life on land (SDG 15), climate action (SDG 13), Sustainable cities & communities (social inclusion) (SDG 11) although it can also accelerate progress on green employment prospects (SDG 8), positions in agriculture, manufacturing, R&D, administrative, and service activities aimed at substantially preserving or restoring environmental quality) Followed by these SDGs' various co-factors are related to the sustainability criteria of these SDGs and are important key connections between blue-green infrastructure and sustainable development that are as follows:

- Climate Change Mitigation and Adaptation: Blue-green infrastructure aids in climate change mitigation by sequestering carbon dioxide, cutting energy usage, and minimizing urban heat island effects. It also increases urban resilience by mitigating the effects of extreme weather events through storm water management, flood control, and soil erosion prevention.
- Water Management and Quality: Blue-green infrastructure incorporates natural water management measures such as rain gardens, artificial wetlands, and green roofs to collect and filter storm water runoff.
- Social and health benefits: Blue-green infrastructure improves urban people' quality of life by establishing green places for recreation, increasing air quality, and minimising noise pollution.
- Economic Opportunities: By producing green jobs, attracting investments, and increasing property values, blue-green infrastructure may produce economic advantages.

Challenges in implementing blue-green Infrastructure

Uncertainties surrounding hydrological performance and service delivery, as well as a lack of faith in communities and decision-makers to accept, support, and take holding of such infrastructure, are impeding the widespread adoption of Blue-Green Infrastructure (BGI). When compared to solely hydrological factors, social-institutional hurdles often provide the greatest challenge to the implementation of sustainable water management systems and have a stronger effect on the selected solution. [15] General approaches such as enhancing education and promoting awareness are critical to public understanding of BGI, often lack specifics and may require additional refining to overcome the various challenges in practice. [16] A study was conducted in new castle, an interview analysis was done using qualitative research software, with asking two major nodes i.e., Barriers to BGI' and 'Overcoming barriers' According to the study's findings, more than half of those polled stated that a lack of understanding, education, and awareness about BGI is a major obstacle to obtaining financing (including paying for continuing maintenance) from local governments and the general public, with three primary barriers being physical science/engineering uncertainty, a lack of suitable space, and future land use and climate.[16].

Review of global policies of BGI

International cities are shifting away from depending on just centralized grey infrastructure and towards decentralized facilities that employ BGI to locally retain, store, and reuse surface water, hence increasing their resilience to possible environmental difficulties.

Best Practices in blue-green infrastructure implementation**Case of: Blue-Green Cities Research Project, UK**

By integrating water management and green infrastructure, a Blue-Green City aims to replicate a naturally directed water cycle while also contributing to the city's amenity. This is accomplished by integrating and conserving the urban landscape's hydrological and biological assets while also offering robust and adaptive flood mitigation methods. The Blue-Green Cities Research Consortium sought to create innovative ways for controlling urban flood risk as part of a larger, integrated urban planning effort aiming at environmental enhancement and urban

**Ananya Tripathi and Subhrajit Banerjee**

rejuvenation, with the numerous advantages of Blue-Green Cities systematically examined and understood [17]. The project's stakeholders were to be its primary focus, and the drainage systems were to be updated. Risks would be mitigated by studying gaps in the urban drain networks, developing adaptable strategies with the communities, establishing a flood footprint to estimate financial costs, identifying obstacles to flood prevention, and putting in place blue-green infrastructure.

Case of: Grey to Green Initiative, Portland, US

Portland has one of the oldest and most effective BGI programs in the country, and over the past 20 years, it has made significant investments in BGI to reduce the burden on the piped infrastructure system, enhance the quality of the water, and control the danger of flooding. The five-year 'Grey to Green' effort aided in the execution of the Portland Watershed Management Plan (2005), with overarching aims of safeguarding natural resources, restoring important ecosystems, and adopting storm water solutions that integrate urban regions with the natural environment [18]. The initiative highlighted aspects such as street and yard tree planting, green streets and eco-roofs. [19].

Case of : Rotterdam, Netherlands

Rotterdam is a pioneer city in the transition to transformational climate governance. [20].and has a long history of combining urban water management, spatial planning, and climate change adaptation to increase the city's resilience to, for example, sea level rise and increasing occurrence of pluvial flood events, while improving the quality of life of urban residents. [21] Potential benefits of project were divided into three criteria: health, energy and carbon detachment; and community live ability with individual statistics to calculate best management practices, and a validity scale that is used to illustrate the benefit's certainty degree. [22]

Case of: Active, Beautiful, Clean Waters Programme, Singapore

The Active, Beautiful, Clean (ABC) Waters Programme was launched in 2006 by Singapore's Public Utilities Department under the Ministry of Environment and Water Resources to realize the full potential of a progressively implemented drainage network of 17 reservoirs and 8,000 km of drains, canals, and rivers. Because catchment regions cover two-thirds of Singapore, holistic and sustainable storm water management was launched using onsite detention and retention systems, even as the need for more community engagement was recognized. [23]. The ABC Waters program's main goal was to turn streams and bodies of water into magnificent urban assets by integrating these drainage systems with the built environment and bringing people closer to water.

Case of: Sponge city, Wuhan, China

Due to current flooding and pollution challenges, the Wuhan government prioritized tackling the issue of water logging and complemented this with water pollution management and rainfall collecting and reuse through the sponge city project. Total 455 sponge projects were planned in the city's two demonstration regions, i.e., Qingshang and Six in Districts, which comprise 38.5 square kilometers [24].

Policy Frameworks and initiatives**Environment and sustainable policies in India****Overview**

For acknowledging the importance of the environment, implementing sustainable policies in India is a need for a better future. A better understanding of the relationship between the environment and sustainable policy in India involves the term "environmental sustainability." Some aspects of environment sustainability for policy initiatives involve investment in water conservation, support for sustainable transportation, renewable energy, environmental conservation, and innovation in urban planning. In response to the UN Framework Convention on Climate Change and the UN's 'Green Economy Initiative,' India implemented the National Action Plan on Climate Change (NAPCC) in 2008. The initiative listed out the macroeconomic, sustainability, and poverty reduction implications of green investment in sectors like renewable energy and sustainable agriculture, and also guided catalysing increased investment in these areas.

**Ananya Tripathi and Subhrajit Banerjee****Existing policies relevant to blue-green infrastructure**

Green infrastructure was first referenced in an early debate of India's environmental policy in the Fourth Five Year Plan (1964-69), and it covers a wide range of challenges, including regulating air and water pollution and protecting forests, mangroves, and other natural resources. Renamed the Ministry of Environment, Forests, and Climate Change in 2014, it remains the focal point for environmental and climate policy planning, monitoring, and implementation, while the Ministry of Water Resources and Ganga Development oversees India's national water resources (the country's blue infrastructure). [25] Some of the existing policies that are relevant to the blue-green infrastructure are elaborated below:

- National Water Policy (2012): This policy focuses on the sustainable development and management of water resources, including the promotion of water conservation, rainwater harvesting, and efficient water use.
- National Mission for Sustainable Agriculture (NMSA): NMSA aims to promote sustainable agricultural practices, including water management, watershed development, and soil conservation.[26]
- National Urban Greening Guidelines: These guidelines provide recommendations for integrating green spaces into urban planning and development, promoting urban forests, parks, and green infrastructure.
- National River Conservation Plan (NRCP): NRCP is aimed at addressing water pollution and promoting the conservation and rejuvenation of rivers, which can contribute to BGI principles.
- National Mission for Clean Ganga (Namami Gange): is a prominent initiative aimed at restoring and protecting the Ganga River. The mission includes several projects, including sewage treatment, riverfront development, and riverbank afforestation. These initiatives not only boost the Ganga River's quality of water but also enhances overall blue-green infrastructure along the river.
- Sustainable habitat, water, agricultural, and forestry missions are multisectoral, overlapping, and cross-departmental in nature. [27] From the above-mentioned list, it is evident that post-independent era, there has been no comprehensive policies to integrate or implement storm water management system, which is a major component of BGI.

Challenges and Gaps in policy implementations

- One of the significant challenge is the lack of awareness and understanding advantages of blue-green infrastructure among policymakers, government officials, and the public. This leads to limited support and commitment to implementing such policies.
- Fragmented governance structure with multiple agencies responsible for various aspects of urban development and environmental management. The lack of coordination and integration among these agencies is also a major hindrance.
- Implementing BGI requires technical expertise in areas such as hydrology, landscape architecture, and urban planning. However, there is a shortage of professionals with the necessary skills and knowledge to design and implement such projects.
- Limited financial resources and competing priorities often result in inadequate funding allocation for these initiatives.
- BGI requires ongoing maintenance to ensure its long-term sustainability often a lack of clarity regarding the responsibility and funding for maintenance, which can lead to the deterioration of infrastructure over time.
- The mentioned policies in the above section are implemented with multiple measures in a single frame, also they fulfil the regulatory framework on an individual resource palette but not as an integrated resource for BGI. There are discrepancies, gaps, and conflicts in ongoing policies related to environmental policies, water policies, etc. For the integrated approach of the BGI, a participatory approach is needed to develop policy implementation. Figure 1. When it comes to complicated issues with a high level of ambiguity, the distance between the government's intentions and the tools utilized in policy execution might increase over time, resulting in an increasing mismatch.

Comparative Analysis between Global and Indian Policy & Initiatives

Comparative analysis of policies related to global and Indian context has been done on the basic key aspects that are important for policy implementation measures.

**Ananya Tripathi and Subhrajit Banerjee****overlapping global and Indian aspects of BGI implementation**

Global policies for blue-green infrastructure must be customized and localized for the Indian context, taking into account India's particular difficulties, cultural diversity, and socioeconomic circumstances. Concerning the local context, Different regions of India have different climates, topographies, and population concentrations. Policies should take into consideration these variations and be flexible enough to be applied in urban, peri-urban, and rural settings. About the current scenario, talking about the "green cities- a Sustainable Urban Future in Southeast Asia", a Technical Assistance document from ADB, guidelines for preparing a Green City Action Plan is provided, whereas similar guidelines and proposals are developed for a Green and blue Master Plan for the city of Bhopal. (Bhopal Smart City Development Corporation). Similarly, the sponge city concept has been adopted in India for flood control from the best practice of Wuhan, china. overlapping of global policies and framework onto the Indian context is adding value to the cities which are facing the same problem that the global cities have faced but one should take into consideration the similar geographical and climatic context as well as the stakeholder engagement, and future monitoring of policies which makes it a successful model of global policies related to BGI because implementing infrastructure is not difficult but to maintain it is a challenging task.

Parameters

By taking these factors into account, Indian and global policies have common goals and methods for every aspect of blue-green infrastructure Major parameters include flood resilience, storm water run-off, surface run-off, urban heat islands. Taking the reference of best practices and policies based on similar parameters, to overlap the policy initiatives needs local context, the character of the city, and its behavior. Referring to the case of Rotterdam, Netherlands the major parameter taken into consideration for BGI was the reduction of floods and the cases of drowning that essentially counter the problem and has been a successful model for flood resilience. Similarly, if we notice the case of Bengaluru, 2023 some parts of the city has been recently flooded due to the incapable storm water drainage and even the cases of flooding have extended to the extent of drowning resulting in the loss of life and collapsing of the entire building was despite new storm water drainage plan implemented by the city authorities. For the Indian context, it is essential to adopt the practices from the global context considering their parameters but the amalgamation of the city character, its typology, and context is necessary for any intervention of such policies

Individual /Sectoral Plans

Almost every city in India has a stormwater drainage plan which has specifications of the initial stage of the inlet of stormwater and the final discharge of water in the river or canal. But the idea of reuse, recharge, and harvest which is a sustainability measure for a city is missing in many of the implemented plans. The lack of established guidelines and policies requiring the inclusion of reuse and recycle principles in stormwater drainage designs might be a barrier. It is difficult to drive required changes and assure compliance if policies and regulations are not in existence or are not successfully implemented. Overlapping a case of ABC water program in Indian context, there is a need for making guidelines for stormwater runoff standards taking reference with the model.

Implementation Procedure

Every effective blue-green project featured a significant level of community involvement, like in Newcastle, UK. Initiatives in Bengaluru and Madurai, India, have also involved a significant amount of public participation. The general understanding of blue-green projects will be improved through active engagement with government, planners, policymakers, and other political representatives, foster ownership in the creation, formulation, implementation, and oversight of such activities.

Gaps in Coordination

Mapping global policies into the Indian context may face limitations due to data and information gaps. Accurate and up-to-date data related to the environment, land use, population dynamics, and socioeconomic factors are crucial for effective policy adaptation. Awareness among the stakeholder and a multidisciplinary approach must be done as, India's vast size and diverse regions pose challenges in obtaining comprehensive and reliable data, hindering the adaptation process.

Ananya Tripathi and Subhrajit Banerjee

CONCLUSION

Development of Indian policies related to BGI can create new opportunities for the implementation of nature-based solutions in cities. Comparative analysis suggested that India has many ongoing sustainable policies that can be relevant to the BGI but that need to be collaborative and bring different multidimensional departments into the same umbrella. The collaborative efforts of policymakers, researchers, professionals, and local populations are key to the development of blue-green infrastructure in India. It requires concerted effort, efficient governance, and the inclusion of several stakeholders. India can achieve sustainable development, improve urban resilience, and create a healthier and more liveable environment for its population by adapting global policies to the Indian context. Global policies serve as a basis for sustainable development and "blue-green" infrastructure as a whole must be customized to the Indian context by taking into account the demands of the nation, as well as local government systems, socioeconomic considerations, and environmental conditions. India should create contextual policies that address its particular difficulties and possibilities by coordinating global goals with national priorities. This will enable the creation of more efficient and inclusive blue-green infrastructure across the entire nation.

Recommendations for enhancing BGI implementation in India

BGI is acknowledged on a global scale for its numerous environmental, social, and economic benefits it suggests that policy and practice need to change to better implement BGI and make it multifunctional rather than being primarily focused on managing flood risk and only mentioning broader benefits in passing. BGI cannot be structured to provide all possible benefits simultaneously, many cities are likely to prioritize enhancing quality of life through high-quality BGI. Indian cities perspective, BGI design will be influenced by the geographic, climatological, socio-political, and governance features of cities, guided by each city's priorities and strategic objectives, and negotiated by the stakeholders involved in BGI projects to maximize benefits and determine which benefit trade-offs will be made. It will be beneficial if we can implement BGI during the construction phase of other infrastructure projects. Annual environmental status reports containing information on natural characteristics and pollution indicators are published by numerous Indian cities. To set reasonable expectations, such actions must be included when conducting an annual blue-green audit for all communities. Governments must uphold uniform statutory terminologies and definitions and carry out the complete integration of all urban plans and documents that highlight environmental elements to streamline processes and ensure the integrity of the original blue-green canvas. Such a framework will provide a certain uniformity for parastatal agencies-incorporated initiatives, and local project initiatives as well.

Table 2. Showing the comparative analysis between global and Indian policy & initiatives with key aspects

Key aspects	Global context	Indian context
Policy Frameworks	International frameworks have strong emphasis on sustainable infrastructure and environmental preservation include the Paris Agreement, the Sendai Framework for Disaster Risk Reduction, and the Sustainable Development Goals (SDGs) of the United Nations. It has its regulations and policies, as well as universal guidelines.	The National Action Plan on Climate Change, Smart Cities Mission, National Water Policy, and Swachh Bharat Mission are policy frameworks in India that address parts of BGI and urban sustainability but are not directly implemented.
Local Context and Adaptation	Global policies give broad recommendations and best practices that must be modified for specific contexts and scales. They advise countries to analyze their individual requirements, priorities, and capacities when it comes to implementing BGI.	Adapting global policies to the Indian setting involves account variables such as different climatic zones, cultural preferences, socioeconomic gaps, and urbanization characteristics. Policies are not prioritized at an inclusive level.
Institutional Framework	Global policies often promote international collaboration, knowledge sharing, and capacity building to support the implementation of blue-green infrastructure.	India has a decentralized governance structure, involving multiple stakeholders, from national to local levels. The implementation of BGI policies requires coordination between various ministries, departments, and local bodies. Collaborative approaches involving government agencies, community organizations, and private sector entities are crucial for effective implementation.
Financing and Resource Mobilization	Global policies emphasize the need for financial resources, technology transfer, and innovative financing mechanisms to support sustainable infrastructure development.	India faces challenges in mobilizing adequate funds for BGI projects. The government encourages public-private partnerships, international collaborations, and leveraging climate finance mechanisms to bridge the resource gap. Efforts are being made to promote green financing, including sustainable bonds and impact investments.
Data and Information Systems	Global policies emphasize the importance of reliable data, monitoring systems, and evidence-based decision-making to assess the effectiveness of blue-green infrastructure.	India is working towards strengthening its data and information systems to support evidence-based policy formulation. Improving data collection, management, and sharing processes is crucial for monitoring and evaluating the impact of blue-green infrastructure initiatives.

ABSTRACT

The advanced IoT-based super car model integrated with a Fresnel Prism-based Solar Energy system provides the feature of enabling the car to operate without any emissions. The following method called Δx is for the analysis, which is the difference between the temperature and the intensity of the sunlight, which in fact reduces the use of fossil fuels to a great extent, hence reducing the carbon emissions and finally aligned with the Sustainable Development Goals. The car is equipped with inbuilt solar panels of between 1.35 to 2.62 square feet each, that consist of Photovoltaic (PV) cells that are engineered to increase the absorption of sunlight to more than 25%. It also included a battery of 90 to 200 volts that consists electrical energy transformed into mechanical, thus making the car have additional solar 450. The vehicle is designed to process solar panels from 2.0 to 4.5 square feet, which generate from 15 to 48 km of electricity daily at speeds between 25 to 45 km/h, reducing the need to lean on a conventional charging station. This integration of prism lenses, solar cells, energy storage, and basic IoT solutions for performance tracking, speech recognition, and navigation will help in integrating mobility features directly into the car. The solar automobile market is expanding quickly as environmental concerns push consumers and venture capitalists toward sustainable transportation options. The possibility that vehicles could work on a large scale with little or no need for extensive charging is appealing both personally and commercially. There exists great potential for green entrepreneurship in this sector, given that there are many opportunities to startup companies that deal with solar cars. At such times when technology is changing at a rapid pace and a huge number are getting inclined towards sustainability, this unification of solar energy with the ML/Artificial Intelligence and holographic solar panels in vehicles has claimed to

Abothula Mishitha *et al.*,

presage an unbeatable game-changer in the coming future of transportation. New frontiers are opened up for salient entrepreneurial enterprise.

Keywords: Free Emission Operation, Energy Independence, Sustainable Transportation, Cost Savings, Prism Photovoltaic Cells, and Holographic Panels.

INTRODUCTION

The depletion of the crude oil resource is now a more heated debate as it involves political forces, industry players, and researchers. The burning need to find other sources of energy has become very imperative with the depletion of the conventional oil sources. Most solar-cars are wholly powered by the photovoltaic cells that convert sun rays into electrical energy, which powers the car's motors. These vehicles are often called "green" because they produce no greenhouse gases during operation. The electric power supplied by the photovoltaic cells can be conserved in batteries, and the DC motor is supplied with this to provide the kinetic energy of the vehicle. Solar vehicles have faced many obstacles, however. This low energy development by solar panels is a significant limitation, driving these vehicles mostly to require alternatives such as batteries or generators for proper functioning on extended trips. These panels have variable efficiency and do not succeed in generating the necessary power in sites where sunlight is reduced. The designed electric solar vehicle is quite complicated for the particular characteristics and systems regarding the management of energy that guarantee optimal workings under different conditions. For instance, using Fresnel Prism lenses, the intensity of sunlight that hits the plates can significantly influence the speed at which the battery will be charged. While the more direct sunlight is at its peak during midday, better charging performance is produced. This can raise the level of efficiency, but, at the same time, in the staff's device with an off-grid principle, the damages due to fluctuations in temperature have to be avoided by having the design in place with thought given to aspects such as a cooling system and trackers. Also, the financial cost of solar technology still remains prohibitive, though the price of photovoltaic cells has plummeted deliberately throughout the recent years. This all implies that new technology and design of the holographic solar panels, Fresnel prisms or lenses, and IoT integrations for these cars have to advance to make them more practicable and affordable for the masses with this growing size of the market. An International Energy Agency report states that with the present oil production capacity, a significant amount of it needs to be replaced by 2030 just for remaining at the current level; hence addressing oil depletion is very much important. Transition is necessary from traditional oil to alternative energy sources. With out good investment in renewable sources of energy in the context of "Green Eco Entrepreneurship" and in energy efficiency, the rate of decline of oil production might result in unimaginable repercussions in the global economy .

Expensive production and low output: |Special Parts|: Solar-powered cars require very complex photovoltaic (PV) panels and other special parts. They are thus expensive to produce. In these modern times, solar vehicle costs range between \$17,500 and \$100,000 on average, well above the cost of regular cars.

Challenges from Technology, Efficiency, and Environmental Factors: Solar panels on vehicles are still quite ineffective, usually 13.65% and 24.55 % at their very best.

METHODOLOGY

Components of solar powered automobiles

Solar vehicles benefit from a plethora of components, which makes it possible to harness solar power to the maximum, convert it into a usable form of energy, and provide for motion. Key components in our solar vehicle, along with a very short description of their role, are enumerated below:

Abothula Mishitha et al.,

Solar Panel Fresnel Prisms

Play: Converts light from the sun into electricity by the photovoltaic effect of photons and electrons. The cells are rated at 200W power, 24V voltage, and dimension >2.0, 3.0 feet. They capture sunlight and change it into electrical energy.

Lead-Acid Batteries

What the component does: It stores the electrical energy produced by the solar panels for use at a different time.

DC Series Electric Motor: What the component does: This converts the electrical energy from the batteries into mechanical energy, which later leads to impulse driving of the vehicle by use of a belt drive system *Power-6500W 1 Horse Power Speed-2600-1440 rpm voltage- 24v current-100Amp.*

Charge Controller

Function: Manages voltage and current from the solar panels streamed to the batteries.

AC/DC Power Converter

Function: Serves as a power electronic interface which, if required/necessary, will adjust the DC output.

Energy Management System

Description: The energy management system actively and efficiently manages the distribution of energy between batteries, solar panels, and the motor. It is adaptive and would be able to accommodate any changes going on, for instance, a good sunny day.

Super solar car Design Model: When combination in a solar car, they allow the solar vehicle to tap into and unlock the potential of the renewable energy used within it. We have elevated this solar energy utilization to an all-time high with the employment of F prisms and lenses in combination with IoT energy management. These vehicles have represented one of the greener and safer vehicle replacements ever to fossil fuel-based traditional transportation. Further developments and deployments of IoT technologies, along with mass production, will improve affordability and performance.. The solar module is used with the output range from 24V to 25V.

RESULTS

We read through a number of techniques, and these are the key issues that we highlighted

IoT Integration: IoT technology applied in solar-driven battery electric vehicle to strategically monitor and control. These EVs independently recharge themselves through solar power, and with the help of IoT technology, they further optimize it for effective performance and efficiency. IoT-enabled features: - Real-time monitoring, follows the real-time monitoring of critical variables such as battery charge, solar panel output, and energy consumption through sensors and IoT devices to provide instantaneous data.

Predictive Maintenance: The IoT system will aggregate data to determine potential issues and plan maintenance.

Bifacial Fresnel-Design Prism: Prism-designed solar panels are capable of trapping light beaming upon the two sides of cells and hence able to produce *35% more energy* when compared to its conventional peers.

Holographic Tuning: They filter the sun's energy through a single sunlight wavelength and

**Abothula Mishitha et al.,**

expose it on solar cells to remain at their optimal performance at any level of concentration. This spectrum selection keeps the cells operating at or near the peak performance, temperature, even at 3X-3.5X concentration.

Material Innovation. The creation of flexible and semi-transparent solar cells improved the look of solar cars and the ability for the technology to work efficiently. The means of such materials enable a significant level of integration to the designs of vehicles with no significant loss to the capture of energy.

Vehicle Design and Performance. The need for light and low-weight designs for efficiency. This includes models that can reach speeds of 75-80 km/hr while keeping a low drag coefficient.

Energy Management Systems: A stride in the incorporation of IoT tracking systems, providing the very best use of solar paneling power under whatever condition.

Sustainability and Environmental Benefits: Solar cars shall be able to bring radical cuts in carbon emissions. E.g., On an average, a solar car can save up to 280 kg of CO₂ emissions annually, providing a cleaner environment for cities. Below are a number of key insights from studies related to improving the effectiveness of solar-powered vehicles

Aerodynamic optimization: Our advanced solar car has helped us a great deal in getting insight into the optimization of shape in solar vehicles for better aerodynamics.

Cutting out drag; the force an automobile meets while in motion moving through the air. This will reduce drag, the more force that the vehicle faces and will need more energy to fight against it to keep moving—more of the solar panel energy being consumed for this purpose.

Minimizing Flow Disturbances: The aim of aerodynamics design is to retain the air in stream with the vehicle surface, thereby avoiding it being detached from the surface, thus creating turbulence and increasing drag.

Improve Energy Utilization: Shaping the vehicle in a manner that allows better airflow helps engineers ensure that more energy can be put into forward motion, rather than being completely spent in turbulence. As a matter of fact, industrialization should be based on aerodynamic design and streamlined shape in the making of a solar vehicle that would be efficient in operating.

DISCUSSION

Aero dynamics: Driving ability vs Vehicle hasten & Simulated solar radiation VS Temperature

One major benefit of integrating IoT into this equation would be the possibility of collecting and analyzing incoming data at runtime. The IoT devices are always working on essential parameters, e.g., the amount of energy produced by solar panels, battery condition, and environmental conditions.

Performance improvement – The performance of solar panels and parts of a vehicle can further be fine-tuned to boost energy efficiency by checking the pattern usage of energy and the conditions of the environment. IOT technology enables more effective management of energy in solar-powered cars.

Better User Experience: Real-time monitoring and control provide updates on how the car is driving, battery health, and when and how much energy is actually required. This visibility will therefore help the user make more precocious judgments on his or her energy use and travel plans. the increasing efficiency and performance of Fresnel Prism-the primary ways in which IoT plays a role in

Abothula Mishitha *et al.*,

Real-time Data Tracking: IoT systems allow the continuous monitoring of various parameters related to solar panel performance including.

Energy Production: The sensors attached to the solar panels keep track of real-time energy output, which enables the user to assess the effectiveness of their solar energy system.

Performance Improvement: The conjunction of IoT allows adaptive control of solar panels based on environmental parameters.

Variable Adjustments: The orientation or angle of solar panels can be adjusted to get more sunlight, based on changed real-time weather conditions and sunlight strength.

Remote Access and Control: IoT technology allows provision of any desired place access and control by customers on their solar panel system.

Software: Users can always monitor performance and health with their solar panels from any place through the mobile apps. This means swift interventions can be made into the occurrences of problems like system failure or debris buildup.

Alerts and Notifications: The IoT system alerts the user of drastic changes in performance or potential problems, thus offering an opportunity to act in urgency in mitigating the problem.

Continuous Monitoring: These devices make it possible to keep track of key factors, such as energy production, at all times. Real-time data evaluates if the efficiency of solar panels is good enough and drives them towards their optimized performance.

Data-Driven Decision Making: Massive volumes of data made available through IoT enable effective decisions such as:

Trend Identification: Analyse the patterns of energy consumption to make adjustments leads to better efficiency and reduced costs.

Performance Insights: Elaborate analytics on how to increase the performance of the solar panels and battery allow much better overall efficiency of the vehicle.

CONCLUSION

Applying IoT to solar-powered EVs with better maintenance, energy management, user experience, and informed decision-making results in efficient and sustainable transportation.

A. Reduce Operating Costs: IoT solutions result in significant reductions of the operating costs of solar-powered EVs.

B. Reduces the Cost of Energy: Through the use of solar to charge your electric vehicle, there is less reliance on the grid's electricity, which is costly many a time.

C. Maintenance Savings: IoT-enabled predictive maintenance provides for advanced prediction of potential issues, thereby saving costs involved in too many repair works and minimizing down time

D. Great Mining of Economics: IoT technology infused into this solar-based EV results in an immensely high rate of return in savings.

E. Better Charging Operations: Charging could be done in a better and efficient way through the features of IoT solutions by the means of better charge-management functions, time optimization of energy inflows, duration reduction.

G. Long-term Investment Returns: Long-term monetary returns by investments in solar EVs installed with IoT technology.

H. Cost Neutralization: The commencing investment in solar panels and IoT systems can be balanced with long-term fuel and maintenance cost savings. It is depicted through research that the total related expenses in owning a vehicle over its lifetime can be minimized to a great extent, hence an economically rational plan. The economic impacts of integrating IoT technology gives better return on investment over time. Further, converting solar energy into usable power is yet too inefficient, between 16.5% and 17.5%. Problem can be rectified by using Fresel prism lens which is very efficient and boosts solar cells to around 30-35%. These challenges shall be circumvented as research in this arena gets more developed. Electric vehicles with solar power integration are a big market opportunity, and these

Abothula Mishitha et al.,

should be introduced to our daily lives aiming to meet the Sustainable Development Goals for OE (Organizational Excellence) and ESG (Environmental, Social, and Governance). The real question that arises: Why and how to go about it in research or practical applications.

Future research or applications need to be focused on Prism Solar Technologies: As they have manufactured novel bifacial solar panels with the holographic tuning technique for high efficiency and low costs. The defining characteristics of the novel Prism-based PVC solar panels are refraction and light concentration. When light enters a prism, the phenomenon of refraction occurs. This results in bending the light towards the normal for the reason of the shift of the medium from air to glass. Such bending can have the effect of focusing more light in an area through which it has travel after passing through the prism, concentrating more energy in a particular area. The temperature of surfaces can be raised through concentrated energy generated by incident reflected or refracted light falling upon them. The dispersion of light occurs when sunlight passes through a prism, splitting it into its constituent colour, forming a spectrum. It is observed that various energies correspond to various wavelengths of light. Thermal measurements have shown that if a thermometer was placed exactly where the spectrum is projected, it would record a temperature increase. A few degrees difference in temperature will most likely show evidence of this reflected light if you place a thermometer in the chosen spot. A recommendation is to use Fresnel Prism Lenses that are more than twice the thickness of PVC. The panels use holographic tuning technology- the holographic optical components divert certain wavelengths of sunlight onto the solar cell. "Spectral selection" thus performs the magic of letting the cells work at or near their optimal temperature efficiency, all this despite a concentration dynamics of $3X-3.5X$: the total sun energy production is roughly *10000 times* more on earth as compared to what is needed for supplying power for all human beings present around the world. By employing holographic film to the materials selection, Prism Solar panels are able to reduce the use of costly silicon by 50-75%, cutting on material expenses in their silicon without losing any much-needed efficiency by spectral tuning. Holographic tuning improves the performance of Prism Solar panels by optimizing light absorption via Fresnel prisms, ensuring more collected energy from both the front and rear sides of the panels, material saving, and enable reliable and repeatable operation. The prism-based, bifacial PVC panels from Prism Solar make its solar energy production more economical and effective, all the more with a focus and high-quality design integration to focus on the innovation of holographic tuning and integration with Internet of Things (IoT) system. Solar technology-designed vehicles drive demand for sustainable products and businesses that are targeting environmentally concerned customers, thereby ratcheting sustainable demand across the ESG sector. New research would pertain to products such as solar backpacks, solar pens, and solar umbrellas, contributing toward changing consumer behaviour serving both B2B and B2C purposes. The B2B Companies, who are the customers for the development of solar cars, would show a sense of environmentalism and contribute to expanding the market for solar cars after 2026.

ACKNOWLEDGEMENT

we would like to thank Ms. Olefin Joule Limited, Mr. Rehan Joe ,Mr. Babu and GIBS Business school, Bangalore for their extensive support and guidance to complete these research paper under the topic Green entrepreneurship/Eco entrepreneurship .

ABSTRACT

This survey aims to provide an overview of recent advances in plant disease detection using machine learning (ML) techniques, particularly deep learning, and convolutional neural networks (CNNs). With the growing demand for sustainable agriculture and increasing concerns about food security, timely and accurate diagnosis of plant diseases has become essential. Traditional methods of plant disease detection, such as visual inspection and laboratory testing, are time-consuming and labor-intensive. In recent years, ML-based approaches have shown great potential in automating the detection of plant diseases, which can significantly improve disease management and reduce crop losses. This survey discusses various ML-based methods and their applications in plant disease detection, including feature extraction techniques, image classification algorithms, and transfer learning. Furthermore, the challenges and future directions of this field are also discussed, highlighting the need for more comprehensive datasets, better training strategies, and more robust and interpretable models.

Keywords: Plant diseases, Convolutional Neural Network (CNN), Deep Learning, Feature Extraction

INTRODUCTION

Plant disease detection is an important task in agriculture, as plant diseases can cause significant damage to crops and reduce crop yields. Traditionally, plant disease detection has been done by visual inspection by experts or by chemical analysis, both of which can be time-consuming and costly. However, with the advent of computer vision and machine learning techniques, it has become possible to automate the process of plant disease detection using image analysis. Convolutional neural networks (CNNs) have shown promising results in plant disease detection, as they are able to learn complex features from images and classify them accurately. By training a CNN on a large dataset of plant images with known disease types, the model can learn to identify characteristic features of different

Jothilakshmi

types of plant diseases, such as leaf spots, discoloration, and deformation. Once the CNN is trained, it can be used to analyze new plant images and identify any diseases present. This automated approach to plant disease detection has the potential to save time and resources, as well as improve accuracy compared to traditional methods. The paper also provides a critical evaluation of the current research in this area and identifies several key research directions for future work. These include the development of more robust and accurate CNN models, the integration of multiple sources of data, such as spectral and thermal imaging, and the development of real-time applications for automated plant disease detection. The paper provides a valuable resource for researchers and practitioners in the field of plant disease detection using CNNs, highlighting the key challenges and opportunities for advancing the state-of-the-art in this important area of research.

Overview of disease detection using CNN

CNN-based plant disease detection is a popular application of computer vision technology in agriculture. Convolutional Neural Networks (CNNs) are a type of deep learning algorithm that can effectively classify images by learning from a large dataset of labeled images. To build a plant disease detection system using CNNs, the first step is to collect a dataset of images of healthy and diseased plants. These images should be properly labeled and annotated to train the CNN model. The dataset should be diverse and large enough to capture various types of diseases and variations in plant appearances. The next step is to train the CNN model using the labeled dataset. The CNN model learns to classify plant images as healthy or diseased by analyzing the patterns and features of the images. During training, the model adjusts its internal weights and biases to optimize its accuracy in classifying images. Once the CNN model is trained, it can be used to classify new plant images as healthy or diseased. This can be done by passing the image through the trained model, and the model outputs the predicted class label. The accuracy of the model can be evaluated using a test dataset that was not used in the training phase.

DATASETS

PlantVillage Dataset

This dataset contains over 54,000 images of healthy and diseased plant leaves. The dataset covers over 38 plant species and 26 diseases.

PlantDoc

This dataset for visual plant disease detection. The dataset contains 2,598 data points in total across 13 plant species and up to 17 classes of diseases, involving approximately 300 human hours of effort in annotating internet scraped images.

New Plant Diseases Dataset

This dataset consists of about 87K rgb images of healthy and diseased crop leaves which is categorized into 38 different classes. The total dataset is divided into 80/20 ratio of training and validation set preserving the directory structure. A new directory containing 33 test images is created later for prediction purpose. The other data sets included in Kaggle are **Tomato Disease Dataset**, **Grape Disease Dataset**, **Potato Disease Dataset**, **Cassava Disease Dataset**, **Apple Disease Dataset**, **Citrus Disease Dataset** These datasets are often used to train machine learning models for plant disease detection, which can then be used to identify and classify diseases in real-time.

Convolutional Neural Networks (CNNs) based feature extraction

Traditional feature extractors can be replaced by a Convolutional Neural Network(CNN), since CNN's have a strong ability to extract complex features that express the image in much more detail, learn the task specific features and are much more efficient.

SuperPoint

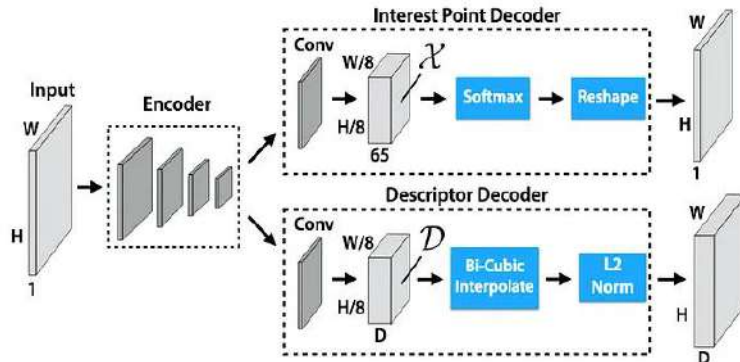

Self-Supervised Interest Point Detection and Description – The authors [1] suggest a fully convolutional neural network that computes SIFT like interest point locations and descriptors in a single forward pass. It uses a VGG-style

Jothilakshmi

encode for extracting features and then two decoders, one for point detection and the other for point description.

D2-Net: A Trainable CNN for Joint Description and Detection of Local Features – The authors[2] suggest a single convolutional neural network that is both a dense feature descriptor and a feature detector.

LF-Net: Learning Local Features from Images– The authors[3] suggest using a sparse-matching deep architecture and use an end-to-end training approach on image pairs having relative pose and depth maps. They run their detector on the first image, find the maxima and then optimize the weights so that when run on the second image, produces a clean response map with sharp maxima at the right locations.

Deep Graphical Feature Learning for the Feature Matching Problem – They[4] suggest using a graph neural network to transform coordinates of feature points into local features, which would then make it easy to use a simple inference algorithm for feature matching.

Deep Feature Extraction and Transfer Learning:[5] The techniques used were transfer learning as well as extracting features on various layers in the network. Later, the extracted features, as well as transfer learning were classified

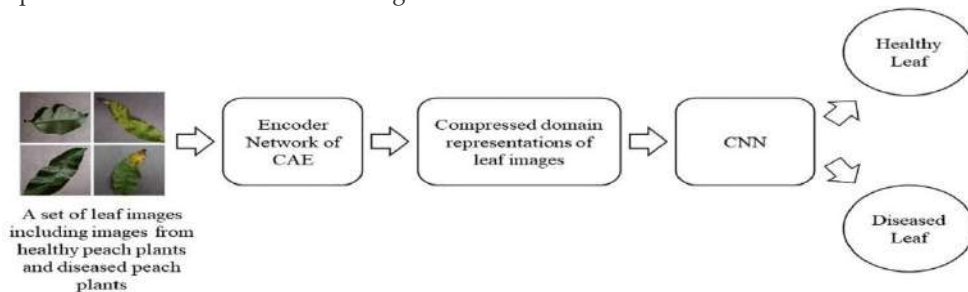

Jothilakshmi

using Support vector machine and K-nearest Neighbor, their time of execution, F1 score, True positive and the True negative are determined.

Hybrid Feature Extraction techniques with ANN and SVM classifier: This paper [6] studies the use of deep-learning models (AlexNet, VggNet, ResNet) pre-trained on object categories (ImageNet) in applied texture classification problems for plant disease detection. In this paper [7], a novel hybrid model was proposed for automatic plant disease detection that was based on two Deep Learning techniques named Convolutional Autoencoder (CAE) network and Convolutional Neural Network (CNN). The proposed hybrid model first obtained compressed domain representations of leaf images using the encoder network of CAE and then used the compressed domain representations for classification using CNN.

In this research [8], authors propose a novel scheme for the detection of plant leaf diseases using deep convolutional neural networks (DCNN). From the segmented images, features are extracted using grey level co-occurrence matrix (GLCM). Dimensionality reduction of features is performed using principle component analysis (PCA). Finally, classification is done using a novel DCNN architecture. In this paper [9], the deep learning model's architecture namely, VGG16 and InceptionResNetV2, are used to train the model. These models are primarily made of convolutional layers. In this paper [10], The experimental results validate that the Xception and DenseNet architectures perform better in multi-label plant disease classification tasks.

The authors [11] proposed a trilinear convolutional neural networks model using bilinear pooling (T-CNN) for disease identification and use 3 CNNs, VGG-16, Inception v3, and ResNeXt-101, as the base networks for the model. The authors [12] proposed a novel deep convolutional neural network model, namely, the Dense Inception convolutional neural network (DICNN). Deep separable convolution is first used by DICNN to build the first two convolutional layers to reduce the number of parameters and prevent the overfitting problem of the model.

Jothilakshmi

Challenges

CNN-based plant disease detection has made significant progress in recent years. However, there are still some challenges that need to be addressed to improve the accuracy and efficiency of the detection system. Here are some of the challenges:

Limited and Unbalanced dataset

In the case of plant disease detection, collecting a large and diverse dataset can be challenging, especially for rare or new diseases. Another challenge in plant disease detection is the class imbalance problem, which occurs when the number of samples in one class is significantly higher than the other class.

Quality of imaging

Illumination changes, shadows, and occlusions can all affect the quality of the image, which can lead to false positives or false negatives.

Similarity between healthy and diseased plants

Some plant diseases can be difficult to detect because the symptoms are not easily visible, or they may resemble symptoms of other diseases or even healthy plants.

Computational complexity

Deep learning models require significant computational resources to train and test, which can be a challenge, especially for resource-constrained devices like mobile phones and embedded systems.

Further improvements

Convolutional Neural Networks (CNNs) have shown great promise in plant disease detection, and there are several future enhancements that can be made to improve their accuracy and efficiency:

Integration of multi-modal data

CNNs can benefit from combining data from different sources such as hyperspectral imaging, thermal imaging, and 3D imaging to improve the accuracy of disease detection.

Transfer learning

Transfer learning can be used to transfer knowledge learned from one domain to another. Pretrained models can be used to train a CNN for plant disease detection.

Data Augmentation

Data augmentation techniques such as rotation, flipping, and cropping can be used to increase the size of the training dataset and improve the robustness of the CNN.

Ensemble methods

Ensemble methods can be used to combine the predictions of multiple CNNs to improve the accuracy of disease detection.

Real-time detection

Real-time detection can be achieved by using lightweight CNN architectures, pruning techniques, and hardware acceleration.

Domain adaptation

Domain adaptation can be used to transfer the knowledge learned from one crop to another, which can reduce the need for large, labeled datasets.

CONCLUSION

Based on the survey conducted on plant disease detection using CNN, it can be concluded that CNN has proven to be a promising technique for the accurate and efficient detection of plant diseases. Most of the respondents have expressed their satisfaction with the performance of CNN-based models for detecting plant diseases. Additionally, the survey revealed that the accuracy of the CNN models is influenced by various factors, including the quality of the dataset, the size of the dataset, and the architecture of the model. To ensure optimal performance, it is important to carefully select these factors and optimize the CNN models accordingly. Overall, the survey results suggest that CNN-based models have great potential for the effective detection and prevention of plant diseases, which can significantly improve crop yields and ensure food security.

ABSTRACT

Wound-healing activities are inferred in the medicinal plant *Menthapiperita* L. This research focuses on the preparation and incorporation of AgNPs with chicken collagen incorporated with *Menthapiperita* extract for their usage in wound healing and antimicrobial tests. The formation of AgNPs was also, determined by UV-Vis spectroscopy, FTIR, TEM and EDX. The AgNPs shows colour change as expected for SPB as well as the maximum absorbance at 430 nm elsewhere confirming the formation and stabilization of AgNPs. The antimicrobial tests of the collagen-coated AgNPs against *Bacillus subtilis*, *Staphylococcus aureus*, *Pseudomonas aeruginosa* and *Escherichia coli* resulted in zones of inhibition similar to Gentamicin with range of 20 to 22 min, this reveals that the nanoparticles have the ability to inhibit both the Gram positive as well as Gram negative bacteria demonstrating that the nanoparticles can be used as potent antib Vero cell cytotoxicity studies for synthesized AgNPs indicated that the cell proliferation percentage ranges between 89-98% for AgNPs at the concentration of 20, 50 and 100µg/ml. Besides, Chicken collagen not only improved the stability and bioavailability of nanoparticles but also stimulated cell growth and migrated rate to improve the healing process. Untoward effects revealed that these nanoparticles stimulate the vital events of wound healing especially the proliferation phase without showing much cytotoxicity thus supporting the ethnopharmacological use of *Menthapiperita* for skin

**Rajeswari et al.,**

disorders. Therefore, it can be concluded that collagen-encapsulated AgNPs derived from *Menthapiperita* can be further used in the process of creating efficient wound healing agents with enhanced antibacterial efficacy. Successive researches should investigate the in vivo effects in order to assess the healing processes, the doses' elaboration, as well as the nanoparticles' long-term consequences. Furthermore, there is a possibility to expand this green synthesis approach for PTX to the industrial scale, which could potentially result in the development of more effective and eco-friendly wound care treatments in the clinical practice.

Keywords: *Menthapiperita*, silver nanoparticles, wound healing, antibacterial activity, collagen encapsulation

INTRODUCTION

Healing of wound is a complex and an active process from the inception of injury towards the formation of scar tissue, which is a delivery essential armory of human and health domain (Eminget *et al.*, 2014). Since there is an increase in chronic wounds that are adjusted by changes like diabetes, infection, and aging then there is need for efficient and new treatment of these conditions. Standard approaches towards wound care often prove to be inadequate when it comes to complicated wounds, as they do not effectively manage the wound bed, and support proper tissue remodeling and re-epithelialization; therefore, prolonged healing time and higher propensity for infection become the consequences (Eminget *et al.*, 2014). New trends in nanotechnology reveal great prospects in preventing microbial adhesion in biomedical devices through AgNPs; acknowledgeable for its antimicrobial properties and functionalities that can hinder the aggregation of microbes efficiently (Martinez-Zapata *et al.*, 2012). Among them, the utilization of AgNPs in wound healing is particularly interesting because of the nanoparticles' ability to eliminate bacterial contamination, which poses a challenge to the healing of chronic wounds (Martinez-Zapata *et al.*, 2012).

This research seeks to exploit the therapeutic use of *Menthapiperita* that has been used for ages in medicinal practices for various diseases and wound and skin infection. The healing potential of *Menthapiperita* can mainly be explained by the fact that it contains a number of phytochemicals including menthol, rosmarinic acid and flavonoids with antimicrobial and anti-inflammatory properties as well as the fact that wounds were treated with it (Velanet *et al.*, 2009). The preparation of AgNPs using plant extracts can be categorised into green methods as it does not involve the use of toxic chemicals and the phytochemicals are used to reduce metal ions to form nanoparticles and it support the green chemistry norms (Frykberg & Banks, 2015). The synthesis procedure of AgNPs integrated with collagen, an essential protein in the extracellular matrix of connective tissue is believed to improve the stability and biocompatibility of the synthesized nanoparticles mainly because of its significance in offering structural support and promoting tissue repair during the wound healing process (Nunanet *et al.*, 2014). Hence, the encapsulation of nanoparticles in collagen offers great prospects since it can act as a support on which the new tissue can form; using AgNPs, it may enhance the therapeutic effect of these nanoparticles when integrated within the wound site. This research will propose the notion that dispersion of silver nanoparticles blended from *Menthapiperita* extract and chicken collagen and encapsulated chicken collagen provides superior wound healing benefits and taller antibacterial activity as compared to the option of the non-encapsulated silver nanoparticles. The particular aim of this work is as follows; To produce *Menthapiperita* extract mediated green synthesis of silver nanoparticles; To encapsulate chicken collagen on the nanoparticles; and to determine the efficiency of the collagen-coated AgNPs against strains of wounds and their skin repairing proficiency through various in vitro methods.

Rajeswari et al.,

METHODOLOGY

Preparation of the extracts

Collection and Preparation of Plant Materials

The leaves of this plant were obtained from mint (*Menthapiperita* L.), manthari (*Bauhinia purpurea* L.), white chaste tree (*Vitexleucoxydon* L.), mehandhi (*Lawsoniainermis* L.), hibiscus (*Hibiscus rosa-sinensis* L.), and Indian mint (*Saturejadouglasii*) grown in and around Chennai, which was taken from perfectly growing plants. The leaves were washed with running tap water to clear the debris and then with distilled water to minimize any contamination. The leaf was then sun-dried for three days after washing with distilled water to prevent destruction of phytochemicals by light and heat. The leaves were then sun dried and ground into a fine powder using a brand-new heavy duty blender commonly used in laboratories. Four grams of the powdered leaves were then required with 100ml of distilled water, and the mixture was placed in a water bath at 55°C for fifteen minutes. After allowing the extract to cool to the room temperature the extract was filtered by Whatman No. 1 filter paper to eliminate any solid particles that may be present and later kept in the refrigerator at temperature of 4°C for the next phase of the nanoparticle preparation.

Synthesis of silver nanoparticles (AgNPs)

Reduction Process

Silver nanoparticles was synthesized using green synthesis procedure by reducing and stabilizing agent using *Menthapiperita* extract. A 1 mM solution of silver nitrate (AgNO₃) was prepared which was then allowed to react with the *Menthapiperita* extract at different concentrations for the enhancement of the synthesis process. After that, the mixture was stirred continuously and heated at 60° C. The reaction progress was judged by an appearance of brown color of the solution from initial pale yellow color due to formation of AgNPs due to reduction of Ag⁺ ions to Ag⁰.

Optimization of Parameters

A number of factors that may affect the size and stability of AgNP were consequently altered in order to assess the effect of these variables on the reaction:

Concentration of Plant Extract

Preliminary studies on the variation of nanoparticle formation were carried out using the 1%, 1.5%, 2%, 2.5% and 3% concentration of *Menthapiperita* extract. The absorbance of the extracts and the identification of the highest value corresponding to the concentration of the extract were made using UV-Vis spectrophotometry.

pH

To the reaction mixture the pH was adjusted with 0.1 N HCl and 0 (zero as in the previous step). 1N NaOH to keep the PH between 5/9. The effect of pH concerning nanoparticle synthesis was endorsed through the absorbance of each developed pH, however pH 8 signified the highest degree of generation and efficiency for AgNPs.

AgNO₃ Concentration

Chemical disinfection process with silver nitrate solution of the following concentrations: 0.5 mM to 2. To ensure that adequate silver ions were available for reduction, 5 mM was chosen and tried. By using UV-Vis spectroscopy the efficiency of nanoparticle synthesis at various concentrations of AgNO₃ was determined.

Temperature

At the same time, the influence of the reaction temperature on the synthesis process was investigated; it was increased from 22 to 42 degrees Celsius. UV-Vis measurements were performed at all the temperatures for stable formation of nanoparticles.

Rajeswari et al.,

Characterization of Silver Nanoparticles

Visual Inspection: The synthesis of AgNPs was first revealed by colour change of the reaction mixture to grey colour. The color change to a dark brown color meant that there was a decrease in silver ions and the development of AuNPs exploding the surface plasmon resonance (SPR). These visual patterns could be used as the first clue demonstrating that the nanoparticles had been successfully produced.

UV-Vis Spectroscopy

UV-Vis spectrophotometry analysis was performed to affirm formation of AgNPs and to study the optical behavior of the sample. Samples were analyzed in the UV-Visible region by scanning wavelength from 300–700nm and a peak at 430nm was obtained. This specific value is due to the SPR of silver nanoparticles and implies the formation and stability of the synthesized AgNPs.

FTIR Analysis

FTIR was conducted because it allows for identification of functional groups responsible for reduction and stabilization of the AgNPs. The authentication of *Menthapiperita* extract and AgNPs was performed and the spectrum of the two samples was super imposed to observe changes made after the preparation of nanoparticles. Some broad bands were captured at 3284cm⁻¹ that was due to O-H stretching along with the reduction of AgIons and 2120cm⁻¹ C=C=O stretching, 1637 cm⁻¹C=C stretching, 1476 cm⁻¹ C-H bending and 1272 cm⁻¹ C-O stretching indicated that all those functional groups existed in the extract (Islam, M. et al.,

Transmission Electron Microscopy (TEM)

The synthesized AgNPs were characterized by TEM which is useful in determination of the size and disaggregate morphology. The specimens were obtained by placing a drop of the nanoparticle solution on to a carbon coated copper grid, which was then allowed to air dry. The morphology characterization of the synthesized nanoparticles was done using TEM and the results depicted that it has a mostly spherical shape and the size of nanoparticles is in the range of 10–200 nm. The average particle diameter of the synthesized AgNPs was ~ 20 nm; Therefore, the information disrupted the structural characteristics of the synthesized AgNPs and as a consequence indicating that they are nano sized (Thuraisingamet al., 2010).

Energy Dispersive X-ray (EDX) Analysis

Energy-dispersive X-ray spectroscopy also known as EDX was administered in order to neutralize the concentration of elements and purity levels of the produced AgNPs. At this stage the obtained nanoparticles were characterized by the use of scanning electron microscope equipped with an EDX. Taking the spectrum analysis results into consideration now, here are some observations: While analyzing the spectrum of the solution, a high intensity of silver was recorded at 3 keV, followed by a very low intensity of other elements, so it means that silver nanoparticles have been synthesized on the solution without much of the other elemental interference.

Incorporation of AgNPs with Chicken Collagen Collagen Extraction and Encapsulation

The process of Collagen extraction, and encapsulation of silver nanoparticles (AgNPs) were pivotal in expanding the functional characteristics of the developed nanoparticles, especially with regard to dispersion stability and bioavailability. Triturated skin of chicken was used to isolate collagen for this study which was preferred due to its high collagen content and ease of extraction. To start the process, the chicken skins were first washed and deboned then trimmed of excess fat and ensure all were free from any other unwanted substances. The sex separated cleaned skin was then treated to an acid digestion process using acetic acid which was used to solubilize the collagen fibers. After the acid digestion, the collagen solution was purified for non-collagenous proteins and other materials which was followed by precipitation. The process of purification included dialysis of the collagen solution against distilled water; this helped in the removal of smaller molecules inclusive of residual acids thus concentrating the collagen solution. The resulting collagen was lyophilized to get it in a powder from which the collagen was confirmed to be pure and of the correct structure by UV-VIS and FTIR studies. The percentages of collagen

**Rajeswari et al.,**

incorporation and the efficiency of fibroblast adhesion of the scaffold were investigated using UV-Vis spectroscopy, and characteristic absorption maxima were obtained. Characterization of the functional groups in collagen and the confirmation that there is no appreciable degradation or contamination were done using FTIR analysis (Li *et al.*, 2007). In the preparation of the AgNPs with the extracted collagen, the idea was to improve the functional properties of the nanoparticles by coating the AgNPs with collagen to make it better compatible with biological systems. In conjugating the synthesized AgNPs with collagen, the AgNPs dispersion was mixed with a collagen solution under controlled conditions to effect coating of the particles with the protein. The prepared suspension was stirred slowly in order to enhance the nanoparticles/collagen molecules interaction which will enhance the encapsulation process (Calinet *et al.*, 2010).

Antimicrobial activity and Wound Healing Assays

To determine the curative effects of the collagen-encapsulated AgNPs, the antimicrobial and in vitro wound healing activities were assayed. These assays were supposed to determine the effectiveness of the nanoparticles to reduce the formation of biofilm and to stimulate the process of healing in the cells.

Antimicrobial Activity

The attempts for the use of collagen-encapsulated AgNPs were made to determine the yields in terms of its antimicrobial activity against various species of bacterial pathogens such as *Staphylococcus aureus*, *Escherichia coli* and *Pseudomonas aeruginosa* using the standard disc diffusion techniques. Disc diffusion methods incorporated using autoclaved discs with collagen encapsulated-nanoparticles that were then applied gently on nutrient agar plates seeded with the target bacteria. The bacterial plates were then incubated under the best condition for the bacterial growth and the measuring of the zones of inhibition around the discs was done after the specific time of incubation was over. The size of the inhibition zones allowed for a more comparative evaluation of the nano-template's antimicrobial properties with bigger zones suggesting greater effectiveness.

In vitro wound healing assays

The wound healing ability of the nanoparticles was further assessed by wound healing assays which are in vitro models that try to mimic the wound healing process. These assays were cytotoxicity assay and the wound healing migration assay which were done on Vero cells, a type of cell line generally used for in vitro wound healing assays.

Cytotoxicity Assay

Cytotoxicity assay was then performed to determine the biocompatibility of the collagen-coated AgNPs on Vero cells to know their toxic impact on cell survival. Cell signaling studies were performed treating cells with 0, 10, and 100 µg/mL of the nanoparticles. This assay and determined the overall metabolic activity of cells thereby giving an estimation of the viable cells present. Altogether, the findings suggested that the particles were relatively harmless at the disclosed concentrations and exerts negligible influence on the cell death rate (Badylak, *et al.*, 2002).

Scratch Assay

Scratch assay was carried out to assess the cell migration ability, an important factor of wound healing with the help of nanoparticles. Wound healing was performed with Vero cells growing in a monolayer: a scratch was made in the monolayer, and the cells' migration into the scratch was observed with time while in the presence of collagen-encapsulated AgNPs. Cell migration and the rate at which the scratch was closed was determined and higher rates of closing was an indication of better wound healing properties. The studies proved that the nanoparticles enhanced the migration of cells tremendously and thereby have a potential to enhance the process of healing (Badylak *et al.*, 2002).

Rajeswari *et al.*,

RESULTS AND DISCUSSION

Synthesis and Characterization of AgNPs

Collection of Medicinal Plant Materials

Six different plant species were used in the study from particular site of Chennai. The collected plants are mint (*Menthapiperita* L.), manthari (*Bauhinia purpurea* L.), white chaste tree (*Vitexleucoxydon* L.), mehandhi (*Lawsoniainermis* L.), hibiscus (*Hibiscus rosa-sinensis* L.), and Indian mint (*Saturejadouglasii*). The plants were selected depending on the favorable environmental factors, health of the plants etc. Reliability of the said materials is paramount for replication of these results because, collection sites influence the phytochemical profile of the plant species used in the synthesis of nanoparticles.

Extraction of Phytochemicals from Plant Materials

Six different plant species were used in the study and phytochemical extracts were extracted by using water based processes (Figure 1). The extraction process proved helpful in the isolation of the bioactive compounds required in the restoration of silver compounds by transforming Ag^+ into Ag^0 . Concerning the color and clarity of the extracts obtained from the various plants, they differed, thus pointing to the different phytochemicals extracted and required for the green synthesis of AgNPs (Gurtner *et al.*, 2008). This method of extraction ensures the retention of active components which are very vital in the formation of nano particles going with other authors who found that water based extraction is very useful in getting potent reducing agents (Richmond *et al.*, 2013).

Synthesis of Silver Nanoparticles (AgNPs)

Particularly, the synthesis of AgNPs was carried out by boro-hydride reduction method. The color change to brown in the solution was highly enhanced from *Menthapiperita* L. extract indicating a higher concentration of the extract and effectiveness in the reduction of silver ions. This colour change is explained by the formation of nanoparticles, by surface plasmon resonance (SPR) phenomenon present in metallic nanoparticles (Rodero and Khosrotehrani, 2010). The incorporation of a capping agent was effective in the prevention of nanoparticle aggregation and maintaining nanoparticles stability in the solution which concurs with other publications that describe green synthesis approaches of plant mediated methods in nanoparticle synthesis where the role of plant extracts play the function of stabilizing agents (Choi & Webster, 2012).

Optimization of Various Parameters for Silver Nanoparticle Synthesis

Concentration of Plant Extracts

Accordingly, the amount of *Menthapiperita* extract which was most effective was the one in the concentration of 2.5% in a 1mM $AgNO_3$ solution for the preparation of the CSP. From UV-visible spectrophotometric study, it was observed that at this concentration, there was a maximum absorbance at 430 nm as shown in Figure 2. This peak shows that AgNPs formed effectively, since the high concentration of plant extract avail the large number of reducing agents that hasten the formation process. The concentration of 2.5% contributed to the almost ideal reaction environment which further corroborates with the mentioned research findings that increased concentrations help in increasing the reduction efficiency of plant mediated nanoparticle synthesis.

pH

This study reveals that the optimum pH for the synthesis of AgNPs was pH 8. From the UV-visible spectrophotometric data, it was determined that pH8 depicted the highest absorbance peak and hence the best conditions for the synthesis of nanoparticles in this case (Figure 3). Stabilizing the pH at 8 proved to affect the charge and stability of the nanoparticles and thus promoted their formation and growth because literature shows that the pH level dramatically affects the synthesis and stabilization of nanoparticles (Choi & Webster, 2012).

Rajeswari et al.,

Concentration of AgNO₃

From the above investigation, the highest production of AgNPs was achieved at a concentration of 2 mM with regards to AgNO₃. Concentration of 5 mM, confirmed from the UV-visible spectrophotometric analysis shown in figure 4. This concentration gave the maximal absorbance peak which confirm or shows that the Ag ions are readily available for reduction. Patterns of optimum concentration reveal that higher values result into generation of more nanoparticles; however, high concentration is limited due to aggregation since high ionic solution may result to unplanned growth of the particles (Bera&Basak, 2014).

Temperature

From the above findings it can be concluded that the temperature at which the synthesis of AgNPs was most optimum was 42°C. This was, again in support with the UV-visible spectrophotometric analysis, where the peak absorbance was recorded at this temperature, which is the optimum temperature for the development of nanoparticles (Figure 5). This temperature increase helps in the faster reduction and synthesis hence faster formation of the nanoparticles and perhaps the formation of even smaller nanoparticles because of faster nucleation probably as a result of temperature optimization in studies of nanoparticles (Li et al., 2007).

Stability Analysis

The prepared AgNPs using *Menthapiperita* were stable from 1hr to 90 days and its UV-Vis showed the peak at 435 nm as depicted in the Figure 6. As time went on, the peak becomes clearer, which suggests that the nanoparticles are progressively becoming more stable. Changes were detected at 435 nm in 6 hours, while the steady peaks at 450 nm were put in 24 hours and 3 months. This stability imply a constant size and shape of the synthesized nanoparticles over a period of time which is important when being used in biomedical fields (Frykberg& Banks, 2015).

Characterization of Green Synthesized Silver Nanoparticles

Visual Inspection

The formation of *Menthapiperita* extract mediated AgNPs was further corroborated biinally by the change in color from light yellow to dark brown color. This change is characteristic of nanoparticles' formation because of the surface plasmon resonance (SPR) phenomenon, which regards the interaction of a material or an object with light of certain wavelength corresponding to its size and geometry. The detected change in color complies with general features of metallic nanoparticles' appearance after synthesis, indicating the process's completion. This visual confirmation of synthesized AgNP is in tune with literature reports where the color change of the solution is reported during the green synthesis of silver nanoparticles employing plant extracts (. Ullah and Bussmann, 2017). This colour change due to SPR is typical of metallic nanoparticles and helps in arguing the presence of silver at the nanoscale (Ullah & Bussmann, 2017). This testifying change produced by *Menthapiperita* supports its role of a reducing and stabilizing agent characteristic in the synthesis of nanoparticles that were disclosed in other research works where plant extracts were used in green synthesis.

UV-Vis Spectroscopy

The UV-Vis spectra of the biosynthesized AgNPs presented a shoulder band in range of 340-450 nm, the higher maximum absorbance value at 430 nm for *Menthapiperita* L extracts (Figure 7). These values of absorbance are characteristic to silver nanoparticles and represent the surface plasmon resonance and therefore the synthesis and stabilization of the nanoparticles are successful. This particular range of absorbance matches what has being found from other related research on AgNPs that has been synthesized using various biological techniques. Therefore, the extent of size reduction and stabilization of nanoparticles as proxied by the UV-Vis spectra corroborates the efficiency of *Menthapiperita* extract for the green synthesis of AgNPs as portrayed in the literature on optical characteristics of silver nanoparticles synthesized using extracts of plants (Herskovitz et al., 2016).

FTIR Analysis

The *Menthapiperita* extract was evacuated to generate FTIR spectra as follows: The extract gave peaks at 3284 cm⁻¹, 2120 cm⁻¹, 1637 cm⁻¹, 1476 cm⁻¹, and 1272 cm⁻¹; which belongs to O-H, C=C=O, and C- H bend functional groups

Rajeswari et al.,

respectively See (Figure 8). These groups are of importance in reducing the silver ions and in stabilizing the formed nanoparticles; herein, information on the chemical processes during green synthesis is revealed. These peaks can be explained as bonds and stretches characteristic for organic molecules within the precipitate interacting with Ag⁺ during nanoparticle formation. These interactions help in the reduction of Ag⁺ to Ag⁰ and significantly aids in stabilizing the nanoparticles by avoiding their agglomeration which is in accordance with the other works reported on the green synthesis involving plant extract. These functional groups give support to the part played by phytochemicals in the extract as efficient reagents in the synthesis process (Rodero&Khosrotehrani, 2010).

Transmission Electron Microscopy (TEM)

As observed from the TEM images, *Menthapiperita* based synthesized AgNPs were predominantly spherical in shape having size between 10-200 nm (Figure 9). It was also observed that the nanostructures' morphology and size increase as the concentration of the plant extract increases. Nano-size and shape of the nanoparticles determining the properties like optical properties as well as the antibacterial properties. Which makes sense when compared to prior research on plant-based synthesis, which shows that the morphology of the resulting nanoparticles actually depends on the concentration of the extract and the chemical content of the reducing agents thereof (Choi & Webster, 2012). This variability has shown that plant extracts are very effective when used in green synthesis methods.

Energy Dispersive X-ray (EDX) Analysis

Figure 10 demonstrates the EDX spectrum of the synthesized AgNPs wherein the presence of Ag-element with maximum peak at 3 keV and no other peak other than the silver element noticed that confirmed the birth and purity of the Silver nanoparticles. No peaks of other elements present demonstrated low level of impurities, which corroborated with the quality of synthesized nanoparticles. The low level of the presence of other elements demonstrates that the green synthesis process for the formation of AgNPs was successful in yielding samples with high purity and without the interference of impurities from the plant extract or the synthesis milieu. This finding is in concurrence with other works which have revealed similar purity of silver nanoparticles synthesized using plant extracts, which clearly substantiates the green synthesis technique as a means of procuring nanoparticles of acceptable quality (Ullah&Bussmann, 2017).

Antimicrobial Analysis of Silver Nanoparticles:

Menthapiperita derived AgNPs resulted the zone of inhibition against both the Gram positive and negative bacterial pathogens. These zones of inhibitions were determined to be 22 mm for *Bacillus subtilis*, 20 mm for *Staphylococcus aureus*, 22 mm for *Pseudomonas aeruginosa* and 20mm for *Escherichia coli* (Figure 11). These findings are quite similar to the reference antibiotic Gentamicin as evident by the high antibacterial efficacy of synthesized AgNPs. The ability to eradicate over ninety percent of bacteria strengthens the aspect of AgNPs as a replacement to the already fading antibiotics effective against antibiotic resistant bacteria. The large inhibition halos measured for *Menthapiperita* derived AgNPs against *Bacillus subtilis* (22 mm), *Staphylococcus aureus* (20 mm), *Pseudomonas aeruginosa* (22 mm), *Escherichia coli* (20 mm) showed the effectiveness of synthesized AgNPs. It is for this reason that nanoparticles are effective in their nanoscale distribution and size, which enhances their interaction with bacterial cell membranes. The antibacterial activity is mainly concern with the ions released from the nano-silver, which be taken into bacterial cell to interrupt metabolic process and induce oxidative stress and then lead to cell death (Frykberg& Banks, 2015).The active mechanism of antibacterial activity of nano-silver is associated with the reaction of silver ions with SH groups in bacterial proteins and DNA interfering with vital cell functions. It leads to alteration in the structural and membrane characteristic of the bacterial cell, increased permeability, and release of enzyme that degrades the bacterial cell wall and hence killing of the bacteria. Besides the mentioned impacts, it is reported that AgNPs induce the generation of ROS which in general boost them up their antibacterial aptitudes via inducing oxidative damage to the lipids, proteins, and DNA of the bacterial cell (Rai et al., 2012). Further, the zones of inhibition evident against both the Gram-positive and the Gram-negative bacteria suggest that AgNPs have a broad spectrum activity that is desirable when developing drugs used in the management of infections produced by different bacterial genera. *P. aeruginosa* and *E. coli* are producers of biofilms and were shown to have an additional outer membrane which can be argued to have been overcome by the AgNPs considering that they are hard targets to the conventional antibiotics.

**Rajeswari et al.,**

The reported broad-spectrum activity makes AgNPs to be very useful in combating MDR bacterial strains, which are some of the main challenges facing contemporary healthcare systems (Ahamed *et al.*, 2010). The findings are in support with other works that have recorded similar antibacterial effectiveness of silver nanoparticles that are prepared from plant extracts. For instance, Gurunathan *et al.* (2014) worked on AgNPs fabricated by using *Azadirachta indica* and realized that the synthesized compound was as effective as the antibiotics as it formed equal zones of inhibition against several bacteria. This supports the prospect on plant synthesized AgNPs in combating bacteria through the research proposal by Gurunathan *et al.*, (2014).

In Vitro Cytotoxicity Assay

In terms of cytotoxicity, Assay with Vero cells involves determination of cell viability with AgNPs that present cell viability between 89%, 93%, 97%, 98% at chosen concentrations of 20 µg/mL, 50µg/mL 75 µg/mL, 100 µg/mL respectively. From these results it is clear that at the given concentration of the biomolecules the synthesized AgNPs are biocompatible and therefore may be used for biomedical applications including; wound healing and drug delivery. This has an implication, in the context of their therapeutic application, with regard to the little or no harm which they are likely to inflict on normal cells (Badylak *et al.*, 2002). The high percentage of live cells indicated means that regardless of the cell type, silver nanoparticles indeed possess a high degree of biocompatibility which may further support for other applications in the biomedical fields. The maintained balance of the viability rates centrally that AgNPs do not lead to the disturbance of the vital processes under concentrations that may be useful for the medicinal purposes and owed to such, their effectiveness in wound healing and as drug delivery systems (Choi & Hu, 2008). Similar to Foldbjerget *et al.*, they affirm on the biocompatibility argument by showing that even at rather high concentrations, AgNPs has negligible impact on cytotoxicity of mammalian cells. This confirms the possibilities of safe use of AgNPs in biomedical applications for instance in drug delivery and tissue engineering since cell viability is very important (Foldbjerget *et al.*, 2009) (Figure 12 & Table 1).

Apoptotic Activity

AgNPs caused apoptosis in Vero cells by binding to DNA and showing green fluorescence with acridine orange and red fluorescence with propidium iodide for chromatin feature and apoptosis respectively as shown in Figure 13. Higher activation of caspase-3/9 supported the findings indicative of apoptosis induced by the AgNPs. This indicates that it can be useful in cancer treatment as well as in the process of healing of a body's wound because there is need to cause death of impaired of cancerous cells (Li *et al.*, 2007). Foldbjerg *et al.* (2011) have demonstrated that silver nanoparticles cause apoptosis in cancer cells through oxidative stress and the intrinsic pathway. This work established that there is a direct relationship between effects of AgNPs and ROS levels such that since ROS causes DNA damage the next effect is activation of apoptotic pathways such as caspase cascade. This correlates with the discover that AgNPs can cause apoptosis in Vero cells, possibly by the same pathways (Foldbjerget *et al.*, 2011). Gurunathan *et al.*, (2015) concluded that silver nanoparticles have the ability to kill leukemia cells through apoptosis by the generation of reactive oxygen species and activation of the intrinsic pro-apoptotic pathway. The study noted elevated caspase-3 levels, and condensed chromatin pattern, typical of apoptosis as seen in the present research (Gurunathan *et al.*, 2015).

In-vitro scratch wound healing assay

Utilizing scratch assay, we looked at how well AgNPs plant extract healed wounds. To find out which chemicals have wound-healing properties, this is a common and easy way to do so. Fibroblasts & keratinocytes migrate and proliferate during this stage of wound healing, and they're connected. This test reproduces conditions under which cells migrate in body after wound heals. Figure 14 and Table 2 show that tested AgNPs were able to seal scratched gap more quickly.

Rajeswari et al.,

CONCLUSION

The present investigation was able to synthesize successfully AgNPs using *Menthapiperita* extract and also encapsulated them with chicken collagen which showed enhanced antimicrobial activity and wound healing ability. Hence the encapsulation with collagen enhanced the solubility, stability and enhanced biocompatibility of the AgNPs leading to cell proliferation and migration without any toxic effects which enhanced the use of *Menthapiperita* in modern medicine. These studies reveal that collagen-encapsulated AgNPs can be used as effective wound healing agents that can improve the aspects of treatments now available on the market by combining the effects of natural extracts and nanotechnology. Thus, for the next steps of research, it is necessary to conduct experimental and clinical studies in vivo to confirm these initial findings and to investigate the possibility of the use of these nanoparticles in clinical practice, as well as to research specific guidelines on the application of these nanoparticles in the wound healing products. The findings of this study reveal a new way to fuse conventional comprehensive medicinal practice with modern nanotechnology, which provides a viable course for inventing adequate opportunities for wound management with the utilization of therapeutic silver nanoparticles during the healing process of the skin.

ABSTRACT

The Siddha system of medicine mainly emphasizes health as the perfect state of a person's physical, psychological, social, & spiritual well-being. One of the significant aspects of the Siddha system is the purification of raw drugs before using them to make medicines. The term *Suddhi* means to get rid of impurities. The *Vateria indica* is a tropical tree that is endemic to the Western Ghats of India & belongs to the family Dipterocarpaceae. The dammar resin obtained from the bark of the tree is used in wounds, leucorrhoea, swelling, cough, asthma, leprosy, & skin eruptions. *Vateria indica* resin regulates the *Tridosha* (*Vatham*, *pitham*, *kapham*) of the body. *Vellai Kungiliyam* is purified using a variety of purification methods, & the phytochemical analysis of separate three samples were evaluated. *Vellai Kungiliyam* is purified as per Siddha literature using three different methods. Physiochemical characterization such as loss on drying, ash values, extractive values, qualitative phytochemical screening, & TLC/HPTLC analysis were estimated as per Pharmacopoeia Laboratory for Indian Medicines (PLIM) guidelines. HPTLC fingerprinting of Sample I revealed the presence of five prominent peaks & the R_f value ranges from 0.02 to 0.90 whereas sample III showed the presence of seven prominent peaks & the R_f value ranges from 0.00 to 0.83. The present study revealed that the bioactive compounds were present in large amounts in purification by *Thiriphala kudineer* (Sample II). The phytochemical analysis confirms the presence of Alkaloids, Carbohydrates, Saponins, Phenols, Tannins, Flavonoids, & Diterpenes. The *Vellai*

Kiruba Annammal et al.,

kungiliyam purified with *Thiriphala kudineer* is known to have the highest therapeutic value in comparison to the other two samples.

Keywords: HPTLC, Physio-chemical analysis, Purification, *Vateria indica*.

INTRODUCTION

Nowadays, Herbal medicines are becoming a widely popular form of health care & it has witnessed a renaissance among consumers throughout the world. One of the oldest systems of medicine in the world that treats the body as well as the mind & the soul is Siddha medicine. The Tamil term *siddhi* means a goal to be achieved, perfection, or heavenly bliss [1]. The recent upsurge of interest in the Siddha system can be seen in the large-scale manufacture of Siddha formulations. However, one of the impediments to the acceptance of the ancient systems of medical preparation is the lack of standard quality control profiles. The process of prescribing a set of standards or intrinsic qualities, constant parameters, & unambiguous qualitative & quantitative values that convey an assurance of quality, efficacy, safety, & repeatability is known as the standardization of herbal medicines.

Suddhi (Purification) of the raw drug is a process aimed at removing the impurities & toxic substances to some extent or potentiating their chemical transformation into nontoxic or comparatively less toxic chemicals, improving the potency, & efficacy, enhancing the synergistic effect of the drug [2]. No medicinal preparation can be done without prior *Suddhi muraigal* (Purification process). The three main phases in herb purification are drying, grinding, & sieving. The secondary purification process entails concentration, drying, & extraction using the appropriate solvents. Extensive separation & purification processes such as solvent-solvent extraction, solid-phase extraction, & liquid chromatography are needed for further purification to produce pure phytochemicals. In addition, thin-layer chromatography (TLC), high-performance liquid chromatography (HPLC), paper chromatography (PC), & gas chromatography (GC) were used in the separation & purification of the secondary metabolites[3].

According to the Indian system of medicine *Vateria indica* L. is used as a tonic, carminative, & expectorant. It is an important medicinal plant that is endemic to the western ghats of India & comes under the family *Dipterocarpaceae*. The resin obtained from this plant has the same uses as pine resin. Phytochemical analysis of *Vateria indica* L. stems revealed the occurrence of carbohydrates, tannins, phenols, & flavonoids in the aqueous & ethanolic extracts. The leaves & roots also have the presence of bergenin, hopeaphenol, stilbenoids, bergenin and benzophenone. The trees of the *dipterocarpaceae* family are primarily found in evergreen & semi-evergreen forests, near the streams of southern Western Ghats. *Vateria indica* was first described by Hook & Gamble in 1874 & 1915. Since then, many researchers have documented it from different sites in the southern western ghats of India, namely Kerala, Karnataka, & Tamilnadu. Traditional medicine & astrology also provide references that help us comprehend their ties to the national culture & heritage. Resins are usually mixtures of organic substances. Plants produce resins in response to injury because of their defensive properties. Resin is one type of secondary metabolite, that shields the plant from infections & insects.

In Siddha medicine, a resin called *vellai kungiliyam*, which is obtained from *Vateria indica* trees, has therapeutic properties. *Vellai kungiliyam* is a component of medicinal oils that are used to cure Vadha illnesses. It works better for disorders caused by *Vatham*. Resin is produced through the reaction of volatile oil & oxygen. They are primarily composed of hydrocarbons. Resins cannot be dissolved in water. They are soluble in both alcohol & ether. The ancient Egyptians coated food storage containers with resin to prevent food from rotting. Some resins are produced in the roots. Many of the resins come from families including *Dipterocarpaceae*, *Anacardiaceae*, *Burseraceae*, *Guttiferae*, *Fabaceae*, *Mimosaceae*, *Stryraceae*, *Umbelliferae*, *Liliaceae*, *Pinaceae*, etc.

Resins are generally categorized into three groups. They consist of hard resins, Oleo resins &, Gum resins. The hard resins are further divided into three categories. The three are lacquer, shellac, & damars. The word ' damar ' is a Malay word. It refers to burning material. 'Damars' refers to *kungiliyam* varieties in trade. The resin is obtained by scratching in the bark & phloem, after which it is obtained & collected. It appears to be white-colored fragments of marble [4]. *The Vellai kungiliyam* has a variety of pharmacological effects, including anticancer, antitumor, anti-inflammatory, & antiulcer properties [5-6].

As per Siddha system *Vellai kungiliyam* is purified by different methods, qualitative & quantitative analysis were done as per PLIM guidelines. Therefore, the purpose of the study is to purify the *Vellai kungiliyam* in three different methods & analyze the chemical changes that occurred during the purification process of *vellai kungiliyam* scientifically [7-8].

MATERIALS AND METHODS

Procurement of the raw drugs

The required drugs for the purification of *Vellai kungiliyam* were procured from a well-reputed country raw drug shop in Parris Corner, Chennai. All the ingredients were purified in the *Gunapadam* laboratory at the National Institute of Siddha.

Identification & Authentication of the drug

The collected raw materials were identified & authenticated by the Assistant Professor, Department of Medicinal Botany, National Institute of Siddha, Tambaram Sanatorium.

Purification of *Vellai kungiliyam* - Process 1 (Sample 1)

Required ingredients

1. *Vateria indica* L. (*Vellai kungiliyam*)
2. *Citrus lemon* (*Elumichai*)

Method of Purification

The *Vellai kungiliyam* was soaked in lemon juice & dried.

Purification of *Vellai kungiliyam* : Process 2

Required ingredients

1. *Terminalia chebula* (*Kadukkai*)
2. *Phyllanthus emblica* (*Nellikai*)
3. *Terminalia bellerica* (*thantrikkai*)

Method of Purification

The *Vellai kungiliyam* was packed in a cloth, soaked in *thiriphala kudineer* & then dried.

Purification of *Vellai kungiliyam* - Process 3 (Sample 3)

Required ingredients

1. Bark of *Azadirachta indica* (*Vembu pattai*)
2. Root of *Solanum Xanthocarpum* (*Kandankathiri ver*)
3. *Trichosanthes cucumerina* (*Peipudal*)
4. Leaf of *Justicia adathoda* (*Adathodai*)

Method of Purification

Veppampattai, *Kandankathiri ver*, *Peipudal*, *Adathodai ilai* each measuring 35 grams is added with 2 liters of water & boiled for a few hours till the water is reduced to 1/8th ratio. Then a cloth is tied up on the mouth of the vessel containing *Vellai kungiliyam* & is closed by the lid & ignited for a few hours till the *Vellai kungiliyam* reaches wax consistency. Following that *Vellai kungiliyam* is washed in water & dried.

**Kiruba Annammal et al.,****Storage**

The purified *Vellai kungiliyam* was stored in a clean, dry, air-tight container & then it was sent to the laboratory for analysis.

Qualitative & Quantitative analysis were carried out as per PLIM guidelines**Organoleptic properties**

This provides first-step information regarding the identity, purity, & quality of the drug.

The organoleptic characters of the samples were evaluated which include their state, nature, odour, touch, flow property, & appearance. The results are shown in Table 1.

Physicochemical analysis

Physico-chemical studies of the plant drugs are necessary for standardization, as it helps in understanding the significance of physical & chemical properties of the substance being analysed in terms of their observed activities & especially for the determination of their purity & quality. The analysis includes the determination of Total ash, Loss on drying at 105°C, acid-insoluble ash, water-soluble extractive, & alcohol-soluble extractive, which were carried out as per the procedures mentioned in standard references. Based on the AYUSH PLIM Guidelines, results are presented in Table 2.

The solubility profiles using various solvents were executed on different samples of *Vellai kungiliyam* & its results are depicted in Table 3.

The following analytical parameters were studied for *Vellai kungiliyam* which is purified by different methods:

Percentage loss on drying

The test drug was accurately weighed in an evaporating dish. The sample was dried at 105°C for 5 hours & then weighed [9].

Determination of total ash

The test drug was accurately weighed in a silica dish & incinerated in the furnace at a temperature of 4000 °C until it turned white in color which indicates the absence of carbon. The percentage of total ash was calculated with reference to the weight of the air-dried drug.

Determination of acid insoluble ash

The ash obtained by total ash test was boiled with 25 ml of dilute hydrochloric acid for 6mins. Then the insoluble matter is collected in a crucible & washed with hot water & ignited to constant weight. The percentage of acid-insoluble ash was calculated with reference to the weight of air-dried ash.

Determination of alcohol soluble extractive

The test sample was macerated with 100 ml of alcohol in a closed flask for twenty-four hours, shaking frequently for six hours, & allowed to stand for eighteen hours. Filter rapidly, taking precautions against loss of solvent, evaporate 25 ml of the filtrate to dryness in a tared flat-bottomed shallow dish, & dry at 105°C, to constant weight & weigh. Calculate the percentage of alcohol-soluble extractive with reference to the air-dried drug.

Determination of water-soluble extractive

The test sample was macerated with 100 ml of chloroform water in a closed flask for twenty- four hours, shaking frequently for six hours, & allowed to stand for eighteen hours. Filter rapidly, taking precautions against loss of solvent, evaporate 25 ml of the filtrate to dryness in a tared flat-bottomed shallow dish, & dry at 105°C, to constant weight & weigh. Calculate the percentage of water-soluble extractive with reference to the air-dried drug [10].

Biological & Pesticide Residue Screening

Sterility Test by Pour Plate Method

**Kiruba Annammal et al.,****Objective**

The pour plate techniques were adopted to determine the sterility of the product. Contaminated /unsterile sample (formulation) when coming in contact with the nutrition-rich medium it promotes the growth of the organism & after the stipulated period of incubation the growth of the organism was identified by a characteristic pattern of colonies. The colonies are referred to as colony-forming units (Cfus).

Methodology

The test sample was inoculated in a sterile petri dish to which about 15 ml of molten agar 45°C was added. Agar & sample were mixed thoroughly by tilting & swirling the dish. Agar was allowed to completely gel without disturbing it. (about 10 minutes). Plates were then inverted & incubated at 37° C for 24-48 hours & further extended for 72 hrs for fungal growth observation. Grown colonies of organisms were then counted & calculated for cfu.

Qualitative phytochemical analysis

Phytochemical screening of the plant gives a vast idea about the chemical constituents present in the drug. Key metabolites of Alkaloids, Carbohydrates, Flavonoids, Glycosides, Phytosterols, Tannins, Phenols, Saponins, Diterpenes, gum, & mucilage, & Quinones were carried out as per the procedures quoted in the standard organic book. The results obtained on each test are given in Table 5. Figure 5-7 shows the qualitative phytochemical investigation of *Vellai kungiliyam* purified by different methods.

Detection of alkaloids

Extracts were dissolved individually in dilute Hydrochloric acid & filtered.

Mayer's Test: Filtrates were treated with Mayer's reagent (Potassium Mercuric Iodide). The formation of a yellow colour precipitate indicates the presence of alkaloids.

Dragendroff's Test: Filtrates were treated with Dragendroff's reagent (Potassium Bismuth Iodide). The formation of a red precipitate indicates the presence of alkaloids.

Wagner's Test: Filtrates were treated with Wagner's reagent (Iodine in Potassium Iodide). The formation of a brown/reddish precipitate indicates the presence of alkaloids.

Detection of carbohydrates

Extracts were dissolved individually in 5 ml distilled water & filtered. The filtrates were used to test for the presence of carbohydrates.

Molisch's Test: To 2 ml of plant sample extract, two drops of alcoholic solution of α - naphthol are added. The mixture is shaken well & a few drops of concentrated sulphuric acid are added slowly along the sides of the test tube. A violet ring indicates the presence of carbohydrates.

Benedict's Test: Filtrates were treated with Benedict's reagent & heated gently. Orange red precipitate indicates the presence of reducing sugars.

Detection of saponins**Foam Test**

0.5 gm of the extract was shaken with 2 ml of water. If the foam produced persists for ten minutes it indicates the presence of saponin

Detection of phenols Ferric Chloride Test

Extracts were treated with 3-4 drops of ferric chloride solution. The formation of bluish-black color indicates the presence of phenols.

Detection of tannins Gelatin Test

The extract is dissolved in 5 ml of distilled water & 2 ml of 1% solution of Gelatin containing 10% NaCl is added to it. White precipitate indicates the presence of phenolic compounds.

**Kiruba Annammal et al.,****Detection of Flavonoids**

Alkaline Reagent Test: Extracts were treated with a few drops of sodium hydroxide solution. The formation of an intense yellow colour, which becomes colorless with the addition of dilute acid, indicates the presence of flavonoids.

Lead acetate Test: Extracts were treated with a few drops of lead acetate solution. The formation of a yellow colour precipitate indicates the presence of flavonoids.

Detection of diterpenes Copper Acetate Test

Extracts were dissolved in water & treated with 3-4 drops of copper acetate solution. The formation of an emerald green color indicates the presence of diterpenes.

Test for Quinones

The extract was treated with sodium hydroxide blue or red precipitate indicating the presence of Quinones.

Test for Gum & Mucilage

To 1ml of extract add 2.5ml of absolute alcohol & stir constantly. Then the precipitate was dried in air & examined for its swelling properties. The swelling was observed which will indicate the presence of gum & mucilage.

TLC analysis

The test sample was subjected to thin layer chromatography (TLC) as per the conventional one- dimensional ascending method using silica gel 60f 254, 7x6 cm (Merck) was cut with ordinary household scissors. Plate markings were made with a soft pencil. Micro pipette was used to spot the sample for TLC applied sample volume 10-micro liter by using a pipette at 1 cm at 5 tracks. In the twin trough chamber with the specified solvent system after the run plates were dried & were observed using visible light short-wave UV light 254nm & light long-wave UV light 365 nm [11].

High-performance thin layer chromatography analysis

HPTLC method is a modern sophisticated & automated separation technique derived from TLC. Pre-coated HPTLC-graded plates & autosampler were used to achieve precision, sensitivity, & significant separation both qualitatively & quantitatively. High-performance thin layer chromatography (HPTLC) is a valuable quality assessment tool for the evaluation of botanical materials efficiently & cost-effectively. HPTLC method offers a high degree of selectivity, sensitivity, & rapidity combined with single-step sample preparation. thus, this method can be conveniently adopted for routine quality control analysis. It provides a chromatographic fingerprint of phytochemicals which is suitable for confirming the identity & purity of Phyto therapeutics.

Chromatogram development

It was carried out in camag twin trough chambers. Sample elution was carried out according to the adsorption capability of the component to be analyzed. After elution, plates were taken out of the chamber & dried.

Scanning

Plates were scanned under UV at 366nm. The data obtained from scanning were brought into integration through camag software. A chromatographic fingerprint was developed for the detection of phytoconstituents present in each sample & their respective rf values were tabulated [12].

RESULTS**Qualitative analysis**

DISCUSSION

Vateria indica L. is an evergreen medicinal tree that grows up to 30m in height indigenous to the evergreen forests of western ghats from north Karnataka to Kerala. It is used for the treatment of respiratory disorders like chronic bronchitis, throat troubles, tubercular glands, boils, piles, diarrhoea, & rheumatism. Studies have shown that the resin of *Vateria indica* is a complex mixture of several triterpenes, hydrocarbons, ketones, alcohols, & acids along with small amounts of sesquiterpenes. On distillation, oleoresin yields essential oils (76%) with a stray balsamic odour. Dipterocarpaceous plants (*Vateria indica* L.) belong to the family Dipterocarpaceae & are known to contain various resveratrol oligomers that exhibit a variety of biological activities such as antibacterial & antitumor effects. The organoleptic characters of *vellai kungiliyam* purified by three different methods are shown in Table no 1. All the samples were found to be solid in nature with non-free-flowing properties. Pharmaceutical powders may be classified as free-flowing or cohesive (non-free flowing). Frictional & cohesive forces (resistance to flow) are increased as the particle size is reduced.

In Physico-chemical parameters, the loss on drying test is to determine to measure the amount of water & volatile matter in a sample when the sample is dried under the specified conditions. Moisture is one of the major factors responsible for the deterioration of drugs & formulations. Thus, low moisture content could get maximum stability & better shelf life. The loss of drying at 105 °c was found to be 9.333 ± 0.210 % (sample I), 12.13±0.4453% (sample II), & 10.93±0.937% (sample III).

The Ash value is the residue remaining after incineration that determines the inorganic substances present in the sample. Similarly, it can also detect the nature of the material, whether it is adulterated or not. Hence, the determination of the ash value provides an idea for judging the identity & purity of the sample. The Ash values of *Vellai kungiliyam* were 0.3313± 0.03% (sample I), 0.5317±0.023 % (sample II), 0.64±0.039 % (sample III). Acid insoluble ash is the ash fraction that is insoluble in an acid & it is a measure of the index for siliceous impurities. The quality of the drug is better if the acid insoluble value is low. The Acid insoluble Ash values of *Vellai kungiliyam* were 0.017±0.003% (sample I), 0.03467±0.025% (sample II), 0.038±0.008% (sample III).

Extraction value determines the number of active constituents in each amount of the formulation when extracted with a solvent media such as water & alcohol. The water soluble & alcohol soluble extract values indicate the extent of polar & nonpolar compounds respectively. Usually, resins are insoluble in water but in these three samples, they show water-soluble extractive values. Both water & alcohol-soluble extractive value plays an important role in the evaluation of crude drugs. Water & alcohol-soluble extractive values of *Vellai kungiliyam* were 1.48± 0.216 %, 0.460±0.265 % (sample I), 2.373±0.308 %, 0.3272±0.188% (sample II), 3.51±0.476 %, 0.141±0.081 % (sample III) respectively. In the solubility test, all three samples were found to be soluble in ethanol. Increased ethyl alcohol extracts are suggestive of increased glycosides, flavonoids, & tannins. The ethyl alcohol extract of *Vateria indica* is found to be 1.014 % (w/w) as per previous studies . In the sterility test by pour plate method, there is no growth /colonies were observed in any of the plates inoculated with test samples I, II, & III.

In the phytochemical study of the Purified sample by Lemon juice, the bioactive compound present is alkaloids detected by Wagner's test. The purified sample by *Thriphala* decoction shows the presence of Alkaloids, Carbohydrates, Saponin, Phenols, Tannins, Flavonoids, & Diterpenes. The purified sample by the *pittaviyal* process shows the presence of Alkaloids detected by Wagner's test (Table 5). Table 7, summarizes the HPTLC analysis of *Vellai kungiliyam* purified by 3 different methods & Figure 8 shows the colour of spots visible in the TLC profiles of different samples of *vellai kungiliyam*. TLC & HPTLC are useful in the identification of individual compounds, & the clinical utility of *Vateria indica* resin & formulations based on this resin, especially in geriatrics & anti-tumor activities, can bring in newer horizons in the medicinal utility of this preparation & establish a firm phytochemical basis for its therapeutic properties. HPTLC analysis was performed & the study shed light on the active constituents present in *Vellai kungiliyam* which is depicted by the presence of 5 prominent peaks (sample I & II), 7 Prominent peaks (sample

**Kiruba Annammal et al.,**

III) at 366nm & in which each peak corresponds to no of versatile components present within it. Sample I contain the Rf value of the peaks ranging from 0.02 to 0.90. Sample II contains the Rf value of the peaks ranging from 0.00 to 0.57. Sample III contains the Rf value of the peaks ranging from 0.00 to 0.83.

CONCLUSION

Vateria indica L. is purified using three different methods in this study. HPTLC fingerprinting analysis of purified sample III shows seven prominent peaks corresponding to the presence of five versatile phytochemicals present with it & it indicates that this purified sample will have higher efficacy in medicine preparations. *Vellai kungiliyam* purified by three different methods is soluble in ethanol, indicating the presence of glycosides, flavonoids, & tannins. The phytochemical screening provides additional evidence that sample II contains flavonoids, alkaloids, carbohydrates, saponins, phenols, & diterpenes. Therefore, it was concluded that samples II & III have the highest therapeutic value.

ACKNOWLEDGMENT

I wish to acknowledge my sincere thanks to Dr A. Mariappan, Associate professor, Department of Gunapadam, & Dr. R. Meenakumari, Director, National Institute of Siddha, Chennai for their continuous support throughout my study &, I wish to express my gratitude to Noble research solutions, Perambur, Chennai for their technical support.

ABSTRACT

Graph theory, a branch of mathematics deals with network of vertices connected by edges. Domination in graphs is one of the important research areas in graph theory. The product signed dominating function assigns -1 or 1 to the vertices of a graph such that the product of functional values of the closed neighborhood of every vertex is one. This research paper studies the product signed dominating functions in the corona product of any simple undirected connected graph with complete graph on even number of vertices and deduce the exact values of their product signed domination number.

Keywords: Corona product of graphs, product signed dominating function, weight of a graph, minimum weight, product signed domination number.

AMS Subject Classification: 05C69.

Velammal et al.,

INTRODUCTION

Domination in graphs is one of the important research areas in graph theory. It has applications in several fields. Signed domination was introduced by Dunbar and others [1-4]. The concept of signed domination was studied in [5-9],[14]. The concept of product signed dominating function, PSDF [13], was introduced in [10]. In [11], PSDF for the corona product of path, cycle and star graph, with complete graph on odd number of vertices are discussed. PSDF for the corona product of complete graph and star graph is discussed in [12] and for probabilistic neural networks is discussed in [13]. Let G be any simple undirected connected graph on “ a ” vertices. This research paper includes the works which enumerates the values of product signed domination number of $G \circ K_b$ for different values of a and even b . Even b may or may not be divisible by 4. Hence there are two cases say $b \equiv 0(mod 4)$ and $b \not\equiv 0(mod 4)$. Hence the results are discussed in main cases relevant to b and correspondingly we consider 4 cases for a as $a < b$ (a is odd), $a \leq b$ (a is even), $a > b$ & $a = kb$ ($k > 1$) and $a > b$ & $a = kb + l$ ($k, l \geq 1$). And finally it is proved that $\gamma_{sign}^*(G \circ K_b) \leq 4$ where G is any simple undirected connected graph on “ a ” vertices and $b \equiv 0(mod 2)$. Here $V(G) = \{v_1, v_2, \dots, v_a\}$. In $G \circ K_b$, at every vertex of G , there is a complete graph on $b + 1$ vertices. Let $K_{b+1}^1, K_{b+1}^2, \dots, K_{b+1}^a$ be the complete graphs at v_1, v_2, \dots, v_a respectively. For $i = 1$ to a , let $V(G \circ K_b) = \{v_i, v_{ij} | 1 \leq i \leq a, 1 \leq j \leq b\}$ and $E(G \circ K_b) = E(G) \cup \{v_i v_{ij} | 1 \leq i \leq a, 1 \leq j \leq b\} \cup \{v_{ij} v_{ik} | j \neq k, 1 \leq j, k \leq b, 1 \leq i \leq a\}$

PRELIMINARIES

Definition 2.1

Let $G = (V, E)$ be simple undirected connected graph. A function $f: V \rightarrow \{-1, 1\}$ is a product signed dominating function [10], PSDF [13] if each vertex v in V satisfies the condition $f[v] = \prod_{u \in N[v]} f(u) = 1$ where $N[v]$ denotes the closed neighborhood of v . The weight of a graph G with respect to the function f is denoted by $w_f(G)$ [13], and defined as $w_f(G) = \sum_{v \in V} f(v)$. The product signed domination number of a graph G is the minimum positive weight of a PSDF and is denoted as $\gamma_{sign}^*(G)$.

Definition 2.2

The graph $G \circ H$ that results from taking one copy of G and $|V(G)|$ copies of H and connecting the i^{th} vertex of G to every vertex in the i^{th} copy of H is called the corona product of two graphs G and H .

Theorem 2.3

For $b \leq 4$, $\gamma_{sign}^*(K_b) = b$, the total number of vertices.

$$\text{For } b > 4, \gamma_{sign}^*(K_b) = \begin{cases} 1 & \text{if } b \text{ is odd and } \frac{b-1}{2} \text{ is even} \\ 2 & \text{if } b \text{ is even and } \frac{b}{2} \text{ is odd} \\ 3 & \text{if } b \text{ and } \frac{b-1}{2} \text{ are odd} \\ 4 & \text{if } b \text{ and } \frac{b}{2} \text{ are even} \end{cases}$$

MAIN RESULTS

Observation 3.1

- (i) Let $f: V(G \circ K_b) \rightarrow \{-1, 1\}$. At each $v_i, 1 \leq i \leq a$, assigning -1 to zero or even number of vertices of K_{b+1}^i with $f(v_i) = 1, 1 \leq i \leq a$ leads to a PSDF.
- (ii) Since $b + 1$ is odd, atleast one vertex in every K_{b+1}^i where $1 \leq i \leq a$ should be assigned 1 in any PSDF.

Velammal et al.,

Theorem 3.2

Let b be an even positive integer such that $b \equiv 0(mod 4)$ and $a < b$ be an odd integer. Then, $\gamma_{sign}^*(G \circ K_b) = \begin{cases} 3 & \text{if } b - (a + 1) \equiv 0(mod 4) \\ 1 & \text{otherwise} \end{cases}$

Proof

Case 1: $b - (a + 1) \equiv 0(mod 4)$

If $a = 1$, then $b - (a + 1) = b - 2 \not\equiv 0(mod 4)$ since $b \equiv 0(mod 4)$. Hence $a > 1$.

Define $f: V(G \circ K_b) \rightarrow \{-1, 1\}$ by

$$f(v_i) = 1 \forall i, 1 \leq i \leq a \text{ and } f(v_{ij}) = \begin{cases} -1 & \text{if } \begin{matrix} 1 \leq i \leq a-1, 1 \leq j \leq \frac{b}{2} \\ \text{or} \\ i=a, 1 \leq j \leq \frac{b+a-3}{2} \end{matrix} \\ 1 & \text{otherwise} \end{cases}$$

$b \equiv 0(mod 4)$ and $b - (a + 1) \equiv 0(mod 4)$ implies $\frac{b+a-3}{2}$ is even.

Here $f[v] = 1 \forall v \in V(G \circ K_b)$

$$\text{Correspondingly, } w_f(G \circ K_b) = \sum_{v \in V(G \circ K_b)} f(v) = 3$$

Further f is defined such that in $a - 1$ copies of K_{b+1} 's, $\sum_{j=1}^b f(v_{ij})$ vanishes for each i . Also $f(v_i) = 1 \forall i, 1 \leq i \leq a$. In the remaining a^{th} copy of K_{b+1} , v_{aj} 's, $1 \leq j \leq b$ are assigned -1 and 1 in such a way to get minimum positive weight.

Case 2: $b - (a + 1) \not\equiv 0(mod 4)$

When $a = 1$, $G \circ K_b \cong K_{b+1}$. Here $b + 1$ is odd and $b \equiv 0(mod 4)$ implies $\frac{b}{2}$ is even. Then by [2.3], $\gamma_{sign}^*(G \circ K_b) = 1$.

Let $a > 1$.

Define $f: V(G \circ K_b) \rightarrow \{-1, 1\}$ by

$$f(v_i) = 1 \forall i, 1 \leq i \leq a \text{ and } f(v_{ij}) = \begin{cases} -1 & \text{if } \begin{matrix} 1 \leq i \leq a-1, 1 \leq j \leq \frac{b}{2} \\ \text{or} \\ i=a, 1 \leq j \leq \frac{b+a-1}{2} \end{matrix} \\ 1 & \text{otherwise} \end{cases}$$

$b \equiv 0(mod 4), a + 1 \equiv 0(mod 2)$ and $b - (a + 1) \not\equiv 0(mod 4)$ implies $a + 1 \equiv 2(mod 4)$ and $\frac{b+a-1}{2}$ is even.

Here $f[v] = 1 \forall v \in V(G \circ K_b)$

$$\text{Correspondingly, } w_f(G \circ K_b) = \sum_{v \in V(G \circ K_b)} f(v) = 1$$

Obviously, $w_f(G \circ K_b) = 1$ is minimum.

Hence the theorem.

Theorem 3.3

Let b be a positive integer such that $b \equiv 0(mod 4)$ and $a \leq b$ be an even integer. Then,

$$\gamma_{sign}^*(G \circ K_b) = \begin{cases} 4 & \text{if } b - a \equiv 0(mod 4) \\ 2 & \text{otherwise} \end{cases}$$

Proof

Case 1: $a = b$

Then $b - a \equiv 0(mod 4)$

Define $f: V(G \circ K_b) \rightarrow \{-1, 1\}$ by

$$f(v_i) = 1 \forall i, 1 \leq i \leq a \text{ and } f(v_{ij}) = \begin{cases} -1 & \text{if } \begin{matrix} 1 \leq i \leq a-1, 1 \leq j \leq \frac{b}{2} \\ \text{or} \\ i=a, 1 \leq j \leq b-2 \end{matrix} \\ 1 & \text{otherwise} \end{cases} \quad \dots (A)$$

Here $f[v] = 1 \forall v \in V(G \circ K_b)$

$$\text{Correspondingly, } w_f(G \circ K_b) = \sum_{v \in V(G \circ K_b)} f(v) = 4$$

Velammal et al.,

Here f is defined such that in $a - 1$ copies of K_{b+1}^i , $\sum_{j=1}^b f(v_{ij})$ vanishes for each i . Also $f(v_i) = 1 \forall i, 1 \leq i \leq a$, $\sum_{i=1}^a f(v_i) = a$. And since $a = b$, if v_{aj} 's where $1 \leq j \leq b$ are assigned -1 , then, it is also a PSDF but the weight would be zero. So in order to get positive weight, f is defined as in (A). Therefore, $w_f(G \circ K_b) = 4$ is minimum.

Case 2: $a < b$

Subcase 2a: $b - a \equiv 0 \pmod{4}$

Define $f: V(G \circ K_b) \rightarrow \{-1, 1\}$ by

$$f(v_i) = 1 \forall i, 1 \leq i \leq a \text{ and } f(v_{ij}) = \begin{cases} -1 \text{ if } & \begin{matrix} 1 \leq i \leq a-1, 1 \leq j \leq \frac{b}{2} \\ \text{or} \\ i=a, \frac{b-a+4}{2} + 1 \leq j \leq b \end{matrix} \\ 1 \text{ otherwise} \end{cases} \quad \text{--- (B)}$$

$b \equiv 0 \pmod{4}, a \equiv 0 \pmod{2}$ and $b - a \equiv 0 \pmod{4}$ implies $\frac{b+a-4}{2}$ is even.

Here $f[v] = 1 \forall v \in V(G \circ K_b)$

Correspondingly, $w_f(G \circ K_b) = \sum_{v \in V(G \circ K_b)} f(v) = 4$

Subcase 2b: $b - a \not\equiv 0 \pmod{4}$

Define $f: V(G \circ K_b) \rightarrow \{-1, 1\}$ by

$$f(v_i) = 1 \forall i, 1 \leq i \leq a \text{ and } f(v_{ij}) = \begin{cases} -1 \text{ if } & \begin{matrix} 1 \leq i \leq a-1, 1 \leq j \leq \frac{b}{2} \\ \text{or} \\ i=a, \frac{b-a+2}{2} + 1 \leq j \leq b \end{matrix} \\ 1 \text{ otherwise} \end{cases} \quad \text{---(C)}$$

$b \equiv 0 \pmod{4}, a \equiv 0 \pmod{2}$ and $b - a \not\equiv 0 \pmod{4}$ implies $\frac{b+a-2}{2}$ is even.

Here $f[v] = 1 \forall v \in V(G \circ K_b)$

Correspondingly, $w_f(G \circ K_b) = \sum_{v \in V(G \circ K_b)} f(v) = 2$

In both the subcases 2a and 2b, f is defined such that in $a - 1$ copies of K_{b+1}^i 's, $\sum_{j=1}^b f(v_{ij})$ vanishes for each i . Also $f(v_i) = 1 \forall i, 1 \leq i \leq a$. In the remaining a^{th} copy of K_{b+1}^i , v_{aj} 's, $1 \leq j \leq b$ are assigned -1 and 1 depending on the value of $\frac{b-a}{2}$ in order to get minimum positive weight.

Hence the theorem.

The following theorems discuss the cases when $a > b$ and $b \equiv 0 \pmod{4}$.

Theorem 3.4

Let b be a positive integer such that $b \equiv 0 \pmod{4}$. Let $a > b$ be given by $a = kb$ where $k > 1$. Then, $\gamma_{\text{sign}}^*(G \circ K_b) = 4$.

Proof

Define $f: V(G \circ K_b) \rightarrow \{-1, 1\}$ by

$$f(v_i) = 1 \forall i, 1 \leq i \leq a \text{ and } f(v_{ij}) = \begin{cases} -1 \text{ if } & \begin{matrix} 1 \leq i \leq k, 1 \leq j \leq b \\ \text{or} \\ k+1 \leq i \leq a-1, 1 \leq j \leq \frac{b}{2} \\ \text{or} \\ i=a, 1 \leq j \leq \frac{b-4}{2} \end{matrix} \\ 1 \text{ otherwise} \end{cases}$$

$b \equiv 0 \pmod{4}$ implies $\frac{b}{2}$ is even and $\frac{b-4}{2}$ is even and $f[v] = 1 \forall v \in V(G \circ K_b)$

Correspondingly, $w_f(G \circ K_b) = \sum_{v \in V(G \circ K_b)} f(v) = 4$

Here f is defined such that for k copies of K_{b+1}^i 's, $f(v_{ij}) = -1$ where $1 \leq j \leq b$ so that $(k)(b)(-1)$ vanishes with functional values of $(k)(b)$ vertices of v_i 's and in another $a - k - 1$ copies of K_{b+1}^i 's, the vertices v_{ij} 's, where $1 \leq j \leq b$, are assigned functional values such that its sum vanishes. And in the remaining one copy of K_{b+1}^i , v_{ij} 's, where $1 \leq j \leq b$, are assigned functional values which sums to 4 which is minimum.

Hence the theorem.

Velammal et al.,

Theorem 3.5

Let b be a positive integer such that $b \equiv 0(mod 4)$ and $a = kb + l$ where k and l are positive integers such that

$$k, l \geq 1. \text{ Then, } \gamma_{sign}^*(G \circ K_b) = \begin{cases} 4 \text{ if } l \equiv 0(mod 4) \\ 1 \text{ if } l \equiv 1(mod 4) \\ 2 \text{ if } l \equiv 2(mod 4) \\ 3 \text{ if } l \equiv 3(mod 4) \end{cases}$$

Proof

Here f is to be defined such that for k copies of K_{b+1}^i 's, $f(v_{ij}) = -1$ where $1 \leq j \leq b$ so that $(k)(b)(-1)$ vanishes with functional values of $(k)(b)$ vertices of v_i 's and in another $a - k - 1$ copies of K_{b+1}^i 's, the vertices v_{ij} 's, where $1 \leq j \leq b$, are assigned functional values such that its sum vanishes. And in the remaining one copy of K_{b+1}^i , functional values are to be assigned depending on the values of l .

Hence the weight would be $w_f(G \circ K_b) = \sum_{v \in V(G \circ K_b)} f(v)$

$$\begin{aligned} &= \sum_{i=1}^a f(v_i) + \sum_{i=1}^a \sum_{j=1}^b f(v_{ij}) \\ &= a + \sum_{i=1}^k \sum_{j=1}^b f(v_{ij}) + \sum_{i=k+1}^{a-1} \sum_{j=1}^{\frac{b}{2}} f(v_{ij}) + \sum_{i=k+1}^{a-1} \sum_{j=\frac{b}{2}+1}^b f(v_{ij}) + \sum_{j=1}^b f(v_{aj}) \\ &= a + [(kb)(-1)] + \left[(a - 1 - k) \left(\frac{b}{2} \right) (-1) \right] + \left[(a - 1 - k) \left(\frac{b}{2} \right) (1) \right] + \sum_{j=1}^b f(v_{aj}) \\ &= a - kb + \sum_{j=1}^b f(v_{aj}) \\ &= l + \sum_{j=1}^b f(v_{aj}) \text{ since } a = kb + l \\ w_f(G \circ K_b) &= l + x \text{ where } x = \sum_{j=1}^b f(v_{aj}) \end{aligned} \tag{D}$$

The value of x depends on the value of l .

Case 1: $l \equiv 0(mod 4)$

Define $f: V(G \circ K_b) \rightarrow \{-1, 1\}$ by

$$f(v_i) = 1 \forall i, 1 \leq i \leq a \text{ and } f(v_{ij}) = \begin{cases} -1 \text{ if } \begin{matrix} 1 \leq i \leq k, 1 \leq j \leq b \\ \text{or} \\ k+1 \leq i \leq a-1, 1 \leq j \leq \frac{b}{2} \\ \text{or} \\ i=a, 1 \leq j \leq \frac{b+l-4}{2} \end{matrix} \\ 1 \text{ otherwise} \end{cases} \tag{E}$$

$b \equiv 0(mod 4)$ and $l \equiv 0(mod 4)$ implies $\frac{b}{2}$ and $\frac{b+l-4}{2}$ are even.

Also $f[v] = 1 \forall v \in V(G \circ K_b)$

$$w_f(G \circ K_b) = l + x \text{ where } x = \sum_{j=1}^b f(v_{aj}) \tag{by (D)}$$

$$\begin{aligned} &= l + \sum_{j=1}^{\frac{b+l-4}{2}} f(v_{aj}) + \sum_{j=\frac{b+l-4}{2}+1}^b f(v_{aj}) \tag{by (E)} \\ &= l + \left(\frac{b+l-4}{2} \right) (-1) + \left(\frac{b-l+4}{2} \right) (1) \\ &= 4 \end{aligned}$$

Since f in (E) is defined to satisfy (D), the obtained weight is minimum.

Case 2: $l \equiv 1(mod 4)$

Define $f: V(G \circ K_b) \rightarrow \{-1, 1\}$ by

$$f(v_i) = 1 \forall i, 1 \leq i \leq a \text{ and } f(v_{ij}) = \begin{cases} -1 \text{ if } \begin{matrix} 1 \leq i \leq k, 1 \leq j \leq b \\ \text{or} \\ k+1 \leq i \leq a-1, 1 \leq j \leq \frac{b}{2} \\ \text{or} \\ i=a, 1 \leq j \leq \frac{b+l-1}{2} \end{matrix} \\ 1 \text{ otherwise} \end{cases} \tag{F}$$

Velammal et al.,

$b \equiv 0 \pmod{4}$ and $l - 1 \equiv 0 \pmod{4}$ implies $\frac{b}{2}$ and $\frac{b+l-1}{2}$ are even.

Also $f[v] = 1 \forall v \in V(G \circ K_b)$

$$w_f(G \circ K_b) = l + x \text{ where } x = \sum_{j=1}^b f(v_{aj}) \quad \text{(by (D))}$$

$$= l + \sum_{j=1}^{\frac{b+l-1}{2}} f(v_{aj}) + \sum_{j=\frac{b+l-1}{2}+1}^b f(v_{aj}) \quad \text{(by (F))}$$

$$= l + \left(\frac{b+l-1}{2}\right)(-1) + \left(\frac{b-l+1}{2}\right)(1) = 1$$

Clearly, the weight is minimum.

Case 3: $l \equiv 2 \pmod{4}$

Define $f: V(G \circ K_b) \rightarrow \{-1,1\}$ by

$$f(v_i) = 1 \forall i, 1 \leq i \leq a \text{ and } f(v_{ij}) = \begin{cases} -1 & \text{if } \begin{matrix} 1 \leq i \leq k, 1 \leq j \leq b \\ \text{or} \\ k+1 \leq i \leq a-1, 1 \leq j \leq \frac{b}{2} \\ \text{or} \\ i=a, 1 \leq j \leq \frac{b+l-2}{2} \end{matrix} \\ 1 & \text{otherwise} \end{cases} \quad \text{--- (G)}$$

$b \equiv 0 \pmod{4}$ and $l - 2 \equiv 0 \pmod{4}$ implies $\frac{b}{2}$ and $\frac{b+l-2}{2}$ are even.

Also $f[v] = 1 \forall v \in V(G \circ K_b)$

$$w_f(G \circ K_b) = l + x \text{ where } x = \sum_{j=1}^b f(v_{aj}) \quad \text{(by (D))}$$

$$= l + \sum_{j=1}^{\frac{b+l-2}{2}} f(v_{aj}) + \sum_{j=\frac{b+l-2}{2}+1}^b f(v_{aj}) \quad \text{(by (G))}$$

$$= l + \left(\frac{b+l-2}{2}\right)(-1) + \left(\frac{b-l+2}{2}\right)(1) = 2$$

Since f in (G) is defined to satisfy (D), the obtained weight is minimum.

Case 4: $l \equiv 3 \pmod{4}$

Define $f: V(G \circ K_b) \rightarrow \{-1,1\}$ by

$$f(v_i) = 1 \forall i, 1 \leq i \leq a \text{ and } f(v_{ij}) = \begin{cases} -1 & \text{if } \begin{matrix} 1 \leq i \leq k, 1 \leq j \leq b \\ \text{or} \\ k+1 \leq i \leq a-1, 1 \leq j \leq \frac{b}{2} \\ \text{or} \\ i=a, 1 \leq j \leq \frac{b+l-3}{2} \end{matrix} \\ 1 & \text{otherwise} \end{cases} \quad \text{--- (H)}$$

$b \equiv 0 \pmod{4}$ and $l - 3 \equiv 0 \pmod{4}$ implies $\frac{b}{2}$ and $\frac{b+l-3}{2}$ are even.

Also $f[v] = 1 \forall v \in V(G \circ K_b)$

$$w_f(G \circ K_b) = l + x \text{ where } x = \sum_{j=1}^b f(v_{aj}) \quad \text{(by (D))}$$

$$= l + \sum_{j=1}^{\frac{b+l-3}{2}} f(v_{aj}) + \sum_{j=\frac{b+l-3}{2}+1}^b f(v_{aj}) \quad \text{(by (H))}$$

$$= l + \left(\frac{b+l-3}{2}\right)(-1) + \left(\frac{b-l+3}{2}\right)(1) = 3$$

Since f in (H) is defined to satisfy (D), the obtained weight is minimum.

Hence the theorem.

Remark 3.6:

In theorem 3.5, the values of k and l may or may not be equal.

The following theorems discuss the cases when $b \not\equiv 0 \pmod{4}$ is an even positive integer.

Theorem 3.7:

Let b be an even positive integer such that $b \not\equiv 0 \pmod{4}$ and $a < b$ be an odd integer. Then, $\gamma_{sign}^*(G \circ K_b) = \begin{cases} 3 & \text{if } b - (a + 1) \equiv 0 \pmod{4} \\ 1 & \text{otherwise} \end{cases}$

Velammal et al.,

Proof:

Here $b \not\equiv 0(mod 4)$ is an even integer implies $b \equiv 2(mod 4)$.

Let $f: V(G \circ K_b) \rightarrow \{-1,1\}$. f is to be defined such that f values of v_{ij} 's, where $1 \leq j \leq b$ at each i in $\frac{a-1}{2}$ copies of K_{b+1} 's vanishes with f values of v_{ij} 's, where $1 \leq j \leq b$ in another set of $\frac{a-1}{2}$ copies of K_{b+1} 's. in the remaining one copy, functional values are assigned depending on the value of $\frac{b-(a+1)}{2}$ --- (I)

Case 1: $b - (a + 1) \equiv 0(mod 4)$

Subcase 1a: $a = 1$

When $a = 1$, $G \circ K_b \cong K_{b+1}$. Here $b + 1$ is odd. $b \not\equiv 0(mod 4)$ is an even integer implies $\frac{b}{2}$ is odd. Then by 2.3, $\gamma_{sign}^*(G \circ K_b) = 3$.

Subcase 1b: $a > 1$

Define

$$f(v_i) = 1 \forall i, 1 \leq i \leq a \text{ and } f(v_{ij}) = \begin{cases} -1 \text{ if } & \begin{matrix} 1 \leq i \leq \frac{a-1}{2}, 1 \leq j \leq b \\ \text{or} \\ i=a, 1 \leq j \leq \frac{b+a-3}{2} \end{matrix} \\ 1 \text{ otherwise} \end{cases}$$

$b \equiv 2(mod 4), a \equiv 1(mod 2)$ and $b - (a + 1) \equiv 0(mod 4)$ implies $\frac{b+a-3}{2}$ is even.

Also $f[v] = 1 \forall v \in V(G \circ K_b)$

Correspondingly, $w_f(G \circ K_b) = \sum_{v \in V(G \circ K_b)} f(v) = 3$

Since f is defined in such a way to satisfy (I), the obtained weight is minimum.

Case 2: $b - (a + 1) \not\equiv 0(mod 4)$

If $a = 1$, then $b - (a + 1) = b - 2 \equiv 0(mod 4)$ since $b \not\equiv 0(mod 4)$ is an even integer. Hence $a > 1$.

Define

$$f(v_i) = 1 \forall i, 1 \leq i \leq a \text{ and } f(v_{ij}) = \begin{cases} -1 \text{ if } & \begin{matrix} 1 \leq i \leq \frac{a-1}{2}, 1 \leq j \leq b \\ \text{or} \\ i=a, 1 \leq j \leq \frac{b+a-1}{2} \end{matrix} \\ 1 \text{ otherwise} \end{cases}$$

$b \equiv 2(mod 4), a \equiv 1(mod 2)$ and $b - (a + 1) \not\equiv 0(mod 4)$ implies $a + 1 \equiv 0(mod 4)$ and $\frac{b+a-1}{2}$ is even.

f is defined to satisfy (I) and here $f[v] = 1 \forall v \in V(G \circ K_b)$

Correspondingly, $w_f(G \circ K_b) = \sum_{v \in V(G \circ K_b)} f(v) = 1$

Clearly, the weight is minimum.

Remark 3.8:

From 3.2 and 3.7, if $b \equiv 0(mod 2)$ and $a < b$ is an odd integer, then $\gamma_{sign}^*(G \circ K_b) = \begin{cases} 3 \text{ if } b - (a + 1) \equiv 0(mod 4) \\ 1 \text{ otherwise} \end{cases}$

Theorem 3.9:

Let b be an even positive integer such that $b \not\equiv 0(mod 4)$ and $a \leq b$ be even. Then,

$$\gamma_{sign}^*(G \circ K_b) = \begin{cases} 2 \text{ if } b - a \equiv 0(mod 4) \\ 4 \text{ otherwise} \end{cases}$$

Proof:

Here $b \not\equiv 0(mod 4)$ is an even integer implies $b \equiv 2(mod 4)$.

Case 1: $a = b$

Then $b - a \equiv 0(mod 4)$

Define $f: V(G \circ K_b) \rightarrow \{-1,1\}$ by

Velammal et al.,

$$f(v_i) = 1 \forall i, 1 \leq i \leq a \text{ and } f(v_{ij}) = \begin{cases} -1 \text{ if } \frac{a-2}{2} + 1 \leq i \leq a-1, 1 \leq j \leq b \\ \text{or} \\ i=a, 1 \leq j \leq \frac{b-2}{2} \\ 1 \text{ otherwise} \end{cases}$$

Here $b \equiv 2 \pmod{4}$ implies $\frac{b-2}{2}$ is even. Also $f[v] = 1 \forall v \in V(G \circ K_b)$

Correspondingly, $w_f(G \circ K_b) = \sum_{v \in V(G \circ K_b)} f(v) = 2$

Here f is defined such that f values of v_{ij} 's, where $1 \leq j \leq b$ at each i in one set of $\frac{a-2}{2}$ copies of K_{b+1}^i 's vanishes with f values of v_{ij} 's, where $1 \leq j \leq b$ in another set of $\frac{a-2}{2}$ copies of K_{b+1}^i 's and f values at each v_i , where $1 \leq i \leq a$ vanishes with f values at another one copy of K_{b+1}^i in which v_{ij} 's are assigned -1 . For the remaining one copy of K_{b+1}^i , functional values are assigned in order to get minimum weight that is positive. Hence, the weight obtained here is minimum.

Case 2: $a < b$

Subcase 2a: $b - a \equiv 0 \pmod{4}$

Define $f: V(G \circ K_b) \rightarrow \{-1, 1\}$ by

$$f(v_i) = 1 \forall i, 1 \leq i \leq a \text{ and } f(v_{ij}) = \begin{cases} -1 \text{ if } 1 \leq i \leq \frac{a-2}{2}, 1 \leq j \leq b \\ \text{or} \\ i=a-1, 1 \leq j \leq \frac{b-2}{2} \\ \text{or} \\ i=a, 1 \leq j \leq \frac{b+a}{2} \\ 1 \text{ otherwise} \end{cases}$$

$b \equiv 2 \pmod{4}$, $a \equiv 0 \pmod{2}$ and $b - a \equiv 0 \pmod{4}$ implies $a \equiv 2 \pmod{4}$ and $\frac{b+a}{2}$ is even.

Also $f[v] = 1 \forall v \in V(G \circ K_b)$

Correspondingly, $w_f(G \circ K_b) = \sum_{v \in V(G \circ K_b)} f(v) = 2$

Here f is defined such that f values of v_{ij} 's, where $1 \leq j \leq b$ at each i in one set of $\frac{a-2}{2}$ copies of K_{b+1}^i 's vanishes with f values of v_{ij} 's, where $1 \leq j \leq b$ in another set of $\frac{a-2}{2}$ copies of K_{b+1}^i 's and f values at each v_i , where $1 \leq i \leq a$ vanishes with f values of v_{aj} 's, $1 \leq j \leq a < b$ and the remaining v_{aj} 's are assigned 1 and -1 equal number of times so that it sums to zero. In the remaining one copy of K_{b+1}^i , v_{ij} 's are assigned functional values which adds 2 to the weight. Hence, the weight obtained here is minimum.

Subcase 2b: $b - a \not\equiv 0 \pmod{4}$

Define $f: V(G \circ K_b) \rightarrow \{-1, 1\}$ by

$$f(v_i) = 1 \forall i, 1 \leq i \leq a \text{ and } f(v_{ij}) = \begin{cases} -1 \text{ if } 1 \leq i \leq \frac{a-2}{2}, 1 \leq j \leq b \\ \text{or} \\ i=a-1, 1 \leq j \leq \frac{b-2}{2} \\ \text{or} \\ i=a, 1 \leq j \leq \frac{b+a-2}{2} \\ 1 \text{ otherwise} \end{cases}$$

$b \equiv 2 \pmod{4}$, $a \equiv 0 \pmod{2}$ and $b - a \not\equiv 0 \pmod{4}$ implies $a \equiv 0 \pmod{4}$ and $\frac{b-2}{2}$ and $\frac{b+a-2}{2}$ are even.

Also $f[v] = 1 \forall v \in V(G \circ K_b)$

Correspondingly, $w_f(G \circ K_b) = \sum_{v \in V(G \circ K_b)} f(v) = 4$

Here f is defined such that f values of v_{ij} 's, where $1 \leq j \leq b$ at each i in one set of $\frac{a-2}{2}$ copies of K_{b+1}^i 's vanishes with f values of v_{ij} 's, where $1 \leq j \leq b$ in another set of $\frac{a-2}{2}$ copies of K_{b+1}^i 's and f values at each v_i , where $1 \leq i \leq a$ vanishes with f values of v_{aj} 's, $1 \leq j \leq a < b$ and the remaining v_{aj} 's are assigned functional values so that it sums to 2. In the remaining one copy of K_{b+1}^i , v_{ij} 's are assigned functional values which adds 2 to the weight. Hence, the weight obtained here is minimum.

Theorem 3.10

Let b be an even positive integer such that $b \not\equiv 0 \pmod{4}$. Let $a = kb$ where $k > 1$ be any positive integer. Then,

$$\gamma_{sign}^*(G \circ K_b) = \begin{cases} 4 \text{ if } a - k \equiv 0 \pmod{2} \\ 2 \text{ otherwise} \end{cases}$$

Velammal et al.,

Proof

b which is an even positive integer such that $b \not\equiv 0(mod 4)$ implies $b \equiv 2(mod 4)$.

Since $a = kb$, f is to be defined such that f values of v_{ij} 's, where $1 \leq j \leq b$ at k copies of K_{b+1}^i 's vanishes with f values of v_i 's where $1 \leq i \leq kb = a$. In the remaining $a - k$ copies of K_{b+1}^i 's, functional values for v_{ij} 's, where $1 \leq j \leq b$ are to be defined depending on the value of $a - k$. --- (J)

Case 1: $a - k \equiv 0(mod 2)$

Define $f: V(G \circ K_b) \rightarrow \{-1,1\}$ by

$$f(v_i) = 1 \forall i, 1 \leq i \leq a \text{ and } f(v_{ij}) = \begin{cases} -1 & \text{if } 1 \leq i \leq \frac{a+k-2}{2}, 1 \leq j \leq b \\ & \text{or } a-1 \leq i \leq a, 1 \leq j \leq \frac{b-2}{2} \\ 1 & \text{otherwise} \end{cases} \quad \text{--- (K)}$$

$b \equiv 2(mod 4)$ implies $\frac{b-2}{2}$ is even and $f[v] = 1 \forall v \in V(G \circ K_b)$

$$w_f(G \circ K_b) = \sum_{v \in V(G \circ K_b)} f(v) = 4$$

Since (K) is defined to satisfy (J), the obtained weight is minimum.

Case 2: $a - k \not\equiv 0(mod 2)$

Define $f: V(G \circ K_b) \rightarrow \{-1,1\}$ by

$$f(v_i) = 1 \forall i, 1 \leq i \leq a \text{ and } f(v_{ij}) = \begin{cases} -1 & \text{if } 1 \leq i \leq \frac{a+k-1}{2}, 1 \leq j \leq b \\ & \text{or } i=a, 1 \leq j \leq \frac{b-2}{2} \\ 1 & \text{otherwise} \end{cases} \quad \text{--- (L)}$$

$b \equiv 2(mod 4)$ implies $\frac{b-2}{2}$ is even and $f[v] = 1 \forall v \in V(G \circ K_b)$

$$w_f(G \circ K_b) = \sum_{v \in V(G \circ K_b)} f(v) = 2$$

Since (L) is defined to satisfy (J), the obtained weight is minimum.

Hence the theorem.

Theorem 3.11

Let b be an even positive integer such that $b \not\equiv 0(mod 4)$. Let $a = kb + l$ where $k \geq 1, l \geq 1$ be any integers. Let m_1 denote $\gamma_{sign}^*(G \circ K_b)$ when $a - k \not\equiv 0(mod 2)$ and m_2 denote $\gamma_{sign}^*(G \circ K_b)$ when $a - k \equiv 0(mod 2)$ Then,

$$m_1 = \begin{cases} m_{11} = 2 & \text{if } l \equiv 0(mod 4) \\ m_{12} = 3 & \text{if } l \equiv 1(mod 4) \\ m_{13} = 4 & \text{if } l \equiv 2(mod 4) \\ m_{14} = 1 & \text{if } l \equiv 3(mod 4) \end{cases} \quad \text{and } m_2 = \begin{cases} m_{11} + 2 & \text{if } l \equiv 0(mod 4) \\ m_{12} - 2 & \text{if } l \equiv 1(mod 4) \\ m_{13} - 2 & \text{if } l \equiv 2(mod 4) \\ m_{14} + 2 & \text{if } l \equiv 3(mod 4) \end{cases}$$

Proof

b which is an even positive integer such that $b \not\equiv 0(mod 4)$ implies $b \equiv 2(mod 4)$.

Case 1: $a - k \not\equiv 0(mod 2)$

f is to be defined such that f values of v_{ij} 's, where $1 \leq j \leq b$ in one set of $\frac{a-k-1}{2}$ copies of K_{b+1}^i 's vanishes with f values of v_{ij} 's, where $1 \leq j \leq b$ in another set of $\frac{a-k-1}{2}$ copies of K_{b+1}^i 's. And in another k copies of K_{b+1}^i 's, v_{ij} 's, where $1 \leq j \leq b$ are assigned -1 so that it vanishes with f values of v_i 's where $1 \leq i \leq kb$. In the remaining one copy, v_{ij} 's, where $1 \leq j \leq b$ are assigned functional values depending on the value of l .

Correspondingly, the weight would be $w_f(G \circ K_b) = \sum_{v \in V(G \circ K_b)} f(v)$

$$= \sum_{i=1}^a f(v_i) + \sum_{i=1}^a \sum_{j=1}^b f(v_{ij})$$

Velammal et al.,

$$\begin{aligned}
 &= a + \sum_{i=1}^{\frac{a-k-1}{2}} \sum_{j=1}^b f(v_{ij}) + \sum_{i=\frac{a-k-1}{2}+1}^{a-1} \sum_{j=1}^b f(v_{ij}) + \sum_{j=1}^b f(v_{aj}) \\
 &= a + \left[\left(\frac{a-k-1}{2} \right) (b)(1) \right] + \left[\left(\frac{a+k-1}{2} \right) (b)(-1) \right] + \sum_{j=1}^b f(v_{aj}) \\
 &= a - kb + \sum_{j=1}^b f(v_{aj}) \\
 &= l + \sum_{j=1}^b f(v_{aj}) \quad \text{since } a = kb + l \\
 w_f(G \circ K_b) &= l + x \text{ where } x = \sum_{j=1}^b f(v_{aj}) \quad \text{--- (M)}
 \end{aligned}$$

Subcase 1a: $l \equiv 0 \pmod{4}$

Define $f: V(G \circ K_b) \rightarrow \{-1,1\}$ by

$$f(v_i) = 1 \forall i, 1 \leq i \leq a \text{ and } f(v_{ij}) = \begin{cases} -1 \text{ if } \frac{a-k-1}{2}+1 \leq i \leq a-1, 1 \leq j \leq b \\ \text{or} \\ i=a, 1 \leq j \leq \frac{b+l-2}{2} \\ 1 \text{ otherwise} \end{cases} \quad \text{--- (N)}$$

$b \equiv 2 \pmod{4}, l-2 \equiv 2 \pmod{4}$ implies $\frac{b+l-2}{2}$ is even and $f[v] = 1 \forall v \in V(G \circ K_b)$

$$\begin{aligned}
 w_f(G \circ K_b) &= l + x \quad \text{(by (M))} \\
 &= l + \sum_{j=1}^{\frac{b+l-2}{2}} f(v_{aj}) + \sum_{j=\frac{b+l-2}{2}+1}^b f(v_{aj}) \quad \text{(by (N))} \\
 &= l + \left[\left(\frac{b+l-2}{2} \right) (-1) \right] + \left[\left(\frac{b-l+2}{2} \right) (1) \right] = 2 = m_{11}
 \end{aligned}$$

Since (N) is defined to satisfy (M), the obtained weight is minimum.

Subcase 1b: $l \equiv 1 \pmod{4}$

Define $f: V(G \circ K_b) \rightarrow \{-1,1\}$ by

$$f(v_i) = 1 \forall i, 1 \leq i \leq a \text{ and } f(v_{ij}) = \begin{cases} -1 \text{ if } \frac{a-k-1}{2}+1 \leq i \leq a-1, 1 \leq j \leq b \\ \text{or} \\ i=a, 1 \leq j \leq \frac{b+l-3}{2} \\ 1 \text{ otherwise} \end{cases} \quad \text{--- (O)}$$

$b \equiv 2 \pmod{4}, l \equiv 1 \pmod{4}$ implies $\frac{b+l-3}{2}$ is even and $f[v] = 1 \forall v \in V(G \circ K_b)$

$$\begin{aligned}
 w_f(G \circ K_b) &= l + x \quad \text{(by (M))} \\
 &= l + \sum_{j=1}^{\frac{b+l-3}{2}} f(v_{aj}) + \sum_{j=\frac{b+l-3}{2}+1}^b f(v_{aj}) \quad \text{(by (O))} \\
 &= l + \left[\left(\frac{b+l-3}{2} \right) (-1) \right] + \left[\left(\frac{b-l+3}{2} \right) (1) \right] = 3 = m_{12}
 \end{aligned}$$

Since (O) is defined to satisfy (M), the obtained weight is minimum.

Subcase 1c: $l \equiv 2 \pmod{4}$

Define $f: V(G \circ K_b) \rightarrow \{-1,1\}$ by

$$f(v_i) = 1 \forall i, 1 \leq i \leq a \text{ and } f(v_{ij}) = \begin{cases} -1 \text{ if } \frac{a-k-1}{2}+1 \leq i \leq a-1, 1 \leq j \leq b \\ \text{or} \\ i=a, 1 \leq j \leq \frac{b+l-4}{2} \\ 1 \text{ otherwise} \end{cases} \quad \text{--- (P)}$$

$b \equiv 2 \pmod{4}, l \equiv 2 \pmod{4}$ implies $\frac{b+l-4}{2}$ is even and $f[v] = 1 \forall v \in V(G \circ K_b)$

$$\begin{aligned}
 w_f(G \circ K_b) &= l + x \quad \text{(by (M))} \\
 &= l + \sum_{j=1}^{\frac{b+l-4}{2}} f(v_{aj}) + \sum_{j=\frac{b+l-4}{2}+1}^b f(v_{aj}) \quad \text{(by (P))} \\
 &= l + \left[\left(\frac{b+l-4}{2} \right) (-1) \right] + \left[\left(\frac{b-l+4}{2} \right) (1) \right] = 4 = m_{13}
 \end{aligned}$$

Since (P) is defined to satisfy (M), the obtained weight is minimum.

Velammal et al.,

Subcase 1d: $l \equiv 3(mod 4)$

Define $f: V(G \circ K_b) \rightarrow \{-1,1\}$ by

$$f(v_i) = 1 \forall i, 1 \leq i \leq a \text{ and } f(v_{ij}) = \begin{cases} -1 \text{ if } \frac{a-k-1}{2}+1 \leq i \leq a-1, 1 \leq j \leq b \\ \text{or} \\ i=a, 1 \leq j \leq \frac{b+l-1}{2} \\ 1 \text{ otherwise} \end{cases} \quad \dots (Q)$$

$b \equiv 2(mod 4), l \equiv 3(mod 4)$ implies $\frac{b+l-1}{2}$ is even and $f[v] = 1 \forall v \in V(G \circ K_b)$

$w_f(G \circ K_b) = l + x$ (by (M))

$= l + \sum_{j=1}^{\frac{b+l-1}{2}} f(v_{aj}) + \sum_{j=\frac{b+l-1}{2}+1}^b f(v_{aj})$ (by (Q))

$= l + \left[\left(\frac{b+l-1}{2} \right) (-1) \right] + \left[\left(\frac{b-l+1}{2} \right) (1) \right] = 1 = m_{14}$

Clearly, the weight is minimum.

Case 2: $a - k \equiv 0(mod 2)$

f is to be defined such that f values of v_{ij} 's, where $1 \leq j \leq b$ in one set of $\frac{a-k-2}{2}$ copies of K_{b+1} 's vanishes with f values of v_{ij} 's, where $1 \leq j \leq b$ in another set of $\frac{a-k-2}{2}$ copies of K_{b+1} 's. And in another k copies of K_{b+1} 's, v_{ij} 's, where $1 \leq j \leq b$ are assigned -1 so that it vanishes with f values of v_i 's where $1 \leq i \leq kb$. In the remaining two copies, v_{ij} 's, where $1 \leq j \leq b$ are assigned functional values depending on the value of l .

Correspondingly, the weight would be $w_f(G \circ K_b) = \sum_{v \in V(G \circ K_b)} f(v)$

$= \sum_{i=1}^a f(v_i) + \sum_{i=1}^a \sum_{j=1}^b f(v_{ij})$

$= a + \sum_{i=1}^{\frac{a-k-2}{2}} \sum_{j=1}^b f(v_{ij}) + \sum_{i=\frac{a-k-2}{2}+1}^{a-2} \sum_{j=1}^b f(v_{ij}) + \sum_{j=1}^b f(v_{(a-1)j}) + \sum_{j=1}^b f(v_{aj})$

$= a + \left[\left(\frac{a-k-2}{2} \right) (b)(1) \right] + \left[\left(\frac{a+k-2}{2} \right) (b)(-1) \right] + \sum_{j=1}^b f(v_{(a-1)j}) + \sum_{j=1}^b f(v_{aj})$

$= a - kb + \sum_{j=1}^b f(v_{(a-1)j}) + \sum_{j=1}^b f(v_{aj})$

$= l + \sum_{j=1}^b f(v_{(a-1)j}) + \sum_{j=1}^b f(v_{aj})$ since $a = kb + l$ Hence $w_f(G \circ K_p) = l + y$ where $y = \sum_{j=1}^b f(v_{(a-1)j}) + \sum_{j=1}^b f(v_{aj})$ --- (R)

Subcase 2a: $l \equiv 0(mod 4)$

Define $f: V(G \circ K_b) \rightarrow \{-1,1\}$ by

$$f(v_i) = 1 \forall i, 1 \leq i \leq a \text{ and } f(v_{ij}) = \begin{cases} -1 \text{ if } \frac{a-k-2}{2}+1 \leq i \leq a-2, 1 \leq j \leq b \\ \text{or} \\ i=a-1, 1 \leq j \leq \frac{b-2}{2} \\ \text{or} \\ i=a, 1 \leq j \leq \frac{b+l-2}{2} \\ 1 \text{ otherwise} \end{cases} \quad \dots (S)$$

$b \equiv 2(mod 4), l \equiv 0(mod 4)$ implies $\frac{b+l-2}{2}$ and $\frac{b-2}{2}$ are even and $f[v] = 1 \forall v \in V(G \circ K_b)$

$w_f(G \circ K_b) = l + y$ (by (R))

$= l + \sum_{j=1}^{\frac{b-2}{2}} f(v_{(a-1)j}) + \sum_{j=\frac{b-2}{2}+1}^b f(v_{(a-1)j}) + \sum_{j=1}^{\frac{b+l-2}{2}} f(v_{aj}) + \sum_{j=\frac{b+l-2}{2}+1}^b f(v_{aj})$ (by (S))

$= l + \left[\left(\frac{b-2}{2} \right) (-1) \right] + \left[\left(\frac{b+2}{2} \right) (1) \right] + \left[\left(\frac{b+l-2}{2} \right) (-1) \right] + \left[\left(\frac{b-l+2}{2} \right) (1) \right]$
 $= 4 = m_{11} + 2$

Since (S) is defined to satisfy (R), the obtained weight is minimum.

Velammal et al.,

Subcase 2b: $l \equiv 1 \pmod{4}$

Define $f: V(G \circ K_b) \rightarrow \{-1,1\}$ by

$$f(v_i) = 1 \forall i, 1 \leq i \leq a \text{ and } f(v_{ij}) = \begin{cases} -1 \text{ if } & \frac{a-k-2}{2}+1 \leq i \leq a-2, 1 \leq j \leq b \\ & \text{or} \\ & i=a-1, 1 \leq j \leq \frac{b+2}{2} \\ & \text{or} \\ & i=a, 1 \leq j \leq \frac{b+l-3}{2} \\ & 1 \text{ otherwise} \end{cases} \quad \text{--- (T)}$$

$b \equiv 2 \pmod{4}, l \equiv 1 \pmod{4}$ implies $\frac{b+l-3}{2}$ and $\frac{b+2}{2}$ are even and $f[v] = 1 \forall v \in V(G \circ K_b)$

$w_f(G \circ K_b) = l + y$ (by (R))

$= l + \sum_{j=1}^{\frac{b+2}{2}} f(v_{(a-1)j}) + \sum_{j=\frac{b+2}{2}+1}^b f(v_{(a-1)j}) + \sum_{j=1}^{\frac{b+l-3}{2}} f(v_{aj}) + \sum_{j=\frac{b+l-3}{2}+1}^b f(v_{aj})$ (by (T))

$= l + \left[\left(\frac{b+2}{2} \right) (-1) \right] + \left[\left(\frac{b-2}{2} \right) (1) \right] + \left[\left(\frac{b+l-3}{2} \right) (-1) \right] + \left[\left(\frac{b-l+3}{2} \right) (1) \right] = 1 = m_{12} - 2$

Clearly, the weight is minimum.

Subcase 2c: $l \equiv 2 \pmod{4}$

Define $f: V(G \circ K_b) \rightarrow \{-1,1\}$ by

$$f(v_i) = 1 \forall i, 1 \leq i \leq a \text{ and } f(v_{ij}) = \begin{cases} -1 \text{ if } & \frac{a-k-2}{2}+1 \leq i \leq a-2, 1 \leq j \leq b \\ & \text{or} \\ & i=a-1, 1 \leq j \leq \frac{b+2}{2} \\ & \text{or} \\ & i=a, 1 \leq j \leq \frac{b+l-4}{2} \\ & 1 \text{ otherwise} \end{cases} \quad \text{--- (U)}$$

$b \equiv 2 \pmod{4}, l \equiv 2 \pmod{4}$ implies $\frac{b+l-4}{2}$ and $\frac{b+2}{2}$ are even and $f[v] = 1 \forall v \in V(G \circ K_b)$

$w_f(G \circ K_b) = l + y$ (by (R))

$= l + \sum_{j=1}^{\frac{b+2}{2}} f(v_{(a-1)j}) + \sum_{j=\frac{b+2}{2}+1}^b f(v_{(a-1)j}) + \sum_{j=1}^{\frac{b+l-4}{2}} f(v_{aj}) + \sum_{j=\frac{b+l-4}{2}+1}^b f(v_{aj})$ (by (U))

$= l + \left[\left(\frac{b+2}{2} \right) (-1) \right] + \left[\left(\frac{b-2}{2} \right) (1) \right] + \left[\left(\frac{b+l-4}{2} \right) (-1) \right] + \left[\left(\frac{b-l+4}{2} \right) (1) \right]$
 $= 2 = m_{13} - 2$

Since (U) is defined to satisfy (R), the obtained weight is minimum.

Subcase 2d: $l \equiv 3 \pmod{4}$

Define $f: V(G \circ K_b) \rightarrow \{-1,1\}$ by

$$f(v_i) = 1 \forall i, 1 \leq i \leq a \text{ and } f(v_{ij}) = \begin{cases} -1 \text{ if } & \frac{a-k-2}{2}+1 \leq i \leq a-2, 1 \leq j \leq b \\ & \text{or} \\ & i=a-1, 1 \leq j \leq \frac{b-2}{2} \\ & \text{or} \\ & i=a, 1 \leq j \leq \frac{b+l-1}{2} \\ & 1 \text{ otherwise} \end{cases} \quad \text{--- (V)}$$

$b \equiv 2 \pmod{4}, l \equiv 3 \pmod{4}$ implies $\frac{b+l-1}{2}$ and $\frac{b-2}{2}$ are even and $f[v] = 1 \forall v \in V(G \circ K_b)$

$w_f(G \circ K_b) = l + y$ (by (R))

$= l + \sum_{j=1}^{\frac{b-2}{2}} f(v_{(a-1)j}) + \sum_{j=\frac{b-2}{2}+1}^b f(v_{(a-1)j}) + \sum_{j=1}^{\frac{b+l-1}{2}} f(v_{aj}) + \sum_{j=\frac{b+l-1}{2}+1}^b f(v_{aj})$ (by (V))

$= l + \left[\left(\frac{b-2}{2} \right) (-1) \right] + \left[\left(\frac{b+2}{2} \right) (1) \right] + \left[\left(\frac{b+l-1}{2} \right) (-1) \right] + \left[\left(\frac{b-l+1}{2} \right) (1) \right]$
 $= 3 = m_{14} + 2$

Since (V) is defined to satisfy (R), the obtained weight is minimum.

Hence the theorem.

Remark 3.12:

In theorem 3.11, the values of k and l may or may not be equal.

Velammal et al.,

CONCLUSION

From the above results, it is clear that $\gamma_{sign}^*(G \circ K_b) \leq 4$ where G is any simple undirected graph on " a " vertices and $b \equiv 0 \pmod{2}$.

ABSTRACT

Benzodiazepines (BZD) can cause a variety of adverse effects, ranging from nausea and vomiting to mental impairment and memory disturbances. Whereas none of the side effects are small enough to be neglected, memory deficiency, motor impairment and vasorelaxation are of utmost importance as they aid the abusers for its utilization as a date-rape drug. These adverse effects take place through action pathways that are yet to be completely uncovered. This review provides the highlights of three main pathways and their crucial roles for the above-mentioned adverse effects, respectively. The studies are based on the pathways of NO:cGMP, L-arginine NO:cGMP and Endothelial NO-dependent and endothelium-independent, which are found to regulate memory deficiency, motor impairment and vasorelaxant effects caused by FNZ, respectively. The common findings of these research studies indicate that NO-related mechanisms could be involved in FNZ produced motor and memory failure in rodents. Nitric oxide (NO), a key bioregulatory molecule, is produced from L-arginine through a reaction catalyzed by nitric oxide synthase (NOS) and is thought to be essential in regulating neuronal excitability, synaptic plasticity, anxiety, seizure activity, and drug tolerance. Moreover, FNZ has showed to have a clear vasodilatory effect in isolated rat thoracic aortas through both endothelial-NO-mediated and endothelium-independent pathways. This review aims to help in discovering a strategical method in blocking or reversing the mentioned adverse effects and terminating the use of flunitrazepam as date-rape drug. Hence, getting a better understanding of FNZ action pathways can be helpful in building tolerance towards its adverse effects and increasing its therapeutic efficacy.

Keywords: Benzodiazepines, flunitrazepam, nitric oxide, date-rape drug.

**Aafiya A. Ganachari**

INTRODUCTION

Flunitrazepam(FNZ), commonly known by the brand name Rohypnol, is a potent sedative-hypnotic drug belonging to the benzodiazepine class. It is a sedative–hypnotic benzodiazepine that is used for the short-term treatment of insomnia, for premedication in surgical procedures, and for inducing anesthesia[1].FNZ is one of the most commonly abused benzodiazepines; nevertheless, it is unclear if BZD abuse is recreational in character or an abnormal drug use related with the drug's therapeutic utility[2]. BZD can cause a variety of adverse effects, such as nausea, vomiting, drowsiness, confusion, dizziness, shaking, poor balance, and memory disturbances. Memory deficiency and motor impairment are one of the many side effects of BZD along with vasorelaxant effects.

Flunitrazepam is frequently misused in social environments mostly involving bars, clubs, etc., often to render individuals helpless for the purpose of sexual assault.It is typically slipped into a person's drink without their knowledge. When used as a roofie, flunitrazepam can cause sedation, confusion, impaired coordination, and anterograde amnesia, making it difficult for victims to remember what happened while under its influence[3-5].FNZ can induce anterograde amnesia, which prevents the patient from recollecting any memories of the past events that have occurred after ingestion of the drug. This feature lends itself to its use as a "date-rape drug," which is frequently delivered in a bar or party ("club drug"), where it is unknowingly put into the beverages of victims who will then have little or no recall of the assault[6].Detecting the presence of flunitrazepam in a person's system can be challenging, as it is rapidly metabolized and eliminated from the body. However, specialized toxicology tests can detect its presence in urine or blood samples.

FNZ acts on the central nervous system (CNS) by enhancing the effects of gamma-aminobutyric acid (GABA), a neurotransmitter that inhibits brain activity. The mechanism of action of FNZ involves its binding to the type A-aminobutyric acid receptor (GABAA-R), an intrinsic membrane protein. Allosteric binding of another medication or modification of lipid phase dynamics near a receptor can lead to the structural changes of its binding site. Thus, knowledge of the modulation of FNZ–membrane binding, including binding to GABAA-R, is required for proper development of functional methods to evaluate FNZ quantity and function simultaneously.

GABA ligands, such as barbiturates, can allosterically regulate FNZ binding depending on the subunit composition of the receptor. For example, pentobarbital and etomidate inhibit $\alpha 1\gamma 2$ receptor binding of FNZ, while the same compounds stimulate $\alpha 1\beta 3\gamma 3$ receptor binding[7]. Perhaps more concerning is the finding that FNZ can act as an inverse agonist on $\alpha 6\beta 2\gamma 2$ receptors, causing insomnia instead of sedation and anxiety instead of anxiolysis, respectively[8]. The paradoxical effects of FNZ, such as hyperactivity, insomnia, aggression, hallucinations, and anxiety, may be explained by this inverse agonist pharmacology. These subtle variations can explain why certain benzodiazepines, such as FNZ, are more likely to be abused or trigger a stronger amnesic effect, more potent anxiolysis, or a strong sedative effect.

To certain extent, all benzodiazepines potentiate GABA binding to their receptor and cause CNS depression, which is clinically manifested as sedative, anxiolytic, and amnesic actions (Griffin et. al, 2013). Flunitrazepam, a high-potency benzodiazepine,can be used as a hypnotic to produce anesthesia and have a stronger anterograde amnesia effect. This property attributes an individual's failure to memorize the events from the moment of administration (parenteral) or after enough absorption of the drug (oral). Small therapeutic dosages of FNZ administered either intravenously or orally can obviously cause memory impairment, however, this effect is transient and appears to fade within 30 minutes of drug administration. GABA_A receptor activation has been found to affect memory formation in the hippocampus formation. Long-term potentiation (LTP) involving the N-methyl-D-aspartate (NMDA) receptor involve the excitatory amino acid transmitters glutamate and aspartate in plastic changes in neurons of this cerebral. FNZ induced LTP induction can be blocked by pre-administration of flumazenil, benzodiazepine receptor antagonist[9]. FNZ also has considerable vasodilatory characteristic, viz. the vascular smooth muscle relaxation, blood pressure reduction and a reflex rise in heart rate. The above characteristic is unique

**Aafiya A. Ganachari**

to this benzodiazepine. According to a clinical investigation, it was found that 2 mg of FNZ causes pleasurable feelings in healthy people[10].

In addition to its illicit use, flunitrazepam can also lead to dependence and addiction when used recreationally or in high doses. Chronic use of the drug can result in tolerance, where higher doses are needed to achieve the same effects, as well as withdrawal symptoms upon discontinuation. Withdrawal from benzodiazepines, including FNZ, is marked by rebound anxiety or sleeplessness, which may be accompanied by headaches, nausea, vomiting, and muscle tremors[11-14].

CLINICAL USES

Flunitrazepam is sometimes used in the short-term management of severe anxiety or agitation. However, due to its sedative effects and potential for abuse, it is generally not recommended as a first-line treatment for anxiety disorders[15]. In some medical procedures, it is given as a sedative, such as endoscopy or minor surgery, to induce relaxation and reduce anxiety. It is administered under strict medical supervision due to its potential for misuse[16]. Flunitrazepam is primarily indicated for the short-term treatment of severe insomnia. It is used when other treatments have failed or are not suitable, and its use is limited to a few weeks due to the risk of tolerance and dependence[17]. It also has muscle relaxant properties which can be utilized in the management of muscle spasms or stiffness. However, its use is generally limited to short-term treatment due to the risk of adverse effects and dependence[18]. Flunitrazepam may be used as a pre-anesthetic medication to induce sedation and reduce anxiety before surgery. It is often administered intravenously or orally in this setting[19, 20]. In some cases of status epilepticus (a life-threatening condition characterized by prolonged seizures), flunitrazepam may be used as an adjunctive treatment to help control seizures. However, other medications are typically preferred for this indication. Due to its anticonvulsant properties, it may be used in the management of certain types of seizures, however, this is not always advised seeing the risks associated with it, and is only used when all the other options have been exhausted[21]. In cases where the use of FNZ is inevitable, a risk-benefit ratio assessment can be done.

MISUSE OF FLUNITRAZEPAM

The misuse of flunitrazepam, is a significant public health concern due to its potent sedative effects and potential for abuse. Moreover, flunitrazepam exhibits characteristics of central nervous system depressants by inducing relaxation, sedation, and amnesia.

One of the most notorious aspects of flunitrazepam misuse is its association with drug-facilitated sexual assault (DFSA). Due to its potent sedative effects and amnesia-inducing properties, flunitrazepam is often used by perpetrators to incapacitate victims, making them vulnerable to sexual assault[22]. The drug is typically slipped into drinks without the knowledge of victim, leading to loss of consciousness, memory impairment, and difficulties in recalling events, which can hinder the victim's ability to report the assault [23, 24]. One of the key factors contributing to flunitrazepam's notoriety as a date rape drug is its potency and rapid onset of action. When mixed with alcohol or other beverages, flunitrazepam can intensify the sedative effects, leading to a quick and profound impairment of cognitive and motor functions[25, 26].

FNZ is also misused for recreational purposes, particularly in settings where individuals seek to enhance the effects of alcohol or other drugs. Some individuals misuse flunitrazepam to experience some euphoric effects associated with it, which can induce feelings of relaxation and tranquillity. However, recreational use of flunitrazepam is associated with a high risk of dependence, tolerance, and overdose, especially when combined with other substances [27, 28].

Chronic misuse of FNZ can lead to the development of dependence, characterized by physical and psychological reliance on the drug to function normally[29]. Individuals who misuse flunitrazepam may experience withdrawal symptoms when attempting to reduce or discontinue its use, including anxiety, insomnia, tremors, seizures, and hallucinations[30, 31].

If taken in high doses or combined with other central nervous system depressants such as alcohol or opioids FNZ can cause overdose. This may lead to severe respiratory depression, coma, and even death. The risk of dependence,

**Aafiya A. Ganachari**

withdrawal and overdose underscores the importance of careful prescribing practices and monitoring of flunitrazepam use [32-35].

ACTION PATHWAYS FOR FLUNITRAZEPAM**L-Arginine:NO:cGMP Pathway**

According to Talarek S. et. al., they conducted some rotarod and chimney experiments using mice to assess the motor impairing effects of FNZ. It was found that both a non-selective nitric oxide synthase (NOS) inhibitor, NG-nitro-L-arginine methyl ester (L-NAME), and an unselective neuronal NOS inhibitor, 7-nitroindazole (7-NI), blocked the development of tolerance to the motor impairing effects of FNZ. Additionally, L-arginine, a precursor of nitric oxide (NO) and a potent inhibitor of phosphodiesterase 5 (PDE5), did not affect the development of tolerance to FNZ-induced motor dysfunction in mice, as evidenced by sildenafil's lack of impact [36, 37].

Nitric Oxide

Nitric oxide (NO) is a key bioregulatory molecule produced from L-arginine through a reaction catalyzed by nitric oxide synthase (NOS) as seen in Fig. 1. Since 2010, research has further elucidated the diverse roles of NO in neuronal function. NO is considered essential in regulating various aspects of neuronal activity, including excitability, synaptic plasticity, anxiety, seizure activity, and drug tolerance [38].

NO mediates its effects by increasing the expression of cyclic guanosine 3',5'-monophosphate (cGMP) and modulating cGMP-dependent signaling. Upon synthesis, NO allosterically interacts with soluble guanylyl cyclase (sGC), leading to the production of cGMP. This molecule then regulates various downstream effectors, including cGMP-dependent kinases, cGMP-gated ion channels, and cGMP-regulated phosphodiesterases (PDE).^[38] The modulation of these effectors by cGMP plays a crucial role in mediating the diverse effects of NO in neuronal physiology [39, 40].

L-arginine:NO:cGMP and GABA:

There is compelling evidence supporting a link between L-arginine: GABA-mediated transmission and the nitric oxide (NO):cGMP pathway in the central nervous system (CNS). Neurotransmitters such as nitric oxide (NO) and gamma-aminobutyric acid (GABA) play crucial roles in neuronal communication and are intricately interconnected. Studies have shown that neuronal nitric oxide synthase (NOS)-positive neurons are co-localized with GABA-positive neurons in various regions of the CNS, including the cerebral cortex and spinal cord, as revealed by histochemical mapping [41-43]. Activation of GABAergic neurotransmission has been shown to result in the production of NO in the animal cortex, highlighting the close relationship between these two systems [44]. Furthermore, NO has been shown to modulate GABA release and uptake in the CNS, suggesting a regulatory role for NO in GABAergic neurotransmission [45, 46]. This intricate interplay between L-arginine: GABA-mediated transmission and the NO:cGMP pathway underscores the complexity of neuronal signaling in the CNS.

Flunitrazepam has been shown to modulate the L-arginine:NO:cGMP pathway in the CNS. Studies have demonstrated that flunitrazepam can alter NO production and cGMP levels in the brain, suggesting a potential interaction with this pathway [47]. Flunitrazepam's effects on the L-arginine:NO:cGMP pathway may contribute to its pharmacological actions, including sedative-hypnotic and anxiolytic effects, by modulating neurotransmission and synaptic plasticity [48, 49].

According to a study conducted by Talarek et. al., using animal models, it was noticed that tolerance to motor impairment can be blocked with the use of nitro-L-arginine methyl ester (L-NAME) and 7-nitroindazole, both being indirect and direct inhibitors of nitric oxide synthase, respectively [50, 51]. Chronic administration of NOS inhibitors and FNZ is thought to prevent GABA-A receptor inhibition, thus helping manage symptoms related to cognition. The activation of N-methyl-D-aspartate (NMDA) receptors help to synthesize more amounts of NO [52, 53]. Drugs that function on the GABA-A receptors, (such as benzodiazepines, barbiturates, and alcohol) cause motor impairing

**Aafiya A. Ganachari**

effects. When NMDA receptor antagonists, (such as amantadine, ketamine and dextromethorphan) are given along with these drugs, the development of tolerance to their motor impairing effects is reduced. Hence, the investigation conducted by Talarek et. al., has gathered some behavioral evidence from animal models that the L-arginine:NO:cGMP pathway can play a key role in the development of FNZ tolerance.

NO-cGMP Pathway

BZDs can cause a variety of adverse effects, such as emesis, disorientation, confusion, dizziness, shaking, poor balance, and memory disturbances. Memory deficiency is one of the many side effects of BZDs, which restricts their use in conditions like anxiety, insomnia, and seizures[54]. These medications inhibit episodic memory, which allows people to remember experiences that they have personally witnessed. There are three primary forms of memory viz., sensory memory, short-term memory, and long-term memory. Amongst which it is the short-term memory which seems to sustain the most damage from FNZ[55]. Short-term memory, often referred to as working memory, is a crucial component of cognitive function responsible for temporarily storing and manipulating information.

Memory and GABA_A receptors:

Memory consists of three stages: acquisition, consolidation, and retrieval[56]. FNZ interferes namely with the initial stage of memory process which enables it to start the pathway of anterograde amnesia. This in turn leads to activation of GABA-A receptors which facilitate the amnesic effect of FNZ. Any new information that a person wants to learn is not possible if some certain new connections in neurons and memory are not made. Thus, this is also one of the ways that FNZ affects development of any new memory. Apart from these, some modifications in the synapse transmission of hippocampus region have also been documented to trigger amnesic effects of FNZ. This is enabled as the hippocampus region has binding sites for the GABA-A receptors to bind on. Another one of the mechanisms, that FNZ is known to interfere with is the long-term potentiation which is thought to lead to learning and memory processes[55].

Nitric oxide (NO) is a vital signaling molecule which is produced from the amino acid L-arginine by the enzyme nitric oxide synthase (NOS)[54]. NO is particularly important in the nervous system, where it regulates neuronal excitability and synaptic plasticity, which are crucial for learning and memory. Furthermore, NO is thought to contribute to drug tolerance, affecting how the body responds to certain medications over time. There are four isoforms of NOS out of which the neuronal, nNOS is predominantly found in neurons and is involved in neurotransmission[57]. NO is believed to play a key role in LTP, influencing learning and memory processes. In various rodent memory models, it has been discovered that inhibiting NOS behavior impairs cognitive reactions. NO donors, L-arginine and molsidomine may help to counteract these negative effects[58]. The fluctuation in levels of NO in the body are also caused by some neurological disorders such as epilepsy and anxiety. These fluctuations have been linked to impair the process of memory formation. Here, some drugs which are also donors of NO, such as sodium nitroprusside and molsidomine can be used to counteract the impairment of cognition[59].

NO helps in production as well as reuptake of many neurotransmitters including even GABA[60, 61]. For instance, the release of GABA in the cerebral cortex, hippocampus, and striatum is positively correlated to great amounts of NO concentration in the CNS[62]. The authors Orzelska et. al., have conducted a research study in animal models comparing the effects of diazepam and flunitrazepam in a novel object recognition (NOR) task. Here two different memory models NOR and mEPM were used. Wherein, the NOR is a behavioral test that is used to model human amnesia in animals. It takes advantage of rodents' natural desire to investigate new items and assesses their ability to remember what they have seen. mEPM, which is a rodent spatial memory model, is another animal model of amnesia. It takes advantage of their inherent aversion to open, elevated spaces. In the mEPM procedure, memory impairments were verified whereas, in the NOR test anterograde amnesic effects were seen. Adding to this a similar study was conducted recently which showed that flunitrazepam enhances memory consolidation in the object recognition task, potentially through modulation of the NO-cGMP pathway[63].

In behavioral studies it has been noticed that sildenafil, a phosphodiesterase (PDE-5) inhibitor and methylene blue, a soluble guanyl cyclase inhibitor, reduces memory damage due to FNZ. Here it showed that memory impairment due

**Aafiya A. Ganachari**

to FNZ can be reversed by using methylene blue. Many recent behavioral studies have found that the cGMP levels improve learning and memory processes by inhibiting PDE, especially PDE-5[64-66]. It acts as a cognitive enhancer by interfering with transduction of signal in the NO:cGMP pathway. The selective behavior of methylene blue or sildenafil on particular GABA-A receptor subunits may be a reason for the divergent effects of both the drugs. It is worth noting that in this analysis, both sildenafil and methylene blue did not show any significant difference in NOR and mEPM models when given alone; as opposed to when they were administered along with FNZ. Based on the findings, we can deduce that NO-related mechanisms could be involved in FNZ-induced memory failure in rodents and perhaps in humans too.

Endothelial-NO-mediated and endothelium-independent pathways**Direct Vasorelaxant Action:**

The endothelial NO-mediated pathway refers to the production of nitric oxide (NO) by endothelial cells in response to various stimuli, including shear stress and neurotransmitters. NO, in turn, plays a crucial role in vasodilation and neurotransmission. Endothelium-independent pathways involve the direct effects of drugs on vascular smooth muscle cells, bypassing the need for endothelial NO production. These pathways can be activated by exogenous NO donors or by drugs that directly activate guanylate cyclase, leading to the production of cyclic guanosine monophosphate (cGMP) and subsequent smooth muscle relaxation[67]. It can be understood with the help of Fig. 2. Flunitrazepam's effects on endothelial cells may involve oxidative stress[68]. Flunitrazepam has been implicated in endothelial dysfunction, a condition characterized by impaired NO production and vascular dysfunction. Research has shown that flunitrazepam can modulate NO production in rat cavernous tissue by down-regulating nitric oxide synthase (NOS) and phosphodiesterase type 5 (PDE5) expressions, leading to increased NO levels and enhanced smooth muscle relaxation[47]. The involvement has been clearly noticed in all the three pathways (Fig 3).

According to a study flunitrazepam when given orally at night for four weeks, resulted in a substantial reduction in nighttime blood pressure in healthy volunteers aged 21 to 30[69]. It was observed that in healthy volunteers that there were reduced levels of systolic as well as diastolic blood pressure[70]. In a few studies, it has been observed that BDZs such as diazepam[71], flunitrazepam[72], flurazepam[71], midazolam[74] and tetrazepam[73] show a direct action on arteries in animal models and cause vasodilation. Studies have also suggested that chronic use of flunitrazepam may contribute to endothelial dysfunction and cardiovascular risk[75].

A study by Zhang et al., investigated whether NO from vascular endothelium is involved in the relaxation induced by four benzodiazepines all of which are known for their vascular relaxing effects. The study found that the arterial relaxation induced by these drugs, as well as by L-NAME (N ω -Nitro-L-arginine methyl ester), a NO synthase inhibitor, was significantly inhibited after endothelium denudation, suggesting the involvement of endothelial NO in the vasorelaxant effects of these drugs[76]. Other study reports found that treatment with BDZs increased NO production in endothelial cells, suggesting a potential mechanism for the vascular relaxing effects of these drugs[77]. Hence, if this vasodilatory action of FNZ is interrupted then the side effects, such as dizziness and palpitation can also be inhibited.

CONCLUSION

Despite its beneficial applications, FNZ remains predominantly utilized for its adverse effects. NO, the key bioregulatory molecule, contributes to all the main pathways through which flunitrazepam induces its primary adverse effects. NO is particularly important in the nervous system, where it regulates neuronal excitability and synaptic plasticity, which are crucial for learning and memory. Flunitrazepam's effects on the L-arginine:NO:cGMP pathway contribute to its sedative-hypnotic and anxiolytic effects, by modulating neurotransmission and synaptic plasticity. The studies included in this review have demonstrated that flunitrazepam can alter NO production and cGMP levels in the brain. In behavioral studies it has been noticed that sildenafil and methylene blue reduce memory damage due to FNZ and thus, it can be used to reverse the memory impairment due to FNZ. Also, it has been

Aafiya A. Ganachari

observed in the endothelial pathways that production of increased levels of NO due to modulation cause enhanced smooth muscle relaxation which eventually lead to drowsiness. Hence, all the findings from different studies give us an understandable perspective towards the workings of FNZ and its adverse effects. In conclusion, we would like to suggest that further study is required to find a possible way to interrupt the interaction of FNZ with the pathways of NO combined with L-arginine, cGMP and endothelial tissues which can help minimize or even alter the adverse effects of FNZ.

ABSTRACT

The primary goal of this proposed work is to enhance the synchronization of media parameters by optimizing grid process running time. The work is divided into four main tasks: estimating grid process running time, optimizing loading harmonization, clustering media parameters based on instructional and media factors, and improving load balancing. The aim is to ensure that a shared media object can be efficiently delivered to a large number of users simultaneously through effective harmonization and clustering. This approach is designed to reduce grid process running time for the same media object, even with a high number of users accessing it at the same time. The clustering in this study is categorized into Instructional Parameters and Media Parameters, with a primary focus on media parameters, particularly in the context of massive clusters. The subsequent category involves load harmonization based on Poisson distribution, where the average and actual numbers of successes from experiments are analyzed. This approach aims to understand and optimize massive clusters within learning grids.

Keywords: harmonization, e-content, grid, load balancing.

INTRODUCTION

Information Technology has advanced significantly over the past twenty five years, leading to a gradual rise in the use of online courses. These courses are typically divided into instructional and media categories. When a single file (a shareable object) is accessed by many users simultaneously, the loading time for that file can increase. To address

82201

Elangovan and Radha

this issue, the proposed work focuses on reducing loading times through harmonization and clustering techniques[1]. The proposed work is shown in the following Figure 1. Initially when the user searches the appropriate documents for learning through Electronic-content developments.

PROPOSED WORK

E-content is becoming a standard due to its flexibility in terms of time, location, and pace of learning. It encompasses all types of content created and delivered through various electronic media and is available across a wide range of subjects and educational levels. E-content caters to diverse learners with different needs, backgrounds, and levels of experience and skill. It can be easily and quickly shared among a vast number of users globally. Both teachers and students benefit from the use of simple and advanced e-content, which offers significant advantages to educational institutions by making their programs accessible in various settings such as fields, homes, and community learning centers. This has profound implications for open and distance learning institutions.

E-content development has seen substantial growth over recent decades, leading to a surge in online learners and the rise of platforms like MOOCs (Massive Open Online Courses), NPTEL (National Programme on Technology Enhanced Learning) and Coursera, which offer unrestricted participation and open access via the internet. Besides traditional materials such as recorded lectures and problem sets, many courses on these platforms now incorporate interactive elements like user forums for community interaction and instant feedback on quizzes to enhance the learning experience. NPTEL, introduced in 2006 and gaining popularity in 2012, initially focused on open-access principles, including open licensing to encourage the reuse of resources, though some courses have since adopted closed licenses while maintaining free access. Similarly, Coursera, launched in 2012, provides a wide range of courses from top universities and institutions, often featuring a mix of open and proprietary content[4]. Today, online courses from platforms like MOOC's, NPTEL and Coursera are increasingly utilized by schools, colleges, companies, and individuals seeking certifications. A major challenge for these platforms is efficiently distributing content to a large number of users, which involves managing one-to-many or many-to-many interactions. To address this, the concept of shareable common objects has been introduced.

Shareable Common Object (SCO)

A Shareable Content Object (SCO) represents the fundamental unit of learning within the SCORM framework. Depending on the context, it may be called a module, chapter, or page. The defining feature of an SCO is its diverse range in size and content. As per the SCORM (Shareable Content Object Reference Model) standard, an SCO should be the smallest unit of content that is both reusable and self-contained[3]. In a Learning Management System (LMS), an SCO is individually listed in the table of contents and tracked separately from other content. It includes its own marker, score, and completion status, as illustrated in Figure 2. A significant challenge with Shareable Content Objects is managing the delivery of content from multiple servers to a large number of clients. This issue can be addressed through Load Balancing. Load Balancing is a method used to distribute tasks or requests across several computers. For example, if many users are seeking e-content on C-Programming, specifically about while loops, Load Balancing ensures that the content is provided to all users promptly. Regardless of whether there are tens, hundreds, thousands, or even millions of users, optimizing Load Balancing for Shareable Content Objects helps manage the distribution effectively. The figures illustrating Load Balance's are shown below.

Load Balancing can be enhanced through the use of clustering. In the realm of e-content development, clustering is a key approach. A cluster typically consists of multiple servers running the same application. This setup serves two main purposes: to distribute the load across different servers and to provide redundancy and fail-over mechanisms[2]. Within a cluster, tasks are evenly distributed among the servers. This method is most effective when all servers have the same capabilities and each task requires a similar amount of effort. The sample e-content are classified into four ways as shown in Figure 4. First it includes normal languages used in the real world environment; second, e-content is related to the mechanical studies; Third, e-content is related to the business management people and Fourth, e-content are categorized into programming languages used in the computer programming

Elangovan and Radha

By analyzing the Shareable Content Object file and its memory usage, you can determine its performance in a grid processing environment using GridSim 5.0. Grid computing technology is increasingly used to deploy e-learning content over the internet, as e-learning environments often require substantial computing resources to support a large number of simultaneous users. Consequently, both software and hardware need to be frequently updated or upgraded to accommodate these demands[1]. Large learning grid could be a machine cooperative setting for effectively endeavor massive pools of e-learners of the online that is turning into vogue the. One among the basic problem in such grid environments is job programming, that is required for achieving higher performance As grid setting is mostly suburbanized and it consists of heterogeneous systems, economical programming technique would be noticeably required for sound acceptable resources for relevant e-content; say massive or little or the e-content.

Load harmonization based on grid process running time has been applied to media parameters in large-scale learning grids. For massive open online courses (MOOCs), load harmonization for media parameters is estimated using a Poisson distribution. The proposed work is categorized into four areas: grid process running time, harmonization, clustering, and load balancing. The size and memory usage of each Shareable Content Object can be determined through Java programming. When many users access the same Shareable Content Object, these metrics can be calculated for each experimental trial using the Poisson distribution.[3]

Find out the chances of occurrence of a number of events in some given time interval or given space conditionally that the value of the average number of occurrence of the event is known. In a dynamic learning grid environment with a vast amount of knowledge and numerous users, virtual warehousing can be utilized for storing and retrieving data. Virtual warehousing, a crucial technology in e-commerce, offers flexibility in managing large datasets. One of its main benefits is cost reduction, as it eliminates the need to structure individual data sets for many concurrent users, allowing multiple learners to access a single data source. Additionally, using independent and Poisson probabilities to minimize redundant computations within learning grid clusters can conserve computational resources for thousands of simultaneous users.

EXPERIMENT AND RESULT

The following shows the instructional objects based on the file size and the memory utilization and the processing times are calculated using GridSim 5.0. File size and Memory are measured in terms of Kilo Bytes. Grid processing time is measured in terms of milliseconds.

- The file size of the 'definable' instruction object in storage is 188KB; and its size in memory is 186.6KB; processing time by the GridSim 5.0 would be around 2300 ms (excluding user retention time).
- The file size of the 'demonstrable' instruction object in storage is 654KB; and its size in memory is 651KB; processing time by the GridSim 5.0 would be around 14300 ms.
- The file size of the 'solvable' instruction object in storage is 362KB; and its size in memory is 660.7KB; processing time by the GridSim 5.0 is around 8600 ms.
- The file size of 'perceivable' instruction object in storage is 160KB; and its size in memory is 158.8KB; processing time by the GridSim 5.0 would be around 1800 ms.
- The file size of the same content integrated into a single document is about 1346KB; size the same in memory is 1340KB; processing time by the GridSim 5.0 would be around 28350 ms (excluding user retention time).
- With authorized research support [Kaladevi 2013], the average computational ratio of Definable , Demonstrable , Solvable , Perceivable has been empirically worked out to be about: 1.00 , 4.00,,3.00 , 0.75 (i.e 11.5% : 46% : 34.5% : 8%), which is more or less matching with size and computational time.
- In a similar empirical study on media categories with authorized research support [Jagadeesan, B 2014], the average empirical computational ratio of Textual: Graphical: Animation is about 1.00 , 1.10 , 1.30 (i.e 28% : 33% : 39%) respectively.

Elangovan and Radha

The above Table 1 shows the summarized the specification, trials and range for the samples and inputs for the proposed experimental setup. Tasks of massive users take 10, 50, 100, 200 and 400 experimental trials of tasks. Clusters or Resources for creation of task for massive

users takes trial ranges from 1000 to 10000. Massive clusters that would be grouped into resources that can be varied different ranges and will be decided through first experiments. Parameters for selection of clusters for experimental trials are trust based performance based and to remove the redundancy.

The above table 2 shows the grid processing time of Instructional parameter. For Each category of instructional parameters the experimental trials of tasks are taken from 1000 to 10000. Instructional Parameters are Definable, Demonstrable, Solvable and Perceivable.

Definable cluster or task ratio is 4,

Demonstrable cluster or task ratio is 8,

Solvable cluster or task ratio is 5

Perceivable cluster or task ratio is 7

Based on the cluster or task ratio and experimental trials of task average grid processing time are calculated by using GridSim 5.0

Above table 3 shows the grid processing time for Media parameter. For Each category of media parameters the experimental trials of tasks are taken from 1000 to 10000. Media parameters are Textual, Graphics, and Animations.

Textual cluster or task ratio is 8,

Graphics cluster or task ratio is 9,

Animations cluster or task ratio is 11

ABSTRACT

Pregnancy, a significant life event, poses dangers for both the mother who is carrying the child and the developing fetus. Machine learning (ML) is essential in the medical field, specifically for healthcare diagnosis, assessment, and therapy. Conventional diagnostic methods may encounter difficulties in accurately diagnosing high-risk pregnancies, leading to potential complications and adverse outcomes for both the mother and the fetus. Recent advancements in machine learning (ML) algorithms have demonstrated remarkable efficacy in detecting and predicting high-risk pregnancies by analyzing a range of clinical, physiological, and behavioral data. This review study describes the supervised and unsupervised learning approaches used to identify high-risk pregnancies. Machine learning algorithms offer benefits in identifying high-risk pregnancies. Some of the advantages include prompt action, enhanced precision, and tailored treatment approaches. Implementing machine learning can lower the expenses associated with costly medical interventions.

INTRODUCTION

Pregnancy, a significant life event, poses dangers for both the mother who is carrying the child and the developing fetus. Machine learning (ML) is essential in the medical field, specifically for healthcare diagnosis, assessment, and therapy. Conventional diagnostic methods may encounter difficulties in accurately diagnosing high-risk pregnancies, leading to potential complications and adverse outcomes for both the mother and the fetus. Recent advancements in machine learning (ML) algorithms have demonstrated remarkable efficacy in detecting and predicting high-risk pregnancies by analyzing a range of clinical, physiological, and behavioral data. This review study describes the supervised and unsupervised learning approaches used to identify high-risk pregnancies. Machine learning algorithms offer benefits in identifying high-risk pregnancies. Some of the advantages include prompt action, enhanced precision, and tailored treatment approaches. Implementing machine learning can lower the expenses associated with costly medical interventions [1]. While technological developments in obstetrics and gynecology have been considerable, it is crucial to realize that not all dangers can be entirely removed [2].

According to World Health Organization in 2020, around 800 women died during pregnancy due to different risk factors involved during pregnancy. Every day in 2020, about 800 women died from pregnancy and childbirth-related causes that may have been avoided. In 2020, a mother's death apparently happened every two minutes. Between 2000 and 2020, the global maternal mortality ratio (the number of pregnancy - related deaths per 100,000 live births) lowered by approximately 34% [3]. Numerous machine learning methods and technology is used for pregnancy related diseases. Stress detection of working lady during pregnancy by using neural network .In a recent studies a semi-supervised machine learning to predict pregnancy related risks in Philippines [4]. A supervised learning was used to detect pregnancy risk due to hypertension, in this study, graph-based SSL was used to simultaneously incorporate labeled and unlabeled data in order to predict pregnancy-related HTN [5]. In 2022, a research was done on creation of a cerebral infarction (CI) threat prediction using machine learning techniques to mine huge data from common test results [6]. Preeclampsia is an anomaly of pregnancy that appears after 20 weeks of pregnancy and is characterized by proteinuria and hypertension and research as done on algorithms for detection of these risks using deep learning and neural network [7].

The study by [8] examined the effectiveness of three classification algorithms: the logistic regression classifier, rule-based classifier, and RF classifier [9]. They made use of the PhysioNet [10] Term-Preterm EHG database. With a sensitivity of 97%, specificity of 86% AUROC of 94%, a mean square error rate of 14%, the RF classifier performed the best. There was no reported accuracy rate, false positive rate (FPR), or false negative rate (FNR). Another study shows the potential of utilizing machine learning techniques to forecast the lifetime of preterm children based on clinical & demographic factors. The creation of the PISA predictor may enable healthcare professionals to make better choices regarding the preterm newborns they treat and care for, thereby improving their patients' outcomes [11]. Another study used graph-based semi-supervised learning to create a prediction model for pregnancy-related hypertension. In comparison to the most recent clinical recommendations and a predictive biomarker, the model had a greater predictive accuracy. The best average model parameters was demonstrated by the top 11 variables chosen by feature selection, with a mean AUC of 0.89 with training dataset & 0.81 in the test set. Using common clinical characteristics, the suggested model may successfully predict the onset of hypertension associated in pregnancy in the early stages of pregnancy [12].

In an effort to enhance prenatal care in remote areas of low- and middle-income nations, the paper suggests adopting portable ultrasound devices, blood and urine testing to identify high-risk pregnancies and send them. In order to care for 10,108 pregnant women over the course of two years and three months, the Healthy Prenatal project, a case study, trained migratory nurses and provided them with mobile ultrasound systems and tests. The findings demonstrated that nursing personnel may quickly identify and refer the majority of obstetric concerns, helping to lower maternal mortality, with the right tools, training, and supervision. The study emphasizes the strategy's potential to enhance maternity care in rural low- and middle-income nations [13].

**Mohit Lal Sah et al.,**

Another study with an objective to examine the outcomes of both Deep Learning & Neural Network models in order to predict the risk of preeclampsia in pregnant women. A particle swarm optimization (PSO) algorithm was used to minimize the number of features from 17 to 9, using the study's 1077 patient data as input. In comparison to the original data, the results indicated that Deep Learning executed more quickly and had an accuracy of 95.12% while using the raw data and 95.68% when using the smaller dataset. The variety of attributes could be greatly reduced with PSO while preserving and enhancing precision. Deep Learning has been demonstrated that it's an effective edge framework that does not need sophisticated systems or in-depth data analysis [7]. The study was conducted in rural India, where the prevalence of preterm delivery is high and there are little resources available to support pregnant women and new babies. The authors want to create a model that could forecast the likelihood of preterm birth and help with intervention decision-making. Several machine learning models, such as logistic regression, decision trees and support vector machines, were developed and tested by the authors. Accuracy, specificity, and sensitivity are used to evaluate the classifiers' performance. Finally, compared to the other learning classifiers utilized in this study, the SVM classifier provides an accuracy of 90.9%[14].

A systematic review was conducted to evaluate the entire artificial intelligence model in pregnancy related risks and labor after conducting a thorough search of numerous databases. A total of nine categories of AI applications were discovered, including pregnancy risk evaluation, prenatal diagnosis, pregnant hypertensive problems, stillbirth, foetal growth, premature deliveries, delivery route, and others. The best artificial intelligence application for evaluating medical issues, in accordance with this systematic review, is ANN approaches. It has been determined that ANN approaches typically have an accuracy of 80–90%. The authors have included papers that apply AI-based algorithms for forecasting adverse affects during pregnancy. The notion that this publication offers a critical examination of the many research is one of its advantages [15]. A random forest regression technique was used in the study discussed in the content to create a prediction models for GDM in pregnant women. Around 4800 pregnant women's data were gathered, and the researchers used a literature review, expert discussion, and 67 indications of GDM to identify them. According to the study, the generated model performed well, with overall predictive accuracy for the F1 data set of 93.10% as well as an AUC of 0.66 and overall predictive accuracy for the F2 data set of 88.70% and 0.87 respectively [16]. The literature on the application of affective computing and artificial intelligence to pregnancy health was examined in this scoping review, which covered the years 2008 through 2020. Although the study revealed that emotional well-being can be a substantial risk factor throughout pregnancy, there is currently a dearth of research on automated emotion analysis. According to the review, future studies should concentrate on creating AI & affective computing-based products to improve the health and wellbeing of expectant mothers [17]. Another study was designed in order to reduce the danger of multiple pregnancies and maintain the best pregnancy odds, the goal of this study was to build artificial intelligence algorithms that could forecast the pregnancy result and repeated pregnancy risk after IVF-ET. Among the six machine learning techniques employed for model development, XGBoost performed the best. The dataset includes 1507 fresh embryo transfer cycles. The accuracy, sensitivity, specificity, and AUC values for the pregnant women prediction model were 0.716, 0.711, 0.719, and 0.787, respectively. With an accuracy of 0.711, specificity of 0.740, sensitivity of 0.649 and AUC of 0.732, the multiple pregnancy prediction method performed well. According to the study, using AI models to reduce the probability of multiple pregnancies following IVF-ET is a promising strategy [18].

DISCUSSION

A number of studies have revealed that the use of Machine learning can reduce high-risk during pregnancy. A decision tree method was employed in one study to predict preterm birth using information on the mother's demographics, previous health history, and foetal growth. In terms of predicting preterm birth, the algorithm has a sensitivity of 79.4% and a specificity of 81.6% [19]. Another study was conducted considering maternal health and demographic information using a random forest algorithm to forecast gestational diabetes. The system successfully predicted gestational diabetes with an area under the curve (AUC) of 0.77 [20].

Mohit Lal Sah et al.,

Deep learning-based neural networks have been utilized to solve a variety of challenges in several disciplines in recent years. Deep neural networks learn complicated relationships between variables using layered design. A well precise decision support system is required to obtain accurate outcomes from the diagnosis procedure while minimizing costs. Classification of diseases based on multiple characteristics is a difficult work for human professionals, but AI can help to detect and handle such risks. Several AI techniques are currently being applied in the field of medicine to accurately diagnose illnesses. AI is a component of computer science that allows computers to become more intelligent [21].

Initially, rule-based decision-making was the main component of AI techniques that was commonly utilized in healthcare. Because they can perfectly mimic the physicians' own decision-making process, AI solutions that use rule-based decision-making fit in with the clinical setting organically. MYCIN was one of the initial rule-based decision-making algorithms. MYCIN was created in 1974 to forecast the best course of treatment for certain bacterial illnesses. It was created as "expert system" that would use a sequence of if-then statements to direct therapists towards the best course of action. It would take another 20 years for these "expert" rule-based systems to be used for the first time, in 1994, when a rule-based predictor of the risk of preterm birth was created. An application of AI known as machine learning (ML) permits learning without explicit programming. An artificial neural network (ANN), a common ML technique, is created to approximate how biological neural networks process data. We identified three main areas where applying AI techniques could help us better understand the pharmacological impacts of pregnancy, including: Acquiring significant and trustworthy information from clinical records; establishing efficient animal experiments to test particular ideas; designing decision-support tools that guide decisions [22].

It has been 25 years since the first AI tool for a woman's health issue—preterm birth—was created, and 45 years since the creation of the first AI system with a health focus. Recently, two studies published in the New England Journal of Medicine brought attention to the critical need for novel approaches to study pharmaceutical effects in both pregnant and lactating women [23]. 90 percent of pregnant women take a pharmacologic at some point during their pregnancy, according to Eke et al. and Mitchell et al., and between 70 and 80 percent of pregnant women gain a pharmacologic during the first trimester of their pregnancies, which is the most dangerous due to congenital anomalies and unfavorable foetal outcomes [24]. We have seen previous work done on utilizing different machine learning algorithms in pregnancy related risk analysis. We can differentiate these models on the bases of their sensitivity, accuracy and precision. We can use these factors to check which model is best for risk detection.

Types of machine learning

We broadly classify machine learning into three categories²⁵ and in some papers they are classified in four categories [26].

- **Supervised learning:** This kind of machine learning entails using labeled data to train the algorithm. It makes use of a dataset where every observation has a corresponding label or result. Then the model uses this information to make predictions on unseen data. Image recognition, speech recognition, and home price forecasting utilizing factors like location, bedroom count, and square footage are all common uses for supervised learning [27].
- **Unsupervised Learning:** The algorithm is trained with unlabeled data in this sort of machine learning. It looks for patterns or clusters in the dataset without knowing what the results should be in advance. Unsupervised learning frequently uses clustering, in which the algorithm groups together data points with similar characteristics [27].
- **Semi-Supervised Learning:** Unsupervised and supervised learning are combined in semi-supervised learning, a kind of machine learning. It entails putting the algorithm through training on a dataset containing both labeled and unlabeled data. While making predictions, the algorithm applies the patterns it has learned from the labeled data to the unlabeled data. When labeled data is expensive or challenging to collect, semi-supervised learning is advantageous [28].
- **Reinforcement Learning:** With this kind of machine learning, a decision-making algorithm is trained to take into account mistakes and previous decisions [29]. By acting and getting rewards or penalties for such behaviors, the

Mohit Lal Sah et al.,

algorithm operates from its surroundings. Throughout time, the aim is to increase the benefits and decrease the penalties. Robotics, video games, and autonomous cars frequently use reinforcement learning [28].

Analysis of machine learning algorithms

From different researches papers we observed different parameters that were mostly used for the analysis of machine learning algorithms. Following are some of the parameters

Accuracy

One of the most often applied evaluation measures in machine learning is accuracy. It calculates the proportion of accurate predictions of a model on a specific dataset makes. Accuracy is specifically determined by the proportion of the number of correct predictions to the sum of all the predictions [30].

It can be calculated by the formula: $AC = \frac{TP + TN}{TP + TN + FP + FN}$

Precision

The proportion of true positives, or instances of a particular class that are properly identified, among all positive predictions that are made by a model, is measured by precision, an extensively used evaluation metric in machine learning [31]. It can be calculated by the formula: $P = \frac{TP}{TP + FP}$

Recall

Recall is a metric that is used to measure how well a model performs at correctly identifying every relevant instance in a dataset. Out of all positive cases in the dataset, it calculates the proportion of real positive instances that the model properly detected [32].

It can be calculated by the formula: $P = \frac{TP}{TP + FN}$

1. F represents the equilibrium in between P and R values. Since we care more about labour data in our results, a higher F value indicates a stronger classifier.

It can be calculated by the formula: $F = \frac{2 * P * R}{P + R}$

2. F1 score

F1 score is a parameter that is frequently used in data analysis along with machine learning to assess how well a classification algorithm is performing. It refers to the harmonic mean of recall and precision, two additional often employed measures. A higher score on the F1 scale, which spans from 0 - 1, indicates superior performance. Using different algorithms for machine learning in pregnancy-related risk analysis has been the focus of past research. These models can be distinguished based on their sensitivity, accuracy, and precision. These elements enable us to assess which model is the most effective at identifying risks.

FINDINGS

Algorithms used in pregnancy related risk

The degree to which a person can accurately predict the result of a model that has been well-accepted by the clinical team is referred to as the applicability of ML models. From the previous papers I came across, the support vector machine, neural networks [33], decision tree, Naive Bayes, logistic regression, deep learning and random forest [34]. ML techniques were most frequently employed to predict pregnancy related problems. In which it was noticed that the highest AUC value was 0.95 for SVM [2].

Model validation methods

Validation procedures are approaches used in machine learning (ML) to assess how well a trained model performs on incoming, unknown data. These techniques measure a model's ability to generalize and generate precise predictions on data that it has never seen before. Three widely used techniques for validating Machine learning algorithms are cross-validation, testing, and training.

Mohit Lal Sah et al.,

- **Training:** When a model is trained, its parameters are adjusted to reduce error on a particular collection of data known as the training set. Usually, an optimization algorithm like gradient descent is used for this.
- **Testing:** Testing is the process of assessing the model's performance using a unique data that it has never seen before. The testing data is used to calculate the model's generalization error, or how well it can predict outcomes using brand-new, untested data.
- **Cross validation:** By dividing the given data into numerous subsets, or "folds," cross-validation is a method for assessing the efficacy of a model. A subset of the data is used to train the model, while the remaining subset is used to test it. Several subsets are employed for training and validation during the course of this process's repetition. To estimate the model's performance, the results are averaged.

Predictive aspects

Studies outline the key aspects of pregnant women that may be important in predicting risk. High-ranking factors for the prediction of premature births include the mother's age, the presence of chronic arterial hypertension, gestational diabetes, Preeclampsia [35], heart disease [36], underlying illnesses, gestational hypertension disorders, Fetal growth restriction (FGR) and the father's nationality. It is also crucial to distinguish between provider-initiated spontaneous preterm births and unplanned preterm births [22].

Pre-labor rupture, placenta praevia, and an unspecified antepartum haemorrhage were among the obstetric problems. Preeclampsia, rupture of membranes, threatened miscarriage, preterm birth, infection of the urinary tract, gestational hypertension, and gestational diabetes are some conditions that may occur [37].

Generalized methodology

Machine learning algorithms use technique to evaluate large datasets in order to identify patterns that may be used to build a model that can be used in future for prediction. In the realm of perinatal care, these algorithms can be trained on enormous quantities of data relating to prenatal care, foetal development, and neonatal outcomes to detect potential risks and forecast future concerns. Methodology was divided into six sequentially steps

1. Data gathering and preprocessing: Gather information that is pertinent to your work and prepare it for the model by cleaning, converting, and normalizing it.
2. Model selection: Based on the type of information, the quantity of data, and the difficulty of the task, selects a suitable machine learning algorithm.
3. Model training: Apply the chosen algorithm to the preprocessed data to train the model.
4. Model evaluation: Measure the trained model's accuracy, precision, recall, and some other metrics by applying it to a different dataset (the test set). Metrics including accuracy, precision, recall, F1 score, and area under the receiver operating characteristic (AUC) curve will be used to assess the model's performance.
5. Model tuning is the process of modifying the model's hyperparameters and parameters to enhance performance.

CONCLUSION

We can conclude that machine learning algorithms are used to identify high-risk pregnancies based on this review paper. The analysis and evaluation of several research and methodologies are utilized in the risk factors involved in pregnancy and provided a process that comprises data gathering, risk analysis, data splitting, developing a deep learning-based model, and prediction made by this model. Overall, the outcomes for maternal and foetal health may be improved by the adoption of algorithms based on machine learning for high-risk pregnancy diagnosis. Yet, it is crucial to make sure that the data is gathered and used ethically, and that the algorithms are accurate, objective, and understandable. In order to advance this subject and guarantee its safe and efficient application, more study and cooperation between physicians, data scientists, and ethicists are imperative. There are still research gaps in need of being filled despite the substantial breakthroughs in using algorithms for machine learning to forecast pregnancy-related hazards. To verify that the methods are generally applicable across diverse populations, for instance, larger datasets including a range of population groupings and demographic data are required. Also, adding additional pertinent parameters, such social and environmental ones, could increase the predictive models' precision. To fill up

Mohit Lal Sah et al.,

the gaps in the existing data and create more precise and generally applicable models for predicting hazards associated with pregnancy, more study is required.

ABSTRACT

Rheumatoid Arthritis is a chronic, inflammatory, and systemic autoimmune disease, it affects elders worldwide. Herbal medicines have been used for the treatment of various ailments from ancient times. Betelvine (*Piper betle*L.) leaves have long been used in Asian countries as a medicine to relieve pain and some metabolic diseases. The present study of methanolic extract of phytochemical analysis confirms the presence of alkaloids, tannins, terpenoids, saponins, steroids, total flavonoids and total phenols. The long-term condition known as rheumatoid arthritis is marked by joint inflammation that progresses to cause bone loss. According to its important qualities such as antioxidant, anticancer, and anti-allergic, extracts from the *Piperbetel* plant have been used for centuries to treat a wide range of illnesses. *Piper betel* flower extract's antioxidant properties was investigated in this study, and also molecular docking study. To virtually screen a large number of tiny molecules in an attempt to find possible hits, molecular docking of compounds across different databases is helpful. By including distinct molecular scaffolds into the discovery process, these predictions save expenses and save time. Molecular docking was done by using Capsaicin receptor protein 3J9J and3EUB PDB.

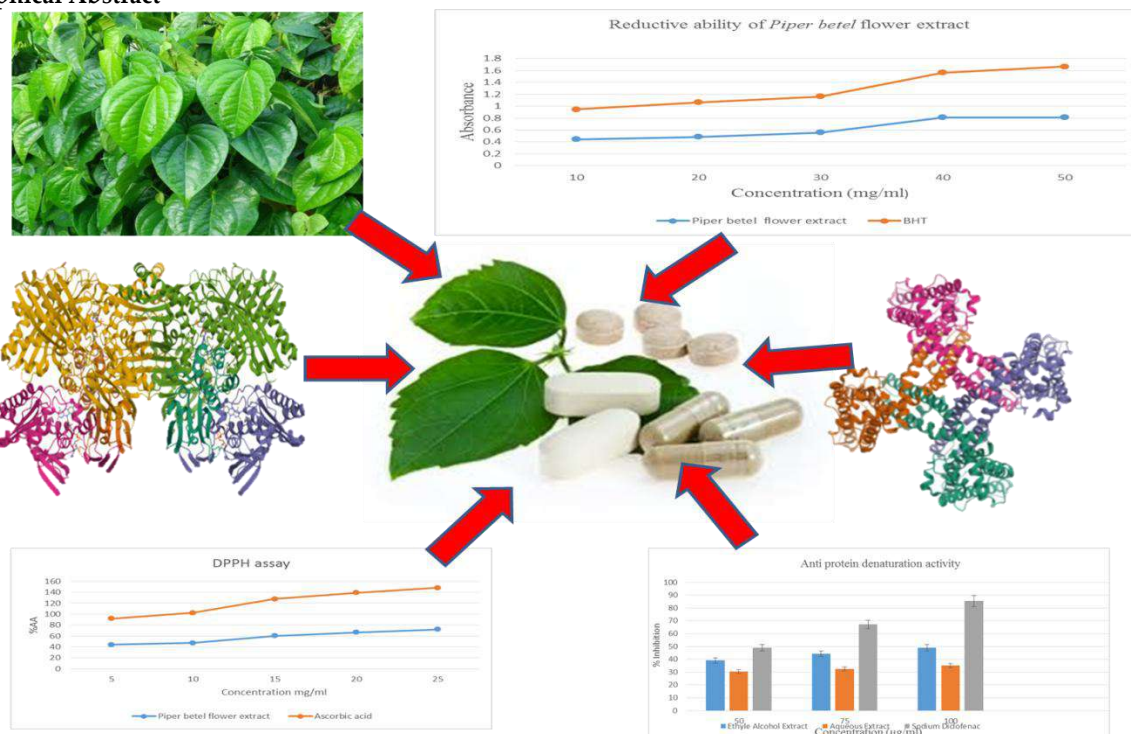

Keywords: Rheumatoid Arthritis, bone, antioxidant, Molecular docking, phytochemical.

Priyanka Devhare et al.,

Graphical Abstract

INTRODUCTION

Rheumatoid arthritis (RA) is a systemic autoimmune disease that is persistent and causes degeneration of the joints and bones [1]. Pain, edema, and cartilage degradation are the main signs and symptoms of RA. When the condition progresses, it gradually destroys bone and cartilage, resulting in permanent bone impairment. The World Health Organization estimates that between 0.3% and 1% of people worldwide suffer from RA, with women three times more likely than males to get the illness. One chronic, systemic autoimmune disease is rheumatoid arthritis (RA).[2]As a component of the intricate biological reaction of vascular tissues to damaging stimuli such as infections, injured cells, and allergens, inflammation occurs. The symptoms include discomfort, fever, redness, swelling and loss of function. It is an intrinsic immune mechanism [3].

Protein denaturation was the primary source of inflammation in rheumatoid arthritis. Sites of inflammation are where protein denaturation takes place, and denatured proteins may be more prone to glycation, a known mediator of inflammation [11]. Denaturation can happen as a result of heating, being near acids or bases, or even from vigorous physical activity. Rheumatoid arthritis inflammation leads to excruciating swelling of joint tissues, which may cause malformed joints and bone loss. Prior studies carried out by Ahmed and his colleagues have indicated that the primary cause of this inflammation is a cytokine protein called interleukin-1 beta (IL-1 beta).[12]

Since denatured proteins are frequently insoluble, they precipitate more frequently, which raises the activity of the macrophase at the tissue's protein de-naturation site and can cause inflammatory and neurodegenerative illnesses.[13]Because conventional drugs have significant adverse effects when used over an extended period of time, managing disorders connected to protein de-naturation presents a significant problem for medical professionals.[14]The clinician attempts to think that using herbal or alternative medication will help with this severe problem. Many modern human drugs are derived from natural resources, which have been a major source of

Priyanka Devhare et al.,

medicinal medicines for thousands of years. So, the main goal for researchers going forward is to produce novel plant-based medications with improved bioactive potential and little to no negative effects [15].

Since ancient times, plants have been used as powerful biochemical factories and as components of phytomedicine. Man can extract an amazing variety of industrial chemicals from plants [13]. Plants based natural constituents can be obtained from any part of the plant, meaning that any portion of the plant may contain active ingredients. Examples of plant parts include bark, leaves, flowers, roots, fruits, and seeds. The last three decades have seen the emergence of antioxidant-based drugs and formulations for the inclusion, prevention, and treatment of complicated illnesses like as cancer, diabetes, Alzheimer's disease, stroke, and atherosclerosis [4].

Oxidative stress, which is a major contributor to numerous diseases like cancer, cardiovascular disease, neurodegenerative disease, rheumatoid arthritis, atherosclerosis, hypertension, and AIDS, is brought on by an imbalance between reactive oxygen species (ROS) and the anti-oxidative defense systems [12]. The potential of antioxidants to prevent or postpone oxidative damage by obstructing the start and spread of oxidizing chain reactions has led to the exploration of antioxidant therapy for cellular degenerations. Because of this imbalance, which can cause damage to cellular components including lipids, proteins, and DNA, our bodies produce more reactive oxygen species than antioxidant species when under stress.

A heart-shaped, shiny, white cat can be found on the evergreen betel leaf creeper. Throughout the world's tropical and subtropical climates, the genus *Piper* (Piperaceae) is still abundant. Growing countries for *piper betel* include East Africa, the Philippines, Malaysia, Indonesia, and Sri Lanka. It tastes harsh and has a faint yellow scent from the essential oils.[4] In the world, betel vines come in over 90 species, with nearly 45 of those being found in India and 30 of those being in West Bengal. It is cultivated in tropical and subtropical regions due to its evergreen leaves, which are utilized as a chewing stimulant and in pooja sessions and other religious events [5].

In the Ayurvedic medicine system, the properties of *Piper betel* are described below[6]

- Guna (Quality): Laghu, Ruksha, Tikshan
- Rasa (Nambitha): Tikt
- Vipak (Metabolism): Katu
- Virya (Power): Ushan
- Prabhav (Impact): Hridya

The *Piper betel* flower is composed of long terminal spikes. A single spike can consist of all staminate flowers, almost all hermaphrodite flowers, or partially or entirely pistillate flowers with sporadic staminocia. This is less common.[7]About two millimeters in diameter, the full staminate flowers diameter and a minimum length of five centimeters. When mature, the female and hermaphrodite spikes measure ten to twelve millimeters in thickness and length, matching that of the male counterparts [8]. There could be as many as 500 or 600 blossoms on a spike. Long terminal spikes make up the *Piper betel* flower. All staminate flowers, nearly all hermaphrodite flowers, or partially or fully pistillate flowers with intermittent staminocia can all be found in one spike. This is not as typical.[9]The complete staminate flower's diameter is approximately two millimeters, and its minimum length is five centimeters. The adult female and hermaphrodite spikes are the same length and thickness as their male counterparts, measuring ten to twelve millimeters. On a spike, there could be 500 or 600 flowers [10].

MATERIALS AND METHODS

Collection and Preparation of Extract

Fresh *Piper betel* flowers were gathered from Tanaji Kharat's personal farm. Fresh flowers were twice washed under running tap water, then distilled water and allowed to air dry. The flowers were mixed into a fine powder after they had properly dried. For later use, the flower powder that had been shade-dried was kept at room temperature. Two

Priyanka Devhare et al.,

separate pre-labeled conical flasks were filled with one gram of the dried powdered flower, 40 milliliters of de-ionized double-distilled water, and ethanol. The mixes were incubated overnight at 30°C and 120 rpm in a BOD shaker incubator. The mixture was run through Whatman filter number one the next day. Every time, newly made alcoholic and aqueous extracts were employed in the anti-protein de-naturation experiment.

Preparation of Extract- for antioxidant assay

Fresh flowers were gathered, then allowed to air dry at room temperature in the shade. Using a mesh screen, dried flowers were mechanically ground into powder. Seventy percent alcohol was used to extract 100 grams of freshly powdered flowers that had been evenly packed in a soxhlet apparatus. After then, the solvent evaporated at a low temperature and with less pressure.

Chemicals

DPPH (2, 2-diphenyl-1-picrylhydrazyl), gallic acid, and catechin are standard chemicals used to measure radical scavenging activity. These compounds were acquired from Sigma-Aldrich Fine Chemicals (St. Louis, MO). The supplier of TPTZ (2,4,6-tripyridyl-striazine) was Sisco Research Laboratories Pvt. Ltd. (Mumbai, India), while Merck (Darmstadt, Germany) provided the Folin-Ciocalteu reagent, methanol, ethanol, ethyl acetate, acetone, acetic acid, and hydrochloric acid. The antioxidant (PHOTOCHEM) kit that was utilized was purchased from Analytikjena (Konrad-Zuse-Strasse 1, Germany). We bought potassium per sulfate, ferric chloride, hydrochloric acid, anhydrous sodium acetate, acetate buffer, and ferrous sulphate from Central Drug House (Pvt.) Ltd. (New Delhi, India).

METHODS

Phyto-chemical Screening

A fresh betel extract was evaluated for bioactive substances such as terpenoids, saponin, sterols, alkaloids, flavonoids, tannin, carbohydrates, amino acids, and proteins. The usual procedure was used to complete the qualitative analysis.

In Vitro - Protein Denaturation Assay

In this experiment, 2.8 ml of phosphate buffered saline (PBS, pH 6.4) and 2 ml of various concentrations of the test extract (50 µg/ml, 75 µg/ml, and 100 µg/ml alcoholic and aqueous extract of *Piper betel* flower) were mixed to prepare the assay mixture. Additionally, 0.2 ml of egg albumin (from fresh hen's egg) was used as their protein source. The control was an equivalent volume of double-distilled water. After being heated to 70°C for five minutes in a water bath, the mixtures were incubated for fifteen minutes at 37±2°C in a BOD incubator. The vehicle was used as a blank to test their absorbance at 660 nm after cooling. To determine absorbance, diclofenac sodium was utilized as a reference medication at final concentrations of 50µg/ml, 75µg/ml, and 100µg/ml and handled in a comparable manner [16].

Calculations

We used the following formula to get the percentage inhibition of protein de-naturation.

$$\% \text{ inhibition} = 100 \times [V_t / V_c - 1]$$

where

V_c = absorbance of the control sample and

V_t = absorbance of the test sample

In vitro- Antioxidant Activity

DPPH photometric assay

When the 2, 2-diphenyl-1-picrylhydrazylhydrate (DPPH) radical was present, the capacity of *Piper betel* extract to donate hydrogen was tested. In ethanol, it yields a violet-colored solution. [14]. A stock solution of the extract (1.0

Priyanka Devhare et al.,

mg/ml) was diluted in ethanol to reach a final concentration of 5, 10, 15, 20, and 25 mg/ml. 2.5 ml of sample solution with varying concentrations was mixed with 1 ml of 0.3 mM DPPH ethanol solution, and the mixture was left to react at room temperature. The absorbance readings at 518 nm were recorded after 30 minutes. As a blank, 1.0 ml of ethanol and 2.5 ml of plant extract solution were utilized. As a negative control, DPPH solution (1.0 ml: 0.3 mM) with 2.5 ml of ethanol was employed. Those utilizing the standard solutions (ascorbic acid) served as the positive control.[8]

Using the following formula, the percentage Antioxidant Activity (%AA) was determined:

$$AA\% = 100 - \left\{ \frac{Abs\ Sample - Abs\ blank}{Abs\ control} \times 100 \right\}$$

The concentration needed at 50% to block or alter absorbance. (IC50) was computed as well.

Measurement of the reductive ability

The Fe³⁺-Fe²⁺ transition in the presence of the extract was examined in order to quantify the reductive ability.[15] 2.5 milliliters of 0.2M phosphate buffer (pH 6.6), 2.5 milliliters of 1% potassium fericyanide [K₃ Fe (CN) 6], and one milliliter of plant extract (1 mg/ml) were incubated at 50 degrees Celsius for 20 minutes. After the liquid was mixed with 2.5 cc of 10% Trichloro acetic acid (TCA), it was centrifuged for 10 minutes at 3000 rpm. A 1.5 ml solution of freshly made 0.1% ferric chloride was added to 2.5 ml of the supernatant, which was then agitated. A 700 nm measurement was made of the absorbance. In place of extract, water was added to the reference solution, which was made similarly to the previous one. A reaction mixture's enhanced absorbance suggests a higher reducing power.[7]

Scavenging of Superoxide anion radical

Xanthine oxidase and hypoxanthine were used in vitro to produce the superoxide anion radical.^[6] A reaction mixture containing 1 mM EDTA and 50 mM KH₂ PO₄ – KOH pH 7.4 was produced, with a final volume of 1 ml per tube. 100 mM NBT and 100mM hypoxanthine. 0.066 U of xanthine oxidase per tube, diluted in 100 ml of phosphate buffer, and 10 ml of saline for the PBLE. The penultimate addition was xanthine oxidase. After five minutes of incubation at 25°C, the absorbance of the reaction mixture was measured at 560 nm. The activity of superoxide anion scavenging increases when the absorbance of the reaction mixture decreases. The findings are given as the percentage inhibition of the NBT decrease rate in comparison to the reaction mixture that contains only saline (no flower extract).^[9]

Inhibition of reaction mixture was calculated by using following formula:

$$I\% = 100 \times \left\{ \frac{A_0 - A_t}{A_0} \right\}$$

where A_t is the absorbance of the test substance and

A₀ is the absorbance of the control.

Molecular Docking

The use of molecular docking in computer-aided drug design and structural molecular biology is essential. An objective of ligand-protein docking is to forecast the main binding mode(s) between a ligand and a protein with a known three-dimensional structure. Many software programs have been created over the past few decades; some of the more well-known ones include AutoDock, AutoDockVina, DockThor, GOLD, FlexX, and Molegro Virtual Docker. Getting the target structure is the initial step in a docking calculation, and it often comprises of a big biological molecule (a protein, DNA, or RNA). The Protein Data Bank (PDB), which offers access to 3D atomic coordinates acquired through experimental techniques, makes the structures of these macromolecules easily retrievable. That the target's experimental 3D structure is unavailable is, nevertheless, not unusual. To get over this problem, the three-dimensional structure of proteins can be obtained using computer prediction techniques including comparison and ab initio modeling.

Priyanka Devhare et al.,

Method

Molecular docking has been an essential part of in-silico drug research in recent years. With this approach, the atomic-level interaction between a small molecule and a protein is predicted. This enables researchers to study the behavior of small molecules, such as nutraceuticals, within the binding area of a target protein and to understand the fundamental metabolic process underlying this interaction. The structure-based method requires a high-resolution 3D model of the target protein, which can be obtained by nuclear magnetic resonance spectroscopy, X-ray crystallography, or cryo-electron microscopy³⁻⁵. Both free and paid computational tools and molecular docking techniques are available.

The molecular docking of active constituent was conducted by using V life MDS 4.6 to evaluate *in silico* Antiarthritic activity of the isolated metabolites the X-ray crystal structure of active Capsaicin receptor protein 3J9J as proposed molecular target, was obtained from the RCSB protein data bank (PDB DOI: <https://doi.org/10.2210/pdb3J9J/pdb>). In silico Antioxidant activity of the isolated metabolites was evaluated by using X-ray crystal structure of protein PDB 3EUB was obtained from the RCSB protein data bank (PDB DOI: <https://doi.org/10.2210/pdb3EUB/pdb>). Water molecules and ligands which are not involved in the binding were removed. The protein was prepared using Protonate 3D protocol in MOE with default options. And then molecular docking was carried out by obtaining docking score of two active constituents present in *Piper betel* Flower extract.

- Hydroxychavicol
- Eugenol

Formula for binding affinity of ligand and protein:

$$\text{BindingAffinity}\Delta G =$$

$$\text{Totalenergyofcomplex} - (\text{Uncomplexed}\Delta G.\text{protein} + \text{Uncomplexed}\Delta G\text{ligand})$$

RESULTS

In the current investigation, Table 1 showed the existence of several bioactive compounds in the *Piper betel* extract, and Table 2 showed the aqueous and ethanolic extracts' anti-protein denaturation properties. The same table also included information on the concentrations of the experimental samples and the reference medication.

DPPH assay

The addition of the *Piper betel* flower extract decreased DPPH in a concentration-dependent manner. In terms of IC₅₀, the extract's free radical scavenging activity was 12.0 mg/ml, surpassing the standard drug's ascorbic acid concentration of 5.35 mg/ml. This suggests that the extract may have antioxidant properties.

Measurement of reductive ability

Comparing the *Piper betel* flower extract to the standard, it exhibited the greatest capacity to decrease Fe³⁺ ions and reductive ability (Table.2). A higher reducing power is shown by a higher absorbance of the reaction mixture.

Scavenging of Superoxide anion radical

Ascorbic acid at 50 mg/ml and the alcoholic extract of *Piper betel* flower decreased NBT reduction by 66% and 77%, respectively. Table 3 indicates that the extract's IC₅₀ values were 20 mg/ml and the standard's IC₅₀ values were 22 mg/ml. This indicates that xanthine oxidase activity was suppressed by the extract.

Molecular Docking

Table 6. Comparative scores obtained from molecular docking responses of 2 active constituents (ligand) showing interaction with optimized PDB.

DISCUSSION

The structural isomers of denatured proteins are incredibly diverse and usually lack the biological activity that were intended for them. Structural and functional characterization of denatured proteins has commonly been viewed as an intimidating and fruitless endeavor due to the intricate structure and absence of biological function. Denatured protein characterization has become more crucial, though, as it has been shown that many inflammatory and neurological illnesses are caused by conformational changes in proteins. A thorough analysis of the various isomers of disease-associated proteins would be necessary in any effort to clarify the cause of these illnesses. Furthermore, it is possible that one of the richest sources of biomolecules that has not yet been utilized for the detection and treatment of disease is conformational isomers of denatured proteins. Animal models are used in pharmaceutical research nowadays, however this has its drawbacks, including ethical concerns and altered bodily homeostasis mechanisms under stressful conditions. We search for alternate approaches from the perspective of fundamental mechanisms as a result of this issue [13]. Therefore, in order to evaluate *Piper betel*'s in vitro anti-inflammatory properties, the protein de-naturation assay methods were chosen for this work. A well-established cause of inflammation-related diseases like arthritis is protein de-naturation, which is one of the main characteristics of inflammatory tissue. It is thought that an agent with anti-protein denaturation properties may one day be employed as a highly effective anti-inflammatory medication.

In India, thousands of tonnes of crop are lost due to lack of exploration in the agro-economy of this crop, particularly in the post-harvest phase. The industrial promise of producing anti-inflammatory drugs and other nutraceuticals from *Piper betel* is therefore promising. The current study assessed *Piper betel*'s in vitro protein denaturation activity in comparison to heat-induced protein denaturation. The chosen plant flower extract exhibits concentration-dependent anti-protein denaturation, according to the current data. Denatured proteins from lysosomal contents were released, triggering an inflammatory reaction that resulted in extracellular release of proteases and neutrophil activation. A qualitative study of the *Piper betel* flower extract indicated the presence of many phytochemicals, including alkaloids, flavonoids, polyphenols, steroids, carbohydrates, and tannins. Many of these bioactive substances have well-established potential biological characteristics. These bioactive substances may be the cause of *Paan*'s or *Piper betel* flower ability to inhibit protein denaturation. Instead of a single effect, there can be a synergistic one.

Piper betel flower extract has the potential to scavenge free radicals on DPPH, as demonstrated by its in vitro antioxidant activity. Rich reductive ability is exhibited by the extracts, which reduced the majority of the Fe³⁺ ions. In comparison with various standards, including ascorbic acid and BHT, the extract exhibited robust scavenging properties against superoxide anion and hydroxy radicals. Free radical scavenging and reduction of free radical-induced cell damage are presumably the antioxidant roles played by *Piper betel* flower extract. The natural antioxidants found in medicinal plants are helpful in reducing or avoiding the harmful effects of oxidative stress. The DPPH free radical scavenging assay and the reducing power assay were used in this study to assess the scavenging abilities of ethanolic extracts of *Piper betel* flowers. Any substance's ability to reduce really depends on the existence of reductants, which have the ability to exhibit anti-oxidative properties by donating an atom of hydrogen to break the free radical chain. In this approach, the ferric (Fe)/ferricyanide complex was reduced to the ferrous form (Fe) by the presence of reductants or antioxidants in ethanolic extracts. The ferrous form (Fe) is thus reached by the concentration procedure. Consequently, Prussian blue from Perl at a wavelength of 700 nm.

Hydroxychavicol and Eugenol Binding Affinity (ΔG) are -74.13 and -54.04, respectively, with a docking score of -4.6639 and -4.1768 when matched with antiarthritis activity. Hydroxychavicol contains one hydrogen bond, but ethanol contains none. A single active molecule, hydroxychavicol, has a docking score of -5.0856, its binding affinity (ΔG) is -99.18, and there are two hydrogen bond interactions, according to molecular docking research on antioxidant activity.

Priyanka Devhare et al.,

CONCLUSION

There have been reports that a number of non-steroidal anti-inflammatory medications can prevent protein denaturation. Thus, it can be inferred from the results of this exploratory experiment that *Piper betel* flowers ethanolic and aqueous extract significantly reduced protein denaturation in vitro, but Ethanolic extract reduces more protein denaturation than Alcoholic extract. Thus, additional research should be done to assess this plant's anti-inflammatory properties in the search for newer.

The current studies have so established the antioxidant activity of ethanolic flower extracts of the *Piper betel* plant. From the DPPH assay IC₅₀ value of the extract of *Piper betel* flowers free radical scavenging activity 12.0 mg/ml and Scavenging of Superoxide anion radical IC₅₀ values 20 mg/ml. According to the results of the current research, *piper betel* flowers may be utilized as a natural antioxidant source. We can conclude from in silico studies that hydroxychavicol, a major antioxidant active constituent found in *Piper betel* flower extract, has a major binding affinity, and that eugenol has an affinity for optimized PDB 3J9J. These studies also demonstrate that hydroxychavicol and eugenol have an inhibitory action on COX1 and COX2, which leads to antiarthritic activity.

ABSTRACT

The Maxillary sinus is one of the four pairs of paranasal sinuses located in the skull. The maxillary sinus is situated within the maxillary bone, which is the large bone of the upper jaw. There is two MS, one on each side of the nose. The size of the MS can vary among individuals, and it tends to enlarge as a person grows. MS are particularly sensitive to sexual dimorphism in terms of dimensions including volume, length, width and height. Understanding how MS varies by gender has applications in numerous fields such as in radiology, dentistry, clinical diagnosis, surgical planning, gender determination in forensic and earlier disease detection are all possible because to an appreciation of these differences. In cases involving pathology or anatomical anomalies of MS it can increase the accuracy of diagnosis. The significance of this knowledge in disease screening and early management is further emphasised by the possible link between sinus dimensions and systemic disorders. Computed tomography (CT) imaging is a revolutionary way for determining MS dimensions and accurate measurements of sinus. CT scan guarantee excellent accuracy and precision in measurements due to their three-dimensional characters.

Keywords: Maxillary Sinus (MS), Computed Tomography (CT).

Akansha Kala *et al.*,

INTRODUCTION

Each side of human skull contains air filled chambers called maxillary sinus or maxillary antra. Due to their diagnostic and forensic importance, sinus is increasingly being examined with imaging methods such as three-dimensional computed tomography (3D CT) scans. Several anatomical structures are found in close proximity to maxillary sinus (Joe Ivanga *et al.*, 2019). Due to their convenient anatomic placement, 3D CT imaging of the maxillary sinus has proven to be of great value in investigations at identifying a person's gender (Gulec *et al.*, 2020). Many anatomical changes, including hypoplasia, antral septa, and bone exostosis, can be seen in the maxillary sinus (Narao Lozano *et al.*, 2017). The possibility of membrane perforation during sinus floor elevation is increased in patients having maxillary sinus septa (A.Hungerbuhler *et al.*, 2019). Anatomical structures which are commonly found include maxillary sinus septa (M.E. Toprak *et al.*, 2021). The maxillary sinus septum formed with the evolution of the middle face region of the skull and is largely developed in all maxillary sinus regions (Young *et al.*, 2011). The volume of the maxillary sinus is correlated with specific characteristics such side, gender, lack of posterior teeth, thickening of the sinus membrane, bony septa, and sagittal and vertical skeletal patterns (Anne Maria *et al.*, 2022). Septa with a transverse orientation are most prevalent in the middle section of the sinus (Henriques *et al.*, 2022).

The ethmoid, sphenoid, frontal, and maxillary sinuses are the four complicated anatomical structures that together make up the paranasal sinuses (Sophie Lee *et al.*, 2022). To distinguish between normal development and unusually massive, hypoplastic, or deformed sinuses, one must be aware of the stages of sinus growth (Adam *et al.*, 2021). There is also a relation between headache and smaller paranasal sinus volume (Levent *et al.*, 2019). The maxillary sinus has two postnatal period at which it grows rapidly 0–3 is the first period's age range, and 7–12 is the second. After the age of twelve, it proceeds to develop slowly until it reaches full maturity. The maxillary sinus became fully mature at the ages between 18-20. After this age any changes in the measurement of maxillary sinus will be sign of pathology and variation of sinus. The shape and size of sinus are affected by many factors including environment, genetics or any kind of infections. A routine implant procedure or tooth extraction could have complications that can affect the craniofacial anatomy. Therefore, it is essential to have a solid understanding of the anatomy and measurements of the maxillary sinus (M. Gulec et al 2020).

Computed Tomography: Basics

Computed Tomography (CT), also referred to as Computerized Axial Tomography (CAT) scan, stands as a pivotal medical imaging technique that has transformed diagnostic medicine by delivering intricate cross-sectional images of the body's internal structures. This imaging modality relies on X-ray technology to generate comprehensive and highly detailed images, empowering healthcare professionals with the capability to observe and scrutinize various anatomical regions with exceptional precision. The advent of CT scans has significantly enhanced diagnostic capabilities, allowing for more accurate and detailed assessments in the field of medical imaging (Seeram. E 2010). X-ray computed tomography (CT) is a non-destructive technique which can disclose an object inside details in three dimensions (Philip *et al.*, 2021). Accurate tissue/organ separation between the various body compartments, such as adipose tissue, skeletal muscle, bones, and organs, is made possible by the high-resolution CT imaging (Michalis *et al.*, 2016). Recent developments in CT technology include extreme multidetector CT, iterative reconstruction methods, dual-energy CT, cone-beam CT, portable CT, and phase-contrast. These advancements are anticipated to have, a substantial therapeutic impact (Daniel Thomas *et al.*, 2014). These developments might be analyzed in terms of how they affect clinical practice, how they enhance performance (Jiang *et al.*, 2021). Due to the rise in CT exams conducted globally, radiation dosage in x-ray computed tomography (CT) has drawn a lot of attention. Patient dosage assessment is still an area in need of progress and global consistency (Willi 2014). Furthermore, with positive results, fresh image reconstruction methods that lower radiation exposure have been developed recently (Stephen *et al.*, 2016). The capacity to collect data in various energy bins is suggested by recent developments in the use of energy-resolving, photon-counting detectors for CT imaging. This is anticipated to further improve the signal-to-

Akansha Kala *et al.*,

noise ratio for material-specific imaging (Cynthia *et al.*, 2015). When suitable scan lengths within each imaging procedure are strictly followed, whenever possible, there is great opportunity for dosage optimization (Mohamed *et al.*, 2015). Several technical methods can be used to obtain dual-energy information in computed tomography (Nils *et al.*, 2020). Computed tomography makes it feasible to take measurements with high precision (Saccucci *et al.*, 2015).

Development of Maxillary Sinus

The intricate anatomy of the paranasal sinuses exhibits individual variance. Normative values for the size of the paranasal sinuses and how they vary with age may be useful in determining whether certain disorders affecting the sinonasal area are present (Degermenci *et al.*, 2016). Different maxillary sinus diameters experience development spikes at various Intra Uterine Life phases. Anteroposterior diameter values grow from the start of intrauterine life to the end. Throughout life, male maxillary sinuses stay comparatively larger (Ghaus *et al.*, 2006). Males have larger width of maxillary sinus when compared with females, which is useful in determining gender dimorphism (Franciellen *et al.* 2022).

Pathology of Maxillary sinus

The dental and otolaryngology communities both admit the existence of a well-known disorder called odontogenic maxillary sinusitis (Kasikcioglu *et al.*, 2016). There might be an underlying dental pathology in about 30% of cases of unilateral maxillary sinusitis (George Psillas *et al.*, 2021). The etiology of persistent odontogenic maxillary sinusitis (OMS) was examined using histopathology of the maxillary sinus mucosa, and the significance of endoscopic sinus surgery (ESS) was elucidated (Sato *et al.*, 2020). For individuals with recurrent and refractory sinusitis, functional endoscopic sinus surgery is a successful treatment option. Radiologists can use preoperative computed tomography (CT) to prospectively identify anatomic variants that put patients at risk for significant surgical problems (William *et al.*, 2016). Maxillary sinus mucosal cysts (MMC) are often found during imaging examinations. It has been found that their prevalence can reach 35.6%. Although quantitative study is lacking, it is known from personal knowledge that numerous procedures are carried out to treat isolated MMC in the absence of symptoms (Evangelos I. Giotakis *et al.*, 2013). Mucous retention cysts (MRCs), sometimes referred to as antral or maxillary sinus pseudocysts, are one of the most frequent pathological observations of the maxillary sinus. They typically manifest as a radiopaque soft-tissue mass that is dome-shaped and linked to the sinus's bony walls (Kuofeng *et al.*, 2021). The variants of maxillary sinuses involve hypoplasia and aplasia, maxillary sinus septae, ethmoidmaxillary sinus, superior meatus-draining maxillary sinus, and over-pneumatization. Hypoplasia of the maxillary sinus is an exceptional disorder. Most people don't have any symptoms, although occasionally they experience facial pain and headaches (Banu Atalay 2021). Many of the maxillary sinus pathology can cause severe symptoms which lead to admit patients in departments like dentistry, Surgery, ENT (Adin Selcuk *et al.*, 2008). For otolaryngologists, rhinologists, oral and maxillofacial surgeons, dental and maxillofacial radiologists, the knowledge of maxillary sinus dimensions is crucial (Whyte *et al.*, 2019). As one of the most prevalent congenital craniofacial defects, cleft lip and palate (CLP) can alter the morphology of the maxillary sinus, skull, and face because it disrupts the fusion of the palatal shelves (Yassaei *et al.*, 2023). Neurilemmoma, also known as Schwannoma, is a benign tumor that develops from Schwann cells that surround the nerve sheaths of the autonomic or peripheral nervous systems, particularly the sympathetic nervous system (Bader *et al.*, 2018). The most frequent sinonasal tumors are polyps and mucocele, while schwannoma is infrequently discovered in the paranasal sinuses (R.S.Minhas *et al.*, 2013). Under general anesthesia, a combination of endoscopic medial maxillectomy with Caldwell-Luc operation can be performed to eliminate the encapsulated mass entirely (Turgut *et al.*, 2022).

The majority of incidental findings don't need to be treated, but some will need the treatment plan to be adjusted. Consequently, anatomical variances and incidental findings should be known to dental practitioners. If these findings are correctly identified, fewer needless additional diagnostic evaluations can be performed, and more suitable treatment options can be chosen (Hakan *et al.*, 2018). Before any treatments that involve close approach to the sinus floor, like tooth extraction, implant insertion, and sinus floor elevation, it is crucial to visualize and evaluate the maxillary sinus (Andy *et al.*,) 20

Akansha Kala *et al.*,

Clinical Applications of dimensions

Anatomic variability across genders has been found by maxillary sinus measurements, and this methodology can be used as a supplementary tool for human identification in forensics. (Nikolas *et al.*, 2023). By evaluating dimensions of maxillary sinus, gender can be identified (Oguzhan *et al.*, 2014). A trustworthy method for determining gender is the morphometric examination of the maxillary sinus (Tanya *et al.*, 2017). Maxillofacial and oral surgery heavily relies on accurate measurements of the maxillary sinus. Sinus dimensions might vary by gender, which can affect preoperative planning. To avoid difficulties during sinus floor elevation or implant insertion, surgeons must be aware of variances in the size and position of the maxillary sinus. Since septa are frequently present and are detected in one-third to roughly half of the investigated cases, a thorough inspection is necessary before doing any surgical procedures in order to prevent any potential consequences (Amani *et al.*, 2023). Before doing any maxillary sinus augmentation, a thorough assessment of various anatomic anomalies must be carried out, especially in elderly individuals (Mohammed *et al.*, 2020). Accurate and risk-free surgical procedures are made possible by the anatomical insights provided by 3D CT scans. The posterior maxilla is a typical area for dental implant insertion. The importance of knowing the maxillary sinus's size cannot be overstated. Gender differences can affect how long implants are and where they're placed. For men with larger maxillary sinuses, for instance, the implant may need to be longer or the sinus floor elevated. However, women with narrower sinuses may have to adjust how their implants are placed (Mathew *et al.*, 2020).

DISCUSSION

To get a complete picture of the range of maxillary sinus volume, the study included participants of varying ages and sexes. Cone beam computed tomography (CBCT), which provides high-resolution, three-dimensional imaging, was the principal technique used to record the maxillary sinuses' anatomical structure. The data was analysed to reveal potential differences in maxillary sinus size across the sexes and age groups. Ex differences in maxillary sinus size were validated by the research. In every three-dimensional CBCT analysis, males were found to have larger maxillary sinuses than females. Consistent with prior investigations, this one found that maxillary sinus diameters differ by gender. The consistency of the results across age groups demonstrates the validity and strength of the study. The use of CBCT enabled more accurate measurements, strengthening the reliability of the results. This research underlined the precision and potential of CBCT in determining maxillary sinus architecture. It demonstrated the value of this imaging method for comprehending differences between the sexes along these lines. Clear evidence of sexual dimorphism in maxillary sinus dimensions was found in the study by Aktuna Belgin and her colleagues, who used CBCT for three-dimensional evaluation. Consistency in findings across age groups demonstrates the validity and versatility of this approach. This study's use of CBCT demonstrates the reliability and promise of this imaging modality for determining gender based on maxillary sinus morphology (Aktuna Belgin *et al.*, 2019).

Researchers in Oral Radiology look at the posterior maxillary region, which is hard for dentists to work with because of its intricate architecture. Cone beam computed tomography (CBCT) scans from 212 patients will be analyzed in this study in order to ascertain the average diameters and frequency of maxillary sinus abnormalities by age and gender. This information is clinically important for surgery; hence the study also looks at how changes are influenced by maxillary sinus sizes. 77.8% of the time, at least one anatomical variation occurs; the most frequent variant is the auxiliary ostium. The investigation examines whether gender, age, and variations impact maxillary sinus morphometry using chi-square, independent t, and one-way Anova. The conclusion emphasizes comprehensive pre-surgical screening to prevent problems because of usual anatomical variances. The study by Ayyildiz and Akgunlu highlights the three-dimensional evaluations of CBCT. This enhances the precision and security of challenging maxillary posterior dental procedures (Ayyildiz & Akgunlu, 2023).

All of the maxillary sinus measurements were taken using computed tomography (CT) scans, a non-invasive and extremely precise imaging method. The study's major aim was to look into whether or not there is a difference in the size of the maxillary sinuses between sexes, hence it included both males and females in its cohort. In order to get

**Akansha Kala et al.,**

precise measurements, Sharma and his group used 3D CT scans to get detailed images of the maxillary sinuses. Maxillary sinus diameters differed significantly between sexes, as demonstrated by this study. The maxillary sinuses of males were measured and found to be significantly larger than those of females. The existence of sexual dimorphism along these dimensions was therefore highlighted. The maxillary sinuses were studied for their volume, length, width, and height, all of which contributed to the reliable separation of the sexes. This study highlighted the importance of maxillary sinus measurements outside of the forensics field. Maxillofacial surgery, orthodontics, and even general medical imaging can all benefit from a deeper understanding and quantification of these differences. The therapeutic importance of the study was further emphasised by the exact measurements obtained by 3D CT scans, which increased the dependability of these findings (Sharma *et al.*, 2014).

A study was conducted on maxillary sinus development in children up to 18 years old, published in the International Journal of Paediatric Otorhinolaryngology. Clinically, understanding how the maxillary sinus changes in size and volume with age helps evaluate radiographs and discover irregularities. The research of CT scans from 170 participants across 17 age groups shows a continuous maxillary sinus growth trajectory from birth to 18 years. Changes are noticeable in horizontal, vertical, and antero-posterior dimensions. Although bilateral dimorphism is absent, gender differences appear in children above 8. According to the study, most growth occurs in the first eight years, and all diameters and volumes peak by the sixteenth year. The study shows that CT scans may reliably assess age-related maxillary sinus changes. This wealth of developmental data helps us comprehend sinus growth, which enhances early sinus anomaly diagnosis and clinical evaluations in children (Lorkiewicz-Muszyńska *et al.*, 2015). Maxillary sinus sexual dimorphism is investigated in a study with cone beam computed tomography (CBCT). CBCT measurements were made of the bilateral maxillary sinus width, length, height, area, perimeter, and volume in 100 patients (50 males and 50 women). For most measures, there are no significant gender differences according to the statistical analysis's unpaired t-tests. Nonetheless, the left side maxillary sinus width of the female group displayed statistically significant greater values, suggesting that it may, with 60% accuracy, determine gender. In forensic anthropology, discriminative analysis reveals that the maxillary sinuses more precisely, its width—can predict gender 71% of the time. (Urooge & Patil, 2017).

A study was done to look at how children's maxillary sinus volumes changed with age. 150 children, ages 0 to 18, had their height, width, and depth measured by CT. The investigation reveals noteworthy patterns of maxillary sinus growth. In every age group, maxillary sinus height increases gradually from birth to age 18. Children under the age of six and those beyond the age of twelve have markedly broader and deeper maxillary sinuses, which indicate distinct phases of growth expansion. The maxillary sinus does not enlarge in width, depth, or volume after 12. This makes the finding puzzling. The complex dynamics of the maxillary sinus during childhood are clarified by this work. Age-specific development patterns are useful to researchers and physicians because they highlight typical disparities. The work of Bhushan *et al.* highlights the significance of taking into account a variety of elements in order to comprehend the complex development of the maxillary sinus during childhood (Bhushan *et al.*, 2016).

Using CT scans, the study evaluated children ages 0 to 18 for potential sexual dimorphism of the maxillary sinus. The study involved the retrospective examination of 170 patients, aged 0-18 (85 females and 85 males), whose CT scans of the head were deemed normal by radiologists. All the patients had their maxillary sinuses measured bilaterally in three planes. The maximum vertical diameter (the maxillary sinus height, MSH); maximum anteroposterior diameter (the maxillary sinus length, MSL); and maximum transverse (horizontal) diameter (the maxillary sinus width, MSW) were measured. Depending on the ontogenesis stage, the sexual dimorphism of maxillary sinus characteristics varies. Males have larger maxillary sinuses at 2-3 years old according to all examined criteria (Agnieszka *et al.*, 2020).

Patients with cystic fibrosis (CF) deal with a severe systemic condition that impacts many facets of their lives. The children with the disease and the control group's computed tomography (CT) scan findings were analyzed. 126 pictures of healthy children aged 0 to 18 and 114 CT images of the study group's children were included in the study. Analysis was done on the frontal, sphenoid, and maxillary sinus volumes. The outcomes were statistically evaluated

Akansha Kala *et al.*,

and compared with those of the control group. Statistically significant differences were seen between the study and control groups, despite the fact that both groups' paranasal sinus volumes and developments grew with age (Agata *et al* 2024). The purpose of this research is to measure the maxillary sinus volumes and areas in patients with clinically unilateral sinus disease. A total of 50 individuals (28 men and 22 women, ages 43.6 years (SD = 18.3), had their contralateral sinuses measured, 50 of which had pathological sinuses and the other 50 of which were healthy. The afflicted sinuses had a three-dimensional occupation volume of 97.1 mm³ (62.5%), while the healthy sinuses had a volume of 40.6 mm³ (22.8%) ($p < 0.0001$). In the frontal plane, the group with cysts had a substantially wider medial-lateral sinus (32.4 mm, CI: 23-41.8 mm) (Mario *et al.*, 2020).

This study sought to determine if sex could be ascertained by using maxillary sinus measures from CBCT scans. One hundred patients (fifty males and fifty females) had their maxillary sinus width, length, and height measured using CBCT pictures. One hundred patients (fifty males and fifty females) had their maxillary sinus width, length, and height measured using CBCT pictures. Male and female differences in the measured parameters were compared using the student's t-test and discriminant function analysis. 78% of females and 74% of males correctly predicted their sex, for an overall accuracy of 76%. Maxillary sinus height was the most noticeable factor in the distinction of sex groups, according to discriminant analysis (Maryam 2017). The average age of 60 adults (31 females and 29 males) was found to be 29.90 ± 10.91 years. They were categorized into three groups based on skeletal vertical face growth patterns: high-angle, low-angle, and normal-angle participants. Using CBCT images, the maxillary sinuses' morphological and dimensional alterations were assessed. In terms of the right maxillary sinus length parameter, the low-angle vertical growth pattern group achieved noticeably superior outcomes than the high-angle group (Ridvan 2017).

The aim of the current investigation was to create an automated instrument that measures the combined air-free and total volume of the maxillary sinus by utilizing computed tomography images. The quantification tool aims to normalize measurements of maxillary sinus volume, so enabling improved analyses and comparisons of the variables affecting maxillary sinus size. The automated instrument made use of morphological operators, thresholds, and watersheds in image processing. In thirty patients, the maxillary sinus volume was measured. To assess the precision of the automated technology, and the outcomes were contrasted with segmentation carried out manually by a skilled radiology professional following a defined protocol. For the total and air-free maxillary sinus volume, the mean percent differences between the automated and manual approaches were $7.19\% \pm 5.83\%$ and $6.93\% \pm 4.29\%$, respectively (Guilherme *et al.*, 2018).

The purpose of this study was to use computed tomographic (CT) scanning based on gender to measure the dimensions of the right and left maxillary sinus in Turkmen ethnic groups living in Gorgan, northern Iran. 100 individual's maxillary sinus were measured after scanning. Males had greater width, height, and volume of the left and right maxillary sinuses than females (Arash *et al.*, 2021). An analysis of the impact of concha bullosa variation on maxillary sinus volume and uncinata angle was conducted. The maxillary sinus volume, uncinata angle, and presence of concha bullosa were measured from the paranasal sinus computed tomography of these patients. maxillary sinus volume and the uncinata angle were same in patients with and without concha bullosa (Uygar *et al.*, 2014). Maxillary sinus evaluation requires radiographic inspection, particularly on CBCT pictures, there is a clear correlation between maxillary sinus septa occurrence and ostium height. It was discovered that the size of maxillary sinus drainage system was not significantly impacted by nasal septal deviation, concha bullosa, Haller cells, or other sinusopathies (Gulsun *et al.*, 2020).

CONCLUSION

The size of the maxillary sinuses has been shown to vary by sex in a large number of studies. The maxillary sinuses of males are larger than those of females in terms of volume, length, width, and height. Understanding how maxillary sinus size varies by gender has applications outside of forensics. It has applications in radiology, anatomy, dentistry,

Akansha Kala et al.,

illness screening, therapy monitoring, clinical diagnosis, and surgical planning. Better patient care, precise surgical planning, fewer surgical complications, and earlier disease detection are all possible because to an appreciation of these differences. In cases involving pathology or anatomical anomalies of the maxillary sinuses, it can increase the accuracy of the diagnosis.

Knowing that men and women have different sized maxillary sinuses is crucially important. Because of this information, doctors may give patients more individualised care. Being aware of these differences is vital for achieving positive results whether diagnosing sinusitis, planning orthodontic operations, performing maxillofacial surgeries, or implanting dental prostheses. The significance of this knowledge in disease screening and early management is further emphasised by the possible link between sinus dimensions and systemic disorders. The clinical implications of maxillary sinus dimensions can be explored further in future studies. The implications of these differences on related medical fields and subpopulations of patients can be investigated.

The gender differences in sinus dimensions can be used in future research to produce individualised medicinal and surgical procedures. Care for patients and the success of treatments can both benefit from this method. Radiological methods of measuring the size of the maxillary sinuses need to be improved as technology advances. This could further boost diagnostic skills and improve patient care. Future research may benefit from focusing on the possible connections between systemic disorders and the size of the maxillary sinuses. If these associations can be understood, perhaps diseases can be detected and treated sooner. The maxillary sinuses and their anatomical variations should be a mandatory element of any medical or dental curriculum. For more precise instruction and diagnosis, more study can aid in the creation of educational methods and resources that take into account differences between the sexes.

ABSTRACT

Acute Coronary Syndrome (ACS) is a major health issue that adversely affects survival as well as Disability Adjusted Life Years (DALYs). Early reperfusion is extremely important and a key component in the management of ACS. However, the process of reperfusion is also associated with myocardial reperfusion injury for which no preventive measure has been proven unequivocally effective. Aim of this trial is to explore the possible value of Class IV laser therapy in limiting myocardial reperfusion injury and thereby improving cardiovascular outcomes. This randomized sham-controlled trial is a prospective study which includes 60 individuals with ACS who satisfy selection criteria will be randomly assigned

82239

Mandeep Kumar Jangra *et al.*,

into two groups by block randomization. All the participants will receive guideline directed interventional and pharmacological therapy on discretion of treating cardiologist irrespective of randomization group. Experimental group will be given Class IV laser over 3 spots in 2nd, 3rd and 5th Intercostal Spaces for duration of 60 seconds at each spot, whereas in the control group laser probe will be placed over the same spots but the laser energy will not be delivered. Ejection fraction will be assessed at baseline and on third day, post intervention. Troponin I will be assessed at baseline, peak hours (at 10 hours after PCI) and 3rd post intervention. Functional outcomes will be assessed at baseline and after one month follow up. The trial will provide evidence for efficacy of class IV laser therapy to reducing myocardial reperfusion injury and improving cardiovascular outcomes among the individuals undergoing percutaneous coronary revascularization for ACS.

Keywords: ACS, Cardiac Biomarkers, Class IV Laser, Ejection Fraction.

INTRODUCTION

Acute Coronary Syndrome (ACS) is a major health issue that adversely affects survival as well as Disability Adjusted Life Years (DALYs) which accounts for approximately annually 7 million deaths and 129 million DALYs [1, 2]. In India, CVD accounts for one fourth of all mortality [3]. Early reperfusion of the ischemic area followed by coronary artery occlusion is accepted, extremely important and a key component in management of ACS to reduce size of infarction and improving cardiovascular outcomes [4, 5]. Reperfusion of an ischemic cardiac tissue (ischemia of more than 45 minutes) itself induced myocardial injury and death of cardio myocytes, phenomenon called as myocardial reperfusion injury [5, 6]. Some experimental studies suggest that reperfusion injury accounts for upto 50% of the final size of infarction [5]. However, currently there is no preventive measure has been proven unequivocally effective to prevent this myocardial reperfusion injury in post revascularization patients [7]. Photobiomodulation in the form of low level laser therapy (LLLT) is a novel cardiac intervention which reduces the infarct size, decreases inflammation and scarring, controls cardiac damage as evidenced by bio-marker levels and enhances tissue repair [8]. Effects of LLLT in cases of myocardial injury are well documented in in-vivo and in-vitro animal models, as well as in human clinical trials to prevent myocardial reperfusion injury. Class IV laser is a recent advancement in the field of laser therapy which overcomes the limitations of low level laser, as it has higher tissue penetration.

Study objectives

This is a pre- post test randomized sham controlled trial to assess the effectiveness of class IV laser to limit the myocardial reperfusion injury.

MATERIAL & METHODS

The study is a pre-post test randomized sham controlled trial; Figure 1 shows an overview of this trial plan. The Helsinki Declaration (updated, 2013) and National standards for biomedical and health research involving human subjects (Indian Council of Medical Research, 2017) shall serve as the guidelines for this study. The Maharishi Markandeshwar Institute of Medical Sciences & Research's Institutional Research Ethics Committee gave its approval for this study at Mullana-Ambala, Haryana, India vide project ID: MMDU/IEC/2157. The trial is registered at clinicaltrials.gov (NCT05160519) on 02/12/2021 and Universal Trial number is U1111-1270-8393. This trial will follow the spirit (standard protocol items for randomized trials) guidelines.

Study Population

This experiment will involve people who have been diagnosed with acute coronary syndrome, have had angioplasty with drug-eluting implantation, are older than 18, and are hemodynamically stable. People with growths or tumors

**Mandeep Kumar Jangra et al.,**

near the mediastinum; those with pacemakers, either implanted or temporary; having left ventricular ejection fraction (LVEF) $\leq 30\%$; who are receiving photosensitive drugs; pregnant and epileptic individuals will be excluded from this study. Study procedure will be informed to the selected participants and asked to sign an informed consent for their voluntary participation. Using the effect size of 0.8 and the study's power of 80%, the sample size was determined using the G power program, version 3.1.9.4 (Heinrich Heine University Dusseldorf, North Rhine-Westphalia, Germany). Minimum sample size required is 54 (27 in each group). We planned to recruit a total sample size of 60, 30 individuals in each group including 10% dropout rate.

Randomization and Blinding

Block randomization procedure will be conducted manually by drawing 60 blocks (15 rows with 4 blocks in each row). The primary investigator is a more than five year experienced cardio-respiratory therapist who provide laser irradiation and the cardiologist who perform echocardiography, the lab technician who assess cardio biomarker will be blinded. Laser protected eye wears will be used for participants blinding.

Study Procedure

After assessing the baseline outcome measures, the experimental group will be irradiated with Class IV laser for three days; immediately (within 30 minutes) after the angioplasty and subsequent two days. The irradiation will be given at three areas over the pericardium (left sternal border to mid clavicular line in the 2nd, 3rd intercostal space and over the apex) [10] for a duration of 60 seconds at each point as shown in figure 2. The dosage of laser irradiation will be 6J/cm² over three areas for 60 seconds at each area with a laser power of 6W and wavelength of 980nm using LCT-1000C (LiteCure Medical). Total energy delivered over one area will be 360J. During the irradiation phase, the probe will be placed perpendicularly and in direct contact with the skin. ECG rhythm and other vitals will be keenly observed during the entire period of irradiation. To maintain laser standard practice, both the participant and the laser provider will wear laser-protected eyewear. The sham control group, on the other hand, will have the identical class IV laser probe over the same regions, but laser energy will not be given. All the participants will receive pharmacological therapy on discretion of treating cardiologist irrespective of randomization group.

Outcome measures

Basic demographic details and medical history will be taken prior to the outcome measures.

Cardiac Biomarker

Troponin is the best marker for definitive diagnosis of acute myocardial injury [11]. Troponin I is used as an early marker as it is more sensitive. Normal reference range of troponin I is 0.04ng/ml [12]. Cardiac Biomarker Troponin I will be assessed by lab investigations. Troponin I will be evaluated at three times: at baseline, at peak hours (after 10 hour of PCI) and on third day post intervention.

Ejection Fraction

One clear way to measure the left ventricle's systolic function is to look at its left ventricular ejection fraction (LVEF). Normal range of LVEF as per the European Association of Cardiovascular imaging and American society of Echocardiography is 52%-72% and 50%-70% as per the American college of Cardiology, and less than 30% is labeled as severe dysfunction [13]. LVEF will be assessed by Philips EPIQ 7 echocardiography and at two time periods: baseline and third day post intervention.

Functional outcomes

A self-administrated Seattle Angina Questionnaire (SAQ) will be used to assess functional status and Quality of life in patients with coronary artery disease. It measures all five major domains of health related quality of life- physical limitation, angina stability, angina frequency, treatment satisfaction and quality of life [14, 15]. SAQ will be assessed at baseline and after one month follow up. Figure 3 shows the enrollment, intervention and assessment schedule.

Mandeep Kumar Jangra et al.,

The chairman of the student project committee will lead the Data and Safety Monitoring Committee (DSMC), which will keep an eye on the data that is gathered and will routinely audit the trial. All this will not be informed to the primary researcher.

RESULTS/ STATISTICAL PLAN

The Statistical Package of Social Sciences (SPSS) version 20 will be used for analysis. Kolmogorov-Smirnov test will be used to assess normality of the data. For normally distributed data, the descriptive statistics will be expressed as mean \pm SD and 95% confidence interval and Paired t test will be used for within group comparison and unpaired t test for between the group comparison. For not normally distributed data, the descriptive statistics will be expressed as median (interquartile range) with range and Mann-Whitney U test will be used for within group comparison and Wilcoxon signed rank test for between the group analysis. Statistical significance will be set at $p < 0.05$ to minimize type 1 error. Post hoc power analysis will be performed using G power to verify whether the study attained sufficient power or not.

DISCUSSION

In this study, we intend to determine the efficacy of Class IV Laser therapy in improving cardiovascular outcomes in individuals undergoing percutaneous coronary intervention for ACS. We hypothesized that class IV laser therapy can have beneficial effects on LVEF, cardiac biomarkers and SAQ amongst individuals with acute coronary syndrome after undergoing coronary angioplasty. Myocardial reperfusion injury results as a complex redox stress response. Any mechanism which may change this deleterious redox stress response into a protective redox reaction is essential to avoid this injury [16]. Multiple molecular and cellular mechanisms including mitochondrial respiration, mitochondrial signaling, modulation of inflammatory cytokines, pro-angiogenic and antioxidant actions of laser therapy in the form of low level laser therapy has been observed in number of animal trials [8, 17]. Most of the studies conducted among the animal model and *in-vitro* with low level laser therapy, were found to be effective in improving myocardial infarction size, improving inflammatory profile, reducing oxygen free radical and scarring of tissue [18, 19, 20, 21, 22, 23, 24]. In a human trial, the low level laser therapy after CABG is found to be effective in reduction of cardiac cellular damage and enhancing the tissue repair [10]. Post STEMI, LLLT to bone marrow is also effective to improve Troponin level without any delay in door to balloon time [25]. Low level laser therapy has its limitations as it has less deep penetration [26] with the help of class IV laser therapy we can overcome this limitation. So we can anticipate better outcomes with its use. In this trial, we are limiting the type 1 error less than 5% and type 2 errors less than 10% and this maybe the first study in exploring the cardioprotective effects of class IV laser therapy. Limitation of this trial can be single centered study and short duration of the intervention. This trial can be extended to assess the efficacy of class IV laser with different wavelength and power output and on other cardiac biomarkers like Myoglobin, BNP also. Study can also be conducted among individuals with coronary artery disease other than ACS.

ACKNOWLEDGEMENTS

The author would like to thank those who would participate in this trial.

FUNDING

No funding or sponsorship was received for this study and publication of this article.

CONFLICT OF INTEREST

The authors declare that they have no conflicts of interest.

ABSTRACT

The main objective of this paper is to establish a novel concept of disconnectedness in topological spaces. We aim to examine the new spaces namely j -disconnectedness and extremally j -disconnectedness using j -open sets. We also attempted to explore its properties using theorems and suitable examples.

Keywords and Phrases : j -open set, j -separated set, j -disconnected, extremally j -disconnected.

2020 Mathematics Subject Classification: 54G05

INTRODUCTION AND PRELIMINARIES

Connectedness is the massive topological property. In the same time we discuss the other side of connectedness equally disconnectedness in topological spaces. Many researchers have focused on finding various types of disconnectedness such as basically disconnected, extremally disconnected, perfectly disconnected and totally disconnected in topological spaces [6,11]. Of all these areas extremally disconnectedness has peculiar applications in topological spaces. Majority of researchers have examined this area of disconnectedness [2, 10]. In 1967, Dona discusses the characterization of disconnected spaces among Hausdorff spaces [4]. In 2013, Majid Mirmiran found the various equivalent statements of extremally disconnected spaces [5]. Sanjay Mishra introduced alpha τ -disconnectedness and investigates the relationship between alpha τ -disconnected and alpha τ -connected sets in 2015 [7]. Recently, Researchers examined various properties of disconnected spaces in different topological spaces [3,9]. Motivated with these researchers we aimed to examine a new spaces called j -disconnectedness and extremally j -disconnectedness in topological spaces using j -open sets. We also made an attempt to explore the properties of these spaces using theorems and suitable examples.

Throughout this paper (X, τ_X) denotes the topological space τ on X .

Definition 1.1 Let (X, τ_X) be a topological space (X, τ_X) is said to be j -open if $R_1 \subseteq \text{int}(pcl(R_1))$. The

Deepa and Sasikala

Definition 1.2. [1] Let (X, τ_X) be a topological space and R_1 be any subset of (X, τ_X) , then

The interior of R_1 is the union of all j-open sets contained in R_1 and it is denoted by $int_j(R_1)$. i.e., $int_j(R_1) = \bigcup \{M : M \text{ is j-open set and } M \subset R_1\}$.

the closure of R_1 is the intersection of all j-closed sets containing R_1 and it is denoted by $cl_j(R_1)$. i.e., $cl_j(R_1) = \bigcap \{N : N \text{ is j-closed set and } R_1 \subset N\}$

Remark 1.3. [1] If R_1 is a subset of any topological space (X, τ_X) . Then

R_1 is j-open if and only if $int_j(R_1) = R_1$

R_1 is j-closed if and only if $cl_j(R_1) = R_1$

The family of all j-open sets of a topological space is denoted by $JO(X)$ (or) τ_j .

Remark 1.4. [2] If R_1 and R_2 are any two subsets of $(, \tau_X)$. Then the following statements are hold.

$$int(\phi) = \phi$$

$$cl(\phi) = \phi$$

$$int(X) = X$$

$$cl(X) = X$$

$$int(R_1 \cap R_2) \supseteq int(R_1) \cap int(R_2)$$

$$cl(R_1 \cup R_2) \subseteq cl(R_1) \cup cl(R_2)$$

$$int(R_1) \subseteq R_1$$

$$cl(R_1) \supseteq R_1$$

Definition 1.5. [8] Let (X, τ_X) be a topological space if the two nonempty subsets R_1 and R_2 of (X, τ_X) is said to be j-separated if and only if $R_1 \cap cl_j(R_2) = \phi$ and $cl_j(R_1) \cap R_2 = \phi$.

Definition 1.6. [8] A topological space (X, τ_X) is said to be j-connected if $X \neq R_1 \cup R_2$ where R_1 and R_2 are j-separated sets in X .

Definition 1.7. [7] A topological space (X, τ_X) is said to be disconnected if X can be expressed as a union of two non-empty open sets in X . i.e., $X = R_1 \cup R_2$ where R_1 and R_2 are two sets with $R_1 \cap R_2 = \phi$.

Definition 1.8. [5] A topological space (X, τ_X) is called as extremally disconnected if $cl(R_1)$ is open for every open sets R_1 of (X, τ_X) .

Definition 1.9. [3] A fuzzy topological space (X, τ_X) is said to be extremally fuzzy α -disconnected if $cl_\alpha(\lambda)$ is fuzzy α -open for every fuzzy α -open sets of (X, τ_X) .

Definition 1.10. [7] Let (X, τ_X) and (X, τ_α) be two topological spaces. Then R_1 and R_2 of (X, τ_X) are said to be α - τ separated if and only if R_1 and R_2 are non-empty, $R_1 \cap cl_\alpha(R_2) = \phi$ and $cl_\alpha(R_1) \cap R_2 = \phi$ also $R_1 \cap R_2 = \phi$

j-disconnected spaces

Definition 2.1. A topological space (X, τ_X) is said to be j-disconnected if X can be expressed as a union of two non-empty j-separated sets in (X, τ_X) .

Example 2.2. Consider $X = \{q, r, s, t\}$ and $\tau_X = \{\phi, \{q\}, \{r, s, t\}, X\}$. For this topology, we have $\phi, \{q\}, \{r, s, t\}$ and X are j-open sets. Then $X = \{q\} \cup \{r, s, t\}$. Since $\{q\}$ and $\{r, s, t\}$ of (X, τ_X) are j-separated sets. i.e., $\{q\} \cap cl_j\{r, s, t\} = cl_j\{q\} \cap \{r, s, t\} = \phi$. Thus (X, τ_X) is a j-disconnected space.

Theorem 2.3. A topological space (X, τ_X) is disconnected if and only if (X, τ_X) is j-disconnected.

Proof Let us take a topological space (X, τ_X) to be a disconnected space. Then

Deepa and Sasikala

$X = R \cup S$, where $\phi \in R$ and $\phi \in S$, such that R and S are separated sets. This implies, $cl(R) \cap S = \phi$ and $R \cap cl(S) = \phi$. Also $cl_j(R) \subseteq cl(R)$, which implies, $cl_j(R) \cap S \subseteq cl(R) \cap S = \phi$. Correspondingly, $R \cap cl_j(S) \subseteq R \cap cl(S) = \phi$. Thus R and S are j -separated sets such that $X = R \cup S$. Hence (X, τ_x) is j -disconnected.

Conversely, suppose (X, τ_x) is not j -disconnected. Then we have, $cl_j(R) \cap S \neq \phi$ or $R \cap cl_j(S) \neq \phi$, for any two j -open subsets R and S of (X, τ_x) . This implies $cl(R) \cap S \neq \phi$ or $R \cap cl(S) \neq \phi$. Thus (X, τ_x) is not disconnected.

Theorem 2.4. A topological space (X, τ_x) is j -disconnected if and only if there exists a proper subset $\phi = R$ of X is both j -closed and j -open.

Proof Suppose (X, τ_x) is j -disconnected space. Then $X = R \cup S$ where $\phi \neq R$ and $\phi = S$ are j -separated sets. i.e., $cl_j(R) \cap S = R \cap cl_j(S) = \phi$. This implies $R \cap S = \phi$ and $X = R \cup S$. Then $S = R^c$ and $R = S^c$. We have $cl_j(R) \cap S = \phi$ and $R \cap cl_j(S) = \phi \implies cl_j(R) \subseteq S^c = R$ and $cl_j(S) \subseteq R^c = S$. But we have, $R \not\subseteq cl_j(R)$ and $S \not\subseteq cl_j(S)$. Thus $R = cl_j(R)$ and $S = cl_j(S)$. Therefore, R and S are j -closed sets and also $R^c = S$, $S^c = R$ are j -open sets. Hence a non- empty proper subsets of X are both j -open and j -closed. Conversely, assume $\phi = R$ be a proper subset of X . Then there exist a subset S which is both j -open as well as j -closed and $R \cap S = \phi$. This implies $cl_j(R) = R$ and $cl_j(S) = S$. Now $cl_j(R) \cap S = R \cap cl_j(S) = \phi$. Thus R and S are j -separated such that $X = R \cup S$. Hence (X, τ_x) is j -disconnected space.

Remark 2.5. The following example shows that, every discrete space (X, τ_j) is

j -disconnected if the space contains atleast two elements.

Example 2.6. Let $X = \{q, r\}$. Then $\tau_x = \{\phi, \{q\}, \{r\}, X\}$, $\tau_j = \{\phi, \{q\}, \{r\}, X\}$ and $\tau^c = \{\phi, \{q\}, \{r\}, X\}$. Since $\phi = q$ is a proper subset of X which is both j -open and j -closed. Therefore (X, τ_j) is j -disconnected.

Theorem 2.7. If $\phi = R$ and $\phi = S$ are two j -separated subsets of a topological space (X, τ_j) then $R \cup S$ is also j -disconnected in (X, τ_j) .

Proof Let R and S be the j -separated subsets of (X, τ_j) . Then we have $\phi \neq R$, $\phi \neq S$, $R \cap cl_j(S) = \phi$, $cl_j(R) \cap S = \phi$ and $R \cap S = \phi$. Now, we consider $X - cl_j(R) = M_j$ and $X - cl_j(S) = N_j$. This implies $cl_j(R) \cap \phi$ and $cl_j(S) \cap \phi$, also $cl_j(R)$ and $cl_j(S)$ are j -closed subsets of $N(X, \tau_x)$. Therefore M_j and N_j are non-null j -open subsets of (X, τ_x) . But $(R \cup S) \cap M_j = (R \cup S) \cap (X - cl_j(R))$
 $= [R \cap (X - cl_j(R))] \cup [S \cap (X - cl_j(R))]$
 $= [R \cap S] \cup [S \cap S]$
 $= \phi \cup S$
 $= S$

In the same way, we get $(R \cup S) \cap N_j = R$. It shows that, there exist a sub- sets M_j and N_j in τ_j such that $(R \cup S) \cap M_j$ and $(R \cup S) \cap N_j$ are non-empty. $[(R \cup S) \cap M_j] \cap [(R \cup S) \cap N_j] = \phi$ and $[(R \cup S) \cap M_j] \cup [(R \cup S) \cap N_j] = \phi \cup R \cup S = X$. Then $M_j \cup N_j$ is the j -disconnectedness of $R \cup S$. Hence $R \cup S$ is j -disconnected.

Theorem 2.8. Let (X, τ_x) and (X, τ_j) be two topological spaces, R be non-empty subset of X and $M_j \cup N_j$ be j -disconnection of R . Then $R \cap M_j$ and $R \cap N_j$ are j -separated subsets of (X, τ_j) .

Proof Let $M_j \cup N_j$ be j -disconnection of R . Using our assumption and the definition of j -disconnected, there exist $M_j, N_j \in \tau_j$ such that $R \cap M_j = \phi$ and $R \cap N_j = \phi$ which implies $(R \cap M_j) \cap (R \cap N_j) = \phi$ and $(R \cap M_j) \cup (R \cap N_j) = R \cap [M_j \cup N_j] = R \cap R = R$. Now we prove, $cl_j(R \cap M_j) \cap (R \cap N_j) = \phi$ and $[R \cap M_j] \cap cl_j(R \cap N_j) = \phi$. Assume the contrary $cl_j(R \cap M_j) \cap (R \cap N_j) \neq \phi$. This implies $x \in cl_j(R \cap M_j)$, $x \in R$ and $x \in N_j \implies (R \cap M_j) \cap N_j \neq \phi \implies (R \cap M_j) \cap (R \cap N_j) \neq \phi$ which contradicts $(R \cap M_j) \cap (R \cap N_j) = \phi$. Thus $cl_j(R \cap M_j) \cap (R \cap N_j) = \phi$. Similarly $(R \cap M_j) \cap cl_j(R \cap N_j) = \phi$. Hence $R \cap M_j$ and $R \cap N_j$ are j -separated sets in $[X, \tau_j]$.

Deepa and Sasikala

Theorem 2.9. Let S be a subset of a topological space (X, τ_X) and (X, τ_X) be j -disconnected if and only if $S = R \cup S$ where R and S are j -separated sets.

Proof Assume $S = R \cup S$ where R and S are j -separated sets in (X, τ_X) . Therefore, $R \cup S$ is j -disconnected. Hence S is also j -disconnected.

Conversely, let S be j -disconnected. To prove R and S are two j -separated subsets of X such that $S = R \cup S$. By the definition of j -disconnected there exists a subsets M_j and N_j in τ_j such that $S \cap M_j \neq \phi$ and $S \cap N_j \neq \phi$. $(S \cap M_j) \cap (S \cap N_j) = \phi$ and $(S \cap M_j) \cup (S \cap N_j) = S$. Put $S \cap M_j = R$ and $S \cap N_j = S$. Hence R and S are two j -separated subsets of $(, \tau_X)$ such that $S = R \cup S$.

Extremally j -disconnected Spaces

Definition 3.1. A topological space (X, τ_X) is called extremally j -disconnected if $cl_j(R)$ is j -open for all $R \in JO(X)$.

Example 3.2. Let $X = \{q, r, s, t\}$ with $\tau_X = \{\phi, \{q\}, \{q, t\}, \{r, s\}, \{q, r, s\}, X\}$. Then $\tau^c = \{\phi, \{r, s, t\}, \{r, s\}, \{q, t\}, \{t\}, \phi\}$. For this topology, $\phi, X, \{q\}, \{r\}, \{s\}, \{q, r\}, \{q, s\}, \{q, t\}, \{r, s\}, \{q, r, s\}, \{q, r, t\}, \{q, s, t\}$ are the collection of pre-open sets. Therefore we have $\phi, X, \{q\}, \{q, t\}, \{r, s\}, \{r, st\}$ are the family of j -open sets. Here $cl_j\{q\} = \{q, t\}, cl_j\{q, t\} = \{q, t\}, cl_j\{r, s\} = \{r, s\}$ and $cl_j q, r, s =$. Therefore j -closure of every j -open set is j -open. Hence $(, \tau_X)$ is extremally j -disconnected.

Theorem 3.3. In general, the following statements are equivalent for any topological space (X, τ_X) .

(X, τ_X) is extremally j -disconnected.

$int_j(R_a)$ is j -closed for all j -closed set R_a in X .

$cl_j(R_a) \cup cl_j[X - cl_j(R_a)] = X$ for all j -closed set R_a in X .

$cl_j(R_a) \cup cl_j(R_b) = X$ for every pair of j -open sets R_a and R_b in (X, τ_X) with

$cl_j(R_a) \cup R_b = X$.

Proof (i) \implies (ii)

Let R be a j -closed subset of (X, τ_X) . To prove $int_j(R_a)$ is j -closed.

Put $X - int_j(R_a) = cl_j(X - R_a)$. Since R_a is j -closed and (X, τ_X) is extremally j -disconnected. Then $(X - R_a)$ is j -open and $cl_j(X - R_a)$ is j -open. This implies $(X - int_j(R_a))$ is j -open and $int_j(R_a)$ is j -closed.

(ii) \implies (iii)

Assume R_a is j -open subset of (X, τ_X) . Put

$X - cl_j(R_a) = int_j(X - R_a)$.

Then $cl_j(R_a) \cup cl_j(X - cl_j(R_a)) = cl_j(R) \cup cl_j(int_j(X - R_a))$

$= cl_j(R_a) \cup int_j(X - R_a)$

$= cl_j(R) \cup (X - cl_j(R)) = X$

(iii) \implies (iv)

Let R_a and R_b be two j -open subsets of (X, τ_X) such that

$$cl_j(R_a) \cup R_b = X. \tag{1}$$

$$\text{Using (iii) } cl_j(R_a) \cup cl_j(X - cl_j(R_a)) = cl_j(R_a) \cup R_b \tag{2}$$

$$\implies R_b = cl_j(X - cl_j(R_a)). \tag{3}$$

From (3), $R_b = X - cl_j(R_a)$.

$X - cl_j(R_a) = cl_j(X - cl_j(R_a))$

$\implies cl_j(R_b) = cl_j(X - cl_j(R_a))$

$\implies cl_j(R_a) = X - cl_j(R_a)$.

$cl_j(R_b) \cup cl_j(R_a) = X - cl_j(R_a) \cup cl_j(R_a)$

$= X$

Deepa and Sasikala

(iv) \implies (i)

Let R_a be any j-open subset of (X, τ_X) .

Take $R_b = X - cl_j(R_a) \implies cl_j(R_a) \cup R_b = X$.

Using (iv) we have $cl_j(R_a) \cup cl_j(R_b) = X$ and $cl_j(R_a)$ is j-open in (X, τ_X) . Hence (X, τ_X) is extremally j-disconnected.

Theorem 3.4. Let R_a and R_b be any two non-empty j-open subsets of (X, τ_X) and $R_a \cap R_b = \phi$. Then a topological space (X, τ_X) is extremally j-disconnected if and only if $cl_j(R_a) \cap cl_j(R_b) = \phi$ for every $R_a, R_b \in X$ such that $R_a \cap R_b = \phi$.

Proof Let $\phi = R_a$ and $\phi = R_b$ be two j-open subsets of extremally j-disconnected

space (X, τ_X) with $R_a \cap R_b = \phi$. $cl_j(R_a) \cap int_j(R_b) = cl_j(R_a) \cap R_b = \phi$. $int_j(cl_j(R_a)) \cap int_j(cl_j(R_b)) = \phi \implies cl_j(R_a) \cap cl_j(R_b) = \phi$.

Conversely, take G be an arbitrary j-open subset in (X, τ_X) . Then $X - G$ is j-closed set. This implies $int_j(G)$ is j-open set such that $G \cap int_j(G) = \phi$. By

hypothesis,

$$cl_j(G) \cap cl_j(int_j(X - G)) = \phi$$

$$\implies cl_j(G) \cap cl_j(X - cl_j(G)) = \phi$$

$$\implies cl_j(G) \subseteq int_j cl_j(G) \subseteq cl_j(G).$$

$$\implies cl_j(G) \cap [X - int_j cl_j(G)] = \phi.$$

$$cl_j(G) \subseteq int_j[cl_j(G)] \quad (4)$$

In general, $int_j(cl_j(G)) \subseteq cl_j(G)$

(5)

From (4) and (5), $cl_j(G) = int_j cl_j(G)$. Thus $cl_j(G)$ is j-open set in (X, τ_X) . Also G is arbitrary j-open set. Hence (X, τ_X) is extremally j-disconnected.

Theorem 3.5. In a topological space (X, τ_X) the following relations are equivalent.

(X, τ_X) is extremally j-disconnected.

For every j-open subsets of R_a and R_b in X such that

$$cl_j(R_a) \cap cl_j(R_b) = cl_j(R_a \cap R_b).$$

For every j-closed subsets S_a and S_b of X , $int_j(S_a) \cup int_j(S_b) = int_j(S_a \cup S_b)$.

Proof (i) \implies (ii)

Taking R_a and R_b as two non-empty j-open subsets of extremally j-disconnected space (X, τ_X) . We have $cl_j(R_a) \cap cl_j(R_b) = cl_j(R_a \cap R_b)$.

(ii) \implies (iii)

Take S_a and S_b are two j-closed subsets of extremally j-disconnected space (X, τ_X) .

Then $(X - S_a)$ and $(X - S_b)$ are j-open subsets. Therefore, we have

$$cl_j(X - S_a) \cap cl_j(X - S_b) = cl_j[(X - S_a) \cap (X - S_b)].$$

$$(X - int_j(S_a)) \cap (X - int_j(S_b)) = cl_j[X - (S_a \cup S_b)]$$

$$X - (int_j(S_a) \cup int_j(S_b)) = X - int_j(S_a \cup S_b).$$

Therefore, $int_j(S_a) \cup int_j(S_b) = int_j(S_a \cup S_b)$.

(iii) \implies (ii)

Proof is similar to (ii) \implies (iii).

(ii) \implies (i)

Let R_a be arbitrary j-open subset of (X, τ_X) . Then $X - R_a$ is j-closed. $cl_j(R_a) = int_j(cl_j(R_a))$. Therefore, we have $cl_j(R_a)$ is arbitrary j-open set in (X, τ_X) . Hence (X, τ_X) is extremally j-disconnected.

Theorem 3.6. If R_a and R_b are any two non-null j-open subsets of (X, τ_X) . Then (X, τ_X) is extremally j-disconnected if and only if

$$int_j(cl_j(R_a)) \cup int_j(cl_j(R_b)) = int_j(cl_j(R_a \cup R_b)) \text{ for all } R_a \text{ and } R_b \text{ in } X.$$

Proof Let (X, τ_X) be extremally j-disconnected space, R_a and R_b be arbitrary j-open subsets of (X, τ_X) . Therefore $cl_j(R_a)$ and $cl_j(R_b)$ are j-closed subsets of (X, τ_X) . Thus, $int_j(cl_j(R_a)) \cup int_j(cl_j(R_b)) = int_j(cl_j(R_a) \cup cl_j(R_b)) = int_j(cl_j(R_a \cup R_b))$.

Deepa and Sasikala

Conversely, Let M_a and M_b are two j -closed subsets of (X, τ_X) . Then $int_j(M_a)$ and $int_j(M_b)$ are j -open subsets of (X, τ_X) . By our assumption, $int_j(cl_j(int_j(M_a))) \cup int_j(cl_j(int_j(M_b))) = int_j(cl_j[int_j(M_a) \cup int_j(M_b)])$, since M_a and M_b are j -closed

subsets of (X, τ_X) . Therefore, we have

$$int_j[cl_j[int_j[cl_j(M_a)] \cup int_j[cl_j(M_b)]]] = int_j cl_j[int_j cl_j[M_a \cup M_b]] \\ = int_j cl_j[M_a \cup M_b]$$

Hence (X, τ_X) is extremally j -disconnected.

Theorem 3.7. If S_a and S_b are any two non null j -closed subsets of (X, τ_X) . Then (X, τ_X) is extremally j -disconnected if and only if $cl_j(int_j(S_a)) \cap cl_j(int_j(S_b)) = cl_j(int_j(S_a \cap S_b))$ for all S_a and S_b in (X, τ_X) .

Proof Assume (X, τ_X) is extremally j -disconnected and S_a, S_b are any two j -closed subsets of (X, τ_X) . Then $int_j(S_a)$ and $int_j(S_b)$ are j -open subsets of (X, τ_X) . Therefore, $cl_j(int_j(S_a)) \cap cl_j(int_j(S_b)) = cl_j(int_j(S_a) \cap int_j(S_b)) = cl_j int_j(S_a \cap S_b)$.

Conversely, let N_a and N_b be any two j -open subsets of (X, τ_X) .

Then $cl_j(N_a), cl_j(N_b)$ are j -closed subsets of (X, τ_X) . Now $cl_j(int_j(cl_j(N_a))) \cap cl_j(int_j(cl_j(N_b)))$

$$= cl_j int_j[cl_j(int_j(N_a))] \cap cl_j int_j[cl_j(int_j(N_b))]$$

$$= cl_j int_j(N_a) \cap cl_j int_j(N_b)$$

$$= cl_j int_j(N_a \cap N_b) = cl_j(N_a \cap N_b).$$

Hence (X, τ_X) is extremally j -disconnected.

CONCLUSION

This paper deals with the findings and observations of j -disconnectedness and extremally j -disconnectedness in topological spaces. We analyzed the characteristics of such spaces by suitable theorems and appropriate examples. Thus the study has proved that these concepts will be used in various areas of topological spaces.

ABSTRACT

This present study was performed to evaluate the enzymic and non-enzymic antioxidant activities of *Momordica charantia* and *Trigonella foenumgraecum* seed extracts in diabetes induced rats. Diabetes Mellitus was induced by a single intraperitoneal injection of STZ-NIC and rats with blood glucose concentration more than 250mg/dl were used for the study. The ethyl acetate seed extracts of the plant samples were administered at doses of 200, 400 mg/kg b.w. and glibenclamide for 21 days and the activities of enzymic antioxidants superoxide dismutase (SOD), catalase (CAT), glutathione peroxidase (GPx) and non-enzymic antioxidants namely vitamin C, vitamin E and reduced glutathione (GSH) and lipid peroxidation were evaluated. There was a significant improvement in the activities and the levels of enzymic and non-enzymic antioxidants catalase, glutathione peroxidase, superoxide dismutase, vitamins C, E and reduced

Ashokkumar Lakum et al.,

glutathione (GSH) and lipid peroxidation treatment with 400mg/kg b.w of the plant extracts and glibenclamide. This study demonstrates the antioxidant effect of the *Momordica charantia* and *Trigonella foenumgraecum* seed extracts that might help in control and prevention of diabetes mellitus.

Keywords: Diabetes, Enzymic antioxidants, Non-enzymic antioxidants, *Momordica charantia*, *Trigonella foenumgraecum*.

INTRODUCTION

Diabetes mellitus (DM) is a complicated, and non-contagious endocrine ailment that has posed clinical challenges globally, often linked with threats related to complicated metabolic development in patients. It is marked by elevated blood glucose and lipids and oxidative stress, which results in chronic complications involving diverse organs, mainly the kidneys, eyes, nerves, and blood vessels, among others, in the body. World Health Organization (WHO) has reported that DM is an outbreak prone to high malaise and death [1]. During hyperglycemia, production of reactive oxygen species and reactive nitrogen species increases. This results in decrease in the activity of antioxidant enzymes, induces oxidative stress in the body [2]. Reactive oxygen species (ROS) level elevation in Diabetes may be due to perturbations in antioxidant defense system. The variation in the levels of antioxidant enzymes makes the tissues susceptible to oxidative stress leading to the development of diabetic complications [3]. Antioxidants are biochemicals that can neutralize the potentially damaging action of free radicals such as unstable molecules as peroxyl radical, hydroxyl radical and singlet oxygen and peroxy nitrate radicals. Antioxidants either completely stop or significantly reduce the damaging effects of free radicals on cells. So, antioxidants and free radical studies are very important in today's research for understanding the relationships of diseases such as cancer, neurodegenerative diseases, Diabetes mellitus and cardiac arrest [4]. One of the great advantages of medicinal plants is that these are readily available and have fewer side effects for management of diabetes.

There are reports about 800 plants that may possess antidiabetic activities [5]. Antioxidants are present in all parts of plants like wood, bark, stems, pods, leaves, fruit, roots, flowers, pollen and seeds. The occurrence of such oxidative mechanisms in plants clarifies why a plenty of antioxidant compounds have been recognized in plant tissue. Plants mostly those with elevated levels of powerful antioxidant compounds have an essential role in the cure and treatment of illness concerning oxidative stress including Diabetes Mellitus [6]. *Momordica charantia* commonly known as bitter melon grows in tropical and subtropic areas, and is used as a food and medicine. It yields prickly fruit and lovely flowers. While bitter melon seeds, leaves, and vines have all been utilized for medicinal purposes, the fruit of the plant is the most widely used and safest part [7]. *Momordica charantia* seed extracts showed potent free radical scavenging activity, alpha- amylase inhibition and the mechanism were found to be noncompetitive inhibition. [8] *Trigonella foenum graecum* (Fenugreek) is a leguminous bean and which belongs to the family Fabaceae. The seeds and green leaves of *Trigonella foenum graecum* used as food possess many medicinal applications. Total fenugreek production in India was 113 thousand metric tonnes in the year 2012- 2013. In India; it is extensively used as ayurvedic medicine and in China as traditional medicine. Fenugreek is consumed in various parts of the world in different forms and has been regarded as a treatment for many ailments known to man [9]. Hence the present study was aimed to evaluate the *in vivo* antioxidant potential of *Momordica charantia* and *Trigonella foenumgraecum* seed extracts in Streptozotocin– Nicotinamide administered diabetes induced rats.

MATERIALS AND METHODS

Plant Collection, Identification and Preparation of Extract

Momordica charantia seeds (MCS) and *Trigonella foenum graecum* seeds (TGS) were dried, finely powdered, and stored in airtight containers at room temperature for further use. 5 grams of *Momordica charantia* seeds (MCS) and *Trigonella*

**Ashokkumar Lakum et al.,**

foenum graecum seeds (TGS) powder were macerated with 50 ml ethyl acetate for 48 hours filtered and collected the solvent. The solvent was evaporated in water bath shaker to get dry extract and used for further analysis.

Experimental Animals

Adult male albino Wistar rats (6 weeks), weighing 150 to 200 g were used for the present antidiabetic study. The animals were housed in clean polypropylene cages and maintained in a well-ventilated temperature-controlled animal house with a constant 12-hour light/dark schedule. The animals were fed with standard rat pelleted diet and clean drinking water was made available *ad libitum*. All animal procedures were performed after approval from the Ethical Committee Clearance No: 53 IAE1012/c/17/CPCSEA-2013 and in accordance with the recommendations for the proper care and use of laboratory animals.

Acute toxicity studies

Acute oral toxicity study of *Momordica charanti* seeds (MCS) extract and *Trigonella foenum graecum* seeds (TGS) extract was studied in healthy rats (n= 3) according to guidelines set by Organisation for Economic Co-operation and Development (OECD). The plant extract was evaluated for the pharmacological potential in normal rats weighing 150 to 200 g. The animals were given 200 mg/kg of MCS and 2000 mg/kg of TGS initially, then 500, 1000, 1500, and 2000 mg/kg b.w., and their toxicity was assessed. For a full day, the animals were watched for signs of death. Further studies will be conducted using 1/5th and 1/10th of the highest dose (2000 mg/kg b.w.) as there was no mortality observed in the acute toxicity studies.

Induction of Diabetes Mellitus

The animals were kept overnight fasting and the initial fasting blood glucose was checked from tip of rat tail vein. Nicotinamide was dissolved in regular saline, and streptozotocin was dissolved in citrate buffer (pH 4.5). A single intraperitoneal injection of 60 mg/kg streptozotocin was given to overnight fasted rats 15 minutes after an i.p. injection of 120 mg/kg nicotinamide. This caused the rats to develop diabetes mellitus. Hyperglycemia was confirmed by the elevated levels of blood glucose determined after 72 hours. The animals with blood glucose concentration more than 250mg/dl were used for further study. The vehicle (saline), standard drug glibenclamide and plant extracts were administered to the respective group animals for 21 days. Throughout the study period glibenclamide and plant extracts were freshly dispersed in normal saline and distilled water before the administration.

Sample collection

At the end of the experimental period rats were fasted overnight and anaesthetized with diethyl ether (100ml/kg), blood samples were collected through retro-orbital sinus puncture with or without EDTA container for the estimation of selected biochemical and haematological parameters. The liver of the experimental rats was removed and a portion of each was stored at minus 40°C for performing the assays involving enzymic and non-enzymic antioxidants.

Determination of Enzymic antioxidants

The activities of enzymic antioxidants namely superoxide dismutase, catalase and glutathione peroxidase were determined in the liver of the control and experimental rats to assess the protection rendered by MCS, TGS and glibenclamide [10,11,12]

Determination of Non enzymic antioxidants

The activities of non-enzymic antioxidants vitamin C, vitamin E and reduced glutathione were determined in the liver of the control and experimental rats to assess the protection rendered by MCS, TGS and glibenclamide [13,14,15].

Ashokkumar Lakum *et al.*,**Determination of lipid peroxidation**

Hyperglycemia associated with hyperlipidemia could be the causative factor for the increased production of free radicals and lipid peroxides like malondialdehyde (MDA) [16]. Hence lipid peroxidation in experimental rats was estimated [17].

Statistical Analysis

The data were statistically analysed and statistical significance was determined by One-way Analysis of Variance (ANOVA) followed by Dunnett's multiple comparison test. A 'p' value of less than 0.05 was regarded as significant.

RESULTS AND DISCUSSION

An imbalance of oxidant and antioxidant defence systems result in alterations in the activity of antioxidant enzymes such as superoxide dismutase (SOD), catalase (CAT) and glutathione peroxidase (GPx). In the present study, the activity of superoxide dismutase, catalase and glutathione peroxidase in normal and Diabetes induced rats were evaluated. The results of antioxidant activity of enzymes on control and experimental rats are depicted in Figures 1 a, 1b and 1c. There was a significant decrease ($p < 0.05$) in the activity of enzymic antioxidants namely superoxide dismutase, catalase and glutathione peroxidase in the liver of diabetic control rats. In diabetic rats treated with glibenclamide and plant extracts, there was a significant improvement ($p < 0.05$) in the activity of these enzymes. The activity of these enzymes in rats treated with highest dose of 400mg/kg b.w of MCS was comparable to the activity of enzymes in glibenclamide treated rats. Oxidative stress is a condition of reduction in anti-oxidative enzyme activities of SOD, CAT and GPx. The antioxidant enzymes SOD and CAT play an important role in reducing cellular stress. While CAT reduces hydrogen peroxides and shields higher tissues from extremely reactive hydroxyl radicals, SOD scavenges the superoxide radical by converting it to hydrogen peroxide and molecular oxygen [18].

The decreased activities of CAT and SOD may be response for increased production of H_2O_2 and O_2 by the auto-oxidation of glucose. Because these enzymes accelerate the dismutation of oxygen radicals and remove organic peroxides and hydroperoxides produced by unintentional exposure to STZ, they are crucial for maintaining physiological levels of oxygen and hydrogen peroxide. [19]. Treatment with MCS and TGS seemed to increase the activity of these enzymes and might help to control free radicals when compared to Glutathione peroxidase enzyme is relatively stable, but it has been reported that is disabled in severe oxidative stress conditions. *Citrullus lanatus* (watermelon) treated diabetic rats showed an increase in the activity of Gpx status which was almost close to the control level and this is remarkable as this implies that the juice could have an ameliorating effect on the altered antioxidant status of diabetic rats [20]. The activities of antioxidant enzymes SOD and CAT were significantly increased after the treatment of ethyl acetate fraction of ethanol extract of *Stereospermum suaveolens* in STZ-induced diabetic rats indicating the free radical scavenging activity and their protective effect against diabetic kidney cellular damage [21]. Treatment with root extracts of *Premnacorymbosa* (Rottl.) increased the activity of antioxidant enzymes SOD, CAT and GPx when compared to diabetic rats. The effect produced by plant extract was comparable with that of standard drug glibenclamide [22].

Non enzymic antioxidants

The changes in the levels of non-enzymic antioxidants namely vitamin C, vitamin E and reduced glutathione (GSH) are important in cellular system in curtailing reactive oxygen species. The levels of these non – enzymic antioxidants in control, diabetic and treated rats were assessed and the results are depicted in Figures 2 a, 2 b and 2 c. There was a significant reduction ($p < 0.05$) in the nonenzymic antioxidants namely vitamins C, E and reduced glutathione (GSH) in diabetic rats when compared to control rats. The levels of these antioxidants were significantly increased ($p < 0.05$) in rats by treating with glibenclamide, MCS and TGS ethyl acetate extracts. The levels of vitamin C, E and reduced glutathione were found to be increased significantly ($p < 0.05$) on treatment with 400mg /kg b.w. Vitamin C is an effective antioxidant in various biological systems [23]. Vitamin C plays a central role in the antioxidant protective system, protecting all lipids undergoing oxidation and diminishing the number of apoptotic cells [24]. Vitamin E acts

Ashokkumar Lakum et al.,

as a non-enzymatic antioxidant and reduces chain reactions of lipid peroxidation [25]. Vitamin E shields cell structures from damage by reducing lipid hydroperoxides produced during the peroxidation process. The decreased level of vitamin E found in the liver of diabetic rats as compared with control rats could be due to increased oxidative stress, which accompanies the decrease in the level of antioxidant and might be related to the cause of Diabetes Mellitus [26]. Enhanced level of vitamin E or tocopherols in plant extract treated groups is based on their ability to donate phenolic hydrogens to lipid radicals. Vitamin E protects poly unsaturated fatty acids from being oxidized [27]. Decreased levels of nonenzymatic antioxidant vitamin C and E in diabetic rats, when compared to those of control rats. The levels of these antioxidants were significantly increased in different organs (liver, kidney, brain, heart and pancreas) of diabetic rats by treatment with root extracts of *Premnacorymbosa* (Rottl) [28]. GSH has a multifaceted role in anti-oxidant defence. It is a direct scavenger of free radicals as well as a co-substrate for peroxide detoxification by glutathione peroxidase [29]. Hyperglycemia is found to be an indirect cause of GSH depletion. As GSH is an important antioxidant molecule, its depletion leads to an increase of oxidative stress [30]. Oral administration of aqueous fruit extract of *Passiflora ligularis* for 30 days showed significant elevation in all the non-enzymatic antioxidants values and reached near normal values. This can reduce the oxidative stress leading to less degradation of GSH due to less production of ROS in diabetic stage [31]. In the present study, there was an increased level ($p < 0.05$) of reduced glutathione in MCS and TGS treated groups which imply that the plant extracts might have an enhanced amount of GSH activity which plays a role in coordinating the body's antioxidant defense processes. Reduced glutathione, synthesized mainly in the liver is an important non-enzymic antioxidant in the antioxidant defense system.

Lipid peroxidation

The status of lipid peroxidation of control and experimental rats were studied and the results are depicted in Figure 3. Lipid peroxidation was increased significantly ($p < 0.05$) in diabetic rats as compared to that of control rats. The rats treated with glibenclamide, MCS and TGS showed significant reduction ($p < 0.05$) in lipid peroxidation. The diabetic rats treated with highest dose of 400mg/kg b.w showed significant improvement ($p < 0.05$) in antioxidant activity and the reduction in malondialdehyde production was comparable to glibenclamide treated rats. Lipid peroxidation is an autocatalytic free radical process formed by oxidative damage of cells. ROS produced in tissues results in lipid peroxidation and subsequently enhances the levels of malondialdehyde which is the major end product and index of lipid peroxidation [32]. Polyunsaturated lipids oxidatively deteriorate due to a process called lipid peroxidation, which is mediated by free radicals. The increase in oxygen free radicals in Diabetes could be primarily due to increase in blood glucose levels, which upon auto-oxidation generates free radicals [33]. *Coleus vettiveroides* Jacob extracts possess potent antioxidant and lipid peroxidation activities and can be employed in protecting tissue from the oxidative stress, which might be responsible for its hypoglycemic property [34]. In the present study, increased lipid peroxidation in STZ-induced diabetic rats might be due to an increase in the generation of free radicals by STZ. The ability of MCS and TGS extracts to quench hydroxyl radicals seems to be directly related to inhibiting the process of lipid peroxidation. After oral administration of the plant extracts for 21 days the elevated values restored back to near normal level. Lipid peroxidation significantly decreased in the treated groups, indicating that it plays a protective role against lipid peroxidation.

CONCLUSION

In the present study *in vivo* antioxidant activities of *Momordica charantia* and *Trigonella foenumgraecum* seed extracts in streptozotocin–nicotinamide administered diabetes induced rats showed a significant improvement in the activities and the levels of enzymic and non-enzymic antioxidants catalase, glutathione peroxidase, superoxide dismutase, vitamins C, E and reduced glutathione (GSH) on treatment with plant extracts. The rats treated with MCS and TGS also showed significant reduction in lipid peroxidation. The various antioxidant activities exhibited by *Momordica charantia* and *Trigonella foenumgraecum* may be attributed to their effectiveness as good scavengers of free radicals. Hence, these might be useful in the control of hyperglycaemia and due to its potent antioxidant properties may help in prevention of complications in diabetes.

ABSTRACT

A number of bacterial cultures were isolated from various sources and tested for their potential to detoxify and decolorize the disperse dyes present in the textile effluent. Out of twenty-two, three strains—*Fictibacillusgelatini*, *Bacillus subtilis subsp. inaquosorum*, and *Bacillus subtilis subsp. subtilis*—displayed exceptional capability for disperse dye decolorization. Enzyme profiling revealed effective production of laccase and azoreductase. A variety of synthetic dyes were selected for experimentation and all the strains showed 100% decolorization at optimum conditions including carbon sources (maltose, starch, mannitol and glucose), nitrogen supplies (yeast extract, ammonium nitrate, beef extract and peptone), pH (6.0- 9.0), temperature (30°C, 37°C and 40°C), inoculum size (3%, 5% and 7.5%), and dye concentrations upto 500 ppm. Microbial consortia of these three isolates resulted in complete decolorization of all the dyes at optimum conditions. These isolates significantly reduced the pH (28%), COD (49%), TDS (51%), and TSS (86%) levels in addition to removing the colors from these effluents.

Keywords: bacterial isolates, consortia, decolorization, disperse dyes, effluents

INTRODUCTION

The demand for synthetic dyes in the Indian textile industries has significantly expanded during the past decade. Due to scarcity and high cost of natural dyes, textile industry has to look for other more cost-effective, readily

**Rashmi et al.,**

accessible dyes. Out of an annual production of about 7×10^7 tonnes, the textile sector uses about 10,000 tonnes of synthetic dyes per year [1]. Improper disposal of waste water by textile industries is one of the major challenges currently affecting the entire planet. These artificial dyes travel over long distances together with the wastewater [2] and persist in the soil and water for an extended period of time. It decreases the amount of dissolved oxygen in water bodies and prevents photosynthetic activity, which contributes to the rise in biological and chemical oxygen demand and eventually has an impact on health of aquatic life and habitats. Additionally, it alters microbial populations and raises soil salinity, causing soil contamination [3,4,5]. Many researchers have investigated the cytotoxic and genotoxic effects of synthetic dyes [6]. Synthetic textile dyes containing polycyclic, triphenylmethane and anthraquinone causes nuclear defects, liver cancer, urothelial carcinoma, spleen cancer and chromosomal abnormalities in human cells [7]. Disperse dyes are non-ionic dyes, toxic to store and difficult to degrade [8]. Synthetic textile dyes are stable and difficult to degrade due to their complex aromatic structure and often created to be resistant to fading from light, oxidising agents, and chemicals [9]. As a result, existing conventional physico-chemical processes for decolorizing dye effluent are costly and not very effective. These methods are economically unfeasible and generate toxic by-products as sludge [10, 11]. Textile effluents have been reported to be treated using ion exchange [12], adsorption [13], chemical coagulation [14], oxidative remediation [15], photo-degradation [16] and membrane treatment technologies including microfiltration, electrodialysis, nanofiltration, reverse osmosis, and ultrafiltration. However, these techniques are costly and could result in undesired byproducts [17]. Therefore, in order to reduce the risk of water contamination, it is necessary to create environmentally safe and commercially feasible technologies for treating synthetic dyes in textile effluents. Researchers have investigated the ability of microbes, such as bacteria, yeast cells, fungal species, and algal species to decolorize and breakdown resistant textile dyes and mineralize to produce water and carbon dioxide. Biological approaches, however, have cheap operating costs and consistent results; are ecofriendly and do not generate a lot of sludge [18]. Numerous bacterial strains including *Bacillus subtilis*, *Paenochrobactrumglaciei*, *Brevibacilluspanacihumi*, *Bacillus cereus*, *Bacillus sphaericus*, *Paenibacilluspocheonensis* and *Escherichia coli* were found to be effective decolorizers of a wide range of disperse dyes [19]. Therefore, the present study is mainly focused on the isolation of potent bacterial cultures for the effective treatment of waste discharge of textile industries containing disperse dyes. The current study's objective was to identify and characterize effective bacterial strains having remarkable capacity to decolorize or degrade different types of disperse dyes. It was planned to use isolated bacteria, either by themselves or in a consortium, to create effective biological processes to facilitate the treatment of discharges containing various dyes.

MATERIALS AND METHODS

Dyes and Chemicals

Different Disperse dyes (Disperse red 1, Disperse orange 1, Disperse orange 30, Disperse blue 79, Disperse red 167, Disperse blue 183, Disperse yellow 198) were procured from Textile Mill, Bhiwani, Haryana, India. Analytical grade chemicals were acquired from Hi-Media Laboratories, India.

Isolation, screening and preservation of bacterial cultures

The following samples were taken from Nahar Textile Industry, Lalru, Punjab: soil, wet sludge, dry sludge, and effluent of disperse dyes. The samples were stored at room temperature in sterile vials, and experiments were performed within 24 hours after collection. 1% of the collected samples were aseptically inoculated in nutrient broth containing 500 mg/L each of the three dyes in a 250 mL Erlenmeyer flask. Dilution tubes were made from the enriched culture after 24 hours of incubation at 37°C under aerobic conditions. Using spread plate and streak plate methods, pure colonies were isolated and their potency to decolorize the dye (500mg/L) was tested. The highest decolorizing colonies were chosen for additional studies. The pure single-colony cultures were kept at -20°C in 15% glycerol for storage. A number of bacterial cultures like *Brevibacilluslaterosporus*, *Enterobacter gergoviae* etc [20]. have been identified by other workers that have ability to degrade disperse dyes.

**Rashmi et al.,****Biochemical and morphological identification of bacterial cultures**

Morphological and biochemical tests were performed for identification of bacterial cultures. Gram's staining technique was used for morphological characterization. Further identification of bacterial cultures was done by MTCC, IMTECH, Chandigarh using 16 S r-DNA sequencing.

Effect of pH and temperature

To evaluate the impact of pH, 500 mg/L of each dye was mixed in modified ZZ media individually and kept at different pH values- pH 6.0, 7.0, 8.0, 9.0. The flasks were inoculated with 5 or 10% v/v of bacterial cultures and incubated at 37 °C. The effect of temperature was investigated by inoculating overnight bacterial cultures in the modified ZZ medium and incubating them at 25°C, 30°C, 37°C, 40°C, and 50°C and pH of the medium was maintained at 7.0.

Effect of nitrogen and carbon source

Different sources were studied to evaluate the effect of nitrogen and carbon source. Glucose, galactose, fructose, mannitol, maltose, sucrose & starch were used as carbon sources. For nitrogen sources, ammonium nitrate, peptone, malt extract, yeast extract, beef extract and sodium nitrate were used at a concentration of 5g/L. These sources were added individually to modified ZZ media. The overnight growing bacterial culture was added to the flasks at concentration of 5 or 10% v/v, and incubated at a temperature of 37°C.

Enzyme screening assays: Quantitative assay

For interpretation, quantitative findings are presented numerically and compared with the related reference period. The activities of enzymes- laccase, azo-reductase, tyrosinase, and lignin peroxidase (LiP) were examined in cell free extracts and culture supernatants.

Laccase assay (EC. 1.10.3.2)

Laccase assay (EC. 1.10.3.2) was performed by a modified protocol of Zarvazina et al. (2004) which used 2, 2'-azino-bis-(3-ethylthiazoline-6-sulfonate) (ABTS) as a substrate at pH 6.0. To start the reaction, 1 ml of the sample was added, which was then spectrophotometrically monitored at 436 nm. A unit of activity was defined as the total amount of enzyme necessary to convert 1 μ M ABTS per minute per ml. Laccase assay was also done by using guaicol as a substrate at pH 6.5 and was measured spectrophotometrically at 465 nm [21]. The amount of enzyme needed to raise absorbance by 0.001 units at 37°C was defined as one unit.

Azoreductase assay (EC. 1.7.1.6)

Azoreductase assay was performed using the procedure, which included 4.45 M of dyes, 50 mM phosphate buffer (pH 7.4) containing 100 μ M NADH and 1 ml of enzyme solution and change in color absorbance (430 nm) was observed at room temperature [22].

Tyrosinase

Tyrosinase assay was done by using a reaction mixture of 2 ml including 0.1M phosphate buffer (pH 7.4) with 0.01% catechol [23].

Lignin peroxidase (LiP)

To measure the activity of lignin peroxidase, a reaction was carried out using 2.5 ml of mixture containing 100 mM n-propanol, 50 mM tartaric acid and 10 mM H₂O₂ and the presence of propanaldehyde at 300 nm was monitored [24]. One unit of enzyme activity was described as the change in absorbance unit/min/mg of enzyme against blank test tube that included all the constituents other than the enzyme solution. All enzyme experiments were performed in triplicates, and the average results were determined. Protein content was estimated by Lowry's method [25].

Rashmi et al.,

Decolorization Assay

All decolorization tests were carried out in a 250 ml Erlenmeyer flask comprising 100 ml of pre-enriched bacterial culture in modified ZZ media. At regular interval of 12 hours, the samples (2ml) were taken out of the test and control media, and centrifuged at 10,000 rpm for 10 minutes to eliminate the cellular debris. Decolorization of dyes was assessed spectrophotometrically at the corresponding λ max of dye, and the results were compared with uninoculated medium containing 500mg/l of dye, taken as control. All the experiments were performed in triplicates. Decolorization efficacy of bacterial cultures was calculated by the given equation [26]:

$$\text{Decolorization (\%)} = \frac{A^0 - A}{A^0} \times 100$$

A^0 = absorbance before decolorization

A = absorbance after decolorization

Development of consortia

Three bacterial isolates identified as *Fictibacillusgelatini*, *Bacillus subtilis* subsp. *inaquosorum* and *Bacillus subtilis* subsp. *subtilis*, having greatest decolorization potential were utilized for consortium development.

Textile effluent and their physico- chemical analysis after treatment

The samples of effluents (L1, L2, and B1, B2) were collected from Nahar textile industry, Lalru, Punjab and Bhiwani textile mill, Haryana respectively. They were purple (L1), brown (L2), dark green (B1) and dark brown (B2) colored and smelled strongly. The effluents were treated with bacterial consortia and tested for their physiological characteristics like pH, color, total suspended solid (TSS), total dissolved solid (TDS), chemical oxygen demand (COD) before treatment and after treatment.

RESULTS

Screening and Isolation of bacterial cultures

Using an enrichment approach, twenty-two distinct types of bacterial strains were isolated. Out of which, three strains showed highest decolorization of dyes in minimum duration during screening protocol.

Biochemical, morphological characterization of bacterial strains and their molecular identification

Three most effective isolates which can decolorize the disperse dyes, were found to be rod shaped, present singly or in chains and gram positive. On the basis of their morphological, biochemical characterization and 16 S-rDNA analysis, they were recognized as *Fictibacillusgelatini*, *Bacillus subtilis* subsp. *inaquosorum* and *Bacillus subtilis* subsp. *subtilis* by MTCC IMTECH Chandigarh.

Analysis of dye spectrum

The percent dye decolorization by the strains was studied using an analytical approach. A spectrophotometric analysis was used to measure the absorbance of the supernatant withdrawn at appropriate time intervals for the dyes: DO 1 (483 nm), DY 198 (390 nm–520 nm), DR 167 (390 nm–520 nm), DO 30 (390 nm–520 nm), DB 183 (200 nm–800 nm), and DR 1 (502 nm) in the visible spectrum. Following that, the percentage of decolorization was computed using the difference between the initial and final absorbance values [29].

Enzyme profiling and activity calculation

In order to profile the enzymes secreted by bacterial cultures, various quantitative and qualitative assays were conducted for laccase, azoreductase, tyrosinase and lignin peroxidase. Enzymes- laccases and azo reductases have been found to be the most promising for bio-remediation of disperse dyes. Isolates *Fictibacillusgelatini* and *Bacillus subtilis inaquosorum* showed the highest enzymatic activity of laccase and azoreductase respectively, with low activities of LiP and tyrosinase. On the other hand, the isolate *Bacillus subtilis subtilis* showed highest enzyme activity of azoreductase and least of laccase, tyrosinase and LiP (Table 1).

Rashmi et al.,

Parametric optimization

By adjusting one parameter at a time, the optimization of various parameters was done in order to achieve an effective decolorization of disperse dyes. For desirable dye decolorization activity, each bacterial strain has its own unique set of requirements.

Effect of pH

Isolate *Fictibacillusgelatini* showed complete decolorization of DO 1 and DR 167 within 18 hours and all other dyes within 2 days at pH 7.0. At pH 8.0 and 9.0, complete decolorization of DO 1, DY 198, DO 30, DB 79 dyes was achieved between 1 to 8 days whereas decolorization was reduced by 20% for DR 167, 12% for DR 1 and 100% for DB 183 at pH 8.0. At pH 10, only three dyes, DO 1, DR 167 and DB 79 showed complete decolorization and 30% decolorization was observed for DY 198 while no decolorization of other dyes was found. At pH 6.0, there was no decolorization of dyes except for DO 30 which showed only 20% decolorization (Table 2). At pH 7.0, isolate *Bacillus subtilis inaquosorum* showed complete decolorization of all the dyes between 18 h to 8 days except DR 167 which showed 45% decolorization after 8 days and dye DB 183 that showed no decolorization. At pH 6.0, only two dyes, DO 1 and DB 79 were completely decolorized between 1 to 2 days and 50% decolorization was found in case of DO 30 after 4 days (Table 3). At pH 7.0, isolate *Bacillus subtilis subtilis* showed complete decolorization of all the dyes between 18 h to 8 days except DB 183 that showed 53% decolorization after 8 days. At pH 6.0, DO 1 and DB 79 showed complete decolorization in 2 to 4 days and DR 167 showed 84% decolorization in 4 days (Table 4).

Effect of temperature

Isolate *Fictibacillusgelatini* showed complete decolorization of all the dyes at 37°C between 18 h to 8 days. At temperature 30°C, dye DR 1 was completely decolorized while DR 167 was 89% decolorized. At 40°C and 45°C, two dyes, DO 30 and DR 1 were 100% decolorized while DO 1 was decolorized up to 86% and 75% at these temperatures respectively, between 2 to 4 days (Table 2). *Bacillus subtilis inaquosorum* showed significant decolorization of disperse dyes at temperatures 37°C and 40°C. Total decolorization of all the dyes was noticed at 37 °C between 18 h to 8 days except DR 167 which showed 45% decolorization after 8 days and DB 183 which showed no decolorization. At 40°C, 100% decolorization of dyes DR 167, DO 30 and DR 1 was obtained between 2 to 3 days whereas DO 1, DY 198 and DB 79 showed 89%, 85% and 96% decolorization respectively and no decolorization was noticed in case of dye DB 183. At 30 °C, DR 1 and DB 79 showed 100% and 89% decolorization respectively, after 3 days. At 45°C, DO 30 and DR 1 showed 100% decolorization while DO 1 and DY 198 showed 67% and 82% decolorization, respectively, after 3 days. At 50°C, dye DO 1 showed 62% decolorization after 3 days (Table 3). Isolate *Bacillus subtilis subtilis* showed complete decolorization of total dyes at temperature 37°C and 40°C between 18 h to 8 days except DB 183 which showed 56% decolorization at 37°C after 8 days and no decolorization was observed at 40°C. At 30°C, DB 183, DB 79 and DR 1 showed 100% decolorization between 3 to 4 days and DY 198 showed 46% decolorization after 3 days. At 45°C, dyes DO 30, DB 79 and DR 1 showed 100% decolorization. At temperature 50°C, DR 167 and DB 79 showed 100% and 88% decolorization, respectively, after 3 days (Table 4).

Effect of Inoculum size

Different levels of decolorization were achieved using different inoculum sizes. Isolate *Fictibacillusgelatini* completely decolorized all the dyes with 10% inoculum size between time period of 18 h to 2 days. At inoculum size 7.5 %, decolorization of all the dyes were obtained between 1 to 8 days except DB 183 which showed no decolorization and DO 30 which showed 85% decolorization after 2 days. Inoculum size 3% resulted in complete decolorization of DO 1, DR 167 and DB 79 between 3 to 7 days while 67% decolorization was observed in case of DO 30 after 7 days. In case of inoculum size 5%, complete decolorization of dyes DO 1, DR 167, DO 30 and DB 79 were obtained after 3 to 4 days while 58% decolorization was observed in case of DR 1 after 6 days. Least decolorization was observed using 1% inoculum which showed complete decolorization of DO 1 and DB 79, between 3 to 4 days and 56% decolorization of DO 30 after 6 days (Table 2). With 10% inoculum size, *Bacillus subtilis inaquosorum* showed complete decolorization of DO 1, DO 30, DB 79 and DR 1 between 10 h to 2 days with 86% and 98% decolorization of DY 197 and DR 167, respectively, between 6 to 8 days. Inoculum size 7.5 % resulted in complete decolorization of dyes DO 1, DR 167 and DO 30 between 18 h to 2 days while 83% decolorization was noticed in case of DY 198, after 8 days. Least

82266

**Rashmi et al.,**

decolorization was observed at inoculum size 1% and 3%, which resulted in complete decolorization of only a single dye-DO 1 after 3 days. In case of inoculum size 5%, complete decolorization of DO 1 was observed after 3 days while 45% and 50% decolorization was noticed in case of dyes, DR167 and DO 30, respectively (Table 3). At inoculum size 5%, isolate *Bacillus subtilis subtilis* completely decolorized all the dyes between 18 h to 8 days except DB 183 which showed 56% decolorization after 8 days. At inoculum size 7.5%, dyes DO 1 and DY 198 were completely decolorized between 2 to 7 days while 60% decolorization was observed in case of DO 30 after 6 days. Inoculum size 10% resulted in complete decolorization of DO 1 after 4 days and 56% decolorization of DO 30 after 6 days. Least decolorization was observed in case of inoculum size 1% which resulted in 79% decolorization of DO 1 after 2 days. Inoculum size 3% resulted in complete decolorization of DY 198 and DR167 between 1 to 8 days (Table 4).

Effect of different concentration of dyes

Isolate *Fictibacillusgelatini* showed complete decolorization of all the dyes at 100ppm, 200ppm and 500ppm between 18 h to 8 days while DO 30 was decolorized upto 78% after 5 days at 1000ppm (Table 2). Isolate *Bacillus subtilis inaquosorum* also showed complete decolorization of all the dyes at 100ppm and 200ppm between 12 h to 8 days. At 500ppm, complete decolorization of dyes DO 1, DO 30, DB 79 and DR 1 were observed between 18h to 2 days while DY 198 and DR167 showed 86% and 98% decolorization, respectively, between 6 to 8 days. At 1000ppm, 49% and 84% decolorization were observed in case of DO 30 and DB 79, respectively, between 3 to 4 days (Table 3).

Isolate *Bacillus subtilis subtilis* showed complete decolorization of all the dyes at 100ppm and 200ppm within 12 h to 4 days while at 500 ppm, all dyes were completely decolorized between 18 h to 8 days except dye DB 183 which resulted in 56% decolorization after 8 days. At 1000ppm, 62% and 40% decolorization were observed in case of DR 167 and DO 30, respectively, between 3 to 4 days (Table 4).

Effect of nitrogen source

The accessibility of nutrients determines the growth of microorganisms which highly influence the decolorization of dyes. Different nitrogen sources resulted in different levels of decolorization. Isolate *Fictibacillusgelatini* showed complete decolorization of all the dyes in presence of yeast extract as nitrogen source between 18 h to 8 days and least decolorization was observed in presence of sodium nitrate which resulted in 100% and 42% decolorization of DO 1 and DY 198 respectively between 3 to 8 days. Using peptone as nitrogen source resulted in complete decolorization of DO 1 and DR 167 between 3 to 4 days while 35% and 87% decolorization were observed in case of DO 30 and DB 79, respectively, between 6 to 8 days. In case of malt extract, complete decolorization of dye DO 1 was observed after 2 days while 38%, 59%, 85% and 48% decolorization were obtained in case of DO 30, DB 183, DB 79 and DR 1, respectively, between 5 to 8 days. Beef extract as nitrogen source resulted in complete decolorization of DO 1 and DR 1 between 2 to 5 days while 17%, 20% and 80% decolorization were noticed in case of DO 30, DB 183 and DB 79, respectively, between 6 to 8 days. Utilizing ammonium nitrate as nitrogen source resulted in complete decolorization of DR 167 and DR 1 after 2 days while 82% and 98% decolorization were found in case of DO 1 and DO 30, respectively, between 3 to 4 days (Fig. 1). Isolate *Bacillus subtilis inaquosorum* showed complete decolorization of dyes in presence of yeast extract between 18 h to 8 days except DB 183 which resulted in no decolorization and DR 167 which showed 45% decolorization after 8 days. Complete (100%) decolorization of all the dyes were observed in presence of ammonium nitrate between 3 to 5 days except DY 198 and DB 183 which showed no decolorization. Least decolorization was observed in case of sodium nitrate which showed complete decolorization of only two dyes- DO 1 and DR 1 after 3 days. Using peptone as nitrogen source resulted in complete decolorization of DO 1 and DR 1 after 3 days while 88% and 22% decolorization were observed in case of dyes DR 167 and DR 30, respectively, after 8 days. In case of malt extract, complete decolorization was observed for dye DO 1 while 27%, 42% and 20% decolorization were obtained for DO 30, DB 79 and DR 1, respectively, between 6 to 8 days. Beef extract resulted in complete decolorization of DO 1 and DR 1 between 2 to 5 days while 42%, 23% and 90% decolorization were noticed in case of DR 167, DB 183 and DB 79, respectively, between 6 to 8 days (Fig. 2). In presence of yeast extract, isolate *Bacillus subtilis subtilis* showed complete decolorization of all the dyes between 18 h to 8 days except DB 186 which resulted in 56% decolorization after 8 days. Using peptone delivered complete decolorization of dyes, DO 1 and DR 167, between 7 to 8 days, while 12%, 84% and 96% decolorization were noticed in case of DO 30, DB 79 and DR 1, respectively, between 6 to 8 days. Malt extract resulted in complete decolorization of DR 167 after 2 days while 46%,

**Rashmi et al.,**

20%, 39% and 32% decolorization were found in case of DO 30, DB 183, DB 79 and DR 1, respectively, between 6 to 8 days. Beef extract showed complete decolorization of DO 1, DR 167 and DO 30 after 2 days while 88% decolorization was obtained for DB 79 after 6 days. In case of ammonium nitrate, complete decolorization was observed for dyes, DO 1, DR 167 and DO 30 between 3 to 5 days. while 50% decolorization was obtained for DB 79 after 6 days. Sodium nitrate as nitrogen source resulted in complete decolorization of DO 1, DR 167 and DB 79 between 2 to 4 days while 28% and 80% decolorization was obtained in case of DY 198 and DB 79, respectively, after 8 days (Fig. 3).

Effect of carbon source

Different level of decolorization was observed utilizing different carbon sources. Isolate *Fictibacillus gelatini* showed complete decolorization of all the seven dyes in presence of maltose between 18h to 8 days. In presence of glucose, complete decolorization of dyes DO 1, DR 167 and DB 79 between 2 to 7 days was observed while 18% and 28% decolorization were obtained for dyes DO 30 and DR 1 respectively, after 8 days. In presence of fructose, 100% and 80 % decolorization were noticed in case of DO 1 and DY 198 respectively, between 4 to 5 days. Galactose resulted in complete decolorization of dyes- DO 1 and DR 1 respectively, between 2 to 3 days while 38% decolorization was obtained for DO 30 after 8 days. No decolorization of dyes was obtained in presence of mannitol. In presence of sucrose, complete decolorization were obtained for DO 1, DR 167 and DR 1 between 1 to 5 days. Complete decolorization of all dyes was observed in case of starch except DY 198 and DR 1 which showed no decolorization (Fig. 4). In presence of maltose as carbon source, isolate *Bacillus subtilis inaquosorum* resulted in complete decolorization of all the dyes between 18h to 8 days except DB 183 which showed no decolorization and 45% decolorization was observed in case of dye DR167 after 8 days. Using starch as carbon source also resulted in complete decolorization of all dyes between 2 to 8 days except DB 183 and DB 79 which showed no decolorization.

In case of Glucose, complete decolorization was observed only for DR 167 after 2 days and 25% and 15% decolorization were noticed for dyes DB 79 and DR 1 respectively, after 8 days. No decolorization was obtained in case of fructose and galactose. Mannitol resulted in complete decolorization of DO 1, DR 167 and DR 1 between 3 to 5 days while 50% decolorization was observed in case of DB 79 after 8 days. Sucrose resulted in complete decolorization of dyes DO 1, DO 30 and DB 79 between 3 to 4 days (Fig. 5). Utilizing maltose as carbon source, isolate *Bacillus subtilis subtilis* showed complete decolorization of all the dyes between 1 to 8 days except dye DB 183 which showed 56% decolorization after 8 days. In presence of glucose, complete decolorization was obtained for dyes DO 1, DR 167, DB 79 and DR 1 between 2 to 6 days while 63% and 80% decolorization were obtained for DY 198 and DO 30 respectively, between 2 to 8 days. No decolorization was obtained in case of fructose and galactose. Using mannitol resulted in complete decolorization of DO 1 and DR 1 between 4 to 5 days while 12%, 60% and 39% decolorization was obtained for DR 167, DB 183 and DB 79 respectively, after 8 days. In presence of sucrose, complete decolorization was noticed for DO 1 and DR 1 between 3 to 4 days while 17% decolorization was obtained for DB 183 after 8 days. In presence of starch, complete decolorization was obtained for DR 167 and DR 1 between 3 to 4 days while 92% and 79% decolorization was obtained for DO 1 and DB 79 between 4 to 6 days (Fig. 6).

Effect of bacterial consortia on decolorization of different dyes

Using a mixture of these three bacterial isolates (*Fictibacillus gelatini*, *Bacillus subtilis subsp. inaquosorum* and *Bacillus subtilis subtilis*) a consortium was prepared. Since almost all of the isolates gave useful results and the highest levels of decolorization were recorded above 60% to 100%, it was beneficial to create an effective consortium that could deliver significant results under all ideal conditions. Comparing the consortium to individual isolates, all the dyes were removed within 3 days under optimum conditions (Table 5).

Effect of bacterial consortia on different textile effluents

To determine the level of contamination for safeguarding the environment and natural resources, the classification of textile effluents is also necessary. Such an analysis report is crucial for textile industries to decide best prevention strategies for environmental pollution.

It was discovered that the pH of untreated effluents varies depending on the processes utilized in a certain company. Textile effluents L1, L2, B1 and B2 were treated with bacterial consortia. Typically, operations in textile companies

**Rashmi et al.,**

were conducted at alkaline pH; however, distinct untreated raw textile effluents were found to have different characteristics; pH variations of the four effluents were 14, 12, 10 and 9.8; COD: 558, 800, 500 and 520 mg/l; TDS: 3442, 3860, 2793 and 2421mg/l and TSS: 1344, 1380, 1440 and 1540 mg/l. All the effluents have been treated at pH 7-8 and their physico-chemical characteristics improved with decrease in COD, TDS, TSS; their new values after treatment being COD: 130, 365, 210 and 265 mg/l; TDS: 2101, 2293, 1120 and 1181 mg/l and TSS: 140, 180, 100 and 202 mg/l respectively, their values got reduced to half or less than half after treatment (Table 6). Table 7 depicts the complete decolorization of effluents L1, B1 within 12 h and B2 within 4 days, whereas the effluent L2 was decolorized by 88% in 3 days.

DISCUSSION

Three isolates, identified as *Fictibacillus gelatini*, *Bacillus subtilis* subsp. *inaquosorum* and *Bacillus subtilis* subsp. *subtilis* were found to completely decolorize the dyes present in textile effluents. Enzymes-laccase, lignin peroxidase, azoreductase, and tyrosinase were found to be produced by these bacterial strains. The increased dye degradation of textile effluent by a bacterial coculture has been found to be very effective by other workers as well. Decolorization by oxidoreductase enzymes including laccase, NADH-DCIP reductase and azoreductase have been reported [27]. Abroad spectrum of textile dyes is mineralized by laccase enzyme [28]. The ideal temperature is a critical determinant of microbial growth, survival, and metabolic activities. The impact of temperature is a pivotal aspect in operations associated with microbial viability, including the bio-remediation of soil and water. The parametric optimization revealed that temperature of 37°C was optimum for dye biodegradation by bacterial isolates. At higher temperature, decolorization activity decreased due to degradation of reductase enzyme or loss of cell viability. A temperature between 30°C- 40°C was found to be optimum for decolorization of crystal violet by *Shewanella* sp. [29]. pH of the medium plays a critical role in dye decolorization process and pH 7.0 was found to be optimum for dye biodegradation in our studies. Enzyme metabolic activity is at its highest at this specific pH level, which makes it easier for the enzyme to attach to the active site of dye and boost the ability of dye to get decolorized. The rate of color removal is higher at the optimum pH level than at pH values that are too acidic or alkaline. The effectiveness of decolorization declines at lower pH values because dye cations cannot outcompete H⁺ ions. At high pH values, the strongest electrostatic interaction between the negatively charged surface of biomass and the positively charged dye cations is seen [27]. pH has a considerable impact on the efficacy of decolorization, with a typical pH range for color removal between 6.0 and 10.0 [30]. Optimal physiological performance of microbial cells and transport of various nutrient components across the cell membrane is crucially affected by pH of the medium.

Our results are in good agreement with [31], who reported that the decolorization of Methyl red by *Micrococcus* strain R3 was found in the pH range of 6.0–8.0. The optimum pH for dyes decolorization ranged between 6.5 and 7.5, as the maximum decolorization occurred at pH 7.0 [32]. The parametric optimization studies indicated that inoculum size 10% was optimum for dye degradation by bacterial isolates. A smaller inoculum volume decreases the biological reaction's overall rate, which lowers the rate of dye decolorization. However, inoculum volume over the optimized level causes early nutritional depletion and microorganism mortality, which lowers the rate of dye decolorization. The increase in *B. cereus* inoculum size from 2.5 to 10% increased the rate of TerasilBlack effluent decolorization; however, increase in inoculum up to 20% did not bring about any significant change in the color intensity [33]. Our parametric optimization results showed that complete dye decolorization by all the isolates under study was attained at dye concentrations- 100 ppm, 200 ppm and 500 ppm. The dye decolorization decreased by increasing its concentration beyond 500 ppm i.e., at 1000 ppm. When dyes are employed in high concentrations, dye decolorization is severely impeded, which may be due to the toxic impact of dyes on microorganisms. Bacterial isolate *Pseudomonas putida* MTCC 102 decolorizing the dyes by only up to 500mg/l [34]. Carbon and nitrogen sources also affect the decolorization process and the results showed that maltose and starch as carbon source and yeast extract as nitrogen source were optimum for complete decolorization of disperse dyes. Suitability of maltose can be due to the fact that *Bacillus* sp. lag phase was significantly shortened, resulting in an incubation time reduction from days to hours to achieve maximum dye elimination. Our results are in good agreement with [35], where *P. oestreatus* also showed

**Rashmi et al.,**

significant shortening of lag phase by one day to cause maximum removal of dye in presence of maltose and starch and these co- substrates also showed stimulatory effect on dye decolorization. Yeast extract has stimulatory effect on the growth of diverse microorganisms which is useful for the decolorization of dyes upto the maximum level. Yeast extract as nitrogen source in synthetic media showed highest decolorization of blue HER by *Trichosporonbeigelii* [36]. When the consortium of our microbial strains was applied to the textile effluent, almost 50% reduction in COD, TDS and TSS of the effluent was achieved. Decolorization can be accomplished using a single, particular strain or co-cultivated microbes. Although bacterial decolorization was discovered to be quicker and more effective, disperse dyes are typically too complex for a single bacterial strain to entirely break down. The intermediate compounds, which must be further broken down, are frequently cancer-causing aromatic amines. Due to the synergistic metabolic activities of the microbial community, treatment systems made up of mixed microbial populations have a higher degree of biodegradation than those made up of pure cultures providing significant degradation of synthetic colors [37]. Decolorization of Disperse red 1 up to 80% was noticed within 72 h by potential bacterial consortium (*Microbacterium sp.*, *Leucobacteralbus*, *Klebsiella sp.* and *Staphylococcus arlettae*) at temperature 36°C and pH 7.0 [38]. These isolates decolorized the effluents containing disperse dyes along with reducing down the cost of entire treatment course. The current investigation can be highly noteworthy as these isolates decolorized these textile effluents almost completely making the effluent transparent from opaque. Apart from the cost reduction, there was much decrease in their TSS, COD and TDS and which were brought down by these microbes.

Other workers have similar findings of reduction of COD and BOD in the treated samples [39, 40]. Considering these facts, the current research can be potentially applied in bioremediating the industrial textile effluent. Studies were conducted for decolorization by these isolates and optimization of different nutritional and fermentation parameters (incubation periods, pH, temperature and dye concentrations) was also carried out. Decolorization studies for assessment of the ability of these strains on textile water effluents were also performed. It was seen that, higher decolorization was achieved at pH 7.0 and at a dye concentration up to 500 mg/l. Also, decolorization of a few dyes was also observed at a concentration of 1000mg/l in time lesser than anticipated. Similarly, four dye decolorizing isolates viz., *Bacillus sp.*, *Salmonella sp.*, *Klebsiella sp.* and *Pseudomonas species* were isolated from the textile effluent [41]. Out of which, *Bacillus sp.* was observed to be more efficient than other three strains in dye decolorization. Our studies indicated that using individual strains for dye decolorization of the textile effluent may not be as effective as using these microbes in the consortia. All these microbial strains when used singly led to complete dye decolorization in 18 hours up to 8 days. This time period was significantly reduced when they were used together leading to complete dye decolorization within 3 days. The nutritional and fermentation requirements of all these strains were similar which made the production and their application part both efficient as well as cost effective giving good results with supplementation of only minimum additives. This research can be efficiently used by the textile industries for decolorization and detoxification of their industrial effluents, thereby reducing the environmental pollution.

ABSTRACT

This paper aims to pioneer and discuss the concept of strongly and strongly total irregular fuzzy semigraphs, conducting a comprehensive comparative examination of these two variants. We examine the unique features of strongly irregular fuzzy semigraphs and explore their relevance within the context of strongly totally irregular fuzzy semigraphs.

Keywords: Degrees, Fuzzy Semigraph, Irregular Fuzzy Semigraph, strongly irregular Fuzzy semigraphs, strongly total irregular fuzzy semigraphs.

INTRODUCTION

The introduction of fuzzy semigraphs was subsequently expanded by K. Radha and Renganathan.P [1]. Archana.s and Preethi Kuttipulackal further elevated the field through significant contributions to regular fuzzy semigraphs[2]. N R Santhi Maheswari and K.Amutha contributed in the study of Neighbourly Edge Irregular Graphs [3]. J. Krishnaveni Jeganathan and N R Santhi Maheswari produced significant findings to support strongly irregular fuzzy graphs, developing their core principles in this area. [4]. S.Nithishraj, A. Nagoor Gani and P.Muruganatham have explored the domain On Irregular Fuzzy Semigraphs adding valuable perspectives and findings[5]. This study aims to introduce the concepts of strongly irregular fuzzy semigraphs and strongly total irregular fuzzy semigraphs and

Nithishraj et al.,

provides a comparative analysis of the two. In addition, the paper analyses the characteristics of neighbourly and highly irregular fuzzy semigraphs, showing significant findings in the area.

METHODOLOGY

By using nodes, edges, adjacent degrees, and consecutive adjacent degrees, we can determine the characteristics of strongly irregular and total strongly irregular. Then, we may proceed to examine neighbourly and highly irregular fuzzy semigraphs.

STRONGLY AND TOTAL STRONGLY IRREGULAR FUZZY SEMIGRAPH

Definition 2.1: Consider $\mathcal{G}: (\sigma, \mu, \eta)$ as a fuzzy semigraph in a semigraph $G: (\mathcal{V}, \mathcal{E}, \mathcal{X})$. The degree of a node v is $d(v) = \sum \eta(E)$ where the summation now encompasses all edges E having v as a terminal node. A fuzzy semigraph \mathcal{G} is considered strongly irregular when each pair of connected nodes in \mathcal{G} have distinct degree. It is represented as $d_{\mathcal{G}}(v)$.

Definition 2.2: Consider $\mathcal{G}: (\sigma, \mu, \eta)$ as a fuzzy semigraph in a semigraph $G: (\mathcal{V}, \mathcal{E}, \mathcal{X})$. When every pair of connected nodes in a fuzzy semigraph \mathcal{G} has a distinct total degree, then \mathcal{G} is said to be strongly total irregular. It is represented as $td_{\mathcal{G}}(v)$.

Definition 2.3: Consider $\mathcal{G}: (\sigma, \mu, \eta)$ as a fuzzy semigraph in a semigraph $G: (\mathcal{V}, \mathcal{E}, \mathcal{X})$. If the edge degrees of adjacent nodes are distinct, we say that the fuzzy semigraph \mathcal{G} is strongly v -edge irregular. It is represented as $d_e(v)$.

Definition 2.4: Consider $\mathcal{G}: (\sigma, \mu, \eta)$ as a fuzzy semigraph in a semigraph $G: (\mathcal{V}, \mathcal{E}, \mathcal{X})$. If every pair of adjacent nodes has a distinct edge total degree, we say that the fuzzy semigraph \mathcal{G} is strongly v -edge total irregular. It is represented as $std_e(v)$.

Definition 2.5: Consider $\mathcal{G}: (\sigma, \mu, \eta)$ as a fuzzy semigraph in a semigraph $G: (\mathcal{V}, \mathcal{E}, \mathcal{X})$. When each pair of connected nodes in \mathcal{G} contains a distinct adjacent degree, we say that the fuzzy semigraph is strongly irregular in adjacent degree. It is represented as $d_{g_a}(v)$.

Definition 2.6: Consider $\mathcal{G}: (\sigma, \mu, \eta)$ as a fuzzy semigraph in a semigraph $G: (\mathcal{V}, \mathcal{E}, \mathcal{X})$. When each pair of connected nodes in \mathcal{G} contains a distinct total adjacent degree, then the fuzzy semigraph is strongly irregular in total adjacent degree. It is represented as $std_{g_a}(v)$.

Definition 2.7: Consider $\mathcal{G}: (\sigma, \mu, \eta)$ as a fuzzy semigraph in a semigraph $G: (\mathcal{V}, \mathcal{E}, \mathcal{X})$. When each pair of connected nodes in \mathcal{G} contains a distinct consecutive adjacent degree, we say that the fuzzy semigraph is strongly irregular in consecutive adjacent degree. It is represented as $d_{g_{ca}}(v)$.

Definition 2.8: Consider $\mathcal{G}: (\sigma, \mu, \eta)$ as a fuzzy semigraph in a semigraph $G: (\mathcal{V}, \mathcal{E}, \mathcal{X})$. When each pair of connected nodes in \mathcal{G} contains a distinct total consecutive adjacent degree, we say that the fuzzy semigraph is strongly irregular in total consecutive adjacent degree. It is represented as $std_{g_{ca}}(v)$.

EXAMPLE 2.9: Let $\mathcal{G}: (\sigma, \mu, \eta)$ represent a fuzzy semigraph in a given fig.1

All the nodes have distinct degrees, including the degree, edge degree, adjacent degree, consecutively adjacent degree, and its total degrees. Hence, the semigraph generated is both irregular and a totally irregular fuzzy semigraph as seen in the table above. It is easy to see that $d_{\mathcal{G}}(v) \leq d_e(v) \leq d_{g_{ca}}(v) \leq d_{g_a}(v)$ and $td_{\mathcal{G}}(v) \leq td_e(v) \leq td_{g_{ca}}(v) \leq td_{g_a}(v)$.

RESULTS AND DISCUSSION

Theorem 2.10 For a fuzzy semigraph $\mathcal{G}: (\sigma, \mu, \eta)$ is referred to $G: (\mathcal{V}, \mathcal{E}, \mathcal{X})$, where σ remains a constant function, the conditions i) and ii) are identical, indicating that \mathcal{G} is both a strongly and strongly total irregular fuzzy semigraph.

Proof: Assume σ remains a constant function.

(i.e.) $\sigma(p) = c$, for all $p \in v$.

Let us assume a strongly irregular fuzzy semigraph \mathcal{G} , in which each node has a distinct degree.

Consider a pair of nodes P_1 & P_2 , where P_1 and P_2 have distinct degrees T_1 and T_2 respectively.

(i.e.) $d_{\mathcal{G}}(P_1) = T_1$ and $d_{\mathcal{G}}(P_2) = T_2$ where $T_1 \neq T_2$

Suppose that all of the nodes in \mathcal{G} have the same total degree if \mathcal{G} is not a strongly total irregular fuzzy semigraph.

$$\Rightarrow d_{\mathcal{G}}(p_1) = td_{\mathcal{G}}(p_2)$$

$$\Rightarrow d_{\mathcal{G}}(p_1) + \sigma(p_1) = d_{\mathcal{G}}(p_2) + \sigma(p_2)$$

$$\Rightarrow T_1 + c = T_2 + c$$

$$\Rightarrow T_1 - T_2 = c - c = 0$$

$$\Rightarrow T_1 = T_2,$$

which is a $\Rightarrow \Leftrightarrow$ to $T_1 \neq T_2$.

Consequently, the implication (i) to (ii) is established by knowing that \mathcal{G} is a strongly total irregular fuzzy semigraph.

Assume that \mathcal{G} is a strongly total irregular fuzzy semigraph. Subsequently, the nodes total degree is all are distinct.

Let p_1 & p_2 be the pair of nodes have distinct total degrees T_1 and T_2 respectively.

Now, $d_{\mathcal{G}}(p_1) \neq td_{\mathcal{G}}(p_2)$

$$\Rightarrow d_{\mathcal{G}}(p_1) + \sigma(p_1) \neq d_{\mathcal{G}}(p_2) + \sigma(p_2)$$

$$\Rightarrow T_1 + c \neq T_2 + c$$

$$\Rightarrow T_1 - T_2 \neq c - c = 0$$

$$\Rightarrow T_1 \neq T_2$$

Therefore, \mathcal{G} is a strongly irregular fuzzy semigraph, which establishes the implication (ii) to (i).

As a result, we can deduce that (i) and (ii) are identical.

Theorem 2.11: For a fuzzy semigraph $\mathcal{G}: (\sigma, \mu, \eta)$ is referred to $G: (\mathcal{V}, \mathcal{E}, \mathcal{X})$, where σ remains a constant function, the conditions i) and ii) are identical, indicating that \mathcal{G} is both a v -edge degree in strongly irregular fuzzy semigraph and a v -edge degree in strongly total irregular fuzzy semigraph.

Proof: Let σ remains a constant function.

(i.e.) $\sigma(p) = c$, for all $p \in v$.

Suppose we have a v -edge degree in strongly irregular fuzzy semigraph \mathcal{G} where the edge degree of its nodes all are distinct.

Consider a pair of nodes P_1 & P_2 , where P_1 and P_2 have distinct degrees T_1 and T_2 respectively.

(i.e.) $d_e(P_1) = T_1$ and $d_e(P_2) = T_2$ where $T_1 \neq T_2$

The proof follows a similar structure as the proof of theorem 2.10.

REMARK 2.12: A v -edge strongly irregular fuzzy semigraph and the total degree is highly irregular. Fig.2.

Now, $d_e(p)=0.6$, $d_e(Q)=0.5$, $d_e(R)=0.7$, $d_e(S)=0.8$, $d_e(T)=0.4$ and $td_e(p)=1.3$, $td_e(Q)=0.9$, $td_e(R)=1.3$, $td_e(S)=1.3$, $td_e(T)=1$. In this case, the nodes of the semigraph have distinct edge degrees and are considered strongly irregular, and the total edge degree of the nodes is also distinct. Therefore, the fuzzy semigraph is highly irregular in total edge degrees.

Nithishraj et al.,

Theorem 2.13: For a fuzzy semigraph $\mathcal{G}: (\sigma, \mu, \eta)$ is referred to $G: (\mathcal{V}, \mathcal{E}, \mathcal{X})$, where σ represents a constant value, the conditions i) and ii) are identical, indicating that \mathcal{G} is both an adjacent degree in strongly irregular fuzzy semigraph and an adjacent degree in strongly total irregular fuzzy semigraph.

Proof : Let σ remains a constant function.

(i.e.) $\sigma(p) = c$, for all $p \in v$.

Suppose we have an adjacent degree irregular fuzzy semigraph \mathcal{G} where the adjacent degree of its nodes all are distinct.

Consider a pair of nodes P1 & P2, where P1 and P2 have distinct degrees T_1 and T_2 respectively.

(i.e.) $d_{\mathcal{G}_a}(P_1) = T_1$ and $d_{\mathcal{G}_a}(P_2) = T_2$ where $T_1 \neq T_2$

The proof follows a similar structure as the proof of theorem 2.10.

REMARK 2.14: An adjacent degree is neighbourly irregular fuzzy semigraph and its total degree is strongly irregular. Fig.3.

Now, $d_{\mathcal{G}_a}(p)=0.7$, $d_{\mathcal{G}_a}(Q)=0.6$, $d_{\mathcal{G}_a}(R)=0.9$, $d_{\mathcal{G}_a}(S)=0.8$, $d_{\mathcal{G}_a}(T)=0.6$ and $td_{\mathcal{G}_a}(p)=0.9$, $td_{\mathcal{G}_a}(Q)=1.1$, $td_{\mathcal{G}_a}(R)=1.2$, $td_{\mathcal{G}_a}(S)=1$, $td_{\mathcal{G}_a}(T)=1.3$. In this case, the nodes of the semigraph have distinct adjacent degrees and are considered neighborly irregular, and the total adjacent degree of the nodes is also distinct. Therefore, the fuzzy semigraph is strongly irregular in adjacent total degrees.

Theorem 2.15: For a fuzzy semigraph $\mathcal{G}: (\sigma, \mu, \eta)$ is referred to $G: (\mathcal{V}, \mathcal{E}, \mathcal{X})$, where σ remains a constant function, the conditions i) and ii) are identical, indicating that \mathcal{G} is both a consecutive adjacent degree in strongly irregular fuzzy semigraph and a consecutive adjacent degree in strongly total irregular fuzzy semigraph.

Proof: Let σ remains a constant function.

(i.e.) $\sigma(p) = c$, for all $p \in v$.

Suppose we have a consecutive adjacent degree irregular fuzzy semigraph \mathcal{G} where the consecutive adjacent degree of its nodes all are distinct.

Consider a pair of nodes P1 & P2, where P1 and P2 have distinct degrees T_1 and T_2 respectively.

(i.e.) $d_{\mathcal{G}_{ca}}(P_1) = T_1$ and $d_{\mathcal{G}_{ca}}(P_2) = T_2$ where $T_1 \neq T_2$

The proof follows a similar structure as the proof of theorem 2.10.

REMARK 2.16: A consecutive adjacent degree is strongly irregular fuzzy semigraph and its total degree is neighbourly irregular. Fig.4. Now, $d_{\mathcal{G}_{ca}}(p)=0.5$, $d_{\mathcal{G}_{ca}}(Q)=0.7$, $d_{\mathcal{G}_{ca}}(R)=1$, $d_{\mathcal{G}_{ca}}(S)=1.1$, $d_{\mathcal{G}_{ca}}(T)=0.9$, $d_{\mathcal{G}_{ca}}(U)=0.6$ and $td_{\mathcal{G}_{ca}}(p)=1.2$, $td_{\mathcal{G}_{ca}}(Q)=1.1$, $td_{\mathcal{G}_{ca}}(R)=1.9$, $td_{\mathcal{G}_{ca}}(S)=1.2$, $td_{\mathcal{G}_{ca}}(T)=1.6$, $td_{\mathcal{G}_{ca}}(U)=1$. In this case, the nodes of the semigraph have distinct consecutive adjacent degrees and are considered strongly irregular, and the consecutive adjacent total degree of the nodes is also distinct. Therefore, the fuzzy semigraph is neighborly irregular in consecutive adjacent total degrees.

Theorem 2.17: For a fuzzy semigraph $\mathcal{G}: (\sigma, \mu, \eta)$ is strongly irregular fuzzy semigraph then it is both highly irregular and neighbourly irregular fuzzy semigraph.

Proof: Let \mathcal{G} be a strongly irregular fuzzy semigraph. It follows that every pair of nodes in \mathcal{G} has distinct degrees. Clearly, it is obvious that every consecutive pair of nodes in \mathcal{G} has distinct degrees, and each node in \mathcal{G} is connected to nodes with distinct degrees. Consequently, \mathcal{G} can be defined as a neighbourly irregular and highly irregular fuzzy semigraph.

Theorem 2.18: For a fuzzy semigraph $\mathcal{G}: (\sigma, \mu, \eta)$ is highly irregular and neighbourly irregular fuzzy semigraph is not required to be a strongly irregular fuzzy semigraph.

Nithishraj et al.,

Proof: The nodes P&Q of G , which are neither adjacent nor incident on the same node can have the same degree, contradicting the definition of a strongly irregular fuzzy semigraph.

CONCLUSION

This study, conducted a comprehensive analysis of strongly irregular and totally strongly irregular fuzzy semigraphs, delving into their edge, adjacency, and consecutive adjacency degrees. A thorough comparative investigation between strongly irregular and strongly total irregular fuzzy semigraphs was carried out, along with a detailed examination of neighbourly and highly irregular fuzzy semigraphs.

ABSTRACT

The study develops substantial insights about the current situation regarding the still-pervasive, life-threatening practice of manual scavenging in India. It tries to understand the significance of Bandicoot, a robotic solution for the eradication of years-old manual scavenging practices and bringing commendable transformation to the lives of sanitation workers. Overall, it focuses on development of analytical skills towards designing robotic solutions for addressing pressing social issues by seamlessly combining robotics and artificial intelligence. Despite the enactment of The Prohibition of Employment as Manual Scavengers and Their Rehabilitation Act in 2013, employment as a manual scavenger is still allowed in India. With the vision of eradicating manual scavenging from the world, Bandicoot 2.0 was introduced in 2017 for cleaning any type of sewer manhole. With the interactive and user-friendly interface of Bandicoot, the poor manual scavenger's position has been elevated to that of a robot operator, preserving their dignity for leading a respectful life in society. The study is primarily based on secondary data, which was gathered through consulting business newspaper articles about the practice of manual scavenging in India and media stories explaining Genrobotics' development of Bandicoot. Additional data is gathered from the company's website, <https://www.genrobotics.org/>. For extracting relevant current information in the context of Bandicoot and manual scavenging, many other websites are referred to, like keralainsider.com, outlookindia.com, dailypioneer.com, and republicworld.com. Information about manual scavenging has been taken from reports by the Tata Trust Policy and the Public Information Bureau.

Keywords: Manual Scavenging, Robotic, Manhole, Cleaning, Sanitation

**Arnaz Kaizad Wadia****INTRODUCTION TO HEARTBREAKING TRUTH OF SANITATION WORKERS IN INDIA**

It is often said that anyone who is dissatisfied with their employment should only contrast it with the work of a manual scavenger in order to experience a miracle. One will undoubtedly feel fortunate to have a job that doesn't demand draining down dignity at the risk of life in a pitiful condition in a manhole. Fatalities with manhole cleaners are very common. Still, the contractors are least bothered to ensure safety precautions like a mask, safety belts, poisonous gas detectors, and checking oxygen levels for their sanitation workers just to cut down on the cost of cleaning. This dire situation raised the question of how to improve the miserable state of manhole cleaners. It's really difficult to come up with an effective remedy in the form of real safety protection for manual scavengers other than their very own prayers for all turning up well while entering the manhole. As manhole cleaners cover their noses and mouths with a small piece of cloth and work barehanded, the question is raised about how someone's life can be so cheap. Simultaneously, the need to get an answer to the question of who is responsible for this situation was strongly felt. Moreover, the major concern was the eradication of the centuries-old practice of manual scavenging, but how? With the birth of Bandicoot by Genrobotics, the much-needed hope of an effective solution for abandoning manual scavenging was enlightened. However, there was a big challenge in how to design the robotic scavenger capable of replacing manholes with robot holes. As an alternative, the dilemma of how successful a robotic scavenger would be compared to a manual scavenger was brought up. Additionally, Bandicoot's success led to the dilemma of how to secure alternate sources of livelihood for all those people who have relied solely on manual scavenging as their only source of income for years. Because of this, a dilemma about whether Bandicoot would be able to bring about the much-needed transformation in sanitation workers' lives and enable them to carry on with their centuries-old practice of cleaning manholes without putting their safety or dignity in danger persisted along with its invention.

While these hazy clouds of confusion were wandering around, Considering the report of the Census of India (2011), it is observed that there are 7,94,390 dry latrines, with almost 73% in rural areas and the remaining in urban areas where men need to clean excreta. Although the employment of manual scavengers was outlawed in India many years ago, they are still employed to clean dry latrines, blocked gutters, and sewers all over the country. This emphasized the urgent need for an amicable solution to the issue that would allow the decades-old manual scavenging practice to continue while also taking all necessary precautions to ensure the cleaners' safety and security. In light of the foregoing debate, a number of questions were raised, such as what constitutes a workable solution to the issue of manual scavenging. How could a solution be derived? Can Bandicoot be a proven solution sufficient enough to fully address the pressing issue of manual scavenging? Moreover, it is worth noting that there has been a sudden spurt in the number of fatalities resulting in the deaths of sanitation workers. In one of the articles published in *The Hindu* on July 20, 2022, it is claimed that in the last five years, almost 347 people have died in India while cleaning sewers and septic tanks. Approximately 40% of these fatalities took place in Uttar Pradesh, Tamil Nadu, and Delhi. However, as per the Press Information Bureau scavengers in the country report posted on March 30, 2022, in total, state-wise, 325 sewer deaths were reported. Its details are highlighted in Table 1 below: Despite the enactment of The Prohibition of Employment as Manual Scavengers and Their Rehabilitation Act in 2013, employment as a manual scavenger is still continued. Sewers enter manholes in the daytime only, and it is considered government or corporation work, and not claimed as illegal. That's the tragedy. Therefore, a National Action Plan for Rs. 1.25 lakh crore was created with government intervention on March 6, 2020, to phase out manual scavenging with high-tech machines in 500 cities and gram panchayats (*Daily Pioneer*, 2020). However, as per the survey conducted in 2013 and 2018 in the context of Ministry of Social Justice and Empowerment Directive, manual scavengers were identified state-wise as follows in Table 2: These facts and figures presented a clear picture of the pathetic state of manual scavenging today. Also these discussions presented the biggest dilemma, namely whether Bandicoot will be a blessing for sanitation workers, protecting them as they clean septic tanks or gutters, or a curse, stealing their means of subsistence through their decades-old practice of manual scavenging.

**Arnaz Kaizad Wadia****Birth of Genrobotics**

Genrobotics, the leading robotics company headquartered in Trivandrum, Kerala, India, was born out of the novel idea of providing service to the Indian army by developing a tailor-made product for soldiers to lift heavy military weapons at remote locations. It was in 2015 when Vimal Govind MK, Arun George, and Nikhil NP, all at 25 years of age, and Rashid Bin Abdulla Khan, at 24 years of age, came together to incubate this idea into reality in the form of Genrobotics, with a common interest in powered exoskeleton technology since their college days at MES College of Engineering in Kuttippuram, Kerala. Together, they developed the first-generation GI-powered exoskeleton, a wearable mobile machine that helps soldiers carry heavy military equipment in off-the-grid settings. This development was entitled Iron Man Suit. The G2 medical exoskeleton, which the team developed, has proven to be a blessing for physically challenged people, like amputees. It ensured their standing up and forging ahead in every step of their lives. As a result of this advancement, they won the best concept prize at the 2016 International Conference on Mechatronics and Manufacturing in Singapore (Forbes India, 2022). The group presented these developments while working with the Kerala Startup Mission (KSUM). Once their engineering studies were completed, they could not immediately continue with their experiments due to a lack of funds. This compelled them to take up IT-related jobs. However, their desire for innovation led them to attend any event where people were discussing the most recent advancements in robotics. Luckily, in 2016, they happened to meet IT Secretary Mr. Sivasankar at an event organized by KSUM, wherein they were enlightened about the burning issue of manual scavenging and the necessity to develop a workable solution. They quickly understood that working in this direction required full-time employment and was a very time-consuming chore. Therefore, they abandoned their well-paying careers despite the wishes of their families and friends because of the commitment needed to the new endeavor.

Left with just their savings, they once again brought Genrobotics to life. Additionally, as co-founder Mr. Rashid mentioned, the idea to start with Genrobotics came to them upon reading a newspaper article describing the asphyxiation deaths of two sewage cleaners and an auto driver who attempted to rescue cleaners in a manhole at Kozhikode. The company finally got registered in 2017 thanks to a grant of 10 lacs from KSUM. This led to the establishment of Genrobotics on June 21, 2017. In addition, five more students joined a core group to transform manholes into robot holes. Because of the team's dedication to their objective, they worked nonstop for days and nights without being disturbed by anything else. Since they were all sharing a single room, they could work together. It was important to figure out exactly what was needed. What was the size of the manhole, what were the problems with sewers, which were the major difficulties faced on entering the manhole, etc.? In the search for answers to these questions, they met and discussed them personally with engineers and sewer workers. These discussions turned out to be very fruitful for them, leading to the development of Bandicoot with the unique feature of adjustable expansion and contraction of robot legs to fit different sizes of manholes. Genrobotics won the first Startup Innovator Award by the Kerala Water Authority (KWA) and an innovation grant of 14 lacs based on the development of Bandicoot. This led to the production of its beta version in only a month. Then after, there was no looking back, with the Kerala Water Authority becoming the first public organization to deploy Bandicoot in Thiruvananthapuram. This way, the success story continued with receiving orders outside the state from other states like Tamil Nadu, Karnataka, Andhra Pradesh, and even international orders from Sharjah. Thus, the team tried hard to develop technology-driven solutions for the nation's problems, but due to financial constraints and the high price of imported parts, they halted their efforts. However, the Kerala Startup Mission (KSUM), the state government's nodal agency for the development of startups and entrepreneurship support to replace the job of manual scavenging with technology, led to the birth of Bandicoot, a robotic solution from Genrobotics for replacing men with a machine for cleaning manholes. This turned out to be the biggest blessing for sanitation workers, saving them from manhole-related deaths.

Genrobotics - Product Portfolio

Three robotic solutions, Bandicoot, Wilboar, and G-Beetle, are offered under the product portfolio of Genrobotics. The names of the Bandicoot and Wilboar robots are derived from the names of animals fond of doing similar work, such as searching underground, just like the robots do while cleaning manholes and other confined spaces. Manholes of any kind are cleaned with the robotic solution of Bandicoot. The robot is composed of two units: a stand unit and a robotic drone unit. A drone unit enters a manhole. Its dive depth is adjusted according to the situation. Any corrosive

Arnaz Kaizad Wadia

sewage situation is handled with a nanocoating in addition to a powder coating. A number of tasks are performed by the drone unit's extending robotic arm, such as grabbing, shovelling, and unclogging manholes. For high-definition displays, the drone units are outfitted with IP68 waterproof cameras. Moreover, the drone unit is tracked continuously with the sensor-based feedback system. This has raised the standard of cleaning without human involvement. Confined spaces like petroleum tanks, sewers, and water treatment plants are cleaned with the technically advanced solution of Wilboar 2.0. The hard sludge in confined spaces is unclogged by the Wilboar high-pressure water jetting system. The waste gets accumulated in the waste collection chamber with the in-built sucking module. Also, tanks are examined from outside with the help of Wilboar ATEX-certified high-resolution machine vision technology for the identification of any kind of sludge. G-Beetle is used for cleaning the skyscraper facade. It has brought a much-awaited revolution to the safety and security of skyscraper facade cleaners. G-Beetle made cleaning and beautification possible without being concerned about the frightening heights of skyscrapers. Its productivity standards are augmented by the robotic drone system and artificial intelligence. During the cleaning process, the required facade contact is maintained by the dynamic balancing of propellers and thrusters. Thus, G-Beetle offered a solution for performing the world's most dangerous jobs at ease without threatening the lives of cleaners working at great heights.

Working of the Robotic Scavenger-Bandicoot

For easier portability, Bandicoot has four robotic legs. Solid waste is removed by its 360-degree rotating robotic arms from every nook and cranny of the manhole. Water jets are fitted to them in order to eliminate sewage obstructions. Through the night vision cameras that are attached to them, a clear image of the interior of the manhole is obtained. The robot may be operated by itself. It comes with features including dirt-proofing, waterproofing, and corrosion protection. Most crucially, it possesses the competency to complete the task of three manual scavengers' three-to-four-hour work in only 45 minutes. The robot can effortlessly raise the bulky manhole covers, which formerly required at least two to three workers. The sensors that are attached to them can also be used to detect poisonous gases. Bandicoot robots use artificial intelligence to mimic any human movement. It is capable of carrying out a variety of activities, including excavating, holding, picking up, and positioning the water-jet for specific cleaning. Any human hand movements are replicated by robotic arms. Considering these numerous benefits of Bandicoot, 17 states have started to avail of its services, including Madhya Pradesh, Maharashtra, Haryana, Gujarat, Uttar Pradesh, Punjab, Andhra Pradesh, Kerala, Tamil Nadu, Assam, Rajasthan, etc. And this way, it has resulted in the successful eradication of years-old barbaric practices of caste-wise discrimination by forcing Dalits to perform all degraded jobs like manual scavenging. Bandicoot 2.0 is proven to be the best technology for enabling zero human intervention in the cleaning process of hazardous gutters, manholes, and septic tanks. Moreover, Bandicoot has successfully contributed to the "Swachh Bharat Abhiyan and Make in India" initiatives of the Government of India. It is evident of our nation's prospering progression. Being designed and manufactured completely in India, it has set an exemplary role model for promoting the Aatma Nirbhar Bharat Abhiyan. Bandicoot has worked wonders in people's lives. As per the article dated December 6, 2021 in The Hindu Business Line Sachin Yadav, a 42-year-old sanitation worker working for Brihanmumbai Municipal Corporation (BMC) for the last 14 years, finds a radical change in his life. As of now, there is a robot working as a ginny in his place, performing all his life-threatening jobs. Bandicoot proved to be a blessing that completely changed his life. Now, he is not supposed to enter the manhole, and his work is done much quicker. This assured his family of his safety. As the robot cleans and removes clotting from any type of manhole and septic tank. From the very beginning of the cleaning process, which starts with the lifting of the gutter covers, to finally collecting the solid waste in a bucket, the robot is well equipped to perform the complete cleaning process without human intervention. Infrared cameras mounted on Bandicoot help project the interiors of the manhole on the monitor screen beforehand only. This assures easy cleaning with a clear picture of a blocked manhole.

Mitigating Covid-19 and Occupational Hazards Risk with Bandicoot

The best part about Bandicoot was realized at the time of COVID-19. The robot worked out as a real miracle at that time, providing Indian sanitation workers with the advantage of operating a manhole from a distance without compromising on any kind of safety measure. During the pandemic, sanitation workers were the front-line workers,

**Arnaz Kaizad Wadia**

and they were exposed to hazardous waste on a daily basis. Moreover, due to the COVID-19 situation, a tremendous surge in waste in the form of used masks, gloves, and other bio-hazardous materials was observed. This was an alarming situation at the places where manual scavenging was practiced, threatening the lives of sanitation workers. In this hard situation, Bandicoot provided a much-needed protection shield. Getting involved with manual scavenging can be as risky as ending a life. Because breathing in harmful chemicals within sewers can be fatal. According to data from Safai Karmachari Andolan (SKA), manual scavengers—who are primarily women—are paid between 180 and 200 rupees per month per household and have an average life expectancy of 40 to 45 years, along with the threat of hepatitis, cholera, meningitis, typhoid, and cardio-vascular problems (The Hindu Businessline 2021, December 06). The article also mentioned records from the National Commission for Safai Karamcharis, which stated 376 deaths between 2015 and 2019 while clearing septic tanks and sewers, as well as the presence of 62,904 manual scavengers between December 2013 and January 2020. This data illustrates the challenging environment in which manual scavenging is practiced in India.

Manual Scavengers Social Obligation in India

Manual scavengers hesitate to reveal their identities. They work most of the time without any kind of protective measure except a rope tied around their waist. It is observed that in India people take up the work of manual scavenging because there are no other job options. And once they take up this task of making the world a better place to live, they end up making their lives hell. Once a manual scavenger tag is applied, no other job is entrusted to him. Even in Indian societies, manual scavenging is always looked down upon as a dignity-less job. To stand on par with society's social obligations, manual scavenger identity is hidden just to get the much-needed acceptance and equally fair treatment that are the rights of every citizen in India, the world's largest democracy. Tata Trusts and the Municipal Corporation of Greater Mumbai jointly initiated Mission Garima in March 2014 to restore the dignity of sewers. The mission emphasized greater usage of technology to minimize manual handling of waste. However, effective results showcasing upliftment in the dignity of manual scavengers were not observed.

Indian Government Measures and Policies for Abolishing Manual Scavenging

No one may be required to perform manual scavenging in accordance with the Civil Rights Act of 1955. Aiming to end the practice of manual scavenging, the Employment of Manual Scavengers and Construction of Dry Latrines (Prohibition) Act of 1993 and the Prohibition of Employment as Manual Scavengers and Their Rehabilitation Act of 2013 were both passed. In addition, the Supreme Court declared on March 27, 2014, that the government must step in to end the practice of manual scavenging and to rehabilitate those who got engaged with it. This guarantees the constitutional obligation to help sewers find better alternative work in order to regain their diminished dignity. The Building and Maintenance of Insanitary Latrines Act of 2013 also forbids the development of such facilities (Outlook India, 2022). It assures the demolition of insanitary toilets or their conversion into sanitary toilets. Therefore, despite all of the legal restrictions that are currently in place to stop manual scavenging, a large number of people from lower social classes have started engaging in it. This reflects administrative inefficiency in the successful implementation of an established law prohibiting one of the most disrespectful manual scavenging practices. Moreover, the worst part of manual scavenging is believed to be untouchability and disrespect for those engaged in this work. As in India, manual scavenging has historically been institutionalized based on caste differentials. Since there are no better employment options, the majority of the people who got engaged in manual scavenging are members of the downtrodden and disadvantaged class.

Bandicoot collaboration with IOCL & other Institutions

In June 2022, IOCL teamed up with Genrobotics to develop a robotic cleaning solution for refineries in light of the widespread success of Bandicoot, the first robotic scavenger in history. At the moment, Bandicoot is used in refineries to clean storm-water and oily sewers. Bandicoot is used by numerous different public and private sector organizations in order to minimize human intervention while cleaning manholes. Indore and Surat Municipal Corporations (SMC), which received the accolade for being the cleanest cities, also make use of Bandicoot services. Additionally, an announcement regarding expanding the use of Bandicoot 2.0R robots for cleaning refineries was made on the 63rd Foundation Day of IOCL. The fire-resistant feature of Bandicoot 2.0R has made it the ideal choice

**Arnaz Kaizad Wadia**

for cleaning the OWS and SWS of refineries. Both the Municipal Committee of Leh and the Municipal Corporation of Pune use bandicoot services. Now that Leh has a robotic scavenger, even bad weather doesn't hinder the manhole cleaning process there. With Bandicoot's development, the Municipal Committee of Leh is better able to support the Ministry of Housing and Urban Affairs' Safai Mitra Suraksha Challenge and Mission Zero Manual Scavenging. Bandicoot is being used by the municipal corporations of Ullhasnagar and Dhule to repair the manholes in the cities. The 16th state to adopt Bandicoot is Rajasthan. Kanpur Smart City Limited has shifted to robotic cleaning with Bandicoot as part of the Smart City Programme.

Bandicoot Turnaround Story

The Ministry of Housing and Urban Affairs (MOHUA) recognized Bandicoot: The Robotic Scavenger as the best innovation for eradicating the practice of manual scavenging. It won the Swachhta Start-Up Challenge in September 2022. Due to its highly advanced technology, this robotic scavenger offered not only societal and environmental benefits but also financial ones as well. As it cleaned 10 manholes in contrast to a manual scavenger's capacity of cleaning just one or two manholes every day. As a result, there are significant labour savings compared to what would have been necessary for manual scavenging. In places where other technology, like grabbing machines, fails to extract solid waste, the bandicoot offers much more advanced technology for cleaning by reaching every corner of the confined manhole. Its services are utilized on a daily basis by 17 states in addition to numerous other urban local bodies, smart cities, and refineries. Thus, it is evident that Mission Robohole, geared by Genrobotics is advancing every day. According to an article in the Times of India from June 8, 2022, Mr. Govind claims that more than 1 lakh robots will be needed to put an end to manual scavenging in India. The main cause driving the demand for Bandicoot deployment is rapid urbanization. In this context, the comment made by Mr. Rashid in the CNBC TV18 Upadhyay, A. (2022, July 19) report is worth noting that "Version 2.0 of Bandicoot is currently available for Rs 39.5 lakh (including the goods and services tax) makes clear that its demand is flourishing. From a small office in 2017, we now have a 12,000 square foot production area in Thiruvananthapuram and one in Palakkad". Additionally, Genrobotics and Google have partnered to offer a better user interface. Furthermore, Bandicoot provides built-in training assistance. This assures efficient learning for sanitation workers in less time. All these developments cleared the dilemma about success of Bandicoot for bring much-needed transformation in lives of sanitation workers.

Future Prospect of the Robotic Scavenger

The illegal practice of manual scavenging can be stopped by Bandicoot. It has been recognized by Ministry of Housing and Urban Affairs and Smart City Mission India. The chairman of the Mahindra Group, Anand Mahindra, also made an investment in Genrobotics as stated in one of S. Chowdhary's articles from Financial Express (2020, October 19). Anand Mahindra also tweeted that there are many worries about how AI and robots will affect society in the future in light of this fantastic invention and its capabilities. Nevertheless, he would still continue to offer prayers at the temple of technology and robotics if robots could free people from this most abhorrent job in the universe. Considering this innovative advancement, Bandicoot could be considered one of the most innovative robotic solutions, reflecting the progression of progressive Swach Bharat. Additionally, the Genrobotic Innovations founders have been chosen for a fellowship by the influential Adani Group. According to the article in The Hindu (2022, December 26), the fellowship will assist Genrobotics in growing its business into new industries and creating solutions for a range of social issues. Also, it stated that with the company's foray into overseas markets like the UK, Malaysia, UAE, and South Korea, the organization's brighter prospects are very apparent.

The capability of Bandicoot to be technically advanced yet user-friendly has highlighted it in the eyes of global-level marquee investors. Stepping one step ahead, global-level expansion of the organization is possible with its unique and novel robot manufacturing capacity. It is also worth noting that the rehabilitation of sewer workers who lost their jobs due to automation is carried out throughout the year at Genrobotics. They are rehabilitated by training them to operate Bandicoot. Additionally, Bandicoot has been designed to provide a simple user interface that ensures seamless navigation of controls. This measure taken by Genrobotics acts as a protection shield for the daily earnings of sewer workers and doesn't let technology snatch away means of livelihood from the hands of the workers. The most rewarding moment, though, for Mr. Arun, one of the Genrobotics co-founders, is witnessing a sewage worker

**Arnaz Kaizad Wadia**

transformed into a machine operator. Diligently handling the machine without being tortured by getting into the sewage lines full of toxic and hazardous gases. Genrobotics' success disproves the notion that hardware start-up companies frequently fail and have lengthy gestation periods. It exemplifies how Bandicoot's solution to the critical social issue of manual scavenging provided a lifeline for low-paid sanitation workers and ultimately turned out to be an incredible blessing for humanity. Hence, Bandicoot has not only revamped sanitation but also empowered the lives of more than 3,000 sanitation workers in 17 states and several union territories across India, ensuring their sustainable existence. Bandicoot has succeeded in achieving nine of the 17 Sustainable Development Goals (SDGs) of the United Nations. It comprises good health and well-being; quality education; clean water and sanitation; decent work and economic growth; industry, innovation, and infrastructure; reduced inequality; sustainable cities and communities; responsible consumption and production; and peace, justice, and strong institutions. Wilboar and G Beetle, two more Genrobotics products, also offer breakthrough technological advancement. Therefore, the main takeaway from all of these facts is that reliance on cutting-edge technology supported by robotics and artificial intelligence needs to be significantly utilized in order to ensure the advancement of a progressive nation like India, as it also aids in the attainment of sustainable development goals.

ABSTRACT

The aim of the present work is to enhance the solubility and dissolution rate of poorly soluble drug, Ticagrelor by formulating as solid dispersions. The solid dispersions were formulated with Gelucire 50/13, poloxamer-P188 and Kollidon VA64 as carriers. The kinetics and mechanisms of drug release from in-vitro dissolution parameters were calculated. The solid dispersions TPFM2 and TGFM2 in the drug: polymer ratio of 1:2 prepared by fusion method showed rapid drug release when compared to the pure drug. Further the optimized dispersions are used for preparation of fast dissolving tablets using different super disintegrants like Croscarmellose sodium and Sodium Starch Glycolate by direct compression technique. The prepared formulations were evaluated for physical parameters such as weight uniformity, hardness, friability, disintegration time and drug content & in vitro drug release. It was found that the formulation F7 and F13 with SSG at 15% showed the rapid drug release when compared to marketed and other tablet formulations. A drug release of tablet formulations in the presence of various super disintegrants were in the order of SSG>CCS.

Keywords: Solid Dispersion, Ticagrelor, Superdisintegrants, Poloxamer –188, Gelucire 50/13.

Sasidhar et al.,

INTRODUCTION

Although various novel and advanced drug delivery systems have been introduced for therapeutic use, the popularity of oral dosage forms particularly tablets have not been eclipsed, because of its numerous advantages. [1] However in case of the oral route there are several challenges such as limited drug absorption resulting in poor bioavailability and poor pharmacological response resulting into inadequate and erratic oral absorption. Drug absorption from the gastrointestinal (GI) tract can be limited by a variety of factors with the most significant contributors being poor aqueous solubility and/or poor membrane permeability of the drug molecule. When delivering an active agent orally, it must first dissolve in gastric and/or intestinal fluids before it can then permeate the membranes of the GI tract to reach systemic circulation. Therefore, a drug with poor aqueous solubility will typically exhibit dissolution rate limited absorption and a drug with poor membrane permeability will typically exhibit permeation rate limited absorption. Hence, two areas of pharmaceutical research that focus on improving the oral bioavailability of active agents include enhancing solubility and dissolution rate of poorly water-soluble drugs and enhancing permeability of poorly permeable drugs. This article focuses on the former, in particular, the use of solid dispersion [2] and fast dissolving/disintegrating tablets (FDDTs) technologies to improve the dissolution characteristics of poorly water-soluble drugs and in turn their oral bioavailability. Hence, fast dissolving/disintegrating tablets (FDDTs) are a perfect fit for them. FDDTs dissolves or more commonly disintegrate rapidly in the saliva without the aid of water.[3]Ticagrelor is used for the prevention of thrombotic events in people with acute coronary syndrome or myocardial infarction with ST elevation.[4]The aim of the work is to enhance the solubility, dissolution rate and oral bioavailability of poorly soluble drug, Ticagrelor by formulating as solid dispersions using fusion method with Gelucire 50/13, Poloxamer-P188 and Kollidon VA64 and subsequent preparation of fast dissolving tablets from solid dispersions using different superdisintegrants and comparing them with that of the marketed product.

MATERIALS AND METHODS

Ticagrelor was obtained as Gift sample from NATCO, Hyderabad. KollidonVA64 Poloxamer P188 and Gelucire 50/13 were obtained as Gift sample from NATCO, Hyderabad. Sodium Starch Glycolate and Croscarmellose sodium was commercially obtained from S.D Fine Chem, Ltd., Mumbai.

Saturated Solubility Studies

Saturated solubility studies of Ticagrelor were performed in different dissolution media. 200mg of Ticagrelor was weighed and transferred into different conical flask. 25ml of different dissolution media i.e., 6.8 pH phosphate buffer, 7.4 pH phosphate buffer, 0.1N HCl, 0.2% Tween 80 and Distilled water were transferred into individual conical flask and were closed appropriately.[5]All the conical flasks were placed in the REMI incubator shaker. The shaker was allowed to operate at 50 rpm at $37^{\circ}\text{C} \pm 1^{\circ}\text{C}$ for 48 hrs. Then the conical flasks were removed from the incubator shaker and the samples were filtered by using Whattmann filter paper. The clear solution obtained by filtration was suitably diluted with appropriate dissolution media and the absorbance values were noted at 296 nm by using corresponding dissolution media as blank solutions. The saturated solubility studies indicated that ticagrelor showed maximum solubility in 0.2% Tween 80 in distilled water.

PREPARATION OF TICAGRELOR SOLID DISPERSIONS

Solid dispersions were prepared by using Poloxamer P188, Gelucire 50/13 and Kollidon VA 64 as carriers by employing fusion method for the preparation of solid dispersions. Specified quantity of carrier was taken in a china dish and subjected to melting by keeping china dish on hot plate. After melting of carrier, specified quantity of drug was added to this melted carrier. Soon after incorporation of drug in to the carrier, the china dish was kept a side for 24 hrs. Then after collect solid dispersion and stored hermetically in desiccator. The composition of various solid dispersions was given in table 1.

Sasidhar et al.,

Evaluation of Solid Dispersions: The prepared solid dispersions were evaluated for various pre formulation parameters such as angle of repose, Carr's index and Hausner's ratio.[6]The results were given the table 2.

In-Vitro Dissolution Studies of Ticagrelor Solid Dispersions

The dissolution studies for the solid dispersions was carried out in USP Apparatus Type II (paddle)with 900 ml of 0.2% tween 80 as the dissolution medium. The samples were drawn at 5, 10, 15, 30 and 45 minutes. Fresh volume of the medium was replaced with the withdrawn volume to maintain the sink conditions and constant volume throughout the experiment. Samples withdrawn were suitably diluted with same dissolution medium and the amount of drug dissolved was estimated by ELICO SL-210 double beam spectrophotometer at 296nm and subsequently analyzed for the cumulative percentage of drug released. The dissolution profiles of ticagrelor solid dispersions were shown in the figures 1&2. Based on the dissolution studies performed on all the formulations, some of the optimized solid dispersions were selected and further characterized by FT-IR and XRD studies[7]. FT-IR and XRD patterns were shown in the figures 3,4.

Development of Ticagrelor Fast Dissolving Tablets From Solid Dispersions

Preparation of Ticagrelor Fast Dissolving Tablets

Among the solid dispersion prepared and based up on dissolution studies performed, Solid dispersions prepared by Fusion method containing Drug:Poloxamer and Drug: Gelucire 50/13 in the ratio of 1:2 were optimized for further preparation of fast dissolving tablets. The tablet was prepared by direct compression process. The tablet formulation consists of Solid dispersion, superdisintegrant, diluent and anti frictional agents. The ratio of drug: carrier was maintained constant while the superdisintegrant concentration was varied.[8]The composition of various tablet formulations were given in table 3. Physical parameters such as weight variation, friability, hardness, disintegration and drug content were evaluated for the prepared tablets.The results were shown in table 4.

In-Vitro Dissolution Studies of Ticagrelor Fast Dissolving Tablets.

The formulated tablets were also further evaluated for drug content, for *in vitro* drug release studies. [9]The dissolution test was carried out in USP Apparatus Type II (paddle) with 900ml of 0.2% tween 80 as the dissolution medium. The samples were drawn at 5, 10, 15, 30 and 45 minutes.The amount of drug dissolved was estimated by ELICO double beam spectrophotometer at 296 nm and subsequently analyzed for the cumulative percentage of drug released[10,11]The drug release profiles for all the formulations were shown in figures 5,6.The comparative drug release profiles of optimised ticagrelor tablet formulations with marketed formulation were given in the figure 7.

Similarity and Difference Factor of Tablet Formulations

The dissolution profiles of F7 and F13 tablet formulations were compared with marketed Ticagrelor tablets.[12]The difference factor (f1) and similarity factor (f2) of formulations results were given in the table 6.

Accelerated Stability Data of Tablet Formulations

Accelerated stability studies were performed for the optimized formulations (F7 and F13). The product was subjected to accelerated stability studies at 40°C±2°C/75% ±5% RH for 60days.There were no significant changes observed in drug release from the tablets after storage at different conditions[13] remained unaltered and found to be quite stable and the results were shown in the figure 8 and 9.

DISCUSSION OF RESULTS

The spectrophotometric method used for estimation of Ticagrelor in 0.2% tween 80 in distilled water was found to be linear and reproducible. The saturated solubility studies for pure drug was carried out in different media. The studies indicated that Ticagrelor showed maximum solubility in 0.2% tween 80 in distilled water. Solid dispersions of Ticagrelor drug were prepared by Fusion method by using Poloxamer P188, Gelucire 50/13 and Kollidon VA 64 as polymers. The dispersions were evaluated for angle of repose and Carr's index and for drug content. The angle of

**Sasidhar et al.,**

repose values obtained for various solid dispersions were in the range of 13^0 - 23^0 . Carr's index values obtained for various solid dispersions were in the range of 9 – 17%. Particle sizes of prepared solid dispersions were found to be in the range of 172 – 179 μm . The drug content of prepared solid dispersions was found to be in the range of 88.58–89.8 mg. The *in vitro* dissolution studies were performed for various solid dispersions in 0.2% tween 80 in distilled water. It was found that the solid dispersions TPFM2 and TGFM2 in the drug:polymer ratio of 1:2 by employing poloxamer P188 and gelucire 50/13 prepared by fusion method shows rapid drug release when compared to the pure drug. The optimized solid dispersions were selected and further investigated for FTIR, DSC and PXRD. IR studies of Ticagrelor and optimized formulations were carried out to study the interaction between the drug and excipients used. N-H stretching, R-COOH stretching, C=N stretching and fluoride of pure Ticagrelor and the optimized formulations were almost in the same. It showed that IR spectrum of Ticagrelor and optimized formulations were having similar fundamental peaks and pattern. Powder X-ray diffraction (PXRD) patterns were traced employing X-ray diffractometer Bruker AXS, DH Advance, Germany for all the samples.

The solid dispersions that shows rapid dissolution when compared to pure ticagrelor was further selected for the preparation of fast dissolving tablets. The fast dissolving tablets were prepared by using superdisintegrants like CCS and SSG at various concentrations. The compressed tablets were further evaluated for physical parameters such as weight uniformity, hardness, friability, drug content and disintegrating time. All the physical parameters evaluated were with the specified limits. The direct compression process was found to be suitable for compressing optimized solid dispersions as fast dissolving tablets dissolution studies were prepared on all the tablet formulations by using USP type II apparatus (paddle). Among the formulations prepared the formulations F7 and F13 prepared by using solid dispersions Poloxamer P188 and Gelucire 50/13 and with 15% SSG as superdisintegrant were found to release the drug rapidly than other formulations. The dissolution profiles of F7 and F13 tablet formulations were compared with marketed Ticagrelor tablets. The difference factor and similarity factor were calculated for these tablet formulations. The difference factor f_1 values are 9 and 12 and similarity factor f_2 values are 54 and 60. The formulations F7 and F13 showed the similarity factor values above 50 indicated that the release profiles for these formulations were similar to that of marketed formulation. The optimized fast dissolving tablet formulations were subjected to accelerated stability studies. These formulations were stored at $40^\circ\text{C}\pm 2^\circ\text{C}$, $75\%\pm 5\%$ RH for 6 months. Then after storage these formulations were evaluated for the physical parameters like weight uniformity, hardness, friability and drug content. There were no significant changes observed in drug release from the tablets after storage at different conditions remained unaltered and found to be quite stable.

CONCLUSION

In the present study an attempt was made to improve solubility and dissolution rate of Ticagrelor by solid dispersions technique with carriers like Poloxamer P188, Gelucire 50/13 and Kollidon VA 64. It was found that the solid dispersions prepared by Poloxamer P188 and Gelucire 50/13 employing fusion method in the ratio of 1:2 showed rapid drug release when compared to the pure drug. The direct compression process was found to be suitable for compressing optimized solid dispersions as tablets. The formulation F7 & F13 with Sodium Starch Glycolate at 15% showed the rapid drug release when compared to other tablet formulations. It may be concluded that Ticagrelor tablets prepared by using solid dispersions with 15% SSG was found to be ideal formulation.

ABSTRACT

Urban areas worldwide face a mounting challenge in the form of traffic congestion, necessitating innovative solutions to augment transportation efficiency. This study presents an approach through the integration of an advanced traffic control system and shortest path optimization, incorporating real-time traffic density estimation. Leveraging Reinforcement Learning (RL), specifically the Improved Deep Q-Network (IDQN) algorithm, the research adaptively manages traffic flow by synthesizing insights from an Improved Single Shot Detector (ISSD) algorithm. The developed system dynamically adjusts traffic signal timings and recommends optimal routes by learning from real-time density metrics. Through continuous interaction with the urban environment, RL agents evolve optimal control policies that strike a delicate balance between minimizing travel time and maximizing traffic flow efficiency. Rigorous experiments conducted in realistic scenarios showcase significant reductions in congestion and substantial improvements in route optimization. This research presents a unified framework, unifying RL and real-time traffic density estimation, contributing substantially to intelligent transportation systems.

Keywords: Traffic Density Estimation, Shortest Path, RL, SSD, DQN

Kavitha and Prabavathi

INTRODUCTION

The enormous rise in the number of automobiles on roadways is a major challenge to urban transportation systems across the globe [1]. This is a direct result of urbanization and population expansion. Continued urbanization has a negative impact on residents' quality of life in addition to causing significant economic losses [2]. In order to overcome this obstacle, we need creative strategies to increase transportation effectiveness and decrease traffic [3]. When it comes to dynamically adjusting to the ever-changing traffic patterns of metropolitan areas, traditional approaches of traffic management, although useful to a certain degree, typically fall short [4-5]. This study is groundbreaking because it combines cutting-edge traffic management systems with shortest route optimization methods [6-7] to reduce traffic congestion in metropolitan areas. The employment of real-time traffic density estimate is crucial to this cutting-edge technology since it gives vital insights into the present status of traffic on road networks [8-9]. The study's ultimate goal is to revolutionize traffic management and route optimization techniques by using this real-time data to make them more flexible, efficient, and sensitive to the ever-changing nature of urban traffic [10, 11]. The central tenet of this investigation is the use of Reinforcement Learning (RL), a potent paradigm in AI, for efficient traffic management [12, 13]. The system is able to learn optimal control policies through persistent interaction with the urban environment thanks to RL algorithms, in particular the Deep Q-Network (DQN) [14].

These algorithms can dynamically adjust traffic signal timings and recommend optimal routes by analyzing real-time density metrics [15]. The proposed system seeks to significantly reduce congestion and improve route optimization in urban areas [16] by striking a balance between minimizing travel time and maximizing the efficiency of traffic flow. Through rigorous experimentation in realistic scenarios, this research aims to demonstrate the effectiveness of the integrated system in significantly reducing congestion and optimizing travel routes. We anticipate that this study's findings will provide a cohesive foundation for intelligent transportation system development by integrating RL approaches with real-time traffic density estimates [17-18]. With this structure in place, urban transportation might be improved, making it more efficient, adaptable, and long-term viable in the midst of rising traffic and fast urbanization. In order to build smarter and more efficient urban settings, novel approaches are essential, such as the one offered in this study, which is especially important since cities undergo continuous change [19-20]. DQN, a type of deep reinforcement learning, is able to reliably predict traffic density in dynamic urban settings as it constantly adjusts its parameters through trial and error [21]. This system provides real-time estimates of traffic density, allowing traffic management systems and authorities to make data-driven decisions, optimize traffic signal timings, and improve overall traffic flow, ultimately leading to more efficient and responsive urban transportation networks [22-23]. The remaining sections of this work are organized as follows. In Section 2, a background study of various researches on estimating traffic density using CNN, DQN, and SSD has been discussed. Section 3 presents the suggested model and the findings are given in Section 4 and conclusion is presented in Section 5.

Motivation of the paper

This study offers a groundbreaking solution to urban traffic congestion by integrating advanced traffic control and real-time traffic density estimation using Reinforcement Learning (RL). Through innovative algorithms and adaptive traffic management, the research significantly reduces congestion, improves route optimization, and contributes substantially to intelligent transportation systems. The system's adaptability to diverse traffic conditions positions it as a robust and efficient solution, concrete the way for smarter, sustainable urban mobility and responsive urban environments.

Background study

In order to forecast highway traffic density, A. Agarwal et al. [1] proposed a modern CNN paradigm. The author used a max pooling layer and a batch normalized layer to enhance the model's accuracy. Images taken from three different traffic films have been used to evaluate the concept. 30 epochs of data were collected for examination of accuracy and loss. With these factors in mind, the author evaluates the suggested technique against an alternative

Kavitha and Prabavathi

CNN model. Additional datasets with restrictions such as lighting and occlusion can be taken into account in the future. To find the traffic conjunction on the signal G. T. Prabavathi and M. Kavitha [5] presented ISSD-YOLOV4 hybrid neural network architecture. The objective of this study is to generate a high-quality vehicle density using the network-based combination of extracted features from low-resolution feature maps. We evaluated the experimental research accuracy with the following models: TV networks include CNN, SPPNET, YOLOV3, YOLOV4, and SSD . The final result of the research showed that YOLOV4 and ISSD gave a better accuracy than the above mentioned models. M. Kavitha and G. T. Prabavathi [12] attempted to review the Intelligent Transportation Systems Safety and Challenges in cyber security of ITS. M. Kavitha and G. T. Prabavathi [13] reviewed the various algorithm in RL DL for traffic signal control and intelligent transportation.

Problem definition

Congestion in metropolitan areas is a prevalent problem that this research aims to alleviate. Rapid urbanization and increased vehicle usage have led to significant challenges in transportation efficiency. Traditional traffic management methods are often insufficient to handle the complexity of modern urban environments. This research aims to tackle this problem by devising solution that integrates advanced traffic control, real-time traffic density estimation, and RL techniques. By optimizing traffic signal timings and recommending optimal routes based on real-time data, the study addresses the intricate challenges posed by congested urban transportation networks, ultimately aiming for more efficient and sustainable urban mobility.

MATERIALS AND METHODS

This section provides a detailed overview of the experimental setup, methods, and algorithms used (Improved DQN & Improved SSD) and the systematic process followed to conduct experiments in realistic scenarios. The traffic control and shortest path optimization through real-time traffic density estimation model flowchart is shown in Figure 1.

System & Energy model

Using the RL paradigm, and more specifically the DQN algorithm, the proposed system integrates an advanced traffic control system with shortest path optimization and real-time traffic density estimation. The real-time traffic density data which is the output from the Improved SSD algorithm is fed into RL agents. RL agents constantly interact with their surroundings and learn optimal control policies allowing for dynamic route recommendations and adaptive traffic flow management. Through shortest path optimization, the proposed system can show significant reduction in congestion in real-world scenarios by adjusting traffic signal timings and suggesting optimal routes based on real-time density metrics. The flexibility of this unified framework under varying traffic conditions makes it an effective answer to the complex problems facing urban transportation networks and paves the way for more responsive and sustainable city planning. The system optimizes traffic light timings and suggests alternate routes with an eye toward reducing fuel consumption in addition to improving travel time and traffic flow. The DQN algorithm used by RL agents constantly learn and interact with the urban environment to optimize traffic signals and routes in order to cut down on energy waste caused by sudden starts, stops, and idling. The system not only reduces congestion but also significantly lessens the carbon footprint associated with urban transportation by promoting smoother traffic flow and reducing energy-intensive traffic patterns.

Traffic Flow management using Improved SSD

The goal of the improved SSD is to detect real-time objects belonging to different classes in a single frame. The feature pyramid networks allow the Improved SSD to detect objects of varying sizes and scales within an image. One of the algorithm's most notable feature is its ability to detect small and large objects simultaneously. Aspect ratio clustering and anchor box refinement are two methods that have been incorporated in this research work. Algorithms can gain a deeper understanding of the shapes of objects they are detecting with the help of aspect ratio clustering, which groups objects with similar aspect ratios together. The aim of anchor box refinement is to adjust the

Kavitha and Prabavathi

predefined anchor boxes, which are utilized to predict object bounding boxes, in order to better align with the actual shapes of objects in the image, thereby enhancing the accuracy of object localization. During the training phase, SSD uses the Adam Optimizer to reduce the sum of the classification loss and the localization loss, which is the loss function being minimized. SSD performs classification using a multi-class softmax loss. Where Z is the number of default-boxes-to-background matches from equation 1.

$$L_{class}(Z, Z) = - \sum_{c=1}^i \sum_{i \in pros} z_{i,c} \cdot \log(Z_{i,c}) - \sum_{j \in neg} \log(Z_{j,\sigma}) \tag{1}$$

$$smooth_{\frac{1}{i}}(X) = \begin{cases} 0.5 \times x^2 & \text{if } |X| < 1 \\ |x| - 0.5 & \text{otherwise} \end{cases} \tag{2}$$

$$\sigma = [Z \ B + D] \tag{3}$$

As the object's exact bounding box, the probabilities in the L class read from the rows of the confusion matrix. Second, in each class, SSD performs ultimate detection with non-maximal suppression. Each recognized item is a tuple (class label, confidence score, bounding box coordinates).

Algorithm 1: Improved Single Shot Detector

Input: An image or a frame from a video feed that contains multiple objects belonging to different classes.

Steps:

1. **Feature Pyramid Network:**
To enable the identification of objects of different sizes and scales, use a feature pyramid network to extract multi-scale features from the input picture.
2. **Aspect Ratio Clustering:**

$$smooth_{\frac{1}{i}}(X) = \begin{cases} 0.5 \times x^2 & \text{if } |X| < 1 \\ |x| - 0.5 & \text{otherwise} \end{cases}$$
3. **Anchor Box Refinement:**

$$L_{class}(Z, Z) = - \sum_{c=1}^i \sum_{i \in pros} z_{i,c} \cdot \log(Z_{i,c}) - \sum_{j \in neg} \log(Z_{j,\sigma})$$
4. **Classification and Localization:**
 - Perform classification using a multi-class softmax loss function to predict class probabilities for each default box.
 - Compute the localization loss to minimize the discrepancy between predicted bounding boxes and ground truth boxes.

Output: List of detected objects along with their corresponding bounding boxes and class labels.

Traffic Density Estimation Using Improved DQN

Improved DQN combines real-time data collection with state-of-the-art machine learning techniques. Relevant features, such as vehicle count, speed, and spacing, are extracted and fed into a neural network by combining data from traffic cameras, sensors, and other sources. The DQN algorithm uses this neural network's ability to learn traffic density estimation patterns. The neural network that makes up a DQN is part of DQ Learning, which sidesteps the Q-table. The neural network's input states are action and Q-value pairs, so there is no need to map states to Q-values. In this case, DQN consists of Q-Network and Target-Q-neural networks. Since the Q-learning method relies on discrete states to generate the Q-table, it is affected by the Curse-of-Dimensionality problem. This problem is solved by DQ learning methods by approximating the Q-value function $Q(s, a)$ with an ANN.

$$L_i(\theta_i) = E(s, a) [Q * (s, a) - Q(s, a; \theta_i)]^2 \tag{4}$$

For every iteration, the goal Q value $Q[](s, a)$ is provided by

$$Q * (s, a) = E_s \ 0 \in S [R(s, a) + r \max_{a0} Q(s0, a0; \theta_{i-1} | s, a)] \tag{5}$$

Kavitha and Prabavathi

Where $Q(s', a')$ is the next state's Q-value computed using the previous iteration's Q-network weights, and $R(s, a)$ is the reward for the current state's action pair (s, a) gleaned from the environment.

$$Q(s, a) = E_{s' \sim p}[r + \gamma \max_{a'} Q(s', a') | s, a] \tag{6}$$

In this setting, deep neural networks can explain the car's behaviour based on the following parameters: r , the instantaneous reward received by state s after action a in states, p is the probability of a state transition, while γ is the discount factor. Therefore, the Q function is represented as a neural network, namely $q(s,a;\theta)$, where θ denotes the parameters of the network. Additionally, DQN defines the Q function $Q(s,a)$, where s is a 1:1 duplicate of the argument. Depicted in Equation 6 is the DQN's loss function. Equation 7 shows the DQN's loss function.

$$L(\theta) = E_{(s,a,r,s') \sim U}[(r + \gamma \max_{a'} Q(s', a'; \theta) - Q(s, a; \theta))^2] \tag{7}$$

The distribution in the experience replay buffer is denoted by U , and the experience tuple is derived by sampling in the buffer. Afterwards, the network parameters are updated using stochastic gradient descent to constantly minimize the loss function, as illustrated in the equation below.

$$\theta \leftarrow \theta - \alpha \nabla_{\theta} L(\theta) \tag{8}$$

In the context of vehicle obstacle avoidance training, the learning rate is used, but instead of updating the target network during training, the parameters are recycled after multistep training. Algorithm 2 shows the density estimation algorithm.

Algorithm 2: Density Estimation algorithm

Input: Real time continuous data from traffic image.

Steps: Deep Q-Network (DQN)

Q-Value Computation

$$Q(s, a) = E_{s' \sim p}[r + \gamma \max_{a'} Q(s', a') | s, a]$$

Loss Function Calculation

$$L(\theta) = E_{(s,a,r,s') \sim U}[(r + \gamma \max_{a'} Q(s', a'; \theta) - Q(s, a; \theta))^2]$$

Optimization:

Apply stochastic gradient descent to update the neural network parameters iteratively.

$$L(\theta) = E_{(s,a,r,s') \sim U}[(r + \gamma \max_{a'} Q(s', a'; \theta) - Q(s, a; \theta))^2]$$

Output:

Traffic Density: The output is a real-time estimation of traffic density in specific urban areas

RESULTS AND DISCUSSION

This section presents the outcomes of the experiments, providing insights into the effectiveness of the proposed methodology in addressing urban traffic congestion. Additionally, it discusses the implications of these results, highlighting the practical applications and significance of the research in the context of intelligent transportation systems. Figure 2 shows density estimation, flow estimation error, density estimation error, and parameters estimation error of CNN, DNN, RCNN and Improved DQN algorithms. The superiority of the proposed methodology becomes evident. The existing methods CNN, DNN and RCNN exhibit relatively higher errors across all parameters, indicating limitations in accuracy. In contrast, the proposed methodology significantly enhances performance. The traffic density estimation error reduces to 0.05, flow estimation error to 0.1, density estimation error to 0.15 and parameters estimation error to 0.2. These substantially lower error values demonstrate the effectiveness of the Improved Deep Q-Network in achieving more precise and reliable traffic density estimation, highlighting its potential for enhancing the accuracy and efficiency of urban traffic management systems.

**Kavitha and Prabavathi****CONCLUSION**

In the face of escalating urbanization and the resultant surge in vehicular traffic, this research has provided a transformative solution to one of the most pressing challenges of time and urban traffic congestion. By integrating RL through the DQN algorithm and real-time traffic density estimation, an efficient traffic management system has been designed. The outcomes of this experiments in real-world scenarios unequivocally demonstrate the efficacy of the proposed approach. The rigorous experiments conducted in realistic scenarios validate the efficacy of this unified framework, showcasing its potential to significantly enhance intelligent transportation systems in urban areas worldwide. Moving forward, continued research and implementation of such innovative solutions will be crucial in addressing the evolving complexities of urban mobility, paving the way for more sustainable and efficient transportation networks.

ABSTRACT

Herbal hair dyes are commonly used as traditional way of coloring the hair. Traditional System may indicate safety, but not up to its efficacy, especially in herbal leaves where tradition is almost completely based on remedies containing active principles at very low and ultra-low concentrations, or relying on magical-energetic principles. The present study is on antimicrobial activity of 4 different herbal natural sources and chemical commercial dye on normal flora of hair. The maximum and minimum zone of inhibition 3nm & 2nm was observed against chemical dyes. The maximum and minimum zone of inhibition 1.7 nm & 1 nm was observed against was observed against herbal natural sources. Traditional herbal natural sources are very much good for maintaining the health of hair where it won't damage the normal flora of hair. Where the chemical dyes will damage the hair and also disturb the normal flora of hair. By these effects there will be allergic reaction on the scalp Governments, international agencies and corporations are increasingly investing in traditional herbal medicine research. Yet little literature

Prasanthi Cheekurumelli et al.,

addresses ethical challenges in this research. In this paper, we apply concepts in a comprehensive ethical framework for clinical research to international traditional herbal medicine research.

Keywords: Herbal, chemical, Hair- Dye, Normal Flora and Antimicrobial Activity.

INTRODUCTION

Herbs are natural products and their chemical composition varies depending on several factors and therefore varying from people to people, from energetic decoctions to the use of herbal extracts following Western methodologies of mainstream medicine. Traditional medicines has a very long history: it is the sum total of the practices based on the theories, beliefs and experiences of different cultures and times, often inexplicable, used in the maintenance of health, as like in the prevention, diagnosis, improvement and treatment of illnesses. In every country traditional medicine find foundation in magical or religious beliefs, or popular experience and the World Health Organization is engaged to establish definitive guidelines for methodology of clinical research and the appraisal of effectiveness of traditional medicine. To evaluate the efficacy, effectiveness and safety of a traditional herbal remedy. Traditional herbal medicines are naturally occurring, plant-derived substances with minimal or no industrial processing that have been used to treat illness within local or regional healing practices. Traditional herbal medicines are getting significant attention in global health debates. Cases like these present challenging questions related to the role of traditional herbal medicines in public health. People have been using natural dyes since ancient times for the purpose of dyeing carpets, rugs and clothing's by the use of roots, stems, barks, leaves, berries and flowers of various dye yielding plants [1]. In India, henna has been used traditionally for colouring palms and hairs. There are so many herbs like Kikar, Bihi, Bhringraj, Patnag, Akhrot, Narra, Jaborandi, Jatamansi, Amla, Kuth, Giloe, Behera which are used as a major constituent in hair care preparations mainly meant for dyeing hair [2 – 5]. In general, international research on traditional herbal medicines should be subject to the same ethical requirements as all research related to human subjects. An ethical framework previously outlined by Emanuel et al. Greying of hair is a natural phenomenon attributable to ageing and frequent use of synthetic shampoos which has encouraged application of synthetic dyes with the increase in the usage of hazardous chemicals in the process of manufacturing and revised for international research offers a useful starting point for thinking about the ethics of international traditional herbal medicine research. [6] This framework includes eight ethical requirements for clinical research These ethical requirements are universal and comprehensive but must be adapted to the particular social context in which the research is implemented. Of these, fair subject selection, independent review, informed consent, and respect for enrolled subjects have been discussed previously in the literature on the ethics of global health research and raise few issues unique to international traditional herbal medicine research. India is a country of vast bio-geographic diversity. Because of the country's diversified climatic and physiographic factors, India is blessed with all types of vegetation: tropical, subtropical, temperate, and alpine. Due to its wide-ranging environmental regimes and diverse biological communities, the country is one of the world's top 12 "mega diversity" nations. [7] However, social value, scientific validity, and favorable risk-benefit ratio raise specific challenges in international herbal medicine research that have not been adequately discussed.

MATERIALS AND METHODS

Collection of the sample

Firstly the samples of normal hair flora was collected from the human scarp and inoculated on to the nutrient agar media and sub-cultured it for further studies (Fig 1). Gram's staining was done to differentiate Gram positive and Gram-negative cell (Fig 2)

Prasanthi Cheekurumelli *et al.*,

Preparation of dye extracts

Herbal: 3 different fresh herbal leaves of *Lawsonia inermis* (Henna), *Aloe barbadensis miller* (Aloe-vera), *Eclipta prostrata* (Bhrinraj) and *Hibiscus rosa-sinensis* (Mandara-aku) were collected from the garden of St. Ann's Degree college for Women and brought to microbiology lab under sterile condition. Immediately the leaves were wash under running tap water separately. These leaves homogenised by using motor and pestle to make it into fine paste

Chemicals dye: Commercially Available godrej dye packet was purchased from a local market and made into paste form for further studies

Antimicrobial activity

Both nutrient and PDA media were prepared, inoculated with the normal flora culture samples which was collected previously by spread plate method under sterile conditions. Both herbal and chemical dye were loaded into the wells on the lawn culture plates (Fig 3) The antimicrobial activity was studied by using well diffusion plate method. The zone of inhibition was measured by using Vernier caliper (Fig 4).

Open Patch Test

Sensitizing the potential of formulation is to be tested. Hence a small quantity has been applied on the fore arm to check for any local reaction

RESULT AND DISCUSSION

Herbal dyes give maintain the health of hair with any damage to the hair as well as normal flora of scalp. Their antimicrobial activity was mainly because of compound that are naturally synthesized by the plant. There was a lot of difference in the effect of herbal and chemical dyes on normal flora. In the present study four different colonies were observed after incubation. Two Gram positive and Gram-negative cells were identified by Gram staining (Table 1, Fig 5). The range of antibacterial activity ranges from 1.0nm to 1.7nm by the herbal dye and 2.0 nm to 3.0nm by chemical dyes (Table 2). Now-a-days gray hair was a big problem for the people. so, people are preferring chemical dyes to color their hair. But the chemicals like phenylenediamine and P-phenylenediamine showing chemical reactions on the normal flora of scalp and also leading to skin allergies. The herbal leaves are in their bioactive compound which are naturally synthesized will not disturb the normal flora of scalp. Herbal dye maintains the health of hair and color will remain for long period of time. By open patch test there was a local reaction by the chemical dye like irritation and erythema within three hours of application where there is no such type of reactions

CONCLUSION

The present study evaluates the formulation of organic hair dye comprising a mixture of powdered plant materials having natural products useful for dyeing the hair. It is evident from the results that this formulation is highly effective at slightly alkaline pH without causing hair damage and skin irritation. A fixative Iron filing with these powders gives darker and stable shade preferred in hair dyeing. Efficacy data shows that all these active constituents have prolonged dyeing effect on hair. The surfactant used cause dry scalp and loss of fat under the skin, which enhances the drying and damage of the hair follicle, thus hair fall starts. Advantage of this formulation is that the plant pigments penetrate into the cortex region without rupturing the hair follicles.

ABSTRACT

In the emerging countries, COPD is the most common pulmonary diseases, as a persistent reduction of lung airflow that interferes with normal breathing and is not entirely reversible. COPD is the third most common cause of death worldwide. It is multifactorial and Inhalational exposures to substances such as tobacco consumption, cigarette smoke, genetic risk factors, and work-related dusts and chemicals are frequently cited as risk factors. **Aim:** To compare the immediate effect of intercostal stretch along with thoracic expansion exercise and pursed lip breathing along with thoracic expansion exercise on pulmonary function and thoracic expansion on mild to moderate COPD subjects. 60 subjects were included in the study according to inclusion and exclusion criteria. subjects with mild to moderate COPD were randomly divided into 2 groups on the basis of the cheat method. 30 subjects were included in Group A received Intercostal Stretch Along with Thoracic Expansion Exercise. 30 subjects were included in Group B received Pursed Lip Breathing Along with Thoracic Expansion Exercise. outcome measures were PFT and CHEST EXPANSION measured pre-post intervention. Pre measures of mean values for Group A for FVC, FEV1, FEV1/FVC were 1.95,1.23,62.89 and the post measures were 2.14,1.60,77.38 respectively. The p-value for FVC, FEV1, FEV1/FVC was 0.000. The pre measures of mean values for Group B for Group B for FVC, FEV1, FEV1/FVC were 1.77,1.03,57.99 and the post measures were 1.83,1.22,66.39 respectively. The p-value for FVC was 0.05 and for FEV1, FEV1/FVC was 0.000. The pre measures of mean values for Group A for Axillary level, nipple level, xiphisternal level were 1.21,1.68,2.06 and post measures were 2.23,2.78,3.26 respectively. The p- value for Axillary level, nipple level, xiphisternal level was 0.000. The pre measures of mean values for Group B for Axillary level, nipple

**Dhruvika D. Rathod and Didhiti Desai**

level, xiphisternal level were 1.23,1.48,1.85 and post measures for Axillary level, nipple level, xiphisternal level were 2.11, 2.55, 3.02 respectively. The p- value in both the groups for pre and post measures was found out to be <0.05. The mean scores for Group A for FVC, FEV1, FEV1/FVC were 0.18,0.37,14.48 and for Group B were 0.06,0.18,8.40 respectively. The p- value for FEV1 was 0.000 and for FEV1/FVC were 0.002. The mean scores for Group A for Axillary level, nipple level, xiphisternal level were 1.01, 1.10, 1.20 and for Group B were 0.88,1.06, 1.17 respectively. The p-value for Axillary level was 0.042. The present study concluded that there is statistically improvement on pulmonary function and chest expansion after immediate application of intercostal stretch and pursed lip breathing along with thoracic expansion exercise. But after immediate application of intercostal stretch along with thoracic expansion exercise there is more improvement on pulmonary function and chest expansion.

Keywords: Mild to moderate COPD, Pursed lip Breathing, Intercostal stretch, Chest Expansion, PFT.

INTRODUCTION

Chronic obstructive pulmonary disease is a widespread, preventable, and treatable condition defined by recurrent respiratory symptoms and persistent air-flow limitation caused by abnormalities in the airways and alveoli, which are usually induced by extensive exposure to noxious particles and gases." [1] "According to World Health Organization report, tobacco smoking contributed to more than 5 million fatalities.[2] The Global Initiative for Chronic Obstructive Lung Disease standards were created to provide healthcare workers with the best suggestions for diagnosing and managing COPD patients.[3] In COPD patients who have barrel-shaped chest, physical changes such as chest tightness occur.[4] Healthcare practitioners frequently utilize the cloth tape measurement approach to evaluate chest expansion.[5] It was used to assess the excursion of the chest wall at upper, middle, and lower lobes.[5] Breathing exercises have been an important part of a comprehensive pulmonary rehab program for individuals with COPD.[6] The purse-lip breathing technique allows users to control their oxygenation and ventilation.[7] The forces that occur during exhalation cause the cartilage-free airways to draw inward and toward the lumen, blocking airflow by raising airway resistance, which may result in carbon dioxide entrapment.[7] In (PNF), the muscle is passively stretched and alternately contracted.[1] This method expands the length of a muscle's nerve receptors.[1] So, the aim of the study is to compare the immediate effect of intercostal stretch along with thoracic expansion exercise and pursed lip breathing along with thoracic expansion exercise on pulmonary function and thoracic expansion on mild-moderate COPD subjects.

MATERIALS AND METHODS

A comparative study was conducted on mild to moderate COPD subjects at Parul Sevashram Hospital, Vadodara, Gujrat. Following an initial screening subjects were selected Both males and females of age is between 40 to 60. [1] Patient with mild, moderate airway obstruction based on gold criteria: gold 1-(mild: fev1 /fvc < 0.70, FEV1 > 80% of predicted) gold 2 -(moderate: FEV1 /FVC < 0.70, 50% < FEV1 < 80% of predicted). [1] Medically diagnosed COPD patient. [8] Willing to participate. [8] smokers or ex-smokers of more than 10 pack-years, and symptoms suggestive of COPD. [9] Exclusion criteria were Hemodynamically unstable subjects. [10] Patients with severe orthopedic problems related to spine, fracture of rib, sternum fracture, neurological deficits, affecting the respiratory muscles, unstable cardiac condition, recent myocardial infarction, intercostal muscles strain. [1] Previous lung – volume reduction surgery, lung transplantation or pneumonectomy.[1] Patient is having history of core pulmonale.[1] Ethical approval was taken by Parul University institutional ethics committee for Human Research (PUIECHR/PIMSR/00/081734/4502). The trial was registered prospectively at the clinical trials registry of India (CTRI/2023/04/051427).

Dhruvika D. Rathod and Didhiti Desai

Outcome measures

1. **Pulmonary function (FEV1, FVC, FEV1/FVC):** “The patient was comfortably seated in front of a PFT machine. The mouthpiece was placed comfortably between the two lips, preventing excess air escaping from the mouth. The patient was then instructed to take a deep breath and exhale as much as possible for several seconds through a mouthpiece. It is not permitted to breathe through the nose. 2 to 3 repetitions were taken. The study included the following parameters: FEV1, FVC, and FEV1/FVC.”
2. **Chest expansion (tape method):** “Subjects were seated on stool, arms crossed behind their backs, heads turned to one side. A cloth tape was used to measure chest expansion at three different rib cage levels. The anatomical marks for thoracic expansion are the axillary level, nipple level, and xiphisternum level. The advantage of selecting these locations is that they represent the elasticity of different lobes. The subjects were instructed to exhale through their mouth, inhale slowly through their nose, and press their chest against the tape to measure the expansion of their lungs. The participants were instructed to exhale through their mouths. The cross-hand technique was used to take measurements at three different levels. Measurements were taken into centimeters (CM).”

Procedure

- Based on inclusion and exclusion criteria, subjects were recruited from the Parul Sevashram hospital in Vadodara. The study was carried out by informing the subjects about the study and obtaining their informed and written consent. The subjects' privacy and confidentiality were respected.
- The study sample included subjects with mild to moderate COPD. The subjects were interviewed, and the clinical histories of the participants were known.
- Prior to starting the intervention, outcome measures in the form of a pulmonary function test and chest expansion were evaluated. The treatment time was 45 minutes.
- After the intervention, i.e., at the end of 45 minutes, outcome measures were Re-evaluated, and a comparison of pre- and post-data were obtained.
- Statistical analysis was done and results were calculated.

Intervention

Subjects will be divided in 2 groups by randomization (chit method).

Group A: inter costal stretch

“patients were in a supine lying position.[1] The Therapist stand behind the patient.[1] First therapist should palpate the suprasternal notch then go downward about 5 cm to palpate the angle of louis.[1] Then trace the finger laterally to palate the 2nd rib and intercostal stretch was given bilaterally at 2nd and 3rd rib with the help of index finger and middle finger.[1] The direction of stretch was downward towards the next rib in midaxillary line.[1] The stretch was maintained as he/she continues to breathe.[1] The stretch was applied at the end of the exhalation for 10 breaths with 1 minute rest and for 10 repetitions. Total treatment duration was 45 minutes.” [1]

Group A: inter costal stretch along with thoracic expansion exercise

Intercostal stretch (10 Breaths With 1 Min Rest For 10 Repetition) [1] Thoracic expansion exercise (breathing with mainly expiration: - 15 minutes of breathing exercise after 2 minute of respiration subjects rested for 1 minute) [11]

Group B: “Pursed lip breathing exercise

Patients were assigned a comfortable seating position.[12] Patients were instructed to inhale slowly through the nose and hold it for 3 to 4 seconds before exhaling gradually and slowly through the mouth by pursing the lips together so that if a flame is held in front of them, the flame bends but does not blow off.[12]Expiration should last approximately twice as long as inspiration.[13] Total 10 Repetition With 5 Min Rest For 3 Set were done.”[12]

Group B: pursed lip breathing along with thoracic expansion exercise

Pursed lip breathing (10 Repetition With 5 Min Rest For 3 Set) [12] Thoracic expansion exercise (breathing with mainly expiration: - 15 minutes of breathing exercise after 2 minute of respiration subjects rested for 1 minute) [11]

**Dhruvika D. Rathod and Didhiti Desai****Thoracic expansion exercise**

“The patient was sitting comfortably in a chair.[11] The therapist stands in front of the patient and instructs him or her to inhale slowly and deeply through the mouth, followed by a prolonged expiration through the mouth.[11] Expiration is the primary mode of breathing (15 minutes of breathing exercise after 2 minute of respiration subjects rested for 1 minute).” [11]

STATISTICAL ANALYSIS

Non-parametric tests were used to analyse the results. IBM SPSS version 27 software was used for analysis. Normality was checked by using Shapiro Wilk Test. Mann-Whitney U test was used for between group analysis and for within group pre and post analysis Wilcoxon Signed Rank test was used. The alpha level of 0.05 was kept for analysis of data. Micro soft word and excel version 2010 were used to create group and tables.

RESULTS AND DISCUSSION**Result****WITHIN GROUP ANALYSIS OF GROUP A**

Table 1.1 shows pre and post intervention mean±SD variance of PFT for Group A. Wilcoxon Signed Ranks Test was used for analysis of data. The pre- intervention mean±SD value for FVC was 1.956±0.746, post intervention mean±SD value for FVC was 2.140±0.899, pre- intervention mean±SD value for FEV1 was 1.233±0.473, post intervention mean±SD value for FEV1 was Table 1.2 shows pre and post intervention mean±SD variance of chest expansion for Group A. Wilcoxon Signed Ranks Test was used for analysis of data. The pre- intervention mean±SD value for axillary level was 1.216±0.363, post intervention mean±SD value for axillary level was 2.233±0.409, pre- intervention mean±SD value for nipple level was 1.683±0.444, post intervention mean±SD value for nipple level was 2.783±0.386, pre- intervention mean±SD value for xiphi-sternal level was 2.066±0.468, post intervention mean±SD value for xiphi-sternal level was 3.266±0.449. p- value for chest expansion at axillary, nipple, xiphisternal level was found out to be 0.000 with $p < 0.005$ which is considered to be significant. Table 1.3 shows pre and post intervention mean±SD variance of PFT for Group B. Wilcoxon Signed Ranks Test was used for analysis of data. The pre- intervention mean±SD value for FVC was 1.771±0.589, post intervention mean±SD value for FVC was 1.834±0.653, pre- intervention mean±SD value for FEV1 was 1.038±0.411, post intervention mean±SD value for FEV1 was 1.225±0.562, pre- intervention mean±SD value for FEV1/FVC was 57.992±10.843, post intervention mean±SD value for FEV1/FVC was 66.399±14.870. p-value for FVC, FEV1, FEV1/FVC was found out to be 0.000 with $p < 0.05$ which is considered to be significant. Table 1.4 shows pre and post intervention mean±SD variance of chest expansion for Group A. Wilcoxon Signed Ranks Test was used for analysis of data. The pre- intervention mean±SD value for axillary level was 1.2333±0.40965, post intervention mean±SD value for axillary level was 2.116±0.536, pre- intervention mean±SD value for nipple level was 1.483±0.463, post intervention mean±SD value for nipple level was 2.550±0.461, pre- intervention mean±SD value for xiphi-sternal level was 1.850±0.511, post intervention mean±SD value for xiphi-sternal level was 3.026±0.532. p- value for chest expansion at axillary, nipple, xiphisternal level was found out to be 0.000 with $p < 0.005$ which is considered to be significant.

BETWEEN GROUP ANALYSIS OF GROUP-A AND GROUP- B FOR PFT

Table 1.5 shows the pre and post intervention mean variance of Fvc, FEV1, FEV1/FVC for Group A and B. Mann-Whitney Test was used for analysis of data, pre and post-test mean ±SD value for group A was 0.18±0.25, 0.37±0.16, 14.48±7.33 and for group B was 0.06±0.24, 0.187±0.203, 8.40±6.12 p-value for FEV1 was found to be 0.000 with $p < 0.05$. post intervention both the groups showed significant improvement but FEV1 was more improved in Group A compared than Group B.

**Dhruvika D. Rathod and Didhiti Desai****BETWEEN GROUP ANALYSIS OF GROUP-A AND GROUP- B FOR CHEST EXPANSION**

Table 1.6 shows the pre and post intervention mean variance of Axillary, Nipple, Xiphisternal level for Group A and B. Mann-Whitney Test was used for analysis of data, pre and post-test mean \pm SD value for group A was 1.01 ± 0.35 , 1.10 ± 0.35 , 1.20 ± 0.48 and for group B was 0.88 ± 0.25 , 1.06 ± 0.50 , 1.17 ± 0.32 p-value for FEV1 was found to be 0.000 with $p < 0.05$. post intervention both the groups showed significant improvement but FEV1 was more improved in Group A compared than Group B. In present study, within group analysis showed that there was statistically significant improvement in all Parameters of PFT (FVC, FEV1, FEV1/FVC) with ($P < 0.05$) in Group A and Group B. The findings of present study showed that after implementation of both the treatments There was a statistically significant change in dynamic ventilatory measures in FEV1 ($P < 0.000$), FEV1/FVC% ($P < 0.002$) in both the Groups. Clinically there was changes in FVC, Nevertheless, no statistically significant difference was seen in FVC. ($P > 0.05$).

DISCUSSIONS

The current study aimed to compare the immediate effect of intercostal stretch along with thoracic expansion exercise and pursed lip breathing along with thoracic expansion exercise on pulmonary function and thoracic expansion on mild to moderate COPD subjects. The improvement in pulmonary function and chest expansion can be explained by **Dangi Ashwini ET al.** "Intercostal stretch may improve chest wall elevation and thus increase expansion to improve intra-thoracic lung volume.[10] This may contribute to an increase in ventilatory capacity, such as tidal volume, minute ventilation, and oxygen status, improving chest expansion, hyperinflation, and air trapping, and thus reducing breathlessness." [10] "The changes in ventilatory parameters could be attributed while giving passive stretch which activates stretch receptors in the chest wall which are linked to the medulla via efferent nerve cells.[10] Intercostal muscles aid in the upward and outward movement of the ribs, resulting in an increase in the anterior posterior diameter of the thoracic cavity.[10] It is beneficial for both inspiration and forced expiration." [10] The findings of our study, which were substantiated by **Mohan V, Bdlisyah, et al.** (2012), examined the "effect of intercostal stretch on pulmonary function parameters.[14] The experimental group in this study received intercostal stretching with breathing control, while the control group received breathing control exercise.[14] The study's findings revealed that FEV1/FVC% and FEV1 in the experimental group significantly improved with $P = 0.017$ ($P < 0.05$). However, there were no significant differences in FEV1 or FVC." [14] When the respiratory muscles, which are crucial to pulmonary function, are treated similarly to skeletal muscles, they not only improve muscle strength and endurance, but they can also enhance maximum inspiratory pressure, maximum expiratory pressure, and pulmonary function.[11] Our study were supported by Seong-Dae Woo et al. (2016), "To measure and verify any changes in chest and pulmonary functions when breathing with primarily inspiration or expiration was performed, and to propose a suitable intervention and exercise method for patients with lung disease." [11]

"A comparison of the BMIG and BMEG results before and after exercise revealed that the BMIG had significant differences in CSI, CEV, FVC.[11] breathing primarily with inspiration contracted not only the diaphragm, which is an inspiratory muscle, but also the inspiratory accessory muscles such as the sternocleidomastoid, scalenus, trapezius, pectoralis major, pectoralis minor, and serratus anterior, resulting in chest expansion.[11] Because breathing with primarily expiration contracts the rectus abdominis, transversus abdominis, obliques, and internal intercostals.[11] Prior to the experiment, there were no significant differences between the groups; however, changes in the measured variables after the experiment revealed that the BMEG showed significantly different increases in CSE, CEV, FEV1/FVC. Because breathing primarily with expiration activated abdominal muscles that are not used during normal breathing." [8] Our study was supported by **Sharp, J.T.; Cluzel, P.; et al.** (2020) reported that "improvement in chest expansion was greater at the level of the axilla than the xiphisternum. Inspiratory muscle stretching has no effect on lung structure; thus, the increase in chest expansion could be due to improved chest wall mobility. Increased chest wall mobility is frequently asynchronous with abdominal motion, either due to diaphragm weakness or increased excursion." [15] "Pursed lip breathing enhances oxygenation, muscle relaxation thus it has a significant impact on increasing lung capacity and respiratory muscle strength.[16] The airway's forces from the exhalation flow are resisted by the positive pressure that is produced.[16] Therefore, pursed-lip breathing aids in

**Dhruvika D. Rathod and Didhiti Desai**

breathing by expanding the airways during exhalation and promoting the excretion of volatile acids in the form of carbon dioxide, which prevents or relieves hypercapnia.” [16] So, if any future study intended to analyse the immediate effect of intercostal stretch along with thoracic expansion exercise on pulmonary functions (FVC, FEV1, FEV1/FVC%) then it can be implemented. Chest expansion at (axillary, nipple, xiphisternal levels) can be used as a part of outcome assessment to predict the expansion of lungs in COPD subjects.

CONCLUSION

The present study concluded that there is statistically improvement on pulmonary function and chest expansion after immediate application of intercostal stretch and pursed lip breathing along with thoracic expansion exercise. But after immediate application of intercostal stretch along with thoracic expansion exercise there is more improvement on pulmonary function and chest expansion.

ACKNOWLEDGMENTS

I Would like to thank Dr. Bhavana Gadhavi, principal of parul institute of physiotherapy for their guidance and support.

ABSTRACT

Prime Labeling, Graceful Labeling, Prime Graceful Labeling, Odd-Graceful Labeling and Odd-Even Graceful Labeling were investigated in this research. The new labeling techniques Odd-Prime Graceful Labeling and Odd-Even Prime Graceful Labeling are proposed along with the subsequent results. The result concerning Odd-Prime Graceful Labeling of Star and Bistar graph and Odd-Even Prime Graceful Labeling of Path Graph, Star Graph and Pan Graph were presented. Furthermore, the efficacy of the new Labeling Techniques are evaluated using the compatible examples.

Keywords: Prime Graceful Labeling, Odd-Graceful Labeling, Odd-Prime Graceful Labeling, Odd-Even Graceful Labeling, Odd-Even Prime Graceful Labeling .

INTRODUCTION

This paper focused on finite simple undirected graphs. The set of vertices $V(G)$, set of elements $E(G)$ and its incidence relation make up the graph G . To obtain a comprehensive list of terms used in graph theory, the following book [1] is considered. Graph Labeling was first developed by Rosa [6] who also provided several graph labeling methods and specifically came up with the phrase β -labeling and it was renamed by Solomon.W.Golomb [4] as graceful labeling. Later, Roger Entringer introduced prime labeling where Tout et.all [10] analyzed a few different kinds of graphs to find the ones that allows for prime labelling. Gnanajothi [3] defined odd-graceful graphs and identified some of the graphs that allows odd-graceful labelling. Furthermore, Sridevi et.all [9] instigated odd-even graceful graphs and found some graphs which admits odd-even graceful labeling. The survey of graph labelling conducted by Gallian J.A[2] is also referred. In 2018 Selvarajan. T.M, Subramoniam. R [8] combined prime and

Keerthika and Kowsalya

graceful labelling and introduced a new labeling technique Prime Graceful Labeling and demonstrated the existence of prime graceful labelling in some graphs. Sayan Panma and Penying Rochanakul [7] also generated prime-graceful graphs and introduced prime-graceful number. In addition to applying the prime graceful labeling to certain graphs, Nandhini. S.P. and Pooja Lakshmi. B [5] generalized the cardinality of the edges for the triangular snake graph. In this paper, the new labeling technique odd-prime graceful labeling and odd-even prime graceful labeling are introduced and analyzed for some connected graphs. Star, Bistar, Path and Pan graphs have been taken into consideration.

PRELIMINARIES

Definition: 2.1

For a Graph $G = (V, E)$ process of assigning labels to the vertices or the edges of a graph is known as **labeling**. Labels are often represented by integers.

Definition: 2.2

For a graph $G = (V, E)$ with p vertices and q edges, if the mapping $\omega: V(G) \rightarrow \{1, 2, 3, \dots, p\}$ are used to label the vertices of a graph with vertex set V in such a way that the labels given to distinct vertices x and y are relatively prime, (i.e) $\gcd(\omega(x), \omega(y)) = 1$ then the graph is said to have a **prime labeling**.

Definition: 2.3

A graph G with p vertices and q edges is referred to have **graceful labeling** if the map depicts a one to one function ω from the vertices of G to $\{0, 1, 2, \dots, p\}$ and the map reflect the induced one-to-one function ω^* from the edges of G to $\{1, 2, \dots, p\}$ defined by $\omega^*((v_i), (v_j)) = |\omega(v_i) - \omega(v_j)|$. So that the resulting edge labels are distinct.

Definition: 2.4

A graph G with p vertices and q edges is referred to as having **prime graceful labeling** if the map depicts a one to one function ω from the vertices of G to $\{1, 2, \dots, k\}$. In this instance, the value $k = \min\{p, q\}$ such that the $\gcd(\omega(v_i), \omega(v_j)) = 1$ and the map reflect the induced one-to-one function ω^* from the edges of G to $\{1, 2, \dots, k-1\}$ defined by $\omega^*((v_i), (v_j)) = |\omega(v_i) - \omega(v_j)|$. Thus, edge labels are different.

Definition: 2.5

A graph G with p vertices and q edges admits **odd-graceful labeling** if the injective function ω from $V(G)$ to $\{0, 1, 2, \dots, 2q-1\}$ and the map reflect the induced function ω^* from the $E(G)$ to $\{1, 3, 5, \dots, 2q-1\}$ defined by $\omega^*((v_i), (v_j)) = |\omega(v_i) - \omega(v_j)|$.

Definition: 2.6

A graph G with p vertices and q edges admits **odd-prime graceful labeling** if the injective function ω from the $V(G)$ to $\{1, 2, \dots, 2q\}$ in such a way that $\gcd(\omega(v_i), \omega(v_j)) = 1$ where $v_i, v_j \in E(G)$ and the map reflect the induced function ω^* from $E(G)$ to $\{1, 3, 5, \dots, 2q-1\}$ defined by $\omega^*((v_i), (v_j)) = |\omega(v_i) - \omega(v_j)|$. Odd-Prime Graceful graph refers to the graph that allows odd-prime graceful labeling.

Definition: 2.7

A graph G with p vertices and q edges admits **odd-even graceful labeling** if the injective function ω from $V(G)$ to $\{1, 3, 5, \dots, 2q+1\}$ and the map reflect the induced function ω^* from the $E(G)$ to $\{2, 4, 6, \dots, 2q\}$ defined by $\omega^*((v_i), (v_j)) = |\omega(v_i) - \omega(v_j)|$.

Definition: 2.8

A graph G with p vertices and q edges admits **odd-even prime graceful labeling** if the injective function ω from the $V(G)$ to $\{1, 3, \dots, 2q+1\}$ in such a way that $\gcd(\omega(v_i), \omega(v_j)) = 1$ $v_i, v_j \in E(G)$ and the map reflect the induced

Keerthika and Kowsalya

function ω^* from $E(G)$ to $\{2,4,6,\dots,2q\}$ defined by $\omega^*((v_i), (v_j)) = |\omega(v_i) - \omega(v_j)|$. Odd-Even Prime Graceful graph refers to the graph that allows odd-even prime graceful labeling.

Odd-Prime Graceful Labeling of Star and Bistar graph

Theorem: 3.1

For any positive integers n , the star graph $K_{1,n}$ admits odd-prime graceful labeling.

Proof

The Star graph of order n is taken into consideration. Let $\{v_1, v_2, v_3, \dots, v_n\}$ be the vertices of the star graph. $V(K_{1,n}) = \{v_i : 1 \leq i \leq n+1\}$. Then, $K_{1,n}$ is a graph with $|V(G)| = n+1$ vertices and $|E(G)| = n$ edges. Define a labeling ω for vertex set as, $\omega : V(G) \rightarrow \{1, 2, 3, \dots, 2q\}$ where q is the total number of edges. Label the vertex of degree n with 1 and the n -pendant vertices are designated as $2, 4, 6, \dots, 2q$. For $1 \leq i \leq n$, $\omega(v_i) = 2i$. The adjacent vertices can be demonstrated as relatively prime. $GCD(\omega(v_i), \omega(v_j)) = GCD(\omega(v_i), 1) = GCD(2i, 1) = 1$

Since among these two numbers one is odd and other is even.

Define a labeling ω^* for edge set as, $\omega^* : E(G) \rightarrow \{1, 3, 5, \dots, 2q-1\}$ where q is the total number of edges. For $1 \leq i \leq n$, $\omega^*(E(G)) = 2i-1$. It is determined by

$\omega^*((v_i), (v_j)) = |\omega(v_i) - \omega(v_j)| = |\omega(v_i) - \omega(v_1)| = |2i-1| = 1, 3, 5, \dots, 2q-1$. Consequently the edge labels are distinct. Thus, ω is odd-prime graceful labeling.

Therefore, $K_{1,n}$ is an odd-prime graceful graph.

Theorem: 3.2

For any positive integers n , the bistar graph $B_{n,n}$ admits odd-prime graceful labeling.

Proof

The Bistar graph of order n is taken into consideration. Let $\{u_1, u_2, u_3, \dots, u_{n+1}, v_1, v_2, v_3, \dots, v_{n+1}\}$ be the vertices of the bistar graph. $V(B_{n,n}) = \{u_i : 1 \leq i \leq n+1\} \cup \{v_i : 1 \leq i \leq n+1\}$

Then, $B_{n,n}$ is a graph with $|V(G)| = 2n+2$ vertices and $|E(G)| = 2n+1$ edges.

Define a labeling ω for vertex set as, $\omega : V(G) \rightarrow \{1, 2, 3, \dots, 2q\}$ where q is the total number of edges. Let u_1 and v_1 be the apex vertices of the bistar graph and label the vertex u_1 as 1 and v_1 as 2. Since the adjacent vertices u_1 and v_1 are 1 and 2, $GCD(\omega(u_1), \omega(v_1)) = 1$.

The pendant vertices of u_i are designated as $6, 8, 10, \dots, 2q$

For $2 \leq i \leq n$, $\omega(u_i) = 2(i+n)$. The adjacent vertices can be demonstrated as relatively prime.

$GCD(\omega(u_i), \omega(u_1)) = GCD(\omega(u_i), 1) = GCD(2(i+n), 1) = 1$

Since among these two numbers one is odd and other is even.

The pendant vertices of v_i are designated as $3, 5, 7, \dots, q$.

For $2 \leq i \leq n$, $\omega(v_i) = 2i+1$, The adjacent vertices can be demonstrated as relatively prime.

$GCD(\omega(v_i), \omega(v_1)) = GCD(\omega(v_i), 2) = GCD(2i+1, 2) = 1$

Since among these two numbers one is odd and other is even.

Define a labeling ω^* for edge set as, $\omega^* : E(G) \rightarrow \{1, 3, 5, \dots, 2q-1\}$ where q is the total number of edges. For $1 \leq i \leq n$, $\omega^*(E(G)) = 2i-1$.

It is determined by $\omega^*((u_1), (v_1)) = |\omega(u_1) - \omega(v_1)| = |1-2| = 1$

$\omega^*((u_i), (u_1)) = |\omega(u_i) - \omega(u_1)| = |2(i+n)-1|$

$\omega^*((v_i), (v_1)) = |\omega(v_i) - \omega(v_1)| = |2i+1-2| = |2i-1|$

It forms the consecutive odd integers. Consequently the edge labels are distinct.

Thus, ω is odd-prime graceful labeling. Therefore, $B_{n,n}$ is an odd-prime graceful graph.

Keerthika and Kowsalya

Odd-Even Prime Graceful Labeling of Path, Pan and Star graph

Theorem: 4.1

For any positive integers n , the path graph P_n admits odd-even prime graceful labeling.

Proof

The Path graph of order n is taken into consideration. Let $\{v_1, v_2, v_3, \dots, v_n\}$ be the vertices of the path graph. $V(P_n) = \{v_i : 1 \leq i \leq n\}$. Then, P_n is a graph with $|V(G)| = n$ vertices and $|E(G)| = n - 1$ edges. Define a labeling ω for vertex set as, $\omega : V(G) \rightarrow \{1, 2, 3, \dots, 2q + 1\}$ where q is the total number of edges.

If n is odd, label the vertex $\left(\frac{n+3}{2}\right)^{th}$ with 1. If n is even, label the vertex $\left(\frac{n}{2} + 1\right)^{th}$ with 1.

The adjacent vertices of vertex label 1 is designated as $3, 5, 7, \dots, 2q + 1$

For $1 \leq i \leq n$, $\omega(v_i) = 2i + 1$. The adjacent vertices can be demonstrated as relatively prime.

$$\text{GCD}(\omega(v_i), \omega(v_{i+1})) = \text{GCD}(2i + 1, (2(i + 1) + 1)) = \text{GCD}(2i + 1, (2i + 1) + 2) = 1$$

Since these two numbers are consecutive odd integers.

Define a labeling ω^* for edge set as, $\omega^* : E(G) \rightarrow \{2, 4, 6, \dots, 2q\}$ where q is the total number of edges. For $1 \leq i \leq n$, $\omega^*(E(G)) = 2i$. It is determined by

$$\omega^*((v_i), (v_j)) = |\omega(v_i) - \omega(v_{i+1})| = |2i + 1 - (2(i + 1) + 1)| = 2, 4, 6, \dots, 2q$$

As the difference of two odd numbers is even. Consequently the edge labels are distinct.

Thus, ω is odd-even prime graceful labeling. Therefore, P_n is a odd-even prime graceful graph.

Theorem: 4.2

For any positive integers $n \geq 3$, the pan graph admits odd-even prime graceful labeling.

Proof:

The Pan graph of order $n + 1$ is taken into consideration. Let $\{v_1, v_2, v_3, \dots, v_{n+1}\}$ be the vertices of the pan graph. $V(G) = \{v_i : 1 \leq i \leq n + 1\}$. Then, pan graph consist of $|V(G)| = n + 1$ vertices and $|E(G)| = n + 1$ edges. Define a labeling ω for vertex set as, $\omega : V(G) \rightarrow \{1, 2, 3, \dots, 2q + 1\}$ where q is the total number of edges. The vertex with the highest degree in the pan graph designated as 1. The adjacent vertices of vertex label 1 is designated as $3, 5, 7, \dots, 2q + 1$

For $1 \leq i \leq n$, $\omega(v_i) = 2i + 1$. The adjacent vertices can be demonstrated as relatively prime.

$$\text{GCD}(\omega(v_i), \omega(v_{i+1})) = \text{GCD}(2i + 1, (2(i + 1) + 1)) = \text{GCD}(2i + 1, (2i + 1) + 2) = 1$$

As these given two numbers are consecutive odd integers that follows one another.

Define a labeling ω^* for edge set as, $\omega^* : E(G) \rightarrow \{2, 4, 6, \dots, 2q\}$ where q is the total number of edges. For $1 \leq i \leq n$, $\omega^*(E(G)) = 2i$. It is determined by

$$\omega^*((v_i), (v_j)) = |\omega(v_i) - \omega(v_{i+1})| = |2i + 1 - (2(i + 1) + 1)| = 2, 4, 6, \dots, 2q$$

Since there is an even difference between two odd numbers. Consequently the edge labels are distinct. Thus, ω is odd-even prime graceful labeling.

Therefore, n -pan graph is a odd-even prime graceful graph.

Theorem: 4.3

For any positive integers n , the star graph $K_{1,n}$ admits odd-even prime graceful labeling.

Proof

The star graph of order n is taken into consideration. Let $\{v_1, v_2, v_3, \dots, v_n\}$ be the vertices of the star graph. $V(K_{1,n}) = \{v_i : 1 \leq i \leq n\}$. Then, $K_{1,n}$ is a graph with $|V(G)| = n + 1$ vertices and $|E(G)| = n$ edges. Define a labeling ω for vertex set as, $\omega : V(G) \rightarrow \{1, 2, 3, \dots, 2q + 1\}$ where q is the total number of edges.

Label the vertex of degree n with 1. The n -pendant vertices are designated as $3, 5, 7, \dots, 2q + 1$.

For $1 \leq i \leq n$, $\omega(v_i) = 2i + 1$. The adjacent vertices can be demonstrated as relatively prime.

$$\text{GCD}(\omega(v_i), \omega(v_{i+1})) = \text{GCD}(2i + 1, (2(i + 1) + 1)) = \text{GCD}(2i + 1, (2i + 1) + 2) = 1$$

As these given two numbers are consecutive odd integers that follows one another.

Keerthika and Kowsalya

Define a labeling ω^* for edge set as, $\omega^* : E(G) \rightarrow \{2, 4, 6, \dots, 2q\}$ where q is the total number of edges. For $1 \leq i \leq n$, $\omega^*(E(G)) = 2i$. It is determined by

$$\omega^*((v_i), (v_j)) = |\omega(v_i) - \omega(v_{i+1})| = |2i + 1 - (2(i + 1) + 1)| = 2, 4, 6, \dots, 2q$$

Since there is an even difference between two odd numbers.

Consequently the edge labels are distinct.

Thus, ω is odd-even prime graceful labeling.

Therefore, $K_{1,n}$ is a odd-even prime graceful graph.

CONCLUSION

The most advantageous area of graph theory is graph labeling which has numerous applications. It is demonstrated that odd-prime graceful labeling is admissible for star graph, bistar graph and odd-even prime graceful labeling is admissible for the path graph, pan graph, and star graph. Furthermore, the newly developed labeling techniques are illustrated with examples. We would also investigate thoroughly other graphs which permits odd-prime graceful labeling and odd-even prime graceful labeling.

ABSTRACT

Conventional lecture is one of the most widely practiced method in teaching – learning. Due to vast syllabus and restricted time allocated per module, makes it difficult to receive feedback and provide necessary corrective actions. Objective was to evaluate knowledge of attendees of lecture using Pre and Post questionnaire model. Faculty, PG students and Interns, after acquiring their consent for participation were provided with pre-test questionnaire and the questionnaire were given as post test to evaluate the effectiveness of teaching as well as receptive power of attendees by comparing pre and post valuation. There was significant improvement in attendees' knowledge after the lecture. Also, there was improvement in median scores from pre to post lecture by 5. Out of 43 participants, 40 got positive ranks indicating improvement in knowledge in post test. Such pre and post test model will help evaluate effectiveness of teachers teaching skills and amount of knowledge gained by attendees.

Keywords: students, lecture, knowledge, scores.

**Shrivardhan R Kalghatgi et al.,**

INTRODUCTION

Didactic lectures been widely used as teaching – learning method. A pre – post evaluation of participants help evaluate the knowledge gained. Some of the active learning strategies help gain the grasp on three major domains of analysis, synthesis and evaluation. Dental education keep undergoing re-modeling phases based on vis-à-vis basis and in tandem with National Education Policy, 2020. NEP, 2020 mandates using of multiple knowledge dissemination tools and also help implement the evaluation strategies [1]. Dating back to 1899, Sir Osler emphasized the complexity of medical care and challenges for teachers to teach everything that student need to know.²And traditional methods of teaching and learning (T – L) methods are no longer sufficient enough. Current Gen Z generation dental students and dentists have grown – up in Social Medica Civilization and it is insufficient and unreasonable to teach them using methods deployed decades ago.

Research in healthcare is at its peak importance currently in both developed and developing countries, especially after Covid -19 outbreak. With increasing knowledge and expertise requirement; the study was intended to deliver a didactic lecture on the same topic which not only will be of interest but also will help in achieving at most concentration during the lecture. The current study was undertaken to evaluate the effectiveness of didactic lecture using Pre-Post test model among dental faculty, dental post-graduates and interns of dental institute irrespective of their demographics.

Need for the study

Didactic lecture was designed with pre and post-test method to assess the effectiveness. This sort of a test method was first of a kind in our institute and was believed to be increasing the receptive capacity along with improvement in thinking, understanding and attention of participants.

Aim and Objectives

This assessment method was employed on faculty, post graduates and interns to check the possibility of inculcating the Pre-Post test method for undergraduate training program in dentistry.

MATERIALS AND METHODS

This study was conducted in a dental institute in Western Maharashtra. Total of 180 participants were invited for didactic lecture through circulars well in prior, with an intent to gather their consent to be part of this exercise. None of the circulars mentioned anything related to test planned during lecture to avoid bias, if any. Total of 60 individuals turned up for the lecture comprising of faculties, post graduate students and interns. Out of which, 43 agreed to be part of the study with their written consent. Before commencement of study, Institutional Ethical Committee approval was obtained.

Before beginning of the lecture, written consent was obtained and pre-test copy was distributed to participants comprising of pre – formed 5 questions of objective nature. The lecture was delivered for about 40 minutes, following which post – test comprising of same questions were administered to participants. This was a pre – tested questionnaire for validity. Scoring was done by single subject expert for both pre and post test, other than the lecturer. Scoring was ranging from 0 to 15 for both pre and post test.

Statistical analysis

Collected data was compiled using Microsoft Excel and Wilcoxon Signed Rank Test was used to assess the statistical difference between paired scale data. P – value was considered significant at $P < 0.05$.

Shrivardhan R Kalghatgi et al.,

RESULTS

A total of 43 participants were part of the study. among those, Pre – test showed 7 median whereas, Post – test showed median of 11. (Table 1) (Graph 1) This shows marked improvement in scores after lecture. However, to check the statistical significance between Pre and Post test, Wilcoxon Signed Rank Test was used, where statistical significant improvement was observed in Post – Test (Positive ranks>Negative ranks, $P<0.001$) (Table 2). Also, the total of 40 participants showed positive ranks indicating direct improvement post lecture; with only 2 participants showing negative ranks and 1 with tie between pre and post test.

DISCUSSION

A prospective study was conducted to assess the pre – test before lecture on the same topic selected improves the performance of the participants in immediate post – test. Majority of the participants felt that conducting pre – test was helpful in improving their attentiveness and understanding of the subject. The reason could be self-realization towards inability to answer pre-test to satisfactory level, which is in tandem with previously conducted similar study [3]. These discernments from participants regarding pre – test was confirmed with statistical significant post – test improvement in scores ($P<0.001$).⁴⁻⁵In post – test, the improvement in scores by median of 5 (Table 1). This type of self evaluation immediately by participants was encouraging and stimulating to study and concentrate more during didactic lectures. These pre and post test measurements are widely used for assessing the impact of interventions and are of great use in behavioural research.⁶ Thus, it is apt to say that, such pre and post test models will be helpful in achieving the learning objectives and help better disseminate the knowledge.

CONCLUSION

Conventional didactic lecture been there in practice for decades and will remain viable for foreseeable future. The application of this pre and post test model will be helpful in self – evaluation of students and also aid in formative assessment of teaching – learning methods. Although, the current study was conducted on very less number of participants though covering various strata of dentistry including, dental faculty with various years of experience in teaching, post graduate students of different stream and internship residents. For conclusive evidence, further study with diverse and more number of participants need to be conducted.

ABSTRACT

Breast Cancer is a leading cause of women death in India and it is measured to have one out of every 28 Indian women are under risk of developing breast cancer. And as a part of treatment, Modified Radical Mastectomy can be considered as a best treatment procedure. But that to have some complications like Decreased Shoulder ROM, Pain & Disabilities. To overcome these complications we can have physiotherapy protocol. But In India it is tough to have a physiotherapist in every rural area. So, this study is mainly focuses on the tele physiotherapy protocol and helps us to find out weather tele physiotherapy is helpful or not. So, after having this research study we have found out that the tele physiotherapy is helpful for reducing the complications like pain, ROM & Disabilities. So, for the patients who resides in rural area where physiotherapy facilities are not available, those patients can be benefited by having tele physiotherapy than compared to No Physiotherapy at all.

Keywords: Breast Cancer, Modified Radical Mastectomy, Tele – Physiotherapy

INTRODUCTION

Breast cancer is a growing concern in India, with increasing incidence and mortality rates[1].According to recent studies, breast cancer is the leading cause of mortality among women in India[1]. In fact, it is estimated that one in every 28 Indian women is at risk of developing breast cancer in her lifetime[2]. In light of the growing concern of breast cancer in India, it is essential to explore treatment options that can offer the best chance of recovery and long-term survival. One such option is the Modified Radical Mastectomy, a surgical procedure involving the removal of the entire breast, including the breast tissue, nipple, and sentinel lymph nodes[3]. After undergoing a Modified

Kalpeshkumar Vasani et al.,

Radical Mastectomy, individuals may experience various complications that could impact their recovery and long-term well-being⁴. These complications can include lymphedema, a condition characterized by swelling in the arm on the side of the surgery, as well as limited mobility and discomfort^[4]. Additionally, some individuals may experience psychological distress, body image issues, and emotional challenges following the removal of the breast^[4]. In conclusion, physiotherapy after a Modified Radical Mastectomy is an essential component of comprehensive care for individuals diagnosed with breast cancer in India^[5]. It plays a vital role in improving physical function, emotional well-being, and overall quality of life after the surgery^[5]. By integrating physiotherapy into the post-operative care plan, healthcare providers can support individuals in their journey towards recovery and long-term well-being^[6]. Tele physiotherapy has emerged as a valuable option for individuals undergoing post-operative care, especially in the current global health crisis^[7]. In India, tele physiotherapy offers a convenient and effective way for individuals to receive physiotherapy services remotely^[8]. Through virtual consultations and guided exercises, individuals can access professional support from experienced physiotherapists without the need for in-person visits^[8]. Tele physiotherapy sessions can include guided exercises, movement assessments, and educational resources to empower individuals in actively participating in their recovery process^[9]. In conclusion, tele physiotherapy has emerged as a valuable tool for individuals undergoing post-operative care, particularly those recovering from breast cancer treatment in India^[9]. It provides convenient access to professional support, especially for those in rural or remote areas^[10]. Furthermore, it reduces the burden of travel and promotes a comfortable recovery environment at home^[10]. The use of tele physiotherapy in India has proven to be a significant advancement in delivering comprehensive care to individuals undergoing breast cancer treatment^[11].

METHODOLOGY

Here we have conducted this study to check about the effectiveness of tele physiotherapy in terms of ROM, Pain & Disability for the patients underwent for modified radical mastectomy. For this study we have selected patients underwent for modified radical mastectomy in the Amreli district of Gujarat during the period of Mar 2021 to Feb 2023. We have found total of 162 patients who underwent for the modified radical mastectomy but among of them we have selected only 138 patients as 24 patients either didn't match the inclusion criteria or they have denied participating in the study. Patients were selected for the study if they fulfil the following criteria. Female at the age of 25 to 70 years suffering with stage I -III breast cancer that was treated by modified radical mastectomy within last 3 months of period. Subjects were excluded from the study if they had a history of previous shoulder and neck surgery, neuro muscular skeletal conditions that may affect the shoulder and neck function, mental illness, subjects having any legal issues patients who did not understand the communication languages selected for the study (Gujarati, Hindi English) patient having cognitive defects that may interfere with the intervention and outcome. Before starting the study, we have given an introduction to all participants about the research and had taken written consent to participate in the study. A total of 138 patients had participated in the study and they had been given 2 choices;

1. They can stay at their home and can join the tele physiotherapy session regularly for 1 hour – Tele Physiotherapy Group – Group A
2. They can stay at home and perform a physiotherapy protocol as given in the pamphlet - Control group – Group B . So, among of those 138 patients, 70 patients have selected to join group A and 68 patients have selected to perform physiotherapy as per the pamphlet and joined group B.

INTERVENTION

Group A – Tele Physiotherapy Group

1. Active exercise and active mobilization to reduce lymphedema and active muscle contraction of upper limb muscles.
2. Active Exercises to improve the shoulder range of motion that includes Flexion, extension and hyper extension exercises either in sitting or in standing position.
3. Strengthening of the muscles of the shoulder girdle was provided either by using dumbbell and Thera bands.

**Kalpeshkumar Vasani et al.,**

4. Functional activities were been educated for the upper limb like shifting objects from the floor to the cupboard, grooming activities, dressing activities, occupational activities and all other decided activities of the patient's choice which are feasible.
5. General aerobic exercises were provided to increase the cardio respiratory endurance and also to increase the chest wall expansion which might be altered following the surgery.
6. Endurance exercises were provided with less weight and more frequency of movement for of the upper limb.

Group B – Control Group

We have provided a pamphlet contain full physiotherapy treatment protocol similar to the physiotherapy protocol we given to tele physiotherapy group.

1. Self mobility exercise to reduce lymph edema in the form of active muscle contraction of upper limb muscles.
2. Self exercises to improve the shoulder range of motion that includes scapular mobility, stretching of the Latissimus dorsi, Serratus anterior, Deltoid and Pectoralis major.
3. Self strengthening of the muscles of the shoulder girdle was provided either using theraband or dumbbell.
4. Functional activities was be educated for the upper limb like shifting objects from the floor to the cupboard, grooming activities, dressing activities, occupational activities and all other decided activities of the patient's choice which are feasible.
5. General aerobic exercises were provided to increase the cardio respiratory endurance and also to increase the chest wall expansion which might be altered following the surgery.
6. Endurance exercises were provided with less weight and more frequency of movement for of the upper limb. The treatment duration is for 60 minutes concentrating equally all the components for 10 minute each and 5 times in a week. Rest was incorporated on a case-to-case basis as per the expertise of the researcher. – for both the groups. For the group A – A tele physiotherapy session has been conducted by zoom meeting every time. We have asked both the group patients to visit the physiotherapy clinic at the end of 1 month for the further assessment.

ANALYSIS

Here in this research, we have analysed the data by means of withing group analysis to check the effectiveness of treatment protocol and between group analysis to check which treatment protocol is superior among of two. For both the groups we have measured 3 different outcome measures of Pain, Flexion ROM & SPADI Score at 2 different intervals:

- i. Baseline, before starting the treatment – Pre-Test
- ii. 1 month post treatment – Post Test

Paired Sample t test had been performed for within group analysis for the pain in tele physiotherapy group and control group and it showed the significant difference between Pretest & Post test in both the groups with having p value of < 0.005 in both the group at every interval. Above result of within group Analysis shows that both the treatment protocol of tele physiotherapy & control group is effective for the treatment of pain in the patients underwent for the modified radical mastectomy

Within group analysis – ROM

Paired Sample t test had been performed for within group analysis for the flexion ROM in tele physiotherapy group and routine physiotherapy group and it showed the significant difference between Pretest & Post test. In both the group p value of < 0.005 is found. Above result of within group analysis shows that both the treatment protocol of tele physiotherapy & Control Group is effective for the treatment of improving flexion ROM in the patients underwent for the modified radical mastectomy

**Kalpeshkumar Vasani et al.,****Within Group Analysis – SPADI**

Paired Sample t test had been performed for within group analysis for the SPADI Score in tele physiotherapy group and Control group and it showed the significant difference between Pretest & Post test in both the group with p value of < 0.005 in both the group. Above result of within group comparison shows that both the treatment protocol of tele physiotherapy & Control Group is effective for the treatment of improving SPADI Score in the patients underwent for the modified radical mastectomy

Between Group Analysis – Pain

Independent Sample t Test had been performed to compare the effectiveness of treatment by means of reducing pain in both the groups and found no significance of difference in the value of pain at Pretest analysis with having F value of 2.74 and p value of > 0.005 . Independent Sample t Test had been performed to compare the effectiveness of treatment by means of reducing pain in both the groups and found a significance of difference in the value of pain at Post test with having F value of 2.09 and p value of < 0.005 . Above mentioned result showed that the Tele physiotherapy group was much more effective in reducing the pain than compared with Control group.

Between Group Analysis – Flexion ROM

Independent Sample t Test had been performed to compare the effectiveness of treatment by means of improving ROM in both the groups and found no significance of difference in the value of ROM at Pretest analysis with having F value of 0.68 and p value of > 0.005 . Independent Sample t Test had been performed to compare the effectiveness of treatment by means of improving ROM in both the groups and found a significance of difference in the value of ROM at Post Test with having F value of 5.15 and p value of < 0.005 . Above mentioned result showed that the tele physiotherapy group was much more effective in improving the ROM than compared with tele physiotherapy group.

Between Group Analyses – SPAD Score

Independent Sample t Test had been performed to compare the effectiveness of treatment by means of reducing SPADI Score in both the groups and found no significance of difference in the value of ROM at Pretest analysis with having F value of 0.54 and p value of > 0.005 . Independent Sample t Test had been performed to compare the effectiveness of treatment by means of reducing SPADI Score in both the groups and found a significance of difference in the value of SPADI Score at Post Test 2 with having F value of 0.19 and p value of < 0.005 . Above mentioned result showed that the tele physiotherapy group was much more effective in reducing the SPADI Score than compared with tele physiotherapy group.

DISCUSSION

Here in this study, we have collected the data and analysed it with having within group analysis and between group analysis and found that both the treatment protocol were effective by means of improving in Pain, ROM & SPADI score but while compared both the group result post treatment, we have found the tele physiotherapy group was much more effective than compared to Control group. In a developing country like India, we are facing a huge lack of healthcare workers especially in the rural areas. So, patients suffering from many conditions like having post operative complication of modified radical mastectomy couldn't receive a proper treatment because they don't have proper medical facility available at their home town So, in the era of 21st century, when we are having a proper technology like tele medicine and when the health & family welfare department of government of India is also promoting the tele physiotherapy. Then why can't we as a physiotherapist take a step forward in this direction & provide a tele physiotherapy to patients who are unable to come at clinic regularly. So, these types of patients can have a better life ahead. This study was to check the effectiveness of tele physiotherapy in the patients underwent the modified radical mastectomy and had been proved that tele physiotherapy can be a better option for the patients who can't go to the physiotherapy clinic regularly than having a no physiotherapy treatment at all. No doubt a tele

Kalpeshkumar Vasani et al.,

physiotherapy can't be as much beneficial as the routing physiotherapy at physiotherapy clinic. But we can provide batter life for those patients who can't come for the routine physiotherapy at clinic regularly.

CONCLUSION

The results of the study suggest that, Tele Physiotherapy and Control Group both are beneficial for reducing pain, improving ROM and Reducing disability index for the patients underwent for modified radical mastectomy. Before starting the physiotherapy treatment, at Pretest analysis, we have found both the group were similar and have not found significantly different in the terms of pain, ROM & SPADI. Tele physiotherapy group was quite more beneficial while compared to Control group at Post Treatment analysis. According to the result we got after having data analysis, routine physiotherapy would always be having an upper hand than compared to tele physiotherapy, and it is preferred for the patients to take the physiotherapy regularly at physiotherapy clinic whenever itis possible. But while it is not possible for the patients to come at physiotherapy clinic regularly, it is preferred to have a tele physiotherapy at home and make a regular follow up at physiotherapy clinic whenever asked.

ABSTRACT

One of the most significant challenges in modern agriculture is producing enough high-quality food grains to feed an ever-increasing population while safeguarding soil quality, fertility, and productivity. Now-a-days, many farmers use these agrochemicals and pesticides indiscriminately, resulting in loss of soil fertility and productivity as well as a harmful impact on human health. Gypsum has a long history of being used to control salt-affected soils; however, major barriers to its use, such as transportation, cost, and availability, prevent small and marginal farmers from adopting it. In this scenario, using green manure provides a glimpse of hope. Green manuring is a simple, cost-effective and environmentally friendly approach to managing these soils. Globally, there are several types of green manure crops that support soil nutrient dynamics and improve soil health.

Keywords: Fertility, Green manure, Gypsum, Soil health, Soil quality

INTRODUCTION

Current world population (7.3 billion) is further projected to increase to 8.5 and 9.7 billion during 2030 and 2050, respectively which is expected to stabilize at around 11.2 billion by the end of the twenty-first century. To achieve nutritional security, this growing population will necessitate increased food grain production from limited land and water resources. Food grain production expanded dramatically at the worldwide level during the twentieth century, leading in a massive yield rise due to a surge in net cultivable land. Additionally, the use of short-duration high-yielding cultivars, synthetic fertilizers, and pesticides is unavoidable (Sihag *et al.* 2015). This technique has resulted in the slow deterioration of soil organic matter as stable soil aggregates break down and organic matter decomposes.

**Antara Pramanik and Soumyakanti Mandal**

Consequently, soil health has deteriorated in terms of reduction in the water-holding capacity of soils, surface and groundwater pollution and multiple nutrient deficiencies. Overuse of nitrogenous fertilizer to boost agricultural productivity endangers the ecosystem. The use of chemical fertilizers in agriculture and different industrial units has caused an increase in atmospheric concentrations of reactive forms of nitrogen (e.g., NO, NO₂, N₂O, NH₃, etc.) by around 100% (Meena *et al.*, 2018). This scenario leads us to reexamine the role of biological nitrogen fixation, and the addition of legumes to green manure appears to be a viable response.

What is green manure crop?

Green, undecomposed plant material used as manure is called green manure. Green manuring is the technique of ploughing and incorporating undecomposed green plant tissue into the soil to improve soil fertility and production. It boosts soil fertility by adding nitrogen directly to the soil via symbiosis, as well as improving soil structure, water holding capacity, and microbial population through the addition of humus or organic matter. The green manuring practices are of two types- in-situ green manuring (short-duration - 45 to 60 days, crops are grown and incorporated into the soil at the same site) and ex-situ green leaf manuring (foliage and tender parts of green manuring crops collected from nearby forests, shrubs, and trees are incorporated into the soil at 15-30 days before the sowing of main crops). The herbaceous leguminous crops, namely dhaincha, sunhemp, cowpea, green gram, black gram, etc., and woody legumes, namely- subabul, gliricidia, karanja etc. can fix the atmospheric N in their root nodules.

Effect of green manure on salinity and sodicity

A significant number of soluble salts, such as Ca⁺⁺, Mg⁺⁺, and Na⁺ present in saline soil which affects plant growth, development, yield, and deteriorates seed quality owing to osmotic stress in the root zone (Shirale *et al.*, 2018). The use of green biomass raises the partial pressure of carbon dioxide and organic acids, triggering a spike in the release of salts into soil solution as an outcome of mineral dissolution. This allows salts to leach below the root zone, establishing an ideal environment for crops to thrive. When GM is introduced to salt-affected soil, it substantially boosts the levels of N, organic C, organominerals, and total carbohydrates in the soil (Zubair *et al.*, 2012). Soil pH decreases when organic acids (amino acid, glycine, cysteine, and humic acid) are produced during heterotrophic mineralisation of organic materials and autotrophic nitrification. During decomposition, the applied green manures release CO₂, which absorbs in water to form carbonic acid. This acid boosts the solubility of calcium carbonate minerals and increases the concentration of Ca²⁺ in soil solutions, which replaces Na⁺ on exchange complex and reduces the exchangeable sodium percentage (ESP) by lowering pH, dissolving calcium carbonate, and generating several kinds of complex calcium ion pairs. Because the sodium carbonate and sodium bicarbonate salts in the solution breakdown humus, especially the fulvic and humic acid portions, sodic soil has a low organic content (Khan *et al.*, 2000). Additionally, they facilitate the exchange sites' calcium-to-sodium ion exchange (Kumar *et al.*, 2020).

Sodic soil usually contains lime as insoluble calcium carbonate; hence it has lower calcium ionic activity. It has been demonstrated that two especially effective green manures (GM) and green leaf manures, respectively, to rehabilitate sodic soils are *Sesbania aculeata* and *Delonix elata*, both of which are resistant to sodicity stress (Baig and Zia, 2006; Chandrasekaran *et al.*, 2010). The following order was followed by the various green manures' levels of reclamation potential: dhaincha > sunhemp > cowpea > green gram (Shirale *et al.*, 2017). *Sesbania aculeata* may assist in replace sodium from sodic soils since it contains 34% calcium on a dry weight basis. Additionally, using green manure reduces the concentration of a number of cations and anions, such as Cl⁻, SO₄²⁻, HCO₃⁻, and CO₃²⁻ (Shirale *et al.*, 2018).

Conclusion: Using organic amendments to recover from salt stress strengthens soil health and food security. Green manure releases nutrients more quickly, is easier to decompose, has a higher N content and a lower C/N ratio, and minimises the risk of N immobilisation for subsequent crops. After decaying, exchangeable sodium in green manure crops is replaced with calcium, which reduces the pH of the soil, stimulates nutrient absorption, and boosts soil health for higher yields of crops. In order to restore soil fertility and production in saline and sodic soils, green manuring crops offer an economical and ecologically responsible solution.

ABSTRACT

Mandibular fractures are the second most common fracture in the face region. The main causes for this fracture are car accidents, personal violence, falls or bike falls. Facial nerve paralysis occur very commonly in head injuries where trauma to the temporal bone causes fracture of facial canal which can cause compression on nerve or may be tearing of nerve leading to paralysis. Despite this high prevalence, there is still controversy on how to manage it. Here we are reporting a rare case of facial nerve injury in a minimally displaced fracture of mandible. An 83-year-old female, involved in a road accident a month prior, presented with a history of unconsciousness. Initial examination revealed subdural hematoma (SDH) and facial fractures. The patient, initially managed with carbamazepine and no mandibular intervention, later developed neurological deficits. A month post-accident, she exhibited difficulty in eating, inability to close her left eye, and impaired facial expressions. CT imaging indicated a minimally displaced mandibular fracture. Prednisolone was prescribed without mandibular intervention. Facial nerve injury in minimally displaced mandibular fractures is a rare occurrence. Understanding the mechanisms and etiologies is crucial for appropriate management and prognosis assessment.

Keywords: Mandibular fractures; facial nerve injuries; facial paralysis

**Monika Tanwar et al.,**

INTRODUCTION

Mandibular fractures are the second most common fracture in the face region, second only to nasal fractures. The main causes for this fracture are car accidents, personal violence, falls or bike falls. Despite this high prevalence, there is still controversy on how to manage it. The literature reviews different ways to manage facial nerve injury post trauma is a rarely identified complication as facial nerve paralysis occur commonly in fracture of skull base, which is associated with other life threatening injuries. There have been only a few cases reported of facial nerve injury post mandibular trauma which is not associated with cranial injuries. Here we are reporting a rare case of facial nerve injury in a minimally displaced fracture of mandible

Case report

A 83 year old female patient reported to the department of OMFS, SGT University. Patient's relative gave a history of fall when she was hit by a vehicle on road 1 month ago. Patient became unconscious for 10 min. Patient was taken to PGIMS Rohtak where clinical examination and CT was done. CT revealed SDH and facial fracture. Patient was put on carbamazepine 200mg twice daily and was referred home without any intervention for mandibular trauma. Patient became neurologically deficit and was not identifying family and relatives after accident. 1 month later patient was brought to OMFS OPD in SGT university with a complain of inability to eat food and inability to close left eye by relatives only. The patient was not oriented to time, place and person and was barely following commands. On clinical examination, the occlusion was not disturbed, but patient was complaining of difficulty in chewing food. Patient was not able to close left eye or was not able to frown. (Fig-1: A, B, C) Salivary drooling was present from corner of mouth A repeat CT face and head was advised which revealed minimally displaced fracture of body of mandible and zygomatic arch. (Fig-2) No evidence of SDH was seen in the CT. Patient was advised a tapering dose of prednisolone without any intervention for facial fractures.

DISCUSSIONS

Facial nerve paralysis occur very commonly in head injuries where trauma to the temporal bone causes fracture of facial canal which can cause compression on nerve or may be tearing of nerve leading to paralysis. But, Facial nerve injury in mandibular fractures is rarely encountered due to its course and impact received by the mandible. Only a handful of cases of unilateral facial nerve palsy secondary to isolated mandibular fractures, i.e without associated temporal bone fractures, have been reported to date. Absence of neurological and otological findings as well as a normal CT scan suggested a peripheral cause for the lower motor neuron type of facial nerve palsy in this patient. Delayed onset of facial palsy has been reported after mandibular fractures. BRUSATI & PAINI authored vascular disturbances consequent upon oedema are probably the cause of delayed onset of facial paralysis[1]. In the present case, the facial palsy was noted on about 9th-10th day postoperative day. The mechanism of facial nerve injuries in mandibular fractures without associated temporal bone fractures or associated otological causes has been variously cited as:

1. oedema in the fallopian canal[2];
2. oedema and haemorrhage around the facial nerve in the region of the parotid gland[3];
3. traction injury to the nerve trunk at its exit from the stylomastoid foramen[1];
4. direct trauma from fractured stump ends[4];
5. vigorous manipulation for fracture reduction[5].

In this case the sudden splaying of the body fracture may have lead to cause traction injury to the facial nerve which might have caused facial paralysis. Although paralysis of all 5 branches of facial nerve is a rare entity in mandibular fracture. Other investigations including MRI, HIV and blood investigations were done to rule out other causes but none of them were associated with aetiology of this case. Secondary facial palsy, similar to other etiologies of facial paralysis, is considered to diminish by itself in a period of 3 to 6 months, with almost no permanent paralysis cases [6,7]. But regular follow ups are required to trace the recovery of nerve function and to identify etiology of paralysis

Monika Tanwar *et al.*,

in such cases. Scuto A, S. Cappabianca in a case report presented delayed post-traumatic facial nerve palsy without radiological evidence of temporal bone fractures, in which magnetic resonance was crucial for diagnosing the nerve impairment. Radiological findings in accordance both with electrodiagnostic tests and clinical presentation suggested the successful conservative management. They stated that delayed FNP is usually due to the pressure effect of a reversible edema within the fallopian canal, best managed by medical treatment. Important prognostic factors are the severity of FNP and timing of onset, with the degree of palsy (based on the House and Brackmann scale and electric testing) having a greater influence on recovery of function than the time of onset.[8,9] Some authors postulate a similar mechanism for this facial weakness as in Bell's palsy with a possible inflammatory reaction in and around the nerve, or a swelling of the nerve in the canal which could lead to ischemia. The vascular damage such as delayed arterial spasm, arterial or venous thrombosis, external compression from bony fragment or soft tissue edema are other etiological causes [10,11].

CONCLUSION

Facial nerve injury in minimally displaced mandibular fractures is a rare occurrence. Understanding the mechanisms and etiologies is crucial for appropriate management and prognosis assessment. Regular follow-ups and comprehensive assessments are essential for tracking nerve function recovery and identifying underlying causes of paralysis.

PATIENT CONSENT

Written informed consent was taken from the patient for the investigations, treatment and publication of their details.

ABSTRACT

This paper explores the integration of human rights education with technological ethics to propel responsible innovation and societal transformation. By examining the role of human rights education in the context of science and technology, the paper highlights how ethical considerations can be embedded in technological development to ensure that advancements contribute to social justice and human dignity. The study concludes with recommendations for educators, policymakers, and technologists on leveraging educational frameworks to promote human rights within the rapidly evolving technological landscape.

Keywords: Human Rights, Education, Innovation, Societal Transformation

INTRODUCTION

Human rights education plays a crucial role in building more equitable, just, and free societies, while fostering transformative societal change. It encompasses a range of educational practices and initiatives aimed at raising awareness, enhancing understanding, and cultivating respect for human rights principles and values. The importance of human rights education in nurturing a culture that respects human rights and in developing active, informed citizenship cannot be overstated. Its impact is evident in the dissemination of knowledge about rights and the development of skills necessary to defend and advocate for these rights. The significance of human rights education is widely recognized by international organizations and scholars within the human rights field. The United Nations has emphasized the importance of human rights education through various resolutions and declarations. Educational systems globally are often anchored in the principles of the Universal Declaration of Human Rights

**Nishi Tyagi and Safia Mustafa**

(UDHR); Article 26 specifically addresses education, stating that it "shall be directed to the full development of the human personality and to the strengthening of respect for human rights and fundamental freedoms" (United Nations, 1948). The United Nations Declaration on Human Rights Education and Training, adopted on December 19, 2011, further underscores the necessity of human rights education as essential for "achieving individual and collective life in dignity" and as a means to "promote equality, justice, sustainable development, social harmony, and peace" (United Nations, 2011). Human rights education can be delivered through both formal and non-formal approaches. Formal education systems, such as school curricula and educational institutions, provide a structured framework for imparting human rights knowledge and values. Non-formal methods, on the other hand, extend beyond traditional educational settings and include community-based initiatives, advocacy campaigns, online platforms, and grassroots efforts. These approaches aim to reach individuals in diverse contexts, including marginalized communities, addressing specific human rights issues and incorporating technological advancements to enhance learning (Osler & Starkey, 2005). Despite its potential, human rights education faces several challenges in its implementation. Obstacles such as conservative societal attitudes, political resistance from certain governments, and a lack of political will continue to hinder its inclusion in official curricula. Additional challenges include a lack of standardized approaches, inadequate teacher training, and limited resources (Andreotti, 2011; Bajaj, 2011). Overcoming these challenges requires concerted efforts and a multi-stakeholder approach involving governments, educational institutions, civil society organizations, and international bodies. Integrating technological ethics into human rights education can also play a crucial role in addressing these challenges by equipping learners with the tools to navigate the ethical implications of emerging technologies, thereby reinforcing the relevance of human rights in today's digital age

Conceptual Framework

Human rights education is a progressive endeavour aimed at instilling an understanding of fundamental human rights principles and values, fostering reverence for the inherent worth of every individual, and enabling people to actively advocate for and protect human rights. This comprehensive approach transcends the mere dissemination of information by cultivating critical thinking, acquiring practical skills, and fostering viewpoints and behaviors that align with human rights principles. The framework is presented in Figure (a).

Principles of Human Right Education

Human rights education is guided by fundamental principles that prioritize a rights-based approach to education. These principles aim to advance understanding, respect, and the implementation of human rights values across educational systems. The following key principles underpin human rights education, particularly in the context of technological advancement (Figure b)

- **Universality and Inalienability:** Human rights education emphasizes that human rights apply to every individual, regardless of race, gender, nationality, or any other distinguishing characteristic. These rights are inherent and cannot be revoked or denied, even as technology evolves. (UDHR, Article 1; United Nations, 1948)
- **Equality and Non-Discrimination:** Human rights education promotes equality and non-discrimination, highlighting the need for technologies that are inclusive and accessible to all, challenging discriminatory practices in their design and application. (Convention on the Rights of the Child, Article 2)
- **Participation and Empowerment:** Human rights education encourages active participation and engagement in decision-making processes, both in educational settings and the broader society. It empowers individuals to exercise their rights, promote social justice, and advocate for ethical technological innovation. (UNESCO, 1974)
- **Interconnectedness and Inseparability:** Human rights education emphasizes the interconnectedness of rights, ensuring that technological advancements do not infringe upon or compromise other human rights. Education should address the full spectrum of human rights to promote a holistic understanding and implementation. (World Conference on Human Rights, 1993)
- **Active Learning & Critical Thinking:** Human rights education employs active learning methodologies to engage learners in critical thinking and reflection, particularly regarding the ethical implications of technology.

**Nishi Tyagi and Safia Mustafa**

It promotes analysis of real-life human rights issues, fosters empathy, and develops skills for the peaceful resolution of conflicts. (UNESCO, 2017)

- **Respect for Diversity and Intercultural Dialogue:** Human rights education fosters respect for diversity and encourages intercultural dialogue, emphasizing the need for technology to respect cultural differences. It aims to develop an appreciation for different cultures, religions, languages, and perspectives, promoting tolerance, understanding, and the celebration of diversity. (Framework for Action on Education for Sustainable Development, UNESCO, 2014)
- **Social Responsibility & Global Citizenship:** Human rights education emphasizes social responsibility and global citizenship, encouraging individuals to recognize their role in creating a just and sustainable world. It advocates for the responsible use of technology to promote solidarity, active citizenship, and global engagement. (UNESCO, 2013)

These principles form the foundation for human rights education and guide its implementation in creating highly inclusive, equitable, and rights-respecting educational environments, particularly in an era of rapid technological change.

Importance of Integrating Human Rights Education across Educational Systems

Integrating human rights education across educational systems is of utmost importance, particularly in the context of technological advancements, for several reasons:

Respect for Human Dignity

Human rights education ensures that education itself respects and upholds the dignity of all individuals. It promotes a learning environment that is inclusive, non-discriminatory, and supportive of diversity, fostering a culture of respect for human dignity in the face of evolving technologies.

Empowerment of Individuals

Human rights education empowers individuals by equipping them with knowledge about their rights, enabling them to exercise agency, make informed choices, and advocate for themselves and others. It fosters critical thinking, empathy, and a sense of responsibility for promoting human rights, particularly in the ethical development and application of technology.

Promoting Social Justice and Equality

Integrating human rights education into educational systems helps to address systemic inequalities, discrimination, and social injustices. It equips learners with the tools to challenge oppressive structures and advocate for equal rights and opportunities for all, especially as technology reshapes societal norms.

Global Citizenship

Human rights education nurtures global citizenship by promoting understanding, empathy, and solidarity with individuals and communities beyond one's own national or cultural boundaries. It fosters a sense of shared responsibility for addressing global challenges, including those posed by emerging technologies, and promoting human rights worldwide.

Sustainable Development

Human rights Education shares a strong connection with the Sustainable Development Goals (SDGs) set forth by the United Nations. Integrating human rights principles into education contributes to achieving goals such as quality education, gender equality, peace and justice, and strong institutions, with an emphasis on the responsible use of technology in sustainable development. Integrating human rights education across educational systems is crucial for fostering a culture of respect, empathy, and active citizenship. It empowers individuals, promotes social justice, and nurtures a generation committed to upholding human rights and transforming societies toward a more inclusive, equitable, and technologically responsible future.

**Nishi Tyagi and Safia Mustafa****Empowering Individuals through Human Rights Education****Impact of Human Rights Education on Knowledge, Awareness, and Understanding**

Human rights education plays a pivotal role in equipping individuals with the knowledge of human rights principles, techniques, and approaches. It raises awareness of their own rights and the rights of others, fostering a deeper appreciation of the universality and indivisibility of human rights (Freire & Macedo, 1987). Through human rights education, individuals gain a comprehensive understanding of the historical, social, cultural, and technological factors that influence human rights breaches, enabling them to recognize and address systemic injustices (Pashby, 2017). Empirical research has demonstrated the positive impact of human rights education on knowledge and awareness. For instance, a study conducted in South Africa found that participation in human rights education programs significantly enhanced students' understanding of human rights, including specific rights such as the right to education and the right to a clean environment (Smit & Rensburg, 2019). Similarly, Merryfield (2011) revealed that human rights education led to significant improvements in students' understanding of human rights concepts, including discrimination and social justice, especially in contexts involving technological advancements.

Development of Critical Thinking, Empathy, and Respect for Diversity

Human rights education fosters the development of critical thinking skills, enabling individuals to analyze complex social and technological issues from a human rights perspective. It encourages individuals to critically reflect on their own beliefs and biases, challenging stereotypes and prejudices (Tibbitts, 2002). By examining real-life instances of human rights violations, particularly those exacerbated by technology, and actively participating in discussions and debates, individuals gain a more profound understanding of the underlying causes and impacts of discrimination, injustice, and technological inequalities. Furthermore, human rights education promotes empathy and respect for diversity. By learning about the experiences of marginalized and oppressed groups, including those affected by technological disparities, individuals develop a sense of empathy and a greater appreciation for the rights and dignity of all people (Briggs, 2008). Human rights education encourages individuals to embrace diversity and challenge discriminatory practices and attitudes in their communities, institutions, and the development of technology (Lombardo, 2011). Research has shown that human rights education enhances critical thinking, empathy, and respect for diversity. A study conducted in the Netherlands revealed that students who participated in human rights education programs demonstrated higher levels of critical thinking and empathy compared to those who did not receive such education (Kwakman, 2018). Similarly, McDonald & O'Connor (2018) found that human rights education programs positively influenced students' attitudes toward diversity, respect for human rights, and their understanding of technology's role in either perpetuating or alleviating inequality.

Promotion of Active Citizenship and Social Engagement

Human rights education empowers individuals to become active citizens who are engaged in addressing social issues and promoting positive change, particularly in the context of technology-driven societies. It encourages individuals to participate in civic activities, advocate for human rights, and contribute to the development of just, inclusive, and technologically responsible societies (Andreotti, 2006). Through human rights education, individuals develop the skills and confidence to take action at the local, national, or international level to uphold human rights principles and challenge violations, including those related to digital rights and technological ethics (Osler & Starkey, 2006). Studies have highlighted the transformative impact of human rights education on active citizenship and social engagement. For example, research conducted in Canada demonstrated that human rights education programs enabled students to critically examine social issues, develop leadership skills, and engage in community-based initiatives to promote human rights, particularly in addressing the ethical challenges of new technologies (Ghosh & Abdi, 2013). Minkenbergh (2015) found that human rights education contributed to young people's engagement in civil society organizations and activism, including those focused on technological justice.

Application of Human Rights in Everyday Life

Human rights education seeks to bridge the gap between theory and practice by enabling individuals to apply human rights principles in their everyday lives, including in their interactions with technology. It equips individuals with the knowledge and skills to identify human rights violations, assert their own rights, and support others in

**Nishi Tyagi and Safia Mustafa**

exercising their rights, particularly in digital and technological contexts (Owens & Murphy, 2012). Human rights education emphasizes the importance of respect, tolerance, and non-violence in interpersonal relationships, workplaces, communities, and online environments (Fuentes, 2018). Research has shown that human rights education enhances the application of human rights in various contexts. A study carried out in Sweden discovered that human rights education played a significant role in fostering democratic values and attitudes among students, leading to a stronger dedication to human rights in both their personal and professional lives, including their approach to technology use and development (Rosenberg, 2019). A study by Jain (2017) demonstrated that human rights education positively impacted individuals' attitudes and behaviors concerning gender equality and women's rights, with an emphasis on the role of technology in either supporting or hindering these rights. In summary, human rights education empowers individuals by enriching their knowledge, awareness, and understanding of human rights. It cultivates critical thinking abilities, empathy, and respect for diversity, promotes active citizenship and social involvement, and facilitates the application of human rights principles in everyday situations, including those involving technology. By embracing these empowering principles, human rights education aims to foster a fairer, more inclusive, and technologically responsible society.

Transforming Societies through Human Rights Education**The Role of Human Rights Education in Challenging Discriminatory Practices and Systems of Oppression**

Human rights education plays a crucial role in challenging discriminatory practices and dismantling systems of oppression within societies, especially in a world increasingly shaped by technology. By promoting an understanding of equality, dignity, and non-discrimination, human rights education empowers individuals to challenge and confront prejudices, stereotypes, and discriminatory behaviors, both online and offline (Andreotti, 2006). It encourages critical reflection on the structural and systemic barriers—including those embedded in technological systems—that perpetuate discrimination and inequality, fostering a commitment to social justice and human rights. Human rights education provides individuals with the tools and knowledge necessary to advocate for the rights of marginalized and oppressed groups, particularly in contexts where technology may exacerbate existing inequalities. It equips individuals with the skills to identify, address, and prevent human rights violations, working towards the creation of inclusive and just societies (Mertens & Jorna, 2018). Through awareness-raising, education, and community mobilization, human rights education empowers individuals to challenge discriminatory practices and advocate for systemic change, including ethical considerations in the design and application of technology.

Fostering Inclusive and Democratic Learning Environments

Human rights education fosters inclusive and democratic learning environments that prioritize the principles of equality, participation, and respect for diversity, while integrating these principles into the realm of technological ethics. By embedding human rights education into educational systems, institutions can create spaces where all individuals feel valued, respected, and included, regardless of their background or access to technology (Osler & Starkey, 2010). Human rights education promotes dialogue, critical thinking, and active participation, encouraging students to engage in meaningful interactions and collaborative problem-solving, including in digital and technologically mediated environments. In inclusive and democratic learning environments, human rights education enables individuals from diverse backgrounds to learn from one another, challenge biases, and build empathy. It nurtures a sense of belonging and ownership, empowering individuals to become active contributors to their communities and agents of change (UNESCO, 2016). By providing students with opportunities to voice their perspectives, particularly in the context of technological development and use, human rights education strengthens democratic principles and cultivates a culture of open dialogue, tolerance, and understanding.

Creating a Culture of Human Rights and Social Cohesion

Research has demonstrated the positive impact of human rights education on developing a culture of human rights and social cohesion, including in technologically driven societies. For instance, a study found that human rights education programs contributed to reducing prejudice and enhancing intergroup understanding among students from different religious and ethnic backgrounds (Dillenbourg et al., 2019). A study showed that human rights education initiatives in schools enhanced students' sense of belonging, acceptance, and inclusivity, leading to

**Nishi Tyagi and Safia Mustafa**

improved social cohesion (Navarro-Varas et al., 2020). Human rights education also plays a crucial role in addressing historical injustices and promoting reconciliation in post-conflict societies, as well as in addressing technological disparities that may contribute to new forms of injustice. By providing a platform for truth-telling, acknowledgment of past wrongs, and fostering empathy and understanding, it helps societies heal and move forward (Simic, 2014). For example, in South Africa, human rights education programs such as the Truth and Reconciliation Commission have been instrumental in promoting social cohesion and reconciliation in the aftermath of apartheid (Dugard, 2000). Furthermore, human rights education encourages individuals to actively engage in promoting human rights and social justice, including advocating for equitable access to technology and the ethical use of digital tools. It empowers individuals to confront institutional disparities, prejudice, and injustices using peaceful means (Friedman, 2018). By creating a sense of agency and a commitment to social change, human rights education develops a culture where individuals are driven to confront social challenges, including those related to technology, and contribute to building a more equal and inclusive society. In conclusion, human rights education is a significant instrument for developing a culture of human rights and social harmony, particularly in the context of a rapidly evolving technological landscape. It promotes values of equality, decency, and respect, enhances intergroup understanding and discussion, and contributes to correcting historical injustices and encouraging reconciliation. Human rights education provides individuals with the tools to actively engage in fostering a collective dedication to human rights, thereby establishing a framework for a society that upholds principles of justice, solidarity, and social cohesion, with a focus on ethical technological advancement.

Challenges and Opportunities in Human Rights Education**Challenges****Lack of Comprehensive Implementation**

Despite global recognition of its importance, many countries struggle to fully integrate human rights education into their formal education systems. This limits opportunities for learners to engage deeply with human rights principles and leaves significant gaps in knowledge, particularly in areas such as digital rights and technological ethics (Amnesty International, 2016).

Inadequate Teacher Training

Teachers often lack the necessary training and resources to effectively incorporate human rights education into their teaching practices. This gap is particularly pronounced in areas related to the ethical use of technology, where educators may be unfamiliar with the rapidly changing landscape of digital rights and responsibilities (Office of the UN High Commissioner for Human Rights, 2012).

Cultural and Contextual Sensitivity

Balancing universal human rights concepts with cultural and local issues remains a significant challenge. Ensuring that human rights education remains relevant and accepted across diverse cultural contexts is crucial, especially as technology introduces new dimensions to cultural and societal interactions (UNESCO, 2019).

Lack of Evaluation and Monitoring

The absence of comprehensive evaluation and monitoring frameworks hinders the ability to assess the impact and effectiveness of human rights education programs. This is particularly challenging in the digital space, where the outcomes of educational interventions may be less tangible and harder to measure (Human Rights Education Associates, 2011).

Opportunities**Integrating Human Rights across the Curriculum**

There is a significant opportunity to integrate human rights education into various subjects and disciplines, including science, technology, and digital literacy. By doing so, learners can explore human rights issues within diverse contexts, fostering a more holistic and interdisciplinary understanding of these principles (Amnesty International, 2016).

**Nishi Tyagi and Safia Mustafa****Technology and Digital Learning**

The rapid advancement of technology provides unique opportunities for innovative approaches to human rights education. Digital platforms, online courses, interactive resources, and virtual simulations can make human rights education more accessible, engaging, and relevant, especially for younger generations who are digital natives (UNESCO, 2020).

Community Engagement and Participatory Approaches

Involving learners in decision-making and action-taking processes empowers them to become agents of change within their communities. Technology can facilitate this engagement by providing platforms for collaboration, advocacy, and civic participation, allowing learners to take an active role in promoting human rights locally and globally (UNESCO, 2019).

Partnership and Collaboration

Collaboration among various stakeholders—including educational institutions, civil society organizations, technology companies, and governments—can enhance the implementation of human rights education. By sharing expertise, resources, and best practices, these partnerships can strengthen the global impact of human rights education and ensure it remains relevant in a technologically advanced world (Amnesty International, 2016).

Empirical Evidence and Case Studies in Human Rights Education**Research Studies on the Impact of Human Rights Education on Individuals and Communities**

Numerous research studies have explored the effects of human rights education on individuals and communities, providing empirical evidence of its effectiveness. These studies indicate that human rights education positively enhances knowledge, awareness, attitudes, and behaviors related to human rights issues, including those in the context of technological advancements. For instance, a study by Bringle and Hatcher (2012) examined the impact of human rights education on college students' attitudes and behaviors. The findings revealed that students who received human rights education demonstrated increased awareness of human rights issues and reported higher levels of engagement in activities promoting human rights, particularly in digital and technological contexts. In a meta-analysis conducted by Juvonen et al. (2020), the impact of human rights education on students' knowledge, attitudes, and skills was investigated. The findings showed that interventions in human rights education significantly enhanced students' knowledge and understanding of human rights, promoted greater empathy towards marginalized groups, and nurtured a stronger dedication to social justice, especially in relation to emerging technologies and digital rights.

Successful Examples of Integrating Human Rights Education in Educational Institutions

Several educational institutions have successfully integrated human rights education into their curricula, offering valuable insights into effective implementation strategies. These examples highlight the transformative potential of human rights education in fostering a culture of rights, social responsibility, and ethical technological engagement. One such example is the Raoul Wallenberg Comprehensive High School in Sweden. This school has embedded human rights education across all subjects, incorporating human rights themes into the curriculum, classroom activities, and school policies. This approach has led to improved student engagement, critical thinking skills, and a school culture rooted in respect for human rights, including an understanding of the ethical implications of technology (Nygren, 2018). Another successful case is the Human Rights Friendly Schools project in South Africa. This initiative supports the integration of fundamental rights education through teacher training, curriculum development, and the establishment of democratic and inclusive learning environments. The project has been associated with increased student participation, improved school atmosphere, and enhanced knowledge and comprehension of human rights principles, including those related to technological access and equity (Human Rights Friendly Schools, n.d.).

**Nishi Tyagi and Safia Mustafa****Lessons Learned and Key Findings from Empirical Research and Case Studies**

Empirical research and case studies in human rights education have provided valuable lessons and key findings for effective implementation, particularly in the context of technology. Firstly, it is essential to adopt a learner-centered approach that encourages active engagement and participatory learning. Empirical evidence consistently highlights the positive impact of interactive and experiential teaching methods in enhancing knowledge, attitudes, and skills related to human rights, including digital rights and technological ethics (Freire, 2018). Furthermore, the integration of human rights education across different subjects and grade levels facilitates a comprehensive understanding of human rights and their applicability in diverse contexts, including technological ones. By incorporating human rights themes into various disciplines, students gain a multidimensional understanding of human rights and recognize their interrelationships with various facets of life, including technology (Bourn, 2020). Moreover, establishing partnerships and fostering collaborations among educational institutions, civil society organizations, and government entities is crucial for the sustained integration of human rights education. These collaborative efforts enable the sharing of resources, capacity-building, and the exchange of successful approaches, thereby bolstering the effectiveness of human rights education initiatives, particularly in adapting to technological challenges (UNESCO, 2017). Empirical evidence and case studies offer valuable perspectives on the influence of human rights education and effective implementation approaches. Research findings reveal the beneficial outcomes of human rights education on individuals and communities, while case studies present exemplary models of integrating human rights education within educational institutions. These studies provide important lessons learned and key insights that inform the design and implementation of impactful human rights education programs, with a focus on the ethical use of technology.

Recommendations for Policy and Practice in Human Rights Education**Policy Implications for Integrating Human Rights Education in Educational Systems**

Integrating human rights education into educational systems requires supportive policies and frameworks that prioritize its inclusion. Policymakers play a crucial role in creating an enabling environment for the effective implementation of human rights education. One key policy recommendation is the development of national curricula that explicitly incorporate human rights education across all levels of education. This ensures a systematic and comprehensive approach to teaching human rights principles, values, and skills (Council of Europe, 2018). Policymakers should also allocate adequate resources for the development of relevant educational materials, teacher training programs, and evaluation mechanisms (Biswas, 2017). Additionally, policies should promote inclusive and participatory approaches to education, fostering a culture of respect for diversity, equality, and human rights within schools. This includes addressing discriminatory practices, promoting inclusive learning environments, and empowering students to participate in decision-making processes (UNESCO, 2015).

Strategies for Teacher Training and Professional Development in Human Rights Education

Teacher training and professional development are vital for developing the willingness of educators to effectively incorporate constitutional rights education throughout their teaching practice. Firstly, pre-service and in-service teacher training programs should incorporate comprehensive modules on human rights education, providing teachers with the necessary knowledge, skills, and pedagogical approaches. This training should focus not only on theoretical foundations but also on practical strategies for implementing human rights education in diverse classroom settings (OHCHR, 2012). Furthermore, professional development opportunities should be provided to educators on an ongoing basis. This can include workshops, seminars, and collaborative learning platforms that facilitate the exchange of best practices, resources, and experiences. Peer support networks and mentorship programs can also contribute to the professional growth of teachers in the field of human rights education (Bourn, 2020).

Collaborative Efforts and Partnerships to Advance Human Rights Education

Collaboration and partnerships among various stakeholders are crucial for advancing human rights education and creating a sustainable impact. Firstly, a collaboration between educational institutions, civil society organizations, and government agencies is essential. These partnerships can facilitate the development of joint initiatives, resource-sharing, and the coordination of efforts to integrate human rights education into policies and programs (United

**Nishi Tyagi and Safia Mustafa**

Nations, 2011). Additionally, collaboration with international organizations and networks can provide valuable support and expertise in advancing human rights education. These partnerships can contribute to the development of global standards, sharing of best practices, and advocacy for the importance of human rights education on the international stage (Council of Europe, 2010). Moreover, fostering collaboration at the local level, including community organizations, human rights advocates, and parents, can help create a supportive environment for human rights education. Engaging the wider community in dialogue, awareness-raising campaigns, and participatory activities can strengthen the impact of human rights education beyond the confines of the classroom (Biswas, 2017). Recommendations for policy and practice in human rights education include the development of supportive policies, comprehensive teacher training, and collaborative efforts among stakeholders. These recommendations emphasize the importance of integrating human rights education into national curricula, providing teachers with the necessary skills, and fostering partnerships to advance human rights education at all levels of society. Human rights education has emerged as an empowering tool that brings about transformative change, fostering a culture of respect for human rights and empowering individuals. This summary highlights the crucial discoveries and contributions in the field, emphasizing the importance of ongoing research, evaluation, and collective action.

Recommendations for Policy and Practice in Human Rights Education**Policy Implications for Integrating Human Rights Education in Educational Systems**

Integrating human rights education into educational systems requires supportive policies and frameworks that prioritize its inclusion, particularly in relation to technology and digital ethics. Policymakers play a crucial role in creating an enabling environment for the effective implementation of human rights education. One key policy recommendation is the development of national curricula that explicitly incorporate human rights education across all levels of education, including a focus on digital rights and technological ethics. This ensures a systematic and comprehensive approach to teaching human rights principles, values, and skills (Council of Europe, 2018). Policymakers should also allocate adequate resources for the development of relevant educational materials, teacher training programs, and evaluation mechanisms, particularly those that address the challenges posed by emerging technologies (Biswas, 2017). Additionally, policies should promote inclusive and participatory approaches to education, fostering a culture of respect for diversity, equality, and human rights within schools. This includes addressing discriminatory practices, promoting inclusive learning environments, and empowering students to participate in decision-making processes, especially those related to technology use and digital citizenship (UNESCO, 2015).

Strategies for Teacher Training and Professional Development in Human Rights Education

Teacher training and professional development are vital for equipping educators to effectively incorporate human rights education throughout their teaching practice, especially in the context of technological change. Firstly, pre-service and in-service teacher training programs should incorporate comprehensive modules on human rights education, providing teachers with the necessary knowledge, skills, and pedagogical approaches, including those related to technological ethics. This training should focus not only on theoretical foundations but also on practical strategies for implementing human rights education in diverse classroom settings, with an emphasis on digital literacy (OHCHR, 2012). Furthermore, professional development opportunities should be provided to educators on an ongoing basis. This can include workshops, seminars, and collaborative learning platforms that facilitate the exchange of best practices, resources, and experiences, particularly in relation to technology. Peer support networks and mentorship programs can also contribute to the professional growth of teachers in the field of human rights education (Bourn, 2020).

Collaborative Efforts and Partnerships to Advance Human Rights Education

Collaboration and partnerships among various stakeholders are crucial for advancing human rights education and creating a sustainable impact, particularly in the context of technological advancement. Firstly, collaboration between educational institutions, civil society organizations, and government agencies is essential. These partnerships can facilitate the development of joint initiatives, resource-sharing, and the coordination of efforts to integrate human

**Nishi Tyagi and Safia Mustafa**

rights education into policies and programs, including those related to technology and digital rights (United Nations, 2011). Additionally, collaboration with international organizations and networks can provide valuable support and expertise in advancing human rights education. These partnerships can contribute to the development of global standards, sharing of best practices, and advocacy for the importance of human rights education on the international stage, especially in addressing the global challenges posed by technology (Council of Europe, 2010).

Moreover, fostering collaboration at the local level, including community organizations, human rights advocates, and parents, can help create a supportive environment for human rights education. Engaging the wider community in dialogue, awareness-raising campaigns, and participatory activities can strengthen the impact of human rights education beyond the confines of the classroom, particularly in promoting ethical technology use and digital citizenship (Biswas, 2017).

Importance of Ongoing Research and Evaluation in Human Rights Education

Ongoing research and evaluation efforts are crucial for understanding the impact and effectiveness of human rights education initiatives, especially in the rapidly evolving technological landscape. Through rigorous investigations and assessment mechanisms, scholars and practitioners have provided valuable insights into the outcomes, methodologies, and recommended approaches of human rights education. Research has established that human rights education positively improves knowledge, understanding, attitudes, and behaviors related to human rights concerns. It develops critical thinking abilities, empathy, respect for diversity, and active citizenship among learners, with significant implications for digital literacy and ethical technology use. Successful case studies have demonstrated strategies for integrating human rights education in educational institutions, highlighting the transformative potential of such programs in both traditional and digital environments. Ongoing research and evaluation contribute to improving and refining human rights education practices. They identify effective teaching methods, curriculum design, and assessment approaches, paving the way for evidence-based pedagogical strategies that address the challenges of integrating technology and human rights. Evaluation frameworks enable practitioners to assess intervention impacts, identify areas for improvement, and ensure accountability and quality assurance, particularly in digital learning contexts.

Call to Action for Promoting Human Rights Education as a Transformative Tool

The findings and contributions in human rights education necessitate collective action to promote its integration and advancement as a transformative tool, especially in the context of technological change. Firstly, policymakers should prioritize human rights education in national agendas, curriculum frameworks, and educational policies. Recognizing human rights education as a fundamental aspect of quality education is essential, ensuring its inclusion and integration at all educational levels, with a focus on digital rights and technological ethics. Adequate resources should be allocated to support the development of human rights education materials, teacher training programs, and monitoring mechanisms that address both traditional and digital learning environments. Secondly, educators and teacher training institutions play a critical role in promoting human rights education. They should actively engage in professional development opportunities, ensuring their competencies in delivering human rights education, particularly in relation to technology. This includes incorporating human rights principles and values into teaching practices, creating inclusive learning environments, and adopting participatory and experiential teaching methods that integrate digital literacy. Furthermore, coordination among stakeholders is vital for advancing human rights education. Partnerships between educational institutions, civil society organizations, governments, and international organizations can enhance knowledge sharing, capacity-building, and advocacy for the importance of human rights education, particularly in the face of technological challenges. Through joint actions, stakeholders can magnify their impact, promote systemic change, and create a broader influence in promoting human rights in both physical and digital spaces. In conclusion, the significance of continuous research, evaluation, and collaborative action in human rights education cannot be overstated. Continuous research enhances our understanding of its impact, while evaluation ensures ongoing development and adaptation to new challenges, particularly those posed by technology. Policymakers, educators, and stakeholders are urged to prioritize, integrate, and promote human rights education as a transformative instrument. By doing so, we can empower individuals, reform societies, and build a culture of respect for human rights, both in the physical world and in the digital age.

ABSTRACT

Watershed cerebral infarct is a rare type of ischemic stroke involving the border zones of brain which could be cortical/external infarct or subcortical/internal infarct. Internal watershed cerebral infarct has a poor prognosis clinically. Specific physiotherapy intervention with action observation priming and task oriented approach have shown better recovery in rehabilitation of stroke patients. This case report analyzes the effect of specific physiotherapy intervention with action observation priming and task oriented training following internal watershed cerebral infarct.

Keywords: watershed cerebral infarct, physiotherapy, task oriented training, action observation priming.

INTRODUCTION

Watershed cerebral infarct is an ischemic stroke that occurs in the brain tissues bordering two main arteries such as the anterior cerebral artery (ACA) and the middle cerebral artery (MCA) or MCA and posterior cerebral artery (PCA). These areas are known as border zones and are located far away from the main arteries in brain [1]. It accounts for approximately 5-10% all the cerebral infarctions which occurs mainly in the elderly age groups [2]. Two types of watershed/ border zone infarct have been identified - external (cortical) & internal (subcortical) where external infarct is caused by embolism and internal border zone infarct is caused by hypoperfusion in presence of severe arterial stenosis or occlusion leading to an increased susceptibility to ischemia.[3,4].The typical clinical presentation is progressive, fluctuating or episodic decrease of motor control of upper limb and lower limb, motor aphasia associated with focal seizures which is more frequent in cortical watershed infarct than sub cortical infarct

**Kowsalya and Rajeswari Muthusamy**

[5,6]. Bilateral border zone infarctions between the ACA/ MCA territories can produce predominantly proximal muscle weakness in the upper limb ("man in the barrel" syndrome), which is caused by bilateral symmetric damage isolated to the upper extremity motor fibers in the motor cortex, corona radiata, internal capsule, and basal ganglia [7]. Although the symptoms are similar to that of other ischemic stroke, it is very challenging to diagnose watershed infarcts as they develop slowly with milder symptoms over a period and are probably underestimated. Prognosis of the watershed stroke is rarely fatal but can cause severe disability and literature has shown poor prognosis for the internal watershed infarct clinically, at 3months [8,9]. Motor recovery following stroke is enhanced by various therapeutic interventions but specific physiotherapy intervention strategies such as task oriented approaches bring about better motor recovery following stroke at individual territories [10,11]. This case report analyses the effect of specific physiotherapy with Action Observation Priming (AOP) and Task-Oriented Training(TOT) intervention following MCA-ACA internal watershed cerebral infarct.

CASE REPORT

A 71 years old female, with right hand dominance was admitted in Neuro-ICU, Sri Ramachandra Hospital, Chennai. She had presented with the complaints of difficulty in using right upper and lower limb and difficulty in speaking and difficulty in performing activities of daily living. The subjective history of patient from the family members showed that patient was apparently normal till the day of stroke. On the day of stroke occurrence, when her daughter woke her up, she did not respond for a while after which blood pressure reading was taken using a home kit and found to have decrease in BP. Her daughter observed difficulty in changing her position in lying involving her right upper and lower limb. Immediately she was taken to a nearby hospital and admitted in emergency department. CT/MRI brain was taken to confirm the diagnosis and emergency medications were given. After getting the suggestion of consultant physician, she was brought to Sri Ramachandra Hospital, Chennai for further treatment. She had a past medical history of systemic hypertension with irregular medication and recently she was diagnosed as type 2 diabetes mellitus. As soon as she was stabilized with medications and found clinically normal, she was shifted to Sri Ramachandra Rehabilitation centre for further rehabilitation.

CLINICAL FINDINGS

On observation, right shoulder was adducted, internally rotated, elbow extended and wrist and hand was in neutral position; right hip adducted, knee extended and ankle was in plantar flexion in lying position. On palpation, muscle consistency was firm with no gross abnormalities. On examination of higher mental functions, the patient was alert, comprehending, oriented to time, place and person, level of attention and memory was good but showed motor aphasia. Motor examination components of Tendon jerks, muscle tone using Modified Ashworth Scale and Stage of voluntary control were assessed on the first day and findings are mentioned in the Table 1,2 and 5 respectively. In the first week of admission into the rehabilitation centre, postural control in sitting was poor and was able to assume only chair-sitting posture. Transition of positions from lying to sitting and standing was done with maximal assistance. Walking ability was poor. Her upper limb motor control and hand functions were poor. Outcome measures like Motor Assessment Scale, Brunnstrom stages of recovery were evaluated pre and post -intervention as shown in Table 4 & 5

CLINICAL INVESTIGATIONS

MRI-brain revealed multiple acute infarcts in left parasagittal frontal, parietal, temporal and occipital lobes suggestive of left internal watershed cerebral infarct of ACA/MCA territory. CT-angiogram showed complete non-opacification of left internal carotid artery from origin to the petro-cavernous segment suggestive of occlusion with delayed opacification in the cavernous supra clinoid segment and middle cerebral artery from the Circle of Willis.

PHYSIOTHERAPY INTERVENTION

The specific intervention protocol was designed according to the patient's needs and limitations. It included conventional physiotherapy exercise along with AOP and TOT. AOP was added prior to TOT in order to have better understanding of the movement to be performed and to enhance the motor performance. AOP was delivered as live demonstration of functional task to be trained in front of the patient by the therapist. Only one task per day was

**Kowsalya and Rajeswari Muthusamy**

practiced with sufficient number of repetitions of AOP by the therapist. Each session lasted for about 50 minutes including the 20 minutes of conventional physiotherapy. Task was observed for two minutes in the observation phase of live demonstration by the therapist, followed by three minutes of action phase where the patients imitates and tries to execute the task with her paretic limb. This sequence was repeated for three times followed by rest and repetition of the entire sequence again. Motor learning was enhanced by verbal feedback given appropriately to maximize the performance. Complexity of the task increased as the patient improved and the same protocol was continued for 8 weeks. The tasks provided in various positions during the interventions are described in Table 3

RESULTS

Motor Assessment Scale (MAS) showed significant improvement in the gross motor activities and recovery in affected upper limb and lower limb after eight weeks of intervention. Pre and post intervention scores of MAS showed a change of 20 point difference. Brunnstrom recovery stages of arm, hand and leg showed significant improvement as shown in Table4 and 5

DISCUSSIONS

Watershed cerebral infarct is one of the ischemic type of stroke affecting the border zones of the tissues supplied by the anterior, middle and posterior cerebral arteries [12] The causes of watershed infarct might be an embolic or due to hypoperfusion and studies show that age group, impaired cardiac wall contractility, presence of cardiac thrombus and ulcerative cardiac plaque could determine the cause and type of watershed cerebral infarct [13]. Studies reveal that prognosis of internal watershed infarcts are poor than the external watershed infarcts at 3 months of duration [14]. AOP and TOT intervention enhances neuroplasticity by promoting activation of damaged motor circuits and creating new areas of cortical control and thereby improving motor learning process and performance of activities [15,16]. In addition, AOT provides a standard method of performing the task which acts as reference preventing compensation and demanding the use of maximal motor control with adequate visual feedback. Prognosis of our patient with internal watershed cerebral infarct of left (MCA-ACA) territory with right side involvement was fairly good at eight weeks with voluntary movements on Brunnstrom staging showing isolated movement patterns in upper limb, lower limb and hand. Motor assessment scale showed considerable change in performance of activities which could be attributed to improved motor learning with AOP and TOT approach. Though the activities of daily living were not measured quantitatively, patient was able to transform slowly from complete dependency to partially independent level.

CONCLUSION

We conclude that providing the specific intervention of AOP and TOT improves motor recovery of affected limbs by the enhancing motor control and motor relearning process which could absolutely result in increased functional performance. In this internal border zone case analysis, the outcomes became favourable after eight weeks of physiotherapy interventions which encourages to plan and incorporate AOP and TOT strategies for appropriate patients.

ACKNOWLEDGEMENT

We acknowledge the Sri Ramachandra Rehabilitation centre to conduct the research for fellowship program in Neuromotor rehabilitation in cerebral lesions and also to the participant involved in the research. The case was reported after getting the informed consent from the participant.

ABSTRACT

This study's objective was to use a disc diffusion assay to ascertain the *in vitro* antibacterial activity of the chloroform extract of *Sauropus androgynous* leaves against various harmful bacterial strains. Comparing the zone of inhibition created by plant chloroform extracts to standard antibiotic discs revealed marginally significant antibacterial activity. MIC has also been assessed. Additionally, the total phenol content has been quantitatively estimated using the Folin-Ciocalteu method, which employed gallic acid as the reference. The peroxide approach has also been used for antioxidant research. The formulation of herbal extract gel took into account its physicochemical properties. Biovia Discovery Studio was used to investigate the reported phytochemicals' molecular docking with the enzyme. With the aid of the HDock server, the interaction's strength was assessed. After the docking process, the lowest score values and most significant confidence values demonstrated a good ligand receptor binding process.

Keywords: In-silico study, HDock, Phenolic content, Folin- Ciocalteu method, *Sauropus androgynous*.

Anindya Bagchi et al.,

INTRODUCTION

Indian traditional medicine is renowned for its long history of employing therapeutic herbs. A number of ethnomedicines have been discovered as a result of years of research into good health, long life, and relief from pain and discomfort. Various medical systems, including Ayurveda, Unani, Allopathy, and Homoeopathy, use plants as remedies [1,2]. Numerous novel therapeutically effective medications, such as anticancer medications or antimicrobials, have been developed from these medicinal plants [3-6]. Compared to current chemotherapeutic methods, the use of plants for healing and as a source of antimicrobials has many advantages [6, 7]. According to studies [8–11], a variety of medicinal plants are an excellent source of bioactive substances like peptides, glycosides, alkaloids, saponins, terpenoids, flavonoids, and phenols, the majority of which have antibacterial activity. The hunt for novel medicinal/bioactive molecules, particularly from plants, has been sparked by the antibiotic resistance of infections and the severe side effects of antibiotic use [12]. Biofilm development is one of the pathways that can lead to antimicrobial resistance. The antibiofilm activity of numerous plant-based compounds has been investigated, and the alternative usage of natural antibiofilm agents has grown in significance [13, 14]. Plant extracts have been proven in studies to limit the growth of harmful bacteria or prevent the formation of biofilms [15, 16]. Due to their safety and lower toxicity, chemicals produced from plants have been discovered to have potential applications in medicines [14–17]. The multivitamin plant, *Sauropus androgynous*, is a good source of carotenoids, vitamins A, B, C, and K. Many conditions are widely treated with various portions of *S. androgynous*, including fever, diabetes, cancer, high cholesterol, allergies, UTIs, and earaches [18–20]. Since the diverse therapeutic characteristics of these plants may have an additive or synergistic effect on one another, extracts of them are frequently used to make raw medicines [12]. A review of the literature reveals that no studies about the antibiofilm activity of *S. androgynous* leaf extracts have been published to yet. In order to assess the phytochemical components, antioxidant and antibacterial capabilities of *S. androgynous* leaf extracts, the current study effort was created.

MATERIALS AND METHODS

Materials

Methanol (Merck, India), Ethanol (Lobachem, India), Chloroform (Lobachem, India) were used during the extraction process. Gallic Acid (Lobachem, India) and Folin- Ciocalteu Reagent (Lobachem, India) had been used for the phenolic content estimation of the extract and Hydrogen Peroxide (Merck, India) was used for the antioxidant study by peroxide method. Hydroxy Propyl Methyl Cellulose (Lobachem, India), Propylene Glycol (Lobachem, India), Propyl Paraben (Lobachem, India), Methyl Paraben (Lobachem, India) were used for the formulation of herbal extract. Chloroform extracts were tested against a panel of 4 pathogenic bacterial strains including *Staphylococcus aureus* MTCC 96, *Bacillus subtilis* MTCC 441, *Escherichia coli* MTCC 443 and *Pseudomonas aeruginosa* MTCC 424 were purchased from Institute of Microbial Technology, Sector 39, Chandigarh, India.

Collection and Extraction of plant material

The plant sample i.e. leaves was collected from an herbal garden situated on Shyamnagar, West Bengal and were air dried under shade at room temperature, ground with electric grinder into fine powder and stored in air tight container for further use. Powdered sample was mixed with methanol: water of 4:1 ratio (solvents) for extraction in 1:1 ratio. After that the material was filtered by using Whatman No.1 filter paper and the filtrate was mixed with (2-3) drops of 2M HCl and then mixed with the equal volume of chloroform as same as of filtrate. After the formation of bottom organic layer, it was taken and separated followed by evaporation of the solvent for obtaining the dried residue. The resulting chloroform extract solution was used for further antibacterial and antioxidant activity [21].

Phytochemical screening of Extract

Terpenoids Test: The Salkowski test determines the presence of triterpenoid by forming a reddish-brown colour at the interface when dry extract is combined with water and a few drops of concentrated H_2SO_4 .

Anindya Bagchi *et al.*,

Alkaloids Test

A good outcome is indicated by the production of a reddish-brown precipitate after adding 1 ml of Dragandroff's reagent to 2 ml of the filtrate.

Wagner's test

When 2 ml of extract are combined with a few drops of Wagner's reagent, a reddish brown precipitate forms to indicate a successful reaction.

Hager's test

A positive result is shown by the production of a yellow-colour precipitate when 2 ml of extract is combined with a few drops of Hager's reagent.

Mayer's test

A positive result is confirmed if a creamy precipitate forms after mixing 2 ml of extract with a few drops of Mayer's reagent.

Glycosides Test

If the extract yields a positive result in either of the Fehling (Fehling test A and Fehling test B) solutions, glycosides are present.

Flavonoids Test

Ammonium test: Layer separation was possible when the extract filtrate was combined with a diluted (1 ml, 1% v/v) ammonia solution. A favourable outcome is indicated if the ammonia layer is yellow.

Alkaline test

A favourable outcome is indicated by the dark yellow substance that turns colourless when diluted hydrochloric acid is added to the extract (2 ml) after being treated with a few drops of a 20% (w/v) sodium hydroxide solution.

Steroids Test and Salkowski test

A positive result was achieved when 2 ml of extract, 2 ml of chloroform, and 2 ml of concentrated sulphuric acid were added. If the chloroform layer was red and the acid layer was yellow-green fluorescence, the test was successful. Ferric chloride test for phenols: If the extract was treated with 3–4 drops of a 10% (w/v) ferric chloride solution and the appearance of a black green colour was noted, phenolic compound was present [22].

Quantitative analysis of total Phenolic content

Quantitative analysis of total phenolic in extracts was determined with the Folin- Ciocalteu reagent. Standard used for the analysis was Gallic acid. Concentration of (10-50) mg/ml of gallic acid was prepared in methanol. Concentration of 1mg/ml of plant extract was prepared in methanol and from that 0.5ml of sample was introduced into test tubes and mixed with 2 ml of Folin- Ciocalteu reagent and 2ml of 10% of sodium carbonate solution. The tube was covered and allowed to stand for 30 min at room temperature before the absorbance was measured at 760 nm spectrometrically. The Folin- Ciocalteu reagent is sensitive to reducing compounds including polyphenols, thereby producing a blue colour upon reaction. This blue colour is measured spectrophotometrically. Accordingly, total phenolic content was determined [23].

Antioxidant activity of the plant extract

The ability of plant extracts to scavenge hydrogen peroxide can be estimated according to the peroxide method. A solution of hydrogen peroxide (40 mM) is prepared in phosphate buffer (50 mM pH 7.4). The absorbance of hydrogen peroxide is determined by absorption at 230 nm using a spectrophotometer. Extract (100µg/mL) in distilled water is added to hydrogen peroxide and absorbance at 230 nm is determined after 10 min against a blank solution

**Anindya Bagchi et al.,**

containing phosphate buffer without hydrogen peroxide. The percentage of hydrogen peroxide scavenging is calculated as follows:

$$\% \text{ scavenged (H}_2\text{O}_2) = (A_0 - A_1)/A_0 \times 100$$

Where A_0 is the absorbance of the control and A_1 the absorbance of the sample [24].

Antimicrobial assessment**Broth dilution method**

The minimum inhibitory concentration (MIC) was determined using the broth dilution method as described by a specific method [25]. Concentrations of extracts (1-9 mg mL⁻¹) dilutions were prepared using tubes containing 9 ml of double strength broth. In all test tubes, test antimicrobial compound is added except uninoculated (negative control) and control (positive) tube. The positive control tube is to check for the suitability of the test microorganism and the viability of the inoculums. The final volume was adjusted in all tubes by using sterile water. The tubes were inoculated with the suspension of standardized inocula (0.5 McFarland standard) and incubated at 37°C for 24 h. MIC was recorded as the lowest concentration of extract showing no visible bacterial growth.

Disc diffusion method

The disc diffusion assay was used to screen for antibacterial activity as described by the scientists [26]. The standard inoculum was introduced onto the surface of the sterile agar plates and a sterile glass spreader was used for even distribution over the media. Blank sterile paper discs (6 mm) were placed on the inoculated Mueller-Hinton agar surface and impregnated with 50 µL of the different extracts. A concentration of 10 µg/disc of Streptomycin (Sigma Aldrich, India), was used as a standard. The procedure was repeated for all the selected bacterial species used. The plates were incubated at 37°C for 24 h. All tests were performed in triplicate and the antibacterial activity was expressed as the mean diameter of inhibition zones (mm) produced by the extracts.

In-silico study

Molecular docking method has been used to identify the phytochemical from the plant extract that act as a ligand and form a strong covalent bond with the microbial protein to successfully inhibit the microbe. The discovery studio module of the biovia software is using for identify molecular interaction and perform molecular docking. In this process, first the pdb files for the phytochemicals (Kaempferol) found in the *Sauropus androgynous* plant were downloaded from the website drug bank. The protein DNA helicase Crystal structure of the N-terminal domain of Staphylococcus aureus single-stranded DNA-binding protein forms complex with a small molecule inhibitor data base code (5XGT) was collected from RCSB protein data bank. Molecular docking was done using the HDock Server. The enzyme molecule was treated as the receptor molecule and the phytochemical was treated as the ligand. The high positive value of those indicators presented a good interaction between the ligand and the receptor. Thus, the interaction with high values might indicate the major phytochemical responsible for curing the disease. Kaempferol inhibit the activity of *S. aureus* by blocking the potential effect of DNA helicase Crystal structure of the N-terminal domain of Staphylococcus aureus single-stranded DNA-binding protein [27].

Method of formulation of herbal extract gel

The required amount of gelling agent was accurately measured and dispersed in a small amount of water with continuous stirring to produce a uniform dispersion. Then the drug was dissolved in a suitable solvent here using propylene glycol and added to the above dispersion. Other substances such as methyl paraben and propyl paraben were also added with continuous stirring. The final weight of the gel formulation was adjusted to 10 g with distilled water. The gel was stored in container with wide mouth.

Evaluation of gel formulation**Physical Characterizations**

The composition of gel using different gelling agents tested for colour, odour, homogeneity, in which the gels were placed in containers.

Anindya Bagchi et al.,

Measurement of Surface pH

The pH formation of gel was measured using a digital pH meter. 1 g of gel was dissolved in 25 ml of distilled water in a beaker. The electrode was then immersed in the beaker solution and allowed to simmer for 1 minute and further reading was observed.

Spreadability

Indicates the level of area where the gel spreads easily when applied to the affected skin. The therapeutic potential of the gel also depends on its spreading value. It is periodically displayed in seconds taken by two slides to move from the gel placed between the slides under the direction of a specific load (20 g).

The formula for calculating gel spreadability is: $S = M * (L / T)$

Where,

M = Weight tied to the top slide (20 g)

L = Length of the glass slide slipped

T = Time taken to split the slides.

Tube Extrudability

In this experiment was taken a closed folding tube containing the composition of the ciprofloxacin gel. The gel was pressed tight at the end and a clamp was placed at the end of the tube to prevent any loosening. A weight of 500 g was placed on tube and removed from the cap. The gel was pulled out.

The formula for calculating tube extrudability is: $E = (M / A)$

Where,

E = Tube extrudability

M = Weight applied on tube (500 g)

A = Extrude gel area [28].

RESULTS AND DISCUSSIONS

Phytochemical Screening

D= Dragandroff's reagent M= Mayer's reagent

H= Hager's reagent W= Wagner's reagent

(+) signify positive result

(-) signify negative result

The result showed that the chloroform extract has primarily flavonoids and phenolic part which is generally important for antibacterial and antioxidant activity. *Ocimum tenuiflorum* was used as positive control to find out the validity of the reagent used for phytochemical screening.

Quantitative estimation of phenolic content

The absorbance value of the plant material is 0.852

Now by plotting the value on the equation the conc. was found out to be is 77.45 ug/ml.

Antioxidant assessment

Percent Scavenged; % (H₂O₂) = $[(A_0 - A_1) / A_0 \times 100]$

A₀ = absorbance of Control = 0.518

A₁ = the absorbance of plant sample = 0.36.

$0.518 - 0.36 / 0.518 = 0.3050 \times 100 = 30.50\%$.

Antibacterial Assessment

Note: The control disc used for solvent had no zone of inhibition, so there data was omitted from the above data. Inhibition zones including the diameter of the paper disc (6 mm). Results are expressed as the mean ± SEM of triplicate measurements. The MIC of chloroform extract of *Sauropus androgynous* were 5 mg/ml and 4 mg/ml against *S. aureus* and *E. coli*. 6 mg/ml and 4 mg/ml against *B. subtilis* and *P. aerogenosa*. The MIC determination was

**Anindya Bagchi et al.,**

performed in triplicate for each organism. The chloroform extract exhibited (Table 4) potent anti-bacterial activity against *S. aureus* (12.12 ± 0.43 mm), *B. subtilis* (11.15 ± 0.30 mm), *E. coli* (10.33 ± 0.36 mm) and *P. aeruginosa* (12.50 ± 0.33 mm). The same for the standard drug was found to be 9 ± 0.12 mm, 10 ± 0.13 mm, 10 ± 0.21 mm and 10 ± 0.23 mm against *S. aureus*, *B. subtilis*, *E. coli* and *P. aeruginosa* respectively. The chloroform extracts of *Sauropus androgynous* was produced antibacterial activity against all the tested organisms i.e. gram negative bacteria (*E. coli* and *P. aeruginosa*) and gram positive bacteria (*S. aureus* and *B. subtilis*).

In-silico Study

Binding site shows that the ligand molecule (golden yellow lines) bind with the THR93 and VAL 92 amino acid fragments of the 5XGT receptor surface.

Expected Confidence score- 0.5-0.7. Table 6: In silico assessment. These are docking score of 10 modules involving docking of ligand and receptor. Module 1 shows the least value so it could be judge as the best fit.

Evaluation of gel formulation

Physical characterizations

ACKNOWLEDGEMENT

The authors are highly thankful to the respected principal sir Dr. Arnab Samanta for providing the necessary facility for the completion of the research work.

CONCLUSION

The results of this study indicate that the chosen plant entity's chloroform extract has a considerable amount of antibacterial activity against two separate pathogenic species. Additionally, the plant extract exhibits spectrophotometrically determined antioxidant activity, which may result in the scavenging of free radical forms inside biological systems. It has been determined that the total phenolic content may affect the antioxidant and antibacterial properties. An investigation has been conducted for a particular pathogenic bacteria enzyme whose activity may be inhibited by known phytoconstituents that have antibacterial properties. Formulations for herbal extracts have been created after careful consideration of their physicochemical properties.

In the future, if the protein or enzyme structure of the pathogenic entity, responsible for the various types of diseases, is known, the herbal formulation can be tested for the antibacterial activity and further In silico study can be done with different phytoconstituents responsible for the different activities.

ABSTRACT

SPINAL CORD INJURY (SCI) is a terrible and debilitating condition that affects all regions of the world. In India, around 1.5 million individuals live with SCI. In low- and middle-income countries patients who sustain spinal cord injuries are more likely to have major consequences after being discharged from the hospital. Telerehabilitation emerged as a means of addressing the unmet requirements of persons with SCI. The study aimed to evaluate the effectiveness of telerehabilitation in spinal cord injury patients, to improve the functional status of a person, and to provide psychological support to the patient. A feasibility trial was conducted in the e-OPD of the College of Physiotherapy in PGIMS Rohtak. 480 patients were recruited from 2021-23. The discharged patients having spinal cord injuries who were admitted to the Paraplegic unit and other orthopedic units of PGIMS Rohtak were taken for the study. The patients were provided with telerehabilitation services at their convenient locations. The common age group of patients was 17- 40 years of age. 125, 143, and 178 SCI cases were recorded with telerehabilitation services for years 2021, 2022 and 2023 respectively. SCI patients were either bedridden or wheelchair-bound or use assisted or orthosis-dependent ambulation. For those patients, telerehabilitation had opened the doors for hope and possibilities as a feasible intervention.

Keywords: Spinal cord injury, telerehabilitation services, Institution-based rehabilitation

**Bhawna Verma et al.,**

INTRODUCTION

Most of the cases of spinal cord injury (SCI) can be divided into two types complete spinal cord injury and incomplete spinal cord injury Complete spinal cord causes permanent damage to the area of the spinal cord. Paraplegia or tetraplegia are result of complete spinal cord injury.[1]SCI is a severe disorder that impacts every part of the world.[2]Compared to their contemporaries without impairment, people with SCI are two to five times more likely to pass away too soon and have worse general health.3 An estimated 10.4 to 83 cases of SCI per million people worldwide are reported each year, with a majority of males.[4]In India, around 1.5 million individuals live with SCI. Every year, over 20,000 new cases of SCI are reported. Most of them are males between the ages of 16 and 30, indicating a greater occurrence among the young, energetic, and economic segment of society.[5] In low- and middle-income countries, patients who sustain spinal cord injuries are more likely to have major consequences after being discharged from the hospital. Common complications include pressure ulcers, respiratory and urinary tract infections, depression, fecal and urine incontinence, and autonomic dysreflexia. These consequences may be life-threatening.[6]Cardiovascular disease is one of the primary cause of early mortality in patients with spinal cord injuries. Exercise and physical activity may help persons with spinal cord injuries maintain or enhance their muscular strength and flexibility as well as decrease pain and the chance of developing cardiovascular disease[7].

Medical issues such as loss of mobility, autonomy, bowel and bladder function, and neuropathic pain, as well as social concerns such as strained spouse relationships and poor social adjustments all contributed to a reduced quality of life. To reduce the probability of poor QoL following SCI, these issues might be addressed by a more complete rehabilitation program[8]. Telerehabilitation emerged as a means of addressing the unfilled requirements of persons with SCI. Individuals with SCI have used telerehabilitation to obtain remote consultations, guidance with exercises and therapy, and even access educational materials suited to their requirements. When the COVID-19 pandemic was at its worst and in-person visits were restricted, the advantages of telerehabilitation for those with SCI became even more evident. Telerehabilitation provided ease and flexibility by eliminating the need for extensive travel and enabling patients to receive treatment from the comfort of their homes. Telerehabilitation also preserved patient and healthcare professional safety by reducing the risk of virus transmission.[9] The present study aims to evaluate the effectiveness of telerehabilitation in spinal cord injury patients, to improve the functional status of a person, to provide psychological support to the patient, and to provide time-to-time guidance for bed-related complications and management of pressure sores.

MATERIAL AND METHODS

A feasibility trial was conducted in the E-OPD of the College of Physiotherapy in PGIMS Rohtak. 480 patients were recruited from 2021-23. The discharged patients having spinal cord injuries who were admitted to the Paraplegic unit and other orthopedic units of PGIMS Rohtak were subjects of taken under the study. The patients were provided with telerehabilitation services at their convenient locations. The patient's and their caregiver's burden was assessed by structured telephonically conversation every month. Patient chief complaints were discussed and were asked about regular inspection of skin. Individualized exercises suitable for people with SCI were filmed and shared individually with participants through WhatsApp and a general physiotherapy advice template was also shared along with patient education. For passive SCI patients' education and exercise programs were made to understand their respective caregivers. Diaries were reviewed remotely by the physiotherapist who contacted patients by phone every 2 weeks. The progress was discussed and updates to exercise programs were made, as appropriate, by adding/removing exercises or changing the difficulty or number of repetitions/sets. A Type of a telephone conversation shared by patients is presented in Table 1.

**Bhawna Verma et al.,**

RESULT

The common age group of patients was 17- 40 years of age. 125, 164, and 178 reported SCI cases were provided with telerehabilitation services for years 2021,2022 and 2023 respectively as shown in Figure 3. The patients were assessed twice weekly initially and then periodic sections every 2 months and then follow-ups after 6 months were conducted. After that ,the patients were allowed to contact as per their needs. The periodic telephonic conversations resulted in self-reported improvement in quality of life and enhanced confidence among patients. One of the such conversation was as follows:”

मुझे पीजीआई –ओपीडीके द्वारा आने वाली कालसे काफी फायदा होरहा है और मैं इस सुविधासे काफी जुड़ा हु आमहसूसकरता हूं मुझे अपनी समस्या के समाधानके लिए पीजीआई आनानही पड़ता जोकि इस महामारीके दौरमें बहुत मुश्किल है”.

The patients have reported that these periodic calls have alleviated their sense of social isolation, improved satisfaction, and assisted them in remembering techniques for SCI management. These periodic calls not only help patients but also help the caregivers of SCI patients. Caregivers have a degree of perceived burden that is closely linked to the increased need for psychological support and lack of social conditioning and mental and physical health.

DISCUSSION

This study reveals that telerehabilitation is a feasible and effective approach for providing exercise to patients with SCI. The follow-up talk indicated that the videos were simple to use, engaging to watch, beneficial for health and well-being, and cost-effective for SCI patients during the COVID-19 pandemic. Telerehabilitation is an increasingly popular method of expanding access to care in low- and middle-income countries, particularly where care delivery is difficult or in remote geographical places. Telerehabilitation includes utilizing information and communication technology to offer rehabilitation services and patient education. People with SCI confront additional challenges than able-bodied people. During the pandemic, telerehabilitation began to thrive to properly provide health care. It served as a safe, viable, and cost-effective approach to treating individuals with spinal cord injury. The method is useful for providing care in low- and middle-income nations where healthcare delivery is difficult. The most commonly related conditions observed in SCI patients were bladder and bowel issues, pain spasticity, and pressure sore injuries. For pressure sore injuries and general mobility of bed-ridden patients, the transfer training included education and training was accompanied by videos. Straater et al. (2014) and Sechrist et al. (2018) also found that video telerehabilitation was an effective and convenient way to discuss bowel and bladder concerns, as well as alleviate pressure sores and chronic pain issues. Furthermore, video telerehabilitation demonstrated a potential benefit to caregivers of SCI patients throughout the transition from acute rehabilitation to home.[10,11] However, some of the major challenges faced while providing telerehabilitation services were a lack of acceptance and a skeptical approach. Similar concerns were described by Mandriola et al. in (2019), and Leochio et al. in (2020). Patients were concerned about sluggish internet speeds and other technological difficulties. [12,13,14] In our study, these difficulties were resolved via phone calls and text messages. Other challenges experienced were a lack of awareness for which patients and caregivers were first given counselling and assurance through long telephonic conversations and a lack of manpower to regulate technical issues and provide a wide network for telerehabilitation services. Taking into consideration, the effectiveness of telerehabilitation services, there are several ongoing efforts by the government to expand the use of telerehabilitation; still, there is a long way to go.

Limitations

The current study was only a feasibility trial so it is difficult to evaluate the true intervention effects and quantify the outcome measures.

**Bhawna Verma et al.,****Future research**

The present study may be replicated using a controlled trial design. SCI-tailored and personalized programs with sufficient outcome measures evaluating quality of life and other parameters should be incorporated.

CONCLUSION

This was a feasibility trial conducted to report the benefits and challenges faced by physical therapists, patients, and caregivers as it is the first study to be conducted in the College of Physiotherapy, E-OPD PGIMS Rohtak regarding the effectiveness of telerehabilitation services provided to Spinal cord injury patients. SCI patients were either bedridden or wheelchair-bound or use assisted or orthosis-dependent ambulation. For those patients, telerehabilitation had opened the doors for hope and possibilities as a feasible intervention. However, it is recommended that specific interventions with proper follow-ups should be implemented by the future potential researcher.

ABSTRACT

The aim of this work is to present a novel mathematical fuzzy model for the secretion of cortisol in response to human stress. The model is based on the use of closest symmetric trapezoidal fuzzy numbers. Frequency distribution is used to partition intervals of varying lengths. By converting trapezoidal fuzzy numbers into the closest symmetric trapezoidal fuzzy numbers, we provide a case study on classification with severely unbalanced data sets. Linguistic fuzzy rule-based systems have been shown to exhibit superior performance compared to other strategies in this scenario. The novelty of this work is to develop a mathematical fuzzy model to analyze cortisol secretion, resulting in human stress, using symmetric trapezoidal fuzzy numbers. And applied through a fuzzy rule-based system with unbalanced data sets to study the secretion of cortisol due to human stress on symmetric trapezoidal fuzzy numbers.

INTRODUCTION

Empirical evidence consistently demonstrates that fuzzy logic surpasses traditional mathematical and statistical modelling methods in several applications that include the representation of real-world data [2]. We are engaged in the examination of the Direct Set Assignment (DSA) extrapolative forecasting technique. The DSA technique is a non-linear extrapolative forecasting approach that was created using the Mamdani Development Framework. It is aimed to imitate the structure of a fuzzy logic control system [3] [4]. Research aimed at enhancing the precision of extrapolative techniques should prioritize the creation of statistically straightforward approaches that possess the quality of being resilient to the variations present in real-world data caused by both random and non-random occurrences.

Elective surgery is a significant cause of stress for the patient [11], [12]. Several endeavors have been undertaken to adequately prepare patients before to surgery in order to diminish stress and enhance the final result. Medical research has determined that our video preparation effectively reduces anxiety and stress, as evidenced by a decrease in systolic blood pressure during surgery and a decrease in cortisol excretion. Additionally, it has been found to reduce the need for pain medication after hip replacement surgery. The assessment of preoperative locus of control yielded contrasting findings. A study by [10] highlighted that in the context of surgical intervention, the capacity to relinquish control may be more advantageous than a controlling approach. The F-transform of function f is a vector that consists of weighted local mean values of f as its components. The first stage in defining the F-transform of $f: X \rightarrow \mathbb{R}$ involves choosing a fuzzy partition of the universal set X using a finite collection of fundamental functions.

$$A_1(x) \geq 0, \dots, A_n(x) \geq 0 \quad (1)$$

which are continuous and satisfy the condition $\sum_{i=1}^n A_i(x) = 1$.

METHODOLOGY

Fuzzy transform

Basic functions of respective fuzzy sets are often referred to as basic functions, or alternatively, granules, information chunks, etc. Their selection demonstrates the kind of ambiguity that is associated with the understanding of x . After selecting the fundamental operations, we proceed to define the F-transform of a continuous function $f: X \rightarrow \mathbb{R}$ as a vector (F_1, \dots, F_n) , where

$$F_i = \left(\int f(x) \cdot A_i(x) dx \right) / \left(\int A_i(x) dx \right) \quad (2)$$

F-transform «satisfies the following properties:

(i) $y = F_i$ minimizes $\int_a^b (f(x) - y)^2 A_i(x) dx$

(ii) for a twice continuously differentiable function f , $F_i = f(x_i) + O(h_i^2)$, where h_i is the length of the support of A_i .

The F-transform is used in applications as a skeletal representation. This model generates a compressed representation of an image when f is an image [7], extracts trend values when f is a time series [8], and produces a numeric model when f is utilized in numeric calculations such as integration or differentiation [9]. Once we have determined the components F_i of the F-transform, we may (roughly) restore the original function f as $\bar{f}(x) =$

$$\sum_{i=1}^n F_i A_i(x) \quad (3)$$

The formula (3) is referred to as the F-transform inversion formula in reference [1]. The formula (3) denotes a continuous function that provides an approximation of f . Under certain acceptable assumptions, a series of functions denoted by (3) converges uniformly to f .

Mohamed Harif and Rajesh Kumar

EXAMPLE

A total of one hundred patients were included in the trial after the provision of written informed permission. The inclusion criteria for the study were individuals aged 18 years or older, diagnosed with osteoarthritis of the hip joint, and without a history of previous hip replacement surgery. Anxiety and pain levels were assessed daily for a period of 5 days, starting from the day before the surgery. Additionally, the use of painkillers and sedatives after the surgery was documented. Cortisol levels in urine were measured in 12-hour samples obtained throughout the night for 5 consecutive nights, starting from the night before the surgery. The preparation group consisted of 46 randomly assigned patients, whereas the control group consisted of 54 patients. Following the surgery, the average levels of state anxiety dropped in both groups. However, the preparation group maintained lower levels of anxiety throughout the four days after the procedure. The pain rating on the visual analog scales shown an increase from the preoperative day to the morning before to surgery, and then demonstrated a reduction on a daily basis after the operation.

Let us give an example of the F-transform of

$f_1(x) = \frac{2}{2+x}$ and $f_2(x) = \frac{2}{1+x}$ «with respect A_1, \dots, A_4 . For simplicity, we assume that basic functions A_1, \dots, A_4

are of trapezoidal shape and constitute a uniform partition of $[0,8]$. Their analytical representation is as follows:

$$\begin{aligned}
 A_1(x) &= \begin{cases} 0, & \text{otherwise} \\ 1, & x \in [1,2] \\ 3-x, & x \in [2,3] \end{cases} &
 A_2(x) &= \begin{cases} x-2, & x \in [2,3] \\ 1, & x \in [3,4] \\ 5-x, & x \in [4,5] \\ 0, & \text{otherwise} \end{cases} & (4) \\
 A_3(x) &= \begin{cases} x-4, & x \in [4,5] \\ 1, & x \in [5,6] \\ 7-x, & x \in [6,7] \\ 0, & \text{otherwise} \end{cases} &
 A_4(x) &= \begin{cases} x-6, & x \in [6,7] \\ 1, & x \in [7,8] \\ 0, & \text{otherwise} \end{cases}
 \end{aligned}$$

Corresponding Fuzzy function for above figure 1.

The original motivation for F-transform came from fuzzy modeling. For example, in the situation corresponding to the inverse F-transform, we have n rules

$$\begin{aligned}
 &\text{If } x \text{ is } A_1 \text{ then } y = F_1, \\
 &\text{If } x \text{ is } A_n \text{ then } y = F_n
 \end{aligned} \tag{5}$$

These rules are Takagi-Sugeno (TSK) rules with singleton (constant) right-hand sides. For TSK rules, the value corresponding to a given input x is $\bar{f}(x) = \sum_{i=1}^n F_i A_i(x) / \sum_{i=1}^n A_i(x)$. Since $\sum_{i=1}^n A_i(x) = 1$, we get formula (3).

Figure2 provides a «graphical representation of the basic functions A_1, \dots, A_4 , of the function $f_1(x)$ and $f_2(x)$ of its F-transform components F_1, \dots, F_4 , and of the inverse F-transform. By (2) the values of the components F_1, \dots, F_4 of the F-transform.

RESULTS AND DISCUSSION

The Known Probabilistic Interpretation of Fuzzy Modeling Leads to a Probabilistic Interpretation of F-Transform.

This work demonstrates that by modifying the probabilistic interpretation presented in reference [5], we are able to provide a justification for the formulae of F-transform without requiring any extra assumptions about the probability distributions. Mathematically, this adjustment involves using Bayes formulae and assuming prior distributions, which serve as a means to explain previous knowledge in statistics, rather of assuming the actual distributions. Therefore, we have a more inherent probabilistic explanation of the F-transform. More precisely

**Mohamed Harif and Rajesh Kumar**

- (i) The paper [5] demonstrates that there is a logical interpretation of the F-transform formulas that is based on probability and is reasonable.
- (ii) However, this interpretation allows for the possibility that there are other equally reasonable assumptions about the probability distributions that can result in different formulas.
- (iii) In our modified interpretation, we prove that the fundamental probabilistic framework definitively determines the F-transform formulas, without requiring any assumptions about the» probability distributions [6].

CONCLUSION

We provide a revision of a probabilistic interpretation outlined in reference [5]. In this alteration, the associated probabilistic model unequivocally yields the equations of the F-transform. An analogous alteration is delineated within a broader context of fuzzy modeling. The analysis revealed that the use of the videotape resulted in a reduction in worry and tension. This was determined by examining the levels of urine Cortisol excretion and the rise in intraoperative systolic blood pressure. These findings align well with the concepts of Fuzzy Transform and Fuzzy modeling.

ABSTRACT

Despite the slow adoption of biopesticides compared to chemicals, with only 2% of biopesticides currently available, there has been success in commercializing products based on various species of *Trichoderma* in India. These potential *Trichoderma* isolates are formulated using a variety of organic and inorganic carriers through either solid or liquid fermentation technologies. They are applied through methods such as seed treatment, bio-priming, seedling dip, soil application, and foliar spray. Formulations of *Trichoderma* with mixed strains have shown better performance than individual strains in managing pests and diseases of crop plants, as well as promoting plant growth. However, the commercialization of these bioproducts is primarily hindered by their poor shelf life. Therefore, research should focus on increasing the shelf life of these formulations by developing superior strains that support increased shelf life, or by standardizing organic formulations that offer maximum shelf life with minimal contaminants. Despite the limitations of these *Trichoderma* products, they can be addressed by enhancing biocontrol through environmental manipulation, accurate strain identification using molecular approaches, use of beneficial organism mixtures, physiological and genetic enhancement of biocontrol mechanisms, and manipulation of formulations. Presently, formulations with nano compounds are being used to reduce the application of conventional pesticides and fertilizers. Among the most commonly used are nanoparticles (NPs) of copper, zinc, or silver, which are known for their cytotoxicity. Their accumulation can alter the dynamics of microbes present in the soil. In agriculture, *Trichoderma* is extensively used as a safe biocontrol strategy and to boost plant yield. This makes it likely to come into contact with nanomaterials that can affect its viability as well as its biocontrol and plant growth

Yogasankari Raju *et al.*,

promotion effects. This study summarizes the key findings regarding the interaction of Trichoderma and nanotechnology, including its use in synthesizing NPs and the potential impact of these compounds on this fungus and its associations.

Keywords: *Trichoderma*, Nanotechnology, Biopesticides, Organic, Inorganic.

INTRODUCTION

Traditional methods of managing plant diseases and improving yields, such as the use of chemical pesticides, herbicides, or fertilizers, are not environmentally friendly. These methods involve substances with various aromatic groups or methylated and ethylated compounds that have significant environmental impacts. Long-term use of chemical pesticides can contaminate water, pollute the atmosphere, and sometimes leave harmful residues that can lead to the development of resistant organisms. To address these issues, researchers are exploring alternative options, such as the use of biocontrol agents (BCAs) for disease control. These can be used either alone or in combination with other chemicals for eco-friendly and sustainable disease control methods. Currently, several BCAs have been identified and are available as bacterial agents, such as *Pseudomonas*, *Bacillus*, and *Agrobacterium*, and as fungal agents, such as *Aspergillus*, *Gliocladium*, *Trichoderma*, *Ampelomyces*, *Candida*, and *Coniothyrium*. The green revolution has led to intensified agriculture to meet the growing global demands for food and fiber. However, this has also damaged natural ecosystems by polluting groundwater and foodstuffs, and degrading the environment. Plant diseases are a major concern in global cultivation, resulting in the loss of billions of dollars of farm produce. There is an urgent need to manage diseases to ensure a steady and consistent supply of marketable produce for the growing world population. In disease management, the increased use of chemicals has negatively impacted environmental quality and led to the emergence of many organisms that are resistant to these chemicals.

Chemical pesticides, the most common means of shielding plants from diseases, have put tremendous strain on the agricultural environment in recent decades. Despite chemical plant protection products' high efficacy, questions remain regarding their safe usage, effects on the environment, and safety for humans and animals (Ghorbanpouret *al.*, 2018). The result of the abuse of chemical pesticides is an increase in the resistance of pathogens to pesticides, and the contamination of soil and ground waters. Furthermore, pesticides have a detrimental effect on non-target organisms (e.g., beneficial insects, including pollinators), soil microbiomes, and the general condition of terrestrial and aquatic ecosystems (Tilman *et al.*, 2002. Alizadeh *et al.*, 2020). To protect the environment from the negative effects of chemical fungicides, various actions and strategies of sustainable food production systems are taken, including Integrated Pest Management (IPM) and organic farming (Rahman *et al.*, 2018, Grasswitz 2019). Biological Control Agents (BCAs) are a tactic used to manage plant pathogen populations. These agents are derived from natural products and living microbes or their metabolites (Rahman *et al.*, 2018, Thambugalaet *al.*, 2020). In an attempt to commercialise non-pathogenic bacteria and fungi as BCAs, the majority of research has been done over the last few decades to assess their viability and efficacy (Subediet *al.*, 2020, Niu et *al.*, 2020). Many bacterial and fungal strains, such as *Pseudomonas* spp., *Bacillus* spp., *Streptomyces* spp., *Trichoderma* spp., *Glomus mosseae*, *Gliocladium virens*, *Pythium oligandrum*, and *Beauveria bassiana*, have been used as BCAs as a result of the conducted studies. These strains have been successful in controlling soil-borne diseases of valuable crops that are caused by fungi, oomycetes, bacteria, and nematodes (Savita 2019).

TRICHODERMA

Trichoderma, a genus of fungi that belongs to the Hypocreaceae family, is known to comprise over 100 species. Among the various species of Trichoderma, such as *T. viridae*, *T. haziarum*, *T. atroviridae*, and *T. asperellum*, only a few have been reported to be useful as biocontrol agents. Trichoderma is known to colonize the root surface or cortex and thrives best in the presence of abundant healthy roots. The fungus Trichoderma has a rich history, with its first report and description dating back to 1794. It was later suggested to be linked with the sexual state of a Hypocrea species.

Yogasankari Raju et al.,

However, morphologically assigning the genus *Trichoderma*/*Hypocrea* proved to be challenging. It was even proposed that *Trichoderma viride* was the only species in the genus. The first steps towards developing a specific protocol for species identification were taken in 1969. For the past 70 years, *Trichoderma* spp. have been recognized for their ability to produce antibiotics that inhibit the growth of pathogenic organisms, leading to their use as a biocontrol agent. Over time, many new species of *Trichoderma* were discovered, and by 2013, the genus already consisted of more than 200 phylogenetically defined species based on rpb2 sequence.

Characteristics

Trichoderma, a genus of fungi, is commonly found in various soil types, where it is often the most abundant type of fungus that can be cultured. *Trichoderma* species are frequently isolated from both forest and agricultural soils, as well as from wood. Some species have even been discovered growing on other fungi. The *Trichoderma* genus is known to encompass approximately 90 species. This fungus typically thrives in a temperature range of 25–30 °C and does not grow at higher temperatures. The most conducive culture media for its growth are cornmeal dextrose agar, where the colonies appear transparent, and potato dextrose agar, where the colonies appear white. Some species may secrete a yellow pigment into the agar and produce a distinctive sweet or coconut-like odor. Under a microscope, the conidiophores are seen to be highly branched, either loosely or compactly tufted, often forming distinct concentric rings or borne along sparse aerial hyphae. The typical *Trichoderma* conidiophore with paired branches takes on a pyramidal shape. Most strains of *Trichoderma* do not have a sexual stage and produce only asexual spores. *Trichoderma* species that reproduce sexually are known as teleomorphs, and they belong to the ascomycete genus *Hypocrea*. The development of fleshy stromata in light or dark brown, yellow, or orange hues is what distinguishes them. The bicellular ascospores are frequently green in colour. To far, descriptions of around 200 species of *Hypocrea* have been made.

Morphology

Trichoderma spp. exhibits rapid growth, maturing within 3–5 days. Initially, the colony appears as fluffy white tufts, which later transition to a greenish color due to conidia production. The presence of concentric rings on the agar plate characterizes it. The colony's reverse side is whitish yellow or light tan, sometimes shifting to yellow or pale orange. Morphologically, this genus features branched conidiophores with coiled, straight, or undulate apices, along with the presence of phialides (Bisset, 1991). To identify the bioagent, cultural and morphological characteristics are compared with those described by Rifai (1969) for *Trichoderma viride*. Factors considered include growth rate, colony appearance, surface color, colony reverse, texture, conidiation, conidiophore branching, shape, and size. These observations were made on potato dextrose agar (PDA). The pure culture of *Trichoderma* was obtained using the single spore technique. Microscopic examination of culture slides confirmed it as *Trichoderma asperellum*, as documented by the Indian Type Culture Collection (ITCC) at the Division of Plant Pathology, Indian Agricultural Research Institute, New Delhi, India.

Ecology

Trichoderma species are widely distributed and commonly inhabit soil. They play a crucial role in cellulose degradation. Our study focused on the impact of temperature on the linear hyphal growth of *T. viride* under in vitro conditions. Initially, fungal growth was robust within the temperature range of 25–30°C, but beyond that, growth declined. The maximum average dry weight was observed at 30°C. pH also significantly influences fungal growth. The highest dry weight occurred at pH 7, followed by pH 6.5. Conversely, the lowest dry weight was recorded at pH 8.5. Regarding radial hyphal growth, purified *Trichoderma* performed best on potato dextrose agar (PDA), followed by malt agar, rose Bengal agar, and Sabouraud's agar. However, growth on Czapek's dox medium was suboptimal. Notably, previous research by Pandey and Upadhyay (1997b) highlighted that potato dextrose agar medium, prepared from fresh potatoes, was ideal for radial growth and sporulation of *T. viride*.

Yogasankari Raju et al.,

Habitats and environmental condition

Trichoderma spp. are commonly found in various environments, including water, decaying wood, soil (especially around plant roots), and even non-natural materials like rubber foam or kerosene tanks. These fungi exhibit rapid growth and are prevalent in agricultural, prairie, forest, salt marsh, and desert soils across different climatic zones. While they are generally present in the litter of humid, mixed hardwood forests, they are more dominant in the H and F horizons. *Trichoderma* typically act as saprophytes, breaking down organic matter. However, they can also attack other fungi. Interestingly, their presence in soil emits a coconut-like odor, attributed to the volatile compound 6-pentyl-a-pyrone. Different species of *Trichoderma* thrive in specific temperature ranges: *T. viride* prefers cooler regions, while *Trichoderma harzianum* thrives in warmer climates. These preferences align with their optimal temperature requirements. Overall, *Trichoderma* spp. tend to be more abundant in acidic soils.

IDENTIFICATION OF TRICHODERMASPP

Morphological and cultural characteristic, and molecular identification of different species of *Trichoderma*, namely, *T. harzianum*, *T. asperellum*, *T. viride*, *T. atroviride*, *T. longibrachiatum*, *T. koningii*, and *T. virens* are described in the following section.

Morphological and cultural characteristic

Trichoderma harzianum

- Mycelium: Changes from watery white to light green in color. Reverse side of petri-plate shows uncolored ring-like zones.
- Colonies: Grow rapidly from 7 to 8 cm in diameter in 5 days, smooth surface, mycelial mat develop with white aerial hyphae.
- Conidiophores: Highly branched and forming loose tufts.
- Phialides: Short-skittle shaped, bulged at the middle, and narrower at the base, arise singly. Phialide size lies within a range of $7.2\text{--}11.2 \times 2.5\text{--}3.1 \mu\text{m}$.
- Phialospores: Sub globose or short ovoid often with truncate base, perfectly smooth walled, size ranging from $2.8\text{--}3.2 \times 2.5\text{--}2.9 \mu\text{m}$.
- Spore germination time: 12 h.

Trichoderma asperellum

- Mycelium: Forms a smooth hairy yellowish green cotton pattern usually in the form of 1–2 ringed Concentrics.
- Colonies: Changes cottony white to yellowish green and after 2 days from too deep chrysolite green, emitting coconut odor.
- Conidiophores: Arise highly branched in compact form and the phialides arise singly or in opposite pairs along the branches.
- Phialides: Appear in ninepin shape attenuated into long neck, usually $6.8\text{--}7.2 \times 3.0\text{--}3.4 \mu\text{m}$.
- Phialospores: Globose or short obovoid in shape, green colored with an approximate size of $3.6\text{--}4.0 \times 3.4\text{--}4.0 \mu\text{m}$.
- Spore germination time: 12–13 h.

Trichoderma viride

- Mycelium: Changes green to dark yellowish green after 2–3 days, no odor.
- 230 Microbiology for Sustainable Agriculture, Soil Health, and Environmental Protection
- Colonies: Smooth surface, cottony white mycelial mat with aerial hyphae.
- Conidiophores: Conidia production is less in center than toward the margins with green conidia distributed throughout.
- Phialides: Long, swollen in middle, like slender, and horn shaped with a size range of $6.2\text{--}10.5 \times 3.1\text{--}3.9 \mu\text{m}$.
- Phialospores: Usually globose or obovoid often, perfectly smooth walled, with a size ranging from $2.6\text{--}3.0 \times 2.0\text{--}2.4 \mu\text{m}$.
- Spore germination time: 13 h.

Yogasankari Raju et al.,

Trichodermaatroviride

- Mycelium: The mycelium mat appears watery white, submerged composed of translucent smooth and appear floccose on PDA.
- Colonies: The colony color changes after 2 days from yellowish green to artemisia green and reverse remaining dull yellowish and odorless.
- Conidiophores: Highly branched arise in compact form and the phialides solitary paired on the terminals, swollen at the middle and narrow at the tips.
- Phialides: Phialides appear in ampulliform and oblong shaped, curved, and constricted at the base, with a varying size of $5.2\text{--}10.5 \times 2.4\text{--}2.8 \mu\text{m}$.
- Phialospores: Globose in shape, green colored with an approximate size of $2.4\text{--}3.6 \mu\text{m}$.
- Spore germination time: 12–13 h.

Trichodermalongibrachiatum

- Mycelium: Mostly submerged translucent or watery white.
- Colonies: Changes after 2 days from yellowish green to lily green, no smell. Smooth conidiophores arise from substratum and form irregular tufts or arise from aerial hyphae.
- Conidiophores: Smooth conidiophores arise from substratum and form irregular tufts or arise from aerial hyphae.
- Phialides: Arises singly or in verticils of 2–3, usually lageniform, slightly constricted at the base, usually $3.4\text{--}5.2 \times 2.3\text{--}3.0 \mu\text{m}$.
- Phialospores: Smooth walled, obovoid to ellipsoidal, dilute green, apex broadly rounded, with an approximate size of $2.4\text{--}3.6 \mu\text{m}$.
- Spore germination time: 12–13 h.

Trichodermakoningii

- Mycelium: Creamy white changes from white to terreverte in color.
- Colonies: Crysty, compact, and glaucous like.
- Chlamydospores or conidiophores: Formed intercalary or terminally, much branched.
- Phialides: Narrow at the base, alternate to conical apices (Note: Most phialides of *T. koningii* arise singly and laterally and appears Nine-pin bowling shaped singly rather than pyramidal, size range of $3.8\text{--}7.6 \times 2.5\text{--}3.2 \mu\text{m}$).
- Phialospores: Ellipsoidal or oblonged, with a rounded apex and acute base, measuring $2.5\text{--}4.2 \times 1.8\text{--}2.6 \mu\text{m}$.
- Spore germination time: 14 h.

Trichodermavirens

- Mycelium: Changes watery white to nice green color with dull blackish green shades granules, no characteristic odor.
- Colonies: On potato dextrose agar medium, colonies grow rapidly from 7 to 8 cm in diameter in 5 days at 25°C temperature.
- Conidiophores: Branched irregularly near the apex with each branch terminated by a cluster of 3–6 closely bunched phialides.
- Phialides: Lageniform to ampulliform, swollen at the middle, attenuated to apex, broadly attached to the conidia in ranges between $4.4\text{--}12.8 \times 2.6\text{--}4.2 \mu\text{m}$ of size.
- Phialospores: Broadly ellipsoidal to obovoid, both ends rounded dark green in color and with a size range of $3.2\text{--}5.6 \times 2.5\text{--}3.9 \mu\text{m}$.
- Spore germination time: 13 h.

ENZYMES

Trichoderma, a saprophyte, is adapted to flourish in various environments and produces a broad spectrum of enzymes. Strains that produce specific enzymes can be selected and cultured in suspension to produce these enzymes in industrial quantities. For instance, with their adaptable metabolisms, Trichoderma and the closely related *Gliocladium* spp. can break down a wide variety of plant biomass, including polysaccharides like cellulose, chitin,

**Yogasankari Raju et al.,**

inulin, laminaran, pectin, starch, and xylan, as well as oligosaccharides like melezitose, raffinose, and sucrose (Kubicek and Harman, 1998). Particular attention was given to *Trichoderma* spp. when it was discovered that strains isolated during World War II were especially effective in producing a complex of enzymes that attacked crystalline cellulose in very high yields. This realization largely came from the studies of E.T. Reese and M. Mandels at the US Army Laboratories (1939 to 1945), Natick, MA. A specific strain, *Trichoderma* sp. QM6a, later identified as *Trichoderma reesei* in honor of Elwyn Reese, produced up to 0.5% extracellular cellulase. In a bioenergy program, the production of ethanol was envisioned through the conversion of waste cellulose, first to glucose, and then by fermentation by yeast. To facilitate the initial hydrolysis of cellulose, hyper cellulolytic mutants were created.

SECONDARY METABOLITES

Trichoderma is a genus that produces a wide variety of secondary metabolites; more than 100 have been identified. These consist of pyrones, terpenoids, polyketides, oxygen heterocyclic compounds, polypeptides, and derivatives of fatty and amino acids. *Trichoderma viride* and certain strains of *Trichoderma hamatum* produce the volatile 6-pentyl- α -pyrone, which is responsible for the coconut smell connected to soils. There are pigments of unknown function, including the anthroquinonespachybasin (1,8-dihydroxy-3-methyl-9,10-anthraquinone), chrysophanol (1,8-dihydroxy-3-methyl-9,10-anthraquinone), and emodin (1,6,8-trihydroxy-3-methyl-9,10-anthraquinone). Some secondary metabolites of Trichothecenes, cyclic peptides, and isocyanide-containing metabolites are the three categories of mycotoxin that the most well-known *Trichoderma* species belong to. *Trichoderma* are hazardous to both plants and animals. Trichothecenes, such as trichodermin, are speculated to be produced in the soil and impair plant growth. Cyclic peptides, including Alamethicin, suzukacillin, trichotoxins, trichopolyns, and trichorianine are lipophilic substances that assault bacterial and eukaryotic cell membranes to induce lysis. Similar to trichoviridin, isocyanides are another family of poisonous metabolites that *T. hamatum* strains are known to produce in large quantities. This species has been linked to sheep's poor thrift by suppressing their cellulolytic rumen microorganisms. It is a prominent soil bacterium in some sheep pastures. *Trichoderma* products are used in the food business under strict monitoring because of their possible toxicity.

TRICHODERMA IN BIOCONTROL OF PLANT FUNGAL PATHOGENS

Numerous strains of *Trichoderma* have been engineered as biocontrol agents to combat fungal diseases in plants. The mechanisms employed include antibiosis, parasitism, induction of host-plant resistance, and competition. These species work particularly well as biocontrol agents against soilborne root diseases as verticillium dahliae and Sclerotiasclerotiorum, wilts (*Sclerotinia sclerotiorum*), damping off (*Pythium* spp.), and cereal take-all (*Gaeumannomyces graminis*), as well as leaf pathogens like gray mold (*Botrytis* spp.). High-performing biocontrol strains have been identified, and large-scale production of conidiospores and chlamydospores has been established. Specialized methods for delivering these spores are being actively developed. Strains of *T. harzianum*, *T. viride*, and *T. hamatum*, along with strains of the closely related *Gliocladium*, are particularly effective. Commercial biotechnological products, such as 3TAC, have been developed using *T. harzianum* and have proven useful in treating *Botrytis*, *Fusarium*, and *Penicillium* sp. (Yedidia et al., 1999). *T. viride* is another species that serves as an effective biological control agent against plant pathogenic fungi, offering protection against pathogens such as *Rhizoctonia*, *Pythium*, and *Armillaria*. In agriculture, *Trichoderma* species are powerful biocontrol agents and are frequently applied to soils to control soil-borne pathogens and enhance crop yields globally. Over 250 products based on *Trichoderma* are thought to be available in India (Mendoza-Mendoza et al., 2015). Additionally, *Trichoderma* species are easily included into agricultural methods due to their innate tolerance to a variety of pesticides and fungicides used in agriculture (Liu and Zhang, 2015; Ons et al., 2020). Numerous metabolites with antibacterial, antifungal, and anticancer activities are produced in large quantities by *Trichoderma* species (Khan et al., 2020). Recently, there has been increased awareness of the function of volatile compounds produced by rhizobacteria in controlling plant growth and development. According to Ryu et al. (2003), certain strains of plant growth-promoting rhizobacteria (PGPR) generated a mixture of volatile organic compounds (VOCs) that promoted the growth of *Arabidopsis thaliana* seedlings. Additionally, airborne compounds from specific strains of *Bacillus* sp. have been shown to have a growth-enhancing impact by Gutiérrez-Luna et al. (2010). Farag et al. (2013) found that during their in vitro evaluation of

Yogasankari Raju *et al.*,

rhizobacteria, bacterial volatile chemicals contribute to plant development. Numerous studies have examined the capacity of Trichoderma to regulate soil phytopathogens via a variety of intricate mechanisms, including mycoparasitism, competition for nutrients and space, pathogen cell wall disintegration, and induction of plant resistance. VOCs seem to be a good strategy. The majority of research has been on the effects of VOCs emitted by PGPR on the interactions between pathogens and plants. However, nothing is known about how PGPF that produces VOCs promotes plant growth and resilience (Tillocet *et al.*, 2020).

TRICHODERMA AS BIOCONTROL AGENT FOR DIFFERENT CROP DISEASES

Cereal crops

Rice (*Oryza sativa* L), the most extensively grown food crop worldwide, faces production challenges due to diseases of fungal, bacterial, and viral origins. Several species of Trichoderma, including *T. harzianum*, *T. viride*, *T. reesei*, *T. longibrachitum*, and *T. koningii*, have been evaluated by numerous researchers and found to be effective against these diseases when used in conjunction with chemical control. Sheath blight of rice, caused by *Rhizoctonia solani*, is a common and destructive disease in India. Wheat (*Triticum* spp. L.) is a globally significant cereal crop and a vital source of carbohydrates, proteins, vitamins, and minerals. Smut diseases are among the biotic constraints causing substantial yield loss and grain quality deterioration. The first report of biocontrol of a seed-borne disease, specifically loose smut of wheat, was demonstrated by Aggarwal *et al.* (1991), who used *T. viride* as a seed treatment. Trichoderma species such as *T. viride* (TV- 5), *T. koningii*, *T. hamatum*, *T. harzianum*, and *T. lignorum* were found to inhibit the germination of chlamydospores of the wheat pathogen *U. segetum* var. *tritici* (Mondal *et al.*, 1995). Maize (*Zea mays* L.), another crucial cereal crop, is affected by soil-borne and foliar pathogens. Efforts have been made to use Trichoderma against significant diseases of maize. Research conducted by Sankar and Sharma (2001) clearly demonstrated the effectiveness of *T. viride* in both *in vitro* and *in vivo* conditions in suppressing the charcoal rot disease caused by *Macrophomaphaseolina* and enhancing crop growth. A decade later, Khedekar *et al.* (2010) evaluated the efficacy of *T. harzianum* against leaf blight caused by *Helminthosporium turcicum* and found comparable results.

Pulse crops

Chickpea (*Cicer arietinum* L.) is a highly consumed pulse in numerous regions globally, accounting for 50% of the major pulse production in India. It is frequently affected by wilt caused by *Fusarium oxysporum* f. sp. *ciceri*, stem rot by *Sclerotinia sclerotiorum*, and damping off caused by *R. solani*, which are distributed worldwide. Initial investigations into the utility of Trichoderma as a biocontrol agent were conducted by Kaur and Mukhopadhyay (1992), who reported the successful combination of *T. harzianum* with fungicides like Vitavax 200 and Ziram in combating chickpea wilt. Sharma *et al.* (1999) identified *T. harzianum* and *Absidiocylinndrospora* as the most effective in inhibiting the mycelial growth of *S. sclerotiorum*, which causes stem rot in chickpea. Prasad and Rangeshwaran (2000) discovered that a modified wheat bran-kaolin granular formulation of *T. harzianum* was effective against *R. solani* under field conditions. In a separate field experiment, two antagonistic fungi, *T. harzianum* (PDBCTH 10) and *T. viride* (PDBCTV), were reported to be effective against chickpea wilt and wet root rot by Prasad *et al.* (2002). Black gram (*Vigna mungo* L.) and green gram (*Vigna radiata* L.), important pulse crops, have been gaining global importance in recent years. Kehri and Chandra (1991) were the first to report the antagonism of *T. viride* to *M. phaseolina* and its use in controlling dry root-rot of mung bean under greenhouse conditions.

Oilseed crops

Brassica juncea (L.), also known as Indian mustard, is a significant oilseed crop in India. A number of studies have focused on eco-friendly methods to manage its major diseases using Trichoderma. One such *in vitro* study showed that *T. viride*, in combination with the fungicides mancozeb and carbendazim, was effective against the mycelial growth of *Alternaria brassicae* (Meena *et al.*, 2004). Soybean (*Glycine max* L.), the third most important oilseed crop, has been the subject of numerous research efforts to develop integrated management strategies for root, seed, and foliar diseases. Singh and Thapliyal (1998) discovered that pre- and post-emergence seedling rot may be successfully controlled by treating seeds with Vitavax 200 combined with *T. harzianum* or *G. virens*. Using biocontrol agents

**Yogasankari Raju et al.,**

Gliocladium virens and *T. harzianum*, Pant and Mukhopadhyay (2001) reported successful management of the soybean seed and seedling rot complex induced by *R. solani* in an in vitro investigation. Because of the high incidence of illness, groundnut (*Arachis hypogaea* L.) yields are frequently decreased. A few diseases include early leaf spot (*Phaeoisriopisarichidicola*), late leaf spot (*Phaeoisriopisersonata*), rust (*Puccinia arichidis*), collar rot (*A. niger van tiegham*), and stem rot (*S. rolfsii*), despite the fact that over 55 pathogens have been identified to damage the crop, root rot (*M. phaseolina*) and alfalfa root (*Aspergillus flavus*) are considered economically important and have been biologically managed by deploying *Trichoderma* spp. Sesame (*Sesamum indicum*), one of the oldest oil-seed crops, has been investigated for the ability of gaseous metabolites from *N. sitophila* and *T. harzianum* to prevent the growth of a variety of fungus that cause sesame wilt. According to Tamimi and Hadvan (1985), age differences may have contributed to the variations in inhibition levels. The following represents the highest level of growth inhibition from test fungus ever observed: Three-day-old *N. sitophila* was found to be 51% on a virulent *R. solani*, 48% on *F. oxysporum*, 40% on *M. phaseoli*, and 55% on virulent *R. solani*. Nevertheless, *N. sitophila* outperformed *T. harzianum* and a few other soil-borne fungi in the test conditions.

Sunflower (*Helianthus annuus*), the third-largest edible oil seed crop in the world, is frequently impacted by fungal diseases including *M. phaseolina*'s charcoal rot and *Plasmoparahalstedii*'s downy mildew. *M. phaseolina*-induced charcoal rot was treated with carbendazim-tolerant *Trichoderma* species (Nagamani and Reedi Kumar, 2011). In comparison to the matching wild type strain TW17 (62.2%), the mutant strain TM17 suppressed the test pathogen's mycelial development by 90%, suggesting that the enhanced antagonistic action is genetically regulated. According to Nagarajuet al. (2012), beneficial bacteria encourage plant growth and create systemic resistance in sunflowers against *Plasmoparahalstedii*-caused downy mildew disease. The most prolific vegetable oil source is oil palm, which yields four to six tonnes of oil per hectare annually. *T. harzianum* and *T. koningii* were shown to have greater lignocellulytic capacity than other isolates, suggesting that they could be used as bioagents for the quick bioconversion of lignocellulosic oil palm empty fruit bunches (Mukhlis et al., 2013). According to Singh et al. (2013), two foliar sprays of mancozeb should be applied after treating seeds with *T. viride* for integrated management of Alternaria blight in linseed.

Cash crops

Tobacco (*Nicotiana tabacum*) is susceptible to serious diseases caused by various soil-dwelling fungi such as *F. oxysporum*f.sp. *nicotianae*, *Pythium* spp., and *R. solani*, as well as the root-knot nematode, *Meloidogyne incognita*. Tests have been conducted on *T. harzianum*'s antagonistic activity against *P. aphanidermatum* and *P. myriotylum*, which induce tobacco root rot (Devaki et al., 1992). In vitro tests have also been performed on *F. oxysporum*f.sp. *nicotinae* (Sumana and Devaki, 2012) and *M. incognita* (Khan et al., 2011). A major commercial crop in tropical and sub-tropical areas, sugarcane is severely yield-depleted by fungi like red rot and smut. Red rot incidents have an impact on the rhizosphere microbiota of sugarcane plants, according to Mishra (1982). Subsequent research revealed that *Colletotrichum falcatum*, the cause of red rot in sugarcane, was suppressed by the secondary metabolites of a *Trichoderma* isolate that was indigenous to the ecosystem (Joshi and Misra, 2013). According to Malathi and Vishwanathan (2013), *T. harzianum* T5 *endochitinase* has been found to have antifungal properties against *C. falcatum*. Another study discovered that applying *T. viride* to the soil, either by alone or in conjunction with other treatments, greatly decreased the amount of *C. falcatum*-caused red rot (Reddy et al., 2009).

Major diseases like root rot (*M. phaseolina*), wilt (*Fusarium vasinfectum*), root rot (*Rhizoctonia bataticola*), anthracnose (*Collectotricumgossypium*), Alternaria leaf spot, bacterial blight, and damping off (*Pythium ultimum*) cause decreased yields in cotton, a commercial crop that is widely cultivated in India. Applying *Trichoderma* to the soil was shown to be far more successful than treating it with seeds (Gaur et al., 2005). The most devastating disease in the world, corm rot, threatens saffron (*Crocus sativus* L.), a low volume, high value perennial crop valued for its therapeutic properties (Gupta et al., 2011). According to a 2011 study by Hassan et al., native *T. viride* isolates could control the pathogens that cause corm rot in the field. Tea and coffee, popular beverage crops cultivated in over 50 countries, are impacted by illnesses such *R. solani*-caused coffee collar rot, *Glomerellacingulata*-caused brown blight, and *Phomopsis* theae-

**Yogasankari Raju et al.,**

caused collar canker. Deb *et al.* (1999) examined the phyllosphere and soil mycoflora of an experimental tea plantation located in Cachar. At different stages, it was found that the isolates of *Trichoderma* JPT9 and *Gliocladium* JPG1 greatly suppressed the growth of *M. phaseolina*'s sclerotia (Bandopadhyay *et al.*, 2008). One main factor restricting coconut production is the basal stem rot disease produced by *Ganoderma lucidum*, which poses a danger to the coconut (*Cocos nucifera* L.), an important oilseed and plantation crop in India. For the purpose of multiplying the fungal biocontrol agent, naturally occurring agricultural waste such as coir pith has been recycled using *Trichoderma* spp. (Kumar *et al.*, 2000).

Vegetable crops

In the 1990s, it was discovered that applying *T. harzianum* or *P. fluorescens* to seeds or roots along with soil solarization was beneficial in controlling tomato, brinjal, and capsicum infections. The tomato, or *Solanum lycopersicum*, is a major vegetable crop that is grown all over India. However, it is susceptible to a number of diseases, including *Phytophthora infestans*, which causes late blight, *A. solani*, which causes early blight, *Fusarium oxysporum* f.sp. *lycopersici*, which causes wilt, *Phytophthora aphanidermatum*, which causes damping off, *Sclerotium rolfsii*, which causes collar rot, *Xanthomonas campestris* pv. *vesicatoria* causes bacterial leaf spot, and *Ralstonia solanacearum* causes bacterial wilt. *Allium cepa*, a vital vegetable crop in India, is linked to six main diseases: *Alternaria alternata* causes foliar blight, *Alternaria porri* causes purple blotch on onions, *Fusarium oxysporum* f.sp. *cepae* and *Pythium* sp. causes damping-off and basal rot, *S. rolfsii* causes white rot, and *A. niger* causes black mould. The management of *A. porri*, the bacterium that causes purple blotch on onions, has been thoroughly investigated. According to reports, susceptible onions can develop more quickly and have a considerable reduction in disease when exposed to *T. harzianum* isolates Th3, Th-30, and Tv-12, Tv-15 of *T. viride* (Prakasam and Sharma, 2012). One of the most widely grown vegetable crops in the nation, aubergine or brinjal (*Solanum melongena* L.), is harmed year-round by a number of fungi, including *A. solani*, *F. solani*, *C. gloeosporioides*, *B. cinerea*, *Penicillium* sp., *Rhizopus niger*, *Curvularialunata*, and *Botryodiplodiatheobromae*. According to a 2009 study by Jadon, *T. viride* is the most efficient in lowering the frequency of *S. rolfsii*-caused collar rot. Chilli (*Capsicum annum*), another important vegetable crop that is also used as a spice and is rich in vitamins C, A, and B, is widely affected by fungal diseases such as damping off caused by *S. rolfsii*, *F. oxysporum*, *Pythium* spp., *R. solani*, and *Phytophthora* sp. Several studies have revealed that isolates of *T. harzianum*, *T. viride* (TVC3), and *T. hamatum* are effective bio-control agents against anthracnose, damping-off, and chilli dieback disease. A study suggested that using coco-peat enriched with *T. harzianum* could enhance plant growth and reduce the incidence of tomato wilt and chilli root rot. This approach also helped in raising disease-free and healthy seedlings, which further reduced wilt incidence in tomato (Sriram *et al.*, 2010).

Major diseases afflict the two main winter vegetables of India: cabbage (*Brassica oleracea* L. var. *capitata*) and cauliflower (*Brassica oleracea* L. var. *botrytis*). *Plasmiodiophorabrassicarum* causes club root, *Xanthomonas campestris* causes black rot, *Rhizoctonia solani* causes wire stem, *A. brassicae* causes leaf spot, *A. brassiciola* causes leaf blight, and *Pythium*, *Phytophthora*, *Corticium*, and *Fusarium* cause damping off. Sugar beet (*Beta vulgaris* L. ssp. *vulgaris* var. *altissima* Doll. Chenopodiaceae), a significant sugar-producing tuber crop, suffers from serious diseases like root rot caused by *S. rolfsii* and *Pythium* spp., leading to substantial yield losses. Several reports have highlighted the use of *Trichoderma* spp. as bioagents to combat these pathogens. One such report by Sawant and Mukhopadhyay (1990) discussed the integration of metalaxyl with *T. harzianum* for controlling *Pythium* damping-off in sugar beet. Many diseases endanger the potato (*Solanum tuberosum*), a vital food crop in the world that lowers its output. These include black scurf, dry rot (*Fusarium* spp.), common scabies (*Streptomyces scabies*), late blight (*Phytophthora infestans*), and bacterial wilt (*Ralstonia solanacearum*). Potato germination and yield are thought to be significantly influenced by the antagonistic fungus population (Dwivedi, 1988).

Fruit crops

Guava (*Psidium guajava*), a significant fruit crop in India, is affected by various pre-harvest diseases such as canker, die back, and decline, which impact plant growth and production. Post-harvest diseases like *Phytophthora*, *Macrophomina*, and others spoil the fruits in the field, during storage, and in transit. *Gliocladium roseum* has been

**Yogasankari Raju et al.,**

identified as a potent pathogen, along with *F.o.f.sp. psidii* and *F. solani*. The mycoflora associated with seeds from healthy and rotten fruits of guava was observed by Pandey and Dwivedi (1987). Subsequently, several groups have evaluated and utilized Trichoderma technology to combat diseases in fruits like guava. Sapodilla (*Manilkara zapota*), a fruit cultivated throughout India, has been the subject of studies testing the antagonistic potentials of five *Trichoderma* species: *T. viride*, *T. harzianum*, *T. koningii*, *T. pseudokoningii*, and *T. virens* against fruit rot pathogens (Bhalleet al., 2013). Mango (*Mangifera indica*), a prominent fruit crop in India, suffers significant economic loss due to various pathogens, including *F. moniliforme var. subglutinans* causing mango malformation. Biocontrol has been used successfully against different pathogens. Bhuvaneshwari and Rao (2001) studied the in vitro interaction of *T. viride* with the postharvest pathogens of mango and found that *T. viride* inhibited the growth of *Pestalotiasp.*, *A. flavus*, *L. theobromae*, *C. gloeosporioides*, *R. stolonifer*, *A. niger*, and *M. phaseolina* by 72.88, 70.74, 62.41, 56.83, 54.60, 52.77, and 51.08%, respectively. Citrus crops are also affected by serious diseases such as root rot by *Phytophthora* spp., dry root rot by *M. phaseoli*, pink disease by *Alternaria citri*, and powdery mildew by *C. gloeosporioides*. The role of phylloplane microflora in managing citrus canker was established by Kalita et al. (1996). Later, Singh et al. (2000) managed citrus scab caused by *Elsinoefawcettii* and found that *T. harzianum* and *E. purpurascens* reduced the disease incidence in the field by 17.8 and 10%, respectively.

Spices crops

Black pepper (*Piper nigrum*), often referred to as the king of spices, has a long history of cultivation in India. One of the most severe diseases it faces is foot rot (quick wilt), caused by *Phytophthora capsici*. Two species of *Trichoderma*, *T. virens*-12 and *T. harzianum*-26, have been identified as potential biocontrol agents against this disease in both greenhouse and field trials (Sarma et al., 2000). Small cardamom (*Elettaria cardamomum* Maton) is another spice that suffers from rhizome rot, a disease caused by *P. vexans*, *R. solani*, and *F. oxysporum*. This disease is a major issue in India, leading to a 30% loss in yield. The effectiveness of the *T. harzianum* isolate in managing this disease, in combination with chemicals and fertilizers, was later confirmed (Bhai and Thomas, 2010). Cumin (*Cuminum cyminum* L.) is affected by wilt caused by *Fusarium oxysporum* f.sp. *cumini*, a major disease for this crop. The in vitro and in vivo effectiveness of two *Trichoderma* species, *T. harzianum* and *T. viride*, in suppressing wilt caused by *Fusarium oxysporum* f. sp. *cumini* has been documented (Chawla and Gangopadhyay, 2009).

Other crops

Bhattiprolu (2008) conducted a study on the antagonism of *T. viride* against *Botrytis ricini* (castor grey rot). The study found that the optimal pH range was 5.0 to 6.0, with an incubation temperature of 25°C. The isolate was compatible with 10% leaf extracts of several plants and common fungicides, but not with certain others. Carnation (*Dianthus caryophyllus* Linn.), a valuable cut flower crop, is primarily cultivated in controlled conditions. Its cultivation, like any monoculture, is affected by numerous diseases leading to significant yield losses. It was determined which *Trichoderma* spp. were antagonistic to *Fusarium oxysporum* f.sp. *dianthi*, which causes carnation wilt. A seasonal but long-lasting cut flower crop, gladiolus (*Gladiolus hortulanus* L.H.Bailey) creates a stable microclimate that is favourable to a number of diseases. In vitro experiments have demonstrated the efficacy of native isolates of *Trichoderma* spp. against *Fusarium oxysporum* f.sp. *gladioli*. *Fusarium oxysporum* f.sp. *gladioli* causes vascular wilt and corm rot, which significantly reduce crop output and lower the quality and quantity of spikes and planting materials (Pan and Das, 2004).

TRICHODERMA – A PROMISING PLANT GROWTH STIMULATOR

Trichoderma is capable of producing plant growth promoters like harzianolide and indoleacetic acid (IAA). By secreting phytase and ferritin, these stimulators encourage the growth and development of plant roots, which in turn improves the absorption of iron (Fe) and phosphorus (P) by plants. Additionally, according to Lombardi et al. (2020a), trichoderma breaks down organic matter in the soil, increases the availability of nutrients, raises crop photosynthetic efficiency, improves plant height, stem diameter, and other agronomic features, and increases production. Trichoderma can improve the availability and efficiency of soil nutrient utilisation. Cucumber seedlings injected with Trichoderma MF-2 showed a 39.07% increase in aboveground biomass, indicating a substantial growth-

**Yogasankari Raju et al.,**

promoting impact. Additionally, as a result, the soil now contains more advantageous bacteria (Singh *et al.*, 2019; Ye *et al.*, 2020). The application of *Trichoderma* wettable powder treatment greatly increased banana production, and different strains of *Trichoderma* showed variable degrees of antagonism to *F. oxysporum* (Samuelian, 2016; Bubiciet *et al.*, 2019; Damodaran *et al.*, 2020). Applying *Trichoderma* can improve the primary agronomic characteristics of peanuts, raise the SPAD value of chlorophyll in peanut leaves, dramatically increase the activity of protective enzymes in peanut roots, stems and leaves, and lower the amount of MDA (Kováčset *et al.*, 2021; Al-Askar *et al.*, 2022). In comparison to the control, there were increases of 24.63, 20.22, 14.10, 4.86, 7.63, and 12.85% in the number of pods per plant, pod weight, seed kernel weight, 100 fruit quality, 100 fruit kernel quality, and yield per plant of peanut when applied at a rate of 1.5 kg/666.7 m⁻² (Al-Askar *et al.*, 2022).

Mechanism of Action

Trichoderma can greatly increase the Na⁺ outflow from *Lycium barbarum*'s root system and its movement to the plant's above-ground sections. This lessens the harm that ion toxicity and oxidative stress produce to PSII by guaranteeing K⁺ absorption and preserving the ion equilibrium in the plant. Additionally, it lessens biomass loss, preserves photosynthetic pigments, and keeps *L. barbarum* performing as a photosynthetic under salt stress (Brotmanet *et al.*, 2013). One of *Trichoderma*'s main mechanisms is the manufacture of plant growth hormones, including IAA, ABA, ET, GA, and CK (Karuppiyah *et al.*, 2019b; Wang *et al.*, 2021; Deganiet *et al.*, 2021b; Agbessenouet *et al.*, 2022). Cucumber has been demonstrated to create IAA, GA, and ABA when exposed to *T. asperellum*, which encourages development (Liu H. *et al.*, 2022). According to a different study, *T. asperellum* has the ability to significantly promote poplar development by upregulating the expression of xylanase genes (Karuppiyah *et al.*, 2019b). By increasing the activities of succinate dehydrogenase and glucose-6-phosphate dehydrogenase, *T. harzianum* has been shown to modulate the tricarboxylic acid cycle (TAC) and hexose monophosphate pathway (HMP) to increase tomato growth (Manganiello *et al.*, 2018). *Trichoderma* generates acidic compounds that have the ability to dissolve intractable trace minerals from soil, giving plants additional nutrition (Samuelian, 2016).

Trichoderma in Plant Growth

Recent findings indicate that *Trichoderma* spp. are opportunistic, exhibiting both virulent plant symbiosis and parasitism of other fungi. Certain strains are known to establish durable colonizations of root surfaces, penetrating the epidermis and a few cells beneath. These strains produce or release various compounds that trigger localized or systemic resistance responses, explaining their non-pathogenic nature towards plants. Furthermore, it has been noted that the parasitic relationship between *Trichoderma* spp. and several pathogenic fungi induces the synthesis of specific lytic enzymes (Haran *et al.* 1996). Depending on the strain, *T. harzianum*'s chitinolytic system consists of five to seven different enzymes (Haran *et al.* 1995). The system appears to consist of four endochitinases (52, 42, 33, and 31 kDa) and two β -(1,4)-N-acetylglucosaminidases (102 and 73 kDa) in the best-characterized *Trichoderma* isolate (isolate TM). It is probable that the various enzyme components of *T. harzianum*'s chitinolytic system operate in complimentary ways. Of special significance is the 42-kDa endochitinase (Ech42), which has been demonstrated to hydrolyze the cell walls of *Botrytis cinerea* in vitro and to prevent the elongation of germ tubes and spore germination in a variety of fungi (Schirmböcket *et al.* 1994). When a fungus is grown in the presence of autoclaved mycelia from many fungi or with colloidal chitin as the only carbon source, the corresponding gene (ech42) is substantially stimulated (Carsolioet *et al.* 1994).

Trichoderma in Stress Tolerance

Trichoderma spp. are endophytic plant symbionts that are commonly used as seed treatments to control diseases and enhance plant growth and yield. Despite recent research on their ability to alleviate abiotic stresses, there is still a lack of specific knowledge about their mechanisms, their ability to control multiple plant stress factors, and their effects on seeds and seedlings. Under stress conditions, seeds treated with *Trichoderma* spp. germinate faster and more uniformly than untreated seeds, regardless of whether the stress is osmotic, salt, or due to suboptimal temperatures. Biocontrol is often associated with the ability of these fungi to produce antibiotics, establish parasitic interactions, or directly affect pathogens (Howell, 2003, 2006). However, it has become clear that beneficial fungi like *Trichoderma* spp. can induce systemic resistance in many cases, mediated by alterations in plant gene expression (Alfano, 2007,

**Yogasankari Raju et al.,**

Shoresh & Harman 2008, Shoresh et al., 2010). Reports also suggest that plant growth can be enhanced as a result of the association of *Trichoderma* strains with plants, especially when plants are under suboptimal conditions or biotic, abiotic, or physiological stresses (Bae et al., 2009, Mastouri Harman 2009). Recent reports suggest that these fungi enhance plant tolerance to abiotic stresses during growth (Yildirim et al., 2006), partly due to improved root growth, increased water-holding capacity of plants, or enhanced nutrient uptake (i.e., potassium). In the absence of stress, plant growth may or may not be enhanced. Molecular studies indicate greater expression of gene families involved in plant protection against abiotic stresses or oxidative damage (Alfano et al., 2006, 2007, Bailey et al., 2006) in plants treated with *Trichoderma* spp. However, no experimental evidence has been presented that correlates enhanced tolerance of plants colonized with biocontrol fungi to these changes at the molecular level.

Trichoderma in Mycoparasitism

A *Trichoderma* species engages in a complicated process called mycoparasitism in which it grows chemotropically towards its host, adhering to, coiling around, and occasionally piercing the host hyphae. The antagonistic activities of antibiosis, competition, the generation of enzymes that break down cell walls, or a combination of these could be the cause of *Trichoderma* spp.'s mycoparasitic activity (McGrew & Green 1990). Partial breakdown of the host cell wall is typically seen in the later phases of the parasite infection. Histochemical and/or ultrastructural methods have been used to study the effects of cell wall-degrading enzymes on the host. In addition, other cell wall-degrading enzymes, including those that hydrolyze minor polymers (proteins, b-1,6- glucans, a-1,3-glucans, etc.), may play a role in the effective and complete degradation of the mycelial or conidial walls of phytopathogenic fungi by *Trichoderma* spp. *Trichoderma* spp. are employed as biocontrol agents against several plant pathogenic fungi, including *Rhizoctonia* spp., *Pythium* spp., *Botrytis cinerea*, and *Fusarium* spp.

Trichoderma in Anti-Fungal Activity

Trichoderma species, known as mycoparasites, are commercially utilized as biological control agents against plant-pathogenic fungi such as *Rhizoctonia solani*, *Botrytis cinerea*, *Sclerotium rolfsii*, *Sclerotinia sclerotiorum*, *Pythium* spp., and *Fusarium* spp. These are used in various countries including the United States, India, Israel, New Zealand, and Sweden, serving as a promising alternative to chemical pesticides (Howell, 2003). The genus *Trichoderma* has been widely recognized for its antagonistic activity against *F. solani* and *R. solani* (Lewis et al., 1998). *Trichoderma harzianum* has been observed to protect bean seedlings from pre-emergence damping off infection, reducing disease severity and promoting plant growth in the presence of the *R. solani* pathogen (Paula et al., 2001). El-Kafrawy (2002) reported that *T. harzianum*, *T. hamatum*, *T. pseudoknonningii*, and *T. polysporum* inhibited the radial mycelial growth of *R. solani* *in vitro*, with inhibition rates ranging from 59.6% to 78.4%. The application of *Trichoderma* fungi in agriculture offers several benefits: 1) colonization of the root and rhizosphere of the plant, 2) control of plant pathogens through various mechanisms such as parasitism, antibiosis production, and induced systemic resistance, 3) enhancement of plant health by promoting plant growth, and 4) stimulation of root growth (Abd-El-Khair et al., 2010)

NANO FORMULATION

Nanotechnology, a swiftly expanding field, has demonstrated significant impact in various sectors including medical sciences, energy, cosmetics, and agriculture. It offers an understanding of antimicrobial properties at the atomic and molecular level, which helps in reducing the cytotoxic effect on cells. Nanoparticles, known for their stability under severe conditions, possess the potential to manage a variety of diseases due to their antimicrobial properties. The application of insecticides, including pesticides and fungicides, can be reduced by agricultural cultivators through the use of nano-delivery systems. Formulations based on nanoparticles could serve as alternatives to fungicides and provide an eco-friendly solution for managing plant pathogenic microbes. Nanoparticles, particularly those composed of metals in oxide form, play a crucial role in magnetism, electrochemistry, and environmental science. These metal oxide-based nano formulations are stable, environmentally friendly, and safe for humans. In the current scenario, the agricultural sector is experiencing a high demand for food products. This necessitates that the soil be enriched with all essential nutrients and possess suitable properties for the optimal growth of crops. Crops are vulnerable to attacks by phytopathogens, necessitating the use of agrochemicals such as fertilizers and pesticides to

**Yogasankari Raju et al.,**

mitigate the adverse effects caused by these pathogens. The recent emergence of agrochemicals containing nanostructured materials offers a promising alternative in agriculture. Various methods exist for the synthesis of nanoparticles, including chemical, physical, and physico-chemical techniques. These methods, however, face challenges due to the use of toxic solvents, reducing agents, expensive metal salts, reductants, and costly equipment. Consequently, researchers have turned their attention towards finding simple, eco-friendly, and non-hazardous alternative methods. In this regard, green nano-chemistry has received significant attention for its potential to replace chemical products and develop green synthesis methods that eliminate substances harmful to the environment and human health. Silver, in various chemical forms as well as in green nano form, is highly toxic. Its nanoparticles have attracted considerable interest due to their potent antimicrobial effects. Some studies have found that the toxicity of silver-based nanoparticles is dependent on both dosage and particle size. Certain phytopathogens, which are nonpathogenic in nature, can be used for mass production of green silver nanoparticles (Ag-NPs).

Among the primary nanoparticles (NPs) used in agriculture are zinc oxide NPs (ZnONPs), copper oxide NPs (CuONPs), and silver NPs (AgNPs). These can be acquired by means of chemical, biological, and physical processes. In addition to being costly, physical and chemical processes include ultraviolet radiation, aerosol technologies, lithography, laser ablation, ultrasonic fields, and photochemical reduction involve the use and discharge of hazardous substances that pollute the environment. The biosynthesis of certain metal nanoparticles, on the other hand, provides an easy, affordable, large-scale, and ecologically friendly substitute. According to reports, because biosynthesized NPs are stabilised with organic chemicals and do not produce any hazardous residues during the synthesis process, they are less dangerous than NPs obtained chemically. Better biocompatibility when using NPs is another benefit of these environmentally friendly production techniques. Plant extracts, bacteria, fungi, algae, yeasts, and the byproducts of their metabolism, such as enzymes, agro-industrial waste, and microbial pigments, can all be used in biosynthesis. According to reports, elemental metal biosynthesis is aided in the conversion of ions into secondary metabolites and other substances secreted by bacteria as a defence mechanism. Certain species that exhibit resistance to metals can release molecules that function as stabilising and reducing agents during the creation of metallic nanoparticles. The physicochemical features of the nanoparticle surface interact with their surroundings through the action of these cappings, which are stabilising or protecting substances. It is significant to remember that the pH affects how stable the cappings are: at high pH levels, the NPs stay stable in solution, but at low pH levels, the proteins that make up the cappings denature. Filamentous fungi stand out among microorganisms for nanoparticle (NP) biosynthesis due to their efficiency compared to other biological alternatives. This efficiency stems from the ease of large-scale cultivation and biomass collection, high tolerance to metals, resistance to high pressure and agitation fluxes, and the production of a large number of extracellular proteins. The secretion of these proteins by fungi has been observed to enhance the synthesis of NPs. A key advantage of utilizing fungi over bacterial systems is that NPs precipitate outside the cell, eliminating cellular contaminants. This allows for the direct application of these NPs in various fields. Consequently, fungi have emerged as valuable agents for the biosynthesis of NPs, a process known as mycosynthesis. The primary fungi employed for this purpose include *Fusarium*, *Aspergillus*, *Penicillium*, and *Trichoderma*.

Trichoderma as a synthesizer of NPs

Enzymes like reductases can aid in the mycosynthesis of nanoparticles (NPs) mediated by *Trichoderma* by acting as bio-reductive agents throughout the biofabrication process. Based on the qualities and traits of the several metallic nanoparticles that were obtained, it appears that *Trichoderma* may be a reliable source for the biological production of nanoparticles. Furthermore, the production of proteins, enzymes, and secondary metabolites that are involved in the biological control of plant diseases can improve the stability and biological activity of the resultant NPs. The antibacterial activity of NPs produced by *Trichoderma* spp. has been shown against a range of microbes, including phytopathogens including *Fusarium*, *Aspergillus*, *Pseudomonas*, and *Xanthomonas*. When performing mycosynthesis, it is essential to optimise the mono-dispersity, stability, and biocompatibility of the NPs by taking into account the parameters employed as well as the unique qualities of the fungal strains. It has been observed that the nucleation and subsequent generation of metallic NPs, along with their size and shape, are controlled by variables like temperature, starting pH, reagent concentration, fungal growth conditions, and reaction duration. *Trichoderma*

**Yogasankari Raju et al.,**

produces a number of different nickel-based polymers (NPs), each with unique properties and antibacterial properties, such as gold (AuNPs), zinc oxide (ZnONPs), copper (CuNPs) and copper oxide (CuONPs), selenium (SeNPs), and silver (AgNPs).

Biosynthesis of AgNPs

Silver nanoparticles (NPs) are highly sought after due to their extensive antimicrobial spectrum, which includes plant pathogens, and their high bioactivity. The application of silver NPs (AgNPs) can enhance the effectiveness of agrochemicals and decrease the usage of pesticides and biocides. There are two mechanisms for the mycosynthesis of NPs: intracellular and extracellular, with the latter being more commonly used as it eliminates the need for NP extraction from cells. In this process, biomolecules secreted by the fungus catalyze the reduction of the metal precursor (AgNO₃ salt), resulting in the formation of AgNPs. The characteristics of the AgNPs produced through mycosynthesis can be varied depending on the fungal culture and production conditions. It has been noted that reductases are the primary enzymes involved in the biosynthesis of metal NPs in fungi. Among these, the nicotinamide adenine dinucleotide (NADH)-dependent nitrate reductase is prominent, playing a key role in the reduction of metal ions. For instance, *T. reesei* produces extracellular enzymes capable of reducing silver ions to AgNPs, with the NADH-dependent nitrate reductase facilitating the reduction of Ag⁺ metal ions into metallic AgNPs. This reduction is facilitated by the transfer of an electron from NADH, with the nitrate reductase serving as the electron carrier. Proteins can also bind to NPs, enhancing their stability. Additionally, it has been described that the reduction of silver to NPs can also be achieved by anthraquinones, naphthoquinones, and quinine derivatives, which can act as electron carriers in the reaction (Khan *et al.*, 2023).

Biosynthesis of SeNPs

Selenium (Se) is known to have positive effects on plant and animal metabolism at low concentrations. It also plays a role in protecting against reactive oxygen species (ROS) in the form of selenoproteins, as reported by B^{ar}bieur *et al.* (2019). Therefore, Selenium nanoparticles (SeNPs) could serve as an alternative to Se salts. In terms of SeNPs synthesis, Hu *et al.* (2019) compared a traditional synthesis method (SNP, SeNPs) and a biosynthesis method (TSNP, SeNPs by *Trichoderma*). For the biosynthesis, a 5mM NaSeO₃ concentration was applied to a solution of metabolites from eight *Trichoderma* species. The SNP method resulted in SeNPs with spherical and pseudospherical shapes of 50 nm, along with the presence of polysaccharides. The TSNP method, on the other hand, yielded SeNPs of 60 nm with an irregular shape, likely due to the capping effect. The study also found an increased presence of amide materials in TSNP compared to SNP, which act as stabilizing agents (cappings). Three distinct media were used to assess the generation of SeNPs in a different investigation by Nandini *et al.* (2017): culture filtrate (CF), cell lysate (CL), and crude cell wall (CW). Each medium contained six distinct species of *Trichoderma* spp., and a concentration of 25 mM Na₂SeO₃ was utilised. As a result, the range of SeNPs in each medium was 49.5 to 312.5 nm. The outcomes showed that, in comparison to CL and CW, CF was the most efficient medium for producing nanoparticles because it made the procedure simpler. In their analysis of other mycosynthesis-related factors, Dikoet *et al.* (2020) looked at the impacts of pH, inoculation time, and SeO₂ concentration. The ideal circumstances (pH of 8, 2 mM SeO₂ concentration, 24 hours of SeO₂ inoculation, and *Trichoderma* sp.) resulted in the production of 20–220 nm spherical and pseudospherical SeNPs. Alkene, alkane, and alcohol functional groups indicated that they were involved as capping in the SeNPs production pathway.

Biosynthesis of AuNPs

According to do Nascimento *et al.* (2021), gold nanoparticles (AuNPs) have a variety of uses in the biomedical area, such as diagnostics, biomolecule detection, and as nanodrug carriers. They can also be used as catalysts and antibacterial agents. According to several studies (Mishra *et al.*, 2014; Abdel-Kareem and Zohri, 2018; Tripathi *et al.*, 2018; Elegbede *et al.*, 2020), AuNPs have antimicrobial activity against a variety of pathogens, including *Aspergillus niger*, *Aspergillus flavus*, *Aspergillus fumigatus*, *Escherichia coli*, *Klebsiella granulomatis*, *Pseudomonas aeruginosa*, *Aspergillus aureus*, and *Shigella sonnei*. In contrast to the electrochemical treatment of reverse osmosis and ion exchange resins, the biosynthesis of AuNPs is thought to be a more economical and ecologically benign method of recovering gold (do Nascimento *et al.*, 2021). *T. harzianum* can biosorb 1,340 mg of gold per g of biomass in 180

**Yogasankari Raju et al.,**

minutes, according to a study by do Nascimento *et al.* (2021). This process produces spherical nanoparticles smaller than 30 nm through mycosynthesis. Abdel-Kareem and Zohri (2018) exposed *T. hamatum* SU136 to three distinct concentrations of Au₂C₁₆ (0.25, 0.5, and 1mM) in their investigation of the ideal parameters for mycosynthesis. All settings resulted in AuNPs; however, 0.5 mM Au₂C₁₆ at pH 7 and 38 °C was the ideal combination to make smaller nanoparticles.

Biosynthesis of CuNPs and CuONPs

According to Salvadori *et al.* (2014b), copper nanoparticles (CuNPs) have a wide range of uses, such as high-temperature conductors, gas sensors, catalysts, solar cells, and wood treatment. Furthermore, it has been discovered that they possess antibacterial properties against phytopathogens (Natesan *et al.*, 2021). Their high surface-to-volume ratio is thought to be responsible for their easy contact with other particles, which can boost their antibacterial activity (Al-Hakkani, 2020). According to Saravanakumaret *al.* (2019), *T. asperellum* uses the amino and aromatic groups of secondary metabolites as reducing agents or encapsulants in the synthesis of CuONPs. The dead biomass of *T. koningiopsis* was utilised in the mycosynthesis of CuNPs by Salvadori *et al.* (2014b) because it had a greater affinity for copper and a better capacity for metal ion adsorption (21.1 mg/g) than the live biomass and other biosorbents. Ninety percent of the nanoparticles were obtained in 60 minutes, indicating a rapid procedure. 87.5 nm was the average diameter of the spherical CuNPs that were synthesised.

Biosynthesis of ZnONPs

Zinc oxide nanoparticles (ZnONPs) are among the nanoparticles most commonly used in agriculture due to their benefits to plants and soil microbiota, as highlighted by Shobha *et al.* (2020). They have demonstrated antifungal activities against various species such as *Fusarium* spp., *Botrytis cinerea*, *Penicillium expansum*, *A. niger*, and *Rhizopus stolonifera*. In addition, ZnONPs are recognized as effective antibacterial agents against a wide range of species (Consoloet *al.*, 2020). In a study by Shobha *et al.* (2020), ZnONPs were synthesized using three different *Trichoderma* isolates and their effectiveness was tested against *Xanthomonas oryzaepv. Oryzae*. The resulting ZnONPs exhibited unique shapes (hexagons and peaks) and sizes ranging from 12–35 nm. These nanoparticles could be produced sustainably and on a large scale.

CONCLUSION

Microorganisms are thought to be more environment friendly and natural alternative to the chemical treatment methods currently in use for the biological control of plant infections. There have been continuous attempts to use *Trichoderma* species, which have been known for their antifungal qualities since the 1930s, to manage plant diseases. These species have been used as biostimulant and biological control agents; their isolates have been commercially made accessible for use in soil for agriculture. *Trichoderma* species are highly efficient biological control agents due to their diversity and diverse methods of action.

ABSTRACT

Examining the benefits and drawbacks of using gamified educational interventions in inclusive classrooms is the goal of this research. The goals of the research are as follows: (1) to determine how gamification affects participation in class, (2) examine the mediating role of implementation issues, and (3) determine the moderating function of educators' opinions. A representative sample of 384 educators took part in the research project and provided their opinions by filling out structured questionnaires. We analyzed the data using structured equation modeling (SEM). Statistical evidence suggests that as the amount of gamification in a course increases, student engagement grows; however, this link is moderated by implementation concerns. To examine the data, structured equation modeling (SEM) was employed. The statistics show that the more gamified a lesson is, the more engaged students are, with implementation challenges mediating the relationship between the two. When it comes to planning and implementing gamified educational interventions in inclusive classrooms, these results highlight how important it is to take into consideration the problems that may arise during implementation as well as the perceived beliefs of educators.

Keywords: gamified educational interventions, inclusive classroom, challenges, perceptions, student engagement

Parul Bhardwaj and Kavita Mittal

INTRODUCTION

Traditional, passive learning methods are now considered outmoded due to the internet, advancements in information and communication technology, and the ever-changing nature of our modern society. (Ucar & Kumtepe, 2020). On the contrary, active learning strategies push teachers to stimulate students' inventiveness and help them acquire new skills. (Murillo-Zamorano et al., 2021). This is particularly the case with online education, which has grown in popularity as traditional classroom settings have grown increasingly inconvenient due to time and space constraints. All people's social, material, and moral lives were negatively impacted by the coronavirus's emergence and the global crisis it caused. However, many businesses and institutions have already begun to use distance learning as a means to ensure the long-term viability of their educational programs, further proving the significance of these applications. In distance learning environments, when peer support and collaborative learning are scarce and solo work is prioritized, it might be more challenging to encourage students to study and pay attention to the lecture. According to (Chang et al., 2015), The advent of new technological possibilities has greatly improved the viability and effectiveness of distance learning and teaching. Programs with gamification elements might be among the most successful technology strategies because people naturally enjoy and need to play games.

Strong emotional responses to games include wonder, annoyance, and happiness (Richard N. Landers , Gustavo F. Tondello & Andrew B. Collmus , Elisa D. Mekler, 2018). Researchers in the field of education are showing a lot of interest in the new trend of gamification as a means to combat student boredom and boost motivation, active learning, and engagement. (Baptista & Oliveira, 2019). To put it simply, gamification is "incorporating elements of game in a non-game context" (Hanus & Fox, 2015). By providing positive feedback, gamification in education encourages greater engagement, teamwork, and enjoyment from the learning process while also increasing student motivation and interest in the material. Reviews of the relevant literature have demonstrated that gamification significantly improves students' mental and physical health. Increased drive, confidence, happiness, flow, perceived value, and contentment are some of these outcomes. Improved performance on tasks, better overall grades, and higher scores are all examples of the former. Nevertheless, despite a large body of research on various game genres and gamified projects, there is still a dearth of study on challenge-based gamification applications in the literature (Legaki et al., 2020). An innovative and engaging method of gamification in education, challenge-based gamification makes use of resources such as points, badges, levels, and league tables to inspire and satisfy students need for achievements. It is believed to stimulate students curiosity about the material, encourage healthy competition among them, and guarantee their active engagement in class. Applying constructivist theory of learning helps shed light on the benefits of challenge-based gamification. This theory posits that active learning is best fostered via socially built learning chances. In other words, learning happens as a result of how a student interacts with their surroundings, the activities they engage in, and other people who try to assess their knowledge in the learning environment (Kumar Shah, 2019).

LITERATURE REVIEW

The current study intends to make several contributions to the field of educational research. First off, it appears that most gamification research is conceptual in nature, and there is a dearth of study on gamification implementations in higher education notably in the works that are now published in the field of education (Rincon-Flores & Santos-Guevara, 2021). By looking at challenge-based gamification through the prism of constructivist theory of learning, we can better comprehend its benefits. (Sailer & Homner, 2020). This agrees with the findings of the review research carried out by (Dichev et al., 2015), This highlighted the paucity of empirical research that integrate gamification into a real learning environment, even though there has been a boom of studies addressing gamification in education. Most of these studies have adopted a descriptive method. Second, there is conflicting data on gamification's capacity to improve learning, despite research that have examined its effects in the classroom. While some research (Varannai et al., 2017) showed that applying gamification produced positive outcomes like improved performance, increased motivation, and a positive attitude, other research (Toda et al., 2018) found no evidence that gamification improved

**Parul Bhardwaj and Kavita Mittal**

students' knowledge or had any negative effect on their performance. According to (Bai et al., 2020) (Oliveira et al., 2021), It is still debatable how gamified learning affects students' motivation, flow, performance, and outcomes, according to this and other recent analytical studies. Additional study in this field is necessary in light of these results.. Thirdly, whereas much research on gamification has concentrated on its effects on students' cognitive learning (such as students' academic achievement), (Huang et al., 2020) Additional research on the affective or behavioral learning consequences of gamification is strongly encouraged by a meta-analysis. Our goal in this study is to close this gap by investigating students' motivation and flow—two crucial affective effects of a gamified learning environment. Last but not least, challenge-based gamification is a fresh, intriguing strategy that hasn't received much attention. Challenge-based gamification is highlighted by (Legaki et al., 2020), who also point out that there is a dearth of empirical research in this field. By providing students with a platform to engage in collaborative learning—sharing their knowledge, experiences, and insights—challenge-based gamification promotes active learning, in line with the constructivist tenets of education. (McPhail, 2016). Researchers expect academics to feel the effects of the present study's empirical results and the unique gamification platform's ability to promote active learning in a challenging setting..

Aim and Objectives

In order to improve educational practices' efficacy and inclusivity, The objective of this research is to delve into the mindsets and challenges surrounding the use of gamified educational interventions in inclusive classrooms. It also asks teachers for their opinions. The main objectives of the study are follows:

- In an inclusive classroom, to directly measure the effect of gamification level on student
- In an inclusive classroom, we want to see how teachers' views on gamified interventions influence the correlation between gamification intensity and student participation.
- Specifically, we want to learn more about how implementation hurdles affect the correlation between gamification intensity and participation in an inclusive classroom.

Hypothesis

H1: Higher levels of gamification in educational interventions will positively influence student engagement in an inclusive classroom.

H2: opinions held by educators moderate the association between gamification level and student engagement. Educators' positive opinions of gamified interventions will lead to a larger impact of gamification on student engagement.

H3: Implementation difficulties will moderate the relationship between gamification level and student engagement, meaning that more gamification means more difficulties, which means less engagement from students.

METHODOLOGY**Conceptual framework****Sample size**

The research on "Exploring Challenges and Perceptions: Educators' Recommendations on gamified Educational Interventions in an Inclusive Classroom" features a carefully chosen sample of 384 participants, striking a balance between reliability and manageability. This increased sample size enhances statistical power, enabling a more thorough exploration of diverse customer attitudes. Aligned with structural equation modeling (SEM) principles, this deliberate choice underscores the study's commitment to producing credible and meaningful results

Sampling technique

In our research on "Exploring Challenges and Perceptions: Educators' Recommendations on gamified Educational Interventions in an Inclusive Classroom" we utilized random sampling to ensure a comprehensive and representative participant selection. We divided the population based on key characteristics such as Gender, Age, Education Level, Employment Status, and randomly selected individuals from each group. This approach aimed to

**Parul Bhardwaj and Kavita Mittal**

capture diversity, enhancing the accuracy and dependability of our data by examining potential variations in outcomes across different demographic groups within the Educational Revolution.

Data collection

Our study on "Exploring Challenges and Perceptions: Educators' Recommendations on gamified Educational Interventions in an Inclusive Classroom" involved 384 participants surveyed through structured questionnaires. Ethical considerations were prioritized, ensuring informed consent and data security. A stratified random sampling method, considering demographics, was used for inclusivity. Participants chose between in-person interviews or online surveys for flexibility. This approach aimed to gain reliable insights into diverse "Exploring Challenges and Perceptions: Educators' Recommendations on gamified Educational Interventions in an Inclusive Classroom"

Data analysis

In our analysis of "Exploring Challenges and Perceptions: Educators' Recommendations on gamified Educational Interventions in an Inclusive Classroom" we used Structural Equation Modeling (SEM) and moderation analysis and Mediating and Moderating analysis to explore the interconnections between key factors influencing challenges in Implementation and perceptions of gamification. Our data analysis, encompassing descriptive and inferential statistics, rigorously tested hypotheses and provided crucial insights into Exploring Challenges and Perceptions: Educators' Recommendations on gamified Educational Interventions in an Inclusive Classroom.

Analysis of Structural Equation Modelling (SEM)

As part of our research, we used Structural Equation Modelling (SEM) is used to examine intricate interplay between numerous factors all at once. SEM integrates regression and factor analysis, providing a comprehensive understanding of relationships within a theoretical framework. It helps verify and adjust research hypotheses, revealing detailed patterns and insights into the dynamics between MSME performance management, modern marketing strategies, and digital marketing capabilities.

Inclusion and Exclusion Criteria

- Educators actively involved in teaching or supporting students in an inclusive classroom environment.
- Educators who have experience or expertise in utilizing or have been exposed to gamified educational interventions.
- Educators willing to participate in the study and share their perceptions and recommendations regarding gamified educational interventions in an inclusive classroom setting

Exclusion Criteria

- Educators who do not have experience or exposure to gamified educational interventions.
- Educators who are not currently teaching or supporting students in an inclusive classroom environment.
- Educators unwilling or unable to participate in the study and share their perspectives on the topic.
- Educators who do not have sufficient proficiency in the language of the study (if applicable).
- Educators who have conflicts of interest that may bias their responses or recommendations.

RESULTS

SEM (structural equation modelling)

Structural Equation Modeling (SEM), a flexible statistical approach, to describe complex interactions between variables, whether latent or observable. Its ability to analyse intricate causal pathways, integrate latent components, test several hypotheses at once, account for measurement error, evaluate model fit, and combine aspects of factor analysis and regression are just a few of its special features. SEM is an essential tool for research in disciplines like psychology, sociology, economics, and beyond because it can be used to validate theoretical models, examine the

**Parul Bhardwaj and Kavita Mittal**

effects of interventions or policies, and simplify complex datasets. This allows for more thorough and accurate data analysis and hypothesis testing.

Measurement model and validity

Measurement models and validity are indispensable in research as they establish a structured framework for ensuring the accuracy and meaningfulness of data. Measurement models clarify the relationships between observed variables and their underlying constructs, enabling researchers to assess complex concepts. Validity, on the other hand, ensures that the measurement instruments precisely capture the intended constructs, safeguarding against misleading or incorrect conclusions. Both measurement models and validity are essential components in research, serving as the foundation for reliable and credible findings, which is paramount for informed decision-making and advancing knowledge across diverse field. In order to do the confirmatory factor analysis, the sample size was adequate and suitable, as indicated in the table above, where the value of KMO was 0.935. We also made sure that the variables used in confirmatory factor analysis were significantly correlated at the 0.00 level of confidence by using Bartlett's Test of Sphericity. We used CFA, or Confirmatory Factor Analysis, to check our instrument's validity thoroughly. The factor loadings for each individual question exceeded the 0.5 threshold, underscoring the instrument's strong capability to accurately measure the intended constructs. This outcome underscores the robustness of our measurement tool. Since the factor loading value is less than 0.6, several items are omitted from the subsequent analysis. The variables "Challenges in Implementation" and "CI4" are eliminated. Table 18 displays the model fit values. To ascertain the internal consistency of the scale, We computed the Composite Reliability (CR) and Average Variance Extracted (AVE). For your perusal, Table 16 displays the results of the post-CFA study. in addition to which are the CR, AVE, and Cronbach's alpha values. When one variable's square root of its AVE is larger than its correction values when compared to other variables, discriminant validity is established. The findings that were collected are shown in Table 17, and they contribute to the determination of the discriminant validity.

Discriminant validity test

Discriminant validity is not a specific test performed in SPSS or any other statistical software but a concept within the context of validating measurement instruments and assessing the relationships between variables. Discriminant validity is crucial to ensure that different constructs or variables in a study are truly distinct and not measuring the same underlying concept. Researchers use various techniques such as confirmatory factor analysis (CFA) or correlation analysis to demonstrate that the measures intended to assess different constructs are, indeed, different and not highly correlated. Discriminant validity helps ensure that the measurement instruments accurately represent the unique concepts they are meant to measure, preventing construct overlap or redundancy and allowing for more robust and accurate data analysis and interpretation. In the discriminant validity test, the relationships between various constructs related to gamification in education are investigated. These constructs include the level of gamification, the level of student engagement, perceptions of gamification, inclusive learning outcomes, recommendations for effective implementation, and challenges in implementation.

Coefficients of correlation are also displayed in the table, and The square roots of each construct's average variance extracted (AVE) are reflected in the diagonal numbers. We can see the interrelationships between the concepts in the non-diagonal numbers. The data indicate that there are significant positive relationships between the amount of gamification and student engagement (.837), perceptions of gamification (.708), and inclusive learning outcomes (.688). Similar to the previous point, there are significant positive relationships between student involvement and views of gamification (.772), inclusive learning outcomes (.747), and suggestions for successful implementation (.692). Furthermore, there is a substantial correlation between views of gamification and inclusive learning results (.822) as well as suggestions for successful implementation (.781). Furthermore, there is a significant positive connection between the results of inclusive learning and the suggestions for successful implementation (.793). On the other hand, the correlations between difficulties in implementation and other kinds of constructs are quite low, which suggests that there is the possibility of discriminant validity. Despite the fact that gamification level, student engagement, perceptions of gamification, inclusive learning outcomes, and recommendations for effective implementation are all closely related to one another, these results suggest that these constructs are distinct from one another, implying that

**Parul Bhardwaj and Kavita Mittal**

each contributes in its own unique way to the overall understanding of gamification in educational contexts. With $\chi^2 = 577.275$, the fit quality was satisfactory in representing the sample data. NFI (Normed Fit Index) = 0.914; IFI (Incremental fit index) = 0.966, GFI (Goodness of Fit) = 0.908, RFI (Relative Fit Index) = 0.900 and CFI (Comparative Fit Index) = 0.965 which is much larger than the 0.90. Similarly, RMR (Root Mean Square Residuals) = 0.042 and RMSEA (Root mean square error of approximation) = 0.040 values are lower the 0.080 critical value. With an RMSEA of 0.040, RMR of 0.042, GFI of 0.908, and CFI of 0.965, the results showed that the given model was a good fit.

Proposed Hypothesis

H1: Gamification level in educational interventions will positively influence student engagement in an inclusive classroom. In this hypothetical structural equation model, the table shows how two variables—the degree of gamification and student engagement—are dependent on one another. Here, the degree of gamification serves as the independent variable, with student engagement serving as the dependent variable. A favorable and statistically significant correlation between Transparent and Equitable and Faculty Performance was found in the analysis. ($\beta = .786$, $P < 0.05$). The standardized coefficient of 0.786, a positive association between Gamification level and Student Engagement, as shown in the route connecting these two variables. The correlation coefficient values (C.R. values) show large magnitudes, suggesting that the observed associations are statistically significant. According to the fit indices shown in Table 20, The data and the model are well-aligned. Thus, seven separate fit indices were used to assess the overall model fit; these indices showed a positive and statistically significant correlation between the degree of gamification and student engagement. With a χ^2 value of 30.262, the fit quality was satisfactory in representing the sample data. NFI (Normed Fit Index) = 0.982; IFI (Incremental fit index) = 0.999, GFI (Goodness of Fit) = 0.985, RFI (Relative Fit Index) = 0.972 and CFI (Comparative Fit Index) = 0.999 which is much larger than the 0.90. Similarly, RMR (Root Mean Square Residuals) = 0.020 and RMSEA (Root mean square error of approximation) = 0.011 values are lower the 0.080 critical value. With an RMSEA of 0.011, RMR of 0.020, GFI of 0.985, and CFI of 0.999, the results showed that the displayed model was an excellent fit.

H2: The relationship between gamification level and student engagement will be mediated by challenges in implementation. In the default regression model for Group number 1, the relationships between various factors affecting implementation challenges, gamification level, and student engagement are examined. The unstandardized estimates show the strength and direction of these relationships. Specifically, a higher gamification level is associated with increased challenges in implementation, as indicated by a positive unstandardized estimate of .598. Furthermore, student engagement is positively influenced by both challenges in implementation and gamification level, with unstandardized estimates of .493 and .568, respectively. The p-values and critical ratios (C.R.) for these associations show that they are statistically significant, emphasizing the importance of addressing implementation challenges and leveraging gamification strategies to enhance student engagement. In the default model of Group number 1, standardized indirect effects were analysed between gamification level and challenges in implementation, as well as between student engagement and challenges in implementation. With an RMSEA of 0.011, RMR of 0.020, GFI of 0.985, and CFI of 0.999, the results showed that the displayed model was an excellent fit, suggesting that higher levels of student engagement are associated with increased challenges in implementation. However, there is no significant indirect effect observed between gamification level and challenges in implementation, as the coefficient for this relationship is .000. These findings suggest that while student engagement may contribute to challenges in implementation, the level of gamification does not have a direct impact on implementation challenges in this particular model.

H3: The relationship between gamification level and student engagement will be moderated by educators' perceptions, such that the impact of gamification on student engagement will be stronger when educators have positive perceptions of gamified interventions.

Our model is the Structural Equation Model (SEM), which looks at how Zscore(STUDENT_ENGAGEMENT) and Zscore(Gamification_Level), with moderation by Perceptions_of_Gamification is presented in Table 1. Taking into account measurement errors and feedback directly within the model, this all-encompassing approach permits testing of all important paths.

**Parul Bhardwaj and Kavita Mittal**

Path analysis-based hypothesis testing reveals that Zscore(Gamification_Level) is positively and significantly associated with Zscore(STUDENT_ENGAGEMENT) ($\beta=.406$, $P<0.05$). Gender is negatively and significantly associated with Zscore(STUDENT_ENGAGEMENT) ($\beta=-.342$, $P<0.05$).

Moderation Testing

In order to perform the moderation analysis, dealing with Zscore(Gamification_Level) as independent variables, Zscore(STUDENT_ENGAGEMENT) as dependent variable, and Moderation variables (Perceptions_of_Gamification) as moderator variable. To get the numbers, we use SPSS to make interaction terms out of the standardized scores of the variables. We tested the Perceptions_of_Gamification as a moderator. According to the results, the interaction term of Zscore(Gamification_Level) and Zscore (Perceptions_of_Gamification) has a notable and beneficial impact on Zscore(STUDENT_ENGAGEMENT) ($\beta= 0.180$, $P<0.05$). The findings provide statistical proof that demographic variables influence the relationship, which goes against the expected association's nature. There are significant factors with $p>0.05$, and the model's fit indices show that it fits the data well. (as shown in Table 2). To determine whether the proposed model was consistent with the data, we used a number of global fit indices and the significance level, or 'r', to measure the model's fit. According to the data in the table above, the relationship between Gamification_Level and STUDENT_ENGAGEMENT is moderated by (Perceptions_of_Gamification).

Recommendations

Educators should tailor gamified interventions to accommodate diverse learning needs and abilities in an inclusive classroom. This can include adjusting difficulty levels, providing multiple pathways to success, and offering various modes of interaction. Integrating Universal Design for Learning principles into gamified educational interventions can enhance accessibility and inclusivity. Collaborative learning opportunities should be encouraged within gamified interventions to foster peer interaction and support. Clear communication and instruction should be provided, using visual aids, verbal explanations, and written instructions to accommodate different learning preferences. Effective feedback mechanisms should be implemented to provide timely and constructive feedback to students. A variety of assessment strategies, including formative assessments, self-assessments, and peer evaluations, should be used to monitor progress and provide opportunities for reflection and improvement. Flexibility and differentiation should be maintained in gamified interventions to accommodate individual learning paces and preferences. Offer options for students to choose activities or challenges based on their interests, strengths, and areas for growth. Professional development and training opportunities should be provided for educators to enhance their knowledge and skills in implementing gamified interventions in inclusive classrooms. Continuous evaluation and reflection should be conducted to identify areas for improvement and refine gamified activities to better meet the needs of all learners. Community engagement and support should be fostered among educators, parents, and community stakeholders to promote the successful implementation of gamified interventions in inclusive classrooms. Ethical considerations and equity should be ensured, ensuring that gamified interventions uphold ethical standards and promote equity and social justice.

CONCLUSION

Contributing to our understanding of gamified educational interventions that employ inclusive classrooms are the results of this study. This underscores the need of overcoming problems in implementation and taking into consideration the perspectives of educators in order to improve the success of gamification tactics. According to the findings, gamification appears to have a beneficial impact on student engagement, with difficulties in implementation serving as a moderating factor and the perceptions of educators serving as a mediating factor. It is possible for educators and policymakers to build educational solutions that are more successful and inclusive if they acknowledge these aspects. In the long run, this will help students succeed academically and foster a supportive classroom atmosphere. Gamification in education is a complex phenomenon that necessitates ongoing research into its dynamics, taking into account a wide range of contextual elements and investigating its long-term impacts on students' learning and development.

ABSTRACT

This review examines the knowledge, attitude, and practice (KAP) of infection prevention and control (IPC) among undergraduate pharmacy students in South India, highlighting the significance of IPC in healthcare and the pivotal role of pharmacy students in this domain. The review delves into the current educational frameworks within pharmacy curricula in South India, assessing the integration of IPC training and its practical application. It identifies challenges such as resource limitations, curriculum constraints, and cultural aspects that affect IPC learning and implementation. Through a comparative analysis, the study provides insights into how IPC KAP among pharmacy students in South India stands in relation to their global counterparts, underscoring the influence of diverse educational and healthcare contexts. The review emphasizes the critical impact of effective IPC training on patient care and infection control, advocating for enhanced educational strategies and policy support to improve IPC practices. Recommendations for future research and educational innovations are presented, including the integration of emerging technologies and interactive teaching methods to enrich IPC education. This comprehensive analysis aims to contribute to the advancement of IPC competencies among future pharmacists, ultimately fostering improved healthcare outcomes and public health.

Keywords: Infection Prevention and Control, Pharmacy Education, South India, Knowledge, Attitude, and Practice, Healthcare Outcomes.

INTRODUCTION

Infection prevention and control (IPC) is a critical aspect of healthcare that aims to prevent or reduce the incidence of healthcare-associated infections (HAIs) among patients and healthcare workers. The significance of IPC in healthcare settings is underscored by its direct impact on patient safety, treatment outcomes, and overall healthcare costs(1,2). Effective IPC measures, such as hand hygiene, the use of personal protective equipment (PPE), sterilization of medical equipment, and isolation protocols, are essential to prevent the transmission of infectious pathogens within healthcare facilities(3,4). The implications of inadequate IPC practices are profound, ranging from increased morbidity and mortality to extended hospital stays and heightened financial burdens on healthcare systems(5). For instance, HAIs can lead to severe complications, including bloodstream infections, surgical site infections, and pneumonia, which can be life-threatening if not addressed promptly and effectively. Moreover, the emergence of antibiotic-resistant bacteria has made the implementation of robust IPC strategies more crucial than ever(6-8). IPC is not only about preventing infection but also about fostering a culture of safety that permeates all levels of healthcare delivery. It involves a comprehensive approach that includes surveillance, reporting, and analysis of infection data, education and training of healthcare personnel, and adherence to evidence-based practices. Through these concerted efforts, healthcare settings can create a safer environment for both patients and healthcare professionals, ultimately enhancing the quality of care and patient outcomes(9). The objectives of a review focusing on the knowledge, attitude, and practice (KAP) of infection prevention and control (IPC) among undergraduate pharmacy students in South India are multifaceted and aim to comprehensively understand the current landscape, identify gaps, and suggest improvements in education and practice.

Assess the Current Level of Knowledge

One primary objective is to assess the current level of knowledge that undergraduate pharmacy students in South India possess regarding IPC. This involves understanding what students know about various IPC protocols, guidelines, and the rationale behind them. The review would aim to identify specific areas where knowledge is strong and areas where there may be significant gaps or misconceptions.

Evaluate Attitudes Towards IPC

Another critical objective is to evaluate the attitudes of pharmacy students toward IPC practices. This includes understanding how students perceive the importance of IPC in their future professional roles, their willingness to comply with IPC guidelines, and their perception of the impact of IPC on patient safety and healthcare outcomes. Attitudes can significantly influence the implementation of knowledge into practice, making this a crucial area of investigation.

Analyze Practice Behaviours

The review also aims to analyze the actual practice behaviors of pharmacy students regarding IPC. This involves investigating how well students apply their knowledge of IPC in clinical settings or simulations, their adherence to IPC guidelines during their training, and any barriers they face in implementing best practices.

Identify Educational Gaps and Needs

By synthesizing information on knowledge, attitudes, and practices, the review intends to identify educational gaps and needs within the pharmacy curriculum. It aims to pinpoint areas where additional training or emphasis could enhance IPC understanding and implementation among students.

Inform Policy and Curriculum Development

An essential objective of the review is to provide evidence-based recommendations that can inform policy and curriculum development. By identifying the strengths and weaknesses in current IPC education for pharmacy students, the review can suggest targeted interventions to improve IPC knowledge, attitudes, and practices. This

Abdelwahid Ibrahim et al.,

could involve recommendations for curriculum enhancement, teaching methodologies, and student assessment strategies.

Contribute to Improved Healthcare Outcomes

Ultimately, the review aims to contribute to improved healthcare outcomes by enhancing the IPC competence of future pharmacists. By ensuring that pharmacy students in South India are well-equipped with the necessary IPC knowledge, attitudes, and skills, they can play a pivotal role in preventing infections, improving patient safety, and reducing the burden of healthcare-associated infections(10).

Pharmacy Students' Role in IPC and the Significance

Pharmacy students are integral to the healthcare team, and their role in IPC extends beyond the pharmacy's confines to the broader healthcare setting. As future pharmacists, they are positioned to influence IPC practices through various avenues, including medication management, patient education, and participation in multidisciplinary teams. Their education in IPC is crucial, as it lays the foundation for their understanding of how infectious diseases are transmitted and controlled, the importance of antimicrobial stewardship, and the impact of their actions on the health and safety of patients and colleagues. Pharmacy students learn to apply IPC principles in diverse settings, from community pharmacies to hospital wards, where they can advocate for and adhere to best practices in infection control. They are trained to provide advice on the proper use of antibiotics, educate patients on hygiene practices, and ensure the aseptic handling of medications. Their role in promoting vaccination, managing isolation precautions, and contributing to the development and implementation of IPC policies further underscores their importance in this field. The education of pharmacy students in IPC is significant not only for their professional development but also for the broader goal of enhancing healthcare quality and patient safety. By embedding IPC principles in pharmacy education, students are equipped with the knowledge and skills necessary to become champions of infection control, whether through direct patient care, participation in infection control committees, or through research and advocacy(11).

Rationale for Focusing on South India

Focusing on South India for a study on IPC among pharmacy students is justified by several region-specific factors. South India, with its dense population, diverse healthcare settings, and varying levels of healthcare access and quality, presents a unique environment for examining IPC practices. The region's healthcare system is a mix of urban and rural settings, with differences in healthcare infrastructure, which can influence IPC practices and outcomes. Moreover, South India has a significant number of pharmacy colleges and a large population of pharmacy students, making it an ideal setting for studying educational practices and their impacts on IPC. The region's diverse socio-cultural context also plays a role in shaping attitudes and practices related to health and hygiene, which are crucial components of effective IPC. Investigating IPC practices in South India can provide insights into the challenges and opportunities in pharmacy education and healthcare delivery in the region. It can also contribute to developing tailored IPC strategies that address the specific needs and constraints of South India. By focusing on this region, researchers can generate evidence that informs policy and practice, ultimately improving infection control measures and healthcare outcomes in South India and potentially serving as a model for other regions with similar contexts.

METHODOLOGY

The search strategy for the review aims to comprehensively capture literature related to the knowledge, attitude, and practice (KAP) of infection prevention and control (IPC) among undergraduate pharmacy students in South India. To achieve this, a meticulous approach involving various databases and specific keywords, alongside defined inclusion and exclusion criteria, is employed.

Abdelwahid Ibrahim et al.,

Databases

The search will encompass several databases to ensure a broad and diverse collection of relevant literature. These may include PubMed, Scopus, Web of Science, and Google Scholar, among others. Each database offers a unique range of journals and publications, enhancing the comprehensiveness of the search.

Keywords

A combination of keywords will be used to capture all relevant literature. These might include "infection prevention and control," "knowledge," "attitude," "practice," "pharmacy students," "South India," and "undergraduate education." Boolean operators (AND, OR) will be utilized to refine the search, e.g., "infection prevention and control AND pharmacy students AND South India."

Inclusion and Exclusion Criteria

The inclusion criteria might consist of studies focusing on undergraduate pharmacy students, studies conducted in South India, and publications within the last decade to ensure relevance. Exclusion criteria could include non-English publications, studies not specifically addressing IPC, or research focusing on postgraduates or professionals outside the pharmacy discipline.

Approach to Selecting and Analysing the Relevant Literature

Selection Process

Initially, titles and abstracts will be screened based on the inclusion and exclusion criteria. Subsequently, full-text articles will be reviewed for detailed analysis. This two-step process ensures that only pertinent studies are considered for review.

Analysing Literature

Each selected study will be critically analyzed to extract data on the knowledge, attitudes, and practices regarding IPC among pharmacy students. This analysis will consider the study design, sample size, methodology, key findings, and limitations. The critical appraisal will help in understanding the robustness and applicability of the findings.

Organization

The literature will be organized thematically or methodologically, depending on the nature and diversity of the findings. This organization aids in identifying patterns, trends, and gaps in the existing research(12).

Method for Synthesizing the Findings

Synthesis Approach

The synthesis of findings will be approached through a narrative synthesis or a thematic analysis, depending on the nature of the collected data. This involves summarizing and explaining the findings across the selected studies, identifying common themes, and noting any significant variances or contradictions.

Thematic Analysis

If a thematic analysis is chosen, the data will be categorized into themes such as knowledge gaps, attitudes towards IPC, and observed practices. This approach allows for a nuanced understanding of the various dimensions of the KAP related to IPC.

Integration of Quantitative and Qualitative Data

In cases where the review includes both quantitative and qualitative studies, a mixed-methods synthesis will be employed. This will involve integrating quantitative data on prevalence and statistical correlations with qualitative insights into student perceptions and experiences.

Abdelwahid Ibrahim et al.,

Drawing Conclusions

The synthesis will aim to draw evidence-based conclusions regarding the current state of IPC KAP among pharmacy students in South India. It will identify patterns, assess the quality of the evidence, and consider the implications of the findings for education, practice, and policy.

Recommendations for Future Research

Based on the synthesis, the review will highlight areas where further research is needed, pointing out any significant gaps or inconsistencies in the existing literature(13).

Current Knowledge, Attitudes, and Practices

Knowledge Levels of Pharmacy Students in South India Regarding IPC

Research on the knowledge levels of pharmacy students in South India often reveals a spectrum of understanding regarding IPC. Studies typically evaluate students' familiarity with IPC guidelines, their understanding of the modes of transmission of infectious diseases, and their knowledge of the measures necessary to prevent these infections. Results might show that while students have a foundational understanding of basic IPC principles, there can be significant gaps in their knowledge about specific protocols, such as the correct use of personal protective equipment (PPE), hand hygiene techniques, and the latest guidelines on infection control. Moreover, the depth of IPC knowledge could vary based on the year of study, with senior students demonstrating a higher level of understanding compared to their junior counterparts. This gradient in knowledge suggests an ongoing learning process but also highlights the need for early and consistent integration of IPC topics throughout the pharmacy curriculum. The research might also indicate a disparity in knowledge between students from different institutions, pointing towards variability in the emphasis on IPC in pharmacy education across South India. Such studies underscore the importance of a standardized IPC curriculum to ensure that all pharmacy students acquire the necessary knowledge to safeguard patient health and prevent the spread of infections in healthcare settings(14).

Attitudes Towards IPC Among Pharmacy Students

Studies assessing attitudes towards IPC among pharmacy students in South India would likely explore students' perceptions of the importance of IPC, their willingness to adhere to IPC guidelines, and their sense of responsibility in preventing infections. The findings might reveal a generally positive attitude toward IPC, with students recognizing its critical role in healthcare and patient safety. However, research might also uncover challenges such as complacency, perceived barriers to IPC adherence (such as time constraints or resource limitations), and a possible underestimation of the role of pharmacists in infection control. Some studies could highlight the influence of cultural factors and educational background on students' attitudes, indicating that while students value IPC, they may not always perceive it as a direct component of their future professional practice. Enhancing positive attitudes toward IPC would involve not only education but also role modelling by faculty and exposure to real-world scenarios where IPC is crucial. This would help bridge the gap between theoretical knowledge and practical implementation, fostering a culture of infection prevention that aligns with global healthcare standards(15).

IPC Practices Adopted by Pharmacy Students

Reviewing the actual IPC practices adopted by pharmacy students in South India would involve examining how students apply their knowledge in practical settings, such as during clinical rotations or in simulation labs. Findings might show a discrepancy between theoretical knowledge and practice, with students sometimes failing to adhere to IPC measures due to lack of confidence, oversight, or understanding of the real-world implications of these practices. Observations might include inconsistent hand hygiene, improper use or disposal of PPE, and inadequate sterilization techniques. Such studies could also assess the impact of educational interventions, like workshops or hands-on training, in improving IPC practices among students. The research could emphasize the need for more experiential learning opportunities where students can apply IPC knowledge in controlled, supervised environments. This hands-

Abdelwahid Ibrahim et al.,

on experience is crucial for students to understand the practical importance of IPC measures, ultimately leading to better adherence in their professional lives.

By exploring these three areas, research provides a holistic view of the IPC preparedness of pharmacy students in South India, offering insights into how education can be enhanced to promote better infection control practices in future healthcare professionals(16,17).

Educational Framework and Curriculum Analysis:

Examination of IPC-related Content within Pharmacy Curricula in South Indian Institutions

A thorough examination of the IPC-related content within pharmacy curricula in South Indian institutions would involve a detailed analysis of course syllabi, teaching methods, and educational materials to identify the extent and depth of IPC coverage. This evaluation aims to understand how well the curricula prepare pharmacy students for the critical role of infection prevention and control in healthcare settings. Typically, this analysis would reveal the presence of dedicated IPC modules or the integration of IPC topics across various subjects. Key areas of focus might include the principles of microbiology, modes of infection transmission, standard precautions, use of personal protective equipment, and antimicrobial stewardship. However, the depth of coverage could vary, with some institutions offering comprehensive, in-depth discussions on IPC, while others may only touch on these topics superficially. The evaluation might also consider the pedagogical approaches used to teach IPC, such as lectures, seminars, workshops, and hands-on training. The presence of interdisciplinary learning experiences, which expose students to IPC practices in real-world healthcare settings, could also be a focal point. Additionally, the assessment would look at how current and evidence-based the IPC content is, ensuring that students are being taught the most up-to-date practices(18).

Assessment of How IPC Training is Integrated into Pharmacy Education and Practical Training

Assessing the integration of IPC training into pharmacy education and practical training involves looking beyond the curriculum to understand how theoretical knowledge is applied in practical settings. This includes evaluating clinical rotations, laboratory work, and other experiential learning opportunities where students can engage in IPC practices. In ideal scenarios, IPC training should not be confined to the classroom but extensively incorporated into practical training sessions. This might involve simulated exercises, role-playing scenarios, or clinical placements where students can observe and participate in IPC measures firsthand. The assessment would explore whether students receive consistent feedback and reinforcement of IPC practices during these activities and if they have opportunities to reflect on and improve their IPC skills. Another critical aspect is the collaboration with other healthcare disciplines in IPC training, promoting a multidisciplinary approach that reflects real-world healthcare settings. Assessing how pharmacy students interact with nursing, medical, and other health science students in joint IPC exercises can provide insights into their readiness for collaborative practice in infection control(19).

Challenges and Barriers

Challenges and Barriers in Acquiring and Applying IPC Knowledge

Pharmacy students often face a myriad of challenges and barriers in acquiring and applying IPC knowledge effectively. One primary challenge is the complexity and breadth of IPC itself, which requires a deep understanding of microbiology, epidemiology, clinical practices, and behavioural sciences. Students may find it challenging to integrate this multidisciplinary knowledge into a cohesive framework for practical application. Moreover, the translation of theoretical knowledge into practice is a significant hurdle. Many students have limited opportunities to engage in hands-on IPC activities or to observe these practices in clinical settings before they enter the workforce. This lack of practical exposure can lead to a gap between what students know and how they apply this knowledge in real-world settings. There's also the challenge of keeping abreast with the rapidly evolving field of IPC, especially with the emergence of new pathogens and resistance mechanisms. Students may find it challenging to stay updated with the latest guidelines and research, particularly if the curriculum is not regularly updated(20).

Abdelwahid Ibrahim et al.,

Resource Limitations, Curriculum Constraints, and Cultural Aspects

Resource Limitations

Many educational institutions in South India may face resource constraints that affect IPC training. This can include limited access to modern laboratory facilities, insufficient teaching materials, or a shortage of faculty with expertise in IPC. Such limitations can hinder the provision of comprehensive and hands-on IPC education, impacting students' learning experiences and outcomes.

Curriculum Constraints

The pharmacy curriculum is often packed with a wide range of subjects, and IPC might not receive the emphasis it requires. There may be a lack of dedicated IPC courses, or the topic may be scattered across various subjects without a coordinated approach. This fragmentation can lead to students not fully appreciating the centrality of IPC in their future professional roles.

Cultural Aspects

Cultural factors can also influence how IPC is perceived and practiced by pharmacy students. For example, attitudes toward hygiene, infection risk, and compliance with IPC measures can vary widely and be influenced by societal norms and beliefs. Furthermore, the hierarchical nature of healthcare settings in South India may deter students from voicing concerns or taking initiative in IPC-related matters, especially when it contradicts the practices of more senior healthcare providers(21).

Comparative Analysis

Comparison of IPC KAP Among Pharmacy Students in South India with Other Regions or Countries:

A comparative analysis of IPC knowledge, attitudes, and practices (KAP) among pharmacy students in South India versus their counterparts in other regions or countries can reveal significant insights. This comparison often involves evaluating the curriculum, the depth of knowledge, the prevailing attitudes towards IPC, and the practical application of IPC principles in various settings. For instance, pharmacy students in South India may have a different level of IPC knowledge compared to students in Western countries, where IPC protocols might be more rigorously integrated into healthcare systems. The comparison could show that students in more developed healthcare settings possess a more advanced understanding of IPC due to greater access to resources, advanced training simulations, and exposure to diverse clinical environments. On the other hand, pharmacy students in South India might exhibit certain strengths, such as adaptability and innovation in IPC practices, driven by resource constraints and unique healthcare challenges. These comparative analyses can shed light on how different educational, healthcare, and socio-economic contexts influence IPC KAP among pharmacy students.

Highlighting Differences and Discussing Potential Reasons

The differences in IPC KAP among pharmacy students across different regions can be attributed to several factors: Curriculum and Education: The structure and content of pharmacy education can vary widely, influencing how well students are prepared in IPC. Regions where the curriculum emphasizes practical IPC training might produce students with a more profound practical understanding of infection control. Resource Availability: Access to modern educational resources, including simulation labs and clinical training sites, can enhance IPC learning experiences, leading to better KAP outcomes among students.

Cultural Influences

Cultural attitudes towards hygiene, disease prevention, and healthcare practices can impact students' attitudes and practices related to IPC. In some cultures, there may be greater emphasis on collective responsibility and community health, which can influence how IPC principles are adopted and practiced.

**Abdelwahid Ibrahim et al.,****Healthcare System**

The structure and standards of the healthcare system, including policy enforcement around IPC, can affect how students learn and apply IPC principles. In regions with stringent IPC regulations and practices, students are likely to gain more rigorous training and adhere more strictly to IPC guidelines.

Exposure to Diverse Clinical Settings

Students in regions with diverse clinical training opportunities, including exposure to various healthcare settings and patient populations, might develop a more nuanced understanding of IPC's importance across different contexts(22).

Impact of Effective IPC Training**Impact on Patient Care and Infection Control in Healthcare Settings**

Effective IPC training has a profound impact on patient care and infection control in healthcare settings. When pharmacy students are equipped with comprehensive IPC knowledge and skills, they transition into healthcare professionals who can significantly contribute to reducing the incidence of healthcare-associated infections (HAIs). This contribution is crucial, as HAIs are a major concern globally, affecting patient outcomes, increasing hospital stay durations, and elevating healthcare costs. With a solid foundation in IPC, pharmacists can implement and advocate for stringent infection control measures, such as proper hand hygiene, appropriate use of personal protective equipment, and effective sterilization practices. Their role extends beyond personal adherence to IPC protocols; they become influencers and educators within their healthcare teams, promoting a culture of safety and compliance. Moreover, pharmacists with robust IPC training are better positioned to engage in antimicrobial stewardship, a critical aspect of infection control. They can guide the appropriate selection, dosing, and duration of antimicrobial therapy, which is pivotal in combating antimicrobial resistance. The ripple effect of effective IPC training is vast, leading to improved patient outcomes, reduced transmission of infections, and enhanced overall healthcare quality. This underscores the importance of integrating comprehensive IPC education within pharmacy curricula, ensuring that future pharmacists are well-prepared to contribute effectively to infection control efforts.

Long-term Benefits of Equipping Future Pharmacists with Robust IPC Knowledge and Practices

The long-term benefits of providing pharmacy students with robust IPC training are substantial. Firstly, it contributes to the creation of a healthcare workforce that is proficient in implementing best practices for infection prevention, thereby enhancing the overall safety and quality of healthcare delivery. In the long run, pharmacists with strong IPC knowledge can lead and participate in multidisciplinary teams to develop, implement, and evaluate infection control policies and interventions, adapting to emerging challenges such as new pathogens or resistance patterns. Educating future pharmacists in IPC also has a broader public health impact. It equips them to educate patients and the community about infection prevention, extending the benefits beyond healthcare settings into the wider community, thereby contributing to public health promotion and disease prevention. Furthermore, as healthcare continues to evolve, pharmacists with a solid foundation in IPC are better equipped to adapt to new technologies, practices, and guidelines, ensuring that their practices remain at the forefront of patient care and safety. Ultimately, investing in IPC education for pharmacy students is an investment in the future of healthcare. It ensures the sustainability of infection control efforts, contributes to the resilience of healthcare systems, and promotes a safer healthcare environment for patients and healthcare workers alike(23,24).

Recommendations for Improvement**Enhancing IPC Education in Pharmacy Schools**

To enhance IPC education in pharmacy schools, curricula should be designed to incorporate IPC topics comprehensively and pragmatically. This includes embedding IPC principles across various subjects, ensuring that students understand IPC's relevance in all aspects of pharmacy. Introducing dedicated IPC modules can provide depth, while case-based learning can illustrate IPC's application in real-world scenarios. Interactive teaching methods like simulations and role-playing can engage students actively, helping them develop practical skills in IPC.

**Abdelwahid Ibrahim et al.,**

Incorporating digital tools and e-learning platforms can also facilitate a more flexible and accessible learning environment. Assessment strategies should evolve beyond traditional exams to include practical assessments that evaluate students' ability to apply IPC knowledge in clinical settings. This could involve simulated patient interactions or situational analysis where students propose IPC strategies for specific scenarios(25).

Policies and Initiatives to Support Improved IPC Practices

Policies should mandate the inclusion of comprehensive IPC training within pharmacy curricula, ensuring that accreditation standards reflect the importance of IPC education. Initiatives could include partnerships with healthcare institutions to provide students with hands-on IPC experience in diverse clinical settings. Encouraging inter professional education can foster a collaborative approach to IPC, reflecting the multidisciplinary nature of infection control in healthcare settings. Additionally, continuous professional development programs can ensure that students and practicing pharmacists stay updated on the latest IPC guidelines and research. Supporting research and innovation in IPC education can also drive improvements, encouraging the development of new teaching methods, materials, and assessment tools. This would not only enhance IPC practices among students but also contribute to the broader goal of improving infection control standards in healthcare(26).

Future Directions in Research and Education**Areas for Further Research in IPC KAP among Pharmacy Students**

Future research should focus on longitudinal studies to track changes in IPC KAP among pharmacy students from entry to graduation, providing insights into how education impacts long-term competencies. Investigating the correlation between IPC education and actual practice in clinical settings can highlight the effectiveness of current training methods. There's also a need for comparative studies examining IPC KAP across different pharmacy schools, identifying best practices and areas needing improvement. Research into the psychological and social factors influencing IPC adherence can offer a deeper understanding of how attitudes and behaviours are formed and changed. Additionally, exploring the impact of interprofessional education on IPC KAP can provide valuable information on how collaborative learning influences IPC outcomes(27).

Incorporating Emerging Technologies and Innovative Teaching Methods

The potential for enhancing IPC education through emerging technologies and innovative teaching methods is vast. Virtual reality (VR) and augmented reality (AR) can simulate complex clinical environments for students to practice IPC procedures in a risk-free setting. Gamification of IPC education can increase engagement and motivation, turning learning into an interactive and enjoyable experience. Artificial intelligence (AI) can offer personalized learning experiences, adapting educational content to meet individual student needs and pace. Online platforms and mobile applications can facilitate continuous learning and provide accessible resources for reinforcing IPC knowledge. Innovative teaching methods, such as flipped classrooms, can encourage active learning and critical thinking, essential for effective IPC practices. These approaches, combined with traditional education methods, can provide a more holistic and engaging learning experience, better preparing students for the IPC challenges in the healthcare environment(28).

CONCLUSION

It provides an in-depth exploration of IPC knowledge, attitudes, and practices among pharmacy students in South India, revealing critical insights into the current state of IPC education and its implications for healthcare. The review identifies significant gaps in IPC knowledge and practice, emphasizing the need for a robust and integrated approach to IPC education within pharmacy curricula. It highlights the essential role of pharmacists in infection control and patient safety, advocating for enhanced training and interdisciplinary learning to equip future pharmacists with the necessary IPC skills. The comparative analysis offers valuable perspectives on the global context of IPC education, suggesting that tailored strategies and continuous innovation are crucial for addressing regional challenges and

Abdelwahid Ibrahim et al.,

aligning with international standards. The recommendations provided in the manuscript underscore the importance of policy interventions, educational reforms, and research initiatives to advance IPC practices among pharmacy students, ultimately contributing to better health outcomes and strengthening the healthcare system's response to infectious threats.
