ABSTRACT

The world shares in equal measure the issue of food security which causes an underprivileged approach to communities driving sustainable development. India has seen its green, white and (nearly) yellow revolution in agriculture, but mountains of food still go waste while poverty leads to starvation deaths by the thousands every year. In the case of developing countries, such as India are more threatened with immediate and future it is food insecurity. Possibly also that agriculture fights climate change but is not the solution to total hunger eradication. Security encompasses also the protection for our environment as well as consumers. The paper has discusses various aspect of food security and instability in the Indian context understanding Sustainable Development Goal No. 2 with initiatives taken by research organizations for poverty eradication. The end of the paper offers a suggestion on how to adapt or strengthen this public-private partnership vision and zooms in on demand-side factors: territory, physical configuration, socio-economics. Institutional reforms in the water sector, like setting up private/tradable rights to withdraw on groundwater and public reservoirs have a massive effect making farm outputs more productive.

Keywords: Agriculture, Environment, Food Security, Groundwater, Sustainable Development.

**Suriya Kumari and Candida Smitha**

INTRODUCTION

Inflation in India is a serious issue at current levels of food inflation. Production is barely up in some areas, while it remains stagnant for other foodstuffs. The 53rd Meeting of the National Development Council (NDC) has just adopted a resolution that seeks to enhance rice production by an extra 10 MT, wheat output by another eight million tons and pulse volume -- two MT more--by dorning their part in making these targets reality before mid-2011. The proposed National Food Security Mission (NFSM), when it is implemented, should assist the nation to meet these targets rapidly. In general food safety, and in particular to encourage entrepreneurship stable production and provision of foods must be available enough stagnant people at risk. Summary This paper seeks to question the problem of food security based on poverty and sustainability. Rising food prices in developed countries have taken its toll on consumers or other industrial workers. The government is trying to reduce the price of food. It affects the farmers yield as well as their earnings. The UN defines food security as a state in which all people, at all times have physical and economic access to enough safe and nutritious food that meets their dietary needs for an active healthy life. Such imports of food are common in India and other developing countries. One aspect of food security is the accessibility and affordability of household foods. Infrastructure must be either created, or built to defeat a food scarcity. A safer response to the problem would be storing food for an emergency or increasing worldwide food provision. The maintenance of agricultural assets including land and water help protect world food stocks. With a quarter of the world's hungry people living in India, UN-India estimates that nearly 195 million are undernourished.

Chronic under nutrition affects 43% of Indian children. In 2020, India was placed at the 71st amongst the leading large nations in terms of food security index. Even though important changes have taken place around the world, food security is still just a dream for over 800 million people in developing countries (Leisinger 1996). However even that 1.5 billion more people world wide exist since then, it is clear progress has been made with regards to food security as the number of undernourished individuals dropped from its peak in 1971 at around 890 million (FAO conducted survey cited in Leisinger et al.imwrite1996). Asia harboring nearly 73 percent of the world's less developed population, for example witnessed a decline in the number of undernourished individuals from 707 million in 1969–1971 to only but five hundred and twenty millions between 1990 – '91 (World Population Data Sheet 1996 as cited by Leisinger). More startling is that its rate of undernutrition has decreased significantly, 37 to 16 according to FAO data from, despite an average annual population growth rate of percent. In its pursuit of food security and self-sufficiency. This means we need to produce enough food on our own land in order to protect our national food security. This includes the need to generate economic growth especially as a means of increasing both poor people's incomes and purchasing power, so that this becomes more affordable; ultimately also would guarantee domestic food security. Irrespective of self sufficiency in food grain at macro level, agriculture management through fixation of FGP Prices, Consumer Pricing Regulation and PDS will have a larger play compared to securing the Food Security substantially on home (Banik 1997; Goyal 2002) Governments insulate farmers against low and unpredictable agricultural prices by interfering in a significant portion of the food market. Nonetheless, ineffective pricing often leads to negative outcomes in terms of people's poverty to food. Regrettably, the paper is unable to deal with this important dimension of the food security (Banik 1997).

REVIEW OF LITERATURE

The State of Food Security in India: Trends, Patterns, and Factors

In an article entitled "Food Security in India: Trends, Patterns and Determinants," authors Anjani Kumar, M.C.S. Bantilan, Praduman Kumar (all affiliated with the International Crops Research Institute for Semi-Arid Tropics), Sant Kumar Singh (Project Directorate on Animal Disease Monitoring & Surveillance) and Shiv Jee declared that all three dimensions of food security are related to each other based on latest availability–accessivity — absorbability situations in India. We have also results showing food management practises, and impacts on food security. The persistence of malnutrition indicates the need for measures to more sustainably increase food supplies in future, notably through protracted effort at enhancing productivity.

**Suriya Kumari and Candida Smitha**

A belt-tightening and simplification of the food delivery system is needed. Further research is needed to understand why PDS always does bad in certain states and fairing well some other places. The fate of the NFSA will be largely decided through how successfully PDS is implemented across India. Since it is well known that dietary intake and household income are positively related, a most obvious conclusion is to increase the provision of anti-poverty programmes for almost all across country development planner while ensuring better results. Improve the productivity of public spending and strength social safety net proposals (MNREGS, ICDS, NFSM, Mid – Day Meal, PDS etc), should be taking into account greater significance in the country's forthcoming planning exercise. If successful states are efficiently managing their PDS, the underperforming states should adopt it. So, you can go for a different PDS system in these states.

Vision 2020 for Nutrition and Food Security

Despite announcing a plethora of programmes for tackling food insecurity, there was no significant improvement in the low energy and high rates of malnutrition as indicated by R. Radhakrishna and K. Venkata Reddy [Food Security & Nutrition: Vision 2020 - An Academic document]. Global improvement in nutritional status also remains slow. He said: 'Nearly half of the population are chronically undernourished, with elderly people and mums and kids at risk in families on low incomes. Even in homes subjected to prolonged malnutrition, the share of consumption expenditure spent on food is very gradually decreasing. We should be quite concerned that 30% of those in the lowest income quintile are food insecure. Not even the middle 40% are safe from this. Auctioning food also did little to end mass hunger. Income poverty, further reduced at the current growth rate, should be substantially on its way to eradication by 2010—even though food insecurity may continue in some impoverished regions. In addition, the recent move towards more market-oriented (and global) macropolicies mean that poorer households are at risk to be a mechanism through which uncertainty in the marketplace is passed on. The consequence of this is that a range of programs has to be targeted specifically at the poor. Bringing in dietary change is a necessary condition but not a sufficient one to fight malnutrition in India. Other leading cause of malnutrition is such as gastrointestinal and respiratory infections (linked with a high prevalence), behavioural factors like incorrect feeding or weaning practises, besides insufficient food consumption. These are all contributing to the poor digestion of what you eat. Although it provides more levers of government intervention, economic growth is unlikely to have a large effect on nutrition in the near future unaided. But until we are able to feed all our citizens adequately then food initiatives must be effective and efficient.

Facts and Interpretation about Food and Nutrition in India

Jean Dreze writes in a recent paper "Food and Nutrition in India: Facts and Interpretations," referring to Angus Deaton's essay on the same topic. It tries to solve some mysteries — including a prediction of the steep reduction in average calorie consumption over the next 25 years. The fall in real per capita spending has taken place at every level of the income distribution, even though both real incomes and the relative price of food are little different from where they were 60 years ago. One hypothesis holds that the change in supposedly underserved hunger has four catalysts (less exercise, a healthier planet or fewer environmental toxins); one of these is also responsible for most allegedly under eaten calories. That being said, this does not mean that Indians are devoid of calorie deficits at all; quite to the contrary in fact. These failures are manifested in some of the worst anthropometric indices in the world and should have long been a source concern given how sluggish their performance is. Nevertheless, current trends remain ambiguous and enhanced nutritional surveillance is urgently required.

India's Food Security: Progress and Issues

The article, "Food Security in India: Performance and Issues," was written by Prof. Kalpana Singh. She stated that one of India's policies' top priorities has been the population's access to food and nutrition. The three crucial elements of food security are accessibility, absorption, and availability (nutrition). All three of these are connected. This paper's main goal is to evaluate India's performance in terms of these three aspects of food security. The average annual growth rates in food grain production yields and area under cultivation have been calculated for five time periods: before the green revolution (1950–51 to 1966–67), during the early green revolution (1967–68 to 1979–80), during the mature green revolution (1980–81 to 1989–90), during the early economic reforms (1990–91 to 1999–00), and during

**Suriya Kumari and Candida Smitha**

the economic reforms (2000-01 to 2011–12). India's production of food grains had decreased when it entered the era of globalization. The free market has hurt food grain production, and since the New Economic Policy (NEP) was introduced in India, the growth rate has decreased. With respect to the accessibility aspect of food security, a long-term trend in household consumption patterns indicates a decrease in per capita direct food grain intake. Furthermore, India hasn't had the best track record when it comes to food security and nutritional outcomes. The World Food Security Index 2012, released in New Delhi in September 2012, categorized India as "moderate". It ranked India 66th out of 105 nations and concluded that the biggest danger to the food security of Indians is not availability but rather price. India scored the lowest (38.4) for food access and the highest (51.3) for food availability. It also highlights how inadequately its infrastructure supports the effective distribution of food. In a similar vein, India fell to 70th place on the 2013 Food Security Index. These are paradoxical times, and the issue is not so much a scarcity of food as it is a deficient distribution system.

India's Food Security: Problems and Difficulties

The scientific essay 'Food Security in India: Problems and Challenges' by Pramod Kumar, P. Anbukkani, D.R. Singh, and Amit Kar states that while half of India's population faces severe famine and droughts, the other half struggles to put food on the table. India is the country with the greatest number of hungry people in the world, with over 200 million individuals. India's food security situation is described as "alarming" by the 2013 Global Hunger Index (GHI), which ranks 63rd out of 84 countries with a GHI of 23.90. One of India's primary worries regarding food security is the impact of such large-scale government purchases of food grains on open market pricing. Identify the primary areas for PDS reform and alternative approaches for providing eligible families with food grains and subsidies in light of the current distribution system's flaws and inefficiencies. It is a positive step toward a universal right to food that ensures that everyone has access to foodgrains subsidized by the PDS. It is also said that identifying and excluding the rich would be significantly easier than doing the same for the poor. Systems of distribution, storage, accountability, and monitoring need to be implemented to guarantee minimal leakage. Decentralized procurement needs to be made available and implemented. There is a need to improve the purchase of coarse cereals and expand the procurement net to include more states. Food coupons or entitlements linked to Aadhaar cards will eliminate the need to buy and distribute more than 500 lakh tonnes of foodgrains each year, as well as the problem of diversion.

India's Food Security: Concepts, Realities, and Innovations

A article named 'Food Security in India: Concepts, Realities & Innovations' is penned by Prof. BJ Lathi and Prof. Parag Narkhede. They stated that global economic and environmental factors are having an increasing impact on food security in general. As a result, food shortages have an impact on food prices, which can worsen humanitarian crises and lead to social and political unrest. Studying the concept of food security provided in the 1996 World Food Summit's Rome Declaration on Global Food Security is preferable in this context. So, the researchers tried to understand how a global issue was impacted by food security. The Declaration of Rome declares that "food security exists when all people, at all times, have physical and economic access to sufficient, safe, and nutritional food to suit their dietary needs and food preferences for an active and healthy life." Based on similar tenets, India has implemented a range of policies aimed at ensuring food security for its populace, ranging from concerted efforts to boost agricultural output to significant market interventions designed to stabilize prices. Initiatives have also been implemented to improve public distribution of food and income-generating programs to enhance the poor's access to it. India is under investing in agriculture compared to other nations since investments are usually reduced more than other expenditures in all sectors, including agriculture, when both public and private budgets are shrinking. In the attempt to handle the load of successive economic and food crises, some bio-nanotechnology breakthroughs will greatly help food security. Thanks to bionanotechnology, agriculture will move from the era of genetically modified (GM) crops to the fascinating new realm of atomically altered creatures. The aforementioned subjects are covered in this essay's three sections: conceptual analysis, the actuality of governmental action, and advances in food security.

OBJECTIVE OF THE STUDY

1. To study about the Food Security and Insecurity in Indian context,
2. To examine Sustainable Development Goal No. 2,

Suriya Kumari and Candida Smitha

3. To examining initiatives taken by research organisations to promote eradication of poverty,
4. To find the Strategies of Food Security to achieve the sustainable development goal no. 2.

METHODOLOGY

The current study can make use of secondary data and is grounded on both qualitative and quantitative methodologies. Secondary data were gathered from a variety of official websites, including those of national and international organizations as well as journals, books, papers, and other publications.

DIMENSIONS OF FOOD SECURITY

When everyone has access to enough food at all times, there is food security.

- ✓ is reasonable, secure, and healthy.
- ✓ is socially appropriate.
- ✓ satisfies particular nutritional requirements
- ✓ is acquired for everyone in a respectable manner
- ✓ is generated in methods that are ethical and fair to society.

Security, system, and sovereignty are all components of food security. A part of the food system is...

- all those who cultivate or harvest food, including farmers, fishermen, and hunters
- energy, earth, air, and water (the physical environment) food packagers, marketers, advertisers, and processors (food industry?)
- food wholesalers and the storage facilities for food
- the modes of transportation, including cars, trucks, boats, and railroads
- locations where food is sold, such as supermarkets, markets, bakeries, farm stalls, co-ops, and restaurants
- Institutions that serve meals, such as hospitals and nursing homes
- Governments, laws, and taxes (political and economic environment), the healthcare system, labour force, labour supply, educational system, and technology (the social, educational and cultural environment)
- anybody who eats!

The sovereignty over food is.

Self-determination of peoples and communities so that they plan their own agriculture, labour, fishing, food and land policy which relates with the social labor economic cultures within ecologically sustainable concepts. The right of peoples and communities to define their own agricultural, labor, food, health and development policies; protect the commons; improve soil quality; clean water rights.

THE SEVERITY OF FOOD INSECURITY

Food insecurity and poverty go hand in hand. Food insecurity in India is also brought on by a declining pace of agricultural growth.

- ✚ One billion people are malnourished worldwide, with 800 million of them living in rural regions.
- ✚ FAO: From 2004 to 2006, there were 16% more hungry individuals in developing nations than there were in 2009.
- ✚ Food grain production in India increased from 50 MT in the 1950s to over 200 MT by 2000, but daily availability increased from 395 g to 500 g. (it fell to 445 grammes in 2006)
- ✚ Indians consume 68 kilogrammes of milk and milk products annually per person, compared to 249 kg for Australians.
- ✚ Almost 200 million people are underfed despite their being a food grain supply of roughly 62 MT and an annual requirement of about 20 MT.
- ✚ The discrepancy in calorie consumption between the top and lowest thirds of the population—the top third consumes 2400 kcal—and food poverty is another factor.

Suriya Kumari and Candida Smitha

- ✚ More than 30% of mothers and more than 50% of children under the age of six are undernourished.
- ✚ Agriculture's growth rate decreased from about 6% in 1992–1993 to less than 3% in 2006–2007. It was 0.2% the prior year.
- ✚ Agriculture investment decreased from roughly 2% in 1990–1991 to 1.7% in 2004–2005.
- ✚ In rural areas, the annual job growth rate fell from 2.07% in 1987-1994 to 0.66% in 1993-2000.
- ✚ Between the farm and the table, 50% of the food is lost.
- ✚ In India as well, obesity is an issue due to junk food, a lack of exercise, and other factors.
- ✚ Agriculture is not only a victim of climate change but also a contributor to it, making it a severe danger.
- ✚ Other dangers include famine and desertification.

Sustainable Development Goal 2 ("zero hunger")

Zero hunger" is the second Sustainable Development Goal, or Global Goal. It was created in 2015 and is one of the 17 Sustainable Development Goals of the United Nations. "End hunger, establish food security, boost nutrition, and promote sustainable agriculture" was the official name. SDG 2 describes the interactions between the food system, nutrition, rural transformation, and sustainable agriculture. Over 690 million people worldwide, or about 10% of the global population, are estimated by the UN to be food insecure. That indicates that one in nine people never eats before going to bed. This includes the 20 million people who are currently under danger of starving in South Sudan, Somalia, Yemen, and Nigeria. Eight goals and fourteen "outcome targets" make up SDG 2, which needs to be met. The following are the eight "ways of attaining" targets and strategies to support them: increasing access to food and reducing the number of hungry people; eliminating all forms of malnutrition; strengthening agricultural practices and resilient food production systems; preserving the genetic diversity of domesticated animals, plants, and seeds; investing in research and technology; and removing trade barriers, market distortions in international agricultural markets, and food commodity markets and their derivatives. Following decades of reduction, undernutrition has increased since 2015. This is mostly because of the several stresses on food systems, such as the COVID-19 epidemic, the locust crisis, and climatic shocks. Due to the epidemic's stress and rising inequality, the most vulnerable individuals have also suffered from undernourishment due to an indirect decline in their purchasing power and the inability to produce and distribute food for themselves. The study estimates that by 2020, 142 million individuals will have undernourished as a result of the epidemic. Statistics on child wasting and stunting will increase as the virus spreads. Depending on the assumption of economic growth, the COVID-19 pandemic "may add between 83 and 132 million people to the total number of undernourished in the world by the end of 2020." The alarming signs and symptoms of the epidemic persuade us that there is still more work to be done before the entire world "leave no one behind" in the pursuit of a future free from hunger.

PROGRAMS AND ORGANIZATIONS

The following organizations, programmes, and funds have been established to combat hunger and malnutrition: United Nations Children's Fund (UNICEF): In more than 190 nations and territories, UNICEF strives to protect children's rights, save lives, and enable them to reach their full potential. In addition to providing social protection services that ensure children have a healthy diet, UNICEF works to end all kinds of malnutrition by expanding access to high-quality nutrition, healthcare, clean water, and sanitation for mothers and children. UNICEF issued a warning despite its best efforts, saying that in nations like South Sudan where malnutrition is a concern and

Suriya Kumari and Candida Smitha

prevention measures are insufficient, the organization will step up treatment and care going forward to ensure the survivors survive childhood and avoid long-term effects.

The Food and Agriculture Organization (FAO); is a specialised organisation of the United Nations that was founded in 1945. Aiding in the eradication of hunger, food insecurity, and malnutrition is one of FAO's strategic goals.

The World Food Programme (WFP): which was established in 1963, is the principal UN body in charge of responding to food emergencies and running global hunger-reduction initiatives. The ECOSOC page above includes reports from the WFP's Executive Board and on its yearly performance.

International Fund for Agricultural Development (IFAD)

IFAD was founded in 1977 with the goal of working with impoverished rural communities in emerging nations to end rural poverty.

World Bank

The World Bank, which was established in 1944, regularly participates in funding food-related programmes and initiatives.

United Nations Environment Programme (UNEP)

Founded in 1972, UNEP is the global organisation in charge of governing and advising on environmental concerns. Food security is one of the subjects the UNEP is now addressing.

Among the international NGOs are

Global non-profit organization Action Against Hunger (ACA) is dedicated to eradicating world hunger. In addition to giving people access to clean water to drink, wholesome food, and long-term solutions to hunger, it assists in feeding undernourished children. Founded in the United States, Feeding America is a nonprofit organization that runs more than 200 food banks. These food banks provide meals to over 46 million people through pantries, soup kitchens, shelters, and other community-based businesses. An organization called The Hunger Project (THP) works to abolish hunger on a sustainable basis. operates long-term, developing-country initiatives inspired by a particular subject, utilizing the tremendous power of rural grassroots communities to achieve family income health education and enduring benefits, spanning Latin America, Africa, and Asia.

OVERALL DEVELOPMENT AND DIFFICULTIES

While progress has been made, research suggests that over 790 million people worldwide remain hungry. Over the last 15 years, there has been real progress in the fight against hunger. In 2017 an event was organized as a side event to the High-level Political Forum on Sustainable Development "Accelerating progress towards achieving SDG2: Lessons from Country Implementation" and several ideas were discussed. It was being led by participants such as the French UN mission, Action Against Hunger and Save The Children in conjunction with Global Citizen. Starvation on the African continent will not have been eliminated by 2030! The world needs political will and ownership from countries to make progress towards SDG 2. It will also need to approach the challenge in a way that deals with issues of gender equity, spatial disparities and extreme poverty whilst enlarging our recognition around nutrition so as integrate into political leaders. It also demands concrete action including working sub-nationally, scaling up nutrition resourcing and a relentless focus on the first 1000 days of life while moving beyond immediate causes to narrow drivers of under nutrition as well as systemic elements along the whole food system.

The WFP Hunger Map displays information about world hunger in 2019

Mention of Important Value Chains and Food Systems by SDG 2 Targets are Ignored SDG 2 targets speak to increasing agricultural productivity and incomes of small-scale farmers, but larger-scale farmers can also earn little from farming; acknowledges 'sustainable agriculture' with no mention as what sustainability entails in any great detail; ignores the health dimensions associated with such diets. Also, the data needed for SDGs monitoring may not always exist (and be tailored) to capture nuanced relationships between the numerous goals of this overall agenda—

Suriya Kumari and Candida Smitha

as a considerable share of indicators currently used in support of SDGs monitoring were never designed specifically with respect to that global framework. SDG 2: SDG 2 progress is hampered by the lack of integrated or coordinated action at all levels, from food production to consumption. Melanesia conducted the first evaluation of SDG 2's food security targets in 2021. Reviews and research have concluded that the underlying root cause of people's bad health in this region is a "global syndemic" of obesity, under nutrition, and climate change. Progress under SDG 2 has been achieved in reducing stunting and wasting, however there is still a long way to go to slow the increase of diet-related non-communicable diseases (NCDs) and achieve food security across PSIDS. Urbanisation, changing lifestyles, imported diets and deforestation are eroding traditional agricultural biodiversity as well as the knowledge of smallholder food systems for Melanesians. Transitioning from conventional diets to smart nutrition will likewise accelerate global hunger. The review highlights that the long term goals for SDG 2 should concentrate largely on forging stronger ties between agriculture, nutrition and health.

GOALS, INDICATORS, AND DEVELOPMENT

SDG 2: The UN has defined constitutional framework based on 8 targets with regards to SDG and additional indicators of the same. It need to be completed by 2020, four of those must have been finished at some point in the decade and three are without a deadline. In addition, for each goal there are one or more indicators which follow up on progress. For SDG 2 the total number of indicators equals fourteen. The six objectives are:

- a universal supply of wholesome food
- Put an end to all types of hunger
- Boost the earnings and productivity of small-scale food producers by twofold
- Resilient farming methods and sustainable food production
- Keep the genetic variety in food production intact.
- Invest in technology, gene banks, agricultural research, and rural infrastructure.
- Prevent export subsidies, market distortions, and trade prohibitions pertaining to agriculture
- Assure steady markets for food commodities and prompt information access.

Food Security Techniques

- With an anticipated 9 billion people on the planet in 2050, productivity will need to quadruple to keep up with diminishing and degraded resources. India must produce 60 MT more rice than it produces now by the year 2030. Both agronomists and policymakers must overcome a significant obstacle.
- Appropriate solutions are needed in order to address vulnerabilities and modernise moderately. These are some things that maybe work on this moment. food production: raise the speed of food and having crop, area specific yield & productivity differences in agriculture which decreases (geo-specific food security) 4-5% agricultural growth rate Creating an Agriculture base literacy around the nation (like farm schools, etc)
- This includes any business implications (e.g., investment management, capital expenses and costs vs. benefits), that a farmer should be alerted about. instead: circular economy + organic manure (using biofuels, etc.), without synthetic pesticides and tackling the GM seed issue) = enhanced biodynamic farming.

Post-harvest management is required in agribusiness

We need innovative bold agri-entrepreneurship strategies for all-around success of not just crop management but also food management, knowledge and quality as this is what will determine the pace. For example, how should agri-entrepreneurship be developed within the greater context of social entrepreneurship that is nested on an environment-enterprise nexus building and managing natural (and in this case as well as with scarce examples material) capital. The right solution is that economic and political decisions must serve farmers, the environment, and democracy. making sure institutional reforms align with technological changes (eg. cheaper and cleaner energy technologies). The ultimate objective is 100 per cent financial inclusion as well: minimising agrarian distress and aiding in risk mitigation on-farms & off-farms, including the move from micro to macro financing with access of intermediation. This should be de-politicised and it may also need to remain a BEAUCRACY for sometime till the nation gets larger doses of bureaucracy immunisation. Growing civil society initiatives to improve production, management, delivery and research on stewardship of food in good governance

**Suriya Kumari and Candida Smitha****2nd Green revolution + Gramme (village) revolution → gene revolutions**

Highlighting these include scoping financial inclusion focusing on reach, dealing with poverty as an insecurity issue and new commercial opportunities for self-help organisations (SHGs) creating composite indicators of livelihood and food security (from production to acquisition, entitlement). And from the realization that both intellectually and in practice, policy making can never exist on its own. It is interdisciplinary and links in various social, economical, ecological and developmental facets that are pertinent to the economy as a whole but more importantly food security.

OBSERVATION AND CONCLUSION

We need food security of the individual, household food securities united at district level to feed into national and global. The Agriculture Department needs to promote an Integrated Farming System (IFS) for uplifting crop yields in India. The environment aside, the other issues include food vs. productive (healthy) food ethnic influences etc. No food security policy should be created at the cost of a farmers dignity. Notice being given for food security bill into some regions is being introduced the partnership of private-public. All food security actors must cooperate and articulate their goals. Disbursement of treadle pumps will, however create untapped resource development so as to change the course for low-income farmers and those who have lacked land lease rates in the agriculturally-lean eastern and north-eastern regions. This way, in the water-abundant areas of both countries, millions of micro-economics units will be developed that ensure use for sustainable management and livelihood. Low-cost water-saving devices will allow even the poorest sections of communities to engage in irrigated agriculture with almost no water, such as farmers producing \$2 tomatoes under plastic multiple kilometres away from trees – a demonstration project focusing on permanence means that people are left untouched (they remain unperturbed) and 30 land-based projects enrich more every week. We need to create and make plans in such a way that more bio-fertilizers are used, the method of farming should be sustainable. Small and marginal farms can be offered subsidies to adopt biogas plants as well as modern composting techniques. Community-based programmes for enhancing biomass production from common property wastelands can also be looked at. Training oriented extension activities are required on efficient composting, organic farming practices; biogas and low cost water saving technology is carried out. Further research in agriculture should not only be converted one from supply side to demand oriented by integrating physical and socioeconomic conditions because of the boundaries involved as facets. By reducing the aggregate demand face of water in agriculture, these reforms to make private and tradable some rights about controlling who gets how much water from public reservoirs — together with using farmers' right-based groundwater powers on those reserves for good or rental reasons – have significant potential to change farm outputs. It will also bring more access and control over the groundwater as well as managing dopa irrigation waters for food production and household foods security.

ABSTRACT

This paper critically examines the MAHILA E HAAT initiative and various schemes of National Rural Livelihood Mission (NRLM) which have created transformative change in financial empowerment among rural Women Entrepreneurs(Tumkur District, Karnataka.). This paper analyzes the effectiveness, problems as well constraints of these schemes and also to examine extent they can act as a change agent in improving women's life particularly rural. The analysis of the implementation, results and feedback from different stakeholders will thus seek to provide useful information did needs response on how these initiatives can foster de empirical landscape Forward while empowering women in this particular region.

Keywords: Economic Independence, Economic Empowerment, Financial Empowerment, National Rural Livelihood Mission, Poverty Alleviation.

INTRODUCTION

Rural women play an important role in the socio-economic fabric of India and their economic independence is one of the main drivers for national development. Against this backdrop, the significance of MAHILA E HAAT initiative and NRLM schemes at reclaiming rural women for Tumkur District (Karnataka) women economic status are explored.

**Sharada and Nirmala****Background**

As a predominantly rural district, Tumkur reflects the complex intricacy of challenges and opportunities interwoven into lives of its fairer sex. Projecting power of financially independent women in transformative community development, the launch MAHILA E HAAT and NRLM schemes are powerful narratives.

Significance of the Study

Getting knowledge of these schemes is very important to know their actual effect on the ground where Rural Women are residing. This study hopes to unravel some of these characteristics beyond quantitative assessments, particularly in terms of understanding the qualitative side of empowerment and learning from experiences — which may inform future ways forward for beneficiaries as well a wider efficiency enhancement involving such initiatives.

Objectives

1. To research on dependency and development levels (financial) among the rural women in India
2. To assess the extent of Mahila E Haat in Creating Entrepreneurial opportunities for rural women.
3. What role do the NRLM schemes play in empowering women financially in villages of Jonawada Constituency?
4. Implementation challenges of MAHILA E HAAT and NRLM schemes?
5. How much game changing are these initiatives in bringing economic empowerment among the women of rural areas.

METHODOLOGY

The study uses an integrated research approach, exiting collection data from multiple sources such as reports, documentation and interviews with key stakeholders. For the assessment of impacts and effectiveness, qualitative analysis will be adopted in MAHILA E HAAT and NRLM schemes. Study involves synthesis of data from collected Secondary data through reports, documentation and stakeholder feedback related to MAHILA E HAAT and NRLM schemes.

The importance of financial empowerment on overall development of rural women in India.

How financial empowerment is significant towards the holistic rural women development in India and way forward. Some of the significant aspects to throw light on regarding financial empowerment are:

- **Economic Independence:** Financial empowerment helps to equip women in the rural area with a means for making money on their own so that they will not continue asking people around them as such reducing dependency and opening up an economic independence. This empowerment gives them the ability to make decisions around money, earn part of their own income and work towards living a life on their terms.
- **Poverty Alleviation:** Rural women are able to experience a reduction in poverty through their engagement in income-generating activities and accessing financial resources, which they can infuse into their households and communities. Financially empowering families opens the door to ensure that entire communities are lifted out of indigence.
- **Education and Skill Development:** Women who are financially empowered often think about investing in education & skill development for themselves as well as their children. This helps in building up human capital in the community, having a positive impact on future generation and breaking intergenerational cycle of poverty.
- **Health and Wellbeing :**More resources of money means better health conditions, access to healthcare facilities, nutritious food intake etc. When women are financially empowered, households allocate money for health and healthier families result in healthier communities.
- **Entrepreneurship and Livelihood Opportunities:** It enables rural women to start small businesses or entrepreneurial ventures. Not only that it lifts up their economy but also helps in the local economic development and locals are getting employment.

Sharada and Nirmala

- **Women Empowerment and Gender Equality:** Access to finance is the essential driver for women empowerment as a whole. This gives girls the self-assurance and confidence to take part in decision-making, defy gender norms & stand up for their rights. This, in turn helps to create more gender equitable families and communities.
- **Community Development:** Economically empowered women are known to give back in productive ways by helping improve local infrastructure, assist with education and be a part of social projects beneficial for community. These combined efforts contribute towards complete rural development.
- **Resilience to Shocks:** The women who are financially empowered will be able stand against sudden economic shocks and uncertainties. AJ: What we know from research is having savings, access to credit and multiple sources of income will insulate families against any kind of shocks that come their way which ultimately makes them more resilient.
- **Access to resources/market/opportunities:** Economic empowerment improves access for women to be able go-outs and as well focused group discussions. Empowerment refers to the increased participation of women in economic activities beyond traditional roles, which makes them broadened and result an important stimulant for overall community development.
- **Social and Cultural Transformation:** As for as the social perspective is concerned; when a community starts earning money with their own potential lots of positive changes occur in society. Women engage in compensation for their work, it changes society to know that women make a significant contribution and the community emancipates.

The impact of Mahila E Haat in fostering Entrepreneurship among rural women.

Entrepreneurship Promotion

- **Impact:** A platform for rural women to display & sell their products, promoting entrepreneurship.
- **Good result:** This platform can be useful for women to introduce local handmade and traditional businesses(artisans) with the main aim of selling their products (local, handmade or artisan).

Market Access

- **Impact:** Women entrepreneurs can access a broader market online from local communities.
- **Good result:** improved access to women-owned products, which facilitates exposure and transactions between producers/suppliers of business opportunities.

Financial Independence:

- **Impact:** Economic empowerment of women — through enabling her to earning income from their entrepreneurial ventures. So a man who earns in the region of €250,000 can afford children and support his wife if she choses to stay at home (but obviously think about putting your eyesight onto optimum fertility) but as it takes two years from fat sperm trying again after an "accident" decides what you're doing with him during maternity leave seems like you've got everything mixed up.

Skill Development

- **Result:** Skill Development, Creativity amongst Women.
- **Positive Outcome:** As a result, women not only acquire economic skills but also get business acumen, how to market their products and financial management which builds on the entrepreneurial capabilities.

Diversity of Products:

- **Impact:** Mahila E Haat works towards diversifying the product base of women entrepreneurs.
- **The Good News:** This diversity breeds innovation and provides that women have access to all market segments, meeting different consumer needs.

Networking and Collaboration:

- **Impact:** The platform allows women entrepreneurs to connect and collaborate with each other.

**Sharada and Nirmala**

- Collaborations can also give rise to shared assets, partnerships and a positive atmosphere which is great for business thriving.

Cultural Preservation:

- **Impact:** Mahila E Haat Sale of handmade and traditional products are promoted through this initiative.
- **Positive Result:** This leads to the Conservation and dissemination of cultural heritage, for women in turn creates; Content that helps preserve traditional workers.

Increased Visibility

- **Result:** Provide women entrepreneurs at national (and global) level visibility.
- **Impact:** More visibility = more customers/clients and increased presence in market for women entrepreneurs.
- **Positive Outcome:** Greater discoverability creates an opportunity to reach a larger demographic resulting potential increase revenue & marketplace currency>.

Capacity Building

- **Action:** Empowerment of women entrepreneurship under Mahila E Haat can solve the capacity problem.
- **Benefits:** Market Reach, customer and business feedback become an opportunity to hone relevant skills for better negotiating in the world of Business female entrepreneurs. It should be remembered that the extent of Mahila E Haat in fostering entrepreneurship among rural women may differ from region to regions and community to communities. Measuring the effectiveness of the program would include tracking how many more women-led businesses have started, changes in incomes and overall economic self that participating has entailed for these other – but by no means all — women. There is also a much more detailed information available through official reports, case studies or evaluations of Mahila E Haat) that can provide an accurate and updated picture.

The financial independence of rural women in Tumkur District; A case study: NRLM Schemes**Overview of NRLM**

The National Rural Livelihood Mission (NRLM) is a flagship programme of the Ministry of Rural Development, Government of India being implemented across all states by taking into account local socio-economic factors.

Implications for Financial Inclusion**Livelihood Promotion:**

- **Target:** Improving livelihood opportunities for rural women.
- **Mechanism:** The NRLM supports a range of livelihood activities including skill development, enterprise training and access to credit so that women in rural areas are able to set up income generating units and sustain.

Self-Help Group (SHG) Formation

- **Aim:** Cultivating community power and economic empowerment
- **Mechanism:** NRLM works on the formation and capitalization of SHGs to enable resource pooling, credit access, combined ventures by women resulting in improved fiscal security.

Credit and Financial Services:-

- **Principle:** Regulate to expand financial inclusion and use of credit.
- **Function:** NRLM is intended to provide the poor, rural women direct access to micro-credit and savings alongside insurance facilities for empowering them with funding of different items, both consumable as well as non-consumables.

Skill Development and Capacity Building

- **Aim:** Improve income-generating capacity
- **Mechanism:** NRLM aims to empower rural women by offering skilling programs where they are trained in a variety of trades and crafts which helps them be employed and earn an income.

Sharada and Nirmala

Enterprise Promotion

- **Objective:** Encourage creation and expansion of entrepreneurship and enterprises.
- **Mechanism:** NRLM promotes and supports rural livelihoods for women by setting up or expanding businesses which result in higher household income generation ensuring self-dependence.

Market Linkages

- Facilitate market linkages for rural producers.
- The goal is that NRLM needs to be robust mechanism with appropriate policy enablers in place so as rural women produce sustainable products provide them away of life line for selling the same at a reasonable price by entering dealers / retailers giving viable and increased income under product trading post sale.

Social Mobilization and power

- **Objective:** To make the advancement of rural women in social,.
- **Mechanism:** NRLM promotes social mobilization and empowerment interventions that would require women to play a leading role in the decision-making processes, thereby scale up inclusive participation particularly from gender lens for development.

Natural Resource Management and Sustainable Agriculture

Objective: To increase sustainable agriculture practices.

Procedure: NRLM promotes organic agriculture and sustainable management of natural resources among the women beneficiaries who engage in rural productive activity. The NRLM schemes can be added to this during the time of implementation such as new being implemented now or planned by GoK in future Learn more For up-to-date and detailed information on how individual NGOs do financial empowerment for rural women, please refer that official report; district level NRLM document go Debug (Provide) source etc Rather than giving state wise funds received from MGNREGAS it is best course if while communication via Channel iGuess-income-increment-policy, one should ask them: Based on materials that we have reviewed you are also implementing. Which all? Why not include hereLet's get specifics regarding what your organization does towards doing bank accounts for Women want might financially empowered(mastered defining Income Increment Policy clearly)?

What are the challenges faced in implementation of MAHILA E HAAT and NRLM schemes?

Specific challenges may differ with respect to the local context as well as on a case-to-case basis but some common issues faced while implementing under schemes such MAHILA E HAAT and NRLM scheme are:

Challenges in MAHILA E HAAT

Limited Digital Literacy

- **Challenge:** most women, especially in rural areas do not have access to and familiarity with digital technologies that prevents them from being involved into an online marketplace (MAHILA E HAAT).
- **Result:** Extensive digital literacy programs can be weaved in to add value and touch upon various parts of the ecosystem.

Logistical Constraints

- **Challenge:** As in any remote area, there might be challenges with logistics (delivery of goods and product transportation).
- **Problem :** There is a need for efficient delivery mechanisms and solutions to overcome logistical bottlenecks, which would make the platform more functional.

Product Quality Assurance

- **Challenge:** It is difficult to monitor quality of the products on sale and question may be raised for satisfaction level by customer & credibility by MAHILA E HAAT.

**Sharada and Nirmala**

- **Solution:** To overcome this issue, quality control measures have to be taken and working on product standard training with certification processes.

Market Competition

Women entrepreneurs are increasingly entering into e-commerce, but being seen in the online market and shining among its products is another challenge.

The way to introduce those extra features is marketing support, branding assistance and how the product be introduced in program.

Challenges in NRLM Schemes**Limited Access to Credit**

- **Problem:** While expanding credit can create an access banks might not in those places, some women face additional hurdles to qualify for loans.
- **Solution:** This problem can be addressed by increasing the financial linkages, imparting literacy about finance and augmenting accessibility to banking facilities.

The Lifetime of Livelihoods

- **Challenge:** One concern will be how livelihoods created through NRLM can be made economically viable in the long-run.
- **Solution:** including market linkage strategies, sustainable livelihood practices and long-term support and mentorships can help make sustainability profits.

Social and Cultural Barriers

- **Challenge:** Women maybe prevented from participating in economic activities due to entrenched social and cultural norms.
- **A potential solution:** programs to deconstruct these hegemonic masculinities and promote gender neutral practices through the use of sensitization, community engagement and awareness.

Monitoring and Evaluation

- **Hurdle:** Monitoring and evaluation of the impact from NRLM schemes require reliable systems, which may not be functional in several areas.
- **Resolution:** The issue can be addressed through the facilitation of adaptive management wherein, a system is strengthened with monitoring and evaluation mechanism using technology along with active participation from local community in assessment process.

Infrastructure and Connectivity

- **Challenge:** Absence of appropriate infrastructure, lack of connectivity in rural areas can hinder smooth implementation of NRLM.
- **Answer:** Investment in rural infrastructure such as roads and communication networks improves overall connectivity / accessibility. Overcoming this challenge will entail a comprehensive response, including cooperation of government agencies with NGOs and local communities to implement the MAHILA E HAAT programme as well as schemes like NRLM in an effective manner.

But to what extent are these initiatives game-changers in empowering rural women economically?

The game-changer in improving the economic condition of rural women or designed impact through schemes such as MAHILA E HAAT and NRLM would depend on program efficacy, local conditions, community involvement etc. We explore the most important factors when considering each here:

Sharada and Nirmala

MAHILA E HAAT

Market Access and Visibility

- **Potential for Impact:** MAHILA E HAAT is projected to enable rural women, artisans etc sell their products and services by releasing them from the limit of local reach.
- **Game-Changer Factor:** The platform has the potential to raise rural women out of poverty and into better economic situations by opening them up to a larger customer base granted that it is promoted well enough, creating other ways for customers in order convenient services Board Members participated more actively diff. Have there been entrepreneurial opportunities?

Description of Impact

Making women entrepreneurs by selling handmade, handicrafts and traditional art products. Why MAHILA E HAAT is a Game-Changer: With this rise in Internet usage, it will be instrumental to accelerate entrepreneurship and provide women an outlet to use their skills & creativity for economic rewards.

Financial Inclusion

Potential Impact: Online transactions, the golden rule within e-commerce is that you should ease on of these to conduct.

Game-Changer Factor

MAHILA E HAAT can be a game-changer, if successful in breaking the barriers for hundreds of rural women to have financial access and inclusion hence managing their finances better.

NRLM Schemes

Self-Help Groups (SHG) & The Power Of Collective Block adenone

- **Potential Impact:** NRLM lays great stress on the formation and building up of SHGs, thereby promoting collective savings approach as also participation in decision-making.
- **Game Changer Factor:** As far as women are concerned strengthening of collectives can be the game changer on economic empowerment, so that they could mobilize themselves economically to get better terms in resources/economic activities.

Livelihood Diversification

Probable Development Outcome

Diversification of livelihoods through skill development, and enterprise promotion

Game Changer Potential

NRLM also has the potential to be a game changer in that rural women can diversify their income sources, reduce dependence on one livelihood and improve overall economic resilience.

Creating Market Linkages and Integration of Value Chain

- **Potential Impact:** Linking rural producers to Markets & value chain interventions.
- **The Game-Changer:** With a win, NRLM has the potential to completely change the face of rural women by providing them access to wider markets and ensuring genuine prices for their products.

Sustainable agriculture and natural resource management

Please explain the overall significance Public Awareness: Promoting sustainable agriculture as well in natural resource management.

A Energizing Change

NRLM has the potential to be a game-changer by harnessing and empowering women at rural areas in resource hay practices thereby ensuring long term economic as well environmental sustenance.

**Sharada and Nirmala****Financial Services and Credit**

- **Expected Impact:** Increase in financial and credit services thereby improving the standard of living.
- **Game-Changer Factor:** If implemented as it should, then the NRLM has a gamechanger in addressing one of its fundamental challenges from poor access to credit, which is empowerment for rural women to invest and start livelihood enterprises. To be real game-changers, these endeavours must respond to the myriad realities of diverse communities they serve; celebrate women as active participants in this journey and invest widely into enabling policies and infrastructure development. There is a strong need of constant monitoring, evaluation and adapting as per feedback from ground to ensure sustenance of empowering economic status women residing in rural areas.

CONCLUSION

MAHILA E HAAT & National Rural Livelihood Mission (NRLM) join hands to complement rural development processes in the hitherto most backward District of Tumkur in Karnataka, weaving a narrative that glorifies every woman — who is central to grassroot carrying capacities everywhere. Conclusions On Closing These Examples : This exhaustive analysis of these initiatives makes it possible to reach several key conclusions which we discuss as parting thoughts. MAHILA E HAAT and Entrepreneurship Among Rural Women — A Multifaceted Impact Acting as a virtual marketplace, Splatters has ushered in entrepreneurship by allowing women to exhibit and sell their products. As a result, there has been more money flow new skills and traditional crafts have not died. However, there have been observed challenges of digital literacy and logistical constraints that requires targeted interventions to maintain success. Contrarily, NRLM has been instrumental in the promotion of entrepreneurship through the formation and nurturing of self -help groups (SHGs) as well as various livelihood activities. SHGs have promoted a sense of togetherness among women which provides them strength; collectively they can access credit, become engaged in joint ventures and help each other participate stronger within the decision making process This diversification of livelihoods has made women more resilient towards economic and uncertain shocks. Financial Inclusion and Empowerment of Rural Women in Tumkur District through MAHILA E HAAT and NRLM It has also helped for easy money transactions and financially managed by women SHGs through MAHILA E HAAT's online platform. The aim of NRLM to provide credit, financial services and skill development has enabled women in taking informed decisions towards finance reducing the bottlenecks that arise with low levels of access.

The examination of these two cases brings to surface a series of challenges faced by both. The MAHILA E HAAT faces challenges concerning the digital literacy issues, logistical constraints and product quality assurance. NRLM grapples with problems like limited access to credit, viability of livelihoods, and social/cultural barriers. A critical aspect of the way forward is to acknowledge these challenges in order to come up with strategies and interventions that are contextualized for Tumkur District. The other hand, the exam also emphasized the positive initiatives of these hands on a total community development. MaDHILA E HAAT and NRLM not merely ensure in completing financial independence at the individual level but helps to develop community development concurrently. Together, the saving of cultural heritage and healthcare, education and other facilities like infrastructure improvements have helped changed for a better outcome in this part. In conclusion, it can be derived from the above analysis that MAHILA E HAAT and NRLM have managed to get a large ground but there are some areas which still need attention. Recommendations: Tailored digital literacy programs; Logistics Cutting down the red tape and e-commerce system improvement for MAHILA E HAAT, Targeted interventions to improve credit access and sustainability of NRLM. Enhanced monitoring and evaluation efforts should make sure that they are linked to community insights, leading to sustainable actions. In conclusion, both these programs MAHILA E HAAT and NRLM have become the agent of change in Tumkur District toward economic empowerment for women. As stakeholders and policymakers continue in to the journey, will these insights be their compass leading towards a more inclusive sustainable development for these women who are making Tumkur's traditional rural economy vibrant.

Sharada and Nirmala

ABSTRACT

The utilization of digital transformations and blockchain technology is crucial in enabling economic progress. This study is highly significant as its objective is to analyze the impact of disruptive technologies on the expansion of information technology (IT) firms in India. The aim of this study is to offer significant insights into the comprehensive performance of the Information Technology (IT) sector. To accomplish the study's aims, a systematic and comprehensive literature review is performed. Disruptive technologies have been seen to augment productivity, boost quality, and streamline usability inside organizational contexts. This phenomena can be attributed to the inclination of disruptive technology to automate manual processes, optimize operations, and eliminate inefficiencies. Moreover, the application of these technologies might lead to improved quality, hence potentially fostering higher levels of consumer satisfaction and loyalty. This study offers valuable insights for managers and decision-makers in these organizations, allowing them to identify specific areas where disruptive innovations can have a significant impact on important performance metrics, such as revenue growth, market share, and customer satisfaction. The results of this study might significantly contribute to the development of a theoretical framework that efficiently utilizes disruptive innovations to improve corporate performance in the IT industry in India.

Keywords: Disruptive technologies, organizational effectiveness, Information technology, Industry 4.0

Soumya S Nair et al.,

INTRODUCTION

The importance of Industry 4.0 in the Indian economy should not be underestimated. India, a rapidly developing nation, has a great predisposition towards embracing technological advancements to boost its economic growth and global competitiveness of Industry 4.0, with its focus on automation, artificial intelligence, and data analytics, has the potential to bring about major transformation in several sectors in India, such as manufacturing, healthcare, agriculture, and logistics (Viraj Vijay and et al, 2019). Indian IT firms possess the capability to make a substantial impact on India's digital revolution and economic progress by employing innovative concepts and establishing reliable assessment mechanisms to analyze crucial performance indicators (Rawat, Pratih & Purohit, Jayant, 2019). Furthermore, the use of Industry 4.0 technologies has the capacity to improve production and efficiency in these sectors. Within the realm of manufacturing, automation possesses the capacity to optimize production processes, mitigate mistakes, and bolster overall quality control. Artificial intelligence (AI) can have a substantial impact on the healthcare industry by aiding in the early identification of diseases and enabling personalized treatment methods (Hoyer, W. D., et al. 2020). Moreover, the application of data analytics has the capacity to enhance agricultural operations, leading to higher crop output and more efficient allocation of resources. The full implementation of Industry 4.0 has the capacity to position India as a significant player in global innovation and propel its economic progress on the world stage (Cirillo, V., et al, 2023). Disruptive innovations refer to the introduction of new and unique products or services that cause a significant and fundamental change in an industry or market (Si, S., & Chen, H., 2020). Often, these technological improvements provide significant difficulties for established businesses and their operational structures, forcing them to adapt their tactics or risk becoming outdated (Palmié, M., et al., 2020). Disruptive innovations have become highly significant in the IT sector in India, considering the industry's rapid and sustainable expansion. The assessment of the efficacy of disruptive technologies is largely dependent on crucial performance metrics, such as revenue expansion, market dominance, and customer satisfaction (Coccia, M. 2020). This research aims to investigate the impact of disruptive technologies on the overall performance and competitiveness of certain IT firms in India by analyzing key characteristics (Wang, C., et al, 2023). The importance of digital transformations in promoting economic prosperity is significant. This study is significant as it aims to assess the influence of disruptive technologies on the growth of information technology (IT) companies in India (Antonio, J. L., & Kanbach, D. K. 2023). This research seeks to provide valuable insights into the overall performance of the IT industry by evaluating crucial performance indicators, such as Productivity, customer happiness, Quality, and ease of use, in connection to the influence of disruptive technologies.

RESEARCH METHODS

The study aims to examine the influence of disruptive technologies on the organizational effectiveness of the IT sector. Consequently, the investigation employs a methodical process that requires analyzing secondary data, resources, and previous investigations. Several academics have asserted that performing a systematic or semi-systematic literature review, together with analyzing secondary data, might enhance researchers' understanding of the topic under examination. This technique guarantees that the study is grounded in empirical or empirically validated data, since it is the sole approach that facilitates the identification, analysis, comprehension, and synthesis of the ways in which artificial intelligence has modified and influenced education and its outcomes. This study employed a systematic literature review approach to analyze previous scholarly works that were pertinent to the research inquiries under investigation. The articles were sourced from reputed journals and were scrutinized to determine the level of quality exhibited by each study. Elsevier database, Routledge and CRC Press Taylor and Francis database. Emerald Group Publishing database, Springer Nature database and Sage database. Several supplementary articles were acquired from reputable academic databases such as Wiley, Academia, JSTOR, and Guildford Press

Soumya S Nair et al.,

RESULTS AND DISCUSSION

In November of 2008, Satoshi Natamoto published the popular paper "Bitcoin: A Peer-to-Peer Electronic Cash System" under the pseudonym Satoshi Natamoto. The idea of using cryptography and TCP (internet) to allow a distributed currency system without a central or regulating authority was first proposed in this article. In terms of technology, block chain is a large database that is distributed/shared by users in order to maintain data consistency. Rather than being handled by a single entity, this database is managed by a group of people, or all peers in a network. Asymmetric cryptography, also known as public key cryptography, is used to complete the exchange using a pair of digital keys. This is so for all types of block chain databases. States (a snapshot of asset/value ownerships) and transactions that change the state make up a block chain ledger. Bitcoin is an example of a stateless protocol that consists solely of transactions. Some protocols just keep track of the most recent condition and transactions. Both block chains, however, have transactions stuffed into blocks with other data such as the hash of previous blocks' header to guarantee that the block chain has not been tampered with. When two parties agree to transact, they send their transaction to the network over TCP and it becomes part of a nominee block (Chege, S. M., et al .2020). To verify transactions, permanently record the candidate block in the block chain ledger, and guarantee that all nodes obtain the most recent version of the ledger, the protocol requires a consensus mechanism. Three criteria direct block chain implementations: trust vs. no-trust, public vs. secret, permissioned vs. permission less. With the increased use of cloud technology by various industries and organizations, the cost of implementing block chain has decreased. Now, all digital contracts and peer-to-peer data can be stored in cloud platforms, where storage costs are significantly lower, and all cloud providers are attempting to promote their offerings in respective cloud to give organizations a competitive advantage. (Hoyer, W. D., et al . 2020).

- For starters, the lack of clarity in terminology and terminologies, as well as the difficulty in understanding it at different stages, make it challenging for novice users to grasp and execute it. Furthermore, as more R&D operations take place, the frequency of adjustment to this platform increases, making things much more complicated.
- Second, throughput and power problems would make scaling up and mass adoption more difficult. For eg, in order for a banking network of millions of consumers to be block chain powered, we need a high rate of transaction per second, similar to that of Twitter and Facebook. Currently, block chain throughput is a fraction of that, making large-scale implementation all the more difficult.
- Third, from the standpoint of user friendliness, using the Application programming interface - API has its own set of challenges. There are different API, such as payments receive API, wallet API, data API, demand API, real-time updates API, exchange rates API, and so on. The APIs available are not in a standard format and are not convenient to plug and play in an application; instead, they must be customized to fit with a specific application.
- Fourth, there is a significant amount of energy lost in mining in order to execute the high-end computation algorithm; there is a lot of opportunity to eliminate this.
- Fifth, usability: Designing services for the Bitcoin API is challenging. There is a need to provide a developer-friendly Block chain API. This could be compared to REST APIs.
- Sixth, various chains, rough forks, and versioning: A 51 percent attack is more likely to occur in a short chain with a small number of nodes. When chains are broken for administrative or versioning reasons, another problem arises.

According to Accenture experts, the world banking industry could save up to \$20 billion by 2022 by introducing block chain. Although block chain is being introduced in a variety of industries around the world, the banking industry would be the first to benefit. The below are the key ways in which banks and other financial institutions may be able to use block chain technology:

1. Faster international transfers and lower costs: Large financial institutions and independent financial experts see block chain technology as a potential replacement for the SWIFT bank payment mechanism in the near future. Costs will be reduced, and bank-to-bank and foreign transactions will be quicker.

Soumya S Nair et al.,

2. Simplified Client Identification System: Another area of block chain application in the banking industry is the implementation of a distributed ledger-based client identification system. Since all credit institutions must execute KYC while handling applications, this is extremely important. Users may be detected on a single occasion via block chain, and this information is safely stored with access given to all banks in the scheme.
3. Decentralized Loan Disbursement: Insuring deposits and loans is a direct result of banking and financial practices. Also in developing countries, the majority of these banking functions are often criticized as inefficient and vulnerable. Private bank deposits in common currencies are insured by state regulators. A distributed mechanism for loans and deposits based on ledger technology is decentralized, and the system cannot go bankrupt because the deposits are not managed by one entity.
4. Insurance Automated Payments: In the financial sector, decentralization ensures stability and reliability. Another important way to boost standard insurance is to automate settlement on insurance claims. People would be able to collect payments directly if the scheme is based on smart contracts that are executed seamlessly and do not entail lengthy procedural waits requiring several managers.

(White, Gareth, 2017) While block chain has the potential to become a significant source of disruptive innovations in business and management, it is critical to understand and identify the areas in which there is a business case for implementing block chain techniques. To arrive at this conclusion, this paper employs Delphi Techniques to conduct a thorough investigation. Business managers must be aware of the potential impact of block chain techniques; this study outlines numerous ways in which it can be used to further shape business processes, as well as a few areas in which it can be applied in the development of innovative and valuable new business processes and products. This paper focuses on the impact of block chain technology on the business management discipline; however, due to the small sample size available, the examination of future applications is limited in this paper. In addition, because of the low rate of knowledge, only a small number of panel members were able to envision future applications. Furthermore, this paper does not consider the impact of Block Chain on society. **(Horia Mircea, Botos, 2017)** Block chain is defined as the decentralized ledger that records all of the transactions. This paper also describes bitcoin intelligence steps and procedures that will assist a bitcoin user, owner, or broker in making the best decision in order to maximise their profit and financial security in the cryptocurrency market. In order to better understand bitcoin and increase its acceptance, it is necessary to gain a better understanding of its market and users, as well as the development of the cryptocurrency and its competitors. According to **Nakamoto (2009)**, the founder of Bitcoin, in his paper proposed an electronic transaction that did not rely on trust, and proposed a peer-to-peer network that used a proof-of-work system that added transparency by recording a public history of transactions that an attacker could not change because the honest nodes controlled a majority of CPU power. Businesses benefit from Business Intelligence, according to **Rouse and Stedman (2014)**, who explain how it helps them make more informed decisions. The research presented in this paper concentrated on Business Intelligence and its application of crypto currency, but it did not address the qualitative aspects of operational performance in any way. **(Jeremy M Sklaroff , 2017)** Smart contracts are computer code-based decentralized agreements kept on a blockchain network of computers. Smart Contracts aim to eliminate the expensive process of contract formation, the need for court intervention, opportunistic conduct, and the inherent uncertainties of written language, while simultaneously reaping advantages. When contracts shift their focus away from the person, they give rise to new forms of inefficiencies. The outcomes are caused by automation, which necessitates the use of fully defined terms in every agreement, decentralization that improves performance through third-party verification, and anonymity that eliminates the reliance on commercial context to interpret agreement terms. Consequently, creating a smart contract in an unstable environment incurs high costs. The main emphasis of this study was on flexibility and semantic contracts, as well as flexibility and EDI, and flexibility and smart contracts. However, the specific methods and strategies to reduce costs while ensuring flexibility in the implementation of smart contracts, as well as the necessary changes to tools and systems for more effective implementation, were not addressed.

Disruptive technologies and Organizational effectiveness

(Grenčíková, & et al, 2020) The Fourth Industrial Revolution has resulted in significant technological, demographic, and socioeconomic developments that have an effect on almost every aspect of industry. Both a labor glut and the

**Soumya S Nair et al.,**

emergence of entirely new careers are anticipated in the human resources sector. The ideology of Industry 4.0 has a huge impact on labor production in individual countries, and the Slovak Republic is no exception. Not only commercial businesses, including all sectors of the labor force would be affected. The aim of this analysis is to examine the potential production of labor productivity in Slovak companies and to forecast its growth over the next few years, taking into account the effects of a shrinking working-age population on the formation and termination of employment and occupations. A primary analysis instrument used to evaluate the survey findings was a questionnaire sent to 319 businesses in the Slovak Republic, with a response rate of 228. The results suggest that, while the labor force in the Slovak labor market will not grow, it will shrink as a result of unfavorable demographic trends. The use of emerging technology would improve overall efficiency in Slovak businesses. The findings show that the Industry 4.0 definition would have a big impact on labor efficiency in the global economy as well as in the Slovak Republic. The guidelines, in particular, are intended to draw attention to improvements in work structure and the need for school reform as a result of Industry 4.0 criteria. **(Backhaus, Simon & Nadarajah, Devika. , 2019)** Previous Industry 4.0 research in Malaysia has mostly focused on cloud manufacturing, automated robotics, and intelligent manufacturing. The beer and electrical equipment industries were the primary subject of the field studies. Industry 4.0 is thought to be the start of a new industrial revolution.

Unlike previous papers, the goal of this strategic report is to provide a conceptual basis for future research in Malaysia aimed at determining the relationship between Industry 4.0 core technologies and productivity. There are also a number of large-scale field experiments on Industry 4.0 and the competitiveness of Malaysian manufacturing firms. The paper summarizes the primary innovations of Industry 4.0 and lists them by absolute frequency as reported in the literature. The research issues that have been raised are about the interaction among competitiveness and Industry 4.0 technologies. Productivity is a critical component of manufacturing firms' productivity. As a result, prior to implementing new manufacturing technology, Malaysian manufacturing firms must conduct research into the relationship between Industry 4.0 technologies and productivity. **(Hercko, Jozef & Slamkova, Eva & Hnat, Jozef. , 2015)** Based on the ideals of the Industry 4.0 definition, this article contains fundamental information on how to improve efficiency. Based on this definition, the article describes the fundamental factors and processes for increasing productivity. This concept's application provides high-added benefit to both the enterprise and its consumers. Companies are able to manufacture goods in one hand while still meeting the demands of consumers in the other. **Del Giorgio, Horacio & Mon, Alicia. , 2019)** Information and communication technologies (ICTs) are a critical component of industrial growth on the path to digital transition, which necessitates the implementation of Industry 4.0. The effect of emerging technology in the industry allows for the early identification of defects, process change, and production time reduction. There are forces that have the potential to dramatically alter output levels in various manufacturing sectors. While various Software Products are currently used in various industries' management, marketing, and logistics systems, the integration of technology into the automation and regulation of manufacturing processes is causing a new industrial revolution that is altering the process control model, directly affecting efficiency and competitiveness. The software industry is faced with the task of creating open and functional products for individual consumers by studying their habits, knowledge, and attributes in order to incorporate methods that can be applied to industry-specific manufacturing processes and knowledge.

The application of usability strategies to the production of products that can be applied in the manufacturing sector, regardless of branch of operation, is discussed in this paper, and a model of the Design/Development Process of Specific Software Products for the Industry is proposed for this reason. This model adapts and customizes various usability approaches to the unique characteristics of this class of user in their actual usage sense. **Walsh and Kirchhoff (2000)** used the following model to provide a relevant overview and provide insight into the term disruptive technologies: The paradigm visually demonstrates the differentiation between transformational and lasting technologies (Walsh & Kirchhoff, 2000). Disruptive technology has the potential to completely eliminate current advancements in a firm. The genesis of groundbreaking innovations can arise from either exogenous input or the initial concept or hypothesis, both of which can be derived from the utilization of information technology for a company's core capabilities. If the customer acknowledges the potential of disruptive technologies, it will drive the introduction of a product that just substitutes or supersedes the current technology. Disruptive technology

Soumya S Nair et al.,

distinguishes itself from sustaining technology by its capacity to eliminate or supplant supporting technology. Conversely, updating the hardware might be advantageous due to recent or substantial enhancements in the gadget. Evolutionary or lasting technology is characterized by its capacity to persist as the most current technology utilized by the organization. If a product is propelled to the market by lasting technology, it simply means that it is built on current technology but with extra features that may include a new and major improvement depending on client or company demands. Based on the model, it can be inferred that disruptive technology is distinct from enduring technology in that it is a contemporary and inventive technology that replaces or causes the discontinuation of current technology, making it outdated and effectively eliminating it. Sustaining technology necessitates the continuous progression of existing innovations. Creativity, in relation to maintaining technologies, refers to the process of enhancing or modifying current technologies with novel or substantial alterations. According to Walsh and Kirchoff's (2000) findings, it was challenging to recognize a new technology before it was implemented and adopted by different customers. Predicting the effects of emerging technology on a market or the specific sector it may disrupt is exceedingly difficult. The features of disruptive technology can offer guidance on identifying when a new technology has the potential to become disruptive.

S-Curve Framework for Disruptive Technology

The corporate climate can utilize the value network to evaluate a company's performance. Given the significant impact of the value network on a company's performance, it is imperative to take into account the implications of the value network while strategically planning for information technology. The S-Curve approach is employed in strategic forecasting to predict the outcomes of a corporation. The S-Curve principle is frequently employed to illustrate the progressive enhancement of a product's uniformity over a period of time (Christensen, 2000). The S-Curve framework is frequently employed to predict the result when a prevailing technology is at risk of being replaced by a novel technology. Managers in the digital economy are confronted with a substantial and rapid increase in technology innovation, which has the potential to significantly alter power dynamics and create wealth in almost every sector. The S-Curve manufacturing line serves as a mechanism for monitoring and evaluating product outcomes. A product line that exhibits a continuous S-curve pattern adheres to the typical life cycle of a product. As a commodity reaches a mature stage, its further development becomes increasingly challenging. The product lifecycle reaches a critical turning point, sometimes referred to as the fault line, at this stage.

The time when a new technology supplants an established technology is referred to as the point of replacement. When two S-Curves overlap, it indicates that the firm has transitioned from one technology to another, marking the arrival of a new technology. Consequently, the introduction of a new technology has disrupted the product lifetime of the incumbent technology. Moore (2000) analyzes the concept of the fault line, as depicted in the S-Curve, within the framework of a production development's business model. The figure below illustrates the S-Curve of a product's business model. The second S-Curve illustrates the superior performance of the disruptive invention compared to the anticipated performance of the initial product. The S-Curve Framework for transformational Technologies highlights a critical juncture in the advancement of transformational technologies. The occurrence of the point of inflection is typically associated with the moment when a new technology supersedes an older technology. Many organizations struggle to anticipate whether a novel technology will cause disruption to an established technology or if it will instead replace the old technology as the dominant one. Businesses have the predicament of determining whether or not to allocate resources towards adopting nascent technology in order to sustain a competitive edge in the market.

Christensen (2000) asserts that the S Curve structure is a highly reliable indicator for managing long-term sustainable technology. However, there is a lack of historical data to substantiate the progression of disruptive technologies along the S-Curve in previous instances. Consequently, the information technology division is required to monitor the advancement of emerging technology as it progresses along the S-Curve of established technology. At the crucial juncture, the information technology business unit must be prepared and capable of reacting. Disruptive technology often emerges in the market without prior anticipation, as seen by the graph below that portrays the progressive triumph of disruptive technology over a period of time (Disruptive technology, 2007). Figure 3 illustrates the progressive advancement of transformational technologies over time, specifically in the context of the retail

80805

**Soumya S Nair et al.,**

industry's lower segment. This depiction highlights the tendency to underestimate the actual potential and capabilities of these technologies. Once the lower end of the market adopts the disruptive technology, it undergoes modifications to enhance its attractiveness to the top end of the market. The upper echelon of the sector expects enhanced functionality of superior quality that can surpass the capabilities of current market technology. The cutting-edge technology has been enhanced to cater to the needs and preferences of consumers who are willing to spend a premium for a high-quality product. Disruptive technology can be replaced due to its provision of a more robust alternative compared to enduring technology, and consumers acknowledge the potential of disruptive technology (Christensen, 2000). Additional factors, such as the specific sector and prevailing patterns in information technology, influence the choice to embrace a new technology. This study will investigate the impact of developing technologies on enterprises.

CONCLUSION

Disruptive innovations have the capacity to be quickly accepted in emerging countries, therefore speeding up the adoption of technology and improving social well-being. A key obstacle that low-income nations continuously encounter is the limited spread of technology, which hinders their ability to improve their competitiveness. In the past, the ability of these nations to embrace and incorporate innovations was hindered by an adverse climatic condition. Contrarily, disruptive inventions have several attributes that might help overcome chronic limitations and initiate change in expanding markets. Both organizations and customers have concerns over the extensive implementation of new technologies and improvements to current business models. Ride-hailing companies in the transportation sector function without owning any tangible cars. Likewise, online retail businesses operate without physically storing any goods. Online lodging platforms provide lodgings without possessing any tangible assets, while social media companies implement steps to moderate content. Although the effects of transformative technology have been thoroughly studied in developing economies, where new technologies usually emerge, emerging markets face increased levels of uncertainty. While the second choice has more promise, technology still has the ability to exceed current institutions and create solutions that are more innovative than those observed in wealthy nations. This is apparent from the illustration of cell phones and electronic payments, which showcased this capacity more than ten years ago. IT administrators frequently employ the strategy of implementing extra technologies in order to tackle different challenges. Nevertheless, it is important to acknowledge that customer happiness cannot be attained exclusively via the acquisition of technology. Instead, it is crucial to synchronize the technology being utilized with the fundamental requirements and inclinations of persons. In addition, the company aggressively pursues the essential information without depending on the client to begin communication. IT firms must concentrate their focus on digital technologies and work processes that proactively detect and resolve gaps in customer experience. The ability to recognize and resolve these weaknesses before they become problems is crucial for ensuring a positive consumer experience and, ultimately, the level of support and satisfaction provided by the IT industry.

ABSTRACT

Physiotherapists need good physical fitness for their job demands and are mostly prone to risk factors of non-communicable disease (NCD), which could harm their health and quality of life. We evaluated the physical fitness variables and risk factors of NCD among physiotherapists. This prospective cross-sectional pilot survey involved working physiotherapists in academic settings in Surat, Gujarat. We examined physical activity by examining cardio-respiratory fitness, flexibility, body composition, muscular endurance, and muscular strength, static balance and dynamic balance, and the prevalence of risk factors for NCD. Of 10 physiotherapists (mean age; 32.20 ± 6.68 years; female, 8), physiotherapists had average lower limb flexibility ($n=6$) and excellent upper limb flexibility ($n=8$) but showed very low upper-body muscular endurance (8.20 ± 10.30), and below-average trunk muscular endurance (12.70 ± 8.41). The dominant hand (24.60 ± 9.94 kg) displayed greater strength than the non-dominant hand (21.40 ± 8.30 kg). Physiotherapists also had elevated risk factors for NCD (obesity [BMI, 23.80 ± 3.94 Kg/m² and waist circumference, 83.20 ± 10.61 cm], prolonged sitting time (7.40 ± 1.76 hours per day), and low physical activity [physical activity MET value, 1864 ± 2280 min/week]). This study emphasizes inadequate physical fitness among physiotherapists, urging urgent policy interventions to combat prevalent risk factors of NCD and physical inactivity. Prioritizing lifestyle changes is critical to enhance physiotherapists' fitness.

Keywords: non-communicable disease, physical activity, physiotherapist, risk factor

INTRODUCTION

Physical fitness is integral to human health and overall well-being and encompasses various aspects, including flexibility, cardiovascular endurance, body composition, and muscular strength endurance [1-4]. Regular physical activity and maintaining health-related physical fitness are crucial markers of overall health outcomes [5, 6]. Physiotherapists acknowledge the significant impact of physical activity and exercise in their practice, recognizing them as fundamental contributors to health and mitigators of risks associated with conditions like diabetes, hypertension, and cardiovascular diseases [7-10]. However, recent research has highlighted instances of physical inactivity among physiotherapists [11-16]. It is paramount to encourage physical activity among physiotherapists to reduce the levels of physical inactivity and the consequent burden of non-communicable diseases (NCD) due to following two main reasons: 1) Physical fitness levels play a direct role in physiotherapists' capacity to provide effective care and function as role models for their patients and 2) Physiotherapists are prone to risk factors of NCD, which could negatively impact their personal health outcomes and quality of life. In lieu of this, the present pilot study aims to evaluate physical fitness variables and risk factors of NCD among physiotherapists.

METHODOLOGY

This prospective cross-sectional pilot survey was conducted among working physiotherapists in academic settings in Surat, Gujarat. Written permission was obtained from the Head of Institute of Physiotherapy College. Each participant was individually briefed about the study and invited to participate voluntarily after providing written informed consent. The study assessed various physical fitness parameters, including cardio-respiratory fitness (via the Queens College step test), flexibility (via YMCA sit-and-reach test and shoulder flexibility test), body composition (via body mass index), muscular endurance (via push-up and curl-up tests), and hand grip strength to determine muscular strength (via the Jamar Hand Dynamometer). Static balance was assessed using the unipedal stance test, while dynamic balance was assessed through the star excursion balance test (SEBT). Risk factors for NCD were assessed using the World Health Organization (WHO) STEPS Instrument (Steps I and II) in accordance with the guidelines outlined in the WHO STEPS manual. Data analysis was performed using Statistical Package for the Social Sciences, Version 22.0. Descriptive statistics are reported as mean \pm standard deviation (SD), median [interquartile range (IQR)] frequency and percentages. Pearson's correlation was used to measure linear correlation between two sets of data.

RESULTS

A total of 10 physiotherapists participated in this survey. The mean age of study population was 32.20 ± 6.68 years and predominantly comprised females ($n=8$). (Table 1). Data are presented as mean \pm standard deviation and upper and lower range. The lower limb flexibility grade and number of curl-ups were 15.75 ± 3.14 , and 12.70 ± 8.41 , respectively. The values for unipedal stance test with eyes open and closed were 39.60 ± 10.41 (16.00–45.00) and 15.30 ± 11.91 (5.00–41.00) seconds, respectively. We found symmetrical balance capabilities between the left and right lower limbs examined by SEBT, with some slight variations in specific directional reaches. Other physical parameters of the physiotherapists are described in Table 2.

Abbreviation

BMI, body mass index;

D, dominant; L, left;

LL, lower limb;

ND, non-dominant;

SEBT, star excursion balance test - science for sport;

R, right; VO_{2max} , maximal oxygen consumption

**Hiral Tarpan Shah and Dhaval Patel**

Data are presented as mean \pm standard deviation and upper and lower range. As demonstrated in Table 3, majority of the participants had average lower limb flexibility grade (n=6), excellent upper limb flexibility grade (n=8), below average number of curl-up (n=4), below average push-up test score (n=4), below average unipedal stance test with closed and open eye (n=4), below average VO_{2max} (n=5), below average hand-grip strength (D) (n=4) and hand-grip strength (ND) (n=4).

Abbreviations

D, dominant;

LL, lower limb;

ND, non-dominant;

UL, upper limb;

VO_{2max} , maximal oxygen consumption

We have found positive correlation between age and VO_{2max} ($r=0.832$, $p=0.003$). In table 4, mean value for physical activity metabolic equivalent of task (MET) was 1864 ± 2280 min/week, and the median (IQR) physical activity MET was 1000 (400–1680) min/week. Other parameters are outlined in Table 4.

Abbreviations

BMI, body mass index;

NCD, non-communicable disease

Data are presented as mean \pm standard deviation and upper and lower range.

DISCUSSION

Physiotherapy demands high levels of physical activity and fitness due to professional requirements and the expectation of being fitness authorities in society [1]. In the present study, six physiotherapists demonstrated average lower limb flexibility and eight had excellent upper limb flexibility, assessed by the sit and reach test. This emphasizes physiotherapists' notable flexibility, potentially lowering the risk of musculoskeletal disorders. In contrast, Multani et al. [11] found over 50% of physiotherapy students had poor upper limb flexibility. Hence, there's a need to explore factors affecting shoulder flexibility. Consequently, there is a necessity to investigate the primary factors influencing shoulder flexibility. In accordance with Parkar et al. [12], physiotherapists in the study exhibited notably low upper-body muscular endurance, as evidenced by push-up test scores (8.20 ± 10.30). Additionally, physiotherapists had below-average trunk muscular endurance, as indicated by the number of curl-ups performed (12.70 ± 8.41). All the findings may be attributed to limited time for regular exercise. The present study reveals a notable disparity in grip strength between the dominant and non-dominant hands, with the dominant hand exhibiting greater strength (24.60 ± 9.94 kg) compared to the non-dominant hand (21.40 ± 8.30 kg), which is consistent with findings of Polina et al. [13]. The findings suggest the necessity of focusing on enhancing muscular strength, particularly in the non-dominant hand. The SEBT that evaluates the dynamic balance of the lower limbs [14], indicated generally symmetrical balance capabilities between the left and right lower limbs in the present study, with minor variations in specific directional reaches. This evaluation offers valuable insights into the individual's dynamic balance skills. In the present study, physiotherapists were found to have higher BMI and waist circumference, coupled with high daily sitting times and low levels of physical activity, indicating a need for urgent actions to promote physical activity and mitigate risk factors for NCD. The low physical activity observed among physiotherapists in our study emphasizes the importance of instilling a positive attitude towards physical fitness among physiotherapists, with the ultimate goal of achieving optimal fitness levels.

**Hiral Tarpan Shah and Dhaval Patel**

CONCLUSION

The present study reveals that the physical fitness level of physiotherapists is unsatisfactory. Considering the elevated prevalence of NCD's risk factors within this group, urgent policy actions are necessary to mitigate these health concerns. It is crucial to improve physiotherapists' fitness levels through lifestyle adjustments.

ACKNOWLEDGEMENT

I express my gratitude to each and every participant for taking part in the research.

ABSTRACT

Soil-borne pathogens were taken into consideration as hazard to agriculture resulting in high yield losses. *Macrophomina phaseolina* (Tassi) Goidis, one of the important soil borne pathogen causing root rot of groundnut prevalent in all growing area worldwide. Owing to the longer survivability of this saprophytic fungus, its control is difficult. Biological control is the most effective component for providing long-term solution for controlling plant diseases. The present study was undertaken to find out the efficacy of bioinoculants such as *Streptomyces*, *Rhizobium* and *Bacillus* alone and in combined effect of bioinoculants fortified with humic acid against root rot incidences. The groundnut plants are treated with combined application of *Streptomyces albobacillus*, *B. japonicum* and *Bacillus subtilis* fortified with humic acid as seed treatment @ 10g/kg of seeds plus soil application @ 2.5 kg ha⁻¹ (T₆) recorded minimum diseases incidence and significantly enhanced the yield parameters. A decrease in disease occurrence and severity may be due to the induced resistance imparted by the bioinoculants. This resulted in significant increments in quantities of defense enzymes, including catalase, peroxidase (PO), Polyphenol oxidase (PPO), Phenylalanine ammonia lyase (PAL) and β -1, 3 Glucanase activity. Thus, bioinoculants can be employed for the production of a potential formulation to support sustainable agriculture by reducing the input of synthetic pesticides and fertilizers.

Keywords: Groundnut, *Macrophomina phaseolina*, bioinoculants fortified with humic acid, induction of defense enzyme.

INTRODUCTION

Groundnut (*Arachis hypogaea* L.) is an important edible oil seed crop grown extensively in tropical and sub-tropical regions of the world and also considered as “king of oil seed crops” or “wonder nut” or “poor man’s cashew nut”. It is fourth most important source of edible oil and third most important source of vegetable protein as the kernels are rich in 40 to 50 per cent of oil, 25 to 30 per cent of protein, 18 per cent of carbohydrates, minerals (P, Ca, Mg and Fe), antioxidants and vitamins (B1, B2 and niacin). India ranks first position in terms of area with 5.75 million hectares, with production of 10.11 million tones and productivity is 1759 kg/ha. (DOES-MOAFW, 2022). In India, the major growing states are Gujarat, Tamil Nadu, Andhra Pradesh, Karnataka, Maharashtra, Madhya Pradesh, Rajasthan. In Tamil Nadu groundnut is grown in 0.37 million hectares, with production of 0.95 million tones and productivity is 2553 kg/ha. (DOES-MOAFW, 2022). Groundnut production is decreasing gradually because of various biotic and abiotic stresses. Biotic stresses such as fungal, bacterial, and viral diseases play a major role in yield reduction. The soilborne diseases caused by fungal pathogens are very important, and several of them have the potential to cause significant yield losses in groundnut production (Pandey *et al.*, 2021). The *Macrophomina phaseolina* is an important pathogen that causes dry root disease (Chakrabarty *et al.*, 2005); it is distributed globally, and groundnut crops at all stages are susceptible to infection. The average yield loss caused due to root rot incidence is 25%. But in severe cases it reaches up to 80-90% (Moradia and Khandar *R*, 2011). Chemical-based management of *M. phaseolina* is not practicable owing to high cost besides causing environmental pollution and development of resistance to target fungus (Backman, 1997). Biological control is the best alternative, especially against soil-borne pathogens (Hibaret *et al.*, 2007; Sreeramuluet *et al.*, 2009). Among the various antagonists, bioinoculants such as *Streptomyces*, *Rhizobium* and *Bacillus*, plays a vital role in reducing the population of *Macrophomina phaseolina*. Bioinoculants exhibited different mode of actions such as competition, parasitism, antibiosis, lysis and Induced Systemic Resistance. Among them defense related enzymes plays a major role in boosting the immunity of host plants and make the resistance to different plant parasitic pathogens.

MATERIALS METHODS

Preparation of talc-based formulation of bioinoculants and fortification with humic acid

Virulent bacterial bioinoculants (*Streptomyces* spp, *Rhizobium*, spp, *Bacillus* spp) were grown in Ken knight & Munaier’s broth, YEMA broth and NA broth respectively @ 28 ± 2° C for 48 hours. One Kilo grams of carrier material (Talc powder) was taken and the pH was adjusted to 7 by adding CaCO₃ at the rate of 15g/kg. Carboxy methyl cellulose (CMC) was then added at the rate of 10g/kg and mixed well. The mixtures were then autoclaved for 30 min at 121°C (15lb/inch²). After autoclaving, 400 ml of bioinoculants suspension (1×10⁸cfu/ml) was added to the sterilized carrier material (1kg) and thoroughly mixed followed by drying aseptically and then grounded to powder. Humic acid powder has been obtained from ARVEEBIOTECH, Chidambaram. The talc-based formulation of bioinoculants were mixed with Humic acid powder @100g/ kg then packed in sterile polythene bags and stored at 4°C (Vidhyasekaran and Muthamilan, 1995).

The concentration of colony-forming units was obtained using the formula

$$\text{Number of cfu/g} = \frac{\text{Number of colonies}}{\text{Amount of sample plated} \times \text{Dilution}} \times 100$$

Pot culture experiment

A pot culture study was conducted to test the efficacy of antagonists bioinoculants fortified with humic acid against root rot of groundnut. The sterilized garden land soil is collected and filled in plastic pots of size 25 x 22x 15 cm with 25 kg and TMV-7 seeds were used for this study. The trial was conducted in completely randomized block design with nine treatments and three replications each at Department of Plant Pathology, Annamalai University, Annamalai Nagar from October 2022 to March 2023. The plants in the pots have been maintained with uniform, regular and judicious watering. The individual and combined application of bioinoculants *Viz*, *Streptomyces albobaciens*, *Bradyrhizobium japonium*, *Bacillus subtilis*, fortified with Humic acid (HA) and chemical Nativo 75 WP@ 1g/Kg of seeds

**Evanjalin and John Christopher**

were tested against *Macrophominaphaseolina*. Mass multiplication of *Macrophominaphaseolina* is grown in sand maize medium and 20 days old culture were inoculated in 30 days old plants. The inoculated plants were incubated in a humid chamber for 48 h and subsequently moved to the greenhouse and it is maintained at 22-28°C, 70-90% relative humidity. Under a light intensity of 85 $\mu\text{mol m}^{-1} \text{S}^{-1}$, 12 h photoperiod and subsequently transfer to pot culture yard.

Treatment schedule

T1- Seed treatment of *Streptomycesalbofaciens* @ 10 g/kg of seed + Soil application of *Streptomycesalbofaciens* @ 50g/ pot on TOS, T2- Seed treatment with *B.japonicum* at @ 10 g/ kg of seed + Soil application of *B.japonicum* @ 50 g /pot on TOS, T3- Seed treatment of *Bacillus subtilis* @ 10g/kg of seeds + Soil application of *Bacillus subtilis* @ 50g/ pot on TOS+, T4 - T1+ T2, T5 - T3 + T4, T6 - T5 + Fortification with humic acid@ 100g/ kgof bio inoculant as soil application on TOS , T7 - Seed treatment with Nativo 75 WP @ 1g/Kg of seeds, T8- Healthy control, T9- Inoculated control .

Assessment of the disease severity in the field

Twelve plants from each plot were randomly selected and tagged for grading the severity of diseases. The severity of *Macrophominaphaseolina* was measured as per the standard evaluation system (SES) for groundnut. The disease severity was recorded at 30,60,90DAS and at the time of harvest and per cent diseases index was determined us usual.

Field trial

The field trials were conducted at Komaratchi, Cuddalore district of Tamil Nadu during May 2023 to August 2023, in field with a history of Root rot incidence. The trial was laid out in plots (5x4 m) arranged in randomized block design. Groundnut seeds of cv. TMV-7 were sown in row/ plant spacing of 30 x 10 cm. Three replicate plots were maintained for each treatment. Regular cultivation practices have been accompanied as according to the recommendation. Treatment application details and experimental observation were the same as in greenhouse experiment.

Treatment schedule

T1- Seed treatment of *Streptomycesalbofaciens* @ 10 g/kg of seed + Soil application of *Streptomycesalbofaciens* @ 2.5 kg ha^{-1} on TOS, T2 -Seed treatment with *B. japonicum* at @ 10 g/ kg of seed + Soil application of *B. japonicum* @ 2.5 kg ha^{-1} on TOS , T3- Seed treatment with *Bacillus subtilis* @ 10g/kg of seeds + Soil application of *Bacillus subtilis* @ 2.5 kg ha^{-1} on TOS , T4 - T1+ T2, T5 -T3 + T4, T6 - T5 +Fortification with humic acid @ 100g/ kg of bio inoculant as soil application on TOS, T7 - Seed treatment with Nativo 75 WP @ 1g/kg of seeds , T8- Untreated control.

Data analysis

The data obtained from the studies conducted under laboratory and field conditions were subjected to the analysis of variance techniques (ANOVA) and were applied to completely randomized design (CRD) and randomized block design (RBD). The data obtained on per cent inhibition were transformed using angular (arc sine) transformation.

Estimation of induction defence enzyme:

Pot culture study was conducted to estimation of induction defence enzyme by combined application of bioinoculants fortified with humic acid against challenge inoculation of *Macrophominaphaseolina* with following treatments, T1- Seed treatment of *Streptomycesalbofaciens* @ 10 g/kg of seed + Soil application of *Streptomycesalbofaciens* @ 50g/ pot on TOS, T2- Seed treatment with *B.japonicum* at @ 10 g/ kg of seed + Soil application of *B.japonicum* @ 50 g /pot on TOS, T3- Seed treatment of *Bacillus subtilis* @ 10g/kg of seeds + Soil application of *Bacillus subtilis* @ 50g/ pot on TOS, T4 - T1+ T2, T5 - T3 + T4, T6 - T5 + Fortification with humic acid @ 100g/ kg of bioinoculants, T7 - Seed treatment with Nativo 75 WP @ 1g/Kg of seeds, T8- Healthy control, T9- Inoculated control. Plants are inoculated with pathogen on 30th days after sowing and estimated the defence on various treatment on 0,3,5,7 and 9 days intervals from the inoculation of pathogen.

**Evanjalin and John Christopher****Enzyme extraction**

One g of root sample was homogenized with 2 ml of 0.1M sodium citrate buffer (pH 5.0) at 4°C. The homogenate was centrifuged for 20 min. at 10,000 rpm. Enzyme extracted in 0.1 M sodium phosphate buffer (pH 7.0) was used for the estimation of Peroxidase (PO), Polyphenol Oxidase (PPO), Phenylalanine Ammonia Lyase (PAL) and β -1, 3-glucanase. Enzyme extract was stored in deep freezer (-70° C) until used for biochemical analysis.

Peroxidase (PO)

Peroxidase activity was assayed as per the procedure described by Hammerschmidt *et al* (1982). In a pre-cooled pestle and mortar, one gram of fresh leaf tissue was mashed using one ml of 0.1M phosphate buffer at pH 7.0. The homogenate was centrifuged at 15000 rpm at 4°C for 15 minutes. The supernatant was served as a source of enzyme. About 1.5 ml 0.05M pyrogallol, 0.5 ml of one per cent H₂O₂ and 0.1 ml of enzyme extract was used for preparation reaction mixture. The reaction mixture absorbance was measured at 420 nm for every 30 seconds up to 3 minutes at room temperature (28 ±2°C). The boiled enzyme preparation served as blank. The enzyme activity was measured as a change in the reaction mixture's absorbance min⁻¹g⁻¹ of the leaf.

Poly phenol oxidase (PPO)

PPO activity was determined as per the procedure given by Mayer *et al.* (1965). One gram of fresh leaf sample was ground in one ml of 0.1M sodium phosphate buffer, (pH 6.5). The homogenate was centrifuged at 15000 rpm in 4 °C for 15 minutes, and the supernatant was employed as an enzyme source. About 1.5 ml of 0.1 M sodium phosphate buffer (pH 6.5) and 0.1 ml of enzyme extract was used to make up the reaction mixture. After adding 0.2 ml of catechol (0.01 M) to the mixture, the reaction was started. The activity was measured as a change in absorbance at 495 nm from every 30 second intervals for three minutes, and measured the enzyme activities in terms of the change in absorbance min⁻¹g⁻¹ of fresh tissue.

Phenylalanine ammonia-lyase (PAL)

The PAL activity was assayed as per the method described by Ross and Sedroff (1992). For phenylalanine ammonia lyase assay (PAL), about five ml of cold 25mM Borate HCL buffer (pH 8.8) containing 5mM mercaptoethanol (0.4 ml per litre) was used to homogenize the 500 mg of plant leaves. The homogenate was centrifuged at 15000 rpm for 15 minutes and the supernatant served as an enzyme source. About 0.2 ml of enzyme extract, 1.3 ml of water and 0.5 ml of borate buffer used to make up the reaction mixture. About one ml of 12mM L-Phenylalanine was added and initiated the reaction. The reaction mixture was incubated for one hour at 32°C. The reaction was stopped with the addition of 0.5 ml of 2N HCL. The 2N HCL and phenylalanine was added after the blank run. The absorbance was measured at 290 nm. The enzyme activity was expressed as nmoles of cinnamic acid Min⁻¹g⁻¹ of fresh tissue.

 β -1, 3-glucanase

β -1, 3-glucanase activity was assayed with the aid of using laminarin-dinitrosalicylic acid method (Pan *et al.*, 1991). The reaction was carried out at 40° C for 10 min. The reaction was then stopped via by means of adding 375 μ l of dinitrosalicylic acid and heated for five min in boiling water. Vortexed and the absorbance was measured at 500nm. The enzyme activity was expressed as μ g glucose released Min⁻¹g⁻¹ fresh tissue.

RESULTS

Efficacy of combined application of *Streptomyces albobifaciens*, *B. japonicum* and *Bacillus subtilis* plus fortification with humic acid against dry root rot of groundnut

Pot culture condition

The pot culture experiment was carried out to evaluate the efficacy of combined application of bioinoculants fortified with Humic acid (HA) against root rot incidence of groundnut. The result revealed that all the bioinoculants were

Evanjalin and John Christopher

found to be effective in inhibiting the progress of disease development than the untreated control (Table I). Among the various treatments, combined application of *Streptomyces albobifaciens*, *B. japonicum* and *Bacillus subtilis* plus fortification with humic acid @ 100g/ kg of bioinoculants as seed treatment @ 10 g/kg of seed and soil application @ 100g/ pot (T6) recorded minimum root rot disease incidence which recorded 4.12%, 5.70%, 8.52% and 9.05% percent disease incidence on 30, 60, 90 and At the time of harvest respectively, it was followed by the combined application of *Streptomyces albobifaciens*, *B. japonicum* and *Bacillus subtilis* as seed treatment @ 10 g/kg of seed and soil application @ 50g/ pot (T5) recording the root rot incidence of 6.02% ,8.51%, 11.01% and 11.30% percent disease incidence on 30,60, 90 DAS, and at the time of harvest respectively and standard chemical check Nativo 75 WP @ 1g/kg of seeds (T7) registered the root rot disease incidence of 7.34%, 8.96%, 11.69% and 12.96% percent disease incidence on 30, 60, 90 DAS and at the time of harvest respectively. All the bioinoculants treated plants significantly reduced the disease incidence as compared to control. Combined application of bioinoculants has reduced the disease incidence than the individual application of bioinoculants. The combined application of *Streptomyces albobifaciens*, *B. japonicum* and *Bacillus subtilis* plus fortification with humic acid @ 100g/ kg of bioinoculants as seed treatment @ 10 g/kg of seed and soil application @ 100g/ pot (T6) significantly reduced the disease incidence of dry root rot of groundnut than all other treatments including standard chemical check and also significantly increased the yield than other treatments, which recorded maximum biomass (30.72g/plant) and pod yield (64.79g/plant).

Field trial

The same trend as pot culture was observed in field trial also. The minimum disease incidence was registered with combined application of *Streptomyces albobifaciens*, *B. japonicum* and *Bacillus subtilis* plus fortification with humic acid @ 100g/ kg of bioinoculants as seed treatment @ 10 g/kg of seed and soil application @ 2.5 kg ha⁻¹ of each (T6) recorded minimum root rot disease incidence, which recorded 4.13%, 6.94%, 9.54% and 8.25% percent disease incidence on 30, 60, 90 and at the time of harvest respectively and followed by the combined application of *Streptomyces albobifaciens*, *B. japonicum* and *Bacillus subtilis* as seed treatment @ 10 g/kg of seed and soil application @ 2.5 kg/ ha of each (T5) recording the root rot incidence of 4.96 % ,8.84 % , 12.73% and 14.65% percent disease incidence on 30,60, 90 DAS and at the time of harvest respectively and plants are treated with standard chemical check Nativo 75 WP as @ 1g/kg of seeds (T7) registered the root rot disease incidence of 5.32%, 7.14%, 13.69% and 15.41% percent disease incidence on 30, 60, 90 DAS and at the time of harvest respectively. Combined application of bioinoculants fortified with humic acid has reduced the disease incidence than the individual application of bioinoculants and standard chemical check. The combined application of *Streptomyces albobifaciens*, *B. japonicum* and *Bacillus subtilis* plus fortification with humic acid @ 100g/ kg of bioinoculants as seed treatment @ 10 g/kg of seed and soil application @ 2.5kg/ha of each (T6) significantly reduced the disease incidence of dry root rot of groundnut than all other treatments including standard chemical check and also significantly increased the yield than other treatments, which recorded maximum No of pods (40.42g/plant) and pod yield (1801 kg/ha). (Table II)

Induction of defence enzymes in groundnut due to combined application of *Streptomyces albobifaciens*, *B. japonicum* and *Bacillus subtilis* plus fortification with humic acid against challenge inoculation of pathogen.

The induction of defence enzymes viz., peroxidase (PO), polyphenol oxidase (PPO), Phenylalanine ammonia lyase (PAL) and β -1, 3 Glucanase in groundnut plant due to combined application of bioinoculants fortified with Humic acid against challenge inoculation with pathogen was estimated. Plants are treated with bioinoculants viz., *Streptomyces albobifaciens*, *B. japonicum* and *Bacillus subtilis* were significantly induce the defense enzymes than the control (Table III). Among the treatments maximum induction of PO (1.73 changes in absorbance / min/ g of units), PPO (1.38 changes in absorbance / min/ g of units), PAL (74.56 μ mol of transcinamic acid/min/g of leaf tissue) and β -1, 3 Glucanase activity (73.5 μ g of glucose released / min/ g of unit) were observed with the combined application of *Streptomyces albobifaciens*, *B. japonicum* and *Bacillus subtilis* plus fortification with humic acid @ 100g/ kg of bioinoculants as seed treatment @ 10 g/kg of seed and soil application @ 100g/ pot against challenged inoculated with *Macrophomina phaseolina* (T6). This was followed by the combined application of *Streptomyces albobifaciens*, *B. japonicum* and *Bacillus subtilis* as seed treatment @ 10 g/kg of seed and soil application @ 50g/ pot (T5) recorded with PO (1.4773 changes in absorbance / min/ g of units), PPO (1.07 changes in absorbance / min/ g of units), PAL (55.33 μ mol of transcinamic acid/min/g of leaf tissue) and β -1, 3 Glucanase activity (63.3 μ g of glucose released / min/ g of

**Evanjalin and John Christopher**

unit) and plants treated with standard chemical check Nativo 75 WP as @ 1g/kg of seeds (T7). The groundnut plants inoculated with the pathogen alone recorded an increase in the activity of PO (1.89 changes in absorbance / min/ g of units), PPO (0.98 changes in absorbance / min/ g of units), PAL (12.90 μ mol of transcinamic acid/min/g of leaf tissue) and β -1, 3-Glucanase (11.64 μ g of glucose released / min/ g of unit) than the groundnut plants either treated with pathogen or treated with bioinoculants. The induction of PO, PPO, PAL and β -1, 3- Glucanase gradually increases up to fifth day of pathogen inoculation and thereafter decline slowly.

DISCUSSIONS

The efficacy of individual application of bioinoculants (*Streptomyces albobacis*, *Bradyrhizobium japonicum*, *Bacillus subtilis*) and in combination along with fortification of humic acid were tested against root rot disease of groundnut under pot culture and field condition. Plants treated with combined application of *Streptomyces albobacis*, *B. japonicum* and *Bacillus subtilis* plus fortification with humic acid @ 100g/ kg of bioinoculants as seed treatment @ 10 g/kg of seed and soil application @ 2.5 kg ha⁻¹ of each was found to significantly manage the root rot disease and in influencing the yield parameters. Similar findings were made by several workers using the bioinoculants of *Streptomyces*, *Rhizobium* and *Bacillus sp.* Seed treatment alone with powder formulation of *Streptomyces* sp. strains, CBE, MDU and PDK, was effective in controlling root rot disease; but, combined application through seed and soil increased the efficacy (Adhilakshmi *et al.* 2013). Al-Ani R.A *et al.* (2012) reported that the *Rhizobium japonicum*, an environmentally friendly alternative to fungicides was able to protect soybean plants against soil-borne pathogens (*F. solani* and *M. phaseolina*) and improve growth and yield. Neetu Singh *et al.* (2008) reported that *B. subtilis* BN1 showed a strong inhibitory effect on hyphal growth of *M. phaseolina*. Bioinoculants are fortified with Humic acid significantly enhancing the efficacy against pathogen and also enhance yield parameters than the bioinoculants alone. The result are accorded with Ranjinder Kaur *et al.* (2021), who reported that Humic acid and its derivatives promote the population of bioinoculants and enhance their excellent survival and root colonization. Similarly, plants are treated with combined application of *Streptomyces albobacis*, *B. japonicum* and *Bacillus subtilis* plus fortification with humic acid against challenge inoculation of pathogen maximum induced the defense enzymes viz., Peroxidase (PO), Polyphenol oxidase (PPO), Phenylalanine ammonia lyase (PAL), and β -1, 3-glucanase enzymes in groundnut.

Several authors have reported the maximum induction of defense enzymes in crop plants due to application of bioinoculants. Adhilakshmi *et al.* (2013) also found that the increased PO activity in mung bean plants treated with *Streptomyces sp.* might be involved in lignin biosynthesis, which in turn might have contributed to the resistance against *M. phaseolina*. Umar Khalid *et al.* (2024) has studied that *B. japonicum*-406 leads to the induction of defense enzyme in soybean plants. The highest increase was estimated in polyphenol oxidases. Kamalakannan (2004) reported the increased activity of PAL, PO, PPO and total phenolics in the bioagents (*Bacillus subtilis*) pretreated peppermint plants challenged with *R. solani*. ISR mediated through bio-control agents resulted on lignification and with increased activities of defense gene products that synthesized via phenyl propanoid pathway (Boller and Mauch, 1988; Kloepper *et al.*, 2004), which is known to oxidize phenols to o-quinones, leading to the formation of melanin. Polyphenol oxidases is responsible for lignification, cross-linking of phenolics and glycoproteins, suberization, phytoalexin production and initiation of hypersensitive response (Wojtaszek, P1997). Phenylalanine ammonia lyase (PAL) plays an important role in the biosynthesis of various defense chemicals in phenyl propanoid metabolism (Daay *et al.* 1997). Mauch and Staechelin (1989) reported that β -1,3-glucanase enzyme solubilises elicitor active glucan molecules from fungal cell walls. Biocontrol agents have a direct antagonistic activity not only by producing various metabolites, but also by inducing defense enzymes, which have recently been found to be a new way whereby plants defend themselves from pathogen attack (Bharathi *et al.*, 2004).

Evanjalin and John Christopher

CONCLUSION

The results reported here indicated that groundnut crop treated with combined application of *Streptomyces albobifaciens*, *B. japonicum* and *Bacillus subtilis* plus fortification with humic acid represents an ecofriendly strategy of managing *M. phaseolina* in groundnut plants and also promoted plant growth. Mixture of bioinoculants also have the advantage of exercising a broad-spectrum activity, enhancing the efficacy, reliability and ensuring greater induction of defence enzymes over the individual strain.

ABSTRACT

Diabetes mellitus is a disease due to abnormality of carbohydrate metabolism and it is mainly linked with low blood insulin level or insensitivity of target organs to insulin. This is characterized by hyperglycemia and long term complications affecting the eyes, kidneys, nerves and blood vessels and is the most common endocrine disorder. Although the underlying mechanism of diabetic complications remains unclear, much attention has been focused on the role of oxidative stress. It has been suggested that oxidative stress may contribute to the pathogenesis of different diabetic complications. Diabetic experimental animal models have shown that oxidative stress causes persistent and chronic hyperglycemia, thereby depleting the activities of the antioxidant defense system and otherwise promoting free radicals generation. *Holostemma annulare* is a well-known medicinal plant, which is an important constituent in more than 34 ayurvedic preparations. The roots are reported to possess cooling, alterative, tonic and lactative properties. They are also used in diabetes, gonorrhoea, coughs, stomach-ache, consumption, fever. The ethanolic extract of *Holostemma annulare* roots has been reported to contain six amino acids, viz; alanine, aspartic acid, glucine, serine, threonine and valine. The benzene extract contains α -amyrin, lupeol and β -sitosterol.

80826

**Mohini Upadhye et al.,**

In the present investigation, we attempted further to investigate the alcoholic root extract of *Holostemma annulare* was studied for its antioxidant status and its effects on key enzymes of carbohydrate metabolism in streptozotocin and nicotinamide induced type 2 diabetic rats.

Keywords: *Holostemma annulare*, enzymes, carbohydrate metabolism etc.

INTRODUCTION

Diabetes mellitus is a condition caused by abnormalities in the metabolism of carbohydrates. It is primarily associated with low blood insulin levels or insulin-insensitive target organs. This is the most prevalent endocrine condition and is characterized by hyperglycemia and long-term problems affecting the kidneys, blood vessels, nerves, and eyes. Sexual disorders, ocular problems, neurological, nephrological, and dermatological complications are all possible outcomes of diabetes¹. In real terms, these side effects usually account for the majority of disease related societal healthcare expenses. Oxidative stress has drawn significant interest, despite the fact that the precise mechanism behind diabetes problems remains unclear. Oxidative stress has been proposed as a potential factor in the pathophysiology of several diabetes problems. Experimental animal models of diabetes mellitus have demonstrated that oxidative stress results in chronic and persistent hyperglycemia, which in turn reduces the antioxidant defense system's activity and promotes the production of free radicals. A huge perennial plant with a somewhat reddish stem that climbs and is laticiferous, is a member of the Asclepiadaceae family². The longest roots reach up to 1 m in length, are twisted, cylindrical in shape, tapering towards the tip, brown-yellow in color. The thickness of the roots depends on their age and the amount of starch present. The surface texture is relatively smooth except for some fine root marks³. *Nighantusamgaram* has six species of *Holostemma annulare* grass. The plant is found in tropical Himalaya, Dehradun, Konkan, Bombay, Deccan, Canara, Karnataka, Kerala and Kanyakumari. It grows in hedgerow and open woodland, especially on the lower slopes of hills⁴. *Holostemma annulare* is a popular medicinal plant and an important part of more than 34 Ayurvedic preparations. The roots are said to be refreshing, expectorant, tonic and expectorant. It is made into a paste and applied for ophthalmia and orchitis. It is also used for diabetes, gonorrhoea, cough, stomachache, consumption, fever and tridosha. The ethanol extract from the roots of *Holostemma annulare* contains six amino acids. Alanine, aspartic acid, glucine, serine, threonine, and valine. Benzene extract contains α -amyrin, lupeol, and β -sitosterol. In the present investigation, we attempt to re-examine the antioxidant power of the alcoholic root extract of *Holostemma annulare* and its effects on the main levels of carbohydrate metabolism in streptozotocin and nicotinamide type 2 diabetic rats⁵.

METHODS AND MATERIALS

Compound microscope, stage micrometer, camera lucida, drawing sheet(black), glass slide, Leica DMLS microscope attached with Leitz MPS 32 camera, silica crucible, ashless filter paper(Whatmann no.44), Petri dish, UV apparatus, stoppered conical flask, magnetic stirrer, alcohol(95%), chloroform, water, chloral hydrate solution, phloroglucinol, hydrochloric acid, glycerin, sodium hydroxide, petroleum ether, acetone, benzene and chloroform.

Chemicals and Instruments

The following chemicals were used for the study: Glucose-6-phosphate dehydrogenase, glucose-6-phosphate, lactate dehydrogenase, streptozotocin, ascorbic acid, metaphosphoric acid, O-phosphoric acid, magnesium chloride, EDTA, sodium citrate, phenazine methosulfate, nitro blue tetrazolium chloride, NADH, NADPH, ATP, glutathione, 5, 5 dithio nitro bis benzoic acid, tocopherol, disodium hydrogen phosphate, potassium hydrogen phosphate, 2,4 dinitro phenyl hydrazine, sodium pyruvate, Tris buffer sodium pyrophosphate, nicotinamide. A UV spectrophotometer, homogenizer, centrifuge and pH meter were the instruments used for the study.

**Mohini Upadhye et al.,****Part used: Roots****Medicinal properties and uses**

The roots are reported to be refreshing, tonic, and expectorant. It is made into a paste and used for ophthalmitis and orchitis. It is also used for diabetes, gonorrhoea, cough, stomachache, fever and tridosha⁵.

Constituents

The ethanolic extract of *H.annulareroots* contain six amino acids, viz., alanine, aspartic acid, glycine, serine, threonine and valine and the benzene extract contains alpha amyryin, lupeol and beta- sitosterol⁶.

Method for anatomical study

To get rid of the coloring material, free-hand pieces of the stems that had been soaked for the entire night were cooked in choral hydrate. After choosing the clear parts, they were mounted with glycerin on a spotless glass slide and covered with a cover slip. After that, the portion was seen at low power (10 X and 40 X)^{2,3}.

Photomicrography

The photomicrography of the sections at different magnifications as demanded by the anatomical details was taken with the help of the audiovisual unit. The microphotographs were taken using Leica DMLAS microscope, attached with Leitz MPS 32 camera.

Powder Analysis

The dried roots of *Holostemma annulare* were examined for its macroscopic character. The powder of the stems were passed through sieve no.60 and observed under microscope for the microscopical character. The powder was boiled with chloral hydrate to remove colouring matters and viewed under microscope after mounting it on a glass slide using glycerin covering with a cover slip. Then the powder was stained with phloroglucinol in the presence of hydrochloric acid for the lignified structures and again it was viewed under microscope as described earlier. Further iodine water was used to locate the starch⁵.

Preparation of Extract**Ethanol extract**

H. annulare roots (160 g) that had been shade-dried and coarsely powdered were extracted with ethanol in a Soxhlet extractor for 72 hours. After cooling and filtering the resulting dark-brown extract, the solvent was extracted in a vacuum and recovered. For further tests, the drug residue kept in a desiccators was utilized. In terms of dry material, the w/w yield was 20%. The dehydrated extract was suspended in 2% gum acacia solution for animal research.

Aqueous extract

The marc obtained after ethanolic extraction was dried and extracted with chloroform water by simple maceration technique. After the extraction, solvent was removed by distillation and concentrated in a suitable lyophilizer.

Animals

Healthy adult male Wistar albino rats weighing 250–300 g were used for the study. The animals were housed in polypropylenecages, maintained under standard conditions (12 h light/12 h dark cycle; temperature 25 ± 30°C; 35–60% humidity), and the rats were fed with a standard rat pellet diet and water ad libitum.

Experiment protocol

Induction of type 2 diabetes

Preparation of Nicotinamide solution:

The required amount of Nicotinamide was accurately weighed and then dissolved in required quantity of normal saline.

Mohini Upadhye et al.,

Preparation of Streptozotocin solution:

Preparation of 0.1M citrate buffer solution pH4.5-

1. Accurately weighed quantity of trisodium citrate (14.9 g) was dissolved in sufficient distilled water to produce 1000 ml and the pH(4.5) was adjusted using conc. HCl.
2. A solution of STZ was prepared by dissolving the weighed quantity of streptozotocin in 0.1M freshly prepared ice-cold citrate buffer (pH4.5) solution. The solution of STZ so prepared was administered in the volume of 0.5-1ml.
3. Selected male animals of 90 days old, weighing between 250-300g, fasted overnight were administered with Nicotinamide 120 mg/kg i.p. route and after 15 min Streptozotocin 60mg/kg IP. Fasting blood sugar levels were determined on 12th day to confirm stable hyperglycemia.
4. After confirmation of stable hyperglycemia, the diabetic rats were divided into different groups of 6 rats each. That day was considered as day zero⁷.

Experimental Design

The animals were divided into four groups (n = 6); normal rats administered with 2% gum acacia solution, diabetic rats administered with 2% gum acacia solution, diabetic rats administered with H. annulare extract 250 mg/ kg and diabetic rats administered with H. annulare alcoholic extract 500 mg /kg for 15 days orally.

Blood Sample

At the end of day 12, the blood samples were collected under light ether anesthesia retro-orbitally from the inner canthus of the eye using capillary tubes (Micro Hemocrit Capillaries, Mucaps). Blood was collected in fresh vials containing anticoagulant, and serum was separated in a centrifuge at 2000 r.p.m. for 2 min.

Collection of Organs

The animals were euthanized using an overdose of intraperitoneal anesthesia, and tissue samples were collected for the assessment of the following parameters. Estimation of Enzymes in Carbohydrate Metabolism The following parameters were evaluated.

Hexokinase

The hexokinase assay is based on the reduction of NAD through a coupled reaction with glucose-6-phosphate dehydrogenase and is determined spectrophotometrically by measuring the absorbance at 340 nm⁸.

Specimen

The excised liver tissue homogenate was prepared in saline.

Reagents

To 0.1 ml of homogenate was added 2.28 ml of

1. Tris(200 mmol l/1), MgCl₂ buffer (20 mol l/1) pH 8,
2. 0.5 ml of 0.67 M glucose.
3. ml of 16 mM ATP.
4. ml of 6.8 mM NAD.
5. ml of 300 U ml of 1 glucose-6-phosphate dehydrogenase.
6. The solution was mixed thoroughly, and the absorbance was measured at 340 nm^{9,10}. Mixed thoroughly and the absorbance was measured at 340 nm.

Reagent	Blank	Sample (ml)
Tris- MgCl ₂ buffer	2.28	2.28
Glucose	0.5	0.50
ATP	0.1	0.1

Mohini Upadhye et al.,

NAD	0.1	0.1
G6PDH	0.01	0.01
Homogenate	-	0.1

Mixed thoroughly and the absorbance was measured at 340 nm.

Calculation

The hexokinase activity in the tissue was estimated and the results were expressed in U/gm.

Glucose-6-Phosphate Dehydrogenase

The rate of increase in absorbance is the measure of glucose-6-phosphate dehydrogenase activity. The addition of maleimide inhibits the oxidation of reaction products by 6-phospho gluconolactone.

Specimen The liver tissue was excised and rinsed with saline solution and the homogenate was prepared in saline solution¹⁰.

Reagents

To 0.02 ml of homogenate were added 0.6 ml of distilled water.

- 0.1ml of 3.8 mmol/l of NADP.
- Tris buffer, 0.5 mol/l
- 6.05g of Tris base dissolved in 70-80 ml water. The pH was adjusted to 7.5 with HCl and the volume made upto 100ml.
- MgCl₂, 0.63 mol/l
- 1.28g in 100ml water.
- Glucose 6 phosphate, 33mol/l
- 531 in 100 ml water¹¹.

Reagents	Sample	Blank
Distilled water	0.6	0.6
NADP	0.1	0.1
Tris buffer	0.1	0.1
MgCl ₂	0.1	0.1
Glucose 6-phosphate	0.1	0.1

Lactate Dehydrogenase

Lactate dehydrogenase catalyzes the conversion of L-lactate to pyruvate with simultaneous reduction and oxidation of NAD to NADH. The change in absorbance with time as a result of the conversion of NAD to NADH is directly proportional to LDH activity.

Specimen

The liver and kidney homogenate was prepared in saline. The supernatant was obtained by centrifugation of the homogenate.

Reagents

- Tris/ NaCl Solution (Tris 81.3mmol, NaCl:0.3mmol, pH 7.2). 0.98 g of Tris and 1.19g of NaCl in 50 ml of the water and the pH is adjusted to 7.2 at 30° C and made upto the volume 100ml . This solution is stored at -0.4° C.
- Tris/ NaCl/ NADH solution (Tris 81.3 mmol/l, NaCl 203.2 mmol/l, NADH 0.244 mmol/l, pH 7.2) 0.009g of NADH, disodium salt was dissolved in 50 ml of the solution A. This solution can be frozen.
- Tris/NaCl/ pyruvate solution(Tris 81.3 mmol/l, NaCl 203.2 mmol/l, pyruvate 9.76 mmol/l, pH 7.2) 0.009g of pyruvate, crystallized monosodium salt in 50ml of the solution A. This solution is stored at 4° C or -20° C.

**Mohini Upadhye et al.,****Procedure**

Tris/ NaCl/ NADH.....2.5 ml

Sample.....0.05 ml

Mixed thoroughly and the solution brought at 30°C.

Tris/NaCl/ pyruvate.....0.5 ml

Mixed and the absorbance measured at 339 nm after exactly at 1 min, 2 min, upto 4 min¹⁰.

Calculation

The LDH activity was calculated and expressed in U/gm.

Glucose-6-Phosphatase

Glucose-6-phosphatase catalyzes the conversion of glucose-6-phosphate to glucose. The rate of increase in absorbance at 700 nm is a measure of glucose 6 phosphatase activity. The activity is terminated by the addition of TCA/Ascorbate.

Specimen

The liver was homogenized in ice-cold sucrose (250 mM) solution. The homogenate was centrifuged for 30 min at 9000rpm at 2°C¹².

Reagents

1. Sucrose/EDTA buffer
2. Imidazole buffer (100 mM, pH 6.5).
3. Na₂HPO₄(1.5 Mm)
4. TCA/Ascorbate.
5. Ammonium molybdate (1% w/v).
6. Sodium citrate (2% w/v)¹³.

Procedure

To 0.1 ml of sucrose/EDTA buffer were added. 0.1 ml of glucose-6-phosphate (100 mM), 0.1 ml of imidazole buffer (100 mM, pH 6.5) and 0.1 ml of homogenate, with thorough mixing. The tubes were incubated at 37° C for 15 min. The enzymatic activity was terminated by the addition of 2 ml of TCA/ Ascorbate (10%/2% w/v), and the solution was centrifuged at 3000 r.p.m. for 10 min. To 1 ml of clear supernatant were added 0.5 ml of ammonium molybdate (1% w/v) and 1 ml of sodium citrate (2%, w/v). The absorbance was measured at 700 nm. The enzyme activity was expressed as unit per gram per minute in tissue¹⁴.

Calculation

The Glucose 6- phosphatase activity in the tissue was calculated and the results were expressed in U/gm in tissue.

Estimation of Antioxidant Parameters

Enzymatic antioxidants glutathione synthetase and glutathione peroxidase, catalase, peroxidase, superoxide dismutase and nonenzymatic antioxidants were determined.

Glutathione Synthetase

Virtually all of the non protein sulfhydryl groups of RBCs are in the form of reduced GSH. 5,5- di thiobis (2- nitro Benzoic acid) is a disulfide chromogen that is readily reduced by sulfhydryl compounds to an intensely yellow compound. The absorbance of the reduced chromogen is measured at 412 nm and is directly proportional to the GSH concentration^{14,15}.

Specimen

Assay was conducted in liver and kidney. The excised organs were rinsed with ice cold saline and blotted dry. It was homogenized in 5 volumes of 1% w/v picric acid. The homogenate was centrifuged. The supernatant was used for the assay^{16,17}.

Mohini Upadhye et al.,

Reagents

1. Precipitation solution
Dissolved 1.67g of glacial meta phosphoric acid, 0.20g disodium EDTA and 30g of NaCl in distilled water and made upto the volume 100 ml. A fine precipitate may form owing to EDTA, but this does not interfere with the test.
2. Disodium phosphate solution, 0.3 mol/l
4.26g of disodium hydrogen phosphate was dissolved in distilled water and made upto the volume 100 ml.
3. DTNB reagent
40 mg of DTNB was dissolved in sodium citrate (1g/dl) and made upto 100 ml¹⁸

Reagent (ml)	Blank (ml)	Sample (ml)
Filtrate	-	2
Precipitating solution	1.2	-
Water	0.8	-
Na ₂ HPO ₄ solution	8	8
DTNB solution	1	1

Procedure

1. 0.2 ml of homogenate was added to the test tube and dissolved in 1.8 ml water. The solution was mixed thoroughly.
2. 3 ml of precipitation solution was added and mixed.
3. Allowed to stand for 5 min at room temperature and filtered through coarse filter paper.
4. Then, the absorbance was measured at 412 nm^{19,10}

Calculation

The GSH concentration in the tissues was calculated and the results were expressed in U/g/min.

Peroxidase

A resonance stabilized radical cation (ABTS⁺) is formed if an excess of substance is used. The amount of ABTS⁺ is proportional to the loss of H₂O₂. Thus with excess POD, the reaction may be used in H₂O₂ determination. Within a certain range, the amount of degraded H₂O₂ is proportional to the POD added.

Specimen

The liver and kidney tissue homogenized in phosphate buffer pH 6. The homogenate was used for the assay.¹⁰

Reagents

1. ABTS solution (2×10 mol/l)
1.1g of ABTS (diammonium salt) dissolved in 100 ml of aqueous phosphate buffer, 0.067 mol/l, pH 6 (0.144g sodium dihydrogen phosphate and 0.798g potassium dihydrogen phosphate in 100 ml water).
2. H₂O₂ (10 mol/l)
The commercial solution of 10 mol/l is diluted to 0.1 mol/l
3. POD (for calibration purpose)
Lyophilized horse radish POD of the highest available purity (250U/mg) dissolved in various concentrations in phosphate buffer. POD solution should be kept at 0-4 °C²⁰.

Reagents	Blank	Sample
ABTS solution	0.2 ml	0.2 ml
H ₂ O ₂ solution	0.2 ml	0.2 ml
Homogenate	-	2 ml
P3whosphate buffer	2 ml	-

**Procedure**

The absorbance was measured at 405 nm.

Calculation

The peroxidase activity was calculated and expressed in U/gm.

Catalase

In the UV range H₂O₂ shows a continual increase in absorption with decreasing wavelength. The decomposition of H₂O₂ can be followed directly by a decrease in absorbance at 240 nm. The difference in absorbance per unit time is a measure of catalytic activity.¹⁶

Specimen

The liver and kidney were excised and homogenized with 1% Triton X-100. Further dilution can be made with phosphate buffer pH 7(1:100)^{21,22}

Reagents

1. Phosphate buffer (50 mmol/l, pH 7)
0.68g of potassium dihydrogen phosphate and 0.89g of disodium hydrogen phosphate were dissolved in water. The pH is adjusted to 7 and the volume made upto 100 ml.
2. Hydrogen Peroxide (30 mmol/l)
0.34 ml of 30% hydrogen peroxide was dissolved in phosphate buffer and made up to a volume 100 ml. This should be prepared freshly.^{23,24}

Reagent	Blank	Sample
Phosphate buffer	1 ml	-
Homogenate	2 ml	2 ml
H ₂ O ₂	-	1 ml

Procedure

Mixed well and the absorbance measured at 240 nm . The reading were taken at different time interval (5 or 10 sec)¹⁰

Calculation

The catalase activity was calculated and the results were expressed in U/g/min × 10³.

Superoxide dismutase

This method is based on the inhibition of NADH-dependent nitro blue tetrazolium reduction by dismutase. Inhibition of 5th chromogen formation by superoxide dismutase was linear with increase in enzyme concentration.¹⁶

Specimen

The liver and kidney were homogenized in sodium pyrophosphate buffer pH 8.3 and the homogenate used for the assay.²⁵

Reagents

1. Sodium pyrophosphate buffer 0.052 M pH 8.3.
2. Phenazine methosulfate (186 μM)
3. NBT (300μM)
2.6034g in 10 ml water.
4. NADH (780 μM)
9 mg in 10 ml water^{26,27}

**Mohini Upadhye et al.,****Procedure**

1. 1.2 ml sodium pyrophosphate buffer, 0.1 ml of phenazine metho sulfate, 0.3 ml of NBT were added in the test tube.
2. 1.2 ml homogenate was added to the test tube. The reaction was started by the addition of 0.2 ml of NADH.
3. After incubation at 30° C for 90 sec, the reaction was stopped by the addition of 1 ml of glacial acetic acid.
4. The reaction mixture was stirred vigorously and shaken with 4 ml butanol.
5. The mixture was allowed to stand for 10 min, centrifuged and the butanol layer was taken out.
6. Colour intensity of the chromogen in the butanol was measured at 560 nm¹⁰.
Calculation The superoxide dismutase activity was determined in the tissue and the results were expressed in U/gm.

RESULTS AND DISCUSSION

The plant *Holostemma annulare* Rosh, Asclepiadaceae was studied for its Pharmacognóstical, phytochemical and antidiabetic activity. Pharmacognóstical studies on the plant which is macroscopy, microscopy, powder analysis are a valuable source of information and provide suitable standards for the identification of this plant material for future investigation. Preliminary phytochemical studies on the plant revealed the presence of mucilage, flavonoids, glycosides, steroids and carbohydrates. Further fractionation of the ethanolic extract led to the isolation of uncharacterized steroidal compounds. The roots of *Holostemma annulare* are long, slightly cylindrical, unevenly twisted, and taper gradually towards the tip. Only a few scars of rootlets break the very smooth surface of the roots. Upon closer examination, the organoleptic features exhibit a color that varies from yellow-brown to brownish-black, a sweet taste, and a faintly sweet odor. Under a microscope, the transverse slice of the root exhibits a cork layer comprising four to five layers of tangentially elongated cells. The cells in the outermost row are light brown in color, and a distinct cork or cambium is seen. The 4-5 layers of tangentially elongated cells that make up the phelloderm are mostly composed of starch grains, and some of these cells also exhibit prominent calcium oxalate crystals. Large in size, with strong walls and many pits or pith chambers, Sclereids are found in the deepest levels of the phelloderm. Five to six layers of cortical cells rich in starch granules are seen as one moves farther within. Radially extended uniseriate rays identify the phloem, whereas the xylem makes up around two-thirds of the radius and is composed of lignified parenchyma with thick walls. In addition, there are prominent uniseriate medullary rays on the primary xylem (figure 1). The properties of root cork powder show that it is composed of four to five layers of empty, thin-walled, tangentially elongated cells. These outermost layer of cell has a light brown tint to it. There are also clearly visible sclereids, or stone cells, which have an isodiametric form.

These stone cells have thick, lignified walls that are filled with many pits or pit cavities. Cluster crystals of calcium oxalate are also seen in the sample. In addition, pieces of spiral, annual, and reticulate vessels can be found in the powder. In the end, the sample exhibits fibers that are both lignified and non-lignified (As per figure). The roots of the plant *Holostemma annulare* have been documented for its use in diabetes mellitus¹. As the activity has not been documented, the present study was undertaken to evaluate the antidiabetic effect of the alcoholic and aqueous extracts in streptozotocin and nicotinamide induced NIDDM rats. The acute toxicity studies revealed the non-toxic nature of the aqueous and alcoholic extracts of *Holostemma annulare*. The extracts were safe up to 3000mg/kg. No lethality or any toxic reactions were found up to the end of the experimental period. The fundamental mechanism underlying hyperglycemia in diabetes mellitus involves the over production (excessive hepatic glycogenolysis and gluconeogenesis) and decreased utilization of glucose by the tissues²⁸. Persistent hyperglycemia, the common characteristic of diabetes, can cause most diabetic complications. In all patients, treatment should aim to lower blood glucose to or near normal levels²⁹. In our investigations, oral glucose tolerance tests revealed the antidiabetic activity exerted by the aqueous and alcoholic extract of *Holostemma annulare*. The alcoholic extract in the dose of 500mg/kg showed a significant reduction on blood glucose level within 2 hr. It is well documented that STZ destroys the beta cells of the pancreas and causes hyperglycemia in rats. Studies on STZ induced diabetic animals treated with test extracts revealed significant reduction in the blood sugar level when compared with diabetic control groups at the

**Mohini Upadhye et al.,**

end of a 15-day experimental period. The significant decrease in the levels of diabetic rats treated with the extracts may be by stimulation of residual pancreatic mechanism or by probably increasing peripheral utilization of glucose³⁰. Significant reduction in urine volume, water intake and increase in food intake was observed at the end of the experimental period. These parameters support the potential antidiabetic activity exerted by the test extracts. The present study showed a marked increase in the serum triglycerides and cholesterol levels in control diabetic rats, which are in agreement with the findings of Nikkila and Kekki, 1973, and Chase and Glasgow, 1976 it is well known that under normal circumstances insulin activates the enzyme lipoprotein lipase which hydrolyzes the triglycerides. Insulin deficiency results in the failure to activate the enzymes thereby resulting in hypertriglyceridemia^{31, 32}. The significant control of the levels of serum lipids in the extract treated diabetic rats may therefore be because of improvements in the insulin level. Significant lowering of total cholesterol and raise in HDL cholesterol is a very desirable biochemical state for prevention of atherosclerosis and ischaemic conditions³³. Impairment of glycogen synthesis in diabetic rats has been reported by Whitton and Hems, 1975. The untreated control group animals in our investigation gave inferences in compliance with the above findings. The significant increase in the liver glycogen levels in extract treated animals may be due to the reactivation of glycogen synthase systems. The activities of different key enzymes viz, Hexokinase, Glucose-6-phosphate dehydrogenase and lactate dehydrogenase levels in diabetic animals treated with 500 mg/kg of the alcoholic extract of *H. annulare* showed better enzyme activity than those treated with the lower (250 mg/kg) dose of the alcoholic extract.

The activity was more in alcoholic extract than aqueous extract. The significant increase in the levels of Hexokinase, a key glycolytic enzyme known to decrease in the diabetic state³⁴, may be due to the direct stimulation of glycolysis in tissues with increased glucose removal from the blood. The significant reversal of diabetes induced decreased levels of Glucose-6-phosphate dehydrogenase and lactate dehydrogenase may be attributed to an increase in Glucose utilization through the pentose phosphate pathway³⁵, interfering with the mitochondrial respiratory chain and promoting the peripheral glucose utilization by enhancing anaerobic glycolysis³⁶. Treated groups exhibited a significant decrease in the levels of Glucose-6-phosphatase, a key enzyme in gluconeogenesis, plays an important role in glucose homeostasis in the liver and kidney³⁷. The decreased levels observed in treated diabetic animals may be because of the suppression of hepatic gluconeogenesis and glucose output from liver. Serum urea and creatinine levels were also decreased significantly compared with the diabetic control. Total Protein levels were also increased in the extract treated diabetic animals compared to the diabetic animals. Antioxidants are of two types: enzymatic and nonenzymatic antioxidants. Catalase, Superoxide Dismutase, Peroxidase and Glutathione synthetase are examples of enzymatic antioxidants. Superoxide dismutase and Catalase are considered primary enzymes since they are involved in the direct elimination of reactive oxygen species³⁸. Superoxide dismutase is an important defense enzyme, which catalyzes the dismutation of superoxide radicals, and Catalase is a hemoprotein, which catalyzes the reduction of Hydrogen peroxides and protects tissues from highly reactive hydroxyl radicals³⁹. The reduced activity of Superoxide dismutase and Catalase in the liver and kidney observed during diabetes may result in deleterious effects as a result of the accumulation of superoxide anion radicals and Hydrogen peroxide⁴⁰.

Glutathione synthetase, the most important biomolecule protecting against chemical induced toxicity, participates in the elimination of reactive intermediates by reduction of hydroperoxide in the presence of Glutathione peroxidase⁴¹. The decreased level of glutathione synthetase observed in the diabetic animals represents increased utilization resulting from oxidative stress⁴². In our study the activity of enzymatic antioxidants (catalase, glutathione synthetase, peroxidase and superoxide dismutase) increased significantly in extract-treated diabetic animals. Tocopherol is a nonenzymatic antioxidant, which reduces lipid hydroperoxides, generated during the process of peroxidation and protects cell structures against damage⁴³. In our investigations, the levels of both enzymatic and nonenzymatic antioxidants, which declined in the diabetic animals, were significantly restored on treatment with the alcoholic extract. The overexpression of these antioxidant parameters in diabetic rats treated with *Holostemma annulare* implies that this potential oxidant defense is reactivated by the active principles of *Holostemma annulare*, with an increase in the capacity for detoxification through enhanced scavenging of oxy radicals. The significant inhibitory activity in in vitro antioxidant studies of the test extracts with DPPH, ABTS & reduction of ferric ions, indicate the free radical scavenging activity of these extracts. Our studies have shown that the plant *Holostemma*

**Mohini Upadhye et al.,**

annulareis endowed with marked antidiabetic activity with minimal toxicity. Its potent antidiabetic activity may be attributed to its principal constituents such as flavonoids. However, longer duration studies of *Holostemma annulare* are and its isolated compounds on chronic models are necessary to develop a potent antidiabetic drug.

CONCLUSION

In streptozocin-induced diabetic rats, these results indicate that *Holostemma annulare* aqueous extract has anti-diabetic properties due to its hypolipidemic, antioxidant, and protective effects on pancreatic β -cells, which help to increase glucose metabolism. Its potent antidiabetic activity may be attributed to the steroids and flavonoids present therein. Plant sterols inhibit the absorption of dietary cholesterol and flavonoids are reported to be useful in the treatment of diabetes mellitus.

ABSTRACT

The current outbreak of pneumonia, originating in Wuhan City, Hubei Province, China, since December 2019, is caused by a novel coronavirus referred to as '2019 novel coronavirus,' or 'COVID-19' by the World Health Organization (WHO). COVID-19, a pathogenic virus, has triggered a wide range of challenges during the pandemic, impacting mental health across all age groups, including children and adolescents. Feelings of grief, fear, and uncertainty, coupled with social isolation, increased screen time, and parental fatigue, have adversely affected the mental well-being of children. While friendships and family support typically serve as strong stabilizing forces for children, the COVID-19 pandemic has disrupted these important sources of support. In this study, the assessment of behavioural changes and evaluation of the usage of siddha prophylactic medicines, home remedies, yoga practices during the Covid-19 pandemic in children by using modified standard questionnaire. This study conducted in children attending Kuzhanthaimaruthuvam OPD, NIS by using direct interview method to the children and their informants, after obtaining proper consent from the informant of the children and assent from the children. There were significant behavioural changes like having trouble in concentrating on things, such as reading the newspaper or watching television; and problems paying attention in class or doing homework or reading a book or playing a game observed in these children. It is also observed that siddha prophylactic medicines were widely used among these children during the pandemic. Therefore, from this study it is observed that there is a need to develop healthy coping mechanisms during the current crisis.

**Subashini et al.,****Keywords:** COVID-19, Behavioural changes, Children, Siddha prophylactic medicines.

INTRODUCTION

A novel coronavirus (CoV) named '2019-nCoV' or '2019 novel coronavirus' or 'COVID19' by the World Health Organization (WHO) is in charge of the current outbreak of pneumonia that began at the early of December 2019 near in Wuhan City, Hubei Province, China. The COVID-19 pandemic emerged, presenting a complex array of challenges that impacted the mental health of individuals of all ages, including children and adolescents. Children have been particularly affected by feelings of grief, fear, uncertainty, social isolation, increased screen time, and parental fatigue, all of which have had a detrimental effect on their mental well-being. While friendships and family support typically serve as strong stabilizing forces for children, the COVID-19 pandemic has disrupted these essential sources of support.[2] There are more than 2.2 billion children in the world who constitute approximately 28% of the world's population. Since January 2020, various countries started implementing regional and national containment measures or lockdowns. In this backdrop one of the principal measures taken during lockdown has been closure of schools, educational institutes and activity areas. These inexorable circumstances which are beyond normal experience, lead to stress, anxiety and a feeling of helplessness in all [1]. Children have been at home for longer period of time than ever before. The closure of schools, absence of extracurricular and outdoor activities, changes in eating and sleeping routines, and limited peer interaction have contributed to feelings of monotony, distress, irritability, and various neuro-psychiatric symptoms. The negative impact of school closures and lockdown has been felt by children across diverse geographies, involving high and low-income settings. [2]

Despite the rapid implementation of remote learning, new health protocols, and reopening plans by national governments worldwide, the effectiveness and scope of these policies have significantly varied depending on the economic status of each country. Even short disruptions in children's schooling can have long-lasting negative impacts due to factors including the lack of structured programmes for catching up. In the siddha system, Epidemics /Pandemics are "UzhiNoi" or "Kothari Noi". In general, they are classified under "KollaiNoikal" (Communicable Diseases) which are most commonly occurred the time of "Ayana Santhi" months (Means end a month of UtharaAyanam&ThatchanaAyanam), fall on Aadi and Margazhi month in Tamil calendar. According to the Mukkutram Theory, it is believed that during those times, human immunity tends to be low.[4] In Guru Naadi, quoted, ThottruNoigal generally caused by Kirumi (pathogens). The symptoms are due to Noiyinvanmai (Immunity of individual), if it is good, he/she will not be affected.[4] The World Health Organization (WHO) promotes traditional medicines and developing new therapies in the search for potential treatments for COVID-19.[3] Marked as the initiator to combat with the existing COVID-19 pandemic, the Ministry of Ayush has published useful guidelines for the registered practitioners of Ayush Systems and also advices people to follow traditional medicines for the prevention of COVID-19. The Ministry of Ayush has introduced the "Ayush Sanjivani" mobile application, aimed at helping the public understand the measures taken to enhance immunity and maintain good health during the challenging COVID-19 situation. The Ministry launched a massive nationwide campaign to distribute its proven poly herbal Siddha formulation KabasuraKudineer for the benefit of the vast majority of peoples. And also, government has created awareness in using simple home remedies, yoga practices, pranayamam procedures and immune enhancing siddha formulations during the COVID-19 pandemic. In India, Children were advised to have herbal formulations to enhance the immunity and prevention of COVID-19. Children who are all visiting to our NIS-KM OPD also had siddha preventive measures for COVID-19. But there is no such data available about the children who consumed siddha medicines and also as prophylaxis during COVID-19. Therefore, it is essential to assess the impacts of COVID-19 lockdown on changes in behaviour and it is essential to know the new normalcy situation and how much children suffered due to pandemic effects. Also assess the usage of traditional medicines as protective factors such as siddha prophylactic medicines in children during the pandemic that could mitigate such impacts.

**Subashini et al.,**

MATERIALS AND METHODS

This hospital based observational cross sectional research was conducted in National Institute of Siddha, KuzhanthaiMaruthuvam OPD in 100 children. The Protocol was prepared and submitted to Screening committee followed by National Institute of Siddha's Institutional Ethical Committee (IEC) for ethical clearance on 25/11/2021(NIS/IEC/2021/MP-8). The study also registered in Clinical Trial Registry of India (CTRI) REF/2022/02/051359. Following the approval of IEC, the study commenced as a cross sectional observational study among the children attending the KuzhanthaiMaruthuvam OPD in NIS, Tambaram and their informants. After obtaining proper consent from the informant of the children, and assent from the children. Data were collected from the selected subjects using modified standard questionnaire. The questionnaire consists of two sections to assessing the behavioural changes in children and usage of siddha prophylactic medicines during COVID-19. The questionnaire was selected from the standard questionnaire called PHQ9 and article from American psychiatric association, siddha guidelines from government. The scoring includes not at all, several days, more than half the days, nearly every day, and also minimal, mild, moderate, severe. The children and informant were informed about the study before enrolment and their consent, assent forms and data were maintained confidentially. Then results were analysed in STATA software.

RESULTS AND DISCUSSION

This cross-sectional study was conducted among 100 children attending KM-OPD, NIS. The findings revealed the significant behavioural changes in children during pandemic and usage of siddha prophylactic medicines, home remedies, yoga practices in children during COVID-19 pandemic in children. As per the questionnaire, the results were obtained based on the children had behavioural changes more than half days in a month revealed that maximum number of about 29% children had problems in paying attention to their work. About 29% of children seemed angry or lost temper more than usual. About 27% of children having trouble in concentrating things such as reading newspaper. And 24% of children seemed more irritated/ annoyed than usual. Also 6% of children were felt nervous/anxious and were not been able to stop worrying, and minimum number of 7% children seemed sad or depressed for several hours. In this research, it was observed that siddha prophylactic medicines were widely used in children population for the prevention of COVID-19. The result based on the usage of siddha prophylactic medicines for more than half days in a month, maximum number of about 56% children were taken KabasuraKudineer as prophylactic medicine for prevention of COVID-19. it shows the increased level of awareness and usage of kabasurakudineer among children during pandemic period. And about 51% of children were taken immuno modulators such as Turmeric milk/pepper milk/ginger tea/athimathuram tea/amla/ neem leaves, also 52% of parents of these children were exposed and aware about these preparations like antiviral siddha herbs such as Thulasi kudineer/injisurasam/keezhanelli. The statistical findings revealed that, there were major significant behavioural changes in having trouble in concentrating on things, such as reading the newspaper or watching television. [significant value of 0.035], Problems in paying attention in class or doing homework or reading a book or playing a game [significant value of 0.002].

CONCLUSION

COVID-19 pandemic leads to a lot of undesirable effects in physical and mental health of children and their behaviours. During the pandemic most of the children's activities and behaviours have been affected due to closure of physical classes and introduction of virtual classes, lack of physical activity, aberrant dietary and sleeping habits. This study shows evidence on the impact of pandemic-related behavioural changes in children. The findings emphasize the importance for decision-makers to consider both the risks and benefits to children's health when implementing public health measures. It is advisable to parents and family members, included increasing communication with children to address their fears and concerns, playing collaborative games to alleviate loneliness,

Subashini et al.,

encouraging activities that promote physical activity, and using music therapy in the form of singing to reduce the worry, fear, and stress[6] This study revealed that the awareness about siddha prophylactic medicines, immuno modulator drugs are boomed among our population. Also, the usage of home remedies, yoga practices among the parents and the usage of siddha prophylactic medicines in children are extensively spread. Comparatively than normal times, the pandemic has brought more awareness and increased the usage of siddha medicines and home remedies, yoga practices. There is still the need for wide publicity to reach the root level of young minds of our country.

ABSTRACT

To synthesis Sn and Ce based ZrO nanocomposites via., hydrothermal method. The synthesized ZrO₂, Sn/ZrO₄ and Ce₂/Zr₂O₇ were characterized by various analytical techniques such as XRD, FT-IR, SEM, and UV-DRS. The crystalline sizes of the synthesized ZrO₂, Sn/ZrO₄ and Ce₂/Zr₂O₇ were 27.8, 37.6 and 43.2nm, respectively. The morphologies of the prepared materials were investigated using SEM, it was discovered that ZrO₂, Sn/ZrO₄ and Ce₂/Zr₂O₇ nanocomposite showed rod, irregular and spherical shapes. UV-DRS analysis was used to determine the bandgap of the synthesized Sn/ZrO₄ and Ce₂/Zr₂O₇ which was found to be 2.5 and 2.0 eV, respectively. The prepared materials were used as a catalyst for the photodegrading of methylene blue dye among which Ce₂/Zr₂O₇ material showed high degradation of the dye molecules up to 90%.

Keywords: The synthesized ZrO₂, Sn/ZrO₄ and Ce₂/Zr₂O₇ were characterized by various analytical techniques such as XRD, FT-IR, SEM, and UV-DRS.

Akshaya Saravanan and Anandalakshmi

INTRODUCTION

In recent years, environmental contamination has grown to be a major problem. Pollution levels are rising daily, causing major and irreversible damage to the planet. It has been shown that the primary source of water contamination is industrial effluent. Photocatalytic degradation is a crucial stage in the treatment of wastewater that may get rid of hazardous heavy metal pollutants[1]. The drawbacks of conventional wastewater treatment applications include high separation costs and the secondary generation of pollutants related to adsorption, clotting, and membrane separation all of which have significant operational costs. When present, metal oxide nanocomposites promote photocatalytic degradation[2]. Sn/ZrO₄ and Ce₂/Zr₂O₇ nanostructures are of interest to researchers in a number of domains, including photocatalytic performance, gas sensors, glucose sensors, and solar cells. All things considered Ce₂/Zr₂O₇ metal oxide nanocomposites are superior photocatalysts. The development of innovative and efficient nanocomposite materials is becoming more and more crucial due to the product's favourable environmental effects. The degradation of methylene blue dye under solar radiation was evaluated in this work using Sn/ZrO₄ and Ce₂/Zr₂O₇ and the obtained data was examined and analyzed.

Experimental

The required chemicals in this study were Zirconyl nitrate (Zr(NO₃)₂·3H₂O), Tin chloride hexahydrate (SnCl₂·6H₂O), Cerium nitrate (Ce(NO₃)₂) and oxalic acid all of which were analytical grade and used without further purification.

Synthesis of zirconium oxide nanoparticles

In order to carry out a single-step hydrothermal synthesis of ZrO₂, 2.61g of zirconium nitrate trihydrate (Zr(NO₃)₂·3H₂O) and 0.24g of NaOH were added to 70 ml of distilled water. The mixture was then stirred with a magnetic stirrer for 30 minutes at room temperature in order to maintain a pH of 7. The mixture was poured into a 150 ml stainless steel autoclave with a Teflon lining and heated to 160°C for ten hours[3-5]. Following the sample's return to room temperature, distilled water and ethanol were used to wash it. In a hot air oven, the product was dried at 80°C.

Synthesis of Sn/ZrO₄ nanocomposite

The standard hydrothermal approach was used to produce the Sn/ZrO₄ nanostructure. To keep the pH level at 7, 1.74 g of zirconium nitrate trihydrate (Zr(NO₃)₂·3H₂O) was added to 40 ml of distilled water, and 0.12 g of NaOH was added to the mixture[6]. To the reaction mixture, 1.13g of tin chloride hexahydrate (SnCl₂·6H₂O) was added. For 30 minutes, the aforementioned combined solution was stirred magnetically and kept at 80°C. The entire mixture was moved into a stainless steel autoclave with a Teflon lining. For ten hours, the autoclave was maintained at 160°C. After that, room temperature cooling was given to the reaction mixture. The synthesized product was kept for later research after being cleaned with ethanol and distilled water, then dried for a whole night at 80°C[7].

Synthesis of Ce₂/Zr₂O₇ nanocomposite

The Ce₂/Zr₂O₇ nanocomposite was created hydrothermally by dissolving 1.74g of zirconium nitrate trihydrate (Zr(NO₃)₂·3H₂O) in 40 ml of water, adding 0.12g of NaOH to 20 ml of distilled water to keep the pH at 7, and agitating the mixture with a magnetic stirrer for 30 minutes at room temperature. The mixture was poured into a 150 ml stainless steel autoclave with a Teflon lining and heated to 160°C for ten hours[8]. Following the sample's return to room temperature, ethanol and distilled water were used to wash it. In a hot air oven, the product was dried overnight at 80°C.

Characterization of ZrO₂, Sn/ZrO₄ and Ce₂/Zr₂O₇ nanocomposite

XRD Analysis

The XRD patterns of the prepared samples after calcination at 500 °C were analysed and the observed diffraction peaks at 2θ values of ZrO₂ nanoparticle were found in the planes of (111), (001) and (131), respectively (JCPDS Card No. 79-1796)[9]. Sn/ZrO₄ nanoparticles are ascribed to the reflection plane of (101), (111) and (200), which matched

Akshaya Saravanan and Anandalakshmi

with JCPDS Card No. 48-0889[10]. $\text{Ce}_2/\text{ZrO}_2\text{O}_7$ nanoparticles are ascribed to the corresponding planes of (111), (200), (220) and (131) which confirmed the formation and well matched with JCPDS Card No. 52-1104[11]. These phenomena indicate that the formation of ZrO_2 , Sn/ZrO_4 and $\text{Ce}_2/\text{ZrO}_2\text{O}_7$ nanocomposite began at the calcination temperature of about 450 °C. Peaks are not detected in other phases, indicating the high purity of the products shown in (Fig.1). Crystallite size of ZrO_2 , Sn/ZrO_4 and $\text{Ce}_2/\text{ZrO}_2\text{O}_7$ nanocomposite were calculated by using Debye–Scherrer formula (Equation 1) and the values were presented in Table 1.

Debye–Scherer’s equation

$$\text{Crystalline size (D)} = \frac{0.9\lambda}{\beta \cos\theta} \quad \text{----- (1)}$$

Where λ is the wavelength ($\lambda = 1.5406 \text{ \AA}$ (Cu $K\alpha$)), β is the full width half maximum (FWHM) and θ is the diffraction angle.

FT-IR Spectrum of ZrO_2 , Sn/ZrO_4 and $\text{Ce}_2/\text{ZrO}_2\text{O}_7$ nanocomposite

Analyzing the various functional groups including oxygen-containing functional groups found in metal oxides was made easier with the use of the FT-IR approach. The stretching vibrations of ZrO_2 , as seen in Fig.2a FT-IR spectra, are centered at 569 cm^{-1} due to Zr-O stretching vibrations; the stretching vibrations of C–O and C=O groups found in metal oxide nanoparticles are represented by the peak at 1108 cm^{-1} [12], while the stretching vibrations of H–O–H are indicated by the peak at 3549 cm^{-1} . The stretching mode of the M–O bond is responsible for the stretching vibration peaks at 539 cm^{-1} (Figs.2b and 2c); the stretching of the C–O and C=O groups present in the metal oxide nanoparticles were shown by the stretching vibration peak at 1187 cm^{-1} [13]. The H–O–H stretching vibrations are shown by the peaks at 3547 , 3561 and 3450 cm^{-1} . Because it inhibits charge carrier fusion and has a synergistic effect that increases the nanocomposite’s catalytic activity.

Morphology Analysis of ZrO_2 , Sn/ZrO_4 and $\text{Ce}_2/\text{ZrO}_2\text{O}_7$ nanocomposite

Using SEM micrographs, the surface morphology of the synthesized ZrO_2 , Sn/ZrO_4 , and $\text{Ce}_2/\text{ZrO}_2\text{O}_7$ nanoparticles were examined. The results are shown in Figs. 3a and 3b. Fig.3a depicts the agglomerated structure of the ZrO_2 nanoparticle, whereas Fig.3b shows the uneven form of the Sn/ZrO_4 nanoparticles[14]. $\text{Ce}_2/\text{ZrO}_2\text{O}_7$ nanoparticles were interestingly spherical (Fig.3c) in various directions[15].

UV - DRS Analysis of Sn/ZrO_4 and $\text{Ce}_2/\text{ZrO}_2\text{O}_7$ nanocomposite

Fig.4 displays the results of UV-diffuse reflectance spectroscopy of Sn/ZrO_4 and $\text{Ce}_2/\text{ZrO}_2\text{O}_7$ nanocomposites. The results demonstrate that the UV absorption edge of the pure Sn/ZrO_4 and $\text{Ce}_2/\text{ZrO}_2\text{O}_7$ nanocomposites were significantly noticed at 200 to 800 nm [15]. However, some samples' UV absorption migrated to the higher wavelength side. The band structure alterations are reflected in the variations in the absorption edges. Additionally, the equation for the Kubelka-Munk function is used to compute the bandgap of samples[16].

$$\alpha h\nu = A (h\nu - E_g)^n \quad \text{----- (2)}$$

Where α is the absorption coefficient and $h\nu$ is the incident photon energy. As shown in Fig.5, the bandgap energies are estimated from the intercept of the tangents. The band gap of prepared Sn/ZrO_4 and $\text{Ce}_2/\text{ZrO}_2\text{O}_7$ nanocomposites were found to be 2.5 and 2.0 eV respectively.

Photocatalytic Measurements

The degradation of methylene blue dye solutions, a model organic pollutant, was used to assess the photocatalytic activity efficiency of produced Sn/ZrO_4 and $\text{Ce}_2/\text{ZrO}_2\text{O}_7$ nanocomposite under visible light and sunshine, respectively. In under 60 minutes, the dye breakdown process utilizing solar radiation was completed (Fig.5). In comparison to Sn/ZrO_4 catalyst, the produced $\text{Ce}_2/\text{ZrO}_2\text{O}_7$ nanocomposite has demonstrated a quicker rate of dye degradation[17]. Fig.5a clearly illustrates the Sn/ZrO_4 nanocomposite’s 72.8% methylene blue degradation efficiency, while Fig.5b displays the $\text{Ce}_2/\text{ZrO}_2\text{O}_7$ nanocomposite’s 83.2% methylene blue degradation efficiency after 60 minutes of sunshine irradiation. The effectiveness of the nanocomposites’ degradation was measured in weight percentages using 20 mg of catalyst. The breakdown efficiency of the produced materials under solar radiation is demonstrated in

**Akshaya Saravanan and Anandalakshmi**

Figs.6a and 6b, where it is found that Ce_2/ZrO_2O_7 is more efficient than Sn/ZrO_4 [18]. Every ten minutes, the degradation efficiency was measured, allowing us to deduce that, when exposed to sunlight, the Ce_2/ZrO_2O_7 composite material was more efficient than the Sn/ZrO_4 nanoparticles.

Mechanisms of photocatalysis:

The actual process of methylene blue dye degradation indicates that conduction band electrons (e^-) and valence band holes (h^+) were created when Sn/ZrO_4 and Ce_2/ZrO_2O_7 nanoparticles were exposed to light energy bigger than or equal to their band gap energy [19]. Organic compound oxidation is mediated by the creation of hydroxyl radicals, while reduction and oxidation processes are mediated by the production of superoxide radicals. A schematic illustration of the degradation mechanism is shown in Fig.7 [20-22]. Heterogeneous photocatalysis is produced through the oxidation pathway by the hydroxyl radical that is generated. The dye may be reduced to superoxide radical a Ce_2/ZrO_2O_7 or photogenerated by combining electrons with electron acceptors such as O_2 that is dissolved in water or adsorbed on surfaces. When the photogenerated holes react with OH^- or H_2O , they can oxidize organic molecules by generating OH radicals [23]. The majority of methylene blue may be oxidized by the OH radical into non-toxic byproducts such CO_2 , H_2O , and mineralized product since it is such a potent oxidizing agent [24].

CONCLUSION

The hydrothermal approach was employed to synthesize the nanomaterials viz., Sn/ZrO_4 and Ce_2/ZrO_2O_7 and were calcined at $450^\circ C$ for 6 hours, producing Sn/ZrO_4 and Ce_2/ZrO_2O_7 nanomaterials with a crystalline size of 36.7 and 47.6 nm with the agglomerated matrix and irregular structures. Kubelka - Munk function plot scrutinized that the band gap of Sn/ZrO_4 was 2.5 and Ce_2/ZrO_2O_7 was 2.0 eV, respectively. The photocatalytic performance of the synthesized Sn/ZrO_4 and Ce_2/ZrO_2O_7 nanocomposites against methylene blue dye was evaluated by sunlight irradiation with 20mg of weight percentages of the catalyst. Ce_2/ZrO_2O_7 nanomaterial showed a high degradation property (81.3%) compared to Sn/ZrO_4 materials (69.0%). The sunlight irradiation is a preferable source for eco-friendly photocatalytic degradation processes. The materials were also used for reducing the water pollution via an efficient photodegradation processes.

ABSTRACT

This study is carried out to analyze the hydrogeochemical characteristics of water in the Aizawl District and the uses of GIS techniques called geospatial for identifying the chemical distribution based on the element concentrations. 55 different samples were collected in the Aizawl district during pre-monsoon. The samples were tested/analyzed with different parameters such as pH, EC, TDS, Chlorine, Carbonate, Bi-carbonate, Calcium, Magnesium, Sulphate, Phosphate, Sodium, Silica and Potassium. The spatial variations map has been utilized to identify the quality location within the study area. The spatial chemical distribution map was prepared to analyze the chemical concentration area in the Aizawl district. The study results show that the water quality in most parts of the sampling area is suitable and falls under the permissible limit except in a few locations. This study reveals that the quality of water in the study area is sustainable for domestic usage, agriculture, and different purposes.

Keywords: GIS, Water quality, Hydrogeochemistry, Groundwater, Aizawl District.

INTRODUCTION

Water is an extremely valuable natural resource, and in the last year, there has been less fresh water available on the surface. Water is a more dynamic renewable resource, but it is still very important to have access to it when and where it is needed in acceptable quality and sufficient quantity. The demand for water supply increases rapidly due to urbanization, the growth of population, and extensive use in domestic and agricultural sectors (Chaudhary et al.,

**Krista Lalnarammawia and Paluchamy Anandhan**

1996). As a result, conducting a quality analysis and detecting potential hazards is essentially important to meet the demand for a clean water supply to the present civilization. Groundwater is an essential natural resource for providing reliable and economical potable water supply in both urban and rural areas. Therefore, it plays a crucial role in human well-being as well as that of aquatic and terrestrial ecosystems (Sar et al., 2015). Geologically, Mizoram state comprises N-Strending ridges with high degree of slopes and narrow intervening synclinal valleys, faulting in many areas has produced steep fault scarps (GSI (2011)). In hilly areas like Mizoram, even though the rainfall is comparatively high, shortage of water is often experienced in the post-monsoon season, as most of the water available is lost as surface runoff (Lalbiakmawia, 2015). Groundwater stored in the hill slopes emanates in the form of springs, which are being used as a source of water supply (CGWC, 2013). Recently, Geographic Information Systems (GIS) and Remote Sensing techniques set a new challenge in mapping the chemical distribution in the field of hydrogeology. It also has a wide range of applications in the field of geosciences. Geographic information system (GIS) and remote sensing (RS) tools are widely used for the management of various natural resources (Krishna Kumar et al., 2012, Magesh et al., 2011). The field of geospatial technology holds immense potential for studying water resources. As a result, numerous researchers have effectively applied these methodologies in groundwater studies (Krishnamurthy et al., 2000, Saraf. A. K & Chaudhury P. R., 1998). Hydrogeology and the development of water resources have demonstrated the enormous significance of these similar procedures (Saraf. A. K & Chaudhury P. R., 1998). The main objective of the present study is to illustrate several thematic maps and spatial maps to demonstrate the chemical distribution of water in Aizawl district and to provide a vital database for future hydrochemical studies within the district.

MATERIALS AND METHODS

Study area

Aizawl district is located in the northeastern part of Mizoram. It is bounded on North and North-east by Kolasib district of Mizoram and parts of Manipur, South by Serchip district, East by Champhai district and west by Mamit district of Mizoram (GSI, 2011). It covers an area of 2138.62 sq. km, and the district is divided into four Rural Development (RD) block. Geographically the Aizawl district is located in 23°18'24.04" N to 24°24'47.23 N latitudes and 92°37'27.62" E to 93°02'26.71" E longitudes. It falls under Survey of India toposheet No. 83D/15, 83D/16, 84A/9, 84A/10, 84A/11, 84A/13, 84A/14, 84A/15, 84E/1, 84E/2, 83H/3 and 83H/4. The climate of the study area ranges from moist tropical to moist sub-tropical (Lalbiakmawia, F., 2015). The district receives heavy rainfall during May to late September with an average annual rainfall of 2,794 mm under the influence of southwest monsoon (CGWC, 2013). The location map of the study area is shown in Figure 1.

Geomorphology of the study area

Geomorphologically the district is characterized by ridgelines and intervening valleys; the landscape is mountainous with notable relief from a physiological perspective and the hill ranges are trending in the north-south direction. Deep gorges are created by synclinal narrow valleys running parallel to subpar anticlinal hill ranges. The primary geomorphic units are structural hills, which are classified as high, moderate, and low structure hills according to elevation. Structural hills, as their name suggests, are formed structurally and are connected to faulting, folding, and other tectonic processes (Lalbiakmawia & Vanthangliana, 2015). Other geomorphic units include the Alluvial Plain and Intermontane valley (Lalbiakmawia & Lalbiakmawia, 2016).

Geology of the study area

The earliest recorded work on the geology of Mizoram was conducted in 1891 and it was reported that the area consisted of great flysch facies of rocks comprising monotonous sequences of shale and sandstone (La Touche THD, 1891). The research area is surrounded by the Tertiary Bhuban and Bokabil formations of the Surma Group, which are primarily composed of argillaceous and arenaceous rocks (GSI, 2011). The Surma group is comprised of the Bhuban and Bokabil Formations, the most developed lithounit in the Surma Basin with a thickness of 5000 meters. Again, the Bhuban Formation is subdivided into Lower, Middle and Upper Bhuban units, Upper Bhuban Formation comprises of an arenaceous succession predominating with sandstone, shale and siltstone (Bharali et al., 2017).

**Krista Lalnarammawia and Paluchamy Anandhan****Drainage system of the study area**

Aizawl district is drained by Tlawng river in the west and Tuivawl river in the east, also Tuirial river drain in the mid part of the district. These major rivers flow in south-north direction throughout the district. Tuivawl and Tuirial river flows in a northward direction till it enter Cachar district in Assam and confluence Barak River in Assam. Tlawng river on the other hand flows northward and enter Kolasib district in Mizoram till it enters Assam. The streams are young stages with deep courses, and the majority of the drainage follows a dendritic to sub-dendritic pattern. Numerous tributaries can be found along the drainage pattern of the major drainage.

Arc-GIS Software 10.8.2 and QGIS

The GIS software ArcMap and QGIS were used to generated several thematic maps including the Geology, Geomorphology, Drainage and Spatial Interpolation map. Arc-GIS spatial analyst consist of numerous interpolation tools. Inverse Distance Weighed (IDW) is the selected tools for this study. The sample points are weighed during interpolation in the IDW interpolation method.

Data analysis

Water samples are collected from 60 different locations and tested for their physio-chemical parameters. The base map was digitized using QGIS software and exported to ArcMap 10.8.2 software for spatial analysis. The chemical characteristics of the water are evaluated using the Indian Drinking Water Standards as per BIS. The major parameters used for analysis are pH, Electrical Conductivity (EC), Total Dissolved Solid (TDS), Chloride, Carbonate, Bi-carbonate, Calcium, Magnesium, Sodium, Potassium, Silica and Phosphate. Spatial interpolation technique such as Inverse distance weighed (IDW) are used for generating spatial distribution of water quality in this study. The spatial variation maps of the major water quality parameters were produced as a thematic layer following BIS guideline. This guideline categorized each ground water parameters as desirable limit, permissible limit and non-potable classes. The different classes within the BIS Guideline were represented in the present study as good, moderate and poor classes respectively (Lalbiakmawia & Vanthangliana, 2015).

RESULTS AND DISCUSSIONS

The water quality attribute database is used to generated the spatial variation layer of the major water quality parameters. Based on the spatial variation layers of major water quality parameters, an integrated water quality map of Aizawl District was prepared using the GIS software. The minimum, maximum and average value of the parameters is shown in table 1. The results and discussion for the major parameters are as follow.

pH

pH is an essential water parameter that indicates its level of acidity or alkalinity. The pH value of water ranges from 6 – 9. The activity of hydrogen ions, represented in logarithmic units, is referred to as pH. Chemical reactions that generate or consume hydrogen ions regulate the activity of hydrogen ions. The pH values of the sample are classified into two classes poor and good classes based on BIS standard. Almost all the sample in the study area are falls into a desirable limit based on BIS guideline (6.5 – 8.5). The average pH concentration in the study area is 7.1. A few locations have a pH value lower than 6.5 and few sample location has a pH value higher than 8.5. The area where the pH value falls into desirable limit were categorized as good class while those area with pH value lower and higher were categorized as poor class. The spatial variation map for pH is shown in Figure 2.

Electrical Conductivity (EC)

The capacity of a material to carry electric current is known as Electrical Conductivity (EC). The conductivity measurement is directly correlated with the water's strength. The EC for the purest water is 0.05 $\mu\text{s}/\text{cm}^2$. Based on the BIS guideline, the value of EC for all the sample falls under desirable limit. The spatial variation of EC is illustrated on Figure 3. The sample is classed into three classes low, moderate and high. The average concentration of EC in the

**Krista Lalnarammawia and Paluchamy Anandhan**

region is 200.77 $\mu\text{s}/\text{cm}^2$. As shown in figure majority of the sample have low concentration of EC and few sample have higher concentration.

Total Dissolved Solid (TDS)

As per BIS guideline the Total Dissolved Solid is Classified into three ranges (0-500 mg/L, 500 – 2000 mg/L, > 2000 mg/L). Nevertheless, all the sample in the study area falls under desirable limit, the TDS concentration in the region ranges from 11.00 mg/l to 411 mg/l, with an average concentration of 102.01 mg/l. The spatial variation map of TDS is shown in Figure 4. Majority of the sample have low concentration of TDS while only few samples are categorized in high concentration. The TDS value are higher in the southern part of the study area and also in the central part of the area. It is true that a rapid determination of total dissolved solids in groundwater can be made by measuring the electrical conductance. This is because the total dissolved solids (TDS) in water increase the electrical conductivity of the water. Therefore, by measuring the electrical conductance of the water, we can estimate the TDS concentration. However, while this method is relatively quick and easy, it may not provide accurate results in all cases and may require additional testing to confirm the TDS concentration.

Chloride (Cl)

Chloride in high concentration led to water a salty taste. Based on BIS guideline the acceptable limit of chloride in water is 250 mg/l. However, all the samples collected are falls under desirable limit. The chloride concentration of the sample in the study area ranges from 17.725 mg/l to 168.387 mg/l with an average concentration of 37.36 mg/l. In Figure 5, we can see that the chloride concentration is high in the northern part and southern part of the region, and also the high in the area with higher population like city or town which is in the central part of the study area.

Sulphate (SO₄)

High concentration of sulphate in drinking water can affects its taste and odour. Sulphate occurs naturally in groundwater due to dissolution of minerals. The maximum acceptable limit is 200 mg/l. Water containing about 500 mg/l of sulphate taste bitter; water containing about 1,0000 mg/l may be cathartic. The study shows the concentration in the region ranges from 37.108 mg/l to 64.705 mg/l. The average concentration in the region is 51.00 mg/l. However, the study area shows no concentration higher than the acceptable limit provide by the BIS guideline. The spatial variation map for sulphate is shown in Figure 6. It is classified into low, moderate and high. The figure shows that the northern part of the region has a high concentration of sulphate and the majority of the samples have a moderate concentration of sulphate in the region.

Phosphate (PO₄)

Phosphate is a critical parameter in water quality analysis as it can have significant implications for aquatic ecosystems. Phosphates are compounds containing the PO₄³⁻ ion and are often found in fertilizers, detergents, and other sources. Groundwater often has low value due to strong absorption of phosphate molecules in soils. The concentration of phosphate in the study area ranges from 1.799 mg/l to 62.283 mg/l. The average concentration in the region is 7.26 mg/l. Again, the spatial map has been classified into three low, moderate and high, which is illustrated in Figure 7. The spatial variation map shows that majority of the samples have low concentration of phosphate, while few samples are classified into moderate and high concentration.

Calcium (Ca)

Calcium is a major contributor to water hardness, which is a measure of the concentration of divalent cations (primarily calcium and magnesium) in water. 75 mg/l in water is the acceptable limit as per BIS guideline. The spatial variation of calcium in the study area is shown in Figure 8. Here, it is classified into three classes based on the concentration i.e., low, moderate and high. The concentration of the calcium in all the sample falls under acceptable limit, and the concentration ranges from 4 mg/l to 34mg/l with an average concentration of 14.70 mg/l. There is a lower concentration of calcium in the southern part of the study area, with most samples showing a moderate concentration of calcium.

**Krista Lalnarammawia and Paluchamy Anandhan****Magnesium (Mg)**

Magnesium is a key contributor to water hardness, alongside calcium. The concentration of magnesium generally less than 50 mg/l in continental water. The result shows very low concentration ranging from 2.4 mg/l to 15.6 mg/l. The average concentration in the study area is 5.56 mg/l. The BIS guideline determined that the acceptable limit of calcium in drinking water is 30 mg/l. This shows that all the samples in the study area falls in acceptable limit. The spatial variation map classified the region into three classes low, moderate and high based on the analyzed concentration, which is shown in Figure 9. The majority of the sample falls into low concentration classes, while few sample have high magnesium concentration.

Silica (H₄SiO)

Silica, which refers to the oxide SiO₄, is a commonly used term for silicon in natural water. However, the actual form of silica is hydrated and is more accurately represented as H₄SiO or Si(OH)₄. The dissolved silica in natural water is generally a result of the chemical breakdown of silicate minerals during the process of weathering, which is irreversible. In this study the region in classified into three group low, moderate and high based on the concentration, the spatial variation is shown in Figure 10. The concentration of silica in the region ranges from 4.8 mg/l to 138.6 mg/l with an average of 49.50 mg/l. The map shows that the southern part of the study area has low concentration of silica while the northern part of the study area has moderate concentration, few sample have high concentration of silica based on the spatial classification.

Sodium (Na)

Sodium is a common element found in water, and its concentration is often measured in water quality analysis. The presence of sodium in water can have various sources, including natural weathering of rocks, industrial discharges, and human activities. The sodium concentration in the study area ranges from 0.9 mg/l to 106 mg/l. The average concentration is 17.65 mg/l. The spatial distribution map shows that the concentration of sodium is high in the northern part of the region. Majority of the samples consist of low sodium concentration. The spatial distribution map is illustrated in Figure 11.

Potassium (K)

Potassium is a naturally occurring element that can commonly be found in rocks, minerals, and soils. It can enter water sources through the natural breakdown of rocks and minerals, as well as through the weathering process. The use of fertilizers containing potassium can also lead to elevated levels of this element in water bodies through runoff. Different countries and regions may have their own specific standards or guidelines for water quality regarding the presence of potassium in both drinking water and surface water. Elevated levels of potassium in water can have a negative impact on aquatic ecosystems. Excessive amounts of potassium may lead to nutrient imbalances, which can affect the growth of aquatic plants and algae. Additionally, some industries may release potassium into water as part of their effluents. This study classified the potassium concentration into three classes i.e., low, moderate and high respectively, which result that the majority of the samples in the region have low concentration. The spatial distribution map shown in Figure 12, which shows that the southern part of the study area has higher concentration compared to the other part of the region in the study area.

Bi-Carbonate (HCO₃)

Bicarbonate is typically produced by the weathering of silicate and carbonate, as carbonate mineral is not very soluble in pure water. The carbonate forms a calcium carbonate scale that limits the flow of fluids in pipes and slows the movement of heat through pipe walls when it mixes with alkaline earth elements, primarily calcium and magnesium. Alkalinity is a crucial component in determining how much lime and soda ash are needed to soften water, as well as a crucial component in corrosion prevention. The value of bi-carbonate in the study area ranges from 24.4 mg/l to 347.1 mg/l with an average value of 6.22 mg/l. Fig. 13 shows that the central part of the study area has higher concentration of bi-carbonate while north part has low concentration.

Krista Lalnammawia and Paluchamy Anandhan

CONCLUSION

The hydrogeochemical analysis results shows that the dominant ion in the region is Bi-carbonate (HCO_3^-) and is also the dominant cation while Sodium (Na^+) is the dominant anion. The geochemical analysis reveals that the majority of geochemical facies of the water samples are dominated by HCO_3^- - Cl^- - Na^+ - SO_4^{2-} - PO_4^{3-} - Ca^{2+} - K^+ - Mg^{2+} types of water. The use of GIS software such as ArcGIS make the water quality analysis easier in understanding and identifying the high intensity area of the study. The water quality maps provide better understanding in the existing water condition in the study area. The study results shows that the water quality of all the sample in the study area are in good conditions and falls under permissible limit recommended by BIS guideline except for pH in which pH value of few samples falls out the permissible limit. Therefore, the quality of water in the study area is sustainable for domestic usage, agriculture, industries and different purposes.

ACKNOWLEDGEMENTS

The author would like to thank to Department of Earth Sciences, Annamalai University to carry out the research work and analyse in the Department, and also would like to give a sincere gratitude to Dr. P. Anandhan, Assistant Professor, department of Earth Sciences, Annamalai University for his guidance in the research work.

ABSTRACT

Vicharchika is among the *Kshudrakushtha* described under the term *Kushtha*, where most skin diseases are mentioned as per Ayurvedic texts. *Kushtha* are the conditions involving *Rakta dhatu* and *Tridosha* which mainly affect the skin in general and form various impairments. Although *KshudraVyadhis* do not significantly impact the body, the patient's mental state is disturbed by their emergence because the ailment is difficult for the patient to recover from. They are extremely challenging to treat because of their high recurrence rate. In this case study we discuss the Ayurvedic treatment given to a female patient, age 37, of *Vicharchika* who had classic symptoms including *kandu*, *strava*, *rukshata*, and *shyavata* on both surfaces of her palms, fingers, and dorsal surfaces of her feet for 4 months. The patient was cured with notable results after one and a half months of treatment after the treatment regimen was followed by the pathophysiology of the condition. The patient was instructed to follow restrictions for a significant diet to prevent recurrence. Overall, repeated *shodhana* with *shamana* medications plays an important role in the speedy recovery of the condition.

Keywords: *Vicharchika*, *Sadyo Vamana*, *Koshthashodhana*, *Shamana*

Meghavi J.Vaghamshi et al.,

INTRODUCTION

Skin is the reflection of the well-being of the person as there may be impairment in lustre, texture or normalcy of skin due to any physical, mental and behavioural disturbances. Skin diseases range from a small spot, discolouration, scar mark or wound to covering the entire body and various lesions. As per the Ayurvedic texts, a major portion of skin diseases is discussed under the heading of *Kushtha* where *Maha kushtha* and *Kshudrakushtha* are two types. The meaning of the word *Kushtha* is "*Kushnati sarvam vapuhu iti Kushta*"—the one who alters the body disgracefully, makes one's skin appear unattractive or ruins the skin texture. Despite the difference in area, severity and prognosis, both equally disturb the mental status of the patient due to the direct appearance on the skin itself.[1] Based on the *Amshamshakalpana* of *Dosha-Dushya*; *Kushtha* is divided into seven types of *Mahakushtha* and eleven types of *Kshudrakushtha*. *Vicharchika* is one among the *Kshudrakushtha*, having *Kandu*, *Pidika*, *Shyava varna*, *Bahustrava*, *Raji*, *Rukshata* and *Ruja* as the classical symptoms and described as *Kapha-Pitta pradhana tridoshaja vyadhi* by Acharyas. In the *Samprapti*(pathogenesis) of *Vicharchika*, there is involvement of *Saptadushyai*.e., *Tridosha*, *Twak*, *Rakta*, *Mamsa* and *Lasika*. [2] *Vicharchika* is commonly found recently, this ailment is upsetting since it results in deformity by impacting a person's appearance cosmetically. Additionally, it has an impact on the quality of life of a person and also due to a high recurrence rate raises economic burden. [3] *Kushtha* is described as *Dushchikitsyavyadhi* as it has more elements in pathogenesis and amount of vitiation and deep-seated *dosha*. As per Ayurveda *Shodhana*(purificatory therapy) is the prime treatment measure and can be applied with *Shamana*(alleviation therapy) and other dietary and behavioural restrictions. A case study of *Vicharchika* is discussed with *Vamana*, *Koshthashodhana* and *Shamana* treatment explained.

Case study

A 37-year-old female patient visited O.P.D., Parul Ayurveda Hospital, having complaints of Itching, scaling, and watery discharge from skin lesions over both palms, fingers and toes with brownish-red discolouration and occasional bleeding from lesions for 4 months. Due to these complaints, her day-to-day household work gets disturbed. There are mental disturbances like excessive thoughts and stress related to the disease condition also found due to repeated occurrences of skin disease. She was previously treated for such skin-related complaints over her abdomen and both upper limbs for 1 year. No significant family history or occupational history was found. The patient was examined and diagnosed with *vicharchika* having classical symptoms like *Shyavata*, *Rukshata*, *Kandu*, *Strava* and *Ruja* and was admitted to the Panchakarma department of Parul Ayurveda Hospital after counselling regarding the *Shodhana* treatments. Other details of patient-related to this case study are as below:

Associated complaints: Burning sensation in the chest, and abdomen occasionally

Past history

- H/O Bell's palsy (5 years back)
- No H/O DM, HTN

General examination

BP: 120/70 mm of Hg

Pulse: 72/min, regular

R.R.: 18/min

H.R.: 74/min

Mala: *Vibandhit*(Habitual constipation)

Mutra: *Samyak pravrutti*, 4-5 times/day

Nidra: Sleep disturbed due to itching

Jihva: *Ishat Lipta*

Koshtha: *Krura*

Agni: *Vishamagni*

Meghavi J.Vaghamshi et al.,

Systemic examination

Cardiovascular system – On Auscultation, normal S₁S₂ heard
Respiratory system – On Auscultation, AEBL clear
GIT – On Palpation, Soft and non-tender abdomen
CNS – NAD, Patient is conscious & well-oriented.

Local examination

Shape – Irregular
Size – Not specific, Covered whole both palms, both toes
Colour – Brownish red
Secretion – Present
Pain – Present occasionally
Inflammation – Present
Loss of sensation – Intact

Sampraptighatak

Dosha – Kaphapradhan Tridosha
Dushya – Rasa, Rakta, Mamsa, Lasika
Srotas – Rasavaha, Raktavaha, Mamsavaha, Svedavaha
Srotodushiti – Sanga
Ama – Sama
Udbhavasthana – Amashaya
Vyaktisthana – Tvacha
Rogamarga – Bahya
Sadhyasadyata – Kricchrasadhya

OBSERVATIONS & RESULTS

In the present study, 1-time classical *Vamana karma* concerning *Shodhana karma* and 2-time *Sadyovamana karma* as repeated *Mrudu Shodhana* measure was conducted, findings are as below.

DISCUSSIONS

As per the classics *Kushtha* is described as *Deergharoga*(deep-seated disease) and included in *Ashta Mahagada*(major diseases) announces the difficulties in the management of particular conditions. *Shodhana* is the main line of treatment in *Kushtha* because *Bahu dosha Avastha*, *Vicharchika* being a *Kshudrakushtha* can be treated with the same principles. By considering the *bala*(strength) of the patient and the amount of vitiated *Dosha*, repeated *shodhana* at regular intervals i.e., *Vamana*(emesis) – once in 15 days, *Virechana*(purgation) – once in a month, *Nasya*(nasal drops) – once in three days, *Raktamokshana*(bloodletting) – once in six months to be conducted.^[8] After the *Shodhana* treatment, *Shamana* also plays an important role in subsiding the remaining *dosha*. *Pathayaahara*(wholesome diet) is essential to prevent recurrence.

Koshthashodhana

The elimination of aggravated *Doshas* and *Mala* present at *Koshtha* is quoted as *KoshthaShodhana*. *Koshthashodhana* refers to *Mrudu virechana* without *Snehapana*.^[9] *TrivrutAvaleha* is chosen for the *Koshthashodhanakarma*, which causes *Pitta-Kaphadosha nirharana* and by its *Snighdhaguna* decreases *Shyavavarna* and *Rukshata* associated with *vata dosha*.^[10] *Triphala Kashaya* acts as *Virechanopaga*.

Meghavi J.Vaghamshi et al.,

Pachana

Before any *Shodhana karma* or *Snehapana*, to obtain *Niraamata – Deepana*, *pachana* is necessary for correcting the status of *Agni*(digestive fire) by which proper digestion of *Sneha* or *Aushadhi* can be achieved.[11]*Chitrakadivati* is used for *Amapachana* and removal of *Pichhilaguna*, it promotes *Jatharagni*, which in turn stimulates all other *Agnis*. [12]*Vasaguduchyadi Kashaya* has ingredients like *vasa*, *Guduchi*, *Triphala*, *katuki* and *bhunimba* which will act on the *sama pitta* and normalize the function of *agni*. [13]

Parisheka

Parisheka is a *Drava sveda* acts on *Pitta-Kapha dosha*. *Panchavalkalakwath* have qualities of *Kaphapittaghna*, *Varnya*, *Vranashodhana*, *Ropana*, *Daha shamana* and *Raktadoshahara* according to *Guna Karma* of drugs. It is also phytochemically rich in phenolic group elements like tannins and flavonoids, which are primarily responsible for its exceptional antiseptic, anti-inflammatory, immune-modulating, antioxidant, antibacterial, antimicrobial, and wound purifying as well as healing. [14]*Panchakola Kashaya* will act by performing *pachana* of the *dosha* present in the *shakha*, thereby removing the *srotorodha*(obstruction). [15]

Abhyantarasnehapana

Shodhananga and *Shamanangasnehapana* used here as *Purvakarma* during the treatment. *Shodhananga Sneha* is given before classical *Vamana karma* in *Bahumatra*(maximum amount) to liquefy the *dosha* and move from *Shakha* to *Koshtha*. Whereas *Shamananga Sneha* is given before *Sadyovamana karma* in *Alpamatra*(minimal amount) for *Pachana* of *Shesha* (remaining) *dosha* and to maintain the status of *Agni* at intervals. Various potent phytoconstituents isolated from *Mahatiktakaghrita* work together to heal *Kushtha*, presumably via the liposomal drug delivery system. [16]

Vamana

Vamana as a prime measure for *Kapha dosha* eliminates *Srotosanga*, expels out the morbid *Dosha* from *Koshtha* and thus does *Sampraptivighatana*(breaking of pathogenesis) of *Vicharchika*. *Vamana* followed by *Purvakarma* helps in reducing symptoms like *Kandu*, *Strava* and *Ruja* in this case by *Kushthaghna*, *Varnya*, *Kandughna* and *Raktashodhaka* properties of drugs used in *Vamana karma*. Probably it leads to cellular-level changes responsible for the reduction of pathogenesis causing the ailment. [17] *Sadyovamana* is planned for the prevention of further accumulation of *Dosha* and chances of recurrence, according to *Bala* of the patient. [18] *Yashtimadhuphanta* is used as *VamanaDravya*. *Yashtimadhu* is included in *Vamanopaga* and *Kandughna mahakashaya* by *Acharya Charaka* which eases the *Vamana* and acts as *Pitta*, *vata*, *raktadoshahara*, also experimentally proven to have anti-tussive & expectorant activity, antioxidant activity, anti-inflammatory activity and immune stimulatory effects. [19]

Shamana chikitsa

KaishorGuggulu works as *Deepana*, *Pachana*, *Kledashoshaka*, *Tridoshashamaka* and by *Rasayana*(rejuvenation) effect it supports *Uttarottara Dhatu Pushti*. [20] *Manjishta* possesses anti-inflammatory, antibacterial and healing qualities for wounds. *Manjishthadighanavati* directly targets the *Rasa*, *Rakta* and *Mamsadhatu* and having *Raktaprasadaka* property also enhances the effect of *KaishorGuggulu*. [21] *Aragvadhadi Kashaya* having *Kandughna*, *Kushthaghn* and *Kaphahara* functions reduces specific features like *Ruja*, *Kandu*, *Vaivarnya*, *Strava* and *Rukshata*. [22] *Dushivisha* can be considered as accumulated toxins in the body at *Dhatu* and *Srotas* levels, provided by environmental and individual factors that may include *Pragnaparadha* and medications like steroids. [23] *Dushivishari agad a* contain *spittakaphaghna*, *vishaghna*, and *raktaprasadak* qualities and the *dravyas* there in are *kushthaghna*. It should therefore be used to treat skin conditions brought on by the modern, fast-paced lifestyle of today. [24]

CONCLUSION

The case study reveals that *Vicharchika* can be treated with *Panchakarma* and *Shamana* medicines. *Pathya sevana* plays an essential part in the management and lessens the chances of reoccurrence as no symptoms appear after 1 month at follow-up. *Vamana karma* aids the benefits of *Apunarbhavachikitsa* and repeated *Mrudu shodhana* creates clearance of

Meghavi J.Vaghamshi et al.,

Hruta dosha from *srotas*. *Shamana* acts as *Rasayana* mainly and does *poshana* of *dhatu*. In today's era maybe due to cumulative toxicity may create an imbalance in bodily humours and cause skin diseases which are difficult to treat; *Shodhana* treatment including *Panchakarma* followed by *Shamana* provides promising results. Further studies include repeated *mrudushodhanachikitsa* like *sadyovamana* with *shamana* as a treatment modality that can be examined in a large sample size to determine efficacy in such skin disorders.

ABSTRACT

The current study offers an overview of parenteral drug delivery systems, covering methods of administration, parenteral formulation, types of containers, and tests for evaluation. Parenteral preparations are sterile liquids devoid of pyrogens that include one or more active ingredients in single or multiple doses. They enter your body through an injection, an infusion, or an implant. Parenteral injections have the benefits of immediate systemic absorption and a rapid commencement of action. The stability of the active ingredient and finished formulation depends on the quality of the excipients, raw ingredients, and equipment maintenance. For drugs with a limited therapeutic index and active pharmaceutical components with low bioavailability, parenteral administration is the most widely used and effective method of delivery. This review article provides detailed information about parenteral dosage forms. A number of technological advancements in parenteral medication administration have led to the development of complex systems that enable drug targeting and the sustained or controlled release of parenteral medicines.

Keywords: Parenteral, Injection, Infusion, Implant, Therapeutic, Bioavailability

Sharma et al.,

INTRODUCTION

The word parenteral is obtained from "para" and "enteron" which signify to avoid the gut. It can be defined as preparations intended to administered through the skin or other external boundary tissue, rather than through the alimentary canal, so that the active substances can be administered directly into a blood vessel, organ, tissue, or lesion. Since parenteral injections are provided through the skin into blood stream, the body's most protective barriers, the products used in them must be "essentially" devoid of biologic contaminants. Most are injected directly into body tissues; they do not pass via liver and enter the bloodstream by avoiding first pass metabolism. This method offers several benefits for patients who need a quick start of action and are unable to take the medication orally, such as those who are asleep. Patients who are bedridden or in hospitals are entirely dependent on parenteral nourishment, which includes nutrients, electrolytes, and fluids. Parenterally delivered medications are typically quite strong requiring close monitoring of the patient's dosage. The quantity and use of parenteral products have increased globally since the development of biotechnology attained greater demand these days. Parenteral injections are either given readily via blood vessels for an immediate and well-controlled response or into the tissues beyond the circulation for a local or systemic effect. Parenteral dosage forms are a sterilized mixtures that can enter the body by injection, infusion, or implantation, among other methods. Parenteral fluids with different volumes are categorized as small and large injections.

- a. **Small volume parenterals** are injectables that are pyrogen-free and sterile. They are dispensed in ampoules for a single dosage and in vials for multiple doses, and prefilled syringes. Their sizes go up to 100 ml.
- b. **Large volume parenteral** products, often known as intravenous infusions or transfusion fluids, which has 100 ml or more that is meant to be given intravenously. These are intravenous infusions that are designed as single-dose injections. They consist mostly of water for injections and are sterilised aqueous solutions or emulsions. (5) Drug solubility, product stability, route of administration syringeability and manufacturability are few difficulties involved in developing a parenteral product. Modernization of pharmaceutical development and production will improve product quality. (6,7) Due to factors such the rising incidence of chronic illnesses, the rising need for biologics and biosimilars, and the continuous developments in drug delivery technology, the worldwide parenteral market is expected to continue growing. Businesses that can take advantage of technology advancements, adjust to changing market conditions, and meet unmet medical requirements stand a good chance of succeeding in this cutthroat environment. They cover a broad spectrum of goods, such as emulsions, suspensions, and solutions. Some parenteral formulations present in the market is given below in **Table 1**.

Characteristics of parenteral preparation

- They must be sterile.
- They need to be free of particulate matter, micro organisms and pyrogens.
- They should be isotonic with body fluids. They
- They should be sterile.

Advantages of parenteral preparation

- They have rapid onset of action.
- They are useful for unconscious patients.
- They can be used to give the medication in both conventional/ controlled manner depending on the excipients used.
- They have high first pass metabolites.
- They can be used for gastric irritating drugs.
- They are used to administer nutrients viz glucose and electrolytes.

Sharma et al.,

ROUTES OF ADMINISTRATION⁽⁹⁾

Various routes of administration of parenterals and their corresponding time to get onset of action are explained in **Table 2**.

TYPES OF PARENTERALS

Parenteral solutions can be used to get immediate or prolonged effect depending on the excipients used in the formulation and based on that they are classified as conventional and novel parenteral preparation.

Conventional parenteral preparations: ^(10,11)

Pharmaceutical preparations intended for delivery by routes other than the digestive tract, such as intravenous (IV), intramuscular (IM), or subcutaneous (SC) injection, are referred to as conventional parenteral formulations. In these formulations the drug will be suspended or dissolved in appropriate solvents or vehicles along with other buffers, stabilizers, preservatives, tonicity adjusters, buffers and other excipients if required. They may also include lyophilized powders for reconstitution, injectable solutions, suspensions, and emulsions. These formulations are essential for the prompt and efficient delivery of drugs, especially in emergency conditions.

Solutions : ⁽¹²⁾

An injectable product is presented in an isotonic aqueous solution with a pH close to blood and body tissues. Parenteral solutions include large volume parenterals (LVP), small volume parenterals (SVP), and irrigation solutions. Infusion fluids are larger volumes of aqueous solutions used for basic nutrition and electrolyte balance restoration. Formulation includes vehicles and added substances. There are three types of vehicles: aqueous vehicles, water miscible vehicles, and non-aqueous vehicles. Added substances in parenteral solutions may include antimicrobial agents, buffers, and chelating agents.

Suspensions : ^(13, 14)

Parenteral suspensions are a useful dosage form for administering insoluble or poorly soluble drugs. They are administered through subcutaneous and intramuscular routes and provide more prolonged release than solutions. Suspensions are better than solutions as they increase resistance to hydrolysis and oxidation. However, they face challenges like formulation difficulties, stabilization and dose nonuniformity. They will include suspending agents to get the stability of the product.

Emulsions : ^(15,16)

Emulsions are two-phase systems made by combining two immiscible liquids, one uniformly dispersed in the other, forming globules with diameters equal to or greater than those of large colloidal particles. Emulsions can be oil in water (o/w) or water in oil (w/o) and are prepared using oily drug, emulsifiers, preservatives, and antioxidants, solvents and other excipients if required. The main issue with emulsions is their thermodynamic instability due to the increase in surface free energy. Parenteral emulsions are administered through subcutaneous and intramuscular routes.

Novel parenteral preparations: ^(17,18)

Novel parenteral formulations for colloidal drug administration include nanoparticles, niosomes, liposomes, polymeric micelles, and in situ-formed systems.

Microspheres : ⁽¹⁹⁾

They should be formed of spherical particles smaller than 125 microns in size and can be delivered using a needle of 18 or 20 number needle. It is made up of solid, sphere-shaped particles dispersed in a biodegradable solution consisting of either solution or crystalline pharmaceutical particles. These particles have been used to deliver anti-cancer drugs and opioid antagonists. The matrix's degradation/dissolution governs the drug's release, which is constructed of bio-compatible and biodegradable polymers like Poly(lactic acid) & Poly(lactic-co glycolic acid).

Sharma et al.,

Nano emulsions : ^(1,20)

Nano emulsions are clear or translucent oil-in-water or water-in-oil mixtures with droplet diameters ranging from 100 to 500 nm. They are thermodynamically stable systems with a single phase, created using emulsifiers to stabilize two immiscible phases. The system is transparent and solubilized, free from common issues like creaming, flocculation, coalescence, and sedimentation. The methods used to create nano emulsions can be classified based on energy required, with high-powered procedures and minimal energy approaches. Oils used include castor beans, coconuts, soybeans, linseed, olives, peanuts, and PEG vegetable oil.

Nanosuspensions : ^(21,22)

Nanosuspensions are micron-sized colloidal dispersions containing solid active pharmaceutical ingredient particles in aqueous phase. They offer several advantages, including improved drug solubility and dissolution velocity, increased bioavailability of poorly soluble/hydrophobic drugs, and resistance to Ostwald ripening. Nanosuspensions are cost-efficient and technically easier to form, particularly for hydrophobic medicines. Current methods for nanosuspension formulation include precipitation, high-pressure homogenization (dissocubes), emulsion, and medium milling. Stabilizers and co-surfactants influence nanosuspensions' stability. Muthu et al. created a risperidone nanosuspension with Pluronic® F-68 and Pluronic® F-127 as a polymeric stabilizer, which increased a drug's therapeutic effectiveness and reduced injection frequency. Salem et al. developed a sustained release version of natural progesterone using stearic acid as a surface stabilizer, resulting in prolonged activity and reduced injection frequency. A method for creating a stable nanosuspension for vitamin B-12 administration has been granted a patent.

Niosomes : ^(23,24,25)

Niosomes are vesicular systems made of non-ionic surfactants, such as sorbitan esters and polysorbates. They are osmotically responsive and self-sustaining, allowing medication to be entrapped and delivered parenterally or topically. Niosomes are biodegradable, biocompatible, and non-immunogenic. They are widely used for parenteral delivery of various drug moieties. In a study, aerosolization was used to distribute hydrophobic cancer treatment using a combination of sorbitan esters and polysorbates, resulting in optimal encapsulation and nebulization efficiency.

Nanoparticles

A nanosuspension is a submicron-sized colloidal dispersion containing medication particles, produced using correct procedures and stabilized with surfactants. It is a prescription formulation for parenteral, pulmonary, oral, and topical administration. Nanosuspensions are developed using either top-down or bottom-up technology, resulting in crystal formation.

PREPARATION PROCEDURE FOR PARENTERALS

Parenteral preparation composition requires in-depth medication understanding and adjuvant use. Overuse of adjuvants in parenteral goods is something to be avoided since some of them might induce medication interactions. To create a stable preparation, the following ingredients are added.

Vehicle

It is used to dissolve or carry the drug and accidents. Types of vehicles used in the preparation of injections are given below.

Aqueous vehicle : ^(2,26)

Water is primarily employed as a transport since it is safe to introduce and well-satisfied by the body. Sterile water is the best solvent solution to use with parenterals. The monograph-recommended water quality, such as IP, USP, and BP. The quality was assessed by gravimetric analysis and TDS (total dissolved solid contents). The water-based vehicles in operation are:

- Water for injection.
- Water for injection free from CO₂
- Water for injection free from dissolved air.

**Sharma et al.,**

The parenteral formulation's most frequently utilized carrier. The water used for injection needs to be very chemically pure and devoid of pyrogen. BP claims that the only way to prepare the water for injection is through a distillation process. A glass still equipment can be used to prepare water for injection, preventing pyrogen contamination of the distillate. Acidic or alkaline gases like CO₂ and NH₃ are eliminated from the water during injection preparation to guarantee that the pH of the water is neutral. Pyrogens are byproducts of a microorganism's metabolism. Chemically speaking, pyrogens are lipid substances linked to a carrier molecule, which is often a polysaccharide but can also be a peptide. To ensure that the water used for parenteral and irrigating solutions is devoid of pyrogens, appropriate control must be exercised throughout preparation and water storage. Water may have pyrogen extracted using a straightforward distillation method.

Non aqueous vehicle : (27)

Non-aqueous carriers such as oils and alcohols are frequently utilized. Almond, cottonseed, and arachis oils are a few fixed oils that are employed as vehicles. Oily vehicles are typically utilized when a medicine has to have a depot effect, when the medication is soluble in oil but not soluble in water, or when both are needed. Features of the non-aqueous preparation medium utilized in parenteral administration. Non-irritating, non-toxic, and inert. When combined with additional substances, stable and compactable are employed. Must be viscous enough to be easily given and removed from the container. Propylene glycol, alcohol, and fixed oil are examples of non-aqueous solvents. 40% propylene glycol was used to make the stable parenteral preparation. 10% alcohol by volume and water, keeping the pH at 7.

Adjuvants / added agent : (28)

Material that has been mixed with active pharmaceutical ingredients (API) to improve stability or stop contamination. Parenteral preparation uses a variety of adjuvants, including stabilizers, chelating agents, buffering agents, and antifungal agents.

- **Antimicrobial agent** : These agents either eliminate microorganisms or stop their development. These agents are used in parenteral preparation to stop microorganisms from growing while being stored. A multidose bottle has an antimicrobial agent added due to the little likelihood of unintentional contamination during repeated usage. Benzalkonium chloride and phenylmercuric nitrate are the two most often utilized antibacterial agents.
- **Buffering agent** : These agents are used to modify the parenteral preparation's pH. the preparation's deterioration brought on by a pH shift. Add an appropriate buffer to maintain the pH of the preparation in order to avoid or stop this deterioration.
- **Antioxidants** : This substance keeps the preparation stable. The most often used antioxidant in aqueous parenteral nutrition is sulfite, bi sulfite, and metabisulfite salts of sulfur dioxide.
- **Tonicity agent** : It is crucial that the solution to be administered by intravenous means be isotonic, or as close to it as possible. Isotonic parenteral preparation is recommended for bodily fluids. Red blood cell haemolysis to ionic species across the red blood cell membrane can occur when the osmotic pressure varies. This is especially true when a non-isotonic solution is administered in quantities larger than 100 millilitres.
- **Solubilizers** : The solubilizers are used to preserve and stabilize the poor water soluble drug's aqueous solubility. similar to solubilizers like polysorbate and tweens.
- **Chelating agent** : Very few chelating agents, such as citric acid, tartaric acid, disodium edta, and various amino acids, are utilized in parenteral preparations. These agents help to complex heavy metals, which enhances the effectiveness of antioxidants and preservatives.

FILLING OF PARENTERALS (28,29,30)

Containers are composed of plastic or glass and are meant for parenteral products. Pharmacopoeia requires the following requirements for a container and closure that should be employed for parenteral preparation.

- No foreign substance should be present in the product.
- It must remain transparent for scrutiny in order to make the content apparent.
- There should be no negative consequences.

**Sharma et al.,****Glass**

The following three kinds of glass are used for container preparation:

- **Type 1 glass:** It is also known as borosilicate glass or resistant glass, and it is mostly used for chemical glassware, oven ware, and containers for alkali sensitive processing. Silica content is decreasing, although aluminium oxide is generally present. Boron oxide is created by combining silica with silicon dioxide.
- **Type 2 glass:** When wet sulphur dioxide is heated to a high temperature, soda lime silicate glass that has excellent hydrolytic resistance is formed. Glass containers are ideal for almost all acidic and intense liquid preparations.

Plastic

Organic polymers that are easily synthesised, can be moulded and extruded, and can be shaped and laminated. Specially designed for packing, but also used to make syringes, tubing devices, and saline solutions.

Advantages

- They are indestructible, because they are light in weight and their transportation cost is minimal.
- They are available in a variety of sizes and shapes.

Disadvantage

- The most typical issue is penetration.
- Since it is a container made of plastic, atmospheric gases, vapours, or fluids from the surrounding environment can enter.
- There are additional issues with oxidation and hydrolysis, as well as leaching.
- Various plastic materials are employed, including polyethylene, polypropylene, and polyvinylchloride.

Rubber Closures

Various types of rubber are utilised for this function, such as butyl rubber, nitrile rubber, silicon rubber, and others, due to their low absorption properties and lower cost than other rubbers. Butyl rubber is extensively used, although it decomposes at 130°C.

SEALING ^(28,31)

The filtered product is placed in final containers such as vials, ampoules, and transfusion bottles. Ampoules are used for single doses, whereas vials are used for several doses. Filling occurs in a laminar air flow.

Ampoules

They are meant for only one usage only; ampoules are opened by fracturing the glass at the scored line on the neck. The substance must be filtered before administration because glass fragments may get displaced during ampoule opening. Because of its unsuitability for multiple-dose administration, the requirement to filter solutions before use, and other safety concerns, ampoule use has decreased significantly.

Vials

These are either plastic or glass vials that are secured with a stopper made of rubber and sealed using an aluminium crimp.

Prefilled syringes

These are intended for easy administration and optimum convenience. When packed in prefilled syringes, emergency drugs (e.g., atropine, epinephrine) may be accessible for instant administration.

Sharma et al.,

Infusion solutions

They are classified into two types: small volume parenteral (SVP), which have a volume of 100 ml or less, as well as large volume parenteral (LVP), which have a volume of 100 ml or more. Infusion solutions are used to provide fluids or medications on an intermittent or continuous basis.

Seal the container either by fusion or with suitable closures :

Ampoules are manually sealed on a small scale by spinning the ampoules' necks in the flame of a Bunsen burner. Rubber closures are used to secure the vials and transfusion containers.

STERILIZATION METHODS

The absence of live microorganisms in pharmaceutical preparation is termed as sterilisation.

For sterilised parenteral preparation, many sterilisation methods are utilised.

- Sterilisation by moist heat
- Sterilisation by dry heat
- Filtration sterilisation
- Sterilisation with ionising radiation
- Sterilisation via gaseous means

Moist heat sterilization: ⁽³²⁾

- ✓ Moist heat sterilisation employs the application of steam at temperatures ranging from 121°C to 134°C.
- ✓ An autoclave is used to eliminate microorganisms and sterilise laboratory glassware, media, and reagents.
- ✓ This procedure is excellent for sterilising glassware, dressing, and closures, among other things.

Dry heat sterilization: ⁽³²⁾

- ✓ In comparison to wet heat sterilisation, dry heat sterilisation is conducted at a higher temperature and needs a longer period for the microbe to be exposed to this temperature.
- ✓ Maintaining temperature is 180°C, 170°C, 160°C for 30 minutes, 60 minutes, and 120 minutes.

Filtration sterilization: ⁽¹⁾

- ✓ This filtering process is used to sterilise thermolabile solutions by passing them through filters that eliminate microorganisms.
- ✓ This technique of sterilisation employs the total eradication of microorganisms within a certain size range from fluids.
- ✓ In general, membrane filters are effective in removing microorganisms.

Ionising radiation sterilisation: ⁽¹⁾

- ✓ There are two forms of radiation: electromagnetic radiation and particulate radiation.
- ✓ Electromagnetic radiation includes gamma radiation and X-rays.
- ✓ Particulate radiation includes beta and alpha radiation.

Gaseous sterilisation: ⁽³²⁾

- ✓ This approach may sterilise heat and moisture sensitive materials.

EVALUATION TESTS

In order to maintain quality control, the final parenteral product is submitted to the following test.

- Sterility test
- Clarity test
- Leakage test
- pH test
- Osmolarity test

Sharma et al.,

f. Pyrogen test

Sterility test : ^(33,34)

The sterility testing test is performed to determine the likely sterility of a certain batch. USP has given the necessary procedure instructions for sterility testing. USP's approved tests are the direct technique and the membrane filtering method. To avoid unintentional contamination of the product during the test, the test must be performed under aseptic conditions. The following procedures are followed for sterility testing:

Membrane filtration technique

This method basically involves filtration of Sample through membrane filters of porosity 0.22 micron and Diameter 47mm. The filtration is assisted under Vacuum, after filtration completion the membrane is placed in suitable media and incubated to check the growth. If growth is not observed sample is found to be sterile.

Direct inoculation method

The material is directly inoculated into two test tubes containing a culture. Because of the continual process of opening the container, transferring the sample, and mixing, this technique is conceptually simple but technically difficult. The parenteral preparation test sample is transferred into a test tube containing sterile culture media for anaerobic bacteria, aerobic bacteria, and fungi in an incubator. The test is incubated for a specific period and the turbidity in the sample is checked. If turbidity is present, it indicates microorganism growth and the sample fails the sterility test.

Clarity test: ⁽²⁶⁾

The product container is evaluated by an individual person in the presence of adequate illumination baffled against reflection in the eyes, and the product is seen against a black and white backdrop with the contents placed in motion with a swirling movement. If the particle is immobile, it is challenging to tell if it is moving, but air bubbles shouldn't be added since they are difficult to discern from dust particles. For detection of light particles, a black backdrop is utilised, whereas for detection of dark particles, a white background is required. If any foreign particle is visible in the parenteral preparation, the preparation is rejected.

Leakage test: ⁽³⁵⁾

The leakage test is carried out only on ampoules by sealing them with fusion so that leakage does not occur in them.

- ❖ Dye bath
- ❖ Vacuum chamber test

The leakage test is performed in the vacuum chamber test. After dipping the ampoules in a 1% solution of methylene blue in a vacuum chamber, the vacuum is applied, and the colour solution enters the ampoules when the suction is withdrawn. The colour solution has a faulty seal. If the colour solution enters the ampoule, it is reported as spilled and hence discarded. Rubbers are not utilised in this test due to their flexibility and unpredictability.

pH test

The best pH to choose is 7.4, which is the pH of blood. Excessive variation from this pH might lead to difficulties. Because blood is a great buffer, the recommended range for intravenous SVPs is 3.0 to 10.5. Other methods of administration of parenterals are routinely adjusted to a pH range of 4 to 9.

Osmolality test : ⁽⁵⁾

Osmolality is a practical way of determining the total contribution of the numerous solutes in the solution to the osmotic pressure that exists in the solution. According to the British Pharmacopoeia, water-based solutions for subcutaneous, intradermal, or intramuscular injection should be isotonic if feasible. Osmolality is measured in osmoles per kilogramme. Unless otherwise specified, osmolality is calculated by measuring the dip of the freezing point ΔT . The following relationship exists

$$\epsilon = \Delta T / 1.86 \times 1000 \text{ milli osmol/kg}$$

Sharma et al.,

Pyrogen test : ⁽²⁸⁾

The test used to determine whether or not pyrogen is present in a liquid parenteral solution. Pyrogens are created by microorganisms as a metabolic product; however the majority of pyrogenic chemicals are produced by gramme negative bacteria. They are thermostable polysaccharides. Because they are soluble in water and can flow through bacteria-proof filters, they are not impacted by bactericide. The exam is conducted in an air-conditioned environment. Dissolve the substance that has been tested in or diluted with pyrogen-free saline solution. The liquid should be tested at 38.5°C before injection. The amount of sample to be administered varies depending on the preparation under consideration and is specified in the specific monograph. The injection volume must be between 0.5ml and 10ml per kilogramme of body weight. A clinical thermometer detection probe is put into the rabbit's rectum to record the body temperature. Two normal rectal temperature recordings should be made to the test injection at half-hour intervals and the mean calculated, which is the starting temperature recorded for rabbit. The fluid is progressively injected into the ear vein in amounts ranging from 0.5 to 10 ml per kilogramme of body weight. Each rabbit's temperature is monitored every 30 minutes for three hours following injection. The difference between the rabbit's initial and maximum temperature measured is used to calculate its reaction. When this variation is negative, the reaction is zero. If an individual rabbit's reaction is less below 0.6°C, the preparation under consideration passes the test.

LABELLING & PACKING ⁽²⁸⁾

After the parenteral preparation is evaluated, the ampoules, vials, & transfusion bottles are appropriately marked and packed. The label should have the following information: the name of the preparation, the amount of the preparation, the manufacturer's licence number, the batch number, the date of manufacturing, and the date of expiration.

Limitations of parenteral preparations : ⁽²⁸⁾

- The injection site hurts when the medicine is administered. or local discomfort brought on by the insertion of the needle.
- They have high cost of production.
- They cannot be easily self-administered. The medication must only be delivered by trained individuals
- Individuals may experience an allergic response to a medication. These responses have a high fatality rate.
- During production, they had to maintain aseptic conditions or use the right aseptic procedure.

FUTURE PROSPECTS ⁽¹⁾

Breakthroughs in biotechnology and product development will end up resulting in more pharmaceutically active dosage forms that will be difficult to give via standard means of administration. Extended-release parenteral medications are difficult to administer, but they have emerged as a highly appealing strategy for managing the release of bioactive chemicals. In recent years, significant advances in the fabrication of injectable sustained release approaches have been made, as indicated by regulatory clearance and the market introduction of numerous new products. The aforementioned drug delivery methods offer a larger potential for a variety of applications, including cancer prevention medical care, radio imaging, genetic therapy, and AIDS therapy, among others. Although each administration strategy has advantages and disadvantages, innovative parenteral medication delivery technologies may increase drug bioavailability. When compared to traditional dose forms, these systems can also be used for acid and enzyme sensitive medications.

CONCLUSION

The drug delivery methods outlined here are utilized to control medicine distribution through parenteral injection. Parenteral routes of administration have matured into important technology platforms used by pharmaceutical companies in recent years. As a result, it is vital to investigate the parenteral medicine delivery system, as it allows for rapid treatment with the objective of rescuing a precious human life. The goal of intravenous controlled medicine

**Sharma et al.,**

administration is to maintain an optimal pharmacological response at a particular location while avoiding undesired interactions at other sites. It is done in two ways. The first method involves chemically modifying a parent molecule to make a derivative that is exclusively active where it is desired. The second technique employs carriers such as lipid membranes, spheres, nanoparticles, and macromolecules to transport the medicine to the target region. As a result, novel medication delivery systems must be developed in order to boost efficacy.

Table 1 : List of some marketed parenteral formulation (8)

S.No.	Drug	Brand name	Activity	Manufacturer
1.	Aurothioglucose	Solganl®	Treating rheumatoid arthritis	Schering
2.	Betamethasone sodium phosphate And Betamethasone acetate	Celestor®	Treating Corticosteroid therapy	Schering
3.	Penicillin G Procaine	Bicillin®	Penicillin antibiotics	CR Wyeth
4.	Medroxyprogesterone acetate	DepoMedrol®	To treat pain and swelling that occurs with arthritis and other joint disorders	Upjohn
5.	Amino acid and dextrose	Aminosin	Dietary supplement for patients who are unable to get enough calorie and protein	Icu Medical Inc.
6.	Gentamicin	Genacyn LA	Antibiotic supplement	Zenley animal health
7.	Plerixafor	Adstem	Autologous stem cell transplant	ADLEY
8.	Daptomycin	Dapmicin	Treat severe infections of the skin, soft tissues, heart, and blood	Glenmark

**Sharma et al.,****Table 2 :Various routes of administration and time to get onset of action**

Administration site	Parenteral formulation	Time to get onset of action
Subcutaneous	Injected into the fatty layer under the skin	15-30 minutes
Intramuscular	Injected into the muscle	10-20 minutes
Intravenous	Injected into the vein. This allows for immediate adsorption. Intravenous includes IV push and IV infusion	30-60 seconds
Intradermal	Injected into the top layer of the skin at a slight angle	Variable (minutes to hours)
Intra-arterial	Injected into the joint	
Intracerebral	Injected into the dura matter (epidural space) of the spinal cord	
Intracardiac	Injected into the heart	
Intrathecal	Injected into the space surrounding the spinal cord	

Antibacterial Effects of Leaf Extracts of four Mangrove Plant Species on *Escherichia coli* and *Klebsiella pneumoniae*

ABSTRACT

Microorganisms are responsible for several human diseases, throughout the world, which is a major reason for mortality and morbidity in immune-compromised patients. In this current investigation, the antibacterial activity of leaves of *Avicennia marina*, *Avicennia officinalis*, *Bruguiera cylindrica* and *Rhizophora apiculata* was evaluated against human pathogens such as *Escherichia coli* and *Klebsiella pneumoniae*. Ethanol extracts of mature leaves of these mangrove plants were prepared and tested for antibacterial activity using agar disc diffusion method. *Escherichia coli* was inhibited by leaf extracts of *A.marina*, *A.officinalis*, *B.cylindrica* and *R.apiculata*. Ethanol extract of *A.marina* and *A.officinalis* were able to inhibit the growth of *Klebsiella pneumoniae*. Charcoal treated leaf extracts of *Avicennia marina*, *Avicennia officinalis*, *Bruguiera cylindrica* and *Rhizophora apiculata* were able to inhibit the growth of both tested pathogenic bacteria more than that of untreated leaf extracts. The leaf extract of *Avicennia marina* exhibited highest antibacterial activity against *E.coli* and *K.pneumoniae* as compared to other extracts. The results suggested that these leaf extracts could be used as an alternative source for treatment of infections caused by these tested pathogenic bacteria.

Keywords: Mangrove, Anti-bacterial, *E.coli*, *Klebsiella pneumoniae*, *Avicennia marina*, *Avicennia officinalis*, *Bruguiera cylindrica*, *Rhizophora apiculata*

Anu Susan Thomas and Liji Koshy

INTRODUCTION

Mangroves are valuable ecological and economic resources, serving as important nursery grounds and breeding sites for birds, fish, crustaceans, shell-fish reptiles and mammals [1]. Mangroves and mangrove associates contain certain biologically active antiviral, cytotoxic, antioxidant, antibacterial and antifungal compounds, including steroids, triterpenes, saponins, flavonoids, alkaloids carbohydrate, reducing sugar, combined reducing sugar, glycosides, proteins, terpenoids and tannins [2][3][4]. Many of these compounds have pharmacological and therapeutic effects and they have been used in folk medicine to treat conditions such as elephantiasis, febrifuge, haematoma, hepatitis, ulcers, asthma, cancer, diabetes, rheumatism and fish poison, as they exhibit antioxidant, antibacterial, antifungal, anti-diabetic and anti-cancer activities [5]. The study was conducted at Ayiramthengu mangrove forest (lat. 9° 02' - 9° 16' N and long. 76° 20' - 76° 32' E), located in the Kollam district. The mangrove ecosystem is a part of Kayamkulam estuary (lat. 9° 07' - 9° 16' N and long. 76° 20' - 76° 28' E), a narrow stretch of tropical backwater on the west coast of Peninsular India[6]. The plant derived natural medicines, which are being used for centuries for the treatment of several human health issues, are relatively safer than the synthetic or artificial alternatives. The present study made an attempt to determine the antibacterial activity of leaf extracts from *Avicennia marina*, *Avicennia officinalis*, *Rhizophora apiculata* and *Bruguiera cylindrica* against two human pathogenic bacteria – *Escherichia coli* and *Klebsiella pneumoniae*.

MATERIALS AND METHODS

Collection of plant samples

Leaves of *Avicennia marina*, *Avicennia officinalis*, *Rhizophora apiculata* and *Bruguiera cylindrica* was collected from Ayiramthengu mangrove forest. The samples were washed thrice with sterile distilled water to remove epiphytes and other foreign particles and mopped using blotting sheets. The leaves were dried under shade for 20 days.

Preparation of leaf extracts

The leaves were chopped into small pieces and pulverized into fine powder using a pestle and mortar. 2.5 g of these powders were soaked in 10mL of ethanol (1:4 ratio). The containers were sealed and stored for a period of 3 days at room temperature. Each sample was then filtered through Whatman No. 1 filter paper and transferred into four beakers, which was then heated in a water bath at 40°C for 2 minutes for solvent evaporation. The extract was then centrifuged at 10,000 rpm for 2 minutes. The supernatant was maintained in eppendorf tubes at 4°C for later use.

Preparation of charcoal treated leaf extract

The leaf extracts of the four mangrove species, soaked in ethanol were filtered and transferred to four separate beakers. A small amount of charcoal was added. The mixture was then heated in a water bath at 40°C for 2 minutes and then centrifuged at 10,000 rpm for 2 minutes. The supernatant was then stored in eppendorf tubes at 4°C for later use [7].

Transfer of bacterial colonies to agar medium

Bacterial pathogens such as *Escherichia coli* and *Klebsiella pneumoniae* were obtained from Tropical Institute of Ecological Sciences (TIES), Kottayam. Bacterial colonies were transferred to nutrient agar medium through swab culture. The bacterial suspension of chosen bacterial pathogens was cultured over the surface of nutrient agar at 37± 2 °C in an incubator, free from contamination.

Antibacterial activity of leaf extracts

The ethanolic extract was impregnated on to a Whatmann filter paper No.1 disc (6 mm. diameter). Discs impregnated with the leaf extracts were placed on the solid agar medium by pressing slightly and incubated at 37±2°C for 18 - 24 h. After that, the zone of inhibition was measured and expressed in millimeter. The diameter of inhibition zone was considered as a measure of antibacterial activity.

Anu Susan Thomas and Liji Koshy

RESULTS AND DISCUSSIONS

In the present study, two human pathogenic bacteria were used to study the effects of mangrove plant leaf extracts of *Avicennia marina*, *Avicennia officinalis*, *Bruguiera cylindrica* and *Rhizophora apiculata* on their growth. Eight different leaf extracts were prepared and different extracts had different effects as listed in table 1 and table 2. As represented in Table 1, all leaf extracts were able to inhibit the growth of *E.coli*. The ethanolic leaf extracts of *A.marina* was more effective against *Escherichia coli* (14 mm), followed by *B.cylindrica* (9.67 mm) and *R.apiculata* (7.83). The leaf extract of *A.officinalis* showed least antibacterial activity against *E.coli* (7 mm). The maximum zone of inhibition for *Klebsiella pneumoniae* was recorded against *A.marina* (12.33 mm), followed by *A.officinalis* (8.5 mm). The ethanolic extract of *B.cylindrica* and *R.apiculata* was unable to inhibit the growth of *Klebsiella pneumoniae*. Controls did not exhibit any inhibitory effect on tested bacteria. These results agree with previous results [8][9]. *Avicennia marina* demonstrated significant inhibition against both bacteria. *Avicennia officinalis* showed moderate inhibition against both bacteria. *Bruguiera cylindrica* and *Rhizophora apiculata* exhibited inhibition against *E.coli* but not against *K.pneumoniae*. Charcoal treated plant extracts strongly inhibited the growth of pathogenic bacteria compared to untreated extracts. Table 2 shows the result of charcoal treated mangrove leaf extracts. The extract of *A.marina* (19.67 mm) showed more inhibition than *A.officinalis* (12.67 mm), *B.cylindrica* (13.33 mm) and *R.apiculata* (11.67 mm) against *E.coli*. In the case of *K.pneumoniae*, charcoal treated extract of *Avicennia marina* had an inhibition zone of 17 mm, followed by *A.officinalis* (12.33 mm), *B.cylindrica* (8.33 mm) and *R.apiculata* (9 mm). The result of antibacterial activity of charcoal untreated and treated mangrove plant leaves against *E.coli* and *K.pneumoniae* is illustrated in figure 3 and figure 4 respectively.

The activated charcoal may play a role in adsorbing impurities, concentrating active compounds, or influencing the release of bioactive substances, contributing to the observed improvements in antibacterial activity. These results suggest that charcoal treatment enhanced the antibacterial activity of the leaf extracts against *E.coli* bacteria. *Avicennia marina* exhibited an increase in the mean zone of inhibition from 14 mm (charcoal untreated) to 19.67 mm (charcoal treated). *Avicennia officinalis* showed an increase in the mean zone of inhibition from 7 mm to 12.67 mm with charcoal treatment. In case of *Bruguiera cylindrica*, the mean zone of inhibition increased from 9.67 mm to 13.33 mm, and for *Rhizophora apiculata*, mean zone of inhibition increased from 7.83 mm to 11.67 mm. Inhibition of *Klebsiella pneumoniae* also showed significant increases with the charcoal-treated extracts. *Avicennia marina* exhibited an increase from 12.33 mm to 17 mm, while *A.officinalis* showed an increase from 8.5 mm to 12.33 mm. *B.cylindrica* displayed an increase in the zone of inhibition from 0 mm to 8.33 mm, and *R.apiculata* exhibited growth inhibition increase from 0 mm to 9 mm. The current study leads to the result that, mangrove plant species of *Avicennia marina*, *Avicennia officinalis*, *Bruguiera cylindrica* and *Rhizophora apiculata* can be considered to produce new medicines for certain bacterial infections.

CONCLUSION

In conclusion, the evaluation of antibacterial activity in mangrove plant extracts against human pathogenic bacteria holds promise for both scientific understanding and practical applications. The potential integration of mangrove plant extracts into pharmaceuticals or topical treatments could address the increasing challenges posed by resistant bacterial strains. The specific strains tested and the corresponding susceptibility patterns provide valuable insights into the potential therapeutic applications of mangrove plant extracts. To contextualize the findings, a comparative analysis with existing antibacterial agents or synthetic drugs could be beneficial. This would help in assessing the relative efficacy of mangrove plant extracts and their potential as alternative or complementary treatments in the face of antibiotic resistance. The study opens avenues for future research, including the isolation, purification and identification of specific bioactive compounds responsible for antimicrobial activity. Further investigations might focus on exploring synergistic effects with conventional antibiotics, or conducting in vivo studies to assess the safety and efficacy of these plant extracts.

ABSTRACT

This present study was performed to evaluate the enzymic and non-enzymic antioxidant activities of *Momordica charantia* and *Trigonella foenumgraecum* seed extracts in diabetes induced rats. Diabetes Mellitus was induced by a single intraperitoneal injection of STZ-NIC and rats with blood glucose concentration more than 250mg/dl were used for the study. The ethyl acetate seed extracts of the plant samples were administered at doses of 200, 400 mg/kg b.w and glibenclamide for 21 days and the activities of enzymic antioxidants superoxide dismutase (SOD), catalase (CAT), glutathione peroxidase (GPx) and non-enzymic antioxidants namely vitamin C, vitamin E and reduced glutathione (GSH) and lipid peroxidation were evaluated. There was a significant improvement in the activities and the levels of enzymic and non-enzymic antioxidants catalase, glutathione peroxidase, superoxide dismutase, vitamins C, E and reduced glutathione (GSH) and lipid peroxidation on treatment with 400mg/kg b.w of the plant extracts and glibenclamide. This study demonstrates the antioxidant effect of the *Momordica charantia* and *Trigonella foenumgraecum* seed extracts that might help in control and prevention of diabetes mellitus.

Keywords: Diabetes, Enzymic antioxidants, Non-enzymic antioxidants, *Momordica charantia*, *Trigonella foenumgraecum*.

**Renuka****INTRODUCTION**

Diabetes mellitus (DM) is a complicated, and non-contagious endocrine ailment that has posed clinical challenges globally, often linked with threats related to complicated metabolic development in patients. Elevated blood glucose, lipids, and oxidative stress are its hallmarks. These factors lead to chronic problems that affect several organs in the body, primarily the eyes, nerves, kidneys and blood vessels. World Health Organization (WHO) has reported that DM is an outbreak prone to high malaise and death [1]. During hyperglycemia, production of reactive oxygen species and reactive nitrogen species increases. This results in decrease in the activity of antioxidant enzymes, induces oxidative stress in the body [2]. Reactive oxygen species (ROS) level elevation in Diabetes may be due to perturbations in antioxidant defense system. The variation in the levels of antioxidant enzymes makes the tissues susceptible to oxidative stress leading to the development of diabetic complications[3]. Antioxidants are biochemicals that can neutralize the potentially damaging action of free radicals such as unstable molecules as peroxy radical, hydroxyl radical and singlet oxygen and peroxy nitrate radicals. Antioxidants either completely stop or significantly reduce the damaging effects of free radicals on cells. Thus, research on antioxidants and free radicals is crucial to understanding the connections between diseases including cancer, neurological disorders, diabetes mellitus, and cardiac arrest[4]. The fact that medicinal plants are widely accessible and have less adverse effects when used to treat diabetes is one of their many benefits. Approximately 800 plants have been reported to have potential antidiabetic properties[5]. Antioxidants are present in all parts of plants like wood, bark, stems, pods, leaves, fruit, roots, flowers, pollen and seeds. The fact that several antioxidant chemicals have been identified in plant tissue is explained by the existence of such oxidative processes in plants. Plants, particularly those with high concentrations of potent antioxidant chemicals, are crucial for the prevention and treatment of oxidative stress-related diseases including diabetes mellitus [6]. *Momordica charantia* commonly known as bitter melon grows in tropical and subtropical areas, and is used as a food and medicine. It yields prickly fruit and lovely flowers. While bitter melon seeds, leaves, and vines have all been utilized for medicinal purposes, the fruit of the plant is the most widely used and safest part [7]. *Momordica charantia* seed extracts showed potent free radical scavenging activity, alpha- amylase inhibition and the mechanism were found to be noncompetitive inhibition[8]. *Trigonella foenum graecum* (Fenugreek) is a leguminous bean and which belongs to the family Fabaceae. There are numerous medical uses for the green leaves and seeds of *Trigonella foenum graecum*, which are consumed. In 2012–2013, India produced 113 thousand metric tonnes of fenugreek overall. It is widely used as traditional medicine in China and as a component of ayurvedic medicine in India. Fenugreek is consumed in various parts of the world in different forms and has been regarded as a treatment for many ailments known to man [9]. Hence the present study was aimed to evaluate the *in vivo* antioxidant potential of *Momordica charantia* and *Trigonella foenum graecum* seed extracts in Streptozotocin– Nicotinamide administered diabetes induced rats.

MATERIALS AND METHODS**Plant Collection, Identification and Preparation of Extract**

Momordica charantia seeds (MCS) and *Trigonella foenum graecum* seeds (TGS) were dried, finely powdered, and stored in airtight containers at room temperature for further use. Five grams of *Momordica charantia* and *Trigonella foenum graecum* seed powder was extracted with 50 ml of ethyl acetate for 48 hours filtered and collected the extract. The solvent extract was evaporated in water bath shaker to get dry extract and used for further analysis.

Experimental Animals

Adult male albino Wistar rats (6 weeks), weighing 150 to 200 g were used for the present antidiabetic study. The animals were housed in clean polypropylene cages and maintained in a well-ventilated temperature-controlled animal house with a constant 12-hour light/dark schedule. The rats were given a normal pelleted food to eat, and they had unlimited access to clean drinking water. Following the guidelines for the appropriate care and use of laboratory animals, and with approval from the Ethical Committee Clearance No. 53 IAE1012/c/17/CPCSEA-2013, all animal treatments were carried out.

Renuka

Acute toxicity studies

Using three healthy rats (n= 3), an acute oral toxicity study of *Momordica charantia* seeds (MCS) and *Trigonella foenum graecum* seeds (TGS) was conducted in accordance with guidelines established by the Organisation for Economic Co-operation and Development (OECD). The plant extract was evaluated for the pharmacological potential in normal rats weighing 150 to 200 g. The animals were given 200 mg/kg of MCS and 2000 mg/kg of TGS initially, then 500, 1000, 1500, and 2000 mg/kg b.w., and their toxicity was assessed. For a full day, the animals were watched for signs of death. Further studies were conducted using 1/5th and 1/10th of the highest dose (2000 mg/kg b.w.) as there was no mortality observed in the acute toxicity studies.

Induction of Diabetes Mellitus

The animals were kept overnight fasting and the initial fasting blood glucose was checked from tip of rat tail vein. Regular saline was used to dissolve nicotinamide, while citrate buffer (pH 4.5) was used to dissolve streptozotocin. A single intraperitoneal injection of 60 mg/kg streptozotocin was given to overnight fasted rats 15 minutes after an i.p. injection of 120 mg/kg nicotinamide. This caused the rats to develop diabetes mellitus. After 72 hours, the higher blood glucose levels were used to confirm diabetes. The animals with blood glucose concentration more than 250mg/dl were used for further study. The vehicle (saline), standard drug glibenclamide and plant extracts were administered to the respective group animals for 21 days. Throughout the study period glibenclamide and plant extracts were freshly dispersed in normal saline and distilled water before the administration.

Sample collection

At the end of the experimental period rats were fasted overnight and anaesthetized with diethyl ether (100ml/kg), blood samples were collected through retro-orbital sinus puncture with or without EDTA container for the estimation of selected biochemical and haematological parameters. The liver of the experimental rats was removed and a portion of each was stored at minus 40°C for performing the assays involving enzymic and non-enzymic antioxidants.

Determination of Enzymic antioxidants

The activities of enzymic antioxidants namely superoxide dismutase, catalase and glutathione peroxidase were determined in the liver of the control and experimental rats to assess the protection rendered by MCS, TGS and glibenclamide [10,11,12].

Determination of Non enzymic antioxidants

The activities of non-enzymic antioxidants vitamin C, vitamin E and reduced glutathione were determined in the liver of the control and experimental rats to assess the protection rendered by MCS, TGS and glibenclamide [13,14,15].

Determination of lipid peroxidation

Increased production of lipid peroxides such as malondialdehyde (MDA) and free radicals may be caused by hyperglycemia linked to hyperlipidemia [16]. Hence lipid peroxidation in experimental rats was estimated [17].

Statistical Analysis

After statistical analysis of the data, Dunnett's multiple comparison test and One-way Analysis of Variance (ANOVA) were used to determine statistical significance. A statistically significant 'p' value was defined as less than 0.05.

RESULTS AND DISCUSSIONS

An imbalance of oxidant and antioxidant defence systems result in alterations in the activity of antioxidant enzymes such as superoxide dismutase (SOD), catalase (CAT) and glutathione peroxidase (GPx). In the present study, the

Renuka

activity of superoxide dismutase, catalase and glutathione peroxidase in normal and Diabetes induced rats were evaluated. The results of antioxidant activity of enzymes on control and experimental rats are depicted in Figures 1 a, 1b and 1c. There was a significant decrease ($p < 0.05$) in the activity of enzymic antioxidants namely superoxide dismutase, catalase and glutathione peroxidase in the liver of diabetic control rats. In diabetic rats treated with glibenclamide and plant extracts, there was a significant improvement ($p < 0.05$) in the activity of these enzymes. The activity of these enzymes in rats treated with highest dose of 400mg/kg b.w of MCS was comparable to the activity of enzymes in glibenclamide treated rats. A decrease in the antioxidative enzyme activities of SOD, CAT, and GPx is referred to as oxidative stress. Cell stress can be decreased in part by the antioxidant enzymes SOD and CAT. While CAT reduces hydrogen peroxides and shields higher tissues from extremely reactive hydroxyl radicals, SOD scavenges the superoxide radical by converting it to hydrogen peroxide and molecular oxygen [18].

The decreased activities of CAT and SOD may be response for increased production of H_2O_2 and O_2 by the auto-oxidation of glucose. Because these enzymes accelerate the dismutation of oxygen radicals and remove organic peroxides and hydroperoxides produced by unintentional exposure to STZ, they are crucial for maintaining physiological levels of oxygen and hydrogen peroxide. [19]. Treatment with MCS and TGS seemed to increase the activity of these enzymes and might help to control free radicals when compared to Glutathione peroxidase enzyme is relatively stable, but it has been reported that is disabled in severe oxidative stress conditions. It is noteworthy that diabetic rats treated with *Citrullus lanatus* (watermelon) displayed an increase in Gpx status activity that was nearly identical to the control level. This suggests that the juice may have a moderating effect on the altered antioxidant status of the diabetic rats [20]. The activities of antioxidant enzymes SOD and CAT were significantly increased after the treatment of ethyl acetate fraction of ethanol extract of *Stereospermumsuaveolens* in STZ-induced diabetic rats indicating the free radical scavenging activity and their protective effect against diabetic kidney cellular damage [21]. Treatment with root extracts of *Premnacorymbosa* (Rottl.) increased the activity of antioxidant enzymes SOD, CAT and GPx when compared to diabetic rats. The effect produced by plant extract was comparable with that of standard drug glibenclamide [22].

Non enzymic antioxidants

The changes in the levels of non-enzymic antioxidants namely vitamin C, vitamin E and reduced glutathione (GSH) are important in cellular system in curtailing reactive oxygen species. The levels of these non – enzymic antioxidants in control, diabetic and treated rats were assessed and the results are depicted in Figures 2 a, 2 b and 2 c. There was a significant reduction ($p < 0.05$) in the nonenzymatic antioxidants namely vitamins C, E and reduced glutathione (GSH) in diabetic rats when compared to control rats. The levels of these antioxidants were significantly increased ($p < 0.05$) in rats by treating with glibenclamide, MCS and TGS ethyl acetate extracts. The levels of vitamin C, E and reduced glutathione were found to be increased significantly ($p < 0.05$) on treatment with 400mg /kg b.w. Vitamin C is an effective antioxidant in various biological systems [23]. Vitamin C plays a central role in the antioxidant protective system, protecting all lipids undergoing oxidation and diminishing the number of apoptotic cells [24]. Vitamin E acts as a non-enzymatic antioxidant and reduces chain reactions of lipid peroxidation [25]. Vitamin E shields cell structures from damage by reducing lipid hydroperoxides produced during the peroxidation process.

The decreased level of vitamin E found in the liver of diabetic rats as compared with control rats could be due to increased oxidative stress, which accompanies the decrease in the level of antioxidant and might be related to the cause of Diabetes Mellitus [26]. Enhanced level of vitamin E or tocopherols in plant extract treated groups is based on their ability to donate phenolic hydrogens to lipid radicals. Vitamin E protects poly unsaturated fatty acids from being oxidized [27]. Decreased levels of nonenzymatic antioxidant vitamin C and E in diabetic rats, when compared to those of control rats. Treatment with root extracts of *Premna corymbosa* (Rottl) resulted in a considerable rise in these antioxidants in the liver, kidney, brain, heart, and pancreas of diabetic rats [28]. GSH has a multifaceted role in anti-oxidant defence. It is a co-substrate for glutathione peroxidase's peroxide detoxification process and a direct scavenger of free radicals [29]. Hyperglycemia is found to be an indirect cause of GSH depletion. As GSH is an important antioxidant molecule, its depletion leads to an increase of oxidative stress [30]. After taking *Passiflora ligularis*'s aqueous fruit extract orally for 30 days, all non-enzymatic antioxidant values significantly increased and

Renuka

eventually approached normal levels. This can reduce the oxidative stress leading to less degradation of GSH due to less production of ROS in diabetic stage [31]. In the present study, there was an increased level ($p < 0.05$) of reduced glutathione in MCS and TGS treated groups which imply that the plant extracts might have an enhanced amount of GSH activity which plays a role in coordinating the body's antioxidant defense processes. Reduced glutathione, synthesized mainly in the liver is an important non- enzymic antioxidant in the antioxidant defense system.

Lipid peroxidation

The status of lipid peroxidation of control and experimental rats were studied and the results are depicted in Figure 3. Lipid peroxidation was increased significantly ($p < 0.05$) in diabetic rats as compared to that of control rats. The rats treated with glibenclamide, MCS and TGS showed significant reduction ($p < 0.05$) in lipid peroxidation. The diabetic rats treated with highest dose of 400mg/kg b.w showed significant improvement ($p < 0.05$) in antioxidant activity and the reduction in malondialdehyde production was comparable to glibenclamide treated rats. Lipid peroxidation is an autocatalytic free radical process formed by oxidative damage of cells. ROS produced in tissues results in lipid peroxidation and subsequently enhances the levels of malondialdehyde which is the major end product and index of lipid peroxidation [32]. Polyunsaturated lipids oxidatively deteriorate due to a process called lipid peroxidation, which is mediated by free radicals. The primary cause of the rise in oxygen free radicals in diabetes may be elevated blood glucose levels, which produce free radicals by auto-oxidation[33]. *Coleus vettiveroides* extract possess potent antioxidant and lipid peroxidation activities and can be employed in protecting tissue from the oxidative stress, which might be responsible for its hypoglycemic property [34]. In the current investigation, elevated lipid peroxidation in diabetic rats generated by STZ may be attributed to an upsurge in free radical production by STZ. Lipid peroxidation inhibition appears to be closely related to MCS and TGS extracts' capacity to squelch hydroxyl radicals. After oral administration of the plant extracts for 21 days the elevated values restored back to near normal level. Lipid peroxidation significantly decreased in the treated groups, indicating that it plays a protective role against lipid peroxidation.

CONCLUSION

In the present study *in vivo* antioxidant activities of *Momordica charantia* and *Trigonella foenumgraecum* seed extracts in streptozotocin– nicotinamide administered diabetes induced rats showed a significant improvement in the activities and the levels of enzymic and non-enzymic antioxidants catalase, glutathione peroxidase, superoxide dismutase, vitamins C, E and reduced glutathione (GSH) on treatment with plant extracts. The rats treated with MCS and TGS also showed significant reduction in lipid peroxidation. The various antioxidant activities exhibited by *Momordica charantia* and *Trigonella foenumgraecum* may be attributed to their effectiveness as good scavengers of free radicals. Hence, these might be useful in the control of hyperglycaemia and due to its potent antioxidant properties may help in prevention of complications in diabetes.

ABSTRACT

This paper addresses the crucial role of teacher education in ensuring a sustainable future. It argues that by embedding Environmental Education (EE) within teacher training programs, educators can become powerful agents for fostering environmental awareness and action in future generations. The article explores the theoretical framework of Education for Sustainable Development (ESD) and its practical application as EE. It outlines the core knowledge base for effective EE, encompassing ecological literacy, environmental issue analysis, and pedagogical approaches to integrate sustainability across the curriculum. Furthermore, the paper examines practical strategies for embedding EE in teacher training programs, focusing on curriculum development, innovative teaching methods (e.g., project-based learning, field studies), and fostering collaboration between teacher educators and environmental experts. By equipping teachers with the necessary tools and fostering their own environmental stewardship, teacher training programs can become a critical catalyst for building a generation committed to a sustainable future.

Keywords: Education, Environment, Teacher Training, Sustainable Development, etc.

INTRODUCTION

In the field of environmental education, there is a notable lack of emphasis in both pre-service and in-service teacher education programs, underscoring the connection between environmental education and teacher preparation. Numerous national and international institutions provide extensive teacher preparation programs that combine standard pedagogical instruction with environmental education. The purpose of this paper is to emphasize how important it is for teacher educators to use awareness-building techniques. The goal of environmental education is to raise awareness of environmental issues among people all over the world and to make them deeply care about them. Its main objective is to provide people with the information, abilities, attitudes, drive, and dedication needed to deal with current environmental issues in a cooperative manner while actively averting the emergence of future ones.

Aims and Objectives

1. Environmental education has many goals, including raising public awareness of environmental issues, encouraging the investigation of possible outcomes, and laying the foundation for fully informed and active personal participation in environmental protection and the sustainable use of natural resources. Resolutions' guiding principles highlight a number of important themes, including:
2. Reaffirming that the environment is a common human legacy.
3. Understanding that maintaining, protecting, and improving environmental quality is our shared responsibility in order to advance ecological balance and human health.
4. Making the case for the judicious and sensible use of resources.
5. Stressing the responsibility of each individual to protect the environment by their own behavior and deeds.
6. Outlining the main goals of environmental education, which include improving environmental management and coming up with workable answers to environmental problems.
7. Providing opportunities to acquire the values, information, attitudes, commitments, and abilities required to protect and improve the environment.
8. Encouraging students to examine and evaluate their surroundings via a range of lenses, such as those pertaining to geography, biology, sociology, economics, politics, technology, history, aesthetics, and ethics.
9. Promoting students' environmental awareness and curiosity while encouraging their active participation in resolving environmental concerns.
10. Understanding how environmental education relates to other trans disciplinary issues found in other subject areas.

Types of Environmental Education

Formal Environmental Education

- a) **Structured Environmental Education:** This aspect entails formal training in educational environments and necessitates the inclusion of environmental subjects in the curriculum at various grade levels.
- b) **Environmental Awareness Courses through Distance Learning:** This program helps people have a better understanding of local environmental difficulties by providing them with the opportunity to study specific environmental issues through distance learning programs.
- b) **Environmental Programs at Open Universities:** The Indira Gandhi National Open University (IGNOU) offers flexible study options by facilitating undergraduate degrees through distant education.
- c) **Integrating Environmental Principles into Business and Management Studies:** The Indian Ministry of Human Resource Development required in 2002 that environmental concepts and issues be incorporated into management and business studies curricula, highlighting the significance of environmental literacy in these domains.

**Neeraj Yadav and Lohans Kumar Kalyani****Non-Formal Environmental Education**

- a) **Environmental Clubs:** These are formalized associations that work to raise environmental awareness and take up issues related to the local or global environment within communities, schools, or other organizations.
- b) **The National Environmental Corps** is a government or non-governmental entity entrusted with organizing and carrying out nationwide environmental sustainability and conservation projects.
- c) **Population Awareness Initiatives:** These are plans or initiatives designed to inform people and communities about the environmental effects of population expansion and to encourage responsible family planning.
- d) **Environmental Advocacy Initiatives:** Usually carried out by individuals, organizations, or activist groups, they are attempts to increase public awareness, shape policy, and spur action to solve environmental challenges.
- e) **Global Environmental Initiatives:** These are cross-border international projects or initiatives that tackle environmental issues like pollution, biodiversity loss, and climate change.
- f) **Eco-Friendly Competitions:** These are occasions or competitions that motivate participants to create and present creative approaches or methods that support ecological footprint reduction and environmental sustainability.
- g) **Forums, Conferences, Training Sessions, Camps, Exhibitions, Community Gatherings, Puppetry Performances, and Street Performances:** These are a few examples of platforms or methods that are used to raise awareness of environmental issues, encourage participation and dialogue, and motivate people to take action to improve the environment.

Importance

The health of our planet is intrinsically tied to the well-being of humankind. The capacity of future generations to survive at all rests on our collective shoulders to protect the natural world. This calls for a change in mindset to one of environmental responsibility, in which each person takes an active role in protecting our common environment. A fundamental aspect of this movement involves cultivating a profound comprehension of the complex network of life that keeps us alive. Development is necessary for society to advance, but it cannot come at the price of the environment being worse. Such deterioration frequently results from a lack of public knowledge about the sensitive ecosystem's equilibrium. Environmental problems like as pollution and climate change have effects on people everywhere on Earth, regardless of where they live. As a result, adding environmental education to the curriculum is a crucial first step. We enable the next generation to take on the role of responsible stewards of the planet by teaching them about the environment and its intricate relationships. With this information, they will be able to make decisions that will guarantee a sustainable future for everybody.

Strategies to Increase Awareness

Launched in 1986 by the Indian government's Ministry of Environment and Forests (MOEF), the National Environment Awareness Campaign (NEAC) is a groundbreaking initiative designed to raise environmental awareness among all societal classes. This campaign emphasizes how important awareness is in addressing environmental issues and advancing sustainable development. In order to run its operations, NEAC provides financial support to community organizations, educational institutions, training facilities, and recognized non-governmental organizations (NGOs). These organizations are tasked with carrying out broad public awareness campaigns for Indian citizens, with an emphasis on incorporating environmental education into teacher preparation programs. The MOEF wants people from a variety of backgrounds to have a profound grasp of environmental challenges and its repercussions through NEAC. NEAC makes ensuring that awareness campaigns are decentralized and customized to the particular requirements and circumstances of many areas and communities around the nation by collaborating with NGOs, educational institutions, and community organizations. Additionally, NEAC acknowledges the critical role educators play in influencing the environmental consciousness of coming generations by integrating environmental education into teacher training programs. NEAC's main goal is to spark a national movement in favor of sustainability and environmental care. Through providing people with information, tools, and resources, NEAC works to promote a culture of environmental responsibility and group action. By means of cooperative initiatives and community involvement, NEAC aims to develop a better educated, involved, and ecologically conscious populace that is equipped to tackle the urgent environmental problems of our day.

**Neeraj Yadav and Lohans Kumar Kalyani****Environmental Information System**

The Environmental Information System (ENVIS) has been a key component in the communication of scientific, technical, and semi-technical information on a wide range of environmental concerns since its establishment in 1982–1983 during the Sixth Plan. All levels of government have benefited greatly from ENVIS's assistance in formulating policies and managing the environment, which has aided in the process of making decisions that protect and improve the environment in order to maintain a good standard of living for all living things. Ensuring the smooth integration of national efforts in the gathering, compiling, storing, retrieving, and distribution of web-enabled environmental information to all stakeholders has been the main goal of ENVIS. This includes researchers, scientists, policy planners, decision-makers, and the general public. ENVIS facilitates informed decision-making and effective action for environmental conservation and sustainable development by giving stakeholders access to comprehensive and current environmental data and knowledge resources. Because ENVIS makes it easier for professionals to share their knowledge and experience with practitioners, it is essential in closing the knowledge gap that exists between scientific research and policy implementation. ENVIS promotes the sharing of creative ideas, cutting-edge solutions, and new developments in environmental management and governance through its extensive network of environmental information centres and online platforms. Furthermore, by democratizing access to environmental information, ENVIS encourages accountability, openness, and public involvement in environmental decision-making processes. ENVIS facilitates public access to pertinent data and research findings, enabling citizens to participate in educated discourse, advocacy, and activism for environmental sustainability and protection. All things considered, ENVIS is a crucial instrument in the toolbox of environmental governance, providing knowledge, insight, and foresight to stakeholders as they negotiate the intricate web of environmental possibilities and problems. Through the promotion of cooperation, exchange of ideas, and development of capabilities, ENVIS makes a major contribution to the group's endeavors to create a future that is cleaner, greener, and more resilient for future generations.

The long-term goals of the Plan

1. The Environmental Information System's (ENVIS) goals highlight how important it is to the advancement of environmental science, technology, and information sharing. These goals provide as a foundation for creating a strong repository and dissemination hub that efficiently gathers, processes, stores, retrieves, and distributes environmental data by utilizing cutting-edge technologies. In addition, ENVIS seeks to promote environmental information technology research, development, and innovation, keeping the sector at the forefront of knowledge advancement. In the near future, ENVIS is concentrated on multiple primary goals:
2. Offering a thorough national environmental information service that meets the demands of environmental information processors, users, and disseminators now and in the future. The goal of this service is to handle the changing needs and difficulties in environmental decision-making and management. Improving dissemination, retrieval, and storage capacities to guarantee stakeholders have quick access to environmental data. This entails developing the systems and infrastructure necessary for effective information management and end-user delivery.
3. Encouraging collaboration and national and international cooperation for the sharing of environmental information. ENVIS aims to facilitate cross-border knowledge exchange and collaboration on environmental concerns by cultivating partnerships and networks.
4. Supporting educational and training initiatives designed to improve participants' abilities to process and use environmental information. Efforts to teach professionals and students how to use information technologies for environmental research and decision-making fall under this category.
5. Facilitating information sharing on the environment between developing nations, acknowledging the significance of international collaboration in tackling common environmental issues and advancing sustainable development.
6. By achieving these goals, ENVIS hopes to significantly contribute to the advancement of environmental knowledge, the encouragement of well-informed decision-making, and the development of global cooperation for environmental sustainability. Through the use of technology, encouragement of learning and training, and information sharing, ENVIS helps to create a future that is more sustainable and resilient for everybody.

**Neeraj Yadav and Lohans Kumar Kalyani****Eco-Clubs in Schools**

Eco-Clubs in schools serve as hubs for fostering environmental awareness and action among students. These clubs, found in various educational institutions, engage students in activities like tree planting, waste reduction, and water conservation. Supported by initiatives like the Department of Environment, they educate students on biodiversity, pollution, and sustainable living. Through workshops, clean-up drives, and nature walks, Eco-Clubs instill a sense of responsibility towards the environment and promote community involvement. Empowering the next generation of environmental stewards, Eco-Clubs play a vital role in shaping a more sustainable future. Delhi, the National Capital Territory (NCT), is proud to have established 2000 of these clubs in a variety of educational settings, including colleges and government, assisted, private, and public schools. The Department of Environment provides each school and college Eco Club with an enhanced token grant of Rs. 20,000 to support their environmentally conscious activities. With the help of this funding, a variety of ecologically friendly initiatives can be put into practice, encouraging an eco-aware and action-oriented culture in educational environments.

Activities under this scheme include

1. **Encouraging Tree Plantation:** Motivating students to participate in tree planting activities to maintain green and clean surroundings.
2. **Water Conservation Promotion:** Advocating for the conservation of water resources by minimizing water usage.
3. **Waste Management Advocacy:** Encouraging students to adopt habits and lifestyles that minimize waste generation, promote source separation of waste, and ensure proper disposal to nearby storage points.
4. **Awareness Campaigns against Waste Burning:** Educating students to raise awareness among the public and sanitation workers about the harmful effects of indiscriminate waste burning, which can lead to respiratory diseases.
5. **Reduction of Plastic Bag Usage:** Sensitizing students to minimize the use of plastic bags and discourage their disposal in public places, as they can clog drains, cause waterlogging, and serve as breeding grounds for mosquitoes.
6. **Environmental Education Programs:** Organizing various awareness programs such as quizzes, essays, painting competitions, rallies, and street plays to educate students about environmental issues. Additionally, educating children about the reuse of waste materials and the preparation of products from waste.
7. **Nature Trail Organizing:** Arranging nature trails in wildlife sanctuaries, parks, and forest areas to acquaint students with biodiversity and the importance of conservation efforts.

CONCLUSION

In order to ensure sustainability in education and beyond, it is critical that environmental education be included into teacher training programs. Future educators are given the information, abilities, and attitudes needed to successfully implement environmental education into their teaching practices by including environmental concepts, issues, and practices into teacher education curricula. This all-encompassing strategy not only enables educators to encourage environmental stewardship in their pupils, but it also promotes a sustainable culture in both communities and educational institutions. Ultimately, we can raise a generation of environmentally aware people who can solve environmental issues and help create a more sustainable future for all if we give environmental education top priority in teacher preparation programs.

ABSTRACT

The use of Potassium Solubilizing Bacteria (KSB) as bio-fertilizer has simultaneously increase potash uptake in plants and improve crop production in various crops. A laboratory study was carried out to isolate, identify, and characterize potash-solubilizing bacteria from rhizospheric soil of paddy. The KSB population was greater in paddy rhizosphere soils. Preliminary selection for KSB was based on the establishment of a halo zone surrounding the bacterial colony on Aleksandrov agar medium. The isolated KSB were identified based on their morphological and biochemical characterisers. The isolates showed positive for catalase oxidation and negative for urease. The isolates were Gram-positive rods known as *Bacillus*.

Keywords: Isolation, characterization, Aleksandrov medium, KSB, *Bacillus*.

INTRODUCTION

Potassium is the most important macro key element in the nutrition of plants, next to nitrogen (N) and phosphorus (P). It plays a key function in the activation of numerous metabolic processes like as photosynthesis, protein synthesis, and enzymes, as well as resistance to pest and diseases(1). The amount of soluble potassium content in the soil plays a crucial role in determining its fertility and ability to support plant growth. This soluble potassium is readily available for direct uptake by plants. Meanwhile, the vast majority, between 90-98%, of potassium in soil exists in insoluble forms, including mineral potassium, exchangeable potassium and non-exchangeable potassium (2). Bio fertilizers are biologically active products containing beneficial bacterial or fungal strains, often in easy-to-use as inoculants to enhance soil fertility by adding, conserving and mobilizing nutrients like nitrogen, phosphorus and potassium for better plant growth(3). They also promote soil health and crop quality. While some bacteria function as bio-pesticides to control harmful organisms and others enhance plant growth by producing phytohormones, they are

80907

Ranjitha and Alagappan Gandhi

not classified as bio fertilizers. Microorganisms are pivotal in the natural K cycle, with rhizobacteria solubilizing potassium in soil. Considerable populations of K-solubilizing bacteria exist in both soil and rhizosphere (4). Several reports revealed the ability of various bacterial species to solubilize insoluble potash minerals, including feldspars, mica, muscovite, potassium aluminosilicate, and biotite. *Bacillus*, *Pseudomonas*, *Klebsiella*, *Acinetobacter*, *Azotobacter*, and *Streptomyces* are among the bacterial genera known for this capacity (5, 6). There is a significant number of potassium-solubilizing bacteria in rhizosphere plant soil. Among these *Pseudomonas*, *Bacillus*, and fungus are the most common soil bacteria. The study investigates the potassium-solubilizing bacteria from rhizospheric soil of paddy, examining their ability to release potassium and enhancing crop nutrition. It aims of the presents study was to identify effective bacteria for solubilizing potassium from different type of unavailable form of potassium, potentially offering an effective KSBto improve soil fertility and increase crop yields with eco-friendly approach.

MATERIALS AND METHODS

Collection of soil sample

Rhizosphere soil samples of paddy were collected from Pudukkottai district. Surface soil was dug to 10cm where the roots of crop were concentrated. From about 0-2.5mm away from the root surface, a zone of soil is located that is significantly influence by living roots and is referred to as the rhizosphere.

Adaptation and enrichment

Collected soil sample were enriched with 5% insoluble potassium and incubated for one weak at room temperature. After adaptation, 1gm of soil was inoculated in 100ml GYF (Glucose Yeast Feldspar) broth and incubated at 37° C on rotary shaker at 120 rpm for 1 week.

Media preparation

Aleksandrov agar medium (AM) was chosen based on the existing reports as a selective medium for the isolation of Potassium Solubilizing Bacteria(7).

Composition of AM medium

Magnesium sulphate	-	0.5g
Potassium alumino silicate	-	0.1g
Glucose	-	5.0g
Ferric chloride	-	0.005g
Calcium phosphate	-	2.0g
Agar	-	20g
Distilled water	-	1000ml
PH	-	7.2±0.

Isolation and screening of KSB

Potassium Solubilizing Bacteria were isolated from soil samples using the serial dilution and spread plate method. Initially, one gram of soil sample was mixed with 10 ml of sterile distilled water and thoroughly shaken. Subsequently, 1 ml of solution from first dilution has transferred to 9ml of sterile distilled water mixed thoroughly. The same procedure was done up to preparing 10⁻⁷dilutions. Each dilution (0.1 ml) was plated onto Aleksandrov agar medium (AM) containing insoluble mica an incubated at Selection of KSB based on halo zone formation 28±2°C for 7 days. Colonies showing halo zones indicative of potassium solubilization were selected and maintained in respective agar sland for further study subjected to two successive subcultures on Aleksandrov agar medium to observe colony morphology. To ensure sterility, the entire procedure was conducted within a laminar airflow (8).

$$\text{Ratio} = \frac{\text{Diameter of zone of clearance (D)}}{\text{Diameter of growth (d)}}$$

**Ranjitha and Alagappan Gandhi****Morphological and biochemical characterization of KSB**

The characterization of isolates involved observing their morphological traits such as shape, margin and colour. Additionally, several biochemical tests were conducted, including Gram staining, Capsule staining, Motility, Catalase oxidation test, MR-VP test, Indole production test, Nitrate reduction, H₂S production, Urease and Starch hydrolysis test.

Cell shape

To observe cell morphology, a loop of bacterial culture was transferred to a glass slide with a drop of sterile water and viewed under a light microscope.

Gram stain

A loopful of 24-36hrs old broth culture of the test bacterium was put on a clean glass slide and air-dried. The slide was then gently heated over the flame of a spirit lamp to fix the bacterial stain. The fixed smear was then immersed in an aqueous Crystal violet solution (0.5%) for 30 to 35 seconds and then rinsed for one minute with a gentle flow of tap water. The stained smear was then flooded for one minute with Gram's iodine solution and gently washed with tap water. Decolourization was done with a 95% ethanol solution until the colour of crystal violet runoff was visible, then washed with a gentle flow of water. Finally, the smear was counterstained with Safranin for about 10 seconds, rinsed with water, air-dried, and examined under a microscope with 40X magnification.

Capsule stain

A capsule stain technique was used to Indian ink method confirm the presence of capsule in the bacterial isolates (9).

Mannitol

motility buds were inoculated with the test organism and cultured at 37°C for 24 hours. Motile species made the medium opaque, but non-motile species grew only along the stab line.

Biochemical characterization

The isolates were essentially subjected to Catalase oxidation test, MR-VP test, Indole production test, Nitrate reduction, H₂S production, Urease and Starch hydrolysis test deamination test were performed by using standard methods(10).

RESULTS AND DISCUSSIONS**Isolation and screening of KSB**

The bacteria were first isolated from rhizospheric soil of paddy using a modified Aleksandrov media containing mica, providing the necessary nutrients and conditions for observing potash solubilizing bacteria. The selected bacteria were screened for their ability to solubilize K minerals, typically evidenced by the formation of clear zones around bacterial colonies, indicating K mineral solubilization. Only colonies displaying distinct morphology and clear zones were chosen, implying they likely possessed the desired solubilization ability. Five bacterial isolates, namely KSB1, KSB2, KSB3, KSB4 and KSB5 were selected based on these criteria. Subsequently, the extent of solubilization exhibited by the chosen isolates was quantified by measuring the diameter of the clear zone around each colony. Notably, isolates KSB1 and KSB2 demonstrated larger zones of solubilization compared to others. The ratio of solubilization zone was measured according to Khandeparkar's selection ratio as listed in (Table 1).

Morphological and biochemical characterization of KSB

The isolates underwent assessment for their capacity to solubilize soluble potassic minerals, while the cultural behaviour of the purified bacterial isolates was observed using Modified Aleksandrov media. Among the five isolates initially tested, only KSB1 and KSB2 were selected for further analysis to tentatively identify and study their morphological and biochemical characteristics, as delineated in (Table 2). KSB1 forms small, opaque, aerobic colonies,

**Ranjitha and Alagappan Gandhi**

with small rod-shaped cells and entire margins. These colonies appear creamy in colour and stain positive in Gram staining. They are also capsulated, motile, and positive for catalase, Methyl Red (MR), nitrate reduction, H₂S production and starch hydrolysis, but negative for Vog-es-Proskauer (VP) test, Indole production, and urease activity. In contrast, KSB2 forms medium-sized smooth colonies with short rod-shaped cells and smooth elevated margins. These colonies are creamy white in colour and stain positive in Gram staining. Unlike KSB1, KSB2 lacks capsules and is VP-positive and urease-positive but Indole-negative. Additionally, KSB2 does not reduce nitrate or produce H₂S.

Identification of isolated bacteria

On the basis of different morphology and biochemical analysis performed the isolated bacterial strain KSB1 and KSB2 were identified as bacillus(Plate 1). The results of present study obtained on morphological and biochemical characteristics of KSB1 and KSB2 are conformity with earlier reports of several workers (8, 10, 11, 12, 13, and 14).

CONCLUSION

Potassium availability to crop plants in soil is generally low since nearly 98% of total K in soil is in mineral form. Solubilization of soil mineral potassium by bacteria is well established. Rhizosphere micro-organisms contribute significantly in solubilization of bound form of minerals in the soil. The results obtained from the current study concerning isolation, screening and characterization of two isolates of KSB from some paddy rhizosphere soil revealed that bacillus species can potentially enhance the dissolution of K-bearing minerals the best isolate with the highest score in Aleksandrov agar were KSB2 (2.08cm diameter). Even though the isolate KSB2 showed maximum solubilizing potentiality in laboratory condition further studies on the mechanism by which KSB solubilize mica and the effectiveness of their use in the fields is needed.

ACKNOWLEDGEMENT

ABSTRACT

The aim of the present study to evaluate the phytochemical screening, HPTLC Finger printing profile, GC- MS analysis and In- Vitro anticancer potential in the methanolic extract of *Helianthus annuus* seeds against Lung , Cervical, Breast and Bone cancer cell line. The preliminary phytochemical screening showed that the most of the active compounds were mainly found in methanolic extract of *Helianthus annuus* seeds. Especially bioactive compounds such as Alkaloids, Flavonoids, Phenols, Saponin and Tannin were highly present in the methanolic extract when compared to other solvents like Chloroform, Ethyl acetate Petroleum ether and Aqueous extract based on the solubility. HPTLC analysis study revealed that flavonoids compounds were found as identified fraction in the methanolic extract of seeds. when compared with standard Quercetin compounds. Essential active compounds have been identified in the methanolic seed extract of *Helianthus annuus* by using GC-MS Technique. GC- MS results revealed that some of the vital compounds were identified as different peak with different molecular weight and RT value. Four different cancer cell lines such as Lung, Cervical. Breast and Bone cancer cell line have been treated with plant drug MEHA. The percentage of cancer cell viability were decreased and increased cancer cell cytotoxicity were observed in maximum concentration of plant drug in four cancer cell lines by MTT Assay .This review focus methanolic seed extract of *Helianthus annuus* as therapeutic potential against cancer and hence proved that it can be used alone or in combination with chemotherapeutic drugs in future.

Keywords: *Helianthus annuus* seeds, HPTLC, Quercetin, GC-MS , MTT assay , A549 cell line, HeLa cell line, MCF-7 cell line & MG-63 cell line

**Aanoorvanitha and Siva Ganesh****INTRODUCTION**

A traditional medicine possess plant-based properties as a good remedy for various diseases. A scientific research to develop anticancer drug from herbal plants began from 19th century [1] WHO reportedly analyzed that more than 75 % of the population in underdeveloped nations relies on natural traditional herbs as a best source for medication. Since ancient times, medicinal therapeutic herbs, often known as herbal medicine, have been identified and applied in traditional medical practices[2]. Therapeutic potential of Indian traditional plants are globally used by all type of people as folk medicines like Siddha, Ayurveda, and Unani. 85% of the world's people depend on natural traditional drug for their primary healthcare needs. The significance of natural medicinal plants to human health is enormous[3]. Chemotherapy using allopathic drugs can produce severe harmful side effects and hence its usage has been constricted [4]. Cancer is a second leading cause of deaths in worldwide[5]. Different type of cancer like Lung cancer, Breast cancer, Stomach cancer, Prostate cancer, Skin cancer, Liver cancer and Stomach cancer etc caused by environmental factor, stress, life style and genetical factor [6]. The recent research reports revealed that the arresting and delaying the tumor growth carried out by the bioactive compounds derived from traditional medicinal plants [7]. The vital advantages of herbal based medicines are their safety and affordable [8]. *Helianthus annuus* (Asteraceae) is an important oilseed crop around the world. *Helianthus annuus* is a widely growing plant which is used traditionally as an, antimalarial, antimicrobial anti-asthmatic, anti-inflammatory anti-oxidant, and anti-tumor activity.[9] It has been utilized as medicines for thousands of years and now there is a growing demand for plant-based medicines, health products, pharmaceuticals and cosmetics. Methanolic decoction of root part of *Helianthus annuus* has been used for rheumatic disorders [10]. The seed part of sunflowers are often taken raw or preferred to be eaten roasted because they are rich source of Vitamins A, D, E K. and Protein. Research studies have revealed that it can prevent us from cancer and many more harmful diseases.

MATERIALS AND METHODS**Collection of plant materials**

The seeds of *Helianthus annuus* were collected from the local area of Kangeyam and Tirupur, Tamil Nadu. Seed part of the plants were prepared for different solvent extractions such as Methanol, Ethyl acetate, Petroleum ether, Chloroform and Aqueous for sample analysis.

Preparation of plant extract

25 gm of plant seed MEHA was dissolved in 250 ml of Methanol, Ethyl acetate, Chloroform, Petroleum ether and Aqueous and kept it in a shaker for 24 hours. The extract was filtered through Whatmann No 1 filter paper and residue was collected. The filter was concentrated using a rotator vacuum evaporator to get methanol extract of the dried plant powder.

Soxhlet Extraction

The Soxhlet extraction process is ultimately needed where the desired active compounds has a limited solubility in a solvent, and the impurity is insoluble in that solvent. If the desired compound has a high solubility in a solvent then a simple filtration can be used to separate the compound from the insoluble substance.[11]

PHYTOCHEMICAL ANALYSIS

Phytochemical studies were performed for observing the secondary metabolites present in the different extracts using procedures described by Trease and Evans[12] The preliminary qualitative phytochemical studies were performed for testing the different active compounds present in different extracts.

Detection of Alkaloids

Extracts were dissolved individually dilute Hydrochloric acid and filtered.

Aanoorvanitha and Siva Ganesh

Mayer's test

Filtrates were treated with Mayer's reagent (Potassium mercuric iodide). Yellow coloured precipitate indicates presence of alkaloids.

Wagner's test

Filtrates were treated with Wagner's reagents(Iodine and Potassium iodide) for identification of alkaloids.

Detection of Flavonoids

Alkaline reagent test

Extracts were treated with few of drops of sodium hydroxide solution. Formation of intense yellow color, which became colorless on addition of dilute acid, indicates the presence of flavonoids.

Lead acetate test

Extracts were treated with few drops of lead acetate solution. Formation of yellow colour precipitate indicates the presence of flavonoids.

Detection of Phenols

Ferric chloride test

Extracts were treated with 3-4 drops of ferric chloride solution. Formation of bluish black color indicates the presence of phenols

Detection of Glycosides

Extracts were hydrolyzed with dil. HCL , and then subjected to test for glycosides

Modified Borntrager's test

Extracts were treated with ferric chloride and immersed in boiling water bath for about 5 minutes. The mixture was cooled and extracted equal volumes of benzene. The benzene layer was separated and treated with ammonia solution. Formation of rose-pink color in the ammonia layer indicates the presence of anthranilic glycosides

Legal's test

Extract were treated with sodium nitroprusside in pyridine and sodium hydroxide. Formation of pink to blood red color indicates the presence of cardiac glycosides

Detection of Saponins

Foam test

0.5 gm of extract was shaken with 2ml of water. If foam produced persists for ten minutes it indicates the presence of saponins

Detection of Tannins

3-5ml of test solution with few drops of 1ml lead acetate and observed red precipitate was observed and indicates the presence of tannin

Detection of Phytosterols

3 ml of test solution and minimum quantity of chloroform was added with 1-4 drops of acetic anhydride and one drop of concentrated nitric acid

Detection of Proteins

Xanthoproteic test

The extracted were treated with few drops of Conc. Nitric acid. Formation of yellow colour indicates the presence of protein

**Aanoorvanitha and Siva Ganesh****Detection of Diterpenes****Copper acetate test**

Extracts were dissolved in water and trail willy 3-4 days drops of copper acetate solution. Formation of emerald green colour indicates the presence of diterpenes.

HPTLC –HIGH PERFORMANCE THIN LAYER CHROMATOGRAPHY

Thin Layer Chromatography was applied to separate the flavonoid compounds to identify and quantify the active compounds compared with standard Quercetin. HPTLC is an unique analytical technique it is rapid, visual, and economical as it utilizes smaller volumes of solvents with minimum sample. Above all, in a short duration, a large number of samples are evaluated simultaneously in a short duration[13] 20mg was weighed accurately in an electronic balance (Afcoset), dissolved in 250 µl of the respective solvent and centrifuged at 3000rpm for 5mins. This solution was used as test solution for HPTLC analysis. 2µl of test solution and 2 µl of standard solution were loaded as 5mm band length 3 x 10 silica gel 60F254 TLC plate using Hamilton syringe and CAMAG LINOMAT 5 instrument. The samples loaded plate was kept in TLC twin through developing chamber (after saturated with solvent vapor) with respective mobile phase and the plate was developed up to 90mm. The developed plate was dried by hot air to evaporate solvents from the plate. The plate was kept in photo documentation chamber(CAMAG REPROSTAR 3) and captured the images at visible light, U 254nm and UV 366nm. The developed plate was photo-documented in visible light and UV 366nm mode using photo-documentation (CAMAG REPROSTAR 3)chamber. After derivatization, the plate was fixed in scanner stage(CAMAG TLC SCANNER 3) and scanning was done at UV 366nm. The peak table, peak display and peak densitogram were noted.

Gas Chromatography/Mass Spectrometry (GC/MS)

It is a common essential technique and used to make an effective chemical analysis. First step of GC/MS was started by injecting the sample to the column of the gas chromatography (GC) device. A mixture compounds will separate into simple substances when heated. Heated gas compounds were carried through a column with an inert gas. The test drug was evaporated in the junction part of the GC technique and segregated in the column by adsorption and desorption technique with suitable temperature which is controlled by software tools. Separation of the eluted components depends on the boiling point of the individual components.[14,15,16].

INVITRO CYTOTOXICITY ASSAY-MTT Assay**Principle**

MTT 3-(4, 5-dimethylthiazol-2-yl)- 2, 5diphenyl tetrazolium bromide enters into the cells and reacts with mitochondrial enzymes where it reduced into insoluble colored (dark purple) formazan product. The formazan crystal within the cells is then solubilized with an organic solvent DMSO and the released solubilized purple color formazan reagent is measured spectrophotometry at 570nm.

MTT Assay

Anticancer assay is carried out for the given test samples by selecting a culture flask with 85- 90% confluences. After trypsinization and centrifugation the cancer cells are seeded in the well plate for one day at 37°C incubation to form a monolayer. The culture medium from the cancer cells is replaced with fresh medium Test sample at different concentration in triplicates were added to the cells. After the incubation of sample with cells at 37°C for 18-24 hrs., MTT (1 mg/ml) were added in all the wells and incubated for 4 hrs. After the time interval DMSO is poured on the wells and read at 572 nm using spectrophotometry method. The percentage of cytotoxicity was calculated using standard formula.[17]

Cytotoxicity = [(Control – Treated)/ Control] X100

Cell viability= (Treated / Control) X 100

RESULTS AND DISCUSSIONS

Phytochemical screening

Various solvent extracts like Methanol, Ethyl acetate, Chloroform, Petroleum ether and Aqueous extracts of the seed part of *Helianthus annuus* showed the presence of secondary metabolites such as Alkaloids, Flavonoids, Phenols, Tannins, Saponin and Phytosterols reported that the most of the secondary metabolites found in MEHA when compared to other solvents.

HPTLC Finger Printing Profile

HPTLC analysis study revealed that flavonoids compounds were found as identified fraction in the methanolic extract of seed part of *Helianthus annuus*. HPTLC finger printing analysis study showed that the identification of flavonoids found in the separated fractions compared with the standard compounds quercetin captured the images at visible light, UV 254nm and UV 366nm respectively. The methanolic extract of the plant *Helianthus annuus* seeds has the excellent pattern of flavonoids identified by using HPTLC technique.

Identification of Bio active compounds of MEHA by using GC-MS Technique

The identification of different peaks with retention time of MEHA were analyzed by GC-MS technique. The methanolic extract of *Helianthus annuus* seeds showed that many active compounds were found in different peak area with RT value. Bufotalin identified in a higher peak 7.30 and RT value was 15.78 present in the sample in which is the most prominent constituent of *Helianthus annuus* seeds and also identified another compound 6-Fluoro-4-hydroxycoumarin has possessed in a peak area 3.80 and RT value was 6.28. The recent research reported that the same active group compounds such as mono terpenoid phenol – Thymol found in volatile ethanolic extraction of the seed part of *Apium leptophyllum* (Pers) belongs to Apiaceae family possessed highest peak area was 96.36% through GC-MS Analysis technique.[18] GC-MS result showed that the presence of several active compounds found in MEHA it may be better anticancer activity for various cancer cell line.

In- Vitro Cytotoxicity Assay –A549 cell line, HeLa cell line, MCF-7 cell line & MG-63 cell line by MTT assay:

The methanolic extract of *Helianthus annuus* showed mild to severe cytotoxicity in HeLa cancer cell line after 24hrs. The higher concentration of plant drug has excellent cytotoxic activity in Cervical cancer, Bone cancer, Lung cancer and Breast cancer cell line respectively. The increased level of cytotoxicity was found in Cervical cancer cell line when compared to other cancer cell line. The decreased cancer cell viability based on the dose dependent manner and the life span of cancer cell viability totally decreased due to the higher concentration of secondary metabolites present in MEHA. The cancer cell viability for HeLa, MG63, A549 and MCF-7 were completely decreased as 18%, 24%, 27% & 34% respectively in a maximum concentration of plant drug MEHA. The increased percentage of cell cytotoxicity found as 82% in HeLa and 76% in MG63 cell line in a maximum concentration up to 100µg methanolic extract of *Helianthus annuus* seeds. In the same observation related to the ethanolic extract of *Nigella sativa* seed possess the increased cytotoxicity in HeLa cell line and A549 cell line in a maximum concentration of 100µg based on dose dependent manner by MTT assay.[19] Results revealed that the methanolic solvent extract possess the higher solubility and better active constituents for different type of cancer cell line. The result concluded that the methanolic solvent extract of the plant compounds might be a better drug formulation for various type of cancer alternative to chemotherapy in future aspects.

SUMMARY AND CONCLUSION

Phytochemical analysis reported that the most of active compounds were highly found in the methanolic extract of plant seed *Helianthus annuus* when compared to other solvent extracts based on the solubility. The identified fraction of the active compounds flavonoids were identified in MEHA when compared to standard compounds quercetin in two different range as UV 254nm and UV 366nm by HPTLC technique. It could be better drug for the evaluation of cancer studies. The methanolic extract of the plant has the excellent pattern of flavonoids identified for further analysis. The identification of different peaks with retention time of MEHA were analyzed by GC-MS technique. GC-MS result showed that the presence of several active compounds found in MEHA it may be better anticancer

Aanoorvanitha and Siva Ganesh

activity for various cancer cell line . The methanolic extract of *Helianthus annuus* enhanced the anticancer activity in different cancer cell lines by MTT assay. The increased percentage of cytotoxicity were observed in Cervical cancer , Bone cancer , Lung cancer and Breast cancer cell lines and also evaluated decreased cancer cell viability in a maximum concentration of plant drug in 100µg MEHA by MTT assay. The higher concentration of plant drug has an excellent cytotoxicity activity in both cervical cancer cell line and bone cancer cell line. Herbal drugs are derived from natural medicinal plants it does not lead to any adverse and side effect to our human body. Finally, it is hoped that this review would be a source of guidance and support for the thirst of researchers to conduct further preclinical and clinical studies through herbal medicine for the treatment of cancer.

ACKNOWLEDGEMENT

The authors wish to acknowledge the South India Textile Research Association (SITRA), Coimbatore, Tamil Nadu, India- 641014 for providing facility to complete HPTLC analysis of active compounds and In- vitro cytotoxicity of plant extract in A549 cell line, HeLa cell line, MCF-7 cell line & MG-63 cell line by MTT assay.

Disclosure & Conflicts of interest

This research did not receive any specific grant from funding agencies in the public, commercial or nonprofit sector. The authors declare that there are no conflicts of interest.

ABSTRACT

This study investigates what influences students' interest in science by using fuzzy logic and cognitive mapping. It provides insights into the influence of several factors on decisions about science education by modelling complex relationships between fear, difficulty, lack of interest, understanding, math ability, financial restrictions, career prospects, job uncertainty, and limited awareness. Interdependent barriers to students' decision-making in science subjects are identified by the research through an extensive assessment of the literature and empirical analysis. With the help of the Trapezoidal Fuzzy Cognitive Map (TFCM) (*Trapezoidal fuzzy cognitive map*) model, the research provides nuanced understandings of the uncertainties affecting students' resistant behaviour. The research is valuable for academics, educators, and politicians since it emphasizes the need for focused initiatives to remove obstacles and improve the STEM (*science, technology, engineering, and mathematics*) education environment. The TFCM method is essential for making well-informed judgments, especially considering the importance society has placed on STEM fields. For more accurate results, we used the eigenvalues approach. It offers significant insights into the intricate relationships and preferences concerning the barriers affecting students' inclination towards studying science.

Keywords: Fuzzy Cognitive Maps (FCMs), Trapezoidal Fuzzy Cognitive Maps, Eigen values, STEM (science, technology, engineering, and mathematics).

INTRODUCTION

In today's rapidly evolving educational landscape, the importance of understanding the factors shaping students' preferences for studying science subjects cannot be overstated. With societies increasingly reliant on innovation and technological advancement, the significance of science, technology, engineering, and mathematics (STEM) education has gained prominence. However, despite the recognition of STEM fields' importance, students' inclination towards science-related courses can encounter obstacles and uncertainties. This paper endeavours to explore the intricate decision-making processes guiding students' choices in science education, employing sophisticated methodologies grounded in fuzzy logic and cognitive mapping. By scrutinizing the intricate interplay between factors such as fear, difficulty, lack of interest, understanding, math ability, financial constraints, career prospects, job uncertainty, and limited awareness, this research aims to unearth the interconnected barriers influencing students' preferences for science subjects. Through a meticulous examination of existing literature and empirical analysis, this study seeks to offer nuanced insights into the uncertainties contributing to students' reluctance towards science education. Leveraging the Trapezoidal Fuzzy Cognitive Map (TFCM) model facilitates a thorough exploration of the multifaceted influences on students' interest in science, providing a deeper comprehension of the underlying dynamics. The implications of this research are anticipated to be profound for various stakeholders, including academics, educators, and policymakers. By emphasizing the necessity for targeted interventions to dismantle barriers and improve the STEM education ecosystem, this study underscores the importance of nurturing an environment conducive to fostering students' engagement and involvement in science-related disciplines.

Furthermore, amidst society's increasing emphasis on STEM fields, the adoption of the TFCM method represents a pivotal advancement in formulating informed strategies for promoting STEM education. By harnessing the benefits of the trapezoidal fuzzy approach over conventional methodologies, this study aims to offer more precise and actionable insights into addressing the challenges impeding students' affinity towards science subjects. In essence, this research endeavors to illuminate the complex dynamics shaping students' interest in science education, with the overarching goal of contributing to the advancement of STEM education initiatives and cultivating a workforce equipped with the requisite skills and knowledge to thrive in an era characterized by technological innovation and progress. In the wake of COVID-19, students are changing how they approach science classes due to changes in career interests and a need for practical application. Interest in robust fields that handle pandemic-related issues, like technology and healthcare, has increased because of the epidemic. A greater understanding of the effectiveness of online learning has caused some students to select courses that are more appropriate for digital platforms. Students now tend to choose courses that they believe will lead to better work opportunities due to uncertainty in the labour market. Students are choosing to study subjects that are in line with their passions due to concerns about their mental health. Technology and information science jobs have become more attractive due to the trend of remote employment. Essentially, students' views on scientific courses in the post-COVID period are shaped by pragmatic concerns, career re-evaluations, and the need to see real-world applications.

LITERATURE SURVEY

In 1965, Lotfi A. Zadeh introduced Fuzzy Cognitive Maps (FCMs) as a mathematical model [1]. Kosko further enhanced cognitive maps by incorporating fuzzy values for concepts and fuzzy degrees of interrelationships between them in 1986 [2]. In 1976, political scientist R. Axelrod popularized FCMs for representing social scientific knowledge and described their use in decision-making within social and political systems [3]. W.B. Vasantha Kandasamy and Smarandache Florentin applied Fuzzy Theory and Neutrosophic Cognitive Maps in 2000 to analyse social aspects of migrant labourers living with HIV/AIDS [4], [5]. In 2013, M. Clement Joe Anand and A. Victor Devadoss introduced

Selvi and Priyadharshini

Triangular Fuzzy Cognitive Maps (TrFCM) to analyse the causes of divorce within families [6].A. Saraswathi and A. Praveen Prakash (2014) investigated problems faced by transgender individuals in India using New Triangular Fuzzy Cognitive Maps (TrFCM) [7]. A. Praveen Prakash and J. Esther (2014) applied Trapezoidal Fuzzy Cognitive Maps to rank problems experienced by deprived rural individuals with disabilities [8]. Kanimozhi Raman (2014) applied Induced Trapezoidal Fuzzy Cognitive Maps to address issues faced by the elderly [9].In 2007, Shi-Jay Chen and Shyi-Ming Chen proposed a fuzzy risk analysis method based on the ranking of generalized trapezoidal fuzzy numbers [10].

Basic Definitions

Definition 1

A fuzzy subset $A \subseteq X$ can be defined by its membership function μ_A , where $\mu_A: X \rightarrow [0,1]$. (i.e) $A = \{(x, \mu_A(x)) \mid x \in X\}$.

A fuzzy set is a set where each element in the universe of discourse is assigned a value indicating its degree of membership in the set. The numerical value assigned by a membership function to an element of a fuzzy set, indicating the strength of its membership in $[0,1]$

Definition 2

Given a fuzzy set A defined on X and any number $\alpha \in [0,1]$. The α -cut of a fuzzy set A is denoted by ${}^\alpha A$ and is defined by

$${}^\alpha A = \{x \in X \mid A(x) \geq \alpha\}.$$

The Strong α -cut of a fuzzy set A is denoted by ${}^{\alpha+} A$ and is defined by

$${}^{\alpha+} A = \{x \in X \mid A(x) > \alpha\}.$$

Trapezoidal fuzzy membership for the linguistic values :

Influences students' interest in science by using fuzzy logic and cognitive mapping provides insights into the influence of several factors on decisions about science education by modelling complex relationships between fear, difficulty, lack of interest, understanding, math ability, financial restrictions, career prospects, job uncertainty, and limited awareness. Fear is one of the linguistic variable and the values of this variable are very low, low, medium, high and very high.

Trapezoidal fuzzy membership for the linguistic values are

Very low	(0,0.1,0.1,0)
Low	(0.1,0.25,0.25,0.1)
Medium	(0.25,0.5,0.5,0.25)
High	(0.5,0.75,0.75,0.5)
Very high	(0.75,1,1,0.75)

Cognitive Matrix

A cognitive matrix is a structured representation of cognitive information, typically organized in a tabular format. In the context of cognitive science, psychology, and artificial intelligence, cognitive matrices are used to represent relationships, associations, or connections between different elements or concepts.

Analysis of the problem

Interdependent barriers to students' decision-making in science subjects are identified by the research through an extensive assessment of the literature and empirical analysis. The following characteristics were identified from research specialists to aid in the problem analysis.

1. C₁- Fear
2. C₂ -No Career and Job
3. C₃-Lack of Awareness
4. C₄ -Hardness

Selvi and Priyadarshini

- 5. C₅- Lack of Interest
- 6. C₆-Lack of Math Ability
- 7. C₇-Lack of Finance
- 8. C₈ -Lack of Understanding

Utilizing the specialist's understanding of indeterminacy as a foundation, we have used the Trapezoidal cognitive matrix to Analysing Barriers Influencing Students' Preference for Studying Science.

METHODOLOGY

Step 1: Form cognitive matrix which is used to represent relationships, associations, or connections between different elements or concepts. the relationships and preferences regarding the barriers influencing students' choice to study science. Each cell contains a relationship strength (e.g., V.H for Very High, M for Moderate, V.L for Very Low), reflecting the cognitive perceptions among the mentioned factors.

Step 2: Assign trapezoidal fuzzy membership from [0,1].
Trapezoidal fuzzy membership for the linguistic values are

Very low	(0,0.1,0.1,0)
Low	(0.1,0.25,0.25,0.1)
Medium	(0.25,0.5,0.5,0.25)
High	(0.5,0.75,0.75,0.5)
Very high	(0.75,1,1,0.75)

Step 3: Employ the α -cut formula to calculate a specific cut of the trapezoidal fuzzy number using a parameter α (set at 0.5 in this case).

$${}^\alpha A = [a + \alpha(b - a), d - \alpha(d - c)] = [f, g]$$

Step 4: Defuzzification takes the fuzzy output produced by the fuzzy inference process and converts it into a single crisp value that can be easily understood and used in decision-making. Here we defuzzify [f,g] using the average (f+g)/2.

Step 5: Compute the eigenvalues of the defuzzified matrix A using the eig(A)function in MATLAB.

Step 6: Taking the modulus ensured that the values obtained were positive, after which ranking was assigned accordingly. This straight forward approach allows you to calculate and display both the matrix and its corresponding eigenvalues in MATLAB.

Selvi and Priyadarshini

The table below shows the absolute value (λ) of eigen values and Ranking

Factors	Absolute value of λ	Ranking
C ₁ Fear	3.9007	1
C ₂ No Career and Job	0.6054	6
C ₃ Lack of Awareness	0.2482	8
C ₄ - Hardness	1.2056	2
C ₅ - Lack of Interest	1.0072	3
C ₆ - Lack of Math Ability	0.8503	4
C ₇ - Lack of Finance	0.5699	7
C ₈ -Lack of Understanding	0.6250	5

Table 3 : Ranking based on absolute value of λ

From the above table the absolute value of (λ) for Fear holds the first place. From this we can say the factor fear dominates the other factors. In summary, the cognitive matrix, defuzzified matrix, and eigenvalues offer significant insights into the intricate relationships and preferences concerning the barriers affecting students' inclination towards studying science. These results serve as a foundational basis for further analysis and interpretation, enabling the extraction of actionable insights crucial for informed decision-making in educational strategies and interventions aimed at enhancing science education.

CONCLUSION

This study identifies the main obstacles impacting students' inclination to pursue science education. A number of important elements were identified, including fear, hardness, a lack of understanding and math ability; other aspects were awareness, financial limitations, and job potential. For students to become more engaged in and involved in science education, these hurdles must be overcome with focused interventions. Educational institutions may foster a more favourable atmosphere that inspires students to pursue science education and jobs by helping, enhancing comprehension, and increasing awareness. This will ultimately lead to a more scientifically literate and active society.

SUGGESTION

- Experiences and bridge the gap between theoretical learning and practical application Dynamic Teaching Strategies: To make science classes enjoyable and engaging, use interactive and dynamic methods of education.
- Practice-oriented Uses: Include examples and applications from everyday life to show how scientific ideas are applicable in real-world situations.
- Mentorship Programs: Set up mentorship programs to offer students direction and an understanding of the opportunities in the scientific community.
- Positive Learning Environment: Reduce the fear and anxiety related to studying science by creating a welcoming and encouraging learning environment.
- Extracurricular Activities: Promote involvement in science-related extracurricular activities to foster a comprehensive understanding of the subject outside of the classroom.
- Practical Exposure: Give students hands-on experience and a peek into possible professions in science by establishing collaborations with firms and industries to provide them with practical exposure.
- Career aid Programs: Put in place career aid programs to help students with their financial worries and doubts while providing them with insightful information about the real-world implications of choosing professions in science.

ABSTRACT

Due to the rise in many disease-causing microbes, it has become not so possible to immediately know of contamination or to rectify the causatives of the contamination of food stuffs. To be able to provide food of good quality without any adulteration is a huge deal when it comes to certain fast-food outlets. The review highlights the various organisms that are capable of causing common foodborne diseases and their pathogenesis. With the knowledge given about the mechanism of infection, it is possible to overcome the obstacles of hygiene with proper awareness given to the vendors. It is indispensable to know the exact methods with which street foods are prepared, which can provide crucial information regarding the potential threat a malpractice can bring to consumers.

Keywords: Street food, Foodborne diseases, Food quality, Foodborne pathogens, and Pathogen

INTRODUCTION

Food is indispensable to living beings, depending upon the requirement of living beings, various sorts of foods are consumed. In this rapidly developing world people have been accustomed to resorting to methods that would make their life easier; street foods are a part of the morning routine of people who seek easier means to satiate themselves. Consumables that are readily produced out in the open for immediate or later consumption are known as "street-vended foods" [1]. Street foods are a cheaper alternative to sophisticated meals and are convenient in providing satiation, where quantity is more, and the price is less. It has been stated that 74% of nations' substantial portion of the urban food supply came from meals sold on the streets [2]. The street vended foods involve foods ranging from fruits, vegetables to meat; it also includes frozen dishes. However, this costs health, since it has been proven that

80930

**Ramya et al.,**

these foods are known to carry a lot of microbes due to the nature in which the food is prepared. It also comes down to the hygiene of people who are involved in vending these edible products, poor hygiene practices like unwashed hands and clothes are responsible for the transmission of pathogenic microorganisms to the food items during preparation. Hence the rise of foodborne illness is seen in such a scenario. The statistics involving foodborne illness' effect revolve around medium to lower income class people and developing countries, however it is not only limited to developing nations but also the developed nations lacking proper methods to control the contamination of foods with toxins, chemicals, and microbes. Such a case involves the report on the effects of raw milk consumption by people in England and Wales. It was reported that since 2014, seven *Escherichia coli* outbreaks were reported [3]. In this review, awareness about eating such foods' consequence is studied by microbiological analysis of the street-vended foods. Several parameters are described by WHO to control such contamination, since contamination of foods can occur at any stage, precautions must be taken to prevent drastic consequences.

CAUSES OF FOODBORNE DISEASES

Due to the risks that might be introduced to the food, which is to be prepared and processed, unprocessed ingredients are crucial to assess the safety of street-vended food. The kind and degree of adulteration of ingredients used in the producing street food will be different to that of other food service-related enterprises. The biggest variations will be seen when vendors buy cheaper, lower-grade raw materials from suppliers, as a result, the raw material is already at a higher chance to get contaminated further and might be already contaminated. Hence, raw materials should be purchased from reputable and well-known sources rather than from unreliable traders. Prior to purchase, raw materials ought to be screened for potential physical hazards and significant chemical contamination, however, it should be highlighted that chemical contamination is seldom detectable without laboratory investigation. Raw materials that are obviously physically dangerous should be avoided, or the dangers should be eliminated. For vendors of street food, managing chemical risks in raw ingredients is sometimes quite challenging [2]. A vital ingredient in many street food businesses is water. Due to its wide use, chances are that it could include harmful chemical, biological, or physical contaminants. Water is used in both liquid and solid forms for the preparation of drinks and foods. Due to the supply of water being unpredictable in certain localities there is a higher degree of the water being unclean, it has been reported that street vendors are often reluctant in washing their utensils due to such reasons. The production and sales units should, as far as is practical, have access to their own potable water supplies. Food and drinks should not be kept in the same container that is used to keep ice that is meant for consumption [2]. A neglect to clean and sterilize surfaces adequately may be caused by using unhygienic materials and poor material maintenance. For instance, to avoid the buildup of dust and other objects, bowls and plates should be placed upside down. Notably when meals are acidic, utensils should be constructed of materials that do not discharge poisonous or dangerous substances (copper, lead, cadmium, etc.) into food and beverages. Similarly, to this, chopping boards should be made and kept in good condition to lessen the possibility of physical and biological dangers contaminating food. In the series of procedures that foods go through before being sold and consumed, preparation and processing play a crucial role in establishing the safety of the product. People involved in the food preparation have a crucial responsibility to make sure that the prepared food is of good quality and free of contamination prior to sale. Food handlers should be instructed, prompted, or closely monitored to immediately cease operations if they have any sort of health issues like fever, sore throat, diarrhea and even discharges from the nose, eyes, or ears, or obviously infected skin lesions due to other health concerns. This hygiene procedure should get special consideration before handling ready-to-eat items. Vendors must adhere to cleaning methods that guarantee the cleanliness of the stall unit, its equipment, and its utensils. Vendors should be informed about the proper procedures and urged to adopt an appropriate cleaning and sanitizing program when sanitizing is necessary to control dangers. These parameters must be considered to ensure foods of good quality, but on the other hand, street vendors fail to meet these requirements. Hence the prevalence of food-borne illness is seen in food items that are exposed to such ill-treatment. In this review various microorganisms that are prevalent in such contaminated food items will be seen and their drastic effects are also discussed.

**Ramya et al.,****FOODBORNE ILLNESSES**

In terms of nutrition, food is a constant requirement for human life. Unwanted microbes, on the other hand, may contaminate food items, food processing settings, or manufacturing environments, increasing the risk for food-borne [4]. Such diseases have the ability to pose a serious threat to humans, sometimes resulting in mortality. Food-borne microbes, which mostly impact animal products that have been contaminated by vegetative pathogens or their toxins, are important pathogens that affect food safety and result in human illnesses all over the world. Most of these bacteria are important zoonotic agents that have a significant impact on the economy and public health [5]. The primary food sources of zoonotic bacteria for humans include meat, dairy products, and eggs. The most common bacteria origin pathogens that cause food-borne disease and mortality worldwide are *S. aureus*, *Salmonella* species and *E. coli* [5]. Ingestion of water and a range of foods contaminated with pathogenic organisms (bacteria, viruses, parasites, and fungi), as well as their toxins and compounds, leads to food poisoning syndrome (Ingestion of water and a range of foods contaminated with pathogenic organisms) [6].

BOTULISM

Clostridium botulin produces an exo neurotoxin, which has systemic effects and causes the neuroparalytic condition known as botulism. The toxin is also occasionally produced by other *Clostridium* species, including *Clostridium butyricum* and *Clostridium barati*. This disease is known for causing flaccid paralysis. Botulinum neurotoxin is a 150kDa protein where it enters the bloodstream depending upon the type of exposure, in the bloodstream it travels and binds presynaptic nerve terminals of the voluntary motor and autonomic Neuromuscular junctions then it inhibits muscular contraction and prevents presynaptic Acetylcholine release, resulting in flaccid paralysis [7]. Due to its tremendous potency and fatality, botulinum neurotoxin is regarded as the most lethal toxin. Its lethal dosage ranges from 1 to 3 ng of toxin per kilogram of body mass. Botulism can be acquired by eating food that has been poorly preserved, receiving an iatrogenic infection, or being exposed to the toxin during bioterrorism. It can also be contracted by the systemic release of the toxin in vivo, as in the cases of newborns and wound botulism. According to serologic specificity and other neurotoxins, seven distinct strains of the organisms (A-G) are categorized. Animals commonly contract type C and D botulism and very rarely type A and B. All strains that produce toxins have been assigned to one of four groups: I, II, III, or IV. Proteolytics are in Group I, non-proteolytics are in Group II, and serological type G is in Group IV. Group III includes type C and type D.

CLOSTRIDIUM PERFRINGEN RELATED FOOD POISONING

C. perfringen type A food poisoning, a common food-borne illness in western nations. It contains seven toxicogenic kinds (A-G), of which strains A and C are harmful to humans and is catalase and superoxide dismutase negative, it generates a wide range of poisons [8] [9]. Food poisoning can be triggered by *C. perfringens* enterotoxin (CPE), which is produced in the small intestine by *C. perfringens* spores that can germinate in meals like meat and poultry. Alpha-toxin (CPA), beta-toxin (CPB), epsilon-toxin (ETX), iota-toxin (ITX), enterotoxin (CPE), and necrotic enteritis B-like toxin (NetB), these toxins production by this pathogen are used as a classification [10]. Toxin-mediated tissue necrosis is the basis of *C. perfringens* pathophysiology. Most toxins have the ability to cause pores in cells, allowing water and solute to flood in and cause swelling and cell death. The fermentation of glucose results in the generation of histotoxic gas, which is a defining feature of *C. perfringens* [9].

STAPHYLOCOCCUS AUREUS FOOD POISONING

Only the enterotoxin-producing strains of the gram-positive bacterium *Staphylococcus aureus* can cause food poisoning. Such toxins are termed *Staphylococcus enterotoxins* (SEs). *Staphylococcus aureus* is a gram-positive bacterium, where only certain strains that produce enterotoxin can cause food poisoning. Such strains are known to produce six types of enterotoxins (SEA, SEB, SEC, SED, SEE, SEG and SEH) that have serological diversity and differ in the levels of toxicity [11]. The emetic action of SEs is a significant aspect since it causes vomiting, which is a primary symptom of Staphylococcal food poisoning. Diarrhea is also caused by some SEs but not SEC. Due to the difficulty in identifying toxins present in food other than SEA and SEE, many staphylococcal related foods poisoning is attributed to the SEA [12]. Appropriate major nutrient contents like carbon and nitrogen sources in the food can give suitable place for the bacteria to grow and this occurs mainly due to food vendors since these bacteria are known to be

80932

Ramya et al.,

present on skin and mucous membranes of humans and that humans are major reservoir of this organism [13]. Reheating food may kill *S. aureus*, but SEs remain emetically active due to its' heat tolerance, these are also tolerant towards gastric enzymes since its activity is based upon their entry thru the intestinal epithelial cells. Once entered, they reach lamina propria and provoke mast cells to release serotonin. In turn serotonin stimulates the vagus nerve and it is involved in the production of an emetic response. It is known that SEs are predominantly found in raw milk and its products where SEC and SEA are commonly found in them.

SALMONELLOSIS

Clinical manifestations of salmonellosis range from the typical *Salmonella gastroenteritis* (diarrhea, stomach pain, and fever) to enteric fevers, including typhoid fever, which is a serious feverish systemic infection that needs immediate antibiotic treatment [14]. *Salmonella nontyphoidal* species are zoonotic pathogens, and the primary means of transmission is through animal-derived foods. Although the microbe has been discovered in other foods, poultry, pigs, and cattle, as well as related products such as meat, eggs, and milk, are most frequently recognized as dietary sources responsible for outbreaks of human salmonellosis [5]. They are known to colonize the small intestine's final section, ileum and the colon and invade the intestinal epithelium by adhering and proliferate there. Most salmonellae elicit an initial inflammatory reaction after infecting the intestine, which can result in ulceration.

KLEBSIELLA PNEUMONIAE RELATED FOOD POISONING

Klebsiella pneumoniae has been regarded as a significant food-borne pathogen since it is regularly discovered in foods such as raw vegetables, powdered newborn formula, meat, seafood, and street foods. The virulence factors that *K. pneumoniae* may express include capsules, endotoxins, siderophores, iron-scavenging systems, and adhesins. It has been shown to be crucial in the pathogenesis of the disease [15]. The capsule is a key factor engaged in at least two pathogenic processes, namely the direct inhibition of the vulnerable host response and the protection of bacteria from phagocytosis. Numerous capsule types (K), including K1, K2, K54, K57, K20, and K5, are frequently linked to the occurrence of invasive pyogenic liver abscess and septicemia [16]. Adhesins are bacterial components or cell surface elements that make it easier for bacteria to adhere to or connect to other cells on the host where they dwell or infect. Adherence is a crucial stage in the pathogenesis of bacteria or an infection that is necessary for the bacteria or infection to colonize a new host. For the prevention or treatment of bacterial infections, bacterial adhesions and adhesions are important targets. Other key components influencing an organism's pathogenicity are lipopolysaccharides and CPS. Antigens found in lipopolysaccharides, including lipid A, core, and O-polysaccharide, are necessary for bacteria to fend off complement-mediated payoff [17].

FOODBORNE PATHOGENS

Pathogens that cause illnesses when consumed foods that are contaminated with them are known as foodborne pathogens. These biological agents that can cause foodborne illnesses undergo a series of events to establish themselves in the vulnerable host to produce toxins or use their virulence factors to elicit an immune response and affect the host.

Escherichia coli

Gram-negative, non-spore-producing, rod-shaped, facultative anaerobic, and coliform bacterium belonging to the genus *Escherichia* is motile pertaining to peritrichous flagella arrangement with the exception of few strains. Typically rod-shaped, cells range in size with 1–3 μm \times 0.4–0.7 μm and 0.6–0.7 μm in volume. By employing negative staining techniques, which result in a brilliant halo over a dark background, the *E. coli* capsules may be seen clearly. They only have one or two peptidoglycan layers in their thin cell wall. On McConkey agar, these lactase fermenters create pink colonies. A particular strain of *E. coli* is known for its hemolytic activity on blood agar. It inhabits the environment, food, and lower gut of homeothermic animals. *E. coli* grows best at 37°C (98°F), however some lab strains may thrive at temperatures as high as 49°C (120.2°F). *Escherichia coli* (*E. coli*) is a gram-negative bacillus that causes a variety of diarrheal diseases, such as dysentery and traveler's diarrhea. It is commonly employed as an indicator organism for water pollution since it can exist for a very long time in feces, soil, and water. It is also classified into 200 serotypes based on its 3 antigens [18]: Somatic or cell wall antigen (o), capsular antigen (K) and

80933

**Ramya et al.,**

flagellar antigen (H) Numerous different *E. coli* strains have been found, causing illnesses ranging from mild, self-limiting gastroenteritis to renal failure and septic shock. *E. coli*'s virulence makes it easier for it to overcome host defenses and acquire antibiotic resistance.

- Enterotoxigenic *Escherichia coli* (ETEC),
- Enterohemorrhagic *Escherichia coli* (EHEC), also known as Shiga toxin-producing *Escherichia coli* (STEC),
- Enteroinvasive *Escherichia coli* (EIEC),
- Enteropathogenic *Escherichia coli* (EPEC) and
- Enteroaggregative *Escherichia coli* (EAEC).

These are the causative *E. coli* subtypes [19]. One out of five subtypes of *E. coli* that cause intestinal sickness may be recognized by their O and H antigens. A repeating polysaccharide chain found in the lipopolysaccharide (LPS) outer membrane defines the O antigen, while the flagellum determines the H antigen as mentioned before. Characterization is done by isolating the targeted organism by identifying the general morphology, depending upon the medium used we can classify different strains of *E. coli*. In general, on a basic nutrient agar medium, *E. coli* form large and thick colonies that appear greyish white in color; they are also seen as opaque or translucent moist and smooth discs in the culture medium. This species gram negative, rod shaped and non-spore producing. Lactose fermenting strain can be isolated using MacConkey agar, here the lactose fermenting strain can be seen as round medium sized colonies that also appear pink in color [20]. It also has to be considered to opt for optimal conditions like salt concentration, temperature and pH, for example using the temperature 45°C will give rise for thermophilic strains. In blood agar they show beta hemolysis when they are obtained from pathological conditions [21]. It has been stated that Eosin-methylene blue agar can be used as media to differentiate gram negative bacilli and enteric bacilli [22], *E. coli* gives out a metallic sheen with a dark center, this is due to the change in the pH of the medium to acidic owing to the metachromatic property of dyes coupled with the lactose fermenting property of this bacilli [21]. The isolates obtained can be further confirmed by biochemical tests involving Indole, Methyl red, Voges-Proskauer and Citrate utilization tests. In Indole and Methyl red test the *E. coli* give out positive results. For the latter tests *E. coli* gives out negative results. Certain selective media can also help in confirmation of the isolates, like The Brilliance *E. coli* agar is used to check for the activity of the enzyme Beta-glucuronidase, a specific enzyme pertaining to this species it cleaves the glucuronide present in agar to yield purple and blue-green colonies in this agar [20].

ETEC

Marked by its characteristic to cause watery diarrhea in infants, children and even adults, is found in contaminated water and food. Their heat stable and labile toxins are key virulence factors in promoting watery diarrhea. The heat labile toxin (LT) acts by stimulating the adenylate cyclase which leads to the formation of increased intracellular cAMP- cyclic adenosine monophosphate, it also promotes increased secretion of chloride from that crypt cells of the intestine. This mechanism prevents sodium chloride from being absorbed by intestinal villi. Ultimately Watery diarrhea results from this process due to free water discharge into the intestinal lumen. On the other hand, the heat-stable toxin (ST) induces the stimulation of guanylate cyclase, leading to a rise in intracellular cyclic guanosine monophosphate (cGMP), which causes chloride to be secreted and sodium chloride absorption to be blocked, resulting in watery diarrhea.

EHEC

This Shiga-toxin producing strain is highly responsible for diarrheal outbreaks caused due to the ingestion of contaminated green leaves and fruits and even undercooked meat. The Shiga toxin 1 and 2 (stx1 and stx2 respectively) are closely related to Shiga toxin produced by *shigelladysenteriae*. Stx2 expressed by this strain is known to cause bloody diarrhea. The Stxs are a class of bacterial AB protein toxins consisting of one A subunit and five identical B subunits that can target eukaryotic ribosomes to impair protein synthesis. The B pentamer binds to the endothelial cell receptor, glycosphingolipid Gb3, whereas the A subunit inhibits protein production. Inhibiting protein synthesis causes the death of enterocyte cells, which is followed by inflammatory colitis. Intimin, the key adhesin of EHEC is encoded by the genome, and EHEC/STEC has a plasmid (pO157) that expresses the pore-forming toxin known as EHEC-hemolysin [23] [24].

**Ramya et al.,****EIEC**

Just like EHEC the Enterotoxins produced by EIEC cause diarrheal secretion. Inflammatory colitis is the outcome of further colonization, invasion, replication, and cell-to-cell dissemination. Such toxins invade and kill the colonic epithelium, causing illness that is initially characterized by watery diarrhea. Inv plasmid, chromosome and plnV genes are the virulence factors involved in causing the disruption of colonic epithelium.

EPEC

The aftermath of contracting this strain is watery diarrhea in children and infants due to the virulent factor called Bundle-forming pilus (BFP) which renders it capable to form an attachment to enterocyte of the small intestine, the plasmid "pEAF" is responsible for encoding the BFP. After its attachment, Intimin an outer membrane protein colonization factor helps in further adherence, within the Locus of Enterocyte Effacement chromosomal island, the attaching and effacing (eae) gene can be found where the intimin is encoded on [25].

EAEC

It is known to cause traveler's diarrhea, Intestinal epithelial adhesion, mucus production stimulation, biofilm development, cytotoxic damage, and mucosal inflammation are all various aspects of pathogenesis. Many virulence factors are said to be involved in these processes. Which includes the Aggregative Adherence Fimbriae (AAF) and its variants (AAF I to AAF V). The virulence plasmid containing AggR (transcriptional regulator) and Dispersin (AAF dispersal contributor) called pAA is where the AAF is encoded on [26]. Several studies have shown the other virulence factors like Enteroaggregative *E. coli* heat-stable enterotoxin-1 (EAST-1), haemolysin E (HlyE) and cytotoxins Pet [27].

Staphylococcus aureus

Gram-positive, spherical in shape, often found in clusters. They are non-motile, non-flagellated, non-capsulated and non-sporing. The cells' diameter ranges from 0.5 to 1.0 μm . On a nutrient-rich agar medium, *S. aureus* develops significant yellow or white colonies. It is aerobic, at times a facultative anaerobe. It is catalase positive and oxidase negative. The nose, throat, hair, skin, and mucous membranes of healthy individuals are *S. aureus*'s natural habitats. Enterotoxins are produced by toxic *s. aureus* strains, when ingested foods contaminated with such strains in the number higher than 10⁴ per g of food, resulting in staphylococcal food poisoning. Serologically different enterotoxins A, B, C1, C2, D, and E are produced by enterotoxigenic *S. aureus* strains. Enterotoxins can tolerate heating at 100°C for 30 minutes. SEs, hemolysins, leukotoxins, exfoliative toxins, and toxic shock syndrome toxin-1 are the most important secreted toxins [28]. The bacterium frequently produces four different forms of hemolysins (alpha, beta, gamma, and delta), due to this it is hemolytic in blood agar. The organism can thrive on mannitol-salt agar medium with 7.5% sodium chloride because it is salt-tolerant. One of the most prevalent bacterial infections in humans is caused by *S. aureus* which includes bacteremia, urinary tract infections, toxic shock syndrome, and gastroenteritis.

There are five phases during a *S. aureus* infection. These include colonization, local infection, systemic spread and/or sepsis, metastatic infections, and toxinosis. The species is known to pertain to the anterior nares during the carrier stage for weeks or months without producing infections; The bacterium can enter the bloodstream and spread throughout the body to various organs, leading to sepsis. Endocarditis, osteomyelitis, renal carbuncles, septic arthritis, and epidural abscesses can all be caused by this hematogenous spread. Specific symptoms can develop because of *S. aureus* extracellular toxins without a bloodstream infection, these include foot-borne gastroenteritis, scalded skin syndrome, and toxic shock syndrome [29]. *Staphylococcal enterotoxins* (SEs) are one of the most frequent causes of food poisoning. During growth, *S. aureus* produces SEs along with a variety of other virulent components. The bacterium has the ability to spread multiple infectious illnesses, such as toxic shock syndrome (TSS), in addition to food intoxication. Exopolysaccharides, surface-associated protein adhesins, immunological modulators, and exoproteins, along with a range of toxins, are among the staphylococcal virulence factors [30]. As previously mentioned, the important toxins secreted include SEs, hemolysins, exfoliative toxins, leukotoxins, toxic shock syndrome toxins (TSST-1), among these 25 SEs have been identified [31]. There is also another class of SEs, called the SEIs (enterotoxin-like proteins). The emetic action of SEs is a noteworthy characteristic. It causes vomiting, which is a

**Ramya et al.,**

primary symptom of SFP. However, SEs do not always produce diarrhea. SEG-SEIZ are referred to as "new enterotoxins," whilst SEA-SEE are referred to as "classical enterotoxins". The emetic activity of classical enterotoxins was described in the paper of Bergdoll M.S et al., 1988 [32]; whereas the emetic activity of new toxins has not been well established yet. The enterotoxins whose emetic potential has not been confirmed in primate models have been designated as SEIs. To be precise SEs are divided into categories based on their nucleotide and amino acid sequences, example: SEA group involves the SEs, SEA, SED, SEE, SEIU, SEH, SEN, SEO, SEP, SES, then there's SEB group involving SEB, SEC, SER,SEIU, SEIW. Food poisoning due to this organism is mostly associated with SEA since detecting the enterotoxins from SEA to SEE is easier using appropriate test kits. It is also possible that all the toxin varieties can act synergistically. The SEs get access to the lamina propria thru mucus producing epithelial or goblet cells of the small intestine, SEs then stimulate the release of serotonin and histamine from the mast cells, this in-turn evokes an emetic response in the host by acting on the vagus nerve.

Clostridium perfringens

They are gram-positive, anaerobic, fermentative, and spore-forming. The most well-known toxin-producing species are *Clostridium perfringens* and *Clostridium botulinum*, which can result in mild to deadly food poisoning. They are motile, obligatory anaerobes with varying tolerance to oxygen and catalase & oxidase negative. The organisms concerned are widespread and are found in the intestines of animals and humans and in the soil, where they can thrive. Different species require growing environments; some are thermophilic, while others are mesophilic [33]. The optimum temperature was found to be approximately 45°C and the generation time is less than 10 minutes, described by Labbe R., et al, 2014 [34]. The species *clostridium perfringens* is well known to cause illnesses infections that range in variety of severity, starting from diarrhea to myonecrosis; this is possible due to its toxins and capability or producing stress tolerant spores. It produces six major toxins, and they are described in the review by Yao P. Y et al., 2023 [9]; hence its classification is based on the major toxin/toxins produced by the different classes of *C.perfringens*. The six major toxins are Alpha toxin (CPA), Beta toxin (CPB), Epsilon-toxin (ETX), Iota toxin (ITX), Enterotoxin (CPE) and Necrotic enteritis B- like toxin (NetB). Class A produces CPA alone, B is involved in the production of CPA, CPB and ETX, C produces CPA, CPB and CPE (positive/negative), D produces CPA, ETX and CPE, E is involved in producing CPA, ITX and CPE as well, then F produces CPA and CPE and finally the class G produces CPA and NetB. Out of this the type A is known to be the cause for almost all *C. perfringens* related food poisoning.

CPA

It is associated with breaking down the phospholipid called the phosphatidylcholine & the sphingolipid called sphingomyelin of the nerve cells, these are components of cell membrane. This results in stimulation of neutrophils and activates arachidonic acid metabolism further leading to aggregation of platelets and vasoconstriction. Since the 1930's the role of these toxins has been researched and it has been established in the paper of MacFarlane, Knight and co workers in 1941 [35] that the alpha toxin is a phospholipase, an enzyme.

CPB

It is pore forming and it binds to endothelial cells possessing neurotoxic properties. Theoret J R et al in 2015 [36] have stated that this beta toxin binds to vascular endothelial cells and causes vascular necrosis, hypoxic necrosis as well as hemorrhage [37].

CPE

This toxin binds to the claudin receptors on the surface of the cell, leading to the formation of hexamer, which causes an influx of calcium ions. This ultimately leads to activation of calpain, it has been that Calpain, a calcium activated protease usually exists as an inactive pro enzyme in cytosol [38], when there is an influx of calcium at intracellular level, the calpain is activated then it proceeds to cleave cytoplasmic & nuclear substrates which leads to cell death.

Ramya et al.,

Klebsiella pneumoniae

They are Gram negative, non-motile, facultative anaerobes and they thrive at 37°C. They produce mucoidal colonies on media that are rich in carbohydrates. They are straight rods approximately 0.3 to 1.8 µm. They are oxidase negative, Voges-Proskauer and catalase positive, certain subspecies of *K. pneumoniae* are Voges-Proskauer negative, E.g: *K.pneumoniae subsp. ozaenae* & *K.pneumoniae subsp. rhinoscleromatis* [39]. Many of the strains are capable of hydrolysing urea and reducing nitrates without hydrogen sulphide gas evolution. *K.pneumoniae* possesses polysaccharide capsule, this determines its pathogenicity. The capsule is made up of complex acidic polysaccharides, it protects the bacterium from host's defenses like phagocytosis and proteins that are bactericidal, the capsular types include K1, K2 K5, K54, K57 and K20. During the infection, the frimbrial and non frimbrial adhesions help in adherence to the host's cell [40]. Along with this they possess additional virulence factors like adhesins, siderophores (enterobactin), endotoxins, and scavenge systems. It produces two major fimbriae, type 1 & 3, the type 1 is thin, rigid and adhesive found on the surface of family- *enterobacteriaceae*. Type 1 fimbriae's adhesive properties are due to FimH adhesin recognizing glycoproteins that contain mannose.

Salmonella enterica

They are gram negative *bacilli*, facultative anaerobes with flagella. Some species like *Salmonella Galinarum* and *Pullorum* are non-flagellated and non-motile [41]. The range is from 0.2 - 1.5 µm x 2 - 5µm in size. They are characterized by the presence of antigens like O, H and Vi. They are non-fastidious and heat sensitive (> 70°C), their optimal temperature requirement is 32 - 35°C and they can thrive at temperatures between 5- 47°C. They can grow at pH ranging from 4 - 9 and the optimum being 6.5 - 7.5. This pathogenic species contains three main antigenic components namely: Flagellar antigen denoted as H, Somatic antigen occurring on surface of outer membrane, it is determined by sugar sequences on cell surface, and it denoted as O and antigen that is specific to serotypes denoted as Vi. The lipopolysaccharide covering is also considered as an antigen, it can function as an endotoxin. Such an endotoxin exists as a complex of three components namely O-polysaccharide covering, middle portion and inner lipid A covering.

CONCLUSION

Antibiotics are substances that inhibit growth and kill the pathogens that cause harm in several ways. Over the years, due to the misuse and overuse of antibiotics, these pathogens have been showing resistance towards the existing antibiotics due to the mutations in their genes and the emergence of resistance genes in their chromosomes and plasmids as well. Antibiotics have several mechanisms to destroy the pathogens, it includes cell wall/membrane disruption/damaging, inhibition of protein or nucleic acid synthesis, interruption of transcriptional/translational processes. The way in which the microbes are resistant varies from species to species, one such mechanism is the production of enzymes that inactivate the antibiotics such as the Beta-lactamase enzyme by Gram positive/negative bacteria. This acts on the amide bond of the beta-lactam ring therefore it inactivates the Beta-lactam ring containing antibiotics hence rendering it useless against such microbes. Likewise, *Klebsiella pneumoniae* has also shown resistance towards a variety of antibiotics, in a study done by Shuhong Zhang *et al* in 2018 [42] it has shown resistance to piperacillin, cephalothin, streptomycin, ampicillin and as well as tetracycline. Carbapenemase producing microbes are also a threat, they are mostly found in the family *enterobacteriaceae*, *Klebsiella pneumoniae* has the ability to produce this enzyme along with another gram-negative organism like the *Pseudomonas aeruginosa*. In certain *E. coli* strains that were found to be resistant had resistance genes that were capable of producing extended-spectrum beta lactamases that act against monobactams, cephalosporins and penicillin [43]. *E.coli* has also seen to be resistant to gentamicin, ceftriaxone and chloramphenicol [44] and its strains were also seen to be resistant to many more antibiotics, this is alarming due to the fact that foods contaminated with multidrug resistant microbes can mean that the illness caused by it to be very challenging and tough to cure, making food poisoning a life threatening condition. Similarly, *Salmonella species* are also found to be resistant to common antibiotics like penicillin, amoxicillin and gentamicin, *staphylococcus aureus* is also found to bear the same resistance. It can be interpreted that foods are potential carriers of pathogens when they are produced with no proper care. When it is contaminated, it can be understood that various

**Ramya et al.,**

toxins from these pathogens can cause severe harm to human beings. Apart from illnesses it can also act as a place that can spread the antibiotic resistant variants of these pathogens. Hence there is a dire need for proper awareness regarding food safety before it turns into a major threat. There is a dire need for current research to be involved in the prevention/control of food borne pathogens. Food preservatives help in the storage of these foods in the longer run, applicable to packed ones but the street foods have no alternatives, highly dependent on the food vendors' hygiene practice.

ABSTRACT

The importance of water in lakes extends far beyond its role as a mere liquid; it regulates temperature, supports aquatic life, and facilitates essential processes like nutrient cycling. The study presents a thorough investigation into the physical, chemical, and biological parameters of two lakes in Karnataka, India: Ayyanakeri Lake, and Sannakere Lake, shedding light on their overall health and pollution status. The analysis of water quality parameters reveals diverse conditions and varying levels of pollution in these freshwater ecosystems. While, some parameters meet acceptable standards, such as pH and fecal coliform counts, others indicate potential environmental concerns, including elevated levels of turbidity, total dissolved solids, and chemical oxygen demand. Additionally, the objectionable odors and disagreeable tastes further underscores the impact of pollution sources on sensory aspects of the water. The findings highlight the distinct characteristics of heavy metal presence in Ayyayanakere and Sannakere Lakes, indicating potential mineral enrichment and contamination sources, respectively. Fecal coliform counts, unveil fluctuating contamination levels, necessitating continual monitoring and management efforts. The research underscores the urgency of implementing remedial measures to enhance water quality and preserve the ecological balance of these lakes. Sustained vigilance and proactive interventions are imperative to mitigate pollution risks and ensure the long-term sustainability of freshwater reservoirs in the region.

Umadevi et al.,

Keywords: Chemical speciation, Contaminant levels, Ayyanakeri and Sannakere Lakes, Physico-chemical analysis, Heavy metals, MPN test.

INTRODUCTION

Water bodies are important resources used for inland fisheries and recognition of various fish fauna, which offers great prospects for the improvement and sustainable management of water bodies (Krishna and Piska, 2006). Water is a renewable natural resource and the basis of life. Lentic water is used for drinking and domestic purposes. Physico-chemical factors are developed based on scientific data on the impact of pollutants on specific water uses (Rashmi et al., 2013; Thirumala and Kiran, 2018). Rapid development, population growth in metropolitan areas and urbanization in rural areas are increasing ecosystem pollution in complex ways. The most affected are water bodies that are severely affected by the addition of foreign bodies such as flora and fauna, domestic and industrial wastewater. Solid waste dumping and unplanned interventions also increase the disturbance. The deterioration of water quality significantly limits its availability for human consumption and marine life. Therefore, consistent and regular monitoring of water quality is essential to take appropriate preventive and medical measures. The BOD and bacterial characteristics of a water body indicate the type of pollution and the water quality. Water pollution has become a challenging issue today as all water resources are under threat due to spontaneous urbanization and industrialization (Singh et al., 2002). It is known that humans, animals, and plants all face various problems arising from different types of environmental pollution (Petak, 1980; Pushkar Lal Dangi et al., 2017). Unlike the misuse of inorganic waste, organic waste is easy to dispose of as it is biodegradable. In fact, nature has some very effective mechanisms to purify itself of such waste over time through biological transformation and recycling. The Stockholm Conference on Human Climate (Jones, 1972) proposed regulating crop residues and animal waste and recycling them as compost. Of course, a heterogeneous mixture of bacteria, plants and other parasites plays an important role in the biological decomposition of organic waste. However, if this is not done efficiently, general health can be significantly impaired, as many types of microorganisms are involved in the exploitation of human and animal sources. Up to 10,000,000 bacteria can be found in one gram of human waste (Hultan, 1981; Pushkar Lal Dangi et al., 2017). Furthermore, organic waste is rich in biologically important nutrients and can alter the environmental conditions of receiving water bodies. As a result, disposal of raw organic waste can accelerate eutrophication. Recognizing the critical importance of lake water quality and the pressing issue of pollution, the main aim of the study was to comprehensively assess the pollution status of lakes in the Arasikere, and Harapanahalli regions of Karnataka. This involved identifying lakes where there is limited information available regarding pollution levels or scientific studies, thus addressing gaps in environmental monitoring and management efforts. The survey encompassed a range of scientific methodologies and interdisciplinary approaches to assess water quality, pollution sources, and ecological health of the two water bodies.

MATERIALS AND METHODS

Study area

A comprehensive field survey was recently conducted to investigate the key parameters of lakes in two locations: Harapanahalli and Arasikere. Located within Vijayanagar district, the Ayyanakeri Lake in Harapanahalli, Karnataka, plays a crucial role in shaping the ecological and socio-economic dynamics of the area. Positioned at 14.787° N latitude and 75.9818° E longitude, this lake is not only a picturesque feature of the landscape but also a lifeline for nearby communities. Serving as a primary water source, it sustains a rich diversity of plant and animal life, making it an essential ecosystem within the region [Figure 2]. Lastly SannaKere, found in Arasikere and marked by coordinates latitude 14.673° N and 76.074° E longitude, holds significance as a prominent lake within the area. The water in the lake was not suitable for consumption due to the direct discharge of wastes from Slaughter houses located around the lake and sewage effluents of the village [Figure 3].

Umadevi *et al.*,

Sampling and Laboratory Analysis

Samples of water from all the five lakes were methodically collected in 5 liter polythene bottles from the field sites and ferried to the laboratory for detailed analysis. These samples were meticulously handled to ensure the preservation of their integrity and to prevent any contamination during transit. In the laboratory, comprehensive assessment of various physico- chemical and biological parameters was performed to assess the quality and composition of the water.

Physical parameters

To determine different physical properties of water such as temperature, pH, turbidity, conductivity, and dissolved oxygen concentration the following procedure were followed

Fecal Coliform testing [MPN] Method

The procedure for Fecal Coliform testing, according to the standard procedure, involved utilizing the Most Probable Number method to quantify fecal coliform bacteria in water samples. The process began with serial dilution of the water sample to generate a range of concentrations suitable for the MPN test. Subsequently, aliquots of these diluted samples were inoculated into multiple tubes or wells containing selective culture media like MacConkey broth or Lauryl tryptose broth. The inoculated media were then incubated at the prescribed temperature [typically 37°C] for 24 to 48 hrs to facilitate bacterial growth. Following the incubation period, the tubes or wells were examined for bacterial growth, indicated by turbidity or gas production. Confirmation tests, such as the indole test or methyl red test, were conducted on samples showing positive growth to confirm the presence of fecal coliform bacteria. Finally, the MPN was calculated based on the number of positive tubes or wells at each dilution level, referencing the MPN table provided in the standard to determine the Most Probable Number of fecal coliform bacteria per 100 milliliters of the original water sample.

RESULTS

Ayyanakeri Lake Water

Physically, the color of the water is measured at 198, which is within the acceptable range according to IS – 22.96 “C”. Temperature of the water was 28°C, the odor is objectionable, and the taste is disagreeable, indicating potential contamination sources affecting the sensory aspects of the water. Chemically, the pH level is recorded at 7.70, falling within the acceptable range of 6.5-8.5. However, the electrical conductivity is notably high at 2500 $\mu\text{s}/\text{cm}$, suggesting a significant presence of dissolved ions. TDS are measured at 1452 mg/L, exceeding the recommended range of 50-250 mg/L, indicating elevated mineral content. Calcium, Magnesium, Sulfate, and Chloride concentrations are within measurable ranges, but some exceed standard limits. For instance, sulfate and chloride levels are above the recommended standards of 250 mg/L. Nitrate levels are also slightly elevated at 3.0 mg/L, although still below the permissible limit of <10 mg/L. Biologically, the total coliform count was 18 MPN/50ml while these counts suggest a moderate level of fecal contamination, they still fall within acceptable limits. Overall, the data indicates a mixed picture of water quality in Ayyanakeri Lake, with some parameters meeting acceptable standards while some express concerns regarding potential pollution sources. Continued monitoring and management efforts are necessary to address water quality issues, ensuring the ecological integrity and usability of the lake for various purposes [Table 1].

Sannakere Lake Water

Physically, the color of the water was 192, and the temperature was recorded at 24.7°C, which falls within the typical range for surface water bodies. However, the odor is objectionable, and the taste is disagreeable, indicating potential contamination affecting sensory aspects of the water. Chemically, the pH level is slightly alkaline at 7.66, within the acceptable range of 6.5-8.5. Electrical conductivity is notably high at 2870 $\mu\text{s}/\text{cm}$, indicating a significant presence of dissolved ions. Turbidity is relatively low at 6.6 NTU, suggesting clarity in the water. TSS are measured at 80 mg/L, which is below the standard limit of 100 mg/L, indicating relatively low levels of particulate matter. However, TDS are recorded at 1683 mg/L, exceeding the recommended range of 50-250 mg/L, suggesting elevated mineral content.

**Umadevi et al.,**

Biologically, the fecal coliform count was 78 MPN/100ml, which is below the permissible limit of 100 MPN/100ml, indicating relatively low levels of fecal contamination. This suggests that the water may be suitable for recreational activities, but continued monitoring is essential to guarantee adherence to water quality regulations. Overall, while some parameters meet acceptable standards, others raise concerns regarding potential pollution sources and environmental degradation. Continued monitoring and management efforts are essential to address water quality issues in Sannakere Lake, safeguarding its ecological integrity and usability for various purposes [Table 5].

DISCUSSION

Comparing the color and temperature of Ayyanakeri Lake, and Sannakere Lake, distinct variations are evident, offering insights into the unique characteristics of each water body. Conversely, Sannakere Lake records a slightly lower temperature of 24.7°C, implying cooler conditions. Our findings align with observations of water color in Bengaluru City lakes, which generally adhere to prescribed limits, signifying minimal pollution, despite seasonal fluctuations affecting other physicochemical parameters (Carrea et al.,2023). Similarly, studies on Puliyanthangal Lake note variations in water appearance from turbid to clear, influenced by the influx of tannery effluents and domestic waste (Chatterjee and Ganesh,2020). In Maharashtra's Malijunga Lake, water temperature displays seasonal variability, indicating the influence of climatic changes on lake water temperature (Maheshwari and Sivachandrabose,2023). Ayyanakeri Lake, and Sannakere Lake exhibit objectionable odor and disagreeable taste, suggesting potential contamination sources affecting water quality. Our findings resonate with studies on Lake Goverdhan Sagar and Puliyanthangal Lake, which report similar issues with odor and color, indicating potential water quality challenges (Maheshwari and Sivachandrabose,2023; Patida,2022; Kumar et al.,2020). The chemical parameters of lake water, including pH, EC, TDS, and Turbidity, have been extensively investigated across various lakes, reflecting their diverse environmental conditions and anthropogenic influences (Turunen and Aroviita,2024). When comparing the pH, electrical conductivity, TDS, and turbidity of Ayyanakeri Lake, and Sannakere Lake with findings from other studies, several noteworthy comparisons emerge. Our results show that Madiwala Lake exhibits a pH of 7.54, similar to findings from Pulicat Lake, which recorded a pH of 8.17, indicating slightly alkaline conditions (Sumithra et al.,2022; Kumar,2023). Additionally, where most physicochemical parameters, including pH, were within WHO limits (Suresha et al.,2023). Electrical conductivity in Ayyanakeri Lake [2500 $\mu\text{s}/\text{cm}$] suggests varying mineral content, resembling observations in Medchal Lake, where water was deemed suitable for drinking based on permissible EC levels (Randrianiaina et al.,2019). Moreover, our study underscores the importance of continued monitoring and management efforts to ensure the sustainability of freshwater resources, echoing the sentiments expressed in various studies emphasizing the significance of assessing physicochemical parameters for water quality and health implications (Tigga and Pandey,2023; Santhi et al.,2023).

The chemical parameters of lake water, specifically sulfate, chloride, nitrate, and fluoride, vary across different studies, reflecting the diverse ecological statuses and anthropogenic impacts on these water bodies. These variations highlight the complex interplay between natural processes and human activities in shaping the chemical composition of lake waters. Comparing sulfate, chloride, nitrate, and fluoride levels across Ayyanakeri Lake, and Sannakere Lake reveals significant variations in these chemical parameters, indicating diverse pollution sources and ecological conditions. Ayyanakeri Lake also exhibits elevated levels of sulfate and chloride, suggesting increased mineralization and potential contamination. Sannakere Lake's data regarding these parameters is not provided. Fluoride levels vary across the lakes, Ayyanakeri Lake's fluoride content is not specified. These variations highlight the diverse chemical compositions and pollution sources affecting the lakes, emphasizing the need for targeted management strategies to mitigate contamination risks and safeguard water quality. Continued monitoring and remedial actions are essential to ensure the ecological integrity and usability of these freshwater ecosystems. The acceptable chloride and fluoride levels in Lake Badovci contribute to its moderate ecological status (Chatterjee and Lataye,2020), contrasting with potential pollution impacts observed in Puliyanthangal Lake (Maheshwari and Sivachandrabose,2023). While specific data on sulfate, chloride, nitrate, and fluoride were not provided for Lake Pomacochas, (Leiva Tafur et al.,2022),our study's focus on these parameters adds depth to understanding water quality issues in different ecosystems. Lake

**Umadevi et al.,**

GoverdhanSagar's chloride and fluoride levels were below permissible limits, consistent with our findings, though sulfate and nitrate concentrations were not specified (Patida,2022). The chemical parameters of lake water, such as DO, [COD], and [BOD, are crucial indicators of water quality and its suitability for various uses. When comparing DO levels across Ayyanakeri Lake, and Sannakere Lake, significant variations in water quality indicators are evident. In contrast, various studies have shown a range of DO levels supporting aquatic life, such as 5.4 mg/l (Santhi et al.,2023)and 5.65 ± 0.13 to 8.99 ± 0.19 mg/l (Arik and Muliadiasa,2023). Urban and rural lakes in Bangalore, including the cleanest one with a DO of 3.6 mg/L [Patida, 2022], exhibited lower DO levels, suggesting some degree of pollution. Similarly, DO levels in Lake GoverdhanSagar ranged from 5.4 ppm (Santhi et al.,2023)to 7.69 mg/L in Lake Hayq (Gobeze et al.,2023). These variations highlight differing levels of aeration and biological activity within these aquatic environments. When comparing COD across Ayyanakeri Lake, and Sannakere Lake, significant variations in water quality indicators are observed. Madiwala Lake exhibits a relatively high COD value of 309.5 mg/L, suggesting a notable organic pollution burden and the presence of oxygen-consuming substances. Lake GoverdhanSagar, on the other hand, showed a COD value of 45.88 ppm (Suresha et al.,2023;Gobeze et al.,2023) , reflecting a comparable organic pollution load. Similarly, in the study of Lake Beratan, COD levels exceeded quality standards, although specific figures were not provided (Patida,2022). These variations highlight fluctuations in water quality influenced by human activities. For example, during a lockdown period, a lake demonstrated COD levels within acceptable limits due to reduced human activities (Premsudha et al.,2022). Conversely, tourist areas showed COD values surpassing quality standards, indicating pollution from domestic and agricultural activities (Fatimah et al.,2021). Additionally, Buyan and Tamblingan Lakes exhibited high COD levels, suggesting significant organic contamination (Khune et al.,2021). BOD levels varied significantly among Ayyanakeri Lake and Sannakere Lake, indicating differences in organic pollution levels across these water bodies. Our findings are correlated with many studies who also reported varied levels of BOD, for instance, Lake GoverdhanSagar displayed a BOD of 3.96 ppm (Leiva Thafur et al.,2022), slightly increasing to 4.02 ppm in a subsequent study (Molla et al.,2022), suggesting a moderate level of organic pollution. Conversely, Lake Beratan's BOD parameters met quality standards, indicating lower organic pollution levels (Premsudha et al.,2022). In contrast, Lake Hayq exhibited a higher BOD of 6.40 mg/L (Angular Torrejan et al.,2023), signifying a relatively more substantial organic load.

These findings underscore the significance of monitoring and managing water quality to mitigate pollution and support aquatic ecosystems. Additionally, the complex interplay of chemical factors, such as BOD, COD, and others like electrical conductivity and alkalinity, underscores the need for comprehensive assessment approaches. Although the Malijunga Lake study primarily focused on physicochemical parameters, it indirectly suggested that factors like BOD and COD could influence water taste and odor by affecting overall quality (Khune et al.,2021). Moreover, BOD levels within quality standards in Lake Beratan implied a moderate level of organic pollution (Birla and Vedashree,2020), while a study on Lake GoverdhanSagar reported a higher BOD of 4.02 ppm, indicating a higher pollution status alongside elevated COD levels (Sukmawati et al.,2020). These collective findings underscore the varying levels of BOD in lake waters, influenced by natural conditions and human activities, necessitating ongoing monitoring and management to preserve water quality. When comparing fecal coliform levels across Ayyanakeri Lake and Sannakere Lake, notable differences in microbial contamination are evident. Ayyanakeri Lake's fecal coliform count was 18 MPN/100ml, while Sannakere Lake shows a higher count of 78 MPN/100ml, suggesting a higher degree of fecal contamination and potential health risks associated with water use. These variations highlight the diverse pollution sources affecting the lakes and underscore the importance of continued monitoring and management efforts to safeguard water quality and protect public health.Comparatively, fecal coliform contamination in lake water across Karnataka, India, presents a significant public health concern, as evidenced by various studies. For instance, in Gidadakonehalli Lake, Bangalore, severe pollution levels were identified, although specific fecal coliform counts were not detailed, indicating severe pollution (Shekar et al.,2015). Similarly, in the Bangalore district, fecal coliforms, including *E. coli*, were detected in 60% of water samples, indicating widespread bacterial contamination (Ramachandra, and Latha,2014). The River Cauvery, a major drinking water source, showed high levels of fecal coliforms, posing a threat to public health and antibiotic efficacy due to multidrug-resistant isolates (Skariyachan, et al.,2015). Studies in South India's reservoirs and lakes have also shown pollution from fecal coliforms due to inadequate civic facilities, leading to the inflow of untreated wastewater (Chandrashekar et

**Umadevi et al.,**

al.,2012). Proximity of wells to open sewerage systems in Bangalore resulted in high levels of fecal coliform contamination, exceeding permissible limits (Singh et al.,2009). Ramasandra Lake's water samples revealed high microbial and fecal contamination, indicating a serious public health threat (Latha and Mohan,2013). Heavy metals in lake water pose significant ecological and health risks, with variations in contamination levels and sources across different regions and seasons. The sources of these heavy metals are varied, including agriculture, transportation, chemical industry, steel-making, and natural sources (Yu et al.,2022). Our study on Ayyayanakere and Sannakere Lakes revealed notable variations in heavy metal concentrations compared to broader research conducted across various regions in India. Ayyayanakere Lake exhibited elevated levels of calcium and magnesium, potentially indicating increased mineral content, while Sannakere Lake showed heightened levels of magnesium, chloride, and manganese, suggesting contamination from industrial discharge, agricultural runoff, or natural processes. This aligns with findings from lakes across India, where heavy metal pollution poses significant risks to aquatic ecosystems and human health. Furthermore, the accumulation of heavy metals in sediments and fish tissues in lakes like Varthur Lake, Bellandur Lake, and Kolleru Lake has underscored the bioaccumulation potential and ecological risks associated with heavy metal pollution (Ramachandra et al.,2020;Muniraju and Delvi,2022;Venkataramana and Sandhya,2023). Remediation strategies such as phytoremediation and bioflocculant treatments have shown promise in mitigating heavy metal pollution in lake waters (Dih et al.,2019). Additionally, industrial activities near water bodies, as observed near a thermal power plant in Udupi District, have contributed to heavy metal contamination of groundwater and soil (Shetty et al.,2021). These findings emphasize the urgent need for continuous monitoring, assessment, and implementation of innovative treatment solutions to address heavy metal pollution in Karnataka's aquatic ecosystems (Prathiba and Muralidhar,2022; Das Sharma,2019).

CONCLUSION

The analysis of water quality parameters across Ayyanakeri Lake, and Sannakere lake reveals diverse conditions and varying levels of pollution in these freshwater ecosystems. While, some parameters meet acceptable standards, such as pH and fecal coliform counts, others indicate potential environmental concerns, including elevated levels of turbidity, total dissolved solids, and chemical oxygen demand. Additionally, the presence of objectionable odors and disagreeable tastes further underscores the impact of pollution sources on sensory aspects of the water. The findings highlight the distinct characteristics of heavy metal presence in Ayyayanakere and Sannakere Lakes, indicating potential mineral enrichment and contamination sources, respectively. Understanding these differences is crucial for targeted management strategies to address water quality concerns effectively. Continued monitoring and mitigation efforts are essential to preserve the ecological balance and ensure the long-term sustainability of these freshwater ecosystems.

ABSTRACT

This present communication explores the diversity and uses of medicinal plants growing in kitchen gardens of Bhadravathi Town, Karnataka. Information on medicinal uses of plants was collected through direct field surveys and interactive questionnaires with owners, traditional healers and knowledgeable people. A total of 43 species of medicinal plants belonging to 04 habits from 30 different families have been recorded and are used in medicine for various ailments in humans and animals. The study shows that the region is very rich in traditional knowledge and kitchen gardens are endemic to a wide variety of medicinal plants, which provides practical strategies to promote cultivation and conservation of a range of medicinal plants in kitchen gardens. The uses of medicinal plants in Bhadravathi town are discussed in this article.

Keywords: Medicinal uses, Kitchen garden plants, Bhadravathi town

INTRODUCTION

Plants are used as medicine. Hundreds of plant species are recognised for their therapeutic values and used to treat various diseases. People living in remote areas primarily depend on herbal and indigenous healthcare systems of medicines due to Limited access of modern healthcare facilities and their expensive nature. Indian systems of medicine depend on plant materials or their derivatives for treatment of human ailments (Prajapati et al., 2003). About 12.5% of total 4,22, 000 plant species documented worldwide is reported (Schippmann et al., 2002). However, in modern medicine around the quarter of the drugs prescribed to patients are derived from medicinal plants and they

Dharmendra

are rigorously tested. The World Health Organization, estimates some two billion people are largely reliant on medicinal plants. The use of plant, based materials including herbal or natural health products which suppose health benefits, is increasing in developed countries (Gershenzon and Ullah, 2022). Herbal medicines have been in use long ago and they effects the health and boosting the immunity. Phyto-chemicals have pharmacological activity in medicinal plant for their use in modern medicine,. For instances, the bark of cinchona tree contains quinine, licenced for use against malaria. Several studies have been undertaken on the role of kitchen garden as main source of medicinal plants in different parts of the world. Kitchen gardens are nothing but a separate space in the home gardens devoted to grow specific plants of purely functional. Kitchen garden is also a delightful hobby which ensures an inexpensive, regular and handy supply of fresh vegetables and other medicinal Herbs. Hence, it has been practiced by Urban population also. Moreover, the conservation and sustainable utilisation of medicinal plants are important for better management of valuable resources. Therefore, an attempt has been made to document, diversity and uses of medicinal plants grown in the kitchen Gardens of Bhadravathi town.

The main objectives of the present study is to survey the medicinal plants, their uses, cultivation methods and need for kitchen gardening in present days of Bhadravathi town of Karnataka.

MATERIALS AND METHODS

The study was conducted in the selected kitchen gardens of 5 different localities of Bhadravathi town (Figure 1) namely Siddharoodha nagara, Hosamane, Jannapura, Huttha colony & Paper town.

Sampling Method

27 Kitchen gardens were selected randomly for the present survey. Information of medicinal use was collected during 2 weeks before the survey by interviewing the house owners through interactive questionnaires focusing on local names, parts used and modes of preparation, use and maintenance. Plant species were identified on the basis of vernacular names, floras, and relevant references (Purabhisikia and Mohammed Latif Khan,2011). On the basis of their growth habit and utilization pattern as provided by the informants, medicinally important plant species were categorized into three different categories such as species cultivated exclusively for medicine, species cultivated for medicinal and household purposes.

RESULTS

The results are depicted in Tables 1-2 and Figure 2-5. In the present study, out of 43 species encountered and have different medicinal utilities. These belong to 31 families which were used in preparation of medical remedies against different ailments of both human being and their livestock. Most commonly represented families of medicinal plants were of which Lamiaceae contributed the highest number of exotic species. The medicinal plants cover a wide range of higher plants belonging to 14 herbs, 12 trees, 14 shrubs. Out of the total medicinal flora of the studies kitchen gardens, 23 species were cultivated and rest 21 species were spontaneously grown weed. Among these, 10 species were cultivated solely for medicinal purpose, species 13 cultivated primarily for other household utilities as well as for medicinal utilities and remaining some species were weedy in nature. Though few of the medicinal plants were common in majority of home garden, variation in medicinal plants occurrence were also observed in the studied home gardens. Majority of plants are used for external application and oral consumption (Figure 3). Medicinal plants are mainly using different plant parts and extracts for primary treatment of large number of diseases like pain, cough, cold, fever, jaundice, allergies, dysentery and diarrhoea. Most commonly used plant parts are leaf, young shoot, stem, bark, fruit, flower, seed, root and rhizome. Among all the plant parts, are most frequently utilized one is leaf. Different plant parts in various formulations such as decoctions, infusions, fresh extract, juice or paste are used to get relief from various ailments. Additive like honey and milk are also added in some formulations. Mode of medical administration for different ailments is also different and includes inhalation, instillation and chewing, oral absorption, applying and rubbing. Most of the remedies are administered orally and externally by applying or

Dharmendra

rubbing. Maximum gastro-intestinal, respiratory tract infection, kidney and urinary remedies are used orally while dermatological remedies are applied topically. Most of the species were found having more than a single therapeutic use. Few medicines are prepared only from single plant species and some others are prepared from mixtures of two or more different plants details of the different medicinal remedies of common plants documented from home gardens are enumerated in table.

Centella asiatica:- Memory enhancer, Has powerful antioxidants, Prevent anxiety and stress, Lowers Blood Pressure level. *Azadirachta indica*- Malaria, indigestion, Intestinal worm, menstrual pain, Measles, Burning, Snake bite, Skin disorder, Tooth infection. *Citrus sp*- Black spot in face, Indigestion, Treat Scurvy, Sore throat, Rheumatism, High Blood Pressure. *Curcuma longa* - Anaemia, Antiseptic, Pain, Cuts and wounds *Hibiscus rosa-sinensis*:- Hairfall, Burning, Skin afflictions, Dry cough Paste is applied for both hairfall and burning. *Mentha sps*- Gastric, Acidity.

Ocimum sanctum:- Cough, Asthma. *Momordicacharantia*- Intestinal worm, Malaria. *Leucas aspera*-Snake bite, Intestinal worm, Antifungal, Cold, Antioxidant, Antipyretic, Antibacterial. Herb has the ability to help reduce fever, Juice of the flowers is used to treat intestinal worm and infections in children, Leaf is boiled with water and the water is given for cold. *Carica papaya*- Dengue, Malaria, Abortifacient, Purgative, Asthma. *Piper nigrum*- Insomania, Oral abscesses, Sunburn, Tooth ache, Cold and fever. *Zingiber officinale*- Antihelmentic, Antibacterial, Anti inflammatory, Used for muscle pain, curbs, cancer growth, Lowers Blood sugar, eases menstrual cramps, Lowers cholesterol, relieves indigestion, Nausea, Arthritis. *Murraya koenigii*- Used as herb in ayurvedic and sidda medicine because of anti disease property, helps in treatment of dysentery, diarrhoea, morning sickness and nausea. It is rich source of vitamin A,B,C and Calcium, Iron etc.

Amaranthus tricolor-Treat infalmmatioin, used as diuretic, Antimicrobial, Antidiabetic, Gastroprotective, Antioxidant, Cardio protective, Anti malarial. *Cyanodon dactylon*-Anasarca, Cancer, Convulsions, Cramps, Diarrhea, Dropsy, Epilepsy, Headache, Haemorrhage, Hypertension, Hysteria, Measles and Rubella. *Basella alba*- Gastro protective activity, ulcer healing, anti-inflammatory, boosts libido in males, safe laxative in pregnant women and children, healthy eyesight, Prevent diabetes.

Moringa oleifera-Anti-tumor, Anti Pyretic, Anti-pyleptic, Anti inflammatory, Anti ulcer, Anti spasmodic, Diuretic, Anti-Hypertensive, Lowers cholesterol, Anti-oxidant, Anti diabetic, Mal-nutrition relief. *Piper betle*- Diabetes, Lower cholesterol, Anti-microbial property, Asthma, Improve oral health, Protect gastric system, Helps depression, Heals wound, Increase appetite, Dry cough. *Colocasia esculenta*- Controls Blood sugar, Improves digestive health, Healthy heart, Improves vision, Skin health, Weight loss, Reduce fatigue, Improves blood circulation, Boosts immune system. *Mimosa pudica*- Used for prolonged bleeding, Fasten wound healing, Diarrhoea, Amoebic dysentery, Piles, Gynecological disorders, Skin diseases, Bronchitis,

Calotropis gigantean- Bacterial infections, lever and spleen diseases, Anti-Cancer Properties, Anti dot for snake bite, Arthritis. Used to treat fever, Elepahantiasis, Nausea, Vomiting, Diarrhea, Skin, digestive, respiratory, circulatory and Neurological disorders. *Nyctanthes-arbor-tritis*- Leaves have been used in ayurvedic medicine and Homeopathy for sciatica, Arthritis, Fevers, Malaria, Chicken gunya, Dengue, Anti allergic, Anti-viral, Anti-bacterial, Treat cough, Prevent radicle damage to body, sedative effect, Anti leishmanial activity, Anti-cancer. *Vinca rosea (Catharanthus roseus)*-Anti- Cancer, Diabetes, High blood pressure, Stroke. Vinblastin and Vincristin are used in treatment of Leukamia and Hodgekin's Lymphoma

Phyllanthusniruri- To treat urinary tract stones, Ulcers, Anti- Diabetic, Wound healing, Immuno modulatory activity, Anti oxidant, Anti infalmmatory, Hepato protective. *Phyllanthus emblica*- It is rich in Vitamin C and Anti-Oxidants, enhances gastro intestinal activity, Fortifies lever, Nourishes brain, Strength then lungs and eyes, Enhances fertility, Good for Heart and urinary system, Promotes good skin and healthy hair. *Impatiens balsamina*- Rheumatism, Fractures and other ailments. Juice from leaves is used to treat warts and snake bite, flower is applied to burns, Constipation, Gastritis, Hair growth.

Dharmendra

Tinospora cordifolia- Anti-diabetic, Fever, Jaundice, Chronic diarrhea, Cancer, Dysentery, Bone fracture, Pain, Asthma, Skin disease, Poisonous insect and snake bite, Eye sight, Aphrodisiac. **Clitoria ternatea**- Memory enhancer, Nootropic, Anti-Stress, Anxiolytic, Anti-Depressant, Anti-convulsent, Tranquilising, Sedative agent

Psidium guajava- Diarrhea, Dysentery, Gastro enteritis, Hyper-tension, Diabetes, carries Pain relief, Cough, Oral ulcers, Liver damage, Inflammation, Hair lice. **Oxalis acetosella**-Anti-inflammatory, Diuretic, Anti-pyretic, Used to treat snake bite and applied to abscess, Cough, Diabetes, Bronchitis, Psychiatric disease, Eye disease, Skin disease.

Punicagranatum- High blood pressure, Athletic performancy, Heart disease, Diabetes, Anti-cancer, Alzheimers disease protection, Digestion, Anti-oxidant, Anti-inflammatory, Arthritis. **Aegle marmelous**- Anti-diarrheal, Anti-microbial, Anti-viral, Radio protective, Anticancer, Chemo preventive, Anti-Pyretic, Ulcer healing, Anti-genotoxic, Diuretic, Anti-fertility, Anti-inflammatory. **Coelus amboinicus**-Cold, Asthma, Constipation, Cough, Head ache, Fever, Inflammation and Skin disease. **Mirabilis jalapa**- Diuretic, Pergative, Aphrodisiac, Vulnerary, Treatment of Dropsy, Reduce inflammation.

Solanum nigrum-Ulcer, Skin disease, Asthma, Whooping cough, Analgesic, Sedative, Stomach complaints, Fever, Tuberculosis, Gastric ulcers, Anti-inflammatory, Anticarcinogenic. **Aloe vera**-Enhances skin health, Treats acne, Inflammation, Constipation, Immune booster, Cures gum diseases, Lower high cholesterol, Stabilizes blood sugar, Regulate weight and energy levels, Reduces heart attack, Treats stretch marks and sun burn, Anti-aging, Promotes hair health, Reduces menstrual pain

Euphorbia hirta- Used to treat breathing disorders including Asthma, Bronchitis, Chest congestion, Nose and throat musilage, Throat spasms, Hay fever and tumor, Diarrhoea, Menstrual cramps, Urinal blockage. **Alternanthera sessilis**- Diuretic, Cooling, Disuria, Haemorrhoides, Good for eyes, Anti-Hypertensive, Anti-asthamatic, Anti-spasmodic
Preparation and mode of use: Orally used as tonic

Acalypha indica-Jaundice, To reduce Phlegm and in treatment of cough, Asthma, Breathing problems, Constipation. It is Anti-helminthic, Anti-inflammatory, Antibacterial, Anti-cancer, Anti-diabetic, Anti-Hyperlipidemic, Anti-obesity, Anti-venom, Hepato protective, Hypoxia and wound healing, Skin problems. **Santalum album** -Treats common cold, Bronchitis, Skin disorders, Heart ailments, General weakness, Fever, Infection of urinary tract, Inflammation of mouth and pharynx, Liver and Gall bladder complaints and other maladies
Preparation and mode of use: Oil is used externally

Musa sps-Increases digestion capacity, Prevent anaemia, Reduce menstrual pains, Prevent ulcers, Provides energy, Helps bones to grow stronger, Regulate bowel system, Kidney stones, Heart diseases, Neural disorders, Weight loss, Detoxification. **Tectona grandis**-Inflammation, Pain relief, Poisoning and burning, Increases blood, Hair enhancer, Treats itchiness, Biliary disorders, Urino-genital disorders, Diuretics, Cough, Fever. **Mangifera indica**-Regulates diabetes, Lower blood pressure and risk of Hypertension, Dissolve gall and kidney stones, Treats restlessness, Respiratory problems, Dysentery, Hiccups, Burns, Various stomach ailments, Ear aches, Anti-cancer, Stomach ulcer, Healthy skin, Nausea, Bleeding nose, Anti-fungal, Anti-bacterial, Anti-helminthic

Bacopamonnieri- entire plant is used in insanity, epilepsy, pox, improves intelligence, fever, cough and inflammations.

DISCUSSION

India has a special position in the world due to its capability in producing most of the important plants used both in modern as well as traditional systems of medicine. Medicinal plants can be valued not only for their short term economic benefits but also for cultural richness and the sustenance that they offer to large number of households. The

Dharmendra

present study indicates that home gardens of Bhadravathi harbour a great diversity of medicinal plants with 23 cultivated species and 21 weedy growths. Here, the weedy grown plants are almost equal to the cultivated plants. This is mainly due to owners growing interest towards daily household needs and other commercial cash crops as food supply economic enlistment is the primary aim of the home garden owners'. The present study reported 43 medicinal species present in 27 home gardens. Moreover, the percentage of indigenous medicinal flora is higher than the exotic flora in the region home garden is maintained on the basis of owners' needs and interest. In the present study, we recorded leaf as the most frequently utilized plant parts followed by fruits. The leaf is used for 41 medical remedies as the most frequently utilized plant parts followed by the root used for 34 medical remedies, fruit used for 21 medical remedies and flower is used for 23 remedies. The leaf decoction of *Catharanthus roseus* is used against diabetes, whereas, it is also used it as anti-carcinogenic agent. In some remedies, two or more plants or plant parts are used jointly in the present report. This may be due to either synergistic or additive effects of the is constituents that have been observed over the years. The predominance of remedies for gastrointestinal disorders by oral absorption and dermatological infections by external use agrees with data from other regions of world. Thus, the present study validates that plants and plant extracts used by Bhadravathi people have promising therapeutic properties and the active ingredients of these plants may be further characterized and tested for their safety and efficacy to uncover their therapeutic potential. Although, a few cultivated medicinal species like *Psidium guajava*, *Murraya koenigii*, *Moringa oleifera*, Papaya etc. were found in more than 50% studied home gardens. Most of the species were found only in one to two studied home gardens and require intensive care and habitat management for further existence. It is necessary to find out suitable ways for effective domestic and commercial utilization of medicinal species to ensure their sustainability. Cultivation of medicinal plants is safe both economically and ecologically. Therefore, cultivation is suggested as an alternative way for conservation and management of the medicinal plant species and also to fulfil the market their role as a main source of medicinal plants in demand and local needs. Studies on ecological conditions required for natural regeneration and habitat management is another prerequisite to conserve these resources.

MEDICINAL USE

People of Bhadravathi city area are mainly using different plant parts and extracts for primary treatment of a large number of diseases like pain, cold, cough, fever, jaundice, dysentery and diarrhoea. Most commonly used plant parts are leaf, young shoot, stem, bark, fruit, flower, seed, root and rhizome. Among all the plant parts, most frequently utilized one is leaf followed by fruit. Different plant parts in various formulations such as decoction, infusion, fresh with medicinal and other multifarious utilities. The extract or paste is used to get relief from various ailments. Additives like honey and milk are also added in some formulations. Mode of medical administration for different ailments is also different and includes inhalation, instillation, chewing, oral absorption, applying and rubbing. Most of the remedies are administered orally and externally by applying or rubbing. Maximum gastro-intestinal and kidney and urinary remedies are used orally and dermatological and snakebite remedies are used externally. Highest number of species is used in different formulation to treat gastro intestinal ailments (gastric, indigestion, constipation, diarrhoea, dysentery, intestinal worm, stomach ache, and other stomach problem) while some species is used in respiratory tract infections (fever, headache, asthma, cold and cough) and some species are used in kidney and urinary ailments (kidney stone, jaundice, diabetes, urinary disorder). Most of the species like *Azadirachta indica*, *Curcuma longa*, *Ocimum sanctum* were found having more than a single therapeutic use. For example, different plant parts of *Azadirachta indica* in different formulation are used in treating a range of diseases like intestinal worm, skin disorder, tooth infection, indigestion, malaria, menstrual pain, measles, burning and snakebite. A few medicines are prepared only from a single plant species and some others are prepared from mixtures of two or more different plants. For example, leaf extract of *Centella asiatica* is used against ear pain. On the other hand, leaf of *Indica* mixed with bark of *chebula* and fruit of *Piper nigrum* are pounded to extract the juice and used for the treatment of menstrual pain.

Cultivation of Kitchen garden

A balcony or terrace with 6-7 hours of sunlight is suitable for this. Remove any rubbish or weeds and till the garden well. After that, improve the soil with compost or cow manure before planting. Recommend growing the seeds in pots filled with soil and transplanting them into the garden after a few weeks. Some plants are better planted

Dharmendra

indoors, while others can be sown directly outdoors. Water the garden thoroughly twice a week, but reduce watering in winter. If have potted plants, check the water level by poking the soil with finger. If it looks dry, water generously. Provide supports or trellises for climbing plants such as cucumbers, tomatoes, beans, and squash, as many of them are vines. Also try vertical gardening by using planters on walls and railings. To avoid competition between plants for nutrients and moisture, always maintain a distance of 45-90 cm between rows or plant the plants in individual containers. Practice intercropping by growing some plants together as companion plants. Raised beds are a viable option for creating vegetable gardens because they are easy to maintain.

CONCLUSION

The knowledge and use of medicinal plants is still very much alive among people. The present study indicates that the home gardens harbour a high diversity of medicinal plants. Despite gradual socio-cultural transformation, people still possess of curative properties of different plants and their formulations. It is very essential to compile and document the available knowledge of our rapidly eroding valuable plant resources and to prove their curative properties through detailed phytochemical, biological and pharmacological investigations. Validation and commercialization through wide cultivation of these medicinal plant resources can also provide subsistence and livelihood to the farmer as well as conservation of these rich genetic resources.

ABSTRACT

Institutional credit to Agriculture in Karnataka is reviewed based on published literature as worked out by various researchers. The agricultural sector in Karnataka has benefited greatly from institutional credit flow, which has increased significantly. The effective interest rate has been reduced to 3% per year to the government's interest subsidy program for farmers who pay back their short-term crop loans on time. The commitment of commercial banks to the agrarian acknowledge is most elevated for 70% followed by Co-operative banks and RRB. The effectiveness of the credit can be seen in the higher credit-to-total GDP and agricultural GDP ratios. Linear regression was used to look at the factors that affect the growth of total agricultural output. It was found that credit has a significant relationship with agricultural output at a probability of 10%. All of the variables, with the exception of pesticide consumption, have an effect on agriculture credit, according to the analysis of the determinants of the supply of institutional credit. Credit flow is influenced the most by gross cropped area, followed by GDP and gross irrigated area. To modernize their farming operations, the farmers heavily rely on credit systems. The findings demonstrated that formal farm credit has a significant impact on modern farm inputs. One notable outcome was that farmers were able to acquire inputs like high-quality seeds, fertilizers, pesticides, and farm machinery thanks to their increased credit capacity. Overall, the agricultural sector's growth and development depend on the flow of institutional credit.

Keywords: Agriculture, institutional credit, NABARD, KSFC, Production function, Self help group, Karnataka.

INTRODUCTION

The first co-operative society of our country was registered in 1905 at Kanaginahal village of Gadag district in Karnataka.(Annual Report for 2009-2010). The Mysore Co-operative Societies Act 1959 is the first legislation in our sate pertaining to the co-operative societies and has come into being from 25-05-1960. Karnataka occupies third position in the economic condition of people involved and has spread to almost all sectors of economic activities, both in rural and urban areas. Karnataka is the first state where in Agricultural loans through co operatives are available at 3% which is lowest in the country. This facility is also extended to the loans borrowed by weavers and fishermen (Ibid). Since the implementation of the recommendation of Prof Vaidyanathan Committee through MOU with Government of India, NABARD and state Government in March 2008, the role of the state Government in respect of Agricultural credit structure Institutions has been metamorphosed from the role of regulator, supervisor to the role of being a Friend, Philosopher and Guide. All statutes, circulars, orders which were coming in the way of day to day internal affairs of the institutions have been withdrawn. Karnataka has a good banking network system which is spread across all the rural areas. There are 27 public sector banks, over 16 private sector banks besides 6 Regional Rural Banks operating in the State. 65% of the total banking business turnover in the State is concentrated in 7 major banks having lead responsibilities in the State. A few new generation banks such as IDRI Bank, Axis Bank, ICICI Bank, Indus Bank, Kotak Mahindra Bank, etc., are also in the banking arena in the State catering to the credit needs of people. The rural credit dispensation in the State takes place through co-operatives, commercial banks and Regional Rural Banks., Of the two major state run lending institutions, the Karnataka State Financial Corporation (KSFC) supports industry and service sectors, the Karnataka State Industrial Investment and Development Corporation (KSIIDC) undertakes promotion and development of medium and large scale industries in the State and acts as a nodal agency to formulate proposals for implementation of infrastructure projects.

The National Bank for Agriculture and Rural Development (NABARD) as an apex level institution prepares the potential Linked Credit Plans (PLPs) every year. Annual action Plans at district level are based on the PLPs prepared by NABARD.¹ Apart from this, NABARD also bring out the State Focus Paper, which covers among other things agriculture and rural economy of the state, performance of rural credit delivery system, policy initiatives of Union and State Governments and NABARD's involvement in supporting credit, developmental and supervisory functions. The State Focus paper is discussed at length in a meeting of Secretaries of various Government departments specially convened for the purpose before pronouncing the credit policy initiatives for the State. NABARD has opened district level offices for better credit planning and monitoring, improving the financial health of rural credit institutions, by creating opportunity for the rural poor to have access to institutional credit through innovations in micro finance like promotion of Self Help Groups (SHGs) and development of rural non-farm sector etc., establishing separate fund for specific activities like promoting infrastructure in rural areas and conservation of scarce land and water resources through watershed management. NABARD is also vested with the power to review Service Area Monitoring and Information System (SAMIS). The working group constituted with the representatives of RBI, NABARD, IBA and nine Commercial banks reviews all aspects of existing SAMIS, constrains in its stabilization and recommends changes to address deficiencies in the system and taken care of future needs of the banking industry. As at the end of March 2009, the total number of bank branches was 5504.

There were 755 bank branches at the time of nationalization in 1969. Since then 4816 bank branches have been added till the end of June 2009, taking total number of bank branches to 5571. out of which 3390 bank branches are located in rural and semi urban areas. At present, the share of rural bank branches in Karnataka Stands at 39.74% as against 25% at the time of nationalization. The per branch population in the state stood at 9593 as at March 2009. The aggregate outstanding deposits of commercial Banks (including RRBs) Stood at Rs. 256709 crore as at the end of March 2009 as against Rs. 210349 crore recorded a year ago. Growth in deposits during the year was 22.04% up to the end of March 2009. As at March 2009, the total outstanding advances of commercial Banks including RRBs in the state stood at Rs. 196719 crore as against the level of advances of Rs. 164110 crore recorded a year ago indicating a growth rate of 19.87%. The credit-deposit ratio (C-D ratio) of the state as of June 2009 was 75.22% vis-a-vis 79.45% as

Hanumanthappa

of June 2008 showing a decline of 4.23%. The performance of commercial banks in Karnataka from 2006-07 to 2008-09 is given in Table 2 Domestic banks are required to provide 40 percent of their net bank credit to the Priority sector. The Priority sector advances of all bank groups in the State amounted to Rs. 71810 crore in March 2009 contributing to 45.80% in total advances made by them, thus exceeding the norms fixed by the RBI. Direct advances to agricultural sector by Scheduled Commercial Banks (SCBs) in March 2009 stood at Rs. 29196 crore as against Rs. 25817 crore recorded in March 2008 contributing to 18.79% of total advances made by SCBs. Weaker section advances stood at Rs. 16103 crore. The advances paid to Minority communities amounted to Rs. 6489 crore, marking an increase of Rs. 1473 crores against the advances paid during the last year as on March 2008. Details of advances to priority sectors by commercial banks in Karnataka from 2006-07 to 2008-09 is given in Table.3. Credit disbursed by banks to MSME sectors in the state in March 2009 increased to Rs. 16920 crore from Rs. 13974 crore recorded in the previous year. Advances to SC/STs accelerated to Rs. 5315 crore in March 2009 as against Rs. 5030 crore recorded in March 2008. Similarly, advances to women stood at Rs. 13466 crore in March 2009 as against Rs. 11512 crore made in the corresponding period of 2008 recording a good growth during the period.

Data collection

Secondary data is collected related to the status, issues and future agenda of institutional Agricultural credit in Karnataka by referring books, journals, monographs and conference/scientific papers. The data is compiled in the form of a review paper

Implementation of Rural Infrastructure Development Fund (RIDF) in Karnataka.

Government utilized institutional finance from National Bank for Agriculture and Rural Development (NABARD) under Rural Infrastructure Development Fund Scheme for financing various developmental programmes in the state to supplement plan financing. In order to select and priorities the works for loan assistance from NABARD a Cabinet Sub-Committee on RIDF has been constituted under the chairmanship of the Hon'ble Minister for Public Works. A High Power Committee (HPC) has also been constituted chaired by the development Commissioner for reviewing the implementation of RIDF projects in the State. The progress in the implementation of the scheme is also being monitored by NABARD from time to time. Government of India, in 1995 announced the scheme for setting up of Rural Infrastructure Development Fund (RIDF) within the apex institution, NABARD for financing rural infrastructure projects. Domestic Scheduled Commercial Banks, both in the public and private sectors which are unable to meet their targets for priority sector/agricultural lending are required to deposit the shortfall amount in to the RIDF with NABARD such amounts as may be allocated to them by the Reserve Bank, depending upon the extent of their shortfall, subject to a ceiling of 1.5%. The benefits accrued from RIDF programme are unlocking of sunk investments already made by State Governments, creation of additional irrigation potential, generation of additional employment, all-weather connectivity/ improved connectivity to villages and marketing centres and improvements in the quality of life through facilities in education, health and drinking water supply. The initial corpus fund was Rs. 2000 crore in 1995-96 and this fund has since been magnified with an additional corpus being announced every year in the Union Budget and has reached Rs. 88,359 crore from tranches I to XIV. Karnataka got the allocation of Rs. 728 crore from implementing works under RIDF-XV. The rate of interest on loans to State Governments is charged at 6.5% from RIDF tranche VIII and onwards.

Programme status

In Karnataka, till 31-03-2009 an aggregate amount of Rs. 4910.41 crore has been sanctioned by the National Bank for Agriculture and Rural Development (NABARD) under various tranches of RIDF to the State Government so far since 1995. The completed projects include rural roads, rural bridges; minor irrigation project; rural godowns; rural markets; Anganawadi buildings, primary health centers and school class rooms. 12213 projects have been completed as against 23246 projects sanctioned so far. An amount of Rs.728 crores has been allocated by NABARD under RIDE-XV and proposals regarding school and college buildings, Rural Roads and Bridges, Anganawadi buildings, Minor Irrigation works, SC/ST and BCM Hostels, Rural Gowdons, Panchayat service centers etc., have been forwarded to NABARD for utilizing the same (Economic Survey of Karnataka).

Hanumanthappa

Integrated Rural Development Programme (IRDP)/ Swarna Jayanthi Grama Swarozgar Yojana (SGSY)

Various programmes such as IRDP, TRYSEM, DWCRA, Toolkits, GKY & MWS were merged to form a new scheme known as Swarna Jayanti Swarozgar Yojana (SGSY) that came into effect from 01-04-1999. Under this programme 10 percent of the funds are earmarked for training, 10 percent for revolving fund, 20 percent for infrastructure development and remaining 60 percent utilized as subsidy for taking economic activities with thrust on group activities. Eligible beneficiaries are identified by the Grama Panchayats with the approval of the Grama Sabha. The greater participation of the Grama Panchayats will enable the Implementing agencies to have greater flexibility in execution and to meet the needs of the local people. To tackle the problem of poverty, programmes have been formulated and implemented and the beneficiaries assisted to acquire productive assets. Self-employment programmes like the Swarna Jayanthi Grama Swarozgar Yojana are implemented in urban areas also. Under some of these programmes lower rates of interest are offered, subsidy provided and a longer time for repayment allowed. These are aimed at encouraging the unemployed to take up self employment. During 2008-09, 635 individual families and 5548 SHGs comprising of 88159 swarozgaries were assisted by providing loan of Rs. 2.16 and 186.08 crore and subsidy of Rs. 0.86 and Rs. 71.41 crore respectively. During 2009-10 disbursements to the tune of Rs. 5.44 and Rs. 175.75 crore of loan and Rs. 1.79 and 63.80 crore of subsidy to 1973 individual families and 5104 SHGs are anticipated. Sanctions and disbursements of loan and the subsidy availed under Swarna Jayanthi Grama Swarozgar Yojana (SGSY) for the period from 2006-07 to 2009-10.

Special Project

Each special scheme is a time bound one with the objective of lifting a definite number of families below the poverty line through self-employment programmes. Organizing the rural poor, providing infrastructure, technology, marketing facilities, training or through other activities, sustainable employment opportunities will be created. Twenty two proposals worth of Rs. 177.76 crore have been submitted to Government of India for sanction. Of which, two projects of Dakshina Kannada, Kolar, Mysore, Bellary, Dharwad and Bagalkote have been sanctioned and released Rs. 23.85 crore, out of which Central share is Rs. 17.94 crore and State share is Rs. 5.91 crore.

Micro Credit Delivery Innovations- Self Help Groups (SHGs)

Despite vast expansion of formal rural credit delivery system, and Implementation of series of anti poverty programmes, the majority of the rural Population still finds itself outside the credit delivery system and continues to depend on local money lenders. This is attributable to the high transaction costs and perceived risks. Self help Groups (SHGs) is the culmination of a pilot study undertaken by NABARD to address the credit needs of rural poor. The focus under SHG bank linkage programme is largely on those rural poor who have no sustained access to the formal banking system. Thus, Micro-finance started by NABARD in 1992 has made rapid strides in recent years. The programme, whose seeds were initially sown in Karnataka, has over the past decade seen many milestones in its progress with active involvement of Government agencies, Non-Governmental Organizations (NGOs) commercial banks and regional rural banks. In Karnataka, the State Government through its Women and Child Development Department is empowering rural women in Stree Shakti Programme.

Present Status of the Programme

Karnataka is the Leader State in using micro finance initiative as an effective strategy to address the credit needs of rural poor. By the end of March 2009 about 94795 SHGs were credit linked involving Bank Loan of Rs. 746.38 Crore during the year.³

Suggestions for promotion and sustenance of SHGs in the State are

- Banks may continue the emphasis on repeat finance to meet growing needs of SHGs.
- Maintain good repayment culture in SHG portfolio.
- Identify, develop and support micro enterprise amongst SHGs members.
- Finance diversified activities from the present traditional farm based activities.
- Devise appropriate Insurance products for SHGs.
- Banks to train staff at various levels on promotion of SHGs on a continuous basis.

Hanumanthappa

- Several districts of north Karnataka have scope for improvement in credit linkages programme.

Kissan Credit Card

Kissan Credit Card Scheme (KCC) introduced by the Government of India in the year 1998-99 aims at providing adequate and timely availability of credit for the comprehensive credit requirements of farmers under a single window, with flexible and simplified procedure adopting whole farm approach including short term and term credit needs and reasonable Component for consumption purpose. The scheme has made rapid progress with the banking system in the state. The banking system has been releasing crop loans through KCCs having recognized it as an accepted mechanism of delivering of credit to farmers. During 2008-09 a total number of 734759 Kissan Credit Cards have been issued by the banking system including Co-operative s in the State involving a credit limit of Rs. 6374.56 crore. This is in comparison to cards with a credit limit of Rs. 4412.91 crore deployed in the corresponding period a year ago. In the current fiscal 2009-10 up to the end of June a total number of 371885 cards with a credit limit of Rs. 2148.32 crore have been issued by Commercial Banks, Regional Rural Banks and co-operatives in the state bringing the outstandings to 2792189 cards with a credit limit of Rs.1 186S.43 crore. The scheme has also been tied up with Personal Accident Insurance scheme (PAIS) wherein card holders are insured up to Rs. 50,000/- at a nominal premium of Rs. 15 for three years.

Regional Rural Banks (RRBs)

The Regional Rural Banks (RRBs) have evolved into a major institution towards credit dispensation in rural areas over the years since their inception in 1975. RRBs being an integral segment of the banking system with focus on rural poor have also been subjected to various reform measures. As a result they have achieved considerable operational and financial stability in recent years. At the end of March 2009 there were 1177 bank branches of 6 Regional Rural Banks (RRBs) (after their amalgamation) spread over all their districts in the State. These Banks have mobilized Rs.9428.86 crore of deposits at the end of March 2009 and advanced Rs. 8178.07 crore, resulting in a credit-deposit ratio of 86.73%. Priority sector advances made by these banks stood at Rs. 6941.03 crore as of June 2008 showing a growth of 11.48% Direct agricultural advances of Regional Rural Banks amounted to Rs. 5061.61 crore constituting 61.89% of total advances made by those RRBs. The State Government in accordance with the provisions of Section (0) of RRB Act 976 has contributed a sum of Rs. 195 lakhs being 15% contribution towards equity share to the 13 RRBs earlier, From time to time several actions were initiated by Govt. of India for enabling the RRBs to attain viability. Under this exercise State Government have infused financial support to these banks to the tune of Rs. 1753.52 lakh in March 2003 towards their re-capitalization in accordance with the policy decision of the Government of India, as part of reform measures to improve the performance of Regional Rural Banks in the State. The Credit Policy announced by the Reserve Bank of India in 2004 indicated that sponsor Banks in consultation with State Governments would initiate steps for amalgamation of RRBs sponsored by them. Accordingly, 13 RRBs in accordance with the policy decision taken by the Government of India to make these banks more vibrant. 4 RRBs sponsored by Canara Bank were amalgamated into one and renamed as Pragati Grameena Bank. Similarly, another 4 RRBs sponsored by Syndicate Bank were amalgamated and renamed as Karnataka Vikas Grameena Bank. The status position of other RRBs sponsored by the State Bank of Mysore, Corporation Bank, State Bank of India and Vijaya Bank remained unaltered. Now all the six RRBs in the State have attained viability.

State Term Lending Institutions

The Karnataka State Financial Corporation (KSFC) and the Karnataka State Industrial Investment and Development Corporation (KSIIDC) are the two major State term lending institutions engaged in the development of Small/medium enterprises and promotion/ development of medium and large scale industries in the State respectively. While KSFC Supports industry and service sectors, the KSIIDC undertakes promotion and development of medium and large scale industries in the State and acts as a nodal agency to formulate proposals for the implementation of infrastructure projects. Keeping in pace with the changed economic scenario, the KSFC has focused its attention on newer areas of financing such as schemes for financing construction activity, infrastructure development IT Parks, Tourism, Health care, Textiles, Insurance, Agro based industries and Food processing, Engineering etc., As at the end of March 2009 the assistance rendered by KSFC aggregated to Rs. 565.24 crore in

Hanumanthappa

sanction and Rs.383.92 crore in disbursements as against Rs. 368.15 crore in sanctions and Rs. 303.13 crore in disbursements made in March 2008, registering a growth in sanctions and disbursements. It is anticipated that sanctions and disbursements of the corporation would reach Rs. 570.00 crore and Rs. 430.00 crore respectively in 2009-10. There is no sanction made by KSIIDC in 2008-09. But, Rs. 7.53 crore disbursements were made by KSIIDC. It is anticipated that the corporation would make disbursement of Rs. 15.09 crore in 2009-10 (Table-5).

Non-Performing Assets (NPA) in Banks

The Non-Performing Assets (NPA) in Banks in the State stood at Rs. 4627.01 crore in June 2009 as against Rs.4214.73 crore in March 2008. The NPAs of farm sector accounts for Rs. 802.01 crore in the State in end of June in the current year. There has been satisfactory growth in credit expansion in recent years, which is associated with greater efficiency and better management. At the same time excessive growth in credit without adequate safeguards could lead to some erosion in credit quality. Hence, balance has to be established between credit quality and associated risks, while allowing bank lending to contribute to higher growth. In view of the rapid growth in bank credit, there may be a need for strict management techniques for prudent evaluation of investment proposals.

Agricultural Loan waiver

Under Central Government Loan Waiver Scheme Agricultural loans have been waived in Karnataka as follows:

Interest Subsidy Scheme on Crop Loans to Farmers

Government of Karnataka has sanctioned a interest subsidy scheme on crop loans to farmers. As per the scheme the farmers availing crop loans through Public Sector Banks and Regional Rural Banks in Karnataka up to Rs.50000/- on or after 01.04.2009 and repaying the loans as per due date or earlier are eligible for interest subsidy of 4%. The farmers are facilitated to get crop loan at an interest rate of 3%. The State Government will release the interest subsidy to Public Sector Bank and Regional Rural Banks through State Level Bankers Committee, the Nodal Agency for implementing the schemes.

Interest Subsidy Scheme for Loans up to Rs.50000/- to Weavers and Fishermen @ 3% P/A.

Government of Karnataka accorded sanction for schemes of interest Subsidy for loans up to Rs.50,000/- availed by Weavers and Fishermen from nationalized Banks and Regional Rural Banks and repaid as per due date or earlier to enable them to get loan at an interest rate of 3% P/A. The scheme is applicable to the loans availed by Weavers and Fishermen with effect from 1.4.2009 and 1.1.2009 respectively during this Financial year.

Co-operative Credit

This section highlights the performance of Co-operative banks towards credit deployment and recovery aspects in the state from 2007-08 to 2009-10 and measures initiated to facilitate development and improve their various performance.

Primary Agricultural Credit Societies (PACS)

These credit institutions at the grass root level deal directly with individual borrowers and provide short, medium, and long term credit there are 4697 PACS functioning in the state. In addition to this, there are 21 District Cooperative Central Banks (DCCBs) with 596 bank branches. Karnataka State Cooperative Apex Bank, Karnataka State Cooperative Agricultural and Rural Development Bank (KASCARD) at the state level and Primary Cooperative Agricultural and Rural Development Bank at Taluk level numbering 177 cater to the long term credit needs in the two-tier credit delivery system. The National Bank for Agriculture and Rural Development (NABARD) provides refinance to the Apex Bank and KASCARD Bank As on 31.03.2009, the short term (ST), Medium term(MT), and Long term(LT) loans issued by the Cooperative Credit System in the State was Rs.3290.68 crore, Rs. 114.41 Crore and Rs. 171.89 crore respectively as against Rs 2849.50 crore (ST), Rs.98.54 crore (MT) and Rs.210.43 crore (LT) issued a year ago. While disbursement in Long term (LT) loans indicated a declining trend, there was a marked improvement in the issue of Short term (ST) and Medium term (MT) loans. In the Current fiscal up to the end of Nov 2009, the Cooperative credit System issued ST, MT and LT loans to the extent of Rs.2229.19 crore, Rs.75.62 crore and Rs.48.52

Hanumanthappa

crore respectively. (Table .6). The Comparative study of Short, Medium and Long term loans were presented in Table 7. As on 30th June 2009, the recovery percentage under short term loans recorded 76.50 as against 68.15 recorded during the year 2007-08. The recovery made under Medium Term and Long Term Loans stood at 65.95 percent as against 42.28 percent and 43.50 percent as against 38.65 percent respectively in 2007-08.

Development Action Plans of DCC Banks and Memoranda of Understanding

DCC Banks and Karnataka State Co operative Apex Bank have prepared Development Action Plan (DAP) to strengthen their financial and organization set up accordance with NABARD. On the basis of this, DAP has been prepared. Memorandum of understanding (MoU) for strengthening the co operative credit structure has been signed by NABARD, State Government and Apex Bank in June 1995. The MOU has been extended for a period of three years from 2000. Similar MoU has been prepared and signed by all the DCC Banks for the years from 2004-05 to 2010-11. These action plans are in operation. The position of working funds of DCC banks was Rs.8701.74 crore as at the end of March 2008. The Annual target for the year 2008-09 is Rs.9611.58 crore and the achievement as at the end of March 2009 is Rs.10174.03 crore. (a growth of 15.16% over the previous year). Deposits in DCC banks, which were Rs. 4639.00 crore as on 31.3.2008 increased to Rs.5237.61 crore by 31.3.2009 (a growth of 12.90%). Of the 21 DCC Banks 18 Banks posted profit during the year 2008-09, 3 Banks continued to suffer accumulated loss.

Business Development Plans (BDP) for Primary Cooperative Agricultural Credit Societies

Business Development Plans (BDP) are being implemented in Primary Credit Cooperative Societies from 1995-96. 4374 societies have been brought under this programme by the end of March 2009. During 2008-09, 4374 societies achieved a business turnover of Rs.4339.74 crore as against the target of Rs.5057.68 crore. Government have sanctioned a sum of Rs.324.50 lakh as grant to 651 societies (including the Integrated Cooperative Development Project) so far for the creation of basic infrastructure facilities such as opening of banking counters and cash chests. In addition to this, the Apex Bank and DCC Banks have sanctioned a sum of Rs.338.50 lakh to 676 societies and Rs.379.91 lakh to 823 societies respectively for the above purpose since 1995-96 till date. The deposits mobilised by the PACS as at the end of March 2009 was Rs. 1472.75 crore. Working capital fund of these 4374 societies brought under BDP was Rs, 4635.29 crore in 2008-09 and now it is projected to increase it to Rs.6161.60 crore during the year 2009-10. The business credit and non-credit (retail business etc.) done during 2008-09 by these societies was Rs. 3773.99 crore and Rs.565.75 crore respectively.

Development Action Plan of Karnataka State Co-Operative Agricultural and Rural Development Bank and Primary Co-Operative Agricultural and Rural Development Banks.

177 PCARD Banks working in the state had a paid-up share capital of Rs.107.01 crore at the end of 2008-09. Target fixed for the year 2008-09 for advancing agricultural loans is Rs. 250.00 crore against which they have advanced Rs. 177.65 crore by the end of March 2009 of which Rs. 87.90 crore were lent to small and marginal farmers and Rs. 6.21 crore to SCs/STs. 28 Banks were considered eligible to get unrestricted finance and 147 are eligible to get restricted finance during 2008-09. Eligibility criteria depends on the NPA level of Banks. The Government has given full stamp duty exemption for all the loans availed by farmer members under agriculture and allied activities upto 2009. The Government has sanctioned a sum of Rs. 2412.02 lakh as compensation to 23838 beneficiaries under the failed well compensation scheme as at the end of March 2008.

Disbursement of Agricultural Loans at 3% through PCARD Banks

State Government has formulated a scheme for disbursement of long-term agricultural loans to farmers at 3% from 01-04-2008 through co operative credit societies. During the year 2008-09 an amount of Rs. 171.89 crore agricultural loan has been disbursed to 23327 farmers.

Agricultural Loans to farmers at 4% through Agricultural Co-operative Credit Institutions.

The State Government has implemented the scheme of lending agricultural loans to the farmers at 4% from 01-04-2006 through Agricultural Co-operative Credit Institutions in the State. During 2006-07, an agricultural loan amounting to Rs. 2471.24 crore has been disbursed to 9.20 lakh farmers. The Government has reimbursed an amount

Hanumanthappa

of Rs.123.7 crore as difference of interest on behalf of the farmers. From 01-04-2008 the Government has implemented the scheme of lending agricultural loans to farmers at 3%. During the year 2007-08, agricultural loan amounting to Rs.3158.46 crore has been disbursed to farmers. Government has reimbursed an amount of Rs.155.93 crore as different of interest on behalf of farmers.

Waiver of Interest & Penal Interest for the Agricultural Loans Availed from Co-Operative Credit Institutions

Agricultural Cooperative Credit Institutions are advancing agricultural loans to the farmers for agricultural activities. The continuous drought in Karnataka for a period from 2001-2004 has caused severe & unprecedented distress & hardship to the farmers. Considering this aspect, the Government have formulated and implemented the scheme of waiver of the interest and penal interest on Short Term, Medium Term and Long Term loans outstanding as on 31.03.2004 from Cooperative Banks: provided the farmers repaid the principal amount within the stipulated period from 01.03.2005 to 31.05.2006. The Government would reimburse the interest waiver amount to the Cooperative Institutions. Under the scheme an amount of Rs. 1519.38 crore has been recovered from 812305 farmer members with respect to Short Term & Medium Term loans. The waiver of interest and penal interest amount is about Rs.797.95 crore. An amount of Rs.296.57 crore has been recovered from 222970 farmer members with respect to Long-term loans and the waiver of interest amount is about Rs.310.74 crore. Under the scheme, a total number of 1200714 farmers have been benefited. The total agricultural loans recovered under this scheme is about Rs. 1812.46 crore and the Government has to reimburse the waiver of interest and penal interest amount which is about Rs. 1123.92 crore Government has released Rs. 1121.02 crore in this regard.

Co-operative Agricultural Credit Sector Agricultural loans to farmers at 3%

The State Government had implemented the scheme of providing agricultural loans through Cooperative credit institution w.e.f. 01-04-2004 at 6% and subsequently the Government has accorded approval to provide agricultural loans at 4% w.e.f. 01-04-2006. In order to further reduce the interest burden of the farmers, the Government has approved the scheme of providing Short term, Medium term and Long term agricultural loans through co-operative institutions at 3% w.e.f. 01-04-2008. The Scheme has been extended to loans availed by weavers and fishermen also. The Government has undertaken to reimburse the loss to the Co-operative credit institutions by way of Interest Subsidy w.e.f. 01-04-2004.

Revival package for short term Co-operative credit structure

In order to strengthen the short term co-operative credit structure in the State, the Govt. of Karnataka has signed the Memorandum of understanding with Govt. of India and NABARD on 25-03-2008 for implementation of Prof. Vaidhyanathan Committee recommendations. In view of the above the State level implementation committee (SLIC) under the chairmanship of the Principal Secretary to the Govt. Finance Dept. has approved Rs.732.25 crores as the amount under this package pertaining to 4131 PACS coming under the Jurisdiction of 19 DCC Banks as on 31-3-2010. Since there was delay on the part of DLIC of Bidar and South Canara DCC Banks to submit the information, the amount to be received under this package pertaining to these 3 Districts of Bidar, South Canara and Udupi are yet to be placed before the SLIC for the approval. Government of Karnataka has provided budgetary provision of Rs 90.07 Crores as its Share under this package and released Rs.39.53 crores along with GOI Shares of Rs. 139.74 crores as 1st instalment on 31-3-2010. The PACS has to adjust their Share out of their profits within one year by increasing Business turn over. The amount released in the 1st instalment is related to the category 'A' PACS which have attained 50% and above recovery as on 31-3-2004. The two weak DCC Banks viz., KCC Bank Darwad has got major Share of Rs.65.33 crores and The Kolar DCC Banks which has got Rs.9.90 crores as a result of this; these Two DCC Banks have become currently viable. This recapitalization assistance has been utilized effectively for the strengthening of credit structure by adopting the Development Action Plan (DAP) for DCCBs and Business Development Programme (BDP) for PACS to become economical vibrant and sustainable in Three years. The follow up action has been taken to avail the 2nd instalment of the revival package during 2010-11.

Hanumanthappa

Self help Group

For the up liftment of financial weaker section of the society Self Help Groups have been formulated and provided linkage for lending by banks. The main objective of the scheme is to encourage the weaker section of the society for the development activities under taken by them and encourage thrift. House Building Co-operative Societies

There are 1493 House Building Co-operative Societies in the State. Out of which 1005 societies are working, 530 defunct and 258 societies are under liquidation.

Karnataka State Cooperative Housing Federation Ltd.,

The Karnataka State Co-op Housing Federation Ltd., Bangalore was registered during the year 1950. As on 31-03-2010 the Federation has got share capital of Rs.633.57 lakhs and working capital of Rs.8924.98 lakhs. The Federation has advanced loan of Rs. 1545.68 lakhs to the House Building Co operative Societies, Industrial Co-operative societies.

Karnataka Plans Farmer Loans At 1 Percent

In the first of its kind budget in the country for farmers, Karnataka proposed to give crop loans at one percent interest rate through cooperative credit institutions in the ensuing fiscal 2011-12. Crop loan will be made available at one percent interest rate to farmers through cooperative credit institutions as against three percent interest rate hitherto "Chief Minister B.S. Yeddyurappa told lawmakers in the assembly, presenting a separate budget for the agriculture sector. The resilient farm sector in the state is projected to grow 5.5 percent this fiscal (2010-11). Mainly owing to above normal monsoon and the food grain production is expected to increase 14 percent over the last fiscal (2009-10), according to the state economic survey report released Wednesday."The difference of interest on account of reduction will be met by the state government, though crop loans up to Rs. 50,000 from commercial banks will continue (to be given) at three percent," the chief minister clarified. Proclaiming to be a farmer's son himself, Yeddyurappa proposed to allocate a whopping Rs. 17,857 crore for the development of agriculture, allied and irrigation sectors in the new fiscal. "A total of Rs. 1,000 crore was provided for the development of one million farmer families under 'Suvarna Bhoomi Yojana' (land enrichment programme)," he said.

The National Bank for Agriculture and Rural Development (Nabard) has estimated a credit flow potential of Rs 41,085.23 crore for Karnataka in 2011-12, an increase of 31 per cent over the previous year. Speaking at the "State Credit Seminar - 2011-12" here, Dr V. Tagat, Chief General Manager, NABARD, Bangalore, said the bank has created potential linked credit plans for all the 30 districts in the State. The Share of crop loans formed 45 per cent of the total potential estimated, owed by other priority sector at 29 per cent, agricultural term loan at 18 per Cent and non-farm sector at eight per cent. Dr. Tagat said the credit flow to crop loans in 2010-11 was Rs 14,622.37 Crore and the potential assessed for financing in 2011-12 was Rs 18,373.51 Crore. The credit flow to water resources sector in 2010-11 was Rs. 947.22 crore and the estimated potential in 2011-12 is Rs 847.44 crore. The cumulative irrigation created under major, medium and minor irrigation touched 34.84 lakh hectares. Credit flow break-up. The estimated credit flow to various activities in 2011-12 is: land development – Rs. 905.94 crore, farm mechanisation -Rs 1,975.62 crore, plantation and horticulture – Rs. 1,415.94 crore, forestry – Rs. 64.99 crore, dairy development –Rs. 668.35 crore, poultry development – Rs. 257.62 crore, sheep goat piggery Rs. 151.05 crore, fisheries – Rs. 134.96 crore, storage godown and market yards – Rs. 561.09 crore renewable sources of energy and waste utilisation – Rs. 59.78 crore, and

Hanumanthappa

food and agro-processing – Rs. 731-98 crore, other activities – Rs. 678.93 crore, term loan – Rs. 7.553-75 crore, non-farm sector – Rs. 3.365.83 crore and other priority sector – Rs. 11,792.11 crore.

CONCLUSION

Credit plays a crucial role in the growth of agriculture. As a result, credit has played a significant role in the growth of the agricultural sector thanks to institutional credit. The agricultural sector in Karnataka has benefited greatly from institutional credit flow, which has increased significantly over time. The agricultural sector's success and expansion depend on having access to agricultural finance. Farmers now rely primarily on commercial banks for credit, so educating them on the ins and outs of banking procedures could make it easier for them to get credit. In addition, it is recommended to implement and streamline microfinance options in order to effectively link small, marginal, and tribal farmers with Self Help Groups (SHGs).

ABSTRACT

In Indian traditional medicine, *Nerium oleander* (*N. oleander*) is a valuable medicinal herb. There are also known cases of suicide utilizing *N. oleander* in South Asian countries, including India and Sri Lanka. Cardenolides, gentiobiosyl, odoroside, oleandrin, and neridin are only few of many cardiac glycosides found in all sections of the *N. oleander* plant. This plant species produces a variety of secondary metabolites, including alkaloids, flavonoids, and steroids, all of which have different medicinal uses. It possesses a variety of significant pharmacological effects, such as hepatoprotective, immunopotent, antibacterial, anthelmintic, anti-inflammatory, antioxidant, antifungal, anticancer, and anti-HIV qualities. This objective of this review is to present evidence-based information on phytochemicals and pharmacological effects of *N. oleander*.

Keywords: Anthelmintic, hepatoprotective, immunopotent, anti-pyretic, antioxidant, antifungal, anticancer, and anti-HIV properties of *N. oleander*.

INTRODUCTION

N. oleander belongs to the family Apocynaceae and is a green plant (fig. 1). It is now the sole species identified by formal classification as belonging to the genus *Nerium*. It bears little resemblance to the unrelated olive *Olea*, known by the name "oleander. It is thought to have originated in Southwest Asia and is now extensively grown. Oleander is

**Manish Kumar Yadav et al.,**

commonly planted as a decorative plant in yards, parks, and by the sides of roadways since it thrives well in warm, subtropical climates [Abderrahim et al., 2017]. Oleandrin, a very lipid-soluble cardiac glycoside, as reported by [Zhai et al. 2022] is the main constituent of the plant *N. oleander* (Apocynaceae). Traditional herbal therapy uses oleandrin due to its excellent pharmacological characteristics. It is frequently used in the treatment of many diseases, including congestive heart failure. Oleandrin's potent antiviral and broad anticancer properties have lately garnered a lot of attention. [Zaid et al., 2022] investigated different cellular models for assessment of plant's toxicity. It was discovered that extract from *N. oleander* has many other beneficial effects on the antioxidant defense system of the cell, including reduction of free radical production in the cells during an inflammatory insult. Benson et al., 2015 investigated and found that the *N. oleander* extract derived from Aloe vera reduces free radical generation within cells and strengthens their antioxidant defense system when an inflammatory stimulus exists or not. Khalid et al., 2023 reported that *N. oleander* should be grown near roadside verges to remove vehicle pollutants, as this could result in long-term management of these corridors. *N. oleander* ethanolic floral extract (NOEE) demonstrated strong anti-inflammatory properties when investigated by Shafiq et al., 2021 in inflammatory models using carrageenan and cotton pellets. They provided scientific validation for the long-standing usage of *N. oleander* flowers to alleviate heightened pain and inflammation, especially in cases of bacterial infections.

Chemical constituents

The plant contains many cardiac glycosides that have properties akin to those of digitalis [Radford et al., 1986] like gentiobiosyl, oleandrin, cardenolides, neriine, and odorside [Duke et al., 1985]. Numerous other potent pharmacological substances found in the plant include oleandomycin, rutin, rosagenin and folinerin [Siddiqui et al., 1997]. The five cardenolides that shown CNS antidepressant effect were found to be neridiginoside and four newly discovered compounds cardenolide, nerizoside, neritaloside, and odorside-H,. It was discovered that neridiginoside had a structure of 3 beta-O-(D-diginosyl).14 (-5 beta) beta-dihydroxy-card-20 (22)-enosil [Begum et al., 1999]. *N. oleander* leaves were found to contain 12 previously identified triterpenes in addition to three newly identified triterpenes: oleanane-type triterpene 2, dammarane-type triterpene and ursane-type triterpene 1 [Dong et al., 2000]. Three new ursane-type triterpenes, 20 beta, 28-epoxy-28 alpha, and 3beta-hydroxyurs-12-en-28-aldehyde; taraxasterane-type triterpenes; 28-nor-Urs-12-ENE-3beta, 17beta-diol, were obtained from an ethyl acetate extract of *N. oleander* leaves [Zhao et al., 2006]. 3-O-caffeoylquinic acid and its structural isomer, 5-O-caffeoylquinic acid, are two examples of chlorogenic acids, were extracted from *N. indica* leaves using hot water. These substances are anti-hyperglycemic medications since it has been demonstrated that they inhibit alpha-glucosidases non-competitively [Ishikawa et al., 2007, Wang et al., 2009, Bai et al., 2007]. Significant antioxidant activity was found in 1-hydroxy-8-glucosyloxy-3, 5-dimethoxyxanthone, 1, 8-dihydroxy-3, 7-dimethoxyxanthone, 3-methoxy-1, 5, 8-trihydroxyxanthone, and ursolic acid are also included, which were shown to be bioactive substances obtained from the aerial portions of *N. oleander* [Chakravarty et al., 1991]. *N. oleander* leaves as a possible source of ursolic acid in light of this discovery. Our study's goals included obtaining, screening, characterizing, and evaluating the plant's anti-inflammatory qualities. [Chakravarty et al., 1991, Rana et al., 2005], Traditional Chinese medicine makes extensive use of oleandrin, a highly lipid-soluble cardiac glycoside that is extracted from the *N. oleander* (Apocynaceae) plant. Congestive heart failure is among the several diseases for which it is commonly used. The toxicity of oleandrin is also extensively studied, and evaluating feasible research approaches to lessen toxicity, a discovery of safe medicinal applications for oleandrin might be achievable [Zhai et al., 2022] structure of ursolic acid is shown below in figure 2.

Botanical Description

The Apocynaceae family includes the *N. oleander*, which is indigenous to South Asia and the Mediterranean. It is a tough shrub that can withstand dryness and is distinguished by its tall, thin stems, lance-shaped leaves, and clusters of colourful, funnel-shaped blooms. Oleander is a well-liked decorative plant in lots of gardens and landscapes because of its several flower colours, which include white, pink, red, and yellow. *N. oleander* has a long and rich history. Numerous ancient manuscripts, including those written by the Greeks and Romans, mention it as having been grown for ornamental reasons for thousands of years. In fact, it's thought that the botanical name "Nerium" comes from the Greek word "nerion," which means "water," probably as a result of the plant's fondness for damp

Manish Kumar Yadav et al.,

soils. Additionally, throughout history, oleander has been mentioned in poetry, literature, and art from various cultures [Poppenga et al., 2020].

Traditional Uses

Traditional medical practices have long used *N. oleander*, especially in areas where it is native. The potential therapeutic properties of the plant's various sections, including the leaves, flowers, and roots, have been explored. Scabies and edoema have been treated externally with a leaf decoction. Bark can be used as a febrifuge and cathartic for sporadic fevers because of its bitterness. The root bark is used to make oil that is used to treat scaly skin diseases like leprosy. As a purgative, seeds are used for rheumatism and dropsy. Because the root is toxic and should only be used externally, it is powerful, dissolves readily, and is used as plasters for tumors. *N. oleander* has diaphoretic, cardiotoxic, and antimicrobial properties in its leaves and petals. *N. oleander* is pounded with water to form a paste that is applied to penile lesions and ulcers. Apart from being beneficial against warts, malignant ulcers, carcinoma, ulcerating or hard tumors, the plant's bark, roots, leaves, juice, and blooms have all been utilized in cancer treatments [Valnet et al., 1976]. In 2011, the Federal Drug Administration (FDA) concluded the first phase of testing with oleander extract and certified it safe for use in cancer treatment. Furthermore, the extract was found to have nearly no cardiotoxicity or adverse side effects and to have a favorable influence on the development of cancers of the breast, pancreas, bladder, colon, and appendix. Advanced cancer patients have been treated with Anvirze, an aqueous extract of the *N. oleander* plant. Additionally, *N. oleander* is used medicinally to treat ulcers, hemorrhoids, ringworm, herpes, leprosy, and abscesses [Pathak et al., 2000, Manna et al., 2000].

Pharmacological properties

Anti-oxidant role

Higher antioxidant properties were reported in *N. oleander* leaf extract. The ability of *Nerium oleander* to reduce and scavenge free radicals is one of its antioxidant activities, and this ability was linked to the total phenolic content discovered in each distinct extract in each experiment [Iran et al., 2012, Kumar et al., 2012]. *N. oleander* leaf, stem, and root extracts are potent free radical scavengers and an organic supply of strong antioxidants.

Anti-inflammatory properties

The ethanolic extracts of fresh flowers and dried leaves of *N. oleander* shown excellent anti-inflammatory effectiveness without endangering stomach health in a mouse model of carrageenan-induced hind paw edoema [Devi et al., 2019].

Antimicrobial activity

Novel medicinal molecules have been inspired by the plant since plant-derived medications have significantly improved human health. Bacterial strains including *B. subtilis* and *Nyctanthes arbortristis* were significantly affected by the ethanolic leaf extract. Oleander extracts have been shown to have antibacterial action against gram-negative bacteria. Researchers came to the conclusion that these chemicals, which lower the concentration of free radicals, are responsible for the antibacterial activity [Kumar et al., 2013].

Larvicidal activity

N. oleander aqueous leaf extract exhibited adulticidal and larvicidal actions on *Anopheles stephensi* in addition to its ovicidal and larvicidal properties [Roni et al., 2013]. The larval mortality of *Culex quinquefasciatus* was compared to crude hexane and aqueous *N. oleander* flower extracts [Raveen et al., 2014].

Anti-cancer cell inhibition properties

Ali and associates successfully employed oleander blossoms [Ali et al., 2009] extracted essential oil from oleander blossoms with success. When applied to Ehrlich Ascites Carcinoma (EAC) cell lines, it demonstrated efficacy. In human cancer cells, anvirzel and oleandrin have the ability to cause cell death, but not in mice. In one trial, oleandrin, According to the study's findings, PBI-05204 showed signs of a tumor response and oleandrin was well tolerated up to a dosage of 10.2 mg extract per day with little adverse effects [Pathak et al., 2000]. *N. oleander* extract can be applied

80980

**Manish Kumar Yadav et al.,**

topically without risk or toxicity; investigations have shown that skin absorption is negligible. This implies that it may be used at lower dosages to increase insect immunity and control pests without causing harm. The National Cancer Institute claims that oleandrin, a significant glycoside in *N. oleander*, has anticancer effects. Anvirzel™, a product of the University of Texas, has been shown to promote autophagy and death in cancer cells while sparing healthy cells. Moreover, it blocks NF-κB, a signal that encourages the proliferation and metastasis of cancer cells [ST et al., 2008, ST et al., 2009].

Cellular and humoral immune responses

Studies reveal the powerful immune-stimulating qualities of *N. oleander*. T and B lymphocytes, as well as the humoral and cell-mediated immune response, are stimulated by extracts. This improves particular subsets of mononuclear cells. Modest dosages of *N. oleander* considerably increased immunity in rabbits. On the other hand, a greater dose decreases the generation of antibodies, delays hypersensitive reactions, and slows down phagocytic activity [Schultz et al., 1982].

Poisonous nature

N. oleander has a variety of its constituents, some of which can be dangerous if consumed in excess, *N. oleander* has historically been thought to be a deadly plant, especially to animals. Lethal cardiac glycosides are present throughout the entire oleander plant. The highest concentration is found in seeds and roots. The water the plant was immersed in and its own smoke both have the potential to be toxic. The dangerous "cardiac glycosides" oleandrin and oleandrogenin are among these drugs; their window of therapeutic use is limited. Among the more serious adverse effects of oleander are mouth irritation, nausea, vomiting, emesis, stomach cramps, and diarrhea [Arai et al., 1992]. Rats were comparatively resistant to the effects of oleander "cardioactive glycosides," according to animal toxicology tests [Szabuniewicz et al., 1972]. More sensitivity has been shown in other mammals, including humans and dogs [Szabuniewicz et al., 1971; Hougen et al., 1979]. She consumed an unidentified oleander extract orally and rectally before she passed away, which resulted in higher amounts of oleandrin in her tissue at autopsy [Blum et al., 1983; Haynes et al., 1985]. Oleander's systemic hyperkalemia can worsen cardiac function, possibly leading to problems with conduction that start in the sinus or AV nodes and develop to PR interval lengthening and atrioventricular dissociation [Eddleston et al., 2000].

Mechanism of toxicity

Cardiac glycosides, which include nerium, folinerium, thevetin, adynerin, neriantin, digitoxigenin, and oleandrin, bind to the α-subunit of cardiac cells cytoplasmic membrane to block the Na⁺/K⁺ ATPase pump. This results in an increase in intracellular calcium levels and hyperkalemia [Dodd-Butera et al., 2005].

Signs of toxicity

It usually takes a few hours after consumption for clinical indications to manifest. Heart glycosides cause symptoms in the gastrointestinal system (localized diarrhea with blood, cramps, nausea, vomiting, and irritation of the mouth and digestive tract) as well as the cardiovascular system (dysrhythmias and ectopic beats, similar to digitoxin overdose). Dizziness, respiratory failure, unconsciousness, and even death could occur [Robert et al., 2020]. This study was unable to fully disclose all properties of *N. oleander*, including the lethal doses for different age groups of humans and different animal species, due to *N. oleander* poisoning and the tiny number of humans and animals that were affected by this plant's ingestion. Therefore, further experimental study is needed to address these issues [Farkhondeh et al., 2020].

Preventative actions

Medical intervention is necessary in cases of oleander plant poisoning or reactions involving humans or animals due to the rapid onset of symptoms. Atropine and isoproterenol are frequently effective treatments for conduction anomalies, and oral activated charcoal is a further option [Singh et al., 2013]. Contra-digoxin treating severe cardiac arrhythmias brought on by yellow oleander with fab fragments has shown to be successful. Anti-digoxin antibodies serve to stabilize sinus rhythm and are a quick treatment for bradycardia and hyperkalemia. The higher dosage

**Manish Kumar Yadav et al.,**

needed for oleander toxicity in comparison to traditional digoxin toxicity, however, is explained by the digoxin-specific Fab's reduced affinity for nondigoxin cardiac glycosides. Some reported pharmacological properties of plant are shown in below table 1.

Future application of *N. oleander*

N. oleander is utilising cutting-edge extraction techniques and biotechnology research to develop a broad line of products that benefit from the unique and potent properties of *N. oleander*. Anti-aging skin creams are readily accessible on the cosmetics market nowadays. Many other products that are comparable to *N. oleander* these days, creams for spots, blemishes, skin repairs, and eyes are manufactured, among others. According to the American Cancer Society, "the effectiveness of oleander has not been proven," and "even a small amount of oleander can cause death." In HIV-positive patients with baseline CD4 values of less than 400, *N. oleander* is also effective in significantly increasing CD4 counts over a 60-day period. *N. oleander* aqueous extract is used in a novel anti-HIV therapy. *N. oleander* plant could be used in cancer and AIDS therapies in the future. *N. oleander* can be used as a potentially safer and more environment friendly way to manage pests like mosquitoes [Fonseka et al., 2002]

Recent Scientific Research

Recent studies have shed insight on *N. oleander* potential medical benefits while also emphasising the need for caution. The plant's cardiac glycosides have been studied for potential anti-cancer properties, particularly in relation to specific cancer cell types. Additionally, studies on oleandrin's potential as a neuroprotective and anti-inflammatory drug are still being conducted [Farkhondeh et al., 2020].

CONCLUSION

A botanical wonder that has fascinated people for millennia is *N. oleander*. It is an interesting topic to examine due to its remarkable look, long history, and variety of traditional therapeutic uses. When thinking about using the plant as medicine, extra caution must be used due to its toxicity, which cannot be ignored. Recent scientific research has provided some promising insights, but more study is needed to fully realize this wonderful but potentially dangerous plant's therapeutic potential. As we continue to explore the realm of natural cures, *N. oleander* serves as a reminder of the intricate interplay between beauty, danger, and healing in the plant kingdom.

Acknowledgement

We appreciate the authors' willingness to share their understanding of the pharmacological importance and practical application of herbal medicinal plants. Both writers contributed equally to the review project.

Author contribution

Equal contributions from all authors were made to the review effort.

Table 1: List of reported pharmacological activities of *N. oleander* and their parts

S.N.	Parts of Plant	Extraction (Medium)	Model (In Vivo/ In Vitro)	Activity	Reference
1.	Fresh pulverized roots	95% EtOH	Disc diffusion method	Antibacterial activity	Huq M. Mostaqul et al., 1999
2.	Freshly ground leaves	Reconstituted lyophilized extract was chromatographed using water, methanol, acetone, and 2 N HCl in a sequential elution method on a Diaion HP-20 column	Effects on the growth of human tumor cell lines were assessed using a modified propidium iodide assay. conducted an acid phosphatase assay	Antitumor activity, Antiproliferative activity	Rashan Luay J. et al., 2011
3	Flowers	Petroleum ether (40 – 60 °C)	Pentylenetetrazol (PTZ)-induced convulsion test	Determination of anticonvulsant activity	Singhal KG, et al., 2011
4	Flowers	Petroleum ether, chloroform, ethyl acetate, methanol and water	Thiocyanate method	Antioxidant activity	Singhal Kumar Gaurav, et al., 2012
5	Flowers	50% Ethanol	Triton WR-1399-Induced Hyperlipidemia	Antihyperlipidemic activity	Gayathri V et al., 2013
6	Leaf	Aqueous extract	Well diffusion and disk methods	Antibacterial activity	S Hamon-Navard, et al., 2013
7	Leaf	Methanol	Method of DPPH	Antioxidant Activity	Siham Lakhmili, et al., 2014.
8	Shoots	Distillate	MTT assay	Antiviral Activity	Avci Oguzhan, et al., 2014
9.	Flowers	Hydro-distillation	Disk diffusion testing and Minimum inhibitory concentration (MIC)	Antibacterial activities	Derwich Elhoussine et al., 2010
10	Leaves	Ethanol extract using cold extraction method	Langendorff method	Cardiotonic effect	AdomeR. O., et al., 2003.
11	Leaves	The extraction was done with ethanol: water (1:1) for one hour at 60 °C	1. Measuring the levels of lactate and glucose in untreated and treated	Inhibition of glycolysis and cytotoxic activity	Calderón-Montaño José Manuel, et al.,

Manish Kumar Yadav *et al.*,

		using an ultrasonic water bath equipment	cells 2. In-vitro MTT assay	against lung cancer cell	2013
12	Whole plant	Hot extract and cold extract	Plaque assay	Anti-poliovirus activity	Sanna Giuseppina, <i>et al.</i> , 2019
13	Leaves	Extracted with petroleum ether, chloroform and alcohol with the help of soxhlet apparatus	1. Anti inflammatory: Borgi and vogel Method 2. Antipyretic activity: Brevers yeast induced pyrexia	Anti inflammatory and Antipyretic activity	Kumar Senthil, <i>et al.</i> , 2010.
14	Flowers	Aqueous extract of flowers	Rotarod test	Activity of skeletal muscle relaxants	Tirumalasetti Jayasree, <i>et al.</i> , 2015
15	Flowers	Methylene chloride with methanol (1:1) extraction	Assay of Comet Diffusion plate technique	1. Level of DNA strand-break formation 2. Antibacterial and antifungal activity	Sawi M. El, <i>et al.</i> , 2010
16	Whole plant	<i>N. oleander</i> extract, Anvirzel™	After treatment, cell viability was assessed using the common Trypan blue dye-exclusion technique.	Effectiveness against human peripheral blood mononuclear cell HIV infection.	Singh Shailbala, <i>et al.</i> , 2013
17	Freshly collected leaves	Extracted with a hydroalcoholic solution (ethanol: water; 1:1)	In vivo studies with guinea pig	Arrhythmogenic activity	Botelho Ana Flávia Machado, <i>et al.</i> , 2017

ABSTRACT

The purpose of this study is to assess NIPUN Bharat, the Indian program for proficiency in reading, comprehension, and numeracy, as well as its difficulties. NIPUN Bharat was introduced as a component of the National Education Policy 2020 with the goal of guaranteeing that all children acquire fundamental literacy and numeracy abilities by the conclusion of Grade 3. The study examines the program's effects and evaluates how well it works to enhance children's reading comprehension and math skills between the ages of three and nine. The study examines the various difficulties encountered in putting NIPUN Bharat into practice. It covers topics like the lack of resources, the digital divide, teacher preparation, diversity in language and culture, and the necessity of ongoing parental involvement. The study also explores the program's resistance to pedagogical adjustments and its flexibility to different educational situations. Through a thorough assessment, this study adds significant understanding of NIPUN Bharat's efficacy and makes suggestions for resolving the issues that arose. Policymakers, educators, and other stakeholders interested in improving foundational education in India are intended to benefit from the findings.

Keywords: NIPUN Bharat, FLN, Education, Training Programme.

INTRODUCTION

The NIPUN Bharat Scheme, recently introduced by the Ministry of Education, marks a significant initiative aimed at addressing the educational needs of children aged 3 to 9 years. Spearheading this effort, The National Initiative for Proficiency in Reading with Understanding and Numeracy was essentially introduced by Union Minister of

80990

**Lohans Kumar Kalyani**

Education Shri Ramesh Pokhriyal, or "Nishank." With a target date of 2026–2027, the overriding objective is to guarantee that every kid in the nation acquires fundamental literacy and numeracy by the end of Grade 3. This national purpose lays the groundwork for revolutionary changes in the country's school and higher education systems. It is an essential part of the National Education Policy (NEP) 2020. NEP 2020, which replaces the 34-year-old National Policy on Education (NPE) from 1986, focuses on important areas like giving children access to and retention during their formative years of education, developing high-quality and diverse learning materials for both students and teachers, and putting in place reliable progress tracking mechanisms to keep an eye on each student's learning outcomes. The launch of NIPUN Bharat aligns with the broader vision of NEP 2020, emphasizing the critical importance of foundational literacy and numeracy as building blocks for a comprehensive and inclusive educational framework in India. The initiative reflects a commitment to fostering a solid educational foundation for the country's youth, paving the way for a brighter and more equitable future.

What is the NIPUN Bharat Initiative's Complete Form

NIPUN Bharat Initiative stands for "National Initiative for Proficiency in Reading with Understanding and Numeracy Bharat Initiative." The NIPUN Bharat Initiative is a comprehensive national initiative that aims to improve the reading and numeracy proficiency of Indian pupils. The effort places special emphasis on ensuring that these fundamental abilities are mastered by the end of Grade 3, laying the groundwork for improved academic performance and increased opportunities for all children in the country.

Vision of NIPUN Bharat Initiative

NIPUN AXOM aims to establish a conducive atmosphere that guarantees the equitable attainment of fundamental literacy and numeracy skills. By the end of Grade 3, 2026–2027, all kids will have achieved the desired learning outcomes in reading, writing, and numeracy thanks to this.

NIPUN Bharat Mission Features

The NIPUN Bharat Mission encompasses a range of features that are strategically designed to foster foundational literacy and numeracy skills among students across India. These features are integral to the mission's comprehensive approach towards transforming the educational landscape.

Universal Learning Competencies

The goal of the NIPUN Bharat Mission is to guarantee that all people acquire the fundamentals of literacy and numeracy. The focus is on imparting essential competencies in reading with comprehension, proficient writing, and numerical skills.

End-of-Grade 3 Mastery

A key feature is the targeted timeline for skill mastery. The mission sets a clear objective that every child should achieve the desired learning competencies by the end of Grade 3. This time-bound approach adds urgency and specificity to the initiative.

Alignment with National Education Policy (NEP) 2020

NIPUN Bharat is in harmony with the transformative goals outlined in the National Education Policy of 2020. It aligns with the broader vision of restructuring and revitalizing the education system to meet the evolving needs of students.

Inclusive Learning Environment

The goal of the mission is to establish a welcoming atmosphere that meets the various needs of every student. It acknowledges how critical it is to accommodate differences in learning styles so that all children, regardless of background, may take advantage of the program.

**Lohans Kumar Kalyani****Strategic Planning for 2026-27**

NIPUN Bharat features a strategic planning horizon, setting the target year as 2026-27. This long-term vision allows for systematic implementation and assessment, fostering sustainable improvements in literacy and numeracy outcomes.

Technology Integration

The initiative acknowledges the role of technology in modern education. It incorporates elements of technology to enhance learning experiences, providing educators and students with digital resources and tools.

Progress Tracking Mechanism

NIPUN Bharat stresses the need of having a reliable system in place to monitor each child's development. Implementing effective monitoring and evaluation systems ensures that the initiative's goals are met and adjustments can be made as necessary.

Teacher Capacity Building

Recognizing the pivotal role of educators, NIPUN Bharat includes provisions for teacher training programs. Enhancing teacher capacity is seen as crucial to the success of the mission, ensuring that educators are well-equipped to facilitate improved learning outcomes.

In essence, NIPUN Bharat Mission's features encapsulate a holistic and forward-looking approach, addressing not only the immediate need for foundational literacy and numeracy but also considering the broader educational landscape and future learning requirements.

NIPUN Bharat Foundational Literacy and Numeracy (FLN)

The National Initiative for Proficiency in Reading with Understanding and Numeracy (NIPUN Bharat) is one of the most significant national missions focused on fundamental literacy and numeracy (FLN). FLN places a high value on a child's ability to read comprehension and solve simple math problems by the end of Class 3. Fundamental literacy and numeracy are highly valued in the National Education Policy (NEP) 2020, which is why it carefully combines two crucial elements: foundational language and literacy and foundational numeracy. The strong emphasis placed on FLN by NEP 2020 is in line with the overarching goal of education, which is to provide students with a solid grounding in language and math to support their future academic pursuits. The fundamental level synergistic integration of numerical aptitude and language competency is essential for supporting holistic educational development and equipping pupils for lifetime academic achievement.

Foundational Language and Literacy**(i). Focus Areas:**

- **Reading Comprehension:** Emphasis on developing the ability to understand and interpret written texts.
- **Writing Proficiency:** Building foundational writing skills, including grammar, vocabulary, and composition.

(ii). Key Components:

- **Phonics:** Understanding the relationship between sounds and letters.
- **Vocabulary Building:** Expanding the range of words known and understood.
- **Reading Fluency:** Developing the ability to read with speed, accuracy, and comprehension.
- **Comprehension Strategies:** Teaching methods to understand and interpret texts effectively.
- **Writing Skills:** Grasping fundamental writing techniques and expressing ideas coherently.

(iii). Teaching Approaches:

- **Storytelling:** Using narratives to enhance language skills and comprehension.
- **Phonics Instruction:** Systematic teaching of sound-letter relationships.
- **Reading Aloud:** Encouraging students to listen and comprehend spoken language.

**Lohans Kumar Kalyani****Foundational Numeracy****(i). Focus Areas:**

- **Basic Arithmetic:** proficiency in addition, subtraction, multiplication, and division—basic mathematical operations.
- **Number Sense:** Developing an intuitive understanding of numbers and their relationships.

(ii). Key Components:

- **Counting:** Learning to count numbers and understand their sequence.
- **Basic Operations:** Building skills in addition, subtraction, multiplication, and division.
- **Problem Solving:** Applying mathematical concepts to solve real-world problems.
- **Number Recognition:** Identifying and understanding the significance of different numbers.
- **Measurement:** Grasping basic concepts of measurement and comparison.

(iii). Teaching Approaches:

- **Hands-On Activities:** Engaging students in tangible, real-world math experiences.
- **Problem-Based Learning:** Encouraging students to solve problems using mathematical concepts.
- **Visual Aids:** Using visuals and manipulatives to aid understanding.

Comparative Insights

- **Interconnectedness:** While these areas seem distinct, they are interconnected. Proficiency in language can enhance mathematical understanding and vice versa.
- **Early Intervention:** Both literacy and numeracy skills are foundational and require early intervention for optimal development.
- **Holistic Approach:** Combining language and numeracy education creates a holistic learning environment, acknowledging the symbiotic relationship between these skills.
- **Individualized Learning:** Recognizing that students may have different learning styles and paces, educators tailor their approaches to cater to diverse needs in both language and numeracy education.

Remember, the effectiveness of these programs relies heavily on the integration of various teaching methodologies, continuous assessment, and the adaptability of educators to the unique needs of their students.

NIPUN Bharat Objective

- The Ministry of Education (MoE) oversees the NIPUN Bharat Mission, which is run by the Department of School Education and Literacy and has a designated Mission Director. The mission has a broad range of goals aimed at changing the educational system, including:
- **Inclusive Classroom Environment:** Create an inclusive learning environment by explicitly introducing home languages into the curriculum, connecting play, discovery, and activity-based pedagogies to children's everyday experiences.
- **Literacy Empowerment:** Give kids the opportunity to develop into enthusiastic, self-reliant, and involved writers and readers who possess long-lasting writing and reading abilities.
- **Numerical and Spatial Proficiency:** Develop children's capacity for reasoning in the areas of numbers, measurements, and shapes so they can solve problems on their own by improving their numeracy and spatial comprehension.
- **Quality Teaching Materials:** Make ensuring that excellent, culturally relevant teaching and learning resources are available and are used effectively in the mother tongue.
- **Continuous Capacity Building:** Make it a priority to continuously develop the competencies of educators, including head teachers, academic resource persons, and education administrators.
- **Stakeholder Engagement:** Actively collaborate with educators, parents, students, members of the community, and legislators to build a solid basis for lifelong learning.
- **Assessment Strategies:** Use a variety of assessment techniques to make sure that evaluation is done as part of and for learning, such as portfolios, group and collaborative projects, games, quizzes, role plays, oral presentations, and quick exams.

**Lohans Kumar Kalyani**

- **Learning Progress Tracking:** Establish mechanisms to track the learning levels of all students, ensuring a dynamic and responsive approach to education.

NIPUN Bharat Mission Benefits

Children between the ages of 3 and 9 benefit greatly from the NIPUN Bharat Yojna's emphasis on helping them build the fundamental reading and numeracy skills that are necessary for their overall development.

- **Comprehensive Support:**By providing support to pupils from preschool through Class 3, the NIPUN Scheme guarantees a thorough approach to early childhood education.
- **Targeted Assistance for Classes 4 and 5:**Special provisions are established for children in Classes 4 and 5 who may not have the foundational skills as part of the NIPUN Bharat objective. To improve their academic performance, these children get committed peer assistance, tutoring, and additional learning resources.
- **Public and Private School Integration:**The mission aspires to achieve its objectives across both private and government-aided schools, intending to cover the entire educational spectrum by the year 2026-27.
- **Clear Learning Goals - "Lakshya":**The NIPUN Bharat Mission sets clear and measurable learning goals, encapsulated under the term "Lakshya," ensuring a focused and goal-oriented approach towards educational outcomes.

Level Learning Outcomes**(i). Balvatika:**

- **Identifies letters and their corresponding phonemes:** The foundational stage involves the recognition of letters and their corresponding sounds, setting the groundwork for language acquisition.
- **Capable of reading simple words with at least two or three alphabets:** Children at this level progress to reading basic words, typically consisting of 2 to 3 alphabets, enhancing their language skills.
- **Recognizes and reads numerals up to 10:** The introduction to numerals begins at this stage, with an emphasis on recognizing and reading numbers up to 10.
- **Sequences the numbers, items, shapes, and occurrences of events:** Developing a sense of order and sequence is fostered, encompassing the arrangement of numbers, objects, shapes, and understanding the occurrence of events in a sequence.

(ii). Grade 1:

- **Reads simple phrases in an age-appropriate unknown text that have at least four to five simple words:** Progressing from single words, students in Grade 1 advance to reading small sentences, typically composed of 4-5 simple words, in texts unfamiliar to them.
- **Read and write numbers up to 99:** Numeric literacy expands, enabling students to read and write numbers up to 99, enhancing their mathematical capabilities.
- **Perform simple addition and subtraction:** Basic arithmetic operations, such as addition and subtraction, become part of the learning outcomes at this stage.

(iii). Grade 2:

- **Read with meaning:** The focus intensifies on reading comprehension, encouraging students to read with a deeper understanding of the content.
- **45 – 60 words per minute:** Reading fluency is emphasized, with the target of achieving a reading speed of 45-60 words per minute.
- **Read and write numbers up to 99:** Numerical proficiency continues to develop, with students maintaining the ability to read and write numbers up to 99.
- **Subtract numbers up to 99:** The scope of mathematical operations expands, incorporating subtraction of numbers up to 99.

(iv). Grade 3:

- **Read at least 60 words per minute meaningfully:** Reading fluency is further refined, with an increased target of reading at least 60 words per minute.
- **Write and read the digits up to 99:** Numeric literacy remains a focus, with continued proficiency in reading and writing numbers up to 99.

**Lohans Kumar Kalyani**

- **Resolve basic multiplication issues:** Introduction to multiplication is initiated, with students expected to solve simple multiplication problems, laying the foundation for more advanced mathematical concepts.

Implementation of NIPUN Bharat

- The implementation of NIPUN Bharat would be under the purview of the Department of School Education and Literacy. A comprehensive five-tier implementation system operating at the national, state, district, block, and school levels will be in place for all States and Union Territories. This project is funded centrally as part of the Samagra Shiksha initiative.
- Three previous programmes, Teacher Education (TE), RMSA, and SSA, were combined into the new 'Samagra Shiksha' programme. This program's main objective is to handle schooling from preschool through Class XII in an all-encompassing manner.
- NCERT is assisting NISHTHA in developing a specific package for FLN under the auspices of NIPUN Bharat. An ambitious initiative to train almost 25 lakh instructors are using FLN to educate pre-primary through primary classes.
- NISHTHA is a vital capacity-building program that aims to improve school education quality by providing integrated teacher training. The training objectives are outlined in a step-by-step manner that includes pre-primary or balvatika sessions, guaranteeing a methodical approach to learning at every level.

Expected Outcomes OF NIPUN

The anticipated outcomes of NIPUN encapsulate a spectrum of transformative impacts on the educational landscape, emphasizing foundational skills and holistic development.

- **Retention and Transition:** It is hoped that foundational skills would act as a solid base, reducing the number of students dropping out and promoting a smooth transition from elementary to upper primary and secondary education.
- **Quality Enhancement:** The implementation of activity-based learning strategies coupled with a conducive learning environment is poised to elevate the overall quality of education, providing a more enriching and immersive experience for students.
- **Innovative Pedagogies:** The incorporation of innovative pedagogical approaches, including toy-based and experiential learning, is set to infuse joy and engagement into classroom transactions, making learning a vibrant and participatory endeavor.
- **Empowered Teachers:** Through intensive capacity-building initiatives, teachers are expected to be empowered, granting them greater autonomy in selecting and implementing pedagogical methodologies tailored to the unique needs of their students.
- **Holistic Child Development:** NIPUN lays a strong focus on the holistic development of children, covering a wide range of areas including literacy and numeracy proficiency, life skills, physical and motor abilities, socio-emotional health, and cognitive development. A thorough Holistic Progress Card will represent these interrelated aspects.
- **Accelerated Learning Trajectory:** Enabling children to achieve a steeper learning trajectory is anticipated to yield positive impacts on later life outcomes and employability, setting the stage for lifelong success.
- **Equitable Access:** Given the near-universal attendance of early grades, the strategic focus on this stage is poised to disproportionately benefit socio-economically disadvantaged groups, ensuring equitable and inclusive access to quality education.

Effectiveness of Nipun Bharat Yojana in the present Education System

The NIPUN Bharat Yojana holds significant importance in the present education system, offering a multifaceted approach to address crucial aspects and challenges. Here are some key points highlighting its usefulness:

- **Foundational Skills Enhancement:** NIPUN Bharat concentrates on teaching kids between the ages of three and nine fundamental reading and numeracy abilities. By targeting these formative years, the scheme aims to equip students with essential skills that lay the groundwork for future academic success.

**Lohans Kumar Kalyani**

- **Early Intervention for Lifelong Learning:** Early childhood is a critical phase for cognitive development. NIPUN Bharat's emphasis on foundational skills ensures early intervention, setting children on a trajectory for lifelong learning and enabling them to grasp more advanced concepts as they progress through the education system.
- **Reducing Dropout Rates:** By enhancing foundational skills, NIPUN Bharat seeks to reduce dropout rates. Strong foundational literacy and numeracy skills contribute to better comprehension and engagement, making it more likely for students to remain in school and pursue higher education.
- **Inclusive Education:** Through the use of a variety of pedagogies, such as play-based and activity-based learning, the program seeks to establish an inclusive learning environment in the classroom. Children from different backgrounds and skill levels can actively engage in the learning process thanks to this inclusion.
- **Quality Enhancement through Holistic Development:** NIPUN Bharat goes beyond academic skills and emphasizes holistic development, including physical, emotional, and cognitive aspects. This holistic approach contributes to the overall quality of education, nurturing well-rounded individuals.
- **Empowering Teachers:** The scheme recognizes the pivotal role of teachers in achieving its objectives. Capacity-building initiatives for teachers ensure they are well-equipped to implement effective teaching methodologies, creating a positive impact on students' learning experiences.
- **Innovative Pedagogies for Engagement:** NIPUN Bharat promotes cutting-edge pedagogies to make learning more interesting and pleasurable, like toy-based and experiential learning. This not only enhances educational outcomes but also fosters a love for learning.
- **Assessment and Tracking:** The scheme places importance on continuous assessment through various methods, including portfolios, collaborative work, and quizzes. This allows educators to track the learning levels of students and tailor interventions accordingly.
- **Socio-economic Inclusivity:** By focusing on foundational literacy and numeracy, NIPUN Bharat aims to bridge socio-economic disparities in education. It ensures that children, especially those from disadvantaged backgrounds, have equal access to quality education. NIPUN Bharat Yojana emerges as a comprehensive initiative designed to fortify the foundations of education, enhance learning experiences, and contribute to a more inclusive and equitable educational landscape in India.

Challenges Of Nipun Bharat Yojana

While the NIPUN Bharat Yojana holds promising objectives for improving foundational literacy and numeracy in India's education system, it also faces certain challenges. Here are some key challenges associated with the implementation of NIPUN Bharat:

- **Infrastructure and Resource Constraints:** Many schools, especially in rural areas, face challenges related to inadequate infrastructure, including classrooms, teaching aids, and learning materials. Insufficient resources can hinder effective implementation of NIPUN Bharat's initiatives.
- **Teacher Training and Capacity Building:** The success of NIPUN Bharat relies heavily on the effectiveness of teacher training programs. Ensuring that teachers are adequately trained and have the necessary skills to implement innovative pedagogies can be a substantial challenge, particularly in remote areas.
- **Diversity in Languages and Cultures:** India is a linguistically diverse country with various regional languages and cultures. Adapting teaching materials and methods to cater to this diversity poses a significant challenge. Localized content is essential to ensure that children can relate to the learning materials.
- **Monitoring and Evaluation:** Continuous assessment and tracking of student progress are fundamental to the NIPUN Bharat mission. However, establishing robust monitoring and evaluation mechanisms at various levels, from national to local, can be complex and resource-intensive.
- **Parental Engagement and Awareness:** Engaging parents in the educational journey of their children is crucial. However, in many cases, there may be a lack of awareness or involvement from parents, especially in marginalized communities. Educating and involving parents becomes a challenge.
- **Digital Divide:** With an increasing emphasis on technology-based learning, the digital divide poses a challenge. Not all schools and students have access to digital devices and the internet, leading to disparities in the implementation of online or technology-driven educational programs.

**Lohans Kumar Kalyani**

- **Resistance to Change:** The adoption of novel pedagogical approaches and instructional techniques may encounter opposition from established educational establishments. It might be difficult to persuade parents, administrators, and educators to accept change.
- **Socio-economic Disparities:** Socio-economic disparities among students can impact the effectiveness of NIPUN Bharat. Children from disadvantaged backgrounds may face additional hurdles such as lack of proper nutrition, health issues, and home environments that are not conducive to learning.
- **Alignment with Existing Curricula:** Aligning NIPUN Bharat initiatives with existing curricula and examination systems can be a challenge. Ensuring that the foundational literacy and numeracy skills align seamlessly with the broader educational framework requires careful planning.
- **Long-term Sustainability:** The sustainability of the initiatives under NIPUN Bharat over the long term is a critical challenge. This involves maintaining the momentum of the program, securing continued funding, and adapting strategies to evolving educational landscapes.

Addressing these challenges will be essential for the successful and sustained implementation of NIPUN Bharat, ensuring that its objectives contribute significantly to improving foundational literacy and numeracy levels across the country.

CONCLUSION

The NIPUN Bharat evaluation highlights the organization's admirable initiatives to improve young students' basic literacy and numeracy abilities in India. The program is a positive step toward achieving the learning goals outlined in the National Education Policy 2020, but there have been challenges encountered along the route that require acknowledgment and resolution. The ability of NIPUN Bharat to lower dropout rates, enhance the transition from elementary to upper primary stages, and establish an engaging learning environment through creative pedagogies is clear evidence of its efficacy. Intense teacher capacity building and a focus on holistic child development all help to improve the educational system as a whole. The report also identifies a number of important obstacles, such as the lack of resources, the digital divide, the diversity of linguistic and cultural environments, and the reluctance to pedagogical innovations. To ensure NIPUN Bharat's long-term success, these issues must be resolved. In order for the project to succeed going ahead, legislators, educators, and stakeholders must work together to improve implementation tactics, supply required resources, and create a positive atmosphere. By doing this, it will be possible for NIPUN Bharat to continue exerting a major effect on the Indian educational system and to ensure that every kid has equitable access to a foundational education of the highest caliber.

ABSTRACT

Children diagnosed with autism spectrum disorders (ASD) have difficulties communicating, interacting with others, and using language. They rarely respond to parents and carers and typically avoid making eye contact. Other disabled youngsters use gestures or nonverbal communication to make up for their lack of language and communication skills. It is rare for kids with ASD to speak out of the blue or have discussions with other kids or adults. While some kids with ASD engage in peer connections on their own, others only react; they don't start conversations. The study's objective is to ascertain how visual aids affect autistic children's social, linguistic, and functional capacities. The current study included a total of thirty individuals, ranging in age from two to nine years old (15 in the experimental group and 15 in the control group). The method used to evaluate functional abilities, while the Indian scale for assessment of autism is used to diagnose autism. notable progress in functional abilities about occupational therapy's visual supports. According to research analysis, visual strategies are quite beneficial for helping children between the ages of 5 and 11 enhance their communication skills. The results of this study lend credence to the idea that the use of visual aids enhances comprehension, boosts engagement, and ultimately leads to more successful communication. The pre-and post-test results for the experimental and control groups were examined. The results are examined in light of important factors that could influence how successful a treatment is in the future for both practice and research. For children with autism, occupational therapy appears to compound the positive effects of both therapeutic modifications by enabling them to be self-sufficient in performing all activities of daily living.

Jegadeesan and Nagalakshmi

INTRODUCTION

Autism Spectrum Disorder (ASD) is frequently associated with language and communication issues, such as difficulties interpreting and producing language. Complex language abilities are needed for conversational speech. It can be challenging for kids with ASD to start and continue a discussion, to take turns in a conversation, and to keep up that interaction. Before starting kindergarten, young children must understand how to end one activity and start another promptly. The effectiveness of using a photo figure cue package to help a young kid with autism successfully transition between daily routines in three distinct school environments, [1]. The article discusses the implications of teaching young infants a range of activities with photo-figure cue packages.. According to, [2] there was a significant increase in the number of grooming behaviors performed by all individuals during treatment. During follow-up, there was only a little decline in behavior completion; this is explained by the pictorial cues, which are frequent stimuli used in other maintenance programming processes to help mentally retarded people develop independent living skills. Baseline-1 and Baseline-2 sessions were carried out, [3]. They removed the schedules when these sessions were over. The children were able to complete a task without supervision or suggestions once the visual supports were removed, therefore it can be said that using visual supports to help autistic pupils transition is successful. According to, [4] autism is a neuro developmental condition that affects socialization and communication and is typified by stereotypical behavior. Globally, autism has advanced in rehabilitation services over the last ten years, and research suggests that the number of cases of autism diagnosis has increased by 50% to 2000%. [5] used the ISAA as a diagnostic tool for autism severity in 400 children who were referred for possible autism and ranged in age from 5 to 15. Results indicated that 78.2% of the 400 children who were chosen to have autism had mild autism, 10.8% had moderate autism, and 11.0% had severe autism.

According to WHOQOL-BREF, parents of children with autism exhibited considerable impairment in all four categories (physical, psychological, social, and environmental) when compared to parents of other children, [6]. The mean summary score for normal kids was 93.12, which is considerably higher than the mean score for kids with minor disabilities. In summary, the ASKp score determination for children without musculoskeletal problems offers valuable insights that can support the ASKp's application in clinical and research contexts to evaluate a child's functional level and track any alterations, [7]. A correlation of 0.81 ($p < 0.0001$) with parent-reported childhood showed the validity of the ASK, and Rasch analysis verified that all questions measured the same construct and validated summary score, [8]. [9], describe three photo-type systems that use mobile personal devices, big group displays, and personal recording technologies to address these design issues. Using visual supports for students with autism in inclusive physical education; analyzing the impact of visual supports on individuals with autism who behave in time-on-task and time-off-task manners in inclusive physical education; and analyzing the impact of visual supports on individuals with autism who behave in assisted task-related ways in inclusive physical education, [10]. After receiving 14 one-on-one sessions, the experimental group showed progress. It is determined that youngsters between the ages of 5 and 11 can develop their communication abilities more effectively by using visual tactics, [11]. Three autistic children were used in the testing, and the results showed that all three of them satisfied the PECS learning requirements and should consequently exhibit improved social communication and behavior, [12]. [13], is to find out how well three low-functioning autistic children may learn daily life tasks using visual self-management. The findings demonstrated that autistic children could effectively utilize pictures to control their behavior when a treatment provider was not present, generalize their behavior to different tasks and environments, and retain their behavior throughout follow-up.

MATERIALS AND METHODS

The objective of the study is to ascertain how visual support affects autistic children's social, communicative, and functional abilities. Pre and Post- tests were conducted in Quasi-experimental design.

**Jegadeesan and Nagalakshmi****MATERIAL SETTINGS**

In total, thirty patients were recruited for this study. They were diagnosed with mild to moderate autism using the ISAA, and they ranged in age from two to nine years. The thirty patients were split into two groups—a control group and an experimental group—and all thirty of them showed delays in social, communicative, and functional skills. Fifteen individuals were drawn from the Occupational Therapy Foundation clinic in Trichunogode for the control group, while the fifteen subjects were drawn for the experimental group from Sri Sarvavidhya Multispeciality Therapy Centre in Erode. The Activities scale for kids is used to quantify social, communicative, and functional skills. The experimental group received visual assistance therapy, while the control group merely received interaction. The therapy was administered for three months, during which time it was increased to one hour on six days each week. The patients in the experimental group had a total of 34 treatment sessions, which were then broken down into 6 sessions: 1–5, 6–10, 11–15, 16–20, 21–25, 26–30, and 31–34. The experimental group of 15 students was divided into two subgroups, consisting of 8 students in one group and 7 students in another. Each group received three days of therapy for its respective subgroup. Pre-test results were obtained using ASK at both groups' entry-level, and post-test results were obtained using ASK once more following the treatment of visual support.

Selection criteria

The selection criteria were divided into two groups: inclusion and exclusion. The study's participant pool consisted of kids with autism who were between the ages of 2 and 9, as per the inclusion criteria. Kids who struggle with communication, socialization, and function. Both males and females were chosen for this study. Children classified as having severe autism (ISAA score > 153). The upper age restriction for the exclusion criteria is nine years old. Based on these criteria, children who had a documented medical history of any severe illness and those who had physical dysfunction were chosen. Mental retardation, Asperger's syndrome, Rett's syndrome, and other associated disorders are excluded by an exclusion criterion.

Equipment

The Activities Scale for Kids (ASK) scales were used for the assessment. The Activities Scale for Kids (ASK), a self-reported indicator of physical impairment in children, shows good reliability (ICC=0.97).

Validity: Based on the premise that the genuine correlation was roughly 0.8 alpha = 0.05, beta = 0.20, the sample size computed for the comparison of the Activities Scale for Kids (ASK) and Childhood Assessment Questionnaire (CHAQ) was based on a correlation of at least 0.6. According to this estimate, 40 out of the 200 children who were gathered for the Rasch analysis were included in the assessment of construct validity, even though baseline data from all 200 children were used.

RESULTS AND DISCUSSIONS**Data Analysis and Interpretation**

The results of both pre and post-tests for the experimental and control groups are displayed in the figures and tables given below, with the significant differences highlighted. The pre-test results of the experimental and control groups' ASK performance are evaluated in [Table 1 and Figure 1]. The ASK performance mean values, according to the unpaired t-test, are 19.733 and the 19.667, t value is 0.03309 and the p-value is 0.9738, in that order. It demonstrates that there is no discernible change in pre-test values for ASK performance between the experimental and control groups. [Table 2 and Figure 2] compare the experimental and control groups' pre- and post-test ASK capacity values. The results of the unpaired t-test reveal that the experimental and control groups' pre-test ASK capacity values do not significantly differ from one another (mean values: 34.133 and 33.333, respectively; t value: 0.3566; p-value: 0.7241). The effectiveness of using a photofigure cue package to help a young child with autism successfully transition between daily routines in three distinct school environments was investigated. The effectiveness of the intervention was assessed using a multiple baseline across contexts methodology. There is a discussion of the implications of teaching young children a range of activities with photofigure cue packages. ASK performance post-test data for the experimental and control groups are compared in [Table 3 and Figure 3]. With a mean value of

**Jegadeesan and Nagalakshmi**

70.800 and 20.666, respectively, t values of 3.061, and a p-value of 0.0048, the unpaired t-test reveals a very significant difference between the experimental and control groups' post-test ASK performance scores. [Table 4 and Figure 4] present a comparison of the ASK capacity post-test values between the experimental and control groups. The unpaired t-test reveals a very significant result with a mean value of 72.400 and 34.600, respectively, a t-value of 6.039, and a p-value of 0.0001. The comparison of the control group's pre- and post-test values for ASK performance is shown in [Table 5 and Figure 5], with mean values of 19.667 and 20.666, respectively, t value of 0.5903, and p-value of $p > 0.05$. It demonstrates that there are no notable differences between the groups. The control group's pre- and post-test ASK capacity values are compared in [Table 6 and Figure 6], with mean values of 33.333 and 34.600, respectively. A t value of 0.6102 and a p value of $p > 0.05$ indicate that there is no significant difference. The experimental group's comparative and post-test results for ASK performance are displayed in [Table 7 and Figure 7]. The paired t-test indicates that the mean values are 19.733 and 70.800, the t-values are 14.697, and the p-value is 0.0167, all of which are highly significant. The findings demonstrated that autistic children could effectively utilize pictures to control their behavior when a treatment provider was not present, generalize their behavior to different tasks and environments, and retain their behavior throughout follow-up. [Table 8 and Figure 8] compare the experimental group's pre- and post-test ASK capacity levels. The mean values of 34.133 and 72.400, as well as the t-value of 10.313 and p-value of 0.0077, indicate that the paired t-test is very significant. It was carried out using thirty kids from Mumbai's special education schools. Visual aids included manual signs, objects, images, and symbols. After receiving 14 one-on-one sessions, the experimental group showed progress. It is established that children between the ages of 5 and 11 benefit greatly from visual tactics in the development of their communication skills. The findings of this study support and strengthen the theory that using visual aids improves understanding, increases participation, and eventually results in more effective communication.

CONCLUSION

The study's findings indicate that, when compared to the control group, the experimental group of autistic children who received visual assistance improved more in social, communicative, and functional skills. This suggests that providing visual assistance to autistic youngsters was a useful strategy for bringing about functional changes in them. Combining a visual support program with occupational Therapy seems to enhance the benefits of both therapeutic changes in children with Autism, which supports them to be independent in doing all their daily tasks.

LIMITATIONS

Convenient sampling was used to enlist participants, and while the researcher used observation and analysis to evaluate the behavioral features, part of the study relied on the subjective input provided by the parents.

ABSTRACT

Soil salinity has become a significant environmental concern due to a growing population and limited arable land. Salt stress on plants has three main effects: It diminishes water potential, disrupts ion balance and homeostasis, and induces toxicity. These alterations in water status initially hinder growth and ultimately limit plant productivity. In this regard, the experimental pot study was carried out to study the impact of salt stress and plant growth regulators salicylic acid and humic acid in mitigating the salinity impact on the *Sesamum indicum* L. (TMV-4) Variety. The plants were treated as, Control, NaCl (100mM), NaCl (100mM) + salicylic acid (1mM), NaCl (100mM) + Humic acid (500mg/L), Humic Acid (500mg/L) and Salicylic acid (1mM/L). The NaCl treatment was given by soil drenching and plant growth regulators were applied by foliar. Plants were collected randomly for experimental study on the 35th, 45th, and 55th, Days after sowing, to analyze the growth parameters and biomass content and estimate pigment composition in *Sesamum indicum* L. NaCl stress caused the reduced effect on root length, shoot length, biomass content, and leaf area of *Sesamum indicum* L. plants, the pigment composition was also declined due to NaCl stress effect. In contrast, the plants treated with salicylic acid and humic acid ameliorate the effects of salt stress and enhance the growth parameters biomass content and pigment composition in the *Sesamum indicum* plants. Thus, it can be concluded that these two plant growth regulators can be used to mitigate the salinity stress in gingelly plants.

Keywords: Salicylic acid, humic acid, salt stress, gingelly, NaCl.

**Silambarasan and Rajan****INTRODUCTION**

Salinity represents a significant environmental constraint that restricts plant growth and overall productivity. Elevated salinity levels exert adverse effects on plants, manifesting as plant mortality or reduced productivity. Numerous plant species have evolved adaptive mechanisms to counteract the negative impact of salinity, either by preventing salt entry into their cells or by developing tolerance mechanisms to cope with salt accumulation within their cellular environment. [1]. High concentrations of sodium (Na⁺) and chloride ions (Cl⁻) are the primary contributors to salt stress. This stress condition has three main effects as follows: - it diminishes water potential, disrupts ion balance and homeostasis, and induces toxicity. These alterations in water status initially hinder growth and ultimately limit plant productivity. Salt stress encompasses both osmotic and ionic stress components. [2,3,] Salt stress prompts a rapid reduction in leaf surface expansion rates, eventually halting expansion as salt concentration increases. Furthermore, it leads to a substantial decrease in the fresh and dry weights of leaves, stems, and roots. [4]. As salinity levels rise, the water potential and osmotic potential of plants become increasingly negative, while turgor pressure increases. [5] Under salt stress, chlorophyll and total carotenoid levels in leaves typically decrease, leading to chlorosis and eventual shedding of the oldest leaves over prolonged exposure to salt stress [6]. *Sesamum indicum* L. commonly known as sesame, is a significant oilseed crop with economic importance.

It is extensively grown across various regions globally, including but not limited to India, China, Thailand, Mexico, Guatemala, Afghanistan, Pakistan, Bangladesh, Indonesia, Sri Lanka, Saudi Arabia, and Turkey[7]. Sesame oil comprises sesamin and sesaminol lignans within its non-glycerol fraction, and these components are acknowledged for their crucial roles in enhancing oxidative stability and antioxidative activity[8]. Salicylic acid has been demonstrated to have a pivotal function in activating defense mechanisms against various abiotic stresses, such as salinity and osmotic stress. Several research investigations have indicated that the external application of salicylic acid (SA) can mitigate the toxic effects caused by salinity stress in numerous plant species[9,10]. Exogenous SA treatment induces the expression of pathogenesis-related (PR) genes, including PR1, PR2, and PR5 [11]. Humic acid, found in organic humus, is not classified as a fertilizer but rather as a plant bio-stimulant. Its application leads to significant enhancements in soil and plant characteristics, thereby effectively enhancing plant growth and productivity [12]. Humic acid possesses the capacity to safeguard plants from both abiotic and biotic stresses while also fostering their growth and development. This stimulation contributes to enhanced yields and agricultural production. [13]. The beneficial impacts of humic acid have been associated with enhancements in soil characteristics, including aeration, aggregation, water retention capacity, ion availability, and transport mechanisms. These improvements facilitate more efficient uptake of nutrients and water by plants, as well as increased accumulation of photosynthates, particularly in conditions of water stress[14,15].

MATERIALS AND METHODS

Sesamum indicum L. specifically the TMV-4 variety was purchased from Tamil Nadu Agricultural University in Coimbatore (TNAU), Tamil Nadu, India. The chemical regulators Humic acid, salicylic acid, and the analytical reagent sodium chloride (NaCl) were purchased from Sisco Research Laboratories [SRL] based in Chennai India.

Experimental design

An experimental study on the plant *Sesamum indicum* L. was conducted at the Botanical Garden situated within the Department of Botany at Annamalai University, located in Chidambaram, Tamil Nadu. The geographical coordinates of the experimental site were recorded as 11°23'23.1"N and 79°43'05.3"E. Prior to sowing, the healthy seeds underwent surface sterilization utilizing a 0.2% mercuric chloride solution for 2 minutes, followed by extensive rinsing with sterile double-distilled water to ensure sterility. The seeds of the TMV-4 variety of *Sesamum indicum* were then sown in a total of 90 pots, which were further categorized into six distinct groups. Each group, comprising ten replicates, received a single application of mixed fertilizer combined with manure, with the soil composition maintained at a ratio of red soil, sand, and farmyard manure in a 1:1:1 proportion. Various treatments were

Silambarasan and Rajan

administered to the plants. Control, (without treatment) NaCl (100mM), NaCl (100mM) + salicylic acid (1mM), NaCl (100mM) + Humic acid (500mg/L), Humic Acid (500mg/L) and Salicylic acid (1mM/L). The salinity levels within the pots were meticulously monitored at regular intervals by assessing soil samples from each pot using an Electrical Conductivity Meter. Plant specimens were harvested at specific time points (i.e., at the 35th, 45th, and 55th days after sowing [DAS] to conduct morphological and chlorophyll pigment analyses, thereby evaluating the impact of the different treatments on plant growth and physiological parameters.

Root length

The collected plant roots are thoroughly washed with tap water and waited for 15 minutes for drying the moisture. To calculate the root length by measuring below the point of root-shoot transition to fibrous root and the lengths of lateral roots were taken as total root length. The root lengths were expressed in cm plant⁻¹.

Shoot length

The length between the shoot tip and the point of the root stem transition region was taken as shoot length. The stem lengths are expressed in cm plant⁻¹.

Fresh weight

The plant samples that are collected, roots, and shoots were thoroughly washed with tap water and tissue paper was used to remove the excess moisture. The root and shoot fresh weights were taken by using an electronic balance (Model - XK3190-A7M) and the values were recorded and expressed in gm plant⁻¹.

Dry weight

After taking fresh weight, the plants were dried at 60°C in a hot air oven for 48 hours. After drying, the weights were measured and the material was kept in the same oven until the constant dry weight was obtained. The values were expressed in gm plant⁻¹.

Chlorophyll and Carotenoid Content

Collected plant samples in fresh leaf tissues of 500mg were measured and ground in pestle and mortar adding 10ml of 80% Acetone after complete extraction and centrifuge at 800g for 15 minutes, further, the extraction was repeated again and then the supernatant was collected and makeup to a final volume of 20ml of Acetone. The Spectrophotometer is used for absorption of reading @645, 663, 480nm, against 80% acetone blank. Chlorophyll and Carotenoid contents were extracted from the leaves and estimated according to the methods of Arnon's method 1949 and Kirk and Allen 1965 and expressed in mg/gram fresh weight.

STATISTICAL ANALYSIS

The experiment data were analyzed statistically using the SPSS Software {Version 22.0} followed by one-way ANOVA. The obtained data represented in bars are mean values of replicates. The P≤0.05 result was chosen as significance by Duncan's Multiple Range Test [DMRT].

RESULTS AND DISCUSSIONS

Root length

The plants treated with NaCl show a reduction in root length compared to the control. The plants that are foliar applied salicylic acid and humic acid show increased root length compared to the control. While the plants treated with NaCl + Salicylic acid and NaCl + humic acid show a reduction in root length compared to the control and the plants treated with plant growth regulators. (Fig-1) NaCl stress affects the root length of the two different cultivars (cv. *Orhangazi* and cv. *Cumhuriyet*) of *Sesamum indicum* at the concentration of 100 mM Concentration [16]. It's reported that the root length and dry mass were reduced due to salinity in wheat plants [17]. Elevated levels of salinity detrimentally impacted the root development of purslane (*Portulaca oleracea* L.), manifesting in reduced

Silambarasan and Rajan

metrics such as root area, root volume, main root length, and total root length [18]. And similar decline in growth was seen in *Zea mays* [19].

Stem length

Salt stress reduced the stem length in *Sesamum indicum* L. compared to the control. However, the plants treated with salicylic acid and humic acid show increased stem length as compared to control. The plants treated with NaCl + SA and NaCl + HA showed increased stem length than NaCl treated plants but it was found less than the control.(Fig-2) Elevating the levels of NaCl resulted in a reduction in the lengths of the plants. This investigation was conducted on moth bean (*Vigna aconitifolia* L.) [20], radish plants (*Raphanus sativus* L.) [21], and cowpea (*Vigna unguiculata* L.) [22].Applying small amounts of salicylic acid (SA) to the shoots of seedlings of horticultural plants such as habanero pepper (*Capsicum chinense*) or perennial trees like the Ramon (*Brosimum alicastrum*) significantly boosts their growth, advancement, and yield. [23].

Fresh weight and Dry weight

The height of the plants notably decreased following the introduction of NaCl in comparison to the control group. Through our current research, it was noted that applying NaCl at a concentration of 100mM to *sesamum indicum* L. led to a greater reduction in both fresh and dry biomass of the entire plant when compared to plants in the control group. (Fig- 3,4). The plants treated with salicylic acid and humic acid show increased fresh weight and dry weight compared to the control. However, the plants treated with NaCl + SA and NaCl + HA showed less biomass weight compared to the control. NaCl stress affects the fresh weight and dry weight of plants as found in Rice cultivars [24]. *Brassica napus* [25]. Studies have indicated that the application of humic acid and salicylic acids positively influences the growth, yield, and fruit quality of three cultivars of red sweet pepper (*Capsicum annuum*), leading to enhanced plant growth and increased yield. [26].

Chlorophyll and carotenoid content

The plants treated with NaCl exhibit reduced levels of chlorophyll pigments compared to other groups. Control plants demonstrate higher pigment levels in contrast to plants treated with NaCl along with either SA or HA. Additionally, HA-treated plants show lower pigment content compared to those treated with SA. The concentrations of chlorophyll-a, chlorophyll-b, and total chlorophyll are elevated in plants treated with Salicylic acid. However, the plants treated with NaCl + SA and NaCl + HA chlorophyll pigment content in these plants is low as compared to the control. (Fig-5.6.7.) Salinity reduces the soil water potential which can lead to osmotic stress, and decreased water potential, salinity shows a potent effect on the photosynthetic composition of *sesamum indicum* plants. [27] and in *Plantago coronopus* L. [28] salicylic acid has been found in alleviating the salinity stress in *Zea mays* and in increasing photosynthesis. [29]. Similar results of enhancing the photosynthesis were found in *Solanum lycopersicum* L. [30].

Carotenoid content

The carotenoid content declined in the salt-treated plants. However, the plants treated with salicylic acid and Humic acid have high carotenoid content. However, in the plants treated with NaCl + SA and NaCl + HA, the carotenoid content is less as compared to the control.(Fig-8). The plant growth regulators salicylic acid and humic acid have been found to enhance the pigment composition and carotenoid content in *safflower* [31]. Similar results were found in strawberry [32].

CONCLUSION

Salt stress is recognized as one of the most detrimental environmental challenges impacting the agricultural productivity of numerous crops, leading to adverse effects on plant growth, physiological and biochemical traits, vigor, and photosynthetic pigments. Foliar spray of salicylic acid and humic acid mitigates the salinity effects in *sesamum indicum* L. (TMV-4) variety. Overall plants responded well to the exogenous application of salicylic acid and humic acid. And it can be concluded that the application of salicylic acid and humic acid through foliar spraying

Silambarasan and Rajan

represents a potential approach to improve salt tolerance in *sesamum indicum* L. Resulting in enhanced growth and development. However, the precise molecular mechanisms underlying their stress protection function require further exploration.

ACKNOWLEDGMENT

We extend our gratitude to the Head of Department of Botany, for granting us the opportunity to conduct research in the department.

ABSTRACT

Allergy and inflammation are important pathophysiological features of several disabilities or medical conditions such as common cold, runny nose, nasal congestion and sneezing. It is caused due to release of Histamine in our body. An Indian study reported that prevalence of allergic rhinitis was 11.3% in children aged 6–7 years, and 24.4% in children aged 13–14 years. *Thoothuvalai Nei* is a well-known siddha poly herbal drug which is widely used to treat the *Kabhathodam* and diseases preceeding the *Kabha thodam* like *Sayam* (Tuberculosis), *Elai* (Cold), *Irumal* (Cough), *Kasam*, 96 types of *Seththumanoi*, *Megam*, *Uttinanoi*, *Eraippu* (Asthma), *Vaayvu*, *Kundalavaayvu*. To ensure anti-allergic and anti-inflammatory properties of *Thoothuvalai Nei* through molecular docking against target enzyme Histamine H1 receptor. Docking study were carried out for 20 retrieved phytocomponents (Solasodine, Ascorbic acid, Apigenin, Quercetin, Vasicoline, Piperic acid, Piperine, Gallic acid, Gingerenone-A, Chebuloside, Betulonic acid, Phellandrene, Diosgenin, Palmitic acid, Embelin, Beta-Sitosterol, Germacrene, Nerolidol, kaempferol, Elemicin) against target enzyme Histamine H1 receptor. It is observed that 19 phytochemicals except gallic acid reveals significant interaction with the core active amino acid residues present on the target histamine H1 receptor. This study ensures that Siddha poly herbal formulation *Thoothuvalai Nei* possesses promising anti-allergic and anti-inflammatory activity.

Keywords: Anti-allergic activity, Anti-inflammatory activity, Molecular docking *Thoothuvalai Nei*

Suvedha et al.,

INTRODUCTION

Thoothuvalai Nei is an ancient Siddha medicine indicated for *EraippuNoi* in various Siddha literatures. Most of the ingredients of the *Thoothuvalai Nei* possess expectorant, tonic and stimulant and also have anti-inflammatory, analgesic, antimicrobial and antioxidant activity. Hence here ancient Siddha drug *Thoothuvalai Nei* was subjected to molecular docking analysis against Histamine H1 receptor target to ensure its anti-allergic and anti-inflammatory properties. Molecular docking is a key tool in structural molecular biology and computer-assisted drug design. The goal of ligand-protein docking is to predict the predominant binding mode(s) of a ligand with a protein of known three-dimensional structure[1]. Histamine is a nitrogenous organic compound involved in immune responses such as allergy and it functions by combining with specific cellular histamine receptors such as H1, H2, H3 and H4, which are the members of the family of rhodopsin-like G protein-coupled receptors. The histamine H1 receptor (HRH1) is one of the four histamine receptors, and it plays an important role in different physiological functions such as inflammation, gastric acid secretion, mast cell-mediated chemotaxis and neurotransmitter release when bound to histamine[2]. Binding of phytocomponents with the core amino acid (428 TRP) of the target by forming hydrogen bond will hinder the function of the histamine H1 receptor with PDB – 3RZE. These amino acid residues are functionally responsible for binding of substrate and inhibitors. Thereby phytocomponents which inhibit the target H1 receptor may act as a potential therapeutic agent for management of allergic conditions[3]. Crystalline structure of the target H1 receptor with PDB – 3RZE (Figure.1) was retrieved from protein data bank and protein clean-up process was done and essential missing hydrogen atom were being added. Different orientation of the lead molecules with respect to the target protein was evaluated by Autodock program and the best dock pose was selected based on the interaction study analysis [3].

MATERIALS AND METHODS

Docking calculations were carried out for retrieved phytocomponents against target enzyme H1 receptor. Essential hydrogen atoms, Kollman united atom type charges, and solvation parameters were added with the aid of AutoDock tools[4]. Affinity (grid) maps of $\times \times$ Å grid points and 0.375 Å spacing were generated using the Autogrid program [4]. AutoDock parameter set- and distance-dependent dielectric functions were used in the calculation of the van der Waals and the electrostatic terms, respectively. Docking simulations were performed using the Lamarckian genetic algorithm (LGA) and the Solis & Wets local search method[5]. Initial position, orientation, and torsions of the ligand molecules were set randomly. All rotatable torsions were released during docking. Each docking experiment was derived from 2 different runs that were set to terminate after a maximum of 250000 energy evaluations. The population size was set to 150. During the search, a translational step of 0.2 Å, and quaternion and torsion steps of 5 were applied. The ingredient and retrieved phytocomponents are tabulated in **Table 1**. Ligand Properties of the Compounds Selected for Docking Analysis are given in **Table 2**.

RESULTS

Total of 20 bioactive lead compounds were retrieved from the herbs present in the siddha formulation *Thoothuvalai Nei*. From the reported data of the herbs, It was observed from the outcome of the present investigation that all 19 phytochemicals except gallic acid reveals significant interaction with the core active amino acid residues present on the target histamine H1 receptor. The docking poses of the retrieved phytocomponents with the Histamine H1 receptor (PDB: 3RZE), along with 2D interaction plot analysis and hydrogen bond plotting with core amino acid analysis, are depicted in Figures 2 to 22. The molecular docking studies of compounds against the histamine H1 receptor (PDB: 3RZE) and the interaction of lead compound with amino acid residues against the same receptor are summarized and presented in Tables 4 and 5, respectively.

Suvedha et al.,

DISCUSSIONS

Thoothuvalai Nei, a Siddha poly herbal formulation, is believed to possess potent anti-allergic and anti-inflammatory properties based on empirical evidence. However, the molecular mechanisms underlying these effects remain largely unexplored. In this study, we utilize molecular docking techniques to gain insights into the potential interactions between the bioactive compounds present in *Thoothuvalai Nei* and key proteins involved in allergic and inflammatory pathways. The findings from our molecular docking study provide valuable insights into the potential molecular mechanisms underlying the anti-allergic and anti-inflammatory activities of *Thoothuvalai Nei*. The identified interactions between *Thoothuvalai Nei* compounds and histamine H1 receptor associated with allergic and inflammatory pathways support the traditional claims of its therapeutic efficacy. Further experimental validations, such as in vitro and in vivo studies, are warranted to corroborate the computational findings and establish the translational potential of *Thoothuvalai Nei* in allergic and inflammatory conditions.

CONCLUSION

Based on the results of the computational analysis it was concluded that almost all bio-active compounds present in herbal ingredients belongs to the siddha formulation *Thoothuvalai Nei* possess significant binding against the target histamine H1 receptor by interacting with active amino acid present on the active site thereby it was concluded that these compounds may exerts promising anti-allergic and anti-inflammatory activity.

ABSTRACT

The present study reports the taxonomy, distribution, and identification of two prominent plant-parasitic nematode species from litchi (*Litchi chinensis*) orchards in the region of Jammu and Kashmir, India. *Aporcelaimellus obtuse caudatus* has been documented specifically in litchi orchards, where as *Orientyluscitri* has been observed in mixed cropping apple orchards alongside cucurbits. Detailed morphological were conducted to characterize these nematode species, facilitating accurate identification. Understanding the taxonomy and distribution of these nematodes is essential for devising effective management strategies to mitigate their impact on litchi and other crops in the region.

Keywords: Plant parasitic nematodes, Nematodes, Crops, Damage, Litchi, Apple, Jammu

INTRODUCTION

Plant-parasitic nematodes, microscopic worms, represent a formidable menace to global agriculture by inflicting extensive harm on crops [1-3]. These nematodes, originating from various genera, infiltrate the roots of numerous crops, resulting in diminished nutrient absorption, hindered growth, and eventual yield reduction [4]. Recent research endeavors have presented the intricate interplay between plant hosts and nematodes, elucidating the molecular mechanisms underlying nematode parasitism [5]. By investigating into the molecular intricacies of nematode-plant interactions, researchers have identified key pathways and molecules involved in nematode

**Jatinder Singh and Shashi Kiran Solanki**

invasion, feeding, and manipulation of host physiology [6]. This deeper understanding opens avenues for the development of targeted strategies to disrupt these interactions and enhance plant resistance to nematode infestation [7]. Moreover, advancements in nematode management strategies extend beyond conventional chemical control methods. Researchers are exploring alternative approaches such as the use of biocontrol agents, soil amendments, and cultural practices to mitigate nematode damage sustainably [8]. These environmentally friendly methods offer promise for reducing reliance on chemical pesticides and promoting the long-term health and productivity of agricultural ecosystems. As researchers continue to unravel the complexities of nematode-plant interactions and innovate in nematode management, the agricultural community moves closer to achieving sustainable and resilient crop production systems capable of withstanding the threats posed by plant-parasitic nematodes [9].

The genus *Aporcelaimellus* Heyns, 1965, classified within the family Aporcelaimidae (Heyns, 1965), predominantly preys upon Oligochaeta worms and nematodes [9]. These nematodes typically possess a robust medium-sized body structure characterized by an offset labial region, a short odontostyle featuring a large aperture, a short rounded tail, and two distinct cuticle layers with differing refractive properties [10]. Male specimens are seldom encountered within this genus. *Aporcelaimellus* is widely distributed and ranks among the most prevalent soil nematodes. Notably, the species *A. obtusicaudatus* (Bastian, 1865) Altherr, 1968 stands out as one of the most ubiquitous terrestrial nematodes, with its range extending across the globe [11]. Researchers have examined and distinguished the genera *Orientylus* and *Calvatylus*. They transferred four species from *Rotylenchus* to *Orientylus*, renaming them as *O. helicus* n.comb., *O. citri* n.comb., *O. secundus* n.comb., and *O. siddiqii* n.comb. Additionally, they identified a new species, *O. geraerti* n.sp., discovered in soil surrounding grass roots in Dalhousie, District Chamba, H.P., India[12].

The present study represents a significant contribution to the understanding of plant-parasitic nematodes in the region by providing the evidence of two nematode species from Jammu and Kashmir, India. This report adds a crucial part to the nematode distribution and diversity in the northwestern Himalayas, shedding light on the geographical range of this particular species. Understanding the dynamics of nematode populations in this region is essential for farmers, agronomists, and researchers to implement effective and sustainable measures to mitigate potential crop losses. This finding emphasizes the importance of continuous monitoring and research efforts to stay ahead of emerging plant health threats and underscores the need for global collaboration to address the challenges posed by plant-parasitic nematodes.

MATERIALS AND METHODS

As a part of the nematode diversity assessment in Jammu and Kashmir, soil samples were collected from Tehsil Akhnoor in District Jammu, located at coordinates 32°.87' N 74°.73' E, at an altitude of 301 m (988 ft.) and District Doda, GandohBalessa, 33.0322° N, 75.9100° E, 662m (Fig. 1). The collection was made in September 2023 from an agricultural land with grapevines, at depths ranging from 0 to 15 cm and 10 to 20 cm. In order to inhibit evaporation, the samples were meticulously preserved in polythene bags that were tightly fastened with rubber bands. The Baerman funnel technique and decanting method was used for nematode isolation during the processing of soil samples. Using the Baerman funnel method, the turbid solution was delicately agitated manually to disintegrate clumps. The solution was further filtered using a coarse sieve to remove any unwanted particles, and then passed through a 300-micron mesh sieve to specifically catch root nematodes by Cobb's sieving and decanting method and Baermann funnel technique [13, 14]. The decantation technique involves the amalgamation of soil and water, followed by the process of sedimentation, and finally, the separation of the water by pouring it out. The mud suspension was deposited onto a petri dish containing a small quantity of water, thereby exposing nematodes suspended or attached to the surface of the dish. Individual live nematodes were selected using a size 0 brush. The nematodes were exterminated by immersing them in test tubes containing a solution of 70 percent alcohol. They were then kept undisturbed for a duration of 24 hours prior to further handling. Lactophenol was used for the purpose of conducting morphological and anatomical analysis, namely during the process of cleaning and mounting. Accurate categorization of nematodes was achieved by the use of morphological and image-based analysis. For the

Jatinder Singh and Shashi Kiran Solanki

identification of nematodes, temporary slides were made and studied under Olympus BX51 compound microscope and identification was confirmed with the help of available literature [12, 15, 16, 17, 18, 19].

RESULTS

Species examined

1 ♀, INDIA, Jammu and Kashmir, District Jammu, Tehsil Akhnour, 32° .87' N 74° .73' E, 301m, 19.09.2023, Jatinder Singh, Voucher specimen (DOZ-J&K-25).

Distribution and Host Range

Aporcelaimellus obtusicaudatus are soil-dwelling nematodes with a predilection for consuming bacteria and algae as part of their free-living lifestyle [20].

Species Description

The female *Aporcelaimellus obtusicaudatus* (Bastian, 1865) Altherr, 1968 exhibited a slender and elongated body morphology, which was typical of the genus with total body size (2.5 mm) (Fig. 2). The cuticle was finely annulated, appearing smooth under light microscopy. The lip region was rounded and slightly offset from the rest of the body. The stylet was robust and well-developed, bearing three prominent knobs at its base. The esophageal glands were

**Jatinder Singh and Shashi Kiran Solanki**

prominent, extending posteriorly towards the intestine. The vulva was located approximately at the mid-body region and was characterized by a slightly raised vulval lip. The tail was bluntly rounded, with a distinct hyaline terminus. Morphometric measurements of body length, stylet length, esophageal length, and tail length were consistent with the species description. Overall, these morphological features distinguished the female *A. obtusicaudatus* from other members of the genus, facilitating its taxonomic identification.

Species account

Phylum: NEMATODA

Order: DORYLAIMIDA

Family: HOPLOLAIMIDAE Filipjev, 1934

Subfamily: HOPLOLAIMINAE Filipjev, 1934

Genus: *Rotylenchus* Filipjev, 1936

Species: *Orientylus citri* (Rashid & Khan, 1973) Jairajpuri & Siddiqi, 1977

Basionym: *Rotylenchus citri* Rashid & Khan, 1973

Species examined

1 ♂, INDIA, Jammu and Kashmir, District Doda, Gandoh Balessa, 33.0322° N, 75.9100° E, 662m, 24.09.2023, Jatinder Singh, Voucher specimen (DOZ-J&K-27).

Distribution and Host Range

The host of *Orientylus citri*, formerly classified as a species of *Rotylenchus*, primarily includes citrus plants. This nematode species is known to infest various citrus species, such as oranges, lemons, grapefruits, and mandarins, among others [21]. It can cause damage to citrus trees by feeding on the roots, leading to stunted growth, reduced yield, and susceptibility to other diseases. Additionally, in some cases, *Orientylus citri* has been reported in association with other crops or plants in citrus-growing regions, potentially indicating a broader host range under specific environmental conditions [22].

Species Description

The male specimen typically exhibited a slender and elongated body shape, with a distinctively shaped lip region and body size (0.99mm) (Fig. 3). Its stylet is well-developed and often bears prominent knobs at its base. The esophageal glands were observable, extending posteriorly toward the intestine. Males of *Orientylus citri* are relatively rare compared to females. Additional features included the presence of spicules and a gubernaculum, which are structures associated with reproduction in male nematodes. Detailed morphological and morphometric measurements are often employed to accurately characterize and differentiate male *Orientylus citri* specimens from other closely related species within the genus.

DISCUSSION

In our comprehensive examination, *Aporcelaimellus obtusicaudatus* emerges as a pivotal species within soil nematode communities, showcasing not only its extensive geographical distribution but also its remarkable adaptability to various ecological niches. By elucidating its feeding preferences, which predominantly target bacteria and algae, alongside detailing its unique morphological features and habitat preferences, we contribute to a deeper understanding of its ecological role. Moreover, our findings underscore the need for further investigations into its interactions with other soil organisms and its potential implications for soil health and nutrient cycling dynamics. Meanwhile, our exploration of *Orientylus citri*, previously classified under *Rotylenchus*, untangles insights into its host specificity, particularly its affinity for citrus plants, thereby highlighting its significant implications for citrus cultivation. The detailed characterization of its morphological traits aids not only in its accurate identification but also in the development of targeted management strategies to mitigate its detrimental impact on citrus orchards. As we investigate deeper into the ecological nuances of these nematode species, there remains a pressing need for

Jatinder Singh and Shashi Kiran Solanki

ongoing research efforts aimed at unraveling their broader ecological roles and devising sustainable management practices for agricultural systems worldwide.

ABSTRACT

Cocos nucifera (CN), commonly known as Coconut tree, has many applications. Generally, coconut shells are considered as waste product. Coconut shells can be used as a source of protease enzyme. Protease enzyme from the coconut shells have many applications. Protease enzyme was extracted from the coconut shell and it was characterized. In this study our aim was to assess the antimicrobial and Cleansing activity (Bloodstain removal), of the coconut shell protease enzyme. The agar disc diffusion method was used for antibacterial and antifungal screening. Protease enzyme from the coconut shell shows excellent inhibitory activity against both gram-positive and gram-negative bacterial strains. The Blood stain removal was done by wash test method. Stains were removed when they were treated with a combination of Coconut shell protease and commercial detergent. This would be used as an alternative in detergent making industries and it is eco - friendly.

Keywords: Coconut shell Protease, antibacterial, antifungal, Blood Stain Removal.

Hema and Poongothai

INTRODUCTION

The genus *Cocos* (coconut) is a member of the *Aracaceae* family. The nutritional and therapeutic characteristics of coconut make it a popular tropical fruit in many nations. The majority of the time, coconut meats are utilized as a staple meal, while other coconut plant parts can be used to make wood and crafts. Throughout history, coconut has also been known as a source of essential oils with biological activity. Coconut shell is a component of coconut that is rarely used in high-value goods. Traditionally, coconut shell is burnt and utilized in cooking. This approach may cause air pollution. At the moment, agricultural waste is receiving greater attention than in the past. Since it is less expensive also more effective for the creation of natural goods, and the best waste disposal option. Particularly, in underdeveloped nations, infectious infections are a significant cause of death and disability among the general population.[1] As microorganisms are increasingly becoming resistant to traditional antimicrobials, in recent years pharmaceutical companies have been driven to create novel antimicrobial medications. There are common reports on bacterial isolates that are known to be sensitive to commonly used drugs but which have become multi-resistant to other medications that are available on the market.[2] This suggests that bacterial species possess the genetic ability to acquire therapeutic properties. Several pathogenic and spoilage bacteria and fungi are becoming more and more resistant to drugs. The focus of scientific research in this area is shifting toward natural ingredients.[3] The growth of pathogenic and spoilage microbes can be slowed by using plant protease enzymes with antimicrobial characteristics from a variety of sources, including fruits, leaves, peels, and herbs. These days, plant Protease is used as an inexpensive, effective, and completely acceptable organic food additive in all industries [4]. It is becoming more popular to use biological resources and by-products to extract bioactive compounds with antimicrobial effects. [5] Existing research has demonstrated that the partly purified proteolytic extract of the pineapple, fig, papaya, etc., shows antibacterial activity against gram-positive and gram-negative bacteria.

Proteases are most often used in laundry detergents, where they help in the removal of stains caused by protein.[16] Protein stains are attacked by protease enzymes, which break down protein molecules into shorter chains of amino acids that may be readily removed from the cloth after washing.[6] Proteases are also expected to play a significant role in the development of environmentally friendly technologies as well as in many bioremediation procedures. Proteases can break down proteins into peptides and amino acids. They are distinguished by the temperature and pH at which they function best in removing the stains. Their capacity to hydrolyse specific proteins has drawn considerable interest as a potential chemical alternative. An enzyme should be stable and active in the presence of common detergent additives, such as surfactants, bleach activators, builders, fillers, bleaching agents, fabric softeners, and many other formulation additives.[7] Proteases may also be employed in the textile industry to remove the stiff and unappealing gum coating of sericin from the raw silk fiber in order to increase the luster and softness. Wool and silk fibers can undergo protease treatments to change their surface, creating novel and distinctive finishes.[8] Protease addition to detergents significantly improves (35–40%) cleaning performance (especially in eliminating stains containing proteins, such as blood) and enhances the consumption of surface-active compounds, Surface active compounds are molecules that can adsorb to solid surfaces or fluid interfaces, allowing them to function as multifunctional ingredients, hence enhancing the ecological situation.[9] The objective of this study was to investigate the impact of the purified proteolytic extract (Protease enzyme) from the Coconut shell for the antimicrobial and stain removal activity.

MATERIALS AND METHODS

COCONUT SHELL PROTEASE ENZYME EXTRACTION

10 grams of coconut shell powder was weighed and soaked in 100 ml of Hydroalcohol solvent, heated in a water bath at 100°C for 15 minutes, and kept for incubation for over 48 hrs. After incubation the extract was filtered and the collected extract was taken for the purification and characterization process. After purification, the purified protease enzymes were checked for antimicrobial and Cleansing properties. [10]

**Hema and Poongothai****DETERMINATION OF ANTIMICROBIAL ACTIVITY****ANTIBACTERIAL ACTIVITY**

The antibacterial activity of coconut shell protease enzyme was tested against both Gram-positive and gram-negative bacteria (*Staphylococcus aureus*, *Escherichia coli*, *Pseudomonas aeruginosa*, *Salmonella typhi*, and *Bacillus sp.*), and the zone of inhibition were recorded (figure: 1 and table:1). Ampicillin (1mg/ml) and Penicillin (1mg/ml) was used as positive control; negative control was double distilled water. In *Pseudomonas aeruginosa* and *Salmonella typhi* inoculated plates, the maximum zone of inhibition was observed. Coconut shell liquid smoke inhibited only gram-positive bacteria (Kailaku et al., 2017) and in the case of coconut husk extract maximum inhibition was found only in gram-negative bacteria. Coconut shell protease had excellent antibacterial activity against *Staphylococcus aureus* (13mm), *Escherichia coli* (15mm), *Pseudomonas aeruginosa* (20mm), *Salmonella typhi* (19mm), and *Bacillus sp.* (16mm). Of different bacteria tested, Coconut shell protease showed maximum inhibition against *Pseudomonas aeruginosa* (20mm), compared to standard antibiotic penicillin (14mm). The zone of inhibition in *Salmonella typhi* was measured as 19 mm which was similar to that of the standard antibiotic ampicillin (20mm) Temikotan et al., 2021). When compared to other studies that show antimicrobial properties for coconut husk extract and coconut shell liquid smoke, the current study on antimicrobial property of coconut shell protease demonstrated that it inhibited both gram-positive and gram-negative bacteria. Hence Coconut shell protease can be exploited for its effective antimicrobial nature.

ANTIFUNGAL ACTIVITY

The antifungal activity of coconut shell protease was tested against *Aspergillus niger* and *Candida albicans* and the results were recorded. The results were shown in Figure: 2 and table: 2. Coconut shell proteases possess antifungal activity for the fungi like *Aspergillus niger* and *Candida albicans*. In *Aspergillus niger*, Amphotericin B was used as positive control and the zone of inhibition was measured as 14 mm and the zone of inhibition of the enzyme was measured as 10mm. In the case of *Candida albicans* the maximum zone of inhibition was noted as 30mm, which is higher than the standard antibiotic Fluconazole (14mm). When compared to *Aspergillus niger*, *Candida albicans* shows the maximum zone of inhibition (30mm). Earlier studies by Jayasree et al., 2019 reported that coconut shell oil shows the maximum zone of inhibition (30mm) against *Candida albicans* which is found equal to the zone of inhibition (30mm) exhibited by coconut shell protease. Ethanol extract from coconut shells shows maximum inhibition for *C. albicans* because of the presence of phenols and other metabolites in it. Coconut shell liquid smoke does not inhibit the growth of *Candida sp.*, (Kailaku et al., 2017). Current research and earlier literature conclude that coconut shell protease plays a prominent role in inhibiting the growth of fungi and ensures that it can act as a best antibiotic for fungal infections.

Blood stain removal

Coconut shell powder proteases were also used to remove the blood stains on clothes. Blood stain removal was studied by washing test. For this study, five white cotton cloth pieces were taken (5cm X 5cm) and stained with blood, then it was dried at 95 - 100°C in the oven for 5 minutes. The stained clothes were used for stain removal studies. Five different sets of treatments were given as follows. Set 1: Water (100 ml) + empty cloth (control), Set 2: Water (100 ml) + blood stained cloth (control), Set 3: Water (100 ml) + blood stained cloth + 2 ml of partially purified enzyme (1.5 U/ml). Set 4: Water (100 ml) + blood stained cloth + 1 ml of commercial detergent (5 mg/ml) + 1ml of partially purified enzyme (1.5 U/ml). Set 5: Water (100 ml) + blood stained cloth + 2 ml of commercial detergent (5 mg/ml). Set 6: Water (100 ml) + blood stained cloth + 1 ml of commercial detergent (5 mg/ml) + 2 ml of partially purified enzyme (1.5U/ml). The stained cloths were incubated for 10 minutes at 55°C. In each set of treatments, three pieces of cotton cloth were maintained. After incubation, the cotton pieces from each set were removed, cleaned with distilled water, dried, and visually examined. Blood-stained cotton pieces that had been treated with water were used as a control.

RESULTS AND DISCUSSION

COCONUT SHELL PROTEASE ENZYME EXTRACTION

Protease enzyme was isolated from Coconut shell powder at 100°C. The extracted protease enzyme was checked by qualitative and quantitative analysis. Coconut shell proteases have 1.1 mg/ml of protein and 1.5U/ml of protease in them. Characterization studies were carried out. In this study, the antimicrobial and Cleansing activity of Coconut shell protease were checked.

DETERMINATION OF ANTIMICROBIAL ACTIVITY

ANTIBACTERIAL ACTIVITY

The antibacterial activity of coconut shell protease enzyme was tested against both Gram-positive and gram-negative bacteria (*Staphylococcus aureus*, *Escherichia coli*, *Pseudomonas aeruginosa*, *Salmonella typhi*, and *Bacillus sp.*), and the zone of inhibition were recorded (figure: 1 and table: 1) In this positive control used was Ampicillin (1mg/ml) and Penicillin(1mg/ml); negative control was double distilled water. In *Pseudomonas aeruginosa* and *Salmonella typhi* inoculated plates, the maximum zone of inhibition was observed. Other bacteria were also inhibited by the coconut shell protease enzyme. When compared to other studies that show antimicrobial properties for coconut husk extract, coconut shell extract and coconut shell liquid smoke this coconut shell protease inhibits both gram-positive and gram-negative bacteria, but in that case, the coconut shell liquid smoke inhibits only the gram-positive bacteria (Kailakuet *al.*, 2017) and in the case of coconut husk extract maximum inhibition was found only in gram-negative bacteria (Temikotan *et al.*, 2021). Hence Coconut shell protease enzyme inhibits both gram-positive and gram-negative bacteria.

ANTIFUNGAL ACTIVITY

The antifungal activity of coconut shell protease enzyme was tested against *Aspergillus niger* and *Candida albicans* and the results were recorded. The results were shown in Figure: 2 and table: 2. When compared to *Aspergillus niger*, *Candida albicans* shows the maximum zone of inhibition (30mm). In earlier studies, Jayasreeet *al.*, 2019 reported that coconut shell oil shows the maximum zone of inhibition against *Candida albicans* which is equal to the zone of inhibition of coconut shell protease enzymes. Ethanol extract from coconut shells shows maximum inhibition for *C. albicans* because of the presence of phenols and other metabolites in it. Coconut shell liquid smoke does not inhibit the growth of *Candida sp.*, Kailakuet *al.*, 2017. Current research and earlier literature conclude that coconut shell protease plays a prominent role in inhibiting the growth of fungi and it would act as a best antibiotic for fungal infections.

Blood stain removal

In this present study, partially purified protease from coconut shell powder has been used as the cleansing supplement in blood stain removal along with the commercial detergent (Surf excel). Results were shown in the figure 3(a), 3(b) and 3(c). Figure 3(a) explains the 6 different sets of blood-stained clothes for the stain removal treatment and figure 3(b) shows the dried blood-stained clothes and in figure 3(c) shows the stain-removed clothes after the treatment with Coconut shell protease enzyme and with commercial detergent. Totally 6 different treatments were used for this assay, in that Set1 plain cloth was kept as negative control and it was treated with 100 ml of distilled water. In set 2 the blood-stained cloth was used as positive control and it is treated with 100 ml of distilled water. In set 3 the blood-stained cloth was treated with 100 ml of distilled water along with 1 ml of commercial detergent (5 mg/ml) and 2 ml of partially purified enzyme (3 U). In set 4 the blood-stained cloth was treated with 100 ml of distilled water along with 1 ml of commercial detergent (5 mg/ml) and with 1 ml of partially purified enzyme (1.5U) and in set 5 the blood-stained cloth was treated with 100 ml of distilled water and with 2ml of partially purified enzyme (3U). In set 6 the blood-stained clothe was treated with 100 ml of distilled water and with 2 ml of commercial detergent (5mg/ml) of all the treatments. Treatment 3 shows a much better result in removing the stain than the other set of treatments. The study concluded that the combination of the Coconut shell Protease and the commercial detergent shows excellent activity in stain removal. The blood stain was partially removed when they

Hema and Poongothai

were treated with Coconut shell protease alone and stains were partially removed when they were treated with commercial detergent alone. Shanmugavel *et al.*, 2016 reported that protease enzyme from *Aspergillus tamari* was used for treating the blood-stained clothes with a combination of commercial detergent (7mg/ml) for 10 mins and the blood stains were removed. Similarly in current study, the blood stains were removed when they were treated with 5mg/ml of commercial detergent along with 2 ml of the coconut shell protease enzyme for 10 mins. It shows that the enzyme from coconut shell protease gave a better result than the *Aspergillus tamari* protease enzyme. Suryawanshi *et al.*, 2017, reported that protease obtained from *Aspergillus niger* and *Trichoderma longibrachiatum* have cleansing properties. Blood-stained clothes were treated with 1% commercial detergent and 1 ml of enzyme of *Aspergillus niger* for 1 hour and *Trichoderma longibrachiatum* shows moderate results in blood stain removal with the combination of 1% commercial detergent and 1 ml of enzyme of *Trichoderma longibrachiatum* for 1 hour. These results also show that coconut shell protease has better cleansing properties than other protease enzymes.

CONCLUSION

From this study, we could conclude that the Coconut shell protease enzyme shows both antimicrobial activity and cleansing activity. Protease extracted from coconut shell at 100°C does not affect the antimicrobial and cleansing activity. This will be useful for the production of antibiotics against disease-causing organisms and also it will protect the environment from getting polluted. This Coconut shell protease would be used as an alternative to hazardous chemicals in the detergent industry in making detergent for laundry purposes.

CONFLICT OF INTEREST

Conflict of interest declared none.

ABSTRACT

The present study evaluated the antimicrobial (AM) activity of aqueous extracts derived from green and black tea (*Camellia sinensis*). Given the growing interest in natural antimicrobial agents, understanding the effectiveness of these commonly consumed teas against various pathogens is crucial for potential therapeutic applications. Multiple samples of tea were collected, and their aqueous extracts were tested for their AM activity against *Escherichia coli*, *Staphylococcus aureus*, *Pseudomonas aeruginosa*, and *Salmonella typhi*. The green and black tea extracts demonstrated significant AM activity ($P < 0.001$) against all selected pathogens. However, green tea exhibited higher antimicrobial efficacy than black tea, particularly in inhibiting *P. aeruginosa*. Packaged tea varieties showed superior antimicrobial activity compared to open forms. Additionally, the minimum inhibitory concentration (MIC) value of all four aqueous extracts (open and packaged green and black teas) displayed potent growth inhibition against the test pathogens. Packaged green and black teas showed MIC values ranging from 400-800 $\mu\text{g/mL}$, while open tea forms showed MIC values ranging from 400-1400 $\mu\text{g/mL}$ against the pathogens. Consequently, it can be concluded that aqueous extracts from *C. sinensis* leaves have the potential to be used as natural AM agents against *E. coli*, *S. aureus*, *P. aeruginosa*, and *S. typhi* pathogens.

**Barkha Bhatnagar et al.,****Keywords:** *Escherichia*, Minimum inhibitory concentration, *Pseudomonas*, *Salmonella*, *Staphylococcus*

INTRODUCTION

Tea is an aromatic beverage crafted from the leaves and buds of the *Camellia sinensis* plant, an evergreen shrub native to Asia[1][2][3]. It is the second most widely consumed beverage globally, surpassed only by water and outstripping the consumption of coffee, beer, wine, and carbonated soft drinks[4]. Teas are categorized into three main types based on their manufacturing process. The first is non-fermented green tea, which undergoes drying and steaming to prevent oxidation; the second is semi-fermented oolong tea, subjected to partial fermentation before drying; and the third is fermented black and red teas, which undergoes post-harvest fermentation, catalyzed by polyphenol oxidase for black tea and by microorganisms for red tea[5][6]. Among the components found in green tea leaves, polyphenols stand out, making green tea a significant dietary source of flavonoids. Conversely, black tea predominantly contains polymerized catechins like theaflavins and thearubigins. These catechins and polyphenols have demonstrated antimicrobial properties, potentially inhibiting various pathogens[7][8][9][10]. The daily moderate consumption of green tea has been observed to eliminate pathogens such as *Bacillus cereus*, *Clostridium perfringens*, *Pleisomonas shigelloides*, *Staphylococcus aureus*, and *Vibrio parahemolyticus*[7]. The antimicrobial effects of catechins involve direct actions such as damaging bacterial cell membranes, inhibiting fatty acid synthesis, and suppressing enzyme activity. Additionally, they contribute to overall antimicrobial efficacy by inhibiting inflammation, induced by oxidative stress, increasing nitric oxide synthesis, inhibiting angiotensin II and interleukin 6 (IL-6)-induced C-reactive protein expression, suppressing IL-6 and receptor activator of nuclear factor kappa beta (RANKL) production in infected osteoblast-like cells, inhibiting IL-8 production, and suppressing hyaluronidase activity activated by chronic inflammation via IL-12 inhibition [11][12][13][14][15]. Despite significant efforts to explore medicinal plants as alternatives with minimal side effects, easy accessibility, and excellent compatibility, further clinical trials and standardization of medicinal plants are imperative for drug discovery [16]. However, there remains a gap in our understanding regarding the antimicrobial effects of aqueous extracts of *C. sinensis* against common pathogens such as *Escherichia coli* MTCC443, *S. aureus* MTCC96, *Pseudomonas aeruginosa* MTCC741, and *Salmonella typhi* MTCC733. Therefore, this study aims to fill this gap by evaluating the antimicrobial properties of aqueous leaf extracts of *C. sinensis* against these specific pathogens.

MATERIALS AND METHODS

Tea sample collection

One sample of packaged and open forms of green and black tea containing *C. sinensis* leaves was purchased from local tea shops in New Delhi.

Preparation of aqueous extract of *C. sinensis* tea leaves

Aqueous extracts of *C. sinensis* tea (green and black, packaged and open) were prepared by soaking 10 g of dry powdered leaves in sterile distilled water (100 mL) in a reagent bottle for 30 minutes. The extract was then filtered through Whatman filter paper No.1 and stored in amber-coloured reagent bottles at 4°C for further use.

Procurement of test pathogens

The pathogens used in the study were procured from the FICCI Research and Analysis Centre (FRAC), New Delhi. Bacterial strains *S. aureus* MTCC96, *S. typhi* MTCC73, *E. coli* MTCC443 and *P. aeruginosa* MTCC741 were used in the study and maintained by subculturing them on nutrient agar at regular intervals.

Antimicrobial (AM) analysis using agar-well diffusion test

The AM potential of *C. sinensis* aqueous extract (open and packaged green and black tea leaves) was conducted in the laboratory using the agar-well diffusion method. Aliquots of 500 µL of 24-hour-old broth culture (exponential phase

**Barkha Bhatnagar et al.,**

of culture) were spread over the dried surface of a Muller-Hinton agar plate to ensure an even distribution of bacterial inoculums. The plates were left undisturbed for 5-10 minutes to allow for any excess surface moisture to be absorbed before making wells. Wells of about 0.6 mm diameter were made on agar plates using a sterile cork borer. A 100 μ L aliquot of the tea leaf extract (green and black) was then introduced into the wells. Petriplates were incubated at 37°C for 24 hr to assess bacterial growth, and results were recorded[17].

Determination of Minimum Inhibitory Concentration (MIC)

The MIC of aqueous tea leaf extract was evaluated by inoculating 1 mL of test bacterial strains into 10 mL of sterile nutrient broth in test tubes containing increasing concentrations (200, 400, 600, 800, 1000, 1200, 1400, and 1600 μ L) of aqueous leaves extract. The contents of the tubes were subjected to gentle shaking for proper mixing of the bacterial broth with the extract. The test tubes were incubated at 37°C for 24 hours. A tube without the test organism was kept as a control. The visual turbidity of the tubes was observed before and after the inoculation to determine the MIC value [18].

Statistical Analysis

The AM activity of green and black tea leaves aqueous extract was expressed as mean \pm standard deviation (SD). The comparison of the AM activity of aqueous extracts of packaged and open green and black tea leaves against each test bacteria was evaluated through an independent t-test. The comparison of antimicrobial activities of packaged and open green tea and black tea extract against *S.aureus* MTCC96, *S.typhi* MTCC73, *E.coli* MTCC443 and *P.aeruginosa* MTCC741 was evaluated by applying one-way analysis of variance (ANOVA).

RESULTS

Antimicrobial Activity of Tea Extracts

The study revealed potent AM activity in the aqueous extract of *C. sinensis*, confirming its efficacy against microbial infections. The AM activity was assessed by measuring inhibition zones formed around wells. After 24 hours of incubation, all four aqueous tea extracts displayed inhibition zones against selected pathogenic strains. Green tea consistently exhibited higher AM activity compared to black tea in all cases. Specifically, green tea (packaged) showed maximum inhibition against *P. aeruginosa* MTCC741, while black tea (packaged) demonstrated minimum inhibition against *S. aureus* MTCC96 and *E. coli* MTCC443. The diameter of inhibition zones for packaged green tea ranged from 22.8 \pm 1.06 mm to 23.6 \pm 0.67 mm, while for packaged black tea, it ranged from 18.8 \pm 0.73 mm to 21.75 \pm 1.34 mm (Table 1). Open green tea displayed inhibition zones ranging from 20.7 \pm 0.42 mm to 23.6 \pm 0.70 mm, whereas open black tea exhibited zones ranging from 9.2 \pm 0.63 mm to 11.2 \pm 0.52 mm against all four studied pathogenic bacterial strains (Table 1). Both green and black tea demonstrated significant AM activity ($P < 0.001$) against all the tested pathogens, while green tea showed more significant inhibition, particularly against *P. aeruginosa*. Packaged green tea exhibited significantly higher AM activity ($P < 0.001$) compared to packaged black tea; a consistent trend was observed in the comparison between open green tea and open black tea (Table 1).

Determining the MIC of Aqueous Tea Extracts

A MIC test was conducted to ascertain the lowest concentration of green tea and black tea capable of inhibiting the growth of selected pathogens. Turbidity in the growth medium indicated the presence of the test bacterial strain, and the MIC represented the lowest concentration at which no visible growth occurred. Results showed that the MIC of packaged green tea was 400 μ g/mL for *E. coli* MTCC443 and *S. aureus* MTCC96, and 600 μ g/mL for *P. aeruginosa* MTCC741 and *S. typhi* MTCC733. Packaged black tea exhibited MICs of 600 μ g/mL for *P. aeruginosa* MTCC741 and *S. typhi* MTCC733, and 800 μ g/mL for *E. coli* MTCC443 and *S. aureus* MTCC96. In the case of open green tea, the MIC was 400 μ g/mL for *P. aeruginosa* MTCC741 and 800 μ g/mL for the remaining three bacterial strains. The open form of black tea demonstrated MICs of 1200 μ g/mL for *P. aeruginosa* and 1400 μ g/mL for the other three strains, as shown in Table 2.

Barkha Bhatnagar et al.,

DISCUSSION

The findings of the present study attribute the presence of different bioactive compounds in green and black tea, which are presumed to possess AM action against the studied pathogens. The major proportions of bioactive are comprised of polyphenols, as reported earlier by Mbata et al. [19]. Various polyphenolic compounds such as epigallocatechin gallate, catechins and theaflavins are recognized as the microbiologically active molecules present in both green and black tea [20][21][22]. A study conducted by Shetty and co-workers demonstrated that Japanese green tea, Chinese tea and black tea inhibited the growth of several bacteria responsible for diarrheal diseases, including *Vibrio cholera* and *S. typhi* [21]. The AM efficacy of boiled water tea extract and organic solvent extract was assessed against a range of bacterial strains including *E.coli* (EPEC P2 1265), *Yersinia enterocolitica* C770, *S. typhi*, *S. typhi* Ty2a, *S. typhimurium* 1402/84 and *Shigella dysenteriae* [23]. Results indicated that both green and black tea extracts significantly inhibited bacterial growth across all tested strains. However, the inhibitory concentration required for green tea extract was lower than that of black tea extract. Notably, *S. typhi* Ty2a exhibited maximum sensitivity, while *Y. enterocolitica* C770 demonstrated greater resistance to the tea extracts. Combining the commercially available antibiotic chloramphenicol at a concentration of 2.5 µg/ml (MIC 5 µg/ml) with 5.094 mg/ml of black tea extract (MIC 9.089 mg/ml) effectively inhibited the growth of *S. dysenteriae*. Other antibiotics such as gentamicin, nalidixic acid, and methicillin along with tea extract were also exhibited AM activity against the tested strains [24]. Furthermore, green tea demonstrates various antibacterial activities, restraining bacterial growth, and exhibiting synergy with β-lactam antibiotics. It was noted that employing tea extracts alongside different antibiotics enhanced the sensitivity of bacterial isolates that were resistant to most antibiotics when used alone [25].

Additionally, it was noted that green tea augmented the bactericidal activity of all tested antibiotics by suppressing the production of β-lactamases. Radji et al. reported the AM activity of Indonesian water-soluble green tea extract, which further proved to be beneficial in combating emerging drug-resistant clinical isolates such as methicillin-resistant *S. aureus* and multi-drug-resistant *P. aeruginosa* [26]. Furthermore, methanol and water extracts of *C. sinensis* tea were demonstrated to inhibit the growth of *Listeria monocytogenes* [19]. Moreover, a combination of green tea extract and penicillin G exhibited inhibitory effects on the growth of *E. coli* ATCC 25922 and *S. aureus* ATCC 25923 compared to penicillin G alone [27]. The AM effectiveness of plant extracts relies on the presence of various secondary metabolites, including hydroxyl groups, on active constituents considered as AM agents. It is reported that chemicals implicated in AM activity typically belong to diverse groups such as flavonoids, alkaloids, saponins, and polyphenols [28]. Green tea leaves comprise of numerous polyphenolic compounds which possess distinct properties for combating the harmful effects of cell proliferation. Green tea is a chemotherapeutic option and is a natural alternative to combat antibiotic-resistant pathogens [29][30]. The findings revealed greater AM activity in packaged green and black tea leaf extracts against all four tested pathogens, with their MIC values proving more effective against *S. aureus*, *S. typhi*, *P. aeruginosa*, and *E. coli*. These values were lower than those of open green and black tea leaf extracts. Aligiannis et al. proposed a classification of plant extracts based on MIC values: strong inhibition (MIC < 500 µg/mL), moderate inhibition (600 µg/mL < MIC < 1500 µg/mL), and low inhibition (MIC > 1600 µg/mL) [31]. According to this classification, aqueous extract of the packaged green tea leaves demonstrated strong inhibitory activity against all tested bacteria, while open black tea exhibited low inhibition. Tiwari et al. observed significant differences in MIC values (ranging from 9.089 to 94.61 mg/ml) of tea extract against different bacterial strains, including *S. typhi*, with MIC values ranging from 79.56 to 91.98 mg/mL [20]. However, Mbata et al. reported MICs of 0.26 and 0.68 mg/mL for methanolic and aqueous extracts of *C. sinensis* leaves against *L. monocytogenes* [19]. Thus, from the study it is indicated that the aqueous extract obtained from *C. sinensis* leaves presents a promising natural source of antimicrobial agents against *S. aureus* MTCC96, *S. typhi* MTCC73, *E. coli* MTCC443 and *P. aeruginosa* MTCC741.

Barkha Bhatnagar et al.,

CONCLUSION

In summary, widely consumed globally, black and green tea (*C. sinensis*) possess antimicrobial and health-enhancing qualities. Consequently, their antimicrobial properties could offer valuable supplements to the existing array of antibiotics. Hence, it suggests that both green and black tea extracts could serve as potent antibacterial agents against *S. aureus*, *S. typhi*, *E. coli* and *P. aeruginosa*, with packaged green tea being the preferred choice.

ABSTRACT

Samai (*Panicum sumatrense*) is known for its health benefits because it is gluten free, rich in iron, calcium and phosphorous. Vallarai leaves (*Centella asiatica*) improves mental characteristics by preventing cell damage, acts as a memory enhancer and helps to improve iron & calcium for children. Many studies revealed unhealthy snacking habit among the children which has adverse effects on them like childhood obesity, early mensuration, anaemia, nutritional deficiencies, and poor mental health status. "Objective of the study is to standardize Samai-Vallarai composite powder (SVCP), to develop value added product from SVCP, to evaluate the organoleptic acceptability, to analyse the nutrients, phytochemical properties, physiochemical properties and shelf life of the developed product. Samai-Vallarai was sundried and grounded into fine powder. SVCP was formulated into three different proportions and developed a value-added Choco-bar in three variations V1, V2 and V3. The developed product was organoleptically evaluated using 5-point hedonic scale with control sample. Selected sample and SVCP was analysed for its nutrients and shelf life. The results indicated that variation V2 was highly accepted with mean score of (4.37 ± 0.490) compared with control sample score (3.50 ± 0.509) , V1 and V3. Nutrient analysis revealed more fat and carbs in SVCP Choco-bar than SVCP whereas protein, fiber, calcium and iron was higher in SVCP than SVCP Choco-bar. Phytochemical analysis revealed greater antioxidant and total phenolic properties in SVCP than SVCP Choco-bar. The physiochemical analysis revealed that the pH and TSS was high in SVCP Choco-bar than SVCP and acidity was found to be same (0.06%) in both. The microbial analysis revealed 0.55×10^5 , 1.69×10^5 , 2.87×10^5 , and 3.42×10^5 cfu/ml during the first, second, third, and fourth days for

**Priyadharshini and Indirani Kaliappan**

four weeks respectively. This study observed that SVCP was a high source of phenols, antioxidants, proteins, fiber, iron and calcium. Considering poor eating habits of kids, this makes it a better choice for making snacks for them. SVCP may be used as a basic ingredient in a wide range of culinary items like the SVCP Choco bar which is nutritious and have high health benefits towards many disease conditions such as diabetic, cataract, cancer and helps to improve cardiac health.

Keywords: Millets, Vallarai, anaemia, memory enhancement, iron, antioxidant, healthy snack.

INTRODUCTION

Indian millets are a class of highly nutritious, drought-tolerant plants that are mostly cultivated in the country's arid and semi-arid areas. Because it has more protein, vitamins, and minerals than wheat and rice, it is a better nutritious choice. They are also low in glycaemic index and gluten-free, which makes them perfect for those who have diabetes or celiac disease [1]. The tribe Paniceae, sub-family Panicoideae, and family Poaceae are native to little millet. Common names for little millet (*Panicum sumatrense* L.) include samai, samo, morai, vari, and kutki. It is cultivated in India in various agroecological conditions [2]. A recent study on small millet revealed that its higher concentration of dietary fiber causes it to display a hypoglycaemic impact, which is one of the factors leading to its low glycaemic index [3]. It plays a vital function in the diet by contributing a substantial number of phytochemicals and antioxidants [4]. It is a fantastic millet that works well for all age groups. It cures various gastrointestinal issues and aids in the prevention of constipation. The complex carbohydrates in it break down gradually, making it ideal for those with diabetes and obesity patients. Nutraceutical elements including phenols, tannins, and phytates are among the many nutrients that Indian pennywort or Vallarai keera contributes to the diet [5]. The plant family Apiaceae (previously Umbelliferae) and subfamily Mackinlayoideae include *Centella Asiatica*, often known as Little Millet. This plant thrives in marshy places found in tropical and subtropical climates worldwide. Native to the Asian subcontinent, it is found in the tropical parts of Southeast Asia, Malaysia, the Solomon Islands, and certain temperate regions of China, Japan, Korea, and Taiwan. The extensive history of *C. asiatica*'s medical usage spans from the first indications of its utilization by the Indian physician Sushruta to the traditional herbal medicine systems found in Asian and African nations [6].

The significance of *C. asiatica* in the Ayurvedic tradition as a "medhyarasayana" plant—that is, a herb with restorative properties that enhance memory, guard against cognitive decline, and enhances brain function [7]. Phytochemical substances such as ursolic acid, myrcene, rutin, sitosterol, eugenol acetate, arjunolic acid, asiatic acid, asiaticoside, brahminoside B, castilllicetin, castilliferol, catechin, chavicol, and corosolic acid [8]. For hundreds of years, *Centella asiatica* has been used in traditional medical systems to treat a wide range of illnesses, such as dementia, hypertension, sleeplessness, infectious infections, and asthma. The Ayurvedic tradition has long acknowledged the plant's ability to enhance brain function. Numerous preclinical investigations conducted in the last ten years have validated these effects in the setting of age-related cognitive decline, both pathological and normal [9]. It is well known that CA—a cognitive and antioxidant—can boost focus and attention span, fight aging, and revitalize the brain and nervous system. It has sedative, antidepressant, antiepileptic, anti-inflammatory, wound-healing, and radioprotective qualities as well [10]. When it comes to supporting changes in the brain and cognitive processing, linear bone development and mineralization, body composition, and other organ systems, nutrition is essential for children during the developmental stage [11]. Numerous studies have demonstrated the negative impacts of children's unhealthy eating habits, including early menstruation, childhood obesity, juvenile diabetes, anemia, nutritional inadequacies, and poor mental health.

MATERIALS AND METHODS

Preparation of Samai-Vallarai Composite Powder (SVCP)

Fresh and high-quality Vallarai leaves were chosen from Chennai's Koyampedu market to make the Samai-Vallari Composite. Freshness, colour, and firmness were the determining factors in the selection of Vallarai leaves. Dried, dark-coloured, and dull-looking Vallarai leaves were rejected. Fresh vallarai leaves obtained from local market were washed with soft water. The leaves were then dried in direct sunlight for almost 3-4 days. To make a fine powder, dried leaves were ground in a mixer, and kept in airtight aluminium zip-lock bags until use. The samai rice was purchased from a nearby grocery in Chennai. The highest-quality millets were chosen from a batch of aged, organic, unpolished, and uniformly sized yellow grains. New, shiny millets with vibrant colours were turned down. Small millets were cleaned, then dry-roasted in a skillet till the smell of samai emerged. After being cooled, the little millet was roasted and then ground into flour using a mixer to produce a fine powder, the millet flour was sealed in an airtight container and kept until use. Lastly, three distinct proportions (V1, V2, and V3) with ratios of 25%, 50%, and 75% respectively was made by mixing vallarai leaves dry powder with millet powder (Figure 1).

Preparation of SVCP Choco-bar

To formulate the SVCP Choco-bar, 100g of SVCP was dry-roasted for a few seconds and set away. Next, 50g of jaggery, 25ml of coconut oil, and 100 g of dark chocolate compound was melted using the double boiling technique. This was mixed with roasted SVCP. After being moved to the mould, 10g of nuts (almonds and cashews) were topped, and the mixture was cooled for two hours at -18 degrees in the freezer. The Choco-bar from SVCP was finally demoulded (Figure 2). This was repeated three times, using SVCP variation of 25%, 50%, and 75% (V1, V2, and V3, respectively). As a control sample, a regular Choco-bar with nuts was purchased from the store. A 5-point hedonic score-card was used to evaluate the organoleptic qualities of these Choco-bars, and the evaluation was conducted by 30 semi-trained panel members [12]. The panellists evaluated the Choco-bar's quality based on a range of sensory factors, including appearance, colour, flavour, texture, taste and overall acceptability of the different variations of Choco-bar (V1, V2, and V3) and control. After an organoleptic study, variation V2 was chosen because it had the greatest overall acceptance score compared to the other two variations and the control.

Analysis of the SVCP and SVCP Choco-bar.

The selected variation V2 SVCP and SVCP Choco-bar were analyzed for nutrients, phytochemical properties, and physicochemical properties. The microbial analysis was also done for the selected products. The results obtained from the organoleptic evaluation were interpreted using statistical tools such as mean and standard deviation using SPSS software.

RESULTS AND DISCUSSIONS

Organoleptic evaluation

Based on a sensory evaluation of SVCP Choco-bar made with 25%, 50%, and 75% SVC powder, it was determined that overall acceptance of variation 2 was very good when compared to other variations and controls. Table 1 presents the mean score and standard deviation for appearance, colour, flavour, texture, taste, and overall acceptability derived from all three variations (V1, V2, and V3) and control. The texture, taste, and flavour of the Choco-bar were significantly impacted by the addition of 50% SVC powder (V2), as seen in Graph 1. Additionally, as seen in Graph 2, the variation with 50% SVCP Choco-bars added was the most acceptable.

**Priyadharshini and Indirani Kaliappan****Nutrient analysis of SVCP and SVCP Choco-bar**

A nutritional analysis of the SVCP and SVCP Choco-bar was shown in Table 2, revealing 65.01g of carbohydrates, 12.31g of protein, 2.69g of fat, 4.85g of fiber, 4.5g/L of calcium, and 2.02 g/L of iron in 100g of the powder. The nutritional composition of the SVCP Choco-bar was 68.42g carbohydrate, 10.58g protein, 12.13g fat, 1.07g fiber, 1.3 g/L calcium, and 0.6 g/L iron. In comparison to the SVCP Powder, the SVCP choco-bar contained more fat and carbs, according to this study. SVCP contained higher protein, fiber, calcium, and iron levels than SVCP Choco-bar. Next to barnyard millets, little millets are fibrous. Research indicates that 37–38% of some Kodo and small millet cultivars contain dietary fiber, which is the main component [13].

Phytochemical analysis of SVCP and Variation (V2) SVCP Choco-bar

The chemical analysis of the SVCP and Choco-bar was shown in Table 3, which showed that 100g of the powder contained 324.58 mg/g of total phenols and 5579.88 µg of total antioxidants. SVCP Choco-bar has a total antioxidant content of 3186.18 mg and 146.13 mg/100 g. According to this study, SVCP is a great source of high levels of phenolic properties and antioxidants when compared to SVCP Choco-bar; the total antioxidant analysis (TAA) revealed these high levels in SVCP. With SVCP Choco-bar's functional qualities and suitability for mixing its high concentration of antioxidant components with other ingredients, it can be made into many confections utilising a range of methods. One study finding suggested that applying heat could increase or decrease Total Antioxidant Activity.

Physiochemical analysis of SVCP and V2 SVCP Choco-bar

The physiochemical properties of the SVCP and SVCP Choco-bar were shown in Table 4, which showed that SVCP powder contained 5.6 pH, and 2 brix of TSS. SVCP Choco-bar has a pH content of 6.6 and 10 brix of TSS. According to this study, SVCP Choco-bar is a great source of high levels of pH and TSS when compared to SVCP powder. Both powder and Choco-bar have an acidity level of 0.06% respectively.

Shelf-life analysis

As a result, the microbiological count was performed on the first, second, third, and fourth days of the respective four weeks. Between the first day of the first week and the thirty-first day, the total number of plates counted was 0.55×10^5 , 1.69×10^5 , 2.87×10^5 , and 3.42×10^5 cfu/ml, respectively. Graph 3 shows that even though it was locked with an aluminium zip lock cover for about four weeks, the total number of plates rose from day one to day thirty. Therefore, another innovative preservation or packaging technique is required to stop microbial development and extend the shelf life to more than 3 months.

CONCLUSION

Samai-Vallarai Composite Powder (SVCP) was formulated and used to create a value-added Choco-bar for the current investigation. It emerged that SVCP was a high source of phenols, antioxidants, proteins, fiber, iron and calcium. Considering how poorly kids eat, this makes it a better choice for making snacks for them. Like the SVCP Choco bar, SVCP may be used as a basic ingredient in a wide range of culinary items. Because of its potential health benefits, including memory enhancement, antidiabetic, anti-hyperlipidaemic, anemia prevention and treatment, bone health and development, constipation prevention, aging prevention, improved heart health, and anticancer action due to antioxidant properties, this composite mixture is suitable for children as well as all other age groups.

"ALWAYS BE RIGHT TO EAT RIGHT": Raising children's awareness of the benefits of eating Indian millets or little millets along with vallarai leaves will help prevent chronic illnesses like diabetes and cardiovascular disease, as well as work toward making our nation diabetes-free [13]. Thus, always consider eating healthy; increase the amount of millet than the amount of rice and wheat.

ACKNOWLEDGMENT

The authors would like to sincerely thank the PSG College of Arts & Science, Department of Clinical Nutrition and Dietetics for their support under the Institutional Research Seed Grants fund scheme, with reference number

ABSTRACT

Dry eye disease is a global issue that continues to grow in terms of the numbers of people it affects and the impact it has on sufferers. It is one of the most prevalent issues and causes of referrals to ophthalmology clinics. The signs and symptoms of dry eye can be correlated to Shushkakshipaka which is one among the Sarvagata netrarogas affecting all parts of eye as explained in Ayurvedic texts. This is a single case study of dry eye, treated according to the treatment principles of Shushkakshipaka as explained in Ayurvedic classics Present study is a case report of 23 years old male patient who approached Shalaky Tantra OPD of Parul Ayurved Hospital, Vadodara, Gujarat with feeling of dryness on both eyes associated with headache, irritation and blurring of vision since 4 months. He was thoroughly examined and diagnosed as Shushkakshipaka. He was treated with Deepana Pachana, Kosthashodhana, Aschyotana along with Snehapana followed by three sittings of Netra Parisheka, Akshi Tarpana, Nasya, as mentioned in the classics. Patient showed marked improvement subjectively and in diagnostic tests like Schirmer-I test, Tear film Break up time and Fluorescein staining in both eyes. The dry eye disease can be considered as Shushkakshipaka and can be treated according to its treatment principles.

Keywords: Shushkakshipaka, Tarpana, Nasya, Parisheka, Aschyotana, Sarvagata netraroga.

INTRODUCTION

Dry Eye is a multifactorial disorder due to inflammation of the ocular surface, lacrimal gland, meibomian gland dysfunction and neurotrophic deficiency.[1]It is a condition in which a person doesn't have enough quality tears to lubricate and nourish the eye. Tears are necessary for maintaining the health of the ocular surface and for providing clear vision. Various environmental factors such as air dryness, pollution, global warming, smoke, allergens, systemic diseases, contact lens wear and age are contributing to more cases of dry eye.[2-5]The disease has increased in recent years with the advent of monitors and prolonged use of computers due to over exposure to visual displays. Similar clinical manifestation of Dry Eye can be observed in a disease called as Shushkakshipaka. It is a Vata- PittajaVyadhi having symptoms like Gharsha (foreign body sensation), Vishushkatwama (feeling of dryness in eyes),Kricchronmeela-Nimeelanama (difficulty in opening the eyes), Rukshadarunavartma,Toda (Pricking sensation), Daha (Burning sensation), Raga (redness) [6] In Ayurveda classics, specific treatment has been mentioned for Shushkakshipaka such as Snehapana Tarpana,Nasya and Pariseka.[7]

MATERIALS AND METHODS

Case Report

A fully conscious, normal oriented male patient, aged 23 years, consulted Shalakya Tantra OPD of ParulAyurved Hospital, Vadodara on 20-12-2023 complaining of irritation, pain, feeling of dryness in both eyes along with frontal headache for 4 months. He was diagnosed as a case of Dry Eye. History of present illness: The subject was apparently normal 4 months ago. He gradually developed dryness of bilateral eyes, irritation and pain. It was associated with Frontal headache and blurring of vision in both the eyes. But gradually the severity of symptoms increased and he approached Shalakya Tantra OPD of Parul Ayurved Hospital, Vadodara. History of past illness: No past history of any systemic diseases like Asthma, Hypertension or Diabetes. No Surgical history.

Family History: Nothing Significant.

Personal History:

Appetite: Good

Bowel: Once a day / Regular

Micturition: 4-6 times/ day

Sleep: Sound

Habits: None

Occupation: Engineering student (Computer Science)

Ashta Sthana Pareeksha:

Nadi: 74/min

Mutra: 4-6 times/day

Mala: **Parkrutha**

Jihwa: Alipta

Shabda: Prakrutha

Sparsha: Prakrutha

Drik: Shuskatha

Akriti: Madhyama

Clinical findings: He was afebrile. The pulse rate was 74/minute. Respiratory Rate was 16/minute and Blood Pressure was 110/70mmHg. Systemic examination was within normal limits.

Ophthalmic Examination:

**Shalaka More and Manjiri Keskar****THERAPEUTIC INTERVENTION**

Deepana Pachana (appetizer & digestant) was done with HingwasthakChurna. [8] 6 gm of the medicine was consumed with first morsel of food, added with cow gheet twice daily for three days. Koshtashodhana (elimination of doshas and malas from koshta) in the form of Sadyovirechana (purgation) was done with Eranda Taila^[9]. 40 ml of the medicine was given with hot water at 6.00 am in the morning. Nasya was done with Anutaila. 8 drops of the Anutaila were instilled in both nostrils for the next seven days at 10.00 am^[10]. Then Tarpana was done in both the eyes with JeevanthyadiGhrita for 5 days. There was a gap of 15 days between each sitting of the treatment, during which, the patient was given Ashchyotana with JeevanthyadiGhrita 2 drops for each eye in the morning and evening. JeevanthyadiGhrita was given internally 10ml twice a day with milk. Subject was assessed 15 days after the completion of 3rd sitting of treatment.

RESULTS

The study showed marked improvement in signs and symptoms of the patient after the treatment as shown in table no. 5. There was no recurrence in signs and symptoms at the time of follow up of the patient. No adverse or unanticipated events were observed during or after the completion of study.

DISCUSSION

Shushkakshipaka is a Vata Pitta predominant vyadhi. In present case the aim of treatment was to achieve Vata Pittahara and Brumhana karma to eyes. HingwasthakChurna was given at first for Pachana of Amadosha. In order to improve the body's absorption of the medications, sadyovirechana was administered to cleanse the koshta. After Kaya Shodhana and Sansarjan karma UrdhwajatruShodhana was planned with Anutail Nasya, as it is indicated in Shushkakshipaka and UrdhwaJatrugata vikaras^[11]. Seka was selected as sthanikamrudusweda. Madhura Rasa and Vipaka, Sheeta Veerya, Snigdha and Guru Guna, Vatapittahara and Rasayana^[12] properties of YastimadhuKsheerapaka, administered as netraseka helps in reducing the inflammation thereby does the healing of conjunctival and corneal epithelial defects. Tarpana with JeevanyadiGhrita was adopted for 5 days. Balya, Rasayana, Drishtivardhaka^[13] properties of JeevanyadiGhrita helps in maintaining the lipid layer of tear film which reduces the evaporation of aqueous layer of tear film. Thus maintains the longer lubrication of the ocular surface thereby relieving dryness, painful blinking of the eyes and foreign body sensation. The internal administration of Jeevanthyadighrita will help in nourishment of depleted dhatus. Aschyotana with Jeevanthyadighrita will help in proper movements of the eyelids, reduces burning sensation, discoloration and irritation of eyes caused due to the dry ocular surface.

CONCLUSION

Dry eye is a very common clinical condition of eye. In which homeostasis between the three layers of tear film is lost. As per Ayurveda, Snehana and Brumhanachikitsa is essential for maintaining the homeostasis and stabilising the tear film. Thus, it can be concluded that, by adapting the above therapeutic procedures, the further vitiation of Vata and Pitta doshas can be prevented and functions of different structure of the eye which are responsible for proper lubrication will be restored.

ABSTRACT

This study analyzed cinnamon oil to identify its chemical composition and evaluated its antibacterial activity against *Aeromonas caviae*. The analysis revealed the presence of various classes of compounds, including acids, alkaloids, coumarins, flavonoids, phenols, quinones, steroids, tannins, terpenoids, and triterpenoids. Among the identified compounds, phenol, vanillin, (Z)-cinnamyl benzoate, and rutamarin were found to be the main constituents. Phenol exhibited disinfectant properties, vanillin had pharmaceutical applications, (Z)-cinnamyl benzoate was used in perfumes and cosmetics, and rutamarin showed potential for protecting against heart disease, diabetes, neurodegenerative diseases, and microbial/fungal infections. The antibacterial activity of cinnamon oil was investigated, and the results demonstrated a dose-dependent increase in the zone of inhibition against *Aeromonas caviae*. At higher concentrations, cinnamon oil exhibited stronger antibacterial activity than the standard antibiotic ciprofloxacin. The molecular mechanism underlying the antibacterial effects of cinnamon oil was attributed to bioactive components such as cinnamaldehyde, which disrupts bacterial cell membranes, leading to membrane damage and inhibition of bacterial growth. Furthermore, cinnamon oil may

**Devika et al.,**

interfere with bacterial enzymes and metabolic processes. However, the exact mechanism of its antibacterial activity against *Aeromonas caviae* may involve additional factors that warrant further investigation.

Keywords: *Aeromonas caviae*, cinnamon oil, well diffusion method, GC-MS

INTRODUCTION

Phytochemical analysis plays a crucial role in the field of natural product research, as it involves the identification and characterization of bioactive compounds present in plant extracts [1-11]. These compounds possess diverse biological activities and have been extensively studied for their potential therapeutic applications [12]. One such plant extract that has gained considerable attention is cinnamon oil, derived from the bark of *Cinnamomum* species [13-15]. Cinnamon oil is known for its distinct aroma and flavor, and it has been traditionally used for various medicinal purposes [16-19]. In recent years, there has been a growing interest in exploring the phytochemical composition and biological properties of cinnamon oil. The objective of this study is to conduct a comprehensive phytochemical analysis of cinnamon oil and evaluate its antimicrobial activity against *Aeromonas caviae*. *Aeromonas caviae* is a Gram-negative bacterium commonly found in aquatic environments and is known to cause a range of infections in humans, including gastroenteritis, wound infections, and septicemia [20]. The emergence of antibiotic resistance among *Aeromonas* species has become a significant concern, necessitating the search for alternative antimicrobial agents.

Specifically, this research aims to

Analyze the phytochemical composition of cinnamon oil using various analytical techniques such as gas chromatography-mass spectrometry (GC-MS). This analysis will provide insights into the presence and abundance of different classes of bioactive compounds in cinnamon oil, including phenolic compounds, terpenoids, and essential oils. Determine the antimicrobial activity of cinnamon oil against *Aeromonas caviae* through well-established microbiological methods. The antimicrobial activity will be compared to standard antibiotics to evaluate its potential as a natural alternative or adjunct therapy. Investigate the mechanisms of action underlying the antimicrobial activity of cinnamon oil. This will involve studying its effects on bacterial cell viability, membrane integrity, and the production of virulence factors by *Aeromonas caviae*. Understanding the mode of action will provide insights into the potential targets of cinnamon oil and its suitability as an antimicrobial agent. By conducting a comprehensive phytochemical analysis and evaluating the antimicrobial activity of cinnamon oil against *Aeromonas caviae*, this study aims to contribute to the growing body of knowledge on natural products with potential therapeutic applications. The findings of this research could have implications for the development of new antimicrobial agents to combat *Aeromonas* infections and serve as a foundation for further investigations into the bioactivity of cinnamon oil.

MATERIALS AND METHODS

All the chemicals, solvents, and essential oils used in investigations were obtained from Aromax trading PVT Ltd, Chennai, India as a standard chemical supplier.

Qualitative Phytochemical Analysis

Phytochemical screening of cinnamon oil was carried out according to the method of Mishra et al. (2014) [21].

Test for Acids

Million's Test: To 1.0 ml oil, five drops Million's reagent was added, heated on a water bath for 5 min. and allowed to cool, followed by addition of 1% sodium nitrite solution. Formation of red colour indicates the presence of acids.

Devika et al.,

Test for Alkaloids

Mayer's Test: To 2.0 ml oil, 2.0 ml concentrated hydrochloric acid followed by few drops Mayer's reagent were added. Presence of green colour or white precipitate indicates the presence of alkaloids.

Test for Anthocyanin and Betacyanin

Sodium Hydroxide Test: To 2.0 ml oil, 1.0 ml 2N sodium hydroxide was added and heated for 5 min. at 100°C. Formation of bluish green colour indicates the presence of anthocyanin and yellow colour shows the presence of betacyanin.

Test for Carbohydrates

Molisch's Test: To 2.0 ml oil, 1.0 ml Molisch's and few drops of concentrated sulphuric acid were added. Formation of purple or reddish ring indicates the presence of carbohydrates.

Test for Cardiac Glycosides

Ferric Chloride Test: To 0.5 ml oil, 2.0 ml glacial acetic acid and few drops 5% ferric chloride were added. This was under layered with 1.0 ml concentrated sodium hydroxide. Formation of the brown ring at the interface indicates presence of cardiac glycosides.

Test for Coumarins

Sodium Hydroxide Test: To 1.0 ml oil, 1.0 ml 10% sodium hydroxide was added. Formation of yellow colour indicates presence of coumarins.

Test for Flavonoids

Sulphuric Acid Test: 1.0 ml oil was treated with few drops of concentrated sulphuric acid and observed for the formation of orange colour, which indicates the presence of flavonoids.

Test for Glycosides

Sulphuric Acid Test: To 2.0 ml oil, 1.0 ml glacial acetic acid, 5% ferric chloride and few drops concentrated sulphuric acid were added. Presence of greenish blue colour indicates the presence of glycosides.

Test for Phenols

Ferric Chloride Test: To 1.0 ml oil, 2.0 ml distilled water, followed by few drops 10% ferric chloride were added. Formation of blue or green colour indicates presence of phenols.

Test for Proteins

Ninhydrin Test: To 2.0 ml oil, few drops 0.2% ninhydrin was added and heated for 5 min. Formation of blue colour indicates the presence of proteins.

Test for Quinones

Sulphuric Acid Test: To 1.0 ml oil, 1.0 ml concentrated sodium hydroxide was added. Formation of red colour indicates the presence of quinones.

Test for Saponins

Foam Test: To 1.0 ml oil, 5.0 ml distilled water was added and shaken well in a graduated cylinder for 15 min lengthwise. Formation of 1.0 cm layer of foam indicates the presence of saponins.

Test for Starch

Iodine Test: To 2.0 ml oil, few drops iodine solution was added. Formation of blue-purple colour indicates the formation of starch.

Devika et al.,

Test for Steroids

Salkowski Test: To 5.0 ml oil, 2.0 ml chloroform and few drops concentrated sulphuric acid were added. Formation of red colour indicates the presence of steroids.

Test for Tannins

Ferric Chloride Test: To 1.0 ml oil, 2.0 ml 5% ferric chloride was added. Formation of dark blue or greenish black indicates the presence of tannins.

Test for Terpenoids

Sulphuric Acid Test: To 0.5 ml oil, 2.0 ml chloroform was added and to this, concentrated sodium hydroxide was added carefully. Formation of red brown colour at the interface indicates presence of terpenoids.

Test for Triterpenoids

Liebermann - Burchard's test (LB test): To 1.5 ml oil, few drops Liebermann - Burchard's reagent (acetic anhydride and concentrated sodium hydroxide) was added. Formation of blue green colour indicates presence of triterpenoids.

GC-MS Spectral Analysis

GC-MS spectral analysis was carried out to determine the presence of aromatic compounds in the essential oil samples. The model of the GC-MS used for mass spectral identification was an Agilent 7890 interfaced with a 240-mass selective detector and an ion trap. Interpretation of GC-MS was conducted using the database of the National Institute of Standard and Technology (NIST) having more than 62,000 patterns. The spectrum of the unknown component was compared with the spectrum of the known components stored in the NIST library. The name, molecular weight, and structure of the components of the test materials were ascertained.

Antibacterial activity

Antimicrobial assay of extracts of different plants was performed by agarwell diffusion method in Mueller Hinton Agar (MHA) plates. The test organisms were inoculated in Nutrient broth and incubated overnight at 37°C to adjust the turbidity to 0.5McFarland standards giving a final inoculum of 1.5×10^8 CFU/ml. MHA plate was lawn cultured with standardized microbial culture broth. Cinnamon oil of 5,10,15,20 and 25 $\mu\text{g}/\mu\text{l}$ concentration were prepared in Dimethyl Sulfoxide (DMSO). Four wells of 6 mm were bored in the inoculated media with the help of sterile cork-borer (6 mm). Positive control(Ciprofloxacin 300 mcg was used. It was allowed to diffuse for about 30 minutes at room temperature and incubated for 18-24 hours at 37°C. After incubation, plates were observed for the formation of a clear zone around the well which corresponds to the antimicrobial activity of tested compounds. The zone of inhibition (ZOI) was observed and measured in mm.

RESULTS AND DISCUSSION

Essential oils, which contribute to the distinctive scent of plants, consist of volatile compounds. These oils vary in composition, as illustrated in Table 1. For instance, cinnamon oil comprises acids, alkaloids, coumarins, flavonoids, phenols, quinones, steroids, tannins, terpenoids, and triterpenoids. The analysis of cinnamon oil through phytochemical analysis involves identifying and quantifying the different chemical compounds present. This examination has unveiled the existence of multiple compound classes, including acids, alkaloids, coumarins, flavonoids, phenols, quinones, steroids, tannins, terpenoids, and triterpenoids. Let's explore the significance of each of these compound classes. Acids, characterized by their sour taste, are organic compounds found in cinnamon oil, including varieties like cinnamic acid and benzoic acid. These acids not only add to the aroma and flavor of cinnamon oil but also harbor antimicrobial and antioxidant properties. Alkaloids, nitrogen-containing compounds, exhibit pharmacological effects and diverse biological activities, such as analgesic, antimicrobial, and anti-inflammatory properties. Examples like cinnamaldehyde and eugenol may be present in cinnamon oil. Coumarins, recognized for their sweet odor, contribute to the distinctive aroma of cinnamon oil and are associated with

**Devika et al.,**

antimicrobial, anti-inflammatory, and antioxidant properties. Flavonoids, a diverse group of plant compounds, bring potential health benefits to cinnamon oil, featuring antioxidant, anti-inflammatory, and anticancer properties. Notable flavonoids in cinnamon oil, such as quercetin and kaempferol, enhance its therapeutic potential. Phenols, characterized by a hydroxyl group (-OH) attached to an aromatic ring, exhibit robust antioxidant properties, effectively scavenging free radicals in the body. Cinnamon oil encompasses diverse phenols, including cinnamic acid derivatives like cinnamaldehyde and cinnamyl alcohol. Quinones, aromatic compounds, play pivotal roles in physiological processes, serving as antioxidants or prooxidants based on the context. The quinones in cinnamon oil may play a role in its antioxidant and antimicrobial properties. Steroids, a lipid class, are vital in various biological processes, regulating cellular functions with anti-inflammatory and immunomodulatory properties. The steroids present in cinnamon oil could offer potential health benefits. Tannins, polyphenolic compounds, are recognized for their protein-binding and precipitating abilities, featuring antimicrobial, antioxidant, and anticancer properties. The inclusion of tannins in cinnamon oil may contribute to its diverse biological activities. Terpenoids, also referred to as isoprenoids, form a diverse category of compounds abundant in numerous plants, playing a pivotal role in imparting the unique aroma and flavor of cinnamon oil. Terpenoids exhibit antimicrobial, anti-inflammatory, and antioxidant activities. Triterpenoids, a specific subclass of terpenoids distinguished by their structure, have been linked to a range of biological activities, including anticancer, anti-inflammatory, and antimicrobial properties.

The triterpenoids found in cinnamon oil may contribute to its potential health benefits. In summary, the phytochemical analysis of cinnamon oil reveals a rich assortment of compounds with diverse biological activities. These compounds collectively contribute to the distinctive aroma, flavor, and potential health advantages associated with cinnamon oil, establishing it as a valuable natural product. Cinnamon oil (Figure 1) was analyzed, revealing the presence of twenty-one compounds. Key compounds identified include phenol (9.145 min), vanillin (15.223 min), (Z)-cinnamyl benzoate (16.589 min), and rutamarin (42.239 min). Phenol is recognized for its disinfectant properties against bacteria, fungi, and viruses [22], while vanillin finds applications in the pharmaceutical industry [23]. (Z)-cinnamyl benzoate serves purposes in perfumes, cosmetics, and exhibits antimycotic activity [24]. Rutamarin, apart from potential benefits against heart disease and diabetes, demonstrates antimicrobial and antifungal properties, suggesting its potential for treating infections. Moreover, rutamarin has been investigated for its cognitive function enhancement and anxiety reduction properties [25]. The study further unveils the antibacterial activity of cinnamon oil against *Aeromonas caviae*, as indicated by the zone of inhibition in Figure 2. The zone of inhibition, reflecting the area where bacterial growth is hindered, reveals a concentration-dependent antibacterial effect. Notably, as the concentration of cinnamon oil increased, so did the extent of the zone of inhibition. The results point towards the effectiveness of cinnamon oil as an antibacterial agent. As per the findings, Cinnamon essential oil displayed notable antimicrobial activity against *Aeromonas caviae*, surpassing the effectiveness of Ciprofloxacin.

The diverse concentrations of geranium essential oil extract (5, 10, 15, 20, and 25 μ l) demonstrated significant inhibitory effects on pathogenic strains, particularly *Aeromonas caviae*. The measured inhibition zones were 6.3 ± 0.11 , 8.4 ± 0.22 , 12.55 ± 0.50 , 17.56 ± 0.50 , and 40.22 ± 0.44 , respectively, indicating the area where bacterial growth was restricted around the oil on the culture plate. This implies that Cinnamon essential oil exerted an inhibitory influence on the growth of *Aeromonas caviae*, preventing its spread within the specified zone. In comparison, the standard antibiotic ciprofloxacin at 30 μ g/ μ l resulted in a zone of inhibition of 15 mm. However, the control antibiotic Ciprofloxacin exhibited a higher efficacy against *Aeromonas caviae*. This suggests that, under the given experimental conditions, Cinnamon essential oil demonstrated greater potency in inhibiting the growth of *Aeromonas caviae* compared to Ciprofloxacin. This indicates that higher concentrations of cinnamon oil demonstrate more robust antibacterial activity against *Aeromonas caviae* compared to ciprofloxacin at the tested concentration. The molecular mechanism responsible for the antibacterial activity of cinnamon oil is likely linked to its bioactive components, with cinnamaldehyde being a key player. Cinnamaldehyde possesses antimicrobial properties and is recognized for disrupting the integrity of bacterial cell membranes. Its ability to penetrate bacterial cell membranes causes structural damage, leading to the leakage of cellular contents. This disruption ultimately hinders bacterial growth and survival. Moreover, cinnamon oil may interfere with bacterial enzymes and metabolic processes, further contributing to its antibacterial effects. It's crucial to acknowledge that the precise molecular mechanism of cinnamon oil's

**Devika et al.,**

antibacterial activity against *Aeromonas caviae* may involve multiple factors and could potentially be more intricate than the general mechanisms outlined here.

CONCLUSION

In summary, the chemical analysis of cinnamon oil revealed the presence of various compound classes, with phenol, vanillin, (Z)-cinnamyl benzoate, and rutamarin identified as the major constituents. These compounds exhibit diverse applications, ranging from disinfectants and pharmaceuticals to perfumes and protective agents against diseases. The antibacterial effectiveness of cinnamon oil against *Aeromonas caviae* displayed a concentration-dependent pattern, with higher concentrations yielding stronger inhibition. Notably, cinnamon oil demonstrated superior antibacterial activity compared to the standard antibiotic ciprofloxacin at the tested concentration. The mechanism of action involves the disruption of bacterial cell membranes by cinnamaldehyde, causing membrane damage and inhibiting growth. Additionally, interference with bacterial enzymes and metabolic processes may contribute to its antibacterial effects. However, a comprehensive understanding of the intricate molecular mechanisms requires further research. The study's findings endorse the potential use of cinnamon oil as a natural antimicrobial agent, emphasizing its promising applications in pharmaceutical and therapeutic realms.

ABSTRACT

Let I_s be an S -prime ideal of a commutative ring R with unity of order p^t and $p^t q$, $t \geq 1$ respectively and A_s be the multiplicatively closed subset of R which is disjoint from the S -prime ideal I_s . In this paper a new graph called multiplicative graph is introduced and denoted by $G_{A_s}(R)$. The vertices of $G_{A_s}(R)$ are the elements of all A_s and any two vertices are adjacent if and only if their product is in any A_s of R . Furthermore, some graph theoretic and algebraic properties of a graph are investigated. Also, relationship between A_s and $nil(R)$ is discussed, where $nil(R)$ is the nilradical of R and proved that the total number of vertices of a graph is the number of elements in the complement of the set $nil(R)$. Finally using Euler's totient function, first Zagreb index and Randić index of $G_{A_s}(R)$ are generalized.

Keywords: S -prime ideal, Multiplicatively closed subset, Nilpotent elements, Orthogonal elements, Girth, Rank.

2010 AMS Subject Classification 05C25, 13A99, 16U99.

INTRODUCTION

Algebraic graph theory is the application of graph theory using algebraic conditions. Group theory, graph invariants and linear algebra are the three main areas of algebraic graph theory. In 1964, Bosak [5] introduced the graphs of semigroups. Later on, many authors developed the wide range of graphs from groups, they are [1, 17, 20], etc., In 2022, Kiruthika and Kalamani [14] derived a new graph from group theory called the vertex order graph and studied its complements with the edge condition. Also, they [15] partitioned the set of vertices and edges of the power graph of a group \mathbb{Z}_{pq} , p, q are primes. In 1988, Beck [4] introduced a graph from a commutative ring with unity. Several different graphs are defined by many authors: [7, 6], nilpotent graph by [8], graphs defined by orthogonality by [3],

Mythily and Kalamani

etc., In 2021, D. Kalamani and G. Ramya [12] introduced a graph called the product maximal graph, it is defined as their vertices are from the elements of a ring R and the vertices a, b are adjacent if their product is in the maximal ideal of R . In 2019, Ahmed Hamed and Achraf Malek [2] defined an S -prime ideal it represents the prime ideal's generalization of a ring R . It is defined as an ideal is S -prime if \exists an $s \in S$ such that $\forall a, b \in R$ if $ab \in I$, then $sa \in I$ or $sb \in I$, where S is the multiplicative subset of R which is disjoint from the ideal I . In 2023, D. Kalamani and Mythily. C. V [11] defined a graph denoted by $G_{S_d}(R)$ it is an undirected graph from the definition of S -prime ideal of R . The vertices are from a ring R and two vertices are connected if either sa or $sb \in I$ whenever the product $ab \in I$, I is an ideal of R and S is the multiplicative subset of R and $S \cap I = \emptyset$. Also, they discussed S -prime ideal of a local and non-local rings in [16]. A number linked to chemical composition that suggests a relationship between chemical structure and different physical attributes, chemical reactivity is called a topological graph index. Many degree based topological indices are discussed earlier [13, 21], in this paper first Zagreb index $F_1[G_{A_s}(R)] = \sum_{u \in V[G_{A_s}(R)]} [d(u)]^2$ and the Randić index of a multiplicative graph is presented. The product maximal graph and the S -prime ideal graph of a ring R were motivated to discover a graph $G_{A_s}(R)$ of finite order. In this paper the ring R is considered as a commutative ring with identity of order $n = p^t$ and $p^t q$, $t \geq 1$ respectively. The set A_s is the multiplicatively closed subset of R which is disjoint from the S -prime ideal I_s and introduced the new graph of R called multiplicative graph denoted by $G_{A_s}(R)$ whose vertex set V contains the elements of all the multiplicatively closed subsets A_s of R .

In section 2, some basic definitions are studied for algebraic and graph theoretical results from [9] and [19]. The notations and symbols of algebra and graph theory are studied from [9], [19] and Algebraic Graph Theory by C. Godsil and G. Royle [10]. In section 3, some examples of a multiplicative graph $G_{A_s}(R)$ of R , also relation between A_s and $nil(R)$ is discussed. In section 4 maximum, minimum distance, girth of the multiplicative graph $G_{A_s}(R)$ and also number of vertices in a graph $G_{A_s}(R)$ are derived. In section 5, degree of the vertex of $G_{A_s}(R)$ is generalized and using Welsh-Powell algorithm to generalize the chromatic number of the graph. In 1967, Welsh and Powell [18] introduced an upper bound for the chromatic number of a graph and its application to timetabling problem, it gives Welsh-Powell algorithm applied to find the chromatic number of a graph by using degree of the vertex. The following steps derive the Welsh-Powell graph coloring algorithm:

- First find the degree of the vertex $\deg(v)$ of every vertex in a graph.
- List the degree of the vertices in descending sequence.
- Next color the first vertex in the list.
- Move to the next vertex in the list and color the vertices which are not connected to the colored vertex then color it with same color.
- Repeat in this way to color all the uncolor vertices in a graph. In section 6, rank and nullity of the multiplicative graph are generalized by using the adjacency matrix of the multiplicative graph $G_{A_s}(R)$ and in section 7, by using Euler's totient function, the first Zagreb index and Randić index of the multiplicative graph is generalized.

PRELIMINARIES

The basic definitions of a commutative ring, zero-divisor, unit, prime ideal, maximal ideals, orthogonal, diameter, girth and complete graph are given in this section.

Definition 2.1. Let a be an element in R ; it is called a **zero-divisor** if \exists a nonzero element $b \in R$ such that either $a \cdot b = 0$ or $b \cdot a = 0$.

Definition 2.2. An element u from a ring is called a **unit** if $\exists v \in R$ $\exists uv = vu = 1$.

Definition 2.3. A proper ideal P is called a **prime ideal** if $a \cdot b \in P$ where $a, b \in R$ then either a or $b \in P$.

Definition 2.4. The subset M is called a **maximal ideal** of R if $M \neq R$ and for any I of R is in M and there is no proper ideal that contains M .

Mythily and Kalamani

Definition 2.5. Let $S \subseteq R$ be the **multiplicatively closed set** such that the following two conditions hold:

- $1 \in S$,
- $ab \in S \forall a, b \in S$

The identity element $0 \in R$ is not in the set S .

Definition 2.6. Let $a \in R$ is called **nilpotent** if $\exists t \in \mathbb{Z}^+ \ni a^t = 0$. The collection of all nilpotent elements, denoted by $nil(R)$.

Definition 2.7. The elements $a, b \in R$ are said to be **orthogonal** ($a \perp b$) if $ab = 0$.

Definition 2.8. Let $I \subset R$ disjoint with $S \subseteq R$. The ideal I is called S -prime if $\exists a, b \in R$ with $ab \in I$ then $sa \in I$ or $sb \in I$.

Definition 2.9. The smallest number of edges in any cycle within the graph is the **girth** of a graph. If the graph has no cycles, the girth is considered to be infinite.

Definition 2.10. Maximum length of the shortest paths connecting any two vertices is the **diameter** of a graph and it is denoted by $diam(G)$. Smallest value of the greatest distance between any vertex and all other vertices in the graph is the **radius** of a graph, it is denoted by $rad(G)$. The diameter and radius of a trivial graph is zero.

Definition 2.11. In a simple graph G , every vertex adjacent to another vertex is called complete.

Definition 2.12. The smallest number of colors required to label the vertices of a graph is called **chromatic number** it is denoted by $\chi(G)$. In order to give distinct colors to vertices that are adjacent.

Definition 2.13. A **clique** of a graph is the size of the maximal complete subgraph of the graph which is denoted as $\omega(G)$.

Definition 2.14. The **rank** of G denoted by $\rho(G)$ is the count of λ , where λ is the non-zero eigen values of the $adjM$ of G where $adjM$ is the adjacency matrix M . The **nullity** of G is defined as the count of the λ 's which are zero of the $adjM$ of G and it is denoted by $\eta(G)$. The dimension of a matrix M is $diamM = \rho(M) + \eta(M)$.

Definition 2.15. **Randi 'c index** of graph G is given by, $\mathcal{R}(G) = \sum_{uv \in e(G)} \frac{1}{\sqrt{d(u)d(v)}}$, $u, v \in v(G)$ and $uv \in e(G)$, where $v(G)$ and $e(G)$ are the vertex and edge set of G .

MULTIPLICATIVE GRAPH OF A RING

In this section, a graph from ring is introduced and discusses the relation between the multiplicative set A_s which contains disjoint elements of I_s and $nil(R)$ of a ring of order n , where $nil(R)$ is nilradical of R , includes every nilpotent element of R .

Definition 3.1. Let R be a finite commutative ring and I_s be an S -prime ideal of R . Let A_s be the multiplicatively closed subset of R which is disjoint from the S -prime ideal I_s of R . The multiplicative graph of R denoted by $G_{A_s}(R)$ is a graph whose vertices are the collection of all the elements of the multiplicatively closed subsets A_s of R and two vertices are only connected if and only if their product is in any multiplicatively closed subsets A_s of R .

Example 3.1. Let $R = \mathbb{Z}_9$ be the local ring the only S -prime ideal I_s is the prime ideal $I_1 = \{0, 3, 6\}$. Let $A_s = R - I_s$ is complement of I_s . The set A_s is disjoint from I_s . Vertex set $V(G_{A_s}(\mathbb{Z}_9))$ is $A_1 = \{1, 2, 4, 5, 7, 8\}$ and the multiplicative graph of \mathbb{Z}_9 shown in Figure 1.

Example 3.2. Let $R = \mathbb{Z}_{14}$ be the semilocal ring and their S -prime ideals are

Mythily and Kalamani

$$I_1 = \{0, 2, 4, 6, 8, 10, 12\}$$

$$I_2 = \{0, 7\} \text{ and}$$

$$I_3 = \{0\}.$$

Disjoint multiplicative subsets of S -prime ideals are

$$A_1 = \{1, 3, 5, 7, 9, 11, 13\}$$

$$A_2 = \{1, 2, 3, 4, 5, 6, 8, 9, 10, 11, 12, 13\} \text{ and}$$

$$A_3 = \{1, 2, 4, 8\}$$

The vertices V of a graph $G_{A_s}(\mathbb{Z}_{14})$ are the elements of all the collections of A_1, A_2 and A_3 of $R = \mathbb{Z}_{14}$. i.e., $V = \cup_s A_s$.

Therefore, the vertex set $V = \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13\}$. The Figure 2 shows that an orthogonal element in a graph is non-adjacent. For instance, the orthogonal elements of 7 in \mathbb{Z}_{14} are 2, 4, 6, 8, 10 and 12. The vertex 7 is not adjacent to the elements of $\{2, 4, 6, 8, 10, 12\}$. The vertices from I_1 is not adjacent to the vertices of any other I_s . By the above examples, it is noted that the multiplicative graph $G_{A_s}(R)$ is complete if R is local ring. The set A_s are multiplicatively closed so that every element of a set A_s is adjacent to the multiplicative identity 1 of R . All the element of a set A_s is V of a graph $G_{A_s}(R)$ they are adjacent with each other and no vertex can be adjacent with itself. Thus, the multiplicative graph of a finite ring R with unity it is a simple and connected.

Proposition 3.1. Let R be a ring of order n . The vertex set V of a multiplicative graph $G_{A_s}(R)$ does not have any nilpotent elements of a ring R .

Proof. Let A_s be the multiplicatively closed subset of R which is disjoint from the S -prime ideal I_s of R and the vertex set of a multiplicative graph of R contains all the elements of A_s . Assume that if the nilpotent element 0 in the vertex set V then 0 is in A_s of R . It contradicts to the definition of multiplicatively closed subset and the S -prime ideal property that $I_s \cap A_s = \emptyset$. Therefore $0 \notin A_s$. The set $nil(R)$ is contained in the intersection of the prime ideals P_i and every prime ideal P_i is the S -prime ideal I_s of R where $1 \leq i < n$. Therefore, the multiplicatively closed subset A_s is also disjoint from $\cap P_i$. Thus, the vertex set V of $G_{A_s}(R)$ does not have any nilpotent elements of a ring R .

MAXIMUM AND MINIMUM DISTANCE OF A GRAPH

A multiplicative graph of a ring R whose vertex set is the collection of all A_s of R which is disjoint from the S -prime ideal I_s and draw a graph for a vertex set V is a multiplicative graph $G_{A_s}(R)$ is connected. The most important thing for drawing a graph is its vertices. The cardinality of vertices of a multiplicative graph and maximum distance of the graph $G_{A_s}(R)$ is $diam[G_{A_s}(R)] = \{0, 1, 2\}$ are generalized in this section.

Theorem 4.1. Let $G_{A_s}(R)$ be a graph of a ring R of order n and V be the vertex set of a multiplicative graph $G_{A_s}(R)$. Then the total number of vertices in a graph is $|V| = |nil(R)|$.

Proof. Let A_s be the multiplicatively closed subset of R which is disjoint from the S -prime ideal I_s . By Proposition 3. 1. the vertex set V does not contain any nilpotent element of R . If x is any non-nilpotent element of a ring then $x^t \neq 0$ for all $t \in \mathbb{Z}^+$. Assume that x is not an element of the set A_s of R then $x^t \notin A_s$ which means $x^t \in I_s$ for all $t \in \mathbb{Z}^+$. Then $x^t = 0$ for some $t \in \mathbb{Z}^+$. This implies that x is nilpotent. It contradicts to x is non-nilpotent. Therefore, the vertex set V contains all the set A_s of R and the set A_s does not contains any nilpotent element. Since all the nilpotent elements of R contained in $nil(R)$. i.e., $V = |nil(R)|$. Then the total number of vertices, $|V| = |nil(R)|$.

Corollary 4.2. If R is a field, then $|V| = n - 1$.

Proof. In a field, every non-zero elements are the units of R and it is a local ring so they have unique S -prime ideal I_s . The disjoint multiplicatively closed subset of I_s is A_s . It contains all the units of R . That is A_s contains $R - \{0\}$. Therefore $|V| = n - 1$.

Theorem 4.3. Let R be a ring of order $n > 2$. Then $diam(G_{A_s}(R))$ is

Mythily and Kalamani

$$diam(G_{A_s}(R)) = \begin{cases} 1 & \text{if } R \text{ is local} \\ 2 & \text{otherwise.} \end{cases}$$

Proof. Case (i)

Let R be a local ring. The multiplicative graph $G_{A_s}(R)$ is complete such that all vertices are connected to every other vertex in $G_{A_s}(R)$. $\therefore diam(G_{A_s}(R)) = 1$.

Case (ii)

Let R be a non-local ring and a, b are the vertices of a multiplicative graph of R . Let us consider a, b are units of R and $a, b \notin I_s$ since $a, b \in A_s$ such that their product $ab \in A_s$ then they are adjacent in $G_{A_s}(R)$ $\therefore d(a, b) = 1$. Let a, b are non-units of R and $a, b \in A_s$ which are in the S -prime ideal I_s . If a, b are in same I_s then they are adjacent in $G_{A_s}(R)$. $\therefore d(a, b) = 1$. If a, b are in different multiplicatively closed subset A_s then a, b in different S -prime ideal I_s of R and their product does not exist in the vertex set of $G_{A_s}(R)$. $\therefore d(a, b) = 2$ Since every vertex of $G_{A_s}(R)$ adjacent to 1 then the distance of a vertices

$$d(a, b) = \begin{cases} 1 & \text{if } a, b \text{ are units} \\ 2 & \text{otherwise.} \end{cases}$$

The maximum distance is the diameter of the multiplicative graph of R . Therefore $diam(G_{A_s}(R)) = 2$.

Corollary 4.4. A ring of order $n = 2$ then $diam(G_{A_s}(R)) = 0$.

Corollary 4.5. Let R be a ring of order n . Then the radius of a multiplicative graph is

$$rad(G_{A_s}(R)) = \begin{cases} 0 & \text{if } n = 2 \\ 1 & \text{otherwise.} \end{cases}$$

A graph $G_{A_s}(R)$ is connected and the order of a ring $n = \{3, 4\}$ are K_2 complete and they are isomorphic. The following theorem states the girth of the multiplicative graph of a ring R .

Theorem 4.6. Let R be a ring. Then the girth of a multiplicative graph is

$$gr(G_{A_s}(R)) = \begin{cases} 3 & \text{if } n > 4 \\ \infty & \text{otherwise.} \end{cases}$$

Proof. Case (i) $n > 4$

Let a and b are the elements in the same multiplicative subset A_s . Then a and b are adjacent in $G_{A_s}(R)$ which are adjacent to the units of R in $G_{A_s}(R)$. Therefore, $1 - a - b - 1$ form a cycle. Thus, $gr(G_{A_s}(R)) = 3$.

Case (ii)

The multiplicative graph $G_{A_s}(R)$ is a singleton graph if the ring of order is 2. Therefore, the multiplicative graph has no cycle. Thus, $gr(G_{A_s}(R)) = \infty$.

DEGREE OF THE VERTEX AND CHROMATIC NUMBER OF A GRAPH

Let vertex set of $G_{A_s}(R)$ are collection of all A_s of a ring R and number of vertices $|V| = |A_s|$ and the elements of R are units and zero-divisors. Consider zero-divisors of R are non-units of R in the subsequent theorem, here talk about the degree of the vertices in the multiplicative graph $G_{A_s}(R)$.

Theorem 5.1. Let $G_{A_s}(R)$ be the multiplicative graph of a ring R then,

$$deg(v) = \begin{cases} m - 1 & \text{if } v \text{ is a unit} \\ |A_s| - 1 & \text{otherwise.} \end{cases}$$

Proof. Let A_s be the subset of R and V be the vertex set contains all the elements of the subsets A_s of a ring R .

Mythily and Kalamani

Case (i)

Let $v \in V$ be the unit element of a ring R . It is contained in the subsets A_s of R . The vertex v is connected to every other vertex of the multiplicative graph $G_{A_s}(R)$ and there is no vertex adjacent to itself. It is a simple graph. Therefore, the degree of the vertex of a multiplicative graph $G_{A_s}(R)$ is, $\deg(v) = m - 1$ where $m = |V|$.

Case (ii)

Let $v \in V$ be the non-unit element of a ring R . If $v \in A_s$ then v is adjacent to all the elements of A_s and non-adjacent to non-unit element of other multiplicatively closed subset A_s of R , therefore $\deg(v) = |A_s| - 1, v \in A_s$ where $|A_s|$ is the number of elements in A_s .

Thus, $\deg(v) = \begin{cases} m - 1 & \text{if } v \text{ is a unit} \\ |A_s| - 1 & \text{otherwise.} \end{cases}$

Using the Welsh-Powell algorithm [18] to find $\chi(G_{A_s}(R))$ for the multiplicative graph $G_{A_s}(R)$ in the next theorem.

Theorem 5.2. Let A_s be the multiplicatively closed subset of R with unity of order n and V be the vertex set is the collection of all A_s . Then the chromatic number of the multiplicative graph $G_{A_s}(R)$ is $\chi(G_{A_s}(R)) = \text{Max}\{|A_s|\}$.

Proof. Let vertex set of $G_{A_s}(R)$ is $V = \{u_1, u_2, u_3, \dots, u_k, v_1, v_2, v_3, \dots, v_l\}$ where vertices u_k and v_l are units and non-units of a ring R and $k + l = m$. By Theorem 5.1, $\deg(v)$ of the multiplicative graph $G_{A_s}(R)$ are calculated. After finding the degree of the vertex they are arranged in descending order. First color the vertex u_1, u_1 is connected to all the vertices of $G_{A_s}(R)$ and move to the second unit u_2 by different color. The process can be repeated till all the units are colored with k colors namely C_1, C_2, \dots, C_k respectively. Next move on to the non-unit of maximum degree v_j with the color C_{k+1} . The sets A_1 and A_2 are the multiplicative subsets of R . Let v_1, v_2, \dots, v_τ be the non-units of A_1 . The non-unit v_i of A_1 is adjacent to all the other non-units of A_1 and is not adjacent to the non-units of A_2 , where $i = 1, 2, 3, \dots, \tau$. Suppose v_1 has the maximum degree then it is colored with the color C_{k+1} . Choose the next non-unit of maximum degree in A_1 and it can be colored with the color C_{k+2} . Continuing the same process till all the vertices A_1 are colored and hence the set A_1 has $C_{k+\tau}$ colors. If A_2 has ρ non-units and $\rho \leq \tau$ then there are $C_{k+\tau}$ colors for the multiplicative graph $G_{A_s}(R)$. If $\rho > \tau$ then there are $C_{k+\rho}$ colors for the multiplicative graph $G_{A_s}(R)$. The minimum number of different colors is the maximum cardinality of $A_i, i = 1, 2$. Therefore, the minimum number of colors used for the graph $G_{A_s}(R)$ is the maximum cardinality of $A_i, i = 1, 2$. Then the chromatic number of the graph is, $\chi(G_{A_s}(R)) = \text{Max}\{|A_s|\}$.

The $\chi(G_{A_s}(R))$ also same as the maximum degree of the vertex in a graph.

Example 5.1. Let us consider a ring \mathbb{Z}_{10} and the S -prime ideal of \mathbb{Z}_{10} are

$I_1 = \langle 2 \rangle = \{0, 2, 4, 6, 8\}$

$I_2 = \langle 5 \rangle = \{0, 5\}$ and

$I_3 = \langle 10 \rangle = \{0\}$

Disjoint multiplicative subsets of S -prime ideals are

$A_1 = \{1, 3, 5, 7, 9\}$

$A_2 = \{1, 2, 3, 4, 6, 7, 8, 9\}$ and

$A_3 = \{1, 5\}$

Vertex set of $G_{A_s}(\mathbb{Z}_{10})$ is collection of all A_s of a ring $R = \mathbb{Z}_{10}$.

Therefore, $V = \cup_s A_s = \{1, 2, 3, 4, 5, 6, 7, 8, 9\}$.

By using Theorem 5.1. finding degree of the vertices in $G_{A_s}(\mathbb{Z}_{10})$ and according to the first step of the Welsh-Powell algorithm, sort the vertices by their degrees as shown in Table 1. The next step is to color the vertex which degree is highest. In the Figure 3 vertices $\{1, 3, 7, 9\}$ are units of \mathbb{Z}_{10} adjacent to each other so they need different color. It is shown in Figure 3. The vertex set $\{2, 4, 6, 8\}$ are adjacent to each other and adjacent to all units of \mathbb{Z}_{10} such that they also need different color those colors are different from the already colored vertices. In Figure 3, vertex $\{5\}$ is adjacent to all the units of \mathbb{Z}_{10} and not adjacent with the vertex set $\{2, 4, 6, 8\}$. So, one of the colors of vertices $\{2, 4, 6, 8\}$ is the

Mythily and Kalamani

color of the vertex {5}. It is easiest way to find minimum color of a graph. The $\chi(G_{A_s}(R))$ is the maximum complete of the graph with m vertices. In Figure 3 the vertex set from A_2 is form a maximum complete. Thus $\chi(G_{A_s}(\mathbb{Z}_{10})) = |A_2| = 8$.

Corollary 5.3. Let R be a ring. Then the clique number of a multiplicative graph is $\omega(G_{A_s}(R)) = \chi(G_{A_s}(R))$.

RANK OF A MULTIPLICATIVE GRAPH

In this section rank and nullity of the multiplicative graph $G_{A_s}(R)$ of a ring R are generalized.

Theorem 6.1. Let $R = \mathbb{Z}_n, n > 2$ be a ring and V be the vertex set of $G_{A_s}(R)$. Then $rank(G_{A_s}(R)) = |V|$.

Proof. The vertex set V is the collection of elements of A_s of R . It contains all units of R and the units of R are adjacent with all other vertices in $G_{A_s}(R)$. No vertex in $G_{A_s}(R)$ is adjacent with itself. By Theorem 5.1, if vis a unit then $deg(v) = m - 1$, where $m = |V|$ of a multiplicative graph $G_{A_s}(R)$. If the vertex vis a non-unit and $v \in A_s$ for some s , then $deg(v) = |A_s| - 1$. Let $M(G)$ be the adjacency matrix of $G_{A_s}(R)$ it is a simple graph do not have an identical row (columns). Hence $|M(G)| \neq 0$. The matrix $M(G)$ of a graph $G_{A_s}(R)$ of the form

$$\begin{bmatrix} 0 & 1 & 1 & 1 & \dots & 1 & 1 \\ 1 & 0 & \dots & \dots & \dots & \dots & \dots \\ 1 & \dots & 0 & \dots & \dots & \dots & \dots \\ 1 & \dots & 0 & \dots & \dots & \dots & \dots \\ \dots & \dots & \dots & \dots & \dots & \dots & \dots \\ \dots & \dots & \dots & \dots & \dots & \dots & \dots \\ \dots & \dots & \dots & \dots & \dots & \dots & \dots \\ \dots & \dots & \dots & \dots & \dots & \dots & \dots \\ \dots & \dots & \dots & \dots & \dots & \dots & \dots \\ 1 & 0 & \dots & \dots & \dots & \dots & 0 \end{bmatrix}$$

It is a non-singular matrix and hence it has no zero eigenvalues. Thus $rank(G_{A_s}(R)) = |V|$.

The rank of a multiplicative graph $G_{A_s}(R)$ also calculate by the Theorem 4.1. as $rank(G_{A_s}(R)) = \overline{nil(R)}$.

Corollary 6.2. Let $G_{A_s}(R)$ be the multiplicative graph of a ring R . Then the nullity of the graph is $\eta(G_{A_s}(R)) = 0$.

RANDIĆ INDEX OF A MULTIPLICATIVE GRAPH

Euler’s totient function, denoted as $\phi(n)$ it calculates the number of integers between 1 and n that share no common factors with n other than 1. By using Euler’s totient function the first Zagreb index F_1 of a multiplicative graph are generalized in the subsequent theorem. Let R be the ring of order either p or $p^t q, t \geq 1$. The ring of order $p^t q$ has two prime ideals generated by p and q and their complement sets are A_1 and A_2 respectively. The Euler’s totient function, denoted as $\phi(n)$ gives the number of units of $R = \mathbb{Z}_n$. With the help of totient function, the first Zagreb index F_1 and Randić indices of a multiplicative graph are generalized and are shown in the following theorems. Denote the cardinality of A_i as η_i and the difference between η_i and $\phi(n)$ as ζ_i for $i = 1, 2$.

Theorem 7.1. Let $G_{A_s}(R)$ be a connected graph of order $n \neq p$ with m vertices. Then the first Zagreb index of $G_{A_s}(R)$ is $F_1[G_{A_s}(R)] = \phi(n)(m - 1)^2 + \sum \zeta_i(\eta_i - 1)^2$.

Proof. By Theorem 5.1, obtained degree of the vertices is $m - 1$ if vertices are units of R and otherwise degree of vertex is $m - 1$. Thus, the two different vertex degrees are obtained for the multiplicative graph. Therefore, the first Zagreb index of the multiplicative graph is

$$\begin{aligned} F_1[G_{A_s}(R)] &= \sum_{u \in V[G_{A_s}(R)]} deg(u)^2 \\ &= \sum_{u \in U(R)} deg(u)^2 + \sum_{u \notin U(R)} deg(u)^2 \end{aligned}$$

Mythily and Kalamani

$$\begin{aligned}
 &= \sum_{u \in U(R)} \text{deg}(u)^2 + \sum_{u \in A_1} \text{deg}(u)^2 + \sum_{u \in A_2} \text{deg}(u)^2 \\
 &= \phi(n)(m-1)^2 + \zeta_1(\eta_1-1)^2 + \zeta_2(\eta_2-1)^2 \\
 F_1[G_{A_s}(R)] &= \phi(n)(m-1)^2 + \zeta_i(\eta_i-1)^2.
 \end{aligned}$$

Example 7.1. Let $G_{A_s}(R)$ of order 13. Then the first Zagreb index of $G_{A_s}(\mathbb{Z}_{14})$ is,
 $F_1[G_{A_s}(\mathbb{Z}_{14})] = \phi(n)(m-1)^2 + \zeta_i(\eta_i-1)^2$. Thus $F_1[G_{A_s}(\mathbb{Z}_{14})] = 1626$.

Corollary 7.2. First Zagreb index of a multiplicative graph of a prime order is $F_1[G_{A_s}(R)] = m(m-1)^2$.

Theorem 7.3. Let $G_{A_s}(R)$ be a multiplicative graph of order m . Then the Randić index of a multiplicative graph is $\mathcal{R}[G_{A_s}(R)] = \frac{\phi(n)c_2}{(m-1)} + \frac{\zeta_i\phi(n)}{\sqrt{(m-1)(\eta_i-1)}} + \frac{\zeta_i c_2}{(\eta_i-1)}$, $i = 1, 2$.

Proof. Let $uv \in E[G_{A_s}(R)]$ be the edge set of a multiplicative graph $G_{A_s}(R)$. Then the Randić index of a multiplicative graph is

$$\begin{aligned}
 \mathcal{R}[G_{A_s}(R)] &= \sum_{uv \in E(G_{A_s}(R))} \frac{1}{\sqrt{\text{deg}(u)\text{deg}(v)}} \\
 &= \sum_{u,v \in U(R)} \frac{1}{\sqrt{d(u)d(v)}} + \sum_{u \in U(R), v \notin U(R)} \frac{1}{\sqrt{\text{deg}(u)\text{deg}(v)}} + \sum_{u,v \notin U(R)} \frac{1}{\sqrt{\text{deg}(u)\text{deg}(v)}} \\
 \mathcal{R}[G_{A_s}(R)] &= \frac{\phi(n)c_2}{(m-1)} + \frac{\zeta_i\phi(n)}{\sqrt{(m-1)(\eta_i-1)}} + \frac{\zeta_i c_2}{(\eta_i-1)}.
 \end{aligned}$$

Example 7.2. Let $G_{A_s}(\mathbb{Z}_{10})$ of order 9. Then the Randić index of a multiplicative graph $G_{A_s}(\mathbb{Z}_{10})$ is,

$$\begin{aligned}
 \mathcal{R}[G_{A_s}(\mathbb{Z}_{10})] &= \sum_{uv \in E(G_{A_s}(\mathbb{Z}_{10}))} \frac{1}{\sqrt{\text{deg}(u)\text{deg}(v)}} \\
 &= 16 \frac{1}{\sqrt{56}} + 6 \frac{1}{\sqrt{64}} + 4 \frac{1}{\sqrt{32}} + 6 \frac{1}{\sqrt{49}} \\
 \mathcal{R}[G_{A_s}(\mathbb{Z}_{10})] &= 4.4523.
 \end{aligned}$$

Corollary 7.4. The Randić index of a multiplicative graph with m vertices of a ring of prime order is $\frac{m}{2}$.

CONCLUSIONS

In this paper, a new graph called the multiplicative graph $G_{A_s}(R)$ is introduced. Some basic graph theoretic properties namely number of vertices, degree of a vertex, girth, diameter, maximum and minimum distance of a graph, chromatic number and clique number are generalized and also algebraic properties rank and nullity are interpreted for the multiplicative graph of a finite commutative ring R with unity. Finally, first Zagreb index and Randić index of $G_{A_s}(R)$ are generalized.

ABSTRACT

Minerals and nutrients in soil result by weathering, erosion and deposition the rock particles. These make soil fertile and productive. These are the most important ingredients of soils, which have an effect on organic activities. The present study is confined to South Delhi Fold Belt (SDFB), that's an aggregate of hilly and pene-plained place. A major part of western side covered with soil with scanty outcrops of Banded Gneisses Complex (BCG). In northwestern aspect of Bar, in the back of the Ramdev temple very big hillocks of granitic gneisses are present, while within side the southwestern aspect close to Haripur Railway station once more the outcrops of granitic gneisses are present, which are covered by coarse textured soils of variable depths. The parent rocks had definite impact on soil characteristics and nutrient. The present paper highlights impact of parent rocks on soil characteristics.

Keywords: Delhi Fold Belt, Banded Gneisses Complex (BCG), arid region, Aravalli, Bar, Agriculture

**Hemant Prakash et al.,**

INTRODUCTION

India has a long history of being an agrarian society, with a substantial portion of its population involved in agriculture. Soil is indeed a valuable and non-renewable resource. Its importance lies in providing a medium for plant growth and supporting various forms of vegetation essential for human sustenance and ecosystem balance. Soil depth, texture, and fertility are pivotal factors that influence the health and productivity of the soil. Farmers and land managers need to understand and manage these factors effectively for sustainable agriculture. The interaction between soil quality, climate, and agricultural practices significantly impacts crop productivity. Higher crop yields contribute to food security, economic prosperity, and overall societal well-being. The soils have originated through the processes of weathering and erosion acting on rocks. These soils may either form in situ or be transported through mechanisms like sand drift or aeolian processes. Regardless of their mode of formation, the soils retain the distinctive characteristics of the parent rock, evident in the minerals that compose the soil. Depending on the raw material, soils exhibit varying morphological, physical, chemical, and biological properties (Pandurang 2022). This study specifically explores the relationship between parent rocks and the soils formed in Bar, Raipur tehsil of Pali district.

MATERIALS AND METHODS

The soils have been studied at 11 sites at Phatakhera, Megarda, Bhilan, Kanuja and Kotra of Pali district, Rajasthan (Table 2). The rocks in the study area predominantly exhibit a conglomeratic nature, particularly in the Bar conglomerate horizon, and are characterized by folding and metamorphism. The soil samples representing various soil types were analyzed for both physicochemical and chemical properties. The chemical properties were determined utilizing a UV-VIS spectrophotometer (Model Shimadzu-1650PC). Additionally, the soil texture was assessed using the particulate organic matter (POM) method. To analyze the available nitrate nitrogen (NO₃-N), we utilized the extraction procedure outlined by Cataldo et al. (1975). Olsen's method (1954) was employed for the extraction and estimation of available phosphorous (PO₄-P). Titrimetric and DTPA methods were employed for assessing other soil nutrients. Lithostratigraphic classification and mineralographic data for the rock samples are provided in Tables 2.

RESULTS AND DISCUSSIONS

GEOLOGY OF THE AREA

The rocks in the southwestern part of the study area comprise scattered outcrops of granitic gneisses, mostly concealed beneath a thick layer of loose sand. Throughout the study area, posts-tectonic dikes, pegmatite and granite sills, and quartz veins are prevalent. Notably, there is widespread igneous intrusive activity, particularly of an acidic nature, in areas such as Bar, Phatakhera, Bhilan, Kotra, and their immediate vicinity. While faint impressions of granitization are observed in the form of veins and boudins at Phatakhera and Megarda villages, they are not as distinctly marked as rock formations. The presence of pegmatite, granite, and quartz veins signifies intrusive activity in the region, a phenomenon also documented by Naha et al. (1984). These veins contain minerals like tourmaline, garnet, beryl, etc. At the Kanuja-Sawanji ki Bariya road section, a distinct break in slope is observed between a hill and the next terrace level. Further southeast, there is a lower terrace level where the Sendra Formation is exposed. A few meters downstream from the Sukri river section at Bheru ki Bariya, well-exposed dark green amphibolite bands alternate with sillimanite gneiss. A detailed examination of the rock sequences of the Sendra Formation along the Sukri river section aimed to identify various lithological units. These include medium to coarse-grained gneisses, the crystalline content in migmatite, and the gradational contact of calc amphibolite gneiss with intrusive granite at Bheru ki Bariya, Kanuja, and Kotra villages, respectively (Figure 1& Table 1). The study area encompasses three primary tectonic divisions of the Delhi Supergroup, extending from southwest to northeast, namely the Banded Gneiss Complex (BGC, as described by Heron in 1953), Barotia (Alwar Group), and Sendra Formation (Ajabgarh

**Hemant Prakash et al.,**

Group). Each of these tectonic divisions exhibits distinct displacement patterns within the study area. The Banded Gneiss Complex (BGC) forms the Precambrian basement in the southwestern part and constitutes the lowermost tectonic unit in the region (Roy et al., 1985). An unconformity separates the BGC from the overlying rocks of the Barotia Formation (Gangopadhyay and Lahiri, 1983). The Barotia Formation comprises the Bar conglomerate horizon, calc amphibolite schist, quartzite schist, and calc-schist with intercalated quartzite schist. The Bar conglomerate horizon further divides into quartzofeldspathic schist, Bar conglomerate schist, garnetiferous mica schist, staurolite schist, and kyanite schist. Moving towards the northeastern part of the study area, the Sendra Formation overlays the region. Dolomite, equivalent to Nandana crystalline limestone according to Heron (1953), serves as a conformable separation between the Sendra Formation and the underlying Barotia Formation. The Sendra Formation is characterized by substantial gneisses with alternating bands of mica schist and foliated quartzite (Tripathi et al. (2015).

SOIL OF STUDY AREA

The soil in the Bar area is intricate, exhibiting high variability in composition, and reflects a diversity of parent materials and physiographic land features. Based on their characteristics, the soils are categorized into five significant groups: (1) light soils or sandy soils, (2) sandy loam or light-medium soils, (3) loam or medium soils, (4) heavy soils, including clay or loam to clay, and (5) shallow rocky or skeletal soils and hilly soils. These encompass grey-brown (wasteland soil), ferruginous pink soil, blended pink, black soil, medium black soil, and alluvial soils. The eastern side of the study area is characterized by rocky and hilly terrain, covered with shallow gravelly and superficial soils, primarily under forest or wastelands. Bernhard-Reversat (1982) noted a strong correlation between soil and vegetation in this area, which belongs to the Barotia and Sendra formations and the Kotra Intrusive granite of the Delhi Supergroup. Among the 11 sites surveyed, four (Phatakhera I, II, and Megarda I, II) cover the Barotia Formation, five (Bhilan I, II, Kanuja I, II) cover the Sendra Formation, and two (Kotra I, II) cover the Kotra Intrusive granite. Metamorphosed dolomite formations are situated on the eastern side of Phatakhera and Megarda villages. Phatakhera, located near Bar market, rests on Bar Conglomerate mica schist, presenting an eroded patch adjacent to the Bar conglomerate bed. Megarda features a small hillock of Calc amphibolite schist, concealed beneath a substantial layer of soil and rock formations. Bhilan and Kotra sample sites are situated on metamorphosed migmatite, with steeply sloping hills. Kotra, in particular, is located in the highly hilly terrain of Kotra Intrusive granite rocks. On the western side, the landscape is relatively plain, with variations in soil depth from shallow to very deep and in texture from sandy loam to sandy clay loam. The soils are brown, calcareous in the lower horizon, and highly productive under both rainfed and irrigated conditions. Gupta (1958) studied desert sands in Rajasthan, finding various easily weatherable minerals of aeolian origin, such as hornblende, feldspars, kyanite, and mica.

Dhir and Singh (1985) reported that in gray-brown soils, illite is the dominant clay mineral, followed by mica, smectite, vermiculite, kaolinite, attapulgite, and chlorite. In the Yamuna alluvial plain in Haryana, Shanwal et al. (1989) identified mica as the predominant clay mineral in soil, followed by kaolinite, chlorite, vermiculite, and smectite. They suggested that the presence of fibrous minerals is due to aeolian material from Rajasthan and not as an alluvial deposit of the Yamuna River. Kasser et al. (1979) studied the sands of red soils and observed quartz as the dominant mineral, with light pink feldspars occurring as an accessory mineral and significant amounts of opaque pyroboles and epidotes. Additionally, moderate amounts of zircon, rutile, tourmaline, and staurolite were noted. The high magnesium availability in soils is associated with the alteration products of ultramafic rocks. The potassium content in the soils shows no correlation with the geology of the area. Micronutrients such as iron and manganese exhibit a strong dependence on the bulk chemistry and mineralogy of the parent rock material. According to Moraetis et al. (2006), the bulk chemistry and mineralogy of the parent rock affect the availability of Mg^{2+} in the soils. Regions underlain by ultramafic parent rocks displayed an oversupply of Mg^{2+} in soil solution. In contrast, potassium availability did not show any correlation with the bulk chemical analysis and mineralogy of the soil; instead, it displayed a good correlation with the particle size distribution, especially with soil clay content. The input and output of magnesium and potassium were strongly related to the availability of these elements in vegetation. Furthermore, the deficiency of essential micronutrients such as manganese and iron followed the bulk chemical analysis and mineralogy of the soil, while zinc and copper showed no correlation with the chemistry and mineralogy

**Hemant Prakash et al.,**

of the different soil types. A direct relationship exists between nutrient concentrations present in soil stores and nutrient deficiency in the soil. Nutrient concentrations in plants are typically correlated with nutrient availability in the soil. Concentrations of nutrients are expected to be higher in under storey vegetation compared to open grassland vegetation. Garcia-Moya and McKell (1970) observed that shrubs help maintain the pool of soil nutrients in desert ecosystems by creating islands of organic matter accumulation. Tiedmann and Klemmedson (1973) studied soil profiles under the canopy zone of Mesquite trees (*Prosopis juliflora* (Swartz) DC.) and compared them with soil from adjacent openings at three depths near Tucson, Arizona. Bulk density was lower in the soil under Mesquite but increased with depth in that location. Organic matter, total nitrogen, total sulfur, and total soluble salt were up to three times higher in the surface 0-4.5 cm of Mesquite soil than in open soil but declined with increasing depths to levels approximately the same as in the open soil. Total potassium was enhanced under Mesquite but increased with depth (Malvi et al., 2021, Choudhary, 2020 and Khandagle et al., 2019). Total phosphorus and hydrogen ion awareness were similar to soil from open areas. Results suggested that Mesquite trees serve to ameliorate soil conditions under their canopies by redistributing nutrients from areas beyond the cover to areas beneath the cover.

The Aravalli Range, the oldest mountain range, stretches across the state of Rajasthan from Mount Abu (southeast) to Khetri in Jhunjhunu district (northeast). It divides the state into 60% in the northwest and 40% in the total carbon and nitrogen in the soil under the canopies of *Acacia senegal* and *Balanites aegyptiaca* trees, impacting tree growth. Soil nutrients undergo changes over time with the occupancy of woody plants in a given patch. Generally, soil nutrient concentrations tend to decrease with increasing soil depth. However, there is substantial evidence of a significant reserve of nitrate-nitrogen at greater depths in groundwater in arid zones. The average values of soil available PO₄-P, NH₄-N, and NO₃-N were 15.22 mg kg⁻¹, 3.82 mg kg⁻¹, and 2.43 mg kg⁻¹, respectively, across all sampling sites and soil layers (refer to Table 2). Regardless of soil layers, available PO₄-P ranged from 11.25 mg kg⁻¹ at Kanuja I to 18.30 mg kg⁻¹ at Phatakhera-I, while available NH₄-N varied from 2.55 to 2.15 mg kg⁻¹ at Phatakhera-I and 5.75 to 4.14 mg kg⁻¹ at Kotra-I. When considering different soil layers, these soil nutrients consistently exhibited higher concentrations in the topsoil compared to deeper layers, showing a decreasing trend with depth, except at Kanuja-III and Megarda-I. In Kanuja III, the availabilities of PO₄-P and NH₄-N were relatively greater in deeper soil layers compared to the topsoil layer. Megarda-I also showed higher concentrations in deeper soil layers. The soil in the Pali district is categorized as gray-brown alluvial soil, containing a substantial nitrate content that contributes to its fertility. The soil depth in the study area varies from nearly bare on hill covers to a few meters in foothills with scattered dunes. In certain areas, especially those adjacent to water bodies, the soil fertility is notable, supporting the growth of agricultural crops and vegetables with distinctive flavors, likely attributed to water quality and trace minerals. Thus, the available soil in the study area may serve as an indicator of the rock degradation pattern and the formation of soil that supports specific types of vegetation.

CONCLUSION

For a sustainable urban future, society must work towards the goal of efficient and judicious mineral use. Any country aspiring to develop its economy and improve living standards must secure a robust and active supply of mineral resources. As more countries emerge from poverty and bolster their economies, the demand for energy, supported by the supply of mineral resources, is bound to rise. The escalating factors of population growth, urbanization, and industrialization are exerting relentless pressure on the supply of ores, mineral resources, drinking water, and energy worldwide. Indiscriminate mining of large quantities of ores, rocks, minerals, placer deposits, and soil for domestic, commercial, and industrial purposes not only presents immediate challenges but also generates long-term consequences that may impact future generations and instill a sense of global insecurity. Soil pollution poses a significant threat to human health, even in urban areas, as the quality of soil deteriorates due to various inorganic and organic contaminants. This issue is not only an ecological risk but also a socio-economic challenge. Polluted soil becomes deficient in physicochemical properties, prone to erosion, lacking in productivity, sustainability, and diminished food chain quality-critical factors for human society. Materials such as granite, dolomite, migmatites, limestone, quartzitic schist, and Bar conglomerates mica schist, which can be utilized for

Hemant Prakash et al.,

making tiles, slabs, and pillars, are in high demand in both rural and urban areas. Additionally, soil, sand, concrete, cobble, pebble, and boulders are already being used for masonry works, generating considerable revenue. However, it is now crucial to curb the exploitation of natural resources and control the unnecessary consumption of modern comforts and luxuries for the economic development of our country. The primary objective of this paper is to advocate for responsible management of soil, water, and mineral resources, lest future generations bear consequences for actions without cause. This paper emphasizes that mineral resources vary from soil to soil, dependent on distinct intensity levels found in the soil, and these minerals are derived from parent rock materials.

ACKNOWLEDGMENT

The author expresses gratitude to Prof. Beena Tripathi, Department of Geology, JNV University, Jodhpur (Rajasthan) for her kind support and valuable suggestions. I also to get benefited from the published information of many unknown workers, their contributions provide me useful suggestions that helped me a lot and improve the manuscript.

ABSTRACT

Developing a comprehensive solid waste management (SWM) programme needs analysis and improvement of awareness, attitude and practice on different aspects of SWM. The present descriptive study is an assessment of existing level of awareness, degree of attitude, and extent of practice on solid waste management (SWM) among university students in the state of Andhra Pradesh in South India and the results unveiled that the general level of awareness of SWM among students is moderate. It also revealed that the degree of attitude of students towards SWM is much greater whereas the extent of practice of SWM is moderate among students. Further, it revealed that gender has significant influence on the awareness of students with respect to SWM rules, community participation and other aspects only, but not in the case of SW minimisation, collection & segregation, disposal and overall awareness of SWM. As regards the attitude, the results reveal that gender has significantly influenced the attitude of students towards overall SWM and the dimensions with respect to collection & segregation, community participation, disposal, transport and other aspects only but not the SWM rules and SW minimisation. Regarding the SWM practices, the results reveal that gender has significant influence on the practices of students with respect to overall SWM and the dimensions refuse & reduce, reuse & recycle only, but not in the case of collection, segregation, transport and disposal.

Keywords: Waste management, university students, awareness, attitude, practice, gender.

INTRODUCTION

Solid waste management (SWM) has emerged as one of the most massive development challenges in India. Numerous studies indicate that the unsafe disposal of waste generates dangerous gases and leachates, due to microbial decomposition, climate conditions, refuse characteristics and land-filling operations. India has already exhausted all available landfill sites, and the concerned ULBs do not have resources to acquire new land (Namita Gupta and Rajiv Gupta, 2015). Various legislations have been passed for regulating the manner of waste disposal. The Ministry of Environment, Forest and Climate Change (MoEFCC) and the Ministry of Housing and Urban Affairs (MoHUA) have together rolled out policies and programmes to address these issues. However, most of these have failed to achieve their objectives due to a lack of clarity and awareness amongst the stakeholders, and poor enforcement by the regulators (Shyamala Mani and Satpal Singh, 2016). On October 2, 2014, Swachh Bharat Abhiyan was introduced nationwide to address issues with solid waste management and hygienic conditions (Jangra et al., 2016). Higher education institutions have long been viewed as both centres of learning and catalysts for social and political transformation. HEIs expand the frontiers of knowledge in addition to educating decision-makers. They have a considerable economic impact both domestically and internationally because they are important employers and consumers of goods and services (UNEP, 2011). One of the main problems of HEIs is waste management. As the number of students increases each year, the amount of waste generated every day also increases. Therefore, Ministry of Human Resource Development, GOI, initiated Swachh Campus for Higher Education Institutions (HEIs) and Universities, which mirrors the principles of green institutions and endeavors to extend learning beyond the classroom to inculcate and develop responsible attitude, habits and lasting commitment to Swachhta, be it at home, on the campus or in the wider community. Students must have awareness about environmental problems so that they can play their role very effectively in proper waste management (Tartiu, 2011).

Nikhat Parvez, Avlokita Agrawal, and Akhilesh Kumar (2019) in a study on "Solid Waste Management on a Campus in a Developing Country: A Study of the Indian Institute of Technology Roorkee " reported that there were some areas without dustbins, that there was no waste segregation in the academic buildings, and that occasionally garden waste (leaves and weeds) was burned in some places. Starovoytova and Namango's (2018) study also found that the university's current SWM system is largely unacceptable and the investigation has demonstrated, in particular, that the university's open and unregulated waste dumpsite makes all environmental degradation, health effects, and safety violations highly likely. Mark Joseph Tamba Reyes & D.V. Madrigal (2020) in a study on 'Assessing Students' Awareness, Attitude, and Practices on Solid Waste Management in a Philippine Catholic School' found that students exhibited a high level of awareness, a very Favourable attitude, and a great extent of practice on SWM regardless of sex(Cited in Mark Joseph Tamba Reyes & D.V. Madrigal, 2020). Though many measures were made, the HEIs still need to develop a comprehensive program on solid waste management to give a solution to the problem permanently. To date, however, there is a dearth of substantial evidence supporting the extent to which students have internalized and practiced the environmental concepts. To develop a comprehensive swm programme, finding out and improvising students' awareness, attitude and practice on different aspects of swm is important. Systematic research is thus, necessary to identify the swm awareness, attitude and practice to help the educators and planners to develop suitable content for environmental education and training programmes with special reference to swm for the students as well as educators. The present study is a limited attempt to assess the swm awareness, attitude and practice of university students in the state of Andhra Pradesh to initiate and develop suitable strategies.

Objectives of the study

1. To assess the level of awareness, degree of attitude and extent of practice of SWM among university students of Andhra Pradesh State.

**Rapuru Yasoda et al.,**

2. To find out the significant difference if any, in the awareness of SWM among university students due to variation in their gender.
3. To find out the significant difference if any, in the attitude of university students due to variation in their gender.
4. To find out the significant difference if any, in the practice of SWM among university students due to variation in their gender.

Hypotheses of the Study

1. There exists no significant difference in the awareness of SWM among university students due to variation in their gender.
2. There exists no significant difference in the attitude towards SWM among university students due to variation in their gender.
3. There exists no significant difference in the practice of SWM among university students due to variation in their gender.

METHODOLOGY

For the present study descriptive survey method was used. The sample group of the research consisted of a total of 590 students from 13 universities were selected by using Stratified Random Sampling Method. The researchers developed the tools with structured statements and validated to assess the students' awareness, attitude and practice on SWM: 1) Solid Waste Management Awareness Scale (SWMAS), 2) Solid Waste Management Attitude Scale (SWMATS) and 3) Solid Waste Management Practice Scale (SWMPS). The SWMAS consists of 20 items. The items were distributed under six dimensions viz., SWM rules, SW minimization principles, collection & segregation, disposal, community participation and other aspects. The dimensions have 3,3,4,3, 2 and 5 items respectively. Each item has three alternate responses viz., Fully Aware, Aware to Some Extent and Not Aware. Pilot study has been conducted to test suitability of the items. The reliability of this tool was found as 0.79. The tool has content validity, intrinsic validity and face validity. The SWMATS consists of 26 statements. The statements were distributed under six dimensions viz., SWM rules, SW minimization principles, collection & segregation, disposal, community participation, disposal, transport and other aspects. The dimensions have 3,4, 6, 3, 3, and 7 items respectively. Each item has five alternate responses viz. strongly agree, agree, undecided, disagree, strongly disagree. Pilot study has been conducted to test suitability of the items. The reliability of this scale was found as 0.77. The tool has content validity, intrinsic validity and face validity. The SWM practice scale consists of 26 items and was distributed under four dimensions viz., SW minimization, collection & segregation, SW disposal, and transportation & others. The dimensions have 10, 5, 5, and 6 items respectively. Each item has three alternate responses viz. Always, Sometimes and Never. Pilot study has been conducted to test suitability of the items. The reliability of this tool was found as 0.81. The scale has content validity, intrinsic validity and face validity. Statistical Techniques Used: Percentage (%), Mean, Standard Deviation and t- test

DATA ANALYSIS AND INTERPRETATION**Levels of Awareness of SWM among Students**

For the purpose of categorizing the university students under different levels of awareness, the investigators computed the values of Mean + σ and M - σ based on the total scores obtained by the students. The obtained values of Mean + σ and M - σ are 32.76 and 19.3 respectively. The students who scored greater than or equal to the value of Mean + σ were considered as students having 'Fully Aware', the students who scored less than or equal to the value of M - σ were considered as having 'Not Aware' and the students who scored between the values of Mean + σ and M - σ were considered as having 'Aware to some Extent'. The frequency and percentage of students identified at different levels of SWM awareness are shown in the Table No. 1. Out of the sample of '590', the students are categorized in to three levels based on the frequencies and percentages such as '16% are not aware of SWM, 67% are aware of SWM to some extent and 17 % students are fully aware of SWM. It implies that a majority of university

**Rapura Yasoda et al.,**

students are aware of SWM to some extent. But, only 17 % of students are aware of all the dimensions of SWM such as SWM rules, SW minimisation, collection & segregation, disposal and community participation, transport and other aspects. This may be due to non-exposure of students to complete cycle of the SWM process or lack of participation of students' participation in these activities. Further, the results also indicate that only 16% of students expressed less level of awareness. It contradicts the results of Kofi Debrah , Diogo Guedes Vidal and Maria Alzira Pimenta Dinis (2021) , Mark Joseph Tamba Reyes & D.V. Madrigal (2020), and Margarita C. Paghasian (2017) which showed high level of awareness of swm among students. The results also contradict with the results of Ifegbesan (2010) and Alfredo P. Nabor Jr., Ruth A. Ortega-Dela Cruz (2022) which reveals low level of pupils' awareness. The low level of awareness of students on solid waste management can be attributed to lack of information they gain from the university and at home about SWM with regard to waste collection, segregation and disposal. This further implies that much amount of concern, responsiveness, and efforts need to be done by the administrators and faculty to promote better waste management.

Degree of students' Attitude towards SWM

For the purpose of categorizing the university students based on their degree of attitude towards SWM, the investigators computed the values of Mean + σ and M - σ based on the total scores obtained by the students. The obtained values of Mean + σ and M - σ are 105.07 and 80.99 respectively. The students who scored greater than or equal to the value of Mean + σ were considered as students having 'Favourable Attitude', the students who scored less than or equal to the value of M - σ were considered as having 'Unfavourable Attitude' and the students who scored between the values of Mean + σ and M - σ were considered as having 'Neutral Attitude'. The frequency and percentage of students identified at different degrees of attitude towards SWM are shown in the Table No. 2. Out of the sample of '590', around 17 % , students expressed Unfavourable attitude towards SWM, around 68 % are neutral whereas around 15% students expressed Favourable attitude towards SWM. It indicates that a majority of students are possessed with neutral attitude towards SWM. The results contradict the findings of Kofi Debrah, Diogo Guedes Vidal and Maria Alzira Pimenta Dinis (2021) which suggests that students at both secondary and tertiary levels have Favourable environmental attitudes, Desa et al. (2012), which showed that pupils have a high level of attitude and the results of Alfredo P. Nabor Jr., Ruth A. Ortega-Dela Cruz (2022) which reveals low level of pupils' attitudes towards SWM. A smaller number of students have Favourable attitude and this may be because students were not sensitized on different components of SWM so as to develop a Favourable attitude towards SWM and thereby help them adopt suitable practices for effective solid waste management.

Extent of Practice of SWM among Students

For the purpose of categorizing the university students, based on extent of their practice, the investigators computed the values of Mean + σ and M - σ based on the total scores obtained by the students. The obtained values of Mean + σ and M - σ are 43.19 and 28.37 respectively. The students who scored greater than or equal to the value of Mean + σ were considered as students practicing in SWM to the maximum extent, the students who scored less than or equal to the value of M - σ were considered as students practicing in SWM to the least extent and the students who scored between the values of Mean + σ and M - σ were considered as practicing in SWM to the moderate extent. The frequency and percentage of students identified at different levels of SWM practice are shown in the Table No. 3. Out of the sample of '590', the investigators observed the 17% are practicing SWM to the least extent, 16 % are practicing to the maximum extent and remaining 67% of students are practicing to moderate extent. The results contradict with the results of Alfredo P. Nabor Jr., Ruth A. Ortega-Dela Cruz (2022) and Ifegbesan (2010) which shows low level of practice of swm by students, and Margarita C. Paghasian (2017) which reveals that the students' practices in terms of segregation, reduce and recycle were good; and their practices in terms of recycle and disposal were fair, Desa et al. (2012), which showed that pupils have a high level of practices regarding solid waste management program. This implies that most of the students practice SWM to the moderate extent only and a smaller number of students practice it to the maximum extent. As an institution committed to providing quality Education which includes concern about the environment, the integration of SWM topics is an essential indicator in the promotion of better SWM practices. This is a desirable step in warranting a better and safe environment and promoting the community's common good. Mark Joseph Tamba Reyes & D.V. Madrigal (2020) found a great extent of practice on SWM .

Rapuru Yasoda et al.,

Influence of Gender on Awareness, Attitude and Practice Scores of Students:

As the distribution follows normality, parametric tests of significance such as 't' was applied to study the significance of the influence of gender on the awareness, attitude and practice of SWM among university students. The hypotheses 1- 3 have been tested on appropriately selected groups – male and female students – to assess the significance of the influence of gender on the awareness, attitude and practice of SWM among university students and the results are presented in Table no 4- 6. From table 4, it is seen that the obtained t- value is significant at 0.05 level with regard to the dimensions SWM rules (t, 2.208), community participation (t,1.987), transport and others (t ,2.381) indicating the influence of gender on the students' awareness of SWM. Hence, the formulated null hypothesis is rejected in the case of SWM rules, community participation, transport and others only. Thus, it is concluded that gender has significantly influenced the awareness of students with respect to SWM rules, community participation, transport and other aspects only, but not the SW minimisation, collection & segregation, disposal and overall awareness of SWM. From the results, it is observed that female students exhibited higher means, which indicates that the female students are more aware of solid waste management compared to male respondents respectively. Mark Joseph Tamba Reyes & D.V. Madrigal (2020), Madrigal and Oracion (2017), Do Paco, Raposo, and Leal Filho (2009), Garcia and Luansing (2016), Adeolu, Enesi, and Adeolu (2014), and Guido and Lim (2015) indicated in their studies that females are more conscious about solid waste management than males (Cited in Mark Joseph Tamba Reyes & D.V. Madrigal, 2020). But contradicts with the results of Tatlonghari and Jamias (2010) which reports that gender is not an influencing factor of male and female students in their awareness of SWM. It is seen from the table-5 that the obtained t- value is significant at 0.01 level with regard to overall attitude towards SWM (t, 5.723) and the dimensions collection & segregation (t, 4.183), community participation (t, 3.442), disposal (t, 3.697), and transport and others (t, 5.266) indicating the influence of the gender on the attitude of university students towards SWM. Hence, the formulated null hypothesis is rejected in the case of collection & segregation, community participation, disposal, transport and others and overall attitude towards SWM. It is concluded that sex has significantly influenced the attitude of students towards overall SWM and the dimensions with respect to collection & segregation, community participation, disposal, transport and other aspects only, but not in the case of SWM rules and SW minimisation. According to demographics, students also showed a very Favourable attitude towards solid waste management regardless of gender. Female students exhibited higher means, which implies that in terms of gender, female students have more possibility to have a Favourable attitude towards solid waste management. Moreover, the findings validated the study of Madrigal and Oracion (2017); and Adeolu (2014); Raudsepp (2001), which emphasized that female students could be said to have Favourable waste management attitude than their male counterpart (Cited in Mark Joseph Tamba Reyes & D.V. Madrigal, 2020) but contradicts the results of Tatlonghari and Jamias (2010) which reports that gender is not an influencing factor of male and female students in their attitude towards SWM. Table-6 clearly reveals that t- values are significant at 0.05 level with respect to overall SWM practices (t, 2.281), and with respect to the dimensions refuse & reduce (t, 2.4), and reuse & recycle (t ,2.21). Hence, the formulated null hypothesis is rejected in the case of refuse & reduce, reuse & recycle, and overall practice of SWM. Hence, it is concluded that gender has significantly influenced the practices of students with respect to overall SWM and the dimensions refuse & reduce, reuse & recycle only, but not the SWM collection, segregation, transport and disposal. The results contradict the findings of Tatlonghari and Jamias (2010) which reports that sex is not an influencing factor of SWM practice among male and female students. Nikhat Parvez, Avlokita Agrawal and Akhilesh Kumar, (2019) also found that improper collection, imprecise segregation, exposed transportation, inefficient processing and disorganized disposal of solid waste are the major reasons for disorganized and incompetent SWM at IIT, Roorkee.

FINDINGS OF THE STUDY

1. Students expressed moderate level of awareness of SWM in general.
2. Students expressed Favourable attitude towards SWM in general.
3. The extent of practice of SWM among students is moderate.
4. Gender has a significant influence on the awareness of SWM of university students, limited to SWM rules, community participation and other aspects only, but not on the other dimensions viz., SW minimisation, collection & segregation, disposal and overall awareness of SWM.

**Rapuru Yasoda et al.,**

5. Gender has significantly influenced the attitude of university students towards overall SWM and the dimensions with respect to collection & segregation, community participation, disposal, transport and other aspects only, but not the other dimensions such as SWM rules and SW minimisation.
6. Gender is an influencing factor of the practices of students with respect to overall SWM and the dimensions refuse & reduce, reuse & recycle only, but not the other dimensions viz., collection, segregation, transport and disposal.

CONCLUSION

From the results of the study, it is implied that students still need to be educated on the issue of solid waste management from a variety of angles, including community involvement, transportation, collection and segregation, disposal, and SW minimization. This will help to increase their awareness of the issue and encourage them to support the implementation of the waste management strategies required to keep the campus clean. Even though the kids show a Favourable attitude towards solid waste management, it is still necessary to teach them about appropriate behaviour in this regard. Therefore, it is recommended that administrators create a solid waste management programme that includes education, attitude, and practice activities to help university members develop environmentally friendly solid waste management practices, promote moral behaviour, and create a comprehensive awareness of the subject in the direction of a more sustainable, healthy, and safe university campus. Additionally, educators can host lectures on solid waste management; incorporate SWM into performance tasks and projects; organise clean-up campaigns; host environmental exhibits and competitions; and run other pertinent programmes that raise awareness of environmental issues and actively involve teachers and students in finding solutions to solid waste management-related problems. Green clubs ought to be established in order to guarantee Green Campuses in university settings, as recommended by UGC. These clubs ought to buy additional trash cans and place them in noticeable locations where students can readily dispose of their waste correctly, such as beside walkways or under every covered space.

ACKNOWLEDGMENTS

The authors are grateful to the all the State Universities of Andhra Pradesh State authorities for providing the necessary facilities to carry out this work. Our sincere thanks to the participants of the present study and especially for the financial support by Mahatma Gandhi National Council of Educational Research and Training (MGNCRE), Hyderabad, A.P.

ABSTRACT

Biomimetics: Can be defined as fabrication of novel materials with remarkable mechanical properties. The words bio and memesis are derived from Greek words meaning life & imitation. The study of biomimetics translates our knowledge of biological structures & their functions to produce new synthetic pathways to emulate biological processes. In this article a detailed review is done on most commonly used biomimetic materials in dentistry. These are the materials that have excellent physicochemical properties along with being biocompatible. A detailed study can provide a basis for material selection in diverse cases.

Key words: biomimetic, biocompatible, mimic, biomaterials

INTRODUCTION

In dental medicine the concept of Biomimetic Material biomimetic is an increasingly applicable word especially in restorative dentistry. The secondary meaning of biomimetics refers to mimicking or recovery of the original tooth both in form as well as function. Biomimetic dentistry is a philosophy that teeth needing restoration should be rebuilt if possible to The invention of glass ionomer cement in 1969 (Qirst mimic clearly the form and the function of the original reported by Wilson and Kent in1971) resulted from design[1].

The following materials can be considered as biomimetic materials:

- Glass ionomer cements
- Calcium hydroxide
- Mineral Trioxide Aggregate

**Suneeth Shetty**

- Calcium sulphate
- Bioactive glass
- Emdogain
- Composites
- Ceramics
- Biodentine

Glass Ionomer Cement

The invention of this cement is from basic studies on dental silicate cements where the phosphoric acid was replaced by organic chelating.

Reinforced Glass Ionomer Cement

The design of the original glass ionomer cements was a hybrid formulation of silicate and polycarboxylate cements. The earliest commercial product was class III/V cavities as an alternative to glass ionomers.

Attempts to further improve the strength of the glass ionomers or composites led to the incorporation of metallic oxide and metal alloy fillers by Seed and Wilson in 1980, but these cements known as MIRACLE MIX had poor wear resistance. Later McLean and Gasser in 1985 overcame this problem by fusing silver particles onto glass – 'CERMETS' rendering better wear resistance, smoother surface radiopacity, but had poor esthetics.

Further development led to the introduction of RESIN version of conventional glass- ionomer that is mixed as a MODIFIED GLASS IONOMER OR HYBRID CEMENTS by Mathis and Ferracane in 1989. In these cements the glass ionomers were reinforced by incorporation of resins and the fundamental acid base curing reaction is supplemented by a second polymerization curing process, which is initiated by light (DUALCURE) or both i.e. light and chemical (TRICURE). HEMA (Hydroxy Ethyl Methacrylate) is the hydrophilic ionomer used in the liquid component of resin modified glass ionomers, so that the final restorations have 4.5-6% resin.

Continued evolution produced the Polyacid modified resin composites (compomers- a misnomer), these materials were introduced in 1993 from manufacturers efforts to improve and combine the best properties of glass ionomers and composite resins. The earliest term for these systems was 'isosit' (combining the terms ionomers and composite), but it was trademarked by a single manufacturer. The industry adopted the alternative arrangement of combined terms (composite and ionomers) which is now known as POLYACID MODIFIED COMPOSITE RESINS. [7].

The main usage of these cements is in Class III/V restorations in place of composites.

Composition**Powder**

∑ Silica (SiO₂) :

Modifications in Powder

Some of the modifications of powder are:

- Σ Dried Polyacrylic Acid (Anhydrous GIC)
- Σ Silver Tin Alloy (Miracle mix)
- Σ Silver Palladium/Titanium mix (Cermet Cement)
- Σ BISGMA, TEGMA and HEMA (Light Dual Cure)

Liquid

The percentage composition of glass ionomer liquid is

- Σ POLYACRYLIC ACID+ITAIONIC ACID 40-50%
- Σ TARTARIC ACID 15%
- Σ WATER 30%

Classification of Glass Ionomer Cements

Type 1: for luting

will craze and crack as a result of desiccation. Uses: cementation of crowns, bridges, inlays etc

Type 2: for restorative

Physical Properties of Glass Ionomers [10]

Type 2.1 -for aesthetic restorations Glass ionomers are rapidly setting cements Uses – class III, class V cavities, tunnel times in the range of 3-8 minutes. Working time should not exceed 45s. They have high compressive strengths.

Type 2.2 – for restorations requiring which may range from 200-400Mpa but are weak in reinforcement Qlexure [5-40Mpa].

Uses – core buildups

Type 3: for liner and base applications

Uses: Low powder: liquid ratio for liners, High Aesthetics: The glass component of glass ionomers

powder: liquid ratios for bases beneath amalgam provides the translucency for the material glass and composite ionomers provide the translucency for the material.

More recently, one more classification for glass Adhesion: Glass ionomers have the important property of permanently adhering to the untreated enamel and Type I- Luting dentin. They also bond to the polar substitutes like base. Type II- Restorations metals.80% of the bond strength is developed in the

Type III- Liners and bases Qirst 15 min of cement application and for this purpose Type IV- Qissure sealants cement should be applied immediately after mixing Type V- Orthodontic cementation without delay.

Type VI- Core build up

Type VII- Intermediate restorations Dissolution and Erosion: Chemical erosion by acids

Type VIII- Atraumatic Restorative Techniques (for generated by plaque or external agents like food and beverages has been found to be less for glass ionomers

Type IX- Atraumatic Restorative Techniques (for than other cements posteriors)

Chemistry of Setting: When the powder and liquid are of thermal expansion of conventional glass ionomer mixed to form a paste, the acid etches the surface of the cements is close to that of dentinal hard tissue and has glass particles and calcium, aluminum, sodium and been cited as a significant reason for the good margin Qluorine ions are leached into the aqueous glass ionomer.

The polyacrylic acid chains are cross-linked by the Coefficient of Thermal Expansion: Glass ionomer has calcium ions within the next 24 hours. Sodium and a linear co-efficient of thermal expansion (10^{-11}), Qluorine ions do not participate in the cross linking of similar to that of tooth structure (11.4×10^{-6}).

Suneeth Shetty

Biocompatibility

Freshly mixed glass ionomer cements are acidic (pH 0.9-1.6) and it rises rapidly within the first 20min to reach a pH of 5.5-6 as the polysalt formation takes place.

Disadvantages

- Susceptible to dehydration over lifetime
- Sensitivity to moisture at placement.
- Poor abrasion resistance
- Average esthetics
- Less Tensile strength than composites
- Technique sensitive powder to liquid ratio and mixing.

Calcium Hydroxide

Calcium hydroxide was introduced to dentistry by Hermann at the beginning of the 20th century and since then it has been widely used in endodontics. It is a strong alkaline substance with a pH of approximately 12.5 and has various biologic properties that prompted its use in several clinical situations. Its dental use relates chiefly to its antibacterial properties and the ability to induce repair and to stimulate hard tissue formation. The main benefit of calcium hydroxide as intracanal medicament lies in the bacterial effects conferred by its high pH as many endodontic micro-organisms are unable to survive in the highly alkaline environment provided by calcium hydroxide.[13]

Mechanism of action

Classification [14]

Can be classified as setting or non setting.

The former is used for lining or sublining of cavities or as root canal sealers, and the latter is used for dressing setting materials eg DYCAL, REOCAP, PROCAL.

Non setting materials

Disadvantages

1. Variability of treatment.
2. Unpredictability of apical closure.
3. Difficulty in patient follow up.
4. Delayed treatment.
5. Canal is susceptible to fracture during treatment.
6. Ca(OH) doesn't adhere to dentin and lack the ability to seal.

**Suneeth Shetty****Mineral Trioxide Aggregate**

MTA is a new material developed for endodontics that appears to be a significant improvement over other materials. Ever since its introduction by Torabinejad and colleagues in 1993 it has been used in both surgical and nonsurgical applications. It is the first restorative material that consistently allows for the overgrowth of cementum and it may facilitate the regeneration of the periodontal ligament.

Advantages [19, 20]

1. Resistance to marginal leakage reduces bacterial migration.
2. Least toxicity of all the filling materials.
3. Excellent biocompatibility.
4. Hydrophilic sets in the presence of moisture. Moisture contamination is not an issue.
5. Negligible Solubility
6. Super Sealing ability
7. Sufficient compressive strength to allow condensation of amalgam when it is used as pulp capping agent.
8. Reasonably radio opaque.

Disadvantages

1. Difficult to manipulate.
2. Prolonged setting time.
3. Dissolves in acidic pH.

Properties [23]

1. MTA has a pH of 10.2 initially and has a pH of 12.5, 3 hours after mixing. This may impart some antimicrobial properties.
2. The material has low solubility.
3. It has a radiopacity slightly greater than that of dentin.
4. It is less cytotoxic than other root end filling materials, it is biocompatible.
5. Its water based chemistry allows normal setting in the presence of moisture and blood.

Types

- a. MTA is supplied as a grey powder ProRoot MTA. The manufacturer recommends that it should be mixed with sterile water into a thick grainy paste. It can be mixed with anaesthetic or other sterile liquids.
- b. Tooth coloured white ProRoot MTA is also available with easy clinical manipulations.

Composition

Mineral trioxide aggregate is a powder consisting of fine hydrophilic particles of:

1. Tricalcium silicate (Ca_3SiO_5)
2. Bismuth oxide powder is added for powder opacity.
3. Dicalcium Silicate ($2\text{CaO}\cdot\text{SiO}_2$)
4. Tricalcium Aluminate ($3\text{CaO}\cdot\text{Al}_2\text{O}_3$)
5. Calcium Sulphate (CaSO_4)
6. Tetracalcium alumino ferrite ($4\text{CaO}\cdot\text{Al}_2\text{O}_3\cdot\text{Fe}_2\text{O}_3$)
7. Tricalcium Oxide
8. Silicate Oxide

Mechanism of Action

Clinical Applications of Mineral Trioxide Aggregate [24,27,28]

It has usage in both surgical and non-surgical procedures

- 1) Direct pulp capping and pulpotomy
- 2) Apexification
- 3) Repair of root perforations (surgically and non-surgically)
 - a) Lateral perforation.
 - b) Furcation perforation
 - c) Strip perforation.
- 4) Root-end filling
- 5) MTA can also be used for repair of perforation due to internal resorption.

Calcium Phosphate

Researchers have shown that calcium phosphate ceramic biomaterial are effective for a variety of the following:

Restorative

Preservative clinical applications

Calcium phosphate ceramics such as hydroxyapatite and beta tricalcium phosphate possess a mineral composition very close to that of normal bone. The composition makes it useful in bone substitution

Emerging dental applications

To fill oversized osteotomies for implants

Craniofacial reconstructions

Interpositional grafting procedures

As a coating around the metallic implants

Calcium Sulfate

It is a material that has been widely used in endodontic practice for the treatment of numerous bone lesions as well as in implantology.

Suneeth Shetty

It can be used both as a barrier and hemostatic material in perforation management. Calcium sulfate creates a tamponade effect mechanically plugging the vascular channels once it sets. It is remarkably biocompatible does not promote inflammation and is bioresorbable in 2-4 weeks.

Bioactive glass

Bioactive glass (BAGs) first introduced by Hench et al are surface active glasses that bond chemically to bone materials. They are non-bone graft materials. These bioactive glasses contain different ratios of Na₂O(24.5%), CaO (24.5%) P₂O₅ – SiO₂ (45%). The bonding of BAGs to living bones is achieved through a bone like apatite layer forming on their surface in the body environment owing to their strong bond with living bone, BAGs have been used as a bone substitute materials in different clinical conditions [31]. The commercially available glass for the application in bone sites is, Bioglass with a particle size of 300-355µm.

Bone morphogenetic proteins [33]

In 1964, Marshall Urist discovered that bone which had been demineralized and dried into a powder could be implanted into the muscle of a rabbit and stimulate the growth of a new bone. Urist and collaborators later determined that the active component was proteinaceous and dubbed it bone morphogenetic proteins (BMP).

There are at least 15 BMP like molecules

BMP-1

BMP-2

BMP - 3 (Osteogenin)

BMP-4 etc

Osteoinductive (OP1)

Eight BMPs namely BMP-1-7 and osteogenic protein have so far been cloned and expressed.

Clinical applications

1. Direct pulp capping
2. Pulpotomy
3. Guided bone regeneration
4. Furcation repair
5. Dental implants

Resin based composites

These composites include

1. Smart composites
2. Ormocers
3. Ceromers

Smart materials: Tooth coloured restoratives which are cariostatic in nature by their inherent ability to leach fluoride are referred to as smart fluorides.

Classification

Passive smart materials:

These are materials that release ions into the oral cavity continuously with or without the necessity to prevent caries

Eg. Glass ionomer cement, Resin modified glass ionomer, Ceromers

Active smart material: These are materials, which can react favourably when there is a hazardous variation in the environment surrounding the restoration & in prevention of caries.

For instance: Smart composites

Smart composites: A new approach in restorative dentistry was the introduction of an ion releasing composite material in 1998.

Suneeth Shetty

It is based on a new developed alkaline glass which aims at reducing secondary caries, reducing demineralization and buffering acid produced by micro-organisms, when the pH around the restorative material falls below 5.5, the material releases hydroxyl, calcium and Fluoride ions.

Mode of supply: It is available in unit dose capsules (caviQils) and in syringes. Uses of smart materials

Prosthodontics	✓ Smart impression material
Orthodontics	✓ Shape memory alloys
Pediatric and Preventive Dentistry	✓ Fluoride-releasing pit and fissure sealants, ACP releasing pit, and fissure sealants
Dental materials	✓ Smart composites ✓ Smart ceramics
Conservative Dentistry and Endodontics	✓ Ni-Ti rotary instruments ✓ Smart prep burs
Oral surgery	✓ Smart suture
Periodontics	✓ Smart antimicrobial peptide
Laser Dentistry [7]	✓ Smart fibers

Ormocers

It is the acronym of organically modified ceramic. It was developed by Fraunhofer institute for silicate research, Wurzburg in co-operation with partners from the dental industry in 1998.

They are new type of material which chemically are methacrylate substituted alkoxy sil. New multifunctional urethane and thioether (meth) acrylate alkoxy as sol-gel precursors have been developed for preparation of inorganic-organic co-polymers composites.

Composition

Ormocer matrix – Ceramic polysiloxane (silicon- oxygen chain)
Zirconium and glass fillers (1-1.5µm in size) o Coupling agents Eg. Admira Voco

Advantages

- Biocompatible
- Reduced polymerization shrinkage
- High abrasion resistance
- Esthetics
- Anticaries property
- Considered as one of the most promising alternatives to Amalgam.

CEROMERS

Ceramic optimized polymers

They are specific combination of the latest in ceramic filler technology and advanced polymer chemistry which provide enhanced function and esthetics. They are composed of specially developed and conditioned homogenous three dimensional fine particle ceramic fillers (0.04 -1mm) of submicrometer size which are densely packed (approx 80% in weight) and embedded in an advanced organic matrix with optimum light and heat curing potential.

e.g Targis / Vectris – Ivoclar

Composition

Barium glass
Spheroidal mixed oxide o Ytterbium trioxide

Suneeth Shetty

BIS-GMA
Urethane dimethacrylate

Disadvantages of Dental Ceramics

1. BRITTLENESS:
2. TECHNIQUE SENSITIVE:
3. HIGH COST:
4. WEAR OF NATURAL TEETH:
5. DIFFICULT TO REPAIR INTRAORALLY

Properties of Dental Ceramics

Table 3. Physical and Mechanical properties of Dental Ceramics¹

Compressive strength	330 MPa
Diametral tensile strength	34 MPa
Transverse strength	62 - 90 MPa
Shear strength	110 MPa
MOE	69 GPa
Surface hardness	460 KHN
Specific gravity	2.2–2.3 gm/cm ³
Thermal conductivity	0.0030 Cal/Sec/cm ²
Thermal diffusivity	0.64 mm ² /sec
Coefficient of Thermal expansion	12 × 10 ⁻⁶ /°C

Fatigue strength plays an important role in the durability and longevity of dental ceramic restorations.

Classification

1. Sintered all ceramic materials.
Alumina based ceramics eg. Hi-ceram
Leucite-based ceramics eq. Optec HP
2. CASTABLE CERAMICS
3. PRESSABLE CERAMICS
Leucite –reinforced
Lithium disilicate reinforced Eg. IPS Empress 1, IPS Empress 2
4. Infiltrated/slip cast ceramics
Alumina-based ceramics • Spinel based ceramics
Eg. InCeram ad InCeram spinel
5. Machineable Ceramics
CAD-CAM systems
Copy-milling systems.
Eg. Cerec Vitablocs Mark 1, Cerec Vitablocs Mark

Biodentine™

Was developed by Septodont's Research Group, Several years of active and collaborative research between Septodont and several universities led to a new calcium-silicate based formulation, which is suitable as a dentin replacement material whenever original dentin is damaged, thus these materials are termed as biomimetic.

Suneeth Shetty

Composition

Powder	Liquid
Tricalcium silicate ($3\text{CaO}\cdot\text{SiO}_2$)	Calcium chloride ($\text{CaCl}_2\cdot 2\text{H}_2\text{O}$)
Dicalcium silicate ($2\text{CaO}\cdot\text{SiO}_2$)	Hydrosoluble polymer
Calcium carbonate (CaCO_3)	
Zirconium dioxide (ZrO_2)	
Iron oxide	

Setting Reaction [41]

The calcium silicate has the ability to interact with water leading to the setting and hardening of the cement. This is a hydration of the tricalcium silicate ($3\text{CaO}\cdot\text{SiO}_2 = \text{C}_3\text{S}$) which produces a hydrated calcium silicate gel (CSH gel) and calcium hydroxide ($\text{Ca}(\text{OH})_2$).

Clinical Application

1. Preservation of pulp vitality
2. Absence of post operative sensitivity: High biocompatibility
3. Prevention of dental failures Has excellent sealing properties
4. Ultimate dentine substitute

CONCLUSION

Biomimetic materials attempt to repair the damaged living tissue, using or promoting natural mechanisms of growth. This method provides remarkable possibilities well beyond the traditional mode of treatments in almost all fields of dentistry including preventive, restorative, periodontal and reconstructive surgery. It is hoped that further research will extend the potential of these biomimetic materials, although it is unlikely that there will ever be a single universal material.

ABSTRACT

Cardio Respiratory Fitness (CRF) measures the cardiovascular and respiratory systems to perform physical activity. VO₂ max is the most accurate measure of cardio respiratory fitness and endurance. Routinely the VO₂ max can be estimated using exercise testing. It is not always feasible to use exercise testing hence; non-exercise test equations have been developed for the estimation of VO₂ max. The study aims to evaluate and compare the validity of non-exercise testing equations for Vo₂ max (developed for the western population) with exercise tests in young adults. Additionally, the study will explore Vo₂ max using Queen's college step test to find its association with BMI, physical activity level, gender, waist circumference and waist-hip ratio. A cross-sectional study on 96 participants was conducted. The participants performed a Queen's college step test. They also completed a physical activity rating scale to calculate non-exercise estimation of VO₂ max. The results show a significant correlation between various methods of VO₂ estimation. The results also show a significant correlation between VO₂ max calculated using Queen's step test with waist circumference ($p = .040$, $r = 0.210$), gender ($p = .000$, $r = .501$), activity ($p = .002$, $r = .310$) and waist-hip ratio ($p = .003$, $r = .304$). The non-exercise testing equation may be as accurate as the sub-maximal exercise test for estimation of VO₂ max. VO₂ max estimated through Queen's college step test is associated with gender, waist-hip ratio, and activity level.

Keywords: Cardio respiratory fitness, exercise testing equation, NET-F equation, non-exercise testing, VO₂ max, Queen's College Step Test

Suraj et al.,

INTRODUCTION

Cardiovascular disease is a leading cause of mortality and morbidity worldwide. The prevalence of cardiovascular disease (CVD) has increased substantially over the past few decades in the younger population.[1] Cardio Respiratory Fitness (CRF) is a fitness parameter that indicates the capacity of the cardiovascular and respiratory systems to perform physical activity. Youth with low cardiovascular fitness and high body fat have unfavorable cardiovascular risk profiles. Low Cardio Respiratory Fitness (CRF) is associated with a higher risk for mortality, which may be mediated by risk factors such as hypertension, diabetes, and hypercholesterolemia. Clinical studies have established a strong link between low CRF and various health conditions, including coronary artery diseases, high blood pressure, diabetes mellitus, and some cancers.[2] Therefore, estimating CRF is important as it can serve as an indicator of the risk for mortality. Increased CRF is often accompanied by favorable changes in other health indicators such as blood pressure, triglycerides, glycemic control, and body fat distribution.[3] Increased physical activity and fitness are associated with a reduction in the risk of cardiovascular disease, but the optimal intensity or amount of exercise necessary for reductions in risk or risk factors is unknown.[1] Therefore, there is a strong need for additional clinical measures and identifying huge risks in asymptomatic patients. Aerobic capacity, also known as VO₂ max, is the most accurate measure of cardiorespiratory fitness and endurance.[2] It is the maximum amount of oxygen used by the person during maximal or submaximal exercise and the value does not change despite an increase in workload over time. Higher oxygen consumption of an individual shows him/her a more efficient cardio-respiratory system. VO₂ max is expressed as liters/min as an absolute value or in milliliters /kg/min as relative VO₂ max. It depends on the genetic factors, body composition, age, sex as well as the ethnicity of an individual.[4]

The VO₂ max can be estimated using direct or indirect methods. Direct methods use instruments in the laboratory, while indirect methods rely on mathematical formulas. The use of a direct method (open-circuit spirometry in a laboratory) to measure VO₂ max is restricted because of its exhausting and difficult experimental protocol and the absence of a well-equipped laboratory. Several exercise-based methods indirectly calculate VO₂ max which takes into consideration a person's characteristics such as age, sex, anthropometric measurements, history of physical activity or resting level physiological measurements. Queen's College step test is one such method and is a submaximal exercise test. Stepping requires no elaborate or expensive equipment, no calibration, and can be easily administered to large numbers of people. [5] Estimating VO₂ max through exercise tests is difficult for large populations due to the need for costly equipment, space, and trained staff. It is also time-consuming and expensive. To overcome these challenges, non-exercise tests are recommended for calculating VO₂ max. Non-exercise predictive models estimate VO₂ max without exercise testing. The equations used for non-exercise testing are easy to apply, low-risk, cost-effective, and feasible. These equations can be performed in areas where infrastructure is limited because all the variables required for the estimation of non-exercise testing are either routinely available {gender, age, body mass index (BMI), resting heart rate (RHR)} or relatively easy to obtain (self-reported physical activity) in a primary care setting. Non-exercise testing estimating method has been shown to have good concurrent validity against exercise testing-estimated cardio respiratory fitness.[6] Evidence also suggests that non-exercise testing methods for estimating fitness (NET-F) equations are as accurate as some submaximal methods (Queen's College step test) to estimate CRF.

One of the studies among medical students evaluated the validity of the non-exercise test using the NASA/ Johnson Space Centre PA-R scale compared to exercise the protocol using the Queen's College step test. The study showed no statistically significant difference between VO₂ max obtained by both exercise and non-exercise protocols using the PA-R scale.[7] Cardio respiratory fitness is a known predictor of cardiovascular diseases (CVD), hypertension, and hyperlipidemia.[1] However, it is not usually assessed as part of individual risk assessment, possibly due to the practical difficulties of using a graded exercise test. To make CRF data more accessible, researchers have developed a range of Non-Exercise Estimated Cardio respiratory Fitness (NEECRF) equations for estimating CRF. NEECRF equations commonly include age, gender, resting heart rate, smoking status, BMI, and self-reported physical activity status (PAS). Studies have shown NEECRF equations to predict all cause and cardiovascular disease mortality on par with measured CRF.[8] Therefore, non-exercise testing methods for assessing cardio respiratory fitness have been

Suraj et al.,

developed. These methods provide a reasonably accurate estimation of CRF without the burden of exercise testing. The non-exercise testing equations have been developed for the Western population. However, it is unclear whether these equations are valid for the Indian population and whether cardiovascular disease risk factors (CRF) are routinely assessed in primary care settings, despite being a significant risk factor. Therefore, the present study aims to compare the estimation of VO₂ max by the non-exercise test with an exercise test to explore the validity of non-exercise test equations in the Indian population.

MATERIALS AND METHODS

The present study was a cross-sectional study conducted in the College of Physiotherapy at Pt. B.D. Sharma PGIMS, Rohtak. The ethical clearance was taken from the institutional biomedical research ethical committee of Pandit Bhagwat Dayal Sharma University of Health Sciences, Rohtak concerning the letter No. BREC/23/017. A signed written informed consent was taken from the participants. A simple random sampling method was used to collect the data. 96 participants aged between 18-25 years participated in this study. The study included both male and female adults. Individuals with a history of cardiac or lung disease, who were on regular medication use that affects the cardiovascular or respiratory system, and those undergoing any physical conditioning program were excluded from the study. The demographic details and self-structured form were completed by the participants. Data was collected regarding participant's height, weight, waist circumference, hip circumference, waist-hip circumference ratio, body mass index (BMI), resting heart rate (RHR), and physical activity level by using the questionnaire. Queen's college step test was used for VO₂ max estimation [2]. The exercise testing method used following equation:

(i) For male subjects: VO₂max (ml/kg/min) = 111.33 - (0.42 x pulse rate in beats per min)

(ii) For female subjects: VO₂max (ml/kg/min) = 65.81 - (0.1847 pulse rate in beats per min) [2]

Two equations for non-exercise testing were calculated. First NET-F equation

NET-F = [sex coefficient × 2.78 - (age × 0.11) - (BMI × 0.17) - (RHR × 0.05) + (physical-activity-level coefficient) + 21.41] [6].

The second equation used the NASA/Johnson Space Centre Physical Activity Rating (PA-R) scale. The equations for male and female subjects is as under:

Formale subjects: VO₂ max (ml/kg/min) = 67.350 – [0.381 x age (years)] – (0.754 x BMI) + (1.951 x PAR)

For female subjects: VO₂ max (ml/kg/min) = 56.363 – (0.381 x age (years) – (0.754 x BMI) + (1.951 x PAR). [7]

Statistical Analysis

Statistical analysis of data was performed using IBM SPSS. Independent t-test was used to compare mean waist and hip circumference, waist-hip ratio, QST, non-exercise testing equation, and NASA equation between males and females. Karl Pearson's coefficient of correlation was used to find out the correlation of the NASA equation with QST and NET-F.

RESULTS

Out of the 96 participants, the majority of participants were females 51 (53.1%) and 45 (46.9%) were males. Table 1 shows mean+SD values of age, BMI and VO₂ max estimation using three methods Table 2 shows a comparison of anthropometric measurements & VO₂max values using QST, NET, and NASA equations between males and females using an independent t-test. Male participants had significantly higher mean values for all the measures than female participants. Karl Pearson's coefficient of correlation was used to find the correlation between estimation using various methods/equation. The VO₂ max estimation using the NASA equation correlated moderately ($r=.588$, $P<0.01$) with VO₂ max estimation using the QST equation, and highly ($r=.838$, $p=.000$) with the NET equation. The results also show a significant and moderate correlation ($r=.560$, $p=.000$) between VO₂ max estimation through the NET equation with the Queen step test. Table 3 (here) Karl Pearson's coefficient of correlation was also used to study the association of VO₂max estimated by Queen's college step test with various demographic factors. The results show a weak significant correlation between QST and Waist circumference ($p = .040$, $r=0.210$) and a highly significant correlation

between QST and gender ($p = .000$, $r = .501$). A moderately significant correlation was found between QST with activity ($p = .002$, $r = .310$) and waist hip ratio ($p = .003$, $r = .304$).

DISCUSSIONS

The present study aimed to compare the exercise and non-exercise testing methods of cardiorespiratory fitness in young adults. The male and female participants differed significantly in BMI, waist circumference and waist-hip ratio. This difference in anthropometric evaluation may be due to inherent physiological differences in body composition and fat deposition. The mean value of the Queen's college step test (39.10 ± 6.38) is comparable to a study done by Narkhede et al. (2014) in which the mean value of the Queen's College Step Test (QST) was 39.91 ± 4.02 . Estimation of VO_2 max by non-exercise testing revealed that the mean value of VO_2 max by using a non-exercise testing equation was in line with the study of Shenoy et al (2012) in which the mean value of VO_2 max by using a non-exercise testing equation was 43.25 ± 7.81 . [9] Estimation of VO_2 max by NASA/Johnson Space Centre physical activity rating scale revealed that the mean value of VO_2 max by using non-exercise testing is consistent with the mean value of VO_2 max calculated by Jang et al. (2012) which was 44.27 ± 7.37 . [10] The results of the present study revealed that there was a significant correlation between exercise testing and non-exercise testing of VO_2 max (** $P < 0.01$). The results of the study are consistent with the study done by Rao et al (2019). [2] Thus, non-exercise protocols are accurate in estimating VO_2 max because they are time and resource-efficient, and may be used for individuals of any age and with any cardiorespiratory disease. They could be especially beneficial for assessing fitness in children and the elderly, who may be unable to comply with exercise guidelines.

The association of VO_2 max estimated by Queen's college step was also studied with various demographic and anthropometric variables. VO_2 max was not significantly correlated with age ($p = .280$), which is contrary to the findings of Varghese et al. (2018). [11] This may be due to the narrow range of age group i.e 18-25 years. The results of the present study show a significant association of QST with gender which is consistent with the findings by Varghese et al.(2018) and Buttar et al. (2020). [11][12] This may be due to discrepancies attributed to physiological variation. Gender is one of the measure determinants of VO_2 max. The factors that influence higher aerobic capacity in males are post-pubertal hormonal-induced higher lean body mass and HB content. [13] Also, females due to smaller body size have small cardiac size or blood volume. Lower hemoglobin in females is associated with reduced blood viscosity resulting in a proportionate increase in blood flow and cardiac output. [14] The waist-hip ratio exhibited a negative association with QST ($r = -.304$). The findings of the present study imply that the human body influences cardiorespiratory fitness. In obese people, there is an increase in type-II muscle fiber and a decrease in type-I muscle fiber, which may contribute to lower oxygen absorption. Obesity in general is connected with decreased physical fitness and an increased risk of cardiovascular disease. There was a significant correlation between QST with activity level ($r = .310$) which is consistent with the study done by Sardar et al. (2008). [15] This might be attributed to physical activity activating the cardiovascular system, resulting in an adaptation that improves oxygen transport and contributes to an increase in VO_2 max.

CONCLUSION

The study found that males had significantly higher VO_2 max as compared to females. The VO_2 max estimation by three methods significantly correlated with each other which suggests that the non-exercise testing equation may be as accurate as the submaximal exercise test. VO_2 max estimation using Queen's college step test was significantly associated with gender, waist-hip ratio and activity level of the participants.

ACKNOWLEDGMENT

We would like to thank our guide, study participants and colleagues for their valuable time and support in making this research work possible.

ABSTRACT

Natural polymers are stemmed from renewable sources such as plants, animals and microorganisms ex: cellulose, starch. Natural polymers are favoured for their biocompatibility and sustainability .They often serves as thickeners and binders. Synthetic polymers are made-made materials created through chemical synthesis. Synthetic polymers offer precise control over properties such as viscosity, solubility and film formation. Semi- synthetic polymers are stemmed from natural sources but are chemically modified to improve their properties or functionally ex: Carboxy methyl cellulose and semi synthetic polymers offer a balance between natural and synthetic options. They provide enhanced stability in cosmetics. Identify suitable natural polymers based on desired properties and functionality ex: Thickening. conduct compatibility tests with other formulation ingredients to ensure stability and efficacy. Select appropriate semi-synthetic ex: cellulose based on their modified properties and assess compatibility and interactions with other formulation components through screening experiments. Choose synthetic polymers ex:” polyvinyl alcohol based on desired functionalities and properties.

Keywords: Natural polymers, Semi-synthetic, Synthetic polymers, Cosmetic formulation, Carrageenan, Xanthum gum, Hydroxyethyl cellulose

INTRODUCTION

The personal care and cosmetics sectors have seen tremendous growth in the twenty-first century. Over the course of the forecast period (2016–2022), the global cosmetics market is expected to increase at a compound yearly growth rate of 4.3%, reaching \$429.8 billion by 2022.[1] Cosmetics are defined by the European Commission (2015) as any material or preparation that is meant to come into touch with the teeth, oral cavity mucous membranes, hair system,

nails, and different exterior aspects of the human body.[2] In fact, polymers can be found in a variety of hair care products, including shampoos, conditioners, hair dyes, fixing gels, and tip repair; in skincare goods, including lotions, liquid soaps, sunscreens, and corporate oils; and in nail care, cosmetics, and scent products.[3] Each of these products has unique uses and applications, as well as variations in composition, production techniques, and physical and chemical factors that necessitate a wide range of polymers. Polymers are a significant category of raw materials used in cosmetic formulations since they are necessary for the creation of high-performing goods. They can be categorised as natural, semi-synthetic, or synthetic macromolecules because they are made up of several repeating units, or monomers, which are often grouped in a chain. Within the formulations of cosmetics, its structural variety is employed as rheology modifiers, thickeners, foam stabilisers and destabilizers, emulsifiers, fixatives, conditioning agents, and film formers to support a range of purposes.[3-5]

Polymers

Being vital to the creation of high-performance goods, polymers constitute a significant class of raw ingredients used in cosmetic formulations. Depending on how many repeating units (monomers) they contain and how they are structured, they can be categorized as synthetic, semi-synthetic, or natural macromolecules. Its structural variety is utilized to support a range of functions in cosmetic formulations, including conditioning, foam formers, emulsifiers, thickeners, foam stabilizers and destabilizers, rheology modifiers, and fusions. Natural, semi-synthetic, and synthetic polymers' characteristics and applications in cosmetic formulations are covered in this review (Figure 1).[3, 5]

Polymers in cosmetic formulation

Polymers are frequently found in many cosmetic and personal care products. They belong to a single class of materials that have a variety of characteristics similar to the class of polymers that have been used. The class of polymers covered in this section has been applied to several fields. The properties of various polymers types are displayed for use in cosmetic formulations.

Synthetic polymers

The fact that synthetic polymers can be customized for particular uses makes them appealing as an excipient in cosmetic formulations. They can be made uniformly on a big scale, are long-lasting, and frequently cost less than natural polymers. Acrylic acid-based polymers, polyacrylamides, silicon, and alkylene oxide-based homopolymers and copolymers are the synthetic polymers most frequently encountered in cosmetics.[6] In recent times, the cosmetics sector has employed silicon materials. Biomethane and cyclomethycaine are two examples of composites made of silicon that are utilized as suspending agents and in processes like emulsification and associative thickening in cosmetics like deodorants, shampoos, and antiperspirants.[7] Analogs of polyethylene glycols (PEGs), whether they are non-ionic or anionic, are frequently found in cosmetics as emollients (which aid in lubricating and softening the skin), emulsifiers (which aid in the proper mixing of water- and oil-based products), and penetration enhancers (which aid in the delivery of other compounds deeper into the skin). They can be found in deodorant, shampoo, hair conditioners, bath and shaving products, skin care products, makeup, and skin cleansing goods.[8] *Mangifera indica* L. kernel extract was used in Poomanee et al. (2020)'s development of nano emulsion loadings to improve the extract's stability and skin penetration, making it a potentially effective anti-acne treatment.[9] Safflower oil served as the oil phase in the mixture, which also included sorbitan, PEG-7 glyceryl cocoate, cetareth-20, and PEG-40 hydrogenated castor oil as surfactants. Butylated hydroxytoluene and oleate together. *M. indica* kernel extract's physicochemical, antibacterial, and skin permeability were demonstrated by the production of a nano emulsion with extremely small droplet sizes and a restricted distribution. The good features of biodegradability, biocompatibility, and mass producibility are possessed by aliphatic polyesters, like poly (lactic acid) (PLA), poly (ϵ caprolactone) (PCL), and poly (3-hydroxybutyrate-co-3 hydroxy valerate). Natural polymers (such cellulose, chitin, and gelatine) do not have the exceptional mechanical qualities or melting processability that these materials possess. Aliphatic polyesters are being considered for the creation of microbeads for environmentally friendly cosmetics because of their qualities[9] according to Table 1.

**Srinivasa Rao et al.,****Semi – synthetic polymers**

With distinct physicochemical and mechanical properties, cellulose derivatives can be broadly classified into two groups: cellulose esters and cellulose ethers. Characteristics of cellulose derivatives include stability against biodegradation, heat, hydrolysis, and oxidation, surface activity, viscosity in solution, and thermoplastic film qualities. As opposed to cellulose esters (cellulose acetate, cellulose acetate phthalate, cellulose acetate butyrate, cellulose acetate trimellitate, hydroxypropyl methylcellulose phthalate), which are soluble in water, cellulose ethers (e.g., methylcellulose, ethyl cellulose, hydroxyethyl cellulose, hydroxypropyl methylcellulose, carboxymethyl cellulose, and sodium carboxymethyl cellulose) are soluble in water. have high film-forming properties but are often water-insoluble polymers.[15] In cosmetics such as creams, shampoos, lotions, and gels, these polymers are primarily utilized as thickening, stabilizing, gelling, and bioadhesive agents. Natural gelling substances such as starches, acacia, sodium alginate, agar, pectin, and gelatine are more resistant to microbial infection.[7] Using synthetic, semi-synthetic, natural, or a combination of polymers, Aung et al. (2019) created dissolving microneedles to facilitate trans epidermal distribution of alpha-arbutin for skin lightening.[16] The patch was made with GantrezTM S-97, hydroxypropyl methylcellulose, polyvinylpyrrolidone K-90, and chitosan as the polymers. I.e. The most appropriate polymer combination to create alpha-arbutin-loaded dissolving microneedles, according to their observations, is 8% w/w HPMC:40% w/w PVP K-90 (1:1). This is because alpha-arbutin has greater mechanical strength and penetration than gel formulation.

Natural polymers

As seen in Figure 2, natural polymers have mostly been employed in cosmetic applications. They may be used for a wide range of purposes, such as skin and hair care, makeup, and as stabilisers and modifiers. They are also biocompatible, safe, environmentally friendly, and very marketable to consumers.[18,19] Polysaccharides, starch, xanthan gum, guar gum, carrageenan, alginate, pectin, gelatine, agar, collagen, and hyaluronic acid are among the most widely utilised natural polymers. Polysaccharides called starches are found in nature and may be utilised in two different ways as soluble and granule starch. After being heated during extraction, the soluble starch dries and becomes resistant to damp, leaving skin and hair feeling silky. The hydrogen bonds in the granule starch are altered, making it unbreakable, which leads to Because of their varying amylase concentrations, the diverse sources of starch, such as non-ionic polymers like potato, maize, pinion,[20] and cassava root, each provide the cosmetic compositions somewhat varied qualities. Starch and other natural polymers, such as chitosan, have been combined to provide antioxidative release and other skin-related properties.[21] In cosmetic applications, such as lotions and nail lacquers, chitosan is frequently used alone. Examples of these applications include hair and skin care.. Another well-known feature of chitosan is its antibacterial capabilities[22-24], and is thus utilized in a variety of deodorants, particularly because the solution is still sprayable. In addition to being utilized as a stabilizer in a variety of formulations,[25-28] chitosan enhances the adherence of fragrances to skin.[29] Furthermore, acne can be treated using chitosan.[30] Chitosan's treatment are what give it its moisturising properties. [31, 32] Additionally, chitosan has been employed as a carrier for many medicinal items. For example, dental plaque was reduced by 70% and bacterial counts were reduced by 85% dental plaque was contained in chitosan gels containing herbal extracts. Spray-drying chitosan was used to create sodium fluoride-containing microparticles that may be used by fluoride-controlled delivery devices to act as a fluoride reservoir in the oral cavity. Dental varnishes with antibacterial efficacy against S. mutations and the capacity to prevent demineralization were created using nanoparticles of chitosan as a fluoride-controlled delivery system carrier was validated. [33, 34] Another naturally occurring polymer is cellulose, which requires chemical changes such substitution processes to be employed in cosmetic applications because it is insoluble in water. After being chemically altered, cellulose fibrils produce skin care products that are non-irritating, have good skin adhesion and spreadability, and are perfect for usage as face masks.[35] Additionally, several cosmetic formulas are thickened using ionic cellulose polymers to boost their viscosity and stability.

Advantages' and disadvantages of polymers used in cosmetic formulation**Applications of polymers in cosmetic formulations**

The application of polymers in the restoration of many materials, including metals, wood, and ceramics, has grown dramatically in recent years. This is because polymers have advantages over traditional materials, such as easy

**Srinivasa Rao et al.,**

processing, increased productivity, and decreased value.[49] Cosmetic goods' viscosity and flow properties can be changed with the use of polymers. In goods with water and oil phases, polymers function as stabilisers and emulsifiers. Polymer/layered silicate (PLS) nano-composites have garnered significant attention in recent times, from academia and industry alike, due to their notable ability to improve material properties when compared to traditional micro and macro composites or virgin polymer. Certain polymers form films on the skin or hair, giving makeup longevity benefits. High moduli, enhanced heat and strength resistance, reduced flammability and gas permeability, as well as enhanced biodegradable polymers are a few examples of these enhancements. However, there has been a lot of interest in theory and simulations that deal with the synthesis and characteristics of such materials, as well as the fact that they are thought to be special model systems for examining the dynamics and structure of polymers in small spaces.

CONCLUSION

For the treatment of skin, teeth, hair, and nails, various physicochemical and biological properties of polymers and other modified derivative polymers can be used. They also possess the ideal attributes to support active chemicals found in cosmetics. Because these crucial characteristics are frequently associated, determining which characteristics are more relevant for a particular application requires a precise polymer characterisation. Because polymers have so many applications, it is important to characterize them not just in terms of their physical-chemical properties but also in terms of their functional attributes, environmental and biological safety, and biopharmaceutical activity.

Table 1: Properties of polymers

Polymers	Properties	Ref
PEG, PPG	Humectant and surface activity	[7]
Dimethicone	Thermoreversible hydrogels that provide protection, emollience, and improved comfort	[10]

Srinivasa Rao et al.,

Poloxamer	Boost body temperature viscosity and non-ionic surfactant	[11]
Poly (lactic acid)	Microbeads for exfoliation, a biodegradable substitute	[12]
Poly caprolactone)	Polymers not biodegradable, forming of films, elastic properties Shape memory impacts	[13]
Polyurethanes	Water resistance, gloss, and feel of the surface	[14]
Polyquaternium	Antistatic, conditioning, and film-forming	[7]

Table 2: Properties of semi-synthetic polymers

Polymer	Properties	Ref
Nitrocellulose	Develop a film, Wear products longer, and improve skin	[17]
Acrylate – copolymers	Enhanced product appearance and safety	[7]
Hydroxyethyl cellulose	Improved product shelf life, rheological control, and simplicity of use	[7]

Table 3: Properties of natural polymers

Polymers	Properties	Ref
Starch	Emulsifying agent , Film forming, High viscosity and Lip care	[36]
Chitosan	Long-term colour adhesion, hydration, antibacterial qualities, and film formation	[37]
Cellulose	gives hair a moisturized, silky, and anti-static finish	[38]
Sericin	Increases elasticity and has a large capacity to take up moisture.	[39,40]

Table 4: Advantages’ and disadvantages of polymers

Polymers	Advantages	Disadvantages	Ref
Natural	Enhancer of water solubility Reduced or non-toxic Excellent transparency and edema Both biodegradable and biocompatible able to combine with medications Easily accessible minimal immunogenicity Passivity	Heavy metal and microbiological pollution Uncontrolled pace of hydration variance from batch to batch Slow production pace arduous extraction process	[41-43]
Synthetic	Simple customization enhanced chemical and mechanical stability Increased Reproducibility Varying Selectivity and Specificity Simple to break down suitable for clinical settings	Inherent biocompatibility and bioactivity deficiencies Potential to induce immunological reaction, inflammation, and toxicity synthesis process that is costly and difficult Problems with water solubility	[44-47]
Semi-synthetic	Sustainability and renewable energy sources Degradability and biocompatibility customized property Effects on the environment	Cost Differentiation in the original content processing complexity limited toughness Regulation-related difficulties	48

	Adjustability

ABSTRACT

The rapidly evolving global landscape is compelling businesses to rethink their traditional models in favour of sustainable business innovations. This paper explores the shift towards Sustainable Business Innovation (SBI), focusing on how firms are altering their strategies to align with environmental, social, and governance (ESG) goals for long-term success. By analyzing key drivers, challenges, and examples of businesses embracing sustainability, the paper demonstrates how incorporating sustainability into core business practices enhances resilience and competitiveness. The study also highlights strategic frameworks and methodologies guiding this transition, emphasizing the importance of circular economy principles and stakeholder collaboration.

Keywords: Sustainable Business Innovation, Circular Economy, ESG Goals, Stakeholder Collaboration

INTRODUCTION

In today's fast-evolving global environment, business firms are facing unique challenges driven by environmental degradation, resource scarcity, and shifting consumer preferences. The traditional business models that once guaranteed success are increasingly becoming obsolete encountering these challenges. As the world contends with the issues of climate change, ecological imbalances, and social inequalities, companies are under pressure to not only deliver financial performance but also to operate in a socially and environmentally responsible way. This has led to the rise of Sustainable Business Innovation, where businesses are rethinking their models and operations to ensure long-term success while positively impacting society and the environment. Sustainable business innovation involves designing and implementing new strategies that prioritize environmental sustainability, social equity, and economic viability. The objective is to embed sustainability within their strategies and initiatives into the very core of a business

**Stephen Deepak and Shanthi**

model, from supply chain operations to product design and customer engagement. Unlike traditional models that aimed at short-term gains, sustainable business models aim for long-term value generation for stakeholders—customers, employees, investors, communities, and the planet. Business firm's that adopt these models are not only more resilient in the face of market disruptions but are also positioned to attract socially conscious consumers and investors who increasingly demand corporate responsibility. The need for sustainable business innovation is further reinforced by global sustainability initiatives, like the United Nations' Sustainable Development Goals (SDGs) and the Paris Agreement on climate action, which urge businesses to take action towards creating a sustainable future. Additionally, technological advancements in areas like clean energy, circular economy models, and digital transformation provide new and different avenues for businesses to innovate to reduce environmental footprint while enhancing profitability. This research article sight sees how companies can rethink their business models through the lens of sustainability to achieve long-term success. It delves into the key drivers behind the shift towards sustainable innovation, the challenges companies face in this transition, and real-world examples of organizations that have effectively incorporated sustainable business practices. The paper also examines the strategic frameworks and methodologies that guide sustainable business innovation, throwing newer insights into how businesses can build a competitive edge while making a positive contribution to global sustainability.

Business Models: An Introduction

A business model is the blueprint through which an organization creates, delivers, and captures value, both for itself and its stakeholders. It defines how a company generates revenue, structures its operations, and engages with its customers. Business models are essential to the survival and success of any enterprise, guiding decision-making and operations in a way that aligns with long-term strategic goals. Essentially, they encompass every aspect of a company's structure, from its products or services to its marketing, distribution, and cost management strategies. Over time, business models have evolved in response to changing technologies, consumer behavior, and economic conditions. Traditional business models, which were dominant before the digital age and sustainability-driven transformations, were primarily profit-oriented and focused on efficiency and mass production. However, these models are being intensely scrutinized for their long-term sustainability in a world facing environmental degradation, resource depletion, and evolving consumer demands.

Traditional Business Models and Their Characteristics

Traditional business models have resulted in commercial success, emphasizing profitability and growth through standard market practices, including mass production, linear supply chains, and economies of scale. These models are precisely developed to prioritize short-term financial gains, driven by cost reduction and efficiency without significant regard for environmental or social impacts (Bocken et al., 2014). The value proposition in traditional models centers on delivering quality products or services to consumers, usually at competitive prices, while maximizing shareholder value. Traditional business models follow a linear, "take-make-dispose" production and consumption framework, where natural resources are sourced, turned into goods, sold, and eventually discarded. This method is embedded in sectors like manufacturing, agriculture, and energy production, allowing businesses to expand quickly by meeting consumer demand. However, the focus on profit maximization often overlooks environmental sustainability and social equity (Yang et al., 2017). Traditional business models refer to the conventional ways' businesses operated before the rapid technological advancements and global sustainability movement. These models were largely centered on profit maximization, mass production, and efficiency through economies of scale. They often involved predictable supply chains, established markets, and relatively static customer bases. Traditional models focused on delivering physical goods or services in an environment with less competition from digital-first enterprises.

Some key characteristics of traditional business models include

1. Profit-Centric Focus: The primary goal of traditional models was maximizing profit margins by leveraging cost efficiencies, often at the expense of environmental or social concerns.

**Stephen Deepak and Shanthi**

2. **Linear Supply Chains:** Traditional models typically follow a linear process from raw material extraction to product creation, distribution, and eventual disposal. This model emphasizes a "take, make, dispose" approach, without considering resource regeneration.
3. **Customer Acquisition and Loyalty:** Traditional models emphasized customer loyalty programs and advertising to acquire and retain customers, primarily through physical stores or direct sales.
4. **Centralized Operations:** These models often featured centralized decision-making, with a top-down approach that was slow to adapt to market changes or customer demands. Innovation was typically incremental rather than disruptive.
5. **Labor-Intensive Processes:** Many traditional models relied heavily on manual labor and large workforces, particularly in sectors like manufacturing, agriculture, and retail.

Negative Impact of Traditional Business Models

While traditional business models have driven global economic growth, they have led to a range of harmful impacts on both the environment and society. The linear model, based on the excessive extraction of natural resources, has led to the depletion of finite resources and significant environmental degradation (Schaltegger et al., 2016). For instance, industries that rely heavily on fossil fuels have highly contributed to carbon emissions, exacerbating climate change and causing irreversible damage to ecosystems. The mass production of goods also results in vast amounts of waste, with products and packaging ending up in landfills or polluting oceans, creating significant ecological imbalances (Bocken et al., 2014). Traditional business models have also been criticized for fostering inequality and social injustice. Companies in pursuit of cost reductions frequently exploit workers in developing nations, resulting in low wages, poor working conditions and child labour. This pursuit of profit at the expense of human welfare has created ethical concerns for consumers and regulators alike (Yang et al., 2017). Additionally, traditional business models often lack transparency, which can lead to corporate scandals, such as environmental violations and the exploitation of marginalized communities. While traditional business models were profitable for decades, they are increasingly seen as unsustainable and harmful in today's evolving market landscape. The negative impacts include:

1. **Environmental Degradation:** Traditional business models, particularly those relying on mass production and resource extraction, have significantly contributed to environmental issues such as pollution, resource depletion, and climate change. The linear "take, make, dispose" approach leads to excessive waste and carbon emissions, which are unsustainable in the long term.
2. **Inflexibility and Resistance to Change:** Traditional models are often slow to adapt to technological advancements or changes in consumer preferences. This can make businesses vulnerable to disruption by more agile competitors who adopt innovative, digital, or sustainable practices. Many companies have struggled to pivot their models, leading to declining market share.
3. **Short-term Profit Focus:** Many traditional models focus prioritizing short-term profits often comes at the cost of long-term sustainability. This leads to underinvestment in areas like innovation, employee well-being, and corporate social responsibility.
4. **Social Inequality:** Traditional business models have promoted exploitative labour practices, especially in global supply chains. Low wages, poor working conditions, and the outsourcing of labour to developing countries are all consequences of models that prioritize cost-cutting and profit over social responsibility.
5. **Depletion of Resources:** Companies relying on finite, non-renewable materials are facing high pressure as these resources become scarcer. The long-term viability of businesses dependent on such resources is under threat, especially as regulatory and consumer demands shift toward more sustainable practices. While traditional business models have historically driven economic growth and profitability, they are no longer suitable for the challenges of the modern world. As environmental sustainability and technological advancements take center stage, companies must reinvent their business models, moving towards innovation and long-term success. Transitioning to sustainable models is not merely for survival but creates opportunities for enduring value for businesses, society, and the planet.

Stephen Deepak and Shanthi

RESEARCH METHODOLOGY

This research employed a qualitative approach using a systematic review of research articles related to business models and sustainability, case studies of companies that have transitioned to sustainable business models were reviewed. Secondary data from industry reports, academic journals was analysed to identify common strategies, challenges, and success factors. Additionally, thematic review was followed to uncover insights into the role of ESG factors in business model innovation. This methodology allows for a comprehensive exploration of sustainable business innovation and its impact on long-term business success.

Sustainability in Business Models

In today's business scenario, sustainability has become a critical component of long-term success. Sustainability in business means operating in ways that are economically practical, socially responsible, and environmentally friendly. It goes beyond profit generation to address the broader impacts of business operations on society and the planet. The objective of fulfilling sustainability in business models has grown due to increasing awareness of climate change, environmental degradation, resource depletion, and social inequalities. Consumers, investors, and governments are now demanding greater accountability from companies, urging them to prioritize sustainable practices that protect the environment and support communities. Sustainability offers several advantages for businesses, including improved brand image, increased consumer loyalty, and reduced operational costs through energy efficiency and waste reduction. Moreover, sustainable businesses are able to mitigate risks related to regulatory changes, market shifts, and resource scarcity.

The Need to Move from Traditional Business Models to Sustainable Business Models

Given the negative impacts of traditional business models, the need to gravitate towards sustainable models has become critical. Sustainable business models integrate environmental, social, and governance (ESG) factors into their core strategies, promoting long-term value creation that benefits society and the planet (Evans et al., 2017). Sustainability in business is not just driven by the need to meet statutory requirements but also by increasing consumer preferences towards ethically produced and environmentally responsible products. Businesses fail to meet these shifting consumer demands risk losing market position and tarnishing their public image (Schaltegger et al., 2016). Sustainable business models focus on circularity, where resources are reused, recycled, and regenerated to minimize waste and reduce dependence on finite resources. This shift from a linear to a circular economy allows businesses to become conscious of their environmental footprint while creating economic opportunities (Bocken et al., 2014). Furthermore, sustainable business models emphasize social equity by ensuring fair labor practices, community engagement, and ethical supply chains. Traditional business models, while profitable for decades, are increasingly seen as inadequate for delivering to the challenges of the 21st century. These models, often characterized by mass production, linear supply chains, and a focus on short-term profit, have contributed to environmental harm, social inequality, and economic instability. The linear "take, make, dispose" approach of traditional models has resulted in massive waste production, resource depletion, and high carbon emissions, exacerbating environmental issues such as climate change and biodiversity loss. Moreover, traditional business models prioritize profit maximization at the expense of long-term sustainability. This short-sighted focus can lead to poor working conditions, exploitative labour practices, and the depletion of resources, all of which undermine the long-term existence of businesses. Companies that fail to adopt sustainable practices risk losing consumer trust, facing regulatory penalties, and falling behind competitors who have embraced more responsible business models. In contrast, sustainable business models prioritize long-term value creation by embedding environmental, social, and governance (ESG) factors into their core operations. These models emphasize resource efficiency, renewable energy adoption, circular economy principles (which aim to reduce waste and recycle resources), and ethical labour practices. By adopting sustainable business models, companies can reduce their environmental footprint, support social progress, and secure their economic future. The global shift toward sustainability is further driven by global efforts such as the United Nations' Sustainable Development Goals (SDGs) and the Paris Agreement on climate initiatives. These frameworks urge businesses to adopt ways that contribute to global sustainability.

**Stephen Deepak and Shanthi****The Paradigm Shift in Developing a Sustainable Business Model**

The transition from traditional to sustainable business models represents a significant paradigm shift. This shift requires businesses to rethink their value propositions, operations, and relationships with stakeholders. The development of sustainable business models are not about tweaking existing practices but about fundamentally transforming the way businesses operate. Companies must move from a linear to a circular economy model, where products are designed for durability, reuse, and recycling, and waste is minimized throughout the supply chain. One of the prominent pointer of this paradigm shift is the integration of corporate social responsibility (CSR) and environmental stewardship into the core business strategy, rather than treating these as peripheral concerns. Businesses are now recognizing that sustainability can be a driver of innovation, opening up new markets, products, and services that cater to environmentally conscious consumers. For instance, the advances in green technologies, renewable energy solutions, and sustainable packaging are all a result of businesses embracing sustainability as a core value. Another critical factor in developing sustainable business models is collaboration with stakeholders. Businesses must work closely with governments, non-governmental organizations (NGOs), consumers, and communities to create systems that benefit all parties involved. This collaborative approach ensures that businesses not only meet regulatory requirements but also address the needs and concerns of the wider society. Lastly, emerging technologies like artificial intelligence, big data analytics, and the Internet of Things (IoT) are helping businesses refine their processes, aligning with sustainability goals by reimagining the core aspects of value creation, delivery, and capture. Sustainability is no longer a niche concern but a fundamental aspect of modern business strategy. As the world faces pressing environmental and social challenges, companies must move away from traditional business models that prioritize short-term gains and adopt sustainable practices that ensure long-term success. This paradigm shift requires businesses to innovate, collaborate, and leverage technology to create models that benefit the environment, society, and the economy. Sustainable business models are not just the future of business—they are essential for the survival and prosperity of companies in the 21st century.

Sustainable Business Model Innovation: A New Framework

Sustainable business model innovation (SBMI) requires a fundamental rethinking of how businesses operate. Companies must redesign their value propositions to offer products and services that address sustainability challenges while meeting consumer needs. SBMI involves developing new technologies, processes, and practices that minimize environmental harm, promote resource efficiency, and support social well-being (Evans et al., 2017). For example, companies can adopt renewable energy sources, improve energy efficiency, and design products with sustainability in mind, such as using recyclable materials or reducing packaging waste. Furthermore, collaboration with stakeholders, including suppliers, consumers, and governments, is essential to developing sustainable business models that are scalable and impactful (Yang et al., 2017). The transition to SBMI also involves financial innovation, such as incorporating the true cost of resources, emissions, and waste into pricing strategies, ensuring that the business's economic activities contribute to environmental and social sustainability. This shift not only reduces the risk of regulatory penalties but also opens new markets and business opportunities (Schaltegger et al., 2016). Sustainable business model innovation (SBMI) has emerged as a critical framework for integrating environmental and social sustainability into the core of a business. Rosaria Ferlito and Rosario Faraci's research article, "Business Model Innovation for Sustainability: A New Framework," offers valuable pointers into how businesses can adapt their models to fulfil the demands of sustainability by rethinking three key components: value proposition, value creation and delivery, and value capture.

Value Proposition

The value proposition in SBMI refers to the sustainable benefits offered to customers and other stakeholders (Ferlito & Faraci, 2023). It goes beyond merely delivering products or services; it involves offering solutions that positively impact society and the environment. Companies aiming for SBMI must realign their objectives to focus on creating shared value for customers, communities, and ecosystems. Sustainable value propositions are often centered around reducing waste, minimizing environmental footprints, and promoting fair labour practices. For instance, firms in the circular economy provide customers with products designed for reuse and recycling, thereby reducing the utilization of resources and fostering environmental stewardship (Ferlito & Faraci, 2023).

Stephen Deepak and Shanthi

Value Creation and Delivery

Value creation and delivery in sustainable business models require innovation in operational processes and supply chains to ensure that business activities are environmentally and socially responsible. According to Ferlito and Faraci (2023), sustainable value creation demands a shift from traditional linear processes to circular systems. Businesses must innovate by adopting clean technologies, using renewable energy, and ensuring resource efficiency throughout the production and delivery process. Additionally, value creation should engage stakeholders, including customers, suppliers, and communities, to ensure that sustainability objectives align with broader societal goals. Collaboration and transparency across the value chain are essential for ensuring long-term sustainability and stakeholder trust.

Value Capture

Value capture in the context of SBMI involves rethinking how businesses generate revenue while ensuring sustainable outcomes (Ferlito & Faraci, 2023). Traditional models focused solely on profit maximization often ignore environmental and social costs. In contrast, sustainable models prioritize long-term value for all stakeholders by incorporating the true costs of resources, waste, and emissions into their financial strategies. This could involve adopting pricing mechanisms that reflect the full environmental cost of products or implementing shared value models where companies reinvest part of their profits into social and environmental initiatives

Model of Sustainable Business innovation

Sustainable Business Models

As businesses worldwide face increasing pressure to address environmental and social concerns, several sustainable business models have emerged, allowing companies to align their operations with sustainability goals while maintaining profitability. Here are five popular sustainable business models that offer long-term benefits for both businesses and society:

Circular Economy Model

The circular economy model is based on minimizing waste and maximizing the reuse of resources. Unlike the traditional linear model of "take-make-dispose," the circular economy emphasizes closing the loop by recycling, reusing, and regenerating materials. This model promotes the making of products are dismantled and reassembled, allowing for the reuse of components. Companies like Patagonia and IKEA have adopted this model by offering repair services and recycling programs, reducing the utilization of virgin materials while extending product life cycles (Bocken et al., 2016).

Product-as-a-Service Model

This model shifts the focus from selling products to providing services. Instead of customers owning the products, they pay for the utility or service the product offers. This approach incentivizes companies to create durable, long-lasting products since ownership remains with the business. For example, Rolls-Royce uses a "Power by the Hour" model, where customers pay for the engine's performance rather than purchasing the engine outright. This model reduces waste, ensures efficient use of resources, and fosters long-term customer relationships (Lacy & Rutqvist, 2015).

Social Enterprise Model

A social enterprise is a business that prioritizes solving social or environmental issues over maximizing profits. These organizations aim to create positive change by reinvesting their profits into causes that benefit society. TOMS Shoes, for instance, operates on a "buy one, give one" model, where every pair of shoes sold helps provide shoes to children in need. Social enterprises contribute to sustainable development by addressing issues such as poverty, health, and education, ensuring that business growth is aligned with social welfare (Alter, 2007).

Inclusive Business Model

Inclusive businesses integrate low-income populations into their value chain as suppliers, distributors, or customers. These businesses create opportunities for marginalized communities by providing access to jobs, goods, and services

**Stephen Deepak and Shanthi**

that improve their standard of living. Companies like Grameen Bank and Unilever's Project Shakti have successfully employed this model by offering microfinance and empowering rural women to distribute products in underserved areas. This model fosters economic growth while reducing inequality (Pralhad & Hart, 2002).

B Corp Certification Model

B Corp Certification is awarded to companies that achieve rigorous standards in social and environmental performance, accountability, and openness. Ben & Jerry's and The Body Shop are examples of businesses that have obtained B Corp certification, ensuring that their operations benefit people and the planet. B Corporations are legally obligated to consider how their decisions affect all stakeholders, including workers, communities, and the environment. This model encourages ethical practices, long-term sustainability, and corporate responsibility (Honeyman, 2014).

CONCLUSION AND DISCUSSION

Sustainable business innovation marks a fundamental shift from traditional, profit-driven models to ones prioritizing long-term environmental, social, and economic benefits. This shift is crucial as businesses face increasing pressure from consumers, investors, and regulators to adopt more responsible practices. Our analysis reveals that companies integrating sustainability into their operations are better positioned to remain competitive, resilient, and compliant with global initiatives like the SDGs. However, the transition is not without challenges, particularly in balancing profitability with sustainability goals. Despite these hurdles, they offer a roadmap for enduring success, providing value to all stakeholders while addressing the urgent challenges of resource depletion and environmental degradation.

Industry and Managerial Implications

For industries, adopting sustainable business innovations presents opportunities to create value beyond profitability, such as brand enhancement, operational efficiency, and risk mitigation. Managers must foster a culture of sustainability by embedding environmental and social considerations into every aspect of decision-making. This includes rethinking supply chains, adopting circular economy principles, and fostering collaboration across sectors. Moreover, businesses that prioritize sustainability will be better equipped to attract socially conscious consumers and investors, adapt to regulatory pressures, and navigate market disruptions. For long-term success, leaders must champion sustainability as a core business strategy, leveraging innovation and stakeholder engagement to drive meaningful change.

ABSTRACT

This study examines the effectiveness of the MUDRA scheme in bridging the finance gap for micro-enterprises in India. Focusing on five key states - Tamil Nadu, Karnataka, Uttar Pradesh, West Bengal, and Maharashtra - and three PMMY categories, the analysis reveals trends in loan disbursements and participation of women entrepreneurs. With over 5.77 crore micro-units seeking high-cost funds outside the formal credit system (NSSO, 2013), MUDRA's impact is crucial. This research provides valuable insights to inform policy decisions and optimize the scheme's effectiveness in supporting micro-entrepreneurs.

Keywords: MUDRA Loan, State-wise comparison, Loan Disbursement, Women entrepreneurs.

INTRODUCTION

Pradhan Mantri MUDRA Yojana (PMMY), launched in 2015, bridges the credit gap for small and micro enterprises. It provides loans up to INR 10 lakh through banks, NBFCs, and MFIs, categorized into Shishu, Kishore, and Tarun based on the business life cycle. In 8 years, PMMY has disbursed INR 22.89 lakh crore to 41.16 crore loan accounts, benefiting weaker sections. The Tarun category's loan limit has been increased to INR 20 lakh, effective from Budget 2024, however this is not reflected in this paper.

**Jayaraksana et al.,****Objectives**

The study objectives are to analyze MUDRA loan trends across India (2015-2023), examine state-wise disbursement trends in the top 5 states (Tamil Nadu, Karnataka, Uttar Pradesh, West Bengal, and Maharashtra), and assess the components benefiting women Entrepreneurs.

SCOPE AND RESEARCH METHODOLOGY

This study analyses PMMY's performance (2015-23) in the top 5 states, loan categories, and women's participation using secondary data from official reports. Statistical tools (mean, standard deviation, coefficient of variation) analyze loan disbursement trends, state performance, and women's participation.

DATA ANALYSIS AND INTERPRETATION

Objective 1: Analyze trends in MUDRA loan disbursements in India (2015-2023)

Pradhan Mantri Mudra Yojana disbursements grew consistently from ₹ 100,000 crores in 2015-16 to nearly ₹ 500,000 crores in 2022-23. Growth doubled by 2018-19, stabilized during COVID-19 (2019-20), and then accelerated post-pandemic, demonstrating Mudra's increasing support for small businesses and economic growth.

Objective 2: Study MUDRA loan trends in TN, Karnataka, UP, WB, and Maharashtra.

PMMY promotes financial inclusion and top-performing states are TN (₹ 231,185), KA (₹ 214,215.43), UP (₹ 210,652.44), WB (₹ 196,374.89), and MH (₹ 191,897), leading in MUDRA loan disbursement and accounting for a significant share of total disbursements.

MUDRA LOAN DISBURSAL TRENDS: TOP 5 STATES**Stability and Financial Support**

Maharashtra and Karnataka are most stable, while Tamil Nadu is moderately stable. West Bengal and Uttar Pradesh are the least stable due to high variability. Tamil Nadu provides the highest financial support, whereas Maharashtra offers the lowest. Uttar Pradesh and West Bengal's support variability affects their stability.

STATE-WISE INTERPRETATION**1) TAMIL NADU**

Tamil Nadu's MUDRA loans (2015-23): SISHU (₹ 14,500.87) was the most stable (CV: 26.89%), KISHORE (₹ 9,377.28) most variable (CV: 57.83%). 2019-2022 saw a shift from SISHU to KISHORE indicating a change in micro-enterprise support trends.

2) KARNATAKA

KA's A/Cs & Disbursement Trends over the years (Rs in crores) Karnataka's MUDRA loans: SISHU (₹ 10,925.55) was most stable (CV: 18.52%), KISHORE (₹ 10,234.19) most variable (CV: 43.50%). 2019-2020 saw a shift from SISHU to KISHORE/TARUN, indicating changed funding priorities.

3) UTTAR PRADESH

UP's A/Cs & Disbursement Trends over the years (Rs in crores)

Uttar Pradesh's MUDRA loans: SISHU (₹ 10,460.39) was fairly consistent (CV: 31.98%), KISHORE (₹ 9,216.86) highly variable (CV: 49.48%), and TARUN (₹ 6,654.30) moderately variable (CV: 41.46%). SISHU surged, dipped, and rebounded; KISHORE grew steadily; and TARUN fluctuated before stabilizing.

4) WEST BENGAL

West Bengal's MUDRA loans: SHISHU (₹ 11,299.66, CV: 31.88%) was most stable, KISHORE (₹ 9,789.93, CV: 68.10%) highly variable, and TARUN (₹ 3,457.27, CV: 50.32%) moderately consistent. SHISHU supported small enterprises steadily, while KISHORE fluctuated and TARUN needed stability.

Jayaraksana et al.,

5) MAHARASHTRA

Maharashtra's MUDRA loans: SISHU (• 9,030.86, CV: 21.62%) was most consistent, TARUN (• 6,918.77, CV: 27.20%) moderately variable, and KISHORE (• 8,037.49, CV: 38.14%) highly variable. Post-pandemic, Maharashtra witnessed a remarkable recovery, fueling a "start-up resurgence".

Objective 3: Evaluate MUDRA's components benefiting women.

MUDRA loans empower women entrepreneurs, driving economic growth and social change. With 65% of beneficiaries being women, more than 35 million have started businesses, becoming self-reliant and contributing to India's socio-economic progress. MUDRA loan allocation to women has shifted significantly. Initially, SHISHU dominated, but its share decreased. KISHORE (growth phase) rose from 13.70% to 42% by 2022-23, while TARUN (mature businesses) also increased. This shift prioritizes supporting women entrepreneurs in growth stages, aligning with efforts to strengthen women's Entrepreneurship.

KEY FINDINGS OF THE STUDY

- Karnataka, Maharashtra, and Tamil Nadu top Shishu loan disbursements, ensuring constant funding for new micro-enterprises.
- Maharashtra's Tarun loans demonstrate steady growth, with the lowest CV.
- The States saw a rise in Kishore loans despite the pandemic, highlighting the ongoing financial needs of existing micro-enterprises
- Shishu loans (up to • 50,000) have consistently grown, benefiting first-time entrepreneurs, driving financial inclusion, and contributing most to Mudra's success.
- Top MUDRA disbursers in FY 2022-23: UP (• 47,427 cr), TN (• 43,730 cr), Karnataka (• 40,746 cr). TN's consistency outshone UP and Maharashtra's volatility.
- TN's higher MUDRA disbursements than Maharashtra, suggest allocation imbalances.
- Most states saw rising Shishu loans in 2019-2020, except TN and Karnataka, where micro-enterprises shifted to larger Kishore/Tarun loans.
- FY 2020-2021 saw a sharp decline in MUDRA loans, especially the Shishu category, due to COVID-19, as NBFCs and SFBs reduced lending.
- Women entrepreneurs received 47.74% of total MUDRA loans.
- Women's MUDRA loan allocation shifted from Shishu to Kishore and Tarun, indicating reduced early-stage dependence and increased support for growing and mature businesses.

CONCLUSION

The MUDRA scheme has made significant strides in fostering micro-enterprise growth and financial inclusion, particularly in states like Tamil Nadu, Karnataka, Uttar Pradesh, West Bengal, and Maharashtra. However, disparities in disbursement highlight the need for more equitable fund distribution across regions. The pandemic-induced decline in Shishu loans underscores the vulnerability of new enterprises and the necessity for crisis-resilient support systems. After an impressive eight-year journey, the scheme has demonstrated its vital role in "funding the unfunded". To enhance its impact, it is crucial to ensure balanced resource allocation, strengthen financial safety nets, and focus on supporting the transition from Shishu to Kishore and Tarun loans, especially for women entrepreneurs. To further strengthen the MUDRA scheme, developing tailored support strategies for different categories of loans will be crucial in ensuring more inclusive and sustainable growth for micro-enterprises across India.

ABSTRACT

This study explores the attitudes of sampled business women in Madurai district towards growth and competitiveness. It aims to understand the factors influencing their entrepreneurial journeys, the challenges they encounter, and their perspectives on the business environment. Through in-depth interviews and surveys, the study collected data from a diverse group of women entrepreneurs operating in various sectors. The findings reveal that while women entrepreneurs in Madurai district are driven by a strong desire to attain financial freedom and contribute to their society. They have also faced significant problems that can hinder their growth. The problems namely lack of capital, societal and cultural barriers, lack of support networks, work-life balance struggles, and policy limitations. Despite these obstacles, many women entrepreneurs demonstrate resilience, adaptability, and a willingness to take risks. In order to address these problems and to improve the development of women entrepreneurs in Madurai district, it is recommended for several policy interventions by the government and NGOs. These include improving access to finance, enhancing support systems, promoting gender equality, and addressing work-life balance issues. This paper is focused to review and study the problems faced by women entrepreneur and to provide suitable solutions and policy recommendations to the government to empower the women entrepreneur in the study area.

Keywords: Entrepreneurship, Growth, Competitiveness, entrepreneur and Empowerment.

**Dilipan and Theenathayalan****INTRODUCTION**

In India for centuries, male entrepreneurs has been dominating predominantly in business, manufacturing and others. Whereas the women involvement in business is not up to the mark. However, in the recent past it observed that a growing emphasis on women's potential to contribute significantly to the nation's economic growth. Indian administrators and policymakers must devise innovative methods to inculcate entrepreneurial skills among women. Indian women entrepreneurs are having a very long history of challenging gender stereotypes, excelling in various fields traditionally dominated by men. From their roles as warriors and rulers to their current achievements in the corporate world, women have consistently demonstrated their capabilities and managerial prowess. Renowned for their attention to detail, dedication, and empathy, women possess qualities essential for successful entrepreneurship. These traits, often observed in their management of household affairs, belie the misconception that they are ill-suited for leadership roles. Indian women have proven to be excellent managers, capable of planning, budgeting, and executing strategies effectively in both personal life and professional life.

Growth of Women Entrepreneurs

In recent years, the entrepreneurial landscape of Madurai district has witnessed a notable surge in the number of women-owned businesses. This is because of several factors, including increased access to education, government initiatives supporting women entrepreneurs, and changing societal attitudes. Education has played a significant role in empowering women in Madurai district to pursue entrepreneurial ventures. With higher levels of education, women have gained the knowledge, skills, and confidence to explore business opportunities. Government initiatives such as self-help groups, microfinance schemes, and skill development programs have also provided essential support to aspiring women entrepreneurs. These initiatives have helped women access capital, acquire necessary skills, and build networks within the business community. Moreover, societal attitudes towards women's entrepreneurship have evolved positively. Traditional gender roles are gradually changing, and women are increasingly encouraged to pursue their career aspirations. This shift in mindset has created a more supportive environment for women entrepreneurs, allowing them to overcome societal barriers and pursue their business goals. Despite these positive developments, women entrepreneurs in Madurai district still face several challenges that can hinder their growth. One of the primary obstacles is access to capital. Obtaining loans and funding for business ventures can be difficult for women entrepreneurs, especially those from marginalized communities. Limited access to financial resources can restrict their ability to expand their businesses, hire employees, and invest in new technologies. Another challenge is the work-life balance struggle. Balancing the demands of running a business with family responsibilities can be particularly challenging for women. Societal expectations and cultural norms often place a disproportionate burden of domestic work and professional work on women. Furthermore, women entrepreneurs may face discrimination and gender bias in the business world. They may encounter challenges in networking, securing contracts, and accessing mentorship opportunities. It is suggested to implement the targeted policies and initiatives for women empowerment through local, state and central governments.

- Improved access to finance: Providing easier access to loans and funding for women-owned businesses through microfinance schemes, government grants, and venture capital funds.
- Enhanced support systems: Establishing mentorship programs, business incubation centers, and networking opportunities specifically designed for women entrepreneurs.
- Skill development and training: Offering targeted capacity building programs to equip women entrepreneurs with fundamental and necessary skills along with computer literacy to succeed in their businesses.
- Policy reforms: Implementing policies that promote gender equality and address discriminatory practices in the business world.
- Awareness campaigns: Raising awareness about the contributions of women entrepreneurs and challenging gender stereotypes.

Dilipan and Theenathayalan

By providing the basic needs and good governance the women entrepreneurs will move forward to take up new business ventures in Madurai district. There by women entrepreneurs contribute to the society in terms of employment and income generation in the study area.

Objectives

- To evaluate the growth trajectory and future prospects of women entrepreneurs in establishing businesses in Madurai district.
- To identify the problems faced by the women entrepreneurs in the Madurai District.

METHODOLOGY

An interview schedule was used to collect primary data from the women entrepreneurs in the study area relating to the prospects and problems. In order to collect data and information convenience method was applied. A sample of 50 respondents have been identified from the study area for collection of primary data. Secondary data was also used where ever necessary.

Tools of Analysis

The Garret value and scores of each rank is used in this study.

$$\text{Per cent position} = \frac{100 (R_{ij} - 0.5)}{N_j}$$

R_{ij} = Rank given for the i th variable by the j th respondent.

N_j = Number of variables ranked by the j th respondent.

RESULTS AND DISCUSSION

The entrepreneurial landscape of Madurai district has witnessed a burgeoning number of women-owned businesses in recent years. This growth is a testament to the increasing number of women who are breaking down traditional gender stereotypes and pursuing their entrepreneurial aspirations. However, despite the progress made, women entrepreneurs in Madurai district continue to face peculiar problems that that can impact their attitudes towards growth and competitiveness. This study aims to explore the attitudes of sampled business women in Madurai district towards growth and competitiveness. By understanding their perspectives, we can gain valuable insights into the factors influencing their entrepreneurial journeys and the challenges they encounter. This knowledge can inform policy decisions and support initiatives aimed at empowering women entrepreneurs and robust a more inclusive, balanced and sustainable business environment.

Prospects of Women Entrepreneurs to establish Business

The entrepreneurial landscape of Madurai district has witnessed a steady increase in the number of women-owned businesses in recent years. However, despite this growth, women entrepreneurs in the region continue to face multiple challenges that can delay their success the business. This study aims to explore the prospects of women entrepreneurs to establish businesses in Madurai district, considering the various issues that influence their entrepreneurial growth. By understanding these challenges and opportunities, we can develop targeted strategies to support women entrepreneurs and foster a more inclusive business environment. From table 1, it is revealed that all the five reasons are equally important for becoming an entrepreneur. The reason for becoming on entrepreneur the respondents favoured mostly in terms of financial improvement, risk taking / decision making followed by independent. It is observed that the data is based on a survey of a relatively small sample size (50 respondents) and may not be representative of the entire population of women entrepreneurs. It is observed that Personality Development / Skill utilization ranked placed as number I followed by Independent, Risk taking / Decision making, Social reorganization / standard of living and Financial Improvement. It is important to note that the table only

Dilipan and Theenathayalan

shows ranking based on the Garret ranking system. There may be other ranking system that order these factors differently.

Problems of Women Entrepreneurs

It has been identified and listed 16 problems faced by the women entrepreneurs in Madurai district. These challenges are multifaceted, stemming from societal, cultural, economic, and policy-related factors. From the table it is understood that problems faced by the women Entrepreneurs. Among all the problems financial problem and competition among / within the business communities are the major problems followed by family life balance, decision making, labour management, net working challenges and lack of confidence. The other problems are manageable problems expressed by the respondents in the study area.

CONCLUSION

Women entrepreneurship is the backbone of economic growth and development of any region. It is a multifaceted profession that is basically interesting, creative and enterprising. For centuries entrepreneurship has historically been a male-dominated one. But today women entrepreneurs plays a crucial role in business, manufacturing and MEMEs. The performance of women entrepreneurs seems to be remarkable and inspiring in Madurai district. Women's economic contribution through self-employment and industrial initiatives start up as increased attention from the NGOs and Government organizations. It is important to note that the problems and challenges faced by the women entrepreneurs in Madurai district can be reduced through policy changes and provision of loan without security along with subsidy and low rate of interest.

ABSTRACT

This study investigates in the factor influence the development of MSMEs in Madurai district, a developing region in India. By employing a mixed-methods approach, combining quantitative and qualitative research techniques, we explore the determinants of MSME growth in this context. **Access to Finance:** MSMEs in Madurai district face significant challenges in obtaining adequate financing, hindering their growth potential. **Infrastructure Development:** The availability of quality infrastructure, including transportation and communication facilities of MSME growth. **Government Policies:** Supportive government policies, such as tax incentives, subsidies, and credit facilities, can significantly boost MSME growth. **Innovation and Technology:** MSMEs that adopt innovative practices and technologies are more likely to achieve higher growth rates. **Human Capital:** The availability of skilled labor and entrepreneurial talent is essential for MSME development. **Market Access:** Access to domestic and international markets is a serious factor in determining MSME growth. Policymakers should focus on improving access to finance, enhancing infrastructure development, implementing supportive government policies, fostering innovation, investing in human capital development, facilitating market access and MSME growth and contribute to the overall economic growth of the region.

Keywords: MSMEs, Entrepreneurs, Growth, Development and Finance.

INTRODUCTION

In the MSMEs cooperate a pivotal task in the financial growth of developing regions, providing employment opportunities, fostering innovation, and contributing to the overall growth of the local economy. It influence MSME growth entrepreneurs skills identical. This study delves into the determinants of MSME growth in Madurai district, a representative district in the developing Indian state of Tamil Nadu. Madurai district, with its rich historical and cultural heritage, has witnessed a significant expansion of its MSME sector in recent years. However, the growth trajectory of MSMEs in this region are complex interplay of factors, including economic, social, and institutional variables. By examining these determinants, the research will employ a mixed-methods qualitative and quantitative research techniques and analysis of survey data collected from MSMEs in Madurai district, exploring the relationship between various factors and MSME growth. Qualitative research will involve in-depth interviews with MSME owners, policymakers, and industry experts and the challenges and opportunities of business sectors.

REVIEW OF LITERATURE

Asghar, Nawaser, Paghaleh and Khaksar (2011) evaluated the government policies with respect to the MSMEs and the performance of these enterprises in relation to these policies and assistance and also concentrate on entrepreneurship within the Micro, Small and Medium-sized enterprises addition, they also consider the contribution of MSMEs towards country's employment generation. Liji Jolly in his article on "Globally, micro, small, and medium-sized enterprises (MSMEs) are acknowledged as a crucial component of national economies, making a substantial contribution to the growth of employment and the reduction of poverty. This includes government policies and tiny sectors in India. Acknowledging the significance of micro and small businesses, which constitute a significant portion of the Indian economy the role in employment, exports, industrial production, and an entrepreneurial foundation Development and promotion for modern era describes as "the most employment-intensive segment".

OBJECTIVE

To analyze the growth rates of MSME factors influencing Madurai district.

METHODOLOGY

An analytical one and comprises of both the primary information and secondary records and publications and documents such as annual reports, census reports, small Industries Service Institute (Now MSMEs Development Institute). District Industries Centre, District Statistical Office and various Statistical Handbooks, journals like Asian Research Consortium, Indian Journal of Agricultural Economics and International Journal of Management Research and Business Strategy, Magazines like Economics and School of Management Studies, CUSAT books like organization and Management of Small-Scale Industries, Himalaya Publishing Home in Micro Enterprises and periodicals. The economics of MSME in Madurai district, 100 respondents were selected by adopting the proportionate probability random sampling method. The factors (i) Cell phone and accessories shops, (ii) Stationary and Xerox shops, (iii) Bakery and sweets Shops (iv) Furniture shops, (v) Sales and service of Motor cycles shops and (vi) Miscellaneous and which included all other enterprises. The following tools are multiple regression formula models are used in the study as follows:

$\text{Log } y = \beta_0 + \beta_1 \log X_1 + \beta_2 \log X_2 + \dots + \beta_{10} \log X_{10} + u$, where

Y = Total growth scale value for ten components (in Nos.)

X1 = Initial capital

X2 = Fixed investment, Rs. in lakhs X3 = Owned fund, Rs. in lakhs

X4 = Borrowed capital, Rs. in lakhs X5 = Working capital

X6 = Term loans

X7 = Employment generation X8 = Value of products

**Karthikeyan and Senthilkumar**

X9 =Sales turnover

X10 =Net profit

$\beta_0 \beta_1 \dots \beta_{10}$ are the parameters to be estimated.

RESULTS AND DISCUSSIONS

It measured the quantity the increase of MSMEs with the assist of a scale built with the aid by the research. In the examined, ten additives have been diagnosed to measure the growth of MSMEs and they shape the basic of measurement. All the 10 additives are accountable both partially or completely for the 100 boom of the MSMEs. In this table 1 shows the level of growth value of MSMEs. As shown in Table 1, the coefficients of difference are 9.91 percent for high-level growth, 7.06 percent for medium-level growth, and 12.52 percent for low-level growth. It is inferred that MSMEs with medium-level growth are more consistent in those with high-level growth. In the calculated outcomes of growth rate of MSMEs in table 2. It is inferred that the table 2 that the co-efficient of R^2 value into 0.5315 indicating 53.15 consistent with cent variant in increase of MSMEs degree of freedom. It step with cent boom in those 4 variables may want to growth boom scale with the aid of 0.2916 according to cent, 0.2819 in step with cent, 0.1132 according to cent and 0.2216 consistent with cent.

CONCLUSION

Empirical evidence gathered through the case study of MSMEs in Madurai district, several key determinants emerged as influential factors in their growth and development. The findings suggest that a combination of strategic initiatives, supportive policies, and favorable market conditions has played a pivotal role in fostering the expansion of these enterprises. The study revealed a notable rise in job creation within the MSME sector. This growth in employment has not only alleviated unemployment rates but has also stimulated local economic activity and consumer spending. Furthermore, the total investment made by MSMEs in Madurai district has witnessed a substantial surge. Directed towards modernizing production facilities, upgrading technology, and expanding business operations. Such investments have enhanced the efficiency and competitiveness of MSMEs, enabling them to cater to a wider market and capture new business opportunities. The sales performance of MSMEs in Madurai has also been impressive. The study observed a significant increase in both sales and revenue. This growth in sales can be attributed to factors such as improved product quality, effective marketing strategies, and a growing demand for MSME- produced goods and services. In particular, the motorcycle shops operating within the MSME sector in Madurai have demonstrated commendable progress. These businesses have exhibited higher levels of efficiency and have successfully met the increasing demand for motorcycles and related services. This growth can be attributed to factors such as skilled workforce, reliable supply chains, and competitive pricing. Many MSMEs struggle to secure adequate funding to expand their operations, invest in new technologies, and meet working capital requirements. This lack of financial resources can constrain growth and limit their ability to compete effectively. Another significant challenge faced by MSMEs is the difficulty in selling their products and services. Market access, distribution channels, and brand recognition can be obstacles for smaller enterprises. Limited marketing resources and a lack of awareness about their offerings can hinder their ability to reach potential customers and generate sales. Moreover, technical guidance and support are often lacking in the MSME sector. Many entrepreneurs may require assistance in areas such as technology adoption, quality control, and business management. The absence of adequate technical support can limit the growth potential of MSMEs and hinder their ability to innovate and remain competitive. In conclusion, the case study of MSMEs in Madurai highlights the multifaceted factors influencing their growth and development. While the region has witnessed significant progress with employment generation, investment, sales, finance, market access, and technical guidance persist and the ensuring the continued growth of MSME sector in Madurai district.

Karthikeyan and Senthilkumar

SUGGESTIONS FOR ENHANCING MSME GROWTH IN MADURAI DISTRICT

Financial Support

- Loan Programs: Implement targeted loan programs with flexible repayment terms and lower interest rates to address the financial constraints faced by MSMEs.
- Credit Guarantee Schemes: Establish credit guarantee schemes to mitigate the risk faced by lenders, thereby increasing access to finance for MSMEs.
- Venture Capital and Angel Investing: Promote venture capital and angel investing to provide equity financing for innovative MSMEs with high growth potential.

Market Access and Promotion

- Trade Fairs and Exhibitions: Organize regular trade fairs and exhibitions to facilitate B2B and B2C interactions, and enhance market visibility for MSMEs.
- Online Marketplaces: Develop or support online marketplaces specifically designed for MSMEs to connect them with a wider customer base.
- Branding and Marketing Assistance: Provide branding and marketing assistance to MSMEs, including training programs and subsidies for marketing activities.

Capacity Building and Skill Development

- Training Programs: Offer vocational training programs to enhance the skills of MSME workers, improving productivity and quality.
- Business Management Workshops: Conduct business management workshops to equip MSME entrepreneurs with essential skills such as financial management, marketing, and operations.
- Technology Adoption Support: Provide technical assistance and subsidies for MSMEs to adopt modern technologies and improve their competitiveness.

Infrastructure Development

- Industrial Parks: Establish well-equipped industrial parks with essential and transportation, to attract MSMEs.
- Technology Incubators: Create technology incubators to foster innovation and provide support services to start-up MSMEs.
- Improved Connectivity: Enhance connectivity through improved roads, railways, and telecommunications infrastructure to facilitate services.

Policy Reforms

- Regulatory Simplification: Streamline regulatory procedures and reduce bureaucratic hurdles to improve the ease of doing business for MSMEs.
- Tax Incentives: Provide tax incentives and exemptions to MSMEs to encourage investment and growth. By implementing these suggestions, Madurai district can create a more conducive environment for MSME growth, leading to increased employment opportunities, economic development residents.

ABSTRACT

Artificial intelligence has seeped into all sectors of the economy and is transforming how systems and businesses operate. It increases efficiency in healthcare, education, finance, manufacturing, and retail—not just this, but even in the automobile industry, where artificial intelligence is very prominent. Autonomous vehicles use artificial intelligence, machine learning, and sensor technologies. Self-driving cars operate without requiring or limiting human drivers' involvement in taking over. By removing the variability associated with human drivers, self-driving cars can greatly increase highway capacity. The study aims to find the factors affecting behavior intention towards AV. With a sample size of 251 sample, SEM, specifically the PLS tool, was used to verify the proposed theoretical model. The most significant variable in deciding the behavior intention toward autonomous vehicles is the utilitarian motive (UM), which means people will buy autonomous vehicles if they get better utility than conventional, manual automobiles. Other important factors having a positive and significant impact on the BIU Avs are environmental Benefits, PIIT, and Economic Benefits. One of the important factors for refraining from using autonomous vehicles are technology anxiety, which means that people who have technology anxiety is likely to refrain from buying autonomous vehicles. India is prepared to allow autonomous vehicles on the roads, much like most affluent nations. However, policy measures and the encouragement of research and development are required to make this happen. This would contribute to India's development while lowering the number of traffic accidents, reducing congestion, lowering parking costs, and Fuel Saving.

Keywords: AV-autonomous vehicles, behavior intention to use, PLS-SEM.

**Avani Karkare and Shweta Sharma**

INTRODUCTION

AI is changing the world in numerous ways by transforming industries, economies, and daily lives. This is one of the greatest technological revolutions as AI is enabling machines to perform tasks that usually require the intelligence and decision-making skills of humans. One such exceptional application of AI is automobile in the automobile field that is autonomous vehicles. Autonomous vehicles are self-driving vehicles, and they operate without human intervention. It uses technologies like machine-learning algorithms, and sensor technologies like LiDAR, radar, and cameras research has found that autonomous helps to reduce the chances of accidents and help to manage traffic by making real-time decisions and navigating complex environments. There are six levels of autonomous as defined by the Society of Automated Engineers (SAE) ranging from level, 0 to level five, and levels one and two are widely used.

Autonomous Vehicles in the Present Day

With leading advancements of companies like Tesla, Waymo, and Uber AV has developed from basic to real-world application. Tesla provides a semi-autonomous driving experience while Waymo gives a fully auto-driving experience in a few regions. In 2019, there were 31 million autonomous vehicles on the road, and it's predicted that by 2035, it will be around 50 million the value of the global autonomous vehicle market is worth \$33.45 million as of 2023. China, Japan, and Singapore are the top three Asian countries in terms of AV testing, despite infrastructure and regulatory barriers. Despite challenges like poor infrastructure and convoluted traffic, India is becoming a significant competitor because of companies like Minus Zero that are creating regional solutions like Z Pod, India's first AV. The government of India is also supporting AV's adoption as a sustainable transportation option. In Indian automobile industries like Mahindra & Mahindra and Tata Motors, are also investing in AV technologies like advanced driver assistance systems (ADAS) and systems to avoid collisions. India's automotive sector contributes significantly to GDP, is expected to grow with the introduction of AV and by 2026 is projected to hit \$300 billion. As autonomous vehicles (AVs) advance, they are expected to yield environmental advantages, reduce traffic, and enhance safety. Countries like Asia and India might greatly improve their economies by integrating autonomous vehicles (AVs) into their transportation networks, there are challenges to be solved including public acceptance, infrastructure development, regulatory considerations, and technical readiness.

REVIEW OF LITERATURE

Behavioral Intention to Use(BIU)

According to Ji and Choi's 2015 study behavioral intention to use an information technology depends upon the perceived utility and ease of use. Many studies (Chau & Hu, 2002; Sheppard, Hartwick, & Warshaw, 1988; Wu, Shen, Lin, Greenes, & Bates, 2008) have found that Behavioral intention, as opposed to actual usage, is a particularly useful dependent variable when studying the early adoption of technological systems. Jing et al. 2019 found that individuals who are young, educated, middle-class, and people who live in cities are more likely to use Avs.

Personal information technology innovativeness(PIIT)

Innovativeness refers to the degree to which an individual relatively adopts innovation earlier than another individual as a member of the social system (Rogers & Shoemaker, 1971). PIIT was created to quantify a person's inclination to experiment with any information technology (Agarwal & Prasad, 1998). Simarmata & Hia, n.d., 2020 have shown in their empirical study that the use of Information technology, over time increases intention to use the technology. Agarwal & Prasad, 1998 concluded that the willingness of one person to experiment with advanced technology increases the PIIT. Similarly to, research on personal innovativeness positively correlates with intending to use location-based services (LBS) to give prospective users marginally supported results (Xu & Gupta, 2009). Hwang, 2014 has highlighted the significance of the PIIT construct in elucidating people's attitudes to the use of technology.

**Avani Karkare and Shweta Sharma**

H_{1a} – Personal Innovativeness in Information Technology (PIIT) has a positive impact on the Behavioural intention to purchase an AV.

Utilitarian motivation

Motivation is an internal state that propels a person's willingness to act and forces them to satisfy their basic needs (Ryan and Deci, 2000). Utilitarian motivation refers to purchasing a product for functional and economic benefits. The primary objective of utilitarian systems is to give the user instrumental value, such as knowledge to complete a task (Van Der Heijden, 2004). We conclude that utilitarian benefits (like perceived usefulness and performance expectancy) are important considerations when deciding whether to accept AVs (Kasper & Abdelrahman, 2020). H_{1b} – Utilitarian Motives positively impact the Behavioural intention to purchase AV.

Economic benefits

A benefit can be expressed numerically as an amount of money that will be saved or generated as the result of an action. Since actual usage of AV technology cannot yet be tested due to its limited availability, the empirical research reviewed in the previous studies only looks at the BIU as the outcome variable and does not investigate its further outcomes (Keszey, 2020). Fagnant & Kockelman, 2014 found that AVs have many economic benefits including savings from fewer crashes, reduced congestion costs, and saved parking costs. Both new and established car manufacturers conduct the development and manufacturing of autonomous vehicles (AVs). With a global market of 44 million vehicles, it is anticipated that by 2035 there will be 75% more autonomous vehicles than there were in 2030, which will have a 71-billion-dollar economic influence on the automotive sector (Curto et al., 2021). H_{1c} – Economic Factors positively impact the Behavioural intention to purchase AV.

Technological Anxiety(TA)

Technological anxiety is the propensity for people to feel uneasy, nervous, or afraid when utilizing cutting-edge technological products like AV (Igbaria et al., 1996). Customers who are truly worried about technology are less likely to interact with complex products (Meuter et al., 2003). Concerns about data security and privacy (such as GPS tracking and smartphone access) are also covered by anxiety. Among the most widely recognized obstacles to technology adoption are resistance to technology and the incapacity to accept new technologies (and the changes they bring about in users' lives) (Davis, 1993, Keszey, 2020, Zmud et al. 2016). H_{1d} -Technological anxiety has a negative impact on the behavioral intention to purchase AVs.

Data privacy Concerns

Keszey 2020, found that data privacy is one of the most important factors affecting Behavioral intention to use AVs. For instance, a recent study showed 93% of the Participants voiced worries about data privacy, with identity theft and fraud being the most serious issues (Clement, 2019). Concerns about data privacy relate to an individual's susceptibility as an outcome of losing control over how personally identifiable information is managed by third parties, like businesses or organizations (Martin et al., 2017). People would only plan to use AVs if they were related, and connected technology offers adequate security and privacy protection for data (Panagiotopoulos and Dimitrakopoulos, 2018). The biggest concern regarding AV is the possibility of safety problems caused by the fear of hacker attacks, unauthorized tracking, and misuse of personal information (König & Neumayr, 2017). Data privacy concerns can be reduced by providing strong data privacy protection to AVs users. H_{1e} – Data Privacy has a negative impact on the Behavioural intention to purchase AV.

Environment Benefit

Hao and Yamamoto (2018) in their review study have highlighted the benefits of AVs and SAVs. AVs can lower the greenhouse effect, reducing congestion by optimizing the routes and reducing ownership of vehicles through SAVs. H_{1f} – The environmental benefit has a significant impact on the Behavioural intention to purchase an AV. Since the world is rapidly growing and evolving in terms of technology there is a major need to check people's preferences related to the automobile industry. Moreover, Autonomous vehicles have the scope to solve many personal travel problems varying from Safety, reducing congestion, lowering parking costs, safety, and Fuel Saving. There is much

**Avani Karkare and Shweta Sharma**

literature that explains AVs, but not many Indian studies have been done in this field. Though Autonomous vehicles are not available in India, it is important to know the Behavioral attitude towards Autonomous vehicles that will be an incentive for the Government to come up with a policy on AVs that is data-driven Vehicle and can provide important insight to car manufacturing firms. The current study objective is to explore and provide an assessment of factors affecting the behavioral intention to use level 3 Avs among the citizens of Silicon Valley (Bengaluru) of India.

Theoretical Framework

The study is based on the theoretical framework of the Unified Theory of Acceptance and Use of Technology, introducing the UTAUT2 model developed by Venkatesh in 2012. This model is developed to understand the factors affecting the acceptance of new information technologies by its users. The UTAUT2 model includes many factors like Performance Expectancy, Effort Expectancy, Social Influence, Facilitating Conditions, Hedonic Motivation, Price Value, and Habit, those are factors that explain the user's decision to adopt and use the technology (Venkatesh, 2012).

Data Analysis

This study develops a key research question: What are the key factors influencing the behavioral intention to use Autonomous Vehicles (AVs) among citizens of Silicon Valley (Bengaluru), India? And covers Behavioral intention to use (BIU) Avs, a fundamental component of the UTAUT2 (Venkatesh, 2012). The study used 18 items for seven constructs and modified them to be relevant to the research. After a pilot study was completed on 30 Bengaluru samples, a reliability test using Cronbach's alpha was performed on the questionnaire. All constructs were evaluated using reflecting modeling, followed by PLS-SEM in smart PLS, a commonly used multivariate analytical process (Hair et al., 2019). Primary data was collected from 251 citizens varying ages between 18 to 50 years in Bengaluru and was used to arrive at various results and draw conclusions from the same. The descriptive Statistic is given in Table 2

Assessment of measurement model

Before the structural model was assessed, Confirmatory Factor Analysis (CFA) and Discriminant validity were established. All the values show satisfactory results. In conclusion, there is no issue of reliability, validity, or multicollinearity. The model specifies causal relationships between all constructs of interest. Path coefficient and R^2 show that data supported the hypothesized model. The analysis was performed on the complete sample of 251 shown in fig 1 and Table 4. The results in Table 4, indicate that PIIT has positive significant effects ($\beta=0.198^{**}$, $p<0.00$), utilitarian motivations have significant, positive effects ($b = 0.258$ $p <.000$); Economic benefits have a positive significant effect ($b= 0.113$, $P<0.05$); technological anxiety has a significant negative effect ($b =-0.252$, $P<0.00$) and Environmental benefits have a significant positive effect ($b=0.225$, $P<0.00$) but data privacy has a negative and insignificant effect on the BIU. Hence H_{1a} , H_{1b} , H_{1c} , H_{1d} and H_{1f} are accepted but H_{1e} is rejected. The results show that out of six factors, five factors have significantly accounted for 36.8% of the variance in behavioral intentions to use Avs. The results have shown that PIIT has a positive significant impact on the BIU as a result aligned with the studies of Agarwal & Prasad, 1998, Simarmata & Hia, n.d., 2020, Xu & Gupta, 2009. Thus, the willingness of one person to experiment with advanced technology increases the BIU Avs. Hypothesis H_{1c} BIU Avs will positively impact the economic benefits of Avs as Avs will lead to an increase in savings from fewer crashes, reduced congestion costs, and saved parking costs (Keszey, 2020, Fagnant & Kockelman, 2014). To encourage the use of Avs, (H_{1f}) the environmental Benefit has a positive and significant ($b=0.225^{***}$) impact on the BIU Avs, as highlighted in the study by Hao and Yamamoto (2018).

DISCUSSION

The aim is to explore the role of Data privacy, Economic benefit, Environmental benefit, PIIT, Technological anxiety, and Utilitarian motivations in determining the behavioral intention to use Avs. The examination results show that the economic benefit, environmental benefit, PIIT, technological anxiety, and utilitarian motivation factors are statistically significant and have a positive impact on predicting the behavioral intention of the user. Empirical results of the studies have proposed new antecedents as utilitarian motivation, Environmental benefits, and economic

**Avani Karkare and Shweta Sharma**

benefits have the maximum impact on the BIU Avs that satisfies the UTAUT2. The results have shown that the most important factor affecting the BIU is the Utilitarian Motivation of the Avs. Therefore, there will be a strong desire among users to use the Avs if they perceive them to be beneficial. Technological anxiety harms BIU Avs. The results aligned with the prior studies (Zmud et.al, 2016). To reduce technological anxiety there is a need to have strong data privacy and safety laws. It is important to highlight the methodological limitations of the study that may limit the generalizability of the results. Several questions about Behavioral intention to use Avs thus need further attention. The study can be extended to examine how respondents' demographic, impact their opinions and attitudes towards the Use of Avs. The above research is restricted to seven factors only but there are other factors like hedonic motivation, and the price of Avs will also affect the BIU Avs.

Policy Recommendations

The study contribute to the knowledge of the policymakers and the firms looking for the opportunity for the manufacture and selling of Avs in India, specifically in Bengaluru. This study affords insights for car manufacturers and self-sustaining gadget designers to meet user wishes and enhance offerings. Understanding the elements influencing consumer recognition of autonomous technology is critical for advertising and marketing corporations to allocate sources correctly, given the tremendous investments in those systems. For example, technical anxiety has a significant negative impact on BIU. AV vehicle stakeholders can organize sessions to make users aware of safety measures, cost-effectiveness, and robustness of AVs. Most of the developed countries, like China, the UK, and Singapore are using and improving on AVs, and India too has huge scope for AVs as the car market grew by 26.7% in FY 23. But to bring AVs to the road there is a need to have a data-privacy policy for the safety and privacy of the user data and infrastructural development is required.

ABSTRACT

The present study delves into the socio-economic obstacles encountered by female entrepreneurs in Bangalore, India, during the post-COVID-19 period, emphasizing their adaptability and resilience. The principal aims comprise of identifying the hindrances faced and investigating the actions implemented to ease these difficulties. Data were collected using a self-administered, standardized questionnaire, and then evaluated using correlation analysis, chi-square testing, and descriptive statistics for analysis. Important findings show substantial effects on the economy, including challenges in obtaining loans and venture capital along with supply chain interruptions that affect operational effectiveness and quality control. According to socioeconomic characteristics, the majority of female businesses faced difficulties with digital operations and decreased profit margins. Many responded by implementing e-commerce plans, looking for assistance via social media platforms, and making fiscal cutbacks. The results of the study indicate that in order to empower women entrepreneurs, it is essential to provide them with focused technological training, improved supplier relationships, alternative financing choices, and solid inventory management. Stakeholders can create an environment that promotes the steady expansion and adaptability of women-owned enterprises amidst persistent obstacles by putting these suggestions into practice.

Keywords: Women entrepreneurs, COVID-19, Socio-economic challenges, E-commerce, Resilience

**Alvina Paul and Shanthi**

INTRODUCTION

Entrepreneurship is a key factor in globalization since it stimulates economic growth and innovation. It involves identifying possibilities to enhance current solutions or address gaps in the market, advancing both societal and economic advancement. Through innovation, diversity, and moral behaviour, entrepreneurship promotes social transformation in addition to financial gains. In the process of empowering people individually and collectively, it fosters competition, brings in fresh perspectives, and produces jobs. The article examines how entrepreneurship is complex and has a big influence that goes beyond financial metrics.

Scope of the study

The socioeconomic effects of COVID-19 on female entrepreneurs in Bengaluru, India, are explored in this study. It focuses on how the pandemic has affected women-owned businesses, notably in terms of funding, technology absorption, and operational issues. The study also looks at the methods used by female business owners to overcome these obstacles, such as using digital tools and cost-cutting techniques. It also assesses the usefulness of government aid initiatives and the function of networking groups for female business owners. The study's overall goal is to give policymakers information they can apply to create pertinent assistance programs.

OBJECTIVES OF THE STUDY

The current study has the following objectives

- To identify and analyze the challenges faced by women entrepreneurs in the post COVID era.
- To explore the measures taken by women entrepreneurs to overcome the challenges posed by the COVID -19 pandemic.

METHODOLOGY

Sample

This study utilised a descriptive research design to analyse the obstacles and strategies faced by forty female entrepreneurs based in Bengaluru, India. The sample population consisted of 40 female entrepreneurs working in Bengaluru, India. An industry-wide diversified sample of 45% product-based businesses, 30% product-service firms, and 25% service-oriented businesses was made possible by the use of the snowball sampling technique.

Methodology

A self-administered, standardized questionnaire that was initially assessed for relevance and clarity was used to collect data. The study applied descriptive statistics, such as pie charts and bar graphs, to examine the distribution of firms and demographic data. The relationships between characteristics and barriers to entrepreneurship were investigated using chi-square testing and correlation analysis. Strict adherence to ethical standards guaranteed participant privacy and informed consent. The objective of this research approach was to offer a thorough understanding of female entrepreneurship in Bengaluru, with significant implications for policy and practice in comparable settings.

RESULTS AND DISCUSSIONS

ECONOMIC IMPACT - CHALLENGES

Women entrepreneurs encounter specific challenges that make it difficult for them to thrive, hence understanding challenges is important and create a just environment for them. Objective - 1: To identify and analyze the challenges faced by women entrepreneurs in the post COVID era. Women entrepreneurs encounter specific challenges that make it difficult for them to thrive, hence understanding challenges is important and create a just environment for them.

**Alvina Paul and Shanthi****Hypothesis-I**

H₀: There is no significant correlation between disruptions in the supply chain, delays in receiving essential equipment, and difficulties in maintaining quality control standards among women entrepreneurs in the post-Covid era.

H₁: There is a significant correlation between disruptions in the supply chain, delays in receiving essential equipment, and difficulties in maintaining quality control standards among women entrepreneurs in the post-Covid era. The study found a moderate negative correlation between disruptions in the supply chain and both delays in receiving essential equipment (-0.45) and difficulties in maintaining quality control standards (-0.26). This indicates that as supply chain disruptions increase, there is a tendency for delays in receiving essential equipment to also increase, and to a lesser extent, difficulties in maintaining quality control standards. However, a weak positive correlation (0.097) was observed between delays in receiving essential equipment and difficulties in maintaining quality control standards, suggesting a slight tendency for these issues to be associated with each other.

Hypothesis -II

H₀: There is no significant correlation between challenges related to technological barriers, acquisition costs of technology, and insufficient technical skills within the team among women entrepreneurs in the post-Covid era.

H₁: There is a significant correlation between challenges related to technological barriers, acquisition costs of technology, and insufficient technical skills within the team among women entrepreneurs in the post-Covid era. The study found very weak negative correlations between technological barriers and both the cost of technology (-0.054) and technical skills (-0.057), suggesting little to no linear relationship between these factors. However, a moderate positive correlation (0.56) was observed between the cost of technology and technical skills, indicating a tendency for higher acquisition costs of technology to be associated with better technical skills within the team, and vice versa.

MEASURES UNDERTAKEN BY WOMEN ENTREPRENEURS

Despite pandemic challenges female entrepreneurs displayed resilience through necessary measures to overcome the challenges.

Objective - 2: To explore the measures taken by women entrepreneurs to overcome the challenges posed by the COVID -19 pandemic.

Hypothesis-I

H₀: There is no significant association between the strategies implemented to reduce costs and the specific cost-saving measures adopted by women entrepreneurs.

H₁: There is significant association between the strategies implemented to reduce costs and the specific cost-saving measures adopted by women entrepreneurs. The study found that there is no significant association between the strategies implemented to reduce costs (such as employee pay cuts or layoffs) and the specific cost-saving measures adopted (such as rent reduction, inventory management, or utility bill reduction) by women entrepreneurs in post COVID-19 pandemic. This is indicated by a p-value of 0.06, which is greater than the conventional significance level of 0.05. This implies that factors other than the strategies themselves, such as industry dynamics, business size, financial resources, market conditions, and regulatory environment, may influence the selection of cost-saving measures by women entrepreneurs. Therefore, we accept the null hypothesis.

Hypothesis - II

H₀: There is no significant association between the implementation of new digital tools or software and the expansion of geographical reach due to digital transformation efforts among women entrepreneurs.

H₁: There is a significant association between the implementation of new digital tools or software and the expansion of geographical reach or reaching new markets due to digital transformation efforts among women entrepreneurs. The study found no significant association between the implementation of new digital tools or software and the expansion of geographical reach or reaching new markets among women entrepreneurs. This is indicated by a p-value of 0.367, which is greater than the conventional significance level of 0.05. Here we accept the null hypothesis. This suggests that while women entrepreneurs may be adopting digital tools and software for managing operations,

Alvina Paul and Shanthi

customer relations, and marketing, these efforts do not necessarily lead to significant improvements in geographical reach or market expansion.

SOCIO IMPACT

The variable taken are skills and knowledge, government support, future perspective and support systems.

Government Awareness regarding Support

Level of Awareness: Less than half (45%) of female entrepreneurs were aware of government support initiatives during the COVID-19 pandemic.

Government Measures' Efficacy

Helpfulness: Only 15% of the 45% who were aware of these measures thought they would be beneficial to their company.

Platforms for networking and support

Use: 65% of female entrepreneurs actively participated in support groups or networking sites, appreciating the unity and cooperation found in the female entrepreneur community.

Future Dependency on Digital Instruments

92.5% of female entrepreneurs see a future where technology and digital tools will be used extensively.

KEY FINDINGS OF THE STUDY

Objective I:

To identify and analyze the challenges faced by women entrepreneurs in the post COVID era.

Economic Impact

Access to Finance

- a) Loan Acquisition: Securing loans from financial institutions was a challenge for most women entrepreneurs after the pandemic, with service businesses being the most impacted.
- b) Venture Capital/Angel Investment: While product-service businesses had a higher success rate, securing funding from VCs or angel investors remained a challenge for some.
- c) Supply chain disruptions negatively impact both equipment arrival time (-0.45) and quality control (-0.26). Delayed equipment arrival further contributes to quality control challenges (0.097).
- d) There is a very weak negative correlation between technological barriers and both the cost of technology (-0.054) and technical skills (-0.057). However, a moderate positive correlation exists between the cost of technology and technical skills (0.56).

Socio Impact

1. 55% of women entrepreneurs found it challenging to manage digital operations due to inefficient skills and knowledge.
2. 87% of women entrepreneurs faced a negative impact on profit margins.

Objective II:

To explore the measures taken by women entrepreneurs to overcome the challenges posed by the COVID -19 pandemic.

Alvina Paul and Shanthi

Economic Impact

- 1) There is no statistically significant association ($p\text{-value} = 0.06 > 0.05$) between cost-reduction strategies (e.g., layoffs) and specific cost-saving measures (e.g., rent reduction) adopted by women entrepreneurs post-COVID, suggesting other factors influence cost-saving choices by chi squared test.
- 2) Digital tool implementation (for operations, customer relations, and marketing) was not statistically linked to geographical reach expansion ($p\text{-value} = 0.367 > 0.05$), suggesting these tools may address internal needs without directly impacting market reach by chi squared test.
- 3) E-commerce Adoption: 77.5% of the women entrepreneurs strategically shifted towards online sales channels.

Socio Impact

1. A significant majority of women entrepreneurs sought connection and support by utilizing networking platforms or support groups.
2. 45% women entrepreneurs were aware of the government measures and only 15% among them found it useful.
3. A significant majority (65%) of women entrepreneurs actively sought connection and support by utilizing networking platforms or joining support groups

SUGGESTIONS

- In order to overcome obstacles in obtaining loans, particularly for service-oriented firms, female entrepreneurs should investigate alternate kinds of funding such as grants, crowd funding platforms, and angel investors who are specifically focused on women.
- Women entrepreneurs can benefit from using strong inventory management to maximize stock levels and protect against delays in production or sales.
- Make training investments to optimize the return on technology investments, taking into account the positive link between technical and cost.
- Use digital tools to increase internal efficiency first so that resources can be allocated to additional market expansion tactics.
- Women business owners ought to devote more time to learning how to fully utilize digital tools for marketing.

CONCLUSION

This study analyses the socioeconomic effects of COVID-19 on female entrepreneurs in Bangalore, India, highlighting barriers including lack of funding, disruptions in the supply chain, and technology constraints. They overcame these challenges by using networking platforms and online sales channels to show resiliency. Policy and corporate interventions, such as improved supply chain management, alternate finance sources, and targeted investments in technology and talent development, are required to enable their sustained growth. In spite of persisting obstacles, these steps can foster a climate that is conducive to the long-term development of women-owned enterprises.

ABSTRACT

Educational institutions and their adaptive, flexible ecosystem open a lighted pathway of opportunity, creativity, design thinking, knowledge, and motivation among students and academicians. The study aimed in showcasing a practical action-oriented entrepreneurial practice and understand its impact. The Educational, Technological, Entrepreneurial and Social impact about the practice was studied using a structured questionnaire. 100 students of the institution were interviewed and the data was analysed. The study proved that the entrepreneurial practice of product development and marketing done by the students was a reflection of the knowledge and opportunity assimilated from the institution. Educational Institutions should include more practical aspect than theoretical in order to allow the students, practice entrepreneurship and get a real-life experience. Though there were challenges and limitations mentioned, the overall impact was positive, which had brought in skilled, creative and socially responsible young adults which paved way to climb the initial steps of entrepreneurship as budding entrepreneurs.

Keywords: Entrepreneurial Education, Entrepreneurial Culture, Ecosystem.

INTRODUCTION

Entrepreneurship does not demand academic qualification. However, to become successful entrepreneurs, both practical experience and formal education will be effective. Entrepreneurship education is a tool which can be used to attain positive students' intentions towards entrepreneurship (Jianpeng, 2024). Entrepreneurship is when an individual who has an idea act on that idea, usually to disrupt the current market with a new product or service (Adam Hayes, 2024). Entrepreneurial culture is an emerging discipline where someone is motivated to innovate, create and take risks and create an impact on the growth of economy through educational institutions. Flexibility, adaptability, a growth mind-set, and a learning orientation are key components of entrepreneurial culture that can lead to long-term success. (Nasia, 2024). Government and non-government organizations should instigate

81158

**Sapna Dinesh and Sundaravalli**

educational institutions to plan and implement entrepreneurship training programs with business organizations, governments and other relevant stakeholders in the local environment (Onu, 2013). Policymakers are encouraged to follow policies to improve entrepreneurial culture growth by promoting strategic cooperation among stakeholders and educational institutions implementing several concepts to enhance entrepreneurial culture. (Al-Lawati, 2022).

Statement of the problem

The concept of promoting and instilling entrepreneurial culture in students have paved way towards developing a bunch of budding entrepreneurs from the student community to face the world of entrepreneurship and its challenges to become successful entrepreneurs. This study intends to overview the significance of educational institutions in fostering entrepreneurial culture among the student community and how the institutions can act to nurture and frame an ecosystem to bring out aspiring entrepreneurs from classroom to market. Every educational institution should include practical component of entrepreneurship along with theoretical aspect to contribute to economy, render practical experience of entrepreneurship and gain real life experiences. In this context, the study emphasis the role of Skill India Mission by Government of India which incorporates skill-based training programs in the school and college curriculum with certifications from industry-recognised learning centres. Henceforth, the Skill India Mission has become one of the best education institutes in India (Skillindiamission Blog, 2024). To substantiate this, the study projected the outcome and impact of an entrepreneurial activity conducted in one institution. This study focused on two objectives - (1) To overview the significance of the educational institutions and role played by organisations in emphasising and instilling entrepreneurial culture in institutions and (2) To show case the impact and output of a practical action-oriented entrepreneurial activity conducted.

METHODOLOGY

The study focussed on reviewing the significance of educational institutions in instilling entrepreneurial culture among students and faculties. To substantiate the concept of having practical aspects in entrepreneurship curriculum rather than only theoretical, a case study was conducted to evaluate the impact of one such practice in Mount Carmel College, Bangalore. The students of the Department of Home Science. were involved in an entrepreneurial practice of consumer product development and marketing inculcating all the elements of marketing and entrepreneurship since 2018. The tool used to study the impact was a structured questionnaire which was administered among the students, through purposive random sampling method. The sample size of the study was 100 which included current students and ex-students of the institution. The questionnaire consisted of 5 sections which included general information of the respondents, impact of entrepreneurial practice among students which was categorized as educational impact, entrepreneurial impact, technological impact and social impact, feedback from students about the entrepreneurial practice, strategies that educational institution could adopt to enhance entrepreneurial development and understanding about the entrepreneurial attitude among students. The data was interpreted and analysed.

RESULTS & INTERPRETATION

Educational institutions have a promising role to play in developing entrepreneurship. A study done in the University of Kashmir pointed out that the prevailing education system covers related business education and not entrepreneurship education. (Arshad, 2013). Recently entrepreneurship is been recognized as an academic discipline and has included theoretical models for formal education and learning (Valerio, Brent, Robb, 2014). Entrepreneurship education and incubation (including mentoring) are the factors that contribute directly to the quantity and quality of new startups and indirectly to the Indian economy (Nandini, 2022). Another study (Al-Lawati, 2021) aimed on the importance of entrepreneurial culture at educational institutions by analysing the relationship between entrepreneurial culture, entrepreneurship education (medium), and entrepreneurial intention (outcome) as study variables. In a study in Karachi on young entrepreneurs (Ammad Zafar, 2017), the researcher recommended the educational institutions (a) should set up entrepreneurship teachings as per international standard (b) should initiate courses that increase entrepreneurial intentions in students (c) should mentor and mould the students to face

**Sapna Dinesh and Sundaravalli**

the corporate sector and (d) should provide a supportive platform to bridge the gap between student entrepreneurs and the corporate sector. As mentioned in the methodology of the present study, the results of the case study are discussed below.

General Information of the respondents

Among the 100 respondents, 78% of them fell under the age group of 20 to 25 years. 33% of the current students and 67% of ex-students responded to the survey. The data showed that among the 67% of the ex-students, 16% of them were working, out of which 10% were entrepreneurs. India's level of Total early-stage Entrepreneurial Activity (TEA) in 2023 was just under 12% (Sunil.et.al, 2023). Despite that, only 5 to 10% of these entrepreneurs take up the risk of building their ventures (Cheggindia, 2024). 21% of the entrepreneurs focused on food products, 19% had their startups in clothing field and remaining of them emphasized on cosmetics, accessories, decor and toiletries as their business venture. Majority (13%) had 5 to 7 years of experience as entrepreneurs,

Impact of the entrepreneurial practice

The Impact of entrepreneurship education and practice have profound effects on students, impacting their personal development, academic performance and career prospects. The result of the study is depicted below in Figure 1.

Feedback on the entrepreneurial practice

The benefits of entrepreneurship in educational institutions and the measure that can be adopted to enhance entrepreneurial skills in students were studied from the feedback obtained from students. 81% of the respondents opined self-employment as the major benefit through entrepreneurship. Boosting leadership qualities of students, creation of opportunities using the latest technologies, enhancement of creativity and innovative skills, learning basic life skills were few benefits mentioned by more than 50% of the students. In order to raise the quality of the entrepreneurial culture in students, the measures suggested by more than 50% of the students were, mentoring from business professionals to help the students to invest and manage entrepreneurial ventures, faculties who has business experience to initiate entrepreneurship in students, Increased practical components in the subject with entrepreneurship as one of major academic discipline, guiding the students to launch their products to the real market, gaining experience through internships, hand on workshop and skill development trainings from government and non-governmental organizations.

Limitations and Challenges

Financial constraints, limited network and connections, competitive market were the major issues commented by more than 55% of the students. Other problems mentioned were poor time management, lack of confidence, over expectations of customers and dealing with negative feedback. Similar results were obtained in study done on issues and challenges of startups in India (Susilaningsih.et.al, 2017). According to the study, the major issues and challenges faced by startups were poor finance and revenue generation, lack of efficient team members, unavailability of supporting infrastructure, ignorance about market trends, not able to meet consumer expectations, lack of mentorship and less knowledge on marketing strategies. Another study examined social issues, lack of proper technological infrastructure, financial issues and sustainability issues as few challenges faced by entrepreneurs during their initial phase of product launch. (Sumit, 2017) The challenges faced by budding entrepreneurs in institutions include lack of experience, competitive complex corporate world, and business education that is too theoretical and lack of real-life practical experience. (Sowbarnigadevi.et.al, 2022).

Entrepreneurial attitude among the students

50% of the students mentioned unawareness and poor knowledge in financial literacy is a must for stepping forward to startup and business ventures. Openness to criticism, being our own boss than some body's, more employment opportunities and growth and development of society were other positive attitude conveyed (Figure 2). In a study (Ali, 2011), when entrepreneurial attitudes from six public sector potential entrepreneurs of Pakistan were explored, majority of students showed generally positive attitudes towards entrepreneurship. Significant difference between negative and positive attitudes were derived from this study.

Sapna Dinesh and Sundaravalli

Kedir (2011), in his study on entrepreneurial attitude found many areas of attitudinal difference between business and non-business students. The three most significant difference attitudes between business and non-business students were ability to make decision, creativity and persistence.

CONCLUSION

Entrepreneurship education and entrepreneurial culture play a significant role in fostering young entrepreneurs and pave way for self-employment. It also equips the students with positive entrepreneurial attitudes and skills required for start ups and to establish and stabilize their business venture consistently. Entrepreneurship education should include more practical component along with theory in order to give the students more entrepreneurial experience in real life situations. Government and non-governmental organisations should collaborate with educational institutions to build sound theoretical frameworks and implement entrepreneurial courses with trained faculties in order to raise the spirit of entrepreneurship in students.

ABSTRACT

This systematic review examines the impact of skill development on entrepreneurial innovation and growth in the tourism industry. A comprehensive analysis of existing literature reveals that skill development enhances entrepreneurial capabilities, fosters innovation, and promotes tourism business growth in tourism. Key skills for tourism entrepreneurial success include technical, business, soft and digital literacy skills. Theoretical frameworks, including Human Capital Theory, Entrepreneurial Learning Theory, and Innovation Capital Theory, support the importance of skill development for tourism entrepreneurial innovation and growth. The review finds a positive relationship between skill development and entrepreneurial innovation in tourism, with tourism entrepreneurs possessing advanced skills more likely to innovate and adapt to changing market conditions. Skill development also has a positive impact on tourism entrepreneurial growth, with entrepreneurs experiencing revenue growth, employment growth, and profitability. The findings have implications for tourism entrepreneurs, policymakers, and educators, emphasizing the need for skill development programs and prioritizing skill development to drive tourism business growth. Overall, this review highlights the crucial role of skill development in driving tourism entrepreneurial innovation and growth, and provides valuable insights for stakeholders to support tourism entrepreneurial success.

Keywords: Skill development, entrepreneurial innovation, tourism business growth, tourism entrepreneurship, human capital

**Lokesh Kumar and Hawaibam Jhalari Devi**

INTRODUCTION

The tourism industry is a significant contributor to the global economy, accounting for approximately 10% of global GDP and employment (UNWTO, 2020). However, the industry faces numerous challenges, including intense competition, changing consumer preferences, and the need for sustainable practices (Hall, 2019). To address these challenges, tourism entrepreneurs must develop the necessary skills to drive innovation and growth (Hjalager, 2020). Skill development is essential for entrepreneurial success in tourism, as it enables individuals to identify opportunities, develop innovative products and services, and adapt to changing market conditions. Furthermore, skill development can enhance the competitiveness of tourism businesses, leading to increased innovation and growth. Tourism entrepreneurship plays a vital role in driving economic growth, innovation, and job creation (Acs & Audretsch, 2003). As such, understanding the factors that contribute to entrepreneurial success in tourism is crucial for policymakers, educators, and entrepreneurs themselves. Innovation and growth are critical outcomes of entrepreneurial success (OECD, 2005). Tourism entrepreneurs who develop innovative products, services, and processes are better positioned to compete in the market and achieve growth (Damanpour, 1991). Therefore, understanding how skill development impacts innovation and growth is essential for promoting entrepreneurial success in tourism. Despite the importance of skill development for entrepreneurial success, there is a lack of systematic reviews examining the impact of skill development on innovation and growth in the tourism industry. This systematic review aims to address this gap by examining the impact of skill development on innovation and growth in tourism entrepreneurship, and aims to provide a comprehensive understanding of the relationship between skill development and entrepreneurial success.

Objectives

1. To systematically review the literature on tourism entrepreneurship and skill development, examining their impact on innovation and growth.
2. To identify the key skills required for success in tourism entrepreneurship, and their role in driving innovation and growth.
3. To examine the relationship between skill development and entrepreneurial innovation and growth in the tourism industry, highlighting best practices and areas for improvement.

RESEARCH METHODOLOGY

This systematic review employed a comprehensive literature search strategy to identify relevant studies examining the impact of skill development on entrepreneurial innovation and growth in tourism industry. The search was limited to peer-reviewed articles, academic journals, books, and book chapters published in English between 2010 and 2022. Empirical research and conceptual papers that focused on tourism entrepreneurship and skill development were also included.

Theoretical Framework

The theoretical framework of this systematic review consists of three key theories: Human Capital Theory, Entrepreneurial Learning Theory, and Innovation Capital Theory. These theories provide a foundation for understanding the relationship between skill development and entrepreneurial innovation and growth in the tourism industry.

Human Capital Theory (Becker, 1964)

Human Capital Theory posits that education and training are essential for enhancing productivity and economic growth in the tourism sector. According to Becker (1964), human capital refers to the knowledge, skills, and experience that tourism entrepreneurs possess, which can be invested in to improve productivity and earnings in tourism ventures. In the context of tourism entrepreneurship, human capital theory suggests that tourism

**Lokesh Kumar and Hawaibam Jhalari Devi**

entrepreneurs' skills and knowledge are critical for their success in developing innovative tourism products, services, and experiences.

Entrepreneurial Learning Theory (Cope, 2005)

Entrepreneurial Learning Theory emphasizes the importance of learning and skill development in entrepreneurial success. Cope (2005) argues that entrepreneurs learn through experience, experimentation, and reflection, enabling them to navigate the complex and dynamic tourism industry. This theory suggests that tourism entrepreneurs' ability to learn and adapt is crucial for capitalizing on emerging trends, embracing innovation, and responding to changing tourist demands.

Innovation Capital Theory (Acs et al., 2017)

Innovation Capital Theory highlights the role of innovation in driving economic growth and competitiveness. Acs et al. (2017) argue that innovation capital refers to the knowledge, skills, and experience that enable firms to innovate and adapt to changing environments. In the context of tourism entrepreneurship, innovation capital theory suggests that entrepreneurs' ability to innovate and adapt is critical for their success in developing new tourism products, services, and experiences. According to the theory, innovation capital is composed of three main elements: human capital (the skills and expertise of employees), social capital (the networks and relationships that facilitate knowledge sharing), and intellectual capital (the patents, trademarks, and copyrights that protect intellectual property).

Key Skills for Tourism Entrepreneurial Success

Tourism entrepreneurship is a complex and multifaceted pursuit that requires a diverse set of skills to succeed (Kirzner, 1997). These skills are essential for navigating the challenges of starting and growing a tourism business, from developing innovative products and services to managing teams and adapting to changing tourist demands and market conditions. The four key skill areas that are critical for tourism entrepreneurial success are given below:

Technical Skills

Technical skills are the foundation of any successful entrepreneurial venture. These skills refer to the industry-specific knowledge and expertise required to start and run a business. For instance, a tourism entrepreneur operating a travel agency needs to possess strong knowledge of destination management, tour operations, and travel regulations. Technical skills enable tourism entrepreneurs to innovate, develop new tourism products and services, and solve complex problems, giving them a competitive edge in the tourism industry.

Business Skills

Business skills are essential for tourism entrepreneurs to manage and grow their tourism businesses. These skills include finance and accounting, marketing and sales, management and leadership, strategy and planning, and operations and logistics. Tourism entrepreneurs with strong business skills can create comprehensive business plans, secure funding, manage teams, and make informed decisions to drive growth and profitability in the tourism industry.

Soft Skills

Soft skills are personal attributes and personality traits that enable tourism entrepreneurs to interact and communicate effectively with others in the tourism industry. These skills include communication and presentation, teamwork and collaboration, leadership and motivation, time management and organization, adaptability and resilience. Tourism entrepreneurs with strong soft skills can build strong relationships with tourists, partners, and team members, navigate conflicts, and adapt to changing tourist demands and market conditions.

Digital Literacy Skills

Lastly, digital literacy skills are crucial in today's technology-driven tourism industry. These skills refer to the ability to effectively use digital tools and technologies to manage and grow a tourism business. Tourism entrepreneurs with

**Lokesh Kumar and Hawaibam Jhalari Devi**

strong digital literacy skills can leverage technology to streamline operations, reach new tourists, and drive innovation in tourism products and services.

Impact of Skill Development on Tourism Entrepreneurial Innovation

The impact of skill development on tourism entrepreneurial innovation is profound and far-reaching. As tourism entrepreneurs develop their skills, they become more adept at identifying opportunities, generating ideas, and turning those ideas into reality (Becker, 1964). This, in turn, leads to increased innovation, competitiveness, and growth in the tourism industry. Skill development enhances tourism entrepreneurial innovation by improving the ability to recognize and capitalize on opportunities. Tourism entrepreneurs with advanced skills are better equipped to analyze tourism market trends, identify gaps, and develop innovative tourism products and services.

Moreover, skill development fosters a culture of experimentation and risk-taking, essential for innovation in tourism. Tourism entrepreneurs who continuously develop their skills are more likely to experiment with new approaches, technologies, and business models, leading to the discovery of new tourism opportunities and the development of innovative tourism solutions. Furthermore, skill development enables tourism entrepreneurs to build and lead high-performing teams (Goleman, 2000). Additionally, skill development facilitates collaboration and partnerships in tourism. Tourism entrepreneurs with advanced skills can effectively communicate and collaborate with stakeholders, including investors, partners, and customers, leading to the development of new tourism ideas, access to resources, and increased innovation. Skill development is a critical driver of tourism entrepreneurial innovation. By investing in skill development, tourism entrepreneurs can enhance their ability to innovate, compete, and grow in the tourism industry.

Impact of Skill Development on Tourism Entrepreneurial Growth

The impact of skill development on entrepreneurial growth is significant, leading to increased revenue, employment, and competitiveness in the tourism industry. As entrepreneurs develop their skills, they become more effective at managing and growing their tourism businesses. Advanced skills enable entrepreneurs to:

- Identify new tourism business opportunities, expanding their market reach and revenue streams. With improved market analysis and strategic planning skills, tourism entrepreneurs can capitalize on emerging tourism trends and customer needs.
- Enhance operational efficiency, streamlining processes and improving productivity in tourism operations. By developing skills in areas like project management and supply chain optimization, tourism entrepreneurs can reduce costs and improve overall performance.
- Build and lead high-performing teams, driving innovation and growth in tourism. Tourism entrepreneurs with advanced leadership and management skills can attract, motivate, and retain top talent, fostering a culture of innovation and collaboration.
- Improve financial management, securing funding and managing cash flow effectively in tourism ventures. With advanced financial skills, tourism entrepreneurs can navigate funding options, manage risk, and maintain a healthy financial foundation (Ross et al., 2019).
- Develop strategic partnerships and collaborations, expanding their network and access to resources in the tourism industry. Tourism entrepreneurs with advanced communication and negotiation skills can build strong relationships with partners, investors, and customers.
- Adapt to changing tourism market conditions, pivoting their tourism business or approach as needed. With advanced skills in areas like market analysis and strategic planning, tourism entrepreneurs can stay ahead of the competition and navigate uncertainty.

Findings

This systematic review of the literature on skill development and tourism entrepreneurial success reveals a number of key findings that highlight the critical role of skill development in achieving innovation and growth in the tourism industry. The following points summarize the main findings of the review, providing insights into the impact of skill development on entrepreneurial success and the specific skills that are most critical for tourism entrepreneurs to develop.

**Lokesh Kumar and Hawaibam Jhalari Devi**

Skill development has a significant positive impact on entrepreneurial success, with a moderate to strong correlation between skill development and innovation and growth in the tourism industry.

The most critical skills for entrepreneurial success are:

- Strategic planning and management
- Leadership and team management
- Market analysis and understanding
- Financial management and planning
- Digital literacy and technology adoption

Entrepreneurs who invest in skill development are more likely to:

- Identify and capitalize on new tourism business opportunities
- Develop innovative products and services
- Improve operational efficiency and productivity in tourism operations
- Build and lead high-performing teams
- Secure funding and manage risk

Skill development has a positive impact on entrepreneurial resilience, enabling entrepreneurs to better navigate uncertainty and adversity. The impact of skill development on entrepreneurial success is influenced by the quality and effectiveness of the skill development program or initiative. Entrepreneurs who develop skills in areas such as sustainability and social responsibility are more likely to achieve long-term success and growth. Skill development has a positive impact on entrepreneurial networks and relationships, enabling entrepreneurs to build stronger connections with customers, partners, and investors. The impact of skill development on entrepreneurial success varies across different stages of the entrepreneurial journey, with different skills being more critical at different stages. Skill development programs and initiatives should prioritize the development of soft skills, such as communication and teamwork, in addition to technical skills relevant to the tourism industry. The impact of skill development on entrepreneurial success is influenced by the entrepreneur's ability to apply and implement the skills developed.

DISCUSSION

The systematic review of existing literature reveals a significant positive impact of skill development on tourism entrepreneurial success, particularly in terms of innovation and growth. The findings suggest that tourism entrepreneurs who invest in skill development are more likely to achieve sustainable growth, innovate, and stay ahead of the competition. The review highlights the importance of skill development in enabling entrepreneurs to identify and capitalize on new tourism business opportunities. By developing skills in areas such as market analysis and strategic planning, entrepreneurs can better understand their customers' needs and develop innovative tourism products and services to meet those needs. Moreover, the review emphasizes the role of skill development in enhancing operational efficiency and productivity in tourism operations. The findings also suggest that skill development is critical for building and leading high-performing teams. Entrepreneurs who develop leadership and management skills can attract, motivate, and retain top talent, fostering a culture of innovation and collaboration. The findings of this review have important implications for entrepreneurs, policymakers, and educators. Entrepreneurs should prioritize skill development as a key strategy for achieving sustainable growth and innovation. Policymakers should invest in programs and initiatives that support skill development for tourism entrepreneurs, particularly in areas such as digital literacy and leadership. Educators should integrate entrepreneurship education with skill development, ensuring that entrepreneurs have the skills needed to succeed. Overall, this systematic review provides a comprehensive overview of the impact of skill development on tourism entrepreneurial success, highlighting the importance of skill development for innovation and growth in the tourism industry. By prioritizing skill development, entrepreneurs can achieve sustainable success and drive economic growth.

Lokesh Kumar and Hawaibam Jhalari Devi

CONCLUSION

In conclusion, the systematic review of the literature on skill development and tourism entrepreneurial success highlights the critical role of skill development in achieving innovation and growth. The findings of this review emphasize the importance of entrepreneurs developing a range of skills, including strategic planning, leadership, market analysis, financial management, and digital literacy. By investing in skill development, entrepreneurs can gain a competitive edge, foster innovation, and achieve sustainable growth in the tourism sector. Moreover, the review reveals that skill development has a positive impact on entrepreneurial success, with entrepreneurs who invest in skill development more likely to achieve sustainable growth, innovate, and stay ahead of the competition. Hence, the evidence suggests that skill development is a critical component of entrepreneurial success. By prioritizing skill development, entrepreneurs can achieve their goals, drive innovation, and create a brighter future for their businesses. As such, it is essential for entrepreneurs, policymakers, and educators to work together to create a supportive ecosystem that fosters skill development and entrepreneurial growth which can unlock the full potential of entrepreneurs and drive economic growth and prosperity.

ABSTRACT

The study lays emphasis on start-ups and how the Ease of Doing parameters play a role in understanding the start-up culture in a region. The study also tries to bring forth the start-up scenario post-pandemic and the challenges faced by start-ups during the same period. The study, therefore, focuses on Karnataka (State) and Andaman and Nicobar Islands (Union Territory). The preliminary observation of factors affecting the start-up culture in both regions are considered for the study. The tools used in the treatment of the data gathered are regression analysis and chi-square analysis. Graphs and appropriate statistical tools have been taken help of for interpretation and inferences to be drawn.

Keywords: Start-ups, Ease of Doing Business, Revenue, Karnataka, Andaman and Nicobar Islands.

INTRODUCTION

The ecosystem for infant companies in India has been eventful due to changing dynamics in investor sentiments, government policies, and the overall regulatory atmosphere that has undergone major overhauling in the last few years. The startup culture has matured in while also highlighting shortcomings and achievements on this front. Government intervention through its policy framework has led to the development of startups and encouragement to entrepreneurs in the country, which include Make in India, Digital India, and Startup India. Recognizing the changing requirements of a dynamic ecosystem, the State/UT Startup Ranking Framework 2019 was developed. The framework also considers lessons learned and comments received from prior ranking efforts. States and UTs are divided into categories X and Y: States and UTs have been separated into Category-X and Category-Y to maintain uniformity and assure standardization in the ranking process. Category X (This group has all States and UTs except those in Category 'Y')

**Top Performers - Karnataka, Kerala**

Category Y (This group has all North-Eastern States except Assam and all UTs except Delhi.)

Best Performer - Andaman and Nicobar Islands

Ease of Doing Business – and what the rankings indicate

The World Bank's Ease of Doing Business rankings offer an unbiased evaluation of business ease pertaining to rules of 190 nations while ranking them across the ten parameter criteria. India improved its overall ranking by 53 spots over a period of two years and by 65 spots over the course of four years, recording a rise of 23 ranks in 2018 after making a notable gain of 30 positions in 2017. It is significant that, despite regulatory hurdles, important areas including cross-border trade, building permits, starting a business, and obtaining financing and power have improved.

REVIEW OF LITERATURE

- Chatterjee, Deepashree. (2020). Startup India. This paper briefly discusses the various action plans and schemes which the government has initiated through the scheme of Start-up India.
- Bhalerao, Vaibhav & Harshal, Dayma. (2020). A Comparative Study of the Indian and the American Start-up Ecosystem.
- Kalyanasundaram, Ganesaraman & Ramachandrula, Sitaram & Mungila Hillemane, Bala Subrahmanya. (2021).

Observations from the ROL-

Most research papers analyze the existing startup culture and ecosystems in India with a primary focus on Government initiatives like Make in India and Startup India. Many research papers analyze the life cycle of startups. However, this study focuses on the factors affecting the startup culture with a focus on Karnataka and Andaman-Nicobar Islands using primary data.

Objectives of the study

- To determine the significance of the parameters of EODB in both the regions (Karnataka and A&N Islands)
- To analyze the challenges faced by startups during the covid-19 pandemic in Karnataka and Andaman and Nicobar Islands

METHODOLOGY

The study is both analytical and descriptive and relies on primary data. Field data has been mobilised through a structured questionnaire from startups operating from Karnataka and Andaman and Nicobar Islands. The questionnaire was curated in a manner that the necessary variables as per the requirement of study objectives was reached out. The study mainly focuses on how the startups have evolved and the key determinants inducing the working of small businesses in both regions. For the primary data requirement, purposive sampling under the Non-probability sampling technique was used, where the sample magnitude is 75. The tests conducted for the data collected are as follows. For Primary data – Regression analysis and Chi-Square test.

**Lysandra Johnson and Vijaya Priya**

RESULTS AND DISCUSSIONS

To ascertain the significance of the parameters of ease of doing business in both the regions (Karnataka and A&N Islands).

- To assimilate the factors and the parameters conducive for the startups in Karnataka and Andaman and Nicobar Islands
- To analyze the challenges faced by start ups in Karnataka and Andaman and Nicobar Islands during the Covid-19 pandemic. A primary survey was administered considering a sample extent of 75, of which 44 responses were recorded from Karnataka and 31 responses were recorded from Andaman and Nicobar Islands using purposive sampling technique under non-random sampling; following which the discussion is presented thereafter-

OBJECTIVE 1 ANALYSIS

Regression analysis on Ease of Doing parameters between Karnataka and Andaman and Nicobar Islands The below mentioned statistical tests were conducted across 5 EODB parameters in Karnataka and the A&N Islands. The parameters under focus are ranked by start-ups on a Likert scale of 1-5, 1 being very difficult and 5 being very easy. The independent variable for the test is the demographic variable – location i.e., Karnataka/A&N Islands. The ordinal regression test is run to predict the ordinal value of Ease of Doing business on an independent variable-the location of the start-up.

Regression Analysis

General hypotheses

Model fitting

H₀- There is no significant difference between the location and the Ease of Doing Business parameter(s)

H₁- There is a significant difference between the location and the Ease of Doing Business parameter(s)

Goodness-of-Fit

H₀- the observed parameter has goodness of fit with the variable- location

H₁- the observed parameter does not have goodness of fit with the variable- location

Pseudo R-Square

A value greater than or equal to 0.7 signifies that the variance between the variables has been explained

PARAMETER 1-Starting a business

INFERENCE

Since the p value is greater than 0.05, there is no significant difference between location and starting a business, signifying that the location does not contribute to influencing one to start a business. It is the same across both Karnataka and Andaman. The p-value is greater than 0.05, indicating a significance between the location and starting a business. The goodness of fit analysis, the population is skewed. Survey entails that, majority of the enterprises tend to find starting a business in their respective locations easy. The R-Square value is less than 0.7 which shows that a very low degree of variance has been explained in the model. Only 1% of the model is explained, stating that it is an unreliable mode.

PARAMETER 2 - Registering property

INFERENCE

The p-value is less than 0.05, indicating the significance between location and registering a property for business. Location influences the property registration decision and process. According to the survey conducted, it is easier for start-ups to register their property in Karnataka when put in comparison to Andaman. Since the p-value is greater than 0.05, there is no significance between location and registering property under the model of good fit test signifying that the distribution is not skewed, as the start-ups in Karnataka find registration of property easy, on the other hand, start-ups in Andaman find registration of property difficult. The R-Square value is more than 0.7 which

**Lysandra Johnson and Vijaya Priya**

shows a high degree of variance has been explained in the model. 70% of the model has been explained, stating that this is a reliable/ good model.

Parameter 3: Dealing with Construction Permits**INFERENCE**

the P value is less than 0.05, which signifies that there is a difference between location and pertaining to construction permits. Location influences the procedure with regard to construction permits. It is comparatively easier for start-ups to acquire construction permits in Karnataka when compared to Andaman. Since the p-value is greater than 0.05, there is no significance between location and dealing with construction permits under the goodness of fit test. This signifies that the distribution is not skewed, as the start-ups in Karnataka find dealing with construction purposes considerably easy than Andaman. The R-Square value is more than 0.7 which shows a high degree of variance has been explained in the model. 80% of the model is being explained that this is a reliable model.

PARAMETER 4 - Getting Electricity**INFERENCE**

The P value is less than 0.05, which signifies that there is a significance between location and getting electricity. Location influences the start-up in ease of getting electricity. According to the survey conducted, it is very easy for start-ups to get an electricity connection in Karnataka when compared to Andaman. Since the p-value is greater than 0.05, there is no significance between location and ease of getting electricity under the goodness of fit test. This signifies that the distribution is not skewed, as the start-ups in Karnataka find getting an electricity connection easy, and on the other hand start-ups in Andaman find it very difficult to get an electricity connection. The R-Square value is less than 0.7 which shows a high degree of variance has been explained in the model. 70% of the model is being explained which states that the model is reliable.

PARAMETER 5 - Getting Credit**INFERENCE**

The P value is greater than 0.05, this signifies that there is no significance between location and getting credit. This means that the location does not influence start-ups in the ease of getting credit. This means that irrespective of the location the start-ups find it easy to get credit to start their business. The P value is greater than 0.05, which means that there is a significance between the location and ease of getting credit. Therefore, according to the goodness of fit analysis, the population is skewed. Both populations tends to find it easy in getting credit to start their business in both locations (Andaman and Karnataka). The R-Square value is less than 0.7 which shows a less degree of variance has been explained in the model. Only 30% of the model is being explained, therefore it is an unreliable model.

OBJECTIVE 2

To analyze the challenges faced by startups during the covid-19 pandemic in Karnataka and Andaman and Nicobar Islands

CHI-SQUARE TEST

H₀- there is no relationship between startups operating online and the challenges(s) faced by startups during Covid-19

H₁- there is a relationship between startups operating online and the challenges(s) faced by startups during Covid-19
Challenges – 1) Lack of funds 2) Temporary shutdown of business 3) Loss of customers

INFERENCE:

Lack of funds: Karnataka - Since the P value is less than 0.05, there is a significant association between the 2 variables. This means lack of funds influences the decision pertaining to whether the startups would want to operate online or not. Andaman - Since the P value is less than 0.05, there is a significant association between the 2 variables. This means lack of funds influences the decision pertaining to whether the startups would want to operate online or not.

**Lysandra Johnson and Vijaya Priya**

There exists a greater association between the 2 variables in Andaman 0.010<0.069. Therefore, H₀ is rejected for both regions. Temporary shutdown of business: Karnataka - Since the P value is less than 0.05, there is a significant association between the 2 variables. This means the temporary shutdown of a business due to covid- 19 influences the decision pertaining to whether the startups would want to operate online or not. Andaman –As noted, the P value is less than 0.05, there is a significant association between the 2 variables. This is because a large number of startups in Karnataka operate in both Physical and online modes of business even prior to Covid – 19 Pandemic, whereas startups operating in Andaman did not have an online mode of business prior to the pandemic. Therefore, the null hypothesis is rejected for both regions Loss of customers :Karnataka - Since the P value is greater than 0.05, there is no significant association between the 2 variables. This means that the loss of customers due to covid- 19 does not influence the decision pertaining to whether the startups would want to operate online or not. Andaman - Since the P value is greater than 0.05, there is no significant association between the 2 variables. This means that the loss of customers due to covid- 19 does not influence the decision pertaining to whether the startups would want to operate online or not. Therefore, the null hypothesis is failed to be rejected.

CONCLUSION

To analyze the factors and parameters conducive to startup culture in A&N islands and Karnataka Ordinal regression using the logit model showed that the location of the startup has a significant influence on the parameters of registering property, regarding construction licenses and getting credit. To analyze the challenges faced by startups in Karnataka and Andaman and Nicobar Islands and the factors affecting them. There was a significant relationship between startups operating in Karnataka with only physical business platforms and the challenges faced by these startups namely, lack of funds, temporary shutdown of business, and loss of customers. However, startups operating only in the physical business workspace in Andaman and Nicobar Islands showed a significant relationship with the challenge of a temporary shutdown of the business. Compared to Karnataka, Andaman and Nicobar Islands still has a lot of areas to work on. The business opportunities in Andaman and Nicobar Islands often do not turn out to be successful as the union territory is classified as defense land under the Government of India. Therefore, because of extremely strict rules and regulations regarding the registration of property and construction permits, there is a discouragement of financial investments made by private players from mainland India. With the onset of improved internet services in the islands, there can be more expectations of digitization of the market in Andaman and Nicobar Islands which will cause an expansion in the market and hence increase the coverage area of the market. Commuting is another major issue regarding trade in the islands, goods are imported and exported through waterways and airways. Improvement in the connectivity of the union territory to the mainland can improve trade and open ways for new businesses to operate from the islands. The Administration of Andaman and Nicobar Islands should work towards simplification of rules and regulations regarding the registration of property and dealing with construction permits. The Government of India should come up with policies that provide subsidies to young entrepreneurs to encourage and develop the startup ecosystem in Andaman and Nicobar Islands. Work towards creating awareness amongst the people in Andaman and Nicobar Islands regarding existing Government initiated schemes and policies which are mainly channelized towards enhancing the entrepreneurial ecosystem like Startup India, Make in India, etc. The Karnataka State authority can interfere towards creating incubation cells and support centers that support the existing startups and the new startups as there has been a tremendous surge in the number of state's startups. More policies that provide subsidies to entrepreneurial projects that are working towards environmental sustainability to maintain ecological balance.

ABSTRACT

Today, wellness is a serious business around the globe as many companies try to create their fortunes in the industry. Given the modern lifestyle induced health issues, customers have started paying more attention to wellness solutions. While a growing economy and populous country like India offers significant market potential for niche products, there is also a shift to age-old practices of Ayurveda as a mainstream care for health issues. Among the many natural approaches to health and wellness, the Indian Ayurveda has retained its charm and impact in a competitive wellness market. Leading domestic player Medimix is synonymous with Ayurveda. The brand Medimix has carved a niche for itself in the personal care segment with its dual approach of preserving ayurvedic traditions and tweaking its media campaigns to changing consumer landscape. The company turned to nature for business idea, conceptualised and pioneered ayurveda based soap at a time when Ayurveda did not receive much recognition in business forums. Part I of the case illustrates entrepreneurship outlook for launching new business and explores various dimensions of entrepreneurship deployed by the company linking it with an appropriate theoretical framework. Part II of the case explores the brand journey of Medimix with focus on brand positioning through various initiatives for 50+ years. The case is developed through an in-depth secondary data reference. Overall, the case would help readers identify essential pivots and growth levers that brand Medimix adopted to unlock value in a highly competitive market. The case calls for crafting new marketing plans to sustain leadership in the Ayurveda market for personal care products. The case can be used for courses of entrepreneurship, marketing management and branding of both under graduate and post graduate management programs. The students are expected to have knowledge of marketing fundamentals.

Keywords: Ayurveda, FMCG, Entrepreneurship, Strategy, Brand Positioning, D2C

**Rajalakshmi Vel and Poornima****INTRODUCTION****Saga of Medimix**

It was 7 p.m in the evening, a hot humid day for Chennai. Dr V.P. Sidhan (Dr.Sidhan) a well-known doctor of Indian railways returned to his quarters engulfed in thoughts. Sowbhagyam Sidhan, the dutiful wife, probed his deep silence with a bright smile and evening coffee. 'I come across our railway labourers who face skin ailments on a recurring basis. Other than medicines, I prescribe ayurvedic oils. My friends advise me to try my formulations and develop a soap' shared Dr.Sidhan. The wife jokingly remarked 'a soap for multiple skin disorders... that would be sheer magic.' The idea of developing an ayurvedic soap bar that could solve multiple skin problems originated. Hailing from a family of ayurvedic practitioners, Dr.Sidhan tried his hand at various formulations. The couple invested their limited salary to make soaps in the kitchen. They were assisted by Ashokan, the first employee of Medimix. No boardroom discussion, no market research, no feasibility study. A pure conviction backed by sound knowledge was what made Dr.Sidhan start his entrepreneurial journey in 1967. During the initial years, the soaps were made by Dr Sidhan himself in the backyard of the railway quarters assisted by his wife who did cutting, pressing and packing. In a day they made anywhere between 100-120 soaps, which were pedalled to medical shops by Dr.Sidhan. Over the years as the soap gained popularity, they rented a house for scaling up production. The quality of the soap to heal skin diseases spread by word of mouth. Doctors recommended it to their clients and Medimix entered the physician's prescription list. 50+ years later, as the company is acing to be No.1 in Ayurveda personal care segment, the second generation leader Mr.Pradeep Cholayil is confronted with newer challenges.

Genesis of Medimix

The visionary doctor with his sharp business acumen commercially launched brand 'Medimix' a name coined from the words Medicine and Mix thereby marking the journey of a prescription-only product to a most-sought after brand. Dr.Sidhan's khadi-enterprise set up its first manufacturing unit with one employee and registered as Cholayil Private Limited²⁰. Medimix, an atypical soap was an amalgamation of 18 herbs²blended with three natural oils that protect and nourish skin in the most natural way. Over the years, though many product categories were added, the brand kept its essence intact i.e Herbal and Handcrafted.

The grandmother swore for its ayurvedic properties

The father enjoyed its fragrance

The mother acknowledged its skin care

The neighbour found value for money

All by a home-grown brand that gave legacy brands a run for their money!

As business evolved challenges arose. Medmix faced its first labour strike at its Chennai plant in 1980s that halted production¹². Dr Sidhan roped in A V Anoop from his family to handle the managerial issues at the plant. Work resumed to normalcy in the plant with adding of one more production unit in Madhavaram, Chennai¹².

Excellence of Brand Medimix

- Pioneer in Ayurveda

The brand had a compelling story to tell. Back in 1900s, Cholayil Kunju Maami Vaidyar, a physician by profession advocated natural and unconventional methods of healing. The family had an oil that was prescribed for all kinds of skin ailments. His contributions earned him the titles Modern Dhanvantri, Miracle Man for medicinal cure. He travelled extensively to other parts of the country and Sri Lanka treating patients. As a tribute to his proficiency, his earnest patient Shri Narayan Guru remarked,

"There are no numbers that can't be divided by one

There are diseases that can't be cured by maami"

Source: www.cholayil.com

Rajalakshmi Veland Poornima

The legacy was carried on by his son Shri Sankaran Vaidyan who exhibited the same proficiency in treatment. Further he helped the financially weak by providing free treatment and medicines. In line with the family wisdom, Dr Sidhan, being a clinically efficient physician combined various ayurvedic formulations for treating patients. He pursued extensive Ayurveda research and Medimix is a testimony to his in-depth knowledge of Ayurveda for economic benefit.

- Handmade

A brand that dates back to half century ago, Medimix soap bars are meticulously made by hand till date, preserving its tradition of 'handmade'. The label 'Medimix' on soap bars is engraved with a hand operated machine. As the conveyor belt takes the soaps to the packaging line, employees do the final packaging by hands. On an average each 8 hour shift produces 1,00,000 soap bars every single day⁹. The sales numbers are pretty impressive that touched the 10,000 ton mark for FY 2019⁹ for the first time in its 50 year long history.

- Process Superiority

According to company sources, unlike most soap manufacturers who use soap pellets that are by-products of oil refineries, Medimix blends the oils directly in the soap making process. To this rich mixture, herbal extracts and perfumes are added at regular intervals, stirred and rotated in huge stainless steel containers causing the aroma to infiltrate the senses. Froths rise to the brim with organised stirring which are eventually laid out on the turntable. Shades of green emerge in varying textures indicating the final time it was stirred. Overall, an optimum proportion of coconut oil mixed with herbs ensures the retention of natural skin glycerine.

"This is why Medimix remains the largest selling handmade soap in the country. At every stage, we've got people operating these machines," states Vinayachandran, VP of AVA group¹².

- Innovation

At a time when the industry was dominated by large players who had automated processes for soap making, the company relied on human interventions at every stage of its production process. The company adopted innovative practices wherein redesigned some aspects of the machinery as suggested by employees. Process innovation was carried out to ensure safety protocols.

Medimix is not only known by what goes into it, but also by what goes behind making this Ayurvedic soap a force to be reckoned with in a market dominated by multinational players. The process does not use any electricity, but relies on a series of innovations made by the labourers involved, which makes it seamless and cost-effective²⁰.

- Employees First

It was a general opinion that scaling up is not possible without use of electricity operated machines. The company regularly solicited ideas from each employee as it strongly believed 'the one who makes the soaps knows better'²⁰. Ideas are screened by an in-house team of experts and once validated, further trials are conducted for implementation. Funds are exclusively allocated for the innovation and experimentation. Unlike, companies who hire the services of external consultants, Medimix turned back to its employees for idea generation.

- Cost Advantage

Handmade soaps involve labour intensive production process. As a result, it consumes less electricity, resulting in savings for the brand. The benefit is passed on to consumers in the form of reduced price. As per 2018 company reports, approximately 800-900 tonnes of soaps were produced per month priced anywhere between Rs.15 – 50 (as per weight)¹². By not taking the mechanized route, the company remains true to its legacy of handcrafted and herbal and is able to offer the soaps at a competitive price.

Rajalakshmi Veland Poornima

Division of Business

The year 2007 saw the split in business operations. Today, the brand name Medimix is shared by two companies, AVA, in the South owned by Dr.Sidhan's Son-in-law A V Anoop and Cholayil in the north run by his son Pradeep Cholayil.

AVA Group

'The Coronavirus has changed the demand for the brand, creating a pull for the product, instead of relying on a push from the marketers.'⁷ AVA group has forayed into the hand-wash and sanitiser category, an opportunity thrown by pandemic. A V Anoop, MD, AVA group remarks "The growth came as sweet surprise for the segment, which was de-growing"⁷ registering a 25% surge in demand for liquid soaps. Marking the 50th year of operations, AVA group also forayed into healthcare segment by opening Sanjeevanam, a holistic health centre in Kochi, Kerala. The centre hosts an ayurvedic therapy unit, a beauty centre, restaurant and nature store. Further diversifications of the group include Kaytra that marks the foray of the brand into skin and hair care segment. The takeover of Melam Spices by AVA group marks its entry in food segment. While retaining its flagship product Medimix soap, in order to tap the beauty segment in personal care products the brand Divine was launched. Divine has six variants which are mostly overlaps; Turmeric and sandal, Clear Glycerine for deep hydration, for Oil balance, for Natural toning, Sandal soap and transparent soap. While it is clear that Medimix is handmade, no such specification is stated for other soap varieties.

Cholayil Private Limited

In North, the company Cholayilmarkets under the same brand name Medimix and the product portfolio consists of soaps with four variants; 18 Herbs, Natural Glycerine, Sandal and Turmeric and face washes with eight variants; anti pimple, anti tan, oil clear, everyday face scrub, moisturising, natural glow, turmeric and anti pimple. In the personal care category, it has Ayurvedic pharma products, Ayurvedic treatment and care services. Medimix, Cuticura and Krishna Thulasi are the three main brands that Cholayil has under its fast moving consumer goods (FMCG) business segment. As a part of digital strategy, Cholayil launched its own website. The brand has chosen direct-to-consumer (D2C) platform to cater to domestic and export market with diversified basket of personal care products. "The D2C business is helping us in generating lot of data and insights about who our real consumers are. Also, it gives us an opportunity to test out new products directly with consumers," notes MD & CEO, Pradeep Cholayil¹³. Given the challenges of a highly penetrated market, the company Cholayil has found an opportunity to grow its offerings to South-East Asian markets of Vietnam, Taiwan and Cambodia. The shift towards herbal-naturals across the globe is an opportunity the company is capitalising on. Buoyed by robust demand for Ayurveda products, Cholayil has unveiled its premium range Sadhev as an independent brand sold through D2C. Sadhev consists of body oils, serums, shampoos and premium soaps which would be eventually marketed through exclusive stores in top metros.

Journey of the brand from Print to Digital

It was the year 1969 and television was the privilege of the elite few in metros. Print media ruled the roost and advertising meant newspaper advertisement only. The soaps that were in vogue were mostly Lux, Rexona which promised beautiful skin to the young ladies and teenagers. Yet, Dr.Sidhan, from Tamilnadu, an allopathic doctor from the Indian railways embarked on providing skin care to sanitation workers launched the soap Medimix using ayurvedic preparation. 'Doctors prescribe Medimix' was their first tagline on print, OOH, and radio. But as early as 1970's they showed a bikini clad woman and launched the soap on the platform of ayurveda claiming cure of the most common skin ailments, pimples, blackheads and more serious diseases like scabbies. During the late 90s and early 2000s, Medimix moved from 'Cure for skin diseases proposition' to 'protection proposition'. The tag line was 'Asli Suraksha, Kudrati Suraksha' meaning natural protection is real protection. The audience for Medimix has been different and has extensively focused on the uniqueness of the product and endorsement by celebrities. 'Tvacha kal ke liye taiyaar' campaign, released in the late 90s, tried to brand Medimix for 'timeless beauty' hinting to the fact that disease free skin means timeless beauty. The next in line advertisement (ad) launched in early 2000 read 'Skin care

Rajalakshmi Veland Poornima

today for better tomorrow'. This featured a mother and daughter duo signalling the transformation from Skin protection to Skin protection + Handing over to generations platform. Television grew in popularity in late 1980's and early 1990's. Medimix was quick to spot the opportunity and featured celebrities like actress Trisha. The television ad focused on branding Medimix as one stop solution for all skin issues with an underlying message that discouraged the use of pimple creams and other beauty products which were considered to be expensive thereby pushing Medimix to value for money platform to influence the price conscious customer. The 'Shut Up' series moved Medimix from Skin protection to Fun platform. In 2004, Medimix released Ms Pimple ad, brought forth the daily skincare problems faced by teenage girls. The fun tone connected well with teenagers and is one of the popular of Medimix series. It also said no to anti pimple lotions and creams sold in the market, thereby positioning Medimix as the ultimate solution aggressively endorsing the '18 herbs' real ayurvedic soap. As more ladies started to work, Medimix embarked on 'Sachchai Aur Suraksha' campaign that celebrating woman who took up tough roles. Designed to showcase the brand's tribute to women army personnel, the ad portrayed a defence woman holding rifle for war purpose. How strong women go with zero skincare by using Medimix underlining that 'Truth is protection'. Another campaign which set apart the soap from its competitors is 'Nothing better than natural'. The ad urged all generations, to chuck their gadgets and go natural.

Medimix in Digital Space

Early 2019 saw the brand again repositioning itself as 'Get skin fit with fast acting Ayurveda'. The medium was mostly digital. Taking advantage of the two way communication being possible in social media, the brand began to engage with young customers by asking their opinion through 'Time to rethink' campaign focused on breaking the myth that Ayurveda is slow and thus was born the 'Fast acting Ayurveda' campaign. The face book page of Medimix Ayurveda has about 2,80,000 people speaking about it. Social media has dual advantage; Firstly, it enables multinodal exchanges. Secondly, social media ads can be changed quickly responding to the mood of the audience. A special ad created for Valentine's Day showed Ayurveda as solution for a speed-date and quick results. Similarly, the Ganesha idol ad during Ganesh Chaturthi, drew the attention of the audience to environment pollution and urged them to use the Medimix bar instead ditching the traditional Ganesha murthi made of mud. The immersion of the idol then would be soap water which could then be used as hand wash. The brand echoed the principle of triple bottom line i.e Profits, People and Planet, the way ahead for modern businesses. The YouTube channel reinforces the campaign 'Get skin fit with Ayurveda' and consists of all commercials which are on TV. The brand has a strong presence in Instagram as well with the content focusing on the concept 'Get skin fit with Fast acting Ayurveda'. Medimix as a brand has come a long way since it first started its brand positioning as 'Soap recommended by doctors', 'Natural protection is the best protection', 'Value for money', 'Nothing better than natural'. In the post pandemic world, the brand has repositioned its strategy with the campaign 'Get skin fit with Ayurveda' insisting on good skin protection through Ayurveda. The brand has taken the celebrity endorsements route by roping in actresses Trisha, Vidya Balan and Parineeti Chopra.

Lead or Bleed

Back in the mid-2000s, a sense of peril gripped Pradeep Cholayil, the second generation leader. As the world evolved, new beauty conscious consumers arrived. It was time to revamp the brand; to ditch the red-black packaging. Dr. Sidhan didn't agree. There were reasons. He had worked hard to make the soap a household brand. Any changes may weaken the loyal customer base which he noticed in the case of other brands who changed packaging and lost significant market share. After much reasoning with his son he agreed and the brand had a complete makeover with a fresh green packaging, marking the move from medicinal bar to beauty soap. A decade later, the space in which the brand pioneered was cluttered with new players popping up each day communicating directly with the customers. Heading into 2019, the jubilee year of the brand, though the company clocked in Rs.200 crore revenue as a top selling brand, volumes were shrinking²². A consumer survey of 2019 carried out clearly pointed that mostly people used Medimix when they faced skin issues and there were few regular users¹⁵. This time around the company invested around 12-15% of overall sales on marketing¹⁶. It was time to change the narrative. It ran digital campaigns to appeal to new age consumers.

**Rajalakshmi Vel and Poornima**

'Young consumers feel that natural products take a lot of time in providing results, and there is a serious dearth of time and patience in their fast-paced life. Medimix has been repositioned to bust this myth with the new brand positioning,' said Ashish Ohlyan, Marketing Head, and Product Development, Medimix¹⁵. Actor Parineeti Chopra was chosen as the new brand ambassador to promote the ayurvedic offerings to young consumers. The tweaked advertising strategy helped to them improve average consumption and purchase occasions. According to Ohlyan, '..... We are continuously investing in revamping our brand image'¹¹. Other moves by the brand included sponsoring team Kolkatta Knight riders in IPL 2020, Search engine optimization (SEO) activities, partnering with e-commerce players Flipkart, Amazon, launch of own digital platform for D2H, deployment on customer analytics, all with a zeal to grow.

Mapping the road ahead

As the brand keeps working on its campaigns in a highly competitive market, the long-term objective of the brand is to evolve as a leader in Ayurveda, a space in which it pioneered 54 years ago. The brand is also transitioning as a personal care player and the sole mission of the company is: To be the go to product for all age groups – millennials to older generation. The challenges are different. The characteristics of the Ayurveda market have changed. It is abysmal flooded with new theories of Ayurveda created by brands. Not until recently, it began to be a part of wellness. People didn't consider herbal as something related to wellness. Just like how sports is regarded as wellness today. They thought both were separate until studies came to show that Ayurveda skin care is holistic leading to overall wellness. With this new found knowledge, consumers are increasingly curious to find out product ingredients i.e what exactly goes into the product they buy. There is a wave of consumer consciousness all industries are facing. Authenticity upholds their purchase decisions. As a result the loyal consumer base for brands keep oscillating. Additionally, there are things like online reviews, social media forums which influence what goes into their cart. How can an iconic brand like Medimix recalibrate authenticity to foster customer loyalty? What could be a well-crafted strategy that the company can aim at for long-term growth? While India is a big market for Ayurveda market for personal care products, there is no one uniform scenario within India. 'There is a stark difference between the scenarios in south and non-south market and there are rural markets within' says Jagdeep Kapoor, Chairman and MD at Samsika Marketing consultants²². Making inroads into state markets of Gujarat, Rajasthan, Maharashtra requires more than running regular regional commercial ads given regional cultures. These markets are also highly penetrated by Hindustan Unilever with its products such as Lux, Hamam and Rexona. What out of box approach can a 50-year brand adopt to gain wallet share first and market share gradually? How can Mr. Cholayil apply his experience of Medimix in Chennai to cater to new markets and eventually grow his new categories of body wash, shampoo, conditioners and premium products? 'We want to be more than a soap company!' exclaims the agile leader²².

ABSTRACT

Education and skill development are pivotal in empowering women and driving India's economic growth. This paper examines the transformative impact of education and skill development on women's empowerment and India's economy. It highlights the positive correlations between women's education, skill development, and economic outcomes, entrepreneurship, and GDP growth. The study also explores the challenges and barriers to women's education and skill development, such as gender bias, limited access to resources, and societal norms. To address these challenges, the paper recommends policy interventions, including gender-sensitive education and training programs, mentorship initiatives, and civil society. By investing in women's development, India can unlock its full economic potential, promote achieve sustainable development.

Keywords: Women empowerment, education, skill development, India, economic growth, gender equality, human capital development.

INTRODUCTION

India's economic growth and development are inextricably linked to the empowerment of its women. However, the country's progress is hindered by the underutilization of its female workforce. Education and skill development are essential catalysts for empowering women and unlocking their full potential. Despite significant advancements, Indian women continue to face numerous challenges, including:

- ❖ Limited access to quality education
- ❖ Gender-based discrimination

Meenakshi

- ❖ Limited career opportunities
- ❖ Social and cultural constraints

These barriers prevent women from participating fully in the economy, leading to a significant loss of talent, innovation, and productivity.

- ❖ Enhancing employability
- ❖ Increasing entrepreneurship
- ❖ Improving decision-making capabilities
- ❖ Boosting economic participation

This paper explores the transformative role of education and skill development in empowering women and driving India's economic growth. By examining the current state of women's education in India and the effective strategies for unlocking the full potential of Indian women and propelling the country towards sustainable development.

- Empower women: Enhance their decision-making capabilities, boost self-confidence, and foster economic independence.
- Reduce gender inequality: Narrow the gender gap in education, employment, and income.
- Stimulate economic growth: Increase labor force participation, boost productivity, and drive innovation.
- Improve social indicators: Enhance health, nutrition, and child welfare outcomes.

LITERATURE BACKGROUND

OBJECTIVES

1. To analyze the trends in women's empowerment indicators in India from 2005 to 2023.
2. To examine the relationship between economic growth and women's empowerment in India.
3. To identify the progress made in women's education, labor force participation, and leadership positions in India.
4. To highlight the gaps and challenges in achieving femininity fairness and women's empowerment in India.

RESEARCH METHODOLOGY

Study used for secondary data journals, statistical databases, and other published literature, reputable sources, such as: Government reports and statistical databases (e.g., Ministry of Human Resource Development, National Sample Survey Office), Academic journals and books (e.g., Journal of Education and Development, Indian Journal of Labour Economics), International organization reports (e.g., World Bank, International Labour Organization)

Period of the study

The study period spans from 2005 to 2023, covering 18 years of data and trends on women's education, skill development, and economic empowerment in India. Statistical tools

RESULTS AND DISCUSSIONS

Women's Education

This table highlights the progress made in women's education and empowerment in India from 2005 to 2023. The indicators show a consistent increase in the average values indicate a steady improvement in women's education and empowerment, with significant progress in literacy rates, primary education enrollment, and higher education enrollment. The projected values for 2023 suggest a continued positive trend, indicating and women's empowerment in India. This table presents the trends in women's education and empowerment indicators in India from 2005 to 2023. The indicators include; Female Literacy Rate (%), Girls' Enrollment in Primary Education (%) Women's Higher Education Enrollment (%) from 2005 to 2022 and projected values for 2023 for the actual value. The 2005 as the base year (100%) in Index number is used. Female Literacy Rate: There has been a steady increase in female literacy rate from 54.2% in 2005 to 67.25% in 2023 (projected). Average literacy rate is 62.45%, Girls' Enrollment in Primary Education: There has been a consistent increase in girls' enrollment in primary education, from 90.2% in 2005 to 98.5% in 2023 (projected). The average enrollment rate is 95.37%. Women's higher education enrollment, from 12.1% in 2005 to 30.2% in 2023 (projected). The average enrollment rate is 21.63%.

Skill Development

This table 2 highlights the progress made in women's skill development and empowerment in India from 2005 to 2023. The indicators show a consistent increase in: The table demonstrates significant progress in women's skill development and empowerment, indicating and economic empowerment. However, the projected values for 2023 suggest a slight decline, emphasizing the need for continued efforts to support women's skill development and entrepreneurship. The table 2 skill development programs, from 10% in 2005 to 50% in 2023 (projected). The average participation rate is 21.63%. Number of Women Trained in Vocational Skills, women trained in vocational skills, from 1.2 million in 2005 to 12 million in 2023 (projected). The average number of women trained is 4.85 million. The average entrepreneurship rate is 23.11%. There women's skill development and empowerment indicators in India over the past two decades. Women's participation in skill development programs has increased by 40 percentage points, and the number of women trained in vocational skills has increased by 10 times. Women's entrepreneurship has seen a substantial increase of 37 percentage points. The steady increase in women's participation in skill development programs indicates a growing focus on skill development and employability.

Women Empowerment

This table 3 highlights the progress made in women's empowerment in India from 2005 to 2023. The indicators show a consistent increase in women's labor force participation, a narrowing of the gender gap index, and a rise in women in leadership positions. The projected values for 2023 suggest a continued positive trend, indicating and women's empowerment in India. This table presents the trends in women's empowerment indicators in India from 2005 to 2023. The indicators include: Women's Labor Force Participation: There has been a steady increase in women's labor force participation, from 23.1% in 2005 to 33.6% in 2023 (projected). The average participation rate is 28.41%. Gender Gap Index: The gender gap index has narrowed over the years, indicating a reduction in gender-based disparities. The index has decreased from 0.593 in 2005 to 0.476 in 2023 (projected).

**Meenakshi****Economic Growth and women Empowerment**

This table highlights the positive correlation between India's economic growth and women's empowerment from 2005 to 2023. The average values indicate a significant improvement in women's empowerment, with women's contribution to GDP increasing by 18 percentage points and women in leadership positions rising by 428%. The projected values for 2023 suggest a continued positive trend, indicating and women's empowerment in India's growing economy. Table 4 Trends in Economic Growth and Women Empowerment Indicators in India (2005-2023). This table 4 presents the trends in economic growth and women's empowerment indicators in India from 2005 to 2023. Government Programs for Women's Empowerment and Skill Development in India

- Sarva Shiksha Abhiyan (SSA)
- National Scheme of Scholarships for Girl Children
- Mahila Shakti Kendra (MSK)
- Deendayal Antyodaya Yojana-National Rural Livelihoods Mission (DAY-NRLM)
- National Skill Development Mission (NSDM)
- Ujjwala Yojana
- Jan Dhan Yojana

Suggestions of the study

- ❖ Increase investment in girls' education and women's skill development programs.
- ❖ Implement policies to address gender-based violence and discrimination.
- ❖ Promote women's entrepreneurship and self-employment opportunities.
- ❖ Increase representation of women in leadership positions in various sectors.
- ❖ Provide training and mentorship programs for women to develop leadership skills.
- ❖ Encourage public-private partnerships to support women's empowerment initiatives.
- ❖ Monitor and evaluate the effectiveness of women's empowerment programs and policies.
- ❖ Address the socio-cultural barriers that hinder women's empowerment.
- ❖ Increase access to technology and digital literacy for women.
- ❖ Provide support for women's organizations and community groups working towards women's empowerment.
- ❖ Encourage men's involvement in promoting gender equality and women's empowerment.
- ❖ Develop and implement gender-sensitive policies in all sectors.

Recommendations of the study**Short-term recommendations (2023-2025)**

- ❖ Increase funding for girls' education and women's skill development programs.
- ❖ Launch awareness campaigns to address gender-based violence and discrimination.
- ❖ Establish mentorship programs for women entrepreneurs and leaders.

Medium-term recommendations (2025-2030)

- ❖ Implement policies to address the gender pay gap.
- ❖ Increase representation of women in leadership positions in various sectors.
- ❖ Develop and implement gender-sensitive policies in all sectors.

Long-term recommendations (2030-2040)

- ❖ Reduce gender-based violence and discrimination by 50%.
- ❖ Increase women's labor force participation to 50%.

Policy-level recommendations

- ❖ Develop a National Policy on Women's Empowerment.
- ❖ Establish a Ministry of Women's Empowerment.

Meenakshi

- ❖ Increase budget allocation for women's empowerment programs.

Social-level recommendations

- ❖ Promote gender equality and women's empowerment through media and cultural events.
- ❖ Encourage men's involvement in promoting gender equality and women's empowerment.
- ❖ Develop community-based initiatives to support women's empowerment.

CONCLUSION

Education and skill growth are necessary tools for empowering women and driving India's economic growth. By investing in women's human capital, the nation can harness the potential of a vast and untapped resource. This research has demonstrated the strong correlation between women's education levels, skill acquisition, and their participation in the workforce.

ABSTRACT

CGTMSE was introduced by the Indian government to boost credit access for MSMEs without requiring collateral. This study evaluates the scheme's impact on MSME growth and entrepreneurship in Meerut, focusing on the credit facilitated by local banks. Using a mixed-method approach, the research analyses loan disbursement and repayment data, as well as information from interviews with bank officials and MSME owners, to assess the scheme's effectiveness in promoting business growth and financial inclusion. The findings aim to highlight challenges and successes, offering recommendations to enhance the scheme's impact on MSMEs and local economic development.

Keywords: CGTMSE scheme, MSMEs, entrepreneurship, credit guarantee, financial inclusion.

INTRODUCTION

MSMEs are integral to the economic framework of India, making substantial contributions to employment, industrial production, and exports. Nevertheless, these enterprises frequently face significant obstacles in obtaining formal credit, primarily due to their lack of collateral. To mitigate this issue, the Indian government launched the CGTMSE scheme in 2000. This initiative aims to facilitate credit access for the MSME sector by offering credit guarantee coverage to financial institutions for loans extended to these businesses, eliminating the requirement for collateral. Punjab National Bank (PNB), a leading public sector bank in India, has been actively engaged in the implementation of the CGTMSE scheme, especially within its branches located in the Meerut Circle. This area, characterized by a diverse array of industrial activities, is crucial for assessing the impact of the CGTMSE scheme on MSMEs. The objective of this study is to evaluate the influence of the CGTMSE scheme on the growth and development of MSMEs that are supported by PNB branches in this region. Meerut is celebrated for its bustling markets, particularly its production of sports goods and scissors, securing its significant role in India's industrial landscape. The city boasts a

**Tamanna Sharma and Apurva**

long history of crafting high-quality sports equipment, such as cricket bats, balls, boxing gloves, and fitness gear, which serve both domestic and international markets. This longstanding reputation has positioned Meerut as a major hub for sports goods manufacturing, with numerous small and medium enterprises contributing to its success. Additionally, Meerut is renowned for its precision-crafted scissors, known for their durability. Skilled artisans in the city have been producing these high-quality scissors for generations, making Meerut a leading supplier across India. The city's blend of traditional craftsmanship and modern techniques highlights its status as a thriving centre for specialized manufacturing. CGTMSE is a trust established by the Government of India, operating under the Ministry of Micro, Small and Medium Enterprises and the SIDBI. Initiated in 2000, the CGTMSE scheme extends credit guarantees to financial institutions for loans amounting to a maximum of Rs. 5 crores, an enhancement from the earlier cap of Rs. 2 crores. This initiative provides guarantees between 75% and 85% to MSEs throughout India. CGTMSE supports young entrepreneurs with promising business ideas who may lack collateral or formal credit sources, enabling them to secure loans to start viable MSEs. This support helps them transition from job seekers to job creators, contributing to national development. Under the scheme, a portfolio guarantee covers 80% of the significant principal amount of the loan to a financial institution. This coverage applies to each transaction within the institution's portfolio.

Points of importance of the CGTMSE Scheme

- Increased guarantee coverage limit from Rs. 2 crores to Rs. 5 crores
- Reduced guarantee fees to lower overall borrowing costs for MSEs
- Inclusion of low capital banking institutions as eligible Member Lending Institutions (MLIs) •Fee concessions and increased coverage for SC/STs
- Additional reductions in guarantee fees by 10% and coverage enhancements to 85% for Women, ZED Certified Units, and units in Aspirational Districts
- Revised annual guarantee fee structure, with rates as low as 0.37%

CGTMSE Coverage Criteria

- The trust guarantees up to 75% of the defaulted principal amount, or 85% for certain categories of borrowers, with a maximum guarantee cap of Rs. 37.50 lakh for credit facility up to Rs. 50 lakhs.
- Term credit, including interest, is covered for one quarter or outstanding capital advances, whichever is lower, as of the account's designation as a Non-Performing Asset (NPA) or the date of filing a suit.
- Other charges, such as penal interest, commitment fees, service charges, or any additional expenses, are not covered by the guarantee. The CGTMSE seeks to motivate financial institutions to assess small and micro enterprises by focusing on the feasibility of projects and the validation of business models, rather than depending exclusively on collateral. Borrowers are required to pay an extra guarantee fee and service charge in addition to the interest levied by the bank. Presently, the CGTMSE fee stands at 1.5%, which is lowered to 0.75% for the North-Eastern region and Sikkim.

LITERATURE REVIEW

Sharma and Kumar (2019), in their study titled "Impact of Credit Guarantee Schemes on MSME Lending: A Study on CGTMSE in India," analyze the effects of the CGTMSE scheme on lending to MSMEs. They find that the scheme significantly enhances access to credit, especially for first-time borrowers, by encouraging banks to lend without collateral due to risk mitigation. However, the study points out issues like delays in claim settlements and limited awareness among potential beneficiaries. The authors conclude that while CGTMSE has promoted financial inclusion, improvements in transparency, faster processing, and targeted awareness programs are needed. Patel and Rao (2021), in "Credit Guarantee Mechanisms and Their Effectiveness in Promoting Small Enterprises: The Case of CGTMSE," assess the scheme's impact using a mixed-method approach. Their findings show that CGTMSE has increased loan volumes to MSMEs and encouraged banks to take higher risks. Despite this, they identify issues concerning the capped size of the guarantee fund, complex procedures, and difficulties faced by MSMEs in meeting

**Tamanna Sharma and Apurva**

eligibility requirements. The authors recommend policy interventions to streamline processes, expand the fund, and improve coordination for banks and CGTMSE for greater effectiveness.

SCOPE OF THE STUDY

1. This research investigates loans of up to 10 lakhs within the manufacturing and service sectors of micro, small, and medium enterprises (MSMEs), emphasizing their contributions to job creation, innovation, economic resilience, and sustainable development.
2. The analysis is based on half-yearly data from 2020 to 2023, covering Punjab National Bank branches in Meerut, Hapur, and Baghpat.

OBJECTIVES OF STUDY

1. To show the impact of the CGTMSE scheme on the growing businesses in the Meerut district.
2. To show the influence of the growing businesses in Meerut on the GSDP of the Uttar Pradesh state due to the CGTMSE scheme.
3. To analyze the insights of banking officials through interviews on the implementation, effectiveness, and challenges of the CGTMSE scheme.

DATA AND METHODOLOGY**The source of secondary data is:**

1. The circle office of Punjab National Bank, Meerut.
2. Annual reports of the CGTMSE scheme.
3. RBI official website.

The methodology used is both quantitative and qualitative which includes:

1. Graphical representation
2. Regression
3. Interview method

RESULTS AND FINDINGS

To show the impact of the CGTMSE scheme on the growing businesses in the Meerut district. The manufacturing and service sectors within MSMEs are vital to the economy due to their significant roles in employment generation, economic diversification, and innovation. These sectors create jobs at lower capital costs, providing crucial employment opportunities and fostering entrepreneurship. By producing a wide array of products and services, they reduce economic dependence on any single industry, enhancing resilience. MSMEs contribute to regional development by operating in semi-urban and rural areas, promoting balanced economic growth. Additionally, they play an important role in the supply chain of larger industries and significantly contribute to exports. By driving inclusive growth and adopting sustainable practices, MSMEs ensure that economic progress benefits a broad spectrum of society, making them essential for sustainable economic development.

- The table and the graph represent the absolute amount of loans sanctioned quarterly
- As shown there has been a consistent jump year on year and quarter on quarter
- Q2 of 2022 recorded 24.31 crores of sanctioned loans in comparison of the Q2 of 2021
- This dip can be attributed to the bank rates increased by the Central Bank to control inflation[2]
- The total number of accounts opened had an average start because of the shutdown in the economy, whose aftermath can be seen until the end of 2022. This can also be attributed to the increase in bank rates The reason for this is attributed to the fact that the amount required to set up a manufacturing unit is significant, which sometimes does not qualify under the CGTMSE scheme. The average quarter-on-quarter and year-on-year

Tamanna Sharma and Apurva

loans sanctioned increased for both sectors, with the service sector consistently outpacing the manufacturing sector.

- Year-on-year increase in the number of loans sanctioned towards micro-manufacturing industries is relatively higher than small and medium.
- Medium ranks lower due to its higher capital requirements and Meerut has fewer small firms therefore the lower amount
- The second quarter of 2023 looked optimistic due to the revival of the economy[3] Micro ranks higher every year compared to small and medium as it reflects that the demand for microservice loans is higher than that of small and medium.

In a region like this, the service sector is important as there is a requirement for services in these regions. The service sector is essential for MSMEs in small towns like Meerut in Uttar Pradesh, as it diversifies the local economy, making it more resilient and stable. It generates employment, provides jobs and skill development opportunities for the local workforce, and supports other sectors by offering necessary services like logistics and marketing. The service sector meets local demand, enhances the quality of life with improved infrastructure, and fosters entrepreneurship due to its low entry barriers. It drives economic growth by generating income, attracting investments, and ensuring better access to essential services like healthcare and education. This holistic support system enables MSMEs to scale up, innovate, and contribute to the town's overall development and prosperity.

The service sector in these regions majorly includes services such as:

- Advertising /publicity
- Hospital activities
- Domestic, laundry, etc.
- Repairing of goods
- Maintenance of computer hardware and software and other electronic goods
- Agriculture service centre
- Cold storage and warehouse
- Telecommunication services
- Travel agencies
- Renting transport, household goods and machines or equipment, etc. Other than that, there are other services as well but in the area under study mentioned above are the main services for which loans are sanctioned.

The data below will show the growth of women entrepreneurs benefitting from this scheme.

- There is a year-on-year increase in the accounts opened by both genders
- But the number of accounts opened by men is more (by a large proportion) than that of women.
- The number of accounts opened has decreased and increased but has shot up in the second quarter of 2023. The graph also indicates the potential which is seen by the peak in 2023 of quarter 2. To show the influence of the growing businesses in Meerut on the GSDP of the Uttar Pradesh state due to the CGTMSE scheme. The state's GDP is influenced by the productivity of its cities and districts, Meerut district is an entrepreneurial hub due to its locational benefits (NCR region) and the district's age-old sports gear production. Looking at how the loans sanctioned under the CGTMSE scheme specifically in Meerut affect the states' GDP, we have obtained the following results.
- Gross state domestic product is regressed on the total amount of loans sanctioned in Meerut.
- The hypothesis is the following: $H_0: B(\text{coefficient of the X variable - amount of loan sanctioned}) = 0$ $H_1: B \neq 0$
- The above regression results can be interpreted as follows: if the amount of the loans sanctioned in Meerut increases by one crore, then the GSDP of UP increases by 47990.6655 crores.
- If the amount of the loans sanctioned in Meerut is 0, then the GSDP of UP is 1011567.91

**Tamanna Sharma and Apurva**

- The R square value is 0.58162843, which suggests that 58% of the variations in UP's GSDP can be accounted for by the amount of loan sanctioned in Meerut.
- P- value for both the intercept and beta coefficient is statistically significant, indicating that the beta value is statistically different than 0, which indicates that there exists a relationship between both variables
- The standard for this model is relatively less for the coefficient of the X variable, indicating the precision of the estimate.
- Multiple R of 0.76 indicates that there is a strong positive correlation between the variables.

To analyze the insights of banking officials through interviews on the implementation, effectiveness, and challenges of the CGTMSE scheme.

Collateral-free loans, like those under the CGTMSE scheme, are crucial for MSMEs as they provide access to credit for businesses lacking assets for collateral, promoting growth and innovation. These loans decrease obstacles to starting a business, stimulate new ventures, and promote financial inclusion by integrating unbanked businesses into the formal financial system, assisting them in establishing credit histories.

However, such loans carry risks, including a higher likelihood of non-performing assets (NPAs) due to increased credit risks without collateral. Borrowers may be less motivated to repay during financial difficulties, and MSMEs, with limited resources, are susceptible to economic fluctuations. Banks also have to face challenges in monitoring small-scale borrowers, which can delay problem detection and increase NPA risks.

- Mr. Vijay, manager of the credits department at the PNB Circle office in Meerut, noted, "Since the loans are provided without collateral and the government covers a substantial portion of the loan amount, there can be a tendency for borrowers to put in less effort, which increases the risk of accounts becoming non-performing assets."
- In his research paper, "Problems of MSME Finance in India and the Role of Credit Guarantee Fund Trust for Micro and Small Enterprises," Chandra Sekhar Mund, Assistant Director at IES from the Ministry of MSME, Government of India, highlights that information asymmetry in this sector results in inadequate bank finance. The reliance on cash transactions leads to discrepancies between reported and actual sales and profitability figures. This discrepancy arises from a lack of documentation for numerous small cash transactions, resulting in MSMEs qualifying for less loan amount than needed. Additionally, higher transaction costs, lower margins, a lack of product innovation, and a low-risk appetite among financial institutions hinder MSMEs from obtaining timely and adequate credit. NPAs also contribute to bankers' reluctance to provide loans, with the NPA growth rate for MSMEs from June 2018 to June 2019 being 12%, compared to 10.8% for large enterprises.
- Conversely, Mr. Amardeep Joshi, Chief Manager at PNB Headquarters in Dwarika, Delhi, shared positive insights about the scheme, stating, "The scheme is primarily designed to support micro-enterprises and individuals who lack collateral to secure loans. Although there is a nominal annual fee, it is still advantageous for those obtaining loans without collateral and making a profit from their business." This feedback from banking officials underscores the scheme's effectiveness in enhancing the entrepreneurial landscape of the district.

CONCLUSION

This study evaluates the impact of the CGTMSE scheme on MSME growth in Meerut, using both quantitative data and qualitative insights. The findings reveal that the scheme has significantly enhanced credit access, leading to increased loan disbursements and growth in the GSDP of Uttar Pradesh. However, sectoral and gender disparities persist, along with the service sector receiving more loans than manufacturing, and male entrepreneurs benefiting more than female ones. Challenges such as delays in claim settlements, limited awareness, and procedural complexities hinder the scheme's full potential. To improve its effectiveness, the study suggests increasing the guarantee fund size, simplifying application procedures, and enhancing outreach and support for women entrepreneurs. Future research should focus on sector-specific impacts and strategies to bridge these gaps.

ABSTRACT

Visionary leaders have significantly shaped the trajectory of India's scientific and technological development, and none more influential than Dr APJ Abdul Kalam often referred to as the "Missile Man of India." This research paper explores Dr. Kalam's strategic influence on India's scientific progress and nation-building efforts, emphasizing how his leadership and innovative mindset integrated technological advancement with national development. By analyzing his contributions to India's defence, space research, education, and socioeconomic growth, this paper highlights Dr Kalam's pivotal role in aligning scientific innovation with the broader objectives of nationhood. The study concludes that Dr. Kalam's legacy endures in India's ongoing progress and aspirations, demonstrating the crucial interplay between visionary science and strategic governance in shaping a nation's future.

Keywords: Innovation, Nationhood, Strategic Influence, Scientific Progress, Nation-Building

INTRODUCTION

In the annals of India's history, few figures stand as towering exemplars of leadership, scientific prowess, and visionary thinking as Dr. APJ Abdul Kalam. As a scientist, engineer, and statesman, Kalam's life and work reflect a profound synthesis of innovation and nation-building, shaping the trajectory of India's rise as a global scientific and technological power. This paper delves into Dr. Kalam's strategic influence on India's scientific landscape, exploring how his contributions transcended the boundaries of pure science to foster a national identity rooted in technological self-reliance and innovation. Dr. Kalam's leadership in India's missile development programs, his pivotal role in the nation's nuclear advancement, and his passionate advocacy for education and youth empowerment were instrumental in redefining India's approach to science and technology. Yet, his impact extended far beyond the realm of defense and research; he envisioned a self-reliant India where scientific innovation served as the cornerstone of

**Abu Katadah and Hafiz Mohd Arif**

socioeconomic progress and national unity. This paper seeks to understand how Dr. Kalam's legacy has shaped the intersection of science and governance in modern India, positioning him as a crucial architect of the nation's scientific and strategic advancements.

Dr. APJ Abdul Kalam: A Visionary Scientist and Leader

Dr. APJ Abdul Kalam's early life was marked by perseverance and a passion for science, ultimately defining his contributions to India. Born in 1931 in Rameswaram, Tamil Nadu, Kalam's journey from humble beginnings to becoming one of India's most celebrated scientists and the 11th President of India is a testament to his relentless pursuit of knowledge. After graduating from the Madras Institute of Technology, he joined the Defense Research and Development Organization (DRDO) and later the Indian Space Research Organisation (ISRO), where he made significant contributions to India's space and missile programs. Kalam's leadership in developing India's first indigenous satellite launch vehicle (SLV-III) and his pivotal role in successfully testing the Agni and Prithvi missiles earned him the moniker "Missile Man of India." His contributions were not confined to defence; Kalam played a key role in shaping India's nuclear policy, overseeing the successful Pokhran-II nuclear tests in 1998. His scientific achievements laid the foundation for India's strategic security and positioned the nation as a formidable force on the global stage. Dr. APJ Abdul Kalam's leadership in India's missile development program is a cornerstone of his legacy, solidifying his reputation as the "Missile Man of India." His work in this area advanced India's defence capabilities and underscored the nation's scientific prowess on the global stage. Through his visionary leadership, Kalam played an instrumental role in transforming India's missile technology from a nascent stage into a robust, world-class defense system. Kalam's journey into missile development began in earnest when he joined the Defense Research and Development Organization (DRDO) in the late 1950s, where he was involved in developing small hovercraft projects. However, it was his transfer to the Indian Space Research Organisation (ISRO) in 1969 that marked the beginning of his significant contributions to India's indigenous missile program. At ISRO, Kalam was appointed project director of India's first Satellite Launch Vehicle (SLV-III), successfully deploying the Rohini satellite in near-Earth orbit in 1980.

This achievement was a crucial milestone in India's space and defence capabilities, as it demonstrated the country's ability to develop Indigenous launch vehicle technology. Kalam's success with the SLV-III led to his appointment as the Director of the Integrated Guided Missile Development Program (IGMDP) in 1983. This ambitious program was the cornerstone of India's efforts to build self-reliance in missile technology when the country faced significant geopolitical challenges, including threats from neighbouring countries with superior military capabilities. Under Kalam's leadership, the IGMDP set out to develop a range of strategic and tactical missiles, including the Prithvi, Agni, Akash, Trishul, and Nag missiles. Among these, the Agni missile series became one of India's most significant achievements. The Agni missile, named after the Sanskrit word for fire, was designed as a long-range ballistic missile capable of carrying nuclear warheads. It became the backbone of India's nuclear deterrence strategy, offering the country a credible second-strike capability. Kalam's leadership in the development of Agni was critical, as it represented not only technological innovation but also a strategic shift in India's defense posture. The successful testing of Agni in 1989 marked a watershed moment for India's defence sector, placing the country among a select group of nations with advanced missile technology. In addition to Agni, the Prithvi missile series was another significant achievement under Kalam's guidance. Prithvi, a short-range surface-to-surface missile, was the first to develop under the IGMDP. Its successful induction into the Indian Armed Forces showcased India's progress in missile technology under Kalam's leadership. The missile's flexibility for use in different strategic scenarios made it a valuable asset for the country. Kalam's leadership style was characterized by a hands-on approach, tireless dedication, and a deep commitment to the nation's security. He worked closely with his teams, often inspiring them through his vision of a self-reliant India. His ability to lead by example and motivate scientists and engineers to overcome technical challenges was instrumental in the success of the missile development program. Kalam was known for his humility and accessibility, traits that endeared him to his colleagues and helped foster a collaborative environment crucial for the complex projects the DRDO undertook. Under Kalam's stewardship, India achieved self-sufficiency in missile technology and sent a strong message to the world about its capabilities. His efforts in missile development contributed significantly to India's strategic autonomy, providing the nation with a credible deterrence

**Abu Katadah and Hafiz Mohd Arif**

capability. Furthermore, his work laid the foundation for subsequent advancements in missile and defence technology, ensuring that India remains a formidable player on the global stage.

Strategic Influence on India's Scientific Progress:

Kalam's influence on India's scientific progress extended far beyond his work in missile technology. He envisioned a developed India driven by scientific innovation and technological self-reliance. His "Vision 2020" plan outlined a roadmap for transforming India into a knowledge-based economy, leveraging science and technology to address key challenges such as poverty, illiteracy, and inadequate infrastructure.

Vision 2020: A Blueprint for a Developed India

Vision 2020, conceptualized by Dr. APJ Abdul Kalam, is a strategic framework aimed at transforming India into a developed nation by the year 2020. Presented in his book *India 2020: A Vision for the New Millennium*, co-authored with Dr. Y.S. Rajan, this blueprint envisions India achieving global recognition through technological advancements, education, agriculture, infrastructure, and economic self-reliance. Dr. Kalam emphasized the need for India to harness its human resources, focusing on skill development and education to empower its vast youth population. Vision 2020 outlined goals such as eradicating poverty, ensuring access to quality education, enhancing healthcare, and improving infrastructure in both urban and rural areas. Kalam advocated for technological innovation, particularly in energy, defense, and space exploration, as drivers of economic growth. At its core, Vision 2020 was about bridging the rural-urban divide, promoting inclusive growth, and creating a knowledge-based economy. While the target year has passed, the blueprint continues to influence India's long-term development strategies, embodying Dr. Kalam's enduring belief that a scientifically driven, socially equitable, and economically self-sufficient India is within reach.

The Role of Science in Strengthening National Security

Science plays a pivotal role in enhancing national security by driving innovation in defense, intelligence, and strategic capabilities. In modern times, scientific advancements are integral to developing cutting-edge technologies that safeguard a nation's sovereignty and deter external threats. From missile systems to cyber defence, scientific research and development (R&D) underpin a country's ability to defend itself against conventional and emerging security challenges. Scientific progress has significantly contributed to national security in India, particularly by developing indigenous missile systems, nuclear technology, and space-based surveillance. Dr. APJ Abdul Kalam, a key figure in this domain, was instrumental in integrating science with national security through programs such as the Integrated Guided Missile Development Program (IGMDP) and nuclear deterrence initiatives. These efforts ensured that India could independently design and deploy advanced defense systems, reducing reliance on foreign technologies. Additionally, science enhances national security by addressing non-traditional threats, including bioterrorism, climate change, and pandemics. Data analytics, artificial intelligence, and biotechnology innovations are increasingly critical for real-time threat assessment and response. A strong scientific foundation ultimately empowers a nation to protect its interests, maintain stability, and project strength in an increasingly complex global landscape.

Nation-Building Through Innovation

Kalam's approach to nation-building was deeply rooted in his belief that scientific innovation must serve the broader goals of societal progress. He championed educational initiatives to inspire the next generation of scientists and engineers, recognizing that a well-educated populace was essential for sustaining India's scientific and economic growth. His interactions with students nationwide, often described as "igniting minds," underscored his commitment to empowering youth as agents of change. Kalam was also a vocal advocate for rural development, emphasizing the need for technological solutions to address the unique challenges India's rural population faces. His PURA (Providing Urban Amenities in Rural Areas) initiative aimed to bridge the urban-rural divide by promoting sustainable development in rural areas, integrating infrastructure, technology, and education to improve the quality of life for millions of Indians.

**Abu Katadah and Hafiz Mohd Arif****The Pursuit of Sustainable Development Goals**

Sustainable Development Goals (SDGs) ensure global prosperity, social equity, and environmental protection. These 17 interconnected goals, established by the United Nations, aim to address critical challenges such as poverty, inequality, climate change, and resource depletion. Achieving the SDGs requires collaborative efforts among governments, private sectors, and civil societies to promote inclusive growth, sustainable resource management, and innovation-driven solutions. By aligning national policies with these global objectives, countries can foster long-term sustainability, ensuring that economic progress does not come at the cost of environmental degradation or social injustice.

Dr. Kalam's Legacy in Contemporary India

The legacy of Dr. Kalam's visionary leadership continues to resonate in contemporary India. His influence on policy and governance, particularly in the areas of science and technology, remains evident in India's continued progress in space exploration, defence, and education. Programs such as the Chandrayaan and Mangalyaan missions and advancements in missile technology reflect the enduring impact of Kalam's work in fostering a culture of innovation and self-reliance.

Influence on Policy and Governance:

Dr. APJ Abdul Kalam's influence on policy and governance in India transcends his iconic status as a scientist and technologist. His tenure as the 11th President of India from 2002 to 2007, combined with his earlier contributions to defence and space research, positioned him as a transformative figure who integrated scientific innovation into the fabric of national governance. Through his visionary leadership, Kalam steered India towards policies emphasising self-reliance, technological progress, and human development, thus shaping the nation's developmental trajectory in profound and enduring ways. Kalam's influence on policy was rooted in his unwavering belief that science and technology are pivotal to national progress. He was instrumental in crafting policies that bridged the gap between scientific research and public welfare, particularly in the areas of defence, education, and rural development. His work at the Defense Research and Development Organization (DRDO) and the Indian Space Research Organisation (ISRO) laid the groundwork for policies aimed at technological self-reliance, ensuring India could stand independently in critical sectors such as missile development, nuclear technology and space exploration. These contributions significantly reduced India's dependency on foreign technology and bolstered its strategic autonomy, influencing defence policies that continue to resonate in contemporary governance.

During his presidency, Kalam leveraged his stature to advocate for science-driven governance, urging policymakers to align national priorities with technological innovation. His Vision 2020 blueprint articulated a forward-looking approach to governance that emphasized a knowledge-based economy, sustainable development, and equitable growth. This vision called for policy reforms in education, healthcare, infrastructure, and environmental sustainability, recognizing that a holistic approach to development was essential for India to emerge as a global power. In education, Kalam's influence on policy was particularly impactful. He championed the cause of universal access to quality education, advocating for policies prioritising scientific and technological education as the bedrock of national development. His deep engagement with the youth of India, epitomized by his frequent interactions with students, reinforced his belief that the nation's future rested in the hands of its young citizens. Kalam's focus on education influenced policies that expanded access to schooling, promoted STEM education, and encouraged technology integration into learning environments. His initiatives inspired reforms to foster innovation and creativity among the youth, which are critical drivers of India's long-term growth. Moreover, Kalam's leadership was marked by his emphasis on transparent and accountable governance. He advocated for policies that promoted ethical leadership, citizen participation, and a governance model that was responsive to the needs of all segments of society. His presidency was characterized by his humility, accessibility, and dedication to serving the nation, which endeared him to the public and reinforced his credibility as a leader who embodied the values he espoused.

**Abu Katadah and Hafiz Mohd Arif****Ongoing Impact on Education and Youth Empowerment:**

Kalam's emphasis on education and youth empowerment has also left a lasting mark on India's educational landscape. His advocacy for inclusive education and his efforts to inspire young minds have contributed to a growing focus on science and technology education, ensuring that future generations are equipped to carry forward his vision of a developed India. Dr. APJ Abdul Kalam's impact on education and youth empowerment resonates deeply across India, shaping the nation's future through his profound influence on educational reforms, youth policies, and inspirational leadership. As a scientist, statesman, and teacher, Kalam's life and work were dedicated to nurturing the potential of India's youth, recognizing them as the driving force behind the nation's progress. His vision for an enlightened and empowered generation has left an indelible imprint on India's educational landscape, guiding policies and inspiring millions long after his tenure as President. Kalam's commitment to education was rooted in his belief that knowledge is the foundation of national development. He viewed education not merely as a tool for academic success but as a transformative force capable of elevating individuals, communities, and, ultimately, the entire nation. Throughout his presidency and beyond, Kalam tirelessly advocated for reforms emphasising access to quality education for all, particularly in science, technology, engineering, and mathematics (STEM). His influence in shaping educational policies can be seen in initiatives that expanded student opportunities across the socioeconomic spectrum, promoting a more inclusive and equitable education system.

One of Kalam's most significant educational contributions was his ability to inspire young minds with a sense of purpose and possibility. He believed that every student, regardless of background, had the potential to contribute meaningfully to society. His frequent interactions with students nationwide were emblematic of his dedication to youth empowerment. Whether in large assemblies or small classroom settings, Kalam's speeches and personal engagement with students often focused on the importance of dreaming big, overcoming obstacles, and dedicating oneself to the nation's service. His message, encapsulated in his famous exhortation to "dream, dream, dream," continues to inspire generations of young Indians to pursue their passions and ambitions with unwavering determination. Kalam's influence on educational policies extended beyond the classroom to encompass a broader skill development and capacity-building vision. He recognised the need for a skilled workforce in a rapidly globalizing economy and championed initiatives integrating vocational training, entrepreneurship, and innovation into the educational curriculum. His Vision 2020 plan emphasized the importance of creating a knowledge-based economy where students were educated and equipped with the skills necessary to contribute to the nation's technological and economic advancement. This focus on skill development has had a lasting impact on educational policies, with an increasing emphasis on fostering creativity, critical thinking, and practical skills among students.

Youth empowerment, for Kalam, was inseparable from education. He understood that empowering the youth meant more than providing them with knowledge; it required instilling a sense of responsibility, ethics, and commitment to the greater good. He consistently advocated for youth participation in nation-building activities, encouraging young people to engage with societal challenges and contribute to the country's development. His leadership and mentorship created a new paradigm in which youth were seen not as passive recipients of knowledge but as active agents of change. This philosophy continues to influence programs promoting youth leadership, community service, and civic engagement across India. Kalam's legacy in education and youth empowerment is also reflected in his emphasis on bridging the urban-rural divide. He believed actual progress could only be achieved when educational opportunities were accessible to all, regardless of geographical location. While primarily focused on infrastructure, his PURA (Providing Urban Amenities in Rural Areas) initiative also had a vital educational component to bring educational resources and technological tools to rural areas. This focus on rural education continues to inform policies that seek to reduce educational disparities and ensure that rural youth have the same opportunities to succeed as their urban counterparts.

The Enduring Relevance of Kalam's Nation-Building Philosophy

Dr. APJ Abdul Kalam's nation-building philosophy remains a vital and enduring force in contemporary India, deeply resonating with the aspirations of a rapidly evolving nation. His vision was rooted in the belief that a self-reliant,

**Abu Katadah and Hafiz Mohd Arif**

technologically advanced, and ethically driven India could ascend to global prominence while ensuring the well-being and dignity of all its citizens. Kalam's philosophy transcends temporal constraints, providing a blueprint for sustainable growth, social equity, and national pride in facing ongoing challenges. Central to Kalam's nation-building philosophy was his unwavering faith in the power of science and technology as engines of progress. He envisioned an India where technological innovation would drive economic growth and social transformation. This belief in the transformative power of science is evident in his seminal contributions to India's missile and space programs, which bolstered national security and symbolized India's growing prowess on the world stage. However, Kalam's vision extended far beyond defence; he saw technology as a means to address pressing societal challenges such as poverty, education, healthcare, and infrastructure. His emphasis on technological self-reliance continues to inform India's policies in various sectors, reinforcing that scientific advancement is a crucial pillar of nation-building. Kalam's philosophy also underscored the importance of inclusivity in national development. He believed that for India to progress genuinely, it must uplift all its citizens, especially those in marginalized and rural communities. His PURA (Providing Urban Amenities in Rural Areas) initiative exemplified this commitment to equitable growth. PURA sought to bridge the gap between urban and rural India by bringing infrastructure, education, and healthcare to underserved areas, ensuring that development was not concentrated solely in urban centres. This focus on inclusivity is a core tenet of Kalam's nation-building philosophy, reminding us that sustainable development is only possible when it benefits the entire population. The ongoing relevance of this idea can be seen in contemporary policies that aim to reduce regional disparities and promote rural development.

At the heart of Kalam's nation-building philosophy was his profound belief in the potential of India's youth. He viewed young people not as passive recipients of development but as active participants in shaping the nation's future. Throughout his life, Kalam devoted himself to inspiring and empowering the youth of India, encouraging them to dream big, embrace innovation, and take responsibility for their country's progress. His philosophy emphasized education and skill development as the foundations of a knowledge-driven society. This belief in the power of education to transform individuals and the nation continues to influence India's educational policies, particularly in the emphasis on STEM education, vocational training, and innovation. Ethics and leadership were also crucial components of Kalam's nation-building philosophy. He believed that the true strength of a nation lay in the character of its leaders and citizens. Kalam consistently advocated for ethical governance, transparency, and accountability, urging leaders to serve with integrity and a sense of duty to the nation. His own life, marked by humility, simplicity, and dedication to public service, exemplified these values. Kalam's call for ethical leadership remains deeply relevant in a world increasingly confronted by corruption, inequality, and governance challenges.

Kalam's nation-building philosophy is not merely a historical artefact but a living framework that continues to guide India's path forward. His vision of a self-reliant, inclusive, and ethically driven nation resonates with the current generation as India grapples with new challenges, from economic disparities and environmental sustainability to global competition and social justice. By integrating science, inclusivity, education, and ethics into a cohesive vision, Kalam offered India a timeless guide for achieving national greatness.

CONCLUSION

Dr. APJ Abdul Kalam's life and work embody the symbiosis of innovation and nationhood. His strategic influence on India's scientific progress and nation-building efforts has left an indelible mark on the nation's development trajectory. Through his contributions to defence, space research, education, and socioeconomic progress, Kalam demonstrated the power of science and technology as instruments of national empowerment. His legacy inspires India's pursuit of scientific excellence and global leadership, ensuring that the visionary ideals he championed remain central to the nation's future.

Abu Katadah and Hafiz Mohd Arif

ABSTRACT

This research examines the relationship between Corporate Social Responsibility (CSR) practices and organizational performance, with a focus on IT firms in Bangalore. The central aim of the research is to understand how different CSR initiatives impact employee morale, brand image and over all financial performance. Following a qualitative meta-analysis approach, Surveys of CSR practices and performance metrics from 30 IT companies; Stakeholders interviews in the process. This study shows that stronger CSR practices are associated with increased employee morale and a better public image. Conversely, the financial impacts from CSR initiatives were not as powerful, pushing for Wednesday's case suggesting CSR contributes to non-financial performance outcomes although there remains somewhat disappointing direct influence on financial elements. The results suggest the expected need for embedding CSR deeply in a business strategy, especially so considering its potential benefits resulting from employee and brand development of mostly IT companies. The study suggests that CSR can have strong positive impact on non-financial performance measures, while results relevant for more long-term financial implications and strategies to enhance those following different ways calls for further research.

Keywords: Corporate Social Responsibility, Organizational Performance, Employee Satisfaction, CSR Impact, Corporate Image.

**Hemalatha Yadav and Kapil Arora**

INTRODUCTION

Corporate Social Responsibility (CSR) in simplified terms means the ethical responsibility and a basic moral working behind it is to assist society beyond their financial stability of course still obeying all local, federal laws. It encapsulates practices such as environmental sustainability, ethnic labor, connection to the community and philanthropic activities. In the recent years, CSR has gained prominence due to growing expectancies of stakeholders regarding firms functioning in a manner socially responsible. Companies are adapting their business strategies to include CSR, reflecting a greater understanding of global challenges — including climate change, social inequality and governance issues at the corporate level. In the case of IT industry and more so in Bangalore, which is also called as Silicon Valley of India CSR has a greater role to play. One reason for this being that Bangalore has not just some of the top multi-national IT companies, who are been in and around invoking technology changes but also lies on a place where it enters people's house through economy powers too. Hence, when these companies scale up; their CSR practices are investigated with a microscope by the consumers and stakeholders. However, CSR in Bangalore IT companies is as important their reputation and have a direct impact on the business competitiveness due to a very dynamic industry. The present study fills the gap by investigating CSR practices of IT companies in Bangalore towards their performance. Whilst some research covers the influence of CSR in different industries, there has been limited attention towards how this might be reflected as ITF products on key performance metrics for these organisations such as employee satisfaction, brand reputation or firm financial outcomes. In addition to lack of resources, the problem is aggravated by absence of sector-specific insights that can direct IT firms about how to design their CSR strategies. The study aims to examine the link between corporate social responsibility (CSR) practices and organizational performance metrics, specifying key CSR activities that boost performance in Bangalore IT sector as well assess their impact on employee outcomes. Implications of Corporate Social Responsibility Practices for Organizational Performance Metrics in Indian Information Technology Organizations—Moderating Role of Employee Outcomes. Unlike other researches, this study may give foundations to initiate action on corporate social responsibility new practices for IT firms. To do so, the study seeks to provide relevant insights and recommendations around how companies can better integrate CSR into their core business strategies by explaining CSR activities that are designed to influence performance outcomes. Doing so will enable IT firms in Bangalore to have higher social impact delivery besides enhancing organizational performance and stakeholder engagement.

LITERATURE REVIEW

THEORETICAL FRAMEWORK

There are numerous theories underpinning the field of study that is Corporate Social Responsibility (CSR). One such perspective is the Stakeholder Theory developed by Freeman, which suggests that organizations need to take into account all stakeholder in order for long term success and legitimacy rather than focusing only on their shareholders. In that view, CSR can be seen as a powerful tool for managing relationships with different stakeholders; from employees and customers to the community. CSR activities as a resource by improving reputation and building stakeholder trust: The work of Barney (Resource-Based View-RBV) proposes that CSR is possible to be considered an organizational resource capable of contributing to competitive advantage through the improvement in reputation, thus fostering stakeholders' trusts. Secondly, The Legitimacy Theory argues that corporations perform CSR to conform with societal standards and expectations in order to be seen as legitimate and minimized the fear of potential social sanctions. In addition, the Institutional Theory helps us to understand that organizations engage in CSR practices because they need it as a part of their institutional environment and face pressures from different stakeholders who influence them such as pressure groups or media. The theory posits that firms are essentially forced to adopt CSR, not if they wish to meet the expectations of their stakeholders (as we might presume), but rather because it is required by society or legislators. Additionally, Social Exchange Theory posits that corporate social responsibility (CSR) initiatives generate mutual benefits for organizations and their stakeholders through a favorable

**Hemalatha Yadav and Kapil Arora**

exchange., which in turn leads to better organizational reputation and sustainability. Collectively, these theories sketch a portrait of the diverse role that CSR plays in contemporary organizations as it unfolds over time.

Previous Research

Numerous researchers have investigated the effects of CSR practices on firm performance. CSR has been linked to financial performance in a study conducted by Orlitzky, Schmidt and Rynes who argue that companies that participate actively in responsible behaviour are likely to achieve positive financial outcomes through the creation of stronger relationships with those they depend on (stakeholders) as well as benefiting from a favourable corporate reputation. In addition, a meta-analysis on CSR by Margolis and Walsh (2003) has also revealed that contributions to non-financial performance e.g., employee satisfaction/organizational commitment or brand loyalty. Other studies in the IT sector have discovered that companies providing a stronger CSR program can obtain greater brand recognition and customer loyalty, which provides an adaptation advantage to other industries (Lantos, 2001). However, some studies e.g. McWilliams and Siegel (2000), have disclaimed that the financial gains of CSR are not always unambiguous since it varies according to practices and context used).

GAPS IDENTIFIED

Even though CSR has been well researched, there are still wide-reaching gaps. Further research is needed to explore sector-specific studies in the configuration of CSR problems and potentials in IT industry. There has been a generalizing practice among existing CSR research that assesses the impact of CSR in different types of industry sectors, yet there is no explicit discussion to be found on why IT companies are unique as they rely heavily on intellectual capital and technology innovation. Though existing literature delves into financial implications of CSR, limited scholarly contribution has been made on the broader performance measurement scale (other than accounting figures) like employee engagement and brand reputation associated with a commitment to CSR in IT company. More research is needed to understand the context contingent effects of CSR, subtle impacts for IT companies and so on.

RELEVANCE

The literature review provides a theoretical justification and context for the current study by reviewing traditional bases for CSR, but specifying IT-sector as one that requires further particular research. The study can capitalize on this accumulated knowledge by grounding its research in existing theories and prior studies as well, to the extent that they are able through identified gaps. The rationale for examining the impact of CSR practices on IT companies in Bangalore is evident through this review as it highlights how these Introduction Page 3 Magician from the Future Journal of Indian Business Research Emerald Publishing, potential influence various performance metrics. In so doing, referencing our findings will help to inform the design of relevant research projects and also provide a set of guidelines for data collection and analysis ensuring that future CSR studies emerge from an academic-practical synthesis.

MATERIAL AND METHODS**Study Design**

The current study employs a mixed-methods approach to analyze the influence of Corporate Social Responsibility (CSR) initiatives on organizational performance, among IT organizations located in Bangalore. This research seeks to provide an extensive evaluation of CSR from multiple performance dimensions by incorporating primary quantitative data and secondary qualitative literature.

Sample

30 IT companies located in Bangalore, using a stratified random sampling technique to ensure representation of various sizes and types within the sector. Inclusion criteria stipulated that companies had to have more than 100 employees and a functional CSR policy in place. Such a selective process would help in providing substantial and relevant sample for assessing the CSR practices as well as outcomes.

**Hemalatha Yadav and Kapil Arora****Data Collection**

Data collection : Both primary sources and secondary were used in data analysis. Finances The data was collected through quantitative methodology and the primary data emphasizes on CSR practices targeting towards financial performance dimensions, employee satisfaction, score assigned to company by rankings which all goes hand in hand with it along Brand image. Secondary data were collected on the other hand from literature, industry reports, policy documents and relevant case studies. This supplementary data enabled us to move beyond what we found in the primary reports by giving a broader context on industry trends and CSR practices. The combination of these data sources enabled a more complete examination into the effects of CSR on performance.

Data Analysis

We used statistical analysis to detect the patterns and correlations of CSR practices with performance metrics on quantitatively based data. The data was analysed using descriptive statistics and inferential techniques (e.g. correlation, regression analysis) to examine the relationship between individual attributes of respondents; For information gleaned from the literature and case studies, we conducted thematic analysis to determine several key themes and patterns running through our data. The data was given a thematic analysis, helping to identify some over-arching themes and values of the respondents in relation to theoretical underpinnings linked between CSR practices that are being introduced by companies and how they were affecting it people who participate here.

Limitations

The study has multiple limitations. Response bias may be introduced by reliance on self-reported data, therefore limiting the generalizability of study findings. While a sample size of 30 companies may not cover the entire IT sector in Bangalore, this provides some insight. Also, secondary data drawn from an existing literature or a case study can be constrained by the information reviewed. Fourth, the study is cross-sectional and cannot capture long-term changes in CSR practices that might influence organizational performance over time.

RESULTS**Descriptive Statistics**

The analysis of the data collected has lead to some key findings about CSR practices and their effect overorganizational performance in IT companies at Bangalore. Results Descriptive statistics Initial descriptive statistics of key variables like CSR activities, employee satisfaction and brand reputation are tabulated. The average value of CSR activities declared by the companies was very high, reflecting an intense mobilization in terms of social and environmental actions [8]. The medium for employee satisfaction was also high, showing a broad approval of the companys CSR. Brand reputation scores averaged 7.5 on a scale of one to ten, which indicates that this were companies performing relatively well in terms of CSR public perception Deeper analysis, however showed that companies with greater CSR also saw improved internal moral and commitment from external stakeholders. In fact, companies that adopted broad CSR strategies like climate programs and community development projects saw higher rates of employee commitment as well as lower staff turnover. However, the study found a higher-ranking but more indirect effect of corporate involvement in CSR on customer satisfaction through brand reputation. This now demonstrates that strong CSR practices not only improve the public outlook on a company, but help keep great employee morale by developing an amazing work environment and closer sense of teamwork. The positive brand perception also backed the claim that CSR initiatives could be considered a giant asset strategically, which clearly increases company performance and long-term success. The broad popularity of CSR activities indicates the universal dividends effective corporate social responsibility can bring to IT industry.

FINDINGS

The results showed a strong, positive relationship between CSR practices and organisational performance metrics. Higher companies that had include different types of CSR practices such as environment friendly program and overall involvement with the community, generally have higher satisfaction among employees along with better

**Hemalatha Yadav and Kapil Arora**

reputation in terms of their brand. Idled in bed, companies with existing CSR programs experienced improvements on their employee satisfaction scores — a signal of higher morale and commitment. Besides, better brand loyalty and public relations (PR), are essential to stay competitive in an IT enterprise perspective. It also concluded that although there were improvements in financial performance, these often fell short of the non-financial gains such as enhanced stakeholder relationships and a perceived aspect to company image[9]. The study notes — “Among companies that are highly adept at delivering on CSR imperatives, there is often a virtuous cycle in which positive employee experiences enhance brand reputation and trust, driving a greater level of customer satisfaction with the organization. Some 82 per cent indicated reluctance to consider sustainability when making investment decisions because they maximally want returns.” This feedback loop can help to position you more competitively in the marketplace. In particular those companies who had invested in CSR activities such as the lowering of carbon footprints, supporting local community; this helped towards strengthening their relationship more holistically nestling next to its conversation pillar. These reinforced relationships are then converted to higher trust and cooperation among your customers, some suppliers, you own investors etc. Additionally, the research showed that while these short-term financial benefits of CSR may be incremental in nature, this approach does facilitate long term strategic benefits such as increased risk management and organizational resilience. While positive ROI can be measured over the short term, net of costs, these non-financial benefits—i.e., increased stakeholder engagement and reputation—are arguably more valuable to organizations' overall objectives in demonstrating long-term individual self-interest.

VISUALS

Results would be presented visually (e.g., bar graphs of the averages for CSR practices and performance metrics, pie charts with shares of types of activities across companies). Tables and figures would serve to complement the descriptive statistics by illustrating how CSR efforts associated with performance outcomes. Line graphs could also be used to show trends over time, demonstrating how CSR practices and performance metrics change as well as correspond. You could even make heat maps showing how many companies address different areas of CSR, and a variety of additional things that are today not engaged or way to difficult. These visualizations not only help understand the data better but also enable comparison of various CSR practices and how they influence organizational performance. Stakeholders can better understand how effectively CSR initiatives are contributing to the organization by presenting this data in a visual manner, which help them take informed decisions.

COMPARISON

These results are consistent with prior evidence for a positive effect of CSR on performance (e.g., Surroca et al. This is in line with the results from Orlitzky, Schmidt and Rynes (2003), which confirmed that extensive CSR practices lead to improved employee satisfaction as well as brand reputation. Nevertheless, while as has been reported from CSR research trove findings such significant financial benefits of the same (e.g., Margolis and Walsh 2003), this was less so than non-financial improvements. One reason could be that this disparity was characteristic only of IT companies in Bangalore, and the manner in which they undertook their CSR efforts. In addition, the results contribute to previous studies by offer sector-specific evidence which call for further exploration of CSR effects in different industry contexts.

CONCLUSION

The research findings highlighted a significant positive association in case of Bangalore (IT companies) between CSR practices and diverse facets organizational performance. Human employees are happier, and your brand looks better overall when you engage in such CSR practices as environmental sustainability or hiring from the community around your corporate office. The financial impacts of CSR may be marginal, but the non-financial benefits such as better stakeholder firm relationships or corporation image outweigh by far. These studies reinforce the tactical importance of not just leveraging but embedding sustainability ventures as part and parcel of a business model — acting like a slow-release capsule that, over time, stands to confer sustained strategic benefits and overall success.

ABSTRACT

Industry 5.0 changes and the fast pace of its development require that curricula in college classrooms be more aligned with expectations from industry to create a future-fit workforce. This contribution introduces a bibliometric analysis of the literature on academia-industry alignment in Industry 4.0 and Industry 5.0 over five consecutive years, ranging from publications between year 2019–2024. The study presents a five-stage method which consists in the whole process of searching, finding, selecting and reviewing relevant publications. Seventy-eight articles met the eligibility and were examined through Keyword Network Structures, Content Analysis (topic modeling), to classify sorts of research. The main aim of this study is to delineate and investigate the research lacunae in academic curriculum development process for aligning with industrial needs, which would ultimately contribute knowledge perspective on what has been done and where future research efforts should be directed. Results show a significant emphasis on quantitative (13 studies) and qualitative (11 studies). In terms of countries responsible for the most publications, Germany is a clear frontrunner, closely followed by UK and USA—and distant fourth China—pointing to widespread global interest in the subject. In summary, “Industry 4.0”, “Industry 5.0” and “education” appeared to be the top three frequently used terms based on keyword co-occurrence analysis which summarized the core themes of research landscape overall (Table, Fig). India has significant contribution from the highest 3 producing countries, yet a paucity of publications originating in India indicates need for further dialogue. Many research gaps have been identified, including discrepancies between intelligent manufacturing and new curricula that need to be explored within academic areas while being receptive of the requirement variations in industries based on Industry 4.0/5. The analysis also highlights the need for re-training and life-long learning of workforce

**Divya and Sumathi**

to remain competitive in Industry 4.0, and eventually be ready to take on challenges posed by industry 5.0 era as well. Future research fills these gaps that will be much useful to refine and tailor the scholarly findings of educational system before getting their students ready for a readmission in an adaptive way toward ensuring compactivity between graduates.

Keywords: Academia, Bibliometric Analysis, Curriculum Development, Educational Policy, Industry 4.0, Industry 5.0

INTRODUCTION

Amidst the extremely dynamic industrial development landscape, a cornerstone marked as Industry 5.0 has arisen; which embodies an era where state-of-the-art technology is inherently woven into true worker inclusive production systems (Stadtler & Schulte, 2022). Industry 5.0 is by building upon the fields of industrial automation and data exchange that were founded in Industry 4.0, which focused on creating what has become known as a "smart factory" with emphasis on collaboration between humans and machines within systems for cyber-physical production. Kagermann et al., (2013). This paradigm change not only has led to higher productivity and efficiency but also underscore the need for educational institutions to address quickly changing requirements of industrial sector. The motivation of this study is to mend the persisting divide between academia and industry in light of Industry 5.0 era. Industry of the 5th generation can be depicted as a domain that emphasizes on theoretical understanding and fundamental competencies (academia), while Industry 4.0 actually requires interdisciplinary knowledge including digitization skills, adaptable problem-solving capabilities driven by empirical reality bringing in new technologies to practice within its environment (Lasi et al., 2014). The mismatch between educational curricula and the increasingly changing need of industries adopting Industry 4.0 technologies has more significantly been underscored by this disconnect (Albrecht et al., 2018). The post-implementation process can appear fruitful as well since society is mature when manufacturers decide to pull out support, so they stop allocating manufacturing capacity way too early in fact their experience economically still should have some growth opportunity left in it.

And the challenge with Industry 5.0 is now: The convergence of physical and digital worlds will be even more pronounced, necessitating a complete overhaul in Educational frameworks this time! Its scope includes both, not only technological innovations but also socio-economic aspects through i) sustainability and ii) ethical considerations in industrial practices (Lee et al., 2021). Thus staking a tradition with practice alongside the academia becomes not just an issue of skill set but also emerges as a strategic lever to shape India's destiny on global turf. Importantly, its potential to spur growth and societal advancement also makes this alignment particularly consequential. A workforce skilled in the ways of Industry 5.0 can fuel innovation and new growth opportunities, delivering solutions to assist with many complex social issues such as climate change at a large scale (Porter & Heppelmann, 2014). The study, therefore do explore the current educational alignment with Industry 5.0 and suggest strategic interventions to equip future workforce that can adapt and tap into transformational potential of era called Industry 5.0

To answer the objectives of this study, we ask the following research questions:

- Research Question 1: Trend of Publication in the Adjustment between Academia and Industry on Industrial Internet of Things from year to not less than for next five (5) years?
- Research Question 2: Which are the most cited studies in alignment of academia with Industry needs in Industry 4.0 & Industry 5.0?
- Research Question 3: What is the citation and co-citation pattern for a comprehensive review on academic — industry alignment in Industry 4.0 or/and get smart to change with Industry 5.0.
- Research Question 4: What tools and methods are used in the research of bridging academia-industry gap within Industry 4.0 & Industry5.0?

**Divya and Sumathi**

- Research Question 5: What are the industry segments that were addressed by previous studies which explored academia–industry alignment in contexts of Industry 4.0 and Industry 5.0?

LITERATURE REVIEW

Industry 5.0 is a way further to the current Industry 4.0, looking at WOW or de-humanized approach of manufacturing and industries towards humans! While Industry 4.0 centered on automation, data exchange and related communication standards in manufacturing technologies using the Internet of Things (IoT) and cloud computing; integrating 'human-in-the-loop' or human intervention processes allowing greater intelligence with less waste is Industry 5.0 —followed by advanced analytics—the Year Supply Chain reinvents industrial systems as collaborative-social-ecological facades that recycle energy while accomplishing more adaptive technology management; this wave builds upon Artificial Intelligence & Cyber compute meanwhile redesigning many operations constituting mass models around tablet computers: agile-apprenticeships assimilate forcible changes whilst self-generating project-based opp's ready to start up–low power-expense internet-operability! The paradigm change emphasizes the human worker as rooting for order within complex manufacturing processes, in a way that furthers productivity hence innovation (Stadtler & Schulte 2022). Key technologies that are part of Industry 5.0 include cobots, AI-driven decision support systems and more advanced human-machine interfaces (HMIs). These technologies are intended to enhance the abilities of human workers, allowing them greater control over and customization in performing production tasks. Parkinson highlights that Industry 5.0 is the latest chapter in a long tradition of technological evolution to address these and other problems, including increasing concentration on sustainable supply chains as well as ethical duties, or making business responsible for its sustainability and social implications (Breque et al., 2021). Such an approach requires a fundamental new look at educational curricula, to turn out workers who can succeed in these complex, ever-changing environments.

The transition to Industry 4.0 has, for instance, uncovered major disparities between the skills taught in academic institutions and those needed by contemporary industries (Bongomin et al., 2020; Mian et al., 2020). Many studies have pointed to these gaps which suggest a corresponding convergence between technical and interdisciplinary knowledge as well as soft skills being part of the curricula (Kipper et al., 2021; Sung, 2018). For instance, Peres et al. This result also agrees with the selection of theoretical knowledge at academic programs while industries require practical/experimental exposure to emerging technologies: according to (2018) Research by Pirola et al. This further corroborates the contention by Rasmussen et al. (2019) which suggests that academic output is frequently not in tune with industry requirements and also, technological advancements are made quicker than educational systems can adapt to them. Consequently, there have been demands for such agile and responsive educational frameworks that can align with technological developments as well industry requirements. Our experience, however damped by the aforementioned factors, is more focused on embedding real-world industrial problems in an academic contexts through collaboration, internships and project-based learning (Benešová & Tupa 2017).

Many theoretical frameworks have been suggested to contribute the hole between academic and industrial particularly now with Industry 4.0 landscape borders, but all these models need an empirical background test in order for them to be applicable by future researchers on their way of modeling better theorindexplanation (theory). A well-known model is the triple helix where universities are expected to work alongside industries and governments for advancing innovation, tech transfer or economic development influences (Etzkowitz&Leydesdorff, 2000). This model promotes a mutually beneficial relationship where both parties add to and take from the knowledge pool. Aproximately opposite in orientation is the framework of competency-based education (CBE), which concerns defining certain competencies that you get out from industry needs, and standards reflect levels within these constructs of competence creation and development. CBE focuses on real-world, results-based learning by only testing students in skills and problems which are directly useful for what they will be doing. This is especially well-suited for the dynamic and interdisciplinary Industry 5.0, where being adaptable in learning new things more than ever matters most. Also, the idea of continuous lifelong learning has emerged as a requisite development experience

**Divya and Sumathi**

for workers to stay in line with Industry 5.0 requirements (European Commission, 2020). Lifelong learning: This approach refers to continually developing skills and acquiring knowledge, which is supported by flexible pathways through education or training and ongoing professional development opportunities.

Initially, the articles related to academia-industry alignment in Industry 4.0 and Industry5. The identified articles were then screened for further detailed review and inclusion. After shortlisting the articles bibliometric analysis & Content analysis done using VOSviewer and MS Excel to ascertain publication trends, type of studies conducted, scope of journals published in search time period and research gaps identified helps suggest future directions for researchers. The methodology of the comprehensive review used for this literature review is explained in next section.

METHODOLOGY

The methodology is the systematic, theoretical analysis of how research strategies and techniques towards solving a problem are undertaken. This study applies a literature review methodology which is particularly helpful for revealing recent research trends and theoretical frameworks, thus highlighting important areas of future work. This would be beneficial to developers assessing the current state of alignment between academia and industry within Industry 4.0 as well as Industry 5.0 context for research opportunities in these two different domains combined together; The methodology follows the five stages method as proposed by Nyirahabimana et al. Those defined by Rabinow and Sullivan (2022) as follows: searching, finding, choosing to include or exclude each one of the relevant publications.

Literature Collection

A bibliometric analysis method is a systematic one used to access the volume, growth and distribution of academic literature in a certain subject area (Aria & Cuccurullo, 2017). Through this study, bibliometric analysis is used to quantitatively assess the prevailing literature concerning academia and industry alignment in relation to Industry 4 and upward thrusting up of Industry5 premises. The analysis is expected to reveal the publication trends, most cited works and high-impact authors associated with collaborative networks in a research domain. The literature collection started with a broad search in several academic databases, like Scopus, Elsevier and Google Scholar. This would be searched by a range of keywords. These are used to do a more specific search, guaranteeing the right retrieved literature through boolean operators (AND and OR). From searching various journal, 78 articles have been identified (Table 1).

Selection Criteria for Literature Inclusion

In this context, the aim of our study is to perform an extensive analysis and review on articles related to alignment among academia vs. industry focusing on Industry 4.0 & Industry 5.0 published in different academic journals so far (Fig-1) Literature was selected for this review based on inclusion criteria which were applied to define relevance and comprehensiveness.

- Published in a peer-reviewed journal or conference proceedings
- Academic and industry convergence focus
- Published within the past ten years to include up-to-date studies.
- Offered in English for ease of use and understanding.

The results were filtered based on the abstract screening approach to be able pick up most relevant articles. Of the initial 259 articles, we discovered that only 78 were of general relevance to the academic/industry alignment theme in Industry4.0 and Industrial5.0. That enlightenment was later used for producing the literature review and analysis. Table 1 displays the distribution of these articles by database and lists search criteria, keywords, and search strings.

**Divya and Sumathi****Review of Selected Literatures**

The relevant articles were reviewed systematically, and research type, tools & methods used in the article, specific industries covered etc. was hard coded as part of review process This process was intended to bring forward the salient findings of each study and provide an overall picture of research in this field.

Analysis Methods

VOS viewer is used for bibliometric analysis to visualize the data. VOSviewer is also used to create the bibliometric maps that allow visualizing relationships between authors, journals and keywords (Van Eck & Waltman, 2010). This tool is useful for identifying research topic clusters and key papers in the field. The model gives an outline on the key metrics which include the Number of publications per year and country, Co-occurrence & analysis of Keywords in articles, Citation Analysis and finally a co-citation network visualisation to give readers more insights about various trends being followed over years by authors as well as collaborations in this research domain. It makes use of content analysis which is executed using MS Excel.

RESULTS AND FINDINGS**Bibliometric Analysis Findings**

The framework of bibliometric analysis are taken from methodology by Donthu et al. (2021). The search using the search parameters presented in Table 1 identified a total of 259 research articles for review. In the last few years an increasing number of academic papers on the subject have been published and just this figure demonstrates a new focus that examinations Industry 4.0 (and sometimes even Industry 5.0) in combination with learning or education opportunity consequences for students (Figure 1). Characterizing the crossroad of Industry 4.0 and emergent trends, such as in some circles referred to into a stage dubbed Industry 5.0, with education is an area experiencing rapid expansion that has emerged from understanding the imperative for educational systems alignment within this new industrial paradigm The contributions of the countries in the field of academia-industry alignment towards Industry 5.0 was further analyzed through bibliometrics (Table 2). Germany is number one with 16 publications and a total of 746 citations, averaging to 46.63 citations per document. After Germany, there are more than 5 publications on enterotoxigenic Escherichia coli in United Kingdom and the rota virus from United States and China each. This distribution accentuates the pressing need to learn how educational systems can respond to industry demands, and at an unprecedented scale.

Keyword Analysis

During bibliometric analysis, three main types of techniques are used to visualize the networks: distance-based visualization approach graph-based view timeline-view. The distance between two nodes in the distance based network is indicative of strength or intensity of relationships existing among them (Segura-Robles et al., 2020). The construction of a distance-based bibliometric network is supported by VOSviewer software, to enable visualization of publication characteristics using network analysis techniques.

Figure 2 demonstrates the keyword co-occurrence network in articles detected. Clusters of keywords in different colors within the network structure indicate themes. The study uses VOSviewer to generate a distance-based bibliometric network that provides an overview of the selected articles. More specifically, this analysis is looking at the keywords that were common across all articles and how often these key words co-occur with one another. The visualization brings out the interconnectedness among research and themes that are relevant to academia-industry alignment with Industry 4.0/5. As the major factors in bibliometric network, "Industry 4.0," "Industry 5.0" and some of the other key words like "artificial intelligence," "higher education," "open innovation", "digital transformation ILL.highlighted through Figure -2(Frame work). In the co-occurrence analysis, "Industry 4.0" (green cluster) most frequently related to "artificial intelligence," "higher education" and "smart manufacturing". Meanwhile, "Industry 5.0" (purple cluster) is often used with the terms digital transformation, higher education and competencies. The clustering results reflect that the keyword "education" (yellow cluster) is most related to "Education 4.0," and following with it nearly equally close degree of "inclusive education", "curriculum design" as well as "open

**Divya and Sumathi**

innovation". After identifying the clusters of keywords, we grouped textbooks in this study into three main categories as follows: (1) Industry 4.0, (2) Industry 5.0 and education; The keyword "Industry 4.0" meanwhile is mostly popular: it appeared around 49 times and got the highest link strength with a total of 261. The topic "Industry 5.0" also appears thirteen times with a link strength of 104 as well. Again "education" is given a score of 97 as link strength better links us to the keyword. In these explicit or intuitive research clusters imply topical activity areas in the field of aligning academia and industry within Industry 4.0/5.

Citation analysis serves as a fundamental component in bibliometric studies, which has been widely used to understand the importance of research documents within a certain field (Song et al. 2023). Citation analysis measures the impact and importance of a publication in its field by determining how many times that document has been cited. Analysis of the scientific and scholarly literature through citation serves as an essential means for discovering landmark works as well as important papers contributing to a field of research. It also emphasizes what articles are making an influence and provides a way to understand the academics behind certain papers. In the framing of academia-to-industry alignment for Industry 4.0–5, then citation analysis provides a way to understanding what base studies are driving discourse and subsequent researcher activities. Table 3 provides an overview of notable articles about university–industry collaboration under the umbrella term Industry (4.0 and) 5. Top 20 cited articles on this research area Looking into these ten most cited works would give researchers a firm knowledge of the origin and roots present studies focused on reshaping educational systems to meet standards for Industry 4.0, leading up to Industry 5.0 as well.

Co-citation Network Analysis

Co-citation algorithms analyze how often two authors' articles are cited together by other scholarly articles and thus show the existence of hidden connections between those works (Song et al., 2023). This kind of analysis allows the users to visualise relationships among world cited works and highlight similarities within a field (Salemi & Koosha, 2022). As a form of co-citation analysis can help locate in theoretical linkages between the citing and cited documents that show how research pieces fit together by virtue of being linked to one another through established citations (Salemi & Koosha, 2022). Through scanning the references of cited articles, we can gain a comprehensive understanding about how scholarly influence is populated and formed from this field animal which in turn helps to summarize its intellectual organization. This approach helps researchers to find out which papers are generally cited together, indicating a close connection in their theoretical or methodological developments. In addition, co-citation analysis can also identify important research clusters of scholarship and core members who contribute to the advance process in this field [44]. When it comes to bringing together academia and industry for Industry 4.0, or even the horizon of a true next shift (Industry 5.0), co-citation analysis can reveal key works that have shaped this dialogue over its course as well drivable theory foundations Thanks to CrescChain}} Visualizing the co-citation network will indicate how ideas have evolved over time, and identify major intellectual flows that shape contemporary academic-industry alignment research in a new era of Industry 4.0 / 5.

Figures 3 and 4 show the co-citation networks of cited authors and sources, respectively. This is useful to understand the background of a field, as who follows which author highlights where authority in this framework lies and also how various aspects are related. There are several important nodes the network reflects including highlighting Prof. Mehmood, and Profs Alahmari; Haleem; Sihm and Wilfried Kipper as well as Xun On the basis of its popularity, this work has established these authors as critical players in discussions on academia-industry cohesion with respect to Industry 4.0 and emerging themes pertinent to Industry 5.0 which should be contextualized throughout literature pertaining to academic–industry relations recapitulate their significance. In the same way, this is indicated in source co-citation network; which signals key journals and papers that appear as primary dissemination vessels of research among their particular scope. Network reveals IEEE Access, International Journal of Production Economics and Journal of Business Research Education & Information Technologies; Journal information About Editorial board News A prominent node in the network remains with 201/346 The aim is to generate behavioral knowledge that will provide better premises for decision making. These sources make up an important portion of the literature, so their large role in publishing influential research on academia–industry alignment is recognized. Through the analysis of

Divya and Sumathi

these co-citation networks, researchers can gain valuable insights into how authors and academic sources are connected to one another and what plays a crucial role in defining this scholarly terrain. In doing so, not only does the identification of key authors and journals shed light on influential works within the literature but it also can help identify future trends as well as critical analyses that add to the ongoing conversation surrounding Industry 4.0 (as well now — potentially — Industry 5.0). In conclusion, it is clear the role of individual scholars as well academic journals are significant for greater advancements in progressing knowledge and practices with regard to interweaving educational systems (academic) needs into industrial requirements.

Content Analysis Method

The concept of systematized content analysis was meant for studying visual, textual and other kinds of documental artifacts (Lindgren et al. This approach allows researchers to analyze massive amounts of data in an organized manner, facilitating the observation patterns and trends within a particular area. This study conducted a content analysis on 78 relevant research articles focusing alignment between academia and industry in the context of Industry 4.0/5. The purpose of this review was to identify trends or themes across the research studies in that area. In order to do this, we built a database summarizing all the articles that were shortlisted for our review in MS-Excel. The database helped categorize the sample according to a variety of parameters such as methodologies and industrial settings. Using a systematic organization and classification of those articles, the research contributes to identifying empirical knowledge that sheds light on how academic and industrial sectors are coming together in Industry 4.0/5. In doing so, it not only guarantees that this approach underscores with the most commonly used methodologies and industry focus areas in the selected papers but also provides a crisp picture about where empirical research is headed.

Figure 5 provides an integrated understanding of the tools and approaches used, thusto comprehend methodologies implemented by researchers in this field. On the contrary, majority of research studies on the alignment between academia and industry in context to Industry 4.0 and onwards (Industry 5.0). The focus of sector in the studies examined by this study is shown at a detailed level in Figure 6. The figure clearly shows that most such research has been successfully conducted with the IT and manufacturing sector.

DISCUSSION

In this paper, a bibliometric review of articles on Industry 4.0 and Industry 5.0 is provided from the academics partnership with industry to develop an insight view over six years (2019–2024). A total number of 78 articles were reviewed and classified. Based on a keyword network structure, clusters of articles were formed and each article was assigned to one cluster group. Results showed that content analysis statistics — quantitative (13) and qualitative analysis (11 studies) are most commonly employed in these research studies. This analysis supplied a number of key insights and areas in need of further research: By location, most publications come from Germany (57), the UK (-30) US is next with China just over 5. In these countries, researchers are particularly interested in how they can incorporate the latest technologies into educational curricula and approaches that have successfully promoted training and workforce engagement. It is worth noting that there are very fewer publications from India and maybe this could be an area for future research. Based on the keyword co-occurrence analysis, "Industry 4.0," "Industry 5.0" and "education" were used repeatedly in the network of keywords which represent main themes addressed within literature [93]. Results from co-citation network analysis identified are authors mainly from Germany, United Kingdom, United States and China that have had a great impact in the field. The impact of these authors: The very interesting collaborations are well presented. Moreover, significant others as IEEE Access Journal of Manufacturing and International Journal of Information Management, play roles in publication research on Industry 4.0 alignment Industry 5.0. This diversity of industries with studies reinforces the broad application area for these concepts — IT, manufacturing, operations... and also healthcare or even oil and gas. This form of engagement is illustrative in the need to evolve educational frameworks for a more discipline specific preparation, as trends point toward nuancing standard approaches that pave the way with knowledge work and performance over many longterm employment

**Divya and Sumathi**

themes. These results provide exciting promise and open new pathways of inquiry in this line of research. Additional research may examine the misalignments in current academic curricula and new demands by Industry 4.0 and Industry 5.0 oriented industries. The focus of this research should be to ensure graduates and students are equipped with the appropriate skills so as not only withstand the waves swept by these industrial revolutions, but also surf them. By bridging these gaps, future research in the space can play a role in evolving more responsive and agile education systems that will effectively prepare workers for jobs of the 21st century era; lastly expanding their job readiness.

CONCLUSION

This study gives a detailed analysis of aligning academia with Industry for the generations, i.e., 4.0 and 5.0 industry using bibliometric methods as an aid tool. Their recommendations stress the urgent requirement of revising academic curricula to include cutting-edge technologies and forming closer ties between educational institutions and industry. There are still many areas to investigate, particularly regarding the integration of Industry 4.0 and 5.0 technologies in various industries, sustainability over time from a curricular perspective, as well as facilitative partnership models between industry and academia.—Is there some research that went on for too long? What retains utmost importance is focusing on these gaps in future research that will help their educational systems prepare students well-enough to support the changing needs of industry and innovation over Industry 4.0, and into Industry 5.0

ABSTRACT

Commercial and non-commercial aircraft alike operate in a technologically advanced, highly competitive, and safety-conscious market. Rather than relying on goods and machinery, a company should build its competitive edge on its people, workers, and customers. A large portion of the organization's architecture, capabilities, security, and even certain day-to-day operations are influenced by these HR practices. It is no longer required to promote products in an environment that prioritises security, customers, and services. Managing the company's internal marketing to acquire client confidence is more important than ever before in the field of human resources management. Human resources' alignment of its methods, procedures, and activities with the organization's development requirements should be a key component of business operations. Service innovation is simple to replicate in today's cutthroat aviation market, but the private client of the aircraft has the secret to innovations that will remain unique. When compared to other global businesses, aviation is among the most unpredictable.

Keywords: workers, technologically, commercial, company's, environment.

INTRODUCTION

External factors are the primary cause of the continuous transformation in the Indian aviation industry's operational style. Not only is this sector vulnerable to takeovers and bankruptcies, but it is also impacted by external forces like politics, the economy, and consumers. In light of the above, it is clear that the aviation industry is confronting

**Darla Nagaraju and Venugopal**

difficulties in filling these positions via recruiting. Airline firms' demands are always changing, thus human operators must devise a method to assess emotions, obtain the necessary resources, and then distribute them accordingly. Ground attendants, pilots, flight attendants, and maintenance personnel are just a few of the various positions available in this division. Consequently, the HR manager is responsible for training staff to fulfil these unique requirements, establishing lines of direct contact, coordinating with other departments, and developing a recruitment strategy based on the information gathered. Organisations have a strong incentive to attend to the minutiae of HR policies and practices for workers since doing so is critical to better unlocking the knowledge, skills, and capacities of people—the company's fundamental competitive advantage. As a result, HR rules and practices are repeated. methods used in human resources. Human resources (HR) functions at its peak in the aviation industry due to both internal management aims and external environmental pressures on corporate executives to adhere to regulations.

REVIEW OF LITERATURE

Appelbaum, S. H. and Fewster, B.M. (2003) examined the field of civil aviation worldwide from the perspective of human resource management. Three audit categories—recruitment and selection, education, training and development, and organisation development—form a particularly cohesive cluster of HRM key success factors, and the paper presents the outcomes of these audits. A comprehensive audit of their organisations' HRM procedures was conducted by thirteen respondents from nine different countries, all of whom were executives from different airlines. There is a strong relationship between happy workers and world-class human resource practices, and a significant connection between happy workers and pleased customers in knowledge-based service businesses, according to the research.

Harel, G.H. and Tzafrir, S.S. (2001) looked analysed the data to see if the public and private sectors of the economy use Human Resource Management (HRM) strategies differently. Representatives from 44 percent of the companies surveyed filled out and returned 102 questionnaires. Evidence from HRM operations data was used to test the hypothesis. Since public sector organisations are heavily unionised, the authors observed that HRM domains dealing with employee selection and grievance processes get more attention from public sector managers. In contrast, private sector management places a premium on career advancement opportunities and performance-based compensation. But the authors also discovered evidence that government agencies are "moving" towards private sector models via the adoption of "high performance work practices" to conquer public demand and a tumultuous environment.

Tjiparuro, Z. (2012) researched and organised HR literature according to the three main domains: HRM, HRD, and OD. In addition, it compiled HRM, HRD, and OD fundamental ideas into a classification system; this scheme was then evaluated, and it was discovered to compare well with the People Capability Maturity Model (P-CMM), a notion recognised for greater organisational maturity. Seven top engineering and manufacturing firms in Pune, India, and fifteen human resources professionals' responses showed that the PCMM was a mystery. On the other hand, commonplace ideas like 5-S, kaizen, Sigma Six, performance management systems, employee satisfaction surveys, and ISO standards were found to have widespread support among practitioners and businesses. The methods were determined to be rooted in Deming's Plan-Do-Check-Action improvement cycle, which is the bedrock of the P-CMM.

Pillai, R. S. (2019). Increasing Productivity by Boosting Employee Engagement in India's Airline Sector. The relationship between engaged workers and productive Indian airlines is the focus of this study. It highlights how HRM strategies are crucial for improving operational results and creating an engaged workforce. Krishnan, S., & Gupta, A. (2017). Human resource management strategies and the happiness of aviation workers in India. This research delves into how HRM practices affect employee happiness, shedding light on how an engaged and enthusiastic workforce may be achieved in the Indian aviation sector via efficient HRM. Mehta (2020) cited staff turnover and retention as one of the industry's most pressing problems. It calls for a great deal of emotional

**Darla Nagaraju and Venugopal**

investment. To overcome this obstacle, companies have been concentrating on making their workers happy in their jobs. Personal, social, interpersonal, and organisational aspects have all shown in research to have a substantial impact on workers' levels of job satisfaction. Satardien et al. (2019) described Opportunities for employees to make decisions on their own, have private conversations, and get positive feedback on their work are highly valued. Considering the organization's suggestions and looking into other causes other than perceived support and organisational commitment might help with this turnover. Considering the organization's high turnover rate, aviation industry stability may be enhanced by fostering organisational commitment via organisational assistance.

Statement of the Problem

Issues pertaining to gender pay gap, employee insurance, and exploitation should be brought to light in the issues statement about HRM practices at Air India. An example of a research issue introduction is provided below: Increased competition, new technologies, and new regulations are all results of the aviation industry's recent expansion and transformation in India. The importance of human resource management (HRM) techniques on job security, performance, and stability has grown in recent years. Having said that, the present evaluation of HRM practices in Indian airlines has to be finalised in order to identify important obstacles and possibilities.

Theoretical framework**Airlines industry**

The majority of Indians still can't afford to fly, hence the country's aviation sector remains underdeveloped despite its enormous untapped potential. People who work in white-collar jobs make up around 40%. If partners want to help India achieve its aviation sector goal, they need to work together and engage with policymakers to put their principles and expertise to use. India can achieve its goal of being the third biggest avionics exporter by 2025 with careful planning and unwavering commitment to quality, value, and cost efficiency. Annual passenger traffic in India reached 308.75 million in fiscal 2018, an increase of 16.52% over the previous year. Between fiscal years 2006 and 2018, the compound annual growth rate was 12.72 percent. With an anticipated rise to 293.28 million passengers in 2020, the number of domestic passengers rose 18.28% from 243 million in 2018. There was a yearly rise of 9.40% in international traffic to 1,886,630 passengers in 2017–18 and a 14.40% increase in domestic traffic to 437,930 passengers.

Human Resource Management Policies in Indian Airlines

A company's policies are its overarching rules for accomplishing its objectives. Managers should have objectives that they want to attain and procedures that they should follow to make sure they do so. Laws are "established before the goal, designed to control the activities of the enterprise and based on the main points of derived behaviour." An organization's policy is a set of rules that members must follow when faced with certain challenges. Determines the extent to which choices may be made and then watches over their implementation to make sure the company meets its goals. Consequently, the fundamental method for managing people effectively may be described as employee rules. Solid employees are necessary, and his right notion is based on the reality that the company can't reach its objectives without an environment where workers feel comfortable interacting with one another and working together. Human resource management in its whole need to be a component of personnel policy. The following are the overarching personnel regulations for all HRM tasks:

Recruitment and Promotion Policy of Indian Airlines

There have been many amendments to the Indian Air Service (General Staff) since it was first declared in Rule 32 of Part 2 of the Gazette of India on 12 March 1960. Except for flight engineers and cabin crew, all workers of Air India are legally obligated to be familiar with these regulations.

recruiting, promotion, disciplinary actions, appeals, compensation, benefits, hours worked, leaves, and recruiting perks are just a few of the numerous services that it encompasses.

Recruitment and Promotion Rules

1. All Appointments made in accordance with this policy are governed by the Service Regulation, which applies to both service personnel and aircraft engineer personnel.

Darla Nagaraju and Venugopal

All employees should be classified in one or the other department-

- Accounting Department
- Central Tax Accounts Department
- Aircraft Engineering Department
- Transport Department
- Accounting Cost Statistics Department
- Internal Audit Department
- Material Supply Department
- General Affairs Department

2. The length of service should be in line with the duties of the position; Here are the conditions:

All four departments—Costs, Statistics, and Research Monitoring—are deemed to be part of the Ministry of Finance for the purposes of this rule.

3. Senior This level is entered by students who are at the same level. Consideration of seniority, age, experience, and field shall be given to long-term transfers across departments or fields.

4. All Posts will be filled by direct hiring, promotions, or, in the case of workers of the Indian or state governments, with the agreement of the President or CEO. Tasks requiring advancement may be filled by departmental hires or promotions from other areas, or by students in grades one through nine. Disputes involving personnel matters (such as promotions or hiring) must be resolved without delay. 6. Inadequate assistance for department heads at the executive level; The business has the right to fill vacant positions by direct hiring, promotions, other organizational means, as deemed necessary.

5. If The senior manager is not currently serving on the Committee. Disagreements over voting rights and Committee support have been reported to senior management. The report has to be examined. The Board of Directors' approval needs to be final.

Selection from Within Indian Airlines

Applicants with passing grades (defined as 60% or above) will be appointed to the panel in ascending seniority, with seniors given precedence. The duration of service in a certain class determines the seniority of that class.

Darla Nagaraju and Venugopal

A candidate will be considered "Excellent" if their score is 80% or greater. Appointments will be given first priority, but seniority will be taken into account when comparing them to others from the same group in the order listed on the panel.

Direct Recruitment from Outside Indian Airlines

Those applicants with the highest scores (60%) will be promoted to the top of the group according to seniority. Successful external applicants will be placed lower than internal candidates based on their scores.

1. Internal applicants with a 10/12 standard, SC/ST candidates, and ex-servicemen should be organised into separate groups according to the stipulated 30% selection.
2. The total number of applicants chosen The data supplied by the Personnel Department will form the basis for the selection groups in each of the mentioned names.
3. Following the interview, the following will be the suggestions put forward by the Selection Committee. You have two days from the time of selection to submit the survey and recommendation letter to the HR department for further processing.

Welfare Activities in Indian Airlines

Finding or supervising staff for both official and informal reasons is the responsibility of this office. Within the context of health policy, this provision permits the tracking of several behaviours. The Labour Law provides an explanation of many legislation:

- Workers' Insurance Law, 1923
- Compensation Law, 1925
- Payment of Wages, 1936
- Right to Complaint Law, 1947
- Employees' Status Insurance Law, 1948 , 1948
- Provident Fund Miscellaneous Act, 1953
- Gratuity Payment Act, 1972

In accordance with the rules set down by the Ministry of Health, Air India offers its workers a plethora of perks. Every area. Every service Whether or whether Air India's facilities double as hotels is only one of several things that will undergo periodic evaluation. Various medical facilities offered by Air India are as follows:-

Health Center

Both inpatient and outpatient therapy treatments are provided to employees at no cost. This job should be handled by trained medical professionals. Healthcare services for workers who pay a little amount into the Contribution Scheme (C.F.M.S.). Insurance coverage using the current REMS and CFMS systems. The glasses have a value of 500 rupees.

Staff Locations

You may find our staff in several major cities and train stations, including Mumbai, Kolkata, Delhi, and Chennai. The appointee will not receive any House Rent Assistance (HRA) funds, and the Authority will refund the licence cost at its discretion.

Restaurant

You may get restaurant services in Ahmedabad, Bangalore, Hyderabad, Kolkata, Chennai, and Delhi. Organisations in different sectors often get grants to bolster their operations.

Loan

Home loan: -Workers are eligible for a house loan depending on their salary after five years of service; the maximum loan amount is 2,000 Turkish Liras. Rs. 3 lakhs.

Darla Nagaraju and Venugopal

Vehicle Loans: - Cars, scooters, and bicycles may be purchased by employees via loans that are based on their wages. Here are the details of vehicle loans:

New car	Rs.75,000
Old Car	Rs.50,000
New Scooter/ Motor Cycle	Rs.15,000
Old Scooter/ Motor Cycle	Rs.6,000
Cycle	Rs.600

Group Insurance Plan

The amount that an employee's family receives from group insurance in the event of an employee's death on the job is directly proportional to the employee's wage as of the time of death. The cost of this non-participatory approach is fifty thousand rupees (Rs.150,000).

Ward Staff Training Program

A person may serve in a maximum of two capacities for a church if they have an associate degree or above. The courses a student takes and the field of study determine the scholarship amount. Participants in the programme are those who have been with the organisation for at least a year and are eligible to receive the stipend.

Holiday Homes

Healthcare centre personnel may also take use of Air India's vacation homes. Hotel No. Resorts and tourist spots in the mountains were the sites of its construction. Rent for housing is an expense that employees must bear. Here, workers have 60 days to plan ahead and 10 days to submit their departmental benefit applications (with an additional 5 days in May and June). The resort's official airline, Air India, takes its name from the nearby airport.

Region	Name of the Station
North Region	Mussoorie, Dharamshala
South Region	Kodaikanal, Ooty
West Region	Goa, Panchgani
East Region	Puri, Gangtok

Nominal rates for Holiday Home

For Grade ½	Rs.25 per day
For Grade 3/9	Rs.35 per day
For Grade 10/12	Rs.75 per day

Three Tier Approach for Evaluation of Performance Appraisal

P.A. In the event that it receives criticism. Afterwards, the employee should get feedback on these, and a proper conversation should be had to explain the employee's loss and how the mistake will be fixed. The P.A. has to be signed by all employees and managers. Everything will be OK. A programme that offers promotions is known as the Fixed Deposit Promotion Programme. Assuming the worker has been free of criminal charges over the last three years. To verify that no wrongdoing has occurred during the last three years, you should compile an integrity and health certificate. Construct a truthful medical certificate that demonstrates his dishonesty throughout the last three years. Typically, a promotion that is applied after the fact is based on both merit and fault. If an employee is found to be lacking, their advancement will only be considered based on the report. Accounting books or yearly statements, as well as monthly statements, are the responsibility of this division. Statements of property, income, etc. The planning department has to provide the site with more personnel and monthly instructions; establish a reporting role and draft various reports.

**Darla Nagaraju and Venugopal****Protection of Company Residence**

More than three months after retiring, retirees are allowed to stay in the corporate apartment. But we won't cancel his account until after Eid.

ID Card

In order to access the IA area and have a good time on vacation, retired workers will get a unique ID card.

Training Department of Air India

Together with other departments and outside trainers, the training department plans the training. Paravartan is a company-wide initiative that Air India (IAL) has previously used to influence employee behaviour. During the course of the two days, almost three thousand employees from all around the Northern Territory were there. From its debut in 1957, when the Ministry of Commerce began offering courses in four disciplines, Air India's training and development programmes have centred on training. Later, in 1965, to address some of the requirements of workers and other economic community members, the Economic Development Corporation was founded. Business performance is impacted by the complete business training network, which is centred on commercial staff training and aircraft training for commercial personnel. In 1968, when management at Indian Airlines saw a need for this kind of training, they engaged Professor Ishwar Dayal to assess the company's requirements and design the first curriculum. According to the results of the poll, Indian airlines should train its employees in the following ways: Air India's Policy on Central Training:-

1. Check the organization's training gap and adjust to meet needs.
2. Course selection must clearly follow the criteria (A) Personal needs related to personal development. Training should continue throughout the event.
3. Provide training to all staff, including senior managers.
4. New recruits and non-commissioned officers will be released through a special induction program.
5. Experience building experience with members of other organizations.
6. Disseminate training results to the broader community.
7. Communicate Air India's plans and policies to all levels of management

Gender Pay Gap

The disparity in salary between men and women who do equivalent work is known as the gender pay gap. All around the globe, this is a major issue, but notably in the airline sector. Women only account for 3.3% of seats and 5.2% of airline CEOs, according to a study by the International Air Transport Association (IATA).

Gender Pay Gap in Indian Aviation Industry

There are several prospects in India's aviation business, which is one of the country's main industries. But the gender wage gap is still somewhat large, even if the economy is doing well.

The gender pay gap in India ranks 112th out of 153 nations, according to a research by the World Economic Forum. According to the data, women in India earn 62.5% less than males. Even the aviation sector follows this rule. Women in Aviation found that compared to male pilots, female pilots in India earn 30–40% less.

Factors Contributing to Gender Pay Gap in Indian Aviation Industry

The disparity in salary between men and women in India's aviation business has several causes. Career Opportunities in Indian Aviation Industry. Lack of female representation in leadership roles is a major contributor to this problem. Women are underrepresented in aviation's upper echelons of management and decision-making, contributing to the industry's overall male dominance. The gender wage gap is exacerbated by the fact that men and women have different roles and responsibilities in the workplace. Generally speaking, males tend to work in higher-paying occupations like drivers or managers, whilst women tend to work in lower-paying positions like housekeeping or agricultural labour.

Darla Nagaraju and Venugopal

There is a gender wage gap, with women holding higher-paying positions. Get away from your desk and tend to your loved ones for a while. They will earn less than males in ordinary jobs since the nature of their labour is different.

Employee Protection

Even while the airline business is massive, it doesn't always translate to happy workers. American Airlines is seeing an upsurge in strikes, and according to Forbes, the staff turnover rate is close to 20%. Look at what airlines might do to boost employee retention rates in light of the perceived stress in the present economy.

Self-Employment

There should be a strong sense of community among the thousands of airline employees. It becomes simpler for managers to take care of employees when the fast-paced nature of the aviation sector brings in a huge number of workers. Airlines need to figure out how to get everyone on the same page if they want to solve their business difficulties. To do this, leaders should familiarize themselves with their team members' strengths and areas for improvement before distributing responsibilities.

Creating a Sense of Community

Airline workers need to feel like they belong somewhere, and that can only be achieved if the company fosters a stronger sense of community. Several things may be done to make this happen, such as working together regularly, choosing leaders in the community, being open and honest, and forming an organisation around the objective.

More than Salary

A competitive wage is not the deciding factor for most job candidates. Rather, they are delving into the perks offered by airlines, which implies they should start thinking about factors other than pay. A gift and reward card redeemable at over a thousand different businesses is just one example.

We Help Employees Reach their Potential

If their demands aren't addressed, most airline personnel will depart in pursuit of professional advancement. Hence, airlines should implement plans to assist their staff in realising their full potential. Anything from giving more training to giving someone more responsibility to show that they are confident might be considered. Working in an environment that challenges and develops airline personnel is common.

Communicating Transparently

Conventional wisdom held that the most effective leaders should rise to the top and work their way down. However, a lot has changed, so maybe the firm has some great ideas now. Consequently, airlines should provide a forum for staff to share their opinions and have their proposals considered. Managers should reach out to all workers who are working together to foster camaraderie if they want to see future success for their company.

Celebration

Workers want to be appreciated and recognised when they put in a lot of effort. While it's important to acknowledge workers' achievements, it's crucial to avoid showing favouritism, especially if doing so encourages everyone to work more. When everyone in the economy is in a good mood, production goes up and the economy falls.

Airline companies should realise that there is more to employment than simply generating a profit and treat their workers with dignity and respect. It is time to modernise, using the principles mentioned before as a foundation.

CONCLUSION

In both industrialized and developing nations, the ready-to-eat food market is expanding at a rapid pace. There has been a rise in the demand for ready-made meals due to changes in consumer behaviour. A lot of things in their life

**Darla Nagaraju and Venugopal**

can be causing these changes. Among them, the rise of two-person or single-parent households, personal income, consumer expenditure, and the number of women in the labour force stand out as particularly significant. Thanks to innovations in healthcare, people may spend less time in the kitchen and more time on other pursuits. Shoppers are putting in less time in the kitchen and more time buying. This is due to the fact that individuals are facing a shortage of leisure time as a result of several variables, such as increased production and earnings. As a result, individuals are compelled to utilise their time to improve their financial situation and spend more quality time with their family, like in the kitchen. Consumers see the elderly as a potentially large and expanding demographic. Teens and young adults, who are often in the workforce and have a family of one or two, make up the next expanding demographic. According to the findings, one major contributor to the expansion of the fast food market is people's more hectic and demanding daily routines as a consequence of their increasingly extended work hours. The respondents, the most of whom are working women, said that they would prepare meals in advance so that they won't have to worry about cooking while they're busy.

FINDINGS

In aviation, like in many other industries, the gender wage gap is a major issue. The gender wage gap is a problem in many fields, including aviation. Businesses in India are strongly urged to follow laws that guarantee equal pay for equal work. Preferred actions included open compensation plans, equal pay regulations, and initiatives to increase diversity and inclusion. Findings from this study could provide light on unique difficulties faced by women in the aviation sector, such as low job security or stagnant professional advancement opportunities. Employees are happier and the public has a better impression of companies that make an effort to reduce the gender wage gap.

Retention and employment

Managing human resources effectively includes retaining employees, which is particularly critical in fields like aviation that need specialised knowledge and education. Competitive pay, chances for professional growth, a healthy work-life balance, and supportive management are common retention tactics. Because of the intense competition and the critical need for skilled workers, airlines may find a high turnover rate to be a problem. When people aren't happy in their jobs, they may experience stress, a lack of possibilities to advance in their careers, and an overall unhealthy work-life balance. Indian airlines may improve their staff retention rates by providing them with a positive work environment, funding their professional development, and instituting retention policies.

Recent Updates

Some things may have changed or happened in the world of business in India since I last checked in. Publications, academic research, and trade journals should be perused for up-to-date information about human resource management techniques in Indian airlines. For the most up-to-date information on gender diversity in HR, employee retention insurance, abuse at Air India, and other related topics, you should read recent academic papers, trade journals, and corporate reports. Further helpful resources include talking to HR specialists, business experts, or researchers in the field.

Suggestions

The results show that the ready meals business has a lot of room to expand. Interacting with ready-meal customers and gathering their views on the crucial missing traits was made possible by the survey. Because of this, the development stage for sellers of ready-to-eat meals will last longer, allowing them to gain the advantages of their product. It would be wise to pay greater attention to the comments and recommendations given by customers in order to encourage them to purchase ready-to-eat meals, because the majority of consumers have a good attitude towards these products.

**Darla Nagaraju and Venugopal****Discounts**

A lot of young adults and students who live on their own choose to purchase pre-packaged meals. The meal preparation firm may expand its target market beyond consumption if it meets their desire for time savings at a reasonable price. This allows the business to maintain a strong position in the fresh food sector, where ready-to-eat meals are sure to attract budget-conscious shoppers who value convenience above price.

Make it available

Important suggestions Indian businesses rely on customers' familiarity with and preference for Indian goods to drive sales, but when supplies run low, buyers will go elsewhere.

Promotion/diversity of Indian food

Another reason more people buy food is because there isn't enough variety in ready-to-eat items. Indian businesses are putting a lot of effort into finding a solution and providing more to consumers, but they need take the aforementioned suggestions into account to make it more accessible.

Product changes

Companies should lower the fat and salt level in various goods as they are aware of the many health issues that may be caused by these ingredients. They also claimed that meal prep services could make lower-fat alternatives in addition to their more dubious offerings.

ABSTRACT

New working patterns, such as flexibility, have emerged today that allow the employee free choice on where, when, and how to work. This work aims to analyze the extended effects of, and the relationship between, flexible working arrangements and organizational productivity, employees' satisfaction and turnover. Studies show that flexibility at work has a positive impact on organizational effectiveness because of increased efficiency, better work-life adjustment, and fewer sick days. Furthermore, they tend to raise the levels of employees' satisfaction because of enhanced job content control and diminished commuting pressure. However, these advantages always come with organizational requirements and meeting the desired balance and distribution among all the employees have remained a problem for HR professionals. Some of the factors that have to be considered include cohesion, control of productivity problem, and equality issues between in-office and work from home employees. Measures that include adequate communication, sound performance management systems, and effective policy enabler and execution are the keystones when it comes to getting the most out of flexible working, while avoiding the pitfalls along the way. Although this research meta-analyzes available literature, SHRM scholars may find its topical suggestions functional for understanding the opportunities and challenges that flexible working arrangements pose to working people and practicing HR practitioners. As a result of such dynamics, reading this paper shall enable the organizations enhance a positive working environment that correlates with the high satisfaction levels and long-term retention among the workers as well as boost organizational performance.

Keywords: SHRM, better work-life adjustment, organizational performance, employees' satisfaction

INTRODUCTION

Recent changes in the organization of work brought by technologies and preferences of employees to have work-life balance have also caused the emergence of FWAs. These arrangements include work from home arrangement, flexible working hours and compressed working weeks which provide employees with self-organization and flexibility as to how they balance work and other duties. Therefore, the study of FWAs and their impact on organisational performance, employees' satisfaction, and retention becomes even more important as organisations strive to gain competitive advantage and attract best talent. Teleworking capabilities are normally seen as having the possibility of enhancing organizational commitment and satisfaction due to flexibility from demands placed on an individual and strain from commuting to work. Increased satisfaction, in turn, means that employees will be less inclined to leave the company, which reduces turnover. Thus, the impact on the organizational performance gives somewhat mixed picture. On one hand, FWAs can contribute to higher productivity and innovation through increased employee motivation, but on the other hand they present certain difficulties when it comes to cohesiveness of the teams and management of their performance. Human Resources is caught between these dynamics, it tries to design and secure FWAs that serve organizational interests but also meet its employees' needs. They include the aspects of providing different lines of communication, creating proper systems of performance management, and considering possibilities of working hours' flexibility in the organization. Regarding these aspects, this research will seek to look at ways and means through which various FWAs can be instituted as well as other recommendations on how the benefits of such can be savored with least frustrations of the challenges mentioned above.

RESEARCH OBJECTIVE

- To assess the Effect of Flexible Working Arrangements on Organizational Performance
- To evaluate the Impact of Flexible Working Arrangements on Employee Satisfaction
- To investigate the Relationship Between Flexible Working Arrangements and Employee Retention
- To develop HR Strategies for Balancing Flexible Working Arrangements with Organizational Needs

RESEARCH PROBLEM

This paper aims to outline how the incorporation of flexible working arrangements (FWAs) into today's work setting has raised noticeable concerns on how it is affecting organizational performance, employee satisfaction, and retention. In the wake of organizations embracing FWAs including tele-work, flexible time, and compacted work schedules, there is a bind to examine the impact of these arrangements on different aspects of organisational life. Thus, the relationship between FWAs and OPB is still unclear although FWAs are considered to positively affect employee satisfaction, experienced decrease in work stress, and improved work-to-family conflict. The nature of the controls raised issues about productivity, team spirit and pattern of performances, all of which needs to be discussed in order to understand the effects of these arrangements. The difficulties arise in the fact how to meet organizational and business needs on the one hand, and promote FWAs on the other one. As a result, HR has to identify such effective strategies that would increase employee satisfaction and retention while at the same time meeting or surpassing the organizational performance goals needed to implement FWAs. Thus, questions such as how FWAs affect overall productivity, how it affects the retention rate of employees, and how FWAs can be effectively balanced with productivity standards fall into the key areas of concern for the management of HR. To arrest these issues, it is consequently necessary to assess the reciprocal impacts of FWAs on the organisations and employees. The following research questions shall be answered The purpose of this research is to identify all the potential effects of FWAs and proffer quantitative suggestions for the utilisation of FWAs in holistic HRM strategies by practitioners taking into consideration the organisational strategic map.

LITERATURE REVIEW

Impact of the Implementation of Flexible Working Arrangement on Organization performance

The use of FWAs has emerged as a successful organizational intervention for the changing nature of work, but the effect on organizational effectiveness and efficiency is recognized to be a complex relationship. Contemporary research on FWAs' impact on performance indicators has reported both benefits and drawbacks. On the other hand, extant literature indicates that FWAs lead to improved productivity and employee satisfaction. For instance, Bloom et al. (2019) observed that workers who were allowed to work from home delivered more and quit at a slower rate than the office workers. This improvement is sometimes explained by "reduced commuting stress and increased work autonomy positively impact job satisfaction and motivation" (Choudhury et al., 2020). Besides, FWAs can catalyse innovation since employees are able to work in contexts that are in harmony with their chronotypes (Allen et al., 2015). On the other hand, FWAs imply some challenges for organizational performance and its enhancement in particular. Some of the challenges that the employees put forward include reduced cohesiveness of the teams, lack of communication, and performance tracking problems (Gajendran & Harrison, 2007). From this, one may deduce that the physical absence can limit IMC because of the reduced ability to support teamwork and result in management issues concerning enforceability of responsibility and work productivity (Kossek & Ozeki, 1998). Hence, the enforcement of FWAs requires appropriate consideration and planning. These challenges indicate that organisations need to have sound performance management systems and also engage in efficient virtual communication. Solving these potential drawbacks, organization can utilize FWAs to improve the organizational performance and at the same time, preserve the positive team relations.

Analysing the possibility of the existence of the Relationship Between Flexible Working Arrangements and Employee Retention

Flexible working arrangements (FWAs) and its link with employees' turnover intention is one of the trending areas of research in today's organizations. LWAs like telecommuting, flexible schedules, and reduced workdays are more implemented to improve the level of the employee's contentment and decrease turnover rates. In order to understand this kind of a relationship, flexibility must be understood depending on the ways in which it influences the factors that make employees to stay or leave a given organization. Descriptive research indicates that the implementation of FWAs can have a direct impact on the levels of staff retention since it addresses issues related to job satisfaction and work life balance. Allen et al., 2015 echoed the same by pointing that for employees with workplace flexibility, they are always happier, more satisfied at their workplace, and would not want to leave their employer. This relationship is believed to be linked to flexibility that comes from these arrangements which have their effects on the stress levels and hence employee performance and retention. Nevertheless, the association is not always proactive and might differ depending on the specific organizational setting and certain employee characteristics. For instance, Choudhury, Foroughi, Larson (2020) indicates that although the FWAs might enhance retention of employees in some categories, they can as well pose some difficulties like social exclusion and communication barriers which would deter retention of the employees. Moreover, generalizability of the FWAs in achieving the retention enhancement may mute with the degree to which employees perceive these arrangements as fair and unbiased at workplaces (Gajendran & Harrison, 2007). For organizations to get the most out of FWAs on the issue of retention of employees, leaders are encouraged to apply these arrangements wisely. Positive managerial actions, which are depicted as communication, performance review, and ensuring FWAs are made available for the employees are essential if flexibility is to boost retention (Kelliher & Anderson, 2017). Thus, recognizing these factors will help organizations to closer ties between the FWAs and retention of employees.

METHODOLOGY

As a consequence, the research of the present paper uses a single quantitative research method for assessing the consequences of FWAs on organizational performance, employee satisfaction, and turnover. In the proposed study, data would be gathered through structured questionnaires administered to employees in different organizations that

**Sharada Shiva Prasad and Nagalakshmi**

have adopted FWAs. The survey data will include quantitative data on organisational performance, job satisfaction and retention rates; objective and standardised, using reliable, valid tools. In order to process the data collected from clients/patients and their relatives, Statistical Package for the Social Sciences (SPSS) will be employed. Qualitative data will be described through basic descriptive analysis while quantitative variables will be subjected to correlation and regression analysis to test their hypothesis between FWAs and the organizational performance, employees' satisfaction, and retention. This analysis will aid in determining several important trends and associations that will allow a better understanding of FWAs' impact on these outcomes and HR's ability to manage these requirements. It will also entail comparing FWAs' perceptions with different demographics and organizational settings to gain insight into the general scope. Due to the combination of the quantitative analysis of data collected with the application of practical advice, the study will be able to provide guidelines to the elements that should be considered by the practitioners, especially the HRM ones, with the intention to make the best out of the FWAs within the organizations' frameworks.

Analysis

Demographic examination

Age

The above-demonstrated figure and table highlight the age distribution of the respondents which efficiently displays that the most frequent was the 36-45 years indicated 29.83%. Moreover, there were 19.75% more than 46 years of age, 22.22% 26-35 years of age people, and the least frequent were 8.64% of 15-25 years aged individuals.

Gender

The above table and figure show the gender of the contestants which advocates the percentage of distribution in the survey. There were 34.57% of females, 24.69% males, and 20.99% of individuals who refused to reveal their gender involved in the survey.

Designation

The above figure and tables establish the designation of the contributing professional personalities in the survey. There were 34.57% of managers, 25.93% of COO, and 19.75% of CEOs participated in the survey.

Descriptive analysis

The above table denotes the descriptive examination of the established IVs and DV. Moreover, the skewness and kurtosis values of DV are 0.297 and -1.445 respectively. However, the mean score values of the IVs are 2.17, 3.09, 2.29, and 2.48 respectively.

Regression**Hypothesis**

H1: There is a strong connection between flexible working hours and organizational performance. The above table highlights the tables of measurement for the first hypothesis showing model summary ANOVA and coefficient tables. It can be realized that the significance value is 0.058 which is around equal to the standard value of 0.05 suggesting a strong connection between flexible working hours and organizational performance.

H2: There is a significant relationship between remote work opportunities and organizational performance

The above table sheds light on the tables of measurement such as model summary, ANOVA, and coefficient table for the third hypothesis. Moreover, the R and R square values are 0.26 and 0.069. However, the significance value is 0.057 which is roughly equivalent to the standard usual value of 0.05 suggesting that there is a positive connection between the IV2 and DV.

H3: Work-life balance plays a huge role in improving the Organizational Performance. From the ANOVA table, it can be seen that the significance value is 0.050 which validates the developed hypothesis three suggesting a strong relationship between the developed dependent and independent variables.

**Sharada Shiva Prasad and Nagalakshmi**

H4: there is a huge impact of Employee Autonomy on the performance level of the organizations. The above table sheds light on the tables of measurement such as model summary, ANOVA, and coefficient table for the fourth hypothesis. Moreover, the R and R square values are 0.47 and 0.227. However, the significance value is 0.054 which is roughly equivalent to the standard usual value of 0.05 signifying that there is a strong relationship between the IV4 and DV.

Correlation test

From the above table of correlation investigation, it can be supposed that the uppermost relation value of IV4 which is the use of technology for learning, and the value is 0.914 which is near to the standard P value of 0.9. Therefore, the developed dependent and independent variables are strongly interrelated with each other.

DISCUSSION

The introduction of FWAs in the context of organizational performance and satisfaction as well as employee's turnover involves a balance, which is quite sensitive for an organization to achieve. According to the current literature, there is an implication that implementation of FWAs will go a long way in improving the level of satisfaction of the current employees hence; increasing their retention rates. When employees do not have control over the working hours, the level of stress rises, however, the organizations that enable the employees to have control over working hours and environment see their employees job satisfaction, organizational commitment, and turnover rate decrease (Choudhury, Foroughi, & Larson, 2020). The convenience, especially in the areas of working time and location, is highly appreciated by the employees because it contributes to non-work activities, and thus affects productivity rates. However, it must be stated that the connection between the introduced FWAs and the performance of an organisation cannot be considered very direct or unambiguous. On the positive side, FWAs have additional repercussions with reference to betterment of satisfaction level of the employees and decline of turnover rates. On the other hand, FWAs have some demerits in connection to performance evaluation and team spirit. There is a possible consequence of timely usage of remote or flexible working patterns that is effective communication disruption and decrease of the six people interaction that in the opinion of Allen et al., (2015) is disadvantageous for the project results or for the final result. Adherence to the requirements will assist in preventing such adverse effects as such; On the same note, conscientious practice of the performance benchmarks and the workers' interactions with their teams is integral in preventing such negative repercussions. Relations with the staff, such as Human Resources (HR) does apply such dynamics with the intention of levelling. For this reason to a large extent FWAs need to be backed by efficiency performance set systems which HR has to implement to factor flexibility while working for the same company at the same time. This involves identification of the goals and objectives, pre-eminence of vehicle communication, and best practice of on call or Butler employment (Kelliher & Anderson, 2017). By remedying these determinates HR could enhance the positive impact of FWAs on the employee satisfaction and work retention without the ill-effects on the organizational performance.

CONCLUSION

This paper reviewed the literature on the effects of FWAs on OP, ES and retention, working with the understanding that FWA presents both opportunities and issues for today's workplaces. Numerous studies have demonstrated that FWAs produce better satisfaction and hence higher retention levels to employees due to the opportunity that grant workers the chance of having work-life balance besides the autonomy they possess that would improve job loyalty hence reducing levels of turnover in organizations. However, organizations have to overcome possible disadvantages, like the issues encountered in communication in performance management, which hinders productivity. In order to strike a proper chord between these requirements, it is imperative that HR departments put into practice strategic plans that consists of guidelines such as specific performance measures that demonstrate virtual communication proficiency as well as equal opportunities in regard to flexible working policies. In this manner, through the active control of those factors above mentioned, the organisations can gain all the pluses of

FWAs without a detriment of their performance, let alone its improvement and creation of the balanced flexibility management.

ABSTRACT

In rural areas, the Primary Agricultural Cooperative Society (PACS) is crucial for the growth of the agricultural sector. PACS provides necessary services, such as agricultural services, financial inclusion services, e-mobility and smart products, PDS services, and other services, to those needy people at the right time and only for the goal of servicing people. As an example, the PACS acting as a bridge between farmers and the government. PACS is the root of every scheme implemented by both the central and state governments. The Cooperatives are functioning at cross root level and also under prescribed principles which are reformulated by ICA. Cooperatives is not a separate owner entity organisation. In this regard, "member can become an owner than owner can become a member". However, the owner of members are not concentrating fully for the betterment of cooperatives in India. Even though the futures are available in the cooperative organizations, they are not able to function well due to lack of members and board of directors participation. The results indicate that due to lack of skills and knowledge, the board members' are not able to lead the cooperatives effectively. The effectiveness of a board is heavily influenced by its leadership, communication, accountability, and ways of making decisions. Higher effectiveness is related to a style of management that transforms which is characterized by empathy, trust, and open communication. The study highlights the need of board member capacity-building initiatives that emphasize communication, focusing on leadership skills, and decision-making. The study additionally recommends that PACS take a more participatory approach when making decisions, involving stakeholders and members in the process. The author suggests that implications for the Cuddalore District's PACS. Overall, this study provides valuable insights into the role of the board of directors in the

81243

**Padhmanaban and Arthi**

leadership of a PACS and highlights the importance of effective leadership in promoting the success of these organization.

Keywords: Leadership, Board of Directors, Accountability, Governance, Management, Leadership style, Effectiveness, International Cooperative Alliance (ICA).

INTRODUCTION

According to the International Cooperative Alliance, by supporting local communities, fostering equity in society, and promoting sustainable agriculture, cooperatives have the potential to improve the livelihoods of billions of people around the world. In cooperatives, the board is in responsible for setting up the overall direction and strategy of the organization, overseeing its day-to-day operations, and making important decisions that impact the success of the organization. **At the highest decision making body in the cooperatives, the Board of Directors leadership is essential in fostering a culture of transparency, accountability, and member participation. Effective leadership by the board of directors can lead to increased efficiency, improved member satisfaction, and enhanced reputation for the cooperative.**

Role and Responsibility of Board of Directors

1. Overall Governance: The Board of Directors is in responsible for setting the cooperative society's overall direction and strategy and making sure that it is consistent with the organization's mission, values, and goals.
2. Policy Making: The Board sets the rules and guidelines that govern the cooperative's operations, ensuring that they are fair, transparent, and represent the needs of the members.
3. Strategic Planning: To ensure sure the cooperative is well-positioned for achieving its goals and objectives, the Board develops and reviews strategic plans.
4. Financial Management: The Board is in responsibility of the cooperative's finances and makes ensuring that it makes prudent and responsible financial decisions.
5. Risk Management: The Board oversees and regulates risks that could impact the cooperative's financial performance, reputation, or day-to-day operations.
6. Governance and Compliance: The Board ensures that the cooperative complies by all relevant regulations, laws, and standards and that its governance practices are transparent and accountable.
7. Member Engagement: The Board engages with members, focusing attention to their issues and ensuring their voices are heard.

REVIEW OF LITERATURE

The researcher reviewed 20 number of literature related to the study, at the same time a minimum no.of literature related to the study which are given below. On the basis of the review done, it was understood that the present research is clearly with a different line of thinking and approach to highlight the Cooperative Governance in the Cuddalore District in Tamilnadu. Relevant literature in Role of Board of Directors is reviewed in this section in order to identify research gap in the field. **Singh and Prathap 1985** – Education is essential for self-control, supervision, and better and successful utilization of cooperative credit in cooperative education. Political intervention in recovery matters should also be reduced, as highly qualified and experienced staff may considerably reduce the adverse impacts of such interface on recovery outcomes. **Ahmed et al., 2016** –A crucial factor in cooperative societies' success is the Board of Directors' leadership. According to the author perspective, accountability, transparency, and strong governance are characteristics of good leadership.

**Padhmanaban and Arthi**

Mwangi et al., 2017 – The leadership of the Board of Directors is also influenced by the role played by stakeholders. The study found that stakeholder engagement and participation can enhance the effectiveness of cooperative leadership. **Abubakar et al. 2017** – Members of the Primary Agricultural Cooperative Society also shared their thoughts on the effectiveness of their board of directors. According to a study, members believed the cooperative's ability to make decisions in an accountable and transparent manner depended on having a strong Board of Directors. **Wahab et al., 2018** – The personalities and behaviours of each board member have an influence on the board of directors' leadership as well. According to this study, the personal beliefs, attitudes, and behaviours of board members significantly predict their cooperative performance. **Abubakar et al. 2019** – To ensure PACS's success and build member trust, accountability and transparency are important. Regular financial reporting and open communication were considered to be essential for upholding accountability and transparency within the cooperative.

Research Gap

There is a need to develop in more number of aspects in the study area Cuddalore District. Which are relating to the Board of Directors in Primary Agricultural Cooperative Societies. The effects of digital transformation, gender diversity, training and development, Awareness and educational programs, involvement of stakeholders, and the long-term impact of leadership styles are a few of these. Despite the fact that men represent the majority of the board, the study did not examine the potential effects of more gender diversity on processes for making decisions, the effectiveness of leadership, and cooperative results. Furthermore, an ongoing study of the ways in which different styles of leadership influence PACS's sustainable growth and performance has been excluded from the study. Filling in these gaps could provide to a more thorough knowledge of the factors affecting PACS sustainability and effectiveness.

Statement of Problem

The leadership of a Primary Agricultural Cooperative Society is important for its success. Even though such significance are available, due to different opinion of both cooperative and Board of Directors, lack of education and skills, weak governance practices, lack of transparency, and accountability can lead to mismanagement and conflicts within the cooperative societies. Inadequacy of leadership quality in the PACS which in turn affects the development of the society. So in the line of thinking, the researcher wanted to study the enhancement of leadership effectiveness of Board of Directors in the PACS.

Objectives of the Study

1. To study the level of Board of Directors participation in the study area in Primary Agricultural Cooperative Society.
2. To access the member satisfaction about the Board of Directors services in Cuddalore District.
3. To find out the suitable solution for the betterment of PACS in the study area.

RESEARCH METHODOLOGY

The present study is based on both Primary and Secondary data. The primary data is collected from the Board of Directors and members by interview schedule of the PACS in the Cuddalore District and Secondary data is collected from the various books, journal, articles and websites relating to PACS. The Primary Agricultural Credit Cooperative Society working under Cuddalore district is divided into 3 circle viz., Cuddalore, Chidambaram, and Viruthachalam. Cuddalore circle consisting 4 blocks, Chidambaram circle consisting 5 blocks and Viruthachalam circle consisting 4 blocks. Chidambaram circle under 57 PACS, Cuddalore circle under 56 PACS and Viruthachalam circle under 46 PACS. Totally, 159 PACS are working in Cuddalore District. The researcher chosen 56 PACS from each block 4 societies undertaken on the year of establishment. Each Five respondents from each society as a Members and 3 from each society have been selected respondents are Board of Directors. Totally, Members are 280 and Board of Directors are 112 respondents. Out of 392 interview schedules, only 92 were answered fully by the

**Padhmanaban and Arthi**

Board of Directors and 268 by Members, resulting in 360 respondents being chosen for the researcher. Proportionate Stratified Random Sampling method was chosen for the selection of proper sampling frame of the study for collecting in the PACS. Sample size mentioned in below Table 1.

Tools of Analysis

The researcher have been used Percentage Analysis for this Study

Data Analysis and Interpretation

It is observed from the below table that out of 100 respondents, there are 6 respondents from the age group of 18 -20 years, 13 per cent of the respondents belongs to 21 – 30 years, 10 per cent of the respondents are from 31 – 40 years, 35 per cent of the respondents belongs to 41 – 50 years, 7 per the age group of 51 – 60 years. 27 respondents are belongs to the age group of above 60 years. It is inferred from the below table that majority (35 per cent) of the respondents belonged to the age group of 41-50 years years which shows that cooperative society is has more board of directors from the above age category. It is observed from the below figure that out of 100 respondents, 74 per cent of the respondents belongs to male and 26 per cent of the respondents belongs to female gender. It is inferred from the below table that majority (74 per cent) of the respondents belonged to male gender which shows that cooperative society has more male members than female gender.

Awareness among Board of Directors about Cooperative Society

The Researcher wanted to know the role and level of awareness about Board of Directors in Cooperatives. In few aspects, which are given below.

Principles of Cooperation

In the Table 4 clearly explained about that the understanding level of cooperative principles by the Board of Directors. According to the Table majority out of 92 respondents, 96 per cent (88) respondents said No about the Principles of Cooperation. And out of 92 a megar, 4 per cent (4) respondents only Aware about the recent principles which are reformulated by the ICA.

Significance of By-laws: In the below Table indicates that Significance level of By-laws by the Board of Directors, out of 92 respondents, 93 per cent (86) respondents are not aware of the Significance of By-laws, and remaining 7 per cent (6) respondents are aware of the by-laws are followed by the Cooperative Society as per the Guidelines.

Significance of Cooperative Movement

In the below Table 4 revealed that Significance of Cooperative Movement by the Board of Directors, out of 92 respondents, 80 per cent (74) respondents are not aware of the Significance about the Cooperative Movement, and remaining 20 per cent (18) respondents are aware of the cooperative movement which is access by the government.

Getting Proper Rights in Cooperative Society

Table 4 despicts that getting proper rights in cooperative society, Out of 92 respondents, 13 per cent (12) of respondents are aware, and remaining 87 per cent (80) of the respondents are not aware about their rights within the cooperative society.

Attending Board of Directors and General Body Meetings Regularly

Table 4 shows that attending Board of Directors and General Body meeting regularly, Out of 92 respondents, this aspect has a relatively higher awareness, with 42 per cent (39) respondents are regularly attending meetings, while 58 per cent (53) of the directors are not aware about attending the general body meeting. The data indicates a general lack of awareness among the board members about the fundamental principles, by-laws, and the overall significance of the cooperative movement. This lack of knowledge could impede effective governance and the functioning of the cooperative society. The highest level of engagement is in attending meetings, yet more than half still do not attend regularly.

**Padhmanaban and Arthi****Board of Directors Services in Members View**

The Researcher collected the necessary information as under about Board of Directors services in members view. In few aspects, which are given below.

Participating in General Body Meetings

Table 5 reveals that participating in General Body Meeting, Out of 268 respondents, only 23 per cent (61) of the respondents participating in the general body meeting, and remaining 77 per cent (207) of the respondents are do not participating the general body meeting.

Sanctioning Agricultural Loans on Time

The table 5 indicates the sanctioning agricultural loans on the time in cooperative society. 27 per cent (72) of respondents are said yes of the loans are sanctioned on time in the cooperative society, compared to 73 per cent (196) of the respondents are said no for loans are not sanctioned on the right time.

Rights to Take Xerox Copies of Records

Table 5 explains that a very small proportion 3 per cent (9) of the respondents said yes that taking Xerox copy of records in the cooperative society, whereas 97 per cent (259) of the respondents said no to that in cooperative they are not allowing to take Xerox copy of the records.

Rights to participate in the Welfare of the Society

The below table revealed that welfare of the society, out of 268 respondents, 22 per cent (8) of members feel they have the rights, and remaining 92 per cent (246) of the respondents are said no for that they did not have a rights to participate in the welfare of the society.

Equality among Members

Table 5 shows that equality among members, out of 268 respondents, 19 per cent of (51) respondents are said yes for there is a equality between members, and remaining 81 per cent (217) of the respondents are said no for equality among members.

Political Influence

From the below table it can understood that out of 268 respondents, 29 per cent (79) of the respondents are said there is no political influence in cooperative society, whereas 71 per cent (189) of the respondents are believe there is more political influence in the cooperative society.

Accountability and Transparency

Table 5 clearly shows that, 18 per cent (47) of the members said yes to there is accountability and transparency, while 82 per cent (221) of the members are said no for accountability and transparency in cooperative society. The data indicates dissatisfaction among members regarding their rights and services provided by the Board of Directors. Issues such as lack of participation in meetings, delayed loan sanctioning, limited rights to access records, low participation in welfare activities, perceived inequality, political influence, and a lack of accountability and transparency are prominent concerns.

Level of Member Satisfaction about Board of Directors Services

The researcher could like to study in detailed manner about opinion regarding Board of Director in cooperative society in select aspects viz, Participating in General Body Meeting, Sanction the Agricultural Loan in Time, Rights to Take Xerox Copies of Records, Rights to participate in the Welfare of the Society, Equality among Members, Political Influence, Accountability and Transparency. It observed from the Figure 2 out of 268 members, 13 per cent of respondents are highly satisfied about the board of directors services, 11 per cent of the respondents are satisfied, 16 per cent of the respondents rate the services as average, 36 per cent of the respondents rate the services as poor, 24 per cent of the respondents mentioned that the services are very poor. The overall satisfaction with the Board of

**Padhmanaban and Arthi**

Directors' services is notably low. A combined 60 of the respondents rate the services as either poor or very poor, indicating widespread dissatisfaction. Only a small fraction of the respondents are highly satisfied or satisfied with the services provided by the board, reflecting potential issues in governance, service delivery, and overall board effectiveness.

Economic Contribution of Board of Directors in Cooperatives

The Researcher collected the necessary information as under about Economic Contribution of Board of Directors in Cooperatives. The researcher would like to study, regarding the director's economic participation (member economic participation) as per 3rd reformulated principles of cooperation by ICA. According to the table, the maximum number of Board of Directors 46 out of 92, 50 per cent of Board of Directors contributed economic wise very less, 33 per cent of the respondents holding 11 to 20 shares, only 3 – 10 respondents are holding above 30 shares which is high.

FINDINGS

1. Out of 92 respondents, the majority 35 per cent of the board members belong to the 41-50 years age group, indicating that the cooperative society tends to have more experienced individuals in the middle-age range in leadership positions.
2. Regularly attend meetings.
3. The majority of members do not participate in general body meeting
4. The total number of respondents are 92, 74 per cent of the board members are male, reflecting a gender imbalance in the leadership of the cooperative society.
5. Out of 268 respondents, only 4 per cent of the respondents are aware of the principles of cooperation, 7 per cent of the directors are understand the significance of by-laws, (20 per cent) of the directors are aware of the cooperative movement's significance, 13 per cent of respondents are aware of their rights within the cooperative society, 42 per cent regularly attending meetings, There is a significant lack of awareness among the board members regarding key aspects of cooperative principles and governance. Only a small fraction s and feel that their rights are not adequately upheld. There is also a perceived lack of equality, accountability, and transparency within the cooperative society.
6. 97 respondents are dissatisfied, with 36 per cent rating the services as Poor and 24 per cent as Very Poor, 16 per cent of respondents rated the services as Average, indicating ambivalence, Only 24 per cent of respondents are satisfied, with 13 per cent Highly Satisfied and 11 per cent are Satisfied.
7. Majority of 46 respondents out of 92, 50 per cent of Board of Directors contributed economic wise very less, 33 per cent of the respondents holding 11 to 20 shares, only 3 – 10 respondents are holding above 30 shares which is high.

SUGGESTIONS

1. The society should take necessary steps to motivate and admit more youth in cooperatives with the help of create awareness about the significance of cooperative movement.
2. The cooperative organisation and government should provide necessary awareness programs through cooperative education and training to the Board of Directors for the betterment of cooperative societies. Without knowing the basic aspects of cooperatives they do not function well. The only organisation functioning under prescribed principles. The member and directors should know the basic principles of cooperation, significance of bylaws, significance of cooperative movement, getting proper rights, attending Board of Directors and General Body Meeting.
3. The government and non-government organisation should provide compulsory awareness program about the features, significance and benefits, with the help of distribution of bit notice, conducting workshop, seminar, symposium, orientation and refresher course.

**Padhmanaban and Arthi**

4. The government and cooperative organisation should conduct periodical evaluation about the performance of Board of Directors.
5. The Board of Director should involve themselves as per the 3rd principles of cooperation they have to contribute more in economic like, buy more shares, deposit in more.
6. The Board of Directors, voluntarily involve themselves to motivate the members and provide all facilitate and benefits which are available in the societies namely (viz) to sanction loan as early as possible, make arrangements to visit frequently, verify the records, create transparency, accountability and trustworthiness also.
7. The cooperatives organisation entirely service oriented and also there is no separate owners entity (owner can become a member, member can become an owner). In this present situation, 71 per cent of the Board of Directors depended on political influences that should be avoided and also eradicate the political influence in the cooperative administration.

CONCLUSION

The study highlights in various aspects of Board of Directors about the level of participation, without member nothing can be done properly and also not able to achieve the goals. Good planning, transparency, accountability, innovation and to ensure the sustainability in cooperatives. This study provides valuable insights into the importance of effective leadership in the Board of Directors of a cooperative society. The author suggests that leaders who are able to foster a culture of trust, transparency, accountability and innovation and who are able to develop and implement effective strategies for challenges, are more likely to be successful in leading the cooperatives.

ABSTRACT

A stability indicating analytical method for estimation of analytes in bulk and/or dosage forms allows the analyst to quantify the analytes even in the presence of degradants. The main focus of present research work is to develop and validate a stability indicating method for simultaneous estimation of selected drugs elvitegravir, tenofovir alafenamide fumarate, emtricitabine and Cobicistat in their fixed dosage forms using acquity UPLC-PDA system. The analytes were successfully quantified on BEH C18, Acetonitrile and 0.1% orthophosphoric acid (55:45%v/v) as mobile phase at a flow rate of 0.2ml/min at 248nm. The run time of analysis is less than 3mins with retention times and linearity ranges of analytes as 0.403min, 37.50-225 µg/mL; 1.028 min, 2.5-15 µg/mL; 1.464 min, 50-300 µg/mL & 2.122 min, 37.50-225 µg/mL for Elvitegravir, Tenofovir, Emtricitabine and Cobicistat respectively. Statistical analysis of validation parameters data were within the acceptable limits indicating the suitability of the method for the routine quantification of analytes in the dosage form.

Keywords: Elvitegravir, Tenofovir Alafenamide Fumarate, Emtricitabine, Cobicistat, UPLC, Stability indicating.

**Divya Narla and Nagaraju Pappula****INTRODUCTION**

Antiretroviral therapy (ART) is a strategic treatment for Human Immunodeficiency Virus (HIV) infection. ART is initiated after early diagnosis of HIV which includes oral therapy with combination of multiple drugs in fixed dose[1]. Fixed dose combinations (FDC's) enhance the efficacy and reduce the pill burden for the patients. Fixed dose combinations in ART contain protease inhibitors (PI), nucleoside transcriptase inhibitors (NRTI's), non-nucleoside transcriptase inhibitors (NNRTI's), integrase strand inhibitors[2]. Pharmacokinetic enhancers may be included to improve the bioavailability of ART drugs[3]. A fixed dose combination of Elvitegravir (ELV). Tenofovir alafenamide fumarate (TAF), Emtricitabine (ETC) and Cobicistat (CBS) is approved by USFDA for HIV treatment in adults and adolescents[4]. Elvitegravir is a potent integrase strand inhibitor having strong anti HIV activity against wild and drug resistant HIV strains[5]. It prevents viral replication by inhibiting the integration of viral DNA into host cell[6]. Tenofovir alafenamide fumarate, a prodrug of Tenofovir, shows 10times more antiviral activity than Tenofovir disoproxil fumarate[7]. It belongs to NNRTI class and is used in FDC's for treating HIV infection[8]. Emtricitabine is NRTI antiretroviral compound whose active metabolite incorporates into viral DNA and terminates the synthesis of viral DNA[9,10]. Cobicistat devoids antiviral activity but is a part of FDC as it acts as booster (pharmacokinetic enhancer) to enhance the plasma concentrations of primary active drugs acting against HIV[11]. It acts by inhibiting Cytochrome P450 enzyme which extensively metabolizes Elvitegravir. Cobicistat in FDC's of ART increases drug exposure thereby reducing pill burden[12]. The chemical structures of the selected drugs was shown in Figure 1. Literature review on the afore mentioned combination for analytical research was extensively done, which showed a handful of HPLC[13-18] and few UPLC[20-24] methods reported for combination of Elvitegravir, Tenofovir disoproxil fumarate, Emtricitabine and Cobicistat. As there is no UPLC method for estimation of FDC consisting of Elvitegravir, Tenofovir alafenamide fumarate, Emtricitabine and Cobicistat, there is scope for developing a newer analytical technique. The present stability indicating UPLC method was developed to provide a sensitive, accurate and reliable method for routine quantification of selected analytes in their marketed commercial formulation.

MATERIALS AND METHODS**Reagents and Chemicals**

Reference standards of Elvitegravir, Tenofovir Alafenamide fumarate, Emtricitabine and Cobicistat were obtained as gift samples from Hetero Labs, Hyderabad and Aurobindo Pharmaceuticals, Visakhapatnam. The fixed dose generic product of Elvitegravir-150mg, Tenofovir alafenamide fumarate -10mg, Emtricitabine-200mg and Cobicistat-150mg was procured from commercial source. Chromatographic grade solvents Acetonitrile, Methanol, Water and Analytical Grade reagents ortho phosphoric acid, Potassium dihydrogen phosphate, Hydrochloric acid, Sodium Hydroxide and Hydrogen peroxide were used for the present work and are procured from Merck Ltd and Thermo Fisher Scientific.

Instrumentation and Chromatographic conditions

The ultra performance liquid chromatographic analysis for determination of selected analytes was performed on UPLC (waters acquity) equipped with PDA detector, quaternary pump and an inbuilt injector operated through Empower 2 software. Additional equipment included Electronic balance (Shimadzu), pH meter, ultra bath Sonicator, UV chamber, Hot air oven were used in the present study. The separation and quantification of analytes in the fixed dose combination was achieved on BEH C18 column (100×2.1mm,1.8µm) with 1.0ml/min of mobile phase (acetonitrile and 0.1%OPA in ratio of 55:45v/v) at 265nm for detection of analytes. The sample size is 0.5 µl with runtime of 3mins.

**Divya Narla and Nagaraju Pappula****Preparation of standard solution**

The reference standards of 75mg of ELV, 5mg of TAF, 100mg of ETC and 75mg of CBS were accurately weighed and dissolved in sufficient quantity of diluent (Acetonitrile and 0.1%OPA in 1:1 ratio) in a 100ml volumetric flask. Final stock solution was obtained after sonication and making the volume. The standard solution for analysis was prepared by further dilution of suitable aliquot of stock solution to obtain required concentration with diluent.

Preparation of sample solution

The tablets of commercial dosage form were used to prepare sample solution. Finely crushed tablet powder equal to half weight of tablet was added to 100ml flask, dissolved, sonicated in diluent followed by vacuum filtration to obtain sample stock solution, which is further diluted to give working sample solution.

Method validation

The developed stability indicating UPLC method was validated according to the ICH guidelines for all the specified parameters such as specificity, system suitability, linearity, precision, accuracy including robustness, limit of detection (LOD) and limit of quantification (LOQ) [13].

System Suitability

The standard solutions were injected in triplicate into the UPLC system and the system suitability parameters were evaluated such as theoretical plates, tailing factor and resolution. Each parameter has its specified role in establishing the suitability of the method for the quantification of analytes.

The number of theoretical plates indicates the efficiency of the column and plate count value of more than 2000 is acceptable. Tailing factor of chromatographic peak reflects the symmetry of the peak, whose value should be close to 1. Resolution is a measure of how well the analyte peaks were separated from each other and its specified value is greater than 2.0.

Specificity

The specificity of the developed method is assessed by looking for the presence of additional peaks in the chromatograms of blank and placebo. Method specificity is indicated by the absence of these additional peaks at the analyte retention times in the chromatogram.

Linearity

Calibration curves are plotted to know the concentration ranges of each individual analyte from the value of correlation coefficient. The plot is obtained by taking concentration on ordinate and mean peak area on abscissa. Triplicates of six different concentrations were prepared for injecting into UPLC system and their peak areas are averaged to plot linearity curve.

Precision

Precision of the developed method was determined by performing system precision, method precision and intermediate precision. In system precision (repeatability) six replicates of standard solution were injected and percentage relative standard deviation for peak areas is calculated. For method precision, sample solutions (n=6) were injected and the assay values were determined. Intermediate precision was carried out on two different days under the same experimental conditions using same solutions (n=6). The %RSD values within acceptable range ensure the reliability and consistency of the developed analytical method.

Accuracy

Recovery studies were done to establish the accuracy of the developed UPLC method. The sample solutions at three different levels such as 50%, 100% & 150% of the target assay were prepared in triplicate and are analyzed by standard addition method. The percentage recovery at each level was calculated.

**Divya Narla and Nagaraju Pappula****LOD & LOQ**

The LOD and LOQ values of the developed method were determined by calibration curve method, where the standard deviation and slope values are used to calculate the LOD & LOQ values.

$$LOD = \frac{3.3\sigma}{s} \qquad LOQ = \frac{10\sigma}{s}$$

Where, σ = standard deviation of intercept; s = slope of calibration curve

LOD and LOQ represent the lowest concentrations of analyte that can be detected and quantified with certainty indicating sensitivity of the method.

Robustness

Deliberate changes in chromatographic conditions were made and their effect was studied on system suitability parameters to determine whether the method is robust or not. Mobile phase composition was varied at $\pm 5\%$ and flow rate at ± 0.1 ml/min to evaluate the tolerance of the method. The impact of the variables on chromatographic parameters such as resolution, peak symmetry, theoretical plates, retention times of analytes were evaluated. The measured values within acceptable limits indicate robustness of the method.

Forced degradation studies

Forced degradation or stress studies were carried out to induce degradation of analytes under specific conditions. The analytes are exposed to various conditions of stress to produce possible degradants which can be separated and quantified in the presence of analytes without interference. The studies were done by subjecting the analytes to undergo hydrolysis in acid, base, water and peroxide solutions; exposing to UV light and high temperature. Acid, alkali, peroxide and neutral hydrolysis was carried out by reflexing the standard solution with 0.1N HCl, 0.1N NaOH, 10% H₂O₂ and water at 60°C for 30mins. Dry heat degradation was done by placing the solution containing analytes in hot air oven at 105°C for 6hrs and photo degradation by exposing to UV light for 7days. The analyte solutions were then diluted and injected into UPLC system and the chromatograms were evaluated.

RESULTS

The developed stability indicating RP-UPLC method was validated according to ICH guidelines for the chromatographic parameters such as Specificity, System Suitability, Linearity, Accuracy, Precision and Robustness to assure the intended use of proposed method.

Specificity

The specificity of the developed analytical method is determined based on the absence of peaks due to additional components (excipients, impurities, degradants, etc) of placebo and blank (mobile phase) in their chromatograms. Specificity of the developed method is assessed by the ability to determine the analytes in the presence of components that are likely to be present such as excipients, impurities, matrix, degradants etc. Thus the chromatograms of mobile phase alone and that of placebo solution were checked for the presence of any peaks. The blank and placebo chromatograms were shown in Figure 2. Absence of peaks indicates the specificity of the method.

System Suitability

The intended use of the proposed analytical method was verified from the parameters of system suitability. The results were given in Table 1 for the system suitability and validation parameters where all the result values were found to be within acceptable limit.

Linearity

The results of the linearity given in Table 2 were plotted to check the linear relationship between concentration of analytes and the mean peak areas. The linearity plots were shown in Figure 3 and the correlation coefficient values were ≥ 0.999 for the four analytes.

**Divya Narla and Nagaraju Pappula****Precision**

Precision indicates the closeness of values for a series of measurements obtained under similar conditions. The results of precision were statistically expressed as percentage relative standard deviation(%RSD) and the set value for acceptance is not greater than 2.0. System precision or repeatability of the method was determined by injecting six replicates of working standard solution under the given set of conditions and the results were shown in Table 3. Method precision was assessed by injecting six replicates of working sample solution into the UPLC system and %RSD values were calculated statistically. The results were compiled in Table 4. Intermediate Precision or Interday precision was performed on two different days by using six standard solutions as represented in Table 5. The data was statistically analyzed and the % RSD values were calculated for each analyte. The % RSD values for the four analytes in precision study did not exceed 2.0demonstrating the high precision of the analytical method for quantitative analysis with consistency.

Accuracy

Accuracy of the present developed UPLC method was determined in terms of percentage recovery. The results of recovery studies carried out were given in Table 6 & 7. The closeness of measured value to the reference or standard value is indicative of method accuracy.

Forced degradation studies

Stress conditions with variable reagents were applied to the sample solutions to favor the degradation of analytes. The method is said to be stability indicating when the analyte peaks were not affected by the degradants. The degradation chromatograms under various stress conditions were shown in Figure 4 and the results of forced degradation studies were depicted in Table 8 & 9.

Assay

The analytical method was applied for the marketed formulation GENVOYA for quantification of four analytes. The assay values of Elvitegravir, Tenofovir alafenamide fumarate, Emtricitabine and Cobicistat were found to be 99.63, 100.82, 99.57 & 99.88 respectively. The UPLC chromatograms of standard and sample solution were shown in Figure 5.

DISCUSSION

The simultaneous quantification of selected drugs Elvitegravir, Tenofovir Alafenamide fumarate, Emtricitabine and Cobicistat was successfully achieved in the presence of their degradants by UPLC equipped with BEH C18 column, PDA detector, Mobile phase of Acetonitrile and 0.1% OPA in ratio of 55:45%v/v at 0.3ml/min flow rate. The results of validation of developed method gave satisfactory results.

CONCLUSION

Thereby it can be concluded that the proposed method can be utilized for estimation of four selected analytes in their fixed dose combination on a routine basis for quality control check with high specificity.

CONFLICT OF INTEREST

None.

ACKNOWLEDGEMENT

The authors are privileged to express our gratitude to the Management and Principal of Aditya College of Pharmacy for their continuous support.

ABSTRACT

This study explores how technology-enhanced language learning (TELL) is developing in the field of English teaching. It offers a thorough summary of the most recent developments, obstacles, and possibilities influencing the use of technology in English language training. Drawing upon a synthesis of recent research, the paper identifies prominent trends such as the widespread use of mobile applications, online platforms, and digital resources for language learning. Additionally, it examines innovative pedagogical approaches, including computer-assisted language learning (CALL), blended learning models, and gamification strategies, which have gained traction in enhancing language acquisition and engagement among learners. Despite the promising developments, the paper also addresses several challenges hindering the effective implementation of TELL in English education. These challenges encompass issues related to digital divide, access to technology, teacher training, and concerns regarding the quality and appropriateness of digital resources. Furthermore, the paper highlights the importance of addressing socio-cultural and linguistic diversity to ensure inclusivity and equity in technology-mediated language learning environments. Amidst the challenges, the paper underscores the vast opportunities offered by technology in English language education. These opportunities include personalized learning experiences, authentic language practice through immersive simulations, and the facilitation of global collaboration and communication. By seizing these chances and tackling the related obstacles, teachers may fully utilize technology to create engaging and productive English language learning environments for a variety of students.

Keywords: TELL: Technology-enhanced language learning, English Education, technology, training, etc.

**Lohans Kumar Kalyani and Vandana Bhartiya**

INTRODUCTION

The core purpose of learning English is to interact with others. This aligns perfectly with effective teaching methods, which also emphasize communication. It's uncommon to find a language class devoid of technology, as it's a valuable tool for developing students' real-world communication skills in the new language. Traditionally, Indian high school English classes rely on large groups, teacher-centered grammar-translation methods, and exam-oriented textbook lectures. This decontextualized approach makes it challenging for students to apply their knowledge flexibly in everyday situations. Large class sizes further restrict individual participation and one-on-one communication with teachers or peers. Fortunately, technology has emerged as a powerful tool to both support and enrich language learning. Educators are increasingly incorporating various technologies to enhance their teaching, engage students, provide authentic cultural examples, and establish a connection between their courses. Teachers can also tailor activities and differentiate instruction using technology, meeting the requirements of each student and fostering a more engaging learning environment. Even though technology is becoming more and more important in language learning, the efficiency of this tool ultimately depends on the skills and knowledge of the teachers who oversee and support the classroom.

LITERATURE REVIEW

Technology-enhanced language learning (TELL) has emerged as a dynamic field within English education, offering both opportunities and challenges for language learners and educators alike. This section reviews key literature on trends, challenges, and opportunities in TELL within the context of English education.

Trends in TELL

Numerous trends influencing TELL in English instruction are highlighted by recent studies. The growing use of digital materials, internet platforms, and mobile applications into language training is one notable development (Hubbard, 2018). This pattern illustrates how technology is being used more and more to support language learning outside of traditional classroom environments. Furthermore, studies highlight the significance of implementing cutting-edge pedagogical techniques to improve learner engagement and motivation, such as gamification techniques and computer-assisted language learning (CALL) (Chapelle, 2020). These developments highlight how TELL is changing and how it has the power to revolutionize English language instruction.

Challenges in TELL

TELL has many obstacles that prevent it from being used effectively in English instruction, despite its potential. One significant problem is the "digital divide," which refers to variations in students' access to technology and internet connectivity (Warschauer, 2019). Inequalities in language learning possibilities are made worse by this difference, especially for students from underprivileged families. Concerns over the caliber and applicability of digital resources used in TELL have also been voiced, underscoring the necessity of carefully assessing and choosing technological tools (Kessler, 2016). Additionally, studies indicate that insufficient teacher preparation and assistance in incorporating technology into language learning impede the successful execution of TELL (Levy & Stockwell, 2021). In order to provide fair access to TELL resources and optimize their influence on English language learning objectives, these obstacles must be overcome.

Opportunities in TELL

TELL offers many options to improve English instruction in spite of obstacles. Personalized learning experiences made possible by technological tools present a significant opportunity since they let students customize their language learning path to suit their unique requirements and preferences (Godwin-Jones, 2018). Additionally, TELL facilitates meaningful interactions in real-world scenarios by providing immersive simulations and digital communication platforms for realistic language practice (Meskill & Anthony, 2017). Technology also makes cross-cultural cooperation and exchange easier, exposing students to a variety of viewpoints and improving their

**Lohans Kumar Kalyani and Vandana Bhartiya**

intercultural competency (Thorne, 2020). These chances highlight how TELL can significantly improve English language learners' ability to communicate across cultural boundaries and acquire an effective language.

The literature review emphasizes how TELL is dynamic in English teaching, highlighting its changing patterns, enduring difficulties, and exciting prospects. Teachers may fully utilize TELL to improve English language learning outcomes and advance inclusive and equitable education for all students by tackling obstacles and seizing opportunities.

TECHNOLOGY-ENHANCED LANGUAGE LEARNING (TELL)

Technology-Enhanced Language Learning (TELL) - often called computer-mediated language learning - investigates how technology affects learning a second language. Through the use of computers as a technology instrument, TELL presents multimedia information in addition to the teaching strategies used by language teachers. It's critical to understand that TELL serves as an adjunctive strategy to support current teaching approaches rather than as a stand-alone teaching style. TELL is closely related to Computer-Mediated Communication (CMC), a field that has been well researched and approved for its effectiveness in supporting students' oral and written foreign language skills. This combination helps students who struggle with language to express themselves both orally and in writing by filling in the gaps in their verbal communication of concepts in the target language. Technology-enhanced language learning makes use of computer hardware, software, and internet resources to improve language learning and instruction. This method covers a range of activities designed to improve language learning, including using portable electronic dictionaries in class, conversing with classmates in English over Instant Messenger, reading news websites, taking part in online discussion boards, finishing computer-based language exercises from the CDs that accompany textbooks, searching words in corpora for contextual usage exploration, immersing oneself in the language through games like World of Warcraft, and texting classmates in English. The concept of TELL is derived from a variety of factors, such as the types of activities (such as fill-in-the-blank, video creation, and chatting), the language skills (reading, writing, speaking, listening, and grammar) that are targeted, the instructional settings (such as blended, distance, and online), and the technological tools that are used (computer, Internet, chat, blog, wiki, gaming, video).

Contemplations on General Learning Resources

When contemplating general learning resources, various factors warrant careful consideration. Decision-makers, including department heads, school board members, and educators, must meticulously assess the content, format, instructional methodologies, evaluation mechanisms, assessment criteria, and treatment of societal issues inherent within these resources. Equally vital are the diverse needs of the intended audience, encompassing considerations such as age, linguistic background, and special educational requirements. Additionally, the purpose, distinctive characteristics, and effective utilization of the available media selections should be thoroughly evaluated. It is imperative to prioritize the strengths of resources over perceived weaknesses, ensuring alignment with educational goals and the diverse learning needs of students.

Content/Format/Design: Considerations for Learning Resources**Content**

- Ensure accuracy, relevance, and alignment with curriculum objectives.
- Incorporate up-to-date information and authentic materials to enhance learning outcomes.
- Provide a diverse range of content to cater to varying learning styles and preferences.
- Include clear learning objectives and instructional goals to guide learners effectively.

Format

- Optimize readability by using clear fonts, appropriate font sizes, and spacing.
- Organize content in a logical and coherent manner to facilitate comprehension.
- To increase engagement, use multimedia components like pictures, movies, and interactive elements.
- Ensure compatibility with different devices and platforms to promote accessibility for all learners.

**Lohans Kumar Kalyani and Vandana Bhartiya****Design**

- Create visually appealing layouts that attract and maintain learners' attention.
- Implement user-friendly navigation features to facilitate ease of use.
- Incorporate instructional scaffolding elements such as prompts, cues, and feedback to support learning progression.
- Maintain consistency in design elements throughout the learning resources to enhance coherence and usability.

METHODOLOGY**Educational materials should**

- ✓ prioritize experiential learning over passive instruction
- ✓ facilitate collaborative and independent learning to accommodate individual development
- ✓ advocate for practical, hands-on learning experiences.
- ✓ cultivate critical-thinking and decision-making skills through questioning, reflection, and analysis.
- ✓ provide options and adaptability to address individual differences in aptitude, ability, learning preferences, multiple intelligences, and interests.

Appraisal/ Appraisement: Educational materials ought to

1. encourages ongoing learning by the learner
2. allow for both developmental and conclusive appraisal/evaluation as suitable
3. cater to the requirements of the learner

Advantages of Technology-Enhanced Language Learning (TELL)

1. **Enhanced Engagement:** TELL provides learners with engaging, multimedia-rich learning experiences that pique their interest and inspire them to participate more.
2. **Access to Real-World Language and Cultural Contexts:** TELL provides students with real-world language exposure by giving them access to real-world language resources including podcasts, articles, and videos.
3. **Personalized Learning:** To better meet the needs of each learner, TELL systems frequently offer adaptive learning capabilities that enable customized content selection, pacing, and feedback. These elements increase the efficacy of learning.
4. **Flexibility and Convenience:** Self-paced learning, asynchronous communication, and remote collaboration are made possible by TELL, which gives students access to language learning resources at any time and from any location.
5. **Enhanced Language Skills:** TELL facilitates the development of all language skills—speaking, listening, reading, and writing—through interactive activities, multimedia content, and communication tools, leading to holistic language proficiency.
6. **Cultural Awareness:** By exposing students to a range of cultural viewpoints and real-world language usage, TELL promotes intercultural competency and sensitivity.
7. **Opportunities for Collaborative Learning:** TELL platforms frequently include social aspects like discussion boards, group projects, and peer evaluation, which encourage meaningful engagement and cooperation among students.
8. **Instant Feedback:** TELL technologies frequently offer learners immediate feedback on language exercises and exams, enabling them to track their development, pinpoint areas for growth, and promptly modify their learning approaches.
9. **Cost-effectiveness:** TELL might possibly save institutions' and students' overall language learning expenses by eliminating the requirement for traditional classroom materials like textbooks and workbooks.

**Lohans Kumar Kalyani and Vandana Bhartiya**

10. The TELL program prepares students for success in today's digital workplace by providing them with the digital literacy skills and knowledge necessary to navigate the increasingly linked and digitally advanced world.

Disadvantages of Technology-Enhanced Language Learning (TELL)

1. **Technological Problems:** TELL systems may experience internet connectivity challenges, device compatibility problems, or technological hiccups that impede learning and aggravate teachers and students.
2. **Digital Divide:** Because TELL depends on having access to the internet and technology, it may widen already-existing gaps in students' access to resources and education, especially for those from low-income families or those who live in rural locations with inadequate infrastructure.
3. **Possibility for Distraction:** When technology is used for language learning, learners may become distracted by non-educational websites, social media, or games, which takes their focus away from language learning goals and tasks.
4. **Lack of Human Interaction:** The use of technology in education may limit possibilities for in-person meetings and interpersonal connection, which might hinder students' capacity to hone their speaking and listening abilities in authentic settings and build sociocultural competency.
5. **Over-reliance on Technology:** Teachers' creativity and adaptability in the classroom, as well as students' capacity to interact with a variety of learning materials and adapt to various learning environments, may be compromised by an over-reliance on TELL tools and resources.
6. **Content Quality:** Some TELL materials may not be of the highest caliber or pedagogically sound, which might result in poor learning outcomes, misunderstandings, or the reinforcement of grammatical faults.
7. **Limited Feedback and engagement:** Learners' opportunities for meaningful engagement, individualized coaching, and formative evaluation may be limited by automated feedback systems in TELL technologies, which may lack the depth and nuance of feedback given by human instructors.
8. **Cultural Insensitivity:** TELL materials may not adequately reflect learners' cultural backgrounds, values, or linguistic varieties, potentially perpetuating cultural stereotypes or excluding marginalized groups from the learning process.
9. **Pedagogical Challenges:** Integrating technology into language teaching requires training, professional development, and ongoing support for educators to effectively leverage TELL tools and methodologies, which may pose pedagogical challenges and barriers to implementation.
10. **Cultural Insensitivity:** TELL materials might not fairly represent the cultural backgrounds, values, or linguistic diversity of students, which could reinforce cultural stereotypes or discourage underrepresented groups from participating in the educational process.
11. **Pedagogical obstacles:** To effectively use TELL technologies and approaches, educators must get training, professional development, and continuing support. This can provide pedagogical obstacles as well as implementation barriers.

Main Types of Media Used in Technology-Enhanced Language Learning (TELL)

1. **Interactive Multimedia:** Interactive multimedia tools use a range of media elements, such as text, graphics, audio, video, and animations, to provide students with dynamic, immersive language learning experiences. Multimedia language classes, online interactive exercises, and interactive language learning apps are a few examples.
2. **Digital Texts and E-books:** These resources give students access to a variety of digital reading materials in the language of instruction, such as online articles, e-textbooks, and e-readers. Frequently, these tools provide functionalities like multimedia improvements, notes, and dictionary look-up to aid in language acquisition and understanding.
3. **Audiovisual materials:** Videos, podcasts, and audio recordings are examples of audiovisual materials that provide learners with real-world language exposure, exposing them to pronunciation, intonation, natural language use, and cultural nuances. Activities including speaking practice, listening comprehension, and cultural knowledge can all benefit from these tools.

**Lohans Kumar Kalyani and Vandana Bhartiya**

4. **Online Communication Tools:** With online communication tools like email, chat rooms, discussion forums, and video conferencing platforms, students may work together and communicate in real time with classmates, teachers, and native speakers of the language they are studying. These tools facilitate language practice, interaction, and cross-cultural communication in authentic communicative environments.
5. **Virtual Reality (VR) and Augmented Reality (AR):** These technologies put students in simulated settings where they can communicate with virtual characters, scenarios, and objects in the language of instruction. Applications for VR and AR provide chances for language use in context-rich environments, cultural inquiry, and experiential learning.
6. **Gamified Learning Platforms:** To encourage students and improve participation in language learning activities, gamified learning platforms make use of game-based components like challenges, rewards, and progress tracking. In order to reinforce language skills and concepts, these platforms frequently include role-playing games, quizzes, simulations, and language learning games.
7. **Social Media Platforms and Social Networking Sites:** Through online discussions, teamwork, and peer evaluation, language learners can connect with peers, exchange language-related resources, take part in language learning communities, and practice their language skills.
8. **Online Language Learning Platforms:** Via web-based interfaces, online language learning platforms provide thorough language courses, tutorials, exercises, and evaluations. To facilitate customized language learning routes, these systems frequently include adaptive learning algorithms, personalized feedback, and progress tracking tools.

CONCLUSION

The investigation of technology-enhanced language learning (TELL) in the context of teaching English reveals a changing environment with potential that are bright and obstacles that never go away. The incorporation of technology in language education has resulted in inventive teaching methods, improved involvement of learners, and refined language acquisition encounters. But issues like the digital divide, worries about the caliber of digital resources, and the requirement for support and training for teachers continue to be major obstacles to the successful implementation of TELL. Even with these difficulties, there are several of ways that TELL may support individualized education, develop intercultural competency, and get students ready for the digital age. Teachers may fully utilize TELL to improve English language learning outcomes and advance inclusive and equitable education for all students by tackling obstacles and seizing opportunities. To ensure that technology continues to be an effective tool for improving English education and enabling students to succeed in a worldwide society, stakeholders must work together, be creative, and adjust to the evolving TELL landscape.

ABSTRACT

DIKSHA, the Digital Infrastructure for Knowledge Sharing, has emerged as a transformative force in Indian education, catalyzing the integration of technology in classrooms. Launched by the Government of India, DIKSHA aims to enhance the quality and accessibility of education across diverse settings. This abstract provides a concise overview of DIKSHA's impact on technology integration in Indian classrooms. DIKSHA plays a pivotal role in digitizing educational content, offering a comprehensive repository of textbooks, videos, simulations, and assessments aligned with national curriculum standards. It empowers teachers through professional development modules and collaborative platforms, fostering innovative pedagogical practices. The platform's emphasis on inclusivity is evident in its provision of content in multiple languages, addressing India's linguistic diversity. The impact of DIKSHA extends to the transformation of classroom dynamics, enabling teachers to adopt interactive and engaging teaching methods. Students benefit from personalized and self-paced learning experiences, cultivating a deeper understanding of subjects. However, challenges such as infrastructural disparities and digital literacy gaps persist, necessitating ongoing efforts to ensure effective implementation. DIKSHA stands as a catalyst for technology integration in Indian classrooms, revolutionizing teaching and learning practices. As the platform evolves, addressing challenges will be crucial to sustaining its positive impact on the nation's education landscape.

Keywords: DIKSHA, Digital Learning, ICT, Knowledge, etc.

Lohans Kumar Kalyani

INTRODUCTION

All pupils could benefit greatly from high-quality learning experiences thanks to ICT integration in the classroom. A wide range of technologically advanced tools and platforms are available to educators in India to help them work together, maximize resource sharing, and create dynamic learning environments. Students can now acquire knowledge and skills despite socioeconomic and geographic constraints because to the government's "Digital India" push and the widespread use of the internet. As a single digital platform for instructors, the Ministry of Human Resources and Development's DIKSHA program is a noteworthy contributor to this ecosystem of digital education. Through the use of scalable digital infrastructures, DIKSHA gives educators the ability to produce content, obtain resources, and interact with a larger learning community. Especially noteworthy is DIKSHA's contribution amid the interruptions caused by the COVID-19 epidemic, enabling remote learning through creative state programs and accelerating the adoption of technology in education. This platform continuously expands its content through digital methods and offers flexible, tailored learning at the learner's pace. This guide provides a thorough implementation of DIKSHA in schools by providing information on curriculum development, teacher preparation, infrastructure readiness, and leadership. It gives administrators the means to establish a nurturing atmosphere that guarantees educators and learners can make the most of DIKSHA's resources. These recommendations facilitate a collaborative effort towards an improved digital learning experience and are of great value to a wide range of stakeholders, including teachers, parents, students, school administrators, and teacher educators.

DIKSHA Platform

The Digital Knowledge Sharing Infrastructure, or DIKSHA, is a national platform that was started in 2017 by the Ministry of Education's National Council for Education Research and Training (NCERT). It acts as a central location for a wide range of curriculum-linked e-content that is designed to satisfy the requirements of teachers and students in every state and union territory. DIKSHA is available on multiple digital platforms, including laptops, smartphones, desktops, and tablets. It utilizes QR-coded Energized Textbooks to facilitate easy engagement. Its many features, which include news updates, instructor profiles, assessment tools, in-class resources, teacher training materials, and communication channels, all work together to create a dynamic teacher community. With support for more than thirty languages, DIKSHA conforms to the national curriculum standards for grades 1 through 12 as set forth by NCERT, CBSE, and SCERT. Additionally, the platform gives every state and UT the freedom to design programs specifically for their teachers and students, allowing them to personalize the DIKSHA experience to meet their specific requirements. The primary objective of DIKSHA is to function as a clearinghouse for Open Educational Resources (OERs), meeting the needs of the ever-changing educational environment and benefiting teachers and students in equal measure.

**Lohans Kumar Kalyani****DIKSHA's (National Teachers Platform) significance**

The National Teachers Platform, or DIKSHA, is significant because of its core design philosophy, which places teachers first in both use and development. In the field of teacher education, DIKSHA becomes a facilitator, accelerator, and amplifier of creative ideas as a result. Its versatility allows states, governmental agencies, and commercial organizations to effortlessly integrate DIKSHA into their own teacher-centric programs, adjusting its use according to their distinct aims, requirements, and capacities. Moreover, DIKSHA broadens its scope to meet the educational demands of students rather than concentrating just on the pedagogical components for educators. By giving children nationwide access to NCERT texts and curricula that are in line with the regular school curriculum, DIKSHA guarantees that their education is both uniform and enriching. This inclusive approach underlines DIKSHA's role in establishing a collaborative educational ecosystem, where many stakeholders can actively participate, contribute, and harness the potential of a unified platform to reach educational objectives on a national scale.

DIKSHA e-learning Portal Advantages

The DIKSHA e-learning platform has numerous benefits to offer. Touted as the National Digital Infrastructure for Teachers, DIKSHA serves as a complete instrument that equips educators around the country with state-of-the-art digital technology, covering every stage of the teacher's career. When it comes to student involvement, DIKSHA makes it easier for instructors and students to communicate directly, which promotes a more complex and interactive grasp of different concepts. In addition to improving learning, this interactive method gives students a chance to ask questions of their teachers one-on-one and get their questions answered. In addition to providing parents with access to personalized sessions with teachers after regular school hours, the portal also helps parents stay informed about what their children are doing in class. The diverse advantages of DIKSHA highlight its essential role in transforming the educational system and guaranteeing the engagement and holistic growth of educators, learners, and parents.

What The Platform Offers?

The NTP Offers are:

- Extensive courses for teacher training that address a variety of topics, including learning objectives, Continuous and Comprehensive Evaluation (CCE), and more.
- A wealth of instructional materials, such as carefully thought-out lesson plans, thought-provoking films, and deftly created worksheets, all in line with the recommended curriculum.
- Tailored exams for teachers, providing insights into their strengths and areas that demand improvement.

Teachers may access this educational content offline with ease thanks to our user-friendly site, using their cellphones, tablets, or other devices whenever it's convenient for them, no matter where they are. Moreover, the content is carefully matched to the curriculum and tailored to the needs of local languages, guaranteeing its applicability and efficacy in a variety of educational settings.

Objective

The platform's objective is to act as a storehouse for Open Educational Resources (OERs), giving teachers and students a place to collaborate. The aim is to establish the platform as a collaborative area for a wide spectrum of education stakeholders, such as academics, experts, governmental agencies, independent schools, non-governmental organizations, and commercial enterprises. These organizations are urged to actively participate, make contributions, and utilize the platform's combined capabilities in order to achieve the country's broad learning goals. The Indian government emphasizes its function as a comprehensive and inclusive hub of educational resources, and sees it as a uniting "One Nation One Platform" for school education.

Features

- The portal includes curriculum-aligned worksheets, concept videos, and lesson plans, among other educational resources. In order to foster a cooperative teacher community, it also has news updates, instructor profiles, assessment tools, teacher training materials, and communication features.

**Lohans Kumar Kalyani**

- The materials can be accessed through online and offline platforms, supporting smartphones, tablets, and other devices. They are customized to meet curricular requirements and are available in local languages.
- It provides users with access to an extensive range of curriculum-linked electronic content via many platforms, such as QR-coded Energized Textbooks (ETBs).
- Progress Monitoring Chart.
- The platform's user interactions provide extensive, anonymized data that helps administrators, teachers in the state of Utah, and content developers successfully plan programs and interventions.

Expected Outcomes

- Offering educators personalized and customized professional development opportunities at any time and place.
- Encouraging teachers to share resources effectively, maximizing their time and efforts.
- Provision of a tailored workplace for teachers, supporting in planning and monitoring their progress.
- Establishment of a complete platform, facilitating seamless contact among all parties.
- Standardized observation tools are being implemented on the platform, providing data to stakeholders to support ongoing training, teacher assistance, and analytical projects.

How will Teachers benefit?

DIKSHA, the National Digital Infrastructure created specifically for educators and easily accessible via a mobile application, has a lot to offer teachers. With so many lesson ideas, worksheets, and interesting exercises, it makes for a fun learning environment in the classroom. Teachers have a rare opportunity to fully comprehend their professional trajectory with the help of this portal. Teachers can map their career progression and skill improvement from their first days of school till retirement. Thus, this cutting-edge platform equips educators with resources for both short-term classroom impact and long-term career planning.

Advantages for Teachers

- Find engaging and interactive learning materials to improve student participation in the classroom.
- Examine and discuss with other teachers the most efficient ways to explain difficult subjects.
- Enroll in classes to further your career development, and when you finish, you can receive certifications and badges.
- Examine the lessons you have learned over your time working as a school teacher.
- Follow the State Department's official announcements to stay informed.
- Use digital tests to see how well your pupils understand the material that has been taught.

How will Students benefit?

Access to the DIKSHA app equips students with the ability to grasp concepts effortlessly and interactively. The app incorporates features that enable comprehensive lesson revisions, ensuring a thorough understanding. Furthermore, students can evaluate their learning independently through self-assessment practice exercises, enhancing their overall comprehension and mastery of the taught material.

How will Parents benefit?

Parents, with the DIKSHA app on their mobile devices, gain the ability to monitor classroom activities and address queries outside regular school hours. This platform serves as a comprehensive tool for seamless interaction among all stakeholders, ensuring a hassle-free experience for parents to stay informed and engage with their child's educational journey.

Benefits for Students and Parents.

- Easily access associated lessons on the platform by scanning QR codes in your textbook.
- Review and reinforce classroom-learned lessons.
- Explore supplementary materials on challenging topics for better understanding.
- Engage in problem-solving practice with instant feedback on the correctness of the answers.

**Lohans Kumar Kalyani**

Top of Form

-
- **Usefulness of Diksha Portal in the current education system**

The Diksha Portal stands as a cornerstone in the contemporary education system, offering multifaceted utility that significantly transforms the teaching and learning landscape. One of its primary strengths lies in serving as a centralized hub for educational resources, providing teachers with a wealth of digital tools and content to enhance their pedagogical practices. From comprehensive training modules on various educational methodologies to an extensive repository of teaching resources such as lesson plans, concept videos, and worksheets, the Diksha Portal empowers educators with a dynamic toolkit. Moreover, the platform plays a pivotal role in assessing teachers' proficiency, offering personalized insights into their strengths and areas for improvement. This feature contributes to ongoing professional development, fostering a culture of continuous improvement among educators. The Diksha Portal's user-friendly interface ensures accessibility for teachers, allowing them to engage with educational material offline on their smartphones, tablets, or other devices, promoting flexibility in learning. In the context of the broader education system, the Diksha Portal facilitates direct interaction between teachers and students, fostering a more interactive and engaging learning experience. It supports a blended learning approach, enabling students to access digital resources aligned with the curriculum, promoting a deeper understanding of concepts. Furthermore, the Diksha Portal enhances parental involvement by providing a window into classroom activities and opportunities for one-on-one sessions with teachers. This aspect bridges the communication gap between educators and parents, creating a collaborative educational environment. The Diksha Portal's usefulness in the current education system extends far beyond being a repository of digital resources. It serves as a catalyst for innovation, professional growth, and improved learning outcomes, contributing significantly to the evolution of a dynamic and responsive educational ecosystem.

CONCLUSION

The research sheds light on the transformative role of DIKSHA as a catalyst for technology integration in Indian classrooms. The platform stands as a pioneering force, driving a paradigm shift in the traditional educational landscape by seamlessly blending technology with pedagogy. Through its comprehensive offerings, ranging from teacher training modules to a rich repository of teaching resources, DIKSHA emerges as a dynamic tool empowering educators across the nation. DIKSHA's significance is not only confined to enriching the professional lives of teachers but extends to fostering interactive and engaging learning experiences for students. The platform's ability to facilitate direct teacher-student interaction, coupled with access to digital resources aligned with the curriculum, positions it at the forefront of the digital revolution in Indian education. The research underscores the crucial role of DIKSHA in addressing the diverse needs of the education system. Its adaptability to offline access ensures that teachers can seamlessly engage with educational material, overcoming infrastructural challenges. Moreover, the platform's emphasis on assessments for teachers contributes to their continuous professional development, creating a culture of ongoing improvement. Beyond the classroom, DIKSHA promotes parental involvement by providing insights into classroom activities and avenues for personalized interactions with teachers. This not only bridges the gap between educators and parents but also fosters a collaborative approach to a child's education. As technology continues to evolve, DIKSHA stands as a beacon, guiding the education sector toward a more inclusive, flexible, and innovative future. Its success as a catalyst for technology integration reflects a collective commitment to leveraging digital tools to enhance the quality of education in India. The research underscores the need for sustained efforts in harnessing technology to address educational challenges, with DIKSHA serving as an inspiring model for effective technology integration in Indian classrooms. Ultimately, DIKSHA emerges not merely as a platform but as a transformative force propelling Indian education into a digitally empowered era.

ABSTRACT

Architecture is a highly interdisciplinary field that draws inspiration from a wide range of natural and social sciences. Architecture and natural science have a significant influence on the construction of structures and the surrounding environment. Natural science is a branch of study that combines the understanding of the physical world through applicable elements of physics, chemistry, biology, earth science, or astronomy, among other disciplines, according to Guo (2021). Architecture is a subject that includes a multitudinous sphere as its foundation and is associated with the processes of planning and designing as well as the construction of human-made structures. Now, there is a requirement to have a wide understanding of numerous factors, such as ornamental and utilitarian functions and disassemblability. The modern architectural profession is at the crossroads due to innumerable impacts that have been introduced to the profession by the natural and social sciences. The application of scientific perspective in architecture education and profession means that the aim is to promote the proper growth of a structure that is strong, durable, and good-looking. It allows architects to create more profound and satisfying shapes, as well as worth and lasting space. This research paper aims to look at the cross-cutting nature of natural sciences in architecture education and practice with special reference to the construction and design of sustainable, energy-efficient, safe, and stable structures

Keywords: -Architecture, Natural Science, Sustainability, Energy Efficiency, Safety, Stability

**Gayatri Desai and Parag Narkhede**

INTRODUCTION

The study of natural sciences entails observing, experimenting, and using theories to investigate nature. The laws that govern the universe and the Earth, where various disciplines are to be identified as counterparts or reflections. Natural science includes the following disciplines: These are the following disciplines of knowledge: physics, chemistry, biology, earth science, and astronomy. These fields are related to major components of architecture, as illustrated in figure 1 below. The potential and decision-making of the natural science, which architects need to comprehend, concerns its working. The procedure used in architectural design commences with site planning, in which earth science is taken into account. The type of land, its fertility, terrain and grading, climatic conditions, and the sky are all important considerations. After analyzing all these terms, design is arrived at, or defined, in other words. For such purposes as laying the foundation and beginning to construct, the characteristics of the land's geology are crucial.

Also, the design process entails planning of particular spaces that should have natural lighting and airflow as per the need and use of the space. To implement well-thought-out decisions, the direction of the sun, changes in seasons, and wind have to be researched. Further in the process of building, physics also plays a vital role in the determination of the structural integrity as well as the materials to be applied in the building process. This can be regarded as a concept that has sustainability at its core: biophilic design, which can be defined as designing with nature. As a result, biophilia helps to keep not only the indoor but also the external environment comfortable and effective.

PHYSICS

Physics can be defined as a branch of natural science that encompasses the qualities of matter and energy. Concepts of and behaviour under these circumstances are refereed. Thus, the building physics can be considered as having a significant impact on the design phase. Building Physics as a part of architecture focuses on the heat and moisture behaviour of the construction materials and structural components, indoor and material moisture, noise and hearing comfort, thermal and daylighting design, mechanical ventilation, energy aspects, and structures. However, practical complications are the principal issues that arise with the contemporary development of architecture in terms of spectacular structures with large cantilevers, various shapes, heights, and new parametric constructions. The concepts of such forms of creativity entail well-measured structuring of physics in such structures. Architecture and design of the columns, beams, and walls of the building are done with the help of principles of physics by structural engineers. There are concerns about providing weight bearing and support for inward and outward forces such as wind pressure, earthquakes, and snow load.

CHEMISTRY

Chemistry is a branch of sciences that deals with the nature, structure, and behaviour of substances, and being one of the fundamental sciences, it plays a major role in the advancement of architectural design because it influences the creation of construction materials and technology. It can thus be argued that the field of chemistry takes on a rather central function in determining the strength, durability, and sustainability of the structures being built. To ensure that correct materials are used in the construction of a given structure, architects are obliged to put into consideration information from chemistry, including location and climate of the area the building is to be constructed in, strength of the given material, ability of the material to combat corrosion, and durability. They also need to know what chemically is going on in the building to ensure that the structure of the building stays intact.

1. For example, concrete, which is the most commonly used building material all over the world, is created through a mixture of aggregates, water, and cement. Some of the technical factors, including setting time, strength of the cement, and workability, are some of the important chemical properties of cement related to the quality of the final product. In addition, the chemical composition of the particles in concrete has an effect on every aspect of the material, including its strength, durability, look, and texture.

**Gayatri Desai and Parag Narkhede**

2. Steel, a commonly used construction material, is made up of iron, carbon, and several alloying elements. The strength, ductility, and corrosion resistance of steel are determined by its chemical composition, resulting in a material that is both structurally versatile and durable.
3. Contemporary building significantly depends on glass, which is produced by subjecting silica and other components to extreme heat. A glass's chemical composition influences its thermal properties, strength, color, and transparency. Because its composition may be changed, several forms of glass with varying attributes have been developed.
4. Chemicals are utilized in almost every aspect of building construction and maintenance, including adhesive, waterproofing chemical and sealants used to keep basements dry and roof membranes that reflect light and keep roofs cool.
5. The building and design industry has been able to develop a diverse array of high-performance materials and products that can assist in the resolution of a variety of issues, including the mitigation of the effects of climate change, the enhancement of the health and wellness of building occupants, the enhancement of energy efficiency, and the resistance of buildings to natural disasters, as a result of advancements in chemistry and materials science.

In conclusion, the quality and sustainability of structures are significantly influenced by the chemical properties of building materials, rendering chemistry a critical element of architecture. The future of the field can be influenced by the collaborative development of new and improved construction materials and technologies through continuous research and innovation.

BIOLOGY

Biology is increasingly impacting design processes as a scientific discipline. This has led to a shift in design methodologies towards a novel hybrid framework in which architects have made an effort to mimic nature by grasping every opportunity to create more effective solutions. In recent years, there has been significant progress in the use of bio-mimicry, mostly because to the rapid development of technology. Architecture has an influence taken from the works of nature, and these architects have come up with buildings that resemble the existing surroundings. To rehearse non-summarised inspiration in the outline, one can notice the use of natural forms and materials, as well as the spaces that are part of the landscape.

1. Biomimetic is defined as the use of biological principles and structures inherent in living organisms for the purpose of designing, adapting, or deriving new technologies or products, according to the present study.
2. It is not the first time that architecture takes ideas from biology, and one can remember the ancient Greeks and Romans that used the motives of the leaves in the friezes of their constructions, the Art Nouveau, and Frank Lloyd Wright, who wanted to create a transformation between his constructions and nature.
3. Biology is applied by architects in the construction of structures that are considered efficient in terms of energy and features that are sustainable in the environment. They apply knowledge of the relationship between organisms and their surroundings in order to ensure that the building does not have a terrible effect of the physical environment it is built in.
4. They are found in ourselves, in other living organisms, in the natural formation, and basically in art worldwide; even in the proportions of the universe, big and small, the measures are in the golden rectangle. For the ancient philosophers, it was extremely significant in spite of the fact that their perception of proportions was quite different and limited; according to them, they were divine, and moreover, they simply look good. However, one must acknowledge the fact that architects incorporated the principles of the golden ratio in designing structures way before the discovery. You can see the impact of this isolated ratio in ancient temples, medieval cathedrals, and early 20th-century buildings.
5. Thus, the confrontation of biological and technological aspects into the architecture settles an actually unexampled idea and a mentality in architecture. Biodesign, or biofabrication, is a branch that uses biological processes to provide architectural solutions that are much more sustainable, adaptable, and innovative.

**Gayatri Desai and Parag Narkhede**

6. In regard to the sub-discipline of biology, ecological studies are a sub-discipline that carries immense importance in the field of architecture in contemporary society. Said to be defined by the Oxford English Dictionary as 'the branch of biology,' this focuses on the relationship of alive organisms with their environment.

EARTH SCIENCES

This article has also mentioned earth science as one of the scientific disciplines with the general responsibility of studying the earth and its attributes and activities. It encompasses geology, palaeontology, environmental studies, seismology, geography, and all is classified as earth science. When one studies the earthly sciences regarding territoriality, one gets the chance to see the scale of territoriality that modern architectural practice assumes. Such cases include the current half of the growing world populations living in only one percent of the geographical land, and in other cases, such as populations dwelling in flood plains, coastal planes, or up hillsides, contingencies that result in cyclic operations of the atmosphere and the surface being dangerous for several varieties of catastrophe. Natural materials have been commonly employed in architecture due to their abundant availability. Stone, lime, and clay are readily available in several regions around the globe, rendering them a rational selection for construction materials.

1. Numerous natural substances exhibit the qualities of being resilient and having a prolonged lifespan. Stone is a robust and long-lasting substance that can endure the effects of weathering and erosion, making it a very suitable option for constructing foundations and walls.
2. Geology plays a crucial role in construction as it occurs either on the surface or underground. The excavation process and foundation type are determined by the ground conditions. Therefore, the study of geology and earth sciences significantly impacts the majority of construction operations as it plays a crucial role in determining its characteristics, form & structure, and expenses of construction.
3. The use of contours and terrain is done in landscaping, basement designing and level differences in architecture.
4. The study of earth sciences also helps the architects and engineers in designing and constructing the structure by providing different factors such as building, water resource development, and urban planning. It provides information on site conditions and material attributes.
5. Seismic zones are utilized to provide design guidelines for structures and infrastructure. The earthquake zoning map is an important tool used by Architects and engineers to devise structures that are capable of withstanding earthquakes.
6. Understanding vernacular architecture highlights the influence of local climate, culture, and resources on design. For instance, the construction of igloos in Arctic climates used the stacking of snow blocks to form curved structures that provided insulation.
7. Laterite is a reddish stone that is created from the compaction of red soil located on the western coastline of India. Laterite stone is widely used in Konkan region of Maharashtra in India, as it is readily available and suitable for the climate.

ASTRONOMY

The fields of architecture and astronomy have had a profound and interconnected relationship since prehistoric times. Astronomy is an interesting branch of natural science that focuses on the study of celestial bodies such as the moon, planets, stars, and universes. It also involves the exploration and understanding of various phenomena that occur beyond Earth's atmosphere. Numerous ancient civilizations have made astronomy their primary scientific focus. Over the years, the study of buildings and their layout has become an integral part of the field of astronomy.

1. In ancient civilizations, the study of astronomy involved a thorough investigation of celestial objects and their paths in the sky, as well as the effects of these paths on living beings on Earth. That is the main source from which the majority of individuals have derived their religious traditions. Even now, our religious structures are constructed based on the astronomical arrangement of stars.
2. The connection between astronomy and building may be traced back to ancient times. Throughout history, global observatories have been established by monarchs and people. Architecture may be utilized as a means to understand astronomy. Examples such as the pyramids of Egypt, the Jantar Mantar, and Stonehenge, etc.

**Gayatri Desai and Parag Narkhede**

3. Astronomy stands to gain significant advantages from well-planned architectural environments. Every aspect of our daily existence, including rituals and calendars, is intricately connected to astrology. The government is currently seeking to develop advanced observatories.
4. Climatology is a discipline of astronomy that studies atmospheric science. The practice of orienting and positioning dwellings in accordance with the sun's path and calculating azimuth angles may be traced back to ancient astrology.
5. VastuShashtra is the study of astrology and climatology and it is commonly used in the area of design and construction. It is an old Indian architectural and design approach that prioritizes a harmonious relationship between a building and its occupants.

The structure can be balanced by aligning it with the natural elements and energy forces that surround it. Ancient Indians developed concepts of living in harmony with nature or the natural way of living with the environment.

CONCLUSION

As an interdisciplinary profession, architecture requires architects to have a comprehensive understanding of numerous subjects within the Arts and Sciences. Architects play an important role in the design process by integrating their knowledge of Biology, Chemistry, Physics, Earth sciences, and Astronomy into their designs. As a result, architects must have a good understanding of the natural sciences as a prerequisite for their profession. During the study of architecture, the curriculum primarily incorporates natural sciences into different architectural courses. A thorough understanding of the natural sciences significantly enhances building design solutions, making them more comprehensive, inclusive, and environmentally relevant. In order to make this knowledge of natural sciences applicable to the profession, the students require appropriate guidance on the best way to effectively employ the knowledge.

ABSTRACT

This study focuses on analysing a dual-warehouse inventory model characterized by distinct Holding cost and deterioration quantity. In the rented warehouse, the holding costs are notably high, while the deterioration rate remains relatively low. Conversely, the own warehouse features low holding costs juxtaposed with a high deterioration rate.

Keywords: Dual-warehouse, comparison model, Deterioration rate.

INTRODUCTION

In [1] he discusses about production model where the production is depended on the demand. In [2] the model is for deteriorating items, where all items are not good for all time which is more relate to the real life situation.[3] this is a two warehouse inventory model with a ramp type demand [4] is also a two warehouse inventory model but with production type [6] and [7] also a two warehouse model with exponential demand and first in and first out model respectively this FIFO means that the product are consumed first when they come first. In[9] and [10] the model is for increasing demand this is for newly launched products in the market where it will get a high demand [11] gives variable holding cost which helps for our model to bult. By this we are taking the real life situations as conditions and we bult this model.

Anusuya Baggiyalakshmi and Maragatham

Assumptions

- ❖ $D(t) = a + bt + ct^2$ this is demand which is quadratic.
- ❖ No repair is done in the cycle.
- ❖ Only one item is considered.
- ❖ Both Own warehouse and Rented warehouse has a limited capacity with N and Q units respectively
- ❖ Shortages are not allowed.
- ❖ Two type models are taken for consideration.

Notations:

- ❖ C_o : Ordering Cost
- ❖ C_d : Deterioration Cost
- ❖ h_r : Holding Cost for Rented Warehouse
- ❖ h_o : Holding Cost for Own Warehouse
- ❖ θ_1 : Deterioration Rate of Rented Warehouse
- ❖ θ_2 : Deterioration Rate of Own Warehouse

Mathematical Model:Model: I

This is the normal traditional model. Items in the rented warehouse is consumed first due to the holding cost of Rented warehouse is higher than the holding cost of the Own warehouse ($h_r > h_o$).

As usual Ordering Cost, deterioration cost for both rented warehouse and own warehouse and Holding cost for both RW and OW are calculated.

Then the total cost can be written as

$$\begin{aligned}
 TC_1 = & C_o + h_r \left[\left(Qt - \frac{at_1^2}{2} - \frac{bt_1^3}{6} - \frac{ct_1^4}{12} \right) + a \left\{ \left(\frac{t_1^2+t_2^2-2t_1t_2}{2} \right) - \theta_1 \left(\frac{2t_1^3-t_2^3-3t_1^2t_2}{6} \right) + \frac{\theta_1^2}{2} \left(\frac{3t_1^4+t_2^4-4t_1^3t_2}{12} \right) \right\} + \right. \\
 & f_1 \left\{ \left(\frac{t_1^3+2t_2^3-3t_1t_2^2}{6} \right) - \theta_1 \left(\frac{t_1^4+t_2^4-2t_1^2t_2^2}{8} \right) + \frac{\theta_1^2}{2} \left(\frac{3t_1^5+2t_2^5-5t_1^3t_2^2}{30} \right) \right\} + \\
 & f_2 \left\{ \left(\frac{t_1^4+3t_2^4-4t_1t_2^3}{12} \right) - \theta_1 \left(\frac{2t_1^5+3t_2^5-5t_1^2t_2^3}{30} \right) + \frac{\theta_1^2}{2} \left(\frac{t_1^6+t_2^6-2t_1^3t_2^3}{18} \right) \right\} + \\
 & f_3 \left\{ \left(\frac{t_1^5+4t_2^5-5t_1t_2^4}{20} \right) - \theta_1 \left(\frac{t_1^6+2t_2^6-3t_1^2t_2^4}{24} \right) + \theta_1^2 \left(\frac{(3t_1^7+4t_2^7-7t_1^3t_2^4)}{84} \right) \right\} + f_4 \left\{ \left(\frac{t_1^6+5t_2^6-6t_1t_2^5}{30} \right) - \right. \\
 & \left. \theta_1 \left(\frac{2t_1^7+5t_2^7-7t_1^2t_2^5}{70} \right) + \frac{\theta_1^2}{2} \left(\frac{(3t_1^8+5t_2^8-8t_1^3t_2^5)}{120} \right) \right\} + \\
 & h_o \left[\left[Nt_1 + \frac{N}{\theta_2} (1 - e^{-\theta_2(t_2-t_1)}) \right] + a \left\{ \left(\frac{T^2+t_2^2-2Tt_2}{2} \right) - \theta_2 \left(\frac{2t_2^3+t^3-3t_2^2T}{6} \right) + \frac{\theta_2^2}{2} \left(\frac{3t_2^4+T^4-4t_2^3T}{12} \right) \right\} + \right. \\
 & g_1 \left\{ \left(\frac{t_2^3+2T^3-3t_2T^2}{6} \right) - \theta_2 \left(\frac{t_2^4+T^4-2t_2^2T^2}{8} \right) + \frac{\theta_2^2}{2} \left(\frac{3t_2^5+2T^5-5t_2^3T^2}{30} \right) \right\} + g_2 \left\{ \left(\frac{t_2^4+3T^4-4t_2T^3}{12} \right) - \right. \\
 & \theta_2 \left(\frac{2t_2^5+3T^5-5t_2^2T^3}{30} \right) + \frac{\theta_2^2}{2} \left(\frac{t_2^6+T^6-2t_2^3T^3}{18} \right) \right\} + g_3 \left\{ \left(\frac{t_2^5+4T^5-5t_2T^4}{20} \right) - \theta_2 \left(\frac{t_2^6+2T^6-3t_2^2T^4}{24} \right) + \right. \\
 & \left. \theta_2^2 \left(\frac{(3t_2^7+4T^7-7t_2^3T^4)}{84} \right) \right\} + g_4 \left\{ \left(\frac{t_2^6+5T^6-6t_2T^5}{30} \right) - \theta_2 \left(\frac{2t_2^7+5T^7-7t_2^2T^5}{70} \right) + \frac{\theta_2^2}{2} \left(\frac{(3t_2^8+5T^8-8t_2^3T^5)}{120} \right) \right\} + \\
 & C_d \theta_1 \left[a \left\{ \left(\frac{t_1^2+t_2^2-2t_1t_2}{2} \right) - \theta_1 \left(\frac{2t_1^3-t_2^3-3t_1^2t_2}{6} \right) + \frac{\theta_1^2}{2} \left(\frac{3t_1^4+t_2^4-4t_1^3t_2}{12} \right) \right\} + f_1 \left\{ \left(\frac{t_1^3+2t_2^3-3t_1t_2^2}{6} \right) - \right. \right. \\
 & \left. \theta_1 \left(\frac{t_1^4+t_2^4-2t_1^2t_2^2}{8} \right) + \frac{\theta_1^2}{2} \left(\frac{3t_1^5+2t_2^5-5t_1^3t_2^2}{30} \right) \right\} + \\
 & f_2 \left\{ \left(\frac{t_1^4+3t_2^4-4t_1t_2^3}{12} \right) - \theta_1 \left(\frac{2t_1^5+3t_2^5-5t_1^2t_2^3}{30} \right) + \frac{\theta_1^2}{2} \left(\frac{t_1^6+t_2^6-2t_1^3t_2^3}{18} \right) \right\} + \\
 & f_3 \left\{ \left(\frac{t_1^5+4t_2^5-5t_1t_2^4}{20} \right) - \theta_1 \left(\frac{t_1^6+2t_2^6-3t_1^2t_2^4}{24} \right) + \theta_1^2 \left(\frac{(3t_1^7+4t_2^7-7t_1^3t_2^4)}{84} \right) \right\} + f_4 \left\{ \left(\frac{t_1^6+5t_2^6-6t_1t_2^5}{30} \right) - \right. \\
 & \left. \theta_1 \left(\frac{2t_1^7+5t_2^7-7t_1^2t_2^5}{70} \right) + \frac{\theta_1^2}{2} \left(\frac{(3t_1^8+5t_2^8-8t_1^3t_2^5)}{120} \right) \right\} + C_d \theta_2 \left[\left[\frac{N}{\theta_2} (1 - e^{-\theta_2(t_2-t_1)}) \right] + a \left\{ \left(\frac{T^2+t_2^2-2Tt_2}{2} \right) - \right. \right.
 \end{aligned}$$

Anusuya Baggiyalakshmi and Maragatham

$$\theta_2 \left(\frac{2t_2^3 + t^3 - 3t_2^2 T}{6} \right) + \frac{\theta_2^2}{2} \left(\frac{3t_2^4 + T^4 - 4t_2^3 T}{12} \right) \Bigg\} +$$

$$g_1 \left\{ \left(\frac{t_2^3 + 2T^3 - 3t_2 T^2}{6} \right) - \theta_2 \left(\frac{t_2^4 + T^4 - 2t_2^2 T^2}{8} \right) + \frac{\theta_2^2}{2} \left(\frac{3t_2^5 + 2T^5 - 5t_2^3 T^2}{30} \right) \right\} + g_2 \left\{ \left(\frac{t_2^4 + 3T^4 - 4t_2 T^3}{12} \right) - \right.$$

$$\theta_2 \left(\frac{2t_2^5 + 3T^5 - 5t_2^2 T^3}{30} \right) + \frac{\theta_2^2}{2} \left(\frac{t_2^6 + T^6 - 2t_2^3 T^3}{18} \right) \Bigg\} + g_3 \left\{ \left(\frac{t_2^5 + 4T^5 - 5t_2 T^4}{20} \right) - \theta_2 \left(\frac{t_2^6 + 2T^6 - 3t_2^2 T^4}{24} \right) + \right.$$

$$\theta_2^2 \left(\frac{3t_2^7 + 4T^7 - 7t_2^3 T^4}{84} \right) \Bigg\} + g_4 \left\{ \left(\frac{t_2^6 + 5T^6 - 6t_2 T^5}{30} \right) - \theta_2 \left(\frac{2t_2^7 + 5T^7 - 7t_2^2 T^5}{70} \right) + \frac{\theta_2^2}{2} \left(\frac{3t_2^8 + 5T^8 - 8t_2^3 T^5}{120} \right) \right\}$$

Model: II

In this model all other assumptions are same as the model I. In traditional model deteriorating rate of Own warehouse is higher than the Rented warehouse but here the deterioration cost of own ware house is higher than the holding cost of the Rented warehouse. So items in the Own warehouse is consumed first and then Rented warehouse items will be consumed.

$$\frac{dI_o(t)}{dt} = -D(t) \quad 0 \leq t \leq t_1 \dots\dots\dots (1)$$

$$\frac{dI_o(t)}{dt} = -D(t) - \theta_2 I_o(t) \quad t_1 \leq t \leq t_2 \dots\dots\dots (2)$$

$$\frac{dI_R(t)}{dt} = 0 \quad 0 \leq t \leq t_1 \dots\dots\dots (3)$$

$$\frac{dI_R(t)}{dt} = -\theta_1 I_R(t) \quad t_1 \leq t \leq t_2 \dots\dots\dots (4)$$

$$\frac{dI_R(t)}{dt} = -D(t) - \theta_1 I_R(t) \quad t_2 \leq t \leq T \dots\dots\dots (5)$$

The boundary conditions we have

$$I_R(0) = N, I_o(t_2) = 0, I_o(0) = Q, I_R(t_1) = N, I_R(T) = 0$$

With this boundary condition the equation (1) will become

Then $I_o(t) = -\frac{ct^3}{3} - \frac{bt^2}{2} - at + Q \quad 0 \leq t \leq t_1 \dots\dots\dots (6)$

$$I_o(t) = \left[a(t_2 - t) + \left(\frac{f_1}{2} \right) (t_2^2 - t^2) + \left(\frac{f_2}{3} \right) (t_2^3 - t^3) + \left(\frac{f_3}{4} \right) (t_2^4 - t^4) + \left(\frac{f_4}{5} \right) (t_2^5 - t^5) \right] \cdot e^{-\theta_2 t},$$

$$t_1 \leq t \leq t_2 \quad \dots\dots\dots (7)$$

$$I_R(t) = N \quad 0 \leq t \leq t_1 \quad \dots\dots\dots (8)$$

$$I_R(t) = N \cdot e^{\theta_1(t_1-t)} \quad t_1 \leq t \leq t_2 \quad \dots\dots\dots (9)$$

$$I_R(t) = \left\{ a(T - t) + \left(\frac{g_1}{2} \right) (T^2 - t^2) + \left(\frac{g_2}{3} \right) (T^3 - t^3) + \left(\frac{g_3}{4} \right) (T^4 - t^4) + \left(\frac{g_4}{5} \right) (T^5 - t^5) - t_5 e^{-\theta_1 t} \right\}$$

$$t_2 \leq t \leq T \quad \dots\dots\dots (10)$$

Where the inventory is continuous t_1 and t_2 , we have

At t_1

$$Q = \left[at_1 + \frac{bt_1^2}{2} + \frac{ct_1^3}{3} \right] + \left[a(t_2 - t_1) + \left(\frac{f_1}{2} \right) (t_2^2 - t_1^2) + \left(\frac{f_2}{3} \right) (t_2^3 - t_1^3) + \left(\frac{f_3}{4} \right) (t_2^4 - t_1^4) + \left(\frac{f_4}{5} \right) (t_2^5 - t_1^5) \right] \cdot e^{-\theta_2 t_1}$$

$$\dots\dots\dots (11)$$

At t_2

$$N = \left\{ a(T - t) + \left(\frac{g_1}{2} \right) (T^2 - t^2) + \left(\frac{g_2}{3} \right) (T^3 - t^3) + \left(\frac{g_3}{4} \right) (T^4 - t^4) + \left(\frac{g_4}{5} \right) (T^5 - t^5) \right\} e^{-\theta_1 t_1}$$

$$\dots\dots\dots (12)$$

Anusuya Baggiyalakshmi and Maragatham

Where the maximum inventory is $M=Q+N$

Ordering Cost

$$OC = c_o \dots\dots\dots(13)$$

Holding Cost for Own Warehouse

$$C_{1OW} = h_o \left[\int_0^{t_1} I_o(t)dt + \int_{t_1}^{t_2} I_o(t)dt \right]$$

$$C_{1RW} = h_o \left[\left(Qt - \frac{at_1^2}{2} - \frac{bt_1^3}{6} - \frac{ct_1^4}{12} \right) + a \left\{ \left(\frac{t_1^2+t_2^2-2t_1t_2}{2} \right) - \theta_2 \left(\frac{2t_1^3-t_2^3-3t_1^2t_2}{6} \right) + \frac{\theta_2^2}{2} \left(\frac{3t_1^4+t_2^4-4t_1^3t_2}{12} \right) \right\} + f_1t_1^3+2t_2^3-3t_1t_2^2-\theta_2t_1^4+t_2^4-2t_1t_2^2+2\theta_2t_1^3t_2+2t_2^3-5t_1^3t_2+2t_1^2t_2^2-4t_1t_2^3+2t_2^4-\theta_2^2t_1^5+3t_2^5-5t_1^2t_2^3+\theta_2^2t_1^6+t_2^6-2t_1^3t_2^3+3t_1^5+4t_2^5-5t_1^2t_2^4-2\theta_2t_1^6+2t_2^6-3t_1^2t_2^4+\theta_2^2t_1^7+4t_2^7-7t_1^3t_2^4+f_4t_1^6+5t_2^6-6t_1t_2^5-\theta_2^2t_1^7+5t_2^7-7t_1^2t_2^5+\theta_2^2t_1^8+5t_2^8-8t_1^3t_2^5 \dots\dots\dots(14)$$

Holding cost for Rented Warehouse

$$C_{1RW} = h_r \left[\int_0^{t_1} I_R(t)dt + \int_{t_1}^{t_2} I_R(t)dt + \int_{t_2}^T I_R(t)dt \right]$$

$$C_{1RW} = h_r \left[\left\{ Nt_1 + \frac{N}{\theta_1} (1 - e^{-\theta_1(t_2-t_1)}) \right\} + a \left\{ \left(\frac{T^2+t_2^2-2Tt_2}{2} \right) - \theta_1 \left(\frac{2t_2^3+t^3-3t_2^2T}{6} \right) + \frac{\theta_1^2}{2} \left(\frac{3t_2^4+T^4-4t_2^3T}{12} \right) \right\} + g_1t_2^3+2T^3-3t_2T^2-\theta_1t_2^4+T^4-2t_2T^2+2\theta_1t_2^3T+2T^3-5t_2^3T+g_2t_2^4+3T^4-4t_2T^3-2T^3-2\theta_1t_2^5+3T^5-5t_2^2T^3+\theta_1^2t_2^6+T^6-2t_2^3T^3+g_3t_2^5+4T^5-5t_2^2T^4-\theta_1t_2^6+2T^6-3t_2^2T^4+\theta_1^2t_2^7+4T^7-7t_2^3T^4+g_4t_2^6+5T^6-6t_2^2T^5-\theta_1^2t_2^7+5T^7-7t_2^2T^5+\theta_1^2t_2^8+5T^8-8t_2^3T^5 \dots\dots\dots (15)$$

Deterioration cost for Own Warehouse

TOTAL COST:

The total cost can be written a

$$TC_2 =$$

$$c_o + h_o \left[\left(Qt - \frac{at_1^2}{2} - \frac{bt_1^3}{6} - \frac{ct_1^4}{12} \right) + a \left\{ \left(\frac{t_1^2 + t_2^2 - 2t_1 t_2}{2} \right) - \theta_2 \left(\frac{2t_1^3 - t_2^3 - 3t_1^2 t_2}{6} \right) + \frac{\theta_2^2}{2} \left(\frac{3t_1^4 + t_2^4 - 4t_1^3 t_2}{12} \right) \right\} + f_1 \left\{ \left(\frac{t_1^3 + 2t_2^3 - 3t_1 t_2^2}{6} \right) - \theta_2 \left(\frac{t_1^4 + t_2^4 - 2t_1^2 t_2^2}{8} \right) + \frac{\theta_2^2}{2} \left(\frac{3t_1^5 + 2t_2^5 - 5t_1^3 t_2^2}{30} \right) \right\} + f_2 \left\{ \left(\frac{t_1^4 + 3t_2^4 - 4t_1 t_2^3}{12} \right) - \theta_2 \left(\frac{2t_1^5 + 3t_2^5 - 5t_1^2 t_2^3}{30} \right) + \frac{\theta_2^2}{2} \left(\frac{t_1^6 + t_2^6 - 2t_1^3 t_2^3}{18} \right) \right\} + f_3 \left\{ \left(\frac{t_1^5 + 4t_2^5 - 5t_1 t_2^4}{20} \right) - \theta_2 \left(\frac{t_1^6 + 2t_2^6 - 3t_1^3 t_2^4}{24} \right) + \theta_2^2 \left(\frac{(3t_1^7 + 4t_2^7 - 7t_1^3 t_2^4)}{84} \right) \right\} + f_4 \left\{ \left(\frac{(t_1^6 + 5t_2^6 - 6t_1 t_2^5)}{30} \right) - \theta_2 \left(\frac{2t_1^7 + 5t_2^7 - 7t_1^2 t_2^5}{70} \right) + \frac{\theta_2^2}{2} \left(\frac{(3t_1^8 + 5t_2^8 - 8t_1^3 t_2^5)}{120} \right) \right\} + h_r \left[Nt_1 + \frac{N}{\theta_1} (1 - e^{\theta_1(t_2-t_1)}) \right] + a \left\{ \left(\frac{T^2 + t_2^2 - 2Tt_2}{2} \right) - \theta_1 \left(\frac{2t_2^3 + t^3 - 3t_2^2 T}{6} \right) + \frac{\theta_1^2}{2} \left(\frac{3t_2^4 + T^4 - 4t_2^3 T}{12} \right) \right\} + g_1 \left\{ \left(\frac{t_2^3 + 2T^3 - 3t_2 T^2}{6} \right) - \theta_1 \left(\frac{t_2^4 + T^4 - 2t_2^2 T^2}{8} \right) + \frac{\theta_1^2}{2} \left(\frac{3t_2^5 + 2T^5 - 5t_2^3 T^2}{30} \right) \right\} + g_2 \left\{ \left(\frac{t_2^4 + 3T^4 - 4t_2 T^3}{12} \right) - \theta_1 \left(\frac{2t_2^5 + 3T^5 - 5t_2^2 T^3}{30} \right) + \frac{\theta_1^2}{2} \left(\frac{t_2^6 + T^6 - 2t_2^3 T^3}{18} \right) \right\} + g_3 \left\{ \left(\frac{t_2^5 + 4T^5 - 5t_2 T^4}{20} \right) - \theta_1 \left(\frac{t_2^6 + 2T^6 - 3t_2^2 T^4}{24} \right) + \theta_1^2 \left(\frac{(3t_2^7 + 4T^7 - 7t_2^3 T^4)}{84} \right) \right\} + g_4 \left\{ \left(\frac{(t_2^6 + 5T^6 - 6t_2 T^5)}{30} \right) - \theta_1 \left(\frac{2t_2^7 + 5T^7 - 7t_2^2 T^5}{70} \right) + \frac{\theta_1^2}{2} \left(\frac{(3t_2^8 + 5T^8 - 8t_2^3 T^5)}{120} \right) \right\} + C_d \theta_2 \left[a \left\{ \left(\frac{t_1^2 + t_2^2 - 2t_1 t_2}{2} \right) - \theta_2 \left(\frac{2t_1^3 - t_2^3 - 3t_1^2 t_2}{6} \right) + \frac{\theta_2^2}{2} \left(\frac{3t_1^4 + t_2^4 - 4t_1^3 t_2}{12} \right) \right\} + f_1 \left\{ \left(\frac{t_1^3 + 2t_2^3 - 3t_1 t_2^2}{6} \right) - \theta_2 \left(\frac{t_1^4 + t_2^4 - 2t_1^2 t_2^2}{8} \right) + \frac{\theta_2^2}{2} \left(\frac{3t_1^5 + 2t_2^5 - 5t_1^3 t_2^2}{30} \right) \right\} + f_2 \left\{ \left(\frac{t_1^4 + 3t_2^4 - 4t_1 t_2^3}{12} \right) - \theta_2 \left(\frac{2t_1^5 + 3t_2^5 - 5t_1^2 t_2^3}{30} \right) + \frac{\theta_2^2}{2} \left(\frac{t_1^6 + t_2^6 - 2t_1^3 t_2^3}{18} \right) \right\} + f_3 \left\{ \left(\frac{t_1^5 + 4t_2^5 - 5t_1 t_2^4}{20} \right) - \theta_2 \left(\frac{t_1^6 + 2t_2^6 - 3t_1^3 t_2^4}{24} \right) + \theta_2^2 \left(\frac{(3t_1^7 + 4t_2^7 - 7t_1^3 t_2^4)}{84} \right) \right\} + f_4 \left\{ \left(\frac{(t_1^6 + 5t_2^6 - 6t_1 t_2^5)}{30} \right) - \theta_2 \left(\frac{2t_1^7 + 5t_2^7 - 7t_1^2 t_2^5}{70} \right) + \frac{\theta_2^2}{2} \left(\frac{(3t_1^8 + 5t_2^8 - 8t_1^3 t_2^5)}{120} \right) \right\} \right] + C_d \theta_1 \left[\left\{ \frac{N}{\theta_2} (1 - e^{\theta_1(t_2-t_1)}) \right\} + a \left\{ \left(\frac{T^2 + t_2^2 - 2Tt_2}{2} \right) - \theta_1 \left(\frac{2t_2^3 + t^3 - 3t_2^2 T}{6} \right) + \frac{\theta_1^2}{2} \left(\frac{3t_2^4 + T^4 - 4t_2^3 T}{12} \right) \right\} + g_1 t_2^3 + 2T^3 - 3t_2 T^2 - \theta_1 t_2^4 + T^4 - 2t_2 T^2 + 2T^3 - \theta_1 2t_2^3 + 2T^5 - 5t_2 T^2 + 3T^4 - 4t_2 T^3 - \theta_1 2t_2^5 + 3T^5 - 5t_2 T^3 + \theta_1 2t_2^6 + T^6 - 2t_2 T^3 + 3T^5 + g_3 t_2^5 + 4T^5 - 5t_2 T^4 - \theta_1 t_2^6 + 2T^6 - 3t_2 T^4 + \theta_1 2t_2^7 + 4T^7 - 7t_2 T^4 + g_4 t_2^6 + 5T^6 - 6t_2 T^5 - \theta_1 2t_2^7 + 5T^7 - 7t_2 T^5 + \theta_1 2t_2^8 + 5T^8 - 8t_2 T^5 \right]$$

Anusuya Baggiyalakshmi and Maragatham

$$\theta_1 \left(\frac{2t_2^3 + t^3 - 3t_2^2 T}{6} \right) + \frac{\theta_1^2}{2} \left(\frac{3t_2^4 + T^4 - 4t_2^3 T}{12} \right) \Bigg\} +$$

$$g_1 \left\{ \left(\frac{t_2^3 + 2T^3 - 3t_2 T^2}{6} \right) - \theta_1 \left(\frac{t_2^4 + T^4 - 2t_2^2 T^2}{8} \right) + \frac{\theta_1^2}{2} \left(\frac{3t_2^5 + 2T^5 - 5t_2^3 T^2}{30} \right) \right\} + g_2 \left\{ \left(\frac{t_2^4 + 3T^4 - 4t_2 T^3}{12} \right) - \right.$$

$$\theta_1 \left(\frac{2t_2^5 + 3T^5 - 5t_2^2 T^3}{30} \right) + \frac{\theta_1^2}{2} \left(\frac{t_2^6 + T^6 - 2t_2^3 T^3}{18} \right) \Bigg\} + g_3 \left\{ \left(\frac{t_2^5 + 4T^5 - 5t_2 T^4}{20} \right) - \theta_1 \left(\frac{t_2^6 + 2T^6 - 3t_2^2 T^4}{24} \right) + \right.$$

$$\theta_1^2 \left(\frac{3t_2^7 + 4T^7 - 7t_2^3 T^4}{84} \right) \Bigg\} + g_4 \left\{ \left(\frac{t_2^6 + 5T^6 - 6t_2 T^5}{30} \right) - \theta_1 \left(\frac{2t_2^7 + 5T^7 - 7t_2^2 T^5}{70} \right) + \frac{\theta_1^2}{2} \left(\frac{3t_2^8 + 5T^8 - 8t_2^3 T^5}{120} \right) \right\}$$

Our primary goal is to reduce the total cost, which requires us to determine the optimal values of t_2 and T . Through the utilization of the Hessian matrix, we identify the optimal solution if it meets our criteria. If it satisfies the condition then (t_2, T) is the optimal solution on TC_1 and in the similar way we have to find the optimal solution for TC_2 where $TC = \min(TC_1, TC_2)$

CONCLUSION

Retailers typically encounter various expenses related to product maintenance, procurement, and warehouse management. It's not always prudent to adhere to a single model; depending on the product and warehouse facility, switching models can effectively reduce the total cost. This paper could be expanded to consider scenarios involving shortages or the storage of multiple items in the warehouse.

ABSTRACT

In this paper, an EOQ model for Bi-quadratic time-varying demand with deterioration is developed. Shortages are allowed and they are fully backlogged. It is assumed here that the deterioration rate follows Pareto distribution. Carrying cost, Shortage cost and Deterioration cost for the model are calculated. Optimal time to consume the physical stock, cycle time and total cost from inventory costs are determined. A numerical example is given to discuss the results. To understand the influence of changes in the parameters on the optimal policies a sensitivity analysis of the example is provided.

Keywords: Inventory, Pareto distribution, deterioration rate, shortages, cycle time.

INTRODUCTION

For an efficiency of an organization and its smooth conduct, physical resources are kept in stock. This is called the Inventory. Researchers consider the demand of the decaying resources as linearly time dependent or constant or exponential. Also at the end of the life period of the inventory deterioration takes place. The process that prevents an item from usage is deterioration. An item in stock can deteriorate over time as it cannot be used further or because of its demand gets decreasing. Covert et al. [1], Jalan A K et al. [2] and Chakrabarty et al. [3] first considered the deterioration rate as a Weibull distribution and trended demand for inventory models. In the year 2019, Singh N, Vaish B and Singh S R [4] framed an EOQ model with deterioration following Pareto distribution having a demand of trapezoidal type with fully backlogged. Sanni and Chukwu [5] extended the Weibull distribution deterioration

Akilandeswari

rate for three parameters with a ramp-type demand. An inventory model for three-parameter Weibull distributed deterioration rate under inflation was developed by Akaninyene Udo Udom et al. [6] in the year 2022.

Pareto Distribution

Multivariate Pareto Distributions was first introduced by Mardia [7] in the year 1962. If a random variable X follows Pareto Distribution, then its probability density function is given by $f(x) = \frac{\alpha\beta^\alpha}{x^{\alpha+1}}$ with $\alpha > 0$ being the shape parameter, scale parameter $\beta > 0$ and $x \geq \beta$ and its cumulative distribution function is given by $F(x) = 1 - \left(\frac{\beta}{x}\right)^\alpha$. Pareto distribution is a left-skewed distribution with high top tail. This is observed in the case of degraded food materials. In this paper, an inventory model for analysis of procurement of degraded food materials, is developed assuming that its deterioration rate follows Pareto distribution and Bi-Quadratic type time varying demand. This EOQ model allows shortages and they are fully backlogged. Optimal time to consume the resources, optimum cycle time, optimum total cost are evaluated. A numerical example is used to prove the result and the sensitivity analysis for the data is also studied. MATLAB software is used to find the optimum values.

THE MATHEMATICAL MODEL

NOTATIONS

The proposed model contains the following parameters and decision variables.

Parameters

A -Ordering cost

h -Holding cost

Q_d -number of deteriorated units

Q -Initial stock

Q^* -Optimal Order Quantity

s -Shortage cost

θ -Deterioration rate

$D(t)=a+bt+ct^2+dt^3+ft^4$ -Demand rate where a,b,c,d,f are constants

$I(t)$ -Inventory level at time t

Z -Total cost per cycle

Z^* -Optimum Total cost per cycle

q_1 -Maximum stock level

q_2 -Maximum stock shortage level

C -Deterioration cost

Decision variables

T -Cycle time

T^* -Optimum Cycle time

T_1 -Time of positive stock

T_1^* -Optimum Time of positive stock

ASSUMPTIONS

1. The rate of replenishment is infinite
2. The inventory model deals with single item
3. Demand rate $D(t)=a+bt+ct^2+dt^3+ft^4$ is assumed to be Bi-Quadratic, where a,b,c,d,f are constants
4. Shortages are allowed and they are backlogged
5. Lead time is zero
6. The deterioration rate follows Pareto distribution

Thus the deterioration rate is given by

$$\theta(t) = \frac{f(t)}{1-F(t)} = \frac{\alpha}{t}$$

Akilandeswari

MODEL FORMULATION

The objective of the inventory model is to maintain a minimum total cost by determining the optimal order quantity and optimum cycle time. At time $t = 0$, it is found the inventory level is maximum of $q1$. At time T_1 , inventory level is 0, and at $t = T$, it reaches the the maximum shortage level $q2$.

Thus the inventory level $I(t)$ can expressed as the differential equations

$$\frac{dI(t)}{dt} + \theta(t)I(t) = -D(t) \quad 0 \leq t \leq T_1 \tag{1}$$

$$\frac{dI(t)}{dt} = -D(t) \quad T_1 \leq t \leq T \tag{2}$$

The solution of the equation (1) with $I(T_1) = 0$ is given by

$$I(t) = \frac{a}{\alpha+1}(T_1 - t) + \frac{b}{\alpha+2}(T_1^2 - t^2) + \frac{c}{\alpha+3}(T_1^3 - t^3) + \frac{d}{\alpha+4}(T_1^4 - t^4) + \frac{f}{\alpha+5}(T_1^5 - t^5) \tag{3}$$

where $0 \leq t \leq T_1$.

At time $t = 0, I(t) = q1$. Hence

$$q1 = \frac{a}{\alpha+1}T_1 + \frac{b}{\alpha+2}T_1^2 + \frac{c}{\alpha+3}T_1^3 + \frac{d}{\alpha+4}T_1^4 + \frac{f}{\alpha+5}T_1^5 \tag{4}$$

The solution of the equation (2) with $I(T_1) = 0$ is given by

$$I(t) = a(T_1 - t) + \frac{b}{2}(T_1^2 - t^2) + \frac{c}{3}(T_1^3 - t^3) + \frac{d}{4}(T_1^4 - t^4) + \frac{f}{5}(T_1^5 - t^5) \tag{5}$$

At time $t = 0, I(t) = q2$. Hence, the maximum shortage quantity is

$$q2 = a(T - T_1) + \frac{b}{2}(T^2 - T_1^2) + \frac{c}{3}(T^3 - T_1^3) + \frac{d}{4}(T^4 - T_1^4) + \frac{f}{5}(T^5 - T_1^5) \tag{6}$$

Thus the initial order quantity

$$Q = q1 + q2$$

$$Q = -\alpha \left(\frac{a}{\alpha+1}T_1 + \frac{b}{2(\alpha+2)}T_1^2 + \frac{c}{3(\alpha+3)}T_1^3 + \frac{d}{4(\alpha+4)}T_1^4 + \frac{f}{5(\alpha+5)}T_1^5 \right) + aT + \frac{b}{2}T^2 + \frac{c}{3}T^3 + \frac{d}{4}T^4 + \frac{f}{5}T^5 \tag{7}$$

The Holding cost (HC) of the inventory model is

$$HC = h \int_0^{T_1} I(t)dt$$

$$HC = h \left[\frac{a}{\alpha+1} \left(\frac{T_1^2}{2} \right) + \frac{b}{\alpha+2} \left(\frac{2T_1^3}{3} \right) + \frac{c}{\alpha+3} \left(\frac{3T_1^4}{4} \right) + \frac{d}{\alpha+4} \left(\frac{4T_1^5}{5} \right) + \frac{f}{\alpha+5} \left(\frac{5T_1^6}{6} \right) \right] \tag{8}$$

The Shortage cost (SC) in the interval $[T_1, T]$ is given by

$$SC = -s \int_{T_1}^T I(t)dt$$

$$SC = \frac{as}{2}(T^2 + T_1^2) + \frac{bs}{6}(T^3 + 2T_1^3) + \frac{cs}{12}(T^4 + 3T_1^4) + \frac{ds}{20}(T^5 + 4T_1^5) + \frac{fs}{30}(T^6 + 5T_1^6) - asT_1T - \frac{bs}{2}T_1^2T - \frac{cs}{3}T_1^3T - \frac{ds}{4}T_1^4T - \frac{fs}{5}T_1^5T \tag{9}$$

The Deterioration cost (DC) of the model is calculated by

$$DC = C \left[Q - \int_0^{T_1} D(t)dt \right]$$

Hence

$$DC = C \left[\frac{\alpha+2}{\alpha+1}(aT_1) + \frac{\alpha+4}{2(\alpha+2)}(bT_1^2) + \frac{\alpha+6}{3(\alpha+3)}(cT_1^3) + \frac{\alpha+8}{4(\alpha+4)}(dT_1^4) + \frac{\alpha+10}{5(\alpha+5)}(fT_1^5) - a(T_1 + T) - \frac{b}{2}(T_1^2 + T^2) - \frac{c}{3}(T_1^3 + T^3) - \frac{d}{4}(T_1^4 + T^4) - \frac{f}{5}(T_1^5 + T^5) \right] \tag{10}$$

Total cost per unit time for the model is

$$Z(T_1, T) = \frac{1}{T} [A + HC + SC + DC]$$

Optimum values of T^* and T_1^* are obtained by solving the differential equations

$$\frac{\partial Z(T_1, T)}{\partial T} = 0 \text{ and } \frac{\partial Z(T_1, T)}{\partial T_1} = 0.$$

The obtained values are minimum if

$$\frac{\partial^2 Z(T_1, T)}{\partial T^2} \frac{\partial^2 Z(T_1, T)}{\partial T_1^2} - \left(\frac{\partial^2 Z(T_1, T)}{\partial T \partial T_1} \right)^2 > 0$$

Akilandeswari

Using MATLAB, the optimum values of T^* , T_1^* and $Z^*(T, T_1)$ are calculated.

NUMERICAL EXAMPLE

Applying the following data for the inventory model,

$a = 10, b = 4, c = 4, d = 3, f = 1, h = \text{€}4$ per unit, $s = \text{€}15$ per unit, $A = \text{€}1000$,
 $C = \text{€}10$ per unit, $\alpha = 1$

The optimum values obtained using MATLAB software are

$T^* = 2.8211, T_1^* = 0.8884, Q^* = 152.0010$ and $Z^* = 341.8539$

RESULTS AND DISCUSSIONS

SENSITIVITY ANALYSIS

Based on the changes of parameter values for the above data, the Table 4.1 gives the sensitivity analysis.

From Table 4.1, the variations of T^*, T_1^* are very slow when the parameter purchasing cost A is varied. But Q^* varies moderately and total cost varies rapidly. In the segment 2, the parameter ' a ' is varied from 8 to 12. Because of this variation T^*, T_1^* , Q^* varies moderately while Z^* varies rapidly. It is seen that as ' a ' varies from 8 to 12, Z^* varies from 337.8953 to 345.0636. Similar kind of changes are noticed for the change in parameter value ' b ' and ' c '. The segments 5 and 6 of the table show the sensitivity analysis of the parameters d and f . For both these parameters it is found that there is gradual increase in the optimum values of T^*, T_1^* but a rapid increase in Q^* and Z^* . Further, the shortage cost ' s ' is varied from 13 to 17 in the interval of 1 unit. Gradual decrease of the optimum values T^*, T_1^* with decreasing Q^* and increasing total cost. The same type of changes is noted down for the parameter change of holding cost. That is, as h increases from 2 to 6, T^* decreases from 2.8761 to 2.7995, T_1^* varies from 1.1206 to 0.7733, optimum order quantity keeps decreasing from 160.4972 to 148.9056 but total cost increases from 314.7016 to 354.7950. By noticing the change in deterioration cost C , its increase in its value gives a gradual increase in T^*, T_1^* , a moderate increase in Q^* but a rapid decrease in Z^* . The last segment of the table shows the changes in the parameter α . Due to the this change there is a gradual decrease in T^*, T_1^* , Q^* and a gradual increase in Z^* .

CONCLUSION

In this paper, a new inventory model with Pareto distribution deterioration rate and Bi-Quadratic demand is developed. The model allows shortages which are backlogged. The Holding cost, Shortage cost, Deterioration cost are found in this model. By using these costs, Total cost is evaluated. Using MATLAB, optimum cycle time, optimum time for positive cost, optimum order quantity and optimum total cost are evaluated for a data. The sensitivity analysis for varying the parameters is given and its changes are discussed.

ABSTRACT

The primary goal of this analysis is to examine the effects of a spontaneously transferring nanofluid. The base fluid used is a Carreau fluid (Blood), and the nanoparticle used is Titanium dioxide (TiO_2). The fluid moves through a cylinder that has been stretched in a fuzzy ambiguous context. To operate an equivalent transformation, the governing equations for physical domains are transformed from a set of partial differential equations (PDE) to ordinary differential equations (ODE). The MATLAB software was used to solve the following set of equations using the bvp5c technique. The exact volume of nanoparticles (TiO_2) is uncertain and is represented by TFNs (triangular fuzzy numbers) [0, 0.05, 0.1]. The triangular membership function (TMF) is employed to analyze the dissimilarities of ambiguity, when the α -cut is utilized to regulate the Fuzzy Numbers (TFNs). Comparison of crisp and fuzzy numbers for accurate numerical results. Tables and graphs are employed to present the results.

Keywords: Buongiorno, Power law index number, TFN, TMFs, FN, α -cut, bvp5c

INTRODUCTION

Scientists and engineers are becoming more fascinated with through conduction flow in nature because of its extensive applications in several fields, including heat transfer devices, refrigeration, insulation, solar energy gathering, chemical catalysts power plants, nuclear material repositories, petrochemical ponds, and more. Many researchers have utilized natural convection to investigate the flow of Newtonian fluid or non-Newtonian fluid through different geometric regions. In recent decades, numerous efforts have been made in scientific literature to provide precise definitions for the thermo physical characteristics of viscous fluids. These efforts have included the exploration of concepts related to Fuzzification and the study of heat transfer on stretched surfaces. Malik et al [1] investigated the relationship between pressure and the viscosity of Carreau fluid as it passed through a porous media. Megahed et al [2] explored the numerical resolution for the movement of a Newtonian fluid across a non-porous stretched surface by a power law indexed momentum; slide boundary momentum, and changing substantial amounts. Ellahi et al [3] study focused on the theoretical analysis of the peristaltic motion of a Jeffrey fluid in a rectangular conduit that is not uniform, taking into account the effects of ion slip and hall. Mukhopadhyay et al [4] explored the slide flow behavior of a magnetohydrodynamic (MHD) viscous fluid across a cylinder under stretched. They hypothesized that the Slip and magnetic parameters cause a decrease in velocity. Hussain et al [5] investigated the consequences of viscous loss of energy and Joule heating on the flow of magneto hydrodynamic Sisko nanofluid across a stretched cylinder. They proposed that MHD is responsible for regulating the velocity boundary layer and is employed for fluid heating purposes. Shaw et al [6] explored the effect of uniform-diverseremarks in micropolar fluid flow over a sheet that is being stretched or shrunk. It is widely accepted that homogeneous-heterogeneous reactions lead to a decrease in the potency of the reacting substances. Hayat et al [7] the effect of homogeneous/heterogeneous responses on MHD motion of fluid over an extending cylinder were examined.

They discovered the concentrations at the region drops as heterogeneous reactions are strengthened; these have an inverse connection with mass diffusivity. Merkin [8] studied the consequences of insufficient reactants on the flow of the boundary layer, both in a uniform manner and with variations in composition. Due to the formation of a reduced reactant surface layer, the homogeneous reaction takes place. It has been found that the outside response is an excellent method for differentiating the edge. Eman [9] investigated a hybrid methodology that utilized fuzzy differential equations (FDE) and devised an intrinsic technique to solve n^{th} order FDE employing distinguishing characteristics concept. Hang et al [10] explained the basic principle of derivatives of fuzzy. Kaleva [11] introduced the concept of fuzzy differential equations (FDEs). Zadeh [12] The FST was first exhibited in 1965. FST, or Fuzzy Set Theory, is a highly efficient approach for representing scenarios that involve uncertain or imprecise data. Dubois et al [13] the utilization of fuzzy numbers to solve FDEs has gained significant importance in the field of fluid motion in recent times. The study aims to utilize the mathematical approach by $p5c$ to analyze the flow of nanofluid described by modified Buongiorno simulation around a cylinder that extends linearly influenced by an indistinct external magnetic field. The Carreau fluid model is used to represent the base fluid, which in this case is blood. The nanoparticle being studied is Titanium dioxide (TiO_2). An investigation is conducted on the influence of the, Prandtl, Schmidt numbers and Weissenberg, as well as the volume percentage of nanoparticles, on the velocity, temperature, and concentration field. A recent finding has revealed that the addition of nanofluid has a substantial impact on the momentum and energy efficiency of the base fluid. This analysis additionally examined the volume proportion of nanoparticle as an unspecified limiting factor, utilizing FN or TFN. The FDEs with the α -cut approach is utilized to address convection in a fuzzy atmosphere.

Basics of Fuzzy concept

This part offers a comprehensive explanation of fuzzy qualities that can be used for subsequent calculations.

Definition 1 A fuzzy set is an assortment of arranged pairs that satisfy a certain condition.

$\bar{A} = \{(\eta, \mu_{\bar{A}}(\eta)) : \eta \in X, \mu_{\bar{A}}(\eta) \in [0, 1]\}$. A mapping function is defined as $\mu_{\bar{A}}(\eta) : X \rightarrow [0, 1]$, X is the all-encompassing set, and $\mu_{\bar{A}}(\eta)$ membership function of \bar{A} .

Asaigeethan and Vaithiyalingam

Definition 2 A crisp set A_α is specified as a subset of the α -Cut fuzzy set $\bar{A}_{A_\alpha} = \{\eta/\mu_{\bar{A}}(\eta) \geq \alpha\}$, $0 \leq \alpha \leq 1$.

Definition 3 TFN $\bar{A} = (q_1, q_2, q_3)$ with membership function $\mu_{\bar{A}}(\eta)$ is

$$\mu_{\bar{A}}(\eta) = \begin{cases} \frac{\eta - q_1}{q_2 - q_1}, & \text{for } q_1 \leq \eta \leq q_2 \\ \frac{q_3 - \eta}{q_3 - q_2}, & \text{for } q_2 \leq \eta \leq q_3 \\ 0, & \text{otherwise} \end{cases} \quad (1)$$

The α -cut approach is used to transform a TFN with a maximum (or middle point) q_2 , right length $q_3 - q_2 > 0$, and left length $b_2 - b_1 > 0$ into interval numbers, which are then written as $\bar{A} = [f'_1(\eta; \alpha), f'_2(\eta; \alpha)]; [\theta_1(\eta; \alpha), \theta_2(\eta; \alpha)] = [q_1 + (q_2 - q_1)\alpha, q_3 - (q_3 - q_2)\alpha]$, where α is a value between 0 and 1. An essential part of fuzzy set theory, the membership function defines the membership function. The α -cut membership function and triangular fuzzy numbers $\bar{A} = (q_1, q_2, q_3)$ are shown in Figure 1. An arbitrarily generated triangular fuzzy number satisfying the conditions given below

- (i) $f'_1(\eta; \alpha)$ and $\theta_1(\eta; \alpha)$ are an developing function on $[0, 1]$.
- (ii) $f'_2(\eta; \alpha)$ and $\theta_2(\eta; \alpha)$ are a diminishing function on $[0, 1]$.
- (iii) $f'_1(\eta; \alpha) \leq f'_2(\eta; \alpha)$ and $\theta_1(\eta; \alpha) \leq \theta_2(\eta; \alpha)$ on $[0, 1]$.
- (iv) $f'_1(\eta; \alpha), f'_2(\eta; \alpha), \theta_1(\eta; \alpha)$ and $\theta_2(\eta; \alpha)$ are defined at $[0, 1]$.
- (v) If $f'_1(\eta; \alpha) = f'_2(\eta; \alpha) = f(\eta)$ and $\theta_1(\eta; \alpha) = \theta_2(\eta; \alpha) = \theta(\eta)$, where $f(\eta)$ and $\theta(\eta)$ are a crisp velocity and crisp temperature respectively.

Mathematical formulation

An applied transverse magnetic (B_0) that is constant was used to submit a modified Buongiorno framework to the incompressible flow of an MHD Carreau nanofluid. An elongated cylinder exhibiting homogeneous-heterogeneous reactions It is done by applying a standard magnetic field (B_0) to the cylinder. In terms of thermal stability, the base fluid and nanoparticle are considered to be indistinguishable. The characteristics of the nanofluid's structure are summarized in Table 1. Based on the presumptions indicated earlier and Merkin [8] theoretical concepts, simple manipulation heterogeneous-homogeneous responses can be expressed in the following manner. Figure 2 illustrates the physical model of the flow system.

On the catalyst surface, a first-order isothermal reaction is taking place.

In this case, l_c and l_s are the constants rate, and p and q are the quantities of the chemical kinds. It is believed that both reactions are isothermal. It was possible to generate the model regulating equation after using the common boundary layer perspective.

$$\frac{\partial}{\partial x}(ru) + \frac{\partial}{\partial r}(rv) = 0 \quad (4)$$

$$u \frac{\partial u}{\partial x} + v \frac{\partial u}{\partial r} = \frac{\mu_{nf}}{\rho_{nf}} \frac{1}{r} \frac{\partial}{\partial r} \left[r \frac{\partial u}{\partial r} \right] \left(1 + \Gamma^2 \left(\frac{\partial u}{\partial r} \right)^2 \right)^{\frac{n-1}{2}} + \frac{\mu_{nf}}{\rho_{nf}} (n-1) \Gamma^2 \frac{\partial^2 u}{\partial r^2} \left(\frac{\partial u}{\partial r} \right)^2 \left[1 + \Gamma^2 \left(\frac{\partial u}{\partial r} \right)^2 \right]^{\frac{n-3}{2}} - \frac{\sigma_{nf} B_0^2 u}{\rho_{nf}} \quad (5)$$

$$u \frac{\partial T}{\partial x} + v \frac{\partial T}{\partial r} = \frac{k_{nf}}{r(\rho C_p)_{nf}} \frac{\partial}{\partial r} \left[r \frac{\partial T}{\partial r} \right] + \tau \left[D_B \frac{\partial b}{\partial r} \frac{\partial T}{\partial r} + \frac{D_T}{T_\infty} \left(\frac{\partial T}{\partial r} \right)^2 \right] \quad (6)$$

$$u \frac{\partial a}{\partial x} + v \frac{\partial a}{\partial r} = D_A \left[\frac{\partial^2 a}{\partial r^2} + \frac{\partial a}{\partial r} \right] + D_B \frac{\partial b}{\partial r} + \frac{D_T}{T_\infty} \frac{\partial T}{\partial r} - p_c a b^2 \quad (7)$$

$$u \frac{\partial b}{\partial x} + v \frac{\partial b}{\partial r} = D_B \left[\frac{\partial^2 b}{\partial r^2} + \frac{\partial b}{\partial r} \right] + D_B \frac{\partial b}{\partial r} + \frac{D_T}{T_\infty} \frac{\partial T}{\partial r} + p_s a b^2 \quad (8)$$

For the Equations (4)– (8), The following is an explicit definition of the boundary conditions::

$$u = u(x), \quad v = 0, \quad D_A \frac{\partial a}{\partial r} = l_c a, \quad D_B \frac{\partial b}{\partial r} = -l_s b, \quad T = T_w, \quad D_B \frac{\partial b}{\partial r} + \frac{D_T}{T_\infty} \frac{\partial T}{\partial r} = 0 \text{ at } r = R, u \rightarrow 0, T \rightarrow T_\infty, a \rightarrow a_\infty, b \rightarrow b_\infty \text{ as } r \rightarrow \infty \quad (9)$$

Where $u(x) = \frac{x u_0}{l}$ where u_0 velocity, l is the characteristic length, u (axial direction) and v (radial direction) are velocity elements.

Asaigeethan and Vaithiyalingam

$D_B \frac{\partial b}{\partial r} + \frac{D_T}{T_\infty} \frac{\partial T}{\partial r} = 0$. It is asserted that the inclusion of thermophoresis results in a lack of movement of nanoparticles at the contact.

$$\rho_{nf} = (1 - \varphi)\rho_f + \varphi\rho_{nf}, \tag{10}$$

$$\mu_{nf} = \frac{\mu_f}{(1-\varphi)^{2.5}}, \tag{11}$$

$$(\rho C_p)_{nf} = (1 - \varphi)(\rho C_p)_f + \varphi(\rho C_p)_n, \tag{12}$$

$$v_{nf} = \frac{\mu_{nf}}{\rho_{nf}}, \quad \alpha_{nf} = \frac{k_{nf}}{(\rho C_p)_{nf}}, \tag{13}$$

$$\sigma_{nf} = \sigma_f \left(1 + \frac{3(\sigma-1)\varphi}{(\sigma+2)-(\sigma-1)\varphi} \right), \quad \sigma = \frac{\sigma_p}{\sigma_f}, \tag{14}$$

$$\frac{k_{nf}}{k_f} = \frac{(2k_f+k_n)-2\varphi(k_f-k_n)}{(2k_f+k_n)+\varphi(k_f-k_n)}, \tag{15}$$

To provide consistency, the stream function $\psi(r, x)$ is added in order to fulfill the continuity equation (3).

$$u = \frac{1}{r} \frac{\partial \psi}{\partial r}, \quad v = -\frac{1}{r} \frac{\partial \psi}{\partial x} \tag{16}$$

Where $\psi = \sqrt{u(x)v_f x} Rf(\eta)$, is the function of the dimensionless stream.

$$\eta = \frac{r^2 - R^2}{2R} \sqrt{\frac{u(x)}{v_f x}}, \quad \theta(\eta) = \frac{T - T_\infty}{T_p - T_\infty} \tag{17}$$

That which follows a depiction of the concentrations of the chemical spices P and Q:

$$m(\eta) = \frac{p}{p_0} \text{ and } n(\eta) = \frac{q}{q_0}, \tag{18}$$

Upon incorporating the designated transformation, the governing equations manifest themselves in the subsequent manner.

$$2D_1 k \left(1 + we^2 (f'')^2 \right)^{\frac{n-1}{2}} + D_1 (1 + 2k\eta) f'' \left(1 + we^2 (f'')^2 \right)^{\frac{n-1}{2}} + D_1 (n-1) we^2 (f'')^3 k \left(1 + we^2 (f'')^2 \right)^{\frac{n-3}{2}} + D_1 (n-1) we^2 (f'')^2 \left(1 + we^2 (f'')^2 \right)^{\frac{n-3}{2}} (1 + 2k\eta) - D_2 D_3 B f' - (f')^2 + f f'' = 0 \tag{19}$$

$$D_5 (1 + 2k\eta) \theta'' + 2k D_4 \theta' + D_4 P r f \theta' + (1 + 2k\eta) [N_b n'(\eta) \cdot \theta'(\eta)] + (1 + 2k\eta) [N_t (\theta'(\eta))^2] = 0, \tag{20}$$

$$\frac{1}{Sc} \left((1 + 2k\eta) m'' + 2km' \right) + m' f - L m n^2 = 0, \tag{21}$$

$$\frac{\delta}{Sc} \left((1 + 2k\eta) n'' + 2kn' \right) + n' f + L m n^2 = 0. \tag{22}$$

The compatible of the boundary conditions.

$$f(0) = 0, \quad \theta(0) = 1, \quad m'(0) = L_s m(0), \quad N_b m'(0) + N_t \theta'(0) = 0, \\ \delta n'(0) = \frac{-L_s n(0)}{v_f}, \quad f'(0) = 1, \quad f'(\infty) = 0, \quad \theta(\infty) = 0, \quad m(\infty) = 1, \quad n(\infty) = 1. \tag{23}$$

In most instances, we anticipate that the coefficients of diffusion of chemical kinds P and Q would be approximately equivalent in size. We assume that the coefficients of diffusion D_A and D_B are equal; meaning that $\delta = 1$.

$$m(\eta) + n(\eta) = 1, \tag{24}$$

Eqs. (21) and (22) are thus transformed into the following expressions.

$$\frac{1}{Sc} \left((1 + 2k\eta) m'' + 2km' \right) + m' f + \frac{N_t}{N_b} [(1 + 2k\eta) \theta''(\eta) + 2k \theta'(\eta)] - L m (1 - m)^2 = 0, \tag{25}$$

Based on the specified boundary conditions

$$m'(0) = L_s m(0), \quad m(\infty) \rightarrow 1. \tag{26}$$

Fuzzification formulation

Small changes in volume fraction of nanoparticle affect momentum and energy. Some researchers utilize the volume fraction of nanoparticles in the vary on [0.01-0.05], presuming flow of fluid is defined under these principles. However, this produces ambiguity. The fuzzy setting, φ denotes the volume fraction of TiO_2 . A fuzzy number should be used for volume fractions in complex scenarios. Fuzzy solutions were created by converting nonlinear ODEs (19), (20), and (25) into FDEs with boundary circumstances through α - cut method.

$$2D_1 k \left(1 + we^2 \left(\frac{d^2}{d\eta^2} [f_1(\eta, \alpha), f_2(\eta, \alpha)] \right)^2 \right)^{\frac{n-1}{2}} + D_1 (1 + 2k\eta) \frac{d^2}{d\eta^2} [f_1(\eta, \alpha), f_2(\eta, \alpha)] \left(1 + we^2 \left(\frac{d^2}{d\eta^2} [f_1(\eta, \alpha), f_2(\eta, \alpha)] \right)^2 \right)^{\frac{n-1}{2}} + D_1 (n-1) we^2 \left(\frac{d^2}{d\eta^2} [f_1(\eta, \alpha), f_2(\eta, \alpha)] \right)^3 k \left(1 + \right.$$

Asaigeethan and Vaithiyalingam

$$we^2 \left(\frac{d^2}{d\eta^2} [f_1(\eta, \alpha), f_2(\eta, \alpha)] \right)^2 \frac{n-3}{2} + D_1(n-1)we^2 \left(\frac{d^2}{d\eta^2} [f_1(\eta, \alpha), f_2(\eta, \alpha)] \right)^2 \left(1 + we^2 \left(\frac{d^2}{d\eta^2} [f_1(\eta, \alpha), f_2(\eta, \alpha)] \right)^2 \right)^{\frac{n-3}{2}} (1 + 2k\eta) - D_2D_3B \left(\frac{d}{d\eta} [f_1(\eta, \alpha), f_2(\eta, \alpha)] \right) - \left(\frac{d}{d\eta} [f_1(\eta, \alpha), f_2(\eta, \alpha)] \right)^2 + f \frac{d^2}{d\eta^2} [f_1(\eta, \alpha), f_2(\eta, \alpha)] = 0, \tag{27}$$

$$D_5(1 + 2k\eta) \frac{d^2}{d\eta^2} [\theta_1(\eta, \alpha), \theta_2(\eta, \alpha)] + 2kD_4 \frac{d}{d\eta} [\theta_1(\eta, \alpha), \theta_2(\eta, \alpha)] + D_4Prf \frac{d}{d\eta} [\theta_1(\eta, \alpha), \theta_2(\eta, \alpha)] + (1 + 2k\eta) \left[N_b n'(\eta) \frac{d}{d\eta} [\theta_1(\eta, \alpha), \theta_2(\eta, \alpha)] \right] + (1 + 2k\eta) \left[N_t \left(\frac{d}{d\eta} [\theta_1(\eta, \alpha), \theta_2(\eta, \alpha)] \right)^2 \right] = 0, \tag{28}$$

$$\frac{1}{Sc} \left((1 + 2k\eta) \frac{d^2}{d\eta^2} [m_1(\eta, \alpha), m_2(\eta, \alpha)] + 2k \frac{d}{d\eta} [m_1(\eta, \alpha), m_2(\eta, \alpha)] \right) + f \frac{d}{d\eta} [m_1(\eta, \alpha), m_2(\eta, \alpha)] + \frac{N_b}{N_b} \left[(1 + 2k\eta) \frac{d^2}{d\eta^2} [\theta_1(\eta, \alpha), \theta_2(\eta, \alpha)] + 2k \frac{d}{d\eta} [\theta_1(\eta, \alpha), \theta_2(\eta, \alpha)] \right] - Lm(1 - m)^2 = 0. \tag{29}$$

Boundary conditions are compatible with the following:

$$f(\eta, \alpha) = 0, \quad \frac{d}{d\eta} [f_1(\eta, \alpha), f_2(\eta, \alpha)] = 1, \theta(\eta, \alpha) = 1, \\ \frac{d}{d\eta} [m_1(\eta, \alpha), m_2(\eta, \alpha)] = L_s m(\eta, \alpha), \quad N_b \frac{d}{d\eta} [m_1(\eta, \alpha), m_2(\eta, \alpha)] + N_t \frac{d}{d\eta} [\theta_1(\eta, \alpha), \theta_2(\eta, \alpha)] = 0, \\ \frac{d}{d\eta} [f_1(\eta, \alpha), f_2(\eta, \alpha)] = 0, \eta \rightarrow \infty, \theta(\eta, \alpha) = 0, \eta \rightarrow 0, m(\eta, \alpha) = 1, \eta \rightarrow 1. \tag{30}$$

Similar to the velocity of a fuzzy field, here $f'_1(\eta; \alpha)$ represents the lowest limit and $f'_2(\eta; \alpha)$ represents the higher limit, the temperature profile $\theta(\eta; \alpha) = [\theta_1(\eta; \alpha), \theta_2(\eta; \alpha)]$ is also involved. The TFN and crisp values corresponding to these FNs are displayed in Table 2. The variance of FN at every α -cut was ascertained by the TFNs. The TMFs of the FNs are defined as TFNs, and they range from 0 to 1.

RESULTS AND DISCUSSIONS

In the Carreau fluid (Blood) model, T_1O_2 nanoparticles enhance velocity and temperature in a stretched cylinder with a constant power law index. In MATLAB, the numerical technique `bvp5c` solves nonlinear ODEs (19), (20), and (25) with boundary conditions. In Figure 3, we discover elements that significantly impact the triangular fuzzy number value of nanoparticle volume percentage $\varphi = [0,0.05,0.1]$. Those parameters include Weissenberg number (We), curvature (k), magnetic field (B), and the effect of constant power law index number $n = 1.4$ on velocity. Figure 3 (a) As the Weissenberg number (We) and nanoparticle volume percentage grow, the velocity profile decreases for the constant power law index number. Weissenberg number, this is the ratio of the fluid's leisure time to the procedure's frequency time, thickens the fluid and slows velocity. Figure 3 (b) reciprocal relationships between curvature parameter and cylinder radius. As curvature increases, the cylinder's parameter reduces the surface and radius. Thus, fluid movement is less constrained, enhancing velocity. Figure 3 (c) shows how the magnetic (B) impacts Carreau nanofluid momentum for constant power law index number. The figure shows that Carreau nanofluid velocity lowers the magnetic projection. Higher nanoparticle volume proportions and magnetic field parameters indicate stronger Lorentz forces. Carreau nanofluid particles had trouble with resistive forces, which lowered velocity curves. Figure 4 (a) demonstrates the consequences of the Prandtl numeral (Pr) on the energy profile in the absence of boundary permeability. The temperature decreases as Pr increases. Increasing the Prandtl number reduces the thickness ($n = 1.4$) of the boundary circumstances of heat. Figure 4 (b) displays the energy (temperature) reductions for a consistent power law index number for various numerical values of the curvature factor (k). The temperature decreases as the curvature factor enhances due to a decrease in the kinetic energy and velocity of fluid flow. Figure 5 shows how the volume fraction of nanoparticles has an impact on chemically reactive species concentration in constant power law index number, as Schmidt number (Sc) increases. Larger Schmidt number values improve concentration profiles due to reduced mass diffusivity. Now let's discuss the volume fraction of nanoparticle T_1O_2 on Fuzzy ambient. Then nanoparticles volume fractions, as specified in Table 1, are classified as TFN while analyzed through the α -cut approach ($0 \leq \alpha \leq 1$). The volume fraction of TFNs (T_1O_2 nanoparticle) is shown in Figure 7 (refer to Table 2). The values of $f(\eta, \alpha)$ and $\theta(\eta, \alpha)$ are influenced by the α -cut values ($\alpha = 0, 0.3, 0.7, 1$). The lower and upper bounds of the velocity fields in Figure 7(a) correspond to the constant power law index number ($n = 1.4$) for TFNs

Asaigeethan and Vaithiyalingam

(φ). The upper and lower limits of the nanofluid are $f_1(\eta; \alpha)$ and $f_2(\eta; \alpha)$ when α – cut values. As α – cut increases, the breadth between $f_1(\eta, \alpha)$ and $f_2(\eta, \alpha)$ diminishes, becoming constant at $\alpha = 1$. Similar way Figure 7(b) shows that when α increases the fuzzy temperature $\theta(\eta, \alpha)$, the difference between $\theta_1(\eta, \alpha)$ and $\theta_2(\eta, \alpha)$ reduces, resulting in $\alpha = 1$ consistency.

CONCLUSION

Sequential body velocity, temperature, and concentration profiles for an MHD Carreau nanofluid moving through a stretched cylinder in a fuzzy atmosphere are computed using a modified version of Buongiorno frame work. We discovered. Numerical convergence of the approach was confirmed using predefined parameters. Uncertainty variability is analyzed by the TMF, and TFNs are controlled by the α -cut. When constant power law index number ($n = 1.4$), nanofluid's velocity profile increases along with the Weissenberg numeral increasing behavior. For a constant power law index number ($n = 1.4$), increasing the curvature limiting factor (k) enhances the nanofluid velocity. The nanofluid velocity diminishes as the magnetic field parameter (B) grows with a constant power law index number ($n = 1.4$). For a given fixed power law index number, the temperature of the nanofluid reduces as the Prandtl number (Pr) grows. The impact on fluid temperature decreases for constant power law index number for increasing curvature parameter (k). The concentration profiles increase for constant power law index number when various values of Schmidt number (Sc). Considering the results, the ideal value for α range from 0 to 1, with the assumed perception of the TFN being determined by the constant width of the fuzzy velocity and fuzzy temperature.

ABSTRACT

Fuzzy sets theory is applied to some real-life domains, such as clustering, decision-making, and pattern recognition to evaluate its performance. We conduct a trial-and-error process to determine the performance of the fuzzy logic-based solutions to such tasks of classification where uncertainties and impreciseness are the daily matters. The works illustrate the capability of fuzzy set theory to overcome traditional methods. In the example of test with Fuzzy C-Means (FCM) showing better clustering accuracy than K-Means on the Iris and Wine data sets. In decision-making tasks, Fuzzy Inference Systems (FIS) are superior to Logistic regression models in forecasting healthy condition risk. Also, Fuzzy Decision Trees (FDT) (MNIST data set) show a high level of competitiveness in a section related with pattern recognition. The fuzzy sets theory is one of the most effective expedients for solving the problems, which have imprecision and uncertainty features. The research contributes to advancing the understanding and application of fuzzy logic-based methodologies.

Keywords: Analysis within the framework of fuzzy sets theory, clustering, decision-making, logistic regression model, pattern recognition, uncertain situations.

INTRODUCTION

In a world where the technology is becoming more and more complex, and there is a high level of uncertainty, the ability of effectively modeling and analyse the objective opinion poll data gains in importance. Classical

**Bhaskar and Vaithiyalingam**

mathematical structures frequently get masked by the vagueness and the vagueness of the matters which a reality usually consist. Here is where fuzzy set theory becomes a mighty tool, standing in for the systematized approach through which the problem of representing and analysis of data which is ambiguity and imprecision is solved. The fuzzy sets theory which Lotfi A. Zadeh developed in the 1960s, emerged as a paradigm departure from the traditional view of set membership that was previously known only with complete or zero membership. It introduced the idea of partial membership [1]. Fuzzy sets are different from classical set theory where the elements either belong to a set or not. Conversely, fuzzy sets range over the interval 0 to 1, signifying degrees of membership. This subtle penetrating strategy means portrayal of being a little more gradual between two ones, simulating general fuzzy in real-life conditions on the Earth. The applications of Fuzzy Sets Theory are diverse and pervasive and they open as doors to the fields of control systems, pattern recognition, decision making, and expert systems. Fuzzy logic has been explained as a flexible and versatile construct that enables control of dynamic and unpredictable system models with non-linear relationships in unknown environments [2]. The recognizing algorithms based on pattern recognition use fuzzy sets to classify and segment data, particularly, where conventional methods overlap because of data ambiguity. Besides, making decisions in the systems of fuzzy logic is also possible, where subjective and vague criteria can be taken into account, and machines can imitate human thinking. Expert systems, with the aim to imitate human expertise in a number of particular areas, take advantage of fuzzy sets for the purpose of handling uncertain and incomplete information at their disposal, and therefore, they are able to make well-founded judgments more easily [3]. The paper aims to consider the extent to which fuzzy sets theory can be employed in pervasion of different areas, concentrating in particular ones. Through analyzing the theoretical components and applications of fuzzy sets, we try to share views on the consistent and versatile use of fuzzy sets in tackling complex real-life problems associated with uncertainty and vagueness.

RELATED WORKS

In recent years, a typical situation is that of increasing the quantity of research that explore fuzzy sets theory and related methods as an extension of their applicability in a variety of fields. Numerous fuzzy math-based methods were engaged closely to prove that is a great tool to respond to the world surrounding us, and that is complex. In this paragraph, there is summary of the previous work that obtained from different areas. The section underlines the main point and the result of recent researches. Chew et al. [15] designate an intelligent medical waste management system in which they used an extension fuzzy Diophantine fuzzy FDOSM and a neural network approach. The focus of their investigation is on circular economy principles application for healthcare waste management, where advancements in synthetic intelligence, such as fuzzy logic and neuron network approaches, would be beneficial. Sonuk et al [16] proposed observer framework modeling Takagai-Sugeno fuzzy bilinear control systems with aim of enhancement of dynamic systems performance. The team is dedicated to developing observers of fuzzy-clock systems which leads to an increase in system stability and robustness. Shimon and Gupta [17] analyzed the fuzzy reliability a turbine structure using bipolar fuzzy instead of trigonal fuzzy numbers. They published a paper introducing a method for reliability assessment of turbines systems under uncertainties, which placed fuzzy sets theory position in reliability engineering in the spotlight. In [18], Dong contrasted the identical attributes of traditional PID and fuzzy PID controllers which he applied to the control of Unmanned Aerial Vehicles (UAVs). Whereas, the findings are refined by comparing the throw control performance of two ways, the study has become useful source in regards to effectiveness of fuzzy logic-based control systems in UAV applications. Feng et al. [19] theorized a latest multi-attribute group decision process founded on probabilistic multi-valued linguistic spherical fuzzy sets for choosing a site for charging stations and storage. Concrete problems dealing with investor decision-making toward charging infrastructure installation for electric vehicles are not the exception motivated by the application prospect of fuzzy sets theory. García-Vélez and Núñez Velázquez [20] examined the association between social spending and social multidimensional wellbeing in Ecuador. Their study comes up with fuzzy logic-based methodologies to evaluate the role of social expenditure in reducing the poverty level which leads to the improvement of social policy effectiveness. Hafiz Muhammad and al. [22] have proposed q-Rung orthopair fuzzy dynamic aggregation operators to apply to dynamic decision-making on the dais of time sequence preferences. Their

Bhaskar and Vaithiyalingam

study is focusing on improving dynamic aggregation operators to provide the decision-making process under uncertainty more flexible and timelier and as a result it will be fast. Ismail et al. [23] designed an algorithm-based multiple attribute decision-making methodology for artery analysis under the uncertain setting of hypo-soft neutrosophic expert set considering fuzzy parametric degrees. The theme of the research is to find decision-making problems in medical diagnosis but it is considering uncertainty and imprecision in expert judgment on that. Iqbal et al. [24] explored multi-objective non-linear programming problems in flow of linear Diophantine equations actually. Their goal was to seek out the appropriate methods of fuzzy optimization to overcome the complex decision problems in the field of fuzzy uncertainty. The researchers' research concerning that supply chain management issues worsened by the pandemic is as that could be, and the technological solution to increase supply chain resilience amidst uncertainty is also offered. On balance, the detail emphasizes the versatility of FST and related approaches which are currently applied in a variety of sectors such as solid waste, control systems, reliability engineering, decision-making, social policy analysis and supply chain management. These researches underscore the importance of a fuzzy logic-based methodology when faced with the complicated decisions that contain fuzziness, indeterminacy, and vagueness.

METHODS AND MATERIALS

The research will focus on utilizing datasets from many domains representing a broad range of application areas in order to demonstrate the usefulness and effectiveness fuzzy sets theory [4]. These datasets are going to be made up of combination of numerical, categorical and mixed data sets of variables in order to ensure an exhaustive evaluation of the algorithms that will be put to test. Notably, synthetic data can be constructed to replicate a particular scenario and assess an algorithm's accuracy for such conditions.

Fuzzy C-Means (FCM)

Fuzzy C-Means (FCM), which is an improved and modified version of the classical K-Means algorithm, is exhibiting a high level of success handling normalized fuzzy memberships [5]. Given a data set with n data points and m clusters, FCM separate the data by the two mentioned process of reiteratively updating cluster center and membership degrees. The objective function to be minimized is given by: $J = \sum_{i=1}^n \sum_{j=1}^m w_{ij}^m ||x_i - v_j||^2$

The formula where w_{ij} stands for the degree of the commitment of data point x_i to cluster v_j is a centroid of cluster k, while m is a weighting exponent that regulates the degree of the allocation of data point x_i in the cluster k [6]. The algorithm keeps updating its membership grades and the central location of each cluster member until it reaches the optimum state.

*“Initialize cluster centroids randomly Repeat
Update membership degrees using fuzzy membership function Update cluster centroids
Until convergence”*

Data Point	Cluster 1	Cluster 2	Cluster 3
1	0.8	0.1	0.1
2	0.2	0.6	0.2
3	0.3	0.4	0.3

Fuzzy Inference System (FIS)

Fuzzy Inference Systems (FIS) are an important sub-branch of fuzzy systems theory and a powerful tool for building fuzzy logic based decision-making processes. A real FIS usually has four stages different from each other, which are fuzzification of the date, rule evaluation, and defuzzification [7]. Mamdani FIS is more widely used relative to other FIS architectures. It begins with a linguistic rule that is created by experts and then it maps input to outputs based on this rule. Concluding process is based on fuzzy logic operations, whose Boolean values are fuzzy AND, fuzzy OR, and fuzzy implication.

Bhaskar and Vaithiyalingam

*“Fuzzify inputs Evaluate fuzzy rules
Aggregate rule outputs Defuzzify to
obtain crisp output”*

Input 1	Input 2	Output
0.6	0.4	0.7
0.3	0.8	0.5
0.9	0.2	0.8

Fuzzy Decision Trees

Among the techniques that represent the alternative way to approach decision trees is Fuzzy Decision Trees which extends traditional decision tree algorithms and allows to deal with fuzzy inputs and outputs. Every step in the tree is related to a set of fuzzy or word abstracts, and a criterion for dividing is based on the operation of fuzzy logic [8]. In a tree form, the structure is recursively constructed, under which the input feature is represented as fuzzy partition and the decision is selected by linguistic rule on each node.

Fuzzy Genetic Algorithms (FGA)

The fuzzy Genetic Algorithm combines the basic of GA with fuzzy logic to achieve global optimality if the problem is complex and its search space is hard to tabulate. FGA uses fuzzy encoding and fuzzy operators that can handle fuzzy individuals [9]. Fuzzy crossover and mutation operators are employed to create fresh solutions, and the fuzzy fitness evaluators are responsible for identifying the quality of the solutions.

EXPERIMENTS

In this integration, fuzzy sets theory application was tested against the proposed algorithms in certain domain/areas of interest. Experiments are aimed to show the practical value and applicability of fuzzy sets in the ability to process ambiguous and misty information that is frequently found in real-life data.

Experiment 1: Clustering Performance

To evaluate performance of the clustering, the Fuzzy C-Means (FCM) algorithm was run on multiple benchmark data sets, like the Iris Data set and the Wine Data set. We evaluated the clustering results achieved utilizing FCM with those given by K-Means clustering, the traditional. The two algorithms whose accuracy is measured through the silhouette score is shown in the table [1]. This table compares the performance of fuzzy clustering method of c-means and K means clustering algorithms on the iris dataset. FCM beat K-Means most of the time on measurements using silhouette parameter that were computed using different number of clusters.

Just like the FCM, K-Means too yielded results in the Wine dataset that were better than the other algorithm, as in Table below. Thus, FCM can recognize the underlying structure of data with much efficiency when it has the mixed clusters; the mixed clusters are moreover overlapped with many inconsistent cluster sizes [11].

Experiment 2: Decision Making Performance

The next on our list was to assess the efficiency of the Fuzzy Inference System (FIS) in the decision-making situation. Constructing a fuzzy rule-based system led us to predict the risk of heart disease in patient population with above mentioned attributes like age, cholesterol level, and blood pressure [12]. The FIS was trained on a dataset consisting of previous patient recordings. Performance of the model was evaluated using accuracy, and area under the ROC curve (AUC) parameters while testing. Table Compares Performance Measures between FIS and a Logistic Regression Classifier: A Classifier that is used for two types of binary classifications tasks [13].

**Bhaskar and Vaithiyalingam**

The results illustrated that the improved fuzzy system surpassed the accuracy and AUC of logistic regression model, which showed that fuzzy logic-based systems are well suited for solving decision-making tasks in the field of medicine when it comes to uncertainties and non-linearity [14].

Experiment 3: Anxiety Screening Efficiency

In our experiment, we considered i.e. Of Fuzzy Decision Trees (FDT) for the recognition of the patterns by the use of the MNIST dataset - a commonly used benchmark set for the recognition of handwritten digits [27]. We investigated the efficiency of FDT regarding the classification accuracy by means of the comparison with standard decision trees and Support Vector Machines (SVMs) approach [28]. The table below indicates that the effectiveness of classification is illustrated with MNIST test set, based on results. Consequently, the findings show that the fuzzy decision trees display up to par outputs just like regular decision trees and Support Vector Machines (SVMs). In consequence, SVMs attain a better accuracy rate. However, Fuzzy Decision Trees have the implication on interpretation and the ability to handle fuzzy inputs, which makes them suitable for applications where understanding is a fundamental condition [29]. The experiments demonstrated in previous paragraphs have shown the robustness and applicability of fuzzy set theory and its algorithms within different cases of applications. In numerous ways, fuzzy logic-based approaches turn out in the encounter as it being more precise than traditional methods [30]. They sometimes bring about greater performance than traditional methods and sometimes prove to be as good as. These results only decrease fuzzy sets' importance and effectiveness in overcoming unpredictability and vagueness of real-world data, so why not give it a wider use in practice.

CONCLUSION

In the end we can say that this research carried out a detailed study of the various chapters of the fuzzy set theory such as applications and methodologies among other things that cut across many fields. Through the means of various experiments and analysis, we have proved that the fuzzy logic-based method can be applied successfully in practice for managing problems that are structurally complicated, expressed in a vague manner, or possess uncertainty and imprecision. Performing experiments on grouping, decision making, totality of details evaluation has demonstrated higher accuracy of fuzzy sets theory in comparison with classical approaches on many practical tasks. Moreover, the author shows how the work studied is related to modern works and the contributions they bring to the development of the field of fuzzy logic and its use in practice. Fuzzy logic-based methods have a high utility in the medical waste management, control systems development, reliability engineering and even in social policy domains. Such methodologies have proven to be robust and flexible offering solution to broad range of problems. The emergence of fuzzy sets theory is a manifestation of the fact that ongoing research in this area is directed at the development of newer and more powerful methodologies of analysis as well as extending the capabilities of fuzzy sets theory. In general, the article delivered towards extending further the credits of fuzzy sets theory and its technical application, focusing on its role in ensuring reliable choice making and issue resolution in complex uncertain environment.

ABSTRACT

In mathematics, graph theory has become a powerful framework for modeling and analyzing complex networks across various fields and domains. Domination theory which is a fundamental concept in graph theory, explores the notion of dominating sets within graphs and their implications for network analysis. In this paper, we explore a little bit more towards the signal domination number and also derive some results for cartesian product of graphs.

Keywords: Signal set, signal number, domination number, signal domination number, cartesian product.

INTRODUCTION

In the domain of mathematics, emerges a field of study known as graph theory that provides insights into the fundamental structures and properties of networks. Furthermore, graph theory serves as a bridge between theoretical concepts and the real-world phenomena. By modeling biological systems as graphs, researchers can study protein - protein interactions, genetic networks, and ecological relationships, shedding light on the complexity of living organisms and many more. In our discussion, we assume G to be a simple non - empty connected graph whose vertex set is $V(G)$ and edge set is $E(G)$. The degree of a vertex v in a graph denoted by $\deg(v)$ is defined as the number of edges in G that are incident to it. The maximum degree $\Delta(G)$ is the highest degree among all the vertices in a graph and the minimum degree $\delta(G)$ is the lowest among all. If the degree is same for all the vertices, then the graph is said to be regular graph. The collection of all vertices of degree one is denoted by $\rho(G)$. The distance

Jachin Samuel and Angelin Kavitha Raj

between any two vertices in a graph is the length of the shortest path between them. If u and v are vertices of G , then $d(u, v)$ denotes the distance between them. For further graph terminologies, refer [6]. In the mathematical field of graph theory, the distance between any two vertices in a graph is defined as the number of edges in the shortest path between them. The length of this shortest path is called the geodesic distance. Conversely, the length of the longest path between any two vertices is termed as the detour distance which was a concept introduced by Gary Chartrand in 2004 [5]. The application of distance in graphs extends to various fields such as image processing, optimization, networking, pattern recognition, and navigation. In this ensuing segment, a new parameter called the signal distance was introduced by K.M. Kathiresanin the year 2010 refer to [8]. After a brief investigation, S. Balamurugan and R. Antony Doss introduced the signal number [1]. For gaining adequate knowledge in the field of distance in graphs, refer [4]. Introduced as a fundamental concept, domination in graph theory deals with the study of dominating sets within a graph. At its core, domination theory seeks to identify sets of vertices within a graph that exert control or influence over the entire graph. Domination theory has found applications in various fields such as computer science, telecommunications, social network analysis and operations research. For any graph G , a subset D of $V(G)$ is said to be a dominating set if every vertices of $V - D$ is adjacent to some vertices of D . The size of the smallest dominating set known as the domination number, serves as a measure of the extent to which a graph can be controlled or monitored by a limited set of vertices. For a better understanding on domination theory, refer [12]. Cartesian product in graphs was first defined by Vizing [13] in the year 1963. Michael S. Jacobson and Lael F. Kinch [9] in the year 1986 studied the patterns of dominating sets in cartesian product of graphs with trees. Later on, M.H. El-Zahar et. al [3] in 2007, made a progress in finding the domination number for cartesian product of cycle and other graphs. A lot of researchers have also worked on various topics that are related to graph products. But still, on the other hand, there are still many questions open. Regarding large-scale interconnection networks, cartesian products are particularly useful in designing network topologies. By taking the Cartesian product of smaller graphs or networks, engineers can create a larger and more complex network while maintaining certain structural properties. This approach allows for scalable and efficient designs in systems such as computer networks, distributed computing systems, and telecommunications networks. The resulting networks often exhibit desirable properties such as fault tolerance, scalability, and efficient routing. In this paper, we identified some bounds regarding the signal domination number and also some results for the cartesian product of graphs.

KNOWN RESULTS

Definition 2.1 [2]

The Cartesian product $G \times H$ of two graphs G and H is the graph with vertex set $V(G) \times V(H)$, in which the vertex (a, b) is adjacent to the vertex (c, d) whenever $a = c$ and b is adjacent to d , or $b = d$ and a is adjacent to c .

Definition 2.2 [10]

The signal distance $d_{SD}(u, v)$ between the vertices u and v in a graph G is defined as $d_{SD}(u, v) = \min_S \{d(u, v) + (\deg(u) - 1) + (\deg(v) - 1) + \sum_{w \in u-v} (\deg(w) - 2)\}$, where S is a path between the pair of vertices u and v , $d(u, v)$ is the length of the path S and w indicates the internal vertices of S . The signal path between u and v is called as the geosig path.

Definition 2.3 [1]

The subset $S \subseteq V$ is called the signal set of G if every vertex u in G lies in a geosig path between the vertices in S and the minimum cardinality of the set S is called as the signal number of a graph. It is denoted by $sn(G)$.

Theorem 2.4 [1]

For any graph G , the set of all pendant vertices is a subset of every signal set of G .

Jachin Samuel and Angelin Kavitha Raj

Definition 2.5 [7]

A set $S \subseteq V$ is called a signal dominating set of a graph G if S is a dominating set of G as well as a signal set of G . The minimum cardinality of the signal dominating set is called the signal domination number and it is denoted by $\gamma_{sn}(G)$.

Definition 2.6 [11]

A banana tree graph is obtained by adjoining one leaf from each copy of star graph with a single root vertex that is distinct from all the star graphs. It is denoted by $B_{n,k}$ where n is the number of copies of star and k is the number of leaves in each copy.

MAIN RESULTS

Theorem 3.1

If G is a connected graph of order $n \geq 3$ and $\gamma_{sn}(G) = n - 1$, then G has exactly one cut-vertex of degree $n - 1$.

Proof. Let S be γ_{sn} - set of G such that $\gamma_{sn}(G) = n - 1$. Let $x \in V - S$ such that x is contained in geosig path formed by some pair of vertices of S . We show that x is the only cut vertex in G . We consider 2 cases.

Case 1: Suppose G contains some pendant vertices, then x must be adjacent to every pendant vertices. If not, then G has more than one cut vertex which contradicts γ_{sn} - set. So G has only one cut vertex x .

Case 2: Assume $\delta(G) \geq 2$. Let $u, v \in S$ such that $u - v$ geosig path contains x . Since $v \notin N(u)$, there exist $u_1, v_1 \in G$ such that $uu_1, vv_1 \in E(G)$. If u_1 and v_1 are adjacent to x in G , then the result follows. Suppose not, then there exist $u_2, v_2 \in G$ such that the geosig path formed by u_2 and v_2 covers u, v and x which contradicts our assumption. So x is the only cut vertex in G . Now we claim that $\deg(x) = n - 1$. Suppose not, then there exist a vertex y in $V(G)$ such that $d(x, y) > 1$. Then there exist a $x - y$ geosig path that contains at least one vertex of V . Since x is the cut vertex, $N(y) > 1$ and so $N(x) \cap N(y) > 1$. So G contains a $x - y$ cycle of length at least 4 which leads to a contradiction that $\gamma_{sn}(G) \neq n - 1$. So x is the only cut-vertex of degree $n - 1$.

Theorem 3.2

For a triangle free graph G with $\delta(G) \geq 2$, if $sn(G) = 2$ then $\gamma_{sn}(G) = \gamma(G)$.

Proof. Let S be γ - set of G . Assume that $\{x, y\}$ be the signal basis of G . If $\{x, y\} \subseteq S$, then the result follows. Suppose not, then at least one of x and y is not in S . Assume $x \in S$. Then there exist $u, v \in V(G)$ with $uv \notin E(G)$ such that $\{u, v\} \subseteq N(y)$ and y lies in the $u - v$ geosig path. It is clear that S contains at least one of u and v . If $\{u, v\} \subseteq S$, then S forms a minimum signal dominating set of G . Suppose $u \notin S$. Then there exist $u_1 \in S$ such that $N(u_1)$ contains u and the geosig path $v - u_1$ covers y . Hence S forms a γ_{sn} - set of G .

Theorem 3.3

Given any connected graph G with diameter at most 3 and $\gamma(G) = 2$, we have $\gamma_{sn}(G) = sn(G)$.

Proof. Let S be a signal basis set of G with $u, v \in S$, where u and v are non - adjacent. Let $x \in V - S$ and assume x lies in geosig path formed by u and v of S . It is obvious that $\deg(x) \geq 2$. If x is contained in $N(u) \cap N(v)$, then S forms a signal dominating set. If x is adjacent to any one of u and v , then the result follows. If x does not lie in the neighborhood of u and v , then $d(u, v) > 3$ which leads to a contradiction.

Lemma 3.4

For (n, k) - banana tree graph, $sn(B_{n,k}) = n(k - 1)$.

Proof. Since every pendant vertex is contained in the signal basis set say S , $sn(B_{n,k}) \geq n(k - 1)$. It is evident that the geosig path formed by any pair of pendant vertices covers every vertices of $V - S$ and so $sn(B_{n,k}) = n(k - 1)$.

Jachin Samuel and Angelin Kavitha Raj

Theorem 3.5

For (n, k) - banana tree graph, $\gamma_{sn}(B_{n,k}) = n(k - 1) + 1$.

Proof. Let S be the minimum signal dominating set of $B_{n,k}$. By Lemma 3.4 $\gamma_{sn}(B_{n,k}) \geq n(k - 1)$. Since $diam(B_{n,k}) = 6$, there exist more than a pair of non-adjacent vertices that lies in the geosig path of some pendant vertices. Clearly, S dominates all the support vertices leaving the induced sub graph $\langle K_{1,n} \rangle$ untouched and therefore $\gamma_{sn}(B_{n,k}) = n(k - 1) + 1$.

Theorem 3.6

For the connected graphs G and H , $\gamma_{sn}(G \times H) \geq \max\{\gamma_{sn}(G), \gamma_{sn}(H)\}$. Equality holds if G and H are complete.

Proof. Let G and H be any two connected graphs whose vertex sets are $\{u_1, u_2, \dots, u_p\}$ and $\{v_1, v_2, \dots, v_q\}$ respectively. Let S_1, S_2 and S_3 be the γ_{sn} - set of G , H and $G \times H$ respectively. Since $V(G \times H) = pq$, it is evident that $\gamma_{sn}(G \times H) \geq \gamma_{sn}(G)$ and $\gamma_{sn}(G \times H) \geq \gamma_{sn}(H)$. So we prove for equality condition. Assume that G and H are complete. We consider two cases.

Case 1: If $p = q$ then $\gamma_{sn}(G) = \gamma_{sn}(H)$. It is clear that the set $\{(u_i, v_i) : 1 \leq i \leq p\}$ forms a signal dominating set of $G \times H$ and so $\gamma_{sn}(G \times H) \leq p$. Suppose $\gamma_{sn}(G \times H) \leq p - 1$, then there exist some (u_k, v_k) in S_3 such that $S_3 - \{(u_k, v_k)\}$ forms a signal dominating set of $G \times H$. Since G and H are complete, there exists some vertices in the k^{th} copy such that they are not dominated by any vertices of $S_3 - \{(u_k, v_k)\}$ and not covered by the signal basis set of $G \times H$ which contradicts our assumption. So $\gamma_{sn}(G \times H) = p$.

Case 2: Assume $p \neq q$ so that $\gamma_{sn}(G) \neq \gamma_{sn}(H)$. Without loss of generality, we take $p > q$. Since G and H are complete, $D = \{(u_j, v_j) : 1 \leq j \leq q\}$ forms a γ - set of $G \times H$. However no geosig path formed by the vertices of D cover $\{(u_k, v_j) : 1 \leq j \leq q; q + 1 \leq k \leq p\}$. Let $S \subseteq \{(u_k, v_j) : 1 \leq j \leq q; q + 1 \leq k \leq p\}$ such that the vertices (u_k, v_j) and (u_{k+1}, v_j) are not adjacent in $G \times H$. Then $D \cup S$ forms a minimum signal dominating set of $G \times H$ where $|D| = q$ and $|S| = p - q$.

Corollary 3.7

For any graph G , $\gamma_{sn}(G) \leq \gamma_{sn}(G \times K_n)$.

Proof. The proof follows from the Theorem 3.6.

Theorem 3.8

The necessary and sufficient condition for a graph of order $n \geq 3$ and $diam(G) \leq 2$ to exhibit the property $\gamma_{sn}(G) = \gamma_{sn}(G \times K_2)$ is that G contains a γ_{sn} - set S with $x \in S$ such that $x - w$ geosig path contains every vertices of $V(G)$ for every $w \in S$.

Proof. Let G be a graph of order n whose vertex set is $\{x, w_1, w_2, \dots, w_{n-1}\}$ and let $\{v_1, v_2\} \in V(K_2)$. Let S be the minimum signal dominating set of G with $x \in S$ such that $x - w$ geosig path covers every vertices of $V(G)$ for every $w \in S$. It is trivial that $G \times K_2$ is formed from two copies of G say G_1 and G_2 . Let $S_1 \subseteq V(G \times K_2)$ such that S_1 contains the corresponding vertices of x and $S - \{x\}$ from G_1 and G_2 respectively and so $|S| = |S_1|$. Now we show that S_1 forms a γ_{sn} - set of $G \times K_2$. Let $(w_1, v_1) \in V(G \times K_2) - S_1$ such that w_1 lies in some $x - w$ geosig path formed by the vertices of S . Since $diam(G) \leq 2$, (w_1, v_1) is adjacent to some vertices in S_1 that corresponds to w . So S_1 dominates (w_1, v_1) . More generally, any vertex (w_i, v_j) where $1 \leq i \leq n - 1$ and $j = 1, 2$ lies in some geosig path formed by the vertices of S_1 . So S_1 forms a γ_{sn} - set of $G \times K_2$. Conversely, assume that $\gamma_{sn}(G) = \gamma_{sn}(G \times K_2)$. Let S be minimum signal dominating set of $G \times K_2$. Since two copies of G forms $G \times K_2$ say G_1 and G_2 , $S \cap V(G_i) \neq \phi$ for $i = 1, 2$. So, let $x \in S \cap V(G_1)$. Let $D \subseteq V(G_1)$ such that D contains the vertices of $S \cap V(G_1)$ and the vertices corresponding to $S \cap V(G_2)$. Clearly, D forms a γ_{sn} - set of G_1 with $|D| = |S|$. Now we claim that contains a vertex such that $x - w$

Jachin Samuel and Angelin Kavitha Raj

geosigpath covers every vertices of G_1 for every $x \in D - \{x\}$. Suppose there exists a vertex u in G_1 such that does not lie in $x - w$ geosig path for some $w \in D - \{x\}$ and (x) does not contain, then $d(x, u) = d(x, w) + d(w, u) > 2$ which contradicts $(G) \leq 2$.

Lemma 3.9

For the cartesian product of P_n and P_2 , $sn(P_n \times P_2) = 2$ for every $n \geq 2$.

Proof. Let $\{(u_i, v_j) : 1 \leq i \leq n; 1 \leq j \leq 2\}$ be the vertex set of $P_n \times P_2$. Since $diam(P_n \times P_2) = n$ for every $n \geq 2$ and only $d((u_1, v_1), (u_n, v_2)) = diam(P_n \times P_2)$, we can conclude that the geosig path formed by (u_1, v_1) and (u_n, v_2) covers every vertex of $P_n \times P_2$ and hence $sn(P_n \times P_2) = 2$.

Theorem 3.10

For the cartesian product of P_n and P_2 , $\gamma_{sn}(P_n \times P_2) = \lceil \frac{n+1}{2} \rceil$ for every $n \geq 2$.

Proof. Let S be the γ - set of $P_n \times P_2$ such that $|S| = \lceil \frac{n+1}{2} \rceil$. We show that S forms a minimum signal dominating set. Suppose there exist a vertex $x = (x_1, x_2)$ in $V - S$ such that no geosig path formed by any pair of vertices of S covers x , then S does not form a signal cover in $P_n \times P_2$. Since x is adjacent to at least one vertex of S , $N(x)$ either contains a vertex of S or adjacent to some vertices of S which contradicts our assumption. So S forms a minimum signal dominating set of $P_n \times P_2$.

Lemma 3.11

For the cartesian product of C_n and P_2 with $n > 5$, $sn(C_n \times P_2) = \begin{cases} 3 & \text{if } n \text{ is even} \\ 4 & \text{otherwise} \end{cases}$.

Proof. Let $u_1, u_2 \in V(P_2)$. Based on the length of the cycle, we consider 2 cases. Assume, n is even. For even cycle, it is evident that $sn(C_n) = 2$. Assume that $\{x, y\}$ be the signal set of C_n . Obviously, $(x, y) = diam(C_n) = \frac{n}{2}$. Let x and y corresponds to (x, u_1) and (y, u_1) in $V(C_n \times P_2)$ respectively. Clearly, (x, u_1) and (y, u_1) can produce a geosig path that can cover (x_i, u_1) for every $x_i \in V(C_n)$ while (x_i, u_2) is left uncovered. By choosing (x, u_2) along with (x, u_1) and (y, u_1) , a signal basis set is formed to cover $V(C_n \times P_2)$ by the geosig path formed by any pair of vertices of $\{(x, u_1), (y, u_1), (x, u_2)\}$. Therefore $sn(C_n \times P_2) = 3$. For the cycle of odd length, $sn(C_n) = 3$ say $\{x, y, z\}$ and the proof is similar.

Theorem 3.12

For $n > 5$, $\gamma_{sn}(C_n \times P_2) = \begin{cases} \lceil \frac{n+6}{3} \rceil & \text{if } n \neq 7,8 \\ 4 & \text{otherwise} \end{cases}$.

Proof. Let S be the γ_{sn} - set of $C_n \times P_2$. For $n \neq 7,8$, let x_1 be a vertex in S . Since it is 3 - regular graph, neglect $N(x_1)$ as well as the vertices that are adjacent to the vertices of $N(x_1)$. Now choose the vertex that is adjacent to more than one vertex in neighborhood of $N(x_1)$ say x_2 . By repeating this process until x_1 appears in the neighborhood of some $N(x_1)$ ($2 \leq i \leq n$) we obtain a minimum signal dominating set for $C_n \times P_2$. Therefore, $\gamma_{sn}(C_n \times P_2) = \lceil \frac{n+6}{3} \rceil$. For $n = 7$ and $n = 8$, the vertices that are at diameter distances in both cycles forms a γ_{sn} - set. So $\gamma_{sn}(C_n \times P_2) = 4$.

Corollary 3.13

For $n \leq 5$, $\gamma_{sn}(C_n \times P_2) = \gamma_{sn}(C_n)$.

Observation 3.14

For $n \geq 3$, $\gamma_{sn}(C_n \times C_3) = n$.

Jachin Samuel and Angelin Kavitha Raj

CONCLUSION

In this study, we explored and highlighted the signal domination parameter by some of its bounds and also obtained some exclusive results regarding the cartesian product of graphs. Their field of application can be extended to various domains such as robotics, monitoring and surveillance such as sensor networks in smart city and also in the placement of transmitters.

ABSTRACT

Because of globalization in the current technological era as well as unpredictable variables, transportation factors can vary within a specific range of a particular time frame. It is difficult to accurately analyse supply, demand, and transportation costs in a transportation problem due to the inconsistency of economic and environmental factors (TP). It is challenging for an exact approach to determine the IDBTP's precise solution in a reasonable amount of time, especially for large-scale problems with enormous interval widths. The purpose of this work is to solve a transportation problem in which supply, demand, and transportation costs are all hexagonal fuzzy numbers (HFNs). The closed interval approximation of the hexagonal fuzzy number is one of the most effective interval approximations for resolving the IDBTP. In this suggested closed interval approximation method, the IDBTP is first transformed into a fuzzy transportation problem (FTP) using the hexagonal fuzzy transformation approach. Based on centroid and Robust ranking procedures, two innovative ranking techniques are then introduced to convert the Hexagonal fuzzer number into the suitable crispness (non-fuzzy). The minimum cost solution was then discovered by combining Unit cost penalty approach with the U-V method.

INTRODUCTION

The growth of science relies heavily on the fields of operations research and management science, as companies consistently seek optimal strategies to effectively manage their operations. Although early studies were initially confined to specific domains, there has been a notable surge in the quantity of studies recently. As a result, operations research and management sciences have gained widespread acceptance worldwide, extending beyond developed nations. The transportation problem (TP) is a well-known challenge within operations research (OR), finding prominence due to its extensive application in real-world scenarios. The TP arises when goods are transported from multiple sources to various destinations, influenced by supply and demand considerations at both the source and destination. The objective is to minimize the total cost of transportation (TC). Scholars have extensively employed fuzzy numbers and ranking functions to address transportation issues, reflecting the prevalent use of these techniques in decision-making, data analysis, and artificial intelligence within operations research disciplines. In the context of transportation issues, Jain [1] originally proposed ranking fuzzy numbers as a crucial step in decision-making under ambiguous conditions, representing the uncertain quantity as a fuzzy set.

Furthermore, in [2], Jain introduced a systematic approach for multi-aspect decision-making using fuzzy sets. This underscores the significance of fuzzy numbers in decision-making processes within a fuzzy environment across various operations research disciplines. Discovering the initial, most viable solution for a balanced transport offers numerous avenues, as illustrated in [3–7]. The utilization of the transportation algorithm to ascertain the most cost-effective transportation cost becomes applicable only upon identifying a station problem with a feasible or basic solution [8,9]. Due to the diverse goals of maximizing profit and minimizing expenses with optimal resource utilization, various transportation models coexist. Within the business sector, different types of transportation problems are encountered, with the overarching objective being the determination of the most economical means to move goods [10,11]. In addressing the conventional transportation problem, it is presumed that decision-makers possessing knowledge of the pertinent issues understand the significance of transportation costs, supply, and demand. Ambiguity is a common occurrence in real-world scenarios, and certain parameters of transportation problems may lack determinism in practical situations [12]. Consequently, while some data may be precise, others might manifest as intervals or fuzzy data. The term "interval-based transportation problem" is coined to describe this situation where supply, demand, and cost are expressed as interval numbers. When these parameters are further described as interval-valued fuzzy numbers, the problem is termed an interval-valued fuzzy transportation problem (FTP). The existing approaches pose significant challenges in directly addressing this specific type of problem (IDTP). Resolving such a transportation problem requires the conversion of intervals into precise numbers [9].

It is important to note that the IDTP is distinct from the traveling salesman problem (TSP), where the objective is to find the shortest path that visits each city exactly once before returning to the starting point. In contrast, interval data-based transportation problems (IDTP) [13] refer to transportation problems characterized by variable demand, supply, and cost. The optimal shipping cost is determined through the mathematical framework of the IDTP. In a historical context of this subject, Zadeh [14] and Goguen [15] aimed to extend the conventional notions of a set and a proposition, introducing a slight acceptance of fuzziness in their inaugural publication on fuzzy set theory. This marked the initial and pivotal stride towards formalizing fuzziness within mathematics. The widespread application of fuzzy numbers in practical scenarios is evident today. Numerous innovative ideas and theories have been advanced to tackle the challenges posed by the FTP. The parameters used to formulate problems are dynamic and unknown rather than constant, rendering the application of mathematical programming challenging. Even with extensive decision-making experience, policymakers may encounter difficulty in precisely articulating their objectives. The decision-making method formulated in a fuzzy environment by Bellman and Zadeh [16] has proven to be enhanced and highly valuable in managing decision problems. Zimmermann [17] introduced fuzzy set theory and its applications, paving the way for a novel model of transportation issues termed FTP, which emerged as a result of integrating an uncertain environment. Panda and Pal [18] established the logical definition for constructing a PFN and the associated arithmetic operations. Mathur et al. [19] introduced a technique based on trapezoidal fuzzy

Jaya and Vimala

numbers to optimize transportation problems within a fuzzy environment. Maliniand and Anantha Narayanan [20] proposed a novel ranking strategy. The resolution of FTPs through Robust's ranking mechanism was initially introduced by Hunwisai and Kuman [21], who employed the allocation table method to identify an initial basic feasible solution (IBFS) for the FT. Purushothkumar and Anantha Narayanan [22] introduced a new approach for addressing multiple analogous problems. Mondal and Mandal [23] presented an adaptation of a PFN. To tackle unbalanced FTP, Samuel and Raja [24] proposed an innovative computational method. Rosline and Dison [25] developed the geometrical representation of quadratic and symmetric PFNs. Maheswari and Ganesan [26] presented an approach to solve the FTP. In the realm of fuzzy mathematics, a subfield of fuzzy set theory and fuzzy logic, Han et al. [27] introduced the concept of fuzzy mathematics forms. Researchers in this domain offer various techniques aiding the creation of diverse models for conventional linear programming problems, providing fuzzy solutions to the aforementioned issues. Addressing transportation problems with fuzzy cost coefficients, Ashour [28] devised two cost-minimization fuzzy transportation problems incorporating hexagonal fuzzy numbers that consider both supply and demand. Stankovic et al. [29] proposed road traffic fuzzy risk analysis. Helen and Uma [30] utilized an evolutionary approach to handle transportation-related problems involving fuzzy coefficients. Bisht and Srivastava [13] suggested a novel ranking method centered on the in-center concept. Rabinson and Chandrasekaran [31] put forth a method for resolving the TP problem with PFNs based on the ranking function. Uddin et al. (2021) dealt with unexpected situations in multi-objective transportation problems (MOTPs) and proposed a fuzzy membership function technique based on goal programming. Chen et al. [32] introduced a new approach for accurately forecasting short-term traffic flow from historical data. During the 2013 Dingxi earthquake in China, Zheng et al. [33] utilized a hyper-heuristic solution approach for emergency railway transportation.

PRELIMINARIES

Definition 2.1. A fuzzy set A_F defined on U' is a collection of ordered pairs, $A_F = \{(u, \mu_{A_F}(u)) / u \in U'\}$ where $\mu_{A_F}(u): U' \rightarrow [0,1]$ is called the membership function.

Definition 2.2. A_S is a fuzzy subset defined on universe set U' . A_S is normal iff $\sup_{u \in U'} \mu_{A_S}(u) = 1$.

Definition 2.3. A_S is a fuzzy subset defined on universe set U' . A_S is convex iff $\mu_{A_S}(\lambda u + (1 - \lambda)v) \geq (\mu_{A_S}(u) \wedge \mu_{A_S}(v)), \forall u, v \in U', \forall \lambda \in [0,1]$ where \wedge denotes the minimum operator.

Definition 2.4. A_F is a fuzzy set defined on U' . A_F is a fuzzy number iff A_F is normal and convex on U' .

Definition 2.5. A_{Tr} is a triangular fuzzy number whose piecewise linear membership function $\mu_{A_{Tr}}$ defined by

$$\mu_{A_{Tr}}(u) = \begin{cases} \frac{u-p_{11}}{p_{12}-p_{11}}, & p_{11} \leq u \leq p_{12} \\ \frac{p_{13}-u}{p_{13}-p_{12}}, & p_{12} \leq u \leq p_{13} \\ 0, & \text{otherwise} \end{cases} \text{ which can be denoted as a triplet } (p_{11}, p_{12}, p_{13}).$$

Definition 2.6. A_{Trap} is trapezoidal fuzzy number whose membership function $\mu_{A_{Trap}}$ defined by

$$\mu_{A_{Trap}}(u) = \begin{cases} \frac{u-p_{11}}{p_{12}-p_{11}}, & p_{11} \leq u \leq p_{12} \\ 1, & p_{12} \leq u \leq p_{13} \\ \frac{p_{14}-u}{p_{14}-p_{13}}, & p_{13} \leq u \leq p_{14} \\ 0, & \text{otherwise} \end{cases} \text{ which can be denoted as a quadruplet } (p_{11}, p_{12}, p_{13}, p_{14}).$$

Definition 2.7. A Fuzzy number A_{hx} is a hexagonal fuzzy number denoted by $A_{hx} = (p_{11}, p_{12}, p_{13}, p_{14}, p_{15}, p_{16})$ where $p_{11}, p_{12}, p_{13}, p_{14}, p_{15}$ and p_{16} are real numbers and its membership function is defined by

Jaya and Vimala

$$\mu_{A_{hx}}(u) = \begin{cases} \frac{\omega}{2} \left(\frac{u-p_{11}}{p_{12}-p_{11}} \right) & , p_{11} \leq u \leq p_{12} \\ \frac{\omega}{2} + \frac{\omega}{2} \left(\frac{u-p_{12}}{p_{13}-p_{12}} \right) & , p_{12} \leq u \leq p_{13} \\ \omega & , p_{13} \leq u \leq p_{14} \\ \omega - \frac{\omega}{2} \left(\frac{u-p_{14}}{p_{15}-p_{14}} \right) & , p_{14} \leq u \leq p_{15} \\ \frac{\omega}{2} \left(\frac{p_{16}-u}{p_{16}-p_{15}} \right) & , p_{15} \leq u \leq p_{16} \\ 0 & , otherwise \end{cases}$$

Basic operations of Hexagonal Fuzzy number

Addition, Subtraction and Multiplication of two hexagonal fuzzy numbers

$P_{HF} = (p_{11}, p_{12}, p_{13}, p_{14}, p_{15}, p_{16})$ and $Q_{HF} = (q_{11}, q_{12}, q_{13}, q_{14}, q_{15}, q_{16})$ are given by,

Addition $P_{HF} + Q_{HF} = (p_{11} + q_{11}, p_{12} + q_{12}, p_{13} + q_{13}, p_{14} + q_{14}, p_{15} + q_{15}, p_{16} + q_{16})$

Subtraction $P_{HF} - Q_{HF} = (p_{11} - q_{16}, p_{12} - q_{15}, p_{13} - q_{14}, p_{14} - q_{13}, p_{15} - q_{12}, p_{16} - q_{11})$

Multiplication $P_{HF} * Q_{HF} = (p_{11} * q_{11}, p_{12} * q_{12}, p_{13} * q_{13}, p_{14} * q_{14}, p_{15} * q_{15}, p_{16} * q_{16})$

The Formulation of the IDBTP

Formally, given the interval supply and demand vectors $s \in R^m, d \in R^n$ and the transportation costs $c \in R^{m \times n}$, the interval data based transportation problem (IDBTP) can be represented by an interval linear programming model, which is understood as the set of all linear programs (transportation problems) with the costs, supply and demand vectors lying in the corresponding intervals c, s and d . A particular linear program in the interval transportation problem, which is determined by a cost $c \in C$, supply vector $s \in S$ and demand vector $d \in D$, is called a scenario of the IDBTP. In the recent literature, an interval transportation problem in the following form is usually considered:

Minimize $\sum_{\alpha=1}^r \sum_{\beta=1}^t c_{\alpha\beta} x_{\alpha\beta}$

Subject to $\sum_{\beta=1}^t x_{\alpha\beta} \leq s_{\alpha}; \alpha = 1, 2, \dots, r$ and $\sum_{\alpha=1}^r x_{\alpha\beta} \leq d_{\beta}; \beta = 1, 2, \dots, t$

Then, $\sum_{\alpha=1}^r s_{\alpha} \geq \sum_{\beta=1}^t d_{\beta}$

where $\underline{S}_{\alpha} \leq s_{\alpha} \leq \bar{S}_{\alpha} \forall \alpha; D_{\beta} \leq d_{\beta} \leq \bar{D}_{\beta} \forall \beta; C_{\alpha\beta} \leq c_{\alpha\beta} \leq \bar{C}_{\alpha\beta}; x_{\alpha\beta} \geq 0 \forall \alpha, \beta$

The formulation of fuzzy transportation problem (FFTP)

Mathematically, the FTP can be formulated as follows:

Min $\bar{Z} = \sum_{\alpha=1}^r \sum_{\beta=1}^t c_{\alpha\beta} x_{\alpha\beta}$

Subject to

$\sum_{\beta=1}^t x_{\alpha\beta} = a_{\alpha}; \alpha = 1, 2, \dots, r, \sum_{\alpha=1}^r x_{\alpha\beta} = b_{\beta}; \beta = 1, 2, \dots, t$

Where $c_{\alpha\beta}, a_{\alpha}$ and b_{β} are HFN. It is assumed that $a_{\alpha} \geq 0, b_{\beta} \geq 0, c_{\alpha\beta} \geq 0 \forall \alpha, \beta$ and $\sum_{\beta=1}^t b_{\beta} = \sum_{\alpha=1}^r a_{\alpha}, x_{\alpha\beta} \geq 0 \forall \alpha = 1, 2, \dots, r; \beta = 1, 2, \dots, t$

Hexagonal fuzzification methods (HFM)

The decision maker can only access the transportation cost, supply, and demand in interval form in the IDBTP due to the lack of accurate information. In order to use the fuzzy approach, the interval data from the relevant IDBTP is fuzzified to a fuzzy number using the following procedure: Let an interval data be $P=(m,n), d=(n-m)/5$. then $P=(m,m+d,m+2d,m+3d,m+4d,n)$ is a HFN.

The proposed Ranking Technique

Jaya and Vimala

The centroid or geometric center is the arithmetic mean position of all the points in a surface diagram. Consider normal HFN $k^* = (p_1, p_2, p_3, p_4, p_5, p_6)$ such that its centroid is (\bar{x}, \bar{y}) . When $\omega = 1$, the linear HFN is defined as follows

$$\mu_{k^*}(x) = \begin{cases} \frac{1}{2} \left(\frac{x-p_1}{p_2-p_1} \right) & , p_1 \leq x \leq p_2 \\ \frac{1}{2} + \frac{1}{2} \left(\frac{x-p_2}{p_3-p_2} \right) & , p_2 \leq x \leq p_3 \\ 1 & , p_3 \leq x \leq p_4 \\ 1 - \frac{1}{2} \left(\frac{x-p_4}{p_5-p_4} \right) & , p_4 \leq x \leq p_5 \\ \frac{1}{2} \left(\frac{p_6-x}{p_6-p_5} \right) & , p_5 \leq x \leq p_6 \\ 0 & , otherwise \end{cases}$$

Then, using the membership function and according to the centroid formula,

$$\bar{x} = \frac{x \int_{p_1}^{p_2} \frac{x-p_1}{2(p_2-p_1)} dx + x \int_{p_2}^{p_3} \frac{1}{2} + \frac{(x-p_2)}{2(p_3-p_2)} dx + x \int_{p_3}^{p_4} dx + x \int_{p_4}^{p_5} \left(1 - \frac{(x-p_4)}{2(p_5-p_4)} \right) dx + x \int_{p_5}^{p_6} \frac{p_6-x}{2(p_6-p_5)} dx}{\int_{p_1}^{p_2} \frac{x-p_1}{2(p_2-p_1)} dx + \int_{p_2}^{p_3} \frac{1}{2} + \frac{(x-p_2)}{2(p_3-p_2)} dx + \int_{p_3}^{p_4} dx + \int_{p_4}^{p_5} \left(1 - \frac{(x-p_4)}{2(p_5-p_4)} \right) dx + \int_{p_5}^{p_6} \frac{p_6-x}{2(p_6-p_5)} dx}$$

$$\bar{x} = \frac{\frac{1}{12} (-p_1^2 - 2p_2^2 - p_2(p_1 + p_3) - p_2^2_3 + p_4^2 + 2p_5^2 + p_5(p_4 + p_6) + p_6^2)}{\frac{1}{4} (-p_1 - 2p_2 - p_3 + p_4 + 2p_5 + p_6)}$$

$$\bar{x} = \frac{1}{3} \left(\frac{(-p_1^2 - 2p_2^2 - p_2(p_1 + p_3) - p_2^2_3 + p_4^2 + 2p_5^2 + p_5(p_4 + p_6) + p_6^2)}{(-p_1 - 2p_2 - p_3 + p_4 + 2p_5 + p_6)} \right)$$

For a normal HFN $k^*=(p_1, p_2, p_3, p_4, p_5, p_6)$, the proposed ranking technique $R(H)$ is defined by $\bar{x} = R(H)$

$$R(H) = \frac{1}{3} \left(\frac{(-p_1^2 - 2p_2^2 - p_2(p_1 + p_3) - p_2^2_3 + p_4^2 + 2p_5^2 + p_5(p_4 + p_6) + p_6^2)}{(-p_1 - 2p_2 - p_3 + p_4 + 2p_5 + p_6)} \right)$$

Robust Ranking Technique

If A is a fuzzy number, then the robust ranking defined by

$$R(A) = \int_0^1 \frac{1}{2} (a_{h\alpha}^L, a_{h\alpha}^U) d\alpha$$

where $(a_{h\alpha}^L, a_{h\alpha}^U) = \{(b - a)\alpha + a, d - (d - c)\alpha\} + \{(d - c)\alpha + c, f - (f - e)\alpha\}$

Proposed Ranking Method

Initially, our IDBTP is transformed to FTP utilizing the HFM shown in section 3. Then, using a Proposed ranking method to convert the HFN into a crisp value. Finally, the modified distribution method (MODI) and Vogel's Approximation Method (VAM) are used to attain the optimal solution. To solve an IDBTP, the following steps to be followed:

- Step 1: Creating a tabular representation of the given problem
- Step 2: Using a HFM in section 3, to fuzzifying a data
- Step 3: To convert FTP into precision value, by using the Proposed ranking Method
- Step 4: To formulate a linear programming problem and check whether it is balanced
- Step 5: To calculate IBFS using VAM Method
- Step 6: To obtain the optimal solution to the problem using MODI Method)

RESULTS AND DISCUSSION

Using proposed Ranking Method

Jaya and Vimala

The following example is solved by Proposed method in this paper

Example 1 A company has three sources or delivers A,B,C with supply (1-9);(4-10);(4-11) respectively and it has three receivers R11, R12, R13 with demand values (3-12);(4-10);(2-8) respectively. The transport cost is given in following table In this example the initial basic feasible solution using VAM is equal to 155 and the optimal solution using MODI method is equal to 154.5

	R 11	R 12	R 13
A	[1,19]	[1,9]	[2,18]
B	[8,26]	[3,12]	[7,28]
C	[11,27]	[0,15]	[4,11]

Using Robust Ranking Method

Our Robust Ranking Method for this paper solves the example 1 as shown in Table 2

In this example the initial basic feasible solution using VAM is equal to and the optimal solution using MODI method is equal to

CONCLUSION

In this study, the unit cost of transportation, supply, and demand elements were taken to be considered as intervals to analyze the IDBTP with the lowest amount of transportation cost. The IDBTP is addressed in this study by combining two innovative ideas. First, the suggested Hexagonal fuzzification method (HFM) is used to convert IDBTP to FTP, and then newly proposed ranking algorithms based on the centroid and Robust ranking concepts are used to convert to crisp numbers. In addressing such IDBTP, where there is a significant disparity between the intervals of supply and demand, the proposed fuzzy approaches are proven to be more efficient. The applications for decision-making in industry and engineering suggested by this approach are significant. Despite the fact that our new ranking approach performs better than the current approach in locating the least cost of small-sized IDBTPs, it does not satisfy any instances of large-sized IDBTPs. Furthermore, because of the competitive market environment today, single-objective fuzzy or non-FTP models cannot handle real-world decision-making problems. As a result, we recommend further investigation to provide a more efficient approach for resolving large-scale interval-based, multi-objective transportation problems.

ABSTRACT

The Fuzzy Assignment Problem (FAP) extends the classical assignment problem by incorporating uncertainty and imprecision, often encountered in real-world scenarios. Traditional assignment models assume exact numerical values for costs or profits, which is not always realistic. This research paper explores the use of fuzzy quantifiers in FAP to model linguistic terms such as "approximately," "almost," and "around." We employ a fuzzy logic-based approach to handle these uncertainties and propose a new algorithm to solve the FAP effectively. Our experimental results demonstrate that the fuzzy quantifier approach provides more flexible and realistic solutions compared to traditional methods. The findings suggest significant implications for decision-making processes in various fields, including logistics, human resource management, and project allocation.

Keywords: Fuzzy Assignment Problem, Linear Programming Problems, Stochastic Assignment Problems. Fuzzy cost Matrix, Triangular Fuzzy Numbers, Hungarian Methods,

INTRODUCTION

The assignment problem is a fundamental issue in combinatorial optimization, where the objective is to assign a set of tasks to a set of agents in a way that minimizes the total cost or maximizes the overall profit. Traditional models assume precise cost or benefit values, which may not be practical in many real-world applications where uncertainty and imprecision are inherent. To address this, the Fuzzy Assignment Problem (FAP) introduces fuzzy numbers to represent uncertain costs or benefits. Fuzzy logic, introduced by Zadeh in 1965, provides a mathematical framework

Jeevitha et al.,

for dealing with vagueness and imprecision. Fuzzy quantifiers, such as "approximately" or "almost," further enhance this framework by allowing more natural and human-like expressions of uncertainty. In this paper, we explore the application of fuzzy quantifiers in FAP, aiming to develop a more robust and realistic model.

LITERATURE REVIEW

The concept of the assignment problem dates back to the early 20th century, with the Hungarian algorithm by Kuhn (1955) being a seminal work in this area. Over the years, various extensions and modifications have been proposed to address different aspects of the problem, such as multi-objective assignment problems, dynamic assignment problems, and stochastic assignment problems. The integration of fuzzy logic into optimization problems began gaining traction in the 1970s. Dubois and Prade (1980) were among the pioneers who introduced fuzzy sets into decision-making processes. Since then, numerous studies have applied fuzzy logic to various optimization problems, including the assignment problem. Notable contributions include the work of Zimmermann (1996) on fuzzy mathematical programming and the research by Chen and Hwang (1992) on fuzzy multiple criteria decision-making. Fuzzy quantifiers, a critical aspect of fuzzy logic, were first introduced by Zadeh (1983). They allow for more nuanced expressions of uncertainty, making them particularly useful in modeling real-world scenarios where linguistic terms are often used. Research by Yager (1988) and Delgado et al. (1993) further developed the theory and applications of fuzzy quantifiers in decision-making processes. Fuzzy logic using fuzzy quantifiers provides a sophisticated approach for handling imprecise and vague data in research. Fuzzy quantifiers, such as "most," "few," and "several," extend classical logic by allowing for degrees of membership rather than strict binary categorizations. For example, in a study analyzing the impact of student attendance on performance, fuzzy quantifiers can be employed to capture linguistic terms like "most students" or "a few students" with varying degrees of membership. In this context, fuzzy quantifiers are defined with membership functions that quantify the extent to which data points belong to fuzzy sets. A proven application is in educational performance analysis, where attendance rates are fuzzified into categories like "low," "medium," and "high," and fuzzy rules such as "If most students have high attendance, then performance is excellent" are used. By applying these fuzzy rules, researchers can derive fuzzy outputs, which are then defuzzified to yield precise performance scores. This method allows for a more nuanced understanding of the relationship between attendance and performance, demonstrating how fuzzy logic and quantifiers can offer valuable insights in research scenarios involving imprecise and qualitative data. However, the application of fuzzy quantifiers in the assignment problem remains relatively unexplored. This paper aims to fill this gap by integrating fuzzy quantifiers into the FAP and proposing a new algorithm to solve it.

EXPERIMENTAL RESULTS

METHODOLOGY

To investigate the effectiveness of fuzzy quantifiers in the FAP, we developed a new algorithm based on fuzzy logic principles. The algorithm incorporates fuzzy quantifiers to represent uncertain costs or benefits and employs a fuzzy inference system to derive the optimal assignment.

Fuzzy Quantifier Representation

Costs or benefits are represented using fuzzy numbers and linguistic terms such as "low," "medium," and "high." Fuzzy quantifiers like "approximately" and "almost" are used to express the degree of uncertainty. Fuzzy quantifier representation is a concept in fuzzy logic and fuzzy set theory that extends the traditional notion of quantifiers used in classical logic. In classical logic, quantifiers such as "all," "some," and "none" are used to describe the extent to which a property applies to a set of elements. Fuzzy quantifiers, however, allow for a more nuanced and flexible representation of quantities that reflect real-world scenarios more accurately. Fuzzy quantifiers can be categorized into two main types: absolute quantifiers and relative quantifiers. Absolute quantifiers refer to fixed quantities, such as "about 10," while relative quantifiers express proportions or percentages, such as "most," "few," or "approximately

Jeevitha et al.,

half." These quantifiers are not strictly defined but instead have a degree of membership that can range between 0 and 1. This allows for the representation of vague and imprecise concepts. For example, the fuzzy quantifier "most" can be represented by a membership function that assigns a degree of membership to different proportions of elements in a set. If we consider the quantifier "most students are diligent," the membership function might assign higher degrees of membership to sets where a large proportion of students are diligent, but not necessarily all.

Inference System

A set of fuzzy rules is established to model the decision-making process. The fuzzy inference system evaluates these rules to determine the optimal assignment. A Fuzzy Inference System (FIS) is a framework used to map inputs to outputs using fuzzy logic principles. It is widely applied in areas requiring decision-making under uncertainty and imprecision. The FIS operates through three main steps: fuzzification, inference, and defuzzification. Fuzzification: Converts crisp input values into fuzzy sets using membership functions. Inference applies fuzzy rules, typically in the form of "if-then" statements, to the fuzzified inputs to derive fuzzy outputs. These rules reflect expert knowledge and capture the relationships between input and output variables. Defuzzification, converts the fuzzy outputs back into crisp values, providing a clear and actionable result. A proven example of FIS is in controlling household appliances like washing machines, where it adjusts washing cycles based on fuzzy rules considering load size, dirtiness, and fabric type. The FIS ensures optimal performance by mimicking human decision-making, enhancing efficiency and user satisfaction.

Defuzzification

The final step involves converting the fuzzy results into crisp values to identify the best assignment. The centroid method is used for defuzzification. Defuzzification in fuzzy logic, particularly in assignment problems, involves converting fuzzy results into a crisp output. This step follows fuzzification and the application of fuzzy rules. Common methods include the Centroid Method (calculating the center of the area under the curve), the Bisector Method (dividing the area into two equal halves), and the Mean of Maximum (taking the average of the maximum values). In assignment problems, defuzzification helps in determining precise assignments from fuzzy evaluations, ensuring actionable decisions. For instance, in task allocation, it translates fuzzy suitability ratings into specific task assignments for optimal performance.

Data and Experiment Design

We conducted experiments using synthetic data sets that simulate various real-world scenarios. The data sets include different levels of uncertainty and imprecision to test the robustness of the fuzzy quantifier approach. Each data set consists of a matrix where the rows represent tasks, and the columns represent agents. The elements of the matrix are fuzzy numbers indicating the cost or benefit of assigning a particular task to a specific agent. In designing an experiment using fuzzy quantifiers, data is collected on relevant variables, such as student performance metrics. Linguistic terms (e.g., "low," "medium," "high") are assigned to this data, and appropriate fuzzy quantifiers like "most" or "few" are defined with membership functions. Hypotheses are formulated and fuzzy rules established (e.g., "If attendance is high, performance is high"). Data is fuzzified, processed through the fuzzy inference system, and defuzzified to yield crisp outputs. Results are validated and membership functions and rules refined accordingly, ensuring nuanced interpretations and actionable insights from complex, imprecise data.

RESULTS

The performance of the fuzzy quantifier-based algorithm was compared to that of traditional assignment algorithms, such as the Hungarian algorithm. The evaluation metrics included total cost, computational time, and solution quality.

Jeevitha et al.,

Total Cost

The fuzzy quantifier approach consistently provided lower or comparable total costs compared to traditional methods. This indicates that the algorithm effectively handles uncertainty and imprecision, resulting in more realistic and practical solutions.

Computational Time

The fuzzy quantifier algorithm exhibited slightly higher computational times due to the additional complexity of fuzzy logic calculations. However, the increase in time was marginal and acceptable given the improved solution quality.

Solution Quality

The fuzzy quantifier approach produced solutions that better matched the real-world scenarios, as evidenced by the closer alignment of the results with the expected outcomes in the presence of uncertainty. To further validate the effectiveness of our approach, we applied the fuzzy quantifier algorithm to a real-world problem: assigning employees to projects in a company. The costs associated with each assignment were represented as fuzzy numbers to account for uncertainties in project requirements and employee performance. The results demonstrated that the fuzzy quantifier approach provided a more balanced and satisfactory assignment compared to traditional methods. Managers reported that the assignments better reflected their intuitive judgments and preferences, highlighting the practical applicability of the approach.

CONCLUSIONS

This research demonstrates the potential of fuzzy quantifiers in enhancing the Fuzzy Assignment Problem (FAP) to address real-world uncertainties and imprecision. By incorporating fuzzy quantifiers, we developed an algorithm that provides more flexible and realistic solutions compared to traditional methods. The experimental results show that the fuzzy quantifier approach effectively handles uncertainty, resulting in improved solution quality and practical applicability. The implications of this study are significant for various fields, including logistics, human resource management, and project allocation. Future research could explore the integration of other fuzzy logic techniques and the application of the fuzzy quantifier approach to more complex and dynamic assignment problems. In conclusion, the use of fuzzy quantifiers in the FAP offers a promising direction for improving decision-making processes in uncertain environments. This approach not only aligns better with human intuition but also provides a robust framework for addressing the inherent imprecision in many real-world scenarios.

ABSTRACT

Let $G = HC_{\lambda,m}(p, q)$, $m \geq three$ be a human-chain graph with $p = 2m\lambda + \lambda + 1$ (vertices) and $q = 2m\lambda + 2\lambda$ (edges). In this article, we concentrated the *ied* – number for Human-chain graphs, Circular Human-chain graph, Strong Human-chain graphs and Weak Human-chain graphs.

Keywords: Intersection Empty Domination Number, Human-chain Graph, Strong Human-chain Graph, Weak Human-chain Graph.

2010 Mathematics Subject Classification: 94C15, 05C31, 68R10, 05C75.

INTRODUCTION

Let $G = HC_{\lambda,m}(p, q)$, $m \geq three$ be a human-chain graph with $p = 2m\lambda + \lambda + 1$ (vertices) and $q = 2m\lambda + 2\lambda$ (edges). Anitha and Selvam [6] presented the human-chain graph (Network] in 2019.and intersection empty domination number was introduced by B.K.Keerthiga Priyatharsini in [7]. A human graph with $\lambda = 1, HC_{1,m}(p, q)$ can be regarded as having only one guy in the chain. Concepts coming from graph theory are widely applied in computer science. Additionally, networking, open banking, telephony, and mobile applications use human-chain graphs. There are several uses for these two networks in bus topology. An intersection empty domination number for circular, strong, weak human-chain graphs is found in this work. We provide some fundamental definitions that are important to this study in this section. Let u and v be vertices of a graph G , which need not be distinct. A finite, alternating series of nodes and edges, starting along with vertex u and finishing with vertex v , so that $\mu_i = u_{i-1}u_i, i = 1, 2, \dots, \lambda$, is called a $u - v$ walk of G . The walk's length is denoted by the number λ . If u and v are separate vertices,

Keerthiga Priyatharsini and Balasundar

the walk is said to be open; if not, it is said to be closed. The sequence of $u_0, u_1, \dots, u_\lambda$ of its vertices determines a walk, $u = u_0, \mu_1, u_1, \mu_2, \dots, \mu_n, u_\lambda$; hence, we specify this walk by $(u_0, u_1, \dots, u_\lambda)$. A path is a walk where each vertex is distinct coming from the others. A cycle is a closed walk $(u_0, u_1, u_2, \dots, u_{\lambda-1})$ in which $(u_0, u_1, \dots, u_\lambda)$ are distinct. The symbol for a path on λ vertices is P_λ and a cycle on λ vertices is C_λ . The degree, represented as $deg_G v$ or $deg v$, of v in G is the count of edges of G which connect along with v . G 's vertices' minimum and maximum degrees are represented by the symbols δ and Δ , respectively. In G , $d(v) = 0$ is mentioned to as an isolated vertex, & a vertex with degree one is mentioned to as an end vertex or pendant vertex. A support is any node that is next to a pendant vertex. If any vertex in $V - D$ is next to every other node in D , a subset D of vertices in G is referred to as a dominant set of G . Let G be a connected graph that is non-trivial. If $\gamma(G) > 1$, then for each $l \in S$, there will be $m \in S$ such that $N(l) \cap N(m) \cap (V - S) = \emptyset$. This dominating set $S \subseteq V$ is named an *ied*- set. The *ied* – number, represented as γ_{ied} , is the lowest cardinality of an *ied*- set. The upper intersection empty dominating set, indicated by Γ_{ied} , is the greatest *ied* – set. The upper *ied* – set, represented by Γ_{ied} , is the greatest cardinality of an *ied* -set. A graph called a *Z – tree* is generated coming from a Path P_λ by connecting an edge to a path vertex that is close to an end point. A Human-chain graph $HC_{\lambda,m}$ is acquired with a path $u_1, u_2, \dots, u_{2\lambda+1}$, $\lambda \in N$ combining a cycle (C_m) & *Z – tree* Z_{m+1} , $m \geq three$ to each u_{2i} for $1 \leq i \leq n$. The vertices of C_m and *Z – tree* are $v_1, v_2, \dots, v_{(m-1)\lambda}$ and $w_1, w_2, \dots, w_{m\lambda}$ respectively. The node & edge sets of $HC_{\lambda,m}$ is used by $V(HC_{\lambda,m}) = \{u_i, v_\mu, \frac{w_k}{1} \leq l \leq 2\lambda + 1, 1 \leq \mu \leq (m - 1)\lambda, 1 \leq k \leq m\lambda\} \& |V| = 2m\lambda + \lambda + E(HC_{\lambda,m}) = \{u_\alpha u_{\alpha+1} / 1 \leq i \leq 2\lambda\} \cup \{u_{2\alpha} w_{m(\alpha-1)+1}; u_{2\alpha} v_{(m-1)}; u_{2\alpha} v_{(m-1)(\alpha-1)+1}; w_{m\alpha} w_{m\alpha-2} / 1 \leq \alpha \leq \lambda\} \cup \{w_{m\alpha+j} w_{m\alpha+j+1}; v_{(m-1)\alpha+j} v_{(m-1)\alpha+j+1}, 0 \leq \alpha \leq \lambda - 1, 1 \leq j \leq m - 2\} |E| = 2m\lambda + 2\lambda$

A circular Human-chain graph is attained coming from a circle $(C_{2\lambda}), u_1, u_2, \dots, u_{2\lambda}, u_1, \lambda \geq 3$ by linking a cycle and tree $(Z_{m+1}), m \geq 3$ to each u_{2j} for $1 \leq j \leq \lambda$. The vertices of the cycle (C_m) and *Z – tree* (Z_{m+1}) are $v_1, v_2, \dots, v_{(m-1)\lambda}$ and $w_1, w_2, \dots, w_{m\lambda}$ respectively and the vertices of $C_{2\lambda}$ is $u_1, u_2, \dots, u_{2\lambda}$. The circular human-chain graph is denoted by $CHC_{\lambda,m}$. The strong Human-chain graph $SHC_{\lambda,\mu}, \lambda, \mu \geq 1$ and $\mu \geq 3$ is attained coming from Human-chain network by linking $w_{\mu i} \& w_{\mu(i+1)-1} / 1 \leq i \leq \lambda - 1$ with common vertices in *Z – tree*. The nodes of $SHC_{\lambda,\mu}$ are $u_1, u_2, \dots, u_{2\lambda+1}, l_1, l_2, \dots, l_{(\mu-1)\lambda}, w_1, w_2, \dots, w_{(\mu-1)n+1}$ and edges of $SHC_{\lambda,\mu}$ are $\{u_i u_{i+1}, 1 \leq i \leq 2n\} \cup \{u_{2i} w_{\mu(i-1)+1}; u_{2i} w_{(\mu-1)i}; u_{2i} v_{(\mu-1)(i-1)+1}, 1 \leq i \leq n\} \cup \{w_{(\mu-1)i+1} w_{(\mu-1)i+(\mu-1)}, 1 \leq i \leq \lambda - 1\} \cup \{w_{\mu-1} w_{\mu-2}\} \cup \{v_{(\mu-1)i+j} v_{(\mu-1)i+j+1}, 0 \leq i \leq \lambda - 1, 1 \leq j \leq \mu - 2\} \cup \{w_{\mu i - \mu + j} w_{\mu i - \mu + j + 1}, 1 \leq i \leq \lambda, 1 \leq j \leq m - 3\}$. The weak Human-chain graph $WHC_{\lambda,m}, \lambda \geq 1$ and $m \geq 3$ is obtained coming from a path $u_1, u_2, \dots, u_{\lambda+1}$ by connecting cycle with length m and *Z – tree* (Z_{m+1}) to every $u_i, 1 \leq i \leq \lambda$. The nodes and edges of $WHC_{\lambda,m}$ are as follows:

$$V(WHC_{\lambda,m}) = \{u_1, u_2, \dots, u_{\lambda+1}, \mu_1, \mu_2, \dots, \mu_{(m-1)\lambda}, w_1, w_2, \dots, w_{m\lambda}\}, E(WHC_{\lambda,m}) = \{u_i u_{j+1}, 1 \leq j \leq \lambda\} \cup \{u_j w_{m(j-1)+1}; u_j \mu_{(m-1)(j-1)+1}; u_j \mu_{(m-1)i}, 1 \leq j \leq \lambda\} \cup \{\mu_{(m-1)j+j} \mu_{(m-1)j+l+1}, 0 \leq j \leq \lambda - 1, \} \cup \{w_{mj+l+1}, 1 \leq j \leq \lambda - 1, 1 \leq l \leq m - 2\} \cup \{w_{mj} w_{mj-2}, 1 \leq j \leq \lambda\}.$$

Theorem: 2.10 [7] $\gamma_{ied}(P_k) = \lceil \frac{k}{3} \rceil, k \geq 4$.

Main Results

Observation: 3.1 $\gamma_{ied}(HC_{\lambda,m}) \geq 2$.

Theorem: 3.2 $\gamma_{ied}(HC_{1,3k+f}) = 2k + 2; f = 1, 2, 3$.

Proof: Case(i): $f = 1$. Let $V(HC_{1,3k+1}) = \{u_1, u_2, \dots, u_{3k}, u, l_1, l_2, v_1, v_2, \dots, v_{3k-2}, x_1, x_2, v\}$ with $d(u) = 5; d(v) = 3; d(w_1) = d(w_2) = 1$ such that w_1 and w_2 are adjacent to v . Now, removal of $\{u, v\}$ coming from $HC_{1,3k+1}$ disconnects the graph and produces two path graphs namely P_1 and P_2 with $3k$ and $3k - 2$ vertices. Without loss of generality, Take P_1 contains u_1, u_2, \dots, u_{3k} vertices and P_2 contains $v_1, v_2, \dots, v_{3k-1}$ vertices. Construct an *ied* –set in P_1 ; $S_1 = \{u_x / d(u, u_x) = 0 \text{ or } \geq 2\}$. Since $\langle P_1 \rangle$ is a path, $\gamma_{ied}(S_1) = \lceil \frac{3k}{3} \rceil = [k]$. Similarly, Construct in $\langle P_2 \rangle, S_2 = \{v_t / d(u, v_t) = zero \text{ or } \geq 2 \text{ and } d(v, v_t) = zero \text{ or } \geq 2\}$. Now, Either $S_2 \cup \{v_1\}$ or $S_2 \cup \{v_{3k-2}\}$ forms an *ied*-

Keerthiga Priyatharsini and Balasundar

set. $\gamma_{ied}(P_2) = \left\lceil \frac{3k-2}{3} \right\rceil + 1$. Then $S = S_1 \cup S_2 \cup \{v_1\} \cup \{u, v\}$ forms an *ied*-set for $HC_{1,3k+1}$. So, $\gamma_{ied}(HC_{1,3k+1}) = \gamma_{ied}(P_1) + \gamma_{ied}(P_2) + 3 = [k] + \left\lceil \frac{3k-2}{3} \right\rceil + 3 \leq 2k + 2$.

Case(ii): $f = 2$. Let $V(HC_{1,3k+2}) = \{u_1, u_2, \dots, u_{3k+1}, u, t_1, t_2, v_1, v_2, \dots, v_{3k-1}, w_1, w_2, v\}$. Now, Removal of $\{u, v, v_1, v_{3k-1}\}$ coming from $HC_{1,3k+2}$ disconnects the graph and produces two path graphs namely P_1 and P_2 with $3k + 1$ and $3k - 3$ vertices respectively. Without loss of generality, Take P_1 contains $u_1, u_2, \dots, u_{3k+1}$ vertices and P_2 contains $v_2, v_3, \dots, v_{3k-3}$ vertices respectively. Construct in P_1 , $S_1 = \{u_x / d(u, u_x) = 0 \text{ or } \geq 2\}$. Clearly, $|S_1| = 3k + 1$. Then, $S_1 \cup \{u_1\}$ or $S_1 \cup \{u_{3k+1}\}$ forms an *ied* set. $\gamma_{ied}(S_1 \cup \{u_1\}) = \left\lceil \frac{3k+1}{3} \right\rceil + 1$. Since $\langle S_1 \rangle$ is a path. Similarly, Construct in P_2 , $S_2 = \{v_t \text{ such that } d(u, v_t) = 0 \text{ or } \geq 2 \text{ and } d(v, v_t) = 0 \text{ or } \geq 2\}$. Clearly, $|S_2| = 3k - 3$ and also $\langle S_2 \rangle$ gives an *ied* set. Then, $\gamma_{ied}(S_2) = \left\lceil \frac{3k-3}{3} \right\rceil = k - 1$. Now, $S = S_1 \cup \{u_1\} \cup S_2 \cup \{u, v\}$ forms an *ied* set for $HC_{1,3k+2}$. $\gamma_{ied}(HC_{1,3k+2}) = \gamma_{ied}(S_1) + \gamma_{ied}(S_2) + 3 = \left\lceil \frac{3k+1}{3} \right\rceil + k - 1 + 3 \leq 2k + 2$.

Case(iii) $f = 3$. Let $V(HC_{1,3k+3}) = \{u_1, u_2, \dots, u_{3k+2}, u, l_1, l_2, v_1, v_2, \dots, v_{3k}, x_1, x_2, v\}$. Now, Removal of $\{v, u, u_1, u_{3k+2}\}$ coming from $HC_{1,3k+3}$ disconnects the graph and produces two path graphs namely P_1 and P_2 with $3k$ and $3k$ vertices respectively. Without loss of generality, Take P_1 contains $u_2, u_3, \dots, u_{3k+1}$ vertices and P_2 contains v_1, v_2, \dots, v_{3k} vertices respectively. Construct in P_1 , $S_1 = \{u_s / d(u, u_s) = 0 \text{ or } \geq 2\}$. Clearly, $|S_1| = 3k$. Then, S_1 forms an *ied* set with cardinality $\left\lceil \frac{3k}{3} \right\rceil$. Since $\langle S_1 \rangle$ is a path. Similarly, Construct in P_2 , $S_2 = \{v_t \text{ such that } d(u, v_t) = 0 \text{ or } \geq 2 \text{ and } d(v, v_t) = 0 \text{ or } \geq 2\}$. Clearly, $|S_2| = 3k$. Also it yields an *ied* -set. Then $\gamma_{ied}(S_2) = \left\lceil \frac{3k}{3} \right\rceil = k$. Since $\langle S_2 \rangle$ also path graph. Now, $S = S_1 \cup \{u_1\} \cup S_2 \cup \{u, v\}$ forms an *ied* set. $\gamma_{ied}(S) \leq |S_1| + |S_2| + \{u, v\} \leq 2k + 2$. Claim: for $\lambda = 1, \gamma_{ied}(HC_{1,3k+f}) \geq 2k + 2; f = 1, 2, 3$. Suppose, $\gamma_{ied}(HC_{1,3k+j}) = 2k + 1; f = 1, 2, 3$. If we remove $\{u\}$ or $\{v\}$ then either $S - \{u\} \cup \{l_1, l_2\}$ or $S - \{v\} \cup \{x_1, x_2\}$ gives an *ied*-set respectively. So, $\gamma_{ied}(HC_{1,3k+f}) \geq 2k + 2; f = 1, 2, 3$. Hence $\gamma_{ied}(HC_{1,3k+f}) = 2k + 2; 1 \leq f \leq 3$.

Theorem: 3.3 For $\lambda \geq 1, \gamma_{ied}(HC_{\lambda,3k+j}) = \lambda(2k + 3) - 1; j = 1, 2, 3$.

Proof: Suppose $\lambda \geq 2$. Let $t_1, t_2, t_3, \dots, t_{\lambda+1}$ be the joining vertices of each human-chain. Then $\{t_2, t_3, \dots, t_{\lambda}\}$ must belong to *ied* set of $HC_{\lambda,3k+j}$. Otherwise, suppose $t_m, (m = 2, 3, \dots, \lambda) \in HC_{\lambda,3k+j}$. Then *ied* -set condition does not hold. Therefore γ_{ied} must contain $\{t_m: m = 2, 3, \dots, \lambda\}$. Therefore, $\gamma_{ied}(HC_{\lambda,3k+j}) = \gamma_{ied}(HC_{1,3k+j}) + \gamma_{ied}(HC_{2,3k+j}) + \dots + \gamma_{ied}(HC_{\lambda,3k+j}) + (\lambda - 1)$.

Since, $\gamma_{ied}(HC_{1,3k+j}) = \gamma_{ied}(HC_{2,3k+j}) = \dots = \gamma_{ied}(HC_{\lambda,3k+j})$. (by Theorem 3.2.)
 $= \gamma_{ied}(HC_{1,3k+j}) + \dots + \gamma_{ied}(HC_{1,3k+j}) + (\lambda - 1) = \lambda(2k + 3) - 1; j = 1, 2, 3. (\lambda \text{ times})$

Theorem:3.4 For Circular Human-chain $CHC_{\lambda,m}, \lambda \geq 2, m \geq 3, \gamma_{ied}(CHC_{\lambda,3k+f}) = \lambda(2k + 3) - 1; 1 \leq f \leq 3$.

Proof: The explanation and Solution of Theorem 3.3 are somewhat similar.

Remarks: 3.5

Observation: 3.6

$$\gamma_{ied}(SHC_{2,5} - \{\emptyset_1, \emptyset_2, \emptyset_3, \emptyset_4, \emptyset_5, \emptyset_6\}) \leq \gamma_{ied}(SHC_{2,5}).$$

So, $\gamma_{ied}(SHC_{2,5} - \{\emptyset_1, \emptyset_2, \emptyset_3, \emptyset_4, \emptyset_5, \emptyset_6\}) \leq \lambda(2i + 3) - 1; j = 1, 2, 3$.

Theorem: 3.7

For $\lambda \geq 2, m \geq 36 \leq \gamma_{ied}(SHC_{\lambda,3i+j}) \leq \left\lceil \frac{\lambda(6i+11)}{3} \right\rceil, j = 1, 2, 3; m = 3i + j$.

Proof:

Clearly, $\gamma_{ied}(SHC_{2,3}) = 6$. Let $SHC_{\lambda,m}$ be the strong human-chain network. Let $S = \{e_1, e_2, \dots, e_{\lambda}\}$ coming from Figure 3. Remove Scoring from $SHC_{\lambda,m}$ yields disconnected graph with two components G and P . Since $\langle P \rangle$ is a path graph with $2\lambda + 1$ vertices and hence, Coming from Observation 5.6 and Theorem 2.10, $\gamma_{ied}(SHC_{\lambda,m}) = \gamma_{ied}(G) + \gamma_{ied}(P) \leq \lambda(2i + 3) - 1 + \left\lceil \frac{2\lambda+1}{3} \right\rceil \leq \left\lceil \frac{\lambda(6i+11)}{3} \right\rceil$.

Keerthiga Priyatharsini and Balasundar

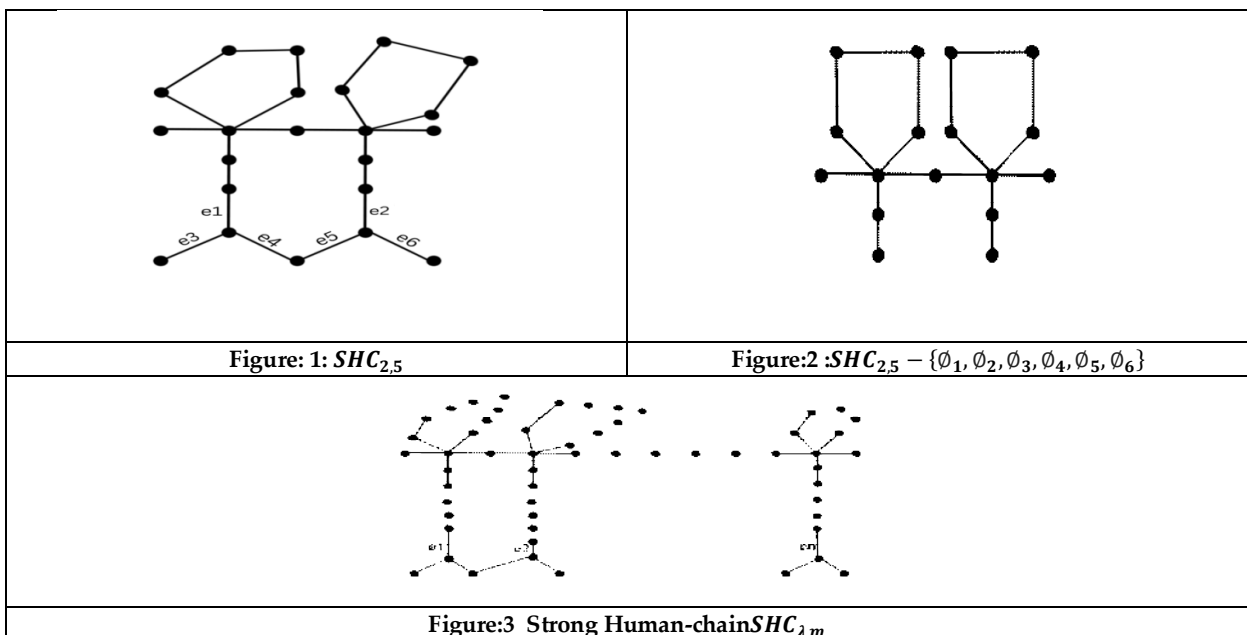

Observation: 3.8 $\gamma_{ied}(WHC_{\lambda,3}) = 2\lambda$ if $\lambda \geq 2$.

Theorem: 3.9 $\gamma_{ied}(WHC_{\lambda,m}) = 2\lambda(p + 1); m = 3p + f; i \geq 1; f = 1,2,3$.

Proof: $\gamma_{ied}(WHC_{1,m}) = \gamma_{ied}(HC_{1,m})$. By Theorem 3.2, $\gamma_{ied}(WHC_{1,m}) = 2p + 2$. So, $\gamma_{ied}(WHC_{\lambda,m}) = 2\lambda(p + 1)$.

ABSTRACT

There are many mysteries in the world. Fuzzy sets were developed as a mathematical tool for dealing with ambiguity. Further generalization of fuzzy sets was extended to intuitionistic fuzzy sets contain both membership, non-membership values and its hesitancy. A rough fuzzy set is identified when all components of a set converge on a crisp number as n approaches infinity. In this paper, we propose an extension of Intuitionistic Fuzzy Rough Sets (*IFRS*) on similarity measure. We developed a decision-based method to an intuitionistic fuzzy rough set. Finally, numerical examples have been provided, utilizing decision-making methods to enrich illustration and enhance clarity.

Keywords: Fuzzy sets, Intuitionistic Fuzzy Rough Set, Decision making, Similarity measure.

INTRODUCTION

A Fuzzy sets (FS) invented by renowned and eminent scientist L.A. Zadeh [11] in 1965, has demonstrated significant applications in numerous areas of study. Fuzzy set theory states that if each element is normally assigned a membership values between 0 and 1, then reluctance or uncertainty may prevent the non-membership degree from always equivalent to 1 minus the membership values. Rough set (RS), established by prominent scientist Pawlak [14] in 1996, and is a wide scientific framework adept at handling data characterized by sets of elements, especially when dealing with ambiguity or incomplete data. It defines a rough set as comprising two components: which are the lower and upper approximations (of the target set), both determined by the relation specified within the set. The target set contains the lower approximation, and it may also contain the upper approximation. Further, in the 1980, Atanassov's research on intuitionistic fuzzy sets (IFS) introduced the hesitation margin, which characterizes the uncertainty within each element. This margin, derived from difference of 1 and the total of both membership

81337

Mythili and Samukthaa

functions and non-membership functions, it delivers a comprehensive perspective on the level of hesitancy present. The conception of characterizing Intuitionistic Fuzzy Sets (IFS) as universal Fuzzy sets is stimulating and beneficial in various domains. Intuitionistic fuzzy sets become most significant, resourceful and appropriate, since they contain both degrees of membership and non-membership function together with hesitation margin, (Atanassov, 1994, 1999) [3]. Nanda & Majumdar [12] was combined the Fuzzy & Rough sets to establish the fuzzy rough sets theory in 1992. As a result, Fuzzy sets are intuitionistic L-fuzzy sets, as noted by Coker [7]. In this article, we use the concept of the Intuitionistic Fuzzy Rough Sets (IFRS) [10] model to find the similar measure between two given Intuitionistic Fuzzy Rough set with 8-tuples. The effectiveness of the more realistic decision-making method is illustrated with a numerical example.

PRELIMINARIES

Definition 1[2]

Suppose that Γ is a universal set and IFS \tilde{A} in Γ is defined as follows $\tilde{A} = \{ \langle \tau, \mu_{\tilde{A}}(\tau), \nu_{\tilde{A}}(\tau) \rangle : \tau \in \Gamma \}$, then each element of membership degree is $\mu_{\tilde{A}} : \tau \rightarrow [0, 1]$ and each element of non-membership degree is $\nu_{\tilde{A}} : \tau \rightarrow [0, 1]$ respectively, for every element $\tau \in \Gamma$, where $0 \leq \mu_{\tilde{A}}(\tau) + \nu_{\tilde{A}}(\tau) \leq 1$. Thus, we have $\alpha_{\tilde{A}}(\tau) = 1 - \mu_{\tilde{A}}(\tau) - \nu_{\tilde{A}}(\tau)$ is said to be the IFS Index or Hesitation Margin. Where, $\alpha_{\tilde{A}}(\tau)$ is the degrees of Indeterminacy, $\alpha_{\tilde{A}}(\tau) \in [0, 1]$ and $0 \leq \alpha_{\tilde{A}}(\tau) \leq 1$, for every element $\tau \in \Gamma$.

Definition 2[3]

Consider the universal set E and IFRS is the Intuitionistic Fuzzy relation is defined by $E \times E$. The pair $(E, IFRS)$ is said to be Intuitionistic Fuzzy Rough approximation. For any $\tilde{A} \in IF(E)$, where $IF(E)$ is denoted by intuitionistic fuzzy power set of E , both lower and upper approximations of \tilde{A} are denoted by $IFR(\tilde{A})$ & $IF\bar{R}(\tilde{A})$. Then it is are defined by:

$$IFR(\tilde{A}) = \{ \langle \tau, \mu_{IFR(\tilde{A})}(\tau), \nu_{IFR(\tilde{A})}(\tau) \rangle : \tau \in E \} \text{ and } IF\bar{R}(\tilde{A}) = \{ \langle \tau, \mu_{IF\bar{R}(\tilde{A})}(\tau), \nu_{IF\bar{R}(\tilde{A})}(\tau) \rangle : \tau \in E \}$$

$$\mu_{IFR(\tilde{A})}(\tau) = \bigcup_{\eta \in E} [\mu_{IFR}(\tau, \eta) \vee \mu_{\tilde{A}}(\eta)] \quad \mu_{IF\bar{R}(\tilde{A})}(\tau) = \bigcap_{\eta \in E} [\nu_{IFR}(\tau, \eta) \vee \nu_{\tilde{A}}(\eta)]$$

Where

$$\mu_{IFR(\tilde{A})}(\tau) = \bigcap_{\eta \in E} [\nu_{IFR}(\tau, \eta) \vee \mu_{\tilde{A}}(\eta)] \quad \nu_{IF\bar{R}(\tilde{A})}(\tau) = \bigcup_{\eta \in E} [\mu_{IFR}(\tau, \eta) \wedge \nu_{\tilde{A}}(\eta)]$$

and

Definition 3[4]

Suppose that the universal set E and $A, B \in IF(E)$. Then

i) The complement of $A = \langle \mu_{\tilde{A}}(\tau), \mu_{\tilde{A}}(\tau), \nu_{\tilde{A}}(\tau), \nu_{\tilde{A}}(\tau) \rangle$ is defined as $A^c = \langle \nu_{\tilde{A}}(\tau), \nu_{\tilde{A}}(\tau), \mu_{\tilde{A}}(\tau), \mu_{\tilde{A}}(\tau) \rangle$ for any $\tau \in E$.

ii) $A \subseteq B$, if for any $\tau \in E$ $\mu_{\tilde{A}}(\tau) \leq \mu_{\tilde{B}}(\tau)$, $\mu_{\tilde{A}}(\tau) \leq \mu_{\tilde{B}}(\tau)$ and $\nu_{\tilde{A}}(\tau) \geq \nu_{\tilde{B}}(\tau)$, $\nu_{\tilde{A}}(\tau) \leq \nu_{\tilde{B}}(\tau)$.

Mythili and Samukthaa

Definition 4[9]

Suppose that the universal set E and $A \in IFRS(E)$. Then the similarity measure is $\Phi: A \times A \rightarrow [0,1]$ where, $\Phi(x, y)$ is known as similarity degree between the IFRS values are

$$X = (\underline{h}_A(x), \overline{h}_A(x), \underline{\zeta}_A(x), \overline{\zeta}_A(x), \underline{\varphi}_A(x), \overline{\varphi}_A(x)) \quad \text{and}$$

$$Y = (\underline{h}_A(y), \overline{h}_A(y), \underline{\zeta}_A(y), \overline{\zeta}_A(y), \underline{\varphi}_A(y), \overline{\varphi}_A(y)) \quad \text{if } \Phi \text{ satisfies the following conditions:}$$

1. $0 \leq \Phi(x, y) \leq 1$
2. $\Phi(x, y) = \Phi(y, x)$
3. For every $x \in A$, $\Phi(x, y) = \Phi(x, z) \Rightarrow \Phi(y, z) = 1$
4. $\Phi(x, y) = \Phi(x^c, y^c)$ Where, x^c & y^c are complements of x and y respectively.
5. If $x \leq y \leq z$, then $\Phi(x, z) \leq \min\{\Phi(x, y), \Phi(y, z)\}, \forall x, y, z \in A$.

Similarity Measures of an extended IFRS

The goal of more than of research [[6], [17], [18], and [19]] has been to enhance the *IFRS* and IFS similarity measure model. Based on the set-theoretic method, Pappis and Karcapilidis [13] defined the similar measure between the fuzzy sets P and Q . Where $p_i \in \ddot{P}$ and $q_i \in \ddot{Q}$ as follows.

$$\Phi_f(\ddot{P}, \ddot{Q}) = \frac{|\ddot{P} \cap \ddot{Q}|}{|\ddot{P} \cup \ddot{Q}|} = \frac{\sum_i^n (p_i \wedge q_i)}{\sum_i^n (p_i \vee q_i)}$$

In Chen[6] was defined by a similarity measure between two *IFS* values of \ddot{p} and \ddot{q} are as follows:

$$\Phi_c(p, q) = \frac{\min(\underline{h}(\ddot{p}), \underline{h}(\ddot{q})) + \min(\underline{\zeta}(\ddot{p}), \underline{\zeta}(\ddot{q})) + \min(\underline{\varphi}(\ddot{p}), \underline{\varphi}(\ddot{q}))}{\max(\underline{h}(\ddot{p}), \underline{h}(\ddot{q})) + \max(\underline{\zeta}(\ddot{p}), \underline{\zeta}(\ddot{q})) + \max(\underline{\varphi}(\ddot{p}), \underline{\varphi}(\ddot{q}))}$$

Definition 5[3]

Consider a Fuzzy Rough Set $A \in \Gamma$ and $\ddot{p} = \langle \underline{h}_A(\ddot{p}), \overline{h}_A(\ddot{p}) \rangle$ & $\ddot{q} = \langle \underline{h}_A(\ddot{q}), \overline{h}_A(\ddot{q}) \rangle$

are the Fuzzy Rough values in A . Then the degrees of a similarity between Fuzzy Rough values of \ddot{p} and \ddot{q} are computed by the following equation:

$$\Phi_z(\ddot{p}, \ddot{q}) = 1 - \frac{1}{2} (|\underline{h}_A(\ddot{p}) - \underline{h}_A(\ddot{q})| + |\overline{h}_A(\ddot{p}) - \overline{h}_A(\ddot{q})|)$$

Definition 6

Suppose that A is an *IFRS* in Γ . Consider a two *IF* rough values are

$$\ddot{p} = (\underline{h}_A(\ddot{p}), \overline{h}_A(\ddot{p}), \underline{\zeta}_A(\ddot{p}), \overline{\zeta}_A(\ddot{p}), \underline{\varphi}_A(\ddot{p}), \overline{\varphi}_A(\ddot{p}), \underline{\lambda}_A(\ddot{p}), \overline{\lambda}_A(\ddot{p})) \quad \text{and}$$

$$\ddot{q} = (\underline{h}_A(\ddot{q}), \overline{h}_A(\ddot{q}), \underline{\zeta}_A(\ddot{q}), \overline{\zeta}_A(\ddot{q}), \underline{\varphi}_A(\ddot{q}), \overline{\varphi}_A(\ddot{q}), \underline{\lambda}_A(\ddot{q}), \overline{\lambda}_A(\ddot{q}))$$

Mythili and Samukthaa

Then the degrees of similarity measure between the two *IF* rough values of \ddot{p} and \ddot{q} as defined by:

$$\Phi_k(\ddot{p}, \ddot{q}) = \frac{(\underline{h}_A(\ddot{p}) \wedge \underline{h}_A(\ddot{q})) + (\underline{h}_A(\ddot{p}) \wedge \underline{h}_A(\ddot{q})) + (\underline{\zeta}_A(\ddot{p}) \wedge \underline{\zeta}_A(\ddot{q})) + (\underline{\zeta}_A(\ddot{p}) \wedge \underline{\zeta}_A(\ddot{q})) + (\underline{\varphi}_A(\ddot{p}) \wedge \underline{\varphi}_A(\ddot{q})) + (\underline{\varphi}_A(\ddot{p}) \wedge \underline{\varphi}_A(\ddot{q})) + (\underline{\lambda}_A(\ddot{p}) \wedge \underline{\lambda}_A(\ddot{q})) + (\underline{\lambda}_A(\ddot{p}) \wedge \underline{\lambda}_A(\ddot{q}))}{(\underline{h}_A(\ddot{p}) \vee \underline{h}_A(\ddot{q})) + (\underline{h}_A(\ddot{p}) \vee \underline{h}_A(\ddot{q})) + (\underline{\zeta}_A(\ddot{p}) \vee \underline{\zeta}_A(\ddot{q})) + (\underline{\zeta}_A(\ddot{p}) \vee \underline{\zeta}_A(\ddot{q})) + (\underline{\varphi}_A(\ddot{p}) \vee \underline{\varphi}_A(\ddot{q})) + (\underline{\varphi}_A(\ddot{p}) \vee \underline{\varphi}_A(\ddot{q})) + (\underline{\lambda}_A(\ddot{p}) \vee \underline{\lambda}_A(\ddot{q})) + (\underline{\lambda}_A(\ddot{p}) \vee \underline{\lambda}_A(\ddot{q}))}$$

Thus, the higher values of $\Phi_k(\ddot{p}, \ddot{q})$ is the more the similarity between the *IF* Rough values of \ddot{p} and \ddot{q} .

Example 1

Consider $\ddot{p} = (0.8, 0.3, 0.5, 0.1, 0.2, 0.3, 0.7, 0.2)$ and $\ddot{q} = (0.9, 0.7, 0.3, 0.05, 0.1, 0.2, 0.5, 0.1)$ are the two *IF* rough values. Then the degrees of similarity between the sets \ddot{p} and \ddot{q} as determined by

$$\Phi_k(\ddot{p}, \ddot{q}) = \frac{\min(0.8, 0.9) + \min(0.3, 0.7) + \min(0.5, 0.3) + \min(0.1, 0.05) + \min(0.2, 0.1) + \min(0.3, 0.2) + \min(0.7, 0.5) + \min(0.2, 0.1)}{\max(0.8, 0.9) + \max(0.3, 0.7) + \max(0.5, 0.3) + \max(0.1, 0.05) + \max(0.2, 0.1) + \max(0.3, 0.2) + \max(0.7, 0.5) + \max(0.2, 0.1)}$$

$$\Phi_k(\ddot{p}, \ddot{q}) = \frac{0.8 + 0.3 + 0.3 + 0.05 + 0.1 + 0.2 + 0.5 + 0.1}{0.9 + 0.7 + 0.5 + 0.1 + 0.2 + 0.3 + 0.7 + 0.2} = 0.65278.$$

Example 2

Consider $\ddot{p} = (0.9, 0.5, 0.4, 0.3, 0.7, 0.1, 0.4, 0.3)$ and $\ddot{q} = (0.8, 0.6, 0.7, 0.2, 0.1, 0.05, 0.25, 0.1)$ are the two *IF* rough values. Then the complementary of \ddot{p} and \ddot{q} as determined by $p^c = (0.4, 0.3, 0.9, 0.5, 0.4, 0.3, 0.7, 0.1)$ and $q^c = (0.7, 0.2, 0.8, 0.6, 0.25, 0.1, 0.1, 0.05)$. Hence the degree of similarity between p^c and q^c can be determined by

$$\Phi_k(p^c, q^c) = \frac{\min(0.4, 0.7) + \min(0.3, 0.2) + \min(0.9, 0.8) + \min(0.5, 0.6) + \min(0.4, 0.25) + \min(0.3, 0.1) + \min(0.7, 0.1) + \min(0.1, 0.05)}{\max(0.4, 0.7) + \max(0.3, 0.2) + \max(0.9, 0.8) + \max(0.5, 0.6) + \max(0.4, 0.25) + \max(0.3, 0.1) + \max(0.7, 0.1) + \max(0.1, 0.05)}$$

$$\Phi_k(p, q) = \frac{0.4 + 0.2 + 0.8 + 0.5 + 0.25 + 0.1 + 0.1 + 0.05}{0.7 + 0.3 + 0.9 + 0.6 + 0.4 + 0.3 + 0.7 + 0.1} = 0.64103.$$

Theorem 1

1. Let A be the *IFRS* Γ , where $\ddot{p}, \ddot{q}, \ddot{r}$ are the *IF* rough values A. then the following conditions are true
2. $\Phi_k(\ddot{p}, \ddot{q})$ is bounded i.e., $0 \leq \Phi_k(\ddot{p}, \ddot{q}) \leq 1$.
3. $\Phi_k(\ddot{p}, \ddot{q}) = \Phi_k(\ddot{q}, \ddot{p})$.
4. $\Phi_k(\ddot{p}, \ddot{q}) = \Phi_k(\ddot{p}, \ddot{r}) \Rightarrow \Phi_k(\ddot{q}, \ddot{r}) = 1$.
5. $\Phi_k(\ddot{p}, \ddot{q}) = \Phi_k(p^c, q^c)$.
6. If $\ddot{p} \leq \ddot{q} \leq \ddot{r}$, then $\Phi_k(\ddot{p}, \ddot{r}) = \min\{\Phi_k(\ddot{p}, \ddot{q}), \Phi_k(\ddot{q}, \ddot{r})\}, \forall p, q, r \in \Gamma$.

Proof

Suppose that A be a *IFRS* in Γ .

$$\ddot{p} = (\underline{h}_A(\ddot{p}), \underline{h}_A(\ddot{p}), \underline{\zeta}_A(\ddot{p}), \underline{\zeta}_A(\ddot{p}), \underline{\varphi}_A(\ddot{p}), \underline{\varphi}_A(\ddot{p}), \underline{\lambda}_A(\ddot{p}), \underline{\lambda}_A(\ddot{p})),$$

Mythili and Samukthaa

$$\ddot{q} = (\underline{h}_A(\ddot{q}), \underline{h}_A(\ddot{q}), \underline{\zeta}_A(\ddot{q}), \underline{\zeta}_A(\ddot{q}), \underline{\varphi}_A(\ddot{q}), \underline{\varphi}_A(\ddot{q}), \underline{\lambda}_A(\ddot{q}), \underline{\lambda}_A(\ddot{q})) \&$$

$$\ddot{r} = (\underline{h}_A(\ddot{r}), \underline{h}_A(\ddot{r}), \underline{\zeta}_A(\ddot{r}), \underline{\zeta}_A(\ddot{r}), \underline{\varphi}_A(\ddot{r}), \underline{\varphi}_A(\ddot{r}), \underline{\lambda}_A(\ddot{r}), \underline{\lambda}_A(\ddot{r}))$$

are the *IFRS* values A. we can defined by the order relation of *IFRS* values as

$$\ddot{p} \leq \ddot{q} \Leftrightarrow (\underline{h}_A(\ddot{p}) \leq \underline{h}_A(\ddot{q}), \underline{h}_A(\ddot{p}) \leq \underline{h}_A(\ddot{q})) \& (\underline{v}_A(\ddot{p}) \geq \underline{v}_A(\ddot{q}), \underline{v}_A(\ddot{p}) \geq \underline{v}_A(\ddot{q}))$$

1. From condition (v), we get the minimum and maximum values are 0 and 1. In other cases, a numerator value is smaller than the denominator value. Thus, the condition (v) must have a positive value that is less than one.

Thus, $0 \leq \Phi_k(\ddot{p}, \ddot{q}) \leq 1$

2. Since both the maximum and minimum procedures are symmetric, Φ_k is symmetric.

3. Since $\Phi_k(\ddot{p}, \ddot{q}) = \Phi_k(\ddot{p}, \ddot{r}) \forall p \in \Gamma$. Then for $p = q$, $1 = \Phi_k(\ddot{q}, \ddot{q}) = \Phi_k(\ddot{q}, \ddot{r})$. Similarly, for $\ddot{p} = \ddot{r}$ & $p = r$. Thus $1 = \Phi_k(\ddot{r}, \ddot{r}) = \Phi_k(\ddot{r}, \ddot{q}) = \Phi_k(\ddot{q}, \ddot{r})$

4. In the case $p^c = (\underline{\zeta}_A(\ddot{p}), \underline{\zeta}_A(\ddot{p}), \underline{h}_A(\ddot{p}), \underline{h}_A(\ddot{p}), \underline{\lambda}_A(\ddot{p}), \underline{\lambda}_A(\ddot{p}), \underline{\varphi}_A(\ddot{p}), \underline{\varphi}_A(\ddot{p}))$ and $p^c = (\underline{\zeta}_A(\ddot{q}), \underline{\zeta}_A(\ddot{q}), \underline{h}_A(\ddot{q}), \underline{h}_A(\ddot{q}), \underline{\lambda}_A(\ddot{q}), \underline{\lambda}_A(\ddot{q}), \underline{\varphi}_A(\ddot{q}), \underline{\varphi}_A(\ddot{q}))$. Thus, $\Phi_k(\ddot{p}, \ddot{q}) = \Phi_k(p^c, q^c)$

5. Given $\ddot{p} \leq \ddot{q} \leq \ddot{r}$. Substituting $\underline{\varphi}_A(\ddot{p}), \underline{\varphi}_A(\ddot{p}), \underline{\varphi}_A(\ddot{r}), \underline{\varphi}_A(\ddot{r})$ we get, $\Phi_k(\ddot{p}, \ddot{r}) = \frac{1 - \underline{Y}_{pr} + 1 - \overline{Y}_{pr}}{1 + \underline{Y}_{pr} + 1 + \overline{Y}_{pr}}$, where $\underline{Y}_{pr} = (\underline{h}_A(\ddot{r}) - \underline{h}_A(\ddot{p})) \vee (\underline{\zeta}_A(\ddot{p}) - \underline{\zeta}_A(\ddot{r}))$ & $\overline{Y}_{pr} = (\underline{h}_A(\ddot{r}) - \underline{h}_A(\ddot{p})) \vee (\underline{\zeta}_A(\ddot{p}) - \underline{\zeta}_A(\ddot{r}))$.

$$\Phi_k(\ddot{p}, \ddot{q}) = \frac{1 - \overline{Y}_{pq} + 1 - \underline{Y}_{pq}}{1 + \overline{Y}_{pq} + 1 + \underline{Y}_{pq}} \quad \text{where} \quad \underline{Y}_{pq} = (\underline{h}_A(\ddot{q}) - \underline{h}_A(\ddot{p})) \vee (\underline{\zeta}_A(\ddot{p}) - \underline{\zeta}_A(\ddot{q})) \&$$

$$\overline{Y}_{pq} = (\underline{\mu}_A(\ddot{q}) - \underline{\mu}_A(\ddot{p})) \vee (\underline{v}_A(\ddot{p}) - \underline{v}_A(\ddot{q})) \quad \text{Clearly,} \quad (1 - \overline{Y}_{pr} + 1 - \underline{Y}_{pr}) \leq (1 - \overline{Y}_{pq} + 1 - \underline{Y}_{pq}) \quad \text{as}$$

$$\underline{Y}_{pr} \geq \underline{Y}_{pq} \quad \text{and} \quad \overline{Y}_{pr} \geq \overline{Y}_{pq} \quad \text{and} \quad (1 + \underline{Y}_{pr} + 1 + \overline{Y}_{pr}) \geq (1 + \underline{Y}_{pq} + 1 + \overline{Y}_{pq}) \quad \text{as}$$

$$\underline{Y}_{pr} \geq \underline{Y}_{pq} \quad \text{and} \quad \overline{Y}_{pr} \geq \overline{Y}_{pq} \quad \text{Hence} \quad \Phi_k(\ddot{p}, \ddot{r}) \leq \Phi_k(\ddot{p}, \ddot{q}) \quad \text{Similarly,} \quad \Phi_k(\ddot{p}, \ddot{r}) \leq \Phi_k(\ddot{q}, \ddot{r})$$

Proposition 1

The generalization of the similarity measure between two given *IFRS*. Let A and B be two *IFRS* in the universal

set $\Gamma = \{\tau_1, \tau_2, \tau_3, \dots, \tau_n\}$. Where,

$$\ddot{A} = \langle \underline{h}_A(\tau_1), \underline{h}_A(\tau_1), \underline{\zeta}_A(\tau_1), \underline{\zeta}_A(\tau_1), \underline{\varphi}_A(\tau_1), \underline{\varphi}_A(\tau_1), \underline{\lambda}_A(\tau_1), \underline{\lambda}_A(\tau_1) \rangle / \tau_1 + \dots$$

$$+ \langle \underline{h}_A(\tau_n), \underline{h}_A(\tau_n), \underline{\zeta}_A(\tau_n), \underline{\zeta}_A(\tau_n), \underline{\varphi}_A(\tau_n), \underline{\varphi}_A(\tau_n), \underline{\lambda}_A(\tau_n), \underline{\lambda}_A(\tau_n) \rangle / \tau_n \quad \&$$

$$\ddot{B} = \langle \underline{h}_B(\tau_1), \underline{h}_B(\tau_1), \underline{\zeta}_B(\tau_1), \underline{\zeta}_B(\tau_1), \underline{\varphi}_B(\tau_1), \underline{\varphi}_B(\tau_1), \underline{\lambda}_B(\tau_1), \underline{\lambda}_B(\tau_1) \rangle / \tau_1 + \dots$$

$$+ \langle \underline{h}_B(\tau_n), \underline{h}_B(\tau_n), \underline{\zeta}_B(\tau_n), \underline{\zeta}_B(\tau_n), \underline{\varphi}_B(\tau_n), \underline{\varphi}_B(\tau_n), \underline{\lambda}_B(\tau_n), \underline{\lambda}_B(\tau_n) \rangle / \tau_n$$

From definition 5, can define similarity measure between the *IFRS* A and B as follows:

Mythili and Samukthaa

$$\tilde{\Phi}_k(\ddot{A}, \ddot{B}) = \frac{1}{m} \sum_{z=1}^n \Phi_k((\hbar_{\underline{A}}(\tau_z), \hbar_{\overline{A}}(\tau_z), \zeta_{\underline{A}}(\tau_z), \zeta_{\overline{A}}(\tau_z), \varphi_{\underline{A}}(\tau_z), \varphi_{\overline{A}}(\tau_z), \lambda_{\underline{A}}(\tau_z), \lambda_{\overline{A}}(\tau_z)),$$

$$(\mu_{\underline{B}}(\tau_i), \mu_{\overline{B}}(\tau_i), \nu_{\underline{B}}(\tau_i), \nu_{\overline{B}}(\tau_i), \varphi_{\underline{B}}(\tau_i), \varphi_{\overline{B}}(\tau_i), \gamma_{\underline{B}}(\tau_i), \gamma_{\overline{B}}(\tau_i)))$$

Thus,

$$\tilde{\Phi}_k(\ddot{A}, \ddot{B}) = \frac{1}{m} \sum_{z=1}^n \left(\frac{\min(\hbar_{\underline{A}}(\tau_z), \hbar_{\underline{B}}(\tau_z)) + \min(\hbar_{\overline{A}}(\tau_z), \hbar_{\overline{B}}(\tau_z)) + \min(\zeta_{\underline{A}}(\tau_z), \zeta_{\underline{B}}(\tau_z)) + \min(\zeta_{\overline{A}}(\tau_z), \zeta_{\overline{B}}(\tau_z))}{\max(\hbar_{\underline{A}}(\tau_z), \hbar_{\underline{B}}(\tau_z)) + \max(\hbar_{\overline{A}}(\tau_z), \hbar_{\overline{B}}(\tau_z)) + \max(\zeta_{\underline{A}}(\tau_z), \zeta_{\underline{B}}(\tau_z)) + \max(\zeta_{\overline{A}}(\tau_z), \zeta_{\overline{B}}(\tau_z))} \right.$$

$$\left. \frac{\min(\varphi_{\underline{A}}(\tau_z), \varphi_{\underline{B}}(\tau_z)) + \min(\varphi_{\overline{A}}(\tau_z), \varphi_{\overline{B}}(\tau_z)) + \min(\lambda_{\underline{A}}(\tau_z), \lambda_{\underline{B}}(\tau_z)) + \min(\lambda_{\overline{A}}(\tau_z), \lambda_{\overline{B}}(\tau_z))}{\max(\varphi_{\underline{A}}(\tau_z), \varphi_{\underline{B}}(\tau_z)) + \max(\varphi_{\overline{A}}(\tau_z), \varphi_{\overline{B}}(\tau_z)) + \max(\lambda_{\underline{A}}(\tau_z), \lambda_{\underline{B}}(\tau_z)) + \max(\lambda_{\overline{A}}(\tau_z), \lambda_{\overline{B}}(\tau_z))} \right) \dots (1)$$

Decision making method

Now, we construct the algorithm for an extension of an *IFRS* on similarity measure.

- Step 1: Constructs the *IFRS* for a standard alternative.
- Step 2: Constructs the *IFRS* for an available alternative.
- Step 3: Computes the similar measure.
- Step 4: Arrange alternatives in descending order to their ranking.
- Step 5: Choose the maximum value is considered as the best option.

Numerical Example

A company has to fire an employee for a manager post that is empty. Eight applicants complete a form and submit their formal application for the position. The head of the human resources department has been a decision-maker. Suppose that the set of candidates $X=(X_1, X_2, X_3, X_4, X_5, X_6, X_7, X_8)$ and $E=(b_1, b_2, b_3, b_4, b_5)$ the set of parameters. b_1 =Communication, b_2 = effectiveness of their leadership, b_3 = experience, b_4 = administration and b_5 =age.

Computation

Step 1: Let E be the standard alternatives.

$$E=(0.5,1,0.4,0.79,0,0.6,0.054,1)/b_1+(0,0.08,0.6,0.4,0.5,0.07,1,0.59)/b_2+(0.65,0.53,0.07,1,0,0.7,0.54,0.2)/$$

$$b_3+(0.74,0.5,1,0.22,0,0.3,0.41,0.89)/b_4+(0.97,0,0.07,0.54,1,0.99,0.1,0.59)/b_5$$

Step 2: Suppose that $X_1, X_2, X_3, X_4, X_5, X_6, X_7$ and X_8 are the available alternatives.

$$X_1=(0.9,0.67,0.02,1,0.43,0.31,0.99,0)/b_1+(0.7,1,0.65,0.99,0,0.9,0.73,0.16)/b_2+(0.09,0.1,0.06,0.03,1,0.75,0.2,0)/b_3+(1,0.01,0.27,0.$$

$$39,0.5,0.2,0.36,0)/b_4+(0.94,0.7,0.33,0.5,0.74,0.41,0.93)/b_5$$

$$X_2=(0.2,0.01,0.9,0.99,0.5,0.8,0.5,1)/b_1+(1,1,0.31,0.66,0.6,0.5,0.45,0.63)/b_2+(0.51,0.5,0.6,0.1,0.7,0.77,0.28,0.7)/b_3+(0.19,0.9,0.07,$$

$$0.1,0.29,0.2,0,0)/b_4+(1,0.06,0.22,0,0.25,0.74,0.09,0.04)/b_5$$

$$X_3=(0.4,0.49,0.07,1,0,0.8,0.7,0.32)/b_1+(0.29,0.3,0.01,0.2,1,0.5,0.55,0)/b_2+(0.04,0.47,0.73,0.1,0,0.7,0.2,1)/b_3+(0.47,0.68,0.7,0.9,0.$$

$$7,0.76,0.8,0.1)/b_4+(0.3,0.1,1,0.4,0.46,0.5,0.5,0)/b_5$$

$$X_4=(0.43,0.1,0.25,1,0.5,0.27,0.3,0.88)/b_1+(0.1,0.01,0.57,0.03,0.95,0.99,0.02,0.3)/b_2+(0.04,0.23,0.2,0.56,1,0.79,0.9,0)/b_3+(1,0.34,$$

$$0.5,0.23,0,0.59,0.88,0.8)/b_4+(0.59,0.95,0.14,0.33,0.06,0.73,0.7,0.5)/b_5$$

$$X_5=(0.05,0.54,0.7,0.1,0.1,0.74,0.65,0.16)/b_1+(1,0.06,0.44,0.04,0.5,0.75,0,0.99)/b_2+(0.54,0.76,0.5,0.92,0.92,0.002,1,0.7)/b_3+(0.9,0$$

$$.24,0.4,0.31,0.07,0,0.3,0.1)/b_4+(1,0.2,0.008,0.33,0.53,0.34,0.54,0.06)/b_5$$

Mythili and Samukthaa

$$X_6=(0,0.1,0.43,0.87,0.4,0.07,1,0.74)/b_1+(0.5,0.01,0.7,0.8,1,0,0.24,0.09)/b_2+(1,0,0.07,0.55,0.22,0.75,0.2,0.7)/e_3+(0.06,0.1,0.2,0.1,0.1,0.57,0.66)/b_4+(0.1,0.35,0,1,0.63,0,0,0.5)/b_5$$

$$X_7=(0.08,0.67,0.01,0.05,0.5,1,0.53,0.77)/b_1+(0.13,0.55,0,0,0.43,0.37,0.94,0.5)/b_2+(0,0.04,0.99,0.4,0.41,0.1,0.5,0.73)/e_3+(0.11,0.4,0.23,0.76,0.33,0.76,0,0.05)/b_4+(1,0.85,0.9,0.086,0,0.29,0.07,0.96)/b_5$$

$$X_8=(0,0.9,0.04,0.1,0.73,1,1,0.3)/b_1+(0.79,0.85,0.6,0.7,0,0.02,0.3,0.5)/b_2+(0,1,0.24,0.7,0.54,0.98,0.2,0.24)/b_3+(0.74,0.07,0.27,0,0.8,0,0.68,0)/b_4+(0,0.74,0.4,0.33,0.5,1,0.74,0.72)/b_5$$

Step 3: compute similarity measure by using Equation (1)

$$\tilde{\Phi}_k(E, X_1) = \frac{1}{4} \left[\frac{2.344}{6.32} + \frac{2.04}{6.33} + \frac{1.18}{4.74} + \frac{1.8}{4.99} + \frac{2.33}{6.48} \right] = 0.4156$$

Similarly, we get

$$\tilde{\Phi}_k(E, X_2) = 0.5068, \tilde{\Phi}_k(E, X_3) = 0.4726, \tilde{\Phi}_k(E, X_4) = 0.5757, \tilde{\Phi}_k(E, X_5) = 0.5119, \\ \tilde{\Phi}_k(E, X_6) = 0.4933, \tilde{\Phi}_k(E, X_7) = 0.4213 \text{ and } \tilde{\Phi}_k(E, X_8) = 0.4646$$

Step 4: If we sort the alternatives in descending order by value $\tilde{\Phi}_k(E, X_i)$. The ranking values are shown below,

Table 1: The assessment score of each alternative

Candidates	Score	Ranking order
X ₁	0.4156	8
X ₂	0.5068	3
X ₃	0.4726	5
X ₄	0.5757	1
X ₅	0.5119	2
X ₆	0.4933	4
X ₇	0.4213	7
X ₈	0.4646	6

Step 5: Thus, we get, X₄>X₅>X₂>X₆>X₃>X₈>X₇>X₁. Hence, X₄ is the best candidate of the manager position.

CONCLUSIONS

In the current article, we propose a model or method for determining the similarity measure in extensions of *IFRS* that is based on fuzzy sets. This model's primary characteristic is that the hesitation margin has been taken into consideration and computed. We also provide some metrics for comparing the similarity of *IFRS* and elements. Ultimately, we used the suggested Decision Making process to solve the problem in real life and arrive at the best possible conclusion.

ABSTRACT

In this paper, we extend to the subdivision of k Heronian mean labeling (k – HML) of graphs. We demonstrate that k-heroiner mean graphs (k – HMG) are made up of subdivisions. In this section, we go over a few common planar graphs that allow for the subdivision of k heronian mean labeling (k – HML).

Keywords: Mean labeling Graph, Heronian Mean Labeling Graph, k - Heronian Mean Labeling Graph, subdivision of Heronian Mean Labeling Graph.

MSC: 05C78

INTRODUCTION

Throughout the study, each graph is regarded as a single, simple, undirected, finite planar graph, with l and m representing G 's vertex and edge sets respectively. Labeling a graph involves assigning integer values to a vertex set, an edge set, or both. Many writers presented various labeling modules. A thorough analysis of the labeling graph assignment is shown in [1]. Somasundaram et al. (2013) provided a description of the ML of graphs. The HML of graphs concept was introduced in 2017 by S. Sandhya et al. [7], deriving inspiration from the work of S. Somasundaram. 2017 [4] saw the presentation and discussion of k – HMLG by M Tamilselvi and K Akilandeswari.

$P_n \odot k_1$, L_n , and T_n 's the subdivision of k – HML is examined in this paper.

Lalitha and Samutkhaa

Definition: 1.1

A graph that contains l vertex and m edge is represented by $G=(V, E)$. Now create a function that says, $\ell: V \rightarrow \{1,2,3,4,\dots, m+1\}$ is known as HML for the given graph G if we can label the vertices $l \in V$ with different rudiments from similar $1,2,3,4,\dots,m+1$ in order that the induced edge labeling provides $\ell^*: E \rightarrow \{1,2,3,4,\dots, m\}$

given by
$$\ell(e) = \left\lfloor \frac{\ell(a) + \sqrt{\ell(a)\ell(b) + \ell(b)}}{3} \right\rfloor$$

Is varied for every edge $e=ab \in E$. It implies that the graph’s distinct vertex labeling results in a different edge labeling. A HMLG is a graph that possesses HML.

Definition: 1.2

A graph which contain l vertex and m edge is represented by $G=(V, E)$. Now, build a function say, $\ell: V \rightarrow \{k+0, k+1, k+2, k+3,\dots, k+m\}$ is known as k - HML for the given graph G if we can label the vertices $l \in V$ with different rudiments from similar $1,2,3,4,\dots,m+1$ in order that it provides an edge labeling

$\ell^*: E \rightarrow \{k+1, k+2, k+3, k+4,\dots, k+m\}$ given as
$$\ell(e) = \left\lfloor \frac{\ell(a) + \sqrt{\ell(a)\ell(b) + \ell(b)}}{3} \right\rfloor$$

Is varied for every edges $e=ab \in E$. It implies that the graph’s distinct vertex labeling results in a different edge labeling. A k - HML is a graph that possesses k - HML.

Definition: 1.3

A graph is said to be a comb which is obtained by adding a complete graph K_1 to each vertex of an open walk with distinct points and $2n-1$ edges. In general, the comb is given by $P_n \odot K_1$.

Definition: 1.4

A graph is said to be a Ladder, which is defined and denoted by $L_n = P_n \times K_2$, where P_n represents an n - vertices path, \times represents the Cartesian product and K_2 represents a two – vertices full network with $2n$ vertices and $3n-2$ edges.

Definition: 1.5

A graph is said to a Triangular Snake, which is defines the limits by connecting each pair of vertices of a distinct open walk to new vertex. A cyclic graph C_3 with $2n+1$ vertices and $3n$ edges may be used to reestablish each edge of an open walk with distinct vertices. In general, it is denoted by T_n .

Definition: 1.6

When the edges ac and cb substitute for e , it is said to be subdivided if $e=ab$ of G and it as no vertex c . the subdivision is formed by reducing each edge of the graph by $S(G)$.

Lalitha and Samutkhaa

MAIN RESULT

Theorem 2.1

Each comb's $(P_n \Theta k_1)$ subdivision is a $k - HM$.

Proof

Comb may exist by linking each vertex of an open walk with different vertices and $2n - 1$ edges with a complete graph K_1 .

A graph $G = S(P_n \Theta K_1)$ obtain by subdividing each and every edges of $P_n \Theta K_1$

A mapping or function $\ell: V \rightarrow \{k + 0, k + 1, k + 2, k + 3, \dots, k + m\}$ is defined and consider for the subsequent scenarios

Case (1)

A subdivision of a Comb $P_n \Theta K_1$ is obtained by subdividing each and every edge $a_j a_{j+1}$ of $P_n \Theta K_1$

On subdividing each and every edge a_j and a_{j+1} we obtain a new vertex $f_j, j \in [1, n - 1]$.

By defined function ℓ the vertices are labeled as

$$\begin{aligned} \ell(a_j) &= 3j - 2 + k / j \text{ in } [1, n] \\ \ell(b_j) &= 3j - 3 + k / j \text{ in } [1, n] \\ \ell(f_j) &= 3j - 1 + k / j \text{ in } [1, n - 1] \end{aligned}$$

The edges are labeled as

$$\begin{aligned} \ell(a_j b_j) &= 3j - 3 + k / j \text{ in } [1, n] \\ \ell(a_j f_j) &= 3j - 2 + k / j \text{ in } [1, n] \\ \ell(f_j a_{j+1}) &= 3j - 1 + k / j \text{ in } [1, n] \end{aligned}$$

Therefore, ℓ is obviously satisfied $k - HML$.

Case (2)

A subdivision of a Comb $P_n \Theta K_1$ is obtained by subdividing each and every edges $a_j b_j$ of $P_n \Theta K_1$

On subdividing each and every edges a_j and b_j we obtain new vertex $g_j, j \in [1, n]$. By defined function ℓ the vertices are labeled as

Lalitha and Samutkhaa

$$\begin{aligned} \ell(a_j) &= 3j - 3 + k / j \text{ in } [1, n] \\ \ell(b_j) &= 3j - 1 + k / j \text{ in } [1, n] \\ \ell(g_j) &= 3j - 2 + k / j \text{ in } [1, n] \end{aligned}$$

The edges are labeled as

$$\begin{aligned} \ell(a_j a_{j+1}) &= 3j - 3 + k / j \text{ in } [1, n - 1] \\ \ell(a_j g_j) &= 3j - 2 + k / j \text{ in } [1, n] \\ \ell(g_j b_j) &= 3j - 1 + k / j \text{ in } [1, n] \end{aligned}$$

Therefore, ℓ is obviously satisfied k - HML.

Case (3)

A subdivision of a Comb $P_n \odot K_1$ is obtained by subdividing each and every edges of $P_n \odot K_1$.
On subdividing each and every edges a_j and a_{i+1} we obtain a new vertex $f_j, j \in [1, n - 1]$.

On subdividing each and every edges a_j and b_j we obtain a new vertex $g_j, j \in [1, n]$.

By defined function ℓ the vertices are labeled as

$$\begin{aligned} \ell(a_j) &= 4j - 4 + k / j \text{ in } [1, n] \\ \ell(b_j) &= 4j - 2 + k / j \text{ in } [1, n] \\ \ell(f_j) &= 4j - 1 + k / j \text{ in } [1, n - 1] \\ \ell(g_j) &= 4j - 3 + k / j \text{ in } [1, n] \end{aligned}$$

The edges are labeled as

$$\begin{aligned} \ell(a_j f_j) &= 4j - 2 + k / j \text{ in } [1, n - 1] \\ \ell(f_j a_{i+1}) &= 4j - 1 + k / j \text{ in } [1, n] \\ \ell(a_j g_j) &= 4j - 4 + k / j \text{ in } [1, n] \\ \ell(g_j b_j) &= 4j - 3 + k / j \text{ in } [1, n] \end{aligned}$$

Therefore, ℓ is obviously satisfied k - HML.

Hence, we can conclude that the graph $G = S(P_n \odot K_1)$ is a k - HMLG by the beyond cases.

Example 2.1: The subdivision of k - HML of the Comb $P_5 \odot K_1$ is given in the Fig:2.1,2.2 & 2.3

Lalitha and Samutkhaa

Theorem 2.2

Every Ladder (L_n) subdivision is k – HMG
 Proof:

Ladder $L_n = P_n \times K_2$, where P_n represents an n - vertices path, \times represents the Cartesian product and K_2 represents a two – vertices full network with $2n$ vertices and $3n-2$ edges.

A graph $G = S(L_n = P_n \times K_2)$ obtain by subdividing each and every edges of $L_n = P_n \times K_2$

A mapping or function $\ell: V \rightarrow \{k + 0, k + 1, k + 2, k + 3, \dots, k + m\}$ is defined and consider for the subsequent scenarios

Case (1):

A subdivision of a Ladder $L_n = P_n \times K_2$ is achieved by splitting each and every edge $a_j a_{j+1}$ and $b_j b_{j+1}$

On subdividing each and every edge $a_j a_{j+1}$ and $b_j b_{j+1}$ we obtain a new vertices $f_j, g_j; j \in [1, n-1]$

By defined function ℓ the vertices are labeled as

$$\begin{aligned} \ell(a_j) &= 5j - 5 + k / j \text{ in } [1, n] \\ \ell(b_j) &= 5j - 4 + k / j \text{ in } [1, n] \\ \ell(f_j) &= 5j - 3 + k / j \text{ in } [1, n] \\ \ell(g_j) &= 5j - 2 + k / j \text{ in } [1, n] \end{aligned}$$

The edges are labeled as

$$\begin{aligned} \ell(a_j b_j) &= 5j - 5 + k / j \text{ in } [1, n] \\ \ell(a_j f_j) &= 5j - 4 + k / j \text{ in } [1, n-1] \\ \ell(f_j a_{j+1}) &= 5j - 2 + k / j \text{ in } [1, n-1] \\ \ell(b_j g_j) &= 5j - 3 + k / j \text{ in } [1, n-1] \\ \ell(g_j b_{j+1}) &= 5j - 1 + k / j \text{ in } [1, n] \end{aligned}$$

Therefore, ℓ is obviously satisfied k - HML.

Case (2):

A subdivision of a Ladder $L_n = P_n \times K_2$ is obtained by subdividing each and every edge $a_j b_j$ of $L_n = P_n \times K_2$

On subdividing each and every edge $a_j b_j$ we obtain a new vertex $h_j; j \in [1, n]$ By defined function ℓ the vertices are labeled as

Lalitha and Samutkhaa

$$\begin{aligned} \ell(a_j) &= 4j - 4 + k / j \text{ in } [1, n] \\ \ell(b_j) &= 4j - 2 + k / j \text{ in } [1, n] \\ \ell(h_j) &= 4j - 3 + k / j \text{ in } [1, n] \end{aligned}$$

The edges are labeled as

$$\begin{aligned} \ell(a_j a_{j+1}) &= 4j - 2 + k / j \text{ in } [1, n - 1] \\ \ell(b_j b_{j+1}) &= 4j - 1 + k / j \text{ in } [1, n - 1] \\ \ell(a_j h_j) &= 4j - 4 + k / j \text{ in } [1, n] \\ \ell(h_j b_j) &= 4j - 3 + k / j \text{ in } [1, n] \end{aligned}$$

Therefore, ℓ is obviously satisfied k - HML.

Case (3):

A subdivision of a Ladder $L_n = P_n \times K_2$ is obtained by subdividing each and every edges of $L_n = P_n \times K_2$

On subdividing each and every edges $a_j a_{j+1}$ and $b_j b_{j+1}$ we obtain a new vertices $f_j, g_j ; j \in [1, n - 1]$

On subdividing each and every edges $a_j b_j$ we obtain a new vertex $h_j ; j \in [1, n]$ By defined function ℓ the vertices are labeled as

$$\begin{aligned} \ell(a_j) &= 6j - 6 + k / j \text{ in } [1, n] \\ \ell(b_j) &= 6j - 4 + k / j \text{ in } [1, n] \\ \ell(f_j) &= 6j - 3 + k / j \text{ in } [1, n - 1] \\ \ell(g_j) &= 6j - 2 + k / j \text{ in } [1, n - 1] \\ \ell(h_j) &= 6j - 5 + k / j \text{ in } [1, n] \end{aligned}$$

The edges are labeled as

$$\begin{aligned} \ell(a_j h_j) &= 6j - 6 + k / j \text{ in } [1, n] \\ \ell(h_j a_j) &= 6j - 5 + k / j \text{ in } [1, n] \\ \ell(a_j f_j) &= 6j - 4 + k / j \text{ in } [1, n - 1] \\ \ell(f_j a_{j+1}) &= 6j - 2 + k / j \text{ in } [1, n - 1] \\ \ell(b_j g_j) &= 6j - 3 + k / j \text{ in } [1, n - 1] \\ \ell(g_j b_{j+1}) &= 6j - 1 + k / j \text{ in } [1, n - 1] \end{aligned}$$

Therefore, ℓ is obviously satisfied k - HML.

Lalitha and Samutkhaa

Hence, we can conclude that the graph $G = S(L_n = P_n \times K_2)$ is a k - HMLG by the beyond cases.

Example 2.2: The subdivision of k - HML of the Ladder $L_4 = P_4 \times K_2$ is given in the Fig:2.4,2.5 & 2.6

Theorem 2.3:

Each Triangular Snake's (T_n) subdivision is k - HMG

Proof:

Triangular Snake T_n is establishes the boundaries by linking each pair of vertices of a distinct open walk to a new vertex. To reconstruct each edge of an open walk with separate vertices, a cyclic graph C_3 with $2n + 1$ vertices and $3n$ edges can be employed

A graph $G = S(T_n)$ obtain by subdividing each and every edges of T_n

A mapping or function $\ell: V \rightarrow \{k + 0, k + 1, k + 2, k + 3, \dots, k + m\}$ is defined and consider for the subsequent scenarios

Case (1):

A subdivision of a Triangular Snake T_n is obtained by subdividing each and every edge $a_j a_{j+1}$ of T_n

On subdividing each and every edge $a_j a_{j+1}$ we obtain new vertices $f_j; j \in [1, n - 1]$

By defined function ℓ the vertices are labeled as

$$\ell(a_j) = 4j - 4 + k / j \text{ in } [1, n]$$

$$\ell(b_j) = 4j - 3 + k / j \text{ in } [1, n - 1]$$

$$\ell(f_j) = 4j - 1 + k / j \text{ in } [1, n - 1]$$

The edges are labeled as

$$\ell(a_j b_j) = 4j - 4 + k / j \text{ in } [1, n - 1]$$

$$\ell(a_{j+1} b_j) = 4j - 2 + k / j \text{ in } [1, n - 1]$$

$$\ell(a_j f_j) = 4j - 3 + k / j \text{ in } [1, n - 1]$$

$$\ell(f_j a_{j+1}) = 4j - 1 + k / j \text{ in } [1, n - 1]$$

Therefore, ℓ is obviously satisfied k - HML.

Case (2):

A subdivision of a Triangular Snake T_n is obtained by subdividing each and every edges $a_j b_j$ of T_n

On subdividing each and every edges $a_j b_j$ and $a_{j+1} b_j$ we obtain a new vertex $g_j, h_j; j \in [1, n - 1]$

By defined function ℓ the vertices are labeled as

Lalitha and Samutkhaa

$$\ell(a_j) = 5j - 5 + k / j \text{ in } [1, n]$$

$$\ell(b_j) = 5j - 3 + k / j \text{ in } [1, n - 1]$$

$$\ell(g_j) = 5j - 4 + k / j \text{ in } [1, n - 1]$$

$$\ell(h_j) = 5j - 2 + k / j \text{ in } [1, n - 1]$$

The edges are labeled as

$$\ell(a_j a_{j+1}) = 5j - 3 + k / j \text{ in } [1, n - 1]$$

$$\ell(a_{j+1} g_j) = 5j - 5 + k / j \text{ in } [1, n - 1]$$

$$\ell(g_j b_j) = 5j - 4 + k / j \text{ in } [1, n - 1]$$

$$\ell(a_{j+1} h_j) = 5j - 1 + k / j \text{ in } [1, n - 1]$$

$$\ell(h_j b_j) = 5j - 2 + k / j \text{ in } [1, n - 1]$$

Therefore, ℓ is obviously satisfied k - HML.

Case (3):

A subdivision of a Triangular Snake T_n is obtained by subdividing each and every edges of T_n

On subdividing each and every edges $a_j b_j$ and $a_{j+1} b_j$ we obtain a new vertices $g_j, h_j; j \in [1, n - 1]$

On subdividing each and every edges $a_j a_{j+1}$ we obtain a new vertex $f_j; j \in [1, n - 1]$ By defined function ℓ the vertices are labeled as

$$\ell(a_j) = 6j - 6 + k / j \text{ in } [1, n]$$

$$\ell(b_j) = 6j - 4 + k / j \text{ in } [1, n - 1]$$

$$\ell(f_j) = 6j - 1 + k / j \text{ in } [1, n - 1]$$

$$\ell(g_j) = 6j - 5 + k / j \text{ in } [1, n - 1]$$

$$\ell(h_j) = 6j - 3 + k / j \text{ in } [1, n - 1]$$

The edges bear labels

$$\ell(a_j f_j) = 6j - 4 + k / j \text{ in } [1, n - 1]$$

$$\ell(f_j a_{j+1}) = 6j - 1 + k / j \text{ in } [1, n - 1]$$

$$\ell(a_j g_j) = 6j - 6 + k / j \text{ in } [1, n]$$

$$\ell(g_j b_j) = 6j - 5 + k / j \text{ in } [1, n - 1]$$

$$\ell(a_{j+1} h_j) = 6j - 2 + k / j \text{ in } [1, n]$$

$$\ell(h_j b_j) = 6j - 3 + k / j \text{ in } [1, n - 1]$$

Therefore, ℓ is obviously satisfied k - HML.

Lalitha and Samutkhaa

Based on the preceding situations, we may deduce that the graph $G=S(T_n)$ is a k Heronian Mean Labeling Graph.

Example 2.3: The splitting of k - HML of the Triangular Snake T_4 is given in the Fig:2.7,2.8 & 2.9

CONCLUSION

In this article, we have shown the subdivision of the k - HML and demonstrated its acceptance on a few graphs. This article’s future scope can be expanded by using other graph families.

ABSTRACT

Magnetite nanoparticles with varying surface coverages are highly sought after for several applications due to their inherent magnetic characteristics, nanometer-scale dimensions, and well-defined surface shape. Magnetite nanoparticles are extensively utilized in various medicinal and biological applications; however, their utilization in optics is less prevalent. The study investigates the movement of water carrying magnetite Nano-particles, and single-walled carbon nanotube (SWCNT) in a flow with a stagnation position along stretching sheets. The effects of viscous dissipation, induced magnetic fields, stratification, and chemical reaction are considered. The numerical analysis is performed with the Runge-Kutta-Fehlberg technique in correlation with the firing methodology.

Keywords: Nanofluids, Magnetite Nanoparticles, Bioconvective, Magnetic field, Runge-Kutta-Fehlberg, SWCNT.

INTRODUCTION

The study of Nano fluids that involve microorganisms is a rapidly emerging field of research that has attracted scientists due to the significance of this field in the creation of biofuels, the elimination of toxins, the precise delivery of medicines, and the digesting of food. In order to highlight the impact that effective parameters have on flow profiles and physical quantities, graphs are utilized. This paper key objectives are to accomplish the following:

**Prasannadevi and Gurumoorthy**

- Develop a bio-convective model to study the behavior of magnetite nanoparticles and SWCNTs in water. Consider the effects of temperature stratification, induced magnetic fields, viscosity dissipation, solutal stratification, motile density stratification, and chemical reaction.
- The purpose of this paper is to provide theoretical understanding regarding the effective parameters and their consequences on flow profiles.
- Investigate the significance of relevant factors with regard to surface drag, mass transfer rate, heat transfer rate, and the quantity of microorganisms per unit area.

RELATED WORK

A nanofluid with a magnetic field is a stable colloidal suspension that consists of a base solution, single-domain magnetic particles, and a surfactant. The stability of the magnetic fluid is determined by the repulsion caused by the surfactant and the motion of Brownian particles. Additionally, the resistance of magnetic particles to gravity sedimentation also contributes to the stability. Heat transfer and thermal management and have gained significant interest due to its use in electronics devices, industrial applications, and thermal systems. Shi et al. evaluated the viscosity, thermal conductivity, and specific heat capacity of the magnetic Fe₃O₄@CNT nanocomposites. The experimental demonstration showcased the recyclability, magnetic responsiveness, and adjustability of heat transfer. The magnetic Nano fluid was generated using the hydrothermal process and the thermophysical features of the Nano fluid, which relied on temperature. These findings were detailed in detail. The study considered the effects of viscous dissipation, heat generation/absorption, and thermal radiation. Khan¹⁴ provides an explanation of the combined influence of electric field and magnetohydrodynamics on the unsteady flow of Maxwell's Nano fluid over a stretching surface, taking into account the effects of thermal radiation and changing heat. The heat exchange efficiencies of a suspension of magnetic nanoparticles, known as magnetic nanofluid, under original convection can be modified by altering the direction, shape, and intensity of the magnetic field. This is possible since magnetic nanofluids possess exceptional magnetic characteristics. Nevertheless, the thermal conductivities of magnetic nanoparticles is lower compared to nano-particles such as CuO and Al₂O₃. This limitation restricts their extensive use, especially in the energy industry and heat exchangers. Therefore, nano-composites that possess both magnetic properties and increased thermal conductivity are an ideal option for significantly enhancing the efficiency of heat exchange by natural convection, surpassing other materials in this regard. Provides a comprehensive analysis of the convective heat transfer properties of Nano fluid in a straight tube, with a focus on its magneto controllable behavior.

METHODOLOGY: MATHEMATICAL FRAME

An incompressible fluid's flow across a linearly extending sheet is the subject of the investigation. The flow is steady and occurs in two dimensions. These assumptions are illustrated in Figure 1.

- The x-axis is tangential to expanding sheet, and the area where the y-value is greater than zero is filled with a water based Fe₃O₄ nanofluid derived from SWCNT.
- $U_w(x) = cx$ and $U_e(x) = ax$ These numbers stand for the free stream velocity and the thickness of the expanding sheet.
- The induced magnetic field vector, denoted as $H = (H_1, H_2)$, is defined so that H₁ represents the magnetic component along the x-direction and H₂ represents the magnetic component along the y-direction.
- The consequences of viscosity dissipation and chemical reaction are considered into the design.
- Solutal slide, motile density, and thermal impacts are taken into account. with respect to the boundary conditions (Z. Iqbal et al., 2017, Alsaedi et al., 2017);

Prasannadevi and Gurumoorthy

$$u = U_W(x) = cx, v = 0, \frac{\partial H_1}{\partial y} = H_2 = 0, T = T_W = T_0 + \delta_1 x, \\ C = C_W = C_0 + \epsilon_1 x, N = N_W = N_0 + \xi_1 x \quad \text{at } y = 0$$

$$u \rightarrow U_e(x) = ax, H_1 \rightarrow H_e(x) = H_0 x, T \rightarrow T_\infty = T_0 + \delta_2 x, \\ C \rightarrow C_\infty = C_0 + \epsilon_2 x, N \rightarrow N_\infty = N_0 + \xi_2 x \quad \text{as } y \rightarrow \infty$$

Where,

$$\alpha_m = \frac{1}{4\pi\mu_e\sigma_{nf}}$$

stands for the magnetic diffusivity

Take into consideration the following transformations of similarity: (Z. Iqbal et al.,2017; Alsaedi et al., 2017):

$$u = cx f'(\zeta), v = -\sqrt{c\vartheta} f(\zeta), H_1 = H_0 x g'(\zeta), \zeta = y\sqrt{\frac{c}{\vartheta}}, H_2 = -H_0\sqrt{\frac{\vartheta}{c}} g(\zeta), \\ \theta(\zeta) = \frac{T - T_\infty}{T_W - T_0}, \psi(\zeta) = \frac{C - C_\infty}{C_W - C_0}, \chi(\zeta) = \frac{N - N_\infty}{N_W - N_0}$$

Employing the similarity transformations into Equations , we get:

$$f''' - A_1 A_2 \left\{ (f')^2 - f f'' - \frac{\beta}{A_2} \left\{ (g')^2 - g g'' - 1 \right\} - A^2 \right\} = 0$$

$$g''' - \frac{A_5}{\lambda} \{ g f'' - f g'' \} = 0$$

$$\theta'' + \frac{A_3 Pr}{A_4} f \theta' + \frac{Ec Pr}{A_1 A_4} (f'')^2 = 0$$

$$\psi'' + Le f \psi' - Kr Le \psi = 0$$

$$\chi'' + Lb f \chi' - Pe \{ (\chi + \Omega) \psi'' + \chi' \psi' \} = 0$$

subject to the boundary conditions

$$f(\zeta) = 0, f'(\zeta) = 1, g(\zeta) = 0, g''(\zeta) = 0, \theta(\zeta) = 1 - S_1, \\ \psi(\zeta) = 1 - S_2, \chi(\zeta) = 1 - S_3 \quad \text{when } \zeta = 0$$

$$f'(\zeta) \rightarrow A, g'(\zeta) \rightarrow 1, \theta(\zeta) \rightarrow 0, \\ \psi(\zeta) \rightarrow 0, \chi(\zeta) \rightarrow 0 \quad \text{as } \zeta \rightarrow \infty$$

Prasannadevi and Gurumoorthy

The hybrid nanofluid models incorporated are (Mabood, Ashwinkumar, & Sandeep, 2022; Sreedevi & Reddy, 2019):

$$\frac{\mu_{hnf}}{\mu_f} = \frac{1}{(1 - \phi_{Fe_3O_4})^{2.5} (1 - \phi_{SWCNT})^{2.5}} = \frac{1}{A_1}$$

$$\frac{\rho_{hnf}}{\rho_f} = (1 - \phi_{SWCNT}) \left\{ (1 - \phi_{Fe_3O_4}) + \frac{\rho_{Fe_3O_4}}{\rho_f} \phi_{Fe_3O_4} \right\} + \frac{\rho_{SWCNT}}{\rho_f} \phi_{SWCNT} = A_2$$

$$\begin{aligned} \frac{(\rho C_p)_{hnf}}{(\rho C_p)_f} &= (1 - \phi_{SWCNT}) \left\{ (1 - \phi_{Fe_3O_4}) + \frac{(\rho C_p)_{Fe_3O_4}}{(\rho C_p)_f} \phi_{Fe_3O_4} \right\} \\ &+ \frac{(\rho C_p)_{SWCNT}}{(\rho C_p)_f} \phi_{SWCNT} = A_3 \end{aligned}$$

$$\frac{k_{hnf}}{k_{bf}} = \frac{1 - \phi_{SWCNT} + 2\phi_{SWCNT} \left(\frac{k_{SWCNT}}{k_{SWCNT} - k_{bf}} \right) \ln \left(\frac{k_{SWCNT} + k_{bf}}{2k_{bf}} \right)}{1 - \phi_{SWCNT} + 2\phi_{SWCNT} \left(\frac{k_{bf}}{k_{SWCNT} - k_{bf}} \right) \ln \left(\frac{k_{SWCNT} + k_{bf}}{2k_{bf}} \right)}$$

$$\frac{k_{bf}}{k_f} = \frac{k_{Fe_3O_4} + 2k_f - 2\phi_{Fe_3O_4} (k_f - k_{Fe_3O_4})}{k_{Fe_3O_4} + 2k_f + \phi_{Fe_3O_4} (k_f - k_{Fe_3O_4})}$$

$$\frac{\sigma_{hnf}}{\sigma_f} = 1 + \frac{3 \left\{ \frac{\phi_{Fe_3O_4} \sigma_{Fe_3O_4} + \phi_{SWCNT} \sigma_{SWCNT}}{\sigma_f} - (\phi_{Fe_3O_4} + \phi_{SWCNT}) \right\}}{2 + \left\{ \frac{\phi_{Fe_3O_4} \sigma_{Fe_3O_4} + \phi_{SWCNT} \sigma_{SWCNT}}{(\phi_{Fe_3O_4} + \phi_{SWCNT}) \sigma_f} \right\} - \left\{ \frac{\phi_{Fe_3O_4} \sigma_{Fe_3O_4} + \phi_{SWCNT} \sigma_{SWCNT}}{\sigma_f} - (\phi_{Fe_3O_4} + \phi_{SWCNT}) \right\}}$$

$$A_4 = \frac{k_{hnf}}{k_f} = \frac{k_{hnf}}{k_{bf}} \times \frac{k_{bf}}{k_f}, \text{ and } A_5 = \frac{\sigma_{hnf}}{\sigma_f}$$

The nanofluid models incorporated are (Sreedevi & Reddy, 2019; Iqbal et al., 2017):

Drag Coefficient:

$$Cf_x = \frac{\tau_w}{\rho_f (U_w)^2} = \frac{\mu_{hnf}}{\rho_f} \frac{\partial u}{\partial y} \Big|_{y=0} (U_w)^{-2}$$

$$\Rightarrow Cf_x Re_x^{1/2} = \frac{f''(0)}{A_1}$$

Nusselt number:

Prasannadevi and Gurumoorthy

$$Nu_x = \frac{x q_w}{k_f (T_w - T_0)} = \frac{-x k_{hnf} \frac{\partial T}{\partial y} \Big|_{y=0}}{k_f (T_w - T_0)}$$

$$\Rightarrow Nu_x Re_x^{-1/2} = -A_4 \theta'(0)$$

Sherwood number:

$$Sh_x = \frac{x q_m}{D_B (C_w - C_0)} = \frac{-x D_B \frac{\partial C}{\partial y} \Big|_{y=0}}{D_B (C_w - C_0)}$$

$$\Rightarrow Sh_x Re_x^{-1/2} = -\psi'(0)$$

Motile density quantity:

$$Nn_x = \frac{x q_n}{D_m (N_w - N_0)} = \frac{-x D_m \frac{\partial N}{\partial y} \Big|_{y=0}}{D_m (N_w - N_0)}$$

$$\Rightarrow Nn_x Re_x^{-1/2} = -\chi'(0)$$

Where,

$$Re_x = \frac{xU_w}{\nu_f}$$

is the Reynold's quantity.

RESULTS: NUMERICAL FRAME & VALIDATION

Given the nonlinear nature of the equations in conjunction with the boundary conditions, it is challenging to obtain an exact solution or closed-form to the challenge at hand. This is why numerical approaches, namely the Runge-Kutta-Fehlberg technique in combination with the shoot-ing methodology, are used to get the approximations. This can be accomplished by first assuming the following assumption:

$$\begin{aligned} \Gamma_1 &= f, & \Gamma_2 &= f', & \Gamma_3 &= f'', & \Gamma_3' &= f''', & \Gamma_4 &= g, & \Gamma_5 &= g', \\ \Gamma_6 &= g'', & \Gamma_6' &= g''', & \Gamma_7 &= \theta, & \Gamma_8 &= \theta', & \Gamma_8' &= \theta'', & \Gamma_9 &= \psi, \\ \Gamma_{10} &= \psi', & \Gamma_{10}' &= \psi'', & \Gamma_{11} &= \chi, & \Gamma_{12} &= \chi', & \Gamma_{12}' &= \chi'' \end{aligned}$$

Presented below is the reduced version of the first-order conventional differential equation:

Prasannadevi and Gurumoorthy

$$\Upsilon_1' = \Upsilon_2, \Upsilon_2' = \Upsilon_3,$$

$$\Upsilon_3' = A_1 A_2 \left\{ (\Upsilon_2)^2 - \Upsilon_1 \Upsilon_3 - \frac{\beta}{A_2} \{ (\Upsilon_5)^2 - \Upsilon_4 \Upsilon_6 - 1 \} - A^2 \right\},$$

$$\Upsilon_4' = \Upsilon_5, \Upsilon_5' = \Upsilon_6,$$

$$\Upsilon_6' = \frac{A_5}{\lambda} \{ \Upsilon_4 \Upsilon_3 - \Upsilon_1 \Upsilon_6 \},$$

$$\Upsilon_7' = \Upsilon_8, \Upsilon_8' = - \left\{ \frac{A_3 Pr}{A_4} \Upsilon_1 \Upsilon_8 + \frac{Ec Pr}{A_1 A_4} (\Upsilon_3)^2 \right\},$$

$$\Upsilon_9' = \Upsilon_{10}, \Upsilon_{10}' = Kr Le \Upsilon_9 - Le \Upsilon_1 \Upsilon_{10},$$

$$\Upsilon_{11}' = \Upsilon_{12}, \Upsilon_{12}' = Pe \{ (\Upsilon_{11} + \Omega) \Upsilon_{10}' + \Upsilon_{12} \Upsilon_{10} \} - Lb \Upsilon_1 \Upsilon_{12}.$$

Having

$$\Upsilon_1(0) = 0, \quad \Upsilon_2(0) = 1, \quad \Upsilon_3(0) = \Gamma_1, \quad \Upsilon_4(0) = 0,$$

$$\Upsilon_5(0) = \Gamma_2, \quad \Upsilon_6(0) = 0, \quad \Upsilon_7(0) = 1 - S_1, \quad \Upsilon_8(0) = \Gamma_3,$$

$$\Upsilon_9(0) = 1 - S_2, \quad \Upsilon_{10}(0) = \Gamma_4, \quad \Upsilon_{11}(0) = 1 - S_3, \quad \Upsilon_{12}(0) = \Gamma_5$$

The values of $\Lambda_1, \Lambda_2, \Lambda_3,$ and Λ_4 are calculated using the Newton Raphson technique, starting with an appropriate initial assumption. The validity of the current problem and accuracy of have been ensured by doing a thorough comparison between the work that is currently being done and studies that have been published in the past. By comparing this study closely to previous publications by Hayat et al. (2015), Iqbal et al. (2016), and Azhar et al. (2017), we were able to determine that the code is genuine and that our research is well-grounded (Table 1). The effects of relevant parameters on the profiles of microbiological concentration ($\chi(\zeta)$), induced magnetic field ($g'(\zeta)$), concentrations ($\psi(\zeta)$), temperatures ($\theta(\zeta)$), and velocity ($f'(\zeta)$), are seen. Experiments have been conducted on a hybrid nano-fluid consisting of water-based Fe3O4 and SWCNT, as well as a nano-fluid containing only Fe3O4. The Prandtl number (Pr) for the hybrid nano-fluid was fixed at 6.3, while the Prandtl number for the Fe3O4 nano-fluid was fixed at 10.1. The thermo-physical characteristics of water, SWCNT (nano-particle 2), and Fe3O4 (nano-particle 1) are presented in Table 2. The study investigates the movement of water carrying magnetite nano-particles, and SWCNT in a flow with a stagnation point along a stretching sheet. The effects of viscous dissipation, induced magnetic field, stratification, and chemical reaction are considered. The numerical analysis is performed with the Runge-Kutta-Fehlberg technique in conjunction with firing methodology. The primary findings of the study can be summarized below:

- The increase in the proportion of nano-particles, and SWCNT results in a rise in the temperature of the nanofluid. Moreover, increasing the Eckert quantity enhances the temperature of the nanofluid. The rise in nanofluid temperature resulting from the relevant factors has a positive effect on the destruction of tumors and cancer cells.

**Prasannadevi and Gurumoorthy**

- The velocity profile exhibits a direct proportionality to the magnetic parameter when A is less than 1, and an inverse proportionality when A is more than 1.
- The highest drag coefficient occurs when the magnetic parameter is at higher levels and the volume fraction of nano-particles, and SWCNT is smaller, with $A = 0.8$. Nevertheless, the highest drag coefficient (at $A = 1.2$) occurs when the magnetic parameter is smaller and the volume fraction of nano-particles, and SWCNT is larger. From a biological standpoint, a higher drag coefficient indicates a greater level of interaction between the surface and the fluid. This interaction is advantageous in the context of biomedical imaging and targeted medication delivery.
- The rate at which mass are transferred decreases as the solutal stratification parameter increases, and increases as the reaction of chemical parameter increases.
- Increasing the reaction of chemical parameter has a detrimental impact on the concentration profile, which in turn improves biomedical imaging, and medication.
- When the nanoparticle volume percentage, Eckert number, and thermal stratification parameter of a SWCNT are all reduced, the highest heat transfer rate is seen.

CONCLUSION

The augmentation of the ratio of nano-particles, specifically single-walled carbon nanotubes (SWCNT), leads to an elevation in the temperature of the nanofluid and it can be seen that the profile of velocity is directly in proportion to the magnetic parameters when A is less than 1, and inversely proportional when A is more than 1. From the research, it can be seen that a higher drag coefficient is present and it signifies a heightened degree of interaction between the surface and the fluid. This relationship is beneficial in the context of biomedical imaging and targeted medicine delivery.

ABSTRACT

In this paper, we introduce certain distance and similarity measures for Interval valued neutrosophic soft multisets with their fundamental properties and examples. Furthermore, we construct a TOPSIS algorithm using one of the proposed distance measures for Interval valued neutrosophic soft multisets. To demonstrate the significance and sufficiency of the proposed TOPSIS algorithm, we apply it for a decision making problem and determined an optimal solution.

Keywords: Distance measure, Similarity measure, Interval valued neutrosophic soft multisets (IVNSMS), TOPSIS.

INTRODUCTION

Lotfi A. Zadeh proposed fuzzy sets (FS)[1] to administ objects which has fuzziness as their property and not belong to crisp sets. Meanwhile, fuzzy sets only have membership function to manage objects. To overcome this intuitionistic fuzzy sets (IFS)[2]were introduced with membership and non-membership functions. Later it was extended to the interval valued intuitionistic fuzzy sets[3] by using intervals as membership functions. F. Smarandache[4] introduced neutrosophic sets with indeterminacy membership function as a generalization of intuitionistic fuzzy set theory to deal inaccurate information. Wang et al. [5]introduced interval valued neutrosophic sets as an extension of neutrosophic sets which is more practical and flexible than neutrosophic sets. In 1999, Molodtsov[6] proposed thoroughly a new mathematical approach called soft sets, apart from fuzzy sets, for

Jayasudha and Kowsalyaharishanthi

modelling objects with uncertainty character. Soft matrices and operations on soft matrices were presented by Çağman-Enginoğlu[7]. Hybrid structures of soft sets like fuzzy soft sets[8], intuitionistic fuzzy soft sets[9] and interval valued intuitionistic fuzzy soft sets[10] were introduced. P.K. Maji [11] established neutrosophic soft sets by incorporating neutrosophic sets with soft sets and made them widely useful in indeterminate and imprecise environment. Later, I. Deli[12] extended neutrosophic soft sets to interval valued neutrosophic soft sets by combining interval valued neutrosophic sets and soft sets. Alkhazaleh et al.[13] proposed soft multisets as an expansion of soft sets in multiple dimensions. Some operations of soft multisets were dealt by several researchers ([14], [15], [16], [17]). Later, Alkhazaleh and Salleh[18] defined fuzzy soft multisets and presented a decision making algorithm to solve an application of fuzzy soft multisets. Further, I. Deli et al.[19] introduced neutrosophic soft multisets by putting together the concepts of neutrosophic sets and soft multisets. A. Al-Quran & N. Hassan[20] and C. Granados et al.[21] defined other hybrid structures like neutrosophic vague soft multisets and weighted neutrosophic soft multisets respectively. In the study of problem solving, there is a necessity to compare two sets. Several researchers have studied the distance and similarity between fuzzy sets, interval valued fuzzy sets, neutrosophic sets, interval valued neutrosophic sets, soft sets, intuitionistic fuzzy soft sets and neutrosophic soft sets. S. Broumi et al.[22] introduced distance and similarity measures of interval valued neutrosophic soft sets with their necessary properties. A. Mukherjee et al.[23] defined some similarity measures of interval valued neutrosophic soft sets and employed it in the application of pattern recognition problems. TOPSIS (Technique for Order Performance by Similarity to Ideal Solution) is one of the most primary methods in decision making which is defined by Hwang and Yoon[24]. The TOPSIS method provides the most appropriate solutions based on its main idea that, the best result should have the briefest distance from PIS (Positive Ideal Solution) and the utmost distance from NIS (Negative Ideal Solution). The TOPSIS method for the group decision making problem was extended by Chen[25], in which the weights of criteria are represented by linguistic variables. S. Saghaian and S.R. Hejazi[26] introduced a TOPSIS method which employs distance measure to find an optimal decision. Ashtiani et al.[27] considered interval numbers as linguistic variables and proposed a new method called interval valued fuzzy TOPSIS method. Jin et al.[28] expanded TOPSIS method to MADM by considering intuitionistic fuzzy sets as attribute values. Verma et al. [29] presented an interval valued intuitionistic fuzzy TOPSIS method and applied it to a facility location problem. Pingping Chi and Peide Liu[30] extended TOPSIS to interval neutrosophic sets by utilizing distance measures of Interval neutrosophic sets. The Interval valued neutrosophic soft multisets (IVNSMS)[31] can effortlessly characterize the incomplete, inconsistent and indeterminate information about objects in multiple universes. In this paper, we introduce the distance and similarity measures between IVNSMS and discuss some properties of distance and similarities. In addition, we establish the TOPSIS algorithm by using one of the proposed distance measures and apply it to a personal selection problem and determine the results.

PRELIMINARIES

Definition 2.1.[4] Let U be a space of points (objects), with a generic element in U denoted by u . A neutrosophic set A in U is characterized by a truth-membership function T_A , an indeterminacy-membership function I_A and a falsity-membership function F_A . $T_A(u)$; $I_A(u)$ and $F_A(u)$ are real standard or nonstandard subsets of $[0, 1]$. There is no restriction on the sum of $T_A(u)$; $I_A(u)$ and $F_A(u)$, so $0 \leq \sup T_A(u) + \sup I_A(u) + \sup F_A(u) \leq 3$.

Definition 2.2.[5] Let U be a space of points (objects), with a generic element in U denoted by u . An interval valued neutrosophic set (IVN-set) A in U is characterized by truth-membership function T_A , an indeterminacy-membership function I_A and a falsity-membership function F_A . For each point $u \in U$; T_A , I_A and $F_A \subseteq [0, 1]$. Thus, an IVN-set over U can be represented by the set $A = \{(T_A(u), I_A(u), F_A(u)) / u: u \in U\}$.

Here, $(T_A(u), I_A(u), F_A(u))$ is called interval valued neutrosophic number for all $u \in U$ and all interval valued neutrosophic numbers over U will be denoted by $IVN(U)$.

Jayasudha and Kowsalyaharishanthi

Definition 2.3.[12] Let U be an initial universe set, $IVN(U)$ denotes the set of all interval valued neutrosophic sets of U and E be a set of parameters that describe the elements of U . An interval valued neutrosophic soft sets over U is a set defined by a set valued function Y_K representing a mapping $v_K: E \rightarrow IVN(U)$.

It can be written as a set of ordered pairs

$$Y_K = \{ (x, v_K(x)) : x \in E \}.$$

Here, an interval valued neutrosophic set v_K is called approximate function of the interval valued neutrosophic (ivn)-soft sets Y_K . And $v_K(x)$ is called x-approximate value of $x \in E$.

Definition 2.4.[12] Let $Y_K \in IVNS(U)$. Based on Y_K , we can define an Interval valued neutrosophic set $\langle \alpha, \beta, \gamma \rangle_{(Y_K)}^{avg} : A \rightarrow IVN(U)$ by

$$\langle \alpha, \beta, \gamma \rangle_{(Y_K)}^{avg}(x_i) = \sum_{u \in U} v_{K(x_i)}(u) / |U| \quad \text{for all } x \in E.$$

The interval valued neutrosophic set $\langle \alpha, \beta, \gamma \rangle_{(Y_K)}^{avg}$ is called the avg-threshold of the ivn-soft set Y_K .

Definition 2.5.[32] Let $x = ([T^L, T^U], [I^L, I^U], [F^L, F^U])$ be an Interval neutrosophic number and the score function $S(x)$ of an Interval neutrosophic number can be defined as follows:

$$S(x) = \frac{T^L + T^U}{2} + 1 - \frac{I^L + I^U}{2} + 1 - \frac{F^L + F^U}{2}.$$

Definition 2.6.[13] Let $\{U_i : i \in I\}$ be a collection of universes such that $\cap_{i \in I} U_i = \emptyset$ and let $\{E_{U_i} : i \in I\}$ be a collection of sets of parameters, $U = \prod_{i \in I} P(U_i)$ where $P(U_i)$ denotes the powerset of U_i , $E = \prod_{i \in I} E_{U_i}$ and $A \subseteq E$.

A pair (I, A) is called a soft multiset over U given by the mapping $I: A \rightarrow U$.

Definition 2.7.[31] Let $\{U_i : i \in I\}$ be a collection of universes such that $\cap_{i \in I} U_i = \emptyset$ and let $\{E_{U_i} : i \in I\}$ be a collection of sets of parameters, $U = \prod_{i \in I} IVN(U_i)$ where $IVN(U_i)$ denotes the set of all Interval valued neutrosophic sets of U_i , $E = \prod_{i \in I} E_{U_i}$ and $A \subseteq E$. An Interval valued neutrosophic soft multiset (IVNSMS) over U is the pair (I, A) given by the mapping $I: A \rightarrow U$. It can be represented by,

$$(I, A) = \{ (a_k, \langle [\inf T_1(u), \sup T_1(u)], [\inf I_1(u), \sup I_1(u)], [\inf F_1(u), \sup F_1(u)] \rangle) : a_k \in A \subseteq E, u \in U \}.$$

DISTANCE AND SIMILARITY MEASURES BETWEEN INTERVAL VALUED NEUTROSOPHIC SOFT MULTISSETS (IVNSMS)

In this section, we define distance measures for IVNSMS, like Hamming distance, Normalized hamming distance, Euclidean distance and Normalized euclidean distance along with their axioms and example. Also, Similarity measures for IVNSMS corresponding to the proposed distance measures are constructed. S. Broumi et al.[22] proposed several distance measures, generalized weighted distance measures and similarity measures for Interval neutrosophic soft sets, which can be used in real life applications. We extend it to IVNSMS.

Throughout this paper, $\{U_i : i \in I\}$ be a collection of universes such that $\cap_{i \in I} U_i = \emptyset$, $\{E_{U_i} : i \in I\}$ be a collection of sets of parameters, $U = \prod_{i \in I} IVN(U_i)$ and $A \subseteq E = \prod_{i \in I} E_{U_i}$. Let $X=(I,A)$ and $Y=(J,A)$ be two IVNSMS

$$(I, A) = \{ (a_k, \langle [\inf T_1(u), \sup T_1(u)], [\inf I_1(u), \sup I_1(u)], [\inf F_1(u), \sup F_1(u)] \rangle) : a_k \in A \subseteq E, u \in U \}.$$

$$(J, A) = \{ (a_k, \langle [\inf T_j(u), \sup T_j(u)], [\inf I_j(u), \sup I_j(u)], [\inf F_j(u), \sup F_j(u)] \rangle) : a_k \in A \subseteq E, u \in U \}.$$

Definition 3.1.

Hamming Distance

$$d_H(X, Y) = \sum_{i=1}^m \left[\sum_{j=1}^{|U_i|} \sum_{k=1}^n \frac{1}{6} \left| \inf T_i(a_k)(u_{(i,j)}) - \inf T_j(a_k)(u_{(i,j)}) \right| + \left| \sup T_i(a_k)(u_{(i,j)}) - \sup T_j(a_k)(u_{(i,j)}) \right| + \left| \inf I_i(a_k)(u_{(i,j)}) - \inf I_j(a_k)(u_{(i,j)}) \right| + \left| \sup I_i(a_k)(u_{(i,j)}) - \sup I_j(a_k)(u_{(i,j)}) \right| + \left| \inf F_i(a_k)(u_{(i,j)}) - \inf F_j(a_k)(u_{(i,j)}) \right| + \left| \sup F_i(a_k)(u_{(i,j)}) - \sup F_j(a_k)(u_{(i,j)}) \right| \right],$$

where $|U_i|$ is no. of elements in the universe $U_i, i = 1, 2, \dots, m$ and $(u_{(i,j)})$ is j -th element of the universe U_i .

Jayasudha and Kowsalyaharishanthi

Normalized Hamming Distance

$$d_{nH}(X, Y) = \sum_{i=1}^m \left[\sum_{j=1}^{|U_i|} \sum_{k=1}^n \frac{1}{6n|U_i|} \left| \inf T_I(a_k)(u_{(i,j)}) - \inf T_J(a_k)(u_{(i,j)}) \right| \right. \\ \left. + \left| \sup T_I(a_k)(u_{(i,j)}) - \sup T_J(a_k)(u_{(i,j)}) \right| \right. \\ \left. + \left| \inf I_I(a_k)(u_{(i,j)}) - \inf I_J(a_k)(u_{(i,j)}) \right| + \left| \sup I_I(a_k)(u_{(i,j)}) - \sup I_J(a_k)(u_{(i,j)}) \right| \right. \\ \left. + \left| \inf F_I(a_k)(u_{(i,j)}) - \inf F_J(a_k)(u_{(i,j)}) \right| \right. \\ \left. + \left| \sup F_I(a_k)(u_{(i,j)}) - \sup F_J(a_k)(u_{(i,j)}) \right| \right].$$

Euclidean Distance

$$d_E(X, Y) = \left(\sum_{i=1}^m \left[\sum_{j=1}^{|U_i|} \sum_{k=1}^n \frac{1}{6} \left| \inf T_I(a_k)(u_{(i,j)}) - \inf T_J(a_k)(u_{(i,j)}) \right|^2 + \left| \sup T_I(a_k)(u_{(i,j)}) - \sup T_J(a_k)(u_{(i,j)}) \right|^2 \right. \right. \\ \left. + \left| \inf I_I(a_k)(u_{(i,j)}) - \inf I_J(a_k)(u_{(i,j)}) \right|^2 + \left| \sup I_I(a_k)(u_{(i,j)}) - \sup I_J(a_k)(u_{(i,j)}) \right|^2 \right. \\ \left. + \left| \inf F_I(a_k)(u_{(i,j)}) - \inf F_J(a_k)(u_{(i,j)}) \right|^2 + \left| \sup F_I(a_k)(u_{(i,j)}) - \sup F_J(a_k)(u_{(i,j)}) \right|^2 \right] \right)^{\frac{1}{2}}.$$

Normalized Euclidean Distance

$$d_{nE}(X, Y) = \left(\sum_{i=1}^m \left[\sum_{j=1}^{|U_i|} \sum_{k=1}^n \frac{1}{6n|U_i|} \left| \inf T_I(a_k)(u_{(i,j)}) - \inf T_J(a_k)(u_{(i,j)}) \right|^2 + \left| \sup T_I(a_k)(u_{(i,j)}) - \sup T_J(a_k)(u_{(i,j)}) \right|^2 \right. \right. \\ \left. + \left| \inf I_I(a_k)(u_{(i,j)}) - \inf I_J(a_k)(u_{(i,j)}) \right|^2 + \left| \sup I_I(a_k)(u_{(i,j)}) - \sup I_J(a_k)(u_{(i,j)}) \right|^2 \right. \\ \left. + \left| \inf F_I(a_k)(u_{(i,j)}) - \inf F_J(a_k)(u_{(i,j)}) \right|^2 \right. \\ \left. + \left| \sup F_I(a_k)(u_{(i,j)}) - \sup F_J(a_k)(u_{(i,j)}) \right|^2 \right] \right)^{\frac{1}{2}}.$$

Proposition 3.2. Let $d(X, Y)$ be distance measure between two IVNSMS $X=(I,A)$ and $Y=(J,A)$. Then

1. $d(X, Y) \geq 0$.
2. $d(X, Y) = d(Y, X)$.
3. $d(X, Y) = 0$ if and only if $X=Y$.
4. $d(X, Y) + d(Y, Z) \geq d(X, Z)$.

Proof: The proof is straightforward from Definition 3.1.

Definition 3.3. A generalized weighted distance between X and Y is defined as, for

$$\lambda \geq 0, d_\lambda(X, Y) = \sum_{i=1}^m \left[\frac{1}{6} \sum_{j=1}^{|U_i|} \sum_{k=1}^n w_{(i,j)} \left| \inf T_I(a_k)(u_{(i,j)}) - \inf T_J(a_k)(u_{(i,j)}) \right|^\lambda + \left| \sup T_I(a_k)(u_{(i,j)}) - \sup T_J(a_k)(u_{(i,j)}) \right|^\lambda \right. \\ \left. + \left| \inf I_I(a_k)(u_{(i,j)}) - \inf I_J(a_k)(u_{(i,j)}) \right|^\lambda + \left| \sup I_I(a_k)(u_{(i,j)}) - \sup I_J(a_k)(u_{(i,j)}) \right|^\lambda \right. \\ \left. + \left| \inf F_I(a_k)(u_{(i,j)}) - \inf F_J(a_k)(u_{(i,j)}) \right|^\lambda + \left| \sup F_I(a_k)(u_{(i,j)}) - \sup F_J(a_k)(u_{(i,j)}) \right|^\lambda \right]^{\frac{1}{\lambda}}, \tag{1}$$

and the Normalized generalized weighted distance is defined as

Jayasudha and Kowsalyaharishanthi

$$d_{\lambda}^n(X, Y) = \sum_{i=1}^m \left[\frac{1}{6|U_i|} \sum_{j=1}^{|U_i|} \sum_{k=1}^n w_{(i,j)} |infT_I(a_k)(u_{(i,j)}) - infT_J(a_k)(u_{(i,j)})|^{\lambda} + |supT_I(a_k)(u_{(i,j)}) - supT_J(a_k)(u_{(i,j)})|^{\lambda} + |infI_I(a_k)(u_{(i,j)}) - infI_J(a_k)(u_{(i,j)})|^{\lambda} + |supI_I(a_k)(u_{(i,j)}) - supI_J(a_k)(u_{(i,j)})|^{\lambda} + |infF_I(a_k)(u_{(i,j)}) - infF_J(a_k)(u_{(i,j)})|^{\lambda} + |supF_I(a_k)(u_{(i,j)}) - supF_J(a_k)(u_{(i,j)})|^{\lambda} \right]^{\frac{1}{\lambda}} \tag{2}$$

Note 3.1. If the weight vector of $(u_{(i,j)})$ is $w_{(i,j)} = \left\{ \left(\frac{1}{n}, \frac{1}{n}, \frac{1}{n}, \dots, \frac{1}{n} \right) \right\}$ and $\lambda = 1$ then equation (1) & (2) is reduced to Hamming distance and Normalized Hamming distance. And if $\lambda = 2$ then equation (1) & (2) is reduced to Euclidean distance and Normalized Euclidean distance.

Definition 3.4. Similarity measures corresponding to the distance measures in Definition 3.1 are defined as follows:

1. $S_H(X, Y) = \frac{1}{1+d_H(X, Y)}$ and $S_E(X, Y) = \frac{1}{1+d_E(X, Y)}$
2. $S_{nH}(X, Y) = \frac{1}{1+d_{nH}(X, Y)}$ and $S_{nE}(X, Y) = \frac{1}{1+d_{nE}(X, Y)}$

Proposition 3.5. Let $S_M(X, Y)$ be similarity measure between two IVNSMSX=(I,A) and Y=(J,A). Then

1. $0 \leq S_M(X, Y) \leq 1$.
2. $S_M(X, Y) = S_M(Y, X)$.
3. $S_M(X, Y) = 1$ if and only if $X = Y$.

Proof: The proof is clear from Definition 3.4.

Example 3.6. Assume that (I,A) and (J,A) are two IVNSMS defined as follow

$(I, A) = \{ (a_1, (\{ \{ [0.4, 0.6], [0.5, 0.6], [0.3, 0.4] \} / u_{(1,1)}, \{ \{ [0.7, 0.8], [0.3, 0.5], [0.2, 0.3] \} / u_{(1,2)}, \{ \{ [0.8, 0.9], [0.2, 0.3], [0.2, 0.3] \} / u_{(1,3)} \})), (\{ \{ [0.5, 0.7], [0.5, 0.6], [0.3, 0.4] \} / u_{(2,1)}, \{ \{ [0.4, 0.7], [0.5, 0.5], [0.6, 0.7] \} / u_{(2,2)} \})), (\{ \{ [0.8, 0.9], [0.2, 0.3], [0.4, 0.6] \} / u_{(3,1)}, \{ \{ [0.6, 0.7], [0.5, 0.8], [0.2, 0.4] \} / u_{(3,2)} \})), (a_2, (\{ \{ [0.5, 0.7], [0.3, 0.5], [0.6, 0.7] \} / u_{(1,1)}, \{ \{ [0.5, 0.8], [0.6, 0.7], [0.2, 0.3] \} / u_{(1,2)}, \{ \{ [0.6, 0.8], [0.2, 0.3], [0.4, 0.5] \} / u_{(1,3)} \})), (\{ \{ [0.8, 0.9], [0.2, 0.3], [0.1, 0.2] \} / u_{(2,1)}, \{ \{ [0.2, 0.4], [0.1, 0.2], [0.7, 0.9] \} / u_{(2,2)} \})), (\{ \{ [0.1, 0.3], [0.1, 0.3], [0.7, 0.9] \} / u_{(3,1)}, \{ \{ [0.7, 0.8], [0.2, 0.3], [0.4, 0.5] \} / u_{(3,2)} \})))$

$(J, A) = \{ (a_1, (\{ \{ [0.5, 0.6], [0.2, 0.4], [0.4, 0.5] \} / u_{(1,1)}, \{ \{ [0.4, 0.5], [0.1, 0.3], [0.4, 0.6] \} / u_{(1,2)}, \{ \{ [0.6, 0.8], [0.4, 0.5], [0.2, 0.4] \} / u_{(1,3)} \})), (\{ \{ [0.5, 0.7], [0.6, 0.7], [0.4, 0.6] \} / u_{(2,1)}, \{ \{ [0.7, 0.8], [0.2, 0.3], [0.4, 0.5] \} / u_{(2,2)} \})), (\{ \{ [0.1, 0.2], [0.5, 0.6], [0.8, 0.9] \} / u_{(3,1)}, \{ \{ [0.5, 0.8], [0.2, 0.5], [0.1, 0.2] \} / u_{(3,2)} \})), (a_2, (\{ \{ [0.6, 0.7], [0.5, 0.7], [0.2, 0.3] \} / u_{(1,1)}, \{ \{ [0.7, 0.8], [0.1, 0.3], [0.4, 0.5] \} / u_{(1,2)}, \{ \{ [0.3, 0.4], [0.5, 0.6], [0.4, 0.5] \} / u_{(1,3)} \})), (\{ \{ [0.5, 0.6], [0.4, 0.5], [0.2, 0.3] \} / u_{(2,1)}, \{ \{ [0.7, 0.8], [0.1, 0.4], [0.5, 0.8] \} / u_{(2,2)} \})), (\{ \{ [0.5, 0.6], [0.4, 0.6], [0.2, 0.4] \} / u_{(3,1)}, \{ \{ [0.8, 1], [0.2, 0.3], [0.1, 0.2] \} / u_{(3,2)} \})))$

Then their distances are:

1. Hamming Distance: $d_H(X, Y) = 2.933$
2. Normalized hamming distance: $d_{nH}(X, Y) = 0.639$
3. Euclidean distance: $d_E(X, Y) = 0.836$
4. Normalized euclidean distance: $d_{nE}(X, Y) = 0.267$.

Their corresponding similarity measures are:

1. $S_H(X, Y) = 0.254$
2. $S_{nH}(X, Y) = 0.610$
3. $S_E(X, Y) = 0.545$
4. $S_{nE}(X, Y) = 0.789$.

TOPSIS FOR MCDM WITH IVNSMS INFORMATION

Jayasudha and Kowsalyaharishanthi

Let $U_{i \in I} U_i$ be the collection of universes which contains collection of possible alternatives, let $A = \{a_1, a_2, \dots, a_k\}$ be the set of parameters under consideration and $D = (D_1, D_2, \dots, D_r)$ be the set of r decision makers who establish the weight vector of the attributes $w = (w_1, w_2, \dots, w_n)^T$ with $\sum_{k=1}^n w_k = 1$ and $0 \leq w_k \leq 1$. The set (I, A) represents the performance of alternatives according to the parameters. Therefore, we proposed the following methodology by using Hamming distance to solve IVNSMS problems based on TOPSIS method.

Step 1: Framing the Decision matrix with IVNSM-sets.

Alternatives rating according to the choice parameter is represented by **IVNSMS** (I, A) and they can be represented in matrix form as follows:

$$D = [d_{(ij)k}]_{m \times n} = \begin{bmatrix} (d_{(1,1)1}) & (d_{(1,1)2}) & \dots & (d_{(1,1)k}) \\ \vdots & \vdots & \dots & \vdots \\ (d_{(1,m_1)1}) & (d_{(1,m_1)2}) & \dots & (d_{(1,m_1)k}) \\ (d_{(2,1)1}) & (d_{(2,1)2}) & \dots & (d_{(2,1)k}) \\ \vdots & \vdots & \dots & \vdots \\ (d_{(2,m_2)1}) & (d_{(2,m_2)2}) & \dots & (d_{(2,m_2)k}) \\ \vdots & \vdots & \dots & \vdots \\ (d_{(i,1)1}) & (d_{(i,1)2}) & \dots & (d_{(i,1)k}) \\ \vdots & \vdots & \dots & \vdots \\ (d_{(i,m_i)1}) & (d_{(i,m_i)2}) & \dots & (d_{(i,m_i)k}) \end{bmatrix}_{m \times n}$$

Here,

$$d_{(ij)k} = \langle [\inf T_I(u_{(ij)}), \sup T_I(u_{(ij)})], [\inf I_I(u_{(ij)}), \sup I_I(u_{(ij)})], [\inf F_I(u_{(ij)}), \sup F_I(u_{(ij)})] \rangle, \quad k = 1, 2, \dots, n, (i, j) = \sum_{i \in I} |U_i| = m \text{ and } |U_i| = m_i.$$

Step 2: Determine the weights of the parameters.

In this process, we have to determine the weights of attributes which is unknown and not same. Decision makers select the Linguistic weighting variable for each attribute which is expressed as an Interval valued neutrosophic set. Then we have to find the threshold interval-valued neutrosophic set for each attribute and use the score function to find the score value. Now, calculate the weightage by the following equation:

$$w_k = \frac{S_F(a_k)}{\sum_k S_F(a_k)} \quad \text{and} \quad \sum_{k=1}^n w_k = 1 \# (3)$$

Step 3: Formation of Weighted decision matrix.

Let us construct weighted decision matrix by

$$X = w_k \cdot D = [w_k \cdot d_{(ij)k}]_{m \times n} = [x_{(ij)k}]_{m \times n},$$

where

$$w_k \cdot d_{(ij)k} = w_k \cdot \langle [\inf T_I(u_{(ij)}), \sup T_I(u_{(ij)})], [\inf I_I(u_{(ij)}), \sup I_I(u_{(ij)})], [\inf F_I(u_{(ij)}), \sup F_I(u_{(ij)})] \rangle$$

and $m = \sum_{i \in I} |U_i|, n = 1, 2, \dots, k$.

Step 4: Positive ideal Solution and Negative ideal solution.

In general, parameters are classified as positive ideal solution and negative ideal solution according to benefit type (α_1) and cost type (α_2) . Let d_k^{w+} and d_k^{w-} be interval valued neutrosophic soft multi positive ideal solution (IVNSMPIS) and Interval valued neutrosophic soft multi negative ideal solution (IVNSMNIS). It can be defined as:

(i). $d_k^{w+} = (d_{U_1,k}^{w+}, d_{U_2,k}^{w+}, \dots, d_{U_i,k}^{w+})$ where

Jayasudha and Kowsalyaharishanthi

$$d_{U_{i,k}}^{w^+} = \langle [\max_{i,j}\{\inf T_{I_k} x_{(i,j)}\}, \max_{i,j}\{\sup T_{I_k} x_{(i,j)}\}], [\min_{i,j}\{\inf I_{I_k} x_{(i,j)}\}, \min_{i,j}\{\sup I_{I_k} x_{(i,j)}\}], [\min_{i,j}\{\inf F_{I_k} x_{(i,j)}\}, \min_{i,j}\{\sup F_{I_k} x_{(i,j)}\}] \rangle. \text{ Here } k \in \alpha_1 \text{ and } k = 1, 2, \dots, n.$$

$$d_{U_{i,k}}^{w^+} = \langle [\min_{i,j}\{\inf T_{I_k} x_{(i,j)}\}, \min_{i,j}\{\sup T_{I_k} x_{(i,j)}\}], [\max_{i,j}\{\inf I_{I_k} x_{(i,j)}\}, \max_{i,j}\{\sup I_{I_k} x_{(i,j)}\}], [\max_{i,j}\{\inf F_{I_k} x_{(i,j)}\}, \max_{i,j}\{\sup F_{I_k} x_{(i,j)}\}] \rangle. \text{ Here } k \in \alpha_2 \text{ and } k = 1, 2, \dots, n.$$

(ii). $d_k^{w^-} = (d_{U_{1,k}}^{w^-}, d_{U_{2,k}}^{w^-}, \dots, d_{U_{i,k}}^{w^-})$ where

$$d_{U_{i,k}}^{w^-} = \langle [\min_{i,j}\{\inf T_{I_k} x_{(i,j)}\}, \min_{i,j}\{\sup T_{I_k} x_{(i,j)}\}], [\max_{i,j}\{\inf I_{I_k} x_{(i,j)}\}, \max_{i,j}\{\sup I_{I_k} x_{(i,j)}\}], [\max_{i,j}\{\inf F_{I_k} x_{(i,j)}\}, \max_{i,j}\{\sup F_{I_k} x_{(i,j)}\}] \rangle. \text{ Here } k \in \alpha_1 \text{ and } k = 1, 2, \dots, n.$$

$$d_{U_{i,k}}^{w^-} = \langle [\max_{i,j}\{\inf T_{I_k} x_{(i,j)}\}, \max_{i,j}\{\sup T_{I_k} x_{(i,j)}\}], [\min_{i,j}\{\inf I_{I_k} x_{(i,j)}\}, \min_{i,j}\{\sup I_{I_k} x_{(i,j)}\}], [\min_{i,j}\{\inf F_{I_k} x_{(i,j)}\}, \min_{i,j}\{\sup F_{I_k} x_{(i,j)}\}] \rangle. \text{ Here } k \in \alpha_2 \text{ and } k = 1, 2, \dots, n.$$

Step 5: Calculate the distance between X and IVNSMPIS, X and IVNSMNIS.

Now, we have to find the hamming distance between alternatives $(x_{(i,j)})$ in X and IVNSMPIS with $d_H(X, d_k^{w^+})$.

$$d_H((x_{(i,j)}), d_k^{w^+}) = \sum_{i=1}^m \left[\sum_{j=1}^{|U_i|} \sum_{k=1}^n \frac{1}{6} \left| \inf T_X(a_k)(x_{(i,j)}) - \inf T_{d_k^{w^+}}(a_k)(x_{(i,j)}) \right| + \left| \sup T_X(a_k)(u_{(i,j)}) - \sup T_{d_k^{w^+}}(a_k)(u_{(i,j)}) \right| + \left| \inf I_X(a_k)(u_{(i,j)}) - \inf I_{d_k^{w^+}}(a_k)(u_{(i,j)}) \right| + \left| \sup I_X(a_k)(u_{(i,j)}) - \sup I_{d_k^{w^+}}(a_k)(u_{(i,j)}) \right| + \left| \inf F_X(a_k)(u_{(i,j)}) - \inf F_{d_k^{w^+}}(a_k)(u_{(i,j)}) \right| + \left| \sup F_X(a_k)(u_{(i,j)}) - \sup F_{d_k^{w^+}}(a_k)(u_{(i,j)}) \right| \right], \tag{4}$$

Similarly,

$$d_H((x_{(i,j)}), d_k^{w^-}) = \sum_{i=1}^m \left[\sum_{j=1}^{|U_i|} \sum_{k=1}^n \frac{1}{6} \left| \inf T_X(a_k)(x_{(i,j)}) - \inf T_{d_k^{w^-}}(a_k)(x_{(i,j)}) \right| + \left| \sup T_X(a_k)(u_{(i,j)}) - \sup T_{d_k^{w^-}}(a_k)(u_{(i,j)}) \right| + \left| \inf I_X(a_k)(u_{(i,j)}) - \inf I_{d_k^{w^-}}(a_k)(u_{(i,j)}) \right| + \left| \sup I_X(a_k)(u_{(i,j)}) - \sup I_{d_k^{w^-}}(a_k)(u_{(i,j)}) \right| + \left| \inf F_X(a_k)(u_{(i,j)}) - \inf F_{d_k^{w^-}}(a_k)(u_{(i,j)}) \right| + \left| \sup F_X(a_k)(u_{(i,j)}) - \sup F_{d_k^{w^-}}(a_k)(u_{(i,j)}) \right| \right], \tag{5}$$

Step 6: Calculate the Relative closeness coefficient:

The relative closeness coefficient of combination of each alternative $(x_{(i,j)})$ in X is calculated with

$$RCC_{(x_{(i,j)})} = \frac{d_H((x_{(i,j)}), d_k^{w^+})}{d_H((x_{(i,j)}), d_k^{w^+}) + d_H((x_{(i,j)}), d_k^{w^-})} \tag{6}$$

Step 7: Rank of Alternatives

Use the $RCC_{(x_{(i,j)})}$ to rank the alternatives in ascending order and find the best alternatives from the given universes.

A NUMERICAL APPLICATION

In this section, we solve a real-life situation to show the efficaciousness of the proposed TOPSIS approach.

Jayasudha and Kowsalyaharishanthi

Example 5.1. Suppose that a student X wants to choose an educational institution, an affordable accommodation to stay peacefully and a part-time job to pursue his higher education with his own revenue. Let (I, A) be an **IVNSMS** which describes "educational institutions", "accommodations" and "part-time jobs" respectively that Student X is considering to choose a good educational institution, an affordable accommodation to stay, and a part-time job that does not affect his studies. Let $U_1 = \{u_{(1,1)} = \text{University}, u_{(1,2)} = \text{Government institution}, u_{(1,3)} = \text{Aided institution}, u_{(1,4)} = \text{Private self finance institution}\}$ be the universe for educational institutions, $U_2 = \{u_{(2,1)} = \text{College hostel}, u_{(2,2)} = \text{Private hostel}, u_{(2,3)} = \text{PG}\}$ be the universe for accommodation and $U_3 = \{u_{(3,1)} = \text{Tutor}, u_{(3,2)} = \text{Library assistant}, u_{(3,3)} = \text{Shop assistant}, u_{(3,4)} = \text{Bank teller / Cashier}\}$ be the universe for part-time jobs. Let $\{E_{U_1}, E_{U_2}, E_{U_3}\}$ be a collection of parameters which describes above universes, where

$E_{U_1} = \{e_{U_1,1} = \text{nice campus atmosphere}, e_{U_1,2} = \text{affordable fee structure}, e_{U_1,3} = \text{best career opportunity}, e_{U_1,4} = \text{good research environment}\}$

$E_{U_2} = \{e_{U_2,1} = \text{reasonable fee}, e_{U_2,2} = \text{hygienic atmosphere}, e_{U_2,3} = \text{taste \& nutritious food}\}$

$E_{U_3} = \{e_{U_3,1} = \text{60 hour working}, e_{U_3,2} = \text{good salary}\}$.

Let $U = \prod_{i=1}^3 IVN(U_i)$, $E = \prod_{i=1}^3 E_{U_i}$ and $A \subseteq E$ such that

$A = \{a_1 = (e_{U_1,1}, e_{U_2,2}, e_{U_3,1}), a_2 = (e_{U_1,2}, e_{U_2,1}, e_{U_3,2}), a_3 = (e_{U_1,4}, e_{U_2,3}, e_{U_3,1}), a_4 = (e_{U_1,3}, e_{U_2,2}, e_{U_3,2}), a_5 = (e_{U_1,4}, e_{U_2,1}, e_{U_3,1}), a_6 = (e_{U_1,3}, e_{U_2,3}, e_{U_3,2})\}$.

Let E_1, E_2 be two well wishers (experts) of Student X , who gives some advice to Student X to lead his career. Now Student X wants to make a choice of combination for his future, from the set of choice parameters. The final assessment of Student X in the form of interval valued neutrosophic numbers is represented by the **IVNSMS** (I, A) in Table 1.

Step 1: Framing the Decision matrix.

We present the IVNSMS (I, A) in the tabular form:

Step 2: Determine the weights of the parameters.

To evaluate the importance of the attributes, the well wishers E_1 and E_2 gave interval valued neutrosophic numbers to the attributes as shown in the table.

Now, we have to find a threshold interval-valued neutrosophic set $(\alpha, \beta, \gamma)_{(A)}^{avg}$ to the attributes in A by using avg-level decision rule;

$$\langle \alpha, \beta, \gamma \rangle_{(A)}^{avg}(a_1) = \langle [0.45, 0.55], [0.25, 0.35], [0.5, 0.6] \rangle$$

$$\langle \alpha, \beta, \gamma \rangle_{(A)}^{avg}(a_2) = \langle [0.8, 0.95], [0.2, 0.3], [0.1, 0.2] \rangle$$

$$\langle \alpha, \beta, \gamma \rangle_{(A)}^{avg}(a_3) = \langle [0.65, 0.8], [0.25, 0.4], [0.25, 0.35] \rangle$$

$$\langle \alpha, \beta, \gamma \rangle_{(A)}^{avg}(a_4) = \langle [0.45, 0.55], [0.5, 0.6], [0.5, 0.6] \rangle$$

$$\langle \alpha, \beta, \gamma \rangle_{(A)}^{avg}(a_5) = \langle [0.25, 0.35], [0.65, 0.8], [0.4, 0.45] \rangle$$

$$\langle \alpha, \beta, \gamma \rangle_{(A)}^{avg}(a_6) = \langle [0.75, 0.9], [0.2, 0.35], [0.25, 0.4] \rangle$$

Now, we shall use the score function in Definition 2.5 to get the score of each alternatives.

$$S_F(a_1) = 1.65, S_F(a_2) = 2.4750, S_F(a_3) = 2.1000, S_F(a_4) = 1.4000, S_F(a_5) = 1.1500, S_F(a_6) = 2.2250$$

Calculate weight of alternatives by using equation (3).

$$w_1 = 0.1500, w_2 = 0.2250, w_3 = 0.1909, w_4 = 0.1273, w_5 = 0.1045, w_6 = 0.2023, \text{ where } \sum_{k=1}^6 w_k = 1.$$

Step 3: Formation of weighted decision matrix.

Step 4: Positive ideal Solution and Negative ideal solution.

The IVNSMPIS (d_k^+) and IVNSMNIS (d_k^-) can be attained from the weighted decision matrix (see Table 3.) given in Table 4 and Table 5:

**Step 5: Calculate the distance between X and IVNSMPIS, X and IVNSMNIS.**

The hamming distance measure of each alternative $(x_{(i,j)})$ in X from IVNSMPIS are calculated by employing Eq.(4) as shown in Table 6:

The hamming distance measures of each alternative $(x_{(i,j)})$ in X from the IVNSMNIS are calculated by using Eq.(5) as given in Table: 7.

Step 6: Calculate the Relative closeness coefficient:

We compute the relative closeness co-efficient $RCC_{((i,j))}$ by employing Eq. (6) as shown in Table: 8.

Step 7: Rank of Alternatives

When we rank the combination of alternatives by relative closeness co-efficient, we get

$$(u_{(1,1)}, u_{(2,2)}, u_{(3,4)}) < (u_{(1,1)}, u_{(2,2)}, u_{(3,2)}) < (u_{(1,1)}, u_{(2,3)}, u_{(3,4)}) < (u_{(1,1)}, u_{(2,3)}, u_{(3,2)}) < (u_{(1,1)}, u_{(2,2)}, u_{(3,1)}).$$

Consequently, Student X will choose University for his higher studies, stay in a private hostel and work as a Bank teller/Cashier for his financial support.

CONCLUSION

Interval valued neutrosophic soft multiset is a more effective tool for describing objects in inconsistent and indeterminate situations, which is a generalization of interval valued neutrosophic soft sets. In this paper, we define distance and similarity measures between IVNSMS with their properties and examples. Further, by employing the proposed Hamming distance we extend the TOPSIS method to IVNSMS. Finally, we resolved a real life problem with the help of the proposed TOPSIS algorithm, and an optimal decision was obtained.

ABSTRACT

The art and architecture of Kashmir reflect a blend of influences from various civilizations and cultures that have left their mark on the region over the centuries. During the Sultanate period in Kashmir, there was a significant transformation in both art and architecture, marked by a profound fusion of Persian and Central Asian influences. This era saw the migration of skilled artisans and craftsmen to Kashmir under the patronage of the Sultans, leading to the construction of magnificent palaces, mosques, and tombs. Architectural styles evolved, with a departure from traditional stone constructions in favor of wood and brick, reflecting the influence of Islamic architectural traditions. Alongside architecture, artistic endeavors enriching the cultural fabric of the region. The legacy of the Sultanate era continues to captivate observers, reflecting the creativity, innovation, and cultural diversity of Kashmir's artistic and architectural heritage. This period also underscores the adaptability of architectural styles to local conditions, as evidenced by the widespread use of wood due to its abundance and suitability to the climate. An endeavor has been undertaken to illuminate the profound impact of Persian and Central Asian aesthetics on the artistic and architectural landscape of Kashmir during the Sultanate period.

Keywords: Kashmir, Sultanate Period, Art and Architecture, Transformation, Wooden Style, Brickwork, Uniqueness, Remarkable.

INTRODUCTION

Kashmir often referred to as "Paradise on Earth," is renowned for its stunning natural beauty as well as its rich cultural heritage. The valley of Kashmir has been a land of artistic skill from ancient times. Art and architecture during the reign of the Sultan in Kashmir underwent a profound transformation, guided by a vision to emulate the splendor of Samarqand and Bukhara. To achieve this, the Sultans actively encouraged the immigration of skilled artisans, architects, and craftsmen from Persian and Central Asian regions. This influx of talent led to the emergence of new architectural styles, blending indigenous Kashmiri influences with the sophisticated techniques brought by the migrants. During the Sultanate rule, there was a big construction boom, and many new buildings were built, like palaces, mosques, khanaqahs, and tombs. These buildings showed different styles of architecture. Three main types of architecture from this time still exist today: pure wooden architecture, brick and wood architecture, and pure brick architecture. One notable example of the wooden architecture is the shrine of Shah-e-Hamdan, also known as Khanqah-e-Moula, which stands as one of the oldest Muslim shrines in Kashmir. Similarly, Jamia Masjid, the largest mosque in Kashmir, represents a remarkable fusion of Islamic architectural elements with local craftsmanship, boasting impressive brickwork and towering wooden pillars. The mosque and tomb of Madin Sahib offer further insights into the artistic endeavors of the era, with their colored tile work and exquisite architectural details. The Budshah Tomb, a masterpiece of pure brick architecture, showcases the influence of Persian and Central Asian craftsmanship, reflecting the close diplomatic ties between Sultan Zain-ul-Abidin and the Timurid dynasty. Beyond architecture, the Sultanate era also witnessed flourishing artistic endeavors in painting, calligraphy, bookbinding, and lattice work. Skilled craftsmen from Central Asia imparted their expertise, leading to the development of unique artistic styles that adorned mosques, palaces, and manuscripts. During the Sultanate period, the art and architecture of Kashmir blended different cultural influences to create stunning buildings and artworks that still impress people today. This fusion of styles and ideas resulted in a diverse range of architectural marvels and artistic achievements. The creations of this era continue to fascinate and inspire observers, showcasing the creativity and innovation of Kashmiri craftsmen and artists.

METHODOLOGY

This study employs a multidisciplinary approach, drawing upon historical analysis, architectural documentation, and art historical methodologies to examine the Persian and Central Asian influence on Kashmiri art and architecture during the Sultanate Period. Primary sources including historical texts, inscriptions, and architectural remains are critically analyzed to identify the stylistic features and motifs characteristic of Persian and Central Asian influence. Additionally, comparative analysis with contemporary architectural styles from Persia and Central Asia is conducted to discern the extent of cross-cultural exchange. Furthermore, field surveys and site visits are conducted to document and analyze the architectural elements and decorative motifs present in extant structures in Kashmir. Finally, scholarly literature and secondary sources are consulted to contextualize the findings within the broader historical and cultural framework of the Sultanate Period in Kashmir.

Objectives of the Study

- ❖ To analyze the architectural transformations in Kashmir during the Sultanate era
- ❖ To identify key architectural monuments reflecting Persian and Central Asian influence:
- ❖ To examine artistic endeavors during the Sultanate period
- ❖ To assess the cultural significance of Persian and Central Asian influence on Kashmiri art and architecture

Shrine of Shah-E- Hamdan

The shrine of Shah-e-Hamdan, also known as Khanqah-e-Moula, holds significant historical importance as one of Kashmir's oldest Muslim shrines, situated along the banks of the river Jehlum.. Its historical roots trace back to Sultan Sikander's era (1389-1413 AD), who commissioned its construction in 1395 A.D in honor of Mir Syed Ali Hamdani, a

**Sarfraz Ahmad Rather and Rajeshwari**

revered Muslim preacher credited with propagating Islam in Kashmir. This architectural marvel, the Khanaqah-i-Mualla, erected under Sultan Sikander's patronage, epitomizes the distinctive wooden craftsmanship of the region. Featuring a two-story structure crowned by a majestic pyramidal roof in three tiers, it boasts intricate woodwork that showcases the pinnacle of the Valley's architectural finesse. Standing tall at 125 feet, its steeple, adorned with a graceful finial, overlooks an open pavilion where the muazzin calls to prayer. The design echoes similarities with the wooden edifices found in neighboring lands, particularly China, renowned for its rich tradition of woodworking. This architectural style likely traversed through the vast mountainous terrain from Tibet to Swat, with Muslim preachers from Kashmir adapting and introducing it to the Valley, influenced by their travels and interactions with rulers of the North West Frontier. This adaptation was not only aesthetically pleasing but also well-suited to the climatic conditions of Kashmir, becoming an integral part of its religious architectural landscape.

Jamia Masjid

Jamia Masjid, situated in Nowhatta, Kashmir, is renowned as the largest mosque in the region and holds significant religious importance for Muslims. Its architectural style, massive size, intricate design, and flawless execution exemplify the remarkable achievements of early Islamic art in the valley. The mosque showcases typical Kashmiri wooden architecture, adding to its uniqueness and cultural significance. The Jamia Masjid, constructed under the reign of Sultan Sikandar, stands as a testament to the fervent religious dedication that drove the establishment of Islamic institutions in Kashmir during that era. Its impressive scale, intricate design, and meticulous craftsmanship mark it as one of the foremost achievements of early Islamic art in the region. Following a traditional mosque layout, it features a central courtyard surrounded by arched arcades, adorned with beautiful naves, pyramidal roofs and steeples, jail decorations and minors. Particularly noteworthy is the exceptional quality of the brickwork, showcasing the skill of its builders. However, the true magnificence of the mosque lies in its towering pillars, crafted from single logs reaching heights ranging from 7.6 to 15.2 meters. These pillars, a marvel of construction, lend an air of grandeur and solemnity to the space. Notably, the mosque's construction was overseen by two skilled artisans from Central Asia, Khawaja Sadar-al-Din Khurasani and Sayyid Muhammad Loristani, who accompanied Sayyid Muhammad Hamadani to Kashmir. According to historical accounts Baharistan-i Shahi, the architectural style of the mosque draws influence from regions such as Syria and Egypt, which was later transmitted to Kashmir via Persia and Central Asia through the movement of people. In essence, the Jamia Masjid stands as a testament to the cultural exchange and architectural brilliance that characterized the Islamic civilization's spread across diverse regions, leaving an indelible mark on the landscape of Kashmir.

Mosque and Tomb of Madin Sahib

The Madani Mosque in Srinagar was built in 1444 for Sayyid Muhammad Madani. The Pir of Sultan Zain-ul-Abidin. It has two notable characteristics. The first distinguishing feature is its colourful tile-work, which originated from Persia and differed from the Mughal tile work. The mosque of Madin Sahib in Zadibal is one of the most well-known pre-Mughal Muslim structures in Kashmir. The base is square and constructed solely from materials originating from a plinth of a mediaeval temple. The superstructure comprises four walls decorated externally with trefoiled brick niches. The corner pilasters and niches' pilasters have bases and capitals that exhibit a distinctly Hindu style. The spandrels of the arches that make up the niches are embellished with exquisite tracery work. The cornice above the walls consists of six layers of wood. The cornices below the eaves are constructed with wooden courses, some of which include delicate designs. The chamber has a pyramidal roof made of clay and birchbark. The roof has a pyramidal shape with a spiral apex, now remaining as a single upright pole and few timber parts. The prayer rooms can be reached through a beautifully carved wooden doorway supported by two curved stone columns. Inside the prayer chamber, there is a Khatamband ceiling made of thin pieces of soft wood woven into a geometrical pattern, supported by four multi-sided wooden columns.

The tomb of Madin Sahib, built in the 15th century, is considered one of the most interesting tombs in Srinagar. The structure was built in honour of saint Madin Sahib and is located to the north of the Madin Sahib mosque in Zadibal. Several inscriptions and architectural styles emphasise the historical significance of the era. The walls were formerly adorned with glazed tiles, showcasing a charming 15th-century Kashmir architectural style, but most of them are

**Sarfraz Ahmad Rather and Rajeshwari**

now absent. Some have been preserved in the Srinagar museum. The mosque and tomb had been built during the reign of Zain-ul-Abidin. The most notable aspect of the structure was the depiction of a beast that had the body of a leopard and the trunk of a human being. It appeared to be shooting with a bow and arrow at its own tail, which ended in a head that resembled that of a dragon. In the vicinity, a fox was quietly watching from among the flowers and cloud forms. According to reports, the utilisation of cloud formations and dragon's head shows influences from Chinese and Persian cultures.

The Budshah Tomb

The tomb build by Sultan Zain-ul-Abidin for his mother is considered the outstanding example of pure brick architecture. It is constructed with a unique kind of brick that is mainly Persian and Central Asian in origin. It is noteworthy that the technique of double-dome architecture was originally brought to Central Asia by Timur (1336-1405). Sultan Zain-ul-Abidin maintained close diplomatic ties with the Timurid dynasty, leading to an exchange of gifts between the two rulers. Initially, Sultan Zain-ul-Abidin sought not only material gifts but also desired to acquire knowledge of advanced sciences and technologies from his Central Asian counterpart. This exchange fostered intimate contacts and resulted in the migration of a considerable number of architects, engineers, and masons from Central Asia to the valley of Kashmir. Consequently, the technology of double-domed architecture was introduced to the region much earlier than it appeared in other parts of India, representing a significant contribution to the evolution of building construction techniques in the area. The Budshah Tomb, located in the Zainakadal area along the right bank of the Jehlum River, serves as the final resting place for Sultan Zain-ul-Abidin's mother. Renowned for its architectural splendor, this tomb stands as a remarkable representation of Shalmiri craftsmanship, unique in its use of brick construction—a departure from the prevalent wooden architectural style in Kashmir during that era. The tomb is constructed on a raised stone plinth with a ground plan featuring 16 sides made of Ashlar stone masonry. The tomb consists of four meticulously arranged courses of stone, complemented by a torus cornice that adds to its architectural grandeur. The main construction of the tomb comprises plain horizontal brickwork, which is reinforced with lime and surkhi to enhance durability. However, the faces of the tomb are adorned with pointed arches, providing a distinctive visual appeal. These arches, with the exception of those facing west, exhibit shallow blind detailing. While most of these arches maintain a simplistic design. The incorporation of glazed tiles into the construction of the tomb enhanced its visual appeal, elevating the aesthetic charm of the edifice. Colorful panels of glazed tiles adorned both the exterior and interior surfaces of the building, breaking the monotony of plain brickwork. The earliest examples of glazed tiles from this period are attributed to the reign of Sultan Zain-ul-Abidin. These tiles, consisting of square units in a variety of vibrant hues such as blue, red, brown, green, and yellow on a single piece, added a touch of brilliance to the structure. Additionally, the tiles featured exquisite paintings, further enriching their artistic value. The introduction of glazed tile work is believed to have originated from Persia and Central Asia, where the craft had undergone significant advancement, before being incorporated into the architectural landscape of the tomb. In the whole of Central Asia all the tombs, mosques and palaces built during the medieval period are made of this type of brick.

Rajdan Palace

Sultan Zain-ul-Abidin built a building in the town of Zainanagari, which in the dialect of Kashmir is called Rajdan. This palace, characterized by its brick and wood construction, stood as a testament to the Sultan's vision of architectural magnificence. Surmounted by a lotus-shaped golden dome of singular beauty, the palace boasted an audience hall adorned with extensive walls lined with glass, showcasing the Sultan's penchant for luxury and refinement. Mirza Haidar Dughlat, in his work, vividly describes the grandeur of the palace, noting its towering twelve stories and numerous rooms, halls, and corridors. While the palace has since vanished, its legacy endures through historical accounts, serving as a reminder of Zain-ul-Abidin's reign and his dedication to creating enduring monuments of architectural brilliance. Surrounding the palace, lands were allotted to top army generals and distinguished men of letters, creating a vibrant community that enriched the Sultan's court with their wisdom and expertise. Though the physical remnants of Zainanagari have faded into history, its memory lives on as a testament to the majesty and sophistication of medieval Kashmiri architecture and culture.

**Sarfaraz Ahmad Rather and Rajeshwari****Artistic Endeavors**

Art has long been a vital expression of human creativity and cultural identity, transcending boundaries and enriching societies. The Sultan's profound interest in the advancement of arts and crafts heralded a transformative era in Kashmir's cultural landscape. Through strategic initiatives, they invited skilled artisans from Central Asia, particularly from Tibet, to impart their expertise to their subjects.

Painting

Painting was a favorite art in Persia and Central Asia during the medieval times and it received full state patronage despite the fact that Islam does not sanction it. During the time when Persian and Central Asian cultures were highly esteemed among Muslims, Kashmir also embraced this trend, aspiring to be recognized as part of this sophisticated cultural circle. Despite the absence of surviving paintings, historical records indicate that Kashmir had a rich artistic heritage and distinctive style. Mulla Jamil, a renowned painter, served under Zain-ul-Abidin, showcasing the region's artistic talent. During the Sultan period in Kashmir, patronage of paintings flourished as an integral aspect of cultural expression and royal prestige. Under the benevolent rule of the Sultans, Kashmir became a vibrant center for artistic endeavors, where painters found generous support and encouragement. The Sultans themselves often commissioned exquisite artworks, fostering a culture of artistic patronage that permeated throughout the society. Paintings during this era depicted a rich tapestry of themes, from scenes of courtly life to depictions of the natural beauty of Kashmir's landscapes. Royal palaces and religious institutions became focal points for these artistic endeavors, adorned with intricate frescoes and murals that reflected the artistic prowess of the period. Skilled artisans were revered and attracted to the region, contributing to the refinement and diversification of artistic techniques. The patronage of paintings by the Sultans not only embellished the physical spaces of Kashmir but also served as a means of legitimizing their rule and projecting cultural sophistication. This period witnessed a renaissance of artistic expression, where painters were celebrated as custodians of tradition and innovation alike.

Calligraphy

It's noteworthy that the palaces and grand residences of both Sultans and nobles were adorned with elaborate wall paintings. Describing the mansions of a noble, their living quarters and gathering spaces were enriched with wall paintings displaying exceptional elegance and craftsmanship. The patronage extended by the Sultans to such artworks not only enhanced the physical allure of Kashmir's spaces but also served to legitimize their authority and showcase cultural refinement. This era marked a revival of artistic expression, with painters revered as guardians of both tradition and innovation. During the Sultan period in Kashmir, the art of calligraphy was highly esteemed and practiced extensively. Calligraphy, the decorative handwriting or lettering, was an integral part of Islamic culture, and it flourished under the patronage of the Sultans in Kashmir. Skilled calligraphers produced beautiful manuscripts, inscriptions, and decorative elements for architecture, often using Arabic script.

Timurids, with whom the Sultans of Kashmir had friendly relations, were great patrons of painting, calligraphy and the art of the books. It is during this period that the great painter Mir Ali of Tabriz invented the feminine and dancing scrip known as Nastaliq. As expert calligraphists were required not only for writing books but also for decorating the interior of khanaqahs, mosques, tombs as well as for writing inscriptions, the Sultans, after their Persian and Central Asian counterparts, patronized the art, attracting a number of master calligraphists from different parts of Timurid empire. The art flourished to such an extent that Kashmiri calligraphists were crowned with laurels by the Mughals. Emperor Akbar was so much impressed by the grace, beauty and symmetry of one of the calligraphists of Kashmir, Muhammad Husain that he conferred upon him the title of Zarrin-qalam (Gold-pen). While lauding the extraordinary genius of Muhammad Husain Kashmiri who rivaled Mir Ali, the classical master of calligraphy, Abul Fazl says, "The artist who in the shadow of the throne of His Majesty, has become a master of calligraphy, is Muhammad Husain of Kashmir. He has been honoured with the title Zarin Qalam, the golden pen. He surpassed his master, Maulana Abdal-Aziz; his maddat and dawa'ir show everywhere a proper proportion to each other, and the art critics consider him equal to Mulana Mir Ali. Some mosques, tombs and epitaphs of the period bear Persian and Arabic inscriptions in elegant naskh and nasta'aliq, which further substantiate that the art had reached to a high perfection.

**Sarfaraz Ahmad Rather and Rajeshwari****Book Binding**

During the Sultan period in Kashmir, the art of book binding flourished as skilled craftsmen learned techniques from experts in Central Asia. The Timurids were known to be strong supporters of the art of the book ; in fact, Balsunqur Mirza, the son of Shah Rukh and a wazir at his father's court in Herat, brought together artists from all across the Timurid empire at the academy and library he established at Herat. The papermaker, scribe, illuminator, margin-cutter, color-grinder, painter, and binder collaborated to create some of the finest books ever produced. Calligraphy, illumination, and painting were just parts of the entire book. During the Timurid era, bookbinders demonstrated their proficiency alongside other artisans. Bindings typically consisted of leather wrapped around pasteboard, with intricate decorations adorning both covers and the flap that shielded the pages' front edge. The embellishments applied to these covers employed elaborate techniques, showcasing the binders skill and attention to detail. Impressed by the art of book, especially the art of book binding of the Timurids, Sultan Zain al- Abidin deputed a few intelligent people of Kashmir to Central Asia to learn it at the feet of its experts. Consequently the art got diffused in Kashmir and there came into existence a colony of book binders which has survived to us in the name of *Jilad gar mohalla* (the quarter of book binders) located in old Srinagar.

Lattice work

Pinjari, the intricate lattice work on wood, holds a special place in the rich tradition of Kashmiri craftsmanship. Found adorning fences, doors, railings, ventilators, room partitions, screens, and windows, this art form adds an exquisite touch to the region's architectural landscape. The geometric designs seen in most wooden structures showcase the mastery and attention to detail of Kashmiri artisans. However, the carved lattice scrolls at the Madin Sahib Tomb in Srinagar offer a unique variation, hinting at the evolution of this craft over time. Dating back to the 15th century during the reign of Zain-ul-Abidin, this tomb serves as a testament to the early existence of lattice craftsmanship in the region, paving the way for its widespread adoption in wooden structures. The introduction of this art form may have been spearheaded by Sultan Zain-ul-Abidin himself, known for his patronage of skilled craftsmen from Central Asia. The legacy of Pinjari continues to enchant visitors, showcasing Kashmir's rich cultural heritage and the timeless beauty of its architectural marvels.

CONCLUSION

In conclusion, the influence of Persian and Central Asian cultures on Kashmiri art and architecture during the Sultanate period was profound and far-reaching. This period witnessed a fusion of artistic styles, techniques, and motifs, resulting in the creation of unique and aesthetically rich monuments and artworks. The architectural marvels such as mosques, tombs, and palaces, with their intricate carvings, domes, and minarets, reflect a synthesis of Persian, Central Asian, and indigenous Kashmiri architectural traditions. Similarly, in the realm of art, Persianate elements such as calligraphy, miniature painting, and intricate designs were incorporated into Kashmiri artistic expressions. This cultural exchange not only enriched the artistic landscape of Kashmir but also contributed to the region's socio-cultural and religious identity. Through this manuscript, we can appreciate the enduring legacy of Persian and Central Asian influences on Kashmiri art and architecture, which continue to inspire and fascinate us to this day.

ABSTRACT

The current study evaluated 34 rice genotypes for germination traits under varying levels of salt stress (0 mM, 40 mM, 80 mM, and 120 mM NaCl concentrations). Correlation and principal component analyses were employed to identify promising genotypes and unfold trait associations conferring salinity tolerance. The genotypes G1, G2, G9, G10, G11, G15, G21, G24, G25, G28, G30, G31, and G34 outperformed the check variety for multiple traits. Germination percentage, root length, shoot length, and seedling vigor indices exhibited strong positive correlations, suggesting their potential as selection criteria. Principal component analysis (PCA) revealed traits total seedling length, root length, germination percentage, dry weight, and seedling vigor index II as major contributors to genetic diversity. Biplots consistently highlighted dry weight and seedling vigor index II as primary sources of variation under various saline stress conditions. This study provides insights into trait prioritization and genotype selection during germination for developing salt-tolerant rice varieties.

Keywords: Rice, germination, salinity, correlation, PCA, dry weight

INTRODUCTION

Rice (*Oryza sativa* L.), a momentous cereal crop worldwide, is adaptable to an extensive spectrum of climatic conditions, yet, its yield characteristics are sternly curbed by several abiotic and biotic stresses [1]. Since salinity constitutes a compelling threat to crop yield, hence, attempts to develop salt-tolerant cultivars have become vital in providing food for the millions of mankind residing in such challenging environments [2]. According to [3], rice is considered sensitive to salt, especially in its early stages. The three predominant stages of rice development where salt injury is most evident are germination [4], vegetative and reproductive [5]. The key stage in a plant's life cycle is seed germination, which determines the eventual growth and development levels making it an important stage for screening and selecting stress-tolerant genotypes in breeding programs. Salinity affects seed germination through osmotic stress, ion-specific effects, and oxidative stress, leading to reduced germination rates and prolonged germination time. Excessive sodium and chloride ions can impede embryo viability, enzyme structure, as well as respiration, photosynthesis, and protein synthesis [6]. While several studies [7] [8] claimed that rice was largely saline tolerant during the germination phase, NERICA rice varieties including the 'Pokkali' varieties exhibited salt sensitive responsiveness to germination energy, speed, and percentage [9] [10] [11] reported that in Pakistani, Egyptian, and Iraqi varieties, salt content had a detrimental effect on germination percentage, germination rate, seedling length, and fresh and dry weight. Utilizing salt-affected lands for sustainable rice farming necessitates the identification of salt-tolerant varieties and the introgression of their salt-tolerant trait into high-yielding cultivars [12]. In this regard, the current study was carried out to evaluate the germination stage performance of 34 rice genotypes under four different concentrations of salt solution.

MATERIALS AND METHODS

The current study employing 34 rice genotypes (Table 1) was conducted at the Department of Genetics and Plant Breeding, Faculty of Agriculture, Annamalai University. The check variety used in the study was CSR 37. The experiment was laid out using a Completely Randomized Design (CRD) with three replications. The treatments consisted of four different concentrations of NaCl: 0 mM (control), 40 mM, 80 mM, and 120 mM in which each genotype was subjected to each NaCl treatment in three replications. After five minutes of surface sterilization with a 0.1% mercuric chloride solution, the seeds of all the genotypes were carefully rinsed with distilled water. Ten seeds were set up in Petri dishes that had two layers of germination paper on them that had been poured with the appropriate NaCl solutions. The Petri plates were held under cold white fluorescent light with a 12-hour light/dark cycle in a growth chamber at $25^{\circ}\text{C} \pm 2^{\circ}\text{C}$. The following traits were recorded, after seven days of germination: Germination percentage (%), Root length (cm), Shoot length (SL, cm), Total seedling length (Root length + Shoot length) (cm), Fresh weight (g), Dry weight (g) obtained after oven-drying the seedlings at 65°C for 72 hours, water content (%) = $[(\text{FW} - \text{DW}) / \text{FW}] \times 100$ Number of roots, Sodium (Na^+) content (g/g dry weight), Potassium (K^+) content (g/g dry weight), Sodium-potassium ratio (Na^+/K^+), Seedling vigor index I (SVI-I) = Germination percentage (%) \times Total seedling length and Seedling vigor index II (SVI-II) = Germination percentage (%) \times Dry Weight. Sodium and potassium contents of the entire plant sample (root and shoot combined) were estimated using the tri-acid digestion method (Nitric acid (HNO_3) : Sulfuric acid (H_2SO_4) : Perchloric acid (HClO_4) in the ratio of 9:1:4) followed by flame photometry analysis. The estimated concentration of Na^+ and K^+ were calculated based on the standard curve. Microsoft Excel was used to perform basic mathematical analyses, such as calculating the significance of the mean genotype performance for all traits at the 5% level ($p < 0.05$) using the critical difference. Pearson correlation was calculated at both 5% ($p < 0.05$) and 1% level ($p < 0.01$) among the germination parameters to estimate the association among different traits using Grapesagril software [13]. Principal components were computed using STAR 2.0.1 software (International Rice Research Institute [IRRI], Los Baños, Laguna, Philippines) and XLstat software.

RESULTS AND DISCUSSION

Mean performance

The mean performance of genotypes for all the traits under different treatments are listed in the Table 2a to 2d. To ensure the best possible stand establishment under salinity stress, higher germination percentage is the most important indicator of seed viability and vigor. At 40 mM and 80 mM NaCl concentrations, the genotypes G28 and G29 demonstrated significantly higher germination percentages than the check variety CSR 37, while at 120 mM NaCl, the genotype G15 outperformed the check variety. When exposed to 80 mM and 120 mM NaCl stress, the genotype G1 developed significantly greater root lengths than the check variety while at 40 mM and 120 mM NaCl concentrations, the root lengths of genotypes G28 and G31 were superior which could contribute to better anchorage, nutrient and water uptake under saline conditions.. The genotypes G9, G23, and G29 revealed more significant shoot lengths than the check variety at 40 mM NaCl concentration. The genotype G11 disclosed a significantly greater shoot length against the check variety at 80 mM NaCl. Greater photosynthetic potential and early seedling growth under salinity stress could be indicated by longer shoots. In all the salinity levels, the genotype G28 explained greater total seedling length than CSR 37. Under 80 mM NaCl treatment, the genotype G11 indicated a higher fresh weight than the check variety while at 40 mM and 80 mM NaCl, the genotype G34 established greater fresh weight, while at 120 mM NaCl, the genotype G15 performed better than the check variety.

The genotypes G1, G2, G4, G8, G9, G10, G15, G19, G21, G24, G25, G30, G31, G33, and G34 described higher dry weight than the check under all the NaCl concentrations. In rice breeding initiatives, dry weight is important for evaluating seedling performance and salt tolerance as it is a valuable predictor of overall seedling vigor and stress tolerance mechanisms by offering an integrated assessment of the seedling's capacity to allocate resources towards growth and biomass accumulation under saline stress conditions. Traits such as shoot length, total seedling length, fresh weight and dry weight were also influenced by salinity stress, with genotypes such as G9, G11, G15, G23, G28, G29, and G34 performing better than the check variety. These traits are crucial indicators of early growth, biomass accumulation, and the ability to maintain growth under stress. When compared to the check variety, the genotype G16 confirmed an increased water content. The genotypes G3, G10, G19, and G24 performed better than CSR 37 at all NaCl concentrations for the trait number of roots. In order for a seedling to survive and flourish under salt stress, possession of more roots could be critical to improve its ability to absorb water and nutrients, anchor itself and explore the resources in the soil. For the trait sodium, the genotype G2 performed better than the check variety at all NaCl levels. At 40 mM and 120 mM NaCl, the genotype G28 recorded a larger potassium concentration, while G18, G16 and G29 performed better than the control at 80 mM and 120 mM NaCl, respectively.

At all NaCl levels, the genotype G31 showed a greater Na/K ratio than the check. Rice seedlings could more effectively govern their water relations and ionic homeostasis by sustaining lower Na⁺ and higher K⁺ level which consequently enhances their capacity to tolerate and the negative consequences of salinity stress. Genotypes with higher K⁺ content, lower Na⁺ content, and a favorable Na⁺/K⁺ ratio in saline environments should be given priority in rice breeding programs for additional analysis and possible use as donors to increase salinity tolerance in rice cultivars. Under 80 mM and 120 mM NaCl treatment, the genotype G34 outperformed the check for the trait Seedling Vigor Index I. The genotypes G1, G2, G8, G9, G10, G11, G21, G24, G25, G28, G30, G31 and G34 surpassed the check variety for the trait seedling Vigor Index II at all saline treatments. Similar results and the trend of reduction in the mean performance of the genotypes with increase in the saline concentration were observed by [14], [15], [16] [4], [17] and [18]. Therefore, in rice saline stress breeding initiatives, the genotypes G1, G2, G9, G10, G11, G15, G21, G24, G25, G28, G30, G31 and G34 that outperformed the check variety for various germination traits could be further analyzed and utilized to generate salt-tolerant rice varieties that will thrive in saline-affected locations.

**Sruthi and Anbuselvam****Correlation analysis**

Correlation coefficient aids in finding out the degree and direction of association between traits. The correlogram obtained for various saline treatments are given in Figures 1 to 4. The trait germination percentage at 0mM and 80mM saline treatment exhibited a high significant positive correlation ($p < 0.01$) with total seedling length ($r = 0.698$ and 0.970 , respectively). Similarly, at 40mM and 120mM, a highly significant positive relationship ($p < 0.01$) was observed with the trait seedling vigor index I. Additionally, at all saline treatments, the trait exhibited a significant positive association ($p < 0.05$) with root length and shoot length. The results indicate that under non-stress conditions, seedling growth is the key associated trait, but, as the salt stress spikes, seedling vigor turn into an increasingly important operator of successful germination. During the germination and early seedling stages of plant growth, this understanding may contribute in determining of prospective selection criteria for saline tolerance. This suggests that selecting for high germination percentage could indirectly improve seedling growth and vigor under salt stress. The trait root length at 0 mM and 120 mM exhibited a high significant positive correlation ($p < 0.01$) with total seedling length ($r = 0.955$ and 0.800 , respectively) indicating that longer root length contributes to increased overall seedling length under both non-saline and high salinity conditions. Similarly, at 40mM and 80mM, a highly significant positive association ($p < 0.01$) was observed with the trait seedling vigor index I ($r = 0.864$ and 0.849 , respectively).

Additionally, at all saline treatments, the trait exhibited a significant positive relationship ($p < 0.05$) with germination per cent. The trait shoot length at 0 mM and 120 mM exhibited a high significant positive alliance ($p < 0.01$) with total seedling length ($r = 0.955$ and 0.800 , respectively). Similarly, at 40mM and 80mM, a highly significant positive correlation ($p < 0.01$) was observed with the trait seedling vigor index I ($r = 0.864$ and 0.849 , respectively). Additionally, at all saline treatments, the trait exhibited a significant positive association ($p < 0.05$) with germination per cent. At 0mM, total seedling length had the highest relationship ($p < 0.01$) with root length ($r = 0.955$) while at 40mM, 80mM, and 120mM, total seedling length explained the highest correlation with Seedling Vigour Index I ($r = 0.996$, 0.996 and 0.971 , respectively) and exhibited significant positive association ($p < 0.05$) with germination percentage and shoot length across all saline treatment. The trait fresh weight at 0 mM and 80 mM exhibited a high significant positive alliance ($p < 0.01$) with water content ($r = 0.525$ and 0.541 , respectively). Similarly, at 40mM and 120 mM, a highly significant positive correlation ($p < 0.01$) was observed with the traits number of roots ($r = 0.621$) and germination per cent ($r = 0.460$), respectively. Additionally, at all saline treatments, the trait exhibited a significant positive relationship ($p < 0.05$) with seedling vigour index II suggesting that maintaining high fresh weight under saline conditions could be associated with better water uptake, root development, germination success, and overall seedling vigor. At all the saline treatments, the trait dry weight revealed high significant positive correlation ($p < 0.01$) with seedling vigour index II ($r = 0.995$, 0.951 , 0.952 and 0.933) highlighting its importance as an indicator of seedling vigor under salt stress while a significant positive association ($p < 0.05$) with water content suggests the need for water uptake for dry matter accumulation. The trait water content at 0 mM, 40 mM and 80 mM established a high significant positive relationship with fresh weight ($r = 0.525$, 0.597 and 0.541 , respectively) while a high significant negative correlation ($p < 0.01$) with dry weight ($r = -0.676$) at 120 mM. At 0 mM and 40 mM saline treatment, the trait number of roots unveiled a high significant positive association ($p < 0.01$) with fresh weight ($r = 0.393$ and 0.621 , respectively) while at 80 mM, it was with germination percentage ($r = 0.535$) and at 120 mM, a high significant negative correlation was observed with dry weight ($r = -0.676$).

By taking into account physiological and biochemical traits instead of basically morphological ones for assessment, it could be possible to comprehend the correlations among traits in rice cultivars associated salinity stress tolerance [19]. The trait sodium described a high significant positive correlation with potassium at 0 mM, 80 mM and 120 mM ($r = 0.779$, 1.000 and 0.955 , respectively) while at 40 mM ($r = 0.563$) it was with water content. At all the saline treatments, the trait potassium explained a high significant positive relationship ($p < 0.01$) with sodium ($r = 0.779$, 0.531 , 1.000 and 0.955 , respectively). The trait Na/K ratio demonstrated a high significant negative association ($p < 0.01$) with potassium and seedling vigour index II at 40 mM and 80 mM ($r = -0.479$ and -0.545 , respectively), respectively and significant positive association ($p < 0.05$) with dry weight. The positive correlation between sodium and potassium suggests the involvement of similar transport mechanisms and the need for ion homeostasis under saline conditions. The negative alliance between Na/K ratio and potassium, and SVI-II indicates that maintaining a

**Sruthi and Anbuselvam**

lower Na/K ratio (higher potassium accumulation relative to sodium) could contribute to better seedling vigor under salt stress. At 40 mM, 80 mM and 120 mM saline treatment, the trait seedling vigour index I elucidated high significant positive correlation ($p < 0.01$) with total seedling length ($r = 0.996, 0.996$ and 0.971 , respectively) while a significant positive correlation ($p < 0.05$) was explained with germination percentage, root length, shoot length and number of roots, making it a potentially useful composite trait for selecting salt-tolerant genotypes during the early growth stages. The trait seedling vigour index II exhibited a high significant positive relationship ($p < 0.01$) with dry weight at all the saline treatments ($r = 0.995, 0.951, 0.952$ and 0.933 , respectively) and a significant positive correlation ($p < 0.05$) was recorded with fresh weight, highlighting its importance as an indicator of overall seedling vigor and biomass accumulation under saline conditions. Parallel outcomes were obtained by [20] [21] in germination stage of rice. However, the results obtained align with the findings of [22], [23], [19] and [24] in different growing stages of rice. Under saline stress conditions, there were strong positive correlations observed between Seedling vigor index II and Dry weight, Seedling vigor index I and Total seedling length, Sodium and Potassium, Root length and Total seedling length, and Shoot length and Total seedling length. This indicates that these traits are closely related to each other. Selecting one trait in these pairs is likely to indirectly improve the other correlated trait during the critical germination and early seedling growth stages and could potentially pave way for developing salt-tolerant rice varieties.

Principal Component Analysis

A key method in rice breeding is principal component analysis (PCA), is used to rank genotypes, determine minimal components, identify maximal variability, and evaluate genetic diversity. Contribution, eigenvalues, and proportion of variance of yield and its contributing traits to different principal components for all the treatments are provided in Table 3. An eigenvalue greater than one was observed in the first three principal components at 0 mM while in all other treatments, the first four principal components exhibited eigen values greater than one. This implies that a considerable amount of the total genetic variation among the rice genotypes, across all treatments, was represented by these principal components. These principal components accounted for 68.80% of the cumulative percentage of variance explained in 0 mM, 84.40% in 40 mM, 84.9% in 80 mM, and 79.10% in 120 mM, suggesting that they constituted a significant proportion of the total genetic diversity across the genotypes. Comparable findings were reported by [25]. The contribution of thirteen germination stage traits to the principal components in 0 mM, 40 mM, 80 mM and 120 mM is presented in Table 3. Principal component analysis conducted across various saline treatments identified variations in the contribution of different germination stage parameters to the genetic diversity among the rice genotypes under study. The cut-off limit for the coefficients of the proper vectors was determined using the [26] criterion, wherein traits with coefficient values less than 0.3 were found not to have significant effects on the total variation, and traits with coefficient values greater than 0.3 were treated as having large effects. The traits with high positive loadings on PC1 in 0 mM saline treatment included germination percentage, root length, shoot length, total seedling length, fresh weight, dry weight and seedling vigour index II indicating that under non-saline conditions, most growth traits were positively associated with PC1, explaining better performance. These traits turned out to be positively correlated with the principal component, and as the principal component's value increased, so did the values of the traits with positive loadings and hence such traits on the same PC could be improved simultaneously, as they are positively associated. Conversely, in 40 mM, 80 mM and 120 mM saline treatments, the traits germination percentage, root length and total seedling length exhibited negative loadings on PC 1 indicating that these traits negatively correlated with the principal component. As salinity levels increased, germination percentage, root length, and total seedling length became negatively correlated with PC1, suggesting a detrimental effect of salinity on these traits. The trait dry weight disclosed negative loadings on PC 2 in the saline treatments of 0 mM, 40 mM, and 80 mM, confirming a negative correlation with the principal component. However, the same trait in the saline treatment of 120 mM disclosed positive loading on PC 2, demonstrating a positive correlation with the principal component by exhibiting a complex pattern. The intricate pattern of dry weight revealed the complex linkages and its contributions to genetic diversity under various salt stress levels. It emphasizes how crucial it is to have an extensive understanding of how traits interact to predict genotypic performance in different stress levels. Scree plot elucidated the variation percentage between Eigenvalues and the Principal components (Fig 5 to Fig 8.). In 0 mM saline treatment, PC1 showed a maximum variation of 28.30% with an eigenvalue of 3.675, compared to other PCs. In 40

Sruthi and Anbuselvam

mM, 80 mM and 120 mM , PC1 exhibited 41.5%, 39.7% and 32.1% variability with an eigenvalue of 5.393, 5.162 and 4.171, respectively. The present findings accord with previous work by [17]. The greatest variation across the various treatments proved to be most reliably attributed to the first principal component (PC1), emphasizing the importance of PC1 in addressing the entirety of genetic variability. Major contributors included traits such as total seedling length, root length, and germination %. By focusing on genotypes with high scores on PC1, which captured a sizable fraction of the total variability, breeders could identify desirable genotypes with favorable combinations of these traits. These genotypes could be prioritized during selection and used as potential donors in breeding programs to improve rice yield and related components under saline stress.

The PCA biplots for the four distinct saline treatments demonstrating consistent and divergent patterns in the traits that most contribute to genotypic variance are presented in the Figure 9 to 12. Dry weight and seedling vigour index II consistently possessed the longest vectors across all four treatments, implying that these traits were the main cause of genotype divergence. Variation in these traits was also a significant factor in differentiating genotype performance. Based on the angle between the vectors in the biplot, the traits seedling vigour index II and fresh weight were positively correlated with the trait dry weight across all the treatment. By prioritizing dry weight as a selection criterion in saline breeding programs, breeders could identify genotypes with superior biomass accumulation and overall vigor under salt stress conditions. In this context, there was a positive correlation found between the genotype G9 with the characteristic dry weight in 0 mM, 40 mM, and 120 mM, as the genotype G9 showed a greater value for dry weight , whereas the genotype G21 showed a higher value for dry weight in 0 mM, 80 mM, and 120 mM. Concordant findings were documented by [1] in seedling stage of rice. Thus the PCA results provide insights into the relationships between traits, their contributions to genetic diversity, and the performance of genotypes under different salinity levels. This information can guide breeders in selecting promising genotypes and traits for developing salinity-tolerant rice varieties.

CONCLUSION

The evaluation of mean performance revealed several promising genotypes such as G1, G2, G9, G10, G11, G15, G21, G24, G25, G28, G30, G31 and G34 outperforming the check variety CSR 37 for various traits under different salinity levels. The correlation analysis provided insights into the strong relationships among various traits such as germination percentage, root length, shoot length, and seedling vigor indices suggesting their potential as selection criteria for salt tolerance during early growth stages. The principal component analysis revealed that traits such as total seedling length, root length, germination percentage, dry weight, and seedling vigor index II were major contributors to genetic diversity among genotypes across salinity levels. The PCA biplots consistently showed dry weight and seedling vigor index II as the primary sources of genotypic variation, indicating their significance in differentiating genotype performance under saline stress. Hence, this study has illuminated the importance of prioritizing the selection of high-potential genotypes and traits during germination stage for the development of salt-tolerant rice varieties.

ACKNOWLEDGEMENT

The authors express their sincere gratitude to the University Grants Commission (UGC), for providing financial support to the first author in the form of Senior Research Fellowship under the Savitribai Jyotirao Phule Single Girl Child Fellowship (SJS GC). The financial assistance received from the UGC was crucial in carrying out this research work.

ABSTRACT

The first year of life of the baby is crucial in laying the foundation of good health. Breastfeeding is the ideal method suited for the psychological and physiological needs of the infant. Breast feeding provides numerous health benefits to both the mother and infant. Breast milk remains as ideal nutritional source for the infant, it is also an integral part of the reproductive process with important implications for the health of mothers. The main purpose of the study isto assess the knowledge and practice of breast feeding among primi mothers in a selected hospital Assam.A non-experimental descriptive research approach was adopted for the study. the study was conducted in postnatal wards of Morigaon civil hospital, district, Assam. the knowledge of fifty-four primi mothers were assessed using structured knowledge questionnaire regarding breast feeding, and the practice regarding breastfeeding were assessed by using observational checklist. The major finding of the study revealed that (75.93%) primi mothers had moderate knowledge (24.07%) had an adequate knowledge, and (74.07%) had a good practice whereas (25.93%) had a poor practice regarding breast feeding. The present study concluded that the level of knowledge of primi mothers regarding breastfeeding was moderate on the basis of findings. it is recommended that a similar study can be replicated in another setting. it is also recommending that effectiveness of self-instructional module can be assessed.

Keywords: Knowledge, practice, breast feeding, primi mothers, information booklet

INTRODUCTION

Breastfeeding is the “Gold Standard” for infant feeding. There are several areas of biological superiority of breastfeeding and breast milk over artificial (formula) milk. Obstetricians and midwives should educate the mother during prenatal and postnatal care for the usefulness of breast feeding[1]. World Health Organization (WHO) recognizes breast milk as the best nutritional food source for infants, which should be available to babies deprived of their mother's milk. WHO and UNICEF recommend that breastfeeding should commence within one hour of the child's birth, it should be administered during the first six months of the child's life and should ideally continue till the age of two to ensure the healthy growth and development of the child apart from reducing the rate of child mortality[2]. Although breastfeeding is the "gold standard," not all women breastfeed their infants. According to UNICEF's State of the World's Children Report 2011, of the 136.7 million babies born worldwide each year, only 32.6% are breastfed exclusively for the first 6 months. Some mothers make the choice not to breastfeed, but others might be unable to breastfeed because of medical conditions, such as HIV, or other reasons, such as problems producing milk[3].

OBJECTIVE OF THE STUDY

1. To assess the knowledge of breast feeding among primi mothers
2. To assess the practice of breast feeding among primi mothers
3. To determine the association between the knowledge of breast feeding among primi mothers with selected demographic variables
4. To determine the association between the practice of breast feeding among primi mothers with selected demographic variables
5. To determine the correlation between the knowledge and practice of breast feeding among primi mothers

MATERIALS AND METHOD

A non-experimental descriptive research approach was adopted for the study. The study was conducted in postnatal wards of Morigaon civil hospital, district, Assam among 54 primi mothers. Ethical clearance certificate and formal permission was taken from the concerned authorities and participants to conduct the research study. The tools used for the study was demographic variable, structured knowledge questionnaire and observational checklist. Non-probability Purposive sampling technique was used for selecting the primi mothers who had normal vaginal delivery. The knowledge of fifty-four primi mothers were assessed using structured knowledge questionnaire, and the practice regarding breastfeeding were assessed by using observational checklist. The data obtained were analysed in terms of objective of the study by using descriptive and inferential statistics.

Inclusion criteria

The study includes those Primi mothers

- who were available at the time of data collection.
- who are willing to participate in the study.
- who can understand and write Assamese.

Exclusion criteria

The study excludes those primi mothers

- With Postpartum complications
- who had a baby with any complication after birth.
- who undergone Caesarean delivery.

RESULT

With reference to the sample characteristics presented in Table 1, most of the primi mothers, 44.4% (24) belongs to the age group between 21–26 years, 38.9% (21) had a primary education, 75.9% (41) were unemployed, 40.7% (22) had a family income of 10,002 – 29,972 per month, 61.1% (33) belongs to rural area and majority of the primi mothers 63.0% (34) had received an information regarding breast feeding through health personnel. With reference to the knowledge presented in fig1, majority 75.93% (41) of the primi mothers had moderate knowledge, 24.07% (12) had an adequate knowledge regarding breast feeding and none of the participant falls under inadequate knowledge. With reference to the practice presented in fig 2, it replicates that 74.07% (40) of the primi mothers had a good practice whereas 25.93% (14) had poor practice regarding breast feeding. With reference to the association on level of knowledge regarding breast feeding among primi mothers with the selected demographic variables, the analysis presented in Table 2 showed that there was a significant association found between knowledge of primi mothers with selected demographic variables viz. education of the participant. Hence the research hypotheses were accepted and null hypotheses were rejected. With reference to the association on level of practice regarding breast feeding among primi mothers with the selected demographic variables, the analysis presented in Table 3 showed that there was a significant association found between practice of primi mothers with education of the participant regarding breast feeding. Hence the null hypotheses were rejected, and research hypotheses was accepted in terms of education of participant. With reference to the correlation between level of knowledge and practice regarding breast feeding among primi mothers. The analysis presented in Table 4 showed a significant correlation ($r = 0.462$ at $p < 0.001$) So, the null hypotheses is rejected, and research hypotheses is accepted which implies that there is a moderate positive correlation between level of knowledge and practice regarding breast feeding.

DISCUSSION

The findings of the study have been discussed with reference to the objective, hypotheses, and findings from other studies.

To assess the knowledge of breast feeding among primi mothers in a selected hospitals

In the present study, the knowledge of the primi mothers regarding breast feeding was assessed by administering structured knowledge questionnaire. The result reveals that 75.93% primi mothers had a moderate knowledge and 24.07% had adequate knowledge regarding breast feeding. The study is supported by a cross-sectional study conducted by **Mohite RV, et.al., (2012)** at Krishna Hospital and Medical Research Center, Karad district Satara. The objective of the study is to assess the knowledge of breast feeding among primi- gravida mothers and to determine the association between socio-demographic variables with their knowledge. Hospital based cross sectional study was conducted in Krishna Hospital and Medical Research Center, Karad district Satara among 590 married primi gravid mothers attending anti-natal clinic during study period by utilizing personal interview method pre-tested structured proforma to collect information. Out of 590 primi gravida mothers, 59.66% showed fair quality of knowledge about breast feeding. knowledge about rooming in, family support for breast feeding & burping after breast feeding was 97.7%, 95.4%, 93.5% however weaning, colostrums feed, hazards of bottle feeding and prelactal food was 84%, 82.7%, 75.5% and 54% respectively. Statistical association was existed between age, education, religion, socio-economic status & occupation of respondents with their knowledge about breast feeding. The knowledge of breast feeding among primi gravida mothers attending ANC clinic was of fair in quality ⁴

To assess the practice of breast feeding among primi mothers in a selected hospitals

In the present study, the practice of the primi mothers regarding breast feeding was observed by observational checklist. The result reveals that 74.07% had a good practice and 25.93% had a poor practice regarding breast feeding. It is supported by a descriptive study conducted by **Rani U and Bhattacharjee T (2018)** A study to assess the knowledge and practice regarding techniques of breast feeding among primipara mothers in selected hospital of Delhi with a view to develop self-instructional module. The purpose of this study is to assess the knowledge and

**Bakor Kharbudon et al.,**

practice of primipara mothers regarding breast feeding technique with a view to develop self-instructional module. According to the Objectives of the study the data collected by from sample who met sampling criteria by using non-probability convenient sampling. The knowledge and practice were assessed by using breastfeeding knowledge questionnaire, infant feeding and breast-feeding practice checklist respectively the present pilot study was carried out among 20 primipara mothers. The study revealed that the knowledge of primipara mothers regarding breastfeeding was not adequate and that was reflected on their practice of breastfeeding. Primary care givers need to implement strategies to educate primi mothers about breastfeeding to enhance good breastfeeding practice thereby reducing infant mortality and morbidity[5].

To find out the association between knowledge of breast feeding among primi mothers with the selected demographic variables

The present study reveals that there is significant association between knowledge of breast feeding among primi mothers with demographic variables for education of the participant $\chi^2=8.609$ at significant level of $p < 0.05$

The present study is supported by a cross- sectional study conducted by **Habibi M, et.al., (2018)** To examine the association between the knowledge of breastfeeding and maternal socioeconomic and demographic characteristics, and to determine any impact on child nutritional. A cross-sectional study using both qualitative and quantitative methods was conducted with mothers of infants aged six- to twenty-four months. Data was collected by a semi-structured questionnaire and face-to-face, in-depth interviews with mothers to get an insight into their breastfeeding perceptions and experiences. Educational achievement and occupational class were used as indicators of socio-demographic status. Nutritional status was assessed by anthropometric measurements. The study reveals a significant relationship between exclusive breastfeeding and the mother's education ($P < .001$) and socio-economic status ($P < .001$) has been highlighted. A strong association was found between maternal employment and exclusive breastfeeding ($P < .001$).the findings of the study shed some light on challenges faced by mothers, as well as an association between socio-demographic characteristics and practices for facilitating exclusive breastfeeding to guide the mothers in breastfeeding management[6].

To find out the association between practice of breast feeding among primi mothers with the selected demographic variables

The present study reveals that there is significant association between practice of breast feeding among primi mothers with demographic variables for education of the participant $\chi^2=9.136$ at significant level of $p < 0.05$. The study is supported by a prospective cross-sectional study conducted by **Dr. Haricharan K R, et.al (2017)** To assess the knowledge, attitude and practice of breast feeding among admitted postnatal mothers and to find out their relationship with socio demographic factors. A cross sectional study was carried out in PES Institute of Medical Sciences and research, KUPPAM. The study population included 240 post-natal mothers admitted in the hospital. A face-to-face interview was conducted after delivery during second post-natal day using pretested questionnaire. The study reveals that majority ($n=201$, $\%=87.5$) of mothers belong to age group of 18 to 26 with mean of 23.4 and standard deviation of 3.14. Maximum (87.5%) mothers belonged to Hindu religion. More than half of them were housewives (61%) living in nuclear families and up to 40% of study population were employed. Majority of mothers from study group were primi - para (54.1%). Pre-lacteal feeds were given by 16% and colostrum was discarded by 8% of mothers. About 80% of mothers were knowledgeable and likely to exclusive breast fed their babies. Antenatal counselling was received by 93.3% of mothers and majority of them by doctor 45.91%. Significant association is seen with antenatal counselling ($pvalue < 0.03$) and good breastfeeding practises in post-natal mothers. The study concludes that antenatal counselling promotes good breast-feeding practises hence existing antenatal counselling on breastfeeding needs to be strengthened by informing all pregnant women about the benefits of breastfeeding and motivating them by curtailing their ill beliefs regarding breastfeeding and educating them that breast Feeding is the healthiest and safest way to feed babies[7].

To determine the correlation between knowledge and practice of breast feeding among primi mothers in selected hospitals

The present study reveals that there is a moderate positive correlation between knowledge and practice of breastfeeding regarding breast feeding $r = 0.462$ a significant level of $p < 0.001$

**Bakor Kharbudon et al.,**

The present study is supported by a comparative cross sectional study conducted by **Chanda Mog (2021)** on knowledge, attitude and practices regarding Breast Feeding Among Primiparous and Multiparous Mothers in an Urban Slum, West Tripura. The objective of the study was to assess the knowledge, attitude and practices (KAP) regarding breastfeeding among primiparous and multiparous mothers. The study was conducted among 200 mothers (100 primiparous and 100 multipara) in an urban slum and eligible mothers were selected using simple random sample technique. Out of 200 mothers, 118 (59%) had adequate knowledge and 86 (43%) mothers were correctly done breast feeding practices. However, 52% multiparous were found more correctly practicing breastfeeding than primiparous (34%) and it was statistically significant ($P=0.01$). The level of knowledge among multiparous (71%) were found more adequate than primiparous (47%) and significant difference was observed ($P=0.001$). Most of mothers (83%) had positive attitude towards breastfeeding (82% primiparous and 84% multiparous) and mothers did not have any negative attitude towards breastfeeding. The study concludes that the level of Knowledge is still needed to be improved in primipara mothers and however, the correct practice of breastfeeding was also found low in primipara mothers than multipara mothers[8].

CONCLUSION

The present study was conducted to assess the knowledge and practice of breast feeding among primi mothers in a view to develop information booklet in a selected hospital Morigaon District, Assam. A total of 54 primi mothers were participated in the study. Out of 54 respondents it was found that 75.93% primi mothers had moderate knowledge, 24.07% (12) had an adequate knowledge, and 74.07% (40), had a good practice whereas 25.93% (14) had a poor practice regarding breast feeding.

Based on the findings, the researcher concluded that the mother had moderate knowledge and good practice level regarding breast feeding. The knowledge and practice go hand in hand. So, if their knowledge increases their practice level also increased.

ABSTRACT

Emissions of greenhouse gases contributes enormously to global warming, which accelerates temperature rise, disrupts ecosystems, and threatens human health and wildlife. In the industrial sector, increased CO₂ emissions can result in tighter regulations, higher operational costs, and serious reputational damage. Incorporating pollution considerations into inventory management can encourage entities to improve their environmental practices. The main objective of this model is to propose Sustainable EOQ model with tax emissions and its considerations under uncertain environment. All the cost parameters are considered as hexagonal fuzzy numbers. Mathematical formulations are discussed in both Crisp and fuzzy sense. Extension of Lagrangian principle is used to obtain optimal solution. Finally the model illustrated with the Numerical example.

Keywords: Carbon Tax, sustainable, Inventory, Emission.

INTRODUCTION

Erupting CO₂ emissions have been detrimental to the ecological health in the developing world. With the increasing of industries and urbanization, greater quantities of carbon ends up released into earth's atmosphere. A corresponding rise in greenhouse gases intensifies the rate of warming and environmental degradation. Environmental sustainability has grown into a top priority among many companies around all over the globe. In responding to elevated benchmarks from governing bodies, prospects, and stakeholders. Business entities are launching steps intended to minimize their adverse social and environmental consequences, while still being profitable overtime. Based on the vital relevance of global environmental issues and the intricate connection between

**Vinola Elisabeth and Rexlin Jeyakumari**

expansion of industries and handling environmental issues, sustainable development and a sense of being sustainable are beginning to gain popularity. The persistent increase in temperatures around the world has driven both consumers and industry to put greater emphasis on emission reductions and safeguarding the environment.[1,2] Inventory remains vital to a company's long-term survival. The majority of supply chain sectors strive to fulfill their consumer demand, enhance client satisfaction, boost receptivity, and optimize productiveness[3]. Alongside with contending on price and assistance, the supply chains are progressively concentrating on ecological sustainability[2]. Inventory costs frequently fall into these categories, ordering costs, which are the costs incurred for ordering things; holding costs, that encompassing the price of maintaining the commodities in facilities. and procurement expenses which related to purchasing specific quantities of goods. These inventory systems have an immense effect on a supply chains emission levels. Stock levels might affect pollutants, especially specific inventory levels either raising or lowering the adverse ecological effects depending on the way the items are carried and operated.[3]. One of the keys for any company's flourishing operations remains in the stock it holds. Conservation issues have emerged as an ongoing emphasize for governments as well as industry. In order to remain fiercely competitive in the business world, companies must focus on environmental complications, like carbon emission, into their strategic initiatives[4,5]. In recent decades, there has been an upsurge of curiosity in the developing inventory structures that adhere to various carbon pricing guidelines. In order to reduce emissions from the industrial processes, regulatory bodies across various advanced economies have enacted a variety of restrictions, But carbon pricing constitutes a notable approach in the industrial aspects.

This tax imposes a fee for the carbon emissions produced by the manufacturers. consequently, with the carbon emission regulations, businesses can try to enhance their management of inventory operations to reduce the carbon emissions amount. In recent times, the emergence of inventory models under various carbon price standards has emerged as a major trend, sparking extensive studies[6]. Arslan and Turkay (2013)[7] extended the traditional EOQ framework through integrating sustainability into carbon pricing systems. Bonney and Jaber (2011)[8] pointed out the necessity of including the effects of environmental factors in inventory models, compared them with conventional strategies. Chen, Benjaafar, and Elomri (2013)[9] displayed that the substantial reduction in emissions can be achieved at minimal expenditure with operational adjustments merely. Battini, Persona, and Sgarbossa (2014)[10] proposed a model that includes environmentally related considerations into a single-product replenishment situation via direct accounting principles. Hovelaque and Bironneau (2015)[11] established a model that investigates sustainability with regard to prices and emission rates, indicating that carbon tax adoption helps both the ecosystem (via lower pollutants) and customers (by more high demand). Dou, Guo, Zhang, and Li (2019)[12] proposed a model for carbon taxation that includes fluctuating rates of taxes over two distinct time frames. Datta (2017) [13] explored a production-inventory model approach that takes into account carbon emissions into implementing taxes concepts. Taleizadeh, Soleymanfar, and Govindan (2018)[14] provided an inventory model which includes sustainability considerations across different shortage policies, highlighting that the approach with partial backordering seemed more comprehensive and effective than the others. Hua, Cheng, and Wang (2011)[15], Kazemi et al. (2018)[16], Wahab, Mamun, and Ongkunaruk (2011)[17] all contributed major advances to this field.

The marketplace is filled with goods and commodities, in which price swings and slides often induce major uncertainties. Fuzzy set theory, with an emphasis on characterizing ambiguity and inaccuracy, has emerged as a vital instrument for utilizing inventory management. Since its inception, the fuzzy set theory's primary task has been marked to address uncertainty-related concerns. Plenty of market factors contributes to this unpredictability, rendering fuzzy set theory essential for fostering inventory studies through the establishment of novel approaches. The adoption of fuzzy models in inventory theory is a major experimental methodology, and many researchers have used fuzzy set theory to come up with far better inventory models[18]. Sharma, Tiwari, Yadavalli and Jaggi(2020) [19] and Mallick and others(2021) [20] proposed an inventory model that accounts for uncertain lead times. Khatua et al,(2021)[21] proposed a production management model in an environment of uncertainty, whereas Govindan (2015)[22] addressed sustainable supply chain management under similar fuzzy situations. Adak and Mahapatra(2020)[23] developed an inventory model that Two-echelon imperfect production supply chain with probabilistic deterioration rework and reliability under fuzziness. Moreover, Pal(2015)[24] made an inventory model

Vinola Elisabeth and Rexlin Jeyakumari

featuring various fuzzy numbers. and Govindan and others(2020)[25] developed a closed-loop supply network in an imprecise uncertain environment. Ghasemkhani et al (2019)[26] examined the EOQ model for perishable products with fuzzy demand rate. Padiyar and others (2022)[27] developed a joint replenishment method for a multi-item, multi-echelon supply chain model with diminishing products in an inaccurate and inflationary scenario. Karthick and Uthayakumar (2021)[28] developed a sustainable supply chain model that takes into consideration of carbon emissions in the context of fuzzy demand. Recently, Utama and others(2019)[29].examined the problems of determining lot sizes while considering environmental sustainability and capital restrictions into account while purchasing raw materials and paying taxes. The proposed research addresses an inventory model with cost attributes such as ordering, purchasing, and holding costs, along with the corresponding emission considerations and their emission tax .In addition, several cost parameters are represented as hexagonal fuzzy numbers. The solution process is based on an extension of the Lagrangian method, with the Graded Mean Integration representation method used to defuzzify the parameters and achieve optimal results. The values are compared in both crisp and fuzzy forms using a numerical example.

Definitions

An outline of the relevant fuzzy definitions is presented as follows.

Fuzzy Set

A fuzzy set \tilde{C} in a universe of discourse X is defined as the following set of pairs $\tilde{C} = \{(x, \mu_{\tilde{C}}(x)) : x \in X\}$. Here $\mu_{\tilde{C}} : X \rightarrow [0, 1]$ is a mapping called the membership value of $x \in X$ in a fuzzy set \tilde{C} .

Graded Mean Integration Representation Method

If $\tilde{B} = (b_1, b_2, b_3, b_4, b_5, b_6)$ is a Hexagonal fuzzy number then the graded mean representation method of \tilde{B} is a defined as $P(\tilde{B}) = \frac{1}{12}(b_1 + 3b_2 + 2b_3 + 2b_4 + 3b_5 + b_6)$

Arithmetic Operations under Function Principle

The arithmetic operations between Hexagonal fuzzy numbers proposed are given below.

Let us consider $\tilde{A} = (a_1, a_2, a_3, a_4, a_5, a_6)$ and $\tilde{B} = (b_1, b_2, b_3, b_4, b_5, b_6)$ be two Hexagonal fuzzy numbers.

$$\tilde{A} \oplus \tilde{B} = (a_1 + b_1, a_2 + b_2, a_3 + b_3, a_4 + b_4, a_5 + b_5, a_6 + b_6)$$

$$\tilde{A} \ominus \tilde{B} = (a_1 - b_6, a_2 - b_5, a_3 - b_4, a_4 - b_3, a_5 - b_2, a_6 - b_1)$$

$$\tilde{A} \otimes \tilde{B} = (a_1 b_1, a_2 b_2, a_3 b_3, a_4 b_4, a_5 b_5, a_6 b_6)$$

$$\tilde{A} \oslash \tilde{B} = \left(\frac{a_1}{b_6}, \frac{a_2}{b_5}, \frac{a_3}{b_4}, \frac{a_4}{b_3}, \frac{a_5}{b_2}, \frac{a_6}{b_1} \right)$$

Extension of the Lagrangean Method

Taha discussed how to solve the optimum solution of nonlinear programming problem with equality constraints by using Lagrangean Method, and showed how the Lagrangean method may be extended to solve inequality constraints. The general idea of extending the Lagrangean procedure is that if the unconstrained optimum problem does not satisfy all constraints, the constrained optimum must occur at a boundary point of the solution space. Suppose that the problem is given by Minimize $y = f(x)$ sub to $g_i(x) \geq 0, i = 1, 2, 3, \dots, m$ The non-

Vinola Elisabeth and Rexlin Jeyakumari

negativity constraints $x \geq 0$ if any are included in them constraints. Then the procedure of the Extension of the Lagrangean method involves the following steps.

Step 1: Solve the unconstrained problem $\text{Min } y = f(x)$ If the resulting optimum satisfies all the constraints, stop because all constraints are redundant. Otherwise, set $k = 1$ and go to step 2.

Step 2: Activate any k constraints (i.e., convert them into equality) and optimize $f(x)$ subject to the k active constraints by the Lagrangean method. If the resulting solution is feasible with respect to the remaining constraints and repeat the step. If all sets of active constraints taken k at a time are considered without encountering a feasible solution, go to step 3.

Step 3: If $k = m$, stop; no feasible solution exists. Otherwise, set $k = k + 1$ and go to step 2.

Notations

This research study utilized the following notations that were mostly derived from Maulana's (29) model, to construct the proposed sustainable inventory system.

k_d - Demand

C^p - cost per order

p^u - purchasing cost per unit

g^h - holding cost per unit

e_{oe} - Total emission from ordering

e_{pe} - Total emission from purchasing

e_{he} - Total emission from holding

x_{et} - emission tax cost

\tilde{K}_d -Fuzzy Demand

\tilde{C}^p -Fuzzy cost per order

\tilde{p}^u -Fuzzy purchasing cost per unit

\tilde{g}^h -Fuzzy holding cost per unit

\tilde{e}_{oe} -Total emission from ordering

\tilde{e}_{pe} -Total emission from purchasing

\tilde{e}_{he} -Total emission from holding

\tilde{x}_{et} -emission tax cost

R_{sp} - optimal number of orders

\tilde{R} - Fuzzy optimal number of orders

$TIC(R_{sp})$ - optimal total inventory cost

Vinola Elisabeth and Rexlin Jeyakumari

$\overline{TIC}(R_{sp})$ - Fuzzy optimal total inventory cost

Assumptions

Assumptions of the SEOQ problems consist of (1) demands, order cost, purchasing cost, holding cost, tax fees, total emissions are considered under uncertain environment (2) components of the assumption are taken as hexagonal fuzzy numbers

Mathematical model

In this model, the study accounted for the costs included with sustainable inventory, considering environmental impact cost, as well as ordering, purchasing, and holding costs. The total inventory cost is formulated as follows:

Mathematical model in crisp sense

$$TIC(R_{sp}) = \frac{(c^p + x_{et} e_{oe})K_d}{R} + K_d(p^u + x_{et} e_{pe}) + \frac{(g^h + x_{et} e_{he})}{2} R \tag{1}$$

Differentiating (1) with respect R , and equate to 0, we get, $R = \sqrt{\frac{2(c^p + x_{et} e_{oe})k_d}{(g + x_{et} e_{he})}}$ (2)

Mathematical model in Fuzzy sense: -

$$\overline{TIC}(R_{sp}) = \left\{ \frac{(\overline{c}^p + \overline{x}_{et} \overline{e}_{oe}) \overline{k}_d}{R} + \overline{k}_d (\overline{p}^u + \overline{x}_{et} \overline{e}_{pe}) + \frac{(\overline{g}^h + \overline{x}_{et} \overline{e}_{he})}{2} R \right\} \tag{3}$$

Now,

$$\begin{aligned} \overline{c}^p &= (c^p_1, c^p_2, c^p_3, c^p_4, c^p_5, c^p_6), \overline{k}_d = (k_{d_1}, k_{d_2}, k_{d_3}, k_{d_4}, k_{d_5}, k_{d_6}) \\ \overline{p}^u &= (p^u_1, p^u_2, p^u_3, p^u_4, p^u_5, p^u_6), \overline{g}^h = (g^h_1, g^h_2, g^h_3, g^h_4, g^h_5, g^h_6) \\ \overline{e}_{oe} &= (e_{oe_1}, e_{oe_2}, e_{oe_3}, e_{oe_4}, e_{oe_5}, e_{oe_6}), \overline{e}_{pe} = (e_{pe_1}, e_{pe_2}, e_{pe_3}, e_{pe_4}, e_{pe_5}, e_{pe_6}) \\ \overline{e}_{he} &= (e_{he_1}, e_{he_2}, e_{he_3}, e_{he_4}, e_{he_5}, e_{he_6}), \overline{x}_{et} = (x_{et_1}, x_{et_2}, x_{et_3}, x_{et_4}, x_{et_5}, x_{et_6}) \end{aligned}$$

are hexagonal fuzzy numbers, the fuzzy total cost is given by,

Vinola Elisabeth and Rexlin Jeyakumari

$$\overline{TIC}(R_{sp}) = \left[\begin{array}{l} \frac{(c^p_1 + x_{et_1} e_{oe_1})K_{d_1}}{R} + K_{d_1}(p^u_1 + x_{et_1} e_{pe_1}) + \frac{(g^h + x_{et_1} e_{he_1})}{2} R, \\ \frac{(c^p_2 + x_{et_2} e_{oe_2})K_{d_2}}{R} + K_{d_2}(p^u_2 + x_{et_2} e_{pe_2}) + \frac{(g^h + x_{et_2} e_{he_2})}{2} R, \\ \frac{(c^p_3 + x_{et_3} e_{oe_3})K_{d_3}}{R} + K_{d_3}(p^u_3 + x_{et_3} e_{pe_3}) + \frac{(g^h + x_{et_3} e_{he_3})}{2} R, \\ \frac{(c^p_4 + x_{et_4} e_{oe_4})K_{d_4}}{R} + K_{d_4}(p^u_4 + x_{et_4} e_{pe_4}) + \frac{(g^h + x_{et_4} e_{he_4})}{2} R, \\ \frac{(c^p_5 + x_{et_5} e_{oe_5})K_{d_5}}{R} + K_{d_5}(p^u_5 + x_{et_5} e_{pe_5}) + \frac{(g^h + x_{et_5} e_{he_5})}{2} R, \\ \frac{(c^p_6 + x_{et_6} e_{oe_6})K_{d_6}}{R} + K_{d_6}(p^u_6 + x_{et_6} e_{pe_6}) + \frac{(g^h + x_{et_6} e_{he_6})}{2} R \end{array} \right]$$

Now we are going to defuzzify the total cost

$$\overline{TIC}(R_{sp}) = \frac{1}{12} \left[\begin{array}{l} \frac{(c^p_1 + x_{et_1} e_{oe_1})K_{d_1}}{R} + K_{d_1}(p^u_1 + x_{et_1} e_{pe_1}) + \frac{(g^h + x_{et_1} e_{he_1})}{2} R \\ +3 \frac{(c^p_2 + x_{et_2} e_{oe_2})K_{d_2}}{R} + K_{d_2}(p^u_2 + x_{et_2} e_{pe_2}) + \frac{(g^h + x_{et_2} e_{he_2})}{2} R \\ +2 \frac{(c^p_3 + x_{et_3} e_{oe_3})K_{d_3}}{R} + K_{d_3}(p^u_3 + x_{et_3} e_{pe_3}) + \frac{(g^h + x_{et_3} e_{he_3})}{2} R \\ +2 \frac{(c^p_4 + x_{et_4} e_{oe_4})K_{d_4}}{R} + K_{d_4}(p^u_4 + x_{et_4} e_{pe_4}) + \frac{(g^h + x_{et_4} e_{he_4})}{2} R \\ +3 \frac{(c^p_5 + x_{et_5} e_{oe_5})K_{d_5}}{R} + K_{d_5}(p^u_5 + x_{et_5} e_{pe_5}) + \frac{(g^h + x_{et_5} e_{he_5})}{2} R \\ + \frac{(c^p_6 + x_{et_6} e_{oe_6})K_{d_6}}{R} + K_{d_6}(p^u_6 + x_{et_6} e_{pe_6}) + \frac{(g^h + x_{et_6} e_{he_6})}{2} R \end{array} \right] \dots(4)$$

In the following steps, we use extension the lagrangean method to find the solutions of

R_1, R_2, R_3, R_4, R_5 & R_6 to minimize $\overline{TIC}(R_{sp})$

Step 1: -

Vinola Elisabeth and Rexlin Jeyakumari

$$\frac{1}{12} \left\{ \begin{aligned} & \frac{(c^p_1 + x_{et_1} e_{oe_1})K_{d_1}}{R} + K_{d_1} (p^u_1 + x_{et_1} e_{pe_1}) + \frac{(g^h_1 + x_{et_1} e_{he_1})}{2} R \\ & + 3 \frac{(c^p_2 + x_{et_2} e_{oe_2})K_{d_2}}{R} + K_{d_2} (p^u_2 + x_{et_2} e_{pe_2}) + \frac{(g^h_2 + x_{et_2} e_{he_2})}{2} R \\ & + 2 \frac{(c^p_3 + x_{et_3} e_{oe_3})K_{d_3}}{R} + K_{d_3} (p^u_3 + x_{et_3} e_{pe_3}) + \frac{(g^h_3 + x_{et_3} e_{he_3})}{2} R \\ & + 2 \frac{(c^p_4 + x_{et_4} e_{oe_4})K_{d_4}}{R} + K_{d_4} (p^u_4 + x_{et_4} e_{pe_4}) + \frac{(g^h_4 + x_{et_4} e_{he_4})}{2} R \\ & + 3 \frac{(c^p_5 + x_{et_5} e_{oe_5})K_{d_5}}{R} + K_{d_5} (p^u_5 + x_{et_5} e_{pe_5}) + \frac{(g^h_5 + x_{et_5} e_{he_5})}{2} R \\ & + \frac{(c^p_6 + x_{et_6} e_{oe_6})K_{d_6}}{R} + K_{d_6} (p^u_6 + x_{et_6} e_{pe_6}) + \frac{(g^h_6 + x_{et_6} e_{he_6})}{2} R \end{aligned} \right\}$$

With $0 < R_1 \leq R_2 \leq R_3 \leq R_4 \leq R_5 \leq R_6$; $R_2 - R_1 \geq 0$; $R_3 - R_2 \geq 0$ and $R_4 - R_3 \geq 0$ where $R_1 \geq 0$. Now let all the above partial derivatives equal to zero, and solve R_1, R_2, R_3, R_4, R_5 & R_6 , we get

$$R_1 = \sqrt{\frac{2(c^p_6 + x_{et_6} e_{oe_6})K_{d_6}}{(g^h_1 + x_{et_1} e_{he_1})}}$$

similarly, $R_2 = \sqrt{\frac{2 \times 3(c^p_5 + x_{et_5} e_{oe_5})K_{d_5}}{3(g^h_2 + x_{et_2} e_{he_2})}}$,

$$R_3 = \sqrt{\frac{2 \times 2(c^p_4 + x_{et_4} e_{oe_4})K_{d_4}}{2(g^h_3 + x_{et_3} e_{he_3})}}, R_4 = \sqrt{\frac{2 \times 2(c^p_3 + x_{et_3} e_{oe_3})K_{d_3}}{2(g^h_4 + x_{et_4} e_{he_4})}},$$

$$R_5 = \sqrt{\frac{2 \times 3(c^p_2 + x_{et_2} e_{oe_2})K_{d_2}}{3(g^h_5 + x_{et_5} e_{he_5})}}, R_6 = \sqrt{\frac{2(c^p_1 + x_{et_1} e_{oe_1})K_{d_1}}{(g^h_6 + x_{et_6} e_{he_6})}}$$

Step 2: -

Convert the inequality $R_2 - R_1 \geq 0$ into equality constrain $R_2 - R_1 = 0$ and optimize $TIC(R_{sp})$ subject to $R_2 - R_1 = 0$ by the lagrangean method.

Fix the constraints as $L(R_1, R_2, R_3, R_4, R_5, R_6, \lambda) = \rho [TIC(R_{sp})] - \lambda (R_2 - R_1)$

Vinola Elisabeth and Rexlin Jeyakumari

$$\frac{1}{12} \left\{ \begin{aligned} & \frac{(c^p_1 + x_{et_1} e_{oe_1})K_{d_1}}{R} + K_{d_1} (p^u_1 + x_{et_1} e_{pe_1}) + \frac{(g^h_1 + x_{et_1} e_{he_1})}{2} R \\ & +3 \frac{(c^p_2 + x_{et_2} e_{oe_2})K_{d_2}}{R} + K_{d_2} (p^u_2 + x_{et_2} e_{pe_2}) + \frac{(g^h_2 + x_{et_2} e_{he_2})}{2} R \\ & +2 \frac{(c^p_3 + x_{et_3} e_{oe_3})K_{d_3}}{R} + K_{d_3} (p^u_3 + x_{et_3} e_{pe_3}) + \frac{(g^h_3 + x_{et_3} e_{he_3})}{2} R \\ & +2 \frac{(c^p_4 + x_{et_4} e_{oe_4})K_{d_4}}{R} + K_{d_4} (p^u_4 + x_{et_4} e_{pe_4}) + \frac{(g^h_4 + x_{et_4} e_{he_4})}{2} R \\ & +3 \frac{(c^p_5 + x_{et_5} e_{oe_5})K_{d_5}}{R} + K_{d_5} (p^u_5 + x_{et_5} e_{pe_5}) + \frac{(g^h_5 + x_{et_5} e_{he_5})}{2} R \\ & + \frac{(c^p_6 + x_{et_6} e_{oe_6})K_{d_6}}{R} + K_{d_6} (p^u_6 + x_{et_6} e_{pe_6}) + \frac{(g^h_6 + x_{et_6} e_{he_6})}{2} R \end{aligned} \right\} - \lambda (R_2 - R_1) \dots\dots\dots (5)$$

Differentiating above equation with respect to $R_1, R_2, R_3, R_4, R_5, R_6, \lambda$ and equate to zero, we get

$$R_1 = R_2 = \sqrt{\frac{2 \left[(c^p_6 + x_{et_6} e_{oe_6})K_{d_6} + 3(c^p_5 + x_{et_5} e_{oe_5})K_{d_5} \right]}{(g^h_1 + x_{et_1} e_{he_1}) + 3(g^h_2 + x_{et_2} e_{he_2})}}$$

$$R_3 = \sqrt{\frac{2 \times 2 (c^p_4 + x_{et_4} e_{oe_4})K_{d_4}}{2(g^h_3 + x_{et_3} e_{he_3})}}, R_4 = \sqrt{\frac{2 \times 2 (c^p_3 + x_{et_3} e_{oe_3})K_{d_3}}{2(g^h_4 + x_{et_4} e_{he_4})}}$$

$$R_5 = \sqrt{\frac{2 \times 3 (c^p_2 + x_{et_2} e_{oe_2})K_{d_2}}{3(g^h_5 + x_{et_5} e_{he_5})}}, R_6 = \sqrt{\frac{2 (c^p_1 + x_{et_1} e_{oe_1})K_{d_1}}{(g^h_6 + x_{et_6} e_{he_6})}}$$

Here, $R_3 \geq R_4, R_4 \geq R_5, R_5 \geq R_6$. It does not satisfy the local optimum.

Step 3: -Now fix the constraints as $L(R_1, R_2, R_3, R_4, R_5, R_6, \lambda_1, \lambda_2) =$

$$\rho \left[TIC(R_{sp}) \right] - \lambda_1 (R_2 - R_1) - \lambda_2 (R_3 - R_2)$$

Vinola Elisabeth and Rexlin Jeyakumari
