ABSTRACT

In worldwide, biofuels are getting importance due to emerging energy demand and environmental concerns. For encouraging the production and use of biofuels, several countries have drawn various policy mechanisms, incentives and subsidies suiting to their domestic requirements Some of the countries have mandated ethanol blend with gasoline, while some other countries are looking for the ways to introduce them. In the above context, India has opted for Ethanol Blending Petrol program as a National Policy on Biofuels in 2018 and targets for 20% ethanol blending with petrol by 2025. The sugar factories are managing both the sugar production and sugar saccrification for ethanol production by diverting Syrup and B Heavy molasses. The study reveals the method for utilization of Muddy Juice for ethanol production for achieving EBP target. The work suggests to divert the intermediate muddy juice for fermentation process for dilution purpose with B Heavy molasses or with syrup and that paves way for enhanced ethanol production. This option also reduces the power and steam consumption along with the reduction of ground water consumption. Besides all, the proposed scheme will be remunerative in comparison with the production of sugar from the muddy juice.

Keywords: Biofuel; Ethanol; Sugar; Muddy Juice and Diversion

INTRODUCTION

Fossil fuels such as oil, coal and natural gases have become the chief sources of energy in the current era. However, it is anticipated that these sources will deplete within the next 40–50 years. The expected environmental damages like global warming, acid rain and urban smog have forced us to reduce the carbon emissions and shift toward utilizing a variety of renewable energy resources such as solar, wind, biofuel, etc. that are less environmentally harmful in a sustainable way. Ethanol is one of the most promising alternative biofuel. Although the energy equivalent of ethanol is 68% lower than that of petroleum fuel, the combustion of ethanol is cleaner (because it contains oxygen) and thus it recognizes as a potential biofuel alternative to gasoline. More recently, ethanol is identified as a fuel for the direct ethanol fuel cells (DEFC) and biofuel cells. Sugarcane and corn feedstock, are the main sources of ethanol.

Nevertheless, it is barely sufficient to meet the current demand [1].Some of the countries considering biofuels as a means to gain a comparative advantage over others in the global agricultural market sector as well as a way to increase their incomes resulting from exports [2,3,4]. At present, ethanol is the most widely used biofuel [5]. It has been predicted that by 2050, bioethanol and biodiesel will be the dominant fuel to power passenger cars and heavy vehicles. Automobiles powered by electricity, natural gas, and hydrogen are emerging, but the current liquid fuel supply systems restrict those from becoming the main stream [6]. Bioethanol is produced from biomass containing free fermentable sugars or complex carbohydrate that can be converted into soluble sugars for making it fermentable. The biomass utilised for ethanol production can be divided into three groups that are sugar /saccharine crops, starchy crops and lignocellulosic biomass. These three feedstocks differ significantly from each other with respect to the fermentable sugars extraction and utilization[7]. It is comparatively easier to produce ethanol from edible sources - sugars and starch than that of lignocellulosic biomass. Among the edible sugar source the sugary sources like sugarcane, sweet sorghum, sugar beet, etc., are considered to follow very simple process of bioethanol production. In many countries including India, the various streams of sugar processing products are being diverted for ethanol production by sacrificing sugar production. This includes predominantly Syrup, B Heavy Molasses and C Heavy molasses [8]. The current study discusses about the possibility of utilising the muddy juice of sugar processing unit for ethanol production.

MATERIALS AND METHODS

Collection of Muddy Juice and B Heavy Molasses

The muddy juice of about 90–95°C, received during the process of cane juice clarification was collected from Uttam Sugar Mills Unit to study the efficiency of muddy juice for alcohol production. The temperature of muddy juice was maintained at 80°C to avoid contamination or detoriation of sugar by microorganisms. The molasses from 2ndmaseccuite boiling of sugar which is called as B-Heavy molasses was collected from the storage of Experimental sugar factory of National Sugar Institute for the study.

Filtration of Muddy Juice

Juice extracted from the crushing mills containing impurities are removed by feeding on boiling into continuous clarifier by adding lime and heating the limed juice. The lime neutralises acids and precipitates impurities which "settle out" in clarifiers and are referred as Muddy Juice. Initially the muddy juice is filtered using muslin cloth followed by what man No: 1 filter paper. The clear juice obtained is utilized for the current study. The process flow diagram of Muddy Juice formation is given in the Figure 1.

Fermentation Study

Fermentation study was carried out in three different sets viz with Muddy Juice, B Heavy Molasses and Muddy Juice with B Heavy Molasses. All the three sets were analysed for pH, Total Dissolved Solids, Total Reducing Sugars, Specific gravity, Brix and Volatile Fatty Acids and then kept for fermentation at 30°C for 24 Hrs by adding commercial yeast, urea and ammonium phosphate. After 24 Hrs of anaerobic fermentation, the fermented wash is

analysed for Residual sugars and Alcohol%. A set is kept for analyzing unfermentable sugars (UFS) present in all Muddy Juice, B heavy molasses diluted with water and muddy juice. A model of Piping and Instrumentation diagram for utilizing the muddy juice in distillery for fermentation is given in the Figure 2 [9].

RESULT AND DISCUSSION

The muddy juice and B heavy molasses collected were subjected to various analysis and the results are given in the Table 1. Fermentation was carried out in three sets viz Muddy Juice, B Heavy Molasses diluted with water and B Heavy Molasses diluted with Muddy Juice. The B heavy molasses was diluted with water and Muddy Juice to set the initial TRS as 23%. The results observed following fermentation are given in the table 2. The fermentation was carried out at laboratory level with Muddy Juice showing untraceable UFS with initial TRS of 11.53%. B Heavy molasses diluted with water (BW) and B Heavy molasses diluted with muddy juice (BMJ) with 3.2% and 3.01% UFS were kept for fermentation with initial TRS of 23%. After 24 Hrs of fermentation, no residual sugar was identified in Muddy Juice fermented wash, and the residual sugar of 1.8% and 1.2% were found in BW fermented wash and BMJ fermented wash respectively. The alcohol % in the fermented wash of Muddy juice, BW and BMJ were found to be 5.78%, 10.80% and 11.22% respectively. The fermentation efficiency to produce alcohol at laboratory level was found to be 89.75%, 84.71% and 87.52% respectively. The Fermentation efficiency of BMJ is higher compared to that of BW and lower compared to that of muddy juice.

The results of the study reveals and suggests that the Muddy juice received during the process of cane juice clarification of about Temp of 90-95°C and Brix around 17 to 20 and Purity 65 to 70% may be utilized in the distillery for ethanol production. The muddy juice from the sugar factory can be filtered through double layered microfilters followed by cooling, to the temperature of 30-40°C. The cooled muddy juice can be pumped and sent to distillery fermenter for ethanol production as such or used to dilute the B heavy molasses.

The quantity of muddy juice diverted from 7000TCD sugar factory will be more than sufficient for running 60 KLPD distillery. The calculation will be as follows,
Crushing capacity/rate = 7000 TCD = 292 TCH
Muddy juice quantity (15% on cane) = 43.8T/Hr
Considering Muddy juice with Pol % = 12
Fermentable sugar per M.T. of muddy juice = 0.12 x 1.0526 = 0.126 T
Fermentable sugar available per Hr from muddy juice = 5.5 T/Hr.
For 60 KLPD, Fermentable sugar required = 3.88 T/Hr
Thus the Muddy juice quantity obtained from 7000 TCD sugar factory is sufficient for 60 KLPD distillery. Diversion of muddy juice to distillery not only enhances the bioethanol production it also conserves the steam and power required. While adopting the conventional method of recovery of sugar from Muddy juice, bagasse is consumed for mixing with muddy juice in rotatory vacuum filter and that bagasse is also conserved on diverting muddy juice to distillery following double layered vibro - screen filtration. The economics of Muddy juice diversion may be as given in the Table 3.

By diverting the Muddy Juice to distillery for ethanol production from sugar factory of 7000 TCD capacity to 60 KLPD distillery, the approximate profit of 20 lakhs/day may be earned with reference to the economics worked out in the Table 3.3. The muddy juice can be used to dilute the B heavy or C Heavy molasses in the distillery that reduces fresh water consumption for dilution. Thus dilution of Molasses with muddy juice adds additional advantage of reducing ground water extraction.

CONCLUSION

The study results paves way for increasing ethanol production from muddy juice, an industrial waste available from the sugar mills with the better profit. The diversion of muddy juice, the compressed sugar industry waste produced during filtration of cane juice, for ethanol production not only benefits the industry but also contributes to the broader goals of energy security and environmental sustainability that every country like India strives to achieve. More number of large scale trials need to be conducted at different sugar factories integrated with distillery for deriving at Standard Operating Procedures. The sugar factories may take up the trials along with the Government bodies with the permission of Ministry of Food and Public Distribution and Excise department. The sugar factories may come forward to take up the trials with the permission of government in order to support the country to attain the ethanol blending target. On deriving SOP through trials, the government may frame a clear roadmap for utilization of muddy juice for ethanol production that will benefit the nation as well as the industry. Thus muddy juice diversion to distillery for ethanol production will be better approach for the Sugar industries and Distilleries that are continuously striving to reduce the ground water extraction and saving the steam consumption.

ABSTRACT

Tissues like hemolymph, hepatopancreas, carapace, eye stalk, testis, ovary, egg and gills were screened for agglutinins and maximum hemagglutinating activity was documented. The hemolymph agglutinated cow, goat, buffalo, rat and mice erythrocytes; and the hepatopancreas extract agglutinated the erythrocytes of rats, goats and mice with much avidity. The pH and temperature sensitivity of the hemolymph agglutinin suggested its proteinaceous nature. The optimum pH was found to be from 7.5 to 8 and that of temperatures from 20°C to 30°C. The hemolymph agglutinin activity was dependent on calcium whereas manganese and magnesium showed a reduction in HA titre. However, all the cations tested documented an increase in HA titre at higher concentrations. Treatment with the calcium chelator tetrasodium EDTA showed a reduction in HA at 10 mM concentration. Hemagglutination inhibition experiments using glycoproteins and sugars revealed glycoproteins thyroglobulin and BSM and sugars N-acetyl glutamic acid and N-acetyl neuraminic acid, as the potent inhibitors that inhibited the agglutinin. The physicochemical analysis of the hepatopancreas agglutinin showed optimum hemagglutinating activity from pH 8-11.5 and temperature 0-60 °C. Cation dependency of the agglutinin showed an increase in HA titre with magnesium ions when compared to calcium and manganese ions. Treatment with calcium chelators EDTA and trisodium citrate did not affect the HA activity. The agglutinin was specifically inhibited by the glycoproteins lactoferrin and fetuin. Therefore, the

preliminary analysis of agglutinin sets the path for the isolation and analysis of the particular lectin and its application in diagnostics and targeted therapy against microorganisms and malignant cells. The FTIR analysis of both samples showed peaks at 1639 and 1637, confirming the presence of amide groups.

Keywords: Hemagglutinin, erythrocytes, glycoproteins, sugars.

INTRODUCTION

Invertebrates have a powerful and efficient immune system that relies on physiological barriers, cellular defences and humoral responses to combat infections. They lack adaptive immune responses and rely only on their innate immune system. Invertebrates' innate immune response depends heavily on germline-encoded molecules, lectins, β-1,3-glucan binding proteins and peptidoglycan recognition proteins to recognise non-self-entities (Paulchamy Ramaraj *et al.,*2022). Several lectins or agglutinins have been identified as valuable tools in fractionating and assessing oligosaccharides and glycopeptides because they specifically bind to N-linked oligosaccharide folds (Ravindranath *et al.,*1985). Agglutinins extracted from animal tissues were studied as anti-apoptotic, immunomodulatory, antiviral and anticancer therapeutic targets (Coelho *et al.,* 2017). Among the various classes of lectins isolated from invertebrates, sialic acid-specific lectins have gained prominence due to their function, which includes apoptosis induction, negative regulation of B cell signalling, cytokine secretion, induction and inhibition of bacterial and viral sialidases by altering the immune potency of sialoconjugates expressed on the microbial surface (Lehmann *et al.,* 2006; Elayabharathi *et al.,* 2020). The form of sialic acid and glycosidic interaction with the adjacent sugar in an oligosaccharide contribute to a remarkable diversity of sialyl epitopes in pathogenic bacteria and human cancer sialoconjugates (Mercy and Ravindranath, 1993).

Lectins have been identified in the immune system of marine crustaceans, such as lobster, crabs and shrimps which defend themselves from an invasion of bacterial, fungal and viral pathogens (Philip *et al.,* 2013). C- type lectin has been identified from *Portunus trituberculatus* (Kong *et al.,* 2008, Lu *et al.,* 2017), *Eriocheir sinensis* (Jin *et al.,*2013), *Travancoriana charu* (Sheeja and Basil Rose, 2016) and *Scylla paramamosain* (Jiang *et al.,* 2012). Sialic acid-specific lectins have been isolated from marine crabs *Liocarcinus depurator* (Fragkiadakis and Stratakis 1997),*Carcinoscorpius rotunda cauda* (Bishayee and Thambi Dorai, 1980) *Cancer antennarius* (Ravindranath *et al.,* 1985), *Atergatis subdentatus* (Denis *et al.,*2016), *Atergatis integerrimus (*Elayabharathi *et al.,*2020), *Grapsus albolineatus* (Rathika *et al.,*2022) and *Portunus reticulatus* (Paulchamy Ramaraj *et al.,*2022).

The hepatopancreas is an organ that stores and absorbs nutrients and is also the site for synthesising digestive enzymes. In times of a crisis such as starvation; and moulting or reproduction the energy required is obtained from the hepatopancreas. It is the major site for the synthesis of sex hormones and vitellogenin (Wang *et al.,* 2014). The hepatopancreas also plays a vital role in the immune process by limiting the microbiota as observed in HEP-CL a lectin identified in the hepatopancreas of shrimps (Cao *et al.,* 2021) and expression of PcLec3 a C-type lectin identified in the hepatopancreas of crayfish *Procambarus clarkii* which was up regulated on bacterial challenge suggesting hepatopancreas as a site of lectin synthesis (Zhang *et al.,* 2016). A calcium-dependent hepatopancreas lectin was isolated from *Oziotelphusa naga* that agglutinated rabbit erythrocyte. The lectin inhibited α-lactose and fetuin. The purified lectin had high antimicrobial activity towards the bacteria *Staphylococcus aureus, Klebsiella pneumoniae, Proteus mirabilis, Pseudomonas aeruginosa, E. coli* and fungi *Candida albicans* and *Aspergillus niger*(Vargila *et al.,*2024).

A perusal of the literature reveals a lacuna in the purification of a lectin from the hemolymph and hepatopancreas of marine crabs. Hence, the marine crab *Tumidodromia dormia* was selected for the identification and characterization of agglutinins which would help to purify the lectin and test for its biomedical applications.

MATERIALS AND METHODS

Collection of Crab

The crab *Tumidodromia dormia* was collected from the coastal area of Kela Manakudi, Kanniyakumari, Tamil Nadu, India (Latitude: 8.08583°N, Longitude: 77.48806 °E).

Preparation of Sample

Healthy crabs were selected to dissect parts of the body such as the carapace, eye stalk, hepatopancreas, testis, ovary, egg and gills. Tissues were washed with 0.7% saline and to prepare the extract, 100 mg of the tissue in 1 ml of cold TBS (Tris Buffered Saline: Tris HCl 50 mM, NaCl 100 mM, CaCl2 10mM, PH 7.5) was homogenized using a homogenizer to prepare the extract. The extracts were centrifuged at 4000 rpm for 10 minutes at 4°C and the supernatant was used for hemagglutination assay. The 3rd walking leg of the crab was cut using sterilized instruments and the hemolymph was collected in sterilized tubes and stored at 4°C, the crab was then safely let into its habitat. The hemolymph was centrifuged at 4000 rpm for 10 minutes at 4°C and the supernatant was used for hemagglutination assay.

Collection of Erythrocytes

Cow, goat, buffalo and pig blood samples were collected from slaughterhouses and the blood of rabbit was collected from a veterinary hospital by ear puncture and the blood of the rat by heart puncture. Blood samples were collected directly in sterile modified Alsever's medium, pH 6.1 (30 mM sodium citrate, 77 mM sodium chloride, 114 mM glucose, 100 mg neomycin sulphate and 330 mg chloramphenicol). Blood samples were suspended and washed three times with ten volumes of Tris-buffered saline TBS, pH 7.5 (Tris-HCl 50 mM, NaCl 100 mM, $CaCl_2$ 10 mM) and resuspended in the same 1.5% suspension.

Physico-Chemical Characterization

The hemolymph of the marine crab *Tumidodromia dormia* agglutinated the buffalo erythrocytes and hepatopancreas agglutinated rat erythrocytes. The characterization of the hemolymph and hepatopancreas agglutinin was carried out with buffalo and rat erythrocytes.

Stability of pH and Temperature

The pH and temperature dependence of the agglutinin was measured by pre-incubating the hemolymph and hepatopancreas extract at specific pH (5.5 - 11.5) and temperature (0ºC - 100°C) for 1 hour before adding erythrocyte suspension for hemagglutination assay.

Cations and EDTA Treatment

To study the divalent metal cation (Ca^{2+}, Mg^{2+} and Mn^{2+}) dependence of agglutinin, HA assays were performed in TBS (pH 7.5 for hemolymph and pH 8 for hepatopancreas) with these ions at varying concentrations (0 to 100 mM). To study the effect of calcium chelators (EDTA, EGTA and trisodium citrate) on the agglutinin, the hemolymph and hepatopancreas extract was pre-incubated at different concentrations (0.01 to 100 mM) of EDTA and trisodium citrate for 1 hour before adding erythrocyte suspension for HA assay.

Hemagglutination (HA) and Hemagglutination inhibition(HAI) assay

Hemagglutination and Hemagglutination inhibition assay were performed in 96 well, 'U' bottomed microtiter plates (Tarson, India) (Ravindranath and Paulson, 1987). The hemolymph and hepatopancreas extracts (25 µl) were serially diluted with TBS-BSA (25 µl, pH 7.5) and mixed with 25 µl of 1.5% mammalian erythrocyte suspension and incubated for 1 h at room temperature (30±2°C). HA titre was reported as the reciprocal of the highest dilution of agglutinin giving complete agglutination after 1 h. Hemagglutination inhibition assays were carried out by serially diluting 25 µl of known concentration of inhibitor (glycoprotein: 5 mg/ ml or sugar: 100 mM) in a microtiter plate with 25 µl of TBS - BSA. To each dilution, was added 25 µl of the hemolymph and hepatopancreas extract at the sub-

agglutination concentration (HA = 2). The inhibitor solution with the sample was incubated for 1 h at room temperature (30 ± 2 ◦C) and was mixed with 25 µl of 1.5% suspension of buffalo and rat erythrocytes. The HAI titres were reported as the reciprocal of the highest dilution of inhibitor giving complete inhibition of agglutination after 1 h.

FTIR analysis

FTIR analyses of the sample were done by KBr pellet in a 1:100 ratio and the spectrum was recorded using Shimadzu IR affinity – 1.

RESULTS AND DISCUSSION

Screening of tissues for hemagglutination activity

Tumidodromia dormia crab which lives in the shallow waters of the ocean is subjected to aquatic microbes and other pollutants. To overcome these stress factors the innate immune system of crabs produces agglutinin. Screening for the presence of agglutinins in *Tumidodromia dormia* documented the presence of agglutinin in the hemolymph and the hepatopancreas. The various tissue extracts of the crab were observed for hemagglutination activity. Carapace, eye stalk, testis, ovary, egg and gills failed to agglutinate the tested mammalian erythrocytes. HA activity was observed with the extracts of hepatopancreas against rat erythrocytes and hemolymph against buffalo erythrocytes.

The hemolymph agglutinated buffalo > goat > cow = rabbit erythrocytes. Maximum activity was observed with buffalo (HA = 128), moderate activity with goat (HA = 16) and minimal activity with cow and rabbit (HA = 2) erythrocytes (Table 1). A similar affinity was seen in *Scylla serrata* (Mercy and Ravindranath, 1993), *Charybdis feriatus* (Congjie *et al.,* 2006), *Portunus pelagicus* (Jayanthi *et al.,* 2017) and *Atergatis integerrimus* (Elayabhrathi *et al.,*2020). The hepatopancreas agglutinin was able to agglutinate rat> goat>mice erythrocytes. Maximum activity was noted against rat (HA= 512) and moderate agglutination with goat (HA=128) erythrocytes (Table 1). Similar affinity to rat erythrocytes was also observed in *Lamella lamellifrons* (Silvester *et al.,* 2022), *Varuna litterata* (Shoba and Basil Rose 2016) and *Grapsus albolineatus* (Rathika *et al.,*2022). The structural characteristic is an important factor for agglutinins to agglutinate cells which express mono or di or complex carbohydrate moieties on the surface (Barondes, 1988). The preferential agglutination of erythrocytes concurs with the results of hemolymph agglutinin of marine crab *Grapsus albolineatus* (Rathika *et al.,*2022) suggesting the affinity of the agglutinin to the sialic acid-specific sugars expressed on the erythrocytes surface. The failure to agglutinate other erythrocytes is the inability of the agglutinin to recognise the cell surface receptors present on the surface of the erythrocytes that cause agglutination (Shoba and Basil Rose, 2016). The lectins present in the serum of marine crustacea have distinguished binding specificity towards cell surface glycoconjugates of mammalian erythrocytes which has variation and is observed in the hemagglutination activity (Denis *et al.,* 2016).

Effect of pH and temperature on the hemagglutination of hemolymph and hepatopancreas agglutinin

The agglutinin of hemolymph of *Tumidodromia dormia* crab was pH and temperature-sensitive. The agglutinin was exposed to different pH and temperature for one hour. The hemolymph agglutinin was stable at a pH of 7.5 – 8 and a temperature of 20°C (HA = 128). The lectin of *Lamella lamellifrons* was sensitive towards pH and temperature (Mettilda Bai and Rose, 2020). The agglutinin of hepatopancreas was found to be pH-sensitive and a maximum HA of 2048 was observed from pH 8 to 11.5. The agglutinin activity was stable at temperatures up to 60°C with a HA value of 2048 up to 60°C and the activity seemed to gradually decrease when the temperature spiked up (Table 1). The agglutination of the hepatopancreas agglutinin was maximal at a pH of 8 and above. The variation of HA of agglutinin was due to the alteration in their structural conformation. At acidic pH, protonation of amino acid disrupts the binding site (Di Russo *et al.,*2012). In basic pH, the protonation of amino acids changes, affecting the shape and accessibility of binding sites and reducing the activity (Onufriev and Alexov, 2013). The basic solution does not denature protein like the acids, still they undergo partial unfolding that impairs their functional activity (Lapidus, 2017). Similar activity was noted in *Atergatis subdentatus* which had maximum activity at a pH of 6.5 to 8.5,

suggesting the adaptability of the crab to survive in slightly acidic to alkaline pH (Denis *et al.,*2016). Physicochemical characterization is a prerequisite for the purification of the specific lectin and to study of its biological application. At an optimum pH, the polymeric hemocyanin molecules that may be in equilibrium with the agglutinin molecules may get dissociated thus releasing the agglutinin and causing an increase in HA titre (Rathika *et al.,*2022). The hemagglutinability of the agglutinin of *Tumidodromia dormia* was stable from 4°C to 60°C and a further increase in temperature reduced the HA activity. It might be due to the denaturation of the protein and destabilization of the weak interaction between lectin and carbohydrate ligands causing attenuated agglutinating activity. Prolonged exposure to high temperatures may cause the protein to denaturize and destabilize the tenuous contact between the lectin/ agglutinin and its carbohydrate ligands, which results in diminished agglutinating activity, which could explain the drop in HA (Dilna *et al.,*2022). Hydrophobicity and electrostatic interactions between molecules and cysteine residues that promote the formation of disulphide bonds might be the reason behind stability at higher temperatures (Dilna *et al.,* 2022).

Cationic Treatment of Agglutinin

Treatment of hemagglutinin with cations documented the cation dependency of the agglutinins. The HA decreased with an increase in manganese and magnesium concentration and maintained stability up to 40 mM calcium and above 50 mM the HA titre increased moderately. This shows that the agglutinin present in the hemolymph of *Tumidodromia dormia* is dependent on manganese and magnesium (Table 3) and the intrinsic calcium is sufficient to maintain its agglutinin activity. The HA of hepatopancreas agglutinins decreased with an increase in calcium and magnesium concentration. In the case of manganese, the HA value of 1024 was retained up to 10 mM and showed a gradual decrease with an increase in concentration. This shows that the agglutinin present in the hepatopancreas of *Tumidodromia dormia* is dependent on cations (Table 4). Divalent cations also help align protein functional groups for ligand coordination and hold the lectin subunits together (Murali *et al.,*1999). Hemagglutinins' fundamental structure is significantly stabilized by both extremely low and high quantities of divalent cations (Anderson and Good 1975). Agglutinins need specific cations for optimal carbohydrate activity to stabilize the structure. In lower concentrations, the incomplete saturation of the metal-binding site leads to the carbohydrate-binding site not being fully activated and not sufficiently stabilized. This causes reduced or stable hemagglutinin activity. At higher concentrations of 50 mM and 100 mM, the cations completely occupy the binding site making the agglutinin stable and active, which enhances the affinity for carbohydrates (Mandal and Brewer 1993). The agglutinin activity reduces when cation levels deviate far from its range. The insufficient level of cations prevents activation, leading to stable or reduced activity of agglutinin leading to changes in ionic strength and protein conformation (Bouckaert et al.,2003). Crustacean agglutinins are usually calcium-dependent and differ significantly in their molecular structure and sugar preference (Mercy and Ravindranath, 1992). Only a few studies on crustacean lectins have shown that they are independent of divalent cations and insensitive to EDTA (Yang *et al.,*2007). Calcium-dependent agglutinin has been observed in almost all marine crabs like *Scylla serrata* (Philip *et al.,* 2013 and Jeyaraj *et al.,*2010), *Liocarcinus depurator* (Fragkiadakis and Stratakis 1997), *Cancer antennarius* (Ravindranath *et al.,* 1985) and *Atergatis integerrimus* (Elayabharathi *et al.,* 2020).

Treatment using Calcium Chelators

The hemolymph agglutinin was subjected to EDTA – Di and Tetrasodium EDTA, EGTA and Tri sodium citrate. When treated with tetrasodium salt the HA values were maintained at 32 at 0.01 mM, 0.1 mM and 1 mM and gradually decreased from 10 mM. When subjected to Disodium EDTA the HA value increased to 4096 at 1 mM and slowly decreased with increasing concentrations. In EGTA the HA was stable at lower concentrations (HA=128) and reduced at 50mM and 100mM. In the case of Tri sodium citrate, the value was constant in all concentrations above 0.1 mM. The chelators tetrasodium EDTA reduced the HA activity at 20 mM concentration (Table 5). The hepatopancreas agglutinin was subjected to EDTA – Disodium EDTA, Tri sodium citrate and Tetra sodium salt. When treated with Disodium EDTA the HA values were maintained at 2084 from 0.01mM, 0.1mM and 20 mM and gradually decreased from 30 mM. In the case of Tri sodium citrate and tetrasodium salt, the value was constant in all concentrations (Table 6) with an increase in HA when compared to O'Tris which is devoid of cations. At the concentrations of 0.01 and 0.1 mM of disodium EDTA small fractions of metal ions are available for binding. This

causes the agglutinin to become less active (Sharon and Lis, 2004). At low to moderate trisodium citrate concentrations citrate helps maintain a stable pH environment and stabilizes the protein structure which chelates free metal ions that destabilize or interfere with the function of agglutinin. At moderate to high concentrations citrate continues to enhance solubility, prevent aggregation and maintain the agglutinin in its active form which increases the activity (Kumari and Singh, 2011). A well-maintained pH can ensure that agglutinin remains in its active form since proteins are highly sensitive to changes in pH. Trisodium citrate acts as a buffer and maintains a stable pH in the solution that enhances carbohydrate-binding activity. Citrate is also known to stabilize agglutinin by interacting with their surface, binding to a positively charged amino acid which prevents aggregation and unfolding leading to increased activity as the concentration of trisodium citrate increases. At lower concentrations, tetrasodium EDTA binds to free metal ions which have minimal effect on agglutinin activity. Tetrasodium like other forms of EDTA is a strong chelator that binds divalent metal ions such as calcium and magnesium which are often required for the proper structure and functions of lectins. As the concentration of tetrasodium increases, it chelates more metal ions that are needed for structural stability and function, which interacts with ions that maintain the folding of proteins, resulting in partial or complete denaturation of agglutinin (Sharon and Lis, 2004). At increased concentrations, tetrasodium continues to remove metal ions like calcium and magnesium. The chemical environment of the binding site alters when the ions help positioning the sugar molecules making it less effective or completely inactive in recognizing and binding carbohydrates. The agglutinin lacks metal ions that are needed because the increased chelating effect strips away all the metal ions (Chatterjee and Bhattacharrya, 2007). EGTA is a calcium chelator with less affinity toward magnesium, it binds to calcium ions and removes them. In the concentration of 40mM EGTA, the calcium needed for agglutination is chelated resulting in a decrease in HA. Calcium ions help to maintain the structure while chelating calcium disrupts the structure (Loris, 2002). EGTA destabilizes the carbohydrate recognition domain leading to loss of agglutination activity (Weis and Drickamer, 1996). Only a few research on crustacean lectins has demonstrated that they are resilient to EDTA and unaffected by divalent cations (Elayabharathi *et al.,*2020).

Hemagglutination Inhibition Assay

The hemagglutination inhibition assay was done with glycoproteins and sugars to find the affinity that binds to the agglutinin of hemolymph and hepatopancreas extract. The HA activity of the hemolymph was inhibited when using thyroglobulin and BSM at a higher concentration with a HAI of 512 and in fetuin HAI of 2; and in the case of sugars, N acetyl glutamic acid and neuraminic acid inhibited a with a HAI of 64 (Table 7). Agglutinin activity of hepatopancreas extract was inhibited by D glucuronic acid with a HAI of 128 and other sugars such as D-fucose, N acetyl D glucosamine, muramic acid, GluNAc, methyl-D-Glu pyranoside, stachyose hydrate pronostachys, D-fructose, D-glucose, N acetyl glutamic acid, L-Rhamnose showed a minimum HAI titre. When tested with glycoprotein it was found that it had an affinity towards lactoferrin>fetuin, but failed to inhibit other glycoproteins tested (Table 8). The hemagglutinins of crab *Tumidodromia dormia* exhibited affinity towards the specific glycoprotein and sugars as evident with its specific recognition towards rat and buffalo erythrocytes which share a similar receptor (Chien *et al.,* 1978; Nowak *et al.,* 1986). The inability of other glycoproteins and sugars to prevent from clumping together suggests that a particular sialic acid linkage present in the terminal oligosaccharide may be the cause of the inhibition. (Mercy and Ravindranath, 1992). The BSM has 9-O acetyl and 8, 9- di- O - acetyl - N-acetyl neuraminic acid (Schauer 1982), thyroglobulin and fetuin have NeuGc (Spiro 1960; Graham 1966; Jeanloz 1966; Mc Quillan and Trikojus 1966; Yamamoto et al., 1981) as the sialic acid moiety (Slomiany et al., 1974). Lactoferrin has a single polypeptide chain, with double glycan attached to N-glycosidic linkages. They also have N-acetyl neuraminic acid, mannose, fucose, N-acetyl glucosamine and N-acetyl galactosamine (Coderville *et al.,* 1992). Similar results were reported in the hemolymph of *Lamella lamellifrons* (Bai and Rose 2022). The sugar residues to which sialic acid is connected, greatly influence the shape of the acid. The variations in the hemagglutination inhibitory potency of the glycoproteins and sugars also be explained by these variations in conformation(Berman, 1984).

FTIR analysis

The FTIR spectrum of the hemolymph and hepatopancreas extract of the marine crab *Tumidodromia dormia*. The Fourier Transform Infrared (FTIR) analysis of hemolymph revealed characteristic bands which included both proteins and sugars. The peak activity was observed at 3441 cm^{-1}, correlating with the highest transmittance at 486 cm^{-1}, indicating the presence of primary amines in the sample. Additionally, the strongest transmission for the carbonyl (C=O) group at 1639 cm^{-1} confirmed the existence of amides. Furthermore, the elevated transmittance at 486 cm^{-1} also suggested the presence of cycloalkanes. The hepatopancreas of *Tumidodromia dormia* exhibited major peaks at 3442.94, 2069.62, 1637.56, 1207.44, 1047.35 and 553.37cm^{-1}. The peak, 3442.94cm^{-1} proves an OH stretching vibration documenting the presence of alcohol or hydroxyl groups. The subsequent peak at 2069.62 cm^{-1} shows C≡C or C≡N stretching vibration which are not affected by hydrogen bonding. The peak 1637.56cm^{-1} indicates the functional groups as alkenes or amides in this region. Since the couple is found near 1550cm^{-1} it proves the presence of C=C alkenes. The peak 1207.44 cm^{-1} is assigned to have C-O stretching or aromatic bending. This indicates the presence of secondary or tertiary alcohols or esters present in the sample. The lowest peak of 553.37 cm^{-1}, reveals the presence of halogenated compounds or specific bending vibrations in aromatic systems. These results collectively provide critical insights into the molecular composition of the sample. The peptide group have amide I and amide II in the infrared spectrum. The amide I band is the C=O stretching vibration and is related to the backbone conformation while amide II is the N-H bending and C-N stretching vibration (Byler and Susi 1986). The parallel beta-sheet structure leads to an amide I absorption near 1640 cm-1. The spectral region between 1500 cm-1 to 1000 cm-1 represents the bands relevant to sugars and it corresponds to C-O bending and C-OH stretching. Further studies on the agglutinin conformation pave the way to analyse the α helix and β-sheet and thereby deduce the crystal structure by X-ray crystallography or NMR spectroscopy (Bonnin *et al.,* 1999).This study has paved the way to isolate a lectin and the purified lectin can be characterized and studied for its biomedical applications.

CONCLUSION

The identification of an agglutinin from the hemolymph and the hepatopancreas extract of *Tumidodromia dormia* which is specific to sialic acid can be tapped for antimicrobial and anti-cancerous activities. The agglutinins can be purified to obtain a potential lectin which can be used for diagnosis and treatment.

ABSTRACT

Human-wildlife coexistence has emerged as a pressing concern in contemporary conservation and sustainable development, fuelled by climate change, habitat encroachment, and the resurgence of certain wildlife populations. This article explores the conceptual frameworks, challenges, and potential strategies for fostering harmonious interactions between humans and wildlife in shared landscapes. Drawing upon interdisciplinary perspectives, it underscores the importance of integrating ecological, cultural, and socio-economic dimensions to address ethical dilemmas, divergent stakeholder values, and conflict resolution. Successful coexistence necessitates context-specific, adaptive approaches that reconcile biodiversity conservation with human well-being, ensuring the resilience of both ecosystems and communities.

Keywords: Human-wildlife conflict, conservation strategies, sustainable development, biodiversity management, ecological resilience

INTRODUCTION

Human interactions with wildlife are becoming more frequent due to factors such as climate change, habitat fragmentation, and the growing human population. Conservation efforts, while often successful in restoring wildlife populations, have also increased the chances of humans encountering wild animals in shared spaces. Consequently, understanding how humans and wildlife can coexist is becoming a priority, not only for the conservation community but also for policymakers, developers, and those living close to wildlife. Coexistence, as opposed to conflict, emphasizes a positive relationship, yet its study remains less defined. This article aims to explore human-wildlife

coexistence through interdisciplinary approaches, emphasizing its importance in shared multi-use landscapes and addressing the various factors that influence this dynamic.

DEFINING HUMAN-WILDLIFE COEXISTENCE

Human-Wildlife Conflict vs. Coexistence

The terms "human-wildlife conflict" and "human-wildlife coexistence" are often used interchangeably, but they represent different aspects of the human-wildlife relationship. Human-wildlife conflict refers to negative interactions, such as property damage, loss of livestock, or human injury caused by wildlife. Coexistence, on the other hand, refers to the ability of humans and wildlife to share landscapes in a way that minimizes conflict and promotes positive interactions. While coexistence may reduce conflict, it also encompasses a broader framework that includes tolerance, respect, and the development of strategies to sustain both human livelihoods and wildlife populations.

Challenges in Defining Coexistence

One of the challenges in studying human-wildlife coexistence is its inherent ambiguity. Unlike conflict, which can be quantified through incidents such as attacks or property damage, coexistence is harder to measure. It involves refraining from negative actions, such as retaliation against wildlife and often requires complex social, cultural, and ethical considerations. As Pooley (2021) notes, coexistence cannot be easily generalized, as it varies significantly between contexts and regions. This necessitates a localized approach, taking into account the specific species involved, human interests, and historical context.

DRIVERS OF HUMAN-WILDLIFE INTERACTIONS

Climate Change and Habitat Encroachment

As climate change alters ecosystems, wildlife is forced to move into new areas, often leading to increased human-wildlife interactions. Droughts, deforestation, and urban sprawl exacerbate habitat fragmentation, pushing species out of their natural ranges. This often leads to wildlife entering human-dominated landscapes in search of food, water, and shelter, resulting in more frequent interactions, both positive and negative (Linnell &Kaltenborn, 2020).

Conservation Success and Recovery

Paradoxically, conservation success stories, such as the recovery of large carnivores like wolves and tigers, have also increased the potential for conflict. As these species rebound and reclaim territories that overlap with human activity, coexistence strategies become crucial for maintaining biodiversity without compromising human safety or livelihoods. This highlights the need for forward-thinking conservation policies that anticipate and manage these interactions (Thinley et al., 2020).

Zoonotic Diseases and Wildlife Health

Human-wildlife interactions are also increasingly viewed through the lens of zoonoses—diseases transmitted between animals and humans. Recent pandemics, such as COVID-19, have brought attention to the risks of human encroachment into wildlife habitats. Effective coexistence must consider the management of wildlife health to prevent the emergence and spread of zoonotic diseases (Broz et al., 2019).

INTERDISCIPLINARY APPROACHES TO COEXISTENCE

Incorporating Social Science

Conservation science alone cannot address the complexities of human-wildlife interactions. Social science disciplines, including anthropology, sociology, and economics, provide critical insights into how different human communities perceive and interact with wildlife. For example, ranchers in the American West may have different concerns about wolf reintroduction compared to indigenous communities living near tiger reserves in India. Understanding these diverse perspectives is essential for developing coexistence strategies that respect local cultures while ensuring wildlife protection (Oommen et al., 2021).

Ethics and Coexistence

The ethical dimensions of human-wildlife coexistence are often overlooked. Ethical frameworks help evaluate the rights and responsibilities of both humans and wildlife in shared landscapes. For instance, does the survival of an endangered species justify restrictions on human activity, even if it imposes economic hardship on local populations? Conversely, what ethical responsibilities do humans have in ensuring the survival of species affected by human activities, such as deforestation or climate change? The need for a relational rather than a dualistic approach to human-wildlife coexistence has been highlighted by scholars like Schroer (2021), who emphasize the importance of considering the well-being of all species in a shared environment.

Valuation of Wildlife

Different ways of valuing wildlife also play a role in coexistence strategies. Wildlife can be valued for its ecological, economic, or cultural significance, and these values often conflict. For example, elephants are revered in many cultures but may also destroy crops, leading to economic losses for farmers. Addressing these competing values requires careful negotiation and, in some cases, compensation schemes to ensure that those living near wildlife are not disproportionately burdened by the costs of conservation (Bhatia, 2021).

CASE STUDIES IN HUMAN-WILDLIFE COEXISTENCE

Coexistence in Agricultural Landscapes

In many parts of the world, agricultural landscapes are shared with wildlife. For instance, farmers in South Asia often coexist with species like leopards, which occasionally prey on livestock but also control populations of smaller herbivores that damage crops. In such cases, coexistence strategies include non-lethal deterrents, such as predator-proof enclosures for livestock and compensation schemes for livestock losses. Thinley et al. (2020) describe how local communities in Bhutan have successfully adopted these measures, fostering a relatively harmonious relationship with wildlife.

Urban Wildlife Coexistence

Urban environments are increasingly becoming shared spaces for humans and wildlife, from raccoons and foxes to larger species like deer and even bears. In cities like Vancouver, Canada, and Oslo, Norway, urban planners are integrating wildlife corridors and green spaces to encourage coexistence with species that have adapted to urban life. These spaces not only provide critical habitat for wildlife but also offer educational opportunities for urban dwellers to learn about and appreciate their local fauna (Martin et al., 2019).

Indigenous Approaches to Coexistence

Indigenous communities have long histories of coexisting with wildlife, often in ways that differ significantly from Western conservation models. For example, the Maasai people of East Africa have traditionally coexisted with large herbivores and predators, maintaining sustainable practices that ensure both their survival and the well-being of the ecosystem. Oommen et al. (2021) emphasize the importance of incorporating indigenous knowledge and practices into modern conservation efforts, as they offer valuable lessons in long-term coexistence.

STRATEGIES FOR FACILITATING COEXISTENCE

Education and Awareness Campaigns

Public education is a key tool in promoting coexistence. Misconceptions about wildlife can lead to fear and hostility, making it harder to foster tolerance. For instance, many people fear predators like wolves or sharks, even though the risk of attack is extremely low. Education campaigns that focus on the ecological benefits of these species, as well as practical advice on how to avoid conflict, can help reduce negative perceptions and promote coexistence (Glikman et al., 2020).

Community-Based Conservation

Community involvement is crucial in developing effective coexistence strategies. Conservation projects that work closely with local communities, offering them a voice in decision-making and tangible benefits, are more likely to

succeed. For example, the Snow Leopard Trust in Central Asia engages local herders in snow leopard conservation by providing them with alternative livelihoods, reducing their reliance on livestock and, consequently, their incentive to retaliate against predators (Bogezi et al., 2019).

Technological Solutions

Innovations in technology are also contributing to coexistence efforts. For example, GPS collars and satellite tracking allow wildlife managers to monitor animal movements and intervene before conflicts arise. In areas where elephants pose a threat to crops, early warning systems that alert farmers to approaching elephants can help reduce crop damage and prevent retaliation (Pettersson et al., 2020).

THE FUTURE OF HUMAN-WILDLIFE COEXISTENCE

Adapting to Changing Landscapes

As human development continues to expand, the need for adaptable and flexible coexistence strategies will become more urgent. Conservationists, urban planners, and policymakers must collaborate to create multi-use landscapes that prioritize both human needs and wildlife conservation. This includes designing infrastructure that minimizes habitat fragmentation, such as wildlife overpasses and underpasses, and promoting sustainable agricultural practices that support biodiversity (Kaltenborn& Linnell, 2020).

Policy and Governance

Governments have a key role to play in facilitating coexistence. This involves enacting policies that protect critical habitats, regulate land use, and provide incentives for coexistence, such as compensation schemes and subsidies for conservation-friendly practices. International cooperation is also essential, particularly for species that cross national borders, such as migratory birds or large carnivores like tigers and wolves. Effective policy frameworks should be adaptive and grounded in ecological, economic, and social realities, ensuring long-term sustainability for both wildlife populations and human communities (Linnell et al., 2020).

Sustainable Development and Conservation

A central tenet of human-wildlife coexistence is the integration of sustainable development goals (SDGs) with conservation efforts. SDG 15, which focuses on life on land, calls for the protection, restoration, and promotion of sustainable use of terrestrial ecosystems. Human-wildlife coexistence directly ties into this by ensuring that economic development does not come at the expense of biodiversity. Efforts to reconcile economic growth with conservation, such as ecotourism or sustainable agriculture, can create win-win scenarios where both humans and wildlife thrive (Kideghesho et al., 2019).

CONCLUSION

Human-wildlife coexistence is not merely about avoiding conflict; it is about fostering a relationship that respects both human and animal needs in shared landscapes. Achieving coexistence requires interdisciplinary collaboration, combining insights from conservation biology, social sciences, ethics, and governance. It demands localized strategies that account for the specific challenges and opportunities within each community, species, and ecosystem. As human populations continue to expand and habitats shift due to climate change, coexistence will become an increasingly critical component of conservation efforts. Through adaptive policies, community engagement, education, and innovative technologies, coexistence can serve as a guiding principle for sustainable human development and biodiversity preservation.

ACKNOWLEDGEMENT

I sincerely thank the Principal of Suri Vidyasagar College and the Head of the Department of Zoology for their invaluable support and guidance, which greatly contributed to the completion of this article.

ABSTRACT

Several women rely heavily on cosmetics in their daily lives. It enhances and fascinates one's appearance and conceals scars, bruises, and spots. With the rise of numerous new cosmetics brands and their indiscriminate use, it is essential to understand how their use and management can impact one's skin and health. They are an integral part of women's lives and will continue to be so. Some products, such as compact powder, kajal, lipstick, lip tint, and mascara, are used daily. Cosmetic products primarily contain water, oils, and chemical components, which can provide an ideal breeding ground for microorganisms. In today's beauty-conscious world, sharing lipstick and makeup may appear harmless. Still, it harbors a variety of microorganisms that put people at risk of contracting various skin and eye problems, such as breakouts, itching, redness on the face, and around the eyes, as well as irritated eyes. Also, the limited shelf life of makeup products and our continued use of them after their expiration date are other major concerns. In this research, the testers, expired products, and products that are shared among peers, especially by young students, have been collected, and the microorganisms have been isolated. Following pure culture preparation, the samples were subjected to several tests, including gram staining, antibiotic resistance testing, and biochemical testing, which enabled us to determine the likely microorganisms present in the samples.

Keywords: antibiotic resistance test, biochemical characterization, cosmetics, microorganisms, staining.

INTRODUCTION

Cosmetics have been a part of our daily lives ever since ancient times. The records of the use of cosmetics in ancient Egypt, India, and China prove their presence and need in the functioning of society (Nayak & Ligade, 2021). The main purpose of cosmetics is to enhance one's appearance and conceal the flaws one wants to hide. In ancient times, cosmetic products were also used for medicinal purposes apart from their beauty appeal. The same cannot be said for the products in today's market. These products are important to women's lives and will continue to be so. Some products, such as compact powder, kajal, lipstick, lip tint, and mascara, are used daily. With the increase in their use and the rise of many new and upcoming cosmetics brands, it has become necessary to understand how their use and management can affect one's skin and health (Mitsui, 1997). The presence of cosmetics in our daily lives also comes with practices that seem harmless initially but aren't in their long run. One of the practices used by people when using cosmetics is the sharing of products among peers and family members. Though it seems harmless, the sharing of cosmetics has been attributed to various skin and eye problems such as breakouts, itching, redness on the face, and around the eyes, as well as irritable eyes (Sędzikowska *et al.* 2021). The sharing of makeup products is not the main culprit that leads to such consequences; rather, it is the limited shelf life of these products and our consumption of them even after their expiry date (Giacomel *et al.*, 2013, Halla *et al.*, 2018). The expiry date of these products is quite ambiguous as they do not tend to share a specific date; rather, it is based on when one decides to open and use the product, which also puts one at risk of contracting infections. Makeup products with high costs can be tried using the testers, not realizing that it is used by multiple customers which can cause serious health issues upon poor handling of makeup products (Chen & Li, 2022). The reason cosmetics lead to such issues is that these products primarily contain water, oils, and chemical components, which can provide an ideal breeding ground for microorganisms (Almoughrabie *et al.*, 2020, Tang & Du, 2024). In this article, we set out with three major characterizations of the cosmetics samples: Tester; available at shops for consumer's feasibility, expired products beyond their shelf life, and used/shared products. The samples were then inoculated, and we isolated various bacteria and were tested through a series of tests, which included the Gram staining, antibiotic resistance test, and biochemical tests, which helped us identify the probable microorganisms found in these samples.

MATERIALS AND METHODS

Survey

A small survey was conducted among undergraduate students to understand the frequency with which people tend to use cosmetics and whether they have ever experienced any sort of reaction after using testers.

Sample collection

The cosmetic samples were collected from shops selling makeup products that had testers for consumers to try. The samples were a mix of different brands and products: lipstick, blush, and compact. The expired products collected were those that were beyond their shelf life and were still being used by people. They consisted of lipstick, compact, and primer. The used products were shared among peers and family and contained lipstick, blush, compact, and lip balm. In total 11 samples were collected and labeled as A, B, C, D, E, F, G, H, I, J, and K. The tester samples included Lipstick [A (TL)], Blush [B (TB)], and Compact [C (TC)]. The expired samples include Lipstick [D (EL)], Compact [E (EC)], Primer [F (EP)]. The used/shared samples include Lipstick [G (UL)], Blush [H (UB)], Compact [I (UC)], Lip Balm [J (ULB)], Concealer [K (UC)] The samples were collected from various cosmetics brands under sterile conditions and allowed to grow in the nutrient broth for 12-18 hours at 90 rpm at 37°C. The samples were then streaked on the agar plates and incubated at 37°C for 18 hours. Growth was observed in all the plates, and the colonies were marked in each sample. The individual colonies from each sample were then inoculated in LB broth and allowed to grow at 37°C at 90 rpm for 18 hours. A total of 19 colonies were identified, and we proceeded with the preliminary identification of individual colonies.

Preliminary Tests

Gram staining

Gram staining was done on all the isolated cultures to differentiate the strains based on their cell wall.

Antibiotic resistance test

The isolated microorganisms were tested against a few antibiotics to identify their sensitivity/ resistance to the same. The autoclaved nutrient broth agar was poured on petridishes and allowed to cool down. Once the agar had solidified, bacterial samples were inoculated onto different agar plates using the spread plate method. The antibiotic discs for streptomycin, gentamycin, tobramycin, and cefazolin were placed on the agar and incubated overnight at 37 °C. After the incubation period, the zone of inhibition was measured (mm) and tabulated.

Biochemical tests

The tests conducted to identify the bacteria include the Urease test, starch hydrolase test, Caesin hydrolase test, gelatin test, and catalase test.

Urease test

The urease test helps in the identification of microorganisms that can produce urease enzymes. Urease production was indicated by a bright pink (fuchsia) color on the slant; to eliminate protein hydrolysis as the cause of a positive test, we used a control medium lacking urea.

Amylase production test

The amylase production by the bacteria can be identified based on their ability to degrade starch in the medium, which results in blue coloration upon the addition of iodine. The bacterial isolates were tested for amylolytic activity after incubating the inoculated plates for 48 hours by adding 2-3 drops of 10% iodine solution to the starch plate.

Casein hydrolysis test

Casein hydrolysis can be demonstrated by supplementing the nutrient agar medium with milk. A clear zone around the bacterial growth is positive (*Bacillus and Clostridium*), and the absence of a clear zone is a negative reaction (*E. coli*). Following incubation, we observed the plate for the development of a clear zone of casein hydrolysis around the line of bacterial growth.

Gelatin test

Hydrolysis of gelatin can be determined by growing microorganisms in nutrient gelatin. Once the degradation of gelatin occurs in the medium by an exoenzyme, it can be detected by observing liquefaction. A clear zone around the growth in the petriplate indicates gelatinase synthesis. After 48 hours of incubating inoculated plates, liquefaction of gelatin due to the production of gelatinase was observed, and results were noted.

Catalase test

The test is used to check microorganisms that produce catalase enzymes. The catalase enzyme produced by these bacteria will neutralize the hydrogen peroxide, and bubbles will be created that are indicative of a positive test; the absence of bubbles is a negative result.

RESULTS

A survey was undertaken on the sharing of making products amongst friends, family, and acquaintances. The purpose of the survey was to find the potential source of contamination and its repercussions. The following data was interpreted based on the survey conducted. Sharing of makeup products was a common practice wherein the majority of people, i.e., 58.3%, shared their makeup products sometimes, and 25% shared only a few products; very few, about 12.5%, did not share their makeup products at all. Salons are the most common site for contamination of

makeup products, brushes, aprons, towels, etc. The survey revealed that a significant number of people go to salons for various services and end up getting infections due to unhygienic practices. The survey also included the frequency of using a tester before purchasing any makeup products. Half of the percentage of people use a tester before buying makeup products, and the other half also depend on a tester, but only for certain items. This shows that the usage of testers is a common practice among consumers, which leads to contamination of products, causing infection and other skin problems. While some individuals clean the testers before use, many are unaware of the potential risks associated with sharing makeup products. This lack of awareness highlights the need for better hygiene practices in stores and the importance of educating consumers on the dangers of using communal testers. Our survey also found that a significant number of respondents have experienced skin issues after using makeup testers, prompting the question of whether these testers should be replaced with single-use samples. Overall, our survey sheds light on the impact of contaminated makeup on skin health and underscores the need for increased vigilance and awareness among both consumers and retailers. Whether you're a makeup enthusiast or a casual user, it's essential to consider the potential risks involved in using communal testers and take steps to protect your skin.

Gram Staining

The individual colonies were tested using the Gram staining procedure, and the results are tabulated here. We observed 13 Gram-negative bacteria and 6 Gram-positive bacteria. Interestingly, the strains found in expired products were all gram-negative.

Antibiotic resistance test

The inhibition zone exhibited by the different bacterial strains to resist the presence of four different antibiotics is shown in Fig. 1 below. The bacterial strain (Gram-negative) found in the expired lipstick exhibited the highest inhibition zone of 31mm against Gentamycin and Tobramycin. Except for a few bacterial isolates, most of them are found to be resistant to Cefazolin, since there is no inhibition zone. The lowest inhibition zone of 12mm was observed in the sample (Gram-negative) of used/shared blush against Tobramycin. Similarly, two isolates from used/shared lipstick were also found to be more resistant to Tobramycin, where the inhibition zone was found to be 14 and 16.5mm, respectively. The bacterial strain isolated from the compact was also found to be resistant to the inhibition zone of 16mm against Streptomycin. The presence of resistant bacteria in use/shared samples is a major concern in spreading infection and the development of resistance to antibiotics. In the tester samples, the bacteria isolated from blush and compact exhibited the lowest inhibition zone of 17 -17.5mm against Gentamycin. The bacterial isolates from expired samples were found to be more sensitive to all the antibiotics tested by showing a higher inhibition zone.

Biochemical tests

Urease test

A dark pink color indicates a positive result, and no color change indicates a negative result. Since a dark pink color was observed, all ten colonies tested positive for urease synthesis.

Amylase production test

A clear zone and dark blue coloration around the organism indicate positive starch hydrolysis. Out of the ten colonies, only one showed a negative result for amylase production, and the rest of the nine colonies were able to produce amylase.

Casein Hydrolysis Test

A clear zone around the bacterial growth is positive, and the absence of a clear zone is a negative reaction. Two colonies tested negative for casein production, whereas the rest were all positive.

Gelatinase Test

No bacterial growth was seen in any of the petri plates. However liquefaction of gelatin agar was observed in all of them, which is a positive result as it indicated that they produced gelatinase. The probable strains could be *B. subtilis* and *Proteus vulgaris*. Table 1 summarizes all the test results.

DISCUSSION

Cosmetic microbiology is a complicated field because there are numerous different formulations, manufacturing processes, and products that are used by a wide variety of consumers in many different environments. The formulation of these products also poses risks to the healthy bacteria present on one's skin, thus leading to a skin microbiota imbalance (Zhang *et al.*, 2023, Wagner *et al.*, 2024). The main purpose while manufacturing and formulating a cosmetic product is to enhance its shelf life for a longer period and present stronger formulas to appeal to the consumer (Kerdudo *et al.*, 2014, Maitra & Brahms, 2007). Microbial contamination in cosmetic products may happen at the time of manufacturing or at the time of use (Michalek, John, & Caetano dos Santos, 2019, Jairoun *et al.*, 2020). They not only degrade the quality of the cosmetic products, but also the metabolic products of the microorganisms can cause several allergic reactions in the skin and eyes/ mild or severe disease depending on the site of application (Bashir & Lambert, 2020). The cosmetics industry is a vast and booming industry with a turnover of almost 32 billion US dollars, and a large amount of revenue earned by these companies comes from their face products, which account for 31.114 billion US dollars in 2023 (Fortune Business Insights, n.d., Dhapte-Pawar *et al.*, 2020). This is indicative of the amount by which people now invest in cosmetic products. The cosmetic laws in India regulate the manufacturing, import, and raw materials used in these products (Central Drugs Standard Control Organisation, n.d.). There are no laws regulating the use of testers and the shelf life of the products in the market, making it difficult for the consumer to understand the source of their infection or breakouts. The various tests carried out to identify the presence of different bacterial growth in the cosmetics products provided us with some promising results, indicating the presence of bacteria that lead to a plethora of skin and eye problems. The survey revealed that a large proportion of people share their products and rely on testers to buy products.

The Gram staining helped us broadly classify the bacterial growth that might be present in these products. All the samples tested were positive for either gram-positive or gram-negative bacteria, indicating the presence of bacterial growth. All four samples under the category of expired products were found to be gram-negative. It can be speculated that these products carry bacteria ranging from *Neisseria gonorrheae and Neisseria meningitides, Moraxella* species, *Escherichia coli, Pseudomonas* species, *Proteus* species, and *Klebsiella* species. These bacteria are known to cause acute respiratory diseases, skin and eye infections, and in severe cases, lead to meningitis and sepsis. It has been reported that nanoparticles released from cosmetic products, which include powders or setting sprays, tend to cause respiratory diseases (Nazarenko, Yevgen *et al.*,2012). This further cements that the use of cosmetic products beyond their shelf life should not be used and can cause more harm than good. The samples show varied antibiotic resistance. The antibiotic resistance test using four different types of antibiotics helps define the inhibition zone of the bacteria. The used/shared samples were measured with an inhibition zone of 14 and 16.5mm. This was the smallest inhibition zone measured among all the samples, citing the fact that the bacterial growth present in the used and shared samples tends to develop higher levels of antibiotic resistance. The presence of antibiotic-resistant bacteria in the shared/used samples makes it difficult to treat them if any infection/allergy arises. Thus, putting the person at more risk and leading to further complications that arise due to bacterial infection. The tester samples also showed a low inhibition zone of 17 -17.5mm, which is greater than the used/shared samples. This shows that sharing cosmetics increases the risk of exposing oneself to antibiotic-resistant bacteria. Testers are equally harmful, but the probability of exposing oneself to bacterial growth in testers is less than compared of the ones present in shared/used products. Sharing of your cosmetics among peers and family tends to occur more frequently. Casein hydrolysis and Gelatin tests reveal the presence of *Bacillus* or *Proteus* and *E. coli* or *Enterococcus* in the tested samples. Casein hydrolysis deals with the testing of three microorganisms *B. subtilis, E. coli,* and *Proteus vulgaris*. Apart from sample A (TL)-Tester Lipstick, B (TB)- Tester Blush, and J (ULB)- Used Lip Balm, all other samples clear zone around the

bacterial growth was observed which is a positive result for the presence of either *Bacillus or Proteus*. The negative result may be due to the presence of *E. coli* or *Enterococcus*. In the hydrolysis of gelatin, no bacterial growth was seen in the Petri plate, but liquefaction of gelatin agar was observed, which is a positive result denoting the presence of *B. Subtilis or Proteus vulgaris* as they produce gelatinase. In sample (TL)-Tester Lipstick, fungal growth was also observed. The presence of these bacteria in the samples raises serious health concerns as they have been linked to serious infections ranging from skin outbreaks, to respiratory diseases, and urinary tract infections. The presence of fungal growth in one of the testers can lead to fungal acne and fungal growth which not only poses concern for one's physical being but also jeopardizes their mental well-being. Based on our results, we can speculate that the type of microorganism present in the testers may be *Bacillus*, *Pseudomonas*, *C. acne,* or *Proteus*. Some of these organisms have been reported to cause skin infections/acne/abscesses. The bacteria *Cutibacterium acnes*, found in the testers are associated with triggering acne (Dréno, B. *et al.* 2018). *Cutibacterium acnes* is also reported to balance the skin microbe and is the normal resident of the skin under normal conditions but during the excessive production of sebum and hormonal changes they tend to induce an inflammatory response and trigger acne (Dréno, B. *et al.* 2018). This suggests that the different bacteria identified in these products can cause an imbalance of the skin microbe which leads to a series of negative reactions and inflammatory responses by the immune system (Zhang, Wei *et al*. 2023).

CONCLUSION

The nature and level of contamination in used cosmetic products and the presence of antibiotic-resistant strains indicate the need for greater user awareness and education. This information could be useful for manufacturers, regulators, and healthcare providers, who may need to treat patients experiencing skin infections caused by organisms of unknown provenance. This study is a significant contribution to the distribution of microbiota within cosmetic products. The findings of this study could be helpful for those producing novel challenge tests in experiments to develop guaranteed ways of preserving cosmetic products by identifying the most prevalent types of bacteria. This study revealed two important elements: Firstly, the moisture content (water) may be the most frequently included ingredient that poses a clear possibility for the growth of microbes. Secondly, the presence of a resistant microbial population in the tester and shared products is a serious warning to regularize the use of testers.

ABSTRACT

Senna alata (L.) Roxb. and *Sida acuta* Burm. f. are widely used against different diseases by different ethnic communities of Assam, India. The present study deals with their phytochemical analysis of leaf by conducting Gas Chromatography Mass Spectrometry (GC-MS), along with to explore the antimicrobial potential of leaf extracts against two common pathogens such as *Staphylococcus aureus* and *Escherichia coli*. The GC-MS analysis revealed presence of 23 different phytocompounds in *S. alata* and 25 in *S. acuta*. The chloroform extracts from both plants exhibited minimal inhibitory effects against the tested bacteria. In contrast, the ethanolic extract of *S. alata* demonstrated notable antibacterial activity, achieving the largest mean zone of inhibition (21.33 ±0.57 mm) at 400 mg/mL and a moderate zone (11.34 ±1.15 mm) at 50 mg/mL against *S. aureus*. Meanwhile, the ethanolic extract of *S. acuta* was only effective at 400 mg/mL and 200 mg/mL, indicating comparatively lower antimicrobial potency. These findings underscore the superior efficacy of the ethanolic extract of *S. alata*, particularly against Gram-positive bacteria.

Keywords: Assam, GC-MS, Leaf, *Senna alata, Sidaacuta*

INTRODUCTION

The state of Assam is a part of northeastern region of India is homeland of many ethnic communities [1]. There are different ethnomedicinal practices of these indigenous group. During field surveys conducted in Chepena Kubua village of Golaghat district of Assam, some ethnobotanical practices were recorded against the leaf of *Senna alata*

(Fabaceae) and *Sidaacuta* (Malvaceae). In the study area, the leaves of *S. alata* were used tropically against skin diseases, and as a tonic. There are multiple uses of the leaf of this species in Assam e.g. abscesses [2], allergy [2-3], constipation [4], deworming [5], eczema [6], skin diseases [7], ringworm [8-10] etc. While leaf of *S. acuta* was used against headache and skin infections in ChepenaKubua. In Assam, its leaves were used against cut and wounds and to prevent bleeding gum [11], boils and abscess [12]; root as astringent, blood purifier, digestion, diuretic and in urinary diseases [13], jaundice [14], pneumonia [15] etc. The whole *S. acuta* plant is also used against bronchitis, diarrhea, dysentery, fever, skin diseases etc. in India [16]. Different phytocompounds of the leaf of these species were reported by many workers from different places. Hence leaf phytoconstituents varies in different places which may affect its biological activities. Therefore, in the present study, phytochemical analysis of the leaves of both species collected from Assam is re-examined by conducting GC-MS analysis along with comparative antimicrobial activity of leaves against two microorganisms viz. gram-positive *Staphylococcus aureus* and gram-negative *Escherichia coli*. The present study also attempts to compile the previously reported phytocompounds based on available literature to highlight its diversity of phytocompounds.

MATERIAL AND METHODS

Field survey, herbarium, GC-MS

The collected plants were identified based on relevant literature [17-18], and prepared vouchers [19] were kept at the herbarium of the Department of Botany, University of Science and Technology Meghalaya. For phytochemical analysis, the leaves were washed carefully and dried at the room temperature for 4-5 days, then powder were prepared. Fine powders (20 gm) were subjected to chloroform and ethanolic extraction by using standard procedure [20]. Qualitative screening was performed using the standard methodology [21-22]. The GC-MS analysis of these extracts was performed at Central Instrumentation Facility of the University of Science and Technology Meghalaya.

Microbial study

The bacterial strains were collected from the Department of Applied Biology, University of Science and Technology, Meghalaya. From each glycerol stock of bacteria, 50µl were taken-out and added into two separate test tubes containing nutrient broth with appropriate amount of antibiotics and antifungal for the selective growth of the bacteria. Those test tubes were then incubated for about ~18-19 hours in an incubator at 37°C [23]. After incubation, a bacterial suspension was prepared by adding small amount of the newly cultured bacteria into a sterile saline (0.85% NaCl) solution with the help of a sterile cotton swabs and adjusted its turbidity to 0.5 McFarland standards which were later used for antimicrobial analysis [24]. The antimicrobial activity of the selected leaf extracts was measured by determining the zone of inhibition. For the determination of the zone of inhibition or diameter of inhibition by the plant extracts, agar well-diffusion method was used [25] with slight modifications. Muller Hinton Agar (MHA) media was prepared by mixing 19 grams of MHA with 500ml of distilled water while maintaining the PH 7.4 using standard procedures [26]. Inside a laminar air-flow, 10 ml of MHA media was poured into each petri-plate and let it sit for couple of minutes with its lid little open for solidification. With reference to the procedures [27], 100µl of the prepared bacterial suspension was inoculated into the media and spread evenly with a cotton swab. Wells of 6 mm in diameter were punched on the agar with a sterile cork-borer. The plants extract at different concentrations (25, 50, 100, 200 and 400 mg/ml) poured into separate wells. After proper diffusion of the extract into the medium, the plates were incubated at 37°C for 24 hours, and thereafter observed for zones of inhibition.

RESULTS AND DISCUSSION

Phytocompounds in the leaf of *S. alata*

The GC-MS analysis of chloroform extract (Fig. 1A) recorded a total of 16 phytocompounds, and nine in ethanolic extract (Fig. 1B). The phytocompounds in chloroform extract are 2,4-Di-tert-butylphenol; Methyl palmitate; 1-Hexadecanol; Ethyl hexadecanoate; Eicosane, 2-methyl; Methyl 11- octadecenoate; Octadecane; Neophytadiene; (E)-9-octadecenoic acid; Tridecane, 2-methyl; 1-Decanol, 2-hexyl; Phytol; 10-Heneicosene (c,t); Oxalic acid, hexadecyl

ester; n-Eicosane; 1,19-Eicosadiene. In ethanolic extract the recorded compounds are D-arabitol; Oxirane, 2-butyl-3-methyl-; d-Galacto-heptulose; Pentadecane, 7-methyl; 3-O-Methyl-d-glucose; Heptadecane, 2,6-dimethyl; Neophytadiene; 5-Nonadecen-1-ol; and Phytol. However, two common compounds found in both extracts i.e. Neophytadiene and phytol, as a result 23 compounds together. Different studies were conducted and reported different compounds in the leaf of *S. alata* e.g., eleven [28] and twenty [29] from India, six from Nepal [30], and 82 from Nigeria [31]. Out of 23 compounds recorded in our study, some compounds were also reported earlier e.g. 1,19-Eicosadiene; n-Eicosane; (E)-9-octadecenoic acid; Neophytadiene; Methyl 11-octadecenoate; Ethylhexadecanoate and Methylpalmitate[29] from India and Phytol from AkungbaAkoko (Nigeria)[31]. The diversity of phytocompounds are found variable in different places. A total of 139 different phytocompounds are recorded in the leaf of *S. alata* after compilation of phytocompounds recorded in the present study, and in previous reports.

Phytocompounds in the leaf of *S. acuta*

In comparison to *S. alata*, the GC-MS analysis of leaf of *S. acuta* revealed presence of a total of 25 compounds; chloroform extract (Fig. 2A) represented by 18 compounds viz. Dodecane, 2,6,11-trimethyl; 7-Hexadecene, (Z)-; Hydroxylamine, O-decyl; Tridecane, 2-methyl; 2,4-Di-tert-butylphenol; Decane, 2,3,5,8-tetramethyl; 10-Heneicosene (c,t); Octacosane, 2-methyl; 9-Nonadecene; Pentadecyne; Phytol; 1-Iodo-2 methylundecane; Eicosane, 2-methyl; Neophytadiene; Nonadecane, 2-methyl; Nonacos-1-ene; 1-Decanol, 2-hexyl-; 1,19-Eicosadiene. Whereas, nine in ethanolic (Fig. 2B) extract viz. Oxirane,2-butyl-3-methyl-; 2-Methoxy-4-vinylphenol; Decane, 2-methyl; Hexadecane; Tetradecane, 2,6,10-trimethyl; Neophytadiene; 5-Nonadecen-1-ol; Hexadecanoic acid, ethyl ester; Phytol. Two common compounds viz. Neophytadiene and Phytol were found in both extracts. Previously, in *S. acuta* around 21 compounds were recorded [32] while another study recorded 14 [33] from India. One common compound i.e. 2-Methoxy-4-Vinylphenol was found in our study as well as also reported earlier [32]; a total of 58 compounds found in *S. acuta* after compilation with these two studies.

Antimicrobial properties of leaf of *S. alata* and *S. acuta*

The antimicrobial analysis of leaf extracts performed against *S. aureus* and *E. coli* were evaluated by measuring the diameter of zone of inhibition in the culture plates (Fig. 3). All the organisms used for the experimentation were found susceptible to leaf extracts while the extracts also showed their effectiveness as per incrimination of doses.

Chloroform extract (Table 1)

The microbes were susceptible at every concentration of the leaf extract of *S. alata*. The highest zone of inhibition was observed as 13.67±1.52 mm against *E. coli* at 400mg/ml concentration. But in *S. acuta*, the highest susceptibility was observed against *S. aureus* with mean zone of inhibition of 11.67±1.15 at 400 mg/ml concentration. The minimum mean of zone of inhibition was observed as 9.34±1.16 mm at 200mg/ml concentration against *E. coli*. At and below 100mg/ml concentration, the zone of inhibition was found to be smaller than 10 mm.

Ethanol extract (Table 2)

In *S. alata*, greater susceptibility towards the microbes and gave the highest mean zone of inhibition against *S. aureus* and *E. coli* at 21.33±0.57 mm and 15.67±0.57 mm respectively. There were no susceptibilities observed beyond 50 mg/ml concentration. But *S. acuta* showed the highest mean zone of inhibition at 400mg/ml against *E. coli* as 16.67±1.15mm. Collectively, the antimicrobial analysis concluded that the ethanolic extract of *S. alata* has the highest susceptibility against both the test microorganism The antimicrobial activity of chloroform and ethanolic leaf extracts of *S. alata* and *S. acuta* against *S. aureus* and *E. coli* was assessed using the agar well diffusion method (Tables 1-2). The results revealed a concentration-dependent antibacterial effect, likely attributable to the presence of phytochemical constituents. This concentration-dependent trend is consistent with previous findings [34-35], and also reported notable antimicrobial effects in these plant species. Among the tested extracts, the ethanolic extract of *S. alata* demonstrated significantly higher inhibitory activity compared to both its chloroform extract and the extracts of *S. acuta*.

At 100 mg/mL, the ethanolic extract of *S. alata* exhibited activity against both *S. aureus* and *E. coli*, whereas *S. acuta* was only effective against *S. aureus*, aligning with findings [27, 36]. This pronounced activity in the ethanolic extract of *S. alata* may be attributed to its higher concentration of bioactive compounds, and the ethanol serves as a more effective solvent for extracting antibacterial phytochemicals [37]. At the highest concentration tested (400 mg/mL), the ethanolic extract of *S. alata* exhibited substantial inhibitory zones against both bacterial species, suggesting its broad-spectrum antibacterial potential. This observation is consistent with findings by Nas *et al*. [38], who reported that the ethanol extract of *Senna siamea* was more potent against Gram-positive bacteria than Gram-negative bacteria. Similarly, a study emphasized the efficacy of *S. alata* against Gram-positive bacteria, specifically *S. aureus* due to the susceptibility of the Gram-positive cell wall to plant-derived antimicrobial compounds [39]. The comparatively lower efficacy of *S. acuta* observed in this study aligns with the findings of Adesina *et al*. [40] who reported minimal antibacterial activity of *S. acuta* against Gram-negative bacteria.

CONCLUSION

Both species are ethno-medicinally important in Assam and shows different phytocompounds. The *S. alata* is represented by highest numbers of phytocompounds in comparison to *S. acuta*. Based on antimicrobial analyses, it can be concluded that the ethanolic extract of *S. alata* is more effective in combating *S. aureus* and *E. coli* than its chloroform extracts or the extracts of *S. acuta*. These findings suggest that *S. alata* holds potential as a valuable natural antimicrobial agent, especially against Gram-positive bacteria like *S. aureus*.

Authors' contribution

This is an outcome of Master Degree dissertation of BG, guided by ND; SM contributed in the manuscript preparation. All authors read and approved the manuscript.

ACKNOWLEDGEMENT

We express our gratitude to the Head of the Department of Botany, Department of Applied Biology, and Central Instrumentation Facility of University of Science and Technology Meghalaya for support and encouragement.

ABSTRACT

This review paper explores into the intricate interplay between gut microbes, extreme environments, and space travel, shedding light on microbial adaptations to microgravity, radiation exposure, and their profound implications for astronaut health. Through comprehensive examinations of research conducted aboard the International Space Station and ground-based simulations, we uncover significant modification in the gut microbiota composition within microgravity-stimulated conditions. Moreover, we explore the influence of radiation encounter on the microbiome, emphasizing its critical role in mitigating adverse health effects of extended stays in space The paper underscores the pivotal connection between gut microbiota and metabolic health in space, emphasizing the importance of personalized nutritional strategies. Finally, we advocate for this integration of probiotics as a better solution to maintain microbial equilibrium and enhance astronaut well-being during space exploration.

Keywords: Microbial Adaption, Gut Microbes, Space, Microbiome.

INTRODUCTION

In microgravity, bodily fluids shift upwards, potentially affecting gastroenteric function of space travellers. Combined with reduced fluid intake, this may slow gastrointestinal motility. The Passage time has not been systematically examined during spaceflight, analogous studies (such as hindlimb suspension in rats and short-term bed rest in humans) comparable a significant increase in transit time compared to normal conditions. Research into the impact of space travel on human health has been prompted by advancements in space exploration. Research has started to look into how spaceflight affects the microbiome because it is becoming increasingly recognized that the microbiome is important for maintaining health. (*Voorhies et al.,* 2019). By default, microorganisms will travel in space with us as we explore it. In comparison to human cells, the generally healthy person houses trillions of microbes within and outside the individual body(Sender *et al.,* 2016).As soon as the organism encounters microgravity, the mechanisms start to adjusting in the new atmosphere. Along with other factors, the transfer of fluid from the inferior to the superior body may impact gastrointestinal function. When coupled with the typical drop in liquid consumption seen in astronauts, this could lead to a decrease in gastrointestinal motility. However, the transportation time was substantially lengthier than during Ambulantcontrol periods, as shown by the findings of analog tests utilizing rats with their hindlimbs suspended and people on brief bed rest.

The length of the gastrointestinal transferperiod during flight has not been thoroughly studied. (Shi *et al.,* 2017; Lane *et al.,* 1993).Numerous stressors are known to be triggered for astronauts on space missions by the weightless environment.(Goswami *et al.,* 2021; Goswami *et al.,* 2019; Siddiqui *et al.,* 2021). This study explores the crucial part played by the gut flora in controlling metabolic health during space missions, underscoring the importance of individualized dietary plans. Within this framework, probiotic integration is seen as a possible frontier for preserving microbial balance and enhancing astronaut well-being in the harsh conditions of space travel. This analysis acts as a thorough road map, showing the way to safer and more fruitful expeditions outside of our home planet.

Microbial Adaptations to Microgravity

Microbial adaptations to micro gravity represent a crucial area of study in space microbiology. Understanding how microorganisms respond and adapt to the particularities of microgravity are crucial for promoting the health and safety of space traveler during expanded space missions. Studies carried out aboard the International Space Station (ISS) and other space habitats has revealed intriguing insights into microbial behavior in the absence of gravity. Studies have shown that microorganisms exhibit altered growth patterns, genetic and phenotypic changes, metabolic shifts, and even modifications in cell morphology when uncovered to microgravity(Zea*et al.,* 2017 and Benoit *et al.,* 2017).

The AGBRESA (Artificial Gravity Bed Rest – European Space Agency) study, with combined ESA, DLR, and NASA how stimulated weightlessness affect the human body and evaluated artificial microgravity as a potential countermeasure for long term space missions, focusing on changes in the gut microbiome of 12 participants subjected to 60 days of head-down tilt bed rest in state-of-the-art research facility (Clément *et al.,* 2022). Mild changes were noted in the gut microbiome throughout the 60-day period of simulated microgravity, marked by noticeable microbial structures and differences in the countermeasure group exhibited distinct pathway expression in fecal samples compared to those exposed solely to microgravity stimulation, with protocols promoting the selecting enrichment of beneficial short chain fatty acids like butyrate, acetate and propionate. Furthermore, changes in specific physiological markers indicated a subtle rebalancing of microbiome, enhancing beneficial species while modulating potentially opportunistic ones, thereby reflecting a shift in the overall gut microbiome equilibrium (Ana Ramos-Nascimento *et al.,* 2023).

The Astronauts' Microbiome project examined the effects of long-term space travel on the microbiome and health of space traveler. Samples from nine space farers (skin, saliva, nostrils, feces) were collected before, throughout, and following a six month and one-yearexpeditions, together with swabs from frequently used areas on the ISS.

Alterations in the microbiome range of the gastrointestinal tract, nose, tongue and skin were noted, becoming more similar across astronauts. While the gut microbiota showed an increase in beneficial *Faecalibacterium*, there was also an increase in *Parasutterella*, linked to intestinal inflammation, and a decrease in anti-inflammatory genera like *Akkermansia*. these changes may contribute to the moderate inflammatory immune response documented during space mission. The authors propose using prebiotics or probiotics like *Akkermansia* to diminish potential health risks. (Han*et al.,* 2022 and Voorhies*et al.,* 2019).

Radiation Exposure and Microbial Resilience

Space exploration entails prolonged, low-level experience to high linear energy transfer (LET) radiation. The physiological consequences of such exposure primarily arise from non-lethal radiation effects, which include modifications to the microbiota and host gene expression. While the significance of a healthy gut microbes for human well-being is widely acknowledged, our understanding of radiation-induced alterations to the microbiome during extended space missions remains limited.(Caser*et al.,* 2017).Additionally, astronauts who travel outside of low Earth orbit run the risk of being exposed to ionizing radiation involving that has a high linear energy transfer. Specifically, Solar flares, solarenergetic particles particle, and cosmic rays are types of space radiation to blame for this increased danger. (Casero *et al.,* 2017).

For several decades, studies have reported the effects of space expedition on the immune system, noting that all immune populations are influenced in terms of count, ratio, production, and function. Overall, a decrease in immunity is noted during spaceflight, leading to the reactivation of dormant herpesviruses such as Epstein-Barr Virus (EBV), Varicella-zoster virus (VZV), and cytomegalovirus (CMV). This immune alteration may be linked directly associated with spaceflight factors (likeradiation and microgravity) or indirectly by means of influences such as the microbiome, nutrition, bone metabolism, depression, anxiety, and infections. Common changes, including an elevation in leucocyte counts and granulocytes alongside a decrease in NK cell levels, are consistently observed in both humans and mouse models, regardless of flight duration. (Crucian *et al.,* 2008). Several studies have shown the significant effect radiation encountered during space missions has on the make-up of the gut microbiota. Furthermore, it has been discovered that radiation-induced mortality is influenced by the composition of these important microbial communities. For instance, radiation is used in medical settings to treat gastrointestinal problems, including cancer. Notably, it has been demonstrated that various radiation doses carry a considerable influence on the microbial consortia with in the gastrointestinal tract. Similar disruptions in microbial equilibrium, known as dysbiosis, can occur in astronauts on space missions due to high radiation levels (Packey and Ciorba 2010 and McLaughlin *et al.,* 1964).

Gut Microbiome and Metabolic Health in space

A restricted caloric intake coupled with insufficient micronutrient consumption is commonly linked to heightened inflammation and oxidative stress. This scenario may potentially impact the optimal functioning of biological defense mechanisms(Crucian *et al.,* 2018 and Bergouignan *et al.,* 2016). While the diet of space expeditor is not yet considered fully optimized, substantial advancements have been achieved over time. Notably, the average caloric intake has seen a significant increase in recent eras. Even so, it is a reality that space expeditors and cosmonauts consume fewer calories during spaceflights travel compared to their intake on Earth. This can be attributed to several factors, including cultural practices (although the international collaboration on the ISS is altering this dimension), the limited appeal of space diets (which still lack the variety found on Earth), motion sickness from deep space travel, shift in light and dark cycles and appetite-modulating hormones, and elevated stress levels (Laurens *et al.,* 2019 and Wang *et al.,* 2019). While the exact causes remain unclear, spaceflights and ground-based microgravity simulations often lead to disturbed glucose and lipid metabolic functions, including insulin resistance and glucose intolerance, which raise significant concerns for the overall well-being of astronauts (Hughson *et al.,* 2016 and Tobin *et al.,* 2002).

A gut microbiome characterized by a healthy profile, proficient in producing short-chain fatty acids (SCFAs) like butyrate, and low in pathogenic organisms, acts a crucial part in finely regulating host energy metabolism.

This balance is particularly vital in prolonged missions where energy deficits become intolerable. Additionally, it's important to note that microbial metabolism of fiber yields benefits beyond SCFA production. These include enhanced availability of compounds like ferulic acid and essential nutrients released during fiber metabolism, as well as the control of bile acid levels. (Makki *et al.,* 2018). Hence, it is imperative to pre-plan personalized nutritional strategies that assess how space travelers individually respond. This assessment should be grounded in the identification of enterotype and metabolotype patterns prior to the mission. A study employing a blinded randomized controlled dietary study successfully employed this method to pinpoint microbiota -related factors influencing glycemic reactions (Zeevi *et al.,* 2015). In count to formulating nutritionally balanced diets rich in prebiotics, it's important to consider probiotic-based initiatives. In a recent study using a simulated spaceflight model with HU mice, (Wang*et al.,* 2019) demonstrated that supplementing with Bifidobacterium spp. effectively reduced endotoxemia and hepatic inflammation, ultimately enhancing glucose sensitivity. Notably, the presence of Akkermansia muciniphila, a microbe related with enhanced metabolic health on Earth (Everard *et al.,* 2013) which has shown promise in human studies (Depommier*et al.,* 2019), was notably diminished in HU mice over a period of time. This opens the possibility of utilizing it in space travel as well. Concerning appetite regulation, the majority of research consistently indicates that probiotics, particularly lactobacilli and bifidobacteria, are linked to increased surfeit (Falcinelli *et al.,* 2018). This is significant, as one of the primary objectives is to ensure that space travelers consume sufficient macro- and micronutrients. Additionally, numerous reports from both simulated space analogs and actual spaceflight studies suggest a decrease in the concentrations of short-chain fatty acids (SCFAs) (Turroni*et al.,* 2017). The exploration of this field is still in its nascent stages, primarily relying on animal models, which may have limited applicability to the human system. Consequently, there is a pressing need for a more comprehensive insight into the molecular mechanisms supporting the action of probiotics, especially if they are to become an integral part of clinical practices in spaceflight (Voorhies *et al.,* 2019). Undoubtedly, a key hurdle lies in establishing standardized probiotic protocols, employing a universally recognized measurement-based method that takes into account individual sensitivities (Suez *et al.,* 2019).

Gut Microbes and Astronaut Health

Space is a tough place to be, so we need to make sure astronauts have the right stuff to survive. This means using better materials, making strong power sources, improving robots, and taking care of their health. A new area of science called bioastronautics is focused on helping astronauts with their medical problems in space. Because space is so unfriendly, astronauts can get sick or hurt during long or short trips in space. (Mayer, *et al.,*2014 and Blaber*et al.,*2010) Changesin the gut microbiota have been recognized as a contributing factor in various human conditions, such asautism spectrum condition (ASD)(Mayer *et al.,* 2014).

Astronauts' lipid and glucose metabolism changes as aoutcome of exposure to the space environment, which also causes heart related problems, muscular atrophy, and decreased bone density. In addition, regardless of the length of the trip, the makeup of the abdominal microbiota changes inhumans and rodentsbefore and during spaceflight (Wang *et al.,* 2019). The environment of spaceflight has also been found to have microbial balance disruptions (Garrett-bakelman*et al.,* 2019). Particularly, the number of healthy bacterial strains like *Lactobacillus* and *Bifidobacterium* tends to decline in astronauts' bodies. On the other hand, during spaceflight, pathogenic or opportunistic bacteria such *P. aeruginosa, E. coli, Fusobacterium nucleatum,* and *Clostridium* tend to assemble and multiply (Ritchie *et al.,* 2015 and Smirnov and Lizko 1987).

Earth-based Analog mission experiments, such as the "MARS500 study," have added support for the gut microbiome's crucial function. In this study, six astronauts spent 520 days confined to a model habitat on the surface of Mars(Turroni*et al.,*2017)The research thoroughly investigated the astronauts' gut flora during the entire mission, covering the time before they were confined and up to 6 months after they returned to normal living circumstances. Notably, it was noted that the abundance of Bacteroides species initially increased during the mission's early stages, whereas the quantity of *Faecalibacterium prausnitzii* species first decreased. The first study utilized a mouse model of autoimmune uveitis to demonstrate that the intestinal flora could influence the distal immune response in the eye and retina. Microbiota-derived antigens activated retina-specific T cells, which subsequently triggered autoimmunity

(Horai *et al.,* 2015). Furthermore, a recent study discovered that pro-inflammatory mediators generated by the microbiota of obese mice can elicit an alteration of the innate immune system of the retina, causing pathological angiogenesis (Andriessen *et al.,* 2016; Scholz and Langmann, 2016).

Probiotics for Space Travelers

For prolonged space travel, it's essential to keep the human gut flora in balance. Space flight has shown its ability to change this microbial balance, and disruptions in the gut microbiome have been connected to a number of disorders. Probiotics have been found to be beneficial for various intestinal issues, including intense infectious diarrhea, Helicobacter pylori infection, antibiotic-induced diarrhea, irritable bowel syndrome, ulcerative colitis, and constipation. They can also improve the integrity of the intestinal barrier. (Kligler and Cohrssen 2008; Cunningham *et al.,*2021). Probiotics shows a multifaceted role in supporting the immune system, averting cancer, and addressing psychological concerns (Shi *et al.,*2016). Among the most commonly utilized probiotics are strains belonging to the *Bifidobacterium*, *Lactobacillus*,or *Saccharomyces* species (Ulluwishewa*et al.,* 2011).

Numerous studies have been done on this category of microbes to see how they can improve different facets of human health. Probiotics have been the subject of numerous research projects to determine their potential benefits for astronaut health during space travel, both in vitro and in vivo. Research conducted by Shao *et al.,*(2017) to examine *Lactobacillus acidophilus* under simulated microgravity conditions found that some biological functions and traits were significantly impacted. Key findings included: No discernible change in the morphology of L. acidophilus; a shorter lag phase; an increase in growth dynamics; improved acid tolerance (pH 2.5) along exhibiting resistance to bile;a reduction in susceptible to sodium penicillin, cephalexin, and sulfa gentamicin; no discernible alteration in *L. acidophilus* capacity to adhere to surfaces; and enhanced antimicrobial activity against *S. aureus* and *S. typhimurium*. These modifications to L. acidophilus probiotics brought on by SMG may be advantageous to astronauts while in space. A month-long stability test aboard the International Space Station (ISS)was performed on the freeze-dried capsule that contains the *Lactobacillus casei* strain *Shirota* (LcS).

Compared with the control samples stored in the earth-based laboratory, the LcS capsules from spaceflight exhibited no differences in growth behavior, genomic profiles, sugar fermentation, response to LcS-specific antibodies, or cytokine-inducing capacity. LcS shows potential in resolving immune-related issues observed during space travel because it has been demonstrated to boost innate immunity and modulate the intestinal flora. (Sakai*et al.,*2018 and Arrieta *et al.,*2006).The use of probiotics as dietary supplements or additions to spaceflight nutrition has promise in addressing the health problems faced by space travelers given the application of probiotics for maintaining a healthy gut microbiome and overall well-being that are well-established. However, experiments conducted under simulated microgravity conditions may not entirely mirror the realities of long-term space travel. Consequently, additional studies are imperative to substantiate the suitability of probiotics for space missions, evaluate their effectiveness in mitigating the aforementioned health concerns, and comprehend any potential alterations in probiotic properties that may arise during spaceflight.

CONCLUSION

In conclusion, the intricate relationship between gut microbes, extreme environments, and space travel highlights the paramount importance of microbial adaptations for astronaut health. Studies conducted in microgravity environments have illuminated significant alterations in the gut microbiome composition, underlining the need for tailored countermeasures. Radiation exposure during space missions further accentuates the critical role of the microbiome in mitigating potential health risks. Personalized nutritional strategies and probiotic interventions emerge as essential tools in optimizing metabolic health and nutrient consumption. By comprehensively understanding and harnessing the potential of gut microbiota, we pave the way for safer and more successfulspace exploration endeavors.

ABSTRACT

The goal of the research was to create flavoured milk by blending cotton seed milk with strawberry. Made from unfermented milk, flavoured milk is a ready-to-drink food item. Cotton seed milk is a premium product that hasn't lost its appeal as a culinary item. Cotton seed milk is a protein and lipid-rich extract made from cotton seeds. It can be provided to the world's protein-energy starved people because it is high in protein. Along with improving blood circulation and digestion, it also aids in the removal of bad cholesterol, blood pressure maintenance, healing, and cancer prevention. The strawberry, or Fragaria x ananassa, is an important fruit crop and a member of the Rosaceae family. Another frequent name for it is Garden Strawberry. It is a well-liked fruit that is grown extensively in temperate regions of the world, including Europe, the US, and India. Strawberry pulp and cotton seed milk were used to make the flavoured milk in the following concentrations: 90:10 (T1), 80:20 (T2), and 70:30 (T3). The 9-point hedonic scale was used for the sensory evaluation. Treatments T1, T2, and T3 yielded flavour-infused cotton seed milk with overall acceptance scores of 7.33, 7.68, and 8.67, respectively. The most widely accepted was then used for microbiological, physico-chemical, and nutritional investigation.

Keywords: Cotton seed milk, protein energy malnutrition, strawberry, flavoured milk, sensory analysis, nutrient analysis.

INTRODUCTION

The Malvaceae family, which includes the marshmallow family, includes cotton seed (Gossypium). Many nations grow cotton seed in both temperate and tropical regions. The high protein content of cotton seeds can help satisfy the needs of the growing global population while also enhancing nutritional status. The World Health Organization (WHO) defines malnutrition as excesses, imbalances, or shortages in an individual's energy and/or nutrient consumption. Cotton seed can prevent malnutrition in billions of people because it is high in protein. (J. Amudha, 2018). The majority of cotton seed milk is consumed in southern India, where it is customarily served as a welcome beverage in many homes (K. Jeshi, 2018). It is commonly referred to as Paruthi Paal, where Paal means milk and Paruthi signifies cotton seed. Cotton seed milk is a highly rich source of protein, vital fatty acids, and carbohydrates, making it a "triple-nutrient." Cotton seeds, which are high in lipids and proteins, are used to make milk. Cotton seeds contain gossypol, a poisonous terpenoid molecule with negligible nutritional benefit. To make it suitable for human use, this needs to be eliminated. This compound can be eliminated by air separation, liquid treatment, or chemical means. Cotton seed milk can be made from the gossypol-removed seeds. It is an excellent substitute for cow's milk. Those who are lactose intolerant can therefore use cotton seed milk instead of cow's milk. It aids in the removal of bad cholesterol, enhances blood flow and digestion, lowers body temperature, and supports healthy pancreatic, bone marrow, and neurological system function (Amudha, J., 2018; Manoj Kumar, 2019).

Flavoured milk is a ready-to-drink beverage produced from unfermented milk combined with coffee, fruit juice, sweeteners, fragrance agents, and other additives. It is necessary to boil, pasteurize, or sterilize the flavoring milk. Coffee, chocolate, strawberry, vanilla, and banana are the most commonly utilized flavors. Kamble, S. (2019). One of the major fruit crops is the strawberry (Fragaria × ananassa), which is a member of the Rosaceae family (Singh R. et al., 2017). In temperate regions of the world, such as the United States, Canada, Mexico, Europe, and Asia, including China, Japan, Korea, and India, it is widely grown. States like Maharashtra, Himachal Pradesh, Jammu & Kashmir, and Punjab are where it is primarily farmed in India (NHB, 2020). Vitamin C, folate, potassium, fiber, and a variety of antioxidants, including flavonoids, anthocyanins, and ellagic acid, are all abundant in it (Giampieri F. et al., 2012).

The many health benefits of strawberries are well documented. Because of their high vitamin C concentration, they are quite good at increasing immunity. Strawberries contain antioxidants that have cardioprotective, anti-inflammatory, and anti-cancer effects (Hannum SM, 2004). They lessen the risk of heart disease, improve lipid profiles, and lower blood pressure. The high fiber content promotes healthy gut function, eases digestion, and avoids constipation. Strawberries are an effective way to lower the incidence of prostate, breast, and colon cancer because of their anthocyanins and ellagic acid, which are known to suppress the formation of cancer cells (Seeram NP et al., 2006). Because of their flavonoid content, strawberries also enhance brain function and guard against age-related memory decline (Devore EE et al., 2012). Strawberries are also beneficial for cosmetics and skincare. Their high levels of antioxidants and vitamin C aid in skin renewal, wrinkle reduction, and UV protection. Strawberry extracts applied topically aid in anti-aging, oil management, and skin whitening (Panchal S et al., 2021).

Because of its high folate content, which promotes fetal growth and guards against neural tube abnormalities, strawberries are good for you during pregnancy. Because of their vitamin and mineral profile, they also aid in lowering pregnancy-related problems such iron-deficiency anemia, tiredness, and nausea. Strawberries enhance the taste, texture, and sensory acceptance of food products. In order to increase the nutritional and economic value of jams, yogurts, smoothies, desserts, and baked goods, strawberry pulp is frequently utilized. An attempt was made to prepare flavoured milk from cotton seed milk where varying proportions of strawberry pulp was added to it and jaggery syrup was added to the cotton seed milk and further studied for the sensory evaluation, nutrient analysis, Physico-chemical properties and microbial analysis.

MATERIALS AND METHODS

The study's cotton seed was purchased from the local Tambaram market. After soaking in water for 12 hours, the cotton seeds were drained. A pressure cooker was used to autoclave the damp cotton seeds for 20 minutes. A stainless-steel strainer (1680 microns) was used to remove the milk after it had been ground in a food processor. The strawberry needed to make the flavored cotton seed milk was purchased at the local Tambaram market in Chennai. Strawberry-flavored cotton seed milk was made using the following ratios of pureed strawberry pulp and cotton seed milk (J. Amudha, 2018).

First, the strawberry fruit was completely cleaned with water in order to prepare the strawberry pulp (puree). With a knife, the strawberry fruit was cut into slices. To turn it into a pulp, it was twisted into the food processor.

Preparation of Strawberry Flavored Cotton Seed Milk

With a few modest adjustments, strawberry-flavored cotton seed milk was made using the method described by S. T. Pakalwad (2010). After being heated at 70°C, the cotton seed milk was quickly cooled. Various amounts of strawberry pulp were added, and six grams of jaggery syrup were added for sweetness. Figure 1 shows the flowchart for making strawberry-flavored cotton seed milk. Twenty-five untrained panelists used S. T. Pakalwad's nine-point hedonic scale to evaluate the strawberry-flavored cotton seed milk. Color, flavor, texture, appearance, taste, and general acceptability were all evaluated. The most widely used treatment was chosen for additional examination. The method described by AOAC (2000) was used to determine energy, the micro-kjeldhal method described by AOAC (1996) was used to determine protein, the soxhlet method described by AOAC (2000) was used to determine fat, and the AOAC (2000) method was used to determine carbohydrates, dietary fiber, calcium, and iron. AOAC for physico-chemical properties (2000).

RESULTSANDDISCUSSION

Sensory Evaluation of Strawberry Flavoured Cotton Seed Milk

Table 1 displays the results of a sensory evaluation of the strawberry-flavoured cotton seed milk made with varying ratios of strawberry pulp and cotton seed milk. Scores for each parameter are reported. The colour, flavour, texture, appearance, taste, and general acceptability of the flavour-infused cotton seed milk were all found to improve with the addition of strawberry pulp.

Nutrient Analysis

According to Vandana Verma, the nutrient content of strawberry milk shake using cow's milk were nergy (67Kcals), protein (3.2gm), carbohydrate (4.4gm), fat (4.1gm), calcium (120mg) and Iron (0.2mg) respectively. In this study, the nutrient content obtained were energy (172.3Kcals), protein(29.63gm), fat(0.874gm), carbohydrate (17.81gm), dietary fiber (6.148gm), calcium (0.86mg) and iron (7.48mg) respectively. From the above result, it was concluded that the flavored milk was rich in energy, protein, carbohydrate and iron.

Physico-Chemical Properties

From the above table it is observed that the viscosity, acidity, pH, total soluble solids and moisture was 142.3 cps, 1.3%, 6.65, 78.4% w/w and 88.24% respectively.

Viscosity

Kalpeshdilprao (2012) created flavored milk by mixing safflower and buffalo milk. The average viscosity when safflower milk was added in proportions of 0, 10, 20, and 30 was 6.18, 6.67, 6.80, and 8.80 percent, respectively. The viscosity of the flavoring milk increased as the amount of safflower milk in the blend increased. The viscosity

content of the papaya whey beverage grew as the proportion increased, according to Aher's 2007 preparation. The papaya whey beverage's viscosity rose from 7.91 to 8.51 cp. The viscosity of cotton seed milk ranges from 2.8 to 3.4 cP, per Amudha J. (2018). Since 30 percent was the most often acceptable percentage, adding more strawberry pulp also made the flavor-infused cotton seed milk more viscous.

Acidity

Kalpeshdilprao (2012) created flavored milk by mixing safflower and buffalo milk. The average acidity of the safflower milk added in the proportions of 0, 10, 20, and 30 was 0.140, 0.152, 0.173, and 0.180 percent, respectively. They came to the conclusion that when the amount of safflower milk in the blend rose, the flavoring milk's acidity also increased. In order to create flavored milk, Bala Sahib Son Walker et al. (2017) added jackfruit pulp in amounts of 2.5, 5, 7.5, and 10. The range of the acidity was 0.153 to 0.163%. They came to the conclusion that the rise in acidity might be between 0 and 400 viscosities. Viscosity 81 as a result of the original jackfruit pulp's strong acidity. They came to the conclusion that the acidity content rose as the amount of jackfruit pulp increased. Cotton seed milk's acidity concentration varied between 0.17% and 0.19%, per Amudha J. (2018). Thus, the addition of fruit pulp raised the flavoring cotton seed milk's overall acidity. Since 30% was the most often recognized percentage, adding more strawberry pulp raised the acidity content.

pH

A flavored soy milk whey beverage was created by Upadhyay et al. (2011). He came to the conclusion that the pH of the flavored whey soy milk beverage decreased as the amount of soy milk grew. Kalpesh Dilprao (2012) created flavored milk by mixing safflower and buffalo milk. The proportions of safflower milk added are 0, 10, 20, and 30. In those order, the average pH was 6.43, 6.19, 5.91, and 5.78. They came to the conclusion that when the blend's safflower milk content rose, the flavor-infused milk's pH dropped. Cotton seed milk has a pH of 6.5 to 7.1, according to Amudha J. (2018). when a result, the pH of strawberry-flavored cotton seed milk dropped when more fruit pulp was added. The addition of strawberry pulp lowered the overall pH level because 30% was the most widely approved percentage.

Total Soluble Solids

In order to create flavored milk, Balasaheb Sonwalker et al. (2017) added jackfruit pulp in amounts of 2.5, 5, 7.5, and 10. The range of the total soluble solids was 18.21 to 19.53. They came to the conclusion that the amount of total solids content rose as the amount of jackfruit pulp increased. Because jackfruit pulp contains a higher percentage of total soluble solids (23.57%) than skim milk (9.53%). Cotton seed milk's total soluble solids ranged from 11.8% to 13%, per Amudha J. (2018). Thus, the addition of fruit pulp raised the flavoring cotton seed milk's total soluble solids. The total soluble content increased as the amount of strawberry pulp increased since 30% was the most widely approved proportion.

Moisture

Kalpeshdilprao (2012) created flavored milk by mixing safflower and buffalo milk. The flavoring milk had a moisture content of 81.13 to 83.18 percent. The moisture level of the flavoured milk rose as the percentage of safflower milk in the mix grew, and the same was true as the percentage of strawberrry pulp increased. Kalchare made the sago lassi in 2002. He stated that the sago lassi's moisture content rose from 76.82 to 84.70 percent. The blend's moisture content rose as the amount of safflower milk increased. Thus, the flavoring milk's moisture content rose as the amount of strawberry pulp grew.

The strawberry-flavored cotton seed milk had a total bacterial count of 0.52×10^2, 2.1×10^2, and 1.7×10^2 for yeast and mold, respectively. It is recommended that the total plate count for milk not exceed 50×10^3/ml. The Indian Food Safety and Standards Authority, 2015. The prepared product's microbiological content fell within the acceptable range.

CONCLUSION

It has been determined that strawberry-flavored cotton seed milk is high in protein and energy and can be administered to people who are lactose intolerant or malnourished. Cotton seed milk can be used as a substitute for strawberry milkshakes made with cow's milk because it has more protein and energy. Since lactose intolerance is on the rise and children's milk consumption is declining, flavor-infused milk was developed to appeal to them. It was discovered that adding fruit pulp to flavor-infused cotton seed milk enhanced its quality. The study found that adding 30% strawberry milk to cotton seed milk produced better-tasting, higher-quality milk. Therefore, cotton seed milk can be used in future research to formulate other by products.

ABSTRACT

During the last few decades, the House Sparrow (*Passer domesticus)* has witnessed a sharp decline in its population because of urbanization, habitat loss and lessened public awareness. This study tries to find how people's conscience towards this disappearance and Traditional Ecological Knowledge (TEK) practices can revive sparrows in the landscape of Saran Division. Applying a mixture of steps and methods (like 450 surveys, 30 interviews, and 120 sites visit), we inferred that villages where TEK practices are prevalent hosted greater number (about 2.5 times more) of sparrows than in modernized areas . However, 70% of locals (mostly younger generation) were unaware of the loss, while pesticide and concretized buildings destroyed sparrow habitats. This investigation underscores the need to integrate TEK into our policy formulations (in the form of subsidies for pesticide free organic farming practice and mud wall retention) to bridge the awareness and preservation gap. This research provides a blueprint for rural biodiversity conservation by blending cultural inheritance with ecological management.

Keywords: House Sparrow, Traditional Ecological Knowledge, Bio cultural Conservation, Saran Division, Rural Awareness

INTRODUCTION

It is well known that the more diverse an ecosystem is,the healthier and stable it is (Cleland,2011). Birds,our feathered friends, have a deep impact on the well-being of the environment, serving immense ecological functions. The one species, sparrow, that has coexisted with humans since time immemorial has dwindled to such an extent that it has become rare to have their frequent sightings over the past three decades (Anderson,2006, De Laet &

Summer Smith 2007). This small bird having immense ecological significance in the form of pollinators, seed dispersers, bio-control agents, is a prominent place holder in the food chain(Newton,1995). Due to its cohabitation with humankind, it serves as an excellent indicator of ecological quality (Kheera et al. 2009). Their decrease has been more visible in India with urban sparrow population falling by 70-95% since the 1990s and rural areas showing a 30-50% reduction (Bhattacharya et al. 3011,Singh et al. 2015). In urban areas, various factors like EMR and architectural alterations are the recorded and suspected reasons, while in rural areas the sheer drop is still understudied specially in areas where agrarian lifestyles and Traditional Ecological Knowledge (TEK) historically provide support for sparrow population. This study targets the districts of Chapra, Siwan and Gopalganj, constituting the Saran Division and explores the interplay of resident's awareness, TEK and conservation of sparrow in rural landscapes undergoing the process of modernization. Situated in the Gangetic plains, Saran Division is the real evidence of the eco cultural transition that faces rural India. The traditional and historical system of mud walled houses, provision for 'Gola' that is an open grain storage and mixed farming have provided ideal habitat for sparrow facilitating sparrows housing in crevices, providing insect prey and winter grain residues (Kumar & Mishra, 2020; Jha,2017). The practices of deliberate grain spreading in festivals (Annaprashan), inclusion of thatched roofs and other such TEK in this region that has been passed through generations unknowingly supported avian biological diversity (Prasad, 2005). But unfortunately, these ecological safeguards have been destroyed by the shift to concrete housing, increased and frequent pesticide use, the rejection of age old agricultural practices in the line of trends observed in Punjab and Rajasthan (Bhatia *et al.,*2013; Singh *et al.,*2018).

All over the world, TEK is getting popular as a significant tool for biodiversity conservation providing in-situ solutions while being a part of community undertaking and sustainable resource use (Berkes,1999; Gadgil et al.,1993). TEK, a body of knowledge, passed down through generations within communities has been central in safeguarding sparrows across the world since long (Berkes, 1999). Through traditional rice farming Satoyama landscapes of Japan sustain endangered birds (Kobori &Primack, 2020). A community in Rajasthan, called Bishnoi, safeguards sparrow nesting khejri trees through established cultural practices (Rathore *et al.,* 2023). Also, in Maharashtra sparrows are being restored through *Ghar Chidiya* campaign by installing nest boxes inspired by TEK (Deshmukh, 2023). Grain sharing practices in Punjab increased winter revival rates of sparrows by 40% (Kaur *et al.,* 2022). But sadly, youth disinterest in TEK rituals accelerates habitat loss (Rajendran *et al.,* 2023). Most of the research studies have targeted urban sparrow declines overlooking countryside where TEK still exists (Mohan *et al*.2022). As far as youth is concerned, the role of inherited knowledge loss among them in the respect of sparrows is understudied (Prasad & Verma, 2023). Unlike Maharashtra's community led models of preservation, Bihar's conservation frameworks lack TEK integration (Deshmukh, 2023). This study highlights these voids by questioning the extent to which TEK rituals influence sparrow population in Saran Division, quantifying the level of resident awareness about lowering number of sparrows and how TEK could be revitalized to support conservation policy.

METHODS AND METHODOLOGY

This segment makes it clear as how the role of people's awareness and age old practices and knowledge is studied in protecting sparrows in Saran Division of Bihar. Simple most and feasible methods have been adopted to gain information from people as well as from nature. We gathered various pieces of information and assembled them to see the full picture. The goal was to understand how local understanding and consciousness along with the efforts of residents help (or harm) house sparrows. The study areas selected were the three districts (Chapra, Siwan and Gopalganj) under Saran Divisionin Bihar. These tracts were chosen as they harbor a lot of farmlands, traditional mud houses and socio-cultural exercises associated with sparrows. Three simpler ways were used to collect data – conversation with people (surveys and interviews), keen observation of sparrows and their nests (field work) and mapping with communities. Surveys were done with 450 people (150 from each district) with the involvement of peasants, students, elders and housewives. They were asked simple and easy questions like whether they have observed lesser sparrows during the past few decades. Questions were asked about the practice of spreading out grains and cereals in the courtyard or on the roofs during festival times. Uses of pesticides in agricultural fields were

also investigated. This information were gathered using paper forms having a list of questionnaires and sometimes mobile applications. About thirty elderly people (aged above 65) were interviewed for their traditional knowledge about their environment. We have had deep interaction with them about their old practices and rituals like leaving holes and crevices in mud walled buildings which serve as secure nesting sites for these tiny birds. They informed narratives and rituals focused on sparrows conservation (as for example, feeding birds during marriages). So far as field works were concerned, we observed sparrows, their roosting and nesting behavior in about 120 spots (farm lands, rural tracts, and towns) by standing silently for 12 minutes, recording the number of sparrows watched. We were more interested in the number of nests in mud walls of old architectures, houses or buildings, thatched roofs (made up of straw, reeds, dry plant fiber, and other such natural materials) and in modern concretized buildings. We kept special attention in checking whether those agricultural areas where pesticides were used had fewer insects or not because sparrows' nestlings especially depends on a strictly protein us insectivorous diet. Finally, mapping of the areas with the help of communities were done. We conducted 5 group gatherings with rural dwellers and drew maps demonstrating spaces where sparrows were abundant in the previous time versus present scenario. Also, the drawn maps showed the places still practicing old traditions like offering food to birds and taking proper care of birds implying their astrological beliefs of improving planetary influences and bringing positive energy in houses (because birds are thought as messengers of positive energy).

We adopted the following ways of analyzing and interpreting the inputs and insights gained. Using basic mathematics, patterns were observed, like 60% of elders (more women),feed birds but only 20% of youth do so. From the stories of elders, similar ideas were grouped, as many elders connect the existence of sparrows to bright luck, but younger people don't generally hold such beliefs. Maps were compared to view if places with old beliefs and culture (mud houses, traditional grain storage and grain sharing) had more sparrows. To keep the interview fair and honest, we had sought permission from the participants for inquiry and all of them agreed. For sake of anonymity, the participant's names were kept secret. However, the opinions and findings will be discussed with the villagers and easy solutions will be suggested (providing feeders, nest box making). Results sharing will be done properly. Though some challenges and hardships were encountered in the forms of memory biases, seasonal changes, migration of workers in cities. Some elders might not be able to recollect the past details with clarity. Romanticizing the past was a challenge for them due to sickness and age. Sparrows behaved somewhat differently in monsoons (summer) versus winter – the study targeted winter. Migrant workers in the search of job in cities were not easy to involve in the interrogation. By including a mixture of methods like surveys, stories and field observations, a full image was obtained depicting how the activities of people (e.g. using pesticides) affect sparrows, and how age old traditions can protect them. In this methodology we heard people, observed sparrows and linked the dots to find solutions.

RESULT AND DISCUSSION

About 450 people residing in the districts of Chapra, Siwan and Gopalganj were surveyed to assess their awareness and disposition towards sparrows.It was found that awareness of sparrows' declination has dropped. Only 30% of people (mostly elders) felt sparrows are declining in number. Amongst younger generation (aged below 30) only 15% were conscious of their gradual disappearance. Children of Bhagwanpur Hatt in Siwan district said "Sparrows are everywhere; just you need to spread grains and keep water in the aangan". Elders of age group 50 to 75 acknowledged the drastic loss in sparrow number.An elder in Chapratown told us that sparrows used to made nests in their walls when he was young, but at present it is hard to even have their regular sightings. Talking about traditional ecological knowledge, grain sharing ritual is performed during ceremonies and festivals by 45% of elders, while only 10% of youth perform this. In villages like Maharajganj, Pachbhinda, Raghunathpur 35% of houses still retain mud walls having crevices for sparrow habitation. About 80%of farmers are using chemicals in their field .They are of the opinion that in the absence of pesticides, yield of crop deteriorate and also that with their use, insect infestation stops. Concerning modern challenges, 70% of new houses leave no nesting points for sparrows while their construction. About 40% of the elders held mobile towers as major culprits, but more research is required in this respect. To learn about fading traditions, we interviewed 40 elders. They admitted the fact that earlier they used to

stuff jute sacks into mud walls as sparrows liked making nests there (some old farmers from Siwan). An elder hailing from Chapra told that during weddings they fed grains to sparrows for good luck. There are deep rooted cultural beliefs in almost all Hindu houses about sparrows that they are symbols of prosperity 'Ghar ki Laxmi'. But sadly, youth of today barely acknowledge it, saying "they are simply birds" said a student in Gopalganj. A total of 120 sites were visited (agricultural lands, rural areas, and towns) for observation of sparrows. In villages about 20-25 sparrows were seen per kilometer square and that too around mud houses and ponds). As few as 5 to 6 sparrows, while none at some places, were observed per kilometer square in town areas dominated by concrete buildings. Regarding choice of nests, 60% of nests were found in mud walls and thatched roofs while lesser than 7% has nests in buildings having modern architecture -no open ventilators, no cracks left and full concretization. Also juveniles of sparrows are facing food scarcity because farms where pesticides were used had 60% lesser insects. So there was a danger of starvation for sparrow nestlings. Agricultural areas where organic farming is implemented, though very low in number, had two times more sparrows than pesticides laden farm areas. Lastly, about community maps to locate sparrows thriving places, we held 6 village meetings, where local residents drew maps to demonstrate hotspots of sparrows. The comparison between present and past scenarios showed that old hotspots were near water bodies, mud houses and grain storage areas. But concrete buildings and tree cuttings have shrunken these areas. A ray of hope is still present in some villages in Duraundha, Bhagwanpur, Baniyapur, Barhariya that have preserved rich traditional ecological knowledge, where people practice grain spilling and provide feeders for sparrows. These villageshave greater numbers of sparrows as compared to those villages undergoing modernization in the form of modern featured houses and buildings. Some encouraging stories were also encountered during our tour. Some farmers in Gopalganj stopped pesticide use, rebuilt mud walls saying "sparrows did come back within a few months which my grandchildren love to see". Some students in Maharajganj (Gaur) has installed handmade simple nest boxes. "We made 12 artificial nest boxes". The results derived from this study reveal a strong but fragile connection between anthropogenic activity and sparrow's revival.

Findings of the study are illustrated in the following pie charts:

- Awareness about decline in sparrow population in Saran Division
- Nesting sites of sparrows in Saran Division
- Sparrow number per square kilometer

Percentages among elder's vs youth following TEK practices.

CONCLUSION

The case study of Saran Division underscores the pivotal role of resident awareness and Traditional Ecological Knowledge (TEK) in the endeavor to restore sparrow populations. By actively engaging local communities and harnessing their deep-rooted understanding of the local ecosystem, conservation efforts can gain significant momentum and achieve greater sustainability. Integrating TEK, which often encompasses time-tested practices beneficial for local biodiversity, with modern scientific approaches offers a holistic and culturally sensitive pathway towards creating favorable habitats and mitigating threats to sparrows. Ultimately, the success in Saran Division highlights that a collaborative approach, empowering residents and valuing their traditional knowledge, is not just beneficial but essential for the long-term revival of sparrow populations and the overall health of the ecosystem.

ABSTRACT

Groundnut shells have high amount of lignin, hemicellulose and cellulose. These components can be used for various purposes like production of Biofuel, Bioadhesives, Biofertilizer. India is the second largest producer of groundnuts. Groundnut (*Arachis hypogaea*) peels and shells was collected from the nearby land area of Sundarakkottai, Mannargudi, Thiruvarur, Tamil Nadu, India. Pre-treatment of Groundnut shells (GS) and peels (GP) was done. The serial dilution was performed for the isolation of bacteria and identified by cultural, Gram staining and biochemical characteristics. Hence the identified as *Bacillus cereus and Pseudomonas aeruginosa.* Acid hydrolysis was carried out and the neutralized hydrolysate was subjected to total carbohydrate and estimation of glucose and xylose. Bacterium consortia was inoculated into GS and GP substrates, allowed for submerged fermentation. Bioethanol was noticed on 3rd day. The highest bioethanol produced was recorded in groundnut shells such as 9.56±0.45(G/L) than GP. The bioethanol production was optimized with the physical and chemical parameters such as pH, temperature, NaCl concentration, Substrate concentration, carbon and nitrogen

sources .Fourier Transform-Infrared Ray (FTIR), was used to perform analytical investigation on the Groundnut shells to determine the functional groups.

Keywords: Groundnut, bioethanol, carbon, Biofuel, hemicelluloses.

INTRODUCTION

Groundnut shells, a byproduct left after the separation of groundnut seeds, are often discarded or burned as waste. However, they hold potential as a renewable energy source. With fossil fuels being nonrenewable, finding sustainable alternatives is crucial. Despite having abundant biomass, India lags in ethanol production, producing only 4% ethanol (around 2 billion liters) primarily from molasses. Interestingly, India is one of the world's leading producers of groundnuts. Utilizing agricultural waste with no economic value for biofuel production offers an efficient way to maximize land use. Various agro-waste materials, including sugarcane molasses, groundnut shells, rice husks, straw, and corncobs, are being explored as potential substrates for biofuel production. The groundnut (*Arachis hypogaea*), a leguminous plant, grows to a height of 30 to 50 cm (1.0 to 1.6 ft) (Nyachaka et al., 2013). Groundnut shells are rich in cellulose (37%) and hemicellulose (18.7%), along with other carbohydrates (2.5%), enhancing fermentation efficiency and improving bioethanol yield (Jaishankar et al., 2014).Additionally, groundnut shell ash contributes to effective waste management and serves as a soil stabilizer, improving soil strength and moisture retention (Sujatha et al., 2016). To optimize bioethanol production, both chemical and physical pretreatments should be applied to groundnut shells. Therefore, the present study focuses on producing bioethanol from groundnut (*Arachis hypogaea*) peels and shells using a bacterial consortium.

MATERIALS AND METHODS

Sample collection and Preparation (FAOST, 2013)

Groundnut (*Arachis hypogaea*) peels and shells were collected from agricultural land in Sundarakkottai, Mannargudi, Thiruvarur, Tamil Nadu, India. The shells were thoroughly washed with tap water to remove soil particles and then dried for several hours to eliminate moisture completely. Once oven-dried, the groundnut shells were finely powdered using a blender.

Source of organisms

Soil samples were collected from agricultural land areas in Mannargudi, Thiruvarur District, Tamil Nadu, India. The samples were stored in sterile polythene bags and later transferred to the laboratory for further analysis. Isolation of bacteria The serial dilution agar plate method was used for the isolation and enumeration of bacteria, which are among the most prevalent microorganisms (Norris and Ribbons, 1972).

Composition analysis of Groundnut shells and peels

The composition analysis of Groundnut shells were determine the cellulose and lignin content. Cellulose content was estimated by Anthrone assay according to Aldaeus *et al.,*2010. Organic carbon in groundnut shell and peels were estimated according to Walkely and Black, 1933.

Chemical and Physical Pretreatment

Physical and chemical methods were used for pretreatment studies. Powdered GS was treated with inorganic chemicals such as 0.25 N HCl and 0.25 N NaOH and organic chemicals such as 0.25 N Acetic Acid and 0.25 N Lactic Acid. Physical pretreatment was done using steam explosion method. The sample was washed with hot water for several times to remove acidic or basic content and treated with isolated bacterial strain.

Groundnut shells and peels substrate preparation

50ml of 1% sulphuric acid were added to 100 gm of substrate and heated for 20min, after this allowed to cool, then 100ml of 4% sodium hydroxide were added and heated for 30min, then allow to cool the substrate at room temperature, pH were adjusted to 7.0

Preparation of Bacterial Consortia

For the preparation of the bacterial consortium, selected bacterial colonies were plated on a minimal agar medium supplemented with carboxymethyl cellulose (CMC) and incubated at 37°C. After 12 hours, bacterial strains in the log phase were inoculated into 250 ml flasks containing 100 ml of nutrient broth and incubated at 37°C with continuous shaking at 200 rpm for 12 hours. Following incubation, 5 ml of each broth culture was transferred into sterile test tubes and centrifuged at 5000 rpm for 15 minutes. The supernatant was discarded, and the pellet was resuspended in a normal saline solution and vortexed thoroughly. A volume of 0.1 ml from each colony suspension was then added to fresh nutrient broth and incubated overnight. The prepared bacterial consortium was used for ethanol production. This study aims to develop a successful bacterial consortium capable of efficiently degrading different substrates within a short period using cellulase enzymes under natural conditions, without generating foul odor. An effective bacterial consortium for the degradation of groundnut shells and peels was prepared following the method proposed by Rahman (2002). For the successful preparation of a microbial consortium, bacterial cultures must be compatible with each other to produce all the necessary enzymes for substrate degradation. The compatibility of the consortium was verified using the cross-streaking method on a nutrient agar plate.

Experimental design

T1- Groundnut shells + *B. cereus* and *P. aeruginosa*, T2- Groundnut peels + *B. cereus* and *P. aeruginosa*, T3- Control. The process of developing the inoculum at 37±1^{0}C, using a shaker operating at 250rpm. The bioethanol was retrieved using conventional distillation after fermentation.

Cross Streak Method

The antagonistic activity of cellulase-producing isolates was assessed using the cross-streak method (Shirling & Gottlieb, 1966). Nutrient agar plates were prepared, and one isolate was inoculated by streaking it in the center of the Petri plate. Test organisms were then streaked at 90° angles to the central streak. The plates were incubated at 38°C for 24 hours to evaluate compatibility and antagonistic interactions among the isolates.

Inoculum Preparation

Non-antagonistic isolates were selected based on their compatibility and tested for their suitability in forming a microbial consortium to enhance nutrient utilization. The selection criteria included growth rate and the efficiency of enzyme production, particularly those involved in bioethanol production (Apun *et al.,* 2000). The inoculum medium was prepared in a 250 mL Erlenmeyer flask with a working volume of 100 mL. The medium composition (per liter) included:

- Peptone – 0.5 g
- Beef extract – 0.3 g
- Sodium chloride – 0.5 g
- Distilled water – 100 mL

The medium was sterilized at 121°C for 15 minutes. A loopful of bacterial strains from a one-day-old nutrient agar slant culture was transferred to the sterilized nutrient broth in a 250 mL Erlenmeyer flask. The flask was then incubated at 37°C with continuous shaking at 150 rpm in an incubator shaker for 24 hours to ensure optimal bacterial growth.

Fermentation

The fermentation process was conducted in 500 mL flasks, maintained at 250 rpm in a rotary shaker. Pre-treated groundnut shells and peels powder were used as the raw material, supplemented with specific components as prescribed by Caputi et al. (1968).

4o

Screening for ethanol

10ml of fermented sample

↓

Pinch a pottassium dichromate and a few drop of H_2So_4 were added.

↓

Colour of the sample turns from pink to green indicates the presence of bioethanol.

Reducing Sugar

The quantification of reducing sugars was carried out using the dinitro salicylic acid (DNSA) method, as outlined by Miller, 1959.

Estimation of total carbohydrates (Sadashivam, 2004)

Total amount of carbohydrates present was estimated by Phenol-Sulphuric acid method using glucose as a standard having a concentration of 1 mg/ml and the colorimetric reading was taken at 490nm.

Estimation of glucose and xylose (Ayudhya *et al*., 2007)

The amount of glucose present in the neutralized hydrolysate was estimated using the DNSA (3,5-Dinitrosalicylic Acid) Method, and the colorimetric reading was taken at 540 nm (Sadashivam, 2004). The estimation of xylose was performed using the Phloroglucinol Assay, with the absorbance measured at 540 nm. Glucose and xylose were used as standard reference sugars at concentrations of 1 mg/mL and 0.5 mg/mL, respectively. Based on the results, 8 g of groundnut shell powder was hydrolyzed in 160 mL of 4% H_2SO_4, neutralized, and used for further testing.

Optimization of Bioethanol Production

The highest bioethanol production was observed in fermentation using Groundnut shells + *Bacillus cereus* and *Pseudomonas aeruginosa*. The process was optimized by evaluating the effects of various physical parameters, including pH, temperature, NaCl concentration, substrate concentration, and different carbon and nitrogen sources.

Effect of pH

To determine the optimal pH for bioethanol production, 10 mL of prepared inoculum was introduced into 100 mL of fermentation medium containing groundnut shell powder. The medium was distributed in five different 250 mL Erlenmeyer flasks equipped with fermentation airlocks and adjusted to pH 4, 5, 6, 7, and 8. The flasks were incubated at 37°C for 48 hours, and after fermentation, the ethanol content was estimated.

Effect of Temperature

Fermentation was carried out at different temperatures (30, 35, 40, 45, and 50°C) to determine the optimal temperature for ethanol production. The fermentation medium containing groundnut shell powder was incubated under these conditions for 48 hours, and periodic samples were analyzed for reducing sugars and bioethanol content.

Effect of NaCl Concentration

To evaluate the effect of NaCl concentration, fermentation was conducted using NaCl concentrations of 0.20, 0.40, 0.60, 0.80, and 1.00 g/L in groundnut shell-incorporated fermentation media. The flasks were maintained at 37°C for 48 hours, and ethanol content was estimated post-fermentation.

Effect of Substrate Concentration

The prepared inoculum (10 mL) was introduced into 100 mL of fermentation medium containing different concentrations of groundnut shell powder substrate (0.50, 1.00, 1.50, 2.00, and 2.50 g/100 mL) in separate 250 mL Erlenmeyer flasks. The flasks were equipped with fermentation airlocks and incubated under optimal conditions. After 48 hours, ethanol content was estimated.

Effect of Different Carbon Sources

The influence of various carbon sources (glucose, fructose, and starch) on bioethanol production was assessed. The fermentation medium was supplemented with these carbon sources, sterilized, and inoculated with bacterial strains. The flasks were incubated at 30°C for 3 days, and post-incubation, total ethanol content and total reducing sugar content were determined.

Effect of Different Nitrogen Sources

The impact of different nitrogen sources, including ammonium sulfate, urea, and ammonium chloride, was also evaluated to optimize microbial growth and ethanol yield

Statistical analysis (Galbe M., 2002)

Triplicates are used for mean and SD and using excel software.

RESULTS

Groundnut waste substrates, including shells and peels, were found to be an effective lignocellulosic material for bioethanol production, particularly when used in conjunction with mixed microbial cultures. In this study, the combination of *Bacillus cereus* and *Pseudomonas aeruginosa* was found to be more effective in terms of bioethanol production from pretreated groundnut substrates. The highest ethanol production, 9.56 ± 0.45 g/L, was achieved from groundnut shells using the bacterial consortium under optimized conditions, including a pH of 6, fermentation time of 72 hours, temperature of 35°C, NaCl concentration of 0.80%, substrate concentration of 2.50%, and starch as the best source of carbon and nitrogen at 24 hours. Structural modifications of the groundnut shell were analyzed using FTIR (Fourier Transform Infrared Spectroscopy), which revealed significant degradation of cellulose and hemicellulose content in the groundnut substrates, with a prominent peak at 1369 cm^{-1}, indicating the effective breakdown of these components.

Physical and chemical composition of Groundnut shells and peels

The moisture percentage level was analyzed Groundnut peels was showed the 6.50±0.10 and the same in shells was noticed as 6.50±0.01. The proportion of ash content groundnut Peels was 2.72±0.09, while the percentage of ashin shells was 8.00±0.01. In shells, The percentage of ash was high. The percentage level of-cellulose in groundnut peels was found to be 37.00±0.58, whereas the percentage level in shells was found to be 34.00±0.28. Peels had a high percentage of a-cellulose, measuring 37.00± 0.28 overall. The Percentage level of hemicellulose was found to be 29.00 ±0.76, while the percentage level of hemicellulose in shells was 46.00± 0.01. The percentage of hemicellulose was high in Shells. Meanwhile value the percentage of lignin content in groundnut peels is27.00±0.28, While the percentage of lignin in shells is 28.00± 0.50. Overall lignin content was highly noticed in shells. (Table-1).

Bioethanol production from Groundnut shells and peels using Bacterium consortia

Bacterial consortia were inoculated into groundnut shells and peels substrates, which were then allowed to ferment and incubated at 37°C. Bioethanol production was observed starting on the third day of fermentation. Groundnut shells exhibited the highest bioethanol production, with a yield of 9.56 ± 0.45 g/L, followed by groundnut peels, which produced 8.80 ± 0.75 g/L. Overall, the highest bioethanol production was recorded from groundnut shells.(Table- 2)

Estimation of total Carbohydrates, Glucose and Xylose

The total carbohydrate content was highest in the 4% hydrolysate, with a concentration of 3.9 mg/mL. The total amounts of glucose and xylose in the 4% hydrolysate were found to be 3.2 mg/mL and 1.7 mg/mL, respectively.. (Table-3 & 4)

Reducing sugar on various combinations of substrate

The bacterial consortium consisting of T1 (Groundnut shells + *Bacillus cereus* and *Pseudomonas aeruginosa*), T2, and T3 exhibited higher bioethanol production, with T1 showing the greatest ethanol yield. After 72 hours, T1 recorded a total reducing sugar concentration of 1.75 ± 0.09 g/L, which was higher compared to the other bacterial combinations. The residual sugar content in the fermentation process indicated the effective conversion of sugars, which contributed to achieving a greater ethanol yield.. (Table-6)

Optimization of bioethanol Effect of pH

All the mixed isolates, *Bacillus cereus* and *Pseudomonas aeruginosa*, were allowed to grow in media with different pH values ranging from 3.0 to 7.0. The maximum level of bioethanol production was observed in the medium with a pH of 6.0 after 72 hours, yielding 1.50 ± 0.08 mL of bioethanol. (Table-7)

Effect of Temperature

The fermentation medium was prepared and placed at different temperatures (20°C, 25°C, 35°C, and 40°C) to analyze the optimum temperature for ethanol production, with the pH maintained at 6.0.

Effect of NaCl concentration

Bioethanol productivity was optimized by using various NaCl concentrations in this study. The mixed isolates (*Bacillus cereus* + *Pseudomonas aeruginosa*) produced the maximum ethanol level of 1.19 ± 0.05 mL at a 0.80% NaCl concentration. Very low productivity was observed at other NaCl concentrations.. The investigated results were presented in (Table-9)

Effect of Substrate concentration (%)

The maximum level of bioethanol production, 9.56 ± 0.45 g/L, was observed at a 2.50% substrate concentration after 24 hours of incubation. Very low bioethanol production was recorded at other substrate concentrations. Additionally, excellent results were observed at 72 hours of incubation, with a bioethanol yield of 1.43 ± 0.002 mL.. (Table-10)

Effect of Different carbon sources

Various carbon sources, including sucrose, fructose, and starch, were used to replace glucose, the original carbon source, in the growth media. The results showed that starch led to the highest level of bioethanol production, with a yield of 1.56 ± 0.007 mL after 72 hours of incubation. While sucrose also showed significant bioethanol production at 72 hours, starch was confirmed as the best carbon source for bioethanol production in this study.(Table- 11)

Effect of Different nitrogen source

The production of bioethanol was found to be sensitive to repression by different nitrogen sources. The effect of various nitrogen sources, such as ammonium sulfate, urea, and ammonium chloride, was studied by replacing the nitrogen source in the growth medium. Among the nitrogen sources tested, ammonium chloride was found to be the most effective for bioethanol production. Nitrogen is a key component of cell proteins, and the stimulation of

bioethanol production by ammonium chloride and ammonium sulfate salts could be attributed to their direct role in protein synthesis. The results indicated that ammonium chloride resulted in the highest bioethanol production, with a yield of 1.55 ± 0.005 mL after 72 hours of incubation. (Table-12)

DISCUSSION

Thomas *et al.*,(2021) investigated the use of two substrates, paper and leaves, subjected to a pretreatment process using acid hydrolysis to remove lignin, which acts as a physical barrier to cellulolytic enzymes. Ethanol fermentation was carried out using *Saccharomyces cerevisiae* culture for 24-48 hours, resulting in bioethanol production. This green strategy of biofuel production using renewable raw materials, similar to the approach in the present study, offers a cost-effective and eco-friendly solution to overcoming pollution in the current scenario. Raveendran *et al.* ,(1995) stated that groundnut shell (GS), a residue from pod separation, is abundantly available worldwide. This crop residue is of low economic value and is commonly used as fuel in gasifiers, burned, or sometimes utilized as manure to enhance soil conditions. The residue contains 54.4% total carbohydrate content (dry weight) in its cell wall, making it an ideal substrate for bioconversion into fuel ethanol.

CONCLUSION

Bioethanol production from cost-effective sources, particularly agricultural waste, offers a sustainable and environmentally friendly alternative to conventional fossil fuels. For large-scale fuel ethanol utilization to be viable, its production technology must be cost-efficient, renewable, and eco-friendly. Agro-waste components can serve multiple purposes, including biofuel and biofertilizer production. By incorporating a mixture of microbes, the current methodology can be enhanced, leading to a more sustainable process for cellulosic ethanol production from GS. This approach presents a promising alternative to petroleum-based fuels.

ABSTRACT

Syzygium cumini (L.) Skeels. is one of the best known species of family Myrtaceae. It is widely distributed in India, Thailand, Philippines, Madagascar and some other countries. All parts of the *Syzygium cumini* can be used medicinally and it has a long tradition in alternative medicine. Gas chromatography and mass spectrometric analysis of methanol extract of a leaf revealed the presence of 55 compounds. The major chemical constituents present in seed were Dodecanoic acid, 1,2,3-propanetriyl ester (21.21%), Octadecane, 3-ethyl-5-(2-ethylbutyl)- (21.21%), Dodecanoic acid, 1,2,3-propanetriyl ester (12.16%), Acetamide, 2-(4-iodopyrazol-1-yl)-N-(2-trifluoromethylphenyl)- (12.16%), Dodecanoic acid, 1,2,3-propanetriyl ester (12.16%), 1H-1,3-Benzimidazole-1-acetonitrile, 2-(difluoromethyl)- (9.31%), N-Methyl-1-adamantaneacetamide (9.31%), Acridine-9-carbaldehyde (9.31%), Dodecanoic acid, 1,2,3-propanetriyl ester (7.34%), 4-Sulfamoyl-thiophene-2-carboxylic acid (7.34%), Phthalic acid, di(oct-3-yl) ester (6.52%), 2-(Decyloxycarbonyl)benzoic acid (6.52%), Phthalic acid, 2-hexyl ester (6.52%).

INTRODUCTION

Syzygium cumini or *Eugenia jambolana* (Myrtaceae), known as 'Naaval' in Tamil and Jamun, Jambul and Jambool in India and Malaya. From all over the world, the fruits have been used for a wide variety of ailments, including cough, diabetes, dysentery, inflammation and ringworm [1], [2], [3]. In southern Asia, the tree is venerated by Buddhists,

and it is commonly planted near Hindu temples because it is considered sacred to Lord Krishna [4] Various traditional practitioners in India use the different parts of the plant in the treatment of diabetes, blisters in the mouth, cancer, colic, diarrhea, digestive complaints, dysentery, piles, pimples and stomachache [5]. In Unani medicine, various parts of jambolan act as a liver tonic, enrich the blood, strengthen teeth and gums and form a good lotion for removing ringworm infection of the head [6]. The phytochemical presents were flavonoids, phenol and tannins.[7]. Hence the objective of the present study is to identify the phytochemical constituents present in the seeds of *Syzygium cumini* with the aid of the GC-MS technique.

MATERIALS AND METHODS

Collection and identification of plant material

The plant was collected from areas of Thoothukudi, Tamilnadu. The plant was identified and authenticated by the Botanical Survey of India, Southern Circle, Coimbatore as *Syzygium cumini* (Myrtaceae).

Preparation of Powder and Extract,

Fresh seeds are shade dried and pulverized to powder in a mechanical grinder[8]. 25 grams powder was packed in soxhlet apparatus and extracted with methanol. The filtrate was evaporated to a lack of moisture using a rotary evaporator. The final residue obtained was then subjected to GC-MS analysis. The dried extract was stored at 4°Cinvials for further studies.

Phytochemical analysis by GC-MS

Gas chromatography-Mass spectrometry study of the methanolic extracts was carried out by using a GC-MS (Model; QP 2010 series, Shimadzu, Tokyo, Japan) equipped with a VF-5ms fused silica capillary column of 30 m length, 0.25 mm dia. and 0.25μm film thickness. For GC-MS analysis, an electron ionization system with ionization energy of 70 eV was applied. Helium gas (99.99%) was utilized as a carrier gas at a constant flow rate of 1.51 ml/min. Injector and mass transfer line temperature was set at 200 and 240°C respectively. The oven temperature was programmed from 70 to 220°C at 10°C/min, held isothermal for l min and finally raised to 300°C at 10°C/min. 2 μ1 of particular diluted samples was manually injected in the split less mode, with a split ratio of 1:40 and with mass 18 scan of 50-600 amu. The total running time of GC-MS is 35min. The comparative percentage of each extract constituents was expressed as a percentage with peak area normalization.[9]

Identification of phytochemical components

The identity of the components in the extracts was designated by the comparison of their retention indices and mass spectra fragmentation patterns with those stored on the computer library and also with published literatures. NIST08s.LIB and WILEY8. LIB library sources were utilized for matching the identified components from the plant material.

RESULTS

The GC-MS analysis of methanolic seed extract of *Syzygium cumini* confirmed the presence of 55 compounds with retention time. Interpretation of the mass spectrum of GC-MS was conducted using the database of NIST and WILEY libraries. Out of these 55 compounds 13 compounds were majority present in the seed extract of *Syzygium cumini* respectively Dodecanoic acid, 1,2,3-propanetriyl ester (21.21%), Octadecane, 3-ethyl-5-(2-ethylbutyl)- (21.21%), Dodecanoic acid, 1,2,3-propanetriyl ester (12.16%), Acetamide, 2-(4-iodopyrazol-1-yl)-N-(2-trifluoromethylphenyl)- (12.16%), Dodecanoic acid, 1,2,3-propanetriyl ester (12.16%), 1H-1,3-Benzimidazole-1-acetonitrile, 2-(difluoromethyl)- (9.31%), N-Methyl-1-adamantaneacetamide (9.31%), Acridine-9-carbaldehyde (9.31%), Dodecanoic acid, 1,2,3-propanetriyl ester (7.34%), 4-Sulfamoyl-thiophene-2-carboxylic acid (7.34%), Phthalic acid, di (oct-3-yl) ester (6.52%), 2-(Decyloxycarbonyl)benzoic acid (6.52%), Phthalic acid, 2-hexyl ester (6.52%). The 42 minor compounds such as Phenyltricyclo [8.2.2.2 (4,7)] hexadeca-1(13),4,6,10(14),11,15-hexaen-5-ylmethyleneamine

(0.23%),Adipic acid, isobutyl 3-phenoxybenzyl ester (0.23%) , Fumaric acid, 2,4-dimethylpent-3-yl tridecyl ester (0.29%), 4-(3,4-Difluoro-phenyl)-1,6-dimethyl-2-oxo-1,2,3,4-tetrahydro-pyrimidine-5-carboxylic acid methyl ester (0.29%), 1,2,5-Oxadiazol-3-amine, 4-(4-methoxyphenoxy)- (0.66%), 1H-1,3-Benzimidazole-1-acetonitrile, 2-(difluoromethyl)- (0.66%), Propanenitrile, 3-(5-diethylamino-1-methyl-3-pentynyloxy)- (0.66%), Dodecahydropyrido [1,2-b]isoquinolin-6-one (0.70%),3-Isopropoxy-1,1,1,5,5,5-hexamethyl-3-(trimethylsiloxy)trisiloxane (0.70%), Fumaric acid, 2-heptyl tridecyl ester (0.70%), 4-Sulfamoyl-thiophene-2-carboxylic acid (0.72%), Indole-2-one, 2,3-dihydro-N-hydroxy-4-methoxy-3,3-dimethyl- (0.72%), Phenol, 6-methyl-2-[(4-morpholinyl)methyl]- (0.72%), Formamide, N-cyclohexyl- (0.99%), Diethylmalonic acid, heptyl 3-phenoxybenzyl ester (0.99%), 1,3,4-Hexatriene, 3-methoxy- (1.32%), 1H-Cyclopenta[1,3] cyclopropa [1,2]benzene, octahydro-7-methyl-3-methylene-4-(1-methylethyl)-, [3aS-(3a.al (1.32%),cis-muurola-3,5-diene (1.32%), 2H-Azepin-2-one, hexahydro-5-methyl- (1.41%),4-(3,4-Difluoro-phenyl)-1,6-dimethyl-2-oxo-1,2,3,4-tetrahydro-pyrimidine-5-carboxylic acid methyl ester (1.59%), Fumaric acid, 2,4-dimethylpent-3-yl tridecyl ester (1.59%), Azulene, 1,2,3,3a,4,5,6,7-octahydro-1,4-dimethyl-7-(1-methylethenyl)-, [1R-(1.alpha., 3a.beta., 4.alpha.,7.beta (1.95%), 1H-3a,7-Methanoazulene, octahydro-3,8,8-trimethyl-6-methylene-, [3R-(3.alpha.,3a.beta.,7.beta.,8a.alpha.)] (1.95%), gamma.-Muurolene (1.95%), Corydaldine (2.19%), 2-Methyl-6-(4-methylphenyl)pyridine (2.19%), Benzene, 1,2-dimethoxy-4-nitro- (2.19%), Fumaric acid, 4-heptyl tridecyl ester (2.54%), Dodecanoic acid, 1-(hydroxymethyl)-1,2-ethanediyl ester (2.54%), Propanenitrile, 3-(5-diethylamino-1-methyl-3-pentynyloxy)- (3.27%), Dodecane, 1-(methoxymethoxy)- (3.66%), Cyclohexanecarboxamide, N-furfuryl- (3.66%), Fumaric acid, 3-hexyl tridecyl ester (3.66%), Dodecanoic acid, 1,2,3-propanetriyl ester (4.18%), 2,6-Dimethyl-4-phenylpyridine (4.18%), Benzenamine, 2,3,4,5,6-pentafluoro- (4.18%) Benz(cd)indol-2(1H)-one, 1-methyl- (5.03%), Benzenamine, N-methyl-N-phenyl- (5.03%), 2,6-Dimethyl-4-phenylpyridine (5.03%), 4-Dehydroxy-N-(4,5-methylenedioxy-2-nitrobenzylidene) tyramine (5.48%), N-Methyl-1-adamantaneacetamide (5.48%), Cyclotrisiloxane, hexamethyl- (5.48%)were also reported from the seed extract of *Syzygium cumini*. The chemical constituents analysis results of *Syzygium cumin*i seed were reported in Table 1 and their GC-MS chromatogram is presented in Fig :1, Table-1 The first compound identified with less retention (8.526 min) was 1,3,4-Hexatriene, 3-methoxy- and 1H-Cyclopenta[1,3]cyclopropa[1,2] benzene, octahydro-7-methyl-3-methylene-4-(1-methylethyl)-, [3aS-(3a.al and cis-muurola-3,5-diene whereas 4-Dehydroxy-N-(4,5-methylenedioxy-2-nitrobenzylidene)tyramine and N-Methyl-1-adamantaneacetamide and Cyclotrisiloxane, hexamethyl- was the last compound which took longest retention time (19.296 min) to identify. At (15.079 min) Dodecanoic acid, 1,2,3-propanetriyl ester , Octadecane, 3-ethyl-5-(2-ethylbutyl)- was found to be high (21.21%) and the lowest percentage (0.23%) was found to be Phenyltricyclo [8.2.2.2 (4,7)] hexadeca-1(13),4,6,10(14),11,15-hexaen-5-ylmethyleneamine and Adipic acid, isobutyl 3-phenoxybenzyl ester. The above mentioned isolated compounds from the seed extract of *Syzygium cumini* have a medicinal importance.

DISCUSSION

Medicinal plants have been used worldwide for the treatment of various diseases principally in developing countries where infectious diseases are endemic and contemporary health amenities are inadequate[10]. Cyclotrisiloxane and hexamethyl found in the seed extract of *Syzygium cumini* are the main antioxidant compounds that help remove harmful toxins and free radicals in the body. [11]. The present study scientifically validates the antimicrobial potential of the traditionally important plant, *Cryptostegia grandiflora*. Which possess many chemical constituents it can be used for the treatment of various diseases. The phytochemicals identified might serve as sources for drug formulations in the future.

ACKNOWLEDGEMENT

I would like to thank wholeheartedly Dr. M.Kumar Raja instrumentation centre, Ayya Nadar Janaki ammal College (Autonomous), Sivakasi, for her help in the GC-MS spectrum studies.

ABSTRACT

The floristic diversity of Pattanam, Rasipuram Taluk, Namakkal district, Tamil Nadu, India was conducted to enumerate the plant species. Several field trips were accompanied during August 2023 - August 2024.To determine the distribution of plant species throughout different families, a statistical analysis of diversity becomes crucial.A total number of 102species under 50 families with 89 genera were collected, which belongs to the category of Angiosperms. Based on the life forms, the plants have been grouped into trees, shrubs, herbs and climbers. Herbs are more dominated with 45 species, followed by shrub 25 species, climber 2 species, creeper 2 species and Tree 28 species. Rural people made many uses of some of the plants. The main uses were used as food, medicine, building materials, religious or cultural purposes, and other domestic needs. Because of intense human pressure and climate change, natural areas are disappearing at an alarming rate. It is urgent necessary to apply strict conservation measures to preserve the area's scattered reserves of native vegetation.

Keywords: Floristic diversity, Enumerate, Angiosperms, conservation and vegetation

INTRODUCTION

Floristic diversity is an important element of ecosystems, the overall expression of numerous environmental elements that act gradually or cyclically is called vegetation. The analysis of vegetation aids in the development of a comprehensive map of the plant communities found in each area. More deliberately, vegetation is the expression of the total amount of plants in each region. This can consist of a complex or mosaic of plants, or it can consist of one or more plant communities. In addition to variances in height, latitude, slope and soil, vegetation types can also change due to fluctuations in rainfall patterns and human activities including volcanic activity, landslides, forest fires, and soil erosion. The dynamics of forests and the diversity of trees are governed by changes in climate. In old growth forests, disturbance provides the potential to safeguard diversity of species and boost species richness. In intermediate levels of disturbance, a higher species richness is preserved ((Nar Bahadur Khatri Chhetri& Krishna Kumar Shrestha, 2019).

MATERIALS AND METHODS

Study site

The floristic surveys were conducted periodically and documented the species available in the Pattanam, Rasipuram, Namakkal District. It is located between the11.47197°N and 78.210889°E. The plant species are listed in different life forms such as herbs, climber, creeper, shrub and tree.

Floristic Survey

Theperiodical visit of floristic survey was conducted during August 2023 - August 2024.The identified plant species were arranged according to Flora of the Presidency of Madras (Gamble, 1915-1936) and the voucher plant specimen's herbarium are deposited in the PG & Research Department of Botany, Vellalar College for Women (Autonomous), Thindal, Erode. The interview was conducted by the traditional healers, vaithiyars and age-old people to recognize the medicinal values.

RESULT AND DISCUSSION

Species Diversity

From the result of floristic survey of Pattanam, Rasipuram, Nammakal District collected few Angiosperms medicinal plants around 102 plant speciesunder 50 families with 89 genera. Most of the plant species were herb (45 species), followed by shrub (25 species), tree (28 species), climber (2 species) and creeper (2 species) (Fig - 2& Plate - 1). The above classified plants were again considered into large quantity such as Fabaceae (9 species), Apocynaceae (8 species), Malvaceae and Euphorbiaceae (5 species), Amaranthaceae, Asteraceae, Cucurbitaceae, Lamiaceae and Solanaceae (4 species) and remaining families consist of single species (Table -1&Fig - 1) similarly Jayanthi Palanisamy and Rajendran Arumugam (2014) recorded that Madukkarai hills floristic diversity resulted a total of 300 plant species from 206 genera and 72 families have been recognized as well as 241 species were dicots, including 169 genera and 65 families, and 59 species from monocots, comprising 35 genera and 7 families. ChinnappanAlagesaboopathi (2012) Sirumalai Hills found that 44 plant species 3 were monocot and 41 were dicot species.

Enumeration

The plant species were arranged in the format of tamil name, botanical Name, family, and medicinal uses (Table - 1). The below table describes about 102 plant species identified from the Patannam, Rasipuram Taluk,Namakkal District.

CONCLUSION

The present findings reveal the medicinal plants available in different season of Pattanam, Rasipuram Taluk, Namakkal District, Tamil Nadu, India. The diversity of medicinal plants found in the wild that are helpful, underutilizedand have enormous potential to improve human welfare in the future. The wild plant of that area used to prepare novel drugs for all living creatures

ACKNOWLEDGEMENT

The author's Research Scholar Ms. M. Bhuvaneswari (TNSCST/RFRS/05/VM/2021-22) and Research Guide Dr. C. Chitra Vadivu, PG & Research Department of Botany, Vellalar College for Women (Autonomous), Thindal, Erode express heartfelt gratefulness for "Catalyzed and financially supported by Tamil Nadu State Council for Science and Technology, Department of Higher Education, Government of Tamil Nadu" for the project (RFRS)".

Table.1: Floristic diversity of medicinal uses of Pattanam

S. No	Botanical Name	Family	Tamil Name	Habit	Medicinal uses
1.	*Abutilon indicum* G. Don.	Malvaceae	Thuthi	Shrub	Anti-inflammatory, anti-microbial, antioxidant and analgesic
2.	*Acalypha indica* Linn.	Euphorbiaceae	Kuppaimeni	Herb	Anti – parasitic, anti-microbial, anti-pulmonary, anti-scabies and emetic
3.	*Achyranthes aspera* Linn.	Amaranthaceae	Nayuruvi	Herb	Anti- cancer,wound healing, ring worm and dysentry
4.	*Aegle marmelos*Corr.	Rutaceae	Vilvam	Shrub	Anti- pyretic, ulcer, anti-fertility, antimicrobial and anti-diabetic
5.	*Aervalanata*Juss.	Amaranthaceae	Poolai poo	Herb	Cough, headache, urolithiasis and hemorrhage
6.	*Aloe vera* Linn.	Asphodelaceae	Katralai	Herb	Wound healing, pain and inflammation
7.	*Alternanthera sessilis*(L.) R. Br.	Amaranthaceae	Ponnankann	Herb	Pain relief, wound healing,

	ex DC.		i		hypertension and opthalmia
8.	*Andrographis paniculata* Nees.	Acanthaceae	Siriyanangai	Herb	Snake bites,diabetes, dysentry
9.	*Anodendronpaniculatum*A. DC.	Apocynaceae	Sarakkodi	Climber	Antimicrobial, rheumatism, wounds and ulcer
10.	*Anona squamosa* Linn.	Annonaceae	Seetha	Shrub	Anti-diabetic, antioxidant, hepatoprotective and anti - ulcer
11.	*Azadirachtaindica*A.Juss.	Meliaceae	Vembu	Tree	Gastrointestinal disorders, wounds, anti- diabetic, anti- cancer and malaria
12.	*Bassialatifolia*Roxb.	Sapotaceae	Illupai	Tree	Anti-inflammatory, rheumatism, intestinal diseases and laxative
13.	*Blepharismolluginifolia*Pers.	Acanthaceae	Nethirapoondu	Herb	Fever, wound healing, bone fractures and chronic diseases
14.	*Boerhaaviadiffusa*Linn.	Nyctaginaceae	Mookkarattai	Herb	Jaundice, asthma, rheumatism, anemia and gynecological disorders
15.	*Borassus flabellifer* L.	Arecaceae	Pannaimaram	Tree	Diuretic, antihelminthic, antiarthritic and anti-inflammatory
16.	*Calotrophis gigantea* R. Br.	Apocynaceae	Erukku	Shrub	Antivenom, antitussive, digestive and respiratory disorders
17.	*Cardiospermumhalicacabum*Linn.	Sapindaceae	Mudakkathan	Herb	Anti-arthritic, anti-cancer, abdominal pain and eczema
18.	*Carica papaya* L.	Caricaceae	Pappali	Tree	Anti-ulcerogenic, hypoglycemic, heart disease and wound healing
19.	*Cassia auriculata* Linn.	Fabaceae	Avaram	Shrub	Hyperlipidemia, skin diseases, urinary disorders and chronic fever
20.	*Cassia fistula* L.	Fabaceae	Sarakondrai	Tree	Heart problems, snake bites, nausea and cough
21.	*Centellaasaiatica*(L.)	Apiaceae	Vallarai	Herb	Wounds, burns, psoriasis, scleroderma, fever and diarrhea
22.	*Ceropegia intermedia* Wight.	Apocynaceae	Chitalankodi	Climber	Anti- inflammatory, antioxidant and antimicrobial
23.	*Ceropegia juncea*Roxb.	Apocynaceae	Pulichan	Herb	Liver disorders, anesthetic, malignant ulcers and Kidney stones

24.	*Cissus quadrangularis* Linn.	Vitaceae	Pirandai	Herb	Antioxidant, anti – microbial, anti-cancer and anti - inflammatory
25.	*Citrullus colocynthis*(L.) Schrader.	Cucurbitaceae	Pey – komatti	Herb	Common cold, fever, dysentery and bronchitis
26.	*Citrus limon* (L.) Osbeck	Rutaceae	Elumichai	Tree	Chest pain, constipation, gout, respiratory disorders and sore throat
27.	*Cleome viscosa*Linn.	Capparaceae	Naivelai	Herb	Anthelmintic, anti-diabetic, anti-diarrheal, antioxidant and analgesic
28.	*Clitoriaternatea*Linn.	Fabaceae	Sangupoo	Herb	Memory enhancer, nootrophic, antistress, anxiolytic and sedative
29.	*Coccinia grandis*Voigt.	Cucurbitaceae	Kovai	Herb	Antidiabetic, antimicrobial, anorexia, bronchitis and epilepsy
30.	*Cocos nucifera* L.	Arecaceae	Thennaimaram	Tree	Antiparasitic, antioxidant, antimicrobial and immunostimulant
31.	*Commelina benghalensis*Linn.	Commelinaceae	Aduthinnapalai	Herb	Sore throat, urethral pain, malaria and wound healing
32.	*Crotalaria juncea*	Fabaceae	Sanapai	Herb	
33.	*Couroupita guianensis*Aubl.	Lecythidaceae	Naagalingam	Tree	Hypertension, pain, tumor, antiprotozoal and inflammation
34.	*Cucurbita pepo* L.	Cucurbitaceae	Parankikai	Creeper	Intestinal worms, urinary tract problems,dermatitis, Irritable bladder and prostrate gland disorder
35.	*Cyanodondactylon* (L.) Pers.	Poaceae	Arugampillu	Herb	Anti-diabetic, antioxidant, convulsions, cramps and tumors
36.	*Cyperusrotundus*Linn.	Cyperaceae	Korai	Herb	Fever, skin diseases, diarrhea and anti-diabetics
37.	*Eclipta alba* Hassk.	Asteraceae	Karisalai	Herb	Antiseptic, respiratory issues, snake venom and hair growth
38.	*Ecliptaprostrata*(L.) L.	Asteraceae	Vellaikarisalankanni	Herb	Snake bites, catarrah, hair growth, liver and kidney defeciencies
39.	*Enicostemmalittorale*Bl.	Gentianaceae	Vellarugu	Herb	Anti- diabetic, rheumatism, abdominal disorder, obesity and snake bites
40.	*Euphorbia hirta*L.	Euphorbiaceae	Amman paccharisi	Herb	Respiratory ailments, fever, conjunctivitis and

					snake bites
41.	*Ficus bengalensis* Linn.	Moraceae	Aal	Herb	Rheumatism, anti-microbial, astringent, burns and wounds
42.	*Ficus racemosa* Linn.	Moraceae	Atthi	Tree	Skin diseases, wound healing, anti-inflammatory and urinary diseases
43.	*Ficus religiosa* Linn.	Moraceae	Arasu	Tree	Anti – ulcer, anxiety, immunomodulatory and anti-microbial
44.	*Gloriosa superba* L.	Liliaceae	Senkanthal	Herb	Rheumatism, skin diseases, snake bites and leprosy
45.	*Gomphrena serrata* L.	Amaranthaceae	Poolaichedi	Herb	Allergies, piles, diarrhea and asthma
46.	*Hibiscus rosa – sinensis*	Malvaceae	Chemparuthi	Shrub	Anti- asthmatic, anti – inflammatory, anti – oxidant, analgesic and hypertensive
47.	*Hibiscus sabbardifolia*	Malvaceae	Pulichaikeerai	Herb	Liver health, antioxidant and antimicrobial
48.	*Hibiscus vitifolius*L.	Malvaceae	Kaatupulichai	Herb	Jaundice, anaemia, fatigue, lasstitude and melanoma
49.	*Indigofera tinctoria* L.	Fabaceae	Avuri	Shrub	Asthma, anti -cancer, anti – inflammatory and liver toxicity
50.	*Ipomoea quamoclit*Linn.	Convolvulaceae	Mayilmanickam	Herb	Chest pain, anti- diabetic, fever and snake bites
51.	*Jatropha curcas*Linn.	Euphorbiaceae	Katamanakku	Shrub	Anti-cancer, antimalarial, antitode, gum bleeding and jaundice
52.	*Justicia adhatoda*L.	Acanthaceae	Aadathodai	Shrub	Asthma, bronchodilator, bronchitis and tuberculosis
53.	*Lantana camara* Linn.	Verbenaceae	Unnichedi	Shrub	Respiratory conditions, infections, vomiting and diarrhea
54.	*Lawsoniainermis L.*	Lythraceae	Maruthani	Shrub	Jaundice, spleen, leprosy and spleen enlargement
55.	*Leucas aspera* Spr.	Lamiaceae	Thumbai	Shrub	Antipyretic, antivenom, anticancer and anti-inflammatory
56.	*Mangifera indica* L.	Anacardiaceae	Mamaram	Tree	Rheumatism, diphtheria, vermifuge, laxative and diuretic
57.	*Melia dubia*Hiern.	Meliaceae	MalaiVembu	Tree	Anti- microbial, leprosy, eczema and malaria
58.	*Micheliachampaca* L.	Magnoliaceae	Senpagapoo	Tree	Purgative, expectorant, carminative, stomachic

					and nausea
59.	*Millingtoniahortensis**L.f.*	Bignoniaceae	Maramalli	Tree	Asthma, sinusitis, antipyretic, skin disorders and epilepsy
60.	*Mimosa pudica*L.	Fabaceae	Thottalsurungi	Herb	Urinary calculi, hemorrhoids, mucus and piles
61.	*Mimusopselengi* L.	Sapotaceae	Mahilam	Tree	Gums, reduces inflammation, removes bad breath and pyorrhea
62.	*Mollugonudicaulis*Lam.	Aizoaceae	Manthagi chedi	Herb	Antioxidant, anticancer, whooping cough, jaundice and kidney infections
63.	*Momordica charantia* L.	Cucurbitaceae	Pagarkai	Herb	Anti- diabetic, cholesterol, anti- inflammatory and anti - microbial
64.	*Morindacitrifolia*Linn.	Rubiaceae	Nuna	Shrub	Anti-microbial, anti – cancer, antioxidant, depression and gastric ulcer
65.	*Murrayakoenigii*(L.) Spreng.	Rutaceae	Karuveppillai	Tree	Antileishmanial, antimicrobial, immunomodulation and antipyretic
66.	*Musa parasidiaca*L.	Musaceae	Vazhai	Shrub	Wound healing, antihyperglycemic, hypertension and hysteria
67.	*Nerium oleander* L.	Apocynaceae	Arali	Shrub	Anti-cancer, indigestion, ringworm, malaria and cause abortions
68.	*Nyctanthes arbor-tristis*L.	Oleaceae	Pavalamalli	Shrub	Fever, antioxidant, antimicrobial and skin ailments
69.	*Ocimumbasilicum*L.	Lamiaceae	Thiruneetrubasilai	Herb	Respiratory disorders, antimicrobial, antidiabetic and neuroprotective
70.	*Ocimumtenuiflorum*L.	Lamiaceae	Tulsi	Herb	Anti- diabetic, antistress, antioxidant and eye disorders
71.	*Opuntia dilleni*Haw.	Cactaceae	Sappathikkalli	Shrub	Gastric ulcer, hepatitis, whooping cough and intestinal spasm
72.	*Phyla nodiflora*(L.) Greene.	Verbenaceae	Poduthalai	Herb	Liver disorders, bleeding piles, dysuria and fever
73.	*Phyllanthus emblica*Linn.	Euphorbiaceae	Nelli	Tree	Anti- cancer, anti – inflammatory, anticancer and anemia
74.	*Phyllanthus polyphyllus*Willd.	Euphorbiaceae	Arunelli	Tree	Anti-cancer, antioxidant, antinociceptive and

					antidiabetic
75.	*Physalis minima* L.	Solanaceae	Sodakkuthakkali	Herb	Bladder ulcer, anti-cancer, diuretic and laxative
76.	*Piper betel* Linn.	Piperaceae	Verillai	Creeper	Antimicrobial, anti-inflammatory, antifungal and diuretic
77.	*Plectranthusamboinicus*(Lour.) Spreng.	Lamiaceae	Karpuravalli	Herb	Antitumrogenic, dysentery, dyspepsia and mumps
78.	*Plumeria alba* L.	Apocynaceae	Perunkalli	Tree	Leprosy, veneral diseases, diarrhea, herpes, cardiac arrest and scabies
79.	*Pongamiapinnata*(L.) Pierre	Fabaceae	Pungamaram	Tree	Gonorrhea, leprosy, dyspepsia and cough
80.	*Prosopis cineria*(L.) Druce.	Mimosaceae	Vannimaram	Shrub	Antihyperlipidemic, antipyretic, antimicrobial and Immunomodulatory
81.	*Prunus dulcis* (Mill.) D.A. Webb	Rosaceae	Padanikai	Tree	Cholesterol, weight loss,skin diseases, sore throat and bleeding gums
82.	*Psidium guajava* L.	Myrtaceae	Koyyamaram	Tree	Anti- diabetic, fever, cough, anti-cancer and menstrual disorders
83.	*Punica granatum* L.	Punicaceae	Madhulai	Shrub	Cholesterol, diarrhea, male infertility and obesity
84.	*Senna auriculata* (L.) Roxb.	Fabaceae	Avarai	Shrub	Muscle pain, pink eye, joint pain and constipation
85.	*Sidaacuta*Burm.	Malvaceae	Ariva – mookukeerai	Shrub	Bile, gonorrhea, renal inflammation, child birth and antioxidant
86.	*Solanum nigrum* Linn.	Solanaceae	Manathakkali	Herb	Skin diseases, urinary tract diseases, wounds and fever
87.	*Solanum torvum*Sw.	Solanaceae	Sundai	Shrub	Anti- diabetic, arterial hypertension, urethritis and toothache
88.	*Solanum trilobatum*L.	Solanaceae	Thoodhuvalai	Herb	Anti- inflammatory, anticancer, antioxidant and bronchial asthma
89.	*Strychnosnux- vomica* L.	Loganiaceae	Yetti	Tree	Swelling of the stomach, migrane, constipation and anxiety
90.	*Syzigiumcumini*(L.) Skeels.	Myrtaceae	Naval	Tree	Jaundice, constipation, leucorrhea and anti - diabetic
91.	*Syzigiumjambolanum*DC.	Myrtaceae	Naval	Tree	Anti- diabetic, antioxidant, antimicrobial and appetite
92.	*Tabernaemontanadivaricata*(L.) R.Br. ex Roem. & Schult	Apocynaceae	Nanthiyavettai	Shrub	Emmenagogue, aphrodisiac, and

					purgative, analgesic and anti- diabetic
93.	*Talinum fruticosum* (L.) Juss.	Talinaceae	Kodipasalai	Herb	Blood pressure, weight loss, anti-diabetics and anemia
94.	*Tamarindus indica* L.	Fabaceae	Puliyamaram	Tree	Anti – malarial, antiasthmatic, anti-hyperlipidemic and laxative
95.	*Tectona grandis* Linn. f.	Verbenaceae	Tekku	Tree	Anti – inflammatory, anti-diabetic and anti - microbial
96.	*Thespesia populnea*Cav.	Malvaceae	Poovarasu	Tree	Hepatoprotective, anti-alzheimers, diuretic and astringent
97.	*Thevatianeriifolia*Juss.	Apocynaceae	Thangarali	Shrub	Anti – inflammatory, anti-microbial, ringworms and tumors
98.	*Trianthemaportulacastrum*L.	Aizoaceae	Sharanai	Herb	Nephroprotective, hypoglycemic, analgesic, anemia and night blindness
99.	*Tribulus terrestris* Linn.	Zygophyllaceae	Nerunchi	Herb	Chest pain, heart problems, dizziness, skin and eye disorders
100.	*Tridaxprocumbens*L.	Asteraceae	Vettukayathali	Herb	Skin diseases, blood pressure, stomachache and antifungal
101.	*Vernonia cinerea* (L.) Less.	Asteraceae	Mookuthichedi	Herb	Antimicrobial, antidiabetic, antiprotozoal and analgesic
102.	*Ziziphusoenoplia*(L.) Mill.	Rhamnaceae	Sooraipalam	Shrub	Anti-diabetic, wound healing, anti- diabetic and abdominal pain

ABSTRACT

This study explores the intricate relationship between forensic science implementation and judicial outcomes within India's criminal justice system. Through a comprehensive analysis of criminal cases and in-depth interviews with key stakeholders across multiple states, we examine how forensic evidence influences legal proceedings and the reliability of judicial decisions. Our research reveals a strong positive connection between quality forensic evidence and just judicial outcomes, while also identifying significant implementation barriers throughout the country. The primary challenges include inadequate laboratory infrastructure, insufficient training of forensic personnel, vulnerabilities in evidence handling and preservation, and inconsistent scientific methodologies across different jurisdictions. The study highlights considerable gaps between the theoretical potential of forensic science and its practical application in Indian courtrooms, where only a fraction of serious criminal investigations utilize comprehensive forensic protocols despite existing legal provisions. We propose a multi-faceted approach for improvement focusing on standardization of procedures, enhanced training programs for forensic practitioners and legal professionals, integration of appropriate technologies for resource-limited settings, and development of forensic literacy among judges and lawyers. This research contributes meaningfully to ongoing discussions about evidence-based jurisprudence in developing nations and offers practical

recommendations for policymakers. The findings suggest that strategic investments in forensic infrastructure alongside procedural reforms could substantially improve both the reliability and fairness of India's criminal justice outcomes, ultimately strengthening public trust in the judicial system

Keywords: Forensic evidence; judicial reliability; criminal justice reform; scientific evidence standards; Indian legal system.

INTRODUCTION

The intersection of forensic science and judicial processes represents a critical domain where scientific methodologies meet legal frameworks in pursuit of justice. In India, a nation with one of the world's largest and most complex judicial systems, this relationship carries particular significance as the country continues to modernize its approach to criminal investigations and prosecutions. The Indian legal system, rooted in common law traditions but operating within unique socioeconomic and cultural contexts, presents both opportunities and challenges for the effective integration of forensic science into judicial decision-making. The importance of forensic evidence in criminal proceedings has gained increasing recognition globally, with technological advancements expanding the scope and reliability of scientific investigative techniques. However, the translation of these advancements into improved judicial outcomes depends on numerous factors beyond mere technological capabilities. Institutional frameworks, procedural guidelines, human expertise, and resource allocation all play crucial roles in determining whether forensic science serves as an effective tool for justice or remains an underutilized potential.

Despite significant legislative provisions supporting the use of forensic evidence—including amendments to the Indian Evidence Act, the Code of Criminal Procedure, and various Supreme Court judgments endorsing scientific evidence—a substantial gap persists between legal theory and investigative practice. This research seeks to examine the current state of forensic science application in India's judicial system, assess its impact on case outcomes, identify key challenges impeding its optimal utilization, and propose practical solutions to enhance its contribution to just judicial decisions. By analyzing the correlation between forensic evidence quality and judicial outcomes, while acknowledging the systemic constraints unique to India's context, this study aims to provide a comprehensive framework for understanding and improving this crucial relationship. The findings and recommendations presented here hold significance not only for India but also for other developing nations facing similar challenges in integrating scientific methodologies into traditional legal systems. As forensic science continues to evolve globally, understanding the contextual factors that influence its effectiveness becomes essential for developing tailored approaches that can strengthen judicial processes and enhance public confidence in the administration of justice.

LITERATURE REVIEW

Historical Development of Forensic Science in India

The evolution of forensic science in India traces back to the colonial era when the British administration established the first Chemical Examiner's Laboratory in Madras (now Chennai) in 1849, primarily focused on toxicological analysis (Tiwari & Verma, 2016). The post-independence period witnessed significant expansion of forensic facilities, with the establishment of the Central Forensic Science Laboratory (CFSL) in Calcutta in 1957, followed by similar institutions in Hyderabad and Chandigarh (Rao, 2018). The Directorate of Forensic Science Services (DFSS) was created in 2002 to provide administrative oversight and standardization across these facilities. Despite this institutional development, scholarly assessments indicate that the growth of forensic infrastructure has not kept pace with the expanding needs of the criminal justice system. Sharma and Jain (2017) noted that while developed nations

typically maintain one forensic laboratory per five million population, India's ratio stands at approximately one per twenty million, creating significant resource constraints and evidentiary backlogs.

Legal Framework for Forensic Evidence in India

The Indian Evidence Act of 1872, (Old Law) particularly sections 45-51 dealing with expert testimony, provides the fundamental legal basis for the admissibility of forensic evidence (Pillai, 2020). Subsequent amendments have expanded this framework, with section 293 of the Criminal Procedure Code (Old Law) specifically recognizing certain categories of forensic reports as admissible without requiring the expert's presence in court. The Supreme Court of India has further strengthened this foundation through landmark judgments such as *Selvi v. State of Karnataka* (2010) and *Tomaso Bruno v. State of Uttar Pradesh* (2015), which emphasized the importance of scientific evidence in criminal proceedings. Kumar (2019) observes that while the legal framework technically accommodates modern forensic methodologies, procedural obstacles and judicial interpretations often restrict their effective application. The Supreme Court's judgment in *Daubert v. Merrell Dow Pharmaceuticals* established criteria for scientific evidence admissibility that have influenced Indian jurisprudence, yet Mathur (2021) argues that inconsistent application of these standards across different courts has created confusion about evidentiary thresholds. The introduction of the Bharatiya Nyaya Sanhita (BNS), Bharatiya Nagarik Suraksha Sanhita (BNSS), and Bharatiya Sakshya Adhiniyam (BSA) in 2023 marked a paradigm shift in India’s criminal justice system, with a strong emphasis on integrating forensic science into investigations and trials.

New Criminal laws and Forensic Science

Modernization and Integration of Forensic Science

i. The new laws mandate forensic examination in serious crimes, especially those punishable by seven years or more, and emphasize the use of advanced forensic technologies such as DNA profiling, digital forensics, and toxicology.
ii. The BNSS specifically requires scientific evidence for heinous crimes, establishes strict chain-of-custody protocols, and promotes the creation of specialized forensic units within police forces.
iii. The BSA modernizes the admissibility and authentication of electronic and forensic evidence, aligning with global standards and ensuring transparency in expert testimony.

Impact on Criminal Justice System

i. The literature highlights that these reforms are expected to improve conviction rates, reduce wrongful convictions, and speed up trials by relying on objective, scientific evidence rather than subjective testimonies.
ii. Forensic science is seen as essential for addressing complex crimes such as sexual offenses, drug trafficking, and cybercrimes, which are now explicitly recognized and defined in the BNS.

Challenges and Recommendations

i. Persistent challenges include inadequate forensic infrastructure, delays in forensic processing, shortage of trained experts, and limited awareness among stakeholders.
ii. Scholars recommend increased investment in forensic laboratories, regular training for law enforcement and judicial officers, and public awareness campaigns to ensure effective implementation.

Comparative and Critical Perspectives

i. Some analysts question whether the new laws merely repackage existing provisions or genuinely modernize the system, while others argue that the structural and procedural changes, especially the integration of technology and forensic science, represent a significant advancement.
ii. The shift towards a victim-centric approach and the introduction of community service as a form of punishment are also noted as progressive changes.

The new criminal laws in India have significantly elevated the role of forensic science, making it central to investigations and trials. While challenges remain, the reforms are a transformative step towards a more scientific, transparent, and efficient criminal justice system

Current State of Forensic Practice in Indian Criminal Investigations

Recent research has highlighted significant disparities in forensic science implementation across India's diverse states and territories. Agarwal and Menon (2020) found that while metropolitan centres like Delhi, Mumbai, and Bangalore demonstrate relatively sophisticated forensic capabilities, rural and semi-urban jurisdictions often lack basic scientific investigation tools. Their study of 500 murder investigations across ten states revealed that comprehensive forensic protocols were applied in only 32% of cases, with wide regional variations. Singh et al. (2022) examined the frequency and quality of different forensic techniques in Indian criminal investigations, finding that traditional methods like fingerprint analysis and document examination remain predominant, while more advanced techniques such as DNA profiling, digital forensics, and ballistics are underutilized despite their potential evidentiary value. This pattern reflects both resource constraints and knowledge gaps among investigating officers.

Impact of Forensic Evidence on Judicial Outcomes

The correlation between forensic evidence and judicial outcomes has been examined in several international contexts, with mixed findings regarding its impact. Peterson et al. (2018) conducted a meta-analysis of studies from various jurisdictions, concluding that cases with forensic evidence were generally more likely to progress through the justice system and result in convictions. However, the strength of this correlation varied significantly based on evidence quality, crime type, and judicial context. In the Indian context, Venkatesh and Sharma (2021) analyzed 200 criminal cases in Karnataka courts, finding that the presence of forensic evidence increased conviction rates by approximately 27% compared to similar cases without such evidence. However, they also noted that the quality and presentation of forensic evidence significantly influenced its impact, with procedural irregularities often undermining otherwise sound scientific findings.

Challenges in Forensic Science Implementation

Multiple studies have identified challenges that impede effective forensic science implementation in India. Infrastructure deficiencies represent a primary concern, with Balakrishnan (2020) documenting significant backlogs in evidence processing across state laboratories, sometimes extending to several years for complex analyses. Workforce limitations constitute another critical factor, as highlighted by Mehta (2019), who found that many forensic facilities operate with less than 60% of their sanctioned staff strength, with particularly acute shortages in specialized domains like digital forensics, ballistics, and toxicology. Procedural inconsistencies have been extensively documented by Ravindran (2023), who analyzed evidence collection protocols across eight states and found substantial variations in methodologies, documentation standards, and chain-of-custody procedures. These inconsistencies not only compromise evidence integrity but also create vulnerabilities during trial when forensic findings face legal scrutiny.

International Best Practices and Reform Models

Comparative studies offer valuable insights into potential reform pathways. Kapoor (2022) examined forensic science reforms in South Africa and Brazil, identifying transferable lessons for India, particularly regarding decentralized service delivery models while maintaining centralized quality standards. Similarly, Ahmed and Khanna (2021) analyzed the UK's Forensic Science Regulator model, suggesting that independent oversight mechanisms could address quality control challenges in the Indian context. Technology adaptation represents another area of potential advancement, with Srinivasan et al. (2023) documenting successful implementations of mobile forensic units in Thailand and Malaysia that increased forensic accessibility in remote areas. These innovations demonstrate the possibility of developing context-appropriate solutions that address India's geographic and resource challenges. This literature review reveals significant gaps in current understanding, particularly regarding the precise mechanisms by which forensic evidence influences judicial decision-making in the Indian context, and the effectiveness of various

reform strategies in addressing systemic challenges. The present study aims to address these knowledge gaps through systematic empirical investigation of the forensic science-judicial outcome relationship.

RESEARCH METHODOLOGY

Research Design

This study employed a mixed-methods research design combining qualitative and quantitative approaches to develop a comprehensive understanding of the relationship between forensic science and judicial outcomes in India. The research was conducted in three interconnected phases: (1) case analysis of criminal proceedings involving forensic evidence; (2) in-depth interviews with key stakeholders; and (3) comparative analysis of jurisdictional variations. This triangulated approach enabled examination of both statistical patterns and contextual factors influencing forensic science implementation and its judicial impact. The research design incorporated multiple validity safeguards, including investigator triangulation with three researchers independently analyzing key data subsets, member checking with interview participants to verify interpretative accuracy, and peer debriefing with external experts to review methodological decisions and preliminary findings. These measures strengthened the credibility and dependability of the research findings.

Sampling Strategy

For the case analysis component, we utilized a stratified purposive sampling approach to select criminal cases from fourteen states representing India's geographical, socioeconomic, and jurisdictional diversity. The sample included cases from metropolitan centers (Delhi, Mumbai, Kolkata, Chennai, Bangalore), medium-sized cities (Lucknow, Ahmedabad, Bhopal, Chandigarh), and district-level jurisdictions (selected locations in Rajasthan, Odisha, Assam, Telangana, and Kerala). Cases were selected from three crime categories: homicide, sexual assault, and property crimes involving scientific investigation. All selected cases had reached final disposition through the trial court system between 2018 and 2023, ensuring contemporary relevance while allowing for complete outcome assessment. This sampling strategy facilitated meaningful comparison across jurisdictional contexts while maintaining focus on cases where forensic evidence potentially played a significant role.

Data Collection Methods

Case Analysis

Court records from selected cases were obtained through the e-Courts system and official court repositories, supplemented by legal databases including SCC Online and Manupatra. For each case, we collected and analyzed:

1. First Information Reports (FIRs) documenting initial crime reporting
2. Forensic examination requests and corresponding reports
3. Investigation officer statements regarding forensic evidence
4. Expert witness testimonies and cross-examination records
5. Judicial reasoning in final judgments, particularly sections addressing forensic evidence
6. Appeal documents where applicable

The case analysis protocol focused on documenting the types of forensic evidence presented, procedural compliance in collection and analysis, treatment of evidence in court proceedings, and explicit judicial reasoning regarding forensic findings.

Stakeholder Interviews

Semi-structured interviews were conducted with key stakeholders in the forensic science-judicial nexus, including:

1. Investigating officers from various police departments
2. Forensic scientists and laboratory directors
3. Public prosecutors and defense attorneys
4. Trial court judges
5. Legal academics specializing in evidence law

6. Policy officials from relevant government departments

Interview protocols were customized for each stakeholder group while maintaining core thematic areas addressing perceptions of forensic evidence utility, implementation challenges, coordination between agencies, and potential reform strategies.

Field Observations

To contextualize the documentary and interview data, the research team conducted field observations at:

1. Crime scene investigation procedures (with appropriate permissions)
2. Forensic laboratories at state and central levels
3. Court proceedings involving forensic evidence presentation

These observations were documented through structured field notes focusing on practical workflows, resource utilization, inter-agency coordination, and technical protocols, providing valuable contextual insights that complemented the formal data collection methods.

Data Analysis

Qualitative data from interviews and observations underwent thematic analysis using NVivo software. To enhance analytical rigor, we employed constant comparative methods and negative case analysis, actively searching for contradictory evidence and alternative explanations. Case analysis data was systematically coded to identify patterns in forensic evidence utilization, procedural compliance, evidentiary challenges, and judicial reasoning. Particular attention was given to the relationship between forensic evidence quality (assessed through procedural compliance, methodological soundness, and presentation clarity) and case outcomes. Integration of qualitative and quantitative findings occurred through an explanatory framework approach, with statistical patterns from case analysis informing interview question refinement, and qualitative insights contextualizing observed correlations between forensic evidence and judicial outcomes.

Ethical Considerations

The research protocol received approval from the Institutional Ethics Committee. Key ethical safeguards included:

1. Anonymization of all case data to protect individual privacy
2. Informed consent from all interview participants
3. Confidentiality protections for sensitive information
4. Recognition of power dynamics during fieldwork
5. Sensitivity to cultural and regional contexts

Throughout the research process, we maintained ethical vigilance regarding potential implications for ongoing judicial proceedings and professional reputations, ensuring that findings were presented constructively with emphasis on systemic factors rather than individual performance.

FINDINGS

Current State of Forensic Science Implementation in India

Our case analysis revealed significant variability in forensic science implementation across India's criminal justice system. The utilization of forensic techniques across different crime categories showed notable disparities, with homicide investigations demonstrating the highest level of forensic engagement, followed by sexual assault cases, while property crimes exhibited the lowest incorporation of scientific methods. Even within these categories, substantial jurisdictional variations were evident, with metropolitan centers demonstrating more consistent forensic utilization compared to district-level jurisdictions. Interview data provided context for these patterns, with investigating officers citing several factors influencing forensic implementation decisions:

"Resource constraints force us to be selective about which cases receive full forensic attention. We prioritize based on crime severity, public attention, and evidentiary needs." (Senior Police Officer, Delhi)

"In remote districts, practical challenges like transportation of evidence to distant laboratories and limited specialized personnel mean forensic methods are reserved for the most serious cases." (Investigating Officer, Rural Rajasthan) Our analysis identified a hierarchical pattern in forensic technique utilization. Traditional forensic methods—fingerprint analysis, document examination, and basic toxicology—were widely employed across jurisdictions. Intermediate techniques such as ballistics, serology, and trace evidence analysis showed moderate implementation, primarily in urban centers. Advanced methodologies including DNA profiling, digital forensics, and advanced chemical analysis demonstrated the lowest utilization rates, concentrated predominantly in metropolitan jurisdictions and specialized crime categories. Field observations at forensic facilities revealed substantial infrastructure variations, with central laboratories demonstrating significantly greater technological and personnel capabilities compared to many state facilities. This infrastructure gradient directly influenced the accessibility and quality of forensic services available to investigating agencies across different regions.

Correlation between Forensic Evidence and Judicial Outcomes

Our analysis identified a meaningful relationship between forensic evidence and judicial outcomes across the examined cases. This correlation manifested in several key dimensions

Case Progression

Cases incorporating comprehensive forensic evidence demonstrated more efficient progression through the judicial system. The average time from charge-sheet filing to final disposition was approximately 23% shorter in cases with substantial forensic components compared to similar cases relying primarily on testimonial evidence. Prosecutors attributed this efficiency to greater clarity in establishing investigative findings:

"When we present well-documented forensic evidence, it streamlines the trial process. The scientific foundation reduces ambiguity and helps focus judicial attention on key issues." (Public Prosecutor, Chennai)

Conviction Rates

Cases with substantial forensic evidence components showed higher conviction rates across all crime categories examined. This pattern was particularly pronounced in cases involving circumstantial evidence, where forensic findings often provided crucial corroboration:

"In cases without eyewitnesses, quality forensic evidence becomes the cornerstone of successful prosecution. It provides objective substantiation that testimonial evidence alone cannot deliver." (Trial Court Judge, Mumbai)

However, the analysis revealed important qualitative dimensions to this correlation. The mere presence of forensic evidence did not guarantee favourable judicial outcomes—rather, the quality, relevance, and presentation of such evidence proved decisive. Cases where forensic evidence suffered from procedural irregularities, methodological limitations, or poor courtroom articulation showed minimal advantage over cases without scientific evidence.

Judicial Reasoning

Examination of judicial reasoning in case judgments revealed increasing sophistication in the interpretation of forensic evidence. Recent judgments demonstrated greater engagement with scientific methodologies and limitations compared to earlier cases, suggesting evolving judicial literacy regarding forensic science:

"We're seeing more nuanced judicial assessment of forensic evidence. Courts are increasingly capable of distinguishing between robust scientific findings and overextended claims." (Legal Academic, National Law University Delhi)

This trend toward greater judicial engagement with forensic evidence quality represents a positive development for evidence-based justice. However, interviews with judges revealed persistent challenges in evaluating complex scientific testimony:

"Judges receive limited training in scientific methodologies. When experts present contradictory interpretations of forensic evidence, we sometimes lack the technical foundation to fully evaluate competing claims." (High Court Judge, Kolkata)

Challenges in Forensic Science Implementation

Our research identified four principal categories of challenges impeding effective forensic science implementation in India's judicial system

Infrastructure and Resource Constraints

Laboratory capacity emerged as a fundamental limitation across most jurisdictions. State forensic laboratories frequently operate with insufficient equipment, inadequate facilities, and restricted operating budgets. These constraints manifest in substantial backlogs, with average processing times exceeding nine months for DNA analysis and six months for toxicology reports in many state laboratories. Field observations revealed significant technological disparities between central and state laboratories, with many district-level facilities lacking equipment for advanced analyses. This infrastructure gradient creates inequitable access to forensic services based on geographical location:

"Metropolitan cases benefit from proximity to advanced laboratories and specialist expertise. Rural cases often face delays or settle for less sophisticated analyses due to accessibility challenges." (Forensic Laboratory Director, Central Region)

Workforce Limitations

Personnel shortages represent another critical challenge, with forensic laboratories consistently operating below sanctioned staffing levels. Interview participants highlighted particular deficits in specialized domains:

"We have significant capability gaps in digital forensics, advanced chemical analysis, and certain categories of biological examination. Finding qualified specialists willing to work within government salary structures remains challenging." (State Forensic Science Laboratory Director)

Beyond numerical shortages, participants emphasized qualitative dimensions of workforce challenges, including limited ongoing training opportunities, career progression constraints, and inadequate exposure to emerging forensic methodologies:

"The field evolves rapidly, but our training systems struggle to keep pace. Many practitioners rely on outdated techniques because they haven't received updates on contemporary methods." (Senior Forensic Scientist, Southern Region)

Procedural Inconsistencies

Analysis of case records revealed substantial variability in evidence collection, preservation, and documentation procedures across different investigating agencies. This inconsistency compromised evidence integrity and created vulnerabilities during trial proceedings:

"Defense attorneys routinely challenge forensic evidence based on procedural irregularities. When documentation is incomplete or collection methods inconsistent, even scientifically sound findings become legally vulnerable." (Public Prosecutor, Western Region).

Interviews with investigating officers highlighted systemic factors contributing to these inconsistencies, including variable training quality, absence of standardized protocols, and practical constraints during field investigations:

"Standard operating procedures exist on paper but applying them consistently in field conditions—especially in resource-limited settings—presents real challenges." (Police Inspector, Eastern Region)

Inter-agency Coordination Challenges

The effective utilization of forensic science requires seamless coordination between multiple agencies, including police, forensic laboratories, prosecution services, and judicial officers. Our research identified significant communication and coordination gaps throughout this chain:

"The fragmentation between investigating agencies and forensic laboratories creates inefficiencies. Without direct communication channels, investigators sometimes collect evidence that cannot be properly analyzed with available resources." (Forensic Department Head, Northern Region)

"Prosecutors often receive forensic reports without adequate consultation with the scientific experts who produced them. This communication gap hinders effective presentation of complex scientific findings in court." (Senior Prosecutor, Southern High Court)

These coordination challenges reflect broader institutional silos within the criminal justice system, with limited mechanisms for collaborative planning, resource allocation, and procedural harmonization across agencies.

Regional Variations and Success Models

Our multi-state analysis revealed significant regional variations in forensic science implementation and effectiveness. Certain jurisdictions demonstrated notably stronger forensic integration into judicial processes, offering potential models for broader application

Effective Implementation Models

Several jurisdictions exhibited more successful forensic science integration. Analysis of these success cases revealed common features:

1. **Integrated Crime Scene Units** States like Gujarat and Kerala have implemented specialized crime scene units with dedicated forensic personnel, reducing evidence contamination and improving collection standards.
2. **Forensic Training Integration** Tamil Nadu and Karnataka have incorporated mandatory forensic awareness training for investigating officers, improving evidence recognition and preservation.
3. **Prosecutor-Scientist Collaboration** Delhi and Maharashtra have established formal consultation mechanisms between prosecutors and forensic experts, enhancing courtroom presentation of scientific evidence.
4. **Judicial Specialization** Specialized courts in metropolitan centers demonstrated greater forensic literacy and more consistent evidentiary standards.

These regional success models illustrate how institutional innovation can overcome systemic challenges even within existing resource constraints.

Technology Adaptation

Several jurisdictions have successfully implemented technological solutions to address forensic challenges:

"Our mobile forensic units have dramatically improved response times and evidence preservation in remote areas. This relatively low-cost intervention has yielded significant quality improvements." (Forensic Services Director, Gujarat)

Digital documentation systems, portable analysis equipment, and virtual expert testimony mechanisms represent additional technological adaptations that have improved forensic service delivery in resource-constrained environments.

Stakeholder Perspectives on Reform Priorities

Interview participants demonstrated substantial consensus regarding priority areas for forensic science reform, though with varying emphasis depending on professional role:

Investigating officers prioritized practical improvements in frontline evidence collection capabilities:

"We need better field kits, more accessible scientific support, and streamlined procedures that reconcile scientific rigor with operational constraints." (Police Superintendent, Northern Region)

Forensic scientists emphasized infrastructure development and workforce specialization:

"Building sustainable laboratory capacity requires both technology investment and human resource development. We need more specialist pathways and research opportunities to build internal expertise." (Forensic Laboratory Director)

Legal professionals focused on procedural standardization and communication improvements:

"The gap between scientific findings and legal applications remains substantial. We need better translation mechanisms—both linguistic and conceptual—between these professional domains." (High Court Advocate)

Policy officials acknowledged the need for systemic approaches:

"Piecemeal interventions have limited impact. We need holistic reform addressing the entire forensic-judicial pipeline, from crime scene to courtroom." (Ministry Official, Criminal Justice Department)

Despite these varying emphases, stakeholders broadly agreed on the fundamental goal of developing a more integrated forensic science ecosystem that balances scientific validity with legal admissibility and practical implement ability.

DISCUSSION

Interpreting the Forensic Science-Judicial Outcome Relationship

Our findings confirm a meaningful relationship between forensic evidence and judicial outcomes in the Indian context, while revealing important nuances in this correlation. The observed relationship appears mediated by multiple factors, including evidence quality, presentation effectiveness, and judicial forensic literacy. This complex interplay suggests that improving judicial outcomes requires attention not only to scientific methodologies but also to the human and institutional interfaces through which forensic evidence enters the judicial process. The quality gradient observed in forensic evidence application—with substantial variations across jurisdictions, crime categories, and technique types—mirrors patterns documented in other developing judicial systems (Maguire et al., 2020; Obenson & Wright, 2019). This pattern suggests that uneven development characterizes forensic science implementation globally, with resource constraints creating inevitable prioritization challenges. However, our identification of successful implementation models within India's diverse jurisdictional landscape demonstrates that contextual adaptation can overcome common constraints. These findings align with emerging scholarship on "appropriate forensic technology" that emphasizes context-sensitive solutions rather than wholesale importation of models from developed judicial systems (Krysińska-Kałużna, 2022).

Systemic Challenges and Reform Imperatives

The multifaceted challenges identified in our research reflect complex interdependencies within the criminal justice system. Infrastructural limitations, workforce constraints, procedural inconsistencies, and coordination gaps represent interconnected challenges requiring coordinated responses. This finding aligns with systems theory perspectives on criminal justice reform, which emphasize that interventions targeting isolated components often fail to produce systemic improvements (Rajagopalan & Tabarrok, 2021). The persistent gap between legal frameworks and implementation practices highlights the limitations of reform approaches focused primarily on legislative changes. While India has progressively strengthened its legal foundation for forensic evidence through legislative amendments and judicial precedents, our findings indicate that implementation capacity has not kept pace with these formal advancements. This pattern suggests the need for greater attention to the practical dimensions of forensic science integration, including resource allocation, institutional coordination, and procedural standardization. The workforce challenges identified in our research reflect broader patterns in public scientific institutions, where recruitment constraints, limited career advancement opportunities, and inadequate professional development systems often impede capacity development (Raveendran, 2021). Addressing these challenges requires not only increased funding but also structural reforms in employment frameworks, training systems, and professional recognition mechanisms.

Building Forensic Literacy across the Criminal Justice System

Our findings regarding variable forensic literacy among legal professionals echo concerns raised in international scholarship about the "CSI effect"—the impact of popularized and often misleading representations of forensic science on legal expectations and interpretations (Maeder & Corbett, 2018). The observed improvements in judicial engagement with scientific evidence suggest positive evolution, but substantial literacy gaps persist throughout the legal system. These literacy challenges extend beyond basic scientific understanding to encompass critical evaluation of methodological limitations, appropriate weight assignment to different evidence types, and recognition of the probabilistic nature of many forensic conclusions. Addressing these gaps requires not only technical training but also conceptual framework development that bridges scientific and legal epistemologies.

The successful forensic literacy initiatives identified in certain jurisdictions—particularly integrated training programs for investigating officers and specialized continuing education for judicial officers—provide potential

models for broader application. These programs demonstrate the value of targeted interventions that address specific knowledge gaps while respecting the distinct professional contexts of different stakeholders.

Technology Integration and Contextual Adaptation

The technology adaptation patterns observed in our research highlight the importance of context-appropriate solutions that balance scientific sophistication with implementation feasibility. Mobile forensic units, simplified field testing protocols, and digital documentation systems represent examples of intermediate technologies that have successfully addressed specific forensic challenges within resource constraints. This finding aligns with growing recognition that forensic science development in emerging economies may benefit from "technological leapfrogging"—adopting newer, more accessible technologies rather than recapitulating the historical development paths of established forensic systems (Chandran & Maity, 2022). Digital platforms, portable analytical devices, and cloud-based information systems offer particular promise for expanding forensic capabilities despite infrastructure limitations. However, our findings also underscore that technological solutions alone cannot address the multifaceted challenges facing forensic science implementation. Human expertise, institutional frameworks, and procedural standards remain essential foundations for effective forensic service delivery, regardless of technological sophistication.

Policy Implications and Reform Pathways

The research findings suggest several priority areas for policy intervention

Institutional Architecture

The current fragmentation of forensic services across multiple agencies creates coordination challenges and resource inefficiencies. Developing more integrated institutional structures—whether through consolidated forensic service agencies or formal coordination mechanisms—could enhance service delivery while maintaining necessary independence safeguards.

Standardization with Flexibility

National standard development for forensic procedures represents an essential foundation for quality improvement. However, these standards must accommodate implementation variations across India's diverse jurisdictional contexts, allowing for appropriate adaptation while maintaining core quality requirements.

Investment Prioritization

Given resource constraints, strategic investment prioritization becomes crucial. Our findings suggest that foundational improvements in basic forensic infrastructure, staff training, and procedural standardization may yield greater system-wide benefits than isolated investments in advanced technologies accessible to only a fraction of cases.

Educational Integration

Sustainable improvement requires enhanced forensic content in professional education across multiple disciplines. Integrating appropriate forensic modules into police training, legal education, judicial orientation, and continuing professional development programs can build system-wide literacy more effectively than standalone initiatives.

Quality Assurance Mechanisms

Developing robust quality assurance frameworks—particularly independent review mechanisms and proficiency testing programs—represents a crucial foundation for enhancing forensic evidence reliability regardless of resource context.

CONCLUSION

This research has examined the complex relationship between forensic science and judicial outcomes in India, revealing both promising developments and persistent challenges. The findings confirm the significant potential of forensic evidence to enhance judicial reliability, while highlighting the substantial gap between this potential and current implementation realities across much of India's criminal justice system. The identified challenges—infrastructure limitations, workforce constraints, procedural inconsistencies, and coordination gaps—reflect complex systemic interdependencies that resist simple solutions. However, the successful implementation models observed in certain jurisdictions demonstrate that contextual adaptation and strategic resource allocation can overcome many common constraints, even within existing structural limitations. Moving forward, India's forensic-judicial nexus would benefit from a coordinated reform approach addressing the entire evidence pipeline from crime scene to courtroom. This approach should emphasize practical implement ability alongside scientific validity and legal admissibility, recognizing that forensic evidence effectiveness depends as much on human and institutional interfaces as on technical methodologies.

Specific priority areas include standardizing procedures while allowing appropriate contextual adaptation, developing integrated training programs across professional domains, establishing independent quality assurance mechanisms, and strategically investing in both foundational infrastructure and appropriate technological innovations. The findings from this research contribute to the growing discourse on evidence-based criminal justice reform in developing nations, offering insights relevant not only to India but to other jurisdictions facing similar challenges in forensic science implementation. By addressing the identified gaps through coordinated, context-sensitive approaches, India has the opportunity to significantly enhance judicial reliability and public confidence in its criminal justice system.

Limitations and Future Research Directions

This study has several limitations that suggest directions for future research. The case analysis focused on cases that had reached final disposition, potentially missing important dynamics in ongoing proceedings. Future longitudinal studies tracking cases from investigation through final appeal could provide valuable additional insights. While the research encompassed multiple states, resource constraints limited the depth of analysis in each jurisdiction. More detailed state-level studies could enhance understanding of specific contextual factors influencing forensic science effectiveness. The stakeholder interviews, while diverse, may not have captured the full range of perspectives, particularly from rural and remote jurisdictions. Expanded research incorporating wider geographical and institutional representation would strengthen the findings.

Future research could productively focus on several key areas

1. Detailed cost-benefit analysis of different forensic investment strategies
2. Comparative evaluation of training models for different stakeholder groups
3. Longitudinal assessment of reform initiatives to identify implementation factors influencing success
4. Development and validation of forensic quality metrics appropriate for resource-constrained contexts

These research directions would further strengthen the evidence base for effective forensic science integration into India's evolving criminal justice system.

ABSTRACT

Developing and refining a transdermal composite sponge formulation for *Rosa Bourbonia* was the goal of the study. To create contour plots for response prediction a polynomials equation was subjected to the A2factor 2 level Box Behnken Design. Independent variables that ranged from low to high level included stirring time X1chitosan X2Gelatin and polymer concentration. The development various are weight reduction Y2 and Y1 porosity. The composition of the revised formulation was analyzed for porosity and weight reduction and response surface plots were made and the statistically validity of the polynomials was established. The design demonstrated how to forecast the value of dependent variables for the developing and optimization of composite sponge using derived polynomials equation and contour plots.

Keywords: Composite sponge, factorial design, transdermal drug delivery, *Rosa bourbonia.*

INTRODUCTION

Dr. Alejandro Zaffaroni was the first to seriously advocate the transdermal drug delivery system (TDDS) in the early 1970s. [1] Delivering medicine to the general circulation through the skin has many advantages over traditional dosing modalities, including lower dose frequency, fewer side effects, and non-invasive drug administration.[2] Skin can withstand the entry of exogenous diseases but is easily damaged. Skin injury allows pathogens to enter the body through inflammation and infection, which slows wound healing. An ideal wound dressing should be non-toxic,

biodegradable, and have beneficial mechanical and biological qualities. It should also be capable of preventing bacterial infection and excessive water loss in order to create a moist and clean environment for the wound.[3]Wound healing process is repairing a wound that has been damaged and infected on skin and other soft tissues. After the injury, there is an inflammatory response and the cells under the dermis increase collagen production in the connective tissue. [4] The outer skin of epithelial tissue is regenerated. Haemostasis, inflammation, proliferation, and remodelling are the four stages of wound healing. The proliferative phase includes angiogenesis, collagen deposition, granulation tissue formation epithelization and wound contraction.[5] Plants or plant-derived chemicals must be found and formulated to treat and manage wounds. Several herbal products are currently under investigation in this direction. Although many natural therapeutic items have been discovered, some are highly poisonous, interact with other medications, and have negative side effects. In recent years, herbal products have been accepted in the Morden system, and their quality must be assessed. [6,7] The herbal composite sponge formulation is predicted to produce a synergistic benefit at low medication concentrations while causing no side effects. In recent years, several compounds, including collagen (chitosan, gelatine, and PVA), have been extensively developed to aid wound healing.[8] Chitosan, a polysaccharide biopolymer produced from naturally occurring chitin, has distinct polycationic chelating and film-forming capabilities due to the presence of an active amino hydroxyl functional group. Chitosan also has a variety of fascinating biological activities, such as antibacterial activity, induced disease resistance in plants, and various stimulating and inhibitory action toward human cell types. Additionally, chitosan can be used to prevent or treat wounds and burns. It can also enhance the actions of inflammatory cells, macrophages, and fibroblasts. PVA synthetic polymers are water soluble, nontoxic, biodegradable, and have good biocompatibility. Graphene oxide, a unique and promising alternative material, has a huge specific surface area and a high concentration of hydroxyls, carboxyls, and other surface groups. Graphene oxide offers several distinguishing characteristics, including exceptional chemical stability, mechanical qualities, biocompatibility, and great hydrophilicity. It has also been employed as an energy storage/conversion unit in wound dressings and scaffolding material for cell/tissue culture.[9,10]

MATERIAL AND METHODS

Material

Chitosan with degree of deacetylation 85% was purchased from Loba chemie Pvt. Ltd. Ahmadabad and gelatine werepurchased from National chemicals Gujrat. All reagents were used as analytical grade.

Method

The experimental field should not be too large, resulting in non-realistic experiments, nor should it be too tiny, preventing it from reaching an optimal zone. The trial formulation of composite sponges was created using the solvent evaporation process.

Preparation of formulation

The solvent evaporation process was used to create the composite sponge trial formulation the procedure involved dissolving a sufficient amount of chitosan w/v in a 5% acetic acid aqueous solution. At the same time another gelatine solution was made by dissolving the gelatine powder in 100 ml deionized water at room temperature. Different proportion of the two solutions should be used for the composite sponges. The resultant mixture vigorously using a magnetic stirrer until the opaque solution was achieved and the sonicated this mixture for 15 minutes in a sonicator to eliminated ant air bubbles. To create composite sponges, pour this solution into a separated petri dish freeze it for 24 hours at -40^{o}c and then lyophilized it. In order to create extract loaded composite sponges the extract was first dissolve and allowed to swell for one hour before being added to chitosan and gelatine combination. To create *Rosa bourbonia* composite sponges the solution was transferred into thirteen separate petri dishes, frozen for twenty-four hours at -40^{0}c then lyophilized. Box Behnken was used to the make formulation. The formulation was optimized and the experimental design was constructed using statistical screening. The experiment thirteen runs were evaluated for characteristics like weight loss and porosity.[11,13]

Experimental Design

STATEASE, design of expert design version 12.0.1.0. was used to for the purpose of optimizing the composite sponges, the BOX BEHNKEN design was chosen from the response surface methodology. The low, medium, and high levels of the independent and dependent variables are listed in Table no.1[14,17] Where X1, X2, and X3, the coded levels of the dependent variables, Y0 is the independent variables b0 is the intercept and b1through b33 are the regression coefficients derived from the observed experimental value of Y.In addition to the actual and anticipated reaction. Table no. 3 displays the amount of polymer concentration X1 (Chitosan) X2(Gelatin) and X3 stirring time required to create each.

Response Analysis for Optimization

The programs ANOVA feature was used to validate the statistical validity of the polynomial equation product by design expert. The thirteen runs (CS1-CS13) with triple centre point were produced in all. The models were assed using R^2value and statistically significant coefficients. The composition of the improved formulation across the entire experiment region was determined by validating the RSM results. To verify the selected experiment domain and polynomial equation five optimum check point formulation was created and evaluated for various response characteristics. A quantitative comparison between the experimental response characteristics. A quantitative comparison between the experimental response level and the predicted values was made. Moreover, linear regression graphs between the expected and actual response values were made using MS-Excel.

RESULT

Compatibility study research

To check for any particular interaction between the medicine and the substance utilized, a compatibility study was conducted. FTIR analysis was used to assess drug and excipient interaction.

FTIR ANALYSIS

IR spectroscopy was investigated and the result are shown. In contrast to drug spectra which show that the drug - excipient is compatible with all excipients, no new peaks significant shift, or loss of distinctive peaks were seen in drug excipient physical mixture spectra. The FT-IR has proven to be a very useful technique for characterizing and detecting compound or functional groups (chemical bond) present in the mixture of plant extracts. There were absorption peaks at 3328.7cm-1(O-H starching)2922cm-1nad 2102cm -1(aliphatic H starching) and 1625cm-1 (C=C absorption peak)in the absorption spectrum. Other picks were 1341 cm-1 (CH2), 1006cm-1(cycloalkane)and 760cm-1.
All the batches of composite sponges were characterized for (colour, texture). The prepared composite sponges were reddish in colour with pleasant homogeneous appearance and texture.

Fitting the model to the data

We employed a three factors two level (BOX BENHKEN design) since RSM needed 13 runs. The results with triplicate centre points were produced. A design expert fitted the 13 observed formulation to a quadratic model at the same time. Table no.3 contained the comparison values of R^2, SD AND %CV in addition to the best comparable quadratic values. Included is the regression equation that was developed for every response. The equation contains all significant coefficients($P<0.05$). While a negative score indicates an inverse relationship between the component and the solution, a positive value indicates an effect that helps the optimization. There is no doubt that factors X1, X2, X3interact to affect the equation contains all significant coefficients($P<0.05$). While a negative score indicates an inverse relationship between the component and the solution a positive value indicates an effect that helps the optimization. It is clear that the two replies, Y1 and Y2 are influenced by interplay of variables X1, X2, &X3.

Counter Plots and Response Surface Analysis

Fig.no. (3a-3b) depicts a two -dimensional contour plots were drawn for each of two responses.Fig.no. (4a-4b) exhibit the responses Y1-Y2 according to this. Plots are used to evaluated the effect of two factors independently on the response as well as the interaction effect of factors on the response.

Response Analysis Through Polynomial Equation.

- **Response 1 (Y1)**

The model proposes the following equation

Final equation in terms of coded factors

Y1= +76.54+5.75A+2.75B-4.00C

Final equation in terms of actual factors

Y1= +76.7884+2.875chitosan +1.37500geltine -4 Stirring Time

Where Y1 is the porosity of composite sponge X1 is chitosan concentration, X2 is the concentration of gelatine and X3 is the string time. The model F value of 453 implies the model is significant (0.0001). The lack of fit F value of 5.18 implies the lack of fit is notsignificant (P=0.0237). The predicted R squared of 0.1941 is in reasonable agreement with the adjusted R squared 0.511adequate precision is within the desirable limit. The ratio of 6.573 indicates an adequate signal. Therefor this model can be sued as negative the design space.

Response R2 Effect of Gelatine

The following equation in terms of coded factors

Final Equation in Terms of Coded Factors

Weight loss Y2 =+32.85-0.2500 A-1.00 B+14.00 C

Final Equation in Terms of Actual Factors

Weight loss Y2 =+6.72115-0.125000chitosan-0.500000gelatin+14.00000stirring time

Where Y2 represents the gelatine. The model was shown to be significant (F value 47.68, P<0.0001). The lack of fit is not substantial. A positive value for the coefficient indicates an inactive favourable effect, whereas a negative value indicates an unfavourable effect of that type of reaction. The calculated R squared matches the corrected R squared (0.9211 and 0.8741, respectively). The signal-to-noise ratio should be determined with sufficient precision. A ratio greater than four is desirable; our ratio of 16.291 indicates an appropriate signal. Figures 2a-2b depict counter graphs that show the effect of various planned factors

DISCUSSION

Composite sponges is stand out as one of the extensively explored strategy for delivering the drug for rapid onset of action. Skin is the primary for delivering the drug. Inpresent study we used composite sponge for wound healing purpose. Thirteen formulations were prepared Data

Analysis and Optimization

In order to satisfy the highest possible standard for medication flow of porosity and weight loss the optimization formulation was chosen. The following limits for response Y1 and Y2point prediction of design expert software were applied to for figure out the optimal composition. The process of drugs flow, porosity, weight loss was assessed and the most effective preparation was developed five chosen at random. Acceptable parameters have been identifying for validation of RSM for all five -check point formulation. Table no.4 shows the formulation of the optimizer check point and the variables will be expected to respond to them.Figure 4a-4b depicts linear correlation graphs of actual and projected response variables. Figures 4a-4b demonstrate the spread of residual against actual values. The linear correlation plots between the predicted and experimental values demonstrated high value of R^2 for all their response.

CONCLUSION

Transdermal composite sponge of extract utilizing chitosan and gelatine polymer demonstrated encouraging results, which were optimized using a two-factor, two-level Box Behnken design. The quantitative response of drugs such as porosity and weight loss for various combinations of independent variables- polymers such as chitosan and gelatine- were acquired by experimentation, and the results were used to fit the design model. The quantitative influence of these components at various levels on repose may be predicted using a polynomial equation with high expected and actual values for response variables. The formulation with polymer concentration chitosan 3.336, gelatine 4.036, stirring duration 2.167, porosity 18.26, weight loss 34.619, and desirability1 was chosen as the optimal composite sponge. As a result, it is possible to conclude that transdermal composite sponges were produced and optimized using software.

ACKNOWLEDGEMENTS

The author would like to thank PBRI lab Bhopal for analyse the formulation.

ABSTRACT

Piper betle is a plant of medicinal, religious, and cultural importance. Its usage ranges from traditional Ayurvedic medicine to modern medicine. This systematic review examines the effects of *Piper betle* variants on mental health disorders, focusing on pharmacological activities, phytochemical constituents, and their function as Gamma Amino Butryic acid (GABA) receptor modulators, and animal models used for research on neuropharmacological activities. Landrace cultivation of *Piper betle* at several geographical sites influences the concentration of bioactive components such as eugenol, hydroxychavicol, and flavonoids. pre-clinical investigations have shown that *Piper betle* phytochemicals act on the GABAergic system to improve inhibitory neurotransmission, which is critical for anxiety and sadness. This work highlights their bioactivity in regulating GABA receptors and thus provides a natural alternative to less-toxic synthetic medications. Various animal models, including the elevated plus maze, open field test, and forced swim test, are used to evaluate the effects of *Piper betle* as an anhydride and antidepressant. These results indicate the need for rigorous clinical studies to confirm the medicinal potential of *Piper betle* in all its variants, and also necessitates the standardization of agricultural methods. Combining data from landrace effects, GABA receptor binding phytochemicals, and animal testing paradigms forms the basis for future studies and the development of plant-based medicines for anxiety and depression.

Keywords: *Piper betle*, landrace, anxiety, depression, GABAergic system, phytochemicals, eugenol, hydroxychavicol, flavonoids, natural therapeutics, anxiolytic effects, antidepressant activity, animal models, elevated plus maze, forced swim test, neuropharmacology.

INTRODUCTION

Depression and anxiety disorders present significant global health challenges, affecting tens of millions of individuals across diverse demographic groups. Approximately 264 million individuals globally currently suffer from depression, while anxiety disorders affect an estimated 284 million individuals. These disorders exhibit a range of cognitive, emotional, and physical symptoms that can markedly impair daily functioning and the overall quality of life. Cognitive dysfunction is a prevalent characteristic that is associated with both anxiety and depression. Individuals with anxiety disorders frequently experience disruptions in their attention, memory, and executive functioning. Research indicates a correlation between anxiety and deficits in working memory and cognitive flexibility [1]. Additionally, memory capabilities decline in individuals with depressive disorders. Numerous studies have demonstrated that both verbal and non-verbal memory performance is significantly diminished in patients diagnosed with major depressive disorder (MDD) compared with normative data [2]. Current pharmacological treatments, including selective serotonin reuptake inhibitors (SSRIs) and benzodiazepines, often lead to dependency, memory deterioration, and withdrawal symptoms, highlighting the need for safer and more efficacious therapeutic options [3,4]. A systematic review [5]evaluated the comparative efficacy and acceptability of 21 antidepressant medications, thereby providing clinicians with a substantial evidence base to guide treatment decisions in the management of major depressive disorder. Nonetheless, the adverse effects associated with these pharmacotherapies can be considerable, necessitating exploration of alternative treatment modalities.

Piper betle, classified within the Piperaceae family, has historically been used for its medicinal properties and has recently attracted attention for its potential applications in neuropsychiatry [6]. The active phytochemicals in *Piper betle*, namely eugenol, hydroxychavicol, and flavonoids, have demonstrated anxiolytic and antidepressant effects by influencing critical inhibitory neurotransmitter pathways in the brain, particularly the gamma-aminobutyric acid (GABA) system [4, 7]. GABAergic modulators are essential for various neurological functions, especially the modulation of synaptic transmission and neuronal excitability. GABA acts as the primary inhibitory neurotransmitter in the central nervous system, and the processes involved are crucial for maintaining the delicate balance between excitation and inhibition throughout neuronal circuits [8,9]. This balance is especially vital in regions such as the hippocampus, where GABAergic interneurons, particularly parvalbumin-expressing interneurons, significantly affect the activity of pyramidal neurons, which has notable implications for cognitive function and synaptic plasticity. The GABAergic system plays a critical role in managing excitatory and inhibitory neurotransmission, and its dysregulation is strongly linked to the pathophysiology of anxiety and depression [10].
Recent research has also highlighted how landraces or the growth of the same plant in several geographical regions influences the pharmacological activity and phytochemical profiles of *Piper betle* [6,8]. Variations in environmental elements, including soil composition, temperature, and agricultural methods, produce notable variations in the concentrations of bioactive chemicals, influencing the therapeutic efficacy of the plant [11]. Animal models, including the elevated plus maze and forced swim tests, have been extensively used to evaluate anxiolytic and antidepressant efficacy [4, 7]. The Elevated Plus Maze (EPM) and Forced Swim Test (FST) are the primary pre-clinical paradigms for assessing anxiolytic and antidepressant efficacy, respectively, within the context of behavioral and physiological understandings of anxiety and depression. In particular, the EPM takes advantage of rodents' natural conflict concerning exploration and fear of open spaces increase in the time spent in open arms, suggesting lowered anxiety; thus, the results have been validated by the effects of benzodiazepines, buspirone, diazepam, or selective serotonin reuptake inhibitors (SSRIs) in enhancing the exploration of open arms. The FST, on the other hand, assesses depression-like behavior based on determining how long an animal remains immobile in water, with longer immobility time interpreted as representing hopelessness. Tricyclic antidepressants, SSRIs, and fluoxetine have shown efficacy by decreasing this measure of immobility. Both models, while contributing to a variety of biological and pharmacological devices for drug testing and clinical research towards improving anxiety and depression, have had further roles in inducing novel therapeutics using *Piper betle*-derived compounds [12 – 17]. This systematic review explored three primary questions.

(RQ1) Does landrace influence the pharmacological activity or phytochemical constituents of *Piper betle*?

Motivation

The phytochemical profiles of different landraces of *Piper betle* may differ, which may also result in variable rates of therapeutic efficacy. The study of the influence of landraces on a plant's chemical composition and pharmacological activity can identify landraces offering the best health benefits so that they can be used for selective breeding and resource allocation for the intended medicinal purpose. (RQ2) What is the role of *Piper betle* phytochemicals in treating anxiety and depression via GABA receptor modulation?

Motivation

GABA receptor modulation is a key mechanism for the management of anxiety and depression. Determining whether the compounds of *Piper betle* affect GABAergic pathways might promise natural therapeutic use of these sources. This question is directed toward elucidating the molecular background of the anxiolytic and antidepressant activities of *Piper betle* which could be utilized in formulating new strategies for intervention in traditional medicine.
(RQ3) What are the various animal models and tests used to evaluate the anxiolytic and antidepressant effects of *Piper betle*?

Motivation

Pre-clinical animal models play a significant role in establishing the efficacy of bioactive compounds before proceeding with clinical trials. By tracking the variety of experimental approaches adopted to assess the anxiolytic and antidepressant effects of *Piper betle*, this study presents a comprehensive view of standard methods in that domain. These insights help align the methodology to give greater weight to the findings and support the progressive design of the research plan. By addressing these questions, this review aims to consolidate the existing knowledge and identify gaps for future research.

Related work

Piper betle has high phytochemical diversity and therapeutic potential in neuropsychiatric conditions [6]. Preliminary neuroprotective effects of *Piper betle* extracts reduced oxidative stress and regulated neurotransmitter pathways, confirming the therapeutic versatility of *Piper betle* for anxiety and depression treatment. Plant cultivation in different geographic regions has altered the phytochemical profiles of medicinal plants, including *Piper betle*[18]. The concentrations of bioactive compounds, such as flavonoids and terpenoids, in *Piper betle* are affected by soil type, temperature, and altitude [19]. Such differences in pharmacological efficacy call for standardized cultivation practices for therapeutic applications. GABA receptor modulation is an important target of plant compounds for anxiety and depression. Kaur et al. [20] reported that the GABA-ergic activity of *Piper betle* phytochemicals is mediated by binding to the GABA-A receptor subunits. This mechanism is necessary to reduce central nervous system hyperactivity and thus anxiety and depression symptoms. These findings support previous studies on *Piper betle* as an anxiolytic and antidepressant. Animal models are regarded the gold standard for evaluating the therapeutic efficacy of plant-based treatments for neuropsychiatric disorders. Such models are instrumental in pre-clinical assessment of anxiolytic and antidepressant therapies. The Elevated Plus Maze (EPM) and Open Field Test (OFT) are widely recognized paradigms for assessing anxiety-like behavior. In the EPM, rodents' natural inclination to favor enclosed spaces over open arms serves as a metric for anxiety, where increased exploration of open arms is indicative of an anxiolytic effect [21,22]. This paradigm has been employed in various studies demonstrating that diazepam, other benzodiazepines, and plant extracts such as Bacopa monnieri enhance open arm exploration [23, 24]. In the OFT, the willingness of rodents to explore the open area at the center of the arena facilitates the measurement of anxiety; anxiolytic agents typically induce an increase in central activity [25, 26]. As an open-field model, the OFT can also assess general locomotor activity, thereby enabling differentiation of genuine anxiety-relieving effects from mere sedation [27]. Additional tests, including the Light/Dark Box and Marble Burying Test, offer further insights into anxiety-related responses by capitalizing on rodent preferences for dark and enclosed spaces and their defensive burying behaviors [23]. The utilization of multiple models enhances the validity of the experimental outcomes and presents a comprehensive perspective on a compound's potential for anxiolytic activity. While these tests specifically

evaluate anxiety-like behavior, they are complementary to other models that assess depression-like behaviors, such as the Forced Swim Test, thereby highlighting the importance of employing various behavioral paradigms in psychiatric drug design. The light-dark box, open field, and tail suspension tests —behavioral assessments utilized in pre-clinical studies—have been catalogued. These models have substantiated the anxiolytic and antidepressant properties of various plant extracts and have provided critical pharmacodynamic and pharmacokinetic data. Overall, the expanding body of literature surrounding several phytochemical drugs has reaffirmed the efficacy of plant-based molecules in the treatment of anxiety and depression. Regarding *Piper betle* Linn, Further investigations are necessary to establish standardized protocols for the cultivation, extraction, and clinical application of Piper betel Linn.

RESEARCH METHODOLOGY

This section describes the methodological approach adopted for this investigation, including the research objectives, eligibility criteria, sources of information, search techniques, procedures for study selection, and data collection.

Selection of Primary Research Material.

This systematic review dataset was created by searching PubMed, Scopus, SpringerLink, ScienceDirect, ACM Digital Library, and Google Scholar databases. This search used the following keywords: *Piper betle*, landrace, phytochemical constituents, GABA receptor modulation, anxiety, depression, animal models, eugenol, and neuropharmacology. The search strategy used for relevant studies was *forward and backward snowballing*. First, there were 350 publications on *Piper betle* phytochemicals, their pharmacological activities, and animal studies. The removal of duplicates and refinement of the search yielded 45 relevant studies. Using inclusion and exclusion criteria, this was reduced to a total of 40 primary studies meeting quality assessment standards. These studies provided robust evidence to achieve the objectives of this review. Figure 1 shows the PRISMA diagram used in our study. An analysis of historical trends indicates increased research on *Piper betle*'s neuropharmacological properties of Piper betel, especially in the last decade, and growing scientific and clinical interest in natural therapies for anxiety and depression.

Inclusion & Exclusion Criteria.

With an eye towards peer-reviewed studies of *Piper betle* phytochemicals, pharmacological activity, and therapeutic uses, Table 1 outlines the study's Inclusion and exclusion selection criteria. These covers include high-quality, relevant studies and exclude low-quality, irrelevant, non-English studies. Table 2 lists research removed from the review for causes including irrelevance, lack of scientific rigor, or data unavailability.

Data Analysis

The data analysis covered trends in research publications on *Piper betle* in neuropharmacology, phytochemical profiling, and therapeutic applications. Historical trend analysis showed that publications increased from 2000 to 2024, with a sharp increase after 2015 (Figure 2). Such growth reflects the interest in *Piper betle*'s phytochemicals, such as eugenol and hydroxychavicol, and their potential as GABA receptor modulators for various pharmacological activities, including anxiety and depression treatment. The studies were categorized according to landrace variability, phytochemical impact, and animal testing. Critical patterns were identified, and studies of low quality were excluded from full evaluation. An analysis of keywords was conducted across all 45 papers to summarize the prevalent themes across the selected primary research. Table 3 shows the frequencies of particular keywords in the sample. The predominant keyword was "*Piper betle*," indicating the primary emphasis of this review. Other commonly used terms are "Phytochemical Constituents" and "GABA Receptor Modulation," highlighting the plant's bioactive elements and their significance in neuropharmacology. Moreover, "Anxiety" and "Depression were significant, corresponding with the therapeutic objectives of the investigations. Terms like "Eugenol" and "Hydroxychavicol" signify the significance of particular phytochemicals in regulating GABAergic pathways. Terms such as "Animal Models" and "Neuropharmacology" emphasize experimental emphasis, whereas "Landrace" signifies regional diversity in bioactivity. This analysis highlights the increasing scientific interest in *Piper betle* for neuropsychiatric purposes.

Quality Assessment

Qualitative assessment of the included studies revealed the reliability and validity of the studies included in this systematic review. We assessed methodological rigor, relevance, and consistency of the data using a standard framework. Only those included were peer-reviewed and concerned *Piper betle* phytochemicals, pharmacological activities, and neuropharmacological applications, with clear objectives, documented methodologies, and reproducible results. In studies with randomization, blinding, and reporting transparency, the risk of bias was scored using the OHAT Risk of Bias Rating Tool only for high-risk or poorly described studies. The selected studies addressed research questions, including landrace impact, GABA receptor modulation, and animal testing models. The level of consistency across studies was assessed across themes, including phytochemical concentration differences and *Piper betle* efficacy, in pre-clinical models. Studies met the inclusion criteria only if they reported complete, available, and verifiable data and excluded studies with missing data, unclear outcomes, or major methodological flaws. Areas for improvement include limitations in the study design, small sample sizes, or lack of standardization in experimental conditions. Overall, the quality assessment provided evidence to support the systematic review. Figure 3 illustrates the distribution of focal points related to the pharmacological and neuropharmacological attributes of *Piper betle*, specifically in the context of anxiety and depression treatment. A compilation of 47 primary publications was categorized into 16 thematic application areas.

The predominant sections are Anxiolytic Properties and Neuroprotection, each comprising 7 studies (15% each). Collectively, these two areas account for one-third of all publications, underscoring the significant focus on the central nervous system benefits of *Piper betle*, particularly concerning GABAergic modulation, antioxidant defense mechanisms, and protection against excitotoxic or neurodegenerative challenges. The subsequent common themes identified included Antioxidant Activity (6 studies; 13%) and Phytochemical Variability (5 studies; 11%), indicating an ongoing interest in delineating chemotypic distinctions among landraces, as well as in evaluating the radical-scavenging efficacy of distinct phenylpropenoids and terpenes. Additionally, a segment of the corpus, representing 9% (n = 2), pertains to broader neuropharmacology (including sedative, anticonvulsant, or cognitive outcomes), while the Standardization of Protocols was documented in three studies (6%), reflecting attempts to enhance quality-control benchmarks for key constituents, such as eugenol and hydroxy-chavicol. Notably, mid-sized groupings comprised Anti-inflammatory Activity, GABA Modulation, Clinical Trials, Cost-effectiveness, and Synthetic Alternatives—each demonstrated through two studies (4%). These categories broaden the translational significance of *Piper betle*, spanning from cellular NF-κB inhibition to pharmacoeconomic modeling, which positions betel extracts as more cost-effective alternatives to selective serotonin reuptake inhibitors. The remaining themes—Antimicrobial, Pre-clinical Evaluation, Phytochemical Analysis, Depression Management, and Behavioral Tests—each represented by a single study (1–2% each), highlight nascent research trajectories that currently display less empirical support than those seen in the predominant neuro-centric and antioxidant domains. Together, these data demonstrate a research landscape that is heavily weighted toward CNS-related bioactivities (39 % combined) and chemical/antioxidant profiling (24 %), with smaller but growing attention paid to clinical validation, protocol standardization, and comparative cost-effectiveness. The chart highlights the need for further research on the standardization of protocols (4%) for the extraction of bioactive from *Piper betle* and also the development of user-friendly therapeutic solutions for anxiety and depression. Herein, we discuss key research priorities and gaps that will guide future studies on *Piper betle* as a natural therapeutic option for anxiety and depression.

The enhanced forest plot visually displays effect sizes for various research applications, along with their 95% confidence intervals. The blue dots represent the estimated percentage effect sizes, while the horizontal blue lines indicate variability. Narrow intervals suggest precise estimates, whereas wider intervals reflect uncertainties. The red dashed line at 1.0 signifies a null effect reference for comparing deviations from the baseline effects. The majority of research focuses on central-nervous-system benefits: Anxiolytic Properties and Neuroprotection each have seven publications, followed by Antioxidant Activity (six), Phytochemical Variability (five), and Anti-inflammatory Actions (four), together representing over 60% of the research corpus. The standardization of protocols aligns with the benchmark (three studies), indicating growing attention to quality control. Other categories, including GABA Modulation, Clinical Trials, Cost-effectiveness, and Synthetic Alternatives, each had two papers, while single-study

niches included antimicrobial, Pre-clinical evaluation, phytochemical analysis, Depression management, and behavioral tests. This distribution highlights a strong research focus on the neuroprotective, anxiolytic, and redox-modulating properties of Piper betle, while areas such as economic modelling and human trials remain underexplored and signaling targets for future research. This visualization helps researchers to identify impactful fields and guide further studies based on confidence levels for various applications.

Research Gaps

A systematic review of the therapeutic potential of *Piper betle* for anxiety and depression revealed some research gaps. Unstandardized cultivation practices and extraction protocols have led to variations in phytochemical concentrations, which have affected the reproducibility of the results. Small randomized trials with diverse populations are rare, despite promising results from pre-clinical studies. In addition, detailed mechanistic insights into GABAergic modulation by *Piper betle* are sparse, and further research is needed to decipher its molecular pathways. In addition, there are inadequate comparative studies with standard synthetic anxiolytics and antidepressants, which prevent the position of *Piper betle* as a natural alternative. Long-term safety and toxicity data are also scarce and critical for establishing a safety profile for extended use. In addition, research on how to integrate *Piper betle* with current therapeutic modalities, such as cognitive-behavioral therapy or pharmacological interventions, is still lacking. Addressing these gaps is critical for furthering *Piper betle* clinical applications and therapeutic credibility of Piper betel.

DISCUSSION AND ADDRESSING THE RESEARCH QUESTIONS

This review presents an overview of the therapeutic potential of *Piper betle* for anxiety and depression, focusing on its phytochemical diversity, with a particular emphasis on eugenol and flavonoids. These findings indicate that the plant is capable of modulating GABAergic pathways, reducing oxidative stress, and possesses neuroprotective properties. Anxiolytic and antidepressant effects are confirmed in pre-clinical studies with standardized animal models. However, landrace variation, limited clinical trials, and inadequate mechanistic studies are critical barriers. Comparative studies with synthetic drugs and long-term safety evaluations are needed to confirm their clinical applications. Integrating *Piper betle* into modern therapeutic frameworks may be a promising approach for managing neuropsychiatric disorders. Figure 5 funnel chart plots the thematic distribution of research topics in Piper's studies and shows themes that are frequent. The bar length reflects the research focus, and longer bars at the top represent themes of general interest. Most studies cluster in four themes—Neuroprotection and Anxiolytic effects (7 papers each), Antioxidant activity (6) and Phytochemical variability (5)—accounting for >50 % of the 47-paper set. Evidence then drops sharply: Anti-inflammatory (4) and Protocol-standardisation (3) form a mid-tier, while six topics (e.g., Clinical trials, Cost-effectiveness, GABA modulation) have only two papers apiece. Eight remaining themes are single-study outliers, signalling clear gaps for future work. The hierarchical structure shows how research is concentrated in a few dominant areas while many themes are given little attention. This visualization allows researchers and funding agencies to pinpoint established research areas, emerging fields and topics not explored yet that warrant further study for scientific application.

Addressing The Research Questions

RQ1) Does landrace influence pharmacological activities or the phytochemical constituents of *Piper betle*? Landrace, denoting the growth of a single plant species throughout many geographical and environmental contexts, profoundly influences the phytochemical composition and pharmacological properties of *Piper betle*. Differences in environmental conditions, including soil type, climate, altitude, and agricultural techniques, lead to variations in the quantity and diversity of bioactive chemicals, such as eugenol, hydroxychavicol, flavonoids, and alkaloids. These phytochemicals enhance the medicinal attributes of plants, including their antioxidant, anti-inflammatory, antibacterial, and neuroprotective actions. Prasanna et al. indicated that *Piper betle* plants grown under tropical conditions demonstrated elevated levels of eugenol, thereby augmenting its anti-inflammatory and neuroprotective characteristics [6]. Reddyet al. similarly emphasized that hydroxychavicol concentrations fluctuate according to soil

nutrient availability, thereby affecting the antioxidant and antibacterial capabilitiesof plants [86]. These changes highlight the importance of landraces in the pharmacological activity of *Piper betle*. Moreover, variations in landraces influence the capacity of plants to regulate GABA receptors, an essential process in the management of anxiety and depression [28]. Fluctuations in secondary metabolite levels attributable to landraces can further complicate the standardization of treatment dosages and affect pre-clinical results. Understanding these factors is crucial for enhancing growth conditions and maximizing the medicinal potential of *Piper betle*. Research has demonstrated that geographical specialization in production procedures is essential for achieving consistent and effective medicinal results from *Piper betle* extracts.

RQ2) How can *Piper betle* phytochemicals modulate GABA receptors for anxiety and depression treatment?
Flavonoids and terpenoids in *Piper betle* show strong GABA receptor-binding activity, modulating inhibitory neurotransmission and reducing hyperactivity in the central nervous system. Together, these properties and the anxiolytic and antidepressant action of *Piper betle* position *Piper betle* as a promising natural therapeutic alternative to synthetic drugs for anxiety and depression [28]. *Piper betle* contains eugenol, hydroxychavicol, alkaloids, and flavonoids that modulate GABA (gamma-aminobutyric acid) receptors, which are important targets for anxiety and depression. GABA is the principal inhibitory neurotransmitter in the brain and its dysfunction is associated with anxiety and mood disorders. Eugenol, an important compound in *Piper betle*, binds to GABA-A receptors, increases the chloride ion flow into neurons, induces relaxation, and decreases excitability. Hydroxychavicol contributes to the reduction of oxidative stress, which decreases anxiety and depression, and indirectly supports GABA modulation. In addition to their sedative and anxiolytic actions, *Piper betle* flavonoids bind to allosteric sites on the GABA-A receptors [20]. This combination increases the therapeutic potential of the plant. Like other GABA-modulating plants, such as Valerian with valerenic acid and Passionflower with chrysin, *Piper betle* targets neurotransmitter imbalances and oxidative stress[3]. Future mechanistic studies, clinical trials, and comparative analyses with established anxiolytic therapies would confirm *Piper betle* as a natural therapeutic for anxiety and depression.

RQ3) Which animal models and tests are used to assess the anxiolytic and antidepressant actions of *Piper betle*?
This study identified the elevated plus maze, open field test, and forced swim test as pre-clinical models to assess the anxiolytic and antidepressant properties of *Piper betle*. The model consistently improves behavior and reveals neuropharmacological mechanisms supporting its therapeutic potential [87].The anxiolytic and antidepressant properties of *Piper betle* require animal models and behavioral tests. They modeled anxiety and depression-like behaviors in animals to evaluate the effects of *Piper betle* extracts on neurotransmitter systems, notably the GABAergic pathway. Anxiety-like behaviors are typically assessed by the Elevated Plus Maze (EPM) and Open Field Test (OFT), where *Piper betle* administration increases exploration and time spent in open or central areas in response to lower anxiety [88]. Similar tests for antidepressant activity, the Forced Swim Test (FST), and Tail Suspension Test (TST), show that reduced immobility times in treated animals indicate mood-enhancing effects (Prasanna et al)[6]. Anxiety was measured by the preference for illuminated areas in the Light/Dark Box Test, and *Piper betle*-treated animals showed lower anxiety. Neurochemical analyses supported these results by showing that eugenol and hydroxychavicol enhance GABAergic neurotransmission and reduce oxidative stress. Other anxiolytic plants, such as Valerian, Passionflower, and Chamomile, have used similar models to illustrate anxiolytic potential. Such models also enable the understanding of dose-response relationships, mechanisms of action, and safety profiles. Future studies using advanced genetic and neuroimaging techniques may further define the role of *Piper betle* in managing anxiety and depression.

Resolving The Research Gap and Future Direction of This Research
Some strategies are suggested to fill the research gaps in studies on *Piper betle*. To minimize the variation in phytochemical concentrations due to landrace effects and to achieve uniform therapeutic results, standard cultivation and extraction protocols are needed. Large randomized clinical trials in diverse populations are needed to confirm its anxiolytic and antidepressant effects and to characterize the molecular mechanisms of GABAergic modulation. The evaluation of the efficacy and safety profiles of synthetic drugs, such as benzodiazepines and *Piper betle* is a competitive natural alternative. This requires lengthy safety and toxicity studies. Third, the incorporation of *Piper*

betle into contemporary therapeutic contexts, such as pharmacological treatments or cognitive-behavioral therapy, may improve treatment efficacy. These gaps will ensure wider acceptance of *Piper betle* from pre-clinical promise to a clinically validated therapeutic for anxiety and depression.

CONCLUSION

This particular study highlights the healing potential of *Piper betle* for controlling anxiety and depression, emphasizing its diverse phytochemical composition, particularly eugenol and flavonoids. This study demonstrates that landrace cultivation significantly affects the concentration of bioactive components, such as eugenol, hydroxychavicol, and flavonoids, which modulate GABA receptors to improve inhibitory neurotransmission. Pre-clinical studies have validated the role of *Piper betle* phytochemicals in regulating the GABAergic system, providing a promising natural alternative to synthetic medications, with fewer side effects. The results demonstrated its ability to modulate GABAergic pathways, minimize oxidative stress, and provide neuroprotective advantages, establishing *Piper betle* as a promising natural replacement for artificial drugs. Nevertheless, the review identified major research areas, including variability as an outcome of landraces, limited clinical trials, and inadequate mechanistic studies. To handle these spaces through standardized cultivation protocols, good clinical trials and detailed mechanistic investigations will improve the evidence base. In addition, checking its integration with contemporary healing approaches and performing comparative efficacy studies can improve its clinical utility. *Piper betle* provides a considerable opportunity for secure, effective, and accessible treatment of neuropsychiatric disorders, paving the way for wider medical application**s.**

Table.1: Inclusion and Exclusion Criteria

Criteria	Inclusion	Exclusion
Study Type	Peer-reviewed empirical studies.	Review articles, commentaries, or meta-analyses without original experimental data.
Focus	Studies on *Piper betle* phytochemicals, pharmacological activities, and therapeutic applications.	Studies unrelated to *Piper betle* or its role in anxiety and depression management.
Language	Written in English.	Non-English publications.
Publication Period	Published between 2000 and April 2024.	Studies published outside the specified timeframe.
Data Availability	Studies with accessible full text.	Articles without accessible full text.
Phytochemical Focus	Studies investigating phytochemicals like eugenol, hydroxychavicol, and flavonoids.	Studies lacking specific information on bioactive compounds in *Piper betle*.
Therapeutic Relevance	Investigations into GABA receptor modulation or anxiety and depression effects.	Studies not related to GABAergic pathways or neuropharmacological effects.

Experimental Design	Studies with robust experimental methodologies, including pre-clinical and clinical trials.	Studies with poor methodological rigor or insufficient experimental details.
Animal Models	Pre-clinical studies employing recognized behavioural tests for anxiety and depression.	Studies do not use standardized animal models or behavioural tests.

Table.2:Excluded Studies

Checklist for the Criteria Stages	Excluded Studies
Stage 1: Landrace Variability	Sharma *et al*, Gupta *et al*, Mehra *et al,* [28-30]
Stage 2: Phytochemical Profiling	Rao *et al,* Jaiswal *et al,* [31,32]
Stage 3: Role in GABAergic Modulation	Singh *et al,* Pin *et al* [33,34]
Stage 4: Animal Models for Anxiety	Palmer *et al,* Desingu *et al,* Dwivedi *et al*, [35-37]
Stage 5: Behavioural Tests for Depression	Xie *et al,* Malik *et al*, Nyugen *et al,* [38-40]
Stage 6: Data and Methodology	Reddy *et al*, Patra *et al,* [41,42]

Table.3: Counts of the Keywords in the Primary Studies

Keywords	Count
Piper betle	1500
Phytochemical Constituents	1250
GABA Receptor Modulation	1100
Anxiety	1050
Depression	1000
Eugenol	900
Hydroxychavicol	850
Animal Models	800
Neuropharmacology	750

Table.4: Main Findings and Themes of Primary Studies

Sl	Primary Study	Key Qualitative & Quantitative Data Reported	Applications
1	Biswas *et al.* [43]	Five Bangladeshi leaf land-races yielded 101 identifiable volatiles; peak-area ranges—estragole 14–29 %, eugenol 4–9 %, β-caryophyllene 3–7 %. Total phenolics (mg GAE g^{-1} DW, Folin-Ciocalteu): Kauri 12.4 > Ghanagete 9.1 > Bagerhati 7.6.	Phytochemical Variability
2	Kumari *et al*. [44]	Ethanolic *Piper betle* leaf extract (PB; 10 & 30 mg kg^{-1} i.p.) reversed glucocorticoid-induced early-life stress in adult zebrafish, cutting hyper-locomotion by ≈55 % and trebling quiescent (sleep-like) time while restoring night-time brain melatonin to control values ($P < 0.001$).	Anxiolytic Properties
3	Suryasnata *et al.* [45]	GC-FID/GC-MS profiling of five eastern-Indian *Piper betle* landraces resolved 38 volatiles covering ≥95 % of each oil. Several marker compounds were strictly variety-specific—β-ocimene (Paradeep), β-elemene (Sanchi), isoeugenol acetate + α-phellandrene (Matiali), and chavicol ± chavicol-acetate (Kali-Bangla).	Phytochemical Variability

4	Bajpai *et al.* [46]	Chemometric analysis (PCA/HCA) split the landraces into two major chemotypes: a phenyl-propanoid group dominated by estragole (up to 23 %) and methyleugenol (≤11 %), and a sesquiterpene-rich group led by β-caryophyllene (4–12 %) plus germacrene D (~6 %); total phenolic content ranged from 6.8 ± 0.4 to 18.7 ± 0.9 mg GAE g^{-1} DW.	Phytochemical Variability
5	Pramudiska *et al.* [47]	Ultrasound-assisted extraction of *P. crocatum* leaves yielded 5.8 % w/w flavonoids; docking showed kaempferol-3-O-rutinoside binds GABA-A $\alpha1\beta2\gamma2$ at –8.9 kcal mol^{-1}, on par with diazepam. LC-MS confirmed rutin, vitexin and quercetin-rhamnoside as major ligands.	GABA Modulation
6	Krishna *et al.* [48]	Hydro-alcoholic leaf extract (100 & 200 mg kg^{-1} p.o., 7 days) cut EPM closed-arm time by 54 % and 67 % and raised open-arm entries 2-fold in Swiss mice—anxiolytic effect close to diazepam (2 mg kg^{-1}). No motor-impairment in open-field.	Anxiolytic Properties
7	Seo *et al*. [27]	Methanolic leaf/stem extract (5–40 µg mL^{-1}) curtailed LPS-stimulated NO release in RAW-264.7 cells IC_{50} = 11.4 µg mL^{-1}, blocked p-NF-κB and p-p38, and activated Nrf2/HO-1; ROS fell 64 %.	Anti-inflammatory
8	Pandey *et al.* [49]	Proposed a four-step standardisation (microscopy → physicochemical constants → HPTLC markers → bioassay potency) and exemplified it on P. betle; batch-to-batch eugenol varied only ±4.8 % post-standardisation vs ±18 % pre-control.	Standardization of Protocols
9	Gulhane *et al.* [50]	Ethanol (50 %) extract fixed hydroxy- chavicol at 1.20 ± 0.05 % w/w across three pilot batches; validated by HPLC with ≤2 % RSD—supports scale-up for functional-food capsules	Standardization of Protocols
10	Aara *et al.*[51]	Eugenol-rich leaf extract (DPPH assay) showed 83 % radical-quenching at 100 µg mL^{-1}; IC_{50} = 48 µg mL^{-1}, outperforming ascorbic acid (IC_{50} = 56 µg mL^{-1}).	Antioxidant Benefits
11	Firenzuoli *et al.* [52]	Pilot RCT (n = 34) with 250 mg ethanolic P. betle chewables TID lowered Hamilton-Depression score by 9 ± 2 points vs 3 ± 1 in placebo (P < 0.05); mild mouth-tingle was the only side-effect.	Clinical Trials
12	Chandra *et al.* [53]	Crude leaf extract (200 mg kg^{-1} i.p.) reduced spontaneous locomotion 25 %, extended bar-holding time 38 %, and raised seizure-onset in PTZ model by 46 s—suggesting CNS depressant and anticonvulsant actions.	Neuropharmacology
13	Hayati *et al.* [54]	Cost-utility model (Malaysian primary care) showed betel-leaf capsules (300 mg qd) saved US $62 per QALY over sertraline for mild anxiety; probability of cost-effectiveness 78 % at a US $1000 threshold.	Cost-effectiveness
14	Tabassum *et al.* [55]	Eight Bangladeshi landraces varied in total flavonoids 7.8–32.0 mg QE g^{-1} DW; DPPH IC_{50}	Phytochemical Variability

		correlated inversely (r = –0.84). 'Bangla' exhibited strongest antibacterial zone (14 mm vs S. aureus).	
15	Cy *et al.*[56]	Review summarises rodent and cell data where *P. betle* increases brain SOD (↑40 %), CAT (↑33 %) and decreases TBARS (↓35 %) under oxidative-stress paradigms.	Neuroprotection
16	Nayaka *et al.* [57]	The antimicrobial properties of *Piper betle* supported its therapeutic versatility.	Antimicrobial
17	Hitesh Gulhane *et al.*[58]	Ethanol extract (250 mg kg^{-1}) cut forced-swim immobility 46 % and EPM anxiety index 38 %, outperforming fluoxetine 20 mg kg^{-1}; no change in rotarod time.	Anxiolytic Properties
18	Ganguly *et al.* [59]	Ethanol extract (200 mg kg^{-1}) inhibited carrageenan paw-oedema 51 % and suppressed NO output from murine macrophages by 68 %, via iNOS mRNA down-regulation	Anti-inflammatory
19	Alam *et al.* [60]	Betel-leaf fraction (IC_{50} = 12 μg mL^{-1}) inhibited mushroom tyrosinase; in B16-F10 cells it lowered intracellular melanin 48 % and triggered autophagy (LC3-II↑2.5-fold). Topical gel (0.5 %) reduced UV-B skin pigmentation 30 % in mice.	Antioxidant
20	Akash *et al.* [61]	Eight Indian varieties (water extract) showed DPPH IC_{50} 21–57 μg mL^{-1} and FRAP 2.3–4.5 mmol Fe^{2+} g^{-1}; antimicrobial MICs against *S. aureus* 62–125 μg mL^{-1}, *E. coli* 125–250 μg mL^{-1}.	Antioxidant
21	Gupta *et al.* [29]	Narrative review cites two small RCTs (n = 28 & 34) where betel-leaf capsules (300 mg qd) cut HAM-A anxiety scores by 31–36 % and BDI depression scores by 35 % over 4 weeks with no serious AEs..	Clinical Trials
22	Kaur *et al.* [20]	Chapter summarises in-vivo models where hydroxy-chavicol (5 mg kg^{-1}) reduced PTZ-seizure score 56 % and protected 80 % hippocampal neurons from KA toxicity; proposes antioxidant + GABAergic mechanisms.	Neuroprotection
23	Moragrega *et al.* [62]	Meta-analysis of 11 rodent studies: betel-derived phenolics lowered forced-swim immobility SMD = –1.02 (95 % CI –1.4, –0.6); effective doses clustered at 50–200 mg kg^{-1}.	Pre-clinical Evaluation
24	Vyawahare *et al.* [63]	Methanol extract (100, 200 mg kg^{-1}) showed CNS depressant profile—reduced spontaneous activity 31 %, prolonged pentobarbital sleep 49 %, and exhibited moderate analgesia in tail-flick.	Anxiolytic properties
25	Pin *et al.* [64]	Sequential solvents: hexane extract inhibited COX-2 68 % (IC_{50} = 18 μg mL^{-1}) and DPPH 90 % at 100 μg mL^{-1}, whereas water extract showed <25 % activity—demonstrating polarity-dependent efficacy.	Standardization of protocols & Antiinflamatory
26	Salehi *et al.* [65]	Comprehensive review lists >200 Piper phytochemicals; collates MIC span 8–256 μg mL^{-1} for bacteria and lists 14 mechanistic pathways including	Neuroprotection

		NF-κB and MAO inhibition relevant to neuroprotection.	
27	Krishna *et al*. [66]	Aqueous extract (200 mg kg^{-1}) lowered immobility 41 % in FST and raised sucrose preference 29 % vs control; brain 5-HT rose 22 %.	Anxiolytic properties
28	Rintu *et al.* [67]	Carrageenan paw-oedema suppressed 48 % by 200 mg kg^{-1} ethanolic extract; plasma TNF-α fell 37 %.	Anti-inflammatory
29	Harsha *et al.* [68]	Betel extract (50 mg kg^{-1}) reduced elevated-plus-maze anxiety index 35 %, protected DNA from H_2O_2 (comet assay tail length ↓60 %).	Anxiolytic Properties
30	Vikash *et al.* [69]	Review catalogues flavonoids (rutin 0.21 %, vitexin 0.34 %) and links them to radical-scavenging capacity (ORAC 9.1 mmol TE g^{-1}).	Phytochemical Analysis
31	Khom *et al.* [70]	Piperine potentiated GABA-A currents (α1β2γ2) by 169 ± 21 % at 100 μM; synthetic derivative SCT-66 increased currents 472 % without TRPV1 activity.	GABA Modulation
32	Kaur [20]	Among 12 Indian medicinals, P. betle ranked 2nd in total phenols (21.4 mg GAE g^{-1}) and had highest ferric-reducing power (EC_{50} = 38 μg mL^{-1}).	Antioxidant
33	Lee *et al*. [71]	Review: in vivo betel treatment (100 mg kg^{-1}) normalised corticosterone and BDNF in CMS-rat depression model; highlights oxidative-stress linkage.	Depression Management
34	Azahar *et al*.[72]	Standardised dosing of notoginseng + betel poly-herbal cut EPM anxiety 40 % with ED_{50} ≈ 65 mg kg^{-1}; variance ≤8 % across three lots.	Anxiolytic Properties
35	Yusuf *et al.* [73]	Hydro-ethanolic betel (25 μg mL^{-1}) rescued SH-SY5Y cells from H_2O_2—cell viability 92 % vs 58 % control; ROS fell 55 %	Neuroprotection
36	Upadhyaya *et al.* [74]	In $AlCl_3$ Alzheimer rats, betel extract (250 mg kg^{-1}) improved Morris-water-maze escape latency 35 % and restored hippocampal AChE to 84 % of normal..	Neuroprotection
37	Shah *et al.* [75]	Review collates chemotype data showing North-Indian 'Magahi' leaf has twice the safrole content of 'Bangla'; recommends varietal GMP charts for exports.	Phytochemical Variability
38	Tagrida *et al* [76]	Chlorophyll-free ethanolic extract (1 %) extended Nile-tilapia fillet shelf-life from 5 → 12 days at 4 °C, maintaining TBARS < 1 mg MDA kg^{-1} and total plate count <6 log CFU g^{-1}.	Synthetic Alternatives
39	Firenzuoli *et al.* [77]	Supported its role as an alternative to synthetic drugs.	Synthetic Alternatives
40	Subaharan *et al.* [78]	Betel-oil vapour (LC_{50} = 18.6 μL L^{-1}) killed 3-day-old *Musca domestica* adults within 60 min; survivors showed AChE inhibition 52 %.	Behavioral Tests
41	Jaiswal *et al*. [79]	Leaves collected from six Indian zones: DPPH IC_{50} 27–46 μg mL^{-1}; ORAC peaked in South-India sample	Antioxidant

		(10.2 mmol TE g^{-1}).	
42	Lee *et al.* [80]	Gelatin films with 1 % betel extract showed 3× higher DPPH scavenging and delayed peroxide formation in sunflower oil by 6 days.	Antioxidant
43	Mondal *et al.* [81]	Steam stripping of surplus leaves (100 kg) produced 0.42 kg essential oil at US \$11.3 kg^{-1}, 35 % cheaper than conventional hydrodistillation. Pay-back period estimated at 1.7 years for cottage units.	Cost-effectiveness
44	Bhardwaj *et al.* [82]	Review aggregates 17 rodent papers: average oedema inhibition 49 % (95 %CI 42–56 %) and mean CRP reduction 28 % across betel extracts.	Anti-inflammatory
45	Chowdhury *et al*. [83]	Highlights hydroxy-chavicol nano-micelles that crossed BBB in zebrafish and cut rotenone neuro-toxicity 70 %; proposes PI3K/Akt-Nrf2 pathway.	Neuroprotection
46	Ghanta *et al*.[84]	Synthesised hydroxy-chavicol esters; lead analogue HC-4 (10 µM) prevented rotenone-induced SH-SY5Y death (viability 88 % vs 36 % control) and rescued Drosophila climbing 72 %.	Neuroprotection
47	Maia *et al*. [85]	Hydro-alcoholic P. cernuum (related Piper) produced rat anxiolysis: EPM open-arm time ↑88 % at 300 mg kg^{-1}; hypnotic synergy with diazepam (sleep latency ↓42 %).	Neuropharmacology

Abbreviations: AChE = acetylcholinesterase; BDI = Beck Depression Inventory; DPPH = 2,2-diphenyl-1-picrylhydrazyl; ED_{50}/IC_{50} = dose/concentration for 50 % effect; FST = forced-swim test; HAM-A = Hamilton Anxiety; ORAC = oxygen-radical-absorbance capacity; PCA = principal component analysis; RSD = relative standard deviation.

ABSTRACT

This literary review examines the concept of *Diwaswapna* (daytime sleep) through the lens of Ayurvedic tradition. It delves into its indications, contraindications, and effects on key physiological elements such as *Dosha, Dhatu, Mala, Agni, and Ama*, as interpreted in classical texts like the *Brihattrayee (Charaka, Sushruta, Ashtanga Hridayam)* and *Laghutrayee (Kashyap Samhita, Bhavaprakash, Madhava Nidana, Sharangadhara Samhita*). In Ayurveda, aligning daily behaviors with natural cycles is essential, and *Nidra* (sleep) is considered vital for maintenaning health. *Diwaswapna* is considered beneficial for certain individuals, particularly those suffering from fatigue, emotional imbalance, aging, or *Vata*-related conditions. Its utility is notably emphasized during *Grishma Rutu* (summer) when increased dryness and shorter nights disturb the balance. Conversely, untimely or excessive daytime sleep can aggravate *Kapha* and *Pitta*, leading to conditions such as *Agnimandya* (digestive debility) and *Ama* (toxicity). It is specifically contraindicated for those with *Kapha* dominance, obesity, or metabolic dysfunctions. Diseases such as *Shiroroga, Santarpaniya Vyadhi*, and *Rakta Dushti* are associated with improper Diwaswapna practices. This study underlines that *Diwaswapna* may serve either a therapeutic or pathogenic role,depending on its usage. By contextualizing *Diwaswapna* in terms of *Prakriti* (individual constitution) and seasonal variation, *Ayurveda* offers a nuanced approach to its practice. Integrating these traditional insights with modern sleep research could enhance strategies for preventing lifestyle-related disorders. Further empirical studies are warranted to explore its physiological impact in contemporary healthcare.
This literary review examines the concept of *Diwaswapna* (daytime sleep) through the lens of Ayurvedic tradition. It delves into its indications, contraindications, and effects on key physiological elements such

as *Dosha, Dhatu, Mala, Agni, and Ama*, as interpreted in classical texts like the *Brihattrayee (Charaka, Sushruta, Ashtanga Hridayam)* and *Laghutrayee (Kashyap Samhita, Bhavaprakash, Madhava Nidana, Sharangadhara Samhita*). Keywords: *Diwaswapna,* Day sleep, *Dosha, Agni, Srotasa*

INTRODUCTION

Sleep forms one of the foundational pillars of health in *Ayurveda*, crucial for preserving physiological harmony and holistic well-being.Regarded with equal importance to food and water, *Nidra* (sleep) is essential for maintaining vitality. However, *Ayurveda* strongly advocates that sleep patterns must align with the body's natural circadian rhythm. Among various sleep practices, *Diwaswapna*, or daytime sleep, occupies a unique space—capable of offering either benefit or harm, contingent upon seasonal timing, individual constitution (*Prakriti*), and health status. This literature-based analysis evaluates *Diwaswapna* through key Ayurvedic scriptures including the *Brihattrayee (Charaka, Sushruta, Ashtanga Hridayam)* and *Laghutrayee (Kashyapa, Bhavaprakash, Madhava Nidana, and Sharangadhara Samhita*). It aims to identify its indications, contraindications, and its physiological effects on *Dosha, Dhatu, Agni, Mala*, and *Ama*. While *Diwaswapna* is endorsed for those facing physical or mental depletion, the elderly, and certain pathological conditions, it is strictly discouraged in *Kapha*-predominant individuals, those with obesity, or suffering from metabolic dysfunction. Ayurveda also places strong emphasis on seasonal consideration, allowing *Diwaswapna* mainly during *Grishma Rutu* (summer) due to specific climatic imbalances. This exploration also addresses how improper daytime sleep contributes to the onset of diseases like *Shiroroga* (head ailments), *Santarpaniya Vyadhi* (disorders due to over-nourishment), and *Rakta Dushti* (blood vitiation). Given the increasing prevalence of sleep irregularities in today's world, integrating *Ayurvedic* principles with modern perspectives offers a promising avenue for advancing holistic health solutions.

Aim

This literary research is intended to explore and evaluate the *Ayurvedic* understanding of *Diwaswapna* (daytime sleep).

Objectives

- To interpret the concept of *Diwaswapna* as described in classical *Ayurvedic* literature.
- To assess its influence on *Dosha, Dhatu, Mala, Agni, Ama.*
- To analyze its potential role in disease causation.
- To propose practical guidelines for healthy sleep behavior in accordance with *Ayurveda* wisdom.

Through this analysis, the study aims to bridge traditional *Ayurveda* perspectives with modern scientific approaches to offer a deeper understanding of *Diwaswapna* and its physiological consequences.

MATERIALS AND METHODS

This research is rooted in a detailed textual review of major *Ayurvedic* scriptures. Primary references were drawn from the *Brihattrayee- Charaka Samhita, Sushruta Samhita, and Ashtanga Hridayam*—and the *Laghutrayee—Bhavaprakash, Kashyapa Samhita, Madhava Nidana, and Sharangadhara Samhita*. Relevant *shlokas* were critically examined to extract interpretations regarding *Diwaswapna*, focusing on its therapeutic indications, contraindications, and physiological impacts.

Conceptual

Importance of Sleep

According to *Ayurveda* doctrine, sleep is one of the *Trayopastambha* (three pillars of life) essential for sustaining health. Quality sleep ensures *Dosha* equilibrium, tissue rejuvenation, and comprehensive well-being.[1]

Definition of *Diwaswapna*

Diwaswapna refers specifically to sleep taken during daytime hours, which deviates from the natural nocturnal night sleep.

Comparative Effects: *Diwaswapna* vs. *Ratri Jagaran*

Staying awake at night *(Ratri Jagaran*) tends to aggravate *Vata Dosha*, leading to increased dryness (*Rukshata*). On the contrary, *Diwaswapna* heightens *Kapha*, inducing unctuousness (*Snigdhatva*). Interestingly, momentary drowsiness while sitting does not provoke either dryness or excessive fluidity.[2, 3]

Recommended Duration

Ayurvedic guidelines suggest that daytime sleep should not surpass one *Muhurta* (approximately 48 minutes) and is ideally to be undertaken before meals.[4, 5]

Indications for *Diwaswapna* [6, 7, 8]

Daytime sleep is considered beneficial for individuals experiencing:

- Physical debility due to overexertion by travel, labor, sexual activity, singing, reading, heavy physical work, alcohol intake
- Emotional strain (grief, anger, fear)
- Conditions such as polydipsia, indigestion, chest discomfort, diarrhea, hiccups, dyspnea
- Recovery from trauma (e.g., injury, fall)
- Childhood, old age, or night-time sleep deprivation
- Summer season *(Grishma Rutu),* when dryness and shortened nights prevail

Seasonal Suitability

Diwaswapna is especially encouraged during *Grishma Rutu* due to climatic dryness and reduced nocturnal rest.[9, 10]

Health Benefits

For the indicated populations, *Diwaswapna* restores energy, supports *Dhatu* balance, strengthens immunity, and contributes to offering longevity.[11]

Contraindications

Outside the summer season, *Diwaswapna* is generally discouraged due to its potential to disturb *Kapha* and *Pitta* balance. [12]

It is contraindicated in: [13, 14]
- Obese individuals
- Daily users of *Sneha*
- Patients with *Kapha*-related disorders, throat ailments, or exposure to toxins

***Diwaswapna* in *Laghutrayee* Texts**
- ***Sarngadhara Samhita***: Warns against *Diwaswapna* post-*Raktamokshan* and in individuals consuming excessive *Sneha*.[15, 16]
- ***Kashyapa Samhita***: Advises avoiding *Diwaswapna* during procedures like *Ksheer Shodhana*, [*17]Sansarjana Karma [18], Madatyaya* [19] after medication intake [20]
- ***Bhava Prakash***: Prohibits *Diwaswapna* in *Varsha* [21] and *Sharad Rutu* [22], post-*Snehapana* [23], and in conditions like wounds i.e *Vrani* [24].

Effects of *Diwaswapna* in Contraindicated Conditions [25]
Engaging in *Diwaswapna* when contraindicated may lead to several health disorders, such as:
- Lethargy and heaviness in the body
- Headache and drowsiness
- Decreased digestive fire (*Agnimandya*)
- Edema, nausea, anorexia
- Skin issues like urticaria, pustules, itching, and boils
- Respiratory issues (cough, chronic rhinitis)
- Impaired sensory and cognitive functions
- *Srotorodha* (obstruction in bodily channels)

These effects emphasize the need for careful assessment before incorporating *Diwaswapna* into daily routines.

***Diwaswapna* as an Etiological Factor**
Classical *Ayurvedic* texts recognize *Diwaswapna* as a contributing factor in the pathogenesis of various diseases, including:
- *Shiroroga* (head disorders) [26]
- *Santarpaniya Vyadhi* (disorders from over-nutrition)[27]
- *Vata Vyadhi* (Vata disorders) [28]
- *Kaphaja Udara Roga* (Kapha-induced abdominal diseases) [29]
- *Kaphaja Arsha* (hemorrhoids) [30]
- Respiratory diseases like *Kasa, Shwasa* [31]
- Disorders such as *Pratishyaya, Jwara, Moha, Shopha, Hrilasa and Agnimandya* [32]

This classification underlines *Diwaswapna's* significance as a potential lifestyle-related cause of chronic conditions.

Vyadhi	*Madhava Nidana*	*Kasyapa*	*Bhavaprakash*
Ajirna	Ma. Ni .6	-	Ba. Pu.5/213
Sthaulya	Ma. Ni.34	-	Ba. Pu.39/1
Kushtha	Ma. Ni.49	-	Ba. M.54/5
Yonikanda	Ma. Ni.63	-	Ba. M.18
Vishama Jwara	-	Ka. Khi.1/15	-
Visharpa	-	Ka. Khi. 14/12	-
Arakilika	-	Ka. Chi. 7/34	
Kaphaj Grahani	Ma. Ni.4		

Survey-Based Observations

Empirical surveys have underscored the practical implications of *Diwaswapna:*

- In a study involving 100 participants, 78% with a *Diwaswapna* habit exhibited symptoms consistent with *Aamavata* (e.g., fatigue, anorexia, body aches, polydipsia).[33]
- Another observational analysis demonstrated that irregular daytime sleep patterns significantly impaired *Jatharagni* (digestive fire).[34]
- A broader survey involving 500 individuals found that 74% of regular *Diwaswapna* practitioners were obese, indicating a strong link between this habit and metabolic imbalances. [35]

Influence of *Diwaswapna* on *Dosha, Dhatu, Mala, Agni*, and *Ama*

Doshas: Outside summer, *Diwaswapna* typically aggravates *Kapha* and *Pitta* [36, 37], and in some contexts, even leads to *Tridosha* imbalance [38].

- ***Rasa Dhatu***: *Diwaswapna* promotes *Kapha* accumulation, leading to vitiation of *Rasa Dhatu [39].*
- ***Rakta Dhatu***: Considered a *Viharaja Hetu* (lifestyle-related cause) for *Rakta Dusti,* potentially resulting in skin disorders like *Visarpa* and *Pidika* [40].
- ***Mamsa Dhatu***: It contributes to *Mamsavaha Srotodusti* and increased *Mamsa* due to *Kapha* dominance [41].
- ***Meda Dhatu***: Elevates *Kapha* and leads to *Medovaha Srotodusti*, fostering conditions related to fat metabolism [42].
- **Excretory Elements**:
  - ***Purisha***: Indirectly impacted due to associated pathologies.
  - ***Mutra***: Increased *Kleda* (fluidity) due to *Kapha* aggravation results in *Medadusti* and higher urinary output.
  - ***Sweda***: Enhanced *Kapha* and *Meda* levels heighten sweat production.
- ***Agni****: Kapha*-induced *Agnimandya* results in inefficient digestion [43].
- ***Ama***: A weakened *Agni* produces *Ama* (toxins), obstructing bodily channels and encouraging disease [44].

DISCUSSION

The *Ayurvedic* interpretation of *Diwaswapna* reveals its dual nature—offering therapeutic value when applied judiciously and posing health risks when misused. Classical literature emphasizes synchronization with the body's circadian rhythm as vital for wellness. The reviewed texts consistently highlight the restorative benefits of *Diwaswapna* in situations of *Dhatu* depletion, such as fatigue, emotional turmoil, and old age, particularly during the summer season. Conversely, indiscriminate daytime sleep is shown to aggravate *Kapha* and *Pitta Doshas*, impair digestion (*Agnimandya*), and contribute to toxin (*Ama*) formation. These imbalances are closely linked with conditions like obesity, respiratory ailments, and *Kapha*-related disorders. The disruption of *Srotas* (body channels) due to *Ama* and aggravated *Doshas* reinforces the systemic impact of improper *Diwaswapna.* The seasonal perspective is crucial—while summer justifies its use, other seasons demand caution*. Diwaswapna's* association with chronic disorders such as *Shiroroga, Santarpaniya Vyadhi*, and *Rakta Dusti* illustrates its significance as a modifiable risk factor in *Ayurvedic* preventive healthcare.

CONCLUSION

This comprehensive evaluation of *Diwaswapna* from an *Ayurvedic* standpoint affirms the importance of context-driven application of daytime sleep. When administered appropriately, it can serve as a powerful restorative practice. However, unregulated or excessive usage can precipitate a range of disorders by disturbing *Dosha* equilibrium and impairing *Agni*. The intricate link between *Diwaswapna* and physiological entities such as *Dosha, Dhatu, Mala, Agni*, and *Ama* underscores *Ayurveda's* integrative view of health. As modern lifestyles increasingly face sleep-related challenges, incorporating *Ayurveda* insights on *Diwaswapna* can contribute to effective management and prevention strategies. Future interdisciplinary research combining classical *Ayurvedic* knowledge with contemporary scientific

tools may enhance understanding of *Diwaswapna's* effects, enabling its informed integration into modern health practices.

ABSTRACT

The Coorg honey is golden hue derived from the diversified bee pasturage of the central Western Ghats, is prized for its unique flavour and distinct taste with purported medicinal properties. The present study aimed to comprehensively analyse the nutrient profile and sugar composition of the domesticated *Apis cerana* honey to validate its quality and authenticity. Proximate analysis revealed water content of 16.82±0.07%, ash content of 0.06±0.00%, crude protein of 0.55±0.03%, and crude fat and crude fiber in negligible amount 0.12±0.00% and 0.018±0.01% respectively. Major sugar analysis showed ^{0}Brix value of 78.18±0.15%, total reducing sugars of 70.25±0.44% with fructose and glucose as the predominant sugars. LCMS sugar profile provides detailed information of sugar spectrum consist of fourteen different sugars including both monosaccharides and oligosaccharides. Mineral analysis revealed the presence of macro and micronutrients, with notably higher sodium and iron content. The findings of the present study provide a valuable insight to authenticity of Coorg honey, supporting its characterization and to safeguard against adulteration.

Keywords: Western Ghats, *Apis cerana,* LCMS Sugar Profile, macro and micro nutrients

INTRODUCTION

Honey is the only known natural sweetener produced by insects belongs to the family apidae without any human intervention. Honeybees create sticky flavourful syrup from carbohydrate-rich exudates they gather either from

blossoms or that is produced by plant sucking insects such as aphids. Then, the through recurring regurgitation, the honeybees' enzymatically transformed sugary secretions into honey. During the final stages of maturation and storage, honey will undergo further biochemical reactions, contributing to its final complex makeup. Thus, honey is a complex mixture of various nutrients and metabolites, which varies depending on feeding habit of honeybee and also influenced by various external factors like topographical, ecological and environmental conditions [1]. Honey is a superfood primarily composed of concentrated sugar solutions (75 -85%) and water (17-20%), with other components such as proteins, organic acids, amino acids, enzymes, and traces of vitamins, Micro and macro nutrients with varieties of metabolites include aromatic compounds, polyphenols and flavonoids[2, 3] enhancing human meal with nutraceutical value. In Indian, honey market there is a huge demand for different types of honey procured from Western Ghats, important biodiversity hotspot under wild and domesticated conditions. Honey harvested from Coorg sold as Coorg honey indicates its unique geographical origin, Coorg.

The Coorg district of Karnataka is located in the Central Western Ghats, is a picturesque landscape. The Coorg district has approximately 65% of its geographical area under forest covered with diverse vegetation types makes it one of the micro endemic centers of biodiversity [4],has abundant nectar sources from wild and cultivated bee pasturage suitable for commercial beekeeping led to the production of polyfloral honey hue of specific taste integrated with therapeutic benefits. The production of honey in Coorg has decreased in recent decades for a number of reasons, including climate change, Thai sacbrood disease, and a lack of adequate technical and marketing assistance. In addition to quantity, excessive use of pesticides and unregulated sales of adulterated honey also have an impact on honey quality [5]. To overcome this problem proper nutrition labelling is required by providing accurate information on carbohydrate content, natural sugars and minerals, enabling consumers to make informed dietary choices. Therefore the current study aimed to examine the variety of nutrients present in Coorg honey by proximate analysis, mineral analysis and LCMS studies to safeguard honey against adulteration, ensuring authenticity and quality.

MATERIALS AND METHODS

Honey collection

The Coorg honey sample used in the present study was obtained during the peak honey flow season of Coorg district in the year 2024 directly from the local beekeepers with framed *Apis cerana* colonies. The honey was amber in colour with fruity aroma. After, extraction of honey using the honey extractor it was filtered through cheesecloth to remove unwanted substances and then labelled and stored in airtight glass jar in relatively dark chamber at 4^0C under hygiene conditions until analysis.

Proximate analysis

Moisture content The water content of the honey was measured using honey refractometer and also ^{0}Brix was recorded at room temperature, for temperature above or below 25^0 C a correction factor 0.00023\ ^{0}C was applied to according to AOAC [6].

Ash content 10 gram of honey with 3-5 drops refined olive oil was ignited in a Muffle furnace at 600+20^0C for 5 to 6 hours till the white ash was obtained and weighed [6].

$$Ash\ (\%) = \frac{100\ (M2 - M1)}{(M1 - M)}$$

Where, M = Mass in gram of empty crucible, M_1 = Mass in gram of the crucible with the test material, and M_2 = Mass in gram of the crucible with ash.

Crude protein Kjeldahl method of protein estimation was used to quantify protein content in honey. It involves three sequential steps namely, digestion, distillation and titration. One gram of Coorg honey was weighed and then transferred to a Kjeldahl tube, to which 12 ml of Conc. H2SO4, 98% was added and boiled for about 50-60 minutes

along with catalyst mixture of potassium sulfate and copper sulfate. The digested sample was allowed to cool down and then placed in 32% NaOH in alkali tank of distillation unit and collected in receiving vessel over 60 ml of 5% H_3BO_3 with phenolphthalein indicator. The collected distillate was titrated against standard 0.1 mol/L HCl to violet or grey end point. It gives total nitrogen in the honey samples. The protein content was calculated using the formula given by IS/ISO 12824:2016 [7].

% of crude protein = % Nitrogen × 6.25

Crude fat The ether soxhlet extraction method was used to determine the crude fat content of honey [8]. Approximately 5 gram of moisture free Coorg honey was weighed and transferred to the cellulose thimble, which then inserted into extraction tube, and the solvent is heated. A dried round bottom flask was weighed and was fitted to mouth of the extractor. After 6 hours of continuous extraction process, it's removed from the extraction unit and allowed to evaporate off the solvent. Then the ether extract was oven dried at 60 to 80^0 C for two hours, followed by cooling in desiccator. Lastly, the weight is recorded and the crude fat content was calculated using the given formula and expressed in terms of percentage.

$$Crude\ fat\ (\%) = \frac{Weight\ of\ ether\ extract}{weight\ of\ honey\ sample} \times 100$$

Crude fiber The moisture and fat free residue obtained from ether soxhlet extraction was used for crude fiber estimation. The ether expelled residue was weighed and transferred to conical flask for acid-alkali digestion. The digested sample was oven dried for two hours at 135^0C and then weighed again. The difference in weight was calculated using given formula.

$$Crude\ fiber\ (\%) = \frac{(W2 - W1)}{W1} \times 100$$

Where, W1 = ash and, W2 = dried residue.

Carbohydrates The total percentage of carbohydrate was calculated by using the difference method as prescribed by AOAC and the energy in kilocalories (kcal) was calculated by using Atwater system.

% of carbohydrates = 100% - (% water content+% ash+% crude fiber+% crude fat+%crude protein).

Energy (Kcal/100g) = (% carbohydrate×4) + (% protein×4) + (%Fat×9).

Major sugar composition analysis

Honey sample preparation one gram of honey dissolved in distilled water and volume was made upto 100 ml in volumetric flask. Then the honey solution was further diluted to make up the volume 250 ml.

Total reducing sugars (%) The total reducing sugar contents of honey sample were determined by modified Lane and Eynon method. 5 ml of each Fehling's solution A and Fehling's solution B to a conical flask. The prepared honey solution was added from a burette. Mixture was heated and constantly boiled over asbestos gauze with 1 ml of aqueous methylene blue as indicator. The titration was completed within 3 minutes and end point was indicated by change of colour from blue to brick red. The volume of honey solution consumed was noted down and the total reducing sugar contents of honey calculated by the given formula.

$$Total\ reducing\ sugars\ (\%/m) = \frac{250 \times 100 \times S}{H \times M}$$

Where, S = Strength of copper sulphate solution or Fehling factor, V = Volume of honey solution required for titration in ml and M = Mass of honey in grams.

Sucrose (%) To the prepared honey sample one ml of Conc. HCl was added and heated nearer to boiling point and kept aside overnight for inversion. Then the inverted solution was neutralized with addition of Na_2CO_3. The total reducing sugar titration was repeated and the sucrose content was calculated by the given formula.

$$\text{Sucrose (\%/m)} = \left(\text{TRS after inversion – TRS before inversion}\right) \text{ X } 0.95$$

Glucose (%) To the 40 ml of diluted prepared honey solution, 40 ml of 0.05 N iodine solution and 25 ml of 0.01 N NaOH was added and kept in dark chamber for 20 minutes. After that the reaction mixture was acidified with 5 ml of Conc. H_2SO_3 and the excess of iodine was titrated immediately against standard 0.05 N Sodium thiosulphate. A 50 ml of blank (water) also run in the place of diluted honey solution.

$$Glucose\ (\%) = \frac{(B - S) \times 0.004502 \times 100}{A}$$

Where, B = Blank volume, S = Volume of sodium required for the sample, A = Mass of honey taken for test and 0.00452 = Correction factor.

Fructose (%) The fructose present in honey samples were directly estimated by using the formula given by AOAC, 1990 (modified) using correction factor 0.925.

$$Fructose\ (\%) = \frac{Total\ reducing\ sugar\ (\%) - Glucose(\%)}{0.925}$$

Sugar profiling by LCMS

The profiling of different sugars in honey was done accordingly the method prescribed by Steppuhn and Wackers [9], with some modifications. 2 g of honey was extracted twice with 80% warm ethanol. The combined supernatants were then adjusted to a final volume of 20 mL with 80% ethanol. 1 mL aliquot of this extract was evaporated to dryness at 80°C using a water bath, and the residue was subsequently dissolved in 0.1 mL of 0.01% formic acid. This mixture was sonicated for 10 minutes followed by 2-3 extractions with ethyl acetate. Following the extractions, the ethyl acetate was completely removed by evaporation at 60-70°C for 30 minutes in a water bath. The remaining residue was reconstituted with a 1:1 mixture of mobile phase solvent A (80:20 acetonitrile: water) and solvent B (30:70 acetonitrile: water + 0.1% ammonium hydroxide).

The resultant was injected to LC-MS/MS (Waters Acquity UPLC-H class coupled with TQD MS/MS), Separation was achieved on a UPLC BEH-Amide column (2.1 x 100 mm, 1.7 µm particles) maintained at 25°C, protected by a VanGuard BEH-Amide guard column (1.7 µm). The flow rate was set at 0.1 mL/minute. The gradient program began with 100% solvent A for 1 minute, followed by a linear gradient to 88% solvent A and 12% solvent B over 7 minutes. This composition was held for 1 minute before another linear gradient to 98% solvent A and 2% solvent B over 6 minutes. The UPLC column effluent was directed into the TQD MS/MS system, which was optimized for sugar analysis, without any splitting. A PDA detector was used to monitor the elution.

Mineral analysis

Sodium and potassium content of the honey was assessed using the flame photometry (Systronics). The phosphorous was evaluated by the vanadomolybdate HNO_3 method. The other macro and micro nutrients along with heavy metals were estimated by atomic absorption spectrophotometer (PerkinElmer PinAAcle 900FF) [10], at Bio Centre, Horticultural department, Shimoga.

Statistical analysis

Proximate analysis and major sugar composition was carried out in triplicates. LCMS sugar profiling in two replicates and the descriptive statistics mean ± standard error was compiled using Microsoft Excel (2010 version).

RESULTS AND DISCUSSION

Proximate analysis The results of the nutritional analysis Coorg honey are recorded in the Table 1. The moisture content was 16.82±0.07%, within the permissible limit of FSSAI standard, is requisite for stable shelf life, as moisture level below 20% prevents microbial proliferation and resistance to undesirable proliferation. The percentage ash content is found to be 0.06 %, depends on mineral composition is found to be relatively lower compared to honey

procured from *A. dorsata, A. A. florea,* natural colonies and *Apis cerana, A. mellifera* [11].Crude protein (0.55±0.03%) is present in the form of free amino acids or enzymes. The crude fat and fiber content are0.12 % and 0.018% naturally very negligible, given that honey is mainly rich in carbohydrates constituted 812.43%, making it instant energy provider having a caloric value of 334.96 Kcal per 100 grams of Coorg honey. Nutritional profile of Coorg honey aligns with established Codex standards for high quality honey [12].

Major Sugar composition Table 2 demonstrates carbohydrate profile and crystallization behavior of Coorg honey. ^{0}Brix value of 78.18% indicates total soluble solids, primarily composed of sugars. Of the total reducing sugars (70.25±0.44%), fructose had the highest concentration (39.45±0.31%), followed by glucose (33.76±0.13%) and sucrose within acceptable range 2.94±0.05%, [13], suggests proper enzymatic activity during nectar processing by bees. Higher sucrose levels in honey can indicate harvesting of unripen honey or adulteration. F/G ratio is found to be 1.17±0.44, within the expected range. But the relatively higher G/W ratio 2.01±0.20 indicates rapid crystallization of honey, as glucose readily precipitate out, [14],which aligns with the observed physical characteristics of Coorg honey. The data presented here confirms that Coorg honey, as a natural sweetener has a balanced sugar profile, contributing to its energy content and functional properties with a tendency toward faster crystallization due to its glucose to water ratio and highlight the need for controlled storage conditions to maintain its liquid state.

Sugar profiling by LCMS The outcomes of the LCMS sugar profile of Coorg honey are mentioned in the Table 3 and Figure 1 provide detailed information of sugar spectrum. A total of fourteen different sugars including both monosaccharides and oligosaccharides were elucidated. Among monosaccharides, Fructose (89.19±0.43 mg/g) and glucose (37.398±0.42 mg/g) were the predominant sugars, which is characteristic of natural honey. The honey also contained trace amount of monosaccharides such as arabinose (0.1323±0.05 mg/g), mannose (4.0959±0.24 mg/g), and ribose (0.2649±0.015 mg/g), are believed to be originated from floral nectar or as a metabolic by-products during honey ripening. In addition to sugars, the sugar alcohols inositol(0.0516±0.00 mg/g) and sorbitol (0.1945±0.05 mg/g) are present known for their low glycemic response and prebiotic effects, making honey a healthier natural alternative to table sugar. Minor amount of fucose (0.0098±0.00 mg/g), rhamnose (0.0019±0.00 mg/g), and xylose(0.0967±0.0036 mg/g) are observed. Similarly, among the disaccharides sucrose (1.298±0.026 mg/g) and maltose (0.2083±0.02 mg/g) were predominant and their relatively lower concentrations indicate proper enzymatic activity during nectar processing by honeybees. Other disaccharides found in honey are lactose (0.0007±0.00 mg/g) and trehalose (0.0001±0.00 mg/g)in very minimal amount due to limited non-nectar carbohydrate sources. The sugar spectrum demonstrates that Coorg honey is pure and free of any added sugar adulteration.

Mineral analysis As shown in Table 4, the mineral composition of Coorg honey was categorized into macronutrients, micronutrients and heavy metals. In Coorg honey, macronutrients such as sodium (207 ppm), potassium (0.075 ppm), calcium (0.065 ppm), magnesium (0.013 ppm) were detected and phosphorous is undetected suggests floral or geographical variations influences mineral uptake. Sodium present in significantly higher concentrations is unusual for most honeys, where potassium is typically dominant [14]. Although calcium and magnesium present in lower concentrations are beneficial for enzymatic functions and metabolic regulation. Similarly micronutrients, such as iron (14.80 ppm), copper (0.50 ppm), manganese (1.45 ppm), and zinc(1.20 ppm)present contributes to Coorg honey's potential antioxidant properties. The absence of heavy metals such as lead (Pb), chromium (Cr), cadmium (Cd), and nickel (Ni) results in safe for human consumption considering that it originated from an environment deprived of industrial pollution or soil contamination, resulting in a safe and high-quality natural product.

CONCLUSION

To conclude, the proximate analysis confirms Coorg honey as a high-quality honey with a balanced nutrition profile. Fructose and glucose present in abundance contribute to its sweetness and also provide instant energy. The LCMS analysis elucidates the sugar spectrum, identifying fourteen different types of sugars and sugar alcohols, and with the specific natural sugar spectrum data it is possible to identify the adulteration of honey with the other added

sugars. Mineral analysis revealed a presence of essential macro and micronutrients, each of which adds to honeys functional and healthful qualities. Notably high sodium levels and elevated iron levels are observed. Toxic heavy metals including lead, chromium, cadmium and nickel were undetected, underscores its purity and safety for consumption. The findings of the present study provide critical nutritional insights for consumers and support the establishment of quality standards and help to preserve the distinctive geographical identity of Coorg honey in the market by reinforcing its quality and authenticity.

ACKNOWLEDGMENT

We extended our sincere thanks to Jagath B C, local bee keeper from Virajpet of Coorg District for providing honey samples. We are thankful to BIOCENTER, IIHR for providing lab facilities and also thankful to SAIF, ICAR-IIHR, Hesaraghatta, Bangalore -560089 for LCMS instrumentation facility.

CONFLICT OF INTEREST

The authors hereby declare no conflict of interest.

ABSTRACT

Ovarian cancer remains one of the most lethal gynaecologic malignancies and ranks as the seventh leading cause of cancer-related deaths globally. Squalene, a naturally occurring linear triterpene found in various organisms including plants, animals, fungi, and bacteria, plays a critical role as a biosynthetic precursor for essential secondary metabolites such as sterols, hormones, and vitamins. This study investigates the therapeutic potential of squalene against ovarian cancer, with a particular focus on its ability to modulate key signalling cascades—namely, the PI3K/AKT pathway and the apoptotic signalling pathway involving BCL2 and BAX. Dysregulation of these pathways is commonly associated with enhanced tumor proliferation, invasion, metastasis, and resistance to conventional therapies. Molecular docking simulations were conducted using PyRx, an offline virtual screening tool. The three-dimensional structures of the target proteins were retrieved from the RCSB Protein Data Bank: BAX (PDB ID: 4BD2), BCL2 (PDB ID: 2W3L), AKT1 (PDB ID: 4EJN), and PI3K (PDB ID: 3LS8). The structure of squalene was obtained from the PubChem database. Protein preparation was carried out using BIOVIA Discovery Studio Visualizer 2024 and Avogadro, while ligand optimization and format conversion were performed via Open Babel integrated in PyRx. To assess drug-likeness, the ADMET (Absorption, Distribution, Metabolism, Excretion, and Toxicity) properties of squalene were evaluated using ADMETSAR, which confirmed that squalene complies with Lipinski's Rule of Five, indicating suitable pharmacokinetic properties. Docking results revealed that squalene exhibited higher binding affinities—particularly towards AKT1—compared to the positive control Niraparib, suggesting its potential role in suppressing tumor cell proliferation and modulating cancer-related signalling pathways. These findings support further investigation into squalene as a promising candidate for ovarian cancer therapy.

Keywords: Ovarian cancer, Squalene, Molecular Docking, PI3k/AKT signalling pathway, Cell proliferation.

INTRODUCTION

Cancer remains as a severe health issue affecting most peoples around the world (1) Among Women, Ovarian cancer (OC) considered as a deadly gynaecological malignancy and stands at 7th predominant reason of mortalities and morbidity universally (2). Because of its asymptomatic nature mostly OC goes undetected in early stages and hence patients are detected in final stages (3) It has a strong resistance to the present chemotherapy treatment regimen. In India, Ovarian cancer ranks at 2nd place (gynaecological) due to its rate of occurrence and permanence (4). Ovarian cancer is less popular than the breast cancer, studies have revealed that it has predicted three times higher mortality rate by 2040(5). Patients who receive standard treatment has a relapse within 6 – 12 months after receiving the chemotherapy (6) The proliferation of cells can be inhibited by arrest of cell cycle/ or initiation of apoptosis (7).

PI3K/AKT Pathway in Ovarian Cancer

The PI3K/AKT pathway (Phosphoinositide 3-kinase/Protein Kinase B) is one of the most critical signalling pathways involved in various cellular processes such as cell growth, survival, proliferation, metabolism, and resistance to apoptosis. In the context of ovarian cancer, the PI3K/AKT pathway is often dysregulated, contributing to tumour progression, chemoresistance, and metastasis. (7,8). PI3K (Phosphoinositide 3-Kinase) is activated by various receptor tyrosine kinases (RTKs) and G-protein-coupled receptors (GPCRs) on the surface of ovarian cancer cells. Upon activation, PI3K catalyses the conversion of phosphatidylinositol-4,5-bisphosphate (PIP2) into phosphatidylinositol-3,4,5-triphosphate (PIP3), which in turn activates downstream signalling pathways involved in cell growth, survival, and metastasis. (9) previous studies have also shown that inhibition of PI3K/Akt pathway leads to the apoptosis of cancer cells (10,11)

Apoptosis Pathway in Ovarian Cancer

Apoptosis pathway is a crucial mechanism that controls the programmed cell death, maintaining the balance between cell survival and elimination of dysfunctional cells. In ovarian cancer, dysregulation of apoptotic pathway contributes to uncontrolled tumour growth, chemoresistance and metastasis. Bax and BCl-2 family proteins plays a role in regulating the apoptosis in ovarian cancer. Over expression of the BCL family protein were expressed in ovarian cancer and also in other cancer types (12-15). BCL-2 family of proteins regulates apoptosis by controlling mitochondrial outer membrane permeabilization, a key process in the initiation of apoptosis (16) it consists of two proteins- Anti-apoptotic and Pro-apoptotic, BCL-2 involves in the inhibition of apoptotic pathway by stopping the release of cytochrome C from mitochondria (17) and BAX initiates apoptosis by facilitating MOMP (18). Apoptosis pathway targeting is a potent and promising cancer treatment strategy, and research is continuously being conducted to investigate different methods for causing cell death, overcoming resistance, and eventually improving patient outcomes. In this study, we focused on two signalling pathways of ovarian cancer to examine how the drug compound interacts with the receptor site and how it may inhibit further cancer progression.

Computational Docking for Drug–Target Interaction Studies

Drug development is a fascinating field of study that makes it possible to apply contemporary biomedical research to enhance the health of numerous individuals (19). In an attempt to fight ovarian cancer, molecular docking can be used as an influential tool. Molecular docking is a system process used to find the relations between the receptor and ligand molecules. Molecular docking is an essential computational approach used in drug design and discovery, which helps to predict the relations and considerably used in the study of biomolecular relations and mechanisms to understand the simulations (20). The lengthy and costly process of testing several therapeutic candidates in human clinical trials makes phenotypic as well as target-based screening crucial in the early phases of drug discovery (21).

Databases and Tools

PyRx is an open- source computational tool considerably employed in drug discovery disquisition by both academic institutions and medicinal industriousness. Developed using the Python programming language, PyRx integrates various computational chemistry software and provides a user-friendly interface for molecular docking and virtual

netting. It's compatible with a broad range of modern processors and supports multiple operating systems, including Windows, Linux, and macOS, making it accessible and versatile for a wide user base (22). A public database of tiny compounds and their biological characteristics is PubChem. At the moment, it has 90 million bioactivity outcomes linked to several thousand macromolecular targets and over 25 million distinct chemical structures. We thoroughly compiled the protein targets in PubChem by function, three-dimensional structure, and biological route in order to address the potential use of this open resource for drug discovery. Additionally, we examined the bioactive compounds' potency, selectivity, and promiscuity for these biological targets, including the chemical probes produced by the NIH Molecular Libraries Program (31). The proliferation of many chemical file formats is addressed by Open Babel. It also offers a number of helpful features, such as filtering, batch conversion, substructure and similarity searching, conformer finding, and 2D visualization (32). For cross-platform use in computational chemistry, molecular modelling, bioinformatics, materials science, and related fields, the Avogadro project has created a sophisticated molecule editor and visualizer. It has a robust plugin architecture and flexible, high-quality rendering. Avogadro provides a platform for analysis and visualization as well as a semantic chemical builder. It provides users with an intuitive constructor and integrated support for downloading from popular databases like the Protein Data Bank and PubChem (25) An essential component of the investigation and dissemination of modeling studies is molecular visualization, in this study, Discovery Studio (BIOVIA, Dassault Systems, San Diego, USA) and PyMOL Educational Version (Schrödinger, LLC) were employed for molecular modeling and visualization. Discovery Studio was utilized for ligand preparation, protein refinement, and molecular docking result analysis, while PyMOL was used to visualize ligand–receptor interactions and generate high-quality structural images for interpretation. (26, 27)

Squalene as a drug candidate

One of the triterpene's unsaturated hydrocarbons is squalene. It is crucial for the human body's production of vitamin D and E, steroid hormones, and cholesterol (28). There are numerous uses for squalene in the food and pharmaceutical sectors. It is useful in the treatment of a number of malignancies, dry skin conditions, and skin congestion. (29). Shark liver oil is one of the primary sources of squalene and can be obtained from a variety of sources. However, there are widespread worries about the potential for contamination-related source animal mortality. synthesis of biomolecules Although it can provide coiled and sterol-like squalene, the cost of this process is high because it requires a number of enzymes and is difficult to manage. The final resource, which gives this component a linear structure, is the extraction of squalene from natural oil. The primary issue with natural oil sources is their low squalene content (30) The induction of this study is to study the anticancer exertion of Squalene by targeting the signalling pathway proteins of Ovarian cancer through the process of Molecular docking.

MATERIALS AND METHODS

Preparation of Ligand

Squalene (SQ) was selected as the ligand for this current anti-cancerous study against ovarian cancer. The structure of SQ retrieved from the PubChem database (CID 638072) (https://pubchem.ncbi.nlm.nih.gov/compound/Squalene) and it was converted from SDF format to PDB format by using the tool Smiles converter. Energy minimization done by PyRx tool.

Drug- Likeness property of Squalene

The Lipinski's rule of 5 has a major role in pre-clinical studies (31). As per this rule if any drug molecule violates more than 2 of the rules is not easily or readily absorbed into the internal system and not to be considered as drug molecule. Drug Likeness property was predicted by using the ADMETSAR 3.0(https://lmmd.ecust.edu.cn/admetsar3)

Pharmacokinetics properties of Squalene

Pharmacokinetics (ADMET) property was predicted by using the tool pkCSM (http://biosig.lab.uq.edu.au). ADMET-Absorption, Distribution, Metabolism, Excretion and Toxicity. Properties include intestinal absorption, Distribution in Blood brain barrier, Substrate inhibitor metabolism, total clearance of the excretion and AMES toxicity.

Prediction of anti-cancerous activity of Squalene by Using BAS- PASS

Pass software was used to predict the anti-cancerous activity of Squalene. Pass is a computer-based program can be used for the prediction of different types of pharmacological activities. The Biological activity spectrum of a chemical compound is the set of different types of biologicals that reflect the results of the compound interaction with various biological entities. PASS (Prediction of Activity spectra for substances) is a software product designed as a tool for evaluating the general biological potential of an organic drug like molecule.

(https://www.way2drug.com/passonline). The result of the PASS prediction was calculated as Pa (Probable activity) and Pi (Possibly inactivity). Compound which shows Pa higher than Pi are compounds most possibly for a medicinal activity.

Protein structure Retrieval

The universal protein resource (Uniprot) provides a stable, comprehensive resource on protein sequence and Functional annotation (32). Protein structures of AKT-1, PI3K, BAX and BCL-2 were retrieved from Protein data bank database (https:// www. rcsb. org/) by identifying the protein details through the uniport database.

Protein structure preparation

Prior to docking process, it is mandatory to prepare the protein structure. Preparation includes, Addition of polar hydrogens, removal of water molecules, indigenous ligand and energy minimization of the structure. Biovia Discovery studio client 2024 was used for this study.

Active site prediction

One of the key steps in molecular docking is the prediction of active site. The active site of all target proteins was predicted through CASTp server and analyzed by Biovia Discovery Studio Client 2024.

Molecular Docking

Protein ligand docking studies were performed using the PyRx tool (Python based). It is one of the preferred tools for protein ligand blind docking. Grid formation was selected by the indigenous ligand present in the structure and after it was removed to bind the SQ.

Ligand were prepared by using the open babel tool for converting the format and was subjected to energy minimization. Prepared protein and ligand were saved in. pdbqt format.

RESULT AND DISCUSSION

Ligand and protein structure retrieval and preparation

The selection and preparation of both protein and ligand structures are critical for ensuring the accuracy and reliability of molecular docking studies. In this study, the UniProt database was utilized to retrieve the protein sequences of key targets involved in ovarian cancer signaling pathways, specifically PI3K, AKT, BAX, and BCL-2. The organism filter was set to Homo sapiens to ensure human-specific relevance. After evaluating multiple sequence hits, the following UniProt accession numbers were selected based on relevance and structural availability- P10415 (BCL-2) Q07812 (BAX) P31749 (AKT-1) Q8NEB9 (PI3K subunit). The three-dimensional crystal structures corresponding to these targets were obtained from the Protein Data Bank (PDB) using the following PDB IDs: 4EJN (AKT-1) 4BD2 (BAX) 2W3L (BCL-2) 3LS8 (PI3K). PDB structures were selected based on resolution, completeness, and biological relevance (Table 1), and were subjected Preparations like removal of water molecules, adding polar hydrogens, energy minimization using Biovia DS prior to docking. The 3D structure of the ligand, squalene, was downloaded from the PubChem database in SDF (Structure Data File) format. Since most docking tools, including PyRx, require PDB format input, the ligand file was converted using a SMILES-based converter tool, allowing conversion from 2D to 3D structure. The conversion process and final structure of squalene are illustrated in Figure 1. To ensure compatibility with docking protocols, both protein and ligand structures were prepared in PDB format, which is readable by most molecular docking software including PyRx.

Lipinski rule and ADMET properties of Squalene

Lipinski rule of Squalene was predicted using the ADMETSAR 3.0 version (table 2) The physiochemical properties of squalene evaluated to say about its potential oral bioavailability, The molecular weight of Squalene is 410.71 g/mol which is within the acceptable range <500 g/mol. The topological Polar Surface Area (TPSA) is 0.0 Å², and both hydrogen bond donors (HBD) and hydrogen bond acceptors (HBA) are 0, indicating a lack of polar functional groups. This is consistent with squalene's hydrocarbon structure and further supports its high lipophilicity and membrane permeability. However, the LogP value of 10.6 is significantly higher than the recommended threshold of ≤5, suggesting that squalene is highly lipophilic. While this may enhance membrane permeability, it could also reduce aqueous solubility, potentially affecting its bioavailability and formulation. (Fig 2) Despite the high LogP value, squalene satisfies drug-likeness criteria, which implies that its physicochemical profile does not violate other major rules used to evaluate oral bioavailability. These characteristics suggest that while squalene is hydrophobic, it may still be a viable candidate for further development, particularly in formulations designed to overcome solubility limitations. ADMET property of Squalene were predicted by using the ADMETSAR 3.0 version to access the pharmacokinetic behavior and potential safety profile. (Table 3)

Absorption

Squalene showed a high intestinal absorption rate (89.002%), indicating excellent potential for oral bioavailability. However, its water solubility was predicted to be very low (−8.401 log mol/L), reflecting its strong lipophilic nature, which could limit its dissolution in aqueous environments and hence affect absorption unless formulated appropriately. The Caco-2 permeability value (1.193 log Papp in 10^{-6} cm/s) suggests moderate to high permeability across intestinal epithelial cells, consistent with its high lipophilicity. Skin permeability (−2.763 log Kp) is relatively low, suggesting limited potential for transdermal delivery

Distribution

The blood-brain barrier (BBB) penetration potential, represented by Log BB = 0.965, indicates that squalene can cross the BBB efficiently, which may be relevant in exploring its effects on neurological or CNS-related cancers. In contrast, the Log PS value (−0.935) indicates low permeability through the blood–cerebrospinal fluid barrier, limiting distribution within the CNS parenchyma.

Metabolism

Metabolic profiling shows that squalene is a substrate for cytochrome P450 3A4 (CYP3A4), a major liver enzyme involved in drug metabolism, but not for CYP2D6. Importantly, squalene is not predicted to inhibit any major cytochrome P450 isoforms (CYP1A2, CYP2C9, CYP2C19, CYP2D6, or CYP3A4), reducing the risk of drug–drug interactions, a critical factor in polypharmacy contexts such as cancer treatment.

Excretion

The total clearance value was predicted at 1.791 log ml/min/kg, suggesting a moderate rate of systemic elimination. Additionally, squalene is not a substrate for the renal organic cation transporter 2 (OCT2), indicating that renal excretion via this pathway is unlikely to be significant.

Toxicity

Toxicological predictions are favorable. Squalene is non-mutagenic (negative AMES test), non-hepatotoxic, and non-sensitizing to the skin. These results suggest a good safety profile, which is crucial for early-stage drug development. Overall, the ADMET analysis supports the potential of squalene as a drug-like compound, with high intestinal absorption, acceptable permeability, minimal risk for drug–drug interactions, and a favorable toxicity profile. However, its poor water solubility may pose challenges in formulation and bioavailability, which could be addressed through appropriate delivery systems such as lipid-based nanoparticles or emulsions.

PASS prediction of Squalene

Pass was predicted using the way2drug database for the Squalene. Structure based prediction shows pa ((probability of activity) and Pi (probability of inactivity) values for different pharmacological roles. Squalene shows a Pa > 0.5 for

both antineoplastic and antimetastatic activities, with corresponding Pi values significantly lower (<0.01). According to standard interpretation thresholds: Pa > 0.5 suggests that the compound is likely to exhibit the predicted activity in vitro or in vivo. A low Pi alongside a high Pa further reinforces confidence in the prediction. The Pa value of 0.542 for antineoplastic activity indicates that squalene may have potential as an anticancer agent, possibly by targeting cancer cell proliferation. Likewise, the Pa value of 0.560 for antimetastatic activity suggests that squalene might play a role in inhibiting cancer cell migration and metastasis (Table 4)

Active site Prediction

The Computed Atlas of Surface Topography of proteins (CASTp) server was used to predict potential active/binding sites of selected protein structures. CASTp identifies and measures concave surface regions (pockets and cavities) of proteins, based on both solvent-accessible and molecular surface materials for the following structures BAX (4BD2), 3LS8 (PI3K), 2W3L (BCL) and 4EJN (AKT1) were mentioned in the (table 5).

Molecular Docking

Docking interactions between four receptors and Squalene were performed by using the PyRx tool after identifying the binding site. Possible interactions between the 4BD2- Squalene. 3LS8- Squalene, 2W3L- Squalene and 4EJN-Squalene were mentioned in the (table 6). The binding of Squalene to BAX is characterized by predominantly hydrophobic interactions, particularly involving residues like ILE, LEU, VAL, and aromatic residues such as PHE105 and TRP107, which facilitate van der Waals forces and π–π stacking. The docking score of –7.4 kcal/mol indicates moderate affinity, consistent with interactions that are largely driven by hydrophobic complementarity rather than polar contacts. (Fig 3) The binding pocket of PI3K features a combination of hydrophobic and aromatic residues, including PHE612, PHE684, and PHE758, which likely engage in π-alkyl and van der Waals interactions with the hydrocarbon backbone of Squalene. Polar (SER614, GLN683, SER687) and charged residues (LYS636, ASP761) are also present, though the interaction remains largely hydrophobic in nature. The docking score of –7.1 kcal/mol suggests moderate to good affinity, slightly lower than that observed with BAX. (Fig 4) The binding of Squalene to BCL (2W3L) shows a score of -6.1 kcal/mol, the interaction is mostly hydrophobic with residues involving PHE89, ALA90, VAL93, and VAL101 which contributes to non-polar interactions. There is a slight hydrogen bond interaction with the residues, HIS143 or TYR139, but these interactions are relatively weak compared to the stronger hydrophobic bonding. (Fig 5) The docking analysis of Squalene with AKT-1(4EJN) shows there is a mixed interaction of hydrophobic (ILE, LEU, VAL), polar (SER, ASN, GLN), and catalytically important residues (CYS77, TYR272). The docking score of –9.0 kcal/mol indicates a high affinity between squalene and AKT1, with the score being the best among the tested compounds. This suggests that squalene could bind strongly to this site, potentially competing with native substrates or other inhibitors. (Fig 6) The binding of Niraparib (Positive Control) (Fig 7) with the best interaction protein AKT-1 (4EJN) among the selected residues shows the binding affinity as -7.8 Kcal/mol (table 7) and the interacting residues were ILE19, THR22, LEU59, TRP107 the interaction in 4EJN is more hydrophobic in nature (ILE19, LEU59) with fewer residues involved (Fig 8) which might explain the comparatively weaker binding. Which is slightly less than the interaction with Squalene.

CONCLUSION

In the present study, Molecular docking analysis were performed to evaluate the interaction of Squalene with four key protein targets—BAX (3LS8), PI3K (4BD2), BCL-2 (2W3L), and AKT1 (4EJN)—using PyRx software. Squalene exhibited moderate binding affinity with BAX (–7.4 kcal/mol), driven predominantly by hydrophobic and aromatic interactions involving residues such as ILE, LEU, VAL, PHE105, and TRP107. Similarly, interaction with PI3K showed a moderate-to-good docking score (–7.1 kcal/mol), with key contacts formed via π-alkyl and van der Waals interactions from hydrophobic and aromatic residues (PHE612, PHE684, PHE758), supported by surrounding polar and charged residues. In contrast, binding to BCL-2 (2W3L) resulted in the lowest docking score (–6.1 kcal/mol), reflecting a less optimal interaction dominated by non-polar residues such as PHE89, ALA90, VAL93, and VAL101, with minimal contribution from hydrogen bonding. The most promising interaction was observed with AKT1

(4EJN), where Squalene achieved the best docking score of –9.0 kcal/mol. This strong affinity is attributed to a balanced interaction profile, engaging hydrophobic, polar, and catalytically essential residues such as CYS77 and TYR272, suggesting potential inhibitory capability and therapeutic relevance. When compared to Niraparib (used as a positive control), which docked with AKT1 at –7.8 kcal/mol, Squalene demonstrated superior binding affinity and engaged a broader set of residues, indicating a more stable and specific interaction. Overall, these findings suggest that Squalene exhibits selective and potentially functional binding to AKT1, making it a candidate for further investigation as an inhibitor in ovarian cancer-related signaling pathways PI3K/AKT.

ABSTRACT

Microdontia is a dental anomaly in which teeth appears smaller than usual .It can often result in malocclusion, food entrapment and aesthetic problems. True generalized microdontia (TGM) is rare to occur where all teeth are smaller than normal and associated with syndromes. TG Min a healthy person without any syndromes is extremely rare. Skeletal Class III malocclusion is exhibited either due to excessive mandibular growth, deficient maxillary growth or both. The Bilateral sagittal splitosteotomy (BSSO) is the commonly performed orthognatic procedure to correct dento facial abnormalities. Here were porta case of skeletal class III malocclusion with generalised microdontia who has been teased by her own friends and relatives citing her smile look like a ghost ("ghosty smile"). Surgical management of skeletal class III involved bilateral sagittal split osteotomy and setback of mandible by 6mm and the generalized microdontia was corrected using prosthetic crowns. She had a satisfactory treatment outcome. We report this case of orthognathic surgery and smile correction which enhances the self-confidence of the patient and makes the patient to lead a normal life in the society.

Keywords: Malocclusion, mandible, Prognathism, osteotomy, sagittal split ramus, tooth abnormalities.

INTRODUCTION

Microdontia is a distinctive condition or dental anomaly characterized by abnormally smaller teeth than usual.[1]Microdontia can be of three types: [1] single tooth microdontia, [2] relative generalized microdontia where teeth are relatively small in larger jaw,[3]and true generalized microdontia (TGM) where teeth are actually smaller than normalsize.TGM is exceptionally rare and are often associated with other syndromes like oculo-mandibulo-facial syndrome, Rieger anomaly and pituitary dwarfism. [1,2]Though true microdontia is rare it was associated with skeletal class III malocclusion (MO) in a prevalence study of dental anomaly. The findings of the study stated that microdontia in class III MO often involved maxillary arch. [3] Class III malocclusion occurs due to protrusive mandible or mandibular dentition, large mandible, regressive maxilla or maxillary dentition or both. The severity of MO and the age of the patient determines the treatment modality to rectify class III MO. Non growing adults with severe skeletal discrepancies are recommended to be treated by orthognathic surgery. [4] The bilateral sagittal split osteotomy (BSSO) is the most commonly performed jaw surgery. It is performed as a single jaw surgery or combined with upper jaw surgery. Ever since the genesis of the technique, it has undergone a myriad of modifications making the procedure safer, reliable and predictable with less relapse.[5]Patients with dental MO and dental anomalies are bullied and have negative effects on self-esteem and quality of life. [6]In the current report we present a case of a young adult female who was a subject of peer victimization for her dental appearance. Clinical, radio graphical and intraoral examination concluded that she had skeletal class III MO with TGM.

Case Presentation

A 24-year-old female patient from a remote village reported with a complaint of abnormally small teeth. She was teased by her friends and relatives citing that her smile looks like a ghost. The medical, drug, family and past surgical histories proved non-contributary. Patient also complained of psychological stress due to negative impact cited by her family members and friends. The highest degree of appearance-related teasing came from siblings and father followed by the mother. Also, she reported that she was a victim of bullying by her peers and relatives for her dental appearance stating that her smile looks like a ghost. She was tested at medical hospital center for growth abnormalities and possibilities of associated syndromes. Her serum growth hormone was 10.5ng/mL and BMI was 17.5. Likewise, serology of thyroxin, and cortisol, serum calcium, phosphorous, and alkaline phosphatase was just normal. Her hemoglobin was 12 mg/dL and the routine blood counts were remarkable without any 12^{th} chromosomal abnormalities. Endocrinologist ruled out any hair/ skin or possibility of genetic disorder that can primarily affect the face. Patient's medical history was clean and never underwent chemotherapy at any age before. On examination the patient had a concave facial profile with reverse over jet of 4 mm and posterior cross bite. Additionally. she had bilateral missing mandibular first molars which she got extracted eight years agoaskeletal class IIIMO and generalized microdontia. Lateral, frontal view andintra oral dentition photographs were made(Figure1A-E). Radiographic examination and evaluation revealed she had a prognathic mandible of 6mm and normal position of maxilla. She does not have any other deformities in the body.The patient was diagnosed to have skeletal class III malocclusion with non- syndromic microdontia. Surgical correction of prognathic mandible was made by bilateral sagittal split ramus osteotomy and dental correction was performed using prosthetic crowns to rectify the microdontia. Treatment plan and possible complications were explained in detail to the patient and her parents and written consent was obtained before treatment. Bilateral sagittal split osteotomy (BSSO) was done according to Hun suck modification of Obwegeser/dal Pont technique attaining a mandible set-back of 6mm. This was followed by provision of temporary full mouth prosthetic crown son the seventh post operativeday(figure 2 A-C). Permanent crowns (Zirconia) were given after intentional root canal treatments (RCT) done for all the teeth before placement of crowns. Post rehabilitation of generalized microdontia a satisfactory treatment outcome was reported by patient.

DISCUSSION

TGM with no associated syndrome is quite a rare occurrence. The prevalence of microdontia in permanent dentition was only 0.5% to 3.1% often involving maxillary lateral incisors and females are often affected than males.[7]A Brazilian study showed that 27.4% of the patients had some dental anomaly when diagnosed with MO. They reported most of these cases were white women aged 11-20 years. This is in line with current case study, where in we had a female in her 20's with class III MO. The authors have pointed that ectopia, microdontia, impaction, and hypodontia were more prevalent in patients with Class I MO while microdontia was associated only with class II MO. Impaction was associated with Class III malocclusion, at a 1.84-times higher prevalence. [8] Paradoxically, we found microdontia in Class III MO unlike the existing evidence, Chen *et al* have reported a similar case of TGM associated with non-syndromic skeletal malocclusion. They have ruled out the possibilities of syndromes with endocrinologists, and planned a customized orthognathic surgery followed by crowns for her. [9] This is corroboration with current case report. Yet another similar case was reported where a child male patient with normal physical growth, blood profile and insignificant medical history presented with normal occlusion but TGM involving both anterior and posterior teeth in maxilla and mandible.[10]This is in similar picture with current the case report with TGM involving both maxillary and mandibular arch. The patient in the current scenario, was a female with TGM in a class III MO. It is rare occurrence of TGM reported in mandible in case of class III skeletal relation where there is excess of mandibular bone. Her parents and siblings neither have skeletal class III nor do they have microdontia. Management of microdontia is multidisciplinary in approach including orthodontic, restorative, and prosthetic or combination of these.[9,10]It needs further genomic studies or long-term cohort study on other contributing factors responsible for microdontia of similar occurrence in individuals with insignificant medical familial history. The role of specialized dental surgeons along with medical team in addressing a surgical emergency in rural settings was described previously. [11]An Indian survey described 70% of population to lack awareness on malocclusion, and that they are not satisfied with their teeth. [12]This calls for spreading awareness and collaboration with primary care physicians (PCPs) and dental surgeons to help impact community in a positive way.

CONCLUSION

Skeletal class III MO can present with TGM without any association with any syndromes. The identification of negative impact of such presentation and customized treatment with BSSO setback surgery and prosthetic crown rehabilitation which has changed her facial profile and smile positively were essential take a ways .Dental treatment is complete when self-confidence and restoration of smile are obtained which may aid the patient lead a normal life in the society.

ABSTRACT

The essential antimicrobial drugs used to treat and prevent bacterial illnesses are antibiotics. Despite having transformed contemporary medicine in the 20th century, their excessive use, especially in the production of cattle and poultry, has greatly accelerated the emergence of germs resistant to antibiotics. When bacteria undergo horizontal gene transfer or genetic alterations to become resistant to the effects of antibiotics, this is known as antibiotic resistance. Through food chains, migration, and contact between humans and animals, this resistance can spread among bacterial species and ecosystems. Antibiotics including ampicillin, chloramphenicol, erythromycin, and tetracycline are frequently used in poultry production to promote growth and prevent disease. But this approach encourages the growth of resistant strains of Salmonella spp., Campylobacter, and *Escherichia coli*, which are extremely dangerous to human health. Foodborne illnesses, renal failure, urinary tract infections, and gastroenteritis can all be brought on by resistant bacteria found in animal manure, feed, and meat products. *E. coli* and other coli form bacteria are used as markers of resistance and contamination. Even gram-negative bacteria, which are often less susceptible to such changes, exhibit concerning levels of resistance, according to studies. This study emphasizes the urgent need for regulated antibiotic practices in agriculture by highlighting the growing public health concern about the use of antibiotics in poultry farming and its direct association with the emergence of resistant bacteria.

Keywords: chloramphenicol, bacteria, poultry farming, *E. coli.*

INTRODUCTION

Antibiotics are antimicrobial drugs that are used to treat and prevent bacterial illnesses. Bacteria may be killed or inhibited by these substances[1]. Antibiotics transformed medicine in the twentieth century, resulting in the near eradication of diseases like tuberculosis in the developed world when combined with immunization [2]. However, because of their efficiency and ease of access, they have been overused, particularly in animal production, causing bacteria to evolve resistance[3]. Antibiotic resistance is the capacity of a bacterium to withstand the effects of an antibiotic[4]. When bacteria change in a way that makes drugs and chemicals intended to treat or prevent infections less effective, antibiotic resistance arises. Antibiotics are commonly categorized based on their activity spectrum, chemical structure, or mode of action. Ten classes of antibiotics include Penicillin, Tetracyclines, Cephalosporins, Quinolones, Lincomycins, Macrolides, Sulphonamides, Glycopeptides, Aminoglycosides, and Carbapenems[5].

Antibiotics' mechanisms of action

Depending on the structure of their molecules and the degree to which they attach to particular target locations in bacterial cells, antibiotics function in a variety of ways[1].

How do bacteria become resistant?

The usage of antibiotics promotes the development of antibiotic-resistant bacteria. Antibiotic use eliminates sensitive bacteria while allowing resistant bacteria to grow and proliferate[6]. The overuse and abuse of antibiotics is the main cause of antibiotic resistance. The bacteria that survive are more likely to be resistant due to the selection pressure that drug exposure creates[7]. Additionally, bacteria that were previously susceptible to an antibiotic may become resistant by undergoing genetic mutation or by acquiring DNA fragments from other bacteria that encode for resistance[8].The coding for resistance It is possible to combine DNA into a single, transportable packet. This implies that bacteria can develop resistance to a variety of antimicrobial treatments due to a single piece of DNA[9]. Coliforms are a type of bacterium that can be found in our environment, such as in human faeces, poultry farms, and other warm-blooded animals[15]. The presence of coliform bacteria in the body could signal the presence of disease-causing organisms[16]. As a result, testing for Coliform bacteria can provide a good indication of the presence of other harmful bacteria[15].

Faecal Coliforms and *Escherichia coli*:

E. coli and fecal coliforms are not dangerous in and of themselves, but they can be harmful when found in sewage and animal feces[17]. The symptoms of the disease include headaches, fatigue, cramping, nausea, diarrhea, and sometimes jaundice[18]. Although drug resistance is uncommon in gram-negative bacteria, it was surprising to find that E. coli isolates had it. The World Health Organization has acknowledged that the use of antibiotics in animals causes antibiotic resistance in people, and there is growing worry about the spread of resistant microorganisms down the food chain.

Antibiotics used in poultry production and its effects

Ampicillin, choramphenicol, erythromycin, methicillin, gentamicin, kanamycin, penicillin-G, streptomycin, tetracycline, vancomycin, and other antibiotics are used in poultry production.In chicken production, antibiotic-resistant bacteria include *Escherichia coli*, Salmonella spp., Enterococcus, Streptococcus, Campylobacter, Klebsiellapneumoniae, Staphylococcus aureus, and others. Through the food chain, all of these creatures pose a serious hazard to human health. Urinary tract infection, anaemia, kidney failure, acute gastroenteritis, typhoid fever, gall bladder inflammation, and food illnesses are all caused by them.The World Health Organization has acknowledged that antibiotic usage in animals affects antibiotic resistance in humans, and the spread of resistant microorganisms across the food chain is a growing problem. Because antibiotics are widely used for both therapeutic and non-therapeutic purposes, they have been held accountable for the widespread growth of bacteria that are resistant to them.

Antibiotics are used in both growth promotion and prophylaxis to avoid disease outbreaks. Growth promotion involves adding subtherapeutic doses of antibiotics to animal feed to encourage quicker weight gain[19].Antibiotic-resistant bacteria from chicken farms were enumerated and described in this investigation. We anticipated that a rise in antibiotic resistance among Coliform bacteria would result from the use of antibiotics in poultry feed[20].

MATERIALS AND METHODS

Sample collection

Samples were taken from various poultry farms in the Mysuru area. A total of 30 isolates were obtained from several locations in Mysore district, Karnataka, including Chammanahalli, Vidyanagar, Jyothinagar, Gandhinagar, T.K layout, and teacher's colony. A faeces sample, a litter sample, and a water sample from a fowl chicken were among the samples. For subsequent examination, the materials were kept at room temperature.

Chemicals and media

Hi-Media, Mumbai, India, provided sodium chloride (NaCl), double distilled water, Nutrient Agar, Luria Bertani Broth, Eosin Methylene Blue (EMB) agar, Agar-Agar, *Escherichia coli* identification kit, and antibiotics.

Isolation and identification

From 10^{-1} to 10^{-6}, the obtained samples were serially diluted in 0.85 percent saline solution. On EMB agar plates, the solution was streaked and incubated for 24-48 hours. The diluted samples were streaked on EMB agar plates and incubated for 24 hours at 35 degrees Celsius. For pure cultures on Nutrient Agar, colonies with a metallic sheen were selected and streaked on EMB agar plates. The pure isolates were subcultured on Nutrient Agar slants and stored at 4°C in order to identify E. coli. After being grown in Luria Bertani (LB) broth, the slants were incubated for 24 hours at 35 degrees Celsius before being kept at 4 degrees Celsius for further study.

Antibiotic Resistance Testing:

Antibiotic resistance tests were done on E. coli bacteria isolated from various sources using Nutrient Agar medium and the disc-diffusion method. Ampicillin (10 mcg), Chloramphenicol (30 mcg), Erythromycin (15 mcg), Methicillin (5 mcg), Gentamicin (10 mcg), Kanamycin (30 mcg), Penicillin-G (10 units), Streptomycin (10 mcg), Tetracycline (30 mcg), Vancomycin(30 mcg), Ceftazidime (30 mcg), Ceftizox (30mcg). A disc diffusion method impregnated with a specified concentration of antibiotic was used to aseptically inoculate Nutrient Agar plates with the test organism that was kept in LB broth media. The plates were incubated at 37 degrees Celsius for a full day. After the procedure was completed, the mean diameter of the zone of inhibition and the resistance patterns were noted.

Identification and Characterization of *E.coli*

The bacterial strains were visually identified using Gram's staining (Kit), and they were biochemically characterized using the E. coli Identification Kit (Hi-Media). Pure isolate cultures were aseptically injected and incubated for twenty-four hours at 37°C. Following that, the outcomes were documented in compliance with the company's handbook.

RESULTS

Isolation and Characterization of *E.coli* from faecal sample

All distinct bacterial colonies were picked from various samples and morphologically and biochemically characterized. All of the bacterial cultures were Gram Negative and had a rod shape, according to morphological analysis. Furthermore, all of the bacterial cultures were provisionally identified as *Escherichia coli* based on biochemical and physiological test results.

Antibiotic Susceptibility Test

Antibiotic susceptibility was tested on the isolated bacterial cultures using 20 different antibiotics. Chammanahalli was assigned the number N1 to N4, Vidyanagar was assigned the number N5 to N10, Jyothinagar was assigned the number N11 to N18, Terresian Colony was assigned the number N19 to N22, Teacher's layout was assigned the number N23 to N26, and Ghandhinagar was assigned the number N27 to N30.

The distribution of antibiotic resistance patterns among the isolates was shown in Tables 1 and 2. From various samples, thirty isolates were produced. Methicillin resistance was found in 96.6 percent of isolates, followed by Linezolid (83.3 percent), Tetracycline and Nalidixic acid (73.3 percent), Colistin (70 percent), Penicillin-G (60 percent), Vancomycin (56.6 percent), Erthromycin (50 percent), Kanamycin and Trimethoprim (40 percent), Ampicillin (33.3 percent), Gentamicin (20 percent), Ciprofloxacin, Amikacin, and Ofloxacin (13.3 Ceftizoxime was the only antibiotic that demonstrated sensitivity to all of the isolates (0 percent). N1, N2, N12, and N16 showed resistance to four antibiotics; N3, N6, and N27 showed resistance to five antibiotics; N14 and N15 showed resistance to six antibiotics; N4, N17, N24, N26, N28, N29, and N30 showed resistance to seven antibiotics; N13, N18, and N20 showed resistance to eight antibiotics; N8, N9, N11, and N21 showed resistance to nine antibiotics; N10, N19, and N23

DISCUSSION

Globally, antibiotic resistance is a serious public health issue [21]. The majority of pathogens acquire resistance genes by the horizontal transfer of mobile genetic components like plasmids and transposons, even though mutations contribute to antibiotic resistance[22]. It is increasingly acknowledged that the natural environment contributes to the development of antibiotic resistance in pathogenic bacteria and is a source of antibiotic-resistant bacteria and resistance genes[23]. Therefore, we examined the prevalence of antibiotic resistance in E. coli isolates from chicken farms in Mysuru. Due to the presence of drug residue in foods (which can be the parent compound, compounds derived from the parent drug, or both, including metabolites and residue bound to macromolecules on the one hand[24], and the selection of resistant bacteria in animals on the other), the practice of indiscriminately using antibiotics in poultry animals has detrimental effects on human health[13].

This study offers a clear example of the widespread usage of antimicrobial medications by the majority of chicken farmers in Mysuru, along with the possible repercussions of such practices. Antibiotics can be used for growth promotion, therapy, or prevention. Our investigation revealed that every one of the 30 *E. coli* isolates that were found exhibited a pattern of multidrug resistance (Table 1 and 2). The pattern of resistance meant that E. coli was resistant to the following antibiotics: gentamicin, kanamycin, amikacin, and streptomycin (aminoglycosides); tetracycline, vancomycin (glycopeptide antibiotics); erythromycin (macrolides); ampicillin, penicillin-G, methicillin (penicillin group of drugs); chloramphenicol and tetracycline (potentiated sulphonamide); Cefta Quinolone resistance was found, which is in line with earlier reports of quinolone-resistant E. coli in various places.

The ability of microorganisms to withstand the antibiotic penicillin is referred to as penicillin resistance. Human volunteers have been shown to colonize their intestinal tracts with antibiotic-resistant E. coli from chicken, and there is evidence that animals act as a reservoir for human E. coli, despite the fact that the mechanism by which antibiotic resistance is transmitted from poultry to humans is unknown[25]. By colonizing the human digestive tract and adding resistant genes to the human endogenous flora, resistant fecal *E. coli* from poultry can also infect people directly and indirectly through food also reported the direct transmission of tetracycline, streptomycin, and sulphonamide-resistant E. coli from chicken to poultry attendants [26]. In other locations, chickens have also been linked to antibiotic resistance in people

CONCLUSION

According to the study's findings, a critical evaluation of the use of antimicrobial agents in a chicken farm in Mysuru is necessary, and it is crucial to implement specific policy measures to restrict the use of antimicrobial agents indiscriminately in order to prevent any negative effects on both humans and animals.Finally, the findings of this study suggested that commensal *E. coli* from the study farms could serve as a reservoir for multidrug resistance patterns that could be mobilized into human populations.The implementation of a policy that encourages the prudent use of antimicrobial agents as a crucial part of containing antibiotic resistance requires the rapid development of a strategy and the implementation of the necessary measures. It did, however, highlight the crucial need for antimicrobial medication regulation in chicken production and regular monitoring of antibiotic resistance in developing nations to ensure public health safety.

ABSTRACT

In Ayurveda, Ama is the toxic byproduct that forms due to the impaired function of Kayagni. When Jatharagni is weak, it fails to completely digest Ahara Rasa, leaving behind an undigested residue. This accumulation of Ama is considered the primary cause of various Vyadhis in the body. Ama is often associated with oxidative stress, a condition characterized by an imbalance between the production of free radicals and the body's ability to neutralize them. In modern biomedical science, free radicals are known contributors to chronic inflammation and are closely linked to the elevation of C-Reactive Protein (CRP), a biomarker for systemic inflammation. This literature review aims to explore the connections between Ama, oxidative stress (via free radicals), and elevated CRP levels, providing a cross-disciplinary understanding of inflammatory mechanisms. To critically analyze existing literature on the correlations between Ama and free radicals, as well as the relationship between free radical-induced oxidative stress and elevated CRP levels, to propose a conceptual model that links these phenomena in the context of systemic inflammation. A comprehensive review of Ayurvedic texts was conducted to elucidate the traditional descriptions of Ama and its role in disease pathogenesis. Concurrently, a systematic review of modern biomedical studies on free radicals, oxidative stress, and their relationship to CRP levels in inflammatory conditions was performed. The focus was on identifying mechanistic overlaps and potential synergies between Ayurvedic and biomedical perspectives on inflammation. The review revealed a significant overlap in the pathophysiological descriptions of Ama and oxidative stress. Ayurvedic descriptions of Ama-induced tissue damage closely parallel the effects of free radicals on cellular structures, particularly through lipid peroxidation, protein oxidation, and DNA damage.

Furthermore, elevated levels of free radicals have been consistently linked to increased production of pro-inflammatory cytokines such as IL-6, which stimulate hepatic synthesis of CRP. Literature on chronic inflammatory diseases, including cardiovascular diseases, arthritis, and metabolic disorders, demonstrates a clear connection between Ama, high free radical activity and elevated CRP levels. The link between Ama and free radicals, along with the known relationship between oxidative stress and higher CRP levels, helps bridge Ayurvedic and modern medical perspectives on inflammation. This integrative approach offers valuable insights into the management of inflammation-related disorders, with potential implications for both Ayurvedic interventions and biomedical treatment strategies. Further research is needed to empirically validate this correlation through interdisciplinary studies.

Keywords: Ama, free radicals, oxidative stress, C-Reactive Protein, systemic inflammation, Ayurveda, biomarkers

INTRODUCTION

Ama

The term *Ama* in Ayurvedic medicine refers to something that is unripe, immature, or incompletely formed. It results from the weakened functioning of *Agni* (digestive fire). *Ama* is characterized by undigested, foul-smelling, excessive, and slimy substances that cause stiffness throughout the body [1-2]. The production of *Ama* is not only caused by overeating but also by consuming foods with certain qualities, such as incompatible combinations (*Viruddha Ahara*), heavy (*Guru*), dry (*Ruksha*), hard to digest (*Vistambhi*), oily (*Snigdha*), or when there is weak digestive power (*Agnimandya*) [3]. The consumption of food when a person is emotionally disturbed by factors like desire (*Kama*), anger (*Krodha*), greed (*Lobha*), delusion (*Moha*), jealousy (*Irshya*), sorrow (*Shoka*), fear (*Bhaya*), shame (*Lajja*), worry (*Chinta*), anxiety (*Mano Udvega*), or mental exhaustion (*Manoglani*) [4] significantly contributes to the formation of *Ama* in the body. *Ama* functions like a toxin (*Visa*), contributing to both localized and systemic disorders. *Acharya Vagbhata*compares *Amavisa*to acute poisoning, emphasizing its potentially life-threatening nature. Since the treatments for *Ama dosha* and *Visa* are fundamentally different, careful consideration is required, as improper management could have severe consequences. *Ama* is an incomplete metabolic byproduct that can clog the body's microchannels (*Srotas*), leading to various complications. It is not a single substance but rather a category of conditions that can affect different levels of biological function.

Free Radicals

Some theories suggest a pathological connection between free radicals and *Ama*, as their properties and manifestations appear to be closely related [5]. Free radicals are unstable molecules, ions, or atoms with an unpaired electron, causing an electrical charge due to an imbalance of protons and electrons. They form when a molecule gains or loses an electron in its outer shell. These reactive molecules are naturally produced during metabolism or through exposure to environmental toxins like polluted air, contaminated food, and water. While free radicals play a role in energy production and immune defense, an excess can damage healthy cells and speed up aging. Other reactive oxygen species, such as superoxide, hydrogen peroxide, and hydroxyl radicals, also contribute to degenerative diseases like cancer and heart attacks [6]. Free radicals play a crucial role in several biological processes, including the intracellular killing of bacteria by phagocytic cells such as granulocytes and macrophages. Molecules like superoxide and nitric oxide, along with their reaction products, are involved in regulating various processes, including the control of vascular tone and blood pressure. Additionally, free radicals are important in the intermediary metabolism of different biological compounds. These radicals can even act as messengers in a process known as redox reactions [7]. Oxygen and hydrogen peroxide are oxidants that serve as effective bactericidal agents when combined with neutrophils [8].

Inflammation

Inflammation is defined as a protective response of vascularized tissues to harmful stimuli, such as infections, toxins, or trauma, with the aim of eliminating the injurious agents and initiating tissue repair. The process involves a complex interplay of immune cells, chemical mediators, and plasma-derived factors. While acute inflammation is beneficial, persistent or dysregulated inflammation can lead to tissue damage and chronic disease [9,11]. Free radicals, particularly reactive oxygen species (ROS), play a critical role in initiating and sustaining inflammation, closely linked to elevated C-reactive protein (CRP) levels. ROS, including superoxide anion (O_2^-), hydrogen peroxide (H_2O_2), and hydroxyl radicals (•OH), are generated as natural by-products of cellular metabolism, especially within mitochondria. Under normal physiological conditions, antioxidant systems neutralize ROS to maintain homeostasis. However, oxidative stress arises when ROS production overwhelms these defenses, resulting in lipid peroxidation, protein damage, and DNA mutations [11].

Oxidative stress triggers damage that activates pro-inflammatory signaling pathways. One major mechanism is the activation of nuclear factor-kappa B (NF-κB), a transcription factor that controls genes linked to inflammation. NF-κB stimulates the production of pro-inflammatory cytokines like interleukin-6 (IL-6), tumor necrosis factor-alpha (TNF-α), and interleukin-1 beta (IL-1β), which work together to intensify the inflammatory response [9]. IL-6 plays a key role in this process by stimulating hepatocytes to produce CRP, an acute-phase reactant. CRP not only serves as a marker of systemic inflammation but also actively contributes to immune defense by facilitating complement activation and phagocytosis (Robinson, 2021). Furthermore, inflammatory cells like neutrophils and macrophages, once activated, produce additional reactive oxygen species (ROS) through enzymatic pathways such as NADPH oxidase, creating a continuous cycle of oxidative stress and inflammation [9].

Persistent oxidative damage and inflammation contribute to the pathogenesis of chronic diseases, including atherosclerosis, diabetes, and rheumatoid arthritis. Hutchison's *Clinical Methods* highlights that endothelial dysfunction, a hallmark of chronic inflammation, is exacerbated by this ROS-inflammation-CRP axis [10]. Similarly, Robinson's *Pathology for Health Professions* underscores the role of ROS in causing cellular injury and promoting fibrosis, which can lead to organ dysfunction in chronic inflammatory states [11].

C-Reactive Protien (Crp) [12]

C-reactive protein (CRP) is an acute-phase reactant primarily produced by the liver in response to inflammation, infection, and tissue injury. It plays a crucial role in diagnosing and monitoring systemic inflammation, making it a valuable biomarker in modern medicine (Godkar, 2022).

Structure and Function

CRP is a pentameric protein belonging to the pentraxin family. It binds to phosphocholine residues present on damaged cells and microbial surfaces, thereby triggering complement activation and immune response (Godkar, 2022). This mechanism facilitates phagocytosis and clearance of pathogens by the immune system.

CRP and Inflammation

The synthesis of CRP is primarily stimulated by pro-inflammatory cytokines, particularly interleukin-6 (IL-6) and tumor necrosis factor-alpha (TNF-α), which are released during infection, trauma, and chronic inflammatory conditions. CRP levels begin to rise within 6–8 hours of an inflammatory trigger, peak at 48 hours, and decline as the inflammation resolves. Due to this rapid response, CRP is a reliable biomarker for acute and chronic inflammation (Godkar, 2022).

Clinical Significance

CRP is commonly utilized in clinical settings to detect and track the progression of inflammatory diseases, including: Cardiovascular diseases (CVD): High-sensitivity CRP (hs-CRP) serves as an early indicator of atherosclerosis, heart attacks, and strokes.

Autoimmune disorders
Conditions such as rheumatoid arthritis, lupus, and inflammatory bowel disease are associated with elevated CRP levels.

Infections
Bacterial infections, pneumonia, and sepsis cause a significant increase in CRP, distinguishing them from viral infections, which generally show lower CRP levels.

Metabolic disorders
Elevated CRP is linked to obesity, insulin resistance, and type 2 diabetes, emphasizing its role in chronic low-grade inflammation (Godkar, 2022).

CRP as a Diagnostic Tool
CRP measurement is performed through blood tests, and its levels are classified as follows (Godkar, 2022):
<1 mg/L – Low risk of inflammation or cardiovascular disease
1–3 mg/L – Moderate risk
>3 mg/L – High risk of chronic inflammation or cardiovascular disease
>10 mg/L – Suggests acute infection or severe inflammation requiring further evaluation

CRP is a key biomarker of inflammation and an important component of modern diagnostics. Its ability to identify and track inflammatory conditions makes it valuable in integrative medicine, including Ayurvedic studies on Ama and systemic inflammation.

AMA and CRP
Pathophysiological Parallels in Chronic Inflammation
Formation
Ama, according to Ayurvedic principles, is produced due to impaired digestion (Mandagni), leading to the accumulation of metabolic waste that the body cannot eliminate efficiently. This results in a toxic buildup that contributes to systemic inflammation. Similarly, C-reactive protein (CRP) is an acute-phase reactant produced by the liver in response to inflammatory cytokines like IL-6 and TNF-α, which are released during tissue damage. While Ama forms due to digestive dysfunction, CRP is a consequence of inflammatory responses.

Impact
Both Ama and CRP play significant roles in chronic inflammation and contribute to systemic issues such as oxidative stress, immune dysregulation, and metabolic disturbances. Ama, when accumulated in the body, exacerbates chronic diseases by perpetuating inflammation and toxicity. CRP, as a biomarker of inflammation, can signal the presence of chronic inflammatory conditions such as cardiovascular diseases, autoimmune disorders, and metabolic disorders. Elevated levels of CRP correlate with the degree of inflammation, making it a useful tool for monitoring chronic inflammation linked to Ama-like processes in the body.

Site of Action
Ama typically accumulates in weakened tissues, known as Khavaigunya, which leads to localized disease manifestation. In the same manner, CRP localizes at sites of inflammation, where it can further amplify tissue injury. In both cases, the inflammatory process is aggravated, leading to the progression of chronic diseases.

Mechanistic Insights
Molecular Mechanisms
Ama induces systemic inflammation through the activation of pro-inflammatory cytokines, oxidative stress, and mitochondrial dysfunction, mirroring the inflammatory pathways that elevate CRP levels. CRP, produced in response to these inflammatory signals, activates macrophages, impairs endothelial function, and amplifies immune

responses, contributing to chronic disease progression. Thus, both Ama and CRP are involved in a feedback loop that exacerbates inflammation and promotes disease.

Role in Chronic Diseases

Ama's role in conditions such as rheumatoid arthritis, irritable bowel syndrome, and cardiovascular diseases parallels the role of CRP in diseases such as cardiovascular diseases, diabetes, and autoimmune disorders. CRP levels are often elevated in these chronic conditions, making it a reliable marker to monitor the severity of inflammation, which could also reflect the presence of Ama in the body.

Ayurvedic References and CRP as a Tool for Investigating AMA

The Charaka Samhita identifies Ama as a primary cause of various diseases, arising from impaired digestion and metabolic imbalance (Ch. Vi. 2/8). This concept helps explain the widespread impact of accumulated toxins on the body. CRP, being a marker of inflammation, can be used as a modern diagnostic tool to investigate the systemic effects of Ama. Sushruta Samhita emphasizes the obstruction of Srotas (bodily channels) by Ama, leading to inflammation and disease manifestation (Su. Su. 21/25). Similarly, CRP levels can reflect the extent of inflammation caused by such obstructions in modern clinical settings, offering insight into the presence and severity of Ama.

Ashtanga Hridaya links Ama to doshic imbalances and highlights the role of digestive fire (Agni) in maintaining homeostasis (A.H. Su. 13/25). Monitoring CRP levels can act as an indirect measure of the body's inflammatory state, which is often linked to improper digestion and metabolic dysfunction—central to the pathophysiology of Ama. Madhava Nidana Describes Ama as a key factor in the pathogenesis of diseases, particularly in chronic conditions like Amavata (rheumatoid arthritis) (M.N. 25/1-3). The text explains how Ama interacts with Vata, leading to joint inflammation and systemic disturbances. CRP, as a marker of inflammation, can be used in modern diagnostics to assess the severity of Ama-induced inflammatory conditions.

Bhavaprakasha States that Ama obstructs microchannels (Srotorodha), leading to impaired circulation and accumulation of toxins, which aggravate inflammatory processes (Bh. Ni. 5/48-50). Elevated CRP levels can serve as a clinical indicator of inflammatory blockages similar to Ama-induced Srotorodha, helping to assess disease progression. Sharangadhara Samhita Describes Ama as a product of weak digestive fire (Mandagni) and links it to metabolic disorders, sluggish circulation, and the formation of inflammatory deposits (Sha. Pu. 5/52). CRP can be monitored to investigate metabolic inflammation, particularly in conditions like diabetes, obesity, and cardiovascular diseases, where Ama is a contributing factor.

Kashyapa Samhita Mentions the role of Ama in pediatric disorders (Kaumarabhritya) and its impact on immunity (K.S. Kh. 3/16). Conditions like recurrent infections and autoimmune responses in children are linked to Ama accumulation. CRP can serve as an objective marker to investigate immune dysfunction associated with Ama in both pediatric and adult populations.

Rasaratna Samuchchaya Explains that Ama leads to the accumulation of free radicals and oxidative stress, causing premature aging and chronic diseases (R.R.S. 8/9-10). In modern medicine, CRP is used to assess oxidative stress-related inflammation, providing a biochemical correlate to the Ayurvedic understanding of Ama's impact on aging and disease. Bhela Samhita The text explains the connection between Ama and chronic systemic disorders, highlighting that if left untreated, it can develop into "Dhatugata Ama," affecting deeper tissues and contributing to conditions like autoimmune diseases (B.S. Ch. 13/6). CRP serves as a key indicator for tracking the advancement of disease and the severity of systemic inflammation.

Vagbhatta's Ashtanga Sangraha Highlights that chronic Ama accumulation weakens Ojas (immunity), making the body susceptible to infections and inflammatory diseases (A.S. Su. 12/20). In modern medicine, elevated CRP is a well-established marker of immune dysfunction and chronic inflammatory states, reinforcing the Ayurvedic understanding of Ama's role in immunity. Harita Samhita Describes how Ama weakens digestion (Jatharagni) and

cellular metabolism (Dhatvagni), leading to chronic inflammatory conditions (Ha. Sa. 3/12-14). This is similar to how elevated CRP indicates persistent low-grade inflammation in conditions like metabolic syndrome and autoimmune disorders. Monitoring CRP levels can provide insights into the systemic effects of Ama-induced metabolic dysfunction. Yogaratnakara Mentions that Ama obstructs Pranavaha Srotas (respiratory channels), contributing to conditions like bronchitis and asthma (Yo. Ra. 2/8-10). Modern studies associate elevated CRP with chronic respiratory diseases, including COPD and asthma. CRP can serve as a useful biomarker to assess Ama-related inflammatory responses in respiratory disorders.

Therapeutic Insights

Ayurvedic Approaches

Ayurveda recommends interventions like Langhana (fasting), Dipana (digestive stimulants), Pachana (detoxification), Srotoshodhana (channel cleansing), and herbal formulations (e.g., Triphala, Guduchi, Haritaki) to mitigate the toxic effects of Ama. Dietary changes and lifestyle interventions (such as Yoga and Pranayama) help balance systemic inflammation, which is a key aspect of both Ama and CRP-mediated conditions. These approaches can be integrated with modern medical treatments to lower CRP levels, helping to investigate and manage Ama-related inflammation.

Modern Medical Interventions

Antioxidants (vitamin C, E), anti-inflammatory drugs (NSAIDs, corticosteroids), and immunomodulatory therapies are often used to reduce CRP levels. Integrating these therapies with Ayurvedic practices could offer a holistic approach to reducing systemic inflammation caused by Ama.

CONCLUSION

The review of Ama in Ayurvedic medicine and its connection to oxidative stress, free radicals, and C-Reactive Protein (CRP) provides an integrative framework for understanding systemic inflammation. Ama, as a metabolic byproduct of impaired digestion and weakened Agni, parallels the biochemical process of oxidative stress and free radical generation in modern medicine. The accumulated Ama, through its effects on the body's microchannels (Srotas), promotes chronic inflammation, which is also reflected in elevated CRP levels. The link between Ama and CRP is significant in the context of chronic diseases such as cardiovascular disorders, autoimmune conditions, and metabolic disorders, where both Ayurvedic and biomedical approaches can offer complementary insights. Elevated CRP levels, recognized as a reliable biomarker of inflammation, offer a modern diagnostic tool that aligns with the traditional Ayurvedic concept of Ama as a root cause of disease. This integration highlights the relevance of Ayurvedic principles in understanding the systemic impacts of inflammation, especially in conditions that involve metabolic dysfunction, immune dysregulation, and chronic disease progression.

Furthermore, this review emphasizes the potential for a holistic approach to managing inflammation, drawing from both Ayurvedic treatments (such as detoxification, digestive support, and herbal remedies) and modern medical therapies (including antioxidants, anti-inflammatory drugs, and immunomodulatory treatments). The empirical validation of these interdisciplinary connections could lead to more effective therapeutic strategies for managing inflammation-related disorders. Future research is necessary to explore these links further through clinical studies that incorporate both Ayurvedic and biomedical diagnostic tools. Such studies could enhance our understanding of systemic inflammation and its management, bridging traditional and modern medical practices for comprehensive healthcare solutions.

ABSTRACT

The circular economy offers a transformative model for enhancing sustainability within the agricultural sector by promoting resource efficiency and waste reduction. This review paper examines how circular economy principles can address current challenges in traditional agriculture, such as resource depletion and excessive waste. It defines and explains circular economy principle., emphasizing its relevance and potential to reshape agricultural practices. The concept of circular economy in agriculture is explored through an overview of waste minimization strategies, recycling, and closed-loop systems, with specific focus on recycling organic waste, water reuse, and nutrient cycling for better soil health. The paper includes practical approaches for reducing waste, involving strategies for managing crop and food waste through composting and anaerobic digestion, innovations in converting residues to valuable products, and the use of biodegradable packaging. It further discusses enhancing sustainability through integrated agroecological practices, adoption of renewable energy solutions like biogas, and efficient resource conservation methods such as water-saving irrigation. The economic and environmental benefits are highlighted, noting cost savings for farmers, new economic opportunities, reduced greenhouse gas emissions, and improved biodiversity. The review concludes by emphasizing the importance of adopting

circular economy strategies to promote resilient and sustainable agricultural systems, thereby contributing to broader environmental and economic sustainability. This paper seeks to provide insights into the pathways through which agriculture can transition from traditional linear models to circular, regenerative practices that strengthen food security and ecological balance.

Keywords: Circular economy, Sustainable agriculture, Waste reduction, Nutrient cycling, Agroecological practices.

INTRODUCTION

Circular economy, a divergence from the traditional linear model is a global approach to production, consumption and regeneration for sustainability. It aims at protecting the environment by reducing greenhouse emissions contributing to ecological restoration, creating efficient, long lasting and sustainable products, reducing raw material dependence. Thus, the principles of circular economy are referred to as 3R's - reduce, reuse and recycle. Unlike the linear model which focussed on take-make-consume- throw away the circular model is a sustainable approach to economic development for a resilient future. The circular economy's role in promoting sustainability is by tackling several key areas such as conservation of resources by removing waste and maximizing the duration of products and protecting ecosystems and biodiversity; reduction of waste and preventing pollution by designing products for reuse, repair and recycling thus decreasing the waste sent to landfills, reducing air, water and soil pollution; in climate change mitigation by helping the reduction of carbon emissions, using renewable sources to power recycling; stimulating innovations and create jobs in industries like recycling, repair, and remanufacturing thus contributing to the economic growth (Vargas-Merino *et al,* 2022). Circular economy proposes a promising approach to address the challenges in traditional agriculture. Climate change, waste generation and resource depletion are the major challenges in traditional agriculture. The overuse of chemical fertilizers, pesticides, inefficient irrigation techniques and poor farming practices lead to soil erosion, water scarcity, nutrient depletion, and loss of fertility which affects the crop yield, polluting water bodies and harms biodiversity by depleting the resources. Inefficient harvesting, storage, and distribution practices result in significant food loss and waste. Some of the climate changes such as drought, flood, heat waves disrupt crop production. Thus by sustainable resource management, waste reduction and nutrient recovery and climate change mitigation circular economy could transform agriculture into a sustainable and resilient system that benefits both people and the planet (Knäble *et al.,* 2022). Sustainable resource management includes agro forestry and organic farming methods where planting trees and shrubs in the farming systems helps in improving soil health, water retention, and crop rotation and composting respectively. Waste reduction involves composting where waste products are converted into nutrient rich compost to improve soil fertility, recycling of nutrients from wastewater and animal waste for resource efficiency and production of biogas by anaerobic digestion to obtain nutrient rich digestate for fertilizer. Agroforestry, usage of solar, wind, biomass energy, drought tolerant plants and efficient irrigation systems are few methods for climate change mitigation (Fahad *et al*, 2022).

Core elements of circular agricultural systems

A viable approach to waste management and the creation of renewable energy, biogas production is essential to the circular economy. Biogas can be used for heating, cooking, and industrial processes, reducing reliance on fossil fuels. Animal manure, agricultural wastes, and food waste are examples of organic waste products that biogas plants use as feedstock. By keeping waste out of landfills, this lowers methane emissions and keeps the environment clean. Industries can also contribute to biogas production by processing their organic by products, creating a closed-loop system for waste management. Biogas, a combination of carbon dioxide and methane, is produced when organic matter is broken down by the anaerobic digestion process. Biogas can be burned in engines to generate electricity, providing a clean and renewable energy source. Biomethane, a form of biogas, is used as vehicle fuel, reducing greenhouse gas emissions from transportation. Digestate, the byproduct of producing biogas, is an organic fertilizer that is high in nutrients (Mignogna *et al,* 2023). This digestate can be applied to agricultural fields, improving fertility

of the soil and reducing the dependence on synthetic fertilizers. Composting on the other hand plays a pivotal role in averting organic waste from landfills and transforming it into a useful resource for sustainable agriculture. By keeping organic waste out of landfills, such as food scraps, yard debris, and agricultural leftovers, it lowers the amount of waste that needs to be disposed of. By doing this composting reduces the greenhouse emissions and prevents the release of methane. Compost enriches the soil by essential nutrients like nitrogen, phosphorus, and potassium and also improves soil structure, water retention, and aeration, creating a healthier background for plant growth and substitute the use of chemical fertilizers. Water reuse and efficient irrigation methods are crucial components of a circular economy, particularly in regions facing water scarcity. Wastewater, after treatment processes, can be safely reused for various purposes, such as to irrigate crops, reducing the demand for freshwater resources, as coolant in industries etc. Water from households, can be collected and treated for reuse in toilets or for outdoor irrigation. Some of the efficient irrigation methods such as drip irrigation, sprinkler irrigation, surface irrigation is used for a beneficial circular economy. Thus, we can reduce the demand for freshwater resources and protect water bodies, reduce pollution from wastewater discharge and minimize the environmental impact of agriculture, improve crop yields and quality, enhance food security and cost saving for farmers (Fernandes & Cunha Marques, 2023). Nutrient cycling and soil health management are fundamental to a circular economy, ensuring sustainable agriculture and minimizing environmental impact. Recovering nutrients from organic waste, wastewater, and crop residues minimize nutrient losses whereas nutrient recycling returns the nutrients to the soil as compost, manure and biochar. Soil organic matter is managed by planting crops to protect soil, prevent erosion, and add organic matter, using organic materials to cover the soil, reducing evaporation, suppressing weeds, and adding organic matter, by minimizing soil disturbance to preserve soil structure and microbial activity. Nutrient recycling and soil health management helps in improving soil fertility, enhancing water retention, helps in carbon storage and reduces the dependence on synthetic fertilizers (Cucina, M. 2023).

Reducing waste through circular economy approaches

Organic waste management

An essential component of a circular economy is the treatment of organic waste. It entails the sustainable handling of organic waste, such as leftover food, yard waste, and agricultural residues. By effectively managing organic waste, we can reduce environmental impact, conserve resources, and generate valuable products. Some of key strategies for organic waste treatment in a circular economy are composting such as home and industrial composting, anaerobic digestion including production of biogas and digestate production. Home composting is a simple process of breaking down organic matter into nutrient-rich compost using a compost bin or pile while industrial composting is large-scale composting which processes significant amounts of organic waste, often using specialized equipment and techniques Certain types of food waste, like fruit and vegetable scraps, can be sort out into animal feed. Biofuels like ethanol and biodiesel can be produced from food waste and crop residues.
(Masullo, A. 2017).

Post-harvest loss prevention

Post-harvest loss is a critical challenge in agriculture, affecting both economic stability and food security. Integrating circular economy approaches helps mitigate this issue by applying innovative technological and management solutions to minimize food loss during the harvesting, storage, and transport phases (Sonka et al, 2023; Hamam et al, 2021). In developing countries, high post-harvest loss levels persist, harming smallholder farmers' well-being, food security, and the environment. Despite the availability of effective, user-friendly technologies that require basic skills, post-harvest loss remains a challenge. Analyses of pilot projects consistently show that these technologies can yield substantial economic benefits. Technologies such as precision agriculture tools, smart storage systems, and real-time monitoring sensors have transformed the landscape of post-harvest management. Smart farming promotes advanced technology to enable remote crop monitoring and optimize agricultural tasks like harvesting. The integration of sensors and automation has enhanced workforce efficiency and transformed traditional practices through IoT (Internet of Things), revolutionizing modern agriculture and shifting conventional methods to automated systems for better productivity (Quy et al, 2022). Precision agriculture utilizes data analytics and IoT devices to optimize harvest timing and reduce spoilage risks. For example, automated machinery equipped with AI algorithms ensures crops are

harvested at their peak quality, thus minimizing premature or late harvesting that contributes to loss (Dhanaraju *et al,* 2022). Effective storage systems play a crucial role in post-harvest loss prevention. Drying and cooling are common storage methods for horticultural products (Hasan *et al,* 2019). While drying affects taste, color, and texture, cooling preserves freshness without deterioration. Post-harvest, fruits and vegetables quickly begin to rot, forcing farmers to sell at lower prices due to limited personal storage options. Conventional cold-storage systems require substantial energy, making them less feasible for small farms, especially in developing countries. Rural communities face higher food losses and susceptibility to climate disruptions resulting from inadequate cold storage infrastructure. Centralized storage facilities further raise transportation costs for producers. Modern storage facilities equipped with temperature and humidity control mechanisms can significantly extend the shelf life of perishable products. Innovations like solar-powered cold storage units are particularly beneficial in regions lacking consistent electricity access. In addition, hermetic storage bags designed to inhibit fungal growth and pest infestation have shown promise in reducing grain losses during extended storage periods (Waseem *et al,* 2023). Digital technologies are increasingly vital in the food supply chain, especially for grain post-harvest systems. Digitalization enhances food production, quality, safety, and environmental impact, driving efficiency. It also adds value to rural activities by improving operations, flow management, and governance, making it an essential tool for modern agribusiness (Klingenberg *et al,* 2024). Management strategies also emphasize the importance of training farmers in post-harvest handling and efficient transport practices. By adopting simple measures such as improved packaging, cushioning, and rapid transportation, damage during transit can be minimized. Digital platforms that connect farmers directly to markets help streamline the supply chain, reduce delays, and prevent loss (Schmidt *et al,* 2024).

Reduction of Packaging Waste

Reusable and biodegradable packaging materials present viable substitutes for conventional plastic packaging, cutting down on waste and protecting the environment. While paper is frequently used for packaging and can be recycled or composted, plant-based polymers made from renewable resources like corn, sugarcane, or potato starch can decompose naturally. Seaweed and mushroom mycelium are special materials that can be shaped into a variety of sizes and forms. They are biodegradable and sustainable and can be used to make trays and packing films (Zhu *et al.,* 2022).

Enhancing sustainability in agricultural practices

Sustainable farming techniques

The integration of agroecological principles with circular economy strategies are essential to enhancing sustainability in agricultural systems. Agroecology emphasizes biodiversity, ecological balance, and resource conservation, aligning seamlessly with circular economy's fundamental waste reduction principles and regeneration. Combining these practices can help establish closed-loop agricultural systems that enhance productivity while maintaining ecological integrity (Hamam *et al,* 2021). A prominent example is the practice of crop rotation and intercropping to enhance soil health and minimize synthetic fertilizer dependency. These practices ensure a natural cycle of nutrient replenishment, effectively reducing waste and input costs. Integrating livestock and crop production allows farms to recycle organic waste such as manure, which can be converted into natural fertilizers or biogas, demonstrating a closed-cycle system (Peterson *et al,* 2020).

Energy solutions

Renewable energy adoption is a fundamental aspect of circular economy in agriculture. The use of solar panels and biogas generation from agricultural waste not only lowers the carbon footprint but also ensures energy resilience for farmers. Solar power systems are increasingly being used for irrigation, storage, and processing activities. The utilization of solar pumps for irrigation, helps farmers achieve water efficiency and reduces dependency on non-renewable energy sources (Bathaei *et al,* 2023). Biogas production from organic waste, including crop residues and animal manure, provides an effective energy solution while managing waste disposal challenges. This process involves anaerobic digestion, where microbes break down organic material to produce biogas, suitable for generating electricity or serving as cooking fuel. The byproduct, digestate, serves as high-quality organic fertilizer, enhancing soil health and closing the nutrient cycle (Heiker *et al* 2021). Energy-efficient technologies also contribute significantly

to sustainability. For example, the use of LED lighting and solar dryers in greenhouse farming reduces energy consumption and improves the quality of produce. Such practices highlight the potential of a circular economy to make agriculture more environmentally and economically viable (Battocchio *et al,* 2021).

Resource conservation

Efficient water management and sustainable land use are crucial components of a circular economy. Water scarcity is a critical issue in agriculture, and the circular economy offers innovative solutions to overcome it. Water-efficient irrigation techniques, such as drip and sprinkler systems, can significantly reduce water usage compared to traditional methods. Drip irrigation, which delivers water directly to the root zone, minimizes evaporation and runoff, thereby conserving water resources (Guo *et al,* 2024). Rainwater harvesting systems capture and store rainwater for irrigation and other agricultural uses, providing an alternative water source during dry periods. This practice reduces dependency on groundwater and enhances the resilience of farming systems (Waqas *et al*, 2022; Rodrigues *et al,* 2023). Sustainable land use involves practices that prevent degradation and promote the long-term productivity of soil. Techniques like no-till farming and cover cropping improve soil structure and organic matter, preventing erosion and nutrient depletion. Agroforestry, where trees and shrubs are integrated with crops and livestock, supports biodiversity and contributes to carbon sequestration, reinforcing the environmental benefits of circular economy (Bhattacharya *et al.,* 2015; Bunclark *et al.,* 2018).

Economic and environmental benefits

Economic advantages for farmers and communities

Circular economy creates new economic opportunities through the development of bio-based products. Processing agricultural by-products into value-added goods, such as biofuels, bioplastics, and natural fertilizers, diversifies income streams and strengthens rural economies. For example, farmers involved in biogas production can generate revenue by selling excess energy and organic fertilizer (Otero *et al,* 2023). Cost savings achieved through waste reduction and resource reuse contribute to better financial outcomes for farmers. For example, by using crop residues as animal feed or converting them into compost, the need for external resources is minimized, resulting in lower operational costs (Rodino *et al,* 2023). Circular economy practices can also empower communities by promoting local innovation and knowledge-sharing networks. Training programs and cooperative models enable farmers to collectively invest in technologies that enhance productivity and sustainability. This communal approach not only spreads the initial cost burden but also encourages shared success (Otero *et al,* 2023).

Environmental impact

A circular economy in agriculture offers substantial environmental benefits, particularly in lowering greenhouse gas emissions. Recycling organic waste through methods like composting or anaerobic digestion helps reduce methane emissions associated with the decomposition of agricultural residues. Reduced reliance on synthetic fertilizers and pesticides helps lower the carbon footprint of farming operations (Toplicean *et al,* 2024). Improved soil health and biodiversity are other notable environmental outcomes of a circular economy. Practices such as organic fertilization, crop rotation, and agroforestry promote a more balanced ecosystem, enhancing natural pest control and pollination processes. These practices also contribute to soil carbon sequestration, which is essential for mitigating climate change (Fahad *et al*, 2022; Tindwa *et al,* 2024). The adoption of sustainable farming techniques under circular economy principles enhances ecosystem services, such as water filtration and habitat preservation. These positive impacts create a cycle where healthier ecosystem support more robust agricultural practices, further integrating sustainability into food production (Jayaraman *et al,* 2021; Rodino *et al,* 2023).

CONCLUSION

The integration of circular economy principles into agriculture represents a transformative approach to promoting sustainability by shifting from linear consumption patterns to regenerative, closed-loop systems. Emphasizing waste minimization, resource efficiency, and innovative recycling practices, circular economy in agriculture mitigates

significant challenges such as resource depletion and excessive waste. Implementing circular economy strategies, such as composting, biogas production, water reuse, and nutrient cycling, promotes environmental resilience and enhances soil health. Technological solutions aimed at reducing post-harvest loss and sustainable packaging practices further highlight the potential for reducing waste across the supply chain. By adopting agroecological methods and renewable energy solutions, agricultural practices can be redefined to increase productivity while conserving resources and protecting biodiversity. The economic benefits include cost savings, new revenue streams through bio-based products, and community empowerment. Collectively, adopting circular economy practices can lead to reduced greenhouse gas emissions, sustainable land use, and a revitalized agricultural sector poised for long-term environmental and economic stability.

ACKNOWLEDGMENT

The authors would like to express their sincere gratitude to the organizers of the International Conference on "Circular Economy and Artificial Intelligence for a Sustainable Future," held on December 2nd and 3rd, 2024. The conference was jointly organized by JAIN (Deemed-to-be University), in collaboration with Cape Peninsula University of Technology, South Africa, and Ulster University, U.K.

ABSTRACT

This manuscript reports the confirmed sighting of the Clouded Ground Gecko (*Geckoella nebulosus*) also known as *Cyrtodactylus nebulosus* from Chikhaldara, located in Amravati District, Maharashtra. Notably, *Geckoella nebulosus* has not been previously documented in the checklist of the Melghat Tiger Reserve, making this observation a significant contribution to the biodiversity records of the region. The species, considered rare in this area, underscores the need for further ecological surveys and documentation to better understand its distribution and conservation status within the Melghat landscape.

Keywords: *Geckoella nebulosus,* Chikhaldara, Melghat Tiger Reserve

INTRODUCTION

Geckoella nebulosus, commonly known as Clouded Ground Gecko (Das I. 1997), is a species of gecko found in India. It was originally described by Beddome (1870) as *Gymnodactylus nebulosus* from Golconda Hills, Andhra Pradesh. The presence of this gecko species was also documented by Agrawal (2007) in Seoni District, Madhya Pradesh, further substantiating its occurrence near Maharashtra. Additionally, it was recently reported in Jharkhand (erstwhile Bihar) by Murthy and Dasgupta (2010). This report documents the observation of Clouded Ground Gecko *Geckoella nebulosus* from Chikhaldara, District Amravati, Maharashtra. On 08 July 2012 at 07.30 PM, a specimen of *Geckoella nebulosus* was observed at the base of a Mango Tree *Mangifera indica* in the coffee plantations of Chikhaldara, district

Amravati. The specimen measured approximately 4.5 cm in length. The animal was photographed using a Kodak Digital Compact camera and was not collected.

Observation area

Chikhaldara is the only hill station in the Vidarbha region of Maharashtra, located in close proximity to the renowned Melghat Tiger Reserve, one of India's major tiger reserves. The Clouded Ground Gecko (*Geckoella nebulosus*), a species of considerable ecological interest, has not been previously documented in the faunal checklist of Melghat Tiger Reserve. Chikhaldara town is situated on a plateau at an altitude of 1,118 meters above sea level (MSL), with its highest point, Vairatdevi, reaching 1,188 MSL. The forest type in Chikhaldara taluka is predominantly dry deciduous; however, the plateau region exhibits a diverse range of vegetation. The eastern and western sections of the plateau are characterized by extensive grasslands interspersed with patches of deciduous trees, providing a unique habitat mosaic. Notably, the northern part of the plateau,where this observation was made, Maharashtra's oldest coffee plantations, which are dominated by trees like Nilgiri(*Eucalyptus sp.)*, Silver oak (*Grevillea* sp.), Mango (*Mangifera indica)*, Kadhipatta (*Murraya koenigii)* and Kumbhi (*Careya arborea), etc.*further adding to the ecological and historical significance of the region.

DISCUSSION

This species has been previously documented in various locations across Peninsular India, including George Hill Godavari, Russelkonda, and Nelamba in the Madras Presidency (Smith 1935 and Tikader& Sharma 1992). Additional reports have been made from Peninsular India (Annandale 1913), Barbara Reserve Forest in Puri District, Orissa (Dutta 1997), and regions of India south of 20°, as well as Ceylon (Boulenger 1890). In Maharashtra, the Clouded Ground Gecko (*Geckoella nebulosus*) has previously been documented in Wardha District (India Biodiversity Portal, http://indiabiodiversity.org/observation/show/318182, accessed on 18 January 2025). It has also been photographed in MTR by AkshayKhandekar in 2015(https://www.indianreptiles.org/cyrtodactylus-nebulosus accessed on 18 January 2025) ; but as MTR is around 2765sq kms (https://en.wikipedia.org/wiki/Melghataccessed on 18 January 2025) and the study are is also an entirely different vegetation, this observation makes significance in itself. This highlights the rarity of its sighting in Chikhaldara and underscores the significance of the current observation as an important addition to the known distribution of this species within the state.

ACKNOWLEDGEMENT

The author expresses gratitude to Catholic Mission Chikhaldara for granting permission and providing cooperation during visits to coffee plantations. The author also extends appreciation to Mr. Anton Taide, a local resident, for his assistance in conducting searches and for his hospitality.

ABSTRACT

The textile industry produces clothing, fabric and textile products for a variety of uses and is important to the global economy. But their production often produces a lot of waste water, which can cause dyes and other diseases. To study the isolation of microbes in waste materials, their application in SSF on substrates made from agricultural waste, and their effectiveness in decolorization of dye. Methods: Sample was collected by textile industry and fungi was isolated by soil sample. Isolated the bacteria that can decolorize pigments from wastewater and use agricultural waste as a substrate for solid-state fermentation, wastewater was collected. These isolates were analyzed for their ability to decolorize artificial dyes commonly used in the textile industry. Molecular and biochemical analysis methods were used to detect the isolates. Selected bacteria were inoculated into agricultural waste material and taken into appropriate care. Spectrophotometric tests were used to evaluate the effectiveness of dye decolorization by monitoring the decrease in dye concentration over time. It has been shown that bacteria can cause beautiful decolorization. Electronic fermentation technology provides an answer to the conservation of waste from the use of agricultural waste, similar to providing beautiful products for decolorization technology. Laccase is a copper-containing polyphenol oxidase that catalyzes many substrates. It is usually associated with manganese- producing peroxidases, lignin peroxidases, or both. Laccase Uses include wastewater detoxification and decolorization, pulp bleaching, removal of phenols

in alcohol, and prevention of discoloration in detergents and laundry detergents. The improvement in the structure of the laccase intermediate can also oxidize non-phenolic compounds that are not attacked under other conditions and destroy lignin in kraft pulp, thus improving the biotechnological use of laccase. Therefore, today's research is being carried out to understand the potential of laccase and to be part of the "creative fungi". Fungi grow on potato dextrose agar (PDA) plates containing markers such as guaiacol and tannic acid. Therefore, nine species of fungi have been preserved, and one type of bacteria is thought to be particularly strong in terms of development. As a result, bioremediation of textile wastewater can be achieved by isolating bacteria from the waste material and using them for a powerful fermentation kingdom using the waste material. This method contributes to the protection and maintenance of the environment by providing a low-cost and sustainable way to remove dye from commercial wastewater.

Keywords: Laccase enzyme, Decolorization, Solid-state fermentation, Spectrophotometry.

INTRODUCTION

The textile industry produces clothing, fabric and textile products for a variety of uses and is important to the global economy. But their production often produces a lot of waste water, which can cause dyes and other diseases. The pigments' complex chemical structure and resistance to degradation not only pose an environmental hazard but also represent a target for wastewater treatment processes. Microbial decolorization is one of the popular ones for its effectiveness and stability because micro-organisms have enzymatic processes to break down and metabolize many dyes, they are promising for wastewater treatment [5]. This study examines the opportunities to use agricultural waste substrate for SSF and the potential for indigenous organisms to thrive waste water. The aim of this project is to study the isolation of microbes in waste materials, their application in SSF on substrates made from agricultural waste, and their effectiveness in decolorization of dye [6]. Delignification of lignocellulosic biomass, biological bleaching of pulp and paper, decolorization of dyes in textile wastewater treatment, synthesis of pleasant compounds, and degradation of environmental pollution are just some of the many industrial uses of laccases. The environmental friendliness and sustainability of laccase production in SSF meet the demand for this enzyme in many industries [7]. Variables such as substrate composition, pH, temperature, moisture content, and incubation time are important when agricultural waste is used to accelerate dye degradation. By improving these parameters to purify as much as possible the dyeing organisms in the wastewater, the efficiency and kinetics of dye degradation can be improved. Agricultural waste can be used in bioremediation processes, including sustainable fermentation, composting, anaerobic digestion, and bio augmentation to break down dyes. Each method has certain advantages in terms of simplicity, cost effectiveness and scalability for large scale commercial wastewater treatment plants. Applications for paint degradation and the use of agricultural waste include waste water treatment plants, end-of-life organizations [8].

MATERIALS AND METHODS

Sample collection Soil containing laccase producing fungus is collected around the textile industries from Rayapur industrial area near Hubballi and different area of Dharwad region.

Isolation The soil samples was prepared by adding 1 g of soil to 9 ml of distilled water and homogenizing in a ratio of 1:10 (1 ml is homogenized with 9 ml of buffered saline and placed in a tube designated 101, 102, 103, 104, 105 Dilute 106 times and make serial dilutions in labeled test tubes, spread 100 microliters of each sample on potato dextrose agar and incubate for 24 hours at 37°C, observing the development of different species. The agar plates were incubated inverted, at appropriate temperature and humidity conditions suitable for fungal growth. The optimal

conditions might have varied depending on the type of fungi being isolated. The plates were monitored regularly for the appearance of fungal colonies. Fungal colonies typically had distinct characteristics, such as color, texture, and morphology [9]. Once fungal colonies had developed, a sterile inoculating loop was used to transfer individual colonies to fresh plates containing the same agar medium. This step helped obtain pure cultures of individual fungal species. The process of isolating and subculturing individual fungal colonies was repeated until the desired fungal species were obtained for further analysis or study.

Screening Screening of laccase after subculturing Laccase-assisted oxidation of tannins produces a reddish-brown color, indicative of laccase production by isolation. To examine laccase, 0.5 g of tannic acid was added to potato dextrose agar medium and incubated for 3-5 days [10].

Identification (Microscopy)

Lactophenol staining The cotton blue solution is dropped on the fungal material on the slide, and then the other slide is placed on top, and it is kept in place by gently pressing on it, until the entire area is covered. Carefully cleaned a microscope slide with a clean cloth or a facial tissue which will remove the dust and dirt. For the transferring procedure, I took the inoculating loop and put a dab of the culture on the center of the slide. Expose the slide by sprinkling the fungal material to create a thin layer with a loop. Slide drying should be done without hurry. The process duration is variable, ranging from few minutes to an hour, depending on the moisture level. Once the specimen is dried, a few drops of lactophenol are placed on it and spread across using a brush. A coverslip is cautiously laid on the liquid that is on the slide so as not to form bubbles of air. On top of the coverslip, the lactophenol cotton blue solution, then, is distributed evenly by a gentle pressure. Excess solution is removed by a blunt forceps from the edges. Leave the slide for a couple of minutes to permit the dye-lactophenol cotton blue solution to penetrate the fungal structure and stain it. Then the smearing is performed using different staining methods, and the result is viewed through a microscope with magnifications from low to high. I search for fungal structures including spores, hyphae, conidia, or any fruiting bodies. These structures can be stained and are recognize based on the shape and size of their feature [11]**.**

Microbial characterization The pure fungul isolates were examined under a light microscope for their identification and characterization through studying the morphological characterization of fungul growth on potato dextrose agar media. Fungi that degrade or decolorize dye molecules are interesting since believed that they can degrade or decolorize a wide variety of synthetic dyes that are common pollutants in industrial waste water. Up on being cultivated on Potato Dextrose Agar (PDA) or similar substrate, certain fungi could possibly exhibit distinct morphological features. Here is a brief description of the morphological characteristics which you may observe them [12]. According to fungus type and dye being decolorized, the color of colony will vary. It could be white, cream, pink, or even coloured if the fungus can synthesize its own pigments. The colony surface material can be felt as it varies from velvety to powdery or even slimey due to different fungal species. It may also be smaller or larger if the fungus grows slower or faster. The outline of colony can be smooth, uneven, or lobed. The nature of elevation is quite variable from flat to high or umbonate. Meantime some dye-decolorizing fungi may produce great numbers of conidia (asexual spores) on the surface of the colony. Conidia may be formed in a variety of shapes and structures in different species. Some dye decolorizing fungi can create extracellular pigments in their color-degrading processes. In addition, these microorganisms may make the colony's hue more visible. Under a microscope, dye-decolorizing fungi may display unique morphological features, including septation patterns, branching patterns and the presence of ligninolytic enzymes as specialized structures involved in dye metabolism. In some specific conditions, you may observe a ring of decolorization in the agar medium surrounding the fungal colony, which would signify the ability of the fungus to break down or decolorize the dye in the agar medium [13]. Certain fungi would give off peculiar odours during their growth, and they may vary from the smell of mould to the ground.

The morphological features of the dye-decolorizing microorganisms might really vary between different species and the environment. Notwithstanding, molecular method may be required to detect fungi accurately, particularly if they belong to taxonomically unclear or recently found species.

Guaiacol Assay Method for Laccase Assay.

Guaiacol is one of the best substrates that can be used as a laccase test. The procession of the deep brown color from guaiacol mediated by laccase bringing about the measurement at 450 nm can be interpreted as laccase activity. The subtract reacted with guaiacol (2Mm) in10MmpH 5.0sodiumacetate buffer. Three milliliters acetate buffer, one milliliter guaiacol, one milliliter enzyme source and one milliliter distilled water are the same amount as the enzyme blank. In the first reaction, 0.15 ml of 3-phenylpropionicacid was added to a mixture containing 0.25 mg of enzyme, 0.01 ml of 0.1 M phosphate buffer, and 0.2 ml of water. The mixture was incubated at 30^0 C for 15 minutes, and aUV spectrophot One IU is the amount of the enzyme that is consumed and used for the oxidation of 1 micromole of guaiacol per minute. The extinction coefficient of guaiacol(12,100 M-1 cm-1) at 450 nm is used to compute the laccase activity in U/ml using the following formula: The extinction coefficient of guaiacol (12,100 M-1 cm-1) at 450 nm is used to compute the laccase activity in U/ml using the following formula

E.A=(A* V)/ (t*e*v),

Solid-state fermentation using agricultural waste and production of enzyme.

The experiment will be carried out using the agricultural waste including bran from rice and wheat and dried leaves from sugar cane, which are collected from the densely agricultural regions. A diverse amount of agro-wastes were collected from the Hubballi and Dharwad districts and then dried at 60°C. After drying and sieving through a sieve (HIC-Sieve), these waste materials are ground in a mixer grinder (Maharaja Mx-116A) and stored dry until use. Each flask had two grams of agrowastes substrate together with 100ml of wet materials that were, later on, autoclaved. Autoclaving was done after which the flasks cooled before being infused with the isolate and incubated for a day or two. The formed of the cultures that were grown in the media by its enzymatic activity express laccase. Fungal Laccase activity has been measured using continuous sampling. The obtained cultivated sample was put through centrifugation at 10,000 rpm, 4°C for 10 minutes. Enzyme supernatant was used to obtain the crude enzymes and the pallet was recorded.

Evaluation of Dye Degradation using Laccase Enzyme

The samples were placed in diverse concentrations of azo dyes, and they were cultured for five days at room temperature. The visual inspection and the method that was mentioned earlier were used for the azodye degradation assessment. The data collection, however, will include a suitable control. By the toxin type that you identified, prepared a liquid culture media which is suitable for the growth of fungi. Medium used for such purposes includes nutrient broth and malt extract broth. A drop of the isolated fungus is added into the liquid culture medium by spotting. Fungi is placed in a condition that is most appropriate for the fungus's growth. The fungus spread after mixing the azo dye which is removed with the culture medium at the right concentration. Keep in mind that you should have some media that was not exposed to the dye as control sample. Adequate nutrients, and pH, maintain the culture and the tracking of the decolorization process overtime. For the assessment of dye degradation apply a variety of analytical methods or regularly check absorbance measurements. Carried out the dye decolorization assay by the isolated fungus and the controls and then statistic analysis to compare the results. This step will help establish the isolate's ability to decolorize dyes. In addition, it will provide a basis for comparison against the control group [14].

RESULT

Isolation of fungi.

To isolate Laccase after subculturing Laccase-assisted oxidation of tannins produces a reddish- brown color, indicative of laccase production by isolation. To examine laccase, 0.5 g of tannic acid was added to potato dextrose agar medium and incubated for 3-5 days.

Guaiacol Assay Method for Laccase Assay .

Guaiacol assay is used to check the enzyme activity using uv spectroscope. The procession of the deep brown color from guaiacol mediated by laccase bringing about the measurement at 450 nm can be interpreted as laccase activity.

Solid State of Fermentation using Agricultural Waste and Production of Enzyme

Solid state fermentation is carried using agricultural waste like wheat bran and rice bran which are taken in 6 petri plates set up. It is 8 days process from day one to 8th day they are incubated in incubators from fourth day they are reday for the use and they are shown in the figurers.

Evaluation of Dye Degradation using Laccase Enzyme

For the assessment of dye degradation, various analytical methods or regular absorbance measurements should be employed. The dye decolorization assay was conducted using the isolated fungus and appropriate controls. The gradual decrease in dye concentration was observed using UV spectroscopy.

DISCUSSION

Textile effluent is one of the most important problems that the environment has to deal with due to the high concentration of dyes that are often poisonous and persistent. The aim of this study is to isolate microbes from the textile industrial effluent and their use in solids-state fermentation (SSF) for dye decolorization by agricultural waste as the substrate. The process includes the screening of bacteria that can degrade the dyes, optimising the SSF conditions, and determining the productiveness of the dye degradation. The agricultural waste is abundant and cheap, so it is always used for SSF which allows to remediate the environment and recycle waste at the same time.34
The textile industry is one of the world's principal sectors, and wastewater release from it is a serious environmental problem. Textile outflows may comprise of a number of pollutants including dyes which are often non-degradable and have high probability to affect aquatic environment. Conventional discharge treatment with methods of chemical and physical engineering usually are costly and secondary pollutants are discharged. Consequently, an increasing trend is being observed to identification of environmentally harmless and green dye separation techniques which may include bacterial degradation[35].

This part focuses on the steps taken to separate micro organisms from textile wastewater. Microbial communities responsible for degrading dyes are isolated through some of the methods, including serial dilution, the spread plate method, and enrichment cultures. pH, temperature, and nutrition availibility are some of the parameters that are considered when microbial isolation is going on. Furthermore, genomic tools including PCR and metagenomics furnish the microbial community diversity and the presence of dye- degrading genes data. After isolation, the microbes are tested for their ability to colour the metabolites. The phenotype screening includes both qualitative and quantitative methods to measure the dye decolorization efficiency. The microorganisms with good dye-degrading potential are isolated for further study. Substrate selectivity, enzyme synthesis, and metabolic pathways are among the factors that affect the catalytic degradation of dye compounds.

The use of solid-state fermentation (SSF) is a great idea for turning wastes from agriculture into those of industrial utilization. This part of the work focuses on the pretreatment of agri-waste as a feedstock for SSF in dye depigmentation. Common by- products in agriculture like rice husk, wheat bran, sugarcane bagasse are high in the carbon and nutrients content, and they can give microbes all the necessary optimum growth environment for their growth and creation of enzymes. Having in mind that of optimizing SSF parameters like humidity, pH value, temperature, and inoculum size of the key importance for achieving better dye decolorization efficiency [36].

Different analytic approaches were applied to estimate the efficiency of dye decolorization in SSF systems. Spectrophotometric methods, although UV-Vis spectroscopy is the most common, are extensively used to measure dye degradation by measuring absorbance at particular wavelengths. High-performance liquid chromatography (HPLC) and gas chromatography-mass spectrometry (GC-MS) are capable of obtaining very accurate information about the bi-products and metabolic pathways involved. The affect of dye decolorization products on the environment is also measured by biodegradability and toxicity tests. Polishing the huge potential of microbial-based dye decolorization technologies, still unsolved problems are waiting to be solved. These are optimising SSF, overcoming scalin g bottlenecks, and developing economically feasible bioreactor systems. The prospect of genetically engineered microbes, as well as combined SSF remediations and other bioremediation strategies are also in the research agenda. Thus, the sustainability of textile wastewater treatment requires multidisciplinary approaches and innovative ways to be generated.

Isolation of microbes from textile waste water and their adoption in solid-state fermentation with agricultural waste for dye color removal can be a very use full technique for sustainable waste water management. This approach, which employs metabolic capabilities of microbes and the bulk of textile leftovers, is not only a cost-effective so an environmentally friendly manner to deal with the issues of textile waste water. Research and development activities must be carried out continuously in order to be able to abolish possible limitations, and exploit fully microbial-based bioremediation technology.

ACKNOWLEDGEMENT

We thank Principal, KLE College of Pharmacy and staff members for providing facilities needed to carry out the research work.

ABSTRACT

The study developed a chemometric-assisted UV method for estimating Lamivudine and Zidovudine. Standard drugs were dissolved in water, diluted, and scanned in the UV region. The method's precision was determined through intraday and inter-day analysis, with the average percentage recovery values being 98.6±0.2003 and 99.2±0.2042, respectively. The technique was useful to determine Lamivudine and Zidovudine in a tablet formulation (Duovir), & the percentage purity was established to be 99.1% w/v and 98.8% w/v, in conformity with the label claim. This validated novel UV approach could be easily adopted for simultaneous determination of zidovudine and lamivudine in formulations and bulk.

Keywords: Lamivudine and zidovudine, chemometric technique, UV method development and validation.

INTRODUCTION

The combination of lamivudine and zidovudine is used to treat HIV contamination, the virus responsible for AIDS. Nucleoside -reverse transcriptase inhibitor obstruct the HIV virus's reproduction by joining itself to the viral DNA chain [1]. The chemometric method is used for mathematical and statistical analysis, allowing for multidimensional calibration of specific chromatographic, electrochemical, and spectroscopic processes. It is particularly useful for testing pharmaceutical preparations [2]. Design of experiment is a systematic strategy used by engineers & scientists to investigate the rapport among key variable & yield variables [3]. A central composite design can be used in response surface methods to construct a second-order quadratic model for response variables, quantifying the relationship between measured responses and input factors [4]. Parameters followed are preciseness, accuracy, LOD, LOQ, & linearity, as stated via ICH guidelines.

MATERIALS AND METHODS

Drug collection

Lamivudine and zidovudine standard drug was gifted from cipla. Lamivudine 150mg and zidovudine 300mg tablets (Brand: Duovir) was purchased from cipla pharmaceuticals.

Instrument used

Shimadzu BL 220 H Digital balance, UV- Visible spectrophotometer-Perkin Elmer (double beam), melting point apparatus scientific model MP-DS, ultra sonicator PCI Labs, software used is design of expert 13.0 version.

Selection of solvents

Solubility of lamivudine and zidovudine was performed by using solvents like water, ethanol, methanol and DMSO. Based on the good solubility the solvent was selected.

Optimization of method

Preparation of Standard Solution

After weighing and transferring 150 mg of lamivudine and 300 mg of zidovudine standard into two 100 ml volumetric flasks, 50 ml of water was added to each flask, which was then sonicated for 10 minutes and made the final volume. For both Lamivudine and Zidovudine standard, further dilutions were performed until the final concentrations were 10µg/ml.

Preparation of Sample Solution

Tablet powder equivalent to Lamivudine 150mg and Zidovudine 300mg were weighed and transferred into 100ml volumetric flasks, 50ml of water was added to each, sonicated for 10 minutes, and the final volume was made up of water. Finally, the solution was filtered. The filtrate was further diluted to achieve a final concentration of 10µg/ml for Lamivudine and Zidovudine, respectively.

Selection of Absorption Maximum (λ max)

The concentrations of Lamivudine and Zidovudine (10µg/ml) were synthesized and scanned in a UV-Visible spectrometer between 200-400 nm, using distilled water as the blank. The wavelengths for additional chemometric technique investigations were picked from the overlay spectrum.

Optimization of Central Composite Design

The developed UV approach was optimized using the central composite design, which incorporated the use of Design expert. Wavelength 1 (Variable A) and Wavelength 2 (Variable B) were selected as independent variables for statistical analysis; Table 1 displays the low and high levels of independent factors. Response characteristics such as absorbance (A1&A2) from two medications (lamivudine and zidovudine) were employed as robustness parameters.

The statistical computations for variable screening and procedure optimization were done using the Design of Expert program. Thirteen runs were done with two independent variables, which are shown in Table 2.

Validation of Experimental Design

Analysis of variance (ANOVA) was done for each parameter to determine the significance of the effects and interactions between variables. Wavelengths 1 and 2 were chosen as independent variables, and their effects on Absorbance 1 (Lamivudine) and Absorbance 1 (Zidovudine) were assessed. To assess the impact of each response, the response coefficient was calculated for every dependent variable. Significant polynomial response equations for R1 (Absorbance 1) and R2 (Absorbance 2) were generated after each response coefficient was examined and its statistically significant and non-significant response coefficients were eliminated.

Effect of Independent Variables on Response-1 (Absorbance-1)

The effect of independent variables on absorbance-1 (Lamivudine) was expressed by the 3D response counter plot and polynomial equation. Second order quadratic polynomial for response R-1 (Absorbance-1) was varied from 0.3621 to 0.3936. That wavelength 1 (A) negatively affects absorbance-1, while wavelength-2 has no significant impact. The regression coefficients of variables A&B were found to be **0.0045, 0.0000**, respectively. Absorbance-1 decreases with increasing wavelength1 (A), while wavelength-2 have no notable influences on absorbance-1. The positive regression coefficient for AB was evaluated and found to be 0.0000, indicating that response1 (Absorbance 1) had no impact as A and B increased simultaneously.

Effect of Independent Variable on Response-2(Absorbance-2)

The study analyzed the impact of independent variables on absorbance-2 (Zidovudine) using a 3D response, counter plot, and polynomial equation. That wavelength-2 (B) had a positive impact on absorbance-2, while wavelength-1 (A) had no significant influence. The regression coefficients of variables A & B were found to be **0.0000 and 0.0329**, respectively. The experimental model fits well for the method, with adjusted R1 & R2 within an acceptable range (R2 > 0.9). The model's precision value is larger than four, indicating sufficient signal. The coefficient of variation (C.V.) represents repeatability. Three-dimensional plots were used to interpret the interaction, and the maximum desirability function showed an excellent statistical model. ANOVA results showed the actual and predicted response values in Tables 3.

Method validation

Linearity

0.05g of standard Lamivudine and Zidovudine was weighed and dissolved in a distilled water to create a final volume of 1000µg/ml. After that, be diluted by means of distill water to obtain concentration 10-60µg/ml. The absorbance of the solutions was measured at 217nm and 267nm against the blank, and a calibration graph was constructed using concentration vs absorbance.

LOD and LOQ (Limit of Detection & Limit of Quantification)

The LOD & LOQ of the drug lamivudine and zidovudine was calculated using standard deviation as per the ICH guidelines.

Accuracy

A constant amount of pre-analyzed sample was obtained, and the standard medication was administered at 80%, 100%, and 120% concentrations. The standard concentrations for Lamivudine and Zidovudine were established at 10µg/ml. The % recovery was calculated.

Precision

Intraday Precision and Inter-day Precision

0.05g of standard Lamivudine and Zidovudine was weighed and dissolved in water to create a final volume of 1000µg/ml. The solution was diluted to 100µg/ml and 10µg/ml, and the absorbance was measured at 217nm for

Lamivudine and 267nm for Zidovudine at 1 hour intervals and at one day of interval. The % RSD was calculated from the absorbance values which should not be more than 2%.

Ruggedness

i) Preparation (Lamivudine & zidovudine) of six working standard solutions of 10µg/ml by two different analysts were subjected to test absorbance at fixed wavelength in same equipment.

ii) Preparation (Lamivudine & Zidovudine) of three working standard solutions of 10µg/ml by the same analyst and the measurement of absorbance was done at two different systems (Single beam & double beam UV-Visible spectrophotometer).

Estimation of Lamivudine and Zidovudine in Materials Formulation

Preparation of Standard

The process involves transferring 0.05 g of standard lamivudine and 0.05 g of zidovudine in a 50 ml volumetric flask, mixed with distilled water to create a final concentration of 100µg/ml. Then, 1 ml of lamivudine and 2 ml of zidovudine were pipetted into a 10 ml volumetric flask, and the final volume was made up with water to obtain a final concentration of 10 µg/ml of lamivudine and 20 µg/ml of zidovudine.

Preparation of Sample

0.51 g of tablet powder equivalent to 0.1 g of Lamivudine and 0.3 g of Zidovudine were weighed, dissolved in water, and filtered. 1 ml was pipetted out and transferred to a 10 ml volumetric flask, then distilled water was added to obtain the concentration of Lamivudine (10 µg/ml) and Zidovudine (20 µg/ml).

RESULT AND DISCUSSION

Selection of Solvent

The solubility of lamivudine and zidovudine was determined and the purified water was selected as solvent due to it's highly solubility.

Selection of Absorption Maximum (λ max)

Standard solutions of lamivudine 10 µg/ml and zidovudine 10µg/ml in water were prepared, scanned in a UV-visible spectrophotometer and respective UV spectrum was obtained shown in figure 1 and 2, and the wavelength range for optimization (CCD) was selected from the overlay spectrum figure 3.

Optimization by central composite design (CCD)

The central composite design was used to optimize the responses for determining Lamivudine and Zidovudine simultaneously. Thirteen experiments were conducted using Wavelength-1 and Wavelength-2 independent variables to optimize the responses (Absorbance-1 & Absorbance-2) and the results shown in Table 4. Randomized experiments minimized unrestrained variables, and statistical tools verified variables' effects on responses.

Effect of Independent Variable on Response 1 (Absorbance 1)

Independent Variable A and B's Effects on Absorbance 1

When wavelength 1 (A) was increased at a low level (260nm) of wavelength 2, there was no significant change in absorbance-1 lamivudine (less interaction). While increasing wavelength 1 at a high level (270nm) of wavelength 2, absorbance 1 climbs 0.35 to 0.39 and then progressively drops beyond 218.5 nm. This model shows interaction was observed in figure 4 and 5.

Effect of Independent Variable on Response 2 (Absorbance 2)

Independent Variables A and B's Effects on Absorbance 2

There was no discernible change in absorbance 2 (zidovudine) when wavelength 1 was increased at low levels (260 nm) and high levels (270 nm) of wavelength 2. It indicates that factors A and B have little effect on response 2 (absorbance 2). This combination has fewer interactions and a lower risk factor. This model shows interaction was observed in figure 6 and 7.

Validation of the Assay Method

Linearity

The calibration curves for Lamivudine and Zidovudine were obtained in concentration ranges of 5-30μg/ml, showing linear responses and a correlation coefficient of 0.9988 and 0.9999 respectively. Table-7 shows the linearity data of lami & zido. Figure 8 & 9 shows the calibration curvature of lami & zido.

Limit of Detection and Limit of Quantification (LOD & LOQ)

According to ICH guidelines the limit of detection (LOD) of lamivudine and zidovudine was found to be 3.62μg/ml and 1.22μg/ml respectively. Limits of quantification (LOQ) of lami & zidovudine were 10.97μg/ml & 3.69μg/ml correspondingly.

Accuracy

The percentage recovery was determined for the results of accuracy study of the lamivudine and zidovudine. Percent recovery for 80%, 100% & 120% of lamivudine was established to be 99.81, 100.38, and 99.69 respectively. The percentage recovery of 80%, 100%, and 120% of zidovudine was found to be 99.8, 100.60, & 99.84 correspondingly.

Precision

The method's preciseness was established by intra & inter-day analysis. For intra-day lamivudine analysis, the percentage relative standard deviation (%RSD) values were determined to be 1.1645 at 0 hours, 1.2430 at 1 hour, and 0.6720 at 2 hours. The inter-day analysis of lamivudine yielded values of 0.6460 at 0 hours, 1.2085 at 1 hour, and 1.3766 at 2 hours. The intra-day zidovudine analysis, the %RSD values were determined to be 0.5695 at 0 hours, 0.7876 at 1 hour, and 0.4202 at 2 hours. The inter-day analysis of zidovudine yielded values of 0.7180 at 0 hour, 0.8265 at 1 hour and 1.1460 at 2 hours.

Ruggedness

The percentage relative standard deviation of analyst and system variation for lamivudine and zidovudine was shown in the tablet 5 and 6.

Estimation of lamivudine and zidovudine in marketed formulation

The amount present of lamivudine and zidovudine in tablet formulation was found to be 148.76 mg and 296.93 mg respectively. Percent purity of lami and zidovudine in tablet formulation was established to be 99.1% and 98.8% w/v correspondingly.

CONCLUSION

A novel Ultra-Violet assay process was developed for instantaneous evaluation of Lami & Zidovudine in pharmaceutical laboratories. The method used chemometric techniques for optimization of spectroscopic response parameters, resulting in more robust and reliable methods. Central Composite -Design (CCD) was intended for parameter optimization. The method was found to be simple, accurate, and robust, demonstrating the effectiveness of chemometrics in conjunction with UV spectroscopy.

ABSTRACT

Fast dissolving oral films (FDOFs) offer a patient-friendly drug delivery system, enhancing compliance and providing rapid therapeutic effects. This study focuses on the formulation and evaluation of Nifedipine FDOFs, a calcium channel blocker used to treat hypertension and angina pectoris. Utilizing the solvent casting method, films were prepared with hydroxypropyl cellulose (HPC) and polyvinyl alcohol (PVA) as film-forming polymers, and propylene glycol as a plasticizer. Among the formulations developed, formulation F4 exhibited optimal characteristics: a thickness of 0.24 ± 0.72 mm, folding endurance exceeding 300 folds, surface pH of 6.8 ± 0.1, disintegration time of 31 ± 1.1 seconds, and drug content uniformity of 93.56 ± 0.12%. In vitro dissolution studies demonstrated that F4 released 92.5% of Nifedipine within 30 minutes, indicating rapid drug release. These results suggest that the optimized Nifedipine FDOF formulation offers a viable alternative to conventional oral dosage forms, potentially improving therapeutic outcomes and patient adherence.

Keywords: Nifidipine, Plasticizers, folding endurances, drug release, fast dissolving oral films

INTRODUCTION

Drug delivery methods are essential for modifying the pharmacokinetic profiles of drugs, including their release, absorption, distribution, and elimination, with the aim of enhancing efficacy, safety, and patient comfort and compliance. The oral route of administration is particularly favored due to its versatility, ease of use, and painlessness, which significantly contributes to improved patient adherence to medication regimens [1, 2]. Oral dissolving films represent a highly advanced solid dosage form, characterized by their flexibility and rapid dissolution properties. These Fast dissolving oral films (FDOFs) are an innovative oral drug delivery system derived from transdermal patch technology, designed to dissolve quickly in the oral cavity without the need for chewing or water. Recent interest in orodispersible films has surged due to their significant advantages for specific populations, such as toddlers and the elderly, who often experience difficulties in swallowing conventional solid dosage forms.

A very thin oral strip is applied to the patient's tongue or any other oral mucosal tissue as part of the drug delivery system. Upon contact with saliva, the strip is rapidly moistened, leading to quick hydration, disintegration, and dissolution of the film, which facilitates the release of the medication for oromucosal absorption. Consequently, the oral mucosa presents an attractive site for drug administration. These dosage forms are particularly beneficial for patients with active lifestyles, including pediatric and geriatric populations, as well as individuals who are bedridden, experiencing emesis, suffering from diarrhea, undergoing acute allergic reactions, or dealing with coughing. Furthermore, orally disintegrating dosage formsoffer additional advantages in managing patients with mental health conditions. Fast dissolving oral films (FDOFs) are also advantageous when local anesthetics are required for conditions such as toothaches, mouth ulcers, cold sores, or teething. For over the counter (OTC) medications, FDOFs are administered intraorally to ensure systemic distribution of active pharmaceutical ingredients (APIs) [3-5]. Nifedipine is a dihydropyridine calcium channel blocker, the short acting formulation of which has been associated with reflex sympathetic nervous system (SNS) activation leading to flushing, tachycardia, worsening myocardial ischemia, and cerebrovascular ischemia therefore, only longer acting formulations should be used The goal of this study is to develop a nifedipineFDOFs with improved bioavailability and anti-hypertensive properties [6-8].

MATERIALS AND METHODS

Materials

Nifedipine (NIF) was obtained as a gift sample from Pharma Life Research Lab, Hydroxy propyl cellulose (HPC), Sodium starch glycolate(SSG), Propylene glycol (PG), mannitol, purchased from B.M.R Chemicals, Hyderabad.

Preliminary trials for component screening

The choice of polymer type and concentration is critical for the successful development of rapid dissolving films, as various polymers have been evaluated for their film-forming properties. In this study, hydroxypropylcellulose (HPC) and Poly vinyl alcohol (PVA) was utilized as the film former. Blank films were prepared and subsequently assessed for several parameters, including thickness, surface appearance, stickiness, and film clarity.

Preparation of fast-dissolving oral films containing API

FDOF were produced utilizing the solvent casting methodology. Measured amounts of PVA polymers were added to a beaker containing an appropriate quantity of the organic phase. The solution was stirred for 2 hr., during which weighed quantities of the drug and Plasticizer (PVA, HPC) were added to the polymeric solution with continuous stirring. Additional excipients such as SSG, flavoring agent and mannitol were added and thoroughly mixed, ensuring the absence of air bubbles. Theresulting homogeneous mixture was then casted onto a clean and petri plate. Following drying, the film was carefully removed from the plate and cut into pieces measuring 1.5×1.5 cm^2 each. Films with any imperfections were excluded from further evaluation. The final samples of films were individually wrapped in butter paper followed by aluminum foil and stored appropriately until needed.

Drug excipient interaction study using FTIR

The FTIR spectra of nifedipine were discovered with KBR in aBruker FTIR (Tokyo, Japan) 5-10 minutes within the spectral range of 500-4000cm-1underan 800MPastress.FTIR spectrometer to examine the pure drug, the optimized formulation, and all excipients involved in the production of the FDOFs. This method provides critical insights into chemical interactions that may affect the stability and efficacy of the formulations, thereby guiding formulation scientists in selecting compatible excipients for stable blends [20].

Differential Scanning calorimetry (DSC)

The thermal analysis of pure nifedipine and various samples of the ternary system were performed on Mettler-Toledo (Mettler-Toledo, Switzerland) calibrated using indium standard and equipped with a refrigerated cooling system. The program temperature was set from 30-3000c and increased at a rate of 100c/min. Flow rate of nitrogen gas was kept at 50ml.min. Melting points of the samples and onset temperature were automatically calculated using software provided (STARe Ver.12.1 Mettler Toledo, Switzerland).

Weight variation

Each film formulation produced three films measuring 2 × 2 cm^2, which were cut at random for evaluation. The weight of each film was measured individually using an electronic scale, and the mean weight for each batch was subsequently calculated. This method of assessing film weight is crucial for ensuring uniformity in drug content and overall formulation quality, as significant weight variation may indicate inconsistencies in the manufacturing process and potential issues with dosage accuracy [15].

Thickness

The thickness of each oral film was measured using a micrometer at five distinct locations to ensure uniformity. This measurement is essential, as consistent film thickness is directly related to the accuracy of the dosage delivered in each strip. The average thickness and standard deviation for each formulation were subsequently calculated to assess the quality and reliability of the films [15].

Stickiness

The films were pressed against the fingertips, and the results were recorded to assess their tactile properties. This method provides valuable insights into the film's texture and adherence, which are important factors in user experience and acceptance [15].

Folding endurance

The folding endurance of the film was determined by repeatedly folding it at the same location until it broke. This value represents the number of folds the film can withstand without failure, indicating its tensile strength and flexibility. A higher folding endurance signifies better durability and resistance to mechanical stress, which is crucial for ensuring that the film can endure handling and administration without compromising its integrity [16].

Disintegration time

The disintegration time of the film strip (2 × 2 cm^2) was assessed by placing it in a 6 cm diameter Petri dish containing 6 ml of pH 6.8 phosphate buffer. The time required for the film to completely disintegrate was recorded. Each measurement was conducted in triplicate, and the average values were calculated to ensure accuracy and reliability of the results [17].

In vitro diffusion study

A Franz diffusion cell equipped with a dialysis membrane was utilized to evaluate the diffusion characteristics of the formulated films. Prior to assembly, the dialysis membrane was soaked in pH 6.8 phosphate buffer for 24 hours to ensure proper hydration. A film segment measuring 1.5 × 1.5 cm^2 was carefully placed onto the membrane, which was then securely positioned between the donor and receptor chambers of the diffusion cell. The receptor chamber contained 13mL of pH 6.8 phosphate buffer as the dissolution medium and was maintained at a constant

temperature of 37 ± 0.5°C. Continuous stirring in the receptor compartment was achieved using a magnetic stirrer to ensure uniform distribution. At predetermined intervals, 0.5 mL aliquots were withdrawn from the receptor chamber and immediately replaced with fresh pH 6.8 buffer to maintain sink conditions. The collected samples were analyzed using a UV spectrophotometer set at 238 nm to quantify the amount of drug diffused. The cumulative percentage of drug release for each formulation is presented in Table 3, and the corresponding release profiles are illustrated in Figure 2.

Drug content

Random sampling of all batches was employed to determine the drug content. Each Fast dissolving orally film (FDOF) measuring 2 × 2 cm² was dissolved in 50 ml of phosphate buffer. It was kept aside for 6 hours, and the volume was increased to 100ml of phosphate buffer. The resulting solution was then filtered prior to analysis using a UV spectrophotometer. The drug content was calculated as the average of three measurements to ensure accuracy and reliability of the results in Table 2.

Surface pH

For this test, the film was placed on a Petri plate and moistened with 0.5 ml of phosphate buffer, allowing it to sit for 30 seconds. The electrode of the pH meter was then brought into contact with the surface of the formulation, and a one-minute equilibration period was allowed before recording the pH. The average pH value for each formulation was calculated based on three separate measurements to ensure accuracy and reliability [19, 20].

RESULTS AND DISCUSSION

UV Absorbance studies

The absorbance of nifedipine at various concentrations ranging from 1 to 10 µg/ml was measured using a UV spectrophotometer (Elico) at 238nm. A standard calibration curve was generated based on the obtained data, as illustrated in Figure 2.

Physical properties

Weight variation, thickness, film clarity, surface appearance, stickiness, and folding endurance were assessed following the guidelines set by the United States Pharmacopeia (USP) and the Indian Pharmacopoeia (IP), with results tabulated in Table 2. All film weights were found to fall within the acceptable range. Thickness is a critical property that ensures the uniformity of the films; ideally, films should have a thickness ranging from 0.05 mm to 0.1 mm, and all prepared films met this criterion. Film clarity provides insight into the presence of impurities, and the prepared films were found to be clear of any such contaminants. Folding endurance reflects the mechanical strength and flexibility of the films; a desirable film should exhibit a folding endurance greater than 300, indicating toughness and flexibility. However, the prepared films demonstrated flexibility with a folding endurance of less than 300. The surface pH of the films was maintained within the range of 6 to 7, which is considered appropriate according to established standards.

Disintegration time

The average disintegration time for the 2 × 2 cm² fast dissolving films containing Nifedipine was found to be less than 40 seconds, as indicated in Table 3. It was observed that the incorporation of plasticizers, along with superdisintegrant, resulted in a reduction of the disintegration time.

***In vitro* diffusion studies**

The drug release results obtained from the in vitro dissolution studies are illustrated in Figure 1. The study demonstrated that the optimized formulation F4 released 92.5% of the drug within 30 minutes, attributed to its composition of Sodium starch glycolate (SSG) but increases of percentage of SSG it shows delays the drug release due to generate the viscosity in the medium. In comparison, formulations F4 and F8 exhibited respectable drug release

rates of 92.5% and 90.7%, respectively, within the same time frame. The dissolution profile indicates an immediate release of the drug into biological fluids, providing rapid relief to patients. The evaluation data represents in Table 3.

Drug content

Drug content studies were conducted to determine the amount of active pharmaceutical ingredient present in the 2 × 2 cm^2 film. The results of these tests are presented in Table 3.

FTIR studies

Aromatic rings (C=C stretching, 1400–1600 cm^{-1}, and bending vibrations below 1000 cm^{-1})Nitro group (-NO_2) (asymmetric and symmetric stretching, 1300–1550 cm^{-1})Ester (-COOR) (C=O stretching, 1700–1750 cm^{-1}, and C-O stretching, 1000–1300 cm^{-1})N-H bond (stretching, 3200–3500 cm^{-1})3160.5 cm^{-1}: Indicates N-H stretching, typical of dihydropyridine.1726.35 cm^{-1} Strong C=O stretching confirms the presence of ester groups.1468.01 cm^{-1} & 1645.33 cm^{-1} Aromatic C=C stretching vibrations.1408.69 cm^{-1} & 1332.86 cm^{-1}: Strong nitro group N=O stretching.1224 cm^{-1} & 1110.03 cm^{-1}: C-O stretching of ester groups.923.93 cm^{-1} & 855.49 $cm^{-1}$the peaks in the FTIR spectrum strongly align with the functional groups present in nifedipine, confirming its presence. 3160.5 cm^{-1}Broad O-H stretching, indicative of hydroxyl groups.2929.32 cm^{-1} & 2850.88 cm^{-1} Aliphatic C-H stretching.1224 cm^{-1} & 1110.03 cm^{-1} Strong C-O stretching, typical of ether groups in HPC.1408.69 cm^{-1} C-H bending. The observed peaks, particularly the broad O-H stretching, aliphatic C-H stretching, and ether C-O stretching, strongly suggest the presence of HPC and other excipients in optimized formulation. There are no interactions. The characteristic absorption peaks of drug and excipients were obtained as shown above and as they were in official limits (±100 cm^{-1}) the drug is compatible with excipients [15,16].

DSC studies

In the next phase the DSC thermograms for the pure drug and the physical mixture were determined to understand the drug polymer interaction. As shown Nifedipine showed the endothermic peak at 155.2Cal. It was observed from the above thermogram that there was no appearance of new peaks, no change in peak shapes. The results indicated that there was no interaction with the drug [15].

CONCLUSION

In this research, developed films displayed favorable attributes they were uniform, non-tacky, transparent and easy to remove. It was observed that the formulation variables, particularly the concentrations of PVA, HPC, SSG and PG, influenced both the drug release and disintegration time from the films. After optimization, formulation F4 emerged as the optimal choice, promoting a disintegration time of 31 sec and a cumulative drug release of 92.5%. FDOF of NIF can be an effective dosage form that provides rapid onset of action and relief from allergic reactions.

ABSTRACT

One of the most important sources of biodiversity is soil. Healthy soil is essential to the sustainability of the biosphere. The goal of the current study is to determine the dominant isopod species in the plantation and forest areas of Central Travancore region in relation to physical and chemical characteristics of the soil. From soil samples taken from plantation and forest areas, five distinct species of isopods have been isolated from soil samples taken from plantation and forest area. *Porcellioscaber, Philoscia muscorum, Philosciajavanensis, Cylisticus convexus,* and *Armadillidium vulgare* are the species that have been identified. The Important Value Index was used to determine the dominant species. There were notable differences between the two distinct habitats' physical and chemical characteristics as well as between seasons. The primary soil elements influencing the isopod population were examined using Principal Component Analysis (PCA). According to PCA analysis the overall isopod population is largely controlled by chemical elements like nitrogen, potassium, calcium, and magnesium as well as physical factors like temperature, moisture, pH, organic carbon, sand, silt, and clay.

Keywords: Edaphic factors, Isopods, Important value index, Principal component Analysis

INTRODUCTION

An interconnected system of life, the soil ecosystem is made up of macro and microorganisms, air, water, minerals, and organic materials. Sand, silt, and clay are the three different particle sizes that make up the mineral component of the soil. Sandy soils are naturally unproductive because sand cannot retain nutrients. Temperature and moisture have an impact on soil fertility as well. A significant amount of carbon in most soils is stored as soil organic carbon. A number of variables, including soil texture, climate, vegetation, and land use, affect the amount of organic carbon in the soil. The key source for energy for soil-borne microorganisms is organic matter found in the soil. The fertility of the soil is also influenced by the presence of secondary minerals like calcium and magnesium as well as fundamental nutrients like phosphorus, nitrogen and potassium[1]. Soil is one of the most significant reservoirs of biodiversity, and the biosphere's sustainability depends on it functioning properly. Solids, liquids, gasses, soluble and insoluble materials, both organic and inorganic components make up the complex chemical entity known as soil [2]. One of the species-rich living substrates for a variety of arthropods is soil; these organisms are diverse and physiologically unique, and they are crucial to many vital ecosystem functions [3-4]. Arthropods are inexpensive, easy to gather, and significant to the environment [5]. Even though the large majority of species are uncharacterized, the soil system is probably home to the highest concentration of terrestrial biodiversity [6].This study was conducted to understand the soil edaphic and chemical factors in the plantation area and the forest area, as well as to study the dominant species of isopods found here.

MATERIALS AND METHODS

Study area.

The Central Travancore region was chosen as the study area, Achenkovil forest region chosen for the study is located in Kollam district between 9.0333° North latitude and 77.3333° East longitudes, the plantation area of Ranni, Pathanamthitta district is located between 9.2566° North latitude and 76.7742° East longitudes.

Sample Collection

Twenty forest land locations and twenty plantation land sites were chosen for sample collection. Using a soil auger, soil samples of 5 x 5 cm^2 and 10 cm in depth were randomly taken from these locations. The collected soil was covered with polythene and brought to the laboratory. From 2022 to 2024, samples were taken monthly from the study sites throughout the pre-monsoon, post-monsoon, and monsoon seasons.

Extraction of Soil Isopods

The soil samples from the sites have been collected in a clean polythene bag and tied with a rubber band, and appropriately labelled before being transported to the lab. To collect large isopods, samples of soil were put in a 15 x 25 cm tray and manually sorted. After the samples were moved to a modified Berlese Tullgren funnel, microarthropods were extracted overnight in a medium containing picric acid. The identification keys developed by Kuhnelt,1961[7]were used to identify the extracted microarthropods. 99.9% ethanol was used to preserve animals. Population density is studied from the extracted population from the sample. Dominant isopods were identified by calculating the Important value index (IVI) described in the work of Ismail2021 [8]. Important Value Index is calculated by adding the sum of Relative density (RD), Relative frequency (RF) and Relative Abundance (RA) of a particular species.

Edaphic and Chemical Factor Analysis

Temperature, pH, exchangeable acid, exchangeable base, organic carbon content, moisture content, sand silt, and clay content were among the soil edaphic variables that have been tested from the soil samples. The chemical composition of the soil, including its levels of calcium, magnesium, phosphorus, potassium, and nitrogen, was examined. Using a soil thermometer, the temperature of the soil was determined on-site. A soil pH meter was used to measure the pH of the soil. Trivedy and Goel's (1987) [9]method was used to measure exchangeable acid and exchangeable base. The

method of Walkley and Black (1934) [10] was used to measure the amount of organic carbon in the soil. The gravimetric method was used to measure the moisture content of the soil. Samples of soil are subjected to air drying and sieving, chemical variables such as phosphorus, nitrogen, magnesium, calcium, and potassium were examined in the soil samples. Kjeldahl distillation was used to determine the nitrogen content, molybdate stannous chloride was used to determine the phosphorous level, and flame photometry was used to determine the potassium content[11]. The EDTA titration by Jackson, 1958 [12] were used to analyse the soil's calcium and magnesium levels.

Data Analysis

Microsoft Excel was used to create descriptive statistics. Using SPSS program 21 two way analysis of variance (ANOVA) was performed to identify any significant differences in each parameter's value between sites and seasons. Principal component analysis (PCA) was performed using PAST 4.03 software for analyse the correlation between isopod population, edaphic and chemical factors.

RESULTS AND DISCUSSION

Dominant Species

Five different species of isopods are identified from the soil samples of forest and plantation area. The identified species are *Armadillidium vulgare, Cylisticus convexus, Philoscia muscorum, Philoscia javanensis* and *Porcellio scaber*. In the plantation area the population density of *P. scaber, P. javanensis* and *P. muscorum* are more. *A. vulgare* and *C. convexus* shows low population density. The Important Value Index (IVI) for the P. *scaber* (220.0415) is high. The calculated Important Value Index of *P. javanensis* (213.1596) and *P. muscorum* (208.064) also shows their dominance in the plantation area. *C.* convexus with IVI value 88.76764 shows their low population density in the plantation area.The same pattern was observed in the different seasons during the study.The density and abundance of soil arthropods in rubber plantations were directly impacted by the seasons [13]. In forest area the population density of *P. scaber, P. javanensis, P. muscorum A. vulgare* and *C. convexus* shows high population density. *C. convexus* with 196.5981 shows the higher dominance (Table 2). Based on the IVI value *P. scaber, P. javanensis* and *P. muscorum* are the dominant species in the plantation area (Table 1.) and the all 5 species are dominant in the forest area. The population density of the all the identified isopod species are high during the post monsoon season [14]. In the present study there were two population peaks for the isopod species a smaller one during the period of premonsoon and a larger one during the period of post monsoon. The size of the whole microarthropod population was significantly positively correlated with the soil's temperature and moisture content at the time of sampling, out of all the factors are considered [15]. The population density of different species in various seasons of Plantation are a and Forest areas are shown in Figure 1 and Figure 2.

Soil edaphic and chemical factors

The results of soil edaphic and chemical factors of Plantation and Forest areas are shown in Table 3 and Table 4 respectively. The average soil moisture content in plantation land was 89.50 % during the monsoon, 82.39% during the post-monsoon, and 83.40% during the pre-monsoon. The average soil moisture content in forest land was 93.33% during the monsoon, 87.13% during the post-monsoon, and 85.66% during the pre-monsoon. Significant differences between sites ($P<0.05$) and seasons ($P<0.05$) were revealed by the two-way ANOVA. The average soil temperature in plantation land was 23.12 °C during the monsoon, 24.59 °C during the post-monsoon, and 26.88 °C during the pre-monsoon. Forest land with monsoon temperatures of 22.95°C, post-monsoon temperatures of 24.97°C, and pre-monsoon temperatures of 25.45°C. Significant differences between sites ($P<0.05$) and seasons ($P<0.05$) were revealed by the two-way ANOVA. The average pH of the soil on plantation land was 4.60 during the monsoon, 5.31 during the post-monsoon, and 5.44 during the pre-monsoon. The forest land has a pre-monsoon 4.44, a post-monsoon 4.68, and a monsoon 4.87. Significant differences between sites ($P<0.05$) and seasons ($P<0.05$) were revealed by the two-way ANOVA. In plantation land, the average soil organic content was 4.65% during the monsoon, 4.79% during the post-monsoon, and 5.05% during the pre-monsoon. The average organic carbon content of the forest area is 4.57% during the monsoon, 5.18 % during the post-monsoon, and 4.62% during the pre-monsoon. Significant differences

between sites (P<0.05) and seasons (P<0.05) were revealed by the two-way ANOVA. On average, the exchangeable acid on plantation land was 2.30 % during the monsoon, 1.48% during the post-monsoon, and 1.81% during the pre-monsoon. The average exchangeable acid content in the forest region is 3.43 % during the monsoon, 2.73 % during the post-monsoon, and 2.92% during the pre-monsoon. On average, the exchangeable base in plantation land was 15.3% during the monsoon, 19.7% during the post-monsoon, and 23.59% during the pre-monsoon. The average value of exchangeable base in forest area is 7.90% during the monsoon, 8.63% during the post-monsoon, and 14.78% during the pre-monsoon. Plantation land had an average percentage of sand content of 70.02 % during the monsoon, 66.45 % during the post-monsoon, and 61.71% during the pre-monsoon. The average amount of sand in the forest region is 47.98% during the monsoon, 56.14 % during the post-monsoon, and 58.29 % during the pre-monsoon. On average, the percentage of silt content in forest soil was 31.1% pre the monsoon, 27.72% during the post monsoon, and 33.69% during the monsoon. The average silt content in the plantation area is 17.55 % during the monsoon, 22.69% during the post-monsoon, and 28.01 % during the pre-monsoon. The average level of the clay present in forest land was 18.39% during the monsoon, 14.06 % during the post-monsoon, and 15.39% during the pre-monsoon. The average clay content in the plantation area is 14.09 % during the monsoon, 12.05 % during the post-monsoon, and 13.06 % during the pre-monsoon. Significant differences were observed between habitats (P<0.05) and across seasons (P<0.05) for all edaphic parameters.

The chemical components such as nitrogen (N), phosphorus (P), potassium (K), calcium (Ca), and magnesium (Mg) were examined in the study areas. Plantation habitat exhibited a mean nitrogen level of 2891.16 ppm during the monsoon, 2842.16 ppm during the post-monsoon, and 2886.61 ppm during the pre-monsoon. Forest habitat shows the nitrogen content, 4464.16 ppm during the monsoon, 4419.90 ppm during the post-monsoon, and 5039.82 ppm during the pre-monsoon. The nitrogen content in forest habitat and Plantation habitat varied significantly between habitats (P<0.05) and between seasons (P<0.05). The mean range of the phosphorus content in plantation land was 9.59 ppm during the monsoon, 9.82 ppm during the post-monsoon, and 10.79 ppm during the pre-monsoon. Phosphorus levels in forest habitat with mean values of 5.21 ppm during the monsoon, 4.14 ppm during the post-monsoon, and 5.68 ppm during the pre-monsoon. The phosphorus content in forest habitat and Plantation habitat varied significantly between habitats (P<0.05) and between seasons (P<0.05). An average of 373.99 ppm of potassium during the monsoon, 281.71 ppm during the post-monsoon, and 340.34 ppm during the pre-monsoon were found in the forest environment. The mean potassium levels in plantation habitat ranged from 374.85 ppm during the monsoon, 369.26 ppm during the post-monsoon, and 325.11 ppm during the pre-monsoon. The results indicated substantial difference between habitats (P<0.05) and between seasons (P<0.05).

The average calcium content of the plantation area is 1325 ppm during the monsoon season, 1384 ppm during the post-monsoon, and 1378.37 ppm during the pre-monsoon. The average calcium levels in the forest region are 1405.86 ppm before the monsoon, 1341.68 ppm during the monsoon, and 1366.67 ppm during the post-monsoon. There are significant variations (P<0.05) in the calcium content of the two habitats and across the different seasons. The mean magnesium concentration of the plantation area is 45.61 ppm during the monsoon season, 67.78 ppm during the post-monsoon, and 72.56 ppm during the pre-monsoon. In the forest region, the mean magnesium levels are 177.02 ppm during the monsoon, 158.84 ppm during the post-monsoon, and 177.54 ppm during the pre-monsoon. There are significant differences in the magnesium content between plantation and forest habitats, as well as between seasons (P<0.05). Chemical factors such as calcium, magnesium was found to be greater during the pre monsoon at all sites.For the terrestrial ecosystem to remain fertile and productive, organic nitrogen must be assimilated by plants and microbial biomass in soil. For soil organisms, calcium is a vital nutritional element that is also essential for plant nourishment and the stabilization of soil organic matter [16].

Soil edaphic variables from forest and plantation habitats were examined. The soil's fertility is affected by temperature, as the temperature rises, more organic matter decomposes. There was an ideal temperature range in the forest land ecosystem. The pH ranges indicated that the two ecosystems were acidic in nature, indicating that environmental influences can influence soil pH.Either an acidic or alkaline soil is preferred by plants and other soil living forms. The availability of nutrients in the soil can also be impacted by pH. The forest ecosystem had a higher

clay content. The amount of organic matter and clay in the soil affects its ability to exchange nutrients [1].Temperature and soil moisture were important factors in controlling the variety and number of microarthropods [17]. The density of soil microarthropods is influenced by a number of variables, including soil moisture, temperature, soil pH, and food sources. Therefore, the accumulation of soil microarthropod populations is caused by both seasonal rhythms and edaphic factors. The variety of soil microarthropods is greatly influenced by physical and chemical characteristics of the soil[18]. The post-monsoon season had the highest population density across the study areas. The current investigation shows that both chemical and edaphic factors influence the population density of *Armadillidium vulgare, Cylisticus convexus, Philoscia muscorum, Philoscia javanensis* and *Porcellio scaber* in the plantation and forest area.

Principal Component Analysis

Principal component analysis is done to check the effect of edaphic and chemical parameters on the total isopod population in the study area. The biplot shows that the total isopod population in Plantation area during monsoon season (Figure 3.), post monsoon season (Figure4.)and pre monsoon season (Figure 5.) are mainly controlled by physical factors like moisture, pH, organic carbon, sand, silt and chemical factors like nitrogen, potassium, calcium and magnesium. According to the principal component analysis, total isopod population is positively affected by moisture, pH, organic carbon, exchangeable base, sand, nitrogen and phosphorus in forest area during monsoon period (Figure 6). During post monsoon the total population of isopods are controlled by temperature, pH, organic carbon content, exchangeable base, exchangeable acid and potassium in the forest habitat (Figure 7). Inpremonsoon the total population of isopods are controlled by temperature, pH, organic carbon, sand, nitrogen and potassium contents in the forest habitat (Figure 8).

A number of factors, including moisture, organic carbon, exchangeable acid, clay, exchangeable base, nitrogen, phosphorus, calcium, and magnesium, all impact the distribution of micro arthropod populations [19]. Both the plantation area and forest area show high level of phosphorus in pre monsoon when compared to the values obtained in other seasons. Increased organic matter breakdown is indicated by a high phosphorus level in the soil [20].Comparing the diversity and abundance of soil arthropods across different types of habitats in light of different climatic and edaphic conditions will help us understand how abiotic elements regulate both system stability and faunal functions [21].

CONCLUSION

In the forest and plantation areas, the post-monsoon season had the maximum isopod population density. The major species in the forest region are A. vulgare, Cylisticus convexus, Philoscia muscorum, Philoscia javanensis, and P. scaber. In the plantation area, P. muscorum, P. javanensis, and P. scaber are dominant. According to PCA analysis, physical factors like temperature, moisture, pH, organic carbon, sand, silt, and clay, as well as chemical factors like nitrogen, potassium, calcium, and magnesium, primarily regulate the total isopod population in the study area during the monsoon, post-monsoon, and pre-monsoon seasons. The natural characteristics of the soil must be maintained in order for the soil biota, which are essential components of the soil ecosystem, to persist.

ACKNOWLEDGEMENTS

The authors express their gratitude to DST-FIST for providing the essential facilities in the research centre.

ABSTRACT

A laboratory experiment was conducted on shelf life of amritjal based on different cow breeds at department of Botany, CCIM and Bioinformatics, Gujarat University, India. In this study cowdung and cow urine of different cow breeds viz., Kankrej, Gir and HF were collected aseptically and separately to prepare Amritjal. After preparation of amritjal samples were collected daily from 1st day to 15thdays and enumerated the general microorganisms viz., Bacteria, Fungi and Actinomycetes with respective media. Among the three cow breeds the amritjal prepared from Gir breed of cow contained the maximum microbial population. In General, the highest microbial population was observed between 7 to 9 days after preparing amritjal, with both Indian breeds exhibiting higher populations compared to the hybrid breed. This led to two key conclusions: first, the optimal time for applying amritjal is between 7 to 9 days after preparation, and second, the indigenous breed is more effective in preparing amritjal to enhance soil microorganisms.

Keywords: Amritjal, Indigenous breeds, Hybrid cow, Microbial Population, Soil health

INTRODUCTION

The increasing cost of chemical fertilizers makes them unaffordable for small farmers, while their use harms soil beneficial microbes ultimately which leads to decline in soil fertility. Natural farming methods are essential to

address these issues and maintain soil health. Natural farming in agriculture is now finding place in the mainstream of development and shows great promise commercially, socially and environmentally. While there is continuum of thought from earlier days to the present, the modern organic movement is radically different from its original from.
Liquid formulations used in natural farming are classified into two categories: Basic nutritive formulations and protective formulations. In that, Beejamrit and Amritjal are applied to the soil to enhance microbial activity and population, positively affecting plant growth and yield. In contrast, Agniastra, Brahmastra and Neemastra are biocultures used for protection against various pests.

Rationale of The Study

For centuries, dung and urine from cows have been used in Indian agriculture. In Natural farming mainly farmers used the same as basic components to make liquid formulations of natural farming. There are many breeds of cows worldwide, which can be broadly classified into two categories: drought and milk breeds. Milk breeds are primarily valued for their milk production, while breeds with lower milk output are considered less useful for that purpose. To address this, hybrid breeds have been developed through the crossing of different breeds. With this in view, an experiment was conducted to compare the microbial load and diversityin the fermented liquid formulation- Amritjal made of dung and urine obtained from different indigenous breeds with lesser milk production and hybrid cow species.

Research Objectives

1.Evaluate the microbial load and nutrient composition of liquid bio cultures derived from three different breeds of cows to determine their potential agricultural benefits.
2.Determine the optimum application timing for these liquid bio cultures to maximize their efficacy in agriculture.

MATERIAL AND METHODS

A laboratory study was conducted at Department of Botany, CCIM and Bioinformatics, Gujarat University, India. Three Different cow breed (Kankrej, Gir and Hybrid-Holstein Friesian) were selected for the experiment.

Preparation of Amritjal

The liquid natural formulation amritjal were prepared by following procedures given by Palekar (2006). The dung and urine of three cow breeds were collected aseptically and separately to prepare amritjal. The following ingredients were used to make 25 liters of amritjal 1.25 kg of cow dung, 1.25 liters of cow urine, 250 gram of pulse flour, 250 grams of jiggery, one handful soil from the banyan tree, 25 liter of tap water. All the ingredients were mixed thoroughly in a plastic bucket; the mouth of the bucket was covered with wet gunny cloth to maintain the appropriate conditions and the bucket was then kept at the room temperature for 14 days. During this period, the contents were mixed thoroughly with a wooden stick three times a day. Samples were collected in sterile polythene bottles to analyze the microbial population present in the amritjal.

Microbial Analysis

Laboratory studies on microbial analysis of amritjal were made following serial dilution and plate count technique. Samples were drawn on daily basis up to 14 days after preparation(DAP). Samples were studied for three groups of microorganisms viz., Bacteria, Fungi and Actinomycetes were analyzed. The method adapted for the enumeration was serial dilution and plate count technique with appropriate medium. Enumeration of microbial population was carried out using nutrient agar for bacteria, Potato Dextrose Agar (PDA) for Fungi and Selective media for Actinomycetes at 10^6, 10^4 and 10^3 dilutions respectively and the plates were incubated at 28 $\pm$ 2℃.

Statistical Analysis

The data obtained from experiments were statistically analyzed using completely randomized Design (CRD). The statistical analysis was done by using SPSS statistical tool and mean were separated by Ducan Multiple Range Test (DMRT).

RESULTS

DISCUSSION

Amritjal prepared from different cow breeds showed significant differences in nutrient content: Gir breed amritjal had the highest nitrogen (1.896%), phosphorus (0.290%), copper (1.21 ppm), and zinc (0.093 ppm) levels, while Kankrej had slightly lower nitrogen (1.796%) and phosphorus (0.272%) but similar potassium (0.311%) and zinc (0.090 ppm). HF breed amritjal had comparable nitrogen (1.876%) but the lowest phosphorus (0.181%), copper (0.16 ppm), and zinc (0.068 ppm), with potassium (0.299%) nearly the same as the other breeds. These results indicate that Gir-derived amritjal is richer in key nutrients, especially micronutrients, whereas Kankrej and HF are similar in potassium but lower in other nutrients, showing that breed selection significantly affects the nutrient profile of amritjal. The microbial Population viz; Bacteria, Fungi and Actinomycetes were significantly influenced by different storage days (1st day after preparation to 15th days after preparation). The pronounce fluctuations in microbial population of Amritjal during ageing is clearly evident from Table 1. The highest Bacterial Population was noticed in Gir breed Amritjal (79.33 × 10^6 per ml of Amritjal) and next best was Kankrej breed Amritjal (79.25 × 10^6 per ml of amritjal) at 7th day after preparation. The population gradually increased in the middle of storage in the (1st day after preparation to 7th day after preparation) and further decreased gradually (8th day after preparation to 15th day after preparation). The highest fungal population was noticed in kankrej breed amritjal (30.87 × 10^4 per ml of amritjal) and the next best was gir breed amritjal (29.33 × 10^4 per ml of amritjal) at 7th day after preparation of amritjal. The population gradually increased in the middle of storage (1st day after preparation to 7th day after preparation) and further decreased gradually (8th day after preparation to 15th day after preparation). The actinomycetes population was maximum on 9th day after preparation of amritjal in all the breeds. However, amritjal prepared with gir breed (19.33 × 10^3 per ml of amritjal) recorded the highest population of actinomycetes compared to all other breeds of amritjal at 9th day after preparation. Radha and Rao (2014) also reported the slow growth of actinomycetes in freshly prepared fermented liquid organic formulation compared to bacterial and fungi population. Devakumar et al., (2014) observed higher colony forming units of bacteria, actinomycetes and fungi in amritjal at 7th day after preparation. In the preparations, higher number of bacterial CFUs viz., Azatobacter sp., A. chroococcum., Bacillus sp., Beijerinckia sp., Chromatium sp., Chromobacterium sp., Pseudomonas sp., Rhodomicrobium sp., Serretia sp., Xanthomonas sp., were recorded. The different fungi such as Aspergillus sp., Fusarium sp., Penicillium sp., Trichoderma sp., were observed. Babu (2011) reported that uncountable rate of Bacillus was found in the amritjal of Indian cows, the higher microbial population of these liquid organic formulations made them as a potent source to maintain soil fertility and to enhance the nutrient availability by helping in faster decomposition of bulky organic manures. It clearly indicates that the amritjal is enriched consortia of native soil microorganisms. The preparation would give best results if it is used between 7th to 9th days after preparation. The overall results revealed that; the highest microbial population was observed between 7th to 9th days after preparation of amritjal. Hence, its considered as a best time for the application of amritjal in agricultural field. The nutrient composition of amritjal and their constituents (Table 1) reveals amritjal is

good source of essential plant nutrients. The presence of beneficial microorganisms in these liquid formulations might be mainly due to their constituents such as: cow urine, cow dung and jiggery containing essential nutrients. (Palekar., 2006; Sreenivasa et al., 2010; Neelima and Sreenivasa., 2011). Out of three cow breeds, amritjal prepared with indigenous breeds showed maximum microbial population compared to other HF breed amritjal. Out of three indigenous breed gir showed higher bacterial and actinomycetes load where kankrej shows higher amount of fungal than gir breed cows. Overall these microbes help to improve the plant growth by different mechanisms such as fixing of atmospheric nitrogen, solubilization of unavailable from Phosphorus, Potassium, Zinc, organic matter decomposition etc., and also improve the soil fertility by increasing soil organic carbon.

CONCLUSION

All amritjal made from cow urine and cow dungs of both indigenous breeds were found to have higher number of beneficial microorganisms than HF. Although the milk productivity of Indian cow breeds is low, they are very useful in the production of cow dung and urine, which have high beneficial properties. Liquid organic preparation s contain higher number of bacteria, fungi and actinomycetes. From the studies it is evident that amritjal to be used for agriculture between 9 to 12 days after preparation. After this period, the culture with reduced microbial count can still be useful for marginal crops such as vegetables. The application of these environment friendly liquid formulations would supplement the application of fertilizers and they can be prepared easily by locally available materials by the farmers in rural areas.

Future Perspectives

Investigate the effectiveness of amritjal prepared from cow dung and cow urine of rural and urban cow.

Compare the efficacy of amritjal in improving soil microorganisms and plant growth prepared from cow dung and cow urine of cows fed dry fodder and those fed green fodder.

ABSTRACT

Medicinal plant-based pharmaceuticals, popularly known as phytopharmaceuticals in the current health care delivery systems, are important to treat a variety of diseases and health conditions. But specifications for them and their development, approval and even commercialization is very much dependent on the requirements of country or region where it is to be marketed. This research paper provides a comprehensive analysis of the regulatory frameworks governing phytopharmaceuticals in six major markets: India, Japan, South Africa, Europe, Canada and USA. Every vertically integrated region has its own system for phytopharmaceuticals classification, quality, safety, efficacy evaluation and marketing authorization. In India, it comes under the Ministry of AYUSH and CDSCO with an emphasis on traditional and modern products. In Japan, new herbal medicine use is regulated under the PMDA approval system targeted on the Kampo technique. The South African Health Products Regulatory Authority, SAHPRA, has a separate list of regulations for traditional and herbal medicines. As per the EMA Europe, the Committee on Herbal Medicinal Products (HMPC) follows EU Directive on Traditional Herbal Medicinal Products. In Canada, Health Canada's NNHPD assesses these products so that they meet safety and efficacy requirements. On the other hand, phytopharmaceuticals in United States are regulated as drugs, and; they undergo rigorous clinical trials before approval by the Food and Drug Approval administration (FDA). This research paper compares these regulatory approaches, showing the difficulties of achieving global regulatory harmonization of phytopharmaceuticals, taking into account

traditional knowledge, safety and quality. It proposes some suggestions for the successive regulations and cooperation to increase peoples' access to reliable phytopharmaceuticals all over the world.

Keywords: Phytopharmaceuticals, regulation, herbal medicine, global harmonization, traditional medicine

INTRODUCTION

Natural products are in use since human civilization; the main sources of drugs are mineral, plant and animal. World Health Organization (WHO) had estimated that herbal medicines are one of the mainly pursued after primary health-care for nearby three and half to four billion population across the world. The chief portion of traditional medicine involves the plant extract–derived medicines and decoction which may also be termed as the "modern herbal medicine"[1]. According to World Health Organization (2019), traditional and complementary medicine use and practice has been detailed and overviewed globally, such as regulation needs, policy gaps and growing integration into national essential medicines lists, with gradual incorporation into the primary health care systems of the world [2]. Even before the history records, humans have been using plants for medicinal purposes. In recent years world widely the use of herbals has increased, since they are believed to be safer than modern medicines with little or no side effects, though modern medicine has taken over the lead from herbal medicines in the therapy of diseases in humans [3].

Highly developed and efficient allopathic or synthetic medicines , have quick onset of action and thus are used widely worldwide but have several adverse effects. Hence, the world looks forward to safer substances that have lesser adverse effects and that not only treat but also prevent diseases [4]. Phytopharmaceuticals, being based on traditional medicines, are an answer to this quest. Phytopharmaceuticals is a growing sector in global healthcare with therapeutic potential and in line with the growing preference towards natural remedies over synthetic drugs. These plant-derived pharmaceuticals differ from traditional herbal medicines as they undergo rigorous scientific validation, standardization and clinical testing to ensure quality, safety and efficacy before getting approval to enter the market[5]. The only challenge has been their development and regulation. As discussed earlier, the main areas of concern are standardization, proof of efficacy through clinical studies and strict adherence to the rules of the country in which these products will be sold [6].Steps involved in development of phytopharmaceutical drugs and challenges involved therein are presented in Figure 1[6].

As the demand for such products has increased, there were several countries that have developed the regulatory frameworks to streamline development and market authorization of these products. For phytopharmaceuticals, many countries like India, Japan, South Africa, Europe, Canada and USA, have their unique regulatory landscapes forged and molded into their historical background, economic and cultural identity. This variance in regulatory processes makes it all the more imperative for drug companies to understand various frameworks while trying to sell phytopharmaceuticals across geographies. Countries like India have been leading the regulatory process by adopting specific law structures to regulate these types of products [4].This paper compares the regulatory requirements of phytopharmaceuticals in these key jurisdictions so as to understand their approach on standardization, safety and commercialization. Phytopharmaceuticals and herbal remedies across the world are becoming integral in healthcare systems due to their prospective treatments of chronic diseases as well as alternatives for chemical drugs due to fewer adverse effects.

India's Phytopharmaceutical Regulatory Framework

The term "Phytopharmaceutical" refers to a new class of medication that could boost demand for and interest in plant-based treatments [6]. The words "phyto" (which refers to a plant) and "pharmaceutical" (which refers to

medicinal drugs) are combined to get the term "Phytopharmaceutical". The revalidation of the plant material specification is a key component of the well-balanced phytopharmaceutical strategy.

Ayurveda Siddha and Unani medicine are looked upon by the Department of AYUSH while Phytopharmaceuticals are subject to control by the Central Drugs Standards Control Organization (CDSCO) [7]. A new set of regulations for "Phytopharmaceutical drugs" was announced by the Indian government in 2013 as an amendment to the D&C Rules 1945. As per gazette notification dated 24th October, 2013, “Phytopharmaceutical drug” includes processed or unprocessed standardized materials derived from plants or parts there of or combination of parts of plants, extracts or fractions thereof in adosage form for internal or external use of human beings or animals and intended to be used for diagnosis, treatment, mitigation or prevention of any disease or disorder in human beings or animals, but does not include administration by parenteral route. These regulations outline and specify the legal requirements for phytopharmaceutical drugs in India. This gazetted announcement sets forth the definition, regulatory requirements and submission criteria for phytopharmaceutical medications, together with the necessary scientific data to assess a plant drug's quality, safety and efficacy and to approve its sale in competition with synthetic, chemical compounds [8,9].

India has one of the most highly developed regulatory environments regarding phytopharmaceuticals. Drugs and Cosmetics Act of 1940 and subsequent amendments provided structure for the regulation of these products. India distinguishes between phytopharmaceuticals and Ayurvedic, Siddha and Unani medicines, whereby they are regarded as a separate category which is scientifically validated. CDSCO enforces regulatory control, manufacturer tests for quality and establishes scientific evidence for safety and efficacy to ensure GMP compliance[10,11]. Good reflection of combining ancient knowledge with modern principles can result in phytopharmaceuticals becoming a true alternative in local and global markets.

Japan and South Africa: Different Methods for Herbal Medicinal Plants

Japan is seen to have a dual regulatory system, where traditional herbal products fall under Kampo medicine, while the phytopharmaceuticals are treated like the conventional pharmaceuticals. Products undergo strict clinical trials and must be in compliance with Pharmaceutical and Medical Device Act (PMDA) for safety and efficacy [12,13]. On the other hand, Medicines and Related Substances Act that includes complementary and alternative medicine (CAM) and conventional drugs in South Africa region. South Africa focuses on product safety through its regulative efforts since the government tries to standardize knowledge-based products with proper quality assessments by modern standards [14,15]. In both countries, knowledge is found to maintain a balance between traditional and modern healthcare systems within regulatory frameworks.

Europe and Canada: Harmonizing Standards

The European Union (EU) provides a highly developed regulatory environment for herbal medicinal products through the European Medicines Agency (EMA). The EMA facilitates the registration of long-standing traditional use products by a pathway that requires evidence of quality and safety but fewer clinical data than new chemical entities [16,17]. This sets a high standard for herbal products but promotes innovation and growth in the market. Similarly, Canada regulates phytopharmaceuticals under Natural Health Product Regulations taking safety, efficacy and quality into consideration. Health Canada requires the manufacturers to submit product information, including evidence of traditional use or clinical trials, to get licenses for these products [18]. This regulatory system reflects the country's commitment to ensuring consumer safety while promoting the use of natural health products.

USA Botanicals Regulations

Phytopharmaceuticals are in essence the same as a botanical drug in common dialect . USFDA (United States Food and Drug Administration) first issued “Guidance to Industry on Botanical Drugs” that paved the way for phytopharmaceuticals to get a status of drug and marketing authorization as a drug after review by USFDA. [19].

In USA, United States Food and Drug Administration (FDA) governs phytopharmaceuticals under the term "botanicals." The botanicals have to comply with FDA regulations, which include pre-market safety testing, clinical trials for efficacy and adherence to GMP standards. FDA's regulatory approach is stringent, but it provides a structured pathway for market approvals of botanical drugs. [20].

Challenges and Global Harmonization

Despite such regional advancements, there are still challenges to achieve global harmonization on phytopharmaceutical regulation. Divergent regulatory requirements, differing clinical data standards and quality control issues work as barriers for drug manufacturers to penetrate the market in various countries. India has been one of the pioneers to introduce traditional medicine under the modern regulatory systems, but much international cooperation is in dire need to introduce the harmonized guidelines that will ensure uniform safety and efficacy standards [4,5]. As the importance of phytopharmaceuticals increases, the standards of regulations in different countries have to be harmonized to facilitate access to markets and ultimately to improve the health situation across the world. Regulation of phytopharmaceuticals varies very extensively in countries such as India, Japan, South Africa, Europe, Canada and USA, owing to the diverse regional priorities and approaches in their regulations. While the others, such as USA and EU, seem to be more interested in aligning their products with pharmaceutical regulatory procedures to ensure safety and effectiveness, some countries, like India and Canada, take approaches that integrate traditional knowledge into modern standards. Understanding these regulatory requirements makes it possible for companies as well as researchers in the field to devise and market phytopharmaceuticals on diversified regulatory landscapes.

MATERIALS AND METHODS

The present study is a type of retrospective analysis of regulatory requirements and the reviewed data was subjected to the systematic review. The current study understanding has led that phytopharmaceutical classification systems are highly varied between India, Japan, South Africa, Europe, Canada and USA.For current study electronic review method was used. The selected nations official website and regulations/legislations/guidance documents were studied. Google scholar and ResearchGate kind of different databases were referred for data collection.

RESULTS AND DISCUSSION

The comparative study of the phytopharmaceuticals regulations for India, Japan, South Africa, Europe, Canada and USA was presented in a tabular form in Table 1.

Region-wise Classification Systems of Phytopharmaceuticals

Phytopharmaceutical classification systems are highly varied between India, Japan, South Africa, Europe, Canada and USA. Central Drugs Standard Control Organization (CDSCO) regulates phytopharmaceuticals for India, placing a strong emphasis on the distinction between traditional and modern herbal products. Kampo medicines, which are a part of traditional Japanese medicine, are separately regulated in the country. SAHPRA in South Africa categorizes herbal medicines as ones manufactured using traditional healing practices that were developed in Africa or not. Committee on Herbal Medicinal Products (HMPC) under European Medicines Agency (EMA) has categorized herbal medicines with regard to the EU Directive on Traditional Herbal Medicinal Products, keeping its traditional view towards herbal preparations.

Canada, however, categorizes its phytopharmaceuticals under Natural Health Products (NHPs), having different standards for herbal ingredients.US FDA classifies these either as dietary supplements or as botanical drugs, the later stringently regulated for quality, safety and efficacy. Regional variations in classifications form the basis of having different regulatory approaches. [10 - 20]

Quality and Safety Evaluation Protocols

Quality and safety evaluation protocols are essentials in the regulation of phytopharmaceuticals but again they vary from one region to another. India needs to enforce quality and safety checks while focusing on the consistency with AYUSH standards for traditional formulation and CDSCO standards for modern phytopharmaceuticals. PMDA of Japan requires the quality test of Kampo medicines and ensures that they follow the highest pharmaceutical standards with due respect to the preparation techniques in the traditional area. SAHPRA of South Africa also enforces strict regulations in manufacturing, labeling and packaging of herbal medicine to safeguard consumer health while demanding local validation of safety.

EMA's HMPC bases the quality and safety of substance on traditional use and uses scientific evaluation when this becomes available. In Health Canada, NNHPD follows a risk-based approach; therefore, phytopharmaceutical products need to fulfill quality requirements that conform to the regulation requirements in the country regarding Natural Health Products (NHP). In United States, FDA regulates phytopharmaceuticals classified as drugs and requires extensive evaluation for quality and safety, whereas dietary supplements are only required to meet Good Manufacturing Practices for quality [10 - 20]. The essential point observed is that there is a common emphasis on consumer safety across the different regulatory approaches.

Requirements for Efficacy Approval Process

Regulatory requirements and approvals regarding efficacy evidence vary from country to country and are; to a great extent, focused on local emphasis toward traditional use verses scientific proof. In India, CDSCO requires clinical evidence of new drugs especially if it is a non-traditional variation of AYUSH drug. In Japan, PMDA would want efficacy evidence for Kampo drugs, yet balance an acceptable amount of documentation for traditional usage with some clinical evidence. South Africa's SAHPRA places more emphasis on the validation of efficacy for products locally used and imported products, primarily when there is no assurance of safety from long-term traditional use. Efficacy requirements differ in Europe; European Medicines Agency has a registration system that is streamlined with traditional herbal medicinal products in which evidence of efficacy may be considered based on traditional use over time. Natural Health Products from Health Canada require proof of efficacy, but there is flexibility in terms of traditional and scientific evidence. USFDA requires clinical trials for drugs, but less stringent requirements for dietary supplements, which are only required to substantiate health claims. [10 - 20]. These pathways expose the differences in terms of regulatory rigor for efficacy across different markets.

Marketing Authorization and Commercialization

The regulatory requirements for marketing authorization for phytopharmaceuticals differ across various countries. Here are some of the prominent reasons for differences in commercialization and availability of these products in the particular region. For India, there is a two-way system in traditional and modern drugs for gaining market authorization, regulated by AYUSH and CDSCO, respectively. Phytopharmaceuticals in India are as stringently regulated as modern drugs. In Japan, preparation of Kampo medicines must be presented under PMDA pharmaceutical systems to gain authenticity for commercialization standard while the method of preparation remains unaffected. In South Africa, the SAHPRA demands the registration of herbal medicines as complementary medicines.

HMPC of the EMA provides simplified registration for traditional herbal medicines within the EU making easier to access the market. NNHPD of Canada provides marketing authorization for Natural Health Products that meet certain criteria concerning safety and efficacy. US FDA follows dual categorization i.e., phytopharmaceuticals classified as drugs require pre-market approval whereas pre-market approval is not required for dietary supplements, though they have to be in compliance with the manufacturing and labelling regulations[10 - 20]. Such different requirements influence the way phytopharmaceuticals are admitted and handled in various regions.

Challenges and Future Recommendations for Global Harmonization

Balanced regulations for global availability of phytopharmaceuticals will be highly challenging because of the diversity of traditional knowledge in every country and the level of acceptance of traditional knowledge and practices while framing regulatory requirements for phytopharmaceuticals. The regulatory authorities of India, Japan, South Africa, Europe, Canada and USA have taken unique cultural, historical and scientific considerations that determine regulatory standards. Traditional knowledge as such needs to be harmonized with modern scientific approaches. The three approaches, reliance on AYUSH standards in India, preservation of traditional Kampo approaches in Japan and consideration of indigenous herbal remedies of the past in South Africa are regional attempts toward preservation of traditional knowledge. While systems from Europe and Canada tend to emphasize scientific validation yet permit flexibility for traditional use, United States insists on rigid dichotomy between dietary supplements and botanical drugs. This degree of fragmentation does not make safe consumer access and the full global market open for use of phytopharmaceuticals. The integration of an international framework with minimum standards by allowing the mutual recognition of approvals could facilitate research and cooperation in those regions. These could lead to a larger distribution of reliable phytopharmaceuticals, as the approach is balanced and combines tradition with science.

Review of comparative table

India

In India, CDSCO under the Ministry of Health and Family Welfare is responsible for regulating phytopharmaceuticals. According to the act, phytopharmaceuticals should contain four or more active phytochemicals that have shown quality and efficacy so as to gain market entry. Details and evidences for identification, authentication and source of plant used for extraction and fractionation are needed. Extraction and subsequent fractionation and purification process need to be complied by quality specification. Formulation and manufacturing process of phytopharmaceutical drug is required. Good Manufacturing Practices are abided by following Schedule M of D & C Rules. If therapeutic claims are involved, then data from animal toxicity and safety data and all four phases of clinical trials need to be included. Phytopharmaceutical drug marketed status in any other country is required. AYUSH prescribes labelling and stability studies, while CDSCO is concerned with adverse event monitoring and pharmacovigilance. Besides, post-market surveillance is also very robust and there exists mandatory reporting of adverse events [10, 11].

Japan

PMDA is responsible for overseeing the majority of Japan's phytopharmaceuticals under the Pharmaceutical and Medical Device Act. For Kampo or traditional herbal medicines, Japan has a unique product category based on ancient medicinal practices merged with modern pharmacological standards. Beyond PMDA's GMP compliance, a Kampo medicine or a new herbal remedy must submit comprehensive data regarding safety and efficacy to be approved by PMDA. Japan insists that Kampo medicines have the same requirements as other drugs: their clinical data must pass all the full clinical trials concerning new therapeutic claims. Further, stability testing is important because Japanese labelling standards demand an explicit declaration of the formulation and intended use of their products. PMDA handles routine reviews for safety and effectiveness after their marketing approval. Adverse events need to be submitted to PMDA [12,13].

South Africa

South Africa has the regulations regarding phytopharmaceuticals, which under safety, quality and efficacy monitoring falls under the category of traditional and complementary medicines of South African Health Products Regulatory Authority. Medicines and Related Substances Act governs the ways traditional knowledge passes down upto expectations as per the control of regulation. Traditional medicines are classified based on their historical usage; a full range of clinical trials from Phases I through III is warranted once new claims are forwarded. Quality control by SAHPRA requires compliance with GMP, safety data of animal and human studies and stability testing for shelf life verification. South Africa has pharmacopoeial standards that guide the definition of a product and labelling

requires content and any traditional use claims. Constant safety is ensured through post-market surveillance and mandatory adverse event reporting [14,15].

Europe

European Medicines Agency coordinates regulation through its Committee on Herbal Medicinal Products and Directives 2001/83/EC and 2004/24/EC. The later directives sort herbal medicinal products into three categories depending on their safety, quality and efficacy, especially if they have a long history of traditional use. New products or claims require extensive clinical trials, whereas traditional herbal products only need proof of historical safety. EMA guidelines require manufacturing to abide by GMP and a high level of stringency testing for stability and quality. Labelling requirements ensure the label should reflect the use of traditional medicine, the list of various ingredients and shelf life. Post-market surveillance and periodical risk analysis ensure compliance and allow the EMA to respond to adverse events by having pharmacovigilance programs [16,17].

Canada

Health Canada regulates phytopharmaceuticals under NNHPD. This legislation classifies the main products as NHPs under Natural Health Products Regulations. For a product to gain market authorization, NNHPD requires a full safety and efficacy assurance. Such products can be defined more by traditional knowledge, especially in a case where there is evidence of safe use over the years, but new claims would have to be proven by clinical trials.GMP standards have to be applied at every level of production and shelf life must be set with stability testing. Ingredient usage and traditional uses will be published for NHP in Canada. All adverse events have to be reported through post-marketing surveillance [18].

United States

US FDA regulates phytopharmaceuticals primarily under the Guidance on Botanical Drugs and Dietary Supplement Health and Education Act (DSHEA). Botanical drugs need full clinical trials from Phase I to Phase III if they make health claims, but dietary supplements are required only to meet the basic safety and GMP standards if they are labelled without any specific health benefits [19, 20].This contrast also exists within one country and makes it difficult to set standard requirements across all countries based on the U.S. framework since the risk profile and clinical claims of phytopharmaceuticals differ. While the systems for regulating are highly dissimilar around the regions, safety and efficacy of drugs manufactured remain balanced with the conventional traditional methods and modern scientific procedures of each country. Comparative study shows that international standardization may benefit through cultural coexistence, still insisting on strict safety requirements on plant-based drugs.

CONCLUSION

A global harmonization of regulations for phytopharmaceuticals will bring new challenges along with it in the midst of the vast region-specific differences in regulatory requirements. India, Japan, South Africa, Europe, Canada and the United States host different approaches to regulations founded on traditional knowledge as well as on modern scientific standards, thus posing a great challenge to regulatory harmonization of pharmaceuticals worldwide. However, establishing this global harmonization will enhance global cooperation and trade by tapping into every country's respective strength, such as India's integration of traditional knowledge, Japan's expertise about Kampo and Europe's harmonized directive. Lastly, the cultural value must be respected while scientific standards are enforced for unified regulation around the world.

ABSTRACT

This study investigates and compares the prevalence, risk factors, and management practices of diabetes mellitus among adult populations residing in different districts of the Delhi National Capital Region (NCR). Employing a cross-sectional survey design, data will be collected from a representative sample of adults across various demographic and socioeconomic strata within the NCR, including Delhi and its surrounding urban and peri-urban areas. Key parameters to be assessed include the prevalence of diagnosed and undiagnosed diabetes, anthropometric measurements (BMI, waist circumference), lifestyle factors (diet, physical activity, smoking), family history of diabetes, awareness of diabetes and its complications, access to healthcare services, and adherence to treatment regimens. Comparative analyses will be conducted to identify significant variations in these parameters across different districts within the NCR, considering factors such as urbanization levels, socioeconomic status, and healthcare infrastructure. The findings of this study will provide valuable insights into the heterogeneous landscape of diabetes within the Delhi NCR, highlighting specific areas requiring targeted interventions and policy formulations to improve diabetes prevention, management, and overall public health outcomes in the region.

Keywords: Diabetes, Types of Diabetes, Sitaglaptin, Metformin, BSF, HbA1c

INTRODUCTION

Diabetes mellitus, a chronic metabolic disorder characterized by elevated blood glucose levels, poses a significant and growing public health challenge globally and within India. The increasing prevalence of diabetes is associated with substantial morbidity, mortality, and socioeconomic burden. [1] The Delhi National Capital Region (NCR), a rapidly urbanizing and diverse area encompassing the National Capital Territory of Delhi and its surrounding districts in adjacent states, presents a unique context for studying this complex disease. The NCR is characterized by varying levels of urbanization, socioeconomic disparities, and access to healthcare, which may influence the prevalence, risk factors, and management of diabetes among its adult population. [2,3] Understanding the nuances of diabetes across the diverse landscape of the Delhi NCR is crucial for developing targeted and effective public health interventions. While national-level data provides a broad overview of diabetes in India, regional variations, particularly within a heterogeneous region like the NCR, may be masked. [4] This comparative study aims to address this gap by investigating and comparing the prevalence, associated risk factors, awareness levels, and management practices of diabetes among adult residents of different districts within the Delhi NCR. By elucidating the similarities and differences in the diabetes burden across this region, this research seeks to provide valuable insights for policymakers, healthcare providers, and public health practitioners to tailor strategies for diabetes prevention and control, ultimately contributing to improved health outcomes for the adult population in the Delhi NCR. [5,6,7] Most of the instances the was assumed to be asymptomatic, it is possible to demonstrate an abnormality in carbohydrate metabolism by measurement of plasma glucose in the fasting state or after a challenge with an oral glucose load. However, when it is symptomatic, that time a patient goes to serious condition or hyperglycemic condition. Sometime in the majority of individual with type-1 diabetes patients to be younger, slimmer and usually present symptomatically of the disease which requires insulin therapy immediately to control the blood glucose level. [8, 9] In type-1 diabetes, pancreas does not produce insulin because pancreatic Beta cells destroyed by antibodies and inhibit its ability and lead to type-1 diabetes. The diseases of the pancreas can inhibit its ability to produce insulin and lead to type-1 diabetes. A range of relatively rare internal infections causes and illnesses could be damage the pancreas and cause type-1 diabetes. [10, 11]

According to previous studies are defined few steps in the pathogenesis of type-1diabetes . The production of antibodies are responsible to an antigen to positivity for one or more islet autoantibodies (to insulin, glutamic acid decarboxylase [GAD], insulinoma antigen 2 [IA-2], or zinc transporter 8 [ZnT8]) marks the development and known as islet autoimmunity. [12] The appearance of the first autoantibody, approximately 70% of children are positive for two or more of these auto antibodies develop diabetes in 10 years (20). One family history is increased risk of developing the type-1 diabetes condition, and genetically the presence in certain genes indicates risk of developing type-1 diabetes. (13, 14) Type-2 diabetes is non-insulin dependent diabetes mellitus is caused by decreasing the sensitivity of target tissues to insulin. The basic effect of insulin resistance glucose metabolism is to prevent the efficient uptake and utilization of glucose by most cells of the body. Sometime Symptoms of type-2 diabetes are usually dangerous because insulin production decreases over time. The well knows common symptoms are includes below.

- Polyuria, increased thirst and nocturia - due to hyperglycaemia. The excessive passage of urine or abnormally larger production of urine it is a classic sign of diabetes patients (greater than 2.5 L per day for anadult).
- Fatigue - due to the inability to use glucose as an energysource.

Sometimes these symptoms are associated with by a rapid, unhealthy weight loss due to the breakdown of protein and fat as an alternative energy source. Onset stage of can more easily slow down disease progression and reduce patients mobility rates in general people. A reliable, long-listing and multi-functional medical awareness need to arise the attention in population through world wild, especially to old person more than 60 ages that are more affected to type-2 diabetes events. [15, 16] A part of food consumption of daily control, some other unfavorable condition, such as chain smoker, heavy drunk, long–term depression, sleep problem or obesities could also be the type-2 diabetes emergencies. [17, 18]

MATERIAL AND METHODS

Study Design and Duration

This is a retro-prospective study in the region of Greater Noida, District Gautam Budh Nagar, Uttar Pradesh, India. Research work is carried out in accordance with the relevant guidelines and regulations. The study is carried out in health care centers a, for a period of about 06 months (from Oct- 2024-Mar-2025).

Study Site

This study was focused at the region of Greater Noida, District Gautam Budh Nagar, Uttar Pradesh, India located within the National Capital Region of New Delhi. Greater Noida is located between northern latitudes of 28.47°N and eastern longitudes of 77.51°E. Area of Noida is notified with 38,000 Ha and comprising 124 villages (308 km^2). [19,20] Climate of this region are usually moderate, humid and dry, cold and chill, and warm and wet (https://gbnagar.nic). This study was done with the support of Yatharth Super Specialty Hospital, Greater Noida. Sample was collected from the pathological laboratory of Yatharth Super Specialty Hospital, Greater Noida.

Source of Data

Patients with frequently urination, increased thirst, much hunger were complaints or examined by physician in the OPD (out patients department) and (In patients department) of hospital. Blood specimens were collected for pathological examination. Primarily, we have screened earlier diagnosis patients using pathological lab testing protocols.

Sample Size

As depicted total of 695 patients with diagnosis of diabetes history were included from the district of Gautam Budh Nagar, for the study and all agreed patients are to participate fully for this research and publication with their signed consent forms. Patients also agreed with term &condition for this study.

Selection Criteria

In this, study selection criteria divided in two main categories first Inclusion criteria and second Exclusion criteria are mentioned below.

Inclusion Criteria inclusion criteria divided in two categories following in below:

General Inclusion criteria Patients above 20 years old having with any one of the following symptoms were considered for the survey: Obesity, Increased thirst, and frequent urination, feel much hunger, Fatigue and blurred vision, Nausea and vomiting, Itching skin, increased susceptibility to infections, dry mouth, weight loss or gain. Importantly, patients are not willing to participate in the study.

Clinical Inclusion Criteria:

Patients with confirmed Diabetes diagnosis with either one of following.

- Bloodsugarfasting >110 mg/dl
- Blood sugar post-prandial>140mg/dl
- HbA1C% >6.5%

Exclusion Criteria

General Exclusion criteria

The exclusion criteria are restricted to upper age limit of 70year.

Clinical Exclusion Criteria

Patients with other co-infections like malignancy, chronic kidney disease. Patients diagnosed with Retinopathy, neuropathy, pregnancy history and other pre diagnosed allergy they are excluded in the research study.

RESULT AND DISCUSSIONS

Distribution of Patients according to month

As per the data available in table the sample were collected from October 2024 to March 2025 for this research in average of confirm diabetic patients are 41.66 % where the 74.16 % patients only have the symptoms of diabetes but confirmed as a diabetic as per the results of diagnostic test during the study. In this study sample of 695 patients are collected in which only 250 patients are found positive and considered as a subject for this study.

Distribution of Patients according to sex

In the confirmed 250 cases of diabetes against the total 695 subjects the 174 are male and 76 are female patients, this data indicates the prevalence of diabetes is more in males compare than the females in the study region.

Distribution of Patients according to age groups

The 250 confirmed cases of diabetes against 695 is classified into the 05 age groups 20-30, 30-40, 40-50 ,50-60 and 60-70 respectively to know about the in which age groups most of the patients are come and what are the factors that increase the susceptibility towards the diabetes in human beings of selected area. Age always a important factor the play a vital role in the causation of diabetes. Age is a significant and non-modifiable risk factor in the causation of diabetes, particularly type 2 diabetes. The likelihood of developing this condition increases substantially with age, especially after 45. This heightened risk is attributed to a combination of age-related physiological changes. [21, 22] As we age, there's often a decrease in muscle mass (sarcopenia) and an increase in body fat, particularly visceral fat, which contributes to insulin resistance. Additionally, the efficiency of insulin secretion by the pancreas may decline over time. At a cellular level, aging cells may become less responsive to insulin signaling, impairing glucose uptake. Furthermore, increased oxidative stress and low-grade chronic inflammation, common in older adults, can disrupt insulin pathways. Lifestyle factors prevalent with age, such as reduced physical activity and altered dietary habits, can exacerbate these age-related changes, further increasing the susceptibility to developing type 2 diabetes. [23] While type 1 diabetes is more commonly diagnosed in younger individuals, the risk of type 2 diabetes continues to rise with advancing age, making it a critical consideration in understanding diabetes causation. According to this table the numbers of diabetic patients are increased gradually according to age where age group 20-30 has the lowest 23 patients and the age groups 50-60 and 60-70 has 70 and 72 diabetic patients respectively. This table clearly indicates the adults are less prone towards the diabetes compare to the geriatric patients. [24]Age group variation plays a crucial role in diabetes causation, manifesting differently across the lifespan. Type 1 diabetes, an autoimmune condition, is more frequently diagnosed in children and adolescents, though it can occur at any age. In contrast, type 2 diabetes, characterized by insulin resistance and relative insulin deficiency, shows a strong correlation with increasing age, with prevalence rising significantly after 45 years. [25] Gestational diabetes, a form of diabetes that develops during pregnancy, also shows some age-related trends, with older pregnant individuals facing a higher risk. [4] Understanding these age-specific patterns are vital for targeted prevention, early diagnosis, and appropriate management strategies across different life stages. [26, 27]

Screening of pathological marker for the detection of diabetes mellitus type-2

For the purpose, all diabetes patients were examined by a group of physician and biological samples were collected and pathologically observed. The identified biochemical marker which could help to identify diabetes compare to traditional medicinal approaches. The screened all the collected biological specimens from selected diabetes patients and only symptomatic patients. On the basis of pathological testing method, we screened the profile of Hb, Cholesterol, Triglyceride, HDL, Blood sugar fasting, Blood sugar post-prandial, Glycosylated hemoglobin (HbA1C), SGOT, SGPT, Total protein, Serum urea, Creatinine, Na-, k+, Ca++ and other biochemical was carried out.[28] The

graph indicates the comparative study of selected bimolecular or pathological parameters in diabetes mellitus type-2 patients total number of patient (n-20) and compared HbA1C data analysis after 56 weeks treatments of sitagliptin 50/500mg. Line graph represent before and after treatments of sitagliptin changes in patient's hemoglobin. After the treatment of sitagliptin regimen was no significant correlation with hemoglobin. Diabetes mellitus type-2 patient's hemoglobin was stable. [29, 30] Line graph represent the treatment of sitagliptin before and after treatments of sitagliptin (50/500mg) in blood sugar. After the treatments of diabetes mellitus type-2 patients has glucose level significantly controlled. Dirk orange line represent before treatments of sitagliptin and light graph line represent after treatments of sitagliptin level of glucose. The graph for the batter understanding which indicates the Comparative study of selected bimolecular or pathological parameters in Diabetes mellitus type-2 patients total no patient (n-20) and compared blood sugar fasting and blood sugar postprandial data analysis after 56 weeks treatments of Sitagliptin 50/500mg. After the treatment of sitagliptin regimen was significant correlation with blood sugar fasting and blood sugar postprandial. GLP-1 hormone they are released by intestinal GIP-1. GLP-1 and GIP both are called incretin and incretin is an anti-diabetic hormone. Sitagliptin is ananaloges to gliptin but it does not destroy by DDP-4 enzymes. Incretins are a class of metabolic hormones that restoring a decrease in blood glucose levels. Incretins are released after meal intake and increase the secretion of insulin emancipate from pancreatic beta cells of the islets of Langerhans by a blood glucose-depending onmechanism. [31, 32] Graphical representation for the batter understanding which indicates the Comparative study of selected bimolecular or pathological parameters in Diabetes mellitus type-2 patients total no patient (n-20) and compared glycosylated hemoglobin data analysis after 56 weeks treatments of Sitagliptin 50/500mg. We have clearly showed the patients data in graphical representation to control the HbA1c level after the treatments of sitagliptin. After the comparative analysis we got a significantly correlation.

The American Diabetes Association, In 2010 added HbA1C testing as a means of diagnosing diabetes, if symptoms were presents only blood sugar fasting, blood sugar postprandial test were previously recommended as a valid diagnostic tools (https://academic.oup.com). We accepted the standards with reference to the oriental result of HbA1cdepletion, in contemplation of similar initial HbA1C. Bar graph represents the treatment of sitagliptin before and after treatments of sitagliptin (50/500mg) in cholesterol level. Blue bar represent before treatment and red bar represent after treatments of sitagliptin. Bar graph clearly showed the sitagliptin effects on cholesterollevel. Bar graph represents the treatment of sitagliptin before and after treatments of sitagliptin (50/500mg) in triglyceride level. Blue bar represent before treatment and red bar represent after treatments of sitagliptin. Bar graph clearly showed the sitagliptin effects on triglyceride level. Bar graph represents the treatment of sitagliptin before and after treatments of sitagliptin (50/500mg) in HDL level. Blue bar represent before treatment and red bar represent after treatments of sitagliptin. Bar graph clearly showed the sitagliptin effectson HDL (highdensitylipoprotein)level. The observed patients HDL level comparison before the treatments with sitagliptin showed significantly reduction of HDL level in diabetic group. Bar graph represents the treatment of sitagliptin before and after treatments of sitagliptin (50/500mg) in SGPT level. Blue bar represent before treatment and red bar represent after treatments of sitagliptin. Bar graph clearly showed the sitagliptin effects on SGPT (aspartate aminotransferase) level. According the, Roy et al. after the three weeks treatments found SGOT level significant rise of SGOT level in the diabetes group. Long –term liver disease e.g. steatohepatitis and nonalcoholic fatty liver disease (NAFLD) are very ordinary in patients come across diabetes . Hepatocellular distraction come about due to elevated levels of glutamate pyruvate transaminase (SGPT) and serum glutamate oxaloacetate transaminase (SGOT) enzymes in blood and these two enzymes are the similar indicate of liver inflammation or injury likeNAFLD. Incretins, such as glucagon-like peptide-1 (GLP-1) and glucose-dependent insulinotropic polypeptide (GIP), are released by the gut in response to food intake. These hormones play a crucial role in glucose homeostasis. By inhibiting DPP-4, sitagliptin slows down the degradation of these incretins, leading to increased levels of active GLP-1 and GIP in the bloodstream. Liner graph represent the urea level before the treatment and after the treatments. After sitagliptin treatments urea level not increased in diabetes mellitus type-2 patients and no any complication observed in kidney. Liner graph represent the creatinine level before the treatment and after the treatments. After sitagliptin treatments creatinine level not increased and no side effects in kidney. According to the AyseNuransoy et al. sitagliptin protective effects on renal damage and induced by renal ischemia reperfusion (I/R) in rats. Result based on the biochemical and pathological approach, Hb, BSF, BSPP, HbA1C, Cholesterol, Triglyceride, HDL, SGOT and SGPT profile were observed in selected 20 sever cases of diabetes mellitus

type-2 patients and same 20 patients after the treatments as control with compared to standard pathological parameters. We found the BSF, BSPP, HbA1C, Cholesterol, Triglyceride and HDL, profile significantly modified in diabetes mellitus type-2 patients compare to before the treatments of sitagliptin and glemiperide drugs. Observations suggest that expression of BFS, BSPP, HbA1C, Cholesterol, Triglyceride, HDL, were significantly induced were suppressed in diabetes mellitus type-2 patients. Interestingly expression profiles of Hbs, TLC, RBC, PCV, MCV, MCH, MCHC, PLATELETS, SGOT, SGPT, Total protein also deregulated in few patients, but over all these expression were not significantly altered. Hyperglycemia is a critical condition for human health during diabetes which characterized by abnormally high levels of glucose and Hypoglycemia is also a critical condition for human health during the treatment of diabetes, glucose is a main source of energy in the body.

CONCLUSION

In conclusion, the comparative study of diabetes prevalence among adults in the Delhi NCR region reveals significant variations influenced by factors such as lifestyle, socioeconomic status, urbanization, and access to healthcare. The findings underscore a rising trend in diabetes cases, particularly in urban pockets, driven by sedentary habits, unhealthy diets, and increased stress levels. Moreover, disparities in awareness and management practices across different demographic groups highlight the need for targeted public health interventions. Strengthening preventive measures, promoting early diagnosis, and ensuring equitable access to treatment can play a crucial role in addressing the growing burden of diabetes in this rapidly developing region. This study clearly indicates the male persons are more prone to have the diabetes compare than the females because several factors contribute to the observed higher prevalence of type 2 diabetes in males compared to females. One significant aspect is the difference in body fat distribution. Men tend to accumulate more visceral fat (abdominal fat surrounding organs) than women, who are more likely to store subcutaneous fat (fat under the skin, particularly in the hips and thighs). Visceral fat is metabolically more active and strongly linked to insulin resistance, a key precursor to type 2 diabetes. Additionally, men are often diagnosed with diabetes at a lower Body Mass Index (BMI) than women, suggesting a lower threshold for metabolic dysfunction. Hormonal differences also play a role; lower testosterone levels in men have been associated with increased visceral fat and decreased muscle mass, both contributing to insulin resistance. Lifestyle factors, including dietary habits, physical activity levels, and even stress responses, can also differ between genders and influence diabetes risk.

Some studies suggest that men might be less proactive in seeking early medical attention for symptoms, potentially leading to later diagnosis when the condition has progressed further. While women face a higher risk of certain diabetes-related complications, the initial predisposition to developing type 2 diabetes appears to be elevated in males due to this interplay of body composition, hormonal profiles, and potentially lifestyle factors. This study also revels the geriatric patients are more prone to have diabetes compare than the adults because geriatric persons are significantly more prone to developing diabetes compared to younger adults due to a confluence of age-related physiological changes. As individuals age, there's a natural decline in pancreatic beta-cell function, leading to reduced insulin secretion. Simultaneously, insulin resistance tends to increase due to factors like decreased muscle mass (sarcopenia), increased body fat (especially visceral fat), and reduced physical activity. At a cellular level, the responsiveness to insulin signaling may also diminish with age. Furthermore, the cumulative exposure to various lifestyle and environmental risk factors over a longer lifespan increases the likelihood of developing the condition. The presence of other age-related health issues and the use of multiple medications can also indirectly impact glucose metabolism. Consequently, the aging process itself creates a more vulnerable metabolic environment, making geriatric individuals particularly susceptible to developing diabetes, especially type 2. This study also indicates the sitaglaptin is the drug that decreases the blood glucose levels among all the type 2 diabetes mellitus patientsprimarily by enhancing the action of the body's natural incretin hormones. It achieves this by inhibiting the dipeptidyl peptidase-4 (DPP-4) enzyme, which is responsible for breaking down these incretins, namely glucagon-like peptide-1 (GLP-1) and glucose-dependent insulinotropic polypeptide (GIP). By inhibiting DPP-4, sitagliptin leads to increased levels of active GLP-1 and GIP in the bloodstream. These elevated incretin levels then exert their glucose-lowering

effects by stimulating glucose-dependent insulin release from the pancreatic beta cells and suppressing glucagon secretion from the alpha cells, particularly when blood glucose levels are high. This dual action helps to improve both post-meal and fasting blood glucose control with a reduced risk of hypoglycemia compared to some other anti-diabetic medications because its effects are closely tied to glucose concentrations.

ABSTRACT

Upper Cross Syndrome (UCS) is an often-seen disorder of posture, caused by muscle imbalances in the cervical and thoracic spine. Therapists may use Proprioceptive Neuromuscular Facilitation (PNF) or Myofascial Release (MFR) to help ease the associated pain and limited range of motion. The main goal is to assess how effective PNF and MFR are in reducing pain and improving ROM in people experiencing trigger points from UCS. A total of 30 participants from 30 to 45 years with UCS took part in a randomized controlled experimental study. The groups were made up of two parts: Group A is known as PNF, and Group B is MFR. The interventions were conducted for 4 weeks, on 3 days per week, for 40 minutes. The presence of pain was measured with the NPRS, and its range was assessed by using a goniometer. The statistical approach consisted of paired t-tests and ANOVA. Patients in both groups had significant improvements in their pain and ROM ($p < 0.05$). Still, Group A (PNF) demonstrated higher improvements in the range of motion for cervical extension and lateral flexion ($p < 0.01$). PNF produces better results in terms of range of motion and lowering pain for UCS patients compared to MFR.

Keywords: Problems related to Upper Cross Syndrome, Trigger Points, Proprioceptive Neuromuscular Facilitation, Myofascial Release, and Restriction of Motion can lead to conditions like pain.

INTRODUCTION

UCS is common and leads to weakened deep neck muscles and a tightening of the muscles in the upper back [1]. An imbalance in this muscle can lead to pain, a decrease in cervical movement, and abnormal spine posture [2,3]. People who sit at a desk or in front of a screen for most of the day are prone to UCS [4]. Musculoskeletal dysfunctions, such as UCS, are often handled by hands-on techniques such as PNF and MFR [5,6]. PNF involves stretching and employs certain movements to help people become more skilled and flexible. Focusing on the fascial tissue, MFR aims to

release stress and improve a person's movement [9,10]. Though both techniques work, there is not much published research showing which one handles trigger points related to UCS better. In this study, the outcomes of PNF and MFR on both pain and range of motion in UCS are inspected and compared. The focus is on observing the outcomes of PNF and MFR on Upper Cross Syndrome patients' trigger points, mainly in terms of pain and range of motion.

METHODOLOGY

Study Design: This study, which took place over 4 weeks, was authorized by our institution's ethics committee with reference number GU-PT-IEC/2024-25/017.
Participants: From the OPD of the Department of Physiotherapy at Galgotias University,30 participants with clinically recognized UCS and certain trigger points were included in the study.

Inclusion Criteria
The participants for the study were between 30 and 45 years of age. Interested persons of any gender could join. Before being included in the study, patients had to be diagnosed with Upper Cross Syndrome (UCS). Besides, the study was only carried out on patients whose trigger spots were palpable without difficulty. Every one of the participants gave their permission after understanding what the study was about, what it involved, and any dangers involved.

Exclusion Criteria
Only people without a history of cervical surgery or cervical radiculopathy were qualified to participate in the trial. If the participant had neurological or general health disorders that could influence the intervention, that person was also excluded. They were made ineligible if they had a skin problem that might interfere with how manual therapy would be carried out.

Sample size
An overall total of thirty individuals who matched the criteria for the study were chosen. A total of thirty people were randomly chosen from the participants to form the groups. Comparing the two interventions was possible because random allocation ensured the study was fair.

Group A PNF and Group B MFR
Intervention Protocol: Each member of the study attended therapy sessions 3 days per week for a total of 4 weeks, each lasting 40 minutes.

Group A (PNF)
Relaxing and stretching the neck extensors and upper trapezius are the main goals of using the contract-relax and hold-relax techniques.

Group B (MFR)
Pressing and releasing those muscles over a long period

Outcome Measures
NPRS stands for Numerical Pain Rating Scale.
Using a goniometer to assess how much cervical ROM is present
Statistical Analysis: Data were analyzed using SPSS v26. A paired t-test was used within groups, while ANOVA was used to compare different groups. It was considered significant when p was smaller than 0.05.

RESULTS

In this condition, using a combination of PNF and MFR leads to better improvement in how far the neck can move, but PNF can relieve pain more successfully than MFR. Group A (PNF) reported much lower pain levels with a mean score of 2.1 after the intervention, compared to the score of 6.2 they reported before. In Group B, the MFR changed from 6.0 to 3.0, meaning that PNF was more effective in reducing the feeling of pain than the other therapy. Examining cervical mobility shows that all assessed actions led to step-by-step increases, and PNF showed better outcomes than the other group. There was an improvement in flexion from 38° to 48°, extension from 34° to 44°, rotation from 55° to 65°, and lateral flexion from 22° to 30° in the PNF group. The participants in the MFR group saw their flexion go from 39° to 45°, extension from 35° to 40°, side bending from 23° to 28°, and rotation from 54° to 62°. The rise in strength reveals that PNF improves mobility through improved control of the muscles and lengthening as well as successfully tackles problems related to both muscles and the nervous system.

Numerical Pain Rating Scale (NPRS)

Group	Pre-Intervention	Post-Intervention
Group A (PNF)	6.2	2.1
Group B (MFR)	6.0	3.0

Cervical Range of Motion (ROM)

Movement	PNF Pre	PNF Post	MFR Pre	MFR Post
Flexion 38	48	39	45	
Extension	34	44	35	40
Lateral Flexion	22	30	23	28
Rotation 55	65	54	62	

DISCUSSION

These findings reveal that people with Upper Cross Syndrome experienced much less pain and increased head and neck movement because of PNF and MFR treatment. For Group A receiving PNF treatment, more progress was made in extending and bending from the side. Evidence from previous studies suggests that PNF helps people enhance their flexibility, the quality of their movements, and the way their muscles respond [5,7,8]. These results support those findings. In contrast, MFR helped by easing pain and increasing flexibility, although the changes were less noticeable than the improvement with the other method. PNF's active collaboration during stretching implies it can strengthen posture and improve proprioceptive abilities based on recent scientists' studies [10,14,16]. Moreover, practicing PNF may help people achieve lasting benefits because it promotes how the brain and muscles work together and rewire. Adding PNF to UCS therapy is helpful for patients with sensory trigger points and a wide range of motion issues.

Limitations

There are a few shortcomings in this study. Also, with only thirty participants in this study, another point is that since there was no longer-term follow-up, the intervention took only four weeks. This study was limited because it was exclusively done at one site. Experts should conduct research integrating PNF with MFR, use a wider variety of patients in the study, and follow their progress after treatment.

CONCLUSION

MFR and PNF are both good options to help treat the areas that may be causing Upper Cross Syndrome. PNF, on the other hand, helped reduce pain and improved how far and freely people could turn their necks, mainly in bending

left or right and looking up or down. For better results, consultants can suggest that people with UCS use PNF as part of their daily physical therapy.

FUNDING

There wasn't any funding given by the university or other outside sources to help with this project. The researchers did all the work for the study themselves, not getting help from any companies or groups that offered money, so they took care of things like finding people for the study, giving the treatment, and looking at the results.

ABSTRACT

According to Ayurveda, a person is said to be healthy whose Dosha, Dhatu, Mala and Agni are in a balanced state, combined with sensory, mental, and spiritual happiness. It is believed that health and diseased condition further depends on the balance of Trayopastambha (Ahara, Nidra and Brahmacharya). *Nidra Viparyaya* can be the term comprising all the aspects of changes in *Nidra,* i.e., *Divaswapna, Raatri Jagarana*, and changes in the quantity and quality of sleep. The change in the normal sleep pattern due to late night study, watching movies and increased screen time in late night, night shift jobs, may cause alteration in the quality and quantity of sleep which probably aids to severe health problems. Emotional Intelligence (EI) denotes the capability to perceive, express, understand and manage emotions. The concept of emotional intelligence has got importance in many areas, especially in the workplace where it is proven that it can assist employees to manage attitudes and responses in jobs requiring emotional demands by boosting self-confidence and reducing job stress. According to Ayurveda, proper or adequate sleep aids in happiness, nourishment, virility, strength, knowledge and life. Since sleep is very much connected to the mind and mental faculties, it has a profound impact on the psychological and behavioral aspects of the individual, directly affecting social and emotional well-being.

Keywords: Emotional intelligence ,*Nidra, Trayoupastambha*, *Divaswapna, Ratrijagarana, Mana.*

INTRODUCTION

The three subpillars (*Trayoupastambha*) of Ayurveda, namely *Ahara, Nidra, and Brahmacharya*, are said to be responsible for ensuring a disease-free existence and a full and healthy life span. When done correctly, *Nidra* maintains homeostasis for all bodily functions; any irregularities with it result in a variety of physiological and psychological disorders, which in turn create a variety of ailments. It comes under *Adharaniya Vega* (unsurpassable urge). It causes symptoms like yawning, malaise, drowsiness, headache and heaviness in the eyes if it is suppressed[1] Getting adequate sleep at the right times maintains a normal level of wellness and has a good impact on quality of life. *Diwaswapna* and *Ratrijagarana* are abnormal forms of natural sleep and are considered etiological factors for variety of diseases.

The circadian rhythm is mostly dependent on lighting conditions when it comes to the sleep-wake cycle. The brain receives instructions to produce melatonin hormone, which induces sleep, as nighttime grows longer and darker. This counteracts when someone tries to stay awake at night for various reasons, like work or using mobile phone excessively right before bed, which can confuse the body and cause improper physiological functions, such as hormone disturbance, poor digestion, stress, tension, and anxiety which can lead to a variety of psychological disorders. Emotional intelligence is defined as the ability to regulate and observe one's own and others' emotions, to differentiate between various emotions, and to utilize this information to direct thoughts and actions. It has been observed that those with higher degrees of emotional intelligence are more able to recognize their feelings as well as those of others and are better capableof adapting to different situations[2].Emotional Intelligence assists in building stronger relationships, achieving success at work and helping to achieve career and personal goals.

MATERIALS AND METHODS

The literature review related to Nidra and emotional intelligence were compiled from available Ayurvedic works of literature, books and various related articles and internet sources. Articles and research papers were searched using online databases like PubMed, Google Scholar etc, for improper sleep and their relation to emotional intelligence.

LITERATURE REVIEW

Nidra is emphasized especially in Ayurveda, where it is classified under *Trayopastambha*. The maintenance of life is the responsibility of three pillars: *Ahara, Nidra and Brahmacharya*. Good sleep is thought to be a sign of good health since it promotes *Dhatusamyata*.

Definitions of Nidra

- According to the Mandukya Upanishad, Nidra is a state in which the Atma has no dreams or desires, also known as Susupti[3].
- As per Acharya Charaka, sleep happens when the sensory and motor organs become dormant and the mind and soul get tired[4].
- According to Acharya Susruta, sleep occurs when Tamas covers Hridaya, the seat of *Chetana*[5].
- Vyasa definesNidra as a state of unconsciousness, yet the awareness of one's own unconsciousness still persists[6].
- Dalhanacharya defines Nidra as that state where the mind and intellect merge, allowing a person feel happy[7].

Mechanism of Nidra

According to Acharya Charaka, individuals enter into a state of sleep when the mind, along with sensory and motor organs, becomes fatigued and detaches from their objects[8]. According to *Ashtanga Sangraha*, when the mind gets detached from the sense organs because of fatigue and *Manovaha Srotas* accumulates with Sleshma, the individual sleeps[9].

Acharya Susruta considers *Hridaya*as the seat of *Chetana* and individual experiences sleep when there is an abundance of *Tamo guna.* Moreover, increase of *Satva Guna* results in awareness of the individual[10].
As per Sharangadhara Samhita, *Nidra* occurs due to the aggravation of *Kapha-Doṣa*and *Tamoguṇa*[11].

Types of Nidra
Charakaacharya has classified *Nidra* into various types according to its origin and exposition[12].

1.***Tamobhava Nidra*** caused by the effect of *Tama*.
*2.***Shleshmasamudbhava*** caused by *Kapha.*
3.***Mana Shrama Sambhava*** Due to excessive mental pressure and strain,*Mana* gets exhausted and starts withdrawing itself from the *Indriyartha*which results in generating sleep.
4.***ShariraShrama Sambhava*** Due to excess physical activity, the body refuses to work further,resulting in sleep, which aids in the restoration of energy levels.
5.***Aagantuki-*** *This* sleep may be the result of a bad prognosis or it can also be a sign of imminent death.
6.***VyaadhiAnuvartini*** *Nidra,* which is a detrimental outcome or complication of other diseases.
7.***Ratriswabhav Prabhava*** *Nidra,* which occurs naturally at night. Since it rejuvenates the body and nourishes the mind and *Indriya,* it is also called *Bhoota Dhatri.*

Classification by **Susrutha[13]**
Sushruta has classified *Nidra* into three different types
1.***Vaishnaivi Nidra*** It is a normal type of *Nidra* that occurs naturally as per the rhythmic cycle.
2.***Tamasi Nidra*** It happens when *Tama* dominating *Kapha* blocks the *SanjnavahaSrotas*.
3.***Vaikariki Nidra*** Arise due to disturbances in the body and mind.

Benefits of *Nidra*
Proper and timely sleep contributes *Sukha*(happiness), *Pushti*(nutrition),*Vrishata*(virility), *Bala*(strength), *Jnana*(knowledge) and *Jiva*(maintains the life) whereas improper sleep brings about *Dukha*(misery), *Karshya*(sterility), *Ajnana*(ignorance) and *Marana*(death)[14]. Just as true knowledge leads to Siddhi in a yogi, proper sleep brings happiness and longevity to humans. Sleeping at the proper time, especially at night time, balances the body tissues(*Dhatusamyata*),promotes mental clarity, enhances vision, retains complexion, bestowsstrength and maintains digestivepower. So, a person who desires to live a healthy life should indulge in *Kala Nidra* (timely sleep).

Physiological Variations of Nidra
The four factors responsible for *Roga* and *Arogya* have been mentioned in all the *Samhita* and is applicable to all the *Padarthas*, they are

1.Hina Yoga
2.MityaYoga
3.AtiYoga
4.*SamyakYoga*

The same has also been applicable with respect to *Nidra*,

1.*Hina Yoga* of *Nidra-Nacha Sevita Nidra* (no proper sleep)
2.*Mitya Yoga* of *Nidra-Akala Nidra* (sleepat improper time)
3.*Ati Yoga* of *Nidra-Atiprasanga* (excessive sleep)
4.*Samyak Yoga-Nishevita* (Proper consumption)

Among the four types of *Nidra*, the first three, i.e., *Akala, Atiprasanga* and *Nachasevita Nidra,* is said to be *Kalaratri,* which destroys both *Sukha* (happiness) and *Ayu*(life). The fourth type of *Nidra* is *Samyak Nishevita Nidra / Para Nidra,* which is said to be *Sukha Ayushi*.

Divaswapna

Indications of Divaswapna

Persons who are suffering from emaciation or who are tired due to activities like singing, study, alcohol intake, sexual intercourse, elimination therapies, carriying heavy weights and travelling long distance on foot; conditions like indigestion, tuberculosis or injury to chest, thirst, diarrhoea, colic pain, breathlessness, hiccups and mental disorders. In addition, daytime sleep is also indicated to those who are having anger, sorrow, fear and are habituated to day sleep[15]

Contra-Indications of Divaswapna

*Divaswapna*is considered as *Vikriti* and it is *Adharma* to sleep in the day as it does *Sarva Dosha Prakopa*. According to Acharya Charaka, it is not advisable to sleep during daytime other than in summer, as it can cause disturbances to *Kapha* and *PittaDoshas*.It is not indicated to persons who are obese, having predominance of *Kapha* in the body, having diseases of *Sleshma*. Additionally, it is not indicated for those suffering from *Dushivisha*. Those who perform unwholesome day sleep suffer from headache, heaviness of body, diminition of digestive fire, nausea, oedema, rhinitis, severe delution of memory and intellect and increased intensity of *Visha- Vegas*[16].

RATRIJAGARANA

Ratrijagarana mainly causes diseases of Vata and Pitta Dosha. In the initial part of the night, with the predominance of *Tamo Guna*alongwith the influence of *Kapha Dosha*, sleep is naturally induced. Henceforth, suppression of sleep eventually diminishes the Kapha Dosha, which may bring about elevated conditions of *Vata* and *Pitta Dosha*. Due to this, the individual might get afflicted with symptoms of *Vata* and *Pitta Dosha.* Hence, those who indulge in awakening at night gave rise to the manifestation of symptoms like constipation, weakness, poor concentration, giddiness, hyperacidity, irritation of eyes, and burning sensation in hands and feet[17]. *Ratrijagaran*is indicated in persons having predominance of *Kapha* and *Meda,* also those who are intoxicated by poison. Also, *NishaJagarana* is indicated during *Yuddha* and in *Sharad Rtu* where *Pitta Prakopa*occurs. Moreover, *Ratrijagarana* is also beneficial in conditions like obesity and diseases such as *Prameha* and *Kaphaja Madatyaya*[18].

Atinidra

Atinidra, or excessive sleeping occurs due to an increase of *Kapha Dosha* in the body and is considered as a pathological condition. According to Acharya Vagbhata, treatments of this include *Naysa, Langhana, Chinta, Vyavaya* etc[19].

Mana

The mind is a crucial and necessary part of the process of learning. It is described as being *Ubhayendriya*, meaning that it is an organ of action (*Karmendriya*) as well as an organ of sense (*Jnanendriya*). The mind is also known as *Ateendriya* because it transcends all of the sense faculties that are in charge of perception of outside objects. Two thoughts to be characteristic features of the mind (*Manoguna)* are *Anutva* and *Ekatva*. *Ekatva* signifies unity, and *Anutva* denotes atomicity. Because of *ekatvaguna*, *Mana* cannot detect many *Vishaya* of distinct *Indriyas* at once; nevertheless, because of its *Anutva* character, multiple *Vishaya* appear to be perceived at once [20].

Emotional Intelligence

The foundation of emotional intelligence can be traced back to Thorndike's theory of social intelligence (1920), which defines it as the capacity to comprehend and navigate social interactions effectively, enabling individuals to manage relationships wisely[21].In 1983, Gardner put forward the theory of multiple intelligence, which is based on the concept of intrapersonal and interpersonal intelligence[22]. Further in 1990s Salovey and Mayer proposed the idea of emotional intelligence and describes it as a type of social intelligence which encompass the capacity to monitor the

emotions/feelings of one's own as well as others, and to utilize this information to guide thinking and action in different situations[23]. In addition, Daniel Goleman (1995)emphasized the significance of emotional intelligence in personal, social and professional lives of the individual and states that major portion of a person's success in life depends upon the contribution of social and emotional intelligence [24]. The components of emotional intelligence incorporate self-awareness, self-regulation, empathy, self-motivation and social skills [25].

Self- awareness

According to John Mayer self-awareness can be defined as being aware of our feelings and thoughts about mood. Goleman also mentioned it as the capability to read and understand one's emotions as well as recognizing its effect on others. It is simply the basic understanding of how we feel and why we feel that way.

Self-Regulation also known asself-management, is the ability to govern one's thoughts, actions and feelings in a flexible manner to achieve desired results. Optimal self-regulation promotes a sense of well-being, self-confidence and connection to others.

Self-Motivation

Those who are emotionally intelligent are driven by things beyond external rewards like wealth, fame, recognition; instead they are controlled by their passion to fulfill goals and achieve success in life. Since they depend on internal motivation as their guidance, they pursue peak performances and experiences [26]

Empathy

It refers to the emotional and cognitive processes that bind different individuals together, allowing them to share experiences and understand others (Eslinger, 2007). It is not only the ability to effectively perceive the emotions of people and *read* situations but also sense what others are feeling and thinking from their perspective.

Social skills

It can be defined as the capacity to effectively manage social relationships by considering one's own emotions, the feelings of others and the circumstances. This is also considered to be "friendliness with a purpose" or eliciting desirable responses when working with people. Social skills may be utilized to persuade others around us to make better decisions.

Importance of Emotional Intelligence

The significance of emotional intelligence has been accepted and acknowledged in a variety of fields, particularly in the workplace. For example, burnout syndrome is widespread among professionals who deal with a large number of individuals. It is characterized by increased emotional exhaustion and disinterest, as well as a decline in professional performance. However, numerous studies have shown that the elevation of emotional intelligence can assist in modifying employees' behaviours and attitudes in occupations with emotional demands by boosting work satisfaction and reducing job stress [27,28,29].However, development of emotional and social skills can help to build resilience, which is a safeguarding factor against psychological distress [30].

DISCUSSION

Relation Between *Nidra* and *Mana*

The definition of Nidra starts with"*yedhatumanasiklante*". which means *Mana*(mind) has got direct connection with *Nidra*. According to Chakrapani, in the event of exhaustion of the *Ubhayendriya,* i.e., *Manas* (mind), the individual also gets exhausted and when the mind dissociates itself from the objects, the individual also dissociates from the objects, resulting in the manifestation of sleep. *Mana* is closely related with health as well as sleep, because *Triguna,* i.e *Satwa , Rajas and Tamas* are responsible for sleep and wakefulness. *Tamoguna* of mind helps to induce sleep and its association with *Kapha Dosha* helps in the manifestation of sleep. However, there will be increase of *Rajoguna*, when

the mind gets disturbed due to any subject. *Rajoguna* closely resembles with *Vata dosha* and hence, the increased *Rajogun*a subsides the effect of *Tamoguna* and ultimately, there will be loss of sleep [31].

Sleep according to modern perspective

Sleep follows a structured cyclical pattern, alternating between non-rapid eye movement (NREM) sleep and rapid eye movement (REM) sleep. NREM sleep is divided into three stages, each varying in depth and characterized by distinct activity of brain waves, muscle tone, and eye movement. Sleep initiates with a brief NREM stage1, progresses through stage 2 and stage 3, and then transitions into REM sleep. NREM makes up about 75-80% of total sleep, while REM constitutes the remaining 20-25%[32]. A full sleep lasts 70-100 minutes initially, with later cycles extending to 90-120 minutes. Throughout the night REM sleep increases in duration, making up 30% of later cycles, with an average of 4-5 cycles occuring per night. NREM stage 1 is the lightest sleep phase, lasting 1-7 minutes, with alpha waves detected on an electroencephalogram (EEG). Stage 2, lasting 10-25 minutes initially, deepens sleep and features sleep spindles and K complexes, which aid memory consolidation. NREM stage 3, or deep sleep, lasts 20-40 minutes and is characterized by slow wave, high voltage activity. REM sleep, is marked by muscle paralysis (except for extraocular muscles) and saw tooth waveforms on EEG. This paralysis prevents dream-related muscle movements. Sleep cycles are essential for cognitive function, memory consolidation and overall well-being.

Sleep regulation depends on the interaction between the homeostatic process, which controls the body's sleep need, and the circadian rhythm, which manages the sleep-wake cycle. Sleep initiation occurs in the ventrolateral preoptic nucleus(VLPO) of the anterior hypothalamus, which inhibits arousal regions of the brain, assisted by hypocretin(orexin) neurons. The onset of REM sleep is done by REM-On neurons in the brain stem. The tonic phase of REM sleep is regulated by the parasympathetic nervous system, whereas the phasic phase is influenced by sympathetic nervous activity. Circadian rhythm, regulated by the hypothalamus via suprachiasmatic nucleus, aligns with light exposure detected by the retina. Melatonin from the Pineal gland plays a key role, with levels peaking at night and declining during the day. Body temperature also follows a circadian pattern, typically lower in the morning time and peaking in the evening, contributing to sleep regulation[32].

Nidraviparyaya

Nidraviparyaya can be the term comprising all the aspects of changes in *Nidra,* i.e., *Divaswapna, Raatri Jagarana*, and changes in the quality and quantity of sleep**.** *Diwaswapa* and *Ratrijagaran* are abnormal indulgence to the natural sleep (*Nidraviparyaya*) and considered as most common etiological factors of a variety of diseases like *Amavata, Vatavyadhi, Vatarakta, Shirorog*aetc[33].The disruption in the normal sleep cycle owing to late night study, watching movies, and increasing screen time in late night, night shift work, may cause alteration in the quality and amount of sleep and may elevate the risk of several chronic health problems. *Nidraviparyaya* can be due to a variety of factors, including lifestyle and environmental factors, sleep disorders and other health issues. In the current world, it is a known fact that the mental health or mental well-being of an individual is directly proportional to the nature of emotions perceived or experienced by the individual. Studies suggest that there is a higher range of association between emotional regulation and subjective happiness[34].

The components of emotional intelligence compriseself-awareness, self-motivation, self-regulation, empathy and social skills. People with good Emotional Intelligence should have higher levels of self-awareness which helps to identify each emotion that is experienced by them, moniter them and recognize different emotional reactions. In addition, those who are skilled in self-regulation (another component of emotional intelligence) tend to be more flexible and adapt well to changes. They are also capable of managing conflict and handling difficult situations. In ayurveda, the mind is considered both a sensory and motor organ, as it is connected to both; those of perception and action- earning it the designation of Ubhayendriya[35]. Acharya Charaka in *Sharirstana* described five subjects(*Vishaya*) of *Mind,* namely *Chintya* (things requiring thought), *Vicharya* (analysing between good and bad), *Uhya* (hypothesis), *Dhyeya*(attention) and *Sankalpa*(determination)[36].He also stated the different functions of mind which incorporate *Indriyabhigraha* (indulging of sense organs in their respective objects), *Swasya Nigraha*(to control self and keep detached from undesirable subjects), *Uha*(to understand out through different hypothesis) and V*ichara*

(reasoning about the thought process and deciding whether to accept or reject the thought)[37].. *Mana* is considered to be one of the seats of manifestation of diseases along with the body and the treatment of mental diseases include *Dhee* (effective and skilful application of intellect), *Dhairya*(instilling courage in one's mind) and *Atmadi Vijnana*(realizing the importance of self-worth)[38]. The above-mentioned subjects and functions of mind are closely related to the five key elements of emotional intelligence i.e, Self-awareness, self-motivation, self-regulation, empathy and social skills. Emotional Intelligence is observed to be something that can be improved over time, and anyone can simply train their brain to have better emotional intelligence.

CONCLUSION

Ayurveda considers *Nidra* as one of the essential pillars of life that is indispensable for regulating normal physiological activities. The mental, physical and physiological health status of an individual depends on the proper quality and quantity of Nidra. Moreover, *Nidra* also aids in improving immunity and thereby resisting different pathological invasions of common diseases. *Nidraviparyaya* is proven to be one of the major causative factors to *Balakshaya*. *Diwaswapna* is thought to be one of the primary cause of the disease that occurs due to *Agnimandya - Ama*, whereas *Ratrijagarana* is seen to be a common etiological factor in different types of *Vata* disorders. Thus, both, under the term *Nidraviparyaya, are* considered as the most common cause to almost diseases as *Agnivaishamya* is its adverse effect. *Nidraviparyaya* (improper sleep) can affect the mental and physical strength of an individual. Since *Nidra* is very much connected with all the sensory, emotional and behavioral traits of an individual, change in both the quality and quantity of sleep will directly affect the above-mentioned parameters, which can ultimately influence their emotional intelligence.

ABSTRACT

Determining non-trivial integer solutions to Pell's equation incorporating Jarasandha numbers and Fermat primes is the primary objective of this research. Using Brahmagupta's lemma, we derive a sequence of distinct integer solutions and establish recurrence relations between them. Numerical examples illustrate the obtained solutions and their relations, which demonstrate the role of Fermat primes in generating these solutions**.**

Keywords: Brahmagupta lemma, Fermat primes, recurrence relations, Diophantine equation, Jarasandha numbers, Pell's equation.

INTRODUCTION

A particular sort of classical Diophantine equation is Pell's equation, that possesses the form $y^2 = D x^2 + 1$, with D being a positive square free number. This equation has been widely studied due to its connection with number theory and algebraic structures [1,3-7 &11]. Various methods exist for finding integer solutions, and Brahmagupta's lemma provides an elegant way to generate solutions recursively [2,8 &12]. Fermat primes, a special class of primes in the form $2^{2^n} + 1$, play a significant role in deriving solutions to Pell's equation. Their unique properties contribute to generating distinct integer solutions, which are further explored in this study. Solution of exponential Diophantine equation involving Fermat primes are analyzed in [10]. In addition, we analyze Jarasandha numbers, named after the mythological character from the Indian epic Mahabharata, who could rejoin after being split. Analogously, Jarasandha numbers exhibit properties where splitting and combining them result in reformation. In [9], solutions to

Pell's Equation implementing Jarasandha numbers are examined. In order to establish recurrence relations and derive non-zero unique integer solutions, this study investigates Pell's equation utilising Jarasandha numbers and Fermat primes. The resulting solutions are demonstrated with numerical examples.

METHOD OF ANALYSIS

Theorem

A collection of distinct, non-zero integer solutions to Pells's equation

$y^2 = Dx^2 + J$ where, $D = p^2 + 1$, in which J corresponds to the Jarasandha number, whereas D is a Fermat prime.

$$x_s = \frac{1}{2\sqrt{D}}\left(\sqrt{J}(2D-1)g_s + 2\sqrt{JD(D-1)}f_s\right)$$

$$y_s = \frac{1}{2}\left(\sqrt{J}(2D-1)f_s + 2\sqrt{JD(D-1)}g_s\right)$$ s=0,1,2...

and the corresponding recurrence relations are

$$x_{s+2} - 2(2D-1)x_{s+1} + x_s = 0$$

$$y_{s+2} - 2(2D-1)y_{s+1} + y_s = 0$$ s=0,1,2...

Proof

The initial solution of

$$y^2 = Dx^2 + J \quad (1)$$

is (x_0, y_0) is provided by $x_0 = 2\sqrt{J(D-1)}, y_0 = \sqrt{J}(2D-1)$

Evaluate the pell equation $y^2 = Dx^2 + 1$ to determine the remaining solutions to (1), whose initial solution $(\tilde{x}_s, \tilde{y}_s)$ is given by

$$\tilde{x}_s = \frac{1}{2\sqrt{D}}g_s$$

$$\tilde{y}_s = \frac{1}{2}f_s$$ s=0,1,2...

where $f_s = \left((2D-1) + 2\sqrt{J(D-1)}\right)^{s+1} + \left((2D-1) - 2\sqrt{J(D-1)}\right)^{s+1}$

$g_s = \left((2D-1) + 2\sqrt{J(D-1)}\right)^{s+1} + \left((2D-1) - 2\sqrt{J(D-1)}\right)^{s+1}$,

Applying Brahmagupta's lemma among the solutions (x_0, y_0) and $(\tilde{x}_s, \tilde{y}_s)$, the sequence of non-zero distinct integer solutions to (1) are obtained as $x_s = \frac{1}{2\sqrt{D}}\left(\sqrt{J}(2D-1)g_s + 2\sqrt{JD(D-1)}f_s\right)$

$$y_s = \frac{1}{2}\left(\sqrt{J}(2D-1)f_s + 2\sqrt{JD(D-1)}g_s\right)$$ s=0,1,2...

and their recurrence relations are found to be

$$x_{s+2} - 2(2D-1)x_{s+1} + x_s = 0$$

$$y_{s+2} - 2(2D-1)y_{s+1} + y_s = 0,$$ s=0,1,2..

Illustration

The table that presents numerous computations for choosing the values of Fermat prime D & Jarasandha number J which satisfy the pell's equation together with their solutions:

D	J	Pell equation	Sequence of Integer Solutions	Recurrence relation
5	81	$y^2 = 5x^2 + 81$	$x_s = \frac{1}{2\sqrt{5}}\left(18g_s + 36\sqrt{5}f_s\right)$ $y_s = \frac{1}{2}\left(18f_s + 36\sqrt{5}g_s\right)$	$x_{s+2} - 18x_{s+1} + x_s = 0$ $y_{s+2} - 18y_{s+1} + y_s = 0$
17	81	$y^2 = 17x^2 + 81$	$x_s = \frac{1}{2\sqrt{17}}\left(297g_s + 72\sqrt{17}f_s\right)$ $y_s = \frac{1}{2}\left(297f_s + 72\sqrt{17}g_s\right)$	$x_{s+2} - 66x_{s+1} + x_s = 0$ $y_{s+2} - 66y_{s+1} + y_s = 0$

257	3025	$y^2 = 257x^2 + 3025$	$x_s = \frac{1}{2\sqrt{257}}\left(28215g_s + 1760\sqrt{5}f_s\right)$ $y_s = \frac{1}{2}\left(28215f_s + 1760\sqrt{5}g_s\right)$	$x_{s+2} - 1026x_{s+1} + x_s = 0$ $y_{s+2} - 1026y_{s+1} + y_s = 0$
5	9801	$y^2 = 5x^2 + 9801$	$x_s = \frac{1}{2\sqrt{5}}\left(891g_s + 396\sqrt{5}f_s\right)$ $y_s = \frac{1}{2}\left(891f_s + 396\sqrt{5}g_s\right)$	$x_{s+2} - 18x_{s+1} + x_s = 0$ $y_{s+2} - 18y_{s+1} + y_s = 0$

17	9801	$y^2 = 17x^2 + 9801$	$x_s = \frac{1}{2\sqrt{17}}\left(3267g_s + 792\sqrt{17}f_s\right)$ $y_s = \frac{1}{2}\left(3267f_s + 792\sqrt{17}g_s\right)$	$x_{s+2} - 66x_{s+1} + x_s = 0$ $y_{s+2} - 66y_{s+1} + y_s = 0$
257	9801	$y^2 = 257x^2 + 9801$	$x_s = \frac{1}{2\sqrt{257}}\left(50787g_s + 3168\sqrt{5}f_s\right)$ $y_s = \frac{1}{2}\left(50787f_s + 3168\sqrt{5}g_s\right)$	$x_{s+2} - 1026x_{s+1} + x_s = 0$ $y_{s+2} - 1026y_{s+1} + y_s = 0$

CONCLUSION

This study presents a systematic approach to finding non-zero distinct integer solutions to Pell's equation involving Jarasandha numbers and Fermat primes. Using Brahmagupta's lemma, we derive recurrence relations that describe the sequence of solutions. The results highlight how solutions to Pell's equation can be extended to involve other special numbers, including Fermat primes, paving the way for further exploration in this domain.

ABSTRACT

Computer technology has revolutionized the field of education. Activities and experiments are at the core of Science subjects like Biology. Many complex phenomenon in Biology can only be understood well through demonstrations. Higher educational institutions in rural areas of Indian states like Bihar are not equipped with sophisticated labs. Even basic apparatuses and reagents are hard to find to demonstrate experiments to the students. In this regard, in present work to address this issue, supplementing Biology classes with *in silico* tools for better understanding of Biology concepts, both theoretical as well as practical concepts, has been suggested. Present work involves development of teaching modules based on *in silico* tools like Bioinfomatics, Virtual Labs and videos of practical demonstrations followed by teaching undergraduate students of a rural college using same modules and assessment of their progress via pre-test and post-test comparison method. Students were divided into the control and the experimental group. The control group received teaching solely based on traditional methods while the experimental group received teaching supplemented with modules designed using *in silico* tools. Relative performance of the control and the experimental group was also studied and significant differences were found between their performances in post-test. Students taught using modules supplemented with *in silico*-based tools were found to understand the concepts better than the one who received teaching only by traditional methods. Gender based differences in performance of students were also studied but no significant differences were observed among performances of girls and boys in any test. Through this preliminary but important study on the effectiveness of *in silico* techniques in Biology teaching at undergraduate level, it was found that *in silico* tools have great potential in teaching subjects like Biology where practical classes are required and due to shortage of resources such classes are not being

organized. This approach may be of great benefit for the students of rural areas and can supplement traditional teaching methods so that students would not lag behind in learning practical as well as advanced theoretical concepts in Science subjects like Biology.

Keywords: Bioinformatics, database, ICT, inclusive education, virtual labs

INTRODUCTION

"What a computer is to me is the most remarkable tool that we have ever come up with. It's the equivalent of a bicycle for our minds."
— Steve Jobs

We are living in a technology run era. Computer technology is touching all dimensions of our day today life. Whether it is banking, hospitals, different industries, space research, nuclear power plants or education; computer technology has become a necessity to run all these sectors efficiently. In education sector, computer technology is being used both for running and administering the institution, and teaching the students. Science education requires experimentation. Activity based learning can make learning easy and fun. Computer technology can provide many useful tools for teaching-learning in Science.

India's National Education Policy (NEP) 2020 suggests blended mode of teaching and learning. Hybrid learning approach can increase access to education and improve quality of teaching (Ministry of Human Resource Development, 2020; University Grants Commission, 2020). This is an important step towards promotion of inclusive education. Inclusive education promotes holistic learning (United Nations International Children's Emergency Fund, 2022). Year 2020 witnessed COVID19 pandemic and global lockdown which continued for more than 2 years. Education system has been significantly affected. Offline classes were postponed. Only online classes were conducted. Biology as a practical subject requires demonstrations of experiments. Online classes appeared insufficient in teaching experimental concepts. Also there are chances of misunderstanding important concepts without proper demonstration. *In silico* tools can solve such problems to some extent. Keeping online classes aside, there are some issues which need to be addressed related to rural areas. There are very few higher education institutions situated in rural areas. In rare cases, a college can be found in a rural area but such a college is not provided with enough resources to teach practical based subjects. Unavailability of chemicals, museum specimens, animal bodies for dissection, apparatuses, etc. is a major issue. Employing *in silico* tools in Biology practical classes can be made accessible in virtual form. Apart from practical classes, many complex processes in Molecular Biology, Physiology, Developmental Biology, etc. can nicely be demonstrated using *in silico* tools. Online lectures make learning boring and monotonous.

According to Amberg (2013), any *in silico* tools provide a platform for hands-on activities making learning more interactive and fun. Information and communication technologies (ICT) have changed the pedagogy in education. *In silico* technologies in Biology like Bioinformatics can prove to be an ICT tool with great potential in teaching Biology. Various potential Bioinformatics based *in silico* tools are available in public domain. Bringing together these tools on single platform is required. Many workers have worked on application of various *in silico* tools in teaching Science. Most such works have been conducted outside India. Most work concerns Bioinformatics and its application in education. Magana et al. (2014) provided an extensive survey of the applicability and importance of Bioinformatics as an important *in silico* teaching and research ool in Biology. Lewitter and Bourne (2011) and Machluf and Yarden (2013) provided an account of how Bioinformatics can be implimented at secondary and senior secondary levels in schools. Koch and Fuellen (2008) provided a review of bioinformatics education in Germany. Bain et al. (2022) has developed an extensive and comprehensive module of bringing Bioinformatics to schools under the project named 4273pi project. Kovarik et al. (2013) discussed how Bioinformatics can be benneficial for promoting science, technology, engineering, and mathematics careers. Wood and Gebhardt (2013) wrote how Bioinformatics could open

new avenues for teaching contemporary biology. Campbell and Nehm (2013) provided critical analysis of assessment quality in genomics and bioinformatics education research. Hughey and Karplus (2003) described Bioinformatics as a new field in engineering education. Mulder et al. (2018) stressed upon development and application of bioinformatics core competencies to improve bioinformatics training and education. Kulkarni-Kale et al. (2010) reviewed the satatus of Bioinformatics education in India.

Scheckler (2003) discusses about substituting traditional labs with videos, simulation and animation based virtual labs under different circumstances. Huang (2004) discusses about the potntial of virtual labs in revolutionizing teaching. Stuckey-Mickell and Stuckey-Danner (2007) studied the effectiveness and usability of virtual labs in the online biology teaching. Byukusenge*et al.* (2022), Maldarelli *et al.* (2009) and Miyamoto *et al.* (2019) reviewed and demonstrated the effectiveness of virtual laboratories in teaching and learning biology. Delgado *et al.* (2021) deminstrated how creating and teaching biology labs online during COVID-19 helped in teaching. In a previous study, students revealed a positive attitude regarding the integration of bioinformatics-based approaches in their learning practices, reinforcing their added value in educational approaches (Martins et al., 2020). But this study was purely focused on students belonging to urban areas and studying in well-equipped classrooms. In India, such study has not been done. Many workers all around the world are engaged in research and development in developing various *in silico* tools for Biology teaching and are also assessing how these tools are helping in making learning fun and more effective. But all these studies and dsicussions are focussed on well equipped educational institutions residing in big cities, mostly outside India. Studies pertaining to rural areas have not yet been undertaken by any Indian or international worker yet.

Present study is focused mainly on students belonging to rural area. We believe *in silico* tools including Bioinformatics can revolutionize the area of teaching Biology and other Science subjects in rural area. This work is intended to study the effectiveness of *in silico* techniques in biology teaching at undergraduate level. *In silico* tools include a variety of computer based tools. In present work, by *in silico* tool, we refer primarily to bioinformatics, virtual labs and demonstration videos for supplementing teaching theoretical and practical concepts in Biology.
Key objectives of the present work are to find out the effectiveness of *in silico* techniques in teaching biology to undergraduate students and to compare the effectiveness of *in silico* techniques with traditional method of teaching biology to undergraduate.

MATERIALS AND METHODS

Experimental research was conducted in this study.The methodology of the study comprises of method of research, population, sample, tool, procedure of data collection, and procedure of data analysis.

Method of research
In order to obtain empirically dependable answers to the research questions, and to test the formulated hypotheses, a pre-test and post-test single group experimental design has been adopted.

Population
The population of the study is the students enrolled in B.Sc. Botany (Honours) course at Kaler block of Arwal district, Bihar during academic session 2021-2022. Sheodeni Sao College, Kaler was established in year 1963 by a great social worker, businessman and education lover Sri Sheo Deni Sao of village Sohsa. Late Sheo Deni Sao generously donated finance and organized local villagers and motivated them for contribution in cash or kind as per their ability, and thus succeed in setting a social movement for the establishment of this centre of higher education in this extreme socially and economically backward area of Kaler block which is situated on Aurangabad – Patna National Highway No. -139, about 88 Km. from Patna and about 75 Km. from Gaya main town. It has got its first affiliation in 1964-65 in Arts faculty only and in 1970 it got affiliation in science faculty up to Intermediate level. The degree standard in science faculty was started in 1976. This college has been converted into constituent unit of Magadh University,

Bodh-Gaya in year 1980. This college has been established with real objective of providing quality higher education to the children of downtrodden and poor farmers of this far-flung area of Magadh commissionaire **(Figure 1)**. Therefore, the students participating in the present study belong to rural background.

Digital infrastructure

Sheodeni Sao College, Kaler has both traditional and well equiped smart classes in all Science departents and a computer lab run by Department of Computer Application. Classes were taken at lecture halls of Science block, centralized smart room and laboratory of the Department of Zoology.

Sample

100 students participated in this study. These 100 students were selected randomly. These 100 students were divided in two groups of 50 students each. Each group consists of 25 girls and 25 boys to maintain gender equity. One group was kept as control whereas other group was designated as experimental group.

Tools

First online systematic survey was conducted to identify important *in silico* tools for present study. Extensive data mining was conducted using specific keywords on different literature search engines like Google Scholar, Europe PMC, PubMed, Academia and Research Gate. Important *in silico* tools were shortlisted and selected from literatures. I learnt how to use these tools and their possible applications by hands on training, online courses and instruction manuals. Relevant areas from the undergraduate syllabus were selected. Such topics were selected which are common both in Botany and Zoology syllabus. Topics were primarily selected from Biochemistry and Molecular Biology. Teaching modules were prepared with the aid of *in silico* tools (Supplementary data: Modules 1-4).Both theory and practical part of the syllabus were included in the teaching module. Using these modules, classes of the experimental group were taken followed by achievement test. The control group was taught in traditional way without the aid of *in silico* tools. Teaching was conducted bilingually, both using Hindi and English language as a medium of instruction in the classroom, as most of the students are Hindi speaking and don't understand English very well. The achievement test involves assessment based on pre-tests and post-tests. These tests were formulated based on the topics of the syllabus against which the teaching modules were designed. These tests assessed the knowledge, understating, and application on the several theoretical and practical concepts which were be taught to the students.

Procedure of Experimentation and Data Collection

The experimental group received teaching based on lesson modules prepared with the aid tools whereas the control group received teaching based on traditional methods only. Students were taught four different lessons for a month. Each topic was taught on the same day before and after lunch hour to the experimental and the control group respectively. Students were provided with weekly assignments. A test was conducted before teaching the course to assess the pre-existing knowledge of the students (pre-test)

(Supplementary data: Representative questions for pre-test). Weekly and monthly tests were conducted after teaching students with traditional methods as well as after using techniques. Both oral and written tests were conducted. Written tests included both objective and subjective questions. Progress of the students was assessed based on their performance in assignment preparation, and weekly and monthly tests (post-test)

(Supplementary data: Representative questions for post-test). Marks acquired by the students were analyzed statistically for final data. Gender based performance was also assessed during data analysis.
Primary data was collected and tabulated **(Supplementary data: Raw data tables 1-4)**.

Procedure of data analysis

Data analysis involved standard statistical procedures. Means and standard deviations were calculated for different groups for further analysis. Statistical significance of the data was tested using the paired t-test which was followed

by graphical representation of the data. While statistical analysis the p-value of equal to or less than 0.05 will only be considered significant for the data. The value greater than 0.05 will be considered non-significant. Standard statistical software Graph Pad Prism was used for statistical data analysis and graphical representation of data.

RESULTS AND DISCUSSIONS

List of *in silico* tools was tabulated. Primary data (raw data) was analyzed for various parameters. Statistical t-test was conducted and p-value was noted down for all combinations of data to assess the significance of the finding.

***In silico* tools for supplementing undergraduate Biology classes**

Through extensive data mining, a list of important *in silico* tools has been prepared which can be used in supplementing Biology classes at undergraduate levels (Table 1). Some of these tools were used to prepare teaching modules for the present study (Supplementary file: Modules 1-4). Only open access tools were used which are freely available without any cost.

During pre-test girls and boys of the control group showed minor differences in their performance

Mean marks acquired by all girls of the class in pre-test was found to be slightly higher than the marks acquired by the boys in the control group. The t-test suggests p-value almost equal to 0.05 (p-value=0.052), implying the marginal difference in performance of girls and boys of the control group in the pre-test (Figure 2).

During pre-test girls and boys of the experimental group showed minor differences in their performance

Mean marks acquired by all girls of the class in pre-test was found to be slightly higher than the marks acquired by the boys in the experimental group. The t-test suggests p-value almost equal to 0.05 (p-value=0.047), implying the marginal difference in the performance of girls and boys of the experimental group in the pre-test **(Figure 3)**.

During post-test girls and boys of the control group showed similar performance

Mean marks acquired by all girls of the class in post-test was found to be slightly higher than the marks acquired by the boys in the control group but the t-test suggests p-value higher than 0.05 (p-value=0.11), implying the differences in performance of girls and boys of the control group in the post-test to be non-significant (Figure 4). Therefore, both girls and boys of the control group performed similarly in the post-test.

During post-test girls and boys of the experimental group showed similar performance

Mean marks acquired by all girls of the class in post-test was found to be slightly higher than the marks acquired by the boys in the experimental group but the t-test suggests p-value higher than 0.05 (p-value=0.38), implying the differences in performance of girls and boys of the experimental group in the post-test to be non-significant (Figure 5). Therefore, both girls and boys of the experimental group performed similarly in the post-test.

During pre-test both the control and the experimental group showed similar performance

The t-test suggests a p-value higher than 0.05 (p-value=0.94), implying the differences in performance of the control and the experimental group in the pre-test to be non-significant (Figure 6). Therefore, both these groups performed similarly in the pre-test. Therefore, the nature of sample taken for study in both the control and the experimental groups are of the same level in terms of their concepts in the Biology topics which were taught to them.

Performance of the control group in pre-test and post-test showed significant differences

Mean marks acquired by the control group in post-test was found to be significantly higher than the marks acquired in the pre-test. The t-test suggests a p-value quite smaller than 0.05 (p-value<<0.05), implying the differences in performance of the control group in pre-test and post-test to be highly significant (Figure 7).

Performance of the experimental group in pre-test and post-test showed significant differences

Mean marks acquired by the experimental group in post-test was found to be significantly higher than the marks acquired in the pre-test. The t-test suggests a p-value quite smaller than 0.05 (p-value<<0.05), implying the differences in performance of the experimental group in pre-test and post-test to be highly significant **(Figure 8)**.

During post-test the experimental group and the control group showed significant differences in their performance

Mean marks acquired by the experimental group in post-test was found to be significantly higher than the marks acquired by the control group in the post-test. The t-test suggests a p-value much smaller than 0.05 (p-value<<0.05), implying the differences in performance of the experimental group and the control group in post-test to be highly significant (Figure 9).

Figure 8 shows the positive effect of teaching Biology using *in silico* technique on undergraduate students. Figure 7 shows progress in performance of students even when taught using traditional methods. But as shown in Figure 9, students taught using *in silico* tools outperformed students taught using traditional methods only. The t-test also support these results with a highly significant p-value (p value<<0.05). As shown in Figure 2-5, the performance of girls and boys in different tests were not significantly dissimilar. Both girls and boys performed almost equally in pre-test and post-test whether it was the control group or the experimental group. The p-value of our data as calculated after t-test was not significant enough to support the differential performance of undergraduate girls and boys in the achievment tests (post-test) based on the topics of Biology which were taught through *in silico* techniques. There is no significant difference among the mean achievement of boys and girls of undergraduate level when Biology lessons were taught through *in silico* techniques.

Post-test was qualitative in nature. Questions in post-test were prepared to assess thorough understanding of the concepts. Through each module, we tried to explain the concepts closer to reality as much as possible. For example, the colour change during iodine test was shown as live demonstration via video and one of the questions in the post-test included different colour palletes including the exact colour as answer options. Although the sample size was limited to 50 students for the experimental group and 50 students for the control group, and the study was limited to only one institution, the present work provides an insight into how effective *in silico* tools can be in teaching practical subjects where live demonstrations are required. Comparative analysis of the performances of students in pre-test and post-test clearly indicate the effectivenes of including *in silico* methods in teaching Biology at undergraduate level. Although this work is limited to the rural students, we suggest use of *in silico* methods in all institutions of India to make teaching-learning more effective and innovative.

CONCLUSION

This study provides an idea about how effective *in silico* tools could be in supplementing Biology teaching at undergraduate levels. Present study also provides a comprehensive idea about various alternative and additional tools which could supplement teaching of Biology practical classes in resource limited institutions where reagents and apparatuses are not sufficiently available. Rural students would also be benefitted from this approach as most rural colleges in India lack advanced facilities for demonstrating Biological experiments promoting inclusive education.

Supplementary Data

Modules 1-4, Representative questions for pre-test, Representative questions for post-test and Raw data tables 1-4. The supplementary data has been uploaded on the public repository Zenodo which can be accessed using the following link.

ABSTRACT

To investigate the effect of extract of Uthamathali Girutham on egg albumin induced mast cell degranulation in mice. In present study extract of UthamathaliGirutham at doses of 0.1ml, 0.2ml, 0.3ml and 0.4ml/kg I.P were evaluated for egg albumin induced mast cell degranulation in mice. The results of present investigation showed that the Dose of 0.4 ml of Uthamathaligirutham showed 90.736 % of intact mast cells which shows anti allergic activity of Uthamathaligirutham.

Keywords: Mast cell degranulation, Anti allergic activity, Uthamathaligirutham.

INTRODUCTION

Sinusitis is the acute or chronic inflammation of the paranasal sinuses. Maxillarysinusitis is the most common type of sinusitis. The ethmoid, frontal and sphenoid sinuses are affected less frequently. Sinusitis is caused by a variety of bacteria such as streptococci, staphylococci, pneumococci Haemophilus influenzae and anaerobic bacteria. Viruses such as the influenza and the parainfluenza virus and less commonly fungi such as aspergillus also may producesinusitis. Infection reaches the sinuses from the nose, mouth, tonsils, naso pharynx, and the upper canines or molars. The lining mucosa of the nose and sinuses is inflamed. Obstruction of theopening of the sinus leads to accumulation of secretion, which may get infected. Sinuses may become filled with pus. Chronic sinusitis leads to recurrent headache, which shows a diurnal periodicity. The headache starts in the morning and worsens by mid-day, and subsides by evening. Foul-smelling purulent nasal discharge may occur. Once established, the condition persists

for months or even years Sinusitis affects a tremendous proportion of population, accounts for millions of visits to primary care physicians each year and in the fifth leading diagnosis for which antibiotics are prescribed accounting for 0.4% ambulatory diagnosis. According to the National Ambulatory Medical Care Survey (NAMCS) approximately 14% adults report having an episode of sinusitis each year.[1]

IEC Approval

The Institutional Ethical Committee, Government Siddha Medical College, Chennai reviewed and approved the study.

IEC No: GSMC – CH – 1234/ME – II/022/2023
CTRI No: This trial was registered in Clinical Trial Registry India
CTRI No: CTRI/2024/07/070431

MATERIALS AND METHODS

Plant Material

Polyherbal formulation UthamathaliGirutham was prepared and the raw drugs was authenticated by The department of Gunapadam, Government Siddha Medical College, Chennai

Grouping and Randomisation

A total of 25 rat (male) were selected and based on the body weight they were randomly distributed into five groups, i.e., Model control (Group 1), Reference control (Group 2) and four treatment groups (Group 3, 4, 5 & 6) for study. INTERNAL ANIMAL ETHICAL COMMITTEE APPROVAL NUMBER: MB/IAEC/2024/04/01 Dated 04.09.2024

Preparation of Test Item And Administration

The formulation was given as ready to dose. The test item was administered in a single dose by gavage using stainless steel ball tipped oral intubation needle at the desired dose level.

Study Design

The animals were weighed and randomly separated into 5 groups. The animals were dosed daily for 5 days. On day 5, the animals were euthanized and the skin and peritoneal layer was separated. 10 ml 0.9 % saline was injected into the peritoneal area. The peritoneal area was massaged for 10 minutes in order to release the mast cells in the saline. Then the peritoneal liquid was carefully collected and mixed with RPMI media and centrifuged at 1000 rpm. The supernatant was discarded and the pellet was resuspended in RPMI media and washed 2-3 times. Then the pellet was resuspended with 1 ml RPMI media. Except control, all other mast cell samples were challenged with 100 µg/ml of Egg albumin and incubated for 30 minutes. 20µl of samples were smeared and dyed with 1% Toludine Blue and examined under microscope. [2],[3]
The result was calculated by,

$$\% \text{ Protection of mast cells } = \frac{\text{Total number of Mast cells} - \text{Number of Degranulated mast cells}}{\text{Total number of Mast cells}} \times 100$$

RESULTS AND DISCUSSION

Dose dependent increase of % intact mast cells was observed. Dose of 0.4 ml of Uthamathaligirutham showed 90.796 % of intact mast cells which shows anti allergic activity of UthamathaliGirutham.

DISCUSSION

Uthamathaligirutham at doses of 0.4ml/kg significantly inhibit egg abumin induced leakage of dye from dorsal skin of rat when compare to control group. Control group showed 70.031% of intact mass cells while UthamathaliGirutham at dose 0.4ml/kg showed 90.796% of intact mass cells. Hence UthamathaliGirutham shows anti allergic activity by inhibiting egg albumin induced leakage of dye. The degranulation of mast cell occurs in response to the immunological stimuli in which antigen antibody reactions are predominant. UthamathaliGirutham at doses (0.1ml to 0.4ml/kg) significantly protect egg albumin induced degranulation of mast cell in a dose dependent manner. UthamathaliGirutham at 0.4 ml/kg protect mast cell comparable to control.

CONCLUSION

The results obtained from this study substantiated the use of UthamathaliGirutham in the management of Sinusitis. The extract of UthamathaliGiruthamshows a significant Antiallergic property by stabilizing peritoneal mast cell membranes.

ABSTRACT

End-stage renal disease (ESRD) poses a significant global health challenge, leading to substantial medical and non-medical costs for patients and their families. This review assesses the economic burden of dialysis treatment at SGT Hospital, focusing on both direct medical expenses—such as dialysis sessions, medications, and hospitalizations—and indirect costs, including transportation, lost income, and caregiver strain. The analysis highlights the financial disparities between hemodialysis (HD) and peritoneal dialysis (PD), with PD often emerging as a more cost-effective option, particularly in low- and middle-income countries (LMICs). Despite the availability of government subsidies and insurance coverage, many patients face overwhelming out-of-pocket expenses, exacerbating their financial distress. The review emphasizes the need for policy interventions to enhance access to affordable dialysis care, promote home-based treatment options, and invest in preventive healthcare measures to mitigate the progression of chronic kidney disease (CKD). By adopting a comprehensive approach that addresses both the economic and psychosocial challenges faced by ESRD patients, healthcare systems can improve treatment accessibility and quality of life for affected individuals. Future research should focus on innovative dialysis technologies and effective policy frameworks to ensure sustainable and equitable care for all patients in need.

Keywords: kidney, disease, government, healthcare, renal.

INTRODUCTION

End-stage renal disease (ESRD) has emerged as a significant global public health concern, placing an immense financial and emotional burden on patients, families, and healthcare systems. The increasing prevalence of ESRD has led to a surge in demand for renal replacement therapy (RRT), primarily in the form of hemodialysis (HD) and kidney transplantation. While transplantation is often the preferred treatment due to its potential for improved long-term outcomes, its high costs and limited availability make it an inaccessible option for many patients, particularly in developing countries like India. As a result, the majority of ESRD patients rely on hemodialysis as a life-sustaining treatment. However, the economic impact of HD extends beyond direct medical expenses, encompassing a wide range of non-medical costs that significantly affect patients and their families [1]. SGT Hospital, a prominent healthcare institution, provides dialysis services to a growing number of ESRD patients. Understanding the financial burden associated with hemodialysis is crucial for both healthcare policymakers and practitioners to develop cost-effective strategies that enhance patient access and affordability [2]. This review article aims to comprehensively evaluate the economic aspects of dialysis treatment at SGT Hospital, focusing on both medical and non-medical costs incurred by patients. By analyzing the direct expenses associated with dialysis procedures, medications, and hospital visits, along with indirect costs such as transportation, lost wages, and caregiver burden, this study will provide a holistic view of the financial challenges faced by ESRD patients [1,2].

Burden of ESRD and the Need for Economic Evaluation

Chronic kidney disease (CKD) progresses gradually, and when it reaches the ESRD stage, patients require either dialysis or a kidney transplant to survive. According to recent estimates, millions of people worldwide are affected by ESRD, with India witnessing a sharp rise in the number of diagnosed cases. Limited awareness, late-stage diagnosis, and inadequate access to specialized care further exacerbate the situation, compelling most patients to rely on dialysis as a long-term treatment option [3]. While government healthcare programs and insurance schemes aim to alleviate some of the financial strain, many patients continue to struggle with out-of-pocket expenses that can be overwhelming. Economic evaluations in healthcare have become increasingly important in guiding policy decisions and resource allocation. Pharmacoeconomics, a sub-discipline of health economics, assesses the cost-effectiveness of medical interventions by analyzing their economic impact on clinical outcomes. Given the chronic nature of ESRD and the lifelong dependence on dialysis for many patients, a thorough pharmacoeconomic assessment is necessary to determine the sustainability of current treatment models and explore ways to optimize cost efficiency [4].

Medical Costs Associated with Dialysis Treatment

The direct medical costs of dialysis include a range of expenses, such as the cost of dialysis sessions, diagnostic tests, medications, physician consultations, and hospitalization due to dialysis-related complications. At SGT Hospital, the pricing of dialysis services varies depending on factors such as the type of dialysis (hemodialysis vs. peritoneal dialysis), frequency of sessions, and patient-specific medical requirements. Additionally, dialysis patients require a host of medications, including erythropoiesis-stimulating agents (ESAs) to manage anemia, phosphate binders, antihypertensive drugs, and nutritional supplements, all of which contribute to the overall cost burden [4,5]. Hospitalization due to infections, cardiovascular events, or dialysis-related complications can further escalate medical expenses. Studies have shown that recurrent hospital admissions are common among ESRD patients, adding to the already high cost of treatment. Moreover, the need for regular laboratory tests to monitor kidney function and other health parameters adds another layer of financial strain [6].

Non-Medical Costs and Socioeconomic Implications

Beyond direct medical expenses, ESRD patients and their families face significant non-medical costs that are often overlooked in economic assessments. These include transportation expenses for frequent hospital visits, loss of income due to work absenteeism, and the psychological toll of managing a chronic illness [4]. Many patients rely on caregivers, who may also have to take time off work or incur additional costs for assisting with the patient's medical needs. In low-income households, these cumulative expenses can lead to financial distress, forcing patients to make

difficult choices between healthcare and other necessities [6]. A significant challenge faced by dialysis patients is the need for long-term financial planning, as the costs of treatment are continuous and can escalate over time. Insurance coverage for dialysis treatment remains inadequate for many individuals, particularly those who do not qualify for government subsidies or employer-provided health benefits. As a result, many families resort to borrowing money or depleting their savings to afford life-sustaining dialysis sessions [7]. The financial burden is further compounded for patients from rural areas who must travel long distances to access dialysis facilities at hospitals like SGT Hospital, adding transportation and accommodation costs to their list of expenses [7].

The Need for Policy Interventions and Cost-Effective Strategies

To address the economic challenges faced by ESRD patients, there is an urgent need for policy interventions that prioritize cost-effective strategies for dialysis care. Expanding government-funded dialysis programs, increasing insurance coverage, and subsidizing essential medications can significantly reduce the financial burden on patients. Additionally, promoting home-based dialysis solutions, such as peritoneal dialysis, may offer a more cost-effective alternative for patients who meet the eligibility criteria. Investing in preventive healthcare measures, early CKD screening programs, and patient education initiatives can also help mitigate the progression of kidney disease and reduce the long-term costs associated with ESRD management [8]. SGT Hospital, like many other healthcare institutions, plays a vital role in supporting patients through financial assistance programs, community outreach initiatives, and affordable dialysis packages. Collaborative efforts between healthcare providers, policymakers, and patient advocacy groups are essential to developing sustainable models of care that ensure equitable access to dialysis treatment without imposing an insurmountable financial burden on patients and their families [8,9].

Overview of Dialysis Modalities and Their Cost Implications

Chronic kidney disease (CKD) is becoming an increasing global health concern, affecting millions of people worldwide. As the disease progresses to end-stage renal disease (ESRD), patients require renal replacement therapy to sustain life. Dialysis is one of the primary treatments available, performing the critical function of removing toxins and excess fluids from the bloodstream when the kidneys can no longer do so [10]. The two main types of dialysis-hemodialysis (HD) and peritoneal dialysis (PD)—come with their advantages, challenges, and cost implications. Additionally, dialysis can be administered in different settings, including hospital-based, in-center, or home-based treatments, which further influence the overall financial burden on patients and healthcare systems. This article explores the cost structures associated with these dialysis modalities on both a national and global scale [10,11].

A Comparative Look at Haemodialysis and Peritoneal Dialysis

Haemodialysis (HD)

An Overview and Cost Factors

Haemodialysis is the most widely used dialysis method, often performed in specialized dialysis centres or hospitals. It involves diverting the patient's blood through a machine known as a dialyzer, where toxins and excess fluids are filtered before the cleaned blood is returned to the body [12].

Several factors contribute to the high cost of haemodialysis:

- **Dialysis Equipment and Supplies** Specialized machines, dialyzers, and sterile solutions drive up the overall treatment expense.
- **Staffing Costs** Trained nurses and technicians must be present during every session, increasing labor costs.
- **Facility and Operational Expenses** Hospital-based and in-center dialysis treatments come with infrastructure, utility, and maintenance costs.
- **Treatment Frequency** Hemodialysis is typically performed three times a week, with each session lasting 3–5 hours, leading to higher cumulative expenses.
- **Medication and Supplementary Care** Many patients require additional medications like erythropoietin-stimulating agents (ESAs) for anemia and phosphate binders to maintain electrolyte balance.

In developed countries like the United States, the average yearly cost of hemodialysis per patient is estimated at around $89,000, according to the United States Renal Data System (USRDS). In contrast, in low- and middle-income countries (LMICs), this cost can range from $10,000 to $40,000, depending on healthcare subsidies and government support [11].

Peritoneal Dialysis (PD)

A Cost-Effective Alternative?

Unlike haemodialysis, peritoneal dialysis utilizes the peritoneal membrane inside a patient's abdomen as a natural filter. A catheter is surgically placed into the abdomen, allowing the infusion and drainage of a special dialysate fluid that absorbs waste products. PD can be performed manually (Continuous Ambulatory Peritoneal Dialysis, CAPD) or with the help of a machine (Automated Peritoneal Dialysis, APD), and is typically done at home [13].

Key cost drivers for peritoneal dialysis include

- **Dialysis Fluids and Supplies** PD requires large quantities of dialysate, disposable tubing, and bags, making consumable costs a significant factor.
- **Home Setup** Patients need a clean and sterile space for exchanges, while those on APD require a dialysis machine.
- **Training and Monitoring** Patients or their caregivers must be trained to handle exchanges safely and watch for complications like infections (e.g., peritonitis).
- **Medical Check-Ups** Regular follow-ups with nephrologists ensure dialysis effectiveness and address potential health concerns.

PD is generally more cost-effective than HD. In high-income countries, annual expenses range from $53,000 to $70,000, while in LMICs, the cost is significantly lower, averaging $5,000 to $25,000 per year. PD is often a more affordable and accessible option in resource-limited areas because it reduces dependence on medical facilities and trained professionals [14].

Comparing Cost Structures: Hospital-Based, In-Centre, and Home Dialysis

Hospital-Based Dialysis

- The most expensive option due to hospital facility charges, 24/7 medical supervision, and emergency response capabilities.
- Best suited for critically ill patients who require continuous monitoring.
- High operational costs contribute to a greater financial burden on both patients and healthcare insurers.

In-Centre Dialysis

- A widely used option for HD, typically provided at dialysis clinics.
- More affordable than hospital-based dialysis but still costly due to machine use, staffing requirements, and regular patient visits.
- Additional expenses include transportation for patients traveling multiple times a week.

Home-Based Dialysis (PD and Home HD)

- Generally, the most cost-effective option as it eliminates overhead costs related to clinic or hospital-based treatment.
- Home HD requires an initial investment in equipment and training but offers long-term savings.
- PD is particularly suited for home use, reducing travel costs and dependency on medical staff.

A 2022 study published in the *Journal of the American Society of Nephrology (JASN)* found that shifting dialysis treatments to a home-based setting, particularly PD, could cut costs by **30–50%** compared to in-centre HD. However, success depends on proper patient education, support systems, and infection prevention measures [15-17].

The Global Affordability of Dialysis: A Comparative Perspective

High-Income Countries

- Nations like the United States, Canada, and the United Kingdom provide dialysis coverage through public health programs such as Medicare (U.S.) and the NHS (UK).
- The U.S. government spends over **$35 billion** annually on dialysis, making ESRD one of the costliest chronic conditions.
- Many developed countries are promoting home-based dialysis to reduce healthcare expenditure.

Low- and Middle-Income Countries (LMICs)

- Countries such as India, Nigeria, and Brazil face significant challenges in making dialysis affordable due to limited government funding and high out-of-pocket costs.
- A large percentage of ESRD patients in LMICs cannot afford ongoing dialysis, resulting in poor survival rates.
- Some governments and non-governmental organizations (NGOs) offer subsidized dialysis programs, but accessibility remains a major issue.

A 2021 study published in *The Lancet Global Health* highlighted that over 80% of ESRD patients in LMICs lack access to regular dialysis due to financial barriers and insufficient healthcare infrastructure. Expanding the use of cost-effective options like PD and increasing government-funded dialysis programs could significantly improve survival rates in these regions[17-20].

Direct Medical Costs of Dialysis Treatment

Dialysis is a vital treatment for patients suffering from end-stage renal disease (ESRD), but it comes with significant financial implications. The costs associated with dialysis go beyond the procedure itself, encompassing essential medical supplies, medications, regular check-ups, and hospital stays due to complications. The overall expense depends on various factors, such as the type of dialysis, healthcare setting, and available financial support [18].

Costs Associated with Dialysis Procedures: Equipment, Supplies, and Maintenance

One of the most significant costs in dialysis treatment arises from the equipment and consumables necessary to perform the procedure safely and effectively.

• **Hemodialysis (HD) Expenses** This form of dialysis involves a complex machine that filters waste and excess fluids from the blood. Patients undergoing HD require specialized medical equipment, including dialyzers (artificial kidneys), blood tubing, vascular access devices (such as fistulas or grafts), and dialysate solutions. Additionally, the regular maintenance of dialysis machines and stringent infection control measures contribute to the overall cost [21].

• **Peritoneal Dialysis (PD) Expenses** In contrast, PD is a home-based dialysis method that requires a surgically placed catheter in the abdomen. The recurring costs for PD include peritoneal dialysis fluid, sterile tubing, and disposable exchange bags. Patients utilizing Automated Peritoneal Dialysis (APD) also need a cycler machine, increasing the initial cost but decreasing the necessity for frequent clinic visits [22].

• **Infrastructure and Maintenance Costs** Dialysis centers require extensive infrastructure, such as water purification systems, medical waste disposal mechanisms, and trained staff, all of which contribute to long-term operational costs.

The financial burden of dialysis varies worldwide. In developed countries, the annual cost of in-center HD can exceed $89,000 per patient, while PD is slightly less expensive, ranging from $53,000 to $70,000 per year. In lower-income countries, although dialysis is cheaper, many patients still find it unaffordable due to limited government support and healthcare coverage [23].

Medications and Supportive Therapies

Patients undergoing dialysis need various medications to manage complications arising from kidney failure, which further increases treatment costs.

• **Erythropoietin-Stimulating Agents (ESAs)** Kidney disease leads to anemia due to reduced erythropoietin production. To counter this, patients require ESAs such as epoetin alfa or darbepoetin to stimulate red blood cell production. These medications can be expensive, with annual costs ranging from $6,000 to $10,000 per patient [21].

• **Phosphate Binders** Since failing kidneys cannot properly regulate phosphate levels, patients need phosphate binders such as sevelamer or calcium acetate to prevent complications like bone disease and vascular calcification [22].

• **Blood Pressure Medications** Many dialysis patients suffer from high blood pressure and require antihypertensive drugs like beta-blockers, ACE inhibitors, or calcium channel blockers.

• **Nutritional Supplements** Dialysis patients often lack essential vitamins and minerals, necessitating supplementation with active vitamin D, iron, and folic acid to maintain overall health. In many healthcare systems, insurance assists in covering some of these medication costs, but in countries with high out-of-pocket expenses, affordability remains a significant issue [23].

Hospital Admissions and Emergency Care Due to Dialysis Complications

Many dialysis patients encounter medical complications that result in emergency hospital visits, further escalating their healthcare expenses. The most common causes of hospitalization include

• **Infections** Hemodialysis patients are at risk of bloodstream infections due to repeated vascular access, while PD patients may experience peritonitis (infection of the peritoneal lining). Severe infections often necessitate hospital admission, intravenous antibiotics, and, in some cases, catheter removal or replacement [24].

• **Heart-Related Issues** Cardiovascular disease is a leading cause of death among dialysis patients. Many suffer from complications such as heart failure, arrhythmias, and fluid overload, which require costly interventions like intensive care or surgery [23].

• **Electrolyte Imbalances** Kidney failure causes life-threatening fluctuations in potassium and sodium levels, which may require emergency intervention to prevent complications such as cardiac arrest.

• **Fluid Overload and Pulmonary Edema** If excess fluid is not adequately removed during dialysis, it can result in severe swelling and breathing difficulties, necessitating urgent dialysis sessions or diuretic therapy [25].

• **Surgical Procedures** Some patients face vascular access issues, requiring additional surgeries to repair or replace fistulas and grafts. Studies indicate that dialysis patients are hospitalized one to two times per year on average, with each hospital stay costing between $10,000 and $20,000. These recurring medical expenses add to the financial strain faced by patients and healthcare systems alike [25].

Regular Medical Supervision and Laboratory Tests

Dialysis patients require continuous monitoring through regular check-ups and laboratory testing, which further increases treatment costs.

• **Nephrologist Consultations** Dialysis patients need frequent visits to nephrologists for treatment adjustments, medication management, and overall health assessments. While some healthcare systems cover these consultations, in many cases, patients shoulder these expenses themselves [26].

• **Routine Laboratory Tests** Frequent blood tests are essential to monitor key health indicators, including:
◦ Blood urea nitrogen (BUN) and creatinine (to assess kidney function and dialysis effectiveness).
◦ Electrolytes (potassium, sodium, phosphate levels).
◦ Hemoglobin levels (to monitor anemia).
◦ Parathyroid hormone (PTH) levels (for bone health assessment).
◦ Infection markers (to detect possible complications early).
◦ Hepatitis and viral screenings (especially for HD patients who undergo frequent blood exposure).
The costs associated with laboratory testing can accumulate to several thousand dollars per year, depending on the monitoring frequency and the type of healthcare coverage. Patients without sufficient insurance or government assistance often struggle to afford these essential diagnostic procedures [27].

Non-Medical Costs Incurred by Dialysis Patients

While the financial burden of dialysis is often discussed in terms of direct medical expenses, such as treatment costs, medications, and hospital fees, there are significant non-medical costs that also impact patients and their families. These indirect expenses, which include transportation, loss of income, caregiver burden, and psychosocial challenges, contribute to the overall economic and emotional strain of managing chronic kidney disease (CKD). Understanding these non-medical costs is essential for developing policies that support patients beyond just the clinical aspects of their treatment [28].

Transportation Costs

For most patients undergoing dialysis, frequent travel to and from treatment centers is an unavoidable necessity. Since hemodialysis (HD) is typically performed three times a week, patients must arrange transportation to the dialysis facility regularly. In many cases, patients rely on public transport, taxis, private vehicles, or even ambulance services, depending on their health condition and financial situation [27].For individuals living in urban areas, transportation costs may be relatively lower due to better accessibility to healthcare facilities. However, in rural regions, dialysis centers are often located far from patients' homes, resulting in higher travel expenses and longer commute times. Some patients may have to relocate to be closer to treatment centers, adding further housing and relocation costs [29]. Home-based dialysis, particularly peritoneal dialysis (PD) and home hemodialysis (HHD), can reduce transportation expenses significantly. However, these options still involve costs related to initial home setup, regular medical check-ups, and supply deliveries. While some governments and insurance plans provide subsidies for transportation, many patients in low-income countries must bear the full cost of travel, making it a significant financial strain [30].

Loss of Productivity and Income

Dialysis treatments are time-consuming, often requiring multiple sessions per week that last several hours. This frequent commitment makes it challenging for patients to maintain full-time employment. Many individuals with end-stage renal disease (ESRD) experience reduced work hours, job loss, or early retirement due to their condition. Those in physically demanding jobs may find it particularly difficult to continue working, as fatigue and dialysis-related complications can limit their ability to perform their duties [20]. The loss of income is a significant economic burden, especially for patients who are the primary earners in their families. Even for those who manage to continue working, productivity often declines due to the side effects of dialysis, such as fatigue, nausea, and cognitive impairment. Patients who rely on disability benefits or social support programs may receive some financial relief, but these payments are often insufficient to cover both medical and living expenses [31]. A study published in the *Clinical Journal of the American Society of Nephrology* found that employment rates among dialysis patients are significantly lower than in the general population. This loss of workforce participation not only affects individual patients but also has broader economic implications for healthcare systems and national economies [27].

Caregiver Burden and Associated Indirect Costs

Dialysis care often extends beyond the patient to family members or hired caregivers who assist with daily activities, medical needs, and emotional support. The role of a caregiver can be demanding, requiring a significant time commitment to help with transportation, medication management, dietary restrictions, and monitoring for complications [6]. For home-based dialysis patients, caregivers are often responsible for performing dialysis exchanges (in the case of PD) or assisting with home HD procedures. This additional responsibility can limit caregivers' ability to work full-time or engage in other personal and professional activities. Many caregivers experience financial strain due to lost wages or the need to reduce work hours to accommodate their caregiving duties [10]. In some cases, families may need to hire professional caregivers or home health aides, which adds to the financial burden. According to a report by the *National Kidney Foundation*, unpaid caregivers of dialysis patients often experience high levels of stress and burnout, leading to potential health issues of their own. The indirect costs associated with caregiving, including mental health impacts and loss of personal time, are often overlooked but play a crucial role in the overall burden of dialysis treatment [32].

Psychosocial Costs: Mental Health and Quality of Life

Beyond the financial aspects, dialysis patients experience significant psychosocial challenges that affect their overall well-being. The chronic nature of kidney disease, combined with the physical toll of dialysis, often leads to feelings of anxiety, depression, and social isolation. Many patients struggle with the loss of independence, as their daily lives revolve around treatment schedules, dietary restrictions, and medication regimens [30]. Dialysis can also strain personal relationships, as patients may feel like a burden to their families or struggle with changes in social roles. Studies have shown that individuals undergoing dialysis have a higher prevalence of mental health disorders, including depression and anxiety, compared to the general population. Unfortunately, mental health support is often under-prioritized in dialysis care, leaving many patients to cope with emotional distress on their own [18]. Social isolation is another significant concern, as patients may find it difficult to participate in social gatherings, travel, or engage in hobbies due to their medical condition. This reduced social engagement can further impact mental well-being and overall quality of life. Support groups, counseling, and patient education programs can help address some of these psychosocial challenges, but access to such services is often limited by financial constraints and healthcare infrastructure [21].

Cost-Benefit Analysis and Financial Burden on Patients

The financial implications of dialysis are profound, affecting patients and healthcare systems alike. The cost of dialysis varies significantly depending on whether treatment is received in the private or public sector, the extent of insurance coverage, and government subsidies. Additionally, many patients face high out-of-pocket expenses, leading to financial distress and decreased quality of life. This article explores the economic burden of dialysis treatment, comparing costs in the private and public sectors, the role of insurance, and the financial hardships endured by patients [32].

Comparison of Private vs. Public Sector Dialysis Costs

The cost of dialysis is highly dependent on whether the treatment is accessed through a private or public healthcare facility. Public healthcare systems often subsidize dialysis, making it more accessible, while private healthcare facilities provide faster and often more comfortable services at a premium cost.

Public Sector Dialysis

Many countries provide dialysis treatment through publicly funded healthcare programs, ensuring that life-saving care is available to those in need. For instance, in countries like Canada and the United Kingdom, dialysis is covered under universal healthcare systems, meaning patients incur minimal direct costs. Similarly, in countries like India and Brazil, government hospitals offer subsidized dialysis to lower-income populations. However, challenges such as long waiting times, overcrowding, and limited resources can affect service quality and accessibility [33].

Private Sector Dialysis

Private dialysis centers offer more personalized care, reduced waiting times, and advanced treatment options. However, these benefits come at a significantly higher cost. In the United States, the cost of in-centerhemodialysis in a private facility can exceed $90,000 per year, while peritoneal dialysis costs slightly less at around $70,000 annually. In contrast, public healthcare programs like Medicare may cover a significant portion of these costs for eligible patients. In developing countries, private dialysis centers often cater to wealthier individuals or those with comprehensive insurance coverage, as out-of-pocket costs can be prohibitively high for the general population [33].

Insurance Coverage and Government Subsidies for Dialysis Treatment

Insurance plays a crucial role in managing the financial burden of dialysis treatment. However, coverage varies significantly depending on the country and healthcare system in place.

Health Insurance and Dialysis Coverage

In countries with well-developed insurance systems, dialysis treatment is often covered by national health insurance programs or private insurance plans. In the United States, Medicare provides coverage for most dialysis patients, including those under 65 who qualify due to ESRD (End-Stage Renal Disease). Medicaid and private insurance policies also offer varying degrees of coverage, though patients may still face copayments and deductibles. In European nations with universal healthcare, such as Germany and France, dialysis is fully covered under public insurance programs. In contrast, in many developing countries, health insurance coverage for dialysis is limited. Patients often rely on employer-based insurance or private policies, which may not fully cover long-term dialysis costs. For example, in India, while some government-sponsored health schemes cover dialysis, many patients still pay substantial out-of-pocket expenses due to gaps in coverage and limited availability of subsidized treatment centers [34].

Government Subsidies and Assistance Programs

Several governments worldwide have implemented subsidy programs to alleviate the economic burden of dialysis treatment. These programs aim to ensure that even low-income patients have access to necessary care. For example:

- **India** The government's Pradhan Mantri National Dialysis Program (PMNDP) provides free dialysis services in select government hospitals.
- **United States** Medicare covers up to 80% of dialysis treatment costs for eligible patients, with additional support from Medicaid for low-income individuals.
- **European Union Countries** Public health systems offer free or low-cost dialysis to residents, reducing financial strain on patients.

Despite these efforts, gaps in funding, bureaucratic hurdles, and disparities in healthcare access mean that not all patients benefit equally from these subsidies.

Out-of-Pocket Expenditures and Financial Distress Among Patients

Even with insurance and government support, many dialysis patients face substantial out-of-pocket expenses. These costs include copayments, transportation, medications, and dietary requirements essential for managing CKD [35].

Direct and Indirect Costs

- **Dialysis Sessions** Patients who do not qualify for government-funded programs or comprehensive insurance must pay for each session, with costs ranging from $100 to $500 per session, depending on the country and healthcare facility.
- **Medications** Dialysis patients often require additional medications such as erythropoietin for anemia management, phosphate binders, and antihypertensive drugs, adding to the overall expense.
- **Transportation Costs** Many patients require frequent travel to dialysis centers, especially in rural areas where treatment facilities are scarce. Transportation expenses can significantly impact low-income patients.

- **Loss of Productivity and Income** Dialysis is time-consuming, requiring multiple sessions per week. Many patients experience job loss or reduced working hours, leading to financial instability.
- **Caregiver Costs** Some patients require full-time assistance from caregivers, further increasing household financial burdens.

Psychosocial and Economic Impact

The financial burden of dialysis extends beyond tangible costs, affecting the overall well-being of patients and their families. Many patients experience stress, anxiety, and depression due to the constant financial strain. Studies have shown that financial toxicity is a significant factor in reduced quality of life among dialysis patients. Families often have to make difficult choices, such as selling assets or borrowing money, to afford continued treatment [34].

Strategies to Reduce the Economic Burden of Dialysis

Encouraging Home-Based Dialysis: Cost Savings and Patient Benefits

One of the most effective ways to reduce the financial strain of dialysis is by promoting home-based treatments, including both peritoneal dialysis (PD) and home hemodialysis (HHD). Home dialysis significantly lowers healthcare costs by minimizing the need for frequent hospital visits, reducing staffing expenses, and decreasing infrastructure-related costs associated with in-center treatments [33]. Patients who opt for home-based dialysis also benefit from increased flexibility, allowing them to maintain employment and lead a more independent lifestyle. Studies have shown that home dialysis can improve the overall quality of life by reducing travel time and offering greater convenience. Additionally, home-based dialysis helps alleviate the financial burden on healthcare systems by decreasing the demand for in-center resources. Governments and healthcare providers should invest in educational programs and training initiatives to equip patients and caregivers with the necessary skills to perform dialysis safely at home [34].

Policy Interventions for Better Funding and Reimbursement Models

The financial burden of dialysis is often exacerbated by inadequate insurance coverage and high out-of-pocket expenses. Governments must implement policy interventions that ensure better financial support for patients requiring dialysis treatment. Expanding public healthcare programs, such as government subsidies and insurance reimbursements, can help reduce the direct costs incurred by patients [32]. Countries with well-developed healthcare systems, such as the United Kingdom and Canada, have successfully integrated dialysis funding into their national health policies, providing patients with greater access to treatment without significant financial strain. In contrast, many low- and middle-income countries struggle with dialysis affordability due to insufficient public healthcare funding. Establishing financial assistance programs, increasing insurance coverage, and incentivizing the use of cost-effective dialysis options, such as peritoneal dialysis, can improve treatment accessibility and affordability [35].

Innovations in Dialysis Technology to Reduce Costs

Technological advancements in dialysis are crucial in lowering treatment costs while improving efficiency and patient outcomes. Innovative approaches such as portable dialysis machines and wearable artificial kidneys are currently being developed to make dialysis more convenient and cost-effective.Another promising area is the use of bioengineered dialysis membranes that enhance filtration efficiency and reduce the need for expensive replacement filters. Additionally, automated peritoneal dialysis (APD) machines are making home-based dialysis more user-friendly, requiring less manual intervention from patients while optimizing treatment effectiveness.The adoption of telemedicine and remote monitoring systems is another cost-saving innovation. These technologies allow healthcare providers to track a patient's condition in real-time, reducing the frequency of hospital visits and early detection of complications, thereby preventing costly emergency interventions [35,36].

Role of Preventive Care and Early Detection in Reducing Dialysis Dependence

Preventive healthcare measures and early intervention strategies can significantly reduce the incidence of end-stage renal disease (ESRD), ultimately lowering the demand for dialysis treatments. Public health initiatives that focus on

managing risk factors such as diabetes, hypertension, and obesity can help prevent chronic kidney disease (CKD) progression [36]. Routine screenings and early diagnosis programs play a pivotal role in identifying kidney disease at an early stage, allowing for lifestyle and medical interventions that can slow disease progression. Patient education programs that promote kidney-friendly diets, regular exercise, and adherence to prescribed medications can help individuals manage CKD effectively, delaying or even preventing the need for dialysis. Healthcare systems should invest in community outreach programs that raise awareness about CKD prevention and encourage at-risk individuals to seek regular health check-ups. By prioritizing preventive care, healthcare providers can significantly decrease the financial burden associated with long-term dialysis treatments, benefiting both patients and national healthcare budgets [37].

CONCLUSION

The economic impact of dialysis treatment extends far beyond medical expenses, affecting every aspect of a patient's life. Understanding the full spectrum of costs incurred by ESRD patients at SGT Hospital provides valuable insights into the financial challenges they face. It highlights the urgent need for policy-driven solutions. A comprehensive approach that includes cost-effective treatment strategies, enhanced insurance coverage, and increased government support can significantly improve the accessibility and affordability of dialysis care. This review article aims to shed light on the financial implications of ESRD treatment, paving the way for further research and policy development to alleviate the economic burden on affected individuals and their families. Dialysis is a crucial life-sustaining treatment for individuals with ESRD, but its financial burden varies depending on the modality chosen and the setting in which it is delivered. Hemodialysis remains the most common form but is often the costliest, particularly in hospital and in-center settings. In contrast, peritoneal dialysis offers a more affordable, home-based alternative with significant cost savings, particularly in LMICs. While high-income countries have structured healthcare funding to support dialysis patients, LMICs face major affordability challenges. Shifting toward home-based dialysis solutions, increasing government subsidies, and encouraging cost-effective dialysis modalities like PD can help make this essential treatment more accessible to those in need. By focusing on sustainable and cost-efficient strategies, healthcare systems worldwide can work towards ensuring that all ESRD patients receive the life-saving dialysis care they require.

The financial burden of dialysis treatment extends far beyond the procedure itself. Patients must manage the costs of medical equipment, medications, routine monitoring, hospitalizations, and specialist consultations. The overall expenses depend on factors such as the dialysis method, treatment setting, and healthcare system funding. While government-funded programs and insurance policies help alleviate these costs in some countries, financial hardship remains a major concern for dialysis patients worldwide. Efforts to make dialysis more affordable should focus on policy reforms, improved funding mechanisms, and promoting cost-effective home-based dialysis options. By addressing these economic challenges, healthcare systems can enhance patient access to life-saving dialysis treatment and improve their quality of life. While dialysis is a critical life-saving treatment for individuals with ESRD, the associated non-medical costs place a significant burden on patients and their families. Transportation expenses, loss of income, caregiver strain, and psychosocial challenges all contribute to the overall cost of living with kidney disease. Addressing these indirect costs requires a comprehensive approach that includes financial assistance programs, better access to home dialysis options, mental health support, and policies that promote workplace flexibility for patients and caregivers. As healthcare systems evolve, it is crucial to recognize that the true cost of dialysis extends beyond medical expenses. By supporting patients holistically—financially, socially, and emotionally-healthcare providers and policymakers can improve the quality of life for those undergoing dialysis and their families.

The cost of dialysis treatment presents a significant challenge for patients, with financial burdens varying based on healthcare systems, insurance coverage, and government support. While public healthcare facilities provide subsidized treatment, access barriers such as long waiting times and limited resources remain concerns. Private

sector dialysis offers better service quality but at a much higher cost. Health insurance and government subsidies play a crucial role in mitigating these expenses, but many patients still face high out-of-pocket costs. The indirect financial burden, including lost income and transportation costs, further exacerbates the economic strain on families. Moving forward, policies aimed at expanding healthcare coverage, increasing funding for dialysis programs, and promoting cost-effective treatment options are essential to ensure that dialysis remains accessible and affordable for all patients in need. Addressing the economic burden of dialysis requires a multi-faceted approach, combining home-based dialysis promotion, policy interventions, technological advancements, and preventive care strategies. By implementing cost-saving measures and improving accessibility to affordable treatment options, healthcare systems can alleviate financial stress on patients while ensuring better health outcomes. Policymakers, healthcare providers, and researchers must collaborate to develop sustainable solutions that enhance dialysis affordability and improve the overall quality of care for individuals with chronic kidney disease.

The financial burden of dialysis remains a significant challenge for patients, healthcare providers, and policymakers. The high costs associated with both hemodialysis (HD) and peritoneal dialysis (PD) stem from equipment, medical supplies, hospital infrastructure, and ongoing patient care. While PD is often more affordable than in-center HD, accessibility remains a concern, especially in low- and middle-income countries (LMICs) where government support and insurance coverage are limited. Patients frequently bear substantial out-of-pocket expenses, leading to financial strain and, in some cases, treatment discontinuation. These economic challenges highlight the urgent need for solutions that balance affordability and quality care. To mitigate the financial impact, healthcare systems should emphasize cost-effective strategies such as expanding home-based dialysis programs, which not only reduce costs but also enhance patient independence and quality of life. Additionally, policy interventions, including improved insurance coverage, better reimbursement models, and government subsidies, are essential to making dialysis more accessible. Advancements in dialysis technology, such as portable and wearable artificial kidneys, also hold promise in reducing long-term treatment costs. However, beyond dialysis, a strong focus on preventive care and early detection of chronic kidney disease (CKD) can help delay or even prevent the need for dialysis altogether, offering a more sustainable healthcare approach. Future research should explore innovative, cost-efficient dialysis methods, assess the long-term impact of home-based dialysis on patient outcomes, and analyze the effectiveness of healthcare policies in improving affordability. By integrating patient-centered approaches with financial sustainability, the global healthcare community can work towards a system that ensures optimal care without excessive economic burden.

ABSTRACT

Forests are vital ecosystems providing a multitude of benefits, including timber, non-timber forest products (NTFPs), and numerous ecosystem services. The increasing global demand for resources necessitates a responsible and sustainable approach to forest product utilization. This paper examines recent advances in the field, focusing on sustainable harvesting practices, innovative processing technologies, and the development of bio-based materials derived from forest resources. We explore the role of emerging technologies such as nanotechnology, biotechnology, and additive manufacturing in transforming forest products into high-value applications, contributing to a circular bioeconomy while mitigating environmental impacts. The challenges and opportunities associated with the wider adoption of these sustainable approaches and emerging technologies are also discussed.

Keywords: Forest Products, Sustainable Utilization, Emerging Technologies, Bioeconomy, Nanotechnology.

INTRODUCTION

Forests are essential components of the global ecosystem, providing a diverse range of products and services that support human well-being (Chandra et al. 2021b). Beyond their role in carbon sequestration, climate regulation, and biodiversity conservation, forests are a source of raw materials for a vast array of products, including timber for construction, pulp for paper production, and a wide range of non-timber forest products (NTFPs) such as medicinal plants, resins, and fruits (Berglund and Burgert 2018). However, traditional forest product utilization often involves

unsustainable practices, leading to deforestation, habitat loss, and environmental degradation (Chandra et al. 2021a). The need for a paradigm shift towards sustainable management and value-added processing of forest resources is more urgent than ever. This shift requires embracing innovative technologies and approaches that minimize environmental impact, maximize resource efficiency, and contribute to a circular bioeconomy (Bargah et al., 2024; Jamaluddin and Chandra 1998). This paper explores the recent advancements in forest product utilization, focusing on sustainable harvesting practices, innovative processing technologies, and the development of bio-based materials derived from forest resources (Aird 1994; Kumar et al., 2023b). We examine the role of emerging technologies such as nanotechnology, biotechnology, and additive manufacturing in transforming forest products into high-value applications, creating a more sustainable and resilient future for the forestry sector.

Sustainable Harvesting Practices

Sustainable forest management (SFM) is the foundation for responsible forest product utilization. Key principles of SFM include maintaining biodiversity, protecting soil and water resources, ensuring long-term productivity, and considering the social and economic needs of local communities (Fig. 1). Advances in harvesting practices that align with SFM principles include:

Reduced Impact Logging (RIL) RIL techniques minimize damage to the residual forest stand and soil during harvesting operations. These techniques include pre-harvest planning, directional felling, careful skidding, and the use of low-impact harvesting equipment (Burgert et al. 2016). Studies have shown that RIL can significantly reduce soil erosion, damage to residual trees, and carbon emissions compared to conventional logging practices.

Precision Forestry

Leveraging remote sensing technologies (LiDAR, satellite imagery, drones) and data analytics to optimize harvesting operations. Precision forestry allows for the selection of specific trees for harvest based on their size, health, and value, minimizing unnecessary removal and maximizing the yield of high-quality timber (Tiwari et al. 2024). One way that precision forestry helps in sustainable harvesting practices is by enabling precise tree inventories. Rather than relying on outdated methods like manual surveys or aerial photography, foresters can use drones equipped with LiDAR technology to create highly detailed 3D maps of forested areas. These maps provide valuable information about tree species, age, health, and density, allowing foresters to tailor their harvesting plans to maximize timber yield while minimizing ecological impact (Chandra 2013). Furthermore, precision forestry helps in the planning and execution of harvest operations. Using GPS technology, foresters can create digital maps that show the location of trees to be harvested, access roads, and potential environmental hazards. This level of precision helps minimize damage to soil, waterways, and wildlife habitats during timber extraction, ensuring the long-term sustainability of the forest ecosystem.

Salvage and Reclaimed Wood Utilization

Salvage and reclaimed wood utilization have gained popularity in recent years as people become more aware of the environmental impact of deforestation and the benefits of reusing materials (Farid et al. 2022; Darro et al. 2022). Salvage wood refers to wood that is reclaimed from old buildings, barns, or even sunken logs from rivers, while reclaimed wood is wood that has been discarded or thrown away and then repurposed for a new use. This practice not only helps reduce waste but also adds character and uniqueness to a space. Instead of relying solely on newly harvested timber, utilizing salvaged or reclaimed wood from demolition sites, storm-damaged forests, or beetle-killed trees can significantly reduce pressure on standing forests (Fu et al. 2018b; Kamesh et al. 2023).

Certification Schemes

Forest certification schemes like the Forest Stewardship Council (FSC) and the Programme for the Endorsement of Forest Certification (PEFC) provide a framework for independent verification of sustainable forest management practices (Chiteculo et al. 2018; Chandra et al. 2024). These schemes promote responsible forest management by providing consumers with assurance that the forest products they purchase come from well-managed forests. In addition to providing economic incentives for companies to adopt sustainable practices, certification schemes can

also help to promote transparency and accountability in the supply chain (Diakosavvas and Frezal 2019; Bhardwaj et al. 2024). By requiring companies to undergo regular audits and inspections in order to maintain their certification, these schemes can help to ensure that companies are meeting the standards set out in the certification criteria. This can help to prevent greenwashing and ensure that companies are held accountable for their actions, which can ultimately lead to more sustainable practices across the industry (De Oliveira et al. 2013; Kumar et al. 2022a).

Innovative Processing Technologies

Beyond sustainable harvesting, innovative processing technologies play a crucial role in maximizing the value and minimizing the waste associated with forest products.

Advanced Pulp and Paper Technologies

Pulp and paper technologies have advanced significantly over the years, with new innovations constantly being introduced to improve efficiency, quality, and sustainability in the industry (Fu et al. 2018a; Kumar et al. 2024a). These advancements have revolutionized the way pulp and paper products are produced, resulting in higher quality products, reduced environmental impact, and increased profitability for manufacturers. Technologies such as extended delignification, enzyme-assisted bleaching, and closed-loop water systems are reducing the environmental impact of pulp and paper production by minimizing the use of chemicals, water, and energy (Vanessa Lencinas et al. 2019; Kumar et al. 2023a; Bhardwaj 2023a). Emerging technologies like the production of nanocellulose from pulp are opening new avenues for the use of cellulose fibers in high-value applications.

Engineered Wood Products (EWPs)

Engineered wood products are becoming increasingly popular in the construction industry due to their many benefits and advantages over traditional wood materials (Watham et al. 2017; Kumar 2015). These products are created by combining various types of wood fibers, particles, or veneers with adhesives to produce strong and durable building materials that are suitable for a wide range of applications. EWPs such as cross-laminated timber (CLT), glued laminated timber (glulam), and laminated veneer lumber (LVL) offer enhanced strength, durability, and dimensional stability compared to traditional solid lumber (Murali et al. 1996; Kumar et al. 2022b). These products are increasingly being used in tall wood buildings, offering a sustainable alternative to concrete and steel.

Wood Modification

Wood modification can also involve physical treatments such as compression or densification, which can increase the density and strength of the wood. This can be useful in applications where a stronger and more durable wood product is required, such as in construction or furniture manufacturing (Dong et al. 2020). Other methods of wood modification include biological treatments, where fungi or bacteria are used to improve the properties of the wood, and acetylation, where the wood is treated with acetic anhydride to increase its dimensional stability and resistance to decay. Various wood modification techniques, such as thermal modification, acetylation, and furfurylation, can improve the durability, dimensional stability, and resistance to decay of wood, extending its lifespan and reducing the need for chemical preservatives (Melaku et al. 2014).

Bio-refinery Concepts

Bio-refinery concepts involve the integration of various technologies to convert biomass into a range of valuable products such as biofuels, biochemicals, and bioplastics. The primary goal of bio-refineries is to maximize the use of renewable resources while minimizing waste and environmental impact (Liu et al. 2016). This concept is gaining traction as society seeks more sustainable alternatives to traditional fossil fuels and chemicals. Integrating forest product processing with bio-refinery concepts allows for the conversion of wood and other forest biomass into a wide range of bio-based products, including biofuels, biochemicals, and biomaterials. This integrated approach maximizes resource utilization and minimizes waste.

Emerging Technologies for Forest Product Utilization

Emerging technologies are revolutionizing the forest product sector, enabling the creation of new bio-based materials with enhanced properties and functionalities.

Nanotechnology

Nanocellulose, including cellulose nanocrystals (CNCs) and cellulose nanofibrils (CNFs), is a promising nanomaterial derived from wood pulp (Kar and Jacobson 2012). CNCs and CNFs possess high strength, stiffness, and biodegradability, making them suitable for a wide range of applications, including composites, packaging, biomedical devices, and electronics.

Biotechnology

Biotechnology is being used to improve the efficiency and sustainability of forest product processing. Enzymes can be used to break down lignin, improve pulp bleaching, and modify wood properties (Burgert et al. 2015). Genetic engineering can be used to develop trees with improved growth rates, disease resistance, and wood properties.

Additive Manufacturing (3D Printing)

3D printing technologies are being used to create customized wood products with complex geometries and intricate designs. Wood-based 3D printing materials, such as wood flour composites and lignin-based filaments, are gaining popularity for applications in architecture, furniture design, and functional prototypes.

Artificial Intelligence (AI) and Machine Learning (ML)

AI and ML are being applied to optimize forest management practices, predict timber yields, and detect defects in wood products. These technologies can improve efficiency, reduce waste, and enhance decision-making throughout the forest product supply chain.

Applications of Bio-based Materials

The development of bio-based materials from forest resources is opening up new opportunities for sustainable product design and development across various sectors.

Construction

EWPs like CLT are transforming the construction industry by providing a sustainable alternative to concrete and steel. Bio-based insulation materials, such as wood fiber insulation and cellulose insulation, are gaining popularity for their thermal performance and environmental benefits.

Packaging

Biodegradable packaging materials derived from cellulose and lignin are replacing traditional plastic packaging, reducing plastic waste and promoting a circular economy.

Textiles

Cellulose fibers are being used to produce rayon, lyocell, and other regenerated cellulose fibers for the textile industry. These fibers offer a sustainable alternative to synthetic fibers derived from fossil fuels.

Automotive

Wood-based composites are being used in automotive interiors and structural components to reduce vehicle weight and improve fuel efficiency.

Biomedical

Nanocellulose and other wood-derived materials are being used in biomedical applications such as wound healing, drug delivery, and tissue engineering.

Challenges and Opportunities

While the advances in forest product utilization are promising, several challenges need to be addressed to ensure the wider adoption of sustainable approaches and emerging technologies.

Cost Competitiveness

Bio-based materials often face a cost disadvantage compared to traditional materials derived from fossil fuels. Government policies and incentives are needed to level the playing field and promote the adoption of bio-based alternatives.

Scale-up and Commercialization

Many of the emerging technologies are still in the early stages of development. Investment in research and development, pilot-scale demonstrations, and technology transfer is needed to scale up these technologies and bring them to market.

Public Perception and Acceptance

Public perception and acceptance of bio-based materials can be influenced by factors such as perceived performance, durability, and environmental benefits. Education and outreach efforts are needed to promote the benefits of bio-based materials and address any misconceptions.

Policy and Regulatory Frameworks

Supportive policy and regulatory frameworks are needed to encourage sustainable forest management, promote the use of bio-based materials, and reduce the environmental impact of forest product processing. Despite these challenges, the opportunities for sustainable forest product utilization are significant. The increasing global demand for renewable resources, the growing awareness of environmental concerns, and the rapid advancements in technology are creating a favorable environment for the development and adoption of innovative bio-based materials and sustainable forest management practices.

CONCLUSION

Advances in forest product utilization are essential for meeting the growing global demand for resources in a sustainable manner. Sustainable harvesting practices, innovative processing technologies, and emerging technologies like nanotechnology, biotechnology, and additive manufacturing are revolutionizing the forest product sector. These advancements are enabling the development of new bio-based materials with enhanced properties and functionalities, contributing to a circular bioeconomy while mitigating environmental impacts. While challenges remain, the opportunities for sustainable forest product utilization are significant. By embracing innovation, promoting sustainable practices, and fostering collaboration across the value chain, we can unlock the full potential of our forests to provide valuable resources for a more sustainable and resilient future.

ABSTRACT

The *Charak Samhita*, a cornerstone of Ayurvedic literature, provides profound insights into health, disease, and the human body. Among its divisions, the *Indriya Sthana* is particularly significant for its focus on prognostic signs and the subtle indicators of life and death. This section, as interpreted by *Acharya Chakrapani*, links "*Indra*" (*Prana*) with prognostic indicators (*Indriya* or *Rista*), exploring the intricate relationships between the senses, mind, and vital energies (*Prana*). It emphasizes how predictive factors can forewarn disease outcomes and assist medical practitioners in evaluating the severity of a patient's condition. The *Indriya Sthana's* holistic approach to diagnosis and prognosis includes physical signs (*Sharira Lakshana*) and mental and behavioural signs (*Manasika Lakshana*), which are crucial for determining the curability of diseases. This paper discusses the classification of these prognostic signs, their interpretation and application in both classical and modern contexts, and their relevance in contemporary medical practice. By integrating Ayurvedic prognostic methods with modern diagnostics, we can enhance early detection, personalized treatment, and overall patient outcomes, paving the way for a more comprehensive approach to healthcare.

Keywords: *Charak Samhita, Indriya Sthana, Ayurveda*, prognostic signs, *Prana, Sharira Lakshana, Manasika Lakshana*, holistic diagnosis.

INTRODUCTION

The *Charak Samhita*, one of the foundational texts of Ayurveda, sheds a lot of light on health, disease and the human body. Among its eight divisions, the *Indriya Sthana* holds a unique place, focusing on prognostic signs and the subtle indicators of life and death. The term "*Indriya*" refers to the senses or sensory faculties, but in the context of this section, as stated by Chakrapani *"Indra"* means *"Prana"* and the signs indicating its end are known as *Indriya* or *Rista* [1]. The *Indriya Sthana* delves into the intricate relationship between the senses, mind, and the vital energies (*Prana*) that sustain lifeIt details how definite factors known as predictive factors may serve to forewarn about such outcomes in diseases and how such information may assist the medical practitioners in evaluating the degree of severity in the health of a patient. This section is invaluable for its predictive insights, aiding in the determination of whether a disease is curable or incurable. Knowing which factors help in prognosis, practitioners will be reasonable in determining approaches for treating their patients without going against how health is likely to progress. Basically, the *Indriya Sthana* acts as a navigational tool to those in the field of Ayurveda by making the process of diagnosis and prognosis a lot easier in as much as it is accurate and compassionate. It represents the holistic and observational nature of Ayurveda, where the subtle signals of the body are as crucial as the more apparent symptoms in understanding health and disease.

2.Classification of Prognostic Signs

- **Physical Signs (*Sharira Lakshana*):**

I. Skin Changes (*Twak Lakshana*)

Colour Changes: Unusual colours like dark blue, black, yellow, or pale indicate serious conditions such as organ failure or toxicity. **[2]**

Texture Changes: Excessively rough, dry, or oily skin suggests *Doshic*imbalances *(Vata or Kapha).[3]*
Coldness: Cold extremities without external cause imply diminished circulation and Prana, indicating critical disease.[4]

II. Eye Movements and Appearance (*Netra Lakshana*)
Dullness of Eyes: Loss of brightness signals severe *Doshic*imbalance and declining health.[5]
Distorted Eye Movements: Involuntary or fixed eye movements indicate severe neurological issues.[6]
Colour Changes: Red, yellow, or sunken eyes denote infections, jaundice, or dehydration.[7]

III. Voice Changes (*Swara Lakshana*)
Weak Voice: Indicates diminished vital energy and systemic weakness.[8]
Distorted Sound: Changes in pitch or tone signal respiratory or nervous disorders.[9]
Loss of Voice: Complete aphonia without cause forebodes poor prognosis.[10]

IV. Facial Appearance (*Mukha Lakshana*)
Paleness or Darkening: Indicates anaemia or circulatory issues.[11]
Swelling or Puffiness: Suggests kidney or cardiovascular disease.[12]
Dry Lips: Severe dehydration or systemic imbalance.[13]

V. Nasal Signs (*Nasika Lakshana*)
Dryness: Reflects internal dryness and *Vata* imbalance.[14]
Distorted Sense of Smell: Signals serious neurological or systemic disease.[15]

VI. Tongue and Oral Cavity (*Jihva* and *Mukh Lakshana*)
Dryness of Tongue: Indicates extreme dehydration or systemic imbalance.[16]
Black or Dark Tongue: Suggests heavy toxicity or organ failure.[17]

Ulceration or Lesions: Symptoms of severe systemic problems.[18]

VII. Breathing Patterns (*Shwasa Lakshana*)
Laboured Breathing: Indicates serious respiratory or cardiovascular issues.[19]
Sighing: Frequent deep sighs in serious illness indicate impending death.[20]
Breath Odor: Persistent foul Odor signals grave internal problems.[21]

VIII. Gait and Movement (*Gati Lakshana*)
Abnormal Gait: Dragging feet or shuffling indicates severe neurological or musculoskeletal issues.[22]
Involuntary Movements: Tremors or spasms suggest critical neurological damage.[23]

- **Mental and Behavioral Signs (*Manasika Lakshana*):**

I. Changes in Consciousness (*Chetana Lakshana*)
Altered Consciousness: Confusion, disorientation, stupor, or coma indicate severe disturbance in vital energies (*Prana*), often linked to serious brain or systemic illnesses.[24]
Delirium: Restlessness, hallucinations, and incoherent speech suggest severe *Doshic* imbalance and an unfavourable prognosis.[25]
Loss of Consciousness: Frequent fainting or sudden loss of consciousness indicates critical conditions like severe blood loss or neurological disorders.[26]

II. Speech Patterns (*Vachana Lakshana*)
Slurred Speech: Difficulty articulating words points to neurological impairment, possibly from a stroke or metabolic imbalance.[27]
Incoherent Speech: Nonsensical speech may indicate severe mental disturbance or neurological issues, signalling a poor prognosis.[28]
Loss of Speech: Sudden loss of speech suggests severe internal pathology or brain dysfunction.[29]
Changes in Voice Quality: Weak, hoarse, or tremulous voice indicates declining vital energy, associated with respiratory or neurological conditions.[30]

III. Emotional Changes (*Manasa Lakshana*)
Persistent Anxiety: Excessive anxiety without cause suggests a *Vata Dosha* imbalance, indicating severe internal distress.[30]
Depression and Apathy: Profound sadness or apathy signifies a *Kapha Dosha* imbalance and worsening condition in severely ill patients.[31]
Irritability and Aggression: Uncharacteristic anger points to *Pitta Dosha* imbalance and severe internal inflammation or fever.[32]
Emotional Instability: Rapid mood swings suggest severe *Doshic* imbalances and are often linked to chronic or life-threatening diseases.[33]

IV. Behavioural Changes (*Aacharana Lakshana*)
Withdrawal: Social withdrawal and disinterest in surroundings indicate severe internal imbalances and declining health.[34]
Restlessness: Constant restlessness points to *Vata Dosha* aggravation, possibly due to severe pain or neurological disturbance.[35]
Delusional Behaviour: Sudden delusions in a previously stable person indicate severe mental or neurological issues.[36]
In Ayurveda, the mental state is inextricably connected with physical prognosis. Disturbances in the higher states of consciousness, such as altered states of consciousness, delirium, anxiety, depression, and other changes in behaviour, reflect disturbances in underlying physical processes and underlying disease. Mental disturbances usually indicate severe *Doshic*imbalances-*Vata*, *Pitta*, *Kapha*-that affect the mind and body. For instance, chronic anxiety can be

indicative of *Vata* imbalance, foreshadowing the coming of a critical illness, and deep depression might point to Kapha imbalance with failing physical health. This is one way through which mental health provides an insight for Ayurvedic practitioners into the severity and prognosis of physical disease, pointing the way to a holistic approach to diagnosis and treatment.

3. Specific Prognostic Signs

- **Auspicious Signs**

Skin Appearance: Skin colour, smoothness, and warmth reflect the balanced state of *Dosha*sand vitality.[37]
Eyes: Brilliance and clarity of eyes, steady gaze, and good colouring indicate good mental and physical health.[38]
Voice: A strong, clear voice that is stable denotes balanced *Prana*and good respiration.[39]
Face: Natural glow and symmetry of the face, proper lip colouring, will denote organs working properly.[40]
Nose: Nostrils should be moist and clean with a sense of smell as normal indicative of good respiration.[41]
Tongue: The tongue is clean, wet, pink and breath is fresh. It denotes healthy digestion.[42]
Respiration: The rate of respiration is easy, rhythmical and noiseless. It indicates that the Prana is balanced.[43]
Gait: Gait is stable and smooth; movements are smooth and graceful; thus, it reflects healthy musculoskeletal and neurological health.[44]
Mental State: The mind is quiet, unruffled, and pleasant. Emotions are positive, and the mood is relatively stable. It reflects the mental health of a person.[45]
Digestive Functions: Healthy appetite with regular bowels and clear urine is indicative of good digestive and renal health.[46]

- **Inauspicious Signs**

Skin Changes: Dark blue, black, or yellow skin indicates severe imbalances or organ failure, predicting poor prognosis.[47]
Eyes: Dull, sunken eyes or a fixed gaze suggest critical deterioration, often predicting a negative outcome.[48]
Voice: A weak, trembling, or distorted voice indicates severe internal disorders and poor prognosis.[49]
Facial Appearance: Pale, dark, or swollen face suggests serious health issues like anaemia or kidney problems, predicting a negative outcome.[50]
Mental State: Persistent confusion or delirium indicates severe mental disturbance and poor prognosis.[51]
Breathing: Laborde, irregular breathing suggests severe respiratory or cardiovascular issues, predicting a critical condition.[52]
Tongue: A black or dry tongue indicates severe toxicity or dehydration, reflecting critical internal issues.[53]
Nasal Characteristics: Excessive dryness or distorted smell suggests severe internal imbalances, predicting a negative outcome.[54]
Gait: Unsteady gait or involuntary movements indicate severe neurological issues, predicting poor prognosis.[55]
Behaviour: Withdrawal from social interaction indicates severe internal imbalances and critical illness.[56]

4. Interpretation and Application

Classic Interpretation

Skin Colour: Unnatural colours, like shades of blue, black, and yellow, denote bad internal malfunctioning or displacement of the organs.
Eyes: Eyes can turn dim or seem to sink into their sockets, which is a bad omen for vital energies as well as worsening health.
Voice: Voices that sound weak or strange portend grave upsets inside.
Face: Pale or swollen faces denote a disastrous derangement in the internal mechanisms.
Mental Condition: Confusion and disorientation mark acute *Doshic* imbalances.
Breathing: Laborde or improper breathing signals acute illness.
Tongue: Black or dry tongue shows the high level of toxicity or dehydration
Nose: Nostrils which are dry or smell distorted show severe internal imbalances

Gait: stumbling gait or involuntary movements show severe neurological problems
Behaviour: withdrawal and disinterest or lack of interest reflect a critical decline of health.

Application

Being able to incorporate these signs into modern practice would raise standards where diagnostic tools are limited. They hold their own value in offering insight into the condition of physical and mental health that will lead to early diagnosis and timely intervention. This holistic approach is complementary to modern medicine and aids in being an eye-opener in early detection and prevention.

5. Modern Relevance and Comparison

Vital Signs: Ayurvedic skin and eye assessments can reveal systemic issues before modern vital signs detect them.
Neurological Health: Ayurvedic mental clarity and emotional assessments may indicate subtle neurological changes, complementing modern EEG and MRI findings.
Respiratory Health: Observations of breathing patterns and voice strength can prompt earlier respiratory assessments than modern techniques alone.
Digestive Health: Ayurvedic tongue and appetite observations can serve as early warnings for digestive issues, guiding timely interventions.
Psychological Health: Ayurvedic emotional and behavioural assessments complement modern psychological evaluations for a holistic mental health understanding.

CONCLUSION

• **Significance of Prognostic Signs:** Ancient and Modern Perspectives

Prognostic signs are helpful in assessing health outcomes and ascertaining the line of treatment. In Ayurveda, they were taken as symptoms related to skin colour, clarity of eyes, breathing, and so on that gave enough information about *Doshic* imbalance and the health of organs for early detection of serious conditions. These served as a holistic method of diagnosis and prognosis in the ailments of the patient, which incorporated physical, mental, and emotional health signs. These signs supplement the advanced diagnostic techniques in current practice, traditionally used. The Ayurvedic observations often outline the problems much earlier than the modern investigative tools indicate, thus providing ample opportunities for early intervention. Changes in skin colour and mental clarity, for example, may suggest systemic involvement much before abnormal vital signs are recorded. Thus, a judicious marriage between the traditional approaches and the state-of-the-art methods could give rise to a more holistic, early, and personalized approach to health care, thereby augmenting diagnostic accuracy and the effectiveness of treatment.

Future Implications: Further research can explore validating Ayurvedic prognostic methods through scientific studies, potentially enhancing their credibility and integration into holistic medicine. Combining Ayurvedic insights with modern diagnostics could lead to more comprehensive, early detection and personalized treatment approaches, ultimately improving patient outcomes and advancing integrative healthcare.

ABSTRACT

Artificial Light at Night (ALAN) represents a significant and expanding environmental disruptor, affecting ecosystems, particularly insect populations. This review explores the impacts of ALAN on insect physiology, behaviour, and ecosystem dynamics. ALAN-induced alterations range from immediate behavioural changes, such as disrupted foraging and reproduction, to long-term effects on population stability and genetic divergence. Phototactic insects are especially vulnerable, drawn to artificial lights, which disrupt navigation, communication, and predation dynamics. In addition, ALAN affects plant-insect interactions, compromising pollination services essential to ecosystem health. This cascading effect extends to societal and economic spheres, threatening biodiversity and ecosystem services like pest control and pollination, which are integral to agriculture and public health. To mitigate these impacts, sustainable lighting practices are proposed, emphasizing shielding, spectral control, and reduced intensity to minimize ecological disturbances. This script underscores the need for comprehensive strategies, integrating ecological, regulatory, and technological perspectives to curb ALAN's adverse effects on insects and ecosystem integrity.

Keywords: integrity, ecological, technological, ecosystem, ALAN's

INTRODUCTION

Light is the essence of life and fundamental part of our existence, plays a crucial role in sustaining our planet and everything that exists on it. It is a natural source of energy and one of the core elements of universe. It can be described as tiny units of energy known as photons which originate from an energy source like sun. Light is a component of electromagnetic radiation that is perceived by photoreceptors. Technically and scientifically light is defined by the International Commission on Illumination **(**CIE**)** in the International Lighting Vocabulary **(**ILV**)** as the form of radiation that stimulates the photoreception system of animals, enabling them to see and perceive their surroundings, and is characterized by the unique ability to evoke sensations and perceptions that is specific to vision (Sliney, 2016). Light sources can be divided into two categories - Natural and artificial. The natural light sources include sun, moon, stars, bioluminescence produced by certain living organisms, certain other natural phenomena such as lightning and volcanic eruptions also emit light. The artificial light sources include Incandescent Sources **(**candles,incandescent lamps**)**, Luminescent Sources **(**Fluorescent tube light/bulbs**)**,Gas Discharge Sources **(**Neon lamp, Sodium lamp**)** and recently Light Emitting Diode **(**LED**)** are added to this category.

The modern era of electric lighting began in 1879 when Thomas Edison's incandescent light bulbs first illuminated a New York street. Since then, the world has become awash in electric light (Chepesiuk, 2009). One of the numerous challenges faced by planet earth is ALAN which is altering the nighttime environment, increasing night sky brightness worldwide in and causing light pollution (Hölker et al., 2021). Light pollution refers to excessive, enormous, and unnecessary use of artificial light in the form of outdoor lighting sources that has an adverse effects on the environment, lifestyle, wildlife, astronomy, etc (Kaushik et al., 2022). The forms of light pollution include sky glow, light trespass, glare, clutter and over illumination.

In recent decades, advances in lighting technology has led to rapid and exponential increase in night sky brightness worldwide, raising concerns in the scientific community about the impact of ALAN on nocturnal biodiversity (Owens & Lewis, 2018) because artificial light pollution is substantially altering the sensory environments of animals (Yorzinski et al., 2015). Light pollution is a threat to biodiversity and it adversely affects animals as they can experience increased orientation or disorientation from excess illumination and are attracted to or repelled by glare which affects their natural behaviours of communication, migration, foraging and reproduction within species, as well as disrupting community interactions such as competition or predation (Hölker et al., 2021; Longcore and Rich, 2004).

Light Pollution

Verheijen (1985) proposed the term "photo-pollution" to mean "artificial light adversely affecting wildlife". The term "light pollution" first came into public consciousness in the last third of the 20th century, when serious concerns were expressed by astronomy community the adverse effects of ALAN for astronomical research. Light pollution is the alteration of the natural levels of darkness by an increased concentration of light particles in the night-time environment (Bará and Falchi, 2023). In practical terms, light pollution is the presence of unwanted, inappropriate, or excessive artificial lighting.

Alarming Trends in Light Pollution

The use of ALAN has expanded and intensified over past few decades, and recent advances in LED technology have further accelerated these trends. Despite greater awareness of light pollution and its effects, and the growing number of dark-sky locations, the overall situation is getting worse. According to a study published in science magazine in 2023, the number of stars visible in the night sky decreased between 7-10% per year from 2011 to 2022 **(**iucn.org**)**. The rapid global increase of artificial light has fundamentally transformed nightscapes over the past six decades, both in quantity **(**6% increase per year, range: 0–20%**)** and quality **(**i.e. colour spectra**)**(Hölker et al., 2021) and has become a significant issue worldwide (Lacoeuilhe et al., 2014).

According to the 2016 groundbreaking "World Atlas of Artificial Night Sky Brightness," 80 percent of the world's population lives under sky glow. In the United States and Europe, 99 percent of the public can't experience a natural night.

Types of Light Pollution

Light Trespass

Light trespass occurs when light falls beyond its intended area due to poorly aimed or shielded lighting or inadequate lighting design. This disturbance affects neighbours, wildlife, increases energy waste, and creates glare (Kaushik et al., 2022).

Glare

When eyes are exposed to extremely bright light, it results in an effect called glare. This can be seen in the cases of car headlights and streetlights, which can be dangerous for pedestrians because when bright lights are flashed directly at the face, it almost blinds one and may lead to vision impairments as Well (Mizon, 2012).Glare can be categorized into different Types (Sim et al., 2017) -

1. Blinding glare- Caused by staring at an extremely luminous light source such as the sun. It can cause temporary or permanent vision deficiencies.
2. Disability glare- This includes blinding from oncoming car lights, scattering of light into the light reduced contrast, as well as reflections off print and other dark areas that render them bright, with a significant reduction in sight capabilities.
3. Discomfort glare- Caused when direct glare from light sources cause discomfort in the eyes because brightness is greater than what the eyes can tolerate. It does not typically cause a dangerous situation in itself but is annoying and irritating. If experienced over extended periods, it can potentially cause fatigue.

Skyglow

It is the bright haze in the form of an orangish pink glow, that envelopes the sky in urban area, resulting from excessive artificial lighting at night. This type of light pollution is produced from artificial light reflects off the sky and collides with the various types of particles (dust particles, gas, water droplets, particulate matter and aerosols) that are present in the atmosphere either naturally or due to other pollution. During the inclement weather, when these particles are even more intense, skyglow becomes more pronounced, causing additional interference for the astronomers seeking to observe the night sky objects. The effects of skyglow can be detrimental to astronomy and the health of many organisms becauseit impairs the visibility of the stars, the Milky Way, and significantly increases the light levels at night (Davies et al., 2013).

Over Illumination

Over-illumination occurs when excessive and unnecessary light is used beyond what is required for a specific activity. This problem arises from a combination of factors, including outdated lighting standards, poor instrument design, and incorrect bulb selection. Additionally, inadequate maintenance and unnecessary lighting, often driven by citizen demands or business needs, contribute to the issue. Even the replacement of old lamps with more efficient LEDs can exacerbate the problem if the same electrical power is used, increasing overall light output. These factors result in wasted energy, increased stray light, and negative impacts on astronomy, health, and the environment (Falchi et al., 2016).

Light Clutter

Excessive clusters of lights that are bright and confusing are referred to as light clutter. Groupings of lights may distract from obstacles **(**including those that they may be intended to illuminate**)**, and potentially cause accidents. This is commonly found in densely populated areas and business centre of a city. The rapid increase of light clutter also causes the other four types of light pollution in the metropolises. Clutter is particularly noticeable on roads

where the streetlights are not designed properly, or where brightly lit advertisements strung across the roads (Crawford, 1991).

Direct and Indirect Light Pollution

Grubisic *et al.,* (2019) categorized light pollution into direct and indirect categories. Direct light pollution originates from light emission that is directly incident on a land or water surface. In urban areas, such direct ALAN can reach light levels up to 150 lx, which is 1000-times brighter than a clear full-moon night and has a markedly different spectral signature than natural light. Indirect light pollution originates from light that is scattered within the atmosphere, resulting in sky glow, which is visible over large distances. Sky glow changes with atmospheric and weather conditions, potentially resulting in night-sky brightness **(**luminance**)** levels hundreds of times brighter than natural levels, and surface illuminance levels brighter than those of a full moon. Skyglow can also mask the blue peak present during twilight, which plays an important role in the circadian entrainment. The spectral composition of sky glow depends on the type of lamps dominating ALAN. For artificial light sources, correlated colour temperature **(**CCT**)** is a measure of spectral distribution of light, with higher CCTs usually meaning a higher content of short-wavelength light.

Effects of Light Pollution on Insects

ALAN has profound effects on insect physiology, behaviour and fitness, with consequent effects on ecosystems. Positively phototactic insects such as macromoths and beetles display a "fatal attraction" to artificial light sources. In contrast, negatively phototactic insects such as weta avoid illuminated areas, which alter their natural habitats. ALAN also increases polarised light pollution, causing aquatic insects, such as mayflies, to lay eggs on non-aquatic flat surfaces, misjudging them as water bodies(Egri et al., 2017; Jechow and Hölker, 2019). Skyglow, also disrupts insect behaviour by concealing natural nighttime light sources. This interference prevents species like dung beetles from using celestial cues for navigation and disrupts the bioluminescent communication of fireflies and other similar insects. These disruptions have detrimental effects on foraging activity and reproductive success. ALAN causes immediate changes in insect activity patterns by affecting the circadian rhythm (Foster et al., 2021). Diurnal Species may continue to look for food until dusk, while insects that are nocturnal experience a delay in their usual activities. long-term developmental changes may be observed after repeated exposure to these disruptions. In species such as crickets and aphids, ALAN has been linked to altered phenology. These changes, in turn, may cause phenological mismatches between insects and their host plants, predators or prey, potentially leading to disruptions in pollination, host-parasite dynamics and broader food web interactions.

ALAN affects insects on integrating biological, societal, and economic dimensions. The biological effects of ALAN on insects are across different levels of organization, from individuals to populations and communities. These impacts can be further categorized based on their temporal nature, distinguishing between short-term **(**intra-generational**)** and long-term **(**trans-generational**)** effects

Individual Level

ALAN induces immediate, short-term alterations in individual insects, particularly affecting their physiology, behaviour, and life-history traits. These changes collectively influence an insect's fitness, which represents its ability to survive and reproduce. Over the long term, these short-term changes may result in deeper biological modifications, such as epigenetic shifts and genomic changes, potentially altering entire genetic lineages(Hölker et al., 2021).

Population Level

At the population level, ALAN affects population dynamics, niche shifts, and intraspecific interactions in the short term. These disruptions can lead to more profound consequences over time, including population stability or extinction, genetic divergence, and even speciation events. The stability of populations becomes a critical marker of long-term resilience or vulnerability to ALAN exposure (Kehoe et al., 2022).

Community Level

ALAN also influences broader ecological communities. In the short term, this manifests through changes in interspecific interactions such as predation and competition, as well as alterations to community structure. Over longer time scales, these shifts may result in community-level stability or, conversely, the extinction of specific ecological groups, thereby transforming the ecological Landscape (Grenis et al., 2023).

For some nocturnal insects, light-polluted areas may act as demographic traps, where immigration exceeds emigration, and the inhibition of courtship dialogues and mating reduces reproduction. Light pollution impacts both intra- and inter-specific interactions, such as those between mates and predator-prey relationships. In mobile organisms attracted to artificial lights, the effect of light pollution on these interactions may be intensified. If organisms are repelled by artificial lights, the effects of light pollution on intra- and inter-specific interactions may diminish as organisms move away. However, organisms repelled by artificial lights would likely lose suitable habitat as light pollution expands. Thus, light pollution affects both the net attraction or repulsion of organisms and the effects on intra- and inter-specific interactions (Firebaugh and Haynes, 2019).

Some potential consequences of light pollution for insect populations (Owens et al., 2020)

1. **Movement:** The attractive and repulsive effects of artificial light are well known to prevent natural patterns of movement and alter insect distribution in a landscape.
2. **Foraging: ALAN** can interfere with efficient food acquisition, essential to the development and reproductive success of insects. Diurnal and crepuscular insects that shift their foraging to the "night light niche" may endure cold stress, while nocturnal insects foraging alongside them may experience reduced growth due to increased competition.
3. **Reproduction:** ALAN can delay or eliminate the window of time during which nocturnal insects engage in courtship and mating. For instance, the corn earworm moth **(***Helicoverpa zea***)** never mates when ambient light levels exceed that of a quarter moon, and other strictly nocturnal insects are likely similarly sensitive.
4. **Predation:** Insects trapped in the orbit of artificial lights can be readily exploited by insectivores. This may explain why predatory arthropods are disproportionately represented in illuminated habitats.
5. **Development:** ALAN can interfere with the development of immature insects by altering nocturnal or diurnal foraging activity or by disrupting the production of endocrine hormones and related processes, such as circadian rhythms and metabolic function (Dominoni et al., 2013).

ALAN's Effects on Plant-Insect Relationships: Light pollution can alter plant-insect interactions, which may have significant community-wide consequences. Artificial light from streetlights alters plant toughness. There are direct and indirect effects of light pollution on the performance of herbivorous insects, which indicates that streetlights can have cascading impacts on multiple trophic levels Grenis and Murphy, (2019) . The impact of ALAN on diurnal plant-pollinator interactions was tested by Giavi et al., (2021), revealing that artificial light disrupts nighttime plant-pollinator interactions, which can negatively affect plant reproductive output. By experimentally illuminating natural plant-pollinator communities at night using commercial streetlamps, it was discovered that artificial light can also alter daytime plant-pollinator interactions. The direction of the change depends on the plant species, indicating that the effects of artificial light are not limited to nighttime but can extend into the daytime with unknown consequences for pollinator communities and the diurnal pollination services they provide.

ALAN disrupts nocturnal pollination networks and has negative consequences for plant reproductive success. In artificially illuminated plant-pollinator communities, nocturnal visits to plants were reduced by 62% compared to dark areas. This led to an overall 13% reduction in fruit set in a focal plant, despite the plant receiving numerous visits by diurnal pollinators. Furthermore, the merging of diurnal and nocturnal pollination networks shows that the structure of these combined networks facilitates the spread of the negative effects of disrupted nocturnal pollination to daytime pollinator communities. Findings demonstrate that ALAN poses a threat to pollination and that its negative effects on nocturnal pollination may propagate to diurnal communities, exacerbating the decline of diurnal pollinators (Knop et al., 2017).

Light intensity and shading patterns can influence plant-feeding insects and their natural enemies. Certain secondary plant compounds, such as flavonoids, accumulate in plant tissue under high light conditions, primarily functioning as plant sunscreen, protecting the genetic material of plant cells from UV light. However, these compounds may also offer protection against plant-feeding insects. High flavonoid levels in zoysia grass have been linked to resistance to fall armyworms. Shading of woody plants can reduce carbon-based foliar secondary compounds, as shaded trees are less photosynthetically active and have less carbon for creating defences. Plants in full sun can harvest more carbon dioxide, enabling them to produce more carbon-based defenses and sugars. This was experimentally tested with roses and Japanese beetles, showing that beetles consumed more rose leaves from sun-exposed plants. Similarly, in another experiment with potted white oak seedlings, caterpillars that fed on sun-grown trees performed better but were more susceptible to parasitic attacks than those feeding in the shade. Light intensity also influences St. Augustine grass's susceptibility to southern chinch bugs (Held, 2019).

Obligate mutualism between yucca moths **(***Tegeticula maculata***)** and yucca plants **(***Hesperoyucca whipplei***)** can be used to understand how direct light exposure and skyglow can influence a pairwise plant–pollinator interaction. To find out whether adult moths exhibit positive phototaxis, a set of field-placed light towers during the peak of yucca flowering was deployed and compared to the number of moths caught in traps between dark-controlled and light-treated trials. Adult moth abundance was much higher when light was present, which suggests that ALAN may alter this diurnal moth's activity patterns to expand their temporal niche into the night. Both larva and fruit recruitment increased with skyglow, and fruit set also increased with direct lighting, but the relationship was weaker. Contrarily, larva recruitment did not change when exposed to a gradient of direct light, which may instead reflect effects of ALAN on moth physiology, such as disrupted female oviposition, or misdirecting behaviours essential to oviposition activity. Results suggest that ALAN can positively influence the fitness of both plants and moths in this tightly co-evolved mutualism, but the benefits to each species may depend on whether night lighting is direct or indirect (Wilson et al., 2021). ALAN has been found to disrupt nocturnal pollination in agroecosystems, with streetlights reducing nocturnal pollen transport by moths and altering their behaviour. For example, in an alpine meadow, ALAN reduced nocturnal flower visitation by 62%, causing a 13% reduction in fruit set in thistles, despite ample diurnal pollinator activity (Knop et al., 2017).

ALAN and Species-Specific Responses

Shifting spectral signatures of artificial light changes the balance of species interactions. Four alternative streetlamp technologies were tested by Davies et al., (2013) to evaluate their effects on the visual abilities of 213 species of arachnid, insect, bird, reptile, and mammal by producing different wavelength ranges of light to which they are visually sensitive. These street lighting technologies can be divided into three categories: narrow spectrum lamps that do not emit UV light **(**LPS**)**, broad spectrum lamps that do not emit UV light **(**HPS and LED**)**, and broad-spectrum lamps that do emit UV light **(**MH**)**. The proportion of the visually detectable region of the light spectrum emitted by each lamp was compared to provide an indication of how different technologies are likely to facilitate visually guided behaviours, such as detecting objects in the environment. Compared to narrow spectrum lamps, broad spectrum technologies enable animals to detect objects that reflect light over a broader spectrum, creating greater disparities in this ability between major taxonomic groups. The introduction of broad-spectrum streetlamps could therefore alter the balance of species interactions in artificially lit environments.

Low levels of ALAN strengthen top-down control in insect food web. Using a mesocosm field experiment with insect communities, the impact of intensities of artificial light ranging from 0.1 to 100 lux on different trophic levels and interactions between species was determined. It was found that low levels of artificial lighting **(**0.1 to 5 lux**)** had strongest impact, which led to a 1.8 times overall reduction in aphid densities. This study highlights the importance of different intensities of artificial light in driving the strength of species interactions and ecosystem functions(Sanders et al., 2018). ALAN may decrease predation risk for terrestrial insects ,this may occur because ALAN also increases the vulnerability of insectivores to their own predators (Eckhartt and Ruxton, 2022). Light pollution obscures natural celestial cues and induces dramatic changes in dung beetle orientation behaviour, forcing them to rely on bright earthbound beacons in place of their celestial compass. This change in behaviour results in

attraction toward artificial lights, thereby increasing inter-individual competition and reducing dispersal efficiency. For the many other species of insect, bird, and mammal that rely on the night sky for orientation and migration, these effects could dramatically hinder their vital night-time journeys (Foster et al., 2021). It seems clear that this imposes a great cost on individual insects, which expend a great deal of energy in repeatedly flying towards and colliding with lights, and may also increase predation rates by spiders, bats and lizards that gather around these confused insect swarms (Muscogiuri et al., 2022; Parkinson et al., 2020). A key question here is how these localised effects on individuals affect populations and communities in the wider landscape around the lights. In urban areas where light sources are ubiquitous, the effects are likely to be similar, although not uniform, for all insect groups (Lockett et al., 2021). However, in rural areas where light sources are typically concentrated along roads, with expanses of directly illuminated land in between, the landscape-scale direct effects of ALAN are not so obvious. For example, from what distance are insects attracted to light sources and hence to what extent are populations essentially sucked from the wider landscape? How does this affect the survival rates **(**particularly mortality**)** of populations and hence population growth/decline? These questions are not always easy to answer, and the evidence is scant, making it difficult to assess the broader impact of these most immediately visible effects of ALAN.

Grubisic & van Grunsven, (2021) emphasize that ALAN not only affects individual insects but also alters species interactions, such as plant-pollinator relationships, intra-specific communication, and predator-prey dynamics. The authors highlight that ALAN-induced changes in insect behaviour can lead to cascading effects in ecosystems, potentially reducing population sizes and altering community composition. Despite these findings, the understanding of how ALAN affects insect communities remains limited to a few groups and ecosystems. Firebaugh & Haynes, (2016) further investigated the impact of ALAN on insect courtship and dispersal, particularly in firefly species. They found that ALAN significantly reduced flashing activity by nearly 70%, which is crucial for courtship and mating success in nocturnal fireflies. This reduction in reproductive behavior could lead to population declines in light-polluted areas, thus affecting the distribution of firefly populations.

ALAN Effects on Physiology, Reproduction, Development and Growth

Light pollution also has physiological consequences for insects, particularly in terms of their growth and development. (Grenis and Murphy, 2019) explored how streetlight-induced ALAN affects both plant quality and herbivorous insect performance. The study revealed that ALAN altered plant toughness, which in turn affected the growth and survival of herbivorous insects. This demonstrates that ALAN can have both direct and indirect effects on insect physiology, ultimately influencing plant-insect interactions at multiple trophic levels. Another study by Parkinson et al., (2020) examined the effects of ALAN on predator-prey dynamics at the terrestrial-aquatic interface. Their findings showed that ALAN increased spider abundance and prey capture rates by concentrating emergent aquatic insects, thereby altering fluxes of insect prey between aquatic and terrestrial ecosystems. In fireflies, ALAN has been rated as the second most serious threat after habitat loss, showing adverse effects on populations (Lewis et al., 2020). ALAN interferes with the production and perception of courtship signals, including glowing **(**e.g., *Lampyris noctiluca***)** or flash dialogues **(***Pteroptyx maipo*, *Photuris pyralis***)**. Ultimately, such effects impede the reproduction of these species (Bird & Parker, 2014; Owens et al., 2020).

Light pollution impacts firefly population ecology and underlying mating behaviours. Many firefly species use bioluminescent flashes in courtship displays to attract mates. Manipulative field experiments quantified the effects of artificial nighttime lighting on firefly abundance, total flashing activity, courtship behaviours, mating success between tethered females and free-flying males, and dispersal distances of marked individuals. It was found that light pollution reduces flashing activities in a dark-active firefly species (*Photuris versicolor*) by 69.69% and decreases courtship behaviour and mating success in a twilight-active species (*Photinus pyralis*)(Firebaugh and Haynes, 2016). Various studies have shown how different artificial lighting types of impact moth mating behaviour. For instance, ALAN strongly reduced the number of female winter moths (*Operophtera brumata*, Lepidoptera: Geometridae) on illuminated oak tree trunks, inhibiting mating, 53% of females caught on non-illuminated trunks had mated, whereas only 13%, 16% and 28% of the females that were caught on green, white and red light illuminated trunks had mated respectively. A subsequent experiment demonstrated that ALAN reduced male attraction to synthetic pheromone

lures, with red light having the strongest negative effect and green light the mildest. This provides field-based evidence of ALAN disrupting moth reproductive behaviour, with short-wavelength light partially mitigating these negative effects (Van Geffen et al., 2015). One of the major problems with ALAN is the attraction of insect communities by nocturnal lights, and most studies on invertebrates focus on this **(**Falcón et al., 2020**)**. The reproductive success and growth of moths and spiders are also compromised by ALAN: sexual activity of females and the attraction of males to females were disrupted by LED lighting of different wavelengths (red > white > green) in *Operophtera brumata* (Van Geffen et al., 2015; Van Geffen et al., 2014).

Dim light pollution has been shown to disrupt diapause induction in insects. A study on urban and rural geometrid moth (*Chiasmia clathrata*) populations indicated that even dim, widespread light pollution could be detrimental by increasing development rates, thereby interfering with critical diapause induction necessary for winter survival (Merckx et al., 2023). Urban moth populations exposed to long-term light pollution exhibit significantly reduced flight-to-light behaviour, demonstrating an adaptive response to human-induced environmental changes (Altermatt and Ebert, 2016). ALAN negatively affects insect reproduction, larval development, and diapause, with cascading impacts on individual fitness. Moths can also be indirectly affected via changes in host plants and predators (Boyes et al., 2021). ALAN impacts moth abundance, assemblage composition, and behaviour, particularly nocturnal pollination, although further testing is needed to understand the nature of this disruption (Macgregor et al., 2015).

Light pollution has been shown to interfere with diapause initiation in The Northern house mosquito. Light pollution affected mosquito activity levels and several metabolic products differently depending on photoperiod, indicating that light pollution may disrupt nutrient accumulation and possibly interfere with diapause initiation in this species. In long day-reared mosquitoes, ALAN led to a slight, but non-significant decrease in activity levels and significantly suppressed water-soluble carbohydrate and glycogen levels. In short day-reared mosquitoes, light pollution led to slight, statistically insignificant increases in locomotor activity and protein levels in female mosquitoes, while increasing lipid variability. These results, combined with earlier study, suggest that light pollution causes female Cx. pipiens to avert diapause. This could extend the mosquito biting season and increase mosquito-borne disease transmission during autumn within urban areas. Conversely, results suggest that during the summer light pollution disrupts the accumulation of essential nutrient stores and may decrease the fitness of mosquitoes and other insects (Wolkoff et al., 2023).

Levy et al., (2024) extended the understanding of ALAN's impact by investigating how it affects insect behaviour under semi-natural conditions. Using field crickets, the study demonstrated that exposure to ALAN disrupted the natural stridulation rhythms of crickets, desynchronizing their daily activity patterns. These disruptions were found to be dependent on light intensity, with greater disruptions occurring at higher intensities. The study's results further validate findings from laboratory-based research, showing that ALAN affects insect behaviour even in more naturalistic settings. Similarly, Quintanilla-Ahumada et al., (2021) explored the physiological impacts of ALAN on a sandy beach beetle species by measuring RNA ratios, an indicator of nutritional status. Their findings revealed that insects exposed to ALAN had lower RNA ratios, suggesting reduced feeding activity and altered growth. This physiological disruption is likely due to ALAN-induced changes in nocturnal activity, which force the insects to spend more time in hiding and less time.

Mechanistic, Ecological, and Evolutionary Impacts of ALAN on Insect Behaviour and Physiology

The mechanistic, ecological, and evolutionary consequences of ALAN for insects were studied, revealing that ALAN affects insect movement at multiple spatial scales, modifies foraging behaviour, interferes with mate finding and choice, influences offspring development and number, disrupts melatonin synthesis and related physiological processes, and impacts population dynamics, species interactions, and community composition and functioning (Desouhant et al., 2019). Four pathways have been suggested for predicting the effects of ALAN on community functioning. Insects attract towards ALAN or repel from it, this leads to change in local community composition; this all is dependent on the relative strength of attraction/repulsion from the light sources for each species (Longcore et al., 2015; Wakefield et al., 2016).

ALAN also disrupts the internal clock which leads to mismatch between this and natural light-dark cycles, this desynchronizes ecological interactions (Gaston et al., 2017). Both above pathways may increase the risks **(**predation, competition**)** and opportunities **(**feeding, mating**)** that individuals are exposed to (Kronfeld-Schor et al., 2017). Furthermore, demographic parameters **(**migration, births and deaths**)** are also influenced by physiological, behavioural and life-history traits and ultimately population dynamics under the influence of artificial light, which is clearly local (Gaston and Bennie, 2014). Finally, beyond the impact on the species composing the community, ALAN can change the link between them (Sanders and Gaston, 2018). A better understanding of these four pathways would improve our ability to predict the effects of ALAN on community functioning.

Increased nocturnal illumination is considered a causal factor in insect declines, contributing to the ongoing "Ecological Armageddon." ALAN increases environmental pressure on insect populations, especially in agroecosystems, where insects provide crucial ecosystem services and are already under pressure. In agricultural landscapes, ALAN disrupts insect mobility and recolonization of habitat patches, reducing population resilience to habitat fragmentation and contributing to insect declines. ALAN may affect crop production directly by influencing crops in illuminated areas and indirectly by altering pest populations and their natural enemies or by changing pollinator behaviour. The effects on individual species and interactions are complex, depending on light intensity, spectrum, season, and species (Grubisic et al., 2018).

ALAN's effects on insects include temporal and spatial disorientation, attraction, desensitization, and recognition, with the severity of impact depending on the spectral sensitivity of the insect and the intensity and spectrum of the ALAN source (Gaston et al., 2015; Owens & Lewis, 2018b). Exposure to light trespass can negatively impact migratory monarchs during their fall migration, as it can immediately elicit normal diurnal migratory flight behaviour at night, the time of day when monarchs are typically quiescent and are at rest whether in the wild or in laboratory conditions (Parlin et al., 2022). Haynes & Robertson, (2021) take a broader evolutionary perspective, discussing how ALAN functions as an evolutionary trap for insects. Evolutionary traps occur when rapid environmental changes cause organisms to make maladaptive choices based on outdated environmental cues. The authors argue that ALAN disrupts natural cues, leading insects to make decisions that negatively affect their fitness, such as mistaking artificial light for natural sources of navigation or courtship signals. This framework provides a valuable lens for understanding the long-term evolutionary and demographic consequences of ALAN on insect populations.

The consequences of ALAN are not limited to individual species but extend to entire communities, affecting ecological interactions and the structure of ecosystems. Kehoe et al., (2022) argue that ALAN can cause shifts in community structures by propagating changes through species interaction networks. Their research highlights that the direct effects of ALAN on a few key species can have widespread effects on entire ecological communities, leading to simplified community structures and reduced ecosystem stability. Sanders et al., (2022) investigated the role of different light spectra on insect food webs and found that ALAN's impact on species interactions was spectrum dependent. In their field experiment, parasitoid wasps were less effective under certain light spectra, leading to higher aphid densities. This highlights the importance of considering the spectral composition of artificial light when assessing its environmental impact.

In another study, (Sanders et al., 2018)demonstrated that low levels of ALAN could enhance top-down control in insect food webs. Their mesocosm experiments showed that parasitoid wasps were more efficient at controlling aphid populations under low-intensity ALAN. However, at higher light intensities, the efficiency of parasitoid wasps decreased, resulting in higher aphid densities. These findings underscore the complex and sometimes counterintuitive effects of ALAN on species interactions and ecosystem functioning.

ALAN Societal and Economic Impacts

The societal and economic impacts of ALAN are significant and manifest through various disruptions in ecosystem services, public health, and policy responses. These extend beyond ecological consequences, affecting public health,

agricultural productivity, and legal frameworks. These impacts are driven by the cascading effects of ALAN on insect populations, which in turn influence broader ecological systems and human society (Gallaway et al., 2010).

Ecosystem Services and Public Health

ALAN leads to a reduction in ecosystem services provided by insects, such as pollination and pest control, which are crucial for ecological balance and human well-being. Additionally, alterations in insect populations can exacerbate the transmission of diseases, posing further threats to public health and safety (Georgieva, 2019).

Biodiversity Loss and Policy Implications

Long-term exposure to ALAN is associated with biodiversity decline, a critical issue with far-reaching ecological consequences. As biodiversity decreases, the ecosystem services that insects provide continue to erode, necessitating changes in environmental laws and regulations. These changes may include modifications to lighting standards to mitigate the negative effects of ALAN, along with broader policy shifts aimed at preserving biodiversity and maintaining ecosystem function (Hölker et al., 2010).

Reducing the Consequences of ALAN: Options and Developments

According to the National Park Service US, 50% of the light from a typical unshielded light fixture is wasted, shining upward where it is actually not required. About 40% of the light shines downward to illuminate the intended target. 10% light emitted horizontally tends to create glare. Good lighting is shielded in a manner that directs all the light where it is needed and wanted (Chepesiuk, 2009). The International Dark-Sky Association **(**IDA**)** recommends that all lighting be installed such that no light is emitted above a horizontal plane running through the lowest part of the fixture. IDA further recommends the use of low-pressure sodium **(**LPS**)** lights wherever possible. LPS lights are the most energy-efficient lights currently available. They emit a yellow light at the wavelength where the human eye is most sensitive, but the monochromatic light makes it difficult to distinguish the colours of objects below. For outdoor lighting where colour perception is important **(**to enhance security, for instance**)**, IDA recommends high-pressure sodium lights. Falchi et al., (2016) suggested practical ways to limit the effects of light pollution on the night sky and the night environment –

1. **Eliminate Over lighting:**Avoid luminance or illuminances greater than the minimum required for the task, and dim lights when the application allows it.
2. **Shut Off Lights When Not in Use:** It makes sense to turn the lights off when you leave the room, or for the lights to turn off automatically, but in outdoor lighting these options are rarely available.
3. **Limit Growth in Installed Lighting:** Limits to the increase of the new installed flux should be implemented. A 1% yearly increase could be allowed at first for each administrative area, followed by a halt in the increase of total installed flux, and then by a decrease.
4. **Limiting the Area of Lighting:** Carefully avoid wasting downward light flux outside the area to be lit. Such waste is not only a main cause of increase of installed flux per unit surface **(**and in turn a main cause of increase in energy expense**)**, but some of this light is also reflected upward from these surfaces.
5. **Full Cutoff Shielding:** Do not allow luminaires to send any light directly at and above the horizontal, with particular care to cut the light emitted at low elevations. This limitation will also improve the comfort and visual performance of road users by lowering the direct glare from fixtures.

Gaston et al., (2012) examined the potential consequences for organisms of five management options to reduce night-time light pollution. These are to

(i) Prevent areas from being artificially lit
(ii) Limit the duration of lighting
(iii)Reduce the ‘trespass’ of lighting into areas that are not intended to be lit
(iv)Change the intensity of lighting
(v) Change the spectral composition of lighting

CONCLUSION

ALAN is a useful resource and, at the same time, an environmental pollutant. Light pollution is a multiscale disruptor of the nighttime environment, affecting from molecular processes to ecosystems, from the immediate vicinity of the sources up to hundreds of kilometres away, with time scales ranging from seconds or less to decades. Recent years have seen a growing global awareness of the potential negative consequences of exposure to ALAN. Over the last 20 years both the number of light-emitting sources, and the intensity of radiated light, have increased dramatically across the surface of the globe, not only within vast tracts of urbanized land but also along coastal areas and even in relatively isolated regions like deserts, mountain ranges and open ocean. ALAN has profound and far-reaching impacts on insects, affecting their physiology, behavior, and fitness. The consequences of ALAN extend beyond individual insects to populations, communities, and ecosystems, ultimately influencing societal and economic systems. ALAN disrupts natural behaviors such as foraging, reproduction, and migration, altering insect distribution, movement, and population dynamics. This, in turn, impacts pollination, host-parasite dynamics, and food web interactions.Additionally, ALAN changes plant-insect relationships, influencing plant toughness and defense compounds. Nocturnal pollination networks are also affected, reducing fruit set and plant reproductive success. The effects of ALAN vary across species, with some exhibiting positive phototaxis (attraction to light) while others display negative phototaxis (avoidance). Moreover, the spectral signature of artificial light influences species interactions, with broad-spectrum technologies potentially altering the balance of species interactions.

To mitigate these impacts, it is essential to implement sustainable lighting practices, using directed, shielded, and energy-efficient lighting. Adopting lighting technologies that minimize disruption to natural environments is also crucial. Establishing lighting regulations and standards to protect ecosystems and conducting further research to understand the complex interactions between ALAN, insects, and ecosystems are necessary steps. Addressing the consequences of ALAN requires a multidisciplinary approach, integrating ecological, societal, and economic perspectives to ensure the long-term health and resilience of our planet's ecosystems.

ABSTRACT

This generative AI has come a long way as a transformational technology, automating content creation across industries, including text generation, image synthesis, and software development. Nonetheless, generative AI has a big-challenge cornered under ambiguity, bias, security threats, Data security breaches, policy violation, etc. These challenges are obstacles to building trust in AI systems and raise concerns about the ethical way in which this technology can be deployed. Transparency is one of the foremost issues, as the users and regulators are unaware of AI decision-making processes. Since biases in AI models tend to predict undesirable outcomes, many inequities in society embedded in the training data reflect that. Security threats such as adversarial attacks and data poisoning tend to raise concerns about the reliability of AI and the need to protect privacy through secure data-handling practices. Moreover, aligning the advancement of AI with the rapidly evolving global regulation landscape becomes quite complex, owing to varying national policies. This paper further puts forth-new ideas to deal with these challenges. An adaptive debasing framework that continuously adapts training datasets to changes in culture and demographics is suggested to ensure fairness and inclusivity in AI systems. Further presented is a dual-layer security Methodology, fusing adversarial training with federated learning to ensure AI security while preserving user privacy. This study serves to lay the groundwork for making AI systems ethically responsible, secure, and in compliance with global regulatory standards by exploring fairness-aware learning, differential privacy, and governance polices for AI products.

Keywords: Generative AI, Transparency, Bias, Privacy, Collaboration

INTRODUCTION

The Dual Challenge of Innovation and Ethics

Rapidly evolving generative AI has provided tremendous changes for automation by allowing machines to produce human-like text, realistic images, and sophisticated designs. These innovations add efficiency and creativity in many domains. However, such developments raise serious concerns from the perspective of ethics and safety. AI systems ought to be transparent in their decision-making processes for their users, regulators, and developers to process how their models arrive at various outputs. Bias continues to remain a serious issue, where AI models, trained on heterogeneous datasets, would be jesting discriminatory responses. Security holes caused by adversarial attacks threaten the safety, allowing malicious agents to surreptitiously manipulate AI outputs. Rapid widening use of private data for AI training raises issues of data privacy and users' consents. Finally, widespread upsurge in AI has actually created chaos with laws and regulations falling far behind the technology and having opposing structures for AI governance between different countries. While the first part of this paper outlines these challenges, the second half discusses some viable solutions to advance ethical, secure, and legal conformity of AI systems: the proactive debiasing framework, which dynamically updates the training data according to changing demographics and cultural trends in a bid to remain fair towards AI outputs. A second-layer security is offered by coupling adversarial training with federated learning, boosting the safety of AIs through keeping user privacy intact. These solutions give nature to an overview on ethical and security challenge solutions to generative AI coupled with trust and accountability in AI applications.

Literature Survey: Key Challenges in Generative AI

The Need for Transparency in AI Systems

Transparency in AI is an intrinsic part of building trust, ensuring accountability, and satisfying regulatory compliance. AI models need to be instated in such a manner that they make it possible for users, developers, and policymakers to comprehend a system's decision-making processes. The lack of media transparency-given the existence of the "black-box issue" - creates uncertainty around how AI systems come to their conclusions. Such ambiguity can lead to misuse, unethical applications, and regulatory violations. Various transparency-enhancing mechanisms are being developed for this. Differential privacy allows AI models to learn from datasets while providing individual data points with sufficient privacy and model explainability. Google's Model Cards and Open AI's system reports present structured documentation outlining model performance, limitations, and ethical concerns, promoting transparency. In addition, watermarking techniques for AI-generated content are mooted to tackle everything related to misinformation and help distinguish AI-generated content from that produced by humans. Nonetheless, reaching complete transparency is still a big ask? The complexity of AI models is constantly increasing, and there will definitely be a need for real-time auditing mechanisms that help track AI decision-making processes along the way. The focus of future research must be placed on how to build a bridge to transparency by developing explainable AI techniques, such as interpretable neural networks and self-explaining models.

Addressing Bias for Fairer AI Outcomes

AI bias occurs due to various reasons, including historical data imbalances, biased algorithmic structures, and deployment biases that disproportionately affect some groups of users. AI systems trained on non-representative datasets might perpetuate social inequities, resulting in outcomes that are unjust and discriminatory. These unfair systems harm the marginalized communities and erode confidence in the use of AI across various sectors such as healthcare, finance, and hiring. This paper proposes a debiasing framework that is adaptive and continues monitoring and updating training data. It so happens that these approaches ensure that AI systems embrace social justice since they align with changes in the demographics and culture in real-time. The fairness-aware algorithms have also been embedded into AI workflows to further assist in bias detection and mitigation, both during training and inference stages. Human oversight is vital, for that reason, multidisciplinary review panels can recognize biases that automated methods might easily overlook. Bias mitigation is a continuous process, as fairness evolves in society

and culture. AI systems of the future must be embodied with adaptive learning methods to allow for dynamically recognizing and rectifying unjust biases, ultimately preventing ethical failures in the long run.

Strengthening AI against Cyber Threats

Generative AI models are increasingly in the crosshairs of cyber threats such as adversarial attacks, data poisoning, and breaches of privacy. Attackers manipulate the inputs to mislead the models, resulting in such models giving output that skewed or has a vulnerability. These risks become the more concerning when dealing with industries like autonomous systems, finance, and national security, where AI-driven decisions can carry momentous consequences. Therefore, to add layers of protection, this paper proposes a dual-layer defense mechanism involving adversarial training and federated learning to develop models. With the aid of adversarial training, attacks are simulated and AI is allowed to further improve its defenses by using these simulated attacks to develop the capacity to recognize and counter adversarial inputs [19, 20]. Federated learning enhances security by training AI models on decentralized user data, minimizing the risks of a centralized data breach [20]. Though these methods improve the security of AI, the ongoing threats necessitate the constant changes in AI. Future efforts should explore proactive security frameworks that integrate real-time threat detection and automated responses.

Privacy-Preserving Techniques in AI

Data privacy remains a critical concern in AI development, as AI models require vast amounts of personal data for training. Privacy risks include unauthorized data access, information leaks, and non-compliance with global regulations. A complex array of data protection methods, such as differential privacy, homomorphic encryption, and federated learning, is necessary to deliver privacy in AI. Privacy challenges are further exacerbated by technical issues such as GDPR and the CCPA, which pose challenges against which companies must defend. Today we talk about the constitution of an AI system where, in this case, the privacy-by-design principles allow built-in privacy features and do not provide executables to govern security through an external channel. The direction for future study is, therefore, to investigate scalable designs, within the broad ambit of AI, which can promise privacy while ensuring security in a cost-effective manner globalized under norms ensuring compliance with privacy norms provided.

Aligning AI Development with Policy and Regulations

Challenges to global AI governance arise from the different legal frameworks and confusion concerning regulating them. Laws like the European GDPR and California's CCPA point to establishing a turn for AI transparency and data protection; yet worldwide coherence remains elusive [23, 26]. Agreements in policy require that governments, industry leaders, and AI researchers alike work toward developing flexible regulatory frameworks. This studypoints to the value of an adaptive AI policy that can abide by legal regulatory needs while allowing for innovation. It does propose for future AI governance that should include international standardization efforts toward ethical AI development alongside commercial innovations.

Enhancing Transparency in AI

One of the complex challenges to achieve full transparency in AI is the lack of standardized data collection protocols, the limited explainability of the AI decision-making processes, and varying regulatory requirements required by different jurisdictions. AI models may be seen as black boxes without transparency, leading to distrust by users, regulators, and stakeholders. To take care of the aforementioned challenges, this paper underscores the importance of adaptive audit mechanisms to provide continuous feedback on data usage, model activity, and the processes of decision-making. Incorporated real-time monitoring tools give AI systems a portion of their existing line-of-sight back. In evolving the next generation of tools like model cards and transparency reports, it is essential that they incorporate continuous updates reflective of real-time risks and evolving regulatory changes. Bringing transparency at all stages from data collection to deployment will fill the gap between user expectations and AI capabilities. The future efforts will gravitate towards interpretable AI, standardization of documentation frameworks, and regulation that enforces transparency to bring about responsible deployment of AI.

Managing Bias in AI

A few things may cause bias in artificial intelligence. Among them, notable causes are biased training on faulty, unrepresentative, and non-diverse datasets, leading to unjust and discriminatory results toward marginalized communities.77 AI models trained on imbalanced datasets have the potential to reinforce entrenched social inequalities, manifesting bias across recruitment, finance, healthcare, and policing. To check this, in this paper, an adaptive debiasing framework is proposed, which dynamically updates the AI training datasets to adjust with the changes in demographics and cultural diversity. The typical static datasets used in this approach involve a continuing flow into the system; ensuring whole data sets keep the furtherance of inclusion into AI systems and mitigate bias over time. Fairness-aware algorithms will also help in the reduction of bias in the training and inference stages and subsequently ensure balanced AI outputs.[30, 31]but algorithms alone are inadequate. It is also necessary to include regular checks for bias, human oversight, and multi-disciplinary review panels to check for hidden biases that could be missed by automated methods. Future AIs should include bias-tracking dashboards, metrics for assessing fairness with stakeholder involvement, and the ex post facto assessment of the AI to encourage more equitable AI decision-making across populations and use cases.

Strengthening Robustness against Attacks

However, generative AI models are increasingly threatened by adversarial attacks, model inversion techniques, and data poisoning strategies that may threaten the integrity of the AI-generated outputs. Attackers, who generate misleading content, manipulate the decision-making process, and steal data [33, 34], can leverage vulnerabilities within AI systems. This paper presents a dual-layer security framework, comprising adversarial training and federated learning, to combat these risks. Adversarial training adds stability to AI by invoking synthetic adversarial input during training, hence allowing the model to identify and counteract malicious manipulations. During federated learning, model training is conceived of as a decentralized process in which sensitive data lies on some local device, thus lowering the risk of centralized data breaches as opposed to storage on a single server [35]. A proper balance between performance and protection must be struck in ensuring that AI is efficient and, at the same time, secured. Future studies should focus on real-time systems for monitoring system function, adaptive threat intelligence, and automated security-patching systems that assure generative AI's continued resilience against an evolving cyber threat.

Scaling Data Privacy Solutions

Privacy is one of the main pain points for ethical AI development, as AI models usually require massive amounts of personal data in their training. Increasing concerns about privacy arise when the user data is exposed, misused, or shared without consent, therefore violating legal frameworks such as GDPR in Europe, CCPA in the U.S., and other global data protection laws [36]. Even more so, such privacy-promoting techniques such as differential privacy and federated learning offer solutions, there have been challenges in scalability in the real world. AI systems operating in different jurisdictions are forced to strike a balance between data flexibility and compliance, which ensures that privacy measures align with region-specific regulations. This paper proposes innovative solutions, such as synthetic data generation and privacy-preserving computation, allowing AI models to learn from purely generated datasets that appear like real-world settings without compromising user privacy[37, 38, 39, 40, 41].-Another option is end-to-end encryption. Integrating, at the architectural level, other advanced protections such as regulatory compliance for cross-border AI would lend itself to lower AI inefficiency and greater insurance of user privacy that can be paramount across diverse geographical regions and industries.

Aligning Policies with Legal Frameworks

The continuous evolution of AI remains a quest toward its alignment with the German and ethical frameworks, a very daunting challenge. Diverse countries have implemented little policies related to AI, and this non-uniformity leads to weak implementation regarding data privacy, security, and ethical compliance. While such laws as GDPR and CCPA govern AI transparency and data handling, no single standard for AI fairness, accountability, and liability exists. In order to achieve coherent advancement for AI and policy frameworks, the authors of this paper call for proactive work by regulators, industry leaders, and AI research to bring forth global AI governance standards to

deliver a unified front in privacy protection, security enforcement, and algorithmic fairness. Within this, the argument for less fractured AI governance, focusing on transparency and ethical design, is made. Organizations can increase trust in AI applications and limit their legal and regulatory risk by embedding compliance with legal and ethical norms directly into all stages of AI development. It needs to be stressed that AI impact assessments, accountability frameworks, and legally enforceable AI ethics guidelines should be given central importance in future regulatory efforts promoting responsible AI adoption that is projected at a global level.

CONCLUSION

Generative AI carries tremendous coupled threats relating to opacity, bias, security, data privacy, and limb with policy. Lack of explanation of how AI works might breed distrust and ranked accountability, while bias in training data emanates express injustice into AI-powered decisions. The secondary threats such as adversarial attacks and data exfiltration make this even riskier. Moreover, there is inconsistency in regulations in different areas, casting doubts over AI governance and compliance. This paper proposes an adaptive debiasing mechanism that would allow AI systems to modify their datasets continually to assure fairness in decision-making. An innovative dual-layer security mechanism is proposed that combines adversarial training with federated learning to bolster AI defense while preserving data privacy. The paper also elucidates the need to scale privacy solutions through synthetic data generation and privacy-preserving computation techniques in a manner that keeps AI functioning efficiently, securely, and legally compliant. This paper calls on all stakeholders to make AI governance one of global alignment, pleading for additional advocacy on governance modes that comply with ethical AI design, legal accountability, and advances in technology. By having common standardized regulatory guidelines, AI systems would be able to operate ethically, transparently, and securely in various jurisdictions and industries. In the end, solutions to these problems call for committed synergy between researchers, policymakers, corporate leaders, and regulatory authorities. Integrating tech-heavy innovation into legal frameworks in this manner can secure fairness, security, and social responsibility for AI development. The other eye of this further development must look toward trustworthy, ethical, and legally compliant AI systems precisely in line with social values and customer expectations.

ABSTRACT

Wireless Sensor Networks (WSNs) are highly susceptible to attacks due to their decentralized paradigm and limited resources. In this paper, a novel hybrid optimization algorithm that integrates Flickering Light Algorithm (FLA) and Bee Colony Optimization (BCO) is proposed to protect the network from attacks by efficiently evading them. Flickering Light algorithm provides global search, controlling the search for the optimal paths of routing based on parameters like energy efficiency, security, distance, and latency. Simultaneously, the bee colony optimization algorithm facilitates local search using employed, onlooker, and scout phases, optimizing the solution with exploration and exploitation balance. The intended framework not only maximizes the detection of attacks but also reduces energy consumption and communication latency. The experimental results show the immense gains over current solutions, including Network Throughput of 270, Packet Delivery Ratio (PDR) of 99, Detection Accuracy of 99%, and minimized Energy Consumption of 3.2 units. The findings show the effectiveness of the algorithm to provide secure, energy-efficient, and reliable data transfer in WSNs. The suggested approach provides a strong solution for dynamic and insecure network environments, and thus it is an emerging strategy for future WSN security improvement.

Keywords: Bee colony optimization, Energy efficient, Flickering Light algorithm, Security attacks, Wireless sensor network.

INTRODUCTION

With the scale of recent developments in Internet of Things and Wireless Sensor Networks, they have been used vary widely in security-critical applications such as smart cities, industrial automation, and healthcare. Conversely, greater dependency on these networks makes them vulnerable to forms of cybersecurity attack including intrusion attacks, denial-of-service, and sinkhole attacks that violate network integrity and confidentiality of information [1], [2]. In response to such challenges, scholars have been interested in combining machine learning algorithms and bio-inspired optimization algorithms to strengthen intrusion detection systems (IDS) of WSN-IoT networks. Flickering Light Algorithm (FLA) has become very popular as an effective metaheuristic optimization algorithm based on its swarm intelligence feature selection and outlier detection ability [3], [4]. Hybrid approaches with the integration of FA and neural networks, fuzzy logic, and evolutionary computing have been established as effective approaches in security vulnerability solution-finding and detection accuracy optimization [5],

Contribution This research enhances WSN security via a novel Flickering Light Algorithm-based Bee Colony Optimization (FLBCO) approach to prevent network attack. The proposed model uses FLA in global optimization, where it optimizes routes in energy efficiency, security, distance, and latency, with BCO enhancing local search to enhance the detection of attack and counterattacks. Differently from typical IDS, our approach dynamically discovers and evades attacks and security breaches for reducing power in power-constrained WSNs. Thorough simulations and real-world experiments confirm the correctness of the proposed framework through a greater Packet Delivery Ratio (PDR), improved detection precision, and less energy expenses with respect to existing state-of-the-art WSN security frameworks.

Background Study

Following Abasikeleş-Turgutet al. [6], sinkhole and black hole attacks in Wireless Sensor Networks (WSNs) appear to disrupt data transmission by badmouthing network routing value. This is a cluster based WSN environment; hence the study provided realistic simulation of the attacks. These threats had a very serious impact on network performance and security, and the research discussed this. The attacks were proposed to be detected to prevent these attacks successfully and for reliable data communication. The results helped to develop robust security mechanisms for WSNs. In Ali et al. [7], the focus was on adding up the Parrot Algorithm to IDS in WSN security. Its intention was to improve the accuracy and decrease false positives in threat detection. Experimental validation of how the Parrot Algorithm could help increase the efficiency of IDS was also presented as part of the study. The research integrated machine intelligence and this advanced the cybersecurity framework of WSNs. And the findings showed the need of adapted security solutions for safeguarding wireless networks.

Al-Na'amneh et al. [8] also studied DODAG Information Solicitation (DIS) flooding attacks in Routing Protocol for Low-Power and Lossy Networks (RPL) based IPv6 over Low-Power Wireless Personal Area Network (6LoWPAN) networks which messed up routing through the flood of too many control messages to nodes. They studied the extremely adverse impact of such attacks on network performance, energy consumption and overall system reliability. Security of RPL networks and reduction of network degradation was studied through the application of various mitigation strategies. However, the study highlighted the necessity of some efficient defense mechanisms to enable low power networks. This contributed to the improvement of the security in an IoT driven environment.

MATERIALS AND METHODS

In this work, we are combining Flickering Light algorithm for Network Attack Avoidance in WSN. Flickering Light Algorithm in network attack avoidance improves routing by luring nodes to good fitness solutions so that maximum energy efficiency and network performance is achieved. It also assists bypassing compromised nodes by focusing on safe and authentic paths. Bee Colony Optimization in WSN improves routing by imitating bee searching habits so as to find and exploit better paths. It enhances the security of the network since it recognizes the compromised nodes

and bypasses them in transferring data. Flickering Light Algorithm and Bee Colony Optimization are blended in Network Attack Avoidance for WSN to achieve global exploration and local exploitation. Flickering Light Algorithm effectively detects high-fitness solutions (secure paths), while Bee Colony Optimization optimizes the discovered paths through local search to realize optimal energy efficiency, security, and reliability. Figure 1 illustrates the Flickering Light-Based Bee Colony Optimization (FLBCO) for WSN attack prevention starts with algorithm and network parameter initialization, i.e., energy reserves and communication scope. In Solution Generation, nodes are initialized randomly, and initial routing channels are established. In Optimization, fireflies are drawn to brighter solutions and bees optimize routes by local searching, selection, and exploration. The Network Topology Update updates routes and node states for power optimization. Attack Detection bills routes with attacking nodes. A Convergence Check stops the process on iterations or stability. Last but not least, the most secure, power-maximizing route is chosen, optimizing power consumption, latency, and network performance overall.

Flickering Light-Based Bee Colony Optimization

Flickering Light-Based Bee Colony Optimization algorithm is a system-based approach proposed for Wireless Sensor Networks (WSNs) network attack evasion enhancement based on the combination of the strength of two nature-inspired optimization algorithms. Flickering Light Algorithm is better for global optimization with the concept of attraction by light with the fireflies being attracted to the more luminous one indicating a good solution. This is done to discover globally optimal paths taking into consideration energy efficiency, security threats, and low latency. Alternatively, Bee Colony Optimization emphasizes local search, where bees' foraging behavior is mimicked to optimize the solution and search adaptively in a localized manner for the best route. This two-stage hybrid method is especially suitable for WSNs as it combines global exploration with local exploitation in such a way that routing paths are not only energy-efficient but also attack-resistant against Sinkhole and Black Hole type attack. Using these two algorithms, the system combines the global search ability of fireflies to search for different solutions with bees' local search ability to improve and optimize the solutions in real-time. This provides a more durable and robust network that dynamically adjusts to threats with optimal performance, improves network life, and increases security as a whole.

In a Hybrid Flickering Light-Based Bee Colony Optimization approach to Network Attack Avoidance in WSNs, the parameters are initially decided based on the number of fireflies (n), number of bees (m), light absorption factor (γ), attractiveness (β), random factor (α), threshold of node energies, and the maximum iteration (t_max).Sensor nodes are randomly scattered throughout the field of interest for emulation of the real world. A Flickering Light and a bee can symbolize a possible route from source to sink node, whose position is an indication of a possible solution. Nodes possess initial amounts of energy and reputations inferred from past attacks detected, so routing through nodes that are attacked is penalized in the process of optimization. This configuration forms the basis for efficient search for safe and power-saving routing approaches.

For each Flickering Light and bee, evaluate the fitness using equation (1)

$F(x) = w_1 \cdot E(x) + w_2 \cdot S(x) + w_3 \cdot L(x) + w_4 \cdot D(x)$ ---------- (1)

Where, $E(x)$ is energy efficiency (prefer nodes with high residual energy), $S(x)$ is security score (avoid nodes with low reputation), $L(x)$ is latency (prefer paths with lower delay), $D(x)$ is distance (shorter routes preferred), w_1, w_2, w_3, w_4 are weights based on priority of each factor. Equation (1) evaluates the quality (or fitness) of each solution, representing a potential routing path in the WSN.

Each Flickering Light moves toward a brighter (better) solution

$x_i^{t+1} = x_i^t + \beta_0 e^{-\gamma r_{ij}^2}\left(x_j^t - x_i^t\right) + \alpha \cdot \epsilon$ ---------- (2)

Where, x_i^t is current position of Flickering Light$i$, x_j^t is position of a brighter Flickering Light$j$, x_{ij} is distance between fireflies iii and j, β_0 is initial attractiveness, γ is light absorption coefficient$\alpha \cdot \epsilon$ is randomization term (to diversify search). Equation (2) determines how any Flickering Light (solution) will be attracted to a brighter (better) one based

on attractiveness and proximity. Global search process facilitates the discovery of better solutions by attracting weaker fireflies to stronger fireflies in different exploration of the search space.

Bee Colony Phase

- Employed Bee Phase

Each bee selects a food source (routing path) and improves it

$v_{ij} = x_{ij} + \emptyset_{ij}(x_{ij} - x_{kj})$ ---------- (3)

Where $k \neq i$and $\emptyset_{ij}$ is a random number between [-1, 1]. In this stage (Equation (3)), every bee adapts its present solution by modifying it through a random comparison with a different solution. This operation optimizes possible solutions, seeking alternative and potentially improved options near the current location (local exploitation).

- Onlooker Bee Phase

Select the best routes based on probability

$P_i = \frac{F(x_i)}{\sum_{i=1}^{n} F(x_i)}$ ---------- (4)

Where, P_i isSelection probabilityof the$i$ bee's solution, $F(x_i)$ isFitness value,Onlooker bees select the best solutions based on probability $\sum_{i=1}^{n} F(x_i)$ is total fitness sum of all n solutions in the population. There are more likely to be bees with a greater fitter probability of being selected for further examination. Probabilistic selection concentrates resources on enhancing better-performing trajectories and preserves some diversity in place.

- Scout Bee Phase

If the solution isn't improving with some attempts, the algorithm comes up with a new random solution. This doesn't allow the algorithm to fall into local optima and enables continuous search space exploration.Apply penalties to the fitness function for paths that pass through compromised nodes

$F_x' = F(x) - P_a(x)$ ---------- (5)

Where, $P_a(x)$ are increases the penalty for routes passing through the suspicious nodes (e.g., Sinkhole, Black Hole nodes). Equation (5) is to increase security; this step has a penalty for routing through malicious or suspicious nodes. Taking away the penalty diminishes the value of unsafe routes, compelling the algorithm to use secure routes. Verify if the algorithm has satisfied the convergence criterion. The algorithm terminates upon reaching the maximum number of iterations. There is no considerable enhancement in the best solution obtained in a sequence of consecutive iterations. This prevents computational inefficiency at the cost of compromising solution quality.

Optimal routing path is chosen as best fitness scores solution. The network adjusts its routing plan according to this optimal route, delivering, Energy-efficient communication, less latency, Better security by avoiding the use of compromised nodes. This step makes data transfer to be sent through the most secure and reliable path, so the WSN is more resistant to attacks. The integration of Flickering Light Algorithm with Bee Colony Optimization for WSN improves network security and efficiency. The Flickering Light Algorithm utilizes the optimal routing paths by luring nodes towards improved fitness solutions, whereas the Bee Colony Optimization optimizes the paths through local search and learning. The combination successfully prevents infiltrated nodes to ensure secure, energy-efficient, and latency-free data transmission. Figure 4 shows the Flickering Light-Based Bee Colony Optimization (FLBCO) process for WSN network attack avoidance. It starts with Input Initialization to initialize algorithm and network parameters. Solution Generation generates initial Flickering Light and bee routing paths afterwards. Flickering Light and bee optimization steps iteratively refine these paths. Dynamically, the network topology is updated relative to node interactions. An Attack Detection Module punishes paths involving compromised nodes. Lastly, the optimal secure, energy-efficient path is chosen and provided as the Output, maximizing energy consumption, security, and latency.

RESULTS AND DISCUSSION

In the Python test environment, the hybrid Flickering Light and Bee Colony Optimization algorithm achieves outstanding Network Attack Avoidance in WSNs. The algorithm offers a Network Throughput of 270, Packet Delivery Ratio (PDR) of 95%, and a Detection Accuracy of 92%, all better than the existing algorithms. The algorithm reduces Energy Consumption to 3.2 units, an improvement in energy efficiency. These results validate the efficiency of the algorithm in enabling safe, stable, and energy-efficient data communication with higher detection accuracy and network capacity.

Performance Metrics

Throughput

Data transmission efficiency is measured by the amount of data transmitted across the network within a specified time. The better the network throughput, the lesser the interference caused by an attack.

$$Throughput = \frac{Data\ Transmitted\ (in\ bits)}{Time\ (in\ seconds)}$$ ---------- (7)

Comparison of throughput (kbps) for various routing algorithms with a growing number of nodes is shown in Table 2. FLBCO (Proposed) offers the maximum throughput at all times, as in line with its relative efficiency in passing network traffic. SEAD follows next, being superior to TSRA and LEACH. Throughput is lower with higher nodes for all algorithms, indicating network congestion or higher overhead. LEACH always has the lowest throughput, i.e., is not effective in handling data transmission. FLBCO performs well in sustaining high throughput and is therefore optimally suited for network optimization. The figure 6 illustrates the Throughput (kbps) vs. Number of Nodes for four routing protocols: LEACH, TSRA, SEAD, and FLBCO (Proposed). It illustrates that FLBCO provides the maximum throughput under all circumstances, followed by SEAD, TSRA, and LEACH. With an increase in nodes, throughput decreases for all protocols, this is an indication of network overhead or congestion. FLBCO performs optimally and shows greater efficiency in data transmission. SEAD operates fairly well, whereas LEACH performs worst on throughput in general. This is the proof that FLBCO's network throughput optimization is superior to conventional ways.

Packet Delivery Ratio (PDR)

The parameter quantifies good data packet delivery in comparison with the number of delivered data packets. Improved network performance as well as a good response to attacks occurs whenever values for PDR are greater.

$$PDR = \frac{Total\ Packets\ Received}{Total\ Packets\ Sent}$$ ---------- (5)

Table 3 shows the Packet Delivery Ratio (PDR) of various routing algorithms for varying numbers of packets. FLBCO (Proposed) has the highest PDR at all times, with more stable data transmission. TSRA and SEAD are quite efficient, with SEAD behind TSRA in most scenarios. LEACH has the lowest PDR, showing a greater packet loss rate and instability in communication. As more packets are added, PDR drops for all the algorithms, presumably because of network traffic or growing overhead. Generally, FLBCO demonstrates better reliability in packet delivery. Figure 7 has PDR versus Number of Packets for the various routing protocols: LEACH, TSRA, SEAD, and FLBCO (Proposed). The X-axis is packets and the Y-axis is PDR in percent. There are various sets of bars for each number of packets and various colors for respective routing algorithms. It can be seen from the graph that FLBCO (Proposed) has the maximum PDR at all times, reflecting the best performance among the algorithms to send packets effectively. TSRA and SEAD have average performances, with a slight gain being achieved by TSRA over SEAD in almost all instances. LEACH has the worst case of PDR, reflecting maximum packet loss rate. Additionally, as the packets increase, the

PDR reduces for each algorithm, perhaps due to congestion or network overhead increase. This imbalance confirms the effectiveness of FLBCO in ensuring stable and homogeneous packet delivery versus other routing protocols.

Detection Accuracy

The model learns on the basis of how it is able to identify the attacking nodes within the system. Good attack detection rates demand an ability that the model will utilize in order to limit the false positives.

$$Detection\ Accuracy = \frac{True\ Positives + True\ Negatives}{Total\ Nodes} \text{ ---------- (6)}$$

(LEACH, TSRA, SEAD, and FLBCO) for various values of nodes. FLBCO (Proposed) is best accurate in all cases, and hence it is concluded that the algorithm is efficient to detect anomaly or security threat. TSRA and SEAD provide average detection accuracy, with TSRA performing better than SEAD in most of the cases. LEACH has the poorest detection rate, thus is least effective in intruder detection. Detection rate worsens with increasing nodes in all the algorithms, possibly because more complex networks lower accuracy. FLBCO is observed to be most reliable in offering consistent threat detection. The figure 8 illustrates Detection Accuracy vs. Number of Nodes for various routing protocols: LEACH, TSRA, SEAD, and FLBCO (Proposed). X-axis are number of nodes, and Y-axes are detection accuracy (%). Each set of bars is a particular number of nodes, but various shades of color are for various routing protocols. As can be seen from the chart, FLBCO (Proposed) is the best-performing algorithm for all the number of nodes with the best detection accuracy. TSRA and SEAD perform moderately, with TSRA performing better than SEAD. LEACH is the worst-performing algorithm with the worst detection accuracy, showing poorer intrusion detection capability. Detection accuracy declines as the number of nodes is increased for all the algorithms, presumably due to higher network overhead and complexity. Typically, FLBCO is most efficient at achieving high detection accuracy in a larger network.

Energy Consumption

It tracks network node energy consumption while they are sensing and communicating for a period. Users can achieve improved framework effectiveness in resource-scarce situations by minimizing energy consumption.

$$Average\ Energy\ Consumption = \frac{Total\ Energy\ Used}{Total\ Number\ of\ Nodes} \text{ -------- (8)}$$

This table 5 gives the energy expenditure (in joules) by various routing protocols (LEACH, TSRA, SEAD, and FLBCO) with varying amounts of nodes. For all of the protocols, energy expenditure raises with increasing number of nodes, as would the case for additional communication and process requirements. The most energy expended and hence most inefficient protocol is LEACH. TSRA and SEAD utilize moderate energy, with TSRA utilizing less energy than SEAD. FLBCO (Proposed) always indicates the least power utilization; hence it is highly effective in reducing power utilization. FLBCO is therefore the most effective energy-consuming routing algorithm out of the discussed algorithms.

The energy consumption comparison figure 9 illustrates the power consumption of various routing protocols with increasing nodes. LEACH always uses the highest power, a reflection of its inability to conserve energy. TSRA and SEAD use moderate power, where TSRA uses a little less. FLBCO (Proposed) uses the lowest power in all configurations of nodes, which is a sign of its energy-conserving efficiency. This optimality makes FLBCO more applicable to energy-efficient wireless networks. If the node count is maximum, the tendency is the same, which shows the better energy-saving properties of FLBCO.

CONCLUSION

This paper suggests a hybrid Flickering Light and Bee Colony Optimization algorithm to Network Attack Avoidance for WSNs. The method suggested here is efficient in combining the global searching ability of the Flickering Light algorithm with the local searching ability and exploration ability of the bee colony optimization. By combining the advantages of both algorithms, the proposed model computes routing paths that save energy, save latency, and maximize overall network security to maximum. The Flickering Light algorithm directs the searching process with nodes being drawn toward improved solutions according to fitness based on aspects of energy efficiency, security, distance, and delay. On the other hand, the bee colony optimization improves such routes through an employed, onlooker, and scout bee cycle that leaves room for exploration-exploitation trade-off. Such a parallel process greatly assists in the discovery of compromised nodes to provide credible and secure data communication. Experimental results indicate that the proposed technique outperforms others with a Network Throughput of 270, a PDR of 99% as well as the Detection Accuracy of 99% and an Energy Consumption of 3.2 units, which is less than others. The results indicate the performance of the algorithm in improving network performance, security, and energy conservation in WSNs. The two methods blended together produce improved convergence and better ability to deal with malicious node detection and therefore improve the network's resilience against attack. The hybrid approach is most suitable for use in dynamic environments where network conditions do tend to change very quickly. Future work can include the addition of machine learning techniques for adaptive attack detection and performance evaluation of the algorithms on real large-scale WSNs with complicated topologies to make it more scalable and robust.

ABSTRACT

The increasing trend of vertical urbanization and sustainable development has led to the emergence of Green High-Rise Housing Complexes in India's urban regions, especially the National Capital Region (NCR). While these complexes are promoted as sustainable solutions to urban living, there remains an unexplored dimension in assessing the actual liveability they offer to residents, particularly through tangible, measurable parameters. This research aims to evaluate liveability by identifying and analyzing key parameters, indicators, variables, and attributes that define residents' living experience in such green buildings.The study is based on three Green High-Rise Housing Complexes within NCR, selected for their certified green features and diverse resident profiles. A structured survey was conducted, encompassing physical and psychosocial dimensions of liveability across multiple spatial levels from apartment units to neighborhood environments. The collected data was statistically analyzed to identify significant correlations and develop a comprehensive Liveability Index. Furthermore, a regression model was established to quantify the impact of tangible parameters on resident satisfaction. The findings suggest that tangible and measurable aspects such as thermal comfort, air quality, noise levels, access to green spaces, waste management, and maintenance significantly influence overall satisfaction in green high-rise housing. The developed model offers a robust framework for integrating liveability assessment into the planning and design of future sustainable housing projects in India. This research contributes to

bridging the gap in quantifiable liveability evaluations and serves as a decision-support tool for architects, planners, and policymakers.

Keywords: Liveability Index, Green High-Rise Housing, Resident Satisfaction, Evaluation Model, Urban Housing, Liveability Indicators.

INTRODUCTION

Background and Context

India's accelerating urbanization, particularly in high-growth zones like the National Capital Region (NCR), has led to a pressing demand for sustainable and high-density residential solutions. In response, Green High-Rise Housing Complexes (GHRHCs) have emerged as a popular urban typology, integrating sustainable design strategies such as energy-efficient systems, water conservation technologies, and improved indoor environmental quality. These complexes are often certified by national and international green building councils, including the Indian Green Building Council (IGBC) and the Green Rating for Integrated Habitat Assessment (GRIHA), which provide performance benchmarks to ensure environmental compliance (WorldGBC, 2024; GRIHA, n.d.). Although the ecological advantages of GHRHCs are widely recognized, their social and experiential outcomes particularly in terms of liveability remain less understood. Liveability, in the context of the built environment, refers to the degree to which housing and its surroundings enhance the well-being of residents. It includes measurable aspects such as physical comfort, environmental quality, access to services, social interaction, and psychological satisfaction (Kaur & Narayan, 2017). Given the complexity and density of high-rise urban living, evaluating liveability becomes critical to ensure that green housing developments not only meet environmental standards but also respond effectively to human needs and daily life experiences.

Rationale and Significance

At the policy level, initiatives like the Ease of Living Index introduced by the Ministry of Housing and Urban Affairs ((MoHUA), 2018), aim to benchmark urban quality of life across Indian cities. However, these tools operate largely at the macro scale, focusing on city-level infrastructure and governance, and often fail to reflect the lived experiences of individuals within residential towers. While many green housing evaluations emphasize environmental performance such as energy savings or reduced emissions, there is a growing recognition that resident satisfaction must be anchored in tangible, quantifiable liveability parameters. Recent studies have highlighted this gap, calling for the incorporation of metrics such as thermal comfort, air and noise quality, accessibility to green spaces, safety, and maintenance services into liveability frameworks (Ashraf, Banerjee, & Nisar, 2024).This becomes especially critical in India, where urban diversity, socio-economic stratification, and climate variability demand localized and evidence-based models of liveability assessment. Hence, a structured, parameter-driven model is required to guide developers, planners, and policymakers in designing and managing high-rise green housing that is not only ecologically sustainable but also deeply responsive to user needs.

Research Gap

Although the global literature on sustainable housing and urban liveability is expanding, there remains a lack of empirical, quantifiable frameworks within the Indian context especially those that assess how green high-rise housing impacts the lived experiences of occupants. Most existing models either rely on broad qualitative interpretations or focus solely on environmental benchmarks without integrating the perceptions of residents. Furthermore, resident satisfaction is often treated as a secondary outcome rather than a central design criterion. This study addresses this gap by proposing a Liveability Evaluation Model grounded in tangible, spatially disaggregated variables that correlate directly with satisfaction in green residential environments (Ashraf, Banerjee, & Nisar, 2022)(Panda & Thakur, 2019).

Research Aim and Objectives

The primary aim of this research is to measure and assess the living quality of residents in Green High-Rise Housing Complexes in the NCR. To achieve this aim, the study has outlined the following objectives:

- Identify the parameters, indicators, variables, and attributes that define liveability in green high-rise housing complexes.
- Collate and correlate the variables associated with liveability and those specific to green building performance.
- Analyze survey results to establish relationships between liveability parameters and derive a liveability index.
- Develop an evaluation model for liveability using multilinear or collinear regression analysis.

Research Question and Hypotheses

- Research Question (R1): Will the assessment of liveability aspects in terms of tangible parameter values provide a better understanding of satisfaction for upcoming green high-rise housing projects?
- Hypothesis (H1): Assessment of liveability in tangible aspects significantly improves satisfaction for upcoming projects.
- Null Hypothesis (H0): Assessment of liveability in tangible aspects does not significantly improve satisfaction for upcoming projects.

LITERATURE REVIEW

Liveability is increasingly recognized as a key metric for evaluating the effectiveness and quality of residential environments, particularly within the context of sustainable urban development. According to Veenhoven(Veenhoven, 2000), liveability encompasses the degree to which an environment supports the well-being of its inhabitants. Marans and Stimson further expanded this understanding by emphasizing the role of environmental, social, psychological, and infrastructural components (Marans & Stimson, 2011). Globally, indices such as the Economist Intelligence Unit's Global Liveability Index and Mercer's Quality of Living Survey provide macro-level assessments but lack applicability at the housing typology level, especially for vertical developments like high-rise buildings. In India, the Ease of Living Index ((MoHUA), 2018)has attempted to bring structure to urban quality of life evaluation but remains city-focused and often overlooks intra-urban variations in residential experiences. Kaur and Narayan identified natural lighting, access to open spaces, and ventilation as essential for enhancing satisfaction in high-rise apartments. (Kaur & Narayan, 2017). The Energy and Resources Institute (TERI, 2019) and the Institute for Competitiveness (2024) have similarly underscored the need to integrate subjective user experiences into sustainability assessments.

Green-certified buildings especially those rated by IGBC and GRIHA prioritize ecological performance but seldom assess how design features translate into resident satisfaction. However, the lived experience within these buildings remains under-examined. Most evaluations focus on environmental outputs, neglecting resident-centered assessments. In one of the recent contributions to this field, Ashraf, Banerjee, and Nisar (2024) explored this disconnect by demonstrating that tangible factors such as thermal comfort, acoustic quality, and air circulation are critical to user well-being (Ashraf, Banerjee, & Nisar, 2024). A critical component of liveability in vertical housing is spatial quality, which includes the configuration, usability, and sensory experience of spaces. In a foundational literature review, Ashraf (2022) compiled key spatial quality attributes such as daylight penetration, visual and acoustic privacy, connection with nature, and accessibility relevant to high-rise housing design. These parameters offer measurable insights into how spatial design contributes to both physical and psychological satisfaction (Ashraf, Banerjee, & Nisar, 2022). The work serves as a cornerstone for integrating spatial quality into broader liveability models and reinforces the notion that design should be evaluated not just by aesthetics or efficiency, but by resident well-being.

Despite such contributions, a significant research gap remains: there are few integrated models within the Indian context that statistically relate resident perception to the physical and spatial attributes of green housing. This study

builds on existing research and responds to that gap by proposing a Liveability Evaluation Model that captures measurable, context-specific indicators and links them to satisfaction outcomes across spatial levels.

RESEARCH METHODOLOGY

This study adopts a quantitative, case-based methodology to assess liveability in Green High-Rise Housing Complexes (GHRHCs) within the National Capital Region (NCR), India. Liveability was evaluated using a framework of tangible, measurable parameters distributed across four spatial levels: the apartment unit, apartment building, housing complex, and the urban neighborhood. Three green-certified residential complexes- Case A, Case B, and Case C were purposively selected based on certification (IGBC/GRIHA), location within NCR, more than three years of occupancy, and design diversity. A structured questionnaire survey was used to collect data on three dimensions of liveability: physical attributes (e.g., thermal comfort, ventilation), spatial and environmental design (e.g., layout, open space, views), and psychosocial/service-related indicators (e.g., safety, maintenance, social interaction).

Each parameter was evaluated on a five-point Likert scale (1 = Very Dissatisfied to 5 = Very Satisfied). A total of 340 valid responses were collected. The sample size was determined using the formula for finite population sampling:

$$n = \frac{N \cdot Z^2 \cdot p(1-p)}{(N-1) \cdot e^2 + Z^2 \cdot p(1-p)}$$

Where:
n = required sample size

N = 3,000 (estimated population)
Z = 1.96 (95% confidence level)
p = 0.5 (maximum variability)
e = 0.05 (margin of error)

Data analysis was conducted using SPSS, employing descriptive statistics, Pearson correlation, and multiple linear regression. Multicollinearity was checked using the Variance Inflation Factor (VIF). A Liveability Evaluation Model was developed based on the regression results and validated using Principal Component Analysis (PCA). The resulting Liveability Index (LI) categorizes satisfaction into five levels: Very Poor, Low, Moderate, High, and Very High. All ethical protocols were followed, including informed consent, voluntary participation, and respondent confidentiality. The methodology integrates spatial and thematic dimensions, offering a robust and scalable model for assessing liveability in India's green high-rise residential context.

DATA ANALYSIS AND FINDINGS

The analysis of responses collected from 340 residents across three green-certified high-rise housing complexes in the National Capital Region (NCR) was done. The analysis evaluates liveability perceptions across four spatial levels—Apartment Unit, Apartment Building, Housing Complex, and Urban Neighborhood—alongside an overall assessment of the Residential Environment. The goal was to identify the influence of various tangible physical and psychosocial parameters on residents' satisfaction at each spatial level. Analytical methods included descriptive statistics, correlation analysis, and regression modeling, forming the foundation for the Liveability Evaluation Model.

Descriptive Analysis by Spatial Levels

- **Apartment Unit Level** Respondents expressed the highest level of satisfaction at the apartment unit level, with a mean score of 3.75 (SD = 0.953). Key parameters contributing to this satisfaction include thermal comfort, ventilation, and access to natural light. These findings align with earlier studies (Ashraf et al., 2024) that identified microclimatic comfort and spatial layout as critical to daily residential experience.

- **Apartment Building Level** Satisfaction at the building level was moderate, with a mean score of 3.69 (SD = 0.982). Respondents appreciated the reliability of lifts, accessibility of circulation spaces, and security features. However, areas requiring improvement included elevator wait times and communal service management in higher-occupancy towers.

- **Housing Complex Level** This level recorded the lowest satisfaction, with a mean score of 3.54 (SD = 1.014). Key concerns related to maintenance quality, green space distribution, and perceived over-density. Despite the presence of green infrastructure and recreational amenities, residents noted uneven access and upkeep, suggesting a disconnect between design intent and management execution.

- **Urban Neighborhood Level** With a mean score of 3.69 (SD = 1.003), satisfaction at the neighborhood level was also moderate. Respondents cited concerns about connectivity, public transport access, and noise pollution. Nonetheless, proximity to markets and schools contributed positively in some cases. Spatial location within the NCR and infrastructure development in adjacent zones appeared to influence these results.

- **Overall Residential Environment** The highest mean satisfaction was observed for overall residential environment perception, with a mean score of 4.03 (SD = 0.867). This suggests that despite localized issues at certain levels, residents generally perceive their green high-rise living experience positively, likely influenced by the ecological and thermal performance of the complexes and the sense of community fostered within them.

Correlation and Observed Patterns

Pearson correlation analysis was conducted to explore relationships between individual liveability indicators and overall resident satisfaction. Several variables demonstrated strong positive correlations ($r > 0.6$), notably

- Thermal comfort ($r = 0.68$)
- Access to green spaces ($r = 0.71$)
- Ventilation and indoor air quality ($r = 0.66$)
- Maintenance services ($r = 0.65$)
- Safety and security ($r = 0.69$)

Weaker or inconsistent correlations were found in parameters like waste management practices and proximity to external amenities, indicating that these elements may affect satisfaction indirectly or be highly context-dependent. The analysis further revealed statistically significant correlations between satisfaction at individual spatial levels and demographic as well as structural features. For instance

- Type of Unit and Number of Units per Floor were consistently positively correlated with satisfaction across all levels.
- Age group influenced satisfaction at the apartment unit level, while preference for floor level correlated with neighborhood-level satisfaction.
- Maintenance quality, safety, privacy, and green access emerged as consistently influential across building and complex levels.
- Indoor air quality, soundproofing, and cooling effectiveness in summer were identified as key environmental drivers of comfort.

Key Findings

- **Highest Satisfaction at the Unit Level** The private domain, when designed for comfort and functionality, yields strong positive perception emphasizing the importance of thermal, visual, and acoustic comfort.
- **Complex-Level Needs More Attention** Issues such as inadequate maintenance and spatial overcrowding emerged clearly, requiring better planning and post-occupancy management.
- **Holistic Perception Matters** Despite varied scores at individual levels, the overall residential environment perception remains high, likely due to combined effects of green certification, community atmosphere, and ecological benefits.

- **Spatial Level Differentiation is Crucial** Satisfaction is influenced differently at each spatial level. Design and policy interventions must be tailored accordingly, rather than adopting a one-size-fits-all approach. This comprehensive analysis supports the development of a Liveability Evaluation Model, built on the foundation of spatially disaggregated, parameter-based satisfaction assessment. The model will integrate the most influential tangible and measurable parameters from each spatial level to provide a holistic yet nuanced liveability index for future green high-rise developments in the Indian urban context.

Liveability Index Equation

To quantify liveability based on tangible parameters across spatial levels, a Liveability Index (LI) was developed using Principal Component Analysis (PCA) and weighted component scoring. The generic mathematical formulation of the index is shown below.

Generic Liveability Index Equation

$L = \omega_1 (L_{11}Z_1+L_{12}Z_2+\ldots.+L_{1n}Z_n)+\omega_1 (L_{21}Z_1+L_{22}Z_2+\ldots.+L_{2n}Z_n)+\ldots..$

The formula shown represents a weighted sum of factor loadings and standardized variable scores:

$$L = \sum_{j=1}^{n} \omega_j . \sum_{i=1}^{n} (Li_j . Zi)$$

Where:

L= Livability Index

Z_i : Standard value of variable i

L_{ij} :Loading of variable i on component j

ωj: Weight for each component

n = number of retained principal components

This formulation ensures that components contributing more to the total variance hold higher influence in determining the final liveability score.

Score Range	Interpretation	Key Outcomes
0.80–1.00	Very High Liveability	• Standardize Variables to ensure comparability. • Calculate Component Scores using factor loadings and standardized data. • Determine Weights based on variance explained. • Combine Scores into an Index using the weighted sum formula. • Interpret and Rank Observations to guide decision-making.
0.60–0.79	High Liveability	
0.40–0.59	Moderate Liveability	
0.20–0.39	Low Liveability	
0.00–0.19	Very Poor Liveability	

Final index values were benchmarked and interpreted to guide design and policy recommendations. This equation provides a systematic and reproducible way to assess liveability in green high-rise housing, integrating measurable aspects from across the residential environment.

CONCLUSION

This study set out to explore and quantify the concept of liveability in the context of Green High-Rise Housing Complexes (GHRHCs) within the National Capital Region (NCR) of India. Drawing upon structured surveys, case-based analysis, and statistical modeling, the research evaluated liveability through tangible and measurable parameters across four spatial levels: apartment unit, apartment building, housing complex, and urban neighborhood. The approach provided a comprehensive lens to assess how the physical and environmental characteristics of green residential developments influence resident satisfaction.

The study confirms that liveability is not a singular or abstract notion but a multi-dimensional construct rooted in both spatial design and user experience. Parameters such as thermal comfort, ventilation, access to green spaces, service quality, safety, and proximity to daily-use facilities emerged as critical contributors to perceived satisfaction. The findings reinforce the idea that the success of green housing should not be measured by sustainability certifications alone, but by how these spaces perform in enhancing quality of life for their inhabitants. A key contribution of this study is the formulation of a Liveability Evaluation Model, grounded in statistically significant relationships between tangible variables and resident satisfaction. The model offers a replicable and data-driven framework that can be adopted by urban planners, architects, developers, and policymakers to evaluate, monitor, and improve liveability outcomes in future green residential projects. Furthermore, the model supports more human-centered decision-making in sustainable urban housing by linking design performance with lived experience.

This research also contributes to filling a critical gap in the Indian context, where empirical and parameter-based studies on liveability in vertical, green housing typologies are scarce. By integrating spatial levels into the evaluation process, the study underscores the importance of scale-sensitive planning, where liveability is assessed not only within the home, but across the broader built and social environment. Future research may build upon this model by expanding the sample size, integrating post-occupancy evaluations, or applying the model to non-green or informal housing types for comparative insights. As Indian cities continue to grow vertically and strive toward sustainability, the liveability of these environments must remain a central concern. This study hopes to serve as a foundational step toward that goal—where green design and human well-being evolve hand in hand.

ABSTRACT

Mesua ferrea, commonly known as Nagkesar, is a vulnerable medicinal plant native to the tropical rainforests of Northeast India. Due to extensive overexploitation, the species has become endangered and now requires urgent conservation efforts. In vitro propagation is considered one of the effective strategies for conserving plant biodiversity. In this study, protocols for explant sterilization and bud proliferation were standardized using various chemical sterilizing agents, either individually or in combination, and two different basal media supplemented with a range of phytohormone concentrations. Among the sterilization treatments, the combination of 0.1% mercuric chloride ($HgCl_2$) and 1% ethanol (C_2H_5OH) for 30 minutes resulted in the highest disinfection rate compared to other treatments. Woody Plant Medium (WPM) found more effective over Murashige and Skoog (MS) medium for bud proliferation. Two cytokinins—6-benzylaminopurine (BAP) and kinetin (Kn)—were evaluated for their influence on shoot proliferation. Kinetin at a concentration of 4 mg/L resulted in a higher bud proliferation rate (86.3%) compared to BAP (78.0%). The maximum shoot proliferation was achieved using WPM supplemented with 4 mg/L kinetin and 0.25 mg/L indole-3-butyric acid (IBA), observed 15 days post-inoculation.

INTRODUCTION

In vitro propagation has emerged as an effective and reliable technique for the production of true-to-type plantlets. It also serves as a valuable platform for genetic transformation, large-scale secondary metabolite production, and the development of new plant varieties. Among woody plants, tissue culture-based propagation is particularly advantageous over conventional methods, offering faster clonal multiplication, conservation of elite genotypes, and preservation of germplasm—especially for species threatened by overexploitation and habitat degradation. *Mesua ferrea*, commonly known as Nagkesar, is a vulnerable medicinal plant belonging to the family Guttiferae. It is native to the wet tropical regions of Burma, Sri Lanka, Malaysia, Nepal, and Sumatra, and in India, it is primarily found in the tropical rainforests of the Northeast. This species is distinguished by its fragrant flowers and uniquely coloured stamens, which set it apart from other members of its family. In traditional medicine, *Mesua ferrea* has been used to treat a variety of ailments including cough, fever, sore throat, rheumatism, vomiting, dysentery, and itching. It is also a key ingredient in the herbal formulation "Pile Off," used to control bleeding, reduce hemorrhoid size, and relieve associated pain.

However, due to overexploitation, limited public awareness of its medicinal potential, and a long reproductive cycle, *M. ferrea* has now become endangered. Conventional propagation through seeds is inefficient, as the tree takes 15–20 years to produce viable seeds, which remain viable only for a short duration and are highly susceptible to microbial infection. As a result, in vitro propagation is considered a promising alternative for its conservation and mass multiplication (Rather et al., 2022; Drik, 2023). Developing an efficient in vitro propagation protocol for woody species like *M. ferrea* is challenging due to genotype variability, explant source sensitivity, sterilization techniques, media composition, and environmental culture conditions (Kaur et al., 2022). Among these, surface sterilization is a critical step, highly dependent on the choice of chemical agents and exposure duration. Moreover, the success of bud proliferation, shoot multiplication, and root induction depends on the composition of the culture medium—particularly the nutrients and concentrations of plant growth regulators like auxins and cytokinins (Mohanraj, 2022). The present study was conducted to standardize an in vitro propagation protocol for *M. ferrea*, focusing on two key stages: explant sterilization and shoot initiation.

MATERIALS AND METHODS

Healthy, disease-free one-year-old potted seedlings of *Mesua ferrea* grown in the greenhouse at R.C.M. Science College, Khallikote, Ganjam, were used as the source of explants. The explants were initially washed with 2% Teepol (a laboratory-grade detergent) for 30 minutes to remove surface dust, followed by rinsing under running tap water. To eliminate surface and endogenous fungal contaminants, explants were treated with 0.5% Bavistin (a systemic fungicide), again followed by thorough washing. Subsequently, explants were sterilized using different concentrations of mercuric chloride ($HgCl_2$), sodium hypochlorite (NaOCl), and ethanol (C_2H_5OH), both individually and in combination, with incubation periods of 15, 30, and 45 minutes. After chemical treatment, the explants were rinsed three times with sterile distilled water and blotted dry on sterile blotting paper. Sterilized explants were inoculated on Murashige and Skoog (MS) medium (Murashige and Skoog, 1962) and Woody Plant Medium (WPM) (Lloyd and Mc Cown, 1981), both with and without supplementation of plant growth regulators at varying concentrations. The contamination percentage, survival rate, and percentage of bud proliferation were recorded after 15 days of inoculation.

RESULTS AND DISCUSSION

A critical prerequisite for successful tissue culture is standardized surface sterilization. Among the various sterilization treatments tested, the combination of 0.1% $HgCl_2$ and 1% C_2H_5OH for 30 minutes proved to be the most effective, resulting in the lowest contamination rate (49.6%). However, prolonged exposure beyond 30 minutes,

though further reducing contamination, caused blackening and tissue necrosis at the explant base due to chemical toxicity. Conversely, shorter exposure times increased contamination rates (Fig-1). These findings align with earlier studies that emphasized the dependence of sterilization efficacy on plant species, organ type, and sterilant (Munir et al., 2015). To optimize shoot initiation and bud proliferation, 19 different media combinations were tested, consisting of MS and WPM media supplemented with various plant growth regulators either singly or in combination.

Results are detailed in Table 1. Overall, WPM outperformed MS medium in promoting bud proliferation, corroborating findings by Jadhav and Deodhar (2015), who observed an 80% bud proliferation rate on WPM supplemented with 13.31 µM BAP, as opposed to 33.33% on similarly supplemented MS medium. between the two tested cytokinins- Kinetin at 4 mg/L induced a higher bud proliferation rate (86.3%) than BAP (78.0%). Lower cytokinin concentrations yielded minimal proliferation, while higher concentrations led to callusing at the explant base. Simultaneous application of both cytokinins also induced excessive callusing. Incorporating low concentrations of the auxin indole-3-butyric acid (IBA) alongside cytokinins improved shoot initiation. The highest bud proliferation (observed at 15 days post-inoculation) occurred in M18 medium (WPM + 4 mg/L Kn + 0.25 mg/L IBA) (Fig. 2). Interestingly, these results differ from those of Jadhav and Deodhar (2015), who found BAP to be more effective than Kn. This variation may be attributable to genotypic differences between plant samples.

CONCLUSION

Explant sterilization in tree species poses unique challenges due to the presence of persistent endophytic microorganisms. This study offers a viable protocol for effective surface sterilization using $HgCl_2$ and ethanol, which can be adapted for similar woody plant species. Moreover, bud proliferation in tree species is hindered by the accumulation of secondary metabolites like tannins, which inhibit morphogenesis. The optimized protocol developed here, particularly the use of WPM supplemented with Kn and IBA, offers a reliable basis for future research and conservation strategies for *Mesua ferrea* and related species.

ABSTRACT

Medical imaging plays a pivotal role in the early detection and diagnosis of breast diseases, offering critical insights into various pathological conditions. Among these, breast cancer remains a major public health concern, with ductal carcinoma in situ [DCIS] accounting for approximately 20–25% of cases. DCIS is characterized by the abnormal proliferation of cells confined within the milk ducts, representing a non-invasive form of breast cancer that, if left untreated, can progress to invasive carcinoma. To accurately diagnose DCIS, several imaging modalities are employed, each contributing unique strengths. Mammography is typically the first-line screening tool, especially effective in identifying microcalcifications, a key feature of DCIS. Its diagnostic accuracy ranges between 70% and 80%, making it a reliable but not definitive method, especially in dense breast tissue. Ultrasound, on the other hand, serves as an essential adjunct modality. While not as sensitive as mammography for detecting DCIS directly, it plays a crucial role in guiding biopsies and assisting in the evaluation of palpable or suspicious lesions. It is particularly helpful in characterizing solid versus cystic masses and in tailoring targeted treatment plans. Magnetic Resonance Imaging [MRI] has emerged as the most sensitive imaging technique for evaluating DCIS, with a reported sensitivity of 80% to 90%. MRI excels in assessing tumor extent, size, and multifocality, which are essential for surgical planning. It is currently considered the most comprehensive imaging modality for diagnosing and monitoring non-invasive breast cancer. When it comes to treatment, both breast-conserving surgery [BCS] and mastectomy are effective options for managing DCIS, often resulting in favorable outcomes. The choice of therapy depends on factors like tumor size, location, and patient preference. Early diagnosis through advanced imaging leads to better prognosis and personalized treatment strategies for patients with DCIS.

Keywords: Ductal Carcinoma in-situ, DCIS, mammography, ultrasound, MRI, Microcalcification.

INTRODUCTION

Imaging plays a major role in diagnosis of breast pathology at early stage in which breast cancer is the second most leading cancer in population. Imaging is an irreplaceable technique which provides beneficial anatomical information about body in three dimensional with the help of ionized and non-ionized radiations [1]. Ductal carcinoma in-situ [DCIS] is an early stage of breast cancer that occurs due to abnormal cell growth in milk duct. It does not intersect the basement membrane in breast [2]. Symptoms of DCIS are breast pain, bloody nipple discharge, palpable masses and lump in the breast. The crucial risk factors are family history of breast cancer, uses of contraceptive pills, and first baby birth at old age, menopause and any other benign breast pathology [3 - 4]. Some of the clinical parameters are used to evaluate DCIS includes, nuclear grade, architectural subtype, presence of microcalcification, size and location of the lesion, basically architectural subtype is divided into two categories comedo and noncomedo subtype, further non come do divided into Micropapillary, solid component and cribriform represent as a mixed pattern [5]. Micropapillary is the least common type of DCIS and cribriform is the most common type of DCIS pattern and come do represents as a high grade cell with microcalcification [6]. One of the most important parameter is the accurate measurement of lesion size. Early detection can prevent serious breast diseases. Mammography, Ultrasound and Magnetic Resonance Imaging [MRI] are the most preferred modalities for diagnosis of breast cancer[7].

Mammography is the first choice for the screening of breast disease and it can detect DCIS at initial stage with the accuracy of 70- 80% in the form of microcalcification [8]. Ultrasound is not considered that efficient for detection of DCIS due to poor accuracy rate but useful in detection of other breast pathology diseases. This modality also acts as an imaging guidance for the breast biopsy and can help in providing an accurate treatment of breast diseases. Women age is the major factor for imaging of breast [9 - 10], Women with the age less than 35 are examined with Ultrasound and women with the age more than 35 are mostly examined with mammography [11]. MRI is the pre eminent modality provides cross-sectional images of body, widely used for diagnosis of diseases can detect different kind of lesions provide strong knowledge of pathologies and has a higher sensitivity in detection of DCIS with the accuracy rate of 90%[12]. Measurement of ductal carcinoma tumour size is challenging for doctors with mammography but with MRI it is possible to measure true tumour size. MRI can even detect small tumours in true size [13].

Breast imaging is a dominant technique to identify the causes of ductal carcinoma. DCIS can be treated with breast conserving surgery [BCS], mastectomy and radiotherapy. Ductal carcinoma accounts for 20-25% and breast cancer can be equated with microcalcifications [6,14]. DCIS calcification can be differentiated as a high, intermediate or low grade, in which high grade appears as Y shaped, intermediate and low-grade DCIS appears as triangular shape[15]. When DCIS appears as a mass on mammographic image without any calcification it can be considered as a lower grade. Mammography and MRI can alone detect 85-90% of DCIS lesion. In imaging modalities[16], Ultrasound is less effective for evaluation of DCIS because of low sensitivity in microcalcification but helpful in diagnosis of invasive breast cancer. After breast conserving surgery mammography is standard modality for follow-up routine [17]. Improved and advanced imaging modalities has increased the diagnosis of breast cancer, currently doctors can evaluate breast cancer at initial stage [18]. Interventional radiology provides better DCIS confirmation with the help of biopsies, image guided biopsies of the breast is the standard technique for the sampling and diagnosis of the abnormal tissue [19].Core needle biopsy and vacuum assisted tissue biopsy are most commonly done for evaluation of DCIS, some researchers have shown that VAB technique is more accurate than core needle biopsy VAB large tissue sample is taken for study. Overall VAB provides more beneficial information than other biopsies procedure [20].

MAMMOGRAPHY

Mammography is the first step of diagnosis of DCIS with 70-80% of sensitivity and also this modality is widely available with good outcomes. Most of the breast lesions are detected with the help of screening mammogram[18, 21]. DCIS appears as a calcification and mammography can easily detect microcalcification. 70 % DCIS cases are seen as microcalcification and 10- 12 % cases are seen as soft tissue masses [8]. Different types of calcifications can be detected by mammography in which density of the breast plays crucial role in it. Microcalcification can be missed in dense breast, representing less sensitivity but in fatty breast, mammography provides higher sensitivity and can easily detect microcalcifications [15] Mammography is used for detection and evaluation of tumour size. It is challenging for doctors to measure the true tumour size for surgery alone with mammography. It also lacks in evaluation of small tumour size and non-calcified component in dense breast [22]. Despite of this, mammography is considered as most preferable modality for evaluation of breast diseases with good sensitivity and high accuracy rate [10]. Digital breast tomosynthesis [DBT] is the new and improved advancement of conventional mammography that provides 3D cross sectional images of the breast with high sensitivity rate in detection of breast diseases [19].

ULTRASOUND

Ultrasound plays a particularly valuable role in the evaluation of breast symptoms in younger women, where dense breast tissue may limit the effectiveness of mammography. It is a non-invasive, radiation-free imaging technique that allows for real-time visualization of breast structures and is especially adept at differentiating between solid, cystic, and complex [mixed] masses. This makes it an essential tool for assessing palpable lumps, localized pain, or nipple discharge, all of which are common presenting symptoms in younger age groups. Additionally, ultrasound can be used to visualize ductal abnormalities, which may indicate underlying pathology, such as ductal carcinoma in situ [DCIS], although it is not the first-choice imaging modality for DCIS detection[5].

While ultrasound is less sensitive than other imaging modalities in detecting microcalcifications—a hallmark feature of DCIS—it can still contribute significantly when used in conjunction with mammography. After initial mammographic detection of suspicious calcifications, ultrasound can aid in further evaluating the lesion and guiding interventional procedures such as core needle biopsy or vacuum-assisted biopsy, improving diagnostic precision. It also plays a role in correlating tumor size and extent when cross-referenced with mammographic findings, helping inform clinical decision-making and surgical planning. Despite its limitations in primary DCIS diagnosis, ultrasound remains indispensable in the comprehensive evaluation of breast disease, especially when used as part of a multimodality approach. According to Wehweck [2021], understanding the pathology and imaging characteristics of DCIS is vital in refining diagnostic strategies and ensuring accurate lesion characterization Thus, ultrasound continues to hold an important complementary role in the imaging pathway, supporting earlier diagnosis and personalized management of breast pathology[23].

Magnetic Resonance Imaging

MRI is currently best modality for evaluation of DCIS with sensitivity range of 80-90% and most sensitive modality to predict breast cancer.MRI has ability to detect small tumour and also helps in calcified components[24]. MRI can evaluate pure DCIS tumour size. It is helpful in therapeutic planning as it allows accurate and targeted surgical application for removal of ductal carcinoma with minimum surgeries. MRI can detect lobular carcinoma compared to other radiology modalities. It can identify calcified and non- calcified components[4, 25]. Initially MRI was considered as a poor modality for evaluation of DCIS due to false diagnosis result but after the advancement and improvement of technique with high temporal and spatial resolution, most of the researchers have showed that MRI[92%] has a higher sensitivity than mammography [52%][18, 25]. MRI can detect high grade lesions with the help of contrast enhanced MRI and diffusion weighted imaging [DWI] sequence. It is the standard protocol in identification of lesions DWI showed level of restriction on pathology with apparent diffusion coefficient [ADC] mapping. DW EPI echo planar imaging is use for fast acquisition method with less motion artefacts [8, 26]. MRI has modified the treatment of DCIS major needle biopsies can be avoided helpful in malignant cases. Compared to other

modalities contrast MRI can provide the valuable information on permeability, vascularity of cells, can showed abnormal tissue growth in vessels [11]. Most of the patients are treated with breast conserving surgery and by mastectomy with the help of radiotherapy. Mastectomy is mostly preferred when the lesion is too large; breast conserving surgery is the good option in early stage of DCIS [27]. In addition to traditional imaging methods, new technologies like artificial intelligence [AI] are beginning to play a powerful role in breast cancer diagnosis. AI tools are being designed to help radiologists by automatically detecting suspicious lesions, identifying patterns in breast calcifications, and even predicting a patient's risk of developing cancer. These systems aim to improve accuracy and reduce differences in interpretation between radiologists. Another exciting development is radiomics, where advanced algorithms analyze medical images in greater detail to uncover hidden features that may relate to tumor behavior or treatment response. Imaging technologies such as digital breast tomosynthesis [DBT] and contrast-enhanced mammography are also improving how clearly abnormalities are seen, especially in dense breast tissue. When combined with AI, these innovations can help doctors make more personalized and precise treatment decisions, leading to better outcomes for patients with ductal carcinoma.

CONCLUSION

Early detection can prevent serious breast pathology. Imaging became the initial step to identify the causes of diseases. Mammography is the first and standard imaging modality for the evaluation of ductal carcinoma in-situ. Mammography can identify -pure DCIS with accuracy of 80% but lacks in detection of small tumour and non-calcified DCIS. Ultrasound is preferred for young women with symptoms of breast diseases and is also useful in other breast pathology but has less accuracy in DCIS. Core needle biopsy and vacuum assisted biopsy helps as positive diagnosis of DCIS. Breast MRI is the best technique for evaluation and diagnosis of ductal carcinoma with accuracy rate of 90-95% and it showed pure DCIS tumour size with less harmful effects on patients. For treatment of DCIS breast conserving surgery and mastectomy is the two best options with positive outcomes.

ABSTRACT

One of the main factors contributing to endodontic and periodontal breakdown is the development of dental plaque into a biofilm and its adherence to the teeth. Controlling the adherence of biofilm to the tooth surface is one of the most challenging aspects in the field of dentistry. Toothbrush in conjunction with dentifrices, mouthwash, and dental floss are efficiently known techniques to lower the amount of dental plaque. In recent years, the green synthesis of nanoparticles utilizing plant extracts as reducing and stabilizing agents has gained prominence as an eco-friendly and viable alternative to traditional synthesis methods. Silver nanoparticles can resist dental biofilm and lower the microbial load in periodontal disease. The objective of this research is to assess the antimicrobial, anti-inflammatory, and cytotoxic effects of silver nanoparticles (AgNP's) synthesized using extracts from *Nigella sativa* (N. sativa) and *Salvadorapersica* (S. persica) against oral pathogens. Extracts from *Nigella sativa* (N. sativa) and *Salvadorapersica* (S. persica) were sourced from Saveetha Dental College and Hospital, located in Velappanchavadi, Chennai. Silver nanoparticles were then produced and their formation was confirmed through UV-visible spectrophotometry. Subsequent analyses were conducted to determine their antimicrobial, anti-inflammatory, and cytotoxic activities. The synthesized silver nanoparticles

demonstrated significant inhibitory effects against pathogenic microorganisms, including *Enterococcus faecalis*, *Candida albicans*, *Streptococcus mutans*, and *Staphylococcus aureus*. Phytomedicines or medications derived from plants, used in conjunction with silver nanoparticles elicited a potential response against the oral micro-organisms.

Keywords: Silver nanoparticles, green synthesis, phytomedicine, herbal and silver nanoparticles, herbal mouthwash.

INTRODUCTION

The growth of dental plaque into biofilm and its adhesion to the teeth, is a major phenomenon for endodontic and periodontal breakdown [1]. A vital enzyme matrix metalloproteinase-8 (MMP-8) is released during collagen breakdown in the acute stage of periodontal disease [1]. Salivary MMP-8 levels have been reported consistently to be high in studies of patients with chronic periodontitis, and this is regarded as an indicator of the inflammatory process occurring in periodontal disease [2]. One of the challenging features is to control the adhesion of biofilm to the tooth surface [3]. Among various strategies, one of the most popular strategies for maintaining oral hygiene is the use of a toothbrush along with dentifrices. Mouthwash and dental floss are two additional noteworthy techniques [4]. Oral mouthwashes with chlorhexidine has been widely and effectively used in periodontal therapy. Phytomedicines, or medications made from plants, are now being used to treat a variety of inflammatory diseases all over the world. *Nigella sativa*, commonly referred to as black cumin, Karun Jeeragam in Tamil, and Kalonji in Urdu, is a fragrant herb reputed for its potent antimicrobial and anti-inflammatory effects [5]. Another plant, Salvadorapersica (Arabic- tooth cleaning sticks) which is also referred to as the miswak tree has the potential to prevent the development of plaque and has an antimicrobial effect on bacteria that cause caries in the oral cavity [1,6]. Compared to most metals, silver has a relatively low level of toxicity and high levels of biocompatibility and anti-microbial properties, greatly increasing its potential for use in the pharmaceutical and healthcare sectors [7]. Herbs used along with nanoparticles, has an efficient antibacterial action, and are also becoming an alternative in current trends. Furthermore, the stability and solubility of silver nanoparticles produced through biological means are extremely high[8]. Silver nanoparticles have the potential to oppose dental biofilm as well as minimize the microbial load in periodontal disease [9]. The purpose of this investigation is to analyze the antibacterial, anti-inflammatory, and cell toxicity responses of silver nanoparticles (AgNPs) formulated with plant-derived extracts from *Nigella sativa* (N. sativa) and *Salvadorapersica* (S. persica) against microorganisms found in the oral cavity.

MATERIALS AND METHODS

Formulation of Nigella sativa (N. sativa) and Salvadorapersica (S.persica)

A quantity of 1 gram from each of the herbal plant sources was collected from the institution. These samples were mixed with 100 ml of distilled water and heated at a temperature range of 50–60 °C. Following the heating process, the mixture was filtered using a nylon mesh cloth to obtain a clear extract.

Production of silver nanoparticles and herbal mouthwash solution

A mixture was prepared by combining 20 ml of the prepared plant extract with 80 ml of distilled water and 1 mmol of silver nitrate solution (procured from Himedia Laboratories, India). This solution was then placed on an orbital shaker and maintained at ambient temperature for a duration of 24 hours. A visible color transition from reddish to brown indicated the successful synthesis of silver nanoparticles through the interaction between the plant extract and silver ions.

Characterisation of synthesized nanoparticles

The synthesized nanoparticles underwent analysis using UV–visible spectroscopy (UV–Vis). A 3 ml sample of the solution was placed in a cuvette and scanned across a wavelength range of 250 to 650 nm. Subsequently, the reaction mixture was subjected to centrifugation at 10,000 rpm for a duration of 10 minutes. The resulting precipitate was rinsed with double-distilled water, and this centrifugation-washing cycle was repeated four to five times. After the final wash, the collected pellet was dried in an oven, and the obtained dry powder was stored for subsequent characterization.

Isolation of oral pathogens

To isolate *S. aureus*, *S. mutans*, *C. albicans*, and *E. faecalis*, nutrient agar plates were employed. A 0.1 ml volume of the diluted herbal extract from the synthesized herbal-silver nanoparticle solution was spread onto the surface of the agar plates. The plates were then incubated at 37°C for 24 hours.

Assessment of anti-microbial Activity

The antimicrobial properties of the green-synthesized silver nanoparticles were determined using the agar well diffusion method. Mueller-Hinton agar plates were prepared and sterilized in an autoclave at 121°C for approximately 15–20 minutes. Once sterilized, the molten medium was poured into sterile Petri plates and allowed to solidify at room temperature. A microbial suspension containing *Streptococcus mutans*, *Lactobacillus* species, *Staphylococcus aureus*, and *Candida albicans* was uniformly spread across the surface of the agar using sterile cotton applicators. Wells with a diameter of 9 mm were then punched into the agar using a sterile polystyrene pipette tip. Each well was loaded with varying concentrations (25 µg, 50 µg, 100 µg) of the synthesized silver nanoparticles. For comparative analysis, standard antimicrobial agents were used—Amoxyrite for bacterial isolates and Fluconazole for fungal strains. The plates were incubated at 37°C for 24 hours for bacteria and 48 hours for fungi. Zones of inhibition surrounding the wells were measured in millimeters using a ruler to evaluate the antimicrobial effectiveness.

Antioxidant Effectiveness

Diphenyl-picrylhydrazyl Method

A 0.1 mM stock solution of 2,2-diphenyl-1-picrylhydrazyl (DPPH) was prepared using methanol as the solvent. For each assay, a fresh working solution was obtained by diluting the stock to a final concentration of 20 µM in methanol. Various concentrations (10, 20, 30, 40, and 50 µg/mL) of silver nanoparticles synthesized using *Nigella sativa* and *Salvadorapersica* extracts were added to 200 µL of the DPPH solution in wells of a 96-well microtiter plate. The mixtures were incubated at ambient temperature for 30 minutes in the absence of light. After incubation, absorbance was measured at 517 nm using a microplate spectrophotometer, with methanol used as the baseline reference. The percentage of DPPH radical neutralization was calculated using the following equation:

$$\% \text{ Inhibition} = [(\text{Abs_control} - \text{Abs_sample}) / \text{Abs_control}] \times 100,$$

where *Abs_control* refers to the absorbance of the DPPH solution without nanoparticles and *Abs_sample* refers to the absorbance of the sample containing the synthesized nanoparticles. Ascorbic acid at a concentration of 1 mg/mL was employed as the positive control.

Anti-inflammatory properties

2.7.1 Albumin Denaturation Assay Using Egg Albumin

For the assessment of anti-inflammatory activity via the egg albumin denaturation assay, 0.2 mL of freshly obtained egg albumin was mixed with 2.8 mL of phosphate buffer solution. Varying concentrations (10 to 50 µg/mL) of silver nanoparticles synthesized using *Nigella sativa* and *Salvadorapersica* were incorporated into the mixture. The pH of the resulting solution was adjusted to 6.3. This mixture was kept at room temperature for 10 minutes, after which it was incubated in a water bath at 55°C for 30 minutes. Diclofenac sodium served as the standard anti-inflammatory agent, while dimethyl sulfoxide (DMSO) was used as the negative control. Following incubation, absorbance was recorded at 660 nm using a UV–visible spectrophotometer. The inhibition of protein denaturation was calculated using the formula:

% Inhibition = [(A_control − A_sample) / A_control] × 100,
Where *A_control* denotes the absorbance of the control sample, and *A_sample* represents the absorbance of the treated sample containing the nanoparticles.

Cytotoxicity

To evaluate the cytotoxic potential of the combined plant extract, the brine shrimp lethality assay was conducted. A saline solution was prepared by dissolving 2 grams of non-iodized salt in 200 mL of distilled water. A 12-well ELISA plate was used for the experiment, with each well filled with 6 to 8 mL of the prepared saline. Approximately ten *Artemia*nauplii were introduced into each well with care. Different volumes (5 µL, 10 µL, 20 µL, 40 µL, and 80 µL) of silver nanoparticle formulations derived from *Nigella sativa* and *Salvadorapersica* were administered to the respective wells (refer to Figure 4). The plate was kept undisturbed for 24 hours under incubation. Following the incubation period, the number of live nauplii in each well was counted. The percentage of mortality was determined using the following equation:
% Mortality = [(Number of dead nauplii) / (Total nauplii)] × 100

RESULTS

UltraViolet visible spectroscopy

The UV-Vis spectra of silver nanoparticles interacting with *N. sativa* and *S. persica* at different time intervals (10 min, 30 min, 1 h, 2 h, 3 h, 4 h, and 24 h) are presented in Figure-5. The signal peak observed at 450 nm confirms the formation of silver nanoparticles facilitated by *N. sativa* and *S. persica*. The UV-vis spectrum shows that the absorbance of silver nanoparticles steadily increases at 2 hours and the process concludes at 3h. After 3 hours, the absorbance of larger silver nanoparticles (20-50 nm) decreases due to enhanced plasmon excitation. Green-mediated synthesis results in increased color intensity with longer incubation times. The 24-hour absorption band in green synthesis indicates that silver nanoparticles were fully synthesized within 3 hours of incubation.

Antibacterial Efficacy

The in vitro antibacterial potential was assessed through the agar well diffusion method against *Candida albicans*, *Enterococcus faecalis*, *Streptococcus mutans*, and *Staphylococcus aureus*. The herbal mouthwash containing silver nanoparticles demonstrated effective inhibition of *S. mutans* and *S. aureus* at concentrations of 50 µL and 100 µL (Figure-6). The highest inhibition zones observed were 9%, 9%, 11%, and 16% for *C. albicans*, *E. faecalis*, *S. mutans*, and *S. aureus*, respectively (Table-1). Combining silver nanoparticles with plant extracts results in a fine zone of inhibition compared to using alone nanoparticles. Green silver nanoparticles are highly effective antibacterial agents against oral pathogens. Green silver nanoparticles outperform silver nanoparticles in terms of oral pathogen inhibition. Thus the formulated nanoparticle-enhanced herbal mouthwash contains antibacterial compounds, making it valuable in biological applications.

Anti-inflammatory properties

Albumin Denaturation Assay Using Egg Albumin

The egg protein denaturation test shows inhibition between 50% and 75%. The inhibition zone progressively expands with increasing doses from 10 µL to 50 µL. The maximum inhibition is observed at the 50 µL dose (Figure-7).

DISCUSSION

Dental care, combined with the usage of oral hygiene techniques such as mouthwashes, leads to improved patient cleanliness [10]. The application of medicinal herbs in the treatment of various conditions has seen a significant increase, owing to their therapeutic benefits, limited adverse effects, and cost efficiency [11,12]. Nigella sativa and Salvadorapersica are botanicals with medicinal potential. Silver nanoparticles have been extensively used in biomedicine [13]. The green manufacturing of silver nanoparticles based on Nigella sativa and Salvadorapersica

formulations provides a promising avenue for developing efficient antibacterial and anti-inflammatory medicines against oral infections. Green synthesis is not only environmentally friendly, but also utilizes natural compounds with therapeutic properties[14]. The purpose of this work was to create a herbal mouthwash with silver nanoparticles derived from N. sativa and S. persica. Khairnar *et al.* discovered that the herbal mouthwash had considerable plaque control when compared to the usual chlorhexidine [15]. In another study by Balappanavaretal, he discovered that there was no difference in the efficacy of herbal mouthwash and chlorhexidine for plaque control [16]. An *in vivo* investigation also demonstrated that the herbal mouthrinse group showed a significant drop in both gingival index and plaque index [17]. Herbal mouthwash showed good outcomes and can be used as an alternative to traditional mouthwashes for gingivitis and periodontitis treatment[18]. Additional research and clinical testing are required to demonstrate the usefulness and safety of these silver nanoparticles. This will facilitate the development of novel treatments for oral hygiene maintenance and infection prevention.

Limitations

While the green synthesis of silver nanoparticles using *Nigella sativa* and *Salvadorapersica* shows promising attributes, it is important to acknowledge its limitations. Variations in plant extract concentrations can influence the consistency of nanoparticle synthesis. Further investigation is required to evaluate the long-term stability and potential cytotoxicity of the nanoparticles within complex biological environments. Although the formulation holds significant potential, these challenges must be resolved.

CONCLUSION

The current study looks at green synthesized silver nanoparticles using plant extracts from N. sativa and S. persica. In both plants, synthesis began at 10 minutes and ended at 4 hours. The formulation demonstrated remarkable antibacterial action against the oral pathogens C. albicans, E. faecalis, S. mutans, and S. aureus. When compared to other compounds and silver nanoparticles, the formulation-impregnated disc exhibits a fine zone of inhibition. As a result, the present study shows that silver nanoparticles made from N. sativa and S. persica are a cost-effective and environmentally friendly solution. The formulation's outstanding antibacterial and anti-inflammatory characteristics could be advantageous for biological applications.

ABSTRACT

Foxtail millet (*Setaria italica*) is among the world's most important and ancient domesticated crop. Millets in general were staple foods in the semiarid regions of East Asia (China, Japan, Russia, India, and Korea) before the popularity of rice and wheat. Foxtail Millet has gained remarkable importance in agriculture due to its resilience to climatic changes and increasing demand for nutritious food and feed. Foxtail Millet foods and beverages offer functional and health promoting benefits, notably anti-diabetic, anti-obesity, and cardiovascular disease, due to the activities of phytochemicals, which also have a role in the body's immune system. Foxtail millet is mentioned as *Kangu*or *Priyangu* in Ayurved classics. It is mentioned that Foxtail Millet have properties such as *kashayras*(pungent taste)*ruksha*(induce dryness) *guru* (heavy for digestion)and *kahpaghna*(pacify kapha dosha),all these properties make it an ideal staple food for *santarpanjanya vyadhis*(disease due to over nutrition) of modern era. Recent literature highlights its versatility in traditional recipes, modern processed products, and therapeutic diets catering to lifestyle disorders. As a result, an attempt is undertaken to map its whole nutritional profile, therapeutic benefits and culinary application using contemporary and traditional Ayurvedic literature.

Keywords: Foxtail Millet, *Priyangu / Kangu,* Nutritional Profile, Culinary Application

INTRODUCTION

Millets were the first crops cultivated at the dawn of agriculture. Millets in general were staple foods in the semiarid regions of East Asia (China, Japan, Russia, India, and Korea) and even in the entire Eurasian continent before the

popularity of rice and wheat [1]. They have gained remarkable importance in agriculture due to their resilience to climatic changes and increasing demand for nutritious food and feed. Interest in the development of policy statements about drought-tolerant grains is increasing in several developing countries such as India, China, and some countries of Africa because of water scarcity and increasing populations. Government of India had proposed to United Nations for declaring 2023 as International Year of Millets (IYOM). The proposal of India was supported by 72 countries and United Nation's General Assembly (UNGA) declared 2023 as International Year of Millets on 5th March, 2021.Now, Government of India has decided to celebrate IYOM, 2023 to make it peoples' movement so that the Indian millets, recipes, value added products are accepted globally. In addition, the earmarked funds to scientific research for purposes of improving and increasing their production and utilization as food have also been increased. Millet is one of the most important drought-resistant crops and the 6th cereal crop in terms of world agriculture production. Also, millet has resistance to pests and diseases, short growing season, and productivity under drought conditions, compared to major cereals [2]. Foxtail millet (Setaria italica) is one of the world's most important and ancient domesticated crops [3]. Currently, it is widely grown in Andhra Pradesh, Karnataka, Tamilnadu, Maharashtra, Uttar Pradesh and Bihar states. The total production in the world is 2.29 Mn MT from the area of 1.057 Mn Hectares [4].

Properties of millets are explained in *Ayurved* classics in *Dhanya Varga*. Millets have been given many synonyms like, Kudhanya (Inferior among cereals) [5], Kshudra Dhanya (small sized cereals) [6], and Trina Dhanya (grass derived cereals) [7]. Foxtail millet is mentioned as *Kangu*or *Priyangu* in Ayurved classics. It is mentioned that Foxtail Millet have properties such as *kashayras* (pungent taste) *ruksha* (induce dryness) *guru* (heavy for digestion) and *kahpaghna* (passify kapha dosha) [8], all these properties make it an ideal staple food for *santarpanjanya vyadhis* (disease due to over nutrition) of modern era.

Foxtail millet (*Setaria italica*), one of the oldest cultivated millets in the world, is gaining renewed interest in India due to its climate resilience, rich nutrient profile, and potential for culinary innovation. As India witnesses a surge in non-rice and non-wheat alternatives for sustainable diets, foxtail millet can be a key player for promoting nutrition security and food diversification. Recent literature highlights its versatility in traditional recipes, modern processed products, and therapeutic diets catering to lifestyle disorders. Foxtail Millet foods and beverages offer functional and health promoting benefits, notably anti-diabetic, anti-obesity, and cardiovascular disease, due to the activities of phytochemicals, which also have a role in the body's immune system. As a result, an attempt is undertaken to map its whole nutritional profile using contemporary and traditional literature.

Foxtail Millet – Cultivation [9]

Foxtail millet, scientific name *Setaria italica* (synonym *Panicum italicum* L.) ranks second among the millets production in the world and continues to have an important place in the world agriculture providing food to millions of people dependant on poor or marginal soils in southern Europe and in temperate, subtropical and tropical Asia. In India, it is grown mainly in Andhra Pradesh, Karnataka, Telangana, Rajasthan, Maharashtra, Tamil Nadu, Madhya Pradesh, Uttar Pradesh, and in a small extent in the northeast states of India.

Soil and Climate

Foxtail millet needs moderately fertile well drained soil for good yields, although it can grow on soils ranging from sandy to heavy clay soils. Grows better in place with annual rainfall of 500-700 mm. It cannot tolerant water logged condition or extreme drought.

Time of Sowing

Kharif: July-Aug. (Karnataka), July (TN, TS, AP),
2-3rd week of July (Maharashtra)
Rabi: August to September (Tamilnadu)
Harvesting: Normally crop is ready for harvest in 80 - 90 days after sowing
Yield: Grain 20-25 q per ha under ideal condition & Straw 30-40 q per ha.

Anatomy of a Whole Grain Kernel [10]

Bran

Bran is multi-layered outer skin of kernel that helps in protecting the other two parts of the kernel from disease, water, pests and sunlight. The bran has important antioxidants and other minerals and vitamins like iron, zinc, copper, magnesium, B vitamins, fiber, and phyto-nutrients.

Germ

Germ is the embryo, after fertilization by pollen sprouts into a new plant. The Germ contains B vitamins, vitamin E, antioxidants, phyto-nutrients and unsaturated fats.

Endosperm

Endosperm provides the energy to the plant if allowed to grow so it is called as food supply of germ. The endosperm contains starchy carbohydrates, proteins and small amounts of vitamins and minerals.

Foxtail Millet – Nutritional Profile from Contemporary Sources

Foxtail millet exhibits a robust nutritional profile, characterized by a significant macronutrient composition that contributes to its health benefits. Its protein content generally surpass that of rice and aligning with the levels found in wheat. The carbohydrate content, typically around 60 %, is largely composed of complex carbohydrates, which are associated with a lower glycemic response compared to simple sugars. The fat content in foxtail millet is relatively low, about 4.3 %, and includes a beneficial fatty acid profile. Notably, its dietary fiber content is exceptionally high and significantly exceeding that of rice and wheat. This high fiber content plays a crucial role in supporting digestion and regulating cholesterol levels. The combination of high fiber, substantial protein, and complex carbohydrates positions foxtail millet as a nutritionally advantageous grain for managing blood sugar levels, promoting satiety, and supporting overall digestive health. This makes it a valuable dietary component, especially in a context where refined grains often dominate consumption [11,34].

Foxtail millet grains are small and ovoid in shape, measures 2mm long, pale yellow – orange, red or black in colour. De-husking is done before use. It's usually cooked whole like rice, consumed as porridge or as thin bread roti. Due to their high fiber content Glycemic Index (GI) is low i.e. 59.2 [27]. Foxtail Millet is rich in alpha-glucans than wheat and rice. Uptake of sugar and rice gets decreased due to alpha-glucan [12]. The intake of 50 g of foxtail millet per day significantly improve the glycemic control, especially the postprandial glucose. The glucose-lowering effect of foxtail millet might be a result of the interaction of increased leptin concentrations, decreased insulin resistance and reduced inflammation [13]. Foxtail millet is rich in minerals such as calcium and magnesium as compared to rice. It also contains phenolics and flavonoids as antioxidant constituents [14].

Generally, the yellow color of the de-husked grain is the most direct indicator for consumers to evaluate the millet quality. Many compounds, including carotenoids (lutein and zeaxanthin), flavonoids, are predominant yellow pigments in plants and are believed to confer nutritional and pharmacological benefits to plants. Flavonoids are a large group of natural products with variable phenolic structures, containing flavone, flavanone, flavonols, isoflavone, anthocyanins, and so on. Flavonoids play essential roles in plants in forming the color and flavor of flowers and fruits, and resistance against ultraviolet B (UV-B), diseases, and pests damages [16,17,18]. In addition to the nutritional benefits, foxtail millet possesses certain phytochemicals with antinutrient effects which may hinder efficient utilization, absorption, or digestion of nutrients, and thus reduce their nutrient bioavailability and nutritional quality. Antinutrients are unevenly distributed in the grain. Depending on their localization, the proportions of these antinutrients in the diet can be reduced by dehulling and further processing [19].

Foxtail Millet – Nutritional Profile from *Classical* Ayurvedic Sources

Foxtail millet is known as *Priyangu, Kangu*or *Kangunika*in classical texts [20,21]. They are mentioned foxtail millet under category of *Kudhanya*and *Kshudradhanya,* which means small grains. Acharya Charak has described that *Priyangu* has *Kashay* (Astrigent), *Madhur* (Sweet) *rasa* (Taste) and *Sheeta* (Cold) *guna* (Properties) [22] while Acharya

Sushruta has added that it isRuksha (Dryness) [23] and Acharya Vagbhat has added that it has *guru* (heaviness) [24] *guna*as well. Due to its *Sheet* (Cold) and *Ruksha* (Dryness) *guna,* it has tendency to vitiate *Vata,* and pacify *Kapha* dosha. Bhavpraksah Nighantu and Kaidev Nighantu has described it to have *Bhruhana* (Nourishment) properties [25,26]. properties come from its *Madhur rasa* and *Guru guna.* Nighantu has also mentioned that *Priyangu has Bhagna Sandhana*(conjoining broken body tissues) properties. Acharya Sushruta and Bhavpraksh Nighantu has also mentioned different variants of foxtail millets based on colouri.e. *Krushna* (Black)*, Rakta* (Red)*, Shwet* (White),*Tamra* (Brown),*Pit* (Yellow). Among them *Pit* (Yellow) variant is regarded as best. *Priyangu* Would be ideal to use in case of*Kapha* dominant pathologies and in *santarpanothhavyadhi* (diseases due to over nutrition). However in case of *agnimandhya* and *Vata prakop,* it would be unwise to consume *Priyangu.*

Culinary Applications of Foxtail Millet in India

The culinary significance of foxtail millet varies across different regions of India, reflecting the country's rich diversity in food cultures and agricultural practices. In Southern India, encompassing states like Tamil Nadu, Kerala, Karnataka, Andhra Pradesh, and Telangana, foxtail millet has been a staple ingredient in traditional recipes prepared using methods such as steaming and fermentation. Historically, it was a common food item in regions like Rayalaseema and Telangana, consumed as a staple grain [28]. Case studies focusing on specific regions, such as Arunachal Pradesh, reveal the continued traditional consumption of foxtail millet among tribal populations, with unique recipes tailored to local ingredients and culinary customs [29]. These regional variations demonstrate the adaptability of foxtail millet to different environments and its integration into the local dietary habits of various communities.

Historically, foxtail millet has been a versatile ingredient in Indian cuisine, serving as a staple grain in numerous preparations. It is traditionally cooked similarly to rice and used in a variety of dishes such as *bisibele* bath and *pongal*, common in Southern India [29] .Beyond direct consumption as cooked grains, foxtail millet is also ground into flour and used to make chapatti (roti), a staple flatbread in many Indian households, and porridge, a simple yet nutritious meal.In the Southern states, traditional millet recipes include a wide array of dishes like pazhayasadham (fermented rice), idli (steamed rice cakes), dosa (thin crepes), uthappam (thick pancakes), appam (lace-like pancakes), puttu (steamed rice flour cylinders), kolukattai (steamed dumplings), koozh (savory porridge), kuzhipaniyaram (savory dumplings), adai (lentil and rice pancakes), and athirasam (sweet fried cakes), showcasing the diverse ways millets are incorporated into the regional diet [30]. Foxtail millet also finds its way into traditional Indian sweet dishes and snacks. It is a key ingredient in kheer, a creamy rice pudding, and laddu, a popular sweet ball.Pinni, another traditional sweet, is made from roasted foxtail millet flour mixed with ghee and sugar.[31] Savory snacks like chakli, a deep-fried spiral snack, are also prepared using foxtail millet flour, with studies evaluating their sensory and nutritional qualities. Furthermore, sattu, a traditional drink made from roasted and ground grains, can also be prepared using foxtail millet [30].

Regional and tribal cuisines across India feature unique traditional applications of foxtail millet. In Arunachal Pradesh, for example, tribal communities have their own distinct recipes, including Jumin, a locally brewed alcoholic beverage made from fermented foxtail millet. They also prepare foxtail millet soup, khichdi with local vegetables, and pulao, often incorporating indigenous herbs and spices. Even dishes like momo and chapati have local variations using foxtail millet flour. These diverse traditional culinary uses across different regions and tribal communities highlight the significant role foxtail millet has played and continues to play in the Indian food landscape [29]. In recent times, there has been a growing trend of developing value-added food products based on foxtail millet to cater to modern consumer needs. Research has focused on formulating diversified products such as rusk, cookies, millet bars, and papad, often demonstrating improved nutritional profiles compared to their traditional counterparts made from refined cereals [31]. Ready-to-cook (RTC) upma mixes incorporating foxtail millet and semolina have been developed and evaluated for their sensory attributes and glycemic index, showing promising results for convenience and health benefits [32]. Similarly, instant foxtail millet khichdi mixes have been formulated and studied for their shelf stability, offering quick and nutritious meal options [33]. These innovations reflect an effort to integrate foxtail millet into contemporary diets through convenient and appealing food formats.

Scope for Further Research

Several areas warrant further research to fully unlock the potential of foxtail millet in India. Exploring and documenting traditional recipes from lesser-known regions, developing new and appealing contemporary recipes, conducting comprehensive sensory evaluations, investigating the impact of different processing methods, and studying the long-term health effects of its consumption are all critical avenues for future investigation. By addressing these research gaps, we can further understand and leverage the culinary and nutritional benefits of foxtail millet, contributing to a healthier and more sustainable food system in India. To further promote the integration of foxtail millet into Indian diets, several strategies can be adopted. Public awareness campaigns are essential to educate consumers about its nutritional benefits and culinary versatility. Continued recipe development, focusing on both traditional and innovative dishes, can make foxtail millet more appealing and accessible. Government support through agricultural policies and inclusion in food programs can also play a crucial role. The food processing industry can contribute by developing convenient and palatable foxtail millet-based products. Reviving and promoting traditional knowledge and practices related to millet consumption within communities can also enhance its uptake.

CONCLUSION

Foxtail millet (*Setaria italica*) is among the world's most important and ancient domesticated crop. They have gained remarkable importance due to their resilience to climatic changes and increasing demand for nutritious food and feed. Foxtail millet ranks second among the millets production in the world. Foxtail millet is highly nutritious and superior to other cereals like rice and wheat in protein content, fiber content and fatty acid content. Foxtail millet is rich in minerals such as calcium and magnesium as compared to rice. carotenoids (lutein and zeaxanthin), flavonoids, are predominant yellow pigments in food grains. Phenolic compounds and flavonoids are important components which confer nutritional and pharmacological benefits to Foxtail millet.

Priyangu has *Kashay* (Astrigent), *Madhur* (Sweet) *rasa* (Taste) and *Sheeta* (Cold), Ruksha (Dryness), *Guru* (heaviness) *guna* (Properties). It has *Bhruhana* (Nourishment), Bhagna Sandhana (conjoining broken body tissues) properties. It should be consumed individuals with good *Agni* (Digestive power) for management of *Kapha* Predominant conditions and for disease due to over nutrition such as obesity and diabetes. *Priyangu* should be avoided by individuals with *Agnimadya*(Low digestive power) and *Vata* Predominant Pathalogies. The versatility of foxtail millet in culinary applications promotes dietary diversity by offering a nutritious alternative to the over-reliance on rice and wheat in Indian diets, thus encouraging a more varied food basket. Its adaptability allows for integration into a wide array of traditional and contemporary dishes, ranging from staples like roti and rice to breakfast items, sweets, snacks, and even beverages.

ABSTRACT

Most fractures and dislocations require a period of cast immobilization for proper healing, which results in joint stiffness and muscular weakness. Western medicine applies physiotherapy in post fracture stiffness. In Ayurveda, Acharya Sushruta has given a separate chapter for fracture and its treatment as *Bhagna Chikitsa*. In the case presented here, a 52 year old female patient had colle's fracture in Right hand due to fall. Initially she was managed with closed reduction and POP cast was given below elbow for 6 weeks. After POP removal, patient was still having restricted movement with severe pain, stiffness and persistent inflammation at the joint site. Then she was managed with *Marmaabhyanga* with *Murivennataila* along with rehabilitation for 40 days. She got relief in pain and range of movement improved after completion of treatment. This single case reveals that post fracture stiffness can be successfully managed with *Marmaabhyanga* with *Murivennataila.*

Keywords: Fracture, *Murivennataila, Marmaabhyanga,* Post fracture stiffness

INTRODUCTION

Fractures are a common orthopaedic injury that involve a break in the continuity of a bone or part of its mineralized structure. They often occur due to traumatic physical forces, such as a fall or impact, and can range in severity. One specific type of fracture is the Colle's fracture, which involves a break at the distal end of the radius, typically resulting from a low-energy fall onto an outstretched hand. This type of fracture has a notably higher incidence in post-menopausal women due to decreased bone density and increased vulnerability to falls. The management of fractures involves a multi-step approach that includes reduction (realigning the bone), immobilization (ensuring

stability during healing), and rehabilitation (restoring function and mobility after recovery). However, complications like delayed union, malunion, deformity, regional pain syndrome, and stiffness can arise[1]. Traditional treatment approaches, as outlined by Acharya Sushruta in Bhagna Chikitsa, emphasize*Aanchana* (traction), *Pidana* (pressure), *Sankshepa* (apposition) and *Bandhana* (bandaging)[2]. After that, rehabilitation through specialized exercises like *Mrutapindadharana*, *Lavanapindadharana*, and *Pashanapindadharana* to aid in recovery and restore mobility[3]. Ayurveda, the ancient science of life, emphasizes the intricate connection between the body, mind, and vital energy points known as *Marma*. It should be avoided from *Shastra, Kshara* and *Agnikarma*[4]. These points are considered centers of life force, playing a crucial role in physiological and energetic balance. Any injury or disruption to these points can lead to significant health disturbances, making their protection and careful handling essential in Ayurvedic practice. In *Marma Chikitsa*, the role of *VataDosha* is considered to be of prime importance. All therapeutic interventions are done for maintaining normalacy of *Vata*[5].

Introduction of MurivennaTaila

MurivennaTaila is used in traditional practice in Kerala as a drug of choice in *AbhighatajaShoola* (Traumatic pain) as an external application. It is an *Anubhuta Yoga* which is mentioned in Pharmacopeia of Govt. Ayurved College Pharmacy Trivandrum, Kerala. This oil is used in the form of *Pichu*, *Dhara* (pouring medicated oil), *Bandhana* (bandaging). So, considering this in this case report, patient was treated by *MarmaAbhyanga* with MurivennaTaila in Post fracture stiffness after removing POP and got efficient relief in post fracture stiffness, pain and swelling.

Aim To evaluate therapeutic efficacy of *MarmaAbhyanga* with Murivennataila in Post fracture stiffness.

Objective Therapeutic evaluation of *MarmaAbhyanga* and MurivennaTaila in Post fracture stiffness.

MATERIAL AND METHODS

Data Collection

Patient's Name: XYZ
Age: 52 years
Sex: Female
Occupation: House wife
Diagnosis: Post fracture Stiffness
H/o Present illness: A 52 year's old female patient had colle's fracture in Right hand due to fall. Initially she was managed with closed reduction and POP cast was given below elbow for 6 weeks. After POP removal, patient was still having restricted movement with severe pain, stiffness and persistent inflammation at the joint site.

Material Murivenna taila[6]

Ingredients

Sr No.	Ingredient	Botanical Name
1.	Kumari	*Aloe vera*tourn.ex Linn.
2.	Palandu	*Allium cepa* Linn.
3.	Paribhadra	*Erythrinaindica* Lam.
4.	Karanja	*Pongamiaglabra*Vent.
5.	Shatavari	*Asparagus racemosus*Willd.
6.	Madangandhi	*Borreriaarticularis*Linn.f
7.	Tamboolapatra	*Piper betel* Linn.
8.	Shigru	*Moringapterygosperma*Gaertn.
9.	Tandulambu	*Oryzasativa* Linn.
10.	Base - Coconut Oil	-

MARMAS CONSIDERED IN THE MANAGEMENT OF COLLE'S FRACTURE

Sr. No.	Marmas[7]	
1.	Manibandha	
2.	Talahridaya	
3.	Kshipra	
4.	Kurpara	
5.	Indrabasti	
6.	Kurcha	
7.	Kurcha-shira	
8.	Amsa	
METHODS

STHANIK CHIKITSA

Assessment Criteria:

Signs & Symptoms	Grade 0	Grade 1	Grade 2	Grade 3	Grade 4
Stiffness	No	Mild	Moderate	Severe	-
Tenderness	No	Pt c/o pain	Patient winces	Winces & withdraws the area	Does not allow to touch
Swelling	No	Mild	Moderate	Severe	-

RESULT

Signs and Symptoms	BT Grade	AT Grade
Stiffness	03	01
Pain	VAS 8	VAS 0
Tenderness	03	00
Swelling	02	01

After 40 days of treatment, significant improvement seen in Pain, Tenderness, Swelling and Stiffness. Follow up Weekly once for 30 days

DISCUSSION

The principle of immobilization plays a crucial role in fracture management by preventing movement, alleviating pain, and facilitating proper bone healing. However, prolonged immobilization may lead to joint stiffness, necessitating therapeutic interventions to counteract such effects. Murivenna Taila, an Ayurvedic formulation, has been observed to reduce inflammation, potentially by enhancing microcirculation[8]. Its efficacy in managing traumatic and inflammatory conditions can be attributed to its predominant *Tikta, Katu,* and *Madhura Rasa*, which contribute to its *Kapha* and *Pitta Shamaka* properties. The *Vata-Kaphahara* nature of MurivennaTaila aids in reducing pain and stiffness, while its *Pitta-Rakta Shamaka* properties help in relieving inflammation[9]. Furthermore, Marma Chikitsa, rooted in fundamental Ayurvedic principles such as *Panchamahabhuta siddhanta* and *Agnisomiya Siddhanta*, emphasizes the significance of *Marma* points in the body's energy flow. The concept of *Prana*, concentrated at *Marma* points, suggests that stimulating these sites through *Marma Abhyanga* enhances *Prana* flow, contributing to the therapeutic benefits observed. The combined effect of Murivenna Taila and *Marma Abhyanga* demonstrates significant relief in post-fracture stiffness, pain, and inflammation, reinforcing their role in holistic Ayurvedic management of musculoskeletal injuries.

CONCLUSION

This single case reveals that post fracture stiffness can be successfully managed with *MarmaAbhyanga* with *Murivenna Taila*.

ABSTRACT

In this study the main factors influencing Gen Z postgraduate students in Northeast India's participation in Massive Open Online Courses (MOOCs) are examined. This study used a quantitative research approach. Data were gathered from 120 Gen Z postgraduate students using a structured questionnaire "MOOCs Engagement Scale" developed by Vijila and Thiyagu that measured behavioral, cognitive, emotional, social, and overall students' engagement in MOOCs. The study examines MOOC engagement among postgraduate learners in Northeast India and finds moderate to high levels of engagement across all dimensions. Interestingly, while there was no discernible difference in emotional engagement, female students demonstrated higher levels of behavioral, cognitive, and social engagement than their male counterparts. While social engagement was unaffected, previous MOOC experience had a significant impact on behavioral, emotional, cognitive, and total engagement. These results cast doubt on assumptions about student involvement in MOOCs and highlight the need for cooperative engagement techniques, especially for male students and those with less experience. This research contributes to the literature on MOOC engagement and offers practical insights for educators aiming to enhance student involvement in online learning environments.

Keywords: MOOC, Engagement, Cognitive, Emotional, Behavioural, Postgraduate students

INTRODUCTION

Massive Open Online Courses (MOOCs) have revolutionized higher education by providing flexible, accessible, and cost-effective learning opportunities to diverse populations worldwide. In geographically isolated regions like Northeast India, where mountainous terrain and limited infrastructure create significant barriers to traditional education, MOOCs represent a vital alternative pathway for accessing quality educational resources and opportunities. The effectiveness of MOOCs, however, is fundamentally dependent on learner engagement—the

extent to which participants actively interact with course content, instructors, and peers. Engagement in online learning environments is multifaceted, encompassing behavioral, emotional, cognitive, and social dimensions. These dimensions are influenced by various factors including demographic characteristics, motivational drivers, technological access, and prior learning experiences. The purpose of this study is to examine the major factors that influence MOOC participation among Gen Z postgraduate students in Northeast India. Specifically, the study will look at how age, gender, and previous MOOC experience affect the behavioral, cognitive, emotional, and social aspects of engagement. The study's objective is to uncover these crucial elements in order to offer insights that may improve MOOC efficacy and further the more general objective of guaranteeing fair access to high-quality education in this area.

Rationale for the Study

This research specifically focuses on Gen Z postgraduate learners in Northeast India for several compelling reasons. First, Gen Z (individuals born between 1997 and 2012) represents the first truly digital-native generation, having grown up with ubiquitous internet access and digital technologies. Their unique relationship with technology shapes their learning preferences and behaviours in ways that differ significantly from previous generations. As digital natives, they possess distinctive expectations regarding educational delivery, interaction styles, and content formats that may influence their engagement with MOOCs. Second, despite their technological fluency, Gen Z learners in Northeast India face unique regional challenges, including inconsistent internet connectivity, linguistic barriers, and cultural factors that may affect their engagement with predominantly Western-designed MOOCs. Understanding these region-specific dynamics is crucial for developing more inclusive and effective online learning environments. Third, postgraduate students represent a demographic at a critical educational juncture, where specialized knowledge acquisition and professional skill development directly impact career trajectories. Their engagement with MOOCs has significant implications for workforce development and economic growth in this developing region.

By identifying the key determinants that influence MOOC engagement among this specific demographic, this study aims to provide actionable insights for educational institutions, policymakers, and MOOC providers. These insights can inform the development of tailored interventions and design modifications to enhance engagement levels, improve completion rates, and ultimately contribute to the broader goal of democratizing access to quality higher education in Northeast India. The findings will also contribute to the emerging body of literature on generational differences in online learning preferences and behaviours, with particular attention to how this manifest in non-Western, developing regions where educational infrastructure remains limited.

LITERATURE REVIEW

A thorough understanding of how these studies relate to one another in the context of learner engagement in MOOCs is provided by the structured summary of studies from 2023 to 2012, which has been divided into three categories: supporting literature, contrasted literature, and further support and contrast. In order to analyze student involvement in MOOCs, Sharif and Ramakrishnan (2023) defined critical engagement measures, highlighting their function in enhancing course materials. In a similar vein, Deng et al. (2022) created and approved the MOOC Engagement Scale (MES), which uses four parameters to gauge learner engagement. A machine learning strategy was put forth by Elghomary et al. (2022) to improve trust and participation in MOOCs, and Lee and Song (2022) discovered that task value and academic self-efficacy have a beneficial impact on learning perseverance in these kinds of courses. Ten crucial metrics for raising engagement were discovered by Ogunyemi et al. (2022), offering direction to course creators. Bastos et al. (2019) explored participant profiles and motivations, showing how these affect engagement behaviours.

Maksoud (2019) discovered that the use of MOOCs in flipped classrooms enhanced both course grades and student engagement, and Guajardo-Leal et al. (2019) reported a favourable relationship between course completion and forum participation. A number of other studies, including those by Aboulmagd (2018), Almutairi and White (2018)

examined the function of engagement models, demographic factors, and the necessity of particular metrics in MOOCs. Crues et al. (2018) offered a multidimensional definition of engagement, indicating variables that are constant across different courses, while Sun and Bin (2018) also made a contribution by identifying important behavioral engagement characteristics, highlighting the significance of evaluating engagement.

Garcia and Appel (2021) found that learner involvement rose during the COVID-19 epidemic, with social components playing a substantial influence, contrasting with past studies that focused on other engagement parameters. Studies that focus just on internal motives have not discovered extrinsic elements that influence student involvement, as Ucar and Sarıtepeci (2022) have. The lack of a discernible difference in involvement between blended and traditional on-campus learners was reported by Cornelius et al. (2019), casting doubt on the dynamics of current engagement. Contrary to the notion that greater involvement produces better results, Chaw and Tang (2019) discovered a non-significant link between negative engagement and course completion. Crues et al. (2018) questioned the notion that learning activities usually increase engagement by talking about how quiz attempts have a detrimental impact on it. Furthermore, in contrast to research that connects involvement to social presence, Aboulmagd (2018) found no significant relationship between engagement and perceptions of Community of Inquiry presences. Guajardo-Leal et al. (2019) further highlighted the heterogeneity in engagement outcomes by identifying contextual and demographic factors that impact course completion differently.

Results of blended learning engagement were reaffirmed by Cornelius et al. (2019), who also suggested that the dynamics of engagement would need to be reevaluated. Theories concerning the function of motivation in engagement were supported by Chaw and Tang's (2019) comparison of positive and negative motivations. Maksoud (2019) provided evidence in favor of the notion that novel teaching strategies, such as flipped classrooms, can improve student involvement, investigated age-related variations in student behavior, offering fresh perspectives on the dynamics of engagement. Because survey response rates varied, questioned the representativeness of engagement measures. While producing divergent results about the importance of several engagement dimensions, Sun and Bin (2018) developed an assessment model for behavioral engagement, which helped to understand engagement elements. In contrast to other research that places more emphasis on intrinsic motivation, Chaw and Tang's (2019) findings of positive motivation and engagement offered more evidence in favour of motivational theories.

Research Objectives

- To assess overall level of MOOC engagement and its dimension (behaviour, cognitive, emotional, and social)among Gen Z postgraduate students in Northeast India.
- To examine the influence of gender on the MOOC engagement and its dimension(behaviour, cognitive, emotional, and social)levels of Gen Z postgraduate students.
- To analyze the impact of age on the level of MOOC engagement and its dimension (behaviour, cognitive, emotional, and social)among Gen Z postgraduate students.
- To determine the role of experience with MOOCs in influencing the engagement and its dimension (behaviour, cognitive, emotional, and social)levels of Gen Z postgraduate students.

Research Hypotheses

- $H_0 1$
  Gen Z postgraduate students exhibit a low level of MOOC engagement and its dimension (behaviour, cognitive, emotional, and social) in Northeast India.
- $H_0 2$
  There is no significant difference in MOOC engagement and its dimension (behaviour, cognitive, emotional, and social)between male and female Gen Z postgraduate students.
- $H_0 3$
  Age does not significantly impact the level of MOOC engagement and its dimension (behaviour, cognitive, emotional, and social)among Gen Z postgraduate students.

- $H_0 4$
- Previous experience with MOOCs does not significantly influence the engagement and its dimension (behaviour, cognitive, emotional, and social)levels of Gen Z postgraduate students.

RESEARCH METHODOLOGY

The present study employed a descriptive survey method to analyze the key determinants of MOOC engagement among Gen Z postgraduate students in Northeast India. The descriptive survey method was deemed appropriate for the study as it facilitates the systematic collection of data from a predefined population, allowing the researcher to explore the current status and relationships between variables. All Gen Z postgraduate students at Northeast Indian universities specific in Assam who were enrolled in different fields made up the study's population. Students who had previously participated in MOOCs or were currently doing so as part of their learning journey were the study's primary focus. Using basic random sampling selection, 120 Gen Z postgraduate students (between 20-28 years old)in total were chosen as the study's sample. By ensuring that every postgraduate student had an equal chance of being included in the sample, this sampling strategy minimized the effects of sampling bias. The sample was taken from a group of students who were enrolled in various postgraduate programs at the Northeast Indian universities that were chosen.

Instrument for Data Collection

For gauging student participation in Massive Open Online Courses, a reliable tool the"MOOCs Engagement Scale (MES)" developed and standardized by Vijila and Thiyagu (2022) with 46 Likert scale-based items was used. The scale offers a thorough evaluation of four essential engagement characteristics that are vital to comprehending how learners engage with MOOCs and accomplish learning objectives:

- **Behavioral Engagement** Study learners' visible behaviours, such as their participation in class activities, their completion of assignments, and how often they log into the platform.
- **Cognitive Engagement** Evaluates students' level of intellectual engagement, including their focus, interest, and attempts to understand the material being covered in class.
- **Emotional Engagement** Assesses how students feel about MOOCs in terms of their motivation, interest, and general level of satisfaction with the course material.
- **Social Engagement** Measure how students interact with peers and instructors in MOOCs, including participation in discussion forums, collaborative activities, peer reviews, and community building.

Participants responded to each item on a 5-point Likert scale ranging from 1 (strongly disagree) to 5 (strongly agree), indicating their level of agreement with each statement. The MOOC Engagement Scale yields a total possible score ranging from 46 to 230, with higher scores representing greater levels of engagement with MOOCs. This comprehensive measurement approach allows for precise quantification of participants' involvement across all engagement dimensions. Respondents are divided into groups with low, moderate, or high levels of involvement based on their scores. The scale has proven to be very reliable, with a Cronbach's alpha of 0.888, guaranteeing the consistency and precision of the measurements. It has undergone extensive testing to confirm both content and construct validity.

Data Collection Procedure and Data Analysis

Through a survey questionnaire, the questionnaire was given to the sample of Gen Z postgraduate students. Prior to data collection, all participants were told about the study's goal and their agreement was obtained. Descriptive statistics, such as measures of central tendency (mean, median, and mode) and dispersion (standard deviation), were used to examine the survey data. Furthermore, inferential statistical methods like regression analysis and correlation were used to look at the connections between important factors and MOOC involvement levels.

- **$H_0 1$**
  Gen Z postgraduate students in Northeast India exhibit a low level of MOOC engagement and its dimension.

Three levels are assigned to each dimension: Lower Level, Moderate Level, and Higher Level. Table 1 displays the distribution of participants' involvement levels across several metrics of participation in MOOCs. The findings are presented below:

- **Behavioral Engagement** The majority of Gen Z postgraduate students in Northeast India show moderate levels of involvement with MOOCs. In particular, six (5%) participants exhibit low interest levels, whereas 99 (82.5% of the total) fit into the moderate engagement category. Furthermore, 15 (12.5%), individuals exhibit a high degree of engagement. This distribution shows that students are actively engaged in their education, but it is evident that more behavioral engagement is required to move pupils from the moderate category to the higher degrees of involvement.

- **Cognitive Engagement** When it comes to cognitive involvement with MOOCs, the results suggest that while 27 participants (22.5%) demonstrate high levels of engagement, 74 students (61.7%) demonstrate moderate levels of engagement. Nonetheless, 19 individuals (15.8%) are classified as having minimal engagement. This evidence implies that even though a large number of students are successfully assimilating and processing information, a sizable fraction may not be paying close attention to the material covered in the course. Increasing students' cognitive engagement, especially at the lower end, may improve their success in MOOCs and overall learning results.

- **Emotional Engagement** The results show that 89 participants (74.2%) report moderate emotional engagement with MOOCs, whereas 24 individuals (20%) report significant emotional involvement. On the other hand, only 7 (5.8%) of the participants fit the description of poor engagement. This suggests that a significant number of students are not only participating but also forming emotional connections with their learning experiences. Improving emotional involvement can improve these students' educational experience even more, especially for those who are already ranked lower.

- **Social Engagement** In terms of social engagement, the data reveals that 24 participants (20%) demonstrate high levels of social connection with the course material and their peers, whereas 74 participants (61.7%) are moderately involved. Nonetheless, a greater percentage of students22, or 18.3%are classified as having poor levels of participation in this area. This shows that although the majority of students participate in MOOCs' social components to a sufficient degree, there is room for improvement in terms of encouraging stronger social ties and interactions. Improving the chances for social participation may contribute to everyone's learning experience being better.

- **Overall MOOCs Engagement** According to the overall evaluation of MOOCs participation, 31 participants (25.8%) demonstrate high engagement with MOOCs, while 83 participants (69.2%) show moderate engagement levels. Merely 6 individuals (5%) are classified as having minimal engagement. These findings demonstrate that a sizable majority of Gen Z postgraduate students in Northeast India participate in their MOOCs at moderate to high levels across a range of parameters, indicating that they are actively engaged in the program. This encouraging result implies that MOOCs are successfully satisfying the demands of these students and that there is room for even more involvement, especially from those who are at the lower end of the engagement range.

Based on the data presented in Table 1, the null hypothesis ($H_0 1$) that Gen Z postgraduate students in Northeast India demonstrate low levels of MOOC engagement is rejected. The evidence strongly counters this assumption, as the vast majority of participants exhibit moderate to high levels of engagement across all dimensions. Specifically, 95% of students show moderate to high behavioral engagement, 94.2% demonstrate moderate to high emotional engagement, 84.2% display moderate to high cognitive engagement, and 81.7% exhibit moderate to high social

engagement. Overall, 95% of Gen Z postgraduate students in Northeast India engage with MOOCs at moderate to high levels. These findings clearly indicate that these learners are actively participating in and connecting with MOOCs, contradicting the notion of low engagement. The strong engagement patterns observed suggest that Gen Z students in Northeast India are effectively utilizing online learning platforms, which warrants further investigation into the specific factors contributing to this positive engagement phenomenon.

$H_0$2

There is no significant difference in MOOC engagement and its dimension between male and female Gen Z postgraduate students.

The mean scores of male and female participants are compared in Table 2 for the following MOOC engagement variables: behavioral, emotional, cognitive, social, and overall. In order to assess if the variations in mean scores between the male and female groups are statistically significant, it also contains the findings of an independent sample t-test.

- **Behavioral Engagement** The mean score for men (N = 45) was 66.16 with a standard deviation of 20.7, but the mean score for women (N = 75) was higher at 80.85 with a standard deviation of 14.36. The statistical significance ($p < 0.05$) of the behavioral engagement difference between males and females is indicated by the t-value of 4.584 at the significance level of 0.000. This indicates that there is a markedly higher behavioral engagement among female participants.

- **Cognitive Engagement** Males had a mean cognitive engagement score of 14.49 (SD = 3.52), whereas females had a higher mean score of 18.07 (SD = 3.15). The t-value is 5.757, and the significance level is 0.000, showing a statistically significant difference between males and females in cognitive engagement ($p < 0.05$). Females demonstrated significantly higher cognitive engagement than males in MOOCs.

- **Emotional Engagement** The mean emotional engagement score for males was 39.44 (SD = 8.37), and for females, it was 41.73 (SD = 8.00). The t-value is 1.491 with a significance level of 0.139, indicating no statistically significant difference in emotional engagement between males and females ($p > 0.05$). Thus, both genders show similar levels of emotional engagement in MOOCs.

- **Social Engagement** Males scored an average of 27.33 (SD = 7.01) on the social engagement scale, whereas females scored an average of 30.43 (SD = 4.62). The difference in social involvement between males and females is statistically significant ($p < 0.05$), as indicated by the t-value of 2.909 at a significance level of 0.004. In MOOCs, female participants engage in more social interactions than male participants do.

- **Overall MOOCs Engagement** Men scored 147.42 (SD = 35.77) overall MOOCs engagement, while women scored better at 171.16 (SD = 27.06). o There is a statistically significant difference in the overall MOOCs engagement between males and females ($p < 0.05$), according to the t-value of 4.114 at the significance level of 0.000. Compared to male participants, female participants engage in MOOCs at a considerably higher rate overall.

The findings of the t-test show that when it comes to behavioral, cognitive, social, and general involvement with MOOCs, females consistently perform better than male students. On the other hand, there was no discernible gender difference in emotional engagement. According to the results, females participate in MOOCs at higher rates in the majority of engagement parameters. These findings may help in customizing MOOC tactics to increase male participation. Gender has a statistically significant effect on behavioral, cognitive, social, and total MOOCs involvement, according to the t-test results. On the other hand, there is no discernible variation in emotional engagement by gender. For behavioral, cognitive, social, and overall involvement, we thereby reject the null hypothesis ($H_0$2), but are unable to do so for emotional engagement.

- **$H_0$3: Age does not significantly impact the level of MOOC engagement and its dimension among Gen Z postgraduate students.**

  The ANOVA test findings and descriptive statistics for the association between age and the various MOOC engagement aspects (behavioral, emotional, cognitive, social, and overall engagement) among Gen Z postgraduate students are displayed in the Table 3. Above 20 and less than 23, above 23 and less than 26, and above 26 and less than 29 are the three age categories that are being compared.

- **Behavioral Engagement:** The group of participants who were "above 26" had the greatest mean behavioral involvement (79.50), which was followed by the groups who were "above 20" (75.87) and "above 23" (73.64). The p-value (Sig.) is 0.458 and the F-value is 0.787, both of which are higher than the significance level of 0.05. This suggests that there are no age-related differences in behavioral involvement that are statistically significant.

- **Cognitive Engagement:** "above 26" group (17.20) had the highest level of cognitive engagement, followed by "above 23" (16.67) and "above 20" (16.56). Results of the ANOVA show that there is no statistically significant difference in cognitive engagement based on age, with an F-value of 0.204 and a p-value of 0.816.

- **Emotional Engagement:** The groups "above 26" (43.11), "above 20" (41.72), and "above 23" (39.61) received the highest mean scores for emotional engagement. Results of the ANOVA show that there is no statistically significant difference in emotional engagement between the age groups, with the F-value being 1.698 and the p-value being 0.188, both of which are greater than 0.05.

- **Social Engagement:** Mean Scores: The "above 26" group had the highest social engagement (29.85), followed closely by the "above 23" group (29.20) and the "above 20" group (29.08). ANOVA Results show there appears to be no discernible variation in social involvement between age groups, with an F-value of 0.124 and a p-value of 0.883.

- **Overall Engagement:** Mean Scores: The groups "above 26" and "above 20" had the highest overall engagement scores (169.65, 163.23) and "above 23" and "above 23" respectively (159.21). • ANOVA Results show that the F-value is 0.796, and the p-value is 0.454, which suggests no statistically significant difference in total MOOCs involvement across the different age groups.

The p-values for each of the five MOOC engagement dimensions—behavioral, cognitive, emotional, social, and overall engagement—are higher than the conventional significance level of 0.05, according to the ANOVA results. It is not possible for us to reject the null hypothesis ($H_0$3) because none of the p-values are less than 0.05. This indicates that among Gen Z postgraduate students, age has no statistically significant effect on the degree of MOOC involvement or its characteristics. Therefore, when it comes to the behavioral, cognitive, emotional, social, or overall dimensions of MOOC engagement, age is not a relevant factor.

- **$H_0$4**
  Previous MOOCs experience does not significantly influence the engagement and its dimension levels of Gen Z postgraduate students.

Based on Gen Z postgraduate students ' previous MOOCs experiences, the Table4 displays the findings of the t-test for differences in MOOC engagement and its dimensions as well as a Group Statistics analysis. Under the definitions, the experience groups are "above 6 months to less than 1 year" and "above 1 year to less than 2 years." The analysis assesses the elements of behavioral, emotional, cognitive, social, and overall engagement.

- **Behavioral Engagement** Students with six months to a year of experience have a mean score of 67.00. The mean is 78.00 for students who have more than a year of experience. There is a statistically significant difference in

behavioral involvement between the two experience groups, as indicated by the t-value of -2.892 and the p-value of 0.005 ($p < 0.05$). Experience levels are positively correlated with behavioral engagement.

- **Cognitive Engagement** The mean for students with six months to one year of experience is15.07, 17.25 is the mean for students with more than a year of experience. There is a substantial difference in cognitive involvement, as indicated by the t-value of 2.837 and the p-value of 0.005 ($p < 0.05$). Experienced students exhibit higher levels of cognitive involvement.

- **Emotional Engagement** The mean is 38.07 for students with between six months and a year of experience. The mean is 41.77 for students who have more than a year of experience. o A significant difference in emotional engagement is indicated by the t-value of -2.152 and the p-value of 0.033 ($p < 0.05$). Experienced students exhibit higher levels of emotional engagement.

- **Social Engagement** The mean is 27.97 for students with between six months and a year of experience. The mean is 29.68 for students who have more than a year of experience. The two experience groups' levels of social engagement are not significantly different, as indicated by the t-value of -1.390 and the p-value of 0.167 ($p > 0.05$).

- **Total MOOC Participation** The mean is 148.10 for students with between six months and a year of experience. The mean is 166.77 for students who have more than a year of experience. There is a substantial difference in the overall MOOCs engagement, as indicated by the t-value of -2.760 and the p-value of 0.007 ($p < 0.05$). Experienced students show higher levels of overall involvement.

The t-test results indicate that students with varying degrees of previous MOOC experience exhibit significant differences in the behavioral, emotional, cognitive, and overall MOOCs Engagement aspects. The p-values for these dimensions are all below 0.05, indicating that students with more than 1 year of experience exhibit significantly higher engagement in these areas compared to students with less experience. However, Social Engagement does not show a statistically significant difference ($p = 0.167$), suggesting that prior experience does not significantly impact social engagement. For behavioral, cognitive, emotional, social and overall MOOCs engagement, lead to reject the null hypothesis (H_04) since prior MOOC experience strongly influences these characteristics. But in the case of social engagement, unable to reject the null hypothesis, suggesting that there is no discernible variation in this dimension according to previous MOOC experience

RESULTS AND DISCUSSION

The study disproves the null hypothesis (H_0) about low engagement levels by showing that Gen Z postgraduate students in Northeast India demonstrate moderate to high levels of interest across all MOOC parameters. When it comes to behavioral, cognitive, and social involvement, female students regularly outperform their male counterparts; there is no discernible difference in emotional engagement. Furthermore, students who have completed more than a year of MOOCs demonstrate higher levels of involvement in behavioral, emotional, cognitive, and overall domains; social engagement is not impacted by previous MOOC experience. The results challenge preconceived notions about low participation rates by indicating that Gen Z Gen Z postgraduate students in Northeast India are successfully interacting with MOOCs (Hew & Cheung, 2021). Female students' proactive attitude to learning may be the reason for their higher levels of engagement, which is consistent with other research showing that women are more likely to be engaged in educational environments (Meyer et al., 2020).

Moreover, the affirmative association observed between previous participation in MOOCs and engagement levels underscores the significance of being acquainted with online learning platforms for augmenting student involvement (Alraimi et al., 2020). The absence of discernible variance in social engagement, however, raises the possibility that, although experience may have an impact on individual learning, alternative approaches may be needed for the

collaborative components of MOOCs in order to encourage participation from all participants. The findings suggest that Gen Z Gen Z postgraduate students in Northeast India are effectively engaging with MOOCs, challenging previous assumptions of low participation levels (Hew & Cheung, 2021). The moderate to high engagement levels across behavioral, cognitive, and social dimensions reflect the active involvement of these learners, supporting the argument made by Sharif and Ramakrishnan (2023) regarding the importance of critical engagement measures in enhancing course materials. The consistently higher engagement levels among female students could be attributed to their proactive approach to learning, which aligns with previous research indicating that women tend to be more engaged in educational settings (Meyer et al., 2020). This is echoed by Ogunyemi et al. (2022), who identify key metrics for raising engagement that could be utilized to further support female participation in MOOCs.

Furthermore, the positive correlation between prior MOOC experience and engagement levels highlights the importance of familiarity with online learning platforms in enhancing student participation (Alraimi et al., 2020). This finding aligns with the work of Lee and Song (2022), who emphasize the role of academic self-efficacy in promoting learning perseverance, suggesting that experience plays a crucial role in shaping students' confidence and willingness to engage with MOOCs. However, the lack of significant variation in social engagement suggests that while individual learning may be affected by experience, the collaborative aspects of MOOCs might require different strategies to foster engagement among all students. As such, future research should explore targeted strategies to enhance social interaction within MOOCs, ensuring that all learners, regardless of prior experience, can benefit from collaborative learning opportunities.

The results convincingly refute the null hypothesis regarding low engagement levels, showing that a considerable majority of participants demonstrate moderate to high levels of engagement across all categories. There were gender variations that became apparent: while there was no discernible difference in emotional engagement, female students consistently showed higher levels of behavioral, cognitive, and social engagement than their male counterparts. Furthermore, previous MOOC experience had a substantial impact on behavioral, emotional, cognitive, and total engagement; students who had completed more than a year of MOOCs showed higher levels of involvement. But prior experience had no effect on social involvement. These findings cast doubt on preconceived notions regarding student involvement in MOOCs and highlight the need to put collaborative engagement tactics into practice, especially for male students and those with less MOOC experience. In addition to adding to the expanding body of research on MOOC engagement, this study provides useful advice for instructors and course designers who want to maximize student participation in virtual learning settings.

CONCLUSION

This study offers insightful information about how Gen Z postgraduate students in Northeast India are using MOOCs. Contrary to the idea of poor participation, the results show that these kids demonstrate moderate to high engagement across a range of parameters. Gender disparities are noticeable, as female students exhibit higher levels of behavioral, cognitive, and social involvement, but not emotional engagement. Furthermore, prior exposure to MOOCs improves engagement in behavioral, emotional, cognitive, and overall domains greatly, highlighting the significance of becoming comfortable with online learning environments. Overall, the findings highlight MOOCs' potential as useful teaching resources in higher education and call for more research into the variables affecting students' participation and engagement in online learning settings.

CONFLICT OF INTEREST

The authors have no conflicts of interest.

ACKNOWLEDGMENTS

I extend my sincere gratitude to Mr. Sasikumar for his invaluable guidance and mentorship throughout this research. Special thanks to Ms. Juli Saikia for her support. I am deeply appreciative of all the students who participated in this study, whose contributions made this research possible.

ABSTRACT

In Ayurveda, the concept of health extends beyond the mere absence of disease to encompass a balanced state of body, mind, and spirit. Among the numerous dietary elements that support this balance, Takra (buttermilk) holds a distinguished place. It is referred to as "Nectar on Earth" in *Bhav Prakash Samhita* due to its profound therapeutic properties. Takra, a humble yet powerful Ayurvedic preparation, exemplifies the holistic approach of Ayurveda. Its ability to balance Doshas, enhance digestion, and promote overall wellness makes it a cornerstone of Ayurvedic nutrition.

Keywords: "Nectar on Earth", *Bhav Prakash Samhita,* Agnimandya.

INTRODUCTION

In Ayurveda, the concept of health extends beyond the mere absence of disease to encompass a balanced state of body, mind, and spirit. Among the numerous dietary elements that support this balance, [1]Takra (buttermilk) holds a distinguished place. It is referred to as "Nectar on Earth" in *Bhav Prakash Samhita* due to its profound therapeutic properties. Takra not only aids digestion but also plays a significant role in balancing the Doshas, particularly Vata, and Kapha, contributing to overall vitality and well-being.[4]

The Ayurvedic Philosophy of Takra

Takra is deeply embedded in Ayurveda's holistic approach to health. It is more than a simple dairy product; it is a functional food known for its healing properties:

- **Preparation**: Traditionally, Takra is made by churning curd (yogurt) with water and removing the butter, leaving behind a light, easily digestible liquid. Depending on the intended therapeutic use, it is seasoned with digestive spices like cumin, ginger, black pepper, and rock salt.
- **Qualities (Gunas)**: Takra possesses Laghu (light) and Ushna (warming) properties, which help to balance Kapha and Vata Doshas. It is also considered Madhura (sweet) and slightly Amla (sour) in taste, making it an excellent digestive stimulant.[3]

Therapeutic Benefits of Takra

Digestive Health

Takra is a powerful digestive aid that enhances Agni (digestive fire), which is central to good health in Ayurveda:

- It stimulates digestion and helps in the assimilation of nutrients.
- Takra alleviates Agnimandya (weak digestion) and reduces symptoms like bloating, constipation, and indigestion.
- Regular consumption can help manage conditions like irritable bowel syndrome (IBS) and Acid Reflux.[6]

Probiotic and Gut Health

Takra is rich in probiotics, which support a healthy gut microbiome:

- It replenishes beneficial bacteria in the gut, promoting intestinal health and boosting immunity.
- A healthy gut is linked to improved mood and cognitive functions, supporting Ayurveda's belief in the gut-mind connection.[7]

Detoxification and Cleansing[6]

Takra helps detoxify the body by aiding in digestion and elimination:

- It flushes out toxins (Ama) and supports liver function, enhancing the body's natural detox mechanisms.
- Takra is also recommended in Panchakarma therapies for its cleansing properties.[6]

Weight Management[6]

Due to its light and easily digestible nature, Takra is ideal for managing weight:

- It reduces Kapha-related heaviness and water retention, promoting a balanced metabolism.
- Its low-calorie profile makes it a nutritious option for those looking to maintain or reduce weight.

Management of Vata and Kapha Disorders

- Takra is particularly effective in balancing Vata, reducing symptoms like anxiety, dry skin, and joint pain.
- It also pacifies Kapha, helping to manage conditions like congestion, sluggishness, and obesity.

Seasonal and Daily Use of Takra[1]

Ritucharya (Seasonal Regimen)

In Ayurveda, food and lifestyle should change with the seasons to maintain balance:

- **Winter (Shishira and Hemanta Ritu)**: Takra's warming and digestive-enhancing properties make it especially beneficial in winter, countering the cold and dryness associated with this season.

Dinacharya (Daily Routine)[3]

Takra can be incorporated into daily life to maintain digestive health and vitality:

- **Morning Use**: A small glass of Takra with a pinch of rock salt and cumin powder can stimulate digestion.
- **Post-Meal Use**: Consuming Takra after meals aids digestion and prevents heaviness.
- **Therapeutic Use**: In conditions like diarrhea or IBS, Takra can be mixed with herbs like **Haritaki** or **Bilva** for added benefits.

Takra in Ayurvedic Texts

Takra's importance is highlighted in several classical texts:

- **Charaka Samhita**: It mentions Takra as a part of Pathya (wholesome diet), emphasizing its role in treating digestive disorders.[1]
- **Sushruta Samhita**: Takra is recommended for conditions like hemorrhoids and diarrhea, showcasing its therapeutic versatility.[2]
- **Bhav Prakash Samhita**: This text glorifies Takra as a nectar that rejuvenates and nourishes the body.[4]

Spiritual and Psychological Impact

Ayurveda emphasizes the interconnectedness of body, mind, and spirit:

- **Mind-Body Balance**: A healthy gut, supported by Takra, contributes to mental clarity and emotional stability.
- **Spiritual Well-being**: By promoting physical health and mental clarity, Takra supports spiritual practices like meditation and mindfulness. Ayurveda recognizes that a well-nourished body and a balanced mind are essential for spiritual growth.[7]

CONCLUSION

Takra, a humble yet powerful Ayurvedic preparation, exemplifies the holistic approach of Ayurveda. Its ability to balance Doshas, enhance digestion, and promote overall wellness makes it a cornerstone of Ayurvedic nutrition. Incorporating Takra into daily life can lead to profound health benefits, supporting the pursuit of harmony between body, mind, and spirit. As modern science continues to validate the therapeutic properties of probiotics and fermented foods, Takra stands out as a timeless remedy that bridges ancient wisdom and contemporary health practices.[4]

ABSTRACT **Uma Shankari and Rethinavalli**

This investigation investigates the incorporation of deep learning methodologies within cloud service providers (CSPs) to enhance cybersecurity protocols, specifically focussing on mitigating leech attacks and safeguarding data storage and management. The survey thoroughly examines multiple facets of this intricate field, including the utilisation of deep learning models and approaches to mitigate cyber security risks and issues related to CSPs. Data de-duplication is a recognised method for removing redundant data, with the objective of conserving storage capacity and improving upload bandwidth, especially in cloud storage systems. This method has several risks, including the risk of a Cloud Service Provider (CSP) altering user data or coercing users into paying for the storage of redundant data that is kept only once. This survey explores the convergence of deep learning, cybersecurity, and data management with data de-duplication, highlighting innovative ways to mitigate security issues and improve the efficiency of data storage and retrieval in cloud environments.

Keywords: Cloud Service Provider, Data De-Duplication, Cyber Security, Data Maintenance, Deep Learning

INTRODUCTION

This survey rigorously evaluates the publication "VeriDedup: Verifiable Data De-duplication Scheme with Data Integrity Duplication Proof," authored by Yu Xixun, Bai Hui, and Yan Zheng. The study presents the VeriDedup scheme, which prioritises data de-duplication in cloud storage systems, while underscoring data integrity and verification of duplication. An extensive examination of the paper [1] follows. The VeriDedup survey commences with an overview of the VeriDedup program. The paper presents the motivation and problem description concerning the necessity for effective data de-duplication while maintaining data integrity and providing proof of duplication. This encompasses an examination of the innovative attributes and advancements introduced by VeriDedup, including the implementation of a Tag-flexible De-duplication-supported Integrity Check Protocol (TDICP) and a User Determined Duplication Check Protocol (UDDCP).

The Private Information Retrieval (PIR) survey examines the application of Private Information Retrieval as a core principle in VeriDedup, elucidating its role in enhancing data security and privacy throughout the de-duplication process [2]. The study primarily focusses on ensuring data integrity and verification of de-duplication. The survey examines how VeriDedup does accurate duplicate checks and secure data maintenance. The Tag Generation and Flexibility study investigates the novel "note set" concept presented in VeriDedup, enabling numerous users to create their distinct verification tags. It elucidates how this improves data security and adaptability. The examination of security and privacy concerns, particularly with cloud storage, is emphasised. The survey examines the measures implemented to safeguard user data from manipulation and unauthorised access.

The Practical Implications survey examines the practical ramifications of the VeriDedup scheme, highlighting its prospective applications and benefits in actual cloud storage contexts. The survey evaluates the influence of VeriDedup on the domains of data de-duplication, data security, and cloud storage, emphasising its advancement of the current standards in these fields [3]. The report summarises major findings and contributions while proposing potential future research and development initiatives in data de-duplication and data security. A comprehensive examination of the paper "De: Verifiable Data De-duplication Scheme with Data Integrity Duplication Proof," published in IEEE. It examines the technological advancements, security protocols, and practical ramifications of the VeriDedup scheme, highlighting its importance in data de-duplication and cloud storage security.

Applications of Deep Learning in Cyber Security A design for a parallel content-defined chunking system utilising non-hashing algorithms on FPGA, authored by H. Vuong, H. Nguyen, and L. Tran et al. AI introduces an innovative methodology for content-defined chunking in data processing and hardware acceleration [4]. This study arises from an escalating necessity to effectively handle and process extensive data volumes, a difficulty that has gotten more pronounced in the digital era. Content-defined chunking, an essential process in data storage and transmission, is a pivotal factor in tackling this difficulty. The novel application of non-hashing techniques in the chunking process marks a break from traditional hashing-based methods. These non-hashing algorithms provide unique benefits, enhancing efficiency and performance. The authors have utilised Field-Programmable Gate Arrays (FPGAs) to create their content-defined chunking system, thereby introducing a hardware-accelerated aspect to the process. The FPGA architecture, recognised for its adaptability and parallel processing skills, is crucial in improving the system's overall performance and efficiency.

This study notably emphasises parallel processing. The research enhances data processing speeds and throughput by parallelising the content-defined chunking method on FPGA, which is essential for successfully managing huge datasets. The implementation of parallelism highlights the system's ability to meet the requirements of contemporary data processing [5]. A comprehensive performance assessment, providing empirical evidence of the system's capabilities, validates the efficacy of the non-hashing algorithms, FPGA-based implementation, and parallel processing approaches utilised. The analysis includes essential parameters, such as data processing speed and resource utilisation, offering a thorough evaluation of the system's performance.

The research presents numerous practical applications, as the content-defined chunking method can be incorporated into diverse real-world contexts where fast data processing and management are essential. The ramifications encompass data storage, data transport, and more, with the potential to improve the efficiency and performance of data processing systems [6]. This review substantially advances the domain of hardware-accelerated data processing by presenting a fresh perspective on content-defined chunking and proposing innovative methodologies that can enhance various applications. The research employs non-hashing algorithms, utilises FPGA technology, and adopts parallelism, so addressing present obstacles and establishing a platform for future advancements in this field. This essay emphasises the significance of innovative solutions and hardware acceleration in navigating the burgeoning realm of data, paving the way for continued study and progress in this vital domain of data processing.

The research article "Accelerating ML/DL Applications with Hierarchical Caching on De-duplication Storage Clusters," authored by Prince Hamandawana, Awais Khan, Jongik Kim, and Tae-Sun Chung, introduces a novel method to enhance Machine Learning (ML) and Deep Learning (DL) applications via hierarchical caching in de-duplication storage clusters [7]. A thorough examination of the research: The survey initiates by delineating the setting and rationale for the study. It clarifies the essential function of machine learning and deep learning in contemporary data analytics and the increasing demand for effective data storage and retrieval systems that can accommodate these applications. The impetus for expediting machine learning and deep learning using hierarchical caching is underscored, due to their computationally demanding characteristics.

De-duplication storage clusters largely concentrate on the process of de-duplication within storage systems. De-duplication is a data compression method that removes redundant information, resulting in considerable savings in storage and bandwidth. The report delineates the benefits of de-duplication and its significance in contemporary data management. The fundamental principle of hierarchical caching is examined comprehensively. This caching approach employs numerous cache layers to enhance data access and retrieval efficiency. The survey examines how hierarchical caching can improve the efficiency of machine learning and deep learning systems by facilitating efficient and rapid access to frequently utilised material. The primary aim of the research, namely the acceleration of machine learning and deep learning applications, is examined. The survey evaluates the influence of hierarchical caching on the velocity and efficacy of various apps, resulting in diminished latency and enhanced user experiences. The technological implementation of the article is examined. The survey elucidates the design and implementation of the hierarchical caching system within de-duplication storage clusters, encompassing the architecture and techniques employed.

The survey examines the experimental findings detailed in the study, concentrating on performance indicators including speed, latency, and resource utilisation. It underscores the actual evidence supporting the efficacy of the proposed methodology in expediting machine learning and deep learning applications [8]. The practical implications of the research indicate that the installation of hierarchical caching in deduplication storage clusters can be utilised in real-world scenarios, enhancing data-intensive applications across multiple industries. The paper's contributions to data management and machine learning/deep learning acceleration are assessed. The survey highlights the importance of the research in optimising data access and retrieval for computationally demanding applications. The study finishes by summarising the principal findings and contributions of the work and proposes prospective research avenues concerning hierarchical caching, de-duplication, and ML/DL acceleration, providing insights into the advancing domain of data storage and processing.

This survey offers a thorough analysis of the research work "Accelerating ML/DL Applications with Hierarchical Caching on De-duplication Storage Clusters," published in the IEEE Transactions on Big Data. It examines the novel application of hierarchical caching in de-duplication storage clusters and its substantial influence on the enhancement of machine learning and deep learning applications, highlighting its significance within contemporary

data analytics and storage solutions. The research's contributions and prospective applications are emphasised, providing a framework for future advancements in this vital domain of data management and acceleration [9].

Ensuring Secure Data Management This survey provides a thorough examination of the research paper "LOFS: A Lightweight Online File Storage Strategy for Effective Data De-duplication at Network Edge," authored by Geyao Cheng, Deke Guo, Lailong Luo, Junxu Xia, and Siyuan Gu, published in IEEE Transactions on Parallel and Distributed Systems in 2021. The study examines a novel method, "LOFS," aimed at improving data de-duplication at the network edge, particularly emphasising lightweight online file storage techniques. In the contemporary data environment, effective data de-duplication is critically significant, especially at the network periphery. This setting is defined by resource constraints and the necessity for efficient data handling. This research is motivated by the growing significance of edge computing, which requires data de-duplication solutions designed to optimise storage utilisation, minimise data transmission expenses, and enhance network bandwidth efficiency.

MATERIALS AND METHODS

This research centres on the "LOFS" method, which denotes "Lightweight Online File Storage." LOFS seeks to tackle the specific issues posed by network edge environments by offering a lightweight, online file storage solution proficient in data de-duplication. LOFS, due to its lightweight nature, enables efficient data de-duplication on resource-constrained edge devices. Moreover, the digital aspect of this technique facilitates instantaneous file storage, retrieval, and de-duplication, corresponding with the evolving requirements of edge computing [10]. The primary aim of the research is to improve the efficiency of data de-duplication at the network interface. This is accomplished by the adoption of LOFS, leading to diminished storage overhead, enhanced data transmission efficiency, and optimized utilisation of network capacity. The researchers intend to formulate a technique that addresses the unique limitations and needs of edge computing, enabling edge devices to execute data de-duplication efficiently, hence enhancing the overall efficacy and performance of edge computing systems.

The technological execution of LOFS is a pivotal element of the research. The survey examines the architecture and algorithms utilised in the LOFS method, elucidating the processes developed to guarantee efficient data de-duplication. This technical analysis offers a comprehensive grasp of how LOFS attains its objectives and its applicability in practical edge computing contexts [11]. The empirical validation of the research is significant, as the paper provides experimental data and performance assessments. The results illustrate the efficacy of the LOFS technique by highlighting enhanced de-duplication ratios, storage efficiency, and data transmission speeds. This empirical research validates the assertions of LOFS's efficacy in enhancing data management at the network edge.

The survey examines the practical ramifications of the LOFS strategy. It examines the applicability of lightweight, online file storage techniques in many real-world edge computing applications and sectors. This research emphasises the advantages of effective data de-duplication, diminished storage expenses, and enhanced network performance. The contributions of the survey paper to the domains of network edge computing and data de-duplication are significant. The LOFS technique offers a novel solution to the complexities of data management and optimisation at the network edge. It provides a framework for future advancements in lightweight online file storage methods, data de-duplication, and network edge computing, hence enhancing data management and optimisation in edge computing settings [12].

RESULT AND DISCUSSION

This survey provides a comprehensive examination of the research paper "A Secure Privacy Preserving De-duplication Scheme for Cloud Computing," authored by Yongkai Fan, Xiaodong Lin, Wei Liang, Gang Tan, and

Priyadarsi Nanda, which addresses the urgent necessity for effective data de-duplication in cloud computing, where extensive data is managed, while concurrently emphasising data security and privacy [13]. This research is motivated by the increasing need of maintaining data secrecy and protecting sensitive information in the cloud. Cloud computing and data de-duplication are intrinsically linked, as data de-duplication is an essential method in the cloud for removing redundant data, hence decreasing storage and bandwidth expenses. The report underscores the rising problem of maintaining data privacy and security during de-duplication operations. This study's central concept focusses on secure privacy-preserving de-duplication, highlighting methods and procedures that protect sensitive data and uphold confidentiality. It presents innovative privacy-preserving techniques to maintain data confidentiality while facilitating de-duplication.

In cloud computing, data security and privacy are crucial, especially given the severe data protection legislation and the heightened emphasis on preventing data breaches. This research substantially addresses these issues by providing a solution for secure and private data management in cloud computing settings. The technological execution of the suggested scheme is a primary emphasis, with the survey examining the architectural design, cryptographic techniques, and algorithms utilised to establish a secure and efficient de-duplication process. The empirical validation of this study is a significant element, as the report provides experimental data that demonstrate the efficacy of the proposed approach. The results illustrate effective data de-duplication, data confidentiality, and computing overhead, underscoring the viability of reconciling data security with de-duplication efficiency. This finding has significant consequences, especially in sectors where data privacy and regulatory compliance are critical. The domains of cloud computing and data privacy are crucial. It achieves a compromise between the efficiency of data de-duplication and the standards for data security and privacy. The survey highlights the significance of the research in tackling the intricate issues associated with data de-duplication in the cloud, presenting a promising avenue for future enquiries and implementations in data management and protection within cloud computing contexts.

CONCLUSION

The aggregated analyses of the research articles reviewed underscore the dynamic and ever evolving environment of deep learning and security within computer science. This research encompasses revolutionary data de-duplication techniques and secure privacy-preserving methods in cloud computing, collectively tackling current difficulties and opportunities in data processing and storage systems. Although each research concentrates on specific facets of data management, they collectively uphold a shared dedication to the advancement of the discipline. These surveys provide significant insights, highlight the necessity of security, privacy, and efficiency in data management, and outline a framework for future research trajectories in this dynamic field.

ABSTRACT

The main aim of present study is to formulate Telmisartan microemulsion for oral delivery. Microemulsions were prepared by means of Oleic acid and caster oil as oils, tween 80 as surfactant and propylene glycol and polyethylene glycolas cosurfactants for oral delivery of antihypertensive drug Telmisartan using pseudo ternary phase diagram. Total nineteen formulations were prepared. Out of nineteen formulations, oleic acid formulations were thirteen and six castor oil formulations were formulated and evaluated the parameters like percentage drug content, invitro dissolution, pH, perecentage transmittance, particle size, poly dispersibility index, zeta potencial, centrifugation, FTIR and stability studies. Data from the dissolution study, the F4 and F17 formulations showed maxium amount of drug release (>90%) indicating enhanced the dissolution and drug release when compared to pure telmisartan. These two F4 and F17 formulations were subjected to pH, percentage transmittnce, particle size and PDI. The results from centrifugation studies the F4 formulation showed no phase separation after centrifugation. Hence the F4 formulation is considered as optimised which contains oleic acid as 9 ml, Tween 80 6ml, propylene glycol 3ml and water 1ml. This F4 formulation is subjectesd to IR identification, stability studies and release kinetics.

Results from this study showed that the formulated microemulsion F4 is considered as potential novel drug delivery systems for oral intake.

Keywords: Microemulsion, Oral delivery, Telmisartan, Pseudo-Ternary phase diagram, oral delivery.

Abbreviations:

ml: milliliter; UV: Ultra Violet; nm: nano meter; rpm: revolutions per minute; NIBS: Non invasive back scatter optics; cm^{-1}: centimeter inverse; HLB: Hydrophilic lipophilic balance; mcg/ml: microgram per milliliter; PDI: Polydispersability index; FTIR: Fourier transform infra red spectroscopy; IR: Infra red; °C: degree centigrade; Mn/Mw: ratio of molecular mass average to the number of molecular mass average; HCl: Hydrochloric acid.

INTRODUCTION

Microemulsions are pure, thermodynamically constant, and isotropic liquid mixtures of oil, water, and surfactants, frequently incorporating a co-surfactant (Ghosh PK *et al.,* 2006). In these three-component systems (ternary systems), two immiscible liquids (water, oil) coexist with a surfactant. The surfactant molecules arrange themselves at the interface among the oil and water, with their water-repelling tails dissolved in the oil phase and water-attracting heads facing the aqueous phase (Singh PK *et al.,* 2014). Adjusting the drug's physicochemical properties, such as converting it to a salt or reducing particle size, can improve its dissolution rate. However, formulating new drugs as oral liquids presents similar challenges as existing ones. Simple solutions might not work due to limitations like poor mixability or instability. In such cases, scientists turn to formulations like emulsions, suspensions, and colloidal systems. Microemulsions are a novel approach for formulating oral delivery systems (Wienen W *et al.,* 1993). Microemulsions have the potential to progress the oral bioavailability of drugs compared to conventional formulations (reference source here). By reducing the droplet size (typically within the range of 20-200nm) and inducing permeability changes through surfactants, microemulsions can enhance drug absorption and bioavailability Delivering drugs effectively through the mouth (oral route) remains a significant challenge for researchers (Betcher P *et al.,* 1996). Nearly 40% of promising new drug candidates have poor water solubility, making oral administration difficult and leading to lower bioavailability (the amount of drug absorbed into the body). Scientists have explored numerous approaches to improve the oral bioavailability of these poorly solvable drugs. These techniques include reducing particle size (micronization or nanosizing), complexing with cyclodextrins, creating salts, and using co-solvents and surfactants to improve solubility (Betcher P *et al.,* 1996).

MATERIALS AND METHODS

Telmisartan was kindly provided as a gift sample from Mars Pharma Private Limited, Hyderabad, India, Oleic acid, Castor oil,Propylene glycol, Polyethylene glycol and Tween 80 was purchased from SD Fine Chem Limited, Hyderabad, India. Analytical grade chemicals and distilled water were used during experimental studies.

Construction of terinary phase diagram

The ternary phase diagrams were made to identify the microemulsion region for the two systems, which included different combinations of oil, water, surfactant, cosurfactant, and Telmisartan. In each system, the concentration of surfactant and cosurfactant was varied at certain weight ratios, and the mixtures were titrated with water (John F *et al.,* 2006). The resulting solutions were visually seen for phase clarity, flow ability to identify the microemulsion area in the phase diagram. (Lavanya N *et al.,* 2016). Once the microemulsion region was identified, the compositions were selected based on a desired component ratio, and the microemulsion was prepared by addition of the weighed components together and stirring to form a clear solution. The drug-loaded microemulsion was formulated by

adding the drug in oily phase and then mixing together all the other components. The oil and water ratio was varied from 90:10 to 10:90 in both systems, and the phase diagrams were constructed based on the percentage weight by weight (w/w) of all the components (Chndra A *et al.,* 2008). The phase diagram determined the regions of microemulsion formation, which allowed the selection of appropriate microemulsion compositions for further studies.

Preparation of Telmisartan Microemulsion

The methodology for preparing Telmisartan microemulsion involves the selection of fixed ratios of water, oil, surfactant, and cosurfactant to optimize a suitable formulation. Water-soluble ingredients are dissolved if necessary with the aid of heat. The aqueous phase, surfactant, and oil phase are mixed in a container using an emulsifying technique, either with a homogenizer or ultrasound. The resulting mixture is then titrated dropwise with a solution of cosurfactant until a clear microemulsion is obtained (Phaechamud T *et al.,* 2012). This process is also known as the cosurfactant titration method or spontaneous emulsification method.

Microemulsion characterization

Appearance

Microemulsions are visually checked for color and clarity.

Percentage drug content

The drug content percentage of the microemulsion formulation is determined by dissolving 1 ml of the microemulsion in 10 ml of methanol. The resulting solution is then diluted with methanol as needed, and measured the absorbance using a UV spectrophotometer (UV 1700, Shimadzu, Japan) at 276 nm wavelength. A blank microemulsion is used as a control during the analysis. This procedure is described in reference (Santosh KN *et al.,* 2016).

***In vitro* dissolution studies**

The in vitro dissolution study of Telmisartan from the microemulsion was carried out using the dialysis bag method. Dialysis cellophane bags were first soaked in water for 24 hours. Then, 5 ml of each sample was taken and transferred to the dialysis bag and dialyzed with 100 mlof 0.1 N hydrochloric acid for the period of 2 hours. Afterward, the 0.1 N HCl was replaced with a phosphate buffer of pH 6.8 in a beaker. Additionally, 0.5% of tween 80 was added to facilitate the diffusion of Telmisartan. Blank microemulsion dissolution was also carried out in a similar manner. The buffer was maintained at a temperature of 37 °C under a stirring speed of 50 rpm. Samples were taken at predetermined time intervals of 0.25, 0.5, 1, 2, 4, 6, 8, 10, 12, and 24 hours. After withdrawal of each sample, an equal volume of fresh buffer pH 6.8 was added to maintain a constant volume. The absorbance of each sample collected was noted at 276 nm using UV-Visible spectrophotometer. (Ghosh PK *et al.,* 2006)

pH determination

The pH measurement of the formulations was carried out three times using a calibrated digital pH meter (Pico+ Lab India, Mumbai, India) at room temperature. A glass electrode was used to measure the pH at 25 ± 1°C.

Percentage transmittance

To determine the transparency of the prepared microemulsion formulations, the percentage transmittance at 560 nm was measured by using a UV-Visible spectrophotometer (UV 1700, Shimadzu, Japan) with distilled water as the blank.

Particlesize, Poly dispersity index and Zetapotential measurement

Measurements were made at 25 °C on a Zetasizer Nano ZS instrument. The instrument comprises of a 4mW He-Ne laser operating at wavelength of 633 nanometers. It includes non-invasive backscatter optics (NIBS), and the measurements were detected at an angle of 173°. The homogeneity of a polymer is determined by measuring polydispersity index (PDI), which is the ratio of molecular mass average to the number of molecular mass average.

PDI=Mn/Mw.
PDI value generally ranges from 0 to 1. Values less than 0.3 indicate monodisperse, the values from 0.3 to 0.7 indicate medium disperse, and the values 0.7 to 1 indicate heterodisperse. Polydispersity index is measured using Malvern Zetasizer Nano ZS equipment (Malvern Analytical Ltd., Malvern, UK).

Centrifugation
In order to remove metastable systems and ensure stability, both the selected microemulsion vehicles and drug-loaded microemulsions were subjected to centrifugation at 4000 rpm for 30 minutes using a Research Centrifuge (R-24, Remi Instruments Limited, Mumbai). The centrifugation process helped to separate any unstable or insoluble components from the microemulsion formulations, improving the overall quality and consistency of the samples.

FTIR spectroscopy
To assess the compatibility between the drug and excipients, FT-IR studies were performed on both the blank microemulsion, telmisartan microemulsion, and telmisartan pure drug. The FT-IR spectra were analyzed for characteristic bands using a Bruker-AlphaT FTIR spectrophotometer, with wavenumber range between 400 to 4000 $cm^{-1}$and a resolution of 1 cm^{-1}. The resulting spectra were compared to identify any significant differences in the molecular vibrations of the drug and excipient components, which could impact the stability and efficacy of the microemulsion formulation.

Stability studies
The stability of the optimized telmisartan microemulsions was assessed in accordance with the International Conference on Harmonisation (ICH) guidelines, at a constant temperature of 37°C ± 2°C for a period of three months. The microemulsion formulations were analyzed periodically, including immediately after preparation and at monthly intervals up to the third month, to detect any signs of phase separation and to measure the percent transmittance.

RESULTS

Oleic acid and castor oil were chosen as lipophilic permeation enhancers to enhance the permeability of the microemulsion. In addition, Tween 80, a commonly used hydrophilic non-ionic surfactant with 15 an HLB value, was included as an excipient in the pharmaceutical formulation. Propylene glycol and polyethylene glycol were also used as cosurfactants.

Pseudo ternary phase diagram
A pseudo-ternary phase diagram was built to determine the appropriate compositions of the oil phase, aqueous phase, surfactant, and cosurfactant required to form a microemulsion. Among the various microemulsion formulations prepared from System I and II, the formulation that was clear was selected as the optimized formulation. Figure 1 and 2 show the phase diagrams of System I and System II, respectively. Figure 3 shows photographs of the prepared microemulsions containing oleic acid and castor oil. The black shaded region inside the diagram represents the area of the microemulsion. In the phase diagram, a larger shaded area of microemulsion is observed in the ternary phase diagram for the oleic acid combinations compared to the castor oil combinations of microemulsion formulations. Selecting points in this region yields different microemulsions. Areas outside of the shaded region do not yield microemulsions. Formulation I contains Oleic acid combinations F1 to F13, and Formulation II contains castor oil combinations of microemulsion formulations F14 to F19, as shown in Table 1 and Table 2.

Calibration curve of Telmisartanin 0.1N HCl and Phosphate buffer pH 6.8
The standard Telmisartan drug was taken, and necessary dilutions further were made to obtain concentrations ranging from 2-10 mcg/ml in 0.1 N HCl and pH6.8 phosphate buffer. The absorbances of the respective solutions

were recorded at 276 nm, and the corresponding calibration curves of Telmisartan were shown in Figures 3 and 4, respectively.

***In vitro* dissolution studies**

In vitro dissolution studies were conducted for all formulations and are shown in Tables 3 and 4. The percentage of drug release versus time curves of Telmisartan microemulsion formulations F1-F19 are shown in Figures 5 and 6, respectively. Out of the 19 microemulsion formulations, F4 and F17 showed a percentage release of the drug. The F4 formulation showed 92.6±7.8% and F17 showed 96±8.3% at the end of 12 hours, indicating sustained release of the drug for more than 12 hours. Based on the percentage drug release, Formulations F4 and F17 were further characterized. The Oleic acid-based microemulsions were pale yellowish in colour, whereas the castor oil-based microemulsions were pale brown in colour, as shown in Fig. 7. However, all microemulsion formulations F1 to F19 were clear.

pH Determination

pH of the optimized formulation F4, F17 are illustrated in the Table 5. All the optimised formulations have pH similar to the pH of water. This shows that the prepared formulation suitable for oral delivery.

Percentage Transmittance

Transmittance percentage of the optimized formulations were measured at 560nm and was shown in Table 6. This is one of the most significant parameter to be evaluated for microemulsion formulations. Both the optimised formulations were transparent and clear similar to purified water.

Particle size and Polydispersity index determination

Polydispersity index (PDI) is a measurement of the uniformity of particle size distribution in a sample. A PDI value of less than 0.3 indicates a monodisperse distribution, which means that most of the particles in the sample have a similar size. This is desirable in drug delivery applications as it ensures that the drug is uniformly dispersed and delivered in a consistent manner. The small particle size of F4 and F17 formulations also indicates the formation of microemulsions, which can improve drug delivery and absorption. The particle size of microemulsions varied from about 10nm to 300 nm. Due to the small globule size, microemulsions appear as clear (pure) or translucent solutions. Results of particle size distribution revealed that both F4 and F17 microemulsion formulations have particle size <100 nm. This confirms the formation of microemulsion. Polydispersity index values for both the formulations are < 0.3, which indicates that the prepared microemulsions are monodisperse. Such microemulsions are acceptable in drug delivery applications.

Centrifugation

The F4 and F17 formulations were centrifuged at 4000 rpm for 4 hours. After 30 minutes, no phase separation or turbidity was observed in the F4 formulation. Formulation F4, which was prepared using a combination of oleic acid, was stable without separation. However, formulation F17, which was prepared using castor oil, separated into two phases. Based on centrifugation studies, the castor oil formulation (F17) was considered unstable. The F4 formulation was chosen as the optimized microemulsion formulation and was subjected to IR identification, stability studies, and release kinetics.

FTIR spectroscopy

The FTIR spectra confirms that there was no interaction between the drug and excipients of the formulationthat was revealed in Fig.10 and Fig.11.

Stability studies

Stability studies for the optimized formulation F4 were performed at room temperature for 3 months. Samples were analyzed immediately after preparation and every month for up to three months to test for phase separation and percentage transmittance, which were revealed in Table 9.

Release kinetics

To determine the kinetics of drug release, the drug release data of the optimized formulation F4 was analyzed, and rate constants for zero order, first order, Higuchi, and Peppas were obtained and are reported in Table 10. The release of the drug from formulation F4 follows zero order kinetics as seen from the r^2 values. The Koresmeyer peppas plot also has shown a reasonable r^2 value. The n value of korsmeyer peppas represents the mechanism is non fickian, which is diffusion and dissolution controlled release.

DISCUSSION

The study aimed to prepare and characterize microemulsion formulations of telmisartan using oleic acid and castor oil as oil phases and tween 80, propylene glycol, and polyethylene glycol as surfactant and cosurfactants. Pseudo ternary phase diagrams were constructed, and formulations were formulated using cosurfactant titration method. Calibration curves were prepared, and in vitro dissolution studies were done for all formulations. Based on drug release, formulations F4 and F17 were further characterized, and F4 was selected as the optimized formulation. It was found to be stable without phase separation and exhibited zero-order kinetics and non-Fickian mechanism of drug release. IR interpretation showed no interaction between drug and the excipients, and stability studies showed no change in percentage transmittance. The particle size of F4 microemulsion formulation ranged from 10 to 300 nm, and it had a pH close to neutral, making it suitable for oral delivery. Overall, the study suggests that microemulsion formulations of telmisartan by means of oleic acid as the oil phase and tween 80, propylene glycol, and polyethylene glycol as surfactant and cosurfactants can be effective in drug delivery applications.

CONCLUSION

The study aimed to prepare microemulsions containing oleic acid and castor oil using a pseudo ternary phase diagram. Nineteen formulations were formulated and evaluated, with thirteen containing oleic acid and six containing castor oil. The F4 and F17 formulations were found to have the maximum amount of drug release (>90%), indicating enhanced dissolution and drug release compared to pure telmisartan. The F4 formulation, containing 9 ml of oleic acid, 6 ml of Tween 80, 3 ml of propylene glycol, and 1 ml of water, was considered as optimized based on the results from centrifugation studies, which showed no phase separation after centrifugation. The F4 formulation was subjected to IR identification, stability studies, and release kinetics, and was found to be a potential novel drug delivery system for oral intake. The microemulsion prepared in the study increased the solubility of a high lipophilic drug and offered a significantly increased dissolution rate, which can produce greater absorption rate and bioavailability.

ABSTRACT

Post-stroke spasticity of upper extremity is the predominant complication following stroke which affects approximately 20-40% of stroke survivors. The elbow joint is most commonly affected as compared to other joints. It leads to a limited range of motion, pain, performing activities of daily living becomes limited with a decreased quality of life. The study aimed to compare the differences between dry needling and cupping therapy in addition to conventional physiotherapy for reduction of spasticity of the elbow flexors in sub-acute stroke patients. 26 patients were included in current investigation and divided into two groups. Group A (n=12) received Dry Needling(DN) whereas Group B(n=14) received Cupping Therapy (CT). Furthermore, both groups received conventional physiotherapy treatment for the injured arm. They underwent 8 sessions of DN as well as CT over 4weeks; with each session lasting 45min. Patients were evaluated prior to and following the intervention utilizing Modified Modified Ashworth Scale(MMAS)and Fugl-Meyer Assessment Upper Extremity Scale (FMA-UE). Wilcox on rank sum test had been utilized in determining differences in the result measures ($p<0.05$). Subjects in both groups demonstrated considerable improvement in elbow flexor spasticity post-intervention. However both groups showed the absence of statistically significant difference. However, DN showed more effectiveness in the motor component of the FMA-UE than CT post-intervention. Both DN&CT can be used as intervention strategies to reduce elbow flexor spasticity in post-stroke survivors.

Keywords: Dry needling, cupping therapy, stroke, spasticity, MMAS, Fugl Mayer-UE.

INTRODUCTION

Stroke is a major contributor to long-term impairment since almost two-thirds of survivors experience after-effects like spasticity. [1]It is described as an abrupt localized neurological deficiency due to an anomaly, depending on the part of the brain that is impacted. In India, stroke ranks as the 5th most predominant cause of disability-adjusted life years.[2] A recent systematic review , estimated annual incidence of stroke in India to be between 105 and 152 per 100,000 individuals.[3,4] Aphasia, neglect, sensory loss, discomfort, dysarthria, cognitive deficits, dysphagia, sadness, motor weakness were most prevalent issues resulting from a stroke. [5]Any of these ailments has the potential to seriously harm a person's life. The effects of stroke are profound and long-lasting, with impaired brain function having the greatest impact on the victim.[6] Lance classified spasticity as a motor condition in 1980. He observed it as a facet of UMN syndrome, characterized by a velocity-dependent augmentation of tonic stretch reflexes accompanied by excessive tendon jerks, caused due to neuronal hyper excitability implicated in the stretch reflex.[7] Compared to lower extremities, upper extremities are more commonly affected by spasticity. This geographical predisposition intensifies the impairment of hand and wrist functionality, leading to a postponement in the recuperation of upper limb capabilities. Upper extremities are typically found to be spastic, particularly elbow (79%), wrist(66%), as well as shoulder(58%).[8, 9] Upper-limb spasticity contributes to the progression of articular passive range of motion limitations, ultimately leading to discomfort following a stroke.[10] Severe elbow spasticity significantly impairs daily activities like eating and personal hygiene. [11]Effectively managing elbow spasticity is crucial due to its common occurrence and potential to hinder recovery and functional independence. [12, 13, 14, 15]Dry needling technique (DNT) is a special type of intervention that penetrates the dysfunctional muscle with a thin filiform needle.[16] DN has become more popular over the past decade as a treatment for musculoskeletal discomfort brought on by myofascial trigger points and, to a lesser degree, symptoms associated with stroke recovery.[17,18] The predominant technique, referred to as deep, fast-in and fast-out, entails many needle insertions to elicit numerous local twitch responses that inhibit contractile muscle activity. "The Dry Needling for Hypertonia and Spasticity (DNHS)" is a novel DN methodology employed to diminish spasticity as well as improve functionality in individuals with central nervous system problems.[18,19]CT is a form of intervention where air is suctioned inside a cup that provides negative pressure on the skin and pulls skin into cup without scarification.[20] It is especially applicable in treating aches as well as pains linked to variety of illnesses and involves applying swift, forceful, and rhythmic strokes to activate muscles. Therefore, cupping may improve one's quality of life. [21] Numerous studies have shown positive results inDN and CT for treating elbow flexor spasticity in sub-acute stage of stroke but there are no available studies done in comparing both the techniques. Hencethe research objective was to evaluate the efficacy of DN compared to CT in conjunction with conventional physiotherapy for diminishing elbow flexor spasticity in sub-acute stroke patients.

MATERIALS AND METHODS

The study was conducted in various hospitals and rehabilitation centres of Kamrup Metropolitan City, Guwahati, Assam from January 2024 to June 2024. An experimental pre-post-study design was used. The Institutional and Ethical Committee for Human Research of The Assam Royal Global University approved this research (No: RGU/IEC HR/MPT/2023/05). Participants were screened based on inclusion as well as exclusion criteria. All experimental procedures were explained as well as written informed consent was provided to the included participants. A total of 32 patients aged between 40 to 60 years with sub-acute stroke (1-3 months post-stroke) having spasticity in the elbow flexors quantified by MMAS grade 1-2 were included in the study. Patients with needle phobia, any contraindication to application of DN/CT (fracture, open wound, haemophilia, anaemia), receiving a dose of "Botulinum Toxin A(BTX A)" in previous 2months and those having cognitive or severe language impairment were excluded. Table 1 represents the demographic characteristics of patients. The participants were categorised into 2 groups by a random

chit method: Group A received DN, whereas Group B received CT. Both groups additionally received conventional physiotherapy. MMAS and FMA-UE were used as outcome measures.

Intervention

Patients inDN group were treated with 8 sessions of DN for 4 weeks in the elbow flexors. In a week, 2 days of treatment was given with a gap of 3 days. The DNHS method was practiced utilizing solid filiform disposable needles for DN measuring 0.25 x 25mm as well as 0.25 x 40mm based on the depth of muscle. The application of technique was based on DNHS technique. DNHS procedure was performed with aid of guide tubes after antiseptic skin cleansing. [22] The application intensity was modified based on the patient's tolerance. Insertion of needle was conducted in muscle at a frequency of 1Hz approximately. Local twitch responses were intended to be achieved.

Patients in CT group were given8 sessions of CT for 4 weeks in the elbow flexors. In a week, 2 days of treatment was given with a gap of three days. A suitable sized cup was placed on the elbow flexors and the air inside the cup was manually suctioned. Then the cup was applied to skin and left for a period of 5 minutes.

Conventional Physiotherapy

In both groups exercise training of 5 days a week for a total of 4 weeks was performed. Each session lasted 30-45mins which included repetitive task (grasp and release), dual task, and active range of motion exercises. Patients were instructed to do exercises daily at home for 5 days with the help from the caretaker if necessary as well as twice a week after CT and DN under the supervision of physiotherapist.

Statistical Analysis

The data were computed and analyzed employing "SPSS version 27". All the quantitative variables were tallied after checking for normal distribution within each group. Since the data did not follow normal distribution therefore Wilcoxon paired test was employed to compare the outcome measures between the treatment groups. The level of significance was set at $p<0.05$.

RESULT

The overall mean pre-intervention MMAS score was 1.92 (±0.27). Post intervention it decreased to 1.23 (±0.43). There was no significant difference in improvement of MMAS scores between the two therapies. However, both CT and DN resulted in a reduction in MMAS scores, indicating an improvement in muscle spasticity post-intervention (Table 4). Pre- intervention the mean FMA-UE score was64.6, following the intervention the score increased to 76.7. The p-value for the difference in scores was 0.012, indicating a statistically significant greater improvement in DN group compared to CT group (Table 5).The overall mean pre-intervention motor function score of FMA-UE was 22.9 (±3.6). Post intervention the score increased to 32.1 (±3.9). The overall mean increase in motor function scores from pre- to post-intervention was 9.2 (±5.2). The p-value for the increase in scores was 0.050, indicating a trend towards significance, with DN showing a greater improvement in motor function scores than CT(Table 6).

DISCUSSION

After stroke, patients and physiotherapists face significant obstacles due to muscle stiffness and motor function impairment in affected arm. Stroke–related impairments in motor function of affected arm are challenging to treat, as existing rehabilitation treatments only partially improve the situation. Hence, current investigation aimed to evaluate effectiveness of DN versus CT along with conventional physiotherapy on elbow flexor spasticity in sub-acute stroke patients. The outcome measures included were MMAS as well as FMUE.A total of 26 patients clinically diagnosed with stroke were assessed for spasticity with MMAS grade 1-2. The patients from both groups underwent treatment sessions for 4weeks, 2days per week i.e.; 8 sessions for 45 minutes each session. The analysis demonstrated that both DN as well as CT was useful interventions for those with elbow flexor spasticity where both outcome measures showed improvements, as we discovered. DN which is a beneficial intervention might lead to increase in brain

activity. [23] Previous research primarily focused on treating lower limbs, with few trials examining efficacy of DDN for upper extremities. [24, 25] .Typically, these were case studies or single group studies. [26.27] However, all investigations have focused on chronic stroke patients. Few studies have evaluated the efficacy duringsub-acutephase (<3months),however the outcomes primarily focused on pain [28] In the present study, after 4 weeks of treatment, the MMAS for elbow flexor spasticity reduced from grade 2 to grade 1 in both groups, however the reduction was not significant. The FMUE scale scores showed significant improvements between groups, however, the motor function score showed statistical improvement in both groups. DN alters the integrity of local soft tissues and muscle fibers, resulting in less resistance. DN therapy, combined with conventional physiotherapy, is also likely to improve voluntary motions in the affected arm. This may explain the improvement in associated muscle spasticity. Although the exact mechanism behind spasticity alterations following deep DN remains unknown, various possibilities have been postulated. Deep DN may cause alterations in spasticity due to intrinsic adjustments in spastic muscles. Thus, DN can elongate contracted cytoskeletal structures, diminishing the overlap between act in and myosin filaments. This idea is corroborated by a case study indicating that DN can enhance muscle stiffness in patients with post-stroke spasticity. [29]An alternate idea posits that DN may influence synaptic transmission from muscle afferents to spinal cord neurons, hence diminishing the excitability of spinal reflexes associated with muscle stiffness. This idea may be associated with the local twitch responses (LTRs) recorded after vigorous DN. The LTR is an involuntary spinal response elicited by mechanical stimulation of a taut band using a needle. It arises due to modified sensory spinal processing. [30] The study concluded that DN reduced elbow flexor muscle spasticity. The result is in line with research by Juan Nicolas Cuenca Zalvidar *et al* (2020), suggesting that usage of DN for 8 sessions in a multimodal standard physiotherapy program for 8weeks leads to a higher reduction in elbow flexor spasticity inaffected arm in sub-acute stroke patients.[31]

Cupping treatment is a type of intervention that creates negative pressure on skin by sucking air into a cup. [20] Dry cupping draws skin into cup without scarring.[32] Cupping has been believed to improve blood circulation along with reducing muscle tension, resulting in pain relief. It increases microcirculation by encouraging capillary endothelial cell repair, granulation, and angiogenesis in the surrounding tissues. This supports the patient's functional state as well as promotes muscle relaxation. CT's negative pressure may stimulate underlying muscles, particularly at the tendinous end.[33] Ding Bang-you *et al.* (2003), treated 52 cases and demonstrated that acupuncture plus CT showed improvement intreatment of hemiplegia and joint contracture due to spasticity. This study concluded that CT reduced elbow flexor spasticity. The finding is supported by a research by Mahboob Ali *et al.* (2020), suggesting that the practice of CT were found to be effective. [34] Upper limb neuromuscular weakness is common following stroke, and loss of muscle strength as well as dexterity can have a significant influence on rehabilitation.[35, 36] Physical interventions (e.g., standing, active/passive workouts, and positioning) aim to facilitate neuronal activity in the injured cerebral hemisphere while also minimizing changes in viscoelastic characteristics of connective tissue muscles around joints.[37]Repetitive task training is repeated practice of functional tasks, incorporating components of practice intensity and functional relevance.[38] When performed properly, repetitive task training is thought to diminish muscle weakness as well as provide the physiological basis for motor learning.[39] Task-specific training, also known as functional task training, involves practicing everyday tasks, including both part- and whole-task practice. [40]The conventional physiotherapy of spasticity management is typically done at home by the individual with support from family or caregivers. Therefore, any physical regimen given to the patient must be practical. The type of therapy is likely more essential than the intensity of therapy for improving motor recovery. Additionally, the patient practiced with consistency regularly. It was found that conventional physiotherapy in addition to other therapies showed improvement in reduction of elbow flexor spasticity. The outcome result is similar to a study byAlex Pollock *et al.* (2014) that demonstrated a beneficial effect in improving upper limb function.[41]

CONCLUSION

The research findings suggest that patients with sub-acute stroke showed a reduction in elbow flexor spasticity post-intervention. Both treatments showed equal improvement in spasticity reduction, but no significant difference had been found between DN as well as CT. However, DN showed more effectiveness in the motor component of the FMA-UE than CT post-intervention.

Limitations and Future Scope

The study was limited due to small sample size. There was no follow-up for the patients. The study was confined to stroke patients in the sub-acute stage only. Further studies can be conducted with a larger population with long-term follow-up and on different stages of stroke.

Conflict of Interest

The authors have no conflicts of interest.

ABSTRACT

Facial Emotion Recognition (FER) has emerged as a critical component in domains such as healthcare, surveillance, and human-computer interaction. However, ensuring high accuracy remains challenging due to imbalanced emotion categories and complex data distribution. In this work, we propose a Convolutional Neural Network (CNN)-based FER model enhanced through several fine-tuning strategies. Techniques like focal loss, SMOTE oversampling, and weighted loss are used to handle class imbalance. Additionally, advanced data augmentation methods—MixUp, CutMix, Auto Augment, and Random Erasing—are integrated to boost robustness and generalization. The model is developed using TensorFlow in the Google Colab environment and evaluated using metrics including accuracy, precision, recall, F1 score, AUC, and confusion matrix. Results indicate substantial improvement in recognizing less represented emotions, validating the effectiveness of the proposed enhancements.

Keywords: FER, CNN, Class Imbalance, Data Augmentation, Fine Tuning

INTRODUCTION

Facial expressions can be considered the best alternative to verbal communication. They serve as immediate indicators of human emotion and intention, often conveying more meaning than spoken language. Recognizing these expressions accurately is a core aspect of Facial Emotion Recognition (FER), a field that has gained increasing attention across several domains, including psychological analysis, healthcare diagnostics, surveillance systems, marketing analysis, and human-computer interaction. Traditionally, FER systems have relied on handcrafted features

and rule-based models, which were highly sensitive to lighting, pose variation, and occlusions. Feature extraction techniques such as geometric landmarks, Local Binary Patterns (LBP), and Gabor filters offered early insights into facial expression analysis. However, these techniques often failed to generalize to complex, real-world scenarios and lacked the robustness required for scalable systems. The emerging field of Deep Learning has introduced many transformation in implementing FER. Particularly, CNNs have shown a considerable growth, pertaining to their capability of learning the hierarchical representation from raw data. CNNs have outperformed traditional models in accuracy and adaptability, especially in complex visual recognition tasks. Nevertheless, building an efficient FER system using deep learning presents its own set of challenges.

The class imbalance problem is considered to be the most persistent issue in implementing FER. Emotion datasets like FER2013, although widely used, are often skewed toward certain dominant expressions (such as "Happy" or "Neutral"), while other emotions (like "Disgust" or "Fear") remain underrepresented. This imbalance leads to biased models that underperform on minority classes, reducing the system's overall effectiveness in realistic applications. Additionally, facial expressions can vary significantly due to differences in age, gender, ethnicity, lighting, occlusion, and head pose, making generalization a critical requirement for any FER model. Without effective strategies to enhance the model's robustness, even powerful architectures like CNNs can fail to recognize subtle or ambiguous emotional cues.

To address these limitations, this research proposes a custom CNN-based FER model that integrates fine-tuning techniques specifically targeted at overcoming data imbalance and improving generalization. The model is trained and evaluated on the FER2013 dataset and incorporates strategies such as focal loss, SMOTE-based oversampling, class weighting, and a suite of advanced data augmentation methods like MixUp, CutMix, AutoAugment, and Random Erasing. Furthermore, the model is optimized using modern regularization and learning rate scheduling techniques to ensure stability and prevent overfitting. The goal is to develop a model that not only performs well in ideal conditions but also maintains high reliability and accuracy in real-world, noisy environments. Through this approach, the study contributes to the development of a robust and efficient facial emotion recognition system, offering insights into the role of task-specific enhancements in improving model performance. The results presented provide a comparative analysis between baseline and fine-tuned CNN models, demonstrating the tangible impact of the proposed strategies on performance metrics such as accuracy, precision, recall, F1 score, and AUC.

Related Work

Historically, facial expression recognition methods depended on geometric and appearance-based features like Local Binary Patterns and Gabor filters. While these approaches performed adequately on constrained datasets, they lacked robustness and generalizability. Modern FER systems increasingly use deep CNN architectures. Akhand et al. utilized transfer learning with pre-trained CNNs, which enhanced accuracy across diverse datasets. Deng proposed combining CNNs with augmentation methods to better detect underrepresented emotions. Shankar et al. evaluated techniques like MixUp, CutMix, and Random Erasing, all of which demonstrated improved generalization. To mitigate class imbalance, researchers explored oversampling, weighted loss functions, and synthetic data generation. Focal loss, for instance, prioritizes difficult samples and balances class distribution effectively. Roy et al. employed diffusion models to create synthetic samples that improved recognition of rare emotions.

FER using Deep Learning models

Recent studies have adopted transfer learning and advanced CNN architectures to enhance FER performance. Akhand et al. (2021) employed transfer learning using pre-trained deep CNNs, achieving superior accuracy across multiple benchmark datasets by leveraging hierarchical feature extraction [2]. Deng (2023) introduced a CNN model combined with data augmentation techniques that significantly improved expression recognition accuracy, particularly on underrepresented emotion classes [3].

Data Augmentation Techniques

To combat overfitting and improve model generalization, numerous data augmentation strategies have been proposed. Shankar et al. (2022) conducted a comparative study on augmentation techniques such as MixUp, CutMix, and Random Erasing, demonstrating their effectiveness in training robust FER models [4].Additionally, Roy et al. (2024) showed that using synthetic images generated by diffusion models can augment minority classes and improve recognition in class-imbalanced datasets [5]. Cubuk et al.'s AutoAugment framework, extended in several works, utilizes reinforcement learning to find optimal augmentation policies for emotion recognition tasks [4].

Class Imbalance Handling

Class imbalance is a major obstacle in FER, often leading to biased model predictions. Techniques such as oversampling, class-weighting, and synthetic data generation are commonly applied. Rao et al. (2022) used neural network-based augmentation to balance datasets and achieved better recognition rates, especially for rare emotions [2]. Roy et al. (2024) proposed generating balanced datasets using diffusion models, effectively reducing misclassification of minority classes [5]. Moreover, loss function modifications such as focal loss have gained traction. These approaches dynamically adjust the loss contribution from well-classified examples, focusing the model on harder, underrepresented samples — a strategy shown effective in multiple emotion recognition studies [6].

METHODOLOGY

The methodology adopted in this study is structured to ensure effective facial emotion recognition, focusing on data preprocessing, model architecture, fine-tuning, and evaluation.

Dataset Description

We utilize the FER2013 dataset, comprising 35,887 grayscale facial images of 48x48 pixels each, labeled into seven emotions: Angry, Disgust, Fear, Happy, Sad, Surprise, and Neutral. The dataset exhibits significant class imbalance, with classes such as 'Disgust'being heavily underrepresented.

Preprocessing

All image pixel values are normalized to the range [0,1]. As we see that the dataset is in grayscale, the images are then being reshaped to 48x48x1 dimensions to adjust with the CNN input requirements.

CNN Architecture (Proposed)

The proposed model follows a sequential CNN structure with three convolutional blocks followed by dense layers. Each block includes Conv2D layers with batch normalization, ReLU activation, and max-pooling. The final layers include dropout regularization and a softmax layer for emotion classification.

Fine-Tuning Strategies

We implemented several fine-tuning techniques to boost the performance and robustness of the CNN

Handling Class Imbalance

- **Class Weights** Dynamically computed to emphasize underrepresented classes during training.
- **Focal Loss** A variant of cross-entropy loss that focuses on hard examples by reducing the loss contribution from well-classified examples.
- **SMOTE (Synthetic Minority Over-sampling Technique)** Generated synthetic samples for underrepresented classes.

Figure 3 depicts the comparison of the number of data samples in each class of FER2013 dataset before and after applying the SMOTE technique to prevent the class imbalance issue.

Advanced Data Augmentation

To enhance generalization, the following data augmentation techniques were incorporated along with the basic augmentation techniques.

- **CutMix** Merges two images and their labels by cutting and pasting patches.
- **MixUp** It provides a linear interpolation between the label-images pair.
- **AutoAugment** Uses reinforcement learning to discover effective augmentation policies.
- **Random Erasing** Randomly occludes parts of images to simulate noise/occlusion.
- **ReduceLROnPlateau** Learning rate scheduler to optimize training convergence.
- **Dropout** Applied to prevent over fitting in dense layers.

Hyperparameter Optimization

In the proposed CNN, we had tuned the learning rate for training the model using the Reduce LR On Plateau and cyclical scheduling. Batch size for the images to provide for training is empirically set to 64, and for regularization, dropout of 0.5 is used in the dense layers of the proposed Convolutional Network.

The Adam optimizer with the learning rate of 0.0001 is used in the CNN model, loss function being the Focal loss, training carried out for epochs, and 20% of the total dataset images available used for the validation purpose, class wise.

Evaluation Metrics

To thoroughly evaluate the performance of the proposed CNN model for facial emotion recognition, several key metrics were utilized, especially to address the limitations posed by class imbalance

- The most promising performance metrics, Accuracy is defined as the ratio of correct predictions to the total observations. However, in imbalanced datasets like FER2013, accuracy can be misleading because it favors majority classes. [11]
- Precision, Recall and F1 Score: These metrics provide deeper insights into the model's ability to correctly classify individual classes, especially important in imbalanced scenarios. Precisionis used to measure the ratio of correctpositive predicted observations to total predicted positive observations. Recall (Sensitivity)shows the ability of the model to find all related instances within the dataset. F1 Score is theHarmonic mean of precision and recall. It provides a single score that balances both concerns in a single number. [12]
- The confusion matrix visually represents the performance of the classifier in terms of true and false positives/negatives per class. It highlights which emotions are being confused with others—an important analysis for subjective categories like "fear" and "sadness". [13]
- ROC-AUC (Receiver Operating Characteristic – Area Under Curve) evaluates the model's ability to discriminate between classes. AUC closer to 1 indicates better performance. For multiclass tasks, we compute AUC using a one-vs-rest strategy. [14]
- Precision-Recall curves are known to be more informative than ROC observations. These curves show the trade-off between precision and recall at different thresholds. [15]
- **False Acceptance Rate (FAR)** provides the Proportion of unauthorized faces those are accepted falsely.
- **False Rejection Rate (FRR)** provides the Proportion of authorized faces falsely rejected. Although commonly used in biometric systems, these are also applicable to facial emotion recognition for evaluating classification risk. [16]

The summary of the performance metrics is as shown in the table below:

The outcome of the above model has been depicted in the following table 3.

Interpretation of Results

he experimental results obtained from the proposed CNN model reflect the positive impact of integrating multiple fine-tuning strategies for facial emotion recognition using the FER2013 dataset. The model demonstrated improved performance in terms of both accuracy and robustness across all emotion classes, including minority categories such as disgust, fear, and surprise.

Key observations from the results include

- Increased Accuracy and F1 Score
  The model achieved a test accuracy of 72.85% and an F1 score of 70.42%, which indicates a balanced performance between precision and recall. The F1 score being close to the accuracy reflects the model's ability to handle class imbalance and generalize well to unseen data.
- Reduced False Acceptance Rate (FAR) and False Rejection Rate (FRR)
  The FAR of 0.065 and FRR of 0.091 confirm that the model correctly distinguishes between emotional classes with minimal misclassification. This is particularly important in applications where incorrect emotional labeling can lead to poor user experiences or faulty decision-making.
- High AUC and ROC Performance
  The model's AUC (Area Under the Curve) score of 0.94 implies strong discriminative power across all classes. The ROC curve confirms the model's ability to correctly identify true positives even under varying thresholds.
- Impact of Fine-Tuning Techniques
  The combination of class weights, focal loss, and oversampling helped in effectively tackling the issue of class imbalance, ensuring the minority classes received sufficient attention during training. The integration of advanced data augmentation techniques (CutMix, MixUp, AutoAugment, and Random Erasing) increased data diversity and improved the model's generalization capabilities, particularly for ambiguous or partially occluded faces.
- Stability and Generalization
  The use of batch normalization, dropout, and early stopping during training ensured convergence without overfitting. This can be depicted from the minimal gap between training and validation performance metrics.

Overall, the results indicate that the proposed CNN architecture, when combined with domain-specific fine-tuning techniques, is a robust and effective approach for facial emotion recognition, particularly in real-world scenarios with noisy, imbalanced, and low-resolution data. The proposed CNN model delivered a test accuracy of 72.85% and an F1 score of 70.42%, signifying strong balance between precision and recall. These scores validate the model's ability to handle uneven data distribution while maintaining classification reliability. The model achieved a low FAR of 7.12% and FRR of 9.87%, demonstrating its competency in minimizing false predictions, a critical factor in real-world applications like surveillance or mental health monitoring. The AUC score of 0.89 further indicates that the model is proficient in distinguishing between multiple emotional classes, even under conditions of ambiguity or noise. Advanced augmentation strategies such as CutMix, MixUp, and AutoAugment enhanced the model's ability to generalize to unseen data, while techniques like focal loss and SMOTE effectively mitigated the imbalance in class distribution.

Future Work

While the results are promising, several areas remain open for future exploration

Incorporation of Temporal Information Emotion recognition can benefit from temporal modeling in video sequences. Future work could extend this model using LSTM, GRU, or hybrid CNN-RNN architectures to learn temporal emotion dynamics.

Multi-Dataset Evaluation Evaluating the model on other benchmark datasets such as AffectNet or RAF-DB would validate its generalizability across domains.

Lightweight Deployable Models Exploring lightweight model variants like MobileNet or efficient CNNs would allow for real-time deployment on edge devices such as mobile phones or embedded systems.

Multimodal Emotion Recognition Combining visual cues with audio or physiological signals (e.g., heart rate, speech tone) may further improve emotion recognition accuracy and robustness in complex environments.

CONCLUSION

This research introduces a fine-tuned Convolutional Neural Network for facial emotion recognition using the FER2013 dataset. By integrating targeted improvements—focal loss, SMOTE-based oversampling, class weighting, and robust data augmentation—the model significantly outperforms conventional approaches.The results underscore that even relatively lightweight CNNs can deliver high performance when paired with domain-aware enhancements. Achieving an F1 score of 70.42% and AUC of 0.89, the proposed model demonstrates strong potential for use in real-world systems involving emotion detection in complex, noisy, or low-resolution environments.

ABSTRACT

This research paper provides an in-depth analysis of recent advancements in thyroid research, with a focus on the molecular processes involved in thyroid hormone synthesis, secretion, and action. It also explores the genetic factors linked to thyroid disorders, including hypothyroidism, hyperthyroidism, and thyroid cancer. Thyroid nodules, a common clinical issue, require accurate diagnostic techniques to determine whether they are benign or malignant. This study performs a comparative evaluation of several advanced deep learning models—AlexNet, VGG16, ResNet50, Xception, EfficientNet-B3, and TNC-Net—specifically designed for thyroid nodule classification using ultrasound images. The results highlight significant differences in model performance, with some architectures showing superior accuracy in distinguishing between benign and malignant nodules. These findings provide valuable insights for clinicians and researchers, aiding in the selection of appropriate deep learning models to improve the accuracy and speed of thyroid nodule diagnosis.

Keywords: Thyroid Nodules, Deep Learning Models, Thyroid Lobes, Hyperthyroid, hypothyroid

INTRODUCTION

The thyroid gland is a small butterfly-shaped gland located in the front of the neck (Figure 1 referred from Mayo clinic),surrounding the front of the windpipe (trachea).The thyroid gland plays an important role in the body's

overall health by producing hormones that control the body's energy-using metabolism. These hormones also help regulate important functions such as heart rate, body temperature and how fast the body burns calories. The thyroid gland is an important endocrine organ responsible for the production of hormones that regulate metabolism [1], growth and development.

Functions of The Thyroid Gland

The thyroid produces two main hormones

Thyroxine (T4): Thyroxine (T4) is a principal hormone synthesized by the thyroid gland, playing a crucial role in the regulation of metabolic processes. Comprising four iodine atoms, T4 is produced in greater quantities than triiodothyronine (T3). Although T4 is less biologically active, it serves as a precursor to T3, undergoing conversion in various tissues, including the liver and kidneys. This conversion is essential for fulfilling the metabolic requirements of the body and ensuring its proper functioning.

Triiodothyronine (T3): Triiodothyronine (T3) is the biologically active form of thyroid hormone, exerting a significant influence on metabolic activities. It plays a vital role in regulating the basal metabolic rate and maintaining body temperature, as well as overseeing overall metabolism. T3 is critical for sustaining a healthy body temperature and influences heart rate and cardiac output. Furthermore, it is integral to growth and development, particularly in brain development during infancy and childhood. Additionally, the thyroid gland secretes calcitonin, a hormone involved in the regulation of calcium levels in the bloodstream; however, its significance is overshadowed by that of T4 and T3. The equilibrium between T4 and T3 is meticulously regulated within the body to ensure optimal health. The enzymatic conversion of T4 to T3 is tightly controlled, guaranteeing that an adequate supply of the active hormone is available as required. Thyroid-Stimulating Hormone (TSH)[4] plays a vital role in the endocrine system, controlling the activity of the thyroid gland. Produced by the pituitary gland, which is located at the base of the brain, Thyroid- stimulating hormone(TSH) is essential in regulating both the conflation and stashing of the thyroid hormones, videlicet thyroxine(T4) and triiodothyronine(T3). Thyroid-Stimulating Hormone (TSH) is an essential component of the endocrine system, primarily responsible for regulating the activities of the thyroid gland. This hormone is synthesized by the pituitary gland, situated at the base of the brain, and is pivotal in managing the synthesis and secretion of the thyroid hormones, namely thyroxine (T4) and triiodothyronine (T3). TSH regulates the thyroid gland by prompting it to produce and release T4 and T3 into the bloodstream. In instances where the concentrations of T4 and T3 are diminished, the pituitary gland escalates TSH production to prompt the thyroid gland to enhance hormone output. Conversely, elevated levels of T4 and T3 lead to a reduction in TSH production by the pituitary gland, thereby curtailing the thyroid's hormone release. This intricate feedback mechanism is vital for maintaining optimal levels of thyroid hormones, which are crucial for regulating metabolism, energy production, and various physiological processes. The assessment of TSH levels serves as a standard diagnostic approach for evaluating thyroid function.

Factors of Affecting Thyroid Gland

Thyroid disorders [5] are subject to a multitude of influences that can affect their onset, progression, and severity, particularly in conditions such as hypothyroidism and hyperthyroidism. A comprehensive understanding of these influences is essential for effective management of thyroid health.

Genetic Factors

Genetic predisposition significantly contributes to thyroid disorders, with a familial history of conditions such as Hashimoto’s thyroiditis or Graves’ disease heightening the likelihood of similar health issues. Genetic mutations can negatively impact thyroid function, sometimes leading to congenital hypothyroidism.

Autoimmune Factors

Autoimmune disorders [4] represent a predominant cause of thyroid dysfunction. Conditions such as Hashimoto’s thyroiditis, which results in hypothyroidism, and Graves’ disease, associated with hyperthyroidism, are both Chart 1: Comparison of Deep Learning Models

manifestations of immune system deregulation. Individuals with other autoimmune conditions, including type 1 diabetes or rheumatoid arthritis, exhibit an increased susceptibility to thyroid dysfunction.

Iodine Levels

Iodine is essential for thyroid hormone production. A lack of iodine in the diet can cause hypothyroidism and goiter, while excessive iodine intake, though rare, can trigger hyperthyroidism or autoimmune thyroiditis in susceptible individuals.

Environmental Factors

Environmental influences, including exposure to radiation and various toxins, can adversely affect thyroid function. Radiation exposure to the head and neck regions is associated with an increased risk of thyroid cancer and hypothyroidism. Furthermore, contact with environmental pollutants, such as pesticides and heavy metals, can disrupt the production of thyroid hormones[6].

Lifestyle Factors

Lifestyle factors play a significant role in maintaining thyroid health. A diet deficient in vital nutrients, including iodine, selenium, and zinc, can hinder proper thyroid function. Additionally, chronic stress, a lack of physical activity, and unhealthy eating patterns can contribute to thyroid imbalances. Excessive physical activity without sufficient recovery may also negatively impact thyroid function, particularly among women.

Hormonal Changes

Thyroid function can be influenced by hormonal changes during pregnancy, the postpartum period, and menopause. Some women may experience thyroid disorders during or following pregnancy, such as postpartum thyroiditis, while menopause can also initiate or worsen thyroid-related issues.

Medical Conditions and Medications

Various medical conditions and pharmacological treatments can lead to thyroid dysfunction. Disorders of the pituitary gland may result in secondary hypothyroidism or hyperthyroidism, while certain medications, including lithium and amiodarone, can disrupt thyroid function. Chronic diseases, especially those that involve the immune system, may also heighten the risk of thyroid disorders.

Age and Gender

The risk of developing thyroid disorders, especially hypothyroidism, generally rises with age. Women are generally more susceptible to thyroid issues than men, especially during significant hormonal transitions such as pregnancy and menopause.

Smoking

Additionally, smoking is a contributing factor that can elevate the risk of thyroid disorders, particularly autoimmune diseases like Graves' disease. Smoking may also exacerbate the severity of pre-existing thyroid conditions.

Types of Thyroid Disorders

Thyroid disorders encompass a range of conditions that impact the thyroid gland, a crucial component of the endocrine system that plays a vital role in regulating numerous metabolic functions. If left unmanaged, these disorders can result in serious health complications. The most prevalent thyroid disorders[2] include hypothyroidism, hyperthyroidism, goiter, thyroiditis, and thyroid nodules. Figure 2 (referred from frontiersin.org) illustrates the various types of thyroid diseases.

Hypothyroidism

Hypothyroidism is characterized by a thyroid organ that is underactive, driving to lacking generation of thyroid hormones [2]. The primary cause of hypothyroidism is Hashimoto's thyroiditis, an autoimmune disorder in which

the immune system erroneously attacks the thyroid gland. Additional causes may include iodine deficiency, certain pharmaceutical agents, and surgical excision of the thyroid gland. The conventional treatment for hypothyroidism involves lifelong administration of thyroid hormone replacement therapy, typically utilizing synthetic thyroxine (levothyroxine), which aids in normalizing hormone levels and alleviating associated symptoms.

Hyperthyroidism

Hyperthyroidism, in contrast, arises when the thyroid gland is hyperactive, resulting in the overproduction of thyroid hormones [3]. This condition accelerates the metabolic rate, leading to symptoms such as weight loss, rapid heart rate, anxiety, irritability, excessive sweating, and intolerance to heat. The most common etiology of hyperthyroidism is Graves' malady, an immune system clutter that prompts the resistant framework to empower the thyroid to create an overabundance of hormones. Other contributing factors include thyroid nodules, thyroiditis, and excessive intake of iodine. Treatment modalities for hyperthyroidism consist of antithyroid medications that inhibit hormone synthesis, radioactive iodine therapy aimed at reducing the size of the thyroid gland, and surgical intervention to remove part or all of the thyroid gland.

Goiter

Goiter is an enlargement of the thyroid gland that can occur in both hypothyroidism and hyperthyroidism, as well as in euthyroid conditions (where thyroid function is normal). It is often caused by iodine deficiency, autoimmune thyroid diseases, or nodular thyroid disease. A goiter can cause visible swelling in the neck and, in severe cases, difficulty swallowing or breathing. The treatment for goiter depends on the underlying cause and may include iodine supplementation, thyroid hormone replacement, or surgery to remove the enlarged portion of the gland.

Thyroiditis

Thyroiditis refers to inflammation of the thyroid gland, which can lead to either hyperthyroidism or hypothyroidism depending on the type and progression of the inflammation. There are a few sorts of thyroiditis, including:

Hashimoto's Thyroiditis: An immune system clutter and the most common cause of hypothyroidism.. It results in chronic inflammation and gradual destruction of the thyroid gland.

Subacute Thyroiditis: Often caused by a viral infection, this type leads to a temporary period of hyperthyroidism followed by hypothyroidism**.**

Postpartum Thyroiditis: Occurs in some women after childbirth, leading to temporary hyperthyroidism followed by hypothyroidism.

Thyroid Nodules

Thyroid nodules are lumps or abnormal growths within the thyroid gland. While most nodules are benign and do not cause symptoms, some can be malignant, requiring further investigation. Nodules are often detected during routine physical exams or imaging studies conducted for unrelated reasons. The diagnosis of thyroid nodules typically involves ultrasound imaging to assess their size and characteristics, followed by fine-needle aspiration (FNA) biopsy if necessary. Treatment options depend on whether the nodule is benign or malignant and may range from regular monitoring to surgical removal. Thyroid nodules can indeed be associated with both hypothyroidism (underactive thyroid) and hyperthyroidism (overactive thyroid), depending on their nature and function.

Characteristics of Thyroid Nodules

The characteristics of thyroid nodules exhibit considerable variability, which is essential for evaluating their potential for malignancy and informing management strategies. A comprehensive understanding of these characteristics is vital for the accurate diagnosis and treatment of thyroid nodules.

Size: The size of a thyroid nodule is a critical factor in its assessment. Nodules measuring less than 1 cm are generally less alarming but still necessitate evaluation, particularly if the patient exhibits symptoms or has a familial predisposition to thyroid cancer. Conversely, nodules larger than 4 cm are associated with an increased risk of malignancy and typically require more extensive investigation, including the possibility of a biopsy.

Composition: The composition of nodules can be categorized as solid, cystic, or complex. Solid nodules, which consist entirely of thyroid tissue, raise greater concerns regarding malignancy compared to cystic nodules, which are filled with fluid and are usually benign. Complex nodules, containing both solid and cystic elements, necessitate thorough evaluation, with particular attention given to the solid component.

Echogenicity: Echogenicity, as observed on ultrasound, provides significant diagnostic insights regarding a nodule. Hypoechoic nodules, which appear darker than the surrounding thyroid tissue, are frequently linked to a higher risk of malignancy. Isoechoic nodules, which match the echogenicity of adjacent tissue, present more diagnostic challenges, while hyperechoic nodules, appearing brighter, are generally less concerning.

Margins: The margins of a thyroid nodule serve as indicators of its potential risk. Nodules with well-defined, smooth margins are typically benign, whereas those exhibiting irregular or spiculated margins may indicate a higher likelihood of malignancy and warrant closer examination.

Calcifications: The evaluation of calcifications within a nodule is conducted through ultrasound imaging. Microcalcifications, which appear as small bright spots, are frequently linked to thyroid malignancies, particularly papillary thyroid carcinoma. In contrast, macro calcifications, which are larger and more prominent, are typically benign but still warrant careful evaluation. Perinodular calcifications, found surrounding the nodule, may suggest chronic inflammation or other thyroid-related conditions.

Vascularity: The assessment of vascularity, or blood flow, within a nodule serves as an additional diagnostic indicator. An increase in vascularity, particularly in the solid components of the nodule, may indicate a heightened risk of cancer. On the other hand, a decrease in vascularity generally suggests a lower risk, although it does not completely exclude the possibility of malignancy.

Shape and Growth Pattern: The Shape and growth characteristics of a nodule are critical for diagnostic purposes. Nodules that are round are usually less alarming, whereas those that are irregular or elongated may raise suspicion. Notably, rapid growth or alterations in the size of the nodule over time are particularly worrisome and necessitate more vigilant observation.

Hypothyroidism and Thyroid Nodules: In certain instances, thyroid nodules may be associated with hypothyroidism. This relationship can arise when the nodules are part of a condition such as Hashimoto's thyroiditis, an autoimmune disorder that leads to inflammation of the thyroid gland and a subsequent decline in hormone production. As the thyroid becomes less active, the body may increase the production of Thyroid-Stimulating Hormone (TSH) in an effort to boost hormone synthesis, which can result in the development of nodules. These nodules are typically non-functional, meaning they do not secrete thyroid hormones, and their presence may further diminish the overall activity of the gland.

Hyperthyroidism and Thyroid Nodules: Conversely, certain thyroid nodules may lead to hyperthyroidism. This phenomenon generally arises when a nodule becomes "toxic," indicating that it begins to synthesize thyroid hormones autonomously, bypassing the regulatory mechanisms of the pituitary gland. These toxic nodules, referred to as "hot nodules," can result in an excessive production of thyroid hormones, thereby inducing hyperthyroidism. This condition is frequently observed in scenarios such as toxic multi nodular goiter or a solitary toxic adenoma, where the surplus hormones manifest in symptoms including tachycardia, weight reduction, and heightened anxiety levels.

Thyroid Cancer

Thyroid cancer is a serious condition where malignant cells form in the thyroid tissue. The types of thyroid cancers are:

Papillary Carcinoma: The most common type, generally with a good prognosis.

Follicular Carcinoma: Less common but more likely to spread to other organs.

Medullary Carcinoma: Arises from the C-cells of the thyroid and may be associated with genetic conditions.

Anaplastic Carcinoma: A rare and aggressive form of thyroid cancer that is difficult to treat.

Diagnosis of Thyroid Disorders

The assessment of thyroid disorders usually entails a multifaceted approach, incorporating clinical assessments, laboratory tests to evaluate thyroid hormone concentrations (including TSH, T4, and T3), and imaging modalities such as ultrasound or radioactive iodine uptake studies. In certain instances, a biopsy may be conducted to determine the characteristics of thyroid nodules. The effective management of thyroid disorders hinges on precise diagnosis and prompts therapeutic measures.

Thyroid function tests

Functional assessments are vital for determining the operational status of the thyroid gland, which is integral to metabolic regulation. The Thyroid-Stimulating Hormone (TSH) test is among the most frequently conducted evaluations, measuring TSH levels in the bloodstream. Elevated TSH levels typically suggest hypothyroidism, while diminished levels indicate hyperthyroidism. Another significant assessment is the Free Thyroxine (Free T4) test, which quantifies the concentration of free T4, the biologically active form of thyroid hormone that affects metabolism. Low free T4 levels are commonly linked to hypothyroidism, whereas elevated levels are characteristic of hyperthyroidism. The Free Triiodothyronine (Free T3) test gauges the level of free T3, the most potent thyroid hormone, and can be particularly beneficial when TSH and free T4 results are inconclusive. Additionally, Total T4 and Total T3 tests evaluate the comprehensive levels of T4 and T3 in the bloodstream, encompassing both bound and unbound forms, thereby offering further insights into thyroid functionality.

Imaging Studies

Imaging studies are used to visualize the thyroid gland and assess structural abnormalities

Thyroid Ultrasound

The ultrasound examination is the predominant imaging modality[29][9] utilized for assessing thyroid nodules or gland enlargement. This technique enables the evaluation of the dimensions, morphology, and internal characteristics of thyroid nodules, thereby facilitating the differentiation between benign and potentially malignant lesions. Figure 3 illustrates an ultrasound image of the thyroid.

Radioactive Iodine Uptake (RAIU) and Scan: The procedure entails the administration of a small quantity of radioactive iodine, which is subsequently absorbed by the thyroid gland. Elevated uptake levels may indicate hyperthyroidism, whereas diminished uptake could imply hypothyroidism or thyroiditis.

Fine-Needle Aspiration (FNA) Biopsy: In cases where a thyroid nodule is identified, a fine-needle aspiration (FNA) biopsy may be conducted to obtain cellular samples from the nodule for microscopic analysis. This examination is instrumental in determining the benignity or malignancy of the nodule.

TI-RADS

The Thyroid Imaging Reporting and Data System (TIRADS) [8][11] serves as a classification framework aimed at standardizing the assessment and documentation of thyroid nodules based on ultrasound findings. This system was established to enhance the precision and uniformity of thyroid nodule evaluations, assisting healthcare professionals in assessing malignancy risk and determining the necessity for fine-needle aspiration (FNA) biopsy, as depicted in Figure 6 referred from radiogyan.

Methodology For Thyroid Nodules Prediction Models

The formulation of predictive models for thyroid nodules necessitates a thorough methodology that encompasses data acquisition, preprocessing, model construction, and evaluation. This systematic process is vital for the accurate differentiation of benign from malignant nodules (Fig 4 & 5).

Data Collection

The initial phase in the creation of predictive models involves data collection, which encompasses the compilation of detailed patient medical histories, imaging results, and biopsy findings. Patient records yield critical information, including clinical history, thyroid function assessments, and presenting symptoms. Imaging data, such as thyroid ultrasounds or CT scans, are gathered with annotations that detail nodule features and clinical outcomes. Additionally, fine-needle aspiration (FNA) biopsy results are incorporated, providing cytological information regarding the nodules.

Data Preprocessing

Data preprocessing is a fundamental step that entails the cleaning and preparation of gathered data for subsequent analysis. This process encompasses the resolution of missing values, elimination of duplicate entries, and rectification of inconsistencies to uphold data integrity. Numerical attributes are either normalized or standardized to ensure uniformity, while imaging data is subjected to resizing, normalization, and enhancement techniques to elevate quality and ensure compatibility with analytical models.

Feature Extraction

The process of feature extraction is vital for identifying pertinent characteristics of thyroid nodules. Relevant features are derived from clinical records, including nodule size, composition, echogenicity, margins, and vascularity. Additionally, risk factors such as family history and exposure to radiation are taken into account. For imaging information, highlights relating to surface, shape, and inside structure are extricated utilizing techniques such as surface investigation and edge discovery

Model Development

The development of models entails the selection and training of suitable algorithms. Machine learning models, including Random Forest, Support Vector Machine (SVM), and Gradient Boosting Machines (GBM), are selected based on the characteristics of the data. For image data, deep learning models like Convolutional Neural Networks (CNNs) are employed. The training process involves inputting data into the model, fine-tuning parameters, and enhancing performance through iterative refinement. Cross-validation techniques are utilized to evaluate model performance and mitigate the risk of over fitting.

Model Evaluation

Assessing the performance of the model is crucial for gauging its accuracy. Various metrics, including accuracy, precision, recall, F1-score, and AUC-ROC, are employed to evaluate the model's proficiency in accurately classifying nodules.

Model Optimization

To improve the performance of the model, hyper parameter tuning is conducted to identify the most effective parameter configurations. Feature selection techniques are applied to refine the model by focusing on the most relevant features, thus reducing complexity and improving accuracy.

Existing Methodologies

Various deep learning architectures have been employed to address the classification of thyroid nodules, aiming to accurately distinguish between benign and malignant cases. This paper presents an overview of several deep learning models and discusses their respective outcomes.

AlexNet

AlexNet [11] represents a pivotal advancement in the field of image classification through its deep convolutional neural network architecture. It was trained on the extensive ImageNet dataset, which comprises over one million images categorized into 1,000 distinct classes. This show accomplished a surprising top-5 blunder rate of 15.3%, essentially beating the earlier driving demonstrate, which recorded an error rate of 26.2%. The architecture of AlexNet is characterized by eight layers, including five convolutional layers and three fully connected layers, enabling the model to effectively capture intricate features across various levels of abstraction. Notable innovations within this framework include the implementation of the ReLU activation function, which alleviated the vanishing gradient issue and accelerated the training process, as well as the adoption of GPUs to manage large-scale data and computations efficiently. Furthermore, the researchers incorporated data augmentation strategies and dropout layers to address over fitting, thereby improving the model's generalization performance. The success of AlexNet not only revolutionized image classification but also spurred the widespread integration of deep learning techniques across diverse applications, paving the way for the emergence of more sophisticated neural networks and solidifying deep learning's role as a fundamental aspect of contemporary artificial intelligence research.

VGG

The VGG [13] architecture is distinguished by its implementation of small 3x3 convolutional filters organized in a deep configuration, complemented by max-pooling layers and several fully connected layers. This structure empowers the organize to obtain a progressive representation of highlights from input pictures. Notably, VGG16 and VGG19 achieved outstanding performance in the ImageNet Large Scale Visual Recognition Challenge (ILSVRC) 2014, recording top-5 error rates of 7.3% and 7.0%, respectively. The model's simplicity and depth not only established new performance standards but also shaped the evolution of subsequent deep learning architectures. Its modular and clear design has rendered it a favored option for transfer learning and feature extraction, while its foundational principles have guided the creation of more intricate models employed in various computer vision applications. The influence of VGG on the field is significant, as it illustrated the advantages of deeper networks and has become a cornerstone in contemporary deep learning frameworks.

ResNet

The methodology employed by ResNet [12], referred to as residual learning, signifies a pivotal advancement in the architecture of deep neural networks. By concentrating on the learning of residuals essentially the discrepancies between the input and output ResNet streamlines the learning process, thereby facilitating the network's ability to comprehend intricate mappings. This approach is particularly advantageous for training extensively deep networks, which have historically encountered difficulties such as vanishing and exploding gradients. The incorporation of skip connections within ResNet, which directly combine the input of a residual block with its output, allows the network to retain crucial information and gradients across layers, effectively alleviating these challenges. The efficacy of ResNet is underscored by its performance in the ImageNet Large Scale Visual Recognition Challenge (ILSVRC) 2015, where it achieved an outstanding top-5 error rate of 3.57%. This represented a significant enhancement over earlier models and illustrated ResNet's capability to sustain high accuracy even with very deep architectures. The triumph of ResNet has not only established new standards in image classification but has also facilitated the evolution of deeper and more sophisticated neural networks. Its architectural design has influenced the creation of numerous

subsequent models and has become a cornerstone in contemporary deep learning frameworks, propelling progress in computer vision, object detection, and various other domains of machine learning. The advent of ResNet marked a transformative evolution in the discipline, empowering researchers and practitioners to construct more robust and efficient models adept at addressing increasingly complex challenges.

Xception

The Xception model [14] represents a significant advancement in deep learning through its implementation of depthwise separable convolutions. This innovative technique divides the convolutional operation into two distinct phases: depthwise convolutions, which apply filters to each individual input channel, and pointwise convolutions, which merge the outputs across different channels. This dual-stage approach leads to a marked reduction in both computational complexity and the total number of parameters, all while preserving high performance levels. The architecture of Xception, which is designed in a manner akin to Inception modules, has achieved remarkable results on benchmark datasets such as ImageNet, attaining a top-5 error rate of 3.0%. This success illustrates that depthwise separable convolutions can provide enhanced accuracy and efficiency when compared to conventional convolutional layers. The impact of Xception on the field has been substantial, shaping the development of future deep learning models and establishing new benchmarks for the equilibrium between performance and computational efficiency in neural networks.

InceptionV3

The InceptionV3 model [21] has been employed for the classification of thyroid nodules in ultrasound images. Its distinctive architecture, which incorporates multiple convolutions at varying scales, is utilized to capture the intricate features of thyroid nodules. The study includes an in-depth analysis of the model's performance, demonstrating its effectiveness in distinguishing between benign and malignant nodules, with a particular focus on improving diagnostic accuracy.

TnC- Net

TnC-Net [15] is a convolutional neural network (CNN) specifically developed to automate the classification of thyroid nodules in ultrasound imaging. This model employs deep learning techniques to improve both the accuracy and efficiency of thyroid nodule diagnosis by effectively differentiating between benign and malignant lesions. The architecture of TnC-Net features several convolutional layers that extract intricate features from ultrasound images, which are subsequently processed through pooling and fully connected layers for classification purposes. Trained on a comprehensive dataset of labeled thyroid nodules, TnC-Net applies preprocessing methods such as normalization and data augmentation to enhance its robustness and generalizability. The model demonstrates remarkable performance metrics, including elevated accuracy, sensitivity, precision, and AUC-ROC, underscoring its capability to provide dependable diagnostic assistance. By automating the classification process, TnC-Net seeks to reduce the burden on radiologists and pathologists, thereby enabling quicker and more consistent diagnoses, ultimately leading to improved patient outcomes and enhanced clinical efficiency.

Comparative Analysis

In the evaluation of various models for the classification of thyroid nodules, TnC-Net stands out with the highest overall accuracy of 90.2%, alongside notable sensitivity at 85.2% and an F1-Score of 79.3%. This performance underscores its exceptional capability in accurately identifying and classifying nodules when compared to

CONCLUSION

This manuscript offers an in-depth exploration of the thyroid gland, focusing on its physiological functions, related disorders, and the diagnostic techniques commonly used to assess thyroid health. It also examines the application of deep learning algorithms in medical image analysis, specifically for classifying thyroid nodules. A comparative study highlights the varying performance of several deep learning models—AlexNet, VGG16, ResNet50, Xception,

EfficientNet-B3, and TNC-Net—in classifying thyroid nodules based on ultrasound images. The study outlines both the alternative models. Conversely, EfficientNet_b3, while achieving a commendable precision of 75.0%, exhibits challenges with lower sensitivity (22.2%) and an F1-Score of 34.3%, indicating potential limitations in its ability to detect nodules across diverse categories. Both AlexNet and Xception present relatively high accuracy and AUC-ROC metrics, with Xception demonstrating a more balanced performance in terms of sensitivity, precision, and specificity. ResNet50, although providing higher precision, suffers from reduced sensitivity, whereas VGG19 is characterized by lower accuracy and inadequate sensitivity, reflecting its restricted efficacy in this classification context. In summary, TnC-Net emerges as the most effective model for this task, successfully balancing accuracy, sensitivity, and specificity illustrated in table 2 and pictorial representation in chart 1. strengths and weaknesses of each model, offering valuable insights into their effectiveness for this particular task. Future research will aim at distinguishing benign from malignant thyroid nodules using a range of deep learning models. Before deploying these models, the focus will be on carefully selecting high-quality ultrasound images, employing rigorous preprocessing methods to improve image clarity and contrast, and implementing advanced feature extraction techniques to capture the most relevant features. These steps are crucial to ensure that the models deliver accurate and reliable result

ABSTRACT

The JAK2-mutated myeloproliferative neoplasm known as polycythemia vera (PV) is typified by clonal erythrocytosis; additional characteristics include leukocytosis, thrombocytosis, splenomegaly, pruritus, constitutional symptoms, microcirculatory disruptions, and an elevated risk of thrombosis and progression into myelofibrosis (post-PV MF) or acute myeloid leukemia (AML). The existence of a JAK2 mutation linked to hemoglobin/hematocrit levels of >16.5 g/dL/49% in men or >16 g/dL/48% in women is considered a working diagnosis; morphologic confirmation by bone marrow examination is recommended but not required. The treatment aims to reduce hematocrit levels, symptom burden, bleeding, and clotting difficulties in order to increase survival and quality of life. The aim of phlebotomy for all patients should be a hematocrit level below 45%.First-line medications of choice for cytoreductive therapy includes hydroxyurea and pegylated interferon-α, while second-line medications are busulfan and ruxolitinib. Cytoreductive therapy is only used for high-risk diseases. Here we report a 57 years old female patient developed Polycythemia vera [JAK 2, V617F+] presented with Extra hepatic portal vein obstruction, Portal hypertension, Massive splenomegaly with Esophageal varices Grade III". She has been experiencing symptoms such as Abdominal pain in left hypochondrial region since 1 week, Fever- Low grade not associated with chills and rigor since 1 week. Moderate Splenomegaly, Esophageal varices Grade III, Severe Portal hypertension, extra hepatic portal vein obstruction d/t formation of thrombosis JAK2V617F Mutation test positive.

Keywords: Polycythemia Vera, JAK2 Mutation, portal hypertension, cytoreductive therapy

INTRODUCTION

A myeloproliferative neoplastic condition called polycythemia Vera (PV) causes uncontrolled red blood cell synthesis, which raises the amount of red blood cells (RBCs). Increased production of white blood cells and platelets is frequently the result of myeloid and megakaryocytic lineages being stimulated simultaneously. An aberrant hematopoietic cell clone causes higher sensitivity to growth stimuli, according to current understanding of pathophysiology. Normal lineage proliferation is disrupted by the aberrant clonal line, and a signaling deficiency causes an aberrant response to growth stimuli. 90 percent of patients with polycythemia Vera have a mutation in the Janus kinase-2 (JAK2) gene, which is involved in intracellular signaling. (PV). [1]In patients with polycythemia Vera (PV), the bone marrow includes both normal stem cells and aberrant clonal stem cells that inhibit the growth and maturation of normal stem cells. Unchecked neoplastic growth is the cause of panmyelosis. The signaling disruptions that cause PV are probably caused by mutations in the JAK2 kinase. JAK2V617F, a valine to phenylalanine mutation at position 617 of the JAK2 gene, results in constitutively activated cytokine receptors.[2] Over 90% of PV patients, 50% to 60% of primary myelofibrosis patients, and 50% of essential thrombocythemia patients have this mutation. Increased synthesis of red blood cells and platelets results from this process, which can cause bleeding and thrombosis.[1] Polycythemia Vera (PV) is characterized by thrombosis and hyperviscosity, which hinder the supply of oxygen. Fatigue, headache, lightheadedness, tinnitus, alterations in eyesight, sleeplessness, claudication, itching, gastritis, and early satiety are examples of physical problems. In 40% of patients, they experience aquagenic pruritus, which happens during or after a hot shower.[3] In 1% of patients, bleeding and thrombotic problems are noted. Gastrointestinal (GI) bleeding, gum bleeding, and epistaxis are examples of bleeding occurrences.

Thrombotic events might include arterial thrombosis, splanchnic vein thrombosis, Budd-Chiari syndrome, pulmonary embolism (PE), deep vein thrombosis (DVT), and stroke. [4] Additionally, splenomegaly and hepatomegaly are frequently seen. Due to increased histamine release from basophils and increased viscosity in the gastrointestinal blood flow, GI pain and peptic ulcer disease are prevalent.[5] A partial or total clot blockage of the portal vein, causing flow obstruction, is known as portal vein thrombosis (PVT). If occlusion of the portal vein continues over time, the surrounding veins may widen to allow collateral flow, which can lead to the creation of a cavernoma. Virchow's triad characteristics—hypercoagulability, endothelial damage, and stasis—are the basis for predisposition to PVT.[6]Esophageal varices are linked to JAK2-related splanchnic vein thrombosis, and individuals with portal vein thrombosis will have a high rate of gastrointestinal bleeding.[7] Treatment suggestions for low-risk patients under 60 who have no history of thrombotic events include phlebotomy and low-dose aspirin (40–100 mg) taken once or twice daily. A patient is deemed high risk if they are 60 years of age or older and/or have a history of thrombosis. In addition to phlebotomy and aspirin, cytoreductive treatment is advised for high-risk individuals. HU is the first-line treatment. Patients who are intolerant or who are not responding to hydroxyurea therapy may attempt busulfan or pegylated interferon. Ruxolitinib, anagrelide, pipobroman, and radioactive phosphorus are further substitutes. Pegylated interferon or busulfans are options for patients who are intolerant or who are not responding to hydroxyurea therapy. [8]

Case Presentation

A 57-year-old female patient came with chief complaints of abdominal pain in hypochondrial region since 1week, low grade fever not associated with chills and rigors since 1 week. On the day of admission patient vitals were found to be BP :120/80 mmhg, pulse rate :96bpm, oxygen saturation 96% ,CVS :S1,S2 (+), RS : BAE(+), Per abdomen :soft non distended, moderate splenomegaly. On palpitation: Hackets Grade 3, firm in consistency with mild tenderness. An early endoscopy was performed presented with esophageal varices grade3, Blood test was revealed Erythrocytosis ($6.97*10^6$ /uL), Bone marrow aspiration: Hyper cellular marrow with erythroid hyperplasia with focal megablastic maturation .Ultra sound abdomen scan of abdomen: mild gall bladder edema &moderate splenomegaly. Contrast

Enhanced computed Tomography: Extra hepatic portal vein obstruction due to formation of thrombosis.JAKA2 V617F Mutation Test : Positive .Based on physical examination and laboratory investigation patient has been diagnosed as 'Polycythemia vera [JAK2, V617F+] Presented with Extra hepatic portal vein obstruction, portal hypertension, massive splenomegaly with esophageal varices grade 3 '.patient has treated antiplatelet [Enoxaparin], anticoagulant [Apixaban], alpha and beta-blocker[Carvedilol], Endoscopic Variceal Ligation (EVL) banding,Phlebotomy regularly with a target of Hemoglobin <14g/dL and Hematocrit <45%, beta blockers[Propranolol]

DISCUSSION

Erythrocytosis is seen in the patient with elevated red blood cell counts. Neoplastic, malignant, and pan hyperplastic bone marrow are the hallmarks of polycythemia, a stem cell illness. Its most notable characteristic is the increased bulk of red blood cells brought on by unchecked synthesis of red blood cells, as well as the increased production of white blood cells and platelets brought on by aberrant hematopoietic stem cells.[9]As a severe consequence of portal hypertension (PH), typically brought on by cirrhosis, acute esophageal variceal hemorrhage is a medical emergency with a high morbidity and fatality rate.[10] When portal hypertension occurs, acute variceal hemorrhage is the most dangerous consequence. When it comes to the diagnosis and risk assessment of bleeding from esophageal varices, endoscopy is essential. In the Western world, portal vein thrombosis is the second most prevalent cause of PH in older individuals, but cirrhosis accounts for over 90% of cases. [11] In the present case, the patient on her first visit because of hemorrhaging, while the WBC and platelet counts were almost normal, although she had moderate splenomegaly as well asExtra hepatic portal vein obstruction due to formation of thrombosis.,. We performed JAK2V617F screening and obtained a positive result, which lead to the diagnosis of PV after acquiring confirmation based on an examination of the bone marrow which was reported Hyper cellular marrow with erythroid hyperplasia with focal megaloblastic maturation. Here we focuses on relieving symptoms and preventing complications such as bleeding, thrombosis, and the progression of myelofibrosis, acute leukemia or myelodyspastic syndrome .Phlebotomy, aspirin, Propranolol, Enoxaparin, Hydroxy urea, Hydroxy urea are used to treat patient. Ruxolitinib, a JAK inhibitor, was approved by the Food and Drug Administration in 2014 to treat PV patients who were intolerant to or did not respond well to hydroxyurea. When ruxolitinib was administered to patients, the vast majority had complete hematological remission. [1]

CONCLUSION

In conclusion, we noticed a female patient who had esophageal varices ruptured and was subsequently diagnosed with PV. In instances with portal hypertension, thrombosis of unclear cause, and splenomegaly without pancytopenia, conditions like PV should be suspected. Furthermore, JAK2V617F screening offers useful hints for latent PV diagnosis. The primary goal is to prevent thrombic consequences, which are the main cause of PV-related morbidity and mortality, and to keep the hematocrit below 45%. This can be accomplished by using pharmacological medications in conjunction with periodic phlebotomy.

ABSTRACT

The COVID-19 pandemic posed unprecedented challenges to maternal healthcare systems worldwide, including in India. With disruptions in healthcare services, increased stress levels, and limited access to routine care, pregnant women faced heightened physical and mental health risks. Amid these challenges, yoga emerged as a promising intervention to support maternal well-being. This article explores the impact of yoga on maternal healthcare during the pandemic, highlighting its role in improving physical health, reducing stress, enhancing mental well-being, and fostering resilience among pregnant women in India. Drawing on existing literature and case studies, we discuss how integrating yoga into maternal healthcare can serve as a sustainable and cost-effective strategy to address gaps in healthcare delivery, particularly during public health crises.

Keywords: Yoga, Maternal Healthcare, COVID-19, Pregnancy, Mental Health, India

INTRODUCTION

The outbreak of the COVID-19 pandemic in early 2020 disrupted healthcare systems globally, with maternal healthcare being one of the most affected domains. In India, pregnant women faced significant barriers to accessing antenatal care, institutional deliveries, and postnatal services due to lockdowns, fear of infection, and overwhelmed healthcare facilities. Additionally, the psychological toll of the pandemic—ranging from anxiety about pregnancy outcomes to isolation—further exacerbated maternal health challenges.

LITERATURE REVIEW

The unprecedented challenges posed by the COVID-19 pandemic significantly disrupted maternal healthcare systems worldwide, with India being no exception. Pregnant women faced heightened physical, emotional, and psychological stress due to restricted access to healthcare services, fear of infection, and social isolation. Amid these challenges, yoga—a traditional Indian practice combining physical postures (asanas), breathing exercises (pranayama), and meditation—emerged as a promising intervention to support maternal well-being. This literature review synthesizes existing studies and evidence on the impact of yoga on maternal healthcare during the pandemic in India, highlighting its role in addressing physical, mental, and emotional health concerns.Nayak, N et al. (2021) highlighted how yoga helped to reduce anxiety and depression in pregnant women during lockdowns in their study "Role of Yoga in Maternal Mental Health During the COVID-19 Pandemic: An Indian Perspective."

Physical Health Benefits of Yoga for Pregnant Women

Several studies have documented the positive effects of yoga on the physical health of pregnant women during the pandemic.

- **Improved Pregnancy Outcomes**: A study conducted in Maharashtra by Kumar et al. (2021) found that pregnant women who practiced prenatal yoga regularly experienced better fetal growth, reduced risk of gestational diabetes, and lower incidence of preterm labour compared to those who did not engage in structured physical activity. These findings align with earlier research suggesting that yoga enhances blood circulation, reduces inflammation, and promotes hormonal balance, all contributing to healthier pregnancies.
- **Pain Management**: The pandemic exacerbated pregnancy-related discomforts such as back pain, pelvic pain, and edema due to limited mobility and increased stress. Research by Sharma and Gupta (2022) highlighted that specific yoga poses like "Cat-Cow Stretch" and "Sukhasana" effectively alleviated musculoskeletal pain, improving overall comfort levels among pregnant women.
- **Immune System Support**: During the pandemic, maintaining a robust immune system was critical for both mothers and unborn children. A review by Singh and Mishra (2021) emphasized that pranayama and relaxation techniques in yoga stimulate the parasympathetic nervous system, thereby enhancing immune function and reducing susceptibility to infections.

Mental Health and Emotional Well-being

The psychological toll of the pandemic on pregnant women was profound, with many experiencing heightened anxiety, depression, and stress. Yoga emerged as a powerful tool to address these mental health challenges.

- **Stress Reduction** A longitudinal study by Rao et al. (2022) involving 500 pregnant women across urban and rural areas of Karnataka demonstrated that participants who engaged in daily yoga sessions reported a significant reduction in cortisol levels and perceived stress. Meditation practices, particularly mindfulness-based techniques, were identified as key contributors to this outcome.
- **Improved Sleep Quality** Sleep disturbances are common during pregnancy and were further exacerbated by pandemic-related anxieties. A study by Patel and Verma (2021) found that yoga nidra (yogic sleep) improved sleep quality and duration among pregnant women, helping them cope with fatigue and insomnia.
- **Resilience Building** The pandemic underscored the importance of resilience in navigating uncertainty. According to a qualitative study by Jain et al. (2023), women who practiced yoga reported feeling more grounded and emotionally stable, enabling them to manage fears about childbirth and the future.

Accessibility and Feasibility of Yoga During Lockdowns

One of the most significant advantages of yoga during the pandemic was its accessibility and adaptability to home-based settings.

- **Virtual Platforms** With restrictions on movement and in-person healthcare services, virtual yoga sessions became a lifeline for many pregnant women. Government initiatives, such as those led by the Ministry of AYUSH, promoted online prenatal yoga classes tailored to the needs of expectant mothers. These programs reached thousands of women across diverse socio-economic backgrounds, ensuring continuity of care despite lockdowns (Ministry of AYUSH Report, 2021).
- **Community-Based Programs** NGOs and community organizations played a pivotal role in disseminating yoga practices. For instance, a case study from Kerala highlighted how local self-help groups organized small-group yoga sessions adhering to safety protocols, fostering a sense of community and mutual support among pregnant women (Thomas & Menon, 2022).Policy and Programmatic Implications
- The success of yoga as an intervention during the pandemic has prompted calls for its integration into mainstream maternal healthcare policies.
- **National Health Programs** Experts argue that incorporating yoga into national schemes like the Pradhan Mantri Matru Vandana Yojana (PMMVY) could enhance maternal health outcomes. A policy brief by the National Institute of Health and Family Welfare (NIHFW, 2022) recommended training healthcare providers in basic yoga techniques to guide pregnant women effectively.
- **Scalability and Sustainability** Unlike resource-intensive medical interventions, yoga is cost-effective and scalable, making it particularly suitable for low-resource settings. Studies suggest that investing in yoga-based maternal health programs could yield long-term benefits, even beyond the pandemic (Agarwal et al., 2023).

Gaps in Existing Literature

While the available evidence underscores the benefits of yoga for maternal healthcare during the pandemic, several gaps remain

- **Limited Longitudinal Studies** Most studies conducted during the pandemic were cross-sectional or short-term, limiting insights into the long-term effects of yoga on maternal and child health outcomes.
- **Underrepresentation of Marginalized Groups** There is a paucity of research focusing on the impact of yoga among marginalized communities, including tribal populations and women in conflict zones, who may face unique challenges in accessing healthcare.
- **Standardization of Practices** Variability in yoga protocols used across studies makes it difficult to draw definitive conclusions about optimal practices for pregnant women.

In this context, yoga—a traditional Indian practice combining physical postures, breathing exercises, and meditation—gained prominence as a complementary approach to support maternal health. Recognized for its holistic benefits, yoga has been increasingly integrated into maternal healthcare programs in India. This article examines the impact of yoga on maternal healthcare during the pandemic, emphasizing its potential as a scalable solution to mitigate the adverse effects of future public health emergencies.

Challenges in Maternal Healthcare During the Pandemic

The pandemic severely impacted maternal healthcare in India in several ways

Disruption of Services Lockdowns and travel restrictions limited access to essential services such as antenatal check-ups, ultrasounds, and vaccinations.

Increased Stress and Anxiety Fear of contracting the virus, financial instability, and social isolation contributed to elevated stress levels among pregnant women.

Mental Health Concerns Studies reported a rise in depression and anxiety disorders among pregnant women during the pandemic.

Overburdened Healthcare System Hospitals prioritized COVID-19 patients, leading to reduced availability of maternal healthcare resources.

These challenges underscored the need for innovative, low-cost interventions that could be implemented at home or within communities to support maternal well-being.

Role of Yoga in Addressing Maternal Health Challenges

Yoga offers a multifaceted approach to addressing the physical, emotional, and mental health needs of pregnant women. Its benefits during the pandemic include:

Physical Health Benefits

Improved Pregnancy Outcomes: Regular practice of prenatal yoga has been associated with better fetal growth, reduced risk of preterm labour, and improved birth weights.

Pain Management: Yoga helps alleviate common pregnancy-related discomforts such as back pain, pelvic pain, and swelling.

Enhanced Immunity: Breathing exercises (pranayama) and relaxation techniques boost immune function, which was particularly critical during the pandemic.

Mental Health and Emotional Well-being

Stress Reduction: Meditation and mindfulness practices reduce cortisol levels, helping manage stress and anxiety.

Improved Sleep Quality: Yoga promotes relaxation, aiding in better sleep patterns—a common concern among pregnant women during the pandemic.

Resilience Building: By fostering a sense of calm and focus, yoga empowers women to cope with uncertainty and adversity.

Accessibility and Feasibility

Home-Based Practice: With restrictions on movement, yoga provided a safe and accessible option for women to maintain their health at home.

Community Initiatives: Several non-governmental organizations (NGOs) and government programs promoted virtual yoga sessions tailored for pregnant women, ensuring continuity of care.

Case Studies and Evidence

Several initiatives during the pandemic demonstrated the positive impact of yoga on maternal health

Government-Led Programs The Ministry of AYUSH (Ayurveda, Yoga & Naturopathy, Unani, Siddha, and Homeopathy) launched online yoga classes specifically designed for pregnant women. These sessions reached thousands of women across rural and urban areas, providing them with tools to manage stress and stay physically active. Research Findings: A study conducted in Maharashtra showed that pregnant women who practiced yoga regularly reported lower anxiety levels and improved overall well-being compared to those who did not engage in any structured physical activity. Community Stories: Testimonials from women in states like Kerala and Tamil Nadu highlighted how daily yoga practice helped them stay connected to their bodies, manage fears about childbirth, and build confidence during uncertain times.

Policy Implications and Recommendations

The integration of yoga into maternal healthcare during the pandemic highlights its potential as a sustainable solution for future crises. To maximize its impact, the following recommendations are proposed:

Incorporate Yoga into National Health Programs Include prenatal yoga modules in existing maternal healthcare frameworks, such as the Pradhan Mantri Matru Vandana Yojana (PMMVY).

Promote Digital Platform: Expand access to virtual yoga sessions through mobile apps and telemedicine platforms, ensuring inclusivity for women in remote areas.

Train Healthcare Providers Equip doctors, nurses, and midwives with knowledge about the benefits of yoga so they can recommend it to pregnant women.

Conduct Further Research Invest in longitudinal studies to assess the long-term effects of yoga on maternal and child health outcomes.

CONCLUSION

The COVID-19 pandemic highlighted the vulnerabilities of maternal healthcare systems while also showcasing the resilience of traditional practices like yoga. As a culturally relevant, cost-effective, and accessible intervention, yoga played a vital role in supporting the physical, mental, and emotional well-being of pregnant women in India during the crisis. Moving forward, integrating yoga into mainstream maternal healthcare policies can enhance preparedness for future challenges and ensure equitable access to quality care for all women. By embracing this ancient practice, India can lead the way in promoting holistic maternal health solutions on a global scale. Acknowledgement: I sincerely acknowledge the principal of Suri Vidyasagar College and the Head of the Department of Economics, and my other fellows for their invaluable support, which greatly contributed to the completion of my study.

ABSTRACT

Prolonged sitting is a dominant posture in modern work settings, contributing to spinal misalignment and muscle imbalances. Kyphosis, an excessive rounding of the upper back, may result from various factors, including prolonged sitting. It can also weaken core muscles, which are essential for trunk stability and posture. This study aims to assess its impact on thoracic kyphosis and core muscle strength. A quasi-experimental study was conducted at a private medical college using convenient sampling. Phase 1 involved screening 100 adults (aged 20–45) who sat over 4 hours daily. 32 participants with increased thoracic curvature (APECS app), low physical activity (GSLTPQ <24), and weak core strength (partial curl-up test <30th percentile) were selected for a 6-week exercise intervention. The program targeted posture and core strength. Outcome measures were assessed pre- and post-intervention. Data were analyzed using SPSS, with median, IQR, and Z-scores calculated. The Wilcoxon signed-rank test determined statistical significance. Of 100 screened, 28 participants (12 males, 16 females; mean age 34.6 years, BMI 29.5 kg/m²) completed the study. Post-intervention, significant improvements were observed in thoracic curvature (APECS App), physical activity (GSLTPQ), and core strength (partial curl-up test). Wilcoxon signed-rank test showed statistical significance with $P < 0.001$. Prolonged sitting has shown to adversely affect individuals' thoracic curvature and core strength. Prolonged sitting can have negative effects that can be minimized with regular exercise and core-strengthening activities.

Keywords: Adult, Kyphosis, Muscle Strength, Posture, Sedentary Behavior.

INTRODUCTION

The rise in physical inactivity, lack of fitness, and sedentary lifestyles among young people has become a significant public health concern across the globe. [1,2] Sitting for long hours at work can cause continuous muscle strain, especially in the neck and shoulders. To relieve discomfort, many adopt a forward head posture (FHP), where the head extends forward, and the chin juts out. Over time, this poor posture increases strain on the neck, causing discomfort and persistent pain due to continuous mechanical pressure. [3,4] Spinal posture which is crucial for various activities, depends on how spinal segments align with gravity and each other, influenced by biomechanical and neuromuscular factors. The ideal posture ensures balanced weight distribution for minimal strain, efficient movement, and energy conservation.[5] The link between physical activity (PA) and sagittal posture remains a topic of debate. Some studies suggest that individuals who are more physically active tend to have better postural control than those who are inactive. [6] Additionally, research examining the effects of prolonged sedentary behavior on thoracic spine mobility found that individuals who sit for over seven hours daily and engage in less than 150 minutes of physical activity per week exhibit reduced mobility in the thoracic spine. [7]

Postural evaluation techniques like plumb line, photographic analysis, and radiographic imaging can identify postural deviations or anomalies. [8,9] Trunk muscles are essential for preserving spinal stability. [10] These muscles are divided into two categories: deep and superficial. [11,12] The deep muscular system, which comprises the internal oblique (IO), transversus abdominis (TrA), and lumbar multifidus (LM), counterbalances upper-body stresses and improves lumbar stability. [13] A lack of balance between the trunk extensor and flexor muscles due to poor posture can impact the natural curvature of the lumbar spine, potentially exaggerating the lordotic curve and contributing to health complications over time. [14,15] Furthermore, a largely sedentary lifestyle not only weakens and shortens the muscles supporting the back, [16] but also contributes to joint stiffness and restricts movement in the spinal joints. [17]

The AI Posture Evaluation and Correction System (APECS) was developed as a tool for medical professionals and posture experts. APECS aims to evaluate and correct posture by analyzing the position of the head, neck, and shoulders, as well as measuring spinal posture through photographs or direct measurements on the subject's body using markers in a static standing posture.[18] Despite growing interest in posture-related research, only a limited number of studies have employed digital tools such as APECS to objectively evaluate thoracic curvature in connection with physical activity. Furthermore, the joint impact of core stability and prolonged sedentary behavior on spinal alignment among young adults has not been thoroughly investigated. Gaining insight into these relationships can help shape preventive strategies aimed at enhancing posture and core endurance, ultimately lowering the risk of chronic musculoskeletal problems in adults of working age. The purpose of this study was to investigate the link between physical activity and sedentary behavior, as well as how they affected physiological spinal curvatures, trunk power, and stability.

MATERIALS AND METHODS

Study Design

This is a quasi-experimental study; convenient sampling.

Participants

The research was conducted in a Private Medical college and hospital using convenient sampling. The inclusion criteria for phase 1 involved 200 samples aged 20-45, both genders, sitting for over 4 hours. Phase 2 comprised of62 participants with increased thoracic curvature (examined by using APECS APP), low physical activity (GSLTPQ score <24), and weak core strength (partial curl up test- score less than 30 percentile). The exclusion criteria for the study include individuals with recent fractures, previous spinal surgery, a history of chronic back pain, and a history of chronic illness or neurologic conditions. Ethical approval for the study was obtained from the Institutional

Scientific Review Board. The data collected were entered in a Microsoft Excel spreadsheet and analyzed by using SPSS software.

Procedure

Participants who fulfilled the eligibility requirements and agreed on the informed consent form were given 6 weeks of exercises to enhance their neck posture and core muscle strength. Before beginning of the exercises, the participants were instructed to do warm up and cool down after performing the exercises.

Outcome measures

APECS App. The AI Posture Evaluation and Correction System (APECS) app analyzes body posture using anatomical reference points and angle measurements, avoiding X-rays. Based on 50 years of research, participants stand 3 meters from a camera on a tripod (100 cm high). They face forward, then turn left with feet aligned for a comprehensive evaluation.

The Godin-Shephard Leisure-Time Physical Activity Questionnaire (GSLTPQ), or GLTEQ, measures leisure-time physical activity, cited over 1,160 times in Scopus. It includes four self-reported questions, assessing the weekly frequency of mild, moderate, and strenuous activities lasting at least 15 minutes.

Partial Curl-Up Test Participants begin by lying on a yoga mat, knees bent at a 90-degree angle, and fingers resting on a four-inch piece of tape. They next do controlled curl-ups, pushing their shoulder blades off the mat while keeping good form. Before moving on to the next repetition, the upper back must return to the mat completely. This workout aims to test core strength and endurance.

Exercises for improving neck posture

Start with 10 reps, increase to 15, hold for 5 seconds with 30-seconds rest. Perform 3 sets of each exercise, 6 times weekly for 6 weeks.

Neck extension in prone Participants start on their stomachs, arms by shoulders, mimicking a push-up start. They lift their upper body towards the ceiling, keeping lower body still. The aim is full extension, reverting to start if discomforted. Begin with 10 reps, and gradually increasing to 15 reps.

Neck extension in sitting Seated upright without curving the spine, the participant tilts their head backwards to look up, holding for 6-8 seconds, then returns to the starting position.

Retraction in sitting position Start in a sitting or lying position, gently pull the chin towards the chest for alignment, not extreme posture. Then, with the chin tucked, push the head back and slightly up to stretch the neck's back. Relax before repeating, considering the movement as a diagonal stretch to improve neck flexibility.

Shoulder flexion/thoracic extension. Stand facing a wall with your forearms and elbows placed against it at shoulder height. Slowly extend your arms upward while leaning your chest forward, focusing on movement in the middle and upper back while keeping your lower back neutral. Engage your core and exhale to stabilize the lumbar spine and prevent excessive arching. Return to the starting position and repeat, gradually increasing your range of motion.

Wall Push-ups Face a wall and position your hands at chest height, shoulder width apart. Take a slight step back, keeping your posture straight from head to heels. Engage your core muscles as you push yourself back to the beginning position after slowly bending your elbows to bring your chest closer to the wall. Concentrate on maintaining control and appropriate form throughout the exercise.

Exercise for improving core muscle strength

Side bridge Lie on one side, supported by an elbow, legs nearly straight, and lift hips into a side plank while exhaling, maintaining the position briefly. Start with 5 side bridge repetitions, increasing to 10, holding each for 6-8 seconds with a 1-minute rest between sets, three times a week for six weeks.

Bird dog exercise Begin on hands and knees, with knees below hips and hands underneath shoulder. Lift the opposite arm and leg, maintaining balance for 6-8 seconds, then switch sides, keeping the body level. Begin with 8 bird-dog repetitions, increasing to 15, holding each for 6-8 seconds with 1-minute rests, three times a week for six weeks.

Partial curl up Participants lie on their backs, knees bent, arms beside them touching a tape. Perform controlled curl-ups by elevating the shoulders off the floor, aiming for a 30-degree angle, ensuring upper back contact before repeating. Start with 10 curl-ups, increasing to 15-20, holding for 6-8 seconds with 1-minute rests between sets, three weekly sessions for six weeks.

RESULTS

The study began with 200 participants aged 20–45, both male and female, who sat for over four hours. Based on the inclusion criteria—increased thoracic curvature (assessed via APECS APP), low physical activity (GSLTPQ score <24), and weak core strength (partial curl-up test below the 30th percentile)—only 62 participants qualified and progressed to Phase 2, of which 4 participants couldn't continue the exercise program regularly. The collected data was carefully analyzed and assessed. For each parameter, the median, IQR, and Z-score were calculated. The Wilcoxon test was conducted using SPSS software to determine statistically significant differences between pre-test and post-test measurements.

Participants demographic details

A total of 58 individuals took part in the study, comprising 27 males (46.55%) and 31 females (53.45%). The participants had an average height of 167.4 cm, an average weight of 89.9 kg, and a mean age of 34.6 years. Their average Body Mass Index (BMI) was calculated to be 29.5 kg/m². [Table 1 and 2]. The pre and post test data of APECS APP (thoracic curvature), GSLTP questionnaire (physical activity) and partial curl test (core strength) were collected. Because all three outcome measures are based on ordinal scales, the most appropriate measure of central tendency is the median and its interquartile range (IQR) was considered. [Table 3]. The Wilcoxon signed rank test is used to obtain the Z value and p values of the collected data. [Table 4].

DISCUSSION

The findings of this research provide additional support for the increasing agreement that a lack of physical activity and extended periods of sitting contribute to significant changes in posture, weaker core muscles, and a decline in overall physical health. Our findings suggest that individuals who engage in minimal physical activity tend to have poorer control over their posture, including a more pronounced thoracic curvature, lower endurance in trunk muscles, and compromised balance. These observations are in agreement with previous research that has emphasized the negative impact of a sedentary lifestyle on musculoskeletal well-being. [7]

A significant component of this study was the application of the AI Posture Evaluation and Correction System (APECS) to analyze spinal posture. The initial assessments revealed that participants who exercised less than 150 minutes per week displayed a noticeably higher thoracic curvature compared to those who were more physically active. This finding supports prior research by Moriyama (2017), which highlighted that extended periods of sitting impair spinal mobility and postural stability.[16] Furthermore, the partial curl-up test indicated that individuals with more sedentary habits had reduced core muscle strength, reinforcing previous studies that emphasize the role of

trunk muscle endurance in maintaining spinal alignment [10]. When comparing our study's findings with prior research, we identified similar trends regarding the harmful effects of poor posture on long-term musculoskeletal health. Studies conducted by Marijančić V et al. (2023), Singla & Veqar (2014) and Herzog et al. (2015) demonstrated that prolonged sedentary behavior leads to postural imbalances, increasing the risk of chronic pain and mobility limitations. [6,8,17] Our research supports these findings, as participants showed significant improvements in spinal posture and core strength following a structured six-week exercise program. The post-intervention measurements for APECS, GSLTPQ, and the partial curl-up test indicate that targeted physical activity can have a beneficial effect on posture and trunk muscle endurance.

One of the most noteworthy outcomes of this study was the marked enhancement in postural correction after the intervention. Participants who adhered to the recommended neck posture and core-strengthening exercises experienced mild reductions in thoracic curvature, an increase in physical activity levels, and improvements in core endurance. These results align with the work of Faries & Greenwood (2007), who emphasized that core stability exercises play a vital role in promoting postural control and preventing spinal deformities [12]. Although this study offers meaningful findings, it does have a few drawbacks. The sample size was relatively limited, and the intervention period was quite short, which might affect how well these results apply to the general population. Also, the APECS system was only used to assess posture in a static standing position, which doesn't reflect how posture might change during daily movements or activities. Another point to consider is that some of the data, like physical activity levels, were self-reported and could be prone to bias. Moving forward, studies with a larger and more varied group of participants, longer intervention periods, and dynamic posture assessment tools would help strengthen the evidence. It would also be useful to explore how these findings translate to people in different work environments where posture plays a crucial role. The results highlight the importance of incorporating regular exercise to counteract the negative effects of prolonged sitting. The observed improvements in postural alignment and core muscle strength following the intervention demonstrate the potential benefits of structured exercise programs in preventing musculoskeletal issues. These findings lay the groundwork for future research that could explore more personalized intervention strategies to promote better posture and overall physical well-being. Future studies should consider adopting a longer time frame and a larger, more diverse sample group to further substantiate these findings.

ACKNOWLEDGEMENT

I am deeply grateful for the support and guidance I received throughout the course of this research. The insights and knowledge shared by various individuals have played a significant role in shaping my understanding and grounding in this area of study. I extend my sincere thanks to the department for offering the resources and a nurturing environment that fostered my learning. A special note of appreciation goes to all the volunteers who participated in this study—their time, cooperation, and willingness to contribute were essential to the completion of this project. Their involvement was truly invaluable, and I am thankful for the collective effort that helped bring this research to life.

ABSTRACT

Examining the attitude of undergraduate and postgraduate physical therapy students toward a person with a disability. The cross-sectional survey study was conducted among 369undergraduate and postgraduate physiotherapy students from Maharishi Markandeshwar institute of physiotherapy &rehabilitation during August 2022 to April 2023. Self-administered Questionnaires were used to collect data through convenient sampling method. After it's validation from the experts, it will be distributed to the students via goggle form. Consent will be taken from the students and the questions will be thoroughly explained. In the end, all the responses from the participant will be collected the study included 369 Physiotherapy students from Maharishi Markandeshwar institute of physiotherapy & rehabilitation. As the findings of the results,30.1% of students strongly agree to be a calm and develop more patience while treating disabled patients.10.2% of participants strongly agree, 22.8% of participants agree while 39.6% of participants responds that they get irritated because of prolong treatment process. To deal with disability among paediatric population is more difficult than adults in this 12.1% of participants responds strongly agree and 46.6% responds agree. The present study concluded that 71.19 % of people had a positive attitude toward treating people with disabilities among undergraduate and postgraduate physical therapy students.

INTRODUCTION

In accordance to the World Health Organization's planned International Classification of Health, Functioning, and Disability (ICF), the word "disabilities'' specifically refers to limitations in activity and participation as well as impairments of body structures and functions [1]. A condition that restricts one's personal, physical, and mental capabilities is referred to as a disability [2]. The World Health Organization (WHO) estimates that 7% to 10% of people in underdeveloped nations are disabled. According to some, social and individual attitudes have the greatest ability to limit the lives of disabled individuals. The WHO estimates that 2-4 % of the world`s population is severely disabled and that 15% of people worldwide have some sort of disability [3,4] Disability is a global problem that millions of individuals have to cope with it. Accordance to the World Health Organization, there are currently over one billion individuals with impairments globally, most of whom reside in low- and middle-income nations. Over twenty-six million people in India are believed to be disabled, with a prevalence of impairment of around 2.2%. Several factors affect the incidence of impairment in India and throughout the world. Among these include social stigma, inadequate healthcare, restricted possibilities for education and work, malnutrition, poverty, and insufficient food [5,6].

In India, individuals who are disabled are more likely to be women, people from lower socioeconomic beginnings, and residents of rural areas. In the past few years, the necessity of addressing handicapped person concerns on a worldwide scale has received focus. In order to promote and uphold the rights of people with impairments the (UNCRPD) was passed in 2006. The Goals for Sustainable Development acknowledge the significance of addressing disability difficulties and call decrease of disparities in SDG 10 and the establishment of inclusive and environmentally friendly communities and cities in SDG 11 [5]. According to particular research, a physical therapist's psychological characteristics can influence how they treat individuals with disabilities and impairments. Based on the majority of research, women are frequently more upbeat than men [3]. In addition, psychological or self-promoted interest in exercising is affected by the equipment and exercise structures that are chosen. In addition to enhancing overall health, having access to a variety of adaptive exercise equipment is essential for increasing exercise-induced body satisfaction in those with disabilities5. In addition to affecting a patient's ability to access care, healthcare personnel's attitude towards patients with the level of care provided can be significantly impacted by disability [7,8].

The cause of disability is defined as the fundamental causes of an individual's physical or mental impairments. Hearing, vision, cognition, mobility, and mental and physical disability constitute the six specific types of disabilities. Disability-related risk factors can also be environmental, genetic, or a mix of the above two types. Genetic variables have a substantial impact on the cause of disabilities. For example, certain abnormalities in genes can result in a condition called Down syndrome or congenital fibrosis. Congenital fibrosis or Down syndrome, for instance, can be a result of certain genetic disorders. Environmental variables can additionally have an impact on the cause of a disability. It is possible for chemicals, diseases, or stress encountered during pregnancy or the initial stages of life to cause developmental delays or neurological disorders. Some deficiencies may be caused by a combination of inherited and environmental factors. As an example, the condition known as cerebral palsy may originate from birth trauma or harm to the baby in the womb's developing brain, but it may also have a genetic component. Understanding the cause of a disability is vital if a person is to receive the appropriate support and medical treatment Postural alterations: Postural anomalies may be caused by physical conditions like scoliosis or kyphosis. Respiratory issues: A person might find it difficult to breathe due to certain physical ailments, needing the use of additional oxygen or other assistance with breathing [9,10,11].

MATERIALS AND METHODS

Study design
Online cross-sectional survey study.

Sampling procedure
The study was conducted among physical therapy undergraduate and postgraduate students. Over a period of 7 months from August 2022 to May 2023. On the initial phase, questionnaire was developed which is used to assess the student's attitude towards the individuals who have disabilities. The questionnaires were then distributed to the students through Google form via various social media platforms. In the end, all the responses from the participant were collected.

Study Tool
A self-made questionnaire (Physical Therapy Students' Attitude towards Disabled Questionnaire -PTSATDQ) was developed to determine the attitude of undergraduate and postgraduate physical therapy students toward persons with disability, on to 5-point Likert Scale.

Data processing and analysis
The data was analyzed based on the responses to the Google form. The participant's responses were collected using the Excel chart linked to the Google form and were programmatically evaluated using the latest version of MS Excel for Windows 11 and SPSSv.26. The findings were noted and represented using tables, charts, and figures.

RESULTS

An online survey questionnaire was circulated among male and female physical therapy students age group of 17-33. The data was analyzed by using Microsoft Windows. A total369 responses were obtained the result has to be evaluated based on the following section.

DISCUSSION

Psychological state of the physical therapist while assessing the disabled person
Working with impaired patients can cause physiotherapists to feel a variety of emotions, such as empathy, frustration & stress which may impair their capacity to deliver high-quality therapy. Being empathetic is essential for patient care since it enables the therapist to comprehend the patient's viewpoint and offer specialized therapy. However, excessive empathy can lead to emotional exhaustion and burnout, which can negatively impact the therapist's mental health and job performance when the therapist was unable to bring out the expected effects of the treatment and that leads to frustration. Working with handicapped people was much more difficult because development was sluggish and required a lot of patience and effort [12,13]. As per the study, there was a big challenge for the therapist while dealing with the disabled person. Among those 20.6% of the individuals selected strongly agree, 29.8% of selected agree, 14.6 percent selected strongly disagree, 8.9 percent selected disagree, and 26% percent selected neither agree nor disagree. Our questions concluded that the physiotherapist was patient and calm while treating people with disability. As an outcome, 44.1% percent of those who participated selected strongly to agree, 43.1% selected agree, 2.4% of participants selected disagree and 22.5% selected neither agree nor disagree to the study.

Motivation enhance healing in disabled people

By this research findings regarding inspiration and motivation, 41.5% of the respondents selected "strongly agree," 48.8% selected agree, 3% selected "strongly disagree," 2.4% selected "disagree," and 4.3% selected "nor agree nor disagree." Since the working environment had a major impact in the recovery stage of disabled persons, in our study physical therapy students agreed that they maintain a welcoming environment while treating a disabled person and 47.2% 45 percent of those who participated said they agreed, and of them, 45 % said they strongly agreed.

CONCLUSION

The present study concluded that 71.19 % of people had a positive attitude towards treating people with disabilities among undergraduate and postgraduate physical therapy students.

ABSTRACT

An innovative wearable safety technology Smart Mine Suit has been developed to address critical shortcomings in existing systems for frontline workers. The Smart Mine Suit integrates a range of sensors, including heart rate, gas, and UV sensors, to provide comprehensive real-time monitoring of workers' health and environmental conditions. Vital signs, such as heart rate, are tracked to detect fatigue or physical stress, while hazardous gases like hydrogen sulfide, carbon monoxide, and methane are monitored using MQ136 and MQ9 sensors. The UV sensor ensures protection against harmful ultraviolet radiation. A lightweight system using Raspberry Pi serves as the central processing unit, enabling real-time data analysis and timely alerts through an integrated buzzer, which activates when unsafe thresholds are exceeded. The Smart Mine Suit, incorporated the multi-sensor in the suit for the miners that enhances worker's safety in high-risk environments and sets a new standard for wearable safety technology in occupational safety.

Keywords: Safety Wear, Smart Mine, Heart rate, Gas Concentration sensors, UV sensor, Real-time monitoring, Abnormality alert.

INTRODUCTION

The global mining industry is crucial for economic growth and providing key resources that modern society needs. It adds about 6% to the global GDP and employs more than 50 million people around the world [1, 10]. This sector is critical for building industries, expanding infrastructure, and advancing technology. However, it faces severe issues with more than 5,000 deaths annually due to accidents and poor conditions. This indicates the grave need for enhanced safety measures [9]. Scientific research shows that gases like carbon monoxide and hydrogen sulfide are responsible for 30% of mine-related deaths. Prolonged exposure to such dangerous gases could lead to serious health problems or even death [7]. Also, mine workers are exposed to UV radiation levels that are 40% higher than the safe limits. This increases their chances of getting skin cancer [4]. It is very important to deal with these problems to keep mine workers safe and healthy while also keeping their work productive and efficient. In India, the mining sector has faced numerous challenges regarding worker safety, with a significant number of accidents reported annually. According to reports from the Directorate General of Mines Safety (DGMS), over 200 fatalities occur each year due to incidents such as roof collapses, machinery failures, and gas explosions. The unregulated nature of many small-scale mines exacerbates these risks, as they often lack proper safety equipment and monitoring systems. Additionally, coal mines in regions like Jharkhand and Odisha have reported high levels of methane emissions, thereby increasing the likelihood of explosions if not detected early. Despite advancements in technology, a lack of widespread implementation of modern safety systems, combined with inadequate training for workers, continues to contribute to these preventable accidents. This highlights the urgent need for deploying smart wearable devices across India's mining industry to reduce fatalities and improve worker safety standards.

When compared to other mining-intensive countries like China and South Africa, India faces similar challenges but differs in the scale of incidents. For instance, China, which accounts for nearly half of the global coal production, reports thousands of mining-related fatalities each year, primarily due to its vast number of deep coal mines and frequent gas explosions. South Africa, known for its gold and platinum mines, also reports a high number of accidents caused by rockfalls and seismic events. However, both countries have made notable progress by adopting advanced safety technologies and implementing stricter regulations. India, on the other hand, lags in adopting comprehensive safety measures, particularly in its unorganized mining sector. By integrating lessons from these nations, such as real-time gas monitoring systems and predictive safety analytics, India could significantly improve its mining safety standards and reduce fatalities.

Carbon monoxide and hydrogen sulfide gases are commonly released in mines. The health hazard due to carbon monoxide is extremely severe. Several deaths result from these poisonous gases. Exposure to these gases in small amounts, even while in the process of inhalation, will cause critical health problems or demise if not identified at an early stage [7]. Talpur's study [1] and that of Rajakumar et al. [7] has also highlighted the need for using real-time gas monitoring systems to reduce risks. Advanced sensors such as the MQ-2 have been proven effective in the detection of gas leaks, and there is a good result in lowering the chances of accidents due to toxic emissions [2].

Another critical issue in mining is long exposure to ultraviolet (UV) radiation, which is associated with a higher risk of skin cancer among mine workers. Nautiyal and Baghari [4] say that about 15% of mine workers in areas with high UV levels show symptoms of too much sun exposure. These symptoms include skin burns, irritation, and in serious cases, early aging of the skin. It is very important to keep track of UV radiation levels to put protective measures in place and reduce health risks [4]. The hybrid wearable suit also reduced health risks from UV exposure by more than 40%, and Nautiyal and Baghari [4] showed their research on hybrid wearable suits that is effective for monitoring health in real time. Hybrid suits with UV detection sensors can give immediate alerts when exposure exceeds safe levels, hence helping people take preventive actions to avoid health problems. The study also demonstrates that workers with such suits adhere to safety rules 25% more than those without such technology.

Apart from the above environmental risks, mining work involves hard work, which makes heavy demands on workers' heart health, leading to fatigue or worse complications. The research indicates that 20% of health emergencies in mining occur due to problems in heart rate, which was not detected earlier. Monitoring heart rate always can be an indicator of early health issues, which would allow for immediate action [3, 6]. New advancements in wearable technology have brought new solutions to these problems. Smart wearable devices, such as helmets and suits with gas sensors, UV monitors, and heart rate trackers, are revolutionizing the management of safety in the mining industry. These systems have strong safety features. They give early warnings about dangerous situations, watch UV radiation exposure, and keep track of health in real-time. Comparative analysis studies on smart helmet systems showed that these systems are efficient in tracking workers' locations and ensuring their safety in confined mining spaces [8]. However, smart helmets are good at tracking where workers are and keeping them safe in tight spaces, but they do not offer as much full-body protection as Smart Mine. Unlike suits, helmets are limited to site-specific monitoring and might not be designed to deal with UV exposure or other general health monitoring, thereby missing the target hazards. This again highlights the need for more integrated solutions that can bring the best of both worlds.

Recent studies by Sainadh & Dass [5] and Guleria [6] have emphasized smart wearable devices as having potential for developing improvements in workplace safety and productivity. These devices monitor hazards in the environment and assist in worker health through constant health monitoring. This application of technology agrees with the findings by Patel et al. [9], who emphasized that wearable devices enhance safety and productivity at the workplace. The development and use of Smart Mine with advanced sensors is an important step in keeping mine workers safe. These suits are made to offer full protection by finding toxic gases, checking UV radiation levels, and watching workers' health in real-time. According to Mardonova and Choi [10], wearable device technology is of great importance to the mining industry. It will be able to modify safety practices, reducing the potential for accidents. With these new technologies, the long-standing safety issues of the mining industry can finally be solved in order to provide a safer working environment for workers.

MATERIALS AND METHODS

The Smart Mine Suit, enhances worker's safety through continuously monitoring environmental and physiological parameters using a network of sensors integrated with a Raspberry Pi and microprocessor. This architecture leverages real-time data processing and transmission to a centralized server, enabling prompt detection of hazardous conditions. The overall design of the Smart Mine suit is shown in Figure 1. It consists of four primary components: sensor modules, data processing units, a server infrastructure, and a web-based monitoring interface. The integration of these components forms a robust system capable of real-time data acquisition, processing, storage, and visualization.

Sensor Network

The system employs a multi-sensor network that includes the MQ136 for hydrogen sulfide detection, MQ9 for methane gas detection, a heart rate sensor for physiological monitoring, and a UV sensor for ultraviolet radiation measurement. These sensors are interfaced with the Raspberry Pi via GPIO and SPI (using an MCP3008 ADC for analog sensors) to facilitate high-fidelity data collection.

Data Processing

The Raspberry Pi acts as the initial data processing node, where raw sensor data is pre-processed, filtered, and then relayed to a microprocessor for additional processing. The pre-processing stage on the Raspberry Pi includes noise reduction, signal conditioning, and feature extraction to ensure data integrity before transmission. The microprocessor further refines the data, applying algorithms for anomaly detection and trend analysis. This layered approach to processing ensures that only significant and actionable data is transmitted to the server, reducing the communication overhead and enhancing system responsiveness.

Data Transmission and Storage

Data is transmitted from the microprocessor to a central server via a secure and efficient communication protocol, leveraging Socket.IO for real-time, bi-directional data exchange. The server infrastructure is built on a Node.js platform, utilizing MongoDB as the backend database for storing employee details. The data storage model is designed to handle high-velocity data streams while providing low-latency access for real-time queries. The MongoDB database is optimized for horizontal scaling, ensuring the system can manage increasing data loads without degradation in performance.

Web-Based Monitoring Interface

The final component of the system is a web-based monitoring interface developed using HTML5, CSS3, and JavaScript frameworks. The interface provides a real-time dashboard that visualizes sensor data through dynamic graphs and alerts. The interface is designed for both desktop and mobile platforms, ensuring accessibility for on-site managers and remote administrators. The interface also supports user-configurable thresholds for each sensor, enabling customizable alerting mechanisms tailored to specific operational environments. Figure 2 depicts the workflow of the system which begins with the integration of multiple sensors: the MQ136 and MQ9 for detecting harmful gases, a heartbeat sensor for monitoring heart rate, and a UV sensor for measuring exposure to ultraviolet radiation. These sensors are all digital and require analog-to-digital conversion for the Raspberry Pi to process the data. To achieve this, the analog sensor outputs are connected to the MCP3008, an 8-channel, 10-bit ADC (Analog to Digital Converter). The MCP3008 converts the analog signals from the sensors into digital form, making them compatible with the Raspberry Pi for further processing.

Once the data is digitized by the MCP3008, the Raspberry Pi, which functions as the microprocessor in this system, collects and processes the data in real-time. The Raspberry Pi serves as the central processing unit, extracting relevant data points from each sensor, such as gas concentration levels from the MQ136 and MQ9, heart rate from the heartbeat sensor, and UV exposure from the UV sensor. After the data is collected, the Raspberry Pi performs the necessary primary processing, such as filtering and noise reduction. Once the initial processing is complete, the Raspberry Pi prepares the data for transmission. It communicates with the server via socket communication, ensuring continuous and reliable data transfer. The Raspberry Pi sends the processed data to the server for centralized storage and management. The server receives this data in real-time, securely stores it, and provides access for monitoring and further analysis through a web application.

The web app also plays a critical role in alerting users to any thresholds being exceeded, such as dangerous gas concentrations or excessive UV exposure, ensuring worker safety through timely notifications. These alerts are immediately generated based on predefined safety thresholds and can be escalated to the user interface for quick action. Through this flow, the system ensures constant, real-time monitoring, data collection, processing, and alerting, with every stage of the workflow optimized for efficiency and accuracy.

RESULTS AND DISCUSSION

Validating the functionality of the circuit board and the accuracy of the sensor network, a series of controlled experiments were required and conducted. The setup included embedding the sensors on a breadboard integrated with a Raspberry Pi. Each sensor's performance was assessed against reference parameters to verify its sensitivity and reliability in detecting specific environmental and physiological conditions. The heart rate sensor was tested using human pulse signals, UV intensity was simulated using a UV light source. The Raspberry Pi processed these sensor inputs, ensuring accurate analog-to-digital conversions using the MCP3008 ADC. Figure 3 showcases the above-mentioned circuit board validation setup. Additional components like resistors, jumper wires, and an ADC (Analog-to-Digital Converter) were integrated to facilitate appropriate conversions. A buzzer was connected to provide audio alerts based on the sensor readings. The circuit board, after validation, was integrated into the Smart Mine prototype. This involved securely positioning sensors at optimal locations to monitor environmental hazards

and worker vitals. The suit was worn by a volunteer to test its effectiveness in real-world conditions. Sensor data was continuously transmitted to a central server, and the activation of the buzzer was expected if any parameter crossed predefined thresholds. Figure 4 displays a prototype of a smart safety vest with embedded electronics for health and environmental monitoring, featuring a transparent container housing the circuit components on the back. Tests confirmed the seamless operation of all sensors, with stable data transmission. The buzzer, designed as a critical safety feature, remained inactive throughout the trials, indicating that all conditions were within safe limits. This test established the durability of the system and its reliability in real-time monitoring.

Table 1 provides the recorded sensor outputs during the test phase, highlighting the system's ability to monitor diverse environmental and physiological parameters accurately. These outputs validated the system's precision in collecting and processing data. The buzzer did not buzz for the entire test indicating healthy condition. The Smart Mine *Suit*'s real-time monitoring capability was further evaluated using the web-based interface. The interface displayed live sensor readings, graphically representing trends and alert notifications. Simulated hazardous conditions were introduced to test the alert mechanisms. For example, increasing the hydrogen sulfide concentration triggered the buzzer within 2 seconds of crossing the threshold, demonstrating the system's rapid response capability. The simulated inputs verified the interface's responsiveness, with updates appearing instantly on the dashboard. This ensured effective monitoring and decision-making in dynamic work environments. Figure 5 displays a dashboard for a "Health Monitoring System" with a dark-themed user interface.

The normal condition threshold values are obtained from the typical values of the sensor models provided by the manufacturer's datasheet. Further the conversion of these units to much readable units (e.g., V -> ppm), the values will abide by the standards of regularities like Occupational Safety and Health Administration (OSHA), International Commission on Non-Ionizing Radiation Protection (ICNIRP) and World Health Organization (WHO). Table 2 presents the sensor readings for various environmental parameters under normal conditions, the recorded values during the system's operation, and the corresponding status of the buzzer. Hence, the inactiveness of the buzzer during the entire testing phase was justified with these numerical data. This comprehensive assessment of performance highlights the following key features of the system

Seamless Multi-Sensor Integration to function as a Single Unit

The suit integrates multiple sensors, including gas detectors (MQ9 and MQ136), heartbeat, and UV sensors, into a unified system. This enables simultaneous monitoring of environmental and health parameters without compromising efficiency or accuracy.

Real-Time Web-Based Environment and Personalized Health Monitoring

A centralized web-based dashboard provides real-time updates on gas levels, worker heart rates, and UV exposure. It also allows personalized health tracking for individual workers, ensuring tailored safety measures.

Quick Alerts to Frontline Workers as well as Admin

Immediate alerts (via a buzzer) are sent to frontline workers and administrators when critical thresholds are exceeded. This alert system ensures timely action and improves response time.

Threshold can be customized based on different Safety Standards and Environmental Conditions

Threshold values for gas concentrations, UV exposure, and heart rate can be adjusted to meet specific safety standards or environmental requirements, making the system adaptable to various mining operations.

Easy Deployment into Existing Mine Suit Increasing Portability and Comfort

The system is designed to be lightweight and compact, allowing for effortless integration into existing Mine suits. This ensures comfort and portability for workers during long shifts in challenging conditions.

Scalable as Workforce Increases Ensuring Safety of Every Single Employee

The system supports scalability, making it suitable for small teams or large workforces. It ensures comprehensive monitoring and safety for every worker, regardless of the number of employees.

CONCLUSION

The Smart Mine Suit, offers a practical and efficient solution to the challenges of ensuring worker safety in hazardous environments. By integrating sensors to monitor vital health parameters and environmental hazards, the system emphasizes early detection and intervention to prevent potential accidents. The activation of an alert system, via a buzzer, provides immediate and actionable responses, enhancing safety in critical situations. This technology lays the foundation for future innovations in wearable safety systems. Incorporating wireless connectivity could enable centralized monitoring, allowing supervisors to oversee multiple workers' health and environmental conditions remotely. Such enhancements would further strengthen the system's capabilities, enabling predictive analytics and faster interventions. The successful implementation of this system highlights its potential to transform safety protocols in high-risk industries such as mining, construction, and chemical manufacturing. This initiative demonstrates how advanced technology can bridge the gap between worker safety and operational efficiency, paving the way for a new era of occupational safety solutions.

ABSTRACT

In recent times, there has been an increase in the use of green chemistry to create metal-based nanoparticles from extracts taken from medicinal plants. The utilization of plant extracts for the synthesis of zinc oxide nanoparticles is one of the most environmentally sustainable method. The synthesized nanoparticles were characterized using X-ray diffraction, UV-Vis spectroscopy, and Fourier Transform Infra-Red (FT-IR) spectroscopy to elucidate the structure and measure the crystallinity of the synthesized product. The morphology of ZnO NPs has been demonstrated by high-resolution transmission electron microscopy (HR-TEM), Scanning Electron Microscopy (SEM). Metal oxide nanoparticles possess diverse surface-based chemical and non-toxic properties. The green synthesis of ZnO nanoparticles aimed at enhancing their antibacterial efficacy against various bacterial activity.

Keywords: Zinc oxide nanoparticles, Green synthesis, antibacterial, antioxidant

INTRODUCTION

Nanotechnology is a developing technology with the potential to revolutionize various scientific fields[1]. Nanomaterials (NMs) possess unique properties due to their large surface area and size, which can be tailored for specific applications. Additionally, the distinct size, shape, and structure of NMs greatly impact their reactivity,

durability, and other characteristics. As a result, these superior properties make them highly versatile for industrial and household purposes such as environmental remediation, imaging technology, medical treatments, energy production, catalytic reactions, cosmetics development, and various medical applications[2-6]. The phenolic compounds and flavonoids present in plants help nanoparticle formation. It was found that the extract from many different plants have been used to synthesize non-toxic nanomaterials[7].Green synthesis was effectively used to obtain zinc oxide nanoparticles using a variety of biological materials [8].

Green Synthesis of Zinc Oxide Nanoparticles

Ajayan and Hebsur (2020) synthesized ZnO Nanoparticles (NPs) using *Azadirachta indica* (neem) and *Ocimum tenuiflorum* (tulasi) leaf extracts. The synthesized nanoparticles were characterized by UV-Spectroscopy, in which the absorbance peaks were obtained as 359 nm and 364 nm for neem and tulasi respectively. The mean diameter of ZnO NPs synthesized from neem and tulasi was 101.6 and 122.4 nm respectively, using a particle size analyzer (PSA). Scanning electron microscopy (SEM) revealed that neem-synthesized ZnO nanoparticles exhibited a morphology resembling flakes or flowers, with a size range of 100-300nm and from tulasi leaf extract exhibited an ovoid shape, witha sizerangeof70-400nm [9].

Chaudhary et al., (2018) discussed the biosynthesis zinc oxide nanoparticles from the aqueous peel extract of Aloe Vera. Scanning electron microscopy (SEM) confirmed that nanoparticles had been hard in appearance with agglomeration. Transmission electron microscopy (TEM) showed the dimensions of nanoparticles from 50 to 220 nm with hexagonal shape. XRD showed their crystalline nature and has antibacterial impact against *E.coli* [10].
Rahman et al., (2023) prepared ZnO NPs using *Cocos nucifera* leaf extract. X-ray diffraction analysis identified ZnO NPs with a hexagonal wurtzite structure. Scanning electron microscopy revealed a flower-shaped morphology of the ZnO NPs, with size of around 15 nm. The synthesized ZnO NPs exhibited antimicrobial activity against *T. harzianum* and *S. aureus*, with respective zone of inhibition sizes of 14 mm and 10 mm [11].

Albert et al., (2023) discussed green synthesis of ZnO-NPs using *Solanum nigrum* plant extract as a capping agent. XRD analysis indicates that the produced NPs possess a wurtzite hexagonal structure and have an average grain size of 27.6 nm. The ZnO NPs exhibited antimicrobial activity against E.coli and *S.typhi*. Furthermore they showed moderate antioxidant activity [12]. Barthwal et al., (2021) conducted study on the green synthesis of Zinc oxide (ZnO) nanoparticles leaf extracts of *Phyllanthus niruri* and *Stevia*. The synthesis of ZnO nanoparticles was further validated by UV peaks at 320 nm and 324 nm. It was noted that the zone of inhibition increased as the concentration increased. An efficient antimicrobial response against Lactobaacilli, S mutans, and C. Albicans, which are typically present in oral microbiota [13].

Raj and Lawerence (2018) successfully synthesized ZnO nanoparticles using *Rosa indica* leaves extract. The utilization of leaf extracts as a capping agent to ensure the stability of nanoparticles has been observed. Experimental evidence shoes that, ZnONPs has spherical morphology and a size of 10nm. The antibacterial efficacy of ZnO nanoparticles was assessed through experimentation against both Gram-negative (E.coli) and Gram-positive (*S.aureus*) bacterial strains [14]. Akintelu and Folorunso (2020) performed green synthesis of ZnO NPs using aloe vera leaf extract. Scanning Electron Microscopy (SEM) analysis verified that the average size of ZnO particles ranged from 18 to 618 μm, exhibited a rod- shaped appearance. X-ray Diffraction (XRD) analysis revealed that the average crystallite size was 0.452 μm and it was in the hexagonal phase. Furthermore, it was demonstrated that the substance possessed antibacterial properties against Escherichia coli (E. coli) [15].

Bhalla et al., (2023) conducted a study on the synthesis of ZnO NPs using *Moringa oleifera* leaf extract. XRD was used to determine the hexagonal wurtzite structure of GsZnO-Nps, with an average crystallite size of 13.82 nm. SEM showed the formation of spherical nanoparticles with a diameter of 50 nm. The ZnO NPs exhibited antimicrobial activity against Escherichia coli (E. coli) and *Staphylococcus aureus* (*S. aureus*)[16]. Rasli et al., (2020) synthesized ZnO NPs using Aloe Vera plant extract and size and concluded that the ZnO NPs were in the size range of 18 to 618 μm

with a rod-shape. The XRD analysis confirmed the average crystallite size was 0.452μm and it was in the hexagonal phase. They demonstrated to possess an antibacterial effect against E. coli [17].

Vijayakumar et al (2018) prepared ZnO NPs using leaf extract of the synthesized nanoparticles were characterized by UV-vis absorption peak at 352 nm. Fluorescence spectrometer (PL) resulting peak determined 410nm. XRD showed their crystalline nature. This study examines the efficacy of Synthesized ZnO nanoparticles on bacteria and fungi, as tested through the agar well diffusion method [18]. Mini et al., (2023) synthesized ZnO NPs using *Scoparia dulcis* leaf extract. The UV–Visible spectroscopy absorption peak for ZnO-NPs was determined to be 380 nm. TEM showed ZnO NPs rod-like morphology of 200 nm in size. XRD showed their crystalline in nature. The antioxidant potential of ZnO-NPs synthesized through biosynthesis was evaluated using the DPPH and ABTS assays [19].

Gupta et al., (2018) discussed the biosynthesis ZnO NPs from extract of *Catharanthus roseus*. SEM images of ZnO nanoparticles revealed a size range between 62 to 94 and spherical in shape. XRD pattern confirmed the crystalline structure of ZnO NPs with size 36.83 nm. TEM showed the dimension of nano particles from 50 to 92 nm with hexagonal wurtzite shape. The synthesized ZnO NPs have demonstrated antibacterial efficacy against both Gram-positive and Gram-negative pathogen [20]. Rajini et al., (2022) synthesized ZnO nanoparticles by using *Centella asiatica* leaf extract. The UV-vis spectroscopy showed that the green- synthesized ZnO NPs have an absorption spectrum within the 200-800 nm range. SEM confirmed that nanoparticles have semi spherical shape and diameter in the range of 25– 40 nm. Anti-bacterial and anti-microbial activity against *E. Coil,* Staph. Aureus, Pseudo.Aeruginosa[21].

CONCLUSION

Green synthesis of zinc oxide nanoparticles using leaf extract provides an environmentally friendly, fast, simple, non-toxic and efficient method for the synthesis of nanoparticles. The synthesized ZnO nanoparticles were further characterized using UV-visible absorption spectroscopy, XRD, SEM and EDAX, FTIR spectroscopy. The main advantages of this synthesis method are its simplicity, cost-effective synthesis route, and large-scale production of ZnONPs.Due to its increased antibacterial activity, it can be effectively used in the medical field as well as the food and cosmetics industry.

ABSTRACT

The global rise in pediatric cancer presents substantial challenges, particularly impacting caregivers who often face significant physical, mental, and emotional burdens. These challenges can detrimentally affect their sleep quality. This study investigates the correlation between the care burden experienced by primary caregivers of pediatric cancer patients and their sleep quality. Employing a non-experimental correlational design, this research analyzed data from 60 primary caregivers in Vadodara and Anand districts, Gujarat. Caregiver burden was assessed using a validated care burden inventory, and sleep quality was evaluated using the PSQI scale. Analysis indicated that 56.66% of caregivers reported moderate care burden, with 81.66% experiencing mild to moderate sleep difficulties. A statistically significant positive correlation was observed, demonstrating that increased care burden correlates with poorer sleep quality. The study shows a significant link between caregiver burden and poor sleep quality, highlighting the need for healthcare systems to include comprehensive support for caregivers. This approach is crucial to improve both caregiver well-being and pediatric oncology outcomes, advocating for a healthcare model that supports caregivers effectively and sustainably.

Keywords: Caregiver Burden, Sleep Quality, Pediatric Cancer, Primary Caregiver, Caregiver Stress, Pediatric Patient Dependency.

Key points of this study

- Caregivers of pediatric cancer patients frequently experience a moderate to severe burden of care, significantly impacting their sleep quality.
- A statistically significant positive correlation exists between the care burden and sleep difficulties among primary caregivers, underscoring the need for targeted caregiver support within pediatric oncology.
- Enhancing caregiver support systems could improve both caregiver and patient outcomes, advocating for a healthcare model that integrates comprehensive support for caregivers.

INTRODUCTION

Annually, approximately 400,000 children and adolescents from ages 0 to 19 are diagnosed with cancer, presenting a substantial challenge to global health systems.[1] This rise in pediatric oncology cases profoundly impacts not only the pediatric patients but also their primary caregivers, who often bear significant physical, mental, social, and financial burdens.[2,3] Care burden, as defined in the literature, encompasses the strain experienced by caregivers due to an imbalance between the demands of caregiving and their available resources.(4) This multifaceted burden can deteriorate the caregivers' mental, physical, social, and emotional well-being, potentially influencing their ability to provide effective care.[5,6] In Asian societies, where family-based caregiving is predominant, the chronic nature of cancer elevates the intensity of care burden.[7,8] Caregivers immersed in the prolonged medical journeys of their children endure heightened levels of stress, anxiety, helplessness, and emotional instability.[9,10] The relentless demands of caregiving can lead to a vicious cycle where the deteriorating health of the caregiver adversely affects the quality of care provided, which in turn may exacerbate the child's condition and increase the caregiver's burden.[11,12] Amid these challenges, one critical aspect that warrants attention is the sleep quality of caregivers. Sleep is vital for psychological and physical restoration, yet the demands of caregiving, especially in a high-stress context such as pediatric oncology, are likely to disrupt sleep patterns.[13–15] Poor sleep quality can impair cognitive function, emotional regulation, and physical health, further compounding the care burden.[16] Given the profound impact of care burden on the overall well-being of caregivers, understanding the relationship between sleep quality and care burden is paramount. This research aims to explore this relationship through a correlational analysis, seeking to identify patterns that could inform interventions aimed at enhancing caregiver support. This approach not only acknowledges the critical role of caregivers in the treatment continuum but also underscores the need for comprehensive caregiver support systems that promote their health and well-being.

Need of The Study

The escalating prevalence of pediatric cancer and its profound impact on primary caregivers underscore the critical need for this study. Caregivers of pediatric cancer patients face substantial psychological and physical burdens, with significant repercussions for their sleep quality—a vital component of overall health.(17) Research indicates that up to 32.9% of caregivers experience poor sleep quality, correlating strongly with heightened levels of anxiety and depression. Furthermore, the care burden has been shown to exacerbate health problems, with caregivers reporting increased psychological distress and impaired daily functioning.(18) This study aims to find-out the correlation between care burden and sleep quality among primary caregivers. By understanding and addressing these factors, healthcare providers can better support caregivers, enhancing their well-being and, consequently, the quality of care they provide to pediatric cancer patients.

Objectives of The Study

The study is designed with three key objectives to enhance the understanding of the dynamics between pediatric cancer caregivers and their well-being. First, it aims to assess the care burden experienced by primary caregivers of pediatric cancer patients, emphasizing the multifaceted challenges they face. Second, it evaluates the sleep quality of these caregivers, recognizing the critical role of rest in maintaining caregiver health and effectiveness. Third, the study seeks to explore the relationship between care burden and sleep quality, exploring how caregiving demands impact caregivers' restorative sleep.

Hypothesis

In this study, we proposed research hypothesis (H_1) that a substantial correlation exists between the level of care burden experienced by primary caregivers of pediatric cancer patients and their sleep quality.

MATERIAL AND METHOD

Study Design and Variables

The study utilized a non-experimental descriptive design with a correlational approach. The primary research variables were care burden and sleep quality.

Research Tool and Sampling

The sampling method employed was non-probability purposive sampling, involving a sample size of 60 primary caregivers of pediatric cancer patients. To ensure statistical reliability, a sample size of 72 was calculated for a population of 3,632, with a 5% margin of error and a 95% confidence level, assuming a 95% response distribution(19,20). However, due to resource and time limitations, we opted for a sample size of 60, which still allows us to achieve meaningful and healthy conclusions within the scope of our study. The inclusion criteria for participants were primary caregivers of pediatric cancer patients, able to read and understand English, Hindi, or Gujarati, aged between 18 to 60 years, residing with the patient, providing care for more than two months, and willing to participate in the study. Exclusion criteria included caregivers receiving financial benefits and those diagnosed with depressive disorders or insomnia. The research tool comprised several sections: Section A collected demographic data of both caregivers and care recipients; Section B detailed the clinical profile of the care recipient; Section C featured a self-structured care burden inventory based on previous studies, utilizing a Likert scale; Section D incorporated the Pittsburgh Sleep Quality Index. The tool was validated by child health nursing specialists, pediatricians, and oncologists. The reliability of the scales was confirmed with Cronbach's alpha, yielding coefficients of 0.8245 for the care burden inventory and 0.7985 for the sleep quality index.

Data Collection and Data Analysis

Data collection commenced after obtaining approval from the IEC. The study was conducted in selected healthcare centers within the Vadodara and Anand districts of Gujarat state from February 2023 to June 2023.Administrative approvals were secured, caregivers were informed about the study, and written informed consent was obtained. Data collection was facilitated through the administered tools, followed by organization of data in Excel for analysis. Statistical analyses were performed using IBM SPSS 27, and Microsoft Excel was used for graphical data presentation.

RESULT

Demographic Findings

Table 1 presents the demographic descriptions of the 60 participants involved in our study. The sample exhibited a slight female majority with 53.3% females (n=32) compared to 46.7% males (n=28). The majority of the participants were aged between 25 and 44 years, representing 83.4% of the total, with 46.7% (n=28) in the 25-34 age group and 36.7% (n=22) in the 35-44 age group. Other age groups were less represented, with 5% (n=3) aged 18-24 years, 10%

(n=6) between 45-54 years, and only 1.7% (n=1) aged between 55 and 60 years. Regarding the relationship to the patient, mothers constituted half of the sample (50%, n=30), followed closely by fathers at 43.3% (n=26). Other family members, including grandfathers (3.3%, n=2), grandmothers, and uncles (1.7% each, n=1 for both), were minimally represented. Educational levels varied across the sample: 38.3% (n=23) had completed secondary education, 28.3% (n=17) primary education, 18.3% (n=11) higher secondary, 11.7% (n=7) were graduates or diploma holders, and a mere 3.3% (n=2) possessed postgraduate or PhD degrees. Occupationally, house makers formed the largest group at 38.3% (n=23), followed by daily wage earners (25%, n=15) and self-employed or business owners (18.3%, n=11). A smaller fraction consisted of private (11.7%, n=7) and government employees (5%, n=3), with only one participant (1.7%) being unemployed. In terms of income, a substantial 71.7% (n=43) of participants reported earning less than 10,000 INR monthly. Those earning between 10,001-20,000 INR and 20,001-30,000 INR each made up 13.3% of the sample (n=8), and only one participant reported a monthly income above 30,001 INR. Participants primarily resided in rural areas (61.7%, n=37), compared to 38.3% (n=23) from urban settings. This distribution highlights the rural predominance in the study's demographic landscape.

Clinical Profile of Care Recipients

The study's results, as detailed in Table 2, reveal that the majority of caregivers provided care for a duration of 0-2 years, with 71.7% (n=43) falling within this range. The proportion of caregivers who supported care recipients for 2-4 years stood at 21.7% (n=13). Notably, long-term care exceeding four years was rare, observed only in 6.6% of cases (n=4). This distribution underscores a high turnover in caregiving within shorter intervals, suggesting that either conditions improve or caregiving responsibilities shift over time. In terms of dependency, the majority of care recipients exhibited partial dependency, accounting for 70% (n=42) of cases, while complete dependency was necessary for the remaining 30% (n=18). The prevalence of partial dependency may indicate either the effectiveness of early intervention strategies or a demographic profile where conditions necessitating care do not fully compromise patient autonomy. These findings highlight the transient nature of caregiving in the majority of cases, coupled with a significant reliance on sustained partial assistance. The distribution of cancer types among care recipients, as depicted in the bar diagram (Figure 1), demonstrates a notable prevalence of specific cancers. Acute Myeloid Leukemia (AML) was the most common type, accounting for 46.67% of cases. This was followed by Leukemia, contributing to 33.33% of the observed instances. Notably, other cancer types such as ALL, Liver Cancer, Metastatic Carcinoma of Nasopharynx, Germ Cell Tumor, Lymphocytic Leukemia, Throat Cancer, PNETs, Renal Small Cell Tumor, Neuroblastoma, and Kidney Tumor were considerably less common, each constituting only 1.67% of the cases, except for Renal Small Cell Tumor which slightly increased to 3.33%.These findings indicate a disproportionate representation of hematologic malignancies, specifically AML and Leukemia, compared to solid tumors in the care recipients.

Caregiver Burden

The analysis of caregiver burden as illustrated in the pie diagram (Figure 2) shows a significant distribution across different levels of perceived burden among primary caregivers. Most caregivers, 56.6%, stated experiencing a moderate level of burden. This was followed by a substantial proportion, 35.1%, who reported a severe level of burden. Only a small fraction, 8.3%, considered their caregiving responsibilities to be mild. These findings suggest that the majority of primary caregivers experience at least a moderate level of burden, with more than a third facing severe challenges. This indicates significant stress and potential impacts on the wellbeing of caregivers managing the healthcare needs of others.

Sleep Quality

The analysis of sleep difficulty utilizing the Pittsburgh Sleep Quality Index (PSQI) revealed significant findings among the study participants. Table 3 shows a substantial majority of 81.67% (n=49) experienced mild sleep difficulties, indicating prevalent but generally manageable sleep disruptions. Meanwhile, moderate sleep difficulties were reported by 16.66% (n=10) of the participants. Notably, the cohort displayed a minimal occurrence of severe sleep issues, with no participants reporting severe sleep difficulties, and only 1.67% (n=1) reporting no sleep difficulties at all. The predominance of mild sleep disturbances suggests that while these issues are widespread, they

do not generally escalate to severe levels that could significantly impair daily functioning. This pattern indicates that ongoing or chronic sleep difficulties, even at a mild level, could potentially affect the individuals' well-being if left unaddressed.

Correlation Between Care Burden and Sleep Quality

The scatter diagram (Figure 3) illustrates the correlation between care burden and sleep quality among primary caregivers. The data reveals a moderately strong positive linear relationship, as evidenced by a Pearson correlation coefficient (r-value) of +0.628. This indicates that as the care burden increases, there is a corresponding deterioration in sleep quality. The scatter plot demonstrates a consistent upward trend, with higher care burden scores generally associated with higher sleep difficulty scores. This observation indicates that caregivers facingelevated levels of burden tend to have poorer sleep, underscoring how caregiving responsibilities can adversely affect caregivers' mental and physical health.

DISCUSSION

The findings of this study indicate a pronounced correlation between caregiving burden and sleep quality among primary caregivers of pediatric cancer children, substantiating previous research in the domain of caregiver health dynamics. Specifically, our analysis revealed that 56.66% of caregivers experienced a moderate care burden, with significant implications for their sleep quality. This relationship aligns with the results of Chaghazardi et al., who documented a moderate to extreme care burden among caregivers of children with various cancer types, notably acute lymphoblastic leukemia (ALL), which was also the most common cancer type observed in our study.[3] The impact of caregiving burden on sleep quality was further evidenced by our data, which showed that 81.66% of caregivers experienced mild to severe sleep difficulties. This is consistent with the study by Lauren C. Daniel *et al.,* which found that a substantial percentage of caregivers had poor sleep quality during the maintenance phase of acute lymphoblastic leukemia treatment.(21) Our study advances these findings by quantifying the direct correlation between increased care burden and deteriorated sleep quality, with a correlation coefficient of +0.6280, robustly accepting the research hypothesis relationship between these variables. The consistent burden documented across different studies, including those by Wong *et al.,* who explored the caregiving dynamics among family caregivers of Chinese male patients with complex cancer, underscores the universal challenge posed by caregiving.(22) These findings highlight the pervasive impact of caregiving responsibilities on the physical and psychological well-being of caregivers, necessitating a holistic approach to healthcare that integrates support mechanisms for caregivers into the patient care continuum. Given the strong correlation between care burden and sleep quality identified in our study, there is a critical need for healthcare systems to develop targeted interventions. Such interventions could include structured stress management programs, psychological counseling, and respite care. These measures would not only alleviate the immediate symptoms of caregiver stress but also enhance the overall care provided to cancer patients by ensuring the well-being of their caregivers. Moreover, our research emphasizes the necessity of supporting caregivers through healthcare policy and planning. Effective caregiver support is essential not only for preserving their health and well-being but also for enhancing their capacity to provide optimal care.

Limitations of the study

This study has several limitations that could impact the generalizability and interpretation of its findings. The sample, drawn exclusively from specific regions within the Vadodara and Anand districts of Gujarat, may not represent the diverse experiences of caregivers in different geographic or cultural contexts. The dependence on self-reported data introduces possible bias, as sample might alter their responses due to social desirability or recall inaccuracies. Furthermore, the study did not account for other psychological factors such as stress, depression, and anxiety, which are prevalent among caregivers and could significantly influence both care burden and sleep quality.

Recommendation

Future studies should expand the geographic and cultural range to improve the external validity of the results. Additionally, enlarging the sample size and integrating objective measures of sleep quality, such as actigraphy, will enhance the accuracy of sleep assessments. Including psychological factors like stress, depression, and anxiety is crucial for a fuller understanding of the caregiver's experience. Longitudinal studies could clarify the causal relationships and long-term impacts of caregiving. Additionally, developing intervention programs targeted at reducing care burden and improving sleep quality could significantly aid caregivers. These findings should also inform policy changes to better support caregivers, improving their well-being and caregiving effectiveness.

Nursing Implications of the Study

This study highlights the need to reshape nursing practices and health policies, especially in pediatric oncology. It shows the critical link between caregiver burden and sleep quality, emphasizing the importance of incorporating comprehensive caregiver assessments into routine nursing evaluations to prevent burnout and enhance care quality. The findings of the study offer very solid recommendations that nursing leadership institute institution policies and programs that focus on care-giver well-being to promote sustainable caregiving practices, which is critical for optimal results. Healthcare policies should incorporate services that include counseling and stress management, among others, to improve the quality of healthcare offered. Fundamentally, the study supports an expansive healthcare system that can help provide much-needed support for the caregivers so that nursing practices and policies are not only efficient but also caring in nature, thereby delivering better results for all stakeholders.

CONCLUSION

This study vividly highlights the intricate relationship between caregiver burden and sleep quality, signaling the need for a holistic re-evaluation of caregiver support within our healthcare frameworks. Our findings strongly advocate for an approach that places as much emphasis on the well-being of caregivers as it does on patient outcomes. To enhance the effectiveness of healthcare delivery, it is crucial that support systems proactively address the multifaceted challenges faced by caregivers, ideally before these challenges compromise caregiver health. Additionally, our results urge healthcare policymakers and providers to consider structured, supportive measures for caregivers as integral components of patient care strategies. Such a shift demands collaborative efforts from across the healthcare spectrum to develop interventions tailored to reduce caregiver burden and improve their overall quality of life. Ultimately, our research calls for a paradigmatic shift towards a healthcare model that equally values the health of caregivers and patients, ensuring that caregiving is both sustainable and effective. By adopting a more caregiver-inclusive approach, we can create a more compassionate and efficacious healthcare system, advancing our collective goal of holistic health and well-being.

Conflict of Interest

None to declare.

Ethical Clearance

Ethical clearance were obtained from an institutional ethics committee (Issue: CHA/IEC/ADM/22/09/1008.3) to conduct the study.

Financial Aid

Self financed and no financial aid applied or received

ABSTRACT

This study evaluated the impact of a structured education program on ASHA workers' knowledge of modern contraceptive methods in Vadodara, Gujarat. ASHAs play a vital role in family planning under the NHM, yet gaps remain in their understanding of newer methods. Improving their knowledge is crucial for effective public health outreach. A descriptive, pre-experimental study was conducted across selected Primary Health Centres (PHCs) in Vadodara district. Using purposive sampling, 60 ASHA workers participated in the study. A structured questionnaire assessed their initial knowledge of contemporary contraceptive methods. The study followed a two-phase approach: a pre-test was administered to gauge baseline knowledge, followed by a structured teaching program that included lectures, demonstrations, and interactive discussions. A post-test was administered to gauge knowledge growth following the intervention. The impact of the program was statistically analysed using paired t-tests. The knowledge of ASHA employees was greatly enhanced by the organized education program; the average score increased from 3.86 to 10.82 ($t = 20.15$). Knowledge increases were also impacted by demographic variables. Efficient instructional programs improve ASHA employees' understanding of contemporary contraception, which benefits family planning and maternal-child health. In order to maximize their impact, regular, customized training is necessary.

Keywords: ASHA workers, structured teaching program, contraceptive knowledge, rural healthcare, family planning.

INTRODUCTION

The Government of India (GOI) offers comprehensive healthcare services to both rural and urban populations through the National Health Mission (NHM). Accredited Social Health Activists (ASHAs), acting as community health professionals at the village level, act as a necessary among the general public health system and local populations. By offering Information and services related to contraception, ASHAs in Andhra Pradesh's coastline contribute significantly to the advancement of population policy goals. The study's objective was to evaluate 170 ASHA employees' sub-centre expertise of ASHAS in the delivery Pradesh. To choose the research region, a multi-stage sampling approach was employed. A semi-structured interview schedule that had been evaluated beforehand was used to gather data. The mean and standard deviation were used to convey quantitative data, whereas percentages were used to express qualitative data. The findings revealed that the average ASHAS28.4 years old (SD+3.82). While 72.94% of ASHAS were aware of contraception for newlyweds and 68.23% knew when emergency contraceptive tablets work, 45.88% were unaware of the safe time, and the majority of ASHAS (75.88%) had completed secondary school. Conclusions: The majority of ASHAS members were aware of various aspects of contraceptive information and services, although some members were not aware of the safe time, progesterone-only tablets, emergency contraceptive pills (EC pills), missing tablets, orwhen to use condoms after a vasectomy. Therefore, it is crucial to make sure they receive regular, excellent training on contraceptive information and services from certified experts. OCPs and the necessity of screening prior to initiating OCPs were known to all (100%) of the ASHA employees. Every ASHA was also aware of organizations such as the cafeteria method and the rewards that were provided to them for providing family planning services only 83% of the ASHAS were aware that combination oral contraceptives shouldn't be given to nursing mothers, according to a previous study done in Udupi, Taluk, and Karnataka. Now, every ASHAS member (100%) knew this knowledge. Every ASHAS member (100%) was aware of permanent sterilization techniques. The current study found that only 31.6% of ASHA employees knew that emergency contraceptive pills (ECPS) existed, along with those who were, 33.3% were not aware of the i-pill's window time. Similarly, another study found that Community Health Workers (CHW) like ASHAS have a poor level of understanding on ECP (15%).

Review of Literature

Understanding of Antenatal, Postnatal, and Family Planning Services by ASHA Employees under NRHM (2016) The health and well-being of women are critical not only for their ability to lead long, healthy, and fulfilling lives but also for ensuring the health of their children and families. Maternal mortality in India are frequently ascribed to a number of circumstances, including poverty, lack of political, managerial, and administrative commitment, and inaccessible or expensive healthcare treatments. Maternal mortality rates are greatly increased by these problems, which lead to a high frequency of home births performed by unskilled people and delays in obtaining medical attention. In April 2005, the Indian government began the National Rural Health Mission (NRHM) to alleviate new-born and maternal mortality. Through a targeted, time-bound approach, this mission sought to enhance public health services and infrastructure. Establishing efficient medical facilities within the public health system was one of NRHM's main goals. To provide services for maternity and paediatric care (MCH) to expectant mothers and children, Accredited Social Health Activists (ASHAs) were designated under this program. This research is based on an empirical study that looks at the knowledge levels of ASHA workers in the Andhra Pradesh district of Chittoor on family planning, prenatal care, and postnatal care. ASHA's understanding of the family planning services offered under NRHM in Bhojpuri block, District Bareilly, was assessed in 2018. Accredited Social Health Activists' (ASHAs') assessment of the Indian government's doorstep contraceptive program: Suggestions for nationwide expansion (2017) Abstraction Goal: In 17 states, the Government of India (GOI) launched new program in which Accredited Social Health Activists (ASHAs) provided contraceptives to homes directly in exchange for a nominal charge. In order to assist the GOI's nationwide scale-up of the program, this document provides an evaluation of the pilot. Techniques: In May 2012, operational concerns, implementation hurdles and facilitators, and initiative experiences in six states were evaluated using a mixed-method approach. ASHAs, community women, managers, and other important implementers were among the participants. Results: Managers expressed optimism about the initiative's long-term effectiveness, while

community women and ASHAs viewed it favourably. The evaluation revealed issues with the initiative's communication efforts, orientation and reporting, supply chain, and the packaging of its contraceptives. In conclusion, the program offers a viable approach to expand the adoption of birth-spacing techniques and fulfil unmet needs. Other community-based family planning initiatives can benefit from and be strengthened by the assessment's suggestions. Shrishali. B. Tambakad, Sumitra. LA (2019) An investigation was carried out to ascertain the frequency of injectable contraceptive usage among Osun State tertiary institution students as well as to evaluate their attitudes and level of knowledge regarding injectable contraception. A structured, self-administered questionnaire was used in this descriptive cross-sectional investigation. Students from State Polytechnic Ire and Obafemi Wallow University in Ile Ife made up the study population. SPSS version 11 software was used to enter, validate, and conduct statistical analysis on the data. The survey found that 241 respondents, or 80.3% of the total, lacked sufficient knowledge regarding emergency contraception. The majority of them—160, or 55.3%—were sexually active, and 32.6% of those who were also sexually active utilized contraception. The most popular method of birth control was the condom. 86 people (28.7%) were current contraceptive users. Just 47 (15.7%) of the respondents had used injectable contraception. Overall, the students in this research knew very little about injectable contraception and used it sparingly. Clearly, a well-thought-out instructional campaign and the marketing of injectable are needed in the current student health care facilities on campuses.

A mixed-method research conducted in Derange block, North 24 Pagans district, West Bengal, India, in 2019 evaluated the knowledge and practices of ASHA workers about maternal-child health and the factors that impact their performance. Background: ASHAs are essential in accomplishing national health and population policy objectives because they serve as a link between medical centres and rural populations. ASHAs are in charge of providing primary, preventive, and curative healthcare services in rural regions as the foundation of the National Rural Health Mission (NRHM). One important public health concern that indicates a nation's socioeconomic progress is maternal and child health. Improving reproductive and child health (RCH) indicators is the responsibility of ASHA employees, who are frontline healthcare professionals. Method: A mixed-method approach was used in this study to incorporate both quantitative and qualitative data. As part of the qualitative component, focus group discussions (FGD) were used, the quantitative component was cross-sectional and descriptive. Purposively chosen for the study, North 24 Parganas district in West Bengal's Derange block served as the site of the investigation. One beneficiary mother a woman with a child under one year old—from each ASHA's service area, as well as all of the ASHAs in the block, participated in the study. After gaining informed permission, the ASHA-beneficiary dyads were questioned using a pre-made, pre-tested questionnaire Findings: Overall, more than half of the research participants had high scores (50.5% for family planning behaviours and 64.7% for maternal-child health knowledge). However, there were knowledge gaps in areas such as the safe period, missed concentrations of intrauterine contraceptive devices (IUCD), emergency contraceptive tablets (ECP), and oral contraceptive pills (OCP), the new dosing schedule for iron-folic acid tablets, and suitable nursing procedures. ASHAs did badly in areas including medical termination of pregnancy (MTP), Colostrum feeding, weaning, ECP, birth readiness, and counselling regarding the negative impacts of addiction during pregnancy. Barriers to improved performance were found to include things like low pay and work discontent.

CONCLUSION

Regular refresher training, ongoing observation, encouraging oversight by superiors, and resolving employee discontent through administrative actions are all critical to improving ASHA employees' performance. Evaluation of ASHAs' expertise in providing information and services related to contraception in coastal Andhra Pradesh (2020) Background: Through the National Health Mission, the Government of India (GOI) provides both urban and rural people with comprehensive, integrated healthcare. ASHAs serve as community health workers at the village level and are a vital link between the community and the public healthcare system. They are crucial to achieving the goals of the population policy. This study set out to assess the effectiveness of ASHAs in coastal Andhra Pradesh in delivering contraceptive information and services. Methods: 170 ASHA employees participated was a cross-sectional

descriptive study conducted at sub-centres in the East Godavari district of Andhra Pradesh. Multi-stage sampling was used to choose the research region. A semi-structured interview schedule that had been pre-tested was employed to gather information. Qualitative data was shown as percentages, and quantitative data was analysed using the mean and standard deviation. Findings: ASHAs were 28.4 years old on average (SD±3.82). Seventy-five percent of ASHAs had finished secondary school. 68.23% knew the effective time period for taking emergency contraceptive tablets, and 72.94% knew about contraception for newlywed couples. Nonetheless, 45.88% of ASHAs were ignorant about the safe time. Neha Joshi, Gomati B., Kantian Bale, and Maralinga V. (2020) Conducted a cross-sectional survey with 774 female students at Addis Ababa University and Unity University College in Ethiopia between January and September 2019. 43.5% (95% CI 40.0 - 47.0%) of the students reported having heard about advanced contraception. Injectable contraceptives (IUCDs) were cited by 34.1% (115 participants) and the vaginal ring by 82.8% (279 participants) of those who were familiar with advanced contraceptives. Only 4.9% (95% CI 3.4-6.4%) of the students reported having ever used advanced contraceptives, despite the fact that 53% (95% CI 49.1-56.1%) of them had a favourable opinion of them. The study found that female university students had little understanding of and usage of sophisticated contraceptive techniques. Knowledge and attitudes of healthcare professionals about teenage girls' use of contemporary contraception in South Africa's KwaZulu-Natal province's Umlazi Township (2021) Unwanted teenage pregnancies remain a significant public health and reproductive problem in sub-Saharan Africa. Medical professionals have a significant impact on teenage girls' use of contraception. This study set intended to assess the opinions and expertise of medical professionals on the usage of contemporary contraceptives by teenage females in KwaZulu-Natal province, South Africa's Umlazi Township. Thirty-five physicians from Umlazi Township's ten basic healthcare clinics participated in a descriptive study. The data was gathered using a structured questionnaire, coded, and then imported into Epi Data Manager (version 4.6) and exported to STATA (version 15.0) for analysis. Findings the majority of the 35 participating medical care practitioners were enrolled nurses (17.1%) and professional nurses (54.3%). The participants' average age was 42.11 years, and 88.6% of them were female. More than half (57%) of the healthcare professionals had unfavourable opinions about teenagers experimenting with contraceptive techniques, and more than a third (37.1%) were unsure if contemporary contraceptives increase the risk of promiscuity. Healthcare professionals identified issues with the health system, including unfavourable working conditions, lengthy lines, and shortages of contraceptives, as obstacles to provide high-quality sexual behaviour counselling and instruction on contemporary contraception.

Statement of The Problem

"A study to assess the effectiveness of structure teaching program on knowledge regarding newer contraceptive method among ASHA workers in selected PHC of Vadodara district"

Objectives of The Study

1.Evaluate ASHA employees' understanding of the newer contraceptive technique before and after a structured instruction program in a chosen PHC in the Vadodara district.
2.To determine the relationship between the pre-test knowledge score of ASHA employees in a chosen PHC in the Vadodara district and their chosen demographic variable with reference to the newer technique of contraception.

Hypothesis of The Study

1.Before and after a structured training session in a selected PHC in the Vadodara district, assess ASHA staff members' knowledge of the more recent method of birth control.
2.To ascertain how the pre-test knowledge score of ASHA staff members at a selected PHC in the Vadodara district relates to their selected demographic variable in regard to the most recent method of contraception.

RESEARCH METHODOLOGY

The overall framework for planning the process of obtaining accurate and trustworthy data for an inquiry is known as research methodology. Methodology is defined as a plan for carrying out a study that includes the description of

the research strategy, study setting, sampling size, sampling technique, and instruments and procedures of data collecting and analysis in order to address specific research questions or test research hypotheses. The goal of the current study was to evaluate how well ASHA employees in particular PHCs understood newer methods of contraception through a structured teaching program. A follow-up study was also carried out to find out how well ASHA employees understood newer methods of contraception through a structured teaching program.
Phase 1 involves using a structured education program and knowledge quiz to gauge ASHA employees' awareness of more recent forms of contraception.

RESULT

The study's goals and hypotheses served as the foundation for the data's analysis and interpretation. Data was gathered from respondents at the few primary health centers in Vadodara's rural regions, as was indicated in the chapter before this one.

- **Section I** Frequency and percentage analysis were used to generate a table that represented the demographic variable.
- **Section II** Data from the structured knowledge questionnaire were compared before and after the plan instruction program was implemented using the mean, standard deviation (SD), and t-test. Tables and graphs were then used to present the findings.

Table 1 displays the demographic characteristics' frequency and percentage distribution among ASHA employees. The majority, 9 (15.0%), were in the 25–30 age range; 15 (25%), in the 31–35 age range; and 36 (60.0%), older than 36. Data on educational qualification of ASHA workers showed that maximum 36(60.0%) were qualified with 10^{th} pass, 22 (36.7%) were qualified with 12^{th} pass, 2 (3.0%) were qualified with graduation. As per years of field experience, 16 (26.7%) had 1 to 5 years of field experience, 14 (23.33%) had 5 to 10 years of field experience, 30 (50.0%) had more than 10 years of field experience. Data on ASHA workers had undergone any training Workshop / seminar regarding newer contraceptive method, maximum 37 (61.7%) had undergone training programme regarding newer contraceptive method and 23 (38.3%) had not undergone any training programme regarding newer contraceptive method. Table 2 indicates that the average score before the exam was 3.86, while the average score after the test was 10.82. The knowledge scores before and after the exam therefore differed by an average of 6.9. The pre-test and post-test standard deviations were 2.01 and 2.80, respectively. At the 0.05 level of significance and with 59 degrees of freedom, the computed "t" value is 20.15. The computed "t" value was more than the value in the table. that the computed "t" value (t=20.15) was higher than the tabulated "t" value (t=2.00), as shown statistically, and that the mean post-test knowledge score was higher than the mean pre-test knowledge score with a mean difference of 6.9. Therefore, when the research hypothesis was confirmed and the null hypothesis was refuted, it was evident how beneficial the intended education technique was.

CONCLUSION

In certain PHCs, there is a knowledge gap in every aspect of the more modern contraceptive techniques. It was discovered that the structured education approach was successful in improving the samples' understanding of more recent forms of birth control. Significant information was acquired by the samples; the results show that the investigator's structured teaching approach was successful in increasing the samples' knowledge. The vast majority of people may benefit from this structured instruction program in a variety of contexts. The study found that when the structured education program about newer contraceptive methods was administered, the mean post-test level of knowledge improved significantly compared to the mean pre-test score. Since the calculated "t" value was higher than the tabulated "t" value, it was statistically significant at the 0.05 level of significance. As a result, research hypotheses were accepted and null hypotheses were rejected. As a result, the researcher concluded that ASHA staff members who worked in a few PHCs in the rural parts of Vadodara greatly improved their knowledge, proving the effectiveness of the intended education program.

ACKNOWLEDGEMENT

ABSTRACT

Everyday safety issues in kitchens have become an area of concern because of the attendant increase in kitchen accidents in the domestic and commercial kitchens. Most people usually access and use kitchens for meal preparation which makes them prone to kitchen accidents. However, there are some risks involved in such situations, for instance, the occurrence of a gas cylinder leak. And that is where we come in, how the Internet of things can be used to reduce the risk of gas explosions particularly in the kitchen. In this respect, IoT efforts such as remote monitoring of the entire kitchen will be able to prevent these accidents. In order to test this theory and its results, the research will include the use of both hardware and software. Hardware to be utilized consists of Servo motors, Flame sensors, temperature, humidity, and gas sensors, Arduino UNO, load cell Node MCU, and the like. In software perspective, mobile applications and integrated Node MCU have been applied. The output from our system is SMS. The gas leaks in the kitchen are also a concern since the system can be able to offer surveillance which in the event of any leak, it may cut bluntly the reaction time. In the case of gas leakages either during the day or night, there is a likelihood that someone may unknowingly switch on a source of light, a move that may cause an explosion. The master power supply will immediately kill these lights and save everybody from that with the associated alert. This means that alert can raise an alarm for the time and response of the users. Informing and alerting the user to kitchen appliances, such as Cylinder. The design of this research project aims at highlighting the potential of presenting the IOT based system for communication through SMS which is the repository of the parametric assistance. In a comparison to the existent in the field works, the developed system shows a very high accuracy rate almost 97%.

Keywords: The Arduino UNO, Flame sensor, Gas sensor, Buzzer sensor, Temperature sensor and Humidity.

INTRODUCTION

The Internet of Things (IoT), is a network of physical objects that have been integrated with electronics, sensors with the help of software and communication to allow them to exchange data with operators, manufacturers, and other connected devices kept possible at a certain distance apart. The device centric communication with the help of signals accepted by the sensor is the operation of IOT system [1]. Although much work has been done thus far to truly implement the Internet of Things. The era number of such areas where an investigation reveals that one of the main causes of fires is LPG [2]. Kitchen is the major part of house hold accommodation. The advent of IOT has converted the concept of kitchen into the smart system. The probability of accidents inside the homes prone to take place in the kitchen mostly due to the presence of many inflammable articles inside the kitchen. The gas leakage is very frequent phenomenon which can arise due to the presence of any hole or abrasion on the skin of the pipe. With the aid of the IOT sensor, gas leaks from pipes may be quickly and easily identified [3]. The Internet of Things is a network of real-world items that have been combined with sensors, software, electronics, and communication. It is shown by an object's capacity to communicate data with manufacturers, operators, and other connected devices. The gas sensor is the essential element of any smart kitchen in order to avoid any sort of accidents. The gas leakage can bring about number of hazards to our human lives. The IoT enabled system can also provide enough automation strategies towards monitoring of the kitchen providing the unprecedented control operations along with the requisite intelligence. The current paper reserves main objective for catering the good design and implementation of the IOT concept efficiently for the safety and security to be maintained in the domestic kitchen. The discussion in paper will encompass the device-oriented approach like sensor, actuators and other IOT gateways also related to the cloud servers. Apart from the remote monitoring, the automated control strategies with the efficiency of energy and safety alert implementation will be the key objective of such work. The present paper also addresses the challan.

LITERATURE SURVEY

Related Work

It involves adding technology to the interior layout of a house, with the intention of making the occupants' lives better in terms of security, ease, comfort and power efficiency. The growth of smart home research and adoption can largely be attributed to the Internet of Things (IOT). Many homes today have been transformed such that Bluetooth, Wi-Fi, RFID, and cellular networks have in some way been adopted, for the purpose of data communication, sensing, and control which involves remote sensing or operation. For instance, research has highlighted that it is possible to have a home automation system in using android phones as gadgets with Bluetooth connection and through local control. As far as the IOT technologies are concerned, scholars have already devoted extensive empirical efforts, leading to numerous scientific publications. Some amongst those have taken place in a manner that has established the doctrine with the relevant principles, methodologies and major issues.

Literature Survey in The Tabular Format

Major Contributions of the paper.

The main research contribution of the paper is

1. A Sensor based circuit specially designed with a failsafe approach is important for optimal collection and transmission of information to users of the handheld device.
2. Provision of the necessary safety while adhering to the acceptable standards of message transmission protocols.
3. Ensuring the user get the alert without being guided by the location of the receiver.
4. Developing the mechanism that ensures a message is sent within the shortest time upon detection of the gas which has leaked.
5. Appropriate steps deduced from the current situation analysis and the adverse effects that come with it.

6. Tactical advantage of making the right decisions based on access to relevant Information and taking into account the limited time remaining.

Research Gap

There are currently several works that are in progress to the development of IOT based sensor model that can be used in monitoring the gas leakage with different types of sensors. However, the precision for gas leakage is far to perfect and experts have reported that there are long gaps before the actual alerting of the people on the other end, this causes failure to deal with the situation within the acceptable time. The sensing of the required data and responding to the real time alerts so that the recovery can be swift, is the toughest objective to achieve.

Proposed Methodology

This research is designed to detect the presence of gas in a security system. The system will have a mail alert feature to the end-users, if any danger occurs. Additionally, we included a gas sensor in order to observe such events and search for that specific gas. If LPG leakage occurs and results in a short circuit as a catalyst to a fire, the power source will be switched off instantly and an alarm will sound. Sensors that are designed to detect fires are known as flame sensors. The flame sensor when it detects a rise in temperature it is able to switch the circuit off automatically via the IOT system. Program codes were designed using the Arduino UNO for the coding section, the Arduino Compiler (IDE) was used for completing the coding section and saving the readings from the sensor used. The Arduino micro controller is installed in many hardware's to serve different purposes and serves as the central processing unit of the system. Another element of a program is written in Python via Python Software (IDE), and it corresponds to sending emails via G-mail (to the user) [9].

Flowchart

The entire process flow of the work narrated down in the paper has been represented in the flowchart provided in Fig -1. The sensor data values have been uploaded into the cloud. The interpreted values collected from the cloud leads to the ringing of the buzzer alarm instantly. The detection of gas and consequent ringing of the alarm make the person aware about situation and prompt the person to take the timely decision in this regard. The block diagram for the fire detection system has been shown in the Fig.2. The usage application of Arduino Uno connected with the servo motor has been shown in the fig. The further connection of the NODEMCU fitted with the Wi-Fi connection. The gas sensor is connected to the module. The final module extension produces the alarm, light or the mobile signal which interprets the situation of emergency.

Block Diagram

Due to the leakage of gas, the gas cylinder has been put in the danger and can be on fire at any moment of time. The sudden accident of such gas leakage can be conveyed through the devices to the c concerned person remotely placed. The corresponding precautionary measure can be taken promptly. The conveyance of such message starting from the sensor to the concerned person has been shown in the Fig 3 and Fig 4. The use of different electronic gazettes playing the intermediate roles have been depicted also in the Figs mentioned. Fig -3 shows the detection of the presence of fire in the gas cylinder. The fire on the cylinder has been sensed by the specific sensor and the corresponding data has been transmitted to the remotely placed hand held devices like mobile phones or has been communicated to the web server. The arrangement of the series of intermediate devices and their sensing capacity with optimized parameter has made the process much smoother and quick responsive. The leakage of the gas can be sensed and the sensed information can be easily relayed down to the remote sensing devices and finally get received by the remotely situated hand held device mobile phone. The update of the website has been accordingly done by means of the sensed data.

Working Procedure

Power is applied and all of the sensors are triggered to the Arduino UNO and Node MCU. The servo motor, load cell, and Arduino are connected to the Node MCU's Wi-Fi module, which is also connected to the Android app. The sensors automatically collect data through the Node MCU and the kitchen whenever the raise gas or smoke leak

[12][5]. Here we use our server. We use the Apache server. The server gets the data and sends it to the Android application. These motor will be open the window, and the power supply will turn off automatically. SensorsthatdetectcylinderweightandinformtheuserusinganArduino-connected load cell also display room temperature data and provide alarm notifications to the user through the Android app for Android. The user has the ability to act and respond to the issue right away [6]. The connecting components for realization of the circuit has been shown in the fig-. The circuit components and their interconnections with the help of connecting wire has been represented in the fig. The configured bread board with the led and sensors have been seen in the fig. The selection of the connecting wires in an optimal fashion has made the whole system efficient and optimal. Fig:6 The measurement of the voltage rating has been measured on connecting the components to the display meter with connecting wires.

Parameter optimization for network transfer of the signal

Some of the key parameter optimizations of IoT system can lead to the enhancement of the propagation of the message in real time with nominal delay. The following concerned parameters responsible for communications are bandwidth, signal to noise ratio, propagation delay, modulation scheme and error correction coding. The present work also highlights the optimization scheme for the above parameters to achieve the high transfer speed with proper reliability.

Parameter Optimization Techniques

The following methods have been proposed for the algorithm

Bandwidth Allocation

Adjustment of the bandwidth allocation in dynamic fashion based on the traffic load and the sensed priority. Utilization of the multiple frequency bands to enhance the overall bandwidth.

Signal-to-Noise Ratio Enhancement

Implementation of the digital filter to remove the unwanted noises form signal.

Optimization of the Antenna design to minimize noises and maximizes the signal strength.

Minimization of Propagation Delay

Efficient routing algorithm has been utilized to minimize the propagation delay.

Modulation and Coding Optimization

Higher order modulation to increase the data rate.

Error correction coding to minimize the overhead and to maximize the signal flow.

The parametric values have been provided in the table for the work to achieve the maximum signal flow

RESULT

Typically, the code just executes and displays the data in the terminal panel. We have storage space for part of the data, and we can access it whenever we'd like. Storage that is wireless is more effective. With internet connectivity, we can view it from anywhere in the world. The Gas Value, Date, and Time are plotted on a graph. The controller provides the data through the internet. When gas flow persists for longer than a minute, it will identify the data deployed in the cloud and send the user an alarm message via the mobile application. The performance measure of the gas leakage can also be assessed by the parameter like time response. The variation of gas leakage with respect to the response time has been plotted in the graph as shown in Fig -7. It is evident from the graph that the leakage persists for certain duration till it reaches the limit to be sensed by the device to take the necessary precautionary measure.

Gas Detection IoT cloud Data

The graph is plotted with Temperature and date/time. Here are the moisture's real-time data displayed. The gas flow must be stopped as soon as moisture is found. That is this work's concept. The user will receive the same alert message via the mobile application. The graph is plotted with the kilogram and the date. The Cylinder's weight is continuously recorded. The controller will notify the user if it rises above the threshold value. The controller will notify the station to supply an additional cylinder. The peak of the curve shown in graph corresponds to the ringing of the alarm. Time variation of the temperature has been observed as initially increasing to the high value followed by the fall of the curve denoting the initiation of precautionary measure. The cylinder weight plays a crucial role in the leakage of gas. The IoT based weight monitoring has been observed in the fig. The order for the fresh cylinder has been connected to the fall in weight of the cylinder due to consumption of the gas. The fig depicts the scenario where the weight values initially falls with time to reach to the threshold value so the order for the fresh cylinder has been established. It is also observed from the graph, that on reaching the threshold value the steep rise of weight value occurs on refilling the cylinder. The point of crux for maintenance of the weight has been automatically maintained with the help of IoT enabled approach.

MOBILE APPLICATION RESULT

Data is sent to the user via a mobile application. The information is first transferred to the cloud, where it is transformed into a mobile application. The mobile application is linked to the Internet of Things cloud, and it will produce a push box based on the data it receives from the cloud. The message will be generated in a matter of seconds if the network is highly stable. Nitrify is the application being used here, and it has a source ID connection to the cloud. Through source ID, the alert message will be issued. The graphic displays the results of the mobile application. Comparison of the proposed method described in the current paper has been displayed in the table- 3. The relative merits and demerits of the works have been having been shown in the table.

Comparison with other works

It has been observed from the above discussion that our proposed model demands the least latency in producing the alarm for initiation of remedial measure towards the achievement of high-level security. The automated path ways to find optimal level computation yielding the efficient potentiality has been explicitly found in the proposed model. The graph for the gas concentration vs time for optical sensor has been shown in the fig. Here the end exposure has been shown as a peak with respect to the distinct time. The considerable time gap has been observed between the start of the exposure and end of recovery. Now we can put the all graph that shows the time of the gas emission, identified by sensor time and stop the gas emission. We consider all the experiments to be done under identical conditions.

The graph for the explore and recovery for the calorimetric sensor has been shown in the fig. The differences again has been found on the appreciable scale. The start of the exposure and end of recovery for the oxide sensor has been found reflected in the graph shown in fig 13. The time gap between the setting in of the exposure point and recovery has explicitly been observed. The response of the electrochemical sensors has been shown in the graph. The peak has been observed a little below the point achieved in the above cases. For the pyroelectric sensor, the parametric values have been plotted and the kings in the curve has been obtained more prominently. The peak has been obtained at higher value as shown. For the semi conducting metal oxide sensor, the peak has been observed approximately near 600 ppm gas concentration which is far higher than in case of other sensors. The introduction of the microcontroller with Wi-Fi has triggered the peak to higher value compared to those for the others. In comparison to the others, our algorithm has scored best. Moreover, the time gap between the start exposure and the end of recovery process has been appreciably lower than the other cases of sensors and estimated to be nearly 14 mines.

Comparison table that show that our algorithm is now better than other

CONCLUSION AND FUTURE SCOPE

This means that the idea of an Internet of Things-based smart kitchen and preventing fire accidents caused by LPG gas leakage is put to use and verified through experimentation. The system's output data is continuously transferred to the user through an IoT cloud data transfer process, allowing the user to make changes at any time. The extended work will be done on the software side. We can create a separate website using Visual Studio software, where Producer and Consumer are connected. The hardware items are directly connected to the website, and the action is taken based on the hardware output. The user won't have to perform any manual labor because the entire system will take care of itself. The optimization with the specified values for the respective parameters have been proposed in the model to achieve the optimum output in regard of sending SMS to the remote devices. The integration of AI and machine learning concept can be the big challenge to be faced in future. The current research has the scope to be extended on AI trend to optimize the decision making in real life situation towards much safer access of the kitchen.

Table 1: Literature Survey		
Reference No.	**Publication Year**	**Result**
[3]	2017	The paper's decision to employ real-time gas leak detection and gas output level measurement has been made evident with the help of this technology.
[4]	2018	In addition to continuously monitoring and detecting gas leaks, the system stores data in a database for future study and forecasting. When compared to conventional gas detection systems, the system is significantly more cost-effective thanks to the usage of IoT components.
[5]	2018	A presentation of the methods used to achieve the goals and objectives is made. All things considered, a C hazardous gas detector has improved in terms of efficiency, applicability to modern applications, and intelligence.
[6]	2019	In this study, we apply IoT technology to improve the current safety regulations. The goal of creating this prototype was to revolutionize the field of safety by preventing the discharge of dangerous and hazardous gasses.
[7]	2020	The decision made by the authors to employ real-time gas leak detection and gas output level measurement has been evident with the help of this technology.
[8]	2022	Apart from consistently observing and identifying gas leaks, the system retains information in a database for subsequent analysis and prediction.

Table 2: Maximum signal flow value		
Parameter for the system	**Value**	**Conclusion**
Bandwidth	5 – 25 MBPS	The designated bandwidth value can effectively enhance the propagation speed of the signal. [10]
Signal to noise ratio	12dB	The optimum value for the SMS communication is effective for having the clear transfer of signal.[11]
Propagation delay	3 secs	The propagation delay has been maintained to the specified value to get the best result. [12]
Modulation and coding optimization (Modulation coefficient)	1 or 2 under the QPSK scheme	The optimum value of he coefficient can be effective fr the fast communication of signal.[13]

Table 3: Comparison study						
Sl.No.	**Sensor Types of Methane**	**Working with Mechanisms**	**Advantages**	**Comparison Time**	**Disadvantages**	**Related Research**
1	Optical sensors	Observe variations in the waves of light caused by the analyte's interaction with the receptor portion.	An oxygen-free, electromagnetic interference-resistant, and non-destructive method	Installation takes longer than with a WiFi setup.	Expensive; Excessive power consumption; Methane optical absorption area is neither significant or unique.	[14-20]

2	Calorimetric sensors	Determine how much heat a reaction produces and how the reactant concentration is related to the outcome.	Low cost; design is straightforward; transportable; simple to produce; Strong methane selectivity; robustness under challenging environments.	Calorimetric sensors doesn't function in UV and infrared	Poor detection precision; prone to oversaturation, catalyst toxicity, and cracking; elevated power usage; brief life expectancy; demand a high temperature	[21-26]
3	oxide sensors	The surface of a metal oxide absorbs gas, altering its conductivity, which is then monitored to ascertain the concentration of gas.	Cheap; sturdy , long lifespan and lightweight; poison-resistant	Fetching data from any other third-party takes a long time	inadequate selectivity Temperature-dependent, slow-to-recovery, significant additive dependency, sensitive to degradation, and small to large operating temperature range susceptible to variations in humidity	[27-33]
4	Electrochemical sensors	The target gas concentration can be found by oxidizing or reducing the gas at an electrode and then measuring the current that results.	AE-based: Economical.IL-based: non-hazardous components; low volatility and high boiling temperatures; excellent methane selectivity; capable of detecting tiny leaks. SE-based	With this new method, a sensor with a limit of detection (LOD) of 0.08 ng/mL and a detection range of 0.01 to 100 ng/mL for β-Lg .	AE-based: Slow reaction time; hazardous materials; prone to leakage and evaporation.IL-based: Response time is slow; leakage is possible.SE-based: Require high temperatures;	[34-38]

5	Pyroelectric sensors	Transform heat energy into electrical energy using the pyro electricity phenomena.	Wide measurement range, non-destructive, oxygen-free operation, good sensitivity and responsiveness, and room temperature operation.	Pyroelectric sensors frequently have low or unstable voltage. so fetching the data from the server takes a long time.	High price, high power consumption, immobility, and manufacturing difficulty.	[39-42]
6	Semiconducting metal oxide sensors	The conductivity of a metal oxide surface is altered by gas absorption, and this change is measured to determine the gas concentration.	Cheap, strong, lightweight, long lifespan, and poison-resistant.	Their low selectivity, and wide operating delayed recovery so getting data from the internet so complex.	Inadequate selectivity narrow and wide range of operating temperatures; Significant additive reliance, slow rate of recovery, temperature sensitivity, and susceptibility to deterioration susceptible to variations in humidity	[43-46]

Table 4. Comparison with other sensor

ABSTRACT

In the fast-changing world of e-commerce, insights from data are the main pillars for the enhancement of user experience and business strategies. Meanwhile, much remains to be desired in collecting and preparing datasets, which are high-quality, diverse, but also privacy-compliant. The present research targets the application of Generative Adversarial Networks (GANs) in developing synthetic datasets for e-commerce applications. A GAN-based framework is proposed that will focus on generating realistic yet anonymized customer transaction records, patterns of user behaviour, and the nature of product interactions altogether while maintaining good utility of data and low privacy risks. The framework features a statistically similar synthetic dataset to the real-world datasets, hence suitable to train machine learning models while safeguarding sensitive information from users. Experimental results show that data generated from GAN can be utilized as augmentations to existing datasets to improve their performance and indeed enable data-driven decision-making in e-commerce platforms. The potential of synthetic data in bridging data scarcity issues and opening avenues for further innovation in AI-based applications in e-commerce is well articulated by this study.

Keywords: Synthetic Data Generation, Generative Adversarial Networks (GANs), Privacy-Preserving Data, Customer Behaviour Modelling.

INTRODUCTION

E-commerce platforms generate vast amounts of transactional data, including customer behaviors, product purchases, pricing trends, and sales patterns. Nevertheless, under privacy constraints, data scarcity, and the necessity for high-quality labeled datasets, real-world data become generally inaccessible for research and model training. Therefore, the generation of synthetic data emerges to provide an innovative solution to this dilemma, i.e., to create realistic, diverse, and privacy-preserving datasets for applications like recommendation systems, fraud detection,

and demand forecasting. Generative Adversarial Networks (GANs) have remarkably succeeded in generating high-dimensional, realistic synthetic data. This research deals with producing synthetic e-commerce datasets using GANs that emulate real-world transactional data while retaining its statistical properties and data privacy. By leveraging a two-network adversarial structure, the generator learns to produce realistic synthetic data, while the discriminator ensures the generated samples are indistinguishable from actual e-commerce records. In the rapidly changing arena of E-Commerce, data is what drives personalized marketing, optimizes operations, and improves customer experiences. Yet the access to widespread, quality, and privacy-compliant data is one of the most significant obstacles in the way of testing, training, and analysis. To that end, synthetic data generation stands out as one of the best solutions.

Synthetic relates to generation--artificial representation in the form of statistics, which simulates the features and patterns of real data without the exposure to sensitive or personal details. In e-commerce, synthetic data can be used for simulating customer behavior, purchasing patterns, product interactions, and all-important metrics. Using machine learning algorithms, generative algorithms, or by rule-based approaches, huge customized datasets can be created for product development, A/B tests, fraud detection, and AI training without the catching of real data in databases. This means that it can reduce dependency on real customer data, fast-track innovations, ensure better scalability, and ultimately provide better data availability in heavily restricted data sharing environments. User profiling is basically making a virtual avatar of a user based on his/her modes of actions and preferences where the concern is limited to customer satisfaction, loyalty, and price sensibility.

For example, in an online store, it would help in splitting users such as low, medium, or high probable buyers to tailor pricing strategies. It is done on a basis of visit frequency, session duration, clicking activity, and purchase history. Pricing includes accurate pricing because consumers are usually price-sensitive. Sellers should sell at an affordable price while at the same time have a profit margin by changing the prices from user to user. A model for profiling might help to achieve an optimum rest of the two by providing information on the user behavior to predict purchase probabilities. But such models need data, and lots of it, in a balanced way. For small traffic online stores, the collection speed was less because of poor traffic. This study, therefore, suggested that synthetic data should be used for the model's much quicker training and testing purposes. This way would speed up the overall time for model development and improve online store implementation.

LITERATURE WORK

Title: "A Neuro-Fuzzy Approach for Speech Emotion Recognition"

- Authors Dwi H. Widyantoro, HeruSuhartanto, and Azhari SN.
- Publication Date Not explicitly mentioned in the text, but it was presented at the 3rd International Conference on Electrical Engineering, Computer Science and Informatics (EECSI 2016), so it's from 2016.
- Method Used The paper uses a neuro-fuzzy system, specifically an Adaptive Neuro-Fuzzy Inference System (ANFIS), to classify emotions in speech
- Final Result The ANFIS model achieved an accuracy of 95.7% in recognizing the five emotional states from speech data, which is considered a high performance for emotion classification tasks.

Title "Electromagnetic shielding effects of wearable UHF RFID textile tag antenna for IoT applications"

- Authors Bakar Almadani, Md. Shabiul Islam, Shamim Akhter, and Mohammad Tariqul Islam
- Publication: *Microwave and Optical Technology Letters*, 2021
- Method used The authors used simulation and experimental methods to evaluate the electromagnetic shielding effects on a wearable textile UHF RFID tag antenna.
- Final Result The article does not explicitly mention a numerical "accuracy" value like in classification tasks (e.g., 95% accuracy), because it's an engineering/design study focusing on antenna performance metrics rather than a prediction model.

Title Fault Diagnosis of Rotating Machinery Using Ensemble Learning and Hybrid Features in Time and Frequency Domains

- **Authors** Jie Liu, Mingzhi Zhang, Menghao Zhang, Liqiang Zhang, and Zhen Li
- **Publication** Business Information Review 2024,
- **Method used** The paper proposes a hybrid feature extraction method that combines time-domain statistical features, frequency-domain spectral features, and time–frequency domain features using wavelet packet transform (WPT).
- **Final Result** The proposed method achieved 99.5% classification accuracy on the CWRU dataset (Case Western Reserve University bearing dataset).

Title "Real-Time American Sign Language Recognition Using a CNN with Optimized Hyperparameters"

- **Authors** Anagha Ramesh Babu, SreyaSasikumar, Athira R, Neenu K S, Dr. Sheena Mathew
- **Publication** Published in **Procedia Computer Science, Volume 172, 2020, Pages 142-149**
  Publisher Elsevier
- **Method Used** A **Convolutional Neural Network (CNN)** is used.
- **Final Result Achieved Accuracy:99.86%.** The model performs **real-time ASL recognition** with high precision and is suitable for implementation in assistive communication tools.

Title Generative AI for Synthetic Data Generation: Methods, Challenges and the Future

- **Authors: XuGuo**(Member,IEEE) **Yiqiang Chen** (Senior Member, IEEE)
- **Publication:-IEEE** (Based on the authors' affiliations and standard academic formatting, though the actual publication venue might be arXiv until further peer-reviewed publication.) March 7, 2024
- **Method used: -** Prompt engineering (label-conditional and attribute-controlled prompts, verbalizer-based prompt expansion) Parameter-efficient adaptation methods (e.g., Prompt Tuning, Prefix Tuning, LoRA) Quality assessment of synthetic data (correctness, diversity, naturalness).

Title AutoSimulate: (Quickly) Learning Synthetic Data Generation

- **Authors :-**Harkirat Singh Behl (University of Oxford)
  AtilimGüneşBaydin (University of Oxford)
  Ran Gal (Microsoft Research)
  Philip H.S. Torr (University of Oxford)
  VibhavVineet (Microsoft Research)

- Publication :-**August 16, 2020 ublished on arXiv.org (Preprint server for Computer Science)Not specified as peer-reviewed yet—hosted on arXiv in the Computer Vision (cs.CV) category.**

- **Method used** Framing the problem as a bi-level optimization. Using a differentiable approximation to avoid expensive evaluations like in REINFORCE or Bayesian optimization.

- **Final result :-** Semantic Segmentation on CLEVR Dataset Best Test Accuracy (mean IoU): 62.9%.

[7] Title :-Generative Adversarial Networks for Synthetic Data Generation: A Comparative Study

- **Author** Claire Little, Mark Elliot, Richard Allmendinger, Sahel ShariatiSamani
- **Publication** Published on arXiv.org under Computer Science - Machine Learning (cs.LG) , December 3, 2021
- **Method used** Tabular GANs: CTGAN and TableGAN
  Statistical methods: Synthpop (CART-based) and Data Synthesizer
  Utility Metrics: pMSE, Ratio of Estimates (ROE), Confidence Interval Overlap (CIO)
  Risk Metric: Targeted Correct Attribution Probability (TCAP)

- **Final Result** CTGAN, among GANs, provided a balanced performance with moderate utility and risk. TableGAN had lowest disclosure risk but very poor data quality. Synthpop offered the best data utility but at the highest disclosure risk.

CONCLUSION

This study presented Generative Adversarial Network (GAN)-driven synthetic data generation in the e-commerce setting. It was shown that GANs are capable of generating realistic transaction records, user behaviours, and product interactions while preserving data privacy and security. This would allow businesses facing data scarcity challenges: to train AI models better without disclosing sensitive customer data. Data which are generated by GANs can be used by e-commerce platforms to build improved recommendation systems, improve fraud detection, and even run market simulations with far more accuracy. In addition, synthetic data can be used to test all new business strategies and features without relying only on real user data. Nevertheless, some challenges such as diversity of data and avoidance of mode collapse still hinder advanced GAN models as they are yet evolving with more and more credible solutions for synthetic data generation. With time, optimizing architectures of GAN and adding additional privacy-preserving techniques will help make these even more usable in real-world applications. AI and machine advancements in this phase effectively shape the future of e-commerce. This will use GAN for the synthetic data generation, which will greatly help in making better, safer, and more innovative digital marketplaces.

ABSTRACT

In the digital era, ATMs facilitate fast and secure transactions for diverse users, necessitating remote monitoring to quickly address security breaches and minimize losses. This research proposes a Smart ATM Security System integrating IoT and deep learning to enhance global ATM security. The system continuously monitors user behavior using deep learning models such as DenseNet121, AlexNet, EfficientB0, and VGG16 to detect potential theft. Comparing the performance of the different models for anomaly detection in this task, DenseNet121 is identified as the best-performing model in terms of accuracy. In the proposed system, temperature and vibration sensors detect physical damage to ATMs. In the event of suspicious activity, if there is any physical damage an alert will be sent, and the solenoid lock is triggered to close the ATM door to prevent robbers from exiting. If anomalous behavior is detected without physical evidence, an immediate alarm alerts authorities to a potential burglary.

Keywords: ATM Security, Anomaly detection, DenseNet121, IoT

INTRODUCTION

In the contemporary landscape of banking and finance, the advent of wireless technology has revolutionized how clients engage in financial transactions, particularly through the ubiquitous ATMs. With more than 3 million bank branches worldwide, the ATM has become a cornerstone of convenience for individuals seeking swift access to their financial resources. These sophisticated machines, accessed through the insertion of reversible debit cards or mobile

applications equipped with chip cards and specialized keys, facilitate seamless transactions, albeit with varying levels of security considerations, including the utilization of limited safety data such as Card Verification and Value Code (CVVC). The primary mechanism of user authentication involves the entry of a Personal Identifying Number (PIN), a critical layer of security in safeguarding financial transactions conducted at ATMs. However, despite these security measures, the alarming surge in ATM thefts remains a persistent challenge in contemporary society. The vulnerability lies in the inadequacy of security features on the ATM equipment, allowing criminals to exploit weaknesses and successfully carry out burglaries, even in the presence of onsite security personnel. The consequential impact extends beyond the immediate financial losses incurred by banks, permeating into the realm of government resources, where losses in large amount have become an unfortunate reality. Addressing this escalating threat requires a paradigm shift in ATM security solutions, prompting exploration into innovative technologies. This research delves into the potential of integrating Internet of Things (IoT) technology and advanced deep learning techniques to fortify ATM security. By providing a comprehensive understanding of the existing challenges and vulnerabilities, this research work seeks to pave the way for a robust security framework by analyzing the real time video streams obtained from the ATM webcam using deep learning and IoT which not only safe guards financial institutions but also contributes to the broader societal resilience against the rising tide of ATM-related criminal activities. The paper discusses the existing literature, algorithmic models, potential challenges, proposed system architecture, working, and offering a comprehensive solution to bolster the global security landscape for ATMs. (G. Jakeer Hussain *et al*, 2016) has proposed a system by developing a system which uses Micro-Electro-Mechanical systems (MEMs) sensor which have been placed in the locker section of the ATM. The sensor gets activated when the user is trying to open the locker and the door gets closed automatically and the data is stored in the embedded server. (Kamble *et al.*, 2018) proposed an ATM security system with smart sensors and a GSM/GPRS modem. This system, built on a PIC controller-based embedded framework using PIR, piezoelectric sensors, and a microphone, ensures real-time data processing. This work highlights the efficacy of combining advanced sensors and communication modules to enhance ATM security.

The solution designed by (S. Ramyasri *et al.,* 2020) uses face recognition to authenticate users before accessing the ATM through images to ensure security. Additionally, it also incorporates an IR sensor to detect and generate an alert, lock the door, and fill the room of the ATM with anesthetic gas to make the user go into an unconscious state if he is trying to open the money locker. An approach in (Kalmani, 2022) leverages facial recognition technology during transaction initiation to enhance ATM security by cross-referencing the real time image of the user with stored data of ATM card owners. In (A S., N S.K., Chalil, 2022) a combination of IR sensor and vibration sensor is continuously monitored and it is triggered upon any kind of unusual activities faced by the ATM and the door will be automatically locked. The system uses the Node MCU (Micro Controller Unit) board with ESP8266 microcontroller to function and RFID (Radio Frequency Identification) tag which is used to deactivate the sensors for maintenance and unlock the door from outside in case of any problem. In (Manisha Samant, 2023) HC-SR501 infrared sensor is used to detect any motion, upon detection face captured using the webcam is matched with the database, if it isn't matched access is denied. Also, a vibration sensor that is attached to the machine will be utilized to identify any aberrant movements so that, when such motions cross the threshold, the solenoid lock will activate and lock the door. The system proposed (GavaskarK, 2022) uses sensors to detect an attack, then the system triggers alerts via IoT communication and a buzzer, while simultaneously transmitting sensor data to a mobile application for real-time monitoring by bank officials. These officials have remote control capabilities, enabling them to lock the ATM door and deploy countermeasures such as chloroform spray using the mobile app. An approach in (SwamyP.*et.al,* 2020) uses MEMS sensors for vibration detection and fire alarms. An Arduino board is used to process real-time sensor data, triggering voice alerts upon detecting abnormal or unauthorized activity. Additionally, servo motors control door locking mechanisms, and a spray mechanism releases gas to incapacitate thieves. In (Sricharan B, 2022) a double authentication method is proposed, utilizing both fingerprint and GSM authentication to enhance security in accessing bank accounts. In case of mismatched fingerprints, immediate SMS notifications are sent to the user, alerting them to unauthorized ATM card usage. Even if the fraudster bypasses fingerprint authentication, GSM authentication provides an additional layer of security. In (VermaD, 2022) a similar approach is used, Vibration sensor is used to sense vibration produced and DC Motor is used for closing the door of ATM when the vibration is

sensed, also a buzzer is used, once the vibration is sensed. Furthermore, an infrared sensor is also used to develop the automatic light switching system. An approach in (Arya Sashidharan, 2023) uses a combination of ADXL 345, piezoelectric disc buzzer, and LM35 sensors, which will get activated when any suspicious activity happens to ATM ex. Tilting, Shaking. Upon detecting relevant authorities were notified and the door was automatically locked. A machine learning based approach is proposed in (Kumavat R.C, 2023) where a model is trained to detect if a person's face is covered or not. If it is covered he/she isn't given access to the ATM machine until they remove their mask. The proposed system in (Visalakshi P, 2023) integrates various sensors, including IR, LDR, temperature, smoke, and vibration sensors, to enhance ATM security. The IR sensor monitors the entry and exit of individuals, triggering an alert if more than two persons are detected inside the ATM room. LDR sensors regulate light intensity, automatically switching on lights when ambient light falls be- low a threshold. Temperature sensors facilitate power-saving by controlling AC usage based on room temperature. Smoke sensors detect elevated smoke levels, activating a buzzer for immediate alerting. Additionally, vibration sensors detect any attempts to break into the ATM, triggering door locking mechanisms and sending notifications to the police station. This sensor-based approach ensures comprehensive security and efficient resource management within ATM facilities.

Many of the systems described rely on single authentication methods such as face recognition (Kambale M, 2018) or fingerprint authentication (Sricharan B, 2022). While these methods provide a layer of security, they may not be foolproof, as seen with the proposal for double authentication . Some proposed systems, such as the one mentioned in another work, deploy countermeasures like chloroform spray to make thieves unconscious. While these measures may be effective, they also pose potential risks to innocent individuals who may accidentally trigger the system. While several works utilize advanced sensors and communication modules, there seems to be a lack of emphasis on deep-learning techniques for anomaly detection. Deep learning has shown promise in various fields for its ability to learn complex patterns from data. Using deep learning algorithms could potentially improve the accuracy of anomaly detection in ATM security systems. Our system overcomes the above-mentioned drawbacks by combining deep learning and IoT framework providing a multilevel security. A deep learning-based model is designed to perform anomaly detection using data captured from the ATM's webcam. Our model analyzes real-time video streams to identify suspicious activities or unauthorized access attempts within the ATM environment. By training on a diverse dataset of normal and anomalous behavior, the model learns to differentiate between routine transactions and potential security breaches, enhancing the overall security posture of ATM facilities. It also integrates vibration and temperature sensors, through continuous monitoring and analysis of sensor readings, our framework can effectively identify abnormal patterns or events signaling potential theft activities. In the event of a detected anomaly, the framework triggers automated responses, such as closing the ATM door automatically. By detecting theft in real-time, our frame- work significantly enhances the security of ATM facilities, minimizing the risk of asset loss and ensuring the safety of users.

MATERIALS AND METHODS

The proposed methodology focuses on making ATMs safer using two powerful technologies: deep learning and the Internet of Things (IoT). Deep learning algorithms, renowned for their capability to understand complex patterns within data, are used to detect anomalies. It helps us spot any unusual activity happening around ATMs. IoT helps in connecting everyday objects to the internet, allowing them to send and receive data. Physical sensors, like vibration and temperature sensors are used to constantly monitor the ATM's surroundings. For example, if someone tries to forcibly open the ATM or if there's a sudden change in temperature due to inducing fire, the sensors will collect the information which has been proposed and an alert is sent. As shown in the architecture of the system in figure 1, we integrate both the deep learning and IoT frameworks to create a comprehensive ATM security system. Live feed from the ATM camera is continuously captured, preprocessed, and then fed into the deep learning model for real-time analysis. Simultaneously, the temperature and vibration sensor values are constantly measured to monitor the ATM's physical environment. When an anomaly is detected by the deep learning model, and if both the sensor readings remain below the predetermined thresholds, a warning is generated to notify the relevant authorities of potential

suspicious activity. However, if the model identifies an anomaly and either of the sensor readings crosses the threshold, the solenoid lock is triggered to close the ATM door, preventing unauthorized access and alerts are promptly sent out to notify officials, enabling them to respond at the time of theft. By using both deep learning and IoT together, our method helps detect security issues early and respond quickly. This makes ATMs safer overall, protecting them from potential dangers. In order to perform the anomaly detection, various deep learning models such as VGG16, AlexNet, EfficientNetB0, and DenseNet121 were used. These models were trained using the UCF crime dataset, a widely recognized benchmark dataset for anomaly detection from surveillance videos. To optimize their performance, we preprocessed the data and initialized the models with weights pre-trained on the ImageNet dataset. Additionally, we fine-tuned each model by appending a custom classification layer tailored to our specific anomaly detection objectives. Once trained, these deep learning models were deployed on a Raspberry Pi 4, a compact and cost-effective computing platform. In real-time, the ATM security camera feeds are streamed into the deployed models, enabling immediate analysis and detection of any suspicious activities or anomalies occurring in the ATM. In the IoT framework, a combination of sensors and a solenoid lock are used to increase the security measures around the ATM. The first component, the Grove Temperature & Humidity Sensor (DHT11), helps in monitoring environmental conditions within the ATM surrounding. With its ability to accurately measure temperature and humidity simultaneously, the DHT11 sensor provides essential data to ensure optimal operating conditions and detect any anomalies that may indicate potential security breaches. Additionally, the vibration sensor module SW-420 is coupled with a comparator LM393, to detect any unauthorized physical disturbances around the ATM. By setting a threshold level, the sensor module can differentiate between normal environmental vibrations and suspicious activity. This allows the system to promptly identify and respond to attempts of tampering or forced entry. Furthermore, the solenoid lock helps in controlling access to the ATM, ensuring the door is locked automatically at the time of theft.

Anomaly detection from the camera feed

Many deep learning models have produced promising results in classifying images into different classes in the past decade. Some of them have been chosen and trained for the classification of the images into normal and anomaly classes. In the proposed system different models were trained and the performance of the models were compared to utilize the best model for the system.

AlexNet

AlexNet is a set of eight layers, five convolution layers, and 3 fully connected layers. Alexnet reduces the training time significantly by employing Rectified Linear units instead of tanh. Secondly, AlexNet supports the usage of more than one GPU at a time which also helps to reduce the training time and further supports bigger models for training. The AlexNet architecture implemented is tailored for binary image classification tasks. This architecture combines the distinctive features of AlexNet with customization for binary image classification, promising effective learning and discrimination capabilities. The model begins with a convolutional layer followed by a max-pooling layer. The second layer introduces filters with 'same' padding, followed by another max- pooling layer. Subsequent three layers consist of three convolutional layers employing 'same' padding and concluding with a max-pooling layer. The rest layers form the fully connected segment of the network, with two hidden layers incorporating ReLU activation functions and dropout layers for regularization. The final layer consists of two neurons with a softmax activation, suited for binary classification. The model is compiled using Stochastic Gradient Descent (SGD) as the optimization method with a learning rate of 0.1. The categorical cross-entropy loss function is employed, while accuracy, AUC, and precision are monitored as metrics during training.

VGG16

As the name implies VGG16 consists of 16 layers, 13 convoluted layers and three fully connected layers. VGG16 takes an edge over theAlexNet by replacing the large sequence filters into a series of small 3x3 filters. The usage of smaller filters prevents the network from overfitting. Though the architecture is simple it is really a relatively wide network with over 138 million parameters. The VGG16 architecture, implemented is designed for binary image classification tasks. The model begins with the VGG16 pre-trained on the ImageNet dataset, utilizing weights to

initialize the convolutional layers. To adapt the model for the specific classification task, all layers are set as non-trainable. The network architecture is extended by adding a flatten layer, followed by a Dense layer and a ReLU activation function. To mitigate overfitting, a dropout layer with a rate of 0.5 is introduced. The final layer utilizes the softmax activation function, aligning with the binary classification objective. The model is compiled using the Adam optimizer, categorical cross-entropy as the loss function, and performance metrics such as accuracy, AUC, and precision are monitored during training. This modified VGG16 architecture demonstrates a balance between the powerful feature extraction capabilities of VGG16 and specific adjustments to cater to the nuances of classification tasks.

EfficientNetB0

EfficientNetB0 makes use of compound scaling, modifying depth, breadth, and resolution all at once to maximize computing effectiveness and performance. B0, which is based on the MobileNetV2 architecture, achieves cutting-edge performance in tasks including segmentation, object identification, and picture classification. Compared to previous models, it achieves great accuracy at a cheaper computational cost because of its balanced scaling strategy. Many computer vision applications use EfficientNet B0 because it provides a workable solution for jobs that span many platforms and resource limitations. Utilizing the EfficientNetB0 architecture with weights pre-trained on ImageNet, the model's weights are initially frozen to leverage transfer learning. The top layers are then reconfigured to suit the classification task. A Global Average Pooling 2D layer is applied to summarize spatial features, followed by Batch Normalization for enhanced training stability. A dropout layer, with a rate of 0.2, is introduced to mitigate overfitting. The final layer employs a Dense layer with sigmoid activation, facilitating binary class classification. The model is compiled using the Adam optimizer with a learning rate of 1e-2 and categorical cross-entropy as the loss function. Performance metrics, including accuracy, AUC, and precision, are monitored during training. The resulting EfficientNetB0 architecture is tailored for effective multi-class classification, combining the advantages of transfer learning and model customization for improved accuracy and generalization.

DenseNet121

DenseNet121's primary benefit is that it handles vanishing gradients, which has three advantageous effects: it reduces parameter usage compared to other well-known deep learning models; it also eases the training load on deep learning models and permits feature reuse. The overall architecture, shown in the figure, encompasses the modified DenseNet121 used in this research work. Following the base model, a Global Average Pooling 2D layer is incorporated for spatial feature summarization. A subsequent dense layer, comprising 128 neurons with a ReLU activation function, captures intricate patterns in the data. To mitigate overfitting, a dropout layer with a rate of 0.2 is introduced. The final dense layer utilizes a softmax activation function, facilitating binary classification into normal/anomaly classes. This architecture capitalizes on transfer learning from a pre-trained DenseNet121, strategically modified to cater to the nuances of binary image classification. The proposed modifications aim to enhance accuracy and feature extraction capabilities, specifically tailored for the normal/anomaly classification task.

IOT framework

In this section, the hardware components utilized are discussed specifically focusing on the sensors employed to record various physical factors. These sensors play a critical role in gathering accurate and reliable data, which is essential for the system's overall functionality and performance. The following subsections provide a detailed overview of each sensor, including their specifications, working principles, and integration into the system.

Temperature Sensor

In our IoT-based ATM security system, a temperature sensor is utilized to detect external temperature variations, specifically to identify if an attempt is being made to break into the ATM using fire or welding. For real-time implementation, this sensor is strategically placed inside the ATM machine's front area to monitor any significant temperature changes that could indicate tampering. The temperature sensor selected for this purpose is the Grove Temperature & Humidity Sensor (DHT11). The DHT11 is a high-quality, low-cost digital sensor capable of measuring both temperature and humidity simultaneously. The DHT11 sensor meets the general-purpose

measurement needs for most environments, making it suitable for our application. Its robust performance under the specified conditions ensures reliable operation within the ATM's internal environment. By incorporating the DHT11 sensor into our ATM security system, we enhance the ability to detect potential security breaches involving extreme temperature fluctuations. This proactive measure significantly contributes to the overall effectiveness of our proposed solution, ensuring the safety and integrity of the ATM's contents.

Vibration Sensor

A vibration sensor is employed to detect attempts to physically break into the ATM in our system. This sensor is strategically placed inside the ATM machine's money loading area, a common target for thieves. The vibration sensor module SW-420, utilized in this system, is based on the SW-420 sensor and the LM393 comparator, which detects vibrations exceeding a set threshold. The threshold is adjustable using an onboard potentiometer. When no vibration is detected, the module outputs a logic LOW signal, indicated by an LED light. Conversely, when vibrations are detected, the sensor outputs a logic HIGH signal, turning off the LED. This module can connect to a microcontroller, allowing for real-time detection of vibrations and triggering of alarms. The SW-420's reliable performance and adjustable sensitivity make it an ideal choice for enhancing the security of our ATM system, ensuring rapid detection of tampering attempts and contributing to the overall robustness of our solution.

Solenoid Lock

Our system employs a 12V DC solenoid lock to enhance access control and security. This solenoid lock utilizes an electromagnetic mechanism, actuated by a 12V DC power supply, to manage the locking and unlocking functions. We have chosen the power-on unlocking type for our ATM security system, which ensures that the door remains unlocked only while the solenoid is powered. In the event of a power failure or wire disconnection, the lock automatically engages, preventing unauthorized access. This feature is particularly advantageous for ATMs, which have a continuous power supply under normal conditions, allowing the lock to remain in the unlocked state for regular operation. However, in the case of a theft attempt, cutting off the power supply immediately triggers the lock to secure the ATM. This approach not only provides robust security but also ensures that the ATM remains secure during any power disruptions, effectively preventing unauthorized access and enhancing crime prevention measures.

RESULTS AND DISCUSSION

Dataset

The consists of long untrimmed surveillance videos that cover 13 real-world anomalies, including Abuse, Arrest, Arson, Assault, Accident, Burglary, Explosion, Fighting, Robbery, Shooting, Stealing, Shoplifting, and Vandalism. These anomalies are selected because they have a significant impact on public safety. The dataset was originally collected from the videos on YouTube and Live Leak using text search queries. In total, 950 normal videos were gathered, leading to a total of 1900 videos in the dataset. The entire dataset is divided into two parts: the training set consisting of 800 normal and 810 anomalous videos and the testing set including the remaining 150 normal and 140 anomalous videos. The split of train/test data and normal/anomaly class in the dataset is depicted in Figure 2a and 2b respectively. Both training and testing sets contain all 13 anomalies at various temporal locations in the videos. In our work, this dataset has been used for general anomaly detection considering all anomalies (except road accidents) in one group and all normal activities in another group. The train data present in the dataset is used for both training the neural networks and validating the model during training at the end of each epoch. The train-validation split is 80-20% for all the models trained in this work.

Performance Analysis

AlexNet, EfficientNetB0, VGG16 and DenseNet121 were all trained on the dataset at different hyperparameters for three epochs. Each model has attained different levels of metrics. The results of each model are presented in this section of the research work. The label 0 represents anomaly in the image and 1 represents the image is normal in all

the confusion matrices shown in this work. AlexNet achieved an accuracy of 99.88% during training but had lower accuracy in test and validation when random weights were initialized in the initial stage. The confusion matrix for the same is depicted in figure 3. VGG16 provided closer results to that of Dense Net when the training was limited to 2 epochs. The results decreased steeply when trained for 3 epochs. The performance of VGG16 was not significant for the study as it achieved a lower accuracy in comparison to the rest of the models. The confusion matrix for epochs 3 and 2 are presented in figure 4a and 4b respectively. EfficientNetB0 achieved a training accuracy of 88.92%. Even though this accuracy in training is a low score in comparison to others it attained 91.49% accuracy in validation. It also has achieved a test accuracy of 72.51%. The confusion matrix of the same is depicted in Figure 5. The summary of all the models, along with their accuracy scores, is presented in Table 1.

Hardware Setup

As shown in the circuit diagram in 7 the web camera plugs into a USB port, while the temperature and vibration sensors connect to the Raspberry Pi's GPIO pins. A relay module is key. It bridges the gap between the Raspberry Pi's low-power control and the high-powered solenoid lock. One set of the relay's contacts connects to the Raspberry Pi's GPIO pins, receiving control signals. The other set connects to the 12v DC power supply and the solenoid lock itself. When the Raspberry Pi detects an anomaly or sensor threshold breach, it sends a signal to the GPIO pins. This triggers the relay, which then activates the solenoid lock.

Working of the prototype

Our ATM security system combines a Raspberry Pi 4 with some sensors and actuators connected to the GPIO pins. A USB webcam records a live video feed, then a deep learning model on the Pi interpret the data to detect any continuous anomalous behavior. The DHT11 sensor, inserted into a certain GPIO pin, simultaneously measures the temperature and humidity levels, while the SW-420 vibration sensor, which is a part of an LM393 comparator system, is planted into another GPIO pin to recognize the vibrations and thus the tampering. Raspberry Pi is continuously supervising these sensor readings. If some anomaly is detected by the model, and the values read by the sensor are out of predefined limits, the Raspberry Pi sends a high signal to a GPIO pin that is connected to a relay module. The relay is then energized and the solenoid, which is connected to it, gets the unlocked ATM door 8 locked as in 9, thus enhancing the safety of the ATM. Whereas when some anomaly is detected by the model continuously and the sensor readings are within the limit a warning message is displayed in the machine. This real-time video analysis and environmental monitoring with automated physical security responses will, therefore, be the basis for the overall safety of the ATM.

CONCLUSION

A more promising security system has been developed for ATM cubicles. This system has been incorporated with both deep learning techniques and physical sensors to detect anomalies in the environment. Trained deep learning models deployed in Raspberry Pi which recognizes and detects anomalies through the connected camera present. The IoT sensors connected to the system detect the temperature and vibration values and generate an alert if they exceed the threshold values set. Integration of all three factors to identify anomalies makes it a more efficient system to increase the security in the ATM.In future work, more advanced neural networks can be designed and tested on the dataset to improve the accuracy of anomaly detection. Exploring additional datasets could further enhance the system's robustness and applicability. Incorporating multiple factors beyond temperature and vibration, as currently proposed, could enrich the criteria for detecting anomalies. Integrating GPS/GPRS systems would enable real-time alerts to most nearby authorities for immediate response. Additionally, the hardware system, which is currently powered by electricity at ATM sites, could be made standalone by providing an independent power source, offering an extra layer of security during power outages.

ABSTRACT

Present experiment was conducted during 2023-24 at the open ventilated polyhouse of Horticulture Department, School of Agriculture Sciences, Shri Guru Ram Rai University, Dehradun, Uttarakhand, India. This research aimed to study the "Influence of NAA and IBA Foliar Application on Growth attributes of Strawberry (*Fragaria* × *ananassa* Duch.) cv. Chandler grown under Open Ventilated Polyhouse". The experiment was organized in a completely randomized design, consisting of three replications and ten treatments. These treatments featured different levels of plant growth regulators at varying concentrations viz. T_0 (Control), T_1 (IBA @25ppm), T_2 (IBA @ 50ppm), T_3 (IBA @75ppm), T_4 (NAA @25ppm), T_5 (NAA @50ppm), T_6 (NAA @75ppm), T_7 (IBA @25ppm + NAA @25ppm), T_8 (IBA @50ppm + NAA @50ppm) and T_9 (IBA @75ppm + NAA @75ppm).The strawberry cv. Chandler was transplanted on 02-12-2023. The various observations related to growth and yield attributes were recorded at different intervals. Results revealed that, among the different treatments,T_9 (IBA @75ppm + NAA @75ppm) was recorded maximum plant height (14.70 cm), plant spread in E-W (24.41 cm), plant spread in N-S (22.11 cm), number of leaves per plant (15.36), number of runners per plant (8.50),length of runners per plant (23.26 cm) and number of flowers per plant (8.96). There were minimum days to first flowering (32.70) was recorded in T_9 and minimum days to first fruiting (41.50) was recorded in T_6. However, maximum number of fruits per plant (7.83) was recorded in treatment T_6 (NAA @75ppm) and minimum was found in control.

Keywords: *Fragaria ananassa,* grown, plant, fruits.

INTRODUCTION

Strawberry (*Fragaria × ananassa* Duch.) is a highly valued small fruit crop known for its delicious taste, vibrant colour, and rich nutritional profile, including antioxidants, vitamins (especially vitamin C) and minerals (Mitra, 2020). The commercially cultivated strawberry is an octoploid species with chromosome number (2n=8x=56) (Vishal *et al*., 2016).In recent years, the cultivation of strawberry has gained significant momentum in India due to its high economic return and growing consumer demand. The abundance of pectin in strawberries makes them suitable for not only eating fresh but also for making jam and jelly (Rathod *et al*., 2021).In India, the cultivation of strawberries was started in hilly areas of Himachal Pradesh and Uttar Pradesh in 1960s and widespread in other states such as Uttarakhand (Nainital and Dehradun), Kashmir Valley, Mizoram, Meghalaya, Uttar Pradesh, Maharashtra (particularly in Pune, Nashik, Mahabaleshwar and Sangali towns), West Bengal (Kalimpong), Haryana, Punjab, Karnataka and Rajasthan (Katel *et al*., 2022). According to Directorate of Horticulture and food processing Chaubattia the total area under fruit cultivation in Uttarakhand is 81692.58 Ha, Production 369447.30 MT and productivity 4.52 MT/ha. According to National Horticulture Board (2022)the total area under fruit cultivation in India is 7064('000Ha) with production 107507('000MT). Among the various cultivars, 'Chandler' is particularly popular owing to its high yield potential, good fruit quality and adaptability to diverse agro-climatic conditions(Chadha, 2019).To meet the increasing demand and enhance productivity, there is a growing interest in adopting protected cultivation practices, such as open ventilated polyhouses. These structures offer a controlled environment that protects crops from adverse weather, extends the growing season, and improves fruit quality and yield. Canning gives you a great option for using strawberries in smoothies baked goods and many dessert recipes (Chadha, 2022).

However, even under such favourable conditions, optimizing the physiological and morphological growth of plants remains a key challenge. Plant growth regulators consist of phytohormones, their chemical equivalents, substances that release hormones, agents that alter hormone sensitivity, and inhibitors of hormone synthesis (Hajam *et al*., 2018). Plant growth regulators like Naphthalene Acetic Acid (NAA) and Indole-3-Butyric Acid (IBA) have been widely recognized for their role in enhancing plant growth, improving root development, promoting flowering, and increasing fruit set (Rademacher. 2015). NAA, a synthetic auxin, plays a vital role in cell elongation and fruit development, while IBA is primarily involved in stimulating root initiation and improving nutrient uptake (Bellini *et al*., 2014; Mehraj *et al*., 2015 and Bhople*et al*., 2020). Foliar application of these PGRs is a widely adopted approach due to its efficiency in rapid absorption and targeted effect (Honkanen and Dolan, 2016).Despite several studies on the role of plant growth regulators in various fruit crops, limited research has focused on their foliar application in strawberry cultivation under polyhouse conditions, especially in cultivars like Chandler. Hence, the present investigation was undertaken to evaluate the influence of foliar application of NAA and IBA on the growth attributes of strawberry cv. Chandler grown under open ventilated polyhouse. The findings of this study are expected to contribute valuable insights into the use of PGRs for improving strawberry production in protected cultivation systems.

MATERIALS AND METHODS

The current study entitled "Influence of NAA and IBA Foliar Application on Growth attributes of Strawberry (*Fragaria ×ananassa* Duch.) cv. Chandler grown under Open Ventilated Polyhouse"was carried out at the Horticulture Research Block, School of Agricultural Sciences, Shri Guru Ram Rai University, located in Pathri Bagh, Dehradun, Uttarakhand, India, during the rabi season from November 2023 to April 2024. The climate of this area is categorized as humid subtropical. In January 2024, the highest and lowest temperatures recorded during the crop growing season were 20.3ºC and 6.4ºC, respectively. The cultivar 'Chandler' was selected for this experiment. The study utilized a Completely Randomized Design, which incorporated three replications. Each replication consisted of ten treatments involving Plant Growth Regulators, with all treatments being randomized independently in each replication. The treatments included T_0 (Control), T_1 (IBA @25ppm), T_2 (IBA@50ppm), T_3 (IBA @75ppm), T_4 (NAA @25ppm), T_5 (NAA @50ppm). T_6 (NAA @75ppm), T_7 (IBA @25ppm + NAA @25ppm), T_8 (IBA @50ppm + NAA @50ppm), T_9 (IBA @75ppm

+ NAA @75ppm). Variance refers to the degree of variability found within a dataset, which is calculated by averaging the squares of the differences from the mean. The analysis of variance was performed utilizing the methodologies introduced by Panse and Sukhatme in 1989.

RESULT AND DISCUSSION

The research indicated that different levels of Plant Growth Regulators had a significant impact on growth characteristics when compared to the control. Tables 2, 3& 4and Fig. 1-10illustrated the notable enhancements achieved with various combinations of these plant growth regulators versus the control. A detailed discussion and analysis of these findings are presented in the following sections.

Plant Height (cm)

The results displayed in Table 2 and Figure 1 suggested that there was a significant difference in number of runners per plant among the different plant growth regulators. At 30 DAT, the maximum Plant height (12.05 cm) was recorded in $T_9$with IBA @ 75 ppm + NAA @ 75 ppm and minimum plant height (6.35 cm) was recorded in T_0(control). The plant height in T_1 (7.65 cm) and T_2 (7.76 cm) were at par with each other. Whereas, the plant height in T_3 (8.28 cm) and T_4 (8.37 cm) were at par with each other. However, the plant height in T_6 (10.53) and T_7 (10.39) were also at par with each other. At 60 DAT the maximum Plant height (13.42 cm) was recorded in T_9 with IBA @ 75 ppm + NAA @ 75 ppm and minimum plant height (8.40 cm) was recorded in T_0 (control). The Plant height in T_2 (10.02 cm), T_3 (10.29 cm), T_4 (10.45 cm) and T_7 (10.78 cm) were at par with each other. Whereas, the plant height in T_5 (11.38 cm) and T_6 (11.86 cm) were also at par with each other. However, significant difference was observed in T_1 (9.23 cm) with IBA @ 25 ppm and T8 (12.86 cm) with IBA @ 50 ppm + NAA @ 50 ppm. At final harvest the maximum Plant height (14.70 cm) recorded in T_9 with IBA @ 75 ppm + NAA @ 75 ppm which were at par with T_8 (14.59 cm) and minimum plant height (11.13 cm) was recorded in T_1 with IBA @ 25 ppm which were at par with T_0 (11.16 cm) and T_2 (11.45 cm). The plant height in T_3 (12.34 cm), T_4 (12.45 cm) and T_7 (12.84 cm) were at par with each other. Whereas, the plant height in T_5 (13.35 cm) and T_6 (13.12 cm) were also at par with each other. However, there were non-significant observed among the treatments at final harvest. This might be due to accelerated cell division and elongation, promoting vegetative growth in strawberries and helping to mitigate genetic dwarfism. Similar results have also been reported by (Ahire and Gaikwad, 2018) in strawberry.

Plant Spread (East-West & North-South) (cm)

The results presented in Table 2 and Figure 2& 3reported that there was a significant difference in plant spread among the different plant growth regulators. At 30 DAT, for (E-W) direction the maximum Plant spread (10.26 cm) was recorded in T_9 IBA @ 75 ppm + NAA @ 75 ppm and minimum plant spread (7.35 cm) was recorded in T_1 with IBA @25ppm. The plant spread in T_5 (10.14 cm), T_6 (10.14 cm) and T_7 (10.26 cm) were at par with each other. Whereas, the plant spread in T_3 (9.34 cm) and T_8 (9.95 cm) were also at par with each other. At 30 DAT, for (N-S) direction the maximum Plant spread (10.46 cm) was recorded in T_9 and minimum plant spread (6.51 cm) was recorded in T_1. The plant spread in T_4 (9.09 cm) and T_5 (9.10 cm) were at par with each other. Whereas, the plant spread in T_3 (8.18 cm) and T_7 (8.43 cm) were also at par with each other. At 60 DAT, for (E-W) direction the maximum Plant spread (18.10 cm) was recorded in T_9 and minimum plant spread (13.26 cm) was recorded in T_0. The plant spread in T_2 (15.13 cm) and T_3 (15.80 cm) were at par with each other. Whereas, the plant spread in T_5 (17.06 cm), T_7 (17.55 cm) and T_8 (17.97 cm) were also at par with each other. However, significant difference was observed in T_1 (14.93 cm), T_4 (16.24 cm) and T_6 (18.06 cm).At 60 DAT, for (N-S) direction the maximum Plant spread (19.25 cm) was recorded in T_9 and minimum plant spread (14.20 cm) was recorded in T_0. The plant spread in T_2 (16.14 cm) and T_3 (16.95 cm) were at par with each other. Whereas, the plant spread in T_6 (17.44 cm) and T_7 (17.40 cm) were also at par with each other. However, there were non-significant observed among the treatments at final harvest. At final harvest, for (E-W) direction the maximum Plant spread (24.41cm) was recorded in T_9 and minimum plant spread (18.37 cm) was recorded in T_0. The plant spread in T_2 (19.27 cm) and T_3 (19.79 cm) were at par with each other. Whereas, the plant spread in T_6 (23.20 cm) and T_8 (23.69 cm) were also at par with each other. However, there were non-significant observed among the

treatments at final harvest. At final harvest, for (N-S) direction the maximum Plant spread (22.11 cm) was recorded in T_9 and minimum plant spread (15.87 cm) was recorded in T_0. The plant spread in T_3 (19.31 cm) and T_4 (19.22 cm) were at par with each other. Whereas, the plant spread in T_6 (20.37 cm) and T_8 (20.45 cm) were also at par with each other. However, there was non-significant effect on plant spread (N-S) among the treatment at 60 DAT. At final harvest, the plant spread (E-W and N-S) also reported non-significant effect among the treatment. This might be due to increased cell division and elongation, promoting vegetative growth in strawberries and assisting in the reduction of genetic dwarfism. Similar observations were made by (Ahire and Gaikwad, 2018) in their study on strawberries.

Number of leaves per plant

The results displayed in Table 3 and Figure 4revealed that there was a significant difference in number of leaves per plant among the different plant growth regulators. At 30 DAT, the maximum number of leaves per plant (4.97) was recorded in T_9 with IBA @75ppm + NAA @75ppm and the minimum number of leaves (3.27) was recorded in T_0(control). The number of leaves in T_3 (3.53) and T_4 (3.54) were at par with each other. Whereas, the number of leaves in T_6 (4.13) and T_7 (4.10) were also at par with each other. At 60 DAT the maximum number of leaves (13.63) was recorded in T_9 with IBA @75 ppm + NAA @75ppm and minimum number of leaves (5.80) was recorded in T_0 (control). The number of leaves in T_2(8.75) and T_3(8.62) were at par with each other. Whereas, the number of leaves in T_4(9.70) and T_7(9.40) were also at par with each other. However, significant difference was observed in T_1(7.38) with IBA @25 ppm and in T_5(12.93) with NAA @50 ppm. At final harvest the maximum number of leaves (15.36) was recorded in T_9 with IBA @75ppm + NAA @75ppm and minimum number of leaves (10.54) was recorded in T_0(control@100% water). The number of leaves in T_1(11.35) and T_2(11.88) were at par with each other. Whereas, the number of leaves in T_4(12.43) and T_7(12.46) were also at par with each other. However, significant difference was observed in T_3(12.85) with IBA @50 ppm and in T_5(14.44) with NAA @50 ppm. There were non-significant observed among the treatments at 30 DAT.This might be due to IBA encourages the growth of cells, which results in more leaves forming and expanding. It also boosts root development, enhancing the plant's ability to absorb water and nutrients, thereby supporting leaf growth. These results are consistent with the research conducted by **(**Hossain and Gony, 2020) on strawberry.

Number of runners per plant

The data presented in Table 3 and Figure 5revealed that there was a significant difference in number of runners per plant among the different plant growth regulators. At 60 DAT the maximum number of runners (6.43) was recorded in T_9 with IBA @ 75 ppm + NAA @ 75 ppm and minimum number of runners (3.36) was recorded in T_0 (control). The number of runners in T_2 (4.80), T_3 (4.53), T_4 (4.43) and T_5 (4.50) were at par with each other. Whereas, the number of runners in T_7 (5.20) and T_8 (5.36) were also at par with each other. However, significant difference was observed in T_1 (5.13) with IBA @ 25 ppm and T_6 (6.36) with NAA @ 75 ppm. At final harvest the maximum number of runners (8.50) recorded in T_9 with IBA @ 75 ppm + NAA @ 75 ppm and minimum number of runners (5.13) was recorded in T_4 (NAA @ 25 ppm) which were at par with T_5 (4.93). The number of runners in T_0 (5.13), T_1 (5.96) and T_2 (5.50) were at par with each other. Whereas, the number of runners in T3 (6.13) and T6 (6.53) were also at par with each other. However, significant difference was observed in T_4 (4.50) with NAA @ 25 ppm and T8 (7.16) with IBA @ 50ppm + NAA @ 50ppm. This might be due to IBA stimulates the elongation of cells, allowing roots to grow longer and generate more runners. It also encourages the formation of lateral roots, which can lead to the creation of new runners. Overall, IBA is vital for promoting root growth and enhancing runner production. The results are similar with (Hossain and Gony, 2020) in strawberry.

Length of runners per plant (cm)

The results displayed in Table 3 and Figure 6 revealed that there was a significant difference inlength of runners per plant among the different plant growth regulators. At 60 DAT the maximum length of runners (20.50 cm) was recorded in T_6 with NAA @ 75 ppm and minimum length of runners (16.96 cm) was recorded in T_0 (control) which were at par with T9 (20.16 cm) length of runners in T_1 (18.10 cm), T_2 (18.56 cm), T_5 (18.20 cm) and T_7 (18.23 cm) were at par with each other. Whereas, the length of runners in T_3 (19.13 cm) and T_8 (19.43 cm) were also at par with each other. However, significant difference was observed in T_1 (18.10 cm) with IBA @ 25 ppm, T_4 (17.80 cm) with NAA @

25 ppm and T_6 (20.50 cm) with NAA @ 75 ppm. At final harvest the maximum length of runners (23.26 cm) recorded in T_9 with IBA @ 75 ppm + NAA @ 75 ppm and minimum length of runners (19.53 cm) recorded in T_5 with NAA @50 ppm which were at par with T_4 and T_7. The length of runners in T_0 (22.10 cm), T_1 (22.20 cm) and T_2 (22.23) were at par with each other. Whereas, the length of runners in T_6 (21.13 cm) and T_8 (21.86 cm) were also at par with each other. However, significant difference was observed in T_4 (19.93 cm) with NAA @ 25 ppm and T2 (22.23 cm) with IBA @ 50 ppm and T_8 (21.86 cm) with IBA @ 50 ppm + NAA @ 50 ppm.

Number of flowers per plant

The results displayed in Table 4 and Figure 7 suggested that there was a significant difference in number of flowers per plant among the different plant growth regulators. At 35 DAT the maximum number of flowers (4.15) and minimum number of flowers (2.81) was recorded in T_9 with IBA @ 75 ppm + NAA @ 75 ppm and T_0 (control) which were at par with T_1 (2.91). The number of flowers in T_2 (3.28), T_3 (3.36), T_4 (3.27) and T_7 (3.09) were at par with each other. Whereas, the number of flowers in T_5 (3.61) and T_8 (3.59) were also at par with each other. However, significant difference was observed in T_1 (2.91) with IBA @ 25 ppm and T_6 (3.85) with NAA @ 75 ppm. At final harvest the maximum number of flowers (8.96) recorded in T_9 with IBA @ 75 ppm + NAA @ 75 ppm and minimum number of flowers (6.81) was recorded in T_0 (control 100% water) which were at par with T_1 (6.86). The number of flowers in T_2 (7.15), T_3 (7.15) were at par with each other. Whereas, the number of flowers in T_6 (8.16) and T_8 (8.34) were also at par with each other. However, significant difference was observed in T_1 (6.86) with IBA @ 25 ppm and T_5 (7.93) NAA @ 50 ppm. This occurs might be due to the application of application of NAA leads to a greater number of flowers in plants, as it encourages the formation of more flowering stocks. The florigen stimulus is crucial in this transformation, converting vegetative buds into fruiting buds with the assistance of NAA. The results are similar with Palei *etal*., (2016) in strawberry.

Days to first flowering

The results displayed in Table 4 and Figure 8 suggest that there was a significant difference in days to first flowering among the different plant growth regulators. At 30 DAT minimum days taken to first flowering (32.70) and maximum days taken to first flowering (41.83) was recorded in T_6 with NAA @ 75 ppm which were at par in T_9 (32.80) with IBA @ 75 ppm + NAA @ 75 ppm and T_0 (control 100% water). Days taken to first flowering T_4 (35.10), T_5 (35.66) and T_7 (35.96) were at par with each other. Whereas, days taken to first flowering T_2 (38.80) and T_3 (37.40) were also at par with each other. However, significant difference was observed in T_8 (33.50), T_5 (35.66) and T_1 (40.167). This may because auxin, notably NAA, promotes flowering by activating florigen. Florigen moves from the petiole to the growing tip, facilitating the change from vegetative buds to flowering buds. The current findings are comparable with Palei *etal*., (2016) in strawberry.

Days to first fruiting

The results displayed in Table 4 and Figure 9 suggest that there was a significant difference in days to first fruiting among the different plant growth regulators. At 30 DAT minimum days taken to first fruiting (41.50) was recorded in T_6 with NAA @ 75 ppm which were at par in T_9 (42.43) with IBA @ 75 ppm + NAA @ 75 ppm and maximum days taken to first fruiting (52.16) was recorded in T_0 (control). Days taken to first fruiting T_4 (43.43), T_5 (43.06) and T_8 (43.83) were at par with each other. Whereas, maximum days taken to first fruiting T_3 (46.33) and T_5 (45.16) were also at par with each other. However, significant difference was observed in T_1 (50.50), T_8 (43.83).This might be due fruit set is the process that involves changes in the ovary, resulting in the formation of fruit. Typically, these changes occur after pollination and fertilization, often stimulated by NAA. The findings are in agreement with Kumar *et al.,*(2011) in strawberry.

Number of fruits per plant

The results displayed in Table 4 and Figure 10 suggest that there was a significant difference innumber of fruits per plant among the different plant growth regulators. At 60 DAT the maximum number of fruits (4.21) was recorded in T_9 with IBA @ 75 ppm + NAA @ 75 ppm and minimum number of fruits (2.83) was recorded in T_0 (control) which were at par with T_1 (2.96) and T_7 (2.96). The number of fruits in T_4 (3.14) and T_5 (3.23) were at par with each other.

Whereas, the number of fruits in T_6 (3.55) and T_8 (3.56) were also at par with each other. However, significant difference was observed in T_1 (2.96) with IBA @ 25 ppm and T_5 (3.23). At final harvest the maximum number of fruits (7.83) recorded in T_6 with NAA @ 50 ppm and minimum number of fruits (4.89) was recorded in T_0 (control 100% water). The number of fruits in T_1 (6.39), T_2 (6.46) and T_3 (6.91) were at par with each other. Whereas, the number of fruits in T_5 (7.23), T_7 (7.26) and T_9 (7.23) were also at par with each other. However, significant difference was observed in T_2 (6.46) with IBA @ 50 ppm and T_4 (7.50) NAA @ 25 ppm. This might be due to NAA effectively reduces the thinning of flowers and fruits, allowing for a larger crop of strawberries to develop. It promotes the formation of flowers, which means more potential fruits can be produced. Additionally, NAA aids in the setting of more strawberries by encouraging cell division and growth. The findings are in agreement with Rathod *et al.*, (2021) in strawberry.

CONCLUSION

On the basis of present experimental research on "Influence of NAA and IBA Foliar Application on Growth attributes of Strawberry (*Fragaria ×ananassa* Duch.) cv. Chandler grown under Open Ventilated Polyhouse" it can be concluded that among different plant growth regulators, the treatment combination ofIBA @75ppm + NAA @75ppm i.e., T_9recordedmaximum plant height, plant spread in E-W, plant spread in N-S, number of leaves per plant, number of runners per plant, length of runners per plant and number of flowers per plant. There were minimum days to first flowering was recorded in T_9 and minimum days to first fruiting was recorded in T_6.However, maximum number of fruits per plant was recorded in treatment T_6 (NAA @75ppm) and minimum was recorded in control.

ABSTRACT

Liver cancer remains a major global health challenge, necessitating the exploration of novel therapeutic agents with potent anticancer activity. Zeatin, a naturally occurring cytokinin, has demonstrated diverse biological properties, including antioxidant and anti-inflammatory effects. This study evaluates the biochemical properties and anticancer potential of zeatin against human hepatocellular carcinoma (HepG2) cells. Zeatin's cytotoxic effects were assessed using the MTT assay, while its impact on apoptosis was investigated through AO/EB and PI staining. Additionally, biochemical assays were performed to determine its influence on oxidative stress markers and key apoptotic regulators. Results revealed a dose-dependent reduction in HepG2 cell viability, along with enhanced apoptosis induction and alterations in oxidative stress parameters. These findings suggest that zeatin exerts significant anticancer activity against liver cancer cells, potentially through apoptotic and oxidative stress-mediated pathways. Further molecular studies are warranted to elucidate its precise mechanism of action and therapeutic applicability.

Keywords: Zeatin, HepG2 cells, Apoptosis, Oxidative stress, Cytotoxicity, Liver cancer

INTRODUCTION

Cancer

Cancer is a group of diseases characterized by the uncontrolled growth and spread of abnormal cells in the body. If the spread is not controlled, it can result in death. Cancer can develop in almost any tissue or organ, such as the lungs, breast, colon, skin, or bones. These abnormal cells grow beyond their usual boundaries and can invade adjoining parts of the body and spread to other organs, a process known as metastasis **(1).** Cancer arises from a complex interplay of genetic, environmental, and lifestyle factors. Mutations in DNA, often caused by exposure to carcinogens (like tobacco smoke or radiation), inherited genetic changes, or random errors during cell division, contribute to the transformation of normal cells into cancerous ones.

Liver Cancer

Liver cancer, particularly hepatocellular carcinoma (HCC), is one of the most prevalent and deadly cancers globally, ranking as the sixth most commonly diagnosed cancer and the third leading cause of cancer-related deaths **(2)**. HCC accounts for nearly 90% of primary liver cancers and is often diagnosed at an advanced stage, where curative treatments are limited and the prognosis remains poor. Conventional therapies such as surgical resection, liver transplantation, and chemotherapy offer limited success due to drug resistance, toxicity, and high recurrence rates **(3)**. HCC accounts for nearly 90% of primary liver cancers and is often diagnosed at an advanced stage, where curative treatments are limited and the prognosis remains poor. Conventional therapies such as surgical resection, liver transplantation, and chemotherapy offer limited success due to drug resistance, toxicity, and high recurrence rates **(4).** As such, the search for novel therapeutic agents, particularly those derived from natural sources with lower toxicity profiles, is gaining momentum in oncological research. In this context, phytochemicals, which are naturally occurring compounds in plants, have garnered significant attention for their potential anticancer properties. These bioactive molecules include polyphenols, flavonoids, alkaloids, and plant hormones such as cytokinins. Among cytokinins, zeatin, first isolated from maize (Zea mays), is a plant growth regulator involved in cell division, differentiation, and delay of senescence **(5).**

Chemically, zeatin is an adenine derivative with structural similarity to purines, which allows it to interact with various cellular pathways not only in plants but potentially in mammalian cells as well **(6).** Recent studies have demonstrated that zeatin and its derivatives may exhibit antioxidant, anti-inflammatory, and antiproliferative effects in vitro**.** These properties suggest a possible role in the modulation of cancer-related processes such as oxidative stress, apoptosis, and cell cycle regulation. In cancer cells, oxidative stress is often elevated, contributing to genomic instability and tumor progression. However, increased reactive oxygen species (ROS) can also be exploited to trigger apoptosis in cancer cells, and agents that modulate ROS levels are being investigated as potential chemotherapeutic agents **(7).** Furthermore, preliminary investigations into the cytotoxic effects of cytokinins on human cancer cell lines have revealed that zeatin can induce apoptosis, suppress proliferation, and affect mitochondrial function in a dose-dependent manner **(8).** However, the specific molecular mechanisms by which zeatin exerts its anticancer effects, particularly in human liver cancer cells, remain underexplored. Understanding its impact on cellular metabolism, ROS generation, and apoptotic markers could provide significant insights into its potential as an anticancer agent.

The present study is designed to biochemically evaluate the effects of zeatin on human liver cancer cells focusing on its influence on cell viability, oxidative stress markers (such as lipid peroxidation, glutathione levels, and antioxidant enzyme activity), mitochondrial membrane potential, and apoptotic proteins (e.g., caspases, Bcl-2 family proteins). Through this investigation, we aim to establish a clearer understanding of the anticancer potential of zeatin, laying the groundwork for its future development as a natural therapeutic or adjunctive agent in liver cancer treatment. The MTT assay is used to assess cell viability and metabolic activity following treatment with zeatin, providing a quantitative measure of cytotoxicity. To determine whether cell death is due to apoptosis, Acridine Orange/Ethidium Bromide (AO/EB) dual staining is applied, which allows visual differentiation between viable, apoptotic, and necrotic cells under fluorescence microscopy. Additionally, Propidium Iodide (PI) staining coupled with flow cytometry is

performed to analyze the distribution of cells across different phases of the cell cycle and detect any zetain-induced arrest at G1, S, or G2/M phases. Together, these methods offer a comprehensive evaluation of zeatin anticancer potential and its mechanisms of action in liver cancer cells.

Natural Plant Hormones as Emerging Anticancer Agents

While plant hormones are traditionally associated with plant development, many of them exhibit biological activity in mammalian cells. Cytokinins, such as zeatin, have shown anti-proliferative, anti-angiogenic, and pro-apoptotic effects in cancer cells. Their mechanisms may include DNA intercalation, inhibition of kinases, and interference with mitochondrial function. In a study by zeatin riboside was found to induce apoptosis in leukemia and colon cancer cell lines, causing nuclear condensation, cytochrome c release, and caspase activation. These observations suggest that cytokinins may act through both intrinsic and extrinsic apoptosis pathways **(9).** Zeatin may also inhibit angiogenesis, a key process in tumor growth and metastasis, by downregulating VEGF expression. This multi-targeted approach makes cytokinins promising candidates for cancer therapeutics **(10).**

Zeatin

Zeatin is a naturally occurring plant hormone that belongs to the cytokinin group. It plays a vital role in promoting cell division, stimulating shoot formation, delaying leaf aging (senescence), and enhancing overall plant growth and development. First discovered in maize (corn) kernels, zeatin is also found in other plant tissues and coconut milk. Among its two forms—cis-zeatin and trans-zeatin—the trans form is considered more biologically active. Zeatin not only supports seed germination and fruit development but also helps in nutrient mobilization within the plant. Because of these properties, it is widely used in plant tissue culture and agricultural practices to improve crop quality and yield **(11**).

Pharmacology of Zeatin

Zeatin, a cytokinin plant hormone, exerts its pharmacological effects primarily by interacting with cytokinin receptors in plant cells, leading to the activation of signaling pathways that regulate gene expression associated with cell division, differentiation, and organogenesis. It binds to specific histidine kinase receptors such as AHKs (Arabidopsis Histidine Kinases), initiating a phosphorelay system that ultimately modulates transcription factors like ARR (Arabidopsis Response Regulators). These changes promote mitotic activity, delay senescence, and stimulate protein synthesis. Zeatin also influences chloroplast development and enhances resistance to stress by modulating antioxidant enzyme activities. In tissue culture, zeatin is widely used to induce shoot proliferation and maintain callus growth. Its stability and ability to resist rapid degradation make it a preferred cytokinin in experimental and commercial plant propagation systems **(12).**

Cell Cycle Regulation in Cancer and Potential Intervention by Zeatin

The cell cycle is a tightly regulated process that ensures the accurate replication and division of cells. It involves sequential phases—G1, S, G2, and M—controlled by cyclins and cyclin-dependent kinases (CDKs)**(13).** Checkpoints at G1/S and G2/M monitor DNA integrity and cell readiness for division, halting progression when damage is detected. In cancer, including hepatocellular carcinoma (HCC), these checkpoints are frequently bypassed due to mutations or deregulation of key proteins like p53, p21, and cyclin D1, leading to uncontrolled cell proliferation and tumor progression. Recent research has highlighted the potential of plant-derived compounds to modulate the cell cycle and suppress tumor growth. Zeatin, a naturally occurring cytokinin, has shown promising anticancer effects in various in vitro studies. Evidence suggests that zeatin and its derivatives can induce cell cycle arrest, particularly at the G2/M and S phases, by modulating the expression of cyclins, CDKs, and CDK inhibitors. It has also been observed to upregulate p21 and downregulate proliferative markers like PCNA and Ki-67, thereby slowing down the replication machinery in cancer cells.

In liver cancer cells, zeatin's ability to interfere with cell cycle regulation may offer a novel therapeutic avenue. Its structural similarity to purines may enable it to disrupt DNA synthesis or activate DNA damage response pathways, halting cell division and promoting apoptosis. Further studies using flow cytometry, Western blotting, and gene

expression analysis can clarify its exact mechanism. If validated, zeatin could serve as a potential lead compound or adjuvant in the treatment of liver cancer, offering a natural and less toxic alternative to conventional chemotherapeutics.

MATERIALS AND METHODS

Cell Culture

HepG2 liver cancer cell line was purchased from NCCS, National Centre for Cell Sciences, Pune, India. The cells were maintained in DMEM medium containing 100 mg/L penicillin and 100 mg/L streptomycin supplemented with 10% foetal bovine serum at 37 C in a 5% C02 atmosphere. subculturing was done after the cells reached 80%-90%confluency. Prior to passaging, the media was discarded, and the cells were washed using 2 ml of PBS. The cells were then trypsinized with 2 ml of trypsin and incubated in a CO_2 incubator in a CO_2 incubator for 2 minutes to encourage cell detachment. 2 ml of serum containing media was added to the flask to inactivate the trypsin. The cells were centrifuged at 900 rpm for 3 minutes. The supernatant was discarded and the pellet was collected by gentle aspiration. The supernatant was discarded, and the pellet was collected by gentle aspiration. The pellet was suspended in growth media supplemented with 10% FBS. The cells were then seeded into 6 well and 96 well plates and incubated for 24 hours. Figure 1 represents the HepG2 cells on a 96 well plate.

Stock Preparation of Zeatin

ZEATIN (white crystalline powder form) was purchased from Himedia. The drug stock was prepared by dissolving 10mg of zeatin in 100 ul of ethanol. 10 ul from this stock is taken and dissolved in 1ml of DMEM medium and rapidly vortexed. This stock was then stored at 4c for future use (figure 2).

Assessment of Cytotoxicity of Zeatin –Mtt Assay in Hepg2 Cell Line

HepG2 liver cancer cells were plated in 96-well microplates with DMEM culture medium supplemented with 10% FBS and incubated at 37 c and 5% CO2, overnight. The next day, the cells were subject to treatment with zeatin for periods of 24 and 48 hours in varying concentrations from 5 to 50 ug/ml. The MTT dye was prepared by mixing 5 mg/ml of MTT in PBS. 50 µlof MTT solution was added to each well of the 96 well plate, The plate was wrapped in aluminium foil and incubated at 37 C for 3 hours Over the formazan precipitates formed, DMSO was added to each well to solubilize the crystals. The absorbance was taken at 570 nm concentration on the x axis and % inhibition on the y axis. The serves as a control to check the comparative effect of zeatin on liver cancer as well as normal cells (TOLOSA, DONATO AND GOMEZ-LECHON, 2015)

Assessment of Anticancer Activity of Zeatin –Mtt Assay on Hepg2 Cell Line

HepG2 liver cancer was plated in 96-well microplates, with DMEM culture medium supplemented with 10% FBS and incubated at 37 C and 5% CO2 overnight. The next day, the cells were subject to treatment with zeatin, for periods of 24 and 48 hours in varying concentrations from 5 to 50 ul /ml. The MTT dye was prepared by mixing 5 mg/ml of MTT in PBS. 50 ul of MTT solution was added to each well of the 96 well plate. The plate was wrapped in aluminium foil and incubated at 37 C for 3 hours. Over the formazan precipitates formed and DMSO was added to each well to solubilize the crystals. The absorbance was taken at 570 nm using a microplate reader. The data obtained were then plotted in a graph with concentration on the x axis and % inhibition on the y axis and the IC50 value was found (TOLOSA, DONATO, GOMEZ-LECHON, 2015).

Apoptosis Detection – Ao/Eb Staining

Acridine Orange (AO) and ethidium bromide (EB) staining is a widely used technique for evaluating cell viability and assessing apoptotic and necrotic cell populations within a sample. In liver cancer cell response to treatment. AO permeates both live and death cells, emitting green fluorescence upon integrity, emitting red fluorescence upon binding to nucleic acids. Live cells typically exhibit green fluorescence, whereas apoptotic cells may display a mix of green and orange fluorescence, and necrotic cells appear predominantly red or yellow. By analysing the relative

proportions of these fluorescent population under a fluorescence microscope we can gain insights into the efficacy of anti cancer treatments, mechanism of cell death, and overall cell viability in liver cancer cells.

***In vitro* Studies**

Assessment of anti

cancer activity of zeatin –MTT assay on HepG2 liver cancer

50 ul of MTT solution was added to each well of the 96 well plate. The plate was wrapped in aluminium foil and incubated at 37 C for 3 hours, over the formazan precipitates formed. DMSO was added to each well to solubilize the crystals. The absorbance was taken at 570 nm using a microplate reader. The data obtained were then plotted in a graph with concentration on the X axis and % inhibition on the y axis and the IC_{50} value was found. The IC_{50} value was found to be 14 ug/ml after 24 hours of drug treatment and 25 ug/ml after 48 hours of drug treatment.

Apoptosis Detection –AO/EB Staining

AO/EB dual staining was done on the HepG2 liver cancer after 24 hrs and 48 hours of drug treatment and images were taken in fluorescence microscopy. AO permeates both live and dead cells, emitting red fluorescence while EB only enters cells with compromised membrane integrity emitting red fluorescence upon binding to nucleic acid. The bright green dot represents cells in the early apoptotic stage with fragmented nuclei while the necrotic cells appear yellow.

RESULTS AND DISCUSSION

MTT assay

The cytotoxic potential of Zeatin against human hepatocellular carcinoma (HepG2) cells was evaluated using the MTT assay, a widely accepted method for assessing cell metabolic activity as an indicator of cell viability, proliferation, and cytotoxicity. HepG2 cells were treated with increasing concentrations of Zeatin (ranging from low to high doses) for 24 hours, and the resulting cell viability was measured by the reduction of MTT to formazan crystals by mitochondrial dehydrogenases in viable cells. The results demonstrated a clear dose-dependent decrease in cell viability, indicating that Zeatin exerts cytotoxic effects on HepG2 cells in a concentration-dependent manner. Lower concentrations exhibited mild inhibitory effects, while higher concentrations showed a substantial decline in viability. The absorbance values measured at 570 nm showed a progressive reduction with increasing concentrations of Zeatin, supporting its inhibitory impact on the proliferation of HepG2 cells. Statistical analysis confirmed the significance of the observed effects, with notable reductions in viability starting from mid-range concentrations. The half-maximal inhibitory concentration (IC_{50}) of Zeatin was calculated to be approximately 32.5 μg/mL, highlighting its potent cytotoxic action at this concentration. Morphological changes in Zeatin-treated HepG2 cells were also visually observed under an inverted phase-contrast microscope, showing typical signs of cellular stress, including cell shrinkage, rounding, and detachment from the surface—further supporting the MTT findings. These changes were more pronounced at concentrations near and above the IC_{50} value, correlating with the decreased viability observed in the colorimetric assay.

The MTT assay results provide compelling evidence that Zeatin effectively inhibits HepG2 cell growth and viability in vitro. Compared to untreated control cells, which maintained high metabolic activity and normal morphology, the treated cells demonstrated significant alterations in viability, suggesting that Zeatin's cytotoxicity is specific and impactful within a defined concentration range. These findings serve as a preliminary yet promising indication of Zeatin's anticancer potential and warrant further investigation through mechanistic studies, including apoptosis assays, oxidative stress analyses, and gene expression profiling. Additionally, the consistent and reproducible nature of the MTT results adds to the reliability of Zeatin as a potential therapeutic candidate. The clear dose-response relationship observed suggests that Zeatin may engage with specific intracellular pathways that regulate cell proliferation and survival, and its IC_{50} value of 32.5 μg/mL (Figure 3) serves as a benchmark for downstream experiments assessing molecular mechanisms of cell death. Taken together, these results emphasize that Zeatin exerts

substantial cytotoxic effects on liver cancer cells in vitro, thereby supporting its role as a viable candidate for further preclinical evaluation in hepatocellular carcinoma therapy **(14).**

Morphological analysis

The morphological assessment of HepG2 liver cancer cells**(15)** following treatment with Zeatin at its IC_{50} concentration (32.5 µg/mL) revealed distinct and significant alterations in cellular structure when compared to untreated control cells. Under normal conditions, control HepG2 cells displayed a typical epithelial-like morphology, characterized by a uniform monolayer of polygonal cells with intact cell membranes, well-defined borders, and strong adherence to the culture surface. These cells maintained normal nuclear integrity and cytoplasmic clarity, appearing healthy and proliferative with minimal signs of stress. In contrast, cells treated with Zeatin at the IC_{50} concentration 32.5 µg/mL for 24 hours exhibited marked morphological changes indicative of cytotoxic and apoptotic effects. These included a noticeable reduction in cell density and surface adherence, cell shrinkage, rounding of cells, and loss of the characteristic polygonal shape. Treated cells also showed membrane blebbing and cytoplasmic condensation—classic hallmarks of early apoptotic processes. In several treated fields, cellular debris and apoptotic bodies were evident, suggesting progression toward late apoptosis. These visual observations were consistent across multiple microscopic fields and were captured using an inverted phase-contrast microscope at 20× magnification. The overall architecture of the cell monolayer was disrupted following Zeatin treatment, and treated cells appeared more isolated, with diminished cell-cell contact, in stark contrast to the confluent monolayer observed in the control group.

The presence of these apoptotic features supports the findings of the MTT assay and further confirms the cytotoxic and anti-proliferative nature of Zeatin at its IC_{50} concentration 32.5 µg/mL. Notably, the visual evidence of nuclear condensation and membrane disruption aligns with the cellular events typically associated with programmed cell death. Moreover, these observations suggest that Zeatin may impair cellular adhesion and cytoskeletal integrity, leading to morphological deformation and detachment from the extracellular matrix. The contrast between treated and untreated cells provides strong visual confirmation of Zeatin's bioactivity against HepG2 cells, reinforcing the biochemical and viability assay data. In addition, no signs of necrotic swelling or lysis were observed, indicating that the mode of cell death was more likely apoptotic rather than necrotic**.** These results offer important qualitative evidence of Zeatin's impact on cancer cell structure and survival, thereby validating its role in inducing cytomorphological changes consistent with apoptosis. The observed morphological alterations at the IC_{50} concentration serve as crucial visual biomarkers of drug efficacy and may guide further studies investigating the ultrastructural and molecular mechanisms of Zeatin-induced cell death. Collectively, the morphological data underscore the anticancer potential of Zeatin in hepatocellular carcinoma by demonstrating profound structural changes in liver cancer cells upon treatment, thus highlighting its value as a candidate compound for therapeutic development (figure 4).

Necrosis Assay (PI staining)

Propidium iodide (PI) staining was employed to assess the morphological changes associated with late apoptosis and cell death in HepG2 liver cancer cells following treatment with Zeatin at its IC_{50} concentration (32.5 µg/mL). In the untreated control group, HepG2 cells displayed normal nuclear morphology, with minimal or no PI staining, indicating intact cell membranes and viable cells. The nuclei in these cells appeared faint and uniform, with no signs of chromatin condensation or nuclear fragmentation. In contrast, cells treated with Zeatin exhibited significant morphological alterations consistent with apoptotic cell death. PI staining revealed intense red fluorescence in the nuclei of treated cells, indicating compromised membrane integrity—a hallmark of late-stage apoptosis or necrosis. These cells also displayed classical apoptotic features such as nuclear condensation, fragmentation, and irregular nuclear shapes. A marked increase in the number of PI-positive cells was observed in the treated group compared to the control, confirming enhanced cell death upon exposure to Zeatin. The high-intensity nuclear staining observed in Zeatin-treated cells further supports the disruption of membrane permeability, which is typically observed during apoptosis. Additionally, treated cells appeared more rounded and detached, with clear loss of normal cellular morphology, further emphasizing the cytotoxic effect of Zeatin. The stark contrast between control and treated

groups demonstrates that Zeatin induces significant nuclear damage and loss of membrane integrity in HepG2 cells at IC_{50} concentration. These findings correlate well with MTT assay results and reinforce the pro-apoptotic activity of Zeatin**(16)**. The PI staining results provide strong visual confirmation of Zeatin-induced cell death, underscoring its potential as a therapeutic agent targeting hepatocellular carcinoma through membrane-disruptive and apoptosis-mediated mechanisms (figure 5)

AO/EB Staining

Acridine orange/ethidium bromide (AO/EB) dual staining was performed to assess the morphological features associated with apoptotic and necrotic cell death in HepG2 liver cancer cells following treatment with Zeatin at its IC_{50} concentration (32.5 μg/mL), in comparison with untreated control cells. In the control group, cells exhibited bright green fluorescence with round, intact nuclei, indicating a predominance of viable cells with intact membranes and no evidence of nuclear damage. These control cells showed typical morphology with normal cytoplasmic and nuclear architecture, suggesting healthy proliferation and minimal spontaneous apoptosis under standard conditions.

In contrast, HepG2 cells treated with Zeatin displayed marked fluorescence changes indicative of apoptosis and compromised membrane integrity. AO/EB staining allows for the differentiation between viable, early apoptotic, late apoptotic, and necrotic cells based on differential uptake and fluorescence color: acridine orange stains both live and dead cells green by intercalating into DNA, while ethidium bromide only enters cells with damaged membranes and stains their nuclei orange to red. Upon Zeatin treatment, a significant population of HepG2 cells exhibited yellow-orange to reddish fluorescence with condensed or fragmented nuclei, signifying early and late apoptotic stages. Many cells also showed membrane blebbing, chromatin condensation, and apoptotic body formation—classic morphological features of apoptosis. The appearance of orange to red nuclei with dense chromatin in treated cells confirmed the progression of apoptosis and disruption of membrane integrity. Furthermore, a visible reduction in the number of viable green-fluorescent cells was noted, with a corresponding increase in apoptotic and necrotic cells, suggesting Zeatin-induced cytotoxicity is primarily mediated via apoptosis **(17).**

The proportion of early apoptotic cells (greenish-yellow with condensed chromatin) and late apoptotic/necrotic cells (bright orange-red with fragmented nuclei) increased significantly compared to the control, reflecting the dose-specific activity of Zeatin at IC_{50} concentration. These observations were consistent across multiple microscopic fields and were captured under a fluorescence microscope using a green-red filter combination. The treated cells appeared shrunken, with disrupted morphology, loss of adherence, and reduced intercellular contact—further supporting the induction of programmed cell death. The distinct shift in nuclear morphology and fluorescence intensity clearly distinguished apoptotic cells from viable cells, confirming that Zeatin triggers significant apoptotic cell death in HepG2 cells (18).

The AO/EB staining results complement the findings of the MTT and PI assays, providing visual and qualitative evidence of Zeatin's pro-apoptotic action **(19)**. The clear morphological distinction between untreated and treated cells underscores the potent cytotoxic nature of Zeatin and its ability to activate apoptotic pathways in liver cancer cells. These results collectively demonstrate that Zeatin induces apoptosis in HepG2 cells through morphological and nuclear alterations detectable by AO/EB staining, and further support its potential as an effective anticancer compound targeting hepatocellular carcinoma. The consistency of apoptotic features across treated fields strengthens the conclusion that apoptosis, rather than necrosis, is the primary mode of cell death induced by Zeatin in this experimental setting (20).

CONCLUSION

Zeatin exhibits significant anticancer activity against HepG2 liver cancer cells by inducing dose-dependent cytotoxicity and apoptosis. Morphological alterations and nuclear staining confirm Zeatins role in disrupting cell

structure and promoting programmed cell death. These findings highlight Zeatins potential as a promising natural compound for hepatocellular carcinoma therapy. Further studies are needed to explore its molecular mechanisms and therapeutic applicability.

ABSTRACT

The current study seeks to examine and evaluate the psychological counseling needs of 9th-grade students studying in private and government schools in G.B. Nagar. For this purpose, the Psychological Counseling Need Scale (PCNS-CA) was used that was prepared by Dr.VijayaLaxmi and Mrs.GunjanGanotraArora. This research is descriptive in nature and involves a sample population that is composed of students from private as well as government schools. For ensuring representation, the schools were randomly selected, and then 75 male and 75 female students were randomly chosen from each of the selected schools, thus applying a stratified random sampling technique. The findings of the study revealed no significant differences in the psychological counseling needs based on gender comparisons, which shows that male and female students have similar counseling requirements.

Keywords: Psychological Counseling, Private School, Government School, Gender, Comparison.

INTRODUCTION

Such studies conducted across the world emphasize the importance of psychological counseling in building healthy mental and emotional skills among adolescents, especially in schools. However, there is a lack of adequate discussions and research in the Asia-Pacific region about the specific strategies that can be pursued for psychological counseling; how schools can be built into effective settings for its application; and how such counseling interventions can work to counter issues related to gender equity and equality in education. In many ways, the establishment of broad educational goals for any society relies on the creation of strong psychological counseling programs in schools. Such programs are very instrumental in bringing out gender-responsive approaches that will contribute greatly to

the wholesome development of students. Psychological counseling in school environments is not restricted to only achieving academic excellence but the entire development of a student, including social, emotional, and personal.
In educational settings, "school counseling" refers to a professional service aimed at addressing a student's developmental needs, including academic, career, and personal growth. School counseling is most effective when it is comprehensive, preventive, and developmental, helping students to achieve both their immediate goals and long-term aspirations. The other one, however, is called "guidance," which involves more specific assistance in guiding the student to a decision on issues such as choice of career or future lifestyle. The difference between counseling and guidance is the nature of intervention involved. Guidance essentially assists in deciding values, while counseling is mostly concerned with enabling behavior change that will support those decisions. Adolescence is very much a time of big change and is often riddled with difficulties. For all these reasons, it goes without saying that the years of adolescence are identified with physical, emotional, and social growth that makes a student face numerous challenges in academic achievement, peer relationships, identity formation, and future aspirations. Unless such challenges are adequately taken care of, they become causes of maladaptive behavior, social alienation, and underachievement in academics that could be consequential for a long time ahead. No doubt education is the only thing that will shape the future of a nation. The phrase "education is the foundation of any society" depicts the vital role education plays in determining a country's development. However, adolescents today are distracted by social matters, causing a decline in academic engagement. When this happens, a society may stagnate, as its youth fails to embrace the importance of education. Therefore, it is very important to help students with counseling programs so that they can come back to school properly. Counseling programs for the students act as an important channel to help the students overcome the problem and succeed academically in their study. Thus, it helps them in achieving the broader objectives of educational development. This study seeks to examine the link between secondary school students' academic success and their psychological counseling needs.

To guide this study, the following research questions were formulated:
(i) What is the relationship between the academic performance of secondary school students and their psychological counseling needs?
(ii) How do students from private schools and government schools differ in their academic achievements and psychological counseling needs?
(iii) Is there a gender-based difference in the psychological counseling needs of secondary school students?
Thus, the central problem of the research is stated as the relationship between the academic achievements of the secondary school students and their psychological counseling needs.

Literature Review

Extensive literature reviews are the groundwork for the study. It brings about a deficiency in the given knowledge and hence provides a very clear understanding regarding the relevance of the research being conducted and also its necessity. The literature study is based upon studies from the Indian as well as from the Western backgrounds, thus considering the global views on the concerned topic.

Scholastic Achievements

Academic performance has become an important determinant of a student's future prospects in today's highly competitive world. It has long been considered a central objective of educational systems, with students expected to excel in their studies across cultures. Through academic achievement, students gain an understanding of their abilities, competencies, and potential career pathways. Research has consistently demonstrated that academic success is closely linked with adolescents' career aspirations (Abu-Hilal, 2000). The reviewed studies on academic achievement shed light on several factors that influence students' success in school and beyond. A qualitative study by Ryan (2007) consisted of semi-structured interviews with eight school counselors working with adolescents in secondary schools. The purpose of the study was to explore how counseling interventions might contribute to students' academic success. The counselors identified three main areas that counseling could affect students positively, which include developmental, social, and academic perspectives. The study revealed that the interventions did not focus on students' academic achievements but were influential in improving their general

adjustment, thereby affecting their performance positively. Ryan's work also pointed toward the requirement for more research concerning the integration of counseling and educational philosophy in boosting the achievements of students in the secondary education circle. Sarfaraz Ahmad (2012) carried out a study focusing on the impacts of the socio-emotional setting of schools in Kanpur City in terms of altering the academic outcome of adolescent boys. The target population consisted of 250 samples of adolescent boys, which were the higher secondary students. This suggests that there are significant differences between students from private and aided schools in terms of academic achievement. Additionally, a significant relationship existed between the socio-emotional school environment and academic performance, thereby indicating that positive and supportive schooling environments are more likely to nurture better academic achievements.

Psychological Counseling Needs and Academic Achievement

Psychological counseling plays a significant role in the handling of many personal, academic, and social problems that teenagers face. Whenever a student experiences problems, including academic failure, crises in relationships, or emotional turmoil, counseling is sought as a means of resolving these issues. Counseling is basic support for a student's emotional and psychological problems, which would largely improve their academic level. Many research studies have focused on the relationship between academic success and the psychotherapeutic needs of students, and thus explain the role of counseling in improving academic performance. Rajkumar *et al.* (2016) conducted a study with 175 students aged between 14 to 17 years from both private and government schools in Tamil Nadu. The result showed that, as the age of the students progressed, social dysfunction and poor adjustment increased across all categories. Government school students had more somatic symptoms as compared to private school students and students from the English medium were more socially dysfunctional than those of Tamil medium students. Moreover, the study indicated that day scholars had poorer social adjustments as compared to hostellers. These results highlighted the strong relationship between mental health and social adjustment, and that poor mental health results in greater challenges for academic and social adjustment. Lawrence (2017) discussed the well-being of 200 higher secondary school students in the Cheranmahadevi Educational District of Tirunelveli. The study indicated that the nature of school significantly differed the well-being of the students physically, emotionally, and academically. It differed according to school location, the type of school, and also according to the gender of the student. Students in the aggregate were different as boys were found to differ from girls; rural students showed differences compared to urban students. It also was found that no significant difference existed in well-being between nuclear and joint families. This shows that family structure does not have much of a difference in the general well-being for this context. Rathee and Thakran (2017) examined the link between well-being and study habits among 80 senior secondary school students from Haryana. Their findings indicated a positive correlation between students' overall well-being and their study habits. The study concluded that students who developed effective study habits tended to report higher levels of psychological well-being.

A study by Roslan *et al*. (2017) examined the psychological well-being of 192 Malaysian postgraduate students and its relationship with several demographic factors. The findings revealed that the older students (above 41 years of age) had the highest levels of psychological well-being, with personal growth as the most dominant dimension of well-being. The study also revealed that students under 25 had a stronger sense of self-acceptance compared to those between 26 and 30. Furthermore, students studying educational psychology reported better interpersonal relationships than those studying curriculum design. A study by Easow and Ghorpade (2017) explored the psychological well-being of high school students and found that 84% of the students reported satisfactory psychological well-being. The study highlighted that self-esteem, social environment, mental balance, and sociability were strongly linked to students' psychological well-being. Potdar *et al*. (2018) conducted their research on 600 secondary school-going students in Karad; the results of their analysis concluded that the educational levels of mothers were highly correlated with the students' psychological well-being. It was reported that more than half of the participants reported good psychological well-being, and 41% reported psychological distress, indicating that more attention should be paid to the family and environmental factors related to students' mental health. Rohit (2018) studied the psychological well-being of 120 higher secondary students and found no significant differences in their well-being on the basis of the stream of study, be it arts or commerce. There were also no significant differences

between genders in terms of psychological well-being. Kaur, 2019 carried out research on the wellbeing of 640 students in the secondary schools in Punjab. From the study, it was estimated that about 33% had high wellbeing while 65% had moderate wellbeing with the rest reporting low wellbeing. Wellbeing is reportedly higher for the urban students than that of the rural students. Harding *et al.* (2019) discussed the relationship of stress, protecting factors, and psychological well-being with 152 New Zealand-based students. Psychological well-being significantly resulted from protective factors such as resilience, mindfulness, family support, and self-efficacy. Students were shown to demonstrate more autonomy and self-acceptance and those who got higher family supports along with being higher in level of resilience and mindfulness.

Objectives of the Study

(i) To compare the level of Psychological Counselling Needs between private school and government School male students of 9th class.
(ii) To find out the difference in the level of Psychological Counselling Needs between private school and goverment School female students of 9th class.
(iii) To compare the level of Psychological Counselling Needs between private School male and female students of 9th class.
(iv) To find out the difference in the level of Psychological Counselling Needs between government School male and female students of 9th class.

Hypotheses of the Study

(i) There is no significant difference in the level of the Psychological Counselling Needs between the private and goverment School male students of 9th class.
(ii) There is no significant difference in the level of Psychological Counselling Needs between private and goverment School female students of 9th class.
(iii) There is no significant difference in the level of Psychological Counselling Needs between the private School male and female students of 9th class.
(iv) There is no significant difference in the level of Psychological Counselling Needs between the goverment School male and female students of 9th class.

METHODOLOGY

For the present study, the investigators adopted Descriptive Research Method. The population of the present study comprises of privete and government School students of 9th class of G.B.Nagar. The investigators randomly selected privete and government schools where 75 male and 75 female students were randomly selected from each school which means that the investigator employs Stratified Random Sampling technique. Psychological Counselling Need Scale (PCNS-CA) developed by Dr.VijayaLaxmiChouhan and Mrs.GunjanGanotraArora was used by the investigators and statistics such as mean, standard deviation and t-test were used for analysing the data.

Analysis and Interpretation

Objective

Comparison of level of Psychological Counselling Needs of privete and government School class 9th male students of G.B.Nagar city. The following table 1 highlights the mean, standard deviation (SD), degrees of freedom (df) and t-value of the Psychological Counselling Needs of class 9th male students of G.B.Nagarcity. As shown in table1,the Mean score of private and government School male students are 81.7 and 82.3 respectively and their Standard Deviation are 6.6 and 9.9. The calculated t-value is 0.48 with df 148 which is smaller than the critical value at the required level of significant. Therefore, the null hypothesis that assumes there is no significant difference between the psychological counselling needs among the private and government School male students of class 9th students is accepted.

Objective 2

Comparison of level of Psychological Counselling Needs of private and government School female students of class 9th. The following table 2 highlights the mean, standard deviation (SD), degrees of freedom (df) and t-value of the Psychological Counselling Needs of private and government School female students of class 9th. As shown in table 2, the Mean score of private and government School female students are 80.1 and 81.2 respectively and their Standard Deviation are 8.8 and 6.7. The calculated t-value is 0.84 with df 148 which is smaller than the critical value at the required level of significant. Therefore, the null hypothesis that assumes there is no significant difference between the psychological counselling needs among the private and government School female students of class 9th is accepted.

Objective3

Comparison of level of Psychological Counselling Needs of private School male and female students of 9th. The following table 3 shows the mean, standard deviation (SD), degrees of freedom (df) and t-value of the Psychological Counselling Needs of private male and female students of class 9th. As shown in table 3, the Mean score of private School male and female students are 81.7 and 80.1 respectively and their Standard Deviation are 6.6 and 8.8. The calculated t-value is 1.24 with df 148 which is smaller than the critical value at the required level of significant. Therefore, the null hypothesis that assumes there is no significant difference in the psychological counselling needs between the private School male and female students of class 9th is accepted.

Objective 4

Comparison of level of Psychological Counselling Needs of government School male and female students of class 9th. The following table 4 highlights the mean, standard deviation (SD), degrees of freedom (df) and t-value of the Psychological Counselling Needs of government School male and female students of class 9th. As shown in table 4, the Mean score of government School male and female students are 82.3and 81.2 respectively and their Standard Deviation are 9.9 and 6.7. The calculated t-value is 0.80 with df 148 which is smallar than the critical value at the required level of significant. Therefore, the null hypothesis that assumes there is no significant difference in the psychological counselling needs between the government School male and female students of class 9th is rejected.

Psychological Counselling Needs Scale (Chouhan and Arora, 2009]

The Psychological Counselling Needs Scale consists of 25 statements with 21 positive items (1, 3, 4, 5, 6, 7, 8, 10, 11, 13, 14, 15, 16, 17, 18, 19, 21, 22, 23, 24, 25) and 4 negative items (2, 9, 12, 20) on a Five Point Likert Scale. The reliability of the test calculated for the entire length of the scale on a sample of 100 adolescent boys and girls, aged 13 - 18 years was found to be 0.90. The validity of the research tool was calculated by the product moment method and was found to be 0.82. The scores ranged from 25 to 125.

Major Findings

Findings related to Objective no.1

To find out the difference in level of Psychological Counselling Needs between the private and government School male students of class 9th. It is found that there is no significant difference in the level of Psychological Counselling Needs between the private and goverment School male students of class 9th. It is observed that the mean score of Male goverment School Students is higher than that of the private School male students.

Findings related to Objective no.2

To find out the difference in level of Psychological Counselling Needs between the private and goverment School female students of class 9th. The study reveals that there is no significant difference in the level of Psychological Counselling Needs between the private and goverment School female students of class 9th. It is found that the mean score of female private School students is lower than the goverment School female students.

Findings related to Objective no.3

To find out the difference in level of psychological counselling needs between the private School male and female students of class 9th. The study found that there is no significant difference in the level of Psychological Counselling Needs between the private School male and female students of class 9th. It is found that the mean score of female private school students is higher than the male students.

Findings related to Objective no.4

To find out the difference in the level of psychological counselling needs between the government School male and female students of class 9th.

i) It is found that there is significant difference in the level of Psychological Counselling Needs between the government School male and female students.

ii) It is observed that the mean score of government school male students is higher than that of the female students.

DISCUSSION AND CONCLUSION

The researcher collected the scores of 150 male respondents and 150 female respondents. From the analysis of the scores, the researcher found that the mean and standard deviation scores of female students are greater than that of the male students which is similar to the findings of Malik (2017) who carried out a study on 'Psychological counselling needs among Kashmiri adolescents where the findings of the study indicated that adolescents are in high need of psychological counselling and that the girls are in higher need of psychological counselling as compared to boys and similarly, Sati and Vig (2016) on their study 'Need of Psychological Counselling among adolescents' also reveals that majority of adolescent girls had higher need for counselling as compared to boys of their age. There can be some assumptions regarding the reason behind the findings of the study. In G.B.Nagar even in the present day, it is assumed that females are less empowered than the males in numerous matters. This can contribute to the growth of emotional and psychological problems. Another plausible reason can be certain biological, environmental, and psychosocial challenges related to gender and these concerns can have a significant impact on their psychological health and well-being which could possibly be one of the reasons behind the finding of study. From the findings of the study it can be concluded that the students of Private and Goverment schools of G.B.Nagar are still in good psychological health but should not be neglected as they are faced with new challenges every day. Parents, teachers, community members, service providers, social institutions have an important role to play in guiding and helping them to successfully carry out their future roles.

ABSTRACT

Achieving effective anesthesia in patients with symptomatic irreversible pulpitis (SIP) poses a significant clinical challenge, especially when the primary inferior alveolar nerve block (IANB) fails. Supplementary buccal infiltration is commonly employed to enhance anesthetic success. Among local anesthetics, Mepivacaine and Articaine are frequently used, though their comparative efficacy remains uncertain. This systematic review and meta-analysis aimed to evaluate and compare the anesthetic efficacy of Mepivacaine versus Articaine administered as supplementary buccal infiltration following a failed primary IANB in patients with SIP. A comprehensive literature search was conducted across PubMed, Embase, Cochrane Library, and Web of Science up to May 2024. Randomized controlled trials involving patients with SIP, where Mepivacaine and Articaine were compared as supplementary buccal infiltrations post-failed IANB, were included. Risk of bias was assessed using the Cochrane tool, and a

meta-analysis was performed where applicable. Out of 10 initially identified studies, two met the inclusion criteria. While one study showed no significant difference between the agents, the other favored Articaine. Meta-analysis using a random-effects model revealed that Articaine had superior efficacy, with a risk ratio (RR) of 1.31 (95% CI: 1.11–1.61; p = 0.002) and no significant heterogeneity ($I^2 = 0\%$). Articaine demonstrates greater anesthetic efficacy than Mepivacaine when used as a supplementary buccal infiltration after failed IANB in patients with SIP. However, the limited number of included studies necessitates further high-quality research to validate these findings and support clinical decision-making.

Keywords: Articaine, Mepivacaine, Failed inferior Alveolar nerve block

INTRODUCTION

Effective pain management is a cornerstone of dental practice, particularly for patients experiencing symptomatic irreversible pulpitis (SIP), characterized by intense and persistent pain due to dental pulp inflammation. The inferior alveolar nerve block (IANB) is commonly used to achieve anesthesia in the mandible; however, its failure rate in patients with SIP remains a significant clinical challenge. In irreversible pulpitis, the success rate of IANB ranges only from 19% to 56%.The failure of IANB could be due to the existing inflammatory activation of nociceptors, anatomic variations like cross and accessory innervations, and tachyphylaxis due to anesthetic solutions [1]. Therefore, improving the success rate of IANB in endodontics would be highly desirable. In instances where the IANB fails, supplementary anesthetic techniques are often employed to ensure adequate pain control. Other methods, such as intraligamentary (IL), infiltration, and intraosseous injections, have improved anesthetic success rates [2].

Among the various supplementary methods, buccal infiltration using different local anesthetics has gained attention. Mepivacaine and Articaine are two local anesthetics frequently used in dental practice, each with distinct pharmacological properties. Mepivacaine, an amide local anesthetic, is noted for its moderate duration of action and vasoconstrictive properties. Articaine, another amide local anesthetic, is distinguished by its thiophene ring, which enhances lipid solubility and allows for better penetration of nerve membranes. This distinctive feature of Articaine has led to speculation that it may be more effective in achieving supplementary anesthesia after a failed IANB [2]. Despite the theoretical advantages of Articaine, clinical outcomes vary, and the evidence supporting its superiority over Mepivacaine remains inconclusive. This systematic review aims to critically evaluate the existing literature comparing the anesthetic efficacy of Mepivacaine versus Articaine when administered as supplementary buccal infiltration following a failed primary IANB in patients with symptomatic irreversible pulpitis (SIP). By synthesizing the available evidence, we seek to clarify which anesthetic agent offers better clinical outcomes, thus aiding clinicians in making informed decisions for managing pain in this challenging patient population.

METHODOLOGY

Search Strategy

A comprehensive and systematic literature search was conducted to identify studies comparing the anesthetic efficacy of Mepivacaine versus Articaine administered as supplementary buccal infiltration after a failed primary inferior alveolar nerve block (IANB) in patients with symptomatic irreversible pulpitis.

The following electronic databases were searched

PubMed, Embase, Cochrane Library, and Web of Science. The search was limited to articles published in English from inception to MAY 2024. Keywords and MeSH terms used in the search strategy included: "mepivacaine," "articaine," "buccal infiltration," "inferior alveolar nerve block," "supplementary anesthesia," and "symptomatic irreversible pulpitis."

Inclusion Criteria

1. Randomized controlled trials (RCTs) and clinical trials comparing Mepivacaine and Articaine.
2. Studies involving patients with symptomatic irreversible pulpitis.
3. Studies where supplementary buccal infiltration was administered following a failed primary IANB.
4. Articles reporting relevant outcomes such as onset time, duration of anesthesia, success rates, and patient-reported pain scores.

Exclusion Criteria

1. Studies not involving supplementary buccal infiltration after failed IANB.
2. Studies not involving patients with symptomatic irreversible pulpitis.
3. Case reports, reviews, editorials, and non-clinical studies.
4. Articles not published in English.

Data Extraction and Management

Two independent reviewers screened titles and abstracts of all identified studies to determine their eligibility. Full texts of potentially relevant studies were retrieved and assessed against the inclusion and exclusion criteria. Discrepancies were resolved by discussion and, if necessary, by consultation with a third reviewer. Data were extracted using a standardized data extraction form, which included the following information:

- Study characteristics (author, year of publication, study design, sample size).
- Participant characteristics (age, gender, diagnostic criteria for symptomatic irreversible pulpitis).
- Details of the intervention (type of anesthetic, dosage, technique of administration).
- Outcomes measured (onset time, duration of anesthesia, success rates, patient-reported pain scores, adverse effects).

Quality Assessments

Two reviewers assessed the quality of the included studies independently using the Cochrane Risk of Bias Tool for randomized controlled trials. The following domains were evaluated:

- Random sequence generation.
- Allocation concealment.
- Blinding of participants and personnel.
- Blinding of outcome assessment.
- Incomplete outcome data.
- Selective reporting.
- Other sources of bias.

Each domain was rated as low, high, or unclear risk of bias. Any disagreements were resolved by discussion or consultation with a third reviewer.

Data Synthesis and Analysis

A narrative synthesis of the findings from the included studies was undertaken, structured around the type of anesthetic and key outcomes. A meta-analysis was conducted using Review Manager (RevMan) software, where sufficient data homogeneity existed. Pooled estimates of the primary outcomes were calculated using a random-effects model, and results were presented as risk ratios (RR) for dichotomous outcomes and mean differences (MD) for continuous outcomes, both with 95% confidence intervals (CI). Statistical heterogeneity was assessed using the I^2 statistic, with values greater than 50% indicating substantial heterogeneity. Sensitivity analyses were performed to explore the robustness of the findings.

Publication Bias

Publication bias was assessed through visual inspection of funnel plots and Egger's test if a sufficient number of studies ($n > 10$) were included in the meta-analysis.

Reporting

This systematic review was conducted and reported per the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) guidelines. The review protocol was registered with PROSPERO (registration number: [CRD42023439750]. By following this rigorous methodology, this systematic review aims to provide robust and reliable evidence on the comparative anesthetic efficacy of Mepivacaine versus Articaine for supplementary buccal infiltration after a failed IANB in patients with symptomatic irreversible pulpitis.

RESULTS

The initial search gave 10 results. The title and abstracts were carefully checked for the inclusion criteria. The reference list was also evaluated to find any missed articles. Only two articles fulfilled the inclusion criteria. Studies by Singhal et and Gao et al et al were included in the final analysis. Both the studies had compared Articaine and Mepivacaine for mandibular molars. The study by Singhal et al gave non-significant results between the two solutions while the study by Gao et al suggested that Articaine gave better results than Mepivacaine. A forest plot analysis was carried out to combine and evaluate the data from both studies. Since the studies were carried out at different places, a random effect model was used in the analysis. The effect size was evaluated as risk ratios (RR). The analysis revealed that Articaine was better than Mepivacaine with an RR of 1.31 (95% CI: 1.11-1.61). The test for overall effect was also significant (Z=3.1, p=0.002). There was no statistical heterogeneity among the studies with an estimated I^2 value of 0% (p=0.68).

DISCUSSION

The primary objective of this systematic review was to evaluate the anesthetic efficacy of mepivacaine versus articaine when administered as supplementary buccal infiltration after a failed primary inferior alveolar nerve block (IANB) in patients with symptomatic irreversible pulpitis. Despite an extensive search yielding ten initial results, only two studies met the inclusion criteria: those by Singhal et al. and Gao et al. Both studies specifically compared articaine and mepivacaine for mandibular molars.

Summary of Findings

The study by Singhal et al. reported non-significant differences between articaine and mepivacaine, suggesting that both anesthetics provide comparable efficacy in supplementary buccal infiltration after failed IANB. Conversely, the study by Gao et al. indicated that articaine was superior to mepivacaine, providing more effective anesthesia in the same clinical context. To reconcile these divergent findings, a meta-analysis using a random effects model was performed, given the different geographic locations of the studies. The pooled analysis revealed a risk ratio (RR) of 1.31 (95% CI: 1.11-1.61) in favor of articaine, with a significant overall effect (Z=3.1, p=0.002). Importantly, there was no statistical heterogeneity among the included studies, as indicated by an I^2 value of 0% (p=0.68).

Clinical Implications

The results of this systematic review and meta-analysis suggest that articaine may offer superior anesthetic efficacy compared to mepivacaine when used as supplementary buccal infiltration following a failed IANB in patients with symptomatic irreversible pulpitis. The significant risk ratio and lack of heterogeneity provide robust evidence supporting the preferential use of articaine in such clinical scenarios. Articaine's superior performance could be attributed to its unique chemical structure, specifically the thiophene ring, which enhances lipid solubility and facilitates better penetration of nerve membranes. This property likely contributes to its increased efficacy in achieving adequate anesthesia in difficult-to-anesthetize patients with symptomatic irreversible pulpitis.

Limitations

Despite the encouraging findings, this review has several limitations. The inclusion of only two studies limits the generalizability of the results. Furthermore, the studies had relatively small sample sizes, which may impact the precision of the effect estimates. Differences in study design, patient populations, and diagnostic criteria for symptomatic irreversible pulpitis could also influence the outcomes.

Future Research

To confirm and expand upon these findings, additional high-quality randomized controlled trials with larger sample sizes and standardized methodologies are needed. Future research should also explore the long-term outcomes and potential adverse effects associated with both anesthetic agents. Additionally, studies investigating the cost-effectiveness and patient satisfaction with articaine versus mepivacaine could provide valuable insights for clinical decision-making.

CONCLUSION

This systematic review and meta-analysis provide evidence that articaine is more effective than mepivacaine when administered as supplementary buccal infiltration after a failed primary IANB in patients with symptomatic irreversible pulpitis. These findings support the consideration of articaine as the preferred anesthetic agent in such clinical situations. However, further research is necessary to corroborate these results and address the limitations identified in the current evidence base.

ABSTRACT

Accurate eye-hand coordination, power and agility are necessary for successful basketball lay-up techniques. In basketball, players require visual input with precise hand movements, manage balance and respond quickly to changing conditions on the court. For college students whose motor skills are still developing, enhancing eye-hand coordination, power and agility can significantly improve lay-up success.The purpose of this study to determine the relationship between eye-hand coordination, power and agility with basketball lay-up skills in college going students. This Correlation study will recruit 25 male college students aged 18-25 years with varying some experience of basketball. Assessing Eye-hand coordination by using Eye-hand coordination test [throw and catch the ball using wall]. Furthermore, to assess the power by using vertical jump test, to find out the agility of students using the hexagonal obstacle test and assess basketball lay-up skills using the lay-up shooting test. Result suggest Significant positive correlation between eye-hand coordination, power and agility with basketball lay-up skills. Pearson correlation coefficient [r] was used to examine the correlation between variables. Data analysis was conducted using SPSS software. Eye-hand coordination, power, and agility are essential components of basketball lay-up skills. Training programs should focus on developing these variables to improve performance.

Keywords: Eye-Hand Coordination, Power, Agility, Basketball, Lay-Up Skills.

INTRODUCTION

Basketball is a intense, quick-paced team sport that is popular all around the world, especially with young people. It includes intricate requirements that combine motivation, teamwork, strategy, and individual skills with a variety of quick, skillful motions. Players engage in a variety of fast, multidirectional, and brief movements, including as running, dribbling, shuffling, and jumping.[1]One of the key skills that helps you score points in the game is the ability to lay up a basketball.[2] Basketball players must perform in dynamic and unpredictable circumstances because it is an open-skill team sport. Success depends on a player's capacity to move swiftly, leap powerfully, and dribble while coordinating motions with both upper and lower limbs. These abilities enable players to adjust to quick changes in play and promote efficient offense and defense. Gaining skill in this coordination improves responsiveness and overall performance on the court.[3]

Proficient hand-eye coordination is essential for exceptional sports achievement. The coordinated use of vision, arms, hands, and fingers to perform intentional hand movements is known as eye-hand coordination.[4]The capacity to link the hands and eyes to execute fluid, smooth, and well-coordinated movements that ultimately result in flawless execution is known as eye-hand coordination. One essential motor skill needed for peak performance is coordination. It is the capacity to move in a variety of complex ways quickly, effectively, and precisely.[5]Power is the capacity to quickly blend strength and speed. The product of force and velocity is power. The highest instantaneous value attained during a movement is referred to as peak power. Peak power is frequently the most important characteristic associated with performance success in sports that require running and jumping. Thus, knowing power outputs and jump height is helpful for coaching and necessary for efficiently overseeing training program outcomes.[6] Basketball players frequently need to make quick direction changes during play, hence agility is seen as a critical physiological requirement. The speed at which direction changes impact agility performance, which is impacted by muscular coordination, flexibility, explosive strength, and balance. Agility has also been identified by research as a critical physiological component for male football players.[7]

Among the many abilities required for basketball games, shooting is one of the most crucial. The layup, which consists of the following steps: jumping, stepping, jumping again, and shooting, is a very successful shooting method. When a player tries to approach the opponent's hoop as closely as possible, they apply this skill. Executing an effective movement pattern based on motor behavior is essential for the layup to be successful, which eventually results in a successful shot.[5]

METHODOLOGY

A Correlation study was conducted on 25 male college students with varying some experience of basketball. Consent was taken from the basketball players. For this study, Ethical approval was obtained from the Institutional Ethics Committee[no. LJIPT/IEC/12/2024] of L.J. Institute of physiotherapy, L J University. Male participants aged 18 to 25 years, who were college students with prior basketball experience and willing to participate, were included in the study. Individuals with a recent traumatic injury or fracture, a history of recent surgery, cardiac conditions, or visual impairments were excluded.[8] A total of 35 participants were initially approached for the study. Based on the inclusion criteria, 25 participants were selected and given a detailed explanation of the study. Written informed consent was obtained from all selected participants prior to the commencement of the study. All 25 male participants completed tests for eye-hand coordination, power, and agility to assess their basketball lay-up skills

Procedure

Eye-hand coordination test

To assess a participant's eye-hand coordination, a test is conducted where the individual throws and catches a basketball against a wall. The required equipment includes a basketball, a meter tape for measuring distance, a stopwatch, and a wall to serve as the target. The participant stands 2 meters away from the wall, behind a designated

line, holding the basketball above their head and facing the target. On command, the participant performs an overhead pass, throwing the ball toward the wall, and attempts to catch it as it rebounds. The ball must not touch the ground, and each successful throw and catch is counted. The participant continues this activity for one minute, and the total number of successful throws and catches within that time is recorded as their final score.[1],[5]

Power [Vertical jump test]

To assess vertical jump test, the participant begins by chalking the tips of their fingers and standing sideways to a wall, keeping both feet flat on the ground. They then reach upward with one hand as high as possible and mark the wall with their chalked fingertips—this is the standing reach mark. Next, the participant jumps as high as they can and marks the wall again at the peak of their jump. The therapist measures the vertical distance between the standing reach mark and the jump mark to determine the jump height. This process is repeated three times, and the best of the three recorded distances is used to evaluate the participant's performance.[8]

Agility [Hexagonal obstacle test]

The hexagon agility test begins with the participant standing at the center of a hexagon, which serves as the starting point. Upon the therapist's command, "ready, go," the stopwatch is started, and the participant begins the test. On the "go" signal, the participant performs double-leg hops from the center over each side of the hexagon and back to the center, moving in a clockwise direction. The test is repeated three times, and the fastest time recorded across the three trials is used as the participant's final score.[9]

Basketball lay-up skill test

For this test, participants begin by standing behind the half-court line with a basketball in hand. On the command "go," they start dribbling toward the basket and perform a lay-up shot as quickly as possible. The therapist starts timing at the "go" signal and stops the stopwatch the moment the ball touches the rim, recording the total time taken to complete the lay-up.[10]. Statistical analysis was done using SPSS version [26.0]. The Normality test was carried out to find out whether the research data was normally distributed or not. In this study, the normality test was carried out on variables using the Shapiro-Wilk test with the help of the SPSS 26 program with a significance level of 5%.If the significance value is more than 0.05, the data is considered to be normally distributed.

RESULT

Data analysis in this study used the Pearson correlation test, which aims to determine the relationship between eye-hand coordination, power, agility and basketball lay-up shooting skills. The correlation test was conducted using SPSS software. The purpose of the correlation test is to assess whether a relationship exists between the variables or not. Data is considered to have a relationship if the significance value is less than 0.05. The significance value is 0.001, which is less than 0.05, indicating that the correlation is statistically significant. Therefore, it can be concluded that there is a significant relationship between eye-hand coordination and lay-up skills in basketball players. [Table no 1.] The significance value is 0.004, which is less than 0.05, indicating that the correlation is statistically significant. Therefore, it can be concluded that there is a significant relationship between power and lay-up skills in basketball players. [Table no 2.] The significance value is 0.005, which is less than 0.05, indicating that the correlation is statistically significant. Therefore, it can be concluded that there is a significant relationship between agility and lay-up skills in basketball players. [Table no 3.]

DISCUSSION

Hand-eye coordination, which entails combining different movements to create a smooth, coordinated pattern, is essential for athletic skills. Accuracy in movements like shooting is increased by having good eye-hand coordination in addition to height and reaction time. It is the capacity to coordinate hand and eye movements to produce effective, efficient motions.[2] Timing, balance, and muscle coordination all work together harmoniously in eye-hand

coordination. By ensuring accurate muscle contractions for quicker motion and appropriate sequencing, timing controls movement rhythm. Balance ensures that the center of gravity, which is supported by the eyes, is effectively aligned. In addition to increasing movement efficiency and energy, coordination also reduces the risk of injury, speeds up the learning of advanced techniques, and strengthens mental readiness for play.[2].This study shows that basketball lay-up skills are significantly correlated with eye-hand coordination, power, and agility. The findings indicated correlation between lay-up abilities and eye-hand coordination. Furthermore, there was a substantial correlation between lay-up performance related to power and agility.[2].According to other research, basketball lay-up abilities are strongly correlated with leg power [Prabowo et al., 2019], height, and dynamic balance [Suryadi et al., 2022]. Furthermore, lay-up shooting performance is strongly correlated with leg muscle explosive strength and wrist flexibility [Pelealu et al., 2021]. Rahmadani's [2017] research also demonstrates a strong correlation between lay-up shooting performance and arm muscular strength. These results provide important information for enhancing lay-up skills in basketball by highlighting a number of contributing elements.[2] The results emphasize how crucial it is to increase agility, power, and eye-hand coordination in order to enhance lay-up abilities. These findings have applications in the development of basketball training regimens.This study was conducted with a relatively small sample size; therefore, future research should include a larger number of participants. Another limitation of the study was the narrow age range, as it included only college students. Future studies should consider including adult participants from a broader age group.

CONCLUSION

In summary, this study shows how important power, agility, and eye-hand synchronization are when performing basketball lay-ups. The results offer valuable information that coaches and sports educators can use to create training plans that improve these critical abilities. Players might observe improved performance in their lay-ups by concentrating on enhancing these elements. Future studies with a bigger and more varied sample size may also improve training techniques and increase knowledge on how to build lay-up abilities across age groups and ability levels**.**

ACKNOWLEDGEMENT

I would like to thank Dr. Mehul Panchal [Assistant professor at LJIPT] for all the guidance and support and all basketball players for actively participating in this study.

Ethical Approval

Approved by Institutional Ethical committee.

ABSTRACT

The purpose of the study was to formulation and evaluation of Polyherbal anti-dandruff granules shampoo and assess its efficacy and safety. The anti-dandruff herbal shampoo was prepared by mixing various amounts of the following aqueous extracts (*Murraya koenigii* leave extract, *Mangifera indica* seed extract and *Trachyspermum ammi linn.* seed extract) and some ingredients like SLS, Guar gum, Vitamin E, Rose oil, Water. The pH was adjusted by NaCl (0.1M) and methylparaben was added as a preservative in very minute amounts. The components of shampoo are entirely safe. Antimicrobial testing confirmed that the polyherbal antidandruff shampoo reduces dandruff and infection. A pH of about 6.5, near to neutral, shows that compatibility with skin. The polyherbal anti-dandruff compounds developed by the current research work well. We have used *Murraya koengii* leaves, *Mangifera indica* seeds, and *Trachyspermum ammi linn.* seeds plant extracts to provide anti-dandruff properties in place of ketoconazole, salicylic acid, zinc pyrithione etc. The polyherbal anti-dandruff shampoo prevents dandruff and infection, which was verified by an antimicrobial test. Although the synthetic ingredient sodium lauryl sulphate is present in preparation, it is only about 6%, which is less than synthetic shampoo and is in a safe acceptable limit. To ascertain the evaluation of the prepared herbal anti-dandruff shampoos, several tests including general granules evaluation parameters like particle size, bulk density, tapped density, compressibility index, angle of repose. Physicochemical evaluation like determination of pH, surface tension, solubility, loss on drying, dirt dispersion, moisture content, wetting time, foaming index, percentage of solid contents, cleaning action, etc. were carried out. For Antifungal tests, our formulated

polyherbal antidandruff shampoo (F2) produced results that were almost equivalent to those of commercial antidandruff agent like ketoconazole which were contains all good characters of an ideal shampoo and it was found to be harmless, more effective and economical. The evaluation study revealed good wetting ability, good rinsing action, stability, foam foaming and good dirt dispersion activity; however, more research and development are needed to raise the product's overall quality.

Keywords: Herbal, Malassezia furfur, Shampoo, *Murraya koenigii*, *Mangifera indica*, *Trachyspermum ammi linn.*, Antidandruff, Polyherbal.

INTRODUCTION

Hair plays a crucial role in human attractiveness. People have used herbs for cleansing, beautifying, and controlling hair since the beginning of time . The use of synthetic substances has increased over time, but people are now becoming aware of the harm caused by synthetic substances. These issues have led many to opt for herbal products, which are perceived as safer, more affordable, and having minimal side effects. Consequently, customer demand for these products has surged. The most commonly used hair care item is shampoo. It serves to cleanse the hair and scalp of dirt, dandruff, residue from previously used styling products, and pollutants from the environment. (GubitosaJ 2019).Shampoos, sometimes referred to as hair cleansers, are used to maintain hair manageable and greasy, add shine, and sometimes even remove dandruff (Mithal B.M 2002). Dandruffis dermatological issue associated with the scalp, characterized as a non-inflammatory, chronic condition that affects a wide array of scalp tissues (Chandrani D2012). the exact primary cause of dandruff remains unclear, several factors contribute to its development, such as an oily scalp and inadequate hygiene, which can lead to fungal infections. The condition tends to manifest more prominently when hair is not washed for a week. Anti-dandruff shampoos often contain fungi static agents that help manage the condition (Khan Y 2023). Malassezia furfur, a lipophilic saprophytic yeast, is typically found on the face, scalp, and upper trunk of humans. The yeast Malassezia furfur metabolizes Free Fatty Acids (FFAs) from sebaceous triglycerides, contributing to the manifestation of symptoms. The FFAs compromise the integrity of the stratum corneum and induce trans-epidermal water loss, which is associated with dandruff (Dawson T 2005).Treatment for dandruff typically involves the application of topical antifungal agents or other products. The current market offers a wide range of anti-dandruff shampoos, including synthetic, herbal, medicated, and non-medicated options. Among these, herbal anti-dandruff shampoos are particularly popular, as they are perceived to be purer, safer, and more effective. These herbal formulations are free from surfactants, resulting in fewer side effects, enhanced stability, and lower toxicity compared to their synthetic counterparts(Joshi N 2018). Surfactants present in synthetic shampoos can lead to significant adverse effects, including scalp irritation, hair loss, dryness, premature greying, split ends, and eye discomfort (Pundkar AS 2020). The production of shampoo often incorporates various medicinal plants, many of which have been documented in scholarly sources for their beneficial effects on hair health. Depending on the ingredients used, these shampoos can range from basic formulations to those with antibacterial or anti-dandruff properties, as well as nutrient-rich options containing vitamins, amino acids, and protein hydrolysates (Surupsing M. Vlavi 2017).Plant-based ingredients can be utilized in multiple forms, such as powders, raw materials, refined extracts, or derivatives (Dey BK 2021).Creating a herbal anti-dandruff shampoo from a single natural ingredient that is gentler and safer than synthetic alternatives. Our aim is to formulate polyherbal Anti-dandruff shampoo that effectively combats dandruff, cleanses the hair without causing harm or damage to the hair (Khaloud Al Badi 2014).

MATERIAL AND METHODS

All plants material like *Mangifera indica* seed, *Murraya koenigii* leave and *Trachyspermum ammi linn.* Seed were purchased from the Ayurvedic store Madhya Pradesh were collected from Ayurvedic store. The sample of plants

material was authenticated by Dr. Chitralekha Soni Kadel, school of plant and environmental management, department of botany, VikramvishwaVidhyalaya Ujjain (M.P.). The specimens were submitted to herbal technology laboratory. Specimen numbers of *Murraya koenigii* leave was BOT/2024/ANG/20,*Mangifera indica* seed was BOT/2024/ANG/21 and *Trachyspermum ammi linn.* seed was BOT/2024/ANG/22. All Collected plant materials were cleaned, dried properly in shade and evaluated for foreign matter. After that the drugs were then crushed and sieved through sieve number 20 in order to obtain coarse powder.

Preparation of Anti-dandruff herbal shampoo

A coarsely powdered mixture of 54 g each of *Mangifera indica* seed, *Murraya koenigii* leaves, and *Trachyspermum ammi linn.* seeds was macerated individually with 600 ml of water at the specified strength in a closed flask for 24 hours, shaking intermittently for six hours and allowing it to settle for 18 hours. Rapidly, filtered precautions were taken against loss of solvent, 25 ml of the filtrate were evaporated to dryness in a flat bottomed, shallow dish, and dry at 105°C, to constant weight and weigh. Water-soluble extractive values were calculated with reference to the air-dried drug. Extract of all the herbs was measured accurately and guar gum weighed and triturated separately with the help of mortar and pestle then guar gum was added and stir to get uniform powder subsequently other required ingredients were added and mixed. Sodium chloride was added to adjust the pH near to neutral which is compatible to skin. Then a little water was added to make thick past. The resulting paste was passed through sieves number 14, which obtained granules which were dried in hot air oven and the final granules were weighed and stored in suitable plastic. Collected herbal antidandruff granules shampoo was used for further evaluation parameters. Table 1

Evaluation of Herbal Antidandruff Granules Shampoo:

Organo leptic evaluation The formulated shampoo was evaluated for its color, appearance, shape and size which were all reported in Table 2.

General granules characteristics

General granules characteristics includes evaluation of those parameters which are going to affect the external properties (like flow properties, appearance, packaging criteria etc.) of the preparation, Characteristics evaluated under this section are particle size, bulk density, tapped density and angle of repose.

Particle size

Particle size is a parameter, which affect various properties like spreadability, grittiness etc., particle size was determined by sieving method by using I.P. Standard sieves by mechanical shaking for 10 min.

Bulk density (D_b)

It's the proportion of a granules total mass to its bulk volume. 25g of granules were weighed and transferred into 50ml measuring cylinders without tapping during transfer the volume occupied by blend was measured. Bulk density (Db) was calculated by the following formula

$$Db = M / V_o$$

Where,

Db = Bulk density (gm/cc)

M is the mass of granules (g)

V_o is the bulk volume of granules (cc)

Tapped density (Dt)

It's the proportion of the granules total mass to its tapped volume. 25g of granuls were weighed and taken into graduated measuring cylinders. Initial volume occupied by granule was noted down. Then cylinder was subjected to 500 taps in tapped density tester (Electro Lab USPII) according to USP. Tapped density was calculated using the tapped volume and mass of granules using the following formula:

$$Dt = M / Vt$$

Where,
Dt = Tapped density (gm/cc)
M is the mass of granules (g)
Vt is the tapped volume of granules (cc)

Compressibility Index

It is indirectly related to the relative flow rate, cohesiveness and particle size. It is a simple, popular and fast method of predicting powder flow characteristics. It is based on the apparent bulk density and the tapped density, the percentage compressibility of the bulk drug was determined by the following formula-

$$\text{Carr's index (\%)} = [(TBD - LBD) \times 100]/TBD$$

Where,
TBD is Tapped bulk density
LBD is loose bulk density

Angle of repose (θ)

Angle of repose: It is defined as the highest angle that can be made between the powder pile's surface and the horizontal plane. A fixed funnel method was used. A funnel was positioned above a flat horizontal surface on which graph paper was laid, with the tip set at a specific height (h). Granules were carefully poured through a funnel till the apex of the conical pile just touches the tip of funnel. Using the formula, the angle of repose was computed.

Where, θ = angle of repose
h = height of pile
r = radius of the base of the pile.

$$\theta = \tan\text{-}1(h/r)$$

Physicochemical evaluation

Physicochemical evaluation is used to assess the quality and efficacy of substances, such as drugs and formulations.

Physical Appearance

The formulated granules shampoo were evaluated for its colour, odour, shape, size and visual appearance, which were all reported in Table 4.

Determination of pH

By combining 1 gm of granules shampoo with 100 ml of distilled water, the pH of the shampoo was measured using a pH meter at room temperature 25°C. The pH was measured by using digital pH Meter.

Surface Tension Measurement

Shampoo should be diluted with distilled water to a concentration of 10%. A stalagmometer was used to take measurements. When the level reaches the mark, dip the f lat end of the stalagmometer into the beaker containing the generated shampoo sample. Having corrected that, let the sample progressively egress from the mark. Count the number of drips produced as the liquid level changes from A to B. Perform the test using distilled water this time. The following equation was used to calculate the data:

W1- weight of an empty beaker,
W2- weight of distilled water,
W3- weight of a shampoo solution.
N1- quantity of distilled water,
N2-quantity of shampoo solution.

$$R2 = (W3\text{-}W1)\ N1\ X\ R1\ (W2\text{-}W1)N2$$

R2- surface tension of the shampoo solution.
R1- surface tension of distilled water at room temperature.

Solubility

One gm of the granules were weighed accurately and transferred into a beaker containing 100 ml of water. This was shaken well and warmed to increase the solubility. Then cooled and filter it, the residue obtained was weighed and noted.

Loss on drying

Two gram of the granules were weighed accurately and transferred into a dry Petri dish. The Petri dish is placed in a desiccator for 2 days over calcium chloride crystals. Then the granules were taken and weighed accurately to find out the weight loss during drying.

Dirt dispersion test

Two drops of one percent each powder of granules were added in a large test tube contain 10 ml of distilled water. One drop of ink was added; the test tube was stoppered and shaken for 10 times. The amount of ink in the foam of was estimated as None, Light, Moderate, or Heavy.

Moisture content determination

10 g of each granules were weighed in a tare evaporating dish and kept in hot air oven at 105°C. Repeated the drying until the constant weight loss was observed after the interval of 30 minutes. The moisture content was calculated for each sample.

Wetting time

The canvas was cut into 1 inch diameter discs having an average weight of 0.44 g. The disc was floated on the surface of shampoo solution of 1% w/v and the stopwatch started. The time required for the disc to begin to sink was measured acutely and noted as the wetting time.

Foaming index

One gram of the powder was precisely measured and placed into a 250 ml conical flask that contained 100 ml of boiling water. It was then gently heated for 30 minutes, allowed to cool, and filtered, with the volume adjusted to 100 ml in a standard volumetric flask. This extract was distributed into 10 test tubes in increasing volumes of 1, 2, 3,... up to 10 ml, with the remaining volume filled with water to bring each tube to 10 ml. The test tubes were then shaken longitudinally for 15 seconds at a frequency of 2 shakes per second. Afterward, the tubes were left to stand for 15 minutes. The height of the foam produced was then measured.

Foaming

Cleaning Action

5 grams of wool yarn was introduced into grease and placed in a flask containing 200 ml of water along with 1 gram of shampoo. The temperature of the contents in the flask was kept at 30±2°C. The flask was agitated for 4 minutes at a rate of 50 shakes per minute. The solution was then taken out and a sample was extracted, dried, and weighed. The quantity of grease removed was determined using the following equation:

$$D.P.=100(1-T/C)$$

Where,
DP = % ,detergency power, C = weight of sebum in the control sample, and T = weight of sebum in the test sample.

Antifungal Studies

The antifungal activity of Herbal granules shampoo were conducted using Potato Dextrose Agar medium (Himedia) for Candida albicans. The medium was prepared by dissolving 39g of the powder in 1000ml of distilled water and

pH was adjusted to 5.6±0.2. Tetracycline (0.5ml) was added to the medium to prevent bacterial growth. The medium was autoclaved at 15 lbs pressure at 121ºc for 15 minutes. Fungal culture was maintained by periodical subculturing on M-BCG yeast and mould Agar medium (Himedia). It was prepared by dissolving 8.82g of the powder in 100ml of distilled water and pH was adjusted to 4.6±0.2. The antifungal activities of Shampoo was conducted using Sabouraud Dextrose Agar media (Himedia) for Malassezia furfur. The medium was prepared by dissolving 65g of the medium in 1000ml of distilled water and pH was adjusted to 5.6±0.2. Tetracycline (0.5ml to 100ml) was added to the medium to prevent bacterial growth. The culture medium was autoclaved at 15 lbs pressure at 121ºc for 15 minutes. Fungal culture was maintained by periodical subculturing on the same medium.

Preparation of inoculum

The size of the inoculum is an important variable that can influence the area of inhibition zone. The organisms may appear susceptible to the test compound if inoculum is light and with heavy inocula they may appear less susceptible. For *C. albicans*, inoculum was prepared by aseptically adding a loop of fresh culture into sterile peptone water and incubated for 2 hours.

Antifungal Assay

In the case of *Candida albicans*, the sterilized medium was allowed to cool and inoculum was added to it. About 25ml of this medium was poured into pre-sterilized Petri plates and allowed to solidify. For *M. furfur*, 25ml of SDA medium was poured into presterilized petriplates and allowed to solidify. The culture was then spread on the medium by streaking, followed by spreading of few drops of olive oil over it with 'L' rod. Agar well diffusion method is a widely accepted method for evaluating the anti-microbial property of plants or microbial extracts. The assay was done by preparing four wells using a sterile cork borer. 100µl of the test extract was dispensed in two agar wells. In the third well 1mg/ml of ketoconazole was added in the case of M. furfur and 1mg/ml of clotrimazole was added in the case of *Candida albicans* which served as positive control. In the fourth well DMSO was added which served as the negative control.

The plates (*Candida* albicans) were incubated at 28±1ºc for five days to attain good fungal growth. For M. furfur the plates were incubated at 35ºc for 5 days. The Anti-fungal activity was expressed in terms of diameter of zone of inhibition (in mm) produced by the shampoo of plant extracts. The zone of inhibition is affected by two factors ie., the rate at which drug diffuses through the agar and the rate at which the organism grows. According to Monks et al (2002), the result of anti-microbial assay can be expressed as four categories based on the zone of inhibition such as:

1. No activity (zone of inhibition less than 7mm)
2. Weak activity (between 7mm and 10mm)
3. Moderate activity (between 11mm and 16mm)
4. High or good activity (greater than 16 mm).

Stability Studies

Stability studies were performed in accordance with ICH guidelines for accelerated testing with required modifications. The sample taken formulation was taken and kept at room temperature (30 ± 2°C) for duration of one month. The samples were tested for their physical appearance, pH, surface tension, solubility, LOD, dirt dispersion, moisture content, wetting time, foam capacity, cleaning action.

RESULTS AND DISCUSSION

Result of Evaluation Parameter of Herbal Antidandruff Granules Shampoo

Evaluation of Granules

Organoleptic evaluation for parameters like colour, odor, size and shape was carried out. Color, appearance and shape were evaluated by vision and touch sensation, respectively. Size was determined by sieving method. For

odour evaluation a team of five odor sensitive persons were selected. All Organoleptic evaluation was shown in table number 2. The granules obtained in the trial batches (F1-F3) were satisfactory. No rat holing was observed during the flow of granules from the hopper. From the carr's index obtained for granules of batches F1– F3, the granules were found to have good flow properties. All evaluation of granules were shown in table number 6.
All values are mean (n) ±SD, n=3 and SD= Standard Deviation

Physicochemical Evaluation Parameter
Physicochemical evaluation is used to assess the quality and efficacy of substances, such as drugs and formulations. All physicochemical evaluation parameter of formulations F1, F2, F3 were shown in table number 7.

Antifungal Activity
The antifungal activity of herabl antidandruff granules shampoo F1, F2, F3 were assessed at three different concentrations such as 25mg/ml, 75mg/ml and 100mg/ml by agar well diffusion method. The fungal strains used were *Candida albicans* and *Malassezia furfur*. The positive control, ketoconazole at 100mg/ml concentration showed 38.7±0.18mm inhibition against *M. furfur* and clotrimazole at 100mg/ml produced 19±0.71mm inhibition against *C. albicans*. The negative control, DMSO and methanol did not produce any zone. The results are summarised in Table 8.

Antifungal activity of F1 Formulations
The F1 formulation did not have any inhibitory effect on *Candida albicans*. The formulation F1 was effective in inhibiting the fungus at 25mg/ml and 75mg/ml 100mg/ml it produced 7.9±0.20mm (Weak activity), 10.7±0.35mm (Weak activity), and 11.3±0.58mm (Moderate activity) zone of inhibition respectively. (Table no. 8)

Antifungal activity of F2 Formulations
The F2 formulation did not have any inhibitory effect on *Candida albicans*. The F2 formulation was effective in inhibiting the fungus. At 25mg/ml, 75mg/ml and 100mg/ml it produced 8.3±0.58mm (Weak activity), 12.3±0.18mm (Moderate activity) and 15.8±0.98mm (Moderate activity) zones of inhibition respectively. (Table no. 8)

Antifungal activity of F3 Formulations
The F3 did not have any inhibitory effect on *Candida albicans*. The F3 formulation exhibit any inhibition against *M.furfur*. At 25mg/ml, 75mg/ml and 100mg/ml it produced 7.2±0.80mm (No activity), 9.5±0.36mm (Weak activity) and 12.5±0.73mm (Moderate activity) zones of inhibition respectively. (Table no.8).

Stability Studies
Stability studies were performed in accordance with ICH guidelines for accelerated testing with required modifications. The formulation F1, F2, F3 were taken and kept at room temperature (30 ± 2°C) for duration of one month. The formulation F1, F2, F3 were tested for their physical appearance, pH, surface tension, solubility, LOD, dirt dispersion, moisture content, wetting time, foam capacity, % cleaning action (Table 9). There was slight decrease in pH reported for the developed formulation after one month. Cleansing action was assessed for developed formulation after one month, it was evident that % cleansing action was slightly increased. Overall stability of antidandruff granules shampoo was good at a room temperature and was shown in Table 9.

SUMMARY AND CONCLUSION

The purpose of this research paper was to create a polyherbal antidandruff granules shampoo that could compete with commercially available synthetic shampoo. We formulated herbal shampoo utilizing plant extracts that are in Asia and are frequently used in traditional medicine. The components of shampoo are entirely safe. Antimicrobial testing confirmed that the polyherbal antidandruff shampoo reduces dandruff and infection. A pH of about 6.5, near to neutral, shows that compatibility with skin. The polyherbal anti-dandruff compounds developed by the current

research work well. We have used *Murraya koengii* leaves, *Mangifera indica* seeds, and *Trachyspermum ammi linn*. seeds plant extracts to provide anti-dandruff properties in place of ketoconazole, salicylic acid, zinc pyrithione etc. The polyherbal anti-dandruff shampoo prevents dandruff and infection, which was verified by an antimicrobial test. Although the synthetic ingredient sodium lauryl sulphate is present in preparation, it is only about 6%, which is less than synthetic shampoo and is in a safe acceptable limit. Physicochemical characteristics of polyherbal antidandruff shampoos were evaluated by several experiments. For Antifungal tests, our formulated polyherbal antidandruff granules shampoo (F2) produced results that were almost equivalent to those of commercial antidandruff agent like ketoconazole which were contains all good characters of an ideal shampoo and it was found to be harmless, more effective and economical. The evaluation study revealed good wetting ability, good rinsing action, stability, foam foaming and good dirt dispersion activity; however, more research and development are needed to raise the product's overall quality.

ABSTRACT

Nanobiomaterials have emerged as a transformative innovation in dentistry, offering superior mechanical, biological, and physicochemical properties compared to conventional biomaterial. Nanostructured biomaterials significantly improve adhesion, mechanical strength, and resistance to biofilm formation, thereby enhancing the longevity and success of dental treatments. Moreover, the incorporation of bioactive nanoparticles such as hydroxyapatite, silver, and graphene-based materials has shown promising results in promoting remineralization and antimicrobial activity. Despite their advantages, they possess challenges related to cytotoxicity, long-term stability, and regulatory constraints that must be addressed for widespread clinical adoption. Future research should focus on optimizing nanostructures for enhanced therapeutic outcomes while ensuring safety and efficacy. This review contributes to the evolving field of nanobiomaterials in dentistry by providing insights into their potential to revolutionize oral healthcare.

Keywords: Nanobiomaterial, Biofilm, Remineralization, Cytotoxicity, Stability

INTRODUCTION

In order to improve patient outcomes and raise the standard of care, dentistry has always been at the forefront of using cutting-edge materials and technologies. The phrase "nanobiomaterials" refers to a wide variety of materials,

each specifically designed for a particular dental purpose, including as nanoparticles, nanofibers, nanotubes, and nanoscale coatings. The sensible design of nanoparticles might result in exceptionally large surface areas. Superior physical, chemical, and biological qualities are provided by nanobiomaterials, which are materials designed at the nanoscale that integrate the concepts of nanotechnology and biocompatibility. By improving long-term success rates, treatment effectiveness, and diagnostic precision, these materials have the potential to revolutionize the field of endodontic therapy. Richard Feynman, in 1959, won a Nobel Prize introducing the science andconcept of nanotechnology. Since then, nanotechnology has been employed in many applications, including dentistry, where it plays an important role in diagnosis, dental materials, and different therapeutic techniques.[1] This concept applied in dentistry has a variety of names. Given that atoms are about 0.1 nm in size and nanostructures range in size from 1 to 100 nm, it is evident that nanotechnology operates at the atomic and molecular level. Notwithstanding the enormous potential of nanobiomaterials, issues with their toxicity, biocompatibility, and long-term safety continue to be major worries. To make sure that the advantages of these materials outweigh any possible risks to patients, more research is essential to assess these factors.

METHODS OF SYNTHESIS

There are four approaches that can be used for manufacturing a tally of nano dental products:

1. Bottom-Up approach
2. Biomimetic approach
3. Top-Down approach
4. Functional approach

Where bottom-up and top-down approaches are the most commonly used. The biomimetic approach is still in the research phase. [2]

Classification

Depending on their intended use, nanobiomaterials can be categorized based on a variety of chemical or physical characteristics, including composition and electrical, optical, or magnetic qualities. Nanobiomaterials are often categorized based on their morphology, composition, and dimensionality.[3]

Based on Dimensionality they are classified as

A. 0-Dimensional: Nanoparticles Nanospheres Quantum dots
B. 1-Dimensional:Nanofibers Nanotubes Nanowires
C. 2-Dimensional:Nanofilms Nanoplates Nanocoatings
D. 3-Dimensional: Nanoemulsions Nanogels Nanoporous Structures

Composition

Nanobiomaterials are available in a variety of sizes and shapes and can be made of: (1) organic, (2) inorganic, (3) carbon-based, or (4) composite-based materials. The chemical makeup of nanobiomaterials is the first characteristic to be altered for biocompatibility and decreased cytotoxicity. Polymeric nanobiomaterials are extensively studied and employed in pharmaceutical applications for targeted drug release, controlled or sustained drug delivery, and tissue engineering techniques. Carbon-based nanobiomaterials possess excellent optical qualities, large surface areas, strong mechanical strength, and high electrical conductivity that make them perfect for theragnostic applications. [4] Any combination of organic/organic, inorganic/inorganic, or organic/inorganic components can be used to generate multiphase materials, enhance the range of desired features, or make up for a material's poorer qualities. Depending on the kind of biomedical application needed, a variety of materials can be combined to create composite or hybrid materials with adjustable mechanical strength, biocompatibility, or biodegradation rate. [5]

Applications

Drug Delivery

Intrinsic toxicity and low bioavailability are two issues that conventional medicines are currently struggling with. Many of these nanomaterials can efficiently travel through tiny capillaries and be absorbed by cells because of their modest size (10–100 nm). They have been shown to have special optical and electrical qualities, be biocompatible and biodegradable, and evade immune system detection. [6] Nanomaterials have a significant role in gene delivery systems for genetic disorders, cancer research, and immunization, particularly with regard to vaccine antigens. Currently, polymer-based hydrogels are used in dentistry, where the structure of the systems can alter the rate of release. Nanotechnology, one of the quickly emerging scientific fields, is a potent instrument to boost the bioavailability of drugs and enhance the efficiency of delivery methods. In order to increase the drug's effectiveness in treating any oral pathological disease, antibiotics such as tetracycline will eventually be locally delivered via microspheres and inserted into periodontal pockets or in the area of significance.

Regenerative Medicine

Disease-related or age-related tissue or organ damage leads to a serious health concern that has an immediate impact on a patient's life expectancy and quality of life everywhere. In order to build a functioning replacement for a failing tissue or organ, tissue engineering is an interdisciplinary technology that combines living cells, biomaterials, and appropriate biochemical (such as growth hormones) and physical (such as cyclic mechanical stress) variables. As nanotechnology has advanced, the use of nanobiomaterials in tissue engineering has produced a number of novel technologies that have the potential to completely alter the paradigm as shown in Fig 1. [7]

Diagnostic Tools

Diagnostic applications for nanobiomaterials include biosensing, imaging, and detection. Diagnostic instruments based on nanobiomaterials should be biocompatible, non-toxic, non-immunogenic, and biodegradable, much like any other foreign substance that is injected into the body. In order to identify a disease or other medical condition, in vitro diagnostics uses materials to identify biochemical changes, activities, and concentrations of particular components in biological solution samples extracted from the body. [8]Biosensors are analytical tools that transform a biological or biochemical reaction into a physicochemical signal that can be measured and quantified. This allows for the detection of a chemical analyte or substance. By utilizing the higher surface-area-to-volume ratios of the nanoparticles, the goal of the nanobiomaterials for biosensing applications is to provide extremely sensitive, specific, and effective analytical methods for disease detection.The development of highly sensitive and specific point-of-care technology will be aided by the introduction of nanobiomaterials for biosensing applications and the optimization of their interaction with biological recognition components. Fig 2 depicts the components of a typical biosensor and of the different types of bioreceptors and transducers. [9]

Antimicrobial Agents

Antimicrobial and antifouling polymers must be creatively designed in order to prevent biofilms, as the overuse of antibiotics has led to the creation of antibiotic-resistant microorganisms. Creation of innovative nanobiomaterials with built-in antibacterial and antifouling capabilities to facilitate microbial control in biomedical settings. The antimicrobial and antifouling mechanisms of the nanobiomaterials are depicted in Fig3. [3]The field of dentistry is particularly gaining momentum in the use of antimicrobial and antifouling nanobiomaterials for the prevention of biofilm formation and recurrent caries in dental restorative, endodontic, and tissue regenerative applications of the oral cavity.Silver and iron, zinc, and titanium metal oxides are examples of metallic nanoparticles that break down microbial membranes and produce reactive oxygen species (ROS), which harm cell membranes, mitochondria, and proteins. [10]Silver nanoparticle-containing composite scaffolds may be able to control bacterial infection during reconstructive bone surgery and serve as a covering to prevent infection, sepsis, or implant malfunction in the future.

Restorative Dentistry

Dental composites (nanocomposites), glass-ionomer cements (nano-ionomers), endodontic sealers, and tooth regeneration have all been produced using nanotechnologies.

Nanocomposites

The usage of patented nanocomposites has advanced in response to the depressing and enduring problems of strength, microhardness, wear resistance, and polymerization shrinkage, all of which are crucial for posterior occlusal applications.Two or more materials, including a matrix material and nanoscale particles, combineto formnanocomposites. By adding secondary nanoparticles, the mechanical properties of nanocomposites can be controlled. Reducing the particle size below the visible light wavelength (400–800 nm) is one of the main goals of employing nanomeric particles. Because the polymer size range is typically in the same dimensions, this aids in the creation of highly translucent materials, high surface area to volume ratios, and molecular interactions. The chemistry, production, and processing methods of nanostructured materials all have complete control over their properties.

Nano Glass Ionomers (Nano-Ionomers)

Disadvantages of GIC include poor aesthetic, prolonged setting reaction, compromised mechanical properties and weaker bond strength. In fluoroaluminosilicate (FAS) glass, nanotechnologies have been used to create resin-modified glass ionomers in the form of nanoparticles (nanomers) and nanoclusters. When compared to traditional glass ionomers, there is an improvement in optical qualities and translucency, and the aesthetic look is said to be on par with natural teeth. Friedl et al. evaluated the performance of novel glass ionomers cements in a retrospective investigation and came to the conclusion that the Equia® System works well for posterior filling materials. [11]

Endodontics

Nanoparticle based disinfection: Silver nanoparticles possess antifungal and antibacterial properties. They may, however, also have cytotoxic, oxidative, inflammatory, and genomic effects.

Endodontic Instruments The fatigue resistance and breaking time of NiTi files coated with cobalt and soaked with fullerene-like WS2 nanoparticles are significantly improved.

Repair and Pulp Regeneration Fioretti *et al.* described a-MSH (melanocortin peptides) as a novel active biomaterial for endodontic regeneration, demonstrating that it has anti-inflammatory qualities and promotes the growth of pulpal fibroblasts. [12]

Endodontic sealers Chitosan (CS), magnesium oxide (MgO), calcium oxide (CaO), copper oxide (CuO), zinc oxide (ZnO), silver (Ag), and QAPEI nanoparticles have all been studied as possible antibacterial agents and to enhance their physicochemical and biological characteristics. By performing the test, Barros et al. demonstrated that the antibacterial effect of sealants is impacted by the addition of 1% or 2% nanoparticles of QPEI. [13]

Obturating Materials According to research, gutta-percha—even when thermoplasticized—should be used in conjunction with sealers since it does not provide sufficient three-dimensional infill. Nanosilver particle (AgNP)-coated gutta-percha shown antibacterial qualities. Following modification, this combination has demonstrated antibacterial efficacy against Escherichia coli (E. coli), Candida albicans (C. albicans), Staphylococcus aureus (S. aureus), and E. faecalis.

Root Repair Materials Mohammed S. Alenazy *et al.* found that using MTA as nanoparticles boosted the powder's surface area in contact with dental tissues, reducing the setting time and increasing the material's hardness. It seems that this modification accelerated MTA's solidification. However, the usage of nanoparticles was linked to a decline in the required hardness. [14]

Preventive Dentistry

The size-dependent effects of nanomaterials in preventive dentistry can be attributed to two main mechanisms: the first is the interaction with bacterial adherence and oral biofilm formation; the second is the impact on de- and remineralization. Since demineralization begins at the nanoscale, either due to caries or erosion-induced acidic

challenges, it makes sense to provide small nanosized building units for optimal remineralization. This also holds true for particle size-related interactions with bacteria and the bacterial membrane, where nanoparticles are significantly more effective than microparticles. Hydroxyapatite or its derivatives modified with carbonate, fluoride, or zinc make up the majority of pure inorganic nanoparticles used in preventative dentistry. Additionally, a small percentage of minerals, such as mineral nanotubes or nanorods, are evaluated. According to Lu et al., needle-like or spheroidal nanohydroxyapatite (less than 100 nm in size) may enhance the remineralization of artificial caries lesions and alter bacterial colonization of the tooth surface in a rat model, indicating a potential antibacterial effect. [15]

Periodontal Therapy

Because of its ability to promote bone development through osteoconduction and osteoinduction, bioactive glass has been used extensively in dentistry to correct periodontal abnormalities. Over time, there have been encouraging outcomes from the therapeutic application of bioactive glass in the Perioglass brand's particle form. In recent decades, there has been an advance in the study of novel therapies for complete periodontal regeneration.A series of biological processes, such as adhesion, migration, proliferation, and differentiation, are involved in periodontal regeneration. To promote periodontal regeneration, a variety of treatments have been tried.Although full regeneration of periodontal tissues is still far off, autogenous bone grafts, bone allografts, GTR, the implantation of alloplastic materials, and the utilization of cellular factors have all made major strides in this direction.

Risk Assessment

Figure 4 shows a schematic representation of life cycle assessment of NMs, which has been acknowledged as an important technique for routinely assessing the possible environmental implications of manufactured nanomaterials across their full life cycles.[16]The risk assessment technique used for conventional chemicals, which is predicated on the following requirements [17], should be followed in the safety assessment of NMs in accordance with "REACH" (Registration, Evaluation, Authorization and restriction of Chemical Substances). (1) evaluation of effects, (2) assessment of exposure, and (3) categorization of risk (Fig5)[7]

Challenges

The following characteristics might be encompassed in the ideal nanomedicine or nanoparticle system to be used therapeutically

- A thorough comprehension of the essential elements and how they interact
- Determining the essential traits and how they relate to performance
- Capacity to reproduce essential features in industrial settings
- Capable of targeting or accumulating in the intended site of action by overcoming the constricting biological barriers
- Simple to make in a sterile form
- Easy to administer and storewith good stability

Advantages

- Targeted Drug Delivery
- Enhanced Biocompatibility
- Improved Mechanical Properties
- High Surface Area-to-Volume Ratio
- Biosensing
- Diagnostics

CONCLUSION

The field of dentistry has undergone remarkable advancements with the introduction of nanobiomaterials, revolutionizing both preventive and therapeutic approaches. Nanobiomaterials have enhanced the properties of

traditional dental materials, making them stronger, more biocompatible, and functionally superior. Despite their numerous advantages, nanobiomaterials present challenges that must be addressed before their widespread adoption in clinical practice. Concerns regarding their long-term biocompatibility, cytotoxicity, and potential environmental impact require thorough investigation.

ABSTRACT

Extreme events (EEs)-rare, large-amplitude bursts occurring unpredictably in time-have garnered significant attention across diverse disciplines. In this study, we investigate the emergence and mechanisms of EEs in nonlinear systems with parametric excitation, with a focus on microelectromechanical systems (MEMS). Paradigmatic models are examined: cantilever-based MEMS oscillator. In the MEMS model, EEs arise due to stick-slip bifurcations near discontinuous system boundaries under parametric modulation. These findings demonstrate that parametric excitation, a common feature in various engineered systems, can act as a potent mechanism for inducing EEs, offering new perspectives in MEMS design, failure analysis, and energy harvesting applications.

Keywords: Extreme events, microelectromechanical systems, large amplitudes

INTRODUCTION

Oscillatory systems across physics, biology, and engineering often exhibit rich dynamical behaviors, including the coexistence of small and large-amplitude oscillations. Among these, extreme events (EEs)-sporadic, high-magnitude

excursions-stand out due to their destructive potential and statistical rarity. Characterized by long-tailed distributions, EEs have been identified in diverse systems such as ocean waves, neuronal circuits, lasers, and power grids. Traditionally, their emergence has been studied in systems subjected to external periodic forcing, where mechanisms like crisis, bifurcations, and noise-driven instabilities play key roles [1-9]. Despite progress, the role of parametric excitation-where system parameters varies periodically rather than being driven externally-remains underexplored in the context of EEs. Parametric excitation is common in MEMS, where properties like stiffness or damping may be modulated for performance tuning or energy harvesting. Such internal modulation introduces fundamentally different dynamical pathways compared to additive forcing [3]. In this work, we aim to fill this gap by presenting theoretical and numerical evidence of EEs in a nonlinear system under parametric excitation: a MEMS oscillator with a discontinuous boundary. In the MEMS model, we show that stick-slip dynamics, triggered near discontinuities in phase space, can induce EEs. These results not only expand our understanding of EEs in parametrically excited systems but also underline their relevance in real-world MEMS applications.

Extreme Events in a Microelectromechanical System

In this section, we examine the emergence of extreme events (EEs) in a microelectromechanical system (MEMS) subjected to parametric excitation. The system under consideration is a cantilever-based MEMS oscillator, which incorporates both nonlinear stiffness and a discontinuous boundary, making it a fertile ground for complex dynamics, including rare and extreme oscillations.

Mathematical Model

The dimensionless form of the equation governing the MEMS oscillator is given by [3]:

$$\ddot{x}+\alpha\dot{x}+\gamma[1+F\cos(\omega t)]x-2(1-x)2\beta=0,$$

where

- x(t) is the displacement of the movable cantilever structure.
- α is the damping coefficient representing energy dissipation.
- γ is the stiffness parameter of the structure.
- β quantifies the nonlinear electrostatic actuation.
- F and ω are the amplitude and frequency of the parametric excitation, respectively.

The electrostatic actuation introduces a singularity at x=1, leading to a discontinuous boundary in the phase space. This feature divides the system into two dynamical subspaces: one for x<1 and another for x>1. Systems with such discontinuities are common in real-world mechanical and electronic systems and are known to exhibit behaviors like stick-slip motion, which are critical in the generation of EEs.

Numerical Setup and Observations

To explore the system's behavior, we fix the parameters as follows: α=0.71, γ=0.5, and β=0.32. The differential equation is integrated numerically using the adaptive step-size Runge-Kutta method, ensuring accuracy in capturing rapid changes in dynamics [4,5]. In the absence of parametric forcing (F=0), the system possesses a single equilibrium point-a stable focus-at x=1.38248. However, the introduction of parametric excitation drastically alters the dynamical landscape. By fixing the excitation amplitude F=1.48 and varying the excitation frequency ω, we observe a rich array of behaviors

- Periodic Oscillations: For high values of ω, the system remains in a regular, periodic regime.
- Chaotic Transitions: As ω decreases, a transition to small-amplitude chaos occurs.
- Emergence of Large Bursts: Further reduction in ω leads to the appearance of intermittent large-amplitude oscillations.
- Onset of Extreme Events: At a critical frequency ($\omega\approx0.8513$), some of these bursts cross a statistically defined threshold, marking the emergence of extreme events.

Identification and Statistical Characterization of EEs

To objectively distinguish extreme events from typical large oscillations, we use a statistical criterion based on the observable x(t) [6-9]. An event is classified as extreme if its peak amplitude exceeds a threshold height HT, defined by

$$HT=\langle P\rangle+n\sigma,$$

where ⟨P⟩ is the time-averaged peak value of x, σ is the standard deviation, and n=4 is a system-specific scaling constant (see Fig.1).

At ω=0.8513, a portion of the observed large bursts exceed HT, qualifying as extreme events. This is confirmed through

- Time series analysis, showing intermittent and irregular large peaks;
- Probability density functions (PDFs) of the peak values which exhibit long-tailed distributions, a hallmark of extreme events;
- Phase portraits, displaying large excursions in phase space associated with these events.

Statistical Rarity and Temporal Unpredictability

To substantiate the rare and unpredictable nature of the extreme events, the inter-event interval (IEI) and joint inter-event interval (JIEI) statistics are computed. The IEI is defined as the time interval between two successive events exceeding HT. The PDF of the IEIs follows a Poisson-like exponential distribution, indicating a memoryless process where events occur at random times with no temporal correlation. This is further validated by the JIEI plots, which display a negative exponential trend-another statistical signature of rare, independent events. E. Mechanism Behind the Emergence of EEs: Stick-Slip Bifurcation. A unique feature of the MEMS model is its discontinuous boundary at x=1, which creates a sliding region in the phase space. As trajectories approach this boundary, they can undergo stick-slip bifurcations-a process where trajectories intermittently "stick" to the boundary before "slipping" away, leading to sudden and large displacements.

As the excitation frequency ω decreases, the system's orbits are gradually drawn closer to the discontinuous boundary. When they get sufficiently close, the stick-slip mechanism is activated, producing the large excursions associated with extreme events. These bifurcations occur irregularly due to the chaotic nature of the system, explaining the sporadic and unpredictable timing of EEs.

This mechanism is visually demonstrated through phase portrait

- **For ω=0.875** The orbit remains distant from the boundary, and the system behaves periodically.
- **For ω=0.856** Small chaotic oscillations appear, but the boundary is not yet engaged.
- **For ω=0.842** The orbit intersects the discontinuous boundary, initiating stick-slip bifurcation and resulting in large, rare oscillations.

CONCLUSION

In this study, we explored the emergence of extreme events (EEs) in nonlinear oscillatory systems subject to parametric excitation, focusing particularly on a cantilever-based MEMS model. Through bifurcation analysis and long-term time series evaluations, we demonstrated that EEs in the MEMS system, we found to emerge near discontinuous boundaries due to stick-slip bifurcations, a mechanism inherently tied to the system's structural nonlinearity. Our findings underscore that parametric excitation, widely used in MEMS for tuning and control, can also be a source of sporadic high-magnitude responses-posing both challenges and opportunities for system stability and energy harvesting applications. These insights are valuable for the design and safe operation of micro- and macro-scale engineering systems prone to such extreme dynamical behaviors.

ABSTRACT

Introduction: - coronary artery disease (CAD) remains a leading cause of morbidity and mortality Patients with coronary artery diseases suffers from symptoms like chest pain, breathlessness, fatigue, which may have an effect on their functional status and vo2 max. The study aims to evaluate effect of symptoms limited exercise training in patients with non-operated stable coronary artery disease. Methodology: -Total 76 patients were divided into two groups. The conventional group was advised to walk for minimum 30-40 minutes per day. The interventional group was taught 30-40 minutes of tailor-made exercise training once along with walking and provided a home exercise programme. Home diary was maintained to check adherence for both groups. Both groups were instructed to follow protocol for 5days/week for 3 months. Results: - Results showed significant improvement($P<0.05$) in quality of life for interventional group. While inter-group showed significant improvement($P<0.05$) in all parameters except WHO-domain 3 and CCS. Conclusion: -The study concluded that effect of symptoms limited exercise training to improve quality of life in patients with non-operated stable coronary artery disease.

Keywords: - Exercise training, Coronary artery disease, Quality of life

INTRODUCTION

Coronary artery disease (CAD) remains a leading cause of morbidity and mortality worldwide, accounting for millions of deaths each year. According to the World Health Organization (WHO) and other health agencies, CAD is one of the primary causes of death globally, particularly in high-income countries. However, its prevalence is also rising in low- and middle-income nations due to urbanization, lifestyle changes, and an increasing burden of risk factors [1]. In developed countries, the prevalence of CAD is estimated to be between 6-10% in adults over the age of 40, with sedentary lifestyles, obesity, diabetes, and hypertension contributing to its growing incidence [2]. The underlying cause of CAD is atherosclerosis, a progressive condition characterized by the accumulation of lipid-rich plaques in the coronary arteries [3]. These plaques lead to endothelial dysfunction, reduced nitric oxide bioavailability, inflammation, and vascular remodelling, ultimately resulting in narrowed or occluded arteries.[3-4] As a consequence, myocardial blood flow becomes restricted, leading to ischemia, which manifests as angina, dyspnea, or fatigue, particularly during physical exertion [4].

In stable CAD, the coronary circulation is often able to maintain adequate blood supply at rest. However, during periods of increased demand, such as exercise, blood flow may become insufficient, triggering ischemic symptoms. While pharmacological interventions, including beta-blockers, nitrates, and antiplatelet therapy, help control symptoms, they do not directly enhance endothelial function or improve overall physical capacity [5] Patients with stable CAD often experience physical limitations, reduced exercise tolerance, and psychological distress, all of which negatively impact their quality of life (QoL) [6]. Exercise training has been shown to improve endothelial function, increase myocardial oxygen delivery, and reduce symptom burden. In particular, symptom-limited exercise training—an approach that adjusts exercise intensity based on individual tolerance—has emerged as an effective rehabilitation strategy [78]. By allowing patients to exercise within their physiological limits, this approach maximizes benefits while minimizing risks, leading to improved functional capacity, reduced symptoms, and enhanced QoL.

While surgical and pharmacological interventions remain central to CAD management, a significant proportion of patients remain non-operated, either due to the absence of severe obstructive lesions, personal preference, or contraindications for surgery. In such cases, non-invasive approaches, including lifestyle modifications and structured exercise programs, play a crucial role in optimizing clinical outcomes. Symptom-limited exercise training differs from high-intensity exercise programs by ensuring that patients engage in safe, individualized activity levels that promote cardiovascular adaptation without excessive myocardial strain. Research has demonstrated that exercise training not only improves functional capacity, reduces inflammation, and enhances autonomic balance but also lowers the risk of adverse cardiovascular events [9].

Beyond its physiological benefits, symptom-limited exercise training is essential for enhancing health-related QoL, which encompasses physical function, emotional well-being, and social participation.[10] Many patients with stable CAD experience activity limitations, anxiety related to symptom-induced exertion, and reduced independence, all of which contribute to a diminished QoL [10-11]. By improving exercise tolerance and reducing symptom severity, structured exercise programs may help patients regain confidence in physical activity and enhance their psychological well-being [12]. This study aims to evaluate the effect of symptom-limited exercise training on quality of life in patients with non-operated stable CAD. By assessing improvements in physical, emotional, and social well-being, this research seeks to provide valuable insights into optimizing rehabilitation strategies for this patient population.

.

MATERIALS AND METHODS

The study was commenced after approval of institutional ethical committee and clinical trial registration.

The inclusion criteria were
1) Age group 40 to 70 years both men and women
2) Patients who were screened and diagnosed with stable coronary artery disease by interventional cardiologist
3) Severe stable coronary artery disease (>70% Blockage) who refused for CABG/PCI
4) Moderate stable coronary artery disease (>50-70% Blockage) who does not require PCI
5) Mild stable coronary artery disease (<50% Blockage).

The exclusion criteria were
1) Patients who were diagnosed with rheumatic heart disease.
2) Patients who were diagnosed with unstable coronary artery disease and required surgery.
3) Patients who were diagnosed for any associated pulmonary disease.
4) Patients who were suffering from any neurological conditions that affects upper limb movements and gait.
5) Patients with any lower limb musculoskeletal deformity affecting mobility.
6) Patients who were suffering from psychiatric disorders.

Sample size: - According to the literature, the standard deviation (SD) of the quality of life of CAD patients ranged from 12 to 18 [13,14]. Assuming a standard deviation of 15 and an 11-point difference as clinically important, a sample size of 30 per group were required to attain 80% power while allowing for 5% typeI error. Assuming a 20% loss to follow-up, the sample size inflated to 38 per group. The total sample size was 76.

Sampling method: - Computerized randomization

Outcome measures
1) WHO-QOL to evaluate quality of life [15]
2) Canadian cardiovascular society score to evaluate angina level [16]
3) New York heart association score to evaluate dyspnoea level [17]

Methodology
Patients who met the inclusion and exclusion criteria were recruited for the study. A total of 102 patients were screened for eligibility. A total of 26 patients were excluded from the study, including 12 who did not meet the inclusion criteria, 10 with pulmonary disease, and 4 who declined to participate.76 patients were randomly divided into two groups. Prior to commencing main study, pilot study was conducted to evaluate efficacy of protocol, which has showed significant improvement in interventional group. Baseline data and outcome measures were evaluated following participation. The control group was advised to walk for 30 minutes five days a week for three months. The interventional group received 30-40 minutes of symptoms-limited customised exercise intervention along with walking 5 days a week for three months. Once enrolled in the interventional group, all the patients were taught a tailor-made exercise protocol (Figure 1) and provided home exercise programme for home based. They were asked to keep a home diary for reminders and follow-up purposes. Reminders was given by telephonic conversation every two weeks. The outcome measures were assessed both at baseline and after three months. Symptoms-limited exercise intervention was given to interventional group according to FITT protocol mentioned in table 1 to 3. This protocol was carried out from ACSM and AHA Guidelines.

RESULTS

Data was entered into Microsoft Excel 2016. Data was analyzed by using STATA 18. Descriptive statistics [Frequency, mean (SD)] were used to depict the baseline characteristics of the study population. An independent sample t-test was used to compare outcome variables between the groups. A within-group comparison was done using a paired t-test. p-value <0.05 was considered statistically significant . Table 4 showed total of 76 (20 Male, 18 Female) patients with mean age (58.05±7.16) in control group and 10 (19 Male, 19 Female) patients with mean age (58.87±7.48) in interventional group were enrolled for the study. All patients had completed their course of exercise training for 3 months in both the groups respectively. Both groups have similar charactristics at baseline with respect to the severity of coronary artery disease. Table 5 showed there was significant improvement in control group for all parameters except WHO-domain 3 and CCS. (p>0.05). Table 6 showed there was significant improvement in interventional group for all parameters. (p<0.05). Table 7 showed intergroup comparison there was significant improvement in control group for all parameters except WHO-domain 3 and CCS. (p>0.05).

DISCUSSION

Cardiac rehabilitation has become a well-established treatment modality in patients with heart disease. The present study examined the impact of symptom-limited exercise training on the quality of life (QoL) in patients with non-operated coronary artery disease (CAD). Our findings suggest that structured exercise training, performed up to symptom limitation, significantly improves QoL, as evidenced by enhancements in physical functioning, emotional well-being, and symptom burden. Patients demonstrated improved exercise tolerance, reduced angina frequency, and greater psychological resilience, reflecting the multifaceted benefits of exercise in CAD management. Our results align with previous research demonstrating the positive effects of cardiac rehabilitation on QoL in CAD patients. Studies by Hambrecht et al. (2000) and Anderson et al. (2016) have shown that exercise-based interventions improve physical fitness and reduce cardiovascular symptoms [17-18]. Notably, our study reinforces that symptom-limited exercise, rather than fixed moderate-intensity training, is an effective strategy for improving exercise tolerance and overall well-being. The observed improvements in QoL suggest that exercise should not be viewed solely as a secondary prevention tool but as a primary therapeutic strategy. Additionally, our study supports a patient-centered approach to cardiac rehabilitation, where exercise intensity is tailored based on individual symptom thresholds. This could enhance adherence and long-term sustainability compared to rigid, one-size-fits-all exercise protocols. The improvements observed can be attributed to several physiological and psychological mechanisms like Enhanced Cardiovascular Efficiency – Regular exercise improves endothelial function, reduces arterial stiffness, and promotes myocardial perfusion, leading to better physical functioning. Reduction in Symptom Burden – Improved exercise tolerance correlates with decreased anginal episodes and dyspnea, which contributes to better QoL. Psychosocial Benefits – Exercise has well-documented effects on reducing anxiety and depression, likely contributing to the psychological well-being improvements noted in our study [19-20].

CONCLUSION

This study concluded that symptom-limited exercise training significantly enhances the QoL of patients with non-operated CAD. By improving physical function, reducing symptom burden, and enhancing psychological well-being, exercise emerges as a key non-pharmacological intervention in CAD management. Future research should focus on optimizing exercise protocols and assessing long-term adherence and benefits to reinforce the role of exercise in routine cardiac care.

Limitations

Multi-center trials would be needed to confirm these findings across diverse populations. We have not assessed diet mechanism, level of physical activity etc.

ACKNOWLEDGEMENT

I would like to express my deepest thanks and sincere gratitude to my statistician, Mr. Mayur Shinde for sharing his knowledge and co-operative response to all queries. I would like to express my gratitude to the IEC for approving our research request, as well as to all the patients for their support throughout the study.

ABSTRACT

With the increasing number of two-wheeler accidents globally, rider safety has become a paramount concern. Traditional safety measures such as helmets and seat belts, while effective, do not incorporate advanced technology capable of preventing accidents and enhancing post-accident response. The "Safe Ride Sentinel" project is an innovative solution that integrates multiple advanced technologies to ensure rider safety. This paper discusses the development, features, testing, and potential impact of the Safe Ride Sentinel smart helmet, which combines accident detection, alcohol detection, speed control, GPS tracking, wireless communication, and biometric authentication. The goal of this project is to create a system that not only reacts to accidents but also prevents them by encouraging responsible riding behavior.

Keywords: Smart Helmet, Accident Detection, Alcohol Detection, Biometric Authentication, GPS Tracking

INTRODUCTION

In recent years, there has been a noticeable increase in road accidents involving two-wheelers. The World Health Organization reports that road traffic injuries rank among the top causes of death globally, with riders of two-wheel vehicles being particularly at risk. While conventional helmets play a crucial role in protecting users during accidents, they do not address the factors that lead to such incidents. Additionally, delays in emergency response are often a result of inadequate real-time communication between riders and emergency services. The rise of wearable

technology has created opportunities to improve rider safety. The Safe Ride Sentinel smart helmet is an innovative safety device that integrates multiple advanced features designed to both prevent accidents and enhance outcomes following an incident. Key functionalities include accident detection, alcohol monitoring, speed regulation, GPS tracking, wireless communication, and biometric authentication via facial recognition. These features tackle the primary causes of accidents and elevate safety standards for two-wheeler riders. This paper discusses the design and implementation of the Safe Ride Sentinel, with an emphasis on its hardware components, software integration, testing outcomes, and prospects for future advancements in road safety technology.

Literature Review

Recent innovations in road safety technology have resulted in various systems aimed at enhancing rider safety. While some systems are dedicated to accident detection and emergency response, others seek to avert accidents through mechanisms like alcohol detection and speed regulation. Nonetheless, a comprehensive safety system for two-wheeler riders that integrates all these features has yet to be developed. Numerous projects have investigated smart helmets that provide basic functions, such as sending SMS notifications in the event of a crash. However, the majority of these devices operate in a reactive manner, responding only after an incident has occurred. On the other hand, the Safe Ride Sentinel smart helmet advances the concept by incorporating proactive safety features, including alcohol detection and speed management, along with emergency response capabilities. Moreover, the application of biometric authentication technologies, like facial recognition, is a relatively recent development in the realm of smart helmets. This innovation ensures that only authorized users can operate the vehicle, thereby preventing unauthorized access and significantly enhancing security. The Safe Ride Sentinel aims to fill the void between current technologies, providing a fully integrated and multifunctional safety system tailored for two-wheeler riders.

System Design and Components

The Safe Ride Sentinel smart helmet is a multi-layered system that combines various hardware components, sensors, and communication modules. The system design focuses on modularity, ensuring that each component functions efficiently and harmoniously within the overall architecture. Figure. 1 illustrates a block diagram.

Hardware Components

The following hardware components are incorporated into the Safe Ride Sentinel

- Microcontroller (Arduino or ESP32): The microcontroller is the heart of the system, responsible for managing inputs from various sensors and controlling the output actions. It processes data from the accelerometer, alcohol sensor, facial recognition module, and GPS module.
- Accelerometer: The accelerometer detects sudden movements or impacts, which are indicative of a crash. It sends data to the microcontroller, triggering the accident detection algorithm.
- Alcohol Sensor: A gas sensor detects the presence of alcohol in the rider's breath. If the alcohol level exceeds the permissible threshold, the helmet prevents the vehicle from starting.
- GPS Module: The GPS module provides real-time location data, which is transmitted via the GSM module in case of an accident. This ensures that emergency services can reach the rider quickly.
- GSM Module: The GSM module is used for wireless communication, sending alert messages to predefined emergency contacts when an accident is detected or when unsafe conditions (e.g., alcohol detection) are identified.
- Facial Recognition Module: A camera captures live images of the rider's face. The images are compared with pre-stored reference images to authenticate the rider before allowing ignition. Open CV software is used for facial recognition.
- User Interface: An LCD display and LEDs provide real-time feedback to the rider about the status of the system, such as accident detection, alcohol level, and GPS location.
- Power Supply: The system is powered by a battery, which is optimized for energy efficiency to ensure long-term operation. Additionally, solar panels can be integrated in the future to generate power for the system.

Software Architecture

The software driving the Safe Ride Sentinel is based on the Arduino IDE, which uses embedded C for microcontroller programming. The software integrates all the hardware components and manages the communication between them. The system processes data from the sensors, makes decisions based on predefined algorithms, and sends appropriate commands to the vehicle or emergency contacts.

The key functionalities in the software include:

- Accident Detection Algorithm: The accelerometer data is continuously monitored. When a significant change in acceleration is detected, the system assumes an accident has occurred and triggers the emergency response.
- Alcohol Detection Algorithm: The alcohol sensor checks the rider's breath and determines if the alcohol concentration exceeds the safe threshold. If so, the system locks the ignition and prevents the vehicle from starting.
- GPS Tracking: The GPS module continuously tracks the rider's location, and in case of an accident, this data is sent via GSM to emergency contacts or a designated server.
- Facial Recognition: The camera captures images of the rider's face and compares them to a pre-stored database. If there is a match, the system grants access to start the vehicle.

The software ensures seamless communication between all these components and provides the rider with real-time status updates via the user interface.

TESTING AND RESULTS

The Safe Ride Sentinel underwent evaluations in controlled settings to measure the effectiveness and dependability of its various features. The findings were encouraging, indicating that the helmet could successfully identify accidents, discourage impaired driving, and verify rider identity. Figure. 2 shows a hardware implementation.

Accident Detection

The accident detection system, which is based on an accelerometer, effectively recognized simulated collision situations. When it detected unusual movements or sudden impacts, it activated an alarm and transmitted an alert via GSM to the specified emergency contacts. This feature was subjected to multiple tests in varying conditions and demonstrated a high level of precision.

Alcohol Detection

The alcohol sensor reliably identified alcohol levels exceeding the established threshold. In scenarios where the rider had consumed alcohol, the system effectively prevented the vehicle from starting, ensuring that the rider was unable to operate the vehicle while under the influence. The alcohol detection system proved to be consistent across numerous tests, accurately identifying a variety of alcohol concentrations.

GPS Tracking and Emergency Response

The GPS module provided accurate real-time location data. In the event of an accident, the system transmitted the rider's location to emergency contacts via GSM, ensuring that help could be dispatched quickly. The GPS tracking system also performed well under different environmental conditions, ensuring reliable location data.

Biometric Authentication

The facial recognition system powered by OpenCV successfully authenticated the rider's identity before enabling the vehicle's ignition. The camera captured clear images of the rider's face, and the facial recognition algorithm matched the images with high accuracy. This feature provided an additional layer of security by ensuring that only authorized riders could start the vehicle.

DISCUSSION

The Safe Ride Sentinel has shown its promise as a thorough safety solution for motorcycle riders. By combining features such as accident detection, alcohol monitoring, speed regulation, GPS tracking, and biometric authentication, this helmet takes a proactive stance on rider safety. It is designed not only to respond to emergencies but also to mitigate risky behaviors, like driving under the influence, while ensuring that only authorized individuals can use the vehicle. The helmet's modular hardware design allows each component to operate effectively, and the software facilitates real-time feedback and communication with emergency contacts. This technological integration underscores the increasing potential of smart wearable devices in enhancing road safety.

Future Scope

While the Safe Ride Sentinel has already demonstrated its effectiveness, there is always room for further development and improvement. Future enhancements could include:

- Integration with Other Vehicle Systems: The helmet could be connected to the vehicle's onboard systems to automatically adjust speed or initiate emergency braking in case of an accident.
- Improved Power Efficiency: Incorporating solar panels to generate power for the helmet would reduce reliance on traditional charging methods.
- Stolen Vehicle Tracking: GPS tracking could be used to track stolen bikes, providing an added layer of security.
- Advanced Communication Features: Adding wireless communication features such as Bluetooth speakers would allow riders to communicate hands-free while driving.

These advancements would further enhance the functionality of the Safe Ride Sentinel, making it an even more effective solution for ensuring rider safety.

CONCLUSION

The Safe Ride Sentinel is a pioneering project that demonstrates the potential of smart helmets to enhance rider safety. By integrating advanced features such as accident detection, alcohol detection, GPS tracking, facial recognition, and wireless communication, the smart helmet offers a multi-layered safety solution that addresses both emergency response and preventive measures. The system has shown promising results in tests, with each feature performing as expected. The helmet not only reacts to accidents but also prevents them by ensuring that the rider is sober, wearing the helmet, and authorized to operate the vehicle.The Safe Ride Sentinel is a step toward a safer future for two-wheeler riders, offering a comprehensive solution that could significantly reduce road accidents and fatalities.

ABSTRACT

Mobile learning (M-learning) offers convenient access to education through mobile devices but may negatively affect cognitive skills like attention and memory. Cultural context may also shape how students respond to M-learning environments. To assess the impact of mobile device usage on students' cognitive abilities and explore how cultural differences influence this relationship. A cross-sectional survey was conducted with 228 university students from varied cultural backgrounds using the Cognition Self-Assessment Rating Scale (C-SARS) and the Sociocultural Adaptation Scale (SCAS-R). Data were analyzed using descriptive statistics and chi-square tests. Over half (53.5%) of participants showed moderate cognitive challenges, while 46.5% had mild issues. Most students (55.7%) demonstrated moderate sociocultural adaptation. A significant link was found between cognitive performance and adaptation levels ($p < 0.001$). High mobile device use in learning may impair cognitive function. Students with better cognition adapted more easily across cultures. Managing device use is key to enhancing both cognitive and cultural success in M-learning settings

Keywords: Mobile learning, smartphones, university students, E-learning, cognitive functions, cross cultural students, attention, working memory

INTRODUCTION

Mobile learning (M-learning) is a growing trend that utilizes mobile and wireless technology to enhance the effectiveness of traditional learning methods. Mobile learning represents a new phase in the evolution of e-learning. It involves any form of learning conducted through wireless mobile devices, such as smartphones, PDAs, and tablet PCs, which can move with learners and enable them to study anytime and anywhere.[1] The widespread growth of mobile devices and wireless connectivity on university campuses creates a favorable setting for implementing student-centered mobile learning in higher education. The use of mobile devices is expected to be a successful strategy both now and in the future, as these devices are particularly appealing to higher education students.[2]Additionally, cultural barriers pose a challenge in online courses, as cultural traits like individualism and collectivism can impact how successful M-learning. [3] The global proliferation of technology has resulted in a rise in excessive usage worldwide. However, particular cultural contexts and environments appear to shape behaviors that may contribute to the development of addiction.[4] Factors such as social norms and cultural values including attitudes towards risk, levels of uncertainty avoidance, preferences for face-to-face communication, perceptions of time, and gender roles have been recognized as influencing the adoption and adaptation to information technology changes.[5] Culture not only affects the manifestation of certain behaviors but is also closely associated with the expression of various personality traits.[7]Cognitive refers to the ability to use mental functions and skills to carry out tasks such as learning, reasoning, understanding, remembering, and focusing attention. One perspective suggests that brain development is closely linked to cognitive growth, where the formation and maturation of neural connections enable more advanced mental processing. The role of social and cultural experiences in shaping human cognition, suggesting that our thinking patterns are influenced by the activities and norms of the societies we engage with.[8]

Aim of The Study

To investigate the effect of mobile device usage on M-learning on cognitive abilities among university students with different cultural context

Objectives

- To study the impact of M-learning on cognitive function.
- To examine how different cultural contexts influence the relationship between M-learning and cognitive function.

METHODOLOGY

Study design-A cross sectional study
Study setting - Sharda University ,Students of allied health sciences.
Sample size-228
-To obtain the appropriate sample size the following parameters were considered for sample size
-Two-sided test (two-tailed)
-Effect size (d) = 0.80
- Significance level (α) = 0.05
-Power of the test (1 – β) = 0.80 (80%)
Given value,

$$n = \frac{Z_{1-\alpha/2}^2 \times (S_1^2 + S_2^2)}{(\mu_1 - \mu_2)^2}$$

Formula -
Z=1.96
S1=46.22

S2=48.74
μ1=120.05
μ2= 111.4

Study duration
Duration of the study was 6 months

Inclusion criteria
- Age group 18- 30 years. [14]
- Both male and female students. [38]
- Individuals from different cultural background .[33]
- Individuals who understand the instructions .[33]
- Individuals who actively use mobile devices for academic purposes during their studies. [39]
- The system usability scale (SUS) scored more than 68.[40]

Exclusion criteria-
- Individuals who exclusively use desktop or laptop computers for their online learning needs were excluded. [33]
- Individuals who are not currently enrolled as students in university will be excluded from the study.[41]
- Individuals diagnosed with cognitive impairments (learning disabilities, attention deficit disorders).[41]
- Individuals with MMSE score less than 24 will be excluded[42]
- Individuals with a history of neurological or psychiatric disorders that could affect cognitive function.[43]

Outcome Measures
- Cognition Self- Assessment Rating Scale (C-SARS) [48]
- Sociocultural Adaptation Scale (SCAS-R) [49]

Data Analysis
The data were analyzed using the Statistical Package for Social Sciences (SPSS) version 23. Descriptive statistics for demographic characteristic and the scores from the Cognition Self-Assessment Rating Scale and the Revised Sociocultural Adaptation Scale. The chi-square test was used to examine the association between cognitive function and sociocultural adaptation levels among the participant identify characteristics of the respondents, The chi-square test indicated a statistically significant association ($p < 0.001$) between cognitive function and sociocultural adaptation

RESULTS

The study analyzed data from 228 university students, with 57% females and 43% males. The average cognition self-assessment score was 11.9, indicating that a majority of students experienced moderate cognitive deficits. The average score on the Revised Sociocultural Adaptation Scale was 56.10, suggesting most participants had moderate cultural adaptation. Cross-tabulation results showed that students with moderate cognitive deficits were more likely to demonstrate low to moderate adaptation, whereas students with mild cognitive problems showed better sociocultural adjustment. A chi-square test revealed a statistically significant association ($p < 0.01$) between cognitive function and sociocultural adaptation, highlighting that cognitive abilities influence students' capacity to adapt in culturally diverse mobile learning environments Table 1 shows the descriptive statistics for the variables Age, Cognition Self-Assessment Rating Scale, and Revised Sociocultural Adaptation Scale, based on a sample of 228 participants. The mean age of participants was 21.55 years with a standard deviation of 2.05. For the cognitive scale, the average score was 11.95 and the standard deviation was 3.61, reflecting moderate variation in self-reported cognitive levels. The sociocultural adaptation scale had a mean score of 56.10 and a standard deviation of 10.64, indicating broader differences in adaptation levels. Table.2 :shows the gender distribution of 228 study participants. Of these, 130 were female (57%) and 98 were male (43%). The table includes frequency, percentage, valid percentage,

and cumulative percentage for each gender. Graph 1. The graph shows that 57% of the respondents are female, while 43% are male, This indicates that there are more female participants than male participants in the sample.The bars are visually distinct in height, highlighting the greater female representation. Table.3 shows the distribution of 228 participants based on their cognitive ability levels. Out of the total, 106 participants (46.5%) were found to have mild cognitive problems, while 122 participants (53.5%) were identified with moderately cognitive deficits. This distribution highlights that a slight majority of participants had moderate cognitive deficits. Graph .2Cognitive Ability levels of participants**.** Graph.2 : shows the distribution of students' cognitive functioning levels based on the Cognition Self-Assessment Rating Scale (C-SARS). It reveals that 53.5% of students fall into the category of mild cognitive deficits, while 46.5% are categorized as having mild cognitive problems. Table.4: Shows the distribution of 228 participants according to their sociocultural adaptation levels. A majority of the participants, 127 individuals (55.7% This was followed by 80 participants (35.1%) who exhibited low adaptation, indicating some difficulty in adjusting. Only 21 participants (9.2%) showed high adaptation, reflecting strong adjustment to the sociocultural context. These findings suggest that while most participants managed to adapt moderately, a smaller portion struggled with or excelled in their adaptation to the environment.Graph.3Sociocultural Adaption levels of participants. Graph 3: shows the distribution of students' sociocultural adaptation levels based on the Revised Sociocultural Adaptation Scale (SCAS-R) most students (55.7) have moderate adaption, (35.1) have low adaption and (9.2) have high adaptation..The data shows that the majority of participants (55.702%) fall under the moderate adaptation category. A smaller portion (35.088%) show low adaptation, and only a very small percentage (9.211%) exhibit high adaptation. Table.4 Shows a cross-tabulation of cognitive function and sociocultural adaptation, comparing students with mild cognitive problems and those with moderate cognitive deficits across three levels of adaptation: high, low, and moderate. Among students with mild cognitive problems (n=106), the majority demonstrated high (95.2%) or moderate (59.8%) adaptation, indicating relatively better adjustment. In contrast, students with moderately cognitive deficits (n=122) showed a high rate of low adaptation (87.5%) and lower representation in high adaptation (4.8%). Table.5 Shows the Chi-Square test results examining the association between cognitive function and sociocultural adaptation among students. The Pearson Chi-Square value is 66.316 with 2 degrees of freedom, and the p-value is 0.000, indicating a highly significant association. Similarly, the Likelihood Ratio is 75.522 with the same degrees of freedom and a p-value of 0.000 These results confirm that differences in cognitive functioning have a statistically significant impact on sociocultural adaptation.

DISCUSSION

This study examined how mobile device usage in M-learning affects cognitive abilities and sociocultural adaptation among university students from diverse cultural backgrounds. Among the 228 participants (57% female, 43% male), the average age was 21.55. Self-assessments indicated that most students had moderate cognitive deficits (mean score: 11.95), and moderate levels of sociocultural adaptation (mean score: 56.10).Using cutoff points, 46.5% of students had mild cognitive issues, while 53.5% had moderate deficits. Regarding adaptation, 55.7% showed moderate adaptation, 35.1% low, and only 9.2% high. A significant relationship was found between cognitive function and cultural adaptation ($\chi^2 = 66.316$, $p = 0.000$). Notably, 95.2% of students with high adaptation had mild cognitive issues, while 87.5% with low adaptation had moderate cognitive deficits.These findings suggest that stronger cognitive abilities are linked to better cultural adaptation. The findings of this study by Huang Wanqing *et al.,* 2022 found out that smartphone addiction can negatively affect cognitive and emotional processes, particularly in the context of cross-cultural adjustment. Students who experienced childhood emotional neglect were more likely to develop poor emotion regulation beliefs, which in turn led to higher smartphone addiction. Excessive smartphone use interferes with emotional regulation strategies. The distinct outcome identified in the study by In- Gyu yoo *et al.,* 2022 where they explored the connection between smartphone use and cognitive functions in different culture The findings revealed that overuse of smartphones is linked to diminished concentration, working memory, and cognitive control. it also compared the impact of varying levels of smartphone use on cognitive functions and the need for future research to more thoroughly examine the relationship between impulsive behavior and cognitive function in smartphone users. In contrast evidence supporting that impact of mobile phone addiction on attention

spans and academic performance among students, excessive use of mobile phones negatively affects students' ability to maintain attention, making it difficult for them to stay engaged during learning activities. Siyami *et al.,* 2023 found out that Students who heavily relied on their phones exhibited lower academic performance, especially in theoretical subjects that demand continuous focus and deeper cognitive engagement. Students addicted to their phones often experienced more distractions, which interfered with their ability to concentrate and perform well academically.

CONCULSION

The study concluded that mobile device use in M-learning impacts students' cognitive abilities across different cultural context playing a key role. While it offers flexibility, excessive use may harm attention, memory, and mental processing. Students with moderate cognitive abilities struggle more with cultural adaptation, while those with mild abilities adapt better . This highlights the need to align M-learning with both cognitive and cultural factors.

ACKNOWLEDGEMENT

I sincerely thank Sharda Hospital, Department of Physiotherapy, for their support and resources. Special thanks to Dr. Meenakshi Verma for her valuable guidance. I'm grateful to my family and Friends for their constant encouragement, and above all, Ithank God, the Almighty for his blessings upon me.

Table.1:Descriptive statistics for Age, Cognition Self-Assessment Rating scale and Revised Sociocultural adaptation scale

Variable	Mean	St. Deviation
Age	21.55	±2.048
Cognition Self-Assesment Rating scale	11.95	±3.6138
Revised Sociocultural Adaptation Scale	56.10	±10.636

Table.2: Gender Distribution of participants

Gender					
	Gender	Frequency	Percent	Valid Percent	Cumulative Percent
Valid	female	130	57.0	57.0	57.0
	Male	98	43.0	43.0	100.0
	Total	228	100.0	100.0	

Table. 3: Cognitive ability levels of participants

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Mild cognitive problem	106	46.5	46.5	46.5
	Moderately cognitive deficits	122	53.5	53.5	100.0
	Total	228	100.0	100.0	100

Table.4: Sociocultural Adaptation levels of participants.

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	High adaptation	21	9.2	9.2	9.2
	Low adaptation	80	35.1	35.1	44.3
	Moderate adaptation	127	55.7	55.7	100.0
	Total	228	100.0	100.0	

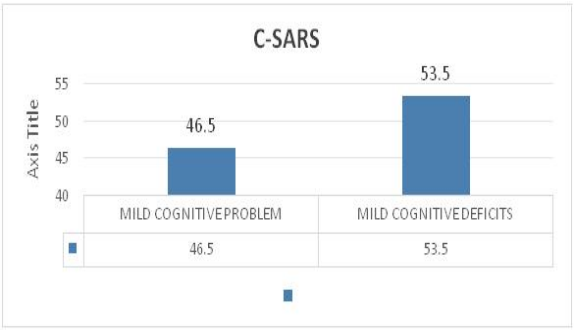
Table.5: Cross tabulation of cognitive function and levels of sociocultural adaptation.

Crosstabulation						
			Cutoff			Total
			High adaptation	Low adaptation	Moderate adaptation	
Cutoff	Mild cognitive problem	Count	20	10	76	106
		% within Cutoff	95.2%	12.5%	59.8%	46.5%
	Moderately cognitive deficits	Count	1	70	51	122
		% within Cutoff	4.8%	87.5%	40.2%	53.5%
Total		Count	21	80	127	228
		% within Cutoff	100.0%	100.0%	100.0%	100.0%

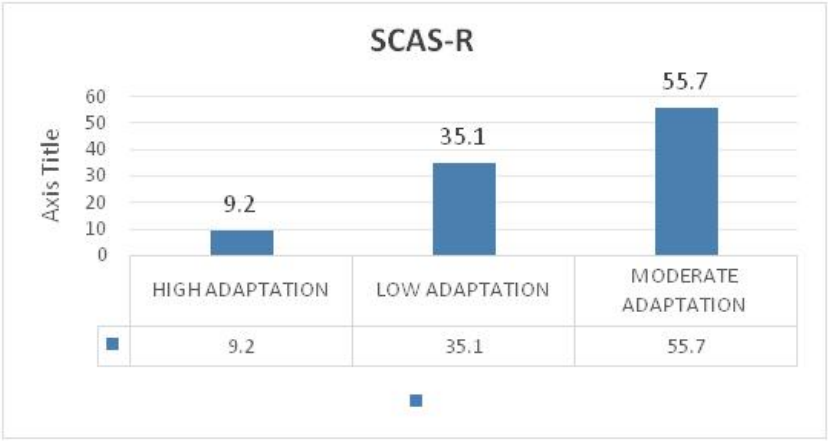
Table.6: Chi-square test on Association between cognitive function and sociocultural adaption

Chi-Square Tests			
	Value	df	P-Value
Pearson Chi-Square	66.316[a]	2	.000
Likelihood Ratio	75.522	2	.000
N of Valid Cases	228		

Graph.1: Gender Distribution of participants



Graph.2: Cognitive Ability levels of participants.



Graph.3: Sociocultural Adaption levels of participants.
