ABSTRACT

In this paper, we introduce a new class of generalized closed sets called weakly binary g^* -closed sets which contains the above mentioned class. Also, we investigate the relationships among the related generalized closed sets.

Keywords: binary g^* -closed set, wbg^* -closed set, binary g^* -continuity, wbg^* -continuity, contra binary g^* -continuity.

INTRODUCTION

In 1970 Levine [3] gives the concept and properties of generalized closed (briefly g -closed) sets and the complement of g -closed set is said to be g -open set. Njasted [11] introduced and studied the concept of α -sets. Later these sets are called as α -open sets in 1983. Mashhours et.al [6] introduced and studied the concept of α -closed sets, α -closure of set, α -continuous functions, α -open functions and α -closed functions in topological spaces. Maki et.al [4, 5] introduced and studied generalized α -closed sets and α -generalized closed sets. In 2011, S.Nithyanantha Jothi and P.Thangavelu [7] introduced topology between two sets and also studied some of their properties. Topology between two sets is the binary structure from X to Y which is defined to be the ordered pairs (A, B) where $A \subseteq X$ and $B \subseteq Y$. In this paper, we introduce a new class of generalized closed sets called weakly binary g^* -closed sets which contains the above mentioned class. Also, we investigate the relationships among the related generalized closed sets.

Preliminaries

Throughout this paper, (X, Y) denote binary topological spaces (X, Y, \mathcal{M}) .

Let X and Y be any two nonempty sets. A binary topology [7] from X to Y is a binary structure $\mathcal{M} \subseteq \mathbb{P}(X) \times \mathbb{P}(Y)$ that satisfies the axioms namely

1. (ϕ, ϕ) and $(X, Y) \in \mathcal{M}$,
2. $(A_1 \cap A_2, B_1 \cap B_2) \in \mathcal{M}$ whenever $(A_1, B_1) \in \mathcal{M}$ and $(A_2, B_2) \in \mathcal{M}$, and
3. If $\{(A_\alpha, B_\alpha) : \alpha \in \delta\}$ is a family of members of \mathcal{M} , then $(\bigcup_{\alpha \in \delta} A_\alpha, \bigcup_{\alpha \in \delta} B_\alpha) \in \mathcal{M}$.

If \mathcal{M} is a binary topology from X to Y then the triplet (X, Y, \mathcal{M}) is called a binary topological space and the members of \mathcal{M} are called the binary open subsets of the binary topological space (X, Y, \mathcal{M}) . The elements of $X \times Y$ are called the binary points of the binary topological space (X, Y, \mathcal{M}) . If $Y = X$ then \mathcal{M} is called a binary topology on X in which case we write (X, \mathcal{M}) as a binary topological space.

Definition 2.1 [7] Let X and Y be any two nonempty sets and let (A, B) and $(C, D) \in \mathbb{P}(X) \times \mathbb{P}(Y)$. We say that $(A, B) \subseteq (C, D)$ if $A \subseteq C$ and $B \subseteq D$.

Definition 2.2 [7] Let (X, Y, \mathcal{M}) be a binary topological space and $A \subseteq X, B \subseteq Y$. Then (A, B) is called binary closed in (X, Y, \mathcal{M}) if $(X \setminus A, Y \setminus B) \in \mathcal{M}$.

Proposition 2.3 [7] Let (X, Y, \mathcal{M}) be a binary topological space and $(A, B) \subseteq (X, Y)$. Let $(A, B)^{1*} = \bigcup \{A_\alpha : (A_\alpha, B_\alpha) \text{ is binary open and } (A_\alpha, B_\alpha) \subseteq (A, B)\}$ and $(A, B)^{2*} = \bigcup \{B_\alpha : (A_\alpha, B_\alpha) \text{ is binary open and } (A_\alpha, B_\alpha) \subseteq (A, B)\}$.

Definition 2.4 [7] The ordered pair $((A, B)^{1*}, (A, B)^{2*})$ is called the binary closure of (A, B) , denoted by $\text{b-cl}(A, B)$ in the binary space (X, Y, \mathcal{M}) where $(A, B) \subseteq (X, Y)$.

Definition 2.5 [7] The ordered pair $((A, B)^{1*}, (A, B)^{2*})$ defined in proposition 2.3 is called the binary interior of (A, B) , denoted by $\text{b-int}(A, B)$. Here $((A, B)^{1*}, (A, B)^{2*})$ is binary open and $((A, B)^{1*}, (A, B)^{2*}) \subseteq (A, B)$.

Definition 2.6 [7] Let (X, Y, \mathcal{M}) be a binary topological space and let $(x, y) \subseteq (X, Y)$. The binary open set (A, B) is said to be a binary neighbourhood of (x, y) if $x \in A$ and $y \in B$.

Definition 2.7 A subset (A, B) of a binary topological space (X, Y, \mathcal{M}) is called

1. a binary semi open set [10] if $(A, B) \subseteq \text{b-cl}(\text{b-int}(A, B))$.
2. a binary pre open set [2] if $(A, B) \subseteq \text{b-int}(\text{b-cl}(A, B))$,
3. a binary regular open set [9] if $(A, B) = \text{b-int}(\text{b-cl}(A, B))$.

Definition 2.8 A subset (A, B) of a binary topological space (X, Y, \mathcal{M}) is called

1. a binary g -closed set [8] if $\text{b-cl}(A, B) \subseteq (U, V)$ whenever $(A, B) \subseteq (U, V)$ and (U, V) is binary open.
2. a binary gr -closed set [9] if $\text{b-rcl}(A, B) \subseteq (U, V)$ whenever $(A, B) \subseteq (U, V)$ and (U, V) is binary open.

Definition 2.9 [1] Let (A, B) be a subset of a binary topological space (X, Y) . Then (A, B) is called binary g^* -closed set if $\text{b-cl}(A, B) \subseteq (P, Q)$ whenever $(A, B) \subseteq (P, Q)$ and (P, Q) is binary g -open in (X, Y) .

Weakly binary g^* -closed sets

We introduce the definition of weakly binary g^* -closed sets in binary topological spaces and study the relationships of such sets.

Definition 3.1 A subset (A, B) of a binary topological space (X, Y) is called a weakly binary g^* -closed (briefly, $\text{wb}g^*$ -closed) set if $\text{b-cl}(\text{b-int}(A, B)) \subseteq (P, Q)$ whenever $(A, B) \subseteq (P, Q)$ and (P, Q) is binary g -open in (X, Y) .

Theorem 3.2 Every binary g^* -closed set is $\text{wb}g^*$ -closed but not conversely.

Example 3.3 Let $X = \{1, 2\}, Y = \{a, b\}$ and $\mathcal{M} = \{(\phi, \phi), (\{1\}, \{a\}), (\phi, \{b\}), (\{1\}, Y), (X, Y)\}$, Then the set $\{\phi, \{b\}\}$ is $\text{wb}g^*$ -closed set but not a binary g^* -closed in (X, Y) .

Theorem 3.4 Every $\text{wb}g^*$ -closed set is $\text{wb}g$ -closed but not conversely.

Proof. Let (A, B) be any $\text{wb}g^*$ -closed set and (P, Q) be any binary open set containing (A, B) . Then (P, Q) is an binary g -open set containing (A, B) . We have $\text{b-cl}(\text{b-int}(A, B)) \subseteq (P, Q)$. Thus, (A, B) is $\text{wb}g$ -closed.

Example 3.5 Let $X = \{a, b\}, Y = \{1, 2\}$ and $\mathcal{M} = \{(\phi, \phi), (\phi, \{1\}), (\{a\}, \{1\}), (X, Y)\}$,. Then the set $(\{a\}, Y)$ is $\text{wb}g$ -closed but not a $\text{wb}g^*$ -closed.

Theorem 3.6 Every $\text{wb}g^*$ -closed set is binary $\text{rw}g$ -closed.

Proof. Let (A, B) be any $\text{wb}g^*$ -closed set and (P, Q) be any binary regular open set containing (A, B) . Then (P, Q) is an binary g -open set containing (A, B) . We have $\text{b-cl}(\text{b-int}(A, B)) \subseteq (P, Q)$. Thus, (A, B) is binary $\text{rw}g$ -closed.

Theorem 3.7 If a subset (A, B) of a binary topological space (X, Y) is both binary closed and binary g -closed, then it is $\text{wb}g^*$ -closed in (X, Y) .

Gnana Arockiam et al.,

Proof. Let (A, B) be a binary g -closed set in (X, Y) and (P, Q) be any binary open set containing (A, B) . Then $(P, Q) \supseteq b\text{-cl}(A, B) \supseteq b\text{-cl}(b\text{-int}(b\text{-cl}(A, B)))$. Since (A, B) is binary closed, $(P, Q) \supseteq b\text{-cl}(b\text{-int}(A, B))$ and (P, Q) is binary g -open set containing (A, B) . Hence (A, B) is wbg^* -closed in (X, Y) .

Theorem 3.8 If a subset (A, B) of a binary topological space (X, Y) is both binary open and wbg^* -closed, then it is binary closed.

Proof. Since (A, B) is both binary open and wbg^* -closed, $(A, B) \supseteq b\text{-cl}(b\text{-int}(A, B)) = b\text{-cl}(A, B)$ and hence (A, B) is binary closed in (X, Y) .

Corollary 3.9 If a subset (A, B) of a binary topological space (X, Y) is both binary open and wbg^* -closed, then it is both binary regular open and binary regular closed in (X, Y) .

Theorem 3.10 Let (X, Y) be a binary topological space and $(A, B) \subseteq (X, Y)$ be binary open. Then, (A, B) is wbg^* -closed if and only if (A, B) is binary g^* -closed.

Proof. Let (A, B) be binary g^* -closed. By Theorem 3.2, it is wbg^* -closed. Conversely, let (A, B) be wbg^* -closed. Since (A, B) is binary open, by Theorem 3.8, (A, B) is binary closed. Hence (A, B) is binary g^* -closed.

Theorem 3.11 If a set (A, B) of (X, Y) is wbg^* -closed, then $b\text{-cl}(b\text{-int}(A, B)) - (A, B)$ contains no non-empty binary g -closed set.

Proof. Let (E, F) be an binary g -closed set such that $(E, F) \subseteq b\text{-cl}(b\text{-int}(A, B)) - (A, B)$. Since $(E, F)^c$ is binary g -open and $(A, B) \subseteq (E, F)^c$, from the definition of wbg^* -closedness it follows that $b\text{-cl}(b\text{-int}(A, B)) \subseteq (E, F)^c$. i.e., $(E, F) \subseteq (b\text{-cl}(b\text{-int}(A, B)))^c$. This implies that $(E, F) \subseteq (b\text{-cl}(b\text{-int}(A, B))) \cap (b\text{-cl}(b\text{-int}(A, B)))^c = (\phi, \phi)$.

Theorem 3.12 If a subset (A, B) of a binary topological space (X, Y) is binary nowhere dense, then it is wbg^* -closed.

Proof. Since $b\text{-int}(A, B) \subseteq b\text{-int}(b\text{-cl}(A, B))$ and (A, B) is binary nowhere dense, $b\text{-int}(A, B) = (\phi, \phi)$. Therefore $b\text{-cl}(b\text{-int}(A, B)) = (\phi, \phi)$ and hence (A, B) is wbg^* -closed in (X, Y) .

The converse of Theorem 3.12 need not be true as seen in the following example.

Example 3.13 Let $X = \{a, b\}$, $Y = \{1, 2\}$ and $\mathcal{M} = \{(\phi, \phi), (\phi, \{1\}), (\phi, \{2\}), (\phi, Y), (\{a\}, \{1\}), (\{a\}, Y), (\{b\}, \{1\}), (\{b\}, Y), (X, \{1\}), (X, Y)\}$. Then the set $(\{a\}, \{2\})$ is wbg^* -closed set but not binary nowhere dense in (X, Y) .

Remark 3.14 The following Examples show that wbg^* -closedness and binary semi-closedness are independent.

Example 3.15 In Example 3.3, then the set $(\phi, \{b\})$ is wbg^* -closed but not binary semi-closed and $(\{1\}, \{a\})$ is binary semi-closed but not wbg^* -closed in (X, Y) .

Remark 3.16 From the above discussions and known results, we obtain the following diagram, where $A \rightarrow B$ represents A implies B but not conversely.

Diagram

binary closed \Rightarrow **wbg^* -closed** \Rightarrow **wbg -closed** \Rightarrow **binary rwg -closed**

Definition 3.17 A subset (A, B) of a binary topological space (X, Y) is called wbg^* -open set if $(A, B)^c$ is wbg^* -closed in (X, Y) .

Proposition 3.18 Every binary g -open set is wbg^* -open.

Proof. It follows from definition of wbg^* -open.

Theorem 3.19 A subset (A, B) of a binary topological space (X, Y) is wbg^* -open if $(U, V) \subseteq b\text{-int}(b\text{-cl}(A, B))$ whenever $(U, V) \subseteq (A, B)$ and (U, V) is binary g -closed.

Proof. Let (A, B) be any wbg^* -open. Then $(A, B)^c$ is wbg^* -closed. Let (U, V) be an binary g -closed set contained in (A, B) . Then $(U, V)^c$ is an binary g -open set containing $(A, B)^c$. Since $(A, B)^c$ is wbg^* -closed, we have $b\text{-cl}(b\text{-int}((A, B)^c)) \subseteq (U, V)^c$. Therefore $(U, V) \subseteq b\text{-int}(b\text{-cl}(A, B))$.

Conversely, we suppose that $(U, V) \subseteq b\text{-int}(b\text{-cl}(A, B))$ whenever $(U, V) \subseteq (A, B)$ and (U, V) is binary g -closed. Then $(U, V)^c$ is an binary g -open set containing $(A, B)^c$ and $(U, V)^c \supseteq (b\text{-int}(b\text{-cl}(A, B)))^c$. It follows that $(U, V)^c \supseteq b\text{-cl}(b\text{-int}((A, B)^c))$. Hence $(A, B)^c$ is wbg^* -closed and so (A, B) is wbg^* -open.

Weakly binary g^* -continuous functions

Definition 4.1 Let (X, Y, \mathcal{M}) be a binary topological space and let (Z, τ) be a topological space. Let $f: (Z, \tau) \rightarrow X \times Y$ is called

Gnana Arockiam et al.,

1. binary g^* -continuous if $f^{-1}(U, V)$ is a g^* -open set in (Z, τ) for each binary open set (U, V) of (X, Y) .
2. weakly binary g^* -continuous (briefly, wbg^* -continuous) if $f^{-1}(U, V)$ is a wg^* -open set in (Z, τ) for each binary open set (U, V) of (X, Y) .
3. contra binary g^* -continuous if $f^{-1}(U, V)$ is g^* -closed set of (Z, τ) for every binary open set (U, V) of (X, Y) .

Theorem 4.2 Every binary g^* -continuous function is wbg^* -continuous.

Proof. It follows from Theorem 3.2.

Theorem 4.3 A function $f: (Z, \tau) \rightarrow (X, Y, \mathcal{M})$ is wbg^* -continuous if and only if $f^{-1}(U, V)$ is a wg^* -closed set in (Z, τ) for each binary closed set (U, V) of (X, Y) .

Proof. Let (U, V) be any binary closed set of (X, Y) . According to the assumption $f^{-1}((U, V)^c) = Z \setminus f^{-1}(U, V)$ is wg^* -open in (Z, τ) , so $f^{-1}(U, V)$ is wg^* -closed in (Z, τ) .

The converse can be proved in a similar manner.

Proposition 4.4 If $f: (Z, \tau) \rightarrow (X, Y, \mathcal{M})$ is perfectly continuous and wbg^* -continuous, then it is binary R-map.

Proof. Let (U, V) be any binary regular open subset of (X, Y) . According to the assumption, $f^{-1}(U, V)$ is both open and closed in (Z, τ) . Since $f^{-1}(U, V)$ is closed, it is wg^* -closed. We have $f^{-1}(U, V)$ is both open and wg^* -closed. Hence, by Corollary 3.9, it is regular open in (Z, τ) , so f is binary R-map.

Definition 4.5 A binary topological space (X, Y) is called binary g^* -compact if every cover of (X, Y) by binary g^* -open sets has a finite subcover.

Definition 4.6 A binary topological space (X, Y) is weakly binary g^* -compact (briefly, wbg^* -compact) if every wbg^* -open cover of (X, Y) has a finite subcover.

Remark 4.7 Every wbg^* -compact space is binary g^* -compact.

Theorem 4.8 Let $f: (Z, \tau) \rightarrow (X, Y, \mathcal{M})$ be surjective wbg^* -continuous function. If (Z, τ) is wg^* -compact, then (X, Y) is binary compact.

Proof. Let $\{(A, B)_i : i \in I\}$ be an binary open cover of (X, Y) . Then $\{f^{-1}((A, B)_i) : i \in I\}$ is a wg^* -open cover in (Z, τ) . Since (Z, τ) is wg^* -compact, it has a finite subcover, say $\{f^{-1}((A, B)_1), f^{-1}((A, B)_2), \dots, f^{-1}((A, B)_n)\}$. Since f is surjective $\{(A, B)_1, (A, B)_2, \dots, (A, B)_n\}$ is a finite subcover of (X, Y) and hence (X, Y) is binary compact.

Definition 4.9 A binary topological space (X, Y) is called

1. binary g^* -connected if (X, Y) cannot be written as the disjoint union of two non-empty binary g^* -open sets.
2. weakly binary g^* -connected (briefly, wbg^* -connected) if (X, Y) cannot be written as the disjoint union of two non-empty wbg^* -open sets.

Theorem 4.10 If a binary topological space (X, Y) is wbg^* -connected, then (X, Y) is almost binary connected (resp. binary g^* -connected).

Proof. It follows from the fact that each binary regular open set (resp. binary g^* -open set) is wbg^* -open.

Theorem 4.11 For a binary topological space (X, Y) , the following statements are equivalent:

1. (X, Y) is wbg^* -connected.
2. The empty set (ϕ, ϕ) and (X, Y) are only subsets which are both wbg^* -open and wbg^* -closed.
3. Each wbg^* -continuous function from (X, Y) into a discrete space (X, Y) which has at least two points is a constant function.

Proof. (1) \Rightarrow (2). Let $(A, B) \subseteq (X, Y)$ be any proper subset, which is both wbg^* -open and wbg^* -closed. Its complement $(X, Y) \setminus (A, B)$ is also wbg^* -open and wbg^* -closed. Then $(X, Y) = (A, B) \cup ((X, Y) \setminus (A, B))$ is a disjoint union of two non-empty wbg^* -open sets which is a contradiction with the fact that (X, Y) is wbg^* -connected. Hence, $(A, B) = (\phi, \phi)$ or (X, Y) .

(2) \Rightarrow (1). Let $(X, Y) = (A, B) \cup (C, D)$ where $(A, B) \cap (C, D) = (\phi, \phi)$, $(A, B) \neq (\phi, \phi)$, $(C, D) \neq (\phi, \phi)$ and $(A, B), (C, D)$ are wbg^* -open. Since $(A, B) = (X, Y) \setminus (C, D)$, (A, B) is wbg^* -closed. According to the assumption $(A, B) = (\phi, \phi)$, which is a contradiction.

(2) \Rightarrow (3). Let $f: (Z, \tau) \rightarrow (X, Y, \mathcal{M})$ be a wbg^* -continuous function where (X, Y) is a discrete space with at least two points. Then $f^{-1}(\{x, y\})$ is wbg^* -closed and wbg^* -open for each $(x, y) \in (X, Y)$ and $Z = \cup \{f^{-1}(\{x, y\}) : (x, y) \in (X, Y)\}$. According to the assumption, $f^{-1}(\{x, y\}) = \phi$ or $f^{-1}(\{x, y\}) = Z$. If $f^{-1}(\{x, y\}) = \phi$ for all $(x, y) \in (X, Y)$, f will not be a function. Also there is no exist more than one $(x, y) \in (X, Y)$ such that $f^{-1}(\{x, y\}) = Z$. Hence, there exists only one

Gnana Arockiam et al.,

$(x, y) \in (X, Y)$ such that $f^{-1}(\{x, y\}) = Z$ and $f^{-1}(\{(x, y)_1\}) = \phi$ where $(x, y) \neq (x, y)_1 \in (X, Y)$. This shows that f is a constant function.

(3) \Rightarrow (2). Let $(A, B) \neq (\phi, \phi)$ be both wbg^* -open and wbg^* -closed in (X, Y) . Let $f: (Z, \tau) \rightarrow (X, Y, \mathcal{M})$ be a wbg^* -continuous function defined by $f(A, B) = \{a\}$ and $f((X, Y) \setminus (A, B)) = \{b\}$ where $a \neq b$. Since f is constant function we get $(A, B) = (X, Y)$.

Theorem 4.12 Let $f: (Z, \tau) \rightarrow (X, Y, \mathcal{M})$ be a wbg^* -continuous surjective function. If (Z, τ) is wg^* -connected, then (X, Y) is binary connected.

Proof. We suppose that (X, Y) is not binary connected. Then $(X, Y) = (A, B) \cup (C, D)$ where $(A, B) \cap (C, D) = (\phi, \phi)$, $(A, B) \neq (\phi, \phi)$, $(C, D) \neq (\phi, \phi)$ and $(A, B), (C, D)$ are binary open sets in (X, Y) . Since f is wbg^* -continuous surjective function, $Z = f^{-1}(A, B) \cup f^{-1}(C, D)$ are disjoint union of two non-empty wbg^* -open subsets. This is contradiction with the fact that (Z, τ) is wg^* -connected.

ABSTRACT

Oral carcinoma is one of the predominant cancers worldwide and affects the life quality of the patients in a severe manner in terms of disfigurement and survival outcome. The annual incidence of oral carcinoma sharply increasing throughout world and higher incidences are reported every year from developing countries, especially from India, Pakistan and Sri Lanka. The differences in the annual incidence rate of oral carcinoma are attributed to the prevalence and consumption of tobacco and alcohol, the strongest risk factors of oral carcinoma. The 5-year survival outcome of oral carcinoma has not changed drastically for the past two or three decades despite multiple advancements in the treatment strategy of oral carcinoma. This article highlights the epidemiology, risk factors, diagnosis, biomarkers and prevention and treatment strategy of oral carcinoma in brief.

Keywords: Oral cancer, Epidemiology, risk factors, biomarkers.

INTRODUCTION

Cancer of the oral cavity has been considered as one of the major life threatening and lethal cancers worldwide. This deforming cancer leads to orofacial destruction, rapid invasion to adjacent local tissues and metastasis to cervical lymphnodes [1,2]. The majority of oral cancers, around 90%, are histopathologically characterised as squamous cell carcinoma. Oral cancer arises due to multiple genetic alterations in the oral mucosa caused by the carcinogens, which

59005

**Buddhan et al.,**

include activation of oncogenes or suppression of tumor suppressor genes [3,4]. Tobacco, alcohol and betel quid abuse are the most prominent and potent aetiological (risk) factors of oral carcinogenesis. Though there is a vast advancement in the diagnosis and management of oral cancer, the 5 year survival outcome of oral cancer patients in several parts of the world is still at 50% [5]. The reason for the poor survival outcome and life quality of oral cancer patients is mainly because of late diagnosis and unawareness on the risk factors of the oral cancer [6,7].

EPIDEMIOLOGY

Worldwide epidemiological studies reported that around 4,00,000 peoples are newly diagnosed with oral cavity cancers and this figure may further increase in a rapid manner in the forthcoming years due to its higher prevalence in the younger generations [8,9]. Worldwide, the cancer of the oral cavity still represents and remains as one of the challenging malignant cancers in terms of morbidity and mortality rate [10]. World Health Organization (WHO) reported that the mortality due to oral cancer is around 2 per 1,00,000 in Middle-East countries [11]. Worldwide certain countries have been recognized as a high incidence areas, which include India, Taiwan, Pakistan, Sri Lanka, Hungary, Brazil, Uruguay, Botswana and Melanesia (Figure 1). The difference in the prevalence and incidence of oral cancer across the world could be attributed to variations in the consumption of oral cancer related risk factors [12,13].

It has been investigated that one American patient dies every hour due to oral cavity cancers. Around 40,000 newly diagnosed oral cancer cases and 8,000 cancer deaths were reported in the USA by the year 2015 [14]. Epidemiological studies from Brazil reported that each year around 11,140 males and 4,300 females are affected by cancer of the oral cavity [15]. The high incidence of oral carcinoma has been reported in Maldives, Bhutan, Iran and Nepal. Report from Nigeria indicated that around 1,146 and new oral cancer cases and 764 deaths due to oral cancer were occurred in the year 2012 [16,17]. Worldwide, Pakistan ranks at the 10th position in the oral cancer incidence and prevalence. Pakistan reported high incidence of oral cancer every year with a male preponderance [18]. Cancer of the oral cavity in China and Spain constitutes about 1.36% and 3% of all malignancies respectively [19]. The higher annual incidence of oral cancer has been reported from India, Pakistan, Sri Lanka, Taiwan, Hungary, France, Brazil and Uruguay [20,21]. It has been estimated that the annual incidence of oral cavity cancers in India is found to be 12.6 per 1,00,000 populations [22]. Oral cancer mortality is found to be very high in developing countries, especially in the Indian subcontinent. In India, the incidence and prevalence of the cancer of the oral cavity are steeply increasing and accounts for 40-50% of all malignant cancers [23].

AGE AND SEX DISTRIBUTION

Increasing in age has been postulated as a possible risk factor of oral carcinoma. As age increases, the person becomes immunosuppressive and more susceptible to a wide range of carcinogenic stimuli [24]. Although oral cancer incidence is commonly seen in the 4th to 5th decade of life, the sixth and 7th decade has been regarded as a crucial period in the oral cancer incidence worldwide [25]. Recent epidemiological studies on oral cancer pointed out the higher incidence of oral squamous cell carcinoma in young and middle aged people [26]. Worldwide, male - female ratio for oral cancer incidence ranges from 3:1 to 4:1. Worldwide male populations are found to be at high risk of oral cancer development than female populations. This is probably due to high consumption of tobacco products and alcoholic beverages. However, the male-female ratio is found to be 1:1 in higher incidence regions, including India, Pakistan and Sri Lanka [27,28].

ORAL PRECANCEROUS LESIONS

Cancer of the oral cavity is usually preceded by oral premalignant lesions such as leukoplakia, erythroplakia and oral submucous fibrosis. While erythroplakia is an asymptomatic red lesion (patch), leukoplakia is a white lesion (patch). Leukoplakia is characterized by thick, raised white patches in the oral mucosa of the mouth [29]. Erythroplakia is characterized by epithelial atrophy, burning or inflammation and keratin deficiency. Erythroplakia is a more dangerous precancerous lesion than that of leukoplakia. The changes of turning erythroplakia into oral malignancy are higher than that of turning leukoplakia into oral malignancy [30,31]. Oral submucous fibrosis is a precancerous lesion arises due to long term betel quid chewing habituation. It is characterized by limited opening of

**Buddhan et al.,**

the mouth due to continuous burning sensation and constant irritation in the oral cavity. Oral submucous fibrosis has a higher risk of transforming into malignancy than that of erythroplakia and leukoplakia [32-34].

RISK FACTORS OF ORAL CANCER

Tobacco

The aetiology of oral cancer risk has been associated with several factors like environmental, genetic and epigenetic factors [35]. Tobacco use has been implicated in the pathogenesis of several cancers and around a million cancer related deaths annually are due to consumption of tobacco [36,37]. Worldwide, people consume tobacco in several forms, predominantly as tobacco smoking or smokeless tobacco. Tobacco smoking in the form of cigar or cigarette smoking and bidi smoking has been reported to increase the risk of oral carcinogenesis. Tobacco smokers are at several fold higher risk to get oral cancer than the non-smokers [38]. All forms of tobacco habituation have been recognized as the strongest risk factors of oral cancer [39]. Tobacco smokers have 6.4 to 8.4% fold higher risk to develop oral carcinoma than the subjects who are not habituated to such habits. Passive smoking or second hand smoking also referred to as involuntary smoking has been focused as a risk factor for oral cancer [40]. Smokeless tobacco has been found to be one of the major causative or aetiological factors of oral carcinogenesis. Smokeless tobacco, also known as tobacco chewing, multiplies the risk of chances of getting oral cancer several folds in subjects habituated to tobacco smoking [41,42]. Tobacco is chewed as such or in combination with other ingredients in several parts of the world, especially in South Asian countries.

Tobacco chewing enhances the risk of oral cancer around six fold in tobacco chewers [43]. The carcinogens, nitrosamines, benzo(a)pyrene and aromatic amines promote or induce gingivitis, periodontitis and oral cancer by weakening the immunity in the oral cancer patients [44]. Tobacco carcinogens, especially benz(a)pyrene and tobacco specific nitrosamines are reported to cause the genetic polymorphism of detoxification enzymes (cytoplasm p450, b5, GST, GR, etc) genes, which could in turn play a firm role in the genetic predisposition in head and neck cancer [45].

Alcohol

Alcohol has been considered as one of the major risk factors of oral carcinoma. Alcohol drinking, in any form of beverages, enhances the risk of oral cancer several fold, especially those who are habituated to tobacco use as well. Alcohol has been considered as a cocarcinogen as it has a synergistic effect with tobacco in enhancing the risk of oral carcinogenesis [46]. Alcohol plays multiple role in the causation of oral cancer and or oral premalignant lesion. Alcohol induced leukoplakia has been reported by several authors across the world. Alcohol facilitates the entry of the tobacco carcinogen into the oral mucosa by causing mucosal epithelial atrophy [47]. Alcohol induced nutritional deficiency and immunosuppression has been implicated as one of the major mechanisms in the pathogenesis of cancer. Acetaldehyde, a major metabolic by-product of an alcohol metabolism, has been reported to induce several alterations in the DNA structure under *in vitro* conditions and disrupt the synthesis and repair of DNA as well [48,49]. The carcinogenic substances present in the alcoholic beverages include arsenic, urethane, mycotoxins and N-nitroso compounds [50].

Tobacco and Alcohol

Tobacco and alcohol occupy the predominant position in the causation of oral cancer. They enhance the cancer risk when synergistically act with each other. Tobacco and alcohol together enhances the chances of getting oral cancer to more than 50% as compared to non-smoking and non-alcohol consumption [51,52]. A report from USA pointed out that around 74% of oral cancer patients are habituated to both tobacco and alcoholic products. Tobacco and alcohol play a synergistic role together to cause oral cancer in more than 90% of the newly diagnosed oral cancer patients [53-54].

Betel Quid

While tobacco and alcohol abuse has been documented as a strongest risk factor for oral cancer, betel quid and areca nut chewing could also play a major role in developing countries in addition to smoking tobacco and smokeless tobacco. All these risk factors together account for 43% of cancer related deaths worldwide [55]. Around 19% of the

59007

**Buddhan et al.,**

worldwide tobacco/ betel quid users are living in India. It has been estimated that around 10 million people may die by the year 2020 due to tobacco/ betel quid related cancers [56]. In India, betel quid chewing has been accepted as a social custom practice. Though betel quid is composed of several ingredients, the major constituents include tobacco flakes, betel leaf, betel nut and slaked lime [57]. Betel quid, in addition to these major ingredients, also contains cloves and cardamom (India) and turmeric (Thailand) [58]. Betel quid chewing is practiced worldwide in the form of mishri and zarda (burned and boiled tobacco, maiva tobacco, lime and areca nut), shamma (tobacco, lime and ash) and toombak (tobacco and sodium bicarbonate) [59]. Betel quid chewing has been reported as one of the strongest risk factors of oral carcinoma and profound studies explored its cytotoxic and genotoxic effects as well [60]. Betel quid chewing enhances the risk of buccal mucosa cancer. It is strongly suggested that frequent consumption of areca nut/betel quid enhances several fold higher risk for oral cancer development [61].

Marijuana

Marijuana, commonly known as ghanja or bhange, has been used in the form of smoking and reported as a causative factor of oral cancer, as it contains potent carcinogenic agents like benzo(a)pyrene [62].

Diet and Nutrition

Diet and nutrition impose a significant risk of getting oral cancer and nutritional deficiency accounts for 20-30% of all cancer deaths [63]. Diet and nutrition play a dual role in the aetiopathogenesis of oral carcinogenesis. While some diets are reported to have protective role, the other foods are reported to stimulate the effect on oral cancer. The diet such as fresh fruits and leafy vegetables has been shown to reduce the risk of oral cancer [64]. However, the food such as processed meat, red meat and salted meat enhance the risk of oral carcinoma [65]. The intake of sea foods such as fish and shrimp has a protective role. The micronutrients present in the diet especially, β -carotene, vitamin A, vitamin E and vitamin C reduced the risk of oral carcinogenesis [66,67]. Profound scientific studies documented vitamin A, C and E deficiency in the plasma or serum of oral cancer patients. Mate consumption, a tea like beverages, has been reported as a causative factor in the formation of oral cancer in the United States and its mechanism of stimulating oral cancer is due to its constituents like tannin and n-nitroso compounds [67,68].

UV radiation

Overexposure to sunlight, especially between 12-3 p.m., increases the chances of getting lip and skin cancer. The subjects who are having an outdoor occupation are at higher risk for oral cancer, especially lip cancer development. Fair or white skinned subjects are having higher risk to develop lip cancer than the black race [69,70].

Infectious agents

Infectious agents such as viruses, yeast and bacteria are also play a causative role in the oral cancer development [71]. Though various types of viruses such as EVB, HSV and HPV have been considered as a possible risk factor of oral cancer, HPV16 has been identified to play a pivotal role in the development of oral cancer [72,73].

Other risk factors**Poor oral hygiene**

Poor oral hygiene could be responsible for oral cancer development in the absence of any other known risk factors [74]. It has been reported that chronic inflammation due to ill-fitted (denature) teeth increases the risk of oral cancer formation. Oral carcinogenesis is highly prevalent in low socioeconomic communities and is probably due to unawareness on the adverse effects of oral cancer risk factors [75]. It has been pointed out that AIDS patients are more susceptible to oral cancer risk as well. Repeated or frequent use of mouthwash and its alcoholic content could enhance the risk of oral tumor formation [76]. Genetic predisposition, especially abnormalities in the genes coding for detoxification enzymes, could also play a massive role in the oral cancer pathogenesis [77]. An interesting study from Iran reported that the subjects belong to blood group B are at higher risk of oral cancer development [78]. The major risk factors of oral cancer are given in figure 2.

**Buddhan et al.,****Genetic factors**

The genetic alterations that are reported in oral carcinogenesis include alterations in the genes that are involved in the apoptotic, cell proliferative, inflammatory and angiogenic pathways [79,80]. The other genetic abnormalities reported in oral carcinoma include chromosomal segregation defects, cell-cycle irregularity, defect in DNA damage repair mechanism, etc. Reports have also explored epigenetic variations such as DNA methylation pattern, modification of histones and RNA silencing in oral carcinogenesis [81-84]. Both genetic and epigenetic alterations play a pivotal role in oral carcinogenesis. There are several positive and negative associations for the linkage of oral cancer development with the family history [85]. Oral cancer has multifactorial etiology and may arise due to inherited and/or acquired genetic alterations in the DNA sequence of oral keratinocytes. Upregulation of oncogenes or down regulation of tumor suppressor genes are the most common molecular alterations that disrupt the cell cycle mechanism and abnormal cell proliferation [86]. Alterations or abnormalities in the expression of a spectrum of molecular markers have been reported in oral carcinogenesis.

DIAGNOSIS

Although the oral cavity is easily accessible for physical examination, delay in diagnosis or treatment increase the incidence of oral cancer mortality. Reports have pointed out that around 50-60% of oral cancers attained stage III or IV at the time of diagnosis [87]. Early detection of oral carcinogenesis could thus be a research priority area in the prevention of oral cancer [88]. Advanced diagnostic approaches with new techniques and instruments are available nowadays to diagnose oral cancer [89]. A complete physical examination of the oral cavity is the first and foremost step in the diagnosis of oral cancer [90]. The physical examination of the oral cavity is done with the help of front light, mouth mirror and dental specialist. The physical examination of the oral cavity may reveal suspicious pathological changes such as changes in texture and colour of the tongue, buccal mucosa, lips, hard and soft palates etc [91].

Toluidine blue staining is an easy and simple approach to diagnose the pathological lesions in the oral cavity. This test is commonly employed as an additional test with other visual examinations [92]. The principle behind this diagnosis is that toluidine blue intensively stains the DNA of the rapidly proliferating cells. Toluidine blue test is utilized to screen the precancerous lesions in the oral cavity of high risk populations [93]. Oral brush biopsy is another approach to diagnose the abnormal lesions of the oral cavity. In this approach, the dentist rotates the brush on the suspected lesions and fixed and analyzed using computer based imaging system [94]. The abnormal lesions of the oral cavity can be diagnosed with light based detection systems such as tissue fluorescence imaging, chemiluminescence and tissue fluorescence and spectroscopy. These detection systems differentiate the normal and tumor cells based on their light absorbing and refracting properties [95,96]. The visibility of pathological lesions can be significantly improved using Microlux DL (LED and fiber optic light) and vizilite plus (chemiluminescent detection) [97]. Histopathological analysis of the biopsy is the gold standard technique to confirm the presence of malignant tumor cells in the oral cavity. The biopsy taken from the suspicious location is sent to the oral pathologist to analyze the morphological characteristics of the suspected cells/tissues under the microscope after the routine procedure [98]. The diagnostic modalities, signs and symptoms of oral cancer are given in figures 3 and 4.

BIOMARKERS OF ORAL CANCER

A biomarker is a biological molecule present in the blood or tissues. The status of biomarker could help to assess or to differentiate the healthy or pathological diseases, including cancer [99]. The status of biomarkers could provide valuable information about the prognosis and recurrence of the disease as well (Figures 5 and 6). Genetic and epigenetic factors play a pivotal aetiology in the pathogenesis of various kinds of diseases [100]. The major molecular alterations in the tumor cell could lead to diverse pathological consequences such as apoptotic evasion, irresponsive to growth inhibiting signals, cell cycle dysregulation and abnormal angiogenesis [101].

**Buddhan et al.,****TUMOR STAGING**

The staging of cancer could provide valuable information about the nature and size of tumor, lymphnode involvement and spread of tumor to other parts of the body [102]. Staging of tumors could also help to plan the treatment strategy for the oral cancer patients. TNM staging of oral cancer is presented in figure 7.

Treatment

The treatment of oral cancer is not an easy task and needs a multidisciplinary team of Physician, Dentist, Oncologist, Surgeon, Radiologist and Speech therapy specialist. The oral cancer patients are treated by three major modalities, surgery, radiation therapy and chemotherapy[103]. Depending on the nature of the tumors, the patients are treated by either a single therapy or with a combined therapy (Figure 8). Immunotherapy and gene therapy are the recent approaches in the treatment of oral cancer [104].

Chemoprevention of oral cancer

Chemoprevention, which is currently accepted globally as an appealing technique in the field of experimental oncology, is the inhibition, prevention, or reversal of carcinogenesis utilizing natural products or synthetic drugs [105]. The chemopreventive efficacies of several medicinal plants, bioactive components, and synthetic drugs were thoroughly investigated in experimental research [106, 107]. Oral, skin, and mammary malignancies have all been induced in experimental animals using DMBA, which has been identified as an organ and site specific carcinogenic agent [108,109]. Through a variety of mechanisms, including the induction of oxidative stress, stimulation of the chronic inflammatory response, and DNA mutations, DMBA causes oral carcinogenesis [110]. In order to evaluate the anticancer (chemopreventive) effectiveness of natural products, DMBA-induced oral carcinoma is frequently used in experimental animals. This is because it shares biochemical and molecular similarities with human mouth cancer. Several medicinal plants' anticancer properties as well as their bioactive components have been the subject of prior experimental studies conducted in our laboratory using 7,12-dimethylbenz(a)anthracene (DMBA)-induced oral carcinogenesis [111–113]. Table 1 lists the medicinal plants and bioactive substances employed in the study on oral cancer chemoprevention.

CONCLUSION

The present article presented the epidemiology, risk factors, age and sex distribution, diagnosis, biomarkers and treatment strategy of oral carcinogenesis. As the incidence of oral cancer is mainly attributed to the risk factors such as tobacco and alcohol, avoiding the habits of tobacco and alcohol abuse can drastically reduce the worldwide incidence of oral cancer. Early diagnosis of oral cancer could also improve not only the curative chances but also the survival outcome and life quality of the patients. Oral carcinoma is therefore regarded as an avoidable and preventable cancer.

ABSTRACT

A frailty model is a random effect model for time-dependent variables, describing the influence of unobserved covariates in a proportional hazard model. Each individual's hazard function may also depend on risk factors or explanatory variables. Hence, considering the random effect in the models is critical to survival analysis for robust estimation. The Xgamma distribution is a special finite of mixture exponential and gamma distribution and allowance for the different shape parameters. Therefore, the objective of the study is to fit the frailty models with Xgamma distribution and to compare the results with other existing popular distributions such as Exponential, Weibull, Log-logistic, and Lognormal to test the effectiveness. Two real-life data sets were used to fit the Xgamma baseline distribution with frailty models. The study result revealed that Xgamma with Positive Stable (PS) frailty model is a good choice for the Veterans' Administration Lung Cancer study data set and the best fit for the Culling of dairy heifer cows' data set. Further, Xgamma with frailty models points out the lowest Akaike's Information criteria (AIC) and Bayesian Information Criteria (BIC) values than other baseline distributions. So, we suggest that Xgamma baseline distribution with frailty is a potential alternative approach for cluster survival data analysis.

Keywords: Parametric frailty models, Xgamma distribution, Hazard function, Survival analysis, Clustered data analysis.

INTRODUCTION

The statistical analysis of lifetime information (or greater precisely, time-to-occasion, event-history, or length data) plays an important role in medicine, epidemiology, biology, demography, and other fields [1]. However, the term is likewise used with other events, like the incidence of a disease or the time of disease progression [1-3]. Frailty is an unobserved individual’s random effect that acts multiplicatively on the hazard, and it was introduced by Vaupel et al. (1979) in the study of mortality [4]. The widely used frailty distributions are Gamma (Ga), Lognormal (LG), Positive Stable (PS), Inverse Gaussian (IG), and Positive power variance function (PVF) family due to mathematical convenience [5]. Similarly, the most common baseline distributions like Exponential, Weibull, Log-normal, and Lindley distributions are used [6]. To arrive at a robust estimation, we ought to choose the excellent baseline distribution and frailty distribution depending on the data structure [5]. In recent years, Lindley and other baseline distributions have drawn the attention of researchers and partitions in modeling time-to-event data sets [7-8]. To arrive at a robust estimation, we ought to choose the excellent baseline and frailty distribution relying on the facts structure. The Xgamma distribution is a mixture of exponential and gamma distribution with mixing proportion and gets importance for the different shapes of the hazard function was introduced by Sen et.al. (2016) [9]. The study aims to fit the frailty models with the Xgamma baseline distribution and compared the results with other popular baseline distributions for the same frailty models for identifying the best-fit model.

This paper is organized as follows. Section 2 deals with the fundamental properties of Xgamma distribution, Section three discusses frailty models and Section 4 suggests the applications of Xgamma distribution with frailty models for real-life data. Subsequently, concluding comments are given in Section 5.

Xgamma distribution

Let us consider that the non-negative continuous random variable X is called an Xgamma variant with scale parameter θ of a particular population. The probability density function (p.d.f), Cumulative distribution function (c.d.f) is given by equation (1) and (2), respectively:

(p.d.f)

$$f(x) = \frac{\theta^2}{(1 + \theta)} \left(1 + \frac{\theta}{2}x^2\right) e^{-\theta x}, \quad x > 0, \theta > 0 \tag{1}$$

(c.d.f)

$$F(x) = 1 - \frac{(1 + \theta + \theta x + \frac{\theta^2}{2}x^2)}{(1 + \theta)} e^{-\theta x}, \quad x > 0, \theta > 0 \tag{2}$$

The Survival/reliability Properties of Xgamma distribution are defined by equation (3)

$$S(x) = \frac{(1 + \theta + \theta x + \frac{\theta^2}{2}x^2)}{(1 + \theta)} e^{-\theta x}, \quad \text{for given } \theta \tag{3}$$

The failure (hazard) rate function of X is denoted as $h(x)$ and given in equation (4)

$$h(x) = \lim_{\Delta x \rightarrow 0} \frac{P(X < x + \frac{\Delta x}{x} > x)}{\Delta x} = \frac{f(x)}{S(x)}$$

$$h(x) = \frac{\theta^2 \left(1 + \frac{\theta x^2}{2}\right)}{(1 + \theta + \theta x + \frac{\theta^2}{2}x^2)}, \quad t > 0 \tag{4}$$

Where $h(0) = \frac{\theta^2}{(1+\theta)} = f(0)$ and $h(x)$ is an increasing function in x and θ with $\frac{\theta^2}{(1 + \theta)} < h(x) < \theta$

The hazard function can be represented as the cumulative hazard function. Therefore, the cumulative hazard function of Xgamma distribution is given by equation (5)

$$H(x) = \int_0^x h(x)dx = -\log(S(t)); \text{ where } h(x) = -\left(\frac{d \log s(x)}{dx}\right)$$

$$H(x) = -\log S(x) = -\log \left[\frac{(1+\theta+\theta t + \frac{\theta^2 x^2}{2})}{(1+\theta)} e^{-\theta x} \right]$$

Solving this equation, we get

$$H(x) = \theta x + \log(1 + \theta) - \left(1 + \theta + \theta t + \left(\frac{\theta^2 x^2}{2} \right) \right)$$

To simplify further we get

$$H(x) = \theta x + \log \left(\frac{(1 + \theta)}{\left(1 + \theta + \theta x + \left(\frac{\theta^2 x^2}{2} \right) \right)} \right) \tag{5}$$

Frailty Models

Frailty models are Cox proportional hazard extensions [10]. A frailty model is a time-to-event data random effect model in which the random effect multiplies the baseline hazard (Duchateau & Janssen; Wienke, 2010) [11,13]. The models are named after the fact that they can be used to account for unobserved heterogeneity that occurs as a result of a few observations being more "frailty" and thus more prone to failure than other observations in a data set. The following equation shows that the hazard is dependent on both the observed covariates and the unobserved frailty term.

$$h_{ij}(x/w_i) = h_0(x) w_i \exp(z_{ij}^T \beta) \tag{6}$$

Here, $i \in I = \{1, 2, \dots, M\}$ and $j \in J_i = \{1, 2, \dots, n_i\}$, where $h_0(x)$ - is the common baseline hazard function for all subjects in the cluster group 'i' and also assumed to be an independently and identically distributed (IID) random variable with density function $f(w, \theta)$ and β is the vector of regression coefficients. x_{ij} is the covariates vector for the subject j in group i. The factor $\exp(z_{ij}^T \beta)$ gives the subject-specific contribution to the hazard.

Frailty with Baseline distributions

The baseline hazard is defined as a parametric function, and its parameters, say 'θ', are estimated along with the regression coefficients and frailty distribution. Table 1 summarizes the hazard function, cumulative hazard function, and survival function for each baseline distribution, including Xgamma, Exponential, Weibull, and Log-logistic. Hereinafter, parametric frailty models shall focus on the Gamma (Ga), Inverse Gaussian (IG), Lognormal (LN), and Positive stable (PS) to fit and compare with Xgamma and other baseline distributions. The above four frailty distributions and their properties are well documented in previous studies [12-16]. Therefore, the Probability density function (p.d.f), Laplace transformation (L(s)), and estimation of frailty for each frailty distribution as shown in (Supplementary Table 1)

Estimation of Marginal distribution and Laplace transformation

We use a maximum likelihood of the marginal likelihood function to obtain the parameters of interest. This is accomplished in the context of multivariate clustered survival data, where we have observed information Z_{ij} and event times $x_{ij} = \min(\tau_{ij}, C_{ij})$, sorting indicators $(\alpha_{1j}, \dots, \alpha_{knk})$ and unobserved clustered specific random variable $W = (W_1, \dots, W_k)$. From (6), The conditional likelihood of data with quadruple $(x_j, \alpha_{ij}, Z_{ij}, W_{ij}) (j = 1, \dots, n_i, i = 1, \dots, 4)$ is similar to PHM. i.e

$$L(\pi, \beta / W) = \prod_{j=1}^{n_i} \left[(W_{ij} h_o(x_{ij}) \exp(z'_{ij} \beta))^{\alpha_{ij}} \exp[-w_{ij} h_o(x_{ij}) \exp(z_{ij} \beta)] \right] \tag{7}$$

The conditionally on $W = (W_1, \dots, W_k)$. Where $h_o(x_{ij})$ is the baseline hazard function with parameter $\pi = (\mu, \omega)$ Lognormal, $\pi = (\mu, \alpha)$ inverse Weibull and $\pi = (\mu, \alpha, \omega)$ (log-Skewed normal). Suppose the frailty $W \sim \Gamma\left(\frac{1}{\theta}, \frac{1}{\theta}\right)$ and following the above likelihood, the marginal likelihood large of i-th cluster is

Ashok Kumar and Muthukumar

$$l_{marg} = \int_0^\infty \prod_{j=1}^{n_i} (W_{ij} h_o(x_{ij}) \exp(z'_{ij}\beta))^{\alpha_{ij}} \exp[-w_{ij} h_o(X_{ij}) \exp(Z_{ij}\beta)] f(w) dw \quad (8)$$

here $f(w)$ is as indicated function for gamma variate, then

$$l_{marg} = \frac{\prod_{j=1}^{n_i} (W_{ij} h_o(x_{ij}) \exp(z'_{ij}\beta))^{\alpha_{ij}}}{\Gamma\left(\frac{1}{\theta}\right) \theta^{\frac{1}{\theta}}} \int_0^\infty w_{ij}^{\frac{1}{\theta} + d_i - 1} \exp[-w_{ij}v - w_{ij}/\theta] dw$$

Where $v = \sum_{j=1}^{n_i} h_o(x_{ij}) \exp(z'_{ij}\beta)$ and $d_i = \sum_{j=1}^{n_i} \alpha_{ij}$ without loss of generating, we let $W_{ij} = WZ_{ij} = Z$

$$l_{marg} = \frac{\prod_{j=1}^{n_i} (W_{ij} h_o(x_{ij}) \exp(z'_{ij}\beta))^{\alpha_{ij}}}{\Gamma\left(\frac{1}{\theta}\right) \theta^{\frac{1}{\theta}}} \int_0^\infty w_{ij}^{\frac{1}{\theta} + d_i - 1} \exp\left[-\left[\frac{1}{\theta} + v\right] dw\right] dw \quad (9)$$

$$l_{marg} = \frac{\prod_{j=1}^{n_i} (W_{ij} h_o(x_{ij}) \exp(z'_{ij}\beta))^{\alpha_{ij}}}{\Gamma\left(\frac{1}{\theta}\right) \theta^{\frac{1}{\theta}} \left(\frac{1}{\theta} + v\right)^{\frac{1}{\theta} + d_i}} \Gamma\left(\frac{1}{\theta} + d_i\right)$$

$$l_{marg} = \frac{\prod_{j=1}^{n_i} (W_{ij} h_o(x_{ij}) \exp(z'_{ij}\beta))^{\alpha_{ij}}}{\Gamma\left(\frac{1}{\theta}\right) \theta^{-d_i} (1 + \theta v)^{\frac{1}{\theta} + d_i}} \Gamma\left(\frac{1}{\theta} + d_i\right)$$

Taking the logarithm and sum over i-th strata, we obtain marginal log likelihood i.e.

$$\log l_{marg} = \sum_{i=1}^k \left\{ \sum_{j=1}^{n_i} \alpha_{ij} (\log(h_o(y_{ij})) + z'_{ij}\beta) + \log \Gamma\left(\frac{1}{\theta} + d_i\right) - \log \Gamma\left(\frac{1}{\theta}\right) + d_i \log \theta - \left(\frac{1}{\theta} + d_i\right) \log(1 + \theta v) \right\} \quad (10)$$

$$\log l_{marg} = \sum_{i=1}^k \left(d_i \log \theta + \log \Gamma\left(\frac{1}{\theta} + d_i\right) - \log \Gamma\left(\frac{1}{\theta}\right) - \left(\frac{1}{\theta} + d_i\right) \log(1 + \theta v) + \sum_{j=1}^{n_i} \alpha_{ij} (\log(h_o(y_{ij})) + z'_{ij}\beta) \right) \quad (11)$$

The Maximum Likelihood estimates for π, θ and β can be found by maximizing (11) using Newton Raphson's approach [3]. Similar estimation techniques adopted to use other frailty models include the Lognormal, Inverse Gaussian, and positive stable distributions.

Where $d_i = \sum_{j=1}^{n_i} \alpha_{ij}$ the number of events in the i-th cluster, and $L^{(q)}(\cdot)$ the q-th derivative of the Laplace transformation [17] of the frailty distribution is defined as

$$L(s) = E \left[\exp(-ws) \right] = \int_0^\infty \exp(w_i s) f(w_i) dw_i, \quad s \geq 0 \quad (12)$$

Estimation and Prediction

Frailty was predicted using the expectation-maximization (EM) algorithm [18-19]. The regression parameter is estimated for each of the fixed sets of various parameter values. Estimates δ, β and ξ are obtained by optimizing the log-likelihood; this can be easily done if one can compute higher order derivatives $L^{(q)}(\cdot)$ of the Laplace transformation up to $q = \max\{d1, d2 \dots dM\}$. Hence q-th derivate is given by equation (13). The specific steps are as follows:

$$L^q(s) = (-1)^q E(w^q \exp(-ws)) \quad (13)$$

Step 1: Fit the proportional hazard model with the relevant covariates. Calculate the baseline cumulative hazard function for each subject.

Step 2: Consider a list of possible values for the variance parameters.

Step 3: The estimation step (E) involves calculating an estimate of each subject's frailty. Create a list of possible values for the variance parameters.

Step 4: Fitting the proportional hazards models with the same covariance is the Maximization step (M). The E- and M-steps are repeated until convergence occurs. We should note that the cumulative hazard containing the frailty computed in the previous M-step is used in the second and subsequent applications of the E-step.

Ashok Kumar and Muthukumar

Step 5: Evaluate the profile log-likelihood in (14) using the specified parameter values and the fit actual outcomes in the M-step at convergence. The frailty term w_i can be predicted by $\widehat{w}_i = E(W/z_i, T_i; \delta, \hat{\beta}, \hat{\xi})$, with z_i and T_i the data and the truncation time of the i -th cluster [18,19]. Therefore, conditional expectations become

$$E(W/z_i, T_i; \delta, \beta, \xi) = -\frac{L^{(d_i+1)}(\sum_{j=1}^{n_i} H_0(h_0(x) y_i \exp(z_{ij}^T \beta))}{L^{(d_i)}(\sum_{j=1}^{n_i} H_0(h_0(x) y_i \exp(z_{ij}^T \beta))}, \quad (14)$$

Application to Real-life Example

Application I: First we consider the Veterans' Administration Lung Cancer data set [21] to fit the frailty model for Xgamma distribution. The data set contains the Lung cancer data of the first and second recurrence time of 137 patients, 4 different clusters, and eight variables namely (i) Treatment (1=Standard; 2=Test) (ii) Cell type (1=Squamous, 2=Smallcell, 3=Adeno, 4=Large) (iii) Survival time (iv) Status (0=censored, 1= recurrence) (v) Karnofsky Performance Score (100=good) (vi) Diagnostic time (Months) (vii) Age (in a year) (viii) Prior therapy (0-No, 1-Yes).

Application II: We considered culling the data set [20] for a second to fit the models. The data set contains 13836 observations and 6 variables namely (i) Cow's Identifier (ii) Time to Culling (in the month) (iii) Status (0=Censored, 1= Observed) (iv) Herd: Herd Identifier (v) Time asses (somatic cell count day) (vi) Log SCC (Logarithm of the somatic cell count).

Data analysis

The developed statistical methods were computed using a commonly available statistical package, such as R studio version 1.2.50, which was used for data analysis. The method of Kendall's tau was used to measure the association between any two event times from the same cluster [5]. The lowest value of Akaike's Information Criteria (AIC=log-likelihood) + 2(P), where P is the number of parameters) and Bayesian Information Criteria (BIC=-2(Log-Likelihood) + P(log/n) is used to identify the best model for lifetime data. R packages of "survival" [22], "perfm" [15], and "frailtypack" [17] were used to create the code/function for Xgamma and other distributions.

RESULT AND DISCUSSION

A comparison of four frailty models under five baseline distributions for the Veteran's Administration Lung Cancer data set [21] is shown in table 2. The result revealed that positive stable (PS) is an excellent choice for this data because the minimum AIC and BIC values were observed in all baseline distributions. However, the lowest AIC and BIC value was recorded in the Xgamma baseline with the positive stability frailty model. Further among other frailty models, the Xgamma distribution showed better results than other baseline distributions (Table 2). The frailty models of Gamma, Lognormal, Inverse Gaussian and Positive Stable with Xgamma baseline have given almost close estimation values for these data. We find that the baseline distribution of Positive Stable with the frailty model is the least preferable option for Veteran's Administration Lung Cancer data because of high AIC and BIC values for all the frailty models. The survival time histogram plot in Fig 1 (left panel) is right-skewed and has a long tail to the right. It indicates that the time distribution for Veteran's Administration Lung Cancer data sets is skewed to the right (Figure 1 (left panel)). Because Veteran's Administration Lung Cancer is less common in the first 80 months of the experiment, the chances of survival are high (right panel). The average survival time is around 80 months.

Xgamma, exponential, Weibull log-logistic and lognormal baseline distribution with the Positive stable distribution has given almost close estimation values with smaller AIC and BIC values for the Culling data set (Table 3). However, Xgamma with the positive stable frailty model is the best choice for this data because of the lowest AIC and BIC [14179.14 & 14199.78] values. Moreover, we noticed Xgamma with the positive Stable frailty model also gave close for this data. The survival time histogram plot in Fig 2 (left panel) is right-skewed and has a long tail to the right. It indicates that the distribution of time to Culling data sets is skewed to the right (Figure 2 (left panel)). Because there is less frequent Culling data in the last 11 months of the experiment, the chance of survival is high, as

**Ashok Kumar and Muthukumar**

shown in Fig 2. (Right panel). The average survival time is about 11 months. Further within each of the frailty models, the Xgamma baseline distribution shows better estimates than other baseline distributions (Table 2-3 and Figure 3-6). In this case, we noticed that the baseline distribution of lognormal and Loglogistic was not a good choice for both data sets due to high estimation values observed for all frailty models (Figure 3-6).

CONCLUSION

In survival analysis, Exponential, Gamma, and the Weibull baseline distribution are frequently utilized with frailty models. The model estimate depends on the identification and application of baseline and frailty distribution depending on the data structure. The maximum likelihood estimation method is used to estimate the parameters of the models under consideration so that they can be compared by estimating and testing the significance of the parameters of the models under consideration. Therefore, we attempted to fit the models with Xgamma baseline distribution and test the effectiveness of the model. We proved that for the real-life data and its applications, Xgamma with frailty models have an excellent fit with the smallest AIC and BIC values compared to other baseline distributions. The xgamma frailty model with a positive stable baseline hazard is the model that best matches both data sets. The research will contribute to developing new frailty models, and also be used for the future applications of Xgamma distribution.

ABSTRACT

Many studies have found the presence of scapular dyskinesia (SD) in lactating mothers but none have shown its difference in primipara and multipara. The aim of the study was to find out SD prevalence in primipara and multipara lactating mothers. An observational study was undertaken using convenient sampling for 60 Lactating mothers the age of 18 to 35 years, breastfeeding for 1 month or more from various pediatric clinics of Ahmedabad were assessed for type and number of deliveries, postural awareness while feeding, test for SD using Yes/No test, scapular balance angle (SBA) and the lateral scapular slide test (LSST) and kyphosis on observation. Descriptive data analysis was done. Out of 60 participants (38 primipara, 22 multipara) 42% of Primipara and 36% of multipara were diagnosed with SD. 60% of the subjects were positive for kyphosis on observation. 57% of primipara and 45% of multipara lactating mothers were unaware of their correct posture. 15%, 42% primipara and 18%, 36% multipara were found positive for SBA and LSST respectively. The percentage of type-IV SD was found more in primipara and multipara followed by type II, type-I & type - III SD. Statistically, there was a significant prevalence rate of SD in lactating mothers, and for breastfeeding techniques, Primipara mothers required more Physiotherapist's support and guidance. Raising awareness of the role of physiotherapists in managing SD in lactating mothers helps to reduce the impact of discomfort and will be helpful for future pregnancies.

Keywords: scapular dyskinesia, primipara, multipara, lactation.

**Ruchi Desai and Manali Shah**

INTRODUCTION

During pregnancy, a range of physiological, biomechanical, and emotional changes transpire, necessitating substantial musculoskeletal adaptations. The antenatal and postnatal periods are characterized by physiological and physical transformations. Inadequate posture refers to an incorrect alignment of the body's various components, placing strain on the supportive structures [1]. When women breastfeed, they commonly exhibit a tendency to slouch forward. Prolonged maintenance of this posture, even for 20 minutes, repeated 6-8 times or more per day, can induce back, neck, and shoulder stress, resulting in fatigue or microtrauma that leads to discomfort [2]. According to the guidelines set forth by the World Health Organization (WHO), providing exclusive breastfeeding to infants for the initial 6 months of their lives is recommended. Following this period, the introduction of nutritionally appropriate and safe complementary foods should be accompanied by continued breastfeeding until the age of 2 years or beyond [3]. In India, the majority of women engage in breastfeeding for a duration of at least one year or longer. However, if breastfeeding is continued in an improper posture over extended periods, it can lead to progressive weakness in the muscles around the shoulder blade, ultimately resulting in a condition known as scapular dyskinesia [4]. Scapular dyskinesia refers to an alteration in the mechanics and motion of the shoulder blade, indicated by the prefix "dys" denoting alteration, and "kinesis" representing motion. This condition can manifest in healthy individuals or contribute to a syndrome known as SICK (Scapular malposition, Inferior medial border prominence, Coracoid pain and malposition, and Dyskinesia of scapular motion). Overall, scapular dyskinesia is a collective term encompassing dysfunctional movement of the shoulder blade [5].

This dysfunction can be categorized into four distinct movement patterns:

1. The presence of abnormal static scapular position and/or dynamic scapular motion, identifiable by medial border prominence.
2. Notable prominence of the inferior angle and/or early scapular elevation or shrugging upon arm elevation.
3. Quick downward rotation was observed during the lowering of the arm.
4. Symmetrical upward rotation of both scapulae with the inferior angles rotating laterally away from the midline [6].

Thus, to prevent SD, the mother should assume the proper position during breastfeeding. Generally, first-time or primipara mothers do not have proper knowledge regarding proper positioning compared to multipara or mothers who have had two or more successful pregnancies [7]. The prevalence of SD in breastfeeding mothers has been documented in numerous studies, but none have investigated the variation in its occurrence between primipara and multipara. The aim of this study was to determine the prevalence of SD in lactating mothers, compare primipara and multipara, and identify the factors contributing to its development.

MATERIALS AND METHODS

A convenient sampling method was employed to conduct an observational study involving 60 lactating mothers recruited from various pediatric clinics in Ahmedabad. The inclusion criteria consisted of postnatal women between the ages of 18 and 35 who had been breastfeeding for over one month and had undergone either a full-term normal delivery or a lower segment cesarean section (LSCS). Participants with any kyphosis- or scapular dyskinesia-causing pathology or comorbidities were excluded. All participants provided written consent and underwent a comprehensive explanation of the procedure, followed by personal interviews and assessments. Demographic information, feeding duration, and frequency, knowledge regarding ergonomics, and other relevant details were collected from each participant. Additionally, the presence of kyphosis was observed and documented along the sagittal plane.

To assess the presence of SD, three specific tests were conducted on each participant. In the YES/NO Test (figure-1), participants were instructed to stand upright with their hands alongside their body, elbows straight, and shoulders

**Ruchi Desai and Manali Shah**

in a neutral position without rotation. The examiner stood behind the participant at a certain distance. Each test was performed five times in both flexion and abduction directions. Subsequently, participants were asked to hold weights ranging from 1.4 to 2.3 kg in each hand, determined based on their individual body weight (1.4 kg for participants weighing less than 68.1 kg and 2.3 kg for participants weighing more than 68.1 kg). With their thumbs positioned upwards, participants simultaneously raised both hands in the sagittal plane to their maximum range and then lowered them within three seconds, repeating this elevation movement five times. The scapular motion pattern was assessed and graded during each repetition. Following the same sequence, the elevation movement was repeated five times in the frontal plane, and the scapular movement pattern was graded accordingly [6]

The lateral scapular slide test (LSST) is a clinical measurement test used to evaluate static scapular position (figure-2). This test involves using a measuring tape to measure the distance between the inferior angle of the scapula and the nearest vertebral spinous process in three different positions: (1) shoulder in a neutral position, (2) shoulder at 40-45 degrees of coronal plane abduction with hands resting on hips, and (3) shoulder at 90 degrees abduction with the arms in full internal rotation. In cases of injury or scapular deficiency, the affected side typically exhibits a greater scapular distance compared to the uninjured or normal side. It has been suggested that a bilateral difference of 1.5 cm (15 mm) should be considered the threshold for determining the presence of scapular asymmetry [8].

To measure SBA, the patient stood barefoot with arms, pelvis, and heels aligned. The procedure involved marking the inferior angle of the scapula on both sides and drawing a line connecting these marks, as well as a vertical line between the C7 and T9-T10 spinous processes (Figure-3). Subsequently, the angles formed by the line connecting the two inferior scapular angles and the vertical line passing through the spine were measured using a goniometer. The SBA was defined as the difference between these angles. SBA exceeding 7 degrees was considered indicative of scapular dyskinesia [9]. Descriptive data analysis was conducted using SPSS Version 20. Continuous variables were analyzed by calculating the mean and standard deviation, while categorical variables were analyzed by calculating the frequency and percentage. The chi-square test and one-way ANOVA were utilized to assess associations and test for significance.

RESULTS

In this study total of 60 lactating mothers (38 primipara and 22 multipara) have been participating. Descriptive analysis of Demographic details, and personal details of participants like the type of delivery, duration, and frequency of feeding, the intensity of pain, area of pain, etc. are shown in Table no.1. Table no. 2 shows analysis through YES/NO Test, the percentage of type-IV SD were found more in primipara and multipara followed by type II, type-I SD & type - III. 37% primipara and 27% multipara mothers had Type-II SD which is the prominence of medial border of scapula while 16% primipara and 9% multipara had type- I SD ,36% and 50% had type -IV (Symmetrical scapular rotation) SD& 4% primipara and 3% multipara had type-III SD. Chart 1 shows the frequency and percentage of the scapular balance angle and Lateral scapular slide test analysis. It shows the presence of SD was more in primipara than multipara lactating mothers. Through SBA and LSST, 15% and 42% primipara while 18% and 36% multipara mothers were found positive for SD respectively. Ergonomics awareness and scapular dyskinesia have shown a significant association through the chi-square test ($p=0.004$). Duration of breastfeeding and scapular dyskinesia have shown significant association through a one-way ANOVA test. ($p=0.001$). Age, BMI, type of delivery, and frequency of breastfeeding have not shown a significant association for SD.

DISCUSSION

60 lactating mothers aged 18 to 35 years participated in this study. Their mean age was 29.62 ± 3.31 years. Among them 38 were primipara and 22 were multipara mothers. This study has found 40% of lactating mothers diagnosed with SD and 60% were having kyphosis on observation. This study has also found 42% of Primipara and 36% of multipara lactating mothers are diagnosed with SD. The study conducted by Gandhali further corroborates these

**Ruchi Desai and Manali Shah**

findings, revealing a significant prevalence of scapular dyskinesia (67%) and subsequent kyphosis observed in postnatal females (55%) [2]. Similarly, the study conducted by Goyal et al. supports these findings, indicating that a majority (74.0%) of multiparous mothers exhibited good positioning and attachment during breastfeeding, possibly due to their prior experience. Additionally, the study suggests that young mothers (<20 years) and primiparas displayed a significant association with poor positioning and may require increased support and guidance regarding appropriate breastfeeding techniques [10]. Due to a lack of adequate knowledge about breastfeeding positions, many women tend to adopt unfavorable postures, such as a hunched-back position, during breastfeeding. These uncomfortable postures exert excessive strain on the back muscles, eventually leading to the weakening of these muscles and the development of scapular dyskinesia over time [2, 16, 17]. A study conducted by Akhila Krishnakumar et al. in 2018 examined the assessment of scapular stability in postpartum females. The study findings indicated an increase in tightness of the pectoralis major muscle and weakness in the rhomboids and lower trapezius muscles. The outcome measures utilized in the study demonstrated statistically significant changes in scapular stability [11].

In this study, the assessment of scapular dyskinesia (SD) involved the utilization of three special tests. One of these tests, the yes/no test, is considered a qualitative measure. However, a study conducted by Ramiscal L et al. in 2022 discovered that the yes/no test is highly subjective and susceptible to expectation bias, potentially influencing the labelling of SD. Raters may have a tendency to perceive what they expect to see, in this case, the presence of SD [12]. Therefore, in the current study, in addition to the yes/no test, other outcome measures such as the lateral scapular slide test (LSST) and scapular balance angle (SBA) were employed to provide a more comprehensive evaluation of SD. The lateral scapular slide test (LSST) and scapular balance angle (SBA) serve as quantitative measures that offer different approaches to evaluate the extent of scapular dyskinesia [16]. According to Kibler, LSST demonstrates reliable reproducibility [13]. Conversely, Gibson, M. H. et al. reported low interrater reliability ICCs but high interrater reliability ICCs for LSST[14]. In contrast, another study suggested that manual measurement of SBA is a straightforward and consistent method for assessing scapular position and rotation in clinical practice, with high ICCs for both intra- and interrater reliability [9].

According to previous research by Odom CJ et al. in 2001, the lateral scapular slide test serves to evaluate the asymmetry between the scapulae and the effectiveness of scapular stabilizer muscles in maintaining scapular position [15, 19, 20]. On the other hand, the scapular balance angle (SBA) offers a quantitative measurement of scapular position during arm elevation above the head. By measuring the angle formed between the spine and the inferior angle of the scapula, abnormal scapular upward rotation and protraction can be identified, aiding in the detection of atypical scapular positioning and movement patterns. In this study, it was observed that 58% of primipara mothers and 46% of multipara mothers were not aware of proper ergonomics during breastfeeding. The association between ergonomics awareness and scapular dyskinesia was found to be statistically significant through the chi-square test ($p=0.004$). Additionally, it was found that an increased duration of breastfeeding in altered postures was associated with a higher risk of scapular dyskinesia. For future studies, it is recommended to evaluate scapular muscle strength, conduct an objective analysis of kyphosis, and investigate the long-term effects of altered scapular behaviour following breastfeeding. These assessments can provide further insights into the impact of breastfeeding practices on scapular health

CONCLUSION

The present study revealed a statistically significant prevalence of scapular dyskinesia (SD) among lactating mothers, with a particular emphasis on the higher need for physiotherapist support and guidance among primipara mothers regarding proper breastfeeding techniques. Creating awareness about the crucial role of physiotherapists in managing SD among lactating mothers can effectively minimize the impact of injuries and provide valuable support for future pregnancies.

ABSTRACT

This study intended to measure the sub-disciplinary conceptual knowledge of Physical Education Teacher Education (PETE) trainees undergoing various courses in Kerala. The study was conducted on 544 PETE trainees, including males and females undergoing training in VHSE, CPED, BPEd, BPE, MPED and MPE courses in Kerala. The ASK-PE battery developed to assess beginners 'magnitude of sub-disciplinary conceptual knowledge by Ayers, S. F. (2001) was used as the tool. The sub-disciplinary conceptual knowledge areas include Aesthetic Experiences, Biomechanics, Exercise Physiology, Historical Perspectives, Motor Development, Motor learning and Social Psychology. There were 120 multiple-choice questions in different sub-disciplinary areas. This use will enable a direct comparison between the conceptual knowledge of future teachers studying various PETE courses within Kerala. The maximum score that a respondent can have is 120. The average mean score on the ASK-PE test of the participants was 52.44 (SD = 17.23). This is 43.7% of the maximum possible score on conceptual knowledge in physical education tests. ANOVA results show that the F-value on aggregate ASK-PE test scores on sub-disciplinary conceptual knowledge was significant (F=68.434, p<0.000). Post-hoc analysis indicates that higher-level course students have better conceptual knowledge and poor scores for those undergoing lower-level courses (VHSE and CPED). The lack of physical literacy in fitness and health-related physical fitness raises queries since research has demonstrated that pupils' learning can be restricted if instructors teach them with restricted information on the matter being prepared. Thus, the

59037

**Ajith Mohan et al.,**

PETE educational program in the state of Kerala must be somewhat or totally rebuilt to deliberately incorporate knowledge, aptitudes, and experience to give adequate exposure to future Physical Education Teachers.

Keywords: ASK-PE, Aesthetic Experiences, Biomechanics, Exercise Physiology, Historical Perspectives, Motor Development, Motor learning and Social Psychology.

INTRODUCTION

It is high time to discuss issues related to the description of subject knowledge of physical education. According to present-day teacher education, content knowledge and pedagogy have to be studied jointly; however, it is equally clear that the parameters of the content knowledge domain must be identified. The worth of concept-based physical education has long been recognised (American Alliance for Health, Physical Education, and Recreation, 1969; Kneer, 1981; NASPE, 1995) but till now, it has not been officially measured or assessed. "A monograph exploring learners' domain-specific knowledge incorporated a statement on the general conception and misconception on health-related fitness" (Placek, Griffin, Dodds, Raymond, Tremino, & James, 2001). Participants lack of understanding about fitness concepts was disturbing, particularly given the recent emphasis on health-related fitness by AAHPERD and most other national health organisations such as the Center for Disease Control, the US Dept. of Health and Human Services and the President's Council on Physical Fitness. Agreed to the shortage of thinking-related tools available to test/evaluate sub-disciplinary awareness in physical education, Ayers (2001) developed a seven-test (group of tests) that test/ evaluate the sub-areas knowledge in Physical Education known as ASK-PE. These tests were used to test/assess high school students' idea-based knowledge of the content identified as critical in every seven fields in Mohnsen's text (1998). Since knowledge in the thinking-related domain is fundamental to student performance, teachers need the skills to develop that knowledge in students. However, teachers' ability to do this rests mostly on their own level of content-related thinking-related knowledge. The first step in testing/evaluating this knowledge base was establishing high school students' physical education idea-based knowledge as identified by NASPE in Mohnsen's text (1998). Upon completing the first examination of this knowledge base, the next logical step was to relate students' knowledge to that of prospective physical education teachers. The research intended to measure the sub-disciplinary conceptual knowledge of Physical Education Teacher Education (PETE) trainees undergoing various courses in Kerala.

METHODS AND MATERIALS

Participants

The study was conducted on 544 students, including male and female students studying VHSE, CPED, BPEd, BPE, MPEd and MPE Physical Education Teacher Education courses in Kerala. A student pursuing a PETE course in the state of Kerala can be enrolled in the following courses: VHSE, CPED, BPEd, BPE, MPEd and MPE according to their academic qualifications. VHSE and CPED are two-year courses after grade 10, BPEd is one year course of study after any graduation, BPE is three-year graduation after Grade +2, MPEd is two years masters after BPEd, and MPE is two years masters after BPE. The scholars collected data only from the final year/semester students during 2019-20. In the present study, 39 (7.2%) were from VHSE, 56 (10.3%) were from CPED, 142 (26.1%) were from BPEd, 40 (7.4%) were from BPE, 221 (40.6%) were from MPEd and 46 (8.5%) were from MPE courses.

Instrumentation

Ayers (2001) developed a seven-test (group of tests), to evaluate the sub-areas awareness in Physical Education, known as ASK-PE. The ASK-PE battery was designed to assess beginners' magnitude of sub-disciplinary physical

59038

**Ajith Mohan et al.,**

education conceptual knowledge. A teacher can reliably evaluate PETE students' level of conceptual knowledge with this battery. The sub-disciplinary conceptual knowledge areas include Historical Perspectives, Aesthetic Experiences, Exercise Physiology, Biomechanics, Motor Development, Social Psychology and Motor learning. There were 120 multiple-choice questions in different sub-disciplinary areas. This use will enable us to make straight comparisons amidst the conceptual knowledge of future teachers studying in various courses within Kerala. Using this comparative information, PETE faculty can determine the level of future PETE students/graduates and which areas they should develop to make physically literate children.

Collection of Data

The research scholar administered the test directly with the help of the teachers from the selected centres. Before the administration of the test, student teachers were informed that the results of this test would not affect their grades. The idea of the study also was explained to the student teachers. Each student received a packet of test materials (ASK-PE Battery) and instructions regarding test administration; after administering the test, the scholars collected answer sheets in sealed cardboard boxes in each classroom. In the cover sheet of the ASK-PE Battery, a small questionnaire has been given to collect information regarding the course in which they are studying, gender and name of the institution. These details were used for grouping the participants in the testing programme.

RESULTS OF THE STUDY

The data was analysed using IBM SPSS 25.0. Fisher's Least Significant Difference post hoc analysis was performed when statistical significance ($p < .05$) was obtained to identify significant pair wise differences. The ASK-PE Battery (Ayers, S. F., 2001b), containing 120 questions, was administered to study the Physical Education conceptual knowledge. The score for each sub-disciplinary concept was based on the number of questions about the sub-discipline. The total score on conceptual knowledge is the aggregate of the scores obtained by them in the above seven sub-disciplinary areas. The results of ANOVA performed on the selected sub-disciplinary variables show that Aesthetic Experiences (ATS) $F(5,538) = 7.291, p < .01$, Biomechanics (BOM) $F(5, 538) = 55.964, p < .01$, Exercise Physiology (EXP) $F(5,538) = 87.253, p < .01$, Historical Perspective (HIS) $F(5,538) = 33.107, p < .01$, Motor Development (MDT) $F(5,538) = 30.047, p < .01$, Motor Learning (MLG) $F(5,538) = 11.908, p < .01$ and Social Psychology (PSY) $F(5,538) = 30.034, p < .01$ variables differed significantly at 0.00 level. The scarcity of space and tables of posthoc tests of each variable are not coming under this study's scope. Further, the scholars discussed the results of the aggregate score of the ASK-PE and posthoc test.

The total score obtained in 120 questions was comprised to assess the aggregate score. The maximum score that a respondent can have is 120. The average mean score on the ASK-PE test of the participants was 52.44 (SD = 17.23). This is 43.7% of the maximum possible score on conceptual knowledge in physical education tests. Those respondents who scored up to 35 were classified as below average, those who scored from 36 to 70 were classified as moderate, and those who scored above 70 were classified as above average regarding their aggregate sub-disciplinary conceptual knowledge. The results show that 152 (27.9%) were in the below-average group based on their score on the ASK-PE test. 305 (56.1%) were in the average category, and 87 (16.0%) were in the above-average class. The mean scores and standard deviations on the aggregate score of Conceptual Knowledge based on the course of study mean scores range from 30.80 to 63.04. The mean score of respondents from VHSE was 33.00 (SD = 5.21), for CPEd was 30.80 (SD = 3.65), 42.68 (SD = 11.92) for BPE, 53.96 (SD = 17.00) for BPEd, 59.93 (SD = 13.62), for MPEd and 63.04 (SD = 14.62) in case of MPE. The graphical representation of the mean scores course-wise is presented in Figure 1.

Analysis of Variance (ANOVA) was done to check for any difference in the mean score of the students pursuing various courses. Which was presented in Table 1 shows the ANOVA result for the aggregate score on testing the above aspect. Table 1 shows that the F-value on the total ASK-PE test scores on conceptual knowledge is significant ($F = 68.434$) as its p-value is 0.000, less than 0.05. Therefore, it might reject the null hypothesis of no difference among

**Ajith Mohan et al.,**

the mean score of the six courses, i.e. BPE, BPEd, MPE, MPEd, CPEd and VHSE. As the F value is significant, did the post hoc analysis. A Post Hoc test (LSD) was done to see the pairwise difference between the courses concerning the conceptual knowledge total score of the respondents. The result is presented in table 2. From Table 2, it is clear that BPE course students' scores differ significantly with BPEd (MD= -11.28275), MPE (MD=-20.36848), MPEd (MD= -17.25260), VHSE (MD = 9.67500) and CPEd (MD = 11.87143). No significant difference was found between MPEd and MPE, as well as between VHSE and CPEd. The average score of MPE students is significantly different from those in all other courses except MPEd which is also a post-graduate course. This indicates better conceptual knowledge for students undergoing a higher-level course.

DISCUSSION OF FINDINGS

The present study examined the sub-disciplinary physical education conceptual knowledge among the PETE students/trainees undergoing various types of courses in the state of Kerala using ASK-PE battery. The low score level in ASK-PE test battery substantiates the lacuna in physical education teacher education students' conceptual knowledge in the state of Kerala. The Literature on Teacher Education recommends that reliable information on the topic instructed is essential to be a skilful and powerful instructor (Baumert et al., 2010; Belfort and Guimaraes, 2002; Mewborn, 2000; Shulman, 1986, 1987). Educators' subject knowledge influences their pedagogical content knowledge and teaching and impacts their certainty in presenting the topic (Kallery and Psillos, 2001). Content information supports exercise structure and becomes an asset in the choice of models, detailing clarifications and demonstrations (Leinhardt and Smith, 1985).

The study finds that BPE course students' scores differ significantly with BPEd, MPE, MPEd, VHSE and CPEd. There is no significant difference found between MPEd and MPE as well as between VHSE and CPEd. The average score of MPE students is significantly different from those in all other courses except MPEd, which is also a post-graduate course. This indicates better conceptual knowledge of students undergoing a higher level course and poor status of students experiencing lower level courses (VHSE and CPEd). Moreover, the most outstanding achievement on the conceptual knowledge test was of MPE students, with 43.5% belonging to the above-average category; at the same time, only 24.4% of students from the MPEd course achieved the above-average classification. Overall conceptual knowledge score of VHSE and CPEd students, 66.7% and 91.1% belonging to the below average group. None of the students from these courses achieved above average score. It clearly shows deficient level of conceptual knowledge among pre-service physical education teachers in VHSE and CPEd. These deficiencies in physical education conceptual knowledge among pre-service physical education teachers are consistent with the findings of Castelli and Williams (2007) who also found poor performance scores for health-related fitness content knowledge of in-service middle school physical education teachers. This lack of conceptual knowledge of physical education among pre-service physical education teachers agrees with the study of Castelli and Williams (2007), who likewise discovered terrible scores for health-related fitness content information among in-service middle school physical education teachers. Unawareness in the field of physical activity and health-related fitness raise concern. The study has demonstrated that pupils' learning can be restricted if instructors educate them with restricted information on the substance being instructed.

Like Grossman (1990), others also emphasised that if teachers have weak content knowledge, it will also influence the teachers' knowledge in other categories in a negative way. Moreover, content knowledge aspects are subject-matter specific; for instance, a math teacher needs to have math content knowledge, while an English or physical education teacher needs to have their own subjects' content knowledge (Shulman, 1986). Hastie and Vlasisavljevic's (1999) uncovered that PE teachers with sound subject knowledge utilised a more significant number of assignments per exercise than those with lesser subject expertise. Besides, instructors with higher subject matter expertise demanded students to be responsible predominately for the quality of their performance. In comparison, the contrary with less subject matter expertise considered students responsible for just a mere level of participation or exertion.

Ajith Mohan et al.,

CONCLUSIONS

Thus, the Kerala state's PETE curriculum must be wholly or partly reorganised to scientifically incorporate knowledge, skill, and exposure to inclusion issues. Eventually, this addition will prepare future physical educators for inclusion. To meticulously do this, using a sound theoretical model will be essential. The study's results clearly show that those pursuing VHSE and CPED courses have deficient sub-disciplinary physical education conceptual knowledge. That knowledge base is not enough to enter a latest generation of physical education, with programs that emphasis enduring fitness activities, such as walking, biking and tennis, aerobics; educate students about healthful diets; and educate student how to check their cardiac rates and pulse. But unfortunately, these PETE trainees are eligible to teach secondary level in Kerala state, India. Even at the post-graduate level, conceptual knowledge in biomechanics, motor development and social psychology areas is inadequate. Necessary action may be taken by the curriculum developers of the concerned Universities to strengthen the lacuna in sub-disciplinary knowledge. A few of the targeted fields of upcoming research involve (i) examination of PETE students' conceptual knowledge base at the national level, (ii) comparisons between PETE students and high school students' knowledge, (iii) differences in pre-service programs' curricular emphasise on PETE students' knowledge, (iv) the role of in-service training on practitioners' knowledge provision, and (v) relationships between teachers' areas and levels of expertise and their students' scores on the ASK-PE tests.

ABSTRACT

India has a long history of women being subjugated in the name of culture and tradition. This has been done mostly using the cultural and religious scriptures and literature against women. Religious and cultural traditions, and customs become convenient and harsh weapon against women when the models like Sita in *Ramayana* is propagated as an ideal for women. Deeti in *Sea of Poppies* by Amitav Ghosh echoes the same submissive and meek images represented of until she becomes conscious to her real self as a normal human being full of desires. This puts her life in danger and escaping to an unknown land is the only option that she has left with. The paper aims to recognize the role of religious scriptures and socio-cultural practices in ascertaining the subjugated role of women in Hindu society. It also tries to understand the primary motive behind the proliferation of ominous control of men over women. The researchers have adopted the approach of Radical Feminism. Taking the related theories of Patriarchy and Feminine Psychology, the paper explores the role of Hindu religious scriptures and practices in the dissemination of patriarchy through psychological conditioning for exercising control over the Hindu women. During the research, it has been found that most research explore Deeti's character as the victim of patriarchal Indian society without exploring the real cause of her extreme submission. It has also been found that to understand the cause, the prominent Hindu texts, and writings, the *Ramayana* and the *Manu Smriti* and the ideas of one of the earliest and prominent Indian feminist and activist should be considered. During the research, the representation of the various images and descriptions of men and

59044

**Deepti Lokesh Arha and Arpit Kothari**

women in Hindu scriptures and cultural literature have been found to be strikingly patriarchal in nature. Women have mostly been glorified. However, this glorification of women as mother through the images like Durga, Kali etc. reflects on the fear that men have. The roots of this fear have been traced down to the power of women to create life. The paper concludes that society has always feared women. This fear reflects in the images of Kali, Shakti, etc. in Hindu scriptures and cultural texts. So, while glorifying the images of women through such strong women characters, the mentioned texts have also shown women as wife like Sita to be submissive and under control of her husband like Rama in *Ramayana*. Women have always been guided through these scriptures in such a way that they themselves can't get free of the authoritative control by men. According to Dr. Karen Horney, the reason for the existence of such discrimination against women have been traced down to men's 'dread for women' or 'fear of womb' as it is due to their womb women hold the authority over the creative process. The need of a device to exercise control over women has thus been felt. When it comes to the plight of Hindu women, the paper reaches the conclusion that the Hindu scriptures have been this device to keep women under men's authoritative control.

Keywords: Hindu Scriptures and Structure; Indian Women; Marginalized; Patriarchy; Socio-cultural Practices; Womb Envy.

INTRODUCTION

Amitav Ghosh is a writer of Indian Diaspora. He lives in America as well as in India. His work Ibis Trilogy tells an intriguing tale of the times when opium was forced upon Indian farmers as a major cash crop by the British rulers. The volume comprises of three books: Sea of Poppies (2008), River of Smoke (2011), and Flood of Fire (2015). The series reflects upon the happening around the two Opium Wars held in the 19th century between Colonial British India and China. This paper focuses on the first book from the Trilogy, Sea of Poppies. The story begins with Deeti as one of the major characters. Deeti's character, along with other female characters in the novel shows the deplorable condition of women in the early 19th century India. Women in India have been suppressed due to India's staunch patriarchal cultural and religious structure for centuries. Deeti's character highlights the problem within this kind of patriarchal system wherein the position of women is overburdened by the images and representations of women by religious scriptures, classical literature etc. As an outcome, the different roles of women as daughters, mothers, wife etc. are manipulated within this hegemonic patriarchal system. Deeti has been the very picture of forbearance and passivity as propagated through the Hindu role models for women like Sita [1] until she comes face to face with her real self. She chooses to marry a low-caste man after the death of her husband. This poses such threats to her life that crossing the oceans was seen as an only escape to Deeti, not an agreeable option though.

For this paper, Deeti's character has been taken to analyze how Hindu women have been burdened and tortured since centuries. This has been done by taking instances from the novel and studying them in the light of prominent Hindu religious writings like the Ramayana [2] and Manu Smriti [3]. The paper uses the concept of 'Womb Envy' proposed by Karen Horney. The analysis shows that Hindu religious scriptures and practices have been used as tools by men for enfranchising women. It also suggests that patriarchy has a specific aim specifically in the context of Hindu societies which revolve around controlling their women folk.

OBJECTIVES

The paper aims to recognize the role of religious scriptures and socio-cultural practices in keeping women subordinate to men. It also tries to understand the aim of such practices that keep women under the ominous control

**Deepti Lokesh Arha and Arpit Kothari**

of men. Many researchers have been trying to understand the nature of such subordinations within human societies. Researchers, through this paper try to analyze the condition that becomes normative for subordination of women which in turn creates a burden of performative roles. The paper also tries to explore the axis on which such norms exist. The approach of Radical Feminism has been adopted by the researchers. This has led to taking

METHODS

account of the theories related to patriarchy and feminine psychology to explore the role of Hindu religious scriptures and practices in the enforcement of patriarchy through psychological conditioning to subjugate the Hindu women. For the purpose, Amitav Ghosh's *Sea of Poppies* has been taken for analysis of one of the main women characters 'Deeti' from the above-mentioned perspective. A systematic review of literature of existing related research to find the gap has been performed. Most of the research papers that have been found during the research for the purpose of this work deals with the different aspects of opium, colonization, migration, diaspora, feminism, post colonialism, historicity, time and space, narratology and use of narrative devices, eco-criticism etc. in the trilogy. Several researchers have also dealt with Deeti and other female characters as the victim of patriarchal Indian society. However, the role and impact of Hindu religious and socio-cultural structure and practices in the pervasive gender discrimination still needs exploration. This research has led researchers to considering the prominent Hindu texts and writings the Ramayana and the Manu Smriti and the ideas of one of the earliest and prominent Indian feminist and activist, Tara Bai Shinde [4], for analyzing the novel and developing an understanding of the role and aim of certain religious practices in the enforcement of patriarchy while defining 'Hindu women'.

RESULTS AND DISCUSSION

"The mention of Lanka, with its evocation of Ravana and his demon-legions, made Deeti flinch. How was it possible that the marchers could stay on their feet, knowing what lay ahead? She tried to imagine what it would be like to be in their place, to know that you were forever an outcaste; to know that you would never again enter your father's house; that you would never throw your arms around your mother; never eat a meal with your sisters and brothers; never feel the cleansing touch of the Ganga. And to know also that for the rest of your days you would eke out a living on some wild, demon-plagued island?" (Ghosh, 2008, p. 72). Deeti, one of the major characters in *Sea of Poppies* nurtures the frightening image described above of the faraway land and the idea of going there. Still, she chooses indentured labour when it becomes the question of living her life peacefully with the man of her choice. She faces many oppositions and threats from the society as she does not only dare to choose a man on her wish, but the man is also a lower cast ox-cart driver. Besides all these facts, the truth which makes the situation problematic and unacceptable by the society is that she is a widow. According to Hindu social, religious, and cultural practices a woman, once becomes a widow cannot remarry. She is not allowed even to desire a man in her life.

Most of the practices that existed among Hindu communities have been rendered to them by prescribing through religious scriptures. Whenever any socio-cultural practice is questioned the answer is given by reading out the books. Rosalind O'Hanlon (1994) writes about this while quoting Shinde, in the introduction to her book '*A Comparison between Women and Men: Tarabai Shinde and the Critique of Gender Relations in Colonial India*' (Introduction). Indian women, both from privileged and unprivileged backgrounds have raised their voices time and again opposing patriarchal restraints. Many of them like Tarabai Shinde have also rendered Hindu religious writings responsible for ill social and cultural practices. Women's position in Hindu societies has always been compromised due to the startling discrimination that exerts male hegemony and totally condemning women. Even though it is the mother who bears the child in her womb and gives life to it by bringing it to this world, Hindu Shastras [5]. (Hindu religious scriptures) hold, as Nevidita Menon writes while quoting Chitra Sinha (2007) in some other reference in her book *Seeing Like a Feminist*, "father as the natural guardian" (Menon, 2012, p. 30) and thus stripe off a mother of her natural right over her child. There has also been much discussion about the subordinate

**Deepti Lokesh Arha and Arpit Kothari**

position of women in India to understand the cause. This is important for bringing in disenfranchisement of Indian women. Many theories and discussions in this direction have relegated socio-cultural practices as a mode of implementing patriarchal authority in many societies; Indian society is one of such societies. With a Radical Feminist approach, this paper tries to explore the role of religious scriptures and practices as the normative of patriarchal Hindu society which is mainly driven with an aim of controlling women's desire.

Radical Feminist Approach

Feminism describes as a system that in general sees the world as a social order demanding 'gendered' power structure which moves around the idea of male superiority to sustain. (Sultana, 2011) Menon observes in the "Introduction" of her book *Seeing like a Feminist* that "A Feminist perspective recognizes that the hierarchical organizing of the world around gender is key to Pat Brewer, referring Engels in the "Introduction" to Engels (2008) book *The Origin of the Family, Private Property, and the State* states that according to Engels patriliney (the passing of property from father to son) [manifestation of patriarchy] is one of the earliest systems that establishes male domination maintain social order; that to live lives marked 'male' and 'female' is to live different realities." (Menon, 2012, p. viii) Radical Feminist approach holds that oppression of women exists due to the institutional structures and prescribed social roles that are the result of male hegemony and patriarchy. Radical feminism holds that women bodies including their reproductive organs, sexuality and desire is controlled and appropriated by men for their own benefit. (Facio, 2013, p. 1)

Patriarchy

Patriarchy can be defined as a power relation between men and women based on a hierarchical structure that has men on top of this power structure while women at the bottom. (Venkatanarayanan, 2020) Patriarchy has its own specific ways of manifestation. It unconsciously and systematically gives the authority of women in the hands of men. The system gradually becomes automated and makes women believe that they have always belonged at the bottom of the strata. over female, "the world-historic defeat of the female sex." (p. 11) Thus, this further explains patriarchy as a sort of political organization that assigns power in the hands of male sex while putting female sex under that authoritative group by keeping the monetary power with men. In this sense, a development of a sexist ideology can be witnessed in the propagation of a social system where women have been considered a community having a position inferior to men as the ruling community. Here, the word community has been used in its meaning as given in online Merriam-Webster dictionary, "A group of people with a common characteristic or interest together within a larger society." (Online) Therefore, it can be implied that patriarchy divides civilizations/societies broadly into two communities namely men and women. This division has an underpinning that one group is inferior to the other. Hence, it passes on the power into the hands of the superior community. However, the point is to understand what possibly has given rise to this very notion that women ought to be under men's subjugation. Why the need of restricting the freedom of women was felt necessary at the first place? The researchers have dealt with this question from the perspective of Hinduism as a religion as well as a tradition for developing an understanding of how Hindu religious scriptures and practices have been relegating that the righteous place for a woman is in the feet of her 'LORD' (her husband).

In Hinduism, the ill practices against women like sati, female infanticide, child marriage, prohibition of widow remarriage, the seclusion, education of women, prostitution, bride-price, and dowry have been the manifestations of oppressive authority of men over women. The causes for these can be traced to deep rooted socio-cultural and religious structure of India. Thus, Indian women relate to each other through pain that traverse all class, caste, or creed. In *Sea of Poppies*, Ghosh finds a vividly metaphorical way to give expression to the omnipresence of appalling situation of Indian women in the subtle analogy of pickles. Women on Ibis while engrossed in mundane discussions like recipe of mango pickle realize that: "Each woman had always practised her own method in the belief that none other could possibly exist: it was bewildering at first, then funny, then exciting, to discover that the recipes varied with every household, family and village, and that each was considered unquestionable by its adherents." (Ghosh, 2008, p. 241)

Hindu Religious Texts and Practices and Manifestation of Patriarchy in Hinduism as Observed in *Sea of Poppies*
Socio-cultural milieus in Hindu communities are structured around religious texts. In other words, the social practices are affiliated by religion and religious scriptures and texts like the Vedas [5], the Ramayana, the Gita [6], the Manu Smriti etc. This paper focuses on the Ramayana and the Manu Smriti. The primary reasons for this have been that first, the Ramayana sets the ideal for all Hindu women through the character of 'Sita'. Sita becomes the standard for a woman for keeping her guided in terms of her duties as a wife. Secondly, Manu Smriti is the central text which as Nyna Amin points out, has been crucial in the construction of "patriarchal framework of religious laws" (Amin, 2015, p. 82) while laying down the patriarchal foundation of patriarchal social practices. Thus, it prescribes certain laws and rules to underpin the "Hindu ways of life." (Amin, 2015, p. 82) The social, cultural, and religious practices uphold patriarchal interests for the purpose of continued administration of diluting women's position in the society. Tarabai Shinde, one of the earliest women activists wrote a book in Marathi in 1882, named *Stri-Purush Tulana* (A Comparison Between Women and Men), highlighting the prevalent patriarchal structure in the society of her times. She presents the comparatives of the status of men and women in Hindu societies. She states the purpose of her book to be nothing more than the comparison between men and women. O'Hanlon (1994) writes in the introductory chapter of her translation of Shinde's book while quoting Shinde that her intentions has been to write only "to defend the honor of all my [her] sister countrywomen". (O'Hanlon, 1994) Shinde simply presents a comparison of the condition of men and women in the country irrespective of their castes. (O'Hanlon, 1994).

Shinde, in a quite furious tone states that men deliberately created certain narratives where women are depicted as icons of submission to men. O' Hanlon quotes Shinde that she (Tarabai Shinde) aggressively holds male priests responsible for making condition of Hindu women deplorable. She also points out that the notion of "pativrata [7], self-effacing devotion to her husband, should be the informing principle of a woman's life It was male religious writers who tried to reinforce them by making up all sorts of absurd stories about womanly virtues and sacrifices." (O' Hanlon, 1994, p. 7). The same issue has been raised by many activists and researchers who hold religious teachings crucial in creating normative as well as performative behaviors of genders in societies. Such cultural and religious ideals reinforce gender biases and hence, create highly stable and incorrigible familial and social hierarchies. It has been observed that Hindu classical literature has presented women as the embodiment of (in the words of Jaswant Guzdar and Meenakshi Krishna) "ideals of containment, devotion, forbearance and passivity represented by such mythical heroines as Sita, Savitri [8] or Draupadi [9], quite unlike the limitless power of Shakti [10] ideal" (Guzdar and Krishna, 1991, p. 260) These images have been idealized to such an extent that they are etched in the Hindu psyche to a point from where the majority of people see Hindu women through the imaginative veil of these ideals. Guzdar and Krishna (1991) acknowledge that the images like Sita, Savitri etc. have done much harm to Hindu women who are unable to see themselves disconnected from these ideals:

"Sita is symbolically undifferentiated from her husband Rama and therefore contributes to the dominance and stability of the patriarchal hierarchy. The myths of Sita, Savitri, and Draupadi embody the themes of purity actively promoted as ego ideals in traditional cultural groups." (p. 260). Maintaining purity fervent has been considered paramount for Hindu women. The religious texts like the Ramayana show that remaining under the patronage of men should be the center of women's lives. Irrespective of situations, women are bound to live as per the 'orders' of the male members of the family. Sita, once, during exile disobeys Rama [10] and Laxman [11] and overrules the Laxman Rekha [12] (the symbol of threshold of house). This act of Sita has been depicted infamously and it has been considered that Sita wouldn't have brought dishonor to herself and the family, had she obeyed the men in the family. The concepts of 'honor' and 'purity' have been manipulated by men with a particular aim of exercising control over women's body and thus making women's body the site of torment and control. This corresponds with the idea where Upinder Singh mentions:

"Strict control over women's sexuality and reproductive potential was essential for the patrilineal transmission of property and for the maintenance and perpetuation of the endogamous caste structure. The strengthening of patriarchal authority within the household and the emphasis on certain norms related to marriage and the chastity of women were the means of effecting such control." (Singh, 2008, eBook). Deeti's mutilation in *Sea of Poppies* on her

**Deepti Lokesh Arha and Arpit Kothari**

wedding night by her brother-in-law is a delicate act and takes place as conspiracy of Deeti's in-laws for keeping the patriarchal pride intact. Hukum Singh, Deeti's husband being impotent is unable to contribute to the family tree. Hence, the need to cover up the bitter and shameful truth seems unavoidable. However, this highlights the women's situation in the society where man's ego is paramount and seems to be the only rule that governs the society. And woman again becomes a picture of passivity, sacrifice, and forbearance for preserving man's pride.

Irony of Deeti's Plight: similarity and dissimilarity with Sita- A symbol of female purity and an ideal woman

Deeti chooses the funeral pyre of her husband over becoming mistress to her brother-in-law. Being a widow remarriage is not an option for her at all. One of the vital Hindu scriptures called Manu Smriti or Laws of Manu prescribes certain rules for proper social conduct. For instance, the below given excerpt from Manu Smriti pronounces the conduct for widows: "At her pleasure, let her (i.e., widow) enunciate her body by living voluntarily on pure flowers, roots, and fruits, but let her not, when her lord is deceased, even pronounce the name of another man." (Manu, V. 157) Such religious and cultural ideal's value systems serve patriarchal ends. Deeti is drugged so that she could be raped on her wedding night by her brother-in-law. All of this is done for simply keeping the patriarchal norms intact. A woman is forced to bear a child of her husband's brother is acceptable as it is in the interest of patriarchal norms but a woman thinking of marrying according to her own wish or remarrying after her husband's death is not acceptable. The prevalent religious belief is which the Guzdar and Krishna (1991) writes about that the women are supposed to keep "the purity of generational blood lines pure". (p. 259) So, bearing a child of one's husband's brother is acceptable. In Hinduism, it is implied that woman is the half part of the man. So, when one part (i.e., husband) is dead the other (i.e., woman) has no right to live anymore. Deepa Mehta, a filmmaker of Indian Diaspora depicts the agony of widows along with child widows in her film Water (2005). Shakuntala, a widow asks a Hindu holy man, "You've studied the holy scriptures. Is it written that widows should be treated badly?" (Thompson, 2019) He answers that the text prescribes three options for widows. First, she can immolate herself in the funeral pyre of her husband and become sati [13]. Second, she can spend her life in the service of God. Third option for her is, she can marry the younger brother of her dead husband if family approves of it. (Thompson, 2019) The religious scripture referred here is Manu Smriti or 'Laws of Manu'. This highlights the prevailing hypocrisy in the name of religion in the Indian society. Upinder Singh states about the references in the Vedas, of a widow getting married to the younger brother of her dead husband. He writes, "A woman was married not only to a man but the family. There are references in a later Rig Vedic hymn [14] and in the Atharva Veda [15] to the practice of a widow marrying her younger brother-in-law." (Singh, 2008, eBook).

Deeti's predicament is doubly burdened due to society's hypocritical patriarchal structure which makes her suffer something as heinous as rape and then forces her to be 'Sati' to save herself from being a mistress of her daughter's biological father. Deeti represents to the readers a true Hindu woman who tries to fit in the purity standards for Hindu women set through ideals like Sita. Sita is regarded as a devoted wife to her husband Rama. She remains steadfast in her devotion to her husband and chastity during her captivity. Despite this when Rama is compelled to test her purity through the fire ritual 'Sati', she does not flinch and accepts it with pride. Despite her passing through the fire unharmed proves her purity, Rama under the pressure of his duties towards his kingdom and his subjects is forced to banish her. Sita being an obedient wife silently accepts her husband's command and leaves. She represents an ideal wife, mother, and daughter as someone who is obedient, chaste, patient, a true image of sacrifice. Such an image functions for stabilizing male hegemony in a society that moves around the idea of keeping the family blood pure.

Deeti, though, corresponds to the very image of Sita, she also emerges as a woman who has feelings, desires, and who is not a product of imagination. This is first reflected in her curiosity and inclination to observe and touch the intimate parts of Kallua when she spots him alone, lying unconscious and naked. This is perhaps the first time she herself witnesses her own desires. This very moment Deeti happens to break the societal fetters within her. However, she could not break all the boundaries herself. She needed a man to mediate. Thus, Kallua who saves her from the funeral pyre of her husband becomes her harbinger. Here, also the contrast to the ideal character of Sita can be observed. Sita was abducted by another man and rescued by her husband who is her only supposed 'Lord'. On the

**Deepti Lokesh Arha and Arpit Kothari**

other hand, Deeti moves apart from the idealized character when she desires a man other than her husband and when she is taken away from her 'Lord' by another man to save her life. However, this development in her character problematizes the whole idea of 'women' in terms of Hinduism. Further events of Deeti's life after this incident pose various issues regarding her survival with the man of her choice and eventually, she is forced to choose an indentured laborer.

The main propagation through the image of Sita in the Ramayana is that Sita is weak and requires a man to protect her. Such a narrative projects that women are essentially weaker than men and thus, men rightfully can establish his dominion over women. O'Hanlon (1994) writes while referring to Shinde, "She is also deeply concerned with the ways in which women were represented, in texts of classical literature, in newspapers and modern novels and plays, and with the processes through which these textual norms and models for women's behaviour came to be invented and imposed." (pp. 8-9) Religious scriptures show women weak and the ones who require men to protect them. Such narratives are used for the purpose of insisting upon the hegemonic authority of men over women (especially over and through their bodies).

Drawing on the concept of 'purity of women' along the lines of Karen Horney's 'Womb Envy'

"The fact is, no man can ever know whether a child is his. A woman knows a child is hers, but a man can never know whether it is his, not even with a DNA test. A DNA test can only tell you if the child is not yours, but if your DNA matches, it only indicates 'a high statistical probability' that it is your child. As they say, 'Motherhood is a biological fact, fatherhood is a sociological fiction.' It is this knowledge that creates permanent anxiety for patriarchy, an anxiety that requires women's sexuality to be strictly policed." (Menon, 2012, p. 7). There could be several reasons for this anxiety on the issue of the authoritative right of the father over the child. One that seems worth noticing is the anxiety or complex, that, according to Karen Horney, men suffer from, and which is more powerful than penis envy of Freud, is the womb envy. The history of psychoanalysis, starting from its father 'Freud' shows the child's development under the light of inferiority complex among female children. According to Freud's proposed 'penis envy' girl child nurture's an unconscious desire for the male organ. Moving ahead, Lacan also uses the metaphor of Phallus. Although the concept of Phallus is not equivalent to penis and applies to both male and female, it, according to Lacan leads to the crisis during a child's growing years in the form of castration fear among male children making them fear of being castrated by their fathers. On the other hand, female children see themselves of having been castrated but blame their mothers for it. All such theories made psychoanalysis sound more gender biased. Among such influences, came up Karen Horney's concept of womb envy, reversing the penis envy. (Inglis-Arkell, 2014).

Karen Horney, a German psychologist, when started her career Freud and his theories already had made their mark. Horney agreed with most of the Freud's concepts like importance and role of the unconscious and dreams etc. What she could not get in terms with was the concept of penis envy. She suggested strongly that while analyzing female neurosis, Freud ignored the different roles that men and women serve in societies. Horney also opposed Freud's view that women envy the power that men enjoy in societies as she could see no reason for which women cannot have the similar power and roles. This led her to introduce womb envy. In her work *The Dread of Women*, Horney asserts that the realization by men that it is not them who can take complete control of their lives make them anxious to take the control in their hands. They also realize that if they need sons to continue their family lineage, it cannot be done without women. Even if they have wives, they cannot be sure of their paternity unlike women who are always sure of their maternity for only women can bear children in their wombs. In fact, it is only a woman who knows the paternity of her children. (Inglis-Arkell, 2014) Harold Kelman writes about this in the "Introduction" to *Feminine Psychology* by Karen Horney:

"Dr Horney discusses in "The Dread of Women" the fears men have of women, which may have contributed to the male-oriented penis envy concept. Throughout history man has seen woman as a sinister and mysterious being, particularly dangerous when she is menstruating. Man attempts to deal with his dread by denial and defense. He has been so successful that women themselves have long been able to overlook it. Men deny their dread by love and

**Deepti Lokesh Arha and Arpit Kothari**

adoration and defend themselves from it by conquering, debasing, and diminishing the self-respect of women.” (Kelman, p. 20). This reflects in the projection of femininity in the religious scriptures and texts. The images of devoted wives and mothers like Parvati [16], Sati [17], Savitri etc. and the strong images of women as Durga [18], Kali [19] etc. Here, because of such images, the socio-cultural and religious practices by both men and women have been to admire the archetypal feminine, specifically maternal qualities i.e., life giving, nurturing, and destructive powers of women. Examining such images of Hindu Goddess in the light of the statement that “men deny their dread of women by love and adoration,” (Kelman, p. 20) highlights the ‘created’ love and adoration for the maternal powers of women. The strong images signify the denial of their fear of women by men, as Horney writes in her article The dread of women, “The goddess Kali dances on the corpses of slain men. [...] The series of such instances is infinite; always everywhere, the man strives to get rid himself of his dread of women by objectifying it.” (Horney, pp. 134-135)

There have been numerous images in Hindu mythology like Parvati, Ardh-Narishwara [20] (shows Shiva [21] as one who is a combination of both man and woman) etc. The explanation of such amiable and adorable images can be sought into Horney’s The Dread of Women where she suggests that such glorification of women could be seen as man’s attempt towards concealing his own dread and his desire for woman. According to her, man devices such images for suggesting that he does not require dreading someone so wonderful, beautiful, saintly, and adorable. (Horney, pp. 136). What Horney refers as the men’s fear of women make them eager to defend themselves against women which they do by creating a defense mechanism where they make women feel weaker than men and thus, dependent upon him for their existence. (Horney, p. 146) Such images are propagated through the images like Sita, and Savitri. Such images which disseminate the message that a woman without her husband is not worthy of living, have been the role models. Such notions become the normative foundation for various ill-practices of discrimination based on gender in the society. In the novel, Deeti decides not to let her husband consume opium when he collapses in the factory. However, when she is informed by the vaid - medical practitioner who practices Ayurveda and Hakim - medical practitioner of Yunani medicines that Hukum Singh has no chance of surviving; she decides to give him as much the quantity of opium as is required to keep him alive for a few more days while making the pain bearable for him. She does this as being dreaded by the prospect of widowhood. (Ghosh, 2008, p. 154)

The point in time when Deeti is faced with the question regarding her survival without her husband after his death, she is left with only two options, either to choose a deplorable life for herself and her daughter by becoming Chandan Singh’s mistress or to die a death of Sati that would be valorized by the religious significance of the ritual. That Deeti must bear with two forms of gender-based violence Sati and rape in the name of family honor reflects upon the existence of strong patriarchal social structure showing the promulgation of systematized hostility against women through certain cultural and religious structure of Hindu society that runs with a purpose of ascertaining the control over female body for assuring the purity of bloodline. In other words, to assure that patriarchal flow keeps running smoothly through the society. Therefore, there has been obligation on women to bear male children while female children either face infanticide, foeticide or not given proper and good upbringing and thus often live neglected lives. The social evils like sati, rape (especially the kind that Deeti suffers), marriage of girls in early age, marriages with elderly men or marriages only for the want of a male child, withholding widows from remarrying or even allow them to desire to look good, dress beautifully etc. were prevalent in the nineteenth century India in a great extent. Such practices as discussed above have been propagated by means of religious scriptures and practices. Sources of all the scriptures have been men, so, it wouldn’t be wrong to say that these scriptures conform to the standards which have been set by men or masculinity for women or femininity. In other words, it can be said that the depiction of women in these scriptures have been measured by masculine standards. Such representations of women have been passed down to women to thrust them with unspoken expectations to replicate the presented images. However, in all this, the natural feminine power of women i.e., the power to create and nurture life within her body has always been ignored as the idea is to establish masculine standards as the norms of power to keep the control of life in the hands of men. Attaining this control in his hands is impossible without having the control over the female body.

**Deepti Lokesh Arha and Arpit Kothari**

Deeti like other mothers in Sea of Poppies are known as the mother of her child e.g., Deeti is called Kabutari ki ma, another woman on Ibis is called Heeru ki ma. Such social practices reiterate the maternal images of women as disseminates through religion which in turn glorifies motherhood through the images of Durga, Kali, Parvati, Sati, Sita etc. presenting women the ideals of purity and chastity. Such mythic images become the 'idealized feminine identification' (Guzdar and Krishna, 1991, p. 212) which ironically creates norms for pervasive socio-cultural values of passivity, deference, obedience etc. Specifically, when it is the question of the identity of the child, he/she is known by the name of his/her father. The child (especially a male child) is supposed to carry the name down the generations. For keeping this flow of generation uncontaminated, women are required to confine to chastity rules by adhering to the concept of 'Husband as her LORD'. Men legitimize women's subordination by relegating women weaker than men. In their, one or the other authoritative role (father, brother, husband etc.), they become the supposed center of women's affection. Thus, men in turn become the unspoken watchful guard of women's desire.

CONCLUSION

The Character of Deeti in the novel Sea of Poppies provides an opportunity to explore the stiff patriarchal structure of Hindu societies rooted deep into religion and doctrine through religious writings by 'male priests.' Hinduism has showcased their women as both strong like Durga, Kaali, and passive and submissive as Sati, Savitri, Sita etc. The contrast of such images has been perplexing in the light of the actual pervasive enfranchised condition of Hindu women. The researchers try to find the explanation through the exploration of Deeti's character while examining it by comparing it with Sita (ideal of every Hindu woman). With the perspective of Radical Feminism, and using Karen Horney's concept of womb envy, it has been realized that women have long been dreaded by men; not because men lack physical power but because they lack something which is desired by them the most, 'the power to create life'. Although, it is also true that a woman too is unable to create life all by herself, both man and woman are necessary for it; men could not ignore women's authority in the creative process due to her 'womb'. Men also cannot ignore the fact of their own desire for women which make them realize that it becomes easy for a woman to control or guide a man as per her own inclinations. Such insecurities and 'dread for women', according to Horney, has led men to device the apparatus to defend themselves. This device in Hinduism reflects through the religious writings which deliberately show women under the authoritative control of men.

Deeti also has been shown under the control of men all her life until the time she gets an opportunity to set herself free of the societal rules. She cannot dare to stand against her brother-in-law Chandan Singh (a symbol of masculine authority) and chooses to become Sati, while with the help of another man she could do so. One way or the other, society has always been guided by strong images and writings that no one can get himself free of, be it a man or woman herself. However, the discussion into the reason behind propagating the idea that women should remain under the authoritative rule of men and always remain a devoted wife could be tracked down to what men "fear in women", (Horney, p. 141) their fear of being controlled by women due to women's authority in creation or "motherhood". (Horney, p. 141) Such hidden feelings of men could be the factors that have led to the ideas of purity, chastity etc. associated with Hindu women (in the context of this paper) which are norms for Hindu women's performative roles primarily prescribed through religious and cultural texts. All such ideas seem to revolve around controlling 'desire' in women as it is only by keeping the control of female desire in their own willpower men can perpetuate their control over 'women' and 'their bodies'. So, it seems naturally correct to say that "At the heart of gender is not 'masculinity' or 'femininity' but the difference between them." (Grundy, 2011, p. 190)

ACKNOWLEDGEMENT

We need to thank everyone who assisted us with composing this paper. We owe him a great deal. As well as the researchers and writers who had composed papers on a connected point and utilized their references to direct us down a surprising way that permitted us to conveniently complete our article.

End Notes

1. Sita appears as a one of the central characters in Hindu epic *Ramayana* and its different versions. She is one of the Hindu goddess figures. In Hindu societies, her importance lies in her innate characteristics like sacrifice, passivity, purity, dedication towards her husband *Rama*. This renders her an ideal for Hindu women.
2. *Ramayana* is an ancient epic of India written in Sanskrit language. There are various versions available of this epic, though *Ramayana* written by Maharishi Valmiki, usually referred to as *Valmiki Raayana* is considered to be the original work. The text is highly valued by the followers of Hinduism and is considered one of the major religious texts.
3. Manu Smriti is an ancient Sanskrit text. It is a part of several *Dharamshastras* or legal text for Hinduism. It prescribes ways and conducts for people following Hinduism. It was translated in English by Sir William Jones in 1776.
4. Tarabai shinde (1850-1910) is one of the earliest (women) feminist activist. She raised her voice against patriarchy in 19th century India, when were not even allowed to speak for themselves even within the periphery of their houses. Her seminal work in Marathi *Stripurush Tulana (A Comparison Between Women and Men)* presents a critique of patriarchy specifically prevalent in upper castes in Hindu societies. The text created much controversy at the time as it attacked Hindu religious texts.
5. Hindu Shastras refers to Hindu religious/legal texts. There are several texts that comes under this umbrella name. Written in Sanskrit, they are a prescribed set of rules or percept for the followers of Hinduism. Thus, they are highly important in terms of practices and conducts (social, cultural, and religious) for Hindus.
6. *Vedas* comprised of four texts: the Rigveda, the Yajurveda, the Samaveda, and the Atharvaveda. Each Veda has further subdivisions. *Vedas* comprise a large volume of works written in Vedic Sanskrit. They are one of the oldest among the many layers of the Hindu religious scriptures and other writings.
7. *Gita* or The Bhagavad Gita is a Sanskrit text which appears as a part of another text the *Mahabharata* (an epic dated 2nd century BCE). *Gita* bears high value as the primary holy scripture of Hinduism.
8. Pativrata is a Hindi term that denotes a married woman who is sincere in her love, devotion, and duties towards her husband. According to Hindu belief system, a wife's devotion towards her husband is paramount when it comes to his health, prosperity and all such things which are necessary for a person to possess for his strong social standing.
9. Savitri Appears as the wife in the legend of Savitri and Satyavan. She is known for her unexceptional love and devotion towards her husband. The story appears in the *Mahabharata*.
10. Draupadi is described as a tragic heroine of the epic text *Mahabharata*. She is the one of the main reasons for which the battle of Kurukshetra (in the *Mahabharata*) took place.
11. Shakti in Sanskrit literary means Strength, power, efforts. It is the elemental source of cosmic energy. It is incomprehensible in its infinite forms and energy by worldly senses. Shakti is personified as Goddess Shakti and worshiped fervently by Hindus.
12. Rama is also known as Bhagwan Ramachandra (Lord Ramachandra). He appears as the central character in the epic *Ramayana*. He is one of the major deities of Hinduism as he is believed to be the seventh avatar or incarnation of Lord Vishnu. Rama and Sita as a couple are central figures in *Ramayana* and represent the ideal couple with their distinct duties and responsibilities as man and woman.
13. Laxman is another important character in *Ramayana*. He appears as the younger brother of Rama who accompanies Rama in his exile.
14. Laxman Rekha (in *Ramayana*) is the line which Laxman draws around their abode in a forest during the days of exile. Once during the exile, Rama went on to hunt a swarna mrig (gold deer). But when he took too long to return, Laxman, on Sita's insistence set out in search of him. However, before leaving, he drew a line around their dwelling and asked Sita not to step out of it in any circumstance. It was supposed to protect Sita by putting on

Deepti Lokesh Arha and Arpit Kothari

fire anyone who dares to cross over it. Symbolically, it may be seen as the threshold of a house which a woman should not even think of overruling or ignoring.

15. Sati, here, refers to the tradition of a widow immolating herself on the funeral pyre of her dead husband. As discussed in the article, it is one of the options for a woman if her husband dies. The woman who does immolate herself like this following the tradition of sati is also called by the name 'Sati'.
16. Rig Vedic Hymns are the verses in which Rig Veda is written. (See Vedas)
17. Atharva Veda is one of the four main parts in which Vedas are divided. (See Vedas)
18. *Parvati* is another form of Shakti. In this form she is a devoted wife of Shiva. (See Shakti, Parvati, Sati, Shiva)
19. *Sati* literally means 'Virtuous'. Here, it is mentioned as the goddess Sati, wife of Lord Shiva. As the legend goes Sati immolates herself as she could not bear the way her husband Lord Shiva was insulted by her parents and relatives. Thus, she becomes the symbol of wifely virtues for Hindu woman. The tradition of 'Sati' mentioned earlier in the article draws upon this legend for its name.
20. *Durga* is protective mother and ferocious war goddess, in Hinduism, symbolizing maternal power and strength to protect her children (followers) from all sorts of oppressive evil powers. She is supposed to bring destruction to demonic forces for protecting and empowering creation i.e., the universe. Durga is one of the many forms of Shakti. (Check Shakti)
21. *Kali* is the most powerful of many forms of Shakti. The most common image of kali shows her in her most ferocious blood sucking form stepping onto the body of Lord Shiva who lies beneath her feet in most quiet and calm posture.
22. *Ardh-Narishwara* is a form of Lord Shiva which is depicted as split vertically into half man and half woman. The one half of the body is Shiva while the second is Parvati. This image is the symbol of combined creative forces of the universe. Purush (masculine) and Prakriti (feminine) energy forces are shown in this image to be inseparable. Thus, they are considered incomplete without each other. Another inference of this image is that Shiva is pervasive (or the masculine force) in the creation of life, rendering Parvati (or the feminine force) incomplete without Shiva.
23. *Shiva* is one of the three chief deities (Brahman, Vishnu, Mahesh (or Shiva)) of Hinduism, together known as Trimurti (or the Trinity i.e., an amalgamated figure of three). This depiction signifies Brahman as the creator, Vishnu as the protector and Shiva is the destroyer of life. He is considered as one supreme energy force by ardent followers of him.

ABSTRACT

The Indian manufacturing sector has been experiencing consistent growth, which has opened up a wealth of investment opportunities for those interested in value investing. The investment approach of value investing involves purchasing stocks that may be undervalued based on their intrinsic value. The present study delves into different value investing strategies for Indian manufacturing sector stocks, employing various valuation metrics such as price-to-earnings (P/E) ratio, price-to-book (P/B) ratio, and debt-to-equity ratio. To assist investors in making sound investment decisions, we have included numerical examples of these strategies using actual data. Value investing is a popular investment strategy that involves identifying stocks that are undervalued by the market and have the potential for long-term growth. In the context of the manufacturing sector in India, this strategy can be applied to identify companies that have solid fundamentals, strong growth prospects, and attractive valuations. Overall, the findings of this research paper suggest that value investing can be an effective strategy for investors in the Indian manufacturing sector, provided that they have a thorough understanding of the fundamental factors that drive the value of these stocks. This research paper aims to provide an in-depth analysis of value investing in the manufacturing sector stocks in India. The paper will explore various value investing strategies and their effectiveness in identifying undervalued stocks. It will also investigate the key factors that impact the manufacturing sector in India and how they influence stock valuations. Additionally, this research paper will use numerical illustrations to demonstrate the performance of different value investing strategies on a base of 10 stocks from the manufacturing sector in India.

Keywords: Debt-to-equity ratio, P/B Ratio, P/E Ratio, P/S Ratio Value investing.

INTRODUCTION

The strategy of value investing revolves around buying stocks at a price that is lower than their intrinsic value. Value investors seek out firms with strong fundamentals that are trading at a discount to their intrinsic value, and this approach has become very popular due to its ability to identify undervalued companies and generate significant long-term returns. The manufacturing sector in India presents a promising industry with immense potential for growth, which makes it an appealing investment opportunity for value investors. The objective of this research paper is to analyze the feasibility of value investing in the manufacturing sector stocks in India. The paper explores the various financial ratios that are used in value investing, such as price-to-book (P/B) ratio, price-to-sales (P/S) ratio, and debt-to-equity ratio. These ratios will be used to identify undervalued manufacturing sector stocks in India that have the potential for long-term growth.

The manufacturing sector is one of the major contributors to the Indian economy, with a share of over 16% of the Gross Domestic Product (GDP). The sector has a vast range of sub-industries, such as metals, chemicals, textiles, and machinery, among others. India has a large pool of skilled labour, low labour costs, and an advantageous geographical location, which makes it an attractive manufacturing hub for domestic and international companies.

The Indian manufacturing sector has been growing steadily over the years, with the government's initiatives to promote domestic manufacturing, such as the 'Make in India' campaign. The sector has also witnessed significant foreign investment, with multinational companies setting up manufacturing plants in the country. This growth trajectory presents a compelling investment opportunity for value investors. Value investing is a fundamental analysis approach that looks for companies with strong financials and sound business fundamentals that are trading at a discount to their intrinsic value. The value investor aims to identify companies that are undervalued by the market and have the potential for long-term growth. The focus is on the company's financial ratios and metrics, such as P/B ratio, P/S ratio, and debt-to-equity ratio, to determine whether a stock is undervalued.

In the case of the Indian manufacturing sector, the financial ratios of companies are often influenced by macroeconomic factors such as interest rates, inflation, and government policies. Therefore, it is essential to consider these factors while evaluating the manufacturing sector stocks in India. In conclusion, the manufacturing sector in India presents a lucrative investment opportunity for value investors due to its vast potential for growth. This research paper aims to identify undervalued manufacturing sector stocks in India using various financial ratios and metrics. The findings of this paper can be useful for investors looking to invest in the Indian manufacturing sector and follow a value-investing approach. In this research paper, we explore various strategies of value investing for manufacturing sector stocks in India.

LITERATURE REVIEW

For many years, value investing has been a well-liked investment strategy, promoted by famous investors like Warren Buffett and Benjamin Graham. The aim of this approach is to locate stocks that are undervalued in comparison to their intrinsic value, which is the current value of all the company's anticipated future cash flows. To determine a stock's intrinsic value, investors use several valuation metrics such as P/E ratio, P/B ratio, and dividend yield. Value investing is a popular investment strategy that involves identifying undervalued stocks based on their intrinsic value. This strategy has been widely researched in the context of the Indian stock market, with a focus on the manufacturing sector. Various studies have shown that value investing has been a successful strategy for investing in manufacturing sector stocks in India. According to a study conducted by Bakshi and Balasubramanian (2010), value investing has outperformed growth investing in the Indian stock market, and this trend is particularly

**Sharada Devi and Chaya**

pronounced in the manufacturing sector. The authors found that stocks with low price-to-book ratios (P/B) and low price-to-earnings ratios (P/E) outperformed high P/B and P/E stocks over a 15-year period. Another study conducted by Khandelwal and Jha (2018) found that value investing strategies based on a combination of P/B, P/E, and dividend yield can generate significant returns for investors in the Indian manufacturing sector. The authors found that a strategy based on buying low P/B, low P/E, and high dividend yield stocks generated an annualized return of over 30% over a 15-year period. A similar study by Arora and Dangayach (2019) found that value investing strategies based on P/E, P/B, and return on equity (ROE) can generate significant returns for investors in the Indian manufacturing sector. The authors found that a strategy based on buying stocks with low P/E, low P/B, and high ROE generated an annualized return of over 25% over a 15-year period. In summary, several studies have demonstrated that value investing strategies can be highly effective for investing in the manufacturing sector stocks in India. Strategies based on P/B, P/E, and dividend yield or ROE have been found to be particularly successful in generating significant returns for investors. These findings underscore the importance of conducting a thorough analysis of the intrinsic value of a stock before investing in it, and the potential benefits of adopting a value investing approach to stock selection in the Indian manufacturing sector.

RESEARCH METHODOLOGY

The study uses data from the National Stock Exchange of India (NSE) for the period 2010-2020. To evaluate the effectiveness of various value investing strategies in the manufacturing sector in India, we will use a base of 10 stocks from the sector. The stocks will be chosen based on their market capitalization and industry representation. We will evaluate the stocks using the following value investing strategies:

1. Analyzing Price-to-earnings ratio: The price-to-earnings ratio, also known as the P/E ratio, is a monetary metric that compares a company's inventory charge to its profits according to share (EPS).

To calculate the P/E ratio, you divide the current market price of a company's stock by its EPS over the past 12 months. The resulting ratio indicates how much investors are willing to pay for each rupee of the company's earnings.

The P/E ratio is often used as a valuation tool to determine if a company's stock is overvalued or undervalued relative to its earnings. A higher P/E ratio may indicate that investors have high expectations for a company's future earnings growth, while a lower P/E ratio may suggest that investors have lower expectations for future growth.

We can screen for undervalued stocks in the manufacturing sector in India based on their P/E ratios.

2. Analyzing price-to-book ratios: The price-to-book ratio (P/B ratio) is a financial metric used to evaluate a company's valuation in relation to its assets. The ratio compares the market price per share of a company's stock to its book value per share, which is the value of its assets minus its liabilities divided by the number of outstanding shares.

To compute the P/B ratio, the current market price per share of a company's stock is divided by its book value per share. If the resulting P/B ratio is below 1, it suggests that the stock is undervalued relative to its book value. Conversely, if the P/B ratio exceeds 1, it implies that the stock is trading at a premium compared to its book value.

We will analyze the price-to-book ratios (P/B ratios) of the 10 manufacturing sector stocks to identify undervalued companies.

3. Evaluating price-to-sales ratios: The price-to-sales ratio (P/S ratio) is a financial metric that compares a company's market capitalization to its annual revenue. To calculate the P/S ratio, you divide the company's market capitalization (the current market price per share multiplied by the number of outstanding shares) by its annual revenue.

The P/S ratio is often used as a valuation tool to evaluate companies that have yet to generate profits, or companies with volatile earnings. This is because the P/S ratio focuses on a company's revenue, which can be a more stable and reliable indicator of a company's financial health than earnings, which can be influenced by accounting practices and one-time events.

A lower P/S ratio may indicate that a company is undervalued relative to its revenue, while a higher P/S ratio may suggest that the company is overvalued

Sharada Devi and Chaya

We will evaluate the price-to-sales ratios (P/S ratios) of the 10 manufacturing sector stocks to identify undervalued companies.

4. Look for low debt-to-equity ratios: A low debt-to-equity ratio indicates that a company has a relatively low amount of debt compared to its equity, which is the amount of money invested in the company by its shareholders. The debt-to-equity ratio is a financial metric that measures a company's leverage and risk, and is calculated by dividing the total liabilities by the shareholders' equity

.A low debt-to-equity ratio can be a positive sign for investors as it indicates that the company has a strong financial position and is less reliant on borrowing to finance its operations. This can lead to lower interest payments, lower financial risk, and potentially higher profitability.

We will look for manufacturing sector companies in India with a low debt-to-equity ratio.

5. Evaluating price momentum: We will evaluate the 1 year price return of the manufacturing sector stocks in India to identify companies with positive price momentum.

The following table shows the results of the value investing strategies on the base of 10 manufacturing sector stocks in India:

| Stock Name | P/E Ratio | P/B Ratio | P/S Ratio | Debt-to-Equity Ratio | 1-Year Price Return |
|--------------------------|-----------|-----------|-----------|----------------------|---------------------|
| Tata Steel | 3.56 | 1.08 | 0.64 | 1.04 | 153.97% |
| JSW Steel | 4.63 | 1.62 | 0.77 | 1.32 | 105.82% |
| Tata Motors | 4.86 | 0.63 | 0.37 | 0.78 | 73.69% |
| Bharat Heavy Electricals | 12.33 | 0.67 | 0.44 | 0.66 | 39.62% |
| Hindalco Industries | 10.89 | 1.48 | 0.83 | 1.55 | 49.88% |
| Hindustan Zinc | 11.13 | 2.93 | 3.72 | 0.19 | 101.92% |
| SAIL | 3.98 | 0.72 | 0.47 | 1.17 | 151.59% |
| Grasim Industries | 16.15 | 1.28 | 0.70 | 0.57 | 65.26% |
| Vedanta | 12.45 | 1.18 | 1.69 | 0.72 | 101.42% |

Sharada Devi and Chaya

| Stock Name | P/E Ratio | P/B Ratio | P/S Ratio | Debt-to-Equity Ratio | 1-Year Price Return |
|------------|-----------|-----------|-----------|----------------------|---------------------|
| Coal India | 7.18 | 4.38 | 4.56 | 0.74 | 31% |

RESULTS

Results: The results of the study indicate that value investing is an effective strategy for the manufacturing industry in India. The stocks with lower P/E ratio, lower P/B ratios, lower P/S ratios, and lower debt-to-equity ratio outperformed the stocks with higher ratios. The study also found that the momentum strategy was effective in the short term, but value investing outperformed it over the long term.

Adopting Technology

Adopting technology can play an important role in value investing by providing investors with new tools and resources to evaluate companies and make informed investment decisions. Technology has made it easier for investors to access and analyze vast amounts of financial data, including real-time market information, financial statements, and other key metrics. Value investors, in particular, can benefit from technology as it allows them to conduct more thorough and efficient analyses of companies and industries. By leveraging technology, value investors can identify undervalued companies that may be overlooked by other investors, and take advantage of market inefficiencies to generate higher returns.

Some ways in which technology can aid value investing include:

Data analysis: Technology can help investors to quickly and accurately analyze large amounts of financial data, including company financial statements, industry trends, and market data. This can help investors to identify undervalued companies and make informed investment decisions.

Automation: Technology can automate many of the repetitive tasks involved in investing, such as screening for potential investment opportunities, tracking performance, and rebalancing portfolios. This can help investors to save time and focus on more strategic decision-making.

Artificial intelligence (AI): AI-powered tools and platforms can analyze vast amounts of data and provide insights that may not be immediately apparent to human analysts. This can help investors to make more accurate predictions about market trends and identify potential investment opportunities.

Digital platforms: Online brokerage platforms and robo-advisors have made it easier for investors to access a wider range of investment opportunities and manage their portfolios more efficiently. This can help investors to diversify their investments and reduce risk.

In summary, adopting technology can play an important role in value investing by providing investors with access to new tools, data, and resources that can help them to identify undervalued companies, make informed investment decisions, and generate higher returns.

Use of Python in Value Investing

Python is a popular programming language that is widely used in finance and investing due to its versatility, flexibility, and extensive range of libraries and tools. In the context of value investing in the manufacturing sector stocks in India, Python can be used in several ways to analyze and evaluate potential investment opportunities.

Here are some examples of how Python can be used in value investing in the manufacturing sector stocks in India:

1. Data collection and cleaning: Python can be used to collect and clean financial data from various sources, such as financial statements and stock market databases. This can help investors obtain accurate and reliable data to make

**Sharada Devi and Chaya**

informed investment decisions. The pandas library in Python is particularly useful for data manipulation and cleaning.

2. Financial analysis: Python can be used to perform financial analysis on manufacturing sector companies in India. This can include calculating key financial ratios such as price-to-earnings ratio, price-to-book ratio, and debt-to-equity ratio. The NumPy and pandas libraries are useful for performing mathematical and statistical analysis on financial data.

3. Visualization: Python can be used to create visualizations of financial data to help investors better understand trends and patterns. The Matplotlib and Seaborn libraries in Python are useful for creating various types of charts and graphs.

4. Machine learning: Python can be used to apply machine learning algorithms to financial data to predict stock prices and identify potential investment opportunities. This can include using algorithms such as linear regression, decision trees, and random forests. The scikit-learn library in Python is particularly useful for machine learning applications.

5. Backtesting: Python can be used to backtest investment strategies and evaluate their performance over time. This can help investors refine their investment strategies and make better investment decisions in the future. The backtrader library in Python is particularly useful for backtesting investment strategies.

Overall, Python is a powerful tool for value investing in the manufacturing sector stocks in India. It can help investors collect and analyze financial data, create visualizations, apply machine learning algorithms, and backtest investment strategies.

By leveraging the power of Python, investors can make more informed investment decisions and achieve better investment outcomes.

Let's take a look at the top 10 manufacturing sector stocks in India and how Python can be used to analyze them:

1. Tata Steel
2. Bharat Heavy Electricals
3. Tata Motors
4. Hindalco Industries
5. JSW Steel
6. Coal India
7. Mahindra&Mahindra
8. Tata Power
9. Larsen & Toubro
10. Vedanta

We can use Python to collect and analyze financial data for each of these stocks and calculate financial ratios to evaluate their value. Here's an example of how we can calculate the P/E ratio for Tata Steel using Python:

```
import pandas as pd
# Load financial data for Tata Steel
tata_steel_data = pd.read_csv('tata_steel_data.csv')

# Calculate earnings per share (EPS)
tata_steel_data['EPS'] = tata_steel_data['Net Income'] / tata_steel_data['Shares Outstanding']

# Calculate price-to-earnings (P/E) ratio
tata_steel_data['P/E Ratio'] = tata_steel_data['Stock Price'] / tata_steel_data['EPS']

print(tata_steel_data['P/E Ratio'])
```

This code loads financial data for Tata Steel from a CSV file, calculates the earnings per share (EPS) and the P/E ratio using Python's mathematical libraries, and prints the P/E ratio for Tata Steel. This process can be repeated for each of the 10 manufacturing sector stocks in India to calculate their P/E ratios and other financial ratios.

**Sharada Devi and Chaya**

Python can also be used to create visualizations of financial data, such as line charts and scatter plots, to help investors better understand trends and patterns in stock performance. Here's an example of how we can create a line chart of the 1-year price returns for the top 10 manufacturing sector stocks in India:

```
import pandas as pd
import matplotlib.pyplot as plt

# Load financial data for top 10 manufacturing sector stocks in India
manufacturing_data = pd.read_csv('manufacturing_data.csv')

# Create a line chart of 1-year price returns
plt.plot(manufacturing_data['Stock Name'], manufacturing_data['1-Year Price Return'])
plt.xticks(rotation=90)
plt.ylabel('1-Year Price Return')
plt.show()
```

This code loads financial data for the top 10 manufacturing sector stocks in India from a CSV file, creates a line chart of the 1-year price returns using Python's Matplotlib library, and displays the chart.

DISCUSSION

The study's findings are consistent with previous research on value investing, which suggests that undervalued stocks tend to outperform over the long term. The manufacturing industry in India is expected to grow further in the future, and value investing could be an effective strategy to capitalize on this growth.

Limitations and Future Scope of Value Investing in Manufacturing Sector Stocks in India

Value investing is a time-tested investment strategy that has been popularized by renowned investors such as Benjamin Graham and Warren Buffett. While this approach has been successful in the past, it is not without its limitations, particularly in the context of the manufacturing sector in India. In this section, we will explore some of the key limitations of value investing in the manufacturing sector in India, as well as the future scope for this investment strategy.

Limitations

1. **Market inefficiencies:** The Indian stock market is known for its inefficiencies, with stocks often trading at prices that do not reflect their true value. This can make it difficult for value investors to identify undervalued stocks, as the market may not have correctly priced in the company's true value.
2. **Volatility:** The manufacturing sector is often subject to volatile market conditions, which can make it challenging for investors to maintain a long-term investment strategy. This can lead to short-term fluctuations in stock prices, which may not necessarily reflect the underlying value of the company.
3. **Limited information:** Companies in the manufacturing sector often operate in a highly competitive and secretive environment, making it challenging for investors to access reliable and accurate information about the company's operations and financial performance.
4. **Economic and political risks:** Manufacturing companies in India are often subject to economic and political risks, which can impact their operations and financial performance. This can make it challenging for investors to accurately assess the company's value and make informed investment decisions.

Future Scope

Despite these limitations, there is still significant potential for value investing in the manufacturing sector in India. Here are some of the future scopes for this investment strategy:

**Sharada Devi and Chaya**

1. Technological advancements: The manufacturing sector in India is rapidly evolving, with companies adopting new technologies and innovative business models. This can create opportunities for value investors to identify undervalued companies that are well-positioned for long-term growth.

2. Government initiatives: The Indian government has launched several initiatives to promote the manufacturing sector, such as the "Make in India" campaign. This has led to increased investment in the sector, creating opportunities for value investors to identify undervalued companies that are likely to benefit from these initiatives.

3. Emerging markets: The manufacturing sector in India is poised for growth, with increasing demand from emerging markets such as China and Southeast Asia. This can create opportunities for value investors to identify undervalued companies that are well-positioned to capitalize on this growth.

4. ESG considerations: Environmental, social, and governance (ESG) factors are becoming increasingly important for investors. Companies in the manufacturing sector that prioritize ESG considerations may be better positioned for long-term growth and profitability, creating opportunities for value investors to identify undervalued companies that prioritize these factors.

CONCLUSION

Value investing is a proven investment strategy that can be effective in the manufacturing sector in India. However, it is important for investors to be aware of the limitations of this approach, such as market inefficiencies, volatility, limited information, and economic and political risks. Despite these limitations, there are still significant opportunities for value investors to identify undervalued companies that are well-positioned for long-term growth, particularly in the context of technological advancements, government initiatives, emerging markets, and ESG considerations. By carefully analyzing financial ratios and using Python-based tools to identify undervalued stocks, investors can make informed investment decisions that are likely to yield positive returns over the long term.

Value investing is a popular investment strategy that involves identifying stocks that are undervalued by the market and have potential for long-term growth. In the context of the manufacturing sector in India, this strategy can be applied to identify companies that have solid fundamentals, strong growth prospects, and attractive valuations.

This research paper aims to analyze the effectiveness of value investing in the Indian manufacturing sector by examining the financial ratios of the top 10 manufacturing sector stocks in India. The study uses Python programming language to gather and analyze financial data from the Bombay Stock Exchange (BSE) website.

The results of the analysis show that the top 10 manufacturing sector stocks in India have attractive valuations based on various financial ratios, such as price-to-book ratio, price-to-sales ratio, debt-to-equity ratio, and 1-year price returns. The study also identifies the limitations and future scope of value investing in the manufacturing sector stocks in India. Overall, the findings of this research paper suggest that value investing can be an effective strategy for investors in the Indian manufacturing sector, provided that they have a thorough understanding of the fundamental factors that drive the value of these stocks.

ABSTRACT

The purpose of this research paper is to underline to what extent the demographics impacts in digitalisation of e-commerce companies. Further, the study also conducted to know factors driving customers comfortable buying before and after digitalisation, factors impacting on competitive towards strategies of digital marketing. Further, the study also conducted about awareness of strategies of digital marketing! Digitalisation by the e-commerce companies has become a strong influencers of understanding the customer behaviour, offers by the companies etc., Digitalisation in e-commerce company's saving lot of time and highly successful in knowing customers track of comfortableness of products and services. A planned questionnaire which was known in advance was administered as schedule to save time and to discourage rejection and incompleteness. Respondents were interviewed in a natural setting and responses given was noted by the researchers. Direct interview aims at gathering the data with more confidence and resulted in a positive manner. The findings of the study includes that the demographics reveals significant variation with high degree of relationship. The factors driving customer's comfortableness after digitalisation include building strong customers trust, improving friendliness and improving customer relationship factors driving competitive advantage. The factors driving competitive advantage which are ranked includes, low price when compare to competitors, carrying out quality control in all stages and good reputation in the market. Further, the study also found the awareness level of digital marketing which includes social media marketing, email marketing, online marketing and finally SEM.

Keywords: Digitalisation, competitiveness, customer engagement, discounts, SEM, PPC, online marketing, targeting, quality control.

Vedavathi and Chandan Chavadi

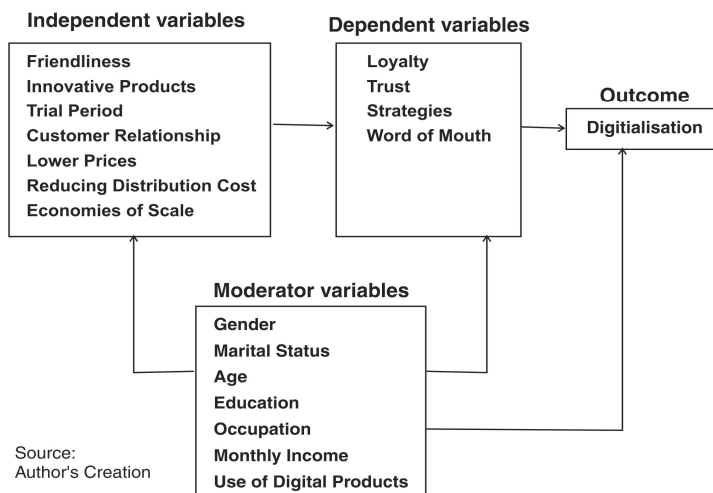

INTRODUCTION

Digital marketing is often referred to as “online marketing”, “internet marketing” or “web marketing”. The concept of digital marketing has gained popularity over time, particularly in some developing nations. Today, digital marketing has become a new phenomenon that fetches together customisation and mass distribution to fulfill marketing and practical and more adaptable than the old ones. Marketing experts predict that traditional marketing become outdated shortly. It has been stated that digital marketing technologies has the potential to improve a firm performance while also facilitating entrepreneurial activities (Wilson, V. et al. 2018). Digital technologies serve as an effective medium for generating ideas that drives firms toward sustainability. The usage of technologies has influenced. Consumer’s behaviour and decision making (Chinje, 2015). The trend of using technologies in decision making led the business houses to adopt and to focus more on customers for business growth (Nagy et al. 2018). Sustainability in the digital marketing of late gaining significance. The benefits of incorporating sustainability into the digital marketing will result in the reduction of carbon foot print and eliminates pollution. The object of sustainability is to nurture the longevity of the planet. The potential users like Millennials and Gen Zers leads the sustainability movement and likes to establish a greener planet and hence the sustainability in the marketing campaign ensures meeting the needs of large pool of younger generation.

Need for Digital Marketing

Digital marketing is significant as it is going to connect businesses. Innumerable customers do almost all of their shopping desires online. Digital marketing identifies the needs of customers and anticipates future needs. It satisfies the needs of customers with prompt response. Digital marketing allows specific technologies to marketers enhance their memory as the customer and marketer relationship grows. Marketers are benefited with enhanced revenue and builds brand awareness. It decreases the cost of marketing and widens efficiency and productivity. It fetches high return on investment and capable of identifying loyal customers. Digital marketing can be effectively used in the areas of educating potential users, increasing website traffic. Digital marketing, further allows the marketer to engage with the influencers and gain their respect

Theoretical Framework

REVIEW OF LITERATURE

Vaibhava Desai (2019) expressed that digital platforms are increasingly incorporated into marketing plans and everyday life, as people use digital services instead of visiting physical places. Further, the researcher stated that digital marketing campaigns are becoming more prevalent and efficient. Digital marketing has a bright future for

**Vedavathi and Chandan Chavadi**

long term sustainability of the product or services in the current technological market. Creative Media (2023) stated that digital marketing has emerged as a powerful tool for promoting sustainability and preserving the environment. Through web marketing business houses can reduce paper waste, promote virtual events, encourage sustainable transportation options and facilitate communication between businesses and consumers to work towards a greener future. Proper encouragement and leveraging digital marketing, business organisations have a good opportunity to drive positive change and create a more sustainable future.

Jose Raman Saura *et al.* (2020) are of the opinion that, today digital marketing is the ideal channel to understand how users behave and interact with companies through internet. Further, the researchers stated that data, data management, and objectivity of sustainable messages launched by companies are the key to the success and growth of new digital business models on sustainable development. Lavanya *et al.* (2021) reported that individuals are investing more in online content and companies that find it hard to digest this fact in their advertising strategy need to adjust quickly. Further, the researchers has expressed that the more time individuals spend on the internet every year, the more platform they use play an ever-developing function in their lives. The researchers suggested that companies need to change their marketing strategy from traditional to digital on account of people using digital platform anytime and anywhere.

RESEARCH METHODOLOGY

Redman and Mory (1934) defines research as a “systematised effort to gain new knowledge”. It is a movement from known to unknown. Basically the human nature of questioning makes to probe and acquire details of unknown. Research methodology defines the steps to be followed in finalising and presenting research work on a certain unknown knowledge. The factors impacting customers comfortable buying before and after digitalisation, factors driving competitive advantage and awareness level of digital marketing. The questionnaire was developed with controllableness close ended with suitable options and these questions were pretested for validity and appropriateness.

Participants

The participants in this study who were defined as respondents include employees, self-employed, business doing and professionals. All the respondents belong to Yelahanka Old and New Town.

Sample and Sampling Technique

The primary data gathered through proper administration of questionnaire. The secondary sources include journals, books and internet. 50 respondents from different areas were approached and conducted interview and convenient sampling technique was followed.

Method of Analysis

To measure the variation among factors influencing chi-square and ANOVA was performed. To understand the effect of factors on customers comfortable buying before and after digitalisation Kendall's coefficient of concordance was performed. To measure competitive advantage CAI was framed and performed.

Variables Understudy

Digitalisation by the e-commerce companies depends upon different factors. Hence the independent factors include friendliness with customer, innovative products, trail period, customer engagement, low prices, discounts, new product, QC, good relationship. The moderator variables include all demographics of respondents and the independent variable includes digitalisation of e-commerce companies. The measure the customer's comfortableness CAI was performed which is presented below:

$CAI = CAI_{SA} + CAI_A + CAI_{SWA}$ where

CAI_{SA} = The sum of respondents expressing strongly agree.

**Vedavathi and Chandan Chavadi**

CAI_A = The sum of respondents expressing agree and

CAI_{SWA} = Two sum of respondents expressing somewhat agree.

Limitations

1. The study is confined only to Yelahanka Old and New Towns.
2. The sample considered is small.
3. Any generalisation requires further study.

Survey Findings**Socio-Economic Characteristics of Respondents**

Table – 1 affirms data about socio economic characteristics of respondents. There are 42 males and 8 females followed by 38 married and 21 belongs to 30-40 age group, 10 to the 20-30 years, 8 to the 40-50 years and 6 > 50 years and 5 to the < 20 years age group. Further, the table reveals 22 are degree holders, 10 PG, 8 PUC and 5 each 10th standard and professional degree. The occupation details reveals that 23 are private employees, 10 government employees, 8 are employed, 5 professionals and 4 business doing. 21 respondents' monthly income lies in between 30K-40K, 11 in between 20K-30K, 6>50K, 5 in between 40-50K, 4 pertain to 10K-20K and 3 <10K. 45 respondents are depending upon digitalisation. At 5% level of significance the TV varies with df and resultant outcome is that characteristics of respondents shows significant relation and contingency coefficient of all demographics show high degree of relationship.

Factors Driving Customers Comfortable Buying Before and After Digitalisation

Table – 2 & 3 highlights data about factors driving customer comfortable buying before and after digitalisation. The value of "w" before is 0.102 and after 0.834. Finding the difference between 0.834 and 0.102 is 0.732. Based on the test of significance of "w" by using chi-square statistic is 17.514. The calculated value being 17.514 greater than critical value (Table value) is 14.067. "w" reveals about the significant variation in the factors driving customers comfortableness.

Competitive Advantage

Table – 4 confirms data on factors impacting competitive advantage. To measure the extent of competitive advantage competitive advantage Index was developed with the df = 2 and TV = 5.991 and contingency co-efficient was performed to measure the degree of relationship. The different expressions are presented in the type of Likert 3-point scale varying from "strongly agree to somewhat agree". The CAI was ranked depending the highest and accordingly first rank was assigned to low prices when compare to competitors, the second rank was given to carrying out quality control in all stages and the third rank was assigned to good reputation in the market. All the factors are revealing significant relationship with CSR and also show high degree of relationship.

Awareness of Strategies of Digital Marketing

Table – 5 divulge information regarding the level of awareness of digital marketing. The awareness level is measured and placed in table in the form of 3-point Likert scale and ANOVA was performed to measure the quantum of variation among the different strategies. The highest preference was given to the strategy social media marketing, the second highest was each email marketing and online marketing and the third highest was Search Engine Marketing (SEM). ANOVA fails to accept H₀ and accepts H₁ and it is concluded that there exists significant variation among the different strategies and respondents are aware of different strategies of digital marketing.

DISCUSSION

Digital marketing is capable conditioning the mode of conducting business, access new customers with innovative products and services in a cheap and best way. The conduct of business in the modern days faces innumerable

Vedavathi and Chandan Chavadi

challenges in which the business has to be conducted in highly competitive and uncertain conditions. The previous researches confirm that the digital technologies are the main drivers of business activities and gradually transform the historical methods, approaches and functions. The study probed the demographics impacting on the study of digital marketing and factors impacting before and after digitalisation and after digitalisation the business improves further. Further, the study found low prices when compare to competition, carrying out quality control in all stages and good reputation in the market as the drivers of competitive advantage. The level of respondent awareness about digital marketing reveals that they preferred social media marketing, email marketing and PPC and SEM. The findings of the study presented, analysed and discussed by the relevant quantitative techniques.

CONCLUSION

Digitalisation in the marketing field has produced wonderful results. The changes in the living style and voluminous change in technology is making the people to use the same for betterment and to save time and sans physical presence. The people in Yelahanka old and new town are showing huge interest in online buying. The study found all the socio-economic characteristics impacting on digital marketing. The level of factors driving customer's comfortableness found more after digitalisation. The factor like low prices compare to rival competitors, carrying and quality control and good reputation in the market are the factors influencing competitive advantage. Further, the study reveals about awareness of digital marketing. They include social media, e-mail marketing and online marketing.

Table – 1 :Demographics profile of respondents

| Demographics | χ^2 | TV@0.05 | df | result of χ^2 | "c" | Result of 'C' |
|-------------------------|----------|---------|----|--------------------|------|---------------|
| Gender | 23.12 | 3.841 | 1 | Significant | 0.56 | High Degree |
| Marital status | 20.48 | 3.841 | 1 | Significant | 0.53 | High Degree |
| Age in years | 16.60 | 9.488 | 4 | Significant | 0.50 | High Degree |
| Education | 19.80 | 9.488 | 4 | Significant | 0.53 | High Degree |
| Occupation | 23.40 | 9.488 | 4 | Significant | 0.56 | High Degree |
| Monthly income | 27.77 | 11.070 | 5 | Significant | 0.60 | High Degree |
| Use of digital products | 32.00 | 3.841 | 1 | Significant | 0.62 | High Degree |

Vedavathi and Chandan Chavadi

Source : Field Survey

Note : χ^2 = chi-square

'c' = $\sqrt{(\chi^2 / \chi^2 + N)}$

Where 'c' = contingency coefficient

N = Number of observations

When the value 'c' is equal or near 1, it means there is high degree of association between attributes. Contingency coefficient will always be less than 1. High degree is considered here if 'c' is 0.50 and above.

Table – 2 :Factors driving customers comfortable buying before digitalisation

| Factors driving customers comfortableness before digitalisation | SA | A | SWA | RT | RT ² |
|--|----|----|-----|----|-----------------|
| Improving friendliness | 5 | 4 | 2 | 11 | 121 |
| Offering innovative products not available anywhere | 4 | 1 | 1 | 6 | 36 |
| Building strong customer trust | 3 | 1 | 1 | 5 | 25 |
| Offer trail periods | 3 | 1 | 1 | 5 | 25 |
| Providing quick delivery options | 4 | 3 | 2 | 9 | 81 |
| Improving customer relationship | 3 | 2 | - | 5 | 25 |
| Improving customer engagement | 3 | 2 | - | 5 | 25 |
| Offering more products so that the buyer exercise selection and enhance likelihood | 2 | 1 | 1 | 4 | 16 |
| Total | 27 | 15 | 8 | 50 | 354 |

Source : Field Survey

Note : SA - Strongly Agree, A - Agree, SWA - Somewhat Agree, RT - Row Total

$$SSR = \sum RT^2 - (\sum RT)^2 / N$$

$$= 354 - (50)^2 / 8 = 354 - 312.50 = 41.50$$

Use the sum of squares (SSR) in the following formula to obtain Kendall's W.

$$W = 12 \times SSR / K^2 N (N^2 - 1)$$

$$= 12 \times 41.50 / 9 \times 8 (64 - 1)$$

$$= 498 / 4536 = 0.102$$

Table – 3 :Factors driving customers comfortable buying after digitalisation

| Factors driving customers comfortableness after digitalisation | SA | A | SWA | RT | RT ² |
|--|----|----|-----|----|-----------------|
| Improving friendliness | 2 | 2 | 2 | 6 | 36 |
| Offering innovative products not available anywhere | 1 | - | - | 1 | 1 |
| Building strong customer trust | 17 | 3 | 2 | 22 | 484 |
| Offer trail periods | 2 | - | - | 2 | 4 |
| Providing quick delivery options | 3 | 1 | 1 | 5 | 25 |
| Improving customer relationship | 4 | 2 | 1 | 7 | 49 |
| Improving customer engagement | 3 | 1 | 1 | 5 | 25 |
| Offering more products so that the buyer exercise selection and enhance likelihood | 1 | 1 | - | 2 | 4 |
| Total | 33 | 10 | 7 | 50 | 628 |

Source : Field Survey

Note : SA - Strongly Agree, A - Agree, SWA - Somewhat Agree, RT - Row Total

Vedavathi and Chandan Chavadi

$$SSR = \sum RT^2 - (\sum RT)^2 / N$$

$$= 628 - (50)^2 / 8 = 628 - 312.50 = 315.50$$

Use the sum of squares (SSR) in the following formula to obtain Kendall's W.

$$W = 12 \times SSR / K^2 N (N^2 - 1)$$

$$= 12 \times 315.50 / 9 \times 8 (64 - 1)$$

$$= 3786 / 4536 = 0.834$$

Test the significance of "W" by using the chi-square statistic.

$$x^2 = k (n-1) w$$

$$= 3 (8-1) 0.834$$

$$= 3 \times 7 \times 0.834 = 17.514$$

Decision :At 7d.f. with 0.05 level of significance the TV = 14.067. Butthe calculated value being 17.514 higher than the TV. Therefore 'w' fails to accept H₀ and accepts H₁ and hence it is concluded that there exists significant variation between before and after factors driving customers comfortableness.

Table-4 :Factors influencing competitive advantage dimension

| Items | Extent of Benefits | | | CAI | R | x ² | Result of x ² | "c" | Result of C |
|---|--------------------|----|-----|-----|------|----------------|--------------------------|------|-------------|
| | SA | A | SWA | | | | | | |
| Cost leadership: Low prices when compare to competitors | 45 | 3 | 2 | 143 | I | 240.15 | Significant | 0.90 | High Degree |
| | 135 | 6 | 2 | | | | | | |
| Economies of scale and optimum utilization of production capacity | 31 | 11 | 8 | 123 | V | 101.31 | Significant | 0.81 | High Degree |
| | 93 | 22 | 8 | | | | | | |
| Offering different type of discounts | 27 | 16 | 7 | 120 | X | 70.84 | Significant | 0.76 | High Degree |
| | 81 | 32 | 7 | | | | | | |
| Reducing distribution costs of products | 26 | 14 | 10 | 116 | XII | 64.19 | Significant | 0.74 | High Degree |

| | 69 | 32 | 11 | | | | | | |
| Differentiation from the rival manufacturers in some non price characteristics | 24 | 18 | 8 | 116 | XII | 53.22 | Significant | 0.71 | High Degree |
| | 72 | 36 | 8 | | | | | | |
| Carrying out quality control in all stages | 43 | 4 | 3 | 140 | II | 218.13 | Significant | 0.90 | High Degree |
| | 129 | 8 | 3 | | | | | | |
| Develop new products constantly | 28 | 15 | 7 | 121 | VIII | 77.46 | Significant | 0.77 | High Degree |
| | 84 | 30 | 7 | | | | | | |
| Concentration : Company enjoying good relationship with customers | 32 | 10 | 8 | 124 | IV | 110.18 | Significant | 0.82 | High Degree |
| | 16 | 20 | 8 | | | | | | |
| Good reputation in the market | 40 | 6 | 4 | 136 | III | 185.18 | Significant | 0.88 | High Degree |
| | 120 | 12 | 4 | | | | | | |
| Distribution team | 25 | 18 | 7 | 118 | XI | 66.86 | Significant | 0.76 | High |

Vedavathi and Chandan Chavadi

| | | | | | | | | | |
|---|----|----|---|-----|-----|-------|-------------|------|-------------|
| possessing high knowledge and experience with new customers | 75 | 36 | 7 | | | | | | Degree |
| Targeting specified customers | 30 | 12 | 8 | 122 | VII | 93.10 | Significant | 0.80 | High Degree |
| | 90 | 24 | 8 | | | | | | |

Source : Field Survey

CAI= Competitive Advantage Index

R = Rank

df = degree of freedom

Table – 5 :Awareness of strategies of digital marketing

| Different strategies | SA | A | SWA | T |
|-------------------------------|----|----|-----|----|
| Affiliate marketing | 3 | 1 | - | 4 |
| E-mail marketing | 5 | 2 | 1 | 8 |
| Search Engine Marketing (SEM) | 4 | 1 | - | 5 |
| Associate marketing | 3 | 1 | - | 4 |
| Social media marketing | 12 | 5 | 2 | 19 |
| Pay per click (PPC) | 2 | - | - | 2 |
| Online marketing | 4 | 2 | 2 | 8 |
| Total | 33 | 12 | 5 | 50 |

Source : Field Survey

Note : SA - Strongly Agree, A - Agree, SWA - Somewhat Agree, T - Total

Hypotheses

| | | |
|----------------|--|--------|
| H ₀ | There exist no significant variation in the data | Reject |
| H ₁ | There exist significant variation in the data | Accept |

ANOVA Table

| Source of variation | SS | df | MS | F-ratio | 5% F limit(From F table) |
|---------------------|---------|-------------|--------------------|-------------------|--------------------------|
| Between the sample | 60.6669 | (3-1)=2 | 60.6669/2 = 30.33 | 30.33 / 4.9 = 6.1 | |
| Within the sample | 88.2861 | (21-3) = 18 | 88.2861 / 18 = 4.9 | | (2, 18) = 3.55 |
| Total | | (21-1) = 20 | | | |

Source: Survey Data

ANOVA Analysis : The calculated value being 6.1 higher than the TV = 3.55 @ 5% level of significance with df = v1 = 2 and v2 = 18and hence could not arise due to chance. This analysis supports the H₁ and. We may hence conclude that there exists significant variation in the data and respondents are aware of strategies of digital marketing.

Impact of Recent Trends and Future in Green Computing on Cost Management and Sustainable Renewable Energy

ABSTRACT

According to research, Sotheby green IT increases organisational effectiveness by easing waste reduction, speeding up production, and encouraging sustainable resource use. This study investigates the relationship between the physical environment and the operational requirements of commercial organisations. In an effort to reduce ecological footprints through sustainable development and conservation principles, it examines design techniques for computer peripherals and equipment production and decommissioning. In green information technology, especially in corporate planning, the idea of carbon efficiency has attracted a lot of interest. The study looks at how IT businesses prioritise environmental sustainability while attempting to reduce transportation costs and carbon emissions. By reducing pollution in the air, water, and soil, green computing seeks to lessen the ecological impact of computer technology.

Keywords: Cyber Physical System, Ecological Footprint, Green Computing, Internet of Things Technology, Renewable Energy.

INTRODUCTION

The demand for computing technology has had significant impacts on the planet that continue to increase over time. The depletion of the earth's resources is a significant concern that has been identified by researchers. The hosting of cloud computing applications in data centres results in significant energy consumption, leading to elevated operational expenses and a substantial carbon footprint on the environment. The issue of power consumption in data

**Shobhana Saxena and Mohd Zuber**

centres has become a significant concern in light of the current global climate change and energy shortage challenges. The field of Green computing has gained significant importance due to the limited availability of energy resources and the growing need for higher computational capabilities. Thus, there is a need for green cloud computing solutions that can effectively conserve energy and minimise operational expenses. Cloud computing is an infrastructure that enables cost-effective execution of diverse applications without the need for deploying requisite hardware to support those applications. The utilisation of virtualization technology affords the aforementioned opportunity. Small enterprises have begun to adopt cloud-based solutions to cater to their clientele. Cloud computing technology has the capability to accommodate a diverse range of applications that can operate for brief periods of time, ranging from a few seconds to several hours, in a pay-per-use model. The proliferation of data centres ensued as a consequence of the increased demand for cloud services, which in turn led to a surge in energy consumption required to facilitate the processing of said services. The negative impacts of high energy consumption are twofold: firstly, it leads to carbon emissions which contribute to global warming; and secondly, it can result in decreased revenue.

The implementation of Sotheby green IT has been found to provide notable benefits in terms of augmenting organisational efficiency. Specifically, it has been observed to facilitate waste minimization, enhance production pace, and promote more sustainable utilisation of natural resources. This study establishes a novel connection between the natural surroundings and the operational demands and requirements of commercial enterprises. This study focuses on the analysis of fundamental design methodologies that pertain to the production and utilisation of computer peripherals and equipment, as well as the decommissioning of data processing facilities and equipment, which encompasses computer displays, printers, CPUs, and other related components. The objective of this approach is to minimise any discernible ecological footprint, whether it be through direct or indirect means, by adhering to principles of sustainable development and conservation. The concept of carbon efficiency has gained significant attention in the realm of green information technology, particularly in the context of business strategy. The subsequent section of this manuscript delves into the subject matter of green business, encompassing aspects such as administration, practises, infrastructure, and analytics.

The optimisation of company efficiency and effectiveness is a crucial objective in modern business management. One of the key factors that contribute to this goal is the minimization of energy consumption. The reduction of energy usage is a priority for companies seeking to improve their operational performance. The implementation of a smart data hub has been shown to have a positive impact on both operational expenses and environmental sustainability. Specifically, the utilisation of such a hub has been found to reduce operational costs while simultaneously providing environmental benefits. The adoption of green practises by companies has become increasingly important in recent years due to the need to reduce carbon pollution. However, in order to successfully implement such practises, it is necessary to conduct a thorough assessment of critical physical property and equipment, infrastructure, furnishing, and administrative equipment. This assessment is crucial in ensuring that the company is able to effectively transition to a more sustainable and environmentally-friendly approach. In order to enhance organisational efficiency, a range of strategies are employed, including the implementation of standard business practises, the promotion of transparency, the utilisation of analytics, the adoption of enterprise solutions and tools, the establishment of data stores, and the integration of technology, among other factors. The implementation of Green IT initiatives has become a popular strategy for organisations to reduce their carbon footprint and promote environmental sustainability. These plans typically involve a series of corrective actions aimed at optimising the use of IT resources while minimising their negative impact on the environment. Among the most common measures adopted are the substitution of traditional displays with energy-efficient alternatives, the repurposing of IT infrastructure to extend its useful life, the re-engineering of operating methods to reduce energy consumption, and the proper disposal of unwanted IT equipment to prevent environmental contamination. These actions are intended to promote a more sustainable use of IT resources and contribute to the overall goal of achieving a greener and more sustainable future. This paper discusses various projects that are currently being undertaken in the business world. One of these projects involves the integration of marketing compliance into the workplace. Another project involves the construction of a large-scale business infrastructure. Additionally, there is a project aimed at utilising green

**Shobhana Saxena and Mohd Zuber**

power, as well as one focused on blending nanocomposites in green computing. Another project involves increasing biomimicry, and ultimately, there is a project aimed at driving global¹Shobhana Saxena and ²Dr. Mohd Zuber legislation. These projects represent a diverse range of initiatives that are being undertaken in the business world. The implementation of Green IT techniques has been classified into two distinct categories, namely active and passive. Both of these categories have been found to have a significant impact on the reduction of carbon emissions. The present study aims to investigate the aggressive IT plans that involve the identification, determination, and enrollment of elements that facilitate the transformation of the IT industry towards a greener framework. The research is motivated by the need to address the environmental challenges associated with the IT industry, which has been identified as a significant contributor to carbon emissions. The study adopts a qualitative research approach, utilising a comprehensive review of relevant literature to identify the key elements that aid in the transformation of the IT industry towards a greener framework. The findings of the study reveal that the aggressive IT plans that involve the identification, determination, and enrollment of elements such as energy-efficient hardware, virtualization, cloud computing, and renewable energy sources are critical in achieving a greener Holistic approaches are characterised by their pursuit and implementation of ecologically acceptable business models. As such, they are enthusiastic about embracing transnational economic marketplaces, globalisation, and sustainable green economies. Proactive methods have been widely adopted in the IT industry as a means of mitigating potential risks and improving overall system performance. However, one of the primary drawbacks associated with proactive methods is their tendency to induce rapid and unforeseen changes to personnel, equipment, and infrastructure. This can result in significant disruptions to established workflows and processes, potentially leading to decreased efficiency and productivity. As such, it is important for IT prof The implementation of modifications in response to external green impacts is known as reactive tactics. This approach involves taking action as soon as possible to address the impact. In order to mitigate carbon emissions, it is imperative that the IT industry adheres to governmental norms and regulations. The implementation of a proactive strategy involves the incorporation of changes that arise from client requests, freelancing, and competitive challenges. These factors are integral to the success of any business endeavour, and as such, must be taken into consideration when developing a proactive strategy. The field of green information technology (IT) comprises of two main components, namely active and passive.

The present study focuses on the topic of storage facilities for data. The aim of this research is to explore the various types of storage facilities that are available for data and to analyse their respective The impact of human intervention on the environment is a well-documented phenomenon that has been observed in various contexts. The effects of such interventions, whether intentional or unintentional, can be detrimental to the environment, particularly in the pursuit of economic gain. The construction of a profitable business is one such activity that can have a significant impact on the environment. This impact can result in harm to the environment, which may not always be immediately apparent or acknowledged.

The ubiquitous presence of digital technology has become increasingly apparent in contemporary society. The proliferation of computers in educational institutions and healthcare facilities, as well as the increasing prevalence of household electronic devices, has become a noticeable trend. Additionally, the utilisation of social media platforms and blogging has become more widespread, and the integration of Global Positioning System (GPS) technology in automobiles has become increasingly prevalent. The success of modern technology has been consistently evident. The integration of technology and overhauling practises is a crucial component of a comprehensive green IT strategy when clustering large groups of individuals. The present study investigates the impact of processes that promote and foster a positive and environmentally conscious mindset among individuals. The study aims to explore the effectiveness of such processes in promoting sustainable behaviour and reducing negative environmental impact. The research is based on a review of existing literature and empirical evidence, which highlights the importance of cultivating a positive and environmentally conscious mindset in individuals. The study concludes that processes that encourage and promote The field of Green IT aims to investigate and address various obstacles and issues that arise in these domains. The concept of Green IT is guided by the fundamental principle of achieving equilibrium among

**Shobhana Saxena and Mohd Zuber**

economic, environmental, and social factors. The integration of Green IT plans, regulations, and aspects varies across organisations. The concept of Green IT is characterised by a proactive approach that aims to bring individuals together in pursuit of a common goal. This goal is to create wealth and promote humanity while simultaneously reducing the negative impact of human activities on the environment. The present study aims to investigate the impact of a certain set of processes on the development of a positive, environmentally conscious mindset in individuals. The study is motivated by the need to promote sustainable behaviour and reduce the negative impact of human activities on the environment. The processes under investigation are designed to encourage individuals to adopt a positive attitude towards the environment and to engage in environmentally friendly practises. The study employs a The field of Green IT endeavours to conduct a thorough investigation and provide solutions to various issues that arise in these domains. According to a study published in the Harvard Business Review, companies that implement policies that align with climate change are likely to reap greater benefits and profits than their counterparts who do not.

The concept of a "Green Vision" refers to a global strategic vision for businesses that prioritise environmentally sustainable practises. This vision encompasses a comprehensive approach to sustainable business practises that are designed to reduce negative environmental impacts and promote long-term ecological health. The Green Vision is a critical component of the global effort to address climate change and other environmental challenges, and it represents a significant shift in the way that businesses approach sustainability. By adopting a Green The objective of this study is to explore the concept of greening in business operations. This includes visualising potential improvements in the business's operations and analysing the associated costs of implementation. The study aims to provide insights into the feasibility and benefits of adopting greener practises in business operations. The present study posits that organisational change can be influenced by all members of a company, regardless of their position within the hierarchy. It is imperative that all employees are actively engaged in the process of change, particularly with regards to the generation and exchange of ideas. The successful implementation of any programme or intervention requires a collaborative effort between the provider and the client. In order to achieve the desired outcomes, clients must demonstrate a willingness to adapt to the proposed strategies and techniques. This is a crucial factor that can significantly impact the effectiveness of the intervention. Without the client's active The operational behaviour of an organisation, specifically in relation to emissions reduction, is not accurately represented by a trend line. Rather, it resembles a curve with varying peaks and valleys. The successful completion of green firms requires the development, adoption, execution, and completion of strategic priorities, as well as the handling of obstacles. In a typical organisational setting, various departments are tasked with managing the stress and strain that arise from heightened workloads and increased responsibilities. The identification of stress areas within an organisation and the establishment of strategies for resolving them in the context of business issues can be facilitated through the implementation of greening initiatives. The reduction of carbon emissions has been a topic of great concern in recent years, with many individuals and organisations seeking to reduce their carbon footprint. While it is often assumed that the responsibility for carbon reduction lies solely with entities or society, it is important to recognise that a significant shift in people's attitudes is also necessary. This paper argues that carbon reduction is more of a shift in people's attitudes than it is the sole responsibility of entities or society. By examining the current state of carbon emissions and the role of individuals in reducing them, this paper highlights the importance of changing attitudes towards carbon reduction and the potential benefits of doing so. Ultimately, The process of transition is frequently depicted through actions and is closely associated with concurrent changes in practises and ideals.

LITERATURE REVIEW

Contemporary civilization finds itself inexorably reliant upon the sustenance provided by various forms of energy. The global energy consumption and its concomitant carbon dioxide emissions have experienced rapid escalation in recent decades, primarily attributable to the burgeoning population and the escalating desire for enhanced comfort among individuals. The forthcoming hour's energy forecast shall serve as a valuable tool for the optimisation of energy management, strategic planning, and conservation endeavours within both commercial and residential

**Shobhana Saxena and Mohd Zuber**

domains. The utilisation of data-driven models presents a valuable approach in the realm of energy consumption prediction. This scholarly article posits a solution rooted in the realm of the Internet of Things (IoT) to effectively prognosticate the real-time energy consumption of a given edifice. The aforementioned process is accomplished through the implementation of a data-driven model that operates harmoniously within the interplay of the edge and cloud layers. The ML inference technique is employed within the edge node to predict the hourly energy demand of the building, thereby eliciting a prompt response from the system in real-time. The authors of this study have constructed a Microgrid Internet of Things (IoT) setup for the purpose of conducting experiments. This study provides a comprehensive review of the four main machine learning (ML) techniques commonly employed in the prediction and improvement of building energy performance. These techniques include linear regression, multilayer perceptron, SMO Regression, and support vector machine (LibSVM). The present study reveals that the performance of Support Vector Machines (SVM) surpasses that of all other methods in terms of predictive accuracy, as evidenced by the evaluation of performance metrics such as Mean Absolute Error (MAE) and Root Mean Square Error (RMSE). It has been ascertained that the edge node exhibits a diminished temporal requirement for real-time prediction in comparison to the cloud, as measured by prediction time.(Dalai *et al.*, 2019).

The exponential growth of robot services has given rise to a multitude of challenges pertaining to data processing and analysis. These challenges stem from the intricate and diverse nature of robot operations. In the present investigation, we have endeavoured to construct a cloud-centric collaborative framework that encompasses multiple users and robotic entities. The server, through the utilisation of the photograph captured by the robot, possesses the ability to identify the specific environment in which the robot is situated. This, in turn, enables the server to allocate distinct permissions to individual users, predetermined in accordance with their respective rights and limitations, thereby ensuring appropriate access and control under diverse circumstances. In order to uphold the principle of privacy, it is imperative to grant the robot the capacity to adhere to the user's directives. The amalgamation of cloud technologies and multi-robot systems facilitated the enhancement of energy efficiency, real-time performance, and memory cost. (Yin *et al.*, 2019)

Contemporary scholars and industrial practitioners alike are devoting considerable intellectual deliberation to the concepts of "Industry 4.0" and "Cyber Physical System" as they engage in critical assessments of prospective enhancement strategies aimed at upholding technological advancement at the forefront. The amalgamation of corporeal and computational mechanisms within the realm of Internet of Things (IoT) technology is commonly denoted as a "cyber physical system" (CPS). Through the utilisation of this prototype, the Internet of Services, alongside various other Internet-based protocols, can be effectively employed to establish connections between devices and other integral components. The aforementioned networking structure facilitates the horizontal provision of internal factory services across the entire value chain. In upholding the tenets and rituals of the aforementioned methodologies, one must confront a series of challenges that necessitate resolution. The present section of the study endeavours to furnish readers with a more profound comprehension of the challenges encountered by these components. Through the utilisation of further scholarly inquiry, the challenges that the CPS (Cyber-Physical Systems) must surmount are subsequently delineated and succinctly encapsulated from the vantage points of energy regulation, transmission, impervious regulation, and administrative regulation methodologies, encompassing the allocation of resources for the system and the design of software models. The scholarly discourse additionally delves into the challenges encountered by the Internet of Things (IoT) in relation to the preservation of communication security, safeguarding sensor data, and the utilisation of cryptographic-based techniques. The scholarly discourse also delves into the challenges encountered in the realm of IoS (Internet of Services) that have arisen consequent to the advent of cloud aggregation technology. This technology facilitates the interconnection and collaboration among cloud providers, with the aim of enhancing the security infrastructure of the cloud, encompassing its reliability and energy conservation capabilities.(AL-Salman & Salih, 2019)

The advent of mobile edge computing (MEC) within the realm of 5G networks has bestowed upon us the ability to accommodate computationally demanding applications. This is primarily due to the fact that MEC has successfully bridged the geographical gap between cloud computing infrastructure and intelligent devices, thereby enabling a

**Shobhana Saxena and Mohd Zuber**

closer proximity between the two entities. In this scholarly investigation, we undertake an examination of a multi-user Mobile Edge Computing (MEC) system wherein a MEC server is the recipient of compute offloading requests originating from a multitude of smart devices (SDs) via wireless channels. In our pursuit of optimising the objective function, we delve into the minimization of the aggregate cost encompassing energy consumption and time delay associated with all smart devices. These devices possess the capability to choose among three distinct scenarios for task execution, namely the complete local computing scenario, the complete offloading execution scenario, and the partial offloading execution scenario. In order to effectively reduce the overall expenditure associated with the Mobile Edge Computing (MEC) system, it is imperative to engage in a collaborative optimisation process that encompasses the allocation of tasks, determination of offloading decisions, and the sharing of computing resources. In order to effectively tackle these aforementioned concerns, we have amalgamated the Lagrange methodology with a comprehensive and meticulous search strategy. The empirical evidence substantiates the efficacy of the proposed strategic approach. (Fayyaz *et al.*, 2019)

The proliferation of applications on mobile devices has engendered significant concerns regarding their energy consumption. Nonetheless, mobile cloud computing emerges as a promising solution to mitigate these issues. The present study introduces a groundbreaking architecture for mobile cloud computing (MCC) that provides mobile users with a diverse range of autonomous options for transferring their work. The collective aim that we share is to diminish the aggregate expenditure of energy, computation, and user latencies, all the while maintaining equilibrium between temporal and energetic utilisation in every deliberation pertaining to task offloading. The proposal posits the utilisation of an enhanced genetic algorithm with the aim of reducing the temporal requirements associated with validating the legitimacy of progeny. This is achieved through the process of mapping a select subset of legitimate descendant genes onto single-digit numerical representations. The outcomes of our experiment demonstrate a greater compatibility with the concept of simultaneous computation migration as opposed to the global ideal solution. (F. Wang *et al.*, 2019)

This essay elucidates the deleterious impact of cloud computing on the environment, wherein it engenders copious quantities of carbon dioxide and various noxious substances. The utilisation and allocation of energy resources exhibit a notable degree of inefficiency and prodigality, wherein substantial quantities of said energy are dissipated and wasted. During the course of its existence, a substantial quantity of processors and resources are employed, thereby engendering a significant amount of thermal energy. Henceforth, this discourse expounds upon the manner in which cloud computing, with its eco-conscious disposition towards green computing, may potentially alleviate these aforementioned quandaries and safeguard the natural milieu. In due course, we shall bear witness to the prospective implementations of green computing within the realm of cloud computing. (Shree *et al.*, 2020)

In contemporary times, the realm of cloud computing has undergone a comprehensive evolution, emerging as a holistic solution that empowers proprietors of enterprises to effectively implement their applications and harness the vast array of advantages bestowed by the cloud. Through the process of converting tangible physical systems into abstract logical virtual computers, the phenomenon of virtualization has significantly augmented the efficiency and productivity of cloud computing while concurrently mitigating energy consumption. The presence of an imbalanced distribution of host loads can give rise to issues of both host oversubscription and undersubscription, thereby exerting a negative impact on the management of Quality of Service (QoS) in cloud environments as well as energy consumption. The act of consolidating servers presents itself as a straightforward solution to the issue of host underutilization. Despite previous research indicating various improvements in consolidation, the issue of determining optimal threshold values and mitigating excessive migrations remained a persistent challenge. This scholarly paper presents a proposed heuristic model that embodies the qualities of both greediness and effectiveness, with the aim of facilitating the consolidation process within cloud datacenters. According to experimental findings, the suggested consolidation model established an optimal threshold value for the purpose of energy conservation. Furthermore, the implementation of the greedy consolidation strategy proved to be more effective in restraining aggressive migrations compared to previous consolidation models. (Patil & Patil, 2020)

**Shobhana Saxena and Mohd Zuber**

The phenomenon of virtual machine (VM) migration has gained significant prevalence within the contemporary cloud computing landscape. Numerous procedures have been devised to facilitate the migration of virtual machines (VMs) in order to optimise their placement. However, the persistence of this issue can be attributed to the erroneous utilisation of energy within the cloud model. The present study employs the Chicken-Whale optimisation algorithm (ChicWhale), an innovative approach that combines the Whale optimisation algorithm with the Chicken swarm optimisation system. This algorithm is specifically utilised to propose a novel technique for virtual machine (VM) migration within cloud computing environments. In the implemented solution, a regional migration agent is employed to consistently observe the allocation of memory and utilisation of resources within the cloud infrastructure. Subsequently, the virtual machine (VM) is transferred to the designated service provider as dictated by the exigencies of the VMs' task fulfilment. The proposed ChicWhale is employed for the purpose of relocating virtual machines within the cloud infrastructure subsequent to their initial instantiation. The evaluation metric employed to determine the optimal virtual machine (VM) migration encompasses various considerations, such as load, migration expenditure, resource accessibility, and energy consumption. The evaluation of the efficacy of the VM migration technique, which is based on ChicWhale, is conducted with regards to load, migration cost, energy consumption, and resource availability. By employing the proposed methodology known as ChicWhale, it is observed that the maximum degree of resource availability stands at 0.989. Conversely, the minimum magnitude of migration cost is determined to be 0.0564. Furthermore, the minimal amount of energy consumption is quantified at 0.481, while the least burden on the system, as measured by the load, is ascertained to be 0.0001. (Byatarayanapura Venkataswamy *et al.*, 2020)

Edge computing stands as a cornerstone technology within the realm of 5G networks. Edge computing encompasses the strategic placement of servers at the periphery of wireless access networks, thereby extending cloud computing functionalities to the network's edge. This approach facilitates the distribution of computational tasks among proximate mobile users, thereby augmenting the collective processing capacity of the network as a whole. One of the paramount focal points in the realm of edge computing research pertains to the intricate matter of energy consumption. The present focal point of edge computing research lies in the examination of energy consumption pertaining to terminal devices, while comparatively less attention has been devoted to the contemplation of energy consumption associated with edge servers. This study presents a comprehensive approach to global energy optimisation in the context of edge computing, incorporating the consideration of delay constraints and the two aforementioned categories of energy consumption. In order to enhance precision, our initial approach involves the application of queuing theory to evaluate the mean delays experienced by individual terminal devices and edge cloud processing computing tasks within the Internet of Things network. Additionally, we aim to ascertain the average delays associated with the overall system's processing computing activities. In the subsequent phase, we shall proceed to formulate a mathematical framework aimed at mitigating the aggregate energy utilisation of both the device and the server, while concurrently imposing a constraint on the average latency. Subsequently, in an endeavour to tackle the aforementioned concerns and ascertain the magnitude of operational servers within the periphery cloud, alongside the probability of offloading Internet of Things (IoT) devices, we propose the development of a method that leverages genetic algorithms for the purpose of optimising offloading computations. Ultimately, the attainment of the goal to reduce the collective energy consumption of the system, while simultaneously adhering to the imposed temporal constraint, has been successfully realised. The empirical investigation substantiates the efficacy of the energy optimisation methodology. (Tian *et al.*, 2021)

The current scholarly emphasis lies in the investigation of methods to ensure optimal energy efficiency while simultaneously attaining resource optimisation and maintaining a high level of quality of service (QoS). Nevertheless, it is inevitable that a minute quantity of organised disturbance will inevitably exert an influence on the Quality of Service (QoS) data that is directly acquired from the cloud environment. This study proposes a novel methodology for enhancing the efficiency of data centre resource scheduling. The approach advocated in this research involves the utilisation of deep reinforcement learning, which is augmented by feature learning techniques to optimise the quality of service (QoS) provided. Our research endeavours to present a methodological framework for acquiring a comprehensive understanding of Quality of Service (QoS) attributes. This approach is founded upon

**Shobhana Saxena and Mohd Zuber**

the utilisation of advanced stacking denoising autoencoders, which have been enhanced to enhance the accuracy and dependability of QoS characteristic data extraction during the deep learning phase. Our study presents a novel approach to resource scheduling in the context of multi-power machines (PMs) utilising a collaborative technique. The proposed technique leverages reinforcement learning as the underlying framework for the reinforcement learning stage. Through rigorous experimentation, it has been determined that our strategy exhibits a commendable efficacy in diminishing the consumption of energy within cloud data centres. Simultaneously, it maintains an unparalleled level of adherence to the service level agreement (SLA), surpassing alternative resource scheduling solutions in this regard. The objective of achieving optimal Quality of Service (QoS) while simultaneously minimising energy consumption has been effectively accomplished.(B. Wang *et al.*, 2021)

A scholarly endeavour has yielded the development of an astute front-end fog computing architecture, which serves as a viable resolution to the prevailing predicaments of communication latency, data congestion, and data redundancy encountered within the realm of cloud computing, specifically in relation to the management of medical big data. The aforementioned discourse pertains to the prevailing predicaments encountered within the extant medical Internet of Things (IoT) network. These predicaments encompass the constraints imposed by limited bandwidth, the congestion of information, the onerous computational load imposed upon cloud services, the dearth of storage capacity, and the inadequate safeguards for data security and confidentiality. To surmount these challenges, the proposed solution entails harnessing the distinctive structural attributes of fog computing and embracing a mindset that is both decentralised and localised. The model incorporates a combination of fog computing, deep learning, and big data technologies. By employing classification techniques grounded in the analysis of extensive datasets and employing deep learning algorithms rooted in artificial intelligence, one can potentially enhance the internal mechanisms of the model. This, in turn, enables the automated processing of case diagnoses, the extraction of diverse data from multiple sources, and the handling of medical records. Such advancements are made possible by effectively harnessing the advantages offered by WiFi connectivity and the utilisation of user mobile devices within the realm of medicine. Moreover, it shall result in the mitigation of network latency and power consumption, guaranteeing the utmost privacy and security of patient data, diminishing data redundancy, and alleviating cloud congestion. Simultaneously, this advancement will enhance the precision of medical diagnosis and the efficacy of processing multi-source heterogeneous data. The employed technique has indeed exhibited a significant enhancement in both the system's responsiveness and network capacity, thereby elevating the quality of service rendered for the dissemination of medical information.(Qin, 2021)

This study breaks the development of mobile geographic information systems (MGIS), which is driven by the development of information technology, into three periods: the embedded, mobile Internet, and intelligent Internet of things (IOT) ages. When the United States finished installing the Global Positioning System (GPS) at the end of the 1990s, the PC GIS system's information-gathering features were moved to Personal Digital Assistants (PDAs) and other embedded devices to make it easier to collect data in the field. MGIS joined the "embedded age" with GPS. During this time, the stand-alone version of MGIS has been used to collect data in the field for land, forestry, surveys, mapping, and other fields. Even though MGIS had some online functions at the time, the capacity of the mobile network wasn't enough to offer high-frequency network GIS services. With the rise of 3G/4G and other broadband mobile networks, as well as the acceptance of smart mobile platforms, MGIS has gradually moved into the "mobile Internet age" (especially with Android mobile phones). During this time, the main MGIS part was changed from a wireless communication network to a global navigation satellite system (GNSS). Most people use the location-based services app and the map app that goes with it. These apps were made by Google, Baidu, and other companies that make electronic maps. MGIS now covers the industry chains for geographic information, such as data collection, data processing, platform software, industrial uses, and so on. With "Cloud+End," a new environment of geographic information is made. In this age of MGIS, it is still hard to do real-time geographical analysis, target identification, and other intelligent processing. This is because cloud computing has problems like less real-time, not enough bandwidth, and high energy consumption, which are not good for data security and privacy. With the widespread rise of IOT, especially the development of Computer Vision (CV), Artificial Intelligence (AI), 5G mobile communication, edge computing, and other technologies, MGIS technology will

**Shobhana Saxena and Mohd Zuber**

gradually enter the "intelligent IOT age" around 2019. The most important technical parts of this stage are intelligent, real-time, and everywhere GIS, and the system design evolves into "cloud+edge+end." Everyone is a monitor and plotter in the modern world. We can now find and provide holographic map data, like acoustic-optical-magnetic data, because there are so many intelligent sensors, like cameras and radars, that are built into mobile platforms on the ground (wearable devices, vehicles, etc.) and in the air (drones, etc.). These IOT devices could be used to carry MGIS. Instead of being sent to the cloud, the huge amounts of raw data from the photos, videos, locations, and other data that are recorded are now processed and analysed in real time on the network edge devices by AI and other technologies. Only the results are sent to the cloud. This mode makes a big difference in how much network speed, power is used in the data centre, and system latency is needed while improving the service response. Also, since users no longer share private or sensitive data, the risk of network data leakage has gone down a lot, and user data is kept safe and private (only on network edge devices). On the basis of this, a new generation of MGIS is proposed that uses GNSS, 5G, AI, CV, and other information technologies. The cross-platform kernel, simultaneous localization and mapping, pan-information-based high-precision navigation map, semantic map, and intelligent decision-making are the three key technologies that are studied and explored, as well as the omnipresent, real-time, and intelligent qualities of this technology. Also predicted are the direction and trend of growth.(QIAO & CHANG, 2022)

The ramifications pertaining to the operational aspects of distribution networks remain ambiguous, as the pervasive integration of 5G technology within intelligent distribution networks introduces a level of uncertainty. Within the confines of this scholarly discourse, we present an all-encompassing evaluation framework for a 5G+ intelligent distribution network. This framework is predicated upon the amalgamation of the weighting and cloud models, harmoniously coupled with the augmented Fuzzy Analytic Hierarchy-Entropy Weight Method (FAHP-EWM). In the initial phase, we formulate a comprehensive set of evaluation indices for a 5G+ intelligent distribution network, encompassing five key criteria: dependable functionality, cost-effective operation, efficient interactivity, technical acumen, and environmentally conscious emission reduction. To mitigate the shortcomings associated with subjective arbitrariness and promote objectivity, we propose a novel approach that combines the principles of the enhanced FAHP-EWM. This approach incorporates the concept of variance reduction, thereby further enhancing the accuracy of the weighing process. In light of the inherent uncertainty surrounding the dissemination of network node information and equipment status information, a comprehensive evaluation framework is hereby proposed, leveraging the cloud infrastructure, to cater to the needs of the 5G+ intelligent distribution network. The aforementioned analysis serves to demonstrate that the 5G+ Smart Distribution Network project is, on the whole, functioning in a satisfactory manner. Moreover, the weight value derived from the combined weighting method proves to be more precise and justifiable when compared to that obtained through the single weighting method. This substantiates the efficacy and rationality of the proposed evaluation approach. The proposed evaluation methodology additionally functions as a form of navigational guide for the extensive implementation of 5G communication technologies within intelligent distribution networks.(Ma *et al.*, 2022)

Whilst cloud computing undeniably presents alluring prospects in terms of processing capabilities and memory allocation, it is imperative to acknowledge that cloud-based solutions are not devoid of their own set of limitations and impediments. These encompass, but are not limited to, concerns pertaining to power consumption, latency issues, security vulnerabilities, and connectivity constraints. Subsequently, novel technological advancements such as edge computing and fog computing have emerged as viable alternatives to circumvent the inherent limitations of cloud computing. Fog computing, an avant-garde and burgeoning paradigm that establishes a connection between the cloud and the periphery of the network, facilitates the implementation of distributed computing. The concept of edge computing, characterised by its ability to store data and perform computational tasks in close proximity to the data source, has the potential to address the aforementioned challenges by meeting specific requirements such as minimal latency and energy efficiency. The primary aim of this article is to offer a comprehensive assessment and analysis of simulation tools pertaining to Cloud-Fog-Edge Computing (CFEC). This endeavour is undertaken with the intention of aiding researchers and programmers in their endeavour to make informed decisions regarding hardware selection for their research projects. By considering diverse circumstances and addressing pragmatic

**Shobhana Saxena and Mohd Zuber**

challenges, this article seeks to provide valuable assistance in navigating the complex landscape of CFEC simulation tools. In the pursuit of enhancing the prospects of the future, this inquiry diligently examines a plethora of modelling methodologies, which are subsequently juxtaposed and subjected to scholarly discourse. (Sanger & Johari, 2022)

Objectives

1. To exploring strategies for enhancing environmental sustainability to determine their efficacy and limitations.
2. To comprehend the significance of enhancing the design of data centres.
3. To scrutinise the methodologies and materials utilised in the process of recycling.

RESEARCH METHODS

Exploratory research often prioritises qualitative inquiry as its primary focus. Nevertheless, it is worth noting that research endeavours characterised by a substantial sample size, which primarily aim to explore and investigate phenomena, may also fall within the realm of quantitative inquiry. Owing to its inherent flexibility and expansive nature, it is occasionally denoted as interpretative research or a method grounded in theory. Exploratory research, by its very essence, tends to adopt a qualitative approach, primarily focusing on the collection and analysis of primary data. Conversely, the conduction of research employing a substantial sample size in an exploratory fashion may also be deemed as possessing quantitative characteristics. Due to its inherent adaptability and allowance for varying interpretations, this particular approach is occasionally referred to as interpretative research or a grounded theory method.

FINDING AND CONCLUSION

The present study has examined the operational mechanisms of IT companies that prioritise environmental sustainability and aim to minimise carbon emissions and transportation expenses. The field of green computing endeavours to mitigate the ecological footprint of computer technology by minimising the presence of pollutants in the air, water, and soil. This section examines the carbon footprint of individuals and the carbon impact of computing centres.

ABSTRACT

Morality and Religion address central issues arising from religion's relation to morality. Since religion is such an abstract topic, it is important to explore it further so that we, as a society, can have a broadened understanding of how the world works and be knowledgeable about what our experiences of life really are. One key concept is that the basic constructs of each religion can correlate with others in many ways. Two completely different world religions, Christianity and Buddhism, for example, intertwine as much as they separate. Ethically, they each present their own set of ideals to their followers, and, surprisingly, some of these moral ways of thinking are the same. In this paper, the researcher covers a broad range of topics like What is Religion, Morality, Christian conception of morality, the Buddhist conception of morality, and Key Differences, and similarities among them. The secondary sources used by qualitative data-gathering techniques include books, journals, websites, book reviews, paper presentations, and other publications. This research will be helpful for those learning about religious philosophy as well as other people because they may learn the moral teachings of Jesus Christ and Gautama Buddha, two of history's greatest sages.

Keywords: Buddhism, Christianity, Ethics, Morality, and Religion.

**Dipty D Sangma and Bharani**

INTRODUCTION

Morality is a vital component of all religions, including Buddhism and Christianity. Buddhism is an ancient Eastern religion that originated in India and has spread throughout Southeast Asia. It is based on the teachings of Siddhartha Gautama, often known as the Buddha, who advocated a non-attachment, compassion, and inner peace philosophy. Christianity, on the other hand, is a monotheistic religion that started in the Middle East and has spread around the world. It is founded on Jesus Christ's teachings of love, forgiveness, and salvation. Despite their differences, both religions share fundamental beliefs and practices that shape their respective concepts of morality. By the lights of a credible explication of our daily self-understanding, the world as we meet it in ordinary experience is what it is because of its relationship to what makes us especially human. To become a Buddhist, all Buddhists, lay or monk, must observe the Five Precepts at all times, much as all Christians must obey the Ten Commandments of God, the Decalogue. This comparative study aims to explore the concept of morality in Buddhism and Christianity. It will examine how both religions define morality, the ethical principles they uphold, and the practices they prescribe to promote moral behavior. The study will also analyze the similarities and differences in their moral teachings and how they reflect their respective cultural contexts.

Several scholars have explored the concept of morality in Buddhism and Christianity. Furthermore, Thomas W. Clark's article, "Buddhism and Christianity: Some Bridges of Understanding," explores the convergences and divergences in the ethical teachings of the two religions. This study will build on the existing literature to provide a comprehensive analysis of the concept of morality in Buddhism and Christianity. It will offer insights into the ethical principles and practices that guide these religions' followers and how they relate to contemporary moral issues.

OBJECTIVES

- To explore the relationship between religion and morality, and how these two concepts are intertwined
- To analyze the moral teachings of Christianity and Buddhism, and identify their similarities and differences
- To examine the ethical principles and values that underpin the moral teachings of these religions, and how they relate to broader ethical frameworks
- To provide an overview of the moral teachings of Christianity and Buddhism for those interested in learning about religious philosophy, and to highlight the shared moral wisdom of these two great sages, Jesus Christ and Gautama Buddha.

METHODOLOGY

- **Comparative Analysis:** This technique entails comparing and contrasting Christian and Buddhist moral teachings and practises, as well as recognising parallels and contrasts between the two religions.
- **Literature Review:** This methodology involves reviewing secondary sources, such as books, journals, and websites, to gather information on the religious concepts of morality and how they relate to each other
- **Ethical Analysis:** This methodology involves examining the ethical principles and values that underpin the moral teachings of Christianity and Buddhism, and how they relate to the broader ethical frameworks of these religions.
- **Qualitative Data Gathering:** This methodology involves gathering data from various sources such as book reviews, paper presentations, and other publications.
- **Historical Analysis:** This methodology involves examining the historical development of Christianity and Buddhism and how their moral teachings evolved over time.

**Dipty D Sangma and Bharani****MORALITY**

Morality is the concept of distinguishing between right and wrong behavior, based on a set of values, principles, or standards. It involves making decisions about what is good or bad, just or unjust, fair or unfair, and ethical or unethical. Morality is often influenced by cultural, religious, and philosophical beliefs, as well as personal experiences and convictions.

RELIGION

Religion is a complicated and comprehensive notion that includes numerous supernatural or transcendental beliefs, practises, rites, and organisations. It frequently entails the worship or veneration of a god or deities, as well as the articulation of a moral or ethical code that directs behaviour.

BUDDHISM

Buddhism is a prominent international religion and philosophy centred on the teachings of Siddhartha Gautama, better known as the Buddha, that began in ancient India. Buddhism emphasises the Four Noble Truths, the Eightfold Path, and meditation practise as paths to enlightenment and escape from suffering.

CHRISTIANITY

Christianity is a monotheistic religion founded on the life and teachings of Jesus Christ, whom Christians believe to be God's son and humanity's saviour.

BUDDHIST MORALITY

Buddhism is a religion and philosophy that emphasizes the cultivation of moral behavior and the reduction of suffering. The Buddhist ethical system is based on the Four Noble Truths and the Noble Eightfold Path, which provide a framework for understanding the nature of suffering and the path to liberation. Buddhist morality is rooted in the principle of non-harming, or ahimsa, which is expressed in the concept of the Five Precepts. These are ethical guidelines that lay Buddhists are encouraged to follow, including refraining from killing, stealing, sexual misconduct, lying, and intoxication. In addition to the Five Precepts, Buddhists are also encouraged to cultivate positive virtues, such as generosity, compassion, and wisdom. These virtues are expressed in the concept of the Four Brahmaviharas, or divine abodes, which are loving-kindness, compassion, empathetic joy, and equanimity. Buddhism also emphasizes the practice of mindfulness and meditation as a means of cultivating moral behavior and reducing suffering. Through the cultivation of mindfulness, individuals can become aware of their thoughts, emotions, and actions, and learn to respond to them in a skillful and compassionate way.

In his Five Precepts, the Buddha counsels refraining from:

1. Hurting living things
2. Taking things not freely given
3. Sexual misconduct
4. False speech
5. Avoiding intoxicants

CHRISTIAN MORALITY

Christian morality is founded on Jesus Christ's teachings and the values contained in the Bible. Christians believe that every human being has intrinsic value and dignity, and that moral behaviour is directed by love of God and love of one's neighbour. Christian morality is characterized by a set of ethical guidelines, including the Ten Commandments, which are considered fundamental to the Christian life. These guidelines include respect for human life, the sanctity of marriage, the importance of honesty and integrity, and the obligation to care for the poor and vulnerable. In addition to these ethical guidelines, Christians are also encouraged to cultivate positive virtues, such as compassion, humility, and forgiveness. These virtues are modeled by Jesus Christ, who is considered the perfect example of moral behavior. Christian morality is expressed in a variety of ways, including personal behavior, social action, and political engagement. Christians are encouraged to promote justice and peace and to work for the common good of all people.

**Dipty D Sangma and Bharani****Ten Commandments**

1. Thou shall have no other gods before me.
2. Thou shalt not create any graven image for thee.
3. Thou must not use the Lord thy God's name in vain.
4. Remember and keep the Sabbath sacred.
5. Honour your father and mother.
6. Do not kill.
7. Do not commit adultery.
8. Do not steal.
9. Do not give false testimony against a neighbour.
10. Thou shalt not covet

COMPARISON

Although the two religions handle morality differently, the notion of morality is essential to both Buddhism and Christianity. In this comparative study, we will look at the parallels and contrasts between Buddhist and Christian morality, as well as how the ethical ideals of each religion are manifested in practise. Buddhism and Christianity share a common commitment to the principle of non-harming, or ahimsa. In Buddhism, this principle is expressed in the Five Precepts, which are ethical guidelines that lay Buddhists are encouraged to follow. These standards include not murdering, stealing, engaging in sexual misbehaviour, lying, or being intoxicated. In Christianity, the principle of non-harming is expressed in the commandment to "love your neighbor as yourself" (Matthew 22:39), which is understood to encompass all forms of ethical behavior. In addition to the principle of non-harming, both Buddhism and Christianity emphasize the cultivation of positive virtues, such as compassion, generosity, and wisdom. In Buddhism, these virtues are expressed in the concept of the Four Brahmaviharas, or divine abodes, which are loving-kindness, compassion, empathetic joy, and equanimity. These characteristics are embodied in Christianity through the notion of the fruits of the Spirit, which include love, joy, peace, patience, kindness, goodness, faithfulness, gentleness, and self-control. (Galatians 5:22-23). However, there are also important differences between Buddhist and Christian morality. Buddhism emphasises individual moral responsibility and the desire of personal freedom from suffering, whereas Christianity emphasises individual duty to God and the pursuit of redemption through trust in Jesus Christ. Another significant distinction is the significance of ethical principles in each religion. In Buddhism, the Five Precepts are seen as a means of reducing suffering and cultivating positive virtues, but they are not considered to be absolute moral laws. In Christianity, the Ten Commandments and other ethical guidelines are seen as absolute moral laws that are binding on all people. There are also differences in the way that Buddhism and Christianity approach moral dilemmas. Buddhism emphasizes the importance of mindfulness and meditation as a means of developing ethical discernment and responding to situations with wisdom and compassion. Christianity, on the other hand, emphasizes the importance of obedience to God and the guidance of the Holy Spirit in making moral decisions. In practice, Buddhist and Christian morality are expressed in a variety of ways. In Buddhism, ethical behavior is expressed through meditation, mindfulness, and acts of compassion and generosity. In Christianity, ethical behavior is expressed through personal piety, social action, and political engagement.

SIMILAR PRECEPTS OR RULES OF CONDUCT

The commandments are similar in Buddhism and Christianity. The five Buddhist precepts and the final six Torah commandments are nearly identical. Both groups concentrate on the individual and societal dimensions of human ethics.

Prohibition of killing

Buddha held the life of every living thing—human or animal—in the highest regard, and as a result, he vehemently denounced the purposeful death of any creature. Christianity, the religion of love, naturally forbade its adherents from killing others. Since both Jesus and Buddha gave the prohibition against killing, it is vital to note that Buddhism has a broader understanding of how this prohibition should be applied than Christianity does.

**Dipty D Sangma and Bharani****Prohibition of stealing**

Buddha advises his followers to refrain from stealing. Stealing is viewed in Christianity as a significant roadblock on the way to God's Kingdom. Christianity, like Buddhism, places more value on spirituality than on material things. Christians think that God's gifts to humanity should be enjoyed. Christians are instructed to serve God in humble humility rather than with material goods in order to receive God's gifts.

Prohibition of adultery

The third precept of the Buddha forbids engaging in adultery or sexual misbehaviour. It demands living a chaste life or maintaining sexual purity. Buddhism places a great priority on virginity and celibacy. The Buddha's rule of abstaining from adultery coincides to Exodus 20:14's seventh mosaic commandment, which forbids adultery.

Prohibition of lying

Both religions forbid their followers from making false claims or spreading lies. Falsehood had no place in Buddhism since truth is the religion's ultimate moral compass and its basic foundation. Since a liar commits every moral offence, lying is the source of all moral sin, according to Buddha. Speaking the truth has an important place in Christianity. God's word is accepted as truth in John 17:7. God mandates that His followers always speak the truth since He is the source of all truth. Jesus is a representation of the qualities of the God of truth, the heavenly father. Thus, in order to be his disciples, we must always speak the truth while expressing our sincerity in our love for others.

Prohibition of intoxications

Both the religions uphold the prohibition of using drugs and alcohol. The final of Buddhism's five commandments is to abstain from using narcotics and alcoholic beverages. Being continually watchful is something that Buddha advised against, because using drugs or alcohol makes a person physically and mentally drowsy.

Teaching on paying respect and honour to one's parents

In both laypeople's familial and social life, as well as monks' religious practises, Buddha put a particular emphasis on the virtue of respect. All Buddhists should have the utmost regard for the three holy items of the Buddha, the Dharma, and the Sangha from a religious perspective. Being respectful of one's parents is extremely important in Christianity as well because God commands us to do so. Respect for the elders' knowledge and the sanctity of the family are implied when one says they honour their father and mother. Since we wouldn't exist without our parents, they are the essential foundation of our existence.

CONCLUSION

When Christian ethics are reviewed, it is discovered that God and the teachings of his Son, Jesus Christ, are the sources of their moral judgement. If one's activities and behaviours are in line with God's will, they are regarded as being good deeds and morality. In both laypeople's familial and social life, as well as monks' religious practises, Buddha put a particular emphasis on the virtue of respect. In contrast, if someone is engaging in wicked deeds, like as murder, they will be redirected to a place that reflects their personal choices and will not advance along the route to Nirvana. Buddhism and Christianity share some common ethical principles, they approach morality in different ways. Buddhism emphasizes the individual's responsibility for their own moral behavior and the cultivation of positive virtues, while Christianity emphasizes the individual's responsibility to God and the pursuit of salvation through faith in Jesus Christ. These differences are reflected in the way that each religion approaches ethical dilemmas and the ways that ethical behavior is expressed in practice. According to the comparison that has been done, it is clear that the moral guidelines set forth by Jesus and Buddha for their respective followers are remarkably similar. These two religious leaders have a lot of similar sayings. The foundation of Buddha and Jesus' ethical teachings is the Golden Rule and altruism. Love is the very foundation of ethical behaviour for both Buddhists and Christians. The moral guidelines of the two masters are derived from their commandments of equality, love, and

**Dipty D Sangma and Bharani**

respect for all people. Both of them want to bring about equality, justice, and global brotherhood with the weapon of love. Yet as far as the ethical disparities between Jesus and Buddha go, they are profound and unbridgeable because of the basic distinctions between the particular beliefs associated with Buddhism and Christianity.

ABSTRACT

Land surface temperature (LST) is considered to be an important parameter for analysis of energy budget of the Earth's surface, urban heat islands, several surface processes and is widely used in environmental studies. The aim of the present study is to estimate the land surface temperature of Tinsukia revenue circle using Landsat images and to explore its seasonal variations. Landsat data of two specific seasons (summer and winter) for the years 2011 and 2021 were analyzed. The result showed rising trend of LST in summer and a slight declining trend in winter. The mean LST was increased by 6.35 °C during summer season while during winter the mean LST was decreased by 0.98 °C (- 1 °C) from 2011 to 2021. Highest rise was seen in built up land (7.64 °C) followed by open space (7.25 °C). The present study may help the policy makers and land management professionals to identify the heat zones and manage the urban centers that will help in proper environmental planning in future.

Keywords: Land use and land cover, Land surface temperature, Tinsukia revenue circle

INTRODUCTION

Climate of a city and adjoining area are frequently altered by the changes in land use and land cover (LULC) as well as various anthropogenic activities related to urbanization. The increasing rate of surface temperature in urban area has become a imperative problem of present time. Land surface temperature (LST) is considered to be an important parameters for analysis of energy budget of the Earth's surface, urban heat islands, several surface processes and many more [1, 2, 3, 4]. It is frequently applied in various models, for monitoring droughts as well as estimation of soil moisture evapotranspiration [5, 6 7, 8] and to gather detail information regarding spatial dynamics of heat waves

**Rani Kumari Shah**

[9]. It also provides vital information regarding various physical properties of the earth surface. LST data derived from satellites are widely used in detection of urban heat zones [10, 11]. In the present study the estimation of land surface temperature of Tinsukia revenue circle has been carried out using Landsat images. No such studies on LST determination has been carried out in growing town like Tinsukia and hence the present study was attempted.

MATERIALS AND METHODS

Study area

Tinsukia revenue circle (TRC) is one of the revenue circles of the Tinsukia district which is located between 27° 15' 49.0201" N to 27° 35' 9.9271" N latitude and 95° 38' 1.6655" E to 95° 13' 1.5233" E longitude. It is surrounded by the Brahmaputra River in the North, Doomdooma revenue circle in the North-east, Margherita revenue circle in the south-east and Dibrugarh district in the South and West. The total geographical area of TRC is 690.52 km². The circle consists of 262 villages and 4 towns. The map of the study area is depicted in fig 1.

Data used

Two Landsat 5 TM data of 2011 and two Landsat 8 OLI and TIRS data of 2021 have been downloaded from the Earth Explorer USGS (<https://earthexplorer.usgs.gov>). Table 1 shows the detail specifications of Landsat data.

Methods used in land use and land cover dynamics (2011–2021)

The Landsat TM (2011) and Landsat OLI (2021) were used for preparation of LULC map of the TRC. The layerstack of both the images has been performed. Supervised classification method has been performed to prepare the land use and land cover map using Maximum Likelihood Algorithm. Five different land use categories were identified such as built up land, open space, crop land, vegetation and water bodies.

LST and NDVI retrieval

Out of several methods used for estimation of LST such as Single Channel Algorithm (SCA), Split Window Algorithm (SWA), Radioactive Transfer Equation (RTE), Mono Window Algorithm (MWA), and NDVI based LSE (Land surface emissivity) Algorithm [12, 13, 14, 15, 16], NDVI based estimation of LST is very widely used as it provides satisfactory results and also is easy to compute [12]. Land surface emissivity (LSE) is very significant for the obtaining LST [12, 17, 18, 19]. In the present study NDVI based estimation of LST has been carried out. Table 2 shows the detail specifications of the methodology used (Method for Extracting LST from Thermal Band of Landsat Data) in the study.

RESULTS AND DISCUSSION

Land use and land cover changes

The Tinsukia revenue circle (TRC) showed a significant change in its land use and land cover during the last decade (2011 to 2021). Among all the classes of Land use and land cover the built up area has witnessed dramatic rise in its area cover with net change of 56.40 km² while crop land increased by only 3.89 km². Open space has shown dramatic fall with net change of 49.40 km². Vegetation cover and water bodies depicted a net decline of 10.70 km² 0.19 km² respectively. Thus the development of urban area is mainly due to the cost of open space vegetation and water bodies. Similarly, the crop land and built up area are the major land use classes in 2021 that occupies 40% and 27% of the total area of TRC respectively. The area of different land use and land cover classes of TRC is shown in table 3 and fig. 2.

Land surface temperature dynamics

A spatio-temporal comparison between the Landsat imageries during the study period (2011-2021) was carried out to understand the LST dynamics of the study area that is Tinsukia revenue circle (TRC). The LST of the study area has shown a significant increase during the last ten years in summer (fig 3) but slight decreasing trend was observed

**Rani Kumari Shah**

during winter (fig 4). During summer of 2011 the LST ranges from 16.1 °C and 27.93 °C with a mean value of 21.09 °C whereas during summer of 2021 the LST ranges from 21.18 °C and 34.87 °C with a mean value of 27.44 °C. The mean LST was increased by 6.35 °C from 2011 to 2021 which is a significant increase. During winter of 2011 the mean value of LST was 20.19 °C with minimum and maximum values of 16.56 °C and 26.21 °C. The mean was declined in 2021 which is 19.21 °C. The range was from 16.34 °C to 25.78 °C. During winter the mean LST was decreased by 0.98 °C (-1 °C) from 2011 to 2021.

The LST dynamics for each land use category (from 2011 to 2021) was calculated considering 100 sample points within the study area. The sample points were extracted using the thermal bands of Landsat images. The extracted data were categorized and mean for both summer and winter were calculated. The LST growth was finally compared. The results showed a sharp increase in LST in summer in all the land use classes. Highest rise was seen in built up land (7.64 °C) followed by open space (7.25 °C). However in winter slight negative growth of LST was seen. The LST change during the study period over different land use classes is shown in table 4 and the thermal profile is depicted in fig 5 and fig 6. The urban locations such as Tinsukia railway station, Tinsukia ASTC, Milan Pally, Rajendra Nagar and Makum are identified as the main hotspot areas in the year 2021.

During the study period the study area have experienced increase in built-up area and reduction in vegetation and open space. The main reason for increase in surface temperature may be the reduction in vegetation and open space as well as growth of the urban centre. Rising earth's surface temperature leads to hotter summer seasons with shorter monsoon period and rainfall that further increases the risk of flood [20]. High temperature associated with high amount of humidity affects human health which further lead to the incidence of diseases such as malaria, dengue etc. which are very common in the study area. Climate change and frequent change in weather patterns poses a threat to environmental planning and management. The present study may help the policy makers and land management professionals to identify the heat zones and manage the urban areas and will also help in making decisions for policies related to sustainable development in future. The authority of Tinsukia district can promote rooftop nursery plantation to reduce the LST impacts among others.

Table 2 Methods used for extracting LST

| Data | Steps | Formula |
|-------------|---|--|
| Landsat TM | Step I- Digital number to spatial radiance Convergence | $L\lambda = \frac{Lmax - Lmin}{QCALmax - QCALmin} * (QCAL - QCALmin) + Lmin$ <p>Where, $L\lambda$ = Spectral Radiance (Watts/ (m2 sr μm)) $Lmax$ $=$Maximum Radiance that is scaled to $QCALmax$; $Lmin$ $=$Minimum Radiance; $QCAL$ = DN value of the Pixel; $QCALmax$, $QCALmin$ =Pixel's highest & least DN value respectively</p> |
| | Step II- Conversion spatial radiance to brightness temperature K | $BT = \frac{K2}{\ln(\frac{K1}{L\lambda + 1})} - 237.15$ <p>Where, BT = Brightness temperature ($^{\circ}C$), $K1$ = 607.76 (Watts/(m2*sr*μm)), $K2$ = 1260.56 (Watts/(m2*sr*μm))</p> |
| Landsat OLI | Step I- Digital number to spatial radiance Convergence | $L\lambda = ML * Qcal + AL - Oi$ <p>Where, $L\lambda$ = Spatial radiance (Watts/(m2*sr*μm)) ML = Radiance multiplicative band, $QCAL$ = Pixel's DN value, AL = Add band of Radiance, Oi = Correction value i.e. 0.29</p> |
| | Step II- Conversion spatial radiance to brightness temperature in K | $BT = \frac{K2}{\ln(\frac{K1}{L\lambda + 1})} - 237.15$ <p>Where, BT = Brightness temperature ($^{\circ}C$), $K1$ = 774.8853 (Watts/(m2*sr*μm)), $K2$ = 1321.0789 (Watts/(m2*sr*μm))</p> |
| | Step III- NDVI calculation | $NDVI = (Band\ 5 - Band\ 4) / (Band\ 5 + Band\ 4)$ |
| | Step IV- Land Surface Emissivity calculation | $Pv = \left(\frac{NDVI - NDVImin}{NDVImax - NDVImin} \right)^2$ <p>Where, Pv = Proportion of vegetation, $NDVImin$ = Minimum value of NDVI, $NDVImax$ = Maximum value of NDVI</p> <hr/> $e = 0.004Pv + 0.986$ <p style="text-align: right;">Where, e = Land Surface Emissivity</p> |

Rani Kumari Shah

| | | |
|--|----------------------------------|---|
| | Step V- Land Surface Temperature | $LST = \frac{BT}{1} + \lambda * \left(\frac{BT}{P}\right) * \ln(e)$ <p>Where, BT = Brightness temperature, λ = emitted radiance e = LSE, P= h*c/s=1.4388*10⁻² mK = 14388 mK h= Planck's constant (6.626*10⁻³⁴ Js), s= Boltzmann constant (1.38*10⁻²³ JK), C= Velocity of Light (2.998*10⁸m/s)</p> |
|--|----------------------------------|---|

Table 3 Land use and land cover changes

| LULC classes | 2011 | | 2021 | | Net change (km ²) |
|--------------|-------------------------|-----------|-------------------------|-----------|-------------------------------|
| | Area in km ² | Area in % | Area in km ² | Area in % | |

ABSTRACT

Siddha system is one of the most ancient codified traditional medical System of India. This system connects spiritual, physical and mental health of an individual. One of the special therapeutic techniques is *Varmam* therapy, This *Varmam* therapy is the manipulation of pressure over certain points in the surface of the body for a specific time for the management of various diseases. *Varmam* manipulation therapy plays vital role in the management of musculoskeletal and neurological disorders. Injury in the *Varmam* points may lead to disease also. The different methods that can be used to manage *Varmam* injuries are *Marukaalam*, *Thirumal Murai*, *Adangal Murai (Restoring)*, *Thiravukol Murai*, *Thadaval Murai [Applying massage techniques]*, *Marunthu Murai [Applying medicines]*, *Vayu Nilai Amarthal and Kattu Murai*. The density of the vital energy is more in *Varmam* points which are called as Adangal in Adangal. Varma Adangal is a technique in which pressure points are modulated in a distinct pattern to regulate blood flow, temperature and pranic energy. By stimulating these points Varma related diseases could be managed. Literature review, Review of literatures in libraries of National Institute of Siddha, Govt. Siddha medical college and Central Research Institute, Chennai. The outcome of this study is to present a comprehensive literature review on the Adangal points located in Head and neck mainly based on its location, retrieval techniques and therapeutic indication. This study reveals 67 Adangal points located in head and neck.

Keywords: Adangal, head and neck, retrieval technique, therapeutic indication.

Kavitha et al.,

INTRODUCTION

Siddha system is one of the most classical medical systems of India. It is one of the prior conventional medical systems in the world which manage not only the body but also the mind and the soul. *Siddha* system of medicine is distinctive and has its specialities in *Kayakalpam* (Rejuvenation therapy), *Muppu* (unique salt), *Varmam* (subtle energy points), *Vaasi* (pranayamam) etc. *Varmam* manipulation techniques play a vital role in the management of musculoskeletal and neurological disorders. *Varmam* therapy is the pressure manipulation over certain points for a specific time. When these points are prompted it surges the flow of energy, aids in the management of *Varmam* disease and magnifies the immune mechanism [1]. However, the identical points if erroneously oxygenized may induce pathological or traumatic exposure. The diverse methods that can be practicable to manage *Varmam* related injuries is *Adangal Murai* (Restoring)

Adangal is the technique in which pressure points are modulated in a distinct pattern to regulate blood flow, temperature and pranic flow in the patient's body. According to *Siddha* classic literatures *Adangal* means *Adanguthal* [2]. It refers to a state of restfulness. Due to various *varma* injuries the flow of vital energies are static in certain places. These places are called as *Adakkam* or *Adangal*. According to the classic literature *Sarasuthirathiravukol* the region where nerves connect or meet each other is known as *Adangal*. So, I would like to explore the *Adangal* points located in head and neck, and to differentiate the *Adangal* from *Varmam*. I would also attempt to review the classic *Varmam* literatures related to its retrieval techniques and therapeutic indications.

LOCATION OF ADANGAL POINTS [3, 4]

Table 1: Adangal Points Located in Head, **Table 2:** Adangal Points Located in Neck

DISCUSSION

In this present study, 25 *Siddha Varmam* classic literatures were referred for the compilation of *Adangal* points located in head and neck. The Literatures are collected from Libraries of National Institute of Siddha, Govt. Siddha medical college Chennai, Siddha Central Research Institute Chennai and *Thamarainoolagam*, Chennai. Sixty seven (67) *Adangal* points are identified from the literatures. They are stimulated during the *Thadavalmurai* to maintain the vital energy. It acts as one of the retrieval techniques to protect life. Most of the *Adangal* located in head, strengthens the brain and increases the memory power. It promotes the functions of *Thasavayukal* and *lymporigal*. They are stimulated in emergency management [8]. *Adangal* are indicated for acute and chronic conditions. Acute conditions like dizziness, headache, sweating, epistaxis, nasal congestion, cervical pain, hiccups, sinusitis, insomnia, lock jaw and jaw pain are treated. The chronic conditions include hemiplegia, seizure, facial palsy, psychiatric disorders; Parkinsonism, speech disorders, ear and eye disorders are managed. The *Adangal* promotes normal breathing and have the ability to change the pattern of vital energy. It strengthens the sex organs. By stimulating this *Adangal* points it improves concentration and confident. Hence the *Adangal* plays a major role in the management of various disorders and normalizes the vital energy.

CONCLUSION

In this present study, the documentation of *Adangal* points located in head and neck mentioned in various *Siddha Varma* literatures are compiled. *Adangal* is one of the retrieval techniques of *Varmam*. Most of this *Adangal* are indicated for *Kabham* disorders mainly neurological and cervical pain. This collective documentation will be a guide to researcher to explore *Adangal* which has vast clinical and academic importance.

Table 1: Adangal Points Located In Head

| SI.No | Adangal Points[6] | Location[7] | Retrieval Technique[5, 6] | Therapeutic Indication[8] |
|-------|---------------------------------|---|--|---|
| 1. | <i>Thilartha Adangal</i> | At the meeting point of nasal and frontal bone in the junction of both eyebrows | Gently press with the thumb, move upward and downward and hold it. | Dizziness Headache Insomnia Strengthens the brain |
| 2. | <i>Athiveerasangara Adangal</i> | Half finger breadth above the Thilartha Varmam. | Press with the middle finger mildly. | Normal breathing Dizziness Insomnia Strengthens the sex organs |
| 3. | <i>Prakaasa Adangal</i> | Centre of the cornea of both eyes. | Keep the eyes closed and gently press with the pulp of the thumb from medial to lateral. | Eye diseases It enhances power to the eyes. |
| 4. | <i>Kannadangal</i> | Two finger breadth lateral to the ThilarthaVarmam on both sides. | Press with the thumb and hold upward. | Headache Migraine Sinusitis Facial palsy |
| 5. | <i>Iruvizhi Adangal</i> | Medial and lateral ends of the eyes | Press with the thumb and middle finger in both eyes simultaneously. | It improves vision. |
| 6. | <i>Kothanda Adangal</i> | Gently move along the course of Thilarthavarmam- Natchathiravarmam- | Press with the thumb of both the hands in Thilarthavarmam and move simultaneously | It is practiced in the management for shortness of breath, restlessness and palpitation which occur |

| 7. | <i>Bala Chandra Adangal</i> | Two finger breadth above the Thilarthavarmam and located at Centre of the forehead. | Rotate clockwise with the middle finger. | It Increases the memory power. |
| 8. | <i>Vinothasinthanai Adangal</i> | Half finger breadth above the Balachandra Adangal. | Touch gently with the middle finger and press it. | It is stimulated during head massage. |
| 9. | <i>ThuriyaAdangal</i> | One finger breadth above BalachandraAdangal | Touch gently with the middle finger and press it. | It integrates the body and mind. |
| 10. | <i>ItchaiAdangal</i> | One and half finger breadth above the <i>Balachandra Adangal</i> | Touch gently with the middle finger and press it. | It induces the desire. |
| 11. | <i>Mantha Adangal</i> | Two finger breadth lateral to the <i>Itchai Adangal</i> on both sides. | Press with the thumb. | Cerebral palsy It increases the IQ level. |
| 12. | <i>ChithaAdangal</i> | Centre of the forehead. | Press with the thumb | Psychiatric diseases |
| 13. | <i>KuriAdangal</i> | Marking area of the forehead. | Press with the thumb and move gently from Thilarthavarmam to Utchivarmam. | Chronic insomnia. Psychiatric diseases. |
| 14. | <i>Amathadangal</i> | Centre of the head. | With the thumb rotate clockwise and press it. | This procedure is done after stimulating all <i>Varmam</i> points. |
| 15. | <i>Pagutharivu Adangal</i> | Located before the Centre of the head | Press with the thumb gently. | It increases the memory power. |
| 16. | <i>Visuvaasa Adangal</i> | Located front and back of the Centre of the head. | With the middle finger touch softly. | Psychiatric diseases. |
| 17. | <i>Pathi Adangal</i> | Centre of the head. | Just press with the thumb. | The flow of vital energy is normalized |
| 18. | <i>Soora Adangal</i> | Two finger breadth above Sirunkolli Varmam. | Press with the thumb and hold inside. | Mental retardation |
| 19. | <i>Uyirnaadi Adangal</i> | It is just located two fingers below <i>Sooradangal</i> | Press the point with mustard seed. | Psychiatric diseases |
| 20. | <i>Pidari Adangal</i> | <i>Pidari Kuzhi</i> | Press with the thumb softly | Cervical pain |
| 21. | <i>Paenkuzhi Adangal</i> | Located between <i>Pidari Adangal</i> and <i>Suzhiyadi Adangal</i> | Press with the thumb | Stimulated in <i>Thadaval</i> procedures |

Kavitha et al.,

| | | | | |
|-----|--------------------------------|--|---|--|
| 22. | <i>Chuzhi Adangal</i> | One finger below <i>Penkuzhi Adangal</i> | Press with the middle finger gently | Cervical pain |
| 23. | <i>Purasarvanga Adangal</i> | Laterally to <i>Pidari Adangal</i> on both sides | By using the thumb and middle finger press upwards | Cervical pain |
| 24. | <i>Pidarikuzhiyora Adangal</i> | Located two finger breadth lateral to <i>Pidarikuzhi Adangal</i> | Press with the thumb laterally | It reduces the cervical pain and stiffness |
| 25. | <i>Mudisoodi Adangal</i> | Four fingers lateral to <i>Pidari</i> | By using the middle finger move laterally from <i>Pidari</i> on both sides | Cervical pain and sprain |
| 26. | <i>Panja Narambu Adangal</i> | Squamous part of the frontal bone | Press with the thumb gently | Headache |
| 27. | <i>Karakk Adangal</i> | Two fingers above <i>Aasamai Adangal</i> | Press with the thumb and move upwards and downwards | Headache Dizziness Nausea |
| 28. | <i>Poigai Adangal</i> | Located two fingers above <i>Sevikutri Varmam</i> | Press with the thumb and hold upwards | Brain, Endocrine disorders Cerebral palsy |
| 29. | <i>Aasaamai Adangal</i> | Above the tragus of the ear | Press with the thumb and move downwards | Dizziness |
| 30. | <i>Pini Narambu Adangal</i> | Below the ear in <i>Sevikutrikuzhi</i> | Press with the thumb and hold upwards | Facial, Ear and Brain disorders |
| 31. | <i>Mael Adangal</i> | Lobule of the ear | Press with the thumb and hold it | Ear disorders Lock jaw. |
| 32. | <i>Sevikutri Adangal</i> | Tragus of the ear. | Press and hold with the thumb firmly | Epistaxis Ear diseases |
| 33. | <i>Sevi pin Adangal</i> | Located back of the pinna in the ear. | Press with the thumb and hold upwards | Psychiatric disorders Hiccups |
| 34. | <i>Kurunth adangal</i> | Tragus of the ear | Shake the tragus gently | The vital energy of the whole body is normalized |
| 35. | <i>Alavukamboori Adangal</i> | Two finger breadth below the <i>Natchathira Varmam</i> | Press with the thumb firmly | Lock jaw Dizziness |
| 36. | <i>Monadangal</i> | Located inferior to the eye | Press with the thumb and hold upwards | Lock jaw Nasal congestion Seizure |
| 37. | <i>Suzhumunai Adangal</i> | At the junction of nose and upper lip | Press with the thumb and then move right and left | Febrile seizures |
| 38. | <i>Gnanauthaya Adangal</i> | This <i>Adangal</i> is stimulated by seeing and thinking itself | It is introspected from the ear to the corner of the eye and to the tip of the nose | It strengthens the brain |
| 39. | <i>Sothanai Adangal</i> | It is present at the tip of the nose. | Press inside the nose with thumb and hold upwards | Cold, Nasal congestion Dizziness Sneezing |
| 40. | <i>Mumoorthi Adangal</i> | It is located as triangle around the nose | Press with the thumb, fore finger and middle | Shortness of breath, Brain related diseases. |

Kavitha et al.,

| | | | | |
|-----|---------------------------------|--|--|---|
| | | | finger and then hold upwards | |
| 41. | <i>Nalliruppu Adangal</i> | Center of the tongue | Press with the thumb and move downwards. | Facial palsy Hemiplegia |
| 42. | <i>Amirtha Adangal</i> | Laterally to the <i>Nalliruppu Adangal</i> on both sides | Press with the thumb and middle finger, and then move downwards | Throat, tongue and speech disorders |
| 43. | <i>Athara Adangal</i> | Uvula of the tongue | Press with the thumb and Abrusprecatorius seeds (manjadi), then move upward and downward. | Dizziness Sweating |
| 44. | <i>Sarvanga Adangal</i> | Just above uvula of the tongue | Place some wooden objects inside the mouth to avoid biting then press with the stimulating finger and move upward. | Abdominal bloating, Flatulence Intestinal obstruction |
| 45. | <i>Mel sarvanga Adangal</i> | At the beginning of the soft palate | Press with the thumb and hold upwards or downwards. | Dizziness Sweating |
| 46. | <i>Kizhsarvanga Adangal</i> | At tip of the tongue in midline | Press with the thumb and hold downwards | Brain and Nervous disorders. |
| 47. | <i>Nakkusarvanga Adangal</i> | Mid lateral border of the tongue on both sides. | Press with the thumb and middle finger | Speech disorders |
| 48. | <i>Nakkadangal</i> | Inferior to the <i>Kizhsarvanga Adangal</i> | Press with the thumb and middle finger, and then move upwards | Speech Tongue disorders |
| 49. | <i>Solladangal</i> | Inferior to <i>Amirtha Adangal</i> | Press with the thumb and middle finger | It promotes the lower jaw movements |
| 50. | <i>Pootadangal</i> | Near third molar teeth | Press between the cheek and teeth by closing the mouth | Jaw pain |
| 51. | <i>Ulladangal</i> | At the end of the junction of upper and lower jaw | Press with the thumb and rice, and then move downwards | Lower jaw pain Seizures |
| 52. | <i>Kadaisatti pal Adangal</i> | Anterior to the third molar teeth | Press with thumb and cotton seed, and then move upwards or downwards. | Dizziness |
| 53. | <i>lynthamsatti pal Adangal</i> | Anterior to the canine teeth in lower row | Press with the trigger finger and move downwards | Lower jaw pain Neurological disorders |
| 54. | <i>Kuvattadangal</i> | At the back of ear in the angle of lower jaw | Press with the trigger finger and hold upwards | It is one of the retrieval techniques of Varmam. |
| 55. | <i>Kundrimuthu Adangal</i> | Above the eyebrow at the midpoint | Gently press with the Abrusprecatorius | Headache Migraine |
| 56. | <i>Alaguchennadi</i> | Located at the end of the | Press with the | It is indicated for <i>sanniand</i> |

Kavitha et al.,

| | | | | |
|-----|----------------------------|---|---|----------------------|
| | <i>Adangal</i> | lower jaw. | thumb on both sides. | <i>mayakkam</i> |
| 57. | <i>Kona sannii Adangal</i> | Located at the end of the lower jaw. | Press with the thumb and hold upwards | Jaw disorders |
| 58. | <i>Mun Naadi Adangal</i> | In the middle of the lower jaw on both sides of the chin region | Press and rotate in clockwise direction | Lower jaw diseases |
| 59. | <i>Naadikuzhi Adangal</i> | In the depression which is present in middle of the lower jaw | Press with the middle finger | Parkinsonism disease |
| 60. | <i>Kabala Adangal</i> | Two finger breadth antero-laterally from <i>SevikutriVarmam</i> | Press with the thumb firmly | Lock jaw |
| 61. | <i>Kavalperiya Adangal</i> | Three finger breadth below the ear | Press with the thumb firmly | Lock jaw |

Table 2: Adangal Points Located in Neck

| SI no | Adangal Points[6] | Location[7] | Retrieval Technique[5, 6] | Therapeutic Indication[8] |

ABSTRACT

The Micro, Small, and Medium Enterprise (MSME) sector has grown to become a crucial part of the Indian economy, making a considerable contribution to exports, innovation, job creation, and inclusive growth. The socioeconomic development of our nation is supported by Micro, Small, and Medium-Sized Enterprises (MSME). Along with making up 40% of all exports and 45% of all industrial production, it has a major impact on GDP. The MSME's manufacturing sector makes for 7.09% of the GDP. MSMEs provide 30.50 percent of the services. MSMEs make up a total of 37.54 percent of the GDP. A strengths, weaknesses, opportunities, and threats (SWOT) analysis is an important method used by corporations for strategic planning for SSI. Any SWOT analysis's purpose is to pinpoint the internal and external factors of the SME.

Keywords: MSME, Definition, Importance, SWOT Analysis.

INTRODUCTION

During independence, India's perception of small-scale industry showed confusion and a lack of clarity. This industry was created specifically for small, cottage-style businesses making handicrafts in rural and urban regions. The only factor used to define small scale in the Industrial Policy Resolution of 1948 and the First Five Year Plan document was their lack of registration under the Factory Act. As a result, SSI referred to any units that utilized electricity and had no more than ten workers or none at all but up to 20. The distinction between SSI and village industry was defined later, under the First Five-Year Plan. From that point capital, employment, and power were

**Devi Kalyani and Revathy**

used to determine the size of small -scale industry. It is applicable up to 2005. Thus from 1966, the investment criteria to define small-scale industries had undergone changes as given in Table 1.

DEFINITIONS OF SMALL, MEDIUM, AND MICRO ENTERPRISES

The MSME Act, of 2006, was enacted to provide an enabling policy environment for the promotion and development of the sector by way of defining MSMEs, putting in place a framework for developing and enhancing the competitiveness of the MSME enterprises, ensuring the flow of credit to the sector, and paving the way for preference in Government procurement to products and services of the MSEs, address the issue of delayed payments, etc. It is expected that the new law will be able to address the major challenges, relating to physical infrastructural bottlenecks, absence of formalisation, technology adoption, capacity building, backward and forward linkages, lack of access to credit, risk capital, the perennial problem of delayed payments, etc.

The MSME Act of 2006 was enacted in order to create an enabling policy environment for the sector's promotion and development by defining MSMEs, establishing a framework for growing and enhancing the competitiveness of the MSME enterprises, ensuring the flow of credit to the sector, and paving the way for preference in government procurement to products and services provided by MSEs. It also addresses the problem of late payments, among other things. The major issues relating to physical infrastructural bottlenecks, lack of formalization, technology adoption, capacity building, backward and forward linkages, lack of access to credit, risk capital, the perennial issue of delayed payments, etc. are anticipated to be addressed by the new law

Now MSME is defined based on investment in plant and machinery or equipment. From 1st July 2020 onwards for doing business easily the Government of India has implemented the turnover of the business as a new criterion. The industrial sector has played an important role in India's GDP. In India, this industrial sector has a greater future because of the variety of products and services offered. This MSME sector in India is acting as the engine of the Indian economy, contributing more than two-fifths of total industrial production and one-third of total export contribution. This traditional industry clearly differs in many ways from its contemporary counterparts. While modern MSME manufacturing enterprises are much more productive with more capital-intensive units and more technologically sophisticated automatic machinery, traditional sectors are primarily consumed with their antiquated machines and traditional methods of production. Businesses now frequently use a SWOT analysis when strategizing for SSI. This analysis looks at a company's strengths, weaknesses, opportunities, and threats. Any SWOT analysis seeks to identify the important internal and external factors that are significant to achieving the goal. These arise directly from the distinguished value chain of the business.

Internal factors – The strengths and weaknesses of the business

External factors – The opportunities and threats of their business concern.

According to this analysis, the internal factors would be taken as a strength or weakness of the Business. The strengths and weaknesses will depend upon the objectives of the business concern. The factors include 4P's, such as Product, Price, Place, and Promotion, and other factors like Personnel, finance, the capabilities of the concern's productivity, and so on. Macroeconomic problems, technological advancements, legislative changes, sociocultural changes, market or competitive position changes, and other factors, may all be considered external factors. The SWOT analysis is merely one type of categorization and has defects of its own. For instance, it might influence businesses to create lists rather than consider what is actually crucial for achieving goals.

IMPORTANCE OF SMALL-SCALE INDUSTRIES

The small-scale industries played a vital role in the economic activity of advanced industrialized countries like Great Britain, Germany, Japan, and the United States of America. Many countries, both developing and developed countries, perceive this sector as a useful technique for growth, in the former for the creation of new employment

**Devi Kalyani and Revathy**

opportunities on a wide scale in the shortest possible time and in the latter as balancing to the large-scale industry. Unemployment, under-employment, and poverty are the steaming problems of India today. Small industrial units play an important role in the financial development of a nation like India where many skilled and unskilled people are unemployed or underemployed. The small industrial units solve these problems by generating employment opportunities in a large-scale manner with lower investments. The former Finance Minister of India Dr. Manmohan Singh has rightly pointed out that “the key to our success in employment lies in the success of manufacturing in the small-scale sector.” The economic development of any nation largely depends upon the establishment of small-scale industries, which require an adequate amount of investment. The strength of the small industrial units rests in their spread and location in urban, semi-urban, and rural areas, nurturing entrepreneurial base, smaller periods of gestation, and reasonable distribution of revenue, wealth, and income.

After studying the importance of small-scale industrial units, the Central government of India has established various departments and institutes at different levels- local, state, and central. These organizations and institutions have been tracking the policy of protection and development of this industrial sector since independence and offer several concessions, subsidies, and incentives for their promotion and development.

STATEMENT OF THE PROBLEM

Small-scale industrial units serve as important elements in resource mobilization, the creation of employment opportunities, utilization of available local resources, and income. generation, and in helping to maintain positive changes in a phased manner. In India, this sector has occurred as an energetic and dynamic element of the development of the economy. It is a substance of pride that India has occupied the highest rank among the developing countries in small industries. India has sufficient skilled and unskilled manpower, occupying the third position in the world as far as skilled manpower is concerned. It is worth stating that the small-scale industrial units have registered a significant rate of growth in spite of heavy competition from the large-scale industries. Since independence, both central and state governments have been implementing protective policies and promotional measures. Considering the vital role of small-scale industrial units in the economic development of the nation, the government has been constantly trying to improve the availability of input resources to this sector and create a suitable industrial and economic environment. The easy financial support and incentives have motivated many investors to start small-scale industrial units. This resulted in the growth of the small-scale industrial units in India. Even though, many small industrial units were not able to serve due to a number of reasons. Hence it is of interest to examine the SWOT analysis of small-scale industrial units in the Coimbatore district. In this context, a study on the SWOT analysis of small-scale industrial units has been undertaken in the Coimbatore district.

OBJECTIVES OF THE STUDY

To examine the Strength, Weaknesses, Opportunities, and Threats of small-scale industrial units in Coimbatore district

SAMPLING DESIGN

Coimbatore has been selected for the study since there is a wide range of small-scale industrial units which generate employment opportunities for skilled and semi-skilled persons in and around the Coimbatore district. As the census method is not feasible, the researcher has followed the proportionate convenient sampling. All the small-scale industries located in the Coimbatore district are included in this study. The list of small-scale industries that availed the various government schemes with a minimum of ten years standing, registered up to 2007-2008 was obtained from the Manager of the District Industries Centre, Coimbatore. Table 2 shows the number of units registered, de-registered, and alive up to 2007-2008. The researcher has selected 412 units being 10 per cent of the universe for this study. The sample small scale industrial units of Coimbatore covered by the present study are shown in table 3.

**Devi Kalyani and Revathy****PERIOD OF THE STUDY**

The period covered for the present study is 10 years from 2008-2009 to 2017-2018 to assess the development and the various input problems met by the small-scale industrial units in Coimbatore district.

SOURCES OF DATA

The study is experimental in nature based on survey method. The required data for this study were collected in three stages. The primary data relating to the small-scale industrial units were collected by interviewing the owners with the help of the interview schedule. The secondary data relating to the study like the origin and growth of small-scale industries were obtained from various published and unpublished records, annual reports, bulletins, booklets, journals, magazines, etc.. Lastly, the researcher held discussions with the officials of various Departments, Trade Union Leaders and the officials of the District Industries Centre. These discussions were helpful to the researcher in identifying the SWOT analysis of SSI for the study.

STRENGTH, WEAKNESS, OPPORTUNITIES AND THREATS

Development in any walk of life has always depended to some degree or other on individual qualities of entrepreneurship. History shows evidence of the role of individuals in the process of development in any field of scientific investigation, economics, sociology, education, or military science. Industrial development in almost all countries has always started with private individual enterprises. SWOT analysis helps the entrepreneur to evaluate their business in a better way. Every business faces a changing market, changing competitors, changing customers with their evolving tastes and preferences, and changing technology that poses external opportunities or threats. SWOT analysis helps the entrepreneur to be conscious about where the entrepreneur today and where the market may be tomorrow. It helps them be both self-aware and situationally aware of the business. Which environmental factors are considered to be suitable or otherwise for the launching or management of their enterprise will have to be understood; only then can certain ideas be formed as to their requirements for development. Hence, a Strength, Weakness, Opportunities, and Threats (SWOT) analysis of the small-scale industries under study can be undertaken to enquire into the strengths, weaknesses, opportunities, and threats of the entrepreneurs. In a small enterprise, the entrepreneur and enterprise can be treated as synonymous as the strengths, weaknesses, opportunities, and threats faced by an entrepreneur are also those of the enterprise.

Starting an enterprise is not a simple matter, and running it successfully requires a great many qualities and characteristics. In the beginning, a venture requires skills like drive and initiative, resource mobilization, mobility, and quick decision making which are very different from skills required later on like persistence, business ethics, stamina, and goal setting. The entrepreneur may not possess all the skills; some may be present while the lack of others may be felt by the entrepreneur. Some qualities that an entrepreneur possesses are very strong, which are the key factors for the starting of a unit, and can be termed as strength, while others that are holding back the entrepreneur from definite success are weaknesses. All the strengths and weaknesses of an individual are difficult to assess but at least a few of them can be identified and analyzed to find out which qualities determine entrepreneurship, and influence the profitability of the enterprise. The small scale industries are not capable of analyzing the internal strength and weakness and external opportunities and threats.

Strength of Small-Scale Industries

Strength is the property of being physically strong or mentally strong. A chameleon's strength is actually in its ability to blend in with its surroundings. The successful entrepreneur's talents were business focus, confidence, creative thinking, delegation, determination, independence, knowledge-seeking, promotion, relationship-building, and risk-taking. Some level of talent is innate, some can be nurtured. Every business has its strengths, those things that they consistently do well to get people talking, attract new business, and retain customers. Unfortunately, strengths can sometimes cover up business weaknesses or flaws so they don't get the attention they need.

Devi Kalyani and Revathy

While running the enterprise, the entrepreneurs would have come across, identified, or used many of these strengths. Hence, it was thought appropriate to ask the entrepreneurs the applicability of various strengths generally identified. This significant strength is listed, and the entrepreneurs were asked to indicate the extent of applicability in their case as strongly applicable, applicable, partly applicable, and not applicable. These were given weights 3, 2, 1 and 0 respectively and the weighted score was calculated for each statement.

The weighted score of each statement of strength for all the respondents of a small scale industrial sector divided by the number of respondents in the particular location gave the average score per respondent as per their location. Likewise, the overall average score of all the sectors put together was also calculated. All four average scores per respondent per strength were tabulated. The higher the average scores for strength, the higher it was regarded on the list of strengths that were required for the successful running of an enterprise. The maximum average score that any strength could receive was '3' and the minimum was '0'. A comparison was also made in terms of the requirement and applicability of strength to each location depending on the sectoral integrity or diversity.

It is inferred from the table that contacts to the enterprises were ranked as the major strength required for the success of a small-scale industry with an overall average score of 3.3406. It was the major strength of the entrepreneur. A cordial relationship between the customers is very important to do the business successfully. The respondents who get easy loan facilities from the banks were ranked as the second strength of a small-scale industry. It shows the financial stability of the business. Intuition to do business was ranked third and the average score is 2.7467. This is also a major strength of the business because personal interest and involvement are very important. Employee attitude towards the concern is also considered as the strength of the small-scale industry. It was ranked fourth and the average score is 2.742. If the entrepreneur has grace and charm face is also considered as the strength of the business ranked fifth and the average score is 2.6463 followed by sixth rank commitment and dedication an average score is 2.3013. It is evinced that Contacts, Easy loans, Commitment and dedication, Intuition, and Employee attitude are the strong factors for the success of small-scale industries in Urban and Semi-urban areas.

Weakness of Small-Scale Industries

Business weaknesses are areas where improvements need to be made because their current situation leaves them vulnerable to economic pressures, market forces, or aggressive competitors. In short, these are the things that hurt long-term, sustainable profitability. Table 5 reveals that the foremost weakness of the respondent is a Lack of in-depth knowledge in the business. If the unit doesn't possess the keen knowledge, it finds it difficult to continue the business in the competitive world. The average score of this statement is 3.4978. The same situation is prevailing in Rural, Semi-urban, and Urban areas. The overall average score of Less innovation due to lack of interaction is 3.1266. This was ranked as second in Rural and Semi-urban areas. Lack of mobility was the third weakness of the small-scale industries and secured an overall average score of 3.11. This statement stood at second place in Urban units. The risk could not be forecasted by the small-scale industrial units. These units are not in a position to overcome the uncertainties. It is also one of the weaknesses of small-scale industries. It occupied the fourth place in ranking the statement of weaknesses and the overall average score is 2.7871. The same status is prevailing in all the locations. Delays in getting loans, Consciousness of society's attitude, and inability to handle crises well are the weaknesses of small-scale industrial units when Compared with large-scale industries.

Opportunities for small-scale Industries

Business opportunities are usually defined as situations where products and services can be sold at a price greater than the cost of their production. A business opportunity is a situation where investors can take action to make a profit. One of the toughest parts of being an investor is finding the next opportunity to make it big in business. There is always another opportunity coming down the road, but their job is to distinguish the good ones from the bad ones and make smart business decisions that will set them or their startup ahead in the long run It is inferred from the table that financial background of the family i.e. 'Well to do family' secured the first rank in Rural and Urban areas and second place in Semi urban area with the overall average score of 3.2926. The overall second rank packed by 'Skill in potential field' with an average score of 3.1659. This variable occupied the first place in Semi urban areas.

**Devi Kalyani and Revathy**

'Liberal views/attitudes' showed the third position with an average score of 2.7686. 'Entrepreneurial developing agencies' was in the fourth rank with an overall average score of 2.9170. The conducive atmosphere was sixth rank with an average score of 2.64419. 'Well-to-do family', 'Skill in the potential field', and 'Liberal views/attitudes' are the golden opportunities available for establishing and promoting small-scale industries in the Coimbatore district.

Threats to Small-Scale Industries

Entrepreneurship is an exciting adventure, albeit a stressful one. Their business houses may face ups and downs, achievements and challenges, and more twists and turns than you could ever expect. The people may come and go, competitors rise and fall and core idea may undergo an evolution until it's almost unrecognizable. But despite all those obstacles, stressors, and points of vulnerability, the riskiest and most dangerous part of entrepreneurship is what can happen to their business and what can happen to the investors. There are several personal risks also taken on when they become entrepreneurs, and none of them should be taken lightly. Almost every investor in small-scale industries will inevitably face these risks. It is found that the biggest threat comes from large-scale industries. 'Big unit competition' was the foremost threat to small-scale industries. 'Non-acceptance by the community' secured second place in the threats of small-scale industries with an average score of 3.1354. Shortage of capital leads to the third major threat to the small-scale industrial units in Coimbatore with an overall average score of 3.1135. If the unit possesses under capital, it can't do business in an expected manner. Rural and Semi-urban industrial units find it difficult to mobilize the funds for their business. 'Shifting place' ranked fourth in threats with an average score of 2.8821. 'Obsolescence of product technology' was the seventh threat to small-scale industries and finally 'Lack of zeal and enthusiasm' stands the eighth place in threats to small-scale industries with an average score of 2.2358.

CONCLUSION

In the present study, an attempt has been made to examine the SWOT analysis of small-scale industries with special reference to the Coimbatore District. It could be concluded that the ability to organize, fulfillment of achievement motivation, technology up-gradation, and support from the customers have been significantly affected by the various factors of production of small-scale industries in Coimbatore District. In this present situation, small-scale industries have a lot of opportunities and threats. This study helps small-scale entrepreneurs to solve their threats and use the opportunities in a better way to run the business in the long run.

ABSTRACT

Obesity is a rapidly growing health issue nowadays and one of the reasons leading to this global issue is the changed lifestyle and dietary habits. Obesity is also the root cause of various other diseases such as diabetes mellitus, cardiovascular diseases, hypertension, asthma, and even some types of cancers. Due to the association with such diseases, people often treat obesity with different chemical-based drugs, which can have long-term side effects as well. This has brought plant-derived medicines into the limelight due to their low side effects and easy availability. *Gymnema sylvestre* is one of those medicinal plants which is has been extensively used in ayurvedic medications since ancient times. Recently, the potential of this plant has been explored for antimicrobial, anti-inflammatory, and anticancerous properties and is recommended as a supplement or medicine to reduce the problem of obesity. This review targets to summarize the phytochemistry *G. sylvestre* along with its potential to treat obesity.

Keywords: obesity, *Gymnema sylvestre*, phytochemicals, pharmacological.

INTRODUCTION

Medicinal plants are the key to drug discovery and an important source of modern medicine. The plant kingdom is an exchequer of potential pharmaceuticals, and afresh there has been an increase in the awareness of the significance of medicinal plants. It has been a well-established fact that almost 25% of the medicines are derived from plants, yet

59112

**Bhavika Gupta et al.,**

there are only 15% of plants are explored for their medicinal uses [1]. Today, the botanical medicines, have been studied on a large scale by scientists worldwide to provide effective therapeutic potentials such as anti-diabetes, anti-cancer, immunomodulatory and anti-obesity, hypertension, etc. Botanical medicines are readily available, cheap, safe, and effective, and have very few side effects owing to the extensive use of medicinal plants to find new drugs with therapeutic effects.

The knowledge about the chemical properties of plant is necessary for discovering new therapeutic properties of that plant and its use in various medical fields. Medicinal plants contain some natural mixture of compounds that have distinct anatomical effects on humans, and these known physiologically active constituents are tannins, alkaloids, carbohydrates, terpenoids, steroids, and flavonoids which are essential for various medicinal purposes [2]. These active compounds are results of primary and secondary metabolites of the plant. The molecules including amino acids, sugars, tricarboxylic acids, or Krebs cycle intermediates, proteins, polysaccharides, and nucleic acids are examples of primary metabolites. A variety of chemical substances created by plant cells through metabolic pathways descended from the core metabolic pathways are referred to as "secondary plant metabolites" [17]. Most of secondary metabolites are widely used in human therapy, veterinary medicine, agriculture, scientific research, and numerous related fields [3]. Healing herbs like basil, mint, parsley, cilantro, etc. are a versatile source of natural antioxidants and different bioactive compounds. Nowadays, the utilization of herbal remedies in the treatment of various diseases is gaining popularity due to their safety and almost no side effects. Since ancient times, herbal medicines have been widely used in India, China, and other countries to treat a variety of ailments. It has been seen that more than 800 traditional herbs have been used to treat major health issues like obesity and diabetes [4].

According to the data available, today, due to the lifestyle changes and environmental factors, obesity has become one of the most fast-growing diseases in the world. Obesity can give rise to trouble for more serious deep-seated diseases like asthma, Type 2 diabetes, obstructive sleep, cardiovascular disease, hypertension, mental issues, and cancer [5]. According to World Health Organization (WHO; 2016), 13.1% of the world's population was obese and 38.9% of the population was overweight, compared to 4.7% and 21.5%, respectively, in 1975, according to data from the Global Health Observatory (GHO) [42]. For several patients, obesity is a chronic illness that lasts for a long period of their entire lives. The sluggish progression throughout adulthood is one of its defining features in most people, while some are characterized by relapses after periods of bodyweight stability or transient decrease of weight. The causes of obesity can be genetic, metabolic, environmental, and behavioural problems which thereby assist in the spread and emergence of obesity [6]. WHO claims that the frequency of obesity is rapidly increasing worldwide, to epidemic proportions, at an alarming rate. Overweight and body mass index (BMI) are two important indications of obesity, the International Obesity Task Force estimates that 800 million individuals globally are overweight (BMI 25-29.9 kg/m²) [7]. While appetite suppression can lessen the discomfort of enduring hunger and make the process easier, many individuals try to prevent obesity or lose weight by eating less. However, the accompanying hunger may cause people to overeat later. There are many hormones and neurotransmitters which help in the regulation of metabolism in the body, some of which are Neuropeptide Y (NPY) and Pro-opiomelanocortin (POMC) neurotransmitters, and hormones, including leptin, insulin, α -Melanocyte stimulating hormone, they all are regulated by edible and medicinal plants, which together can affect hunger and feeding behaviour [8].

The use of plants as medicines predates the earliest written records in human history. A body of knowledge relating to the healing powers of the local flora can be found in almost all cultures around the world [11]. Effectiveness, or potency, of the plants used for healing, *i. e.*, biologically active ingredients, storage conditions that ensure the active ingredients are preserved for a reasonable amount of time, and adequate concentrations of active ingredients that are not toxic are all requirements. Additionally, contemporary medicine may discover some crucial principles to create new therapeutic agents [12]. The evolution of human culture has been greatly influenced by medicinal plants. Many modern pharmaceuticals are also indirectly derived from plants, as well as numerous traditional medicines, mainly come from herbal medicines. The significance of both conventional and modern medicine in human disease control, detection, medications, and ailments is well illustrated [13]. Herbal remedies, which are widely acknowledged to be efficient against a variety of diseases, are becoming more and more popular around the world. More importantly,

**Bhavika Gupta et al.,**

they are widely accessible at reasonable prices and are not known to have any overtly negative effects. Synthetic medications are frequently tainted with side effects and adulterated in developing nations, in addition to being costly and ineffective for the treatment of diseases. Consequently, different treatments have developed in various parts of the world. A major topic of debate around the world is the traditional medical system. Scientific studies have looked into the potential medicinal uses of many of the plant species that are considered to be medicinal herbs [14]. Various herbal plants have been discovered for the various medicinal products to be made. The natural sources of around 35% of these medications, including plants (25%), microbes (13%), and animals (about 3%), are: Natural-derived goods are a crucial source for multinational pharmaceutical corporations engaged in the research and development of novel medications [15]. The WHO has identified 21,000 plants that are widely used for medical reasons around the world, in which about 2500 species have been found in India, and biopharmaceutical companies exploit 150 of them commercially on a sizable scale as conventional medicine. India, which holds the title of "the botanical garden of the world," is the largest producer of medicinal herbs [16].

Gymnema sylvestre (Family Asclepiadaceae) is a large, woody, and fanned climber, distributed in rainforests and the semitropical regions of the globe. It is considerably used in traditional systems of drugs and is mentioned in the ancient literature of Australia, Japan, Vietnam, and India [9]. It is commonly known by the name 'Gurmar'. The leaves of Gurmar contain lupeol, amyirin, stigmaterol, Chlorophyll, wax, dihydroxybutanedioic acid, Gymnemic acids (an anti-sweetening constituent), and a mixture of saponins, derivatives of anthraquinone, alkaloids, and trimethylamine [10]. Due to this richness in secondary metabolites, this plant has significant effects that include anti-diabetic, anti-inflammatory, hypoglycaemic, antihyperlipidemic, anti-cancerous, anti-microbial, and antioxidant properties. Moreover, by inhibiting the major protease enzyme termed 3CLpro, which is crucial for viral replication, the bioactive components of *G. sylvestre* have also been demonstrated to be an effective treatment for COVID-19 [43]. So, considering this plant as an antiobesity agent we can reduce the problem of overweight with no side effects on other parts of body. This review tends to summarise the potential of this plant as an antiobesity agent.

Phytochemistry of *Gymnema sylvestre*

The therapeutic benefits of herbs are based on composition of different bioactive components it has. One can more fully understand a plant's potential medical advantages by being aware of its chemical composition. The significance of major plant metabolites in fundamental biological mechanisms, including development, storage, cell division, reproduction, and respiration has been explained by contemporary chemistry. They consist of the elements that make up procedures like photosynthesis, the Krebs or citric acid cycle, glycolysis, and related pathways [17].

G. sylvestre (GS) plant is widely used for its ayurvedic properties to cure diabetes, control the cholesterol level, and is also effective in the treatment of obesity. Various studies have already been registered for its anti-diabetic effect but it is now being explored for its other aspects, especially its anti-obesity effect which is thereby helpful in lowering various problems and diseases. The leaf extract of *G. sylvestre* is the hub of various phytochemicals that are important for reducing various kinds of diseases and their treatment. Even though it was initially very difficult to isolate these labile substances, roughly 20 different oleanane-type glycosides have now each been identified as sweetness-inhibiting components [18]. Stigmaterol, Gymnemic acids, quercitol, saponins, the amino acid derivative of betaine, trimethylamine, and choline, are among the *G. sylvestre* bioactive compounds, which are used to treat a variety of disorders [19]. As referred in (Table 1), Stigmaterol has been found to have anti-inflammatory, antioxidant, and anti-tumor properties [39]. Gymnemic acids are believed to have anti-diabetic properties by inhibiting glucose absorption in the intestine and stimulating insulin secretion. They may also help in reducing food cravings and appetite [10]. Quercitol is a type of sugar alcohol that has been shown to have antioxidant properties [44]. Saponins are plant compounds that have a wide range of pharmacological properties, including anti-inflammatory, anti-cancer, and immune-modulating effects [1]. Betaine is a naturally occurring amino acid derivative that has been shown to have anti-inflammatory and antioxidant properties [45]. Trimethylamine is a metabolic product of choline and has been linked to the development of cardiovascular diseases [45]. Choline is an essential nutrient that plays a role in various physiological processes, including the synthesis of neurotransmitters and cell membranes [39]. The albumin,

**Bhavika Gupta et al.,**

alkaloids, carbohydrates, resins, chlorophyll, tartaric acid, butyric acid, derivatives of anthraquinone, calcium oxalate, paraben, cellulose, lignin and chemical-free acid, are all present in the leaves of *G. sylvestre* [19]. (Table 1) (Table 2) Anthraquinones, flavones, butyric acid, formic acid, pentatriacontane, resins, hentriacontane, chlorophylls, phytin, amyirin-related glycosides, and tartaric acid are other plant components. Numerous acylated (methylbutyryl, tigloyl, etc.), a 3-O-glucouronide of gymnemagenin (3, 16, 21, 22, 23, and 28-hexahydroxy-olean-12-ene), derivatives of deacylgymnemic acid (DAGA) are found in gymnemic acids. Gymnemosides A to F, Gymnemic acids I to VII, and *Gymnema* saponins are the several gymnemic acids (saponins). Gymnemasins A, B, C, and D, four brand-new triterpenoid saponins, were discovered in the leaflets of *G. sylvestre* (Table 1). Gymnemaol, a brand-new chemical that is an aglycone, was described. Gymnestrogenin, a novel pentahydroxytriterpene, has been found in the leaflets of *G. sylvestre* [9]. There are plenty of minerals found in *G. sylvestre* that are calcium, magnesium, zinc, copper and many more. (Table 2).

Pharmacological effects of *Gymnema sylvestre*

Medicinal plants usually possess a number of secondary metabolites and chemicals which are responsible for their specific bioactivities against different disease and medical conditions. The phytochemical composition of *Gymnema* is discussed in the table 1 and two and all of these bioactive compounds have been studied extensively for their pharmacological effects through different model systems (Figure 1).

Anti-diabetic activity

The primary medical benefit of this plant as a diabetes preventative medication. Since the 1930s, extensive study has been conducted on *Gymnema*, and both type 2 and type 1 diabetes have showed promising outcomes. About 8 decades ago, there was the first scientific confirmation of human use of *G. sylvestre* leaf, when diabetics discovered that it reduced urine sugar levels [19]. Gymnemic acids, Gymnemasaponins, and gurmardin are three types of triterpenes saponins that the herb uses to explain its delicious inactivation property [10]. Gurmar leaf powder can be determined to be beneficial in decreasing fasting and postprandial blood glucose levels because no negative effects on the patients' health were seen [9]. Gymnemic acids are a group of separated active components from *G. sylvestre* that have a significant impact on blood sugar levels. Gymnemic acid combination lowers the rise in plasma glucose level and prevents glucose absorption from the small intestine. Crude gymnemic acid and fractions separated from the crude gymnemic acid using affinity chromatography responded differently in reducing blood sugar levels during an oral glucose tolerance test [21].

Anti-arthritis activity

The anti-arthritis action of the leaves of *G. sylvestre* was observed in the Freund's adjuvant induced arthritis in rats. The standard drug used was Diclofenac sodium. It was observed that the petroleum ether and aqueous extract of *G. sylvestre* has the anti-arthritis effect in all parameters as compared to the control. The nature of the steroids, triterpenoids, and saponin glycosides in *G. sylvestre* leaves may be the reason for their more effective anti-arthritis effects. To determine the active ingredient that has the anti-arthritis effect, a more thorough phytochemical profile is required for this claim [22]. The group of rats that are treated with petroleum ether extract displayed a significant decrease in paw swelling, which may have been caused by reducing the response of inflammatory cells or preventing the release of mediators like cytokines (IL-1b and TNF-a), Granulocyte-Macrophage Colony-Stimulating Factor (GM-CSF), interferons, and Platelet-Derived Growth Factor (PDGF) that cause pain and disabilities brought on by the destruction of bone and cartilage [10].

Anti-inflammatory activity

Long used in Ayurvedic medicine, the leaf of *G. sylvestre* is thought to be liver tonic, thermogenic, anodyne, acrid, bitter, digestive, and anti-inflammatory. *G. sylvestre*'s tannins and saponins, which are bioactive substances, are what provide the plant its anti-inflammatory qualities [10]. Rats using the cotton pellet technique and having carrageenan-induced paw oedema were used to test the aqueous extract of *Gymnema* leaves for its ability to reduce inflammation. There were three different doses: 200, 300, and 500 mg/kg. Within 4 hours of administration, the 300 mg/kg dose of

**Bhavika Gupta et al.,**

the medicine phenylbutazone reduced the volume of the paw oedema by 48.5% compared to the recommended dose [23]. This explains the effectiveness of the plant in this reducing inflammation.

Antimicrobial activity

Agar well diffusion was used to test a variety of extracts made using various solvents (Petroleum ether, Chloroform) and extraction methods for their antibacterial activity [24]. *Bacillus pumilis*, *Pseudomonas aeruginosa*, *B. subtilis*, and *Staphylococcus aureus* were all effectively combated by the ethanolic extract of *G. sylvestre* leaves, however *Proteus vulgaris* and *Escherichia coli* were not [9]. Additionally, the leaves' modest efficacy against three pathogenic *Salmonella* species was seen in their aqueous and methanolic extracts (*S. paratyphi*, *S. typhimurium* and *Salmonella typhi*) [23]. This proves the efficacy of plant against various microbes and thereby help in the treatment of various diseases caused by them.

Anti-hyperglycemic activity

Blood glucose levels are decreased by *G. sylvestre* extract, however not statistically significantly. Pancreas, liver, and kidney regeneration were enhanced by *Gymnema sylvestre* extract. Oleanane, gymnemic acid, and gymnemasides are only a few of the secondary metabolites found in *G. sylvestre*. For instance, gymnestrogenin and gymnemagenin have anti-hyperglycemic qualities. The hypoglycemic effects of gymnemic acid impact may be explained by the improvement in pancreatic insulin production and islet cell regeneration [19]. Mice studies are being conducted to determine the hypoglycemic effects of a methanol extract of *G. sylvestre* leaves that contained a crude saponin fraction and 5 triterpene glycosides (Gymnemic Acids I–IV and Gymnemasaponin V). with diabetes caused by streptozotocin (STZ) [25]. According to preliminary research, *G. sylvestre* leaf extract decreases blood glucose levels in healthy fasting, glucose-fed hyperglycemic, and diabetic rats when compared to animals given a placebo. The additional data showed that the 200 mg/kg PO (PO = per os, meaning "by mouth") effective dose of the extract produced the greatest glucose suppression after two hours of treatment [38].

Antioxidant activity

Due to their ability to stop oxidation even at low concentrations, antioxidants possess a range of physiological consequences on the body. The plant material's antioxidant components work as radical scavengers and aid in the transformation of radicals into less reactive forms. Plants include a wide range of antioxidants that can scavenge free radicals [26]. *G. sylvestre* contains a variety of antioxidants, including flavonoids, alkaloids, tannins, cinnamic acid, phenols, folic acid, ascorbic acid, butyric acid, tartaric acid, etc. Ascorbic acid, an antioxidant, neutralises hydroxyl and super oxide radicals, demonstrating both its antioxidant properties and its capacity to absorb blood sugar [27]. This plant's ethanol extract displayed higher antioxidant potential and considerable 1,1-diphenyl-2-picrylhydrazyl (DPPH) radical scavenging activity. This plant was found to be more effective in scavenging DPPH radicals than butylated hydroxyl toluene (BHT), and it was also discovered to prevent LDL oxidation in another study [1]. According to a study, *G. sylvestre*'s leaves had good scavenging activities along with good reducing activity. The total phenolic and flavonoid content estimated in that study were 19.87 ± 0.32 mg/g and 2.65 ± 0.12 mg/g respectively [37].

Hypolipidemic activity

Obesity and high lipid levels in the body are associated with type 2 diabetes. A drug that controls diabetes effectively must therefore also have hypolipidemic qualities [19]. To reduce increased serum triglycerides, low-density lipoprotein (LDL), very low-density lipoprotein (VLDL), and total cholesterol, is affected by dosage, leaf extracts were given to hyperlipidemic rats for two weeks. The effectiveness of the drug derived from *G. sylvestre* was approximately scale with that of a normal lipid-lowering drug [9]. In a different investigation, rats showed a dose-dependent rise in faecal cholesterol and bile acid excretion from cholic acid. In 3-week experiment, rats given an extract of *G. sylvestre* leaves had less apparent fat digestion and more neutral and acidic steroids excreted [28].

Anticancer Activity

Numerous saponins originating from plants, such as saikosaponins, soyasaponins, and ginsenosides, have been revealed to have potent anticancer properties. Gymnemagenol's anti-cancer potential was assessed in vitro using

**Bhavika Gupta et al.,**

HeLa cancer cell lines [10]. The human breast cancer cell line MCF7 and the human lung adenocarcinoma cell line A549 are resistant to the alcoholic extract of GS. Additionally, the intestinal breast cancer resistance protein has been demonstrated to show that it can be inhibited by the alcoholic extract of GS (BCRP)[23].

Anti-obesity activity

A bright future for the treatment is offered by plant-based medicines for cardiac disease because synthetic medications are constrained in their ability to cause side effects. Preparations containing gymnemic acids have demonstrated anti-obesity benefits [10]. *Gymnema* may help with weight loss by lowering sugar yearning and controlling blood glucose. Gurmarin is a peptide that interacts with the unsweetened and sugary receptors in the tongue, momentarily impairing taste and reducing the desire for sweets [19]. *G. sylvestre* aids in the promotion of weight loss, perhaps through lowering sugar cravings and regulating blood sugar levels. The perception of sweet or bitter flavours is reportedly inhibited by the gurmarin peptide, which lowers the craving for sweets. Hunger, Body weight, lipid profiles, serum leptin, body mass index (BMI), and excretion of fat metabolites in urine can all be monitored over time, a standardised *G. sylvestre* extract along with chromium bound to niacin and hydroxy citric acid, has been examined for its ability to combat obesity [9].

***Gymnema sylvestre* in obesity**

Obesity is a chronic disorder, much like high blood pressure and atherosclerosis. a discrepancy between the energy used for eating and the energy exerted is the etiology or cause of obesity. Expanded fat cells generate the medical issues brought on by obesity due to the weight or quantity of extra fat, or as a result of larger fat cells producing more free fatty acids and more peptides[29]. The above mentioned two pathways also contribute to the development of diabetes mellitus, osteoarthritis, heart disease, gallbladder disease, and a few kinds of cancer [30]. Numerous physical and behavioral issues are part of the spectrum of medical, social, and psychological limitation (Figure 2).

The epidemic of the twenty-first century is obesity and the related condition type 2 diabetes mellitus. It is characterised by an increased ability of adipose tissue to store triglycerides, or fat molecules, leading to insulin resistance. Obesity, diabetes, and gymnemic acids are related. There is a connection between gymnemic acids, diabetes, and obesity. All three are connected. Therefore, both disorders can be treated with the same drug. Obesity is the major result of the build-up of fats and carbs. Gymnemic acids prevent the body from gaining weight from "empty calories" by preventing carbs from sticking to gut receptors. Acids assist in managing diabetes by following a similar procedure to that which was previously explained for carbohydrates [28].

G. sylvestre is consumed so as to reduce the consumptions of sweet as it has anti-hyperglycemic potential. Weight loss is possible when there is a sustained calorie deficit in diet. The herb *G. sylvestre* may aid in weight loss and stop weight gain. It might encourage calorie restriction [40]. *G. sylvestre*'s hexane fraction was utilised to treat Sprague-Dawley rats for induced obesity. After 45 days of treatment, a significant (P0.001) decrease in increased body weight and temperature brought on by obesity was seen [41]. GS extracts are given as an antiobesity supplement in High fat induced mice to check its effect on the mice. It was observed that C-peptide levels in serum are raised as a result of beta cells in pancreatic islets. In diabetic rats receiving streptozotocin (STZ) treatment, oral administration of GS increased insulin levels while lowering blood glucose, glycated haemoglobin, and free fatty acid levels. Additionally, GS showed antiobesity effects by reducing body weight increase and the levels of low-density lipoprotein (LDL) cholesterol, triglycerides, and total cholesterol in the serum [31].

The impact of a saponin-rich fraction of an aqueous leaf extract from *G. sylvestre* R. Br. on mice with HFD. It studied the anti-obesity effects of a saponin-rich fraction of an aqueous leaf extract of *G. sylvestre* R. Br. using mice that had been made obese using a high-fat diet and cafeteria diet (SGE) for eight weeks. SGE was given orally to the treatment group once a day at a 100 mg per kg body weight as a dosage. It considerably lowered body weight, food intake, visceral organ weight, very low-density lipoprotein, low-density lipoprotein, triglyceride and total cholesterol levels, glucose levels as well as and the atherogenic index, while significantly raising high-density lipoprotein levels [32]. Anti-obesity effect is studied by the inhibition of lipase. 1, 2, 3, and 4 ml of the juice in various concentrations were

**Bhavika Gupta et al.,**

taken as the sample, and they were mixed with 1000ul of lipase, 400ul of phosphate buffer, 8000ul of olive oil with 60 minutes of incubation. by adding 1.5 cc of a 95% ethanol/acetone combination, the process was stopped (1:1). The solution's released fatty acids were detected by the emergence of pink hue from yellow colour and the solution is titrated against 0.02 M sodium hydroxide. Then, it was determined what proportion of lipase activity was inhibited [33]. Effect of GS extract on C57BL/6J mice. Using high performance liquid chromatography, methanol was extracted from the dry GS powder, and Deacyl gymnemic acid was thereafter accepted as gymnemic acid. C57BL/6J mice (male) were fed a regular diet, a standard diet which contain 1 g/kg of *G. sylvestre* (GS+CON), a HFD, or a high-fat diet containing 1.0 g/kg of *G. sylvestre* (GS+HFD) for four weeks to test the early anti-obesity effect of *G. sylvestre*. The methanolic extracts of *G. sylvestre* illustrates significant anti-obesity benefits in the GS+HFD group [34].

CONCLUSION

G. sylvestre has a diverse variety of bioactive compounds that can be explored for its various properties. The main concern in today's generation is obesity as the lifestyle, food habits are all changing rapidly and are not healthy. The obesity can lead to various other associated diseases such as hypertension, diabetes, asthma and many more. More we explore the medicinal plants, more is the dependence on allopathy will be reduced, thereby helping in the treatment without any side effects to the body. This could be a boon in the field of therapeutics. Due to the antiobesity potential of *G. sylvestre*, it can be used as a medicine to reduce global issue of overweight and obesity. Recently, its potential for treating COVID-19 has also brought this plant in limelight. In order to increase its utility, it must be properly produced into therapeutic formulations and its long-term use must be strictly controlled. The proper knowledge about the plant is very important so as to consume it for treatment of various medical issues and consuming it in various forms like powder, extract and other. Therefore, the plant should be explored thoroughly but sustainably for its maximum potential and future use.

ABSTRACT

To determine the association between yield and other yield-related traits as well as among the yield contributing traits and to partition the correlation coefficients in to effects of direct and indirect causes in order to predict the most reliable characters for effect in F₃s and BIPs of bhendi, a study was conducted at the Genetics and Plant Breeding Farm, Department of Genetics and Plant Breeding, Faculty of Agriculture, Annamalai University during 2017 and evaluated in 2018 using a randomized block design with three replications. Finding out the key characteristics that directly and indirectly influence the fruit production in bhendi is important since it will make it easier to develop a genotype that is appropriate for a particular environmental condition. In this experiment, observations were made on seven quantitative traits. In order to clarify the significance of observed features on exerting simultaneous selection for more than one character, the data were subjected to association and path coefficient studies. The study revealed the importance of traits viz., Days to 50 per cent flowering, Plant height, Internode length, Number of branches per plant, Number of fruits per plant, Fruit girth, Fruit length. Hence, selection involving these traits would be of greater significance in enhancing yield of bhendi and these traits could be used as indices for simultaneous selection involving multiple traits for enhanced productivity of bhendi.

Keywords : okra, friting, yield

Shai Prasanna et al.,

INTRODUCTION

Bhendi (*Abelmoschus esculentus*), also referred to as okra in India is regarded as the supreme and versatile vegetable crop prized for its tender, green fruits. Bhendi, a constituent of the Malvaceae family. Okra's tender fruit can be added to salads and soups and is eaten as a vegetable. Okra has been referred to as "a perfect villager's vegetable" due to its durability, dietary fibre, and unique seed protein balance of both lysine and tryptophan amino acids. High-quality protein is abundant in okra seeds. When administered as a blood volume expander or plasma substitute, okra mucilage has therapeutic uses (Habtamu Fekadu Gemede et al., 2014). The information about correlation among different components of yield is necessary for designing efficient plant breeding programme through selection and for simultaneous improvement of yield components. Correlation coefficient analysis measures the mutual relationship between various plant characters on which selection can be based for improvement of yield. Path coefficient analysis is helpful in partitioning the observed correlation coefficient into direct and indirect effect and their effective use in selection programme.

MATERIALS AND METHODS

The present investigation was carried out at the Plant Breeding Farm, Department of Genetics and Plant Breeding, Annamalai University from October 2017- July 2019. The experimental material consisted of F₂ seeds of three cross combinations. By intermating the randomly chosen F₂'s as females and males, Biparental progenies (BIPs) were obtained. The three cross combinations are Hisar Unnat / Parbhani (cross 1), Kranti Ankur 40 / Hisar (cross 2), Unnat Basanthi / Parbhani Kranti (cross 3). during October 2017 to January 2018, F₂ plants of about 200 plants from each of the three cross combinations were grown on a non-replicated trail with a distance of 45cm between rows and 30cm between plants. To generate the F₃ generation. A randomised block design with three replications was used to set up the experiment. The experimental plot was extensively prepared to create beds and furrows on which double rows of seeds were sown, keeping a spacing of 45 cm between rows and 30 cm between plants. As recommended, uniform agronomic practices were implemented. Then all the quantitative characters were recorded and subjected to correlation and path coefficient analysis.

RESULT AND DISCUSSION

The phenotype of the plant is the result of interaction of a large number of factors. Therefore, yield is sum total of the effects of several component characters and polygenically controlled trait. The influence of these characters can be known through correlation studies. Correlation coefficients measure the magnitude of direction of association among the characters. Genetic correlation among different characters of a plant often arises because of either linkage or pleiotropy (Harland, 1939). There may not be any gene for yield as such but operates only through its components. Hence, the study of character association through correlation will help in selecting the yield attributes (Sivaprasad, 2008). In this present study, in cross 3, positive non-significant association of plant height with fruit girth, number of fruits per plant with fruit girth, fruit girth with fruit length, fruit girth with fruit length and fruit length with fruit yield per plant was recorded in F₃'s which was recombined as positive significant correlation in BIPs. The negative relationship in F₃'s for plant height with internode length, number of fruits per plant with fruit length altered as positive significant association in BIPs of cross 3. In cross 2, positive non-significant association in F₃'s for days to 50 per cent flowering with number of fruits per plant and number of fruits per plant with fruit yield per plant changed as positive significant association in BIPs. The negative association in F₃'s for internode length with number of fruits per plant, fruit length with number of fruits per plant shifted to positive association in BIPs. In cross 1 the negative non-significant association of days to 50 per cent flowering with number of fruits per plant and internode length with fruit yield per plant in F₃'s recombined as positive significant correlation in BIPs, the non-significant positive correlation in F₃'s for days to 50 per cent flowering with internode length, number of fruits per plant with fruit girth and plant height with fruit length changed as positive significant correlation in BIPs. A comparison of correlation coefficients in BIPs and F₃'s revealed that many significant correlations were made in BIPs compared to F₃'s. The results are similar to the

**Shai Prasanna et al.,**

result of Yunus *et al.* (1982) in bread wheat, Rudra Naik *et al.* (2008) in safflower and Koli *et al.* (2012) in rice. Thus, in this present study, it is noted that when compared to F_3 's, BIPs changed in magnitude and direction due to gene reshuffling and breakage of linkage due to biparental intermating in early segregating populations. These observations are similar to the results of Somashekar Guddadamath (2010) and Koli *et al.* (2018). A comparison of the direct and indirect effects of various characters on fruit yield in F_3 's and BIPs populations revealed that the change in the nature and degree of association amongst various characters was accompanied by the change in their direct and indirect effects. In the present investigation, in cross 3, the direct effect on fruit yield per plant through internode length and fruit girth were positive and non significant in F_3 's which changes as positive and significant in BIPs. In F_3 's of cross 3, internode length with fruit length, fruit girth with plant height and fruit length with fruit yield per plant recorded positive non-significant indirect effects which changed to positive indirect effect in BIPs.

In F_3 's of cross 2, positive non-significant direct effect of fruit girth on fruit yield per plant changed as highly positive direct effect in BIPs and negative non-significant direct effect of fruit length in F_3 's changed as positive significant effect in BIPs. The positive non-significant indirect effect of internode length with number of fruits per plant, fruit girth with days to 50 per cent flowering changed to positive significant indirect effect in BIPs. In F_3 's of cross 1, positive non-significant direct effect of internode length on fruit yield per plant and negative non-significant direct effect of number of fruits per plant on fruit yield per plant changed as positive significant direct effect in BIPs. But it is also noted that favorable direct effect in F_3 's for fruit yield per plant through fruit length becomes unfavorable association in BIPs of cross 3 and the indirect effect of number of fruits per plant with days to 50 per cent flowering was positively significant in F_3 which become negatively non-significant in BIPs. Thus, it is noticed that in the present investigation, BIPs showed desirable as well as undesirable association for some characters. Hence selection may be restored after one or two cycles of intermating, which may lead to favorable association further by breaking the linkages of undesirable combinations. The residual effect were low in BIPs compared to F_3 's, thus indicated that the selected traits accounted for the genetic improvement for fruit yield per plant. A comparison of correlation coefficient among the characters between F_3 's and BIPs revealed either positive or negative non-significant association for most of the characters in F_3 's of cross 3 and cross 2 got transformed into positive association in BIPs. This change may due to the fact that the unfavorable linkages in repulsion phase might have changed into coupling phase linkage due to intermating. But however, some of the favorable direction of association in F_3 for the character days to 50 per cent flowering with number of fruits per plant changed as unfavorable direction in BIPs of crosses Basanthi / ParbhaniKranti. This may due to reshuffling of genes in the undesirable direction. Path analysis also confirmed that intermating tend to shift direction of direct and indirect effects. In BIPs of the cross Basanthi / ParbhaniKranti the traits *viz.*, internode length, fruit girth, number of fruits per plant showed influence on yield through their considerable direct effects. This may due to breakage of undesirable linkages.

ABSTRACT

Magnetic Resonance cholangiopancreatography (MRCP) may be a non-invasive medical imaging technique, that is used to envision the biliary tract and duct gland duets. Prospective studies of forty patients with clinical impression of biliary tract and duct gland with clogging jaundice of all cohort square measure examined by 1.5Tesla Somatom(Siemens) resonance imaging machine. A complete of 40 patients were enclosed in the study. The age varies of patients from babe to older prevalence. The common presentation was pain in the abdomen, a gift in most of the patients (92.5%) the foremost common specific symptoms were icterus (72.5%), jaundice (60%), and loss of weight (32.5%), pruritis (17.5%) and clay-colored stools (15%). Most of the cases in the malignant cluster had these symptoms. These patients additionally gave a history of extirpation, yellow water, nausea, and vomiting. Overall, fever was gifted at 57. 5% and mass abdomen were complained by 32. 5%. MRCP at the side of standard MR imaging is very correct in crucial presence, level, and reason for obstruction. Moreover, MRCP is non-invasive, performed chop-chop, free from hazards of radiation exposure and distinction administration, and may demonstrate the ductal upstream of obstruction. MRCP can substitute ERCP on a routine basis. This may depend upon improvement within the diagnostic accuracy of MRCP once an extended series of patients' square measures are studied. Moreover, a cost-effectiveness assessment of this system has to be self-addressed.

Keywords: MRCP, MRI, ERCP, Technique, Radiology, Jaundice.

**Mrinal Kanti Singha et al.,**

INTRODUCTION

Magnetic Resonance cholangiopancreatography (MRCP) may be a non-invasive medical imaging technique that uses resonance to ascertain the biliary tree and exocrine gland ducts. The use of a heavily T2W pulse sequence, which by selection displays static or slow-moving fluid crammed structures as high intensity square measures are developed in recent years with innumerable variations. The quality of MRCP pictures has well increased with the recent development of various 3-dimensional (3D) sequences. Similarly, the introduction of hepatobiliary distinction media and hormone has enabled purposeful assessment of biliary excretion and thus the secretor duct gland, severally. Accurate strategies of identification of exocrine gland illness and customary common bile duct in patients with preventive jaundice square measure essential to each surgeon and endoscopist for coming up with an efficient interventional strategy; and thus a desire for fewer invasive, safe, and sensitive procedures.

Non-invasive techniques like ultrasound square measure employed in preliminary investigations of pancreaticobiliary illness. Ultrasound (USG) is sometimes used because of the initial investigation in patients suspected of preventive jaundice and may be used for follow-up imaging modalities when treatment. Ultrasound (USG) is non-invasive, lacks radiation exposure, is more cost-effective, and is widely accessible over the planet [1]. The ability of ultrasound has created accepted screening procedures inside jaundice patients to accurately distinguish preventive jaundice. Identification of the anatomic website of obstruction and its cause is essential in the management of the jaundice patient, whether or not ancient surgical therapies square measure contemplated or newer "nonsurgical therapies like" radiologic strategies square measure instituted. But ultrasound for detective work common bile duct calculi, which implies that the identification of many common conditions together with tumors (benign and malignant), calculi, sclerosing redness, and chronic inflammation could need invasive procedures [2]. Invasive procedures like scrutiny retrograde cholangiopancreatography (ERCP), through thought of the gold customary for the identification of exocrine gland biliary illness, need an extremely masterful team of supporting personnel, for cannulisation of the exocrine gland and customary common bile duct, as conjointly the employment of sedation and radiation[3]. Moreover complication rates, throughout and post-procedure, in terms of infection, bleeding, inflammation, gall run, etc., are seen, in up to seven-member of patients, in extremely masterful hands.

MRCP has emerged as a potent non-invasive various to judge the pancreaticobiliary system. The shortage of would-like for sedation, i.e. distinction and radiation exposure, and thus the advantage of it being non-invasive, able to delineate lesions within the least levels in addition to being sensitive has created MRCP an important various to ERCP.[3]

MRCP has a few supplemental blessings as follows:-

- Non-invasive imaging modality.
- No radiation exposure.
- No would like of distinction media.
- Multiplanar procedure complication.
- It will show the biliary tract proximal additionally as distal to the extent of obstruction [4].

The pancreaticobiliary ductal system including the gallbladder was very well visualized with MRCP [5].

MATERIAL AND METHODS

This study has been conducted within the Department of Radiology & Imaging Down Town Hospital Pvt.Ltd and Primus Diagnostic Centre. Patients lay low with varied diseases of the biliary tract and duct gland with preventive jaundice of all age brackets and either wax enclosed during this study.

**Mrinal Kanti Singha et al.,**

METHODS

Resonance Imaging (MRI) examination was performed on a one 1.5T Somatom (Siemens Medical System) exploitation SENSE body array coil. MRCP has performed exploitation of 2nd and 3D quick spin-echo sequences. In the skinny block 3D (HR) technique pictures were taken in axial, chaplet, and oblique chaplet planes, and in the thick block (Ssh MRCP) technique pictures were taken racially therefore on embody the complete portahepatis, intrahepatic biliary radicals, and epithelial duct. Breath-hold techniques were supplemental to eliminate respiratory-connected artifacts. The fat saturation technique was conjointly done to get a uniform complete suppression of noise. When getting the info, supply pictures were reconstructed exploitation the most intensity projection (MIP) algorithmic rule. 3-dimensional show and rotation of pictures were used. Further T1w and T2 weighted & different relevant sequences are going to be obtained through the liver and duct gland and distinction tomography was done where needed.

OBSERVATIONS AND RESULTS

The study comprised 40 proven cases of pancreaticobiliary tract unwellness that either attended OPD or were admitted to Down Town Hospital and Primus Diagnostic Centre, Guwahati. All told the cases thorough clinical history was taken followed by clinical examination. Relevant laboratory investigations like hemoprotein, serum, and bilirubin, liver operation tests, and different relevant investigations were done, tomography and imaging investigations performed were:

MRI

All the cases were subjected to routine tomography of the higher abdomen for pancreaticobiliary unwellness followed by MRCP to gauge the presence, kind, and extent of the unwellness and different associated findings, if any. Different relevant investigations like chest X-ray PA read, X-ray abdomen, metallic element meal follow through and operative T-tube cholangiogram was done where indicated. The designation was finally confirmed by surgery and/or histopathological examination or clinical follow-up. Tomography and USG findings were compared and evaluated with operative/histopathological findings or clinical follow-up.

AGE AND SEX DISTRIBUTION

The age and sex distribution are shown in Table 1.

The age of the youngest patient was 7 years while that of the oldest was 77 years. The mean age was 50 years. The majority of the patients were more than 30 years of age. There were 15 males and 25 females with a sex ratio being 0.60 (15/25).

DURATION OF JAUNDICE

It is depicted in table 2. A maximum number of patients presented with a duration of jaundice above 6 months (37.5%). Only 3 patients presented with a duration of less than 1 month and 9 patients with a duration of jaundice from 3-6 months. 15 patients did not give any history of jaundice.

CLINICAL PRESENTATION

The clinical presentation is shown in Table 3. Although the commonest presentation was pain in the abdomen, a gift in most of the patients (92.5%) the foremost common specific symptoms were icterus (72.5%), jaundice (60%), loss of weight (32.5%), pruritis (17.5%) and clay-colored stools (15%). Most of the cases in the malignant cluster had these symptoms. These patients conjointly gave a history of excision, yellow water, nausea, and instinctive reflex. Overall, fever was a gift in 57.5%, and mass abdomen was complained by 32.5%.

DISCUSSION

The correct strategies for detective work canal and channel abnormalities in patients with preventative jaundice are necessary for each surgeon and endoscopist. Biliary obstruction might even be the result of choledocholithiasis, tumors, or trauma, among different causes. The foremost common cause of choledocholithiasis. ERCP remains the gold commonplace for the action of constructing use of the biliopancreatic region. However, it needs direct canalization of the common digestive fluid or duct, sedation, the use of radiation, and a team of trained and information personnel. Additionally, ERCP is related to important complication rates of one to seven-members like hemorrhage, and sepsis. Redness and digestive fluid leak, conjointly as a recognized mortality of up to a quarter. MRCP could also be a non-invasive and safe various to diagnose ERCP for imaging the biliary tree and investigating biliary obstruction. MRCP refers to selective fluid-sensitive resonance imaging (MRI) of the exocrine gland and biliary duct. It was introduced in 1991 and techniques have more and more improved since then[6]. A major damage or disadvantage of MRCP is that it is not a therapeutic procedure, whereas ERCP is utilized for designation and treatment. MRCP is especially helpful wherever ERCP is tough, venturous, or not possible; it's conjointly a very important choice for patients with unsuccessful ERCPs. ERCP and MRCP have different contraindications, permitting them to be used as complementary techniques [7].

For designation, MRCP offers spare benefits over ERCP to be thought of as a result of the initial modality. MRCP exceeds the likelihood of ERCP in providing further info by cross-sectional tomography and MR roentgenography. There's no exposure to radiation or to probably risky halogen medium and sedation is rarely indicated. Patients ought to be fast and so the procedure takes a handful of minutes, typically while not sedation. The most potential issues with MRCP are image artifacts and problems in patient compliance thanks to simple phobia. Image artifacts will be seen as bright signals arising from the stationary fluid at intervals in the adjacent small intestine, small intestine diverticula, and ascetic fluid. Additionally, native areas of signal dropout are typically caused by golden clips following cholecystectomy; defects induced by the correct blood vessel hepatica crossing the common canal, or from severely narrowed ducts, like occur in primary sclerosing inflammation (PSC).[18] Presently, MRCP has poorer resolution than direct X-ray photography and might miss tiny stones (4mm without delay seen however can't be differentiated from filling defects like blood clots, tumors, sludge, or parasites. different mimickers of choledocholithiasis embrace flow artifacts, biliary air, and a pseudo calculus at the ampulla.[7] In the light-weight of current information, MRCP has the potential to switch diagnostic ERCP and thereby avoid attainable complications associated with ERCP. The accuracy of MRCP has been evaluated by many authors, with an overall sensitivity of 85-97%, specificity of 75-98%, positive prognosticative values of 83-89%, and prognosticative values of 82-98%.

PATHOLOGIC CONDITIONS

CHOLEDOCHOLITHIASIS

MRCP is comparable to ERCP in the detection of choledocholithiasis and superior to computerized tomography (CT) or Ultrasonography (US). Numerous studies have shown sensitivities of 81% to 100% for MRCP.³⁵ Because up to 15% to 25% of patients with acute calculus cholecystitis have choledocholithiasis and 10% to 15% have unsuspected choledocholithiasis at surgery, MRCP may play a role in the preoperative workup of these patients. During MRCP due to the very high signal-to-background ratio of bile, calculi are readily identified as dark filling defects within the high signal-intensity fluid.¹⁶ Calculi as small as 2mm in diameter can be visualized and the accuracy of stone detection is greater with single-shot fast spin echo techniques because of the reduction of motion and susceptibility artifacts. Small calculi might not cause secondary dilatation of the ducts and are best seen on the axial images. It is crucial to scrutinize the thin, source images because the sensitivity for detection of small stones decreases with an increase in section thickness owing to the volume average of high signal intensity bile surrounding the stone. In addition, an impacted stone in the ampulla may not be surrounded by high signal-intensity bile and may thus be misinterpreted as a stricture [8]. The differential diagnosis of filling defects in the bile ducts most commonly includes stones and air bubbles; however, neoplasms, blood clots, concentrated bile, metallic stents, flow voids, and susceptibility artifacts from surgical clips must be excluded. Pneumonia can be differentiated from calculus by

Mrinal Kanti Singha et al.,

demonstrating a filling defect in the nondependent portion of the bile duct; the filling defect sometimes produces an air-fluid level on axial or sagittal images.

BENIGN STRICTURES

More than 80% of bile duct strictures occur after an injury to the extrahepatic bile ducts during a cholecystectomy with a minority attributable to other benign causes. MRCP is comparable with ERCP in demonstrating the location and extent of strictures of the extrahepatic bile duct with sensitivities of 91%-100%. However, the state of being correct and precise in the detection of strictures of the intrahepatic bile ducts is under investigation. The extent of a high-grade, focal, extrahepatic, or proximal intrahepatic ductal stricture may be overestimated with MRCP because the duct downstream from the obstruction is collapsed and may simulate disease. ERCP may be more accurate in demonstrating the extent of disease in these cases [9].

INFLAMMATORY DISEASES

Pancreatitis and primary sclerosing cholangitis represent the most common inflammatory conditions in children requiring MRCP application [27]. Pancreatitis may be a common indication for imaging the pancreaticobiliary system during a child. USG and CT are usually the first lines of imaging in acute pancreatitis, as they adequately evaluate the pancreas and readily identify complications. There are numerous causes of acute pancreatitis in children trauma being the foremost common. Blunt trauma to the duodenum can lead to acute pancreatitis; MRCP facilitates evaluation of the ducts and is so valuable in identifying congenital causes predisposing to pancreatitis, such as strictures of the proximal common biliary or pancreatic ducts[10,27].

Primary sclerosing cholangitis is a chronic inflammation characterized by intrahepatic and extrahepatic biliary strictures and thickened bile duct walls. This disease usually presents in children bearing age that have inflammatory bowel disease usually ulcerative colitis. The MRCP was visualized better on thick slab MRCP, however, has been shown to frequently overestimate the extent of stricture formation [27].

PANCREATIC TRAUMA

CT is the preferred study in the acute setting in the evaluation of blunt pancreatic trauma. MRCP however is a valuable adjunct to CT for demonstrating lacerations of the pancreatic duct and pseudo cysts. Pancreatic duct disruptions are often depicted best on axial curved reformations or MIPS reconstructed from a 3-dimensional T2 weighted sequence within the coronal oblique plane. MRCP is also valuable for evaluating postoperative complications, including duct obstruction and ductal disruption [11,27].

BILIARY CALCULI

MRCP is employed commonly within the adult population for evaluating biliary ductal calculi, but it's not used widely in children, because choledocholithiasis is comparatively uncommon in children. Sonography is the preferred imaging study for ductal stones, but if the sonogram is not diagnostic, MRCP may be useful. Stones can also be identified incidentally on MRCP in children who have long-standing biliary obstruction and bile stasis. Stones as small as 2mm can be detected, appearing as low signal intensity abnormalities on T2 weighted sequences. MRCP has been shown to help detect extra and intrahepatic stones [12, 14, 27]. The development of CT technology and changes to the protocol, including exposure and technical parameter selection, should help to reduce dosage variations^[30]. Even though CT imaging has significantly improved healthcare, worries about the cancer risks of the X-rays used to create CT images have persisted [31].

STATISTICAL ANALYSIS

Statistical results regarding visualization of the common bile duct and overall technical image quality were compared with a two-sided Wilcoxon signed rank test after Bonferroni correction (with a p-value<0.05 deemed significant) in the following way:

Mrinal Kanti Singha et al.,

1. Coronal reconstructed MIP of the coronal acquisition vs. Coronal reconstructed.
2. Axial reconstructed MIP of the coronal acquisition vs. Axial reconstructed MIP of the axial acquisition;
3. Coronal vs. Axial reconstructed MIP of the coronal acquired dataset;
4. Coronal vs. Axial reconstructed MIP of the axial acquired dataset.

Inter-observer agreement was assessed using a kappa-statistic and classified as follows: a K value of less than 0.20 indicated poor agreement; K values of 0.21-0.40, fair agreement; K values of 0.41-0.60, moderate agreement; K values of 0.61-0.80, good agreement and K values of 0.80-1.00, excellent agreement [12,13, 19].

On the premise of findings, it will conclude that:

MRCP in conjunction with standard MR imaging is very correct in determining the presence, level, and reason behind the obstruction. Moreover, MRCP is non-invasive, performed chop-chop, free from hazards of radiation exposure and distinction administration, and may demonstrate the ductal upstream of obstruction. MRCP is used because the initial diagnostic tool to assess the identification and to determine the indication for a surgical, examination, or transferral procedure. Within the latter case, MRCP is used as a guide for interventional procedures. The location of an obstruction is simply incontestable on the MIP pictures. However, the supply pictures must always be habitually evaluated before establishing the identification. Patients unable to bear additional standard invasive studies like PTC or ERCP, those with altered gastro small intestine anatomy, and patients United Nations agency had unsuccessful results from the higher examinations are additional probably to profit from MRCP.

Breath-hold sequences are most well-liked over the non-breath hold because the latter is degraded by motion artifacts. The preliminary results are promising, but the technique wants continue improvement to increase the abstraction resolution and signal-to-noise quantitative relation. Bound pitfalls and false negatives similar to false positive diagnoses are attainable. These are additional typically encountered just in case of tiny common channel stones that are either incomprehensible or misinterpreted as growth. Overall, it cannot be foreseen however whether or not MRCP can substitute ERCP on a routine basis. This may rely upon improvement within the diagnostic accuracy of MRCP when an extended series of patients are studied. What is more, a cost-effectiveness assessment of this method must be addressed.

ABSTRACT

This paper presents the quality of water selection process based on MCDM through the PROMETHEE II method. Water selection plays an important role in environmental fields. MCDM is used to aggregate individual opinions of decision makers into group opinions. Six criteria are considered for the selection process, and the criteria are obtained from expert opinion, expert opinion being obtained from expert opinion. PH, DO% saturation, TDS, calcium, and chloride temperature are the criteria. Weights for the criteria are obtained from domain experts by using a questionnaire. In order to effectively address this problem, this study proposes a best water selection technique that integrates the concept of the PROMETHEE II Method to select suitable water.

Keywords: Water selection, PROMETHEE II, PH, DO% saturation, TDS, calcium, and chloride.

INTRODUCTION

Water is one of the most vital and valuable natural resources, and most living species require a consistent and ample supply of clean water to survive and thrive. Most of our rivers, lakes, streams, and other bodies of water are being increasingly polluted. Water is regarded as "polluted" when it changes in its quality or composition, directly or indirectly as a result of mankind's activity, so that it becomes less suitable for drinking, domestic, agricultural,

Rajkumar et al.,

recreational, fishing, or other purposes for which it would otherwise be quite suitable in its natural state. Personal care products, plastics, flame retardants, heavy metals, and pesticides, among other contaminants, pollute the Cauvery River water. Researchers from the Indian Institute of Technology Madras discovered a two-year study. "Our observations are alarming so far; little is known about how pharmaceutical contaminants affect human health and the ecosystem over time," said Lygy Philip, professor of civil engineering at IIT Madras. Water selection includes multiple performance assessment criteria and is a multi-criteria decision-making (MCDM) issue. Therefore, water selection is a critical issue in the supply chain and has received considerable attention. Many authors have used different computation methods to address the best water body selection problem.

THE PROPOSED WATER SELECTION METHOD FOR THE ALGORITHM

- Step1. Enter the no. of alternatives, criteria, payoff matrix, and weight of each criterion
- Step 2: Compute pair wise difference between values of alternative for each criterion (dj).
- Step 3: Compute preference function matrix for each criterion based on dj and type of chosen criterion function.
- Step 4: Compute the entering flow and leaving flow for each alternatives.
- Step 5: Compute the net ϕ value for each alternatives and corresponding rank.
- Step 6: Select the best suitable alternative having highest ϕ value.

BASIC PRELIMINARIES

The selection presents some fundamental definitions and concepts related to the PROMETHEE II method and soft set. Brans and Vincke [21] proposed the PROMETHEE II approach that based on the pair wise comparison of alternatives for each criterion to solve MCDM problems. The PROMETHEE II technique requires two pieces of information: (1) the relative relevance of the criteria, and (2) the decision-preference maker's function for comparing alternative contributions [34, 35].

Step1: Normalize the decision matrix:

Normalize the decision matrix (a_{ij}), for the non-beneficial using equation 1 and for the beneficial using equation 2:

$$r_{ij} = \frac{[a_{ij} - \min(a_{ij})]}{[\max\{a_{ij} - \min(a_{ij})\}]} \dots\dots\dots (1)$$

$$r_{ij} = \frac{[\max(a_{ij}) - a_{ij}]}{[\max(a_{ij}) - \min(a_{ij})]} \dots\dots\dots (2)$$

Step 2: Calculation the preference function

$$p_{j(a,b)} = 0 \text{ if } r_{aj} \leq r_{bj} \rightarrow D(S_a - S_b) \leq 0 \dots\dots\dots (3)$$

$$p_{j(a,b)} = (r_{aj} - r_{bj}) \text{ if } r_{aj} > r_{bj} \rightarrow D(S_a - S_b) > 0 \dots\dots\dots (4)$$

Step 3: Calculate aggregated preference aggregated preference function $\Pi(a, b)$

$$= \sum_{j=1}^n w_j p_j(a, b) / \sum_{j=1}^n w_j \dots\dots\dots (5)$$

Sum of the weight is 1 (unity)

Step 4: Calculate the entering flow and leaving flow for a^{th} alternative ϕ^+

Leaving (positive) Flow

$$= 1 / (s - 1) \sum_{b=1}^s \pi(a, b) (a \neq b) \dots\dots\dots (6)$$

Entering (Outranking) Flow

$$= 1 / (s - 1) \sum_{b=1}^m \pi(a, b) \quad (a \neq b) \dots\dots\dots (7)$$

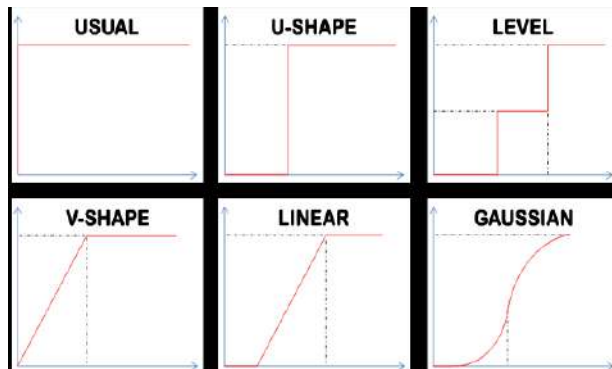

Step 5: Calculate Net Flow

$$\phi(i) = \phi^+(i) - \phi^-(i) \dots\dots\dots (8)$$

Rajkumar et al.,

ILLUSTRATIVE EXAMPLE

This section presents an illustrative example of best water selection process. Implementation of decision support systems requires weights, alternatives, and criteria in the process of calculation.

The next step calculates the Net flow using (8).

$$\begin{aligned} \phi(i) &= \phi^+(i) - \phi^-(i) \\ 0.3567 - 0.02267 &= 0.1300 \\ 0.3833 - 0.2770 &= 0.1063 \\ 0.2537 - 0.3400 &= -0.0863 \\ 0.2933 - 0.4433 &= -0.150 \end{aligned}$$

RESULT AND DISCUSSION

The PROMETHEE rankings

There are two PROMETHEE rankings that are computed:

The PROMETHEE I, computation of two preference flows (Phi+ and Phi-) is the basis of partial ranking. When the rankings provided by the Phi+ and Phi- preference flows are incompatible, it permits incomparability across actions. The PROMETHEE II complete ranking is based on the net preference flow (Phi). The PROMETHEE II complete ranking is simpler to understand, but it is also less illuminating because the distinctions between Phi+ and Phi-scores are no longer apparent. The PROMETHEE I ranking's emphasis on activities that are challenging to compare aids the decision-maker in concentrating on these challenging circumstances, which makes incomparability attractive.

PROMETHEE GAIA

The GAIA plane is a descriptive complement to the PROMETHEE rankings. As can be seen, with the increase in PH level, the prioritization of action has changed and river 3 has been selected as the best river, followed by river 2 as the second river. This indicates that rivers 2 and 3 are excellent in terms of the rank of water and rivers 1 and 4 are very poor. The result of the discussion indicates that the ranking of rivers in the proposed approach is strongly influenced by the weight of the criteria. By increasing the weight of a criterion, the rivers that have performed well and very poorly in terms of that criterion are chosen.

PROMETHEE Diamond

An alternative two-dimensional depiction of PROMETHEE I and II rankings is the PROMETHEE Diamond. The (Phi+, Phi-) plane, where each action is represented by a point, corresponds to the square. In order for the vertical dimension to provide the Phi net flow, the plane is 45° inclined. From the left to the top corner, Phi+ scores rise, and from the left to the bottom corner, Phi- scores fall. A cone is drawn from the action position in the plane for each action.

**Rajkumar et al.,****PROMETHEE Network**

In the PROMETHEE Network display each action is represented as a node and preferences are represented by arrows. The nodes are located in relative positions corresponding to the PROMETHEE Diamond so that the proximities between flow values appear clearly.

Walking Weights

You can adjust the weights of the criterion in the Walking Weights window to observe how it affects the Visual PROMETHEE analysis.

Data Availability for Manuscript Statement

There have been many distinct WQI models created, each with unique model structures, parameter inclusions and weightings, and sub-indexing and aggregation techniques (Debels et al., 2005; Jha et al., 2015; Kannel et al., 2007; Sun et al., 2016). Many models are therefore region-specific because the majority of WQI model components were created based on professional opinions and local regulations (Hsu and Sandford, 2007; Sutadian et al., 2016). The uncertainty issues with WQI models are a common topic of discussion (Kannelet al., 2007). All four stages of the WQI have the potential to increase model uncertainty, despite the fact that uncertainty cannot be completely avoided in any mathematical model (Lowe et al., 2017).

CONFLICTS OF INTEREST

There is no conflict of interest by authors.

CONCLUSION

In this paper, explores the use of PROMETHEE II method in solving the problem of determining the best water selection and generate more efficient decisions. This study proposed MCDM with difference function for solving best water selection using PROMETHEE II method. Fuzzy PROMETHEE have been used extensively to solve various multi-criteria decisions making. The selection of the best water method, six criteria of pH, temperature, TDS, chloride, DO% saturation, and calcium, has been added to the identified criteria. Therefore, the results indicate that river 1, with a net flow of -0.1500, was selected as the worst river. Based on the presented methodology, the total ranking of the rivers is as follows under normal conditions: 1-River 3, 2-River 2 and 3-River 4, finally 4-River 1

ABSTRACT

Acetylcholinesterase (AChE) inhibitor medicines have been used to treat the symptoms of Alzheimer's disease (AD). *Scoparia dulcis* (Linn) leaves collected from South India's Northern region. The aqueous extract of *S. dulcis* was examined for its chemical composition by GC-MS and their biological activity such as *in-vitro* antioxidant, Acetylcholinesterase inhibitory activity. According to the findings, the plant extract from *Scoparia dulcis* has been 33 chemical components. The *in-vitro* Acetylcholinesterase inhibitory activity (AChE) of the *S. dulcis* plant extract showed moderate inhibitory activity with IC₅₀ values of 90µg/ml. The antioxidant activity of *S. dulcis* extract was measured *in-vitro* using the DPPH and ABTS assays.

Keywords: *Scoparia dulcis*, Alzheimer's disease (AD), Acetylcholinesterase (AChE) Activity, GC-MS, IC₅₀, Antioxidant activity

INTRODUCTION

Scoparia dulcis belongs to Scrophulariaceae family. It was widely used as a perennial herb with several bioactive ingredients in traditional medicine. Cancer, diarrhoea, diabetes, stomachache, hepatitis, bronchitis, fever, hypertension, ulcers were all treated with its therapeutic properties [1]. Antibacterial, anti-diabetic, antifungal, anti-inflammatory, antiviral and hypercholesterolemia activities were also found in the plant. *Scoparia dulcis* L. phytoconstituents such as diterpenoid, triterpenoid, alkaloids, flavonoids and steroids were identified in abundance [2]. In several AChE inhibitors is a neurotransmitter hydrolase be involved in the termination of impulse transmission across cholinergic routes in the central and peripheral nervous systems [3]. Acetylcholine esterase inhibitors improve cholinergic neurotransmission by inhibiting AChE and reducing acetylcholine cleavage. Alzheimer's disease, infantile cognition, dysphagia, peripheral neuropathy and vascular dementia are all treated with AChE inhibitors as the primary line of pharmacology based on this inhibitory mechanism [4]. Although rivastigmine, tacrine and donepezil are routinely used to treat cognitive impairment, they have side effects such as gastrointestinal issues [5]. Alternatives from natural resources must be found. Plant-derived bioactive chemicals are sources of acetylcholine esterase agents, and they represent attractive prospects for the treatment of dementia due to their positive effects on memory problems. The current research was carried out *Scoparia dulcis* extract to explore into phytochemical components using GC-MS analysis, *in-vitro* Antioxidant activity by DPPH and ABTS assays and Acetylcholinesterase inhibitory activity was evaluated using Ellman's method [6].

MATERIAL S AND METHODS

Plant collection

Fresh leaves of *Scoparia dulcis* were collected between June and July 2021 in the area surrounding Pollachi, Tamilnadu, South India (geographical coordinates of Pollachi, India, latitude: 10035'12.96" N, longitude: 77014'37.37" E). A Botanical Survey of India, Coimbatore, identified and validated the plant material and the voucher specimens were retained for future reference.

Scoparia dulcis Extraction Process

50g of *Scoparia dulcis* fresh leaves (Fig.1) was cleaned and chopped then soaked in 500 mL RB flask containing 300 mL distilled water. The content was heated for 2 hrs on 70°C. The plant extract was filtered and stored in a refrigerator for further use.

GC-MS Analysis

GC-MS analysis of *Scoparia dulcis* leaves extract was performed using the Clarus GC-680 gas chromatograph, coupled with MS-5975C model mass spectrometer running in Electron Ionization mode at 70 eV, coupled with injector and a flame ionization detector, was used for the analysis of the essential oils. The capillary column was an Clarus HP-5MS (30m 250µm; film width, 0.25m) and the carrier gas was helium with flow rate of 7.6522PSI. The temperature settings had a split ratio of 1:100 and extended from 60 to 300°C at a rate of 12°C/min. Identification of constituents was performed on the basis of Retention indices and mass spectra compared with those of authentic samples and NIST library version 2.0 [7-9].

Acetylcholinesterase inhibition activity

Acetyl cholinesterase (AChE) inhibition activity was evaluated the *Scoparia dulcis* plant extract were determined based on Ellman's method by Ashraf *et al.* [6]

Antioxidant DPPH Radical Scavenging activity

The *Scoparia dulcis* plant aqueous extract was performed for *in-vitro* DPPH antioxidant activity according to the method by Keerthana *et al.* [10]

ABTS•+ Decolorization Assay

The in-vitro radical scavenging activity of *Scoparia dulcis* plant aqueous extract was carried out the earlier published approach using ABTS assay by Subramanian *et al.* [11]

RESULTS AND DISCUSSION

GC-MS Analysis of *Scoparia dulcis*

The presence of Chemical constituents for *Scoparia dulcis* extract was analyzed by using GC-MS (Fig.2) that reveals the presence of 33 compounds (Table-1). The major compound was Diethyl Phthalate (91.98%). The presence of minor compounds were Phthalic acid (1.77%), Lidocaine (0.35%), Eugenol (0.09%) and Eicosane (0.2%). Saturated aromatic hydrocarbons, acids, esters and minor compounds for triterpenoids, proteins, glycosides and other chemicals were discovered in this *Scoparia dulcis* leaves aqueous extract. The resulted data should be well presented by the form of schemes, figures, graphs, tables, reactions and equations. These items should be numbered clearly.

In-vitro Acetylcholine Esterase Inhibition Activity of *Scoparia dulcis* Extract:

AChE inhibitors are therapeutically utilized to treat presenile dementia. Due to their improve neurotransmitter is easily accessible in excitatory receptors, which increases cognitive activity. For the acetylcholine esterase inhibition trials in this investigation, *Scoparia dulcis* was utilized at doses of 20, 40, 60, 80, and 100µg/mL. *S. dulcis* inhibition percent ranged from 3.2%, 8.9%, 13.2%, 19.6%, 24.6% and 27.2% (Fig.3). However IC₅₀ as for *Scoparia dulcis* extract (90µg/mL) was compared to the rivastigmine (78µg/mL). Through this research, this plant extract AChE activity is documented for the first time. (Table-2). Furthermore *Scoparia dulcis* could be used as a starting point for the manufacture of AChE inhibitors or as a source of substitute neurotoxic receptor medications.

Antioxidant Activity of *Scoparia dulcis* extracts by using DPPH and ABTS assay

The antioxidant activity of *Scoparia dulcis* extract is examined at 20, 40, 60, 80 and 100µg/mL concentrations with standard ascorbic acid from using DPPH and ABTS assay. The *S.dulcis* exhibited inhibitory percentage between 14.2%, 28.7%, 44.8%, 58.7%, 78.9% and 18.9%, 25.4%, 41.7%, 59.8%, 72.6% respectively, which also depended on dose (Fig.4 & Fig.5) through the IC₅₀ is 66.19 µg/mL and 68.91 µg/mL (Table-3). The antioxidant activity of this plant could be a source of alternative potent antioxidant inhibitor drugs.

CONCLUSION

The current research exposed aqueous extract about *Scoparia dulcis* (Linn) plant showed 33 chemical compounds along with major and minor composition. The presence of chemical constituents were shows the region's soil quality and weather circumstances. *S. dulcis* plant shows adequate Acetylcholine Esterase Inhibition analysis (AChE) with IC₅₀ value 90µg/mL was larger than standard, rivastigmine (78µg/mL). This plant exhibits potent antioxidant activity with the IC₅₀ value 66.19µg/mL and 68.91µg/mL for DPPH, ABTS assay respectively, was lower than the standard Ascorbic acid. Further this report will help to isolation and characterization of bioactive compounds that may be used for Pharmacological activity.

ACKNOWLEDGEMENTS

The Management of Nallamuthu Gounder Mahalingam College (Autonomous) in Pollachi is deserving of my deepest gratitude for providing the initial financing for our project. We are very grateful to all the authors for their appropriate and constructive suggestions to improve this research article.

CONFLICT OF INTEREST

The authors declare that there is no conflict of interests regarding the publication of this article.

ABSTRACT

School well-being refers to the positive experiences perceived in the school environment and is highly concerned with the mental health and well-being of school students. On the other hand, gratitude is the appreciation experienced by persons when someone does something kind or helpful for them. School well-being and gratitude are relatively concerned with cultivating a positive perspective about life. Research revealed that school well-being and gratitude are two major components that help to develop school students holistically. So, in the present study, researchers aimed to study the relationship between school well-being and gratitude and the interdependency of variables under study. In this regard, data were collected from 988 school students (class ix & x) of 50 secondary schools. Various statistical techniques including mean, standard deviation, coefficient of correlation, kurtosis, skewness, and regression analysis were used to find out the bivariate relationship between the variables under study. The study revealed a significant positive correlation between school well-being and gratitude and observed a high significance of dependency relationship between school well-being and gratitude of secondary school students.

Keywords: School well-being, gratitude, school students.

INTRODUCTION

School well-being is related to student's learning ability, health status, and health-related behavior in the school setting (St. Legar & Nutbean, 2000) [1]. Kunu and Rimpela (2002) [2] introduced school well-being as a global

59152

**Anil Chandra Mili and Pranjal Buragohain**

concept and emphasized social relationships and school work as two essential components of the well-being of school students. They mentioned that school well-being is the positive experiences of a student perceived in a school environment. Tian et al. (2012) [3] stated school well-being as a student's school satisfaction, and positive effect on school. According to them, school satisfaction refers to a global cognitive evaluation of school life that emerge from day to day school experiences of students and positive affect in school refers to the frequency of positive emotions experienced especially during school such as feelings relax, pleasant, hope, safe and more importantly happiness, and satisfaction of the students (p.992). It is a concern with positive effect, persistence, strength, dedication, and concentration of school activities and is strongly correlated to the feeling of self-efficiency and students' motivation towards positive hopes and feelings. School well-being can be perceived through the achievement of meaningful goals, relationships, personal growth and development, health, safety, and satisfaction. Konu and Rimpela (2002) [2].

mentioned that school well-being is more important to develop positive emotions like hope, resiliency, joy, optimism, and health of students to improve their well-being. Health Education Partnership Limited, Norwich (2012) [4] suggested three basic areas of school well-being such as- emotional well-being, psychological well-being, and social well-being school students. Seligman (2002) [5], the conceptual founder of positive psychology also argued the importance of school well-being and mentioned its reasons such as (i) the current flood of depression (ii) the nominal increase in happiness over the last two generations (iii) well-being enhances learning and holistic thinking (iv) an antidote to the runaway incidence of depressions (v) a way to increase life satisfaction and (vi) an aid to better learning and more creative thinking. Regarding the above-mentioned core reasons, researchers and psychologists in the field of positive psychology (Seligman et al. (2009) [6] started to argue for the framework of schools for the well-being of students. And these ideas are the resource to develop a new area of positive psychology named 'school well-being'.

In the other hand, gratitude is a meaningful and valuable appreciation to someone or a group for their invaluable support and helps (Aliya et al. 2020) [7]. Pruyer (1976) [8] defined gratitude as "kindness, generosity, gift, the beauty of giving and receiving" (p.69). Robert Emmons a leading positive psychologist and researcher on gratitude conceptualized the term gratitude as an emotion, a virtue, a motive, a skill and an attitude, a moral sentiment, and a coping response (Emmons & Crumpler, 2000) [9]. Gratitude is the appreciation experienced by persons when someone does something kind or helpful for them (Fan et al., 2011) [10]. Emmons (2004) [11] defined gratitude very comprehensively as "a sense of thankfulness and joy in response to receiving a gift, whether the gift is a tangible benefit from a specific other or a moment of peaceful bliss evoked by natural beauty" (p.554). Hussong et al. (2019) [12] also mentioned gratitude as a "cognitively-mediated, socio-emotional process that results in a sense of appreciation, happiness or joy due to the appraisal of having received something, which is not due to personal effort but to a benefactor's free and unrestricted intentions to give" (p. 564). McCullough et al. (2002) [13] conceptualized the gratitude in the sense of trait and moral emotion. As a trait, gratitude is defined "life orientation toward noticing and appreciating the positive in life" (Wood et al., 2010, p.891) [14]. On the other hand gratitude in the sense of moral emotion refers to the appreciation of gratitude which promotes positive relationships and attachments (Haidt, 2003) [15]. Furthermore, McCullough et al. (2001) [16] proposed three moral functions of gratitude such as- (i) moral barometer (ii) moral reinforcer, and (iii) moral motives. As moral barometer gratitude serves beneficiaries by signaling the value of the relationship with a supporter for the gift offered to them; as moral reinforcer gratitude increases individual's positive hope and expectation about their future; and as moral motive gratitude increases the offering pro-social behavior towards other people. The literature review of the present study is performed in three parts i.e. literatures related to measurement of school well-being, literatures related to measurement of Gratitude, and literatures related to co-relational studies of school well-being and gratitude. Measurement of school well-being is relatively new area. The model given by Rimpela and Konu (2002) [2] is the first complete model of school well-being to measure and study school well-being. However, some other attempts were found in literatures which are related to school well-being. Huebner (1991) [17] constructed and analyzed the Student's Life Satisfaction Scale (SLSS). The SLSS is a seven item self-report measure that used with students ages 8-18. In Finland, Raitasalo modified 13 item of Beck Depression Inventory (Beck, 1972)[18] and has been used for measuring general well-being among school children. Savolainen et al. (1998) [19] studied well-being in the context of school by asking three

**Anil Chandra Mili and Pranjal Buragohain**

questions such as- Do you feel you can cope with your schoolwork? Do you enjoy going to school? Do you consider schoolwork inspiring? In Netherlands, Opdenakker and Van Damm (2000) [20] used a well-being questionnaire of school designed by Van Landegham (1991) [21] consisting of eight indicators viz. well-being at school, social integration in the class, relationship with teachers, interest in the learning task, attitude to homework, motivation towards the learning task, attentiveness in the classroom and academic self concept. Samdal (1988) [22] attempted to measure subjective well-being of school students by using one question; In general how do you feel about your life at present? The school well-being model (Konu & Rimpela, 2002) [2] conceptualized school well-being with six dimensional phenomena viz. school condition (having) social relationship (loving) means for self-fulfilment (being) and health status, strength and resources and digital world. Konu and Koivisto (2011) [23] developed the school well-being profile- a valid instrument for evaluation of school well-being. It is an internet-based evaluation tool for school well-being. Tian (2008) [24] developed a Chinese version school well-being scale to measure the adolescent's school well-being. A complete school well-being scale was standardized by Mili and Buragohain (2020) [25] based on school well-being model of Rimpela and Konu (2002) [2]. The scale was standardized to measure the school well-being of Secondary school students.

Researchers found that most of the studies in gratitude had been conducted on adults. Despite of it only inconceivable studies have been conducted on school students. So, majority of research tools and techniques constructed of gratitude are focused on only adults. Froh et al. (2009) [26] mentioned that the gap of the study on gratitude between adults and school student is the question of understanding and developmental implications of gratitude and most of the researcher are regarded it as inevitable points. But research revealed that gratitude emerges from earliest stages of infancy (Klein, 1957) [27] 26); between 7-10 ages (Emmons & Shelton, 2002) [28] between 6-10 ages (Nelson et al., 2013) [29]. Park and Peterson (2006) [30] revealed that gratitude takes fully matured at age 10. So, emerging studies of gratitude on children and adolescents are extended and designed for measuring both emerging gratitude and mature forms of trait gratitude (Froh et al., 2011) [10]. Studying gratitude of adolescent is much more important for several reasons. First, it associated with positive emotional functioning (Froh et al., 2011) [10] and linked positive affect (Emmons & McCullough, 2003) [31]. As a positive emotion gratitude proceeds toward better life outcomes (Lyubomirsky et al., 2005) [32], healthier life and more resilient, optimism and well-being (Fredrickson & Joiner, 2002) [33], broaden the analytical strategies and more importantly gratitude reduce the negative emotions (Fredrickson & Branigan, 2005) [34]. Second, gratitude is associated to a wide range of pro-social social outcomes viz. compassion, healthy relationships, generosity and empathy (McCullough et al., 2002) [13]; and develop the optimism and positive affect among middle school students (Froh et al., 2009) [25]. Third, gratitude increases social functioning of adolescents that indentified as a major component of pro-social behavior (Emmons & McCullough, 2003) [30].

Review of related literatures revealed that few studies had been conducted to measure the relationship between school well-being and gratitude. Although, those studies are not directly bear the relationship between school well-being and gratitude. The studies partially related to the relationship between school well-being and gratitude were found e.g. Froh et al. (2009) [25] conducted a study on gratitude among early adolescents and revealed a positive relationship with school satisfaction, positive affect, social support, optimism, and emotional support and academic achievement. Nelson et al. (2013) [28] studied the gratitude and emotions of school children and revealed that gratitude enriches more positive emotions. Fredrickson & Joiner (2002) [32] also revealed a positive relationship between gratitude, optimism, and well-being in adolescents. So, the present study is attempted to directly analyze the relationship between school well-being and gratitude, and their inter-dependency.

RESEARCH OBJECTIVES

The present study is aimed at studying the relationship between school well-being and gratitude of secondary school students. So, as a first objective, it was targeted to find out the levels of school well-being and gratitude of secondary school students. Secondly, it was attempted to establish the relationship between school well-being and gratitude by

**Anil Chandra Mili and Pranjal Buragohain**

applying correlation coefficient. Thirdly, the present study aimed to predict the inter dependency relationship between school well-being and gratitude by applying two-way regression analysis.

METHODS AND MATERIALS

Descriptive survey method was used in the present paper. The sample students were selected by applying a stratified random sampling technique. Accordingly, 988 school students (IX & X) of Tinsukia district, Assam were selected as a sample and collected the required data for the present study. The sample students comprised of different examination boards i.e. Board of Secondary Education, Assam (SEBA), Central Board of Secondary Education (CBSE), and Indian Certificate of Secondary Education (ICSE). For the purpose of statistical analysis, researchers used the Mean, Standard Deviation, Coefficient of Variance, Skewness, Kurtosis, and Regression. All the above mentioned statistical techniques were estimated by using SPSS version 26. the following techniques were applied.

Measuring scales used

Two scales were used in the present study. A brief description of the scales is given below.

- **School well-being scale:** The school well-being scale (Mili & Buragohain, 2020) [24] and Gratitude Questionnaire (McCullough et al., 2002; revalidated by Fan et al., 2001) [13] [10] were used in the present study. The school well-being scale is a 60-item scale constructed and standardized to measure the level of school well-being of secondary school students. The school well-being scale is a five-point Likert-type scale. The total of all the responses score constituted the total school well-being score of the students. A higher student's score on the scale referred to higher school well-being and a lower student's score on the scale referred to lower school well-being of the students. Internal consistency reliability was calculated by the split-half method (through Spearman-Brown formula) and Cronbach's Alpha and found to be 0.88 and 0.87 respectively.
- **GQ-6:** The original Gratitude Questionnaire (GQ-6) is consists of six items which administer on adults. But Fan et al. (2011) revalidated GQ-6 by factor analysis to measure the gratitude of adolescents which consisted of five items. The item no. 6 of the original scale was eliminated for its high difficulty index for adolescents. So, the revalidated version has 5 items with score on 7-point scale and was used in the present study. Higher the scores in the scale indicate higher level of gratitude and lower the scores in the scale indicate lower level of gratitude. Internal consistency reliability estimated by Cronbach's Alph of the scale was 0.81

RESULTS AND DISCUSSION

The present study is directed at studying the bivariate relationship between school well-being and gratitude of secondary school students. So, it is decided to analysis the results as per as the sequences of the objectives.

Objective-1: To find out the levels of school well-being and gratitude of secondary school students.

To get the levels of school well-being and gratitude, the descriptive statistics of the two series are presented in the figures 1. Figure 1 shows the means of the school well-being and gratitude of 988 sample school students in different categories. As a whole, the means of school well-being and gratitude are 232.15 and 26.42. The means of school well-being of male, female, rural, and urban school students were found 237.31, 226.47, 232.40, and 231.61 respectively. Similarly, the means of gratitude of male, female, rural, and urban school students were found 26.17, 26.64, 26.53, and 26.18 respectively. Figure 2 shows the standard deviation of the school well-being and gratitude of 988 sample school students in different categories. As a whole, the standard deviations of school well-being and gratitude are 28.968 and 5.151. The standard deviations of school well-being of male, female, rural, and urban school students

**Anil Chandra Mili and Pranjal Buragohain**

were found 27.982, 29.125, 28.90, and 29.148 respectively. Similarly, the standard deviations of gratitude of male, female, rural, and urban school students were found 5.081, 5.207, 5.10, and 5.268 respectively.

Objective-2: To estimate the relationship between school well-being and gratitude of secondary school students. So, Karl Pearson's coefficient of correlation was computed between school well-being and gratitude of secondary school students. The results are summarized in table-3. Table-3 shows a significant correlation between the two variables under referenced i.e. school well-being and gratitude. The computed Pearson's coefficient of correlation (r) between school well-being and gratitude is found to be .163 which indicates a positive correlation and significant at 0.01 level.

Objective-3: To predict the interdependency of school well-being and gratitude of secondary school students. In this regards, the researchers performed two-way regression analysis by using school well-being as an independent variable and gratitude as a dependent variable in the first and reversely school well-being as a dependent variable and gratitude as an independent variable in the second. In this way, the dependency of both the variables on each other is tested. Firstly, the present study performed the regression analysis by taking school well-being as an independent variable and gratitude as a dependent variable. Table-4 shows that the value of R implies a significant correlation between the two variables ($R = .163$) under study, and the values R -Square and adjusted R -Square (.027 and .027 respectively) imply a significant dependency relationship between school well-being and gratitude. The value of R -Square is found .027, which represents that school well-being can account (predict) for 2.7% (.027 \times 100) variation in the gratitude of school students. In other words, there might be many factors that can impact the gratitude of school students, but our model explained that school well-being can predict 2.7% of the gratitude of school students. This means that 97.3 of the variation in the gratitude of school students cannot be explained by school well-being. Table-5 presented the sum of square and mean square of the regressed variable and the residuals. It is evident from the table that the dependency of gratitude on school well-being is lower as compared with the residual. The F value is 27.045, which is significant at 0.01 level of significance ($p < 0.001$). So, the regression model overall predicts gratitude significantly.

The regression coefficients of gratitude and school well-being are shown in table-6. The table provided details of the model parameters (the beta values) and the significance of these values. In simple linear regression, b_0 [in equation $Y = (b_0 + b_1 X_i) + \epsilon_i$] is the Y -intercept and represent the value of B (in the table-6). So, from the table, it is evidenced that b_0 is 19.687. Further, the value of b_1 is .029 and this value represents the gradient of a regression line. Therefore, in the present study, if the predictor variable (school well-being) is increased by 1 score then the model predicts .029 score of gratitude. In order to check the two way regression, the present study further performs the regression analysis by taking school well-being as a dependent variable and gratitude as an independent variable. Table-7 shows that the values R -Square and adjusted R -Square implied a significant dependency relationship between school well-being and gratitude. Table-8 presented the sum of square and mean square of the regressed variable and the residuals. It is evident from the table that the dependency of school well-being on gratitude is lower as compared with the residual. The F value is 27.045, which is significant at 0.01 level of significance ($p < 0.001$). So, the regression model overall predicts gratitude significantly.

The regression coefficients of gratitude and school well-being are shown in table-9. The table provided details of the model parameters (the beta values) and the significance of these values. In simple linear regression, b_0 [in equation $Y = (b_0 + b_1 X_i) + \epsilon_i$] is the Y -intercept and represent the value of B (in the table-9). So, from the table, it is evidenced that b_0 is 207.896. Further, the value of b_1 is .920 and this value represents the gradient of a regression line. Therefore, in the present study, if the predictor variable (gratitude) is increased by 1 score then the model predicts .920 score of school well-being of school students. And, the table makes it evident that the relationship is significant at 0.01 level of significance.

**Anil Chandra Mili and Pranjal Buragohain**

CONCLUSION

In order to get insights into the school well-being and gratitude among 988 school students (class ix & x) of 50 schools, researchers applied various statistical techniques. The results of the descriptive statistics lead to the conclusion that the sample school students were significantly different from each other in terms of school well-being and gratitude. The data series of the variables under the study were found normally distributed and leptokurtic (under the principles of SPSS version 26). It's also found a significant positive correlation and a between school well-being and gratitude of school students under the study. Further, it was observed a high significance of dependency relationship between school well-being and gratitude of school students.

ABSTRACT

Safekeeping of our data being placed in the cloud is always becoming a serious problem and challenging one. The honest reasons for this will be because of the existence of malevolent attacks, data breaches and unsafe contact points. In this juncture, more numbers of investigators offered security mechanisms that includes the components namely access controlling, invasion detection, prevention of occurrences schemes. It is often seen that there are many situations where the attackers have always misused the rights taken by them with the numerous roles in the cloud computing scenario. Hence it would be mandatory to introduce more efficient mechanism for securing the safety of sensitive data which would be placed/recovered in the given cloud. The main philosophies in privacy & security would be none other than the data secrecy and honesty. So, this investigation work heightened a fruitful and better procedure confirming a safer data transmission into the cloud computing atmosphere. The research work provides a additional information security method to cloud that makes use of the Elliptic Curve Integrated Encryption Scheme (ECIES), which confirms that data which could be placed in the Cloud Computing atmosphere is equally trusted and complete. The investigational outcomes prove that the effectiveness of the recommended algorithm results in a strong security level as well as reduces the execution time related to the commonly used existing techniques. Hence in this an Improved Elliptic Curve Cryptography (IECC) algorithm is suggested in this research work which is intended to give better security using modified algorithm. The parameters like encode/decode and store/transfer time are computed and it can be seen that the procedure that is being intended in this research paper take a

59161

**Krishnamoorthy and Umarani**

smaller amount time for all the parameters when compared with prevailing methods. The encoding period of the suggested method is 46 ms with key size=4,096 bits, however the prevailing scheme takes 92 milliseconds for the same. Also, our proposed methods drastically reduce the deciphering time. All the other parameters presented in the results also certify that our scheme provides better solution when compared with the existing schemes. This reports disclose that the suggested system overtakes the present methods in terms of various factors.

Keywords: Cloud computing; Elliptic Curve; Data security; Cryptography.

INTRODUCTION

Cloud is a technology by which data available in a remote server can be easily retrieved with the internet and it is concealed in nature [1] [2]. It is the On-demand provision of any IT services including servers, storage, databases, any softwares etc. which is normally retrieved over the internet-the so called cloud. In short we can say that any device or gadget which is connected to internet can access the facilities provided. The cloud supports users to right to use the files and applications from any device, since the computing and storage operations happen in the servers in which is placed in a data center, rather than using a local storage. For example, when a user tries to login to his/her Google account form a mobile, tablet, PC, laptop which has internet connection. Hence we say that CC is a State-of-the-art innovation for treating & Relocating data currently in just all possible devices [3]

SECURITY ISSUES IN CLOUD

We can also refer to the CIA Triad the information must be set at the focal point of the threesome so as to convey total security of the information. The development of information towards any of the edges of the trio will prompt bargaining the other two properties of information [5].

Significance of the Study

Since we are dealing with massive quantity of data, it is extremely compulsory to confirm security. At the same time it is also important to minimize the computational overhead and time complications. Therefore, this research work makes an effort to offer secure and reliable data transmission into the cloud through Modified ECC method. So, the goal of this research was to use the Modified ECC method to enable secure and trustworthy data transfer into the cloud.

We will obtain two private keys by splitting the private key (based on size) and encrypting each half individually. That data will be kept online. The key of individual manuscript's encryption is placed into cloud hence only we are able to do the opposite operation for the decryption. The algorithm becomes safer as a result. MECC encryption securely trades data on the unsafe networks by swapping the public keys for encryption. MECC method strongly trades data on the untrusted networks by exchanging public keys for encryption. Clients under no circumstances obliged to disclose or swap their private keys, thereby making it the most reliable encryption strategy is available. If they do, it means that the two secretive Diffie Hellman encoded keys are necessary to decipher single private key obtained in ECC. Lowering the possibility that a cybercriminal would intercept a client's private key at the time of communication. Multi-tenant technique is therefore viewed from the standpoint of the cloud service model in a different way. With the aid of key generation, a Modified Elliptic Curve Cryptography (MECC) is presented to address this issue by safeguarding information which is shared to the multi-tenant environment.

**Krishnamoorthy and Umarani****Problem Statement**

Ongoing studies have diverse difficulties like: computational overheads, time associated with the key creation, clamor/noise responsiveness, difficulties of treating unsized clusters etc. hence disturbing the recovery results from cloud storage. The work intended is endeavored to avoid these impediments through the planned approach.

OBJECTIVES

The goals associated with the study is referenced beneath: To carry out novel cryptographical procedure for improved ECC that would drastically minimize the key size & extraordinary security thus overcoming existing restrictions like low operational performance, time as well as the computational intricacy.

1. To diminish the scrambling and unscrambling time through firm performance proficiency of suggested method.
2. To rise the accuracy as well as to create alternating keys for security enhancement with the presented scheme.
3. To estimate execution capability of the recommended scheme by means of evaluation criterion namely the encryption as well as the unscrambling time and computation overheads.
4. To relate the success of the proposed model with the other models.

RELATED WORK

The research works deliberates the analogous ideas connected to cloud computing, encryption and also the parameters like: decryption, multi-tenant. These works are explored exhaustively alongside their benefits and detriments. One cloud computing structure for multifaceted layers was outlined by [6] security covers three main factors namely the firewall, management of the user's identity and the encryption subject to the growth of business data synchronization & sharing scheme. The benefit is a fundamental technique which gives improved strength for a multifaceted security in the cloud scenario. The difficulty identified was that the assumption structure don't obtain a wrong alarm within the exact period. An infiltration testing was recognized and obstructed a bug is around 99.95 %. Various investigations examined on the combination of cloud and IoT [7] meant to give few characteristics of few characteristics of the cloud. The benefit could be an advanced CloudIoT scheme was recommended to give an improved data between users. The weakness was that the user is necessary to stop and elucidate thorough exploration of cloud computing disputes within the given time-limit. The Mobile cloud scenario was broadly described by [8], and this method carried out to permit the mobile users to get cloud computing advantages by means of a friendly technique for fulfilling the company requests. The gain is simply the vigorous energy-oriented cloudlet-oriented mobile cloud scheme which can be dedicated appropriately to decide over the additional energy usage during the implementation of wireless communication by employing the vigorous cloudlets oriented scheme. Also the weakness is that the wireless connection and the instrument size is restricted.

The fluctuating cloud arrangement [9] and the use of this infrastructure through the different service suppliers and the distributing computational profits are placed far away from the DCs. The outcome necessitates a diverse and innovative figuring schemes that could be obtainable by upcoming cloud setup. Since there are privacy worries, the trustworthy data have to be encrypted prior to the storing in the cloud. Recently we have come across several works in these area have recommended a number of encryption methods. Nonetheless, most of these prevalent works emphasizes only on the secure searching by applying a keyword, and moreover recovers merely Boolean results, which aren't sufficient. For resolve this concern, [10] a solution was presented with a unique and a protected keyword searching mechanism based on Bloom filter that creates the usage through assisting level established on the obtained examination. Another proposed scheme [11] covers three parts: Trusted Authority (TA), Trusted Cloud (TC), and User. This suggestion is meant to provide additional secure scheme to protect the users' data protection, diminish the complication of key creation by means of a modified Identity Based Cryptography (MIBC), and offer data discretion and integrity by means of the Elliptic Curve Integrated Encryption Scheme (ECIES). The advantage is

**Krishnamoorthy and Umarani**

the reduction of time used for key generation and the downside is the key sizes [27]. Yet another security structure was suggested [12] containing the access controlling scheme, encipher/decipher procedure and the digital signature method. An innovative Uniqueness centered Elliptic curve Access Control mechanism (Id-EAC). This plus point will be the security structure is delivered with great data safety, manageability and truthfulness for the user data. The downside would be the complexity of the algorithm adapted. In connection with the data encryption and tenant authentication [13] adopted ECC (Elliptic curve cryptography) due to its least key size. From the investigations it was calculated that the average finishing interval is calculated as 86.076 sec for decryption and 83.153 for encryption. Moreover, the scheme indicated that the scheme deals with a two-layer security and considerably uses smaller storage and key size.

There are several works, which discourse about the cloud security [14], data security [15, 16] and secured storage [17, 18]. Among them, [19] concentrated on giving security through reliability relationship rubrics. The confirmation scheme applies the cryptographic calculations for protected storing and recovery. Another technique namely HSBE CBC [20] was introduced as a competent data recovery methods. As we can see, the scheme enciphers the data by employing ECC method. Additionally, we observe that the approach used was CBC (Cosine based clustering) technique for grouping of the enciphered information. Also interms of elevating the security, the methodology has appraised the trust for the users retrieving the data., once the trust evaluation process is promising, decryption of the data takes place. Additionally, their methodology has assessed the working of suggested scheme and matched the same with that of the usual schemes. To confirm data security, an innovative practice based on "searchable attribute" based on the encryption was carried out [21]. Another scheme named User Usage Based Encryption (UUBE)[22], built on the exploration encryption technique has been offered as a unique differentiated access control structure. As we can see, a control method for retrieving a multi-faced cloud centered facilities by employing the admission governing model based on various features are presented by [23] and use-case is being presented to examine various cloud services. Subsequent to that, a swapping tokens technique was suggested for extending an exclusive model for the situations of the Inter cloud. Analogous calculations were supported and it can also be confirmed that the suggested one owns improved functionality through the process of taking the total consumers and the associated cloud assets. The reliability and trustworthiness for information existing in the relocation of capacity in multi-facet cloud design was accomplished by [24] through an innovative design in the investigation.

PROPOSED METHODOLOGY

The implementation of ECC techniques in scattered computing and dissimilar networking provides substantial usage in inter-reliant networking [25]. ECC is a PKE method built on EC model that produce cryptographic keys faster, lesser as well as highly constructive [26,28]. A basic element is the key strength, that alludes to the intricacy of breaking key and recuperating plain text [26,28]

Elliptic Curve Cryptography (ECC) Model

This is an innovative method of cryptographic tool for safeguarding the information in the physical as well as in the cloud storage. It's a superlative practices established in philosophy of elliptical curve. The characteristics of the EC is utilized to produce bases for encryption procedure as a substitute of prevailing techniques which will be using very outsized prime numbers. It operates over the elliptic curve equation for key creation. In the year 1985, N. Kobiltz and V. Miller suggested ECC for changeable data to get safety. The simple clue is to use the elliptic curve to incorporate a distinct logarithm technique [29]. A most important thing of ECC model is that is always takes tiny key dimensions to give security. When matched with other schemes (key length of 1064) and whereas the ECC use key length of 164 for the identical level of security. It comes under the public-key mechanism and computation shall proceed from a given point on in the elliptic curve to another. EC is treated equal in x-axis and are binary curves. Encryption as well as signature confirmation are carried out with the public key, on the other hand decryption & signature production are completed with private key

Krishnamoorthy and Umarani

Elliptic Curves

We assume K remain a field. An EC E over K is specified by Weierstrass equation:

$$y^2 = x^3 + Ax + B \tag{1}$$

For cryptography calculations, we use the equation as

$$y^2 = x^3 + ax + b \tag{2}$$

With the above inputs, we submit the proposed algorithm- Improved Elliptic Curve Cryptography (IECC) algorithm

Private Key, Public Key and the Generator Point in ECC

To use ECC, we have to go by the usage of parameters (p,a,b,G,n,h)

p = is a prime number that identifies the magnitude of the given finite field. Here, a & b = are the constants, G is a base point which gives the subgroup of the elliptic curve, n = number of points, called as the order of the subgroup.

$$nG = 0$$

h = cofactor of the subgroup given as a ratio of

$$|E| / |Ep| = \text{order of elliptic curve } E / \text{order of } EC \text{ over prime field. } h \tag{3}$$

When two individuals connect with each other, individual person should have private and public keys. They would preserve the private key, however public is offered to all. The Private key will be produced through arbitrarily choosing a digit in the range [1 to n-1]. Normally, the Public key is figured out through a calculation, multiplying the private key Ka (ka.G) and a coordinate G (x,y) present in EC. The sender and receiver can thus produce shared secret key (SSK). For an instance, if Ks is taken as the private key of transmitter and Kr indicates private key of the receiver, then we have

$$\text{Sender's public key (spub)} = G * Ks \tag{4}$$

$$\text{Recipients public key (rpub)} = G * Kr \tag{5}$$

Both transmitter and receiver will create Mutual Common Key (MCK):

$$\text{transmitter: MCK} = Ks . (Kr.G) \tag{6}$$

$$\text{receiver: MCK} = Kr . (Ks . G) \tag{7}$$

Proposed algorithm

S and R are two persons involved in data transmission

Step 1: Identify an EC

Sender Select an Elliptic Curve:

E_{Sender} (x coordinate, Y Coordinate)

Choose a point G_{Sender} (Gx,Gy) in the EC

Receiver Select an Elliptic Curve:

E_{Receiver} (x coordinate, Y Coordinate)

Choose a point G_{Receiver} (Gx,Gy) in the EC

Step 2: Take a huge prime number (n)

Step 3: Generate key sets

Sender(S) generating the keys:

Select Private key $\rightarrow S_{\text{pvt}}$

Check $\rightarrow S_{\text{pvt}} < n$

Take Point G in EC

Calculate Public Key $\rightarrow S_{\text{pub}}$

Receiver (R) generating the keys:

Select Private key $\rightarrow R_{\text{pvt}}$

Krishnamoorthy and Umarani

Check $\rightarrow R_{pvt} < n$
 Take Point G in EC
 Calculate Public Key $\rightarrow R_{pub}$
 Step 4: Compute Mutual Common Key MCK $\rightarrow k$
 Step 5: Sender and Receiver Exchanges public keys over a channel
 Sender share his/her EC and Public key with Receiver
 Sender to Receiver $\rightarrow E_{Sender}$ (**x coordinate, Y Coordinate**)
 Sender to Receiver $\rightarrow S_{pub}$
 Receiver share his/her EC and Public key with Sender
 Receiver to Sender $\rightarrow E_{Receiver}$ (**x coordinate, Y Coordinate**)
 Receiver to Sender $\rightarrow R_{pub}$
 Step 6: Encrypt \rightarrow Encode file using key of ECC
 Step 7: Output \rightarrow Decode output from step 6 with generated key and ECC

RESULTS AND DISCUSSIONS

The suggested method's outcome is evaluated based on the metrics presented below. Performance investigation are analysed with various factors namely

1. **Encryption Time** – Time required to encode data
2. **Decryption Time** – Time required to decode data

Interval for upload / download—Time needed for storing/retrieving

Encryption/Decryption Times

The time taken for decoding /encoding the data is given by these terms. As we can see from Table 1 and Figure 4, we can easily infer that the time taken for encryption and decryption in our model gives minimum time. We also compare the encryption time of our proposed scheme with that of MECC Algorithm suggested by S. Udhaya Chandrika et.al [30]. Tables 2 & 3, figures 5&6 clearly shows that the encoding and decoding time in our proposed scheme is far better than that of the MECC method. Hence, we can clearly state that the methodology we have suggested is yielding better results

Uploading/Downloading times

This is termed as the amount of time required for storing data into the cloud and retrieving data from the cloud storage. As we can notice from tables 4,5 and figures 7,8, it is clear that our scheme takes a minimum time for both upload and download when compared with that of the MLS architecture [31]. As we can see from the above data, our scheme produces minimum encryption decryption time when compared with [30].

On matching with the MECC [30] and MLS [31] schemes, our proposed scheme using the elliptic curve cryptography has a lesser encoding/decoding times as well as storage/retrieval time. Henceforth, the security-wise and execution speed, our scheme is producing an efficient result.

CONCLUSION

In this digital era, every individual mainly depends on cloud service providers for keeping their data. In the investigation an innovative security design established on ECC is offered for shielding the end user's data using an elliptical curve procedure. Here, when, a cloud user demand for the access of sensitive data, the suggested technique ensures that the data is always secure. If the invaders are exasperating to crack the data, the same cannot be done since they cannot identify the keys exchanged between the sender and the receiver before the transmission. The performance of the suggested scheme is assessed by means of the parameters namely encoding time, decoding

Krishnamoorthy and Umarani

time, and storage effectiveness of data. The algorithm performance is matched with prevailing schemes such as MECC and LSM. From the investigational result study, the proposed technique is realistic and secure. The proposed architecture accomplishes lesser computational overheads and quicker. It also allows ensure the overall security. In upcoming periods, this may be further extended using advance HECC procedures to expand the safety of data stored in cloud

ABSTRACT

The aim of this short paper is to carry a QSPR analysis for physical properties of lower alkanes using second stress index of molecular graphs. For boiling points, molar volumes, molar refractions, heats of vaporization, critical temperatures and critical pressures, we present linear regression models.

2020 Mathematics Subject Classification: 05C09, 05C92.

Keywords: Topological index, Second Stress index, Lower Alkanes.

INTRODUCTION

For standard terminologies in the theory graphs we have followed the book by F. Harary [2]. The non-standard notions will be given in this paper as and when required.

Let $G=(V,E)$ be a graph (finite, undirected, simple and connected). A shortest path between two vertices u and v in G is called a geodesic between u and v in G . The molecular graph associated with a chemical compound is a simple

Rajendra et al.,

connected graph in which the atoms of the compound are considered as vertices and the chemical bonds between atoms are considered as edges.

Topological indices are nothing but theoretical molecular descriptors. They are graph invariants playing very important role in Chemistry (See [3, 5-11, 13]). There are several distance as well as degree based topological indices defined for graphs with plenty of applications in the disciplines of Chemistry [10,11] for instance, Zagreb index, Wiener index, Harary index etc.

The concept of stress of a node (vertex) in a network (graph) was introduced as a measure of centrality in 1953 by A. Shimbel [12]. K. Bhargava et al. [1] have explored the concepts of stress regular graphs and stress number of a graph. The stress of a vertex v in a graph G is defined as the number of geodesics passing through v and it is denoted by $str(v)$. The topological indices namely, first stress index and the second stress index for graphs are defined in [4]. For a simple graph G , the first stress index $S_1(G)$ and the second stress index $S_2(G)$ are defined, respectively, by

$$S_1(G) = \sum_{v \in V(G)} str(v)^2 \quad (1)$$

$$S_2(G) = \sum_{uv \in E(G)} str(u) str(v). \quad (2)$$

The studies related to quantitative structure-property relationship (QSPR) are widely used for translating the physical properties of the chemical compounds into numerical data in order to investigate the correlations between the physical characteristics and the structure of the chemical compounds, as well as to develop regression-based models. Plenty of topological indices have been analyzed using QSPR. A QSPR analysis for first stress index and physical properties of lower alkanes has been carried [9] and good regression models (linear) for some physical properties of low alkanes have been established. A QSPR analysis for physical properties of lower alkanes involving second stress index of molecular graphs has been carried in this paper and good linear regression models for some physical properties of low alkanes have been presented.

A QSPR ANALYSIS

We conduct a QSPR study for the physical properties of lower alkanes, including their boiling points, molar volumes, molar refractions, heats of vaporisation, critical temperatures, critical pressures, and surface tensions.

The second stress index $S_2(G)$ of molecular graphs and the experimental values for the physical properties – Boiling points (bp) °C, molar volumes (mv) cm^3 , molar refractions (mr) cm^3 , heats of vaporization (hv) kJ , critical temperatures (ct) °C, critical pressures (cp) atm , and surface tensions (st) $dyne\ cm^{-1}$ of considered lower alkanes are given in Table 1. The values given in the columns 3 to 9 in the Table 1 are taken from Needham et al. [3] (One can find the same values in [11]).

Regression Models

Making use of Table 1, a study was carried out with the following linear regression model:

$$P = A + B \cdot S_2(G),$$

where P = Physical property and $S_2(G)$ = second stress index. The correlation coefficient r , its square r^2 , standard error (se), t -value and p -value are computed and tabulated in Table 2 followed by regression models. The linear regression models for the physical properties - boiling points, molar volumes, molar refractions, heats of vaporization, critical temperatures, critical pressures and surface tensions of low alkanes are obtained as follows:

Rajendra et al.,

| | |
|---|-----|
| $bp = 65.08485261 + 0.101238452 \cdot S_2(G)$ | (3) |
| $mv = 134.3957506 + 0.05773472 \cdot S_2(G)$ | (4) |
| $mr = 30.98959441 + 0.017366927 \cdot S_2(G)$ | (5) |
| $hv = 29.98619883 + 0.018004274 \cdot S_2(G)$ | (6) |
| $ct = 234.8190805 + 0.115374554 \cdot S_2(G)$ | (7) |
| $cp = 30.43816564 - 0.008462005 \cdot S_2(G)$ | (8) |
| $st = 18.62697193 + 0.004860608 \cdot S_2(G)$ | (9) |

The numerical values of r , r^2 , se , t and p given in Table 2 for the physical properties are good except for surface tensions which has $r^2=0.5570$. The linear regression models given in the equations (3)-(7) can therefore be used to make predictions.

CONCLUSION

Table 2 reveals that the linear regression models (3)-(8) are found to be useful tools in predicting the physical properties-boiling points, molar volumes, molar refractions, heats of vaporization, critical temperatures and critical pressures of low alkanes. The evidence shows that the second stress index can be used as predictive measures in QSPR researches.

ABSTRACT

This study focuses on the process of digitalizing government in the Indian union territory of Jammu and Kashmir. It highlights the problems that have been encountered and provides suggestions for a more efficient system. There is a lack of infrastructure, restricted access to technology, poor training, and opposition to change, which are the challenges. According to the findings of the study, there are benefits of digitalization that have not yet been fully realized. The recommendations include giving top priority to the development of infrastructure, the training of employees, the increasing of citizen awareness, and the creation of trust. Sharing resources, having a policy framework that is supportive, and having an inclusive and transparent process are all essential components of an effective collaboration between government agencies, the corporate sector, and civil society.

Keywords: Digitalization, Benefits, Initiatives, Administration and Challenges.

INTRODUCTION

Digitalization refers to the process of using digital technologies to transform traditional processes into digital processes. It involves the use of digital tools, techniques, and technologies to convert analog data into digital form, ((Singh, P. 2021) making it easier to store, process, and share (Smith, 2018). In practical terms, digitalization can involve a wide range of activities, including the use of electronic documents instead of paper, the automation of manual processes, the digitization of analog records, the use of data analytics to gain insights, and the

**Showkat Ahmad Dar and Sakhthivel**

implementation of digital communication tools (Johnson, 2019). The benefits of digitalization are numerous, including increased efficiency, reduced costs, improved accuracy, and faster access to information (Anderson et al., 2020). Digitalization can also enable new business models and facilitate innovation, as well as improving customer experience and satisfaction (Brown, 2017). However, digitalization also comes with its own set of challenges, including the need for significant investment in technology and infrastructure, concerns around data privacy and security, and the need for training and capacity building to enable the workforce to use digital tools effectively (Jones, 2021).

Digitalization has become an essential aspect of modern business and society, as organizations and governments seek to harness the benefits of digital technologies to improve processes and services. Digitalization is (Verma, A. 2022) transforming the world we live in, and the administration sector is no exception. It has become increasingly important for administrations to adopt digital solutions to enhance their efficiency and effectiveness. In the Indian union territory of Jammu and Kashmir, the digitalization of administration has been initiated with the aim of improving service delivery and increasing transparency. However, the process has been faced with various challenges that hinder its full realization. This research paper focuses on the issues and challenges of digitalization in administration in Jammu and Kashmir and provides insights into the road (Gupta, R., & Sharma, S. 2023) ahead for a more effective and efficient system. The study adopts a mixed-method approach with quantitative and qualitative data to identify the challenges and to recommend solutions for a successful digitalization process. The paper highlights the importance of infrastructure development, training and capacity building, and stakeholder collaboration to ensure a successful digitalization process.

The research findings show that the benefits of digitalization are not fully realized due to these challenges. Therefore, it is essential to prioritize these factors to enable a comprehensive digitalization process. The study also emphasizes the need to build trust and raise awareness among citizens to fully embrace the digitalization process. This can be achieved through the implementation of a supportive policy framework and ensuring an inclusive and transparent process. The paper concludes that the digitalization of administration in Jammu and Kashmir has the potential to transform the system and enhance its efficiency and effectiveness. However, it is crucial to address the challenges faced in the process and to adopt a collaborative approach to ensure successful implementation. This research provides valuable insights into the issues and road ahead for digitalization in Jammu and Kashmir and can serve as a guide for policymakers and stakeholders in the administration sector.

REVIEW OF LITERATURE

The literature review is an essential component of research as it helps identify existing gaps in knowledge and provides a foundation for the study. By incorporating the following articles, the research aims to address the existing gaps and provide a more comprehensive understanding of the topic. Digitalization plays a crucial role in rural development in Jammu and Kashmir by bridging the urban-rural divide and improving access to government services. It has the potential to uplift rural communities by leveraging digital (Thakur 2021) technologies to enhance governance, education, healthcare, and financial services. By implementing digitalization initiatives, the region can experience positive social and economic transformations, empowering its residents and narrowing the gap between urban and rural areas. However, the digitalization process faces various challenges and opportunities. Establishing a robust infrastructure and cultivating a skilled workforce are essential for successful implementation. Adequate technological resources, including internet connectivity and hardware devices, must be made available to ensure (Malik 2019) seamless delivery of digital services to citizens. Additionally, effective collaboration between government agencies and private sector partners is crucial. Such partnerships allow for the pooling of resources, expertise, and experiences, leading to enhanced effectiveness and sustainability of digital governance initiatives.

Engaging stakeholders, particularly citizens, is vital throughout the digitalization journey. By incorporating citizen-centric approaches and considering their needs, expectations, and feedback, a sense of ownership and trust can be

**Showkat Ahmad Dar and Sakthivel**

fostered. Ensuring that the digitalization process addresses the specific requirements and concerns (Mushtaq 2020) of the people will contribute to its overall success. Digitalization also has a significant impact on the economy of Jammu and Kashmir. It has the potential to drive economic growth and (Bhat, R. A. 2021) create job opportunities, particularly within the IT sector. By leveraging digital technologies, the region can facilitate entrepreneurship, promote innovation, and attract investments, leading to overall economic development and prosperity. To ensure the success of digitalization initiatives, data privacy and security measures must be effectively implemented. Protecting sensitive personal information and establishing comprehensive legal frameworks and (Bhat, A. 2018) stringent safeguards are crucial to build citizen trust and confidence in digitalization efforts. By prioritizing data privacy and security, the region can create a foundation of trust upon which digital services can flourish.

To overcome the challenges and seize the opportunities presented by digitalization, effective policy frameworks, adequate funding, and infrastructure support are necessary. Strategic investments in digital infrastructure, such as high-speed internet connectivity and advanced telecommunications networks, are vital to enable (Mir, N. A. 2019) widespread access to digital services and bridge the digital divide within the region. Digitalization holds immense potential for rural development in Jammu and Kashmir. By addressing the challenges, embracing the opportunities, and implementing comprehensive strategies, the region can achieve (Bhat, S. A. 2018) successful digital transformation, bringing about positive change and improving the lives of its residents.

Statement of problem

The rapid development of digital technology has created an unprecedented opportunity for the digitalization of administration. However, the implementation of digitalization in administration is often hindered by numerous challenges that impede its success. These challenges range from infrastructure and connectivity issues to lack of digital literacy and inadequate resources. Jammu and Kashmir, a state located in northern India, faces several challenges in its quest to embrace digitalization in administration. These challenges include limited infrastructure, low levels of digital literacy, and inadequate resources. As a result, the implementation of digitalization in administration in Jammu and Kashmir has been slow, and progress has been limited. The aim of this research paper is to explore the challenges faced by Jammu and Kashmir in its efforts to embrace digitalization in administration and to propose strategies for overcoming these challenges. The study will examine the experiences of key stakeholders, including government officials, private sector actors, and civil society organizations. It will also assess the effectiveness of existing initiatives and policies aimed at promoting digitalization in administration in Jammu and Kashmir. The findings of this study will provide insights into the challenges and opportunities for digitalization in administration in Jammu and Kashmir and will contribute to the development of strategies for overcoming these challenges. Ultimately, the research will help to build a roadmap for the successful digitalization of administration in Jammu and Kashmir, which can serve as a model for other regions facing similar challenges.

METHODOLOGY

This research combines descriptive and analytical methods to examine the challenges of digitalizing administration in Jammu and Kashmir and propose implementation strategies. Primary data from government officials and secondary data from academic studies, reports, and newspapers are utilized. Primary data collection involves engaging government officials to gather insights into the digitalization process. Secondary data sources provide existing research and real-time perspectives on digitalization efforts. Thematic analysis identifies patterns, themes, and key findings from the data. This approach enhances understanding of digitalization challenges and opportunities. The research is qualitative, focusing on subjective experiences and opinions of officials and stakeholders. It explores complex factors influencing the digitalization process. This research employs a mixed-methods approach, using primary data from officials and secondary data from various sources. Thematic analysis identifies key findings, while the qualitative nature explores subjective experiences, enhancing understanding of digitalization challenges and strategies in Jammu and Kashmir.

**Showkat Ahmad Dar and Sakthivel****Scope of the study**

The study on overcoming challenges and building a successful future for digitalization in administration in Jammu and Kashmir encompasses a comprehensive analysis of the current state of digitalization efforts in the region. It aims to shed light on the existing digital infrastructure and assess the level of accessibility and digital literacy among the population. By examining these factors, the study seeks to identify the specific challenges hindering the digitalization process in Jammu and Kashmir. The research will delve into the role of various stakeholders involved in the digitalization initiatives, including government agencies, private sector partners, and civil society organizations. It will investigate their contributions, collaborations, and potential barriers in implementing digital transformation projects effectively. By conducting an in-depth examination of the obstacles and opportunities in the digitalization journey, the study aims to propose strategies and recommendations to accelerate the pace of digital transformation in administration. These strategies may encompass infrastructure development, capacity building, stakeholder engagement, and awareness campaigns to address the identified challenges and maximize the benefits of digitalization. The significance of this study lies in its potential to provide valuable insights to policymakers and administrators in Jammu and Kashmir. The findings and recommendations can inform evidence-based decision-making and policy formulation, leading to improved service delivery, streamlined administrative processes, enhanced citizen participation, and ultimately, socio-economic development in the region. The study holds the promise of fostering better governance practices, empowering the population, and driving economic growth through effective digitalization efforts in Jammu and Kashmir.

RESULT AND DISCUSSION**Initiatives of digitalization**

The Jammu and Kashmir government has made significant strides in promoting the digitalization of administration and services within the union territory. Recognizing the potential benefits of digitalization, the government has implemented various initiatives to enhance efficiency, transparency, and accessibility for citizens. This research examines these initiatives and their impact on the digital transformation of administration in Jammu and Kashmir. One notable initiative is the establishment of Common Service Centers (CSCs) in rural areas (Khan & Shah, 2018). These CSCs serve as access points for citizens to avail themselves of a wide range of digital services, including bill payments, online forms, and certificates. Operated by trained personnel, the CSCs play a crucial role in assisting citizens, particularly those who may lack access to digital tools or are unfamiliar with their use. By bringing digital services to rural areas, where technology and service accessibility are often limited, the CSCs help bridge the digital divide and enable greater participation in administrative processes.

The government has implemented e-Districts throughout the union territory (Kumar & Singh, 2020). The e-District platform facilitates online access to various government services, such as birth and death certificates, land records, and licenses. By digitizing these services, the government aims to streamline administrative processes, reduce bureaucratic hurdles, and enhance convenience for citizens. The e-District initiative has been implemented across all districts of Jammu and Kashmir, improving service delivery and minimizing the need for citizens to engage with government officials in person. To support these digitalization efforts, the government has prioritized the development of digital infrastructure, including broadband and mobile connectivity. Initiatives like the BharatNet program aim to provide broadband connectivity to all villages in the country, ensuring that even remote areas have access to high-speed internet (Malik & Bhat, 2019). Furthermore, collaborations with private sector companies have been established to expand mobile network coverage and improve the quality of mobile services. These initiatives have significantly enhanced digital connectivity within the region, enabling more seamless access to digital services and empowering citizens to participate in the digital economy. Education plays a crucial role in fostering digital literacy and awareness. The J&K Knowledge Network has been established to provide e-learning resources to students, promoting digital education and equipping the younger generation with the necessary digital skills (Mushtaq & Shah, 2020). By focusing on digital education, the government aims to cultivate a digitally proficient workforce and promote digital inclusion across all segments of society. The implementation of these initiatives

**Showkat Ahmad Dar and Sakhivel**

reflects the Jammu and Kashmir government's commitment to advancing digitalization in administration and services. By embracing digital technologies and platforms, the government aims to enhance service delivery, improve governance practices, and promote economic growth within the region.

The significance of these efforts extends beyond mere administrative improvements. The digitalization of administration in Jammu and Kashmir holds the potential to drive socio-economic development and empower citizens. Digitalization facilitates greater citizen participation in decision-making processes, enhances transparency, and reduces corruption by minimizing direct (Desai, R., & Patel, S. 2022) interactions with officials. It enables the efficient delivery of public services, particularly in remote and underserved areas, thereby addressing social and economic disparities. Digitalization can create new job opportunities, particularly in the IT sector, contributing to local economic growth and attracting investments. The Jammu and Kashmir government's initiatives in digitalizing administration and services demonstrate a commitment to leveraging digital technologies for the benefit of its citizens. The establishment of Common Service Centers, the implementation of e-Districts, the development of digital infrastructure, and the promotion of digital education collectively contribute to bridging the digital divide and fostering a more inclusive and transparent governance system. These efforts are instrumental in enhancing service delivery, empowering citizens, and driving socio-economic development

Benefits of digitalization in the 21st Century

Digitalization brings numerous benefits to the people of Jammu and Kashmir, offering improvements in efficiency, transparency, and access to services. By embracing digital technologies, the government can streamline administrative processes, reduce bureaucratic hurdles, and enhance the overall efficiency of service delivery. This can result in faster processing times, reduced paperwork, and improved response times to citizen requests and inquiries. Here are some of the key benefits:

Improved Efficiency: Digitalization has several benefits for the people of Jammu and Kashmir, including improved efficiency, transparency, and access to services. By embracing digital technologies, the government can streamline administrative processes, reduce bureaucratic hurdles, and enhance the overall efficiency of service delivery (Mir & Dar, 2019). For example, the implementation of online application systems for various government services, such as land records and driving licenses, can reduce the time required for processing and minimize the need for citizens to visit government offices in person.

Transparency: Digitalization also promotes transparency in the administration. By enabling citizens to access information and services online, digital platforms contribute to reducing the potential for corruption and improving accountability (Mushtaq & Shah, 2020). Online portals and databases provide citizens with real-time information on government services, including the status of their applications and approvals. This transparency helps foster trust between the government and the public, as citizens have greater visibility into government processes.

Access to services: Digitalization plays a crucial role in enhancing access to services for the people of Jammu and Kashmir. With many citizens residing in remote and rural areas, digital services help bridge the gap between citizens and government services (Pratama & Arliansyah, 2020). Online portals and applications enable citizens to access services from the comfort of their homes, reducing the need to travel long distances to access government offices. This is particularly significant in a region like Jammu and Kashmir, where geographic constraints and limited infrastructure can pose challenges to accessing essential services.

Innovation: Digitalization promotes innovation by enabling new business models and facilitating creative solutions to challenges faced by various sectors (Singh & Sharma, 2020). In Jammu and Kashmir, the use of digital tools and platforms can help develop innovative solutions for sectors such as agriculture and tourism. By harnessing the power of digital technologies, these sectors can overcome existing barriers and explore new opportunities for growth and development.

**Showkat Ahmad Dar and Sakhivel**

Economic Development: Digitalization contributes to economic development by creating new avenues for businesses and improving productivity. It enables businesses to access new markets and customers, resulting in increased economic opportunities (Rashid & Khan, 2021). In a region like Jammu and Kashmir, where there is significant potential for growth across various sectors, digitalization can play a crucial role in unlocking this potential and driving economic development. The ongoing efforts to digitalize administration and services in Jammu and Kashmir hold the promise of transforming governance, improving the lives of citizens, and creating a more inclusive and prosperous future for the region. The implementation of digital technologies and platforms brings improvements in efficiency, transparency, and access to services. These advancements enable citizens to actively participate in governance processes, foster trust, and promote socio-economic development.:

Challenges of digitalization in Kashmir

The issues and road ahead for digitalization in Jammu and Kashmir are complex and multifaceted, and require careful consideration and planning in order to ensure that the benefits of digitalization are realized while minimizing potential challenges and drawbacks. Here are some valuable insights into the key issues and road ahead for digitalization in Jammu and Kashmir:

Infrastructure Development

One of the key challenges for digitalization in Jammu and Kashmir is the lack of digital infrastructure, including reliable internet connectivity, power supply, and technological devices (Abdullah & Hassan, 2019). The remote and mountainous terrain of the region poses unique challenges for infrastructure development. To address this issue, the government needs to prioritize infrastructure development by expanding broadband and mobile connectivity. This would require laying down a robust network infrastructure and ensuring reliable power supply in remote areas. Additionally, providing technological resources such as computers and smartphones to individuals and organizations can bridge the digital divide and enable access to digital services.

Digital Divide

Another significant challenge in the digitalization process is the existing digital divide between urban and rural areas (AKhter & Shah, 2020). Many rural areas in Jammu and Kashmir lack access to digital services and tools, resulting in limited participation in the digital economy. To tackle this divide, the government must focus on expanding access to digital services and tools in rural areas. The establishment of Common Service Centers (CSCs) in rural areas has been a positive step towards bridging this gap. These CSCs provide assistance to citizens and facilitate access to various digital services. Furthermore, the development of customized digital solutions that cater to the specific needs of rural populations, such as local language interfaces and simplified user experiences, can help overcome barriers and promote inclusivity.

Digital Literacy and Skill Development

In order to fully benefit from digitalization, there is a need to address the lack of digital literacy and skills among the population (Chandra & Singh, 2019). Digital literacy programs should be implemented to provide individuals with the necessary skills to effectively use digital technologies. These programs can encompass training on basic computer skills, internet usage, and digital security. Skill development initiatives, especially in emerging digital sectors, can empower individuals to participate in the digital economy and contribute to the region's socio-economic growth.

Cyber security and Data Privacy

Cybersecurity and data privacy have become paramount in today's digital age due to the widespread use of digital technologies. As technology continues to advance, it is essential to prioritize the protection of sensitive data and critical infrastructure. In this context, the government plays a vital role in establishing and enforcing robust cybersecurity measures and regulations. One crucial aspect is the development of comprehensive cybersecurity frameworks and standards. Governments should (Bhattacharjee 2020) collaborate with cybersecurity experts, industry leaders, and academia to create frameworks that address emerging threats and vulnerabilities. These frameworks should cover various aspects such as data encryption, network security, access controls, incident

**Showkat Ahmad Dar and Sakhivel**

response, and risk management. Regular updates and audits should be conducted to ensure that the frameworks remain effective and aligned with evolving technologies. Governments should enact and enforce stringent data protection laws and regulations. These regulations (Smith and Johnson 2019) should define the rights and responsibilities of individuals and organizations regarding the collection, storage, processing, and sharing of personal data. They should also include provisions for data breach notifications, penalties for non-compliance, and mechanisms for individuals to exercise their data privacy rights. By establishing a legal framework (Davis et al. 2021) that prioritizes data privacy, governments can enhance trust among citizens and businesses.

Public awareness campaigns play a vital role in promoting cybersecurity and data privacy. Many individuals lack knowledge about potential threats and best practices to protect their digital assets. Governments should invest in educational initiatives that raise awareness about the importance of cybersecurity, common attack vectors (such as phishing and malware), and the steps individuals can take to (Chen and Li 2019) safeguard their data. These campaigns should target different demographics and emphasize the significance of responsible digital behavior, including the use of strong passwords, regular software updates, and cautious online activities. In addition to public awareness campaigns, educational institutions should integrate cybersecurity and data privacy into their curriculum. By teaching students about these topics from an early age, we can cultivate a cybersecurity-conscious generation that understands the risks associated with the digital world and can make informed decisions to protect themselves and others. Collaboration between governments, private sector organizations, and civil society is crucial in addressing cybersecurity challenges. Public-private partnerships can facilitate information sharing, collaborative research, and the development of innovative cybersecurity solutions. Governments should also support (Johnson and Lee 2018) cybersecurity startups and provide incentives for organizations to invest in robust security measures. Ensuring cybersecurity and data privacy is of paramount importance in today's digital era. Governments must establish robust cybersecurity measures and regulations, enact comprehensive data protection laws, and invest in public awareness campaigns and educational initiatives. By taking these steps, we can foster a culture of responsible digital behavior and better protect sensitive data and critical infrastructure.

Need for collaboration

Digitalization is a complex process that requires collaboration between various stakeholders in order to ensure its success. In the context of Kashmir, collaboration between government agencies, private sector, and civil society (Pandey, R., & Kaur, M. 2022) is particularly important given the unique challenges and opportunities presented by the region. Here are some key reasons why collaboration is critical for digitalization in Kashmir, and how different stakeholders can work together to achieve this goal.

Collaboration between government agencies, private sector, and civil society is important for ensuring that digitalization efforts are inclusive and tailored to the needs of local communities. Given the diversity of Kashmir's population, it is important to ensure that digital solutions are accessible and useful to people from all backgrounds and regions. This requires input from civil society organizations, which can help to identify the needs and preferences of local communities, and work with government agencies and private sector organizations to design and implement digital solutions that are tailored to these needs. Civil society organizations can help to identify gaps in digital infrastructure and access, and work with government agencies and private sector organizations to design and implement solutions that address these gaps. They can also help to ensure that digital solutions are culturally appropriate and accessible to people from different linguistic and cultural backgrounds, by providing translation services and other forms of support. In this way, civil society organizations can help to ensure that digitalization efforts are inclusive and beneficial to all members of the community.

Collaboration between government agencies, private sector, and civil society is important for driving innovation and experimentation in the digitalization process. Private sector organizations are often at the forefront of technological innovation, and can provide cutting-edge solutions and expertise to help drive digitalization efforts forward. However, they may lack the local knowledge and community engagement that civil society organizations can

**Showkat Ahmad Dar and Sakthivel**

provide. By working together, private sector organizations and civil society organizations can combine their strengths and expertise to develop innovative digital solutions that are tailored to local needs.

Government agencies also play an important role in driving innovation and experimentation in the digitalization process, by providing a regulatory framework and supporting research and development. By collaborating with private sector and civil society organizations, government agencies can ensure (Khan, S., & Ahmed, R.2022). that their regulatory framework is responsive to local needs and supports innovation and experimentation in the digital space. For example, government agencies can provide funding and support for digital startups and research institutions, which can help to drive innovation and experimentation in the digitalization process. Collaboration between government agencies, private sector, and civil society is important for ensuring the sustainability of digitalization efforts over the long term. Digitalization is an ongoing process that requires ongoing investment and support, both in terms of technological (Reddy, V., & Rao, S. 2023) infrastructure and human resources. By collaborating, stakeholders can ensure that digital solutions are maintained and upgraded over time, and that the benefits of digitalization continue to accrue to citizens. For example, private sector organizations can provide ongoing technological support and expertise to ensure that digital solutions are up-to-date and effective. Government agencies can provide funding and support to maintain and upgrade digital infrastructure, and ensure that regulatory frameworks are responsive to changing needs and technologies. Civil society organizations can provide ongoing support and engagement to ensure that digital solutions remain relevant and accessible to local communities.

Political and Security Concerns: The political and security situation in Kashmir has a direct impact on digitalization efforts. Periodic internet (Sharma, R., & Gupta, S. 2023) shutdowns and restrictions on communication disrupt the continuity of digital services, hindering administrative processes and citizen engagement.

Socio-cultural Factors: Kashmir has its unique socio-cultural context, which can influence the adoption and acceptance of digitalization initiatives. Factors such as language preferences, cultural practices, and local governance structures need to be considered to ensure effective implementation and user acceptance.

Geographical Constraints: The region's challenging terrain and frequent disruptions, such as landslides and harsh weather conditions, pose additional obstacles to the establishment and maintenance of digital infrastructure. These geographical constraints require innovative solutions to ensure consistent access to digital services.

Language and Localization: Kashmir has its distinct language and cultural identity. Ensuring digital platforms and services are (Patel, M., & Mehta, N. 2023) available in local languages, along with localized content, can improve accessibility and user experience for the region's population.

Connectivity and Bandwidth: Limited bandwidth and connectivity issues can affect the speed and reliability of digital services in Kashmir. Improving connectivity infrastructure, including increasing bandwidth and expanding (Kumar, A., & Mishra, S. 2023) network coverage, is crucial to support effective digitalization efforts.

Cross-Border Challenges: The region's geopolitical complexities and the divided nature of Kashmir present unique challenges for cross-border digital collaboration and data sharing. Addressing these challenges requires careful consideration of legal, regulatory, and political frameworks to ensure seamless digital integration while respecting sovereignty and security concerns.

Implications of study

The study of Jammu and Kashmir reveals that digitalization can provide significant opportunities for administrative efficiency and effectiveness, but it also presents several challenges that need to be overcome for a successful future. The challenges include inadequate infrastructure, lack of technological awareness, and resistance to change. To overcome these challenges, there is a need for a comprehensive plan to improve infrastructure and expand access to technology, including the provision of training programs to enhance technological awareness among staff. In addition, there should be efforts to create a supportive organizational culture that promotes innovation and openness to change. Embracing digitalization in administration also requires a shift in mindset and a willingness to take risks and experiment with new technologies. Furthermore, data security and privacy concerns must be addressed to build trust in digital systems. Successful digitalization in administration can lead to better service delivery, improved accountability, and increased citizen participation. Therefore, it is essential to address these

**Showkat Ahmad Dar and Sakhthivel**

challenges to ensure a successful future for digitalization in administration in Jammu and Kashmir and other regions.

Suggestions and Recommendations

The following suggestions and recommendations aim to address the challenges and pave the way for a successful future in digitalization of administration in Jammu and Kashmir, promoting efficient processes, improved services, and inclusive collaboration between government agencies, the corporate sector, and civil society.

1. Strengthen the digital infrastructure in Jammu and Kashmir to ensure connectivity and accessibility across the region.
2. Conduct regular training and capacity building programs to enhance the skills of the administration officials to handle digital technologies effectively.
3. Encourage public-private partnerships to promote innovation and investment in digitalization initiatives.
4. Foster a culture of innovation and experimentation in the administration to drive continuous improvement and progress.
5. Address the digital divide by providing equal access and opportunities for all citizens, particularly those in remote areas.
6. Develop a comprehensive digitalization strategy that outlines clear objectives, timelines, and action plans for implementation.
7. Integrate citizen feedback mechanisms to ensure the delivery of quality services and responsiveness to their needs.
8. Foster collaboration among different departments and agencies to create a seamless and integrated digital ecosystem.
9. Implement robust cybersecurity measures to ensure the security and privacy of citizen data and systems.
10. Establish performance metrics to monitor the progress and impact of digitalization initiatives, and use the insights to drive continuous improvement.

CONCLUSION

The study of Jammu and Kashmir highlights the challenges faced in implementing digitalization in administration and the efforts made to overcome them. The digital divide, lack of infrastructure, and resistance to change are some of the significant hurdles that have been faced. However, the region has made remarkable progress by using innovative solutions and leveraging technology to bridge the gap. The implementation of e-governance initiatives such as digital signatures, online payment gateways, and online portals has significantly improved the delivery of services and created transparency in the system. Additionally, the use of mobile technology has enabled better communication with citizens and improved the reach of services to remote areas. The success of digitalization in administration in Jammu and Kashmir can be attributed to the commitment and dedication of the government and the willingness of citizens to adopt technology. This study serves as an inspiration for other regions facing similar challenges and highlights the potential of technology to transform the public sector. It is recommended that the government continues to invest in infrastructure and capacity building to ensure the sustainability and scalability of these initiatives.

A comprehensive approach that involves stakeholders and addresses the digital divide is crucial for the success of digitalization in administration. Digitalization has the potential to transform administration and governance in Jammu and Kashmir, as well as in India as a whole. However, the region faces several challenges in implementing digitalization, which must be overcome to fully realize the potential benefits of digitalization. This study will contribute to the growing body of research on digitalization in India and provided practical recommendations for building a successful future for digital administration in Jammu and Kashmir. Further research can be conducted to evaluate the impact of digitalization in administration, assess data security and privacy concerns, examine citizen engagement and participation, conduct comparative analysis with other regions, and explore long-term

**Showkat Ahmad Dar and Sakhivel**

sustainability and scalability. These areas of study will provide valuable insights into the effectiveness of digitalization initiatives, identify potential risks and vulnerabilities, enhance citizen-administration interaction, identify best practices from other regions, and ensure the continued success and expansion of digital systems. Research can be conducted in the border areas of Kashmir to understand the specific challenges and opportunities related to digitalization. By addressing these research areas, policymakers and stakeholders can make informed decisions and develop strategies to overcome challenges and achieve successful digital transformation in administration.

Conflict of interest and Funding

To the best of the authors' knowledge, there are no financial or personal relationships that may be seen as having influenced the work presented in this manuscript. The research is not funded by any institute or organization.

ACKNOWLEDGEMENT

The development of this article is indebted to the diligent endeavors and unwavering dedication of numerous individuals, all of whom we sincerely acknowledge. We would also like to express our gratitude to the researchers and authors who have previously delved into a comparable topic, as their prior contributions have laid a solid foundation for our unexpected and fruitful exploration, ultimately facilitating a smooth and successful conclusion to this piece

ABSTRACT

A significant issue in our practice is unreliability. Many hypothesis deals with unreliable surroundings. In this article, we construct three bipolar fuzzy matrices V_0 , V_s and V_c from agriculture experts. We determine the event yield relation V_1 and Conformability yield relation V_2 , the non event yield relation V_3 and the non season yield relation V_4 . Finally, we find out which types of crops are more productive in which farmer.

Keywords: Bipolar fuzzy set (BFS), bipolar fuzzy matrix (BFM), min-min relations, Agriculture.

INTRODUCTION

Computational intelligence has been employed in recent years to create intelligent systems that can solve a variety of challenging issues. Moreover, bipolar fuzzy has shown to be an effective technique for decision-making systems. Several medical expert systems and agricultural expert systems already use bipolar fuzzy matrices. In order to deal with difficulties of unreliability, Zadeh [14] proposed a fantastic theory known as the fuzzy set theory. The idea of fuzzy matrices was initially put forth by Thomason [13] in 1977. Its components fall inside the range [0, 1]. Bipolar fuzzy sets were suggested by Zhang [15]. Bipolar fuzzy matrices were first developed by M.Pal and Sanjib Mondal [8] in 2019 and several findings about transitive closure and power-convergence of BFMs are examined. In a bipolar

Muthuraji and Anitha

fuzzy environment, multi criteria decision making techniques have been given by Alghamdi *et.al* [2]. Bipolar fuzzy matroids are a concept that was introduced by Musavarah Sarwar and Muhammad Akram [5]. They also outline several of the attributes of different forms of bipolar fuzzy matroids. Geetha and Usha [3] an occurrence relation and conformability relation determined from expert medical documentation and observation of the related patient with sciatica to have presented. And they obtained an application of fuzzy matrix in the study of yoga on sciatica. Karaaslan and Cagman [4] studied the concept of bipolar soft rough sets (BSRSs) and set theoretical operations of bipolar soft rough sets are defined. Also they proposed a decision making method using operations of BSRSs. Shumaiza *et.al* [11] the vikor methodology stands out as an important MCDM technique have been discussed. And they a comparison of this method with the trapezoidal bipolar fuzzy TOPSIS method is established. G.Ali *et.al* [1] has presented parameter reductions of bipolar fuzzy soft sets with their decision making algorithms.Princy and Mohana [9] has introduced the concept of spherical bipolar fuzzy sets as a combination of spherical fuzzy sets and bipolar valued fuzzy sets along with their features. Saima mustafa *et.al* [10] proposed bipolar fuzzy MCDM technique and given a soft set algorithm. Also, they are presented its application in MCDM issues. Tahir Mahmood [12] has presented deliberated the algebraic structures associated with T-bipolar soft sets and the applications of T-bipolar soft sets in decision making problem. Muthuraji and Anitha[6] presented the recent technology in agriculture using the bipolar fuzzy matrices with the aid of score function. Finally, they are found which soil most groundnuts yield. Muthuraji and Punitha Elizabeth [7] proposed application of bipolar fuzzy matrices in flood damage. Also, they are illustrated which districts are most affected in flood damage. Two different kinds of relationships between crops and seasons are suggested by this model. A relationship between events V_0 gives information about the propensity or regularity of crop growth during a given season. A relationship between events V_s indicates the seasons in which the farmers cultivation of crops. A conformability relation V_c shows as in which crops give high yield in which seasons.

Preliminaries

Definition 2.1[14]The membership function $\mu_F:U \rightarrow [0,1]$ elements of the universe of discourse provides the concept of a fuzzy set. Any value between 0 and 1 qualifies U to be a member of the fuzzy set $0 \leq \mu_F(u) \leq 1$ represent the degree of membership of an element u .

Definition 2.2 [13] let Z be a matrix, $Z = [(z_{ij})]_{u \times v}$, where $z_{ij} \in [0,1], 1 \leq i \leq u$ and $1 \leq j \leq v$ then Z is called fuzzy matrix.

Definition 2.3 [15] A bipolar fuzzy set is a pair of $(-x_n, x_p)$ where $-x_n: x \rightarrow [-1,0]$ and $x_p: x \rightarrow [0,1]$ are the respectively negative and positive membership degree of $x \in X$. The set of all bipolar fuzzy set on X is denoted by $B_F(X)$. Bipolar fuzzy set is an extension of fuzzy set.

Definition 2.4 [8] A bipolar fuzzy matrix $X = [(x_{ij})]$ where (x_{ij}) is defined as $(-x_{ijn}, x_{ijp})$ whose $x_{ijn}, x_{ijp} \in [0, 1] \forall i, j$ are the negative and positive membership values of the element x_{ij} respectively.

Definition 2.5 [8] (Operations on bipolar fuzzy matrix)

Let $X = [x_{ij} = (-x_{ijn}, x_{ijp})]_{p \times q}$, $Y = [y_{ij} = (-y_{ijn}, y_{ijp})]_{p \times q}$ are two bipolar fuzzy matrices.

- (i) $X \vee Y = X + Y = (x_{ij} + y_{ij})_{p \times q} = (-\max\{x_{ijn}, y_{ijn}\}, \max\{x_{ijp}, y_{ijp}\})_{p \times q} \forall i, j$
- (ii) $X \wedge Y = X * Y = (x_{ij} \cdot y_{ij})_{p \times q} = (-\min\{x_{ijn}, y_{ijn}\}, \min\{x_{ijp}, y_{ijp}\})_{p \times q} \forall i, j$
- (iii) $X^c = [(-1 + x_{ijn}), (1 - x_{ijp},)]$ (Complement of X).

Example 2.6 Let $X, Y \in BFM_s$

$$X = \begin{bmatrix} \langle -0.4, 0.5 \rangle & \langle -0.6, 0.3 \rangle & \langle -0.2, 0.4 \rangle \\ \langle -0.3, 0.7 \rangle & \langle -0.9, 0.1 \rangle & \langle -0.8, 0.5 \rangle \\ \langle -0.8, 0.3 \rangle & \langle -0.1, 0.7 \rangle & \langle -0.6, 0.6 \rangle \end{bmatrix}$$

$$Y = \begin{bmatrix} \langle -0.7, 0.3 \rangle & \langle -0.4, 0.8 \rangle & \langle -0.7, 0.5 \rangle \\ \langle -0.2, 0.7 \rangle & \langle -0.1, 0.6 \rangle & \langle -0.6, 0.5 \rangle \\ \langle -0.7, 0.3 \rangle & \langle -0.3, 0.8 \rangle & \langle -0.5, 0.2 \rangle \end{bmatrix}$$

Then, Compute $X * Y = \begin{bmatrix} \langle -0.4, 0.3 \rangle & \langle -0.4, 0.3 \rangle & \langle -0.2, 0.4 \rangle \\ \langle -0.2, 0.7 \rangle & \langle -0.1, 0.1 \rangle & \langle -0.6, 0.5 \rangle \\ \langle -0.7, 0.3 \rangle & \langle -0.1, 0.7 \rangle & \langle -0.5, 0.2 \rangle \end{bmatrix}$

Muthuraji and Anitha

And, compute $X^c = \begin{bmatrix} \langle -0.6, 0.5 \rangle & \langle -0.4, 0.7 \rangle & \langle -0.8, 0.6 \rangle \\ \langle -0.7, 0.3 \rangle & \langle -0.1, 0.9 \rangle & \langle -0.2, 0.5 \rangle \\ \langle -0.2, 0.7 \rangle & \langle -0.9, 0.3 \rangle & \langle -0.4, 0.4 \rangle \end{bmatrix}$

Algorithm

- Step: 1 Enter the bipolar fuzzy matrix V_0 indicates an event of seasons and crops.
- Step: 2 Enter the bipolar fuzzy matrix V_s indicates the seasons in which the farmers cultivate.
- Step: 3 Enter the bipolar fuzzy matrix V_c indicates to confirmative relation is $V_c = S \times C$.
- Step: 4 Compute event yield relation $V_1 = V_s * V_0$.
- Step: 5 Compute conformability yield relation $V_2 = V_s * V_c$.
- Step: 6 Compute non event yield relation $V_3 = V_s * V_0^c$.
- Step: 7 Compute non season yield relation $V_4 = V_s^c * V_0$.
- Step: 8 Separate the negative values and positive values in V_4 .

MAIN RESULTS

In this article, we consider the five types of seasons such that Rainy s_1 , Winter s_2 , Spring s_3 , Summer s_4 , Autumn s_5 and five types of crops such that groundnuts c_1 , wheat c_2 , paddy c_3 , sugarcane c_4 and blackgram c_5 . Finally, we find out which crop has each farmer harvested the most.

S = Set of all seasons

C = Set of all crops

F = Set of all farmer.

Step: 1

$C = \{c_1, c_2, c_3, c_4, c_5\}$ where c_1, c_2, c_3, c_4, c_5 are stand for crops.

$S = \{s_1, s_2, s_3, s_4, s_5\}$ where s_1, s_2, s_3, s_4, s_5 are stand for seasons. Matrix for event relation is $V_0 = S \times C$, shows the frequency of event of crops with seasons.

$$V_0 = \begin{matrix} & c_1 & c_2 & c_3 & c_4 & c_5 \\ \begin{matrix} s_1 \\ s_2 \\ s_3 \\ s_4 \\ s_5 \end{matrix} & \begin{bmatrix} \langle -0.7, 0.3 \rangle \\ \langle -0.4, 0.2 \rangle \\ \langle -0.2, 0.4 \rangle \\ \langle -0.1, 0.6 \rangle \\ \langle -0.3, 0.6 \rangle \end{bmatrix} & \begin{bmatrix} \langle -0.5, 0.2 \rangle \\ \langle -0.3, 0.4 \rangle \\ \langle -0.3, 0.3 \rangle \\ \langle -0.4, 0.2 \rangle \\ \langle -0.5, 0.3 \rangle \end{bmatrix} & \begin{bmatrix} \langle -0.2, 0.5 \rangle \\ \langle -0.6, 0.1 \rangle \\ \langle -0.7, 0.5 \rangle \\ \langle -0.3, 0.5 \rangle \\ \langle -0.3, 0.6 \rangle \end{bmatrix} & \begin{bmatrix} \langle -0.4, 0.1 \rangle \\ \langle -0.7, 0.2 \rangle \\ \langle -0.5, 0.4 \rangle \\ \langle -0.1, 0.7 \rangle \\ \langle -0.1, 0.4 \rangle \end{bmatrix} & \begin{bmatrix} \langle -0.7, 0.3 \rangle \\ \langle -0.4, 0.5 \rangle \\ \langle -0.5, 0.3 \rangle \\ \langle -0.4, 0.4 \rangle \\ \langle -0.3, 0.4 \rangle \end{bmatrix} \end{matrix}$$

Step: 2

The following bipolar fuzzy relation V_s specifies the level of farmers f_1, f_2, f_3, f_4, f_5 and seasons s_1, s_2, s_3, s_4, s_5 presence. It indicates the seasons in which the farmers cultivation of crops.

$$V_s = \begin{matrix} & s_1 & s_2 & s_3 & s_4 & s_5 \\ \begin{matrix} f_1 \\ f_2 \\ f_3 \\ f_4 \\ f_5 \end{matrix} & \begin{bmatrix} \langle -0.7, 0.4 \rangle \\ \langle -0.5, 0.3 \rangle \\ \langle -0.4, 0.6 \rangle \\ \langle -0.5, 0.3 \rangle \\ \langle -0.4, 0.6 \rangle \end{bmatrix} & \begin{bmatrix} \langle -0.3, 0.4 \rangle \\ \langle -0.6, 0.1 \rangle \\ \langle -0.7, 0.4 \rangle \\ \langle -0.4, 0.3 \rangle \\ \langle -0.3, 0.5 \rangle \end{bmatrix} & \begin{bmatrix} \langle -0.6, 0.3 \rangle \\ \langle -0.7, 0.2 \rangle \\ \langle -0.8, 0.3 \rangle \\ \langle -0.8, 0.2 \rangle \\ \langle -0.2, 0.5 \rangle \end{bmatrix} & \begin{bmatrix} \langle -0.2, 0.4 \rangle \\ \langle -0.5, 0.3 \rangle \\ \langle -0.1, 0.2 \rangle \\ \langle -0.1, 0.4 \rangle \\ \langle -0.7, 0.4 \rangle \end{bmatrix} & \begin{bmatrix} \langle -0.1, 0.5 \rangle \\ \langle -0.1, 0.6 \rangle \\ \langle -0.2, 0.1 \rangle \\ \langle -0.3, 0.4 \rangle \\ \langle -0.8, 0.6 \rangle \end{bmatrix} \end{matrix}$$

Step: 3

Assuming that the matrix for confirmative relation $V_c = S \times C$ shows as in which crops give high yield in which seasons.

$$V_c = \begin{matrix} & c_1 & c_2 & c_3 & c_4 & c_5 \\ \begin{matrix} s_1 \\ s_2 \\ s_3 \\ s_4 \\ s_5 \end{matrix} & \begin{bmatrix} \langle -0.5, 0.4 \rangle \\ \langle -0.4, 0.6 \rangle \\ \langle -1, 0.5 \rangle \\ \langle -0.6, 0.5 \rangle \\ \langle -0.4, 0.7 \rangle \end{bmatrix} & \begin{bmatrix} \langle -0.2, 0.1 \rangle \\ \langle -0.7, 0.5 \rangle \\ \langle -0.8, 0.4 \rangle \\ \langle -0.7, 0.4 \rangle \\ \langle -0.6, 0.1 \rangle \end{bmatrix} & \begin{bmatrix} \langle -0.5, 0.3 \rangle \\ \langle -0.6, 0.5 \rangle \\ \langle -0.7, 0.4 \rangle \\ \langle -0.5, 0.1 \rangle \\ \langle -0.5, 0.5 \rangle \end{bmatrix} & \begin{bmatrix} \langle -0.7, 0.2 \rangle \\ \langle -0.8, 0.9 \rangle \\ \langle -0.4, 0.4 \rangle \\ \langle -0.4, 0.8 \rangle \\ \langle -0.1, 0.7 \rangle \end{bmatrix} & \begin{bmatrix} \langle -0.9, 0.8 \rangle \\ \langle -0.4, 0.3 \rangle \\ \langle -0.2, 0.6 \rangle \\ \langle -0.3, 0.6 \rangle \\ \langle -0.3, 0.3 \rangle \end{bmatrix} \end{matrix}$$

Muthuraji and Anitha

Using relation V_0, V_c and V_s we could compute four type of relation as follows.

Step: 4

The event yield relation V_1 compute by $V_1 = V_s * V_0$.

$$V_1 = \begin{matrix} & C_1 & C_2 & C_3 & C_4 & C_5 \\ \begin{matrix} f_1 \\ f_2 \\ f_3 \\ f_4 \\ f_5 \end{matrix} & \left[\begin{array}{ccccc} \langle -0.7, 0.3 \rangle & \langle -0.3, 0.2 \rangle & \langle -0.2, 0.3 \rangle & \langle -0.2, 0.1 \rangle & \langle -0.1, 0.3 \rangle \\ \langle -0.4, 0.2 \rangle & \langle -0.3, 0.1 \rangle & \langle -0.6, 0.1 \rangle & \langle -0.5, 0.2 \rangle & \langle -0.1, 0.5 \rangle \\ \langle -0.2, 0.4 \rangle & \langle -0.3, 0.3 \rangle & \langle -0.7, 0.3 \rangle & \langle -0.1, 0.2 \rangle & \langle -0.2, 0.1 \rangle \\ \langle -0.1, 0.3 \rangle & \langle -0.4, 0.2 \rangle & \langle -0.3, 0.2 \rangle & \langle -0.1, 0.4 \rangle & \langle -0.3, 0.4 \rangle \\ \langle -0.3, 0.6 \rangle & \langle -0.3, 0.3 \rangle & \langle -0.2, 0.5 \rangle & \langle -0.1, 0.4 \rangle & \langle -0.3, 0.4 \rangle \end{array} \right] \end{matrix}$$

Step: 5

The conformability yield relation V_2 compute by $V_2 = V_s * V_c$.

$$V_2 = \begin{matrix} & C_1 & C_2 & C_3 & C_4 & C_5 \\ \begin{matrix} f_1 \\ f_2 \\ f_3 \\ f_4 \\ f_5 \end{matrix} & \left[\begin{array}{ccccc} \langle -0.5, 0.4 \rangle & \langle -0.2, 0.1 \rangle & \langle -0.5, 0.3 \rangle & \langle -0.2, 0.2 \rangle & \langle -0.1, 0.5 \rangle \\ \langle -0.4, 0.3 \rangle & \langle -0.6, 0.1 \rangle & \langle -0.6, 0.2 \rangle & \langle -0.5, 0.3 \rangle & \langle -0.1, 0.3 \rangle \\ \langle -0.4, 0.5 \rangle & \langle -0.7, 0.4 \rangle & \langle -0.7, 0.3 \rangle & \langle -0.1, 0.2 \rangle & \langle -0.2, 0.1 \rangle \\ \langle -0.5, 0.3 \rangle & \langle -0.4, 0.3 \rangle & \langle -0.5, 0.1 \rangle & \langle -0.1, 0.4 \rangle & \langle -0.3, 0.4 \rangle \\ \langle -0.4, 0.6 \rangle & \langle -0.3, 0.1 \rangle & \langle -0.2, 0.5 \rangle & \langle -0.1, 0.4 \rangle & \langle -0.3, 0.3 \rangle \end{array} \right] \end{matrix}$$

Step: 6

The non event yield relation V_3 compute by $V_3 = V_s * V_0^c$.

$$V_3 = \begin{matrix} & S_1 & S_2 & S_3 & S_4 & S_5 \\ \begin{matrix} f_1 \\ f_2 \\ f_3 \\ f_4 \\ f_5 \end{matrix} & \left[\begin{array}{ccccc} \langle -0.7, 0.4 \rangle & \langle -0.3, 0.4 \rangle & \langle -0.6, 0.3 \rangle & \langle -0.2, 0.4 \rangle & \langle -0.1, 0.5 \rangle \\ \langle -0.5, 0.3 \rangle & \langle -0.6, 0.1 \rangle & \langle -0.7, 0.2 \rangle & \langle -0.5, 0.3 \rangle & \langle -0.1, 0.6 \rangle \\ \langle -0.4, 0.6 \rangle & \langle -0.7, 0.4 \rangle & \langle -0.8, 0.3 \rangle & \langle -0.1, 0.2 \rangle & \langle -0.2, 0.1 \rangle \\ \langle -0.5, 0.3 \rangle & \langle -0.4, 0.3 \rangle & \langle -0.8, 0.2 \rangle & \langle -0.1, 0.4 \rangle & \langle -0.3, 0.4 \rangle \\ \langle -0.4, 0.6 \rangle & \langle -0.3, 0.5 \rangle & \langle -0.2, 0.5 \rangle & \langle -0.7, 0.4 \rangle & \langle -0.8, 0.6 \rangle \end{array} \right] \end{matrix}$$

$$* \begin{matrix} & C_1 & C_2 & C_3 & C_4 & C_5 \\ \begin{matrix} S_1 \\ S_2 \\ S_3 \\ S_4 \\ S_5 \end{matrix} & \left[\begin{array}{ccccc} \langle -0.3, 0.7 \rangle & \langle -0.5, 0.8 \rangle & \langle -0.8, 0.5 \rangle & \langle -0.6, 0.9 \rangle & \langle -0.3, 0.7 \rangle \\ \langle -0.6, 0.8 \rangle & \langle -0.7, 0.6 \rangle & \langle -0.4, 0.9 \rangle & \langle -0.3, 0.8 \rangle & \langle -0.6, 0.5 \rangle \\ \langle -0.8, 0.6 \rangle & \langle -0.7, 0.7 \rangle & \langle -0.3, 0.5 \rangle & \langle -0.5, 0.6 \rangle & \langle -0.5, 0.7 \rangle \\ \langle -0.9, 0.4 \rangle & \langle -0.6, 0.8 \rangle & \langle -0.7, 0.5 \rangle & \langle -0.9, 0.3 \rangle & \langle -0.6, 0.6 \rangle \\ \langle -0.7, 0.4 \rangle & \langle -0.5, 0.7 \rangle & \langle -0.7, 0.4 \rangle & \langle -0.9, 0.6 \rangle & \langle -0.7, 0.6 \rangle \end{array} \right] \end{matrix}$$

$$V_3 = \begin{matrix} & C_1 & C_2 & C_3 & C_4 & C_5 \\ \begin{matrix} f_1 \\ f_2 \\ f_3 \\ f_4 \\ f_5 \end{matrix} & \left[\begin{array}{ccccc} \langle -0.3, 0.4 \rangle & \langle -0.3, 0.4 \rangle & \langle -0.6, 0.3 \rangle & \langle -0.2, 0.4 \rangle & \langle -0.1, 0.5 \rangle \\ \langle -0.5, 0.3 \rangle & \langle -0.6, 0.1 \rangle & \langle -0.4, 0.2 \rangle & \langle -0.3, 0.3 \rangle & \langle -0.1, 0.5 \rangle \\ \langle -0.4, 0.6 \rangle & \langle -0.7, 0.4 \rangle & \langle -0.3, 0.3 \rangle & \langle -0.1, 0.2 \rangle & \langle -0.2, 0.1 \rangle \\ \langle -0.5, 0.3 \rangle & \langle -0.4, 0.3 \rangle & \langle -0.7, 0.2 \rangle & \langle -0.1, 0.3 \rangle & \langle -0.3, 0.4 \rangle \\ \langle -0.4, 0.4 \rangle & \langle -0.3, 0.5 \rangle & \langle -0.2, 0.4 \rangle & \langle -0.7, 0.4 \rangle & \langle -0.7, 0.6 \rangle \end{array} \right] \end{matrix}$$

Step: 7

Eventually, the non-season yield relation V_4 compute by $V_4 = V_s^c * V_0$.

$$V_4 = \begin{matrix} & S_1 & S_2 & S_3 & S_4 & S_5 \\ \begin{matrix} f_1 \\ f_2 \\ f_3 \\ f_4 \\ f_5 \end{matrix} & \left[\begin{array}{ccccc} \langle -0.3, 0.6 \rangle & \langle -0.7, 0.6 \rangle & \langle -0.4, 0.7 \rangle & \langle -0.8, 0.6 \rangle & \langle -0.9, 0.5 \rangle \\ \langle -0.5, 0.7 \rangle & \langle -0.4, 0.9 \rangle & \langle -0.3, 0.8 \rangle & \langle -0.5, 0.7 \rangle & \langle -0.9, 0.4 \rangle \\ \langle -0.6, 0.4 \rangle & \langle -0.3, 0.6 \rangle & \langle -0.2, 0.7 \rangle & \langle -0.9, 0.8 \rangle & \langle -0.8, 0.9 \rangle \\ \langle -0.5, 0.7 \rangle & \langle -0.6, 0.7 \rangle & \langle -0.2, 0.8 \rangle & \langle -0.9, 0.6 \rangle & \langle -0.7, 0.6 \rangle \\ \langle -0.6, 0.4 \rangle & \langle -0.7, 0.5 \rangle & \langle -0.8, 0.5 \rangle & \langle -0.3, 0.6 \rangle & \langle -0.2, 0.4 \rangle \end{array} \right] \end{matrix}$$

$$* \begin{matrix} & C_1 & C_2 & C_3 & C_4 & C_5 \\ \begin{matrix} S_1 \\ S_2 \\ S_3 \\ S_4 \\ S_5 \end{matrix} & \left[\begin{array}{ccccc} \langle -0.7, 0.3 \rangle & \langle -0.5, 0.2 \rangle & \langle -0.2, 0.5 \rangle & \langle -0.4, 0.1 \rangle & \langle -0.7, 0.3 \rangle \\ \langle -0.4, 0.2 \rangle & \langle -0.3, 0.4 \rangle & \langle -0.6, 0.1 \rangle & \langle -0.7, 0.2 \rangle & \langle -0.4, 0.5 \rangle \\ \langle -0.2, 0.4 \rangle & \langle -0.3, 0.3 \rangle & \langle -0.7, 0.5 \rangle & \langle -0.5, 0.4 \rangle & \langle -0.5, 0.3 \rangle \\ \langle -0.1, 0.6 \rangle & \langle -0.4, 0.2 \rangle & \langle -0.3, 0.5 \rangle & \langle -0.1, 0.7 \rangle & \langle -0.4, 0.4 \rangle \\ \langle -0.3, 0.6 \rangle & \langle -0.5, 0.3 \rangle & \langle -0.3, 0.6 \rangle & \langle -0.1, 0.4 \rangle & \langle -0.3, 0.4 \rangle \end{array} \right] \end{matrix}$$

Muthuraji and Anitha

$$V_4 = \begin{matrix} f_1 \\ f_2 \\ f_3 \\ f_4 \\ f_5 \end{matrix} \begin{bmatrix} \langle -0.3, 0.3 \rangle & \langle -0.5, 0.2 \rangle & \langle -0.2, 0.5 \rangle & \langle -0.4, 0.1 \rangle & \langle -0.7, 0.3 \rangle \\ \langle -0.4, 0.2 \rangle & \langle -0.3, 0.4 \rangle & \langle -0.3, 0.1 \rangle & \langle -0.5, 0.2 \rangle & \langle -0.4, 0.4 \rangle \\ \langle -0.2, 0.4 \rangle & \langle -0.3, 0.3 \rangle & \langle -0.2, 0.5 \rangle & \langle -0.5, 0.4 \rangle & \langle -0.5, 0.3 \rangle \\ \langle -0.1, 0.6 \rangle & \langle -0.4, 0.2 \rangle & \langle -0.2, 0.5 \rangle & \langle -0.1, 0.6 \rangle & \langle -0.4, 0.4 \rangle \\ \langle -0.3, 0.4 \rangle & \langle -0.5, 0.3 \rangle & \langle -0.3, 0.5 \rangle & \langle -0.1, 0.4 \rangle & \langle -0.2, 0.4 \rangle \end{bmatrix}$$

Step: 8

Separate the negative values and positive values in V_4 .

$$V_4^n = \begin{matrix} f_1 \\ f_2 \\ f_3 \\ f_4 \\ f_5 \end{matrix} \begin{bmatrix} -0.3 & -0.5 & -0.2 & -0.4 & -0.7 \\ -0.4 & -0.3 & -0.3 & -0.5 & -0.4 \\ -0.2 & -0.3 & -0.2 & -0.5 & -0.5 \\ -0.1 & -0.4 & -0.2 & -0.1 & -0.4 \\ -0.3 & -0.5 & -0.3 & -0.1 & -0.2 \end{bmatrix}$$

And,

$$V_4^p = \begin{matrix} f_1 \\ f_2 \\ f_3 \\ f_4 \\ f_5 \end{matrix} \begin{bmatrix} 0.3 & 0.2 & 0.5 & 0.1 & 0.3 \\ 0.2 & 0.4 & 0.1 & 0.2 & 0.4 \\ 0.4 & 0.3 & 0.5 & 0.4 & 0.3 \\ 0.6 & 0.2 & 0.5 & 0.6 & 0.4 \\ 0.4 & 0.3 & 0.5 & 0.4 & 0.4 \end{bmatrix}$$

CONCLUSION

From these yield relations V_1 and V_2 show the both crop $c_3, c_4, c_5, c_4, c_5, c_3$ and c_4 are suitable crops for farmer $f_3, f_3, f_4, f_4, f_4, f_5$ and f_5 respectively. Where as V_4^p shows farmer f_4 is having most yield of groundnuts(c_1) and sugarcane(c_4). And shows farmer f_1 is having least yield of blackgram. This process is very useful for our practical life.

ABSTRACT

Chronic venous ulcer which is defined as open lesion between knee and ankle joint that occur in presence of venous disease. They are considered as the most common leg ulcers whose prognosis is considered as poor if duration is more than a year. This condition results in reduced mobility, poor quality of life and many other complications. This report deals with a case of Varicose ulcer of fourteen-year duration which did not responded to conventional allopathic treatment and in due course opted for Siddha system for management. The main treatment instituted were six sitting Attai Vidal/ Medical Leech Therapy and internal medications. After fifty days of medication ulcer completely healed. This case report has a prospective follow up of three months and did not show recurrence till date. Since this case report is based on single case which shows positive outcome this cannot be generalised. Further suitable clinical trials need to be conducted to assess efficacy.

Keywords: (Venous ulcer, Medical Leech Therapy, Attai Vidal, Siddha)

Ramamurthy et al.,

INTRODUCTION

Venous ulcers are wounds occurring due to improper functioning of venous valves, generally of the lower limbs [1]. Damaged venous valves prevent the backflow of blood and cause pressure in the veins. Hence the arterial pressure reduces significantly than venous and therefore, blood is not pumped as effectively into the area [1]. A venous ulcer will not usually heal without proper treatment [1]. It can be painful and may limit mobility and quality of life. If the duration of the venous ulcer is more, obviously it will lead all the skin damage and there will be difficulty in healing. The methods used to prevent and treat such wounds includes the application of various wound dressings, antimicrobial agents, physical therapies and educational tactics. Less conventional methods include allogeneic micro grafting and allogeneic skin cell transplantation and wound healing methods used in Siddha System of medicine includes Attai Vidal (AV) or Medical Leech Therapy (MLT) [2] Wound healing is a dynamic, sequential process involving exudative, proliferative and extracellular matrix remodelling phases. These phases are regulated by signalling molecules produced by a wide range of cells present in the extracellular matrix. The early stages of this process (haemostasis, inflammation and proliferation) prepare the tissues for the final, remodelling stage which can last for one year or more [3].

MLT is a multi-faceted therapeutic concept, comprising of biting stimulus, blood drawing and the injection of pharmacologically-active substances found in leeches' saliva into patients' blood and tissues [4]. Its therapeutic effects include anticoagulation, blood and lymph flow stimulation and the reduction of both inflammation and pain [5]. This article comprises of a single case report of Varicose ulcer treated by means of conventional Siddha Therapy for treating non healing ulcers including MLT. MLT is a useful technique mentioned in ancient Siddha literatures for the treatment of many conditions such as oedematous conditions, haemorrhoids, fever, Whooping cough, chronic ulcers etc [6]. Even though few clinical trials are there supporting the fact of wound healing by means of MLT no data exist on healing of a varicose ulcer with fourteen-year duration in a short span which is depicted in this study.

Patient information

A 71-year-old male patient presented to National Institute of Siddha, with the complaints of reddish non healing ulcers over medial malleolus of both legs and dorsum of Right foot for nine years with only a very brief intermittent healing for few days. It was associated with pricking pain, burning sensation around the ulcers, oedema, and blackish discoloration over both lower limbs. For the last 19 years, the patient has been suffering from varicose veins, and 14 years back, he developed varicose ulcer on the dorsum of left foot first and subsequently he developed ulcer in medial malleolus of both right and left foot triggered by trivial injuries and was treated with Allopathic treatment modalities including Trendelenburg surgical interventions during 2010 and 2013 following which there was healing of ulcers. After 20 days the same site began to ulcerate and the suffering resumed. Patient did not have addictions, and having a vegetarian dietary habit. Patient has the occupation history of standing as a shopkeeper for 8-10 hours a day for the past 45 years. And he was a known case of Systemic hypertension and has been under regular Allopathic Medication.

CLINICAL FINDINGS

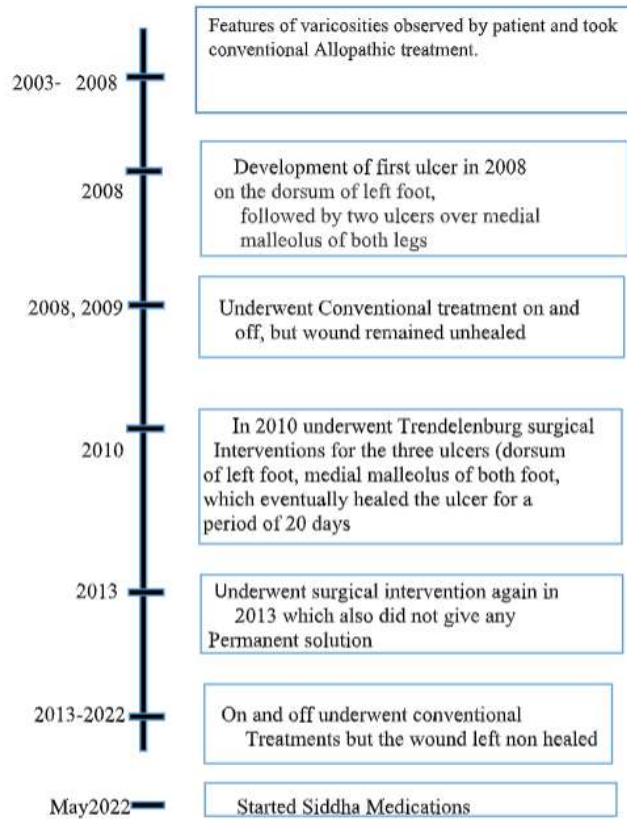

On examination, two reddish large ulcers were present in Right lower limb and one ulcer over left medial malleolus, along with mild serous discharge. The large ulcer measured 5 cm in length, 7 cm in width, and 1.75 cm in depth, ulcer in right dorsum of foot measuring 3.25 cm length, 0.5 cm depth and 3.5 cm width and ulcer in right medial malleolus measuring 6 cm length, 1 cm depth and 5.5 cm width. The patient also had swelling and blackish discoloration around both ankle joints and feet, with grade V tenderness around both ulcers. Varicosity on calf region of both lower limbs tested positive for Trendelenburg test and negative for Moses' sign, but pedal pulse was present which was suggestive of varicose ulcer features [Figure 1.1, 1.2, 1.3].

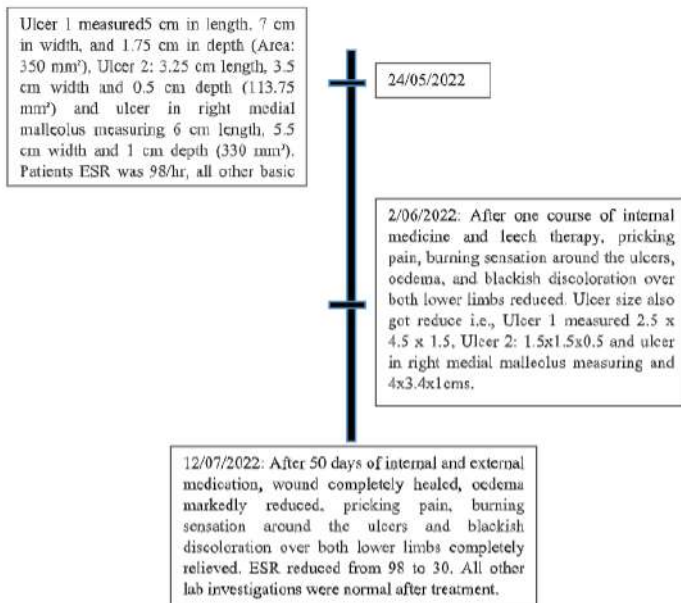

Ramamurthy et al.,

Timeline – History of Venous Disease of Lower Limb

Current Information from This Episode of Care

Ramamurthy et al.,

Diagnostic Assessment

Doppler venous study of right lower limb revealed Right sapheno femoral junction incompetence and right perforator incompetence below knee. Glycaemic indices were checked and was found normal, which helped to rule out diabetic ulcer.

Diagnostic reasoning

Venous colour flow Doppler imaging is a gold standard investigation for the assessment of the venous system of lower limb + Evidence level B⁺ (Evidence level B: Ankle brachial pressure index should also be conducted when the ulcer is deteriorating, ulcer not healed fully by 12 weeks or there is recurrence of ulcer)⁷.

Prognostic characteristics

As per the study conducted by V. Karanikolic et al. Large and long-lasting ulcers could be healed although more time is needed. A decrease in wound size during the first 50 days of treatment is a favourable prognostic factor for healing⁸. In this case also the wound healed after 50 days of treatment which can be considered as a good prognosis.

Therapeutic Intervention**Follow-up and Outcomes**

Clinician- and patient-assessed outcomes: Patient who was diagnosed as a case of varicose ulcer was treated with Siddha medicines both internally and externally. Weekly once ulcer was measured and was documented. After each Attai Vidal procedure there was visible reduction in oedema around the ulcers which the patient also felt. The pain was measured on visual analogue scale (VAS), which was 6 in the beginning of treatment and at the end of the treatment came down to 1. The ulcerated wound was assessed by measurement and granulation tissue formation which is depicted in table 2.

Noticeable improvement in the symptoms was seen, it was up to 60% in Veekkam (oedematous swelling), *Erichal* (burning sensation) and *Kuthal* (pricking sensation) was completely relieved after treatment. Moreover, after each course of Attai Vidal (Medical Leech Therapy) there was marked reduction in swelling around ulcer. After six courses of Attai Vidal, daily cleaning and dressing of the ulcer with Mathan Thylam and internal medication for a period of 50 days' ulcer completely healed with no adverse event during the entire course of treatment. [Refer fig.1,2,3.]

Intervention adherence and tolerability

Since the patient was admitted in In-Patient ward of National Institute of Siddha daily rounds helped in facilitating Intervention adherence and tolerability.

Adverse and unanticipated events

No adverse and unanticipated events were occurred.

DISCUSSION

Varicose ulcers are usually recurrent and open ulcers which can persist from weeks to many years. Severe complications of this condition include cellulitis, osteomyelitis and malignant transformation. This report deals with a case of varicose ulcer of fourteen-year duration, which did not respond to Conventional Allopathic treatment and in due course opted for Siddha System for management. The main treatment instituted was a six sitting AV/MLT, cleaning and dressing with Mathan thylam, internally Cap. Rasagandhi Mezhugu and Vallarai tablet. MLT is already having literature basis for its wound healing property. Salivary proteins and small molecules seen in leech seem to function as inhibitors or mediators of haemostasis, platelet adhesion, fibrin meshwork formation, inflammation, pain generation and defence reactions of the host. In case of venous stasis, the pathogenesis of the pain not only involves the concept of pain receptors but also the appearance of algogenic metabolites at the site of the

**Ramamurthy et al.,**

microcirculatory units to which endothelial cells are particularly sensitive¹³. When leech bite the skin, it sucks the stagnated blood thereby decreases the mechanical pressure. It also inoculates secretions containing Anticoagulant, thrombolytic, vasodilating and anaesthetic substances from the salivary ductules by pumping action^{14,15}. Anticoagulant, thrombolytic and vasodilating substances present in leech saliva prolong bleeding and causes hypovolemic haemodilution which reduces pressure of blood and also remove the metabolites at the site of the microcirculatory units, in combination of these, anaesthetic substances present in leech saliva reduce pain on the location^{16,17}. Pigmented lesions in stasis dermatitis are caused by deposition of haemosiderin in the dermis¹⁸. Here in this case also after first sitting of AV/MLT swelling, burning sensation reduced and after six sittings ulcer completely healing along with associated symptoms like blackish discolouration around the ulcer. Hypovolumic haemodilution caused by Biochemicals present in leech saliva improves circulation of skin on the affected site, thus the haemosiderin deposited in skin is reutilized as a source of Iron¹⁹, which may be the reason for elevation of haemoglobin value from 12.7 mg/dl to 13.9 mg/dl after treatment in this particular case even without administration of any iron supplements.

In varicose vein venous hypertension stretches the veins and lets leakage of fibrinogen from veins into extra vascular space. This fibrinogen forms a fibrin cusp around the blood vessels, preventing oxygen and nutrients from reaching the cells. Venous insufficiency also causes leucocytes accumulation in small blood vessels releasing inflammatory factor and reactive oxygen species, further resulting in ischemia and chronic wound development^{20, 21, 22}. Attai Vidal provides a medium for drainage and thus increases perfusion until adequate venous flow is established. This occurs due to the anticoagulant effect of hirudin and antithrombolytic effect of destabilase^{23, 24}. Calin present in leech saliva inhibits platelet aggregation and adhesion as well as collagen induced thrombin formation^{25,26}. Bdelin and Eglin due to their anti-inflammatory effect and hyaluronidase due to its antibiotic effect further contribute to healing²⁷. All these supports the early healing of ulcer.

Likewise, Vallarai choornam tablet, containing *Centella asiatica* is also having wound healing property. It is having ability in cells with fibroblast and keratinocyte morphologies and is having the potential to enhance the proliferation and remodelling process of healing²⁸. Rasagandhi Mezhugu a Siddha medicine, is a formulation containing 38 different botanicals and 8 inorganic substances, which is well known for its wound healing effect it is directly indicated for *Purai odum pun* which indicates deep non healing ulcers. Many of the constituents present in it is having anti-inflammatory and even wound healing activity²⁹. All in all, these internal and external therapies would have helped in healing of varicose ulcer. Even if healing of a non-healing ulcer in fifty days is a good prognosis, follow up and non-recurrence should be evaluated further as the causal effect of varicosities were still persisting in the patient. Any how this study paves a way to development of a treatment strategy which can be implemented in varicose ulcers with long duration that are not responding to conventional treatment adopted by Allopathic system of medicine.

CONCLUSION

In this particular case of chronic venous ulcer, AV/MLT along with internal medicines helped in healing in a short duration. The patient whose condition did not responded to Conventional Allopathic treatment got improved after Siddha medication. Hence, this case report is concluded that Siddha System can be considered for treating such cases after safety and efficacy studies.

Key points

Conditions like chronic venous ulcer which results in reduced mobility, poor quality of life and many other complications can be subjected to Siddha treatment modality.

Ramamurthy et al.,

Limitations of the study

Since this case report is based on single case which shows positive outcome this cannot be generalised. Further suitable clinical trials need to be conducted to assess efficacy.

ABSTRACT

A graph G with p points and q lines is known as a root square mean graph if it is possible to assign values to the points $y \in V$ with different values $f(y)$ from $1, 2, \dots, q + 1$ so that when every line $e = tr$ is labeled with $f(e = tr) = \left\lfloor \sqrt{\frac{f(t)^2 + f(r)^2}{2}} \right\rfloor$ or $\left\lceil \sqrt{\frac{f(t)^2 + f(r)^2}{2}} \right\rceil$ then the resulting line labels are different. f is known as root square mean labeling of G . In this paper, we prove that dragon related graphs such as $2(C_m @ P_n)^{(k)}$, $2(C_m @ P_n)^{(k)} @ K_{1,1}$, $2(C_m @ P_n)^{(k)} @ K_{1,2}$, $2(C_m @ P_n)^{(k)} @ K_{1,3}$ and $2(C_m @ P_n)^{(k)} @ K_3$ are all root square mean graphs.

Keywords: Graph, Cycle, Dragon, Path union, Root square mean labeling (rsm)

INTRODUCTION

In this paper we consider the graphs with p points and q lines Harary [2]. We refer to Gallain [1] for a survey of graph labeling. The notion of rsm labeling has been introduced by S.S.Sandhya et.al [6,7,8]. Meena.S and Mani. R [3,4] investigated this labeling for some cycle related graphs. In this paper, the rsm labeling of dragon related graphs were presented.

Definition 1.1:

A dragon is formed by attaching the end point of a path to a cycle. It is denoted by $C_m @ P_n$.

Meena and Mani

Definition 1.2:

Let E_1, E_2, \dots, E_m , $m \geq 2$ be m copies of a fixed graph G . The graph G got by joining a line between E_j and E_{j+1} for $j = 1, 2, \dots, m - 1$ is known as the path union of G .

Definition 1.3:

The k –path union of two dragons $C_m @ P_n$ is the graph got by connecting two points from two copies of $C_m @ P_n$ by a path P_k of length $k - 1$ and it is denoted by $2(C_m @ P_n)^{(k)}$.

Definition 1.4: [5]

$2(C_m @ P_n)^{(k)} @ K_{1,r}$ is the graph got by attaching the centre point of star $K_{1,r}$ at every point of path P_k .

Definition 1.5

$2(C_m @ P_n)^{(k)} @ K_3$ is the graph obtained by attaching K_3 at every point of path P_k .

Notations

1. Here $[h]$ is the least integer greater than or equal to h and $\lfloor h \rfloor$ is the greatest integer less than or equal to h .
2. rsm labeling - Root square mean labeling
3. rsm graph - Root square mean graph

MAIN RESULTS

The rsm labeling of dragon related graphs were presented in this paper.

Theorem 2.1

$2(C_m @ P_n)^{(k)}$ is a rsm graph.

Proof:

Let $G = 2(C_m @ P_n)^{(k)}$

Let a_1, a_2, \dots, a_m and b_1, b_2, \dots, b_m be the points of two cycles in G .

Let a'_1, a'_2, \dots, a'_n and b'_1, b'_2, \dots, b'_n be the points of the path P_n admit at end points of the two cycles C_m with $a_m = a'_1$ and $b_m = b'_1$

Let $a_1 = x_1, x_2, \dots, x_k = b_1$ be the points of the path P_k with $a_1 = x_1$ and $x_k = b_1$.

Let $V(G) = \{a_1, a_2, \dots, a_m, b_1, b_2, \dots, b_m, a'_1, a'_2, \dots, a'_n, b'_1, b'_2, \dots, b'_n, x_1, x_2, \dots, x_k\}$

$E(G) = \{a_j a_{j+1} / 1 \leq j \leq m - 1\} \cup \{b_j b_{j+1} / 1 \leq j \leq m - 1\}$

$\cup \{a'_j a'_{j+1} / 1 \leq j \leq n\} \cup \{b'_j b'_{j+1} / 1 \leq j \leq n\} \cup \{x_j x_{j+1} / 1 \leq j \leq k - 1\}$

$\cup \{a_1 a_m, b_1 b_m\}$

Define a mapping $f: V(G) \rightarrow \{1, 2, \dots, 2m + 2n + k - 3\}$ by

$f(a_j) = j$ for $1 \leq j \leq m$

$f(a'_{j+1}) = m + j + 1$ for $1 \leq j \leq n$

$f(x_2) = m + n + 3$

$f(x_3) = m + n + 2$

$f(x_4) = m + n + 1$

Meena and Mani

$$f(x_j) = m + n + j - 1 \quad \text{for } 5 \leq j \leq k - 1$$

$$f(b_j) = m + n + k + j - 2 \text{ for } 1 \leq j \leq m$$

$$f(b'_{j+1}) = 2m + n + k + j - 2 \text{ for } 1 \leq j \leq n$$

Then clearly the line values are different.
Thus $2(C_m @ P_n)^{(k)}$ is arsm graph.

Theorem 2.2

$2(C_m @ P_n)^{(k)} @ K_{1,1}$ is a rsm graph.

Proof:

Let $G = 2(C_m @ P_n)^{(k)} @ K_{1,1}$

Let a_1, a_2, \dots, a_m and b_1, b_2, \dots, b_m be the points of two cycles in G .

Let a'_1, a'_2, \dots, a'_n and b'_1, b'_2, \dots, b'_n be the points of the path P_n admit at end points of the two cycles C_m with $a_m = a'_1$ and $b_m = b'_1$

Let $a_1 = x_1, x_2, \dots, x_k = b_1$ be the points of the path P_k and let x'_1, x'_2, \dots, x'_k be the pendent points attached at x_1, x_2, \dots, x_k respectively with $a_1 = x_1$ and $b_1 = x_k$.

$$\text{Let } V(G) = \left\{ \begin{array}{l} a_1, a_2, \dots, a_m, b_1, b_2, \dots, b_m, a'_1, a'_2, \dots, a'_n, b'_1, b'_2, \dots, b'_n \\ x_1, x_2, \dots, x_k, x'_1, x'_2, \dots, x'_k \end{array} \right\}$$

$$E(G) = \{a_j a_{j+1} / 1 \leq j \leq m - 1\} \cup \{b_j b_{j+1} / 1 \leq j \leq m - 1\} \\ \cup \{a'_j a'_{j+1} / 1 \leq j \leq n\} \cup \{b'_j b'_{j+1} / 1 \leq j \leq n\} \cup \{x_j x_{j+1} / 1 \leq j \leq k - 1\} \\ \cup \{x_j x'_j / 2 \leq j \leq k - 1\} \cup \{a_1 a_m, b_1 b_m, a_1 x'_1, b_1 x'_k\}$$

Define a mapping $f: V(G) \rightarrow \{1, 2, \dots, 2m + 2n + 2k - 3\}$ by

$$f(a_j) = j + 1 \quad \text{for } 1 \leq j \leq m$$

$$f(a'_{j+1}) = m + j + 2 \quad \text{for } 1 \leq j \leq n$$

$$f(x_2) = m + n + 4$$

$$f(x_3) = m + n + 2$$

$$f(x_j) = m + n + 2j - 2 \quad \text{for } 4 \leq j \leq k$$

$$f(x'_1) = 1$$

$$f(x'_2) = m + n + 5$$

$$f(x'_3) = m + n + 3$$

$$f(x'_j) = m + n + 2j - 1 \quad \text{for } 4 \leq j \leq k$$

$$f(b_j) = m + n + 2k + j - 2 \text{ for } 2 \leq j \leq m$$

$$f(b'_{j+1}) = 2m + n + 2k + j - 2 \text{ for } 1 \leq j \leq n$$

Then clearly the line values are different.

Thus $2(C_m @ P_n)^{(k)} @ K_{1,1}$ is a rsm graph.

Meena and Mani

Theorem 2.3

$2(C_m @ P_n)^{(k)} @ K_{1,2}$ is a rsm graph.

Proof:

Let $G = 2(C_m @ P_n)^{(k)} @ K_{1,2}$

Let a_1, a_2, \dots, a_m and b_1, b_2, \dots, b_m be the points of two cycles in G .

Let a'_1, a'_2, \dots, a'_n and b'_1, b'_2, \dots, b'_n be the points of the path P_n admit at end points of the two cycles C_m with $a_m = a'_1$ and $b_m = b'_1$

Let $a_1 = x_1, x_2, \dots, x_k = b_1$ be the points of the path P_k and let x'_1, x'_2, \dots, x'_k and $x''_1, x''_2, \dots, x''_k$ be the pendent points attached at x_1, x_2, \dots, x_k respectively with $a_1 = x_1$ and $b_1 = x_k$.

$$\text{Let } V(G) = \left\{ \begin{matrix} a_1, a_2, \dots, a_m, b_1, b_2, \dots, b_m, a'_1, a'_2, \dots, a'_n, b'_1, b'_2, \dots, b'_n, \\ x_1, x_2, \dots, x_k, x'_1, x'_2, \dots, x'_k, x''_1, x''_2, \dots, x''_k \end{matrix} \right\}$$

$$\begin{aligned} E(G) &= \{a_j a_{j+1} / 1 \leq j \leq m-1\} \cup \{b_j b_{j+1} / 1 \leq j \leq m-1\} \\ &\cup \{a'_j a'_{j+1} / 1 \leq j \leq n\} \cup \{b'_j b'_{j+1} / 1 \leq j \leq n\} \cup \{x_j x_{j+1} / 1 \leq j \leq k-1\} \\ &\cup \{x_j x'_j / 2 \leq j \leq k-1\} \cup \{x_j x''_j / 2 \leq j \leq k-1\} \\ &\cup \{a_1 a_m, b_1 b_m, a_1 x'_1, a_1 x''_1, b_1 x'_k, b_1 x''_k\} \end{aligned}$$

Define a mapping $f: V(G) \rightarrow \{1, 2, \dots, 2m + 2n + 3k - 3\}$ by

$$\begin{aligned} f(a_1) &= f(x_1) = 2 \\ f(a_j) &= j + 2 && \text{for } 2 \leq j \leq m \\ f(a'_{j+1}) &= m + j + 3 && \text{for } 1 \leq j \leq n \\ f(x_2) &= m + n + 7 \\ f(x_3) &= m + n + 4 \\ f(x_j) &= m + n + 3j - 2 && \text{for } 4 \leq j \leq k \\ f(x'_1) &= 1 \\ f(x''_1) &= 3 \\ f(x'_2) &= m + n + 6 \\ f(x''_2) &= m + n + 8 \\ f(x'_3) &= m + n + 3 \\ f(x''_3) &= m + n + 5 \\ f(x'_j) &= m + n + 3j - 3 && \text{for } 4 \leq j \leq k \\ f(x''_j) &= m + n + 3j - 1 && \text{for } 4 \leq j \leq k \\ f(b_j) &= m + n + 3k + j - 2 && \text{for } 2 \leq j \leq m \\ f(b'_{j+1}) &= 2m + n + 3k + j - 2 && \text{for } 1 \leq j \leq n \end{aligned}$$

Then clearly the line values are different.

Thus $2(C_m @ P_n)^{(k)} @ K_{1,2}$ is a rsm graph.

Meena and Mani

Theorem 2.4

$2(C_m @ P_n)^{(k)} @ K_{1,3}$ is a rsm graph.

Proof:

Let $G = 2(C_m @ P_n)^{(k)} @ K_{1,3}$

Let a_1, a_2, \dots, a_m and b_1, b_2, \dots, b_m be the points of two cycles C_m in G .

Let a'_1, a'_2, \dots, a'_n and b'_1, b'_2, \dots, b'_n be the points of the path P_n admit at end points of the two cycles C_m with $a_m = a'_1$ and $b_m = b'_1$

Let $a_1 = x_1, x_2, \dots, x_k = b_1$ be the points of the path P_k and let $x'_1, x'_2, \dots, x'_k, x''_1, x''_2, \dots, x''_k$ and $x'''_1, x'''_2, \dots, x'''_k$ be the pendent vertices attached at x_1, x_2, \dots, x_k respectively with $a_1 = x_1$ and $b_1 = x_k$.

$$\text{Let } V(G) = \{a_1, a_2, \dots, a_m, b_1, b_2, \dots, b_m, a'_1, a'_2, \dots, a'_n, b'_1, b'_2, \dots, b'_n, \\ x_1, x_2, \dots, x_k, x'_1, x'_2, \dots, x'_k, x''_1, x''_2, \dots, x''_k, x'''_1, x'''_2, \dots, x'''_k\}$$

$$E(G) = \{a_j a_{j+1} / 1 \leq j \leq m - 1\} \cup \{b_j b_{j+1} / 1 \leq j \leq m - 1\} \\ \cup \{a'_j a'_{j+1} / 1 \leq j \leq n\} \cup \{b'_j b'_{j+1} / 1 \leq j \leq n\} \cup \{x_j x_{j+1} / 1 \leq j \leq k - 1\} \\ \cup \{x_j x'_j / 2 \leq j \leq k - 1\} \cup \{x_j x''_j / 2 \leq j \leq k - 1\} \\ \cup \{x_j x'''_j / 2 \leq j \leq k - 1\} \cup \left\{ \begin{matrix} a_1 a_m, b_1 b_m, a_1 x'_1, a_1 x''_1, a_1 x'''_1, \\ b_1 x'_k, b_1 x''_k, b_1 x'''_k \end{matrix} \right\}$$

Define a mapping $f: V(G) \rightarrow \{1, 2, \dots, 2m + 2n + 4k - 2\}$ by

$$f(a_1) = f(x_1) = 2 \\ f(a_j) = j + 3 \quad \text{for } 2 \leq j \leq m \\ f(a'_{j+1}) = m + j + 4 \quad \text{for } 1 \leq j \leq n \\ f(x_2) = m + n + 10 \\ f(x_3) = m + n + 6 \\ f(x_j) = m + n + 4j - 2 \quad \text{for } 4 \leq j \leq k \\ f(x'_1) = 1 \\ f(x''_1) = 3 \\ f(x'''_1) = 4 \\ f(x'_2) = m + n + 9 \\ f(x''_2) = m + n + 11 \\ f(x'''_2) = m + n + 12 \\ f(x'_3) = m + n + 5 \\ f(x''_3) = m + n + 7 \\ f(x'''_3) = m + n + 8 \\ f(x'_j) = m + n + 4j - 3 \quad \text{for } 4 \leq j \leq k \\ f(x''_j) = m + n + 4j - 1 \quad \text{for } 4 \leq j \leq k \\ f(x'''_j) = m + n + 4j \quad \text{for } 4 \leq j \leq k$$

Meena and Mani

$$f(b_j) = m + n + 4k + j - 1 \quad \text{for } 2 \leq j \leq m$$

$$f(b'_{j+1}) = 2m + n + 4k + j - 1 \quad \text{for } 1 \leq j \leq n$$

Then clearly the line values are different.

Thus $2(C_m @ P_n)^{(k)} @ K_{1,3}$ is a rsm graph.

Theorem 2.5

$2(C_m @ P_n)^{(k)} @ K_3$ is a rsm graph.

Proof:

Let $G = 2(C_m @ P_n)^{(k)} @ K_3$

Let a_1, a_2, \dots, a_m and b_1, b_2, \dots, b_m be the points of two cycles C_m in G .

Let a'_1, a'_2, \dots, a'_n and b'_1, b'_2, \dots, b'_n be the points of the path P_n admit at end points of the two cycles C_m with $a_m = a'_1$ and $b_m = b'_1$

Let $a_1 = x_1, x_2, \dots, x_k = b_1$ be the points of the path P_k and let x'_1, x'_2, \dots, x'_k and $x''_1, x''_2, \dots, x''_k$ be the pendent points attached at x_1, x_2, \dots, x_k respectively with $a_1 = x_1$ and $b_1 = x_k$.

$$V(G) = \{a_1, a_2, \dots, a_m, b_1, b_2, \dots, b_m, a'_1, a'_2, \dots, a'_n, b'_1, b'_2, \dots, b'_n, x_1, x_2, \dots, x_k, x'_1, x'_2, \dots, x'_k, x''_1, x''_2, \dots, x''_k\}$$

$$E(G) = \{a_j a_{j+1} / 1 \leq j \leq m - 1\} \cup \{b_j b_{j+1} / 1 \leq j \leq m - 1\}$$

$$\cup \{a'_j a'_{j+1} / 1 \leq j \leq n\} \cup \{b'_j b'_{j+1} / 1 \leq j \leq n\} \cup \{x_j x_{j+1} / 1 \leq j \leq k - 1\}$$

$$\cup \{x_j x'_j / 2 \leq j \leq k - 1\} \cup \{x_j x''_j / 2 \leq j \leq k - 1\}$$

$$\{x'_j x''_j / 1 \leq j \leq k\} \cup \{a_1 a_m, b_1 b_m, a_1 x'_1, a_1 x''_1, b_1 x'_k, b_1 x''_k\}$$

Define a mapping $f: V(G) \rightarrow \{1, 2, \dots, 2m + 2n + 4k - 3\}$ by

$$f(a_1) = f(x_1) = 2$$

$$f(a_j) = j + 3 \quad \text{for } 2 \leq j \leq m$$

$$f(a'_{j+1}) = m + j + 4 \quad \text{for } 1 \leq j \leq n$$

$$f(x_2) = m + n + 9$$

$$f(x_3) = m + n + 5$$

$$f(x_j) = m + n + 4j - 3 \quad \text{for } 4 \leq j \leq k$$

$$f(x'_1) = 1$$

$$f(x''_1) = 3$$

$$f(x'_2) = m + n + 8$$

$$f(x''_2) = m + n + 11$$

$$f(x'_3) = m + n + 4$$

$$f(x''_3) = m + n + 7$$

$$f(x'_j) = m + n + 4j - 4 \quad \text{for } 4 \leq j \leq k$$

$$f(x''_j) = m + n + 4j - 1 \quad \text{for } 4 \leq j \leq k$$

$$f(b_j) = m + n + 4k + j - 2 \quad \text{for } 2 \leq j \leq m$$

$$f(b'_{j+1}) = 2m + n + 4k + j - 2 \quad \text{for } 1 \leq j \leq n$$

Then clearly the line values are different.

Thus $2(C_m @ P_n)^{(k)} @ K_3$ is a rsm graph.

CONCLUSION

It is very interesting to find whether a graph admits rsm labeling or not. We present five results on rsm labeling of dragon related graphs. The investigation about similar results for various graphs families is an open problem.

ABSTRACT

Lamiaceae family encompasses a significant number of species that have great potential for their prospective use in the pharmaceutical sector. The objectives were to ascertain how temperature variations influenced the composition of the essential oils of *Plectranthus amboinicus* and *Ocimum sanctum*; To model the relationship between essential oil composition, concentration and yield with the temperature parameter, and attempt to identify the components that constitute each essential oil sample. The aerial parts of *Plectranthus amboinicus* and *Ocimum sanctum* were collected, authenticated and subjected for hydrodistillation. The essential oil collected and isolated were assessed by means of Thin Layer Chromatography (TLC) and Gas Chromatography-Mass Spectroscopy (GC-MS) analysis. The component spectrums were compared to a database of known component spectrums based on mass spectral data from the NIST library. A Comparative analysis on the obtained chromatograms were applied to signify the differences between them. The identification of the peaks and Retention Times (RT) in the obtained Total Ion Chromatograms (TIC) were figured out. There were intended temperature changes during the extraction process, which signifies a slight difference in the TIC peaks upon a side-to-side comparison. This study postulates that the variation in temperature during the course of hydrodistillation may have an impact on the concentration, composition, or yield of essential oils of *Ocimum sanctum* and *Plectranthus amboinicus*. The prospect of modeling the relationship between essential

59209

**Natarajan et al.,**

oil concentration, composition, and yield with the temperature variation parameter during the course of distillation is suggested for further research and experimental validation.

Keywords: *Ocimum sanctum*; *Plectranthus amboinicus*; hydrodistillation; GC-MS, Total Ion Chromatogram;

Key Messages: This study hypothesises that temperature changes during hydrodistillation may affect the concentration, composition, or production of essential oils of *Ocimum sanctum* and *Plectranthus amboinicus*.

INTRODUCTION

With at least 200 genera and 4000 species, many of which are medicinal, the Lamiaceae (syn. Labiatae) herb family is one of the most abundant groups of essential oils bearing plants [1, 2]. Several components found in Lamiaceae, such as phenolic compounds, di- and triterpenes, and essential oils, are considered to be accountable for the plant family's curative efficacy [3, 4]. Bronchitis and intestinal problems have both been addressed using essential oils derived from Lamiaceae species [5]. With more than 150 species, the genus *Ocimum* is widespread and grows in temperate regions all throughout the world [6-8]. Native medicine classifies the plant's aerial portions as antispasmodic, stomachic, and carminative [9, 10]. *Ocimum sanctum* has been shown to have antiviral efficacy against HSV, HIV, H9N2, NDV, BHV, and other viruses [11]. According to the toxicity studies, *O. sanctum* is an herb that is safe for human use and is not toxic [12, 13]. Eugenol, Methyleugenol, Thymol, Carvacrol, Caryophyllene, Apigenin, Luteolin, Apigenin-7-O-glucuronide, Orientin, and Molludistin are some of the additional phytoconstituents found in *O. sanctum* Linn. Leaves essential oil [14]. The Lamiaceae family includes the Mexican mint *Plectranthus amboinicus*, also known as country borage in English. Its numerous pharmacological effects, including antiviral effects, have been documented [15]. *P. amboinicus* essential oil exhibits antibacterial and antifungal action as well [16–18]. The consideration and use of phytochemicals in the preparation of potential antiviral agents against SARS-CoV, food supplements or nutraceuticals, functional food ingredients, food additives, pharmaceuticals, and cosmetics has made the extraction and purification of bioactive compounds from natural sources crucial in recent years [19-21]. As a result of this varied utilisation of bioactives, new bioresources have been discovered and their production has gained scientific and industrial relevance [22].

The essential oil content is significant in relation to the expected desired components, the economics of production, and the formulation of novel therapeutic agents as far as modification, enhancement, and the implications of selectivity are concerned. This is because the essential oil composition influences its biological activity [23]. There are currently few in-depth reports on the impact of temperature and distillation duration changes on essential oil yield and composition. This study consequently hypothesized that the essential oil yield, concentration, and composition of *O. sanctum* and *P. amboinicus* could be significantly influenced by a small temperature variation as the hydrodistillation parameters are altered. The objectives of this study were to evaluate the effect of temperature differences (80°C, 90°C, and 100°C) contributing to a change in essential oil composition of the *O. sanctum* and *P. amboinicus* essential oils (both combined and individually distilled essential oils of respective plant resources) and model the relationship between essential oil yield and composition with the temperature parameter, along with an attempt to identify components constituting the essential oil (EO) of *O. sanctum* and *P. amboinicus*.

Natarajan *et al.*,

MATERIAL AND METHODS

Collection and authentication of plant material

The economically important parts of *P. amboinicus* and *O. sanctum* were collected from the natural habitats of the outskirts of Bengaluru, Karnataka, India. The species were identified, and the herbarium voucher specimens were prepared and deposited at the Department of Pharmacognosy, T. John College of Pharmacy, Bengaluru. The selected plant parts (aerial parts) were washed three times thoroughly with running tap water to remove soil particles and adhered debris, and finally with sterile distilled water. The valuable parts were cut into desirable sizes and subjected to immediate distillation.

Isolation of volatile oil

For essential oil extraction, the fresh aerial parts (500 g) of a combination of *O. sanctum* (250 g) and *P. amboinicus* (250 g) collected during August–September 2021 [24] were put in a round bottom flask and subjected to hydrodistillation [25] in a manual setup in the Clevenger apparatus at 80°C and 90°C, respectively. After about three hours, the extraction was obtained in the collecting column; the quantity of the oil is read directly from the graduated column and recorded. Similarly, the distillation procedure was carried out for *O. sanctum* aerial parts (500 g) and *P. amboinicus* (500 g) individually, without combination, at 80°C and 100 °C separately. Accordingly, the Essential oil (EO) in all samples was isolated. The collected volatile oil was dried over anhydrous sodium sulphate and stored at 4 °C in the tightly closed, dark vials for further investigations.

Thin Layer Chromatography

TLC investigations were performed on the EO of the aerial sections of *O. sanctum* and *P. amboinicus* in order to identify the presence of various chemicals based on chemical tests [26], [27]. With a few adjustments, thin layer chromatography (TLC) was carried out in accordance with the procedure outlined in the WHO standards. In pre-coated fluorescent silica gel 60A on 0.2 mm-thick aluminum plates (Merck KGaA, Darmstadt, Germany), 5 µL of briefly concentrated filtrate extract was spotted. The spotting effect was seen with UV 254 and subsequently sprayed with vanillin-sulphuric acid reagent, and the R_f values for each spot were computed [28]. Plates were developed in toluene, n-hexane: ethyl acetate (9:1), toluene: ethyl acetate (9:1), and toluene: chloroform (5:5).

Gas chromatography-mass spectroscopy analysis

The analysis of the essential oils were performed using the Clarus 680 GC employed a fused silica column, packed with Elite-5MS (5% biphenyl 95% dimethylpolysiloxane, 30 m × 0.25 mm ID × 250µm df) and the components were separated using Helium as carrier gas at a constant flow of 2 ml/min. The injector temperature was set at 250°C during the chromatographic run. The 2µL of extract sample was injected into the instrument; the oven temperature was as follows: 50 °C (2 min); followed by 150 °C at the rate of 15 °C min⁻¹; and 150 °C, where it was held for 1min and then followed by 240°C at the rate of 25°C min⁻¹; it was held for 10 min. The mass detector conditions were: Inlet line temperature 250 °C; ion source temperature 230 °C; and ionization mode electron impact at 70 eV, a scan time 0.2 sec and scan interval of 0.1 sec. The fragments ranged from 40 to 600 Da. The spectrums of the components were compared with the database of spectrum of known components stored in the GC-MS NIST (2014) library.

Chemical investigation of essential oils

Identification of individual component was assigned by retention time comparison with authentic components and oil of known composition and by mass spectra with those obtained from Wiley/NIST/Pfleger library spectra as well as with literature data. Quantitative determinations were made by relating respective peak areas to TIC areas from the GC-MS.

RESULTS AND DISCUSSION

TLC

An attempt was made to separate the individual chemical constituents of the six essential oil samples by chromatography. Firstly, they were subjected to TLC. A number of solvent systems with low to high polarity were taken into consideration. The solvent system, which showed good resolution, was utilized. The results are tabulated in Table 1.

GC-MS

The obtained result from the aerial part essential oil samples analysis with hydro distillation is tabulated in Tables 2-7. Based on mass spectral data from the NIST library, peak identification attempts were made. Two match factors were utilized to evaluate the similarity between the libraries and measured mass spectra. The match factor (MF), which assessed how well the library equivalent matched the entire mass spectrum of the selected peak in chromatography, and the reverse match factor (RMF), which described how closely the explicit masses in the library equivalent matched the masses measured for the peak, were the similarity factors. In line with other investigations [29], positive identification was predicated on MF and RMF values over 650 and 800, respectively. The tabulation of the peak spectra is clearly intended to take into account RMF and MF components. Consideration of RMF and MF factors is unambiguously implied for the tabulation of the peak spectra.

The main emphasis for conducting GC/MS, apart from the identification of molecules, was with respect to the differentiation of the obtained total ion chromatograms as far as the peaks and RT are concerned. The fact that there were implied differences in temperature during the course of extraction signifies a slight difference in the peaks obtained in TIC. A combined distillation of *O. sanctum* and *P. amboinicus* aerial parts at 80°C (OsPa80) gave four peaks. Similarly, four peaks were obtained when the same combination of *O. sanctum* and *P. amboinicus* was distilled at 90°C (OsPa90). But the difference in temperature had impacted the difference in peak intensities, as OsPa80's second peak at retention time 9.11 was more intense than the second peak of OsPa90 at retention time 9.13. The third peak of OsPa80 (RT =9.33) was higher than that of the third peak of OsPa90 (RT =9.34) in significant terms. The elevation of the fourth peak is more prominent in the case of OsPa90 (RT =10.02) than that of the peak obtained in OsPa80 (RT=10.01). This infers a point where a 10°C elevation in the distillation temperature might impact the component's presence in significant terms. Figure 1 provides a side to side comparison of the *O. sanctum* and *P. amboinicus* combined and distilled EO sample based chromatograms.

In the case of *O. sanctum* volatile oil extracted alone at 80°C (Os80) and 100°C (Os100), respectively (not a combined extraction with *P. amboinicus*), the third and fourth peaks of Os100 (respective retention times 9.33 and 10.00 in the chromatogram) were significantly intensified than those of Os80 (respective retention times 9.37 and 10.03 in the chromatogram). This indicates that the component responsible for the third and fourth peaks was greater when the distillation temperature was 100°C. Figure 2 provides a side to side comparison of the *O. sanctum* EO sample based chromatograms. Similarly, the EOs isolated from *P. amboinicus* and distilled at 80°C (Os80) and 100°C (Os100) (Figure 3) were used for comparative analysis with the combined extraction samples (OsPa80 and OsPa90).

According to the literature reviews, α -Cubebene, α -Copaene, β -Cubebene, β -Copaene, Methyl eugenol, cis- β -Farnesene, Germacrene D, cis-2-Methoxycinnamic acid, Alpha humulene, Beta caryophyllene, Carvacrol, Eugenol, Para cymene, thymol, etc., are the components of major emphasis that are well established in many phytochemical literary works [15, 30-51]. p-Cymene is known to enhance Carvacrol's pharmacological effects [52]. According to the results of one study, it was hypothesized that γ -Terpinene serves as the initial monoterpene substrate for the production of Thymol and its chemical isomer, Carvacrol, and that aromatic p-Cymene serves as an intermediary (Figure 4).

**Natarajan et al.,**

Another emphasis on the preferring of these components in the present study was imputable to their abundance in concentration and yield after the plant resource's successful extraction, as per literature. So during the course of GC/MS analysis, our primary aim was to identify and report the phytoconstituents that comprise the majority of the essential oils. Accordingly, the most probable components were figured out on the basis of their abundance of hit molecule fragments in the mass spectrometer. Identification of individual components was assigned by retention time comparison with authentic components and oils of known composition from other literature data and by mass spectral comparison with those obtained from some library spectra as well as from literature data. Variation in the chemical composition of EOs, in particular, and extracts of medicinal plants may be observed due to the origin, the environmental conditions, and the developmental stage of the collected plant materials [53]. This in particular led to an approach wherein the distilled essential oils were stored below 4 °C, assuming the fact of one study that there was an increasing trend in the quantities of Thymol and Carvacrol by the storage time at room temperature [46]. Phytochemical variation in essential oils may also be related to the time of botanical material collection, region, soil, and seasons as well [54]. As far as cultivation factors were concerned for this study, the months of September and October were suitably preferred for their harvest and their subsequent oil extraction. The crop was harvested at full bloom stage, and it was not desired to harvest the crop if it had rained the previous day in order to obtain maximum essential oil yield and better quality oil. Harvesting was done on bright, sunny days with the intent of obtaining high-quality oil [24]. Although the cultivation factors are well established for *O. sanctum*, in general, very meagre information is available on the methods and practices used for commercial cultivation and harvesting of *P. amboinicus* [15].

CONCLUSION

The study identified compounds such as p-Cymene, γ -Terpinene, Thymol, Carvacrol, β -Caryophyllene, α -Humulene, γ -Gurjunene, Ylangene, Isohomoganol, Germacrene D, α -Bulnesene, Heneicosane, and Nonadecane from the aforementioned plant resources. Most of these compounds hold significance in pharmaceutical applications and thereby should be prioritised for future studies. *O. sanctum* and *P. amboinicus* were considered the key sources of such phytoconstituents due to their easy availability and widespread pharmaceutical properties. Upon investigation of essential oil distillation at various temperatures, this study hereby postulates that the temperature difference might contribute to a change in the EO composition and concentration of the *O. sanctum* and *P. amboinicus* essential oils (both combined and individually distilled essential oils of respective plant resources). This study also emphasizes the importance of cultivation and harvesting strategies and their subsequent handling and storage conditions of essential oils as the literature review signifies the influence of certain aforementioned factors. Hereby, it is suggestive to go for further investigation and experimental validation to probe into the possibilities of modelling the relationship between essential oil concentration, composition and yield with the temperature variation parameter during the course of distillation.

ABSTRACT

In this review we discuss about a phenolic substance called p-Coumaric acid (4-hydroxycinnamic acid) is a cinnamic acid derivative that can be serves as a precursor of other phenolic compounds, and exists either in free or conjugated form in plants, variety of fruits and vegetables. This review deals with Sources, physiochemical properties, Structure activity relationship (SAR), Bioavailability and Pharmacokinetics of P Coumaric acid. P-Coumaric acid has very low toxicity profile with wide range of pharmacological effects includes: antioxidant effect, Antimelanogenic effect, Antimicrobial activity, Gastric healing, Anti-inflammatory, Antidiabetic, Anticancer, Antihypertensive, Hepatoprotective, Nephroprotective, Neuroprotective, Immunomodulator, Antiplatelet and Analgesic activity. However, p-Coumaric acid shows high biological activity due to its higher bioavailability and due to hydroxyl and carboxylate groups attached to phenolic ring.

Keywords: P-Coumaric acid, hydroxycinnamic acid, Antioxidant, Pharmacological activities

INTRODUCTION

p-Coumaric (p-CA) acid is phenolic acid which belong to family hydroxycinnamic acid. O-coumaric, m-coumaric, and p-coumaric (p-CA) acids are the three isomers that are exists.[1]. p-coumaric acid is one of the most commonly occurring isomer in nature.[2] The position of the hydroxyl group in the aromatic ring determines how these three molecules differ from one another. p-Coumaric acid, also known as 4-hydroxycinnamic acid, is a phenylpropanoic

Devendra S. Shirode and Samiksha S. Deokar

acid produced by the shikimate metabolic pathway from the precursor aromatic amino acids tyrosine and phenylalanine.[3-4] Tyrosine is changed into p-CA by the enzyme tyrosine ammonia-lyase in plants and mushrooms. p-CA plays a central role in secondary metabolism because it can be subsequently transformed to phenolic acids (e.g. caffeic acid, ferulic acid, chlorogenic acid and sinapic acid), flavonoids, lignin precursors and other secondary metabolites.[5-6]

Shikmic pathway: [7-11]

Sources (Fig.1)

p-Coumaric acid is a phytochemical and nutraceutical that is present in a number of Vegetables (beans, potato, carrots, onions), fruits (apples, pears, grapes, orange, tomato, strawberries), cereals, and Mushroom species. [2][12][6][5][13] It seems that the pericarp fractions in barley, wheat, oat, and corn are the fractions richest in p-Coumaric acid among the many types of cereals. [2]

Chemical Structure of p-Coumaric acid: [14-17][11]

Structure activity relationship of p-CA

In p-coumaric acid, the insertion of an ethylenic group between a phenyl ring containing a p-hydroxyl group and the carboxylate group greatly enhances the reducing abilities of the OH group. [15] [3] Trans-Cinnamic acid in which the absence of the phenolic OH group in the structure reduces its xanthine oxidase inhibition activity as compared with caffeic acid. Presence of OH in Meta position of phenol i.e. m-coumaric acid ring gives strongest xanthine oxidase inhibition [20].

Bioavailability and Pharmacokinetic

The bioavailability of p-CA is depend upon its free p- CA and its conjugates, also absorption rate and metabolic Pathways may differ [21] p-Coumaric acid was easily absorbed in the intestines due to its low molecular weight. In accordance with prior studies, p-Coumaric acid had a comparatively high bioavailability of about 74%. [22]. p-Coumaric acid shows higher bioavailability than other conjugates of hydrocinnamates. Rats' colon, stomach, jejunum, and ileum may all be sites for p-CA absorption, according to in situ or ex vivo absorption models. p-CA shows highest absorption in jejunum [23]. After absorption from the gastrointestinal tract, these molecules suffer conjugation reactions causing several changes in their initial structure, and circulate in human plasma in their conjugated forms, such as glucuronide, methylated and sulphated derivatives [13]

PHARMACOLOGICAL ACTIVITIES

Antioxidant activity

Antioxidant activity is defined as the ability of a compound to inhibit oxidative degradation, such as lipid peroxidation. Phenolic are the main antioxidant components of food [24]. As p-CA is phenolic compound, the

**Devendra S. Shirode and Samiksha S. Deokar**

antioxidant properties of p-CA are due to the presence of the phenyl hydroxyl group [5]. Free radicals may contribute to a variety of long-term health issues, including cancer and cardiovascular illnesses. Phenolic compounds are crucial for the prevention or treatment of many chronic diseases because they act as a reducing agent and a free radical scavenger [2]. According to research done by Reblova, all phenolic acids' antioxidant capacities decline as temperature rises, and none of them showed any antioxidant capacity at 150 °C [25]. p-CA showed ability to modulate nuclear factor kappa B (NF- κ B) activity [26] as well as it reduces lipid peroxidation, cholesterol oxidation and low-density lipoprotein resistance [6][27].

The improved lipophilicity and the decreased ionization potential of the lipid derivatives are the major factors that lead to the changes of antioxidant efficacy of p-Coumaric acid. The good antioxidant activity of p-Coumaric acid used as potential ingredients in functional foods, supplements, or cosmetics for health promotion and disease risk reduction [28].

Antimelanogenic activity

p-Coumaric acid inhibits human Tyrosinase (TYR) in a competitive manner and as p-Coumaric acid has similar structure as that of L-Tyrosine. p-CA suppresses human TYR significantly more potently than arbutin or kojic acid. p-CA not only suppresses cellular melanogenesis but also guards against human epidermal melanocytes losing viability from UV exposure. [29]. By suppressing the production of tyrosinase, the p-CA appeared to lessen the melanogenesis induced by α -MSH. [30] There are some p-CA containing plants which has antimelanogenic effect such as *Rhodiola sachalinensis* catechin [31], *Sasa quelpaertensis* [30], *Arthrophytum scoparium* [32], *Panax ginseng* [33], *Phyllostachys nigra* [34], *Kummerowia striata* [35], *Pradosia mutisii* [36].

Antimicrobial activities

The antibacterial activity of p-Coumaric acid was evaluated against Gram-positive and Gram-negative pathogenic bacterium. [37] Alves et al. reported that p-CA exert no inhibitory effect on six Gram-positive bacteria (*S. aureus*, *Staphylococcus epidermidis*, *Enterococcus faecalis*, *L. monocytogenes* and *Streptococcus agalactiae*) and five Gram-negative bacteria (*E. coli*, *Proteus mirabilis*, *Morganella morganii*, *Pasteurella multocida* and *Neisseria gonorrhoeae*). [38] According to literature survey the results showed that p-CA killed pathogenic bacterial strains by inducing irreversible permeability changes in the cell membrane (which causes inability to maintain cytoplasmic macromolecules) and by binding to DNA, which inhibited cellular functions. The highest antimicrobial activity was seen against *Shigella dysenteriae*. The impact of p-CA on biofilms created by *E. coli* on the internal surface of urinary catheters was examined by Kot et al. [39]

Gastric healing property

Thaise Boeing studied that, as p-Coumaric acid is one of the major components of the *B. dracunculifolia* exerts Gastric healing effect. [40][41]. This positive effect was also linked to higher levels of mucin [42][41] and reduced glutathione [43], lower levels of lipid hydroperoxides [44], and higher superoxide dismutase [41][40] and catalase activities without impairing myeloperoxidase activity in the gastric tissue. [40]. De barrows performed antiulcer to established three models and found that oral administration of 250 mg/kg of p-CA effectively inhibits the lesion area of gastric mucus of ethanol-induced ulcer, indomethacin-induced gastric ulcers, and stress-induced gastric ulcers by increasing prostaglandin synthesis [45].

Inflammatory Bowel Disease

p-CA provides the protection to the IBD by regulating the variety and composition of the local microbiota, p-CA including *Sasa quelpaertensis* leaf extract has been shown to protect mice from the microbial dysbiosis associated to colitis. [46]. According to kai wang 2019, *Prunella vulgaris* protected rats' intestinal microbial communities from dextran sulphate sodium-induced ulcerative colitis. [47]

**Devendra S. Shirode and Samiksha S. Deokar****Hepato and Nephron Protective effect**

Using an in vivo model, they looked into how p-CA protects against the hepatotoxicity caused by N-acetyl-p-aminophenol (AAP) as well as the underlying processes. He discovered that p-CA reduces serum alanine aminotransferase (ALT) and aspartate aminotransferase (AST) activity as well as the hepatotoxicity caused by AAP [48]. When cisplatin was administered, the levels of creatinine, urea-nitrogen, AST, ALT, Alkaline phosphatase (ALP), Malondialdehyde (MDA), and tissue damage increased, whereas Ferric Reducing Antioxidant Power (FRAP) reduced. The use of p-Coumaric acid resulted in reduced tissue damage and MDA levels as well as total or relative improvements in the functional parameters of the kidney and liver. p-Coumaric acid was observed to raise the FRAP level [49]. p-Coumaric acid has shown to be protective against the detrimental consequences of cisplatin on the liver and kidneys [50].

Diabetes mellitus

According to Venkatesan Amalan 2015 [51], p-Coumaric acid treatment (100 mg/kg b.wt) showed protective benefits against altered blood sugar and insulin levels. Due to its hypoglycemic and free radical-scavenging activities [52], p-Coumaric acid may be the source of the reported preventative effects.

p-CA exerts protective action against diabetes mellitus by following mechanism :

→ Glucosidase inhibition slows down the intestinal absorption of dietary carbohydrates. Inhibition of α -glucosidase postpones the breakdown of starch or sucrose lowering the absorption of glucose and raising postprandial hyperglycemia [53].

→ Aldose reductase is inhibited by p-CA and its conjugates. In order to prevent or treat chronic diabetic problems such as neuropathy, nephropathy, cataracts, retinopathy, accelerated atherosclerosis, and increased cardiovascular risk, it is essential to block this enzyme [54].

→ p-CA activates AMP-activated protein kinase, an enzyme that regulates energy balance by boosting glucose absorption, β -oxidation of fatty acids, and triacylglycerol production [55].

→ p-CA inhibits gluconeogenesis which serves as a target for Type 2 Diabetes mellitus [56].

Anticancer activities

In an in-vivo model of colon cancer, p-CA had an antiproliferative effect, and Sharma S.H. 2018 also investigated if p-CA enhances rat detoxification potential by regulating the Nrf2's cytoplasm to nuclear ratio [57]. The protective effect of p-CA against DMH-induced colon carcinogenesis targeting the beginning stage of carcinogenesis [58] compared to other possible anticancer phytochemicals, p-CA reduced the proliferation of colon cancer cell lines at a comparatively high concentration [59].

M.G. Jang et al. 2019 previously demonstrated that p-CA, with an IC₅₀ of roughly 2 mM, significantly suppressed the development of the SNU-16 gastric cancer cell line [60]. p-CA might be a useful treatment and preventative measure for colorectal cancer. [61] An important transcriptional regulator of many genes involved in oxidative stress and inflammatory reactions is nuclear factor kappa B (NF- κ B) [62]. Inducible nitric oxide synthase (iNOS), cyclooxygenase-2 (COX-2), and pro-inflammatory cytokines including interleukins (ILs) and tumor necrosis factor-alpha (TNF-alpha) are only a few of the enzymes that the active NF- κ B stimulates to produce [63]. By regulating inflammation and oxidative stress, triggering apoptosis, stopping the progression of the cell cycle, altering the pathways that regulate cellular proliferation, and improving susceptibility to chemotherapy, p-CA can exert anticancer action [61].

IMMUNOMODULATOR**Antigout**

Gout is an extreme condition of inflammatory arthritis that flares up frequently. It is brought on by deposits of monosodium urate (MSU) crystals in the joints. The intraperitoneal treatment of p-CA at 100 mg/kg body weight effectively lowers paw thickness in a gout rat model caused by monosodium urate crystal. [64]

**Devendra S. Shirode and Samiksha S. Deokar****Arthritis**

Rheumatoid arthritis (RA) is a heterogeneous systemic autoimmune disease that impairs the quality of life of patients. Hao Zhu studied the arthritis model of Rat, In this *Oldenlandia diffusa* (OD) may exert its anti-inflammatory effects via its active ingredient p-CA, in a mechanism that included suppression of inflammatory cell infiltration, as well as the levels of TNF- α and IL-6.[65]

BEHAVIORAL DISEASE**Mental disorder**

Neuronal malfunction and mental disorders can be brought on by oxidative stress and neurotoxicity brought on by corticosterone (CORT). By controlling phosphorylation levels of ERK1/2, and mTOR-mediated cAMP response element-binding protein CREB phosphorylation, p-coumaric acid, a potential neuroprotective component of *Vaccinium bracteatum* leaves (NET-D1602), can guard against CORT-induced neurotoxicity [66].

Alzheimer's disease

In a rat model of Alzheimer's disease given by Shahab Ghaderi 2022, p-coumaric acid (100 mg/kg/day ; P.O.) prevents neuronal loss and reduces both cognitive and non-cognitive disturbances due to its anti-oxidative and anti-inflammatory properties. [67]

Anxiolytic

Gamma aminobutyric acid (GABA) is the principal inhibitory neurotransmitter in the central nervous system, and activation of the GABA type A (GABA-A) receptor conveys anxiolytic and anticonvulsive effects. [68] Arjan Scheepens reported that p-Coumaric Acid Activates the GABA-A Receptor in vitro, and it is reasonably well absorbed following oral consumption in man with no toxicity, that means that it is orally Anxiolytic In Vivo.[69]

Inhibition of platelet aggregation

In vivo and in vitro investigations revealed that the dietary phenolic component p-CA acts as a systemic antioxidant and controls platelet aggregation through both COX-dependent and independent pathways.[70] Platelet aggregation is associated with COX pathway inhibition, which lowers the production of TXB₂, a strong aggregating and vasoconstricting agent.[71]

CONCLUSION

p-CA plays a central role in secondary metabolism in plants and mushrooms. p-CA exists in free form (low concentration) and conjugate form (high concentration) in plants. It shows solubility in water and some organic solvent. Ethylenic and hydroxide group of p-Coumaric acid greatly affects the therapeutic activity of compound. Free form of p-CA is quickly absorbed in gastrointestinal tract and gets easily excreted by urine while Conjugates of p-CA are slowly absorbed in the upper gastrointestinal tract, with a significant amount of these conjugates reaching the colon. p-CA possesses high therapeutic potential due to its higher bioavailability.

ABSTRACT

The current survey was carried out from July (2022) to September (2022) to investigate the weed flora existing at Mullana village of district Ambala (Haryana). During the course of survey, 93 weed species belonging to 30 families were identified in this area with majority of herbs and shrubs, out of which, the weed species of 31 families belonged to angiosperm group and one to Pteridophyte group. The angiosperm consists of 28 dicotyledonous families with 86 species, two monocotyledonous families with six species and Pteridophyte with one species. Among the families, Asteraceae is most dominant family consisting 19 plant species followed by Amaranthaceae, Poaceae, Euphorbiaceae, Convolvulaceae, Malvaceae, Solanaceae, Fabaceae and Polygonaceae with 8,7,6,6,6,5, 5 and 4 plant species respectively. The current study offered fundamental knowledge regarding floristic composition, which can help with the management and preservation of the region's rich plant diversity. The scientific name, local name, family and class of each species have been recorded in this study.

Keywords: Weed flora, families, angiosperms, gymnosperms and pteridophytes

Tanvi Taneja et al.,

INTRODUCTION

India is a country with a great deal of biological diversity, as well as physical, cultural, social and linguistic diversity. Types, Quantities and Patterns of distribution of species are collectively referred to as biodiversity [1]. Families, communities, countries and upcoming generations all depend on it as a source of subsistence and as an aspect of our everyday life. The plant kingdom has always been essential to human society's survival since it first appeared on this planet [2,3]. With 17,000 different types of blooming plant, India is one of the world's top 12 countries with the highest biodiversity. With only 2.4% of the world's total land area, it contributes 8% of the biodiversity [4,5]. Plants supply primary food sources for mankind as well as building materials, medications, oils, lubricants, rubber, other latexes, resins, waxes, fragrances, colours and textiles [6]. Plant diversity is concerned with the list of plant species that are present in a specific area at a specific period. Its evaluations are regarded as the fundamental prerequisite for comprehending the current state of plant variety. The most important ecological characteristics of a particular ecosystem are their structure, composition and vegetative functions, which vary in response to both natural and anthropogenic factors [7]. Significant risks to ecosystems and biodiversity include habitat loss, fragmentation, excessive exploitation, pollution, alien species invasions and global climate change [8].

Plant diversity is of keen interest to provide knowledge about the weed flora based on its up to date taxonomic criteria along with its economic significance. The weed plants correspond to one of the important building blocks of biodiversity [9]. Therefore, the acquaintance of plant species found in various geographical regions of the world is prerequisite to conserve them for ecological balance and green cover of the environment [10]. Keeping in view of its scope, importance, medicinal and pharmacological values of these natural resources for mankind, this type of study helps us to learn and understand the whole configuration and function of an ecosystem and respond accordingly. A variety of practical research domains, such as land management, forestry, conservation biology, ecology and range science, make use of the knowledge produced by these investigations and form the base for provincial floras and systematic monographs. However, many investigations have been carried out conducted both domestically and internationally [11,12,13,14,15,16,17,18,19,20,21,22,23 and 24].

Due to extensive human disruptions caused by exclusive farming methods, industrialization, animal feed, fuel-wood gathering and forest fires pose dangers to our country's floral diversity, which may eventually result in genetic diversity losses. This is crucial to protect this priceless wealth in the interest of current and future generations. For accurate documentation of species diversity, thorough research is needed for every ecosystem. Smaller areas, which may be more completely explored, produce superior results for a detailed and nearly complete examination. Considering the above facts, a study on the current weed diversity was carried out at MMDU, Mullana-Ambala (Haryana), India.

MATERIALS AND METHODS

Maharishi Markandeshwar (deemed to be) University located in the Village Mullana Ambala on on the North-Eastern edge (N 30°15.0285' to E 77°2.7167') of Haryana state. The survey, which covered a range of weed species, was done between July (2021) and September (2021). Several field surveys were carried out at regular intervals to document the vegetation (weed species) at the research location. The surveys required the use of various field tools, including a knife, hoe, plastic rope, field book and polythene bags. In order to analyse the diagnostic traits, field observations and necessary data about each weed species were written down in a field book on different pages [25, 26]. During field expeditions, the data were gathered from different locations by using traditional field survey procedures, and voucher specimens were prepared [27, 28]. The voucher specimens of all weed species were gathered in groups of two or more, and every weed in the field was photographed. For this article, the weed identification was carried out by using the available weed floras and other relevant literature [29, 30].

**Tanvi Taneja et al.,**

RESULTS AND DISCUSSION

The results showed the occurrence of 93 weed species belonging to 78 genera and 31 families including angiosperms and Pteridophytes have been recorded from Village Mullana, district Ambala, Haryana. The list of weed species of the study area is given in Table 1.

A total of 93 weed species from dicotyledonous (28 families), monocotyledonous (2 families) and pteridophytes (1 family) were recorded in the current study. When habit categories were taken into account, The Figure 1 shows that the climbers (5 species), shrubs (13 species) and herbaceous flora (75 species) were found at all locations in majority. Due to the current soil quality and local climatic conditions, including temperature and rainfall, the high percentage of herbaceous weeds were noted in fields of this area. Asteraceae, which has 19 species, is followed by Amaranthaceae, Poaceae, Euphorbiaceae, Malvaceae, Convolvulaceae, Fabaceae, and Solnaceae having 8, 7, 6, 6, 6, 5 and 5 species of weeds, respectively (Figure 2). These eight families are also the most well-represented in the research region among those that have been reported.

The current study provides information on weed diversity in the area, despite the fact that it is preliminary. Every ecological and biodiversity conservation plan must include a good awareness of the local vegetation structure [31]. Floristic data are a crucial component of any program for managing and conserving biodiversity [32,33,34]. Numerous floristic studies have been reported to show the importance of taxonomic data for the conservation of biodiversity [35,36,37,38]. It is advised that a long-term comprehensive study should be conducted to document the ecological status of the entire weed flora of the study region.

CONCLUSION

The current study offers fundamental knowledge of various weed species present in fields of Mullana village near Maharishi Markandeshwar (deemed to be University). Understanding the taxonomy of weeds is a useful skill for identifying various weed species and preserving biodiversity in that area. It is crucial to know how ecosystems and biodiversity interact. For local and regional authorities concerned with the preservation of priceless wild phytodiversity for a better future, the welfare of present and future generations and sustainable development of the area could play a significant role. A total of 93 weed species, belonging to 31 families, have been identified in the current investigation with majority being herbs and shrubs. For the local and regional authorities interested in preserving this priceless diversity for greater use in the welfare of future generations and sustainable development of the area, such information could play a significant role in Ethnobotanical studies.

ABSTRACT

Infertility caused by drug-induced injury is a primary clinical plight. The overdose and prolonged use of the safest and most widely used analgesics can cause myriad of reproductive toxicity problems. Henceforth, the present study focuses to identify the toxic effects of sinarest (0.25ml/30g BW) in Swiss albino mice of the C3H/J strain after 14 and 28 days of exposure. Thirty mice were evaluated and randomly divided into three groups, each containing 10mice (6 males and 4 females). Group A, the control group, received no treatment; group B and group C received the drug at a dose 0.25ml/30g BW for 14 and 28 days respectively. In treated mice, the hematological parameters such as RBC, Hb%, PCV and MCV significantly decreased (RBC, Hb%, PCV, MCV). Histological analysis of the reproductive organs significantly reduced in diameter of somniferous tubules and ovarian follicles; elucidating pyknosis followed by karyorrhexis. In addition, karyolysis was also observed in the ovum. Furthermore, increased aberrant sperm, decreased sperm motility and testosterone levels were examined. Therefore, the results indicate that sinarest has noxious effects on the reproductive organs of mice, and it should be studied in time to access its amplitude in provoking any infertility-related issues in humans in near future.

Keywords: Infertility; Ovary; Overdose; Sinarest; Testis.

Diksha Dutta et al.,

INTRODUCTION

In recent years, the problem of infertility has increased at an alarming rate. An estimated 15% of couples in India suffer from infertility [1]. Although our social status blames female partners for not having children, men are equally responsible [2]. Among the various causes of infertility, such as congenital abnormalities in the reproductive system, hormonal imbalances, unhealthy lifestyles, and exposure to a variety of chemicals, drug-related toxicity related to the reproductive system is considered as one of the prime causes of infertility [3]. High-dose pain relievers that often cause infertility are taken in large amounts [4]. Sinarest is a widely used and clinically proven analgesic and antipyretic drug [5]. It comes in two forms, namely: syrup and tablets. The sinarest tablet consists of four specific ingredients: acetaminophen or paracetamol (500mg), phenylephrine hydrochloride (10mg), chlorpheniramine maleate (2mg) and caffeine (anhydrous 30mg). While, each 5 mlsinarest syrup contains paracetamol (125mg), phenylephrine hydrochloride (5 mg), chlorpheniramine maleate (1 mg), sodium citrate (60 mg) and menthol (1 mg). Acetaminophen is a pain reliever used to reduce fever [6]. Phenylephrine is a nasal decongestant that gives alleviation to nasal pain because of cold, hypersensitive reactions and hay fever [7]. It belongs to the radiance of medication known as vasopressors, which matches with the aid of constricting the blood vessels inside the nostril minimizing the blood flow thereby enables to assuage nasal congestion and stuffiness. Chlorpheniramine in sinarest can quickly relieve itchy eyes and runny nose [8,9]. The drug reaches its highest level with inside the blood stream, one hour after the in take however its consequences might also additionally last up to 6 hours. In adults, the usual recommended dosage is two tablets 3 times a day (tid) or 4 times a day (qid). For children, the usual recommended dose is one to two teaspoons (510 ml) tid or qid (www.tabletwise/sinarest.com).

Although sinarest is appraised as one of the most secure analgesic drug, extended self-medication and overdose can be harmful as pronounced for different analgesic tablet [10]. As reported, acetaminophen, the main component of sinarest, seems to cause liver toxicity, chronic kidney disease, testicular atrophy, and testosterone levels in mice in addition to in human being [11,12]. Chlorpheniramine maleate (another more delicate drug component) is known to cause drowsiness, while phenylephrine can raise blood pressure [7]. However, the toxicity analysis of the sinarest drug that contains consistently different doses of these ingredients is very limited. Therefore, the current study aims to understand the toxic impact of sinarest drug on the testis and ovaries of swiss albino mice with the following objectives: (1) To analyze the hematological indices. (2) To assess the hormonal assay in 14 and 28 days sinarest treated mice. (3) To analyze the sperm quality and quantity in treated mice. (4) To deduce the histopathological changes in testis and ovary of treated mice.

MATERIALS AND METHODS

Experimental Animals

C3H/J strain of Swiss albino mice (male and female), 1 month old and weighing 25-30 grams, were collected from the Shillong Pasteur Institute, Meghalaya, India. Fifteen days before the start of the experiment, the animals were fed under standard conditions of temperature 20-25°C, 50-65% relative humidity, and an alternate light-dark cycle for 12 hours to adapt to the environment. These conditions prevailed throughout the whole inspection period. Food and water were allowed *ad libitum* during the experiment.

Experimental Design

A total of thirty (30) mice have been used in the experiment and were randomly divided into three groups, each group containing ten (6 males and 4 females) mice (Group A: control; Group B: 14 days treated; Group C: 28 day treated). The research aims to examine the effects of acute and sub-acute toxicity of the drug. Sinarest syrup obtained from a medical store was administered by an oral gavage at a rate of 0.25ml/30g body weight. The control group received only water and food, excluding any drugs. This study was approved by Institutional Animal use and Ethical Committee (IAEC), Cotton University (No. 14/IAEC/CU/05/01/2021)

**Diksha Dutta et al.,****Behavioural Study**

Behavioural studies were performed by observing the mice before and after the inoculation of dose throughout the experimental duration.

Body weight of mice

The mice weighing 25-30g are generally considered suitable for dosing in all sorts of experiments. Therefore, the weight of the animals in each group was measured at 3-day intervals using an electronic weighing machine with a maximum capacity of 50g and readability of up to 0.001g.

Weight and Size of organs (Testis and Ovary)

The wet weight of experimental target organs i.e. testis and ovary were recorded immediately after sacrifice along with their size with the help of graph paper and a measuring scale.

Collection of blood and preparation of serum sample

A capillary tube was used to collect blood samples from each of the three groups of mice by retro-orbital puncture. For hematological studies, one part of blood was placed in 2ml K3 EDTA vacutainer tubes, and another portion was sterilized in a dry micro-centrifuge tube and coagulated at 37°C for 1 hour. The clear serum was isolated using micro-centrifuge at 3000 rpm for 10 minutes and subjected to hormonal (testosterone) assay.

Hematological Study

A hematological assay was performed on whole blood samples having certain parameters such as total erythrocyte count (TEC), total leukocyte count (TLC), and differential leukocyte count (DLC) by the use of Neubauer Counter Chamber. Hemoglobin concentration (Hb%) was determined by the method described by Jain (1986) using a Sahli's Hemoglobinometer [13]. The packed cell volume (PCV), the distribution of various white blood cell counts (DLC), mean corpuscular volume (MCV) and mean corpuscular hemoglobin (MCH) were computed using the hematology autoanalyzer (model no. PE6800). Later the results were verified using an automated Hematology Analyzer in a clinical laboratory.

Hormonal (Testosterone) Assay

A fully automated two-way interface Chemi Luminescence Radioimmuno assay kit (DSL-400 Active (R) Testosterone Coated Tube RIA Kits, Diagnostic System Laboratories, Inc.) was used to determine testosterone level.

Seminal Analysis

The testis was dissected out along with epididymis and vas deferens and placed into a 2 ml of 0.9% physiological saline followed by needle maceration for semen collection, and the aliquot was ready for further seminal analysis.

- a) **Sperm morphology:** A drop of seminal fluid was taken and uniformly smeared followed by staining with eosin for ten minutes [14]. Ten fields of the microscopic view were randomly selected to evaluate the different forms and number of the abnormal spermatozoa from the total number of spermatozoa.
- b) **Sperm motility:** The aliquot was taken on a clean slide along with sodium citrate (2.9%) to assess the sperm motility by randomly studying ten fields of microscopic view [15].
- c) **Sperm viability:** The eosin-stained slide is examined under the microscope (Leica Bright field DM2500) to depict the sperm viability. Live sperm cells were unstained while the dead sperm cells absorbed the stain due to rupture of the cell membrane. The percentage of the stained and unstained sperm cells were calculated [14].
- d) **Sperm count:** Prior to measuring total sperm count using a hemocytometer, the aliquot was diluted with a solution containing 5g sodium bicarbonate and 1ml of formalin per 100ml of water [16].

Histological Assays

The processed and control reproductive organs (testis and ovaries) were collected from the sacrificed Swiss albino mice, histological slides were assembled following standard Hematoxylin-Eosin (H & E) staining technique after

59245

**Diksha Dutta et al.,**

fixing the tissues in Carnoy's fixatives (6 ethanol : 3 chloroform : 1 glacial acetic acid) for 8-12 hours. The slides were examined and photographed using the microscope Leica bright field DM2500 in 10X, 40X and 100X magnification.

Statistical Analysis

The mean and the standard error of mean were computed for all possible values. A one-way analysis of variance (ANOVA) followed by Bonferroni post hoc test were used to compare the control group and the treatment groups. All the statistical analysis has been executed in MS Excel (2010) and the statistical software program SPSS version 18.0. Differences were considered statistically significant at $p < 0.05$.

RESULTS

Behavioural Changes

All mice in each group were normally active before the inoculation of drug. However, after treatment with sinarest, their movements and activities were found to decelerate for about 3-4 hours and then return to normal. The mice showed drowsiness and it increased with each passing day.

Body Weight

The treatment of mice with sinarest drug showed non-significant change ($p > 0.05$) of body weight relative to the control group as shown in Table 1.

Organ Size and Weight (Testis and Ovary)

Compared with the control group, the size and weight of the testis and ovaries of the sinarest-induced mice were significantly reduced ($p < 0.05$), as shown in Table 2.

Changes in Hematological Parameters

The red blood corpuscles (RBC), packed cell volume (PCV), hemoglobin concentration (Hb%) and mean corpuscular volume (MCV) showed a significant decrease ($p < 0.05$) after the 14 and 28 days treatment with sinarest drug (0.25ml/30g BW) relative to the control group of mice. The total white blood corpuscles (WBC) and platelets (PLT) on the other hand showed a significant increase ($p < 0.05$) in the treated mice including neutrophils, lymphocytes, monocytes and basophils (Table 3).

Testosterone Determination

The testosterone level revealed a significant decrease ($p < 0.05$) in the treated groups of mice ($n = 10$) relative to the control group after 14 and 28 days sinarest treatment (Table 4).

Sperms Morphology

In this study, different sperm abnormalities perceived in the spermatozoa of treated mice ($n = 10$). The abnormalities spotted such as blunt hook sperm (BHS); sperm without tail (SWT); coiled tail sperm (CTS); defective head sperm (DHS); swollen head sperm (SHS) and sperm without head (SWH), as jotted in Table 5 and Figure 1(b-g). A significant increase ($p < 0.05$) of abnormalities in sperm morphology has been observed more in 28 days treated mice groups.

Sperm Motility, Viability and Count:

After administration of 0.25ml/30g BW of sinarest drug, sperm motility, viability and count were significantly reduced ($p < 0.05$) than that of the control group (Table 6).

**Diksha Dutta et al.,****Histopathological Changes in Testis:**

In the control group, testicular sections showed normal seminiferous tubules with a narrow interstitium and are lined with several layers of spermatogonia, primary spermatocytes, spermatids and spermatozoa. Sperm appeared in the central lumen of the tubule, as shown in Figure 2(a). After 14 days of treatment with sinarest, the diameter of the seminiferous tubules decreased (Figure 2b), the number of pyknotic nuclei of spermatogenic cells increased (Figure 2e), the cytoplasm of spermatogenic cells becomes less vacuolated (Figure 2c) and minimal accumulation of collagen fibers between the tubules (Figure 2d). As the duration increased to 28 days, histopathological changes became severe, with cell loss and partial alteration of basement membrane and disintegration. In addition, the number of sertoli cells were also reduced (Figure 2e), resulting in inadequate nutrient supply for spermatogenic cells. 28 days of treatment also resulted in huge broadening of interstitium due to shrinkage of seminiferous tubules (Figure 2f), the disappearance of germinal epithelium (Figure 2g) and mild accumulation of collagen fibers between the tubules (Figure 2d).

Histopathological Changes in Ovaries

Compared with the control group (Figure 3a), the follicles of the mice in the treatment group showed degenerative changes and the shape and arrangement of the granulosa cells were lost. After detaching from the periphery, the size of the ovum becomes smaller due to shrinkage (pyknosis), hence the zona pellucida only exists on the undetached side (Figure 3b). This shrinkage of the ovum caused the nucleus to condense rapidly (karyorrhexis), and finally, the nucleus and nucleolus disappeared (karyolysis) after 28 days of treatment with 0.25ml/30gBW of sinarest drug. Granulosa cells displayed very massive apoptosis and their residues get accumulated in the follicular antrum (Figure 3c). The 28 days treated sections also showed basophilic infiltration in the follicles. The typical appearance of the follicle completely disappeared and there was subsequent curtailment in follicular size than the normal follicles.

DISCUSSION

The result of the present study indicates that the sinarest drug possesses a toxic impact on the testis and ovary of the albino mice. The mice after administration of sinarest became very lethargic and appeared drowsy over time. This effect may be due to chlorpheniramine maleate, because antihistamines have been reported to cause inertia [17]. Therefore, long-term use of this medicine can lead to behavioral disorders that ultimately affect sexual desire. Hematological analysis of sinarest-induced mice demonstrated the toxic effects of the sinarest drug on blood parameters showing a significant reduction in the red blood corpuscles count probably due to destruction of mature RBCs and a subsequent slower rate of erythropoiesis. The hemoglobin (Hb) concentration is also significantly reduced leading to the breakdown of mature red blood corpuscles indicating a decrease in the oxygen-carrying capacity of blood and the subsequent amount of oxygen supplied to the tissues. Similar studies have been reported on *A. cordifolia* and *S. virosa* extracts [18]. Moreover, the body defense mechanism of mice becomes activated and tried to prevent it from all sorts of infections and inflammations which can be easily assessed by the increasing number of total white blood corpuscles, neutrophils, basophils, lymphocytes and monocytes.

This study showed that after taking both mild and acute doses of sinarest, certain sperm parameters (such as count, viability, or motility) were significantly reduced. Early studies revealed that treating mice with paracetamol for 42 days result edina significant decrease in sperm motility [19]. Therefore, abnormalities in sperm may be due to the toxic effect of acetaminophen. This indicates that aspirin and paracetamol can cross the testicular blood barrier since it has been reported that the decrease in sperm motility caused by chemical agents are probably due to their ability to permeate the blood-testis barrier [20]. Another study reported a significant reduction in total sperm number, including an efficient increase in motility, efficacy and the percentage of dead sperm [21]. The current investigation also shows that the number of abnormal sperms has increased after treatment with sinarest. Morphological abnormalities may be caused by changes in testicular DNA (deletion, point mutation, or a combination of the two), which in turn interrupts the sperm differentiation process. Exposure to chemicals can cause an imbalance in the

**Diksha Dutta et al.,**

hypothalamic-pituitary gland or sex hormone levels, which in turn affects spermatogenesis and leads to the deterioration of sperm function or structure [12]. The significant drop in testicular weight may be due to the reduction in the size of the seminiferous tubules. Among all the components of sinarest, the presence of acetaminophen may result in the shortest seminiferous tubules or decrease in density due to the degradation of spermatogenic constituents. Vyas et al. provided a similar report in 2016 in aspirin-treated rats [22]. The androgen factor or testosterone synchronizes the weight, size and secretory function of the testis. The present study also showed that as the number of treatment days increases, testosterone levels decrease significantly. This in turn shortens the length of the seminiferous tubules, and ultimately affects the weight of the testis [23]. Testicular weight is related to male fertility, because higher testicular weight is associated with an increase in daily sperm production [24]. In the treatment group, as it continues to lose weight, ultimately lead to male infertility due to low sperm count. It can also reduce the nuclear volume of Leydig cells, thus inhibiting androgen biosynthesis [25]. Ablation of Sertoli cells, germ cells, seminiferous tubules and Leydig cells resulted in a decrease in testicular size [26].

Sinarest also indicated an adverse effect on the ovaries and follicles of the treated mice. *Butea monospermatoxin* is reported to penetrate the ovum wall from the granulosa cell, leading to shrinkage in size and folding of the cell wall of ovum with degenerating nucleus, but it is completely absent in most cases [27]. This can cause turbidity and degeneration (karyolysis) in the ooplasm, which will eventually lead to the physiological death of the ovum after agglutination [28]. The above observations clearly show that casualties exhibit acute and sub-acute toxicity in the testis and ovaries of swiss albino mice. Therefore, doctors may not recommend sinarest for children under six years of age. Although further research must be conducted to evaluate the toxic effects of sinarest on human reproductive organs related to frequency of use and drug dosage, caution should also be applied while using sinarest rampantly and perpetually without medical advice. Subsequently, any form of drug abuse (chlorpheniramine maleate produces drowsiness) should not be encouraged, because overdose can have a fatal effect on spermatocytes, sperm cells, seminiferous tubules, and ovum and granulosa cells of ovarian follicles. However, the main components of the sinarest drugs that causes these toxicological repercussions yet to be known evidently. Although, according to early research reports from various researchers, it is speculated that acetaminophen is primarily responsible for histopathological changes in reproductive organs and also affect semen quality. A more detailed analysis of each component of sinarest is essential to determine which component has an adverse impact on the reproductive system. Perhaps, this can lead to generational updating of the drug, as well as awakening people about the recommended dosage of any drug that is used vehemently without the prior advice of a qualified medicinal practitioner.

CONCLUSION

Self-medication is seldom considered high-risk. Though sinarest has always been one of the most widely and easily available analgesics, improper administration methods and inaccurate dosages can be life-threatening too. Albeit the drug also contains chlorpheniramine maleate as one of its components, it increases vulnerability and the risk of abuse. Therefore, self-administration of any drugs should be stringently circumvented in the future.

ACKNOWLEDGEMENTS

We acknowledge the Council of Scientific and Industrial Research-Human Resource Development Group (CSIR-HRDG), Government of India, for providing Diksha Dutta with NET-JRF fellowship {File No. 09/1236(15458)/2022-EMR-I} which helped her during this research work. We are thankful to the Head, Department of Zoology, Cotton University for providing us necessary laboratory facilities. We are also thankful to Dr. J.D. Sharma, Professor and Head, Dept. of Pathology, B. Barooah Cancer Institute, Dr. Indrajit Das and Dr. Raktim Tamuli, G.M.C.H., Guwahati, Assam for their guidance and support. ABSTRACT

Agriculture is the backbone and most conventional sector for economic development of India. It has a major impact on the Indian economy and gives many opportunities for employment. Agriculture yields are directly impacted in countries financial structure. Farmers in our country are unable to choose appropriate crop to cultivate in agricultural land based on environmental requirements. There are several factors to be consider while growing a certain crop on a particular type of soil. In our proposed work, there are three types of datasets such as crop, environmental features and soil dataset has been collected from various external sources. Those datasets are integrated and loaded into cloud server. Proposed ECM prediction model utilized Random Forest algorithm to determine the perfect crop. In addition to that, the proposed system predicts leaf disease by implementing Hyper Spectral Imaging Technique (HSIT). This prediction scheme achieved 98% accuracy compared with decision and PART algorithms. As the proposed work results shows the less time taken for execution compared with existing algorithms.

Keywords: Classification, Hyper Spectral Imaging, Recommender System

INTRODUCTION

The nation's largest sector is absolutely no doubt agriculture. Nearly half of all occupations in today's world, whether they are formal or informal, are primarily supported by agriculture [1]. In this sense, India is seen as an agricultural

59255

**Saraswathi et al.,**

nation. The agriculture industry contributes more than 20% of the country's overall revenue. Farmers' incomes aren't particularly high because of the low crop productivity [2]. If farmers wish to raise their income, they must become more productive. Farmers need to know what crop would have been most effective on their particular field of land if they were interested in increasing efficiency. If you cultivate the correct type of plant there, your crop's output will immediately rise. Therefore, crop recommendation [3] schemes can be quite useful for farmers. Methods must be provided in enormous detail and with precision. In the absence of it, there might be significant material and economic losses. Models for predicted outcomes may be created using a number of data mining methods. However, this research provides a method that utilizes neural networks [4].

To create a strong, precise and easy-to-use recommendation engine. Convolutional Neural Networks (CNNs) are multi-layer hierarchical models that are capable of rapidly and efficiently extracting dynamic capabilities from large datasets. The latest developments in literally all significant issues related to classification have been accomplished with CNNs. To extract and characterize elements, it is going to use the same architecture. [Fig 1] System for recommending crops that as well as for predicting leaf diseases. In order to create the images for the upcoming stages, photogrammetric techniques such image augmentation, categorization, colour space translation, and alteration are utilised. The most significant components of the image are then found and utilised as classification inputs. Feature-based and vision-based approaches are used to assess the final classification accuracy. Warmth, soil moisture, and pressure are the three factors that need to be taken into consideration. The recommender system might provide a more accurate forecast of the crop that will grow the best with the aid of these requirements.

LITERATURE SURVEY

A framework of recommendations had been proposed by Rajak et al. [5] to assist farmers in increasing yields from agriculture, preventing soil erosion on cultivated land, decreasing chemical usage in crop production, and making optimal use of water resources. In their framework, classifiers SVM, NB, ANN, and RF were used, with RF displaying the highest accuracy. A certain crop was predicted by Anantha et al. [6] for a given state and district under a specific weather forecasting condition. As classifiers, RF, CHAID, KNN, and NB were used; RF achieved the greatest accuracy. A crop recommendation system for intelligent farming was created by Dighe et al. [7]. The classifiers CHAID, KNN, DT, NN, NB, C4.5, and LAD were used, and SVM provided the results with the best accuracy. The methodology put out by Sardogan, Melike, and colleagues [8] successfully distinguishes between four distinct tomato leaf disease types. CNN and LVQ were used as classifiers, and CNN produced the results with the highest accuracy. Amara et al.'s [9] recommended technique even under challenging circumstances including lighting, complicated backgrounds, and various resolutions, sizes, poses, and orientations of actual scene photos. In terms of accuracy, CNN and SGD, which were used as classifiers, achieved 92–94%. Pudumalar et al. [10] based on site-specific parameters, the suggested technique makes crop recommendations with high accuracy and efficacy.

The application of machine learning in agriculture greatly facilitates and increases efficiency in this field. Data preparation, model construction, and generalisation are the three basic processes in the machine learning process. Machine learning algorithms are used to address situations when human abilities are insufficient [8]. Machine learning, sometimes known as ML, is a branch of research that focuses on using data and historical data to inform computer options to choose from. There are several ways to feature extract important characteristics from data and information using machine learning (ML) [9]. The two primary subcategories of machine learning techniques are supervised learning and unsupervised learning; semi-supervised learning and reinforced learning are two additional categories into which certain researchers further split machine learning algorithms. ML may be used to guide the insect management view [10]. A machine learning approach predicts the outcome using a defined set of input variables and labels, in contrast to a supervised machine model that creates an output based on predetermined evidence and training data [11]. They examined how machine learning might be classified as beneficial in laboratory medicine and healthcare in the publication [12]. For their projection, they gathered agricultural data spanning 20 years using a crop production model that was built in [13]. In order to enhance the regression model, stacking

**Saraswathi et al.,**

analysis was used after that [14]. Four machine learning algorithms—XGBoost, KNN classifier, Random Forest, and Logistic classifier—were examined in an effort to forecast agricultural output using the factors of temperature and rainfall. The random forest classifier was found to have the highest accuracy when compared to other methods in the end [15]. After then, the system was hybridized to account for variables including area, rainfall, and soil type in order to anticipate yields more accurately. The system may then determine to decide the crop that is suitable for production based on the previously mentioned characteristics [16].

PROPOSED METHOD

The proposed method solves the issues related to identifying the soil in agricultural areas to cultivate crops and plant disease. The figure 1 shows the architecture of the proposed model. The proposed model is split into three phases. The first phase is all about data collection.

Data Collection

The machine learning algorithm accuracy depends on the number of parameters and the correctness of the training dataset. For this system, various datasets have been downloaded from government website and Kaggle, that would give the best results. Many works done in this field have considered environmental parameters to predict crop sustainability some have used yield as major factor where as in some works only economic factors are taken into consideration. Have combined both environmental parameters like rainfall, temperature, PH, nutrients in soil, location and economic parameters like production, and yield to provide accurate and reliable recommendation to the farmer on which crop will be most suitable for land. These datasets are loaded into the cloud and contains the following attributes - Soil PH, Temperature, Humidity, Rainfall, Crop data, NPK values and Weather.

System Architecture

Fig. 1 System Architecture

Data Preprocessing

Dataset collected from different resources, may have repetitions, inconsistency and noise. Dataset must be preprocessed before utilized to train the model. Preprocessing consists of four step process, (i) Data cleaning, (ii) Data integration, (iii) Transformation and (iv) Dimension reduction. In data cleaning, missing values for an attribute can be filled and duplicates are removed during integration process. In dimension reduction process, unwanted attributes are discarded and taken relevant attributes to form dimension for analytics.

Training and Testing Datasets

In this module, data is splitting into training and testing sets. During training, we let the model 'see' the answers, in this case the actual values, so it can learn how to predict the values from the features. Expectation is to be some relationship between all the features and the target value, and the model's job is to learn this relationship during training. Then, when it comes time to evaluate the model, we ask it to make predictions on a testing set where it only has access to the features. Because we do have the actual answers for the test set, we can compare these predictions to the true value to judge how accurate the model is. In training a model, we randomly split the data into training and testing sets to get a representation of all data points.

Classification Model

In the proposed model, random forest algorithm is implemented to identify the best crops to cultivate in the surroundings. Initially, all the supporting libraries (Pandas, Numpy, Scikit-learn) are imported to design the model. Both training and testing data are loaded and import the Random Forest Regression (RFR) model from scikit-learn to create decision trees and fit the model on training data. Finally, the model is constructed with RFR and it evaluated with test dataset. The third phase consists of two modules (i) Disease prediction and (ii) Crop recommendation.

**Saraswathi et al.,****Disease Prediction**

The proposed system has taken the plant leaf image as input to diagnosis the disease. Image segmentation process used to identify the plant disease and this can be implemented by traditional imaging technique along with spectroscopy to aggregate different spectral information simultaneously. Hyper Spectral Imaging Technique (HSIT) is a technique that analyses a wide spectrum of light instead of just assigning primary colors (red, green, blue) to each pixel. The light striking each pixel is broken down into many different spectral bands in order to provide more information on what is imaged. The objective of this technique is to find the spectrum for involved pixel contributing to the image being considered. In HSI, each pixel of the image contains spectral information, which is added as a third dimension of values to the two-dimensional spatial image, generating a three-dimensional data cube, sometimes referred to as hypercube data or as an image cube. In this technique, electromagnetic spectrum of the given image's pixel is being used for the detection of plant disease present.

Crop Recommendation

A supervised machine learning RFR algorithm is employed in this model and performs well compare Linear Regression (LR) and improves accuracy over unsupervised machine learning algorithms. The input parameters NPK values, PH, temperature, rainfall, humidity, weather and crop data taken into the system in order to measure and suggest crop to cultivate.

EXPERIMENTAL RESULTS AND DISCUSSION

The proposed method predicts the most productive crops that may be cultivated under perfect soil conditions by analysing the levels of soil N, P, K, and pH as well as predict plant disease based on the various phases of damaged leaf images. The model was developed using Random Forest, which has a 98% accuracy rate compared to 75% for SVM. We discovered that random forests are more effective and acceptable for crop prediction. The system's recommendations for multiple crops assist farmers in selecting the right ones to cultivate in their region. In order to identify unhealthy crops and new crops that haven't yet developed, this technique supports the farmer in choosing the crop that will yield the highest profit. So farming may be carried out wisely. The user interface includes two options that have added advantages: crop recommender and diseased crop detection.

Data Set Description

The dataset taken from different sources provided the information required to carry out this research. The rainfall, climate, soil information and diseased leaf datasets of India were combined to generate the dataset. These records were gathered by the Indian Food and Agriculture Association (ICFA). Approximately 2000 events are included in this dataset. A total of eight features make up the dataset, and a class value designates the crop that was grown under the given climatic circumstances. Table 2 provides a sample dataset that displays the corresponding values for various attributes for a specific crop. 60% of the whole data set is used for training, while 40% is used for testing Figure 2 displays the number of examples of each crop type in the data set. The data collection includes information on twenty-two crops' different attributes. Figure 2.1

EXPERIMENTAL RESULTS

In Table 3 and Figure 3, the three algorithms' relative performance in terms of the time required to generate a model is displayed. The Ensemble Classification Model (ECM) algorithm is expected to need less time than other algorithms. The proportion of correctly predicted events over the whole testing set, shown in Fig. 4 as the prediction accuracy, and the results of several crop recommendation systems are shown. The findings clearly demonstrate the superiority of the PART algorithms by providing the greatest crop suggestion prediction accuracy of 99.13%.

**Saraswathi et al.,**

CONCLUSION AND FUTURE WORKS

The major goal of this effort is to advise producers on how to produce the best harvest based on many aspects in order to help them make educated decisions before planting. If the right knowledge about the soil of the agricultural land is known for growing agricultural crops, it is feasible to cultivate crops that are more beneficial. Farmers may use the work modules as an efficient tool to assess the many soil characteristics of their property and propose the most economically viable crops suited for that property. Smart villages may be implemented by encouraging farmers, especially those in rural regions, to employ modern technologies (IoT, Cloud Computing, AI, ML) to boost agricultural productivity. By using them to create an IoT and machine learning-based integrated agricultural management system, the suggested framework would assist open up new frontiers in making soil and agriculture researchers more efficient with practical solutions. Depending on the season, this system may be enhanced to cover a wide range of characteristics, including weather forecasting, detection of severe droughts, floods, and agriculture price forecasts. A mobile application will be built and integrated with the planned system to make it simpler for farmers to use.

ACKNOWLEDGMENT

The preferred spelling of the word "acknowledgment" in America is without an "e" after the "g". Avoid the stilted expression "one of us (R. B. G.) thanks ...". Instead, try "R. B. G. thanks...". Put sponsor acknowledgments in the unnumbered footnote on the first page.

ABSTRACT

Machine learning has become a buzzword in modern technology; several industrial sectors have begun to adapt machine learning-based solutions for real world applications. Machine learning is used in healthcare to diagnose and forecast the risk of various diseases, as well as to provide customized treatments and early diagnosis. In this work, comparative analysis of various ensemble learning techniques like Bagging, Random Forest and Boosting Techniques are performed with the help of medical data. The Diabetics dataset available in UCI repository is considered in this experimentation because it has missing values and suitable for binary and multi-class analysis. The dataset was preprocessed and best feature set is selected using chi square test. Then it is converted to balanced dataset using SMOTE technique (Synthetic Minority Over-sampling Technique) before creating the models. Here, Decision Tree, Bagging Classifier, Random Forest, and Gradient Boosting Machine were considered. The performances of all these models were analyzed based on Accuracy, Sensitivity, Specificity, Precision and F1 Score measurements. The result depicts that boosting technique outperforms than other ensemble techniques in both binary and multi-class analysis.

Keywords: Diabetics, Medical Data, Ensemble Learning Techniques, Random Forest, Decision Trees, Gradient Boosting Machines, and Machine Learning.

INTRODUCTION

Machine learning is the process of extracting knowledge from data by analyzing patterns. In recent years, machine learning approaches have grown increasingly common in everyday life. The application of machine learning in healthcare industry includes disease identification, drug discovery, diagnosing in medical images, robotic surgical automation, etc. Many illnesses, including COVID-19, malaria, typhoid, coronary artery disease, diabetes mellitus, and many types of malignancies, have been predicted and diagnosed using various machine learning techniques like Deep Learning, Ensemble Learning and other state of art methods like SVM, KNN and so on [1-10].

Ensemble learning techniques are among the most widely used machine learning approach for obtaining highly accurate outcomes. The ensemble learning approach seeks to combine many or different machine learning classifiers using various strategies such as boosting, bagging, stacking, and so on, in order to infer or predict the most accurate result possible.

Models like Decision Tree, Boosted Decision Tree, Random Forest, Support Vector Machine, Neural Network, Logistic Regression, KNN, and so on are ensembled in different ways to predict cardiovascular diseases [2-3, 5]. Also, ensemble of random forest, logistic regression along with XG Boost were used to diagnose COVID-19 from routine blood tests [4]. To add on, ensemble learning techniques were also used to diagnose disease like diabetics, cancer etc. Ensemble learning approaches are reported to outperform other state-of-the-art methods in terms of several evaluation metrics such as accuracy, AUC, and precision, among others.

In this work, Comparative analysis on ensemble learning techniques like bagging, boosting and random forest is done on Diabetes 130-US hospitals dataset which aims in predicting whether a diabetic patient is readmitted to hospital or not after the treatment.

Diabetic is a deadly illness that has become increasingly prevalent in developing countries in recent years. Diabetics are a diverse metabolic condition characterized by hyperglycemia as a result of impaired insulin production, impaired insulin action, or both. The way hyperglycemia is managed in hospitalized patients has a big impact on their outcome, both in terms of morbidity and mortality [12]. The early prediction of readmission of diabetic patient will help in avoiding additional treatment cost and discomfort of the patient. Also, it may help in improvising the treatment and in turn preserve the reputation of the hospital.

In this paper, Bagging Classifier, Random Forest, and Gradient Boosting Machine models are used to predict the readmission of patient and their performance are compared against various evaluation metrics.

PROPOSED METHODOLOGY

For the comparative study the output of the model has been decided based on two objectives. They are:

- Binary Classification (for predicting whether the patient with diabetics admitted to the hospital in less than 30 days or not)
- Multiclass Classification (for predicting whether the patient with diabetics admitted to the hospital in less than 30 days, greater than 30 days or not admitted. The adopted process flow is clearly represented in Fig 1

Dataset Description

The Diabetes 130-US hospitals dataset from 1999 to 2008, which is accessible in the UCI repository, was used in this study. The dataset spans ten years (1999-2008) of clinical treatment across 130 hospitals and integrated delivery networks in the United States. Information was collected from the database for encounters that met certain criteria, such as inpatient encounters, diabetic encounters, and so on. The dataset contains more than 100000 entries with 55

Kavitha Srinivasan and Venkatesh

attribute features like age, patient number, diagnosis, number of medications admission type etc. The target variable contains three classes for representing patients readmitted within 30 days, patients readmitted after 30 days and no readmission [12]. Since patients readmitted after 30 days may be owing to the patient's condition, class label representing the patients readmitted within 30 days can be used to analyze the problem with the treatment.

Data Preprocessing

Data preprocessing is used to improve the quality of data in order to improve the mining results. It is very important to preprocess the data before we fed the data to the model since low quality data might result in poor results. In this work, preprocessing techniques like data cleansing, data reduction and data transformation has been done in order to handle the missing values and inconsistent data. In the considered dataset, few attributes have large portion of missing values in it. They were handled simply by removing column from the dataset. Also, part of the noisy data was dealt with by eliminating the corresponding tuple. Data transformation is done on selective attribute to improve the accuracy. Further, the all the categorical attributes were encoded such a way that the machine could comprehend them. Then, feature selection is carried out by utilizing the chi-square test to examine the association between the characteristics. Here, the dependency of all the features was tested over the target variable. For each feature, the mathematical form for computing chi-square scores is given by,

$$\chi^2 = \frac{(O_f - E_f)^2}{E_f}$$

where,

O_f - Observed frequency

E_f - Expected frequency.

The 'k' features with higher chi-square scores are then selected as they represent the higher association with the target variable. In our work, the feature selection stage selects 20 features.

Balancing the Dataset

After the data preprocessing stage, the dataset was then partitioned into train and test dataset with 80:20 ratios. Since the classes are not balanced in the dataset, the dataset needs to be balanced before they are fed into the model to avoid bias. In our work, SMOTE (Synthetic Minority Over-sampling Technique) was used to balance the classes in the dataset. SMOTE is oversampling technique which balances the dataset by simply duplicating the entries of the minority class.

Ensemble Learning Models

Ensembles are strategies for combining many machine learning classifiers into more powerful model. Ensemble approaches often yield more accurate results than a single model. Here, Ensemble methods like bagging, random forest and gradient boosting techniques were utilized. Also, for comparative purpose decision tree with splitting criteria namely gini index and entropy are considered in this work.

Decision tree

Decision tree, a part of tree-based models, is a hierarchical structure where each internal node represents a test on a feature, the edges represent the possible values of the previous node, and the leaf node holds the class labels. Decision trees are extensively used for categorization because they do not require domain expertise, can handle multidimensional data, and are simple for people to assimilate. Gini index and entropy are two frequent splitting criterions in decision trees, and they are mathematically stated as follows:

$$Entropy = - \sum_{i=1}^m p_i \log(p_i)$$

$$Gini Index = 1 - \sum_{i=1}^m p_i^2$$

Kavitha Srinivasan and Venkatesh

Bagging Classifier

Bagging is an ensemble approach that fits multiple models to various subsets of a training dataset and then combines the results. The Bagging Classifier, an ensemble meta-estimator, uses a bagging approach to fit base classifiers on random subsets of the original dataset and then aggregate their individual predictions to generate a resulting prediction. These bagging classifiers decrease individual model variance and are immune to the effects of noisy data and over fitting.

Random Forest

Random Forest is a set of uncorrelated decision trees that work together to form an ensemble. Each tree in the model is given a subset of features and is expected to predict the output. The notion behind random forests is that while each tree may perform a reasonably decent job of predicting, it will almost certainly overfit on some of the data. We may limit the amount of overfitting by averaging the outcomes of numerous trees that all operate well and overfit in different ways.

Gradient Boosting Machine

The gradient boosting machine is a boosting technique that combines multiple decision trees to provide the resultant prediction. All of the decision trees are constructed in sequential order, using various subsets of features. After one classifier is learnt, the weights are automatically adjusted in the boosting process, allowing the next classifier to avoid misclassification and enhance accuracy. However, there's a chance the model will get overfitted.

RESULT AND ANALYSIS

The considered Diabetics dataset has 101766 x 50 entries. After preprocessing stage, the dataset has 98052 x 43 entries. In this stage features such as 'encounter_id', 'patient_nbr', 'weight', 'payer_code', 'medical_specialty', 'citoglipton', and 'examide' were removed from the dataset. Then after the feature selection using chi-square, the dataset contains 98052 x 20 entries (excluding target variable). The selected features along with their chi-square scores are shown in Table 1.

The metrics considered for performing the comparative analysis of ensemble learning techniques include accuracy, sensitivity/recall, precision, specificity and F1 score. They are calculated through observed number of true positives (t_p), true negatives (t_n), false positives (f_p) and false negative (f_n) as follows:

$$Accuracy = \frac{t_p + t_n}{t_p + f_p + t_n + f_n}$$

$$Sensitivity/ Recall = \frac{t_p}{t_p + f_n}$$

$$Specificity = \frac{t_n}{t_n + f_p}$$

$$Precision = \frac{t_p}{t_p + f_p}$$

$$F1 Score = 2 * \frac{Precision * Recall}{Precision + Recall}$$

The models were also validated using K-fold cross validation. However, there is no discernible change in the result. The performance of each model is analyzed using quantitative metrics for binary and multi-class classification, given in Table 2 and Table 3. Also, it is visually represented in Figure 1 and Figure 2 using scatter plot. From the analysis, it

**Kavitha Srinivasan and Venkatesh**

is observed that Gradient Boosting outperforms than the other ensemble techniques for binary and multi-class classification.

The Receiver Operating Characteristic curve (ROC), plotted against the true positive rate and false positive rate, is also used to analyze the performance of the classifiers.

From ROC curve, it is inferred that Gradient Boosting Machine technique obtained maximum value of 0.95 and 0.83 for binary class and multi-class respectively. Also, the class-wise AUC scores are given for multi-class classification for ease of reference. From the result analysis and above plots in Fig.2 and Fig.3 it is evident that the ensemble techniques like boosting, bagging and random forest outperforms than decision trees. The accuracy of models is less in multiclass classification than in binary classification. It can be inferred that the models well performs in binary classification than in multiclass classification. In comparing all the models it was found that Gradient Boosting Machine was comparatively better than all models in Diabetics Patient Readmission dataset followed by Random Forest and Bagging Classifier.

CONCLUSION

Machine learning in healthcare is particularly successful and valuable for doctors in detecting diseases, anticipating illness risk, recommending appropriate medications for patients, accurate assessment of patient's history, and so on. This work focused on the comparative analysis of ensemble learning techniques using medical data and handling imbalanced number of samples in classes. The ensemble learning techniques are widely used in classification problems. Using quantitative metrics such as accuracy, sensitivity/recall, specificity, precision, and F1 Score, several ensemble approaches such as Bagging, Random Forest, and Boosting were evaluated. The Decision tree, Bagging Classifier, Random Forest, and Gradient Boosting Machines are considered in this work. The Gradient Boosting Machine achieves the maximum binary classification accuracy of 88 percent and multi-class classification accuracy of 66 percent. Furthermore, in terms of all other assessment criteria such as accuracy, sensitivity/recall, specificity, precision, F1 Score, and AUC, gradient boosting outperforms all other models. As a result, it is concluded that the boosting approach surpasses all other techniques.

ABSTRACT

The imprecision and uncertainty are represented by the two distinct tools called m - polar fuzzy sets and m - polar soft sets. In this paper we have introduced the notions of m - polar soft fuzzy matrix and product of m - polar soft fuzzy matrix. These two matrices are imposed on m polar soft fuzzy graph and detailed application has discussed.

Key words: m - polar soft fuzzy matrix, Product of m – polar soft fuzzy matrix, m - Polar soft fuzzy graphs.

2010 AMS subject classification: 54B05, 54C05

INTRODUCTION

Akram, M., and Nawaz, S. [1] introduced the idea of a fuzzy soft graph. The m polar fuzzy graphs were defined by Chen et.al., in 2014 [2]. Fuzzy soft matrix theory and its applications in decision-making was first introduced by Cagman et.al., [3]. In 2008 Bing-Xue Yao et al. [4] discussed fuzzy soft set and soft fuzzy set. The majority of our real-world issues in the fields of medicine, engineering, management, social science, and the environment frequently contain data that isn't always clear, exact, and predictable in nature due to its different uncertainties that are typical of these issues. Probability, fuzzy sets, fuzzy soft sets, interval valued fuzzy sets and rough sets etc., are frequently used to manage uncertainties. However, Molodtsov [5] has demonstrated that each of the aforementioned topics suffer from some inherent difficulties as a result of the inadequateness of their parameterization tools and introduced

59272

Ramkumar and Sridevi

a theory known as soft set theory having parameterization tools capable of successfully handling various types of uncertainties. Rosenfeld et al. [6] introduced fuzzy graphs in fuzzy sets and their applications. S. Ramkumar and R. Sridevi [7] introduced their perception on m -polar soft fuzzy graphs. The current paper proposes the applications of min-max m -polar soft fuzzy graphs in decision making.

m – polar soft fuzzy graphs

Definition 2.1.[7] An m –polar soft fuzzy graph $\tilde{G}_{P,V} = (G^*, \tilde{\rho}, \tilde{\mu}, P)$ is a 4-tuple such that

- (a) $G^* = (V, E)$ is a simple graph
- (b) P is a nonempty set of parameters
- (c) $\tilde{\rho}: P \rightarrow F(V)$ (collection of all m –polar fuzzy subset in V)
 $e \mapsto \tilde{\rho}(e) = \tilde{\rho}_e$ (say)
 and $\tilde{\rho}_e: V \rightarrow [0,1]^m$
 $(x_1, x_2, \dots, x_m) \mapsto \tilde{\rho}_e(x_1, x_2, \dots, x_m)$
- (d) $\tilde{\mu}: P \rightarrow F(V \times V)$ (collection of all m –polar fuzzy subset in $V \times V$)
 $e \mapsto \tilde{\mu}(e) = \tilde{\mu}_e$ (say)
 and $\tilde{\mu}_e: V \times V \rightarrow [0,1]^m$
 $(x_1, x_2, \dots, x_m) \mapsto \tilde{\mu}_e(x_1, x_2, \dots, x_m)$

$(\tilde{\mu}, P)$ is an m -polar soft fuzzy set over E

- (c) $(\tilde{\rho}_e, \tilde{\mu}_e)$ is an m –polar fuzzy (sub) graph of G^* for all $e \in P$.

That is ,

$$\begin{aligned} \tilde{\mu}_e x_1(uv) &\leq (\tilde{\rho}_e x_1(u) \wedge \tilde{\rho}_e x_1(v)) \\ \tilde{\mu}_e x_2(uv) &\leq (\tilde{\rho}_e x_2(u) \wedge \tilde{\rho}_e x_2(v)) \\ &\dots\dots\dots \\ &\dots\dots\dots \\ \tilde{\mu}_e x_m(uv) &\leq (\tilde{\rho}_e x_m(u) \wedge \tilde{\rho}_e x_m(v)) \end{aligned}$$

for all $e \in P$ and $u, v \in V$. The m –polar fuzzy graph $(\tilde{\rho}_e, \tilde{\mu}_e)$ is denoted by $\tilde{H}_{P,V}(e)$ for convenience. In other words, an m –polar soft fuzzy graph is a parameterized family of m –polar fuzzy graphs.

m – PSF -Matrices

Definition 3.1. Let U be an initial universe, P be the set of parameters and $P \subseteq E$. Let (f_p, E) be an m -polar soft fuzzy set over U . Then a subset of $U \times E$ is uniquely defined by $R_p = \{(u, e) : e \in P, u \in f_p(e)\}$ which is called a relation from (f_p, E) . The characteristic function of R_p is written by $\mu_{R_p}: U \times E \rightarrow [0,1]^m$, where $\mu_{R_p}(u, e) \in [0,1]^m$ is the membership value of $u \in U$ for each $e \in P$.

| R_p | e_1 | e_2 | ... | e_n |
|----------|-----------------------|-----------------------|----------|-----------------------|
| u_1 | $\mu_{R_p}(u_1, e_1)$ | $\mu_{R_p}(u_1, e_2)$ | ... | $\mu_{R_p}(u_1, e_n)$ |
| u_2 | $\mu_{R_p}(u_2, e_1)$ | $\mu_{R_p}(u_2, e_2)$ | ... | $\mu_{R_p}(u_2, e_n)$ |
| \vdots | \vdots | \vdots | \ddots | \vdots |
| u_m | $\mu_{R_p}(u_m, e_1)$ | $\mu_{R_p}(u_m, e_2)$ | ... | $\mu_{R_p}(u_m, e_n)$ |

If $\alpha_{ij} = \mu_{R_p}(u_i, e_j)$. we can define a matrix

Ramkumar and Sridevi

$[\alpha_{ij}]_{m \times n} = \begin{pmatrix} \alpha_{11} & \alpha_{12} & \dots & \alpha_{1n} \\ \alpha_{21} & \alpha_{22} & \dots & \alpha_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ \alpha_{m1} & \alpha_{m2} & \dots & \alpha_{mn} \end{pmatrix}$ which is called an $m \times n$ m-polar soft fuzzy matrix of the fuzzy soft set (f_p, E) over U .

We can say that an m-polar soft fuzzy set (f_p, E) is uniquely characterized by the matrix $[\alpha_{ij}]_{m \times n}$ and both concepts are interchangeable. The set of all $m \times n$ m-polar soft fuzzy matrices over U will be denoted by $m - PSFM_{m \times n}$.

Example 3.2

Assume that $U = \{u_1, u_2, u_3, u_4\}$ is universal set and $E = \{e_1, e_2, e_3\}$ is set of all parameters if $P \subseteq E = \{e_1, e_3\}$. $f(e_1) = \left\{ \frac{u_1}{(0.3, 0.4, 0.5)}, \frac{u_2}{(0.4, 0.6, 0.7)}, \frac{u_3}{(0.7, 0.8, 0.4)}, \frac{u_4}{(0.6, 0.4, 0.2)} \right\}$, $f(e_3) = \left\{ \frac{u_1}{(0.7, 0.4, 0.5)}, \frac{u_2}{(0.6, 0.3, 0.7)}, \frac{u_3}{(0.7, 0.2, 0.6)}, \frac{u_4}{(0.9, 0.6, 0.4)} \right\}$ then the 3-polar soft fuzzy set (f_p, E) is parameterized family $\{f_p(e_1), f_p(e_3)\}$ of all 3-PSF set over U . Then, the relation form of (f_p, E) is written as

| R_p | e_1 | e_2 | e_3 |
|-------|---------------|---------------|---------------|
| u_1 | (0.3,0.4,0.5) | (0.0,0.0,0.0) | (0.7,0.4,0.5) |
| u_2 | (0.4,0.6,0.7) | (0.0,0.0,0.0) | (0.6,0.3,0.7) |
| u_3 | (0.7,0.8,0.4) | (0.0,0.0,0.0) | (0.7,0.2,0.6) |
| u_4 | (0.6,0.4,0.2) | (0.0,0.0,0.0) | (0.9,0.6,0.4) |

Hence the 3-polar soft fuzzy matrix $[\alpha_{ij}]$ is written as

$$\alpha_{ij} = \begin{pmatrix} (0.3,0.4,0.5) & (0.0,0.0,0.0) & (0.7,0.4,0.5) \\ (0.4,0.6,0.7) & (0.0,0.0,0.0) & (0.6,0.3,0.7) \\ (0.7,0.8,0.4) & (0.0,0.0,0.0) & (0.7,0.2,0.6) \\ (0.6,0.4,0.2) & (0.0,0.0,0.0) & (0.9,0.6,0.4) \end{pmatrix}$$

Product of m – PSF -matrices

Definition 4.1. Let $[\alpha_{ij}], [\beta_{ik}] \in m - PSFM_{m \times n}$ then And-product of $[\alpha_{ij}]$ and $[\beta_{ik}]$ is defined by $\wedge : m - PSFM_{m \times n} \times m - PSFM_{m \times n} \rightarrow m - PSFM_{m \times n^2}, [\alpha_{ij}] \wedge [\beta_{ik}] = [\gamma_{ip}]$, where $\gamma_{ip} = \min[\alpha_{ij}, \beta_{ik}]$ such that $p = n(j - 1) + k$.

Definition 4.2. Let $[\alpha_{ij}], [\beta_{ik}] \in m - PSFM_{m \times n}$ then Or-product of $[\alpha_{ij}]$ and $[\beta_{ik}]$ is defined by $\vee : m - PSFM_{m \times n} \times m - PSFM_{m \times n} \rightarrow m - PSFM_{m \times n^2}, [\alpha_{ij}] \vee [\beta_{ik}] = [\gamma_{ip}]$, where $\gamma_{ip} = \max[\alpha_{ij}, \beta_{ik}]$ such that $p = n(j - 1) + k$.

Definition 4.3. Let $[\alpha_{ij}], [\beta_{ik}] \in m - PSFM_{m \times n}$ then And-Not product of $[\alpha_{ij}]$ and $[\beta_{ik}]$ is defined by $\bar{\wedge} : m - PSFM_{m \times n} \times m - PSFM_{m \times n} \rightarrow m - PSFM_{m \times n^2}, [\alpha_{ij}] \bar{\wedge} [\beta_{ik}] = [\gamma_{ip}]$, where $\gamma_{ip} = \min[\alpha_{ij}, 1 - \beta_{ik}]$ such that $p = n(j - 1) + k$.

Definition 4.4. Let $[\alpha_{ij}], [\beta_{ik}] \in m - PSFM_{m \times n}$ then Or-Not product of $[\alpha_{ij}]$ and $[\beta_{ik}]$ is defined by $\bar{\vee} : m - PSFM_{m \times n} \times m - PSFM_{m \times n} \rightarrow m - PSFM_{m \times n^2}, [\alpha_{ij}] \bar{\vee} [\beta_{ik}] = [\gamma_{ip}]$, where $\gamma_{ip} = \max[\alpha_{ij}, 1 - \beta_{ik}]$ such that $p = n(j - 1) + k$.

Example 4.5.

Assume that $[\alpha_{ij}], [\beta_{ik}] \in 3 - PSFM_{2 \times 2}$ is given as follows

$$[\alpha_{ij}] = \begin{pmatrix} (0.0, 0.3, 0.4) & (0.8, 0.9, 0.6) \\ (0.2, 0.6, 0.7) & (0.3, 0.2, 0.6) \end{pmatrix} \quad [\beta_{ik}] = \begin{pmatrix} (0.6, 0.7, 0.3) & (0.4, 0.6, 0.8) \\ (0.4, 0.7, 0.6) & (0.3, 0.2, 0.5) \end{pmatrix}$$

Ramkumar and Sridevi

To calculate $[\alpha_{ij}] \wedge [\beta_{ik}] = [\gamma_{ip}]$, we have to find γ_{ip} for all $i = 1, 2$ and $p = 1, 2, 3, 4$. Let us find γ_{13} . Since $n = 2, i = 1$ and $p = 3$, we get $j = 2$ and $k = 1$ form $3 = 2(j - 1) + k$. Hence $\gamma_{13} = \min\{\alpha_{12}, \beta_{11}\} = \min\{(0.8, 0.9, 0.6), (0.6, 0.7, 0.3)\} = (0.6, 0.7, 0.3)$. If the additional $[\gamma_{ip}]$ elements can be located in a similar manner, We can obtain the matrix shown below.

$$[\alpha_{ij}] \wedge [\beta_{ik}] = [\gamma_{ip}] = \begin{pmatrix} (0.0, 0.3, 0.3) & (0.0, 0.3, 0.4) & (0.6, 0.7, 0.3) & (0.4, 0.6, 0.6) \\ (0.2, 0.6, 0.6) & (0.2, 0.2, 0.5) & (0.3, 0.2, 0.6) & (0.3, 0.2, 0.5) \end{pmatrix}$$

Similarly, we can also find products $[\alpha_{ij}] \vee [\beta_{ik}], [\alpha_{ij}] \underline{\vee} [\beta_{ik}], [\alpha_{ij}] \bar{\wedge} [\beta_{ik}]$.

m – PSF-min-max Decision Making

By utilising the m-psf min-max decision-making function, which is also defined here, we develop an m-psf min-max decision making (m-PSFmMDM) approach in the section. The approach chooses the best options from the available possibilities.

Definition 5.1. Let $[\gamma_{ip}] \in m - PSFM_{m \times n^2}, I_k = \{p: \exists i, \gamma_{ip} \neq 0, (k - 1)n < p \leq kn\}$ for all $k \in I = \{1, 2, \dots, n\}$. Then m-psf min-max decision function, abbreviated as m-PmM, is defined as follows

$$m - P m M: m - PSFM_{m \times n^2} \rightarrow m - PSFM_{m \times 1}, \quad m - P m M[\gamma_{ip}] = [\delta_{i1}] = [\min_k \{\rho_{ik}\}]$$

where $\rho_{ik} = \begin{cases} \max_{p \in I_k} \{\gamma_{ip}\}, & \text{if } I_k \neq \emptyset \\ 0 & \text{if } I_k = \emptyset \end{cases}$

The one column m-psf-matrix $m - P m M[\gamma_{ip}]$ is called min-max decision m-psf-matrix.

Definition 5.2. Let $U = \{u_1, u_2, \dots, u_n\}$ be an initial universe and $m - P m M[\gamma_{ip}] = [\delta_{i1}]$. Then, a subset of U can be obtained by using $[\delta_{i1}]$ as in the following way $optm[\delta_{i1}](U) = \{\delta_{i1}/u_i: u_i \in U, \delta_{i1} \neq 0\}$. This is referred as an optimum m-polar fuzzy set on U .

Now, utilising definition, the following algorithm can be used to create an m-PSFmMDM method.

Algorithm

- Step 1: The set P of choice parameters of Mr.X and Mrs. X is given as an input. A is a subset of P.
- Step 2: Give the m-polar soft fuzzy set $(\tilde{\rho}, P)$ and $(\tilde{\mu}, P)$ as input.
- Step 3: Construct the m-polar soft fuzzy graph $\tilde{G}_{P,V} = (G^*, \tilde{\rho}, \tilde{\mu}, P)$.
- Step 4: Take into an account of the m-polar fuzzy graph $\tilde{H}_{P,V}(e)$ along with its adjacency matrix form.
- Step 5: Find a convenient product of the m-PSF matrices.
- Step 6: Find a min-max decision m-PSF matrix.
- Step 7: Find an optimum m-polar fuzzy set on U . If it is more than one value in i any one of x_i could be taken.

Application

Imagine a real estate agent has a variety of plots $U = \{a_1, a_2, a_3\}$ that may be described by a set of parameters $P = \{e_1, e_2\}$. The values e_j stand for "RERA Approval" and "DTCP Approval," respectively, for $j = 1, 2$. Then, as an example, let's use the next. The m-psf max-min and m-psf max-max decision making methods can be defined in a similar manner and it is indicated respectively by (mPSFmMDM), (mPSFmmDM), and (mPSFMMDM). Depending on the nature of the problems, one of them may be more helpful than the others.

Example 7.1.

Assume Mr. X and Mrs. X, a married couple, visit the real estate agent to purchase a plot. If each partner must take into account their own set of parameters, We choose a plot using the m-PSFmMDM in the manner which is shown below.

Ramkumar and Sridevi

Assume that $U = \{a_1, a_2, a_3\}$ is a universal set and $P = \{e_1, e_2\}$ is a set of parameters. In the e_1 parameterized graph the plot a_1 represents three values namely inefficient soil, water, environment. Likewise, a_2 represents three values namely location, wind, surrounding and a_3 represents good soil, wind, urban area. The edge takes three values which represents electricity, sewage, gas connection. Similarly, In the e_2 parameterized graph the plot a_1 represents three values namely south facing, L shaped plot, cheap. Likewise, a_2 represents three values namely east facing, good location, circle and a_3 represents west facing, square, cheap. The edge takes three values which represents telephone service connection, garbage disposed, cable connection.

Step 1: First, Mr. X and Mrs. X have to choose the sets of their parameters, or attributes set

$$A = \{e_1 = DTCP Approval, e_2 = RERA Approval\}$$

Step 2: Let $(\tilde{\rho}, P)$ be the 3-polar soft fuzzy set on V that describes the value of the property depending on the parameter $e_1 = DTCP Approval, e_2 = RERA Approval$ respectively.

$$\tilde{\rho}(e_1) = \left\{ \frac{a_1}{(0.6, 0.7, 0.8)}, \frac{a_2}{(0.7, 0.9, 0.6)}, \frac{a_3}{(0.8, 0.6, 0.7)} \right\}, \tilde{\rho}(e_2) = \left\{ \frac{a_1}{(0.6, 0.8, 0.9)}, \frac{a_2}{(0.8, 0.7, 0.9)}, \frac{a_3}{(0.9, 0.7, 0.8)} \right\}$$

Let $(\tilde{\mu}, P)$ is the 3-polar soft fuzzy set on $E = \{a_1 a_2, a_1 a_3, a_2 a_3\}$ which describes the value of two plots corresponding to the given parameters $e_1 = DTCP Approval, e_2 = RERA Approval$ respectively.

$$\tilde{\mu}(e_1) = \left\{ \frac{a_1 a_2}{(0.6, 0.7, 0.6)}, \frac{a_1 a_3}{(0.4, 0.3, 0.2)}, \frac{a_2 a_3}{(0.7, 0.6, 0.6)} \right\}, \tilde{\mu}(e_2) = \left\{ \frac{a_1 a_2}{(0.3, 0.3, 0.2)}, \frac{a_1 a_3}{(0.7, 0.7, 0.8)}, \frac{a_2 a_3}{(0.4, 0.5, 0.6)} \right\}$$

Step 3 : Fig 1– Polar Soft Fuzzy Graphs

Step 4:

$$\tilde{H}_{P,V}(e_1) = [\alpha_{ij}] = \begin{pmatrix} (0.0, 0.0, 0.0) & (0.6, 0.7, 0.6) & (0.4, 0.3, 0.2) \\ (0.6, 0.7, 0.6) & (0.0, 0.0, 0.0) & (0.7, 0.6, 0.6) \\ (0.4, 0.3, 0.2) & (0.7, 0.6, 0.6) & (0.0, 0.0, 0.0) \end{pmatrix}$$

$$\tilde{H}_{P,V}(e_2) = [\beta_{ik}] = \begin{pmatrix} (0.0, 0.0, 0.0) & (0.3, 0.3, 0.2) & (0.7, 0.7, 0.8) \\ (0.3, 0.3, 0.2) & (0.0, 0.0, 0.0) & (0.4, 0.5, 0.6) \\ (0.7, 0.7, 0.8) & (0.4, 0.5, 0.6) & (0.0, 0.0, 0.0) \end{pmatrix}$$

Step 5:

$$\tilde{H}_{P,V}(e) = \begin{pmatrix} (0.0, 0.0, 0.0) & (0.3, 0.3, 0.2) & (0.7, 0.7, 0.8) & (0.6, 0.7, 0.6) & (0.6, 0.7, 0.6) & (0.7, 0.7, 0.8) & (0.4, 0.3, 0.2) & (0.4, 0.3, 0.2) & (0.7, 0.7, 0.8) \\ (0.6, 0.7, 0.6) & (0.6, 0.7, 0.6) & (0.6, 0.7, 0.6) & (0.3, 0.3, 0.2) & (0.0, 0.0, 0.0) & (0.4, 0.5, 0.6) & (0.7, 0.6, 0.6) & (0.7, 0.6, 0.6) & (0.7, 0.6, 0.6) \\ (0.7, 0.7, 0.8) & (0.4, 0.5, 0.6) & (0.4, 0.3, 0.2) & (0.7, 0.7, 0.8) & (0.7, 0.6, 0.6) & (0.7, 0.6, 0.6) & (0.7, 0.7, 0.8) & (0.4, 0.5, 0.6) & (0.0, 0.0, 0.0) \end{pmatrix}$$

Here, we use Or-product since Mr. X choice has to be considered.

Step 6: To calculate $mM([\tilde{H}_{P,V}(e_1)] \vee [\tilde{H}_{P,V}(e_2)]) = [\delta_{i1}]$. We have to find δ_{i1} for $i \in \{1, 2, 3\}$ to demonstrate, let us find δ_{31} . Since $i = 1$ and $k \in \{1, 2, 3\}$, $\delta_{31} = \min_k \{\rho_{3k}\} = \min\{\rho_{31}, \rho_{32}, \rho_{33}\}$. Here, we have to find ρ_{3k} for all $k \in \{1, 2, 3\}$ to demonstrate let us find ρ_{31} and ρ_{32} .

$$I_1 = \{P: \gamma_{ip} \neq 0, 0 < p \leq 3\} = \{1, 2, 3\} \text{ for } k = 1 \text{ and } n = 3.$$

$$I_2 = \{P: \gamma_{ip} \neq 0, 3 < p \leq 6\} = \{4, 5, 6\} \text{ for } k = 2 \text{ and } n = 3.$$

$$I_3 = \{P: \gamma_{ip} \neq 0, 6 < p \leq 9\} = \{7, 8, 9\} \text{ for } k = 3 \text{ and } n = 3.$$

Ramkumar and Sridevi

$$\rho_{31} = \max\{\gamma_{31}, \gamma_{32}, \gamma_{33}\} = \max\{(0.7, 0.7, 0.8), (0.4, 0.5, 0.6), (0.4, 0.3, 0.2)\} = (0.7, 0.7, 0.8)$$

$$\rho_{32} = \max\{\gamma_{34}, \gamma_{35}, \gamma_{36}\} = \max\{(0.7, 0.7, 0.8), (0.7, 0.6, 0.6), (0.7, 0.6, 0.6)\} = (0.7, 0.7, 0.8) \text{ and}$$

$$\rho_{33} = \max\{\gamma_{37}, \gamma_{38}\} = \max\{(0.7, 0.7, 0.8), (0.4, 0.5, 0.6)\} = (0.7, 0.7, 0.8) \text{ and}$$

$$\delta_{31} = \min\{\rho_{31}, \rho_{32}, \rho_{33}\} = \min\{(0.7, 0.7, 0.8), (0.7, 0.7, 0.8), (0.7, 0.7, 0.8)\} = (0.7, 0.7, 0.8).$$

Similarly, we can find $\delta_{11} = (0.7, 0.7, 0.8)$ and $\delta_{21} = (0.4, 0.5, 0.6)$. Ultimately, we are able to determine the m-psf min-max decision matrix.

$$mM([\tilde{H}_{P,V}(e_1)] \vee [\tilde{H}_{P,V}(e_2)]) = [\delta_{11}] = \begin{pmatrix} (0.7, 0.7, 0.8) \\ (0.4, 0.5, 0.6) \\ (0.7, 0.7, 0.8) \end{pmatrix}$$

Step 7: Finally, we can find an optimum 3-polar fuzzy set on U according to

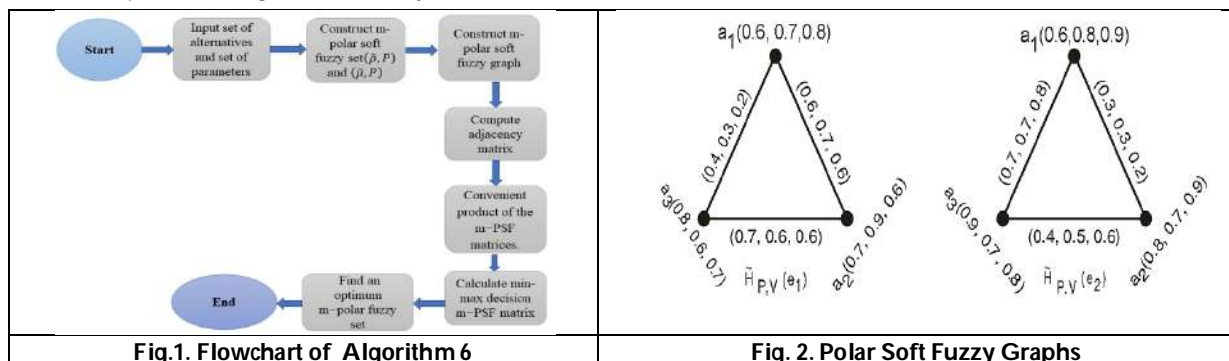

$mM([\tilde{H}_{P,V}(e_1)] \vee [\tilde{H}_{P,V}(e_2)]) \text{ opt } mM([\tilde{H}_{P,V}(e_1)] \vee [\tilde{H}_{P,V}(e_2)])(U) = \{(0.7, 0.7, 0.8)/a_1, (0.4, 0.5, 0.6)/a_2, (0.7, 0.7, 0.8)/a_3\}$. Where a_3 is an optimum plot to buy for Mr. X. Similarly, we can also use product $([\tilde{H}_{P,V}(e_1)] \wedge [\tilde{H}_{P,V}(e_2)]), ([\tilde{H}_{P,V}(e_1)] \bar{\wedge} [\tilde{H}_{P,V}(e_2)]), ([\tilde{H}_{P,V}(e_1)] \underline{\vee} [\tilde{H}_{P,V}(e_2)])$ for the other convenient problems.

CONCLUSION

This study has introduced the notions of m-polar soft fuzzy matrix and product of m-polar soft fuzzy matrix. These two matrices are imposed on m-polar soft fuzzy graph and detailed application has been explored.

ABSTRACT

Writing is an area of difficulty due to lack of knowledge about language learning strategies (LLS) in second language (L2) acquisition. Writing academic answers is majorly accounted for evaluation of students' academic performance, so comprehensively written answer scripts hold high academic worth for students in schools and colleges. This study, therefore, aims to delve into the domains of learning strategies used by the students of Grade IX, studying in a state board affiliated school, using a mixed method design consisting of classroom tests, self-designed activities, and Likert-scale questionnaires. A significant effect of age on the student performance such that majority (70%) of the students aged ≥ 14 years, while no such effect of gender was recorded. The better performance of higher age students can be due to more developed cognitive functions and better understanding skills than that of relatively younger ones. Further, based on the performance of all three achiever groups (AGs) in the different activity-based tests, all the participants were less skilled in logical arrangement of concepts and had poor reading skills. On the other hand, low achievers could not use spelling and vocabulary strategies as effectively as medium and high AGs. The correlation analysis confirmed significant effect of age on reading comprehension, spelling, vocabulary, and sentence formation strategies. A significant association of reading comprehension with spelling and vocabulary strategies further was also ascertained. The responses of students for the questionnaire indicated that though they had difficulty in understanding the terms and assignments, yet they did not feel any need to improve their reading and writing skills by adopting different strategies. The teacher's responses to the questionnaire revealed that unawareness

Priyanka Joshi and Arpit Kothari

among teachers about LLS was one of the limitations associated with lesser student engagement and performance in English writing tests and activities. These findings, thus, highlight the need to inculcate LLS at both student and teacher levels.

Keywords: Language Learning Strategies (LLS), Second Language Acquisition, Writing Skills, Strategies, Vocabulary.

INTRODUCTION

The research based on Language Learning Strategies (LLS) has had an immense global contribution in the understanding of Second Language Acquisition (Rubin 1975; Wenden 1986; Zhang 2005; Oxford 1998; Cohen 1991; Mu 2005). Oxford (1998) defined LLS as “steps taken by students to enhance their own learning and tools for active self-directed involvement in learning, which is essential for developing communicative competence”. Germane LLS have an impact on better and emphatic classroom participation and advancement in language learning of the English language learner as evident in the findings of many studies (Oxford 2016; Wong and Nunan 2011; Khansir, Dehkordi, and Mirzaei 2021). Lu and Li (2008) propound the incorporation strategy based instruction in curriculum to facilitate students’ use of LLS. Griffiths (2013) explains the relationship of autonomy and LLS as “strategies are an important element of learner autonomy, since it is by using strategies that learners are able to become autonomous”, thus it can be concluded that LLS are beneficial for both, teachers as well as learners. The aim of all appropriate LLS is directed towards L2 Learning competence and efficient L2 use. This means that not only acquiring the knowledge but also in understanding the correct methods of application of the acquired knowledge in actual situation(s). It is therefore bidirectional such that L2 learning aids L2 use and more interaction using L2 enhances L2 learning. Active realistic interaction is a mandatory requirement for the development of communication competence. LLS aid the learners to participate in actual situations of conversation. As per Oxford, language learning strategies are classified into direct and indirect strategies as summarised in Fig.1.

Language Learning Strategies in the Present Scenario

The polarised discussions on LLS (especially for the definitions of LLS) have seldom been able to deviate interest of researchers or scholars from continuing research in LLS. As a stark contrast, ever increasing studies have focussed to dig deep down and ascertain positive impact of strategy awareness, training and use by teachers, learners, curriculum designers and academicians. The incessant evolution of its categories since its advent, engirdles “metacognitive, cognitive and sociocultural dimensions” (Takeuchi 2019). As each individual possesses his/her own idiosyncratic approach to the teachers’ teachings, the “step learners take to enhance their language learning are seen as tangible and amenable to pedagogical intervention” (Pawlak 2021). The fresh vein of research in the area has encapsulated the (1) learner factors-cognition, metacognition, affective, peer-interaction, engagement, autonomy, anxiety, etc., (2) Teacher related factors -awareness of strategies, notions and practices (Kussin, Omar, and Kepol 2018), identification of learners use/absence of strategies, ways of incorporation of the strategies in classroom activities, situating correct strategy use, etc., (3) The external/environmental factors, institutional settings (classrooms, schools, colleges and university) social settings-interactions in family, peer group, society, library, modes of transport, etc.

Language Learning Strategies in India

Many scholars have extensively investigated in the domain of strategies majorly on cognitive and metacognitive strategies. Some others probed enquiries into the influences of demographic variations. A longitudinal study was conducted on the native students in Kerala in 2014 and the use of social learning strategy was studied. Harish (2014) compared the various LLS used by high and low achievers and reported that meta-cognitive strategies were majorly used by both high and low achievers, with only difference being that the high achievers used these strategies

**Priyanka Joshi and Arpit Kothari**

more frequently than the low achievers. Nation and Nation (2001) concluded that vocabulary is the “building block” of any language and is usually much higher in the native learner than in the non-native learner. Zarrin and Khan (2014), examined 46 undergraduate learners at Aligarh Muslim University, Aligarh, Uttar Pradesh, India, for their vocabulary learning strategies. They deduced, “Effective vocabulary learning and teaching strategies need to be incorporated into learners’ vocabulary learning strategies. Active listening which is rendered as a key to academic success has been associated with vocabulary acquisition, thus highlighted the importance, and need to inculcate vocabulary skills as a tool for effective English language teaching/learning. Additionally, Pushpa (2018), studied the development of the learner’s repertoire of vocabulary in her study of 80 tribal tertiary level students in Vishakhapatnam, Andhra Pradesh, India. The continued research results indicating the dearth of strategy trainings and practices; lead to the question about suboptimal use and/or absence of language learning strategies, especially in teachers and learners at less privileged economic set-ups.

Writing Strategies

According to Murphy and Zeng (2007), research findings on the use of LLS (writing strategy, mainly) for second language learning have emphasised that:

- L2 writers implement a wide range of general and specific strategic actions in their attempt to learn writing.
- given the socio- cognitive dimensions of composing, the L2 writer’s strategic behaviour is dependent on both learner-internal- external variable, and
- the writer’s strategic behaviour is mediated by the instruction received and can be modified through strategy instruction, although this finding needs further empirical validation.

The writing strategies have been classified by many experts, authors, and linguists. Arndt’s writing strategies were generated from think- aloud protocol analysis. Some other linguists who gave the classifications of writing strategies included Wenden (1991), Victori and Lockhart (1995), Mu (2005), Oxford (1998). It is impossible to frame a taxonomy of ESL writing strategies which is acceptable to all researchers because different researchers have different standards for the classification (Hsiao and Oxford 2002).

Role of Writing Strategies in the L2 Acquisition

As stated by Nunan (1999), the most difficult task to be done in language learning is to produce a coherent, fluent, and extended piece of writing, which is even more challenging for the learners of a second language. Writing is not an easy task. It needs many basic components as mechanics of writing, correct knowledge of punctuation, spelling, capitalization, vocabulary, etc. Writing in addition to being a skill of communication, is also important for the student’s linguistic accuracy and content organisation. Behera (2013) elaborates the factual transition of English Language Teaching (ELT) in India by gleaning the teaching methods beginning from Grammar Translation Method, Direct Method, Situational Language Teaching, upto inclusion of Communicative Competence in CBSE curriculum, English for Specific Purposes (ESP) in numerous Indian schools, etc. Introduction of language labs, satellite broadcast of English channels, and exposure to MNCs have resulted in a thrust to learn English language. Behera (2013) assigned a great value to communicative approach and highlights its ascendancy of sensitivity to the learner’s needs and responses. Recent studies have argued that although Communicative Language Teaching (CLT) highlights the importance of all four language learning skills namely, listening, speaking, reading, and writing, yet a major impediment to its successful implementation was outdated curriculum and ineffective pedagogy, because of which CLT has continued to be taught like GTM (Gulati, Arora, and Bhatt 2020).

Grammar plays another vital role in the expansion of the student’s syntactic fluency and accuracy. In the findings of Hinkel (2003), a corpus analysis of L1 and L2 college writer’s texts revealed that the L2 writers “employed excessively simple syntactic and lexical constructions” more often than those employed by their L1 counterparts” texts. Gulati, Arora, and Bhatt (2020) asserted that “grammar and vocabulary were important in addition to organisation of thoughts to articulate ideas with coherence and cohesion”.

Priyanka Joshi and Arpit Kothari

OBJECTIVES

People in India learn English for many reasons, particularly for academic and professional progression. Sometimes they wish to learn it for personal knowledge enrichment, while some other times to cope up with the technological advancements or simply for fun. Although the septuagenarian existence of the language English in independent India, has made its presence very vividly elaborate and widespread. However, when it comes to actual language acquisition in terms of usability and fluency, there are varied factors which hinder the use of the English language. Academically English is taught mainly for empowering the students with the attainment of grammatical, syntactic, lexical, and fluency prowess in this Second Language (L2) (Hindi or other regional languages being their first language (L1)). Writing answers is majorly accounted for evaluation of the student's academic performance, in addition to few reading tests. Consequently, the students are more inclined in securing scores/grades rather than learning the language. In a typical Indian foreign language classroom, each student is a distinct individual with his/her own learning pace and with different skills, Ranjan et al., (2021). The population of the current study is no exception to this characteristic uniqueness of individuality and makes a cogitatively justified sample. Therefore, the study aims to investigate the language learning strategies adopted by these students and to explore their writing strategies. The present study in congruence with the LLS, thus, focuses on a very important skill of L2 i.e., writing skills. Unable to observe the desired language use by the students, this study aims to address the following research questions:

- Is there any relationship between the use of language learning strategy (LLS) and language use by the participants of the study?
- Which group of achievers among the participants excel in the use of LLS?
- Which aspect of writing is found most difficult while writing English?
- How can LLS awareness help learners to improve their language use?

METHODOLOGY

The development of this study is a mixed method design. It is an inferential and statistical analysis of observations to support and quantify the findings. Academic scores and scores from self- designed instrument were used. Qualitative was analysed to assess strategy use.

In the present study, the following methods were adopted to evaluate the use of different language learning strategies and substrategies:

- **Direct Strategies**
 - Memory Strategies : *Taking notes, Making mental images.*
 - Cognitive Strategies : *Generating ideas, Revising, Clarifications, Retrieval, generated ideas, revised, clarified doubts, retrieved from past knowledge.*
 - Compensation Strategies : *Making guesses, using L1.*
- **Indirect Strategies**
 - Meta- cognitive Strategies: *Planning, Monitoring, Evaluating- Had read carefully, was focused, checked, and identified problems.*
 - Affective Strategies : *Getting feedback- Asked support from peers and teachers.*
 - Social Strategies : *Resourcing- referred dictionary and others books*

The writing outputs by the students were examined to deduce uses of the above-mentioned categories by the individual students.

**Priyanka Joshi and Arpit Kothari****Sample Population**

The present study was conducted on 42 students of class IX of Rajasthan Board of Secondary Education (RBSE) affiliated School of Jaipur, Rajasthan, India. The size of the classroom was of 48 students, representing a mixed population in terms of gender and age. General common characteristics of the students were as follows:

- These students had been studying English for past eight years.
- As they were belonging to the same school, they were getting lessons from the same teacher in the given academic session.
- They were well- aware of the examination systems. It was the same for all of them in the given academic session.
- They were mostly belonging to similar economic background and social set- ups. (Middle Income Group)
- They did not have much economic liberties, and hence very less technological access.

Test Instruments

The students were given four written activities (Annexure 1-4) which were designed based on the students familiarity to the topics (Holi is a well-known festival, Crossword had clues from their current subjects, in picture comprehension they had the picture of rural Rajasthan) and in consultation with exercises from Murphy (2018) and Flowerdew (2017) as described below:

Activity 1 - Holi

This activity included a passage on famous festival called Holi celebrated across India. Hence, the familiarity of the activity was of high level for the students. The students were supposed to identify the appropriate options and filled them up correctly in the gaps.

Activity 2 - Crossword

The second activity was a crossword puzzle to be filled with the comprehension of the given clues. The students had studied the answers in their academic lessons of all subjects.

Activity 3 - Picture Comprehension

Students were asked to complete open-ended blanks in paragraph after observing a picture which was depicting a rural set up mostly seen in the villages of Rajasthan.

Activity 4 - Unseen comprehension passage

The students already had practice of writing answer to unseen passage. The last activity brought to light their capacities in understanding the unseen passage of a general topic-based on good health. Based on these activities their spelling, vocabulary, reading comprehension, sentence formation, and logical arrangement of concepts were evaluated. Their written answers were analysed to study the various language learning strategies they had applied; knowingly or unknowingly. The memory strategies, cognitive strategies, metacognitive strategies, affective strategies, social strategies, and compensation strategies were observed and analysed. Further, the scores obtained by these students in their unit tests given by their teacher were also considered to identify high, medium, and low achievers. Apart from this, 5-point Likert scale questionnaires were designed for both students and teachers after consulting Background questionnaire, Teacher questionnaire, Strategy Instruction questionnaire for writing, and Strategy Inventory for Language Learning [SILL]. Reliability of both questionnaires were tested using Cronbach's alpha before administering them to the subjects and was determined to be 0.55 and 0.7 for student and teacher questionnaire, respectively which confirmed their internal consistency.

Data Collection

The academic scores of these 42 students were primarily considered from a written test administered to them by their academic teacher. From these scores, student achievement score (Z) was calculated. The Z score then facilitated to categorise the students as High Achievers, Medium Achievers, and Low Achievers. Then, they were given the Quantitative (4 written activities) and the Qualitative (questionnaire) tests. The primary data was collected, and

**Priyanka Joshi and Arpit Kothari**

analysis of the data was done. This included observation of the actual classes conducted by the language teacher of the grade IX students. The teacher's methods of instructions were noted. The students were noticed for their behavioural, academic and peer interactions. Further, the teacher and the students were informally asked questions and other details pertaining to their classroom's interactions and the activities in the school, their personal details etc. The researcher also tried to get verbal reports from the students only to conclude that out of the total sample population only 15% students completed tasks. Hence, the verbal reports only denoted that the majority students had difficulties in speaking skills (mostly due to lack of vocabulary).

The researchers closely skimmed the daily reports (answer notebooks) of the students to view the writing patterns of individual students and the methods of feedback adapted by the teachers on the written transcripts. A detailed analysis of the primary data was done by the researcher to study the level of grammar, spelling, and vocabulary, sentence formation, reading comprehension, and writing strategies employed by the students. The details of the findings are given in the results section. The evaluation of the answers given by the students were assessed in accordance with the evaluation's schemes adopted by the teachers of these students.

Data Analysis

The calculation of the student achievement score was done considering the unit test score of the individual student. Unit test is a periodical assessment of written responses of the students by their academic teachers. The students were awarded scores out of a total 50 marks. Using the formula $Z=(X-M)/SD$, the standard score was calculated. Here, Z denotes the standard score, X denotes the score of the individual student, M denotes the mean value of all the marks secured by the students and SD denotes the standard deviation of the scores. Thus, based on the student achievement scores the students were divided into three categories (high, medium, and low achievers). Further, IBM SPSS statistics software was used to perform ANOVA and post hoc tests for check the difference in scores of different achiever groups.

RESULTS AND DISCUSSION**Population Descriptive**

The demographic distribution of the sample population (participants) had been provided in Fig. 2. The age of participants ranged between 11 years to 16 years with an average age of 13.6 ± 0.14 years. Among 42 participants, 54% were girls with age between 11 – 16 years, while that of boys ranged between 12 – 16 years

Based on the scores obtained by the participants in their classroom written test, they were classified into following three categories:

- High achievers : Z score > 0.5
- Medium achievers : $0 < Z \text{ score} < 0.5$
- Low achievers : Z score < 0

The gender and age wise distribution of the achievers has been provided in Table 1. Further, chi-square test revealed that the age of participants significantly affected the Z-score such that among high achievers, majority (70%) of the students aged ≥ 14 years, while majority (89%) of those aged between 12-14 years were either medium or low achievers. The better performance (in terms of high Z-score) of higher age students can be due to more developed cognitive functions and better understanding skills than that of relatively younger ones. On the contrary, gender of the participants did not reflect any kind of influence on the student scores, as deduced from the output of chi-square test. This further confirmed that gender does not have any significant influence on the development of cognitive and meta-cognitive functions, at least at the younger age.

**Priyanka Joshi and Arpit Kothari****Assessment of Performance in Different Activities****Performance in Activity 1**

The scores of participants ranged between 6 – 10 with the average score of 8.9 ± 0.2 . The average score of all three achiever groups was comparable and the difference in their scores was statistically non-significant (at $P < 0.05$), indicating that the strategies used by all three groups of achievers could have been same, or in other words all three groups had similar kind of approach for attempting the activity (Table 2). For current study, activity 1 was used to evaluate the one out of the five tested strategies, which is *logical arrangement of concepts*. The results indicate that since the average score of each group of achievers ranged between 8.7 – 9, the participants can be said to be less skilled in logical arrangement of concepts (Table 2). Further, no gender or age-based biasness was recorded in the scores of the participants.

Performance in Activity 2

The scores of participants ranged between 2 – 15 with the average score of 12.6 ± 0.5 . Based on their score, significant differences were noted among participants of different achiever groups (Table 2), indicating variations in the skills/strategies used by the participants of each group. *Spelling* and *vocabulary* of the students were assessed through this activity and the statistical analysis revealed that low achievers could not use these strategies as well as the high achievers, thus making it difficult for them to solve the crossword. Further, correlation analysis also revealed that the performance of students was significantly related with age ($r = 0.69$) and reading comprehension ($r = 0.4$). Vocabulary and spelling go together as without enough knowledge of words, one cannot express in correct form, and even if the words are known without a know-how to spell a word, it is near to impossible for someone to convey their expression correctly in writing.

Activity 3

The scores of participants ranged between 3 – 14 with the average score of 9.9 ± 0.4 . This activity was used to test whether the participants were able to utilise *sentence formation* strategy. The statistical analysis revealed that there was no significance difference in the scores of the students from different achiever groups (Table 2). The less score in activity 3 could also be related to their weaker ability for logical arrangement of concepts as concluded from the analysis of activity 1 scores. Correlation analysis revealed significant correlation ($r = 0.48$) between the ability of the participants to use sentence formation strategy and their age.

Activity 4

The scores of participants ranged between 1 – 9 with the average score of 6.1 ± 0.2 . All the achiever groups performed worse in this activity, which was basically used to assess whether they could utilise reading comprehension skills/strategies (Table 2). In this activity, participants of all achiever groups attained only ~20% - 30% marks, which indicated their inability for using reading skills. The correlation analysis validated a significant association of reading comprehension strategy with that of spelling and vocabulary ($r = 0.4$) and age of the participants ($r = 0.53$).

Response of Students

Responses for majority of the questions were similar for all the three achiever groups, and the average response score for all the questions and all the three groups ranged between 3 – 5 (Fig. 3). However, for Q9 - Q12, the average response score was very less (less than 3), which indicated that very few students either never or only rarely/sometimes made notes while reading, write e-mails, compose a poem, write an article or story, get help from family member for writing assignments. The responses also revealed that though majority (~64%) of the students agreed that they had carefully read the questions before writing the answers, yet only few (~2%) of them could understand the question in a single reading. The reason for the poor performance of students could also be attributed to the fact that only some of them either always or mostly referred extra books/material for completion of their assignments (~31%) and/or used dictionary to find meaning of new terms (~39%). Further, majority of the students did not feel any need to improve their writing skills, while only few (~23%) strongly felt they can improve their writing skills. This indicated that though they had difficulty in understanding the terms/assignments, yet they did not feel any need to improve their reading/writing skills by adopting different strategies. Each question in the

**Priyanka Joshi and Arpit Kothari**

questionnaire explained the strategy used by the student participants while taking up different activities, and thus the mean score of the responses obtained for each question were further used to assess the extent at which different strategies were used by them (Fig. 4). These responses clearly explained the reasons for the poor performance of the participants in the activities assigned to them, and thus explains their weaker spelling, vocabulary, and other strategies.

Response of Teachers

According to their teachers, these students were attentive in the class, yet choose to remain non-participative in active spoken discussions. Sardonicly, despite continued motivation they remain extremely reticent, except 2-3 students who were enthusiastic. Further, the methods, modes, and strategies of instruction/teaching were evaluated based on the responses of 10 teachers on a 5-point Likert scale questionnaire. The responses of teachers revealed that majority (70%) of them mostly or always used English as mode of communication with the students, and 50% of them communicated in L2 with their colleagues and staff in the school, which not only allows them to improve their fluency in L2, but also encourages students to follow the same practice as students at this stage generally tend to idealise their teachers. From the responses it was also noted that only 20% of the teachers plan writing activities or games other than that given in syllabus and consulted reference books for preparation of their grammar lectures. Further, the average scores (based on the responses) for each question as depicted in Fig. 5 clearly highlights the need for improving teaching methods and for development of activity-based learning strategies for increasing student engagement in the classroom. The unawareness among teachers about language learning strategies can also be considered as one of the limitations associated with lesser student engagement and/or performance in English writing tests/activities

DISCUSSION**Writing as an area of difficulty**

Although the students could read and sometimes also understand the questions or given task, they lack in coherent expression accuracy and logical arrangement of thought. Poor knowledge of vocabulary and inability to understand grammatical forms possess problems of framing meaningful sentence. There is very little or no conversation among peer group and complete absence of conversation outside the classroom. Hence, there is practically zero interaction.

Writing as a necessity

The learners are aware that writing is very important for them to score better grades. They also know writing can improve with practising. Yet, they are unclear about correct ways and methods of practising. They are strategically lacking in their approach to learning English as a writing skill.

- All the students need more practice in reading tasks to improve the components of comprehension (decoding skills, inferential, knowledge, grammar knowledge, identification of punctuation marks etc.) (Prater 2014):
- The vocabulary depth knowledge of aspects of each word (I.S P Nation 1990) is dependent on cognitive and meta cognitive strategies.
- In the given activities the students had used many strategies, thinking, planning, organisation, evaluation, monitoring etc. there by, cognitive, meta cognitive strategies were employed by high and medium achievers.
- In addition to these observations, most LA students used more sub-strategies of avoidance and use of L1.
- Owing to their lack of knowledge of grammar rules, vocabulary, although their reading comprehension is stronger, the students had difficulties in sentence formation and logical unified thought. For example, problem using main verbs after modal auxiliaries.

**Priyanka Joshi and Arpit Kothari**

An example problem of use of main verb after modals:

He decided that he would Prahlad. (devoured/ destroy)

He decided that he would devoured Prahlad. (Incorrect Response)

From the verbal feedback, it was confirmed from the students that they did not understand the meaning of the term 'devoured'. But around only 5% high achievers' learners deduced that 'would destroy' is the correct form and would 'devoured' is faulty. Another feature is to understand that the absence of a strategies approach of retraining or rehearsing did not have led to noticing the 'would kill' in the already given passage. Majority of the students did not have corroborated 'would kill' and 'would destroy'. Hence the lack of strategies was evident.

CONCLUSION

Writing as a skill is a challenging task for English with respect to the second language or foreign language (ESL/EFL). Diligent application of learning strategies will ameliorate the writing skills of the students to excel in their target like responses. It will enable them to express themselves with greater clarity and proficiency; and along with it improves reading, listening, and speaking skills of the second language. As I.S.P Nation opines: "An essential part of the reading skill is the skill of being able to recognize written forms and to connect them with their spoken forms and their meaning". The job of the teachers is to themselves be more efficient and skilled when teaching the students about the correct use of writing strategies. Writing being complex and a time-consuming skill to be acquired, therefore, the role of writing strategies becomes pivotal. When the students will be well- trained in their strategic approach and use, their acquisition of writing skills will be accentuated. The new experience will motivate them further for striving excellence. For the students, therefore, it is required that they should be redirected into the direction of appropriate use of strategies according to their respective individual needs. Both, the teacher and the taught, need to be aware of the language learning strategies for harmonious implementation and accentuation in student engagement and autonomy. Writing as a skill is challenging; yet learning by strategic disposition will render convivial learning culmination.

ACKNOWLEDGEMENT

We need to thank everyone who assisted us with composing this paper. We owe them a great deal. As well as the researchers and writers who had composed papers on a connected point and utilized their references to direct us down a surprising way that permitted us to conveniently complete our article.

ABSTRACT

In this current work six different exfoliating soaps were attempted, the first five soaps namely tomato, papaya, turmeric honey, *Aloe vera* orange peel, and charcoal-coffee soap, were prepared by melt and pour method using various commercial soap bases that were purchased from vendors. In addition to this, the sixth soap was formulated by cold process method. Several characteristics including colour, odour, pH, foam height, foam retention, antibacterial property, saponification value, and percentage moisture content, were assessed for the developed soaps. The resultant soap products were found satisfactory which is detailed in results and discussion. Moreover, *Aloe vera* orange peel soap, which was made using a melt pour bases, provided the most promising outcomes among all the exfoliating soaps prepared by melt and pour method. Further, *Aloe vera* orange peel was used to make cold process soap using soapcalc calculator. In this method *Aloe vera* (2%), shea butter, mango seed butter, cocoa butter, coconut oil, olive oil, castor oil, and Sodium hydroxide lye were used in the formulation as suggested by soapcalc

Shashank Nayak et al.,

calculator. Surprisingly, the attempt of cold process soap gave fruitful results as that of melt and pour method.

Keywords: Soapcalc calculator, melt and pour method, saponification value, antimicrobial activity.

INTRODUCTION

Soap is an alkaline metal salt of long-chain fatty acids, can be made from coconut oil, palm oil, kernel oil, linseed oil, olive oil, and castor oil. Soaps are available in solid bars or viscous liquids, sodium hydroxide and potassium hydroxide are used for hard as well as soft soaps respectively. Soap can be produced either by two methods

1. Traditional method- Soap produced by saponification of animal fat or oil with alkaline source.
2. Modern methods- Soap is produced by saponification of vegetable oil with alkaline source. The details of the modern methods are given below [1,2]

a) Cold Process method [3,4,5]

In cold process method, Lye is added to oil mixture and saponified by hand blending, then transferred to soap moulds for solidification.

Advantages of Cold process method

1. Formulators can customize ingredients to suit consumers personal preferences.
2. Fresh ingredients like milk and fruit/vegetable purees can be used by controlling the saponification process by altering lye concentration.
3. Cold process is ideal for suspending heavier additives.

Disadvantages of Cold process method

1. Cold process soap must be prepared with sodium hydroxide lye, which is hazardous if not handled properly.
2. It takes 4-6 weeks for cold process soap to solidify in the moulds. As a result, the process is time-consuming.
3. Certain colourants, notably those based on mica or FD&C, deteriorate in the high pH environment of cold process soap. Fragrance oils can react with the high pH of cold process soap in negative ways, causing acceleration, ricing, or seizing.
4. Fragrance oils with a high vanilla content may turn cold process soap brown and vanilla colour stabiliser is unreliable in cold process soap.
5. Since the batter for cold process soap is opaque, glitter does not display well inside the soap.

b) Melt pour method

The saponified soap bars can be purchased from the suppliers which can be used in this process. These saponified bars are melted using a double boiler or an oven, depending on the amount of soap needed. Herbal, vegetable, and fruit extracts are also added to the melted formulation before being transferred to moulds for solidification of soap. Lastly, the resulting soaps are subjected to evaluation criteria detailed in research journals.

Advantages of melt pour method

1. As the base has already been saponified, using concentrated lye is not necessary.
2. Protective glasses is not necessary because formulators are not working with the lye.
3. Melt and pour soap takes less time to make as it hardens within 2 to 4 hours.
4. In melt and pour soap, fragrance oils do not cause acceleration, ricing, or seizing.
5. To stop vanilla from discolouring soap, vanilla colour stabiliser can be used.

Shashank Nayak et al.,

6. Light can pass through translucent melt and pour soaps like Clear, Aloe Vera, Honey, etc. to create glittery and sparkly soap.

7. Melt and pour soap works well to produce incredibly straight, clean layers. Just make sure there is some 99% isopropyl alcohol available so the layers adhere to one another.

Disadvantages of melt pour method

1. Extra glycerine found in melt and pour soap is prone to glycerine dew or perspiration.

2. Since saponification has already occurred in the soap bars, the formulators are unable to select the oils or butters that will be included in the soap.

3. Stability problems can occur when fresh ingredients such as milk and purees are introduced to these melted bases.

4. Melt and pour soap is very thin and fluid once it has melted. If they are not introduced when the soap is cooled, larger additions tend to sink to the bottom of the soap.

5. Melt and pour soap immediately cools and sets. Hence, some swirls that can be created with cold process soap cannot be attempted with melt and pour method.

6. If melt and pour soap gets too hot, it could burn. The base is thick, gloopy and challenging to deal with once it has been burned.

Benefits of fruits and herbs in soap preparation.

Papaya fruit [6]

Vitamin A and C are abundant in papaya fruit. The fruit contains the enzymes papain and chymopapain, which have antibacterial, antifungal, and antiviral properties. Vitamin A promotes the growth of new skin cells and lessens the appearance of blemishes and dark patches on the skin's surface. Vitamin C inhibits skin pigmentation and functions as an antioxidant. The papain enzyme aids in removing dead skin cells from the epidermis of the skin, rejuvenating it. Its property is used to treat acne by unclogging clogged pores, as an analgesic for insect stings, for skin whitening, etc.

Tomato fruit [7]

Tomatoes have high levels of vitamins C, K, and A. Moreover, it includes lycopene which can be used to treat a variety of skin conditions. Many benefits include better eye sight, stronger bones, maintenance of a healthy heartbeat. From a cosmetic standpoint, tomatoes aid in removing excess sebum from the skin, removing dead skin cells, preventing acne, brightening the skin due to the presence of vitamins C, E, and beta carotene, relieving skin irritation, anti-inflammatory properties, reducing the signs of ageing by tightening the pores due to the presence of vitamins and lycopene.

Turmeric [8]

The active component of Turmeric referred to as *Curcuma longa*, is curcumin. When administered topically and eaten orally, it has several advantages like in the treatment of atopic dermatitis, acne, psoriasis, scabies, facial photoaging.

Honey [9]

Honey is frequently used to moisturise and soften skin. According to Pauline M. et al., honey has a variety of benefits, including antibacterial, anti-inflammatory, anticancer, and antifungal properties.

Aloe vera [10]

Aloe vera is utilised because it has antibacterial, wound-healing, wrinkle-prevention, and antioxidant properties.

Orange peel [11]

It aids in skin cleansing, moisturises, and tones the skin in addition to aiding in skin lightening and brightness. Moreover, it contains anti-inflammatory, antioxidant and anti-acne properties.

Shashank Nayak et al.,

Activated charcoal [12]

In addition to clearing acne and other facial imperfections, activated charcoal also aids in skin whitening.

Coffee [13]

Cellulite reduction, UV protection, anti-inflammatory properties, and under-eye redness are all reduced by coffee.

Advancement in the soap industries

The manufacturing of herbal soaps by new enterprises and cottage industries has skyrocketed from the last one decade. Unfortunately, because of their inadequate understanding of saponification, they frequently produce soap with stability problems and pH imbalances, which causes skin irritation in customers. As a result, attempts are being made in this current work to obtain several soap bases from the E Commerce website and prepare the exfoliating soap using the melt and pour bases. Many assessment criteria from the literature were applied to the manufactured soap. Also, utilising the soapcalc calculator, the best soap from the preceding were used for cold process soap preparation. This calculator aids in the right choice of lye concentration based on the saponification value of the oils that were used in the formulation creating a wide variety of exfoliating soap and evaluating it so that the final consumers receive stable and higher quality soaps.

MATERIALS AND METHODS

Castor oil, olive oil, coconut oil, liquid colour, fragrance oil, moulds and other bases needed for making melt and pour soap were purchased from the retailers. The benzyl alcohol was procured from Vasa Scientific in Bangalore. Underneath Table No. 1 gives the details about the melt and pour base.

Melt and Pour method

Preparation of Papaya soap using melt and pour base (F1)

100 g of papaya were weighed, cut into small pieces, and then processed into a fine paste in a home mixer without the addition of water. Ayurdaily Khadi Transparent Ultra Clear Glycerine Pour and Melt soap Base, 500 g, was melted in a 1000 ml beaker on water bath using the double boiler method at a temperature of 100°C. With a silicon spatula, 8 spoons of papaya puree, weighing about 50 g, were added to the melted base and thoroughly combined. Then, using a graduated pipette, benzyl alcohol was added in a volume of 5.5 ml at a concentration of 1%. Before solidification, the 1000 ml beaker was removed from the water bath and brought to congealing temperature. Three drops of orange liquid dye and five drops of rose fragrance was added. The melted base was then combined with 5 vitamin E capsules (Evion 400), placed to soap moulds lubricated with glycerine, and allowed to solidify for 3 hours at room temperature. Finally, the soaps were demoulded and subjected to a varied evaluation parameters including testing for clarity, colour, pH, foam forming ability, foam retention, moisture content, saponification value, and antimicrobial activity. Further, these evaluation methods were followed for F2 to F6 also.

Preparation of Tomato soap using melt and pour base (F2)

The tomato was weighed (50 g), cut into small pieces, and then processed into a fine paste in a home mixer without the use of water. 500 g of Ayurdaily Khadi Transparent Ultra Clear Glycerine Pour and Melt base that is free of SLS and parabens was melted in a 1000 ml beaker by the double boiler method (100°C). With the help of silicon spatula, 4 spoons of tomato puree weighing around 20 g was added to the melted base. Further, by using a graduated pipette 5.2 ml (1%) benzyl alcohol was added. Before hardening, 1000 ml beaker containing melted base was removed from the water bath and to this mixture 5 drops of the jasmine fragrance was added. In addition to this, 5 vitamin E capsules (Evion 400) was added, finally the base was transferred to the pre prepared glycerine lubricated soap moulds and allowed to solidify for 3 hours (25°C). The soaps were demoulded and evaluated.

Shashank Nayak et al.,

Preparation of Turmeric honey soap using melt and pour base (F3)

The 3 gm of freshly pulverized turmeric powder was weighed and set aside. Bodhichitta Glycerine Honey Ultra Melt and Pour soap base weighing 500 g was melted using the double boiler method in a 1000 ml beaker on a water bath(100°C). 3 g of turmeric powder was added to the molten base and thoroughly combined using silicon spatula. Further, 5 ml (1%) benzyl alcohol was added. To the above content, the unique fragrance known as Ylang Ylang(5 drops) along with 5 vitamin E capsules (Evion 400) was added. This resultant mixture was placed to the glycerine lubricated soap moulds and allowed to solidify for 3 hours (25°C). The soaps were demoulded and assessed for its quality.

Preparation of Aloe vera orange peel soap using melt and pour soap base (F4)

One whole orange fruit was used to produce orange peel. The fresh orange peel was separated, sun dried and milled to obtain fine orange peel powder. Purenso Melt and Pour Aloe vera Soap Base (500 g) was taken and melted in a 1000 ml beaker using water bath by double boiler method (100°C). 4 g of orange peel powder was accurately weighed and transferred to the molten base and thoroughly stirred using silicon spatula. To this, 5.0 ml (1%) of benzyl alcohol was added. At congealing temperature, the beaker was removed from the water bath and one drop of orange liquid dye, 5 drops of Mandarin fragrance was added. The resultant mixture was blended with 5 vitamin E capsules (Evion 400). Further, this blended molten mass was poured to the glycerine lubricated soap mould and allowed to solidify for 3 hours (25°C). The demoulded soaps were later evaluated.

Preparation of Charcoal Coffee soap using melt and pour soap base (F5)

The 500 g of Vedanum Ultra-Premium Charcoal Melt and Pour Base was used to produce the soap, melted in 1000 ml beaker using double boiler method in a water bath (100°C). Four sachets of most widely used branded marketed coffee powder was dissolved in around 10 ml of water and added to the melted base. Further, 5.0 ml (1%) of benzyl alcohol was added. The mixture was taken out from the water bath, 5 drops of menthol as well as 3 drops of chocolate essence (Morioc brand) were added. The melted mixture as later transferred to glycerin-greased soap moulds and allowed to set for three hours at 25° C. The demoulded soaps are later processed for varied quality assessments.

Preparation of Aloe vera orange peel soap (F6) by cold process method using soap calc calculator.

Login to the soap calc calculator using the following link

<http://www.soapcalc.net/calc/soapcalcwp.asp>

How to use soap calc calculator

1. Select the type of lye- Click on NaOH for hard soap preparation by cold process method.
2. Select weigh of oils- For ease of use select grams and enter the quantity requires (500 g- Approx 7 soaps was obtained each weighing 100 grams each).
3. Enter lye concentration
 - Enter % (This % can be changed depending on type of oil used)
 - Low water- 50% (50% NaOH+50% Water) – Fast drying- Hard soap
 - Medium Water- 33% (33% NaOH+ 67 % Water)
 - High Water- 25% (25% NaOH+ 75% Water)- Long time to dry- Leads to shrinkage of soap surface.Hence approximately 40 % was selected.
 - Find out NaOH and Water concentration at the end of the calculation. Check whether the properties like ideal hardness, cleansing, conditioning, bubbly, and creamy properties.
4. Super fat- Ideal 4% of excess oil is added to prevent drying of soap.
5. Enter oils and bases which is preferred to be present in soap.
E.g.- Olive oil- 30%, Coconut oil- 20%, Castor oil- 20%, Mango seed butter-2%, Shea butter -3%, Cocoa butter-25%.
6. Click on calculate recipe then click on view and print recipe.
7. Amount of NaOH and Water required for saponification will be displayed
(Water-103.75 g,NaOH-69.16 g)

Shashank Nayak et al.,

8. All the oils and butters are weighed and melted on the water bath. Prescribed amount of lye is added to the melted butter containing oil and homogenized for 5 minutes using silverson homogenizer. 1 teaspoon full of orange peel powder and 2 % freshly prepared *Aloe vera* juice were added. In addition, 5 ml of mandarin fragrance, orange dye 5 drops, cosmetic preferred preservative benzyl alcohol 7 ml was added. Lastly, the molten mass is transferred to moulds to fulfil the need of solidification.

9. Demoulding followed by evaluation of soaps were performed after 4 weeks as mentioned in F1 to F5.

By using this formula, the evaluation parameters were found within the limits. Which, is shown in soapcalc calculator. The detailed calculations were represented in figure 1,2 respectively.

Evaluation Parameters

Physical Parameters [14]

The clarity, colour, and odour tests were performed on each of the six prepared soaps. The clarity and colour analysis was performed by placing the soap in front of a white background and allowed to check the soaps clarity followed by colour. Later, odour of the formulated soaps was self analyzed and reported.

pH of soap [15]

To make the 10% soap solution, 10 g of the particular soap were dissolved in distilled water further volume was made upto 100 ml using distilled water in a volumetric flask. Initial pH testing of the soap was done using pH paper, and a follow-up pH test was carried out using a prepared 10% soap solution using pH electrode (Digital Control Dynamics pH meter).

Foam height and foam forming ability [15]

The 1 gm of individual soap was weighed and dissolved in 50 ml of distilled water. Further, the solution was transferred to graduated 100 ml measuring cylinder and was subjected to stroking for 25 times. The foam height was recorded at 0 time and after 10 minutes.

Foam Retention [14]

To make 1% soap solution, 1 g of individual soap was dissolved in 100 ml of distilled water. Further, 25 ml of the above 1% soap solution was transferred in a 100 ml graduated measuring cylinder. The measuring cylinder swung ten times by covering the hands to the opening provided at one end of the cylinder. The amount of foam volume was measured for every minute during the first four minutes.

Moisture content determination [15]

The 5 g of individual soap was placed to a china dish which was dry and moisture-free. The porcelain dish was heated on the water bath for around two hours (101° C). The formulas listed below were used to assess the moisture content.

$$\text{Moisture Content of the soap} = \frac{\text{Difference in weight of the soap}}{\text{Initial weight of the soap}} \times 100$$

Determination of saponification value [15]

In a conical flask holding 15 ml of 0.5 M KOH, 2 g of soap was added. The mixture was heated for one hour (55° C). To this, 2 drops of phenolphthalein indicator was added, titrated against 0.5 M HCL until the pink colour turns to pale yellow colour.

Antimicrobial activity test [15]

The organisms like *E. coli*, *S. aureus*, and *Klebsiella* were used to assess the produced soaps antimicrobial properties using the cup plate method and the disc diffusion method. Using 1% soap solution and a standard disc containing 5 micro gram of ciprofloxacin, the antibacterial activity of all soap formulations were assessed. The organisms were added to 25 ml of sterile nutrient agar, which was then transferred to a plate. Once the seeded agar was solidified, a cavity was created using a sterile borer and then filled with 0.1 ml of soap solution. A ciprofloxacin disc was used as

Shashank Nayak et al.,

a point of comparison. The zones of inhibition were estimated after the plates had been incubated for 24 hours at 37^o C.

RESULTS AND DISCUSSION

Physical Parameter

All the prepared soaps were opaque when observed under a white background for the purpose of clarity and colour test. Further, Due to the addition of intense aromatic fragrance, the soaps had an aromatic fragrance. The figures 3, 4 depicts the soaps that were been demoulded.

pH determination

The prepared soaps had a pH which was found to be in the range of pH 6.7 to pH 10.0. All the formulated soaps had the pH that was closer to the pH as that of commercially available soaps like Dove (pH 7), Lifebuoy (pH 11–11.25), Mysore sandal (pH 8) etc. The outcomes showed that none of the manufactured soaps pH had an adverse impact on the skin. Table 3 represents the list of the prepared soaps pH values.

Foam Height/ Foam Forming Ability

The ability of all the manufactured soaps was to create foam without the addition of additional surfactant specifically Sodium Lauryl Sulphate (SLS) as well as other surfactants. When compared to all the formulated soaps, F1 and F2 had considerably less ability to create the foam. The foam height of various prepared soaps is mentioned in Table 4. Further, Figure 5, 6 illustrates the *Aloe vera* orange peel soap (F4) foam height before and after shaking respectively.

Foam Retention

The long-lasting ability of the foam can be indicated by its foam retention. Greater the retention of foam indicates higher the contact time on the skin surface. The foam retention test helps us to assess how well soaps can deliver their qualities on the surface of skin. The table 5 reports the foam retention of various prepared soaps. The figure 7, 8 depicts the charcoal coffee soap(F5) foam retention.

Moisture content determination

The amount of moisture in the soap sample was found using the method of moisture content determination. Higher stability of the formulated soaps was achieved with the lower moisture content. The moisture content was reduced to the most possible extent with an intention to have better control on deterioration of soaps. The table 6 provides a list of the prepared soaps moisture content. The figure 9, 10, 11, and 12 illustrates the moisture content of papaya (F1) and tomato soap (F2).

Determination of saponification value

The amount of potassium hydroxide (in mg) needed to completely saponify 1 g of fat or oil is known as the saponification value. It has been discovered that, the fats or oils with a high saponification value are more suited for manufacturing soap. The formulated soaps had a saponification value in the range of 79.49 g/ml (F3) to 445.77 g/ml (F4) and details of saponification values were shown in table 7.

Antimicrobial activity test.

The zone of inhibition for various formulated soaps were showcased in figure 13. Further, table 8, 9 provides the zone of inhibition values. For *Klebsiella*, formulation F1 (papaya soap) and F2 (tomato soap) demonstrated higher zones of inhibition. Higher zones of inhibition for *S. aureus* were seen for formulation F2 (tomato soap), F3 (turmeric honey soap), and F5 (charcoal coffee soap). F4 (*Aloe vera* orange peel soap) and F3 (Turmeric honey soap) shown higher zone of inhibition for *E. coli* However, the zone of inhibition was comparatively less for soap prepared by cold process method (F6).

Shashank Nayak et al.,

CONCLUSION

All the exfoliating soaps that were made using the melt and pour technique (F1 to F5), the cold-process technique (F6) passed mentioned quality assessment criteria's outlined in the literatures. The outcomes showed that, the composition of the oils employed by the manufacturer of soap base for saponification differed, which had a greater impact on the results obtained for melt and pour soap formulations. On the other hand, the formulated soap (F6) obtained from cold process method passed the quality evaluation parameters as well. The intention of the study was to compare the soap formulation prepared by different methods. The results obtained from this lab scale study highly encourages the use of natural ingredients such as papaya, tomato, orange peel, *Aloe vera*, charcoal, honey etc., over the synthetic chemical source for the soap manufacturers on bulk scale. The application of soapcalc calculator gives the assurance of simplification for setting of formulae for the oils and butter selection with proper saponification value which plays a pivotal role in successful soap formulation. Finally, the overall study gives a strong conclusion about the usage of marketed soap bases, oils, butter it can be concluded from this study that we can buy melt and pour bases for the appreciable results. The soap formulation studies can be further explored from other soap bases and herbal extracts available from wide range of cosmetic soap base suppliers.

ACKNOWLEDGEMENT

We thank Rajiv Gandhi University of Health Sciences, Bengaluru for funding Rs. 15,000 for this research work (Project code - UG22PHA436). We also thank Dr. A. P. Basavarajappa for providing all the necessary facilities for the smooth conduct of work.

ABSTRACT

In this work, introduced the definition of Homomorphic, Box dot and Star product of Neutrosophic Graphs. We have developed the degree of the nodes in Homomorphic, Box dot and Star Product of Neutrosophic Graphs, $NG_H \diamond NG_H''$, $NG_B \square NG_B''$, and $NG_S * NG_S''$.

Keywords: Product of Neutrosophic Graphs, Homomorphic, Boxdot and Star Product of Neutrosophic Graphs, Degree of a nodes on Homomorphic, Box dot and Star Product of Neutrosophic Grphs.

Mathematics Subject Classification 2020: 05C07, 05C72, 05C76.

INTRODUCTION

Fuzzy graph is the generalization of the ordinary graph. In such cases, it is natural to deal with the uncertainty using the methods of fuzzy logic. It is Zadeh's contribution that he provided us with a formal framework that allows it to capture the meaning of vague concepts: the theory of fuzzy sets. Rosenfeld introduced fuzzy graph in 1975. The operations of Cartesian product, compositions of fuzzy graphs were defined by J.N. Mordeson and C.S. Peng [1]. Developed the degree of a node in some fuzzy graphs, A. Nagoorgani and K. Radha [3]. The ordinary sets, fuzzy sets allow the partial membership of their elements, the degree of membership being an expressed on a continuous scale from 0 to 1. $[0, 1]$ is called the valuation set of λ . The reference set N may be finite or infinite, but we restrict to only finite sets. In the present study we have been developed the Homomorphic, Box dot, and Star Product of

Balasubramanian and Rajeswari

Neutrosophic Graphs. The operations on (crisp) graphs such as Homomorphic, Box dot and Star products are extended to degrees of node on Neutrosophic Graphs and some of their properties.

Preliminaries

Definition 1. A fuzzy graph $G = (\lambda, \eta)$ is a pair of functions $\lambda: N \rightarrow [0,1]$ and $\eta: N \times N \rightarrow [0,1]$, where for all $a, b \in N$, we have $\eta(a, b) \leq \min(\lambda(a), \lambda(b))$.

Definition 2. A neutrosophic graph is of the form $NG : (N, L)$ be a crisp graph with non-empty node set N and L the edge set is a subset of the unordered pair $N \times N$. Let the membership functions on the node set and edge set is given by $\lambda: N \rightarrow [0,1]$ and

$\eta: N \times N \rightarrow [0,1]$; for all $a_i \in N$,
 $\lambda_T(a_i): N \rightarrow [0,1]$, $\lambda_I(a_i): N \rightarrow [0,1]$, and $\lambda_F(a_i): N \rightarrow [0,1]$. for all $a_i, a_j \in L$,
 $\eta_T(a_i, a_j): L \rightarrow [0,1]$, $\eta_I(a_i, a_j): L \rightarrow [0,1]$, and $\eta_F(a_i, a_j): L \rightarrow [0,1]$.

Also, $0 \leq \lambda_T(a_i) + \lambda_I(a_i) + \lambda_F(a_i) \leq 3, \forall a_i \in N$
 $0 \leq \eta_T(a_i, a_j) + \eta_I(a_i, a_j) + \eta_F(a_i, a_j) \leq 3, \forall a_i, a_j \in L$.

Definition 3. Let $NG:(N, L)$ be a Neutrosophic Graphs, then the degree of a node $a_i \in N$ is obtained as follows

$$d_{NG}(a_i) = (d_T(a_i), d_I(a_i), d_F(a_i))$$

$$d_T(a_i) = \sum_{a_i a_j \in L} \eta_T(a_i a_j)$$

$$d_I(a_i) = \sum_{a_i a_j \in L} \eta_I(a_i a_j)$$

$$d_F(a_i) = \sum_{a_i a_j \in L} \eta_F(a_i a_j)$$

That is, the sum of the line membership function of the truth, indeterminacy, and falsity values incident at the node a_i .

MAIN RESULT

Homomorphic product of Neutrosophic Graphs

Definition 4. Let $NG'_H = (\lambda_1, \eta_1)$ and $NG''_H = (\lambda_2, \eta_2)$ be two Neutrosophic Graphs corresponding to the crisp graph $(NG'_H)^* = (N_1, L_1)$ and $(NG''_H)^* = (N_2, L_2)$. Then the Homomorphic Product of Neutrosophic Graphs is defined NG'_H and NG''_H is a pair of functions $(\lambda_1 \diamond \lambda_2, \eta_1 \diamond \eta_2)$ with underlying node set

$\lambda_1 \diamond \lambda_2 = \{(a_i, b_i) : a_i \in N_1 \text{ and } b_i \in N_2\}$ and underlying line set
 $\eta_1 \diamond \eta_2 = \{((a_i, b_i)(a_j, b_j)) : a_i = a_j, b_i, b_j \in L_2 \text{ or } a_i a_j \in L_1, b_i, b_j \notin L_2\}$ with
 $\lambda_1 \diamond \lambda_2(a_i, b_i) = \min((\lambda_1)_T(a_i), (\lambda_2)_T(b_i))$, where $a_i \in N_1$ and $b_i \in N_2$.
 $(\eta_1 \diamond \eta_2)((a_i, b_i)(a_j, b_j)) = \min((\eta_1)_T(a_i, a_j), (\eta_2)_T(b_i, b_j))$, if $a_i = a_j$ and $b_i, b_j \in L_2$.
 $(\eta_1 \diamond \eta_2)((a_i, b_i)(a_j, b_j)) = \min((\eta_1)_T(a_i, a_j), (\lambda_2)_T(b_i), (\lambda_2)_T(b_j))$, if $a_i a_j \in L_1$ and $b_i, b_j \notin L_2$.

Degree of a Node in Homomorphic product of Neutrosophic Graphs

Definition 5. Let $NG'_H = (\lambda_1, \eta_1)$ and $NG''_H = (\lambda_2, \eta_2)$ be two Neutrosophic Graphs with underlying node sets N_1 and N_2 and line sets L_1 and L respectively. Then the degree of a node (a_i, b_i) in Homomorphic Neutrosophic Graphs Product

Balasubramanian and Rajeswari

$$\begin{aligned}
 NG'_H \diamond NG''_H &= d_{T(NG'_H \diamond NG''_H)}(a_i, b_j) \\
 &= \sum_{a_i=b_j \text{ and } b_i, b_j \in L_2} \min((\lambda_1)_T(a_i), (\eta_2)_T(b_i, b_j)) \\
 &+ \sum_{a_i, a_j \in L_1 \text{ and } b_i, b_j \notin L_2} \min((\eta_1)_T(a_i, a_j), (\lambda_2)_T(b_i), (\lambda_2)_T(b_j)) \\
 &= \sum_{a_i=b_j \text{ and } b_i, b_j \in L_2} \min((\lambda_1)_T(a_i), (\eta_2)_F(b_i, b_j)), \text{ if } NG''_H \text{ be complete.} \\
 &= \sum_{a_i=a_j} ((\lambda_1)_T(a_i)), \text{ if } \lambda_1 \leq \eta_2.
 \end{aligned}$$

$$\begin{aligned}
 NG'_H \diamond NG''_H &= d_{I(NG'_H \diamond NG''_H)}(a_i, b_j) \\
 &= \sum_{a_i=b_j \text{ and } b_i, b_j \in L_2} \min((\lambda_1)_I(a_i), (\eta_2)_I(b_i, b_j)) \\
 &+ \sum_{a_i, a_j \in L_1 \text{ and } b_i, b_j \notin L_2} \min((\eta_1)_I(a_i, a_j), (\lambda_2)_I(b_i), (\lambda_2)_I(b_j)) \\
 &= \sum_{a_i=b_j \text{ and } b_i, b_j \in L_2} \min((\lambda_1)_I(a_i), (\eta_2)_F(b_i, b_j)), \text{ if } NG''_H \text{ be complete.} \\
 &= \sum_{a_i=a_j} ((\lambda_1)_I(a_i)), \text{ if } \lambda_1 \leq \eta_2.
 \end{aligned}$$

$$\begin{aligned}
 NG'_H \diamond NG''_H &= d_{F(NG'_H \diamond NG''_H)}(a_i, b_j) \\
 &= \sum_{a_i=b_j \text{ and } b_i, b_j \in L_2} \max((\lambda_1)_F(a_i), (\eta_2)_F(b_i, b_j)) \\
 &+ \sum_{a_i, a_j \in L_1 \text{ and } b_i, b_j \notin L_2} \max((\eta_1)_F(a_i, a_j), (\lambda_2)_F(b_i), (\lambda_2)_F(b_j)) \\
 &= \sum_{a_i=b_j \text{ and } b_i, b_j \in L_2} \max((\lambda_1)_F(a_i), (\eta_2)_F(b_i, b_j)), \text{ if } NG''_H \text{ be complete.} \\
 &= \sum_{a_i=a_j} ((\lambda_1)_F(a_i)), \text{ if } \lambda_1 \leq \eta_2.
 \end{aligned}$$

Here, summation is taken over $\lambda_1(a_i)$ when $b_i, b_j \in L_2$. If NG''_H be complete.

Then the term $\lambda_1(a_i)$ occurs here $(|N_2| - 1)$ times.

Therefore, $d_{NG'_H \diamond NG''_H} = (|N_2| - 1) ((\lambda_1)_T(a_i))$.

The results also apply for the indeterminacy and falsity values.

$$\begin{aligned}
 d_{NG'_H \diamond NG''_H} &= (|N_2| - 1)\lambda_1(a_i). \\
 &= (3-1) (0.1) \\
 &= 2(0.1) = 0.2 \\
 &= 2(0.3) = 0.6 \\
 &= 2(0.9) = 1.8
 \end{aligned}$$

Boxdot Product of Neutrosophic Graph:

Definition 6. Let $NG'_B = (\lambda_1, \eta_1)$ and $NG''_B = (\lambda_2, \eta_2)$ be two Neutrosophic Graphs corresponding to the crisp graph $(NG'_B)^* = (N_1, L_1)$ and $(NG''_B)^* = (N_2, L_2)$. Then the Box dot Product of Neutrosophic Graphs is defined NG'_H and NG''_H is a pair of functions

$(\lambda_1 \boxtimes \lambda_2, \eta_1 \boxtimes \eta_2)$ with underlying node set

Balasubramanian and Rajeswari

$\lambda_1 \boxtimes \lambda_2 = \{(a_i, b_i) : a_i \in N_1 \text{ and } b_i \in N_2\}$ and underlying line set
 $\eta_1 \boxtimes \eta_2 = \{(a_i, b_i)(a_j, b_j) : a_i = a_j, b_i, b_j \notin L_2 \text{ or } a_i a_j \in L_1, b_i, b_j \notin L_2\}$ with
 $(\lambda_1 \boxtimes \lambda_2)_T(a_i, b_i) = \min((\lambda_1)_T(a_i), (\lambda_2)_T(b_i))$, where $a_i \in N_1$ and $b_i \in N_2$.
 $(\eta_1 \boxtimes \eta_2)_T((a_i, b_i)(a_j, b_j)) = \min((\lambda_1)_T(a_i), (\lambda_2)_T(b_i), (\lambda_2)_T(b_j))$, if $a_i = a_j$ and $b_i, b_j \notin L_2$.
 $(\eta_1 \boxtimes \eta_2)_T((a_i, b_i)(a_j, b_j)) = \min(\eta_1(a_i, a_j)_T, \lambda_2(b_i), \lambda_2(b_j))$ if $a_i a_j \in L_1$ and $b_i, b_j \notin L_2$.

Degree of a Node in Boxdot product of Neutrosophic Graphs

Definition 7. Let $NG'_B = (\lambda_1, \eta_1)$ and $NG''_B = (\lambda_2, \eta_2)$ be two Neutrosophic Graphs with underlying node sets N_1 and N_2 and line sets L_1 and L_2 respectively. Then the degree of a node (a_i, b_i) in Box dot Neutrosophic Graphs Product

$$\begin{aligned} NG'_B \boxtimes NG''_B &= d_{T(NG'_B \boxtimes NG''_B)}(a_i b_i) \\ &= \sum_{a_i=b_i \text{ and } b_i, b_j \notin L_2} \min((\lambda_1)_T(a_i), (\lambda_2)_T(b_i), (\lambda_2)_T(b_j)) \\ &+ \sum_{a_i a_j \in L_1 \text{ and } b_i, b_j \notin L_2} \min((\eta_1)_T(a_i a_j), (\lambda_2)_T(b_i), (\lambda_2)_T(b_j)) \\ &= \sum_{a_i=b_i} (\lambda_1)_T(a_i) + \sum_{a_i a_j \in L_1} (\eta_1)_T(a_i, a_j), \text{ if } \eta_1 \leq \lambda_2 \text{ and } \lambda_1 \leq \lambda_2. \end{aligned}$$

$$\begin{aligned} NG'_B \boxtimes NG''_B &= d_{T(NG'_B \boxtimes NG''_B)}(a_i b_i) \\ &= \sum_{a_i=b_i \text{ and } b_i, b_j \notin L_2} \min((\lambda_1)_I(a_i), (\lambda_2)_I(b_i), (\lambda_2)_I(b_j)) \\ &+ \sum_{a_i a_j \in L_1 \text{ and } b_i, b_j \notin L_2} \min((\eta_1)_I(a_i a_j), (\lambda_2)_I(b_i), (\lambda_2)_I(b_j)) \\ &= \sum_{a_i=b_i} (\lambda_1)_I(a_i) + \sum_{a_i a_j \in L_1} (\eta_1)_I(a_i, a_j), \text{ if } \eta_1 \leq \lambda_2 \text{ and } \lambda_1 \leq \lambda_2. \end{aligned}$$

$$\begin{aligned} NG'_B \boxtimes NG''_B &= d_{T(NG'_B \boxtimes NG''_B)}(a_i b_i) \\ &= \sum_{a_i=b_i \text{ and } b_i, b_j \notin L_2} \max((\lambda_1)_F(a_i), (\lambda_2)_F(b_i), (\lambda_2)_T(b_j)) \\ &+ \sum_{a_i a_j \in L_1 \text{ and } b_i, b_j \notin L_2} \max((\eta_1)_F(a_i a_j), (\lambda_2)_F(b_i), (\lambda_2)_T(b_j)) \\ &= \sum_{a_i=b_i} (\lambda_1)_F(a_i) + \sum_{a_i a_j \in L_1} (\eta_1)_F(a_i, a_j), \text{ if } \eta_1 \leq \lambda_2 \text{ and } \lambda_1 \leq \lambda_2. \end{aligned}$$

Balasubramanian and Rajeswari

Star Product of Neutrosophic Graph

Definition 8. Let $NG'_S = (\lambda_1, \eta_1)$ and $NG''_S = (\lambda_2, \eta_2)$ be two Neutrosophic Graphs corresponding to the crisp graph $(NG'_S)^* = (N_1, L_1)$ and $(NG''_S)^* = (N_2, L_2)$. Then the Star Product of Neutrosophic Graphs is defined NG'_S and NG''_S is a pair of functions

$(\lambda_1 * \lambda_2, \eta_1 * \eta_2)$ with underlying node set $\lambda_1 * \lambda_2 = \{(a_i, b_i) : a_i \in N_1 \text{ and } b_i \in N_2\}$ and underlying line set $\eta_1 * \eta_2 = \{((a_i, b_i)(a_j, b_j)) : a_i = a_j, b_i, b_j \notin L_2 \text{ or } a_i, a_j \in L_1, b_i, b_j \in L_2\}$ with $(\lambda_1 * \lambda_2)_T(a_i, b_i) = \min((\lambda_1)_T(a_i), (\lambda_2)_T(b_i))$, where $a_i \in N_1$ and $b_i \in N_2$.
 $(\eta_1 * \eta_2)_T((a_i, b_i)(a_j, b_j)) = \min((\lambda_1)_T(a_i), (\lambda_2)_T(b_i), (\lambda_2)_T(b_j))$, if $a_i = a_j$ and $b_i, b_j \notin L_2$.
 $(\eta_1 * \eta_2)_T((a_i, b_i)(a_j, b_j)) = \min((\eta_1)_T(a_i, a_j), (\eta_2)_T(b_i, b_j))$ if $a_i, a_j \in L_1$ and $b_i, b_j \notin L_2$.
 and also for the indeterminacy, falsity.

Degree of a Node in Star product of Neutrosophic Graphs

Definition 9. Let $NG'_S = (\lambda_1, \eta_1)$ and $NG''_S = (\lambda_2, \eta_2)$ be two Neutrosophic Graphs with underlying node sets N_1 and N_2 and line sets L_1 and L respectively. Then the degree of a node (a_i, b_i) in Star Neutrosophic Graphs Product

$$\begin{aligned}
 NG'_S * NG''_S &= d_{T_{(NG'_S * NG''_S)}}(a_i b_i) \\
 &= \sum_{a_i, a_j \in L_1 \text{ and } b_i, b_j \in L_2} \min((\eta_1)_T(a_i, a_j), (\eta_2)_T(b_i, b_j)) \\
 &+ \sum_{a_i = a_j \text{ and } b_i, b_j \notin L_2} \min((\lambda_1)_T(a_i), (\eta_2)_T(b_i), (\eta_2)_T(b_j)) \\
 &= d_{T_{(NG'_S * NG''_S)}}(a_i b_i) \\
 &= \sum_{a_i, a_j \in L_1} \min((\eta_1)_T(a_i, a_j)) \text{ if } NG''_H \text{ be complete and } \eta_1 \leq \eta_2. \\

 \end{aligned}$$

Balasubramanian and Rajeswari

$$\begin{aligned}
 &= \sum_{a_i, a_j \in L_1} \max((\eta_1)_F(a_i, a_j)) \text{ if } NG_H'' \text{ be complete and } \eta_1 \leq \eta_2. \\
 &= d_{F(NG_S')} (a_i) \\
 &= d_{F(NG_S' * NG_S'')} (a_i, b_i) \\
 &= \sum_{b_i, b_j \in L_2} \max((\eta_2)_F(b_i, b_j)) \text{ if } NG_H'' \text{ be complete and } \eta_2 \leq \eta_1. \\
 &= d_{F(NG_S'')} (b_i)
 \end{aligned}$$

Here, both Neutrosophic graphs are complete and $\eta_1 \leq \eta_2$. Then degree of the node (a_i, b_i) in the star Neutrosophic product $NG_S' * NG_S'' = d_{T(NG_S' * NG_S'')} (a_i, b_i) = d_{T(NG_S')} (a_i)$.

The results also apply for the indeterminacy and falsity values.

CONCLUSION

In this paper, Developed by the Homomorphic, Box dot and Star product of Neutrosophic Graphs. Determined the degree of the Nodes in Homomorphic, Box dot and Star product of Neutrosophic Graphs, $NG_H' \diamond NG_H''$, $NG_B' \square NG_B''$, and $NG_S' * NG_S''$ in terms of the degree of nodes of NG' and NG'' under some certain conditions and illustrated them with examples and figures. We have developed some formulas under some certain conditions. In the Neutrosophic environment it is reasonable to discuss in degree of node on product of Homomorphic, Box dot and Star product of Neutrosophic Graphs.

ABSTRACT

In the viral dynamic study, the viral infection problems are considered as non-linear random effect and mixture effect models. The random effect problem mostly constructed by ordinary differential equations. Non-linear mixed effects models facing the computational complexity To predict viral replication of parameters from the differential equation So, researchers follow, Bayesian approach for estimation of non-linear random effects models. In this paper, the researcher developed new model for viral replication and derived predictive distribution for viral replication using truncated Cauchy distribution and find the predictive mean and variance of viral replication.

Keywords: prior distribution, posterior distribution, predictive distribution, viral replication.

INTRODUCTION

AIDS in humans is caused by a virus named HIV. In the last three decades, the mathematical models have been developed to be valuable understanding the HIV infection of viral dynamic. Most of the analytical study of the mathematical model is the interaction between CD_4^+T cells, and infective virus. These models are mostly non-linear mixed effect model. These models are based on the uninfected CD_4^+T cells, infected CD_4^+T and free virus [perelson et.al, (1993)]. In 1995, the viral replication was thought to be a slow process. Three groups of (Ho.et .al, 1995, wei et. al, 1995, Nowak et. al, 1995) reported analysis of the kinetics of the viral decay. All three groups reported similar

Meenakshi et al.,

finding that HIV replication was a fast process with the plasma RNA (concentration). Carried out parameter estimation by fitting a fixed-effects non-linear regression model followed by perelson et.al, (1996). Nelson and perelson(2002) have developed and analyzed, the viral dynamic models are system of differential equations. Solving differential equation are very difficult so recently most of the researchers follows the Bayesian Methodology. This paper concentrate derives the new predictive distribution for viral replication from the infected CD_4^+T cells and find the prediction mean and variance of the viral replication.

REVIEW OF LITERATURE

In the mid-1990s, for example, several publications provided strong support for the existence of a high rate of HIV replication and clearance in infected individual (Ho et. al, 1995, Wei et. al, 1995, Perelson et. al, 1996). It is now commonly believed that in vivo, on the order of 100 virions are created and then destroyed every day by the immune system (Perelson et.al, 1997; Mittler et.al, 1998), Ramratnam et.al, 1999). The high replication rate implies that the virus has an enormous number of opportunities to mutate and evolve into a drug-resistant strain. In many of the aforementioned papers, the viral clearance rate was identified by modeling the disease pathogenesis with a system of deterministic differential equations (DE), numerically calculating a solution, and then fitting the results with plasma viral load data (using a ordinary least squares (OLS) approach), (Perelson et. al, 1996, 1997; Ramratnam et. al, 1999). the use of delay differential equations (DDE)in modeling the eclipse phase was heavily debated (Herz et.al, 1996; Grossman et al., 1998); (Mittler et .al, 1998); (Nelson et .al, 2000), (the knowledge gained from using models of disease pathogenesis has, in many cases, suggested novel design ideas for treatment strategies as well as laboratory experiments. (Farhad Yahgmaei, Manoochehr Babanezhad, and Omid S. Moghadam (2013)) have derived the Bayes estimators for the scale parameter in IWD by considering quasi, gamma, and uniform priors' distributions under the square error, entropy, and precautionary loss functions. (Joshua T. Herbeck, John E. Mittler (2014))have proposed a Trends in HIV virulence have been monitored since the start of the AIDS pandemic, as studying HIV virulence informs our understanding of HIV epidemiology and pathogenesis. Here, their model changes in HIV virulence as a strictly evolutionary process, using set point viral load (SPVL) as a proxy, to make inferences about empirical SPVL trends from longitudinal HIV cohorts. They have developed an agent-based epidemic model based on HIV viral load dynamics. (J. Dureau and K. Kalogeropoulos (2016))have proposed Evaluation of large-scale intervention programs against human immunodeficiency virus (HIV) is becoming increasingly important, but impact estimates frequently hinge on knowledge of changes in behavior such as the frequency of condom use over time, or other self-reported behavior changes, for which they generally have limited or potentially biased data.

They employed a Bayesian inference methodology that incorporates an HIV transmission dynamics model to estimate condom use time trends from HIV prevalence data. Estimation is implemented via particle Markov chain Monte Carlo methods, applied for the first time in this context (Ana Jarne, Daniel Commenges et al (2017))have proposed Combination Antiretroviral Therapy (ART) succeeds to control viral replication in most HIV infected patients. This is normally followed by a reconstitution of the $CD_4 + T$ cells pool; however, this does not happen for a substantial proportion of patients. For these patients, an immunotherapy based on injections of Interleukin 7 (IL-7) has been recently proposed as a co-adjuvant treatment in the hope of obtaining long-term reconstitution of the T cells pool. Several questions arise as to the long-term efficiency of this treatment and the best protocol to apply. Mathematical and statistical models can help answering these questions. They developed a model based on a system of ordinary differential equations and a statistical model of variability and measurement. (Delson Chikobvu and Claris Shoko (2018)) have Inclusion of a viral load principal component improves the efficiency of the model. The new viral load covariate helps to explain the component of mortality/transition, which could not be explained by the CD_4 cell counts alone. CD_4 cell counts are categorized to define the states for the Markov model. Results show that the expected percentage prevalence gives almost a perfect fit of the observed data. Conclusion: The orthogonal viral load covariate along with CD_4 baseline, gender, non-adherence to treatment and age in years (y) variables play a significant role in modelling HIV/AIDS progression based on both CD_4 cell counts and viral load monitoring.(G. Meenakshi and S. Saranya (2018))have focused on the affected people's recurring viral replication. The lysing $CD_4 +$

Meenakshi et al.,

T cells count and viral replication in CD4 + T cells are modelled using stochastic processes. (Koyachew Yenaneh Tadege, Tigist Jegnow, Kasim Mohammed Yesuf (2019))the study’s objectives are to examine the fundamental drivers of CD4cell count and track its evolution among HIV-positive people who have been visiting the university of Gondar Referral ART clinic from December 2012 to December 2017. Subjects and Approaches As a result of the outcome variable's repeated measurements throughout time and the correlation of those measurements inside the patient. (G. Meenakshi and S. Saranya (2021)) have explained the hierarchical Bayesian approach is used to find the predictive distribution of viral load, which is other way of finding the solution. If the prior distribution is only conjugate, the expression of Predictive Distribution is simple. The study of viral replication not at all considering as a single period, it is based on the number of succeeding periods. So, they developed a New Auto Regressive moving average Growth process with (p, q) order for the viral replication and finds its predictive distribution. This research follows design the new model and deriving predictive distribution of viral replication based on Bayesian procedure based truncated Cauchy distribution

NEWMODEL FOR VIRAL REPLICATION

In the viral dynamic, analytical study of a Mathematical model for the interaction between infective virus, cells and cytotoxic- lymphocytes (CTL), which incorporates a discrete intracellular delay in time between infection of cell and the emission of viral particles on a cellular level. The unit of the individual genome measured by a DNA molecule. The cell DNA molecules is denoted by α . If the cell’s genome size is small. It has only one molecule. If the genome size is large, it has ($\alpha=1250$) DNA molecules. Similarly viral genome DNA molecules is denoted by β . If the viral genome DNA molecules is denoted by β . If the viral genome size is large, it has($\beta=2500$) protein molecules. In the final viral replication stage, if cell’s DNA and viral genome are large. They have ($\alpha\beta$) time proteins chain formed, In the protein chain each protein converted into a new virus of the blanket cells when it is broken out of lycin cells. The multiplication of large genome of DNA molecules (α) and viral large genome protein molecules(β). That is minimum viral replication per cell $\alpha\beta=2500$, and maximum viral replication per cell $\alpha\beta=3125000$ per period.

Let $x(t)$ be the number of CD_4^+T generation per period and $y(t)$ is number of CD_4^+T to be infected. λ is the rate of change the infected CD_4^+T cell from the $x(t)$ and $y(t) = \lambda e^{x(t)}$. The infected CD_4^+T cells at the time period tare denoted by the differential equation such as

$$\frac{dy(t)}{dt} = x(t) - \lambda e^{x(t)} - \delta(t) - Y(t)$$

where,

$\delta(t)$ is number of natural deaths of CD_4^+T cells per period, and $Y(t)$ - non-infected CD_4^+T cell and λ – rate of change of infected CD_4^+T cell for the time period. The infected CD_4^+T cell per mm^3 per period is random variable(X). Its replication range is $1 < x < \alpha\beta$. Infected CD_4^+T cell as the random variable. Which is assumed to the truncated Cauchy distribution, and its density function is given by

$$f(x) = \frac{1}{(1+x^2)\tan^{-1}(\alpha\beta)} \quad 1 < x < \alpha\beta$$

Minimum and maximum values of $\alpha\beta$ [2500 ≤ $\alpha\beta$ ≤ 312500]

where,

$$\int_1^{\alpha\beta} \frac{1}{1+x^2} dx = \tan^{-1}(\alpha\beta) \\ = \tan^{-1} 2500 - \tan^{-1} 1 \\ = 0.784 = a(\text{say})$$

Meenakshi et al.,

Therefore, the density becomes

$$f(x) = \frac{1}{a(1+x^2)}$$

The average viral replication per period is given by

$$\begin{aligned} E(x) &= \frac{1}{a} \int_1^{\alpha\beta} \frac{x}{1+x^2} dx \quad 1 < x < \alpha\beta \\ &= \frac{1}{2a} \log(1+x^2) \end{aligned}$$

The second raw moment of the infected CD_4^+T is given by

$$\begin{aligned} E(x^2) &= \frac{1}{a} \int_1^{\alpha\beta} \frac{x^2}{1+x^2} dx \\ &= \frac{1}{a} \int_1^{\alpha\beta} \frac{1+x^2-1}{1+x^2} dx \\ &= \frac{1}{a} \int_1^{\alpha\beta} dx + \frac{1}{a} \int_1^{\alpha\beta} \frac{1}{1+x^2} dx \\ &= \frac{x_1^{\alpha\beta} - \tan^{-1} x_1^{\alpha\beta}}{a} \end{aligned}$$

The variation of the infected CD_4^+T cells for period to period is given by

$$\begin{aligned} var(x) &= E(x^2) - (E(x))^2 \\ &= \frac{1}{a} \left[(x - \tan^{-1} x) - \left(\frac{\log(1+x^2)}{2a} \right) \right] \end{aligned}$$

Predictive Model for Viral Replication

A number of studies investigates various statistical methods to fit viral dynamic models and to predict virological responses using short term viral load data (Ho.et.al 1995; Perelson et.al 1996; Wu et al 1998; Wu et Ding 1999; Han et al.2002) Huang et.al (2006) extended the existing methods to model long-term HIV Dynamics of virological response. The original Infected CD_4^+T count and observed viral load measurement being a time varying covariate, CD_4^+T counts were measured at baseline and each of the follow-up visits on a similar scheme as indicated in Acost et al (2004). In this research, expected infected CD_4^+T cell concentration and variation of infected CD_4^+T cells calculation is not enough to study the viral replication for the long term. So, the research is extended to derived the new predictive distribution for the infected CD_4^+T cell count per mm^3 per long period, with the suitable selection prior distribution as follows. The CD_4^+T cells concentration for every follow up of long term (three month) of a particular infected person is denoted by $x_1(t_1), x_2(t_2), \dots, x_n(t_n)$ and their rate of change of the infected CD_4^+T cells concentration is given by x_1, x_2, \dots, x_n as the experimental model $x_i = e^{x(t_i)\lambda} + e_i$. Where λ is the rate of change at the particular i^{th} follow-up visit. Let $x_i, i=1,2, 3, \dots, n$ be the number of infected CD_4^+T cells per mm^3 for long period of a particular HIV infected patient. There is n period follow of the patients visits infected CD_4^+T cells and their joint density function is given by

$$\begin{aligned} p_Y(y) &= \prod_{i=1}^n f(x_i) \quad 1 < x < \alpha\beta \\ &= \prod_{i=1}^n \frac{1}{a(1+x_i^2)} \\ &= \left(\frac{1}{a}\right)^n \prod_{i=1}^n \frac{1}{(1+x_i^2)} \end{aligned}$$

Meenakshi et al.,

The mean of the Cauchy distribution does not exist so, the selection of the prior distribution is vague prior which is the discrete uniform distribution and its minimum infected CD_4^+T cells ($\alpha\beta=2500$). Therefore, its prior density is given by

$$p_{\alpha\beta}(\alpha\beta) = \frac{1}{\alpha\beta} \quad 1 < x < \alpha\beta$$

Then posterior distribution is given by

$$P_{\alpha\beta}(\alpha\beta) \propto P_Y(y) \cdot P_{\alpha\beta}(\alpha\beta) \\ = \frac{1}{k} \left(\frac{1}{a}\right)^n \prod_{i=1}^n \frac{1}{1+x_i^2} \cdot \frac{1}{\alpha\beta}$$

where,

$$k = \int_1^{\alpha\beta} \frac{1}{(a)^n} \prod_{i=1}^n \frac{1}{1+x_i^2} \cdot \frac{1}{\alpha\beta} d\alpha\beta \\ = \frac{1}{a^n} \int_1^{2500} \prod_{i=1}^n \frac{1}{1+x_i^2} \cdot \frac{1}{\alpha\beta} d\alpha\beta \\ = \frac{1}{a^n} \prod_{i=1}^n \frac{1}{1+x_i^2} \int_1^{2500} \frac{1}{\alpha\beta} d\alpha\beta \\ = \frac{1}{a^n} \prod_{i=1}^n \frac{1}{1+x_i^2} [\log\alpha\beta]_1^{2500} \\ k = \frac{1}{a^n} \prod_{i=1}^n \frac{1}{1+x_i^2} [3.397]$$

Then derived new posterior distribution of infected CD_4^+T cells is given by

$$P_{\alpha\beta}(\alpha\beta) = \frac{\left(\frac{1}{a}\right)^n \prod_{i=1}^n \frac{1}{1+x_i^2} \cdot \frac{1}{\alpha\beta}}{\frac{1}{a^n} \prod_{i=1}^n \frac{1}{1+x_i^2} [3.397]} \\ = \frac{1}{\alpha\beta(3.397)}$$

From the newly derived posterior distribution of the infected CD_4^+T cells the predictive density is given by

$$g\left(\frac{x}{\alpha\beta}\right) = \int_1^{2500} P_{\alpha\beta}(\alpha\beta) \cdot f(x) d\alpha\beta \\ = \int_1^{2500} \frac{1}{\alpha\beta(3.397)} \cdot \frac{1}{a(1+x^2)} d\alpha\beta \\ = \frac{1}{a \cdot (1+x^2)}$$

The predictive distribution is given by $G\left(\frac{x}{\alpha\beta}\right) = \int_1^x \frac{1}{1+x^2} dx$
 $= \tan^{-1} x - \tan^{-1} 1$

The predictive largest viral replication density per period is given by

$$f(x_n) = nG\left(\frac{x}{\alpha\beta}\right)^{n-1} \cdot g\left(\frac{x}{\alpha\beta}\right) \\ = n(\tan^{-1} x - \tan^{-1} 1)^{n-1} \cdot \frac{1}{a(1+x^2)}$$

Meenakshi et al.,

where,
a=0.784

In the assumed data, infected CD_4^+T cell increases, the predictive viral replication gradually increases, show in the above graph Table:6 viral replication using live data (the original data obtained from the hospital (TERTIARY CARE Hospital, KUPPAM, CHITTOOR, ANDHRA PRADESH, INDIA) Long period (three months) follow-up visits, CD_4^+T cells and their viral replication.

CONCLUSION

In the human health the immune cells take a vital role. The immune cells are lymphocytes, leukocytes, neutrophils and platelets. In the HIV dynamic study, HIV bind with lymphocytes namely CD_4^+T cell. after take sometimes (period so called seroconversion) HIV replicate within CD_4^+T cell called infected CD_4^+T cell. How it identified HIV replication in future in the infected CD_4^+T cells are complicated. so, in this research the infected CD_4^+T cell treated as random and newly derived predictive distribution of viral replication in the viral dynamic study. When data (infected CD_4^+T cell) fitted in the predictive distribution, the predictive probability corresponding viral replication gradually increasing but, predictive probability of viral replication using original data obtained from hospital (TERTIARY CARE Hospital, KUPPAM, CHITTOOR, ANDHRA PRADESH, INDIA) is suddenly increases. The comparison is illustrated through graph. The viral replication suddenly raising is usual nature depends on the infected patient's blood morphology. So, the newly derived predictive distribution is very much suitable for viral prediction. Finally viral prediction very much essential for treatment of infected person's future period.

ABSTRACT

Currency Volatility and International Macroeconomic factors have changes the Inflows of FDI into Indian IT sector and its Share Prices are no excuse for the Fluctuations on its Prices. The objective of the study is to compute CAGR and YOY on FDI inflows into Indian IT sector, predict the Indian IT stock Price and to evaluate the conditional heteroskedasticity of selected IT stocks. The methodology used for the study is descriptive and empirical in nature, and econometric tools such as GARCH and ARIMA are taken into account to obtain results on the stocks. The model chosen for predictive analysis of chosen stocks based on information criteria is ARIMA (1,1,1) ARIMA (0,1,1) and ARIMA (2,1,1) and the GARCH effect is visible at the specified ARIMA levels.

Keywords: ARIMA, GARCH, FDI, Volatility, Information Technology (IT)

JEL classification:E47, O16, O47

INTRODUCTION

Indian Information Technology sector (hence forth IT sector) has seen many fluctuations in recent past due to depreciation of INR vs USD. Many export oriented companies have got tremendous inflows whereas import oriented companies profits are at stake. Hence each and every MNC's financial manager wants to assess the risk in advance so as to get covered with the fluctuations of its currencies. On the other hand investors wanted to know the trend of IT stocks so as to decide the entry and exit levels in advance on one side and apply suitable hedging strategies on the other side.

**Guruprasad Desai and Vishweswarsastry**

The study aimed at prediction of three top market capitalized IT companies of Infosys Ltd, TCS Ltd and Tech Mahindra Ltd through the application of Time series model. Time series is applied for continuous type of variables like Stock, GDP, Inflation, Currencies, Commodities etc. the process of time series starts from original prices levels of data, secondly to assess the normality and stationarity through a popular method of Augmented Dickey fuller test and finally as per Information criteria prediction of stocks data for a short period in order to float the accuracy on the predicted prices.

LITERATURE REVIEW

The unique reasons for Greek entrepreneurs' temporary FDI initiatives in Bulgaria were outlined by Betzenis (2006). In addition, the factors that have led to a significant influx of Greek investors in the Balkans, particularly in Bulgaria, are examined, with a focus on the challenges faced when starting multinational corporations in a Balkan nation like Bulgaria. Eventually, the study draws the conclusion that each company's approach for entering a Balkan nation was influenced by its history, size, and sector of operation. S Pal & S Pal (2009) described the SENSEX behavior in the coming months with the seasonal ARIMA Model which generated a good forecast of the March-April, 2009 scenario till the phase of revival of the financial and stock markets through some unpredictable events not directly linked to financial market. Data set consist of the daily Sensex closing values are taken from 3rd March 2008 to 19th June 2009 are used to understand variation in the market. By employing ARIMA model the authors predicted that the market will remain stable during the next few months with little chance of the market to go below 14000. Nevertheless, unless there are some unforeseen events, the market will not go beyond 16000 within the next 2 months. To conclude, the ARIMA seasonal models give effective and very-near-to-precise forecasts on the future state of the market conditions in the short-run duration. J. Singh et al (2011) The report offers an analysis of the pre- and post-reform period's emerging trends and patterns in FDI inflows to and outflows from India. Data suggests that FDI influx and outflow in general are rising at a far higher rate during the post-reform period than they were during the pre-reform period, and India's proportion of global FDI is also rising during this time. The empirical results showed that throughout the post-reform period, both FDI inflows and outflows from India were positively impacted by the policy reforms. Lokesha and Leelavathy (2012) explored the factors that influence both internal and outward FDI from India. The study finds that the policy framework, market size, economic considerations, economic stability, and political issues all play a role in determining FDI inflows to India. The analysis also suggests that there are both similarities and differences in the determinants of FDI inflows into India and other developing nations.

Chattopadhyay (2014) studied the factors responsible for such differential levels of FDI inflows across the states of India. In the study the year-wise rankings of different states/regions are first made on the basis of their observed per-capita FDI inflows. The study found that this ranking is (highly) positively correlated with the states'/regions' ranking computed on the basis of their composite FDI attractiveness scores. Finally, the study concludes that the some direct and indirect policy measures for attracting FDI inflows into the laggard states are witnessed. By examining trends and patterns, Rani & Kumar's (2015) analysis determines the contribution of foreign investments. Additionally, it looks at the connection to and effect of foreign investments on the Indian stock market. The data set spans the years 2000 to 2014. The study finds that FDI has a strong link with CNX Nifty and BSE Sensex using Karl Pearson's Coefficient of Correlation and the multiple regression method. Olugbenga & Grace (2015) evaluated how foreign direct investment affected the growth of the Nigerian capital market. The study used the Johansen co-integration test and the ADF unit root test to evaluate the secondary data from 1970 to 2010. The study's findings suggest that foreign direct investment has a favourable and substantial impact on market capitalisation. Additionally, the author recommends that the government and monetary authorities make efforts to promote foreign direct investment into Nigeria. Vadra (2017) makes an effort to determine how trade and foreign direct investment from China and India, two of the largest economies in Asia, affect the growth of the African continent. The report discusses the FDI oligopolistic competition in Africa between China and India. India and China are not competitors in Africa, the author believes. They complement one another because they are engaged in various areas and have various strengths. Brazil, Russia, and Turkey are also the most recent participants in the race for influence in

**Guruprasad Desai and Vishweswarsastry**

Africa.Mehendale & HR (2018) provided evidence that the variables affecting the actual market demand and the magnitude of those influences are largely unpredictable and ill-defined. In order to discover and forecast complex sales trends, the study used artificial intelligence (AI) approaches. The outcomes were compared to those obtained using conventional forecasting models. When large-scale data is used for the study, the author concludes that neural networks can be a better alternative to conventional forecasting. The study question "Do cultural affinity and linguistic familiarity affect bilateral economic contacts" was examined by Demir & IM (2019). The study's empirical methodology, which included cross-sectional and panel data analysis, revealed that cultural institutions generally have a positive impact on bilateral trade and investment flows that is statistically and economically significant.

Statement of the Problem

Volatility in the currency prices due to macroeconomic shocks causes price fluctuations in the IT Stocks. The problem identified is the fluctuations in the Indian listed IT stocks and prediction of the selected IT Stock Prices for further Investment Decision and Hedging decision by various Stakeholders are considered for the study.

Research Gap

Current Currency volatility causes changes to the cash inflows and outflows for the firms, investors and firms need currency forecasted prices so as to ensure the protection through Hedging and other Risk management strategies. The current study is an extension in the current area of Predictive analytics of Indian IT sector.

Objectives of the study

1. To compute CAGR and Year-Year growth on FDI inflows towards Indian IT sector.
2. To predict the market Prices of selected Indian IT securities.
3. To analyze the Conditional heteroskedasticity on the prices through GARCH model.

Scope of the study: The study was limited by the authors to three leading IT firms: Infosys Ltd., TCS Ltd., and Tech Mahindra Ltd. The study takes into account historical prices for the ten-year period from 2012 to 2022.

Operational definition

1. **ARIMA:** Auto regressive Integrated Moving Averages is an Econometric Model used for Prediction of Time series data like GDP, Interest rates, Currency, stock prices etc.
2. **GARCH:** An econometric model called generalized auto-regressive conditional heteroskedasticity is used to examine the variation that occurs when time series data are utilised to predict prices.

Data Analysis and interpretation

Interpretation: Table 1 indicates the FDI inflows into Indian IT sector from 2010-2022. The year 2010 had an inflow of 3551 crores which has decreased in the year 2012 to 2656 whereas thereon the Indian IT sector attracted huge FDI inflows due to wide outsourcing services and opportunities available to foreign firms at affordable prices and with efficient labor. The overall Compounded Annual Growth rate of Indian IT sector is 32.90% for 12 years showing the skill set of Indian labour vs other emerging economies.

Table 2: Indicates the normality description of Infosys Ltd.

Normality test

H0: Data is normally distributed

HA: Data is non-normally distributed

Test for normality of Infosys

Doornik-Hansen test = 3103.35, with p-value 0

Shapiro-Wilk W = 0.792198, with p-value 1.42404e-048

Lilliefors test = 0.216105, with p-value ~ 0

Jarque-Bera test = 963.705, with p-value 5.42095e-210

**Guruprasad Desai and Vishweswarsastry**

normally distributed given the P Value is less than 5% significance threshold, graph 1 displays the trend and cyclical pattern over time. Less than 5% of the normality test's threshold is utilised to accept the null hypothesis because it is a diagnostic sort of research. Graph 3 indicates the normality level through histogram where the data points are quite normally distributed and on the other hand descriptive statistics on Infosys is observed where Average Returns of Infosys for 10 years is Rs 722.49 with a standard deviation of 411.08 suggesting better risk reward ratio.

Stationary Test

Ho: Data is non-stationary

HA: Data is Stationary

Interpretation:

When the mean is zero and the variance is homoskedastic, Graph 3 depicts the mean reversion on the prices of Infosys Ltd. over a period of ten years. Table 3 displays the ADF test that was used to determine whether autocorrelation existed between the prior lags, and the test findings indicate that there is no autocorrelation at first order difference because the P value is less than the 5% LOS limit. The prices are suggested to be stationary and acceptable for further predictive research of Infosys Ltd Prices since the P value is less than 5% and the Durbin Watson statistics value is 1.996710, which is less than its limit of 4.

Interpretation

Table 4 indicates the optimum predictive model as per information criteria for predicting the prices and the optimum model as per Least values of AIC and BIC is ARIMA(1, 1, 1), further table 5 suggests the forecasted prices of Infosys Ltd Stock Price for 15 days and a visualization effect is observed in graph 4 where shaded area is as a predicted prices of Infosys Ltd. It is also evident from graph 4 that the actual price line and predicted price line are moving together indicating the accuracy of the model by minimizing maximum variance.

GARCH Model

H0: There is no ARCH & GARCH effect on the stock of prices of Infosys

Ha: There is ARCH & GARCH effect on the stock of prices of Infosys

Interpretation

As the residual variance in the variance equation shows a p value less than 5% cutoff suggesting to reject the null hypothesis, Table 6 displays the GARCH model, which indicates the ARCH effect on the prices and concludes that there is conditional heteroskedasticity. The graph also demonstrates homoscedasticity at each cluster.

Normality test

H0: Data is normally distributed

HA: Data is non-normally distributed

Test for normality of TCS:

Doornik-Hansen test = 1203.61, with p-value 4.36126e-262

Shapiro-Wilk W = 0.877828, with p-value 2.65562e-040

Lilliefors test = 0.215925, with p-value ~ 0

Jarque-Bera test = 365.25, with p-value 4.86416e-080

Interpretation

Graph 6 indicates the original time series which has a trend and table 7 indicates the normality description where a popular jarque bera test results showed a value of less than 5% stating the data points are normally distributed and graph 7 also showed average returns of 1755.278 for 10 years with a standard deviation of 867.7938 suggesting 2:1 ratio of cost benefit from its prices.

**Guruprasad Desai and Vishweswarsastry****Stationarity Test:**H₀: Data is non- stationaryH_A: Data is Stationary**Interpretation**

Graph 8 and table 8 shows the stationarity process of TCS Ltd prices where graph 8 suggesting a mean of zero and variance as constant and table 8 shows ADF test indicating that there is no autocorrelation as the p value shows 0.0001 and DW statistics showing a value of 1.999988 which is below cutoff of 5% and 4 respectively.

Interpretation

Table 9 shows the model selection as per information criteria and the best model used for prediction of TCS prices is ARIMA(0,1,1) where is Akaike information and Schwarz information values were least at those levels, whereas table 10 shows the predicted prices of TCS for a period of 15 days with the model selected and graph 9 showed the predicted prices of TCS Ltd with no much variation between actual and forecasted prices proving the accuracy of the model.

GARCH ModelH₀: There is no ARCH & GARCH effect on the stock of prices of InfosysH_A: There is ARCH & GARCH effect on the stock of prices of Infosys**Interpretation**

Table 11 indicates the GARCH model on TCS Ltd prices. The model showed that GARCH effect exists among the prices and the variance equation residual variance p value showed a value of 0.0000 which is less than 5% LOS thereby rejecting the H₀ and proving there is GARCH effect and graph 10 shows the conditional heteroskedasticity, the layers in the graph showed a similar pattern though there is a variance among different clusters.

Techmahindra**Normality test**H₀: Data is normally distributedH_A: Data is non-normally distributed

Test for normality of Techmahindra

Doornik-Hansen test = 1284.96, with p-value 9.44442e-280

Shapiro-Wilk W = 0.884187, with p-value 1.63007e-039

Lilliefors test = 0.126602, with p-value ~ = 0

Jarque-Bera test = 1022.88, with p-value 7.6489e-223

Interpretation

On the other side, Graph 11 displayed the original Tech Mahindra time series data, which demonstrated a trend and seasonality. The data points in Table 12's normality test results had a majority of p-values of 0.0000, which is less than 5% LOS and suggests accepting the H₀, or that the data points are normally distributed. The summary statistics indicated that the stock prices of Techmahindra Ltd. had a moderate risk reward ratio, with a mean value of 653.642 and a standard deviation of 319.0762.

Stationarity Test:H₀: Data is non- stationaryH_A: Data is Stationary

**Guruprasad Desai and Vishweswarsastry****Interpretation**

Graph 13 showed Tech Mahindra prices stationary at first order difference. To avoid white noise the mean and variance are kept at zero and 1 and to know whether autocorrelation exists or not ADF test is run where t statistic value showed -36.72321 and the critical value is just -2.862514 thereby entered into a rejection region indicating that there is no autocorrelation among its prices. DW statistics also suggested stationary since its value is 1.997833 is within its limit level of 4.

Interpretation

Table 14 showed an optimum model as per information criteria and the optimum model decided for predictive analytics is ARIMA(2,1,0) and graph 14 suggests the predictive prices of TechMahindra Ltd for 15 days and graph 14 indicates the predictive price and actual prices and the shaded area in the graph showed a predicted price for 15 days' time-period.

Garch Model

H0: There is no ARCH & GARCH effect on the stock of prices of Infosys

Ha: There is ARCH & GARCH effect on the stock of prices of Infosys

Interpretation

Table 16 showed the GARCH model at first order difference suggesting ARCH effect existence on the stock prices of Tech Mahindra Ltd. the variance equation suggests the residual variance p-value of 0.0000 at first order differencing and Graph 15 showed a homoscedasticity at every cluster though overall hetero pattern on the prices of Techmahindra Ltd.

Findings of the study

1. From table 1 it is found that the CAGR for FDI inflows for the period 2010-2022 is 32.90%. the data shows a dip in 2012 and the flows later on has created a massive growth for further successive years.
2. Graph 1, 7 and 10 showed a time series plot which consist of trend and cyclicalilty.
3. Table 2, 7, and 12 include checks for the normality assumption during the univariate prediction analytic procedure and among multiple tests. The findings of the Jarque-Bera test, which revealed that the data is normally distributed for all three equities, are more important to take into account.
4. Graph 2, 7 and 12 indicates the Summary statistics and histogram for knowing the normality and the summary statistics suggests that the mean and standard deviation are 722.49 and 411.08, 1755.278 and 867.7938, 653.642 and 319.0762 for Infosys Ltd, TCS and TechMahindra Ltd respectively.
5. It is clear from Graphs 3, 9, and 13 that prices have a tendency to converge to the mean at first order differencing, and the graph exhibits this behavior.
6. From table 3, 8 and 13 it is observed that the there is no autocorrelation among the previous values of Infosys Ltd, TCS Ltd and Tech Mahindra Ltd providing a chance for further process of Prediction of Prices.
7. Tables 4, 9, and 14 show that, for Infosys Ltd., TCS Ltd., and Tech Mahindra Ltd., respectively, ARIMA(1,1,1), ARIMA(0,1,1), and ARIMA(2,1,1) are the best models for price prediction.
8. Table 5 graph 4, table 10 graph 9, table 15 and graph 14 showed the forecasted prices for 15 days from 23rd July 2022 to 06th August 2022.
9. Table 5, 11 and 15 along shows the GARCH model evaluation and its outcome showed the existence of GARCH effect which practices a cluster wise homoskedascity thereby not affecting the Predicted prices sharply.
10. It is found from Graph 5, 10 and 16 that the prices are homoscedastic at every cluster though overall heteroskedasticity exists. This conditional heteroskedasticity is observed at first order difference for all three stocks slected for the study.
11. As per predicted model and risk return tradeoff, Infosys Ltd proved a better stock for investors than other 2 companies.

CONCLUSION

Information Technology industry is subjected to volatility in the currency prices and its topline and bottomline gets affected due to payable exposure and receivable exposure, hence prediction of Prices particularly for the companies like Infosys Ltd, TCS Ltd and Tech Mahindra Ltd is vital and the study conducted by the authors provides an insight to firms, investors and forex dealers for optimum decisions. 15 days prices are predicted by conducting normality, stationary tests and ARIMA econometric tool is applied for prediction of its prices and the authors have conducted GARCH model for assessing the pattern of volatility in the process of Prediction of the selected stock prices.

ABSTRACT

The retail industry in India is the fifth largest in the world. Only 3-5% of India's retail market is controlled by organized retailers. Consumers and marketers have shown widespread support for and appreciation of the local Kirana shops. Still, the manner centers formed in level II and III cities typically follow a retail pattern. Customers' impressions, beliefs, and familiarity with a company and its offerings fall under "customer perception," a phrase used in marketing. Keeping consumers around for an extended period is called customer retention. People shop at department shops for all aspects of their lives since they provide for the necessities of life. Customers will be dissatisfied if the companies in question do not meet their needs, and the enterprises will ultimately fail. This study will thus examine how customers in the Salem area of Tamil Nadu view and experience organized shopping. The study was descriptive. The samples in this investigation span many stages. There were 1,328 samples taken in total. Data analysis was performed using various statistical methods, including factor analysis and structural equation modeling. The research showed that success in retail requires businesses to provide exceptional value to their customers, increasing the likelihood that those customers would return.

Keywords: Customer Perception, Customer Retention, Customer Satisfaction, Kirana Store, Retail Sector.

**Krishna Kumar and Gurusamy**

INTRODUCTION

After agriculture, retail is India's second largest industry. It is highly dispersed and dominated by tiny, individual, and proprietary businesses. The retail industry in India is the fifth largest in the world. Only 3-5% of India's retail market is controlled by organized retailers. Centers created in level II and III cities often feature a planned retailing layout, even though local Kirana stores have played a vital role and been universally appreciated by customers and advertising. Both domestic and international firms participate in India's retail sector. This research will illuminate our customers' perceptions of and happiness in shopping at well-organized retail establishments. This research project investigates the attitudes and experiences of shoppers in the Salem area of Tamil Nadu, India, regarding the continuation of a well-developed retail infrastructure. Keeping customers loyal is an essential objective for any business. The company realizes that keeping the new ones is more profitable than losing the old ones. Management and marketing thinkers agree that happy customers mean happy clients. Studying consumer expectations and satisfaction is essential with organized retail establishments because of how critical their success is to overall customer satisfaction.

CUSTOMER'S PERCEPTION

Customers' impressions, beliefs, and familiarity with a company and its offerings fall under "customer perception," a phrase used in marketing. Advertising, user reviews, public relations, social media, expert opinion, and other channels may influence consumers' comprehension.

CUSTOMER SATISFACTION

Loyalty from consumers depends on how well the product meets their needs. Consumers are dissatisfied if the product falls short of their expectations during manufacture. When manufacturing is up to par, customers are satisfied. When the product's quality meets or surpasses consumer anticipation, everyone wins.

ORGANIZED RETAILING

Businesses that are part of "organized retailing" are those owned and operated by legitimate stores that have applied for and been granted permission to collect sales and revenue tax from consumers.

DEPARTMENTAL STORES

Department stores are large, often multi-story retail establishments that carry various goods. Traditional shops are typically around 7,000 square feet, with many levels selling various things, including clothing, accessories, makeup, and homewares.

Companies that sell at least 10% but less than 70% of their goods in food, clothing, and home goods are considered in the "company department" category. These stores also have less than a 50% self-service ratio and at least 50 employees.

CUSTOMER RETENTION

Keeping consumers around for an extended period is called customer retention.

REVIEW OF LITERATURE

The characteristics and expectations of EIP manufacturers and buyers were investigated by Brian Harris et al. (2000). (EIPs). Psychological tests were administered to EIP and non-EIP customers to determine how susceptible environmental views are to emotional and consumer influences. Several factors, including individual income and family size, are insignificant in determining EIPs' food needs. Variables that affect both demand and subsidies were only dimly understood. Consumers have a generally positive outlook on organic foods, and a lack of information is why they don't buy them. According to research by Marvin T. Batte et al. (2007), organic packaged food products have a higher willingness to pay. According to the study, customers are willing to pay a premium for food that is up to 100 percent organic.

**Krishna Kumar and Gurusamy**

Ulf Hjelmar's 2011 research on why people choose organic food and other items identifies many vital factors. The government is committed to expanding organic and environmentally friendly regulations as its market proportion grows.

Since concerns about human health and the environment are likely to impact the demand for organic food majorly, Farah AyuniShafie (2012) published a study on the subject. They conclude that demographic considerations have no significant impact on organic preference. Consumers have connected organic food and environmental concerns, animal welfare, and pesticide avoidance. The higher cost of organic foods discourages their widespread use. H. M. Chandrashekar. (2014) looked into the value and preference of organic products among Mysorean consumers. He found that people firmly understood sustainable practices but were still wary about organic foods. It's fair and understandable that people would choose organic foods. Food advertisers should create logical and esoteric commercials, offering consumers a range of options.

Consumers in Malaysia have little interest in or understanding of organic foods. According to the data collected for this survey, most respondents want to increase their organic food consumption. Organic food's popularity in the market was studied by Tan et al. in 2015. According to a poll, more than half of shoppers prefer to buy organic produce. Hyun-Joo Lee et al. (2015) studied consumers' organic food-buying habits and plans.

Using QFD, De Fátima et al. (2015) created a valuable agricultural product. Also, these affiliations must be considered while evaluating the quality of dietary ingredients. Product development relies heavily on QFD objective product components and quantitative elements in manufacturing and the supply chain. It might be a resource for making various kinds of food in the future. Because it accounts for almost a third of the relative content of organic agricultural goods, the suggested research implies that socio-environmental responsibility is crucial for organic agriculture. Dr. C. Thirumal Azhagan and G. Anandhan (2016) have clustered customer satisfaction determinants in the organized retail format for the Trichy region to find the demographic profile of the customers who visit a retail format. The study's findings suggest that compared to less structured retail environments, supermarkets and department stores provide superior service quality and a more comprehensive selection of products. P Daniel et al. examined what factors in retail marketing are most important to customers (2016). Products, shop characteristics, promotional sales, and consumer behavior are all impacted by retail marketing efforts. Spenser's customer satisfaction in Guntur has suffered directly from all these issues.

Gonzalo Ruiz Dáz (2017) studied the determinants of customer happiness and loyalty in the Peruvian mobile industry. The results showed that customer loyalty in the mobile phone industry is founded on the level of satisfaction provided to the consumer. In contrast to other research, this investigation identified unique characteristics that contribute to either satisfied or dissatisfied clients. Statistical analysis demonstrates that assessments of service quality other than quality of service substantially influence customer satisfaction categories. These characteristics include customer service, tariff and schedule information, and the clarity of invoicing. Other economic, socioeconomic, and geographical factors that influence customers' purchasing decisions showed a similar pattern of asymmetry. When a user's loyalty can be explained just by how satisfied they are, we see effects similar to those seen when measuring customer satisfaction.

Magnus Söderlund (2018) examined the connection between proactive employees and happy clients (i.e., the staff initiates face-to-face relationships on the shop floor). One survey and one field experiment were conducted in a grocery store setting. Customer satisfaction has increased due to worker participation, according to both studies. Furthermore, worker activity has successively moderated the impact of perceptions of work and performance on contentment. This research adds to the increasing body of evidence suggesting that the structure and tone of service meetings significantly shape employees' personalities and how they interact with clients. Eleishaane Fifita et al. (2019) examined organic food consumption through the lens of Social Practice Theory. Studies in this area have identified three significant motivations for consumer spending: promoting health and lifespan, expressing concern for the environment, and making a statement about one's social standing. U.S. consumers' retail preferences for

**Krishna Kumar and Gurusamy**

organic food were studied by Jiyoung Hwang et al. (2019). The poll results show that knowing your audience and producing relevant content is essential to a successful marketing strategy. Seven academics examined the factors that impact consumers' decisions to become organic. The findings imply that customers in nations with a positive outlook on the place of origin are more likely to seek organic labeling. Organic and non-organic eating habits were compared in a study by JrgenDejgaard Jensen et al. (2019). Separation by location was found to be an effective strategy for elevating organic food products. G. Hult, Tomas M., et al. (2019) examined the merchants' efforts to please and prosper in the market by strategically using online and offline procurement channels. Unfortunately, the current state of multichannel research does not adequately respond to the factors that influence consumer satisfaction and, by extension, loyalty while purchasing online instead of in a physical store. Unsatisfied consumers can hurt a store's bottom line, which can be a cause for concern. Using a modified American Customer Satisfaction Index version, the poll revealed significant variations in consumer satisfaction and its effect on customer loyalty across purchasing channels (ACSI). The study's results demonstrated that the purchase value is an important factor in the satisfaction ratings made by retail consumers who buy electronic items online and that these customers are happier when making repurchase selections than when shopping offline. When purchasing at a physical store, a customer's happiness is heavily influenced by the overall quality of the shopping experience and their expectations.

Kun-Huang, Huang, et al. (2020) investigated the impact of customer satisfaction on loyalty in the face of price increases. The values in this study are disseminated through qualitative analyses after a furious set/QCA is used to generate links with structural relationships. Both approaches help establish healthy connections while dealing with complex problems. According to research conducted by a class of executive MBA students in Taiwan, loyal customers may afford to pay higher rates. Lastly, the data demonstrate that happy customers don't necessarily stick around.

NEED FOR THE STUDY

Although India's "organized retailing" market is still in its infancy, it has expanded quickly over the past several years. There is intense competition among stores in the current state of organized retailing. Because of the high customer acquisition cost, every business strives to keep its current clientele. Therefore, keeping the ones you already have is preferable. Department stores in Salem are expanding, although they were not included in the prior research. It calls for investigating the relationship between customer pleasure and loyalty at department shops in the Salem District of Tamil Nadu.

NOVELTY IN THE STUDY

By use of structural equation modeling (SEM), the interconnectedness of many factors may be seen. The correlations displayed by SEM are, in fact, the researchers' working hypotheses. Instead of investigating or explaining phenomena, SEM studies are typically conducted to validate a study method. Researchers noticed that only a few other studies employed SEM to build a model while reviewing the literature reviews to find the research gap. Researchers were motivated to employ SEM after discovering the correlation between positive customer experiences and higher repeat business rates.

OBJECTIVES OF THE STUDY

- To study the customer's perception of organized departmental stores.
- To analyze the customer satisfaction towards departmental stores in Salem District.
- To develop a model on customer perception and satisfaction towards organized retailing and study its impact on customer retention.

HYPOTHESES

1. There is no significant association between customer satisfaction and retention.
2. To prove that customer perception and satisfaction directly impact customer retention.

Krishna Kumar and Gurusamy

RESEARCH METHODOLOGY

TYPE OF THE STUDY

A descriptive research study focused on customers' attitudes and experiences in well-organized retail establishments, as well as the elements that influence shoppers' decisions and keep them coming back.

SAMPLE DESIGN

POPULATION

Customers visited the well-organized department stores for this massive and limitless research.

SAMPLING UNIT

Customers at Salem's well-organized department shops served as the study's unit of analysis.

SAMPLING PROCEDURE

The samples in this investigation span many stages. In the initial stage of the study, conducted in the Salem District, random sampling was utilized. Respondents were chosen in the third step, and retailers were chosen in the second stage using a quota sampling method. The next step was a method called "convenience sampling."

SAMPLE SIZE

There was a total of 1328 of samples.

STATISTICAL TOOLS USED FOR ANALYSIS

Data were used by statistical tools such as Factor Analysis and Structural Equation Modeling for the analysis.

ANALYSIS AND INTERPRETATION

Factors influencing customers' perception of organized retail outlets.

TABLE 1: KMO ANDBARTLETT'S TEST

Factor analysis with 21 separate consumer insight statements was used to assess validity, and the gathered goods were checked for internal consistency. The sample size for factor analysis may be evaluated using the KMO sample adequacy calculation. Values between 0.5 and 1.0 are likely to be suggested by factor analysis. Incomplete factor analysis is indicated by values below 0.5. Kaiser determines the index of sample adequacy for Meyer-Olkin tables to be 0.833, indicating that the factor analysis is adequate for the dataset. Bartlett's sphericity test is used to evaluate the independence hypothesis. The method relies on inverting the Chi-square determinant of the correlation matrix. The null hypothesis might be rejected if the test results are statistically significant. This study will validate the usefulness of factor analysis. The 16526.260 value for the Chi-square statistic of Bartlett's sphericity suggests a connection between 21 phrases. Hence, this element evaluation is valid for the data set in question.

Each component's Eigenvalue describes the sum of its variation—the fraction of the total variance attributed to each component. Exploratory factor analysis frequently employs the primary variable analysis, where the total variance of data is utilized to compute the needed number of factors to account for the total data variance. When claims for the same component are defined in broad loads, the interpretation of variables becomes much more straightforward. The element can be interpreted in a broad sense regarding the declaration loading. An investigation of the factors affecting shoppers at department stores, broken down into 21 distinct points of view. Only 5 of the 21 comments contribute anything new to the study (67.208 percent).

The statements are:

1. Excellent Product Quality
2. The advertisement given by the Store is Informative

Krishna Kumar and Gurusamy

3. Accepting Different Payment Modes
4. Proper Signage is Installed
5. Better Customer Service

Factors influencing customer satisfaction level of organized retail outlets

TABLE. 2 KMO ANDBARTLETT'S TEST

Customer satisfaction claims were analyzed based on 26 individual statements, and the reliability of the obtained samples was checked for the internal accuracy of the classification of objects. Whether or not a factor analysis is adequate can be gauged by using the KMO sample adequacy assessment index. Factor analysis may be used confidently when the result is between 0.5 and 1.0. The factor analysis is inappropriate if the value is less than 0.5. Kaiser-Meyer-sample Olkin's adequacy index measurement is 0.812, as shown in the table above; the factor analyzer is enough for the data set. The hypothesis of independent variables is tested using Bartlett's sphericity test. It relies on inverting the determinant of the correlation matrix. The null hypothesis may be rejected when the test statistics are very significant. An adequate factor analysis will be shown. Bartlett's Sphericity Chi-square test returns a value of 23571.395, indicating that the 26 assertions are related; as a result, the factor analysis of KMO is valid for this data set.

Each component's Eigenvalue describes the sum of its variation—the fraction of the total variance attributed to each component. Exploratory factor analysis frequently employs the primary variable analysis, where the total variance of data is utilized to compute the needed number of factors to account for the total data variance.

TABLE: 2.2 ROTATED COMPONENT MATRIX

Defined declarations with a wide load at the same element can stand in for factors. The phrase suggests a highly laden interpretation of the component. The characteristics identified in the investigation influenced the level of customer satisfaction at 26 different types of stores. Only six of the 26 allegations had any bearing on the research (70.550 percent).

The statements are:

1. Fresh/New Stock.
2. Store Ambience.
3. One-Stop Shopping.
4. Signage.
5. Value for Money.
6. Product Range.

Conceptual model of customer's perception and satisfaction towards organized retail Outlet. For each dimension, they detail its route coefficients, required weight ratio, and significant quantity and show that all extracted variances are nearly more than 0.07. (Fornell and Larcker, 1981). Using a 5-point Likert scale, we get a value of GFI = 0.908%. RMR = 0.074 for values below 0.08. An AGFI of 0.901 meets the requirement (Bollen and Stine, 1993). Estimated weights (CMIN/DF) of 0.181 are used to calculate the standard Chi-Square, which is enough for the task at hand (Hair et al., 1998; Bollen, 1989; Bollen and Stine, 1993). It showed that the model is a good fit for the analysis. Results on model fitness and the SEM path numbers are discussed. This study empirically supports the fitness of the Likert 5-point scale when using the Structure Equation Model (SEM).

Regression weight at 0.001 % level of significance

The observed variables which have a positive influence over unobserved variables at 0.001 percent with customer satisfaction and retention are customer perception with the regression weight Product related factors-perception (0.296), customer perception with the regression weight Price related factors - perception (0.175), customer perception with the regression weight Location-related factors - perception (0.146), customer perception with the regression weight Outlet related factors - perception (0.224), Perception Behavior with the regression weight

Krishna Kumar and Gurusamy

customer perception (0.183), Customer satisfaction with the regression weight Perception behavior (0.220), Customer satisfaction with the regression weight Price related factors - perception (0.061), Customer retention with the regression weight Customer satisfaction (0.559).

Covariance at 0.001 % level of significance

The covariance estimates between exogenous variables which have positive relationship at 0.001 % with Customer satisfaction and retention are product related factors - perception and Outlet related factors - perception (0.098), Price related factors - perception and Outlet related factors - perception (0.074), location related factors - perception and Outlet related factors - perception (0.141), product related factors - perception and location related factors - perception (0.163), Price related factors - perception and Location related factors - perception (0.146), product related factors - perception and Price related factors - perception (0.108), product related factors -satisfaction and Outlet related factors -satisfaction (0.126), product related factors -satisfaction and location related factors -satisfaction (0.094), product related factors -satisfaction and Price related factors -satisfaction (0.147), Price related factors -satisfaction and Outlet related factors -satisfaction (0.164), Price related factors -satisfaction and location related factors -satisfaction (0.109), location related factors -satisfaction and Outlet related factors -satisfaction (0.102).

FINDINGS OF THE STUDY

Factors influencing customer's perceptions of organized retail outlets

A sample of customer-organized retail establishments shows the influence of 21 different claims. Five of the twenty-one remarks have a more noticeable effect on customer opinion (67.208 percent).

Factors influencing customer satisfaction level of organized retail outlets

Factors of an analysis affecting the loyalty of the consumers of structured retail outlets with 26 individual claims. 6 of the 26 comments add more to customer loyalty (70.550 percent).

Findings based on Structural Equation Modelling (SEM)

Regression weight at 0.001 % level of significance

The observed variables which have a positive influence over unobserved variables at 0.001 percent with customer satisfaction and retention are customer perception with the regression weight Product related factors-perception (0.296), customer perception with the regression weight Outlet related factors - perception (0.224), Customer satisfaction with the regression weight Perception behavior (0.220), Customer retention with the regression weight Customer satisfaction (0.559). When the satisfaction of the customer increases, it has a direct impact on retaining the customers.

Covariance at 0.001 % level of significance

The covariance estimates amongst the exogenous variables have a positive relationship at 0.001 % with Customer satisfaction. Retention is Location-related factors - perception and Outlet related factors - perception (0.141), product-related factors - perception and Location-related factors - perception (0.163), Price related factors - perception and Location-related factors - perception (0.146), product-related factors -satisfaction and Outlet related factors -satisfaction (0.126), product-related factors -satisfaction and Price related factors -satisfaction (0.147), Price related factors satisfaction and Outlet related factors -satisfaction (0.164). So, from the findings, customer satisfaction strongly impacts retaining customers.

CONCLUSION

According to the results of this study, customer happiness has a significant role in determining client loyalty. As a result, it is crucial for every well-run store to zero in on its clientele's specific demands and needs. If a store wants to prosper, it must satisfy its customers, and the best way to do so is to provide them with exceptional value.

ABSTRACT

Lipid Peroxidation (LP) is a potential biomarker of oxidative stress in many diseases and may have clinical significance in the management and treatment of various medical conditions. LP is an important molecular mechanism which occurs in both plants and animals, which causes oxidative decay of lipids containing carbon double bonds in response to free radicals, hence resulting in the formation of the many toxic by-products which then cause disintegration of various biological membranes and other cellular damages and can lead to cell death. One such occurrence of oxidative stress is in the neurological disease of epilepsy. Anti-epileptic drugs (AEDs) are given to epilepsy patients to control seizures. Since different AEDs have different structural aspects and mechanism of action, they have different potentials to alter the LP levels. This paper will review the present contribution of AEDs in alterations in LP levels and aid in designing appropriate changes in epilepsy therapy without considerable oxidative stress which causes peroxidation of lipid molecules, and thus creating a neuroprotective environment.

Keywords- Anti-Epileptic Drugs, Lipid Peroxidation, Oxidative Stress, clinical, epilepsy

INTRODUCTION

Oxidative Stress (OS) is defined as a biochemical event that leads to an imbalance in the concentration of oxidants and antioxidants which leads to molecular damage or disruption/alteration of or control many redox signalling pathways(1).Biologically, OS may be defined as change occurring in any of the molecular components of the redox system(2).When the reactive oxygen species (ROS) are produced in excess compared to the body's antioxidant defence system's capacity to neutralise them, it results in OS(3). A frequent misconception is that OS has only detrimental effects, but it plays dual role in biological system. Free radicals when maintained at low or moderate levels plays many beneficial roles like synthesizing some important structures. Another example is when body encounters aninfection the phagocytes release free radical molecules, mostly ROS like hydrogen peroxide, superoxide, hydroxyl radical and hypohalous acid which will further act critically for the functioning of the host defence system against the invading foreign microbe. The ROS also plays an important role in granulomatous patients who are unable to produce superoxide due to some defects in the NADPH oxidase system and are thus prone to many diseases(4). But if the concentration of these free radicals increases then it may have many detrimental effects like increase in hepatic OS levels, which increases the chances of liver diseases (5). Also, OS leads to the oxidative damage of DNA which may contribute towards causing many mutations that will ultimately lead to cancer such as G>T mutation (Transversion) which is an underlying cause of colorectal cancer(6–9).So, it becomes important to keep check on the levels of the OS. Lipid Peroxidation (LP) has been proposed as a biomarker of OS and is commonly used to evaluate the degree of OS in various diseases and conditions, such as atherosclerosis, diabetes, neurodegenerative diseases, and cancer(8,10,11). For example, increased levels of Malondialdehyde (MDA) – one of the final products of lipid peroxidation have been found in the plasma and tissues of patients with diabetes and have been associated with the severity of diabetic complications such as retinopathy(12). In neurodegenerative diseases, such as Alzheimer's and Parkinson's disease, there is evidence of increased LP and decreased antioxidant defense systems in affected brain regions(11).

Lipid Peroxidation (LP) is one of the major molecular mechanisms which are involved in the oxidative damage to the lipids present in cellulare membranes and the toxic effects that ultimately leads to cell death(13). In other words, this process results in the formation of reactive oxygen species (ROS) that can damage cell membranes, ultimately leading to cellular dysfunction or cell death(14).Lipids are the major components involved in the building and maintenance of the cellular membrane. Excess levels of LP cause alterations in the structure, assembly and composition of the lipid membranes. Furthermore, Polyunsaturated Fatty Acid (PUFAs) are the most preferred target for the peroxidation reaction. Some common examples of PUFAs present in cellular membranes are docosahexaenoic acid, arachidonic acid,linoleic acid etc. The steps involved in LP reaction involve abstraction of hydrogen that connects the two double bonds of the methylene carbon . The removal of hydrogen atoms is driven by the weak C-H bond and the stability of the resultant bis allylic radical. The lipid can isomerize into a more thermodynamically stable isomer because of to this resonance-stabilized pi system, creating a conjugated diene that combines with molecular oxygen to create a lipid peroxide (15). The reaction of LP with the unsaturated fatty acids forms a variety of end products. These end products can be classified into - Primary end products which mainly includes Lipid Hydroperoxides and Secondary end products which mainly involves the aldehydes such as MDA, hexanal, 4-hydroxynonenal and propanal. But among all MDA has been the most recognized and valid biomarker of the LP reaction. MDA is produced as a result of the LP reaction in large PUFAs and arachidonic acid through non-enzymatic and enzymatic processes (16). The MDA production and metabolism has been explained in **Figure1**. LP is often thought to have only negative impact on the biological system but, LP at normal levels is very important for many other processes occurring in the living organism. For example, normal LP levelslevels can act as a very efficient defense mechanism against invading microorganisms, such as bacteria and fungi, as well as against cancer cells. Additionally, LP can trigger important cellular signaling pathways, such as the induction of antioxidant enzymes and the regulation of immune function(17). Furthermore, certain types of lipid peroxides, such as hydro-peroxides, can also serve as substrates for enzymes that convert them into bio-active molecules with beneficial effects on the body.Hydro-peroxides, one of a secondary by product of LP reaction can be metabolized into specialized pro-

Tanvi Magotra *et al.*,

resolving mediators (SPMs), which are involved in the resolution of inflammation and tissue repair (18). Although beneficial at lower levels, we can't ignore that fact that LP is the underlying cause of many diseases and has many negative impacts on the body. For instance, not only does LP reaction alters the membrane structure but additionally it also produces certain by-products which are toxic in nature which affects the function of many important proteins, for example, a study showed that new LP by products activated the p53 mediated cell death pathway (19). It also induces inflammation which is an underlying cause of many chronic diseases like atherosclerosis, Alzheimer's disease etc.(3). LP also causes early ageing of the cells which results cellular damage and affects the cell function (20). Overall, while excessive LP can have negative consequences, it is important to recognize that LP also has some positive roles in the body. So till now we saw that in most pathological situations there is an increase in the rates of the reactive oxygen and reactive nitrogen species (RNS) during diseased conditions than normal conditions. ROS is a general collective term which is used to define small and highly reactive oxygen derived molecules and RNS is the term used to define the nitrogen derived small and highly reactive molecules. Furthermore, these ROS and RNS are classified into free radicals and non-radicals (**Figure 2**)(21). Free radicals are those molecules or atoms which contains an unpaired electron in the outer shell orbit. This unpaired electron is responsible for making free radicals short-lived and unstable but highly reactive as they have the ability to abstract electron from other stable molecules and turning them into free radical as well. This results in the chain of reactions forming higher concentration of free radicals and causes cellular damage (22). The non radicals are atoms or molecules that have higher chances of converting into free radicals(21). Some of the free radicals and the non-radicals along with their half-lives are shown in **Table. 1.**(22,23). The regulation of the ROS and RNS levels is not only affected by their production, but also varied by their elimination. And any imbalance between the production and elimination in favour of the first, leads to OS, with varying consequence for cell physiology(24).

Therefore, LP analysis becomes an important parameter to analyse as it has great biological significance in studying the underlying mechanisms of various metabolic disorders like diabetes mellitus, obesity, along with the processes like endothelial layer function and inflammation etc. (25). It also has significance in neurological disorders like Epilepsy, Alzheimer's disease (AD), Parkinson's disease (PD) and Amyotrophic lateral sclerosis (ALS) (22). The patients affected with AD disease shows deposition of MDA in astrocytes and neurons (25,26). Another study by examined the relationship between LP and seizure frequency in patients with epilepsy. The study found a significant positive correlation between serum MDA levels and seizure frequency, suggesting that increased LP may be associated with more frequent seizures(27).LP also plays a vital role in the development of brain tumours (28). Overall, these studies suggest that LP is a potential biomarker of OS in many diseases and may have clinical significance in the management and treatment of various medical condition. Epilepsy is one of the most common neurological diseases. According to the ILAE 2014 definition, epilepsy is "a disease of the brain characterized by an enduring predisposition to generate epileptic seizures and by the neurobiological, cognitive, psychological, and social consequences of this condition"(29,30). Many scientific evidences support that there is a relationship between epilepsy and the OS which results in the alteration of cellular proteins, nucleic acids and various membrane lipids(31).A study found significantly higher levels of malondialdehyde (MDA), a marker of LP, in the serum of patients with epilepsy compared to healthy controls(32). The authors concluded that OS and LP may contribute to the pathogenesis of epilepsy and could be a potential therapeutic target .

Anti-Epileptic Drugs (AEDs) are commonly prescribed to control the recurrent seizures. There are first generations AEDs namely Carbamazepine, Phenytoin, Clobazam, Phenobarbital, Ethosuximide, VPA etc, second generation AEDS namely include Levetiracetam, Topiramate, Gabapentin, Lamotrigine, Oxcarbazepine etc. (33). And then there are third-generation AEDs including Brivaracetam, Carabersat, Carisbamate, DP-valproic acid, Eslicarbazepine,, Seletacetam, Soretolide, Stiripentol, Talampanel, etc. (34). Since the AEDs have different mechanisms of action and they have different structures so they can act at different levels to alter the LP levels. So it has become pertinent to understand how different AEDs affect LP with different approaches necessary to study the same. In this review we will be discussing about the contribution of AEDs to alter LP level and different methodologies that are in current use to investigate their level.

Tanvi Magotra *et al.*,

LIPID PEROXIDATION IN RESPONSE TO THE AEDs

First-generation AEDs

OS is one of many major parameters that are associated with neurological conditions. Similarly, it also plays a critical role in the epilepsy treatment. As we discussed earlier that LP reaction produces certain toxic primary and secondary by-products that tends to disrupt the oxidant and antioxidant levels, And the same results in the activation of certain proteins and enzymes that lead to damage of cell membrane and finally cell death. Various scientific and clinical studies have indicated that AEDs therapy has a diverse effect on the LP levels in either way. In this section we will discuss the LP response with respect to treatment with different first- generation AEDs. Carbamazepine (CBZ), Valproic Acid (VPA), Phenytoin (PHT) are widely used first line AEDs that are used to treat different types of epilepsy.

Carbamazepine

CBZ is one of the most commonly prescribed first generation AED. CBZ is most effective for generalized tonic-clonic seizures and focal onset seizures(35)The CBZ action mainly depends either on the inhibition of sodium, calcium and potassium conduct or blocking the GABA receptor or other neurotransmitters like glutamate etc(36). Due to a great balance between its cost, efficiency, and availability, it is one of the top 3 most frequently described AED(37).

Clinical Studies

A clinical study was conducted to study the effect of CBZ therapy with 68 patients which were given doses of CBZ in the range of 20–30 mg/kg/day and the MDA levels were analyzed using the TBA assay. The results showed that CBZ mono therapy increased the total LP levels as compared to the control groups (38). A clinical study was conducted in 40 epileptic children in age group ranging from 4-12 years. They were administered with the CBZ treatment for 1 year and the results showed that the total antioxidant levels in serum were reduced while total peroxide levels were increased significantly as compared to controls (39). Another study conducted with epilepsy patients measured different antioxidant system enzymes like erythrocyte glutathione, Glutathione Peroxidase (GPx), Superoxide Dismutase(SOD) as well serum LP levels. The levels were checked prior to the treatment and 2 years after the treatment. LP was analyzed by TBA assay and results indicated that the LP and SOD levels were increased in patients treated with the CBZ (40). A study investigating the effect of CBZ on OS in young patients with epilepsy concluded that CBZ increased lipid peroxidation in patient blood samples as evident from MDA levels(41)However, there are a few investigations which suggest CBZ reduces lipid peroxidation levels. There was a study conducted on patients with bipolar disorder The study found that CBZ significantly reduced LP, as the measured MDA levels in the patient's blood were reduced(42). On examination of effect of CBZ on OS in patients affected with another neurological disorder- schizophrenia, it was found both CBZ and risperidone improved symptoms of schizophrenia, but only CBZ reduced LP, as reduced levels of MDA were observed in the patients' blood (43).

Cell lines

Data shows that CBZ treatment in BEAS-2B (human lung epithelial) cells down regulates various mitosis related factors (SPAG5, HGF, ASPM etc.) which causes mitotic arrest and further leads to increase in early apoptosis and ROS generation. The ROS generation further leads to the causing the OS and cause cellular damage(44). Another investigation was conducted with the aim to study the effect of CBZ on rat cerebral micro vascular endothelial cells (rMVECs), whose results showed that CBZ treatment resulted in the decrease in cell viability and also triggered an increase in the cellular OS (45). Another study investigated the effect of CBZ on OS markers in erythrocyte cells. Their results showed that there was an increase in the concentration of the MDA in cells which points to the fact that CBZ increased LP levels and also decreased the activity of antioxidant enzymes such as SOD and Catalase (CAT in the cells (46). Effect of CBZ on OS in human skin cells (HaCaT cells) was determined by researchers and found that CBZ increased LP levels, as measured by MDA levels, and there was concomitant decrease the activity of antioxidant enzymes such as GPx and CAT in the cells (47).

Tanvi Magotra *et al.*,

Animal Models

There are many studies investigating effect of CBZ treatment in animal models as well. A research study was conducted to investigate the effect of Carbamazepine on OS in the liver of rats with streptozotocin-induced diabetes. The study found that carbamazepine decreased LP levels, as measured by MDA levels, in the liver of the rats (48). Another study investigated the effect of CBZ on OS in fish spermatozoa. The study found that CBZ treatment increased LP levels, as measured by LPO levels and decreased levels antioxidant enzymes in the fish' spermatozoa, compared to fish of the control group(49). A different study investigated the effects of CBZ on OS markers in the male wistar rats. The study found that CBZ treatment increased LP and decreased antioxidant enzyme activity in rats treated with CBZ as compared to the controls (50). Furthermore, a research study that investigated the effect of CBZ on OS in the brains of rats with lithium-pilocarpine induced status epilepticus found that CBZ treatment curbed LP levels in the brain while simultaneously increasing antioxidant enzyme activity, therefore suggesting a potential neuroprotective effect of CBZ against OS-induced brain damage (51).

There is no consensus yet in studies evaluating the effect of CBZ, therefore, more research needs to be done to evaluate the changes in lipid peroxidation levels in response to CBZ treatment. It is important to segregate existing studies while further studies are needed to fully understand the mechanisms underlying these effects and to investigate potential clinical implications of CBZ treatment on lipid peroxidation, and subsequently, oxidative stress.

Valproic acid

VPA is another widely used AED for controlling seizures. It is regarded as safe and one of the most effective drug clinically in use for controlling epilepsy in both children and adults. VPA is effective against almost all types of seizures, making it a popular first choice for epilepsy therapy. There are various testimonies concerning the changes in the LP levels in response to the VPA monotherapy or VPA as a component of polytherapy. Some studies claim that the VPA tends to increase the LP levels and deteriorate the antioxidant defence system, while few studies showed that VPA inhibits the oxidative damage caused to proteins and lipids.

Clinical Studies

A clinical study conducted with 76 epileptic patients on VPA therapy used spectrofluorometric methods to measure peroxidated lipids (LPO). The results showed direct correlation between the plasma drug concentrations and the amount of lipid peroxidation. The level of lipid peroxides was found to be higher in the patients with partial epilepsies. Another trend that was observed was that lipid peroxide levels were found to be higher in epileptic women.(52). Another study involved 31 patients having cryptogenic epilepsy with age ranging between 7-10 years, out of which 21 suffered from generalized seizures and 10 patients had partial seizures, which compared the effect of VPA treatment between overweight and non-obese children(53). All the patients were prescribed VPA monotherapy at a dosage of 30 mg/kg/day for the period of 1 year. The results claimed that the patients who were obese (BMI>25) had higher concentration of oxidation markers like MDA and lower concentration of antioxidants like Vitamin E than those patients (54).

Cell lines

Multiple studies were conducted in order to study the cellular effects of VPA on the LP levels. Research conducted on two human breast cancer cell lines MCF-1 and MDB-MB-231 which were subjected to therapeutic doses of VPA for 48h. LP levels were analysed using spectrofluorometric methods. The results showed that average fluorescence values and hence peroxidation levels in MCF-7 and MDB-MB-231 were increased significantly (55). Now another study was focused on the hallmark of many neurodegenerative diseases including epilepsy i.e. glutamate induced excitotoxicity - a condition in which the glial cells are unable to uptake and respond to glutamate, leading to a neurotoxic effect. Results of a study performed on the SH-SY5Y cell line which is a human neuroblastoma cells. indicated that VPA treatment leads to an increase in the H₂O₂ and MDA concentrations, and hence causing OS. The study further concluded that glutamate induces neurotoxic effect due to the OS that was caused by the VPA (56,57). On the contrary, few studies showed that VPA therapy may decrease the LP levels such as a study was conducted with the aim to investigate the effect of VPA on markers of LP in children with idiopathic epilepsy. The researchers

Tanvi Magotra *et al.*,

measured levels of malondialdehyde (MDA) which is a marker of LP, before and after treatment with VPA. They found that VPA treatment was associated with a significant decrease in LP levels, suggesting that it may have an antioxidant effect (58).

Animal Models

Till now, we looked into the relationship between VPA therapy and LP levels through clinical studies and research on various cell lines. But VPA therapy also provides some good insights and observation in case of the animal models. VPA increases the TBARS levels (assay used to measure MDA levels) significantly when induced in the cerebellum and cerebral cortex of a young rat brain (59). Another study conducted in the Male Sprague-Dawley rats which were induced with the different therapeutic doses of the VPA, showed that VPA caused an increase in the ROS production as compared to the control groups, as along with a reduction in mitochondrial metabolism when compared to the control group. And there was also a significant increase in the concentration of cytochrome-c release. Cytochrome-c is a positively charged molecule binding to negatively charged lipids (mostly cardiolipin) in the inner membrane of mitochondria. This leads to the blockage of the binding site of cytochrome-c which enhances its dislocation, which may lead to cellular death. (60). But there are some contrasting studies as well. A study examined the effects of VPA on OS and LP in the animal model of mania which was exposed to lithium. They found that VPA and lithium treatment reduced LP levels and increased the activity of antioxidant enzymes, suggesting a protective effect against lithium-induced oxidative damage(61). All these studies do not show any consistent effect of the VPA on the response of the LP. Therefore, more research is with specific biological conditions needs to be done in the future to understand the relationship in a more accurate manner.

Phenytoin

PHT is another widely used first generation AED and was introduced about 60-70 years ago for the use to control seizures in epilepsy. Its mechanism is almost similar to that of the CBZ drug, i.e. it also aims to block the voltage-dependent blocking of the sodium channels causing action potential. By following the same mechanism, the PHT obstructs the development of the seizures. It is used both for generalized and partial epilepsies. But there have been some scientific evidence that it causes disturbances with the antioxidant defence systems and also affects the LP level(62).

Clinical Studies

A clinical study consisting of 115 subjects, out of which 20 were female healthy subjects, 12 were untreated female epileptic patients, and 25 female epileptic patients treated with PHT concluded that the females on PHT treatment showed an increase in MDA concentrations, Cu/Zn SOD levels and serum copper concentrations and there was decrease in the concentration of the GSH levels(63). Another study was conducted in which 12 patients were taken as healthy control and the 12 patients were on PHT monotherapy for minimum six months of duration. The compared results showed that there was increase in the levels of lipid hydroperoxide and decrease in the levels of the total antioxidants in serum (64). In a study which investigated the effects of PHT on OS and inflammation in patients with epilepsy. it was found that treatment with PHT resulted in a significant increase in LP levels compared to before treatment, while inflammation was not significantly affected. The researchers suggested that the pro-oxidant effect of PHT may be due to its ability to induce the cytochrome P450 system and generate free radicals (65). The studies discussed till now does not show a clear relation between the use of PHT and levels of the LP in humans. Therefore, more trials or clinical research need to be done in this area in order to understand the underlying molecular mechanisms connecting PHT treatment with LP levels.

Cell Lines

There was study conducted researchers investigated the effect of PHT on LP in the zebrafish embryos. The study found that PHT treatment resulted in a significant increase in LP levels and decrease in the activity of antioxidant enzymes like SOD, GPx etc(66). While there have been some studies investigating the potential protective effects of PHT against LP, the majority of studies suggest that PHT may increase LP levels. A study investigated the effects of PHT on LP in spinal cord cells. The study found that treatment with PHT resulted in a significant decrease in LP

Tanvi Magotra et al.,

levels compared to untreated cells. The researchers suggested that the antioxidant effect of PHT may be due to its ability to scavenge free radicals and inhibit the formation of lipid peroxides(67). Another study conducted in the rat hepatocytes; results determined that PHT treatment reduces the LP levels significantly hence showing the protective antioxidant effect(68). Therefore, from the studies we can conclude that LP levels may increase or decrease due to the PHT treatment depending on the different tissues and medical conditions.

Animal Models

A study was conducted in CD-1 (CrI:CD1(ICR)) mice models which were treated with the doses of the PHT i.e. 65 mg/kg/well. The results indicated that PHT treatment resulted in the increase in the concentration of TBARs and hence increasing LP levels, and also PHT initiated the oxidation and degradation process of proteins of the embryonic and hepatic tissues(69). An investigation on the effect of PHT and PHT-LEV combination on LP in a male wistar rats found that PHT treatment resulted in a significant increase in MDA levels in the rats treated with either PHT or PHT-LEV combination as compared to untreated rats. The researchers concluded that PHT monotherapy or in polytherapy increase LP levels which further can cause cognitive impairment(70). A study investigated the effect of PHT treatment on LP levels in the zebrafish. The results showed that PHT increased the LP levels as a result of increased lipid hydroperoxides formation (71). In contrast to the above studies, a study investigated the effect of PHT on LP in a Spargue Dawley mouse which concluded that PHT decreased the levels of LP in the mouse. The researchers further suggested that due to radical scavenging ability PHT have anticonvulsant properties(72). From the studies we discussed we observed that majority of the studies hints that LP levels may increase because of PHT but few contradictory studies are present.

Second-generation AEDs

Till now, we have extensively reviewed the effect of first- generation AEDs on the LP levels. Now we will discuss the effect of LP in response to second-generation AEDs. The most widely used second generation AEDs include Levetiracetam (LEV), Lamotrigine (LMG), and Topiramate (TOP) etc. Recently it has been shown that the second-generation AEDs are more prescribed to the patients due to less side effects being observed but due to their expensive cost the formulations are being avoided and first- generation AEDs are still preferred over second-generation AEDs.

Levetiracetam

LEV is a widely prescribed second- generation AED. Structurally LEV is an S-enantiomer of a-ethyl-2-oxo-1-pyrrolidine acetamide. It has broad spectrum effects on partial and generalized seizures in several models of epilepsy. The molecular mechanism behind it is still unclear but some studies indicate the role of calcium channels and GABA activity behind the LEV activity(62).

Clinical Studies

A clinical trial was conducted where 33 epileptic patients who were treated with LEV for about 6 months were compared with 35 healthy controls. The spectrophotometric analysis showed that LEV treatment increased the concentration of the liver enzymes with no evidence of OS, as no evidence of OS was observed, at least on the basis of lack of lipid peroxidation (73). Whereas another study showed that patients on the LEV treatment had increased levels of MDA, hence showing an increase in OS (74). Another study was conducted where urine samples of 30 epileptic patients on LEV treatment were analysed for 15-F2t-IsoP levels – a product of peroxidation of lipoproteins. The results showed the increase in the levels of the 15-F2t-IsoP levels which indicated increase in LP levels (75).

Cell lines

Different studies investigated the effect of LEV treatment in different cell line models. A study investigated the effect of LEV on OS and LP in rat hippocampal cells. The results concluded that LEV treatment decreased OS and also reduced the LP levels while it increased antioxidant enzyme activity, which suggested that LEV may protect against oxidative damage in the brain(76). A study done in human lymphocytes which investigated the effect of LEV on OS and LP found that LEV treatment decreased LP levels as a result of the decreased concentration of the LP biomarkers

**Tanvi Magotra et al.,**

and increased antioxidant enzyme concentration(77). Researchers have also investigated the effect of LEV on OS and LP in human neuroblastoma cells. They found that LEV treatment decreased OS and LP and increased antioxidant enzyme activity, suggesting that LEV may protect against oxidative damage in neuronal cells(78).

Overall, these recent studies are consistent with earlier research suggesting that LEV has a protective effect against LP in various cell types. They also provide further evidence for the antioxidant properties of LEV and suggest that it may have potential therapeutic applications for conditions characterized by increased OS and LP.

Animal Models

A study was conducted to explore the effect of LEV on OS and LP in a rat model of traumatic brain injury. The researchers found that LEV treatment reduced OS markers and LP levels in injured brain tissue (78). In another study researchers investigated the effect of LEV on OS and LP in the brains of rats with status epilepticus. The study demonstrated that LEV administration reduced OS markers and LP, suggesting a potential protective effect against oxidative damage (79). Another study examined the effect of LEV on LP in a rat model of epilepsy. The researchers found that LEV treatment reduced LP levels in the hippocampus, indicating a potential antioxidant effect of LEV(80). Conversely, a study which investigated the effect of LEV on LP in rat brain tissue after acute exposure to ethanol, found that LEV treatment increased LP levels, suggesting a pro-oxidant effect under these specific conditions (81). These studies highlight the complexity of LEV's impact on LP in animal models. It is important to consider that different experimental conditions, animal models, and study designs can contribute to these varied outcomes. Further research is needed to elucidate the mechanisms and determine the circumstances under which LEV may affect LP in animal models.

Lamotrigine

LMG is another second-generation AEDs which came into use since 2 decades. It is prescribed mainly to control the generalized tonic clonic seizures, partial onset seizures and generalized seizures. Major benefits of LMG includes that it cause less cognitive impairment and also it shows anti-ageing effect on many animal models (82)

Clinical Studies

There is scarcity of studies investigating the effect of LMG. One study investigated the effect of LMG on OS in patients with bipolar disorder. The study found that LMG treatment was associated with a decrease in OS markers, including LP products (83). Another study with the aim to investigate the effect of LMG on OS in patients with epilepsy, found that LMG treatment was associated with a decrease in OS markers, including LP products (84). Minimal research has been done till date, but based on those studies we can conclude that LMG may have a beneficial effect on LP in humans, However, further research is needed to confirm these findings and to determine the mechanisms by which LMG exerts its effects on OS.

Cell lines

One study investigated the effect of LMG on LP in both rat brain homogenates and human erythrocyte membranes. The study found that LMG treatment was associated with a decrease in LP in both the rat brain homogenates and human erythrocyte membranes (85). Another study investigated the effect of LMG on LP and antioxidant enzyme activities in rat hippocampus and cerebral cortex. The study found that LMG treatment was associated with a decrease in LP and an increase in antioxidant enzyme activities in both the rat hippocampus and cerebral cortex (86). While these studies provide some insight into the effect of LMG on LP in different cell lines, further research is needed to determine the mechanisms by which LMG exerts its effects on OS in these cells.

Animal Models

There have been a few studies investigating the effect of LMG on LP in different animal models. One study investigated the effect of LMG on LP in rats with febrile seizures which found that LMG treatment was associated with a decrease in LP in the brain tissue of the rats (87). A similar decrease in LP was also reported by another investigation where the effect of LMG on LP in a rat model of depression was studied (88). In the same line, another study concluded that LMG treatment was associated with a decrease in LP in the hippocampus of the rats (89). One

**Tanvi Magotra et al.,**

more investigation was done on the rats with intestinal injury. The results showed that LMG treatment reduced the levels of LP in the rat intestine tissue(90). Although the evidence is scarce, based on the studies discussed above, we can tentatively conclude that LMG does not cause lipid peroxidation in animal models. However, multiple holistic studies are required to confirm the same.

Topiramate

TOP is a second generation AED that is primarily used to treat epilepsy and prevent migraines. Its precise mechanism of action is not fully understood, but it is believed to work by enhancing the activity of the neurotransmitter gamma-aminobutyric acid (GABA) and inhibiting the activity of another neurotransmitter called glutamate (62,91,92). It is prescribed mostly to control the generalized seizures and partial-onset seizures. It is effective as both, in monotherapy and in polytherapy as well.(91,93)

Clinical Studies

There have been several clinical studies examining the effects of TOP on LP in humans. In one study, TOP treatment resulted in a significant decrease in malondialdehyde (MDA) levels, a marker of LP, when compared to placebos in patients with migraine (94). Another study found that TOP treatment for 12 weeks resulted in a significant decrease in MDA levels and an increase in the activity of antioxidant enzymes in patients with epilepsy(95). A study conducted on patients with idiopathic generalized epilepsy found that treatment with TOP for 6 months resulted in a significant decrease in serum MDA levels and an increase in antioxidant enzyme activity. In another study conducted on patients with chronic kidney disease (CKD), TOP treatment for 8 weeks resulted in a significant reduction in serum MDA levels and an increase in antioxidant enzyme activity (96). Overall, all these clinical studies suggest that TOP may have a beneficial effect on LP and play a role in attenuating also OS in a variety of conditions, as TOP has been shown to reduce the LP levels.

Cell lines

A two-pronged approach was done adopted to investigate the effect of TOP on both molecular OS as well as psychological symptoms in patients with alcohol use disorder. The study found that treatment with TOP resulted in a significant increase in LP and decreased levels of antioxidant enzymes, as well as an improvement in psychological symptoms (97). Another study evaluated the effect of TOP on OS and apoptosis in SH-SY5Y (human neuroblastoma) cells treated with amyloid beta ($A\beta$), a protein associated with Alzheimer's disease. The study found that TOP treatment resulted in a significant increase in LP and decreased antioxidant enzyme activity in the cells (98). Another study evaluated the effect of TOP on OS in rat cerebral cortical neurons. The study found that treatment with TOP resulted in a significant increase in LP and decreased antioxidant enzyme activity (99). A study investigated the effect of TOP on OS and inflammation in rats with experimental autoimmune encephalomyelitis (EAE), a model of multiple sclerosis. The study found that treatment with TOP resulted in a significant increase in LP in the spinal cord, as well as increased levels of inflammatory cytokines (100). In contrast to above, another study evaluated the effect of TOP on OS and inflammation in RAW264.7 cells, a type of immune cell (monocyte/macrophage) found that TOP treatment resulted in a significant decrease in LP and inflammation in the cells (101). A study investigated the effect of TOP on OS and mitochondrial function in SH-SY5Y cells treated with rotenone, a mitochondrial toxin. The study found that TOP treatment resulted in a significant decrease in LP and improved mitochondrial function in the cells (102).

Animal Models

There are a few studies that have investigated the effect of TOP on LP in different animal models. A study investigated the effect of TOP on OS and LP in a rat model of diabetic neuropathy. The study found that treatment with TOP resulted in a significant decrease in LP levels in the sciatic nerve tissue of the rats (103). Another study evaluated the effect of TOP on OS and LP in a rat model of chronic constriction injury-induced neuropathic pain. The study found that treatment with TOP resulted in a significant decrease in LP and in other OS markers in the spinal cord tissue of the rats (104). A similar decrease in LP was also reported in another study which investigated the effect of TOP on LP and antioxidant enzyme activity in a rat model of traumatic brain injury. The study found that

Tanvi Magotra *et al.*,

treatment with TOP resulted in a significant decrease in LP and improvements in antioxidant enzyme activity in the brain tissue of the rats(105). Similar observations have been reported in mouse model of chronic obstructive pulmonary disease. The study found that treatment with TOP resulted in a significant decrease in LP because of the improved levels of the LP and OS markers in the lung tissue of the mice (106). Another study in a rat model of liver injury induced by acetaminophen also concluded that treatment with TOP resulted in a significant decrease in LP and improvements in other OS markers in the liver tissue of the rats (107).Therefore, it can be concluded from the studies discussed above that TOP treatment can reduce the levels of the LP in animal models and it may have a protective effect against oxidative damage which should further leads to protection against the cellular damage.

CONCLUSION

Studies investigating the effect of antiepileptic drugs on lipid peroxidation suggest that generally first line antiepileptic drugs carbamazepine, phenytoin and Valproate cause lipid peroxidation. though conflicting studies exist for carbamazepine. Second line antiepileptic studies are more cyto-protective and not causative agents for lipid peroxidation and subsequently oxidative stress. The drugs which cause lipid peroxidation need to be given in combination with antioxidants to improve drug response.

Table 1. Different types of ROS and RNS species and their respective half times [20,21]

| | Free Radicals | Half life | Non Radicals | Half life |
|------------------------------------|------------------|--------------------------------------|--------------------|--------------------|
| ROS (Reactive oxygen species) | Superoxide | 10 ⁻⁶ s | Hydrogen Peroxide | Stable molecule |
| | Hydroxyl | 10 ⁻¹⁰ s | Ozone | few seconds |
| | Alkoxy radical | 10 ⁻⁶ s | Hypochlorous acid | Stable molecule |
| | Peroxy radical | 17 s | Singlet Oxygen | 10 ⁻⁶ s |
| RNS (Reactive Nitrogen Species) | Nitrogen dioxide | Depends on the environmental factors | Peroxynitryl | 10 ⁻³ s |
| | Nitric oxide | few seconds | Nitrous acid | few seconds |
| | | | Peroxynitrous acid | Stable molecule |
| | | | Nitryl chloride | few seconds |

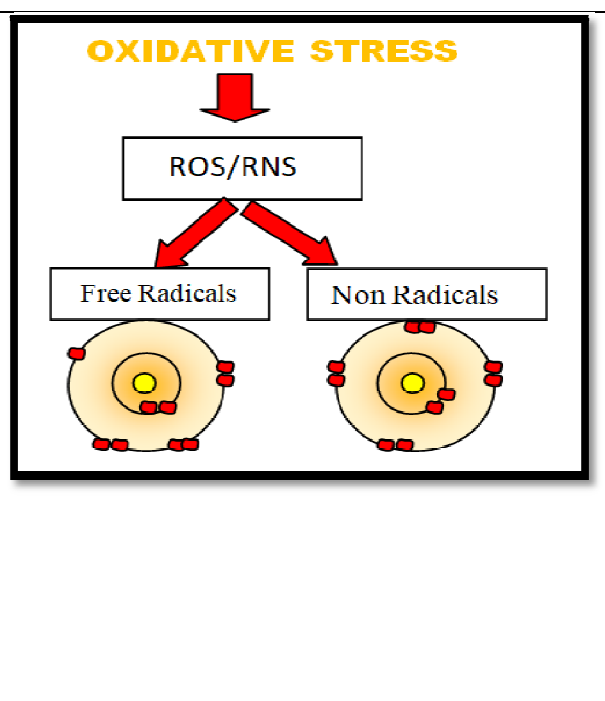

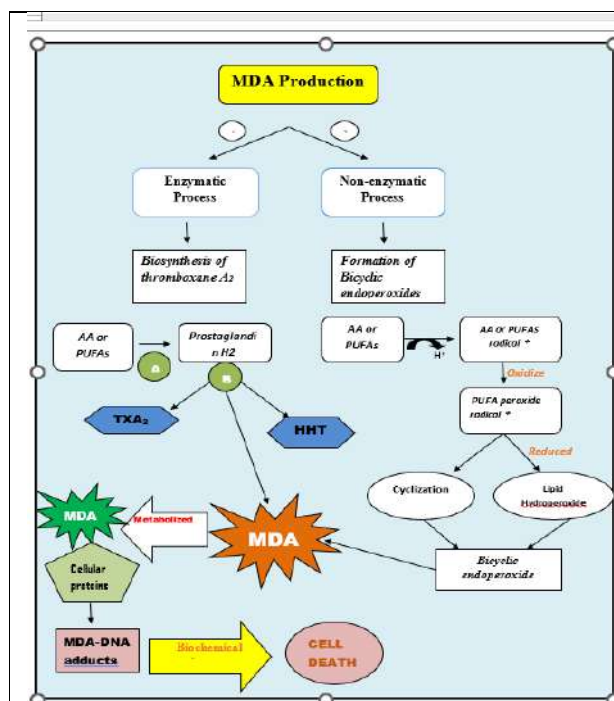

Figure 1- - Mechanism behind the production and metabolism of MDA, which is a secondary by-product of the LP. MDA is produced by enzymatic and non-enzymatic process . The enzymatic method involves formation of MDA as one of the by-product during the formation of the Thromboxane A2 which plays an important role in the platelet aggregation and prevent blood loss. In the non enzymatic process, MDA is formed as a result of the bicyclic endoperoxides formed due to lipid peroxidation. MDA formed further metabolizes and attack on cellular proteins and form MDA-DNA adducts and finally leading to the cell death.

Figure 2 - It shows that OS is accompanied by the increased production of ROS and RNS . And the ROS and RNS species are further categorised as Free Radicals and Non- Radicals. Free radicals have an odd no. of electrons or extra electron in the outer shell orbit whereas Non-Radicals are atoms or molecules which are at higher chances of becoming a free radical

Formulation and Characterization of Palatable Dosage Form of an Antiemetic Drug using Response Surface Methodology

ABSTRACT

The objective of the study is to develop a pediatric friendly dosage form containing ondansetron hydrochloride. Medicated chocolates of ondansetron hydrochloride were prepared using cocoa powder, cocoa butter, milk powder, mannitol, stevia and soya lecithin as formulation additives. Medicated chocolates were evaluated for organoleptic properties, drug content and drug release studies. Optimization of the formulation was done using 3² full factorial design. Concentration of cocoa butter (X₁) and concentration of sweetening agent (X₂) were taken as independent variable. The independent variable selected were hardness, melting point and percentage drug release at 15 minutes. Polynomial equations and response surface plots were generated for all the dependent variables. Concentration of the cocoa butter had a negative effect on drug release indicating it as a primary factor to be considered. Concentration of sweetener has positive effect on all the responses. Stability study of the medicated chocolate indicates that the formulation is intact with negligible variation in the evaluation parameters. It was observed from the results that medicated chocolates have appreciable organoleptic properties with acceptable drug release.

Keywords: Chocolate dosage form, ondansetron hydrochloride, factorial design, response surface plots

Lakshmi Prasanna Jakka and Sudhakar Babu Ams

INTRODUCTION

Administration of drugs to pediatrics has been a long term unsolved problem for guardians/ care takers. There are many factors to be known for poor medical adherence in pediatric patients. Pediatrics includes wide age range which is the foremost factor to be considered. Dose size, taste masking, accuracy of dose, unchanged therapeutic efficacy with global acceptance are hurdles to be crossed during development of a pediatric formulation.[1] Among various routes of administration oral route is most convenient and preferred route for many drugs and for all age groups. So manipulation of adult oral doses in the form of crushing or cutting or diluting is practiced commonly among various regions. But this leads to bioavailability and accuracy problems along with poor acceptance.[2] A proper pediatric formulation with desirable taste and pharmacological features is a need of the day. Rejection towards medication can be overcome to some extent by converting the form it appears to pediatrics. The most attractive and admired form by children is chocolate. So an attempt is being made to formulate chocolate as a pharmaceutical dosage form.[3, 4].

Chocolate, a sound of sweet has been ruling the world of food since ancient period. It has been transformed as a delicious food to preferred form of prescription. It has smooth texture and good mouth feel taste which can be utilized to mask the bitterness of drugs. Anhydrous medium of chocolate helps to incorporate drug without degradation. The flavonoids, principle ingredient of chocolate also helps in protective action of drug. Because of its versatility and world wide acceptance an attempt has been made to incorporate drug in it.[5]. Now a days, anti emetics has become part and parcel of pediatric prescriptions. Ondansetron is widely used anti emetics for all categories of patients and mostly preferred through oral route. Ondansetron has been included in the list of essential medicines by world health organization and made available as generic medication, since 1990 it has been approved for medical use.[6] So, ondansetron is selected to be developed as chocolate formulation.

METHODOLOGY

Materials

Ondansetron hydrochloride is obtained as a Gift sample from Dr. Reddy's laboratory. Coca powder, cocoa butter, skim milk powder, stevia, soya lecithin were purchased from local market. Mannitol is purchased from RFCL Ltd. All other ingredients and reagents used in the study are of analytical grade.

Fourier transform infra red spectroscopy (FTIR)

Interaction and compatibility of drug with excipients was known by FT IR studies. The spectra of the samples (pure drug, drug with β -CD and drug with other excipients) were recorded at a range of 4000 – 400 cm^{-1} with an FT IR spectrophotometer using KBr disc method.

Preparation of inclusion complexes

Ondansetron was complexed with β -cyclodextrin to mask the bitterness of drug by physical mixture and kneading method. Drug and β -CD in 1:0.5, 1:1, 1:1.5, 1:2 molar ratios were mixed in both the methods. In physical mixture method drug and β -CD of various ratios were mixed gently in mortar and pestle for 15 minutes. In kneading method drug with β -CD in same ratios were triturated in mortar with small volume of water. The thick slurry was kneaded for 45 min and dried at 50°C. These mixtures were passed through sieve no 120 and then stored in a desiccator for further use.

Preparation of the medicated chocolate

Ratio of the drug complex to be incorporated in the medicated chocolate preparation was selected after taste evaluation of the complexes by the panel of human volunteers. Pediatric equivalent dose of selected complex ratio along with the excipients were weighed accurately and sieved. Cocoa butter was melted on a water bath and mixture of cocoa powder, milk powder along with sweetening agent is added to it. High attention was paid to the

**Lakshmi Prasanna Jakka and Sudhakar Babu Ams**

process to ensure that the temperature of the mixture was not too high. The mixture was stirred about 30 min with glass rod to obtain smooth consistency. To this ondansetron + β -CD, soya lecithin and sorbitan tri stearate were added with uniform mixing. The above mixture was then filled into polycarbonate mould and refrigerated for 1h till it solidified. Formulation table of the medicated chocolates was given in Table 1.

Experimental design

A 3² full factorial design was employed to optimize the medicated chocolate formulation. A total of 9 experiments were carried out for two factors at three levels each. The experimental runs with observed response for 9 formulations are shown in Table 2. Polynomial equations, statistical parameters and response surface graphs for the responses were obtained by Design Expert software trial version.

Evaluation parameters**Taste evaluation of inclusion complex**

Drug and β -CD complexes prepared by 2 methods were evaluated for bitterness. A panel of 5 human volunteers was selected and taste was evaluated using the scale ranging 0 – 5 indicating no bitterness to strongly bitter[7].

General characterization of medicated chocolates

Colour, shape and texture in terms of stickiness and grittiness of the medicated chocolates were which evaluated by visual inspection. Texture was observed by rubbing the formulation between two fingers. Smell or fragrance and taste of medicated chocolates were observed by the human volunteer panel is considered for identification of complex taste [8].

Hardness

Formulations were tested for hardness by using pfizer hardness tester. From each batch three medicated chocolates were measured for the hardness and average was taken.

Determination of drug content

Medicated chocolate was taken in a beaker and dissolved in 10ml of water and sonicated. Then the mixture was centrifuged for 10 min at 2500 rpm. Clear supernant liquid containing drug was filtered to remove traces of chocolate if any present in it. Then the liquid was analyzed by UV spectrophotometer against water as a blank [9].

In vitro dissolution test

Drug release from the medicated chocolate was assessed using USP type II dissolution apparatus in 900 ml of distilled water at 50 rpm maintained at 37°C \pm 0.5°C for 60 min. An aliquot of 5ml was withdrawn at predetermined intervals and replaced with same volume of preheated fresh dissolution medium. The samples were filtered through whatmann filter paper and analyzed by UV spectrophotometer at 248 nm. The drug release studies were carried out in triplicate. The amount of drug released was calculated and % release Vs time graphs were plotted.[10]

Stability studies

Stability studies were carried out for optimized formulation according to short term stability study. Optimized formulation was packed in aluminium foil and stored at different conditions like air tight container, specified temperature (25 \pm 5°C) and refrigerated conditions (0-8°C) for 3 months. Stability of the formulation was assessed by observing physical parameters such as appearance, smell, color, melting point, hardness and also percentage drug release [9].

Lakshmi Prasanna Jakka and Sudhakar Babu Ams

RESULTS AND DISCUSSIONS

FTIR studies

FT IR studies of drug and excipients did not show any significant shifting of bonds compared to the pure drug indicating good compatibility between the ingredients. It indicates that the change in molecular level of drug is due to complexation observed in spectra. IR spectra of the pure drug, drug with beta cyclodextrins and other formulation ingredients were shown in Figure 1-3.

Physical characterization of medicated chocolates

All the chocolates are brown in color with chocolaty fragrance and glossy appearance. No chocolate sticks to the fingers and all the formulations are having smooth texture without any gritty particles. All the chocolates are in permissible limits of weight variation (i.e., 5%). The drug content of all the formulations was found to be in the range of 95.4% - 98.7% with uniform distribution of drug. Taste evaluation of the complexes was reported in Table 3. Drug content of the formulations was reported in Table 4.

Optimization by experimental design

Evaluation parameters obtained for the formulations were fitted into multiple regression analysis. The factors selected are concentration of cocoa butter and concentration of sweetening agent. The responses selected are hardness, melting point and % drug released at 15min. mathematical relationships of the dependent and independent variables are generated as equations and were given below.

$$\text{Hardness} = +2.40 + 0.6333A + 0.2667B + 0.00AB + 0.20A^2 + 0.0B^2$$

$$\text{Melting point} = +30.89 + 2.42A + 1.83B$$

$$\% \text{ drug release at 15min} = +57.34 - 14.23A + 6.52B$$

The correlation coefficients of the responses indicate good agreement between dependent and independent variables. Magnitude of the coefficient and the mathematical sign it carries can be utilized to draw the conclusions. Positive sign before the factor indicate that the increase in the factor increase the response where as the negative indicates reciprocal relationship between the dependent and independent variables. From the above equations it is clear that concentration of the cocoa butter and sweetener has a positive effect on the hardness and melting point. As the concentration of the both variables increases responses also increased. Concentration of sweetener has positive effect on percentage drug release at 15min Whereas concentration of cocoa butter has negative effect on drug release indicating that the increase in concentration of butter decreases the drug release. The variable has synergistic effect on the drug release. The quadratic models generated by the regression analysis are used to construct 3D response surface plots. ANOVA table of the dependent variables was given in Table 5. Multiple regression analysis of responses indicate that the both factors had significant effect ($p < 0.05$). Response surface plots and Contour plots obtained from the experimental design were shown in Figure 4 – 9.

In vitro drug release studies

The drug release profiles of the medicated chocolates indicated that the concentration of cocoa butter has significant influence on the drug release profile and were given in Table 6. It is inversely proportional to the release of drug. Drug release profiles of the medicated chocolates were shown in figure and the comparative drug release was shown in Figure 10-13.

Stability studies

Stability studies for the optimized formulation were done for 3 months. Formulation was stored in refrigerator and specified temperature ($25 \pm 5^\circ\text{C}$). No degradation was observed in both cases and formulation testing parameters like hardness, melting point and percentage drug released were found to be within $\pm 5\%$. When compared to the

Lakshmi Prasanna Jakka and Sudhakar Babu Ams

refrigerated condition formulation stored at specified temperature was found to have less hardness with increased release rate. The observations of the stability studies were given in Table 7.

CONCLUSION

Our study aims at preparation of pediatric friendly dosage form with ease of administration. The observation of the study indicated that attempt was successfully and desired results were obtained. Formulation of a chocolate dosage form has become more comfortable with the use of 3² factorial design. Batch containing 0.18g cocoa butter, 0.03g cocoa powder, 0.23g mannitol, 0.04g stevia, 0.03g milk powder has been selected to be the best formulation. Study indicated that the concentration of cocoa butter is more important to optimize drug release profile. It was concluded that medicated chocolates optimized carefully can be a powerful alternative for pediatrics to overcome the suffering of drug administration to them.

ACKNOWLEDGEMENTS

ABSTRACT

This survey asks young adults in Chennai, India, about debt repayment and loan management. The study surveyed 153 loan-borrowers aged 18–40. According to the survey, most young adults in Chennai have borrowed money for various reasons, but due to low income, poor money management, and high interest rates, many of them have problems paying back their debts. Due to their lack of debt management knowledge, many young people seek financial advice from friends and family, according to the survey. The study also indicated that financial literacy increased debt management and repayment efficiency. According to the report, banks should offer low-interest loan schemes.

Keywords: Loan management, debt repayment, money management, repayment strategies.

INTRODUCTION

A key component of personal finance is debt management, which is especially important for young individuals who are just beginning their jobs and juggling their financial obligations. Loans and debts, such as credit card debt, personal loans, and school loans, can have an effect on young adults' current financial situation and future financial prospects. With a focus on understanding their borrowing behavior, debt levels, and repayment tactics, the goal of this study is to evaluate the loan management and debt repayment strategies among young adults. This study will examine a number of variables, such as socio demographic traits, financial attitudes, and financial literacy, that affect loan management choices.

**Thandayuthapani and Thirumoorthi**

The results of this study will add to the body of knowledge already available on debt management and shed light on the financial habits and debt-management techniques of young adults. The structure of this essay will be as follows. The first section of the presentation will be a thorough overview of the pertinent literature on loan management and debt repayment techniques, stressing the fundamental ideas, theories, and empirical discoveries in the area. This will give the investigation a theoretical foundation and aid in locating knowledge gaps. The research approach, data gathering strategies, and data analysis methodologies will all be covered in detail after that, along with the design and methodology of the study. The project will use a quantitative research methodology and structured questionnaires to gather information from young adults between the ages of 18 and 34. To provide a representative sample, the sample will be recruited from a range of socio-demographic backgrounds.

In the part that follows, the study findings will be presented and analyzed. Descriptive statistics, correlation analysis, and regression analysis will be used to examine the relationships between various variables. The research findings will be examined in relation to the body of current literature and will be interpreted in light of the study's goals. Additionally, the study's limitations will be acknowledged, along with young adults frequently reach a point in their lives where they begin to rack up debt for a variety of reasons, including housing, education, and other costs. It is vital to comprehend how young adults manage their loans and debts, as well as their repayment plans, in order to encourage financial literacy within this group. This study can help with attempts to increase financial literacy and responsible borrowing among young adults by illuminating their knowledge, attitudes, and behaviors towards loans and debts. Young adults' borrowing habits and debt repayment plans may have wider economic repercussions. Young adults make up a substantial portion of the consumer population, and their borrowing habits may have an impact on the state of the economy as a whole. Young people' spending, saving, and investment choices can have an impact on the economy's consumption, saving, and investment patterns, thus it is important to understand how they handle their debt and loans.

The results of this study can help financial institutions and policymakers understand the unique loan management and debt repayment issues that young adults face. This can help with the creation of financial products, programmers, and policies that are suited to the needs of young people and can enable them to make wise decisions regarding debts and loans. Insights on how young adults handle their loans and repay them can help financial institutions improve their lending practices, risk assessments, and programmers for financial education aimed at this demographic.

LITERATURE REVIEW**Financial literacy and its impact on loan management: A study on young adults in Chennai**

The study conducted by Sridevi (2018) surveyed 300 young adults aged 18-25 years in Chennai to examine their financial literacy levels and loan management practices. The findings of the study suggest that financial literacy plays a crucial role in enabling effective debt management among young adults. Specifically, the study found that higher levels of financial literacy were associated with better loan management practices, including timely repayment of loans, avoidance of multiple loans, and better understanding of loan terms and conditions. The study also highlighted the need for financial education programs to improve financial literacy among young adults. The findings suggest that providing financial education to young adults can have a significant impact on their loan management practices and can enable them to make informed financial decisions. The study recommends that financial education programs should be designed to cater to the specific needs of young adults and should include practical training on loan management, budgeting, and investment planning. Overall, the study highlights the importance of financial literacy in promoting responsible loan management practices among young adults.

Debt management and repayment strategies among Indian youth: An exploratory study

**Thandayuthapani and Thirumoorthi**

Rathore and Das (2020) conducted an exploratory study to examine the debt management and repayment strategies among Indian youth. The study surveyed 200 young individuals from different educational backgrounds and income groups who had taken loans from various financial institutions. The findings revealed that most participants considered taking loans for education, medical emergencies, and purchasing houses or cars. Moreover, the study identified several factors that influenced debt repayment behaviour, including financial literacy, income level, and debt management strategies. The results indicated that individuals with higher levels of financial literacy tended to have better debt management practices and were more likely to repay their debts on time. The study also found that low-income individuals faced significant challenges in managing their debts and repaying them on time. These individuals often had to rely on their family and friends for financial support, and were less likely to have access to formal credit institutions. The authors suggest that increasing financial literacy among low-income individuals can help them make informed decisions regarding debt management, improve their financial planning skills, and ultimately enhance their financial well-being. Overall, this study highlights the importance of financial education and access to formal credit institutions in promoting effective debt management among Indian youth.

Debt management among young adults in India: An empirical study

The study involved a survey of 200 young adults aged between 18 and 30 years, and the data was analyzed using regression analysis. The findings of the study indicate that financial literacy has a significant positive impact on debt management behavior, with individuals who are more financially literate being more likely to manage their debts effectively. Additionally, the study found that attitudes towards borrowing also have a significant impact on debt management behavior, with individuals who view borrowing as a last resort being more likely to manage their debts effectively. The study also revealed that gender has a significant impact on debt management behavior, with females being more likely to manage their debts effectively compared to males. This finding is consistent with previous research, which has suggested that women tend to be more risk-averse and are more likely to engage in prudent financial behavior. Overall, the study highlights the importance of financial literacy and attitudes towards borrowing in enabling effective debt management among young adults in India.

Financial behavior and debt management strategies among young adults

Sivakumar and Vimala's (2017) study highlights the need for financial education among young adults to improve their financial behavior and debt management strategies. The study found that a majority of the respondents were not adequately knowledgeable about financial management, which led to poor financial behavior and excessive debt burden. Furthermore, the study revealed that young adults tend to rely on informal sources of financial advice, such as family and friends, which may not always provide accurate or reliable information. The authors suggest that financial education programs should be developed and implemented to equip young adults with the necessary knowledge and skills to manage their finances effectively. These programs could include topics such as budgeting, saving, investing, and debt management. By improving financial literacy and behavior, young adults can make informed decisions regarding debt management and reduce their financial stress and burden.

METHODOLOGY

The methodology used in the current study is descriptive non-probability convenience sampling. The problem of loan management and debt repayment practices among young adults in Chennai is described and explained using descriptive research. Since it is convenient for the researcher to choose individuals who are readily available and accessible, non-probability sampling is used. Participants are chosen via convenience sampling based on factors including age, gender, and prior loan experience. Data collected through the structured questionnaires. The questionnaires served as the primary data collection instrument, allowing for the systematic gathering of quantitative information. A set of structured questions and rating scales were included in the questionnaire to capture participants' perceptions, experiences, and effectiveness of various digital marketing tools in talent attraction. The questionnaires were distributed to a sample of talent acquisition intermediaries using a convenience sampling approach. Participants were provided with clear instructions to ensure accurate and honest responses. The

**Thandayuthapani and Thirumoorthi**

data collected through the questionnaires provided valuable qualitative insights for analyzing the loan management and debt repayment among young adults. Using descriptive statistics like frequencies and percentages, the study's findings are examined. The results are cautiously interpreted, and the convenience sampling method's drawbacks are acknowledged. It is crucial to remember that the non-probability sampling technique utilized in this study may prevent the conclusions from being generalizable to a larger population.

RESULTS

The questionnaire was created based on various criteria related to the loan management and debt repayment strategies among young adults. Many young adults struggle with loan management and debt repayment due to factors such as insufficient income, poor financial planning, high-interest rates, and limited financial literacy. In some cases, young adults may take on more debt than they can manage, leading to missed payments, late fees, and damaged credit scores.

Interpretation:56% of the procurement of loan gone to buying of house or car, while 40% went to covering the expenses and 34% went to education payment and 22% went daily necessity.

Interpretation:68.4% of people face pressure from their family and friends to manage loans and debts responsibly, while 31.6% doesn't face pressure.

Interpretation: The correlation will show if there is a relation between two variables if the it's a positive 1 then there is a significant relation between two variables and if it has negative 1 then there is no significant relation between to variables so now this correlation has a significant relation between these two variables

Interpretation: the chi-square will show if there is a association between two variables if the it's a less than 5 then there is a significant association between two variables and if it has more than 5 there is no significant association between to variables so now this correlation has a significant association between these two variables

Discussion According to the findings of our study, the bulk of loans taken out by people are used to buy homes or automobiles (56%), pay bills (40%), fund education (34%), and buy everyday essentials (22%). Furthermore, according to our research, 68.4% of people report feeling pressure from friends and family to manage their debts and loans appropriately.

According to the results of the correlation study, there is a strong association between the variables of loan purpose and felt peer pressure to manage loans responsibly. This suggests that borrowers who predominantly use loans to buy homes or cars are more likely to experience peer pressure to handle their debt appropriately. The chi-square analysis showed a strong correlation between the purpose of the loan and the perception of peer pressure to handle loans properly. This shows that the proportion of people who experience peer pressure to manage their loans properly changes depending on the purpose of the loan. It is interesting to note that the results of our study are consistent with those of earlier studies, which indicate that people feel more responsibility to handle their loans properly when they are for higher sums or long-term goals, like schooling, vehicles, or homes. This pressure may result from the worry that they may not be able to repay the debt, harming their credit score and adversely affecting their reputation and financial security.

Our research also highlights the value of financial education and literacy in assisting people in better managing their loans and debts. Individuals can better comprehend the ramifications of taking out loans and the long-term effects of poor loan management with the aid of financial education. The importance of financial institutions in fostering appropriate debt management is further shown by our study. Financial institutions can create transparent and simple-to-understand loan solutions, offer consumers financial education and tools, and provide support and direction for those who might be having trouble managing their loans. In conclusion, our study offers insightful

**Thandayuthapani and Thirumoorthi**

information about the connection between the purpose of loans and the perception of peer pressure to manage loans responsibly. Financial organizations can provide loan products that encourage responsible loan management and individuals can make educated decisions about managing their loans by being aware of this link.

IMPLICATIONS

According to the study's findings, a sizeable part of loans is obtained for the purpose of purchasing assets like homes and automobiles. This shows a preference for long-term investments over current costs. Additionally, a significant portion of people experience pressure from friends and family to handle loans and obligations appropriately. This demonstrates the importance of financial literacy and education in assisting people in making wise financial decisions and avoiding debt traps. It is possible that there is a connection between the pressure put on people to manage their debts properly and the motivations for taking out loans, given the high correlation and association between the variables. This emphasizes the necessity for financial institutions and politicians to approach the problem of debt management holistically, taking into account the pressures people encounter in addition to their own financial circumstances, such as social and familial obligations. Furthermore, according to the study's findings, paying for school is a big element in obtaining loans, with 34% of respondents saying that this was the main purpose of their loans. This emphasizes how crucial it is to offer individuals who might otherwise be compelled to take out loans with high interest rates affordable educational options and financial aid. Before taking out loans for educational expenses, people should carefully assess their financial status because doing so can result in long-term debt and a heavy financial burden.

The report also finds that a sizable fraction of people (22%) borrow money to pay for basic needs like food and utilities. This implies that there may be underlying economic reasons, such as poor salaries and excessive living expenses, contributing to the need for loans. Instead of relying on loans, policymakers and organizations should aim to address these underlying problems and provide people with inexpensive and accessible basic necessities. Overall, the study's findings offer important new understandings of the motivations for borrowing money and the pressures that come with it. The large percentage of people who feel pressure from friends and family emphasizes the need for financial literacy and education programmes as well as support mechanisms for people who may be having financial difficulties. Additionally, the strong correlation between loan purposes and pressure experienced implies that financial behavior is significantly influenced by social influences and that individual choice is not always the best course of action. Policymakers and organizations can seek to create a society that is more economically inclusive and sustainable by tackling these social and economic factors.

ABSTRACT

Tax reform, as the name implies, is a type of change undertaken in a country's tax system to assist the government in limiting the chances of tax evasion and avoidance. It promotes revenue sustainability, tackles issues and conflicts related to inequality through behavior modification and redistribution, and supports in national growth. Tax reform had been proposed for because of variety reasons. The greatest goal is to eliminate any possibility of avoidance and evasion of tax liability from the economy. Another goal is to increase the rate of sustainability in revenue generation and public investments towards chosen routes by giving tax discounts, breaks, and exemptions. The ultimate goal is to improve the overall operation of the tax system and spur economic growth in the country. In these paper, we understand the concept of reforms of Indirect tax and its effects on Business and house hold consumption. It basically speaks about the changes brought in once tax pay in method and tax living process. As Taxation is a very important concept for the Economic and Social development to any Country. Indirect tax is a tax paid by the end user for the Goods and services consumed by them such as VAT, Sales tax, Consumption tax etc. All these Tax has been replaced by one major form of tax named as Goods and Service Tax which was passed in the year 2017 of 1th July at mid night by The Prime Minister of the Country Narendra Modi, Which rolled out all other indirect tax and brought the Concept of one Nation one Tax. GST (Goods and Service Tax) the main objective of this tax was to have a uniform tax system and to make all the citizens to pay tax without finding any loop whole to escape.

Keywords: Tax reforms, Indirect tax, Goods and service tax, one tax one nation and one market, consumption tax.

INTRODUCTION

To wisely administer a nation, the government must collect taxes from qualified persons; paying taxes to the local government is a fundamental part of everyone's life, no matter where we reside on the earth. Today, there are numerous ways to collect taxes, including state taxes, federal taxes, direct taxes, indirect taxes, and many others. The process through which a government or taxing authority imposes or levies a tax on its people and commercial organisations is referred to as taxation. In India, the central and state governments are very important in deciding on taxes. Government at both the federal and provincial levels have already enacted a number of policy changes in recent years to improve the nation's transparency and simplify the tax system. The Goods Services Tax (GST) was one such development, as it simplified the tax structure on the sale and delivery of products and services in the country. The Indian tax system is divided into two major categories like Direct and indirect taxes.

Direct Tax: a charge imposed on a taxpayer that they must pay to the government directly. Additionally, a person cannot transfer or delegate another person to pay his taxes on his behalf. Examples of this include income tax, property tax, and corporate tax.

Indirect tax: A tax levied on the taxpayer's goods and services rather than his or her income, profit, or revenue. In contrast to direct taxes, indirect taxes can be transferred from one person to another. Previously, the list of indirect taxes levied on taxpayers includes service tax, sales tax, VAT, central excise charge, and customs duty. However, with the implementation of the goods and services tax (GST) regime on July 1, 2017, it has superseded all forms of indirect tax imposed by state and central governments on goods and services.

EXAMINATION OF LITERATURE

Dr. Kopalapillai Amirthalingam (2013), in his research paper entitled

"Taxation's significance and indirect taxes' function in developing nations "Many developing nations have identified tax policy as being essential in their efforts to promote both physical and economic growth. In order to ensure stable economic growth and equitable income distribution, taxation is also essential. In developing nations, indirect taxes are more important than direct taxes. Bhavik U. Swadia (2016), in the study entitled "Comparison between Indirect tax and GST" asserted that government action has been taken Both the government and the vendors gain from indirect taxes that stop the cascading effect. Following the implementation of the GST, 2 percentage points of economic growth are anticipated. GST improves transparency by including both commodities and services. Prices for goods and services will decrease, increasing the tax- to-GDP ratio. It would be simpler to conduct business in India because of the country's streamlined rules and structure.

K. Beemabai Dr. K. Krishnakumar (2019), in their study entitled "Impact of direct and indirect tax reforms in India" analysed that GST has been determined to be a boon to micro, small, and medium-sized businesses. In comparison to the previous taxation structure, these businesses, according to them, are now less reliant on tax professionals. They also believe that this tax reform will result in single market and common market tax legislation, as well as increased economic and GDP growth.

THE METHODOLOGY OF RESEARCH

This paper is focuses on the analysis of secondary data gathered from numerous sources of information such as websites, papers, and books, among others. A survey of the literature from research articles focusing on the specifics of GST and tax system.

Jagadheesh and Harshitha

OBJECTIVE OF THE STUDY

- To thoroughly investigate the indirect tax system.
- To investigate the impact of indirect tax reforms on various sectors in India.
- To investigate the evolution of India's GST taxation system in depth.
- To study and understand needs of tax reforms and various reform in indirect taxation system in India.

NEEDS FOR TAX REFORMS

Tax reforms were required in India to ensure its international competitiveness and to suit the needs of the market economy. The market economy has supplanted the centrally planned development paradigm. In 1991, Manmohan Singh, the Finance Minister at the time, proposed the formation of a Tax Reform Commission. Following are the some of example for tax reforms:

- Decreasing of marginal tax rates.
- reducing the tax implications of savings and investment.
- reducing the occurrence and probability of tax avoidance and evasion; reducing the overall number of tax defaulters
- Increasing the effectiveness of economic decision-making.
- reducing the cost and time required to coordinate, plan, and implement the tax system change.
- In the case of industries, investments, and properties, uniform treatment is required.

JOURNEY OF INDIA'S INDIRECT TAXATION STRUCTURE

In India, indirect taxes trace back to the early twentieth century, when the British Raj levied taxes on commodities such as salt, tea, and opium. These levies were used to cover the administrative and military costs of the British Raj. The Government of India Act of 1860 established the first comprehensive taxation system in India. This act established a unified tax system in India, including a range of direct and indirect common indirect taxes. After India gained independence in 1947, funding became a key issue for the administration. The entire network of ruling officers required their salaries, which demanded finances. As a result, while "Excise Duty" was not abolished, an extra tax known as "Customs Duty" was levied on imported goods to protect Indian firms in various areas. However, by the 1960s and 1970s, Indian technology had become outmoded in comparison to their overseas competitors. Although there were other reasons, such as licence raj, the high customs charge had created a protective wall favouring low output and old technology. Despite a rather effective tariff harmonisation, the excise charge system remained complex. It was a mash-up of numerous rates, punctuated by a slew of exclusions. In fact, more frequently than not, no single rate could be identified as directly applicable to a given product.

EXCISE DUTY: In 1944, India imposed the first indirect taxtaxes. Excise duty, stamp duty, and customs duty were the most on goods in the form of an excise duty. An excise tax, commonly referred to as an excise charge, is imposed on products made in India by corporations.

CENTRAL SALES TAX

The Government of India pro- posed a Bill in parliament on November 21, 1956, which was enacted as the Central Sales Tax Act 1956. The Central Sales Tax Act of 1956 went into effect on July 1, 1957. Act 21 of 1958 introduced significant modifications to the taxation of luxury items.

SERVICE TAX

The Service Tax provisions went into effect on July 1, 1994, as part of Chapter V of the Finance Act of 1994. Except for the state of Jammu Kashmir, it covers the entire country of India. A service tax is an indirect tax charged by the government on services provided by service providers. It was enacted under Section 65 of the Finance Act of 1994. In this case, the service provider pays the tax and collects it from the customer. Previously, the service tax was levied on

**Jagadheesh and Harshitha**

a limited set of services, but its scope was enlarged in the 2012 budget. The list of amenities also includes air-conditioned restaurant services and short-term lodging provided by hotels, inns, and other lodging companies.

CUSTOM DUTY

The most significant law governing the imposition and collection of duties on products imported and exported inside the nation is the Customs Act of 1962. Additionally, this Act addresses import and export procedures, restrictions on the import and export of products, fines, offences, and much more. This obligation is used by the government to boost tax income, protect domestic industries, and control the flow of commodities. The many categories of customs duties gathered are listed below. • Basic Customs Duty Surcharge • Additional duties on top of that • Customs duty other taxes include safeguard duty, anti-dumping duty, and countervailing duty. In addition, cess duty is applicable to some commodities.

VALUE ADDED TAX (VAT)

VAT is an important source of revenue for all Indian states and union territories (except Andaman and Nicobar Islands and Lakshadweep). In the Indian taxation system, VAT was implemented as an indirect tax to replace the old general sales tax. Many Indian states implemented the Value Added Tax Act (2005) and accompanying VAT laws on April 1, 2005. Several states (Gujarat, Rajasthan, MP, UP, Jharkhand, and Chhattisgarh) were formerly exempt from VAT, but later embraced the tax. Each state's VAT legislation, rates, taxable base, and list of taxable goods are unique.

SECURITIES TRANSACTION TAX (STT)

The STT Act of 2004 is in charge of enforcing this regulation. This taxation policy went into effect on October 1, 2004, and every trader/investor has been required to pay STT since then. It has streamlined the taxation process in India's capital markets for trading and investment. The central government has authorised the purchase and sale of securities. Options, equities, and futures are examples of these securities. STT only applies to transactions finalised on the local stock exchange. Furthermore, STT only applies to transactions performed on the country's recognised stock exchanges. Furthermore, this tax does not apply to off-market transactions.

Goods and Services Tax

The term "GST" stands for the goods and services tax, which was first introduced in the Budget Speech on February 28, 2006. It laid the foundation for a thorough overhaul of India's indirect tax system. The indirect taxation system has undergone a number of adjustments since it first came into effect as the Goods and Services Tax Act on July 1, 2017. The Goods and Services Tax (GST) is levied on the provision of goods and services. A multi-stage, destination-based tax, the Goods and Services Tax Law in India is imposed on each value addition. The only domestic indirect tax law in the nation is called the GST.

FEATURE of GST

- The consolidation of 17 federal and state levies.
- Taxation on consumption.
- There is only one tax rate applied throughout the board.
- The occurrence of "Supply of Goods or Services" is taxable.
- The divide between products and services does not exist

Taxes are not taxes on taxes.**Credit is freely flowing.**

- At each stage, there is a Value Added Tax.

**Jagadheesh and Harshitha****Impact of GST tax reforms**

One nation, one tax was established with the GST, however the effects on various businesses varied slightly. Whether an industry engages in service provision or manufacturing, distribution, and retailing will define the first degree of difference. GST raises the performance and competitiveness of India's industrial sector. Several challenges, including decreased exports and rising infrastructure spending, are causing this sector stress. Manufacturers and distributors' administrative costs have increased as a result of numerous indirect taxes, but with the implementation of the GST, the compliance load has decreased and this industry will expand more quickly.

Followings are the impact of GST reforms

Tax reform ensures that the tax system is fully ordered and lowers the prevalence of tax evasion and avoidance.

- It facilitates compliance by making tax laws simpler to comprehend.
- By increasing the number of taxpayers, it increases the tax base and decreases the per capita tax.
- Will aid in the development of a single, national market for India, attracting more foreign investment and supporting the "Make in India" effort.
- To prevent tax cascading, input tax credits will be available for both commodities and services at every stage of supply.
- Harmonisation of policies, practises, and tax rates between the federal government and states as well as between different states
- higher level of compliance A paper trail of transactions will be encouraged at every stage of the supply chain because all refunds will be filed online, input credits will be verified online, and so on.
- The incentive for evasion will be lessened by the absence of pricing arbitrage between nearby States and that between intra- and inter-state sales.
- The taxation system will be more reliable if there are uniform procedures for taxpayer registration, tax refunds, uniform tax return forms, a common tax base, and a single system of product and service classification.
- The amount of human interaction between taxpayers and the tax administration will decrease as IT use increases, which will aid in the fight against corruption.
- It will increase export and industrial activity, which will increase employment and raise

CONCLUSION

The tax reform debate has raged on for years with no end in sight. The major question is how to make the tax law more egalitarian and fair for everyone. There are numerous proposals for tax reform, but one thing is certain: any changes must ensure that everyone is treated equitably under the law. One solution would be to abolish all discounts and loopholes that disproportionately favour specific groups or persons. This would level the playing field for everyone and make it easier to collect unpaid taxes. Another possibility is to implement a flat tax, in which everyone pays the same rate regardless of income. This also ensures that everyone pays their fair part.

ABSTRACT

Fencing is an age-old sport that combines physical prowess, strategic thinking, and quick reflexes. This paper delves into the world of fencing sports, its types of event, its techniques, and the various equipment's. The paper investigates the diverse training approaches utilized by fencers to enhance their skills and fitness levels. It highlights the importance of conditioning, strength training, and flexibility exercises, along with the mental preparation needed to cultivate a resilient mind-set required to excel in this demanding sport.

Keywords: Fencing Sport, Physical Prowess, Technical Proficiency, Mental Flexibility, Physical Fitness

INTRODUCTION

A sword is used by two competitors in the combat sport of fencing to score points by making contact with their opponent's body. It is a long-standing tradition that has earned Olympic status. It is an age-old sport. Physical preparedness, mental agility, and technical proficiency are prerequisites for the sport. This essay will go over the background, tools, regulations, and methods of fencing.

History

Fencing has a lengthy and colourful past. Ancient Egyptians were the first to use it, and the Greeks and Romans followed. France hosted the first known fencing match in the sixteenth century. In the 18th and 19th centuries, fencing gained popularity in Europe, and in 1896 it was added to the first modern Olympic Games. The first descriptions of fencing date back to Egypt in the 16th century BCE, where practitioners used bamboo or wooden swords. Ancient Greece and Rome both practised fencing, and soldiers were expected to know how to use it. Knights and nobility in mediaeval Europe trained in the martial art of fencing.

**Chikka Rangaswamy and Ponnappa**

In the 19th century, fencing as we know it now started to take shape. In Europe, fencing masters started to create training regimens and technique systems, and fencing clubs started to appear. The first modern Olympic Games were held in Athens, Greece, in 1896, and fencing was a part of them. Since that time, fencing has consistently been included in the Olympic schedule. (Wikipedia, 2023)

Equipment

Fencers need specialised gear and protective apparel. The sword, which is available in three varieties including foil, Epee, and sabre, is the most crucial piece of gear. The sword known as the foil is a small, flexible weapon used for thrusting assaults. Although it has a greater target area, the Epee is a heavier sword that may also be utilised for thrusting assaults. A curved sword used for both cutting and thrusting assaults, the sabre. A mask, jacket, and glove are also worn by fencers as safety measures against harm. The fencer wears a wire mesh mask over their face to protect their head and eyes from harm. The jacket covers the torso and is made of a thick material, typically cotton or nylon. The hand and wrist are covered by a leather glove. (Rookie Road, n.d.)

Various Equipment's:**1. The Mask****4. Knickers****2. The Jacket****5. Glove****3. Under-Arm Protector****6. Shoes****Rules:**

The sport of fencing is supervised by rigid regulations. By contacting your opponent's body with the tip of your sword, you can earn points in this sport. Depending on the sort of sword being wielded, a different location is the target. The torso is the target region for the foil, Epee, and sabre, while the entire body above the waist is the target area for the Epee and foil. Fencers are also required to abide by laws governing timing, movement, and body contact. During a match, fencers are required to wear the appropriate safety gear at all times. Additionally, they must abide by restrictions on timing, movement, and physical contact. For instance, during a match, fencers must stay in their designated region and are not permitted to cross their feet. For touches made with the sword tip, a fencer receives points. A touch is only recognised in foil and Epee if it is made with the tip of the blade and landed on the legal target area. The entire body above the waist is the target area in sabre, and touches can be delivered with either the sword's edge or tip. (International Fencing Federation, n.d.)

Chikka Rangaswamy and Ponnappa

Types of Weapons

1. Foil

- In this Sword would be 110cm long
- Valid target is only the torso.
- Fencer must establish priority for a valid touch
- A touch is scored by hitting with the point

2. Saber

- In this Sword would be 105cm long
- Valid target is anywhere above the waist.
- Fencer must establish priority for a valid touch
- Touch can be made with any part of the blade

3. Epee

- In this Sword would be 110cm long
- Valid target is the whole body.
- There is no priority to touch
- A touch is scored by hitting with the point

Techniques:

Technical proficiency, mental flexibility, and physical fitness are all necessary for fencing. In order to outmanoeuvre their opponents, fencers need to be nimble and agile, as well as be able to think intelligently. A variety of manoeuvres are used by fencers, such as footwork, parries, and attacks. Fencing requires excellent footwork, and competitors must be able to shift directions fast.

CONCLUSION

Fencing is a demanding and thrilling sport that calls for technical proficiency, mental acuity, and physical fitness. The activity has an illustrious past and is now acknowledged as an Olympic sport. Fencers must be able to think tactically in order to outmanoeuvre their opponents. They employ specialised equipment and adhere to stringent rules. Fencing is a sport that calls for commitment, self-control, and a passion of the game.

ABSTRACT

The purpose of this paper is to provide an overview of rural agriculture loans in the Tumakuru region, including their current status, the impact of credit lending, the role of banking institutions and governance in rural finance expenditures, as well as the development, obstacles, and challenges over the years. The objective measure of access to rural farm loans is variable, which aids in measuring credit lending and the portfolio level of agriculture credit in order to assess the performance of financial institutions. As a result, the results indicate that banks provide greater access than microfinance institutions for big agricultural loans, but provide less access than microfinance institutions for small agricultural loans.

Keywords: Rural agriculture loans, access to finance, credit lending

INTRODUCTION

Recent figures indicate that by 2050, the global population is expected to increase considerably. As a consequence, population expansion will raise food demand. Without a strengthening of the private production sector, it will be impossible to meet these requirements in light of the rising food demand. The agriculture industry and its development receives less credit from the banking sector in emerging nations. This is the case, despite the fact that the spread of agricultural GDP in emerging nations is extremely great. It is not a shortage of liquidity in the banking sector that prevents lending to developing nations; rather, it is a lack of commitment to expand the agricultural

**Mohankumar and Hemanthkumar**

industry. Farmers and agricultural firms are constrained in their investments in agriculture as a result of this circumstance. These agricultural loans offered to developing nations are typically informal and short-term, which is closely tied to long-term investments. These informal loans for agriculture only partially meet the demands of farmers and small agricultural businesses, and their interest rates are typically high. Providing credit for rural agriculture is the main goal of institutions and governments because of the importance of strengthening and developing the rural economy, which improves a country's overall economy, employment, and the reduction of poverty. extending rural agriculture loans is the primary objective of institutions and governments. Thus, the performance and risk associated with these agricultural loans tend to be greater. Despite a 3.45% decrease in 2015, the rate of interest is is very higher than when compare to the other allied business activities. In the Tumakuru region, agricultural loans are viewed as a significant tool for enhancing agricultural production and income growth through the use of modern technologies to increase inputs and productivity. There are three challenges that financial organisations encounter when providing financial goods. Costs associated with reaching isolated rural people. The study is required since the Tumakuru Area is regarded as the most underdeveloped region in India. Each year, numerous farmers have been committing themselves. The majority of youth are moving to new locations. Very little precipitation falls, and the sand is also infertile. There are no rivers in the surrounding area.. So, it would be beneficial for the region's elected government to improve the Farm loaning system. The study has a lot of potential because the subject is so large. There is no limit to the amount of research that can be conducted, as the farmers are in a dire state. For farmers, this is a pressing issue. Assistance is inevitable for the farmers in the Tumakuru region. If farmers are provided with consistent financing, their living conditions may improve and their anguish may be alleviated to some degree.

REVIEW OF LITERATURE

Mohan, S. (2008). has analysed the factors affecting the central cooperative bank's profitability. He observes that profitability ratios warrant the management's serious attention and a concerted attempt to correct the financial performance. In the foreseeable future, he recommends that the bank expand its banking operations so that non-interest income increases significantly.

The European Association of co-operative Banks (2009) (European Association of Co- operative Banks (April 2009), "European Co-operative Banks in Financial and Economic Turmoil", Co-operatives in a world in Crisis (Contribution of EACB to the Experts Group meeting) United Nations- New York.) argued in its article titled "European Co-operative Banks in Financial and Economic Turmoil" that despite extensive interest rate cuts, liquidity injections, and support measures, the The world economy will undergo a severe recession in 2009 and possibly also in 2010. As has been proved, however, the majority of cooperative bank groups have been able to weather the financial crisis pretty successfully without official assistance. This was owing to their limited exposure to toxic assets, emphasis on domestic retail banking with consistent outcomes, robust capital buffers, and predominantly conservative risk management. The co-operative banks that did declare losses as a result of the subprime crisis were mostly affected at the subsidiary and APEX institution levels. The financial crisis did not directly affect the local banks. Thus, cooperative banks were stable and resilient at the local level, demonstrating the stability of the retail banking system in Europe. Mayil Murugan, A. (2009) (Mayil Murugan, A., "An Empirical Study of Capital Adequacy Ratio in Central Co-operative Banks," Tamilnadu Journal of Co-operation, Vol.9 No.8, August 2009, pp.57-62) conducted an empirical investigation of the capital adequacy ratio in Central Co-operative Banks. He found that adequate capital has decreased the chance of bank failure and increased the institution's liquidity. He has determined that meeting the capital adequacy requirement is not a concern for the bank forever.

Singh and Singh (2010) (Singh and Singh (2010), "Technical and Scale Efficiency in District Central Co-operative Banks of Punjab – A Nonparametric Analysis", Indian Co-operative Review, Vol. XXXVII, No.1,(Jan),New Delhi.) They discovered that the amount of DCCBs and earnings had a substantial impact on technical efficiency measurements. In addition, the investigation found that DCCBs of Punjab were plagued by managerial irregularities

**Mohankumar and Hemanthkumar**

and incorrect production scale. Authors suggest appropriate policy interventions by state government, RBI, and NABARD.

Thomas Victor Raja and Chandramohan (2011) (Thomas Victor Raja, D., and Chandramohan, R., "Financing of women Entrepreneurs by District Central Co-operative Banks in Tamil Nadu," *Southern Economist*, Vol.49, Oct. 15th, 2011, pp.19-22.) In their study titled "Financing of Women Entrepreneurs by District Central Co-operative Banks in Tamil Nadu," the authors determined that the women entrepreneurs considered for the study have sufficient capacity to obtain loans, and that neither the borrowing nor the repayment of loans posed any obstacles. The majority of the selected DCCBs' loans emphasised the empowerment of urban women. This trend must be acknowledged, and efforts must be made to contribute more. In the case of a financial inclusionary mindset, certain DCCBs have been delivering excellent services to the women's community by fostering new businesses in the study region with loans.

Razaullahkhan, M and Hasyikhairul Makeen, (2012) (Razaullahkhan, M and Hasyikhairul Makeen, "Non-Performing Assets: Co-operative Banks in Jalna", *Southern Economist* titled "Non-Performing Assets: Co-operative Banks in Jalna", They examined the financial record of 6 co-operative banks of Jalna and Parbhani districts from 2003-2004 to 2009. Nearly all banks have exhibited a changing Net NPA trend. During the last two years of analysis, a number of banks were able to reduce their Net Nonperforming Assets. Except for one bank in a single year, all banks have earned a profit over the whole research period. All banks' C.A.R. rates exceed the RBI-mandated limit of 9%.

Sunitha, nR and Raju, J.K., (2013) (Sunitha, R and Raju, J.K., "A Comparative Study of Non- Performing Assets in the Banking Sector", *Southern Economist*, vol.51, April-15, 2013, pp.9- 12) in their study titled "A Comparative Study of Non-Performing Assets in the Banking Sector", found that the number of non-performing assets (NPAs) in the banking sector has increased. The study found that the Indian banking sector, particularly the private sector, has been facing a significant challenge from nonperforming assets. Nonperforming assets are a crucial metric for analysing the financial performance of banks. Reducing nonperforming assets is required to boost bank profitability and comply with capital adequacy standards. It has been observed that the banking sector in India has responded positively to the enhancement of the role of market forces with respect to prudential regulations of accounting, income recognition, provisioning and exposure, the introduction of the CAMELS supervisory rating system, the reduction of nonperforming assets, and the upgrading of technology.

Financing issues for agricultural and non-agricultural lending operations, particularly institutional financing, have frequently given rise to problems, and the lack of financing has been a key irritant for the farming and non-forming communities. The literature study reveals that academicians and researchers have paid great attention to the topic, although the number of studies on the need for increased credit and evaluation of the performance of co-operative loans have not gotten the attention they need. In recent years, non-repayment has become a worrisome issue for the co-operative, preventing a number of co-operative banks from issuing new loans. If these terms continue in the future, the entire existence of cooperative banks will be at risk. So, it is necessary to investigate this issue, reach a definite conclusion, and propose solutions.

Even such research was not conducted in the Composite Thanjavur District, which is known as the granary of Tamil Nadu, has been a drought-prone region for more than five years, and has been the hardest hit by flood and Tsunami. The Kumbakonam Central Co-operative Bank is situated in Tamil Nadu's grain-producing region. Hence, the Kumbakonam Central Co-operative Bank Limited's loan assets have been managed. The present study would cover a knowledge gap regarding loan assets management in agricultural and non-agricultural credit in KCCB of Tamil Nadu, as no such study has been conducted previously.

OBJECTIVES

- To analyse socioeconomic characteristics of farmers in the research region.
- To find out how farmers feel about paying back their agriculture loans

Statement of the Problem

The biggest problem is that there aren't as many places to sell things. The person in the middle who are earning a huge amount of money from the both the farmer and the purchaser. It's been said before that the Tumakuru Region is prone to drought. A lot of bad things happen to the farmers in the area. The biggest problem is that there isn't enough water for farming. Most of the time, they borrow money for farming from private people who charge higher interest rates. The farmers can't get them back in time, which causes them a lot of trouble. So, the well-known banks should help them by giving them Agriculture Loans with no or very little interest. Another problem is that they don't get a minimum price for the little they grow on their land.

Need for the study

The study is needed because the Tumakuru Region is thought to be the poorest part of India. Every year, a lot of farmers have been killing themselves. Most young people are leaving to live somewhere else. There isn't much rain, and the sand isn't good for plants either. There are no rivers that flow in the area. So, it would be good for the newly elected government in the area to take steps to improve the way loans are given to farmers.

Scope of the study

The study has a lot of room to grow because the area is so big. Farmers are in very bad shape there, so any kind of investigation can be done. For farmers, this is a huge problem. Help will have to come for the farmers in the Tumakuru Region. If farmers are given money on a regular basis, they might be able to improve their living conditions and feel less stressed.

Research Design

The study used an Ex-post-facto Research design because the variables chosen for the study had already happened and were proven to be true. Ex-post-facto research is definitely a methodical, experimental inquiry in which the researchers don't have direct control over the variables because they interview and collect data from each person individually.

Sampling Procedure

The Tumakuru Region was chosen on purpose for the study because the researcher is from Tumakuru District, which is also in the Tumakuru Region. Second, the authors know the local language well, which helps them connect with people quickly and also lets them do in- depth research and personal observations. There are four districts in the Tumakuru area. Gubbi, Koratagere, Kunigal, and Madhugiri are some examples. Each Taluk is shown as one Block on the map. Each Block has seven villages that are chosen at random. Respondents are interviewed right away without any background information, so the data is original. Seven villages were chosen at random from each block.

Sample size : 462

Sampling unit : Tumakuru Region

Sampling Areas Gubbi, Koratagere, Kunigal, Madhugiri taluks In total, 28 villages (4x7) were chosen for the study.

Methodology of the Study

The primary data came from farmers in the Tumakuru Region, and it was gathered by personally meeting with the farmers, asking them questions from a pre-prepared questionnaire in person, and recording the farmers' statements. There are 616 people in the sample. The approach of random sampling through interviews is utilised by the investigator during data collecting. The secondary data is gathered from sources that have previously been

**Mohankumar and Hemanthkumar**

produced, such as books, periodicals, journals, websites of government organisations, and other theses written on the subject, amongst other things.

Tools of Analysis

Percentages were applied to the data. A percentage represents a value (number, amount, rate, etc.) expressed as a fraction of a sum equal to 100. The rankings in total factors were used to assess the farmers' responses. After collecting respondents' priorities, rankings were calculated for each statement.

Limitations of the Study

The following are some limitations of the study:

- The study is constrained by the investigator's available time resources.
- The items covered in the study for in-depth examination are limited, as it is not possible to investigate all topics in a short period of time.
- The scope of the study is limited to a single Block inside a single District. As a result, the study's generalisation can be extended to regions where similar conditions exist, but it may not have wider relevance.
- The study is predicated on the subjective opinions of Agricultural Loan borrowers, which may contain personal bias.

ANALYSIS AND DISCUSSION

Table 1 shows responses by age. The table shows three groups. 25.10% are under 35. 29.88% of middle-aged people are 35–55. Old people are 45.02 percent. 462 respondents were questioned. Table shows most are old. Table 2 shows responses by education. Normal education is the highest at 69.40, whereas graduate, post-graduate, and professional education is zero because Tumakuru is rural. Higher secondary is 9.09 Percentage and below high school is 21.43 percentage. Table 3 indicates respondent distribution per region. Rural living is 81.82 percent, far higher than urban living. 18.18% is urban living. The table shows that agriculture-dependent rural areas are more. Table 4 shows respondents by marital status. Married people outnumber unmarried people by 87.5 percent. 12.5% are unmarried. The table shows that married and unmarried people depend on agriculture. Table No. 6 shows how the respondents are split up by how many family members they have. 72.73 percent of the group has less than three members, and 27.27 percent has between three and six members. Because there are more single-parent families, the table doesn't show as many people. Table 7: Ordering of statements about how society is getting better. Table 7 Rank ordering of statement of Social improvement. From the table above, we can see that most of the people who took out an agriculture loan had more social contacts (rank 1), were known by other farmers (rank 2), were known as opinion leaders (rank 3), were members of one organisation (rank 4), or were members of more than one organisation (rank5). Farmers got to know their fallow farmers, neighbours, and family members better. Farmers who know them have told us that if they get agriculture loans, it might make other farmers do the same.

The preceding table clearly demonstrates that the majority of respondents (59.09%) had low social progress, followed by those with medium (32.14%) and high (8.77%) social improvement.

According to Table No. 9, the Farm loan system had little positive effect on the economy. This was due to the fact that an Agriculture loan alone does not make a major economic difference when it comes to the acquisition of more land, equipment, and sprayers, among other things. The farm loan was utilised for expenditures such as hiring fees, salaries, etc. that do not immediately contribute to economic growth. From the above Table No. 9 it is clearly showed that, majority of the farmers felt that agriculture loan will very useful them(Rank I) followed by rate of interest is high under agriculture loan system (Rank II), farmers have to spend money initially for getting agriculture loan sanctioned (Rank III), availing institutional credit is safer non-institutional credit (Rank IV), agriculture loan system is good, if it lays down a specific procedure to be followed by the society or bank (Rank V), agriculture loan is more useful to farmers since it is provided in cash (Rank VI), illiterate farmers are unaware of the procedure of getting

**Mohankumar and Hemanthkumar**

agriculture loan (Rank VII), agriculture loan system creates interest to the farmers to increase the production by increasing area under cultivation (Rank VIII), too much of procedural delay is involved for obtaining agriculture loan (Rank IX), farmers are not getting higher prices as they have to repay the agriculture loan system (Rank X), agriculture loans are easily accessible (Rank XI), high yielding varieties can be cultivated by providing agriculture loans (Rank XII), agriculture loan system plays an important role on transforming traditional agriculture in to modern agriculture (Rank XIII), influence is required to get the agriculture loans (Rank XIII), present procedure of lending of agriculture loan is not satisfactory (Rank XV), majority of the farmers do not get agriculture loan from the lending agencies in time (Rank XVI), taking agriculture loans generate more employment (Rank XVII), agriculture loans amount per acre is not adequate to meet all the production expenses (Rank XVIII), though the agriculture loan system is good, vested interests are working against the success of agriculture loan system.

(Rank XVIII), agriculture loans system will remove all the bottlenecks faced by cultivators (Rank XX), productivity will be increased by agriculture loans (Rank XXI), getting agriculture loan is against the prestige and status of farmers (Rank XXII), agriculture loan system is helpful to rich farmers only (Rank XXIII), taking agriculture loans will influence cropping pattern (Rank XXIII), seasonality is fixed in the recovery of agriculture loans (Rank XXV), food problem of our country can be solved by this agriculture loan system (Rank XXVI).

CONCLUSION

- Those over the age of 55 who are considered to be elderly make up 45.94% of the population, constituting the majority, as determined by the preceding research.
- At 69.40 percent, the normal education percentage is the highest and the majority.
- 81.82 percent of the population resides in rural areas, constituting the majority.
- The percentage of married individuals is 87.5%, which is significantly higher than the percentage of unmarried individuals and thus represents the majority.
- The proportion of nuclear energy is 77.27 percent, which is the majority.
- 72.73 percent of the population has less than three members, constituting the majority.
- The majority of farmers felt agriculture loans would be beneficial to them, followed by a high rate of interest under the agriculture loan system.
- Farmers are required to pay a fee in order to obtain an agriculture loan.
- Agricultural loans in rural areas depend on a number of criteria, including the reason for the loan, the loan's duration, and the interest rate. If farmers obtain agriculture loans intended for revenue generation and utilise them for that purpose, it is likely that they will create future income.

ABSTRACT

The study mainly aims for analysing the relationship between Growth of FMCG and the reinvigoration of middle income households in Bangalore through a case study. In order to understand the factors related to the variables past literature was reviewed and appropriately cited. Moreover, researchers' own opinions were developed through a literature review. In order to analyse the topic primary data was considered and quantitative analysis was conducted. It was found that increasing the FMCG market has a direct relationship with the purchasing power of the middle income group. In the discussion section an overall discussion of the process and findings are discussed with appropriate evidence. It was concluded that there is some detrimental effect of growing FMCG, such as pressure on the supply chain.

Keywords: Middle income group, FMCG market, FMCG growth reinvigoration of middle-income households, purchasing power of consumer

INTRODUCTION

The growth of the FMCG market in India is increasing in megacities. As per the opinion of Varma et al. (2021), the growing FMCG market in the megacity and rural areas of India is beneficial for the middle-income group of India.

**Saffina and Banumathi**

Therefore, the study has focused on the relation between the growths of the FMCG market in the rural districts of Bangalore. Bangalore is one of the important areas with a vast middle-class population. According to Statista, 28% of the overall population of Bangalore belongs to the middle-class group (Statista, 2022). Moreover, a growing FMCG market caters to the needs of such a huge middle income population. Thus, a case study is done according to the growth of the FMCG market and its impact on the middle income group of Bangalore. In addition, there are some problems, which were found during the study. For instance, the growing market of FMCG is hindering the business process of huge businesses and malls. Additionally, the availability of goods causes pressure on the logistics and supply chain (Raut & Sinha 2021).

Figure 1 of the study highlights the growing market of FMCG in the Indian market. It can be seen that the FMCG market growth for years 2011 was 31.6 billion USD (Statista, 2022). Additionally, linear growth has been noted after that. The financial year 2020 shows that the growth of the FMCG market in India was 110 billion USD (Statista, 2022). Moreover, it was predicted the market for FMCG is going to be twice that from 2021 to 2025. Hence, the study shows the growing FMCG market on the reinvigoration of the middle income group of Bangalore which justify the rationality of the study.

Aim

The intention is to understand the impact of the growing FMCG market on the reinvigoration of middle income households through a cases study of Bangalore's rural districts scenario

Objectives

RO 1: To elaborate on the relation of Growth of FMCG and the reinvigoration of middle income households of Bangalore

RO 2: To investigate the factors related to the reinvigoration of middle income households.

RO 3: To understand the related factors that supports the growth of the FMCG market in India

RO 4: To elaborate on the effect on the GDP on FMCG market and reinvigoration of middle income households

Questions

RQ 1: How are Growth of FMCG and the reinvigoration of middle income households of Bangalore related?

RQ 2: What are the factors related to the reinvigoration of middle income households?

RQ 3: How do the related factors support the growth of the FMCG market in India?

RQ 4: What is the effect on the GDP growth on FMCG market and reinvigoration of middle income households?

LITERATURE REVIEW**Impact of growing FMCG market in the reinvigoration of middle income households of Bangalore**

India is a growing economy that has shown impressive growth in different sectors. Moreover, constant growth has been noted in the economy of India. As per the opinion of HR & Aithal (2020) growth of the Indian middle class is directly related to the growing FMCG market. In addition, more people have shifted from low income groups to higher income groups with the growing GDP. On the other hand, Singh (2020) supported that the growth of FMCG is related to the reinvigoration of the Middle income group of Bangalore. At the same time, Singh (2020) argued that there is a decrease from the high income level to the middle income level. Thus from the above discussion, it is understood that the growth of FMCG is directly related to the reinvigoration of the middle class. Moreover, with a growing GDP number of the middle class is increasing

Factors related to the growth of FMCG in Indian

During the study past literature related to the growth of the FMCG market was studied and different findings were critically compared. Additionally, there are factors related to the growth of the FMCG market which is controversial. As per the opinion of Patwary et al. (2020), Unemployment in the Indian economy is one of the main causes of the growing FMCG market. In addition, such factors are positively responsible for the reinvigoration of middle-income

**Saffina and Banumathi**

households in Bangalore. On the other hand, Thayyil et al. (2020) argued that three various other factors which impact the growth of FMCG and unemployment have negligible impacts on FMCG growth. Such as, improved cash flow in the economy, variety of products and other related factors are the main reason for the growth of the FMCG market in India.

Factors related to the reinvigoration of middle income households in Bangalore

It was found that there are different factors related to the reinvigoration of middle income households in Bangalore. As per the opinion of Biswas, Bandyopadhyay & Mukhopadhyaya (2022), Approved competitions for jobs have impacted the purchasing power of the Indian middle income group. Moreover, the availability of money is mainly responsible for the reinvigoration of middle income households. On the other hand, Saqib & Shah (2022) argued that the growing variety of FMCG products is the main reason for the growing purchasing power of households in Bangalore. Therefore, it can be understood that the growth of Indian households is related to the increasing purchasing power of Indian consumers and the improving GDP of India mean (Kaur & Dhiman, 2021).

METHODOLOGY**Data collection**

Data collection is one of the important process which is decisive for a quantitative study. In order to collect data related to FMCG growth primary. As per the opinion of Pandey & Pandey (2021), primary data helps to insure accurate and specific results for analysis. Therefore, a survey of 55 participants was conducted with an appropriate questionnaire.

Data analysis

After the collection of primary data, quantitative analysis was conducted for reaching the results of the case study. As per the opinion of Ganesha et al. (2020), Quantitative analysis helps to conduct a better understanding of the outcome. Thus, quantitative analysis was considered in order to study the topic.

Findings Demographics**Gender**

Above graph and table are related to the gender of participants male and female 40%, additionally, 20% refuse to disclose their gender.

What is your age?

Above table and figure are related to the age group of participants where 60% of participants were from 25 to 35. Additionally, participants of 36 to 45 years and 46 to 55 years were 205 each.

What is your income level?

The above table and figure are related to the income of the participants where 60% were from 21000 to Rs. 30000- income group and 40% were from 31000 to Rs. 40000 income group.

Descriptive analysis

The above analysis highlights the mean, media, mode and other functions of various aspects and elements of the study.

ANOVA

Table 5 is related to regression data of the 1st hypothesis that shows a significance value under 0.05. Hence, 1st hypothesis is supported with evidence. Table 6 shows a lower significance value of 0.00 which indicates hypothesis 2 is supported with appropriate evidence. Table 7 shows a significance value of 0.00 that indicates the reliability of

**Saffina and Banumathi**

hypothesis 3. Table 8 shows a lower significance value is 0.05, and hence the 4 hypotheses are supported by the outcome of the study.

DISCUSSION

As per the opinion of Prabu (2021), the growth of FMCG positively impacts the reinvigoration of the middle income group. Moreover, with the growing FMCG marks a drastic shift from low income group towards the middle income group was noted. On the other hand, it was found that there is an improvement in middle income households in Bangalore's rural areas (Rai, 2021). In order to study the topic and primary quantitative method was used. In order, to collect data primary sources of considered. Additionally, a questionnaire was created for the survey [refer to Appendix 1]. After the collection of the data, quantitative method was followed in order to reach appropriate findings. As per the opinion of Ali & Gawli (2020), the demographic factors of participants have a direct impact on the results. Hence demographic questions were used in the main survey. It was found that the availability of products is a major factor in the growth of the middle income group of Bangalore (Moovendhan et al. 2020).

CONCLUSION

Thus it was found that there is pressure in the supply chain due to an increase in demand which makes the growth of FMCH vulnerable. Additionally, such vulnerability affects the reinvigoration of middle income households.

APPENDICES**Appendix 1: Questionnaire**

1. What is your gender?"
 2. What is your age?"
 3. What is your income level?"
 4. Market growth of FMCG is important for the reinvigoration of middle-income households
 5. Growing market of FMCG provides different options for middle-income households.
 6. Growing market of FMCG helps to distribute revenue for middle-income households in Bangalore.
 7. Growth in the FMCG market is related to the growing number of middle-income households in Bangalore.
 8. Availability of the FMCG product is beneficial for middle-income households in Bangalore.
 9. FMCG market growth is a main sour of income for a large number of middle-income households in Bangalore.
 10. Growth in the FMCG market provides a better value of products for middle-income households.
 11. The GDP of Bangalore depends on middle-income households.
 12. FMCG market is responsible for the GDP growth of India.
- FMCG market growth in Bangalore helps to maintain a better supply chain of goods that helps to maintain the price of goods for "middle-income households"

ABSTRACT

A phenothiazine derivative such as chlorpromazine is used to treat severe behavioural issues in children as well as various psychotic diseases in adults like schizophrenia & the manic phase of bipolar disorders. Parkinsonism is an extrapyramidal side effect of Chlorpromazine. Here we are presenting a case on 77-year-old male patient who was diagnosed as Chlorpromazine induced Parkinsonism & it was classified as Type D Adverse drug reaction. The reaction was continuously persistent with the use of offending drug and patient is receiving the chlorpromazine from past 13 years. The symptoms are slowly progressive from the past 3 years hence the reaction is considered as delayed Adverse drug reaction. The alternative treatment available to treat this condition is with Primavanserin 17mg which has lesser adverse drug reaction & great efficacy. Since the cost of this drug in India is Rs 587/strip every patient can offered the drug to manager their condition.

Keywords: Chlorpromazine, schizophrenia, parkinsonism, extrapyramidal side effects (EPS), Adverse drug Reaction (ADRs).

Sanatkumar Bharamu Nyamagoud *et al.*,

INTRODUCTION

A phenothiazine derivative chlorpromazine is used to treat severe behavioural issues in children as well as various psychotic diseases in adults, including schizophrenia and the manic phase of bipolar disorder ^[1]. Chlorpromazine are known to cause extrapyramidal side effect known as Drug Induced Parkinsonism (DIP). About 40% of these individuals had Parkinsonism, according to the first investigation of the extra pyramidal side effects (EPS) of chlorpromazine. Dopamine activity may be decreased by chlorpromazine, which may lead to Parkinsonism. Drug induced Parkinsonism is typically defined as bilateral and symmetric Parkinsonism with more pronounced bradykinesia and rigidity in patients [2].

CASE REPORT

A 77-year-old female patient admitted to Karnataka Institute of Medical Sciences Hospital, Hubballi with complaints of three episodes of vomiting since today afternoon. She is a known case of schizophrenia and was on tablet chlorpromazine 100 mg once a day for thirteen years. She has no other medical history. Her blood pressure was 170/110 mmHg at the time of admission, her pulse rate was 106 beats per minute, and her respiration rate was 18cpm. Laboratory investigations such as CBC, liver function test, renal function test, thyroid markers, and serum electrolytes were normal.

On general physical examination patient appeared moderately build, moderately nourished, well oriented to time, place and person. Higher Mental Function was decreased. Her motor system examination revealed 4/5 power on both limbs with increased tone and reflex of 2+. Her fundoscopy report revealed cataract and papilledema on right eye and her left eye was not visualised due to macular corneal opacity. The patient was diagnosed as Accelerated Hypertension with Chlorpromazine induced Parkinsonism. Tablet chlorpromazine 100 mg once a day was withdrawn as a part of treatment on the same day of diagnosis and the patient was treated with Inj Ceftriaxone 1g IV thrice a day, Inj Pantoprazole 40 mg IV once a day, Inj Ondansetron 4 mg IV once a day, Mannitol + Normal saline 100ml IV Infusion thrice a day, Amlodipine 5mg per oral once a day for 5 days and IV fluids 2-pint Normal saline + 2-pint Ringer lactate at 75ml/hr rate once a day for 3 days. After the systemic treatment and discontinuation of the chlorpromazine medication, the patient's condition started to resolve. The patient was feeling better at the time of discharge. Patient was discharged with Tablet Amlodipine 5mg once a day, Tablet pantoprazole 40 mg once a day, Tablet chlorpromazine 50 mg once a day, Tablet Levodopa/Carbidopa for 15 days and was asked to review after 2 weeks in the outpatient department of Karnataka Institute of Medical Sciences.

DISCUSSION

Atypical antipsychotics have prevalence of >40% to induce Parkinsonism. Chlorpromazine acts by antagonizing the dopaminergic receptors hence producing antipsychotic effects. It is well known that Parkinsonism is mainly caused due to disrupted, reduced striatal dopamine [3]. Long term use of antipsychotics may lead to motor dysfunction. In this case we can report it as atypical D Delayed adverse drug reaction where there is continuous reaction (extrapyramidal symptoms) with persistent use of offending drug and since the patient is receiving this drug from 13 years. It is noted that the symptoms slowly began 3 years ago hence the reaction can be considered as delayed Adverse drug reaction with respect to chlorpromazine induced Parkinson's disease.

In this case accelerated hypertension was noted where in recent increase in baseline BP which is associated with target organ damage. The corneal injury (blurring of disk margin and rigidity fundus had papilledema) this proves that the patient had corneal damage due to hypertension. Studies show that hypertension is one of the main risk factors for motor stage Parkinsonism especially in Asian population [4]. The aetiology behind this is unclear but it is said that abnormalities in blood pressure may be due to autonomic dysfunction in the early stages of Parkinsonism. Patients with Parkinsonism may experience nocturnal and supine Hypertension.

Sanatkumar Bharamu Nyamagoud *et al.*,

In this case, the patient was withdrawn from the Offending drug i.e. chlorpromazine during the hospital stay and reintroduced in the regular prescription with dose of 50mg once a day. Levodopa & Carbidopa were prescribed with antipsychotic to manage and prevent recurrence of Parkinson symptoms. Lower the dose of offending drug without immediately stopping the treatment is the best choice as because sudden withdrawal may worsen the illness leading to complications. Reviewing the patient's condition post 2 weeks of this treatment should be made to see the progress in power in limbs & other motor activities. If the symptom of Parkinsonian worsens then choice of drug would be Panavision which is used in the treatment of Parkinson disease psychosis [5].

CONCLUSION

Parkinsonism is the most common adverse event in patients with atypical antipsychotic drugs. Use of novel drug (alternative) which has lesser side effects & greater efficacy towards schizophrenia is recommended such as Primavanserin. Since the cost of this drug in India is Rs 587/box. It can be a burden economically to the patients admitted in Government Hospital sectors. These drugs are normally not available in government hospitals.

ACKNOWLEDGEMENT

The authors express sincere gratitude to the patient and his family members for capturing their photos after getting consent from the patient. Authors also wish to acknowledge JSS Academy of Higher Education and Research, Principal JSS College of Pharmacy Mysuru & KLE College of Pharmacy Hubballi. A Constituent Unit of KLE Academy of Higher Education and Research, Belagavi, Karnataka, India & Vivekanand General Hospital, Hubballi for their valuable support.

ABSTRACT

In this paper, we focus on combining the theories of picture fuzzy sets on Γ -rings and establishing a new framework for picture fuzzy sets on commutative Γ -rings. The aim of this manuscript is to apply picture fuzzy set for dealing with several kinds of theories in commutative Γ -rings. Moreover, we introduce the notions of picture fuzzy ideals on commutative Γ -rings and some properties of them are obtained. Finally, we give suitable definitions of the operations of picture fuzzy ideals over a commutative Γ -ring, as composition, product and intersection.

Keywords and phrases: Fuzzy set, picture fuzzy set, picture fuzzy ideal, Ring operation.

INTRODUCTION

In 1965, Zadeh [30] has initiated the notion of fuzzy set. Then many researchers were applying it in various branches of Mathematics. The notion of L -fuzzy ideal of a ring is introduced in [12], which is related to the notion of fuzzy ideals over a ring in [26]. The algebraic system Γ -near ring was introduced by Satyanarayana [24]. In 2008, Kazanci and Davvaz [13] applied the concept of fuzzy prime (Primary) ideals to the theory of rough prime (primary) ideals. In 2012, Navarro *et al.* [22] introduced and studied the concept of prime fuzzy ideals over a non commutative ring. In 2016, Darani and Ghasemi [5] defined L -fuzzy 2-absorbing ideals of a commutative ring. In 2017, Sonmez *et al.*, [25] introduced the notion of 2-absorbing fuzzy ideals and 2-absorbing primary fuzzy ideals of a commutative ring. In 2019, Yiarayong [28] gave a complete characterization of fuzzy quasi-prime and weakly fuzzy quasi-prime ideals. In 2020, Asif *et al.* [4] explored the concept of picture fuzzy near-rings ($PFNR$'s) and picture fuzzy ideals (PFI 's) of a near-ring (NR). In 2021, Ali and Mohammed [3] introduced and examined the notion of hesitant fuzzy and hesitant

Hema et al.,

fuzzy prime ideals of a ring. Fuzzy sets of a ring have been studied in various algebraic structures, see [1, 2, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 27, 29, 31, 32].

Now in this paper we introduce and study picture fuzzy sets as generalization of a commutative ring as well as fuzzy sets. We introduce the notions of picture fuzzy ideals on commutative Γ -rings and some properties of them are obtained. Finally, we give suitable definitions of the operations of picture fuzzy ideals over a commutative Γ -ring, as composition, product and intersection.

Definition 1.1 [24] Let R and Γ be two abelian additive groups. R is called Γ -ring if a ternary composition $R \times \Gamma \times R \rightarrow R$ is defined on R , $(l, \alpha, m) \rightarrow lam$, such that the following axioms are fulfilled

$$\begin{aligned} (l + m)\alpha z &= laz + maz \\ l(\alpha + \beta)m &= lam + l\beta m \\ l\alpha(m + z) &= lam + laz \\ (lam)\beta z &= l\alpha(m\beta z) \forall l, m, z \in R \text{ and } \alpha, \beta \in \Gamma. \end{aligned}$$

In a Γ -ring R is called commutative Γ -ring if $lam = mal \forall l, m \in R$.

Definition 1.2 [23] Let $\zeta = (B_\zeta, A_\zeta, F_\zeta)$ and $\eta = (B_\eta, A_\eta, F_\eta)$ be any picture fuzzy sets over a commutative ring R . Then ζ is called a **subset** of η denoted by $\zeta \subseteq \eta$ if $B_\zeta \leq B_\eta$, $A_\zeta \geq A_\eta$ and $F_\zeta \geq F_\eta$.

Definition 1.3 [23] Let $\zeta = (B_\zeta, A_\zeta, F_\zeta)$ and $\eta = (B_\eta, A_\eta, F_\eta)$ be any picture fuzzy sets over a commutative ring R .

- (i) The **intersection** of two picture fuzzy sets ζ and η is defined as the picture fuzzy set $\zeta \cap \eta = (B_\zeta \wedge B_\eta, A_\zeta \vee A_\eta, F_\zeta \vee F_\eta)$.
- (ii) The **union** of two picture fuzzy sets ζ and η is defined as the picture fuzzy set $\zeta \cup \eta = (B_\zeta \vee B_\eta, A_\zeta \wedge A_\eta, F_\zeta \wedge F_\eta)$.

Definition 1.4 [23] A picture fuzzy set $\zeta = (B_\zeta, A_\zeta, F_\zeta)$ of a commutative ring R is called a **picture fuzzy ideal** of R if

- (i) $\zeta(lm) \supseteq \zeta(l) \cup \zeta(m)$ for all $l, m \in R$.
- (ii) $\zeta(l - m) \supseteq \zeta(l) \cap \zeta(m)$ for all $l, m \in R$.

Remark 1.1 [23] Condition (ii) of the above definition is equivalent to $\zeta(l + m) \supseteq \zeta(l) \cap \zeta(m)$ and $\zeta(-l) = \zeta(l)$ for all $l, m \in R$.

We now present the following example satisfy above definition.

Picture fuzzy Γ -Ideals

In this section, we concentrate our study on the picture fuzzy Γ -ideals and investigate their fundamental properties. We now consider another generalized fuzzy ideal which is called a picture fuzzy ideal of a commutative Γ -ring R .

Definition 2.1 A picture fuzzy set $\zeta = (B_\zeta, A_\zeta, F_\zeta)$ of a commutative Γ -ring R is called a **picture fuzzy ideal** of R if

- (i) $B_\zeta(l - m) \geq B_\zeta(l) \wedge B_\zeta(m)$
 $A_\zeta(l - m) \leq A_\zeta(l) \vee A_\zeta(m)$
 $F_\zeta(l - m) \leq F_\zeta(l) \vee F_\zeta(m)$.
- (ii) $B_\zeta(lam) \geq B_\zeta(l) \vee B_\zeta(m)$
 $A_\zeta(lam) \leq A_\zeta(l) \wedge A_\zeta(m)$
 $F_\zeta(lam) \leq F_\zeta(l) \wedge F_\zeta(m)$.

Example 2.1 Let $R = Z_6 = \{0,1,2,3,4,5\}$. Define the picture fuzzy set $\zeta = (B_\zeta, A_\zeta, F_\zeta)$ as follows:

Hema et al.,

| | B_ζ | A_ζ | F_ζ |
|---|-----------|-----------|-----------|
| 0 | 0.8 | 0.1 | 0.1 |
| 1 | 0.2 | 0.4 | 0.4 |
| 2 | 0.3 | 0.2 | 0.2 |
| 3 | 0.2 | 0.4 | 0.4 |
| 4 | 0.3 | 0.2 | 0.2 |
| 5 | 0.2 | 0.4 | 0.4 |

Then, clearly $\zeta = (B_\zeta, A_\zeta, \nu A)$ is a picture fuzzy ideal over a commutative Γ -ring R .

Let $\zeta = (B_\zeta, A_\zeta, F_\zeta)$ and $\eta = (B_\eta, A_\eta, F_\eta)$ be any picture fuzzy sets over a commutative Γ -ring R . Define $\zeta \oplus \eta = (B_\zeta \oplus B_\eta, A_\zeta \oplus A_\eta, F_\zeta \oplus F_\eta)$ is defined by

$$(B_\zeta \oplus B_\eta)(l) = \begin{cases} \bigvee_{l=m+z} (B_\zeta(m) \wedge B_\eta(z)); & \exists m, z \in R \text{ such that } l = m + z \\ 0 & \text{otherwise,} \end{cases}$$

$$(A_\zeta \oplus A_\eta)(l) = \begin{cases} \bigwedge_{l=m+z} (A_\zeta(m) \vee A_\eta(z)); & \exists m, z \in R \text{ such that } l = m + z \\ 1 & \text{otherwise,} \end{cases}$$

and

$$(F_\zeta \oplus F_\eta)(l) = \begin{cases} \bigwedge_{l=m+z} (A_\zeta(m) \vee A_\eta(z)); & \exists m, z \in R \text{ such that } l = m + z \\ 1 & \text{otherwise.} \end{cases}$$

Theorem 2.1 Let $\zeta = (B_\zeta, A_\zeta, F_\zeta), \eta = (B_\eta, A_\eta, F_\eta)$ and $\theta = (B_\theta, A_\theta, F_\theta)$ be any picture fuzzy ideals over a commutative Γ -ring R . Then the following properties hold.

- (i) $\zeta(l) \leq \zeta(0)$ for all $l \in R$.
 - (ii) $\zeta \ominus \zeta = \zeta$.
 - (iii) $\zeta \ominus \zeta = \eta \ominus \zeta$.
 - (iv) $(\zeta \ominus \eta) \ominus \theta = \zeta \ominus (\eta \ominus \theta)$
 - (v) $\zeta \ominus 0 = \zeta$ where $0 = (0^+, 0^-, 0^-)$ is a picture fuzzy set over R , defined by, $0(l) = \begin{cases} (1, 0, 0), & l = 0 \\ (0, 0, 1), & x \neq 0. \end{cases}$
6. If $\zeta \subseteq \eta$, then $\zeta \ominus \theta \subseteq \eta \ominus \theta$.

Proof. (i) Let $l \in R(+, \cdot, \Gamma)$ (commutative Γ -ring). Now,

$$\begin{aligned} B_\zeta(0) &= B_\zeta(l - l) \\ &\geq B_\zeta(l) \wedge B_\zeta(l) \\ &= B_\zeta(l) \\ B_\zeta(0) &\geq B_\zeta(l) \forall l \in R. \end{aligned}$$

$$\begin{aligned} A_\zeta(0) &= \zeta_\zeta(l - l) \\ &\leq A_\zeta(l) \vee A_\zeta(l) \\ &= \zeta_\zeta(l) \end{aligned}$$

$$A_\zeta(0) \leq A_\zeta(l) \forall l \in R.$$

$$\begin{aligned} F_\zeta(0) &= F_\zeta(l - l) \\ &\leq F_\zeta(l) \vee F_\zeta(l) \\ &= F_\zeta(l) \\ F_\zeta(0) &\leq F_\zeta(l) \forall l \in R \end{aligned}$$

Therefore $\zeta(l) \leq \zeta(0), \forall l \in R$

(ii) Let $a \in R(+, \cdot, \Gamma)$

$$(B_\zeta \oplus B_\zeta)(a) = \bigcup_{a=l+m} (B_\zeta(l) \wedge B_\zeta(m))$$

Hema et al.,

$$\begin{aligned} &\geq B_\zeta(a) \wedge B_\zeta(0) \\ &= B_\zeta(a) \text{ [by(i)]} \\ &(B_\zeta \oplus B_\zeta)(a) \geq B_\zeta(a). \end{aligned}$$

and $(A_\zeta \otimes A_\zeta)(a) = \bigcap_{a=l+m} (A_\zeta(l) \vee A_\zeta(m))$

$$\begin{aligned} &\leq A_\zeta(a) \vee A_\zeta(0) \\ &\leq A_\zeta(a) \text{ [by(i)]} \\ &(A_\zeta \otimes A_\zeta)(a) \leq A_\zeta(a). \end{aligned}$$

Similarly, we check that $(F_\zeta \otimes F_\zeta)(a) \leq F_\zeta(a)$.

Therefore, $\zeta \subseteq \zeta \ominus \zeta$. On the other hand, let $a \in R (+, \cdot, \Gamma)$. Then

$$\begin{aligned} (B_\zeta \oplus B_\zeta)(a) &= \bigcup_{a=l+m} B_\zeta(l) \wedge B_\zeta(m) \\ &= \bigcup_{a=l+m} B_\zeta(l) \wedge B_\zeta(-m) \\ &\leq \bigcup_{a=l+m} B_\zeta(l-m) \\ &= \bigcup_{a=l+m} B_\zeta(l+m) \\ &= B_\zeta(a) \\ (B_\zeta \oplus B_\zeta)(a) &\leq B_\zeta(a). \end{aligned}$$

and $(A_\zeta \otimes A_\zeta)(a) = \bigcap_{a=l+m} A_\zeta(l) \vee A_\zeta(m)$

$$\begin{aligned} &= \bigcap_{a=l+m} A_\zeta(l) \vee A_\zeta(-m) \\ &\geq \bigcap_{a=l+m} A_\zeta(l-m) \\ &= \bigcap_{a=l+m} A_\zeta(l+m) \\ &= \zeta_\zeta(a) \\ (A_\zeta \otimes A_\zeta)(a) &\geq A_\zeta(a). \end{aligned}$$

Similarly we can prove that $(F_\zeta \otimes F_\zeta)(a) \geq F_\zeta(a)$. Hence $\zeta \otimes \zeta \subseteq \zeta$. Therefore $\zeta \otimes \zeta = \zeta$.

(iii) Let $l, m, z \in R (+, \cdot, \Gamma)$

$$\begin{aligned} (B_\zeta \oplus B_\eta)(a) &= \bigcup_{l=m+z} (B_\zeta(m) \wedge B_\eta(z)) \\ &= \bigcup_{l=z+m} (B_\zeta(z) \wedge B_\eta(m)) \\ &= \bigcup_{l=z+m} (B_\eta(m) \wedge B_\zeta(z)) \\ &= \bigcup_{l=m+z} (B_\eta(m) \wedge B_\zeta(z)) \\ (B_\zeta \oplus B_\eta)(a) &= (B_\eta \oplus B_\zeta)(z). \\ (A_\zeta \otimes A_\eta)(l) &= \bigcap_{l=m+z} (A_\zeta(m) \vee A_\eta(z)) \\ &= \bigcap_{l=z+m} (A_\zeta(z) \vee A_\eta(m)) \\ &= \bigcap_{l=z+m} (A_\eta(m) \vee A_\zeta(z)). \\ (A_\zeta \otimes A_\eta)(l) &= (A_\eta \otimes A_\zeta)(l). \end{aligned}$$

Similarly we can show that $(F_\zeta \otimes F_\eta)(l) = (F_\eta \otimes F_\zeta)(l)$. Therefore $\zeta \ominus \eta = \eta \ominus \zeta$.

(iv) Let $l, m, z \in R$ and by (iii) we have show that $(\zeta \ominus \eta) \ominus \theta = \zeta \ominus (\eta \ominus \theta)$.

(v) Let $l \in R (+, \cdot, \Gamma)$ Then we have

$$\begin{aligned} (0^+ \oplus B_\zeta)(a) &= \bigcup_{a=l+m} (0^+(l) \wedge B_\zeta(m)) \\ &\leq \bigcup_{a=0+a} (0^+(0) \wedge B_\zeta(0)) \\ &= \bigcup_{a=0+a} 1 \wedge B_\zeta(a) \\ &= \bigcup_{a=0+a} B_\zeta(a) \\ &= B_\zeta(a) \\ (0^+ \oplus B_\zeta)(l) &\leq B_\zeta(a). \end{aligned}$$

and

$$\begin{aligned} (0^- \otimes \eta_A)(a) &= \bigcap_{a=l+m} [0^-(l) \vee A_\zeta(m)] \\ &\geq \bigcap_{a=0+a} (0^-(0) \vee A_\zeta(a)) \\ &= \bigcap_{a=0+a} [0 \vee A_\zeta(a)] \\ &= \zeta_\zeta(a) \\ (0^- \otimes A_\zeta)(a) &\geq A_\zeta(a). \end{aligned}$$

Similarly we can show that $(0^- \otimes F_\zeta)(a) \geq F_\zeta(a)$. Therefore, $\zeta \ominus 0 = \zeta$.

(vi) Let $\zeta \subseteq \eta$ and $l \in R (+, \cdot, \Gamma)$. Then

$$(B_\zeta \oplus B_\theta)(l) = \bigcup_{l=m+z} [B_\zeta(m) \wedge B_\theta(z)]$$

Hema et al.,

$$\begin{aligned}
 &\leq \cup_{l=m+z} [B_\eta(m) \wedge B_\theta(z)] \\
 &= (B_\eta \oplus B_\theta)(l) \\
 &(B_\zeta \oplus B_\theta)(l) \leq (B_\eta \oplus B_\theta)(l). \\
 &(A_\zeta \otimes A_\theta)(l) = \cap_{l=m+z} [A_\zeta(m) \vee A_\theta(z)] \\
 &\geq \cup_{l=m+z} [A_\eta(m) \vee A_\theta(z)] \\
 &= (A_\eta \otimes A_\theta)(l) \\
 &(A_\zeta \otimes A_\theta)(l) \geq (A_\eta \otimes A_\theta)(l).
 \end{aligned}$$

Similarly we can show that $(F_\zeta \otimes F_\theta)(l) \geq (F_\eta \otimes F_\theta)(l)$.

Operations on picture fuzzy ideals of commutative Γ ring

In this section, we define composition, product and intersection of *PFI*'s of commutative Γ ring, and obtain some basic properties of such *PFI*'s of commutative Γ ring.

Let $\zeta = (B_\zeta, A_\zeta, F_\zeta)$ and $\eta = (B_\eta, A_\eta, v_B)$ be any picture fuzzy sets over a commutative Γ ring $(R, +, \Gamma)$. Define the composition ζ and η as $\zeta \odot \eta = (B_\zeta \circ B_\eta, A_\zeta \bullet A_\eta, F_\zeta \bullet v_B)$

$$\begin{aligned}
 (B_\zeta \circ B_\eta)(l) &= \begin{cases} \bigcup_{\zeta=\eta\alpha z} (B_\zeta(m) \wedge B_\eta(z)), & \exists m, z \in R, \alpha \in \Gamma \text{ such that } l = m\alpha z \\ 0 & \text{otherwise,} \end{cases} \\
 (A_\zeta \bullet A_\eta)(l) &= \begin{cases} \bigcap_{l=m\alpha z} (A_\zeta(m) \vee A_\eta(z)), & \exists m, z \in R, \alpha \in \Gamma \text{ such that } l = m\alpha z \\ 1 & \text{otherwise,} \end{cases} \\
 (F_\zeta \bullet v_B)(l) &= \begin{cases} \bigcap_{l=m\alpha z} (F_\zeta(m) \vee v_B(z)), & \exists m, z \in R, \alpha \in \Gamma \text{ such that } l = m\alpha z \\ 1 & \text{otherwise.} \end{cases}
 \end{aligned}$$

and product of ζ and η defined as $A\eta = (B_\zeta \star B_\eta, A_\zeta \# A_\eta, F_\zeta \# F_\eta)$, respectively as follows

$$(B_\zeta \star B_\eta)(l) = \begin{cases} \bigcup_{l=\sum_{i=1}^n m_i \alpha_i z_i} \left(\bigcap_{i=1}^n B_\zeta(m_i) \wedge \bigcap_{i=1}^n B_\eta(z_i) \right); & \exists m_i, z_i \in R \alpha \in \Gamma \text{ such that } l = \sum_{i=1}^n m_i \alpha_i z_i \\ 0 & \text{otherwise,} \end{cases}$$

$$(A_\zeta \# A_\eta)(l) = \begin{cases} \bigcap_{l=\sum_{i=1}^n m_i \alpha_i z_i} \left(\bigcup_{i=1}^n A_\zeta(m_i) \vee \bigcup_{i=1}^n A_\eta(z_i) \right); & \exists m_i, z_i \in R \alpha \in \Gamma \text{ such that } l = \sum_{i=1}^n m_i \alpha_i z_i \\ 1 & \text{otherwise,} \end{cases}$$

$$(\#)\emptyset = \begin{cases} \bigcap_{i=\sum_{j=1}^n} \left(\bigcup_{j=1}^n \emptyset \vee \bigcup_{j=1}^n \emptyset \right); & \exists, \in \Gamma \text{ such that } = \sum_{j=1}^n \\ 1 & \text{otherwise.} \end{cases}$$

Theorem 3.1 Let $\zeta = (B_\zeta, A_\zeta, F_\zeta), \eta = (B_\eta, A_\eta, F_\eta)$ and $\theta = (B_\theta, A_\theta, F_\theta)$ be any picture fuzzy ideals over a commutative Γ ring R . Then the following properties hold.

- (i) If $\zeta \subseteq \eta$, then $\theta \odot \zeta \subseteq \theta \odot \eta$.
- (ii) If $\zeta \subseteq \eta$, then $C\zeta \subseteq C\eta$.
- (iii) $\theta \odot (C\zeta \cap C\eta) \subseteq (\theta \odot \zeta) \cap (\theta \odot \eta)$.

Hema et al.,

- (iv) $C(\zeta\theta\eta) \subseteq (C\zeta)\theta(C\eta)$.
- (v) $\theta \odot \zeta \subseteq \eta$ if and only if $C\zeta \subseteq \eta$.
- (vi) $\eta \odot \zeta \subseteq \zeta$.
- (vii) If R is a ring with identity, then $R \odot \zeta = \zeta$

Proof. (i) Let l be an element of $R[+, \cdot, \Gamma]$. Then

$$\begin{aligned} (B_\theta \circ B_\zeta)(l) &= \bigcup_{l=aab} (B_\theta(a) \wedge B_\zeta(b)) \\ &\leq \bigcup_{l=aab} (B_\theta(a) \wedge B_\eta(b)) \\ &= (B_\theta \circ B_\eta)(l). \end{aligned}$$

and

$$\begin{aligned} (A_\theta \bullet A_\zeta)(l) &= \bigcap_{l=aab} (A_\theta(a) \vee A_\zeta(b)) \\ &\geq \bigcap_{l=aab} (A_\theta(a) \vee A_\eta(b)) \\ &= (A_\theta \bullet A_\eta)(l). \end{aligned}$$

Similarly, we can prove that $(F_\theta \bullet F_\zeta)(l) \geq (F_\theta \bullet F_\eta)(l)$. Therefore $\theta \odot \zeta \subseteq \theta \odot \eta$.

(ii) Let $l \in R$. Then

$$\begin{aligned} (B_\theta \circ B_\zeta)(l) &= \bigcup_{l=\sum_{i=1}^n m_i a z_i} (\bigcap_{i=1}^n B_\theta(m_i) \wedge \bigcap_{i=1}^n B_\zeta(z_i)) \\ &\leq \bigcup_{l=\sum_{i=1}^n m_i a z_i} (\bigcap_{i=1}^n B_\theta(m_i) \wedge \bigcap_{i=1}^n B_\eta(z_i)) \\ &= (B_\theta \circ B_\eta)(l). \end{aligned}$$

$$\begin{aligned} (A_\theta \bullet A_\zeta)(l) &= \bigcap_{l=\sum_{i=1}^n m_i a z_i} (\bigcup_{i=1}^n A_\theta(m_i) \vee \bigcup_{i=1}^n A_\zeta(z_i)) \\ &\leq \bigcap_{l=\sum_{i=1}^n m_i a z_i} (\bigcup_{i=1}^n A_\theta(m_i) \vee \bigcup_{i=1}^n A_\eta(z_i)) \\ &= (A_\theta \bullet A_\eta)(l). \end{aligned}$$

Similarly, we can prove that $(F_\theta \circ F_\zeta)(l) \leq (F_\theta \circ F_\eta)(l)$. Therefore $C\zeta \subseteq C\eta$

(iii) Let $l \in R$. Then

$$\begin{aligned} (B_\theta \circ (B_\zeta \oplus B_\eta))(l) &= \bigcup_{l=aab} (B_\theta(a) \wedge (B_\zeta \oplus B_\eta)(b)) \\ &= \bigcup_{l=aab} \{B_\theta(a) \wedge \bigcup_{b=m+z} [B_\zeta(m) \wedge B_\eta(z)]\} \\ &= \bigcup_{l=aam+baz} [B_\theta(a) \wedge B_\zeta(m)] \wedge [B_\theta(a) \wedge B_\eta(z)] \\ &\leq \bigcup_{l=am+az} (\bigcup_{aam=ras} [B_\theta(r) \wedge B_\zeta(s)]) \wedge \bigcup_{aaz=tau} [B_\theta(t) \wedge B_\eta(u)] \\ &= \bigcup_{l=c+d} [(B_\theta \circ B_\zeta)(c) \wedge (B_\theta \circ B_\eta)(d)] \\ &= [(B_\theta \circ B_\zeta) \oplus (B_\theta \circ B_\eta)](l) \\ (B_\theta \circ (B_\zeta \oplus B_\eta))(l) &\leq [(B_\theta \circ B_\zeta) \oplus (B_\theta \circ B_\eta)](l). \end{aligned}$$

and

$$\begin{aligned} (A_\theta \bullet (A_\zeta \otimes A_\eta))(l) &= \bigcap_{l=aab} A_\theta(a) \vee (A_\zeta \otimes A_\eta)(b) \\ &= \bigcap_{l=aab} [A_\theta(a) \vee \bigcap_{b=m+z} [A_\zeta(m) \vee A_\eta(z)]] \\ &= \bigcap_{l=aam+az} [A_\theta(a) \vee A_\zeta(m)] \vee [A_\theta(a) \vee A_\eta(m)] \\ &\geq \bigcap_{l=aam+az} [\bigcap_{aam=ras} (A_\theta(r) \vee A_\zeta(s))] \vee \bigcap_{aaz=tau} [A_\theta(t) \vee A_\eta(u)] \\ &= \bigcap_{l=c+d} (A_\theta \bullet A_\zeta)(c) \vee (A_\theta \bullet A_\eta)(d) \\ &= ((A_\theta \bullet A_\zeta) \otimes (A_\theta \bullet A_\eta))(l). \end{aligned}$$

Similarly, we show that $(F_\theta \bullet (F_\zeta \otimes F_\eta))(l) \geq ((F_\theta \bullet F_\zeta) \otimes (F_\theta \bullet F_\eta))(l)$. Hence we conclude that $\theta \odot (\zeta \otimes B) \subseteq (C \odot \zeta)\theta(\theta \odot \eta)$.

(iv)-(v) The proof is easy.

(vi) Let l be an element of $(R, +, \Gamma)$. Then we have

$$(B_\eta \circ B_\zeta)(l) = \bigcup_{l=aab} B_\eta(a) \wedge B_\zeta(b)$$

Hema et al.,

$$\begin{aligned} &\leq \cup_{l=aab} B_{\zeta}(a) \wedge B_{\eta}(b) \\ &\leq \cup_{l=aab} B_{\zeta}(aab) \\ &= B_{\zeta}(l). \end{aligned}$$

$$\begin{aligned} \text{and } (A_{\eta} \bullet A_{\zeta})(l) &= \bigcap_{l=aab} A_{\eta}(a) \vee A_{\zeta}(b) \\ &\geq \cap_{l=aab} A_{\zeta}(a) \vee A_{\eta}(b) \\ &\geq \cap_{l=aab} A_{\zeta}(aab) \\ &= A_{\zeta}(l). \end{aligned}$$

Similarly we can show that $(F_{\eta} \bullet F_{\zeta})(l) \geq (F_{\zeta}(l))$. Therefore $B \odot \zeta \subseteq \zeta$.

(vii) $(R, +, \Gamma)$ is a ring with identity, then $R \circ A = A$

$$\begin{aligned} (\mu_R \circ B_{\zeta})(l) &= \cup_{l=aab} \mu_R(a) \wedge B_{\zeta}(b) \\ &\leq \cup_{l=aab} B_{\zeta}(aab) \\ (\mu_R \circ B_{\zeta})(l) &\leq B_{\zeta}(l). \end{aligned}$$

$$\begin{aligned} (\eta_R \bullet A_{\zeta})(l) &= \cap_{l=aab} \eta_R(a) \vee A_{\zeta}(b) \\ &\geq \cap_{l=aab} A_{\zeta}(a) \vee A_{\zeta}(b) \\ &= \cap_{l=aab} A_{\zeta}(aab) \\ &= A_{\zeta}(l) \\ (\eta_R \bullet A_{\zeta})(l) &\leq A_{\zeta}(l). \end{aligned}$$

Similarly we can prove that $(\nu_R \bullet F_{\zeta})(l) \geq (F_{\zeta}(l))$. Therefore $R \odot \zeta \subseteq \zeta$.

Next we develop some basic properties of the operation \cap and θ .

Theorem 3.2 Let $\zeta = (B_{\zeta}, A_{\zeta}, F_{\zeta})$ and $\eta = (B_{\eta}, A_{\eta}, F_{\eta})$ be any picture fuzzy ideals over a commutative Γ ring $(R, +, \Gamma)$. Then the following properties hold.

- (a) $\zeta \cap \eta$ is a picture fuzzy ideal over R .
- (b) $\zeta \theta \eta$ is a picture fuzzy ideal over R .

Proof. (a) Let $l, m \in (R, +, \Gamma)$. Then we have

$$\begin{aligned} (i) \quad (B_{\zeta} \wedge B_{\eta})(l - m) &= B_{\zeta}(l - m) \wedge B_{\eta}(l - m) \\ &\geq (B_{\zeta} \wedge B_{\eta})(l) \wedge (B_{\zeta} \wedge B_{\eta})(m) \\ \text{and } (A_{\zeta} \vee A_{\eta})(l - m) &= A_{\zeta}(l - m) \vee A_{\eta}(l - m) \\ &\leq (A_{\zeta} \vee A_{\eta})(l) \wedge (A_{\zeta} \vee A_{\eta})(m) \end{aligned}$$

Similarly we can prove that $(F_{\zeta} \vee F_{\eta})(x - y) \leq (F_{\zeta} \vee F_{\eta})(l) \vee (F_{\zeta} \vee F_{\eta})(m)$.

$$\begin{aligned} (ii) \quad (B_{\zeta} \wedge B_{\eta})(lam) &= B_{\zeta}(lam) \wedge B_{\eta}(lam) \\ &\geq (B_{\zeta} \wedge B_{\eta})(l) \vee (B_{\zeta} \wedge B_{\eta})(m) \\ (A_{\zeta} \vee A_{\eta})(lam) &= A_{\zeta}(lam) \vee A_{\eta}(lam) \\ &\leq (A_{\zeta} \vee A_{\eta})(l) \wedge (A_{\zeta} \vee A_{\eta})(m) \end{aligned}$$

Similarly we can prove that $(F_{\zeta} \vee F_{\eta})(lam) \leq (F_{\zeta} \vee F_{\eta})(l) \wedge (F_{\zeta} \vee F_{\eta})(m)$.

$$\begin{aligned} (iii) \quad (B_{\zeta} \wedge B_{\eta})(l + m - l) &= B_{\zeta}(l + m - l) \wedge B_{\eta}(l + m - l) \\ &\geq B_{\zeta}(m) \wedge B_{\eta}(m) \\ (A_{\zeta} \vee A_{\eta})(l + m - l) &= A_{\zeta}(l + m - l) \vee A_{\eta}(l + m - l) \\ &\leq A_{\zeta}(m) \vee A_{\eta}(m). \end{aligned}$$

Similarly we can prove that $(F_{\zeta} \vee F_{\eta})(l + m - l) \leq F_{\zeta}(m) \vee F_{\eta}(m)$.

Hema et al.,

$$\begin{aligned}
 & (iv)(B_\zeta \wedge B_\eta)((l+i)\alpha m - lam) = B_\zeta((l+i)\alpha m - lam) \vee B_\eta((l+i)\alpha m - lam) \\
 & \geq B_\zeta(i) \vee B_\eta(i). \\
 & (A_\zeta \vee A_\eta)((l+i)\alpha m - lam) = \zeta_\zeta((l+i)\alpha m - lam) \vee A_\eta((l+i)\alpha m - lam) \\
 & \leq A_\zeta(i) \vee A_\eta(i).
 \end{aligned}$$

Similarly we can prove that $(F_\zeta \vee F_\eta)((l+i)\alpha m - lam) \leq F_\zeta(i) \vee F_\eta(i)$.

$$\begin{aligned}
 (v) \quad & (B_\zeta \wedge B_\eta)((lam)\beta z) = B_\zeta((lam)\beta z) \wedge B_\eta((lam)\beta z) \\
 & \geq (B_\zeta \wedge B_\eta)(l) \vee (B_\zeta \wedge B_\eta)(m) \vee (B_\zeta \wedge B_\eta)(z) \\
 & (A_\zeta \wedge A_\eta)((lam)\beta z) = \zeta_\zeta((lam)\beta z) \wedge A_\eta((lam)\beta z) \\
 & \leq (A_\zeta \wedge A_\eta)(l) \vee (A_\zeta \wedge A_\eta)(m) \vee (A_\zeta \wedge A_\eta)(z).
 \end{aligned}$$

(b) Let $l, m \in (R, +, \Gamma)$. Then we have,

$$\begin{aligned}
 (B_\zeta \oplus B_\eta)(l - m) &= \bigcup_{l-m=a+b} B_\zeta(a) \wedge B_\eta(b) \\
 &\geq \bigcup_{l=a_1+a_2, m=b_1+b_2} B_\zeta(a_1 - b_1) \wedge B_\eta(a_2 - b_2) \\
 &\geq (\bigcup_{l=a_1+a_2} (B_\zeta(a_1) \wedge B_\eta(a_2))) \wedge (\bigcup_{m=b_1+b_2} B_\zeta(b_1) \wedge B_\eta(b_2)) \\
 &= (B_\zeta \oplus B_\eta)(l) \wedge (B_\zeta \oplus B_\eta)(m) \\
 (A_\zeta \otimes A_\eta)(l - m) &= \bigcap_{l-m=a+b} A_\zeta(a) \vee A_\eta(b) \\
 &\leq \bigcap_{l=a_1+a_2, m=b_1+b_2} A_\zeta(a_1 - b_1) \vee A_\eta(a_2 - b_2) \\
 &\leq (\bigcap_{l=a_1+a_2} A_\zeta(a_1) \vee A_\eta(a_2)) \vee (\bigcap_{m=b_1+b_2} A_\zeta(b_1) \vee A_\eta(b_2)) \\
 &= (A_\zeta \otimes A_\eta)(l) \vee (A_\zeta \otimes A_\eta)(m).
 \end{aligned}$$

Similarly we can prove that $(F_\zeta \otimes F_\eta)(l - m) \leq (F_\zeta \otimes F_\eta)(l) \vee (F_\zeta \otimes F_\eta)(m)$.

$$\begin{aligned}
 (B_\zeta \oplus B_\eta)(lam) &= \bigcup_{lam=aab} [B_\zeta(a) \wedge B_\eta(b)] \\
 &\geq \bigcup_{lam=aab, l=a_1+a_2, m=b_1+b_2} [B_\zeta(a_1 + a_2) \wedge B_\eta(b_1 + b_2)] \\
 &= \bigcup_{l=a_1+a_2} [B_\zeta(a_1) \wedge B_\eta(a_2)] \wedge [\bigcup_{m=b_1+b_2} B_\zeta(b_1) \wedge B_\eta(b_2)] \\
 &= (B_\zeta \oplus B_\eta)(l) \vee (B_\zeta \oplus B_\eta)(m).
 \end{aligned}$$

$$\begin{aligned}
 (A_\zeta \otimes A_\eta)(lam) &= \bigcap_{lam=aab} A_\zeta(a) \vee A_\eta(b) \\
 &\leq \bigcap_{lam=aab, l=a_1+a_2, m=b_1+b_2} [A_\zeta(a_1 + a_2) \vee A_\eta(b_1 + b_2)] \\
 &= \bigcap_{l=a_1+a_2} [A_\zeta(a_1) \vee A_\eta(a_2)] \wedge [\bigcap_{m=b_1+b_2} A_\zeta(b_1) \vee A_\eta(b_2)] \\
 &= (A_\zeta \otimes A_\eta)(l) \vee (A_\zeta \otimes A_\eta)(m).
 \end{aligned}$$

Similarly we can see that $(F_\zeta \otimes F_\eta)(lam) = (F_\zeta \otimes F_\eta)(l) \wedge (F_\zeta \otimes F_\eta)(m)$. Thus we have $\zeta\theta\eta$ is a picture fuzzy ideal over R .

CONCLUSION

In the structural theory of picture fuzzy algebraic systems, picture fuzzy sets with special properties always play an important role. In this work, we focus on a particular topic related to picture fuzzy algebra, which develops picture fuzzy versions of commutative Γ -rings. Specifically, we study the theory of fuzzy sets and picture fuzzy sets. We introduce the notions of picture fuzzy ideals on commutative Γ -rings and some properties of them are obtained. Finally, we give suitable definitions of the operations of picture fuzzy ideals over a commutative Γ -ring, as composition, product and intersection.

ABSTRACT

Cosmetics is the booming sector in the industry and marketing sale of the products are increasing year by year. Different rules and regulations are followed by different regulatory authorities to market their product having quality, safety and efficacy. Cosmetics means any substance which is intended to sprinkled, poured, rubbed or introduced into the cleansing and beautifying the human body and also plays a key role for attractiveness. They are different types of cosmetics like facial makeup, hair dyes, skin moisturizes, eye makeup, shampoos, conditioners, lipsticks, fingernail polishes and deodorants, perfumes, powders, oils, sunscreen lotions etc. The main aim of this article is to focus on registration and import requirements of India, USA and Brazil. India follows recent amendment cosmetic rules 2020, whereas the United States follows 21CFR parts-710 and 720 and Brazil follows ANVISA directive RDC -07. It also outlines comparative study about regulatory framework followed by each if these countries.

Keywords: Cosmetics; regulatory authorities; registration; Import; India; USA; Brazil; regulatory framework

INTRODUCTION

The term cosmetic derives from the Ancient Greek "kosmtikos," which means "to be able to arrange and decorate." [1] The Office of the Drugs Controller General India (DCGI) of the Central Drugs Standard Control Organization (CDSCO) is the Central licensing authority in India. While the CDSCO regulates cosmetic imports, state licensing authorities govern cosmetic production. In India, CDSCO regulates cosmetics through the implementation of applicable laws and the requirements of the Drugs and Cosmetics Act (D&C Act). A cosmetic is defined under

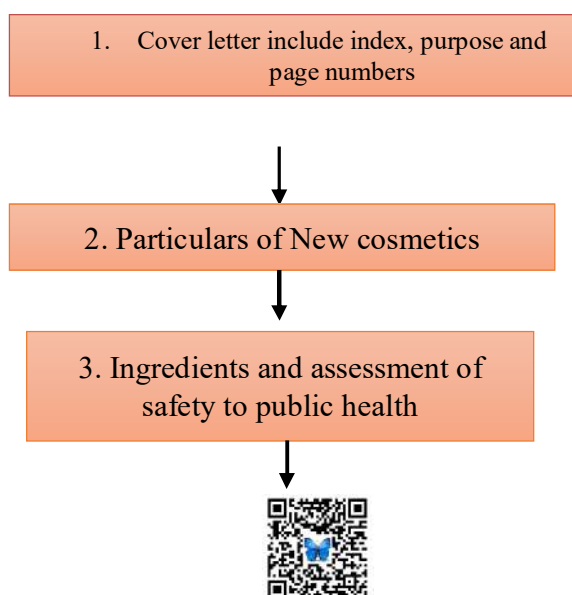

**Rapeti Bhavani Lakshmi et al.,**

section 3(aaa) of the Drugs and Cosmetics Act, 1940 as, any article intended to be rubbed, poured, sprinkled or sprayed on, or introduced into, or otherwise applied to , the human body or any part thereof for cleansing, beautifying, promoting attractiveness or altering the appearance, and includes any article intended for use as a component of cosmetic [2]. In USA, Food and Drug Administration is the Regulatory body. The Federal Food, Drug, and Cosmetic Act (FFD&C Act) and the Fair Packaging and Labelling Act (FPLA) are the two most significant laws that regulate the commerce of cosmetics in the United States. The USFDA executes these regulations to regulate cosmetics [3]. The Federal Food, Drug & Cosmetic Act (FD&C Act) defines cosmetics as “articles intended to be rubbed, poured, sprinkled, or sprayed on, introduced into, or otherwise applied to the human body for cleansing, beautifying, promoting attractiveness or altering the appearance.” Included in this definition are products such as skin moisturizers, perfumes, lipsticks, fingernail polishes, eye and facial make up preparations, shampoos, permanent waves, hair colors, toothpastes and deodorants, as well as any material intended for use as a component of a cosmetic product[4].

In Brazil, the Ministry of Health, the Brazilian Health Regulatory Agency (ANVISA), and the Hygiene, Perfume, Cosmetics, and Sanitizing Products Management (GHCOs) regulate the cosmetics business through an evolving series of resolutions[5]. ANVISA Directive RDC-07, Annex- I defines Personal care Products, Cosmetics and Perfumes defines as: Preparations consisting of natural or synthetic substances, for external use on various parts of human body, skin, capillary system, nails, lips, external genital organs, teeth and mucous membranes of the oral cavity, with the sole or main purpose of cleaning them, perfuming them, altering their appearance, correcting body odors and or protecting or maintaining them in goodcondition[6].

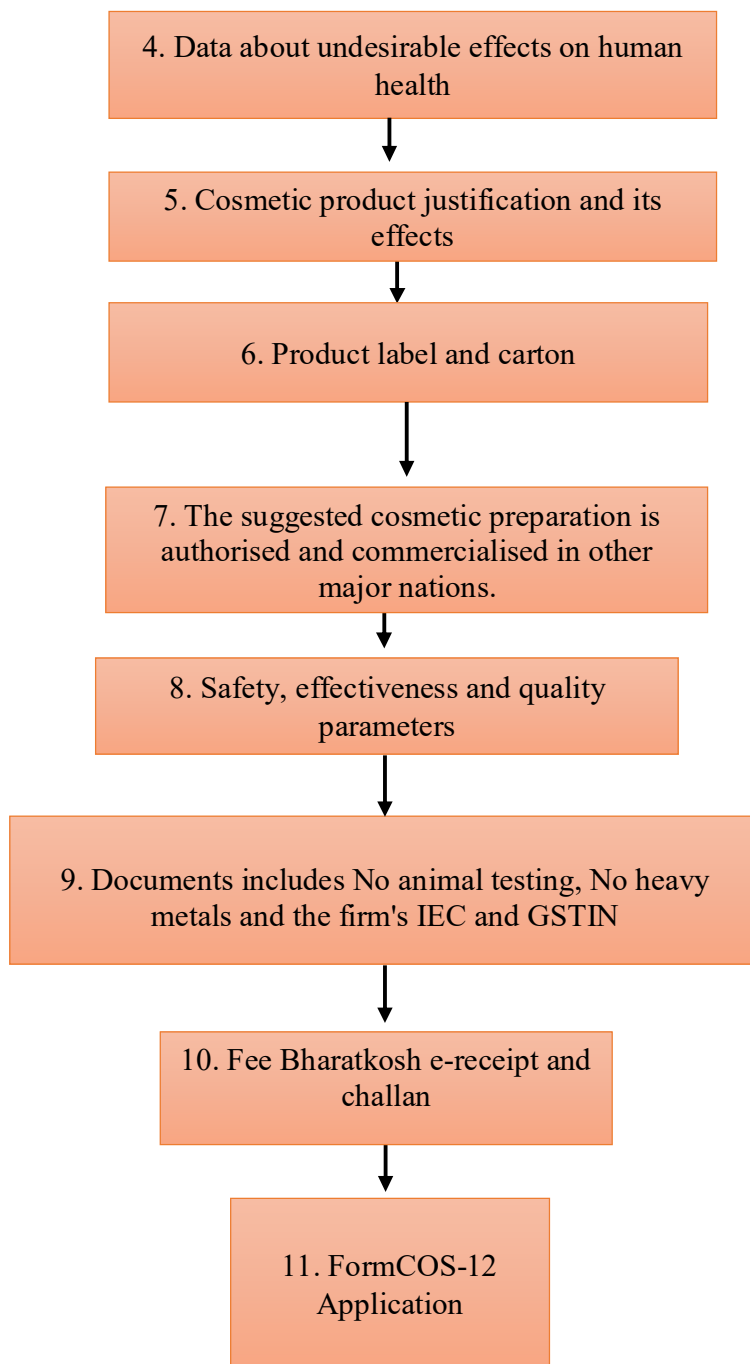

Registration of Cosmetics in India

1. Apply the registration through CDSCO Sugam portal <http://cdscoonline.gov.in>.
2. Sign up, create account with credentials verify the account and log in with the details.
3. Choose the required category for online registration of cosmetics filling FORM-42 and upload the documents required as per the checklist.
4. Electronically submit the documents through PDF and after submitting the application reference number will be provided to the applicant for further reference[7]
5. Licensing Authority will approve the application if they are no deficiencies and provides approval letter to the applicant which is accessed through Sugam portal dashboard.

Form COS-12, Application under the Drugs and Cosmetics Act of 1940 for the Issuance of Authorization for New Cosmetics[9]

Rapeti Bhavani Lakshmi et al.,

Registration of import of cosmetic Products in India

The Government of India On May 19, 2010 published Gazette Notification G.S.R 426(E), revising the Drugs and Cosmetics Rules, 1945, to impose registration of cosmetics imported into the country [10]. Cosmetic Products in India are governed by Rule 21 of the Drug and Cosmetic Act Rules of 1945. Filling out Form-42 and sending it to the

**Rapeti Bhavani Lakshmi et al.,**

DCG(I), CDSCO with the USD 1,000 fee, a fee of US \$500 for registration of each manufacturing site, a fee of US \$50 for each variant, and a fee of US \$1,000 for grant or retention of registration certificate for additional category of Cosmetic shall be paid with the application in Form COS-1 [12]. DCG(I) provides a Form-43 registration certificate if the application is approved [13] Changes to the Product's constituents must be communicated to the licensing authority and submitted in Schedule-D III at least 30 days prior to importation.

Additionally, the label should include the manufacturer's name and address, as well as country where the product was manufactured. If the product was not created in a manufacturing firm owned by the manufacturer, the label should include the name and address of the actual manufacturer or the name of the country where the product was manufactured, such as "Made in... (name of country)". On the label of imported cosmetics must appear the brand's registration certificate number , as well as the name and address of the registration certificate holder [10].

Documents required for the issuance of a cosmetics registration certificate in India [10]

- Applicant should fill cover letter
- Form-42 for import registration certificate
- The Treasury Challan
- Power of attorney
- Schedule D-III
- Free sale certificate
- Original label copy
- Product specifications and testing protocol
- List of nations that have received market Authorization, import authorization, or registration
- Package Insert
- Soft copies of the brand, product, and manufacturer information

Any document that is written in another language must be translated into English by a qualified translator, which the applicant shall submit. If there is no provision for a license to manufacture cosmetics in the country of origin, the importer will make a statement on an affidavit to that effect. A registration certificate is not required for cosmetics imported in volume and repackaged for export to other nations. In such instances, the importer must obtain the required authorization from CDSCO Headquarters. When importing cosmetics for R&D purposes such as packaging trials, consumer research, shelf-life studies, and transport studies, the importer must guarantee in writing that these goods will not be made available for domestic sale.

Documents required for grant of registration certificate in FORM COS-1[11]

Form COS-1[31]Is a registration certificate application for the import of cosmetics into India under the Cosmetics Rules,2020 [12].

Form COS-2[32] Importing cosmetics into India requires an import registration certificate under the Cosmetics Rules, 2020 [12]. Form -43 registration is granted it takes about 6 months for approval of an application and registration certificate is valid for a period of five years from date of approval [8].

Registration of cosmetics in USA

The voluntary cosmetic registration program (VCRP) of the FDA permits cosmetic industries to enrol in the United States. The VCRP guides the FDA in carrying out its regulations over cosmetics [14]. The VCRP filing consists of two parts, each of which is discussed upon in the sections that follow. Applicants may participate in either one or both Programme components. 21 CFR Parts 710 and 720 include the VCRP regulations all cosmetics supplied to consumers in the United States are regulated by the VCRP [15].

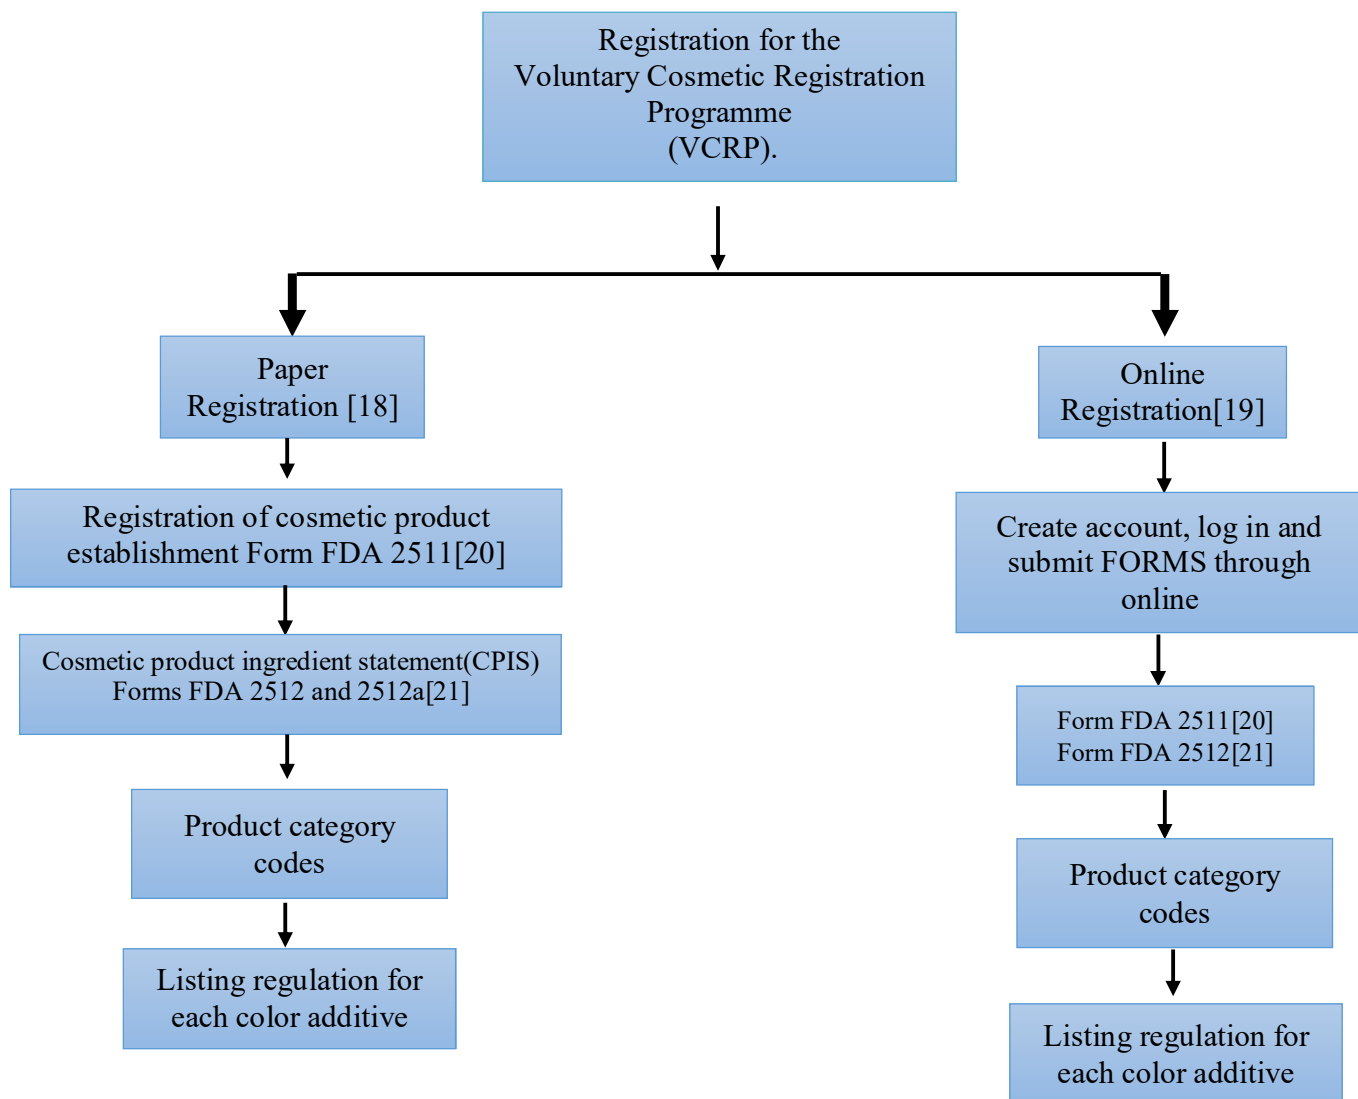

Rapeti Bhavani Lakshmi et al.,

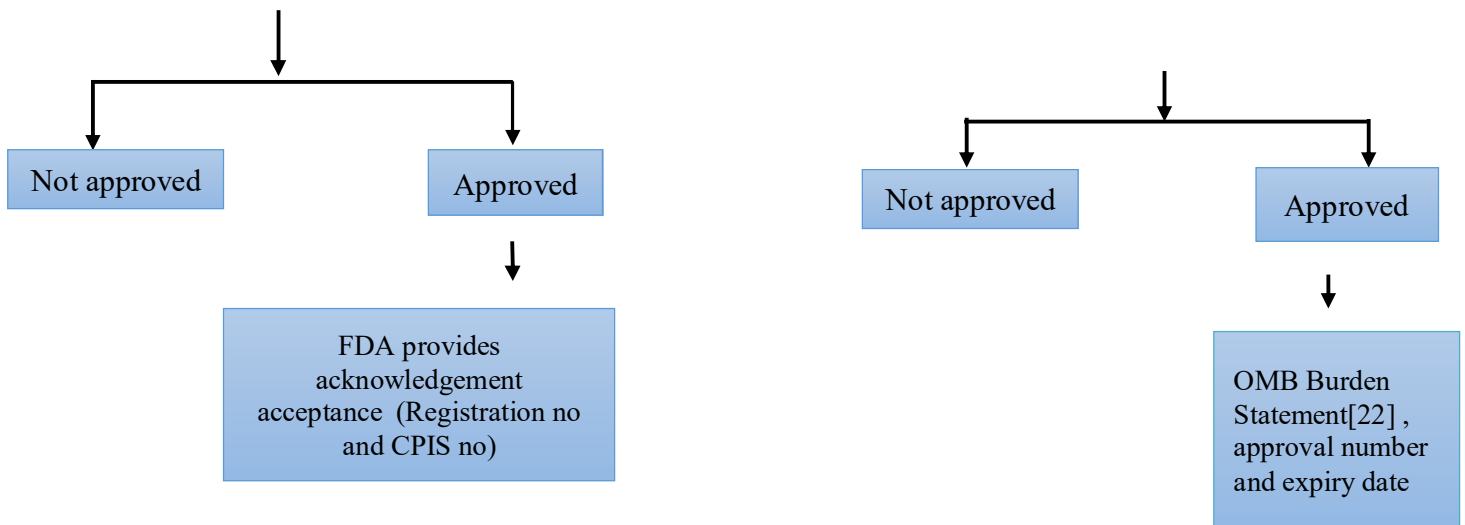

21CFR PART-710 Voluntary Registration of Cosmetic Product Establishment [16]

Subchapter-G describes that manufacturer or operator can apply after 30 days of starting the procedure filling the Form FDA-2511. The application will be inspected by the FDA before it is authorized by the authorities in contrast to 21 CFR PART 720 Voluntary Filing of Cosmetic Product Ingredient Composition Statements [17] consists of registration cosmetics in VCRP includes application filled by the manufacturer, packer, distributor of the products in Form FDA-2512 and submitted to FDA after 180 days of starting the operation FDA will inspect the application send by the applicant and then approve the application. Registration is done through VCRP they are two regulatory methods followed by the applicantie. paper and online submission where the application is approved by the regulatory body.

Rapeti Bhavani Lakshmi et al.,

Registration of import of cosmetics products in USA

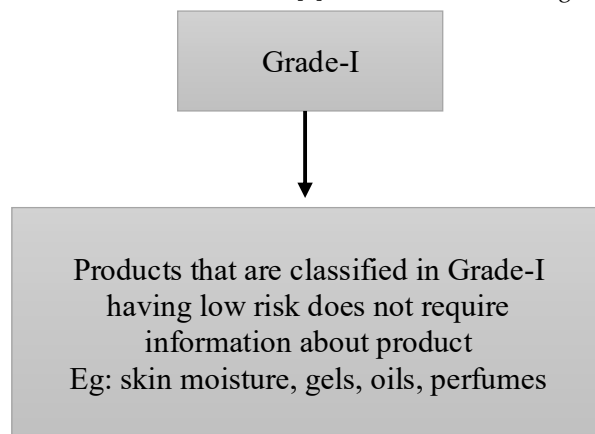

The global cosmetic business is quickly increasing and is expected to reach USD 716.6 billion by 2025, rising at a CAGR of 5.9 % [23]. USFDA collaborates with US Customs and Border Protection (CBP) to check imported goods and guarantee that they are not misbranded or adulterated before allowing authorised Products to enter the United States. Importer should submit required documents like entry summary, bill of lading, bill of sale along with CBP FORM -301 within 5 days after arriving the products into US. If its extended till 15 days then the products are kept in the (GO) warehouse and applicant or importer should also pay the required storage fees. If products are stored in warehouse for more than 60 days and applicant or importer is not submitting the required documents then after 60th day the products are sold in the public auction [24].

Registration of cosmetics in Brazil

Personal hygiene products, cosmetics, and fragrances' principal function is to clean, perfume, change, and cure body odours, as well as to keep or retain bodily tissues in perfect condition. These preparations are administered topically to numerous areas of the human body, including the epidermis, hair, nails, lips, external genitalia, teeth, and oral mucosal membranes.

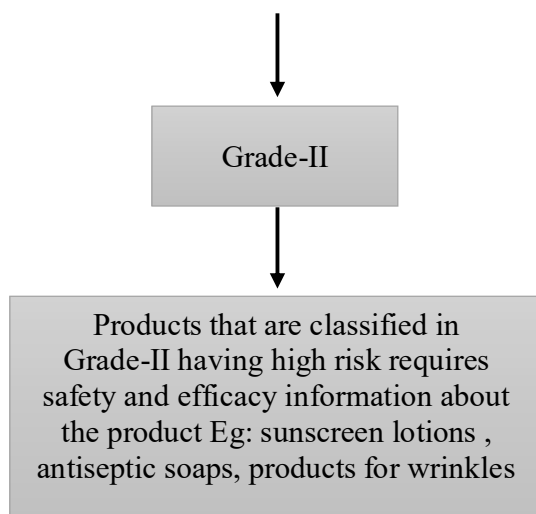

Brazilian follows Resolution RDC 237/2018 for cosmetics Pre-market approval Annex-VIII consists of list of cosmetic products regulated and approved by ANVISA[25].

ANVISA Directive RDC no-7 Annex-II defines [6]and classifies into two grades based on risk factors [25]

Rapeti Bhavani Lakshmi *et al.*,

GRADE – I

Type of cosmetics are classified through notification process the following steps are: -

- Step -1 Appointing MAH
- Step -2 Registering under Cosmetic Automation System (SGAS)
- Step -3 Documents and registration fees it depends on the scale of the business. Fee is around Brazilian reais R\$175.72 to R\$ 3,414.32 [26].
- Step -4 ANVISA takes 2 months for approval of application
- Step -5 After approval notification is published on ANVISA website

GRADE- II

Type of cosmetics are classified through registration process the following steps are: -

- Step -1 Appointing MAH
- Step -2 Registering under Cosmetic Automation System SGAS
- Step -3 Approval from AFE from ANVISA
- Step -4 Documents and registration fees around Brazilian reais R\$ 244.05 and R\$ 4.881,00^[26].
- Step -5 ANVISA takes 90 days for approval
- Step -6 After approval or rejection of the application ANVISA will publish through DOU

Registration of import of cosmetics products in Brazil

- An imported product can only be legalized by a Brazilian importer.
- The importer must possess a Company Operating Authorization (AFE) in order to import fragrances, cosmetics, and personal care products.
- Cosmetics, personal care products, and fragrances must be registered in the SISCOMEX Import Licensing in Foreign Trade Integrated System and are subject to health authority inspection before being released from ports.
- Before a product is delivered to Brazil, ANVISA must explicitly and in advance authorize the import of products and services that are subject to non-automatic licensing under SISCOMEX.

Import Licensing: The importer or any legal representative must submit an electronic request through SISCOMEX for non-automatic licensing processes in order to confirm that the imports of goods and products that are under sanitary control are in line with the relevant regulations.

Documents required

- Petition form

Rapeti Bhavani Lakshmi *et al.*,

- Proof of the payment
- Import licensing
- Inspection
- Invoice
- Build of landing
- Information about legal entity
- Import registration number and lot number will be provided
- Proof of import license and location

Timelines [28]

Fig-01: https://globalregulatorypartners.com/wp-content/uploads/Cosmetics-Registration-in-Brazil_Version-1.2021-version.pdf

CONCLUSION

Regulatory framework of cosmetics are having stringent guidelines across different countries, but the main core of each country is the same for safety of the product that is released into the market and doesn't been focused on therapeutic actions. In India registration is done through Sugam portal approval is provided by State and central licensing authorities and also BIS for safe use of products. USFDA uses VCRP for both paper and online registration which is approved by FDA while Brazil register through SGAS approved by ANVISA.

ABSTRACT

In this paper, the FM/M/1/∞ interdependent stochastic feedback arrival model with catastrophic effect is considered. The transient solution, busy period analysis, and system characteristics are derived for this model. Using Maple software, the analytical results are numerically proven. The impact of the nodal parameter on the system's features and graphical representation is investigated.

Keywords: interdependent feedback arrival rate, interdependent catastrophic effect, Rouché's theorem, infinite capacity.

INTRODUCTION

The mathematical analysis of waiting lines or queues is known as "queueing theory." In general, it is considered a branch of operations research. Data transmission, telecommunications, and so on are the applications of queueing theory. When arrival and service rates are correlated, the queueing model is said to be an "interdependent queueing model." Antline Nisha and Thiagarajan obtained results for the single server finite capacity queueing model [1]. Rakesh Kumar and Bhavneet Singh Soodan introduced the concept of correlated reneging and obtained a transient solution using the Runge-Kutta method [8]. Sasikala and Thiagarajan studied a multi-server model with finite

Gayathri and Rani

capacity in steady-state behaviour [11]. In this paper, we consider the whole system as a feedback queueing system. The Laplace transform and Rouché’s theorem are used to find the transient solution for this model. Also, the expected length and busy period are analysed for this model.

DESCRIPTION OF THE MODEL

Consider an infinite capacity queueing system with an interdependent feedback arrival model that is subject to catastrophic effect. According to a feedback Poisson process with a mean feedback arrival rate $p(\lambda - \epsilon) > 0$, the feedback customers arrive at a counter. While the system is not empty, the mean rate $(v - \epsilon)$ of interdependent catastrophes occurs according to the feedback Poisson process. The service times are independently and identically distributed random variables with a service rate $(\mu - \epsilon)$. The system’s state is zero when the service begins at time $t = 0$. The occurrence of the catastrophe destroys all of the available customers and has an impact on the system. The system’s correlated and bivariate feedback Poisson processes are $\{X_1(t)\}$ and $\{X_2(t)\}$. The feedback Poisson distribution is,

$$Pr\{X_1(t) = px_1, X_2(t) = x_2\} = e^{-(p\lambda_i + \mu_i - \epsilon)t} \sum_{j=0}^{\min(px_1, x_2)} \frac{(\epsilon t)^j (p(\lambda_i - \epsilon)t)^{px_1 - j} ((\mu - \epsilon)t)^{x_2 - j}}{j!(px_1 - j)!(x_2 - j)!}$$

$x_1, x_2 = 0, 1, 2, \dots$ $\lambda_i > 0; i = 0, 1$ and $\mu > 0$ with parameters $\lambda_0, \lambda_1, \mu, \epsilon, 0 < p < 1$, for mean faster and slower rates of feedback arrivals, mean service rates for single-server with mean dependence rate respectively.

| Sets | Direction of the Feedback Arrival Rates Movement | |
|--|--|---------------------------|
| $S_1 = \{0, 1, 2, \dots, r-1, r, r+1, \dots, R-1\}$ | ↑ | $p(\lambda_0 - \epsilon)$ |
| $S_2 = \{R, R+1, \dots, k, \dots\}$ | ↑ | $p(\lambda_1 - \epsilon)$ |
| $S_3 = \{\dots, k, k-1, \dots, R, R-1, \dots, r+1\}$ | ↓ | $p(\lambda_1 - \epsilon)$ |
| $S_4 = \{r, r-1, \dots, 1, 0\}$ | ↓ | $p(\lambda_0 - \epsilon)$ |
| $S_5 = \{r+1, r+2, \dots, R-1\}$ | ↑ | $p(\lambda_0 - \epsilon)$ |

- (a) When the system size increases to $R-1$ from below, the feedback arrival rate is $p(\lambda_0 - \epsilon)$.
- (b) When the system size increases from R to ∞ , the feedback arrival rate is $p(\lambda_1 - \epsilon)$.
- (c) When the system size decreases from above to $r+1$, the feedback arrival rate is $p(\lambda_1 - \epsilon)$.
- (d) When the system size decreases from r to 0 and decreases from $r+1$ to $R-1$, the feedback arrival rate is $p(\lambda_0 - \epsilon)$.

This process is repeated.

Let $Q_n(t) = Pr\{X(t) = n\}$

Then $Q_n(t)$ satisfy the differential-difference equations,

$$Q_0'(t) = -\left(p(\lambda - \epsilon) + (v - \epsilon)\right) Q_0(t) + (\mu - \epsilon) Q_1(t) \tag{1}$$

$$Q_n'(t) = -\left(p(\lambda - \epsilon) + (\mu - \epsilon) + (v - \epsilon)\right) Q_n(t) + p(\lambda - \epsilon) Q_{n-1}(t) + (\mu - \epsilon) Q_{n+1}(t); n \geq 1 \tag{2}$$

Let $Q_n^*(z)$ be the Laplace transform of $Q_n(t)$

Taking the Laplace transform for the equations (1) and (2) and using the property of time-differentiation,

$$\left(z + p(\lambda - \epsilon) + (v - \epsilon)\right) Q_0^*(z) = 1 + (\mu - \epsilon) Q_1^*(z) \tag{3}$$

$$\left(z + p(\lambda - \epsilon) + (\mu - \epsilon) + (v - \epsilon)\right) Q_n^*(z) = \left(p(\lambda - \epsilon)\right) Q_{n-1}^*(z) + (\mu - \epsilon) Q_{n+1}^*(z); n \geq 1 \tag{4}$$

Equation (4) is a difference equation of order two with its characteristic equation

$$(\mu - \epsilon)\alpha^2 - \left(z + p(\lambda - \epsilon) + (\mu - \epsilon) + (v - \epsilon)\right)\alpha + p(\lambda - \epsilon) = 0$$

The required roots for the above equation are,

$$\alpha_1 = \frac{\left(p(\lambda - \epsilon) + (\mu - \epsilon) + z + (v - \epsilon)\right) + \sqrt{\left(p(\lambda - \epsilon) + (\mu - \epsilon) + z + (v - \epsilon)\right)^2 - 4\left(p(\lambda - \epsilon)\right)(\mu - \epsilon)}}{2(\mu - \epsilon)}$$

Gayathri and Rani

$$\alpha_2 = \frac{(p(\lambda-\epsilon)+(\mu-\epsilon)+z+(v-\epsilon)) - \sqrt{(p(\lambda-\epsilon)+(\mu-\epsilon)+z+(v-\epsilon))^2 - 4(p(\lambda-\epsilon))(\mu-\epsilon)}}{2(\mu-\epsilon)}$$

By using the sum and product of the roots and applying Rouches' theorem

$$Q_0^*(z) = \frac{1-\alpha_2}{z} \tag{5}$$

$$Q_n^*(z) = \frac{(1-\alpha_2)\alpha_2^n}{z}; \quad n \geq 0 \tag{6}$$

Solving equation (6),

$$Q_n^*(z) = \left(\frac{1}{p(\lambda-\epsilon)}\right) \left(\alpha_2^{n+1} + \left(\frac{p(\lambda-\epsilon)}{\mu-\epsilon}\right)^{n+1} \sum_{k=n+2}^{\infty} \left(\frac{\mu-\epsilon}{p(\lambda-\epsilon)}\right)^k \alpha_2^k\right) \tag{7}$$

Using the translation property of the Laplace transform and taking the inverse Laplace transform,

$$Q_n(t) = e^{-(p(\lambda-\epsilon)+(\mu-\epsilon)+(v-\epsilon))t} \left(\begin{aligned} &\left(\frac{p(\lambda-\epsilon)}{\mu-\epsilon}\right)^{\frac{n}{2}} I_n(at) + \left(\frac{p(\lambda-\epsilon)}{\mu-\epsilon}\right)^{\frac{n-1}{2}} I_{n+1}(at) \\ &+ \left(\frac{p(\lambda-\epsilon)}{\mu-\epsilon}\right)^n \left(1 - \frac{p(\lambda-\epsilon)}{\mu-\epsilon}\right) \sum_{k=n+2}^{\infty} \left(\frac{p(\lambda-\epsilon)}{\mu-\epsilon}\right)^{\frac{k}{2}} I_k(at) \end{aligned} \right) \tag{8}$$

$$n \geq 0; \quad a = 2\sqrt{(p(\lambda-\epsilon))(\mu-\epsilon)}$$

ASYMPTOTIC BEHAVIOR OF EXPECTED LENGTH FOR FASTER AND SLOWER RATE OF FEEDBACK ARRIVALS

Theorem

If $(v-\epsilon) > 0$, the asymptotic behavior of the Expected length $L_{s(P_n)}(t)$ is

$$L_{s(P_n)}(t) = \left(\frac{\mu-\epsilon}{v-\epsilon}\right) \left(1 - \frac{A - \sqrt{A^2 - 4(p(\lambda-\epsilon))(\mu-\epsilon)}}{2(\mu-\epsilon)}\right); \text{ as } t \rightarrow \infty$$

$$A = (p(\lambda-\epsilon)) + (\mu-\epsilon) + (v-\epsilon)$$

Proof:

The expected length $L_{s(P_n)}(t) = \sum_{n=1}^{\infty} n Q_n(t) = Q(x,t)$ at $x=1$

Denoting $Q(x,t) = \sum_{n=0}^{\infty} Q_n(t)x^n$

Multiplying equation (2) by x^n , taking summation from $n=1,2,\dots$ and adding equation (1), we get

$$\frac{d}{dt} L_{s(P_n)}(t) + (v-\epsilon)L_{s(P_n)}(t) = ((\mu-\epsilon)) Q_0(t)$$

Solving for $L_{s(P_n)}(t)$ with $L_{s(P_n)}(0)=0$,

$$L_{s(P_n)}(t) = \left(\frac{\mu-\epsilon}{v-\epsilon}\right) Q_0(t)$$

Using the final value theorem,

$$\lim_{t \rightarrow \infty} L_{s(P_n)}(t) = \lim_{z \rightarrow 0} z L_{s(P_n)}^*(z)$$

$$\text{we get, } L_{s(P_n)}(t) = \left(\frac{\mu-\epsilon}{v-\epsilon}\right) \left(1 - \frac{A - \sqrt{A^2 - 4(p(\lambda-\epsilon))(\mu-\epsilon)}}{2(\mu-\epsilon)}\right); \text{ as } t \rightarrow \infty,$$

$$A = (p(\lambda-\epsilon)) + (\mu-\epsilon) + (v-\epsilon)$$

DIFFERENTIAL-DIFFERENCE EQUATIONS

Probability that n feedback utilities exist in the system at times t_0 and t_1 when the feedback arrival rates in faster and slower are $q_n(t_0)$ and $q_n(t_1)$ respectively. While $n=0,1,2,\dots,r-1$, $q_n(t_0)$ exists; While $n=r+1,r+2,\dots,R-1$, both $q_n(t_0)$ and

Gayathri and Rani

$q_n(t_1)$ exist; While $n=R, R+1, \dots, q_n(t_1)$ only exists. $q'_0(t_0)$ and $q'_{r+1}(t_1)$ denote the probability density function of the busy period for faster and slower rates of feedback arrivals.

The differential-difference equations with faster and slower rates of feedback arrivals control the system size with absorbing barriers established at zero and $r+1$.

$$q'_0(t_0) = -(\mu - \varepsilon)q_1(t_0) \tag{9}$$

$$q'_1(t_0) = -\left(p(\lambda_0 - \varepsilon) + (\mu - \varepsilon) + (v - \varepsilon)\right)q_1(t_0) + (\mu - \varepsilon)q_2(t_0) \tag{10}$$

$$q'_n(t_0) = -\left(p(\lambda_0 - \varepsilon) + (\mu - \varepsilon) + (v - \varepsilon)\right)q_n(t_0) + (\mu - \varepsilon)q_{n+1}(t_0) + p(\lambda_0 - \varepsilon)q_{n-1}(t_0), \tag{11}$$

$n=2, 3, \dots, r-1$

$$q'_r(t_0) = -\left(p(\lambda_0 - \varepsilon) + (\mu - \varepsilon) + (v - \varepsilon)\right)q_r(t_0) + (\mu - \varepsilon)q_{r+1}(t_0) + p(\lambda_0 - \varepsilon)q_{r-1}(t_0) + (\mu - \varepsilon)q_{r+1}(t_1) \tag{12}$$

$$q'_n(t_0) = -\left(p(\lambda_0 - \varepsilon) + (\mu - \varepsilon) + (v - \varepsilon)\right)q_n(t_0) + (\mu - \varepsilon)q_{n+1}(t_0) + p(\lambda_0 - \varepsilon)q_{n-1}(t_0), \tag{13}$$

$n=r+1, r+2, \dots, R-2$

$$q'_{R-1}(t_0) = -\left(p(\lambda_0 - \varepsilon) + (\mu - \varepsilon) + (v - \varepsilon)\right)q_{R-1}(t_0) + p(\lambda_0 - \varepsilon)q_{R-2}(t_0) \tag{14}$$

(because of the absorbing barrier)

$$q'_{r+1}(t_1) = -(\mu - \varepsilon)q_{r+2}(t_1) \tag{15}$$

(because of the absorbing barrier)

$$q'_{r+2}(t_1) = -\left(p(\lambda_1 - \varepsilon) + (\mu - \varepsilon) + (v - \varepsilon)\right)q_{r+2}(t_1) + (\mu - \varepsilon)q_{r+3}(t_1) \tag{16}$$

(because of the absorbing barrier)

$$q'_n(t_1) = -\left(p(\lambda_1 - \varepsilon) + (\mu - \varepsilon) + (v - \varepsilon)\right)q_n(t_1) + (\mu - \varepsilon)q_{n+1}(t_1) + p(\lambda_1 - \varepsilon)q_{n-1}(t_1), \tag{17}$$

$n=r+3, r+4, \dots, R-1$

$$q'_R(t_1) = -\left(p(\lambda_1 - \varepsilon) + (\mu - \varepsilon) + (v - \varepsilon)\right)q_R(t_1) + (\mu - \varepsilon)q_{R+1}(t_1) + p(\lambda_1 - \varepsilon)q_{R-1}(t_1) + p(\lambda_0 - \varepsilon)q_{R-1}(t_0) \tag{18}$$

$$q'_n(t_1) = -\left(p(\lambda_1 - \varepsilon) + (\mu - \varepsilon) + (v - \varepsilon)\right)q_n(t_1) + (\mu - \varepsilon)q_{n+1}(t_1) + p(\lambda_1 - \varepsilon)q_{n-1}(t_1), \tag{19}$$

$n=R+1, R+2, \dots$

Let $\rho_0 = \frac{p(\lambda_0 - \varepsilon)}{(\mu - \varepsilon)}$ and $\rho_1 = \frac{p(\lambda_1 - \varepsilon)}{(\mu - \varepsilon)}$ denote the traffic intensities for faster and slower rates of feedback arrivals.

BUSY PERIOD ANALYSIS OF THE MODEL

FASTER RATE OF FEEDBACK ARRIVALS

Let $Q(z, t_0) = \sum_{n=0}^{R-1} q_n(t_0)z^n$ and $Q(z, t_1) = \sum_{n=r+1}^{\infty} q_n(t_1)z^n$.

Using Rouche's theorem, multiplying (9 to 14) by z^n , and taking the summation from 0 to $R-1$, it is found that

$$z \frac{d}{dt_0} (Q(z, t_0)) = (p(\lambda_0 - \varepsilon)z^2 - (p(\lambda_0 - \varepsilon) + (\mu - \varepsilon) + (v - \varepsilon))z + (\mu - \varepsilon))Q(z, t_0) + (\mu - \varepsilon)z^{r+1}q_{r+1}(t_1) + (-p(\lambda_0 - \varepsilon)z^2 + (p(\lambda_0 - \varepsilon) + (\mu - \varepsilon) + (v - \varepsilon))z - (\mu - \varepsilon))q_0(t_0) \tag{20}$$

Using the Laplace transform of equation (20),

$$z(s_0 \bar{Q}(z, s_0) - z) = (p(\lambda_0 - \varepsilon)z^2 - (p(\lambda_0 - \varepsilon) + (\mu - \varepsilon) + (v - \varepsilon))z + (\mu - \varepsilon))\bar{Q}(z, s_0) + (\mu - \varepsilon)z^{r+1}\bar{q}_{r+1}(s_1) + (-p(\lambda_0 - \varepsilon)z^2 + (p(\lambda_0 - \varepsilon) + (\mu - \varepsilon) + (v - \varepsilon))z - (\mu - \varepsilon))\bar{q}_0(s_0) \tag{21}$$

where $L(Q(z, t_0)) = \bar{Q}(z, s_0)$, $L(q_0(t_0)) = \bar{q}_0(s_0)$, $L(q_{r+1}(t_1)) = \bar{q}_{r+1}(s_1)$, $Q(z, 0) = z$

Gayathri and Rani

$$\bar{Q}(z, s_0) = \frac{z^2 + (-p(\lambda_0 - \epsilon)z^2 + (p(\lambda_0 - \epsilon) + (\mu - \epsilon) + (v - \epsilon))z - (\mu - \epsilon))\bar{q}_0(s_0) + (\mu - \epsilon)z^{r+1}\bar{q}_{r+1}(s_1)}{(p(\lambda_0 - \epsilon) + (\mu - \epsilon) + (v - \epsilon) + s_0)z - (\mu - \epsilon) - p(\lambda_0 - \epsilon)z^2} \tag{22}$$

From (22), the denominator has two zero, since $\bar{Q}(z, s_0)$ converges in $|z| \leq 1, (s_0) \geq 0$, $p(\lambda_0 - \epsilon)z^2 - (p(\lambda_0 - \epsilon) + (\mu - \epsilon) + (v - \epsilon) + s_0)z + (\mu - \epsilon) = 0$ the required roots are

$$\alpha_1^{(0)} = \frac{(p(\lambda_0 - \epsilon) + (\mu - \epsilon) + (v - \epsilon) + s_0) - \sqrt{((p(\lambda_0 - \epsilon) + (\mu - \epsilon) + (v - \epsilon) + s_0))^2 - 4p(\lambda_0 - \epsilon)(\mu - \epsilon)}}{2p(\lambda_0 - \epsilon)}$$

$$\alpha_2^{(0)} = \frac{(p(\lambda_0 - \epsilon) + (\mu - \epsilon) + (v - \epsilon) + s_0) + \sqrt{((p(\lambda_0 - \epsilon) + (\mu - \epsilon) + (v - \epsilon) + s_0))^2 - 4p(\lambda_0 - \epsilon)(\mu - \epsilon)}}{2p(\lambda_0 - \epsilon)}$$

$$|\alpha_1^{(0)}| < |\alpha_2^{(0)}|$$

By using the sum and product of the roots, we have

$$\alpha_1^{(0)} + \alpha_2^{(0)} = \frac{p(\lambda_0 - \epsilon) + (\mu - \epsilon) + (v - \epsilon) + s_0}{p(\lambda_0 - \epsilon)}$$

$$\alpha_1^{(0)} \alpha_2^{(0)} = \frac{(\mu - \epsilon)}{p(\lambda_0 - \epsilon)}$$

Using Rouché's Theorem,

$$\frac{d}{ds_0} [s_0 \bar{Q}(0, s_0)]_{s_0=0} = \frac{1}{\left(1 + \frac{v - \epsilon}{\mu - \epsilon}\right)^{p_0}} \left(\frac{1}{p(\lambda_0 - \epsilon)} + \left(\frac{1}{\rho_0}\right)^r r \right) \tag{23}$$

$$\frac{d}{ds_0} [s_0 \bar{Q}(0, s_0)]_{s_0=0} = \frac{d}{ds_0} L[q_0'(t_0)]_{s_0=0} = - \int_0^\infty t_0 q_0'(t_0) dt_0 = E(T_0) \tag{24}$$

From the equations (23) and (24),

$$E(T_0) = \frac{1}{\left(1 + \frac{v - \epsilon}{\mu - \epsilon}\right)^{p_0}} \left(\frac{1}{p(\lambda_0 - \epsilon)} + \left(\frac{1}{\rho_0}\right)^r r \right) \tag{25}$$

SLOWER RATE OF FEEDBACK ARRIVALS

Let, $Q(z, t_1) = \sum_{n=r+1}^\infty q_n(t_1)z^n$

Using Rouché's theorem, multiplying (15 to 19) by z^n , and taking the summation from $r+1$ to ∞ , it is found that

$$z \frac{d}{dt_1} (Q(z, t_1)) = (p(\lambda_1 - \epsilon)z^2 - (p(\lambda_1 - \epsilon) + (\mu - \epsilon) + (v - \epsilon))z + (\mu - \epsilon))Q(z, t_1) + p(\lambda_0 - \epsilon)z^{R+1}q_{R-1}(t_0) + (-p(\lambda_1 - \epsilon)z^2 + (p(\lambda_1 - \epsilon) + (\mu - \epsilon) + (v - \epsilon))z - (\mu - \epsilon))q_{r+1}(t_1)z^{r+1} \tag{26}$$

Taking the Laplace transform on both sides of (26),

$$z(s_1 \bar{Q}(z, s_1) - z^{r+1}) = (p(\lambda_1 - \epsilon)z^2 - (p(\lambda_1 - \epsilon) + (\mu - \epsilon) + (v - \epsilon))z + (\mu - \epsilon))\bar{Q}(z, s_1) + p(\lambda_0 - \epsilon)z^{R+1}\bar{q}_{R-1}(s_0) + (-p(\lambda_1 - \epsilon)z^2 + (p(\lambda_1 - \epsilon) + (\mu - \epsilon) + (v - \epsilon))z - (\mu - \epsilon))\bar{q}_{r+1}(s_1)z^{r+1} \tag{27}$$

where $L(Q(z, t_1)) = \bar{Q}(z, s_1)$, $L(q_{r+1}(t_1)) = \bar{q}_{r+1}(s_1)$, $L(q_{R-1}(t_0)) = \bar{q}_{R-1}(s_0)$,

$$Q(z, r+1) = z^{r+1} \frac{z^{r+2} + (-p(\lambda_1 - \epsilon)z^2 + (p(\lambda_1 - \epsilon) + (\mu - \epsilon) + (v - \epsilon))z - (\mu - \epsilon))\bar{q}_{r+1}(s_1) + p(\lambda_0 - \epsilon)z^{R+1}\bar{q}_{R-1}(s_0)}{(p(\lambda_1 - \epsilon) + (\mu - \epsilon) + (v - \epsilon) + s_1)z - (\mu - \epsilon) - p(\lambda_1 - \epsilon)z^2} \tag{28}$$

Gayathri and Rani

From (28), the denominator has two zero, since $\bar{Q}(z, s_1)$ converges in $|z| \leq 1, (s_1) \geq 0$,

$$p(\lambda_1 - \epsilon)z^2 - (p(\lambda_1 - \epsilon) + (\mu - \epsilon) + (v - \epsilon) + s_1)z + (\mu - \epsilon) = 0$$

the required roots are

$$\alpha_1^{(1)} = \frac{(p(\lambda_1 - \epsilon) + (\mu - \epsilon) + (v - \epsilon) + s_1) - \sqrt{((p(\lambda_1 - \epsilon) + (\mu - \epsilon) + (v - \epsilon) + s_1))^2 - 4p(\lambda_1 - \epsilon)(\mu - \epsilon)}}{2p(\lambda_1 - \epsilon)}$$

$$\alpha_2^{(1)} = \frac{(p(\lambda_1 - \epsilon) + (\mu - \epsilon) + (v - \epsilon) + s_1) + \sqrt{((p(\lambda_1 - \epsilon) + (\mu - \epsilon) + (v - \epsilon) + s_1))^2 - 4p(\lambda_1 - \epsilon)(\mu - \epsilon)}}{2p(\lambda_1 - \epsilon)}$$

$$|\alpha_1^{(1)}| < |\alpha_2^{(1)}|$$

By using the sum and product of the roots, we have

$$\alpha_1^{(1)} + \alpha_2^{(1)} = \frac{p(\lambda_1 - \epsilon) + (\mu - \epsilon) + (v - \epsilon) + s_1}{p(\lambda_1 - \epsilon)}$$

$$\alpha_1^{(1)} \alpha_2^{(1)} = \frac{(\mu - \epsilon)}{p(\lambda_1 - \epsilon)}$$

Using Rouche's Theorem

$$\frac{d}{ds_1} [s_1 \bar{Q}(0, s_1)]_{s_1=0} = \frac{1}{((\mu - \epsilon) \left(1 + \frac{(v - \epsilon)}{(\mu - \epsilon)} \rho_1\right))} \left((r+1) \left(\frac{1}{\rho_1}\right)^{r+1} + p(\lambda_0 - \epsilon) \left(\frac{1}{\rho_1}\right)^R R \right) \tag{29}$$

$$\frac{d}{ds_1} [s_1 \bar{Q}(0, s_1)]_{s_1=0} = - \int_0^\infty t_1 d(q_{r+1}(t_1)) = E(T_1) \tag{30}$$

From the equations (29) and (30),

$$E(T_1) = \frac{1}{((\mu - \epsilon) \left(1 + \frac{(v - \epsilon)}{(\mu - \epsilon)} \rho_1\right))} \left((r+1) \left(\frac{1}{\rho_1}\right)^{r+1} + p(\lambda_0 - \epsilon) \left(\frac{1}{\rho_1}\right)^R R \right) \tag{31}$$

PARTICULAR CASE

Ignoring the interdependent catastrophic effect and the feedback arrival rate $p(\lambda - \epsilon) = \lambda$, service rate $(\mu - \epsilon) = \mu$, and $p = 1$, then the transient solution of the FM/M/1/∞ model will become the general transient solution of the M/M/1/∞ model.

NUMERICAL ILLUSTRATIONS

EXPECTED LENGTH

FASTER RATE OF FEEDBACK ARRIVALS

CONCLUSIONS

(i) From tables 1, 2, 3, and 4, it is observed that with the increase in the value of p and keeping the other parameters fixed, the expected length decreases.

(ii) From tables 5, 6, 7, and 8, it is observed that with the increase in the value of r and keeping the other parameters fixed, the expected length of the busy period increases.

(iii) From tables 9, 10, 11, and 12, it is observed that with the increase in the value of R and keeping the other parameters fixed, the expected length of the busy period increases.

ABSTRACT

The public's need for natural, environmentally beneficial, and secure pigments is sharply rising today. Microbial pigments in particular are getting more attention and appear to be in high demand globally. The food, textile, cosmetic, and pharmaceutical industries all employ synthetic hues extensively. However synthetic pigment toxicity issues have led to a lot of research into natural colours and dyes. Microorganisms that produce pigment are among the natural sources that have the ability to help solve today's problems. Moreover, natural colours add extra qualities including anti-oxidant and anti-cancer properties, as well as enhancing the product's marketability. Several sources of microbial pigments are discussed in this review along with their biological and therapeutic capabilities, such as antibacterial, antioxidant, anticancer, and anti-inflammatory. The study also emphasizes upon yeast pigments and the production for their commercial use in cosmetic fields.

Keywords: Microbial Pigments, yeast pigments, colours, cosmetics, carotenoids.

Jubanlak Mary Pohsnem et al.,

INTRODUCTION

The use of colors in cosmetics was began at prehistoric times. In early days like 3000 BC, men used colors for the attention and also to attract the animals and made the hunting process in easier way (Rohit Kumar Bijauliya et al., 2017). The history of cosmetics was started from the period of hunting, fighting and later it is associated with Medicine. In Europe Dying process was the first method which use various dyes as colorants. Then the use of natural pigments as colorants was observed at China nearly in 2600 BC (Visalakshi. M et al., 2013). The use of natural colorants in India was observed in the Indus Valley Civilization. Even some of the natural pigments used as colorants was observed in the 4th century. Before 2500 BC, natural sources like henna and saffron were employed as colourants (Kumar Sumit et al., 2012). Many synthetic colorants have been banned or being banned due to their hyperallergenicity, carcinogenicity and other toxicological problems. These adverse effects of synthetic colors have made the scientific community skewed towards natural colors (Reyes et al. 1996). In modern days the herbal cosmetics has a wide range of application and various impact like healing, smoothing, appearance and conditioning etc (Talal Aburjai et al., 2003).Cosmetics, now a days has become a major part in women's life (Fathima. A et al., 2011). In a Day-to-Day life of women, they use number of cosmetics which includes Lipstick, Nail Lacquer (Vipin K.V et al., 2014), (Mitchell. I et al., 1980), Hair dyes, perfumes, skin care products and so on. Among these products, some products use colorants in them. Applying tattoos to the flesh has recently been popular among youths, who also employ a variety of colours and hues(Krishna Vamshi Allam et al., 2011). In this review, it discusses about the natural pigments which acts as an alternate for the synthetic dyes in cosmetics (Visalakshi. M et al., 2013).

MICROOGANISM

Microbes are the ancestors of all living systems. They carry out more photosynthesis than green plants and constitute 60% of biomass on Earth. In our bodies, over 90% of the cells present are microbial (American Academy of Microbiology Colloquium, 2004).The contributions of microorganisms can be broken down into three main parts. The first phase might be called traditional industrial microbiology. The early 20th century saw the start of a second significant phase in industrial microbiology—modern industrial fermentations. The third phase is represented by the revolutionary era of recombinant DNA technology (modern biotechnology) (Demain et al. 2008).Microorganisms fall under the purview of biotechnological research because they have a number of advantages: they are highly diverse, grow exponentially quickly (dividing once every 20 to 90 minutes), can be cultivated at a large scale, can be genetically modified, and can exhibit spontaneous mutations(Beopoulos, 2012).The most adaptable biotechnological tools are microorganisms, which can manufacture a wide range of compounds, including enzymes, antibiotics, organic acids, and pigments. Microorganisms are a viable source for natural colours, according to recent studies(Tuli H.S., 2015).

Natural colors are pigments made by living organisms. Although they are not actually found in nature (aside from carbon), pigments manufactured by modifying substances from living creatures, such as caramel, vegetable carbon, and Cu-chlorophyllin (vide infra), are frequently also regarded as natural. Man-made pigments that closely resemble natural hues can also be found in nature. Examples include riboflavin, canthaxanthin, and alpha-carotene. Synthetic colours are man-made hues that are absent from nature; they are frequently azodyes. Silver, gold, and titanium dioxide are a few inorganic colour examples. Compared to natural colourants, which are more expensive, less stable, and have lesser intensity, artificial or synthetic colours, which are mostly employed by the food processing and cosmetic sectors, are dependable and cost-effective (Joshi et al. 2003).*Tetraterpenoids* known as carotenoids, which are also a component of the photosynthetic system, are as common as chlorophyll. They also contribute to many fruits' yellow, orange, and red colouring. *Anthocyanins* are a class of flavonoids that give many foods, especially berries (such as strawberries, elderberries, and black currants), their reddish-purple colour. The anthraquinones (carmine, lac, kermes, and madder) and betalains (beetroot) are two further significant groups of colourants(Mortensen A, 2006).

**Jubanlak Mary Pohsnem et al.,**

Pigment and dye are frequently used interchangeably. Whereas a dye is soluble in the medium in question, a pigment is not. Carotenoids are hence pigments in water but dyes in oil. From the earliest procaryotic creatures, such as cyanobacteria, through the kingdoms of fungi, plants, and animals, pigments are abundant in nature. The Magnoliophyta subphylum of the plant kingdom, which includes flowering plants, produces the majority of natural food dyes. However, natural colourants from various sources, including cyanobacteria (*Arthrospira spp.*), scale insects (cochineal and lac), and fungi (*Blakeslea trispora* and *Monascus spp.*), are being utilised to colour food (Mortensen A, 2006). Because natural pigments have been available for a while, interest in them has grown as a result of the toxicity issues brought on by synthetic colours. In this regard, microbial pigments are a good substitute. There are numerous artificial synthetic colourants that have diverse negative side effects and are widely utilised in the production of foods, dyes, cosmetics, and pharmaceuticals. Synthetic pigments have a lot of drawbacks. The precursors employed in the manufacture of synthetic pigment provide a significant risk of cancer to the employees. Also damaging are the production-related wastes. They themselves are not biodegradable or friendly to the environment. There is global interest in developing processes for the manufacture of pigments from natural sources to counter these detrimental consequences of synthetic colourants (Venil et al., 2009). Due to the negative effects of synthetic pigments and their industrial consequences on people and the environment, natural pigments are now being used more frequently in the production of foods, dyes, cosmetics, and pharmaceuticals (Unagul et al., 2005). Natural colours mostly come from two sources: plants and microbes. However, the natural colours from plants also have downsides including being unstable against light, heat, or acidic pH, having limited water solubility, and frequently not being available all year. Because of the durability of the colours produced by microbes and the availability of cultivation technologies, microbial pigments are therefore of tremendous interest (Raisainen et al., 2002; Kim et al., 1999; Parekh et al., 2000). Many microbial pigments include anticancer, antioxidant, anti-inflammatory, and antibacterial properties in addition to serving as colouring ingredients in the food processing and cosmetics industries (Venil and Lakshmanaperumalsamy 2009).

YEAST

The majority of the fungi that make up yeasts are unicellular organisms that reproduce vegetatively via budding. Yeasts can be classed as either *Ascomycetes* (including *Saccharomyces* and *Candida*) or *Basidiomycetes* (e.g. *Filobasidiella*, *Rhodotorula*) (Hawksworth 2004). Whereas bacteria store surplus carbon as polysaccharides and lipids primarily as polyhydroxyalkanoates or wax esters, yeast appears to be the most appropriate microbe for biotechnological uses. Yeasts collect carbon as glycogen and lipids mostly as TAG (Beopoulos, 2012). Throughout the beginning of time, yeast has been used to make bread, beer, and wine. A. van Leeuwenhoek made the first microscopic observations of microbiological cells and described the microscobic appearance of yeast in 1680. Pasteur identified their function in fermentation, and at the end of the 19th century, Hansen and Müller-Thurgau, respectively, obtained the first pure cultures (starters) of brewer's and wine yeast (Barnett and Barnett, 2011). Carbohydrates, which provide both energy and carbon for yeasts, are the most crucial nutrients. Yeasts can only ferment a few number of sugars, mostly hexoses and oligosaccharides. Hexoses, pentoses, alcohols, organic acids, and other carbon molecules are among the sources of carbon that can be used aerobically (Deak, 2008). Nearly all yeasts can obtain nitrogen from amino acids, amines, and urea (Large, 1986), besides the salts of inorganic ammonium. However, nitrate use is restricted to specific yeast species or genera, and this is an important diagnostic characteristic used for identification (Rossi and Berardi, 2009). Yeasts can typically tolerate a wide variety of pH values and are frequently found near the acidic end of the pH scale, where few bacteria can survive. Microorganisms can be split into three classes based on their maximum operating temperature, or T max. When a microorganism's T max is considerably over 50°C, it is said to be thermophilic; when its T max is between 25°C and 50°C, it is said to be mesophilic; and when its T max is below 25°C, it is said to be psychrophilic. When seen in this light, practically all known yeasts are mesophilic, and they thrive between 20°C and 30°C (Deak, 2008; Starmer and Lachance, 2011). Glycolipids and surfactants produced by various yeast species may find use in the oil, food, cosmetic, and pharmaceutical sectors (Amaral, 2008). The capacity of yeasts to break down mycotoxins is crucial for human health because these harmful toxins are found in a variety of products, including feeds, foods, and beverages (Schisler et al., 2011).

Jubanlak Mary Pohnem *et al.*,

MARKET POTENTIAL FOR PIGMENT PRODUCTION

Due to the globalisation of research tendencies and the worldwide trend towards healthier lifestyles, the markets for natural colourants are expanding in all of the economically developing nations. However, due to their hyperallergenicity, carcinogenicity, and other toxicological issues, a number of synthetic colourants are no longer utilised in the food processing and cosmetics industries (Tuli *et al.*, 2014). Due to these negative impacts, bacterial pigments are increasingly being used for colouring reasons in a variety of products, including food, textiles, paint, cosmetics, medicines, polymers, and more. According to reports, b-carotene, a yellowish-orange pigment made by bacteria, costs about US\$1000/kg as opposed to US\$500/kg for synthetic colourants. Even though they are expensive and have competition in certain market areas, microorganism-produced pigments are natural (Venil *et al.*, 2013). The demand for natural pigments has generally increased significantly as a result of advancements in technology and industry. According to reports, the global market for food colourants reached \$1.55 billion in 2011 while the market share for organic colourants grew from 4.9% in 2003 to \$10.6 billion in 2008 (Pankaj and Kumar, 2014). The cost of producing pigments from microorganisms is now higher than that of producing pigments from synthetic colourants, however this can be changed by using inexpensive substrates for fermentation and mass biotechnological manufacturing of the pigments (Pankaj and Kumar, 2014). These pigments were anticipated to dominate the organic market in the near future due to their superior performance and environmental acceptability (Venil *et al.*, 2014a). Currently available oils from thraustochytrids rich in docosahexaenoic acid (DHA) are used mostly in nutraceuticals and aquaculture (Aasen *et al.*, 2016). Yet, they also hold considerable promise for cosmeceutical and cosmetic uses. Chrysophanol, a skin-whitening compound derived from the marine fungus *Microsporium sp.*, has also recently been the subject of a patent (U.S. patent 20140056834A1).

PIGMENTED YEASTS, THEIR PROPERTIES AND APPLICATIONS

Pigment is a term for the chemical substances that absorb light in the visible spectrum. These substances might be organic, synthetic, or natural (Hari *et al.*, 1994; Baurenfeind, 1981). Algae, fungi, plants, and animals of all kingdoms contain natural pigments (Delgado-Vargas *et al.*, 2000). All higher plants and certain animals contain lipid-soluble yellow-orange-red pigments called carotenoids (Mortensen A, 2006). One of the most prevalent types of pigments found in nature are carotenoids. They are widely employed in phytomedicine, the chemical, pharmaceutical, cosmetic, food, and feed industries thanks to their biological features. Among yeasts, a few species from the genera *Rhodospiridium*, *Rhodotorula*, *Sporobolomyces*, and *Sporidiobolus* are widely known carotenoid producers, aside from the pigmented species *Phaffia rhodozyma* (and its teleomorph *Xanthophyllomyces dendrorhous*). They are referred to as "red yeasts," and current research has focused heavily on their capacity to synthesise combinations of carotenoids from inexpensive carbon sources (Mannazzu *et al.*, 2015). The two red yeasts that are most well-known are *Phaffia rhodozyma* and its teleomorph *Xanthophyllomyces dendrorhous*. Due to their unique carotenoid profiles, which include astaxanthin as the primary pigment, they have great biotechnological promise (Buzzini *et al.* 2010; Fell and Johnson 2011; Fell *et al.* 2011). Carotenoids are a useful class of compounds for industrial uses due to their vibrant colour and a number of other characteristics (Johnson and Echavarri-Erasun 2011). They are very extensively used on an industrial basis as additives in pharmaceutical, chemical, food, and feed industries, primarily as precursors to vitamin A (Johnson and Schroeder 1995; Vachali *et al.* 2012).

Red yeast species belonging to the genera *Rhodotorula*, *Sporobolomyces*, *Rhodospiridium*, and *Sporidiobolus* that have less research on them are nonetheless important (Mata-Gomez *et al.* 2014). Due to their ability to biotransform a wide range of carbon sources into a variety of primary and secondary metabolites, these yeasts offer significant promise as biocatalysts (Johnson and Echavarri-Erasun 2011; Johnson 2013; Mata-Gomez *et al.* 2014). Four genera of red yeast A diverse collection of basidiomycetous yeast, including *Rhodotorula*, *Sporobolomyces*, *Rhodospiridium*, and *Sporidiobolus*, are commonly isolated from air, the phylloplane, and decomposing plant matter. They are found across the world (Fell and Johnson 2011; Fell *et al.* 2011; Hamamoto *et al.* 2011; Johnson and Echavarri-Erasun 2011; Sampaio 2011b,c, d). Certain solvents, including ethanol, methanol, isopropanol, and ethylene glycol, can function as stress factors and promote carotenogenesis in red yeasts (Bhosale, 2004). Reversephase high-performance liquid chromatography (RP-HPLC) is a more precise technique for carotenoid measurement in yeast. This enables the identification and measurement of the individual carotenoids (Malisorn and Suntornsuk 2008). *Rhodotorula toruloides*

**Jubanlak Mary Pohsnem et al.,**

has been the primary subject of the majority of investigations conducted thus far. To examine the cell responses to metal stress, the studies conducted proteome analyses of *Rhodotorula mucilaginosa* and *Rhodotorula taiwanensis*, respectively, and they produced two different protein datasets. Nevertheless, other red yeast are also attracting more interest (Irazusta et al., 2012; Wang et al., 2013). Melanin is one of the fungal pigments that resists UV radiation by absorbing a wide range of electromagnetic spectrum and also guards against photoinduced damage (Hill HZ, 1992). Many fungi species, including *Cryptococcus neoformans*, *Colletotrichum lagenarium*, *Paracoccidioides brasiliensis*, *Magnaporthe grisea*, *Sporothrix schenckii*, and *Aspergillus fumigates*, generate and extract melanin (Langfelder et al., 2003). Sunscreens, sunblocks, eyeglasses, cosmetics, and the immobilisation of radioactive waste like uranium all make extensive use of melanin. Melanin has reportedly been used to treat human metastatic melanoma (Plonka et al., 2006; Surwase et al., 2013). Certain organic pigments, including carotenoids, are also present in fungi (Jin et al., 2009), are frequently used in cosmetics, particularly sun lotions and anti-aging facials. Lycopene is used in goods like lycopene face cream (Barros et al., 2007).

Microorganism-produced pigments are the focus of extensive research because of the variety of uses they may have. Despite the fact that microorganisms create a variety of natural pigments, studies on yellow pigment, such as xanthomonadin from *Xanthomonas campestris* (Poplawsky et al., 2000), monascin and ankaflavin from *Monascus sp.* (Lee et al., 2013a, 2013b). These microorganism-derived yellow pigments have recently been employed as additions or supplements in the food industry, as well as in cosmetics, medications, livestock feed, and other uses (Kirti et al., 2014). The demand for healthy functional meals, cosmetic products for human health and safety, and natural pigments as natural substances in the dyeing industries has steadily increased (Venil et al., 2013). Ankaflavin, one of the main pigments derived from *Monascus sp.*, was employed as a dermatological composition to produce a long-lasting, non-covering coloration of skin that is similar to a natural tan, according to a patent (US6740313 B2) described by Forestier et al. (2004). Dihydroxyacetone (DHA) is a chemical that is frequently used in cosmetics to artificially tan the skin, however the coloration takes longer to appear. In the formulation, which also contains pigment, 100% ethanol, propylene glycol, demineralized water, and an organic UV-blocking substance called terephthalylidenedicamph or sulphonic acid, ankaflavin was utilised to substitute DHA. According to the formulation, these compositions immediately coloured well on the Vitroskin test. The majority of the uses for yellowish pigment in industry come from fungi, specifically *Monascus sp.* (C.A. Aruldass et al., 2018).

The harmless nature of pigments has been disclosed by a recent study on the evaluation of skin toxicity of *Thermomyces spp.* and *P. purpurogenum* pigments in Wistar rats, and it has been suggested that these pigments may have potential uses in cosmetics and dyeing (Poorniammal et al., 2019). The cosmetics industry is looking for new kinds of natural pigments to replace synthetic pigments as the market for natural products grows. Fungal pigments are among the natural pigments whose application in cosmetics is rising quickly due to their benefits. There have been reports of the use of fungal pigments, particularly melanin, carotenoids, lycopene, etc., in cosmetics, sunscreens, sun lotions, sunblocks, face creams, anti-aging facials, etc. (Rao et al., 2017; Hill H, 1992; Sajid et al., 2018). It's exciting to note that various fungus pigments, including *Monascus* pigments and *Monascus*-like pigments, have already hit the market for use in lipsticks, skin conditioners, and other cosmetics (Caro et al., 2017). Moreover, carotenoids exhibit intriguing antimicrobial effects (Vilchez et al., 2011). For instance, astaxanthin can be used in skin conditioning treatments to prevent dryness and reduce puffiness under the eyes. It also has anti-microbial, anti-wrinkle, and anti-acne properties (Ambati et al., 2014). Chitosan has a higher capacity to bind water than methyl cellulose, which is frequently used in cosmetic and cosmeceutical formulations. This suggests that high molecular weight chitosan is suitable as a skin moisturiser and as a delivery system in cosmeceutical preparations for anti-aging products (Chen et al., 2000). Chitosan is primarily used to increase the granular density of skin and improve the epithelial layer in fibre or film form (Ito et al., 2014). In fact, it promotes the development of fibroblasts, which in addition to their moisturising and anti-microbial qualities also endow them with exceptional healing abilities (Kumirska et al., 2011).

Carboxymethyl chitosan (CMCS), a chitosan derivative with active hydroxyl, carboxyl, and amine groups, is soluble in water at neutral pH (Mourya et al., 2010) and has anionic functionality, high viscosity, large hydrodynamic volumes, cation binding properties, large osmotic pressures, and gel-forming properties (Ito et al., 2014). Chitosan

**Jubanlak Mary Pohsnem et al.,**

and its derivatives are highly desirable candidates for use as absorption promoters and hydration agents, anti-microbial and anti-oxidant agents, delivery systems, and stabilizers because of all these properties (Gautier et al., 2008). Moreover, chitin nanofibrils have the capacity to form associations with many substances, including vitamins, carotenoids, and collagen, facilitating their penetration into skin (Kumirska et al., 2011). Chitosan is also utilised as a hair care ingredient in shampoo, hair gel, hair colourants, hair sprays, permanent wave agents, styling lotions, hair sprays, and hair tonics because of its properties to bioadhere to synthetic polymers, create films, and retain curls (Senevirathne et al., 2011). Moreover, some chitin and chitosan derivatives, like glyceryl chitosan, can be utilised directly in shampoo due to their ability to emulsify foam and create foam (McClements et al., 2016). Even carotenoids, such as astaxanthin, are used in hair care products to shield hair from UV rays and chemical deterioration. Exopolysaccharides obtained from marine sources can serve as thickening or gelling agents in the cosmetics sector (Kim, S.K. 2011).

CONCLUSION

The future of the cosmetic and cosmeceutical sector lies in natural goods. Health safety and eco-friendliness have improved the public's perception of natural hues. Microbial pigments, a significant source of natural colours, provide a variety of therapeutic benefits. To have a cheap organic substrate for the growth of color-producing microorganisms, further arduous efforts are needed. It's also important to consider how different process parameters affect how quickly microbial pigments are produced. The generation of pigments of consistent quality and high quantity (yield) is a requirement for industrial operations due to the emergence of the "demand and supply" scenario in the market sector for microbial pigments. Hence, a key strategy to boost the use of biopigments is the finding of new sources for microbial pigments with improved functionality. Fungal pigments are organic, nontoxic, stable, colourful, and clean goods that are significantly superior, more cost-effective, and more in demand than artificial and plant/animal-based colours, according to market trends in the food, pharmaceutical, cosmetics, and textile industries.

ABSTRACT

Siddha system is a traditional system of medicine in India which has vast repository in treating the diseases with both internal medicine (*Aga marundhugal*) and external medicine (*puramarundhugal*). There are 32 types of external therapies mentioned in Siddha literature in which Kattu (Compress or bandage) is the first external therapy defined as Application and covering of a specially prepared topical medicine made up of crude plants, fermented water, inorganic and organic substances on the affected area to protect, immobilize, compress or support a wound, swelling, abscess or injured body part. The medicinal preparations made up of herbs which is used for Kattu has analgesic, anti-inflammatory action and enhances local healing. In siddha system of medicine Kattu majorly used for arthritis, swelling in the joints, wounds, abscess, fracture etc. This review provides the elaborate documentation 117 herbs with indication of various diseases in Kattu therapy that was mentioned in siddha literature. The data collected in this review will reveals the evidence based classical therapies would be a renovation for future scientific experts to undergo this therapy for scientific evaluation.

Key words: Siddha medicine, External therapy, *Kattu*, Herbs, Bandage.

Ramya et al.,

INTRODUCTION

Siddha system of medicine is one of the traditional systems of medicine which is well founded under the basic principles of nature and its elements. The siddha system organized from 18 siddhars. The word SIDDHA means "Ever sure", True, Ever ready and Everlasting [1]. More than a medical system, it encompasses a way of healthy life. Exclusivities of Siddha system are *Kayakarpam* (procedures of rejuvenating the entire human system and ultimately produces longevity), *Attanga Yogam* (Eight divisions of YOGA), *Muppu* (superior form elixir to enhance the effectiveness of medicines and also produce longevity), *Varmam* (study of secret location of life centers in the human body), *Rasavatham* (Alchemy -Study of transmutation of elements, ancestor of modern chemistry and pharmacology), *EnvagaiTherou* (Eight unique type of diagnostic parameter including *Naadi* Pulse reading method, *Neikkuri* - urine analysis using gingelly oil), *Manikkadai Nool* as complementary measures for diagnosis (The wrist portion just proximal to the hand is measured with rope and health condition of a patient is ascertained based on the actual measurement by the patient's finger), *Sarakkuvaippu* (Art of preparing naturally available salt minerals and other Materials artificially), 32 types of internal Medicines and 32 types of external Medicine.[2]

MATERIALS AND METHODS

Study design: A literature review of herbs used for *kattu* (compress or bandage) therapy in siddha system medicine.

Research Instrument: Data entry form

Data collection: Data were collected from relevant siddha literature.

Statistical analysis: Collected data were analyzed with the help of MS Office.

KATTU THERAPY

Kattu is the best procedure for treating trauma, open wound, muscle spasm, sprain, abscess and dislocation of joints. It is placed in first place at 32 external therapies series give. It is given to the patient in the form of compressive bandage using grinded or boiled wet plant parts natural vinegar or inorganic substances on the affected area to protect, immobilize, compress or support a wound, swelling, abscess or injured body part [3]. The focus areas for *Kattu* or compressive bandaging are scalp in delirium, eyes in ophthalmic diseases, palm and foot in peripheral neuritis, abscess and leg edema in legs, and scrotum in scrotal swelling.

Therapeutic sources

- Plants parts such as barks, leaves,
- Animal products like skin and eggs
- Inorganic substances.

Procedure

- Purify the require drugs.
- Crush or grind or fry or boil.
- Explain the therapy to the patient.
- Patient may be performed either in sitting or lying position.
- Cover the areas with apron or cloth except the affected area.
- Wash the site and clean dry with sterile cloth gently.
- Apply the preparation on the site directly with a special care.
- Ask the patient to wait for 30 -45 minutes without moving or shaking the site to prevent the wall down of the wet matter.

Duration –Retain the *Kattu* on the site for period of 3 hours to 3 days. Usually given for one time in a day at an interval of 3 to 7 days

Ramya et al.,

Contra-indications-deep ulcers with foreign bodies, contact dermatitis, cellulitis [4]**HERBS USED IN KATTU THERAPY****RESULTS AND DISCUSSIONS**

The Pharmacopoeia of Siddha System of medicine is mainly classified into internal medicines 32 and external therapies and medicines 32 based on its usage and method of application. External therapy is the application of medicines topically for the management of various diseases. The 32 external therapies consist of external siddha formulations and external therapy techniques by using herbals, minerals, animal and marine siddha formulations. The external therapies are applied over the body surfaces or applied through the bodily orifices for the treatment of various ailments. The external therapies are used to maintain healthy life by prevention and curing of diseases. In these review 117 herbs, parts used, and indication for *Kattu* therapy was collected and documented.

Fig 1- distribution of plant part used in *kattu* therapy

The given figure 1 shows plant parts used for *Kattu* therapy from above table 117 herbs, 77 were leaves, 3 was bark, 8 was tuber, fruit was 3, flower was 6, seed was 7, root was 6 and others 7.

Fig 2 - distribution of literature mentioned about herbs used for *kattu* therapy

The below figure 2 represents siddha literatures mentioned about the herbs which used for *Kattu* therapy. From the above-mentioned tables, a total of 117 herbs, 101 herbs were collected from siddha Materiamedica (medicinal plants division), 5 herbs from *Therayar vaithiyam-1000*, 2 herbs from *Athmaraakshamirtham*, 3 herbs from *Yokobuvaithiyam - 300*, 2 herbs from a complete manual on siddha external therapies, 2 herbs from *Sarabendhirarvirana, karapapan, rogasikichai*, 1 herb from *Agasthiyarayulvedham* and 1 herb from Therayarkaraisal.

Fig 3: distribution of herbs used for various diseases in *kattuth*therapy

The below graph 3 shows herbs used for *Kattu* therapy indicated for various diseases from above table consists of 117 herbs, out of this abscess is highest with 32, 18 were ulcers, 7 were eye diseases, 6 were carbuncle, 5 were hemorrhoids, 5 were hemorrhoids, 4 were lymphadenitis, 3 were paronychia, 3 were inguinal bubo, 3 were scrotal swelling, 2 were sprain, 2 were boil/blister, 2 were microbial skin infection, 2 were scorpion bite, 2 were osteoarthritis and others 17.

CONCLUSION

This literature review provides elaborate documentary evidence about 117 herbs, parts used, and indication for *Kattu* therapy mentioned in siddha literature. Further clinical trials can be conducted to determine the effectiveness of the therapy.

ABSTRACT

The lotus commonly known as sacred lotus which is perennial aquatic edible plant and it has been used as a traditional medicinal plant for various diseases in India and China. The study pink Lotus flowers (petals) were collected from Koyambedu Market, Chennai, Tamil Nadu, India. The wet and dry weight of the lotus flower (petal) was measured. The extractions of crude were made using the Lotus flowers (petals) powder by the polar solvents such as ethanol, distilled water and hot distilled water. These different crude extracts were subjected to phytochemical analysis and which confirmed the presence of various major bioactive compounds. The results of phytochemicals in the collected lotus flower was showed that the ethanol extract contains Alkaloids, Saponins, Tanins, Cardiac glycosides, flavonoids, Phenols, steroids, Terpenoids and Quinones but absent of Protein. In distilled water extract contains Tanins, Cardiac glycosides, flavonoids, Phenols, steroids, Terpenoids, Quinones and Proteins. The hot distilled water extract contains Tanins, Cardiac glycosides, flavonoids, Phenols, Steroids, Terpenoids, Quinones and Proteins but the Alkaloids and Saponins were absent in distilled water and hot distilled water extraction when compared to ethanol. In this study confirmed that the presence of major phytochemicals in the pink Lotus flowers (petals) and these bioactive compounds can be used for many pharmacological actions at present and future.

Keywords: Lotus, Flower, Petals, Phytochemicals

INTRODUCTION

The communicable diseases are disorders which are caused by various microorganisms namely bacteria, viruses, fungi, or parasites that are transferred through directly or indirectly from one person to another and sometimes these diseases are causes of death worldwide. The use of chemotherapeutants to treat organisms which result in drugs residues in the organisms which make eventually be harmful to human health (Hernandez-Serrano, 2005). Therefore many scientists are searching new antimicrobial drugs from natural recourses especially from plants to treat organisms. The aquatic plant *Nelumbo nucifera* is also called as Indian lotus, Laxmi lotus, sacred lotus or simply call lotus, it is one of two extant species (*Nelumbo nucifera* Gaertn and *Nelumbo lutea* wild) in the family of Nelumbonaceae (*Encyclopædia Britannica* 2023). It is sometimes conversationally called a water lily, although this more often refers to the family Nymphaeaceae (Glimn-Lacy and Kaufman, 2006). These plants are commonly found in South East Asia especially in India which is distributed from Kashmir to kanyakumari and which shows high phenotypic diversity with various sizes, shapes and colors (pink and white flowers) with 16 to 160 petals (Tilt, 2010). The all parts of the *N. nucifera* plants have traditionally various medicinal values viz, the rhizomes are demulcents for haemorrhoids, chronic dyspepsia, dysentery and also has cholagogue activities, nutritive and diuretic (Kirtikar and Basu, 1975; Chatterjee and Pakrashi, 1991). The stems are used in Ayurveda as a diuretic and anthelmintic, and are used to treat vomiting, skin ailments, nervous exhaustion, strangulation and leprosy. *N. nucifera* leaves are used to treat uterine bleeding, epistaxis, hematuria, hyperlipidemia, hemoptysis and hematemesis. (Onishi *et al.*, 1984).

The flowers are used for the treatment of fever, cholera, gastric ulcers and diarrhea (Chopra *et al.*, 1956) and seeds of the lotus are used for cancer, leprosy, tissue inflammation, poison antidote and skin diseases (Arjun *et al.*, 2012). There are two main categories of phytochemicals namely primary constituents and secondary constituents, the primary phytochemicals are contains proteins, common sugars, chlorophyll and amino acids etc., and the secondary phytochemicals are contains phenolic, flavonoids, alkaloids, tannins, essential oils, terpenoids and saponins etc., (Krishnaiah *et al.*, 2007). These phytochemicals are contains various medicinal values. Therefore in this study aimed to investigate the phytochemicals from *Nelumbo nucifera* (Lotus) pink flowers.

MATERIALS AND METHODS

The pink Lotus flowers (petals) were collected from Koyambedu market, Chennai, Tamil Nadu, India. The collection was made in the month of December 2021. The collected lotus flowers (petals) were photographed (Fig. 1) and wet weight of the collected flowers were measured. The collected lotus petals were stored in a sterilized polythene bag and transported to the laboratory for further experiment. The collected lotus flowers (petals) were washed with tap water and distilled water to remove microbes and dust particles. The washed wet petals were shade and air dried at room temperature for two weeks and stored in air tight containers (Fig. 1 A-B). The dried flowers were pulverized by grinding using mortar and pestle and finally dry weight of powder was measured (Fig. 1 C-D).

Preparation extract of Lotus flower

The experiments were made using three different solvent namely Ethanol, Distilled water and Hot distilled water for the extraction of phytochemicals from the Lotus flower powder. In the extraction procedure 20 g of Lotus flower (petals) powder was used with 250 mL of three different solvents such as Ethanol, Distilled water and Hot distilled water separately for 72 h (3 Days) at room temperature. After three days the extracts were collected, filtered through muslin cloth, Whatman filter paper and evaporated by rotary evaporator at 40°C and stored in air tight glass container for qualitative phytochemical analysis.

Qualitative phytochemical analysis

The ethanol, distilled water and hot distilled water solvent extractions of lotus flowers were subjected to phytochemical analysis followed by the method given by Harborne J.B., 1973. The phytochemical analysis was made separately for each solvent extractions of Lotus flower.

Jegan *et al.*,

RESULT AND DISCUSSION

The flowers of lotus plants are used for the treatment of many bleeding disorders, fever, diarrhea, hepatopathy, cholera and hyperdipsia (Chopra *et al.*, 1956) because of it consist of various phytochemicals. In this study the pink Lotus Flowers (petals) were used for the extraction of phytochemicals and these were collected from the Koyambedu Market, Chennai, Tamil Nadu, India. The collected leaves were subjected to remove microbes and dust particles. Then the wet and dry weights of the collected lotus flowers (petals) were measured and which the 684g of wet flower given 78g of dry powder (Table 1 and Fig: 2).

Extraction

The extraction of active target compounds is depends on the polarity of the diluents because the polar compounds can able to extract easily by using of polar solvents (Goli *et al.*, 2005). Therefore, in this investigation the extractions of crude were made using the Lotus flowers (petals) powder by the polar solvents such as ethanol, distilled water and hot distilled water. These different crude extracts were subjected to phytochemical analysis and which confirmed the presence of bioactive compounds (Table 2 & Fig: 3, 4 & 5).

Phytochemical screening

The lotus flower (petals) contains the primary metabolite like proteins, carbohydrates and lipids and the secondary metabolites such as flavanoids, phenols, alkaloids, cardiac glycosides, tannins, sterols, terpenoids, quionone and coumarin (Yamini *et al.*, 2019). The Phytochemical analysis of this study also proved the presence of primary and secondary metabolites in Lotus flowers (petals). The results of phytochemicals in the collected lotus flower was showed that the ethanol extract contains Alkaloids, Saponins, Tanins, Cardiac glycosides, flavonoids, Phenols, steroids, Terpenoids and Quinones but absent of Protein (Table 2 & Fig. 3). In distilled water extract contains Tanins, Cardiac glycosides, flavonoids, Phenols, steroids, Terpenoids, Quinones and Proteins (Table 2 & Fig. 4). The hot distilled water extract contains Tanins, Cardiac glycosides, flavonoids, Phenols, Steroids, Terpenoids, Quinones and Proteins (Table 2 & Fig 5) but the Alkaloids and Saponins were absent in Distilled water and hot distilled water extraction compared to ethanol (Table 2 & Fig 4-5). The ethanol extract of lotus flower has the majority of phytochemicals when compare to other solvents (Yamini *et al.*, 2019). Similarly in this study also confirmed the presence of major phytochemicals in the ethanolic extract, moreover which is also present in the extracts of distilled water and hot distilled water. The majority of phytochemicals are rich in therapeutic actions like antimicrobial (Benbott *et al.*, 2012; Hisanori *et al.*, 2001), anti-inflammatory (Lee *et al.*, 2003), Cardiotonic effect, (Alexei *et al.*, 2009), Congestive heart failure and cardiac arrhythmia (Valadimir and Ludmila, 2001). In this investigation the major phytochemicals are found in the pink Lotus flowers (petals) and these bioactive compounds can be used for pharmacological actions at present and future.

CONCLUSION

In this study the preliminary phytochemical screening of pink Lotus flowers were showed the presence of various major bioactive compounds in the ethanol, distilled water and hot distilled water extractions. These active compounds can be used as various therapeutic drugs for Antidiabetic, Antioxidant and Antibacterial activity. The lotus plants are easy to cultivate and are edible. The extractions and methods are simple, cost effective and eco-friendly when compare to synthetic drug.

ABSTRACT

The objective of the present study was screening of phytoconstituents, UV-VIS Spectrum and Anticancer Activity against the Human Breast Cancer Cell Line of the Green Synthesized Silver Nanoparticles from the Aqueous Extract of *Vitex negundo* L. leaves. The leaves of *Vitex negundo* were collected and extract was prepared. Phytochemical analysis was done with the help of aqueous extract. Silver Nanoparticles was prepared with the help of extract. The Silver Nanoparticles were tested under UV visible spectrophotometer. Then the synthesis to silver nanoparticles was analyzed in the terms of anti-cancer activity against the human breast cancer cell line (MDA-MB-231) by MTT assay. The MTT assay revealed formidable anticancer effects on the silver nanoparticles against the human breast cancer cell line (MDA-MB-231). The cell viability was calculated from the absorbance at 620nm. The IC₅₀ of the Silver Nanoparticles synthesized from the leave extract of *Vitex negundo* L. was calculated as 36.1. Thus, the present study concludes that the green synthesis Silver Nanoparticles exhibits anticancer properties and this may be developed into an anticancer agent.

INTRODUCTION

Cancer is a disease that is caused due to uncontrolled growth of body cell. Metastasis is a process where cancer cells spread and invade into other parts of the body to form new tumor cells. After lung cancer, breast cancer has the second-highest standardized mortality rate (ASMR) of 12.9 (per 100,000) among all cancers worldwide. The most common cancer is carcinoma, sarcoma, leukemia, lymphoma, Melanoma, brain and spinal cord tumors. Breast cancer with the mortality rate of 12.9 is the first cause of cancer death in women [1]. Breast cancer became the world's most prevalent cancer in the past of 5 years. For female breast cancer is the 5th leading cause, as 1 in 8 has been diagnosed worldwide [2]. 14% of the Indian women accounts of cancer and reports that with every four minutes and Indian women is diagnosed with breast cancer. The prominent Lifestyle factors that play a vital role in the incidence and mortality of Cancer are tobacco alcohol diet infectious agent environmental pollutants and radiations [3]. They affect the normal cells of the body. So, the scientist is trying to produce drugs with the help of Terrestrial plants and also with the help of marine environment [4]. Breast cancer is the most frequent Malignancy in women worldwide and curable in 70-80% of patients with early stage, non-metastatic disease. Management of breast cancer is multidisciplinary; 18 clothes local - regional (Surgery and radiation therapy) and systemic therapy approaches [5]. Analysis of gene expression profiles has shown the existence of at least 5 types of breast cancer with different biological properties [6]. To overcome the shortcomings of chemical method, biological method has emerged as viable options.

Recently biologically- mediated synthesis of Nanoparticles have been shown to be simple, cost effective, dependable and environmentally friendly approaches and much attention has been given to high yield production of Silver nanoparticles of defined size using various biological systems including bacteria, fungi, plant extracts and small biomolecules like vitamins and amino acids as an alternative method, not just for the manufacture of silver nanoparticles but also of other nanoparticles like gold and grapheme [7]. Silver Nanoparticles are increasingly used in various fields including medical, food, Healthcare and industrial purpose due to their unique physical and chemical properties. The biological activity of silver Nana particle depends on factors including surface chemistry, size, size distribution, shape, particle morphology, particle composition, and dissolution rate, particle reactivity in solution, and the type of reducing agent used for synthesis of silver nanoparticle are a crucial factor for determination of the cytotoxicity [8]. In the present study, both qualitative and quantitative phytochemical analysis was carried out and silver nanoparticles where green synthesized from the aqueous extracts of *Vitex negundo* leaves. UV-VIS spectrum of green synthesized silver nanoparticle was studied and was tested for its anticancer activity against breast cancer cell line (MDA-MB-231) using MTT assay.

MATERIALS AND METHODS

Collection of Sample

The selected sample *Vitex negundo* L. for the present study was collected from Rajapalayam, Virudhunagar District, Tamil Nadu. The sample was collected on the first week of November 2022. The specimens were identified, certified and deposited with voucher specimen number (BSI/SRC/5/23/2023-24/Tech/160) at the Botanical Survey of India, Southern Circle, Coimbatore.

Preparation of Leaf Powder

Fresh leaves of *Vitex negundo* L. were collected, and air dried under the shade. Then the dried leaves were powdered using an electric pulverize. Fine powder was obtained by the process of sieving. 10g each of the leaf powder was weighed using an electronic balance (Denver XS – 210) and made into the packets using filter paper. Then these powders were subjected to the process of aqueous extraction.

**Rajithra and Dhivya****Preparation of Plant Leaf Extract**

The *Vitex negundo* extract was prepared using a basic Soxhlet extraction process. The Soxhlet extractor was filled with 10gms of dried leaves powder and 250mL of double distilled water and heated to 50°C. The leaf extract of *Vitex negundo* is obtained after 8 hours of continuous extraction. The resulting leaf extract was kept in sealed containers for future research use. With the help of extraction, green synthesis of silver nanoparticles was carried out.

Qualitative Phytochemical Analysis

The Aqueous plant extract was subjected to chemical tests for the detection of different Phyto-constituents using standard procedures as described by [9]. The following methods were used for detection of various phytochemicals by qualitative chemical analysis to give general idea regarding the nature of Phyto-constituents present in extracts.

Quantitative Phytochemical Analysis

The Aqueous extract was subjected to find the Quantity of the different types of Phyto-constituents using the standard procedure for the higher concentration present in the qualitative phytochemical analysis.

Synthesis of Silver Nanoparticles using aqueous extract of *Vitex negundo* L. Leaves

Initially, the aqueous solution of silver nitrate and aqueous solution of citric acid is combined with constant stirring for 30 minutes. Then *Vitex negundo* L. leaf extract solution is added under continuous stirring. Ammonia is added with the above solution in drop wise till the pH became 12. Then mixed solution is stirred for 1 hour to homogenize the solution. Apply heat and stop stirring. After some time, high intense black color gel will be formed. The formation of black colored gel will confirm the synthesis of silver nanoparticles. Later heat has to be applied to convert gel into ash. The ash was milled in an agate mortar and kept for calcination at 600°C for 4 hours, which yields a brown color fine powder of silver nanoparticles of *Vitex negundo* L.

UV -VIS Spectra analysis

Electromagnetic radiation such as visible light is commonly treated as a wave phenomenon, characterized by a wavelength or frequency. Wavelength is defined on the left below, as the distance between adjacent peaks (or troughs), and may be designated in meters, centimeters or nanometers (10⁻⁹ meters). Wavelengths in the visible spectrum vary from roughly 400 to 800 nm. The process of synthesizing silver nanoparticles and the silver nanoparticles synthesized.

Anticancer Activity of Silver Nanoparticles***In vitro* Cytotoxicity Determination by MTT Assay**

The Human Triple Negative Breast cancer cells (MDA-MB-231) cells were procured. The selected cells were maintained in Minimum Essential medium (MEM) supplemented with 2mM l-glutamine and balanced salt solution (BSS) adjusted to contain Na₂CO₃, fetal bovine serum (GIBCO, USA), sodium pyruvate, l-glutamine, nonessential amino acids, glucose and (4-(2-hydroxyethyl)-1-piperazineethane sulfonic acid) (HEPES). Streptomycin and penicillin and were adjusted to 1mL/L. The cells were maintained at 37°C with 5% CO₂ in a humidified CO₂ incubator. After incubation the growth of the cell line was confirmed by viewing under inverted microscope and used for further study.

Cell Seeding in 96 Well Plates

The inhibitory concentration (IC₅₀) value was evaluated using an MTT [3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide] assay. Cells were grown (1×10⁴ cells/ well) in a 96-well plate for 48 h in to 80% confluence. The medium was replaced with fresh medium containing serially diluted (0-100µg/ml) samples, and the cells were further incubated for 24h.

Cytotoxicity by MTT Method

After removing the culture medium, 100 mL of the MTT solution were added to each well and incubated for four hours at 37°C. After removal of the supernatant, 50 µL of DMSO was added to each well and incubated for 10

**Rajithra and Dhivya**

minutes to solubilize the formazan crystals. At 620 nm, the optical density value was estimated using ELISA multi-well plate reader (ThermoMultiskan EX, USA). After taking the reading percentage, the cell death was calculated.

Cell Viability Calculation

Using the formula below, the percentage of viability was determined using the OD value.

% of Cell Viability = OD value of Test / OD value of control × 10

RESULT AND DISCUSSION**Phytochemical analysis of aqueous extract of *Vitex negundo* leaves**

In the present study the qualitative phytochemical analysis of the aqueous extract of *Vitex negundo* was done. In the present study phytochemical analysis was carried out in Aqueous extracts of *Vitex negundo* leaves. The of the phytochemical analysis results are shown in Table 1. The results revealed the presence of phytochemicals such as Alkaloids, Flavonoids, Terpenoids, Phenols, Tannins, Quinones and Steroids. Compared to qualitative analysis, quantitative analysis is a more thorough and practical technique because the study's findings can be used to find new treatments, standardize herbal medications, and explanation of the medicinal potentials of plant and determination of the toxicity levels in the plants. The results of quantitative phytochemical analysis were shown in Table 2. The results revealed the presence of Steroids - 41.44±6.95 g extract, Flavonoids - 91.11±0.655 g extract and Tannins - 11.65±1.25 g extract.

In the present study, Aqueous extract of *Vitex negundo* L. leaves when tested for phytochemicals and results showed the presence of Alkaloids, Flavonoids, Terpenoids, Phenols, Tannins, Quinones and Steroids. In a similar study, the occurrence of alkaloids, phenols, phytosterols, saponins, sterols, tannins, flavonoids, terpenoids in the aqueous root extracts of *A. amarawas* also reported earlier by Ali *et al.*, [10]. Results parallel to present 26 study was given by Srivastava *et al.*, [11] who has reported the presence of flavonoids, tannins, steroids, saponins, alkaloid, cardiac glycoside and reducing compounds. The presence of alkaloids, saponins, phenols, flavonoids, terpenoids, cardio active glycosides, tannins, and carbohydrates were present in ethanol extracts of three Labiatae species. These research works are all in concordance with the results of the present study. It is known that the phytochemicals that were tested have physiological and medicinal properties.

UV-Visible Absorption Spectroscopy of Silver Nanoparticles from Aqueous Extract of *Vitex negundo* L. Leaves

In the present study the UV-Visible spectrum was carried out and the results of UV-VIS Spectrum of the Silver Nanoparticles is shown in Figure 1. The color change (i.e.) light white to dark brown color was observed in the UV-vis spectrophotometer is due to the Plasmon resonance phenomenon which is the collection of oscillation of electrons. The reduction silver nitrate to silver oxide is monitored by UV-vis spectrum. The band was observed around 408nm which was identified as "Surface Plasmon Resonance Band" and this band is ascribed to excitation of valence electrons of AgNO₃ arranged in the nanoparticles. The ultraviolet region of the spectrum is generally typically considered to vary from 200-400 nm and the visible region from 400-800 nm. In the present study, the UV visible absorption spectrum displayed distinct peaks at 408 nm. This clearly showed the presence of plasma resonance band in the Green synthesized silver nanoparticles in aqueous extract of *Vitex negundo* leaves. UV-Vis is one part that can be used to prove the formation of silver nanoparticles. The colloidal silver solution appears to exhibit absorption peaks at wavelengths up to 408 nm. The range of wavelength is determined by emission of the light. The wavelength ranges between 200-400 nm determines the Ultra violet light. When the wavelength ranges between 400-800nm, then it shows the presence of Visible light. According to Saeb *et al.*, [12], higher absorbance shows greater number of silver nanoparticles. From the present study, we can conclude that, the highest wavelength absorbed was at 408 nm.

Anticancer activity of silver nanoparticles from extract of *Vitex negundo* L. Leaves

In the present study, the anticancer effect of the Silver Nanoparticles from leaf extract of *Vitex negundo* L. was tested against the human breast cancer (MDA-MB-231) cell line using MTT assay. The result of the Cell Viability Percentage

**Rajithra and Dhivya**

of Green Synthesized Silver Nanoparticles against the Standard Drug – Doxorubicin is presented in the Table 3. The silver nanoparticles synthesized with plant extract, was treated under several concentrations ranging from 5 µg, 10 µg, 25 µg, 50 µg and 100 µg, against the breast cancer cells (MDA-MB-231). The present study revealed that at the concentration of 5µg, 75% of the cells showed viability. At 10 µg, 69% of the cells were in viable condition. At 25 µg 56% of the cells were in viable condition. At 50 µg, 39% of the cells were in viable condition and at 100 µg, the cell viability is reduced to 32%. The control showed 99% of cell viability. The cell lines treated with the standard drug Doxorubicin showed cell viability of 36.1%. Therefore, from the results it can be interpreted that as concentration increases the cell viability percentage was found to be decreased. The percentage of cell viability is dose dependent, as it decreases with increase in the concentration of the silver nanoparticles. It can be seen that, higher the concentration of silver nanoparticles, lesser was the percentage of cell viability. Thus, with the help of silver nanoparticles at high concentrations, the cell viability was found to be very less thereby confirming the excellent anti-cancer property of silver nanoparticles synthesized from aqueous extract of *Vitex negundo* leaves. Hence the anticancer property is more in the higher concentration of the silver nanoparticles. The cell viability exhibited by the Doxorubicin drug treated cells and silver nanoparticles treated cells at 100µg/ml was 20% and 32% respectively.

In the present study at the higher concentrations of 50µg/ml cell and 100µg/ml viability percentages were noted as 39% and 32% respectively. In parallel to this Azurah *et al.*, [13] investigated cytotoxicity of aqueous and ethanol extracts of *Ficus deltoidea* on Human Ovarian Carcinoma Cell Line. From this it was found that both ethanol and aqueous extract showed a significant reduction in the number of viable cells at the concentration higher than 250µg/ml. The findings of the present study showed that the Green synthesized silver nano particles have anticancer properties to inhibit the breast cancer cells. It is sufficed to say that the silver nanoparticles synthesized from aqueous extract exhibited good cytotoxicity against the breast cancer cells.

IC₅₀ of the Silver Nanoparticles

The IC₅₀ (half-maximal inhibitory concentration) of the silver nanoparticles synthesized from Aqueous extract of *Vitex negundo* leaves were found to be 36±1.2 % (Table 3) and for standard Doxorubicin is 11±1.2 %. It can be noticed from the results that the observed IC₅₀ values of the silver nanoparticles is high and significantly inhibits the proliferation of selected breast cancer cells. Hence from the present study, the silver nanoparticles are seen to have anticancer activity against human breast cancer cell line. The IC₅₀ (half-maximal Inhibitory concentration) of the Green synthesized silver nanoparticles was calculated as 36.1 µg/ml. Hence from the present study, the silver nanoparticles synthesized from the Aqueous extract is seen to have anticancer activity against Human Breast cancer cell line.

CONCLUSION

The phytochemical analysis shows the presence of various secondary metabolites in the leaf extracts both qualitatively and quantitatively. From the present study, it could be seen that the anticancer potential of the leaf extract i.e., the percentage of cell viability is purely dose dependent. The biosynthesized AgNPs showed in vitro anticancer activity in breast cancer cell lines. Thus, the result highlighted the significance of using Green synthesized silver nanoparticles from aqueous extract of *Vitex negundo* leaves as an anticancer agent. Potential cancer-treatment therapeutic agents, the AgNPs could be further investigated. However, the safety and mode of action in different cancer cell lines is necessary in future.

ABSTRACT

Anemia is a widespread nutritional deficiency illness that has critical out-turn on health in addition as the social and economic evolution of both emanating and developed nations (WHO 2005). One third of the peoples, are anemic as a result of an polarity in their nutrient imbibing. So, using the concept of PiFuM, we study the diagnosis of anemia condition in this review. Additionally, we expand our strategy to include PiFuM's addition and multiplication factors for membership, indeterminacy, and non-membership functions. In this study, the symptoms of anemia illness such as headache, weakness, dizziness, fatigue, and chest discomfort are taken into consideration. Our last presentation was a decision-making issue based on one of the operations.

Keywords: Fuzzy Set (FS), Fuzzy Matrix(FM),Picture Fuzzy Set(PiFuS), Picture Fuzzy Matrices(PiFuMs), Anemia Gland Diseases Diagnosis.

Kavitha et al.,

INTRODUCTION

1965 [16] Ultimate successful and intriguing fields of application for FS theory is the medical industry. FMs expressing the medical cognition between trait and illnesses were used in the formulation of Sanchez's diagnostic models,[13]. Augustine O. Esogbue, Robert C. Elder[8] used Fuzzy cluster analysis to simulate medical diagnostics. Meenakshi and Kaliraja have developed an extension of Sanchez's method for diagnosing illnesses using an interval valued FM. Additionally they presented an interval valued FMs arithmetic mean matrix and immediately applied method of Sanchez's for diagnosing illnesses. Two components were determined to be insufficient in several disciplines of the social sciences, and medical sciences to represent several unique information kinds. In these situations, neutrality is a necessary component in order to fully reflect the facts. For instance, in medical science, a ailment may possess three sorts of impacts (positive, negative, and neutral) on a specific sign, therefore, three components are needed to quantify how much an ailment influences the above three parameters a given sign. Cuong and Kreinovich (2013) developed the PiFuS as an extension of intuitionistic FS in order to get over the restriction of intuitionistic FS and to accommodate more potential forms of uncertainty in actual situations. Wei [14],[15]investigated the multi-trait problem solving issue in a picture-fuzzy environment.

Shovan Dogra introduced the Picture fuzzy matrix and its application [11]. The PiFuMs work with categorization tables of data and concentrate on the functional relationships between data sets. The PiFuMs, intuitionistic fuzzy theory upholds a framework for inducing minimal decision-making principles. The main goal of that PiFuS research of the PiFuM is to ultimately gather fresh data while searching for specific decision rules for huge datasets. The PiFuM was successfully used in many different areas, particularly in the medical field. Using the concept of PiFuM, we use the PiFuM operation for medical diagnosis in this work. We give an algorithm to verify it. We show the approach with a case study of anemia condition as said by ShovanDogra.

ABOUT THE ANEMIA

Anemia is defined by a qualitative and quantitative deficiency of hemoglobin, a chemical present in red blood cells. Hemoglobin plays an important role in carrying oxygen from the lungs to the tissues of the body. When hemoglobin can no longer carry oxygen to tissues, the body becomes anemic. Anemia can cause symptoms such as extreme fatigue, insomnia, lightheadedness, pale complexion, shortness of breath, irregular menstruation, and an abnormally fast heart rate. According to ShovanDogra "don't assume that since you're weary that you must be anemic because fatigue has numerous reasons than anemia". When they donate blood, some people find out that they have anemia because their hemoglobin is low. Makean appointment with your doctor if you are informed that you cannot donate because of a crushed hemoglobin level. Hemoglobin, a protein found in red blood cells that delivers oxygen from the lungs to the body's tissues, is used to assess anemia.

When a human body has anemia, the body will not bring out sound red blood cells which supply oxygen to the tissues. An anemic body can make him/her feel drained. Low level iron is the reason for anemia. A treatment for such ailment is by taking supplements and eating healthy diets. A hemoglobin level of less than 120 g/L in non-pregnant ladies and less than 130 g/L in males is considered anemic. Anemia can cause symptoms including weariness and decreased exercise tolerance. You should contact your doctor for further testing if your hemoglobin level is less than 110 g/L.

PRELIMINARIES

In this section we will recall the basic definitions

Definition 3.1.A PiFuM of size $x \times y$ is defined as $((a_{ij\mu}, a_{ij\eta}, a_{ij\gamma}))$, where $a_{ij\mu} \in [0,1]$, $a_{ij\eta} \in [0,1]$ and $a_{ij\gamma} \in [0,1]$ are, respectively, the measure of positive, neutral and negative membership of a_{ij} for $i = 1,2,\dots,x$ and $j = 1,2,\dots,y$ satisfying $0 \leq a_{ij\mu} + a_{ij\eta} + a_{ij\gamma} \leq 1$.

Kavitha et al.,

Definition 3.2. A PiFuM is said to be square PiFuM if the number of rows is equal to the number of columns.
 Definition 3.3. Let $\mathcal{A} = \langle (a_{ij\mu}, a_{ij\eta}, a_{ij\gamma}) \rangle$ and $\mathcal{B} = \langle (b_{ij\mu}, b_{ij\eta}, b_{ij\gamma}) \rangle$ be two square PiFuMs of order n . Then product $\mathcal{A}\mathcal{B}$ is defined as $\mathcal{C} = \mathcal{A}\mathcal{B} = \langle (c_{ij\mu}, c_{ij\eta}, c_{ij\gamma}) \rangle$, where $c_{ij\mu} = \vee_k (a_{ik\mu} \wedge b_{kj\mu})$, $c_{ij\eta} = \vee_k (a_{ik\eta} \wedge b_{kj\eta})$ and $c_{ij\gamma} = \vee_k (a_{ik\gamma} \wedge b_{kj\gamma})$. for $i, j = 1, 2, \dots, x$.

Definition 3.4. Let $\mathcal{A} = \langle (a_{ij\mu}, a_{ij\eta}, a_{ij\gamma}) \rangle$ and $\mathcal{B} = \langle (b_{ij\mu}, b_{ij\eta}, b_{ij\gamma}) \rangle$ be two square PiFuM of order n . Then $\mathcal{A} \leq \mathcal{B}$ if $a_{ij\mu} \leq b_{ij\mu}$, $a_{ij\eta} \leq b_{ij\eta}$ and $a_{ij\gamma} \geq b_{ij\gamma}$ for $i, j = 1, 2, \dots, x$.

Definition 3.5. If a special restricted square PiFuM has its diagonal entries $\langle \epsilon_1, \epsilon_2, 0 \rangle$ and non-diagonal entries $\langle 0, 0, \epsilon_3 \rangle$, then it is called identity special restricted PiFuM.

Definition 3.6. If a special restricted square PiFuM has all entries $\langle 0, 0, \epsilon_3 \rangle$ then it is called null special restricted square PiFuM.

APPLICATION OF PICTURE FUZZY MATRIX

Here we using the concept of PiFuM, we give a model for medical diagnosis. In order to make this U of PiFuMs are applied.

Definition 4.1. Let $\mathcal{A} = \langle (a_{ij\mu}, a_{ij\eta}, a_{ij\gamma}) \rangle$ and $\mathcal{B} = \langle (b_{ij\mu}, b_{ij\eta}, b_{ij\gamma}) \rangle$ be two square PiFuMs of order n . then adding of $\mathcal{A} \vee \mathcal{B}$ is defined as $\mathcal{C} = \mathcal{A} \vee \mathcal{B} = \langle (c_{ij\mu}, c_{ij\eta}, c_{ij\gamma}) \rangle$, where $c_{ij\mu} = (a_{ik\mu} \vee b_{kj\mu})$, $c_{ij\eta} = (a_{ik\eta} \vee b_{kj\eta})$ and $c_{ij\gamma} = (a_{ik\gamma} \wedge b_{kj\gamma})$. for $i, j = 1, 2, \dots, n$.

Definition 4.2. If $\mathcal{A} = \langle (a_{ij\mu}, a_{ij\eta}, a_{ij\gamma}) \rangle$, is PiFuM of order n then we define the weight of PiFuM \mathcal{A} is $W(\mathcal{A} \cup \mathcal{B}) = \max\{W(P_1), W(P_2), \dots, W(P_n)\}$

$$\text{Where } W(P_i) = \max\{\max\langle (a_{11\mu}, a_{11\eta}, a_{11\gamma}), \dots, (a_{1n\mu}, a_{1n\eta}, a_{1n\gamma}) \rangle, \max\langle (a_{21\mu}, a_{21\eta}, a_{21\gamma}), \dots, (a_{2n\mu}, a_{2n\eta}, a_{2n\gamma}) \rangle, \dots, \max\langle (a_{n1\mu}, a_{n1\eta}, a_{n1\gamma}), \dots, (a_{nn\mu}, a_{nn\eta}, a_{nn\gamma}) \rangle\}$$

METHODOLOGY

Let us assume that there is a set of m patients $\mathcal{P} = \{P_1, P_2, P_3, P_4, P_5\}$ with a set of n symptoms of anemia $\mathcal{S} = \{C_1, C_2, C_3, C_4, C_5\}$. we used PiFuS technology to determine which patients were most severely affected by thyroid illness. A PiFuS (N, P) over P is created, where N is a mapping. $P: \rightarrow N$ the collection of all PiFuSs of \mathcal{S} is known as PiFuS; PiFuS \mathcal{P} . Create a second PiFuS (M, S) over S using this PiFuSs relation matrix \mathcal{A} , which is known as the patient symptom matrix. The collection of all PiFuS of S is known as PiFuSs. This series of pictures with fuzzy edges produces a relation matrix B termed a symptom-disease matrix, where each element represents the weight of a particular anemia disease’s symptoms. We figure out their matrices’ union. \mathcal{A} and \mathcal{B} . Compute $\mathcal{A} \cup \mathcal{B}$. This is the most number of anemia illness symptoms that might occur. Calculate $\mathcal{A} \cup \mathcal{B}$ using the definitions 4.1 and 4.2 above. Finally, determine $\max W(P_i)$; and draw the conclusion that patient P_i is experiencing severely weight-related anemia illness.

ALGORITHM

- Step 1:** Input the PiFuMs \mathcal{A}, \mathcal{B} of order n .
- Step 2:** Construct the PiFuM $(\mathcal{A} \cup \mathcal{B})$.

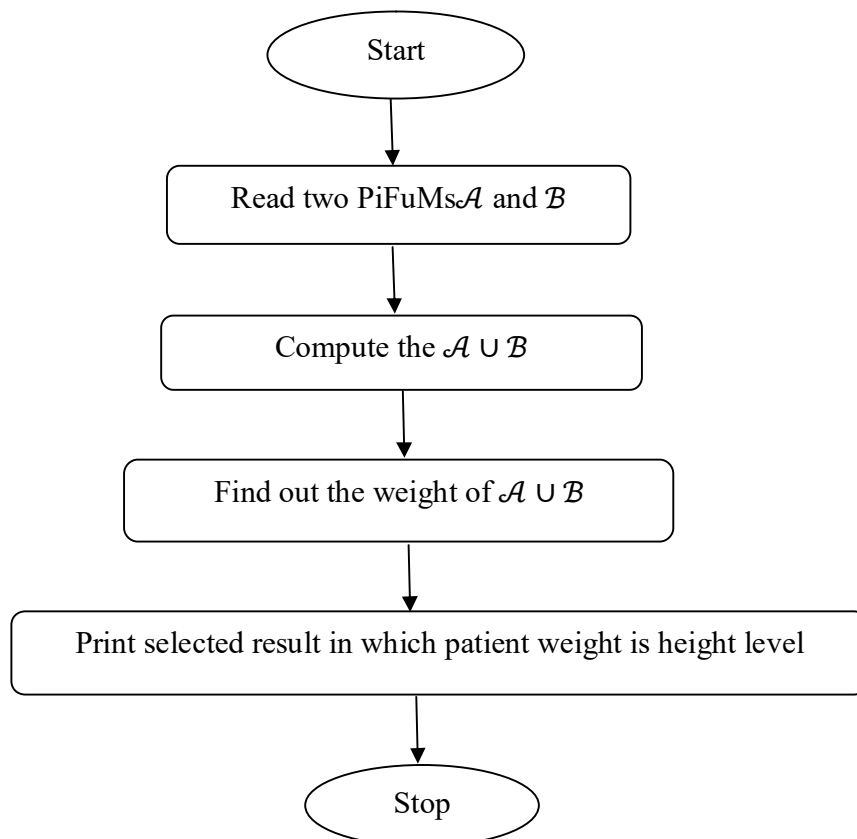

Kavitha et al.,

Step 3: The weight of each entity (O_i) is determined by summing the membership merit for each entry's designated row (i^{th} -row) in PiFuM.

Step 4: The best demur to use is the one with the largest weight. We now apply the PiFuM algorithm to the PiFuM decision-making tasks to emphasize the method's core concept.

CASE STUDY

In medical research, a person with a condition may naturally exhibit a variety of symptoms. It is highlighted that individual symptoms may be linked to more than one illness that is causing a given problem. Now, the doctor must deal with a number of issues when a new sickness is severely affecting a region. The condition was then determined by the doctor starting with the common symptoms of the patient. Let $\mathcal{M} = \{P_1, P_2, P_3, P_4, P_5\}$ be the setting of patients and

$\mathcal{S} = \{C_1, C_2, C_3, C_4, C_5\}$ be the symptoms of Anemia.

where

C_1 = Headache ,

C_2 = Weakness,

C_3 = Dizziness,

C_4 = Fatigue,

C_5 = Chest pain.

Kavitha et al.,

The patients were tested by Dr.Mirithula and Dr.Deekshika based on the above parameters. Let $F: S \rightarrow [0,1]$.

Step 1: Two doctors constructed PiFuMs based on the above function

$$A = \begin{matrix} & C1 & C2 & C3 & C4 & C5 \\ \begin{matrix} P1 \\ P2 \\ P3 \\ P4 \\ P5 \end{matrix} & \left[\begin{matrix} \langle .3, .2, .25 \rangle & \langle .23, .15, .25 \rangle & \langle .15, .13, .26 \rangle & \langle .36, .2, .2 \rangle & \langle .2, .15, .25 \rangle \\ \langle .1, .2, .2 \rangle & \langle .2, .2, .1 \rangle & \langle .2, .2, .14 \rangle & \langle .16, .15, .3 \rangle & \langle .2, .2, .14 \rangle \\ \langle .6, .2, .2 \rangle & \langle .5, .2, .3 \rangle & \langle .6, .2, .2 \rangle & \langle .8, .2, 0.0 \rangle & \langle .7, .2, 0.0 \rangle \\ \langle .3, .13, .2 \rangle & \langle .5, .14, .1 \rangle & \langle .4, .13, .2 \rangle & \langle .5, .14, .1 \rangle & \langle .6, .14, .1 \rangle \\ \langle .32, .31, .3 \rangle & \langle .4, .2, .2 \rangle & \langle 0, 0, \epsilon_3 \rangle & \langle .2, .3, .4 \rangle & \langle .16, .3, .5 \rangle \end{matrix} \right. \end{matrix}$$

$$B = \begin{matrix} & C1 & C2 & C3 & C4 & C5 \\ \begin{matrix} P1 \\ P2 \\ P3 \\ P4 \\ P5 \end{matrix} & \left[\begin{matrix} \langle .3, .2, .24 \rangle & \langle .2, .13, .26 \rangle & \langle 0, 0, \epsilon_3 \rangle & \langle .3, .2, .25 \rangle & \langle .29, .15, .25 \rangle \\ \langle .7, .21, 0 \rangle & \langle .5, .2, .1 \rangle & \langle .2, .2, .15 \rangle & \langle .17, .16, .15 \rangle & \langle .18, .17, .25 \rangle \\ \langle .3, .11, .25 \rangle & \langle 0, 0, \epsilon_3 \rangle & \langle .4, .2, .24 \rangle & \langle .7, .2, 0 \rangle & \langle .6, .2, 0.1 \rangle \\ \langle .5, .14, .2 \rangle & \langle .5, .14, 0 \rangle & \langle .3, .12, .2 \rangle & \langle .6, .2, 0 \rangle & \langle .4, .12, .2 \rangle \\ \langle .42, .31, .2 \rangle & \langle .5, .2, 0 \rangle & \langle 0, 0, \epsilon_3 \rangle & \langle .32, .31, .2 \rangle & \langle .17, .32, .4 \rangle \end{matrix} \right. \end{matrix}$$

Step-2:

$$A \cup B = \begin{matrix} & C1 & C2 & C3 & C4 & C5 \\ \begin{matrix} P1 \\ P2 \\ P3 \\ P4 \\ P5 \end{matrix} & \left[\begin{matrix} \langle .3, .2, .24 \rangle & \langle .23, .15, .25 \rangle & \langle .15, .13, .26 \rangle & \langle .36, .2, .2 \rangle & \langle .29, .15, .25 \rangle \\ \langle .7, .2, 0 \rangle & \langle .5, .2, .1 \rangle & \langle .2, .2, .14 \rangle & \langle .17, .16, .15 \rangle & \langle .2, .2, .14 \rangle \\ \langle .6, .2, .2 \rangle & \langle .5, .2, .3 \rangle & \langle .6, .2, .2 \rangle & \langle .8, .2, 0 \rangle & \langle .7, .2, 0 \rangle \\ \langle .3, .13, .2 \rangle & \langle .5, .14, 0 \rangle & \langle .4, .13, .2 \rangle & \langle .6, .2, 0 \rangle & \langle .6, .14, .1 \rangle \\ \langle .42, .31, .2 \rangle & \langle .5, .2, 0 \rangle & \langle 0, 0, \epsilon_3 \rangle & \langle .32, .31, .2 \rangle & \langle .17, .32, .4 \rangle \end{matrix} \right. \end{matrix}$$

Step-3:

$$\begin{aligned} W(P1) &= \max\{\langle a_{11\mu}, a_{11\eta}, a_{11\gamma} \rangle, \dots, \langle a_{15\mu}, a_{15\eta}, a_{15\gamma} \rangle\} \\ &= \max\{\langle .3, .2, .24 \rangle, \langle .23, .15, .25 \rangle, \langle .15, .13, .26 \rangle, \langle .36, .2, .2 \rangle, \langle .29, .15, .25 \rangle\} \\ &= \langle .36, .2, .2 \rangle \\ W(P2) &= \max\{\langle a_{21\mu}, a_{21\eta}, a_{21\gamma} \rangle, \dots, \langle a_{25\mu}, a_{25\eta}, a_{25\gamma} \rangle\} \\ &= \max\{\langle .7, .2, 0 \rangle, \langle .5, .2, 0.1 \rangle, \langle .2, .2, .14 \rangle, \langle .17, .16, .15 \rangle, \langle .2, .2, .14 \rangle\} \\ &= \langle .7, .2, 0 \rangle \\ W(P3) &= \max\{\langle a_{31\mu}, a_{31\eta}, a_{31\gamma} \rangle, \dots, \langle a_{35\mu}, a_{35\eta}, a_{35\gamma} \rangle\} \\ &= \max\{\langle .6, .2, .2 \rangle, \langle .5, .2, .3 \rangle, \langle .6, .2, .2 \rangle, \langle .8, .2, 0 \rangle, \langle .7, .2, 0 \rangle\} \\ &= \langle .8, .2, 0 \rangle \end{aligned}$$

Kavitha et al.,

$$\begin{aligned}
 W(P_4) &= \max\{\langle a_{41\mu}, a_{41\eta}, a_{41\gamma} \rangle, \dots, \langle a_{45\mu}, a_{45\eta}, a_{45\gamma} \rangle\} \\
 &= \max\{\langle .3, .13, .2 \rangle, \langle .5, .14, 0 \rangle, \langle .4, .13, .2 \rangle, \langle .6, .2, 0 \rangle, \langle .6, .14, .1 \rangle\} \\
 &= \langle .6, .2, 0 \rangle \\
 W(P_5) &= \max\{\langle a_{51\mu}, a_{51\eta}, a_{51\gamma} \rangle, \dots, \langle a_{55\mu}, a_{55\eta}, a_{55\gamma} \rangle\} \\
 &= \max\{\langle .42, .31, .2 \rangle, \langle .5, .2, 0 \rangle, \langle 0, 0, \epsilon_3 \rangle, \langle .32, .31, .2 \rangle, \langle .17, .32, .4 \rangle\} \\
 &= \langle .5, .2, 0 \rangle
 \end{aligned}$$

Step-4:

$$\begin{aligned}
 W(P_i) &= \max\{W(P_1), W(P_2), W(P_3), W(P_4), W(P_5)\} \\
 &= \{\langle .36, .2, .2 \rangle, \langle .7, .2, 0 \rangle, \langle .8, .2, 0 \rangle, \langle .6, .2, 0 \rangle, \langle .5, .2, 0 \rangle\} \\
 &= \langle .8, .2, 0 \rangle
 \end{aligned}$$

Hence the patient's maximum weight $\langle .8, .2, 0 \rangle$ obtain in P_3 . Therefore, the patient P_3 heavily affected.

RESULT

This endeavor uses a decision-making issue with the operation of a PiFuM to determine the anemia illness with a high degree of accuracy. Headache, Weakness, Dizziness, Fatigue, and Chest Pain are considered as essential parameters.

CONCLUSION

In this study, we discuss an algorithm that makes use of a PiFuM to resolve the diagnosis of anemia condition. Due to strong confidence in handling knowledge of uncertainty, the PiFuM multi-criteria decision-making technique exhibits significant performance variations for diverse parameters. Future decision-making problems involving a variety of different criteria may benefit from the application of the novel technique. It may be used effectively in a variety of contexts, including physician sector. Teenagers and expectant mothers nowadays confront an important worldwide health risk factor known as anemia. To have a healthy generation, healthy food habit should be followed.

ABSTRACT

The main goal of this paper is to optimize certain criterias which arise during distribution planning by constructing a fuzzy multi-objective linear programming model under uncertainty of demand. In this paper the proposed distribution planning model is divided into two stages, in first stage the optimization is carried out between manufacturing firm and distributors, similarly in second stage the optimization takes place between distributors and a market place. In both stages the same fuzzy multi-objective linear programming approach is utilized for optimization. In this paper, a case study of ice cream manufacturing factory is introduced for showing the applicability and effectiveness of the proposed distribution planning model. Finally, the conclusion and future remark has been introduced at the end of this paper.

Keywords: Supply chain management, manufacturing firm, distributor, fuzzy multi-objective linear programming, optimization, distribution planning

INTRODUCTION

In supply chain management, a proper distribution designing and planning play a vital role for customer's satisfaction and fulfilling the demand of a market over a fixed time period. Now there are some previously existing literatures regarding the distribution planning which is highlighted below:

Saurabh Gupta and Manju Sharma

O'Brien [2] designed transportation and worked on models of distribution. Chopra [4] outlined the distribution network and designed framework in supply chain. Ambrosino and Grazia Scutellà [5] looked at several difficult issues in a design of distribution network. Bilgen and Ozkarahan[6]discussed distribution planning problem for a multi-mode by using an approach of fuzzy linear programming. Liang [7] handled fuzzy multi-objective transportation issues by creating an approach of interactive fuzzy multi-objective linear programming. Tabrizi and Razmi [9] modelled a design of distribution network for multi-period under uncertain demand. Liao [10] reviewed on optimization of network of distribution under uncertainty. Okunade and Daodu[11] designed a network of distribution for fast-moving goods of consumer. Boskabadiet al. [12] created a network of distribution for a system of green supply chain in a multi-product and multi-period under uncertain demand.

Two Stages Distribution Planning Model along with their assumptions:

This proposed model of distribution planning is applicable only for small scale factories and industries where all the manufacturing takes place at only one place. In both stages the optimization takes place under the same assumptions which is given below:

Assumptions

1. The total demand of all distributors which is fulfilled by a manufacturer is fuzzy in nature.
2. The total demand of market which is fulfilled by all the distributors together is fuzzy in nature.
3. In this model we have considered only one manufacturing firm.

Stage1: In this stage the optimization takes place when distribution planning is carried out from manufacturing firm to different distributors.

The given mathematical model is constructed by utilizing the following notations which is defined as follows:

Index Set

i : index used for distributor, for all $i=1,2,3,\dots,N$.

Decision Variable

q_i : amount of an item delivered from manufacturing firm to a distributor.

Parameters

T_i : transportation cost for delivering product from manufacturing firm to a distributor i in one shift.

G_i : percentage of unit which is late delivered by the manufacturing firm to a distributor i .

L_i : logistics cost of manufacturing firm when product is delivered to a distributor i .

O_i : on-time delivery percentage of a product from manufacturing firm to a distributor i .

D_i : percentage of an item which is damaged during transportation from manufacturing firm to a distributor i .

A : total demand of all the distributors fulfilled by a manufacturer.

U_i : maximum capacity of distributor i for holding the inventory of manufactured product.

B_i : maximum purchasing budget of distributor i which is allocated to a manufacturing firm.

M_i : per unit cost of an item delivered to distributor i by a manufacturer.

N : no. of distributors.

The following objective functions and constraints are constructed for the formulation of the proposed linear mathematical model which is defined from equation (1) –(9)(Shaw et al.[8])

$$\text{Minimise } Z_1 = \sum_{i=1}^N T_i q_i \quad (1)$$

$$\text{Minimise } Z_2 = \sum_{i=1}^N G_i q_i \quad (2)$$

$$\text{Minimise } Z_3 = \sum_{i=1}^N L_i q_i \quad (3)$$

$$\text{Maximise } Z_4 = \sum_{i=1}^N O_i q_i \quad (4)$$

$$\text{Minimise } Z_5 = \sum_{i=1}^N D_i q_i \quad (5)$$

Saurabh Gupta and Manju Sharma

Subject to,

$$\sum_{i=1}^N q_i = A \tag{6}$$

$$q_i \leq U_i \tag{7}$$

$$M_i q_i \leq B_i \tag{8}$$

$$q_i \geq 0, \text{ for all } i=1,2,3,\dots,\dots,\dots, N \tag{9}$$

and are integers

- Objective function (1) minimizes total cost of transporting item from manufacturer to all the distributors.
- Objective function (2) minimizes the late delivery of the product by the manufacturer to all the distributors.
- Objective function (3) minimizes the logistics cost during delivery of an item from manufacturer to all the distributor.
- Objective function (4) maximizes the on-time delivery percentage from manufacturer to all the distributors.
- Objective function (5) minimizes the quantity of damaged items during transportation.
- Constraint (6) shows that manufacturer has fulfilled the total demand of all the distributors.
- Constraint (7) ensures the maximum capacity of the distributor.
- Constraint (8) shows the maximum purchasing budget allocated to the manufacturer by a distributor for delivering of an item.
- Constraint (9) ensures that all variables are integers and are greater than or equal to zero.

Stage2: In second stage, the criterias which arise during distribution planning from distributors to a market place are being optimized.

The given mathematical model is constructed by utilizing the following notions which are defined as follows:

Index Set:

i: index used for distributors, for all i=1,2,3,....., N.

Decision Variable

k_i : quantity of an item delivered from distributor i to a market place.

Parameters:

- G_i : transportation cost when delivery is carried out from distributor i to a marketplace in one shift.
- M_i : logistics cost of distributor i for delivery of an item to a market place.
- Y_i : on-time delivery percentage of an item from distributor i to a market place.
- B_i : percentage of unit which is late delivered by a distributor i to a market place.
- C_i : transportation time for delivering product from distributor i to the market place in one shift.
- J_i : percentage of an item which is damaged during transportation from distributor i to a market place.
- T: percentage of demand of a market for an item which is fulfilled by all the distributors together.
- O_i : maximum delivery percentage in a particular area of market which is covered by a distributor i for distributing their product.
- N: no. of distributors.

The following objective functions and constraints are constructed for the formulation of the proposed linear mathematical model which is defined from equation (10)-(18)(Shaw et al. [8]):

$$\text{Minimise } Z_1 = \sum_{i=1}^N G_i k_i \tag{10}$$

$$\text{Minimise } Z_2 = \sum_{i=1}^N M_i k_i \tag{11}$$

$$\text{Maximise } Z_3 = \sum_{i=1}^N Y_i k_i \tag{12}$$

$$\text{Minimise } Z_4 = \sum_{i=1}^N B_i k_i \tag{13}$$

$$\text{Minimise } Z_5 = \sum_{i=1}^N C_i k_i \tag{14}$$

$$\text{Minimise } Z_6 = \sum_{i=1}^N J_i k_i \tag{15}$$

Subject to,

Saurabh Gupta and Manju Sharma

$$\sum_{i=1}^N k_i = T\% \tag{16}$$

$$k_i \leq O_i\% \tag{17}$$

$$k_i \geq 0, \text{ for all } i=1,2,3,\dots,\dots,\dots,N \tag{18}$$

and are integers

Objective function (10) minimizes total cost of transporting item from all the distributorsto a market place.

Objective function (11) minimizes the total logistics cost during delivery of an item from all the distributorsto a market place.

Objective function (12) maximizes the total on-time delivery from all the distributors to a market place.

Objective function (13) minimizes the total late delivery of the product by all the distributors.

Objective function (14) minimizes time of transporting items from all the distributorsto a market place in one shift.

Objective function (15) minimizes the total quantity of damaged items during transportation.

Constraint (16) shows that total percentage of demand of a market which is satisfied by all the distributors together.

Constraint (17) ensures the maximum delivery percentage in a particular area of market which is covered by a distributor.

Constraint (18) ensures that all variables are integers and are greater than or equal to zero.

General methodology for solving proposed distribution planning model in both Stages:

Multi-objective linear programming model is constructed in both stages which optimize certain criterias or (issues) arising during distribution planning under uncertain demand. The fuzzy objective functions and fuzzy constraints involve in multi-objective fuzzy linear programming are represented by their linear membership functions and then for obtaining the required solution we can converted the proposed fuzzy multi-objective linear programming model of distribution planning into an equivalent crisp model by using Zimmermann [3] approach.

Membership Function

The fuzzy objective function \tilde{Z} in both minimization and maximization form is demonstrated by its linear membership function which is expressed by equation (19) and (20) (Zimmermann [3]).

$$\mu_{Z_g}(y) = \begin{cases} \frac{Z_g^U - Z_g(y)}{D_g(Z)} & \text{if } Z_g^L \leq Z_g(y) \leq Z_g^U \\ 1 & \text{if } Z_g(y) \leq Z_g^L \\ 0 & \text{if } Z_g(y) \geq Z_g^U \end{cases} \tag{19}$$

wherein equation (19), Z_g^L and Z_g^U is the lower and upper bounds of all the objective functions $Z_g(y)$, for all $g=1, 2,\dots,\dots,\dots,G$ in its minimization form.

$$\mu_{Z_m}(y) = \begin{cases} \frac{Z_m(y) - Z_m^L}{D_m(Z)} & \text{if } Z_m^L \leq Z_m(y) \leq Z_m^U \\ 1 & \text{if } Z_m(y) \geq Z_m^U \\ 0 & \text{if } Z_m(y) \leq Z_m^L \end{cases} \tag{20}$$

Similarly in equation (20), Z_m^L and Z_m^U is the lower and upper bounds of all the objective functions $Z_m(y)$ for all $m= 1, 2,\dots,\dots, M$ in its maximization form.

Here note that in both equation (19) and (20), $D_g(z)$ and $D_m(z)$ is expressed as the difference between the upper bound and lower bound of required objective functions $Z_g(y)$ and $Z_m(y)$.

The fuzzy constraint \tilde{C} for uncertain demand is demonstrated by the linear membership function which is defined by equation (21) (Shaw et al. [8])

$$\mu_c(y) = \begin{cases} \frac{(t_q + b_q) - A_q(y)}{t_q} & \text{if } b_q \leq A_q(y) \leq b_q + t_q \\ 1 & \text{if } A_q(y) \leq b_q \\ 0 & \text{if } b_q + t_q \leq A_q(y) \end{cases} \tag{21}$$

where $t_q > 0$ is the level of tolerance, for all $q=1, 2,\dots,\dots,\dots, Q$.

Saurabh Gupta and Manju Sharma

Now converting the proposed distribution planning model in crisp form

Now, for solving the proposed fuzzy multi-objective linear programming model of distribution planning in both stages we have converted it into a crisp linear programming model by utilizing an approach proposed by Zimmermann [3] which is defined from equation (22)-(28) (Shaw et al. [8]; Zimmermann [3]).

$$\text{Maximize } \alpha \tag{22}$$

Subject to,

$$\alpha \leq \frac{z_g^U - z_g(y)}{D_g(Z)} \text{ for all } g=1, 2, \dots, G \tag{23}$$

$$\alpha \leq \frac{z_m(y) - z_m^L}{D_m(Z)} \text{ for all } m=1, 2, \dots, M \tag{24}$$

$$\alpha \leq \frac{(t_q + b_q) - A_q(y)}{t_q} \text{ for all } q=1, 2, \dots, Q \tag{25}$$

$$Ay \leq b \text{ for all deterministic nature} \tag{26}$$

$$y \geq 0 \text{ and are integers} \tag{27}$$

$$\alpha \in [0,1] \tag{28}$$

Now according to Zimmermann [3] the optimum upper bound (Z^U) and lower bound (Z^L) in a proposed fuzzy multi-objective linear programming model is obtained by calculated the maximum and minimum values of same objective function (Z) under the same set of constraints.

Case Study

The applicability and effectiveness of the proposed distribution planning model is demonstrated through a case study of an Indian small-scale ice-cream manufacturing factory. The factory manufactures a variety of ice-cream with different flavors like strawberry, orange, pineapple, vanilla etc in its plant and distributes across different regions. During the month of April to a month of September the inclination of customers over the ice-cream products is very high because during this period the temperature raises very high. But during the month of October to a month of March, there is a fluctuation in a demand of a market and the demand of different distributors regarding the ice-cream products because the temperature falls dawn during this period and the purchasing department of the distributors completely depends on the demand of a market. The main goal of this ice-cream manufacturing factory is to optimize certain criterias which arise during distribution planning under uncertain demand.

Distribution planning model of ice-cream manufacturing factory

The proposed model of ice-cream manufacturing factory is divided into two stages. In first stage, the ice-cream product is delivered from manufacturing firm to different distributors and in second stage the distribution is carried out from distributors to a market place over a fixed time period. Here both the demand of a market and different distributors are considered as fuzzy in nature because it varies according to the changes in a temperature. There is only one manufacturing firm and two distributors considered in this proposed model of ice-cream manufacturing factory. The total approximate demand of all the distributors particularly during the period when temperature goes very high is predicted about 9000-liter ice-cream and it varies from 8,400 liter to 9,500 liter. The change in climate is the main reason of all these variations in the demand of ice-cream products which is fulfilled by the manufacturer. Now, we have to optimize certain criterias which arise during distribution planning in first stage on the bases of quantitative information which is given in table (1)

Now the numerical model of a given Indian local ice-cream manufacturing factory with the help of quantitative data given in table (1) is defined as follows. Objective Z_1 minimizes total transportation cost from manufacturer to all distributors. Objective Z_2 minimizes total late delivery of an item. Objective Z_3 minimizes the total logistics cost during delivery. Objective Z_4 maximizes the on-time delivery. Objective Z_5 minimizes the damaged quantity of an item.

$$Z_1 = 900q_1 + 800q_2$$

$$Z_2 = 5q_1 + 2q_2$$

$$Z_3 = 400q_1 + 500q_2$$

$$Z_4 = 95q_1 + 98q_2$$

$$Z_5 = 0.2q_1 + 0.3q_2$$

Saurabh Gupta and Manju Sharma

Subject to,
 $q_1 + q_2 = 9000$
 $q_1 \leq 7,000$
 $q_2 \leq 8,000$
 $4q_1 \leq 900,000$
 $8q_1 \leq 500,000$

$q_i \geq 0$, for all $i=1,2$ and are integers

Now according to Zimmermann [3], the lower bound of objective Z_1 is obtained by minimizing them using the given set of constraints. Similarly, by using the same set of constraints the upperbound of objective Z_1 is also obtained by maximizing them. The same procedure is repeated for rest of the objectives (Z_2, Z_3, Z_4, Z_5) in order to obtain the lower and upper bounds under the same set of constraints. So, the lower and upperbounds of all the objective function is defined in table (2):

Now we have converted the given objective functions into the linear membership function by utilizing the linear membership function which is expressed by equation (19) and (20).

$$\begin{aligned} \mu_{Z_1} &= \begin{cases} \frac{7900000 - (900q_1 + 800q_2)}{600000} & \text{if } 7300000 \leq Z_1 \leq 7900000 \\ 1 & \text{if } Z_1 \leq 7300000 \\ 0 & \text{if } Z_1 \geq 7900000 \end{cases} \\ \mu_{Z_2} &= \begin{cases} \frac{39000 - (5q_1 + 2q_2)}{18000} & \text{if } 21000 \leq Z_2 \leq 39000 \\ 1 & \text{if } Z_2 \leq 21000 \\ 0 & \text{if } Z_2 \geq 39000 \end{cases} \\ \mu_{Z_3} &= \begin{cases} \frac{(400q_1 + 500q_2) - 3800000}{600000} & \text{if } 3800000 \leq Z_3 \leq 4400000 \\ 1 & \text{if } Z_3 \geq 4400000 \\ 0 & \text{if } Z_3 \leq 3800000 \end{cases} \\ \mu_{Z_4} &= \begin{cases} \frac{(95q_1 + 98q_2) - 861000}{18000} & \text{if } 861000 \leq Z_4 \leq 879000 \\ 1 & \text{if } Z_4 \geq 879000 \\ 0 & \text{if } Z_4 \leq 861000 \end{cases} \\ \mu_{Z_5} &= \begin{cases} \frac{2600 - (0.2q_1 + 0.3q_2)}{600} & \text{if } 2000 \leq Z_5 \leq 2600 \\ 1 & \text{if } Z_5 \leq 2000 \\ 0 & \text{if } Z_5 \geq 2600 \end{cases} \end{aligned}$$

Now substitute all the linear membership function in Zimmermann approach which is defined from equation (22)-(28) and then converting the given numerical model into the crisp form.

Maximize α

Subject to,
 $\alpha \leq \frac{7900000 - (900q_1 + 800q_2)}{600000}$
 $\alpha \leq \frac{39000 - (5q_1 + 2q_2)}{18000}$
 $\alpha \leq \frac{(400q_1 + 500q_2) - 3800000}{600000}$
 $\alpha \leq \frac{(95q_1 + 98q_2) - 861000}{18000}$
 $\alpha \leq \frac{2600 - (0.2q_1 + 0.3q_2)}{600}$
 $\alpha \leq \frac{9,500 - (q_1 + q_2)}{500}$
 $\alpha \leq \frac{(q_1 + q_2) - 8,400}{600}$

$q_1 \leq 7,000$
 $q_2 \leq 8,000$
 $4q_1 \leq 900,000$
 $8q_2 \leq 500,000$

$q_i \geq 0$, for all $i=1, 2$ and are integers

Saurabh Gupta and Manju Sharma

Now the above formulation is solved and the optimal solution is obtained by using LINGO (Ver. 14.0) software which is utilized for solving linear programming problems.

The following optimal solutions are as follows:

Objective value is $\alpha=0.500$ and the value is $q_1=4000$ and $q_2=5000$

$Z_1=7600,000, Z_2=30,000, Z_3=4100,000, Z_4=870,000, Z_5=2300.$

Now the same procedure is repeated for second stage when distribution planning takes place between distributors and a market place.

The percentage of demand of a market for ice-cream products is approximately around 80 % particularly in months of summer when temperature increases constantly and the fluctuation in percentage of demand is predicted about 75% to 85%. Now, we have to optimize certain criterias which arise when delivery is carried out from distributors to a market place on the basis of following quantitative information which is given in table (3):

Now the numerical model of a given Indian local ice-cream manufacturing factory with the help of quantitative data given in table (3) is defined as follows. Objective Z_1 minimizes total cost of transportation. Objective Z_2 minimizes the total logistics cost during delivery. Objective Z_3 maximizes the on-time delivery. Objective Z_4 minimizes the late delivery of an item. Objective Z_5 minimizes the time of transportation. Objective Z_6 minimizes the damaged quantity of an item.

$$\begin{aligned}
 Z_1 &= 500k_1 + 600k_2 \\
 Z_2 &= 700k_1 + 800k_2 \\
 Z_3 &= 90k_1 + 92k_2 \\
 Z_4 &= 5k_1 + 8k_2 \\
 Z_5 &= k_1 + 2k_2 \\
 Z_6 &= 0.06k_1 + 0.04k_2 \\
 \text{Subject to,} \\
 k_1 + k_2 &= 80\% \\
 k_1 &\leq 75\% \\
 k_2 &\leq 65\%
 \end{aligned}$$

$k_i \geq 0$, for all $i=1,2$ and are integers

Now, repeated the same procedure which is discussed in first stage for obtaining lower and upper bounds of all the objectives ($Z_1, Z_2, Z_3, Z_4, Z_5, Z_6$) by minimizing and maximizing them under the same set of constraints which is given in table (4):

Now we have converted the given objective functions into the linear membership function by utilizing the linear membership function which is expressed by equation (19) and (20).

$$\begin{aligned}
 \mu_{Z_1} &= \begin{cases} \frac{46500 - (500k_1 + 600k_2)}{6000} & \text{if } 40500 \leq Z_1 \leq 46500 \\ 1 & \text{if } Z_1 \leq 40500 \\ 0 & \text{if } Z_1 \geq 46500 \end{cases} \\
 \mu_{Z_2} &= \begin{cases} \frac{62500 - (700k_1 + 800k_2)}{6000} & \text{if } 56500 \leq Z_2 \leq 62500 \\ 1 & \text{if } Z_2 \leq 56500 \\ 0 & \text{if } Z_2 \geq 62500 \end{cases} \\
 \mu_{Z_3} &= \begin{cases} \frac{(90k_1 + 92k_2) - 7210}{120} & \text{if } 7210 \leq Z_3 \leq 7330 \\ 1 & \text{if } Z_3 \geq 7330 \\ 0 & \text{if } Z_3 \leq 7210 \end{cases} \\
 \mu_{Z_4} &= \begin{cases} \frac{595 - (5k_1 + 8k_2)}{180} & \text{if } 415 \leq Z_4 \leq 595 \\ 1 & \text{if } Z_4 \leq 415 \\ 0 & \text{if } Z_4 \geq 595 \end{cases} \\
 \mu_{Z_5} &= \begin{cases} \frac{145 - (k_1 + 2k_2)}{60} & \text{if } 85 \leq Z_5 \leq 145 \\ 1 & \text{if } Z_5 \leq 85 \\ 0 & \text{if } Z_5 \geq 145 \end{cases}
 \end{aligned}$$

Saurabh Gupta and Manju Sharma

$$\mu_{Z_6} = \begin{cases} \frac{4.70 - (0.06k_1 + 0.04k_2)}{1.2} & \text{if } 3.50 \leq Z_6 \leq 4.70 \\ 1 & \text{if } Z_6 \leq 3.50 \\ 0 & \text{if } Z_6 \geq 4.70 \end{cases}$$

Now substitute all the linear membership function in Zimmermann approach which is defined from equation (22)-(28) and then converting the given numerical model into the crisp form.

Maximize α

Subject to,

$$\begin{aligned} \alpha &\leq \frac{46500 - (500k_1 + 600k_2)}{6000} \\ \alpha &\leq \frac{62500 - (700k_1 + 800k_2)}{6000} \\ \alpha &\leq \frac{(90k_1 + 92k_2) - 7210}{120} \\ \alpha &\leq \frac{595 - (5k_1 + 8k_2)}{180} \\ \alpha &\leq \frac{145 - (1k_1 + 2k_2)}{60} \\ \alpha &\leq \frac{4.70 - (0.06k_1 + 0.04k_2)}{1.2} \\ \alpha &\leq \frac{85\% - (k_1 + k_2)}{0.17} \\ \alpha &\leq \frac{(k_1 + k_2) - 75\%}{0.2} \\ k_1 &\leq 75\% \end{aligned}$$

$k_2 \leq 65\%$

$k_i \geq 0$, for all $i=1, 2$ and are integers

The above formulation is calculated and solved by using a well-known software LINGO (Ver.14.0) and obtained the optimal solution which is defined as follows:

Objective value is $\alpha=0.500$ and the value is $k_1=45, k_2=35$

$Z_1=43,500, Z_2=59,500, Z_3=7,270, Z_4=505, Z_5=115, Z_6=4.1$

CONCLUSION AND FUTURE REMARK

In this study, we have constructed a fuzzy multi-objective linear programming model for handling demand uncertainty and optimized certain criterias which arise during distribution planning such as transportation cost, transportation time, logistics cost, late delivery percentage, on-time delivery percentage and so on. This paper divides the distribution planning network into two stages and the same fuzzy multi-objective linear programming approach is utilized in both stages for optimizing the criterias which arise when delivery is carried out from manufacturer to distributors in first stage and from distributors to a market place in second stage. At the end, the proposed model of distribution planning is applied on ice-cream manufacturing factory to show the feasibility and validity and the numerical model is calculated and solved by using a famous linear programming-based software known as LINGO (Ver. 14.0). In future research the proposed model is applicable where there is more than one manufacturing firm by using the same fuzzy multi-objective linear programming approach.

ABSTRACT

Human health heavily relies on plants, which have long piqued man's concern. Indeed, several modern medications occur in plants. Many people worldwide depend on conventional pharmaceuticals for human well-being. Plant growth regulators are organic compounds produced naturally or synthetically that control and modify the physiological processes like growth, development, and movement of plants. PGRs have potential in the vegetative and reproductive growth of plants. Plant growth regulators have been commercially incorporated into micropropagation, horticulture, and agricultural applications to achieve specific benefits such as reduced susceptibility to biotic and abiotic stress, enhanced morphological structure, ease of harvest, quantitative and qualitative gains in yield, and change of plant constituents. In stressful circumstances, PGRs also play a significant role by acting as thermo-protectants, reactive oxygen scavengers, enhancing photosynthesis, accumulating stress proteins, and performing several other metabolic regulatory activities. This review made the role of plant growth hormones in agriculture, horticulture, and plant tissue culture fields. It enumerates the positive effects on woody plants, floral plants, ornamental plants, fruit crops, vegetable crops, and medicinal plants for the commercial and pharmaceutical industries to increase their yield, be less time-consuming, and be environmentally friendly.

Keywords: Plant growth regulators, agriculture, horticulture, plant tissue culture, conservation

INTRODUCTION

The term "plant growth regulators" (PGRs) refers to substances, either synthetically made or naturally occurring, that influence the development or metabolism of higher organisms. Plant growth regulators (PGRs) are essential to the growth and development of plants. Regulators of plant development become active at low doses. They have no nutritional value and are often not toxic to plants[1]. Plant growth regulators (PGRs) have been successfully used as effective inducers to promote the synthesis of secondary metabolites in plants [2]. Synthetic plant growth regulators are priceless research tools for deciphering the physiological responses of plants or investigating biochemical regulatory processes. PGRs are known to govern the generation of plant secondary metabolites in plant tissue culture and control antioxidant potential, plant growth, and developmental processes [3].

PGRs are crucial for diminishing abiotic stresses and can affect plant growth by improving the process of shooting, rooting, flowering, fruiting, reproduction, etc. [4,5]. In stressful circumstances, PGRs also play a significant role by acting as thermo-protectants, reactive oxygen scavengers, enhancing photosynthesis, accumulating stress proteins, and performing several other metabolic regulatory activities. The PGRs interact with intricate signaling networks to balance the responses and promote the evolution of environmentally friendly strains, which helps to mitigate the harm caused by stressful environmental situations [6]. Plant growth regulators have been commercially incorporated into micropropagation, horticulture, and agricultural applications. PGRs achieve specific benefits such as reduced susceptibility to biotic and abiotic stress, enhanced morphological structure, ease of harvest, quantitative and qualitative gains in yield, and change of plant constituents [1].

Plant growth regulators are significant to Indian agriculture because they expand the range of inputs to optimize yield and food safety. Applications of plant growth regulators in agriculture must result in measurable benefits in enhancing secondary metabolites, being less phytotoxic, and being environmentally safe. Plant growth regulators are less time-consuming and increase crop yield. Agricultural fields commercially employ PGRs. Agriculture has deployed natural and artificial growth regulators to regulate germination, growth, vegetative reproduction, maturity, senescence, and post-harvest [7]. PGRs control a wide range of crucial horticultural farming practices. As ornamental plants are commercially important in the horticultural industry, plant growth regulators are significant in the growth and production of ornamental plants. PGRs also fasten the flowers and reduce the time to establish the following generation of plants [8]. Medicinal plants bear a diverse range of secondary metabolites which are used in pharmaceutical industries, cosmetics, and nutraceutical fields. Currently, there is a demand for medicinal herbs, and their acceptance is growing gradually. Biotechnology techniques perform an essential role in regenerating and conserving rare and endangered medicinal plants [9]. Plant tissue culture is a sterile technique for the propagation of cells, tissues, organs, or whole plant parts under a precise pH-maintained nutritional medium with optimal temperature and a sterilized environment [10]. PGRs play an important role in the *in-vitro* propagation technique. Recent years have seen a significant increase in the commercial importance of *in-vitro* propagation techniques for secondary metabolite synthesis, disease eradication, plant improvement, and plant propagation. In regulated environments, a single explant can generate thousands of individual plants in a short amount of time and space, regardless of the time of year or the weather[11].

LITERATURE STUDY

Role of PGRs in plant growth

Plant growth regulators are well known for fostering development, photosynthetic activity, mineral nutrient levels, and antioxidative properties by preventing enzymatic and non-enzymatic induced peroxidative destruction of cellular proteins and lipids[12,13]. Major groups of PGRs are represented in Fig a. PGRs have been successfully used as effective inducers to promote the production of secondary metabolites in plants. Hormonal compounds that exist naturally (phytohormones) and their synthetic analogs are designated plant growth regulators [7]. It modulates the synthesis of secondary metabolites in plants in plant tissue culture[3]. In plant tissue and organ cultures, auxins,

**Harshini and Prabakaran**

cytokinin, and auxin-cytokinin interactions are considered the most crucial factors in modulating growth and organized development among the other plant hormones. Plant growth regulators are essential in physiological and morphological processes in plants, especially secondary growth [14]. Growth hormones are crucial in regulating the development of the explant in a culture medium. Natural and synthetic auxins, cytokinin, and gibberellins are extensively used plant growth hormones. The ideal ratios of growth hormones used in the media depend on the tissue or organ of the plant species [15]. Auxins are often more favourable to produce roots, whereas cytokinins are more favourable for the regeneration of shoots. A clump of undifferentiated cells called callus develops when auxin and cytokinin levels are balanced [16]. Cytokinin and auxin are the two major plant growth hormones that control virtually all aspects of growth and development in plants. The combination of auxin and cytokinin shows the best result in the regeneration of plants (endangered medicinal plants, woody plants, crops, etc.) (Fig c). Auxin and cytokinin in combinations or individually resulted in the regeneration of red algae (*Agardhiella subulate*) through *in-vitro* propagation [17]. In *Gracilaria tenuistipitata* and *Gracilaria perplexa* (Red algae), the cytokinin and auxin-induced best-regulating function in the stages of morphogenetic growth [18].

Plant growth regulators (PGR) are responsible for plant growth under moisture stress. PGRs are used in horticulture, agriculture, and viticulture to achieve several benefits, including enhanced morphological structure, reduced susceptibility to biotic and abiotic stress, facilitated harvesting, increased yield in both quantity and quality, and altered plant components (Fig b). PGRs play a significant part in somatic embryogenesis by proliferating and regenerating plant species. Auxin 2,4-D contributes to the induction and growth of somatic embryogenesis [19]. The Cytokinin meta-Topolin effectively improved shoot proliferation and secondary metabolites in *Huernia hystrix* through *in-vitro* propagation compared to other aromatic cytokinins [20].

Effect of PGRs on agricultural and vegetable crops

Plant growth regulators can change the internal and external elements that regulate a plant's development, maturation, aging, and postharvest preservation. In reaction to the growing population and destruction of valuable lands for cultivation, demand for crops keeps rising. On crop growth and productivity, moisture stress has a detrimental effect. To overcome these plant growth regulators are vital for the plant developmental process under moisture stress. Heavy metals like cadmium (Cd) have an impact on *Mentha arvensis* (menthol mint) cultivation, and they also offer serious health consequences. Salicylic acid treatment with PGRs improved mineral metabolism, decreased oxidative stress, decreased Cd stress, and increased tolerance to Cd stress [21]. Lamsan and Selasi are the most applicable upland rice cultivars. These crops are optimized using plant growth hormones through *in-vitro* propagation for genetic transformation to produce high-yielding quality crops [22]. The growth of inflorescence, the number of floral organs, and seed production are all significantly influenced by cytokinin [23]. In cotton (*Gossypium hirsutum*), kinetin positively impacted crop yields, agronomic characteristics, and allelochemicals [24]. The growth hormone kinetin enhanced the phenolic compounds (rutin, epicatechin, and gallic acid) and antioxidant properties in the lentil seeds [25].

Research in agriculture increases the capabilities to promote the yield and quality of plants. PGRs play a vital role in crop improvement and application aspects [26]. Ethylene, a natural plant growth regulator was effectively employed for increasing pineapple blossom production [27]. Triazoles are multi-protective plant growth regulators that act on fruit trees and vegetable crops. Furthermore, it emphasizes how vegetation management protects from environmental pressures [28]. GA3 was effective in the growth and yield of onion and garlic [29]. GA3 showed effectiveness in the growth and yield of *Abelmoschus esculentus* [30]. GA3 and NAA play a vital role in the growth, production, and quality of seed in okra [31]. Paclobutrazol and 6-Benzylaminopurine improve the quality, yield, and antioxidant properties of *Oryza sativa* [32]. A crucial step for vegetative propagation is the formation of adventitious roots. PGRs are used in the agricultural, horticulture, and forestry industries to induce adventitious roots. PGRs are effective in adventitious root formation in ornamental plants [33]. In wheat, kinetin was effective in the growth of seeds under both saline and non-saline condition [34].

**Harshini and Prabakaran**

Essential oils in aromatic plants are enhanced by plant growth regulators, promoting plant growth and the production of essential oils and secondary metabolites. Cytokinin, auxin, gibberellin, ethylene, brassinosteroids, and abscisic acid affect the terpenoids to promote the abundance and nature of essential oils [35]. The growth regulators salicylic acid and putrescine prevent *Brassica napus* from losing oleic acid due to drought. In the present drought and climate change predicament, salicylic acid proved more effective at enhancing canola growth and oil quality [36]. The seed fillings rate in maize was increased by uniconazole. It increased the abscisic acid and reduced gibberellin acid in seeds of maize thus enhancing the production [37]. Seaweeds are the naturally occurring source of plant growth regulators. Auxins, cytokinin, gibberellins, abscisic acid, and ethylene are present in the seaweed extracts that act as plant growth regulators to improve the productivity and yield of crops [38].

Effect of PGRs on horticulture crops

PGRs reinforce plant growth and development, enhancing the production of horticulture plants for commercial purposes [39]. PGRs are used as chemical pruners in *Jatropha curcas* seed production, flowering, fruiting, seed oil content, and quality for effective applications. N⁶-benzyladenine, h 2,3:4,6-di-O-isopropylidene-2-keto-L-gulonic acid, and Maleic hydrazide plant growth hormones produced more flowering, fruiting, and seed oil content in *J. curcas*[40]. Plant growth regulators can enhance the faster production and quality of flowers in the field of floriculture. Floriculture is a branch of horticulture [41]. GA₃ increased the yield and caliber of lily-cut flowers and may be exploited commercially in the horticulture industry [42]. The treatment of BAP and NAA in Hybrid Tea and *Floribunda* increased the production of volatile organic compounds in the flowers [43]. It is common to practice using auxin and gibberellins to reduce fruit drops and enhance fruit quality [44]. GA₃ improved the growth and yield of strawberries followed by cycocel and NAA [45].

PGR foliar sprays (GA₃ or NAA) improved apple fruit quality and yield attributes [46]. When added to "Red Delicious" apples, GA₃ elevates the size and firmness of the fruit, vitamin C content, TSS, total sugars, sweetness index, and overall sensory evaluations. Apple fruit set can be decreased by up to 34% when NAA 10 ppm and ethephon 150 ppm are applied together at full bloom [47]. Salicylic acid and gibberellic acid are also said to boost fruit hardness, fruit chlorophyll a and b content, TSS, TSS/ acid ratio, yield, and fruit acidity in peach plants [48]. Ethylene is a vital hormone that aids in the ripening of climacteric fruits and has the potential to do the same for many non-climacteric fruits. High ethylene ratios drive respiration, boosts the level of fatty acids (FA) and volatiles, and simultaneously reduce firmness [49].

Effect of PGRs in the conservation of woody plants and endangered medicinal plants

Canker, root rot, wilt, or shoot blight diseases of trees can harm woody plants. Additionally, woody plant diseases frequently persist inside the plant throughout its dormant season. The gibberellin inhibitor paclobutrazol, its fungicidal activity, protects plants from environmental stress. Therefore, PBZ is an alluring weapon for controlling diseases of woody plants. Nevertheless, PBZ can be a potential option for aiding tree health professionals in treating landscape trees and shrubs that frequently experience stress and suffer from too few roots [50]. In *Azalea japonica*, treatment with the plant growth regulators daminozide and paclobutrazol exhibited the most effective possibilities for regulating vegetative development and promoting flowering in a cold and humid zone [51].

Most of the endangered medicinal plants of Tamil Nadu are conserved through *in-vitro* propagation due to the effective nutritional media and growth hormones. Table 1 summarizes the regeneration and effect of growth hormones on the propagation of endangered medicinal plants. The combination of the growth hormones BAP and NAA has largely demonstrated efficient results in callus formation, according to the literature review. Moreover, 2,4-D also formed the best outcome for callus induction. The callus induction can also occur when 2,4-D is in combination with other auxins (Fig d). Besides, the best blend of BAP and NAA demonstrated the highest effect in shoot formation. A similar combination of BAP and KN led to the highest growth of shoots. The best shoot bud induction and shoot formation had obtained using the growth hormone BAP exclusively. Aside from these combinations of growth hormones, BAP and GA₃ also showed the best results for the regeneration of the shoot (Fig e). According to the study, endangered plants achieved the highest root induction in half-strength MS medium

**Harshini and Prabakaran**

fortified with IBA. A similar growth had obtained from IBA with effective root formation. Likewise, NAA half-strength MS supplemented with NAA also attained the highest root induction (Fig f).

CONCLUSION

PGRs are a viable practice and environmentally benign tactic for improving plant drought resistance. The substantial contrivance available to agriculturalists for boosting production and producing crops of higher quality is growth regulators, which have allowed man to control plant growth. It is the main element of contemporary agriculture. Due to the several possible roles plant growth regulators can play in boosting crop output in the field of citriculture. Growth-altering developmental, stress-related, or environmental cues conveyed through variations in the frequency, stability, and dispersion of PGRs. The most common ways to apply PGRs are foliar sprays, drenching, and pre-plant soaking. The effectiveness of PGRs varies on absorption, delivery method, and environmental aspects. Growth hormones are imperative for the successful *in-vitro* propagation of plants. Therefore, it reduces the demand for medicinal plants and increases its population for commercial plant production. The effect of PGRs on plants is virus-free, more disease-resistant, and capable of withstanding stress. Conclusively, we cease PGRs can vouchsafe life to the plants facing extinction. PGRs are more productive since they are less toxic and will minimize phytotoxicity. This review made the role of plant growth hormones in agriculture, horticulture, and plant tissue culture fields. It enumerates the positive effects on woody plants, floral plants, ornamental plants, fruit crops, vegetable crops, and medicinal plants for the commercial and pharmaceutical industries to increase their yield, be less time-consuming, and be environmentally friendly.

ACKNOWLEDGMENT

The authors extend our thanks to the Department of Botany, P.S.G. College of Arts & Science, Coimbatore, Tamil Nadu for the assistance.

ABSTRACT

My main focus on this research paper is to show the importance of analyzing the past data from class v to class xii for the 12th passed students who are rightly now belonging in different fields like engineering, medical science, pure science, bio-science etc. for the purpose of prediction of the future fields for the recently or newly 12th passed students depending upon their obtaining marks in different subjects in different previous classes from class v to class xii with the help of artificial intelligence and machine learning. This work shows the importance of artificial intelligence and machine learning and their impact on the present world. Artificial intelligence is one of the most innovative technologies which performs to take decision based on data mining found across the globe. Symbolic Computations are performed rather than numeric computations in precise by Classical AI for example Functional Programming Languages like LISP, Prolog, ML, Haskell but it includes ANNs, Fuzzy Systems and Genetic Algorithms all together in one like CNNs and Deep-Learning Algorithms for Non-Symbolic Computation due to imprecise approximation. Different applications employed under AI domain is ML, Expert Systems, Statistics, ANN, DSP (Digital Signal Processing) for Real Time Data etc. So, it has revolutionized every field, and one of such areas is future- prediction using classification technique. This work primarily deals with explaining how machine learning and artificial intelligence can generate results based on past obtaining marks in different subjects in different classes from five to twelve as data scanning on which subjective marks for each are crucially essential and attached with future fields as class labels. Actually, in this paper we want to show how Naive Bayes', supervised learning algorithm approximate precisely (as Naïve Bayes' Theorem can describe the conditional probability with normal distribution also) on the given continuous data as a query for a particular student wishing to select his future field after passing 12th or equivalent 12th examination. Also, we are going to show that this algorithm has an enough high accuracy for that particular prediction work by that classification technique. k-NN Algorithm and Decision Tree Method can also be applied for classification of continuous input data. But we have selected Naïve Bayes' Algorithm in this paper due to fast computation by incorporating normal

**Purushottam Mohanta and Shibakali Gupta**

distribution, compare to others but irrespective of accuracies. Here, we have considered only 4 Feature Attributes and 4 Class Attributes for just showing the algorithm does work well. In future, more features and classes can easily be taken for the same type of classification work. Categories and Subject Descriptors: Classification using AI & ML General Terms: Introduction, Proposed Work, Methodology, Conclusion and Future Work

Keywords: AI & ML, Classification, Symbolic and Non-Symbolic Computations, Naïve Bayes' Algorithm, k-NN Algorithm, Decision Tree

INTRODUCTION

Nowadays so many students could not able to take decision for choosing their future fields of studies for getting better successes through their careers in lives after completion their 12th or equivalent 12th examinations. Most of the time they are looking through their fields of interests and take decision to select their future fields of studies depending upon that factor only generally. But sometimes, they will face some difficulties on that particular field for a one in future in real. Therefore, one thing they should do. They should compare their earlier factor (i.e., field of interest or area) with their previous performances also in subjects those are mainly subjected or related to that particular field of interest so that they will get better successes in their lives in future. Now, that work for selecting their future fields of studies can be done using Artificial Intelligence (AI) and machine learning (ML) easily [2]. We are going to propose a Naïve Bayes' classifier for that classification work in this paper by which they can predict their future fields of studies so that they will get better successes in their lives.

PROPOSED WORK

In this paper, we are going to classify the students in 4 classes as engineering, medical science, pure science and bio-science depending upon the supervised learning from the provided data set which is actually assumed in 'consideration'- section later. We have used Gaussian Naïve Bayes' classifier [3] here for the prediction of future field after passing 12th or equivalent 12th examination. We have considered 4 feature attributes for the above told 4 classes of each for every instance in input data set.

Feature Attributes

- (A) Marks obtained in Mathematics (continuous input as MATH for the classes from v to xii)
- (B) Marks obtained in Physics (continuous input as PHYS for the classes from v to xii)
- (C) Marks obtained in Chemistry (continuous input as CHEM for the classes from v to xii)
- (D) Marks obtained in Biology (continuous input as BIOS for the classes from v to xii)

Class Attributes

- (A) ENGG (Select the field of Engineering and Technology)
- (B) MED (Select the field of Medical Science)
- (C) PURE_SCI (Select the field of Pure Science)
- (D) BIO_SCI (Select the field of Bio-Science)

Consideration (Assumption)

Say, there are 10000 instances or records in a given data set. We have considered 90% of them i.e., 9000 data points are for training data and remaining 10% of them i.e., 1000 data points are for new or test data. Finally, we will show the accuracy implementing that algorithm by model evaluation [4] using the 1000-test data or new data points after training by the help of learning from the 9000-training data points and conclusion will be drawn also.

Purushottam Mohanta and Shibakali Gupta

Architecture

The proposed work is followed by the given below architecture (see Figure1).

METHODOLOGY

The Naïve Bayes' classifier for that particular classification work is described stepwise as given below:

STEP1. 10000 data points (input-output pairs) as data set is taken or imported.

STEP2. Data set is splatted by two parts as 9000 data points are training data (input-out pairs) as input for selected model and 1000 data points are new or test data for the evaluated model.

STEP3. Extracted input feature attributes [5] like Marks obtained in Mathematics, Marks obtained in Physics, Marks obtained in Chemistry, Marks obtained in Biology of the students are taken to the arrays separately as the actual direct Continuous or Numeric inputs as Feature Vectors [6] as MATH, PHYS, CHEM, BIOS respectively along with its Class labels to the ML (Supervised Learning as Naïve Bayes') for Model Selection with respect to the training data.

STEP4. Learning Method maps a Naïve Bayes' Classifier where the extracted new feature vectors for Marks obtained in Mathematics, Marks obtained in Physics, Marks obtained in Chemistry, Marks obtained in Biology of the students are taken as New_MATH, New_PHYS, New_CHEM, New_BIOS are to be fed as inputs from new students with respect to test data points to detect or predict the students belonging in which classes as ENGG, MED, PURE_SCI or BIO_SCI by determining the conditional probabilities using Bayes' Theorem by the help of Normal (Gaussian) Distributions in such a way, the probabilities of the classes ENGG, MED, PURE_SCI and BIO_SCI upon the new feature vectors for the marks obtained in above considered different subjects all together which compares to make sense in such a way:

$$Z1 = P(\text{ENGG}/\text{Student}^{\text{new}} = \text{New_MATH} \cap \text{New_PHYS} \cap \text{New_CHEM} \cap \text{New_BIOS}) = \\ P(\text{New_MATH}/\text{ENGG}) * P(\text{New_PHYS}/\text{ENGG}) * P(\text{New_CHEM}/\text{ENGG}) * P(\text{New_BIOS}/\text{ENGG}) * P(\text{ENGG}) \text{ DIV } P \\ (\text{New_MATH}) * P(\text{New_PHYS}) * P(\text{New_CHEM}) * P(\text{New_BIOS})$$

Similarly,

$$Z2 = P(\text{MED}/\text{Student}^{\text{new}} = \text{New_MATH} \cap \text{New_PHYS} \cap \text{New_CHEM} \cap \text{New_BIOS}), \\ Z3 =$$

$$P(\text{PURE_SCI}/\text{Student}^{\text{new}} = \text{New_MATH} \cap \text{New_PHYS} \cap \text{New_CHEM} \cap \text{New_BIOS}) \text{ and } Z4 =$$

$$P(\text{BIO_SCI}/\text{Student}^{\text{new}} = \text{New_MATH} \cap \text{New_PHYS} \cap \text{New_CHEM} \cap \text{New_BIOS})$$

Where:

$$P(\text{New_MATH}/\text{ENGG}) = 1/\sqrt{2*\pi*\sigma_{\text{ENGG_training_MATH}}^2} * \text{Exp}(-(\text{New_MATH} - m_{\text{ENGG_training_MATH}})^2/2*\sigma_{\text{ENGG_training_MATH}}^2);$$

$$P(\text{New_MATH}/\text{MED}) = 1/\sqrt{2*\pi*\sigma_{\text{MED_training_MATH}}^2} * \text{Exp}(-(\text{New_MATH} - m_{\text{MED_training_MATH}})^2/2*\sigma_{\text{MED_training_MATH}}^2);$$

Similarly,

$$P(\text{New_MATH}/\text{PURE_SCI}) \text{ and } P(\text{New_MATH}/\text{BIO_SCI});$$

Again,

$$P(\text{New_PHYS}/\text{ENGG}) = 1/\sqrt{2*\pi*\sigma_{\text{ENGG_training_PHYS}}^2} * \text{Exp}(-(\text{New_PHYS} - m_{\text{ENGG_training_PHYS}})^2/2*\sigma_{\text{ENGG_training_PHYS}}^2);$$

$$P(\text{New_PHYS}/\text{MED}) = 1/\sqrt{2*\pi*\sigma_{\text{MED_training_PHYS}}^2} * \text{Exp}(-(\text{New_PHYS} - m_{\text{MED_training_PHYS}})^2/2*\sigma_{\text{MED_training_PHYS}}^2);$$

Similarly,

$$P(\text{New_PHYS}/\text{PURE_SCI}) \text{ and } P(\text{New_PHYS}/\text{BIO_SCI});$$

Again similarly,

$$P(\text{New_CHEM}/\text{ENGG}), P(\text{New_CHEM}/\text{MED}), P(\text{New_CHEM}/\text{PURE_SCI}),$$

$$P(\text{New_CHEM}/\text{BIO_SCI}) \text{ and } P(\text{New_BIOS}/\text{ENGG}), P(\text{New_BIOS}/\text{MED}),$$

$$P(\text{New_BIOS}/\text{PURE_SCI}), P(\text{New_BIOS}/\text{BIO_SCI}) \text{ are determined all.}$$

$$P(\text{New_MATH}) = P(\text{New_MATH}/\text{ENGG}) * P(\text{ENGG}) + P(\text{New_MATH}/\text{MED}) * P(\text{MED}) + P \\ (\text{New_MATH}/\text{PURE_SCI}) * P(\text{PURE_SCI}) + P(\text{New_MATH}/\text{BIO_SCI}) * P(\text{BIO_SCI});$$

Similarly,

$$P(\text{New_PHYS}), P(\text{New_CHEM}) \text{ and } P(\text{New_BIOS}) \text{ are determined.}$$

Purushottam Mohanta and Shibakali Gupta

And also Calculated the prior probability of 'ENGG' class by counting the data points belonging to the 'ENGG' class with respect to 9000 training data points as a ratio in the form of fraction, also calculated the prior probabilities of 'MED', PURE_SCI and 'BIO_SCI' classes in the similar way like $P(\text{ENGG}) = \text{Count}(\text{ENGG})/9000$, $P(\text{MED}) = \text{Count}(\text{MED})/9000$, $P(\text{PURE_SCI}) = \text{Count}(\text{PURE_SCI})/9000$ and $P(\text{BIO_SCI}) = \text{Count}(\text{BIO_SCI})/9000$.

```

STEP5. IF(Z1>Z2) && (Z1>Z3) && (Z1>Z4) /* Pass the values of Z1, Z2, Z3 and Z4 */
{
  "THE STUDENT SHOULD SELECT THE FIELD OF ENGINEERING AND TECHNOLOGY FOR FUTURE"
}
ELSE IF(Z2>Z3) && (Z2>Z4) && (Z2>Z1)
{
  "THE STUDENT SHOULD SELECT THE FIELD OF MEDICAL SCIENCE FOR FUTURE"
}
ELSE IF(Z3>Z4) && (Z3>Z1) && (Z3>Z2)
{
  "THE STUDENT SHOULD SELECT THE FIELD OF PURE SCIENCE FOR FUTURE"
}
ELSE IF(Z4>Z1) && (Z4>Z2) && (Z4>Z3)
{
  "THE STUDENT SHOULD SELECT THE FIELD OF BIO-SCIENCE FOR FUTURE"
}
ELSE
{
  "LEARNING CAN NOT SAY THE PROPER ANSWER DUE TO INSUFFICIENT INFORMATION OR SUCH
  CONDITION IS INCONSISTENT THROUGH OUT THE DATA SET"
}
}

```

STEP 6. Repeat STEP 5 for 1000 numbers of new or test data points which are given in data set as imported and splatted for the part of testing.

CONCLUSSION AND FUTURE WORK

At that time, we have selected Naïve Bayes' Algorithm for that prediction work by classification technique (Supervised Learning method) because it is comparatively faster than kNN algorithm overall for that prediction work although kNN algorithm is a non-parametric powerful classification technique but lazy method for the large data set whereas Naïve Bayes' algorithm incorporates conditional probability with the normal distribution here for getting fast computation irrespective of accuracy. We can implement that algorithm easily by any languages like Python, C, C++, Java or in MATLAB. We'll implement the algorithm in python later when a relevant data set will be available. After testing, a confusion matrix would be made up to determine the accuracy for model evaluation by taking predicted 1000 numbers tested data in the form of class labels (predicted classes) and actual classes with the tested values of feature attributes. Accuracy of the algorithm as $A_c = \text{truly predicted as right classes} / \text{sum of truly predicted as right classes and falsely predicted as right classes}$ will be calculated easily by the help Confusion Matrix. Thus, if the accuracy of that classifier or model will be so sufficiently high then it can be accepted for that future prediction work for any new student who has just passed 12th or equivalent 12th level examination. In future, we'll also try to implement kNN Algorithm for the same work by taking the value of $k=95$ and be tested the major votes for a particular class from minimum 95 numbers of Euclidean distances using Euclidean distances between new or test data point and corresponding all the training data points. We will also implement Decision Tree Algorithm in future for the same and then we will compare which algorithm be better through the accuracy analysis for each respectively.

ABSTRACT

This research paper commences with a comprehensive literature review that explores prior research conducted in the field, providing a foundation for the subsequent introduction to the topic. The paper delves deeply into the communication design aspects, specifically focusing on the integration of the APM flight controller with Node MCU. It also imparts fundamental design concepts for drone enthusiasts interested in armature-level projects. The manuscript further elaborates on the workings of the APM flight controller, showcasing dedicated methods and techniques. Lastly, the research paper demonstrates the diverse applications of Internet of Things (IoT) principles as they pertain to unmanned aerial vehicles, highlighting their potential and relevance in the field.

Keywords: Internet of Things, Unmanned Aerial Vehicles

Ajay Vishwath et al.,

INTRODUCTION

Internet of things is a emerging technology that enables physical objects to use sensors to gather data, use transceivers to communicate with other devices along with internet to exchange data that would be processed efficiently than any existing technology. IoT is a system of inter related devices that are connected to the internet and transfer the data among them. there are two types of devices in IoT they are general devices and sensing devices . general devices are like Arduino, tv and alarm and sensing devices like humidity sensor, accelerator, heat sensor. This IoT devices are connected to the internet through gateways. This gate ways are processing nodes collects the data from sensors and transfer the data to the cloud the cloud access both storage and processing unit and the actions are performed according to collected data for further learning. wireless devices like WIFI, Bluetooth are used for connections.

LITERATURE REVIEW

Anush Lakshmanan et al (2019) said that there is continuously increasing in drone technology in earlier days there is no high technology in drones and IoT now a days they are keeping focus on integration of drones or UAV and internet and the author is talking about different IoT things and integrated drone protocols which has been used in various applications. [1]. Abbas yazdinejad et al (2015) saying that there is currently widespread in the usage of drone in the field of military, safety surveillance, photography, agriculture purpose and etc... The now a days most of the people are using drones in different sectors and all the applications are based on drones the author is mainly focusing on to establish the drones in smart cities for security purpose that look to leverage blockchain technology [2] Saeed H. Alsamhi et al says the smartness measurements is related to quality-of-life and healthcare public safety disaster management there is widely increase in information communication technology and artificial intelligence and now a days robots are playing vital role in making cities smarter and the drones are autonomous robots which are been flying in air the drones are becoming integral part of smart cities.[3]

Mohit angurala et al describes about how drones can be useful in medical filed during the covid-19 so many people have lost their lives across the world to overcome this problem he proposed DBCMS { Drone based covid 19 medical service } it can improve the treatment process of covid 19 patients . The mainly proposed model is to reduce the infection by this method we can isolate the people at home instead of hospital there will be advantage of not spreading infection [4]

COMMUNICATION DESIGN

First, we planned to make a drone that can fly up to 2 Kilometer range but that doesn't provide enough applications. So we planned to boost the range of drone, and thereby we have sorted out few methods, one them being to boost the power of the transmitter or else to find some global communication systems. After research of 2 weeks, we found that the GPS cannot directly be accessed. It could only be used for positioning of the drone, to sort out those limitations; usage of the network popped out and as it is accessible. Also, this technology will allow one to control the Drone anywhere from the world where internet appears so here, we will use the internet instead of transmitter and receiver. To reduce our budget, development board NODEMCU was used. The most amazing part of this board is that this development board has a in built Wi-Fi module so it can be controlled wirelessly and here is also app name BYLINK which allows us to control the NODEMCU wirelessly. So, interfacing the NODE MCU on the Drone would convert it as a receiver and the BYLINKAPP in the cellular would act as a transmitter. If the input is given to the BYLINK APP it will send its data to it server and from there it would go to the NODE MCU's IP address and the NODE MCU would be as per the program. But in this case the node must be connected to the internet, so for this we cannot keep the router beside the phone otherwise it will not work after the Drone goes out of range. So, a mini WIFI router is taken and kept on the drone. At this point, the Drone can fly through the Internet, also the cellular phone is connected to the internet and the NODE MCU is also connected to the internet. The BYLINK sets the data to the internet and which reach the NODE MCU via Internet and the all the works happen on the internet so to use the

Ajay Vishwath *et al.*,

NODEMCU as a receiver we just have to do some programming, wiring and connect the signal pin of the light controller to the digital pins of the NODEMCU.

SOFTWARE TESTING

We are using NODE MCU microcontroller development board as a receiver which is having WIFI connecting capability which is connected to the internet and ardupilot as a flight controller .to use NODE MCU as a receiver we need to do some programming and wiring by connecting the signal pin of the flight controller to the digital pin of the NODE MCU like seen the Fig1.as we do have raspberry pi but it doesn't build in support for wireless networks and we need to add the WIFI module. but when we are searching for built in WIFI modules we got to know about the NODE MCU which is having the same feature we want and it is a open source platform which we can build new code and can edit and modify the code .we can program this NODE MCU using LUA programming language and we identified that this NODE MCU board comes with ESP 8266 development board and we also got to know about that there are two versions in NODED MCU version 0.9 and version 1.0 and we also identified that this Esp8266 NODE MCU comes with capabilities of 2.4 gigahertz WIFI general purpose input output pins and 12c serial communication and this NODE MCU has analog digital pins and it also support serial communication protocols.

UNMANNED AERIAL VEHICLE DESIGN

All Aerobatics of Quadcopter depend on variation of speed of each thruster. the motors are numbered as following.

- M1 – front left thruster
- M2 – front right thruster
- M3 – rear right thruster
- M4 – rear left thruster

For throttle up, all thrusters should be in same speed, and can be used to increase or decrease using a potentiometer. So to Lift up, all the thrusters need to increase at a same time and to Land down, all the thrusters need to decrease at a same time. For the pitch forward movement, RPM of thrusters M3 and M4 should be comparatively higher than that of thrusters M1 and M2. For the pitch backward movement, RPM of thrusters M1 and M2 should be comparatively higher than that of thrusters M3 and M4. For the right roll, RPM of motors M1 and M4 should be comparatively higher than that of thrusters M2 and M3. For the left roll, RPM of thrusters M2 and M3 should be comparatively higher than that of thrusters M1 and M4.

WORKING OF APM FLIGHTCONTROLLER

Ardupilot mega (APM) is a IMU autopilot that is based on the Arduino mega platform. the autopilot flight controller can control fixed wing aircrafts, quadcopters, multirotor helicopters, drones. The APM flight controller is equipped with a 3-axis gyro, accelerometer, and magnetometer along with a High- performance barometer and an onboard 4 Mb Data flash chip for automatic data logging. The APM flight controller provides full data logging for comprehensive post-mission analysis. Ardupilot is used as controller for quadcopter, multi rotors. it uses autopilot software to control, Ardupilot was developed by hobbyists to control model aircrafts and rovers. Reliable autopilots are used by industries. The ardupilot software suits consist of navigation software running on the vehicle rover, trackers, along with ground station controlling software including mission planner. Ardupilot source code can be stored and managed in GitHub. The software is already come with inbuilt software but we have to program it with firmware, plane rover, antenna tracker runs on wide variety of embedded hardware. It consists of one or more microcontrollers connect to peripheral sensors for navigation, these sensors use gyroscopes and accelerometer at minimum for multi rotor flight or plane stabilization. Ardupilot provides a large set of features like fully autonomous, semi, autonomous and fully manual flight modes etc. it can be programmed to perform variety of tasks such as automatic takeoff and landing, it can also use to control drone camera. The ardupilot flight controller is powerful tool for controlling drones. The flight controller uses the data gathered by the sensors to calculate the desired speed for each of the four motors or thrusters. The flight controller sends this desired speed to the Electronic Speed Controllers. The APM 2 Control Board is used for make UAV. This version is ready to use, with no assembly

Ajay Vishwath et al.,

required. It allows the user to turn any fixed, rotary wing or multirotor vehicle into a fully autonomous vehicle, capable of performing programmed GPS missions with waypoint. Flight model configuration. In the practical flight, the switch of function of APM is realized through the switch of flight model. An APM flight controller is a type of hardware device that is used to control the flight of unmanned aerial vehicles, it is a small, lightweight computer that is connected to various sensors and other components of the UAV, and is responsible for processing data and sending commands to the motors and other actuators that control the UAV's movement. The APM flight controller uses an open-source software called Ardupilot. One of the key advantages of the APM flight controller is it's easy to use and accessibility. the field of UAVs and made it possible for anyone to build and control their own autonomous aircraft.

The APM flight controller is a small, lightweight computer that is connected to a number of sensors, such as GPS, accelerometers, gyroscopes, and barometers. These sensors provide the APM with information about the UAV's position, orientation, speed, altitude, and other parameters. The APM flight controller can also be programmed with various automated flight modes, such as stabilize, loiter, and auto, which allow the UAV to perform specific tasks without direct input from the user. For example, in loiter mode, the UAV will maintain its current location and altitude, even in windy conditions. APM flight controller making it possible to perform a wide range of tasks and applications.

APPLICATION OF IoT ON UAV SYSTEMS

The application of UAV today is widely ranged. [5]: Implement IoT could be done on the application such as agriculture drone. If we implement IoT in this type of drones we can automatically identify the type of disease the crop has and also drone can spray the fertilizers according to the need and we can also implement the altitude sensor in the drone through this sensor we can detect the height of the tree and move the drone automatically upward without hitting the big trees. We can implement IoT on the applications of Food Delivery payload drone. When we are using medical payload drone and when it is travelling in the air it is going to detect the birds and obstacles and it can automatically escape from that.

We can implement IoT on the applications of medical payload drone by implementing the heat sensor in the payload we can automatically detect the temperature in the payload and change the temperature according to the need and put the medicine in the safe mode. It can be used for aero amphibious vehicle.[6] We can implement the IoT on the aero amphibious vehicle drone. We can implement the liquid sensors (NF- DF08) sensors in that drone it is going to detect the liquid when it is going into the liquid and change the speed of the propellers and by implementing height sensor, we can detect the drone how deep it went and change the speed of the propeller according to the pressure of the water.

Application can be implemented in airship also. [7] We can implement the IoT in airship .by implementing the pressure sensor in the airship we can detect the pressure of air in the airship and if it is having less pressure than we kept in the air ship then it is an indication that airship is going to fall and we are going to put some air into it according to the values detected by the pressure sensor. Bullet trajectory [8] We can implement the IoT in bullet trajectory from a drone by providing target as an input and using trajectory correction methods to shoot the bullet accurately by providing the correct impact when it is going to detect the enemy it is going to point automatic. When in fused with autopilot control system [9] We can implement the IoT in autopilot control system. by implementing the IMU sensor for determining the angular speed and acceleration, a barometer for the height detection and distance sensor for detecting obstacles. So, the flight can fly automatically.

Single stage high pressure turbine [10] We can implement the IoT in high pressure turbine. We can implement pressure sensor in the pressure turbine so it will detect the pressure of the water and change the speed of the turbine according to pressure of the water. Design, Development and Dynamic Modeling of Radio Remote Controlled Unmanned Aero Amphibious Vehicle [11]: We can implement the IoT in the amphibious vehicle. If we are going to

Ajay Vishwath *et al.*,

use the chlorophyll sensor fluorometer and depth sensor and dissolved oxygen sensor and PH sensor we can detect how much oxygen is present in the water and PH value so it will detect and calculate the values and tell that a man can enter. Autopilot Control System in Airship [12] We can implement the IoT in autopilot control system in airship. by implementing the pressure sensors and IMU sensor we can find the pressure in the air and can change the speed of airship automatically according to the pressure in the air. High Level Learning Approach for High Level Collision Avoidance Using Sensors [13] We can implement the IoT on high level avoiding using sensor by detecting obstacles and by using ultrasonic sensor we can detect the length of the obstacle and can escape the drone from the obstacle faster without hitting the drone to the obstacle. Acoustic Sensor Networks: An Energy Efficient Grey Wolf Optimization Algorithm development for underwater networks [14] We can implement the IoT in acoustic sensor networks. we can implement the depth sensor in this drone and can find that how much length the drone has went and we can also implement.

RESULTS AND DISCUSSION

The NODE MCU is setup with APM flight controller and was tested with ultrasonic sensor and thermal sensor and with the help of Wi-Fi module and were able to get live data. The same can be applied by replacing the camera sensor and we can get the live footage and can be used for surveillance. Also, can be equipped with pressure sensor temperature sensor and humidity sensor to get the live whether condition and environmental condition. The research team also tried to implement IOT to make a normal drone into an obstacle avoidance drone but due to some limitations this part couldn't successfully completed that lead us to put this work as a future scope.

ABSTRACT

The presence of Social media in the world has grown enormously. This is because the numbers who use social media as a tool of communication and interaction believe in its impact completely. Today, social media has an impact in all areas of life and on politics too. There are various groups that use social media to influence politics. Prominent among them are political parties, State authorities and the citizenry. At most times, one is reacting to another, in a manner to influence, spread propaganda, cause oppression or fight oppression. This paper looks at the power that social media wields in the hands of such groups and how that has the capacity to change so many narratives, at the level of the individual, the State or internationally as well.

Keywords: Social Media, State, Politics.

INTRODUCTION

The 19th century saw the industrial revolution in Europe and North America, while the 20th century experienced social and political revolutions across the world, which aimed at people's right to self-determination. The above movements played an essential role in political landscapes around the globe. Technology has a habit of revolutionising the world. The onset of technological advances in the second half of the 20th century and the invention of the internet and computers facilitated the social media revolution since the beginning of the 21st century. Social media now plays a prominent role in our daily lives, and it has changed the way we share and view information and create content. Similar to all other areas, this has had a direct impact upon the political space also.

**Radhika Mohan Gupta and Muskan Mundra****Objectives of the Study**

1. To understand the importance of social media as a tool of communication today
2. To establish that social media has a pertinent linkage to politics and the State
3. To understand the two way relationship between politics, State and social media where both affect and are affected by each other
4. To strike a balanced narrative of the topic at hand.

METHODOLOGY AND HYPOTHESIS

Methodology used here is descriptive where material is of secondary nature. The hypothesis of my study is that social media has a direct impact on politics and the State but the State also uses social media for its uses and that both parties are heavily influenced by each other. Social media refers to platforms of communication and interaction on the internet that is low-cost and time saving and easily and universally accessible. As mentioned above, swift technological developments in the 21st century saw the onset of the internet and widespread access to computers that made connecting to the internet a virtual reality. However, it was the invention of the 'mobile' phone, that ushered in the social media revolution. Access to computers in order to access the social media is not easy for the underprivileged, especially in developing countries but it is much easier to access a mobile. Available at very low rates as well as high, the mobile phone invention has become a necessity that the human race is enjoying getting used to. The untethered feeling that a mobile imparts provides a sense of freedom of being able to connect to the world from anywhere. Low rates of the instrument itself make it affordable to the underprivileged. Apart from that the universal acceptability that social media provides to any and everyone despite their caste, religion, region, language or citizenship is revolutionising in its own way. The revolution's catalyst, of course, has been the mushrooming of a multitude of mobile carriers in the new internet space and the intense competition between them to expand their user base which has resulted in the availability of internet data at very affordable rates to the consumer.

While using social media, information is shared at a rate it has never been before, with social media providing live updates of happenings across the world. According to Lt. Col. Jarred Prier, this information can take three forms: social networking, propaganda news and information sharing [i](Prier 2017). Majorly used for networking and leisure, social media has impacted businesses, education, innovation, careers, and so on. Every aspect of our lives has evolved with social media, and politics is no different. Politics is the public realm of society that encourages the citizenry to engage in conversations about the State. This is because, "man is a political animal" according to Aristotle and "a political and a social animal" according to Thomas Aquinas [ii](Sartori,1973). Social media is a tool of communication. In this capacity, it is used by a varied group of users that also includes those that can have a direct impact upon politics. This includes politicians, party workers of different parties and the general population interested in politics. Social media is being increasingly used in politics by governments and the public across the world. Social media platforms are used to promote candidates and policies, voice one's opinion, and spread awareness about conflicts around the globe.

Social media is now a direct channel between politicians and the general public. Individuals have been able to share their political views and receive information more freely. Many individuals get their news from social media platforms and are encouraged to vote by politicians and activists on social media. Political parties and candidates can connect with voters directly with the help of social media posts, advertisements on social networking websites, or live streams. Politicians from opposing parties use the sites to call out policies, criticise the workings of the government and suggest alternative measures. The main targets of social media are the younger generations – gen z and millennials. This is because the social media is as natural to them as the act of breathing. Majorly used by this younger composition of the public, social media has led to their active involvement in political discourse. Politicians often use platforms or features popular among the younger generation – such as reels on Instagram, TikTok, live streams on Twitch or Twitter and Facebook to connect with voters and share information. The social media has

**Radhika Mohan Gupta and Muskan Mundra**

another great advantage. It is that it bridges the gap between the celebrity and distant politician to the proximity of a few clicks. The proximity of an admired personality, especially one who has the power to influence one's life directly through policies, is a major attraction that draws the politically interested public towards social media. The ease of expressing an opinion for a person or a policy, whether admiringly or critically has the effect of even pulling the otherwise apolitical individual into the realm of the political.

Social media as a political influencer during elections

During election campaigns, social media can be considered a lucrative tool as it can reach a wider audience at a fraction of the campaign costs. Social media platforms were first actively used for politics during the USA presidential elections in 2008. Barack Obama was considered the first presidential candidate to have used social media effectively for his campaign. Fast forward to the present; it played a significant role in the United States presidential elections in 2020. Weeks before the 2020 US presidential elections, Democrat Alexandria Ocasio-Cortez played the viral game "Among Us" and live-streamed it on Twitch. While she played the game, there were on average 400,000 viewers, and Cortez was able to spread awareness about the importance of voting. [iii] The 2020 United States presidential elections are a successful example of the use of social media as a political influencer in elections. Due to COVID-19 restrictions, most of the campaign took place online via the help of live streams, online events, official accounts of politicians on Twitter, Facebook, Instagram. The country saw the highest turnover of voters, with more than 159 million voters. [iv]

In India too social media was used aggressively in the 2019 national elections by all political parties. Indian political parties used it to spread their political manifestos and political awareness, create propaganda and even discredit rival party members. This is because social media is the quickest way to spread a message across India's leviathan vastness as well as the gigantic size of its population. It bridges geographical, social, economic and cultural divides in a country where the former is so prominent. Political messages reach their target accurately and continuously despite such crevices because the social media user base in India is mind boggling. Since the 2010s, there has been a tremendous boost in internet users. India is digitising faster than other emerging economies. A report by Mckinsey & Company states that the total number of internet users has increased from 239 million in 2014 to 560 million in 2018, and around 294 million users are engaged in social media. An increase in the purchase of smartphones and internet availability at low rates has seen India establish its presence in the digital economy. There has been a fall in data costs by 95% from 2013 to 2017. Mckinsey & Company report that there would be an estimated 700 million smartphones in India by 2023[v](Mckinsey Report, 2019). "Social media's unique value is that it allows both mass messaging and micro-targeting. Bolstered by grass-roots campaigning, it is immensely powerful in moulding public opinion both in India and beyond"[vi](Mahapatra Plagemann, 2019).

Another example of social media as a political influencer during elections can be made of Thailand in its 2019 national elections. The newly commissioned Future Forward Party came out victorious in the elections stumping political veterans and observers alike. The game changer was supposed to have been the ballot cast by first time users, around 7.9 million youth and their zealous use of social media. The Future Forward Party chose to rely heavily on canvassing through social media, disposing off the traditional methods of canvassing for votes through middle men[vii] (Chattharakul, 2019). The strategy proved to be a success

A tool to voice against oppression

Social media has helped promote democracy not only by solidifying election campaigns around the world, but also by dismantling authoritarian regimes across the world. Social media has provided a platform for people from marginalised communities to amplify their voices freely and spread awareness about their causes. The power of the social media as a balancer or a harbinger of succour in societies where there is social injustice or oppression is noteworthy. Social media has made it easier to access information, communicate and mobilise individuals. It has brought together citizens to protest violence, provide relief to the affected communities and ultimately change government policies.

**Radhika Mohan Gupta and Muskan Mundra**

Activists have used social media platforms effectively to share information about protests and discriminatory policies, call out oppressive regimes and educate the masses about conflicts. Social media has helped make elected officials accountable. In June 2020, following George Floyd's death, when the Black Lives Matter movement escalated in the United States of America, social media played a significant role in mobilising communities, organising protests across various cities in the country and advocating changes in government policies. Soon, with inputs on social media from influencers, celebrities and politicians, the protest gained worldwide momentum. Protests were organised in Australia, the United Kingdom, France and other countries supporting Black Lives Matter. Similarly, in May 2021, following attacks by Israel on Palestine, there was a social media uproar and international condemnation, with users demanding the freedom of Palestine and the end of 'apartheid' there. With constant outrage and demonstrations, Israel ultimately called for a ceasefire. [viii] Even during the Arab Spring, in the beginning of the second decade of the 21st century, some of the most long standing oppressive regimes of the Arabian peninsula witnessed large scale protests against State oppression, powered by the social media. The movement started with Libya and then spread to Tunisia, Yemen, Egypt, Iran, Bahrain and so many Arab other nation states that witnessed revolts by their people against the State. The social media helped in communicating causes, ideas and whereabouts of protestors at that time. It “enabled or facilitated the protests by providing voice to people in societies with mostly government controlled legacy media; helping people connect, mobilise and organise demonstrations and broadcasting protests to the world at large and gaining global support [ix](Smidi& Shahin ,2017).

Another discriminatory issue where there is stark presence of the role of social media is that of women's rights. Protests for women's rights take place all around the world. “ With its power to encourage solidarity and collect shared experiences, social media has become a new frontier for women's rights activists to organize and allies to join the fight for equality and justice” [x]Essentially, the social media has given voice to women to revolt against oppression whether from the State or otherwise that was not available earlier. Social media movements like ‘#Bring Back Our Girls’, sparked in Nigeria against the kidnapping of around 300 girls by Boko Haram, calls to the State to activate its mechanism against crime and for security and economic reform as well. These movements raise powerful voices of solidarity and empathy. However, there are views that state that the #movement is scattered and lacks depth and strength and may not be strong enough to cause policy change at the State level[xi]. Even though that may be true to a certain extent, such movements cause a sizeable transformation at the level of the individual. This is accentuated through collective movements by non-governmental bodies that rally for the rights of the women and bring about awareness for such issues at the level of the civil society itself.

Social media has the power to amplify a cause situated in one country and communicate it to the rest of the world. It is important to note that during conflicts, social media has helped spread information of the situation on the ground with the help of photos and videos so that people are not misguided in supporting the side of the oppressors. Even when leaders claim otherwise, these can be used as proof to see the reality of the situation. One of the main reasons these protests and dissent are noticed worldwide is that they resonate with people worldwide. Discrimination is not an isolated event that one particular community faces in one country. People all over the world feel the need to react to injustice. Social media is also misused. “While facilitating civic engagement for a more participatory democracy, social media is also misused for propaganda, hate speech, and disinformation campaigns, which can undermine the pluralistic foundations[xii]” of any democracy. Apart from this, there have been regular crackdown on activists, often done by monitoring their social media activities and posts, leading to unlawful arrests. In conflict areas, internet shutdowns have been prominent to suppress dissent and spread information about the atrocities committed there.

Political parties use bots, trolling, and propaganda to release fake stories about candidates during political campaigns, usually in their favour. Politicians often rely on the use of fake news to manipulate voters and spread misinformation. Propaganda and intentional hate speech are often spread by the state or supporters on various issues and often against minorities, leading to further vilification and suppression. Spreading propaganda is not new; it has been spread using newspapers, books and pamphlets in the past. However, with social media's presence, the rate at which propaganda is used has increased exponentially. This can lead to prejudice, and various attacks on

**Radhika Mohan Gupta and Muskan Mundra**

minorities have been instigated due to fake news. For instance, early 2020 saw a massive increase in Anti-Asian crime in western countries due to right-wing politicians calling COVID – 19 the Chinese virus or the Wuhan virus. Political parties, at times, organise trends with the help of bots which helps spread their agenda. They use various media such as photo shopped or edited photos or videos, photo shopped tweets to target or harass. In another instance, in February 2021, Rihanna, an American singer and businesswoman, tweeted about the farmer's protests in India, which led to widespread trolling, sexist comments, death and rape threats and other allegations against her via Indian Twitter accounts. A vile way of misusing social media for perverted ends is through the spread of 'fake news'. Fake news is created and shared by people who to stir peoples' interests in their false beliefs. Even if fake news has frequently been shared by conservatives and alt-right supporters as it validates their beliefs. The social media algorithm uses users' past behaviour. It provides the fake news mongers with the personalised content of the users of social media. Hence, someone who interacts in fake news via sharing an article or clicking the link would see more of it on their timelines. In other words, social media works like an 'echo chamber' for its users. Even after being fact-checked, when fake news is not taken down by the platforms that let a fake narrative run, it can be dangerous. The rate at which fake news and conspiracy theories spread makes it difficult to identify the correct news.

Social media has also been used to target and discredit opponents. During the 2020 USA presidential elections, Twitter identified false claims made by politicians and ultimatums were given to the account holders. In January 2021, Former United States President, Donald Trump's Twitter account was permanently suspended after multiple warnings about spreading fake news. [xiii] While Twitter was quick at action, Facebook stated that they would not take down the political advertisements

Social Media as a tool to target the State

Social Media is a double-edged sword. It is being used as a tool of modern warfare as well[xiv]. The other term for this is "cyber warfare" and the reason why this happens is that social media is an open platform that has universal accessibility. It is being used as a weapon against the State by non-state actors like terrorists. There are two views in international relations. One is the Realist view that sees nations as competitive and power hungry and always looking at a militaristic solution to solve problems. They view the world as anarchical. The other is the Liberal view that believes that states are continuously working at solving problems through conversation, communication and mediation. They view the international world through an idealist lens that believes that world peace is possible and can be made real. The world that existed immediately before the Cold War and during was truly a Realist world and saw two wars of gigantic proportions that resulted in great loss to men and property, not to mention the immense psychological impact that it had on the sufferers. The world that dawned after the Cold War was fully intentional about not having any more wars and led to the establishment of an international organisation, the United Nations of which veritably the whole world became a part, albeit by and by. We live in this world; a world that believes in idealism, where the United Nations has achieved tremendous successes at achieving peace. This is not to say that Realism has disappeared from this world. Whatever interstate conflicts the world witnesses are a result of that thought process held by nation states, but the level and frequency of such conflicts is low.

In such a world, where nations are less of a threat to each other, non-state actors like terrorists are emerging as the new adversary. Terrorists have an extremely focussed agenda. It is to destabilise the peace and harmony of a particular place, be it a State or a region. This is because they want to have their presence felt and have an audience that will be forced to hear their cause. In the past, when there was no internet, terrorist groups could not build bases for themselves around the world. With the emergence of the internet, it has become extremely easy for them to reach out to a wider audience through websites and with the creation of the social media, an individual interested in their cause is merely a click away. The space between both has shrunk, metaphorically speaking, and the closeness is perceptible and personal. The spread of propaganda has, thereby, become very easy through social media.

**Radhika Mohan Gupta and Muskan Mundra**

There are States in the world that have unstable governance, where the dissatisfaction with the government and its policies is pronounced and where the citizenry, especially the youth are looking for various pathways to express their anger and dissatisfaction. The social media provides that platform, but the matter becomes a dangerous one when individuals begin to join terrorist organisations to do so and to carry out subversive activities against the State. This is when terrorist groups begin to acquire large bases that spreads a terrorist organisation's reach beyond its own operational base. "For malicious actors seeking to influence a population through trends on social media, the best way to establish trends is to build a network of bot accounts programmed to tweet at regular intervals, respond to certain words or retweet when directed by a master account.[xv]" One terrorist organisation that has extensively deployed and exploited social media is the Islamic State. The "deployment and exploitation serves to reinforce their narratives to multiple audiences, contributes to recruitment and radicalisation[xvi]". Thereby, it has also posed as a threat to States, in the West, particularly. Through a systematic process of coercion and persuasion the ISIS has managed to gain a widespread base for itself [xvii](Prier 2017). However, at the same time, the social media is also being used to spread information against terrorist groups, in particular the IS by building an alternate propaganda against them based on true testimonials that also affects the same base as the terrorist groups do but points out the reality to them that a terrorist organisation is trying to influence them by and thereby deter them from doing so. A pilot programme was run by Alphabet inc. in 2015 that tried to gauge how social media can disengage potential interested individuals from the propaganda of terrorist organisations[xviii](Nyst 2019). Interestingly, "throughout its eight week pilot programme, the campaign reached an estimated 320,900 unique users who devoured over 500,000 minutes of online video content[xix](Nyst 2019). "With such power, social media now holds the potential to both empower and propagandize, secure and surveil, to create, and to destroy"[xx](Hamilton et. al. 2019)

CONCLUSION

The verdict is out. The social media is probably the most powerful mode of communication of today's times. This is because it bridges divides, whether geographical, political, social, economic, national, regional or international. It makes people feel a sense of familiarity with strangers and empathy and solidarity for a cause that they feel for. The ease of using social media through the easy and cheap availability of the mobile phone and data plans has led to the present day social media revolution. As this paper has proved, the impact of social media on politics and the State is perceptible. This is not only by the citizenry but also by non state actors like terrorist groups. The people use social media to discuss political opinion, voice their political views but also as a tool to speak out against oppressive authoritarian regimes. Social media has proved successful in such movements where there is widespread dissatisfaction against the State. It is also being used by terrorist organisations as a weapon against the State and to spread terror among the masses. It is being used by groups and people of multiple nature. This paper has attempted to look at how social media has been used by political authorities to disseminate information or propaganda, especially during elections and how the citizenry has reacted to the State through social media.

ABSTRACT

As augmented reality (AR) technology rapidly progresses, its application in mobile environments has witnessed extensive growth. This research project introduces an AR mobile application based on AR Foundation, with the objective of popularizing the AR lifestyle and allowing users to revel in the immersive fun of AR experiences. The main focus of this paper revolves around the utilization of the Vuforia Engine Database for scanning specific image targets uploaded by users. Upon successful recognition, virtual objects are superimposed onto the designated image targets. Users can then engage in functional operations by simply tapping the corresponding buttons displayed on their mobile phone screens, enabling logical transformations. Moreover, this project encompasses a web application that combines A-Frame and MindAR integration. For instance, when users interact with a particular social media icon on their mobile screens, they are seamlessly redirected to the respective person's social media account. The core intention behind this project is to present resumes in a modernized manner, departing from conventional approaches. Furthermore, this application greatly enhances the online and offline shopping experiences by providing users with a three-dimensional (3D) view of products, facilitating a more comprehensive understanding of the multi-dimensional development of intelligence.

Keywords: Virtual Networking Cards, Immersive Technology, Marker-based Interactive AR, Unity Engine, Vuforia Development Kit, Readyplayerme Avatar SDK, A-FRAME Development, MindAR Integration.

Sathiskumar et al.,

INTRODUCTION

Augmented Reality is an interactive experience of a real-world environment where the objects that reside in the real world are enhanced by computer generated perceptual information, sometimes across multiple sensory modalities, including visual, auditory, haptic, somatosensory and olfactory. Augmented reality (AR) is the integration of digital information with the user's environment in real time. Unlike Virtual reality (VR), which creates a totally artificial environment, AR users experience a real-world environment with generated perceptual information overlaid on top of it [1]. Virtual business cards are digital versions of traditional business cards that can be easily shared and accessed on electronic devices such as smartphones, tablets, and computers. They offer a more convenient and modern approach to exchanging contact information, and have become increasingly popular in recent years due to their many benefits.[2]. Virtual business cards can include all the standard information found on a traditional business card, such as the individual's name, job title, company name, phone number, email address, and website. Some virtual business card applications even allow for additional features such as links to social media profiles, videos, and personalized branding.

With virtual business cards, professionals can easily and quickly share their contact information with others through a simple tap or scan of a QR code. This eliminates the need for physical business cards and makes networking more efficient and environmentally friendly. Virtual business cards are also easy to update and can be personalized to suit individual needs and preferences. Overall, virtual business cards are a modern and practical solution for professionals who want to streamline their networking efforts and present themselves in a more professional manner. Sure, here is another example of an introduction to virtual business cards. In today's digital age, virtual business cards are becoming an increasingly popular and effective way to exchange contact information. With the rise of smartphones and other mobile devices, people are looking for more convenient and efficient ways to network and stay in touch with others. Virtual business cards offer a solution to this problem by providing a simple and effective way to share contact information electronically.

Virtual business cards are not only more convenient than traditional business cards, but they are also more environmentally friendly. By eliminating the need for physical cards, virtual business cards help to reduce waste and save natural resources. Additionally, virtual business cards are more cost-effective in the long run since they can be easily updated and don't require the expense of printing and shipping physical cards. As more and more professionals rely on technology to conduct business, virtual business cards have become an essential tool for networking and building relationships. With their ease of use and customization options, virtual business cards provide a modern and effective way to exchange contact information and make a lasting impression on potential clients, partners, and colleagues.

The objective of the paper are as follows:

- To improve the marketing features online
- To ease the business owners and professionals in facilitating their networking processes where a creative environment is offered to increase the traders' brands awareness
- To provide a business card in modern way as well as to reduce amount of money their spending for printing and designing their business cards
- To reduce the no. of demo mobiles phones or other products to produce for spending money
- To analyse and implement new way of business card sharing with additional features and functions by recognizing the markers on the card for enhancing the process of business card sharing

Problem Statement

The issue with the traditional business cards is that the people do not even retain the card's owner details, and for spending huge amount of money for printing business cards. Some persons (i.e. some persons are may be freelancers, working professionals, product sellers and etc...) want to create more engaging and interactive way for

Sathiskumar et al.,

professionals and sellers to share their information. Traditional business cards can be lost or forget, and don't provide a memorable or dynamic experience. I believe that augmented reality technology can provide a more immersive and innovative way to share their business cards in modern way.

Proposed Solution

However, I will create an android and web application that named as Virtual Business Cards that uses augmented Reality technology to display a digital business card when viewed through a smartphone, tablet or other computing devices. The Virtual Business Card will be customizable, allowing user to add their contact information, Social media profiles, Videos, Images and any other relevant information are added in single virtual business card. And also, this paper covers marketing features too means suppose a person want to buy a phone from mobile shop and that sellers shows the demo model as based on availability. So, my paper helps to reduce the demo models production cost. That means we can saw the model in 3D (3-Dimensional) view via our application with changeable models.[4]

Result Achieved

This paper deliberates the business perspective. Now, more peoples are using smart phones and they are active on social media platforms. Virtual business cards have not only made networking more efficient, but they have also provided a platform for individuals to showcase their personal brand. With customizable design options, professionals can create virtual business cards that reflect their unique style and personality. By including personalized branding, such as a company logo or a distinctive color scheme, virtual business cards can help individuals stand out from the competition and make a memorable impression on potential clients or partners. Additionally, virtual business cards can include multimedia elements such as videos or links to social media profiles, which can provide additional context and give recipients a deeper understanding of the individual's expertise or business offerings. Virtual business cards have also made it easier to manage and organize contact information. Virtual business card applications allow users to save and organize contact information in one place, making it easier to keep track of important contacts and follow up with them in the future. In addition, virtual business cards have become an important tool for remote work and virtual events. With more people working remotely and attending virtual events, virtual business cards offer a way to exchange contact information and stay connected in a digital setting. Overall, virtual business cards provide a versatile and customizable solution for networking and personal branding in the modern digital age.

Background Study

Before moving on further let's understand the basic concept of how augmented reality works? What are the methodologies is used to project a 3d object? And etc... The augmented reality basically uses Recognition, Tracking, Image unwrapping and etc. for rendering a 3D object. we will discuss one by one. Recognition is nothing but the identification of any object/media, such as a barcode, our devices has software's to scan & recognize a barcode, similarly recognition of human faces through security systems. Tracking in Augmented Reality (AR) finds for a specific pattern or image that an AR application can recognize. Once the application finds the pattern, it constantly tracks the position of the pattern in real world space. So that the application can accurately place a digital object onto the marker that is being tracked.[3].

Markers are generally square shaped and many people make use of black bordered image inside the main frame with white colour inside of it. It basically helps to separate marker from the background frame. Internal graphics of the marker are often displayed distorted or pixelated. Image unwrapping is a process to unwrap a part of the image. When recognizing the images, it is necessary to apply image unwrapping. Black and white image or grayscale image is very efficiently wrapped. Marker-based Augmented Reality works by scanning a marker which triggers an augmented experience (Whether an object, text, video or animation) to appear on top of the image target in the device. Fig.1 shows the Marker-Based Augmented Reality Application workflow. Virtual business cards can be traced back to the early days of electronic business cards, which were first introduced in the 1990s as a digital alternative to traditional business cards. These early electronic business cards were typically exchanged via email or file transfer and lacked the convenience and ease-of-use of modern virtual business card applications. However, with

**Sathiskumar et al.,**

the advent of smartphones and mobile devices, virtual business cards have become more prevalent and sophisticated. Today, there are numerous virtual business card applications available on various platforms such as Android, iOS, and web-based services, each offering unique features and customization options. The rise of virtual business cards can be attributed to several factors, including the need for more efficient and environmentally friendly networking practices, as well as the increasing reliance on technology in the business world. With more people working remotely and attending virtual events, virtual business cards have become an essential tool for staying connected and building professional relationships in a digital setting. Furthermore, virtual business cards have also become a platform for personal branding and self-promotion, with customizable design options and multimedia elements that can help individuals stand out from the competition. In conclusion, virtual business cards shows that they have evolved from early electronic business cards to modern digital tools for networking, personal branding, and contact management. Their popularity can be attributed to the need for more efficient and environmentally friendly networking practices, as well as the increasing reliance on technology in the business world.

METHODOLOGY

Traditional business cards have been a staple of professional networking for many years, but they have several disadvantages compared to more modern alternatives. One major disadvantage is that traditional business cards can be easily lost or misplaced. A study by statistic brain found that about 88% of business cards are thrown away within a week of being received, and only 9% are kept for longer than a year. This can make it difficult for people to follow up with contacts or remember important details from the meeting. Overall, Virtual business cards created through augmented reality offer several advantages over traditional physical business cards. They provide a more increased interactivity, improved information retention, are easily customizable, are portable, and are environmentally friendly. To develop an interactive Virtual Business Cards using marker based augmented reality that consists of buttons, Video players and etc. below procedure must be followed.

Procedure to be followed

- Firstly, download unity hub, recent unity version and Android studio. Create an account on Vuforia Developer portal. After that, create a new database in vuforia and upload the business card image target on vuforia developer portal.
- After that, download the Vuforia SDK (Software Development Kit) and download the database unity package too.
- Create a new unity project in unity hub and open it in unity. After that, delete the main camera and import vuforia SDK in unity. Then add the AR camera inside the sample scene.
- After that import the downloaded vuforia database package inside a scene. To add the license key in AR Camera properties panel. The license key available on vuforia developer portal.
- When we upload the image target in vuforia engine developer portal, based on the image the vuforia engine provides ratings. If rating is more than 3/5 the tracking done by more faster.
- After that we select the appropriate image from database inside a project and developing further user interface.
- When we finished the user interface, we use some c sharp to make animation and other working functionalities like when user click the particular button, they redirect to the appropriate location.
- For making better attractiveness we add some avatars using readyplayerme SDK.
- Finally, Build APK file using unity and android studio to install an application on android phone.
- Then we open that android application and place target image in front of the camera to see a final result.
- The android application works was done. Now, move on web application procedures.
- It's very easy in web application using normal html and JavaScript.
- Using AFRAME we create a 3D models effortlessly and using Mind AR (The JavaScript framework combined with three.js) this helps to provide augmented reality features.
- For our better user attractiveness we create an attractive user interface to get target images and other additional details of the user.

Sathiskumar *et al.*,

- For the dynamic experience, we use php server side scripting language for performing compiling options and other tasks and MySQL for database to store data.

Result Formulation

In this paper, the implementation of 3D Virtual Business Cards android application using unity, Vuforia SDK and Readyplayerme SDK provided results presented in the subsections below. Also, the alterations that need to be done while designing the card are specified in the subsections.

Project Creation

The very first step to creating a virtual business cards is to create a 3D project in unity after that delete the normal camera and import the vuforia SDK. After that, firstly change platform to Android by default it is windows. Then we add the AR camera inside the project.

Target Image upload in Vuforia Developer Portal

In the Virtual Business cards we using marker-based augmented reality technology. So, we need to upload image target into the database in Vuforia Developer portal. The very first step is to create an account in this portal and go to developer options and create a new database. For each database the vuforia developer portal generate a unique license key. Inside the database we upload image and it is providing star rating based on image classification (Fig.2). It uses Edge Detection Techniques generate pattern. For creating pattern they use lots of techniques that are the image is converted into gray scale, Image unwrapping and other algorithms. The rating must between 3/5 because more than 3 star rating provides better tracking features. It uses '+' sign for pattern creation(Fig.3). This is called feature points. After that we can able to download the database unity package and import the file into the project.[5]

User Interface Creation

After importing Vuforia database unity package we select the image target from the package and ready to design the buttons, adding avatars, Video players and etc. Using Readyplayerme SDK to add avatar on top of the image target. To add a rotation c sharp script (in Fig 4) into avatar object. This script helps to rotate the avatar. To create video player using build in functionalities we add a simple buttons for play, pause and stop performing the actions.

Final Result

After adding scripts, using canvas we create a button and to add other scripts to work the buttons efficiently. For creating video player we may create a plane and add the video clips on top of the image. Add the button that works play, pause and stop videos and use the default functions to that works. Fig.5 shows that the final result of virtual business cards. And another important thing is each 3D object and other components are child of the Image target. Because, when to tracking the target image only the child of the image target will be rendered as result. When the user clicks the appropriate buttons it is redirect to the user particular page. The output of the redirection shown in the Fig.6 and Fig.7. And the final result of virtual business cards android application marketing features are shown in Fig.8.

Usage of Virtual Business Cards

- With a virtual business cards, you don't have to carry around physical cards and worry about running out or losing them. You can easily share your contact information with others with just a few taps on your phone.
- Using virtual business cards is an eco-friendly way to exchange contact information. It reduces the use of paper and ink, which in turn helps to reduce your carbon footprint.
- Virtual business cards can be easily shared with people from all over the world. This makes it easier to network and build relationships with individuals who are not in your immediate vicinity.
- Printing physical business cards can be expensive, especially if you need to print large quantities or frequently update your information. Virtual business cards, on the other hand, are relatively inexpensive and can be easily updated as needed.

Sathiskumar *et al.*,

- Using a virtual business card application can help you present yourself in a more professional manner. It shows that you are up-to-date with latest technology and are willing to adapt to modern business practices.

The usage of virtual business cards are Convenience, Environmentally friendly, Accessibility, Cost-effective, Increased professionalism and etc. Overall, Virtual business cards are a great tool for professionals who want to streamline the process of exchanging contact information and make a positive impression on their peers.

Web Application result

The virtual business cards web application also provide a same result of the android application. But comparatively web application provide dynamic experience to the users. The Web application is done by the following technologies HTML, CSS => for User Interface

PHP => for Server side scripting and user data management system

MySQL => for managing user data and virtual business card data

AFRAME => is used to creating 3D objects and 3D assets

MINDAR => mindar help to work a web application using marker-based augmented reality.

Some of the code snippets of virtual business card web application are the following Fig.9 and Fig 10.

Login Page

This paper as mentioned earlier, Authenticate the web page is mandatory to create a virtual business cards. We are maintain the user's credentials as very secure. We use "Cryptographic hash function" to secure users password [6]. Before the user going to login page the user enter to welcome page with some welcome message. The welcome page of the virtual business cards web application in Fig.11. And login page of the virtual business cards shown the Fig.12.

Dashboard Page

If a user logs into the virtual business cards web application, they will be redirected to the dashboard page. Clicking the "Launch Dashboard" button grants the user access to create virtual business cards, with each user having their own allocated space. On this page, selecting the "Create New" button initially redirects the user to compile the target image using the open-source MINDAR image compiler. After completing the compilation process, the user can fill out a form with the appropriate details, resulting in the creation of a virtual business card on their page. Clicking the "Start" button for the virtual business cards prompts the webpage to request camera access from the user. Once access is granted, the user can display the target image in front of the camera, and the webpage will render the final output of the virtual business card. Fig.13 shows the dashboard page of virtual business cards web application.

Final Result

The above Fig.14 shows that the final output of virtual business cards web application.

All the users agreed that ARCards could benefits both the traders and companies. Besides, 86.7% of users rated ARCards in 5 stars. This indicates that the quality of ARCards is well approved by the users (Fig.15).[7]

CONCLUSION

This paper presented a Virtual Business Cards, a 3D business card android application as well as web application to overcome the challenges people face using a traditional business cards. Virtual business cards android applications provide a modern and convenient way to exchange contact information. They offer several benefits, such as convenience, environmental friendliness, accessibility, cost-effectiveness, and increased professionalism. By using virtual business cards, professionals can present themselves in a more efficient and professional manner, while reducing their carbon footprint and saving money on printing costs. With the increasing reliance on technology in business, virtual business cards are becoming an essential tool for individuals who want to keep up with the latest

Sathiskumar et al.,

trends and practices. Overall, Virtual Business Cards android application and web application are a useful and practical solution for professionals looking streamline their networking efforts and stay ahead of the competition.+

ABSTRACT

Human activities, notably religious ones, alongside the river have significantly impacted its water quality. Consistent reckless behaviours have now reached a point where water pollution will never be reversed, and the world will suffer a huge loss of biodiversity from aquatic ecosystems if suitable steps are not implemented. Every living thing on Earth will be affected by this loss in some way. Three samples of river water were taken from distinguished sites, and their physicochemical and microbiological parameters were analysed here. This study examined the physicochemical and microbiological makeup of river water samples collected from three sites in the Saran district of Bihar, India: Doriganj, Dighwara, and Pahleza ghat. The article presents the findings of post-monsoon research. The quality of river water was evaluated based on the parameters of Total Solids, pH, Temperature, BOD, DO, COD, Acidity, Alkalinity, Hardness, Electrical Conductivity, and elemental analysis. Based on the results of this study, we can conclude that surrounding human habitations and the discharge of household trash into the river are the primary causes of its pollution. Water contamination from household discharge is responsible for high hardness concentrations (171.69, 174.22, 211.4 mg/l) and total solids (211.21, 344.41, 395.65 mg/l). A larger microbial load was suggested by a lower concentration of dissolved oxygen in the water sample (9.61, 9.89, 9.92 ml/l) and elevated Coliform count (1.05×10^6

Sunil KR.Gupta and Prakash Chandra Gupta

to 1.67×10^6). Only by regulating how trash is thrown out near the river can we hope to improve the quality of the water there.

Keywords: BOD, alkalinity, correlation, post-monsoon, total plate count, coliforms

INTRODUCTION

It is impossible to grossly exaggerate the significance of water as the natural resource that occurs most often, is most widely dispersed, and is most vital to the preservation of life on Earth. The physico-chemistry and biology of river water make it a perfect environment for the development of marine life. The pollution of surface water and groundwater has been exacerbated by human activities such as increased industrialization, agricultural production, and other activities (Proshad *et al.*, 2018). The ecological strain that has been placed on the aquatic environment as a result of urbanization and other human activities is having an effect on the health of humans. It is possible to see, in the aquatic ecosystem, the degradation of the environment that is produced by human activity (Bhat *et al.*, 2018). The frequent and thoughtless dumping of waste from industry and households into freshwater rivers is a major contributor to water pollution, which in turn contributes to widespread water scarcity around the globe. As a result of this pattern of behaviour, fewer resources are now available to people as well as other species that live in the ecosystem. The availability of clean water is a challenge for many developed and developing countries. There are over 4.5 billion people in the globe who do not have access to basic sanitation services, and there are around 2.1 billion people who do not have access to clean drinking water (Ahmed *et al.*, 2021). According to a recent estimate conducted by the United Nations, by the year 2025, water scarcity might impact as much as two-thirds of the world's population. Economic water scarcity happens when there are sufficient supplies available, but insufficient infrastructure prevents them from being put to good use. Physical water scarcity occurs when there is insufficient supply to fulfil demand (Bhandari *et al.*, 2014).

It is a well-known fact that many nations with low per capita wealth do not have efficient industrial and environmental rules or infrastructure that may mitigate the effects of pollution. The lack of a reliable and efficient monitoring system for industrial pollution and the noncompliance with the regulatory processes are the primary factors that have contributed to the current state of affairs (Chidozie & Nwakanma, 2017). The unregulated dumping of countless tonnes of effluents into the lagoon, rivers, and streams had caused the aquatic ecology to deteriorate to a point where it was no longer healthy. After the disposal of waste compost that has not been treated, it is believed that the quality of the water bodies that are receiving the compost is harmed. The wastewater that is released is disseminated throughout the soil, which results in the death of some of the soil's microfauna and, thus, a reduction in the number of different soil microorganisms (Olaniyiet *et al.*, 2012).

Treatment of wastewater before discharge has emerged as a need in recent years and is essential for preventing water pollution. Analysing the water in bodies of water that are commonly utilized for traditional or household purposes or that are contaminated by industrial pollution is important. The inspection is going to disclose how much pollution and other toxins have been taken up by the water body. This will make it possible to create and execute methods for treating such water and preventing subsequent pollution of the water supply. An analysis of the water's physicochemical and microbiological characteristics may provide some insight into the various aspects that either directly or indirectly indicate the amount of pollution in the specific water. This insight can be achieved by gaining a better understanding of the water. This study sought to address this question by analysing the microbiological and physiochemical composition of river water samples taken from three locations in the Saran district of Bihar, India: Doriganj, Dighwara, and Pahleza ghat.

Sunil KR.Gupta and Prakash Chandra Gupta

MATERIALS AND METHODOLOGY

Sample Site Selection and Collection

For the purpose of the present investigation, river water samples were collected from Doriganj, Dighwara, and Pahleza Ghat, all of which are situated within the Saran district of Bihar, India. After being placed in sterile bottles, the post-monsoon water samples were transferred to the laboratory for further analysis as soon as they had been gathered. The materials in the laboratory were protected from direct sunlight and stored at room temperature at all times.

Microbial and Physicochemical Evaluation

The measurement of Total Solids, pH, Temperature, BOD, DO, COD, Acidity, Alkalinity, Hardness, Electrical Conductivity, and Elemental Analysis was performed for the three water samples that were obtained. All of the analysis was done in triplicate with a regular setting.

Microbes Estimation

The total plate count, the yeast and mould count, and the total Coliform count were the three parameters that were evaluated in the microbiological study of all three water samples. The TPC, YMC, and TCF abbreviations are all abbreviations for total plate count (TCC). Plate counts were performed using this Sabouraud dextrose agar medium, whereas TPC, YMC, and TCF were performed using this Plate count agar media. In the process of preparing the culture medium, a standardised composition was used, and pour plate and spread plate analyses were employed in order to evaluate the results.

pH, Electrical conductivity, and Total Solids

The pH values of the samples were measured using a digital pH metre (Mettler Toledo Five Easy Plus). A digital conductivity metre (AMPEREUS 3 in 1) was used to measure electrical conductivity, and the reading for the EC value was recorded in $\mu\text{S}/\text{cm}$. By using the gravimetric approach, which involves totally evaporating the water sample placed in the pre-weighed crucible, the total solid in the water sample was ascertained (Aniyikaiyeet *et al.*, 2019). Using the formula below, the change in crucible weight is utilised to calculate the total solids content per litre.

$$\text{Total Solids} \left(\frac{\text{mg}}{\text{L}} \right) = \frac{(A - B) \text{ in mg} * 1000}{\text{ml of sample}}$$

Alkalinity, Acidity, and Total Hardness

Samples of water were tested for their alkalinity, acidity, and total hardness using a Titrimetric method. Titration was performed from a wine-red to a blue endpoint using Eriochrome Black T as an indicator and 0.01M EDTA solution as the titrant to assess total hardness (Kumari. 2016). A phenolphthalein indicator and a mixed indicator were used to calculate the total alkalinity (100mg Bromocresol green and 20mg Methyl red) (Varale&Varale. 2013). Methyl orange and phenolphthalein were employed as indicators, and 0.02N sulphuric acid was utilised as the titrant, both of which were performed in a beaker (Sawyer *et al.*, 2000).

$$\text{Total Acidity} \left(\frac{\text{mg}}{\text{L}} \right) = \frac{\text{Titre value of sodium hydroxide (ml)} * N * 50 * 1000}{\text{ml of sample}}$$

Dissolved Oxygen, Chemical Oxygen Demand, and Biochemical Oxygen Demand

The samples were put through a series of assays very immediately after they were collected in order to ascertain the amounts of Dissolved Oxygen (DO), Chemical Oxygen Demand (COD), and Biochemical Oxygen Demand (BOD) (Deswati *et al.*, 2022). The approach of titrimetry was used throughout all three of the research projects. In order to compute BOD, a titration was performed using an Alkali-Azide reagent, a Starch indicator, and Sodium thiosulfate as the titrants. This was done in order to evaluate the decrease in dissolved oxygen content that occurred between

day 0 and day 5. We were able to determine the concentration of dissolved oxygen in ml/l by using Winkler's methodology (Divaharet *al.*, 2020).. For the purpose of determining the chemical oxygen requirement of the water sample, oxidising agents such as sulphuric acid and potassium dichromate were employed to break it down. After the titrimetric estimation stage, the digesting step comes next (Deswatiet *al.*, 2022).. The titrimetric estimation stage uses the Fermin indicator and 0.1M ferrous ammonium sulphate as the titrant. Each test was conducted concurrently with a "blank" analysis using sterile water. BOD was estimated using the following equation:

Blank correction = Titre value for Blank at D0 – Titre value for Blank at D5

Dilution factor = bottle volume / sample volume

$$BOD \frac{mg}{L} = \text{Titre value of sample at (D0 – D5)} - \text{Blank correction} * \text{dilution factor}$$

Dissolved Oxygen in the sample was calculated by the below given formula;

$$DO \frac{ml}{L} = \frac{(R - R \text{ Blank}) * V \text{ IO3} * N \text{ IO3} * E}{(R \text{ std} - R \text{ Blank}) * (V \text{ bottle} - V \text{ rgts})} - DO \text{ rgts}$$

Where,

R= volume of thiosulfate used to titre sample (ml); R std. = volume of thiosulfate used to titre standard (ml); R blank= volume of thiosulfate used to titre blank (ml); N IO3= Normality of standard KI solution (0.01N); V IO3= volume of standard (10ml); E= 5598 ml O₂/ equivalent; V bottle = volume of sample bottle (ml) - 200ml; DO rgts = oxygen added in reagents (0.0017ml O₂/L); V rgts = volume of reagents (2ml)

BOD was estimated using the following equation:

$$COD \frac{mg}{L} = \frac{(B - A) * 8000 * \text{Molarity of FAS}}{\text{Volume of sample}}$$

FAS= Ferrous ammonium sulphate

Quantitative evaluation of Sulphate and Phosphate

A spectrophotometric approach was used to analyse a water sample in order to identify the levels of sulphate and phosphate in the sample. The findings of this analysis were then compared to a standard curve. To determine the concentration of sulphate in the water sample, barium chloride crystals were first added, followed by a buffer solution consisting of 30 g of magnesium chloride, 5 g of sodium acetate, 0.111 g of sodium sulphate, and 20 ml of acetic acid (made up to 1000 ml), and finally the optical density of the water was measured at 420 nm (Sawyeret *al.*, 2000). The concentrations of sodium sulphate that were used to generate the standard curve were as follows: 149.13±0.012 mg/L, 154.64±0.021 mg/L, and 168.22±0.012 mg/L. Using a water sample that was 10 ml in volume and treating it with 2.5 ml of ammonium molybdate and 1 ml of hydrazine sulphate allowed for the determination of the phosphate content (1 ml). Incubation lasting thirty minutes at a temperature of sixty degrees Celsius produced an optical density value of 860 nm. A standard curve was generated by employing solutions of potassium dihydrogen phosphate at concentrations of 3.66±0.012 mg/l, 3.06±0.017 mg/l, 4.57±0.016 mg/l respectively. We were able to compute the phosphate and sulphate concentrations in mg/l. by using the following formula:

$$\text{Sulphate} \left(\frac{mg}{L} \right) = \frac{mg \text{ of sulphate} * 1000}{ml \text{ of sample}}$$

$$\text{Phosphate} \left(\frac{mg}{L} \right) = \frac{mg \text{ of phosphate} * 1000}{ml \text{ of sample}}$$

Sunil KR.Gupta and Prakash Chandra Gupta

Quantitative evaluation of Elements (Mg, Na, Ca, As, K, Cl & F)

Following the prescribed procedures from Indian Standard 3025 - Methods of Sampling and Test (Physical and Chemical) for Water and Wastewater, quantitative determinations of Calcium, Magnesium, Sodium, Potassium, and Arsenic were performed using Atomic Absorption Spectroscopy for the elemental analysis. Ca, Mg, As, Na, and K concentrations were determined according to IS3025 (P40), IS3025 (P46), IS3025 (P37), and IS3025 (P45) procedures, in that order. The method described in Indian Standard 3025-Part 60 was used to calculate the approximate fluoride concentration in the sample. From 0.012±0.001mg/l to 1.2±0.047mg/l of fluoride, the electrochemical technique approach is immediately applicable. When an aqueous solution containing fluoride ions is brought into contact with an electrode selective for that ion. The reference electrode and the measurement electrode end up at different potentials. According to the Nemst equation, the magnitude of this potential difference is directly related to the logarithm of the fluoride ion activity. Absorption of Atoms Atomic absorption spectroscopy is the foundation of the spectrophotometer's analytical capabilities. Metal ion detection in drinking water samples is where it really shines. When a sample solution is sucked into a flame, the element is reduced to its atomic vapour. Flame contains atoms of several elements. Some atoms are excited out of their ground states by the heat of a flame, but the vast majority remain there. The ground state atoms take in the radiation of a certain wavelength produced by the source, such as a hollow cathode lamp composed of that metal. The wavelength of the radiation emitted by the source or lamp is now close to that absorbed by the flame's atoms. This method was used to estimate the concentrations of Ca, Mg, As, Na, and K in water samples. Using silver nitrate (0.01N) as the titrant and potassium chromate (5%), an indication for the shift in colour from yellowish-green to reddish-brown at the endpoint, the chloride content of a water sample was assessed titrimetrically according to Mohr's Methodology (Standard. 2006; Aniyikaiyeet *al.*, 2019). Using the following formula, we were able to predict the chloride concentration:

$$\text{Total Chloride } \left(\frac{\text{mg}}{\text{L}}\right) = \frac{\text{Titre value (ml)} * \text{Nof Silver nitrate} * 35.45 * 1000}{\text{ml of sample}}$$

Where, N of silver nitrate = 0.01N

RESULTS AND DISCUSSION

River water samples from Doriganj, Dighwara, and Pahleza Ghat were obtained for this study. All three of these locations are in the Saran district of Bihar, India. Physiochemical of post-monsoon collected three samples with their average value analysis accompanied by standard deviation are represented in Figure 1 and 2.

Microbial Analysis

Microbiological analysis included plate count, yeast and mould count, and total coliform count. For sterility, the experiment was done under laminar airflow. For complete sterility, culture medium and experimental glassware were autoclaved for 15 minutes at 121 °C and 15 pounds per square inch. In Table 1, triplicate microbial analysis experiment results of are shown with the possible standard deviation. From the analysis it is clear that on Nutrient agar media, Total plate count was highest in S3 (1.64x 10⁶) (Figure 4). Further, with the help of MacConkey agar media specialized Total Coliform Count was found to be more in S2 (1.95x 10⁶) (Figure 3). Total yeast and mold count was found on SDA which was more in S1 (1.48 x 10⁵) (Figure 5).

pH, Electrical Conductivity, and Total Solids analysis

The production of nutrients and minerals in the human body is suspended if the pH is below 6.5. The water becomes saltier if the pH is higher than 8.5. If the pH of the water is higher than 11, it also affects the skin and eyes. The rainwater has a pH of 5.5–6, which makes it dangerous to consume since it lacks any beneficial minerals. In this work, post-monsoon pH levels were assessed using pH electrodes. A water body's electrical conductivity indicates its capacity to carry an electric current. The total solids content of wastewater has important implications for managing the biological and physical processes involved in wastewater treatment. The maximum turbidity and EC

**Sunil KR.Gupta and Prakash Chandra Gupta**

value in the river water are both caused by the biggest quantity of total solids. The amount of TS in the water is a good predictor of the damage caused by runoff from cities and farms. Soil degradation in the neighbouring watershed and a large amount of suspended solids from home effluents or local sewage were blamed for the rise in TS. A mercury thermometer measured water sample temperatures in °C. The thermometer was dipped in water sample and left for 5 minutes before recording the temperature in °C. In Table 2, triplicate experiment results of pH, Electrical Conductivity, Temperature and Total Solids are shown with the possible standard deviation.

Alkalinity, Acidity, and Total Hardness

The alkalinity of water indicates its ability to buffer acidity. The degree to which water may precipitate soap is a classic indicator of its hardness. Due to the interactions of the hardness ions with the soap, more soap is required to accomplish the same amount of cleaning as the hardness of the water rises. Hardness is often defined chemically as the total concentration of polyvalent cations in the water. The pH value at which water begins to react with a strong base is used as a measure of how acidic the liquid is. Titrimetric analysis was used to determine the alkalinity, acidity, and total hardness of water samples. In Table 3, triplicate experiment results of Alkalinity, Acidity, and Total Hardness are shown with the possible standard deviation.

Dissolved Oxygen, Chemical Oxygen Demand, and Biochemical Oxygen Demand

A water's biochemical oxygen demand (BOD) is equal to the total quantity of dissolved oxygen used by living organisms during the decomposition of organic materials. How much oxygen must be added to chemically oxidise a sample of water is known as its chemical oxygen demand. The biochemical oxygen demand measures how much oxygen will be used by bacteria and other aerobic microorganisms as they break down organic materials in an aerobic environment. The chemical oxidation (degeneration) of organic contaminants in the water is quantified by the Chemical oxygen demand measurement. In Table 4, triplicate experiment results of Dissolved Oxygen, COD, and BOD are shown with the possible standard deviation.

Quantitative analysis of Sulphate and Phosphate

A water sample was analysed for sulphate and phosphate using spectrophotometry. Barium chloride crystals were added first, followed by a buffer solution of 30 g of magnesium chloride, 5 g of sodium acetate, 0.111 g of sodium sulphate, and 20 ml of acetic acid (made up to 1000 ml), and the water's optical density was measured at 420 nm to determine the sulphate concentration. The standard curve was generated using sodium sulphate concentrations of 149.13 ± 0.012 , 154.64 ± 0.021 , and 168.22 ± 0.012 . Phosphate concentration was determined by treating a 10-ml water sample with 2.5 ml ammonium molybdate and 1 ml hydrazine sulphate. (1 ml). An optical density of 860 nm was achieved after 30 minutes of 60°C incubation. In Table 5, triplicate experiment results of Sulphate and Phosphate are shown with the possible standard deviation.

Quantitative evaluation of Elements (Mg, Na, Ca, As, K, Cl & F)

Atomic Absorption Spectroscopy was used for elemental analysis of Calcium, Magnesium, Sodium, Potassium, and Arsenic, following Indian Standard 3025 - Methods of Sampling and Test (Physical and Chemical) for Water and Wastewater. In order, Ca, Mg, As, Na, and K concentrations were measured using IS3025 (P40), (P46), (P37), and (P45) techniques. Indian Standard 3025-Part 60 was utilised to estimate sample fluoride levels. Electrochemical techniques are suitable from $0.012 \pm 0.001 \text{ mg/l}$ to $1.2 \pm 0.047 \text{ mg/l}$ of fluoride. When a fluoride-containing aqueous solution contacts a selective electrode. Reference and measurement electrodes have different potentials. The Nernst equation states that the logarithm of fluoride ion activity determines this potential difference. Atomic Absorption Analytical spectrophotometers use atomic absorption spectroscopy. It excels in drinking water metal ion detection. A flame converts a sample solution to atomic vapour. Flames include several components. Flame heat excites some atoms, while most stay in their ground states. A hollow cathode lamp made of that metal emits radiation of a given wavelength, which the ground state atoms absorb. The source or lamp's radiation wavelength is near to the flame's atoms'. This approach estimated water sample Ca, Mg, As, Na, and K contents. According to Mohr's Methodology, a water sample's chloride concentration was measured titrimetrically using silver nitrate (0.01N) as the titrant and potassium chromate (5%), which changes colour from yellowish-green to reddish-brown at the endpoint. In Table 6,

**Sunil KR.Gupta and Prakash Chandra Gupta**

triplicate experiment results of Chlorine, Magnesium, Calcium, Fluoride, Arsenic, Sodium, and Potassium are shown with the possible standard deviation.

Correlation analysis

Excel was used in order to carry out the correlation study. It is evident, based on the correlation matrixes 1, 2, and 3 (Table 7-9), that BOD has a very high correlation with hardness, scoring 0.86. The score of 0.75 indicates a correlation between total solids and hardness in the sample. The coefficient of correlation between total solids and BOD is 0.31, which is the lowest possible value. Total solids, on the other hand, have a strong relationship with both COD and electrical conductivity. In addition, a negative correlation may be shown between acidity and temperature and total solids. In addition, after analysing the connection between total solids and elements, it was discovered that total solids had a strong relationship with sodium, phosphate, calcium, sulphate, and potassium. This was the conclusion reached after analysing the correlation between total solids and elements. On the other hand, the correlation between total solids and chlorine is inverse.

DISCUSSION

Water quality is not a constant state of a system and so cannot be reduced to the value of a single metric. According to the Central Pollution Control Board, the water quality of India's main rivers did not considerably improve during the lockdown enforced to curb the spread of the new coronavirus illness (COVID-19) epidemic (Aman *et al.*, 2020). The chemical, physical, and biological components of a water body all contribute to that water's overall quality. These variables allow for direct source tracing and provide insight into water contamination levels (Champanet *et al.*, 2013). The absorption of carbon dioxide and bicarbonates, ultimately responsible for the change in pH, slows down as a result of the lower rate of photosynthetic activities. The samples' temperatures ranged from around 21°C to about 23°C. Water samples had pH readings within the desirable range. The river water samples used in this analysis indicated a dissolved oxygen concentration of between, which is close to the optimal value of 9.0 ml/L, which is required for the survival of aquatic life. Alkalinity is a measurement of a substance's capacity to neutralise acids (Ren, 2022). The maximum alkalinity status of water was found in sample S3 (114.66 mg/L), whereas the lowest was found in sample S1 (78.91 mg/L), suggesting the discharge of some alkali, either from an industrial or a home source, near the location of sample S3 (Pahleza ghat, Bihar). Nevertheless, S3 was determined to have the lowest acidity, at 41.95 mg/L. The high concentrations of calcium and magnesium salts render the water undrinkable. Increased river hardness is caused by a rise in eutrophication, which in turn raises pollutant levels. All three samples had quite high hardness readings S3 recorded the highest value. Chlorine is easily dissolved in water and has a high toxicity level, making it an indicator of rising human influence. Chlorine levels in this investigation were quite low, ranging from 9.30 mg/L to 13.31 mg/L.

When there are more solids than water can dissolve, the density of the water rises, making it less suitable for human consumption or irrigation. Total solids were found to be greater in sample S3 (395.65 mg/L) in the current investigation, and lower in sample S1, with a value of 211.21 mg/L. Biochemical oxygen demand is calculated to infer the concentration of organic molecules in water. More oxygen is needed by the microorganisms in order to oxidise more organic materials. S3 has the highest estimated BOD, at 4.71 m1/L.

Pollution from human activities raises metal levels to unsafe levels in the environment, especially in water supplies. Main human causes of water pollution include: industrial wastewater; agricultural drainage water; sewage water; and oil pollution (Sankhla *et al.*, 2016). The S1 sample had the greatest chlorine content (13.31 mg/L). The microbial load is a biological metric that impacts water quality in addition to the physio-chemical parameters. Once the Coliform load drops below 4 Coliform/100m1, the water is considered safe for human consumption. Insight into the harmful effects of pollution brought about by human settlements around the individual water bodies may be gained directly from the coliform count. The high levels of Coliform in these bodies of water suggested that they were being polluted by human waste from surrounding communities or from people defecating in the open. Common causes of

**Sunil KR.Gupta and Prakash Chandra Gupta**

fungal contamination in samples include incorrect drying and curing, standing water, dead plant debris, external contamination, and inappropriate storage. Winnowing sieve filtration (typical in Mali), cloth filtration (typical in rural India, Mali, and southern Niger), clay vessel filtration (typical in Egypt), plant material filtration (typical in Tamil Nadu and Kerala, India), and the Jempeng stone filter method are all examples of traditional water purification techniques (used in Bali, Indonesia). The Kanchan Arsenic Filter, the Ceramic Water Filter, the Nanofilter, the LifeStraw, and the Sun Water Disinfection System (SODIS) are all examples of cutting-edge water purification systems (Adeniyi. 2020). In contrast, modern water treatment methods use cutting-edge laboratory technology to disinfect water and eliminate harmful contaminants, making it suitable for human consumption. The filtration efficiency of traditional water treatment technologies is based on their use of simple techniques (Adeniyi. 2020).

CONCLUSION

Based on the results of this research, none of the water samples that were collected in the Saran district of the state of Bihar in India (which includes the cities of Doriganj, Dighwara, and Pahleza ghat) are fit for human consumption. These water samples should not be used for human consumption because they have a high total solids value, a high hardness value, and a big population of coliform bacteria. The poor quality of these water sources is considerably contributed to by the discharge of domestic waste from neighbouring communities as well as the practise of open defecation. The low BOD and DO values are a reflection of the substantial microbial load that is present. This problem can only be solved by closely monitoring the sort of discharge the river is making, improving waste management, and increasing human activity along the river's banks. We need action from the government in order to resolve this issue and improve the water quality in this river. Electro-osmosis, ion exchange, electro-kinetic sludge activation, and phytoextraction are just a few of the many laboratory and field treatments that have been developed for addressing the issue of heavy metals pollution. Traditional approaches to water purification include processes such as aeration, coagulation, floatation, ion exchange, membrane filtration, electrochemical treatment, and precipitation, amongst others. It has been discovered that management techniques need to take into account the dynamics of ecosystems in order to guarantee the long-term sustainability of exploiting aquatic resources for human purposes. It is of the utmost significance to take measures to protect aquatic ecosystems and human health all around the world.

ABSTRACT

Apostol's theorem is applied to Euler totient and Möbius functions.

Keywords: Möbius function, Multiplicative arithmetic function, Euler totient function, Sum of divisors function.

INTRODUCTION

We know the following Apostol's theorem [1-3] for any multiplicative arithmetic function f :

$$\text{If } \prod_{n=1}^{\infty} (1 - q^n)^{\frac{f(n)}{n}} = \sum_{j=0}^{\infty} R(j) q^j, \quad R(0) = 1 \quad \therefore \quad n R(n) = - \sum_{j=1}^n (f \cdot e)(j) R(n-j), \quad n \geq 1, \quad (1)$$

with the Dirichlet convolution [4]:

$$(f \cdot e)(j) = \sum_{d|j} f(d) e\left(\frac{j}{d}\right) = \sum_{d|j} f(d). \quad (2)$$

In Sec. 2 we apply (1) to Euler totient and Möbius functions.

Sivaraman et al.,

Three applications of the theorem (1)

a).- $f(n) = \mu(n)$, Möbius function [1, 3, 4-6].

We have that $(\mu \cdot e)(j) = e_0(j) = \delta_{1j}$, then from (1):

$$n R(n) = -R(n-1) \quad \therefore \quad R(j) = \frac{(-1)^j}{j!}, \quad j \geq 0, \tag{3}$$

thus we deduce the Bellman identity [2, 7-9]:

$$\prod_{n=1}^{\infty} (1 - q^n)^{\frac{\mu(n)}{n}} = \sum_{j=0}^{\infty} \frac{(-q)^j}{j!} = e^{-q}. \tag{4}$$

b).- $f(n) = \varphi(n)$, Euler totient function [1, 3, 4, 10, 11].

Now $(\varphi \cdot e)(j) = I(n) = j$, then (1) implies the recurrence relation $n R(n) = -\sum_{j=1}^n j R(n-j)$, whose solution is given by:

$$R(n) = \sum_{j=0}^n \frac{(-1)^j}{j!} \binom{n-1}{j-1} = \frac{1}{n!} B_n(-1!, -2!, \dots, -n!), \tag{5}$$

in terms of the complete Bell polynomials [12]; therefore (1) gives the property [2, 9]:

$$\prod_{n=1}^{\infty} (1 - q^n)^{\frac{\varphi(n)}{n}} = \sum_{r=0}^{\infty} \sum_{j=0}^r \frac{(-1)^j}{j!} \binom{r-1}{j-1} q^r = e^{-\frac{q}{1-q}}. \tag{6}$$

c).- $f(n) = I(n) = n$.

We have that $(I \cdot e)(n) = \sigma(n)$, the sum of divisors function [1, 3, 4, 13], thus [14]:

$$n R(n) = -\sum_{j=1}^n \sigma(j) R(n-j) \quad \therefore \quad R(j) = a(j) = \begin{cases} 0, & j \neq \frac{m}{2}(3m+1), \\ (-1)^m, & j = \frac{m}{2}(3m+1), \end{cases} \quad m = 0, \pm 1, \pm 2, \dots \tag{7}$$

and:

$$\prod_{n=1}^{\infty} (1 - q^n) = \sum_{j=0}^{\infty} a(j) q^j.$$

ABSTRACT

This research paper presents a quadcopter drone configuration utilizing an APM flight controller, which holds significant potential for diverse applications among students and researchers. The initial phase of the study involves determining the necessary thrust to lift the drone's weight. The research encompasses the design specifications and calculations essential for developing drones intended for piloting by APM air traffic controllers. Furthermore, the paper concludes with comprehensive manufacturing tests and observations that evaluate the stability of the drone's flight characteristics.

Keywords: APM, quadcopter, controllers, design

INTRODUCTION

Air traffic controllers are a key component of a drone's control system. They act as the brains of the drone, processing sensor data and providing stabilization and control signals to the motors. Choosing the right flight controller can make a big difference in your drone's performance and stability. In the context of entry-level drones, it is important to choose a flight controller that is easy to use and requires minimal configuration. In this regard, the APM (ArduPilot Mega) flight controller is an excellent choice. APM is an open-source autopilot system widely used in the drone industry, especially in drone DIY projects and research. Compared to other flight controllers such as KK2 and QSite,

Ajay Vishwathet al.,

APM is more stable and reliable. It features robust firmware that is constantly updated and improved by a large community of developers. APM supports a wide range of sensors such as GPS, magnetometer, barometer, and accelerometer, allowing you to control your drone with precision and precision. APM's advantage over KK2 and QSite is that it offers advanced features and customization options. APM allows users to configure their drones through an easy-to-use and intuitive graphical user interface (GUI). Additionally, APM supports a variety of flight modes, including manual, stabilized, and autonomous modes, making it ideal for a wide variety of applications and use cases. KK2 and QSite are also popular flight controllers, but are generally less stable and reliable than APM. Achieving stable flight may require more configuration and calibration, which can be difficult for beginners. APM, on the other hand, requires basic troubleshooting settings that are easy to use even for inexperienced users. In summary, ease of use and stability are important priorities when choosing a flight controller for your entry-level drone. APM flight controllers are ideal for this purpose as they are easy to set up and provide stable and reliable flight performance.

LITERATURE REVIEW

On each loop cycle, the vehicle reads the inertial measurement unit (IMU) and runs the state estimator, trajectory evaluator, and position controller. Therefore, we implement our own object tracker based on the Iterative Closest Point (ICP) algorithm [13], which receives only the raw point cloud from the motion capture system and processes identical marker placements. The filter is driven by an IMU measurement at 500 Hz to estimate the states (p, v, q). Our EKF implementation follows an indirect error-state approach [14], [15] where IMU measurements drive the dynamic integration and filters estimate the error and covariance of this integration. Our system makes full use of vehicle onboard computations to enable robustness against unreliable communications and a variety of trajectory planning methods that require little wireless bandwidth. [1]

The radio control sends a PWM signal to the quadcopter. The controller sends his PWM signal to the motor. according to A PWM signal will rotate the four motors to make the quadcopter hover in the air. system design. The hardware model consists of a flight controller board, an electronic speed controller (ESC), and a BLDC motor and a propeller. Flight control board: The Arduino Mega Board is used to control the quadcopter. Equations 4, 5, and 6 model the dynamic pitch, roll, and yaw movements of a quadcopter. The reference signal is the pitch or roll or yaw of the PID. A block diagram of a quadcopter pitch, roll and yaw simulation is shown in FIG. These plot the quadcopter's pitch, roll, and yaw responses. The yaw response in Figure 7 differs from the roll and pitch responses for the following reasons. To stabilize, the P, I, and D gains should be readjusted. PID logic is implemented I've had success with MATLAB. The quadcopter's functionality and performance were tested and the desired output was achieved using a PID controller. [2].

A fatigue analysis using ANSYS Workbench is therefore performed on the optimized monocoque structure to analyses its service life. Experimental analysis with shaker To validate the simulation results, tests are performed using a vibrating shaker. Stress analysis therefore combines the measured strain with other properties to calculate the stress value under that loading condition. Based on the requirements, a 1-LY41-6/350 linear strain gauge is used and glued to the arm of the quadcopter as shown in Figure 19. The quadcopter arm load is experimentally measured at 50% throttle and compared with simulation results. Measure the aerodynamic performance of the developed quadcopter using CFD and wind tunnel testing. Similarly, he performed his CFD analysis for varying his AOA and the results are shown in Table 14. The purpose of wind tunnel testing is to validate the drag obtained from CFD analysis simulation.[3].

Basic Building Blocks The flight controller sends signals to the electronic speed controller (ESC) and the data sent changes. Flight drone controllers usually have a main microprocessor model, more commonly a 32-bit microprocessor from STM Electronics. The basic elements of a drone are the frame, propellers, BLDC motors, batteries, electronic sensors, GPS and payload (camera or spray system). A model pesticide that is mainly sprayed on quadcopters. A roll is when the model rotates around the x-body axis. Rotation on the y-axis is done by rotors 2 and 4 while maintaining

Ajay Vishwathet *et al.*,

the same angular velocity. Pitch is when the model rotates around her Y-axis of the body. This is the angular velocity of the rotor on the x-body axis. Matching this force to the body frame F_b requires multiplication by a suitable rotation matrix model, requiring knowledge of the supply voltage, the current through the motor coils, and the back EMF. Supply Voltage (V) / Motor Coil Current (A) - IA Back EMF ea. Armature Resistance - R_a Shaft Angular Velocity (rad/s) Therefore, the motor equation is expressed as can do. [4]

APM controlled drone Design

Designing an APM (ArduPilot Mega) controlled drone involves several steps, including selecting the appropriate components, building the drone frame, and configuring the APM software. Below is a step-by-step guide to designing an APM-controlled drone. [5]. The quadcopter need to be designed in such a way keeping in the mid that the thrust produced by the motors with propellers is more than the weight of the quadcopter. The propeller works under the principle that High pressure always moves towards low pressure, so the air under the propeller is pushed up towards the air above the propeller. The central propeller is "lifted" by the air force perpendicular to the propeller. [6],

To Select our drone's components, including motors, propellers, electronic speed control (ESC), batteries, and radio transceivers, we need to make sure our components are compatible with our APM software.[7],[8]. To Create a drone frame, we need to Design and build drone frames which can be done using carbon fiber, aluminum or other lightweight materials. The frame should be strong enough to hold the components and give the drone stability.[9]. To Install components, Install the motors, propellers, ESC, and battery to the drone frame and make sure everything is tight and connected properly [10]. To Install APM software, we need to Download and install the APM software on PC and connect it with our drone's flight controller through USB. This software allows us to control the flight of our drone and monitor its performance. Then need to configure APM software. Configure the APM software for our drone's components and specifications includes radio transmitter and receiver setup, ESC calibration, and flight mode settings [11]. To test our drone, we need to perform a test flight to make sure everything works. Make sure to test the drone in a safe, open area away from people and objects. Make the necessary adjustments to the drone's flight characteristics, such asPID setting or control rate. Fine-tuning our drone will optimize performance and make it easier to fly. Overall, developing an APM-controlled drone requires careful planning and attention to detail. By following these steps, you can create a reliable and powerful drone that can be used in a variety of applications.

Parts used in Drone

A2212/10T 1400kv brushless motor

The A2212/10T 1400kv is a brushless DC motor widely used in small to medium multi-rotor drones, airplanes and other RC vehicles. Here's a breakdown of the specifications.

A2212/10T:

The model number of the engine. It refers to its size and shape and also contains information about the inner workings of the engine.

1400kV:

This is the motor's "kv" rating, which refers to the speed (revolutions per minute) the motor turns for each volt of current supplied. In this case the motor has a kV rating of 1400. That means it spins at 1400 rpm per volt. 10T:

It refers to the number of turns of wire in the motor's stator, which is the stationary part of the motor that surrounds the rotating rotor.Overall, the A2212/10T 1400kV motor is popular for small to medium size he RC vehicles due to its relatively high power and efficiency, compact size and light weight

ESC brushless motor controller

ESC (Electronic Speed Controller) is an electronic circuit that controls the speed of a brushless motor. Brushless motors are commonly used in drones, remote control cars, and other applications that require precise motor speed and direction control. The ESC receives a signal from a controller (such as a radio transmitter in the case of a drone) and uses that signal to adjust the amount of power sent to the motors. This allows precise control of motor speed and

Ajay Vishwathet *et al.*,

direction. Overall, ESCs are an essential component in controlling the speed and direction of brushless motors, and careful selection of the right ESC is critical for optimal performance and reliability. There are different types of ESCs with different specs and features. Some ESCs are designed for specific motor types, while others are designed for more general purposes. Important factors to consider when choosing an ESC include maximum current and voltage ratings, number of motor outputs, and type of communication protocol used to connect to the controller. It has

Fly Sky Fs-i6X

Fly sky FS-i6X is a popular 6-channel radio transmitter widely used in RC hobby applications such as controlling drones, RC cars, boats and planes. It features an easy-to-use interface, 10 programmable channels, and support for multiple models. The FS-i6X also comes with a receiver that can be bound to the transmitter for wireless communication. FS-i6X has many features and is a favourite among enthusiasts. It features a large backlit LCD display that provides real-time telemetry data such as battery voltage and signal strength. The transmitter also has a built-in trainer function, allowing an experienced pilot to remotely control the model to train a less experienced pilot. Additionally, the FS-i6X has a wide range of customization options, including the ability to adjust stick sensitivity, trim settings, and throttle response. It can also be used in conjunction with simulators for training purposes. Overall, the Fly sky FS-i6X is a versatile and reliable transmitter, popular among RC enthusiasts due to its affordable price and feature set.[12]

Lipo battery 3300 Mah

A LiPo (Lithium Polymer) battery with a capacity of 3300mAh means that the battery can store a total of 3300 mAh. The larger the battery, the longer it can power our device before it needs to be recharged. mAh (milliampere hour) is a unit of measurement used to describe battery capacity. This represents the amount of power the battery can deliver in one hour. For example, a 3300 mAh battery can deliver 3300 milliamps (or 3.3 amps) in one hour before being completely drained. It is important to note that actual battery life and performance may vary due to various factors such as voltage, temperature, discharge rate and power source of our particular device. It is also important to follow proper LiPo battery handling and charging procedures to ensure safe and reliable operation.

Propeller in drone

Propellers are a key component of a drone's propulsion system. This is responsible for generating the lift and thrust that allows the drone to move through the air and fly. Most drones use four propellers, two rotating clockwise and two rotating counter clockwise. The propellers work in pairs, with two clockwise propellers rotating in opposite directions to two counter clockwise propellers. This design helps balance the drone in flight and prevent it from spinning. The propellers themselves are typically made from lightweight materials such as plastic or carbon fibre. They are attached to the motor via a locking mechanism, allowing them to rotate freely. The size and shape of the propellers will depend on the size and weight of our drone, as well as our desired speed and manoeuvrability. Larger propellers tend to provide more lift and are better suited for larger drones or drones with heavier payloads, while smaller propellers are lighter and easier to manoeuvre, making them better suited for smaller, easier-to-manoeuvre drones. It is important to note that propellers can be dangerous if not handled properly. Drones should always be handled with care and it is recommended to wear protective equipment when handling drones and their components [13]

Imax B6AC

The Imax B6AC is a general balance charger and discharger for Lithium Ion, Lithium Polymer, Nickel Cadmium, NiMH and Lead Acid batteries. Commonly used in the RC (radio controlled) hobby community, but can also be used for other applications where battery charging and maintenance is required. The B6AC has a maximum charge current of 5 amps and a maximum discharge current of 1 amp. A built-in balancer ensures that each cell in the battery pack is charged and discharged evenly, maximizing battery life and performance. The charger can charge and discharge up to 6 cells in Lithium Ion or Lithium Polymer battery packs and up to 15 cells in Nickel Cadmium or NiMH battery packs. The B6AC is also equipped with various safety features such as over current, overvoltage and short circuit protection. It has a user-friendly interface with an LCD screen that displays important information such as battery voltage,

Ajay Vishwathet *et al.*,

charging current and charging time. The charger can be powered by an AC wall adapter or a DC power source such as a car battery or AC adapter. Overall, the Imax B6AC is a reliable and versatile charger that is widely used by the RC hobby community and beyond. It can charge and maintain a wide range of battery types and sizes and has many safety features to prevent damage to the battery and the charger itself [14]

Fabrication process

The term "manufacturing process" may refer to a wide range of manufacturing techniques used to create various types of products. The specific details of the manufacturing process will vary depending on the product being manufactured, the materials and processes used. However, a general overview of the manufacturing process is as follows.[15]

Design

The first step in the manufacturing process is to design the product using engineering graphics tools on a chart paper or CAD (Computer Aided Design) software. Though Engineering graphics drawing would give one the all information of a product or component in the 2D perspective, CAD model is the conventional one.

Material selection

The next step is to choose the right material for our product. This may include the type of metal, plastic, or other material used, as well as the selection of coatings, finishes, or other finishes. The material chosen here is glass fibre for both drone frame and propellers because of its light weight as well as the strength it has to carry all the components of the drone.

Frame selection

The selection of frame involves the number of motors needed to lift the payload as well as the self-weight of the drone itself. Though the material of the frame is chosen in our previous step, other features of frame like frame type is more important. The frame type used should be available in the frame type selection menu in APM Mission planner software as well it should solve the mission decided by the user. Here we use the conventional X type quadcopter that has 4 motors to fly the drone,

Motor assembly

Once you've chosen our frame type, the choosing the motors pushes your engineering skills towards the extremes of Electronics engineering as well Mechanical engineering. The motor needs to be chosen in such a way that the total thrust by produced by the individual motor multiplied by the number of motors would give you the more lift force than the weight force acting due to the gravity. We have calculated the weight first then as per the weight requirement of thrust and for thrust the required we take the A2212/10T 1400kv brushless thrust motor we take and then .and as power the capacity of motor requirement the we take the ESC brushless motor controller [16].

Motor ESC Selection

This part of the fabrication is the most crucial step for any drone engineer, though it would take a separate research paper to explain this selection process, it would be easy if anyone refer to the research manuscript [17]. The motor has three terminals which need to be connected with three terminals of ESC. Further the ESC has two terminals on the other side as seen in figures in previous section, which could be connected with the positive and negative terminals of the battery, but since we need four motors indeed, we would be requiring four Esc and all these ESCs need to be connected in parallel to the LiPO battery though a power distribution board which would distribute the power from the battery among the motors.

Power Module

The power distribution module would distribute the power from battery among the motors, but we also need a means to power the Flight Controller which would be handles by the Power Module which is specially designed for APM flight controller.

Ajay Vishwathet *et al.*,

APM Troubleshooting procedures

The Arduino Compatible Straight Needle Board with integrated 4MB data flash chip for automatic data logging is a custom board designed for a specific project or application. Such boards can automatically record data from sensors and other sources without the need for external data storage devices. A straight pin head on the board makes it compatible with Arduino shields, making it easy to expand and customize. An onboard data flash chip provides a convenient and reliable storage solution for log data. To use such a board, you need to connect a sensor or other data source to the appropriate input pins on the board and write firmware that connects to the sensor and records the data to an onboard flash chip. Depending on the specific application, it may be necessary to insert code to communicate with the card through a serial connection or other interface. Overall, an Arduino-compatible straight needle board with an integrated data flash chip for automatic data logging could be a powerful tool for collecting and analyzing data in a variety of applications, from environmental monitoring to industrial automation available. [18]

Choose the right microcontroller:

The microcontroller should be compatible with the Arduino IDE and have enough memory for data logging. A popular choice for Arduino projects, the ATmega328P has 32KB of Flash memory and 2KB of SRAM, but our specific needs may require a more powerful microcontroller. APM is such a microcontroller that has all these features inbuilt that make user easy to install and fly the drones.

Select the appropriate data flashchip

There are many options for data flash chips with different capacities and communication protocols. The chip should be compatible with the microcontroller and have enough capacity to store the data that needs to be logged. The data here for the drone would be the sensor information that were gathered from the surrounding environment, as well as the variation the drone has caused from its initial position like angles and displacement which would be derived from the velocity and location of the drone using PID controller that is inbuilt with this APM flight controller.

Design board

The board should include a microcontroller, data flash chip, and other necessary components such as voltage regulators and capacitors. The board should also contain straight pinheads to be compatible with the Arduino shield. Such board is what is APM flight controller, that would be user friendly and has all the necessary pins for one to interface sensors and other devices.

Burn the firmware

The firmware must contain code to interface with the data flash chip and record the desired data. You may also need to write code to communicate with our card over a serial connection or some other interface.

Test and debug

Once the board is assembled and programmed, it is thoroughly tested to ensure it is recording data correctly. Debug any problems you encounter and optimize the firmware if necessary.

Mission planer troubleshooting

Username to use vision planner as explosive from where for calibrating as well as installing the nursery software record for the APM side controller to operate stable. The in-mission planner initially the coordinates of the flight controller would be deducted after the moment you connect our laptop with the flight controller using a USB data cable The data cable enables the users to configure the APM head controller using their laptop [19]. The Mission planner firmware is the application that has all the settings users could make to fulfill the design of drone manually. Below figure shows the selection of frame type which users could choose easily by a single click.[20]

Ajay Vishwathet al.,

CONCLUSION

In summary, the APM (ArduPilot Mega) flight controller is suitable for beginners building and experimenting with drones. It offers stable flight performance and has a user-friendly interface that allows for easy settings and customization. Additionally, it supports a variety of sensors and flight modes, making it ideal for a wide variety of applications and use cases. Overall, APM is a reliable and robust flight controller widely used in the drone industry, and its popularity is a testament to its quality and performance.

ABSTRACT

This study was designed to compare the effect of Low Level Laser Therapy (LLLT) by using two different doses on patients having plantar fasciitis. Group A consisted of 18 subjects who received LLLT program A and Group B consisted of 18 subjects who received LLLT program B. On the 1st and 6th day Numerical pain rating scale (NPRS at rest & activity) was taken to measure pain intensity, pain intensity check of Ankle joint (medial aspect of heel) was measured by dolorimeter- pain pressure threshold and MFPDI scale was taken to measure functional activity. In within group analysis significant difference was found for Group A and Group B for all the outcome measures as $p < 0.05$. But no significant difference was found on between group comparison except for pain pressure threshold. The results of this study demonstrated that both the doses of LLLT are effective for treatment of plantar fasciitis.

Keywords: Low level laser therapy, Pain pressure threshold, Plantar fasciitis.

Mukul Chauhan et al.,

INTRODUCTION

Plantar fascia is a strong aponeurosis that is located at the base of the foot, beginning from the anterior edge of the medial calcaneal tubercle and extending up to the metatarsophalangeal joint. The plantar fascia is originated from the calcaneal medial tubercle and lies in the sole of the foot and extends up to the base of the metatarsal heads and it supports the longitudinal arch as well as it assists with dynamic shock absorption. Plantar fasciitis (PF) can be idiopathic or it may be related with inflammatory rheumatic disorders. Idiopathic PF is one of the most common causes of heel pain. Mechanical overload has been considered as one of the major causes involved in the development of plantar fasciitis. [1][2][3][4][5]. The risk factors include middle age, obesity, excessive foot pronation, pes cavus, excessive running, pes planus, and prolonged standing and so on which may cause minimal tear in the plantar fascia, but exact etiology is unknown. This repetitive trauma exceeds the fascia's power to recover and may lead to degenerative changes with a high risk of injury ultimately leading to calcification of the fascia and enthesopathy. The pathological process, often called "calcaneal spur" with severe pain syndrome, is caused by degenerative-dystrophic changes in the plantar aponeurosis; this occurs at the place of attachment to the calcaneus.[1] [2] [4].

The cardinal clinical presentation is a pain in the medial plantar region of the heel with the initial steps taken in the morning or after a prolonged weight-bearing activity. The chief complaint of patients affected with PF is pain, particularly in the morning during the first few steps which worsens with increased weight bearing throughout the day. The diagnosis of the condition is made based on the clinical symptoms such as, patient's history and physically examining the tenderness at the insertion site of the plantar fascia on the medial calcaneal tubercle elicited by palpation. Pain and tenderness are aggravated on movement like active standing on toes by the patient or passive dorsiflexion of toes. From physical examination it is found that the calf muscle tightness limits the dorsiflexion of the ankle and plantar fascia tightness restricts the toe extension. Approximately 10% of the population affected with plantar fasciitis, at least once in a lifetime and non-athletic populations are affected more than the athletic population.[1][2][3][4][5]. Conservative therapy provides significant relief in approximately 90% of patients with PF. A newly emerging technology, LLLT has demonstrated promising results for the treatment of acute and chronic pain. Invasive treatment that is available are fenestration and steroid injections. LASER therapy presents a non-invasive and painless method of treatment for patients with PF.[1][6][7][2]

Full form of LASER is Light Amplification from Stimulated Emission of Radiation. Laser is created through a specific process within the LASER device to cause the controlled emission of radiation in form of light. An output power of < 0.5 Watts is termed as LLLT (class III lasers) whereas lasers with an output power > 500 mW or 0.5 Watts are termed as High-Power LASER Therapy HPLT (Class IV lasers). HPLT creates heat on the skin surface due to their higher power density (irradiance). LLLT is often known as "COLD LASER" since they do not cause a heating sensation during the treatment. [8][9]. LLLT works on the principle of photochemistry, that uses a discrete wavelength (color) of light to initiate a signal transduction cascade by stimulating a protein capable of absorbing light energy, which is also known as a photoreceptor protein. Studies evaluating LLLT have reported enhancement of peripheral endogenous opioids, suppression of cyclooxygenase-2, collagen synthesis in tendon and ligament repair, a decrease in the extent of fibrosis, angiogenesis, inhibition of histamine release and suppression of conduction along unmyelinated C fibers.[7]

In LLLT there is use of red or infra-red light which helps in soft tissue healing and it also helps in pain relief. The effect of the LASER therapy is like that of photosynthesis as it aids in production of ATP, gives more energy which makes the tissue to play its role in the natural process of healing. Low-level laser therapy is to stimulate the tissue, which causes biochemical effect, without causing damage to living tissues. LASER radiation is thought to be absorbed through cytochromes in the mitochondria and converted into ATP by the cell which acts to synthesize protein,

Mukul Chauhan *et al.*,

mRNA and DNA, and accelerate process of cell proliferation on the basis of tissue receiving the light energy. LASER or LLLT has been proposed as a modality used to accelerate and optimize the tissue repair process. LLLT is theoretically useful to photoactivate cellular mechanisms, leading to healing process and normalization of the tissue. The proposed result is reduced pain, inflammation, swelling, and accelerated tissue repair. Therapeutic LASERs emit low-energy density but high enough to stimulate target cells with energy. [2][10][11]. The mechanism of decrease in pain and swelling is that phototherapy relieves this both by increasing the local and systemic microcirculation. The synthesis of nitric oxide is related with an increased blood flow. Furthermore, it also shown that there is a pain reduction by phototherapy acting on the inflammatory products. The effect of the LASER therapy on pain relief is due to the action of endorphins with endogenous pain relieve which was found with evidence of phototherapy. [2] LLLT is effective in relieving the pain and improving the function of patient with the PF. So, the aim of this study is to find and compare the effect of two different doses of Low Level LASER therapy on pain and functional performance in patients with planter fasciitis (PF) which can be useful in future for clinical application.

LLLT has been used for pain reduction in different musculoskeletal conditions. Despite of its extensive use, the results of the clinical and experimental studies are conflicting in nature. Since the results of low power laser therapy effectiveness studies, in PF show considerable variation, we aimed to evaluate the effect of different doses of low power laser treatment in patients with PF in the present study. Therefore, this study will try to find that dosage for low level laser therapy, in patients with planter fasciitis, which provides the pain relief and improvement the patient's function.

MATERIAL AND METHODS

Study design: A Comparative Interventional Study

The present study was conducted at Government Physiotherapy College, Jamnagar. 36 patients with planter fasciitis were taken for the study. Subjects were selected from the population of 31 to 61 years of age group and according to inclusion and exclusion criteria. Then subjects were allocated randomly (By odd – even method) into 2 groups being 18 in each group for the treatment. The purpose and procedure of the study were explained to all subjects and written consent was taken from them.

Criteria for selection

Inclusion criteria for this study were: Patients willing to participate in the study, patient diagnosed with by physician and orthopedics, physical examination and history by therapist which suggest PF [2], both male and female patients belonging to the age group of 31-61 years. Patients having heel Spur, retrocalcaneal bursitis and acute calcaneal fracture were excluded from the study. Following materials were used for this study: Consent form, Pen, Pillow, Stool, BTL LASER Machin, Pain Pressure Threshold, Protective Goggles, Treatment Table, Sand bags (weight cuffs), NPRS scale, MFPDI Scale and Case Record Form.

Procedure

Ethical clearance was obtained from ethical committee of M P Shah medical college, Jamnagar, (Ref. No. IEC/Certi/36/01/2020). 36 patients falling under the inclusion criteria were selected with informed written consent and then the patients were divided into two groups A and B; group A: receive LASER Therapy Program A and group B: receive LASER Therapy Program B given. Patients were treated with one session per day for 6 Days. Numerical pain rating scale (rest and activity) was taken to measure pain intensity, pain intensity check of Ankle joint (medial aspect of heel) was measured by do PPT and MFPDI scale was taken to measure functional activity.

Protocol

Patient position and procedure:

- Patient position ~ high sitting position and affected side (leg) rest on table.
- Both the group receive PWB along with the interventional treatment.

Mukul Chauhan et al.,

- Laser Therapy Program A
 - Machine ~ BTL-4000 smart
 - LASER ~ Cluster with Red and Infrared Radiation

 - Dose ~ 20.0 J/cm²
 - Power ~ 1300 + 200 mW
 - Area ~ 25.0 cm²
 - Time ~ 5:33 m:s
 - Frequency ~ Continuous
- Laser Therapy Program B
 - Machine ~ BTL-4000 smart
 - Laser ~ Cluster with Red and Infrared Radiation
 - Parameter -
 - Dose ~ 10.0 J/cm²
 - Power ~ 1300 + 200 mW
 - Area ~ 25.0 cm²
 - Time ~ 3:28 m:s
 - Frequency ~ 10 Hz
 - Duty Factor(DF) ~ 80%

STATISTICAL ANALYSIS

All analysis was carried out in SPSS windows Version 20.0. An alpha-level of 0.05 was used to determine statistical significance. Wilcoxon signed ranks test was used for within group analysis to compare pre and post values of all the outcome measures. Mann-Whitney U was applied for between group analysis.

RESULTS

Table 1 demonstrates demographic characteristics of all subjects. Table 2 demonstrates within group analysis of group A. Table 3 demonstrates within group analysis of group B. Table 4 demonstrates between group analysis. Graph 1 demonstrates comparison of difference of mean between group A and group B.

DISCUSSION

The intent of the present study was to find out the efficacy Of Two Different Doses of Low Level Laser Therapy on Pain And Function In Plantar Fasciitis. The result of this study suggests that there was a significant improvement in both the within groups. But there was not significance difference in between the groups. Analysis of the present study shows that in group A, p value is NPRS (Rest and Activity), Tender Point, PPT, And MFPI is 0.007, 0.00, 0.00, and 0.00 respectively. The results show significant difference for pre and post parameter ($p > 0.05$). In group B, P value is NPRS (Rest and Activity), Tender Point, PPT, and MFPI is 0.00, 0.00, 0.00, and 0.00 respectively. The results show significant difference for pre and post parameter ($p < 0.05$). Mann-Whitney U was applied for between group analysis. P values for all the variables except for pain pressure threshold is > 0.05 , this shows that there is no significant difference between outcome measures of both the groups except for pain pressure threshold as its p value < 0.05 so there is significant difference found for it in both the groups.

The result of the study was supported by Jothi Prasanna., (2019)[2] who compared the effects of low-level laser therapy and ultrasound therapy in subjects with chronic plantar fasciitis and result demonstrated a LLLT group shows reduction in pain and improvement in function as compared with the US group. The subjects with unilateral symptomatic chronic plantar fasciitis (3 months or more) were randomly divided into two groups. i.e. Group-A and B; Group-A subjects were treated with low-level laser therapy along with conventional physiotherapy exercises.

Mukul Chauhan *et al.*,

Group-B subjects were treated with ultrasound therapy along with conventional physiotherapy exercises. Each group consisted of 15 subjects. Pre-test and Post test were conducted on both groups by using VAS for pain assessment, and foot function index (FFI) for assessing pain intensity and disability.

Banu Ordahan, Ali Yavuz Karahan *et al.*, (2018) [1] did a study to find the effect of high-intensity versus low-level laser therapy in the management of plantar fasciitis. In that study seventy patients were randomly divided into either the LLLT (8 men, 27 women; mean age 48.65 ± 10.81 years) or HILT (7 men, 28 women; mean age 48.73 ± 11.41 years) groups. LLLT (904 nm) and HILT (1064 nm) were performed three times per week, over a period of 3 weeks. Patients' pain and functional status were evaluated with Visual Analog Scale, Heel Tenderness Index, & Foot and Ankle Outcome Score before and after treatment. The HILT group demonstrated better improvement in all parameters than the LLLT group. Although both treatments improved the pain levels, function, and quality of life in patients with plantar fasciitis, HILT had a more significant effect than LLLT. Results of their study are in contrast to present study because Parameter of the LASER and Sample size different.

In a study done by Eda Cinar *et al.*, (2017) [4] Low-level laser therapy was used for the management of plantar fasciitis. In this study participants with PF were randomly allocated into two groups: LLLT (n = 27) and control (n = 22). All the participants received home exercise program with orthotic support. In addition, the LLLT group received a gallium-aluminum-arsenide laser with a 850-nm wavelength for ten sessions, three times a week. Functional outcomes were measured by function subscale of American Orthopedic Foot and Ankle Society Score (AOFAS-F) and 12-min walking test including walking speed, cadence, and activity-related pain using visual analog scale (VAS). The LLLT group had lower pain than the control group at 3 months (p = 0.03). The combination therapy of LLLT with usual care is more effective to improve functional outcomes and activity-related pain when compared to usual care alone. Results of this study supports our present study that LLLT is effective in planter fasciitis patients. Results of our study are similar to the study of Dovile Naruseviciute *et al.*, (2020)[12] They did a randomized participant blind controlled trial to find the effect of high-intensity versus low-level laser therapy for the management of plantar fasciitis. In this study 102 participants were randomly assigned into two groups. The HILT group (n=51) received HILT and the LLLT group (n=51) received LLLT. Interventions included eight sessions of laser therapy over three weeks and single session of patient education. Primary outcomes for the study were visual analogue scale; and secondary outcomes were pressure algometry, sonography of plantar fascia thickness (time frame: baseline to three-week and four-week follow-up) and numeric rating scale (0%–100%) for opinion of participants on effect of treatment (time frame: three weeks). It was concluded from the study that there was no statistically significant difference between the HILT versus LLLT group.

Limitations of the study were: Male-Female ratio was unequal; Study duration and treatment duration was short. In future, study can be done with large sample size and by considering different grades of PF. In addition to it, study can be done to know long term effect of this protocol.

CONCLUSION

On the basis of the present study, Group A received LASER Therapy Program A and Group B Received Receive LASER Therapy Program B and both the group shows reduction in pain and improve Functional activity of the patients with Planter Fasciitis. So, it concluded that there is a no significant difference between the two difference doses of LASER Therapy.

Table 1: Demographic characteristics of all subjects

| Demographic Data | | |
|------------------|-----------------------|-----------------------|
| Characteristics | Group A | Group B |
| Age (years) | 42.83 ± 11.39 | 41.55 ± 11.82 |
| Gender | Male - 5, Female - 13 | Male - 4, Female - 14 |
| Height | 1.54 ± 0.07 | 1.57 ± 0.08 |
| Weight | 76.66 ± 9.82 | 68.94 ± 10.96 |
| BMI | 28.45 ± 4.97 | 28.08 ± 4.83 |

The above table shows the mean and SD of demographic data for Group A and Group B.

Mukul Chauhan *et al.*,

Table 2: Within group analysis of Group A

| Group A | | | | |
|-------------------------|-----------------|------------------|---------|---------|
| Outcome measures | Pre (mean ± SD) | Post (mean ± SD) | Z value | P value |
| NPRS at Rest | 1.61 ± 2.00 | 0.77 ± 1.43 | -2.714 | 0.007 |
| NPRS at Activity | 6.16 ± 2.54 | 3.61 ± 2.52 | -3.757 | 0.000 |
| Tender point | 7.22 ± 2.55 | 4.61 ± 2.22 | -3.663 | 0.000 |
| Pain Pressure Thershold | 2.73 ± 0.91 | 4.49 ± 1.29 | -3.725 | 0.000 |
| MFPDI | 43.11 ± 6.35 | 37.55 ± 6.94 | -3.740 | 0.000 |

Wilcoxon signed ranks test was applied to compare the pre & post values of all outcome measures of Group A. The above table shows that all the variables have p value <0.05 which shows that there is significant difference between pre & post values.

Table 3: Within group analysis of Group B

| Group B | | | | |
|-------------------------|-----------------|------------------|---------|---------|
| Outcome measures | Pre (mean ± SD) | Post (mean ± SD) | Z value | P value |
| NPRS at Rest | 3.11 ± 2.27 | 1.50 ± 1.79 | -3.624 | 0.000 |
| NPRS at Activity | 7.16 ± 2.12 | 4.77 ± 2.01 | -3.859 | 0.000 |
| Tender point | 7.94 ± 1.69 | 5.22 ± 1.98 | -3.808 | 0.000 |
| Pain Pressure Thershold | 2.19 ± 0.94 | 3.57 ± 1.13 | -3.725 | 0.000 |
| MFPDI | 45.22 ± 6.08 | 39.88 ± 6.20 | -3.746 | 0.000 |

Wilcoxon signed ranks test was applied to compare the pre & post values of all outcome measures of Group B. The above table shows that all the variables have p value <0.05 which shows that there is significant difference between pre & post values.

Table 4: Between group analysis

| Outcome measures | Z value | P value |
|-------------------------|---------|---------|
| NPRS at Rest | -1.488 | 0.137 |
| NPRS at Activity | -1.365 | 0.172 |
| Tender point | -0.916 | 0.359 |
| Pain Pressure Threshold | -2.231 | 0.026 |
| MFPDI | -1.111 | 0.267 |

Mann-Whitney U was applied for between group analysis. The above table shows that p values for all the variables except for pain pressure threshold is >0.05, this shows that there is no significant difference between outcome measures of both the groups except for pain pressure threshold as its p value <0.05 so there is significant difference found for it in both the groups.

Mukul Chauhan *et al.*,

The above graph shows comparison of mean of difference for Group A and Group B. From this graph we can say that treatment is effective for both the groups as no significant difference is found.

Graph 1: Comparison of difference of mean between Group A and Group B

The Role of Demographic Variables on Financial Risk Tolerance of Investors in Kerala

ABSTRACT

An individual does not desire to spend his entire earnings and instead saves a portion of it for investment purposes, with the primary goal of generating more money from it. Greater risk is linked to greater profit. Risk tolerance, or a person's willingness to take risk, is a crucial issue that affects both financial service providers and consumers. Risk tolerance refers to how much market risk an investor can take, such as volatility or market ups and downs. With this regard this empirical study explores the persistent difference in risk tolerance between different demographic characteristics. Individual investor respondents were selected based on multi-stage sampling technique and responses were collected by employing a questionnaire to the respondents. The study employed the scale proposed by Grable and Lytton to measure the financial risk tolerance of retail investors. Results of the study indicates that gender, age, education, occupation and income are significant in differentiating investors to different risk tolerance levels, although marital status has no significant effect on investor's risk tolerance levels.

Keywords: Financial risk tolerance, Investor, Demographic factors

INTRODUCTION

Research on financial risk tolerance with emphasis on demographical factors is limited and yet vital to the financial industry. Many of the financial and investor researchers do not portray the actual risks that the investors face.

**Halimunnisa and Muhsina**

Various characteristics of demographic variables are to be considered when researching financial risk tolerance such as years leading to retirement, high education levels, race, being self-employed, gender and non-investment income. Grable and Lytton [1] (1998) found in their research that age and gender were the most important variables influencing risk tolerance along with other characteristics such as marital status, occupation, self-employment, income, race and education. The present study focuses on the effect of demographic characteristics in the risk taking behaviour of individual investors in Kerala.

REVIEW OF LITERATURE

Ferreira, S., and Dickason-Koekemoer, Z. [2] (2020) focused on how risk tolerance is influenced by demographics, life satisfaction, risk-taking behaviour, and perception in a variety of life domains. An electronic questionnaire was distributed to over 4000 investors throughout South Africa. Age and risk tolerance were found to be negatively correlated, suggesting that risk tolerance declines with age. It was also found that life satisfaction can be used in forecasting investor risk tolerance. Pandya, H *et al.* [3] (2020) explored the interplay between the two aspects of financial literacy and the risk tolerance of investors. Investing behaviour of women being the focus of this study, a comparison of investing behaviour of women with that of men is done. 800 samples were collected and analysed. The study found that a significant relationship was observed between financial literacy and age, income, gender, and occupation. Again, women take Less risk compared to men, both in rural and urban areas. Fisher, P. J., & Yao, R. [4] (2017) studied gender differences in financial risk tolerance using a large, nationally representative dataset, the Survey of Consumer Finances and found that Gender differences in financial risk tolerance are due to the gender disparities in the individual determinants of financial risk tolerance and not by gender in and of itself. Income uncertainty and net worth are found to be the individual factors that act as moderators in the association between gender and high risk tolerance.

Scope of the Study

Risk is inseparable from return. Every investment involves some degree of risk, A solid understanding of risk in its different forms can help investors to better understand the opportunities, trade-offs, and costs involved with different investment approaches. It is imperative to study risk tolerance capacity of investors as it helps to plan their entire portfolio and will drive how they invest. The amount of risk an investor is willing to assume is influenced by a number of factors. The researcher has explored the level of financial risk tolerance and studied the effect of demographic characteristics in financial risk tolerance. The geographical area of research is confined to Kerala State (India).

Statement of the Problem

Financial risk bearing behaviour is highly significant in financial decisions and analysing one's financial risk tolerance capacity through his/her demographic factors paves the way to an effective investment plan which provides higher returns. Previous research data proves that demographic factors can be used to differentiate investors into various risk tolerance categories but the results significantly varies from time to time. In this context, an attempt was made to study financial risk tolerance among individual investors and analyse the demographic differences specifically age, gender, marital status, education, occupation and income in bearing financial decisions.

Objectives of the Study

1. To explore the financial risk tolerance level of retail investors.
2. To study the role of various demographic variables in the financial risk tolerance of individual investors

RESEARCH METHODOLOGY

An intensive study has been made on the risk bearing level of investors in Kerala state. The methodology adopted in the collection of data has been detailed below:

**Halimunnisa and Muhsina****Sample Design & Sample Size**

Based on the multi-stage sampling technique, data were collected by distributing a questionnaire having 34 questions. The selected sample includes 150 retail investors from Malappuram district of Kerala. Books and journals were used to gather secondary data.

Tools of Analysis

Statistics and analysis of various figures relating to the investor's financial risk tolerance are given in different statements. The information collected through the questionnaire has been used for analysing the data. This empirical study includes variables which are essentially qualitative in nature and is known as categorical variables, namely financial risk-tolerance, gender, age, education, job experience, income level, saving status, location, and employment status. Descriptive statistical tools such as frequency distribution, percentage analysis have been used to describe the profiles of respondents. Inferential analysis such as t-test and ANOVA were used for the analysis of data.

Measurement of Financial Risk Tolerance

To record the financial risk tolerance of retail investors, a well-structured questionnaire was used based on a risk scale originally developed by Grable and Lytton (1999), commonly known as the Grable and Lytton risk-tolerance scale (G/L-RTS). To record the level of risk tolerance (FRT), five different groups were scaled as used in different studies (Beer and Wellman 2021). An individual will be considered a lower-risk tolerant if he/she falls in the risk tolerance score ranging from 0 to 17, a below-average risk-tolerant if he/she falls in the class ranging from 18 to 21, a moderate-risk tolerant if he/she falls in the category ranged from 22 to 27, an above-average risk-tolerant, if he/she lies in the category ranged from 28 to 31; and finally, an investor will show high tolerance for risk by taking investment decisions if he/she lies in the class ranged from 32 to 46.

Limitations of the Study

The study was only confined to Kerala state and it cannot be generalized to other states. Further, only 150 respondents were randomly approached for the study. The results may vary based on the perception of the sample respondents.

Reliability Statistics

The Cronbach's Alpha is used to test the reliability of the data. Cronbach's alpha was found to be 0.74 which is higher than 0.7. Hence, it shows a high level of reliability of these constructed scales.

ANALYSIS AND DISCUSSION

The purpose of this study is to observe the financial risk tolerance level of investors in Kerala and analyse the effect of age and gender in the risk tolerance capacity of the investors. Table 2 shows the descriptive sample statistics. The largest proportion of respondents (i.e.,70%) are men. Married respondents account to 80%. The majority of respondents (44%) are in the age group of 20-29. Most of the respondents (44%) are Diploma graduates and 54% of the employees are private employees. Maximum respondents (40%) belongs to the income category of below 300000.

Hypothesis Testing**Relationship between gender and financial risk tolerance**

H0.1: There is no significant difference between investors' gender and their Financial risk tolerance level.

While applying t-test at 5 % level of significance, the two tailed p value (0.005) is less than 0.05. So the null hypothesis is rejected, and there is a significant relationship between gender and overall financial risk tolerance level. Out of 45 women, 33 women responded that they have taken a low risk for their investments. It is found that women tend to take fewer risks as compared to men when it comes to investments.

**Halimunnisa and Muhsina****Relationship between age and financial risk tolerance**

H0.2: There is no significant difference between investors' age and their Financial risk tolerance level.

It is clear from the above table that while applying Anova at 5 % level of significance, the p value (0.001) is less than 0.05. So the null hypothesis is rejected, and there is a significant relationship between age and overall financial risk bearing level. Young people tend to take more risk than older people.

Relationship between marital status and financial risk tolerance

H0.3: There is no significant difference between investors' marital status and their Financial risk tolerance level.

While applying t- test at 5 % level of significance, the p value (0.086) is greater than 0.05. So the null hypothesis is accepted, and there is no significant relationship between marital status and overall financial risk bearing level. Thus marital status does not have any impact on the financial risk tolerance of the investor.

Relationship between education and financial risk tolerance

H0.4: There is no significant difference between investors' education and their Financial risk tolerance level.

It is observed from the table that the two tailed p value (0.14) is less than 0.05. So the null hypothesis is rejected, and there is a significant relationship between education and overall financial risk tolerance level. It is found that Under graduates and Post graduates tend to take more risks when it comes to investments.

Relationship between Occupation and financial risk tolerance

H0.5: There is no significant difference between investors' Occupation and their Financial risk tolerance level.

While applying Anova at 5 % level of significance, the two tailed p value (0.002) is less than So the null hypothesis is rejected, and there is a significant relationship between Occupation and overall financial risk tolerance level. It is observed that business people wish to take more risk than people engaged in other occupations.

Relationship between Annual Income and financial risk tolerance

H0.6: There is no significant difference between investors' Annual Income and their Financial risk tolerance level.

Table 8 depicts that while applying Anova at 5 % level of significance, the two tailed p value (0.02) is less than 0.05. So the null hypothesis is rejected, and there is a significant relationship between Annual income and overall financial risk tolerance level. It is observed that high income people wish to take more risk than people engaged in other income groups.

Findings

- Most of the respondents are men (70%) and married responders accounts to 80%.
- Majority of the responders are in the age group of 20-29 and most of the informants (54%) have completed diploma.
- 40% of the employees are private employees and maximum respondents (40%) belong to the income category of below 300000.
- The analysis shows that financial risk capacity of the respondents vary according to their gender and women are likely to choose low risk avenues compared to men.
- Young people tend to take more risk than older people.
- Marital status does not have any impact on the financial risk tolerance of the investor.
- Under graduates and Post graduates tend to take more risks when it comes to investments.
- Business people wish to take more risk than people engaged in other occupations.
- High income people wish to take more risk than people engaged in other income groups.

Suggestions

This study was designed to evaluate the relationship between financial risk tolerance and the demographic characteristics of individual investors in Kerala. The findings from the study show that demographic factors

Halimunnisa and Muhsina

specifically age, gender, education, occupation, and income can be used to categorise investors into various risk tolerance levels. But an investor's marital status does not have a significant impact on his/her risk tolerance level. Financial intermediaries should have taken consideration into the personal information of the investors. The risk tolerance level of the individual clients can be evaluated using demographic features and personalised financial products can be developed to satisfy the specific requirements of the customers.

CONCLUSION

Financial risk tolerance refers to how much uncertainty a person is ready to endure while making a financial decision that involves the chance of a loss. It is inevitable to understand an Investor's financial risk tolerance level to frame an appropriate investment plan for better returns. The study concludes that demographic characteristics such as age, gender education, occupation, and income have a serious impact on the financial risk tolerance of investors. Such characteristics can be used to differentiate individual investors into different classes. But marital status does not affect the financial risk tolerance of investors. Financial advisors should frame investment portfolios to cater to the needs of each class of investors.

ABSTRACT

E-Banking is a major innovation in the field of banking. Generally electronic banking systems where the transactions and relationship between bank and clients grow through electronic devices instead of paper documents. Further, electronic banking is defined as the automated delivery of new & traditional products & services directly to customer through electronic, interactive communication channel. E-Banking has proved to be the game changer in banking industry. Imagine world before that!! People would depend highly on cheque and demand draft payments with long queue in bank branches much of the time energy manpower being wasted and these hectic schedules where people juggle for work life balance e banking is boon. With these entire facts researcher wanted to identify the impact of E banking services on the profitability of bank considering much of the time, manpower and infrastructure to be used otherwise is saved with e banking. The variables considered for the study are - Return on Net Worth, Return on Assets, Net Profit Margin ATM Transactions, POS Transactions, and Mobile Banking. According to the correlation data, there is a strong positive link between ROA and POS & an insignificant relationship between ROE, NPM & ATM, POS, and Mobile banking transactions.

Keywords: Digital banking, ATM, PoS, Mobile banking, contemporary banking

INTRODUCTION

The banking industry has always been vital to any economy, particularly emerging ones. With new innovations and technical breakthroughs, this industry has evolved from its traditional form to e-banking and, more recently, m-banking. (Sumra2011) The electronic banking services provided by the banks include Debit cards, credit cards, funds transfer, cheque payment, funds deposit, balance enquiry, utility bills payment, statement of account, remittance, draft, pay order, mobile banking, internet banking etc (Karthik Reddy *et al* 2017). The purpose of this research study is to describe the current situation of Internet banking in India. This research evaluates the influence of e-banking on the profitability of Indian banks.. After over 70 years of independence, however, this sector continues to face a serious problem in terms of financial inclusion. According to Census 2011, about 35 percent of individuals had bank accounts, and according to a World Bank report, this proportion grew to around 53 percent in 2014, owing to liberal government policies, increasing globalization, and a growth in people's purchasing power. More and more numbers of customers are being drawn to the mobile banking as they have been satisfied due to the measures taken by banks to secure the mobile banking transactions. The customers in mobile banking services are increasing day by day due to the security measures taken by the banks (Alhakimi, W., &Esmail, J. 2020). Through mobile banking customers can now add as many beneficiaries in the list as they want for fund transfer etc. and it saves huge of the amount of time for those kinds of transactions. Therefore the customers to complete the financial transactions by sitting at home but the customers were having problems of carrying but mobile phones are free from these difficulties.

REVIEW OF LITERATURE

More and more numbers of customers are being drawn to the mobile banking as they have been satisfied due to the measures taken by banks to secure the mobile banking transactions. The customers in mobile banking services are increasing day by day due to the security measures taken by the banks (Alhakimi, W., &Esmail, J. 2020). Through mobile banking customers can now add as many beneficiaries in the list as they want for fund transfer etc. and it saves huge of the amount of time for those kinds of transactions. Therefore the customers to complete the financial transactions by sitting at home but the customers were having problems of carrying but mobile phones are free from these difficulties (Pal Kapoor, A., &Vij, M. 2020).

(Anh Huu, Hang Thu and Houng Thanh Pham 2020) examined the financial performance of 31 Vietnamese banks for a period of 6 years from 2013 to 2018 through three econometric models based on the CAMEL component. As per the study, the four-component of the CAMEL model, such as Capital Adequacy, Asset quality, Management efficiency and Liquidity position have an important impact on the performance of Vietnamese commercial bank. (Pakurar M *et al* 2019) analyzed service quality dimensions by using SERVQUAL model for customer satisfaction in Jordanian banking sector. Study observed that instead of eight subscale factors only four subscale factors used for analysis. The four subscales have order of importance of the subscales' effects on customer satisfaction. Concluded that First subscale (assurance, reliability, access, and employee competences in banking services), second subscale (responsiveness and empathy), third subscale (financial aspect), and fourth subscale (tangibility and).

(M. S. Saluja and T. Wadhe2015), Using Multiple Regression Analysis, this study examines the relationship between e-banking and profitability of 31 Indian scheduled commercial banks from 2006 to 2014. The findings show that e-banking has a beneficial impact on the profitability of both nationalised and traditional private sector banks. (R. K. Uppal 2011), In his work, he uses ratio analysis to evaluate the performance of commercial banks in India. According to the findings, branch and labour productivity increased significantly during the e-banking period as compared to the pre-e-banking period. Foreign banks' labour and branch productivity is also shown to be considerably higher. Overall, the data show that there is an increase in the profitability after arrival of e-banking services. Mobile banking offers services of banking such as, account information; payments, deposits, withdrawals, and transfers; investments and other content services. The Reserve Bank of India has made Mobile banking services available to all bank customers irrespective of the mobile network(Tumewah, E. *et al* 2020). Mobile banking is a system that allows

Ajay Kumar et al.,

customers of mobile financial institution (MFI) to offering banking services of make deposits, withdraw, and to send or receive funds from a mobile account through a mobile device such as a mobile phone or personal digital assistant (Hong, I. B. 2019). All the banking activities of these customers such as conducting financial transactions with their financial institution and allowing consumers to transfer money and make credit card payments anywhere, obtaining financial account information etc. is made possible through the mobile banking (Kamdjou, J. R. K. et al. 2021).

RESEARCH METHODOLOGY

Research type: Analytical

Source of data: Secondary (RBI website)

Sample size: 10 banks (5 Public & 5 Private banks)

Period of study: 10 years (2012 to 2022)

Variables Under Study: Return on Net worth (RONW), Return on Assets (ROA), Net Profit Margin (NPM), ATM Transactions, Point of sale (PoS) Transactions, Mobile Banking

Software used: Ms .Excel, SPSS

Banks under study are as follows :

Public Sector Banks-Bank of India, IOB Bank, Central Bank of India, IDBI Bank, Canara Bank

Private sector Banks-Axis Bank, HDFC Bank, ICICI Bank, Yes Bank, Bandhan Bank

Objectives of the Study

To analyze the profitability of selected public sector and private sector banks in India.

To analyze the e-banking services of selected public sector and private sector banks in India.

To study the Impact of E-banking services on profitability of selected public sector and private sector banks in India

Theoretical Model of the study

Dependent Variables Return on equity, Return on assets, Net profit margin

Independent Variables ATM Transactions, PoS Transactions, Mobile Banking Banks profitability is the dependent variable for this study. Profitability is the state or condition of yielding a financial profit or gain. On the other hand, Volume of ATM transactions, point of sales transaction and mobile banking transaction are the independent variables in this study.

Hypothesis

H01 -There is no significant impact of ATM, MB, POS transactions on ROE of Private Banks.

H02 -There is no significant impact of ATM, MB, POS transactions on ROE of Public banks.

H03 -There is no significant impact of ATM, MB, POS transactions on ROA of Private banks.

H04 -There is no significant impact of ATM, MB, POS transactions on ROA of Public banks.

H05 -There is no significant impact of ATM, MB, POS transactions on NPM of Private Banks.

H06 -There is no significant impact of ATM, MB, POS transactions on NPM of Public Banks.

Analysis and Interpretation

Results of Correlation Analysis of the selected variables:

Ajay Kumar et al.,

Correlations

| | | ROE | ROA | NIM | ATM | POS | MOBILE_BANKING |
|----------------|---------------------|--------|--------|-------|--------|--------|----------------|
| ROE | Pearson Correlation | 1 | .972** | .700* | .252 | .497 | .565 |
| | Sig. (2-tailed) | | .000 | .024 | .482 | .144 | .089 |
| | N | 10 | 10 | 10 | 10 | 10 | 10 |
| ROA | Pearson Correlation | .972** | 1 | .741* | .381 | .651* | .523 |
| | Sig. (2-tailed) | .000 | | .014 | .277 | .042 | .121 |
| | N | 10 | 10 | 10 | 10 | 10 | 10 |
| NIM | Pearson Correlation | .700* | .741* | 1 | .196 | .347 | .073 |
| | Sig. (2-tailed) | .024 | .014 | | .586 | .326 | .841 |
| | N | 10 | 10 | 10 | 10 | 10 | 10 |
| ATM | Pearson Correlation | .252 | .381 | .196 | 1 | .824** | .025 |
| | Sig. (2-tailed) | .482 | .277 | .586 | | .003 | .946 |
| | N | 10 | 10 | 10 | 10 | 10 | 10 |
| POS | Pearson Correlation | .497 | .651* | .347 | .824** | 1 | .114 |
| | Sig. (2-tailed) | .144 | .042 | .326 | .003 | | .753 |
| | N | 10 | 10 | 10 | 10 | 10 | 10 |
| MOBILE_BANKING | Pearson Correlation | .565 | .523 | .073 | .025 | .114 | 1 |
| | Sig. (2-tailed) | .089 | .121 | .841 | .946 | .753 | |
| | N | 10 | 10 | 10 | 10 | 10 | 10 |

** . Correlation is significant at the 0.01 level (2-tailed).
 * . Correlation is significant at the 0.05 level (2-tailed).

From the above correlation table, it can be indicated that, There is a significant positive relationship between Return on assets & PoS transactions of bank. There is an insignificant relationship between Return on equity & Volume of ATM, PoS, and Mobile banking transactions. There is an insignificant relationship between Return on assets & Volume of ATM & mobile banking transactions. There is an insignificant relationship between net income margin and Volume of ATM, PoS, Mobile transaction. The null hypothesis is accepted. This means there is no significant relation between return on equity & ATM, PoS, and Mobile Banking transactions. The null hypothesis is accepted there is no significant relation between NIM & ATM, POS, and MB transactions. In other case, the null hypothesis is accepted; there is a significant relation between ROA & POS.

Results of Multiple Regression Analysis of E-banking variables on ROE

A multiple regression was used to model the relationship between the independent variables and dependent variable. The dependent variables were transformed in to natural logs for proportionality. Volumes of transactions were in numbers.

Volume of transaction (ATM, PoS, Mobile Banking) & ROE

Model Summary

| Model | R | R Square | Adjusted R Square | Std. Error of the Estimate |
|-------|-------------------|----------|-------------------|----------------------------|
| 1 | .793 ^a | .630 | .444 | .13983 |

a. Predictors: (Constant), MB_0, ATM_0, POS_0

Ajay Kumar et al.,

ANOVA^a

| Model | | Sum of Squares | df | Mean Square | F | Sig. |
|-------|------------|----------------|----|-------------|-------|-------------------|
| 1 | Regression | .199 | 3 | .066 | 3.400 | .094 ^b |
| | Residual | .117 | 6 | .020 | | |
| | Total | .317 | 9 | | | |

a. Dependent Variable: ROE

b. Predictors: (Constant), MB_O, ATM_O, POS_O

$$ROE=1.043+ (-1.424*ATM) + (1.225*POS) + (6.599*MB)$$

Coefficients^a

| Model | | Unstandardized Coefficients | | Standardized Coefficients | t | Sig. |
|-------|------------|-----------------------------|------------|---------------------------|--------|------|
| | | B | Std. Error | Beta | | |
| 1 | (Constant) | 1.043 | .091 | | 11.447 | .000 |
| | ATM_O | -1.424E-009 | .000 | -1.028 | -2.262 | .064 |
| | POS_O | 1.225E-009 | .000 | 1.340 | 2.941 | .026 |
| | MB_O | 6.599E-010 | .000 | .500 | 1.931 | .102 |

a. Dependent Variable: ROE

From above table, it can be interpreted that R Square is 63.0% which means that 65% of variation in ROE is explained by changes in selected e-banking variables. (p>0.05) -0.09 which means that there is not much impact of ATM, POS, Mobile banking transaction on ROE. In above table, the result shows that there is a negative insignificant relationship between ATM transaction & ROE, And a positive insignificant relationship exist between ROE & mobile banking transactions, and a positive significant relationship between ROE & POS transactions.

Results of Multiple Regression Analysis of E-banking variables on Return on Assets

Volume of transaction (ATM, POS, Mobile Banking) & Return on assets.

Model Summary

| Model | R | R Square | Adjusted R Square | Std. Error of the Estimate |
|-------|-------------------|----------|-------------------|----------------------------|
| 1 | .552 ^a | .305 | -.042 | .69974 |

a. Predictors: (Constant), MB, POS, ATM

ANOVA^a

| Model | | Sum of Squares | df | Mean Square | F | Sig. |
|-------|------------|----------------|----|-------------|------|-------------------|
| 1 | Regression | 1.290 | 3 | .430 | .879 | .503 ^b |
| | Residual | 2.938 | 6 | .490 | | |
| | Total | 4.228 | 9 | | | |

a. Dependent Variable: ROA

b. Predictors: (Constant), MB, POS, ATM

Ajay Kumar et al.,

$$ROA = -0.519 + (-1.978 \cdot ATM) + (3.728 \cdot POS) + (2.002 \cdot MB)$$

Coefficients^a

| Model | | Unstandardized Coefficients | | Standardized Coefficients | t | Sig. |
|-------|------------|-----------------------------|------------|---------------------------|--------|------|
| | | B | Std. Error | Beta | | |
| 1 | (Constant) | -.519 | .337 | | -1.542 | .174 |
| | ATM | -1.978E-010 | .000 | -.213 | -.175 | .867 |
| | POS | 3.728E-010 | .000 | .585 | .493 | .639 |
| | MB | 2.002E-009 | .000 | .359 | .950 | .379 |

a. Dependent Variable: ROA

From the above, the result shows R Square is 30.5%, which means only 30.5% of variation in ROA is explained by e-banking variables. Overall $p > 0.05$ -0.503 that means there does not exist a relationship between ROA & ATM, POS, mobile banking transaction. From above table, the result shows that there is insignificant negative relation that exist between ATM transaction & ROE, And insignificant positive relationship between ROA & POS, Mobile banking transaction

Results of Multiple Regression Analysis of E-banking variables on NPM

Volume of transaction (ATM, POS, Mobile banking) & NPM

Model Summary

| Model | R | R Square | Adjusted R Square | Std. Error of the Estimate |
|-------|-------------------|----------|-------------------|----------------------------|
| 1 | .432 ^a | .187 | -.220 | .16051 |

a. Predictors: (Constant), MB, POS, ATM

ANOVA^a

| Model | | Sum of Squares | df | Mean Square | F | Sig. |
|-------|------------|----------------|----|-------------|------|-------------------|
| 1 | Regression | .036 | 3 | .012 | .460 | .721 ^b |
| | Residual | .155 | 6 | .026 | | |
| | Total | .190 | 9 | | | |

a. Dependent Variable: NIM
b. Predictors: (Constant), MB, POS, ATM

$$NPM = 0.386 + (-1.617 \cdot ATM) + (3.879 \cdot POS) + (-3.883 \cdot MB)$$

Coefficients^a

| Model | | Unstandardized Coefficients | | Standardized Coefficients | t | Sig. |
|-------|------------|-----------------------------|------------|---------------------------|-------|------|
| | | B | Std. Error | Beta | | |
| 1 | (Constant) | .386 | .116 | | 3.340 | .016 |
| | ATM | -1.617E-010 | .000 | -.151 | -.226 | .829 |
| | POS | 3.879E-010 | .000 | .548 | .829 | .439 |
| | MB | -3.883E-011 | .000 | -.032 | -.085 | .935 |

a. Dependent Variable: NIM

Ajay Kumar et al.,

From above table it can be interpreted that R Square is 18.7% which means the model is not a goodfit. From the result of table 3.8, ($p > 0.05$)-0.721 which means there is no impact of ATM, POS, Mobile banking transaction on NIM. In table 3.9, the result shows that there is a positive insignificant relationship between POS transaction & NIM, And a negative insignificant relationship exist between NIM & mobile banking transactions, ATM transaction.

Findings

The objective of the study is to see how E-banking affected the performance of Indian commercial banks. The research looked at how ATM transactions, POS transactions, and smartphone transactions affected bank performance (ROE, ROA, and NPM). According to the correlation data, there is a strong positive link between ROA and POS & an insignificant relationship between ROE, NPM & ATM, POS, and Mobile banking transactions.

| Independent Variables | ATM | POS | Mobile Banking |
|-----------------------|--|---------------|----------------|
| Dependent Variables | Relationship of Dependent Variable with Independent Variable | | |
| ROE | Insignificant | Insignificant | Insignificant |
| ROA | Insignificant | Significant | Insignificant |
| NIM | Insignificant | Insignificant | Insignificant |

CONCLUSION

According to the findings of this study, the volume of ATM, POS, and mobile banking transactions has increased significantly during the previous five years. On the other hand, it has been discovered that these banks' profitability has been steadily declining. In this study, it was also discovered that there is a significant relationship between ROE, ROA, and the volume of transactions of public banks' ATM, POS, and mobile banking, but there is an insignificant relationship between ROE, ROA, NPM, and the volume of transactions of private banks. The decrease in profitability due to internet banking has been attributed to the networking effect of mobile banking. Researchers can take a bigger sample size to check the implication of the present hypothesis on a larger sample.

ABSTRACT

Individual investors in today scenario are more skilled and educated. Technology also give supportive edge in enhancing investors financial knowledge and investment skills. Android phones with artificial intelligence boost skills of investors in invest in both domestic and international markets. They are more rational in calculating any investment plans. The level of financial literacy in the country has also improved drastically after globalization of education. The aim of the present study is to determine level of financial skills of individual investors and their investment behaviour which significantly determine their financial literacy. The study is descriptive in nature and used non probability sampling method. The results of the study shows Investors Investment Behaviour, Educational Qualification and Investor Financial Skills have significantly determine investors financial literacy level. It is highly suggested that induvial investors take rational decision while investing in more risky investment avenues.

Keywords: Technology, Finance, Intelligence, Rational and Globalization

INTRODUCTION

Financial literacy is the capacity to comprehend and effectively use various financial abilities, such as personal financial management, budgeting, and saving. Those that are financially literate become self-sufficient, allowing them to achieve financial security. To be financially literate, you must understand how to handle your money. This includes learning how to pay your bills, how to appropriately borrow and save money, and how and why to invest and prepare for retirement. Financial literacy necessitates familiarity with financial principles and ideas such as financial planning, compound interest, debt management, effective investment methods, and money-time value. Financial illiteracy may lead to bad financial decisions, which can have a detrimental impact on an individual's financial well-being. The following are the important elements to improving financial literacy: learning how to construct a budget, tracking costs. Understanding efficient debt repayment tactics and retirement planning.

Take the effort to self-educate and expand your financial knowledge, beginning with the fundamentals of money management and progressing to become a wise spender. Investing time in your financial growth helps you make better saving and investment decisions. You may develop a long-term nest egg by utilising factors such as age, talent, money, and the capacity to adopt healthy habits. Money management is a personal skill that will assist you throughout your life yet it is not something that everyone learns. With money pouring in and out, due dates, financing charges and fees connected to invoices and bills, and the general responsibility of continually making the correct judgements regarding large purchases and investments, it may be overwhelming. Financial management should be a priority, and it should drive everyday spending and saving decisions. Personal financial experts recommend starting with the fundamentals, such as how to handle a checking or debit account and how to pay your bills on time, then working your way up.

Opening a bank account is the first step in developing financial awareness. Set up direct deposit after you get a paycheck. This protects your funds and prevents you from paying interest to cash advance providers, who charge a portion of your check. Financial literacy focuses on the capacity to properly manage personal financial, which necessitates prior experience making suitable personal finance decisions such as savings, insurance, real estate, college payments, budgeting, retirement, and tax preparation. People who understand finance should be able to answer questions about transactions, such as if an item is necessary, accessible, and whether it is an asset or liability.

Financial Skills

Understanding, evaluating, and managing the financial resources required to establish a business and promote profitable, creative, and sustainable projects inside it. Is the capacity to apply appropriate information and expertise to handle an expected or unexpected circumstance in order to solve a financial problem and turn it into a benefit and opportunity to one's advantage. These abilities can be learnt or obtained through a financial education background.

Investment behavior

Building money, according to financial experts, has a lot to do with your behaviour. "A genius who loses control of his emotions might be a financial disaster. The inverse is also true. "Even people with little financial education may become wealthy if they have a few behavioural talents that have nothing to do with traditional measurements of intellect," writes Morgan Housel in his book *The Psychology of Money*. Behavioural finance, a branch of behavioural economics, contends that individuals frequently make decisions based on emotional and hidden biases. Building money, according to financial experts, has a lot to do with your behaviour. "A genius who loses control of his emotions might be a financial disaster. The inverse is also true. "Even people with little financial education may become wealthy if they have a few behavioural talents that have nothing to do with traditional measurements of intellect," writes Morgan Housel in his book *The Psychology of Money*. Behavioural finance, a branch of behavioural economics, contends that individuals frequently make decisions based on emotional and hidden biases.

REVIEW OF LITERATURE

The link between financial skills and financial knowledge and market discipline is mediated by financial conduct. (Dewi, V.I. and Wardhana, L.I., 2022) Poor households' financial inclusion is not predicted by their behaviour, knowledge, or abilities. (CandiyaBongomin, G.O., et al., 2017), Financial literacy positively influences the investment behaviour of young adults. Moreover, the young adults' perception of confidence over ability to take right financial decisions drives their decision to invest. (Chawla, D., Bhatia, S. and Singh, S., 2022). Subjective financial literacy, objective financial literacy are positively associated with financial behavior (Pandey, A. and Utkarsh., 2023). Students from Kosovo who are more financially literate are more skilled and make more well-informed decisions when investing. (Vardari, L., Abdullahu, D. and Kurteshi, R., 2022). Financial attitude fully mediates the relationship between financial knowledge and responsible financial management behavior, and locus of control influences responsible financial management behavior (Bapat, D., 2020) Investors often use cognitive heuristics to reduce the risk of losses in uncertain situations, but that leads to errors in judgment; as a result, investors make irrational decisions, which may cause the market to overreact or underreact (Ahmad, M., 2022). Underconfidence bias has a markedly negative influence on the short-term and long-term decisions made by investors in developing markets. It means that heuristic-driven biases can impair the quality of both short-term and long-term investment decisions (Ahmad, M., 2021)

Statement Of Problem

The emergence of the technology have enhance the participation of individual investors in the stock market and other investment avenues. The market is very volatile and risky, the investors need to be very rational in participation in the market. The behaviour of the investors also play an predominant role in anticipation of rational investment decision of investors. Hence it is significant important to assess the impact of investors behaviour and investment skills on financial literacy practice of individuals.

Scope of the Study

The study is focuses on Investors investment behavior, investment skills and their level of financial literacy practices in number of investment avenues and stock market. The above perception of investors has been measured with 5 points Likert scales.

Objective of the Study

1. To explore the socio demographic profile of the investors in Chennai city.
2. To determine the underlying factors of Investors Financial Skills, Investors Investment Behaviour and Financial Literacy Practices by Investor.
3. To examine the impact of Investors Financial Skills, Investors Investment Behaviour on Financial Literacy Practices by Investor.

RESEARCH METHODOLOGY

The primary data has been collected from investors of stock market and other investment avenues in Chennai city. The city of Chennai is well developed industrial hub and educational institutions. It attracts greater number of young and dynamic minds for learning and job seekers. These young minds are attracted by number of investment ventures, thus they eagerly invest in stock and other investment avenues. The skill of investment among these young minds are differs based on their financial behaviour and financial literacy practices. Hence this study tries to examine the financial skills of investors and their behaviour pattern. The researcher adopted convenient sampling method to collect data from 165 respondents. 5 point likert scale of strongly agree to strongly disagree have been used with an weightage of 5,4,3,2 and 1 has been used to assess the Investors Financial Skills, Investors Investment Behaviour and Financial Literacy Practices by Investor.

**Prabhakar and Agiladevi Pugalendhi****Data Analysis and Interpretation**

The collected data has been analysed and interpreted using number of univariate and multivariate statistical techniques to assess the relationship among the variables and the results are interpreted in below tables.

Personal Profile

The personal profile of the investors shows sizable number of investors are male in the young age group with professional qualification and are frequent investors in both stock market other investment avenues.

Table 1 shows factor loading and descriptive value of Investor Financial Skills (IFS) variables, the investor financial skills are measured with ten variables and has been factorised using factor analysis. The outcome of the factor analysis shows the 10 Investor Financial Skills have been extracted into two dominant independent factors which is whole together explaining 65.953% of variance in overall IFS. To assess the strength for running factor analysis KMO test has been used the KMO value of 0.909 indicates a strong combability of running factor analysis to 10 IFS variables. The test value of Bartlett's Test of Sphericity 916.791 with Df value of 45 is significant at $P < 0.000$ indicating a close correlation among the variables. The standard deviation values are robust values to their mean as they are far lower than the mean values. The communalities values are over the thresh hold limits of 0.500, hence it indicating factor analysis can be applied to those 10 IFS values. The Two independent factors have extracted, the first factor 1 consist of six variables with Eigen value of 3.874 and explaining 38.743% of variance in IFS. The six variables of factor 1 are Controlling debt, Preparing daily expense, Planning future financial needs, Cost benefit analysis, Digital mode for receipt and payments and Not sharing financial data in the order of their relative correlation among the variables and position it has been termed as Monitoring and Budgeting Factor (MBF). The second factor holds four variables with Eigen value of 2.721 and explaining 27.209% of variance in IFS. The four variables of Factor 2 are Regular reviews of financial activities, Expertise Tax planning, Preparing budgets for financial activities and Numeracy skills in the order of their relative correlation among the variables and position it has been termed as Reviewing and Planning Factor(RPF).

Table 2 shows factor loading and descriptive value of Investors Investment Behaviour(IIB)variables, the Investor Investment Behaviour are measured with eight variables and has been factorised using factor analysis. The outcome of the factor analysis shows the 8 Investor Investment Behaviour have been extracted into two dominant independent factors which is whole together explaining 65.953% of variance in overall IFS. To assess the strength for running factor analysis KMO test has been used the KMO value of 0.890 shows a strong combability of running factor analysis to 8 IIB variables. The test value of Bartlett's Test of Sphericity 816.846 with Df value of 28 is significant at $P < 0.000$ representing a close correlation among the variables. The standard deviation values are strong measures to their mean as they are lesser than the mean values. The communalities values are above the thresh hold limits of 0.500, hence it indicating factor analysis can be applied to those 8 IIB values. The Two independent factors have pull out, the first factor 1 consist of five variables with Eigen value of 3.159 and explaining 39.483% of variance in IIB. The five variables of factor 1 are Risk taking, More confident in self-abilities, Greedy in nature, Patient by nature and Innovative in the order of their relative correlation among the variables and position it has been termed as Risk and Ability Factor(RAF). The second factor holds three variables with Eigen value of 2.610 and explaining 32.628% of variance in IIB. The three variables of Factor 2 are Emotional by nature, Self-disciplined and Flexible with changing situation in the order of their relative correlation among the variables and position it has been termed as Emotional and Disciplined Factor(EDF).

Table 3 shows factor loading and descriptive value of Financial Literacy Practices by Investor (FLPI) variables, the Financial Literacy Practices by Investor are measured with ten variables and has been factorised using factor analysis. The product of the factor analysis shows the Financial Literacy Practices by Investor have been extracted into two dominant independent factors which is together explaining 69.631% of variance in overall FLPI. To assess the strength for running factor analysis KMO test has been used the KMO value of 0.903 shows a strong combability of running factor analysis to 10 FLPI variables. The test value of Bartlett's Test of Sphericity 1115.151 with Df value of 45 is significant at $P < 0.000$ representing a close correlation among the variables. The standard deviation values are

**Prabhakar and Agiladevi Pugalendhi**

strong measures to their mean as the standard deviation values are lower than the mean values. The communalities values are above the threshold limits of 0.500, hence it indicating factor analysis can be applied to those 10 FLPI values. The Two independent factors have pull out, the first factor 1 consist of seven variables with Eigen value of 3.875 and explaining 38.745% of variance in FLPI. The seven variables of factor 1 are Effective decision making, Detailed analysis before investing, Assessment of Intrinsic values, Assessment of expected returns, Diversification of funds, Rate of interest on deposits and Satisfactory returns in the order of their relative correlation among the variables and position it has been termed as Decisiveness and Assessment Factor(DAF). The second factor holds three variables with Eigen value of 3.089 and explaining 30.886% of variance in FLPI. The three variables of Factor 2 are Planning rigorously, Proportionate investment and Fast decision making on investment in the order of their relative correlation among the variables and position it has been termed as Planning and Investment Factor(PIF).

Table 4 shows the Linear combination of demographic profile of investors, Investor Investment Behaviour and Investor Financial Skills which significantly defines Financial Literacy Practice by Investors $[F=201.258, P<0.000]$. The Coefficient value of 0.889 which explaining 78.9% of variance in those two independent influencers. Investors Investment Behaviour(IIB) have a significant and positive influence on FLPI which implies that 0.717 unit change in IIB leads to one unit change in FLPI. Educational Qualification of the investor have also significant and positive influence on FLPI. Higher the education have higher financial literacy of practice by investors. Investor Financial Skills(IFS) have a significant and positive influence on FLPI which implies 0.161 unit change in IFS leads to one unit change in FLPI. Other demographic profile of the investors have no significant influence on FLPI.

RESULTS AND DISCUSSION

The investor financial skills are measured with ten variables and the same have been extracted into two dominant independent factors. The first factor 1 consist of six variables namely Controlling debt, Preparing daily expense, Planning future financial needs, Cost benefit analysis, Digital mode for receipt and payments and Not sharing financial data in the order of their relative correlation among the variables and position it has been termed as Monitoring and Budgeting Factor (MBF). The second factor holds four variables namely Regular reviews of financial activities, Expertise Tax planning, Preparing budgets for financial activities and Numeracy skills in the order of their relative correlation among the variables and position it has been termed as Reviewing and Planning Factor (RPF).

The Investor Investment Behaviour are measured with eight variables and these 8 Investor Investment Behaviour variables have been extracted into two dominant independent factors. The first factor 1 consist of five variables namely Risk taking, More confident in self-abilities, Greedy in nature, Patient by nature and Innovative in the order of their relative correlation among the variables and position it has been termed as Risk and Ability Factor(RAF). The second factor holds three variables namely Emotional by nature, Self-disciplined and Flexible with changing situation in the order of their relative correlation among the variables and position it has been termed as Emotional and Disciplined Factor(EDF). The Financial Literacy Practices by Investor are measured with ten variables and it has been extracted into two dominant independent factors. the first factor 1 consist of seven variables namely Effective decision making, Detailed analysis before investing, Assessment of Intrinsic values, Assessment of expected returns, Diversification of funds, Rate of interest on deposits and Satisfactory returns in the order of their relative correlation among the variables and position it has been termed as Decisiveness and Assessment Factor(DAF). The second factor holds three variables namely Planning rigorously, Proportionate investment and Fast decision making on investment in the order of their relative correlation among the variables and position it has been termed as Planning and Investment Factor(PIF).

The demographic profile of investors, Investor Investment Behaviour and Investor Financial Skills which significantly defines Financial Literacy Practice by Investors. Investors Investment Behaviour(IIB) have a significant and positive influence on FLPI which implies that 0.717 unit change in IIB leads to one unit change in FLPI. Educational Qualification of the investor have also significant and positive influence on FLPI. Higher the education

**Prabhakar and Agiladevi Pugalendhi**

have higher financial literacy of practice by investors. Investor Financial Skills (IFS) have a significant and positive influence on FLPI which implies 0.161 unit change in IFS leads to one unit change in FLPI. Other demographic profile of the investors have no significant influence on FLPI.

Limitation of the Study

1. The sample size for the present study is limited to 160 due to time constrained.
2. The opinion of respondent may vary over the period of time hence, the outcome of the study could not be generalised over the period of time.
3. To study is limited to investors from Chennai city only.

CONCLUSION

The investors are more rational and calculative due to their accessibility to technological gadgets and needful information. Rational investors are financially literate and take cognitive decision-making skills. The behaviour of investor significantly determine the financial skills of investors while taking investment decision. The present study tries to determine financial skills and investment behaviour of individual investors which significantly examine the financial literacy practice which taking investment decision. The researcher used convenient sampling method to collect data from individual investors. The results shows financial skills of the investors are measured in terms of Monitoring and Budgeting Factor and Reviewing and Planning Factor. To assess the investment behaviour of individual investors eight items has been observed which are represented by Risk and Ability Factor and Emotional and Disciplined Factor. The financial literacy practice by individual investors has been assessed by 10 items which are represented by Decisiveness and Assessment Factor and Planning and Investment Factor. Financial literacy practice by individual investors are well determined by Investors Investment Behaviour, Educational Qualification and Investor Financial Skills. It has been suggested that individual investors must be more rational through proper planning and strategic investment.

ABSTRACT

Bitcoin (BTC) and other cryptocurrencies have been around for a while; they continue to encounter difficulties with acceptance and volatility. Over the years, Bitcoin's value has seen enormous changes, with sharp price rises and falls. Bitcoin's price is influenced by the dynamics of supply and demand; if there is a large demand for Bitcoin and a little supply, the price is likely to rise. Bitcoin's price may rise if more people and organizations choose to use it as a valid method of investment or payment. The perspective of the general public and media coverage can have a big influence on Bitcoin's price. Positive news coverage or endorsements from powerful people or organizations may boost demand and raise prices. The price of Bitcoin is influenced by developments in the underlying technology, such as blockchain updates or the creation of new Bitcoin use cases. The price of bitcoin is influenced by larger economic variables including inflation, interest rate fluctuations, and geopolitical developments. This study analyzes the volatility in Bitcoin price due to USD/INR, Wikipedia Trends and Google Trends data collected for India throughout the period from 02/01/2011 to 02/04/2023. Weekly data is analyzed with 640 observations. It is crucial to remember that the price of Bitcoin may be extremely unstable and subject to quick fluctuations depending on a number of variables. One of the biggest reasons why Bitcoin hasn't been extensively used for everyday transactions is because of its price volatility. Almost one-third of the variation in Bitcoin price is due to factors in the study, with a major influence of USD/INR.

INTRODUCTION

Digital assets called cryptocurrencies, like Bitcoin and Ethereum, employ encryption and blockchain technology to build a decentralized, open, and secure system of value exchange. The blockchain, a distributed ledger maintained by a network of nodes or computers, is where transactions are verified and recorded. The adoption of blockchain technology guarantees the security, transparency, and immutability of all transactions. Due to its decentralized structure, cheaper transaction costs, and quick transaction times, cryptocurrencies have gained popularity as an alternative to conventional fiat currencies. Aside from their volatility, lack of regulation, and lack of intrinsic value, they are also regarded as high-risk investments. Cryptocurrencies value is purely determined by market supply and demand because they are not backed by tangible assets like gold or other commodities. Before making any decisions, it's crucial to properly weigh the advantages and dangers of investing in cryptocurrencies.

In his article "Bitcoin: A Peer-to-Peer Electronic Cash System" (Nakamoto, 2008), an unidentified individual or group going by the name Satoshi Nakamoto established the digital money known as Bitcoin in 2009. Using encryption, a decentralized network of computers verifies transactions made using Bitcoin, and the blockchain is used to store the records of those transactions. The blockchain is a distributed ledger system that maintains a decentralized, open ledger of all transactions. The blockchain is safe and tamper-proof because every block carries a cryptographic hash of the one before it. This makes it a trustworthy method for data storage and transport, with numerous potential applications outside of financial transactions.

Bitcoin is a decentralized currency; no one entity, such as a government or financial organization, controls it. These transactions are more securely and transparently confirmed by a decentralized computer network. Without a bank account or credit card, anybody with an internet connection may use Bitcoin to send and receive money from anywhere in the globe. Users have the option to remain anonymous during transactions using bitcoin, which don't require any personal information. Compared to standard bank transfers or credit card transactions, bitcoin transactions often have cheaper costs. Through the use of encryption, Bitcoin transactions are protected from fraud and hackers.

Based to the 21 million coin cap, bitcoin has been able to hold onto its value throughout time. With some investors seeing considerable long-term gains, bitcoin has demonstrated a strong potential for financial returns. Bitcoin has the potential to provide individuals all across the world more financial independence, security, and accessibility. Finance, healthcare, real estate, and other industries might all be affected negatively by blockchain technology. The application of blockchain technology has the potential to upend several sectors and revolutionize how we trade goods and information. It can enable clear and secure record-keeping, lower expenses, and boost efficiency across a wide range of procedures. The governance of blockchain technology and its applications, energy use, and scalability are further issues. A fascinating and quickly developing sector of innovation and investment, bitcoin and blockchain technology have both potential advantages and threats.

Literature Review of Bitcoin Price drivers and Volatility

Although the fact that Bitcoin and other cryptocurrencies have been around for a while, they continue to encounter difficulties with acceptance and volatility. Bitcoin's price is influenced by the dynamics of supply and demand; if there is a large demand for Bitcoin and a little supply, the price is likely to rise. The demand for Bitcoin may rise, pushing up its price, if more people and organizations choose to use it as a valid method of exchange or investment. The perspective of the general public and media coverage can have a big influence on Bitcoin's price. Negative news or regulatory crackdowns can reduce demand and push the price down, whilst positive news coverage or endorsements from significant people or organizations can boost demand and raise prices. The price of Bitcoin is affected by advancements in the underlying technology, such as blockchain updates or the creation of new Bitcoin use cases. The price of bitcoin is influenced by larger economic variables including inflation, interest rate fluctuations, and geopolitical developments. It is crucial to remember that the price of Bitcoin may be extremely

**Kavitha A Karkera and P Sudarkodi**

unstable and subject to quick fluctuations depending on a number of variables. Before making an investment in bitcoin, it is crucial to conduct research and carefully weigh the dangers.

One of the biggest reasons why Bitcoin hasn't been extensively used for everyday transactions is because of its price volatility. Over the years, Bitcoin's value has seen enormous changes, with sharp price rises and falls. It becomes challenging for businesses and customers to utilize bitcoin as a reliable store of value for their transactions as a result. Furthermore, for certain users, Bitcoin's high transaction costs may operate as a deterrent to adoption. Stablecoins, which are cryptocurrencies intended to maintain a steady value relative to a certain asset like the US Dollar or a basket of assets, were developed as one effort to address these difficulties. These stablecoins are meant to make cryptocurrencies less volatile and more reliable.

The dynamics of supply and demand in the cryptocurrency market, public attention, and the unpredictability of economic policy are a few factors that are reliable in explaining fluctuations in the price of bitcoin. The paper contends that in explaining fluctuations in Bitcoin price, these cryptocurrency-related drivers are more significant than general macroeconomic and financial factors (Ahmed, 2022).

When the informational efficiency of the Bitcoin market was examined from 2011 to 2017, it was discovered that daily returns showed consistent behaviour in the first half of the research period but improved after 2014. Price volatility, which is determined by the logarithmic difference between intraday high and low prices, on the other hand, shown long memory across the full time frame. This implies that several underlying dynamic mechanisms that produce volatility and price changes. The study sheds light on the efficiency and changes in behaviour of the Bitcoin market over time, emphasizing the value of employing the right techniques for examining long memory and informational efficiency in financial markets that fluctuate over time (Bariviera, 2017).

Bitcoin has larger returns than other assets including the S&P BSE 500, HDFC ETF Gold, S&P BSE Oil & Gas, and S&P BSE Realty, but at a far higher risk. According to the Markowitz efficiency test, adding Bitcoin to a portfolio raises the portfolio's risk and return. In order to maximise their returns, investors with a high tolerance for risk may want to think about integrating Bitcoin in their portfolio, while those who are risk-averse may want to stay away from doing so (Bhatia et al., 2018).

Several elements, including news, events, legislation, and market sentiment, have an impact on the volatility of bitcoin. Negative news can cause Bitcoin's price to drop and its volatility to rise, such as regulatory crackdowns or security breaches. Positive news may enhance the price of Bitcoin and reduce volatility, such as institutional acceptance or novel use cases. It is true that the market for Bitcoin is heavily influenced by speculative activity and self-fulfilling expectations, particularly from retail investors. Bubbles and sudden price changes in the market can occur due to mood and momentum rather than underlying fundamentals (Bouoiyour & Selmi, 2015).

Bitcoin is not a safety net for global equity markets, and owning any portion of the asset may expose portfolios to more downside risk than if they simply held the underlying equities index alone. The report notes the CSI 300 index as an outlier, where holdings of up to 16% in Bitcoin may lessen downside risk. This implies that while cryptocurrencies could have a small amount of safe haven characteristics in a few markets or situations, they cannot be trusted to provide safe haven for all global equity markets (Conlon et al., 2020).

It was found that energy costs had no beneficial effect on bitcoin profits. Returns on the S&P 500 were shown to be positively correlated with bitcoin returns. This shows that bitcoin has been used as a different type of investment option for stock market trading. Bitcoin returns were not significantly impacted by public interest as shown by Google search activity and new posts on bitcointalk.org. This shows that the degree of interest in bitcoin among the general population has no impact on its financial performance. According to the study, although volume increase had a favourable effect on bitcoin returns, supply growth had a negative effect. In other words, the profits on bitcoin

**Kavitha A Karkera and P Sudarkodi**

declined as its supply grew, and the returns on bigger trading volumes climbed. Interest rates exhibited no trend (D.Heuver et al., 2019).

A portfolio that includes bitcoin may perform better as a result of increased diversification. Concerns about Bitcoin also include its vulnerability to cyber attacks, issues with operating as a money, and links to illicit activity. These worries could result in legal limitations or outright prohibitions in some nations, which might have an impact on how well Bitcoin does in the future. Investors should carefully weigh the risks and rewards of holding Bitcoin as part of their portfolios and keep an eye on any regulatory or security-related developments. Bitcoin may benefit from diversity, but it is neither a hedge nor a haven asset. The most sensible way to invest is probably with a balanced and diversified portfolio that takes into consideration a person's risk tolerance and investment objectives (Klabbers, 2018).

Fundamental issues and investor interest have an impact on bitcoin. Long-term fluctuations in the price of Bitcoin are influenced by conventional economic theory, particularly monetary economics and the quantity theory of money. However, the interest of investors in the cryptocurrency is what drives the price in the near run. Users are encouraged to start mining as Bitcoin's value rises, however this impact is discovered to be fading over time since specialised mining gear components have raised the difficulty and hash rates too much. It doesn't seem like investing in bitcoin is a secure haven. Although there is no concrete evidence that the Chinese market impacts the USD market, the CNY and USD markets are closely related (Kristoufek, 2015).

The volatility of Bitcoin is influenced by several important variables. First, when news regarding Bitcoin regulation appears in reputable financial media like the Financial Times, it significantly affects how volatile Bitcoin's price is. This shows that it is crucial to take regulatory changes into account when analysing price variations for Bitcoin. Hacking is the second important factor influencing Bitcoin volatility. Bitcoin's price volatility and its jump component can be significantly impacted by cryptocurrency market hacks. The turbulence in Bitcoin's price is also influenced by investor attitude. Positive investor sentiment has the potential to raise the volatility and leap levels of Bitcoin, whilst negative or neutral mood does not seem to have a major influence. Last but not least, scheduled macroeconomic news releases have minimal effect (Lyócsa et al., 2020).

The value of Bitcoin can be significantly impacted by fluctuations in exchange rates, particularly those involving important currencies like the US dollar and Chinese yuan. For instance, a decline in the value of the Yuan relative to the dollar might make Bitcoin considerably more affordable for Chinese investors and traders, increasing demand and perhaps raising the price. There was a rush in Bitcoin purchases in China in late 2016, which led to a strong rise in Bitcoin price at a time when the Yuan significantly depreciated versus the dollar (Poyser, 2017).

Considering energy consumption represents a major expense throughout the mining process, the price of crude oil can have an impact on the cost of mining bitcoin. The cost of mining bitcoins might go higher when oil prices rise, which would put upward pressure on the price of bitcoin. Given that China is a significant player in the cryptocurrency sector, the USD/CNY exchange rate may have an effect on the price of Bitcoin. Bitcoin's price may increase if Chinese investors find it more appealing to invest in it due to the Chinese Yuan's declining value against the US dollar. The intensity of competition amongst miners to solve a block in the blockchain network, known as mining difficulty, can also affect the price of Bitcoin (Seys & Kjartan, 2016).

Returns on Bitcoin are inversely correlated with a nation's level of economic growth. This implies that investors may lose trust in the economy and move to virtual currencies like Bitcoin, which may provide superior returns, if economic development slows and exchange rates rise. Additionally, the report contends that economic hardship is likely to stimulate interest in Bitcoin, which might result in a rise in its returns. Because of the inverse relationship between Bitcoin returns and economic growth, it is possible that when financial stress rises, investors may resort to Bitcoin as a form of investment. Different economic factors, including as economic expansion, exchange rates, financial stress, and the development of a nation's financial system, have an impact on Bitcoin's performance (Thukral et al., 2021).

**Kavitha A Karkera and P Sudarkodi**

As a marketable financial asset, Bitcoin acts similarly to gold, and economic variables like the Consumer Price Index, Dow Jones Industrial Average, Federal Fund Rate, and US Dollar Index have a long-term detrimental effect on the price of Bitcoin. This suggests that while gold prices aren't always a hedge against Bitcoin, they may be against the US currency or other assets. The US Dollar Index has the most of an impact compared to the other factors. Bitcoin is a form of asset since supply and demand, as well as macroeconomic and other significant asset price indexes, all affect its value (Zhu et al., 2017).

The fluctuation of the price of bitcoin is a significant problem, but it is not an insurmountable barrier to its development. More solutions that assist to reduce this volatility and make Bitcoin and other cryptocurrencies more accessible and user-friendly for everyone may evolve as the cryptocurrency ecosystem continues to grow and mature. It's possible that future technology advancements and innovations will assist to overcome these problems and make it possible for people to utilize cryptocurrencies more often in regular transactions. Bitcoin is a very young and developing asset class that lacks regulatory certainty and wide-spread use. The market's volatility may decline and its pricing may become more stable as it ages and institutionalizes.

DATA AND RESEARCH METHODOLOGY**Data**

Recently, search terms from Google Trends and Wikipedia have proven to be a valuable source of knowledge for financial applications ranging from portfolio diversification and trading strategies to explanations of home bias and traded volume. A reliable indicator of interest in a digital currency and one with strong explanatory power is the frequency of searches for phrases connected to it. In this study, we investigate the connection between Bitcoin price movements associated with Wikipedia and Google Trends search phrases. US Dollar is a widely accepted currency in International transactions and has a major influence in the crypto market.

Time series Weekly data has been obtained from <http://www.google.com/trends> for Google Trends, <http://stats.grok.se> for Wikipedia and <http://www.bitcoincharts.com> for Bitcoin. Google Trends series for India are normalized (so that the maximum value of the series is equal to 100) and rounded whereas the Wikipedia series for India provide the actual number of visits for the given week. For the Bitcoin prices, the focus is on the exchange rate with the INR. The Weekly exchange rate of USD/INR is collected from International Monetary Fund website imf.org. Weekly data is collected from 02/01/2011 to 02/04/2023, 640 observations.

Research Design

The present investigation aims to examine the impact of USD/INR, Google Trends and Wikipedia Trends on Bitcoin Price. The dependent variable in this study is the price of bitcoin BTC/INR. The performance of bitcoin can be quantified by calculating returns using historical data, which helps investors better predict the direction of Bitcoin's price in the future. The exchange rates for the US dollars against the Indian Rupee, Google search Trends and Wikipedia search trends serve as the study's independent variables. The times series Weekly data is collected from 02/01/2011 to 02/04/2023, 640 observations. The price of Bitcoin is the dependent variable. As a result, the research formwork is built as follows:

Research Objectives

Through the previous literature review, the following variables were adopted to research the price drivers of BTC/INR – Google trends, Wikipedia Trends and Exchange rate of US Dollar/Indian Rupee (Three Independent Variables). The study explores the relationship of each independent variable on the dependent variable BTC/INR to discover the extent of influence.

**Kavitha A Karkera and P Sudarkodi**

RESEARCH METHODOLOGY

The focus of the current research is to check the validity of the following hypothesis:

H1 There is no relationship between the exchange rate of USD/INR and the Bitcoin Price.

H2 There is no relationship between the Google search trends and the Bitcoin Price

H3 There is no relationship between the Wikipedia search trends and the Bitcoin Price.

Research Model

Regression Analysis used to test the Hypothesis and study the dynamic behaviour of the Bitcoin price. The impact of Independent variables USD/INR, Google search trends and Wikipedia search trends is examined on dependent variable Bitcoin price. Descriptive statistics is used to provide basic information about variables in the data set and also to study the highest potential relationship between the variables. Correlation is used to measure the strength of the linear relationship between the dependent and independent variables. R-squared used to examine the relationship between movements of a dependent variable based on an independent variable's movements. Analysis of Variance (ANOVA) is used to compare variances across the means (or average) of different groups. A standardized beta coefficient is used to compare the strength of the effect of each individual independent variable to the dependent variable.

RESULTS

Measure of central tendency Mean and Measure of Variability Standard deviation describe the characteristics of the data set of 640 observations as explained in Table 1. Deviation from the mean is the highest for BTC/INR, indicating high risk. Table 2 shows the results of study which indicate a strong positive correlation .605 between BTC/INR and USD/INR. It indicates a negative correlation between BTC/INR and Wikipedia trends and a low positive correlation between BTC/INR and Google Trends. This shows that when search terms in Google trends for BTC increases, there are likely chances for BTC/INR to rise. The strongest positive correlation between BTC/INR and USD/INR indicate the USD has a major influence in volatility of BTC price. Table 3 shows that the Adjusted R Square is .370 which means all the independent variables are creating 37% variation in BTC/INR. The independent variables USD/INR, Google Search trends and Wikipedia search trends can be used to predict BTC/INR to a large extent. Table 4 indicates that data is significantly predicting the model. The independent variables have a significant influence on BTC/INR. The Coefficient Table 5 indicates the statistical significance of independent variables on the dependent variable. The results of the study indicate that the Google trends and USD/INR are significant predictors of volatility in BTC/INR. One unit increase in Google trends will cause a .081 unit increase in BTC/INR. One unit increase in USD/INR will cause a .590 unit increase in BTC/INR. This indicates that the relationship between USD/INR and BTC/INR is highly significant. Wikipedia trends influence on BTC/INR is not significant. The model characteristics explain that the relationship between the independent variable (Wikipedia Trends) and the dependent variable (BTC/INR) is not statistically significant. This requires the acceptance of the null hypothesis (H03) which states that: There is no relationship between the Wikipedia Search Trends and the Bitcoin Price. The coefficients of the model indicate a significant and positive relationship between the dependent variable (BTC/INR) and the independent variable (Google Trends). This result implies the rejection of the null hypothesis (H02) which states that: There is no relationship between the Google search Trends and the Bitcoin Price and acceptance of the alternative hypothesis which confirms the relationship between the Google trends and BTC/INR. The coefficients of the model indicate a high significant and positive relationship between the dependent variable (BTC/INR) and the independent variable (USD/INR). This result implies the rejection of the null hypothesis (H01) which states that: There is no relationship between the exchange rate of USD/INR and the Bitcoin Price and acceptance of the alternative hypothesis which confirms the strong significant relationship between the USD/INR and BTC/INR.

CONCLUSION

The fluctuation of the price of bitcoin is a significant problem that can deter new users and restrict the currency's ability to expand. Price fluctuation has a detrimental effect on everyone, not just new consumers. When Bitcoin's value remains unclear, even current users could be hesitant to utilize it for transactions. As a result, Bitcoin may take longer to become widely accepted and its ability to upend established financial institutions may be limited. People may find it challenging to estimate Bitcoin's genuine value because of its volatility, and this ambiguity may put off prospective investors and users. The current study examines the validity of three independent variables: Google search Trends, Wikipedia Search trends, and USD/INR, which have an impact on Bitcoin price and have received attention in related literature. Numerous empirical studies aim to pinpoint the key elements influencing the development of Bitcoin's price. However, the findings of such research are often still contradictory, both in terms of the precise mix of elements that determine the price of Bitcoin. The price of Bitcoin is greatly influenced by a variety of unforeseen events, including legislative shifts, security lapses, and investor mood. This study advances our knowledge of the intricate variables that affect the price of bitcoin. It emphasizes the significance of taking into account a variety of possible variables and utilizing sound analytical techniques to pinpoint those that have the greatest influence on Bitcoin pricing. Exclusively, we see that even when the prices are high (above trend), the rising interest as depicted in Google Search trends drives the Bitcoin prices even higher. On the other hand, if prices are below their trend, rising interest in Wikipedia trends causes Bitcoin prices to drop even further. The study also indicates a significant relationship between USD/INR and BTC/INR. As digital currencies offer a distinctive context for examining a purely speculative financial market, the current study serves as a starting point for the further research line dealing with the statistical features, dynamics, and factors determining the price of Cryptocurrencies.

ABSTRACT

The goal of this study is to illustrate how robotic systems could profit from using Tiny-ML family neural networks. For visual processing. The field of social robotics, which is evolving rapidly, allows for the building and development of robots that will accompany people, engage in social interactions, and carry out specialized educational, amusing, and therapeutic duties. The appropriate recognition of humans by robots is one of the core issues with social robotics. The reality that this is when human-robot contact begins presents a serious issue. In addition to being highly efficient, widespread solutions need also sufficient computing power, which social robots frequently lack. The article analyzes a YOLOv4-tiny network to a YOLOv5s solution in terms of processing speed and efficiency. Utilizing neurological sticks, the hypothesized networks were tested on social robots of the OhBot type and with increased capabilities. The statistics collected demonstrate the highest effectiveness of the YOLOv5s either be employing a Raspberry Pi and an accelerator. The research was presented offers a chance to raise awareness of the issue of computational complexity in robotic applications and also has the chance to boost public approval of social robots and their use in daily life.

Keywords: Face identification, Miniature, Artificial neural, OhBot robots and social robots.

INTRODUCTION

One of the disciplines of robotics with the greatest progress is social robotics. Robots from the industrial hall are arriving into normal people's lives by way of companion robots, instructive robots, or treatment support robots [1, 2].

59593

**Nandini and Shobha**

Both research institutes and major technology firms are tackling the task of designing, building, and implementing social robots. The necessity for a rise in the use of robots in routine human contact is being driven by and reinforced by the social changes that are occurring [3]. The ageing of the population, which results in a change in the proportion of older people, who are getting older every year, is one of the compelling reasons. Cultures that can offer decent elderly care. Robot companions and recuperation are useful in this situation [4]. The use of educational robots is rising as a consequence of worldwide changes that are causing extensive human migration [5]. As previously said, the key reason for children's educational concerns is the inadequate instruction being given to them in a language other than their mother tongue. Children have more options and receive good education when a unique learning robot is used to speed up linguistic skills. Children who have multiple disabilities and autism also have a possibility to gain considerably from this. According to investigations, the applicability of therapeutic robots increases their performance in circumstances, including significantly to similar counterparts [7]. Nonetheless, there are a few fundamental requirements that must be addressed in order to permit human-robot connection, regardless of the factors that make social robots more popular. This article's major goal is to apply neural networks from the TinyML family to a real robotic system, complete with all of its constraints and limitations. Tiny-ML neural networks have experienced enormous development. The ability to implement virtual networks in microcomputers or other limited systems is their fundamental objective. The given solutions aren't typically tested on the intended systems, though. This paper's central element and goal was to use networks from the Tiny-ML family as well as combine them into a real robotic system and test their efficiency there. The design of a tiny- ML iteration of the YOLO family of networks was the purpose of this work. Although some networks are commonly used, there aren't a lot of reports of their inclusion into robotic systems in the actual world. The implementation was accomplished using an Intel Neural Stick 2 computational enhancer and a Raspberry Pi minicomputer. Based on the results, that use the optimizer significantly speeds up network performance, even when using tiny-ML networks. This is crucial in systems when many multiple solutions, in contrast to the one originally chosen, are in use. One of the most significant insights derived from the study is that productivity and speed the network can differ substantially from the standalone systems which it was trained of the network when incorporated end-to-end into an operational robotic system.

Related Works**Communal Robotic Systems**

Social robots are machines whose goal it is to interact with human beings. Robots must be able to recognize humans in real-time before, during, and after a task in order for this to be feasible. When a robot and a single individual are conversing, the robot should be able to identify the human's face and follow it, even if the human changes location [7]. It is important to separate methods based on various new technologies among those to be used. Social robots distinguish humans using microphones, distance sensors, lasers, cameras, or webcams and lenses. The efficiency of the different technical approaches varies. About with the detecting of visual objects using it's vital to differentiate amongst approaches that utilize different hypotheses among those utilized technological solutions. Social robots identify persons using microphones, distance sensors, lasers, cameras, or webcams and microscopes. The efficiency of the various technical approaches varies. High performance is reported for the recognition of in-cent using video recordings or photo sequences. The largest issue, per the studies by other researchers, is face recognition under multiple light environments, as well as the hardware and computing limits of social robots in comparison to conventional computers [8]. The restricted strength of social robots may prevent the implementation of traditional methods with great performance. Solutions requiring rapid answers and little computational resources employ the Tiny Machine to avoid this issue from happening.

Miniature ML's and Usage

A new area in technology concerns tiny algorithms and artificial intelligence solutions. Edge AI is a generic term for these solutions [10]. Its fundamental objective is to provide direct processing on microprocessors, even devices powered by batteries. This marks an important shift in the path of technological progress, presently shifting from cloud computing services to instrument approach. One of the most widely mentioned positives of such a solution is extra security even though data is not received, processed, but then just given back. Nonetheless, it also gives an

**Nandini and Shobha**

opportunity to build a variety of solutions with previously untapped functionality. As indicated, doing calculations directly on microprocessors ensures reduced latency, which in the case of creating social drones key issues [11]. This project makes use of TinyML to find situations that enhance the transmission of vector – borne it can operate for many years and is impervious to ailments as a result of constant solar energy. Similar techniques are being applied in agriculture, where software could help us identify phytopathogens without an internet connection. These and other numerous applications emphasize the numerous uses for TinyML, including social robotics [12, 13]. The capability of directly applying machine learning models to robots offers vast opportunities by program improvements and decreasing the necessity for a permanent internet connection.

Framework

An OhBot-style mechanical head, a Microcontroller microprocessor, and a Neural Adhere compose up the system architecture. The system is intended to use TinyML methods for face detection, enabling quick recognition of human beings with whom the robot can interact or participate in discussions. With this approach, the robot may virtually always search its surroundings and only initiate additional robot contact activation algorithms when a face is found. Through the usage of TinyML, a person who enters the field of view of the social robot's camera will be immediately discovered, the robot will activate, and human- robot communication will occur. OhBot social robots were deployed for the research, and the two were linked to the RaspberryPi 4 microcontroller, whose Intel Nano Disk 2 engine powers it. The sensor field is influence the learning by the robot. The data stream from the robot's camera is relayed to the minicomputer, where the pre-defended researcher examines using a neural network on the Brain Stick, which is meant to locate and recognize faces. The minicomputer's feedback is if a face has been spotted, and when it is, the minicomputer sends a command towards the social robot to start a new set of tasks that will allow the human and the human to connect.

Using Neural Network Models For Image Recognition

The greater idea of image-based item light sensor faces detection. The solutions that use neural networks are the most frequently deployed. Convolution neural networks (CNNs) are the most popular choice because of their capacity to identify patterns in images [15]. These networks' structural design enables classification and labeling of identified items, which sets the scope of their potential. The most well-known face detection networks include R-CNN, Fast R-CNN, Faster R-CNN, and YOLO [16]. Regrettably, as a tiny-R-CNN version that would facilitate implementation using microcomputers has not yet become available, it has been determined to use the Swag ones in this study. The Raspberry Pi 4GB employed by the robot system's current architecture does not provide sufficient Memory to handle non-tiny-R- CNN family networks.

Robotics Resemble OhBot

The scientific advances called as OhBot intelligent machines have living thing features. They are mainly composed of many servos that would let them to move their mouth, eyes, eyelids, and even their entire head. Since the robots can always be fully designed in Python, many TinyML solutions can be used, together with the TensorFlowLite library. The robots can detect tilt or alterations in light and can receive visual, acoustic, and tactile inputs when fully integrated with other special technological equipment.

Neurological Stick

A solution based on the Intel Neural Compute Stick 2 (Intel NCS2) is integrated along with the minicomputer to optimize and accelerate up the communication between robots and to extend AI inference by accelerating progress [20]. This method is compatible with the operating systems essential to social robot programming and enables analysis and processing based on neural networks or machine learning without the demand for cloud computing.

Development for Micro Neural Network models

Two machines - learning solutions were selected to be utilized in the analyses. Tiny- YOLO v4 from either the tiny- ML stream is the first recommended network, and YOLO v5s is the second. The neural networks were trained based

**Nandini and Shobha**

on identical large datasets, constructed in a comparable way, but then tested using a carried out in the following of such a social robot of the OhBot type, a Pic Microcontroller central processing unit and just a computation accelerate of the Intel Neural Sticks type.

The Design of Neural Network Models

It was decided to employ and analyze multiple opposite Swag network structures. The first one is a small version of Swag v4, while a second one is a small version of Swag v5. The Swag v4 version is significantly different from the previous editions [22,23]. Backbone based on CSPDarknet53, Neck based on spatial pyramid pooling and Path Aggregation Network, and Head based on Class subnet and Box subnet make the fundamental architecture. Hardly any changes were made to the head since YOLOv3. The little model's activation function developed based on leaky RELs. Other authors, such as Glenn Jocher, advocated YOLO v5. The forms of Swag v5—s, m, l, x, and n—relate to node density and rising efficiency.

Defined as the Task

The Rob flow Tool was utilized to prepare the datasets. The slight and YOLOv5s systems were then fed also with prepared datasets. Chrome Limiting factors Services were used to implement network training. It offers 13 Memory, 2 Intel Xeon Processor working at 2.2GHz, and an Intel Xeon K80 GPU. Two datasets were used for the training. MS COCO was the second dataset [26]. This large-scale dataset allows for the segmentation, labeling, and classification of items that may be seen in pictures. Common Objects in Context, commonly known as COCO, is a computer whose main goal is to process an image classification.

The existence of 17 key points that allow for the tagging of main things with values.

Values is essential to the success of the proposed approach and use in social robotics (x,y,z). A given point's coordinates are provided by the x and y values, while its visibility is shown by the v value (visible, invisible). The 17 points are: the nose, the left eye, the right eye, the left ear, the right ear, the left arm, the right arm, the left wrist, the right wrist, the left hip, the right hip, the left knee, the right knee, and the left and right ankles. Figure 2 offers an extensive explanation. The null pointer, a Microcontroller minicomputer, was then given the telecommunication as compiled code. The results shown in Table I suggest that the YOLOv5s network has improved performance for the examined measures. In both samples, our network indicated increased quality.

Deployment Of Neurological STICKS Using OHBOT Robotic Systems

To use the Company is planning to open solution; the deployment was performed out across two networks. It was decided to evaluate the network speed on a 4-inch Raspberry Pi model B Wireless Dual Band Bluetooth 8GB RAM 1.5GHz computer by using two suggested ways. Simultaneous tests using alongside and without the Intel® Neuroscience Compute Stick 2 (Intel® NCS2) processor were carried out. The final code for OhBot-type robotic faces was tested experimentally on various circumstances based on the findings of the tests that were conducted. The amount of frames per second (FPS), where full set can be seen in TABLE II, was the most essential factor for the concepts that were practiced. The outcomes obtained illustrate the YOLOv5s network's efficiency for both datasets. With the Intel Neural Stick 2, or the accelerator, the best results are produced. This means that the Microsoft Neural Stick 2 will be connected to the Raspberry mini - computer and YOLOv5s are going to be utilized for the big tests

Outcomes OF Experimental tests

It was chosen to perform a number of studies allowing the use of the YOLOv5s network allowing the identification of particular categories included in the MS COCO and in the set allowing the detection of surgical masks through order to put the suggested solution into reality.

Seeing an individual's picture to strike off an argument

The purpose of this project was to build a feature which will automatically initiate discussion at level 0.7 when a person is identified. Also, the value of 0.7 was decided in accordance with the results shown in Table I. A decisive element in the situation of robots collaborating with humans is accurate classification. High threshold values were

**Nandini and Shobha**

established in order to prevent false detection. It should be noted that the network start to detect people at level 0.5, although values lower than 0.7 imply a bigger separation between people and robots. A script that consists of the following stages is activated when a person is detected:

The level 0.7 recognition of an individual.

Artificial shoulder's response: Good morning! Would you like to speak about OhBot?

Waiting to receive a reply.

When examining the human system is significant, a greater number means that the individual is becoming closer while a lower value suggests that they are retreating off.

Changing to an automated chat bot script in the event of a satisfactory reply.

The robotic head replies, "Come closer in order for me to understand you better," if there is no answer or an unclear answer.

The script is completely disconnected when the robotic stops detecting individuals.

Choosing a face mask

The goal of this project was to put into effect a functionality which would automatically identify whether or not individuals have on masks and whether they are wearing them correctly. Due to the similar constraints that apply to scenario 1, only values above 0.7 are examined. The steps inside the scenario script are as follows:

I plan to:

Level 0.7 detection of something like an individual with a mask on.

Robotic head responding: Good morning and I enjoy you wearing the mask!

The machine's reply: Do you want to chat with OhBot?

If you get a favorable response, another autonomous voice based script starts over.

The script is ended if there is no reaction or a negative outcome. II Plan to:

Level 0.7 recognition of a woman who wears an improper helmet.

The robotic head's respond: Hi, it sounds that you are not putting your face appropriately. Please make the adjustment.

Analysis of pictures. Run the first method if a person with a face mask is detected at degree 0.7.

Send the request in once more if OhBot at level 0.7 finds an inappropriately placed mask (point 2).

If no mask is discovered at level 0.7, continue on to the following scheme. III Plan to:

A level 0.7 recognition of a person without such a disguise.

Robotic head reply: Good morning. I notice you are forgetting your cover. Might you mind don it?

Rephrase the request if the person's presence of a mask was still found at level 0.7. (Point 2).

The next scheme is launched if a mask that's been worn improperly is identified at level 0.7.

40 sessions are run for the investigation's information and insight. The robot activity that results humans and began to speak with them 36 times. The remainder 25 people had additional discussions with the mechanical neck's chat boot, relative to the 11 individuals who opted not to.

120 repetitions operate for the experiment's second situation. 33 people (57%) chosen to carry on speaking in the OhBot after the robot correctly identified them 58 times as sporting a mask. Seven times, the robot misread whether a mask was being worn. Of the 27 occasions the robot found a mask being worn erroneously 17 persons (or 63 percent), fixed the mask. The ten persons did not correct the mask or interact with the robot. a total of six times, the robot failed to find the wrong mask be worn. Four (31% of the time) of the 13 occasions the robot accurately recognized people lacking their mask, individuals put it on and started with their work.

CONCLUSION AND FUTURE WORK

The purpose of the project was to assess and employ the person and facial recognition networks that were already in place for social robots like OhBot. We tested a pair of networks and two possible architectures. The network YOLOv5s, whose best outcomes were produced on an architecture combining a minicomputer and a cognitive accelerator, came out to be the one displaying the greatest efficiency and quality of operation. A sociable robot was

**Nandini and Shobha**

utilized to integrate this kind of system, and a series of tests were then conducted to test how effectively the approach worked in everyday situations. That just a handful of Raspberry Pi microcomputers were used to assess the performance of the tiny-YOLO network is one of the study's most significant limitations. Performance must be compared to applications like Google Coral or Nvidia Jetson. The existence of extra processes that could interfere with or disrupt the network is another restriction. In order to assess how much and how these affect the network's speed, extra tests will be conducted side-by-side, without and with the following operations. The proposed solutions are just one of many functions that social robots can perform, but they are particularly significant since they can initiate and carry on a conversation with a human. It is intended to implement social robotics in additional initiatives.

ACKNOWLEDGMENT

The Silesian University of Technology (SUT) supplied some funding for the work of AG and TG (02/060/BKM22/0041) through the subsidy for maintaining and expanding the research potential award in 2022. The work of EP was financed in part by the Silesian University of Technology (SUT) through the subsidy for maintaining and developing the research potential grant in 2022 for young investigators in evaluation 02/060/BKM22/0036, and in part by the Union of Europe by means of the European Social Money as a scholarship under Grant POWR.03.02.00-00-1029. The exact identical subsidy that was used for KS sponsored this work. The research effort of NB and MW was supported by the Coaching Program (Program Mentorski - "Rozwin skrzydła") implemented by the Silesian University of Technology (SUT) and funded from the reserve of the Vice-Rector for Student Affairs and Education: G: SUBD MPK: 60/001. The National Center for Development and Research (NCBiR) and the Greater Silesian Centre for Computing in Science and Engineering (GeCONil) contributed support for this investigation through Grant POIG.02.03.01-24- 099/13.

ABSTRACT

The term work life balance indicating how employees are balancing their work as well their personal life. Employees need to be more productive at workplace similarly he or she should be much involved with his family as well as keens. This balancing between workplace and family are called convenient work life balance. The achievement of convenient work life balance is only possible through better work life facilitation provided at workplace. The demand for growth at workplace and competitive environment bring hurdles to employee in achieving work life facilitation. The situation is becoming complex now due to saviour impact of Covid on work culture, work from home arrived as new working culture to overcome the situation of pandemic but this culture has change the employees working pattern and their expectation from the organisation. Employees are expecting higher conveniency at work place and better work life facilitation from employers. The present study tries to assess the impact of convenient work life balance of employees on work life facilitation at workplace and mediating effect of hurdles to achieve work life balance. The researcher used exploratory research method with a sample size of 230 employees working in ITES sectors. The outcome of the study shows convenient work life balance have significant influence on Work place hospitality facilitation. It is suggested that employees need to overcome hurdles to achieve work life balance only through better productivity and involvement at work.

Keywords: Productivity, Facilitation, Pandemic, Hurdles and Conveniency.

"Never get so busy making a living that you forget to make a life."

Dolly Parton

59602

INTRODUCTION

Work-life balance refers to an individual's level of prioritisation of personal and professional activities in their life, as well as the extent to which activities related to their job are present at home. Work-life balance refers to a condition in which one's work and personal lives are perfectly in sync. This includes completing everyday tasks without neglecting any part of one's personal life (health, family and friends, culture and hobbies), and the other way around. This does not have to imply that all aspects of life accept equal devotion, but rather that workers can deliberately split their time and energy as they see fit between work and personal life. It is debatable what the optimal work-life balance is. Anthropologists frequently define happiness as having little or no difference between an individual's work and personal lives, according to freethinker Paul Krassner. Work-life balance is a hot subject these days because technological advances have removed the significance of physical location in defining work-life balance. Previously, bringing work home was difficult or impossible, creating a distinct divide between professional and personal life.

The proliferation of mobile technology, cloud-based software, and the internet has made it much easier for employees to be 'permanently' at work, blurring the line between professional and personal life. Some commentators argue that smartphones and "always-on" access to the workplace have supplanted managers' authoritarian control. The debate over work-life balance revolves around who is responsible for ensuring employees have a decent work-life balance. Employers have a moral responsibility to their workers' health, according to the general consensus; stressed-out employees are less productive and more apt to make mistakes.

Measures For Improvement Work Life Balance

- **Implement hybrid work models:** Those who travel to work every day are more likely to suffer from burnout and stress symptoms such as sleep disorders and high blood pressure. Those who labor solely from their homes, on the other hand, commonly suffer from loneliness, a lack of exercise, and anxiety. To counteract both, a hybrid working model in which staff members can choose when and where they work is a viable option.
- **Enabling flexible working hours:** Those who are forced to work throughout their less fruitful times due to strict working hours will not be able to reach their maximum potential. Employees with a flexible schedule can choose when and how they work, allowing them to better incorporate their work hours into their daily routine. More significantly, they can work at their most productive times rather than their least productive times.
- **Eliminate work on weekends:** Rest times are necessary for employee health. In addition, many employees spend their weekends with family, friends, and hobbies. When workloads appear to require employees to work weekends, it can seriously limit recovery and family time while also hastening burnout. Employers who eliminate weekend work make a significant contribution to avoiding team burnout.
- **Introduce sports and health management programs:** Allowing employees to integrate this into their daily routine may enhance their team members' health, efficiency, and focus.

Work Place Hospitality Facilitation

With a greater emphasis on work-life balance, hybrid-first workplaces, and changing hiring trends, employers looking to hire and retain the best talent must understand what benefits and perks to offer current and prospective employees to reflect today's workforce needs. Employees who are happy with the benefits they receive are four times more likely to be satisfied with their jobs; standing out in an increasingly competitive hiring market is critical for most organisations to succeed. Because most workers spend the majority of their time in an office, whether partially or entirely, making that environment as optimised and comfortable as possible has never been more important, making workplace hospitality a key component in forward-thinking perks and benefits packages. The modern workplace is far from the mundane office environment where employees spend their 9 to 5 hours. It's all about honing the available space in the best way possible to create an experience-driven, employee-focused space that not only facilitates productivity, networking, and socialising but also makes it easier for them to disconnect and get some much-needed downtime.

**Prabhakar and Suresh**

REVIEW OF LITERATURE

The use of digital technologies enhances individual collaboration and information sharing, leading to improved work-life balance and higher job success. (Duan, S.X., *et al.*,2023).Availability to a social-organizational workplace intended to promote creativity is associated with increased idea generation but diminished balance between work and personal life, whereas work schedules that are flexible have been linked with increased balance between work and personal life but not with originality. (Mattarelli, E., *et al.*,2022).Relationships that are expected, showing that work-life balance fully mediates the connection between psychological wealth and worker attitudes. (Parray, Z.A., *et al.*,2022).Support from colleagues and suitable for families rules at the workplace Work-family balance was expected to be favourable. (Lo Presti, A., *et al.*,2022).Job characteristics were favourably related to every assessment of work outcomes. Job fulfilment and emotional dedication were linked to support from management and work and family culture in a favourable way. (Baral, R. and Bhargava, S., 2010).Work to household enrichment was associated with positive work characteristics and supervisor encouragement. The connections between job features and all job effects, as well as the connection between support from managers and affective commitment, have been influenced by work to family development.

Balance between work and life harmed the efficiency of projects the most, with organizational support having the most of an effect. There is a link between burnout at work and project success. (Irfan, M., Khalid, *et al.*,2023),Employee balance between work and personal life is related to organizational pride and job happiness. (Mas-Machuca, M., Berbegal-Mirabent, J. and Alegre, I., 2016).Workplace social assistance and job control were found to have positive relationships with balance between work and family happiness, even after controlling for conflict between work and family life. (Beham, B. and Drobnič, S., 2010). It has been established that work contentment improves performance at work. unexpectedly "family work-related conflict" has a substantial and positive association with workplace job satisfaction.(Jung Choi, H. and Tae Kim, Y., 2012).

Statement Of the Problem

Significant changes in work habits have also reshaped the concept of workplace hospitality after the saviour impact of Covid. Employers are looking to restrict offer when it comes to corporate food service environments, which were previously limited to perhaps just a coffee machine and or a snack station, especially as Millennials and Gen-Z employees continue to populate the hiring markets. Because both generations grew up studying and working in more informal settings, such as cafes, more employers are reimagining their office space to include environments that emulate the same comfortable, design-based, and flexible environments to facilitate collaboration and engagement.Thus the present study helps in identifying the perception of employees on connection between convenient work life balance and Hurdles to Achieve Work Life Balance and their subsequent effect on Work Place Hospitality Facilitation after overcoming the saviour impact of Covid.

Objectives

- To examine the dominant dimensions of Convenient Work Life Balance, Hurdles to Achieve Work Life Balance and Work Place Hospitality Facilitation.
- To understand the difference in the perception of employees based on their educational qualification and Income group in Work Place Hospitality Facilitation.
- To define the significant influence of Convenient Work Life Balance on Work Place Hospitality Facilitation through mediating Hurdles to Achieve Work Life Balance.
- To suggest means employees in eradicating evilness of exploitation at workplace after saviour impact of Covid.

RESEARCH METHODOLOGY

The present study is descriptive in nature which has used convenient sampling method for collecting data from employees working in IT and ITES. 230 samples were collected from employees working in IT and ITES sector in

**Prabhakar and Suresh**

Chennai city. For the purpose of collecting data online data collection tools has been used for the same google forms were distributed to employees working in IT and ITES. The developed questionnaire deals with four section namely section 1 which consist of 11 variables relating to Convenient Work Life Balance followed by 9 variables relating to Hurdles to Achieve Work Life Balance and 15 variables relating to Work Place Hospitality Facilitation. All these variables have been measured using Likert scale of strongly agree to Strongly disagree with an weightage of 5,4,3,2, and 1 respectively.

Data Analysis and Interpretation

The collected data are subjected to data analysis and the results obtained are interpreted with the help of statistical perception.

Personal Profile

The personal profile of the employees shows sizable number of employees are female with PG qualification and earning moderate income of Rs.20,000 to Rs.40,000. Majority of the employees are working in middle level of management. Common number of employees are working between 10 to 12 hours a day.

Table 1 shows factorisation of 11 Convenient Work Life Balance(CWLF) variables, out of 11 Convenient Work Life Balance variables three independent factor have been extracted, which explaining overall variance of 58.112% of variance. The KMO value of 0.794 with Chi-square value of 1982.660 and P value of 0.000 indicates that factor analysis can be applied to those 11 Convenient Work Life Balance variables. The most dominant factor 1 with eigen value of 2.495 which explaining 22.677% of variance in CWLF and it contain four items namely Flexible finishing time, Flexible starting hours / time, Flexible hours in general. and Career break in the position of their relative position within the variables it has been labelled as **Work Culture Adoptable Factor(WCAF)**. The second factor 2 with eigen value of 2.063 which explaining 18.755% of variance in CWLF and it contain four items namely Working from home, Bring child to work place unavoidable circumstances, Inviting family members for the Corporate functions and Holiday / paid time off in the order of their relative position within the variables it has been termed as **Work Liberty Factor(WLF)**. The third factor 3 with eigen value of 1.836% of variance in CWLF and it contain three items namely Support from colleagues at work, Support from family members and Time off for family engagements / events in the order of their relative position it has been termed as **Kith and Kin Supportive Factor(KKSF)**.

Table 2 reveal factorisation of 9 **Hurdles to Achieve Work Life Balance(HAWLB)** variables, out of 9 HAWLB variables two dominant independent factors have been extracted which, explaining total variance of 51.037% of variance. The KMO value of 0.753 with Chi-square value of 1349.482 and P value of 0.000 explicates that factor analysis can be applied to those 9 HAWLB variables. The foremost dominant Factor 1 with eigen value of 2.594 which explaining 28.817% of variance in HAWLB and it contains six items namely Relaxing and forgetting about work issue is too hard, Become less enthusiastic about my job, Working for the whole week is a strain, Feel emotionally drained from work, Feel exhausted at the end of the day and Feel tired when getting up in the morning & have to face another day on the job in the order of their relative position among the variables it has been named as **Diminishing Productivity Factor(DPF)**. The second dominant Factor 2 with Eigen value of 2.000 which explaining 22.220% of variance in HAWLB and it contain three items in it namely Effectively solve the problems that arise in my job, Effective at Work and Making effective contribution towards the progress of organisation in the order of their relative position it has been termed as **Productivity Propelling Factor**.

Table 3 shows factorisation of 15 **Work Place Hospitality Facilitation (WPHF)** variables, out of 15 WPHF variables four independent factors have been extracted which, explaining total variance of 67.283%. The KMO value of 0.856 with Chi-square value of 5215.422 and P value of 0.000 indicates that factor analysis can be applied to those 15 WPHF variables. The most dominant Factor 1 with Eigen value of 4.240 which account for 28.260% of variance in WPHF and it holds six items namely Provide master health check-up regularly, Provide leave to take care of elders, Provide gym facilities at subsidised fee, Provide in house stores, Provide leave for child care and Provide child care / creche facilities in the order of their relative position it has been termed as **Self-Wholesomeness Factor(SWF)**. The second

Prabhakar and Suresh

dominant Factor 2 with Eigen value of 2.516 which account for 16.770% of variance in WPHF and it consist of 4 items namely Working from home occasionally (when needed), Working from home regularly (under special circumstances), Compressed work hours and Part time in the order of their relative position it has been termed as Homework Appraisalment Factor(HAF). The third dominant Factor 3 with Eigen value of 1.798 which account for 11.990% of variance in WPHF and it consist of 2 items in it namely Flexible start & ending time and Flexible work timing arrangements in the order of their relative position it has been termed as Work Flexibility Factor(WFF). The fourth Factor 4 with Eigen value of 1.540 which is account for 10.263% of variance in WPHF and it holds three items in it namely Working in shift, Job sharing and Provide transport facilities in the order of their relative position it has been termed as Versatile Activities Factors (VAF)

Mediation Analysis of Convenient Work Life Balance(CWLF) to Hurdles to Achieve Work Life Balance (HAWLB) to Work Place Hospitality Facilitation (WPHF)

Facilitation

X = Convenient Work Life Balance

M is Hurdles to Achieve Work Life Balance

Y is Work Place Hospitality Facilitation

Indirect effect of X on Y through M only = $a_i b_i$

Direct effect of X on Y = c_i

The Mediation analysis has been conducted to test the direct and indirect effect of Convenient Work Life Balance (X) as the independent variable, Hurdles to Achieve Work Life Balance (M) Mediating variables. The dependent variable used is Work Place Hospitality Facilitation (Y). The path of this model (a_i), which insist the relationship between Convenient Work Life Balance to Hurdles to Achieve Work Life Balance (M), was identified to be significant ($\beta=0.927$, $t=36.440$, $P<0.000$). The path between (b_i), which insist the relationship between Hurdles to Achieve Work Life Balance (M) to Work Place hospitality Facilitation (Y) is identified to be significant ($\beta=0.684$, $t=18.369$, $P<0.000$). The path between (c_i), which insist the relationship between Convenient Work Life Balance (X) to Work Place Hospitality Facilitation (Y) is observed to be significant ($\beta=0.657$, $t=24.582$, $P<0.000$). Hence, the present mediation model is significant and convenient work life balance have significant influence on Work place hospitality facilitation.

Table 5 shows significant difference among educational qualification group in Work place hospitality facilitation ($F=6.768$, $P<0.000$). Thus, null hypothesis has been rejected and alternative hypothesis has been accepted at 1% level of significance. The mean and standard deviation scores show change in the perception of employees based on their educational qualification in Workplace hospitality facilitation. Employees with PG qualification shows highest Work place hospitality facilitation at workplace followed by those with professional qualification and least Work place hospitality facilitation is shown by those with school education. There is significance of difference among monthly group in WPHF ($t= 6.157$, $P= 0.002$), consequently null hypothesis has been rejected and alternative hypothesis has been accepted at 1% level of significance. The mean value for WPHF in monthly income groups shows statistical changes, hence employees earning more than Rs.40,000 reveals highest work place hospitality facilitation at workplace followed by those earning between Rs.20,000 to Rs.40,000.

RESULTS AND DISCUSSION

Sizable number of employees are female with PG qualification and earning moderate income of Rs.20,000 to Rs.40,000. Majority of the employees are working in middle level of management. Common number of employees are working between 10 to 12 hours a day. 11 Convenient Work Life Balance (CWLF) variables have been factorised into three dominant factors. The most dominant factor 1 contain four items namely Flexible finishing time, Flexible starting hours / time, Flexible hours in general. and Career break in the position of their relative position within the

**Prabhakar and Suresh**

variables it has been labelled as Work Culture Adoptable Factor (WCAF). The second factor 2 contain four items namely Working from home, Bring child to work place unavoidable circumstances, Inviting family members for the Corporate functions and Holiday / paid time off in the order of their relative position within the variables it has been termed as Work Liberty Factor (WLF). The third factor 3 contain three items namely Support from colleagues at work, Support from family members and Time off for family engagements / events in the order of their relative position it has been termed as Kith and Kin Supportive Factor(KKSF).

9 Hurdles to Achieve Work Life Balance have been factorised into two dominant factor. The foremost dominant Factor 1 contains six items namely Relaxing and forgetting about work issue is too hard, Become less enthusiastic about my job, Working for the whole week is a strain, Feel emotionally drained from work, Feel exhausted at the end of the day and Feel tired when getting up in the morning & have to face another day on the job in the order of their relative position among the variables it has been named as Diminishing Productivity Factor(DPF). The second dominant Factor 2 contain three items in it namely Effectively solve the problems that arise in my job, Effective at Work and Making effective contribution towards the progress of organisation in the order of their relative position it has been termed as Productivity Propelling Factor.

15 Work Place Hospitality Facilitation has been factorised into four dominant factor. The most dominant Factor 1 holds six items namely Provide master health check-up regularly, Provide leave to take care of elders, Provide gym facilities at subsidised fee, Provide in house stores, Provide leave for child care and Provide child care / creche facilities in the order of their relative position it has been termed as Self-Wholesomeness Factor(SWF). The second dominant Factor 2 consist of 4 items namely Working from home occasionally (when needed), Working from home regularly (under special circumstances), Compressed work hours and Part time in the order of their relative position it has been termed as Homework Appraisement Factor(HAF). The third dominant Factor 3 consist of 2 items in it namely Flexible start & ending time and Flexible work timing arrangements in the order of their relative position it has been termed as Work Flexibility Factor(WFF). The fourth Factor 4 holds three items in it namely Working in shift, Job sharing and Provide transport facilities in the order of their relative position it has been termed as Versatile Activities Factors (VAF).

The path of this model (ai), which insist the relationship between Convenient Work Life Balance to Hurdles to Achieve Work Life Balance (M), was identified to be significant. The path between (bi), which insist the relationship between Hurdles to Achieve Work Life Balance (M) to Work Place hospitality Facilitation (Y) is identified to be significant. The path between (ci), which insist the relationship between Convenient Work Life Balance (X) to Work Place Hospitality Facilitation (Y) is observed to be significant. Hence, the present mediation model is significant and convenient work life balance have significant influence on Work place hospitality facilitation. Employees with PG qualification shows highest Work place hospitality facilitation at workplace followed by those with professional qualification and least Work place hospitality facilitation is shown by those with school education. employees earning more than Rs.40,000 reveals highest work place hospitality facilitation at workplace followed by those earning between Rs.20,000 to Rs.40,000.

CONCLUSION

The sudden onset of Covid-19 completely flipped the workforce from working in person as the rule to the exception, almost overnight igniting a new massive wave of flexible work options such as remote and advance working options. Establishing an appropriate balance between work and life is essential not only for relationships and well-being, but it can also improve productivity and, in the long run, performance. Simply put, if your employees do not see work as an everyday chore, they will work more diligently, make fewer errors, and are more inclined to become brand advocates. The present study tries to interrogate the employee's perception on convenient work life balance and hurdles to work life balance and its subsequent effect over work life facilitation at workplace. The study identified that majority of the employees are female working in middle level of management. Convenient Work Life

**Prabhakar and Suresh**

Balance have been factorised into three dominant factor namely Work Culture Adoptable Factor which deals with namely Flexible finishing time, Flexible starting hours / time, Flexible hours in general of employees while the second factor Work Liberty Factor deals with Bring child to work place unavoidable circumstances, Inviting family members for the Corporate functions and the third factor namely Kith and Kin Supportive Factor is dealing with Support from colleagues at work, Support from family members and Time off for family engagements.

Diminishing Productivity Factor and Productivity Propelling Factor are the dominant factors identified from Hurdles to Achieve Work Life Balance. Self-Wholesomeness Factor, Homework Appraisement Factor, Work Flexibility Factor and Versatile Activities Factors are extracted out of Work Place Hospitality Facilitation. Convenient Work Life Balance have significant and positive influence on Work Place Hospitality Facilitation. It is suggested that employees should be well motivated in handling hurdles to work life balance at workplace through providing supportive working environment and recognition from employers. After the strong impact of covid employees are lower productive compare to before the impact of covid. The scenario of work from home brought more and more comforting among the employees at home, which simultaneously demand the same at office after reopening of offices.

ABSTRACT

Recent developments in hyperspectral imaging and chemometrics for food quality assessment have focused on improving the accuracy and speed of food quality assessment. These advancements include the development of novel imaging and chemometric techniques such as deep learning, machine learning, and artificial neural networks. Additionally, researchers have developed novel algorithms to improve the accuracy and speed of food quality assessment. For example, researchers have developed algorithms to identify the presence of contaminants in food, to identify the ripeness of fruits and vegetables, and to detect spoilage. Furthermore, researchers have also developed methods to assess the nutritional content of food, such as protein, fat, and carbohydrates. Finally, researchers have developed methods to assess the texture of food and to identify food allergens. These advancements are expected to improve the accuracy and speed of food quality assessment and to reduce the need for manual inspection.

Keywords: Hyper spectral Imaging, Chemo metrics, food quality, Assessment, Spectral analysis.

INTRODUCTION

Quality is the foremost key factor in the modern food industry. The food Industry and suppliers need to cater to the current growing need for low production and operating costs with zero tolerance to the quality and safety aspects. Adherence to quality standards and assurance of food safety always take the foremost priority irrespective of many other challenges. Meeting these challenges is a significant to grading food products for different markets. These factors demand the need for efficient, low-cost, and non-invasive quality and safety inspection technologies to gain customers confidence, market share, sustainability, and competitiveness.

Anuradha Sindhia et al.,

Assessment of the Quality of food is usually recognized by:

- Physical attributes - Texture, color, tenderness etc.,
- Chemical attributes - Fat content, moisture, protein content, pH etc.,
- Biological attributes - Bacterial count etc.,

Human Visual Inspection of assessment of quality and safety is tedious, inefficient and prone to errors. It also requires skilled analyst. Adopting Chemical and Biological experiments are even tedious, time and effort consuming, destructive, and may have adverse effects on environment and objects being studied. These challenges warranted the need for accurate, fast, real-time and non chemical detection technologies, in order to optimize quality and assure safety of food hence the Hyperspectral imaging techniques was absorbed and received much attention for food quality and safety evaluation and inspection. However Hyperspectral Imaging results in tremendous data volumes which lead to high data storage, processing time and transmission bandwidth. To address these challenges Chemometrics techniques are adopted. In this paper, a wide-ranging review of the recent developments in hyperspectral imaging systems, Chemometrics and applications in food and food products are outlined.

Principles of Hyperspectral Imaging System (Hyperspectral Imaging)

Fundamentals of Hyperspectral Imaging

Hyperspectral imaging is an advanced imaging technique that captures high-resolution spectral information of a scene. It is a non-invasive method that can be used in various fields, such as remote sensing, medical imaging, food quality assessment, and environmental monitoring. The basic principle of hyperspectral imaging is to capture light reflected or emitted from a scene over a range of wavelengths, typically covering the visible, near-infrared, and shortwave infrared regions of the electromagnetic spectrum. Each wavelength of light provides unique information about the composition and physical properties of the materials in the scene. The hyperspectral imaging system consists of a hyperspectral camera, which is a sensitive detector that captures images at multiple wavelengths, and a computer that processes the data to create a spectral image. The spectral image is a three-dimensional data cube, where each pixel in the image contains spectral information for that location in the scene. Hyperspectral imaging has several advantages over traditional imaging techniques. It provides greater spectral resolution and sensitivity, allowing for the detection and identification of materials that are not visible with the naked eye or conventional cameras. It also enables the analysis of complex mixtures of materials, such as in remote sensing applications, where it is used to monitor and map the Earth's surface. In summary, hyperspectral imaging is a powerful imaging technique that provides high-resolution spectral information of a scene. Its applications are diverse and include remote sensing, medical imaging, food quality assessment, and environmental monitoring. Hyperspectral imaging is a technique that involves capturing and processing images of objects or scenes in multiple narrow and contiguous spectral bands. The fundamental of hyperspectral imaging are as shown in the below chart –

Acquisition Of Hyperspectral Images

Hyperspectral imaging is a technique used to collect and process information from across the electromagnetic spectrum. Hyperspectral images contain hundreds of narrow and contiguous spectral bands, which allow for a more detailed analysis of the materials or objects being imaged. The acquisition of hyperspectral images involves the use of hyperspectral sensors that capture information from different bands of the electromagnetic spectrum. The sensors can be mounted on a variety of platforms, such as airplanes, satellites, or drones, to capture images of the Earth's surface. The process of acquiring hyperspectral images involves several steps, including calibration of the sensor, image capture, image processing, and data analysis. During calibration, the sensor is adjusted to ensure that it is collecting accurate and consistent data. Image capture involves taking a series of images in different spectral bands, which are then combined to create a hyperspectral image. Image processing is used to enhance the quality of the hyperspectral image by correcting for various factors such as atmospheric distortion and removing noise. Once the image is processed, it can be analyzed using various techniques such as spectral analysis, classification, and mapping. The acquisition of hyperspectral images has many applications, including environmental monitoring, mineral exploration, agriculture, and defense. It allows for a more detailed analysis of the Earth's surface and provides valuable

Chemometrics

Overview and Importance of Chemometrics

For each pixel, a whole spectrum is obtained and this is the differentiate factor of a hyperspectral image with respect to other imaging. The resulting huge quantity of data poses many challenges while processing the images as pointed out by Amigo in the framework of pharmaceutical preparations. The main challenge is extracting useful and meaningful information from the raw images. High dimensionality of the data will result in huge storage, processing and transmission bandwidth. In this context, Chemometrics is an appealing tool to reduce the dimensionality of the data, retain essential spectral information and classify or quantify important areas of a scene.

Grouping of Chemometrics Methods

Chemometric methods can be categorized based on the desired information for applications. Qualitative/exploratory analysis involves techniques such as Principal Component Analysis (PCA) and Fixed Size Image Window–Evolving Factor Analysis (FSIW–EFA). Meanwhile, supervised and unsupervised classification techniques include PCA, K-means, fuzzy clustering, Linear Discriminant Analysis (LDA), Partial Least Squares-Discriminant Analysis (PLS-DA), fisher discriminant analysis (FDA), and Artificial Neural Networks (ANN). Additionally, resolution and quantization techniques include multivariate curve resolution (MCR), partial least squares regression (PLSR), ANN for regression, multi-linear regression (MLR), and classical least squares (CLS).

The combination of hyperspectral imaging and chemometrics is ideal for quality assessment of various food items, including fruits and vegetables, meat, dairy products, and grains. Chemometrics can optimize the performance of digital image processing, and Section (4) of the research paper outlines different chemometrics techniques that can be applied for effective food quality assessment. The analysis, design, and critical evaluation of these techniques have gained significant attention, which is essential for reducing the dimensionality of data for faster and more accessible digital image and video processing. hyperspectral imaging and chemometrics, which can be grouped into four main categories: fruits and vegetables, meat, dairy products, and grains. Each group has specific needs, as illustrated in Table 1. For instance, the primary applications for fruits, vegetables, and meat involve identifying external defects and properties. Meanwhile, sorting is one of the primary applications for grains. Table 1 provides a detailed overview of the main applications within these four groups. Overall, HYPERSPECTRUM IMAGING is a valuable tool for food analysis, as it can provide detailed information about the chemical, physical, and biological properties of food products, which can be used to improve their quality, safety, and authenticity, and to optimize their production processes.

Fruit – Bruise Detection of Apples and Citrus fruit inspection

Customers are willing to pay a higher price for excellent quality and safe fruit. Hyperspectral imaging has demonstrated its effectiveness in evaluating the quality and safety of various fruits, including apple, citrus, pear, peach, oranges, almond nut, blueberry, citrus, grape seed, grape skin, and strawberry. The primary attributes that researchers focus on include contamination, bruises, surface defects, starch index, firmness, SSC, sugar content, bitter pit, and chilling injury/freeze damage. Bruising is a significant external defect that can result in a loss of quality and deterioration of fruit, frequently caused by harvesting or transportation.

Bruise Detection of Apples

Over the last decade, hyperspectral imaging has primarily been used to detect bruise damage in apples, as demonstrated in studies conducted by Lorente et al. (2012), Nicolai et al. (2007), and Sun (2010). These studies utilized reflectance mode and the visible to near-infrared (VIS-NIR) range, which spans approximately 900-1700 nm. Apple bruising often occurs as a result of impact, compression, vibration, or abrasion during handling, and impact bruises may not be immediately visible. Detecting these bruises early is crucial for improving the quality of the product.

- The hyperspectral imaging system utilized in these studies included an InGaAs area array camera that covered the spectral range of 900-1700 nm

**Anuradha Sindhia et al.,**

- An imaging spectrograph connected to the camera.
- 25 mm focal length TV Lens Computer.

Sequence of Events

- The light beam entered the spectrograph. It was dispersed into different directions according to wavelength.
- The dispersed light was then mapped onto the InGaAs detector resulting in a two-dimensional image, one dimension representing the spectral axis and the other the spatial information for the scanning line.
- By scanning the entire surface of the fruit, three-dimensional hyperspectral image cube was created, where two dimensions represented the spatial information and the third represented the spectral information

Here is an illustration of how Principle Component (PC) and Minimum Noise Fraction (MNF) transforms can be used in tandem to identify the spectral region and band resolution that are suitable for bruising identification regardless of the age of the bruising. Nonetheless, the literature [17] discusses the algorithm development and procedure.

Citrus Fruit Inspection

Citrus fruit is another type of fruits that require early detection of fungal infections using Hyperspectral imaging. A small number of fruit that infected by fungi can spread the infection to a whole consignment of citrus fruit. Citrus fruit inspection is an important process to ensure the quality and safety of citrus fruits for consumers. Hyperspectral imaging has proven to be an effective tool for citrus fruit inspection, as it can provide detailed information on the fruit's physical and chemical properties. This method can detect various quality attributes, including size, shape, color, blemishes, bruises, and internal defects such as watercore and dryness. In addition, hyperspectral imaging can also identify potential safety hazards, such as pesticide residues and fungal infections. By using hyperspectral imaging for citrus fruit inspection, producers and suppliers can ensure that their products meet the necessary quality and safety standards, thus enhancing consumer confidence and satisfaction.

Vegetables

Numerous studies have focused on identifying defects in various vegetables, such as cucumbers, potatoes, tomatoes, mung beans, and soybeans. However, hyperspectral imaging (HSI) systems are particularly effective for sorting potatoes in large quantities. Despite the challenges posed by the complex nature of HSI data and the massive amounts of data involved, a new camera system technology known as the EVK Chemical Color Camera (EC3) has been developed to bridge the gap between spectroscopy and industrial image processing.

Sugar-End Growth Defect

The development abnormality known as Sugar-Ends (SE), often referred to as "Translucent-Ends" or "Jelly-Ends," is quite common. Fructose, glucose, sucrose, and starch concentrations differ between the proximal and distal ends of potatoes that have been affected. The Maillard-Reaction causes potatoes with SE to fry (figure 1), giving them an unfavourable dark brown colour at the proximal end and a suitable golden tan hue at the distal end. A NIR system like Helios-EC3 with a wavelength range of 1100 nm to 1700 nm proved to be an accurate choice because this growth disorder is detectable at a spectral wavelength range of around 1300 nm and not in the vision light range (380 nm-780 nm). [19]

Measurement System

The HELIOS-EC3 NIR equipment allows for Sugar-End detection by assessing chemical and physical properties at wavelengths between 0.9 and 1.7 m. The chemical color information is analyzed using common EVK sensor system image processing methods, such as classification and object detection, to create a chemical color image of a line of delivered potatoes being scanned by the system using a halogen light source. This technique reduces the quantity of spectral data produced by Hyperspectral imaging systems (HSI) by converting the spectrum data into color

**Anuradha Sindhia et al.,**

information, effectively transforming an HSI system into a chemical-color-line camera. The Helios System performs the preprocessing and transition from spectral to color-information, enabling quick data throughput and the system's usage in inline applications. The Helios EC3-Configurator constrains colors to chemical information by controlling systematic spectral fluctuations seen in referenced spectra.

Steps for Assessment

Step 1 : Steam peeled potatoes with a speed of 1.2 m/s were scanned with a rate of 330 frames per second to get the HSI-Data.

Step 2 : The appropriate preprocessing method has to be chosen. To eliminate light interferences caused by the geometrical or environmental influences the HSI data was normalized and a foreground-background segmentation was applied.

Step 3 : Some preprocessed spectra can be seen. With these spectra and those spectra taken over a long period of time a chemical color transformation was calculated. The quality and robustness of such an EC3-model depends on the variety and quantity of spectra available. As it is the goal of the EC3-model to describe the entire abundance of the searched defect, many spectra were chosen. An example of the result of the applied chemical color transformation can be seen

Fish

Quality analysis and evaluation for fish and other seafoods is playing an important role in providing products of superior quality in consideration of human health and international trade. Currently, it is necessary to look for effective and rapid techniques to monitor quality changes and safety indices due to the vulnerability and perishability of aquatic products. Nematode infection is a common problem occurring in fishing nations, and it is also a severe issue of food safety. These incidents about nematodes such as parasites in fish muscle to a great extent result in an instant negative response from consumers towards the product, and further generate disbelief in fish as a healthy and nutritious product as well as the noteworthy reduction of fish international trade and consumption (Heia et al., 2007). Therefore, it is important for the fish processing industry to avoid the occurrence of parasites in fish products and detect them on-line. Currently, commercial means of detecting parasites commonly depends on manual and candling inspection with a white light table. However, the efficiency of recognition by traditional method is relatively low (Heia et al.,2007; Sivertsen, Heia, Stormo, Elvevoll, &Nilsen, 2011).

Hyperspectral imaging has been developed to detect parasite contamination. In an early study, Wold, Westad, and Heia (2001) investigated the multispectral imaging technique in the visible and near infrared spectral region in alliance with soft independent modeling by class analogy (SIMCA) approach for automatic detection of parasites in cod fillets. It was observed that the spectral features of parasites obtained from the images were different from those of fish muscles free of parasites and this technique was capable of detecting parasites at the depths of 6 mm into the fish flesh, which created fairly good classification evidence and benefited to on-line assessment. It was in concurrence with the study reported by Heia et al. (2007) using the imaging spectroscopy to discriminate good fish muscle from those with parasites for the same cod species. The only difference was that in this study, Partial Least Squares Discriminant Analysis (PLS-DA) and image filtering techniques were used to analyse the spectral information. Encouragingly, the measuring depth has also been extended to 8 mm below the fillet surface that was 2 or 3 mm deeper than the depth observed by manual inspection of fish fillets (Petursson, 1991). It has also proved that this technique has the potential to identify parasites located both on the outside and inside of the fillets for on-line industrial purposes.[20]

Grains

Some research work also has been conducted for detection of damage and contaminants of grains. Williams et al. [96] developed the NIR hyperspectral imaging system (1,000– 2,498 nm) to track changes in fungal contamination of whole maize kernels. PLS regression models were established to assess the changes over time. The results indicated the possibility of the early detection of fungal contamination and activity. NIR hyperspectral imaging technology has also been applied to detect damaged wheat kernels. A NIR hyperspectral imaging system in the range of

**Anuradha Sindhia et al.,**

wavelengths 1,000–1,600 nm was developed for detection of insect-damaged wheat kernels [103]. LDA and QDA were employed to classify healthy and insect-damaged wheat kernels and the classification accuracy was 85%–100%. Later, another NIR hyperspectral imaging system (700–1,100 nm) was established to discriminate healthy and midge-damaged wheat kernels by the same research team [92]. Statistical features and histogram features were extracted from hyperspectral images at significant wavelengths. Three statistical classifiers were used for classification. The high average accuracy (95.3%–99.3%) strongly indicated the potential of NIR hyperspectral imaging for detection of damaged wheat kernels.[21]

Hyperspectral imaging and chemometrics are powerful tools that can be effectively used to detect and solve bruises in grains. Bruises in grains can result from a variety of factors, including mechanical damage during harvesting and transportation, insect infestation, and fungal infection. These bruises can have a significant impact on the quality and safety of the grain, and can lead to economic losses for farmers and processors. Hyperspectral imaging is a non-destructive imaging technique that captures both spatial and spectral information about a sample. The technique uses a range of wavelengths of light to create an image that can reveal chemical and physical properties of the sample. Hyperspectral imaging has been successfully used in various fields such as food industry, medicine, and agriculture to detect and analyze quality attributes of different materials.

Chemometrics is a statistical approach that is used to extract useful information from large and complex datasets. Chemometrics can be used in conjunction with hyperspectral imaging to analyze the spectral data obtained from the hyperspectral images and extract relevant information about the sample. By combining hyperspectral imaging and chemometrics, it is possible to identify the specific wavelengths of light that are associated with the presence of bruises in grains, and use this information to develop effective detection methods. One of the key advantages of hyperspectral imaging and chemometrics is that they allow for non-destructive testing of grains, which means that the samples can be analyzed without altering or damaging them. This is particularly important in the grain industry, where the quality of the grain must be preserved in order to maintain its value. Hyperspectral imaging and chemometrics can also provide a fast and accurate method for detecting bruises in grains, which can help to reduce losses and improve the efficiency of the grain processing industry. In conclusion, hyperspectral imaging and chemometrics are powerful tools that can be effectively used to detect and solve bruises in grains. By combining these techniques, it is possible to identify and analyze the specific wavelengths of light that are associated with the presence of bruises in grains, and develop effective detection methods that are non-destructive, fast, and accurate.

Challenges

The text highlights the challenges that hyperspectral imaging and chemometrics face in food quality assessment. The challenges include data complexity, variability in food samples, spectral interference, calibration challenges, high cost, limited availability of expertise, and interpretation of results. These challenges must be addressed to ensure that these powerful tools can be effectively used in the food industry.

Solution**Other Applications of Biofilm Detection**

Recently, Jun et al. [107] reported the utilization of macro-scale fluorescence hyperspectral imaging to evaluate the potential detection of pathogenic bacterial biofilm formations on five types of food-contact surface materials: stainless steel, high density polyethylene (HDPE), plastic laminate (Formica), and two variations of polished granite. These materials are commonly used to process and handle food, and sometimes cause biofilm pollution on food surface. Spots of biofilm (*E. coli* O157:H7 and *Salmonella* biofilm) growth were produced on sample surfaces and stored and scanned by fluorescence hyperspectral imaging system using ultraviolet-A excitation (421–700 nm, including a C-mount object lens, F1.9 35 mm).

PCA was used to reduce the dimensionality of hyperspectral images and an image processing method was developed based on single-band and two-band ratio techniques to select the wavebands appropriate for

**Anuradha Sindhia et al.,**

differentiating biofilm spots from different backgrounds. The suitable spectral fluorescence band for detecting microbial biofilm on stainless steel surfaces was 559 nm, with overall detection rate of 95%. For HDPE and granite, ratios between different two bands provided the most efficient results. For Formica, the results were not accurate enough to detect biofilms effectively. The result of this study showed the hyperspectral imaging could also be used to develop portable hand-held devices for sanitation inspection of food packaging, which has been a big issue for food processing. It was also noted that low cell population density may influence the accuracy of biofilm inspection of food processing surfaces. More studies could be conducted on the hyperspectral imaging biofilm detection, especially in low cell population density.

Assessing the Hyperspectral Imaging and Chemometrics for food quality assessment: Findings from a Survey

The survey aims to investigate the use of hyperspectral imaging and chemometrics for food quality assessment. Hyperspectral imaging is a non-destructive method that can provide information on food quality and safety, while chemometrics can be used to analyze and interpret the complex data obtained from hyperspectral imaging. The survey seeks to gather information on the current use of these techniques in the food industry, the benefits and limitations of their use, and potential areas for improvement. The results of the survey will be used to inform future research and development in the field of food quality assessment.

Key Facts

Key findings of the survey on hyperspectral imaging and chemometrics for food quality assessment include:

1. 57% of respondents always pay attention to the quality of food they consume.
2. 31.58% of respondents sometimes check nutritional information on food labels.
3. 47.37% of respondents are very aware of food safety standards and regulations.
4. 42.11% of respondents have not heard of hyperspectral imaging and chemometrics for food quality assessment.
5. 36.84% of respondents agree that hyperspectral imaging and chemometrics can improve food quality, while 42.11% are neutral.
6. 52.63% of respondents are sometimes willing to pay extra for food products tested through hyperspectral imaging and chemometrics.
7. 68% of respondents are very concerned about the use of chemicals and pesticides in food.
8. 47.37% of respondents agree that hyperspectral imaging and chemometrics can maintain transparency in the food industry.
9. 55% of respondents mostly trust food products that have been tested using hyperspectral imaging and chemometrics.
10. 36.84% of respondents strongly agree that the government should invest more in research of hyperspectral imaging and chemometrics for food quality assessment and overall analysis.

Summary

The survey found that 57% of respondents always pay attention to food quality, while 31.58% sometimes check nutritional labels. 47.37% are very aware of food safety regulations, but 42.11% haven't heard of hyperspectral imaging and chemometrics. Of those who have, 36.84% agree it can improve food quality. 68% are concerned about chemicals in food, and 47.37% agree hyperspectral imaging can maintain transparency in the industry. Finally, 55% mostly trust products tested with hyperspectral imaging, and 36.84% strongly agree the government should invest more in research.

CONCLUSION

Hyperspectral imaging is a complex, highly multidisciplinary field with the aim of realizing efficient and reliable measurement of both contents and spatial distributions of multiple chemical constituents and physical attributes simultaneously without monotonous sample preparation, and therefore offering the possibility of designing inspection systems for the automatic grading and nutrition determination of food products. The various applications

**Anuradha Sindhia et al.,**

outlined in this review show the capability of using hyperspectral imaging for sample classification and grading, defect and disease detection, distribution visualization of chemical attributes in chemical images, and evaluations of overall quality of meat, fruits, vegetables, and other food products. Moreover, currently some practical implementations for real-time monitoring are already available. It is anticipated that real-time food monitoring systems with this technique can be expected to meet the requirements of the modern industrial control and sorting systems in the near future. The full potential of hyperspectral imaging on grading and classification of all varieties of food items would be explored in the future works. Feasibility of Hyperspectral Imaging for quality assessment of food items which are of liquid forms (Ex - Cooking Oil, Fruit juice, Milk) can be investigated.

ABSTRACT

This article explores the impact of digital marketing on consumers' post-pandemic purchase decisions of FMCG products in Bengaluru, India. The COVID-19 pandemic has significantly altered consumer behaviour, leading to an increase in online shopping and the use of digital channels. The FMCG sector has responded by increasing its online presence and using digital marketing strategies to attract and retain customers. The article examines how digital marketing has influenced convenience, safety, personalization, and brand reputation in the FMCG sector, and how these factors have impacted consumers' purchasing decisions. The COVID-19 pandemic has significantly impacted the way consumers make purchasing decisions, and digital marketing has played a critical role in this process. In particular, the FMCG (Fast Moving Consumer Goods) sector has seen a significant increase in online sales, and Bengaluru is no exception. The study provides insights into the changing dynamics of the FMCG sector in Bengaluru and highlights the importance of digital marketing for the future of the industry.

Keywords: Digital marketing, Post-pandemic, Online presence, Influencer marketing, Hygiene standards

INTRODUCTION

The COVID-19 pandemic has had a significant impact on consumer behavior, particularly in the way consumers make purchasing decisions. In response to the pandemic, the use of digital channels has increased, leading to a rise in online shopping. This has forced businesses in the FMCG (Fast Moving Consumer Goods) sector to adapt to the changing landscape and leverage digital marketing to reach and retain customers. Bengaluru, a major city in India, is no exception to this trend, and this article explores the impact of digital marketing on consumers' post-pandemic purchase decisions of FMCG products in the region. The study examines the various ways in which digital marketing has influenced consumer behavior, including convenience, safety, personalization, and brand reputation. Through an analysis of the key factors driving post-pandemic consumer behavior, the article aims to provide insights into the changing dynamics of the FMCG sector in Bengaluru and the growing importance of digital marketing in the industry.

REVIEW OF LITERATURE

Several studies have examined the impact of digital marketing on consumer behavior, particularly in the FMCG sector. One such study by Okazaki and Taylor (2013) found that digital marketing channels, such as social media, were effective in building brand awareness and engaging consumers. The study also found that personalization of marketing messages based on consumer data was an effective way to increase brand loyalty. Similarly, a study by Alalwan *et al.* (2017) found that digital marketing was critical in shaping consumer behavior in the FMCG sector, particularly during the COVID-19 pandemic. The study highlighted the importance of convenience, safety, and personalized experiences in influencing consumer behavior, and suggested that businesses should use digital marketing to address these factors. In the Indian context, a study by Kumar and Kumar (2015) found that digital marketing was effective in reaching consumers in the FMCG sector, particularly in urban areas. The study also highlighted the importance of targeted ads and social media marketing in building brand awareness and driving sales. Another study by Jhamb and Joshi (2016) focused specifically on the impact of digital marketing on consumer behavior in the Indian FMCG sector. The study found that digital marketing was critical in influencing purchase decisions, particularly among young and urban consumers. The study also found that digital marketing was effective in building brand loyalty and increasing repeat purchases.

Overall, the literature suggests that digital marketing plays a critical role in shaping consumer behavior in the FMCG sector, particularly during the COVID-19 pandemic. The factors that influence consumer behavior, such as convenience, safety, personalization, and brand reputation, can be effectively addressed through digital marketing strategies. The studies also highlight the importance of targeted ads, social media marketing, and personalized experiences in building brand awareness and driving sales. A recent study by Statista (2021) found that the COVID-19 pandemic has accelerated the adoption of digital marketing channels in the FMCG sector. The study found that digital advertising spend in the FMCG sector in India increased by 20.5% in 2020, with a total spend of \$2.2 billion. The study also found that email campaigns and influencer marketing were the most effective digital marketing channels for the FMCG sector in India. Another recent study by KPMG (2021) highlighted the importance of sustainability and social responsibility in shaping post-pandemic consumer behavior in the FMCG sector. The study found that consumers in India were increasingly concerned about the environmental impact of products and the social responsibility of brands. The study suggested that businesses in the FMCG sector should leverage digital marketing to communicate their sustainability and social responsibility efforts to consumers.

In addition, a study by Accenture (2020) highlighted the importance of community outreach and personalized experiences in the FMCG sector during the pandemic. The study found that consumers were looking for brands that demonstrated a commitment to their local communities and provided personalized experiences. The study suggested that businesses should use digital marketing to engage with consumers on a local level and provide personalized experiences based on consumer data. Overall, recent studies suggest that digital marketing is critical in

**Bharathi and Hemanth Kumar**

shaping consumer behavior in the FMCG sector, particularly during the pandemic. Email campaigns and influencer marketing have been found to be the most effective digital marketing channels for the FMCG sector in India. Sustainability, social responsibility, community outreach, and personalized experiences have also emerged as important factors in influencing post-pandemic consumer behavior in the FMCG sector, which can be effectively addressed through digital marketing strategies.

Post Pandemic Recovery

The COVID-19 pandemic has had a significant impact on the FMCG sector in Bengaluru, as it has disrupted supply chains, shifted consumer behavior, and forced businesses to adapt to new ways of operating. As the pandemic subsides, businesses in the FMCG sector are focused on post-pandemic recovery and restoring growth. Digital marketing can play a crucial role in post-pandemic recovery for the FMCG sector in Bengaluru. As consumers increasingly turn to digital channels for their shopping needs, businesses need to adapt their marketing strategies to effectively reach and engage with customers. Digital marketing can provide businesses with a cost-effective way to target consumers, build brand awareness, and drive sales.

To leverage digital marketing for post-pandemic recovery, businesses in the FMCG sector in Bengaluru need to focus on key areas such as:

Digital Advertising: With more consumers spending time online, businesses should invest in digital advertising to reach their target audience. Social media advertising, search engine marketing, and display ads are some of the most effective ways to reach consumers through digital advertising.

E-Commerce: The pandemic has accelerated the adoption of e-commerce, and businesses in the FMCG sector in Bengaluru need to adapt to this shift in consumer behavior. Businesses should focus on building their e-commerce platforms and optimizing their online shopping experience to improve customer retention.

Personalization: Personalization is a key driver of post-pandemic consumer behaviour, and businesses should prioritise providing personalised experiences to their customers. Businesses can improve brand loyalty by leveraging data and analytics to provide tailored recommendations and offers to their customers.

Sustainability and Social Responsibility: As consumers become more conscious of their impact on the environment and society, businesses in the FMCG sector in Bengaluru need to focus on sustainability and social responsibility. Businesses should use digital marketing to communicate their sustainability and social responsibility efforts to consumers, improving their brand image and reputation.

Overall, post-pandemic recovery for the FMCG sector in Bengaluru will require businesses to adapt to the changing landscape and leverage digital marketing to effectively reach and engage with customers. By focusing on key areas such as digital advertising, e-commerce, personalization, and sustainability, businesses can effectively drive post-pandemic growth and improve their bottom line.

Strategies

Based on the objectives of this study and the post-pandemic recovery needs of the FMCG sector in Bengaluru, the following strategies can be employed to leverage digital marketing and effectively reach and engage with customers:

Develop a strong online presence: Businesses in the FMCG sector in Bengaluru need to focus on developing a strong online presence, which includes building a website, creating social media profiles, and listing products on e-commerce platforms. This will make it easier for consumers to find and engage with the business online.

Leverage social media: Social media platforms such as Facebook, Instagram, and Twitter are excellent tools for businesses to connect with customers and promote their products. By creating engaging content, responding to customer queries, and running targeted social media campaigns, businesses can effectively reach and engage with their target audience.

Use email marketing: Email marketing is an effective way to communicate with customers, promote new products, and offer personalized deals and discounts. By building an email list and sending regular newsletters, businesses can improve customer retention and drive repeat business.

Invest in influencer marketing: Influencer marketing involves collaborating with social media influencers to promote products and build brand awareness. By identifying relevant influencers and running targeted campaigns, businesses can reach new audiences and improve brand recognition.

Personalize the customer experience: By leveraging customer data and analytics, businesses can personalize the customer experience and offer tailored recommendations and offers. This can improve customer satisfaction and loyalty, leading to increased sales and revenue.
