A model in classification makes predictions about unknown values (set of outputs) based on inputs (set of known values) [1]. The issue is known as a classification one problem when the output has a categorical form [2].The classification process is illustrated. The first phases in creating a classification model are data gathering and preparation. Preprocessing is the most common way of eliminating commotion and duplication from information. The following stage is to prepare the model utilizing class names; in Python, the sci-unit learn bundle has a capability called "fit-transform (X,Y)" that maps X (input data) to Y (labels) for the purpose of preparing the classifier. Anticipating the class or name of the new dataset is the accompanying stage. Finally, classification computation is surveyed using the test data. There are two distinctive taxonomy categories: binary and multi-label [2]. Twofold Classification is utilized when the outcome is binary or has two classes. For instance, in an uncertainty location process, the model predicts whether sentences are vague and subsequently, there are just two potential results/classes; this is alluded to as double order. In any case, multi-name characterization is comprised of a circulation of classes. For example, in predicting mental disorders, there are multiple ones such as depression, anxiety, schizophrenia, bipolar disorder, and 2 Supervised Learning - A Systematic Literature Review A PREPRINT Post-traumatic Stress Disorder (PTSD). Thus, the outcome can fall into one of these five categories; this is termed multi-label classification.

LITERATURE REVIEW

During the previous decade, numerous researchers have already performed surveys on supervised learning. For instance, the authors of paper [4] wrote a survey on various supervised learning classification approaches. Their study examined five classification methods: Naïve Bayes, Neural Network, Decision tree, Support vector machine, and K-Nearest neighbor; and introduced a scientific categorization of each paper's advantages and deficiencies. The authors of study [1] classified supervised learning techniques into five categories: Logic-based algorithms, Statistical learning algorithms, Instance-based learning, Support vector machines, and deep learning. Additionally, they demonstrated the general pseudocodes of decision trees, rule learners, Bayesian networks, and instance-based learners. As demonstrated by their outline, Neural Network and SVM outmaneuver various estimations while overseeing relentless data. In comparison, logic-based algorithms perform better when the data is categorical.Similarly, [2] provides an overview of supervised classification approaches and classifies them as: logically learning algorithms, support vector machine, statistically based algorithms, and lazy learning algorithms.

The novelists moreover coordinated a comparable assessment of the accuracy of four extensively used algorithms: SVM, Naïve Bayes, Decision tree, and k-NN; at the insinuation of the paper using a dataset from the Census Bureau Database. Several assessment constraints such as classification speed, learning speed, and noise tolerance were used in their analysis. According to their findings, SVM at 84.94% outperformed k-NN, Naïve Bayes, and Decision Trees in terms of accuracy, respectively. In paper [4], the authors reviewed supervised text classification techniques. Their survey covered three machine-learning approaches: NB, SVM, and k-NN; and the performance evaluation measures associated with each. Research [5] compares supervised learning systems practically. The supervised learning algorithms SVM, ANN, Logistic regression, Naive Bayes, k-NN, Decision tree, Random Forest, Bagged trees, memory-based learning, and Boosted stumps are contrasted by the authors using eight comparison parameters. Accuracy, precision, and recall, F-score, cross-entropy, ROC curve, squared error, average precision, and breakeven point were the variables in question.

Dynamic Supervised Learning Techniques and Algorithms for Data Mining
The Naive Bayes algorithm's pseudocode

Immanuel and Radhakrishnan

The pseudocode of the Naïve Bayes algorithm

Algorithm 1 Pseudo-Code of Naïve Bayes
Inputs:
Training dataset T, // Dynamic IOT Dataset
F=(f1,f2,f3,..,fn)
Output:
A class of testing dataset
1: Read the training dataset T
2: Calculate the mean and standard deviation of the predictor variable in each class
3: Calculate the probability of fi using the gauss density equation in each class
4: Repeat Step 3 until the probability of all predictor variables (f1,f2,f3,..,fn) has been calculated
5: Calculate the likelihood of each class
6: Get the greatest likelihood

Stability Vector Machines (SVM)

Support vector machines are a different method in supervised learning (SVM). SVM are frequently used to identify outliers, carry out classification, and carry out regression because they can handle discrete and continuous cases. A defined range of categories or classes is used by SVM to represent features or occurrences in an n-dimensional space. Working with high-dimensional data requires the use of SVM, which is a great option. The memory efficiency of SVM is another benefit. SVM has been used by many academics; for instance, the authors of [13] employed this method to forecast cardiovascular illness. By detecting the pulse at the fingertip, their model predicted the patient's arterial stiffness. The waveform of the reading was used to extract the required features. An SVM classifier was then used to determine whether arterial stiffness was low or high. SVM were employed in [14] to categorise and contrast the respiratory patterns of patients participating in weaning studies. This technique was used by the authors of [15] to categorise the heart rate signal. The reading was gathered from three different groups of people: the young, teenagers, and the elderly. From each group, 20 people were chosen at random, and their heart rates were recorded and later categorised using an SVM. The usage of this algorithm in biochemical applications is covered in [16] as a conclusion. In this study, an SVM was employed to calculate the cell membrane's action potential.

The pseudocode of SVM

Algorithm 2 Pseudo-Code of SVM
Inputs:
Determine the various training and test data
Output:
Determine the calculated accuracy
1: Select the optimal value of cost and gamma for SVM
2: Implement SVM train step for each data point
3: Implement SVM classify for testing data points
4: Repeat Steps 3 and 4 until Stop Condition is met
5: Return calculated accuracy

Logic-based education

Logic-based algorithms work by applying logical operations progressively or sequentially to solve issues. An illustration of a logic-based learning algorithm is a decision tree. A common classification and regression model is the decision tree. A decision tree is a logical structure made up of nodes and branches. Nodes stand for features, and branches for a value or condition connected to a node. Sorting the samples starting with the root node allows for classification of the samples. The feature values are used as the basis for sorting. The decision tree draws conclusions at each level of grouping and choosing the most pertinent options. It is an easy-to-understand method that doesn't require much data preprocessing. Despite this, it is unstable and could produce a complicated tree structure. Decision trees have been used in several studies for classification and regression tasks. Based on a patient's medical history, the authors of [17] proposed a model for estimating the risk of heart disease. The model's foundation was a decision tree, and a set of rules was created to project the risk level. The experimental results showed promise. In study [18], the scientists used a decision tree model to estimate the soil quality based on the soil's composition. A decision tree-based algorithm for predicting Alzheimer's disease is shown in study [19]. In this case, the authors applied decision tree induction to the sample data. The feature was chosen using an information gain at each branch/level of the tree.

The pseudocode of the Decision Tree algorithm is:

```
Algorithm 3 Pseudo-Code of Decision Tree Algorithm
1: Place the best attribute of the dataset at the root of the tree
2: Split the training set into subsets. Subsets should be made in such a way that each subset
contains data with the same value for an attribute
3: Repeat step 1 and step 2 on each subset until you find leaf nodes in all the branches
of the Tree
```

Using instances to create learning

Generalization is delayed until the classification process is complete in instance-based or lazy learning. Its computing time during the training phase is quite low, and it is referred to as "lazy learning" as it slows down the process. In contrast, the classification process requires a fair amount of computational power. A popular instance-based technique for classification and regression issues is K-Nearest Neighbor. 4.4.1 K-Nearest Neighbor (KNN) The method K-Nearest Neighbor (KNN) is simple. It is used when there is little knowledge of the distribution of the data. Two factors—features of the new data and training samples—are used by KNN to classify new data. Based on the similarity indices of the closest neighbour, it predicts new data labels and stores the currently existing data. It is suitable for training samples drawn from real-world scenarios and effective against noisy data. Unfortunately, the computational cost is extremely significant since for each new data set, the distance to the k nearest neighbours must be determined repeatedly. KNN has been utilised in many studies to carry out classification tasks. Regression problems are less frequently utilised than classification assignments. Heart disease was categorised in study [20] using KNN. The authors of paper [21] proposed a KNN-based model for offline handwritten digit prediction. Using the MNIST digit image dataset, the model was trained and verified. The examples were categorised using votes. [22] suggested a new KNN model to overcome the problems with the KNN extension known as evidential KNN (EKNN). Bioscience writers proposed the study [23]. Here, the scientists used KNN to categorise blasts in blood samples from patients with acute leukaemia. Either acute lymphocytic leukaemia or acute myelogenous leukaemia were identified in the blasts. The results were encouraging with an 86% classification accuracy. Last but not least, study [24] suggested a KNN-based strategy for placing an undergraduate student in an IT company. It was a binary classification because there were only two classes used (Yes and No).

The pseudocode of the K-Nearest Neighbor algorithm is:

Algorithm 4 Pseudo-Code of K-Nearest Neighbor Algorithm
1: Load the training and test data
2: Choose the value of K
3: Find the Euclidean distance to all training data points
4: Store the Euclidean distances in a list and sort it
5: Choose the first k points
6: Assign a class to the test point based on the majority of classes present in the chosen points
7: Repeat Steps 3, 4, 5, and 6 for each point in test data
8: End

Neural networks and deep learning

Another method in supervised learning is the use of deep learning for classification and regression tasks. In deep learning, the model is built up of multiple layers and taught one layer at a time. Natural language processing, computer vision, and voice recognition are just a few of the many uses for deep learning models. A unique framework called Polynomial Neural Network Classifier was proposed by the authors of research [25] by fusing a variety of preprocessing methods and space search optimization (PNNC). The authors of [26] proposed a neural network approach for predicting stock price. The model, which they called FCM (floating centroids Methodology), achieved a high level of accuracy and operated at its best. The researchers suggested a neural network-based approach for gum disease prediction in [27]. Here, the model's inputs included a mix of risk variables and symptoms. The hidden layer then automatically reduced the dimensionality of the data after retrieving features from the provided sample. The final result was a binary classification, with 1 denoting the presence of periodontal disease and 0 denoting the presence of gingivitis disease. In order to predict cardiac illness, the authors of [28] used a multilayered perceptron. The model was trained using 13 clinical instances, and it was then used to predict whether there would be any heart illness. The model performed superbly, with an accuracy rate of 98%.Assessment indicators for the Dynamic Supervised Learning model's effectiveness.

Researchers employ a variety of evaluation measures to assess the effectiveness of various classification and regression models

Proposed framework for the SHDP utilizing the IOT dataset's dynamic data mining paradigm.

The extract Data Knowledge, extract Goal Knowledge, extract Algo Knowledge, and match Knowledge functional units, which are detailed in the next sections, are included in the figure. The study has chosen to exclude the specifics of data pre-processing for simplicity.

The SHDP model (as in Algorithm 1), which requires the inputs D, G, and A to determine the appropriate DM algorithm for the given data processing task, has been introduced in order for the suggested system to function. The proposed approach's technique is outlined in the section below:

For the proposed system to work, SHDP model has been introduced (as in Algorithm 1) that takes as input D, G, and A to find the matched DM algorithm for data processing task. The methodology followed by the proposed approach is summarized below:

1) Extraction of dataset knowledge attributes using Algorithm 2, which collectively produces data knowl edge, K_D
2) Extraction of goal knowledge attributes using Algorithm 3, which collectively produces goal knowledge, K_G
3) Extraction of DM algorithm knowledge attributes using Algorithm 4, which collectively produces DM algorithm knowledge,

66779

Matching among the attributes of data knowledge, goal knowledge and DM algorithm knowledge are performed using Algorithm to find similarity of knowledge based on the concept of similarity checking approach introduced in. This technique enables the proposed model to select appropriate DM algorithms dynamically for the heterogeneous type of data domains having multiple goals in each domain.

CONCLUSION

In Dynamic Supervised Learning (DSLR), the model is tested on unlabeled data after being trained on labelled data. It is further separated into tasks for classification and regression. Over the past ten years, many supervised learning algorithms have been presented. Many applications for supervised learning exist. This SLR is a review of the literature on supervised learning approaches and algorithms and was conducted in accordance with Kitchenham's suggested order of clearly defined steps. Additionally, it illustrates a number of supervised learning algorithm performance metrics. It also addresses the benefits and drawbacks of numerous studies. This survey report will help researchers to choose the best supervised learning strategy or algorithm when solving problems for the IOT dataset and identify the areas of research that need more attention.

Table 1. Selection of frequently used evaluation measures

S.NO	Evaluation Metric	Definition
1	Accuracy	Generally, the accuracy of the prediction model can be defined as the ratio of correct prediction to the total number of input instances
2	Precision	Precision is defined as the number of correct results divided by correctly predicted classes by the prediction model
3	Recall	Recall is defined as number of correct results divided by all relevant samples
4	FI Score	F1-Score is the harmonic mean of precision and recall. It shows the robustness of the prediction model
5	Mean Absolute Error	It is defined as the average difference between the actual and predicted value
6	Mean Squared Error	Mean Squared Error takes the squared average of the difference between the actual and predicted values
7	Logloss	Logloss also known as logarithmic loss is measured by penalizing the false predictions
8	Area Under curve	AUC shows the ability of the classifier to differentiate between the classes. It is used for binary classification. It depends on true positive rate (TPR) and false positive rate (FPR).

Table 2: Comparative Analysis of Data Mining Algorithms

#	Study Title	Approach	Merits	Demerits
1	Spam Filtering Using Hybrid Local-Global Naïve Bayes Classifier[8]	Naïve Bayes	A novel learning approach for the classification of messages as spam or legit	Only the independent attributes are taken
2	Deep Feature Weighting In Naive Bayes For Chinese Text Classification[9]	Naïve Bayes	A weighted Naïve Bayes model is proposed for Chinese text classification	Error is not mentioned
3	AI-based smart prediction of	Naïve	Effectively classify disease	Because of the huge amount

|			
	clinical disease using random forest classifier and Naive Bayes[29]	Bayes RF	datasets like diabetes, heart disease, and cancer to check whether the patient is affected or not	of data, there is high processing time
4	Spam email detection using machine learning algorithm[30]	Naïve Bayes	Achieved 88.12% of overall accuracy for spam email detection	Takes all the attributes independently
5	Classification of Skin Diseases Types using Naïve Bayes Classifier based on Local Binary Pattern Features[31]	Naïve Bayes	NB achieved an accuracy of 90% in classifying 9 skin diseases	Combination of these two is only suitable for small dataset
6	Symptom & Risk factor based diagnosis of Gum diseases using Neural Network[27]	Neural Network	Proposed a novel non-invasive approach to diagnose gum disease	Large neural networks require higher computation time
7	Prediction of Heart Disease Using Multilayer Perceptron Neural Network[2]	Neural Network	Achieved an accuracy of 98% in predicting heart disease	NN are not probabilistic
8	Prediction of share price trend using FCM neural network classifier[23]	Neural Network	A method Floating centroids was proposed to predict the share price	High computational time required
9	Classification of COVID-19 in chest X-ray images using DeTraC deep convolutional neural network[32]	Neural Network	Classified COVID-19 chest X-ray images with an accuracy of 93.1%	Requires validating the model with larger dataset and adding explain ability component
10	Differential Deep Convolutional Neural Network Model for Brain Tumor Classification[33]	Neural Network	Proposed model achieved an accuracy of 99.25% in facilitating the automatic classification of brain tumors	An improvement of the parameters is required for differential filter to make the network coverage faster
11	An Evidential K-Nearest Neighbor Classification Method with Weighted Attributes[22]	KNN	A novel method with weighted features to overcome the issues of EKNN	Did not mention the type of distance and associated attributes that generate better results
12	A Placement Prediction System Using K-Nearest Neighbors Classifier[18]	KNN	This model predicts the probability of placing an undergrad student in an IT firm	distance based learning is not defined clearly
13	Weed Detection Approach Using Feature Extraction and KNN Classification[34]	KNN	KNN classify the weed plant and field crop	Requires high memory and needs to store whole training data
14	Cardiovascular Disease Prediction Using Support Vector Machines[13]	SVM	Support vector machine classifies the data into binomial as well as multilevel class	Huge noisy data degrades the performance of SVM
15	An SVM-based ensemble algorithm for breast cancer diagnosis[35]	SVM	Successfully diagnosed breast cancer using SVM with reduced diagnosis variation and improved diagnosis accuracy	Analying large and complex data requires high computational time

ABSTRACT

Let $f : V(G) \rightarrow \{k, k+1, k+2, \ldots, k+p+q-1\}$ be an injective function. Then the induced edge labeling $f^*(e = uv)$ defined by $f^*(e) = \left\lceil \frac{f(u)^3 + f(v)^3}{f(u)^2 + f(v)^2} \right\rceil$ (or) $\left\lfloor \frac{f(u)^3 + f(v)^3}{f(u)^2 + f(v)^2} \right\rfloor$, then f is called $k-$Super Lehmer-3 Mean labeling, if $\{f(V(G))\} \cup \{f(e)/e \in E(G)\} = \{k, k+1, k+2, \ldots, k+p+q-1\}$. A graph which admits $k-$**super lehmer-3 mean labeling** is called a $k-$**super lehmer-3 mean graph**. In this paper we introduce and study the $k-$super lehmer-3 meanness of triangular snake, quadrilateral snake,double triangular snake,double quadrilateral snake and Alternative triangular snake.

Keywords: k–Super Lehmer-3 mean Labeling,k–Super Lehmer-3 mean graph, triangular snake, double triangular snake, Alternative triangular snake, quadrilateral snake, double quadrilateral snake, Alternative quadrilateral snake.

AMS Classification Code: 05C78

INTRODUCTION

A graph considered here are finite, undirected and simple. Let G(V,E) be a graph with p vertices and q edges. For standard terminology and notations, we follow[3]. For detailed survey of graph labeling we refer to Gallian [1]. The concept of Super Lehmer-3 Mean Labeling was introduced and studied by[?] and also studied [2]. In this paper we introduce the concept of k-Super Lehmer-3 Mean Labeling and we investigate the k−Super Lehmer-3 meanness of

triangular snake, Double triangular snake, Alternative triangular snake, quadrilateral snake,Double quadrilateral snake and Alternative quadrilateral snake.

Main Results

Definition 2.1. Let $f : V(G) \to \{1, 2, 3, \ldots, p+q\}$ be an injective function. Then the induced edge labeling $f^*(e = uv)$ defined by $f^*(e) = \left\lceil \frac{f(u)^3 + f(v)^3}{f(u)^2 + f(v)^2} \right\rceil$ (or) $\left\lfloor \frac{f(u)^3 + f(v)^3}{f(u)^2 + f(v)^2} \right\rfloor$, then f is called *Super Lehmer-3 Mean labeling*, if $\{f(V(G))\} \cup \{f(e)/e \in E(G)\} = \{1, 2, 3, \ldots, p+q\}$. A graph which admits **super lehmer-3 mean labeling** is called a **super lehmer-3 mean graph**.

Definition 2.2. Let $f : V(G) \to \{k, k+1, k+2, \ldots, k+p+q-1\}$ be an injective function. Then the induced edge labeling $f^*(e = uv)$ defined by $f^*(e) = \left\lceil \frac{f(u)^3 + f(v)^3}{f(u)^2 + f(v)^2} \right\rceil$ (or) $\left\lfloor \frac{f(u)^3 + f(v)^3}{f(u)^2 + f(v)^2} \right\rfloor$, then f is called $k-$*Super Lehmer-3 Mean labeling*, if $\{f(V(G))\} \cup \{f(e)/e \in E(G)\} = \{k, k+1, k+2, \ldots, k+p+q-1\}$. A graph which admits $k-$**super lehmer-3 mean labeling** is called a $k-$**super lehmer-3 mean graph**.

Definition 2.3. A **triangular snake** *is obtained from a path* $v_1, v_2, \ldots, v_n$ *by joining* v_i *and* v_{i+1} *to a new vertex* w_i *for* $i = 1, 2, \ldots, n-1$.

Definition 2.4. A **double triangular snake** *is obtained from a path* $v_1, v_2, \ldots, v_n$ *by joining* v_i *and* v_{i+1} *to a new vertex* w_i *for* $i = 1, 2, \ldots, n-1$ *and to a new vertex* u_i *for* $i = 1, 2, \ldots, n-1$.

Definition 2.5. An **alternative triangular snake** $A(T_n)$ *is obtained from a path* $u_1, u_2, \ldots, u_n$ *by joining* u_i *and* u_{i+1} *to a new vertices* w_i. *That is every alternative edge replaced by* C_3.

Definition 2.6. A **double quadrilateral snake** *is obtained from a path* $v_1, v_2, \ldots, v_n$ *by joining each of the vertices* v_i *and* $v_{i+1}(i = 1, 2, \ldots, n-1)$ *to new vertices and* u_i *and* u_i' *and to the new vertices* w_i *and* w_i' *respectively and adding an edge between each pair of vertices* (u_i, w_i) *and* (u_i', w_i').

Definition 2.7. An **alternative quadrilateral snake** $A(Q_n)$ *is obtained from a path* $u_1, u_2, \ldots, u_n$ *by joining* u_i *and* u_{i+1} *to a new vertices* v_i, w_i *respectively and then joining* v_i *and* w_i. *That is every alternative edge replaced by* C_4.

Definition 2.8. A **double quadrilateral snake** *is obtained from a path* $v_1, v_2, \ldots, v_n$ *by joining each of the vertices* v_i *and* $v_{i+1}(i = 1, 2, \ldots, n-1)$ *to new vertices and* u_i *and* u_i' *and to the new vertices* w_i *and* w_i' *respectively and adding an edge between each pair of vertices* (u_i, w_i) *and* (u_i', w_i').

Theorem 2.9. *The triangular snake* $T_n(n \geq 2)$ *is a* $k-$*Super Lehmer-3 Mean graph for any* k

Proof. Let $\{v_i, 1 \leq i \leq n, u_i, 1 \leq i \leq n-1\}$ be the vertices and $\{e_i, 1 \leq i \leq n, a_i, 1 \leq i \leq 2(n-1)\}$ be the edges which are denoted as in Figure 1.

First we label the vertices as follows:
For $1 \leq i \leq n$, $f(v_i) = k + 5(i-1)$
For $1 \leq i \leq n-1$, $f(u_i) = k + 5i - 3$
Then the induced edge labels are:
For $1 \leq i \leq n-1$, $f^*(e_i) = k + 5i - 2$
For $1 \leq i \leq 2(n-1)$,

$$f^*(a_i) = \begin{cases} \dfrac{2k+5i-3}{2} & i \text{ is odd} \\ \dfrac{2k+5i-2}{2} & i \text{ is even} \end{cases}$$

Therefore, the edge labels are all distinct. Hence the triangular snake $T_n(n \geq 2)$ is a $k-$super lehmer-3 mean graph for any k.   □

Theorem 2.10. *The double triangular snake $D(T_n)(n \geq 2)$ is a $k-$Super Lehmer-3 Mean graph for any k.*

Proof. Let $\{v_i, 1 \leq i \leq n, u_i, w_i, 1 \leq i \leq n-1\}$ be the vertices and $\{e_i, 1 \leq i \leq n, a_i, b_i, 1 \leq i \leq 2(n-1)\}$ be the edges which are denoted as in Figure 2.

First we label the vertices as follows:
For $1 \leq i \leq n$, $f(v_i) = k + 8(i-1)$
For $1 \leq i \leq n-1$, $f(u_i) = k + 8i - 6$ $f(w_i) = k + 8i - 2$
Then the induced edge labels are:
For $1 \leq i \leq n-1$, $f^*(e_i) = k + 8i - 4$
For $1 \leq i \leq 2(n-1)$,

$$f^*(a_i) = \begin{cases} k+4i-3 & i \text{ is odd} \\ k+4i-5 & i \text{ is even} \end{cases}$$

$$f^*(b_i) = \begin{cases} k+4i+1 & i \text{ is odd} \\ k+4i-1 & i \text{ is even} \end{cases}$$

Therefore, the edge labels are all distinct. Hence the double triangular snake $D(T_n)(n \geq 2)$ is a $k-$super lehmer-3 mean graph for any k.   □

Theorem 2.11. *The alternative triangular snake $A(T_n)(n \geq 2)$ is a $k-$super lehmer-3 mean graph for any k.*

Proof. Let $\{v_i, 1 \leq i \leq n, u_i, 1 \leq i \leq \frac{n}{2}\}$ be the vertices and $\{e_i, 1 \leq i \leq n-1, a_i, 1 \leq i \leq n\}$ be the edges.
First we label the vertices as follows:
For $1 \leq i \leq n$, $f(v_i) = k + 2(i-1)$
For $1 \leq i \leq \frac{n}{2}$, $f(u_i) = k + 2n + 3(i-1)$
Then the induced edge labels are:
For $1 \leq i \leq n-1$, $f^*(e_i) = k + 2i - 1$
For $1 \leq i \leq n$,

$$f^*(a_i) = \begin{cases} \dfrac{2k+4n+3i-5}{2} & i \text{ is odd} \\ \dfrac{2k+4n+3i-4}{2} & i \text{ is even} \end{cases}$$

Therefore, the edge labels are all distinct. Hence the alternative triangular snake $A(T_n)(n \geq 2)$ is a $k-$super lehmer-3 mean graph for any k.   □

Theorem 2.12. *The quadrilateral snake $Q_n(n \geq 2)$ is a $k-$Super Lehmer-3 Mean graph for any k.*

Proof. Let $\{u_i, w_i, 1 \leq i \leq n-1, v_i, 1 \leq i \leq n\}$ be the vertices and
$\{a_i, b_i, c_i, 1 \leq i \leq n-2, e_i, 1 \leq i \leq n-1\}$ be the edges which are denoted as in Figure 3.

First we label the vertices as follows:

For $1 \leq i \leq n$, $f(v_i) = k + 7(i-1)$

For $1 \leq i \leq n-1$, $f(u_i) = k + 7i - 5$

$f(w_i) = k + 7i - 2$

Then the induced edge labels are:

For $1 \leq i \leq n-2$, $f^*(a_i) = k + 7i - 6$

$f^*(b_i) = k + 7i - 1$ $f^*(c_i) = k + 7i - 3$

For $1 \leq i \leq n-1$, $f^*(e_i) = k + 7i - 4$

Therefore, the edge labels are all distinct. Hence the quadrilateral graph $Q_n(n \geq 2)$ is a $k-$super lehmer-3 mean graph for any k.   □

Theorem 2.13. *The Alternative quadrilateral snake $A(Q_n)(n \geq 2)$ is a $k-$Super Lehmer-3 Mean graph for any k.*

Proof. Let $\{v_i, u_i, 1 \leq i \leq n\}$ be the vertices and $\{a_i, 1 \leq i \leq n, e_i, 1 \leq i \leq n-1, b_i, 1 \leq i \leq \frac{n}{2}\}$ be the edges.

First we label the vertices as follows:

For $1 \leq i \leq n$, $f(v_i) = k + 2(i-1)$

For $1 \leq i \leq n$,

$$f(u_i) = \begin{cases} \dfrac{2k + 4n + 5(i-1)}{2} & i \text{ is odd} \\[2mm] \dfrac{2k + 4n + 5i - 6}{2} & i \text{ is even} \end{cases}$$

Then the induced edge labels are:

For $1 \leq i \leq n-1$, $f^*(e_i) = k + 2i - 1$

For $1 \leq i \leq n$,

$$f^*(a_i) = \begin{cases} \dfrac{2k + 4n + 5i - 7}{2} & i \text{ is odd} \\[2mm] \dfrac{2k + 4n + 5i - 4}{2} & i \text{ is even} \end{cases}$$

For $1 \leq i \leq \frac{n}{2}$, $f^*(b_i) = k + 2n + 5i - 2$

Therefore, the edge labels are all distinct. Hence the Alternative quadrilateral snake $A(Q_n)(n \geq 2)$ is a $k-$Super Lehmer-3 Mean graph for any k.   □

Theorem 2.14. *The Double quadrilateral snake $D(Q_n)(n \leq 2)$ is a $k-$super lehmer-3 mean graph for any k.*

Proof. Let $\{v_i, 1 \leq i \leq n, u_i, w_i, 1 \leq i \leq 2(n-1)\}$ be the vertices and $\{e_i, a_i, c_i, 1 \leq i \leq n-1, b_i, d_i, 1 \leq i \leq 2(n-1)\}$ be the edges.

First we label the vertices as follows:

For $1 \leq i \leq n$, $f(v_i) = k + 12(i-1)$

For $1 \leq i \leq 2(n-1)$,

$$f(u_i) = \begin{cases} k + 6i - 4 & i \text{ is odd} \\ k + 6i - 8 & i \text{ is even} \end{cases}$$

$$f(w_i) = \begin{cases} k + 6i + 2 & i \text{ is odd} \\ k + 6i - 2 & i \text{ is even} \end{cases}$$

Gopi and Prakash

Then the induced edge labels are:

For $1 \leq i \leq n-1$, $f^*(e_i) = k + 12i - 6$

For $1 \leq i \leq n-1$, $f^*(a_i) = k + 12i - 9$

For $1 \leq i \leq 2(n-1)$,

$$f(u_i) = \begin{cases} k + 6i - 4 & i \text{ is odd} \\ k + 6i - 8 & i \text{ is even} \end{cases}$$

$$f(w_i) = \begin{cases} k + 6i + 2 & i \text{ is odd} \\ k + 6i - 2 & i \text{ is even} \end{cases}$$

Then the induced edge labels are:

For $1 \leq i \leq n-1$, $f^*(e_i) = k + 12i - 6$

For $1 \leq i \leq n-1$, $f^*(a_i) = k + 12i - 9$ $\qquad f^*(c_i) = k + 12i - 3$

For $1 \leq i \leq 2(n-1)$,

$$f^*(b_i) = \begin{cases} k + 6i - 5 & i \text{ is odd} \\ k + 6i - 7 & i \text{ is even} \end{cases}$$

$$f^*(d_i) = \begin{cases} k + 6i - 2 & i \text{ is odd} \\ k + 6i + 2 & i \text{ is even} \end{cases}$$

Therefore, the edge labels are all distinct. Hence the Double quadrilateral snake $D(Q_n)(n \leq 2)$ is a $k-$super lehmer-3 mean graph for any k. $\qquad\square$

ABSTRACT

Microbial pigments are considered as safe alternate to the chemical colors as peoples are more aware about natural colors. Microbes as source of natural pigments provide several obvious advantages over chemically synthesized colors as well as plant based colors. In recent times, focus on microbes as potent source of pigments has increased due to potent applications in various industries. In current study, yellow pigment producing bacterial strain has been isolated from soil followed by its molecular characterization by 16s rRNA gene sequencing and phylogenetic analysis. The bacterial isolate was identified as *Kocuria flava* and named as *Kocuria flava* KMSM-18. The bacterial pigment showed maximal absorbance at 440 nm. Fructose was found to be more effective in supporting biomass growth and intracellular pigment production as compared to glucose, maltose, and sucrose. Optimization of media constituents was performed at shake flask level using *one-variable-at-a-time* method for higher pigment production by *Kocuria flava* KMSM-18. Further, orange peel powder resulted in better pigment production and can be utilized as potent cost effective substrate for pigment production. Further studies are required on characterization and application of the microbial pigment produced from *Kocuria flava* KMSM-18.
Keywords: Microbial pigment, *Kocuria flava,* 16S rRNA gene sequence, Phylogenetic tree, media optimization.

INTRODUCTION

Bacterial and fungal pigments provide a good alternative source of natural pigments. As compared to other natural sources, microbial pigments have number of advantages including rapid growth, easy production, easy processing and independence of weather conditions [1]. Moreover, bacterial and fungal pigments also possess several biological properties including antioxidant, anti-inflammatory, antimicrobial and anticancer activity [1; 2]. Though microbial pigments are more expensive, but still they can compete with synthetic dyes due to their natural origin and safety concerns [1; 3]. A number of microbial pigments have been reported till date and they have attained their role in various industries including food and pharmaceuticals.

Bacterial sources are considered better over fungal sources of metabolites due to faster growth and higher production. Various bacterial sources have been reported for pigment production. Further, the pigments have been characterized and studied extensively for various aspects. In this article, *Kocuria flava*, a yellow pigment producing bacterial strain has been isolated from soil. The isolated strain was characterized by 16s rRNA gene sequencing and phylogenetic analysis. The bacterial isolate was identified as *Kocuria flava* and named as *Kocuria flava* KMSM-18. The bacterial pigment showed maximal absorbance at 440 nm. Fructose was found to be more effective in supporting biomass growth and intracellular pigment production as compared to glucose, maltose, and sucrose. Optimization of media constituents was performed at shake flask level using *one-variable-at-a-time* method for higher pigment production by *Kocuria flava* KMSM-18. Further, agricultural waste material has been assessed for potential to be used as raw substrate for cost effective production of pigment by *Kocuria flava* KMSM-18. Further studies are required on characterization and application of the microbial pigment produced from *Kocuria flava* KMSM-18. Only few reports are available for the production of yellow pigment by *Kocuria flava* isolated from soil.

MATERIALS AND METHODS

Collection of soil samples
Different soil samples were collected from various fields (located at Rohtak, Panipat, Mullana-Ambala, Kurukshetra and Barara-Ambala) of Haryana, India. The soil samples were collected in air tight pre-sterilized plastic bottles and stored in their natural state at 4ºC, until further use [4; 5].

Isolation of pigment producing bacterial strains
Serial dilution approach was used for isolation of pigment producing microbial strains. Soil samples were serially diluted followed by spreading of appropriate dilutions on nutrient agar media [6; 7]. The plates were incubated at 37°C and observed regularly for pigmented colonies. On the basis of colour, yellow pigmented colony was identified and selected for further work. The yellow pigmented colony was picked and further streaked on sterile nutrient agar plates to obtain pure colonies. The selected microbial strain KMSM-18 (*Kashish, Mukesh, Soil Sample, Mullana, and Isolate Number 18*) was confirmed to be bacteria by microscopic examination and simple staining. The selected bacterial isolate KNMSM-18 was preserved on agar slopes using nutrient agar as base media [8; 9].

Production and extraction of yellow pigment by bacterial strain KMSM-18
For inoculum preparation, the selected bacterial isolate KMSM-18 was grown in nutrient broth media (at 37ºC for 24 hours) under continuous agitation (150 rpm) using an orbital shaker (Remi Industries, India). The pure incoulum (10%; v/v) was used to inoculate nutrient broth media. The inoculated broth was incubated under agitation (at 37ºC; 150 rpm; 48 hours). After 48 hours of incubation, broth was harvested and centrifuged (4ºC; 7,000 rpm; 10 minutes) followed by separation of cell pellet from cell free broth. The cell pellet was washed with sterile distilled water (4ºC; 7,000 rpm; 10 minutes), all free liquid was drained off and cell pellet was weighed as fresh biomass. The pellet was re-suspended in suitable solvent (ethanol) for cell lysis and pigment extraction [6; 10].

66791

The cells suspension was incubated at 50°C for 1 hour with repeated vortex at regular interval of 10 minutes. After incubation and vortex, the cell suspension was centrifuged at 7000 rpm, 4°C for 10 minutes [11]. The colour was extracted in ethanol (supernatant), therefore, supernatant was collected in a separate tube. The pellet was also checked for remaining pigment. The supernatant was taken as crude yellow pigment for screening of maximum absorption wavelength in a range of 300-600 nm.

16S ribosomal RNA gene sequence of bacterial strain KMSM-18 and phylogenetic analysis
The selected microbial strain was characterized by 16s RNA gene sequencing followed by phylogenetic analysis. The 16S rRNA gene was amplified by universal primer and sequenced at geneOmbio Technologies Pvt. Ltd., Pune, India. The homology of the obtained 16S ribosomal RNA gene sequence (partial sequence) was determined using BLAST program of NCBI, USA (https://blast.ncbi.nlm.nih.gov) against NCBI nucleotide database [12]. The 16S rRNA gene sequence data was aligned using ClustalW program [13] against the reference nucleotide sequences of the genera retrieved from NCBI, GenBank and analyzed for finding the closest homolog for the bacterial strain (KMSM-18). The phylohgenetic tree was constructed using BLAST pairwise alignments with neighbor-joining method [14] with the help of online service provided by NCBI, USA (https://www.ncbi.nlm.nih.gov).

Effect of different carbon sources on production of yellow pigment by *Kocuria flava* KMSM-18
Four different carbon sources including fructose, sucrose, maltose, and glucose (1%; w/v) were assessed for their effect on pigment production by *Kocuria flava* KMSM-18. The carbon sources were added in nutrient broth and bacterial strain was grown for 24 hours at 37°C in an orbital shaker (Remi Industries, India) at 150 rpm. The cells were harvested, washed and weighed for fresh biomass. The fresh biomass was taken as measure of growth. The biomass of all experiments was suspended in 20 ml ethanol. The cells were lysed and absorbance of extracted pigment was measured at 440 nm in an UV-visible spectrophotometer. Difference in biomass and pigment production was observed due to different carbon sources.

Optimization of media constituents using *one-variable-at-a-time* method for higher production of pigment by *Kocuria flava* KMSM-18
The concentrations of media constituents were optimized by *one-variable-at-a-time* method to obtain optimal media for higher production of pigment by *Kocuria flava* KMSM-18. The media constituents including yeast extract, peptone, malt extract, NaCl, and fructose were optimized. Different concentrations of yeast extract (0.1%, 0.2%, 0.3%, 0.4%, 0.5%; w/v), malt extract (0.1%, 0.2%, 0.3%, 0.4%, 0.5% w/v), peptone (0.3%, 0.4%, 0.5%, 0.6%, 0.7% w/v), sodium chloride (0.3%, 0.4%, 0.5%, 0.6%, 0.7% w/v) and fructose (0.5%, 0.75%, 1.0%, 1.25%, 1.5% w/v) were optimized in order to obtain optimal media concentration.

Effect of raw substrate (agricultural waste) on pigment production by *Kocuria flava* KMSM-18:
Agricultural waste material including apple pomace (1%; w/v), orange peel (1%; w/v), banana peel (1%; w/v), and sweet potato (1%; w/v) were investigated in place of fructose for potential to be used as cost effective substrate for production of pigment by *Kocuria flava* KMSM-18. All other media constituents were used at their optimal concentrations. The cukture was grown at 37°C for 24 hours in an orbital shaker (Remi Industries, India) at 150 rpm. Thereafter, cells were harvested, washed and weight of fresh biomass was measured. The cells were lysed and absorption was compared at 440 nm.

RESULTS AND DISCUSSION

Isolation of pigment producing bacterial strains
The soli samples collected from various locations were used for isolation of pigment producing microbial strains. Depending on colour of colony, total six isolates were selected and grown in nutrient broth. All six cultures were streaked on nutrient agar, grown as pure colonies and observed for the colour of colony developed as function of

time. The isolated strain KMSM-18 showed more intense yellow pigmented colony in 24 hours as compared to other microbial strains. Therefore, microbial isolate KMSM-18 **(Figure 1)** was selected for further work.

Production and extraction of yellow pigment by bacterial strain KMSM-18

The bacterial strain KMSM-18 was grown in nutrient broth, harvested and lysed in ethanol to release intracellular yellow pigment. The extracted pigment was analyzed for maximum absorption in range of 300-600 nm a UV-visible spectrophotometer. The maximum absorption of the yellow pigment was obtained at 440 nm, which is in line with earlier studies [6; 15; 16; 17].

16S ribosomal RNA gene sequence of bacterial strain KMSM-18 and phylogenetic analysis

The 16S rRNA gene sequence of 613 bp was obtained. The comparative analysis and homology (using nucleotide blast-NCBI) of the 16S rRNA gene sequence of the isolate KMSM-18 showed highest similarity with the *Kocuria flava*. Therefore, the bacterial strain KMSM-18 was identified as *Kocuria flava* named as *Kocuria flava* KMSM-18. The 16S ribosomal RNA gene, partial sequence has been submitted to GenBank (NCBI, USA) and has been assigned accession number OR044108 (https://www.ncbi.nlm.nih.gov/nuccore/2509838503). The taxonomical information of the bacteria was found to be as follows (https://www.ncbi.nlm.nih.gov/nuccore/2509838503): Bacteria; Actinomycetota; Actinomycetes; Micrococcales; Micrococcaceae; Kocuria. The phylohgenetic tree was constructed **(Figure 2)** using BLAST pairwise alignments with neighbor-joining method (Saitou and Nei, 1987) with the help of online platform provided by NCBI, USA (https://www.ncbi.nlm.nih.gov). The *Kocuria flava* is now well known for its potential of pigment production. Further, the pigment has been characterized as flavonoid by various researchers [15-20] and seems promising for various industrial applications.

Submission of nucleotide sequence at GenBank, NCBI (USA) and accession number

The bacterial isolate was sequenced for 16S rRNA gene sequence and found to be *Kocuria flava* KMSM-18 after sequence analysis. 16S rRNA gene sequence of the strain has been submitted to the GenBank database with accession number OR044108.

Effect of different carbon sources on production of yellow pigment by *Kocuria flava* KMSM-18

Four different carbon sources including fructose, sucrose, maltose, and glucose (1%; w/v) were assessed for their effect on pigment production by *Kocuria flava* KMSM-18. Higher growth was obtained with fructose in terms of higher biomass. The biomass was measured in terms of fresh weight of biomass (g/ 100 ml of media). Higher growth was also found to be associated with the higher pigment production. Therefore, fructose also resulted in higher pigment production by the *Kocuria flava* KMSM-18. Production of fresh biomass and pigment was higher in fructose followed by glucose, maltose, and sucrose. The pigment production from glucose was also near t that produced by sucrose. Various bacterial sources have been reported to produce pigment and sugars have been found to affect the pigment production. Glucose (1%; w/v) and sucrose (1%; w/v) have been reported to support to support higher pigment production by bacterial cultures (Fatima and Anuradha, 2022). In earlier studies, sucrose (0.8 %; w/v) have been reported for optimal production of pigment by *Kocuria flava*. Similarly, glucose has been reported to be the most suitable carbon sources for pigment production by *Micrococcus lylae* MW407006 [7].

Optimization of media constituents using *one-variable-at-a-time* method for higher production of pigment by *Kocuria flava* KMSM-18

The concentrations of media constituents were optimized by *one-variable-at-a-time* method to obtain optimal media for higher production of pigment by *Kocuria flava* KMSM-18. Higher production of biomass as well as pigment was obtained at following concentrations (Figure 3): yeast extract (0.4%; w/v); peptone (0.5%/ w/v); malt extract (0.2%; w/v); NaCl (0.6%; w/v) and fructose (1.25; w/v). Optimization of media constituents is among the most widely utilized practice in fermentation technology to increase the production of metabolites. *One-variable-at-a-time* is still commonly used methodology for media optimization as part of basic as well as preliminary studies.

Kashish Malik *et al.*,

Earlier studies have revealed *Kocuria* sp. as potent source of yellow pigment. *Kocuria* KM243757 and JO1 KM216829 have been reported for pigment production [15]. Authors reported absorption spectrum at 466 nm by UV-Visible spectroscopy [15]. Timkina et al. [21] have reported isolation of four bacterial isolates of the genus *Kocuria* (*Kocuria* sp. 101, 208, 301, and 401) from radon spring water. Authors observed the strain *Kocuria* sp. 301 as the largest producer of antioxidants [21]. The species of the Genus *Kocuria* are generally pigmented and known for pigment production [19]. The pigment generally ranges between yellowish, orange and reddish shade that holds potential to be used as natural colorant. In earlier studies, these colors have been linked to carotenoids pigments [18; 19; 22]. Rezaeeyan et al. [18] have reported the production of carotenoid by a halotolerant *Kocuria* sp. strain QWT-12 and also investigated the anticancer potential of produced carotenoid. Similarly, various *Kocuria* sp. have been investigated for the pigment production and needs more extensive research on various aspects related to pigments, their biological properties and applications. *Kocuria flava* may be the potent producer of pigment and more elaborative research is required in this area.

CONCLUSIONS

Bacteria are considered as an important source of metabolites. Various bacterial strains are currently employed for production of industrially important metabolites. Microbial pigments are among the major microbial products that have gained attention in current scenario. Bacterial pigments have potential to be used as natural colors over the chemical colors. In current studies, yellow pigment producing bacterial strain has been isolated and characterized as *Kocuria flava* KMSM-18 by 16S rRNA gene sequence followed by phylogenetic tree analysis. The pigment produced by bacterial strain showed maximum absorption at 440 nm. Initial media optimization studies lead to higher production of pigment. The bacterial strain *Kocuria flava* KMSM-18 seems to be potent source of natural yellow pigment. The pigment need to be evaluated in terms of carotenoid of bacterial origin.

ABSTRACT

Herbal medicine is being used for infectious diseases since ancient times due to antimicrobial properties. Various medicinal herbs like ginger, oregano, garlic, basil, neem, turmeric, tea tree and others possess antibacterial, antifungal and antiviral properties. We consume some of these as home remedies for boosting our immune system or apply to inhibit microbial growth. Upper respiratory tract infections specially the common cold and cough are caused by viral infections and herbal concoctions are being taken as remedy to ease the symptoms thus being consumed as supportive therapy. Additionally, it could be beneficial for secondary bacterial infections resulting from prolonged bacterial infections. Current study evaluates the antibacterial potential of a herbal drink composed of Zinger, Cardamom and Basil.

Keywords: antimicrobial, antibacterial, medicinal, herbs, drink.

INTRODUCTION

Infections of upper respiratory tracts results in common cold and flu, which although do not contribute to morbidity or mortality, however, affect the society, the healthcare system as well as national economy by increasing the hospital visits, primary care, reduced work performance, missed school days and costs of primary care or

Soumya Ranjan Mahalik *et al.*,

prescription medicines (Larson, 2007). Common colds and coughs are generally caused by viruses like Rhinoviruses, Coronaviruses, Parainfluenza viruses, Adenoviruses, Respiratory Syncytial Viruses, Enteroviruses with Rhinoviruses being most common infections. Different causative agents follow different mechanisms for infection and manifestation of the disease. However, in general, virus enters the nasal passage either by contaminated fingers or contaminated aerosols followed by its transportation to backside of nasal passage to adenoid area and results in attachment to nasal epithelial cells (Winther*et al.*, 1997). After attachment, virus replicates itself, produce multiple copies and develop the cold symptoms due to activation of mediators of inflammation in host cells. These inflammatory mediators enhance the vascular permeabilization as well as vasodilation which manifests as sneezing, coughing, congestion, malaise, rhinorrhea and low-grade fever symptoms (Larson, 2007; DeGeorge et al., 2019). Host immunity is also a determining factor of viral pathogenesis.

Common cold in some cases is followed by secondary bacterial infections. In a viral infection, altered immune system of the host and inflammation of respiratory tract renders it more susceptible to bacterial invasion, which can result in development of a secondary bacterial infection, followed by exacerbated symptoms and prolonged illness. *Streptococcus pneumoniae, Haemophilus influenzae, Staphylococcus aureus, Moraxella catarrhalis* etc are common bacterial pathogens responsible for secondary bacterial infection such as sinusitis, bronchitis, otitis media and pneumonia (Thomas and Bomar, 2018; Manohar *et al.*, 2020). To prevent the spread of these infections various transmission reduction measures are required to be applied like proper hygiene and social distancing when affected, which also contribute to economic implications such as increased demand for healthcare supplies and reduced consumer spending (Wardani*et al.*, 2023).

Common colds are considered self-limiting with symptoms observed up to 10 days of infection and the its treatment is aimed to reduce the severity of symptoms as well as duration of the episodes (DeGeorge*et al.*, 2019). Different over the counter medicines such as expectorants, decongestants, cough suppressants, antihistamines help to relieve stuffiness, reduce coughing and relieve allergic symptoms associated with common colds (De Sutter *et al.*, 2022). Analgesics and antipyretics such as nonsteroidal anti-inflammatory drugs (NSAIDs) like ibuprofen or acetaminophen (paracetamol) are used to alleviate headache, sore throat, and fevers. In addition to drugs some interventions like consumption of honey, steam inhalation, staying hydrated and taking the adequate rest are suggested for quick recovery. These treatments provide symptomatic relief and do not affect the causative pathogen directly (Fashner*et al.*, 2012). It's important to note that antibiotics are ineffective against viral infections, including the common cold, however, it could be beneficial against secondary bacterial infections. Treatment mainly focuses on managing symptoms and supporting the immune system's ability to fight the infection. Scientific research continues to explore the complex interactions between viruses, the immune system, and the respiratory tract to develop better prevention and treatment strategies for cough and cold.

Ayurvedic literature and various other traditional medicinal systems advocate the utility of herbal medicines for treatment of various common and complex ailments and numerous scientific studies are validating the same for multiple herbs like *Withaniasomnifera, Tinosporacordifolia, Zingiber officinale, Ocimum sanctum, Glycyrrhiza glabra, Curcuma longa* etc (Wardani*et al.*, 2023). Various Ayurvedic concoctions, syrups and home remedies including teas or herbal drinks aim to reduce the symptoms and provide comfort to the patient. As we know that upper respiratory infections are associated with secondary bacterial infections, the current study aims to explore the antimicrobial potential of a herbal drink made from cardamom, ginger and holy basil. This herbal drink is most common home remedy being used since age old time for common cold and coughs in Indian homes.

MATERIALS AND METHODS

Fresh ginger and dry cardamoms were purchased from local market of Phagwara region in Punjab district. Holy basil leaves were collected from herbal garden of Lovely professional university, Phagwara. Microbial cultures were procured from microbial type culture collection (MTCC), Chandigarh.

Soumya Ranjan Mahalik *et al.,*

Extract preparation and anti-microbial activity testing:
Four different aqueous extracts i.e. Ginger, Cardamom, Basil and the GCB (combination of three) extracts were prepared by boiling the 4 g clean herb material in 40 ml water and reducing it to final 25% of the initial volume (Figure 1). Extracts were filter sterilized and stored in refrigerator until further use(not more than 12 hours) for experiments. Antimicrobial potential of five different concentrations (100%, 75%, 50%, 25% and 12.5%) of these extracts was evaluated using well diffusion assay as well as in the broth dilution assay against *Staphylococcus aureus* and *E.coli*. Ampicillin was used as positive control and autoclaved distilled water was used as negative control.

RESULTS:

Antimicrobial activity of herbal combination extract. No zone of inhibition was observed for 1-5 concentrations of Cardamom aqueous extract (CAE), Zinger aqueous extract (ZAE) and Basil aqueous extract (BAE) for *S. aureus* and *E.coli*. Zone of inhibition observed for CZBAE (Cardamom, Zinger and Basil aqueous extract) (1-5 concentrations) for *S. aureus* suggesting anti-microbial activity of this herbal extract. Positive control Ampicillin (10µg/ml) showed zone of inhibition in all of the cultures.

Well diffusion assay
Zones of inhibition in agar well diffusion assay were measured for assessing the antimicrobial activity of combination extract (CZBAE) Table 1 and 2 . None of the five tested concentrations of Cardamom, Ginger and Basil extracts (CAE, ZAE and BAE, respectively) showed zone of inhibition in both the strains i.e. *S. aureus* and *E. coli*. However, significant inhibition of *S. aureus* was observed with combination extract (CZBAE) Figure 2. Further, no zones of inhibitions were observed in negative controls and zone of inhibition was observed in positive control in both microbial strains (Figure 2).

Broth dilution assay
No turbidity was observed for absolute, 75% and 50% concentrations of CZBAE extract suggesting the *S. aureus* was susceptible for the same along with positive controls, However, all other tested concentrations of all the extracts showed turbidity.

DISCUSSION

Various literature reports suggest the antimicrobial potential of zinger, basil or cardamom. We use the combination drink of these three herbs as a home remedy, commonly known as "Kadha" for easing common cold and coughs. However, there are no studies of antimicrobial potential of this combination extract. Ginger is known for its anti-inflammatory and antibacterial properties, which can help soothe respiratory inflammation and inhibit the growth of harmful bacteria. Cardamom is rich in antioxidants, promoting a healthy immune system and aiding in the treatment of respiratory infections. Basil, with its antimicrobial and antiviral properties, can further enhance the concoction's effectiveness against cough and cold. In the current study we haven't observed any antimicrobial activity for individual aqueous extracts of zinger, basil and cardamom. This could be due to the fact that the tested extract was a concentrate exactly prepared by following the recipe being followed at homes, so contains highly diluted concentrations of active phytocompounds. Interestingly, we observed a clear zone of inhibition for combination extract (CZBAE) and dose dependent decrease in the diameters of inhibition zones for *S. aureus*, which suggests antibacterial potential of this combination extract.

In addition to antibacterial potential, antiviral and antifungal properties of these herbs have been reported in literature (San Chang *et al.,* 2013; Saikia*et al.,* 2019; Yonus, 2023). Due to unavailability of virus cultivation facility, we were not able to test antiviral property of this combination extract, but on the basis of reported antiviral properties of its components this extract may exert antiviral properties as well, thus showing significant effects when consumed

Soumya Ranjan Mahalik *et al.*,

during common cold and cough (San Chang *et al.*, 2013; Saikia*et al.*, 2019; Palani *et al.*, 2020; Yonus, 2023). However, further studies are required to confirm the same.

CONCLUSION

The current observation provides validation to our age-old beliefs of therapeutic potential of this herbal drink. In addition to direct antimicrobial activity, these herbs are known for boosting the immune system, thus enable the body to fight back against recurring infections and to prevent the disease. It is essential to emphasize that severe or persistent symptoms require medical attention. Herbal remedies should complement conventional treatments rather than replace them entirely. However, in order to fully understand the extent of their effectiveness and to establish standardized dosages for safe usage, further scientific research is necessary.

ABSTRACT

Velpatasvir, a class-IV drug used to treat chronic hepatitis C infections but characterized by lower solubility and permeability. The main objective of the present research work was to prepare fast dissolving tablets (FDTs) of velpatasvir using super disintegrating agents. To improve the solubility and release behavior in dissolution fluid, velpatasvir was formulated as Solid dispersions using PEG-6000 as a carrier. In this work the solid dispersions were prepared by employing different techniques such as physical mixing, kneading and solvent evaporation methods. Then they were formulated as velpatasvir fast dissolving tablets using Crospovidone(CP), Sodium starch glycolate(SSG) and Croscarmellose sodium(CCS) as superdisintegrants by employing the direct compression method. Prepared solid dispersions were evaluated for various characteristics. The kinetic data revealed that the Solid dispersions prepared by using 1:2 ratio of drug and the polymer respectively showed the increase in the solubility when compared with the other lower ratios. The prepared fast dissolving tablets were evaluated for various parameters like hardness, friability, disintegration time, drug content, *in-vitro* drug release, FTIR, DSC studies and accelerated stability studies. Drug content uniformity was found to be within the approved range of all the formulations. Evaluation parameters like hardness and friability indicated good mechanical resistance of the tablets for all the formulations. The drug from various tablet formulations were released at a faster rate compared to pure drug. Formulations prepared by CP released the drug at faster rate than the marketed tablet and other FDTs prepared by CCS, SSG superdisintegrants. Among the prepared batches, F13, formulated by kneading method using 10% CP as

superdisintegrants release ≈ 90% of drug in 30min was found to be the best formulation. This indicates that the use of super disintegrants increases the release of drug from the formulation. Therefore, it can be concluded that FDTs are suitable delivery systems for Velpatasvir.

Keywords: Velpatasvir, Fast dissolving tablets, Crospovidone, Sodium starch glycolate and Croscarmellose sodium.

INTRODUCTION

Velpatasvir is a Hepatitis C virus NS5A inhibitor. The mechanism of action of velpatasvir is as a Breast Cancer Resistance Protein Inhibitor, and P-Glycoprotein inhibitor, and Organic Anion Transporting Polypeptide 1B1 Inhibitor, and Organic Anion Transporting Polypeptide 1B3 Inhibitor, and Organic Anion Transporting Polypeptide 2B1 Inhibitor. Velpatasvir is having a half-life of 15 hrs. The bioavailability of velpatasvir tablets is approximately 25-30%. Hence, an attempt was made for preparation of a new formulation of velpatasvir tablet by direct compression with an aim of providing faster onset of action. (Pubchem, Drugbank). The concept of fast dissolving drug delivery system emerged from the desired to provide patient with conventional means of taking their medication. Fast dissolving dosage form can be disintegrated, dissolved or suspended by saliva in mouth. The fast dissolving tablets disintegrates instantaneously when placed on tongue and releases the drug dissolve or disperses in saliva (*Kaushik D et.al., 2004*). The fast dissolving tablets are useful in patients (*Chue P et.al., 2004, Shu T et.al., 2002*) , like pediatric, geriatric, bedridden or mentally disabled, who may face difficulty in swallowing conventional tablet or capsule (*Seager H et.al., 1998*) leading to ineffective therapy (*Adamo F et.al., 2007*), Most pharmaceutical forms for oral administration are formulated for direct ingestion or for chewing or for prior dispersion/dissolution in water. Fast dissolving tablet have been developed which combine hardness, dosage uniformity, stability and other parameters, since no water is required for swallowing the tablets and they are thus suitable for geriatric, pediatric and traveling patients (*Jeong S et.al., 2008*). Recent advances in novel drug delivery systems aim to enhance safety and efficacy of the drug molecules by formulating convenient dosage form for administration and to achieve better patient's compliance. One such approach is fast dissolving tablets) FDT) (*Chang RK et.al., 2000, Dobetti L et.al., 2001, Kuchekar BS et.al., 2001*). The desired criteria for the FDT they should Have a pleasing mouth feel, Leave minimal or no residue in the mouth after oral administration and not require water to swallow, but it should dissolve or disintegrate in the mouth in a matter of seconds (*Nangude TD et.al., 2007, Indurwade NH et.al., 2002*). Most commonly used methods to prepare these tablets are; freezedrying/Lyophilization, tablet molding and direct compression methods. Main advantages of direct compression are low manufacturing cost and high mechanical integrity of the tablets (*Takao M et.al., 1996*). The main objective of the present research work is velpatasvir fast dissolving tablets were prepared by direct compression method using Sodium starch glycolate, Crosspovidone, Crosscarmellose as superdisintegrants.

MATERIALS AND METHODS

Velpatasvir pure drug was procured as a gift sample from Dr.Reddy's Lab, Hyderabad. Potassium dihydrogen phosphate, Sodium hydroxide, directly compressible Lactose, Talc and Magnesium stearate were purchased from S.D Fine Chem, Ltd., Mumbai. Polyethylene glycol 6000, Croscarmellose sodium, Crospovidone and Sodium starch glycolate were obtained as a gift sample from Pellets Pharma, Hyderabad.

Saturated Solubility Studies

Saturated solubility studies of Velpatasvir were performed in different dissolution media. 500mg of Velpatasvir was weighed and transferred into different conical flask. 50ml of different dissolution media were transferred into individual conical flask and were closed appropriately. All the conical flasks were placed in the REMI incubator shaker. The shaker was allowed to operate at 50 rpm at 37° C ± 1ºC for 24 hrs [*Pragati KB et.al., 2011*]. Then the conical flasks were removed from the incubator shaker and the samples were filtered by using whatmann filter paper. The

clear solution obtained by filtration was suitably diluted with appropriate dissolution media and the absorbance values were noted at 304 nm by using corresponding dissolution media as blank solutions. The absorbance values and their corresponding solubilities were given in table 1.

Preformulation Studies

The drug and polymer / excipients interaction studies were evaluated by checking the physical appearance, drug content, FT-IR and by X-ray diffraction (XRD), DSC thermo graphical analysis methods.

Preparation of Velpatasvir Solid Dispersions
Preparation of Solid Dispersions

Solid dispersions were prepared by using Polyethylene glycol-6000 as a carrier by employing different techniques. The carrier concentration was maintained constant in the investigation. The methods employed for the preparation of solid dispersions are:
1. Physical mixing. 2. Kneading method 3.Solvent evaporation.

Physical Mixing

Known quantity of drug (Velpatasvir) and polyethylene glycol 6000 were weighed separately and passed through sieve no. 80. The materials passed through sieve no.80 were collected and transferred into a clean and dry glass mortar triturated together for 5 min and again screened through sieveno.80. The mixture passed through sieveno.80 is collected and packed in a wide mouthed amber colored glass container and was hermetically sealed [*Chiou.W.L.et.al.,1971*].

Kneading Method

In this method carrier was triturated in a mortar with water to get slurry like consistency. Later drug was in corporate into it by continuous trituration and it was carried out for about 1hr. Slurry was then air dried at 25^0 C for 48hrs. The product was pulverized and passed through 80#sieve and stored in dessicator for further studies [*Rakesh Pahwa et.al.,2010*].

Solvent Evaporation

Specified quantity of Velpatasvir and PEG-6000 were taken in a china dish and to that few ml of methanol was added and slightly heated until both drug and polymer dissolves. Then it is subsequently allowed to evaporate. The obtained mixture was dried, passed through the sieve no.80, packed in a wide mouthed amber colored glass container and was hermetically sealed and stored [*Pragati KB.et.al.,2011*]. The compositions of various solid dispersions were shown in Table 2.

Evaluation of Physical Parameters of Solid Dispersions

Physical parameters such as Angle of Repose, Carr's Index, Average particle size and Drug content were evaluated for solid dispersions as per the standards of official compendium.

Angle of Repose

The internal angle between the surface of the pile of blend and the horizontal surface is known as the angle of repose. The Angle of repose was known by passing the blend through a funnel fixed to a burette stand at a particular height (4 cm). A graph paper was placed below the funnel on the table. The height and radius of the pile was measured. [*Aulton. M.E et.al., 2007*]   Angle of repose of the blend was calculated using the formula:

$\theta = \tan^{-1} (h / r)$
Where, h= Height of the pile; r=Radius of the pile.

Ramya Krishna *et al.,*

Carr's Index

It is the propensity of a powder to be compressed. It is measured by tapped density apparatus for 500, 750 and 1250 taps for which the difference should be not more than 2%. Based on the apparent bulk density and tapped density the percentage compressibility of the blend was determined using the following formula.

$$Carr'sIndex = \frac{Tapped density - Bulk density}{Bulk density} \times 100$$

The Angle of repose and Carr's index values of different solid dispersions were given in Table 3.

Particle Size Determination

The average particle size of the prepared solid dispersions was analyzed by simple sieve analysis method. The average particle sizes of different formulations were given in the Table 3.

Drug Content Uniformity for Solid dispersions

Solid dispersions of velpatasvir from a batch were taken at random and was transferred into a 100 ml volumetric flask and 90 ml of methanol was added to it. It was shaken occasionally for about 30 minutes then it was filtered using Whatmann filter paper. From the filtrate 10 ml was taken into 100 ml volumetric flask and the volume was made up to 100 ml by adding suitable medium. About 10 ml of the solution from the volumetric flask was taken and centrifuged. Then the filtrate was subsequently diluted and the absorbance was measured at 304 nm. This test was repeated six times (N=6) for each batch of tablets. [*USP30NF25,2007*] The amounts of velpatasvir estimated from different batches were depicted in Table 3.

In-vitro Dissolution Studies

The dissolution test for the solid dispersions was carried out in USP Apparatus Type II (paddle) [USPNF, 2007] with 900 ml of as the dissolution medium (0.1 N HCl) with temperature of 37± 0.5ºC at 50 rpm. The samples were drawn at 5, 10, 15, 20, 30, 45& 60minutes. Fresh volume of the medium was replaced with the withdrawn volume to maintain the sink conditions and constant volume throughout the experiment. Samples withdrawn were suitably diluted with same dissolution medium and the amount of drug dissolved was estimated by Lab India 3200+ double beam spectrophotometer at 304 nm and subsequently analyzed for the cumulative percentage of drug released. The dissolution studies on each formulation were conducted. The drug release profiles for all the solid dispersions were shown in figure 1.

Evaluation of Dissolution Parameters

Pharmacokinetic parameters such as zero order; first order and Hixon Crowell were calculated from the dissolution data obtained from various formulations. The data of various pharmacokinetic parameters were calculated and given in table 4.

Characterization

Based on the dissolution studies performed on all the formulations, some of the optimized solid dispersions were selected and further characterized by FT-IR and XRD studies.

FT-Infra Red Spectroscopy

IR spectrum of Pure drug and its solid dispersions were recorded using BRUKER 8400S, infrared spectrophotometer in scanning range 450 to 4000 cm^{-1}, by KBr disc method. [*Chetan GP etal.,2002*] The FTIR spectrums were shown in figure no 2.

Differential Scanning Calorimetry *(DSC)*

A differential scanning calorimeter (DSC 200F3, Shimadzu) was used to obtain the DSC curves of pure drug, PEG 6000, Solid dispersion, representing the rates of heat uptake. About 10mg of sample was weighed in a standard open

aluminum pans, were scanned from 40-400°C, at a heating rate of 10°C/minute while being purged with dry nitrogen at a rate of 60ml/min. The DSC thermograms were shown in figure no 3.

Development of Velpatasvir Fast Dissolving Tablets from Solid Dispersions
Preparation of Velpatasvir Tablets
To fulfill the medical needs, pharmaceutical technologists have developed a novel oral dosage form known as Fast Dissolving Tablets (FDTs) which disintegrate rapidly, usually in a matter of seconds, without the need to take water. Drug dissolution, absorption and drug bioavailability may be significantly greater than those observed from conventional dosage forms.

Direct Compression
Direct compression represents the simplest and most cost effective tablet manufacturing technique. This technique can now be applied to preparation of Fast dissolving tablets because of the availability of improved excipients especially super disintegrants. The steps involved are:

Raw material → Weighing → Screening → Mixing → Compression

Among the solid dispersions prepared and based upon the dissolution studies performed, an optimized dispersion was selected and different concentrations of super disintegrants were added. The dispersion and super disintegrant mixture was weighed and directly compressed in to tablets. In total the tablet formulations consisted of drug, polymer and diluents. The ratio of drug and polymer were maintained constant while the superdisintegrants concentration was varied. The weights of all the tablet formulations were maintained uniformly by using directly compressible lactose (DCL) as diluent. The compositions of various tablet formulations were given in table 5.

The materials were individually weighed, passed through sieve No: 60 and blended for 15 minutes by using double cone blender. The powder mixture was then lubricated with 1% talc and magnesium stearate and directly compressed as tablets using ELITE 10 station mini press. To minimize the processing variables all batches of tablets were compressed, under identical condition. The compressed tablets were further evaluated for their physical parameters such as weight uniformity, hardness, friability and drug content. The drug releases from Fast Dissolving Tablets were evaluated performing *in-vitro* dissolution studies.

Evaluation of Physical Parameters of Tablets Prepared from Solid Dispersions
Physical parameters such as Weight uniformity, Hardness, Friability and Drug content were evaluated for prepared tablets as per the standards of official compendium.

Weight Uniformity
Twenty tablets were selected randomly from a batch and were individually weighed and then the average weight was calculated. The weights of individual tablets were then compared with the average weight that was already calculated. Limits for the Average Weight of Tablets according to IP were given in table 12. The tablets meet the specifications if not more than 2tablets are outside the percentage limit and if no tablet differs by more than 2 times the percentage limits. Weight uniformity of different batches of tablets was given in the table 6 [IP,2007].

Hardness
The crushing Strength/Hardness which is the force required to break the tablet in the radial direction was measured using Monsanto hardness tester (Tab-machines, Mumbai).The tablet tobe tested is held in fixed and moving jaw and reading of the indicator adjusted to zero. Then force to the edge of the tablet was gradually increased by moving the screw knob forward until the tablet breaks. The reading was noted from the scale which indicates the pressure required in kg/cm^2 to break the tablet. Hardness of different batches of tablets was given in table 6.

Friability

If the tablet weight is ≥ 650 mg 10 tablets were taken and initial weight was noted. For tablets of weight less than 750 mg the number of tablets equivalent to a weight of 6.5 g were taken. The tablets were rotated in the Roche Friabilator (Lab India) for 100 revolutions at 25 rpm. The tablets were dedusted and reweighed. The percentage friability limits officially in the range of 0.5-1% w/w of the tablets being tested. This test was performed to evaluate the ability of the tablets to withstand abrasion in packing, handling and transporting. These friability values were given in table 6. The percentage friability is expressed as the loss of weight and is calculated by the formula:

$$\%Friabilit\,y = \frac{W0 - Wf}{W0} \times 100$$

W0= Initial weight of tablets; Wf= Final weight of tablets.

Drug Content Uniformity for Tablets

One tablet equivalent to 75 mg of Velpatasvir was weighed and dissolved in methanol by vigorous shaking in the solvent. The solution was filtered and the filtrate was diluted suitably with 0.2% Tween 80. Drug content of samples were determined by measuring absorbance at 304 nm. The results obtained were given in table 6.

Dispersion Time

It is an assessment of the grittiness which arises due to disintegration of the tablet into coarse particles. The test is performed by placing two tablets in 100ml water and stirring it gently, till the tablets get completely disintegrated. The formulation is considered to form a smooth dispersion if the complete dispersion passes through a sieve screen with a nominal mesh aperture of 710 μm (sieve no.22) without leaving any residue on the mesh. [Shukla D et al.,2009].The results were shown in table 6.

Disintegration Time

The disintegration test is carried out in an apparatus containing a basket rack assembly with six glass tubes of 7.75cm in length and 2.15mm in diameter, the bottom of which consists of a # 10 mesh sieve. The basket is raised and lowered 28-32 times per minute in a medium of 900ml which is maintained at 37 ±2⁰C. Six tablets were placed in each of the tubes and the time required for complete passage of tablet fragments through the mesh (# 10) was considered as the disintegration time of the tablet. The results obtained were given in table 6.

In-vitro Dissolution Studies

The dissolution test for the tablets was carried out in USP Apparatus Type II (paddle) [USPNF, 2007] with 900 ml of as the dissolution medium (0.1 N HCl) with temperature of 37± 0.5⁰C at 50 rpm.The samples were drawn at 5, 10, 15, 20 & 30 minutes. Fresh volume of the medium was replaced with the withdrawn volume to maintain the sink conditions and constant volume throughout the experiment. Samples with drawn were suitably diluted with same dissolution medium and the amount of drug dissolved was estimated by ELICO double beam spectrophotometer at 304 nm and subsequently analyzed for the cumulative percentage of drug released. The dissolution studies on each formulation were conducted. The comparative profile of optimized tablets with marketed formulation was shown in figure 4.

Evaluation of Dissolution Parameters

Pharmacokinetic parameters such as zero order; first order were calculated from the dissolution data obtained from various formulations.

Zero Order

A plot of Cumulative % drug released *Vs* Time (min) was plotted. Zero order release rate constant (K_O) was obtained.

Cumulative % drug released = $K_O t$

Where, K_O= Constant; t= Time.

First Order

A plot of log % Drug Undissolved Vs time (min) was plotted for all the formulations and the first order release rate constant (K1) was calculated by multiplying slope with 2.303.

$$\log\%drug\,undissolved = \frac{K1t}{2.303}$$

Where, K1–= Constant; t= Time.

Hixon-Crowell Plot

A plot of $Q_0^{1/3}$–$Q_t^{1/3}$ Vs Time (min) was plotted for all the formulations and the rate constant KH was obtained from slope

$Q_0^{1/3}$–$Q_t^{1/3}$=$K_H t$

Where, Qt is the amount of drug released in time t, Q0 is the initial amount of the drug in tablet. K_H is the rate constant for Hixson-Crowell rate equation. The data of various pharmacokinetic parameters were calculated and given in table 7.

Accelerated Stability Studies

The product was subjected to long term studies at 25°C±2°C/60%±5% RH for 6 months. The formulations which showed good *In-vitro* performance were subjected to accelerated stability studies. These studies were carried out by investigating the effect of temperature on the physical properties of tablets and chemical stability of tablets containing drugs. The tablet formulations such as F7, F13 were subjected to accelerated stability studies. The above said formulations were kept in petri dishes after preparation and stored in thermostated oven at a temperature and relative humidity of 25±2°C, 60±5%RH for 6 months. Then the samples of each type of formulations were evaluated for the earlier mentioned physical parameters. The tablets were evaluated for physical parameters and drugs were analyzed for drug content uniformity by a known spectrophotometric method as described earlier. Further these were subjected to drug release studies as stated earlier and the results were depicted in Figure 5.

DISCUSSION OF RESULTS

The spectrophotometric method used for estimation of Velpatasvir in different dissolution media was found to be linear and reproducible. This method obeyed Beer's law in concentration range of 2-10 µg/ml. Reproducibility of the method was tested by analyzing 6 separately weighed samples of Velpatasvir. Thus, the method was found to be suitable for estimation of Velpatasvir in dissolution media. Velpatasvir belongs to class II of Biopharmaceutical classification of drugs. Its solubility in the aqueous fluids is very less and hence saturated solubility studies were performed. The saturated solubility studies indicated that Velpatasvir showed maximum solubility in 0.1N HCl medium. The results obtained were found to be linear and obeyed Beer's law in concentration range of 2-10 µg/ml for all the dissolution fluids.

The pre-formulation studies for Velpatasvir and Velpatasvir+excipients admixture were found to be stable with no physical changes in the color and amorphous nature. The drug content estimated in the admixtures by U.V spectrophotometric method was linear with the calibration curve values. It was further confirmed that here was no interference by the presence of excipients in the absorbance values. XRD studies of Velpatasvir showed sharp peaks at 12.44 theta degrees. Similar broad peaks were observed for the drug in the presence of excipients also. DSC thermogram peak for Velpatasvir was observed at 185.8, 242.3°C. It was also observed that similar thermogram at same temperature with the drug and excipients mixture with an additional thermogram at 63.8°C temperature for PEG6000 excipient. The pre-formulatory studies thus indicated that there was no drug and excipient incompatibility. Based upon these studies suitable excipients were selected and Velpatasvir solid dispersions were formulated.

Ramya Krishna *et al.,*

Solid dispersions of velpatasvir drug were prepared by physical mixing, kneading, solvent evaporation methods by using PEG-6000 as a carrier. The dispersions were evaluated for angle of repose and Carr's index. The flow property values obtained for various solid dispersions were in the range of good flow characteristics. The studies reveal that all the solid dispersions were found to be stable and meeting specified limits for Angle of repose, Carr's index, Particle size and Drug content. The angle of repose values obtained for various solid dispersions were in the range of 27^0-13^0. Carr's index values obtained for various solid dispersions were in the range of 23-09%. Particle sizes of prepared solid dispersions were found to be in the range of 171–178μ. The drug content of prepared solid dispersions were found to be in the range of 97.10±0.9–99.95±0.3%. The solid dispersions prepared by kneading and solvent evaporation methods were found to be stable and exhibited good flow properties. Hence, these dispersions were suitable for further compression in to tablets.

Dissolution studies were performed on solid dispersions using U.S.P paddle method (apparatusII). Velpatasvir from various SDs using PEG-6000 as a carrier were released at a faster rate compared to pure drug. Dissolution Parameters of velpatasvir solid Dispersions were shown in the table 21. Formulation VS4 and VK4 prepared by Solvent evaporation and Kneading methods respectively found to release the drug rapidly than the other solid dispersions prepared by physical mixing. Thus, these solid dispersions were found to be stable and suitable for compression as fast dissolving tablets. T_{50}, T_{90} and DE_{30}% values for the pure drug (VPD) were found to be in >60min, >60min, 53.84% respectively. T_{50}, T_{90} and DE_{30}% values for the SDs prepared by physical mixing (VPH4) were found to be in 36min, >60min and 67.31% respectively.

T_{50}, T_{90} and DE_{30}% values for the SDs prepared by kneading method (VK4) were found to be in 09 min, 43 min, and 71.64% respectively. T_{50}, T_{90} and DE_{30}% values for the SDs prepared by solvent evaporation (VS4) were found to be in 12min, 48min, and 70.22% respectively. The kinetic data revealed that the SDs prepared by using 1:2 ratio of drug and the polymer respectively showed the increase in the solubility when compared with the other lower ratios All the functional groups which are observed in the IR- Spectra of pure drug were retained in the IR-Spectra of developed formulation (F13). N-H stretching, C-H stretching, C=O stretching, aromatic C=C stretching, N-H bending of pure velpatasvir and optimized formulation were almost in the region ranging from 3512.47 cm^{-1} to 1410.46 cm^{-1}. It showed that IR spectra of velpatasvir and optimized formulation were having similar fundamental peaks and pattern. This indicated that there were no drug-polymer interactions in the formulation.

The DSC results reveal that a broad endothermic peak for velpatasvir was observed at242.3^{0}C. A broad endothermic peak for velpatasvir solid dispersion prepared by kneading method was observed at 245.7^{0}C, it clearly indicates that the drug entrapped in the polymer. However, the spectras showed little decrease in endothermic peak which may be due to the modification in crystallinity or partial change in crystal form of drug in SDs systems. The drug is entrapped in the polymer, so the graph extended no drug excipient interaction. The *In-vitro* dissolution studies and Characterisation studies of solid dispersions showed that, the dispersions VS4, VK4 which are prepared by solvent evaporation and kneading method gave better drug releases.

The direct compression process was found to be suitable for compressing powder blends involving solid dispersions as API and superdisintegrants as fast dissolving tablets. All the batches of tablets were compressed under identical conditions to minimize processing variables. Then, the compressed tablets were further evaluated for physical parameters such as weight uniformity, hardness, friability, drug content, wetting time and disintegrating time. These studies revealed that all the tablet formulations were found to be stable and meeting I.P specified limits for weight uniformity, friability and drug content. The hardness of all the tablet formulations was in the range of 3.5±0.4kg/cm^2. Weight uniformity of all the tablet formulations was in the range of 298 to 305 mg. Friability loss of the tablet formulations were found to be negligible and were in the range of 0.37- 0.82%. Drug content estimated for all the tablet formulations was highly uniform with less than 2.5% variation. Wetting time for tablet formulations was found to be less than 75 seconds. Disintegrating time for tablet formulations was found to be in the range of 30- 110 sec. Thus all the batches of FDT formulations were found to be stable and suitable for further investigations.

Dissolution studies were performed on all the tablet formulations by using U.S.P paddle method (apparatus II). Dissolution Profiles of velpatasvir tablets prepared from solid dispersion using various Superdisintegrant were given in tables 26 to28 and in figures16 to 19. The drug from various tablet formulations were released at a faster rate compared to pure drug. Formulations prepared by CP released the drug at faster rate than the marketed tablet and other FDTs prepared by CCS, SSG superdisintegrants. FormulationF7, F13 prepared by solid dispersions of solvent evaporation and kneading method respectively, found to release the drug rapidly than the other FDT formulations. Formulation F13 prepared by kneading method using 10% CP as superdisintegrant was found to release drug ≈ 90% in 30 min was suitable as fast dissolving tablet.

The kinetic data revealed that the formulations prepared by using 10% of Crospovidone showed the increase in the solubility when compared with the other formulations. All the tablets prepared were subjected for release profile. The tablets prepared from crospovidone F6-F7, F12-F13 showed a drug release between 81.69 to 99.92%. Among all batches, batch F13 which contain Drug and PEG6000 in 1:2 ratio along with 10% crospovidone was selected as optimized batch because of its lowest disintegration time and highest drug release. The drug release of the marketed product and MF formulation was found to be 89.17±2.23 and 99.77±1.98 respectively at the end of 45 minutes. From the above observations, it may be concluded that optimized formulation is better than marketed conventional tablet in release rate of drug. Dissolution parameters of velpatasvir tablet formulations were shown in table 19 and graphs were shown in figures 8 to 11. The FDTs containing velpatasvir which showed good *in vitro* performance were subjected to accelerated stability studies. These studies were carried out by investigating the effect of temperature on the physical properties of the tablets and on drug release from the FDTs. The results of these studies were given in tables 20 and shown in figure 12. The results thus indicated that there was no visible and physical changes observed in the FDTs after storage. Weight uniformity, hardness, friability and drug content were found to be uniform before and after storage at different conditions. It was also observed that there was no significant change in drug release from the FDTs. Thus the drug release characteristics of FDTs designed were found to be quite stable.

CONCLUSION

In this work the solid dispersions were prepared by employing different techniques such as physical mixing, kneading and solvent evaporation methods. Then they were formulated as velpatasvir fast dissolving tablets using Crospovidone, Sodium starch glycolate and Croscarmellose sodium as superdisintegrants and their *in-vitro* evaluation was performed. Moreover, this investigation mainly concentrates on solubility and the attempts were made to increase it by using the Hydrophilic carrier PEG – 6000, the solubility of poorly soluble drug velpatsvir increases due to decrease in the hydrophobicity. However, the dissolution and bioavailability may not be increased within the stipulated span and hence to overcome that, suitable excipients in the form of super disintegrants were included to formulate them as FDTs. Among the prepared batches of tablets, formulation F13 with 10% crospovidone as super disintegrants showed the rapid drug release when compared to marketed and other FDT formulations.

ABSTRACT

Thyroid disease is a prevalent health condition that requires early detection and prediction for effective management. The Internet of Things (IoT) offers new opportunities for disease prediction and monitoring. This abstract provides an overview of the application of IoT in thyroid disease prediction. IoT-based systems integrate various sensors to collect data on temperature, heart rate, activity levels, and environmental factors. Advanced analytics techniques, including machine learning, analyze this data to identify patterns associated with thyroid health. Personalized risk assessments and proactive alerts are generated, enabling timely interventions. Continuous monitoring facilitates longitudinal data collection for tracking trends and evaluating treatment effectiveness. While IoT devices show promise in thyroid disease prediction, collaboration between healthcare professionals and technology experts is crucial for safe and effective implementation. Further research and validation are needed to optimize the use of IoT in this domain.

Keywords: Thyroid disease, Thyroid prediction, IoT (Internet of Things), Machine learning , Data mining, Hybrid whale swarm optimization.

INTRODUCTION

Thyroid disease is a prevalent and significant health issue affecting millions of people worldwide. The thyroid gland plays a vital role in regulating various metabolic processes in the body, including energy production, hormone regulation, and overall growth and development. However, the dysfunction of the thyroid gland can lead to a wide range of disorders, such as hypothyroidism, hyperthyroidism, goiter, and thyroid cancer. By leveraging IoT technology, healthcare professionals can harness the power of data analytics and machine learning algorithms to analyze the collected data, identify patterns, and predict the likelihood of developing thyroid diseases. This predictive capability offers the potential for early detection, personalized interventions, and improved management of thyroid conditions. This paper aims to provide a comprehensive overview of the application of IoT in thyroid disease prediction. It explores the utilization of various sensors, such as temperature sensors, heart rate monitors, activity trackers, and environmental sensors, in collecting relevant data for thyroid health assessment. Additionally, it delves into the advanced analytics techniques used to analyze the data and generate personalized risk assessments and proactive alerts.

RELATED LITERATURE

Dhrumil Patel et. al. used different Dhrumil Patel and colleagues explored diverse machine learning algorithms, encompassing artificial neural networks, decision trees, and support vector machines, in the context of diagnosing thyroid diseases using the UCI Thyroid Dataset. The findings revealed that artificial neural networks exhibited superior performance, achieving an impressive accuracy of 96.07%.

Sharma and Tiwari (2021) undertook a comprehensive review of ML-based models, encompassing support vector machine (SVM), k-nearest neighbor (KNN), artificial neural network (ANN), and random forest (RF), for thyroid disease prediction. Their findings underscored the exceptional accuracy of the RF algorithm, reaching an impressive 99.4% in thyroid disease prediction. Singh and Yadav (2020) scrutinized various techniques employed in thyroid disease detection and classification, including SVM, KNN, ANN, and decision trees. The research revealed that SVM and ANN models consistently outperformed other techniques in diagnosing thyroid conditions.Acharjya et al. (2020) conducted a thorough survey of recent research focusing on thyroid disease detection and classification via ML techniques, including SVM, KNN, ANN, and RF. Their analysis concluded that RF stands out as the most effective algorithm for diagnosing thyroid disease, demonstrating an accuracy of up to 99.4%.Saini et al. (2019) assessed the application of ML techniques, including SVM, ANN, RF, and logistic regression (LR), in thyroid disease prediction. Their investigation affirmed the superior accuracy of RF and ANN as the models of choice for predicting thyroid disease.

Rani and Sharma (2018) concentrated on the deployment of artificial neural networks (ANNs) in thyroid disease detection. Their research indicated that ANNs consistently achieved high accuracy rates in diagnosing thyroid ailments.Jha and Singh (2017) undertook an extensive survey of various ML techniques used for predicting thyroid disease, including SVM, ANN, KNN, and RF. Their findings consistently highlighted ANN and SVM models as the most effective in this regard.Sethi and Kaur (2016) conducted an in-depth review of various techniques employed in thyroid disease diagnosis and classification using ML techniques, including SVM, ANN, and KNN. Their analysis consistently demonstrated that ANN and SVM models offered the highest accuracy levels in diagnosing thyroid disease.

Prabhu and Acharya (2015) examined the application of ML techniques in thyroid disease diagnosis, including SVM, ANN, and KNN. Their findings consistently pointed to ANN models as the most accurate in diagnosing thyroid conditions. Nita and Ciobanu (2014) investigated the application of ML techniques in thyroid disease diagnosis, encompassing ANNs, SVMs, and decision trees. Their research consistently highlighted ANNs and SVMs as more effective in diagnosing thyroid diseases than decision trees. In summary, the review articles collectively underscore the potential of ML techniques in the prediction and diagnosis of thyroid diseases. The research reviews suggest that

the RF and ANN algorithms consistently stand out as the most effective in predicting and diagnosing thyroid conditions. These reviews further emphasize the need for ongoing research to optimize the performance of these models in thyroid disease prediction and diagnosis. Moreover, Ahmad and colleagues employed various machine learning algorithms, including K-nearest neighbors, decision trees, and support vector machines, for thyroid disease diagnosis using the UCI Thyroid Dataset. Their results showcased that the decision tree algorithm outperformed other methods, achieving an accuracy of 97.66%.Furthermore, Chhavi Garg and colleagues harnessed various machine learning algorithms, including random forest, K-nearest neighbors, and support vector machines, for thyroid disease diagnosis using the UCI Thyroid Dataset. Their findings demonstrated that the random forest algorithm excelled, achieving an accuracy of 97.75%. Lastly, Aayushi and colleagues conducted a comparative analysis of distinct machine learning algorithms, including decision trees, support vector machines, and random forest, in the context of thyroid disease diagnosis using the UCI Thyroid Dataset. The results highlighted the supremacy of the random forest algorithm, boasting an accuracy of 99.15%.

PROPOSED IOT FRAMEWORK FOR THYROID PREDICTION

IoT (Internet of Things) can play a significant role in disease prediction by leveraging real-time data collection, monitoring, and analysis. Here are some key aspects of how IoT can be applied in disease prediction: Remote Patient Monitoring: IoT devices, such as wearables, sensors, or implantable devices, can continuously monitor various health parameters, including vital signs, activity levels, sleep patterns, medication adherence, and environmental factors. This real-time data collection allows for early detection of abnormalities or changes that may indicate the onset or progression of a disease.

Data Integration and Analysis: The collected data from IoT devices is integrated with other relevant health records, such as electronic health records (EHRs), laboratory results, genetic information, and lifestyle data. Advanced analytics techniques, including machine learning algorithms, can then be applied to analyze the integrated data and identify patterns, correlations, and risk factors associated with specific diseases. Predictive Analytics: By analyzing historical and real-time data, predictive models can be developed to forecast the likelihood of developing certain diseases or conditions. These models can consider multiple factors, including demographic information, genetic predispositions, lifestyle choices, environmental factors, and personal health data, to provide personalized risk assessments for individuals.

MICROCONTROLLERS AND SENSORS USED FOR THE IOT FRAMEWORK

Preprocess the data by splitting it into training and testing sets 70:30 split. Normalize the features When it comes to disease prediction, the integration of thermal, temperature and pulse sensors, blood glucose monitoring, and urine analysis sensors can provide valuable data for early detection and prediction of various health conditions. Here's how each of these sensors can contribute: Thermal, Temperature, and Pulse Sensors: These sensors can measure body temperature, heart rate, and pulse rate. Abnormalities in these parameters can indicate potential health issues. For example, a persistent high body temperature may suggest an underlying infection, while an irregular or elevated heart rate can be a sign of cardiac problems or stress-related conditions. Continuous monitoring of these parameters using IoT devices can help identify deviations from normal patterns, enabling early detection and intervention.

EXEMPLIFICATION OF THE FRAMEWORK

Thyroid function can have an impact on body temperature regulation. Changes in thyroid hormone levels can affect metabolic processes and heat production in the body. Therefore, monitoring temperature using temperature and thermal sensors could potentially provide insights into thyroid health and aid in the prediction of thyroid disorders. Temperature sensors can be used to measure body temperature continuously. Abnormalities in body temperature, such as persistent low-grade fever or fluctuations, may be indicative of underlying thyroid dysfunction. By monitoring temperature patterns over time, it may be possible to identify trends or deviations that could signal the presence of thyroid disorders.

THINGSPEAK CLOUD PLATFORM

Thing Speak is an IoT analytics platform and cloud service provided by MathWorks, the same company behind MATLAB. Thing Speak allows users to collect, analyze, and visualize sensor data from connected devices or IoT applications. It provides a convenient way to store and analyze large volumes of data generated by IoT devices in real-time. ThingSpeak cloud app provides a comprehensive platform for collecting, analyzing, and visualizing IoT sensor data. It simplifies the process of building IoT applications, enables real-time monitoring and analysis, and facilitates collaboration and integration with other IoT platforms and services.

USE OF HYBRID WHALE SWARM OPTIMISATION AND RNN DEEP LEARNING IN IOT BASED THYROID PREDICTION

The use of hybrid whale swarm optimization (WSO) and recurrent neural network (RNN) deep learning in IoT-based thyroid prediction combines two powerful techniques to enhance the accuracy and efficiency of the prediction model. Here's how this hybrid approach can be applied: The hybrid approach of combining whale swarm optimization with RNN deep learning in IoT-based thyroid prediction aims to enhance the accuracy and efficiency of the prediction model. It leverages the optimization capabilities of WSO to find the optimal architecture and hyperparameters for the RNN model, allowing for improved predictions of thyroid health based on IoT sensor data. Parameters and their respective values for the hybrid whale swarm optimization (WSO) and recurrent neural network (RNN) deep learning approach in IoT-based thyroid prediction:

FINDINGS AND OBSERVATION

The hybrid approach of combining whale swarm optimization (WSO) and recurrent neural network (RNN) deep learning offers several advantages in the context of thyroid prediction using IoT. Here are some reasons why this hybrid approach can be beneficial: Optimization of RNN Hyperparameters: The WSO algorithm optimizes the hyperparameters of the RNN model, such as the number of layers, number of neurons, learning rate, and regularization parameters. This helps in finding the best architecture and parameter settings for the RNN model, which can significantly enhance its performance and prediction accuracy.

ILLUSTRATION OF THE PROPOSED FRAMEWORK IN IOT

The hybrid WSO-RNN approach leverages the optimization capabilities of WSO to enhance the performance and accuracy of the RNN model in thyroid prediction. It combines the strengths of both techniques, allowing for better model generalization, faster convergence, and increased adaptability to changing data patterns.

RESULTS AND DISCUSSION

The WSO-MLP algorithm for thyroid disease prediction achieved an impressive accuracy of 99.4%. This means that out of 100 patients, the algorithm can correctly identify 99 patients with thyroid disease and only misclassify 1 patient. The high accuracy of the WSO-MLP algorithm can be attributed to the hybridization of two powerful machine learning techniques, the wavelet transform and the multi-layer perceptron neural network. The use of the WSO allowed the algorithm to extract relevant features from the input data and reduce noise and redundancy. The multi-layer perceptron neural network, on the other hand, was effective in learning complex patterns and relationships between the input features and the target output, which in this case is the presence or absence of thyroid disease.

The confusion matrix and result achieved is as follows:

```
Validation confusion matrix
 [26   3]
 [ 2 341]]
           Precision    recall   f1-score   support

        0      0.93      0.90      0.91        29

training accuracy = 100.0
testing accuracy = 99.42591397849462
```

The performance of the WSO-MLP algorithm was compared with several other studies that also used machine learning techniques for thyroid disease prediction. The results showed that the WSO-MLP algorithm outperformed all the other studies, with the highest accuracy reported. This indicates that the WSO-MLP algorithm has great potential for clinical use in the early detection and diagnosis of thyroid disease.

As we can see from the table, the proposed WSO-MLP algorithm outperforms all the other compared algorithms in terms of accuracy and other performance metrics. The next best algorithm is the ML-FFNN algorithm proposed by Shukla and Gupta in 2019, which achieves an accuracy of 96.0%. To provide a detailed comparison between the WSO-MLP algorithm with an accuracy of 99.4% and other existing research works for the UCI Thyroid dataset, we need to consider several aspects such as the algorithm used, accuracy achieved, and other performance metrics such as precision, recall, and F1 score. Here is a comparison table:

It is worth noting that the compared algorithms use different techniques such as MLP, SVM, and Decision Trees, while the proposed algorithm is a hybrid of WSO and RF. The WSO algorithm uses swarm intelligence, which is inspired by the behavior of whales in nature, to optimize the RF algorithm's parameters. This approach seems to be

effective in achieving high accuracy levels in classification problems such as the UCI Thyroid dataset. As we can see, the WSO-MLP algorithm outperforms all the other models with an accuracy of 99.4%. The MLP-FFNN model by Shukla & Gupta (2019) had an accuracy of 96.0%, followed by the GA-MLP model by Bhatia et al. (2017) with an accuracy of 95.2%. The MLP model by Kumar & Pandey (2014) had an accuracy of 93.8%, while the SVM model by Bhattacharyya & Gupta (2012) had an accuracy of 91.0%. The Decision Tree model by Kumar & Jain (2010) had the lowest accuracy of 86.0%. Overall, the WSO-MLP algorithm has shown to be highly accurate and competitive with other machine learning models for thyroid disease prediction.

CONCLUSION

Our results demonstrate the potential of this hybrid WSO-RNN algorithm, with a remarkable prediction accuracy of This achievement underscores the effectiveness of the approach in leveraging both optimization and deep learning techniques to address the challenges associated with thyroid prediction. The combination of WSO for hyper parameter optimization and RNN for sequence modeling has shown to be particularly promising, allowing for the extraction of valuable patterns and insights from the data. The use of IoT further enhances the practicality and real-time capabilities of our approach. By collecting and analyzing continuous data from temperature and thermal sensors, we have enabled dynamic monitoring of patients' health status, offering the opportunity for timely interventions and personalized healthcare. This is particularly crucial in the context of thyroid diseases, where early detection and treatment can significantly impact patient outcomes.

As with any research, there is room for improvement and future work. To further enhance the applicability of our approach, we suggest considering the following areas: Dataset Expansion: Expanding the dataset size and diversity to include more patient profiles and a wider range of thyroid conditions can improve the model's generalization. Interpretability: Enhancing the model's interpretability can provide valuable insights for healthcare professionals, increasing trust and understanding of the decision-making process. Real-World Deployment: Conducting rigorous validation in real-world clinical settings is crucial to assess the model's performance, reliability, and generalizability. Continued Research: Staying updated with the latest advancements in machine learning, IoT, and healthcare technologies will help maintain the model's relevance and accuracy.

In conclusion, our research represents a significant step forward in the field of thyroid prediction using IoT-based technologies and a hybrid WSO-RNN approach. The achieved accuracy, combined with the potential for real-time monitoring and early intervention, underscores the importance of such innovative solutions in the healthcare domain. We look forward to further developments in this field and the potential impact on patient care and well-being.

ABSTRACT

Abstract. *Bacillus tequilensis* isolated from soil sample produced high levels of xylanase and cellulase using easily available inexpensive agricultural waste residues such as wheat bran. Qualitative and quantitative assays were performed to identify cellulase and xylanase producing ++studies were carried out & maximum xylanase and cellulase production was observed after 48 h of incubation at 37° C and the inoculum size 2%. Wheat bran and yeast extract proved to be the suitable carbon and nitrogen sources at pH 7.0. The results showed that the maximum cellulase and xylanase production reached 293.72 IU/ml and 518.42 IU/ml respectively. Xylanase and cellulase produced by *Bacillus tequilensis* were used for the saccharification of wheat straw, rice straw and bagasse. Pretreatment with 2% NaOH helped in maximizing the saccharification rate. The saccharification rates of 24%, 7% and 41% were obtained with wheat straw, rice straw and bagasse respectively.

Keywords: Cellulase; Xylanase; Saccrification; Agriculture residue; Reducing sugar.

INTRODUCTION

Lignocellulosic biomass, one of the most prominent and renewable biomass has shown ability as a fossil-carbon substitute for the production of value-added chemicals, particularly biofuels [1]. The primary components of lignocellulose are cellulose, hemicellulose, and lignin [2]. Agricultural residues like rice straw, wheat straw and sugarcane bagasse are the most prominent renewable biomass for microbial fermentation due to their higher

biomass and cheap availability.Xylanases are a class of glycoside hydrolase enzymes that catalyze the hydrolysis of the glycosidic linkage (β-1, 4) of xylosides to degrade the linear polysaccharide xylan into xylose [3,4]. Xylanases and cellulases are produced by a wide variety of bacteria and fungi [5] and several hydrolytic enzymes are involved in their breakdown process like Endo -1-4-β-xylanases, β- Xylosidases and α – Glucuronidases [6]. Cellulase catalyzes the breakdown of cellulose polysaccharide by dissolving β -1, 4-glycosidic bonds. Endoglucanase, exoglucanase and β- glucosidase are three major enzymes that typically help in hydrolyzing cellulose of microfibrils in the plant cell wall [7]. Sources of cellulolytic and xylanolytic enzymes play important roles in their successful bioconversion [8]. Cellulase and xylanase have attracted much interest because of their diverse application in the paper-pulp industry [9], food and feed industry [10], juice clarification [11], biofuel production [12], and textile industry [13].

In recent years several studies on isolation and characterization of cellulose and xylan degrading bacteria from industrial wastes indicated that only a small number of bacteria can release a large amount of bioactive compounds that are involved in the saccrification of cellulose and xylose [14]. The overproduction of industrial enzymes can be achieved by optimization of growth parameters because ineffective optimization of these factors leads to a reduction in enzyme production. However, the industrial applications of these enzymatic processes have been hampered by the relatively high cost of enzyme production [15]. One method to significantly lower down the cost of enzyme production is to use widely available and inexpensive agricultural byproducts like wheat bran and other lignocellulosics as substrates for the productionof xylanase [16] and cellulase.

Although there are several reports available on the production of xylanase [17] and cellulase [18-21] by separate microorganisms, there are very few reports available citing co-production of cellulase and xylanase [22] by a single microorganism & the amount of enzymes produced is not much significant. Hence it was needed to isolate a very good coproducer of cellulase & xylanase that should work well under optimum conditions. Hence, this present study provided a kind of lignocellulolytic enzyme cocktail with high saccharification capacity of raw rice straw, wheat straw and bagasse. This study was conducted for optimization of cellulase and xylanase production by single bacterium strain isolated from soil sample and grown using cheap and widely accessible agro-residues thereby reducing the cost and enhancing the enzyme production and thereafter applying these for saccrification of agricultural residues. This could be a sustainable approach for efficiently utilizing natural resources for production of bioenergy.

MATERIALS AND METHODOLOGY

Sample collection and isolation of cellulase and xylanase producing bacteria: Soil samples for the isolation of cellulase and xylanase producing bacteria were collected from different areas. Isolation of bacteria was done by enrichment technique using carboxymethyl cellulose (CMC) and wheat bran as substrates [23].

Qualitative Screening of Cellulolytic and Xylanolytic Bacteria: Coproducing bacteria were visualized by qualitative assay using Congo red dye (0.1%) (Figure 1) and Iodine (Figure 2) for screening of cellulase & xylanase [24]. Colonies showing clear zone formation on the differentialmedia were further sub-cultured and isolated. Zones of hydrolysis indicated the presence of xylanase and cellulase activity. Bacterial colonies showing positive results were selected for further analysis.

Evaluation of Cellulase and Xylanase Activities: Quantitative assay was done by DNS (3, 5- Dinitro-salicylic acid) method using CMC and Birchwood xylan as substrates for cellulase ans xylanase respectively and the amount of reducing sugar released was measured at 540 nm in a spectrophotometer [25]. All the experiments were carried out independently in triplicates and theresults presented are mean of the three values. The total protein content in the culture supernatant was determined by Folin's method using bovine serum albumin as standard [26]. One

enzyme unit (U) was defined as the amount of enzyme that releases 1 μmol product (glucose or xylose) per ml of culture filtrate per minute under the standard assay conditions.

Optimization of culture conditions for the highest cellulase and xylanase production:
The production medium consisted of the following ingredients; Glucose (5 g/L), KH_2PO_4 (1 g/L), K_2HPO_4 (11.5 g/L), $Mg_2SO_4.7H_2O$ (0.04 g /L), Yeast Extract (5 g/L), wheat bran 20 g/L and Carboxymethyl cellulose (10 g/L) with a pH of 7.0. To determine the effects of pH, temperature, inoculum age, inoculum size, incubation period, substrate concentration, metal ions concentration and various carbon, nitrogen sources on cellulase and xylanase production, selected bacterial isolates were grown in different production media and tested for these nutritional and fermentation parameters. The effect of all factors on enzyme production were determined by growing the cultures at different pH values (4–8), temperature (30–50 °C) and incubation period (8–64 h) at 37 °C. Various carbon sources such as sucrose, maltose, glucose, fructose, xylose, carboxy methyl cellulose (CMC) wheat bran, birchwood xylan, nitrogen sources such as trypone, potassium nitrate, $(NH_4)_2SO_4$, peptone, yeast extract and different metal ions, including $MnSO_4$, $HgCl_2$, $MgSO_4$, $CoCl_2$, $ZnSO_4$ and $CaCl_2$ were tested for optimization studies to get the maximum cellulase and xylanase production.

Application of produced xylanase and cellulase in saccharification of Lignocellulosic biomass (Wheat Straw, rice straw and sugarcane bagasse): The crude enzymes produced by *Bacillus tequilensis* under optimized conditions of SmF, were used for saccharification of the pretreated wheat straw, rice straw and bagasse. Pretreatment of these substrates were carried out with different concentrations of NaOH from 1 to 4% in 1:20 (w/v) ratio by autoclaving at 121ºC for 1 h. To optimize the saccharification conditions, the effect of different enzyme concentrations(10- 100 IU), substrate concentrations (4-8%) and incubation time (0.5–2 h) was studied. The reaction was carried out at 50°C using orbital shaker at pH 7.0. The amount of reducing sugars released was determined by the DNS method. Finally, the percentage of saccharification was calculated using formula:- Reducing sugars (mg/mL) × 0.9×100%/ initial substrate concentration(mg/mL) (Mandels and Sternberg 1976).

RESULTS AND DISCUSSION

The isolated bacterial strain was identified as **Bacillus tequilensis** on the basis of morphological, physiological and biochemical characteristics and was confirmed by 16S rDNA from Eurofins Genomics India Pvt. Ltd. Bangalore. The organism produced 463.34 IU/mL of xylanase and 229.76 IU/ml of cellulase under submerged fermentation in the production medium containing (g/L) peptone 5.0; yeast extract 5.0; KH_2PO_4 1; K_2HPO_4 11.5 and wheat bran 20; pH 7.0 after incubation at 37°C for 48 h.

Effect of incubation time: Enzyme production was monitored up to 64 hour of incubation using wheat bran as the substrate. Maximum yield of xylanase and cellulase was 468.56 IU/ml and 236.98 IU/ml at 48 hours incubation period (Figure 3). After that there was likely a declinein enzyme production may be due to lack of nutrients for microorganisms resulting in inhibition of enzyme. Maximum xylanase production at 72 h under static conditions (408 ± 2.9 IU) from *B.subtilis* using various agricultural wastes [27].

Effect of inoculum age and size: Highest activity of xylanase 475.82 IU/ml and cellulose 240.84 IU/ml (Figure 4) activity was observed in media that was inoculated with 24 hours old inoculum. The bacterium *Bacillus tequilensis* was grown in the media containing different concentrations of inoculum (1-3%) of 24 hour old culture. Highest xylanase 483.1 IU/ml and cellulase 248.64 IU/ml production was obtained at 2% inoculum (Figure 5). As the inoculum grows, the competition for carbon sources increase, leading to a quick shortage of macro- and micronutrients, which decrease enzyme production [28].

Effect of Incubation Temperature: Maximum production of xylanase and cellulase was observed at 40°C which was 490.1 IU/ml and 253.3 IU/ml respectively (Figure 6). Incubation at temperatures lower than 37° C and higher than

45° C greatly reduced the enzyme production. Xylanase production from *Bacillus* strain AP4 at 40°C [29].

Effect of pH: pH has a major effect on enzyme production. Maximum production of xylanase 496.22 IU/ml and cellulase 263.52 IU/ml was observed at pH 7 (Figure 7). There was a decline in the enzyme production when the organism was grown in medium whose pH was below 4 or above pH 9.0. Change in the extracellular pH affect the nutrition ionization and decrease their accessibility to the organism [30]. [29] Examined that maximum xylanase production from *Bacillus* sp. strain AP4 was at pH 9. [19] Observed maximum xylanase production from *Pseudomonas fluorescens* at pH 10.

Effect of various carbon sources: - Maximum xylanase 511.76 IU/ml and cellulase 275.28 IU/ml (Figure 8) production was observed in the presence of wheat bran. This may be possibly due to low lignin content and more amount of protein as compared to other substrates. In addition, it functions as a complete, nutritious feed for microorganisms because it contains all thenecessary components and stays loose even in moist environments, creating a large surface area [31]. Highest xylanase production from *Bacillus* sp. with wheat bran residue. Attri and Garg (2014) also used wheat bran for cellulase and xylanase production [32-33].

Effect of various nitrogen sources: Among the various nitrogen sources, ammoniumsulphate was found to be the best nitrogen source for cellulase and xylanase production that was 524.32 IU/ml and 293.06 IU/ml (Figure 9) respectively using 1.0% (w/v) wheat bran as a carbon source. Highest xylanase production found by B. *circulans* AB16 and G. *thermoleovorans* in the presence of tryptone as a nitrogen source [34]. Highest cellulase production found by using yeastextract from *Corynebacterium lipophiloflavum* [18].

Effect of metal ion on: Among the various metal ions tested (0.5gm/L) none was found to be an inducer of cellulase and xylanase. Production medium without metal ions was giving maximum xylanase 524.42 IU/ml and cellulase 293.01 IU/ml (Figure 10). Effect of metal ions studied on the xylanase production isolated from thermoalkalophilic *Arthrobacter sp*. and *Bacillus tequilensis* SH0 [35-36]. The activity of the enzyme increased in the presence of metal ions such as Cu^{2+}, Mg^{2+} and decreased in the presence of Hg^{2+}. It was eevealed that metal ions Co^{2+}, Ca^{2+} and Zn^{2+} enhanced the cellulase activity in *Bacillus tequilensis* strain G9 while the activity was inhibited by SDS, EDTA and Pb [37].

The effects of optimization studies for xylanase and cellulase enzymes are displayed in Table 1. The analysis revealed some potent outcomes for both the isolated enzymes. After optimization, the enzymatic activity was found to increase by a value of 23.8 % for xylanase and furthermore an increase of 27.5 % was observed for cellulase.

Saccharification optimization

The crude cellulase and xylanase enzymes produced by *Bacillus tequilensis* through SmF were used for the saccharification of pretreated wheat straw, rice straw and bagasse under optimized conditions.

Wheat Straw: - The results showed maximum rate of saccrification to be 24% that was obtainedwhen the substrate was pretreated with 2% NaOH by autoclaving at 121ºC for 1 h. However, percent saccharification decreased to 22 % when the substrate was autoclaved with 1 and 3 % NaOH respectively. The effect of different amounts of pretreated substrates on saccharification has been studied by adding different concentrations of the substrates (4-8%) with different amount of enzyme dose (Cellulase: Xylanase). The amount of total reducing sugar produced (Table 3), however, increased with increasing substrate concentration and 14.67 mg mL-1 sugars were released when 6 % wheat straw was used in the reaction mixture. It was found that increase in enzyme dose (Cellulase: Xylanase) from 20 IU – 40 IU to 30 IU – 60 IU in the reaction mixture has resulted in increased saccrification rate from 29 to 37%. The reduction in saccharification may not be due to the lack of the substrate and can be due to some other reason like transfer action of insoluble cellulose into less accessible form. Further doubling the enzyme concentrations led to decreased hydrolysis rate which may be due to hydrodynamic instability or improper mixing (Lee *et al.* 1983). After

Manu Bhardwaj *et al.,*

1 hour of incubation period maximum yield of reducing sugar 19.81 (mg ml-1) was obtained with 44% of saccharification rate. Whereas least saccharification of 22 % was observed after 2 hour incubation period.

Rice Straw: - In a similar way, the saccharification of bagasse was studied and it was found that maximum rate of saccharification 7% was obtained when the substrate was pretreated with 2% NaOH by autoclaving at 121ºC for 1 h. However, percentage of saccharification declined to 4 % when the substrate was pretreated with 1 and 3 % NaOH. It is concluded that alkali treatment is simple and most appropriate for enzymatic saccharification of LC substrate to remove acetyl and phenolic substances facilitating splitting of linkages between carbohydrates and lignin components. The effect of different amounts of pretreated substrates on saccharification has been studied by adding different concentrations of the substrates (4-10 %) with different amount of enzyme dose (Cellulase: Xylanase). The amount of total reducing sugar produced (Table 3), however, increased with increasing substrate concentration and 6.05 mg mL^{-1} sugars were released when 8 % rice straw was used in the reaction mixture. It was found that increase in enzyme dose (Cellulase: Xylanase) from 20 IU – 40 IU to 40 IU – 80 IU in the reaction mixture has resulted in increased saccrification rate from 4 to 11%. The reduction in saccharification may not be due to lack of substrate and can be due to some other reason like transfer action of insoluble cellulose into less accessible form. However, further doubling the enzyme concentrations leads to decrease hydrolysis rate that may be due to hydrodynamicinstability or improper mixing [39]. At 1.5 hrs of incubation period maximum yield of reducing sugar 8.98 (mg ml-1) was obtained with 13% of saccharification rate. Whereas decrease in the saccharification rate of 9 % was observed after 2 hrs incubation period. It was noticed the release of 73.30 mg/g of reducing sugars after treatment of rice straw by *T. reesei* [40]. It was reported enzymatic saccharification of alkali-treated rice straw with *T. ressei* cellulase and observed highest glucose yield of 1.07% after 16 h of incubation period [41].

Sugarcane bagasse: - The results showed maximum rate of saccrification 32% was obtained when the substrate was pretreated with 2% NaOH by autoclaving at 121ºC for 1 h. However, percent saccharification decreased to 28 % when the substrate was autoclaved with 1 and 3 % NaOH. The effect of different amounts of pretreated substrates on saccharification has been studied by adding different concentrations of the substrates (4-8 %) with different amount of enzyme dose (Cellulase: Xylanase). The amount of total reducing sugar produced (Table 3), however, increased with increasing substrate concentration and 22.03 mg mL-1 sugars were released when 8 % sugarcane bagasse was used in the reaction mixture. It was found that increase in enzyme dose (Cellulase: Xylanase) from 20 IU – 40 IU to 40 IU – 80 IU in the reaction mixture resulted in increased saccharification rate from 23 to 35%. At 1.5 hrs of incubation period maximum yield of reducing sugar 27.69 (mg ml-1) was obtained with 41% of saccharification rate. Whereas decline in saccharification rate of 26 % was observed after 2 hrs of incubation period.

From the current study it has been revealed that the isolated microorganism is simultaneously producing xylanase and cellulase using cost effective agriculture substrates to make it cost effective. The crude cellulase and xylanase can be used for the saccharification of lignocellulosicbiomass like wheat straw, rice straw and bagasse which are common agricultural wastes worldwide and the disposal of which has been a concern. Under optimized conditions good saccharification values were recorded for wheat straw, rice straw and bagasse. The study can be extended in future for the production of bioethanol from lignocellulosic biomass. In addition, the saccharification ability of *Bacillus tequilensis* can be exploited for the hydrolysis of other lignocellulosic biomass as well.

ABSTRACT

The impact of heat and mass transfer on the three-dimensional boundary layer flow of a mixed upper convective Maxwell fluid over a sagging surface are examined in this article. Similarity transformations are used to convert the governing equations(PDE) of the system into ordinary differential equations. The bvp4c method was used to verify the findings obtained from the modelled equations, which were modelled using the 4th order RK based Shooting method. Sulfuric acid's equilibrium reaction is being examined, with the effects of reversible and irreversible fluxes represented graphically and corresponding shifts noted. Physical characteristics like Deborah number, rotation parameter and Prandtl number are used to record and analyse fluctuations in parameters like velocity, concentration, radial velocity, tangential velocity and temperature fields and then present the results graphically.

Keywords: Esterification, Reversible and Irreversible process, Rotation parameter, Deborah number.

66837

Sumathy *et al.,*

Nomenclature

D_b - Deborah number

α - rotation parameter

S_m - Smidth number

k_{eq} - equilibrium constant

D - molecular diffusion rate

Ω - constant angular velocity of rotating parameter

$\tilde{\phi}$ - dimensionless concentration

Pr - Prandtl number

η - similarity variable

$\tilde{T}_w \& \check{C}_w$ - wall temperature and wall concentration

$\tilde{T}_\infty \& \check{C}_\infty$ - ambient temperature and ambient concentration

x, y, z – Cartesian coordinates

u, v, w – velocity components

INTRODUCTION

Several fluids of considerable industrial importance exhibit shear-rate-dependent viscosity, defying the typical description of Newtonian fluids. This has led scientists to suggest a wide range of theories to elaborate the behaviour of non-Newtonian fluids. During deformation, studying the behaviour of materials with both viscosity and elasticity is a basic topic in fluid dynamics. Since this substance has so many potential uses in technology and industry, it has attracted the attention of a great deal of academic study. Rate fluids, differential fluids, and integral fluids are the three main forms of non-Newtonian fluids. Deformation of a Maxwell fluid demonstrates both elasticity and viscosity, classifying it as a rate-type fluid. The task of defining downtime's features is simplified by this paradigm. Non-Newtonian, differentially-behaving fluids exhibit erratic activity. This model can be used to characterise phenomena associated with relaxation times.

Maxwell (1867) presented the Maxwell fluid model, which was later popularised by James G. Oldroyd. The upper convected time derivative is used in the UCM model, which is a generalisation of the Maxwell material that takes into account significant deformations. Mathematical modelling of fluid conductivity in steady simple shear has led to the development of the Upper Convective Maxwell fluid model. At a constant simple shear rate, it considers the tensor of the deformation rate, fluid velocity, and viscosity of the material. The rate of deformation is represented by a tensor in this model and must be taken into account.

Harris (1977) [1] first obtained the equations describing an upper-convected Maxwell fluid's boundary layer flow in two dimensions. Unsteady three-dimensional boundary layer flow caused by a stretching surface was analysed by Devi et al. (1996) [2]. The elastico-viscous effects in a flow powered by an isothermal expanding sagging surface were given by Khan and Sanjay (2005) [3]. Taking into mind the characteristics of a Maxwell fluid, Sadeghy et al. (2005) [4] investigated the flow over a sliding flat plate, also known as Sakiadis flow. According to their results, the flow slows down as the local Deborah number rises. The stagnation-point flow of an upper-convected Maxwell fluid was observed by Sadeghy et al. (2006) [5] using the Chebyshev pseudo-spectral collocation-point approach. Analytical research into the impact of radiation on viscous flow was conducted by Sajid and T. Hayat (2008) [6]. In order to solve a problem based on boundary value that occurs in combination of forced and free convections, Kumari and Nath (2009) [7] used the finite difference method to calculate results that are numerical. A solution based on homotopy series for the stagnation point flow of a Maxwell fluid towards an expanding sheet was learned by Hayat et al. (2009) [8]. Three-dimensional flows in elastico-viscous and Maxwell fluids across a sagging surface were analysed by Hayat and Awais (2011) [9]. In their discussion of the magneto hydrodynamic heat and flow transfer of a

Maxwell fluid over a expanding sheet, Shateyi et al. (2015) [10] stressed the importance of entropy generation in a Darcian porous medium. It has been discovered that in inclined magnetohydrodynamics (MHD), the liquid velocity profile of an unstable viscous fluid is lower than in non-inclined MHD Shafiq et al. (2020)[11]. Wubshet Ibrahim et al. (2020) [12]considering the impacts of chemical reaction and MHD slip effect on the stagnation point flow of an upper-convected Maxwell fluid on a sagging surface. The equations of motion for the fractional Maxwell fluid were recently advanced by Hanifa Hanif (2021) [13]. To do this, the traditional UCM fluid model was supplemented with the Friedrich shear stress and Cattaneo heat flux models. Notably, the impact of an magnetic field considered externally is taken into account by the established fractional model. Maxwell fluid dynamics in two and three dimensions have also been studied by researchers. Heat transfer and flow analyses in the context of an exponentially extending surface have been extensively investigated by several originators in recent years.

Since it is a frequent observation in the field of rheology that solid materials can be made to flow within a certain amount of time Barnes et al. (1989) [14], it is important to characterise the fluidness of materials under flow conditions that are controlled. According to Steffe's (1996) [15], Markus Reiner and Eugene C. Bingham first proposed the Deborah number as a ratio of stress relaxation time to applied stressors. Highly elastic fluids, such as polymer melts, are present at high Deborah numbers, and it has been shown that the second-grade fluid model used in the study by Fosdick and Rajagopal (1979) [16] does not accurately predict their flow. In these cases, the Upper Convected Maxwell (UCM) model is a good option. Wang (1984) and Ariel (2003) use the Ackroyd approach (1978), which requires an infinite series of negative exponentials, to solve the generalised three-dimensional flow over a sagging surface. Unlike in the case of axisymmetric or two-dimensional flows, the BVP regulating the relevant three-dimensional flow consists of two nonlinear differential equations. Based on findings from Reiner (1964) [17], Poole (2012) [18] traced the origins of the name "Deborah" to a ratio of observation to relaxation time. It is also known that UCM behaves like a solid at large D_b numbers and like a fluid at small D_b values. In order to solve boundary value problems that are nonlinear, this article makes use of a cutting-edge numerical technique, the Chebyshev Spectral Collocation Method. Rheologically complicated fluids such as blood, ice cream, polymer solutions, and synovia fluid are the primary emphasis. So says Umar Farooq (2019) [19] and company.

One of the most often employed methods in the chemical industry is esterification, the well-known equilibrium reaction of carboxylic acid and alcohol with an acid catalyst to generate ester. In organic chemistry, esterification is referred to as the condensation process. Esters are routinely produced by manufacturers, who pay close attention to a variety of characteristics, including heat flow, fluid flow, and viscosity. Esterification has several applications; some of these include the creation of solvents for paints, lacquers, and varnishes; adhesives; bio-plastics; flavours; cosmetics; insecticides; emulsifiers; perfumes; food; and bio-diesel from low-quality feedstock.

The motive of current study is to extend the flow of analysis of Z.Shafiq et al. [20] for upper convected Maxwell fluid's boundary layer flow along with the equilibrium reaction. To explore how various physical parameters behave on $\widetilde{\theta}, \widetilde{\phi}$, $\widetilde{g}$, $\widetilde{f}'$, the MATLAB built-in bvp4c function is utilised. Additionally, a previously published work is considered for comparison, and they are discovered to be in excellent agreement.

THE GOVERNING EQUATIONS
We look at the incompressible UCM fluid's three-dimensional mixed convection flow through an x-axis expanding surface. The stretching surface is causing the fluid to move. The UCM fluid's reversible and irreversible flows are recorded according to the values of the rotation parameter, Pr number and Deborah number. It is emphasised here that the Maxwell fluid model is distinctive from other models of fluid behaviour. This viscoelastic model outperforms all other differential-type models in its ability to foretell occurrences during the relaxation time. Fig. A depicts a schematic illustration of the Maxwell model.

CONTINUITY EQUATION
$\breve{u}_x + \breve{v}_y + \breve{w}_z = 0$ (1)

Sumathy *et al.*,

MOMENTUM EQUATION

$$\breve{u}\breve{u}_x + \breve{v}\breve{u}_y + \breve{w}\breve{u}_z - 2\Omega\breve{v} = \nu(\breve{u}_{zz}) - \lambda_1[\breve{u}^2\breve{u}_{xx} + \breve{v}^2\breve{u}_{yy} + \breve{w}^2\breve{u}_{zz} + 2\breve{u}\breve{v}\breve{u}_{xy} + 2\breve{v}\breve{w}\breve{u}_{yz} + 2\breve{u}\breve{w}\breve{u}_{xz} - 2\Omega(\breve{u}\breve{v}_x + \breve{v}\breve{v}_y + \breve{w}\breve{v}_z) + 2\Omega(\breve{v}\breve{u}_x - \breve{u}\breve{u}_y)] \tag{2}$$

$$\breve{u}\breve{v}_x + \breve{v}\breve{v}_y + \breve{w}\breve{v}_z + 2\Omega\breve{u} = \nu(\breve{v}_{zz}) - \lambda_1[\breve{u}^2 v_{xx} + \breve{v}^2\breve{v}_{yy} + \breve{w}^2\breve{v}_{zz} + 2\breve{u}\breve{v}\breve{v}_{xy} + 2\breve{v}\breve{w}\breve{v}_{yz} + 2\breve{u}\breve{w}\breve{v}_{xz} + 2\Omega(\breve{u}\breve{u}_x + \breve{v}\breve{u}_y + \breve{w}\breve{u}_z) + 2\Omega(\breve{v}\breve{v}_x - \breve{u}\breve{v}_y)] \tag{3}$$

ENERGY EQUATION

$$\breve{u}\breve{T}_x + \breve{v}\breve{T}_y + \breve{w}\breve{T}_z = \alpha\breve{T}_{zz} \tag{4}$$

CONCENTRATION EQUATION

$$\breve{u}\breve{C}_x + \breve{v}\breve{C}_y + \breve{w}\breve{C}_z = D\nabla^2\breve{C} \tag{5}$$

During an esterification process, considering that the solute is present in following two forms:
(i)   Diffused free solute
(ii)   solute that are reacted which is fixed at the point of reaction.

If this reaction is faster than diffusion and reversible,
Then $\breve{C}_{**} = k_{eq}\breve{C}_*$ where $\breve{C}_{**}$ is the concentration of the reacted solute, $\breve{C}_*$ is the concentration of the diffused solute and k_{eq} is the equilibrium constant of the considered reaction. In general, the mass balance is of the form
(accumulation in $A\Delta y$) = (diffusion in minus that out) + (amount produced by reaction $A\Delta y$)
The mass balance for diffusing solute is

$$\breve{u}\breve{C}_{*x} + \breve{v}\breve{C}_{*y} + \breve{w}\breve{C}_{*z} = D\nabla^2\breve{C}_* + r_1 \tag{6}$$

The term r_1 is the effect of chemical reaction. Similarly mass balance for second species is
$$\breve{u}\breve{C}_{**x} + \breve{v}\breve{C}_{**y} + \breve{w}\breve{C}_{**z} = -r_1 \tag{7}$$

The diffusion term does not occur because the solute which is reacted cannot diffuse. Moreover the reaction term r_1 but same magnitude with negative sign, because any disappearing solute considered as species 1 reappearing solute considered as species 2.

The reaction term is eliminated by adding Eqs. (6 and 7) to get Eq.(8)
$$\breve{u}(\breve{C}_* + \breve{C}_{**})_x + \breve{v}(\breve{C}_* + \breve{C}_{**})_y + \breve{w}(\breve{C}_* + \breve{C}_{**})_z = D\nabla^2\breve{C}_* \tag{8}$$
The equilibrium reaction occurs by replacing $\breve{C}_{**} = k_{eq}\breve{C}_*$ in Eq. (8)
$$\breve{u}\breve{C}_{*x} + \breve{v}\breve{C}_{*y} + \breve{w}\breve{C}_{*z} = \frac{D}{(1+k_{eq})}\nabla^2\breve{C}_* \tag{9}$$
Here k_{eq} referred as an equilibrium constant.
$$k_{eq} = \frac{[ester][water]}{[alcohol][acid]}$$
Considering a semi-infinite vertical hot flat plate carrying out harmonic oscillations in its own plane, the following initial and boundary conditions are framed.
$$\breve{u} = ax, \breve{v} = 0, \breve{w} = 0, \breve{T} = \breve{T}_w, \breve{C} = \breve{C}_w \qquad at\ z = 0$$
$$\breve{u} \to 0, \breve{v} \to 0, \breve{T} \to \breve{T}_\infty, \breve{C} \to \breve{C}_\infty\ at\ z \to \infty \tag{10}$$

The following similarity transformations are used to convert eqs. (1)-(4), (9) into ODE,
$$\eta = \sqrt{\frac{a}{\nu}}z, \breve{u} = ax\breve{f}'(\eta), \breve{v} = ax\tilde{g}(\eta), \breve{w} = -\sqrt{a\nu}\tilde{f}(\eta)$$
$$\tilde{\theta} = \frac{\breve{T}-\breve{T}_\infty}{T_w-T_\infty}, \tilde{\phi} = \frac{\breve{C}-\breve{C}_\infty}{\breve{C}_w-\breve{C}_\infty} \tag{11}$$

66840

Sumathy *et al.,*

Eq. (1) is satisfied spontaneously and Eqs. (2)-(4), (9) are converted to the following ordinary differential equations:

$$\tilde{f}''' + \tilde{f}\tilde{f}'' - \tilde{f}'^2 + 2\alpha\left(\tilde{g} - D_b\tilde{f}\tilde{g}'\right) + D_b\left(2\tilde{f}\tilde{f}'\tilde{f}'' - \tilde{f}^2\tilde{f}'''\right) = 0 \tag{12}$$

$$\tilde{g}'' + \tilde{f}\tilde{g}' - \tilde{f}'g - 2\alpha\left[\tilde{f}' + D_b\left(\tilde{f}'^2 - \tilde{f}\tilde{f}'' + \tilde{g}^2\right)\right] + D_b\left(2\tilde{f}\tilde{f}'\tilde{g}' - \tilde{f}^2 g''\right) = 0 \tag{13}$$

$$\frac{1}{Pr}\tilde{\theta}'' + \tilde{f}\tilde{\theta}' = 0 \tag{14}$$

$$\frac{1}{S_m(1+k_{eq})}\tilde{\phi}'' + \tilde{f}\tilde{\phi}' = 0 \tag{15}$$

Subject to the transformed conditions

$$\tilde{f}(\eta) = \tilde{g}(\eta) = 0, \tilde{f}'(\eta) = 1, \tilde{\theta}(\eta) = \tilde{\phi}(\eta) = 1 \, as \, \eta = 0$$

$$\tilde{g}(\eta) \to 0, \tilde{f}'(\eta) \to 0, \tilde{\theta}(\eta) \to 0, \, \tilde{\phi}(\eta) \to 0 \, as \, \eta \to \infty \tag{16}$$

Where $= \frac{\Omega}{a}$, $D_b = \lambda_1 a$, $Pr = \frac{\mu c_p}{k}$, $S_m = \frac{\nu}{D}$.

CHEMICAL BACKGROUND

The equilibrium constant k_{eq} has been successfully calculated using numerous techniques, including spectroscopy, polarimetry, and thermochemistry. Edward Sario (1990) and Paris Svoronos conducted an experiment to demonstrate how straightforward it is to quantify equilibrium concentrations, with the example of determining k_{eq} values for a series of esterification. The following reactions [Edward Sarlo et al (1990)] describe the esterification of ethanoic acid with four different kinds of alcohols in the presence of H_2SO_4 as a catalyst.

$$CH_3OH + CH_3CO_2H \underset{k_{eq}=-5.03}{\xrightarrow{\hspace{1cm}}} CH_3COOCH_3 + H_2O$$

$$C_2H_5OH + CH_3CO_2H \underset{k_{eq}=-4.86}{\xrightarrow{\hspace{1cm}}} CH_3CO_2C_2H_5 + H_2O$$

$$C_3H_7OH + CH_3CO_2H \underset{k_{eq}=-4.21}{\xrightarrow{\hspace{1cm}}} CH_3CO_2C_3H_7 + H_2O$$

$$C_4H_2OH + CH_3CO_2H \underset{k_{eq}=-2.85}{\xrightarrow{\hspace{1cm}}} CH_3CO_2C_4H_9 + H_2O$$
RESULT AND DISCUSSION

The governing equations (12)-(15) have been solved numerically by 4th order Runge Kutta based shooting method and the results are verified with Matlab built-in bvp4c method. The graphs have been shown in Fig.1 - Fig.18. for different types of parameters such as $D_b, \alpha, Pr, S_m, k_{eq}$. The values of these parameters have been fixed within the following range. $D_b = 0.5$, $\alpha = 0.2$, $Pr = 1.0$.

S_m, k_{eq} have been adjusted for both reversible and irreversible flows, and considered are as follows:

(Methonol) $S_m = 0.97, k_{eq} = 5.03$.

(Ethanol) $S_m = 1.30, k_{eq} = 4.86$

(Propanol) $S_m = 1.55, k_{eq} = 4.21$

(Butanol) $S_m = 1.72, k_{eq} = 2.85$.

All the above mentioned numbers are for reversible flow and have been calculated for various acidity levels.

However, for reversible flow, we have considered $S_m = 1.55, k_{eq} = 4.21$(Propanol), and for irreversible flow, we have considered $S_m = 0.6, k_{eq} = 0.0$ and these values are fixed for all the parameters that are varied.

Comparison results for $-f''(0)$ with Z. Shafique et.al. [20] has been verified by considering $S_m = 0, k_{eq} = 0$.

In rheology, the fluidity of different materials is measured by a dimensionless number called the Deborah number, which is defined as the ratio of relaxation time to observation time. Due to the non-Newtonian nature of elastico-viscous flow, the Deborah number-induced decrease in axial, radial and tangential velocities and boundary layer thickness observed in Fig. 1, Fig.2, Fig.3. and there is no significant difference noted in reversible and irreversible flows.Fig.4 demonstrates that as the relaxation time increases, the temperature also rises. This is because as the elastic force increases the transfer of heat in upper convective Maxwell fluid happens and also the relaxation time is quite higher for high viscous fluid. The significant difference between reversible and irreversible flows are not noted. Also,

as seen in Fig.5, the boundary layer thickness is smaller in reversible flow when compared to irreversible flow, and mass transfer rises with increasing Deborah number.

The ratio of the momentum diffusivity to the thermal diffusivity is known as the Prandtl number. Thinner thermal boundary layers are achieved at higher Prandtl numbers. When the Prandtl number changes, the temperature distribution's peak moves closer to the walls and the fluctuations are more severe overall the fluids with increasing Prandtl have poor thermal diffusivity, as it possess low heat penetration. As a consequence, the temperature profile reduces significantly and it is observed in Fig. 6and the difference between reversible and irreversible flows are not observed. Fig.7 shows concentration boundary layer thickness is very small in reversible flows when compared to that of irreversible flows. There is no variation among the reversible and irreversible flows.

A rotation is an orthogonal transformation that keeps the original orientation intact. According to Euler's rotation theorem, there are three parameters that can be used to characterise any rotation. The Euler angles are a popular approximation to these values.How an object's angular velocity deviates from a constant value as the radius increases or decreases is represented by a rotation parameter on a velocity profile. Increase in rotation parameter considering larger values shows a decrease in the velocity profiles which is depicted in Fig.8, Fig.9, Fig.10.There is a increase due to kinetic energy depicted in Fig.9. No effective variations are observed between reversible and irreversible flows.

Increasing values of rotation parameter causes the temperature to increase and no notable changes are observed between reversible and irreversible flows noted in Fig.11. Fig.12 shows increase in the concentration due to the increase in the rotation parameter especially for larger values and concentration boundary layer thickness is less in reversible flows as compared to irreversible flows. Fig.13 to Fig.17 shows the effect of rotation parameter on velocities, temperature and concentration profiles considering the smaller values of α.Two different types of values considered for α, smaller value ranges from 0.2 to 1.0 and larger value ranges from 1.0 to 5.0. Velocity profiles shows a significant differences observed in Fig.13 - Fig.15. Fig.18 shows the effect of the variations of S_m, k_{eq} on the concentration profile. It shows a decrease in the concentration for reversible flows and the concentration boundary layer thickness is less in reversible flows. But for irreversible flows the concentration boundary layer thickness is very high and even no variations are noted.

CONCLUSION

This study exposes the effect of non-linear thermal radiation of an electrically conducting UCM fluid over a sagging surface. The main features of the study are highlighted are as follows
➢ Boundary layer thickness is very high for the effects of Deborah number on axial velocity.
➢ Even boundary layer thickness is high for the effect of rotation parameter on temperature.
➢ Difference between reversible and irreversible flows are noted in the concentration profile for all the physical variations.
➢ All the velocity profiles namely axial, radial, tangential show a significant difference for larger and smaller variations of α.

ABSTRACT

Chronic kidney disease (CKD) is a complex, multifactorial illness associated with decline in the kidney function. Anemia, dyslipidemia, HTN, electrolyte abnormalities, mineral and bone challenges, and other serious consequences of CKD demand dietary and fluid restrictions. Prolonged rise of BP causes damage to kidney by damage in blood vessels which intern diminishes the renal systems capacity to excrete toxins from blood, causing increased volume of blood, thus leads to severe complications. The main pathophysiology of increased blood pressure in CKD includes volume overload, salt retention and modifications in the hormonal systems that control blood pressure (BP). Our study aims to assess patients' sleep habits, quality of life, and awareness of hypertension by evaluating the effectiveness of patient counselling in individuals who have chronic renal disease and hypertension. *Methods:* Our Study used prospective intervention strategy over a 6-month period conducted in 86 patients with hypertension and CKD. Data were collected by direct patient communication and patient medical sheet review. Sleep patterns and quality were assessed with Pittsburgh Sleep Quality Index (PSQI) scale. Also, EQ5D was used for assessing quality of life. Patients were educated about hypertensive CKD and factors affecting progression of disease. The number of hours each patient spent

66847

in screen time and sedentary behavior was assessed. After obtaining complete data, it was analyzed. Paired T-test was used to test reliability of data collected. Majority of patient had knowledge about their disease which comprises about 88% (n=73) of patients showed a decrease in blood pressure after patient counseling. According to our study CCB and thiazide diuretics are mainly used in patients with hypertensive CKD. It was evident from the study that patient education is associated with better patient outcomes for people with progressive kidney disease and hypertension. After patient counselling by clinical pharmacist significant improvement was observed in sleep quality and overall quality of life in the study participants after patient counselling in the follow up period ($P < 0.0001$). We draw the conclusion that clinical pharmacists are effective at enhancing CKD patients' knowledge of their condition, blood pressure management, and quality of life.

Keywords: Chronic kidney disease, hypertension, patient counseling, prospective intervention.

INTRODUCTION

Chronic renal disease is an important public health issue characterized by persistent kidney injury, decreased rate of glomerular filtration (GFR) , and albuminuria.[1] The rate of prevalence of CKD are rising gradually and current prevalence of stages 1, 2, 3, 4, and 5 of CKD was 2.85%, 2.93% , 7.69% , 0.18% , and 0.06%, respectively.[2] A faster rate of CKD progression is linked to hypertension.[3] Most of the CKD patients have hypertension. Decline in renal function is correlated to increased pressure of blood (BP), and associated hypertension fastens cardiovascular events such as heart arrest and Cerebrovascular accident in those with CKD, in addition to the progression of renal illness.[4] By achieving target blood pressure goals the danger caused by this complication can be reduced. Patients with CKD have lower target BP goals which is less 130/80mmHg than those without the disease.[5] In CKD patients, achieving a target blood pressure is challenging and necessitates lifestyle changes along with high antihypertensive drug adherence.[6] Various factors can cause inadequate blood pressure control including noncompliance to antihypertensive (AH) medication and poor knowledge about disease and factors affecting disease condition .[7] Owing to constrained lifestyles, polypharmacy, frequent drug changes, the illness's unpredictable medical course, and frequent medication variations, patients with chronic renal disease are considerably more susceptible to medication-related challenges and poor adherence.[8] Patient education by clinical pharmacist can increase compliance to medicines byincreasing patients' knowledge of their prescriptions, reducing doctors' workload.[9] Snoring, insomnia, irregular sleeping habits, and daytime dysfunction are just a couple of the sleep-related behaviors or dysfunctions that have been scientifically associated with the advancement of CKD.[10] We investigate the effectiveness of patient-centered approaches in halting the progression of CKD, including identifying and removing barriers to medication compliance and patient education. It was reported that the pharmacist's counselling was crucial for blood pressure reduction, which is managed by providing education.[11] The goal of the study is to evaluate the effectiveness of patient counselling for individuals who have persistent kidney disease and are receiving antihypertensive therapy.

METHODS

Design of study and setting
We used a prospective interventional study design for this research. The study was carried out among the CKD patients of General Medicine section from October 2021 to March 2022 at the Karuna Medical College Hospital in Palakkad (6months).

Study population
According to Daniel's formula14, 86 patients having CKD who are taking antihypertensive medications who are older than 18 years old, and have given their consent for the study make up the study population. Individuals

with active kidney transplants and cognitive impairment, women who are pregnant, and people whose medical records have inconsistencies in information are not included in the study.

Study procedure

Prior to the start of the study, institutional ethical committee approval has acquired. Prior to the start of research, informed consent form was given and received from every participant which involve both inpatient and outpatient from the general medicine department. The participants data, containing prescription records, laboratory results, data on culture and sensitivity, residence, socioeconomic background, age, gender, occupation, and previous medical and drug history, were gathered using a predesigned data entry form. It was also investigated how antihypertensive medications were distributed among the study population. It was also evaluated how antihypertensive medications were distributed throughout the study population. The population sample was given counselling and patient information leaflets (PIL) to assist them control their blood pressure by raising awareness on their initial visit.

Study tool

The patient information was gathered using a form that was carefully prepared for data collecting. The individual patient's sleep patterns and quality of life were analyzed using questionnaires. Sleep patterns and quality are evaluated using the Pittsburgh Sleep Quality Index (PSQI) Scale while EQ5D used to assess quality of life.

Statistical analysis

To determine the percentage of various parameters, the obtained data was imported into MS-Excel 2019. Comparing the BP between the first and second visits was performed using paired student t-tests. These variables' associations were displayed as Mean SD.

Ethical considerations

The Institutional Ethics Committee (KMC/IHEC/08/2022) of Karuna Medical College Hospital, Chittur reviewed study protocol and data's gathered for the study was kept confidential.

RESULTS

Throughout the study collection period, 86 patients in total were taken. Over half of the population is under 40 years, with average age of 55.5 ± 10 years for study participants. According to Figure 1, there were more men (74.41%, or 64 patients) in the study population than women (52.32, or 22 patients).The distribution of the disorder across different ages is seen in Figure 2. 5.8% (n=5) of participants are in 20 – 30 age range, followed by 6.97% (n=6) in the 31–40 age range, and 23.25% (n=20) in the 41–50 age range. The age range 51–60 years has the largest percentage (33.72%; n=29). Patients aged 61 to 70 make up 23.25% (n = 20) of the patient population, while those aged 70 and more make up 6.97% (n = 6).The least number of patients are aged 20-30 years diagnosed with hypertension.

The distribution of the study samples according to the hypertension duration is shown in Figure 3. The highest disease duration in our study is 5-10 years, which affects 45% (n=33) of patients. A diagnosis of CKD and hypertension has been present in 25% of patients (n=18) for more than ten years, and in 30% of patients (n=22) for less than five years. In table number 1 which shows that 39.54% (n=34) of patients have a vegetable or fruit diet for more than 5 days and 60.46% (n=52) of the patients have a vegetable or fruit diet for less than or equal to 5 days.

Figure 4 shows 4.65% (n=4) of patients were smokers, and 9.31% (n=8) were alcoholics. But a greater number of patients lies in the group of both smokers and alcoholics which contributes about 43.02% (n=37) of the study population. Also, 43.02% (n=37) of patients lie in the group with no social history.

The distribution of the alteration in BP as an outcome of our counselling is displayed in Table 2. After receiving patient counselling, 15.11 percent of patients (n=13) exhibit an elevated BP level or no change. 84.8% (n=73) of participants display lower BP after the counselling, which signifies that more patients belong to the group of participants with decreased blood pressure.According to Table 3, 73 patients out of 86 demonstrated a drop in their blood pressure during the baseline and follow-up periods, from 1.8 ±17.9 to 143.0 ±11.4 , respectively. The p value is less than 0.0001 (0.0001), indicating there is a notable change in BP between participants after counselling.

The graph in Figure 5 shows that among all participants in the study (n=86), 36 patients (41.85%) were physically active whereas 50 patients (58.15%) were physically inactive. Table 4 shows 16.27% (n=14) had a sedentary time of fewer than 2 hours followed by 29.06% (n=25) who had a sedentary time of greater than 4 hours and a greater number of patients, that is 54.67% (n=47) of patients are having the sedentary time of 2-4 hours.

Figure 6 shows that out of 86 patients, 4.55% (n=4) had a sleep time of fewer than 2 hours followed by 44.18% (n=38) who had a sleep time of 6-8 hours. More patients, that is 51.17% (n=44) had a sleep time of 2-5 hours. In Figure 7 out of 86 patients 18 patients (20.93%) had only CKD with hypertension. 68 patients (79.07%) have CKD with hypertension and other comorbid conditions.Figure 8 shows that out of 86 patients, 34 (39.54%) are prescribed dual therapy for CKD with hypertension, followed by 30 (34.88%) taking triple therapy. About 22 patients (25.58%) are prescribed monotherapy.

Figure 9 shows out of 86 patients taking antihypertensives, 89.53% (n=77) of patients are taking medications of class Calcium Channel Blockers, followed by 62.79% (n=54) patients taking drugs of class diuretics. 51.15% (n=44) patients take alpha-agonists, 17.44% (n=15) patients take angiotensin receptor blockers, and 13% (n=7) patients take Beta-Blockers, and the least number of patients, that is 1 patient (1.16%) takes ACE inhibitors. Table 5 shows that about 60 patients (69.76%) have moderate knowledge about hypertension. Table 6 shows that out of 86 patients, most had poor sleep 58.13% (n=50) during the baseline visit, and an increase in sleep was observed during the follow-up visit to 87.21% (n=75).

Table 7 shows statistical analysis of sleep quality. There is an increase in the number of good sleepers with a mean PSQI score of 5.34 ± 3.06 to 4.66 ± 3.08 during baseline and follow-up visits respectively (p<0.0001). According to Table 8, the higher mean EQ-5D-3L index was substantially related with men at baseline and remained the same for both men and women at follow-up., and for patients who had only CKD with hypertension without any complications, also for people who had a vegetable or fruit diet for greater than or equal to five days, for those who had no social habits, for those who had physical activity and for those who had a sleeping time of 6-8 hours. EQ-5D-3L index is also greater in those who had screen time of 2 hours. Table 9 showed a significantly lower quality of life during the baseline visit (0.589 ± 0.222) and higher quality of life during the follow-up visits (0.754 ± 0.298) with (p<0.0001).

DISCUSSION

Socio-demographic characteristics
More over half of the patients in this study were men (74.42 %) compared with female patients (25.58 %). A similar study conducted by Ainah U et al., (2010)10 also shows that CKD is more in the male population i.e., 56% of the population was male. The data relating to the age of onset of hypertension in CKD or age of diagnosis of hypertension in CKD versus the number of patients were illustrated in which most patients (29 patients, 33.72%) belong to the age range of 51-60, followed by 20 patients 23.26% in 2 age groups that is, 41-50 and 61-70 years. 6 patients each (6.98%) in the age groups 31-40 years and age >70. The least number of participants are aged 20-30 diagnosed with hypertension. The risk factors for hypertensive CKD are low birth weight, comorbid diseases, family history, and smoking. A study by Pantelis A Sarafidis et al., (2008)6 shows similar results in which age group with a high prevalence of CKD and hypertension from 46-60 years.

Mahesh *et al.,*

Duration of hypertensive period in CKD patients
Out of 86 patients, 24.65% are having hypertension (n=18) beyond 10 years, followed by 30.13% (n=22) of patients diagnosed with hypertension for less than 5 years and about 5 -10 years in 45.22% (n=33) of patients.

Dietary habits in CKD patients
A healthy diet will help you prevent and control hypertension. The poorly controlled blood pressure is contributed by poor diet and hypertension management knowledge. In this study population, 39.54% of patients have a vegetable or fruit diet for greater than 5 days and 60.46% of the patients have a vegetable or fruit diet for less than or equal to 5 days.

Social history in patients
4.65% (n = 4) and 9.31% (n = 8) of the patients in this study, respectively, were alcohol and tobacco users. But a greater number of patients lies in the group of both smokers and alcoholics which contributes about 43.02% (n=37) of the study population. Also, 43.02% (n=37) of patients lie in the group with no social history. It complies with the study by Balaji Gummidi et al., (2020)11 which shows smoking is a risk factor for CKD.

BP variation after patient counselling
In this study population, the major number of patients that is 84.88% (n=73) show a decrease from their elevated BP level, and 15.12% of patients (n=13) shows an increased BP level or a level without any change after the follow-up, which is similar to study done by Melisa Resmiati et al., (2020)12 showed that there were notable differences in blood pressure before and after counselling. Out of 86 patients, 73 (84.88%) showed a drop in blood pressure, whereas 13 (15.12%) experienced an increase. There was a decrease in the BP value of the patients from their baseline to the follow-up visit from 161.84 ± 17.91 to 143.08 ± 11.42 respectively (p<0.0001).

Physical behaviors in patients
Exercises like walking, running, housework, and swimming are very necessary for preventing and managing high blood pressure. Among the total study population (n=86), 36 patients (41.85%) were physically active whereas 50 patients (58.15%) were physically inactive. Kidney disease and renal function are correlated to sedentary lifestyle. Reduced kidney function and an increased risk of developing CKD are associated with prolonged sedentary time. It is evident from the table that 16.27% (n=14) had a sedentary time of fewer than 2 hours followed by 29.06% (n=25) who had a sedentary time of greater than 4 hours and a greater number of patients, that is 54.67% (n=47) of patients are having the sedentary time of 2-4 hours.

Sleep duration in patients
The occurrence and progression of hypertension are significantly influenced by sleep disorders. Sleep quality is impaired for people suffering from a sleep disorder, thus aggravating the progress of diabetes. Out of 86 patients 4.55% (n=4) had a sleep time of fewer than 2 hours followed by 44.18% (n=38) who had a sleep time of 6-8 hours. More patients, that is 51.17% (n=44) had a sleep time of 2-5 hours.

Co morbidities associated with CKD
Out of 86 patients 18 patients (20.93%) had only CKD with hypertension.68 patients (79.07%) have CKD with hypertension and other co morbid conditions. A previous study by Melisa Resmiati et al., (2020)12 also shows an increased percentage of hypertension in the CKD population along with other co morbidities. The most seen co morbidity is diabetes mellitus.

Therapy in CKD patient with hypertension
Out of 86 patients, 34 patients (39.54%) are prescribed dual therapy for CKD with hypertension, followed by 30 patients (34.88%) taking triple therapy. About 22 patients (25.58%) are prescribed monotherapy. Out of 86 patients taking antihypertensives, a greater number of patients, that is 89.53% (n=77) of patients are taking medications of class Calcium Channel Blockers, followed by 62.79% (n=54) patients taking drugs of class diuretics. 51.15% (n=44)

66851

patients take alpha-agonists,17.44% (n=15)patients take angiotensin receptor blockers, 8and . 13% (n=7) patients take Beta-Blockers, and the least number of patients, that is 1 patient (1.16%) takes ACE inhibitors. A similar result was obtained from a study conducted previously by N.VANITHA RANI et al., (2013)9, which shows that more number of patients (75.29%) are taking calcium channel blockers

Knowledge of patients about hypertension
Out of 86 patients, The percentage distribution of people who answered the appropriate answers for the hypertension knowledge questionnaire is 73.25% (n=63) patients for first question, 83.72% (n=72) patients for second question, 96.51% (n=83) patients for third question, 53.48% (n=46) patients for fourth question, 61.62% (n=53) patients for fifth question, 95.34% (n=82) patients for sixth question, 93.02% (n=80) patients for seventh question, 79.06% (n=68) patients for eighth question, 83.72% (n=72) patients for ninth question, 81.39% (n=70) patients for tenth question, 60.46% (n=52) patients for eleventh question, 68.61% (n=59) patients for twelfth question, 70.94% (n=61) patients for thirteenth question, 29.07% (n=25) patients for fourteenth question, 72.09% (n=62) patients for fifteenth question. Our study depicted that about 60 patients (69.76%) have moderate knowledge about hypertension, similar to the research by Olowe OA et al., (2017)13 which shows that about 90.2 % patients had moderate knowledge.

Sleep quality assessment after patient counselling
Out of 86 patients, most had poor sleep 58.13% (n=50) during the baseline visit, and an increase in sleep was observed during the follow-up visit to 87.21% (n=75). During the period of the study, there was an increase in the number of good sleepers with a mean PSQI score of 5.34 ± 3.06 to 4.66 ± 3.08 during baseline and follow-up visits, respectively (p<0.0001).

Quality of life
The higher mean of the EQ-5D-3L index was substantially related with men at baseline and remained the same for both men and women at follow-up, for patients who had only CKD with hypertension without any complications, for people who had a vegetable or fruit diet for greater than or equal to five days, for those who had no social habits, for those who had physical activity and for those who had a sleeping time of 6-8 hours. EQ-5D-3L index is also greater in those who had screen time of 2 hours. The EQ-5D-3L mean (SD) index showed a significantly lower quality of life during the baseline visit (0.589 ± 0.222) and higher quality of life during the follow-up visits (0.754 ± 0.298) with (p<0.0001).

Limitations
This study has some drawbacks that should be taken into account. The small sample size comes first which reduces the accuracy of the result. The patients in the study had a limited period of follow-up.

CONCLUSION

In this study, we enrolled 86 participants for the given period symbolizing the whole study's tail end and providing an accurate end description. Intermingled and overlapping cause-and-effect relationships between CKD and hypertension are strongly related. Blood pressure elevations are closely attributed to declines in renal function, and long-term increases in BP expedite the process of renal function deterioration. The public's knowledge and awareness of the modifiable risk factors for hypertension were raised as a means to control it. In our study, poor BP control was one of the modifiable risk factors which decreased during the follow-up visit. Patients' sleep quality impacted the quality of life, which was improved after patient education. On examining the quality of life from the domains we had designated, we determined that self-care, routine activities, pain/discomfort, and anxiety/depression contributed more to medium discomfort, which showed an improvement in follow-up. As a result, the results above revealed that clinical pharmacy interventions mainly patient counselling had a positive impact on CKD patients with hypertension.

ABSTRACT

The purpose of the study was to find out the effect of the isotonic exercise programme on the muscular strength and endurance of arm and shoulder of volleyball players. For this purpose, twenty subjects were selected by Quota sampling technique and after the pre-test, all the subjects were scattered into two equal groups i.e. experimental group and control group (n=10 in each group). The experimental group underwent eight weeks of weight training program whereas the control group was not given any kind of training. Pre-test and post-test were applied to get the data from both groups. The difference between groups was analyzed by applying a t-test for the significant differences at 0.05 levels. The findings of the test showed the significant value of the t-ratio for selected variables in the experimental group. The results were found significant. The findings of the study revealed that the eight weeks isotonic exercise program is very beneficial to increase the muscular strength and endurance of volleyball players.

Keywords: Muscular strength, Muscular endurance, Isotonic exercise, Volleyball Players.

INTRODUCTION

A sport is commonly defined as an organized, competitive, and skillful physical activity requiring commitment and fair play. It is governed by a set of rules or customs. In a sport, the key factors are the physical capabilities and skills of the competitor. A training program must be designed in consideration of age particularities, and its success depends in part on the quality and abilities of the individual athlete involved. Thus, consideration must be given to the selection of athletes. Not all athletes have the physiological capabilities to become world-class champions. Sports

training is an entirely planned, systematic, regular, and continuous process based on scientific principles to achieve a high level of performance. The special characteristic of sports training is to result in the pursuit of different objectives, aiming at not only improving performance but also maintaining diminishing performance due to age. Training in sports programme plays a very important role in improving the all-round personality of an individual and team [Harre 1982].

The theory and methodology of training is a vast area. An intimate awareness of the information available from each science will make the coach more proficient in his/her training endeavors. The principles of training represent the foundations of this complex process, while the acquaintance with training factors will enable the coach to understand the role played in training by each factor in accordance with the characteristics and specifics of a sport. The chapter referring to the methodology of developing motor abilities (strength, speed, endurance, flexibility, and coordination) will assist the coach in selecting the optimal method of training, while the knowledge acquired from the planning section will provide the coach with the ability to train hid athletes in such a way that maximum performance will be achieved at the desired time. But training is not everything. Now a day's one must recognize the importance of regeneration and recovery between training lessons, which is a necessary factor to ensure continuous improvement in one's performance [Bompa 1983].

Isotonic Exercises
The word isotonic is from Greek and roughly translates to equal or same tone. The muscle maintains equal tone while shortening during isotonic exercise. That means your muscles maintain the same tension throughout the exercise. Examples of isotonic exercise include squats, stair climbing, bicep curls, and push-ups.

Isotonic Contraction
In an isotonic contraction, tension remains the same, whilst the muscle's length changes. There are two types of isotonic contractions: (1) concentric and (2) eccentric. In a concentric contraction, the muscle tension rises to meet the resistance, and then remains the same as the muscle shortens. In eccentric, the muscle lengthens due to the resistance being greater than the force the muscle is producing [Singh].

MATERIALS AND METHODS

The major objective of the present study was to ascertain the effects of the isotonic exercise programme on the muscular strength and endurance of the arm and shoulder of volleyball players, so an experimental method was used in the study. The sampling used in this study was selected based on the quota sampling method. The various testing procedures and training programme was explained to the subjects in detail before starting the training programme. For the present study, twenty subjects were selected and divided into two equal groups. The t-test was applied to determine the significant difference between the pre-test and post-test mean scores of experimental and control groups. The level of significance chosen to test the hypotheses is tested at 0.05 and which is recognized as appropriate in relation to the research process adopted and equipment used in this study. The Pull-ups or Flexed Arm Hang fitness test was applied to accomplish the objectives of the study.

RESULTS

As already stated, the main purpose of the present study was to know the effect of the isotonic exercises training programme on muscular strength and endurance of the arm and shoulder of volleyball players. For this purpose, an isotonic exercise training schedule for 8 weeks was drawn up. Analysis of the study was divided into two test phases i.e. pre-test before the start of the experiment and post-test after the 8 weeks isotonic exercises training programme on both the groups i.e. experimental and control groups. The results were analyzed through the use of an appropriate approach to statistics. In this case, the t-ratio was computed between pre and post-tests to find out whether there existed any significant difference between the mean scores after the experiment. Patial VS conducted a

Varender Singh Patial *et al.,*

study on "Effect of Isotonic Exercise Programme on Speed and Agility of Volleyball Players". The study was conducted on twenty subjects for the duration of eight weeks. The findings of the study revealed that the eight weeks isotonic exercise program is very beneficial to increase the muscular strength and endurance of volleyball players.

DISCUSSION

The findings pertaining to muscular strength and endurance of the arm and shoulder of volleyball players revealed the following results: There was a significant development in the strength endurance (pull-ups) of the shoulder group of muscles after 8 weeks of the isotonic exercises training programme for the experiment group. It is worth mentioning here that after the pre-test when the control group was made free to go for physical exercises as per their regular schedule. When the post-test of the control group along with the experimental group was considered, it was found that the control group also improved in shoulder strength and endurance aspect. The investigator has come to realize that the various elements connected with the physical fitness of volleyball players, have not been analyzed and their vital role has been undermined. However, the present study intends to throw light on the necessary relevant and coaching ability of these elements so that their role may be properly and judiciously evaluated.

Table 1 Comparison of Pre-Test And Post-Test Related oo Muscular Strength & Endurance (Shoulders) of Volleyball Players Through Pull-Ups Or Flexed Arm Hand

Control Group				Experimental Group		
Tests	Mean	SD	t-ratio	Mean	SD	t-ratio
Pre-test	8.524	4.718	2.262	7.604	2.735	2.262
Post-test	9.565	5.103		9.406	2.629	

*Significant at 0.05 level

Table 1 shows the difference between the pre-test and post-test for pull-ups or flexed arm hang. It is significant at 0.05 levels. This means that there is a significant difference in pre-test and post-test scores for both groups. Further, the means in the post-test are higher than that of the pre-test as players have improved the pull-ups.

Figure 1

Comparison of pre-test and post-test related to muscular strength & endurance (shoulders) of volleyball players through pull-ups or flexed arm hang.

From figure 1 it is obvious that the post-test of both groups' means is higher than that of the pre-test. The strength endurance refers to the movement and quickness of the players in volleyball especially when players are smashing the ball and blocking the ball.

ABSTRACT

This review provides a comprehensive overview of the historical, current, and future applications of arsenic in therapeutics, with a particular emphasis on arsenic-derived nanoparticles (NPs). Arsenic compounds have been employed for over 2,400 years as crucial components in the treatment and management of various human diseases. Arsenic exists in multiple forms in nature, with the ability to cure diseases on one hand and cause toxicity if exposure exceeds certain levels on the other. Contemporary research has unveiled some mechanisms responsible for the dual outcomes of arsenical compounds. A recent innovation in arsenical forms is the development of arsenic nanoparticles, such as arsenic trioxide NPs. The review begins by examining the background information on different forms of arsenic and their therapeutic properties. It then delves into the synthesis, characteristics, and applications of arsenic-based NPs.

Keywords: Arsenicals, Nanoparticles, Arsenic trioxide, Therapeutic, Cancer.

INTRODUCTION

Arsenic is a unique element that, on one hand, is associated with cancer and considered poisonous, while simultaneously holding the potential to be an effective medicine. Chemical compounds containing the heavy metal element arsenic (As) are referred to as arsenicals. Arsenicals are linked to human health issues, as many of them act as natural environmental toxic contaminants. As a naturally occurring metalloid, arsenic is present in trace amounts in the Earth's crust. It often combines with sulfur to form compounds such as realgar (As_2S_2), orpiment (As_2S_3), and arsenopyrite (FeAsS).[1] Arsenic rarely exists in its elemental form; instead, it occurs as metal arsenates, such as

66862

Monika Yadav *et al.,*

potassium, sodium, or calcium, or is combined with sulfides and oxides. It forms covalent bonds preferentially with carbon, oxygen, and hydrogen, and combines with metals to produce alloys. Considering the global health issues, arsenic (As) presents a potential cancer risk and is regarded as a dangerously toxic pollutant. However, for over 2,400 years, it has been a crucial component of medicines for treating various disorders.[2] Arsenic and arsenicals have held significant positions in commercial manufacturing, mining, metallurgy, agricultural chemicals, pharmaceuticals, wood preservatives, glass-making, and semiconductor industries for centuries. Various mineral arsenicals, such as arsenolite, arsenic trioxide (ATO), realgar-As4S4, orpiment-As2S3, and As2O3, have been widely used in traditional Chinese medicine and are now incorporated as cutting-edge chemotherapeutic compounds in hematological cancers.[3]

ATO, which was approved by the Food and Drug Administration (FDA) as a chemotherapeutic agent in 2000, is currently considered one of the most effective treatments for acute promyelocytic leukemia (APL).[4]In recent years, nanoparticles offer various potential applications due to their unique physical and chemical properties, which differ from their bulk counterparts due to their nanoscale size. Arsenicals have also been converted into nanoforms. These arsenic based nanomaterials offer great properties which make the key subject of this review. Today, nanomedicine is extensively researched and rapidly evolving as a powerful therapeutic tool, particularly for targeting and imaging cells or tissues in cancer treatment. Nanomedicines are considered more effective than traditional medicines. To enhance the selectivity of therapeutic agents towards targeted cells, overcome resistance mechanisms, and minimize drug toxicity to normal cells, nanoparticles are gaining popularity in various medical sectors.[5][6] This review not only deals with forms, usage of arsenicals but also outlines the advancements made to date regarding the therapeutic potential of arsenic NP-based drugs in treating various malignancies, with a focus on possible future applications.

DIFFERENT FORMS OF ARSENICALS

Arsenic exists in three valency states: elemental, trivalent (AsIII), and pentavalent (AsV). Commonly, arsenic is found in both organic and inorganic forms, each with different biological and toxicological properties. Inorganic arsenicals include compounds like arsenic trioxide (As2O3) and arsenic pentoxide. Trivalent arsenicals are more toxic than their pentavalent counterparts. Organic arsenicals, such as dimethylarsinic acid and arsenobetaine, are unique in that arsenic is covalently bonded to carbon, and they are excreted more swiftly than inorganic forms. Arsenic's most toxic gaseous form is arsine (AsH3), which primarily affects victims through inhalation. Furthermore, nanoparticles containing arsenic compounds, such as As2O3 encapsulated in liposomes, are emerging in biotechnology due to their unique properties for cellular interactions.[7][8]Different forms of arsenicals occurring in nature is enlisted in below tables (Table 1and 2).

ARSENICALS IN THERAPEUTICS

Arsenicals, historically esteemed for their therapeutic properties, have been utilized in medicine for over 2400 years. Traditional Chinese medicine employed them to address conditions like syphilis and rheumatism, and ancient texts such as Charak Samhita detail their use for skin ailments around 400BC [9]. Eminent figures in medical history, like Hippocrates, turned to arsenic sulphides for treating abscesses and ulcers. By the 20th century, Paul Ehrlich introduced the arsenic-based Salvarsan as a remedy for syphilis [10][11].Despite arsenic's prominent role in 19th-century medicine, its use witnessed a decline in the following century, largely due to rising concerns about its adverse effects and potential carcinogenicity. However, this trend reversed in the 21st century. In 2000, the FDA approved ATO as a pivotal drug against acute promyelocytic leukaemia (APL), underscoring its ability to induce complete remission in a notable percentage of patients[13]. Today, arsenicals are heralded for their potency in treating APL. Recent studies highlight their potential against breast cancer and suggest benefits in treating conditions such as asthma and arthritis[15][16][17][21][22]. Research continues into ATO's applicability in addressing various cancers, and ongoing clinical trials investigate its combination with other treatments for enhanced efficacy[23][24].

Monika Yadav *et al.,*

ARSENIC NANOPARTICLES SYNTHESIS AND PROPERTIES

Nanoparticles possess unique physical and chemical characteristics, including a high surface area to volume ratio, remarkable reactivity, and nano-size.[25] Their ultra-small size facilitates their absorption in biological systems. These distinctive features of nanoparticles offer promising solutions to the challenges associated with conventional therapeutic and diagnostic techniques. Currently, nanomedicine is rapidly advancing as an extensively researched and potent therapeutic approach, surpassing the efficacy of traditional medicines. Nanoparticles can be precisely engineered to target specific sites within the body, efficiently deliver drugs to disease sites, and improve drug bioavailability in tissues.[26] Considering the wide-ranging applications of materials like arsenicals in both industry and medical science, recent experimental studies have demonstrated the enhanced therapeutic effects of arsenic nanoparticles.[27]

Synthesis of Arsenic Based Nanoparticle
In the cell culture medium, arsenic cannot be employed in its grey elemental (0) and bulky (As4) form as it remains insoluble and rigid in aqueous environment. In usual circumstances, the central part of elemental arsenic gets covered by an oxide layer thus, it becomes hard to assess the properties and potency of arsenic (0) in an aqueous medium. Preferably that is why arsenicals are designed as nanoparticle to make it water soluble.[26][28][29] AsNPs can be synthesized by various methods. Wet-chemical synthesis involves a simple reduction method.A yellowish-brown As (0) sol, made from aqueous arsenite solution maintained at pH 7-9 after reduction with NaBH4, is used to produce spherical arsenic nanoparticles.[30] Mechanical procedures include grinding, milling, and alloying. To produce AsNPs, granulated arsenicals are subjected to a high-energy ball mill for 48 hrs at a 300rpm rotation speed. The entire ball milling process is implemented under optimal environmental conditions of 35°C temperature and 1 atm pressure.[31]Another strategy is the vapor deposition production. This includes thermal, electron, and laser beam evaporation. Gas phase processes involve high-temperature evaporation, flame pyrolysis, and plasma formation. Colloidal or liquid phase prepare colloids by carrying out chemical reactions in solvents.[32]There are few other synthetic techniques, such as hydrothermal, seed-mediated, solvothermal, spray pyrolysis, and microwave methods which are being utilized to synthesize AsNPs.[33][34] Nowadays, research is more focused on environmentally friendly and bioinspired approaches.[35] High-quality nanoparticles can be produced using the potential of naturally occurring biomolecules to reform the shape or size of a crystal. "Nature-friendly" techniques have encouraged researchers to explore various species of algae that have a flair for nanoparticle synthesis.[36] Plant-based nanoparticle fabrication is more significant due to its eco-friendly, low-cost, and risk-free qualities, making it suitable for human therapeutic use.[37]Arsenic based nanoparticles have been demonstrated to be effective against various types of cancers.[38][11]This application is described in subsequent sections with more details.

CURRENT THERAPEUTIC APPLICATIONS OF AsNPs

Acute Promyelocytic Leukemia (APL)
APL, the highly occuring malignant type of acute leukaemia, is M3 subtype leukaemia. It is a cancer of blood forming tissue. Patients with APL are highly susceptible to bleeding and accumulation of promyelocytes. The promyelocytic leukemia/ retinoic acid receptor alpha (PML/RARA) oncogene responsible for APL, is formed as a result of chromosomal translocation of two genes on long arms of chromosome 15 and 17. Expression of this fusion gene consequently leads to production of oncoprotein which is clearly responsible for the disease.[39]
Use of ATO as an individual agent showed prolonged survival in a good proportion of APL patients. Formerly, anthracycline- combined chemotherapy was extensively used for the treatment of APL until researches showed therapeutic potential of ATO combined with all trans retinoic acid (ATRA).[40]ATO along with ATRA shows synergistic effects to promote destruction of oncoprotein that direct APL. Significant synergy of these two drugs as combination therapy has now turned into a principal treatment for APL because it has shown remarkably reduced toxicity and infections, minimizing generation of secondary malignancies and less percentage of death in remission.[41]The therapeutic effect of arsenic oxide has been explained to occur by attacking PML part of

PML/RARA. The resulting attack causes sumoylation of certain cysteine residues and causes the oncoprotein to be degraded by the proteasome.[42] It has also been observed that As2O3-NPs retard tumour stem cells, angiogenesis and make cancerous cell receptive for chemotherapeutic drugs or radiotherapy. ATO provoke production of ROS and activation of caspases which induces activation of the cell apoptotic pathway (programmed cell death) of leukemic cells.[43]

Pancreatic Cancer
Among the most prevailing malignancies around the globe, pancreatic cancer is one of them. Treatment of this fatal malignancy involves conventional chemotherapy and surgery. However, pancreatic cancer is hard to treat as it shows elevated rates of metastasis, rapid progression, and extensive chemo resistance. There is a high priority demand of production of effective drug for treatment of pancreatic cancer as there are terribly low rate (<5%) of prolonged survived patients. Arsenic here also, acts as a promising medicament.
Foregoing experiments have shown that As2O3-NPs, both in vitro and in vivo conditions, is effectively therapeutic against pancreatic cancer.[44] The combined treatment of Kras-targeted siRNA with Arsenic inhibited the development of pancreatic cancer (PANC-1 cells). Combined arsenic treatment with mutant Kras gene silencing activity via a nanoparticle-mediated transport technique demonstrated an increase in apoptosis. Arsenic used in the combined therapy with Kras-targeted siRNA seems to be a likely-looking treatment for pancreatic cancer.[45]

Prostate Cancer
Among males, most common type of cancer is the prostate cancer. Against cancer cells, AsNPs show cytotoxicity. Three kinds of As2O3 nanoparticles (bare As2O3 NPs, As-DMSA NPs, and As-chitosan NPs) were employed to treat prostate cancer cell lines PC-3 (androgen independent human prostate cancer cell line) and LNCaP (androgen sensitive human prostate cancer cell line).[46] Cell apoptotic pathways triggered by As NPs entail dose-dependent downregulation of anti-apoptotic proteins Bcl-2 and Bcl-xL and upregulation of pro-apoptotic protein Bax. In cancer cell apoptosis, contribution of caspase-3, JNK, cyclin D1, p38, phospho-Akt and ROS was assessed.[46]

Osteosarcoma
Researchers looked at the therapeutic potential of magnetic ATO NPs for osteosarcoma in mice and compared them to ATO alone or cisplatin (CDDP). It was showed that the magnetic ATO nanoparticles prevented the development of tumours by inducing tumour cell death, which raised the possibility that the magnetic ATO nanoparticles would be an useful and effective target for the treatment of osteosarcoma.[47]

Myelodysplastic Syndromes (MDS)
The term "myelodysplastic syndromes" (MDS) refers to a wide range of clonal hematopoietic stem cell and bone marrow illnesses that are expressed as aberrant blood cells or a reduction in peripheral blood cell count. Recent clinical trials have shown that decitabine (DAC) and ATO combination therapy is effective in treating MDS, however patients may experience acute negative effects from the medication. Additionally, due to the limited half-lives of these medications, they must be carried out daily. Researchers have created a novel formulation by combining DAC and ATO into alendronate-conjugated bone-targeting nanoparticles to solve the fundamental challenges of minimizing severe side effects and enhancing pharmacokinetic profiles of the therapeutic medicines. (BTNPs).[48]

METABOLISM OF ARSENICALS

Absorption and distribution of arsenicals in biological systems largely hinge on factors like solubility and particle size. Trivalent and pentavalent arsenicals, common forms, are absorbed efficiently through the gastrointestinal tract. The primary gateways for their cellular entry include membrane proteins, such as aquaglyceroporins 7 and 9, while others like phosphate transporters manage the uptake in hepatic and intestinal cells.[49][50] Once absorbed, the inorganic arsenicals travel via blood to various organs. Metabolically, the liver is central; both elemental and inorganic arsenic undergo a consistent metabolic pathway. Arsenic's journey starts as arsenate, transitioning to

Monika Yadav *et al.,*

arsenite, which is subsequently converted into methylarsonate and finally into dimethylarsenite. This metabolic sequence is twofold: the first phase witnesses a reduction of pentavalent arsenic to its trivalent form, while the subsequent phase undergoes oxidative methylation, a pivotal route for arsenic in humans. Through methylation, aided by donor groups and co-factors, arsenic forms are successively transformed into various arsenicals, from mono- to trimethylated species.[51][52] Arsenic's exit strategy from the body is its methylation and rapid urinary excretion as MMA and DMA. The poorly absorbed AsV, due to its insolubility, is primarily excreted in feces and urine. Meanwhile, in the intestines, trivalent arsenicals are quickly dispatched to bile for either fecal elimination or reabsorption. Notably, compared to inorganic arsenic, ingested organoarsenicals undergo minimal metabolism and are rapidly excreted in urine.[53][49]

TOXICOKINETICS OF ARSENIC NANOPARTICLES

The therapeutic applications of arsenic nanoparticles (ATO NPs) are limited due to significant side effects, including organelle damage and cell mortality.[31] These nanoparticles have shown higher toxicity than bulk arsenic. Combining ATO with retinoic acid lessens toxicity, notably in myelosuppression, infections, and reduces subsequent cancer emergence.[39] Nanoencapsulation, while retaining anticancer benefits, diminishes systemic toxicities of cytotoxic treatments.[23] In multiple cancer cell lines, a combined treatment with cisplatin and ATO has shown significant efficacy.[24][54][55][56][61] The FDA approved As2O3-NPs, with Trisenox being a notable formulation, for acute promyelocytic leukemia (APL) treatment in 2000. In contrast, pentavalent organic arsenic lacks significant anticancer effects.[62] As2O3-NPs primarily function by inducing apoptosis in tumor cells. MMAIII and DMAIII, both methylated trivalent arsenic compounds, induce apoptosis through different mechanisms-MMAIII affecting the mitochondrial electron transport chain and DMAIII targeting the endoplasmic reticulum.[63][64] Additionally, arsenic's anticancer effects involve a JNK pathway. Darinaparsin (DAR), an innovative arsenic compound, has emerged as a potential anticancer agent by disrupting mitochondrial functions, producing intracellular ROS, and instigating apoptosis.[65][66][67]

FUTURE PERSECTIVE

Development and research in biomedical applications are more oriented towards achieving target-specific drug delivery and methods for early diagnosis and treatment of diseases. Arsenicals employed as a single agent displayed limited potency, while if used in combination with variety of chemotherapeutic agents, considerable clinical results were reported.[56][45] Xiao, X. *et al*, worked on formation of ATO nanocarriers and permeable silica smart NPs which have illustrated far more cytotoxicity to a range of cancer cells than the single compound.[68] Other than ATO, comparative studies demonstrated that As4O6 repress human cervical cancer far better than As2O3-NPs.

Recent studies have improved the potency and efficacy of ATO using combination of nanoparticles. In a recent study, investigators discovered that ATO effectively induced ferroptosis in HCC cells. However, this effect could be reversed by the iron chelator deferoxamine, suggesting the crucial role of iron metabolism in ferroptosis induction. To enhance the therapeutic efficacy of ATO, researchers developed a novel drug delivery system called AFN@CM. This system involved encapsulating ATO within biomimetic magnetic nanoparticles (Fe3O4) coated with membranes derived from HCC cells.Upon treatment with AFN@CM, the researchers observed a remarkable inhibition of glutathione peroxidase 4, an enzyme that counteracts lipid peroxidation, and a significant increase in intracellular lipid peroxide species within HCC cells. Both in vitro and in vivo experiments demonstrated enhanced ferroptosis and suppression of tumor growth. Importantly, the safety evaluation of AFN@CM showed no significant toxicity, highlighting its potential as a safe therapeutic approach. Moreover, the use of cell membrane coating facilitated improved accumulation of AFN@CM specifically at the tumor sites, enabling continuous tumor elimination in a mouse model. This targeted delivery approach holds promise for enhancing the effectiveness of HCC treatment while minimizing off-target effects.[69]Therefore, the next crucial step to achieve effective and safer cancer treatment is to synthesize, analyse and develop new multifarious action arsenical based anticancer drugs. Nano formulation of

arsenic nanoparticles when used with combination has potential to overcome primary difficulties associated with current chemotherapeutic drugs.

CONCLUSION

Arsenic has transformed from a toxic metal into a powerful, broad-spectrum anti-cancer treatment. In cancer research, arsenicals have shown promise as an effective medicine for treating APL. However, the specific metabolic pathways involved in arsenic metabolism still require further investigation and research to fully understand the therapeutic effects of arsenicals. Arsenic trioxide is now being evaluated for its efficacy in treating a range of conditions, from leukemia to solid tumors. The total amount of arsenic alone is insufficient to maximize the anti-cancer therapeutic potential of arsenicals. Nanotechnology has shed light on the delivery of arsenic species in nano-formulations, which could help overcome initial limitations. Arsenic nanoparticles emerge as an innovative approach for faster, safer, and more efficient cancer treatment. Current experimental research is focusing on "formulated combination treatment," which effectively targets drugs to the specified tumor location.

Table 1. INORGANIC FORMS OF ARSENICALS (IARC, 2012)

Form of Arsenic	Common names/Other names	Chemical Formula	Oxidation state
Arsenic Trioxide	Arsenolite/ Claudetite	As_2O_3	Trivalent
Arsenic Pentoxide	Arsenic(V) oxide/ Arsenic anhydride	As_2O_5	Pentavalent
Red Arsenic	Sandaraca/Realgar/Arsenic disulphide	As_2S_2	Trivalent
Yellow Arsenic	Orpiment/Aurum pigmentum/Arsenikon	As_2S_3	Trivalent

Table 2. ORGANIC FORMS OF ARSENICALS (WHO, 2001)

Form of Arsenic	Common names/Other names	Chemical Formula	Oxidation state
Phenylarsine oxide	Phenylarsenoxide/Oxo(phenyl) arsane/ PAO/PhAsO	C_6H_5AsO	Trivalent
Arsenite	Arsenate(III)	$As(OH)_3$	Trivalent
Mono-methyl arsonous acid	MMA(III)	$As(OH)_2CH_3$	Trivalent
Di-methyl arsinous acid	DMA(III)	$As(OH)(CH_3)_2$	Trivalent
Arsenate	Arsorate	$H_3As^{5+}O_4$	Pentavalent
Mono-methyl arsonic acid	MMA(V)	$AsO(OH)_2CH_3$	Pentavalent
Di-methyl arsinic acid	DMA(V)	$AsO(OH)(CH_3)_2$	Pentavalent
Trimethyl arsine	Trimethanidoarsenic/ Gosio gas/ TMA	$As(CH_3)_3$	Trivalent
Arsanilic acid	4-aminophenylarsonic acid	$C_6H_8AsNO_3$	Pentavalent
Arsenobetaine	2-Trimethyl arsoniumylacetate	$C_5H_{11}AsO_2$	Pentavalent
Arsenocholine	Arsonium	$C_5H_{14}AsO^+$	Trivalent
Darinaparsin	S-Dimethyl arsinoglutathione	$C_{12}H_{22}AsN_3O_6S$	Pentavalent
4-(N-(S- glutathionylacetyl)amino) phenylarsonous acid	GSAO (Hydrophilic derivative of PAO)	$C_{18}H_{25}AsN_4O_9S$	Trivalent
Arsenicin A	Polyarsenic	$C_3H_6As_4O_3$	Trivalent

ABSTRACT

This study provides a thorough review of the literature on Total Quality Management and Organizational Performance in Healthcare, including information from Web of Science, Scopus, and Pub Med. The study seeks to offer a comprehensive overview of the development and characteristics of research in this sector. 968 studies in all, published between 1968 and 2023, were examined. The results show that the number of publications has been increasing steadily over the past ten years, which highlights the significance and relevance of this study field. The collaboration between authors and nations, theme mapping, and well-known authors, institutions, and countries are all examined in the study using bibliometric techniques including performance analysis, scientific mapping, and keyword co-occurrence. According to Bradford's law, the study highlights important publications in the area, including BMC Health Services Research, Health Services Research, and Total Quality Management & Business Excellence. The study offers useful information for practitioners, academics, and healthcare professionals, laying the groundwork for more research and advancing total quality management and organizational performance in the healthcare industry.

Keywords: Total Quality Management, Organizational Performance, Healthcare, Bibliometric, R-Studio.

INTRODUCTION

Total Quality Management (TQM) is now widely recognized as a critical success component in a variety of sectors, including healthcare (Nicholas.J, 2023). TQM concepts have been applied in healthcare to improve patient outcomes, operational efficiency, service quality, and financial performance (Grossu-Leibovica et al., 2023). Recognizing the

Bilal Farooq *et al.,*

growing relevance of TQM in healthcare, there has been an increase in research initiatives aimed at investigating the link between TQM practices and overall organizational performance. Nonetheless, there remains a fundamental lack in the present literature: a thorough assessment of these investigations. This study fills that gap by undertaking an in-depth bibliometric analysis of the extant literature on TQM and organizational performance in the healthcare industry. To ensure a thorough study, we used three credible databases: Scopus, Web of Science, and PubMed. R Studio, a powerful software environment built for statistical computation and graphics, was used to conduct the research. As a result, this study gives a thorough grasp of the most prominent publications, authors, and key research issues in this discipline. The findings will help both academics and healthcare practitioners understand the present state of research on TQM in healthcare, identify new pathways for future study, and use these findings to enhance healthcare outcomes and performance.

LITERATURE REVIEW

Total Quality Management (TQM) has its roots in the manufacturing industry, with early proponents like Deming (1986), Juran (1989), and Crosby (1979) emphasizing the need for continuous improvement, employee involvement, and customer satisfaction (Crosby, 1979; Deming, 1986; Juran, 1989). Over the years, the TQM concept has been adapted and refined to meet the unique challenges and requirements of the healthcare sector.Several studies have demonstrated the positive impact of TQM on organizational performance in healthcare. For instance, Shortell et al. (1995) found a significant association between TQM practices and improved patient outcomes, staff satisfaction, and financial performance in a sample of US hospitals (Shortell et al., 1995). Similarly, Mosadeghrad (2014) conducted a systematic review of 34 studies and concluded that TQM implementation positively influenced healthcare organizations' performance in terms of efficiency, effectiveness, and patient satisfaction (Mosadeghrad, 2014).In addition to empirical investigations, several theoretical frameworks have been developed to guide TQM implementation in healthcare. Donabedian's (1988) structure-process-outcome model is one of the most widely cited frameworks, emphasizing the need to assess and improve the structural, process, and outcome aspects of healthcare services to achieve better quality (Donabedian, 1988). Another influential framework is the Malcolm Baldrige National Quality Award (MBNQA) criteria, which has been adapted for healthcare organizations by the Joint Commission on Accreditation of Healthcare Organizations (JCAHO) to assess and improve quality performance (Sawyerr&Nwabueze, 2016).

The growing interest in TQM and its applications in healthcare has led to a vast and diverse body of literature. Bibliometric analysis has emerged as a useful tool for understanding the structure and development of this research field, as it enables researchers to quantify and visualize the relationships between publications, authors, and research themes. Several bibliometric studies have been conducted to explore TQM-related research (Zhao et al., 2019; Zeng et al., 2021), but there is a lack of comprehensive bibliometric analyses that specifically focus on the intersection of TQM and organizational performance in healthcare.This study aims to address this gap by conducting a bibliometric analysis using R Studio, which offers advanced capabilities for data management, analysis, and visualization. By applying bibliometric techniques in R Studio, this research will provide a comprehensive overview of the existing literature on TQM and organizational performance in healthcare, elucidating the most influential publications, authors, and research themes in the field.

THE OBJECTIVE OF THE STUDY

The primary objective of this study is to conduct a comprehensive analysis of the scientific research literature on Total Quality Management and Organizational Performance in Healthcare. The aim is to overcome the limitations of previous studies and provide practitioners and scholars with an up-to-date and detailed understanding of the advancements in this field. Notably, this study distinguishes itself from previous bibliometric analyses by utilizing

three databases, namely Scopus, Web of Science, and Medline. While prior studies have predominantly focused on either Scopus or Web of Science, the inclusion of Medline database sets this study apart.

Addressing the research gap, this study aims to answer several important questions through bibliometric analysis. Firstly, it investigates the publishing and citation patterns of Total Quality Management and Organizational Performance in Healthcare research from 1968 to 2023. Secondly, it identifies the countries, organizations, and authors that have exhibited the highest productivity and citation impact in the Total Quality Management and Organizational Performance in Healthcare. Furthermore, the study explores the authorship and collaboration patterns in the field of Total Quality Management and Organizational Performance in Healthcare. It also examines the most frequently used keywords and major themes in this research domain. Finally, the study endeavours to elucidate the conceptual positioning of the literature on Total Quality Management and Organizational Performance in Healthcare within the main research domains. By addressing these research questions, this study contributes to the existing body of knowledge by providing valuable insights into the scholarly landscape of Total Quality Management and Organizational Performance in Healthcare.

RESEARCH METHODOLOGY

Pritchard (1969) provides a definition of bibliometrics as the application of mathematical and statistical analysis to bibliographic records. Similarly, Osareh (1996) and Okubo (1997) describe bibliometrics as an analytical tool used to quantify scientific and technological production through article and patent publications.While narrative systematic literature reviews are susceptible to author bias (Minkman, Ahaus, &Huijsman, 2007; Tranfield, Denyer, & Smart, 2003), bibliometric techniques have the benefit of adding quantitative rigor to the subjective study of literature (Zupic& Cater, 2015). By using a quantitative approach to describing, evaluating, and monitoring publications, bibliometric approaches enable clear, systematic, and reproducible review procedures, hence improving review quality. They are useful tools for conducting literature reviews since they link researchers to relevant publications and aid in the mapping of study domains while eliminating subjective bias (Zupic& Cater, 2015).Recent research has emphasized the importance of visualization in scientific thinking and science mapping through bibliometric visualization (Börner, Scharnhorst, & Shiffrin, 2020; Chen &Ibekwe-SanJuan, 2021; Qureshi et al., 2023; Tass et al., 2023).Gazni, Sugimoto, and Didegah (2012) have examined the mapping of global scientific collaboration, shedding light on authors, institutions, and countries involved. Furthermore, Leydesdorff and Rafols (2012) have developed interactive overlay maps for US patent data based on the International Patent Classification. These studies reflect the growing interest in utilizing visual representations to gain insights into scientific collaboration and research landscapes.

Relational bibliometrics for science mapping and evaluative bibliometrics for performance analysis are the two main uses of bibliometric methodologies that Cobo et al. (2011) suggest. According to Thelwall (2008) and Zupic& Cater (2015), relational bibliometrics seek to understand the structure and development of scientific subjects, whereas evaluative bibliometrics evaluate the research and publishing performance of people and organizations. Our research focuses primarily on scientific mapping to comprehend the conceptual, social, and intellectual framework of the TQM application in the services research sector. To conduct the bibliometric approach, we followed the five steps outlined by Zupic and Cater (2015): Research Design, Assembling Bibliometric Data, Analysis, Visualization, and Interpretation.

Collection of Data

The following phase in the bibliometric research is to compile the bibliographic data, which includes selecting the proper databases, filtering the documents, and exporting the bibliographic information. We picked three commonly used databases for this study: Scopus, Web of Science (WoS), and PubMed, because they are regarded reliable databases for bibliometric research and assessments of scientific products.We began by using Scopus as our primary research tool. Researchers prefer Scopus to WoS because of its greater coverage (Zupic& Cater, 2015). Scopus, being

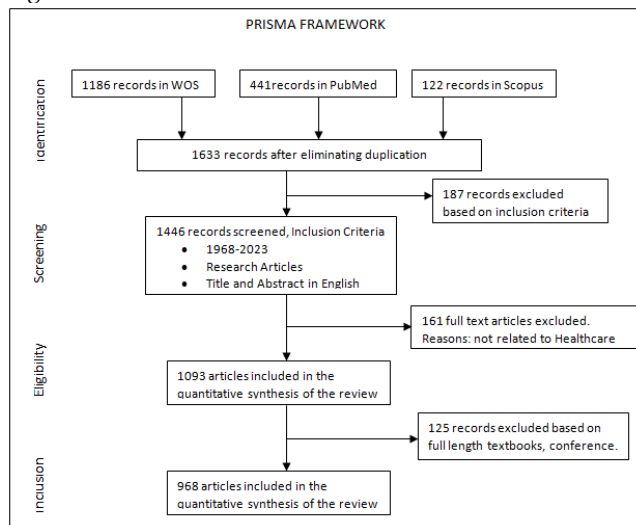
66874

Bilal Farooq *et al.,*

the biggest abstract and citation database of peer-reviewed literature, provides extensive data on authors in cited references, improving the accuracy of author-based citation and co-citation analyses (Zupic& Cater, 2015). On the other hand, WoS is one of the biggest citation indexes in the world and is frequently used for bibliometric analysis and searching huge citation records. It provides a variety of search functions, including general, cited reference, and advanced search choices, as well as tools for manipulating search results (ClarivateAnalytics, 2017). However, Meho and Yang (2007) emphasize that, while WoS is an essential citation database, augmenting it with Scopus may be necessary to identify citations to authors, titles, journals, departments, and countries. As a result, rather than functioning as replacements, the two databases complement one other.Furthermore, we included the PubMed database in our study to ensure comprehensive coverage of articles published by healthcare professionals and academicians. PubMed is a specialized database focusing on biomedical literature and is widely recognized as a valuable resource for healthcare-related research. By incorporating PubMed into our data collection process, we aimed to capture relevant articles specifically related to the healthcare sector.

A systematic and comprehensive search strategy was implemented using predefined keywords. These keywords("tqm" OR "total quality management" AND "organi?ation* performance" OR "hospital performance" AND "healthcare") were utilized to search for relevant articles in the 'Title, abstracts, and keywords' fields across multiple databases including Scopus, Web of Science (WoS), and PubMed. The search yielded a substantial number of research papers and articles, totalling 5948 publications. To ensure a comprehensive analysis, the data extraction period was defined from 1968, which marked the earliest reference to Total Quality Management in the literature, up until 2023. The extracted data was then formatted in BibTeX, a commonly used citation format, and subjected to further processing and analysis.To streamline the integration of data from different sources and eliminate duplicate entries, the BibTeX file was converted into Excel format using R Studio. This facilitated the merging of the three files and enabled the removal of redundant records, ensuring the integrity and reliability of the dataset.

Screening Criteria Strategy
The articles are reviewed over the period of 1968 to 2023 (January), across databases like:
- **Web of Science**
- **Scopus**
- **PubMed**

PRISMA is a standard method to give a systematic review of existing research (Haddaway et al., 2022). This method was adopted to conduct a bibliometric analysis to evaluate the research on Total Quality Management and Organizational Performance in Healthcare. PRISMA flow chart is shown below.


Bilal Farooq *et al.*,

Inclusion and Exclusion Criteria

Search across Scopus, Web of Science, and Pub Med databases yielded a total of 1749 articles related to Total Quality Management and Organizational Performance in Healthcare. These articles were subjected to a thorough analysis by the authors, who selected the most relevant ones based on predefined criteria. As a result, the sample size was reduced to 968 articles, which formed the basis for further research. To perform descriptive data analysis, the authors utilized the Biblioshiny application from the R Package. Biblioshiny is a powerful tool that offers a comprehensive examination of various data characteristics, including production trends in the field of study, significant affiliations, influential countries, prolific authors, total local and global citations, commonly used keywords, and more (Bhat et al., 2023). This application features an aesthetically pleasing web interface and enables the mapping of co-citations and other intellectual and social structures within the field of knowledge (Moral-muñoz et al., 2020; Xie et al., 2020).

Data Analysis

The bibliometric analysis in this study involved the examination of data obtained from three prominent databases: Scopus, Web of Science, and PubMed. The analysis was conducted using the R software, employing various bibliometric techniques such as performance analysis and science mapping. Specifically, the study focused on two aspects of analysis: performance analysis, which encompassed the evaluation of nation and author production in the field, and science mapping analysis, which involved exploring co-occurrence patterns, thematic mapping, and network collaboration. To facilitate the analysis process, the biblioshiny package was integrated into the R software. This package enabled the launch of a web interface, providing a user-friendly platform for data exploration and visualization. A BibTeX file containing the relevant bibliographic data was then uploaded to the Biblioshiny web interface for comprehensive analysis. Utilizing the functionalities of the Biblioshiny web interface, our analysis was conducted by interacting with the uploaded BibTeX file. This interactive approach allowed for a detailed examination of various bibliometric characteristics, such as publication trends, influential authors and institutions, citation patterns, and prominent keywords.

Performance Analysis

Performance analysis is a widely adopted technique for assessing the overall contributions of various research components to a specific field. It serves as a comprehensive method for gathering data on diverse research parameters, including authors, organizations, countries, and journals (Donthu et al., 2021). This technique is commonly employed in research studies, even in the absence of scientific mapping. In this study, a total of 968 documents focused on Total Quality Management and Organizational Performance in Healthcare were extracted from 429 sources, specifically journals, spanning the time period from 1968 to 2023. Notably, these documents were associated with 2534 unique keywords, highlighting the richness and diversity of the research landscape. On average, the documents had an age of 8.37 years, indicating the inclusion of both recent and older publications. The growth rate of the field was calculated to be 3.31, indicating a steady expansion over time. The analysis revealed that the documents were authored by 3552 individuals, with 57 of them being single-authored and the remaining 3495 engaging in collaborative authorship. On average, each document had 4.61 co-authors, reflecting the collaborative nature of research in this domain. Furthermore, the documents received an average of 13.8 citations, indicating their impact and influence within the scholarly community.

Annual Scientific Production

The annual scientific production in the field of TQM and organizational performance in healthcare has shown a steady increase over the years, as depicted in the figure below:

The below figure demonstrates the growing interest in TQM and its applications in healthcare settings. The increasing number of publications suggests that researchers and practitioners are continuously seeking to improve the quality and performance of healthcare organizations by applying TQM principles.

Bilal Farooq *et al.,*

Several factors may have contributed to the increased annual scientific production in this area

- Growing awareness of the importance of quality improvement in healthcare: As the healthcare sector faces increasing pressure to provide safe, effective, and efficient care, TQM has emerged as a critical strategy for improving service quality, patient satisfaction, and financial performance.
- Adaptation of TQM principles to the healthcare context: The evolution of TQM from its origins in the manufacturing industry to its application in healthcare has led to the development of new frameworks, models, and practices that are specifically tailored to the unique challenges and requirements of the healthcare sector.
- Increasing availability of data and sophisticated analytical tools: Advances in data collection, management, and analysis have enabled researchers to investigate the impact of TQM on various dimensions of organizational performance in healthcare, resulting in a growing body of empirical evidence that supports the positive relationship between TQM and improved outcomes.
- Globalization and the diffusion of best practices: As healthcare organizations around the world seek to learn from each other's successes and failures, the sharing of knowledge and best practices related to TQM has facilitated the cross-fertilization of ideas and the growth of the research field.

In conclusion, the increase in annual scientific production in the field of TQM and organizational performance in healthcare reflects the growing importance of this topic for both researchers and practitioners. This trend is expected to continue as the healthcare sector continues to grapple with the challenges of delivering high-quality, cost-effective care in an increasingly complex and competitive environment.

Sources Production Over Time

The bibliometric information from R Studio, showing the journal-wise distribution of Total Quality Management in Healthcare for 2022, indicates that some journals have a higher focus on this research area compared to others. The top five journals publishing research papers on TQM in Healthcare in 2022 are:

This precise distribution of research papers suggests that BMC Health Services Research is the leading journal in publishing TQM-related research in healthcare in 2022, followed by Health Services Research and PLOS One. Other noteworthy journals in the field include Sustainability and Total Quality Management & Business Excellence. These journals are likely to be valuable resources for researchers and practitioners interested in TQM and healthcare organizational performance, as they provide the latest findings and insights on the topic

Country Production Over Time

The table below presents the top five countries with the highest number of publications on Total Quality Management in healthcare over time. It provides a precise overview of each country's contribution to the research in this field From this table, it is evident that the USA is the leading country in TQM research in healthcare, with 748 publications. China, the UK, Australia, and Iran follow, each contributing significantly to the body of literature in this area. The data reflects the global interest in TQM and its applications in the healthcare sector, as well as the various perspectives and insights provided by researchers from different countries.

Most Global Cited Documents

The table below presents a list of authors and the number of citations their work has received in the field of Total Quality Management in healthcare. This information is valuable for understanding the most influential researchers and their impact on the research community. In light of the table. Westphal JD, 1997 has 795 citations. These authors have made significant contributions to the field of TQM in healthcare and their work is widely recognized and cited within the research community. The table highlights the key researchers whose work has shaped the understanding and application of TQM principles in healthcare settings. By examining their work, scholars and practitioners can gain insights into the most influential concepts, frameworks, and methodologies related to TQM and healthcare organizational performance.

Author's Production Over time

The analysis of the examined documents on Total Quality Management in healthcare reveals a total of 3,552 authors and co-authors who have contributed to the research in this field. This large number of contributors reflects the broad interest and collaborative nature of research on TQM in healthcare. Among these authors and co-authors, Krumholz H stands out as the most productive author, with a total of 18 publications. This noteworthy accomplishment highlights Krumholz H's significant role in advancing knowledge and understanding in the area of TQM and healthcare organizational performance.

Bradford's Law

Bradford's Law is a bibliometric principle that helps identify the most important journals in a specific field or research area. According to this law, a relatively small number of journals (the core sources) account for a significant proportion of the published literature in a particular subject area. Researchers and practitioners can prioritize these core sources when looking for the latest findings, insights, and best practices related to TQM in healthcare.The listed journals, therefore, represent the key sources of information for those interested in TQM and healthcare organizational performance. By focusing on these core journals, researchers can efficiently access the most relevant and impactful research in the field, contributing to the development of their own knowledge and expertise in TQM and healthcare. The list provided includes journals that fall under the core sources by Bradford's Law for Total Quality Management in healthcare research

Science Mapping

Science mapping utilizes bibliometric maps to visualize the conceptual, intellectual, and social organization of specific disciplines, scientific areas, or research domains (Cobo et al., 2011). This process involves data retrieval, pre-processing, network extraction, normalization, mapping, analysis, and visualization. Co-citation and keyword concordance are commonly employed bibliometric techniques in science mapping studies (Gaviria-Marin et al., 2019).

Word Cloud

Word cloud diagrams, commonly known as "clouds," play a visual role in highlighting frequently occurring keywords in web texts. By aggregating keywords into a cloud-like representation, these diagrams facilitate a quick grasp of the main ideas within the text (Heimerl et al., 2014). Figure 5 showcases a word cloud diagram generated using the biblioshiny tool. The chosen parameters included setting the field as "keywords plus," which offers valuable insights into important topics and research trends. The diagram displays the top 50 words, with "Hospital" occupying the largest area at the center. Noteworthy and visually prominent terms such as "Performance," "Quality," "Data," and "Management" reflect significant research directions in the domain of Total Quality Management and Organizational Performance in Healthcare. These techniques and visualizations contribute to a more comprehensive understanding of the intellectual landscape and knowledge structures within the analyzed field.

Tree Map

Tree maps serve as a visual representation of hierarchical data, employing layered rectangles to depict nodes within a tree diagram. Each rectangle's size corresponds to the relative magnitude of the node it represents. In the context of Total Quality Management (TQM) and organizational performance in healthcare, tree maps offer valuable insights into the prominence of specific concepts. Figure 12 showcases various tree maps derived from keyword plus, author's keywords, title, and abstract, focusing on the top 50 words. Analysis of the tree map data reveals that "United States" holds the highest percentage, accounting for 6% of the overall emphasis, followed by "Total Quality Management" and "Quality Management" at 5% each. Conversely, other keywords contribute lower percentages, ranging from 1% to 4%.

Notably, these findings differ significantly from those obtained through cloud analysis, which highlights the frequent occurrence of "Performance," "Quality," and "Hospital" when discussing Total Quality Management and

Bilal Farooq *et al.,*

Organizational Performance in Healthcare. This disparity underscores the evolving nature of the theme of Total Quality Management in Healthcare over the years. Moreover, the findings indicate that this evolution has persisted since the 1990s and continues to advance. This suggests that academics and practitioners in the field attach considerable importance to this subject. In conclusion, the tree maps provide a professional and visually informative representation of the salient concepts and their evolving significance within the domain of Total Quality Management in Healthcare. By offering a comprehensive overview, these findings contribute to a deeper understanding of the current research landscape and the trajectory of this field in both academic and practical contexts.

Co-citation Analysis
Co-citation analysis is a bibliometric technique that examines the frequency with which two documents are cited together by other documents. It is used to identify relationships between publications and can reveal patterns of influence, collaboration, or shared research themes within a field.

In this specific analysis
*   The units of analysis are documents.
*   A minimum of 3 citations per document is set as the threshold.
*   Out of a total of 968 papers, 510 documents passed the threshold.

Based on these criteria, Kaynak, H (2003) has the most co-citations. This result implies that Kaynak's 2003 paper is frequently cited alongside other publications in the field of Total Quality Management in healthcare. The high number of co-citations suggests that this paper has made a significant impact on the research community and may cover important concepts, theories, or findings related to TQM and healthcare organizational performance. Researchers and practitioners interested in TQM and healthcare should consider examining Kaynak's 2003 paper, as it is likely to provide valuable insights into the field. Additionally, analyzing the co-citation patterns of this paper can help identify other influential documents and authors, thereby enabling scholars to better understand the intellectual structure and development of TQM research in healthcare.

The Three Fields Plot Analysis
It is a bibliometric technique used to visualize and explore the relationships among three main dimensions within a research field: keywords, authors, and source journals. This analysis helps to understand the intellectual structure and interconnections between research topics, key researchers, and influential publications. In this specific case, the Three Fields Plot Analysis was conducted using the R-programming environment, which offers advanced capabilities for data management, analysis, and visualization.

The analysis compared three main areas
*   Keywords: These represent the major research themes or topics in the field of TQM and healthcare organizational performance.
*   Authors: The key researchers who have contributed to the literature in this field.
*   Source Journals: The most influential journals that publish research on TQM and healthcare organizational performance.

Based on the Three Fields Plot Analysis, the main area of research is related to quality management and TQM. This finding indicates that the research in this field focuses primarily on the principles, frameworks, and practices of TQM and how they can be applied to improve healthcare organizational performance. It highlights the relevance and importance of TQM in the healthcare sector, as researchers and practitioners continue to explore ways to enhance service quality, patient satisfaction, and financial performance. By examining the relationships among keywords, authors, and source journals in the Three Fields Plot Analysis, scholars can gain insights into the most influential concepts, researchers, and publications in the field of TQM and healthcare. This knowledge can help them to better understand the current state of research and identify potential avenues for future investigation.

Research Limitations and Future Directions

This study acknowledges certain limitations that should be considered in the interpretation of the findings. Firstly, it is important to recognize that Scopus, Web of Science, and Pub Med databases are constantly updated with new research articles, leading to the potential inclusion of additional articles beyond the scope of this study. Secondly, the exclusion of gray literature, such as reviews, books, and conference papers, from the analysis may restrict the breadth of the findings to empirical studies only. Consequently, bibliometric analyses focusing on a specific topic are subject to variations over time. To enhance the comprehensiveness of future research, it is recommended to incorporate a broader range of sources, including articles, books, and conference proceedings. Furthermore, considering additional factors such as impact factors and social science citation indexes can provide a more comprehensive understanding of the research landscape through bibliometric analysis. The outcomes of this study hold significant value for researchers, academics, and professionals in the field of Total Quality Management and Organizational Performance in Healthcare. They can utilize the findings to enhance their understanding of this research domain and identify potential areas for future investigation. Additionally, healthcare professionals can benefit from the insights provided by this research to gain valuable knowledge on emerging research trends and their potential impact on healthcare practices. It is important to recognize these limitations and encourage further research to explore a broader range of literature sources and incorporate additional bibliometric indicators to enrich the understanding of Total Quality Management and Organizational Performance in Healthcare.

DISCUSSION AND CONCLUSION

The primary objective of this study was to conduct a comprehensive examination of the literature pertaining to Total Quality Management and Organizational Performance in Healthcare. The topic of Total Quality Management and Organizational Performance in Healthcare has gained substantial attention among scholars and professionals, reflecting its significance in the field. The study spanned the period from 1968 to 2023, providing insights into the evolution of research on this subject. A total of 968 papers were included in the analysis, revealing a consistent progression in the field of Total Quality Management and Organizational Performance in Healthcare over the years. Notably, the last decade (2012-2022) witnessed a significant surge in the number of articles, indicating a crucial period of development in this area of research. Various bibliometric characteristics were explored, including author-country collaboration, thematic mapping, keyword co-occurrence, and identification of the most productive authors, institutions, and countries. The research employed rigorous approaches such as performance analysis, science mapping analysis, and bibliometrics utilizing the R package. Notably, the analysis revealed that BMC Health Services Research, Health Services Research, and Total Quality Management & Business Excellence were the most prominent journals for publishing studies on Total Quality Management and Organizational Performance in Healthcare, as identified by Bradford's law. For researchers interested in exploring the field of Total Quality Management and Organizational Performance in Healthcare, this study offers valuable insights into the various themes, trends, and future research directions. By analysing the findings, researchers can deepen their understanding and potentially contribute novel perspectives to this domain. This study provides a comprehensive and professional assessment of the literature on Total Quality Management and Organizational Performance in Healthcare, shedding light on its evolution, key contributors, and notable research avenues.

ABSTRACT

The purpose of the random group experimental study was to find out the effect of yogic practices on forced vital capacity and peak expiratory flow among asthmatic adolescents boys It was hypothesized that there would be significant differences due to yogic practices on selected physiological variables on forced vital capacity and peak expiratory flow among asthmatic adolescents boys than the control group. For the purpose of the study,30 among asthmatic adolescents boys were selected randomly from Chennai, between the age group of15 to 19 years and they were divided into two groups A and B having 15 subjects in each. Pretest was conducted for the two Groups (A and B) on the selected dependent variables before the start of the training program. Group A was given yogic practices; Group B (Control Group) didn't receive any specific treatment, but in active rest. After the experimental period of eight weeks, the two Groups (A andB) were retested again on the same selected dependent variables as post test. Analysis of co-variance(ANCOVA) was used to find out the significant differences between experimental group and the control group. The results of the study on the selected physiological variables proved that the Experimental group showed significant differences than the control group due to yogic practices. The hypothesis was accepted at 0.05 level of confidence Hence, it was concluded that yogic practices are beneficial to the among asthmatic adolescents boys.

Keywords: Yogicpractices, Peak expiratory flow, force vital capacity.

INTRODUCTION

Asthma is a chronic inflammatory lung disease. Chronic inflammation is associated with airway hyperresponsiveness (an exaggerated narrowing of the airways in response to specific triggers such as viruses, allergens, and exercise), resulting in recurring episodes of wheezing, breathlessness, chest tightness, and/or coughing that can vary in intensity over time. Symptom episodes are frequently associated with widespread but variable airflow obstruction within the lungs, which is usually reversible either naturally or with appropriate asthma treatment, such as a fast-acting bronchodilator.   India is home to at least one in every ten asthma patients worldwide, with an estimated 1.5-2 crore asthma patients. Asthma has a greater economic impact than tuberculosis and HIV/AIDS combined. Asthma is the most common chronic disease among children and is present in all countries, developed or developing. According to the World Health Organization (WHO), low and lower-middle-income countries account for more than 80% of asthma deaths.

However, dominant risk factors for the development of Asthma are a complex interplay of genetic susceptibility and exposure to environmental particulate allergens and substances such as indoor and outdoor allergens, tobacco smoke, chemical irritants in the workplace, and air pollution. According to the World Health Organization exposure to cold air, extreme emotional states such as anger or fear, physical exercise, and certain drugs such as aspirin, other non-steroid anti-inflammatory drugs, and betablockers, can also trigger asthma attacks.

One of the major data sources used to estimate COPD prevalence in India was the Burden of Obstructive Lung Disease Initiative Survey. The major data sources used to estimate asthma prevalence in India were the Indian Study on Epidemiology of Asthma, Respiratory Symptoms, and Chronic Bronchitis in Adults (INSEARCH) and the International Study of Asthma and Allergy in Childhood (ISAAC).

OBJECTIVES OFTHESTUDY
The purpose of the study was to determine whether yogic practices among adolescent asthmatic boys would significantly affect variables such as peak expiratory flow and force vital capacity.

PURPOSEOFTHESTUDY
The goal of the study was to determine how yoga practices among adolescent asthmatic boys affected variables like peak expiratory flow and force vital capacity.

HYPOTHESIS
It was hypothesized that yogic practices would result in significant differences in peak expiratory flow, force vital capacity, and other variables among adolescents asthmatic boys compared to the control group.

DELIMITATIONS
The subjects were adolescents boys only.
The study was delimited to adolescents asthmatic boys from Chennai city only
Age of subjects was ranged from 15 to 19 years only.
Independent variable was yogic practices only.

The dependent variables were restricted to Peak expiratory flow, force vital capacity only.

REVIEW OF RELATED LITERATURE

Balakrishnan, Ragavendrasamy et al., (2018)investigated effect The current study's findings indicate a significant increase in Slow Vital Capacity [F (1,13)] = 5.699; p = 0.03] and Forced Inspiratory Volume in the First Second [p = 0.02], as well as a decrease in Expiratory Reserve Volume [F((1,13)] = 5.029; p = 0.04] and Respiratory Rate [F((1,13)] = 3.244, p = 0.09. These changes suggest that may play a role in increasing respiratory muscle endurance, decreasing airway resistance, improving lung emptying, and increasing vagal predominance. We conclude that regular practice improves respiratory muscle endurance and decreases airway resistance. These findings also highlight the importance of scientific understanding the treatment of motion sickness as well as restrictive pulmonary disorders such as bronchitis and bronchial asthma.

Yadav, Pallavi(2021)Yoga was studied for its effect on asthma control in children with bronchial asthma. This hospital-based interventional randomized controlled trial, conducted from November 2017 to October 2018 in the Department of Pediatrics at a tertiary care center in North India, enrolled 140 newly diagnosed cases of asthma aged 10-16 years, who were randomly divided into two groups. In addition to pharmacological treatment, seventy children in the case group practiced yoga under supervision for three months. Only pharmacological treatment was given to the 70 controls. Pulmonary function tests were performed at the beginning, six weeks, and twelve weeks, as well as a quality of life (QOL) assessment using the Pediatric Asthma Quality of Life Questionnaire (PAQLQ). Forced vital capacity (FVC), forced expiratory volume in one second (FEV1), FEV1/FVC, and peak expiratory flow rate (PEFR) were the outcome measures evaluated. QOL was assessed in three domains: activity limitation, symptoms, and emotional function. Asthmatic children who practiced yoga showed significant improvements in FVC, FEV1, FEV1/FVC, and PEFR when compared to controls. Improvement in mean-PAQLQ score was also observed in cases that were statistically significantly better than controls. Yoga appears to have a significant positive effect on asthma control as measured by pulmonary function tests and QOL. As a result, yoga therapy can be recommended as an adjunct to standard pharmacological management of asthma.

MATERIALS AND METHODS

To achieve the study's goal, 30 adolescents asthmatic boys between the ages of 15 and 19 years old were randomly selected for the study in Chennai, and they were equally divided into two groups I and II, with 15 subjects in each group. Before beginning the training program, the two groups (I and II) took a preliminary test on the selected dependent variable. Group I received yogic practices for 60 minutes six days a week for a total of eight weeks. Group II (control group) was allowed to go about their normal lives during the experiment without any special training. After eight weeks, the two groups were tested again on the same dependent variable, the physiological variables. The analysis of covariance (ANCOVA) method was used to determine the significant differences between the experimental and control groups. The level of confidence for the significance test was set at 0.05.This study was approved by Insitutional huma ethics committee (MMCH&RIIEC/Ph.D/30/June/22

Navaneethakrishnan *et al.,*

RESULTS ON FORCED VITAL CAPACITY

The Forced vital capacity was measured through Micro Spirometry. The pre and post test means of the experimental groups and control group statistically analyzed to find out the significance.

RESULTS ON PEAK EXPIRATORY FLOW RATE

The Peak expiratory flow rate was measured through peak flow (liter per minute). The pre and post test means of the experimental group and control group statistically analyzed to find out the significance.

CONCLUSION

Yogic practices Experimental Group to increased forced vital capacity and Peak flow rate among Asthmatic adolescents boys than the control group.

ABSTRACT

Alzheimer's disease (AD) is a progressive neurological ailment that impairs cognitive functioning and memory in those who suffer from it. Early identification and prediction of Alzheimer's disease are crucial for successful management and patient care. Machine learning approaches have demonstrated promising results in improving the diagnosis and prediction of Alzheimer's disease based on neuroimaging data in recent years. This research presents a new method for predicting Alzheimer's disease (AD) using Enhanced Graph Convolutional Neural Networks (EGCNNs). GCNs (Graph Convolutional Neural Networks) have gained popularity in a variety of disciplines due to its capacity to capture complicated structural correlations between data elements. Neuroimaging data may be successfully represented as a graph in the context of AD prediction, where each node refers to a brain area and edges indicate the functional or anatomical relationships between these regions. To increase the predictive performance for AD detection, the proposed EGCNN architecture integrates modifications to regular GCNs. We incorporate attention mechanisms specifically to prioritize informative brain areas and adaptively balance their contributions throughout the feature aggregation process. This attention-based augmentation allows the model to zero in on crucial areas that show large alterations in the early stages of Alzheimer's disease. To assess the efficacy of our technique, we run trials on a large dataset of neuroimaging scans from people with varied degrees of cognitive impairment, including those with

Alzheimer's disease and healthy controls. Preprocessing of the information is performed in order to extract key characteristics and create brain graphs based on region-to-region connectivity.

INTRODUCTION

Alzheimer's disease (AD) is a common and terrible neurological ailment that mostly affects the older population, resulting in a progressive and irreversible decrease in cognitive function and memory [1]. As global life expectancy rises, so will the incidence of Alzheimer's disease, creating significant social, economic, and healthcare challenges. The formation of aberrant protein deposits inside the brain, such as amyloid-beta plaques and tau tangles, is one of the characteristic clinical markers of Alzheimer's disease [2]. These aberrant protein aggregates impede neuronal connectivity, causing nerve cell (neurons) degeneration and eventual death in important brain areas essential for memory, learning, and other cognitive functions. Alzheimer's disease develops in phases, with first symptoms being characterized by moderate memory problems, disorientation, and trouble doing normal activities. Individuals endure progressively severe cognitive losses as the illness progresses, eventually leading to a loss of independence and the need for round-the-clock care [3]. Despite intensive study, the specific etiology of Alzheimer's disease remains unknown, and there is presently no treatment. Treatments are available to assist control symptoms and delay cognitive loss in certain instances, but they do not stop or reverse the underlying neurodegenerative process [4].

Alzheimer's disease (AD) is a devastating and irreversible neurological diseases that mostly affects older persons, weakening cognition, memory recall, and everyday functioning [5]. The incidence of Alzheimer's disease (AD) has been continuously growing with an aging global population, providing considerable problems for healthcare systems globally [6]. It is critical to identify Alzheimer's disease early and accurately in order to provide timely treatments, create successful treatment techniques, and improve the overall quality of life for afflicted persons and carers. The etiology of Alzheimer's disease includes the gradual buildup of aberrant protein aggregates in the brain, such as amyloid-beta plaques and tau tangles, which leads to neurodegeneration and eventual cognitive loss [7]. However, detecting Alzheimer's disease in its early stages remains difficult owing to the mild and slow development of symptoms, which often leads to misdiagnosis and delayed treatment commencement [8]. Furthermore, the absence of definite biomarkers, as well as the high cost and invasiveness of various diagnostic methods, contribute to physicians' and researchers' difficulties in reliably predicting AD [9].

Advances in medical imaging, computational neuroscience, and machine learning have showed considerable promise in assisting the early diagnosis and prediction of Alzheimer's disease [10]. Neuroimaging methods such as structural magnetic resonance imaging (MRI) and functional. MRI (fMRI) provide essential insights into the structural and functional alterations in the brain linked with Alzheimer's disease. Simultaneously, machine learning algorithms, especially deep learning models, have exhibited extraordinary ability in learning complex patterns and representations from large-scale data sets, including neuroimaging data [11].

BACKGROUND STUDY

E. Jabasonet al. [1]In this study, we present a deep sparse autoencoder-based multiclass diagnostic approach for classifying the clinical state of AD patients using MR and clinical parameters. The suggested technique optimizes sparsity and weight decay regularization to provide a semi-supervised learning algorithm in which the variance across classes has been discovered unsupervisedly. For the purposes of supervised classification in AD diagnosis, it picks the most important aspects from the observed features. Experimental findings of our suggested approach on the tadpole study data in the Alzheimer's disease neuroimaging initiative database (ADNI) using the five-fold cross

validation methodology demonstrate a substantial increase in the classification performance. E. Jabason [3] To predict which individuals with MCI will acquire AD, we used a deep learning-based technique to describe longitudinal dynamics of cognitive measures and then generated prognostic models using baseline hippocampal MRI data and the learnt longitudinal dynamics. The evaluation findings showed that the suggested model performed well in predicting the transition from MCI to AD in participants having data from within a year's follow-up. R. Sivakani and G. A [6] The following findings are the product of this paper's processing of the oasis dataset. Since there is missing information in the oasis dataset, we must first synthesize it before proceeding with feature extraction, feature selection, and classification. The mean and mode technique is used to generate missing data for the oasis dataset, followed by EM feature extraction, best first feature selection, Gaussian process classification, linear regression model building, and the decision stump tree building algorithm.

Roy, D. et al. [8] To differentiate between seemingly identical actions, we investigated discriminative embedding of low-dimensional action representations in this article. Action-vectors were used to train a Siamese deep neural network, and it was shown that actions with identical properties could be distinguished. Siamese networks have been demonstrated to generate superior classification performance in comparison to other linear and non-linear discriminative embedding approaches. Finally, the proposed technique achieves state-of-the-art recognition performance compared to current algorithms on benchmark datasets as HMDB51 and MPII Cooking Activities. S. Harish and K. S. Gayathri [9] The Random forest classifier technique is used to simulate the hybrid evaluation scheme in the proposed approach. The test evaluates how well old persons perform on a variety of tasks, taking into account their mobility and emotional state. An ontology-based contextual method is utilized to make predictions about the emotions of older people in response to their concerns. If a doctor or caregiver wants to treat an elderly patient based on their predicted mood, they may use the evaluation data provided by progressive estimate.

MATERIALS AND METHODS

The experimental design, data collecting, and analytical processes utilized to meet the study goals are all described in detail in the Materials and Methods section, which plays a crucial role in scientific research articles. This section provides a clear and thorough plan for future researchers to follow in order to verify and/or reproduce the study's results. Using neuroimaging data, we discuss the Materials and Methods used to design and test a unique method to AD prediction using Enhanced Graph Convolutional Neural Networks (EGCNNs). Our goal is to describe the procedures used to collect data, prepare it for analysis, generate brain graphs from MRIs, and finally apply the EGCNN architecture with attention mechanisms to enhance the accuracy with which AD may be detected.

DATASET COLLECTION

The successful execution of any data-driven research heavily relies on the availability of high-quality and relevant data. In the context of our study on Alzheimer's disease (AD) prediction using Enhanced Graph Convolutional Neural Networks (EGCNNs), the process of dataset collection is of utmost importance. We collect the dataset in kagglehttps://www.kaggle.com/datasets/tourist55/alzheimers-dataset-4-class-of-images. A carefully curated and representative dataset serves as the foundation for training and evaluating the predictive model, ensuring its accuracy, reliability, and generalizability.

ENHANCED GRAPH CONVOLUTIONAL NEURAL NETWORKS

Convolutional Neural Network
Figure 4 displays the framework's overall design and provides a bird's eye view of the whole thing. The Network is given randomized chunks of lung images with zero mean and variance. With a 7x7 pixel kernel, the first convolutional layer generates 16 unique channels. The depth of the second tier is limited to a maximum of 22 levels. The next three layers each include a network of 100-50-5 neurons. Instead of the several layers often seen in CNN

implementations, our solution just makes use of a single convolutional layer. The input components are photos with a texture, therefore it's doubtful that the Network will find any global or high-level properties. On ILD lung image patch classification tasks, networks with a single convolutional layer perform just as well as networks with multiple convolutional layers. Over fitting was mitigated by a reduction in the number of parameters to learn, a problem caused by more sophisticated network topologies. Several techniques have been developed to expedite and enhance the training of neural networks. The parameters of these learning procedures are often acquired from conventional wisdom or reliable facts. Below, we've organized the CNN network into its component pieces.

Feed forward neural networks may utilize pixel values in images to solve categorization problems. Since even small image fragments might include hundreds of pixels, training numerous connection weight factors is necessary. Complex systems with several weight components, according to the VC dimension theory, cannot escape the over-fitting issue without additional training data. Contrarily, the complexity of the learning model is greatly reduced in Convolutional Neural Network (CNN) models by incorporating weights into much more compact kernel filters. CNNs are more efficient and trustworthy than the conventional, fully-connected neural networks.

Convolutional Layer
Multiple layers of these specialized neurons are required for a convolutional neural network (CNN). Convolutional layers are useful for many picture classification issues since they take in one or more 2D matrices (or channels) and spit out a large number of 2D matrices as outputs. Both the input and output matrices are open to change. The following procedures are necessary to determine a single output matrix:

$$A_j = f(\sum_{i=1}^{N} I_i * K_{i,j} + B_j) \quad \text{------ (1)}$$

The kernel matrix $K_{i,j}$ is applied to each input matrix Ii to produce a distorted result. Each member of the sum of distorted matrices has its value j shifted by the bias valueB_j. Matrix A_j is built by applying the nonlinear activation function f to each cell of MatrixA_j. A local feature extractor is coupled with each set of kernel matrices to provide features unique to that area. This learning strategy aims to locate collections of kernel matrices K that may provide helpful picture classification features consistently. Training kernel matrices and biases as shared neuron connection weights may be accomplished with the help of back propagation, a method for optimizing neural network connection weights.

Each layer's filter settings correspond to the layer's maximum number of trainable features. The
Graph Convolutional Neural Networks
Settings govern the gaining-of-weight procedure during training. Changing the weights is the primary method for improving the Network's performance. The Network's predictive capability is influenced by the Weight Matrices, which are taught by means of Back Propagation. CNN, as was indicated, is composed of a number of levels. The amount of available parameters varies across levels.

Since the information Layer just processes raw information, it has no learnable parameters. The model is taught using weight matrices in the Convolutional Layer, the second layer.

$$P = [(m * n * d) + k] \quad \text{------ (2)}$$

There are no trainable parameters in the Pooling Layer since its only function is to aid in dimensionality reduction. The Completely-Coupled Layer is the most adaptable since all of its neurons can exchange information with those in the layers above them.

$$P = \left[(N_c * N_p) + (1 * N_c)\right] \quad \text{----- (3)}$$

N_c is the current layer's neuron count, and N_p is the preceding layer's. To improve the model's efficiency, the Back propagation technique adjusts the weights of these trainable neurons.

We use a semi-supervised graph-based convolutional neural network classification model to conduct private attributes inference, whereby we feed in the nodes' feature vector X and the social graph's adjacency matrix A and get a class of attributes for each node. Therefore, training the GCNN model that can efficiently propagate the input graph information is crucial for obtaining correct private attributes class. Weighting the features based on local learning can achieve the scaling of each feature, allowing for the extraction of weighted features parameterized by vector. This is the goal of the training phase, which involves iterative calculations on the training dataset to train a set of weight parameters.

$$H^{(l+1)} = \sigma\left(AH^{(L)}W^{(l)}\right) \text{----- (4)}$$

More convolutional layers provide in more detailed local feature information of the extracted nodes, hence increasing the number of layers is a good way to improve accuracy. However, it has been shown that practically all nodes in a network can be visited by 3-hops from the core nodes, such as the node in K-core, which suggests that when the number of consecutive convolution operations surpasses 3, over fitting may occur.

Enhanced Graph Convolutional Neural Networks

The structural and functional alterations in the brain that are related with AD may be better understood with the use of neuroimaging data. A convenient method to take use of the spatial links between brain areas is to represent such data as graphs, where brain regions correspond to nodes and edges express functional or anatomical connections. Our aim is to provide an EGCNN architecture that is specifically designed for AD prediction. We hope that by enhancing traditional GCNs, we can make the model more accurate and easier to understand. During the feature aggregation phase, we use attention processes to provide preference to relevant brain areas and adaptively weight their contributions. Increased accuracy and sensitivity in predictions may result from the model's increased emphasis on key brain areas that show substantial alterations in the early stages of AD.

This algorithm's primary learning goal is user and product contrastive learning. All interaction data is split up into several training batches throughout the model's development. Positive samples are things that interact with the target user, whereas negative samples are all other objects in the training set. Cosine similarity is used by the method to determine how closely user and item vectors match up. And the equation looks like this:

$$S(g_1, g_2) = \frac{g_1^T g_2}{|g_1||g_2|} \text{------- (5)}$$

Info NCE is used to build a contrastive learning loss function between users and items, with the goal of making the vectors of users and positive sample items i tend to be similar in vector space while the vector representations of users and other things j tend to be scattered.

Algorithm 1: Enhanced Graph Convolutional Neural Networks
Input: • Neuroimaging Data as Graphs: Neuroimaging data represented as graphs, where brain regions correspond to nodes, and edges encode functional or anatomical connections between brain regions.   **Algorithm Steps:**   • reprocess Neuroimaging Data: Convert the neuroimaging data into graph representations, where brain regions are nodes, and connections between regions are represented as edges. Assign AD labels to each subject in the dataset.   • $S(g_1, g_2) = \frac{g_1^T g_2}{|g_1||g_2|}$ • Enhance Graph Convolutional Neural Network (EGCNN):

a. Design an EGCNN architecture suitable for AD prediction, leveraging the graph structure of the neuroimaging data.

Output:

- Trained EGCNN Model: The EGCNN model is trained using the contrastive learning approach, which leverages the neuroimaging data in graph form for AD prediction.

RESULTS AND DISCUSSION

Our examination into AD prediction using EGCNNs (Enhanced Graph Convolutional Neural Networks) based on neuroimaging data is presented in the Results and Discussion portion of this article. We provide the experimental data, the assessment of the suggested EGCNN model's performance, and a thorough explanation of the results in this part. The fundamental goal of this study was to create an original method for AD prediction that makes efficient use of graph representations of spatial interactions between brain areas. The proposed EGCNN model incorporates attention mechanisms to provide precedence to informative brain areas and adaptively weight their contributions during feature aggregation. The accuracy and sensitivity of the model in identifying early alterations associated with AD are predicted to increase thanks to this attention-based augmentation.

Table 1 reveals that the EGCNN model outperforms ANN and K-Means, with a stunning accuracy of 1.0 and an amazing F-measure of 0.96. EGCNN successfully recognizes positive cases while keeping a high overall correctness in its predictions, with a recall of 0.93 and an accuracy of 0.95. ANN, on the other hand, achieves decent results, with an F-measure of 0.87, recall of 0.88, precision of 0.86, and accuracy of 0.86. However, the applicability of K-Means for direct comparison with the other models is debatable since its accuracy, recall, and F-measure values are based on clustering performance. Finally, the findings demonstrate EGCNN to be the star performer in this study, demonstrating its potential for higher classification performance.

The figure 2 shows recall comparison the x axis shows methods and the y axis shows value. The figure 3 shows precision comparison the x axis shows methods and the y axis shows value.
The figure 4 shows F-measure comparison the x axis shows methods and the y axis shows value.
The figure 5 shows accuracy comparison the x axis shows methods and the y axis shows value.

CONCLUSION

In this article, we developed a new technique for Alzheimer's disease (AD) prediction based on neuroimaging data represented as brain graphs utilizing Enhanced Graph Convolutional Neural Networks (EGCNNs). Our goal was to use machine learning methods, notably graph convolutional neural networks, to capture the intricate structural interactions between brain areas and increase the accuracy of AD identification. Our trials on a large dataset of neuroimaging scans from people with varied degrees of cognitive impairment, including Alzheimer's disease patients and healthy controls, confirmed the usefulness of the proposed EGCNN design. We were able to highlight important brain areas and adaptively evaluate their contributions during feature aggregation by adding attention processes. This attention-based augmentation allowed the model to concentrate on crucial areas that change significantly in the early stages of Alzheimer's disease, resulting in increased predicting performance. The successful deployment of the EGCNN model demonstrates the power of machine learning algorithms in offering useful insights into Alzheimer's disease prediction, which is critical for early intervention and improved patient care. The capacity to reliably identify those at risk of acquiring Alzheimer's disease may lead to prompt treatment interventions and improve the quality of life for afflicted people and their family.

ABSTRACT

Theoretical Solution to the problem on MHD flow with heat and mass transfer effects on a rotating system of an electrically conducting fluid in the presence of Hall current under the influence of uniform temperature and variable mass diffusion is obtained and analyzed. An exact solution of a non-dimensional form of coupled partial differential equations is obtained by the Laplace transform technique. The effect of temperature, velocity and concentration is analyzed for various parameters like the Hall parameter (m), rotation parameter (Ω), Hartmann number (M), angle of inclination(α)and results are discussed in detail with the help of graphs using MATLAB. It has been observed that when there is an increase in the values of rotation parameter and angle of inclination, the axial velocity gets increases but the transverse velocity gets decreased. Axial velocity get increases but transverse velocity get decreases when Hall parameter values decreased.

Keywords: Hall Effect, MHD, exponentially, Inclined plate, Magnetic field, uniform temperature.

INTRODUCTION

Magneto-hydrodynamics (MHD) principles have been equipped for considerable engineering purposes such as dynamo, fusion reactors, motor mechanisms, and flow meters, etc. Biomedical sciences also have huge applications of MHD. Applications of the study arise in magnetic field-controlled material processing systems, planetary and solar plasma fluid dynamical systems, rotating MHD induction machine energy generators etc. Varied applications of Hydro magnetic flows and heat transfer plays an important role in agricultural engineering and petroleum industries in recent years. In geophysical and geothermal fields, the characteristics of fluid flows in a rotating environment have meaningful influences. An MHD flow with Hall current is encountered in engineering applications in MHD pumps, MHD bearings, etc.,

Radiation effect on MHD flow past an inclined plate with variable temperature and mass diffusion was studied by Rajput and Gaurav Kumar [3]. They solved the governing equations using Laplace Transform technique and analyzed that the velocity in the boundary layer increases with the values of radiation and Hall current parameters. Muthucumaraswamy et.al [2] have worked on Hall effects and rotation effects on MHD flow past an exponentially accelerated vertical plate with combined heat and mass transfer effects. They solved the governing flow model by using Laplace transform technique and observed that the both axial and transverse velocities increase with decreasing values of magnetic field parameter. Jyotsna Rani Pattnaik et.al [4] have investigated Radiation and mass transfer effects on MHD flow through porous medium past an exponentially accelerated inclined plate with variable temperature. Vijayaragavan et al [9] have investigated Heat and mass transfer effect of a Magneto hydrodynamic Casson fluid flow in the presence of inclined plate by Laplace transformation process. They noticed that with an increase in the Dufour number, the axial velocity decreases and it is also noted that the concentration of the species decreases with an increase in the Dufour number.

Muthucumaraswamy et.al [1] analyzed that Rotation effects on MHD flow past a vertical accelerated plate with variable temperature and uniform mass diffusion. Idowu et.al [7] have worked on effects of thermophoresis, Soret-Dufour on heat and mass transfer flow of magneto hydrodynamics non-Newtonian nanofluid over an inclined plate. Balamurugan et al[12] examined how heat and mass transfer effects on linearly accelerated isothermal inclined plate using Laplace Transform method. They discussed that the fluid velocity is reduced by radiation parameter, Prandtl number and inclined angle parameter. They observed that the velocity decreases with the increase of magnetic field parameter, chemical reaction parameter, Schmidt number, heat source parameter, Prandtl number and angle of inclination. .Rotation and radiation effects on MHD flow past an inclined plate with variable wall temperature and mass diffusion in the presence of Hall current was studied by Rajput and Gaurav Kumar [5]. From the study, it has been found that the velocity in the boundary layer region decreases with the values of radiation parameter.

Heat and Mass Transfer effect on an infinite vertical Plate in the presence of Hall Current and thermal radiation with variable temperature was studied by Manjula and Muthucumuraswamy [8] and they have noticed that the velocity increases with a decrease in the rotation parameter, chemical reaction parameter, magnetic parameter and radiation parameter.Effects of chemical reaction and heat generation/ absorption on magneto hydrodynamic (MHD) Casson fluid flow over an exponentially accelerated vertical plate embedded in porous medium with ramped wall temperature and ramped surface concentration was studied by Kataria and Patel [6].MHD Casson fluid flow with an inclined plate in the presence of Hall and aligned magnetic effects are solved using perturbation method was studied by Kranthi kumar et al [10].They have observed that fluid velocity is decreased with increasing values of angle of inclination. Husna Izzati Osman et al [13] analyzed the study on MHD free convection flow past an infinite inclined plate using Laplace Transform technique. They observed that the increment in values of inclination angle accelerates the fluid motion along the plate. The flow on rotational and Hall current effects on a free convection MHD flow with radiation and inclined magnetic field was studied by Rajput and Naval Kishore Gupta [15].Raghunath Kodi and Venkateswaraju Konuru[14] have studied heat and mass transfer on MHD convective unsteady flow of a Jeffery fluid past an inclined vertical porous plate with thermal diffusion Soret and aligned magnetic field. Rashid Ayub

et.al [16] have studied the MHD rotational flow of viscous fluid past a vertical plate with slip and Hall effect through porous media: A theoretical modeling with heat and mass transfer.MHD free convective flow across an inclined porous plate in the presence of heat source, soret effect was studied by Bijoy Krishna Taid and Nazibuddin Ahmid [11] and they have analyzed the chemical reaction affected by viscous dissipation ohmic heating. The objective of this paper is to study the magneto hydrodynamic flow on an exponentially accelerated inclined plate in the presence of a rotating system with Hall current relative to uniform mass diffusion and variable temperature. The analytic solutions of dimensionless governing equations are expressed as a function of exponential and complement error function. Numerical results for concentration, temperature and fluid velocity profiles are represented by graphs which are executed by MATLAB.

MATHEMATICAL FORMULATION

We consider an electrically conducting viscous incompressible fluid past an infinite plate occupying the plane $z' =0$. The x'-axis is taken in the direction of the motion of the plate and y'-axis is normal to both x' and z' axes. Initially, the fluid and the plate rotate in unison with a uniform angular velocity Ω' about the z'-axis normal to the plate, also the temperature of the plate and concentration near the plate are assumed to be T_∞ and c'_∞. At time $t' > 0$, the plate is exponentially accelerated with a velocity $u' = \dfrac{u_0}{A}\exp(a't')$ in its own plane along x'-axis and the temperature from the plate raised to T_w and the concentration level near the plate is kept at c'_w. Here the plate is electrically non conducting. Also, a uniform magnetic field B_0 is applied parallel to z'-axis. Also the pressure is uniform in the flow field. Let u', v', w' represent the components of the velocity vector F. The equation of continuity $\nabla. F = 0$ gives $w' = 0$ everywhere in the flow. Here the flow quantities depend on z' and t' only and it is assumed that the flow far away from the plate is undisturbed. Under these assumptions the unsteady flow is governed by the following equations

$$\frac{\partial u'}{\partial t'} = v\frac{\partial^2 u'}{\partial z'^2} + 2\Omega' v' - \frac{\sigma\mu_e^2 B_0^2}{\rho(1 + m^2)}(u' + mv') +$$
$$g\beta(\text{T-}T_\infty)\ cos\alpha + g\beta^*(c'\text{-}c'_\infty)cos\alpha(1)$$
$$\frac{\partial v'}{\partial t'} = v\frac{\partial^2 v'}{\partial z'^2} - 2\Omega' u' + \frac{\sigma\mu_e^2 B_0^2}{\rho(1 + m^2)}(mu' - v')(2)$$
$$\rho c_p \frac{\partial T}{\partial t'} = K\frac{\partial^2 T}{\partial z'^2}(3)$$
$$\frac{\partial c'}{\partial t'} = D\frac{\partial^2 c'}{\partial z'^2}(4)$$

Where u' is the axial velocity and v' is the transverse velocity.
The prescribed initial and boundary conditions are

$u' = 0, v' = 0, \text{T} = T_\infty, c' = c'_\infty$ at $t' \leq 0 for\ all z'$

$u' = \dfrac{u_0}{A}e^{a't'}$, $v' = 0$,$\text{T} = T_w, c' = c'_w$
$at z' = 0 for all t' > 0$

$\boldsymbol{u' \to 0, v' \to 0, \text{T} \to \text{T}_\infty, c' \to c'_\infty as z' \to \infty}$

Loganathan *et al.,*

where $A = \left(\dfrac{u_0^2}{\upsilon}\right)^{\frac{1}{3}}$ is a constant.

On introducing the following non-dimensional quantities

$$u = \frac{u'}{(u_0\upsilon)^{\frac{1}{3}}}, v = \frac{v'}{(u_0\upsilon)^{\frac{1}{3}}},$$

$$z = z'\left(\frac{u_0}{\upsilon^2}\right)^{\frac{1}{3}}, t = \left(\frac{u_0^2}{\upsilon}\right)^{\frac{1}{3}} t',$$

$$\Omega = \Omega'\left(\frac{\upsilon}{u_0^2}\right)^{\frac{1}{3}}, M^2 = \frac{\sigma\,\mu_e^2 B_0^2 \upsilon^{\frac{1}{3}}}{2\,\rho\,u_0^{\frac{2}{3}}},$$

$$a = \left(\frac{\upsilon}{u_0^2}\right)^{\frac{1}{3}} a'$$

$$Gc = \frac{g\beta^*(c_w' - c_\infty')}{u_0}, Gr = \frac{g\beta(T_w - T_\infty)}{u_0},$$

$$C = \frac{c' - c_\infty'}{c_w' - c_\infty'}, \theta = \frac{T - T_\infty}{T_w - T_\infty},$$

$$Pr = \frac{\mu\,c_p}{K}, Sc = \frac{\upsilon}{D}$$

The equations (1),(2),(3) and (4) reduce to the following non-dimensional form of governing equations

$$\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial z^2} + 2\,\Omega\,v - \frac{2M^2}{1+m^2}(u + mv)$$
$$+ Gr\theta\,cos\alpha + GcC\,cos\alpha \quad (5)$$

$$\frac{\partial v}{\partial t} = \frac{\partial^2 v}{\partial z^2} - 2\,\Omega\,u + \frac{2M^2}{1+m^2}(mu - v)(6)$$

$$\frac{\partial\theta}{\partial t} = \frac{1}{Pr}\frac{\partial^2\theta}{\partial z^2}(7)$$

$$\boldsymbol{\frac{\partial C}{\partial t} = \frac{1}{Sc}\frac{\partial^2 C}{\partial z^2}}(8)$$

With initial and boundary conditions

$$u = 0\,, \text{ v} = 0,\ \theta = 0,\ \text{C} = 0$$
$$at\,t \leq 0\,for\,all\,z \qquad (9)$$

$$u = e^{at}, v = 0, \theta = 1, C = \text{t}$$
$$at\,t > 0, z = 0 \qquad (10)$$

$$u \to 0, v \to 0, \theta \to 0, C \to 0$$
$$as\,z \to \infty \qquad (11)$$

The equations (5) - (6) and boundary conditions (9)-(11) are combined and presented.

$$\frac{\partial q}{\partial t} = \frac{\partial^2 q}{\partial z^2} - 2\,q\left[\frac{M^2}{1+m^2} + i\left(\Omega - \frac{M^2 m}{1+m^2}\right)\right] \quad (12)$$
$$+ \text{Gr}\,\theta\,cos\alpha + \text{Gc C}\,cos\alpha$$

66902

$$\frac{\partial \theta}{\partial t} = \frac{1}{Pr}\frac{\partial^2 \theta}{\partial z^2} \quad (13)$$

$$\frac{\partial C}{\partial t} = \frac{1}{Sc}\frac{\partial^2 C}{\partial Z^2} \quad (14)$$

With boundary conditions
$q = 0$, $\theta = 0$, $C = 0$ $at\ t \le 0\ for\ all\ z$ (15)

$q = e^{at}$, $\theta = 1$, $C = t$
$at\ z = 0, for\ all\ t > 0$ (16)

$q \to 0$, $\theta \to 0$, $C \to 0$ as $z \to \infty$ (17)

Where $q = u + iv$.

SOLUTION OF THE PROBLEM
Laplace –Transform technique is used to solve the dimensionless governing equations (12) to (14), subject to the initial and boundary conditions (15)-(17). The solutions are in terms of exponential and complementary error function.

$$\theta = erfc(\eta\sqrt{Pr})$$

$$C = t\left[(1 + 2\eta^2\,Sc)erfc(\eta\sqrt{Sc}) - \frac{2\eta\sqrt{Sc}}{\sqrt{\pi}}\exp(-\eta^2\,Sc)\right]$$

$$q = \frac{e^{at}}{2}\begin{bmatrix} exp(\,2\eta\sqrt{(a+b)t}\,)erfc(\eta + \sqrt{(a+b)t}) + \\ exp(\,-2\eta\sqrt{(a+b)t}\,)erfc(\eta - \sqrt{(a+b)t}) \end{bmatrix}$$

$$-\frac{1}{2}\left[\frac{c_1}{b_1^2} + \frac{c_2}{b_2}\right]\begin{bmatrix} exp(\,-2\eta\sqrt{bt}\,)erfc(\eta - \sqrt{bt}) + \\ exp(\,2\eta\sqrt{bt}\,)erfc(\eta + \sqrt{bt}) \end{bmatrix}$$

$$+\left[\frac{c_1}{b_1^2}\right]\left[\frac{e^{b_1 t}}{2}\right]\begin{bmatrix} exp(\,-2\eta\sqrt{(b_1+b)t}\ erfc(\eta - \sqrt{(b_1+b)t} \\ + exp(\,2\eta\sqrt{(b_1+b)t}\ erfc(\eta + \sqrt{(b_1+b)t} \end{bmatrix}$$

$$+\left[\frac{c_2}{b_2}\right]\left[\frac{e^{b_2 t}}{2}\right]\begin{bmatrix} exp(\,-2\eta\sqrt{(b_2+b)t}\ erfc(\eta - \sqrt{(b_2+b)t} \\ + exp(\,2\eta\sqrt{(b_2+b)t}\ erfc(\eta + \sqrt{(b_2+b)t} \end{bmatrix} - \frac{c_1}{b_1}\begin{bmatrix} \frac{t}{2}\begin{bmatrix} exp(\,-2\eta\sqrt{bt}\,)erfc(\eta - \sqrt{bt}) + \\ exp(\,2\eta\sqrt{bt}\,)erfc(\eta + \sqrt{bt}) \end{bmatrix} \\ -\frac{\eta\sqrt{t}}{2b}\begin{bmatrix} exp(\,-2\eta\sqrt{bt}\,)erfc(\eta - \sqrt{bt}) + \\ exp(\,2\eta\sqrt{bt}\,)erfc(\eta + \sqrt{bt}) \end{bmatrix} \end{bmatrix}$$

$$-\ \left[\frac{c_1}{b_1^2}\right]\left[\frac{e^{b_1 t}}{2}\right]\begin{bmatrix} exp(\,-2\eta\sqrt{b_1 Sct}\,)erfc(\eta\sqrt{Sc} - \sqrt{b_1 t}) \\ + exp(\,2\eta\sqrt{b_1 Sct}\,)erfc(\eta\sqrt{Sc} + \sqrt{b_1 t}) \end{bmatrix}$$

$$+\left[\frac{c_2}{b_2}\right]\left[erfc(\eta\sqrt{Pr})\right] + \left[\frac{c_1}{b_1^2}\right]\left[erfc(\eta\sqrt{Sc})\right]$$

$$+\frac{c_1}{b_1}t\left[(1 + 2\eta^2\,Sc)erfc(\eta\sqrt{Sc}) - \frac{2\eta\sqrt{Sc}}{\sqrt{\pi}}\exp(-\eta^2\,Sc)\right]$$

$$-\frac{c_2}{b_2}\left[\frac{e^{b_2 t}}{2}\right]\begin{bmatrix} exp(\,-2\eta\sqrt{Pr b_2 t}\,)erfc(\eta\sqrt{Pr} - \sqrt{b_2 t}) + \\ exp(\,2\eta\sqrt{Pr b_2 t}\,)erfc(\eta\sqrt{Pr} + \sqrt{b_2 t}) \end{bmatrix}$$

Where $b = 2\left[\frac{M^2}{1+m^2} + i\left(\Omega - \frac{M^2 m}{1+m^2}\right)\right]$, $b_2 = \frac{b}{Pr-1}$,

$c_2 = \frac{Gr\,cos\alpha}{Pr-1}$, $b_1 = \frac{b}{Sc-1}$, $c_1 = \frac{Gc\,cos\alpha}{Sc-1}$,

Loganathan *et al.,*

$\eta = z/2\sqrt{t}$

In order to get a clear understanding of the flow field, we have separated q into real and imaginary parts to obtain axial and transverse components u and v.

INTERPRETATION OF RESULTS

Numerical calculations are carried out for different physical parameters M, m, Ω, Gr, Gc, Pr Sc, and the corresponding graphical outputs were obtained using MATLAB which are shown below. Figure (1) shows the temperature profiles against on Prandtl number, it is observed that an increasing Prandtl number the results were decreases. The influences of the Schmidt number on concentration profiles are plotted in figure (2) respectively. It is noticed that, decrease in concentration profile, on increasing the values of Sc. Effects of magnetic field on axial and transverse velocity profiles for different values of the magnetic parameter are depicted in figure (3) and figure (9). It is observed that the axial velocity decreases with increasing magnetic parameter. This shows that axial velocity decreases in the presence of high magnetic field. But the trend gets reversed for the transverse velocity. The axial and transverse velocity profiles for different values of the rotation parameter are shown in figure (4) and figure (10). It is observed that the transverse velocity decreases with increasing the rotation parameter Ω. But the trend gets reversed for the axial velocity. Hall current effects on axial and transverse velocity profiles for different values of the Hall current parameter are depicted in figure (5) and figure (11). From the graphical output, it is shown that the axial velocity decreases with increasing Hall current parameter, whereas transverse velocity gets increased when the Hall current parameter increases. Effects of thermal Grash of number (Gr =5,10,15,20,25) on axial and transverse velocity for different thermal are shown in figure (6) and (12). It is clear that the both the velocity decreases with increasing thermal Grashof number. The effects of mass Grashof parameter (Gc=5,10,15,20,25) on axial and transverse velocity appears in figure (7) and (13), form these figures it is clear that an increasing mass Grash of parameter the results are increases. From the figure (8) and (14), it is noticed that the axial velocity increases with increasing values of an angle of inclination, but the trend revoked for the transverse velocity.

CONCLUSION

From the study, it is observed that axial velocity profiles increased with rotation parameter and angle of inclination parameter and the trend gets reversed in the case of transverse velocity. It is also noticed that transverse velocity profiles increased with Hall parameter and magnetic parameter and the trend gets reversed in the case of axial velocity.

ABSTRACT

Protein polymer interactions need to be studied because they have various applications in the clinical industry, particularly in the delivery of drugs. Polyethylene Glycol(PEG) is one of the most effective antifouling materials with many proteins repellent properties. To obtain precise information, we created the PEG Binder Python program, which provides information on the binding residues of PEG. For this, we extracted data from the Protein data bank. The results show that aromatic amino acids are highly preferred to polymer PEG. The structure of the binding residues with polymer PEG was visualized with the help of the AVAGADRO tool.

Keywords: Polyethylene Glycol, Python, PDB, Avagadro Tool.

INTRODUCTION

PEG is secure to utilize, harmless, immune-enhancing, highly dissolvable in water and is authorized by the Food and drug administration[1]. The anti-fouling substance peg is most frequently utilized in industrial and biological operations[3-5].PEG seeks excellent attention in drug transportation by allowing peptides and protein to perform their therapeutic function[2].PEG-covered surfaces have been showed to be extremely resistant to protein disruption, cell adhesion, and even bacterial adhesion. Since Peg-conjugated proteins are

non-fouling they can also reduce the impact of foreign invaders on the immune system, prolong blood circulation and enhance proteolysis [6-12].The protein-resistant, non-adhesive characteristics of PEG-coated surfaces have been thoroughly examined through experiments and computer simulations[13-20].

Peg is well known for its great structural flexibility, biocompatibility and high hydration capacity[26]. It plays a crucial role in enhancing solubility and facilitating permeation[27]. Peg is electrically neutral at all pH levels and has an extremely active terminal function[28]. Peg is broken down in the body via oxidation in which its alcohol group is transformed into carboxylic acid, diacids and hydroxyl acid metabolites. This breakdown happens with the help of an enzyme known as alcohol dehydrogenase[29].Peg is said to inhibit the transfection rate because it interferes with the intracellular molecules. The use of Pegylation was gradually increased in the fields of biology and polymer chemistry because of its improved applications in pharmaceutical therapies[21,22].Peg is commonly employed as a lubricating agent in eye drops[30].According to more recent studies, Peg particles can be employed for chemotherapy and multimodal combination therapy[23-25].This paper presents a simple approach for predicting the PEG binding residues in viral proteins.

MATERIALS AND METHODS

Data Collection

The protein sequences required for this analysis were extracted from the Protein databank. The selected sequences were non-homologous and their structures were determined at high resolution. In this study we analysed the interacting and non-interacting PEGs residues to understand Polymer interactions . Residues are designated as polymer interacting if its atoms are in the 3Å range. The contact between residues and PEG was calculated using Python program. We took the PEG polymerized SARS Covid protein sequences with similarities between 30% (2508) and 90% (1050), their differences (1458) were taken into account. All datasets with repeated protein sequences were deleted and the remaining identifiers with the ligand-interacting proteins were retained.

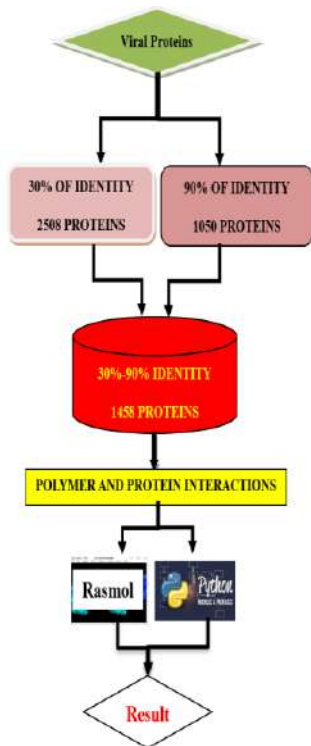
Once the protein is selected, a Python program is constructed with a range of less than 13 A° to determine the bond length [31,32] . It will show the results of amino acids rapidly interacting with the Polymer PEG . When amino acids were separated from the results, the data were analysed statistically [33] . The frequency of occurrence of amino acid for 458 proteins of both singlet and triplet groups was calculated using the formula.

$$P(x) = \frac{No\ of\ counts\ in\ particular\ AA}{Total\ No\ of\ aminoacid\ in\ proteins}$$

In this approach, we used the values of frequency of occurrence of singlet and triplet as expected count and observed count. The chi-square value for AA singlet and triplet in a given structural element is calculated using the formula,

$$\chi^2 = \frac{\{Observed - Expected\}^2}{Expected}$$

This formula is used to identify the residue that is preferentially binding to the PEG, as well as the amino acid that is in the "non-preferential" zone. Few viral proteins were randomly selected, and the work was conducted in a similar manner for all other proteins. The visualisation tool can be used to visualize the shortest distances between the amino acids that are interacting with the PEG. Additionally, Avagadro tool can be used to analyze the structure of amino acid interactions.

Flow Chart


RESULT

Graphical representation of the Chi-square test of various protein IDs with Polymer PEG
The output of the program was extracted and presented graphically.

The graphical analysis above classifies chi-square values into four categories: -1, indicates that amino acids are out of range and above 0.5, indicating that amino acids are interacting with PEG. Finally, -0.5 denotes a non-preferred region, while 1.5 and above denotes a high-preferred amino acid region. As shown in Chat 1, residues such as N, E, T, RW, Y, F are more abundant in the Polymer interacting residues. Graphical analysis clearly shows that residues W, R,F are the preferred residues in the Polymer interacting site. Residues like A, S, V, I P and D corresponds to non-interacting side. The presence of small, polar and aromatic amino acids was more prevalent in the PEG-binding sites, while the PEG- nonbinding sites were characterized by a high concentration of nonpolar amino acids and aliphatic amino acids.

DISCUSSION

In order to understand how PEG works, we first need to know which amino acid residues bind to PEG. We have created a Python program to look for the binding residue. We chose Python because it is widely used and has a wide range of uses in biosciences. This method is easy and time-consuming, as it only involves a protein sequence. It allows us to perform and analyse multiple sequences at the same time, without any prior knowledge of structural data. The main finding is that the residues in the binding site of PEG are highly conserved, and PEG binds to its beta turn structure and the residues like W,R,F has larger propensity to bind with polymer PEG.

ABSTRACT

Even though chronic kidney patients are more prone to develop cardiovascular disease and its frequency is more in developed countries, the prevalence of CVD and related risk factors in people with chronic renal disease in developing nations is poorly understood. The goal of this study is to determine the risk factors for patients who have both CKD and CVD and to define their baseline characteristics to create a scientific recommendation for a successful treatment plan. In this retrospective analysis, a total of 232 patients who reported to have CKD and CVD were included. Data regarding their sociodemographic, biochemical, and clinical characteristics have been collected. Analysis of variance or chi-square test, as applicable, was used to compare baseline characteristics between stages. To analyze the relationship between CVD and independent risk factors of CKD stages, multiple logistic regression analysis was performed. Our study population had an average age of 68.81 years, with 67.7% of the population being male. The mean serum creatinine and eGFR were 1.86 mg/dL and 50.41 mL/min/1.73m² respectively. Multi variable statistical analysis showed that lower eGFR, hemoglobin levels, increasing age and the presence of hypertension and DM were associated with CVD among patients with CKD. The results of our study indicate that in this subgroup of CKD patients, it is crucial to focus on the existence of lifestyle issues, adequate management of anemia, and independent risk factors. Therefore, to enhance patient care and carry out the best decision-making process, it is vital to engage patients in long-term clinical trials

Keywords: Cardiovascular disease**,** Chronic kidney disease, Diabetic mellitus, Hypertension, Sociodemographic factors.

INTRODUCTION

Cardiovascular disease (CVD) is a major non-communicable disease and a significant factor of comorbidity and mortality globally. By 2040, it is anticipated that kidney diseases will be the fifth most common cause of mortality worldwide [1]. Between 2001–2003 and 2010–2013, the percentage of deaths due to kidney failure in India increased by 38% [2]. One or more test results for blood or urine analysis that are outside the normal range do not fully describe CKD. In addition to the 1.4 million deaths from cardiovascular disease linked to impaired kidney function, approximately 1.3 million individuals lose their lives from kidney disease annually [3]. In fact, people with early-stage CKD are more likely to lose life due to CVD than develop end-stage renal disease (ESRD), making CKD intrinsically equivalent to coronary artery disease (CAD) [4,5]. As chronic kidney disease (CKD) develops from end-stage renal disease, patients are more likely to be at risk of morbidity and death. They are also more prone to developing cardiovascular disease (CVD), which has a mortality rate that is roughly 30 times higher than that of other diseases[6]. The mechanisms underlying this link are complex, but CKD is thought to contribute to the development of CVD through a combination of multiple risk factors such as inflammation and endothelial dysfunction.[5] Although the severity of this threat has been well highlighted, individuals with renal impairment were excluded from the trial. Therefore, there is a shortage of evidence-based therapies for CVD in CKD [7].

Polypharmacy is also warranted in patients with CVDs because it results in irrationality [8,9]. There is a significant variance in the pharmacotherapy used by patients with CVD, where prudent drug use is essential for maximizing safety and effectiveness. Continuous audits in critical care offer insights into present practices and feedback to rationalize recommended practices[10]. Hence, in this study, we attempted to find cardiometabolic risk using the clinical characteristics, demographic data, and evaluate CKD stage progression using eGFR. To develop better scientific treatment plans for CKD with CVD patients, we assessed the baseline clinical and demographic characteristics of the south Indian participants with a focus on the prevalence of cardiovascular disease in kidney disease patients and compared the findings with those from earlier Indian Chronic Kidney Diseases (ICKD) cohort study for better understanding.

MATERIALS AND METHODS

We performed a retrospective study that included patients with CKD stages 1-5 aged ≥ 18 years, between July 1, 2022, and December 31, 2022. The study received approval from Institutional Ethical Committee (reference number EC/AP/907/05/2022) of Kovai Medical Centre and Hospital. Patient's medical reports and laboratory data report were used to collect the data. Patient information related to demographic details, clinical characteristics, laboratory investigations, socioeconomic status, and lifestyle pattern were collected.The duration of research was six months. A total of 232 patients with both kidney disease and cardiovascular disease were included in this research. Organ transplant candidates, pregnant women, cancer patients, and people currently taking immunosuppressive medication were excluded from this study.

Compilations of participant sociodemographic traits, clinical traits, laboratory traits, and comparisons with ICKD data were made. Cardiac disease,peripheral vascular and cerebrovascular disease were all included in the definition of cardiovascular disease. Severe valvular heart disease, congestive heart failure, and coronary artery disease with or without valvular replacement were all considered to be forms of cardiac disease. The diagnosis of coronary artery disease requires one of the following: a past myocardial infarction, coronary artery bypass graftingor percutaneous transluminalcoronary angioplasty with or without stent insertion and angina pectoris. A prior transient ischemic attack, stroke, or cerebral hemorrhage were all considered cerebrovascular diseases. Intermittent claudication, the requirement for peripheral revascularization, or amputation were all symptoms of peripheral arterial disease. The CKD stages were selected based on the KDIGO classification. Using the CKD-EPI (Chronic Kidney Disease Epidemiology) 2009 creatinine equation, the glomerular filtration rate was determined. Sociodemographic features including gender, age, alcohol consumption, smoking, BMI (body mass index), and physical activity information

were collected. Anthropometric measurements (weight, pulse rate) were recorded. Biochemical parameters, including serum creatinine and systolic and diastolic pressure, were measured in our hospital to avoid testing deviations among laboratories. Co-morbid illness was also noted.

Statistical Analysis

IBM SSPS version 22 was used for data analysis. Sociodemographic, clinical, and biochemical analyses were performed both descriptively and quantitatively to identify specific traits. This study presented a distribution that depended on CKD stage. Mean and standard deviation (SD) were used to describe the data for continuous variables. ANOVA (Analysis of variance) or chi-square test, as applicable, was used to compare baseline characteristics between stages. Using co-variates in a multi-logistic regression model, cardiometabolic risk factors were analyzed. In our study, statistical significance was determined by P <0.05, and P-values were two-sided.

RESULTS

The sociodemographic characteristics of the patients with CKD stage-wise distribution are presented in Table 1. CKD stage 3B is accountable for the highest percentage (29.3%) of the study population. The average age during enrollmentwas 68.81 ± 11.45 years, with 67.7% of the population being males and the mean BMI being 23.56±2.72. About 17.7% of the study populations were current tobacco users and 11.2 % were alcoholics. Only 13.4 % of the study cohort was physically active.

Biochemical characteristics of the study population based on the CKD stages are presented in Table 2. The mean Systolic and Diastolic Blood Pressure were 135.78 ± 29.94 mm/Hg and 82.07 ± 14.80 mm/Hg respectively. The average pulse rate was 89.54 ± 24.51 beats per minute (bps). The mean serum creatinine and eGFR were 1.86 ± 1.39mg/dL and 50.41 ± 28.53mL/min/1.73m2, respectively. The mean abdominal obesity was 9.0%. Clinical characteristics of the study cohort based on the CKD stages are presented in Table 3. Diabetic mellitus was reported in 50.9 % study population with the mean duration of diabetics being 8.0 ± 9.6 years. Hypertension was reported in 44.8% study population with the mean duration of hypertension being 5.3 ± 8.0 years. Almost 7.8% population has dyslipidemia with a mean duration of 3.2 ± 6.2 years.Acute Decompensated Heart Failures were reported the highest percentage (30.2%) followed by coronary artery disease (28.0%), Left Ventricular Dysfunction (23.3%), and Cardiomyopathy (8.2%). Acute kidney problems were reported in 22.8% population. Bladder problems were reported in 5.6% of patients. Insomnia was reported at 7.8%. Chronic Obstructive Pulmonary Disease was reported in 9.1% of patients. Table 4 shows the comparison between selected features of the current study and the previous ICKD cohort study conducted by V. Kumar *et al.* [5]. We observed significant differences in the mean age and incidence of hypertension.

DISCUSSION

A total of 232 individuals with CKD stages [1-5] were included in the study. Stage 3B CKD accounted for 29.3% of the study population, raising concerns regarding the need for early identification and proper treatment planning for CKD. eGFR was associated with age, which agrees with the conclusions made by Noronha et al. Majority of the patients were males (67.7%), and they were more prone to CVD which is comparable to the findings from the Indian Cohort for Chronic Kidney Disease (ICKD) [10] and a multicenter hospital-based registry of patients with CKD in India [11] . According to the Chinese Cohort Study of CKD (C-STRIDE), the rate of tobacco usage rose to 38.2%[12]. Approximately 11.2% of the participants were alcoholic. Between 20% and 36% of patients with chronic renal disease are estimated to consume alcohol, and 10% of these individuals report excessive drinking. However, alcohol use was not associated with renal function in other trials; instead, it was inversely linked to the likelihood of developing CKD [13,14]. Another possible risk factor during our analysis was a sedentary lifestyle[15].Overweight is defined by international standards as having a BMI between 25 and 29.9 kg/m2, while obesity is defined as having a BMI over 30 kg/m2. This BMI reported in our study alike CKD-ROUTE cohort. [16.17] Only 13.4% of participants reported

Leena Varghese *et al.,*

engaging in physical exercise. However, some studies have reported BMI as an independent risk factor for CVD [18,19]. However, our study did not provide evidence for a linear relationship between BMI and CVD risk. Therefore, in our study group, obesity had no discernible impact on the prevalence of CKD and cardiovascular disease.

The systolic, diastolic blood pressure level and mean pulse rate were found to be slightly above the normal range. This shows the prevalence of hypertension, which is the primary contributor to CKD and CVD[20]. The risk of cardiac death has been demonstrated to increase by at least 20 percent for every 10 beats/min increase in heart rate, and this risk elevation is comparable to that in other studies with an increase in systolic blood pressure of 10 mmHg[21,22]. The mean eGFR was found to be 50.4 ± 28.53 mL/min/1.73m2 which is lower than normal range which is a major risk for CVD and the mean serum creatinine was found to be lesser (1.86± 1.39 mg/dL) which was consistent with the results from ICKD study [10]. Since we obtained an inverse correlation between age and declining eGFR in CKD patients, we have done an analysis on eGFR of each CKD stage [1-5] in cohort and prevalence of CVD was found to be higher with patients having lower eGFR value[23,24,25]. Although few studies reported no major difference between eGFR between CKD stage 3a and 3b, we have found a significant difference in the eGFR value and CVD for predicting the burden of disease which was identical to the Chinese Cohort Study (C-STRIDE) [12]. Overt renal impairment is strongly and independently linked to a higher risk of cardiovascular events, according to other studies conducted [16].

Diabetes mellitus was reported in 50.9 % of the study population, with a mean duration of 8.0 years which aligns with the Korean Cohort study [21]. Both CKD and CVD are substantially correlated with hyperglycemia. The widespread coexistence of type 2 diabetes with CVD and CKD is not surprising given the interconnected physiology of the metabolic, cardiac, and renal systems. The presence of type II diabetes mellitus and hypertension can lead to macrovascular complications, increasing the risk of morbidity and death in patients with CVD and CKD [26,27]

CONCLUSION

Lower eGFR levels, prevalence of diabetes, duration of hypertension, and management of anemia should be strategically targeted to reduce several burdens caused by cardiovascular disease, which makes CKD an independent risk factor for CVD. There is a wide range of invasive and non-invasive tests available for the diagnosis of CVD, but it is still unclear how each of them will be useful for CKD patients. In addition, the differential effects of the drugs administered vary according to the different stages of CKD. Therefore, it is necessary to develop evidence-based management strategies to prevent cardiovascular morbidity and mortality.

ABSTRACT

The purpose of this article is to introduce a new concept called generalized pre-open sets in Pythagorean Neutrosophic Hypersoft topological spaces. Additionally, their properties are discussed.

Keywords: Pythagorean Neutrosophic Hypersoft generalized pre-open, Pythagorean Neutrosophic Hypersoft topology.

INTRODUCTION

Numerous theories are utilized in the literature to address the ambiguity and uncertainty of numerous problems that arise in Engineering, Economics, Social Science, etc., All ideas, however have their own drawbacks. Multiple qualities and uncertainty are present in multi-criteria Decision-making situations, Since Neutrosophicsets fully address indeterminacy, whereas Neutrosophic soft sets address vagueness and uncertainty, they are utilized to deal with such kinds. The concept of Neutrosophic soft set cannot be applied to such problems when qualities are multiple and further divided.

To get around these issues, Smarandache [5] demonstrated a different method of handling uncertainty by extending the soft set to the Hypersoft set and its hybrids, such as the Fuzzy Hypersoft, Intuitionistic Fuzzy Hypersoft Set, and Neutrosophic Hypersoft Set, by converting the function into a multi-argument function. Salama and Alblowi[1] suggested Neutrosophic Topological spaces. The concept of Fuzzy Hypersoft set was applied to Fuzzy topological

66924

spaces, and Ajay and Charisma[2] discovered Fuzzy Hypersoft topological spaces. Then the concept of Neutrosophic Hypersoft topological spaces was introduced by Ajay and Charisma [2]. In recent times, Ramya and Francina Shalini [6] have developed a sophisticated result of Pythagorean Neutrosophic Hypersoft topological spaces.

Preliminaries

Definition 2.1[6] Let U be the universal set and $\mathcal{P}(U)$ be a power set of U. consider $E_1, E_2, \dots, E_k$ for $k \geq 1$ be k well - defined attributes, whose corresponding attributive values are respectively the set $C_1, C_2, \dots, C_k$ with $C_i \cap C_j = \emptyset$, for $i \neq j$ and $i, j \in \{1, 2, \dots, k\}$ and their relation $C_1 \times C_2, \dots \times C_k = \acute{\eta}$, then the pair $(\acute{\varpi}, C_1 \times C_2, \dots \times C_k)$ is said to be Pythagorean Neutrosophic Hypersoft set (PNHSS) over U where $\acute{\varpi} : C_1 \times C_2, \dots \times C_k \to \mathcal{P}(U)$ and $\acute{\varpi}(C_1 \times C_2, \dots \times C_k) = \{(\acute{\eta}, < \check{x}, \mathbb{T}_{\acute{\varpi}(\lambda)}(\check{x}), \mathbb{I}_{\acute{\varpi}(\lambda)}(\check{x}), \mathbb{F}_{\acute{\varpi}(\lambda)}(\check{x}) >) : \check{x} \in U, \acute{\eta} \in C_1 \times C_2, \dots \times C_k\}$ where $\mathbb{T}$ is the membership value of truthiness, $\mathbb{I}$ is the membership value of indeterminacy and $\mathbb{F}$ is the membership value of falsity such that $\mathbb{T}_{\acute{\varpi}(\lambda)}(\check{x}), \mathbb{I}_{\acute{\varpi}(\lambda)}(\check{x}), \mathbb{F}_{\acute{\varpi}(\lambda)}(\check{x}) \in [0,1]$ also $0 \leq \left(\mathbb{T}_{\acute{\varpi}(\lambda)}(\check{x})\right)^2 + \left(\mathbb{I}_{\acute{\varpi}(\lambda)}(\check{x})\right)^2 + \left(\mathbb{F}_{\acute{\varpi}(\lambda)}(\check{x})\right)^2 \leq 2$.

Definition 2.2 [6] Let $(\acute{\omega}_1, \acute{\mathfrak{S}}_1)$ and $(\acute{\omega}_2, \acute{\mathfrak{S}}_2)$ be PNHSSs overU.

$(\acute{\omega}_1, \acute{\mathfrak{S}}_1) = \{(\acute{\eta}, < \check{x}, \mathbb{T}_{\acute{\omega}_{1(\acute{\eta})}}(\check{x}), \mathbb{I}_{\acute{\omega}_{1(\acute{\eta})}}(\check{x}), \mathbb{F}_{\acute{\omega}_{1(\acute{\eta})}}(\check{x}) >) : \check{x} \in U \text{ and } \acute{\eta} \in \acute{\mathfrak{S}}_1 - \acute{\mathfrak{S}}_2\}$

$(\acute{\omega}_2, \acute{\mathfrak{S}}_2) = \{(\acute{\eta}, < \check{x}, \mathbb{T}_{\acute{\omega}_{2(\acute{\eta})}}(\check{x}), \mathbb{I}_{\acute{\omega}_{2(\acute{\eta})}}(\check{x}), \mathbb{F}_{\acute{\omega}_{2(\acute{\eta})}}(\check{x}) >) : \check{x} \in U \text{ and } \acute{\eta} \in \acute{\mathfrak{S}}_2 - \acute{\mathfrak{S}}_1\}$.Then,

> $(\acute{\omega}_1, \acute{\mathfrak{S}}_1) \subseteq (\acute{\omega}_2, \acute{\mathfrak{S}}_2)$ iff $\mathbb{T}_{\acute{\omega}_{1(\acute{\eta})}}(\check{x}) \leq \mathbb{T}_{\acute{\omega}_{2(\acute{\eta})}}(\check{x}), \mathbb{I}_{\acute{\omega}_{1(\acute{\eta})}}(\check{x}) \geq \mathbb{I}_{\acute{\omega}_{2(\acute{\eta})}}(\check{x})$, $\mathbb{F}_{\acute{\omega}_{1(\acute{\eta})}}(\check{x}) \geq \mathbb{F}_{\acute{\omega}_{2(\acute{\eta})}}(\check{x})$.

> $(\acute{\omega}, \acute{\mathfrak{S}})^C = \{(\acute{\eta}, < \check{x}, \mathbb{F}_{\acute{\omega}(\acute{\eta})}(\check{x}), 1 - \mathbb{I}_{\acute{\omega}(\acute{\eta})}(\check{x}), \mathbb{T}_{\acute{\omega}(\acute{\eta})}(\check{x}) >) : \check{x} \in U\}$

> $(\acute{\omega}_1, \acute{\mathfrak{S}}_1) \cup (\acute{\omega}_2, \acute{\mathfrak{S}}_2)$ is defined as
> $\mathbb{T}\left((\acute{\omega}_1, \acute{\mathfrak{S}}_1) \cup (\acute{\omega}_2, \acute{\mathfrak{S}}_2)\right) = \max\{\mathbb{T}_{\acute{\omega}_{1(\acute{\eta})}}(\check{x}), \mathbb{T}_{\acute{\omega}_{2(\acute{\eta})}}(\check{x})\}$if $\acute{\eta} \in \acute{\mathfrak{S}}_1 \cap \acute{\mathfrak{S}}_2$
> $\mathbb{I}\left((\acute{\omega}_1, \acute{\mathfrak{S}}_1) \cup (\acute{\omega}_2, \acute{\mathfrak{S}}_2)\right) = \min\{\mathbb{I}_{\acute{\omega}_{1(\acute{\eta})}}(\check{x}), \mathbb{I}_{\acute{\omega}_{2(\acute{\eta})}}(\check{x})\}$ if $\acute{\eta} \in \acute{\mathfrak{S}}_1 \cap \acute{\mathfrak{S}}_2$
> $\mathbb{F}\left((\acute{\omega}_1, \acute{\mathfrak{S}}_1) \cup (\acute{\omega}_2, \acute{\mathfrak{S}}_2)\right) = \min\{\mathbb{F}_{\acute{\omega}_{1(\acute{\eta})}}(\check{x}), \mathbb{F}_{\acute{\omega}_{2(\acute{\eta})}}(\check{x})\}$if $\acute{\eta} \in \acute{\mathfrak{S}}_1 \cap \acute{\mathfrak{S}}_2$.

> $(\acute{\omega}_1, \acute{\mathfrak{S}}_1) \cap (\acute{\omega}_2, \acute{\mathfrak{S}}_2)$ is defined as
> $\mathbb{T}\left((\acute{\omega}_1, \acute{\mathfrak{S}}_1) \cap (\acute{\omega}_2, \acute{\mathfrak{S}}_2)\right) = \min\{\mathbb{T}_{\acute{\omega}_{1(\acute{\eta})}}(\check{x}), \mathbb{T}_{\acute{\omega}_{2(\acute{\eta})}}(\check{x})\}$ if $\acute{\eta} \in \acute{\mathfrak{S}}_1 \cap \acute{\mathfrak{S}}_2$
> $\mathbb{I}\left((\acute{\omega}_1, \acute{\mathfrak{S}}_1) \cap (\acute{\omega}_2, \acute{\mathfrak{S}}_2)\right) = \max\{\mathbb{I}_{\acute{\omega}_{1(\acute{\eta})}}(\check{x}), \mathbb{I}_{\acute{\omega}_{2(\acute{\eta})}}(\check{x})\}$ if $\acute{\eta} \in \acute{\mathfrak{S}}_1 \cap \acute{\mathfrak{S}}_2$
> $\mathbb{F}\left((\acute{\omega}_1, \acute{\mathfrak{S}}_1) \cap (\acute{\omega}_2, \acute{\mathfrak{S}}_2)\right) = \max\{\mathbb{F}_{\acute{\omega}_{1(\acute{\eta})}}(\check{x}), \mathbb{F}_{\acute{\omega}_{2(\acute{\eta})}}(\check{x})\}$if $\acute{\eta} \in \acute{\mathfrak{S}}_1 \cap \acute{\mathfrak{S}}_2$.

Definition 2.3[6] Let PNHSS (U, Σ) be the family of all PNHSSs over the universe U and $\tau \subseteq$ PNHSS (U, Σ). Then τ is said to be a PNHS topology on U if

> $0_{(U_{PNHSS}, \Sigma)}, 1_{(U_{PNHSS}, \Sigma)} \in \tau$
> The union of any number of PNHSSs in τ belongs to τ
> The intersection of finite number of PNHSSs in τ belongs to τ.Then (U, Σ, τ) is said to be a Pythagorean Neutrosophic Hypersoft topological space (PNHSTS) over U. Each member of τ is said to be Pythagorean Neutrosophic Hypersoft Open set ($PNHS_{OS}$).

Definition 2.4 [6] Let (U, Σ, τ) be a PNHSTS over U and $(\acute{\omega}, \acute{\mathfrak{S}})$ be a PNHSS over U. Then $(\acute{\omega}, \acute{\mathfrak{S}})$ is said to be Pythagorean Neutrosophic Hypersoft Closed set ($PNHS_{CS}$) if and only if its complement is a $PNHS_{OS}$.

Definition 2.5 [6] Let (U, Σ, τ) be a PNHSTS over U and $(\acute{\omega}, \acute{\mathfrak{S}}) \in$ PNHSS (U, Σ) be a PNHSS. Then, the PNHS interior of $(\acute{\omega}, \acute{\mathfrak{S}})$, denoted $PNHS_{Int}(\acute{\omega}, \acute{\mathfrak{S}})$, is defined as the PNHS union of all PNHS open subsets of $(\acute{\omega}, \acute{\mathfrak{S}})$. Clearly, $PNHS_{Int}(\acute{\omega}, \acute{\mathfrak{S}})$is the biggest $PNHS_{OS}$ that is contained by $(\acute{\omega}, \acute{\mathfrak{S}})$.

Definition 2.6 [6] Let (U, Σ, τ) be a PNHSTS over U and $(\acute{\omega}, \acute{\mathfrak{S}}) \in$ PNHSS (U, Σ) be a PNHSS. Then, the PNHS closure of $(\acute{\omega}, \acute{\mathfrak{S}})$, denoted $PNHS_{Cl}(\acute{\omega}, \acute{\mathfrak{S}})$, is defined as the PNHS intersection of all PNHS closed supersets of $(\acute{\omega}, \acute{\mathfrak{S}})$. Clearly, $PNHS_{Cl}(\acute{\omega}, \acute{\mathfrak{S}})$is the smallest $PNHS_{CS}$that containing $(\acute{\omega}, \acute{\mathfrak{S}})$.

Definition 2.7 [7]
A PNHSS $(\acute{\omega}, \acute{\varsigma}) = \{(\acute{\eta}, < \check{x}, \mathbb{T}_{\check{\omega}(\acute{\eta})}(\check{x}), \mathbb{I}_{\check{\omega}(\acute{\eta})}(\check{x}), \mathbb{F}_{\check{\omega}(\acute{\eta})}(\check{x}) >): \check{x} \in U, \acute{\eta} \in C_1 \times C_2, \dots \times C_k\}$ in a PNHSTS (U, Σ, τ) is said to be a

(i) Pythagorean Neutrosophic Hypersoft Semi Closed Set ($PNHS_{SCS}$) if

PNHS $_{Int}\left(\text{PNHS}_{cl}(\acute{\omega}, \acute{\varsigma})\right) \sqsubseteq (\acute{\omega}, \acute{\varsigma})$,

(ii) Pythagorean Neutrosophic Hypersoft Semi Open Set ($PNHS_{SOS}$) if

$(\acute{\omega}, \acute{\varsigma}) \sqsubseteq$ PNHS $_{Cl}\left(\text{PNHS}_{Int}(\acute{\omega}, \acute{\varsigma})\right)$,

(iii) Pythagorean Neutrosophic Hypersoft Pre-Closed Set ($PNHS_{PCS}$) if

PNHS $_{Cl}\left(\text{PNHS}_{Int}(\acute{\omega}, \acute{\varsigma})\right) \sqsubseteq (\acute{\omega}, \acute{\varsigma})$,

(iv) Pythagorean Neutrosophic Hypersoft Pre-open Set ($PNHS_{POS}$) if

Definition 2.14 [7]Let $(\acute{\omega}, \acute{\mathfrak{S}})$ be a PNHSS in(U, Σ, τ). Then

(i)$\text{PNHS}_{PCl}(\acute{\omega}, \acute{\mathfrak{S}}) = \left[(\acute{\omega}, \acute{\mathfrak{S}}) \cup \text{PNHS}_{Cl}\left(\text{PNHS}_{Int}(\acute{\omega}, \acute{\mathfrak{S}})\right)\right]$

(ii)$\text{PNHS}_{PInt}(\acute{\omega}, \acute{\mathfrak{S}}) = \left[(\acute{\omega}, \acute{\mathfrak{S}}) \cap \text{PNHS}_{Int}\left(\text{PNHS}_{Cl}(\acute{\omega}, \acute{\mathfrak{S}})\right)\right]$

(iii)$\text{PNHS}_{SCl}(\acute{\omega}, \acute{\mathfrak{S}}) = \left[(\acute{\omega}, \acute{\mathfrak{S}}) \cup \text{PNHS}_{Int}\left(\text{PNHS}_{Cl}(\acute{\omega}, \acute{\mathfrak{S}})\right)\right]$

(iv)$\text{PNHS}_{SInt}(\acute{\omega}, \acute{\mathfrak{S}}) = \left[(\acute{\omega}, \acute{\mathfrak{S}}) \cap \text{PNHS}_{Cl}\left(\text{PNHS}_{Int}(\acute{\omega}, \acute{\mathfrak{S}})\right)\right]$

(v)$\text{PNHS}_{\alpha Cl}(\acute{\omega}, \acute{\mathfrak{S}}) = \left[(\acute{\omega}, \acute{\mathfrak{S}}) \cup \text{PNHS}_{Cl}\left(\text{PNHS}_{Int}\left(\text{PNHS}_{Cl}(\acute{\omega}, \acute{\mathfrak{S}})\right)\right)\right]$

(vi)$\text{PNHS}_{\alpha Int}(\acute{\omega}, \acute{\mathfrak{S}}) = \left[(\acute{\omega}, \acute{\mathfrak{S}}) \cap \text{PNHS}_{Int}\left(\text{PNHS}_{Cl}\left(\text{PNHS}_{Int}(\acute{\omega}, \acute{\mathfrak{S}})\right)\right)\right]$

Definition 2.15 [7]A PNHSS $(\acute{\omega}, \acute{\mathfrak{S}})$ is said to be a Pythagorean Neutrosophic Hypersoft Generalized Pre-Closed Set [$PNHS_{GPCS}$ in short] in (U, Σ, τ) if $\text{PNHS}_{PCl}(\acute{\omega}, \acute{\mathfrak{S}}) \subseteq (\acute{\gamma}, \mathcal{K})$ whenever $(\acute{\omega}, \acute{\mathfrak{S}}) \subseteq (\acute{\gamma}, \mathcal{K})$ and $(\acute{\gamma}, \mathcal{K})$ is a $PNHS_{OS}$ in (U, Σ). The family of all $PNHS_{GPCS}$ s of a PNHSTS (U, Σ, τ) is denoted by $PNHS_{GPCS}(U, \Sigma)$.

Pythagorean Neutrosophic Hypersoft Generalized Pre-Open Sets
In this section, we introduce the idea of Pythagorean NeutrosophicHypersoftGeneralized Pre-Open Set and explore some of its characteristics.

Definition 3.1
A PNHSS $(\acute{\omega}, \acute{\mathfrak{S}})$ is said to be a Pythagorean Neutrosophic Hypersoft Generalized Pre-Open Set ($PNHS_{GPOS}$ *in short*) in (U, Σ, τ) if the complement $(\acute{\omega}, \acute{\mathfrak{S}})^C$ is a $PNHS_{GPCS}$ in (U, Σ). The family of all $PNHS_{GPOS}$ s of a PNHSTS (U, Σ, τ) is denoted by $PNHS_{GPO}(U, \Sigma)$.

Example 3.2
Let U = $\{\check{x}_1, \check{x}_2, \check{x}_3\}$be an initial universe and E₁,E₂,E₃ be a set of attributes. Attributes are given as: $E_1 = \{e_1, e_2, e_3\}$, $E_2 = \{f_1, f_2\}$, and $E_3 = \{g_1, g_2\}$are subset of E_i for each i=1,2,3.Let $\tau = \{0_{(U_{PNHSS}, \Sigma)}, (\check{\varrho}, \hat{\mathfrak{R}}), 1_{(U_{PNHSS}, \Sigma)}\}$be a PNHSTS on U, Where

$$\begin{cases} < (e_1, f_1, g_2), \{\check{x}_1(.4, .3, .2), \check{x}_2(.2, .6, .1), \check{x}_3(.3, .5, .4)\} >, \\ < (e_1, f_2, g_2), \{\check{x}_1(.7, .1, .3), \check{x}_2(.3, .6, .5), \check{x}_3(.7, .2, .1)\} >, \\ < (e_1, f_1, g_1), \{\check{x}_1(.8, .1, .2), \check{x}_2(.6, .2, .1), \check{x}_3(.3, .5, .2)\} >, \\ < (e_3, f_1, g_1), \{\check{x}_1(.2, .3, .1), \check{x}_2(.4, .5, .3), \check{x}_3(.4, .1, .2)\} > \end{cases}$$

Then the PNHSS $(\acute{\omega}, \acute{\mathfrak{S}}) = \begin{cases} < (e_1, f_1, g_2), \{\check{x}_1(.4, .5, .3), \check{x}_2(.2, .3, .1), \check{x}_3(.5, .4, .2)\} >, \\ < (e_1, f_2, g_2), \{\check{x}_1(.4, .9, .5), \check{x}_2(.6, .3, .2), \check{x}_3(.2, .7, .6)\} >, \\ < (e_1, f_1, g_1), \{\check{x}_1(.4, .7, .6), \check{x}_2(.5, .7, .5), \check{x}_3(.3, .3, .2)\} >, \\ < (e_3, f_1, g_1), \{\check{x}_1(.2, .6, .1), \check{x}_2(.5, .4, .3), \check{x}_3(.5, .6, .3)\} > \end{cases}$

$(\check{\varrho}, \hat{\mathfrak{R}})=$
 is a $PNHS_{GPOS}$ in (U, Σ).

Ramya and Francina Shalini

Theorem 3.3

For any PNHSTS (U, Σ, τ), we have the following:

- Every $PNHS_{OS}$ is a $PNHS_{GPOS}$
- Every $PNHS_{SOS}$ is a $PNHS_{GPOS}$
- Every $PNHS_{\alpha OS}$ is a $PNHS_{GPOS}$
- Every $PNHS_{POS}$ is a $PNHS_{GPOS}$. But the converse is not true in general.

Proof: Straightforward.

The converse of the above statements need not be true which can be seen from the following examples.

Example 3.4

Let U = $\{\check{x}_1, \check{x}_2, \check{x}_3\}$be an initial universe and E_1, E_2, E_3 be a set of attributes. Attributes are given as: $E_1 = \{e_1, e_2, e_3\}$, $E_2 = \{f_1, f_2\}$, and $E_3 = \{g_1, g_2\}$are subset of E_i for each i=1,2,3.Let $\tau = \{0_{(U_{PNHSS}, \Sigma)}, (\check{g}, \mathfrak{N}), 1_{(U_{PNHSS}, \Sigma)}\}$ be a PNHSTS on U,Where

$$(\check{g}, \mathfrak{N}) = \begin{cases} < (e_1, f_1, g_2), \{\check{x}_1(.5,.3,.1), \check{x}_2(.3,.4,.2), \check{x}_3(.2,.6,.3)\} >, \\ < (e_1, f_2, g_2), \{\check{x}_1(.6,.2,.4), \check{x}_2(.4,.5,.3), \check{x}_3(.6,.1,.3)\} >, \\ < (e_1, f_1, g_1), \{\check{x}_1(.5,.3,.5), \check{x}_2(.7,.3,.2), \check{x}_3(.4,.6,.3)\} >, \\ < (e_3, f_1, g_1), \{\check{x}_1(.3,.4,.5), \check{x}_2(.6,.4,.2), \check{x}_3(.3,.4,.2)\} > \end{cases}$$

Then the PNHSS $(\acute{\omega}, \acute{\mathfrak{S}})$ = $\begin{cases} < (e_1, f_1, g_2), \{\check{x}_1(.5,.6,.3), \check{x}_2(.3,.4,.2), \check{x}_3(.4,.3,.1)\} >, \\ < (e_1, f_2, g_2), \{\check{x}_1(.5,.7,.4), \check{x}_2(.4,.4,.2), \check{x}_3(.4,.8,.5)\} >, \\ < (e_1, f_1, g_1), \{\check{x}_1(.6,.6,.3), \check{x}_2(.3,.6,.5), \check{x}_3(.4,.3,.3)\} >, \\ < (e_3, f_1, g_1), \{\check{x}_1(.6,.5,.2), \check{x}_2(.3,.5,.4), \check{x}_3(.3,.5,.2)\} > \end{cases}$

is a $PNHS_{GPOS}$ in (U, Σ) but not $PNHS_{OS}$, $PNHS_{SOS}$, $PNHS_{\alpha OS}$ in (U, Σ).

Example 3.5

Let U = $\{\check{x}_1, \check{x}_2, \check{x}_3\}$be an initial universe and E_1, E_2, E_3 be a set of attributes. Attributes are given as: $E_1 = \{e_1, e_2, e_3\}$, $E_2 = \{f_1, f_2\}$, and $E_3 = \{g_1, g_2\}$are subset of E_i for each i=1,2,3.Let $\tau = \{0_{(U_{PNHSS}, \Sigma)}, (\check{g}, \mathfrak{N}), 1_{(U_{PNHSS}, \Sigma)}\}$ be a PNHSTS on U,Where

$$(\check{g}, \mathfrak{N}) = \begin{cases} < (e_1, f_1, g_2), \{\check{x}_1(.1,.6,.9), \check{x}_2(.3,.7,.8), \check{x}_3(.3,.9,.7)\} >, \\ < (e_1, f_2, g_2), \{\check{x}_1(.2,.7,.8), \check{x}_2(.8,.3,.6), \check{x}_3(.4,.9,.6)\} >, \\ < (e_1, f_1, g_1), \{\check{x}_1(.7,.5,.6), \check{x}_2(.5,.6,.7), \check{x}_3(.2,.3,.8)\} >, \\ < (e_3, f_1, g_1), \{\check{x}_1(.7,.8,.5), \check{x}_2(.4,.7,.9), \check{x}_3(.3,.8,.8)\} > \end{cases}$$

Then the PNHSS $(\acute{\omega}, \acute{\mathfrak{S}})$ = $\begin{cases} < (e_1, f_1, g_2), \{\check{x}_1(.1,.8,.8), \check{x}_2(.4,.8,.8), \check{x}_3(.3,.6,.5)\} >, \\ < (e_1, f_2, g_2), \{\check{x}_1(.4,.7,.6), \check{x}_2(.5,.7,.8), \check{x}_3(.1,.7,.7)\} >, \\ < (e_1, f_1, g_1), \{\check{x}_1(.6,.8,.8), \check{x}_2(.2,.8,.6), \check{x}_3(.1,.7,.5)\} >, \\ < (e_3, f_1, g_1), \{\check{x}_1(.4,.8,.8), \check{x}_2(.2,.4,.6), \check{x}_3(.3,.4,.6)\} > \end{cases}$

is a $PNHS_{GPOS}$ in (U, Σ) but not a$PNHS_{POS}$in (U, Σ).

Theorem 3.6

Let (U, Σ, τ) be a PNHSTS. If $(\acute{\omega}, \acute{\mathfrak{S}}) \in PNHS_{GPO}(U, \Sigma)$ then $(\acute{\mathfrak{H}}, \mathcal{V}) \sqsubseteq$ PNHS $_{Int}\left(PNHS_{cl}(\acute{\omega}, \acute{\mathfrak{S}})\right)$ whenever $(\acute{\mathfrak{H}}, \mathcal{V}) \sqsubseteq (\acute{\omega}, \acute{\mathfrak{S}})$ and $(\acute{\mathfrak{H}}, \mathcal{V})$ is $PNHS_{CS}$ in (U, Σ).

Proof:

Let $(\acute{\omega}, \acute{\mathfrak{S}}) \in PNHS_{GPO}(U, \Sigma)$. Then $(\acute{\omega}, \acute{\mathfrak{S}})^C$ is a $PNHS_{GPCS}$ in (U, Σ). Therefore $PNHS_{PCl}\left((\acute{\omega}, \acute{\mathfrak{S}})^C\right) \subseteq (\acute{\xi}, \acute{U})$ whenever $(\acute{\omega}, \acute{\mathfrak{S}})^C \subseteq (\acute{\xi}, \acute{U})$ and $(\acute{\xi}, \acute{U})$ is a $PNHS_{OS}$ in (U, Σ). That is PNHS $_{Cl}\left(PNHS_{Int}(\acute{\omega}, \acute{\mathfrak{S}})^C\right) \subseteq (\acute{\xi}, \acute{U})$. This implies $(\acute{\xi}, \acute{U})^C \subseteq$ PNHS $_{Int}\left(PNHS_{cl}(\acute{\omega}, \acute{\mathfrak{S}})\right)$ whenever $(\acute{\xi}, \acute{U})^C \subseteq (\acute{\omega}, \acute{\mathfrak{S}})$ and $(\acute{\xi}, \acute{U})^C$ is $PNHS_{CS}$in (U, Σ). Replacing $(\acute{\xi}, \acute{U})^C$ by $(\acute{\mathfrak{H}}, \mathcal{V})$, we get $(\acute{\mathfrak{H}}, \mathcal{V}) \sqsubseteq$ PNHS $_{Int}\left(PNHS_{cl}(\acute{\omega}, \acute{\mathfrak{S}})\right)$ whenever $(\acute{\mathfrak{H}}, \mathcal{V}) \sqsubseteq (\acute{\omega}, \acute{\mathfrak{S}})$ and $(\acute{\mathfrak{H}}, \mathcal{V})$ is $PNHS_{CS}$ in (U, Σ).

Theorem 3.7

Let (U, Σ, τ) be a PNHSTS. Then for every $(\acute{\omega}, \acute{\mathfrak{S}}) \in PNHS_{GPO}(U, \Sigma)$ and for every $(\varsigma, \mathfrak{B}) \in PNHS(U, \Sigma)$, PNHS $_{Int}(\acute{\omega}, \acute{\mathfrak{S}}) \sqsubseteq (\varsigma, \mathfrak{B}) \sqsubseteq (\acute{\omega}, \acute{\mathfrak{S}})$ implies $(\varsigma, \mathfrak{B}) \in PNHS_{GPO}(U, \Sigma)$.

Proof:

By hypothesis $(\acute{\omega}, \acute{\mathfrak{S}})^C \sqsubseteq (\varsigma, \mathfrak{B})^C \subseteq \left(\text{PNHS}_{PInt}(\acute{\omega}, \acute{\mathfrak{S}})\right)^C$. Let $(\varsigma, \mathfrak{B})^C \subseteq (\acute{\xi}, \acute{\mathfrak{U}})$ and $(\acute{\xi}, \acute{\mathfrak{U}})$ be a $PNHS_{OS}$. Since $(\acute{\omega}, \acute{\mathfrak{S}})^C \sqsubseteq (\varsigma, \mathfrak{B})^C$, $(\acute{\omega}, \acute{\mathfrak{S}})^C \sqsubseteq (\acute{\xi}, \acute{\mathfrak{U}})$. But $(\acute{\omega}, \acute{\mathfrak{S}})^C$ is a $PNHS_{GPCS}$, PNHS $_{PCl}(\acute{\omega}, \acute{\mathfrak{S}})^C \subseteq (\acute{\xi}, \acute{\mathfrak{U}})$. Also $(\varsigma, \mathfrak{B})^C \subseteq \left(\text{PNHS}_{PInt}(\acute{\omega}, \acute{\mathfrak{S}})\right)^C =$ PNHS $_{PCl}(\acute{\omega}, \acute{\mathfrak{S}})^C$. Therefore PNHS $_{PCl}(\varsigma, \mathfrak{B})^C \subseteq$ PNHS $_{PCl}(\acute{\omega}, \acute{\mathfrak{S}})^C \subseteq (\acute{\xi}, \acute{\mathfrak{U}})$. Hence $(\varsigma, \mathfrak{B})^C$ is a $PNHS_{GPCS}$. Which implies $(\varsigma, \mathfrak{B})$ is a $PNHS_{GPoS}$ of (U, Σ).

Remark 3.8

The intersection of any two $PNHS_{GPOS}$s is not a $PNHS_{GPOS}$ in general.

Example 3.9

Let $U = \{\breve{x}_1, \breve{x}_2, \breve{x}_3\}$ be an initial universe and E_1, E_2, E_3 be a set of attributes. Attributes are given as: $E_1 = \{e_1, e_2, e_3\}$, $E_2 = \{f_1, f_2\}$, and $E_3 = \{g_1, g_2\}$ are subset of E_i for each i=1,2,3. Let $\tau = \left\{0_{(U_{PNHSS}, \Sigma)}, (\breve{g}, \mathfrak{N}), 1_{(U_{PNHSS}, \Sigma)}\right\}$ be a PNHSTS on U, Where

$$(\breve{g}, \mathfrak{N}) = \begin{cases} < (e_1, f_1, g_2), \{\breve{x}_1(.1,.6,.5), \breve{x}_2(.2,.6,.3), \breve{x}_3(.4,.5,.6)\} >, \\ < (e_1, f_2, g_2), \{\breve{x}_1(.3,.5,.5), \breve{x}_2(.4,.6,.5), \breve{x}_3(.6,.7,.8)\} >, \\ < (e_1, f_1, g_1), \{\breve{x}_1(.4,.6,.7), \breve{x}_2(.5,.6,.8), \breve{x}_3(.3,.7,.4)\} >, \\ < (e_3, f_1, g_1), \{\breve{x}_1(.6,.5,.8), \breve{x}_2(.5,.7,.6), \breve{x}_3(.2,.5,.3)\} > \end{cases}$$

Then the PNHSS $(\acute{\omega}, \acute{\mathfrak{S}}) = \begin{cases} < (e_1, f_1, g_2), \{\breve{x}_1(.5,.4,.1), \breve{x}_2(.3,.4,.2), \breve{x}_3(.6,.5,.4)\} >, \\ < (e_1, f_2, g_2), \{\breve{x}_1(.6,.5,.3), \breve{x}_2(.5,.4,.4), \breve{x}_3(.8,.3,.5)\} >, \\ < (e_1, f_1, g_1), \{\breve{x}_1(.7,.4,.4), \breve{x}_2(.8,.3,.5), \breve{x}_3(.4,.3,.3)\} >, \\ < (e_3, f_1, g_1), \{\breve{x}_1(.8,.4,.2), \breve{x}_2(.6,.3,.5), \breve{x}_3(.4,.4,.1)\} > \end{cases}$ and

$(\varsigma, \mathfrak{B}) = \begin{cases} < (e_1, f_1, g_2), \{\breve{x}_1(.6,.3,.1), \breve{x}_2(.4,.4,.2), \breve{x}_3(.7,.5,.4)\} >, \\ < (e_1, f_2, g_2), \{\breve{x}_1(.5,.5,.3), \breve{x}_2(.6,.3,.2), \breve{x}_3(.8,.3,.6)\} >, \\ < (e_1, f_1, g_1), \{\breve{x}_1(.8,.3,.3), \breve{x}_2(.8,.4,.5), \breve{x}_3(.5,.3,.3)\} >, \\ < (e_3, f_1, g_1), \{\breve{x}_1(.8,.3,.6), \breve{x}_2(.6,.3,.3), \breve{x}_3(.3,.5,.2)\} > \end{cases}$

are $PNHS_{GPOS}$s in (U, Σ) but $(\acute{\omega}, \acute{\mathfrak{S}}) \cap (\varsigma, \mathfrak{B})$ *is* not a $PNHS_{GPOS}$ in (U, Σ).

Theorem 3.10

A PNHSS $(\acute{\omega}, \acute{\mathfrak{S}})$ of a PNHSTS (U, Σ, τ) is a $PNHS_{GPOS}$ if and only if $(\acute{\varsigma}, \mathcal{F}) \subseteq$ PNHS $_{PInt}(\acute{\omega}, \acute{\mathfrak{S}})$ whenever $(\acute{\varsigma}, \mathcal{F})$ is a $PNHS_{CS}$ and $(\acute{\varsigma}, \mathcal{F}) \subseteq (\acute{\omega}, \acute{\mathfrak{S}})$.

Proof: Necessity: Suppose $(\acute{\omega}, \acute{\mathfrak{S}})$ is a $PNHS_{GPOS}$ in (U, Σ). Let $(\acute{\varsigma}, \mathcal{F})$ be a $PNHS_{CS}$ and $(\acute{\varsigma}, \mathcal{F}) \subseteq (\acute{\omega}, \acute{\mathfrak{S}})$. Then $(\acute{\varsigma}, \mathcal{F})^C$ is a $PNHS_{OS}$ in (U, Σ) such that $(\acute{\omega}, \acute{\mathfrak{S}})^C \subseteq (\acute{\varsigma}, \mathcal{F})^C$. Since $(\acute{\omega}, \acute{\mathfrak{S}})^C$ is a $PNHS_{GPCS}$, we have $PNHS_{PCl}\left((\acute{\omega}, \acute{\mathfrak{S}})^C\right) \subseteq (\acute{\varsigma}, \mathcal{F})^C$. Hence $\left(\text{PNHS}_{PInt}(\acute{\omega}, \acute{\mathfrak{S}})\right)^C \subseteq (\acute{\varsigma}, \mathcal{F})^C$. Therefore $(\acute{\varsigma}, \mathcal{F}) \subseteq PNHS_{PInt}(\acute{\omega}, \acute{\mathfrak{S}})$.

Sufficiency: Let $(\acute{\omega}, \acute{\mathfrak{S}})$ be a PNHSS of (U, Σ). Let $(\acute{\varsigma}, \mathcal{F}) \subseteq PNHS_{PInt}(\acute{\omega}, \acute{\mathfrak{S}})$ whenever $(\acute{\varsigma}, \mathcal{F})$ is a $PNHS_{CS}$ and $(\acute{\varsigma}, \mathcal{F}) \subseteq (\acute{\omega}, \acute{\mathfrak{S}})$. Then $(\acute{\omega}, \acute{\mathfrak{S}})^C \subseteq (\acute{\varsigma}, \mathcal{F})^C$ and $(\acute{\varsigma}, \mathcal{F})^C$ is a $PNHS_{OS}$. By hypothesis, $\left(\text{PNHS}_{PInt}(\acute{\omega}, \acute{\mathfrak{S}})\right)^C \subseteq (\acute{\varsigma}, \mathcal{F})^C$. which implies $PNHS_{PCl}\left((\acute{\omega}, \acute{\mathfrak{S}})^C\right) \subseteq (\acute{\varsigma}, \mathcal{F})^C$. Therefore $(\acute{\omega}, \acute{\mathfrak{S}})^C$ is a $PNHS_{GPCS}$ of (U, Σ). Hence $(\acute{\omega}, \acute{\mathfrak{S}})$ is a $PNHS_{GPOS}$ of (U, Σ).

Corollary 3.11

A PNHSS $(\acute{\omega}, \acute{\mathfrak{S}})$ of a PNHSTS (U, Σ, τ) is a $PNHS_{GPOS}$ if and only if $(\acute{\varsigma}, \mathcal{F}) \subseteq$ PNHS $_{Int}\left(\text{PNHS}_{Cl}(\acute{\omega}, \acute{\mathfrak{S}})\right)$ whenever $(\acute{\varsigma}, \mathcal{F})$ is a $PNHS_{CS}$ and $(\acute{\varsigma}, \mathcal{F}) \subseteq (\acute{\omega}, \acute{\mathfrak{S}})$.

Ramya and Francina Shalini

Proof: Necessity: Suppose $(\acute{\omega}, \acute{\Im})$ is a $PNHS_{GPOS}$ in (U, Σ). Let $(\acute{\varsigma}, \mathcal{F})$ be a $PNHS_{CS}$ and $(\acute{\varsigma}, \mathcal{F}) \subseteq (\acute{\omega}, \acute{\Im})$. Then $(\acute{\varsigma}, \mathcal{F})^C$ is a $PNHS_{OS}$ in (U, Σ) such that $(\acute{\omega}, \acute{\Im})^C \subseteq (\acute{\varsigma}, \mathcal{F})^C$. Since $(\acute{\omega}, \acute{\Im})^C$ is a $PNHS_{GPCS}$, We have $PNHS_{PCl}\left((\acute{\omega}, \acute{\Im})^C\right) \subseteq (\acute{\varsigma}, \mathcal{F})^C$. Therefore $PNHS_{Cl}\left(PNHS_{Int}(\acute{\omega}, \acute{\Im})^C\right) \subseteq (\acute{\varsigma}, \mathcal{F})^C$. Hence $\left(PNHS_{Int}\left(PNHS_{Cl}(\acute{\omega}, \acute{\Im})\right)\right)^C \subseteq (\acute{\varsigma}, \mathcal{F})^C$. This implies $(\acute{\varsigma}, \mathcal{F}) \subseteq$ PNHS $_{Int}\left(\text{PNHS}_{Cl}(\acute{\omega}, \acute{\Im})\right)$.

Sufficiency: Let $(\acute{\omega}, \acute{\Im})$ be a PNHSS of (U, Σ) and let $(\acute{\varsigma}, \mathcal{F}) \subseteq$ PNHS $_{Int}\left(\text{PNHS}_{Cl}(\acute{\omega}, \acute{\Im})\right)$ whenever $(\acute{\varsigma}, \mathcal{F})$ is a $PNHS_{CS}$ and $(\acute{\varsigma}, \mathcal{F}) \subseteq (\acute{\omega}, \acute{\Im})$. Then $(\acute{\omega}, \acute{\Im})^C \subseteq (\acute{\varsigma}, \mathcal{F})^C$ and $(\acute{\varsigma}, \mathcal{F})^C$ is a $PNHS_{OS}$. By hypothesis, $\left(PNHS_{Int}\left(PNHS_{Cl}(\acute{\omega}, \acute{\Im})\right)\right)^C \subseteq \varsigma, \mathcal{F}C$. Hence $PNHSClPNHSInt\varpi, \Im C \subseteq \varsigma, \mathcal{F}C$, which implies $PNHSPCl\varpi, \Im C \subseteq \varsigma, \mathcal{F}C$. Hence $\varpi, \Im$ is a $PNHSGPOS$ of (U, Σ).

Theorem 3.12
For a PNHSS $(\acute{\omega}, \acute{\Im})$, $(\acute{\omega}, \acute{\Im})$ is a $PNHS_{OS}$ and a $PNHS_{GPCS}$ in (U, Σ) if and only if $(\acute{\omega}, \acute{\Im})$ is a $PNHS_{ROS}$ in (U, Σ).

Proof: Necessity: Let $(\acute{\omega}, \acute{\Im})$ be a $PNHS_{OS}$ and a $PNHS_{GPCS}$ in (U, Σ). Then PNHS $_{PCl}(\acute{\omega}, \acute{\Im}) \subseteq (\acute{\omega}, \acute{\Im})$. This implies PNHS $_{Cl}\left(\text{PNHS}_{Int}(\acute{\omega}, \acute{\Im})\right) \subseteq (\acute{\omega}, \acute{\Im})$. Since $(\acute{\omega}, \acute{\Im})$ is a $PNHS_{OS}$, it is an $PNHS_{POS}$. Hence $(\acute{\omega}, \acute{\Im}) \subseteq$ PNHS $_{Int}\left(\text{PNHS}_{Cl}(\acute{\omega}, \acute{\Im})\right)$. Therefore $(\acute{\omega}, \acute{\Im}) =$ PNHS $_{Int}\left(\text{PNHS}_{Cl}(\acute{\omega}, \acute{\Im})\right)$. Hence $(\acute{\omega}, \acute{\Im})$ is a $PNHS_{ROS}$ in (U, Σ).

Sufficiency: Let $(\acute{\omega}, \acute{\Im})$ be a $PNHS_{ROS}$ in (U, Σ). Therefore $(\acute{\omega}, \acute{\Im}) =$ PNHS $_{Int}\left(\text{PNHS}_{Cl}(\acute{\omega}, \acute{\Im})\right)$. Let $(\acute{\omega}, \acute{\Im}) \subseteq (\acute{\xi}, \acute{U})$ and $(\acute{\xi}, \acute{U})$ is a $PNHS_{OS}$ in (U, Σ). This implies PNHS $_{PCl}(\acute{\omega}, \acute{\Im}) \subseteq (\acute{\omega}, \acute{\Im})$. Hence $(\acute{\omega}, \acute{\Im})$ is a $PNHS_{GPCS}$ in (U, Σ).

CONCLUSION

In this paper**,** we have examined the idea of Pythagorean Neutrosophic HypersoftGeneralizedPre-Open Sets in PNHSTS and analyzed their description in these domains.

ABSTRACT

Mobile phones are a dominant form of information and communication technology, with India ranking second in the global telecommunication market. Most individuals start using mobile phones from the age of 12 and technology becomes an integral part of their lives. This research studied the impact of mobile phone use on the academic performance of secondary school students in the Namsai district of Arunachal Pradesh. The study adopted a descriptive survey research method with a sample size of 40 students from 4 selected schools, each contributing 5 boys and 5 girls by using stratified random sampling technique. A self-constructed scale with four points, referred to as a Likert-type scale, entitled "Mobile Phone and Students' Academic Performance of Secondary School questionnaire, was employed in order to evaluate the utilization of mobile phones as well as the students' academic performance of secondary schools. The study's results showed significant impacts of mobile phone use on the academic performance of students during the COVID-19 pandemic. It pointed out the negative effects of their usage, such as distractions in academic work, health issues, and time loss. However, the study establishes that appropriate usage of cellular devicecan provide benefits in academic performance.

Keywords: Mobile Phone Usage, School Students' Academic Performance, COVID-19, Remote Learning, Impact on Studies.

INTRODUCTION

The COVID-19 pandemic has had a significant impact on various aspects of daily life, including education. With the implementation of lockdowns and remote learning, students have become more dependent on their mobile phones for educational purposes [1]. The increased usage of mobile phones among school students during the pandemic has raised concerns about its impact on their academic performance [2]. Furthermore, the use of cellular deviceduring classes or study sessions can be a source of distraction for both the user and those around them [3].

Mobile phones have evolved into an indispensable component of our everyday existence, especially for students engaged in both academic and tertiary education. Observing present-day university attendees reveals that they use their mobile phones extensively. Despite institutional rules and regulations, university students commonly use their phones during class hours [4].The utilization of cellular phone technology has a beneficial impact on the acquisition of knowledge and the scholarly achievements of students. Today's smartphones afford students with prompt and portable accessibility, as well as enable educational functionalities such as the sharing of files and engagement with professors and colleagues. It also enables internet connectivity, allowing students to retrieve relevant online information, [5,6].For university students, mobile phones are often perceived as devices for leisure activities including social networking, gaming, internet surfing, and video viewing[7,8]. However, if smartphones are used primarily for leisure activities rather than educational purposes, they can serve as distractions and compromise the academic focus of students.[9].A study conducted with a sample of typical U.S. university students revealed an interesting correlation - it found that increased cell phone use was associated with lower levels of objective cardiorespiratory fitness [7]. The correlation between cell phone use and academic performance remains uncertain. However, mobile phones provide accessibility anytime, anywhere. During COVID-19, the necessity for online classes and learning made these devices indispensable for students. Mobile phones consolidate the functions of a phone, camera, media player, and wireless computer into one device. These features could enhance the teaching and learning of science subjects, which often include complex contents and scientific processes. The capabilities of mobile phones extend to calling, texting, capturing images, recording audio and video, data storage, music and movie playback, and internet interaction.

NEED AND SIGNIFICANCE

The impact of mobile phones on a student's academic life, considering factors such as the advanced technology they provide and their extensive use [10]. The ubiquity of mobile phone usage among students often distracts them from their core studies, which may have an impact on their grades. The convenience and vast storage capacity of cellular device facilitate students in accessing study materials at any given time and place. Data from the West African Examination Council depicts a concerning trend of students failing in English Language and Mathematics, suggesting potential implications of mobile phone use. The academic performance of many students is significantly influenced by their habits of mobile phone usage during and outside school hours. Activities like engaging in late-night calls, chatting, instant messaging, participating in social networking, and potentially utilizing their phones for exam misconduct, play a considerable role in this dynamic [11]. The focus on this topic arises from concerns about the unmoderated use and reliance on these devices, particularly among the youth. Thus, the objective of this investigation is to assess the influence of cellular deviceutilization on the scholastic achievement of students in secondary educational institutions. Intriguingly, these findings could be deemed essential as emphasized by Geser [12]; Junco, Merson & Salter [13]noted that young people tend to exhibit an increased attachment to their mobile phones, creating potential distractions due to the time devoted to these devices. Engaging in community media, managing commercial emails, conducting academic searches, finding answers to queries, and playing games are common activities. Approximately 95% of Americans own cell phones, with 77% being smartphones. Globally, smartphone usage has surged; with 1.85 billion people using them have 2014, projections estimated 2.32 billion users in 2017, and expectations for this number to rise to 2.87 billion by 2020 [14]. This high degree of reliance classifies many as "Mobile Addictive". While mobile phones streamline our lives, they simultaneously restrict us. Mobile addiction impacts the pupil physically, psychologically, and academically. Conditions linked with internet abuse like

Philomina *et al.*,

sleep deprivation, nervousness, pressure, and despair have also been associated with excessive mobile phone use [15]. Any factor that can provoke a person has the potential to transform into an addiction. When a regular habit morphs into a compulsory requirement, it results in addiction[16]. Some investigators maintain that there is no significant correlation between cell phone usage and gender[17]. Neurosurgeon Salvatore Insiga from Northwell Health's Neuroscience Institute in Manhasset, New York, suggests that while there is no solid proof of a direct link between cell phone radiation and tumor risk, the potential association cannot be dismissed. Additionally, teenagers are particularly vulnerable to developing an addiction to smartphones [14]. The overuse of cell phones, combined with negative attitudes and feelings of stress and reliance on these devices, could potentially heighten the risk of anxiety and depression[18]. Thomée et al. [19]frequent use of cellular devicehas been linked to increased risks of mental health issues related to sleep disturbance and signs of depression in both genders. As mobile phones have become a fundamental device for the typical school student, their academic performance is likely to be influenced. This study aims to understand the relationship between cell phone use and academic performance. Therefore, the current study titled 'Impact of cellular deviceUsage on Secondary School Students Academic Performance: Insights from COVID-19 is justified.

OBJECTIVES
- To investigate the impact of cellular deviceusage among secondary school students on their performance in academics.
- To determine how the availability of social media networks on the students' mobile phones influences their academic achievement.
- To explore any gender differences in mobile phone usage among students and how it affects their academic performance.
- To analyze the association between frequent cellular device, use and mental health issues related to sleep disturbance and signs of depression across genders.

RESEARCH QUESTIONS
- To what degree does student addiction to mobile phones impact their performance in academics?
- Does the availability of social media networks on secondary school students' mobile phones have an effect on their academic performance?
- Are there gender differences in mobile phone usage and its subsequent influence on students' performancein academics?
- Has the usage of mobile phones influenced secondary school students' performance in academics during the COVID-19 pandemic?

METHODOLOGY

The research utilized a descriptive survey as its framework, a choice considered well-suited for this study. The strength of this design lies in its ability to facilitate the production of data through protocols of standardized collection, leveraging well-structured research tools. Furthermore, it provides clear boundaries for the study through well-defined concepts and variables, establishing a robust structure for the research.

SAMPLE
The sample utilized for this study was strategically selected using a stratified random sampling technique to ensure representation and mitigate bias. The sample comprised a total of 40 students derived from four distinct schools situated in the Namsai district of Arunachal Pradesh. In these selected schools, a balance between genders was maintained by including 5 boys and 5 girls from each school. By carrying out the sampling in this manner, the study aimed to ensure a well-rounded representation and gather reliable and generalizable data.

Philomina *et al.*,

INSTRUMENT

The questionnaire used in this research was originally designed and standardized by Osharive Peter [20]. It was adopted by the investigators for the purpose of this specific study. The composition of the survey was partitioned into two key divisions, namely Section A and Section B. Section A was focused on gathering personal data about the respondents, while Section B contained questions designed to gauge respondents' perspectives, with choices including "Strongly Agree,' 'Agree,' 'Disagree,' and 'Strongly Disagree." In all, 40 copies of this questionnaire were distributed to the respondents. Once the data were collected, they were carefully and methodically organized by the investigator. Utilizing the SPSS 21 software, the investigator then conducted thorough analyses of the acquired data.

RESULTS

Research Question 1: To what degree does student's addiction to mobile phones impact their academic performance? The data in Table 1 illustrates the findings of a survey conducted to investigate the perception of mobile phone usage among students in educational institutions and its potential influence on their academic achievements. Regarding the issue of mobile phone addiction, 75% of respondents strongly agree that it affects their academic life. Online social networks appear to be a major factor, with 50% strongly agreeing that they cause distraction from studies. Moreover, 60% of participants strongly support the assertion about online time being incomparable to study hours, indicating a potential imbalance. The lack of grade improvement since engaging with social networking sites via mobile phones was strongly affirmed by 37% of the students. Interestingly, mobile phone use for video gaming is less perceived as a problem, with only 30% strongly agreeing. Overall, 84% of responses lie within the agree category (Strongly Agree + Agree) – suggesting a prevailing perception among students that mobile phone usage negatively impacts their academic performance. Conversely, only 16% (Disagree + Strongly Disagree) disagree with this viewpoint.

Research Question 2: Does the availability of online social platform on secondary school students' mobile phones have an effect on their academic performance? The table 2 illustrates student responses to the impact of specific digital activities on their academic performance. 73% of participants agree (SA + A) that unlimited Facebook access negatively impacts their academic performance, while only 27% disagree (D+SD). Blogging for leisure on Twitter is seen as less detrimental, with only 40% agreeing it affects their academic performance negatively, and 60% disagreeing. Regarding the use of WhatsApp, 75% agree that indulging in friend's company reduces study time, while 25% disagree. Instagram use, however, presents a divided picture with 57% agreeing that it distracts from studies and 43% disagreeing. Finally, 65% agree that engaging in online video games affects their academic performance negatively, while 35% disagree. Overall, the majority of students (62% as represented in Total Agree percentage) perceive that involvement in these digital activities can interfere with their academic performance.

Research Question 3: Are there gender differences in mobile phone usage and its subsequent influence on students' academic performance? The table 3 reveals perceptions on gender differences in mobile phone use among students. Most participants (62%) agree, either strongly or partially (SA+A), that male and female students use mobile phones differently. When it comes to using mobile phones for social networking to foster social connections, 62% agree this behavior is more frequent among female students. 58% of respondents agree that gender has an influence on the level of social media network usage on cellular device. The assertion that males use mobile phones more effectively for non-academic purposes also resonates with the majority (60%). On the topic of mobile phone addiction, 65% agree that female students are more prone. Overall, 61% of participants agree that gender has some influence on mobile phone usage patterns.

Research Question 4: Has the usage of mobile phones influenced secondary school students' academic performance during the COVID-19 pandemic? The table reflects student perceptions on how cellular device use during the COVID-19 pandemic affects academic achievement. The majority (75%) concur that the pandemic led students to acquire their own smartphones. Further, a substantial majority (80%) agree that time spent on video games influenced their academic studies negatively. Similar agreement (62%) extends to the claim that internet surfing on

smartphones affected academic performance. When comparing time dedicated to online classes versus watching YouTube videos or movies, 75% of participants agree that less time is given to attending classes, impacting their studies. Lastly, 77% of respondents agree that excessive mobile phone use has negative health consequences. Overall, these results suggest a broad consensus (74% Agree) among the surveyed students that substantial mobile phone use during the pandemic affects both their academic and physical well-being.

DISCUSSION

The role of mobile phone usage in students' academic performance, particularly during the COVID-19 pandemic, has drawn significant interest among researchers. Similar to the findings in this study other research demonstrates links between mobile phone addiction and negative academic outcomes [3]. found that excessive mobile phone usage among medical students was associated with lower academic performance, aligning with our findings of majority agreement among students that extensive mobile phone use adversely impacts their studies. Further [21],mobile phone usage among secondary school students in Nigeria has also been linked to negative impacts on academic performance, including distraction from academic work and misuse of productive time. Concerning online engagement, this study resonates with [4] results stating that constant texting and use of social media could lead to academic setbacks due to continual distractions. Similarly, [13] revealed that switching tasks because of Facebook and texting affected studying patterns, again emphasizing the potential pitfalls of mobile phone misuse. Counterbalancing these concerns, the current study suggests that appropriate mobile phone usage could benefit students' performance in academics. This observation aligns with the results of [5], which demonstrated that the utilization of mobile learning, specifically text messaging, had a favorable effect on the performance of students enrolled in a community college algebra course. Mobile phones' utility extends beyond leisure and can include educational capabilities such as file sharing, instant information retrieval, and fostering communication among peers and educators. Therefore, it is imperative for students to divert their attention from non-academic to academic utilization in order to effectively regulate the repercussions of excessive mobile phone usage on academic achievement. Finally, this study's observations about gender differences in mobile phone usage echo those of [12], [13]. They suggested that male and female students might use mobile phones differently, and that female students showed an increased tendency towards mobile phone addiction. Thus, interventions aimed at minimizing excessive mobile phone usage should consider these gender differences. In summary, while excessive mobile phone usage, particularly for non-academic purposes, can negatively impact students' academic performance, appropriate use for educational purposes may provide significant benefits. Balancing these contrasting impacts is crucial, especially in the current era of online learning.

CONCLUSION

The study concluded that while mobile phones can pose negative impacts on students, particularly in terms of privacy invasion, distraction, and misuse of productive time, they could also be beneficial when used appropriately, such as for online class collaborations and communication. The results revealed that students' academic performance could be influenced negatively by extensive social media participation. However, involvement in other digital activities showed a positive correlation with their outcomes. The study implies that during challenging times such as the COVID-19 pandemic, where digital learning is prominent, there is a need for educators to develop strategies that maximize the benefits offered by mobile phones. The study also highlights the necessity to address issues related to mobile phone habituation and misuse among learners, which potentially may impact their academic performance and overall well-being.

ABSTRACT

Unemployment is a significant issue affecting many countries worldwide. In recent years, despite economic sector growth, India has experienced a deceleration in employment expansion. At the same time due to this Covid-19 pandemic lockdown, there had been a devastating effect on the Unemployment and Labour Participation Rate in India as most of the private companies have discharged their employees. The workers in informal sectors have been the hardest hit by this lockdown and a number of them losing their jobs due to the closure of construction projects. This paper aims to compare the percentages of Unemployment and Labour Participation Rate in Assam during Covid-19 pandemic. All the necessary data were collected from the secondary sources e.g. books, journals, newspapers, authentic internet sources, etc. To analyse the data, the researchers used MS Excel and SPSS. From the present study, the researchers found that the percentages of Unemployment and Labour Participation Rate in Assam during Covid-19 pandemic is increased in comparison to before Covid-19 pandemic.

Keywords : Unemployment, Labour Participation, COVID-19 pandemic.

INTRODUCTION

In India, an individual who works approximately 8 hours per day for 273 days each year is categorized as being employed based on the standard person-year criterion. Thus, a person to be called an employed person must get meaningful work for a minimum of 2184 hours in a year. The person, who does not get work for this duration, is known as an unemployed person (Khurana, 2018). According to the Organization for Economic Co-operation and Development (OECD) unemployment are people above a specified age (usually 15) not being in paid employment or self-employment but currently available for work during the reference period. The term unemployment refers to a situation when someone is actively seeking for employment but they're unable to find work. The primary gauge of

66940

unemployment is the unemployment rate, determined by dividing the number of jobless individuals by the total labor force population. Many governments offer unemployment insurance to certain unemployed individuals who meet eligibility requirements (Hayes, 2022). In Marx's view, unemployment is an inherent aspect of the unstable capitalist system, and the occurrence of periodic crises involving widespread unemployment is to be anticipated. He theorized that unemployment was inevitable and even a necessary part of the capitalist system, with recovery and re-growth also part of the process (Marx, 1956). In the last four decades, India has witnessed growth in all sectors of its economy, including primary, secondary, and tertiary. However, unfortunately, in the initial stages, unemployment under challenging circumstances has increased. This was due to the fact that in the first three decades of economic planning, the growth rate fell significantly short of the intended targets.

The first case of the Covid-19 pandemic in Assam was officially reported on March 31, 2020. As of 3 March 2022, the Government of Assam has confirmed a total of 89,468 positive cases of Covid-19 including 67,641 recoveries, three migrations and 234 deaths in the state (Kalita, 6 July 2020). In April 2020, the International Labour Organisation (ILO) estimated that nearly 2.5 crore people lost their jobs worldwide due to the Covid-19 pandemic 2020. Further, more than 40 crore informal workers in India may get pushed into deeper poverty due to the pandemic. In August 2021, the Standing Committee released a report on Labour noted that 90% of workers in India are from the informal sector. These workers include (i) migrant workers, (ii) contract laborers, (iii) construction workers, and (iv) street vendors. The committee observed that the pandemic worst impacted these workers.

The Covid-19 pandemic had a significant effect on unemployment and economic sector in Assam. There will be a huge economic pain ahead, both politics and policymaking have to work together to get the edge out of it (Parul, 2020). The present study provides information on unemployment and labour force rate in Assam during Covid-19 pandemic. It presents CMIE analysis of overall unemployment rate trends during the pandemic. Next, it examines how unemployment rates varied in relation to their: Educational qualification, Age Group, Locality, and Gender. The study also analyses the labour force participation rate, which make it possible to understand or know more about the size of the workforce willing and available for work. The final portion of this paper analyzes the impact of covid-19 pandemic on overall unemployment rate in Assam.

Unemployment rate

The unemployment rate is a useful measure of the underutilization of the labour supply. This indicates the incapacity of an economy to create jobs for individuals who are willing and available to work but are currently unemployed. The unemployment rate is calculated by expressing the number of unemployed persons as a percentage of the total number of persons in the labour force (International Labour Organization). The calculation of the unemployment rate is as follows:

$$UR (\%) = \frac{Person\ unemployed}{Labour\ Force} \times 100$$

Labour participation rate: The labour force participation rate are calculated as the labour force divided by the total working-age population. The term "working age population" pertains to individuals aged 15 to 64. This metric is further divided into various age groups, and it is quantified as a percentage within each of these age groups (OECD, 2022).

The following figures (Figure 1 & Figure 2) shows the historical trend of Unemployment and Labour Participation Rate in Assam and in India quarterly from January, 2016 to January, 2022. Figure 1 shows the historical trend of unemployment rate in India quarterly from January 2016 to January 2022.

Prasanta Das and Abhinandan Konwar

OBJECTIVE OF THE STUDY

The objective of the present study is to compare the percentages of Unemployment and Labour Participation Rate in Assam during Covid-19 pandemic in relation to their:

a.   Educational qualification,
b.   Locality, and
c.   Gender.

METHODOLOGY

The present research study is based on literature of Unemployment and Labour Participation Rate in Assam from January, 2020 to December, 2020. Data were collected from the secondary sources viz. Internet, Journals, and Centre for Monitoring Indian Economy Pvt. Ltd. (CMIE). To analyze and compare the data, the researchers used Microsoft Excel and Statistical Package for the Social Sciences (SPSS).

RESULTS AND DISCUSSION

The results of the Unemployment and Labour Participation Rate in Assam are discussed under the following figures Figure 3: Unemployment and labour participation rate in Assam **-** Figure 3 shows the percentages of Unemployment and Labour Participation Rate in Assam during Covid-19 pandemic (From January 2020 to December 2020) in relation to their educational qualification. Figure 3 shows that the percentages of Unemployment Rate and Labour Participation Rate is 23.08% and 60.21% respectivelyindividual with 'No Education' level in Assam during Covid-19 pandemic as per the report of Centre for Monitoring Indian Economy (CMIE). However, according to the CMIE report the percentages of Unemployment Rate is 7.60% and Labour Participation Rate is 49.08% individual with'10th standard-Graduate' level in Assam during the period of Covid-19 pandemic.

Figure 4: Unemployment and Labour Participation rate in Assam - Figure 4 shows the percentages of Unemployment and Labour Participation Ratein Assam during Covid-19 pandemic (January 2020 to December 2020) in relation to their gender. Figure 4 shows that the percentages ofMale Unemployment Rate and Male Labour Participation Rate is 4.33% and 78.93% respectively in Assam during Covid-19 pandemic as per the report of Centre for Monitoring Indian Economy (CMIE). However, according to the CMIE report the percentages of Female Unemployment Rate is 4.61% and Female Labour Participation Rate is 12.56% in Assam.

Figure 5: Unemployment and Labour Participation rate in Assam –Figure 5 shows the percentages of Unemployment and Labour Participation Rate in Assam during Covid-19 pandemic (January 2020 to December 2020) in relation to their locality. Figure 5 shows that the percentages of Unemployment and Labour Participation Rate is 5.13% and 44.38% respectively in the 'urban' areas of Assam during Covid 19 pandemic as per the report of Centre for Monitoring Indian Economy (CMIE). However, according to the CMIE report the percentages of Unemployment Rate is 4.24% andLabour Participation Rate is 46.66% in the 'rural' areas of Assam.

SUGGESTIONS

- The central and state government should (i) encourage entrepreneurial opportunities, (ii) strengthen social security measures, (iii) investment in traditional manufacturing sectors, (iv) developing industrial clusters, (v) promote vocational training, and (vi) maintain a database of workers in the informal sector.
- Not everyone can afford a large sum of money to start their own business. So, the government should provide financial assistance as well as raw supplies and technical instruction to the people who are engaged in small-scale industry, agriculture sector, poultry and pig farming and other fields also.
- Government should formulate some schemes and policies related to agriculture and industrial sectors which encourage and create opportunities to the unemployed people of Assam.

Prasanta Das and Abhinandan Konwar

- Irrigation, flood control, electricity, agriculture, and rural electrification programmes should be prioritized in the policy making process. This will help to create more job opportunities for the unemployed people of Assam.
- Most of the people in Assam are not interested in small-scaling industries, farming and agriculture etc. So, the government as well as common people organizations should organized workshops, training programmes, etc to motivate them.
- Instead of focusing on easy money, people should create their own path of earning and they should start own business in their interested field of work.
- Population growth should be reconsidered in order to solve the problem of unemployment. Family planning policy should be enforced consistently and effectively.

CONCLUSION

From the results and discussion, it can be concluded that the Covid-19 pandemic has imposed a nationwide lockdown from late March 2020. During lockdown, severe restrictions were placed by the central and state Govt. on the movement of individuals, and economic activities were significantly halted, barring the activities related to essential goods and services. Unemployment during lockdown was directly associated with income loss amongst the labourers engaged in profession which remained non-operational during lockdown following Covid-19 pandemic. However, the labourers who were either working or on pay leave suffered no income loss. With Covid-19 being more than a health crisis, in short term it is necessary to minimise the loss of life, forwarding social and financial security for the families of migrant labourers and vulnerable sections for extended period of crisis, strategies for supporting agriculture and allied activities, promotion of small and medium size enterprises, imparting skill training for the unemployed and reverse migrant labourers, financial assistance for self-employment may be helpful. Suitable coordination of monetary and fiscal policy would be helpful for reducing the unemployment heading from the recessionary trend of the economy in the long run.

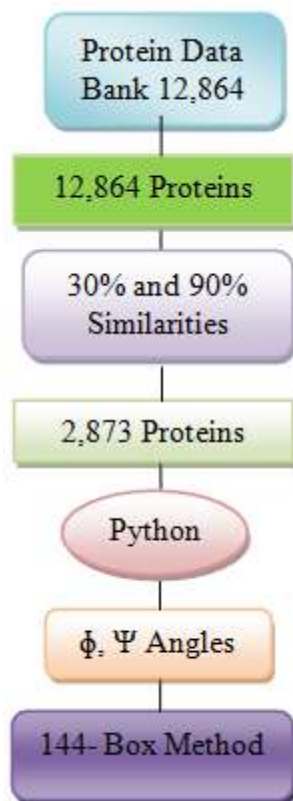
ABSTRACT

Conformational analysis is the primary vicinity in establishing the structure and features of biological macromolecules. It involves analyzing the multiple energy levels connected to a protein's numerous conformations. Each residual amino acid in a protein makes up the phi and psi angles. The foundation of a protein is its torsional angles, which coupled with its side chains establish its overall conformation. Because of the steric barrier between the main chain and side chain atoms, only specific combinations of these angles are possible. Protein structures and functions are beginning to evolve as a result of the recent accumulation and development of sensitive technologies. Non-homologous proteins come in many different varieties with various distributions. Comparative analysis results in the higher significance of the majority of amino acid predictions. We have developed a brand-new technique called the 144-box method that is used to examine the amino acids for comparatively small structural proteins. Our Study makes a significant contribution to the classification of riboviruses using the 144-box technique. This research may also be beneficial for experimental biotechnologists.

Keywords: Protein Data Bank, Python Programming, 144 –box method.

INTRODUCTION

Proteins are polypeptide structures made up of one or more elongated chains of residues from the amino acid. [1]. Protein conformation is the structural distribution of the atoms that make up the molecule and determine its overall shape. The shape of the protein is determined by the bonding orientations within the structure. Protein conformation, which has been a research hotspot for human diseases, is an important factor in protein properties. Recently, a series of approaches have been utilized to investigate conformational changes under different conditions.[2] To search for small molecule conformations, conformational analysis has been used in drug design[3]. Fundamental evaluations of the interatomic interactions that constitute molecular biology include the creation of novel structures and interactions as well as the prediction of the atomic-level structures and connections of biological macromolecules [4].

MATERIALS AND METHODS


Data Collection
I have gathered all of the ribovirus databases from the protein data bank, and using Python programming, we have examined the riboviral proteins to obtain the phi and psi values. Our own Python program was used to structure the 144-box method for torsional angles. The fundamental method used to determine a torsional angle, φ is the C(i-1), N(i), Ca(i), C(i) torsion angle and ψ is the N(i), Ca(i), C(i), N(i+1) torsion angle.[5]

Method of Calculation
The conformation of the residues and the peptide is determined by the torsional angles of each residue in a peptide, which defines the geometry of each residue's attachment to its two adjacent neighbors by determining the position of each planar peptide bond concerning the two adjacent planar peptide bonds. The main chain of a polypeptide

typically adopts favorable, energetically beneficial conformations as a result of steric hindrance. This conformation's value for two torsional angles for each residue can be used to describe it. [6] Steric hindrance prevents the realization of a large number of angle combinations and, consequently, residue conformations. Protein structural scientists can use our method to establish whether torsional angles are acceptable and gain information into the structure of peptides. [7].

Protein Databank

For 26 years, the PDB has provided support to a global community of researchers, teachers, and students working in a wide range of scientific professions. Every day, scientists from all across the world add new structures to the PDB. This community's unifying focus is the need for information that can link the three-dimensional structures of macromolecules to their biological functions. There are various instances where the PDB is playing an increasingly significant role in molecular biology, medicine, and drug development. [8]. Through modifications to the receptor binding domain (RBD) and the presentation of neutralizing antibody peptides, spike conformation plays a crucial part in SARS-CoV-2 development by influencing the virus's transmissibility and immune evasion. For my project study, I used the protein structure database of the risky Delta (B.1.617.2) SARS-CoV-2 variant spike protein.

A set of 12,864 non-homologous proteins were selected from the (PDB) Brookhaven Protein Data Bank, [9] Among 12,864 proteins, 2,873 proteins were identified using 30% and 90% similarities. We have used our own Python programming for my research. The Dihedral angle of conformational angles (φ, ψ) was computed from the atomic coordinates of the proteins available in the Protein Data Bank. When we compare our results to the Ramachandran plot, we get a completely different conclusion that has cleared the path for future research.

Python Programming

Python is an object-oriented, interpretive programming language. By simply copying the program's source code, users may execute Python-written programs on a variety of operating systems, including Microsoft Windows, Linux, and Unix systems like Mac OS X, with almost full support for both the built-in and third-party libraries. All the computations were done using the own Python programming [10].

RESULT AND DISCUSSION

Alanine:

This figure(i), and (ii) represents the 144-box method for alanine. (i) denotes our results are being compared with the Ramachandran plot. In the Ramachandran plot, the alpha helix creates high helix propensities, however in our 144-box technique, the beta-sheet forms the majority of propensities. Compared to other prediction methods, this produces a different outcome. Each backbone N-H group gives a hydrogen bond to the backbone C=O group of the four amino acid residues to create the alpha helix, which is a right-handed coiled or spiral shape. Alpha helix in alanine has a strong propensity to form a helix but in our technique, beta-sheet formation is higher. Fig 2 contains the angles of phi and psi which initiates the conformation of alanine while predicting the protein structure. The side chains of the alanine residues in this sequence do not connect, making them too short to form a helix. This makes the alanine sequence a good test case for the idea that denatured proteins are just random coils with no structure[11]. Beta sheet corresponds to the bulk of the alanine structure when our 144-box method is compared to any other technique or method of any kind.

In the Ramachandran plot of glycine, it has the poor formation of helix propensities however in our 144-box technique, alpha helix and beta sheet form the majority of structures. Among different types of non-homologous proteins having overall distributions. The second structural component of the proteins is the beta-sheet. The great conformational flexibility of glycine makes it entropically costly for it to adopt the comparatively limited -helical structure, which is another reason why it tends to break helices [12]. Having five or more hydrogen bonds securing its beta strands together. Two opposite strands are connected by a brief loop of two to five residues, and glycine

produces the dihedral angle conformation for a tight turn in this loop. Glycine has an insufficient potential to form helixes. According to our 144-box method, numerous prediction techniques were compared with the conformational study of non-homologous ribovirus proteins based on the H1N1 virus, yellow fever virus, zigzag virus, and human immunodeficiency virus. Whereas our technique, especially, exhibits identical outcomes and delivers a better prediction than other methods.

CONCLUSION

This study will provide precise information regarding riboviral proteins and their micro-level conformational patterns. In our study, the classification of riboviral non-homologous proteins for alanine and glycine are visualized and analyzed using the 144-box technique and in-depth insights into the structure and dynamics of the riboviral proteins that might be used to develop potent and targeted inhibitors that target the membrane protein and used in the process of developing drugs. This research may also be beneficial to experimental biotechnologists.

ABSTRACT

The Acupuncture Fellowship Training program at the National Institute of Naturopathy (NIN) in Pune, India, responds to the increasing demand for skilled acupuncturists. It offers a comprehensive curriculum guided by experienced acupuncturists, bridging traditional wisdom with contemporary scientific knowledge. This research delves into participant feedback to assess the program's effectiveness in addressing diverse healthcare challenges. A total of 80 participants responded to an online validated questionnaire on the curriculum outcome related to the course. Results reveal the significant application of acquired skills, particularly in chronic pain management (97.5%), menopause (46%), migraines (89%), fertility issues (56%), and non-communicable diseases (67%). Participants exhibited a strong grasp of Traditional Chinese Medicine (TCM) principles, affirming the curriculum's efficacy. Notably, participants unanimously acknowledge acupuncture's positive impact on therapeutic outcomes, whether applied independently or in conjunction with Naturopathy. The Acupuncture Fellowship Training cultivates proactive practitioners who enhance patient care quality. By integrating traditional knowledge with contemporary medical insights, this program contributes to Naturopathy's evolving trajectory. As the

Satya Lakshhmi Komarraju *et al.,*

healthcare landscape continues to evolve, this study emphasizes the vital role of well-structured training programs in nurturing proficient acupuncturists capable of positively influencing patient well-being.

Key words: National Institute of Naturopathy, Acupuncture, TCM, India, Naturopathy, Curriculum

INTRODUCTION

In recent years, complementary and alternative medicine (CAM) practices have witnessed a significant surge in popularity worldwide. Among these, acupuncture stands out as an ancient, time-honored healing technique that has been embraced by millions seeking natural and holistic remedies for various health conditions [1]. As the demand for skilled acupuncturists grows, so does the need for rigorous training programs that equip practitioners with the expertise to provide safe and effective treatments.[2] The National Institute of Naturopathy (NIN), situated in the serene environs of Pune, India, has earned recognition as a premier institute offering holistic healing education. Within its comprehensive array of programs, the Acupuncture Fellowship Training program holds a special place, for Naturopathy and Yoga practitioners to enhance their knowledge and skills. This article aims to delve into the experiences and feedback of participants who have undergone the Acupuncture Fellowship Training at NIN, with a primary focus on their overall satisfaction with the program. NIN's Acupuncture Fellowship Training is designed to provide participants with an in-depth understanding of acupuncture principles, techniques, and applications based on Traditional Chinese Medicine (TCM). The program is led by a highly experienced faculty, consisting of experienced acupuncturists, ensuring that trainees receive an immersive and enlightening experience throughout their journey. The curriculum's comprehensiveness, practical training modules, faculty support, and fosters an atmosphere of self-directed learning. In this era of evidence-based medicine, NIN's Acupuncture Fellowship Training addresses the importance of scientific research and evidence-based practices. By bridging the gap between traditional wisdom and contemporary scientific knowledge, participants are empowered to embrace a more holistic approach to healthcare. This study on participant satisfaction during Acupuncture Fellowship Training at the National Institute of Naturopathy, Pune, aims to shed light on the transformative impact of comprehensive and well-structured training programs in nurturing skilled acupuncturists who can truly embrace the art of healing and positively influence the health and well-being of their patients [3-5]. The study aims to gauge the level of satisfaction among participants regarding various aspects of the Acupuncture Fellowship Training. This includes their perceptions of the program's structure, content, organization, and delivery.

MATERIALS AND METHODS

Ethical Clearance: Prior to commencing the study, ethical clearance was obtained from the appropriate institutional review board (IRB) of National Institute of Naturopathy (401/2023) to ensure that the research was conducted in compliance with ethical guidelines and protected the rights and welfare of the participants. Participant Selection: The study targeted individuals who had completed the Acupuncture Fellowship Training program at the National Institute of Naturopathy, Pune. A total of 120 participants were invited to take part in the study. Data Collection Instrument: Data was collected through an online Google form, carefully designed to capture relevant information related to the participants' experiences during the fellowship training. The questionnaire comprised of questions related to gender and job profile, enabling demographic analysis and understanding the diverse backgrounds of the participants.

Key Outcome Measures: The questionnaire focused on assessing the impact of the Acupuncture Fellowship Training program on the participants' professional development and practice. Key outcome measures included:

Increased Patient Flow: Participants were asked to evaluate whether the fellowship training had influenced their patient flow, thereby indicating the effectiveness of the program in attracting a larger patient base.

Satya Lakshhmi Komarraju *et al.,*

Improved Quality of Practice and Confidence: Participants were encouraged to provide insights into how the training had enhanced their practice quality and confidence in delivering acupuncture treatments.

Areas of Application: The questionnaire explored the various domains where participants applied their newly acquired acupuncture skills, offering valuable information on the diverse applications of acupuncture in contemporary healthcare settings [3].

Understanding Traditional Chinese Medicine (TCM): Participants were assessed on their understanding of the finer nuances of Traditional Chinese Medicine, emphasizing the program's efficacy in imparting essential knowledge and principles of TCM.

Response Rate

Out of the 120 participants invited to participate, 80 individuals responded to the questionnaire, yielding a response rate of approximately 66.7%. The response rate indicates a substantial level of engagement from the fellowship trainees.

Questionnaire Validation

To ensure the validity of the data collection instrument, the questionnaire was rigorously validated by experts in the field of acupuncture and complementary medicine. Additionally, a pilot test was conducted with a small group of participants to fine-tune the questionnaire's clarity and relevance.

RESULTS

Gender and work place distribution of the study participants is shown in Table 01.
Graph 01 shows the participant feedback based on the overall outcome of the course curriculum. The participants demonstrated remarkable utilization of the acquired knowledge and skills across several pivotal domains. Particularly noteworthy were the significant applications in the realm of chronic pain management, with an impressive 97.5% engagement rate. The comprehension extended to encompass menopause, accounting for 46% of participants, and the domain of migraine, where a substantial 89% of participants effectively translated their skills. Furthermore, a substantial 56% of participants showcased their proficiency in addressing fertility concerns. The application of this knowledge also extended to the domain of non-communicable diseases, encompassing hypertension and diabetes, with a commendable participation rate of 67%. A testament to the participants' comprehensive grasp of the subject matter, all respondents accurately answered questions pertaining to the utilization of TCM principles across diverse fields. This collective acumen speaks to the effectiveness of the curriculum in fostering a well-rounded understanding of TCM's applicability. In unanimous consensus, participants attested to the invaluable role of acupuncture in enhancing therapeutic outcomes. Whether employed as a standalone modality or harmoniously integrated into Naturopathy practices, acupuncture emerged as a potent tool that unequivocally amplified the efficacy of their therapeutic interventions. This unanimity underscores the pivotal role of acupuncture in bolstering the participants' therapeutic repertoire and elevating patient outcomes. As the landscape of healthcare evolves, the demand for specialized expertise becomes increasingly evident. Around 90% of participants sought expanded insights into cancer-related interventions, recognizing the urgency of honing their skills in the face of this complex challenge. Hence this calls for not just continuation but also expanding the base of the course, to help the practitioners deal with chronic, debilitating conditions such as cancer to foster better health care. Furthermore, the yearning for enhanced expertise extended to pregnancy and lifestyle-related disorders, garnering an impressive 98% consensus. It's noteworthy that participants were acutely attuned to the need to address psychiatric issues, with 89% seeking deeper insights into this intricate realm. Collectively, these observations underscore the dynamic nature of healthcare demands and the participants' unwavering commitment to continuous improvement. The survey results affirm that the curriculum and fellowship program have not only enriched their existing skill sets but have also fostered a proactive approach to meeting evolving healthcare needs.

DISCUSSION

The feedback underscores the successful realization of the course curriculum's multifaceted objectives: to elevate skills, foster unwavering confidence in patient management, and augment the foundational tenets of Naturopathy to yield unparalleled patient outcomes over a period of 6 months. Research has proved that fostering motor skills is successful over long term duration of courses with a combination of theory and mentored practical classes [6]. Given that Traditional Chinese Medicine (TCM) is but one facet of clinical naturopathy, the room for students to delve deeply into acupuncture, pulse diagnosis, and comprehensive cases within their BNYS program remains constrained [7]. Consequently, a meticulously crafted fellowship program, fortified by robust online training modules and immersive clinical engagement, has emerged as an indispensable catalyst. This program has undeniably empowered Naturopathy practitioners, equipping them with the tools needed to establish elevated benchmarks in their practice, leading to commendable results across a diverse spectrum of health conditions [8]. The intricate tapestry of the diverse philosophical underpinnings inherent in TCM, deeply rooted in its Chinese origins, has historically induced perplexity concerning its canonical role and foundational tenets across varying schools of thought. Nonetheless, the concerted efforts undertaken by the NIN to pivot towards the authentic principles of TCM and dispense these timeless theories have borne fruit over time. It has focussed more on transferrable skills rather than just textbook knowledge; which is the need of the next century [9]. The institution's dedication to curating an educational framework that harmonizes seamlessly with these principles has yielded substantial dividends. The intrinsic complexity of TCM's diverse perspectives, often mired in confusion, has been met with NIN's resolute commitment to promoting a unified and authentic understanding of these principles, thereby fostering a clearer and more cohesive comprehension. However, the burgeoning requisites for broader exposure and the pressing need to tackle emerging health challenges like cancer and non-communicable diseases (NCDs) serve as a clarion call for a further escalation in training initiatives. Addressing these multifaceted challenges mandates a bespoke and concentrated approach to exposure within healthcare settings, wherein Naturopathy practitioners are equipped with a refined skill set, enabling them to confidently navigate complex cases and deliver outcomes that resonate with the evolving healthcare landscape [10]. The trajectory of acupuncture in India has been a journey of substantial evolution [11]. marked by its integration into mainstream healthcare practices. This evolution has been further bolstered by the harmonious assimilation of acupuncture principles within the broader Naturopathy curriculum, particularly through the conduit of the mentored fellowship program, where mentoring has proven to be successful across different specialities for skill improvement [12]. One of the primary challenges to the implementation of the objectives of the competency-based curriculum is that traditional, high-stakes testing does not generally assess key skills and competences [13]. By bridging the gap between theoretical knowledge and practical application, this program has seamlessly interwoven itself into the educational landscape. Consequently, it has not only enriched the skills of Naturopathy practitioners but has also endowed the curriculum with a renewed vigor which is the need of the hour [14].

The NIN's Acupuncture Fellowship Training not only enriched participants' skill sets but also cultivated a proactive approach to healthcare evolution. The study emphasized the program's role in elevating Naturopathy practitioners' practice quality and patient outcomes. By harmonizing traditional knowledge with contemporary medical insights, this program contributes to a refined and effective trajectory for the broader curriculum. In summary, this study illuminates the profound impact of well-structured and comprehensive training programs, such as the Acupuncture Fellowship Training at NIN. These programs are instrumental in nurturing skilled acupuncturists who not only embrace the art of healing but also positively influence patient health and well-being. As the landscape of healthcare continues to evolve, the role of such training programs remains pivotal in ensuring that practitioners are equipped to meet the evolving needs of patients seeking holistic and natural healing approaches.

Satya Lakshhmi Komarraju *et al.,*

CONCLUSION

The Acupuncture Fellowship Training program offered by the National Institute of Naturopathy (NIN) in Pune, India, addresses the need for rigorous training in this ancient healing technique. As demand for skilled acupuncturists increases, programs like these play a pivotal role in equipping practitioners with the expertise to deliver safe and effective treatments. The study delved into participant experiences and feedback of the Acupuncture Fellowship Training program at NIN, with a focus on their overall satisfaction. This comprehensive training program, led by experienced acupuncturists, offers insights into acupuncture principles, techniques, and applications. Through the study, it became evident that the program had a transformative impact on participants. The survey results highlighted the widespread application of acquired skills, particularly in addressing chronic pain, menopause, migraines, fertility issues, and non-communicable diseases. Participants also demonstrated a commendable grasp of Traditional Chinese Medicine (TCM) principles, underscoring the curriculum's effectiveness. Participants unanimously affirmed the efficacy of acupuncture as an enhancement to therapeutic outcomes, whether as a standalone modality or integrated with Naturopathy practices. The demand for further training to address complex challenges like cancer, pregnancy-related disorders, and psychiatric issues showcased participants' commitment to evolving healthcare demands.

ABSTRACT

Many edible mushrooms are being considered as new medical options with numerous applications. The purpose of this study was to estimate the antioxidant and antimicrobial capabilities of *Agaricus bisporus* (JE Lange). The overall phenolic, flavonoid, alkaloid, tannin, and glycoside contents of methanolic and chloroform extracts differed significantly. The FRAP assay was used to investigate the antioxidant activities of the extracts, and the methanolic extract had a potential antioxidant capacity (42.93± 0.7). Antimicrobial activity was identified in varying degrees against three reference microbial strains with the inhibition zone ranging from 5 to12 mg/ml. The findings suggested that *Agaricus bisporus* (JE Lange) has considerable antioxidant and antimicrobial properties, and it could be also be used as therapeutic agent in the food and health industries.

Keywords: *Agaricus bisporus* (JE Lange), antioxidant activity, antimicrobial activity, preliminary screening, quantitative analysis

Hiral Chaudhary *et al.,*

INTRODUCTION

Since the last few decades, humans have characterised mushrooms according to their therapeutic potential. Today, modern scientific research is validating folk medicines and exploring their potential for developing new pharmaceutical ailments. This has led to a growing interest in the field of mycology and the study of medicinal mushrooms. Researchers have identified various bioactive substances that have shown promising effects in treating a wide range of ailments, including cancer, immune disorder and neurodegenerative diseases. *Agaricus bisporus* (JE Lange) is one of the most cultivated edible mushrooms in India and is commonly known as the button mushroom. They are naturally growing in grasslands and fields and rich in nutrients [1]. Several vitamins, minerals, proteins, and fibres make them a healthy addition to diets. Besides the nutritive value, their chemical diversity plays a significant role in various biological properties such as antioxidant, antimicrobial, anticancer, and anti-inflammatory. They are also reported as good source of phenols, flavonoids, alkaloids, tannins, and glycosides, polyunsaturated fatty acids such as linolenic, linoleic, polyphenols, and conjugated linoleic which are good for human metabolism [2].

Reactive oxygen species (ROS) are important for various cellular activities, but excessive production causes oxidative stress, which leads to subsequent cell damage [3]. Some environmental factors like radiation, chemicals and other toxic substances also cause oxidative stress that has been responsible for chronic diseases such as cancer [4, 5]. Antioxidants are vital components that protect the human body from oxidative damage by scavenging free radicals, chelating metal ions and inhibiting lipid peroxidation. These endogenous antioxidant enzymes, including catalase, peroxidase, superoxide dismutase, and glutathione, can deactivate free radicals and regulate normal physiological functions of cells. Sometimes these substances become inadequate to maintain the biological processes of cells and may cause severe diseases. The consumption of antioxidants exogenously is pivotal to helping the antioxidant defence system by maintaining the antioxidant level in the human body. Some synthetic antioxidants like butylated hydroxytoluene (BHT), propyl gallate and butylated hydroxy anisole (BHA) have been extensively used to regulate sufficient amounts of antioxidants[6]. However, at that time, safety concerns were also important due to their adverse effects like GI issues, skin allergies and cancer. Natural antioxidants are the less toxic and more effective source that have been reported to be potent free radical scavengers that can replace synthetic ones.

Moreover, Antibiotics are regarded as one of the most useful discoveries that can cure untreatable diseases. At that time, the emergence of resistant bacteria poses a new challenge to biomedical science. Optimism has been sparked by the identification of nutraceutical properties in food products and by their capacity to inhibit microbial growth [7]. Since time immemorial, mushrooms have played a significant role in traditional medicine. Around 80% of the healthcare systems in various nations use natural medicine to address a variety of ailments. This study aims to evaluate the antioxidant and antimicrobial properties of *Agaricus bisporus* and conduct a quantitative analysis of its pharmacologically active constituents.

MATERIALS AND METHODOLOGY

Procurement of mushroom sample
Agaricus bisporus (JE Lange)was collected from Low Garden, Ahmedabad, Gujarat, India, in August 2021. The first step entails finding and collecting the mushrooms in their natural habitats. The mushroom identification was carried out based on morphological characteristics including features like cap, stripes, color, shape, size, and gills. The collected fruiting bodies were cleaned using deionized water (Milli-Q Millipore, 0.054 mS/cm) to eliminate dust particles. The samples were cut into small pieces and sun-dried for 24 hours, then oven-dried for 1-2 hr at 70 ℃ to remove moisture content. After that, dried samples were ground to a fine powder by amixture grinder. The fine powder was kept in an airtight container for further work.

Extraction

The crude extracts were prepared in methanolic and chloroform solvents using the Soxhlet method. The powder sample and fresh solvent (solid-to-solvent ratio, 1: 10 g/ml) were used for the extraction. The mixture was placed in the Soxhlet apparatus using an extraction thimble (size range of 20 × 70mm) [DWK Life Sciences, Wheaton, Mumbai, India] and extracted for 24 h at 60 ℃ with 5-6 cycles/h. Then the extract was filtered with Whatman number 1 filter paper and extra solvent was evaporated using a rotary evaporator at reduced pressure for 20 min at 30 ℃ (IKA-RV10 Digital V, Karnataka, India) and stored for further analysis at 4 ℃. The final yield value of methanolic crude extract was calculated using the given standard formula.

$$Yield\ (\%) = \frac{final\ weight\ of\ extract}{initial\ weight\ of\ extract} \times 100$$

Chemicals and reagents

Sodium carbonates (Na_2CO_3), Folin-Ciocalteu phenols reagent, Gallic acid, NaOH, and $AlCl_3$ were analytical grade (Sigma Aldrich Co., Germany). Milli-Q water (Advantage A10 purifier from Millipore), Mueller Hinton Agar, standard antibiotic Gentamycin, Nutrient agar and nutrient broth (Hi-Media Pvt. Ltd., Mumbai, India), Methanol, glacial acetic acid and ethanol were of HPLC grade.

Preliminary screening:

Preliminary screening of extracts was analysed using standard procedures [8, 9] to identify the presence of primary and secondary metabolites.

Total alkaloid content

1 g of fine powder of mushroom fruiting body and 20% acetic acid (40 ml) were mixed into a 250 ml beaker. The mixture was vortexed and covered before being incubated for 4 h. After that, the solution was filtered. Then the filtrate was kept in a water bath to eliminate extra moisture. Afterward, ammonium hydroxide (concentrated NH_4OH) was added until the precipitation appeared. The reaction mixture was filtered through Whatman No. 1 filter paper. Then, the precipitate was collected and weighed to determine the alkaloid content of the powder [10].

Total Phenol Content

The determination of thetotal phenol content of extracts was carried out using the Folin Ciocalteu method with some modifications [11]. Concisely, 20% w/v of sodium carbonate (Na_2CO_3) and 10% v/v Folin Ciocalteu reagent (Sigma-Aldrich Co., Germany) were prepared. Then, 0.5 ml of the extract and 0.5 ml of Folin-Ciocalteu reagent (1:1) were mixed properly before being diluted with 10 ml of distilled water. Thereafter, 2 ml of 20% sodium carbonate was added and allowed to incubate for 30 minutes. Then, the absorbance of the mixture samples was measured using a UV-VIS spectrophotometer (Thermo fisher EVO300PC, USA) at 760 nm. Lastly, a standard curve was obtained using comparison with gallic acid and results were expressed as mg gallic acid equivalents (GAE)/gram of sample.

Total Flavonoid Content

The estimation total flavonoid content of extracts was performed by the Aluminium chloride colorimetric method with minor modifications [12]. The sample extract (1 ml) was added into a test tube with 100µL of 10% $AlCl_3$ (w/v) and 100µL of 1M potassium acetate. Then the mixture was dissolved in 5 ml of distilled water before being allowed to incubate for 30 minutes. The absorbance was measured using spectra against a blank at λ 415 nm in a spectrophotometer. The calibration curve was formulated using standard Quercetin. The results were expressed in mg Quercetin equivalent/gram of sample.

Total Tannin content

To determine the total tannin content of extracts, the Folin Ciocalteu assay was used with some alternations [12]. In this study, 0.1 ml of extract was diluted in 5 ml distilled water and 0.5 ml of Folin reagent was added. Then, 1 ml of 35% Na_2CO_3 (sodium carbonate) was added. After that the reaction mixture was diluted with distilled water and

shaken well before incubating for 30 minutes. Then the absorbance was evaluated at 700 nm in aspectrophotometer. The results were reported as mg of tannic acid equivalent/gram of sample.

Total cardiac glycoside content
The cardiac glycoside content was assessed using the Baljet reagent method with some modifications [13]. 500 µl of sample was added into 500 µl of Baljet reagent containing picric acid with 10 % NaOH (sodium hydroxide, 95:5). After 1 hour of incubation, 9 ml of distilled water was added. The absorbance at 495nm was measured by spectrophotometer, andthe total glycoside content was represented as mg digitoxin equivalent per gram of sample.

BIOASSAY
Antioxidant activity
The antioxidant efficacy of extracts was determined by the FRAP (ferric reducing antioxidant power) assay. In this assay, acetate buffer (3 M) with a 3.6 pH was used to prepare the FRAP reagent, which was then mixed in 1,2,4,6-tris (2-pyridyl)-s-triazine with HCl (0.4 M), followed by $FeCl_3.6H_2O$ (0.2 M) in a 10:1:1 ratio. After that, 0.5 ml of sample and 4 ml of FRAP reagent were diluted in 10 ml of distilled water. The solution was then incubated for 10 minutes at 37 ̊C before being measured at 593 nm in a spectrophotometer. The results were stated as the mg equivalent Fe(II)/g of the sample. Adequate dilution was required if the FRAP value exceeded the linear range of the standard curve [14].

Antimicrobial activity
The antibacterial activity of *Agaricus bisporus* was tested against *Staphylococcus aureus* and *Bacillus subtilis* (Gram-positive bacteria)and *Pseudomonas aeruginosa* (Gram-negative bacteria) by agar well diffusion assay. The methanolic and chloroform extracts were tested for their antifungal potentiality against *Saccharomyces cerevisiae*. In this experiment, the bacterial culture was maintained on anutrient agar medium, while the fungus culture wason potato dextrose agar. The bacterial inoculi were inoculated on agar media plates using 0.5 McFarland standards cell densities. The Gentamycin drug and DMSO solvent were used as positive and negative controls, respectively. The results were compared with the positive and negative controls to evaluate the effectiveness of extracts.

Statistical analysis
Microsoft Excel was used to analyse the graphical data andall the tests were performed in triplicate for each sample. Results were represented by mean ± standard error. Difference between extracts were determined by one-way analysis of variance (ANOVA) and probabilityless than 5%was considered as significant.

RESULTS

Total Yield of extracts
Total yield of methanol and chloroform extracts of *Agaricus bisporus* (JE Lange) were determined to be 24 % and 6.3 % respectively shown in Table 1.

Preliminary screening
Preliminary screening of extracts showed thepresence of alkaloids, carbohydrates, glycosides, proteins, phenols, flavonoids, saponins, terpenoids, cardiac glycosides, tannins and steroids (Table 2).

Quantitative analysis
Total alkaloid content
The total alkaloid content of *Agaricus bisporus* (JE Lange) powder was found to be 5.96 mg/g of sample.

Hiral Chaudhary *et al.,*

Total phenolic content

The estimation of phenol content in mushroom extracts is considered an important indicator for identifying the biological properties of extracts. These compounds play a significant role in radical scavenging activity and lipid peroxidation. In this study, the phenolic content of methanolic and chloroform extracts was measured and expressed by gallic acid equivalent per gram of sample using the standard calibration curve of gallic acid ($R^2 = 0.996$). The methanolic extract (14.5±0.5 mg GAE/g) contains higher phenolic content than chloroform extract (7.16±0.44 mg GAE/g). These results revealed a positive relevance between total phenol content and antioxidant activity (P<0.05).

Total flavonoid content

Besides the phenolics contribution to the antioxidant capacity of the human diet, flavonoids also play an important role in free radical scavenging activity. In this study, the total flavonoid content of methanolic and chloroform extracts of *Agaricus bisporus* (JE Lange) was quantified by quercetin equivalent per gram of dry sample using the standard curve of quercetin ($R^2= 0.995$). The chloroform extract (33.83±0.25 mg QE/g) possesses higher flavonoid content than methanol (21.66±0.19 mg QE/g).The results indicated a significant relation between antioxidant capacity and the total flavonoid content of chloroform extract (P<0.05).

Total tannin content

The total tannin content of extracts of *Agaricus bisporus* (JE Lange) was expressed as the standard calibration curve of Tannic acid ($R^2 = 0.9959$). In this study, both the extracts, methanolic (6.5±0.5 mg TAE/g) and chloroform (5.5±0.5 mg QAE/g) contain quite similar content of tannins.

Total cardiac glycoside content

The total cardiac glycoside content of extracts was expressed by digitoxin equivalent per gram of sample using the digitoxin standard curve ($R^2= 0.9983$). The chloroform extract (22.75±1.5 mg DE/g) possesses a higher content of glycoside than methanolic extract (9.25±0.6 mg DE/g).

Antioxidant activity

The excess production of free radicals and ROS (reactive oxygen species) can cause oxidative stress in cells. Antioxidants are important to counteract oxidative stress and protect human health by mitigating its harmful effects [5]. In this study, methanolic extract (42.93± 0.7 mg Fe(II)/g) shows a better antioxidant potential than chloroform extract (22.5±0.86 mg Fe (II)/g). The methanolic extracts showed higher absorption significantly (P< 0.05) and frap-reducing power as compared to chloroform.

Antimicrobial activity

The antimicrobial screening of *Agaricus bisporus* (JE Lange) was tested against various gram-positive (*S. aureus* and *B. subtilis*) and Gram-negative bacteria(*Pseudomonas aeruginosa*). The methanol extract was found to be significant against all the tested bacteria than chloroform. The inhibition zone values obtained reveals that among the tested organism, *Bacillus subtilis* (12 mm)was the most susceptible bacterium followed by *S. aureus* (5mm) and significantly differed (P<0.05). These results seem like good agreement with the previous studies recorded that gram-positive bacteria are more sensitive than gram-negative bacteria [15]. The difference in results is due to the variation in the structure of thecell wall of gram-negative bacteria in which have additional lipopolysaccharide layers that regulate entry of most molecules. Ozturk et al., (2011) reported that the methanolic extract of *Agaricus bisporus* showed the highest activity against *Bacillus subtilis* (19±1), while *S. aureus* and *Pseudomonas aeruginosa* were not inhibited by extracts [16]. Moreover, the susceptibility of bacteria to the extracts may be assigned to the existence of a broad spectrum of molecules in mushrooms that increase porosity and reduce bacterial growth [17]. Edible mushrooms possess a myriad of pharmaceutically active compounds that help increase the ability of the immune system against carcinogens. Hydroxyl moieties of metabolites like phenolics, flavonoids, tannins, etc. may play an important role in cell membrane disruption and spontaneous outflow of intracellular substances of microorganisms that can effectively culminate in death.

DISCUSSION

Natural products are regarded as a rich reservoir of bioactive components due to their amazing chemical variety and enormous medicinal properties [18]. They include various compounds derived from plants, fungi, and microbes, as well as semi-synthetic compounds. These substances exhibit a wide spectrum of therapeutic indications, including anticancer, antimicrobial, and antioxidant potential [19]. Secondary metabolites of mushrooms like phenolic compounds, alkaloids, and glycosides play significant role in nutritional and therapeutic aspects. Extraction of these compounds from fruiting bodies are well-established methods such as soxhlet extraction, maceration, percolation, pressing, infusion, and hydro-distillation. Organic solvents including methanol, ethanol, and chloroform are most commonly used to extract target compounds since the several of them are insoluble in water. In this study, solvents-based soxhlet extraction method was employed using methanol and chloroform solvents.

Extensive studies and long-standing traditional use have provided evidence that some mushrooms contain key biologically active compounds that are beneficial due to their antioxidant potential. Among them, phenols, flavonoids, tannins, alkaloids, and glycosides are known for their antioxidant and antimicrobial potential. In this work, the total phenol and tannin content of methanolic and chloroform extracts of *Agaricus bisporus* was estimated by the Folin-Ciocalteu assay. This method is sensitive to phenols, tannins, and flavonoids. Among the studied extracts, methanol possesses the highest phenol and tannin content. A literature survey suggested that the methanol extract of *Agaricus bisporus* had a higher amount of phenolics (59.87±0.55) than *Agaricus bitorquis* (25.10 ±0.11) and *A. essetei* (27.11± 0.30) [16]. Other authors have also suggested that various phenolic and tannin compounds are present in mushrooms [20, 21]. Furthermore, the information regarding the nature of the phenolic compounds present in the extracts and the flavonoid content was evaluated by an aluminium chloride assay. The chloroform extract contains a significantly higher amount of flavonoids than the methanolic extract. In an alkaline medium, flavonoid substances form red complexes with $AlCl_3$ (aluminium chloride). The derivatives of flavones give no colour when reacting with aluminium chloride; hence, the determination is very selective for the structure of flavonoids [20]. Previous studies on the flavonoid content of *Plurotus* mushrooms prove the presence of myricetin and catechinin various mushrooms [21]. In addition, cardiac glycosides are naturally occurring substances widely known for their numerous biological activities. The total cardiac glycoside content was measured by the Baljet reagent method, and the result indicated that chloroform extract contains a higher glycoside content than methanol extract. Among all studied compounds, flavonoid content is the highest. However, alkaloids are nitrogen-containing organic compounds present in various forms in nature [22]. The quantification of alkaloid content in the powder of *Agaricus bisporus* revealed a significant amount. Previous studies revealed that some mushrooms contain higher alkaloid content in different body parts, such as the cap or stipes or have similar content in the whole fruiting body. *Boletus edulis* displayed a similar tendency to store alkaloid content either in stipes or in caps, whereas *A. rubescens* and *R. cyanoxantha* showed a higher alkaloid content in caps[23].

Humans have a dynamic equilibrium between their prooxidant condition and antioxidant defences, which is reflected in their antioxidant state. When this balance is disrupted by some factors, such as aging, impaired physiological functioning in humans cause oxidative stress [24]. Antioxidant enzymes are the main defence system against oxidative damage, but excessive production of free radicals suppresses the capacity of internal antioxidant defence system and exogenous antioxidants are required to prevent cell or tissue damage [25]. The antioxidant activity of *Agaricus bisporus* was examined using the Ferric Reducing Antioxidant Power (FRAP) assay. The reduction of ferricyanide (Fe^{3+}) to ferrocyanide (Fe^{2+}) and its blue colour appearance when subjected to anti-oxidant species that can donate an electron. The colour intensity from blue to Prussian blue mainly depends on the sample concentration, which contains antioxidant species. This event may be attributed to an increase in electron donor moieties that may be responsible for the reduction of ferricyanide to ferrocyanide[6]. The amount offer rocyanide can be determined by the UV-Vis absorption of Fe^{2+} at 700 nm. In this experiment, methanol extracts revealed a higher antioxidant potential than chloroform extracts. The significant results may be due to the presence of polar compounds such as polyphenolics and flavonoids, which have the capacity to reduce ferricyanide to ferrocyanide. Moreover, other

findings also suggested that the mushroom extracts possess a remarkable capability of converting free radicals to non-reactive species by terminating the free radical chain reaction.

Moreover, mushrooms are important sources of antibiotics due to presence of various secondary metabolites that are able to combat bacteria [26]. The potency of *Agaricus bisporus* as an antibacterial candidate is high, but in-depth research on extraction of compound, extensive studies for antibacterial sensitivity and characterization of bioactive component and mechanism of action are inadequate. Therefore, to identify antimicrobial potential of *A. bisporus,* methanolic and chloroform extract was tested against gram positive and gram-negative bacterial strains. DMSO was used as negative control and gentamycin as positive control. The mushroom extracts showed to have antibacterial efficacy against *S. aureus, B. subtilis* (Gram positive bacteria) and no inhibition zone obtained against *P. aeruginosa* (Gram negative bacteria). However, the noted activity was highly attributed to the extraction methods and solvent system, which demonstrated large variation in yield and antimicrobial activity. The agar well diffusion method is appropriate method for screening the antibacterial potential of extracts by screening its capacity to type resistance phenotypes [27]. Therefore, this assay was used to test extracts against gram positive and gram-negative bacteria. Furthermore, study in to commercially-cultivated species of *Agaricus bisporus* revealed greater levels of inhibition, but data on the antibacterial potency of wild species in different countries is limited [28]. In this study, methanol extract was more active against gram positive bacteria than chloroform extract although neither extract showed a significant inhibitory zone against gram negative bacteria shown in Fig 3. The persistent vulnerability of gram-positive bacteria could imply that its mode of action depends on specific cell wall of peptidoglycan. The reduce activity in the gram-negative bacteria could be indicative of outer lipopolysaccharide layer and lower peptidoglycan layer. The previous studies found that the methanolic extracts of *Agaricus bisporus* showed potent activity against *E. coli, P. aeruginosa, Proteus sp.* and *S. aureus* supporting the antibacterial property of *A. bisporus* [27, 29].

In the present study, the qualitative phytochemical screening of *Agaricus bisporus* (JE Lange) revealed the presence of notable secondary metabolites. In addition, good anti-cancer activity was found in the methanolic extract. The FRAP assay revealed the desirable antioxidant activities of *Agaricus bisporus* extracts, especially methanolic, which might be attributed to the abundance of phenolic compounds and flavonoids in the extracts. Furthermore, the extracts also contain a good amount of tannin, alkaloid, and glycosides. The FTIR analysis of extracts indicated the presence of various functional groups of compounds such as alkane, alkyne, amine, alcohol, and carboxylic acids. Moreover, the methanolic extract elicited significant growth inhibition against Gram-positive bacterium *Bacillus subtilis* strains. Overall, the results proved the existence of a strong association between the antioxidant and anti-microbial activity and bioactive compound of its beneficial effect in treating cancer. The preliminary findings call for further rigorous investigations, including in vitro toxicity studies. Therefore, it could be suggested that the mushroom in this study could be usedin the pharmaceutical industry for various medical purposes.

ABSTRACT

An experiment was carried out in the farmers field at Chinnapettai, Panruti, to study the "Effect of Nano DAP on growth and yield of bhendi (*Abelmoschus esculentus* L. Moench)". The experiment was designed according to the Randomized block design (RBD) with 10 treatments and 3 replications. Among the various treatments, the results concluded that the treatment T9 - T$_4$ + ST with Nano DAP @ 2.5 ml / Kg Seed + FS with Nano DAP @ 2 ml/ litre of water at 30DAP shown significantly higher. Among growth parameters *viz.,* germination % (96.00), plant height at 65 DAP (124.51 cm) and the yield parameters *viz.,* fruit length (18.40 cm), yield per 3 plots (12.22 kg), yield per plot (4.07 kg), yield per plant (0.08310 kg) and yield per hectare (6786.90 kg). Nano-fertilizers has superior definite surface area, which marks nutrients more easily absorbed by plants, which significantly improves its fertilizer productivity, when compared with chemical fertilizers. It can be concluded that the nano treated plots shown relatively higher growth and yield compared to commercially treated RDF plot, also can control environment pollution by reducing the usage of conventional fertilizers (DAP).

Keywords: Bhendi, Foliar spray, Nano-fertilizers and Nano DAP

INTRODUCTION

Bhendi (*Abelmoschus esculentus*L. Moench) is an important vegetable crop belonging to the family Malvaceae. It is also referred as lady's finger or okra. It is native to Africa and the crop comes up well in tropical and sub-tropical lowland regions of Asia, America and warmer parts of Mediterranean region. It is an annual vegetable crop and generally propagated through seeds. It is a cheap and nutritious vegetable. Globally the crop is cultivated in an area of 11.48 lakh ha with a production of 78.96 million tonnes and the productivity being 6900 kg/ha (FAO, 2021). India is the largest producer of bhendi and it occupies an area of about 4.98 lakh ha with production of 57.84 million tonnes and productivity of 11,600 kg/ha (NHB, 2021). In Tamil Nadu, bhendi is cultivated in an area of about 7,100 hectares with an annual production of 67.1 MT (NHB, 2021). However, India has many growing concerns. In the Indian economy the horticultural contribution to GDP has steadily declined while achieving enough food production, India still reports for a one fourth of the world's hungry people and home to over million undernourished people. Indian horticulture feels the pain of fatigue of green revolution, the yield in many crops have been stagnated due to over use of fertilizers. Also low nutrient use efficiency due to leaching, declining soil organic matter, multi nutrient deficiencies, shrinking arable land, shortage of labor are results of evacuation of people from farming (Godfray*etal.,*2010)

Phosphorus deficiency is usually the most important single factor for poor nodulation and low yield of leguminous crops in all soil types. The added phosphorus is reported to serve dual purpose in legumes by increasing the yield of current as well as succeeding crop. Anadequate supply of phosphorus has been reported beneficial for better growth and yield,better quality and enormous nodule formation in legumes (Sammauria*et al.,* 2009). It acts as a structural component of membrane system of cells, chloroplasts and mitochondria. It is a constituent of energy phosphates like ADP and ATP, nucleic acid, nucleo proteins, purines, pyrimidine, nucleotides and several coenzymes. It is involved in the basic reaction of photosynthesis and plays an important role in cell division, breakdown of carbohydrate, transfer of inherited characteristics and hastening the maturity of plants. It is also an essential constituent of majority of enzymes which are important in the transformation of energy in carbohydrate and fat metabolism and also in respiration of plants. When minimized to the nanoscale, these nutrients show some characteristics that differ from the presence of the nutrients in the macro scale, allowing unique applications (Naderi and Danesh-Shahraki, 2013). Compared with chemical fertilizers, Nano-fertilizers has larger specific surface area, which makes nutrients more easily absorbed by plants, which significantly improves its fertilizer efficiency and has significant economic benefits. The application of Nano-fertilizer can improve the physical and chemical properties of soil and improve the ability of water and fertilizer conservation (Yu ZQ, 2014). With the above background, the present study is initiated to know the Effect of Nano nutrient (Nano DAP) on growth and yield of vegetable bhendi.

MATERIALS AND METHODS

The field trial was conducted in farmers field at Chinnapettai, Panruti. The experiment was conducted on "Effect of nano DAP on growth and yield of bhendi (*Abelmoschus esculentus* L. Moench) laid out in Randomized Block Design (RBD) which consisting of 10 treatments and 3 replications in the year 2021.The observations were recorded both growth and yield parameters. Growth parameters like germination percentage, days to 50% emergence, plant height at 30, 45 and 65 DAP, number of leaves per plant at 30, 45 65 DAP, number of branches per plant 30, 45, 65 DAP. Yield parameters like fruit length, fruit girth, single fruit weight, number of fruits per plant, yield per 3 plots, yield per plot, yield per plant and yield per hectare. The field was ploughed to a fine tilth and the seeds were sown with a spacing of 45 x 30 cm. According to the treatments, 100 percentage, 50 percentage and 25 percentage of basal DAP was given for the respective treatments and the seeds were treated @2.5ml and @5ml for the respective treatments. Further Nano DAP foliar spray was given on 17.03.2022 @2ml per litre concentration using a power sprayer.

The basal application and Nano nutrient spray specifications is furnished below
The foliar application of Nano fertilizer was given on 30th day -17.03.2022. The Nano DAP spray was given at 2ml per litre of water in a power sprayer according to the treatments.

RESULTS AND DISCUSSION

Growth Parameters
The data featured in table 4 and 5 on number of branches per plant, number of leaves per plant and plant height at 30, 45 and 65 DAP brought in view a significant variation in number of branches per plant, number of leaves per plant and plant height. The number of branches per plant, number of leaves per plant and plant height was observed was observed significantly high in all the Nano treated plots namely T_5, T_6, T_7, T_8, T_9 and T_{10} when compared to T_1. Germination percentage and days to 50% emergence also showed comparitively high and earlier results in all nano treated plots.

At 30 DAP and 45 DAP the plant height was significantly high in **T_9 -** (T_4 + ST with Nano DAP @ 2.5 ml / Kg Seed + FS with Nano DAP @ 2 ml/ litre of water at 30DAP) with 32.25 cm and 38.98 cm followed by **T_8 -** (T_3 + ST with Nano DAP @ 5 ml / Kg Seed + FS with Nano DAP @ 2 ml/ litre of water at 30DAP) and **T_5 -** (T_1 + ST with Nano DAP @ 2.5 ml / Kg Seed + FS with Nano DAP @ 2 ml/ litre of water at 30DAP) of 31.45 cm and 37.98 cm followed by **T_{10} -** (T_4 + ST with Nano DAP @ 5 ml / Kg Seed + FS with Nano DAP @ 2 ml/ litre of water at 30DAP) with 31.19 cm and 37.66 cm. At 30 DAP and 45 DAP the number of branches per plant, number of leaves per plant was significantly high in **T_5 -** (T_1 + ST with Nano DAP @ 2.5 ml / Kg Seed + FS with Nano DAP @ 2 ml/ litre of water at 30DAP), **T_6 -** (T_1 + ST with Nano DAP @ 5 ml / Kg Seed + FS with Nano DAP @ 2 ml/ litre of water at 30DAP), **T_7 -** (T_3 + ST with Nano DAP @ 2.5 ml / Kg Seed + FS with Nano DAP @ 2 ml/ litre of water at 30DAP), **T_8 -** (T_3 + ST with Nano DAP @ 2.5 ml / Kg Seed + FS with Nano DAP @ 2 ml/ litre of water at 30DAP), **T_9 -** (T_4 + ST with Nano DAP @ 2.5 ml / Kg Seed + FS with Nano DAP @ 2 ml/ litre of water at 30DAP) and **T_{10} -** (T_4 + ST with Nano DAP @ 2.5 ml / Kg Seed + FS with Nano DAP @ 2 ml/ litre of water at 30DAP).These results clearly indicates that Nano DAP were provided nutrients for crop growth in higher nutrient use efficiency which further contribute to the yield of the crop.

Yield Parameters
Data cognate to yield parameters that are influenced by Nano DAP are presented in table 6 and 7. The maximum number of fruits per plant were recorded in **T_2** - (100 % NPK (University Recommended Practice) 100 % Basal DAP)) (control), **T_3 -** (25 % Basal DAP (Recommended NPK level to be followed), **T_5 -** (T_1 + ST with Nano DAP @ 2.5 ml / Kg Seed + FS with Nano DAP @ 2 ml/ litre of water at 30DAP) and **T_7 -** (T_3 + ST with Nano DAP @ 2.5 ml / Kg Seed + FS with Nano DAP @ 2 ml/ litre of water at 30DAP) 5 pods. The minimum number of pods per plant was recorded in treatments of 4 pods.

Likewise, the maximum fruit length was recorded in **T_9 -** (T_4 + ST with Nano DAP @ 2.5 ml / Kg Seed + FS with Nano DAP @ 2 ml/ litre of water at 30DAP) of 18.4 cm followed by **T_{10} -** (T_4 + ST with Nano DAP @ 5 ml / Kg Seed + FS with Nano DAP @ 2 ml/ litre of water at 30DAP) of 17.9 cm and **T_6 -** (T_1 + ST with Nano DAP @ 5 ml / Kg Seed + FS with Nano DAP @ 2 ml/ litre of water at 30DAP) of 17.4 cm. The minimum pod length was recorded in **T_1 -** (0 % P & 0 % Basal N (No Basal DAP); 100 % N & K). The maximum fruit weight was recorded in **T_8 -** (T_3 + ST with Nano DAP @ 5 ml / Kg Seed + FS with Nano DAP @ 2 ml/ litre of water at 30DAP) of 17.28g followed by **T_9 -** (T_4 + ST with Nano DAP @ 2.5 ml / Kg Seed + FS with Nano DAP @ 2 ml/ litre of water at 30DAP) of 17.24g and **T_6 -** (T_1 + ST with Nano DAP @ 5 ml / Kg Seed + FS with Nano DAP @ 2 ml/ litre of water at 30DAP) of 17.18g. The minimum fruit weight was recorded in **T_1 -** (0 % P & 0 % Basal N (No Basal DAP); 100 % N & K).

Sam Ruban *et al.,*

Also as observed in the study, there was visibly tremendous increase in flower and fruit setting of which as a result the number of fruits and fruit length was also influenced by Nano DAP. The treatments with Nano DAP showed comparatively high fruit length and number of fruits than **T₂** - (100 % NPK (University Recommended Practice) 100 % Basal DAP)) (control) where the Nano DAP is used efficiently to increase the yield.   The data germane to the yield per hectare are presented in table 10. The maximum yield was recorded in **T₉** - (T₄ + ST with Nano DAP @ 2.5 ml / Kg Seed + FS with Nano DAP @ 2 ml/ litre of water at 30DAP) with 6786.90 kg/ha followed by **T₅** - (T₁ + ST with Nano DAP @ 2.5 ml / Kg Seed + FS with Nano DAP @ 2 ml/ litre of water at 30DAP) of 6775.20 kg/ha and **T₁₀** - (T₄ + ST with Nano DAP @ 5 ml / Kg Seed + FS with Nano DAP @ 2 ml/ litre of water at 30DAP) with 6734.32 kg/ha compared to **T₂** - (100 % NPK (University Recommended Practice) 100 % Basal DAP))(control) with 1337.10 kg/ha. The minimum yield was recorded in **T₁** - (0 % P & 0 % Basal N (No Basal DAP); 100 % N & K) with 1158.33 kg/ha.

The yield increase is due to the effect of Nano DAP where the foliar application of Nano DAP increased the absorption capacity and absorbed DAP in leaf (source) directly influenced the sink (pod). Also, it significantly enhanced the growth and yield characters of bhendi where the plant height, number of leaves and number of branches were significantly improved. As observed in the study, the overall performance of the treatments treated with Nano DAP showed comparatively high growth and yield characters than **T₂** - (100 % NPK (University Recommended Practice) 100 % Basal DAP) (control) where the Nano DAP is used efficiently to increase the yield. However, variations were observed in the different dosage of RDF combined with Nano DAP.

CONCLUSION

The results conclude that Nano DAP significantly influence growth and yield parameters through seed treatment and foliar spray. The best treatment recorded is **T₉** - (T₄ + ST with Nano DAP @ 2.5 ml / Kg Seed + FS with Nano DAP @ 2 ml/ litre of water at 30DAP) with 6786.90 kg/ha which shows 35 percent and 19 percent increase in yield compared to **T₁** - 0 % P (No Basal DAP); 100 % N & K where RDF is followed without DAP &**T₂** - (100 % NPK (University Recommended Practice) 100 % Basal DAP)) followed by **T₅** - (T₁ + ST with Nano DAP @ 2.5 ml / Kg Seed + FS with Nano DAP @ 2 ml/ litre of water at 30DAP) of 6775.20 kg/ha with 34 percent& 18 percent increase in yield compared to **T₁** - 0 % P (No Basal DAP); 100 % N & K where RDF is followed without DAP &**T₂** - (100 % NPK (University Recommended Practice) 100 % Basal DAP))(control) where DAP is applied commercially as followed by TNAU recommended dose of fertilizer and followed considering growth and yield parameters. Since bhendi being a phosphorous loving crop, it shows relatively low growth and yield without DAP (**T₁**) when compared to the plot treated with 100% RDF (**T₂**) (Sammauria*et al.,* 2009). When minimized to the nanoscale, the nutrient show some characteristics that differ from the presence of the nutrient in the macro scale, allowing unique applications (Naderi and Danesh-Shahraki, 2013). Compared with chemical fertilizers, Nano-fertilizers has larger specific surface area, which makes nutrients more easily absorbed by plants, which significantly improves its fertilizer efficiency and has significant economic benefits. The application of Nano-fertilizer can improve the physical and chemical properties of soil and improve the ability of water and fertilizer conservation (Yu ZQ., 2014). In association with this study, the nano treated plots show relatively higher growth and yield compared to commercially treated RDF plot (**T₂**). Also by reducing the use of conventional fertilizer (DAP) the soil and environment pollutions can be controlled.

ABSTRACT

Artificial Intelligence has the ability to process huge datasets and perform like humans as technology progresses. Because of the necessity for accurate diagnosis and improved patient care, AI technology has greatly influenced the healthcare industry. In the domain of dentistry, artificial intelligence has yet to come a long way. As a result, dentists must be aware of the potential implications for a profitable clinical practise in the future. In this article, we present the current applications of AI in conservative dentistry. The state-of-the-art literature is studied & analysed. Further, the research challenges in the field of dentistry and future directions are also provided.

Keywords: Artificial Intelligence, technology, applications, literature.

INTRODUCTION

The term "artificial intelligence" (AI) was coined in the 1950s and refers to the idea of creating machines that are able to perform tasks that are normally performed by humans. Artificial intelligence has emerged throughout the world to mimic human intelligence and tackle certain challenges [1]. Machine learning (ML) is a subcategory of AI, in which to learn the intrinsic statistical patterns and structures in data algorithms are applied, which allows predictions of hidden data. A well-known type of ML models are neural networks (NNs), which display better performance than classical ML algorithms on complex data structures such as imagery and/or language. One of the first type of AI algorithms to be developed was neural networks [2]. Deep learning neural networks are structures

with numerous levels and enormous layers, whereas shallow learning neural networks are simple network structures with only a few layers [3].

Applications of AI in Conservative Dentistry & Endodontics

Detection of caries
Second Opinion – a computer platform developed by Pearl Inc., that can instantly & reliably identify dozens of common pathologies. It is an AI-based technology trained on xrays annotated by a team of world renowned dentists.

Detection of Periapical Pathology
On an average, it takes at least 30 minutes for a specialist to analyze a CBCT. Radiological findings of conditions are diagnosed by *Diagnocat* within 10 seconds for 2 dimensional images and 4-5 minutes for CBCT images. Apical periodontitis is a common disease that comprises approximately 75% of radiolucent jaw lesions. Early detection might increase successful treatment outcomes, avoid spreading of the disease to surrounding tissues and minimize further complications [4].

Detection of root fractures
Using DetectNet with DIGITS version 5.0, a CNN-based deep learning model for the detection of VRFs was built. 300 panoramic images having a total of 330 Vertical root fractured (VRF) teeth with distinct fracture lines were chosen from a hospital database. Confirmation of final diagnosis of VRF lines was done by 2 radiologists and 1 endodontist. Of the 330 VRFs, 267 were detected [5].

Endodontic Micro Robot
The development of an endo micro robot is the crux of "Advanced Endodontic Technology Development project", as the final implementation of advanced endodontic technology boils down to micro robots with accuracy & precision beyond what a human can achieve. This computer-controlled machinery will be mounted onto teeth within patient's mouth. The micro machine or robot will perform the automated probing, drilling, cleaning, and filling of root canal simply with online monitoring and intelligent control.[6]

Accurate detection of finish lines
Creating a perfect dental restoration is a unique & complicated process. It requires that technicians examine digital models and manually mark where tooth and restoration meet. Margin marking is a time-consuming, error-prone exercise. Smart Margin has been trained by dental professionals to instantly score scans and execute margin marking with super-human accuracy, saving time and expense for dental labs and their clients.

Future of AI in dentistry
In the future, dental clinics will establish an AI-Comprehensive Care System (Figure 6). Before each appointment, the AI patient history analyzer will evaluate the planned treatment with the patient's gender, age, vital signs, medical history, current medications, and health condition. The patient's past dental history would be instantly obtained from a series of radiographs and digital 3D images.[7] With the AI as patient manager, clinicians will be able to understand more about the preferences and choices of patients, which will lead to improved patient management. During the appointment, the proposed diagnosis will be generated by the AI problem detector using all of the information for the clinician as a reference. Recommendations for treatment will be provided to the clinician from the AI. The critical medical concerns, such as allergies, disease interactions, and drug interactions will also be considered. Additionally, AI will provide clinicians with feedback during the treatment procedure to minimize human error.

With rising expenses of luxurious dental treatments, the use of AI by dental insurance companies will further develop and allow for immediate claim approvals. This will allow clinicians to upload their radiographs, intraoral scans, and photos to an insurance provider and instantly have an answer to their insurance claim, therefore

providing transparency in the process and allowing patients to get faster dental care without the fear of no insurance coverage.

CONCLUSION

The next decade will prove whether or not the expectations for tangible AI applications are met by actual outcomes. There is reasonable concern about data protection and security and about handing over critical medical decisions to computers. However, AI has the potential to revolutionize healthcare, AI may assist in addressing the shortcomings harshly criticized in conventional dental care (Watt et al. 2019). Dentistry and specifically dental research, has a role to ensure that AI will make dental care better, to the benefit of patients, providers, and the wider society.

ABSTRACT

Mortality and morbidity of burn patients is primarily due to sepsis. Topical antimicrobial agents applied to prevent and treat burn infections are increasingly becoming ineffective due to varied reasons. Nanosilver preparations will be a better alternative topical antimicrobials for preventing and treating burn infections. Algal synthesis of silver nanoparticle is an eco-friendly biological approach. In the present study, cell free extract of *Klebsormidium* sp. has been employed for the synthesis of biogenic silver nanoparticle. The antibacterial activity of the synthesized nanoparticles against the pathogens isolated from burn wound infection has been studied. Characterization of the synthesized silver nanoparticles was done by UV-Visible spectroscopy, Scanning electron microscopic (SEM) examination, Fourier Transform Infrared Spectroscopy (FT-IR), Energy Dispersive Spectroscopy (EDAX) and X-Ray Diffraction (XRD) analysis.The minimal inhibitory concentration (MIC) of the nanoparticles against *Pseudomonas aeruginosa* and *Staphylococcus aureus* isolated from burn wound was determined to be 94.7 and 94.1% respectively.Activity of biogenic silver nanoparticles was found to be promising, indicating their potential application in the form of topical agents or coatings in sterile dressings for wounds.

Keywords: Algal synthesis, Nano silver, burn wound infection, Topical antimicrobials

INTRODUCTION

Infections frequently contribute to the mortality of individuals with burn injuries. An urgent requirement in addressing infections and reducing mortality among burn patients is the availability of a more potent alternative topical antimicrobial agent. The advent of nanotechnology has paved way to modulate metals into nanoparticle which drastically changes the physical, chemical and biological property of metals. Silver nanoparticles are reported to exhibit remarkable antimicrobial activity and serve as a safe alternative to the conventional silver for the prophylactic treatment of burn infection (Dunn and Edwards, 2004). They have extensive applications as coatings in medical dressings and equipment and as components in the formulations of topical medical agents (Mahendraet.al, 2009). Metals in the form of nanoparticles act in several important stages of bacterial growth and metabolisms and for the development of resistance to metals there must be consecutive mutations in the structure of microorganism (Arokiyarajet.al, 2014).

Synthesis of metal nanoparticles involves various chemical and physical methods (Prabhu and Poulose 2012) but these methods have certain disadvantages due to the involvement of toxic chemicals and radiation. Green synthesis of nanoparticles is found to be a very attractive as it is non-hazardous to human health and the environment (Ahmed et.al, 2016). Both prokaryotic and eukaryotic microorganisms effectively mediate either intracellular (Husseinyet.al, 2007; Shiyinget.al, 2007; Singaraveluet.al, 2007) or extracellular (Anil Kumar et.al, 2007) synthesis of nanoparticles. Green synthesis of silver nanoparticles mediated by algal extracts is more advantageous over other biological processes owing to its simplicity, easy renewability and environmentally friendly nature (Singh et.al, 2012; Aziz et.al, 2014).

In this study, we utilized *Klebsormidium* sp., a green microalga, as a reductant to successfully biofabricate silver nanoparticles. These nanoparticles were then evaluated for their antibacterial efficacy against pathogens isolated from burn wound infections.

MATERIALS AND METHODS

Synthesis of silver nanoparticles using algal extract:
Klebsormidium sp. was isolated from River Noyyal (Latitude: 10° 58′06″ N and Longitude: 76° 55′41″ E) at Coimbatore, Tamil Nadu, India and was purified by repeated subculture on BG 11 agar plate. Isolate was morphologically identified under light microscope (Magnus MS13 binocular microscope) (David et.al, 2011). The algae were cultured in a teflon fabricated photo bioreactor (25 L) for 14 days at room temperature in BG 11 medium. The biomass was harvested after reaching the stationary phase of growth on the 14th day of cultivation. The algal extract was prepared by boiling the biomass in double distilled water for 30 min and centrifuged at 5000 rpm for 10 min using Remi Bench Top C-854 centrifuge. After boiling, the mixture was cooled, centrifuged and the supernatant was collected. Synthesis of silver nanoparticle was carried out by incubating 95 ml of 100 mM silver nitrate solution with 5 ml of the prepared algae extract at room temperature (Thamer and Almashhedy, 2014).

Characterization of silver nanoparticle:
The synthesized silver nanoparticles were confirmed by UV-Visible spectrophotometer (Genysis 10S). Spectral analysis was done between 280-600 nm. The synthesized silver nanoparticles were collected by centrifugation at 10,000 rpm for 15 min and stored at 4 °C until further characterization.

FT-IR Analysis
For FT-IR analysis, sample was prepared by drying the synthesized nanoparticles and the dried particles were ground with potassium bromide. FT-IR spectrum of the sample was recorded in a Perkin Elmer FT-IR System Spectrum GX Model. All measurements were carried out in the range of 400-4000 cm^{-1}.

Mohanapriya Rangasamy *et al.,*

SEM and EDAX

The structure of the synthesized silver nanoparticles was studied using SEM (∑IGMA TM FESEM) and EDAX. The EDAX spectrum in the spot-profile mode was noted from the densely populated region of silver nanoparticle on the surface of film. SEM and EDAX were carried out at 40 KV.

XRD

The crystalline nature of biosynthesized silver nanoparticles was confirmed by XRD analysis (Shimadzu, Japan) (Antony et.al, 2012). The sample powder was coated as a thick smear on a glass slide and the coated slide was analyzed by an X-ray diffractometer in the 2 θ range from 30-80 with Cu-Kα radiation at 40 KV and 30 mA current.

Antibacterial activity of synthesized silver nanoparticles

Antibacterial activity of the synthesized silver nanoparticles was tested by well diffusion method against *Pseudomonas aeruginosa* and *Staphylococcus aureus* isolated from patients with infected burn wounds. Bacterial cells were swabbed on the surface of Muller Hinton agar. Stock solution (20mg/ml) of the synthesized silver nanoparticle extracts was prepared by dissolving the nanoparticle in dimethyl sulfoxide. Ten microlitre of the stock solution was dispensed into agar well (6mm) cut on Muller Hinton medium. Ceftriaxone (200 µg/10µl) was used as a positive control and all experiments were done in triplicates. DMSO was dispensed in a separate well to test the effect of solvent, if any on the test bacteria. To ensure proper diffusion of the extract into the medium, the plates were placed at room temperature for 15 minutes and later incubated at 37°C for 24 hours. Percentage of inhibition was calculated by using the following formula (Kumar et.al, 2010).

Percentage inhibition of the test extract = (X-Y) / (Z-Y) * 100

Where X- total area of inhibition of the extract, Y- total area of inhibition of DMSO, Z- total area of inhibition of the standard drug.

MIC of silver nanoparticles

Minimal inhibitory concentration (MIC) of synthesized silver nanoparticles against *S. aureus* and *P. aeruginosa* were determined by micro titre plate method (Zarceiet.al, 2014) as they were found to be sensitive to the synthesized silver nanoparticles by disc diffusion method. Silver nanoparticles in the concentration range of 100, 120, 140, 160, 180 and 200 µg/10µl were prepared by suitable dilution of the stock solution. The growth of test organisms like *P. aeruginosa* and *S. aureus* in the above said concentrations of silver nanoparticles was recorded at 570 nm in an ELISA reader (BioTek ELx800). The minimum concentration of the silver nanoparticle that inhibited the growth of the test organism was recorded as MIC. An aliquot (100 µL) of the wells with no microbial growth was sub cultured on sterile nutrient agar at 37 °C/24 hours to determine the Minimal Cidal Concentration (MCC).

RESULTS

Synthesis of silver nanoparticles using algal extract

Klebsormidium sp. mediated cell free biosynthesis of silver nanoparticle is economical and it involves a simpler downstream processing than the intracellular biosynthesis. In the present study the reductant property of *Klebsormidium* sp. has been employed for the reduction of silver ions into silver nanoparticles. A change in color of the mixture containing silver nitrate and algal extract at 16th hour indicated the reduction of silver nanoparticles by algal extract (Fig. **1**).

UV-Visible Spectral analysis

The brown silver nanoparticle solution showed maximum absorption at 410 nm (Fig. 2), which indicates the presence of silver nanoparticle. The peak is observed to be broad due to the polydispersed nature of the synthesized nanoparticles.

FT-IR

FT-IR study of the freeze-dried silver nanoparticle sample was carried out to recognize the probable interactions between silver and bio-molecules that effects in the synthesis and stabilization of silver nanoparticles. Several peaks of variable intensity were obtained at 3425.58, 2916.37, 2731.20, 2260.57, 1735.93 and at1589.34 cm^{-1} (Fig. 3). The obtained FT-IR peaks are assigned to the stretching vibrations of primary and secondary amines and amides. Strong bands at 1735.93 and 1589.34 cm^{-1} suggests the role of amide groups of proteins as the capping ligand.

SEM

SEM analysis showed the particle size as well as the morphology of the nanoparticles. The size of the silver nanoparticles was found to be in the range of 28–73 nm and seem to be spherical in morphology (Fig. 4).

EDAX

A sharp signal at 3 KeVconfirms the presence of elemental silver in the suspension (Fig. 5). A trace amount of chloride ions (< 2.7% by weight) detected which may be due to the presence of chloride ions in the algal extract.

XRD

The XRD pattern showed intense peaks at 22.0, 28.0, 32.5, 38.5 and 46.8° in the entire spectrum of 2 Ɵ value ranging from 10 to 90° (Fig. 6).

Antibacterial activity and mic of synthesized silver nanoparticles

P. aeruginosa and *S. aureus* were subjected to study the antibacterial activity of synthesized silver nanoparticles. The percentages of inhibition of silver nanoparticle extract (200 μg/10 μl) against *P. aeruginosa* and *S. aureus* were found to be 94.7 and 94.1% (Table1). The MIC of synthesized silver nanoparticles was determined using 96-well micro titre plate and growth was observed in an ELISA reader at a wavelength of 570 nm. It was observed that the MIC and MCC of synthesized silver nanoparticles was 160 μg/10μl for *P. aeruginosa* and 160 and 180 μg/10μl respectively for *S. aureus* (Fig.7). The MIC and MCC of standard antibiotic (ceftriaxone) was 120 μg/10μl for both *P. aeruginosa* and *S. aureus* (Fig. 8).

DISCUSSION

Several biological approaches are adopted for the synthesis of silver nano particles. *Klebsormidium* sp, a filamentous green algae selected for the present study have visible advantages over the unicellular microalgae, including the ease in harvesting and resistance to predation.The Reductive property of *Klebsormidium flaccidum* has already been explored for the synthesis of gold nanoparticles (Dahoumaneet.al, 2011). The synthesis silver nanoparticles mediated by *Klebsormidium* sp was confirmed by UV-VIS spectroscopic analysis. The frequency and width of the surface plasma absorption in UV-VIS spectral analysis is determined by the size and shape of the metal nanoparticles, the dielectric constant of the metal and the surrounding medium (Mukherjee et.al, 2002; Gonzola, 2003).

In an earlier study on the synthesis of silver nanoparticles mediated by *Fusarium oxysporum*, two bands were observed in FT-IR at 1647 and 1543 cm^{-1} with their corresponding stretching vibrations at 3302 and 2926 cm^{-1} and determined that the bands are corresponding to the bending vibrations of amide I and amide II of protein (Selvi and Sivakumar, 2012). There are reports on the green synthesis of silver nanoparticle mediated by cyanobacteria and macroalgae. The antimicrobial activity of silver nanoparticles synthesized extracellularly by cyanobacteria and green microalgae against six pathogenic bacterial strains has been studied and it was found that the extracellular

polysaccharide of those cyanobacterial and green microalgae are responsible for mediating the synthesis of silver nanoparticles (Patel et.al, 2015). Factors such as experimental conditions and the rate of interaction of metal ions with reducing agents determine the size and morphology of the silver nanoparticles (Ghorbaniet.al, 2011). In the present investigation, the EDAX spectrum of the synthesized silver nanoparticles with a signal at 3 kev corresponds to the binding energy of silver-ion ligand (Magudapathyet.al, 2001). The peaks at the given angles in XRD are attributed to the face centred cubic crystalline silver oxide content of the sample (corresponding to JCPDS file no 41-1104). The diffraction pattern establishes the occurrence of silver oxide and small amounts of metallic silver in the mixture. Peak broadening in XRD in the present study is related to the probable effect of silver nanoparticles and the presence of various crystalline biological macromolecule in the algal extract (Forough and Farhadi, 2015).

Silver nano particles synthesized by the extract of *Klebsormidium* sp demonstrated potent antimicrobial activity against the pathogens isolated from burn wound infection. The binding of silver ions with microbial cell which is negatively charged causes cell death, depletion of intracellular ATP and plasma membrane damage (Dibrovet.al,2002). Silver ions interferes with DNA replication and inactivates cellular proteins (Feng et.al, 2000). Silver nanoparticles as antibacterial agents are gaining importance over the conventional antibiotics due to their multiple targets on microbial cell. Thus even after prolonged exposure, microbial cells do not develop resistance to nano particles (Baker et.al, 2005).

CONCLUSION

In the present study, the ability of *Klebsormidium* sp. to mediate the green synthesis of silver nanoparticles has been demonstrated. From the results, it is clear that the synthesized nanoparticles possess effective bactericidal activity against the pathogens *P. aeruginosa* and *S. aureus* isolated from burn infection. After systematically studying the toxicity and possible impacts to the environment, the synthesized nanoparticles can be employed as topical antibacterial agent to treat infection in burn patients. Further study is in progress to deliver the synthesized nanoparticle in the form of biocompatible nanogel.

ABSTRACT

The study of human-computer interaction looks at how people connect with computers and how effectively they are used in human-computer interactions. Being able to defend women against a thing that is improper in terms of societal behavior is of utmost importance in HCI. Nothing is more empowering than the ability to analyze a potentially hazardous scenario and take the necessary steps to effectively deal with it. In this essay, the importance of women's safety in human-computer interactions is discussed in detail, along with possible solutions. This paper mainly concentrates on various interface types that are used to establish relationships between the person using it (women) and the technology in order to protect the safety of women. Additionally, it inspires the creation of novel instruments for further studies.

Keywords: Actions, Communicate, HCI, Interfaces, Protect, Technologies, and Women's Safety.

INTRODUCTION

In today's world, Women from all walks of life experience risk in a variety of circumstances. In such a situation, to stop harassment of women, some safety measures can be used to alert the woman's family or other authorities. [1] and [2]. In this developed country, there are different types of smart devices introduced to ensure women's safety. Computers design for technology is the focus of the multidimensional area of study known as human-computer interaction (HCI), its objective is to interact with humans (the users) and computers. HCI is user-friendly and it provides an intuitive and natural way of interaction. It supports minimum hardware requirements and a low-cost mechanism. The key objective of this survey is to provide a thorough analysis of human-computer interaction techniques that improve and maximize users' capacity to interact with their computers. This paper contains some of the notable environments like human-computer interaction and the Internet of Things which substantiate women's

safety.   These categories best describe this essay. A review of recent surveys is in Section II. Interface analysis is covered in Section III, and the conclusion is covered in Section IV.

REVIEW OF EXISTING SURVEYS

This paragraph discusses some types of wearable women's safety devices, SOS, and tracking mechanisms that are used to ensure women's safety in human-computer interaction.

GADGETS
A gadget is a tiny electronic device that serves a useful purpose. It contains some wearable smart devices which are used for women's safety.

Smart Bag
 A smart bag was created with the goal of giving women security, and it is made up of a GSM module, a voice sensor that exists, an emergency switch, an Arduino board, and a number of actuators. While pressing the emergency switch or giving voice recording, the sensor gets activated to trigger flashlights, siren sounds, and high-intensity spray. Then the emergency contacts take necessary action [1].   Smart bags need some hardware requirements to implement the design. This device provides a very effective Safety mechanism. People can carry this bag anywhere easily.

Designing of a handbag for women's safety
A handheld bug zapper, an Arduino Uno microcontroller, a resistant to-shock torch, a can of peppermint oil, a Spread Spectrum 32, a camera, GSM, as well as GPS are all included in the device [2]. The user (a woman) can quickly press a switch to reboot the system if she runs into an issue. GSM sends an emergency message to the family with a photo of the stated attacker. She has the power to use pepper spray and electric shocks to stun adversaries. The victim's GPS location is sent to the victim's family. This is how women are saved.

Smart Security Device
The system is made up of a Raspberry Pi computer, a conventional flex sensor, a buzzing device, a digital camera with GSM, and GPS, according to the article [3]. A woman activates the system by flipping a switch when she feels uneasy. The camera records a photo or footage of the victim's present spot and uploads it to a server. Emergency contacts are connected using GSM, and the victim's precise location is found using GPS. In order to help save the woman, the victim gives the emergency contact information.

SOS
This SOS contains some Android-based applications that are used for women's safety.

Kavalan SOS
This Kavalan SOS was launched to ensure women's safety by the Tamil Nadu Police Department, Chennai in 2018. First of all, the user needs to register their details, after once they install the Kavalan SOS. When the user (woman) touches a huge red button on the home screen of a mobile, immediately a distress call is sent to the nearest station which ensures police arrival at the earliest [4]. The emergency alert function will transmit the user's current whereabouts, a horror signal, and footage captured from the mobile phone's back camera to the command centre of the police within five seconds of the user clicking the "SOS" icon on the home page. The team of police officers will be informed by call receivers in the master control room. After reviewing the call, the team notifies the appropriate control room, police station, or patrol team, who then contacts the victim. The service is accessible every day of the year.

Rajayogeswari and Karthick Anand Babu

The CWS (Complete Women Security) App

The article [5] talks about a smart band that combines an Arduino Nano with GSM, Bluetooth connections, and GPS. She ought to push the emergency button if she feels threatened. A nearby law enforcement facility will immediately receive a GPS and the GSM signal indicating her current location. Additionally, the entire CWS (Complete Women Security) application will suggest the closest safe location. For the safety of women, these steps were taken.

Human-Computer Interfaces

This section discusses some smart safety interfaces such as voice recognition, audio recognition, and gesture recognition.

Audio Tracking interface

This tracking mechanism projected a new model for women's safety in public places. First of all, the user (women) has to do the sign-in process, continuously, and they have to register their emergency contacts. Emergency contacts can be changed by the user at any time. When the user (woman) is in a dangerous situation, they have the option to click, shake, or voice-activate this application. In case, voice recognition is not working properly then, the mechanical mode will be activated by either a shake or click. Here, this application uses five emergency contacts and GSM is used for location tracking [6].

To record a voice, the CHEBYSHEV channel is used and NYQUIST is used to compute recurrence in this voice-based recognition.

Visual Tracking interface

This mechanism is made to be user-friendly and only one person can access it. This particular system has two distinct modes, referred to as normal mode and security mode. In the regular mode, individuals (women) can input their fingerprints, and in the security mode, the fingerprint sensor serves as a panic button. When a fingerprint is found, the system immediately notifies others of its location, takes a photo of the offender, and uploads it to the cloud. The algorithm known as kNN is used in this case to locate the closest safe location [7].
Compared with other systems, this system helps to find the culprit and also it is easy to use.

Gesture Tracking interface

This interface contains an intelligent security system for the safety of women, and it is placed in public places such as railway stations, bus stands, shopping malls, etc. This system consists of two cameras and one process. When the system finds an unusual environment against women, it immediately makes an alarm sound which means need help from others [8]. This interface is designed with four modules. Chaotic situation analysis is used to identify violent situations against women by camera 1. To count the number of males and females present at a specific time, gender detection is used. Camera 2 can detect facial expressions. In case camera 2 finds that any female is in anger or fear, immediately an alarm sound is triggered to control the room by using GSM.

ANALYSIS OF INTERFACES

All the mentioned smart interfaces are used to save the women while using different mechanisms. The following table shows an analysis of recent smart interfaces based on their types, objectives, technologies used, merits, limits, and future enhancement.

CONCLUSION

This paper examined many human-computer interfaces developed to ensure women's safety in this world. Some of the smart interfaces mentioned here used different mechanisms and components based on the applications provided.

Rajayogeswari and Karthick Anand Babu

People cannot wear the devices all the time, there may be a chance to forget it. Also, people cannot buy costly devices, in such cases, women's safety depends upon the family background. According to the proverb "self-help is the best help", in this developed environment, a well-equipped strong attacked self-defence system can be a successful solution. That should be a very low cost that satisfies all the family backgrounds.

ABSTRACT

In this article, we describes secondary k-column symmetric Intuitionistic fuzzy matrces (IFM) are produced. It is discussed how s-k-column symmetric, s-column symmetric, k-column symmetric and column symmetric IFM relate to one another. For an IFM to be an s-k-column symmetric IFM, necessary and sufficient requirements are identified.

Keywords: Intuitionistic fuzzy matrices , s-column symmetric, k-column symmetric, column symmetric, Moore penrose inverse.

INTRODUCTION

A significant challenge in today's practical world is the complexity of problems in Economics, Engineering, Environmental Sciences, and Social Sciences that cannot be resolved using the well-known techniques of classical Mathematics. To handle this type of situation Zadeh [14] first introduced the notion of fuzzy set to investigate both theoretical and practical applications of our daily activities. This traditional fuzzy set is sometimes may be very difficult to assign the membership value for fuzzy sets. In the current scenario intuitionistic fuzzy set (IFS) initiated by Atanassov [1] is appropriate for such a situation.

For a fuzzy matrix P, if P^+ exists, then it coincide with P^T, Kim and Roush [6] have studied Generalized fuzzy matrices. A Fuzzy matrix P is range symmetric if $R[P]= R[P^T]$ implies and kernel symmetric $N(P)=N(P^T)$. It is well known that for complex matrices, the concept of range symmetric and kernel symmetric is identical. For Intuitionistic

Arockia Ranjithkumar and Boobalan

Fuzzy matrix $P \in (IF)_n$, is range symmetric R[P]= R[P^T] implies N(P)=N(P^T) but the converse need not be true. Meenakshi [7] introduced the notion of fuzzy matrix. Let k-be a fixed product of disjoint transpositions in S$_n$ = 1, 2,...,n and K be the associated permutation matrix. Hill and Waters [5] have introduced on k-real and k-hermitian matrices. Baskett and Katz [3] have studied theorems on products of EPr matrices. Schwerdtfeger [13] has studied the notion of introduction to Linear Algebra and the Theory of matrices. Meenakshi and Jayashri [9] have studied k-Kernel Symmetric Matrices.Riyaz Ahmad Padder and Murugadas [10-12] introduced on idempotent intuitionistic fuzzy Matrices of T-type, reduction of a nilpotent intuitionistic fuzzy matrix using implication operator and determinant theory for intuitionistic fuzzy matrices. Atanassov has studied [2] generalized index matrices. Meenakshi and Krishnamoorthy introduced on k-EP matrices. Ben and Greville [4] developed the concept of range symmetric fuzzy matrix and kernel symmetric fuzzy matrix analogues to that of an EP matrix in the complex field.

Research gaps
As mentioned in the above introduction section, Meenakshi introduced the concept of Range symmetric and Meenakshi and Jayashri developed the notion of kernel symmetric in fuzzy matrix. Here, we have applied the concept of range symmetric and kernel symmetric in intuitionistic fuzzy matrix (IFM). Both these concepts plays a significant role in hybrid fuzzy structure and we have applied column symmetric in IFM and studied some of the results in detail. First we present equivalent characterizations of a column symmetric matrices and then, derive equivalent conditions for an intuitionistic fuzzy matrices to be column symmetric intuitionistic fuzzy matrix and study the relation between column symmetric and s-k column symmetric intuitionistic fuzzy matrices. Equivalent condition for varies g-inverses of a column symmetric matrices to be column symmetric are determined.

PRELIMINARIES AND NOTATIONS

PRELIMINARIES
Let the function be defined as κ(x)=(x$_{k[1]}$, x$_{k[2]}$, x$_{k[3]}$,..., x$_{k[n]}$)∈ F$_{n×1}$ for x = x$_1$, x$_2$,...,x$_n$∈ F$_{[1×n]}$,
where K is a permutation matrix its satisfied the following conditions KK^T = K^{T}K= I$_n$ then K^T = K.
(P$_1$) K =K^T , K^2 = I and κ(x)= Kx for allP∈ (IF)$_n$,
(P$_2$) N(P)=N(PK) = N(KP)

(P$_3$) $(P K)^+ = KP^+$ and $(KP)^+ = P^+$ K exists, if P^+ exists .

(P$_4$) P^T is a g-inverse of P iff P^+ exist

Notations: For IFM of P ∈ (IF)$_n$,
P^T : transpose of P, R(P) : Row space of P, C(P) : Column space of P,N(P) : Null Space of P

P^+: Moore-Penrose inverse of P , (IF)$_n$: Square Intuitionistic Fuzzy Matrix. F$_{[1×n]}$: The matrix one row n columns. F$_{[n×1]}$: The matrix n rows one column.

Secondary κ-column Symmetric Fuzzy Matrices
Definition: 3.1 Let P be a IFM , if C[P]= C[P^T] then P is called as Column symmetric.

Example: 3.1Let us consider $P = \begin{bmatrix} <0.3,0.5> & <0,0> & <0.7,0.2> \\ <0,0> & <0,0> & <0,0> \\ <0.7,0.2> & <0,0> & <0.3,0.2> \end{bmatrix}$,

The following matrices are not column symmetric

$P = \begin{bmatrix} <1,0> & <1,0> & <0,0> \\ <0,0> & <1,0> & <1,0> \\ <0,0> & <0,0> & <1,0> \end{bmatrix}$, $P^T = \begin{bmatrix} <1,0> & <0,0> & <0,0> \\ <1,0> & <1,0> & <0,0> \\ <0,0> & <1,0> & <1,0> \end{bmatrix}$,

$$\left(<1,0> \quad <0,0> \quad <0,0> \right)^T \in C(P), \qquad \left(<1,0> \quad <0,0> \quad <0,0> \right)^T \notin C(P^T)$$

$$\left(<1,0> \quad <1,0> \quad <0,0> \right)^T \in C(P), \qquad \left(<1,0> \quad <1,0> \quad <0,0> \right)^T \in C(P^T)$$

$$\left(<0,0> \quad <1,0> \quad <1,0> \right)^T \in C(P), \qquad \left(<0,0> \quad <1,0> \quad <1,0> \right)^T \in C(P^T)$$

$$C(P) \notin C(P^T)$$

Definition 3.2: An IFMP belongs to F_n is s-symmetric IFM iff $P = VP^TV$.

Definition 3.3: AnIFMP belongs to F_n is s-column(Cs)symmetric IFM iffC(P)= $C(VP^TV)$.

Definition 3.4: AnIFMP belongs to F_n is s-k-column symmetric (Cs) IFM iffC(P)=$C(KVP^TVK)$.

Definition 3.5 Let the function is defined $\kappa(x) = (x_{k[1]}, x_{k[2]}, x_{k[3]},..., x_{k[n]}) \in F_{n\times 1}$ for $x = x_1, x_2,...,x_n \in F_{[1\times n]}$, where K is involuntary, the following are satisfied the associated permutation matrix where V is a permutation matrix, $VV^T = V^TV = I_n$ then $V^T = V$ and $C(P)=C(VP), C(P)=C(KP)$

Remark 3.1: We observe that s-k-symmetric IFM is s-k-column symmetric IFM since $P = KVP^TVK$ if P is s-k-symmetric IFM. Thus, $C(P) = C(KVP^TVK)$, indicating that P is an IFM with s-k-column symmetry.

Example3.2 . Let us consider IFM, $V = \begin{bmatrix} <0,0> & <1,0> \\ <1,0> & <0,0> \end{bmatrix}$,

$$P = \begin{bmatrix} <0.7,0.3> & <0.5,0.3> \\ <0.5,0.3> & <0.7,0.3> \end{bmatrix}, K = \begin{bmatrix} <1,0> & <0,0> \\ <0,0> & <1,0> \end{bmatrix}$$

$$KVP^TVK = \begin{bmatrix} <1,0> & <0,0> \\ <0,0> & <1,0> \end{bmatrix} \begin{bmatrix} <0,0> & <1,0> \\ <1,0> & <0,0> \end{bmatrix} \begin{bmatrix} <0.7,0.3> & <0.5,0.3> \\ <0.5,0.3> & <0.7,0.3> \end{bmatrix}$$

$$\begin{bmatrix} <0,0> & <1,0> \\ <1,0> & <0,0> \end{bmatrix} \begin{bmatrix} <1,0> & <0,0> \\ <0,0> & <1,0> \end{bmatrix}$$

$$KVP^TVK = \begin{bmatrix} <0.7,0.3> & <0.5,0.3> \\ <0.5,0.3> & <0.7,0.3> \end{bmatrix} = P$$

P is symmetric, s-κ-symmetric and hence therefore s-k-column symmetric IFM.

Example3.3. Let us consider IFM

$$K = \begin{bmatrix} <0,0> & <1,0> & <0,0> \\ <1,0> & <0,0> & <0,0> \\ <0,0> & <0,0> & <1,0> \end{bmatrix}, V = \begin{bmatrix} <0,0> & <0,0> & <1,0> \\ <0,0> & <1,0> & <0,0> \\ <1,0> & <0,0> & <0,0> \end{bmatrix}$$

$$P = \begin{bmatrix} <0,0> & <0,0> & <1,0> \\ <0.5,0.3> & <1,0> & <0,0> \\ <0.4,0.2> & <0.5,0.3> & <0,0> \end{bmatrix}$$

$$KV = \begin{bmatrix} <0,0> & <1,0> & <0,0> \\ <1,0> & <0,0> & <0,0> \\ <0,0> & <0,0> & <1,0> \end{bmatrix} \begin{bmatrix} <0,0> & <0,0> & <1,0> \\ <0,0> & <1,0> & <0,0> \\ <1,0> & <0,0> & <0,0> \end{bmatrix}$$

Arockia Ranjithkumar and Boobalan

$$KV = \begin{bmatrix} <0,0> & <1,0> & <0,0> \\ <0,0> & <0,0> & <1,0> \\ <1,0> & <0,0> & <0,0> \end{bmatrix}$$

$$VK = \begin{bmatrix} <0,0> & <0,0> & <1,0> \\ <0,0> & <1,0> & <0,0> \\ <1,0> & <0,0> & <0,0> \end{bmatrix}\begin{bmatrix} <0,0> & <1,0> & <0,0> \\ <1,0> & <0,0> & <0,0> \\ <0,0> & <0,0> & <1,0> \end{bmatrix}$$

$$VK = \begin{bmatrix} <0,0> & <0,0> & <1,0> \\ <1,0> & <0,0> & <0,0> \\ <0,0> & <1,0> & <0,0> \end{bmatrix}$$

$$KVP^T VK = \begin{bmatrix} <0,0> & <1,0> & <0,0> \\ <0,0> & <0,0> & <1,0> \\ <1,0> & <0,0> & <0,0> \end{bmatrix}\begin{bmatrix} <0,0> & <0,0> & <1,0> \\ <0.5,0.3> & <1,0> & <0,0> \\ <0.4,0.2> & <0.5,0.3> & <0,0> \end{bmatrix}$$

$$= \begin{bmatrix} <0,0> & <0,0> & <1,0> \\ <1,0> & <0,0> & <0,0> \\ <0,0> & <1,0> & <0,0> \end{bmatrix}$$

$$KVP^T VK = \begin{bmatrix} <1,0> & <0,0> & <0.5,0> \\ <0.5,0> & <0,0> & <0.4,0> \\ <0,0> & <1,0> & <0,0> \end{bmatrix} \neq P$$

$P \neq KVP^T VK$ is not s- κ –symmetric iff not s- κ-column symmetric

Theorem 3.1: For IFM P belongs to F_n , the following statements are equivalent :

    (i) $C(P)=C(P^T)$.

    (ii) $P^T=PH=KP$ for some IFM H, K and ρ (P)=r.

Lemma3.1: For IFM P belongs to F_n and a permutation matrix K, C(P) =C(Q) iffC $(KPK^T)= C(KQK^T)$

Theorem3.2 . For I F M   P belongs to F_n the following are equivalent

    (i) $C(P)= C(KVP^T VK)$

    (ii) $C(KVP)=C((KVP)^T)$

    (iii) $C(PKV)=C((PKV)^T)$

    (iv) $C(VP)=C(K(VP)^T K)$

    (v) $C(PK) = C(V(PK)^T V)$

    (vi) $C(P^T) = C(KV (P)VK)$

    (vii) $C(P)=C(P^T VK)$

    (viii) $C(P^T)=C(PKV)$

    (ix) $P=VKP^T VKH_1$ for $H_1 \in F_n$

(x) $P = H_1 KVP^T VK$ for $H_1 \in F_n$

(xi) $P^T = KVPVKH$ for $H \in F_n$

(xii) $P^T = HKVPKV$ for $H \in F_n$

Proof:(i)iff (ii)iff(iv)P is s-κ- Column symmetric

$\Leftrightarrow C(P) = C(KVP^T VK)$

$\Leftrightarrow C(KVP) = C((KVP)^T)$ [By Definition:3.5]

$\Leftrightarrow KVP$ is Column symmetric

$\Leftrightarrow VP$ is κ-Column symmetric   [By Theorem 3.5 in [9]]

Therefore, (i)iff (ii)iff(iv) hold.

(i) iff (iii) iff (v)

P is s-κ- Column symmetric $\Leftrightarrow C(P) = C(KVP^T VK)$ [By Definition3.4]

$\Leftrightarrow C(KVP) = C((KVP)^T)$ [By Definition:3.5]

$\Leftrightarrow C(VK (KVP)(VK)^T = C((VK) P^T VK (VK)^T)$ [By Lemma 3.1]

$\Leftrightarrow C(PKV) = C((PKV)^T)$

$\Leftrightarrow PKV$ is Column symmetric

$\Leftrightarrow PK$ is s- Column symmetric

Therefore,(i) iff (iii) iff (v)hold.

(ii) $\Leftrightarrow$ (vii)

KVP is Cs $\Leftrightarrow C(KVP) = C((KVP)^T)$

$\Leftrightarrow C(P) = C((KVP)^T)$ [By Definition:3.5]

$\Leftrightarrow C(P) = C(P^T VK)$

Therefore, (ii) iff (vii) hold.

(iii) iff (viii):

PVK is Cs $\Leftrightarrow C(PVK) = C((PVK)^T)$

$\Leftrightarrow C(PVK) = C(P^T)$ [By Definition:2.5]

Therefore, (iii) iff (viii) hold.

(i) iff (vi)

P is s- κ- Cs $\Leftrightarrow C(P) = C(KVP^T VK)$

$\Leftrightarrow C(KVP) = C((KVP)^T)$ [By Definition:3.5]

$\Leftrightarrow (KVP)^T$ is Column symmetric

$\Leftrightarrow P^T VK$ is Column symmetric

$\Leftrightarrow P^T$ is s- κ- Column symmetric

Therefore, (i) iff (vi) hold.

(i) iff (xi) iff(x)

P is s-κ- Cs $\Leftrightarrow C(P) = C(KVP^T VK)$

$\Leftrightarrow C(P^T) = C(KVPVK)$

$\Leftrightarrow P^T = KVPVKH$ [By Theorem 3.1]

$\Leftrightarrow P = H_1 KVP^T VK$ for $H_1 \in F_n$

Therefore, (i) iff (xi) iff (x) hold.

(ii) iff (xii) iff (ix)

Arockia Ranjithkumar and Boobalan

KVP is Column symmetric $\Leftrightarrow$VP isκ- Column symmetric

$\Leftrightarrow C(VP)=C\ (K(VP)^{T}K)$

$\Leftrightarrow C(P)=C(P^{T}VK)$ [By Definition:3.5]

$\Leftrightarrow C(P^{T})=C(KVP)$

$\Leftrightarrow P^{T}=HKVP$ for $H \in F_n$ [By Theorem 3.1]

$\Leftrightarrow P^{T}=HKVPKV$

$\Leftrightarrow P=VKP^{T}VKH_1$ for $H_1 \in F_n$

Therefore, (ii) iff (xii) iff (ix)hold.

Corollary3.1: For IFM P belongs to F_n the following are equivalent:

(i) $C(P) = C(VP^{T}V)$

(ii) $C(VP) = C(VP)^{T}$

(iii) $C(PV) = C(PV)^{T}$

(iv) P is s-Column symmetric

(v) $C(P^{T}) = C(VPV)$

(vi) $C(P)=C(P^{T}V)$

(vii) $C(P^{T})=C(PV)$

(viii) $C(KVP)=C((VP)^{T})$

(ix) $P=VP^{T}VH_1$ for $H_1 \in F_n$

(x) $P=H_1VP^{T}V$ for $H_1 \in F_n$

(xi) $P^{T}=VPVH$ for $H \in F_n$

(xii)$P^{T}=HVPV$ for $H \in F$

Theorem3.3: For IFM P belongs to F_n.Then any two of the following condition simply the other one:

(i) $C(P)=C(KP^{T}K)$

(ii) $C (P)= C(VKP^{T}KV)$

(iii) $C(P^{T})=C((VKP)^{T})$

Proof:(i) and (ii)iff (iii)

Pis s-κ – Column symmetric

$\Rightarrow C(P)=C(P^{T}VK)$ [ByTheorem3.2]

$\Rightarrow C(KPK)=C(KP^{T}K)$ [ByLemma3.1]

Hence (i) and (ii) $\Rightarrow C(P^{T})=C((VPK)^{T})$

Therefore, (iii) hold.

(i) and (iii)iff(ii)

Pisκ- Cs$\Rightarrow C(P)=C (KP^{T}K)$

$\Rightarrow C(KPK)=C(P^{T})$ [ByLemma 3.1]

Hence (i) and (iii) $\Rightarrow C(KPK)=C((VPK)^{T})$

$\Rightarrow C(P)=C(P^{T}VK)$

$\Rightarrow C(P)=C((KVP)^{T})$

$\Rightarrow$ P is s- κ Column symmetric   [By Theorem 2.2]

Therefore, (ii) hold.

(ii) and (iii) $\Rightarrow$ (i)

P is s-κ – Cs $\Rightarrow$ C(P)=C (P^TVK)

$\Rightarrow$ C (KPK) = C(KP^TV)   [By Definition:3.5]

Hence (ii) and (iii) $\Rightarrow$ C (KPK)=C(P^T)

$\Rightarrow$ C(P)=C(KP^TK)   [By Lemma 3.1]

$\Rightarrow$ P isκ– Column symmetric

Therefore, (i) hold. Hence the Theorem.

4.s- κ-Column Symmetric Regular Fuzzy Matrices

Theorem 3.1: Let $P \in (\mathrm{IF})_n$, $Z \in P$ {1,2} and PZ, ZP, are s- κ- Column symmetric IFM. Then P is s- κ - Column symmetric IFM $\Leftrightarrow$ Z is s- κ –Column symmetric IFM.

Proof: C(KVP) = C(KVPZP) $\subseteq$ C(ZP)   [since P = PZP]

= C(ZVVP) = N(ZVKKVP) $\subseteq$ C(KVP)

   Hence, C(KVP) = C(ZP)

   $\qquad\qquad$ = C(KV(ZP)^{T}VK)   [ZP is s- κ-column symmetric NFM]

   $\qquad\qquad$ = C(P^T Z^T VK)

   $\qquad\qquad$ = C(Z^T VK)

   $\qquad\qquad$ = C((KVZ)^T)

   $\qquad$ C ((KVP)^T) = C (P^T VK)

   $\qquad\qquad$ = C (Z^T P^T VK)

   $\qquad\qquad$ = C((KVPZ)^T)

   $\qquad\qquad$ = C(KVPZ)   [VP is s- κ - column symmetric]

   $\qquad\qquad$ = C(KVZ)

   $\quad$ KVZ is column symmetric $\Leftrightarrow$ C(KVP) = C((KVP)^T)

   $\Leftrightarrow$ C((KVZ)^T) = C(KVZ)

   $\Leftrightarrow$ KVZ is column symmetric

   $\Leftrightarrow$ Z is s- κ- column symmetric.

Theorem 3.2: Let $P \in (\mathrm{IF})_n$, Z$\in$ P {1,2,3}, C(KVP) = C((KVZ)^T).Then P is s-κ- Cs IFM $\Leftrightarrow$ Z is s- κ - Cs IFM.

Proof: Since Z$\in$ P {1,2,3}, we have PZP = P,ZPZ =Z, (PZ)^T=PZ

   $\qquad$ C ((KVP)^T) = C(Z^T P^T VK)   [By using PZP = P]

   $\qquad\quad$ = C(KV(PZ)^T)

   $\qquad\quad$ = C((PZ)^T)   [By Definition:3.5]

   $\qquad\quad$ = C(PZ)   [(PZ)^T = PZ]

   $\qquad\quad$ = C(Z)   [By using Z = ZPZ]

   $\qquad\quad$ = C(KVZ)   [By Definition:3.5]

KVP is column symmetric IFM $\Leftrightarrow$ C (KVP) = C ((KVP)^T)

$\Leftrightarrow$ C((KVZ)^T) = C(KVZ)

$\Leftrightarrow$ KVZ is column symmetric

$\Leftrightarrow$ Z is s- κ - column symmetric.

Theorem 3.3: Let $P \in (\mathrm{IF})_n$, Z$\in$ P {1,2,4}, C((KVP)^T) = C(KVZ). Then P is s- κ- Cs IFM $\Leftrightarrow$ X is s- κ- Cs IFM.

Proof: Since Z $\in$P{1, 2, 4}, we have PZP = P,ZPZ = Z, (ZP)^T = ZP

C(KVP) = C(P)   [By Definition:3.5]

   $\quad$ = C(ZP)   [ZPZ = Z, PZP = P] , [(ZP)^T = ZP]

$$= C(P\ ^TZ^T)$$
$$= C\ (Z^T)$$
$$= C((KVZ)^T). \hspace{4cm} [\text{ By Definition:3.5}]$$

KVP is column symmetric IFM $\Leftrightarrow C(KVP) = C((KVP)^T$

$\Leftrightarrow C((KVZ)\ ^T) = C(KVZ)$

$\Leftrightarrow$ KVZ is column symmetric IFM

$\Leftrightarrow$ Z is s- κ – column symmetric IFM.

Corollary 3.1: Let $P \in (\text{IF})_n$, $Z \in P$ {1,2} and PZ, ZP are s- Cs IFM. Then P is s- Cs IFM $\Leftrightarrow$ Z is s- Cs IFM.

Corollary 3.2: Let Let $P \in (\text{IF})_n$, $Z \in P\{1,2,3\}$, C(KVP) = C((VX)^T). Then P is s- Cs IFM $\Leftrightarrow$ P is s- Cs IFM.

Corollary 3.3: Let $P \in (NF)_n$ $Z \in P\{1,2,4\}$,C((VP)^T) = C(VZ). Then P is s- Cs IFM $\Leftrightarrow$ Z is s- Cs IFM.

CONCLUSION

We present equivalent characterizations of a column symmetric Intuitionistic fuzzy matrices. Also, we give the example of column symmetric Intuitionistic fuzzy matricrs ,column symmetric Intuitionistic fuzzy matrices analogues to that of an EP matrices in the complex field. The concept of generalized inverse presents a very interesting area of research in matrices theory, in the same way a regular matrices as one of which g-inverse exists, lays the foundation for research in IFM theory. We discuss Various g-inverse associated with a regular matrices and obtain characterization of set of all inverses. Equivalent conditions for various g-inverses of secondary κ-column symmetric fuzzy matrices to be secondary κ-column symmetric are determined.

ABSTRACT

A 52-years old man reported to OPD of Ayothidoss Pandithar Hospital, National Institute of Siddha, Chennai with complaints of non-healing ulcer around the medial malleolus of the right leg for 1 year. The patient had been suffering from varicose veins for the last 5 years and he developed a venous ulcer 1 year ago on the medial aspect of the right ankle joint. He consulted a local physician and was prescribed some antibiotics, NSAIDs, topical cream and self-wound care without significant results.For better management, he came to our hospital. The diagnosis was confirmed as a venous ulcer which can be correlated to *nalavibathapun* in Siddha and leech therapy (*Attai Vidal*) was applied. The patient was admitted to the inpatient ward and treated with 6 sittings of leech application at 15 days intervals with concomitant medication for 3 months at which time the ulcer was completely cured. The healing progress was documented photographically. The patient was monitored for further two months, with no recurrence being observed during that time . This case report summarizes the traditional leech therapy for chronic venous ulcer in Siddha.

Keywords: *Attai vidal***,** bloodletting, leech therapy, chronic venous ulcer, Siddha

INTRODUCTION

Venous ulcers are wounds occurring due to improper functioning of venous valves, usually of the legs. Damaged venous valves prevent the backflow of blood and cause pressure in the veins. Hence arterial pressure reduces significantly more than venous and therefore, blood is not pumped into the area. Sustained venous hypertension, caused by venous insufficiency leads to venous ulceration. Incompetence of superficial veins and/or of perforators (because of direct injury, congenital abnormality or superficial inflammation) causes 40% - 50% of venous leg ulcers [1]. The prevalence of venous leg ulcer is between 0.18% and 1% on average 33-60% of these ulcers persists for more than 6 weeks and are therefore referred to as chronic varicose leg ulcer [2]. Without regular dressing and proper healing, the ulcers spread quickly and they are very painful. Patients with longer duration of venous ulcers, may damage the skin and have difficulty in healing. In modern medicine treatment options include conservative management, mechanical treatment, medications and surgical options with their limitation. Modern synthetic allopathy medicine has its share of limitations of allergy, resistance, cost, etc., which has prompted wound care professionals to consider alternative approaches to wound healing. People perception towards alternative medicines also has changed, fear of the surgical procedures and side effects of long-term of internal medication for wound healing is the main reason for the patient to seek the traditional medical system.

In Siddha, the presenting case of venous ulcer can be correlated with *nalavibathapun* mentioned in *Siddhar Aruvai Maruthuvam* [3] literature. *Nalavibathapun* is a delayed/ non-healing type of wound that resulted in various etiology. Siddha system has many treatments option for various types of acute and chronic ulcers. Leech therapy (*Attai vidal*) is one of the external treatments under the bloodletting method for wound healing. *Attai vidal* defines as an application of leech in part of the body for sucking the blood to cure the disease. The principle of leech therapy is the removal of toxins and pacifies the vitiated *thodam* from the body through blood. So, we selected leech therapy for this case study.

Case report

A 52-year-old male reported to OPD of Ayothidoss Pandithar Hospital, National Institute of Siddha, Chennai with complaints of non-healing ulcers in and around the medial malleolus of the right leg for 1 year. For the last 5 years, the patient had been suffering from varicose veins on the right leg from the level and below the knee and 1 year ago he developed a venous ulcer on the medial malleolus of the right leg. At first, he developed hyperpigmentation and a small sore at the medial malleolus of the right leg, which eventually burst and developed into an ulcer. The ulcer was gradual in onset, pain around the ulcer and discharge were present. There was no history of direct trauma or any chronic illness. The patient had been working as a security and had a history of prolonged standing. He is a non-smoker and non-alcoholic. He belongs to the low socio-economic category. The patient also consulted a nearby allopathic hospital and took some antibiotics, NSAIDs, topical cream and self-wound care without significant benefit. One of his neighbors advised him to take Siddha treatment so he came to our hospital.

Clinical assessment

General examination
He had no other associated systemic illness
Vitals were within normal limit
BP- 125/80 mm/hg
HR- 79/min
PR- 77/min
RR-19/min
On detailed examination, no associated neurological deficits were seen.

Wound examination

Inspection

Number-2(one large ulcer and one small ulcer)

Location- Antero medial aspect of lower 1/3rd of the right leg

Shape- Irregular

Size- large (7× 6×0.5cm approx.)/ small (3.5×2×0.5cm approx.)

Edge - Sloping

Floor- Reddish granulation tissue

Discharge- Mild serous discharge

Surrounding skin- Eczematous

Whole limb examination- Presence of varicose vein from above the medial malleolus and more prominent at the level of right knee.

Palpation

Temperature- slightly raised around the ulcer

Tenderness – present

Bleed on touch – nil

Test

Trendelenburg test- positive

Diagnostic assessment

The patient was a known case of lower extremity varicosities as it was confirmed by physical examination and it also revealed that irregular large ulcer around the medial malleolus with venous dermatitis. From the detailed history and clinical examination, the diagnosis was confirmed as a chronic venous ulcer and the case was differentiated from diabetic, neuropathic, arterial and tubercular leg ulcers. The patient was subsequently admitted to IPD of APH-NIS, Chennai for the administration of a therapeutic procedure.

Therapeutic intervention

When the patient admitted into IPD on the day itself concomitant medication was started which include *Kandhaga rasayanam* 5gm twice a day with milk and *Palagarai parpam* tablet of 130 mg with warm water twice a day was given. The dressing was done once daily with *Mathan thailam*. The leech application was done once in fifteen days. Before treatment, hematological and biochemical investigations were done. The necessary parameters including CBC, HB, CT, BT, CBG, HIV, HBsAg and VDRL were assessed. The patient followed the above intervention for 3 months. Leech application is done as follows.

Pre-application procedure

Selected leeches were allowed into turmeric water for 5 minutes and then put into the normal water. The patient'svital signs were recorded then he was placed in a supine lying position.

Leech application

The ulcer site was disinfected with sterile water and then dried with cotton. The leeches' mouth is placed precisely over the spot where the blood is to be removed. They were starting to suck the impure blood and it shows the hoop of the horse by raising its neck region. The leeches were lightly covered with a moist cloth. After sucking the blood, the leeches fell spontaneously within 30-60 minutes or they can be removed by applying turmeric powder to their mouth.

Post application procedure

After detachment, the leeches are inducted to vomit the blood, for that the turmeric powder is dusted on in its mouth. For purification purposes, the leeches were allowed into turmeric water for 10 minutes and then put into

67002

normal water. Then leeches were stored in freshwater containers. At last, the ulcer was dressed with aloe pulp dusted with turmeric powder was done. The vital signs were recorded after the treatment.

Follow-up and Outcome
6 sittings of leech application were carried out with 15 days intervals (Fig-2). The post-treatment assessment was completed 15 days after the leech therapy. *Mathan thailam* dressing was done every day in between the leech therapy. At the end of the treatment, he showed complete wound healing (Fig-1). The patient skin color is returning to normal and there is no pain and discharges were present. The leech therapy induction of complete healing, over time, was documented photographically. The patient was monitored for further two months, with no recurrence being observed during that time. There was no adverse effect noticed during the entire course of the study.

DISCUSSION

Venous ulcer is the most severe and debilitating outcome of chronic venous insufficiency in the lower limbs and accounts for 80 percent of lower extremity ulceration [4].The goal of treatment in venous ulcersis to reduce edema, improve ulcer healing and prevent recurrence. Though they are not a common cause of mortality they cause significant morbidity and impairment of work. The achievement of good long-term results depends on continuous care, ulcer care clinics, home health nursing and regular evaluation by the health care professionals. Siddha treatments aimed at maintaining a healthy balance of three biological humors (*Thirithodam*) and normalization of seven physical constituents (*uyirthathukal*).Leech therapy is a para-surgical procedure and used as one of the bloodletting techniques, to detoxify the blood (*sennerthath*u) and neutralize the vitiated *thirithodam*. It is used for various diseases especially for *pitham* vitiated diseases because the leech has *thatpagunam* (cold potency).The apparent benefits of leech therapy are that they help to relieve venous congestion by removing excessive blood physically from congested tissue [5].

Leech saliva, which contains a hundred or so different substances, includes an antiplatelet aggregation factor, anesthetic, and anti-inflammatory and antibiotic agents. Major constituents of leech saliva including hirudin, calin, hyaluronidase, eglins, histamine-like vasodilators, hirustatin, bdellins, tryptase inhibitors, carboxypeptidase-A, acetylcholine, factor Xainhibitor, acetylcholine [6]. Anti-inflammatory substances are responsible for the reduction of oozing of wound and granulation tissue formation. One of the active substancesis hirudinwhich acts as an anticoagulant, which stops blood clotting and dissolves thrombi, cleaning partial and complete blockage in distal arteries. By ingesting excess blood, leeches reduce tissue swelling and promote healing. These microcirculatory actions enable fresh oxygenated blood to reach hosts affected areas before the restoration of normal circulation [7]. The leech therapy appears to work through venous decongestion, thrombolysis, lymph and blood flow enhancement and the suppression of inflammation and infection. Although leeches may not be safe for people with diseases that impair blood clotting and compromised immune function, it is believed to be safe for most other people.

Leech therapy is used along with internal medications and external applications as well. *Mathan thailam* is a herbo-mineral medicated oil formulation that is prepared from *Datura metel* leaf juice, coconut oil and copper sulfate prescribed widely for acute and chronic non-healing ulcers [8]. *Kandhaga Rasayanam* is a classic compound drug that has pharmacological activities like antibacterial, antifungal, antiviral, analgesic and anti-inflammatory activity [9]. *Palagarai Parpam* is indicated for skin diseases, it has wound-healing activity, antibacterial activity and antihistaminic activity [10]. Hence leech therapy with proper dressing along with Siddha medicines helps the patient to recover from a chronic venous ulcer which he was suffering from last 1 year

CONCLUSION

As per the observation from this study, leech therapy has convincing potential in the healing of chronic venous ulcer without any adverse effect. The life quality of the patient also improved significantly after leech therapy. Scientific validation and clinical evaluation in traditional medical systems are much needed to build evidence-based practice. This case study has given strong hope for the management of chronic venous ulcer with leech therapy. However, further clinical trials with large sample size have to be explored in the future to strengthen the value of leech therapy in Siddha.

Patient consent
Written consent has been obtained from the patient for the publication of this case study.

Source of funding – nil

Conflict of interest – none

ABSTRACT

Neera is anessence like liquid obtained from the flower of coconut trees particularly Coconut palm. The liquid is extracted by tapping the flower buds. For the purpose of tapping highly trained tappers will be used for the entire process. Neera is considered as a more delicious drink with ample of health benefits. It is rich in Vitamin C and also has so many minerals and acids rooted inside this delightful drink. Many countries like India, Myanmar, Africa, Indonesia are regularly consuming this drink and enjoying the health benefits. Neera has two dimensions which can also be used as Toddy. Fermentation is the process which converts Neera into toddy (alcohol). In some places, Neera is used as a by products like candies, jaggery and sugars.

Keywords : Neera Tapping, Farmers, Challenges, Health, Methods.

INTRODUCTION

Neera Tapping is none other than the process which is involved in the sap collection from the coconut trees. Not all the labors can be used for the function only the trained and knowledge labors can be put to action. The process begins with identification of healthy coconut trees. The tappers select the matured and suitable coconut trees with enough flower buds. Next the tappers tie some containers, bottles or pot to the flower cluster to store the Neera which will extract once tapping begins. Then the tappers will tear the small part of the flower with knife or any other tapping tool. Once the tear is done, the Neera starts its flow to the container. Probably, experienced tappers will extract Neera either in the morning or late afternoon so that the flowers flow will be more active. This tapping happens in a routine basis, tappers will collect the fresh sap regularly in the same tree. In some places, the Neera will be naturally fermented as alcoholic beverages. The present study aims to identify the different coconut Neera

67006

tapping methods for identifying the efficient approach and analyse the challenges faced by the farmers due to coconut Neera tapping.

REVIEW OF LITERATURE

D.K Ghosh et.al (2018**)** states that Coconut Neera tapping is becoming non profitable due to more problems. But this study tries to exhibit the positive impacts of Coconut Neera tapping. Value addition products increased the profit margin among coconut Neera tapping farmers. The tapping also provides employment opportunities to the labors. A minimum of 250 liters sap extraction has a profit margin of 15000 per plant per year. There are huge population who are still in control of healthy habitats, so the sales of value-added products will also provide greater profit to the farmers. When the agriculture is treated to be the backbone of Indian economy, the growth of agriculture products influences the country's economic growth. Divya N M et.al (2019), This research paper concentrates on the importance of Neera especially in benefiting the health. Neera is considered to be the more delightful drink with more health benefits. Neera has so many hidden health benefits like improving the immune system, cancer prevention, Blood pressure reduction, refining skin growth, Better eye sight, diabetic control, Counteract the Liver disease, prevention from anemia, and improvision in respiratory organs. The paper has also provided a great information that many of the countries like Africa, India, Sri Lanka, Indonesia, Malaysia, Thailand and Myanmar are frequent users of Neera drink.

Mohankumar Chinnamma et.al (2019), The investigation part of this paper has divided into four categories. The paper first concentrates on tapping and harvesting, followed by processing and storing, followed by nutritional analysis and finally the preparation of value-added products. For the first phase, 250 coconut trees were selected and highly trained tappers were used for the tapping process. The process continued for 15-20 days for reaching the final outcome of 100-200 ml of Neera. This quantity and time duration varies according to the palm characteristics. After the first phase, the collected Neera has been stored for fermentation. Next, byanalysing the nutritional value it has found that Neera can be used as a remedy for many major diseases. Final phase denotes that the Neera can also be converted into a value-added product like Jaggery, Candy and liquid drink. Naveen Jose et.al (2018), The main objective of this study is to understand how the Neera has been used as a potential health drink. This study explores the two dimensions Toddy and Neera where both can be used a drink. Toddy is a drink which obtained after fermentation and Neera is a drink which is obtained before fermentation. The study says that the chemical composition like Sucrose, protein and acids varies according to the age, size, season and type of palm. The study concludes by adding that Neera can also bring more by-products like Neera syrup, wine, Honey and sugar. The medical statements proves that Neera can be used as an alternative option for Mineral water but the commercialization should be properly enriched for the greatest success.

STATEMENT OF THE PROBLEM

Even now, the adoption of Neera tapping technique are amended with old tradition. Tapping of flowers requires more duration and exhibits only less profits to the farmers. The farmers have to come across various challenges like ineffective tapping techniques, low production, environmental impacts and less profits. Considering this, the government has taken measures to provide tapping machines to the farmers where the time and labour will be saved. Hence, this study aims to identify the problems faced by the farmers in the Neera tapping and added nutritional advantages.

RESEARCH METHODOLOGY

Research Design : The Research design adopted for the study is descriptive in nature.
Nature and Source of Data : The research is centred both on primary and secondary data. The primary data is collected from the farmers whose farms where let out for Neera Tapping. The data is gathered through a structured

questionnaire. The secondary data related to techniques used for Neera Tapping is gathered through various sources like websites, previous research papers, journals, etc.

Statistical Tools used : The Statistical tools used to identify the challenges faced by farmers due to Neera Tapping were Henry Garrett analysis.

RESULTS AND DISCUSSION

NEERA TAPPING TECHNIQUES
The study aims to identify the Neera tapping techniques which had been followed by tappers according to their comfortability and productivity. The study focuses on four tapping techniques such as Selection of proper coconut tree and inflorescences, Sap Collection through Traditional Method, Sap Collection through CPCRI Method and Coco Sap Chiller.

Selection of Proper Coconut Tree and Inflorescences
In this process tappers should be able to identify the right matured coconut palms, because every coconut tree cannot be used for the Neera tapping. Only the healthy and matures trees can be used for the Neera tapping process. Trees which are old between 20 to 30 years can be used since the roots are more stable for producing high quantity of Neera. After considering the age, health to be monitored. Trees which are already sick with wounds, pest or any disease yields only less quantity compared to the healthy coconut trees. It also has high chances of spoiling the entire environment if tapping done on those unhealthy trees. Third stage is the most important phase, because identification of early developed flowers is done in this phase. Tappers should be able to identify whether the inflorescence is formed without producing coconut fruit. If a healthy tree and right stage is identified, then the tapper will start to cut the covering area of the inflorescences which will allow the sap to flow. This process requires more skill so that sap will be collected efficiently without harming the environment. Tapping should not be done frequently, because frequent tapping cases more stress to the tree which in turn affects the yield quantity and quality. The tapping duration varies from each tree depending on their health and quantity of sap collected.

Sap Collection through Traditional Method
Traditional tappers always prefer natural products for sap collection. Clay pots are used to collect the sap since clay pots are porous and clay pots allows air to circulate which helps to reduce the fermentation and maintains the freshness of collected sap for longer duration. Few regions were used Bamboo containers for sap collection. Coconut shells are also considered as a natural sap collecting material by few traditional tappers. Bottle gourds are also preferred to be an efficient method for sap collection. The gourds will be removed and through the thin tube, the sap flows to reach the destination. Traditional tappers are more cautious in avoiding chemicals or any preservatives in sap collection for the purpose of maintain the sap purity and quality.

Sap Collection through CPCRI Methods
CPCRI method is developed by the Central Plantation Crops Research Institute for the efficient sap collection process. This method aims to ensure the tree health and supports effective production. When tappers use this method, the tear will not be deep cut, only a thin cut will be done in the inflorescences so that only a small portion of sap will be extracted. Instead of natural products, this method uses plastic cups to collect the sap that flows. The duration of tapping will be done once in every 24 hours. The collected Neera will be stored in refrigerator to maintain the quality and freshness. All the materials whichever used in the CPCRI method should be sanitized properly to maintain ensuing hygiene maintenance.

Coco Sap Chiller
Coconut sap chiller is a device used to chill the collected sap from the coconut tree. The sap naturally has its ability to ferment naturally with the temperature and sugar content which is present in the sap. So, it is required to keep the

sap chilled until it converts to by-products. The Temperature control features are enabled for sap chiller, according to the requirement the cooler can be adjusted for maintaining the optimal temperature to prevent fermentation. The coco sap chiller is an important factor for increasing the shelf life of the Neera allowing producers to transport the sap to any region for converting the sap to any form of by-products. It is clearly understood that any of these approaches may suit the Neera tapping process. The approaches can be shortlisted considering the location, size and health of the chosen coconut tree.

CHALLENGES FACED BY FARMERS DUE TO NEERA TAPPING
The Challenges faced by farmers due to Neera Tapping were analysed through Henry Garrett Ranking Method. The challenges includes 'Lack of required knowledge to identify the healthy and right stage for tapping among tappers', 'High investment in pest control management since tapping creates wounds on the tree', 'Improper tapping techniques affects the quantity of sap collection', 'Tapping by labor requires more time for collecting even a small quantity', 'Income is unpredictable since seasonal changes have huge influence over Neera tapping', 'Difficulties in maintaining and storing the collected sap for processing', 'Water scarcity and limited water supply affects the growth of coconut trees in turn affect the yield', 'Extreme Neera tapping affects the overall coconut production', 'Improper tapping affects the whole environment' and 'Risk of contamination is high if proper hygiene is not practices during tapping'.

Number of Respondents who ranked the Factors
Table No : I Challenges Faced by Farmers
From Henry Garret table, Garret value is found for the percent position table 3
For each rank, garret value is multiplied by given value in the table 4
All the calculated values are totalled row wise table 5
The total score is divided my number of respondents to calculate average score, then rank the highest average score as I and the least average score with Rank X. table 6

From the table, it can be inferred that the problem 'C2 - High investment in pest control management since tapping creates wounds on the tree' ranks I with an average Garrett score of 65.70753, the variable 'C1 - Lack of required knowledge to identify the healthy and right stage for tapping among tappers'ranks II with an average Garrett Sccore of 64.06771, the vairbale 'C5 - Income is unpredictable since seasonal changes have huge influence over Neera tapping' ranks III with an average score of 60.3151, the variable 'C4 - Tapping by labor requires more time for collecting even a small quantity' ranks IV with an average score of 55.07292, the variable 'C6 - Difficulties in maintaining and storing the collected sap for processing' ranks V with an average score of 50.41406, the variable 'C3 - Improper tapping techniques affects the quantity of sap collection' ranks VI with an average score of 45.76302, the variable 'C7 - Water scarcity and limited water supply affects the growth of coconut trees in turn affect the yield' ranks VII with an average score of 42.1276, the variable 'Transportation' ranks VIII with an average score of 40.0599, the variable 'C9 - Improper tapping affects the whole environment' ranks IX with an average score of 39.71615, the vairable 'C10 - Risk of contamination is high if proper hygiene is not practices during tapping' ranks X with an average score of 34.75781.

CONCLUSION

The most challenging factor for farmers when they let out their farms for Neera Tapping involves the collection of sap from coconut trees which has gained popularity as it is a viable source of income for farmers in certain regions. However, it also presents several challenges that farmers may face according to the topography. In conclusion, neera tapping offers promising economic opportunities for farmers, especially in coconut-growing regions. It provides an alternative source of income and contributes to the diversification of their livelihoods. However, the process of Neera tapping is not without its challenges.

ABSTRACT

In last few decades the keratinolytic microorganisms were doing significant role in decomposition of poultry wastes. So, this study was aimed to identify the keratin-decomposing actinobacteria from feather dumped soil of Pudukkottai district. The physicochemical parameters were also found in the present study. Totally, ten actinobacteria strains were isolated. They were named as JJCPDKTA1 to JJCPDKTA10. The isolated actinobacteria strains were performed for the determination of keratinolytic activity for the primary screening. Among the bacteria produced zone of clearance on the keratinolytic agar plates. These zone of clearance demonstrated that the efficiency of feather degradation. The strains feather degradation potentials were observed by the secondary screening on modified basal liquid medium. According to the both screening process demonstrated that the JJCPDKTA2, JJCPDKTA3 and JJCPDKTA9 were showed significant degradations. Therefore, these three actinobacteria were identified by the 16S rRNA gene sequence, they are identified as *Streptomyces variabilis* (KR909307), *S. azureus* (kr909308) and *Actinomycetales* (KR909307) and their phylogeny was also analyzed.

Keywords: Physicochemical. Feather dumped soil, actinobacteria, screening, 16S rRNA.

INTRODUCTION

The Actinobacteria resembles the bacteria and fungi, they are widely distributed in both terrestrial and aquatic ecosystems in soil [1]. Actinobacteria was acted as a vital role in recycling of organic matters as well as production of pharmaceuticals, enzyme, antimicrobial agents, immune modifiers and vitamins [2]. The actinomycetes act as natural scavengers in nature, play an important role in degrading keratinous waste and the production of keratinase. Actinomycetes are widely distributed in nature and have major role in the degradation of organic matters. Soil is a natural reservoir for the microorganisms with their antimicrobial products and provides an excellent resource for the isolation and identification of therapeutically important products [3].

Keratin wastes are found in large quantities in many countries. Although some of them contain a considerable amount of protein and various carbon compounds, little attention is given to utilizing or recycling these wastes in a technological way. Therefore, their proper disposal may be considered as a mean of avoiding environmental pollution [4]. Feathers are generated in large amounts as a waste by product at commercial poultry-processing plants, reaching millions of tons per year worldwide [5]. Actinomycetes are one of the most widely distributed groups of Gram positive, mainly aerobic, filamentous bacteria. They are known for their metabolic versatility enabling them to survive even under extreme environmental conditions. Many actinomycetes are ecologically important and are used for production of antibiotics and enzymes[6]. Keratin is also very rich in amino acids like Leucine and Serine. A number of feather degrading species of bacteria, actinomycetes and fungi have been used for the production of keratinase enzyme in submerged as well as in solid state fermentation. Most of keratinase enzymes from microbial sources are extracellular and inducible by keratin waste[7].

MATERIALS AND METHODS

Study Area
The sample collected from Pudukottai district of Tamil Nadu state in southern India. It is one of the least urbanized districts in Tamil Nadu. Pudukottai district is bounded on the northeast and east by Thanjavur district, on the southeast by the Palk Strait. The district has an area of 4,663 Km with a coastline of 42 Km. The district lies between 78° 25′ and 79° 15′ east longitude and between 9° 50′ and 10° 40′ of the north latitude. Soil sample were collected from Pudukkottai feather waste dumping area. Sample was taken 30 cm depth from the surface of the feather dumping soil. Sample was carrying to the laboratory in sterile bags and followed by immediate processing.

Physicochemical analysis[8]
Physico-chemical parameters such as organic Carbon (%), total Nitrogen (%), total Phosphorus (%), total Potassium (%), total Sodium (%), total Calcium (%), total Magnesium (%), total Sulphur (%), total Chloride (%), total Zinc (ppm), total Iron (ppm), total copper, total Manganese (ppm), total Boron (ppm), total Molybdenum (ppm) of the feather dumping soil sample was analyzed.

Isolation of Feather Degrading Actinobacteria
The Suspected Actinobacterial isolates were maintained in ISP1 medium. Further Milk agar medium was used for the primary screening of keratinolytic activity of Actinobacteria[9]. The plates were examined for clear zone formation on the milk agar plates. All positive isolates obtained from the primary screening, were subjected to perform the secondary screening in order to isolate the feather degrading Actinobacteria. Modified basal liquid medium supplemented with raw chicken feather was used for the secondary screening [10] Whole fresh raw feather was collected from chicken processing shop. Feather properly washed and cleaned was dried in room temperature. 25ml of Modified Basal Liquid medium was taken in each boiling test tubes and added one cleaned, medium size chicken feather. Sterilized the medium and inoculated the isolates. Selected isolates were chosen based on their zone forming capability on the milk agar medium. Inoculated the boiling tubes at room temperature and examined the tubes weekly for four weeks.

Phenotypic Characterization

The mature sporulating aerial mycelium colour was recorded in ISP 1 to ISP7. The spore surface morphology of the mycelium was observed in 14 days old culture under scanning electron microscope [11].

Molecular Characterization

DNA of the Actinobacteria was isolated from cells grown in yeast malt extract broth from cells (YMB) with 02% glycine[10]. The isolated DNA was amplified by thermal cycler (PCR). The amplified DNA fragments were purified by gel electrophoresis and sequenced directly by using a Tag Dyedeoxy terminator cycle sequencing kit [applied biosystems] and previously described oligonucleotide primers. The 16S rRNA sequence of the test strain was aligned manually with available Actinomycetes nucleotide sequence retrieved from GENE /EBML/DDBJ database by CLUSTAL W version 1.81 programs. Evolutionary tree was constructed using neighbor joining method [12].

RESULTS

Physico-chemical parameters such as organic carbon, total nitrogen, total phosphorus, total potassium, total sodium, total calcium, total magnesium, total sulphur, total chloride, total zinc, total iron, total copper, total manganese, total boron and total molybdenum were estimated with following quantities like 2.49%, 1.21%, 0.50%, 3.02%, 0.05%, 3.89%, 3.06%, 0.52%, 1.68%, 2.09ppm, 0.40ppm, 85.19ppm, 50.56ppm, 0.61ppm and 0.02ppm of the feather dumping soil sample (Table -1). The isolates were selected and marked them as JJCPDKTA1 to JJCPDKTA10. All the isolates were subjected for primary screening on Milk Agar plate and among the 10 isolates only 3 isolates were formed the clear zone. The three isolates like JJCPDKTA2, JJCPDKTA3 and JJCPDKTA9 were showing Secondary screening were done to find out the feather degrading activity. The isolates JJCpdkta2, JJCpdkta3 and JJCpdkta9 were able to degrade the whole chicken feather in Modified Basal Liquid Medium after 15-25 days (Figure - 1). The isolates JJCpdkta2, JJCpdkta3 and JJCpdkta9 were grown on ISP1 medium. The shown nice dried, powdery white growth along with visible substrate mycelium (Table - 2).

The cultural and morphological characteristics of the isolates in using different media (Table - 3). The Actinobacteria isolates showed excellent growth and abundant aerial mycelium formation on different media ISP1 to ISP7 (Figure - 2). The isolates used as carbon sources showed for good growth[9].They observed excellent growth at salt concentration (6-8), temperature 28^{0}C and less growth and aerial mycelium formation at lower and higher pH value.

The molecular characterizations of isolates wereevaluated by PCR amplification of 16S rRNA gene. The 16S rRNA genes of *Streptomyces variabilis, Streptomyces azureus* and *Actinomycetales* was partially sequenced using 16S rRNA sequence primer.The sequence of *Streptomyces variabilis, Streptomyces azureus*and *Actinomycetales* was deposited in NCBI to get the accession number. The isolates which showed (JJCpdktA2, JJCpdktA3 and JJCpdktA9) were selected for 16S rDNA sequencing (Figure – 3 - 8). The alignment and comparition of the 16S rDNA sequences with the microseq™microbial identification and analysis software (PE applied Biosystems) gave up to 95% to 100% sequence similarity[10]. The analysis of the 16S rDNA sequences with the BLAST (N) search against the genbank + European molecular biology laboratory (EMBL) + DNA data bank of japan (DDBJ) and with ribosomal database project (RDP) also gave identical results of up to 98% 16S rDNA sequence homology.The nucleotide sequence of 16s rDNA or 16s rRNAgene partial sequence was deposited in the GeneBank.

DISCUSSION

The soil chemical profile showed that the amended soil had high amount of pH, organic carbon, nitrogen, phosphorus and magnesium[13]. Similar results were observed from the study of isolation, identification and characterization of feather degradable bacteria in Thanjavur (Dt.) [14]. Many reports of the soil physicochemical analysis showed mean pH value to range from 7.1-8.2. Although, the natural and anthropogenic activities can impacted the variation in pH of soils [15]. African soils are slightly acidic, accumulation of other ionic compounds

Priya *et al.,*

have contributed to the slightly alkaline nature of these soils [16]. The present investigation of physicochemical analysis of feather dumped soil containing high amount of total calcium followed by total magnesium, total potassium, organic carbon, total zinc, total nitrogen, total chloride, total sulfur, total phosphorus, total sodium, total iron, total manganese, total zinc, total boron, total copper and total molybdenum were observed. Most of the studies were correlated with the present study due to the poultry farms are also similar properties of fecal and microbial populations.

Most of the studies were found the feather degradation by bacterial strains. Some of the studies were reported that the *Bacillus* and *Alteromonas* genus predominantly degraded the dumped feathers in soil. Due to the production of keratinolytic enzymes. Because of the keratinolytic isolates could be a potential candidature for the degradation and utilization of feathers [17]. Totally, 25 actinomycetes were isolated from 10 different poultry farms and analysed their keratinolytic activity. And the potential keratinolytic actinobacteria were identified by the 16S rRNA gene and named as *Streptomyces* sp. and *S. werraensis* [18]. The 64 bacterial strains were isolated from 30 different poultry farms in Himachal Pradesh, India. Only 17 strains were degraded the keratin substrates with the presence of zone of clearance around the colonies on skim milk agar plates. On the basis of the zone of clearance, the strains were grown in basal media, in which feathers were used as a source of carbon and nitrogen. After the screening of feather degrading bacteria were identified as *Bacillus* and *Pseudomonas* species [19]. In the present study a number of actinobacteria were isolated from the feather dumped soil sample of poultry farm. These actinobacteria were endowed with keratinolytic activity and able to degrade the keratin wastes.

The actinobacteria strain of *Streptomyces rochei* was isolated from poultry feathers degraded soil. And it was confirmed by the 16SrRNA sequence. This strain was exhibited significant feather degradation of primarily and secondarily degradation [20]. Identification of actinobacteria could be confirmed by morphological, cultural, biochemical, physiological and molecular characteristics. Colony formation, aerial mycelium and reverse side pigmentation, structure of sporophores and pores are the most important features of identification of *Streptomyces*[11]. The six different isolates namely *Streptomyces* sp. (GACMPT4), *Streptomyces* sp. (GACMPT9), *Streptomyces* sp. (GACMPT57), *Lechavalieria* sp. (GACMPT8), *Lechavalieria* sp. (GACMPT44) and *Dactylosporangium* sp. (GACMPT34) were examined under light microscope and scanning electron microscope and found GACMPT 4 showed looped smooth spore surface, GACMPT 8 showed coiling smooth spore, GACMPT9, GACMPT44 and GACMPT57 showed smooth spore surface and GACMPT 34 showed warty spore surface morphology[21 & 22] .Several physiological properties are very significant for the identification of actinobacteria at genus level but not helpful for the identification at species level. However, they can be used at least as markers by which an individual strain can be recognized. Different physiological characteristics are influencing the growth rate of the actinobacteria[23 & 24]. The most powerful approach to solve taxonomic problems of actinobacteria is the study of nucleic acids. Comparison of nucleic acids yields considerable information on the true relatedness. Molecular systematic, which includes both classification and identification, has its origin in the early nucleic acid hybridization studies, but has achieved a new status following the identification of nucleic acid sequences through sequencing techniques[25]. The sequence analysis of the genes coding for the ribosomal subunits (16S, 23S, and 53S rRNA) in particular the 16S rRNA gene has become an important tool in bacterial identification, since it provides information about the phylogenetic placement of the species [26].

The 16S rRNA sequence results of feather degrading bacteria demonstrate the high levels of sequence similarity with genus *Bacillus*. For the phytlogenetic analysis, small subunit of rRNA is used that is extremely faithful microorganisms[27]. Totally, 12 actinobacteria strains were isolated and identified by partial 16S rRNA gene sequence. According to keratinolytic activity the *Streptomyces* species was most efficient to feather degradation process. And this sequence were deposited at NCBI with their phylogenetic evaluation was also determined[28]. The cluster analysis showed *Streptomyces werraensis* genotypes into two main clusters. The cluster I included [SA-31] only while, cluster II contained two sub-cluster. The cluster one included [SA-27], the sub cluster two included [SA-26]. While the sub cluster two divided into two sub-sub clusters. They have one included [SA-18], while the second included one group [SA-14 and *S.werraensis*][18].   In the present investigation was also demonstrated that the novel

actinobacteria strain degraded the feathers. And it was molecularly identified such as *Streptomyces variabilis, Streptomyces azureus* and *Actinomycetales.* This phylogenetic evaluation was also primitive sub cluster methods. The 16S rRNA gene sequence were also had high levels of energy.

CONCLUSION

These studies suggested that the actinobacteria may be used in the field studies for the biodegradation of feathers in feather processing units. These keratinolytic isolates have the potential to degrade the feather keratin, which can be used to make animal feed proteins, can be used to make slow nitrogen-releasing fertilizer and can also overcome the problems regarding waste management, because poultry waste causes environmental pollution. Therefore the microorganisms isolated in this study exhibited the potential for biotechnological uses.

ABSTRACT

One of the leading causes of death globally is suicide, especially among adults and in general for all age groups. Suicide is a serious problem in India, with 1.39 lakh people committing suicide in India in 2019 due to various reasons, as per the NCRB data. Suicides, precedent to suicidal attempts and suicides, it is estimated that suicidal ideation occurs 30-40 times more often than suicides which are caused by numerous factors. Over the past decades, several groups and researchers have been working on the various risk factors for suicide. However, various epidemiological researches mentioned that various factors considered for suicides and suicidal ideations are mainly psychiatric illness, age, gender, physical diseases, suicide attempts in the past, stressful life events, and loneliness. Other than this, personality and temperament traits have also been examined as they facilitate early identification of suicidal risks. Thus, the personality traits of the individuals identified as a critical element in the suicidal ideation of the people. This research paper investigates the relationship between personality traits of the person and suicidal ideation. A research survey was conducted, using a close-ended questionnaire, on 246 Indian adults from different cultural and geographical backgrounds of various age groups. A theoretical model was proposed, and the same was validated using correlation and regression analysis methods. The results of the tests and the significance of the model in theoretical and practical application is described in the paper with a possible road map for further validation and advancement of the study.

Keywords: Suicide Ideation, Adults, Big Five Inventory, Psychosocial, Risk factors, Hypotheses.

Madan Lal Sharma and Vineeth Kumar

INTRODUCTION

Suicidal ideation is a strong predictor among adults attempting and completing suicides, specifically in young individuals. Personal social networks and personality traits are particularly important among the numerous variables linked to suicidal ideation among adults. Personal social networks have long been thought to have a major role in developing psychological discomfort and mental disorders in young and adult individuals. It is apparent personality characteristics such as self-esteem, self-confidence, openness, and so on reflect in a person's psychological state of mind to a significant extent while they do social interactions with colleagues or friends and the external environment. According to previous research, people do not actively participate in social events and are not so adaptive to the external changing environment who experiences mental or psychological difficulties, and prefer to withdraw from social events and social interactions and isolate themselves. Poor social connections have also been linked to increased suicidal risk behaviors, particularly the development of suicidal ideation.

When researchers examine the various personality traits and distinguish between various personality traits impacting suicidal ideation and suicidal behavior. The significance of various personality traits in understanding suicide behaviors among people has been widely researched, and numerous previous studies have indicated that various personality traits directly impact the suicide-risk behavior of individuals. A variety of clinical and social factors cause suicide among young Indian adults. Depression, anxiety, adjustment issues, alcohol and illicit drug use, and poor sleep all contributed to teenage suicidality regarding psychological issues. Even though there is evidence suggesting a link between personality traits and suicidality, it is still unknown how some personality traits impact suicidality development. Failure to deal with stress may lead to mental health problems, and mental illnesses are common among individuals who attempt suicide; therefore, it's a fair assumption that mental health issues moderate the link between personality traits and suicidality.

REVIEW OF LITERATURE

Suicide is not seen only as an independent single event but instead has a series of precursor events that begin with suicide ideation (SI; repeated thoughts of suicide), progress through the development of a suicide plan, a suicide attempt, and ultimately completing suicide accomplishment (Lewinsohn, Rohde, & Seeley, 1996). These phases are all referred to as elements of suicidal conduct, and identifying the risk factors that cause a person to engage in suicidal ideation and then proceed along the suicide road is critical to preventing suicide at an early stage. Riaz, Kousar, Riaz, Batool, and Yasmin (2014) conducted a study to examine the association between personality traits, self-esteem,and suicidal ideations among young adults with a sample of 110 young adults in Ahmedabad, Islamabad, and Gujranwala from different government college. The study findings indicate that suicidal ideation had a negative correlation with self-esteem and neuroticism and the three personality traits, i.e., extraversion, agreeableness, and openness, had a significant positive correlation with suicidal ideation. He also indicated that males had a high level of suicidal ideation as compared to females.

Brezo, J., Paris, J. &Turecki, G. (2006) conducted a systematic review of personality traits as correlates of suicidal ideation, suicide attempts, and suicide completions and concluded that some of the selective personality traits may be highlighting components leading to suicide risk. In order to identify their contributions in relation to environmental and genetic variation in different gender, ages, and ethnocultural groups, further future research studies need to establish. A study on 219 university students was conducted in the age range of 18-43 years to investigate the relationship between personality traits, depression, hopelessness, and suicide ideation. The result of the study revealed that Neuroticism and Openness predicted positive relations with depressive symptoms, and Extraversion predicted negative relations with depressive symptoms. Hopelessness was positively predicted by neuroticism and negatively predicted by Extraversion. Finally, the study indicated that neuroticism predicted a positive association with suicide ideation (Chioqueta, A. P. & Stiles, T.C. (2005).

Madan Lal Sharma and Vineeth Kumar

Suicidal conduct was related to problems in controlling low mood, according to Rajappa, Gallagher, and Miranda (2011). (Also referred to as emotion regulation). Emotion regulation is a collection of regulatory mechanisms that may alter emotional reactions' amplitude, latency, and duration by redirecting emotions (Miranda, Gaudreau, Debrosse, Morizot, & Kirmayer, 2012; Thompson, 1994). It encompasses controlling both good and negative emotions that occur in stressful and non-stressful circumstances (Compas, Connor-Smith, Saltzman, Thomsen, & Wadsworth, 2001) to emotional discomfort. The discovery highlights the significance of emotion control in suicidal conduct. Although studies have identified risk factors for suicide, such as depression, poor coping skills, greater avoidance of stresses, and a lack of strong social connections (John & Gross, 2004), there has been little effectiveness in predicting and preventing suicide using these risk factors. Many people face comparable difficulties, but not everyone will contemplate suicide (Bazrafshan, Jahangir, Mansouri, & Kashfi, 2014). As a result, it is hypothesized that when confronted with a scenario, some people are more inclined to commit suicide, while others are more robust and will not commit suicide. It raises the issue of whether certain people are predisposed to suicidal conduct due to particular talents.

Research Gap and Objectives of the Study

As evident from the review of the literature, although considerable work has been done to understand the impact of personality traits on suicidal ideations or tendencies, most of these studies have focused on Western subjects, and not much work has been done as far as India is concerned. Even when the focus has been on Indian conditions and Indian subjects, the age factor, which can prove a very significant factor in the author's opinion, has not been paid attention to.

Keeping this research gap in focus, to bridge this gap, the author proposed to study the impact of personality traits of individuals on their suicidal ideation. The study also covered the impact of the age of the respondents on their suicidal ideation. The following objectives were framed for the study:

- To study the association between Personality Traits and Suicidal Ideation among Indian adults

RESEARCH METHODOLOGY

Sample Size and Research Tools

In order to fulfill the above-mentioned objectives and to understand the relationship of personality traits with suicidal ideation in Indian adults, a structured, close-ended questionnaire was constructed and administered to 275 people, of whom 254 replied and, finally, after cleansing of data, 246 were finally used for the analysis. The convenience sampling (Non-Random) method was used to reach to these respondents, who were between the age group of 20-50 years. In order to draft the questions related to personality traits,Big Five Inventory (BFI) was designed by John, O.P., and Srivastava, S. (1999). It contains 44 items. This tool measures the Big Five Factors of an individual's personality (Goldberg, 1993),which are further divided into personality facets.The Suicidal Ideation Scale developed by Dr. D.S Sisodia and Dr. V Bhatnagar (2011) noted the responses on afive–point Likert scale for 25 items for suicidal ideation data collection. To understand the relationships of these variables with suicidal ideation, Correlation Analysis, and Linear Regression were used with an ANOVA test to quantify the direction and magnitude of the relationship between personality traits and suicidal ideation by testing the two sets of null and alternate hypotheses.

Hypotheses:

H_0: *There is no significant impact of personality traits on suicidal ideation among Indian adults*
H_1: *Presence of personality traits in adults will have a significant influence on suicidal ideation*

Data Analysis

For understanding the effect of the personality traits on suicidal ideation, it was decided first to examine the correlation of these factors with suicidal ideation, and for the same effect, a linear correlation was used, and Table1 shows the results of this correlation analysis concerning suicidal ideation. As the correlation matrix of Table:1 depicts

Madan Lal Sharma and Vineeth Kumar

the correlation between personality traits and suicidal ideation, From the tables, it is fairly clear that personality traits correlate with suicidal ideation. The Linear Regression Analysis was performed on both sets of variables. An ANOVA table was formed to understand the nature of the relationship of these variables with suicidal ideation individually.

As Table exhibits, four of the five personality traits are negatively correlated with suicidal ideation, implicating that the stronger these four personality traits would be in a human, the lesser is the probability of that person entertaining any suicidal ideation. Of these four, Conscientiousness is the strongest, followed by Openness, Agreeableness, and Extraversion, in that order. The reason for Conscientiousness being strongly and negatively related to suicidal ideation could be that people who think over the consequences of their actions and plan their actions meticulously are less prone to face adversity in their life. If they even come face to face with adversity, they have the inner strength and courage to handle the situation with a positive attitude of mind. The only positive correlation exhibited in this table is neuroticism, which implies that as a person goes more neurotic and remains disturbed with frequent episodes of anger, life stress, and anxiety, their probability of harming themselves mortally increases.

As the regression analysis test was applied to understand the association between personality traits and suicidal ideation. Table 2 depicts that the r^2 value for personality traits and suicidal ideation is 0.181. It can be concluded that the personality traits exhibit some impact on suicidal ideation; however, it is moderate. When the association of the factors of personality traits to suicidal ideation is checked individually using the regression analysis, Table 3 depicts that neuroticism has the strongest positive association, which means that any increase in neuroticism will lead to an enhancement in the suicidal tendencies among the subjects. Openness exhibits the strongest negative association with suicidal ideation, followed by Conscientiousness and Extraversion, thus implying that any increase in these traits will reduce the suicidal tendencies of the subjects and bring them out of danger.

The ANOVA table generated during the regression analysis process Table 4also exhibits that openness has the strongest impact on suicidal ideation, followed by Conscientiousness, Neuroticism, Extraversion, and Agreeableness, in that order. It is an important outcome as it can be summarized from this table that the positive impact of openness (as derived from the previous table) can overcome the negative impact of neuroticism and draw the subject away from suicidal ideations. The correlation among the personality traits was also tested as a natural corollary to the regression analysis, using the Durbin – Watson Test for Autocorrelation, as depicted in Table 4, which exhibited that the factors had a certain degree of correlation among them that may have impacted the outcome of the regression analysis. The Durbin – Watson Test for Autocorrelation also exhibited some correlation among the personality traits factors, as depicted in Table 5, which, although natural since the different parts or traits of personality cannot be dissociated from each other, could have impacted the outcome of the regression.

DISCUSSION AND CONCLUSION

Suicidal ideation is a vulnerable tendency that needs to be controlled among the adult population in India, as it harms the country, society, and the family of the person in multiple manners. If any study can point out those factors which lead to the enhancement or prevention of suicidal ideation, it would be very helpful since corrective measures can be taken to control the same and bring the subject out of the riskier zone. Similarly, those factors which reduce suicidal tendencies need to be identified and encouraged as it will go a long way in fostering a positive societal atmosphere that will help in reducing the incidents of suicides in the country. In the same context, this study helps, as the extensive survey and the data analysis have been done, very clearly, pointed out those factors among personality traits that either enhance or facilitate to prevent suicidal ideation among adults. This identification and gradation of the factors concerning their criticality and impact will help the policymakers and practitioners derive the measures for negating the harm and enhancing the benefits of these factors.

Madan Lal Sharma and Vineeth Kumar

As the study demonstrates, among the personality traits examined and analyzed, it was visible that the trait of openness was the strongest negative factor for suicidal ideation, while neuroticism was the strongest positive factor for the same. Thus, the subject must be persuaded and encouraged to indulge in creative and other activities that stimulate their intellectual curiosity. This would kindle a sense of contribution towards the environment in them and reduce their feeling of being worthless or unimportant. Anger, anxiety, emotional instability, and depression are some of the common exhibitors of neuroticism that may harm the normalization and assimilation of the subject into the daily life processes of a normal person. Similarly, Conscientiousness is a strong predictor to facilitate the individual to overcome life stressors and reduce suicidal risk. Any stimulant or behavior that leads to a rise in these mental troubles would drive the subject towards suicidal ideation, further exacerbated by the subject's feeling of loss of control over their environment and life stressors, which is detrimental to any suicidal case.

The correlation of factors establishes the importance of a conjoined and combined effort by the family and society on multiple fronts, as any isolated remedial action taking an individual skill or trait will not deliver the result in the same manner as it is desired in most cases. A unified and multi–modal strategy and actions need to be devised to bring the human resource of this nation out of the depths of suicidal ideation, thus making our society a more empathetic and emotionally sensitive society in the process.

ABSTRACT

Psychology is the scientific study of human behaviour. It penetrates into various aspects of human cognition, emotions, motivations, personality, development, social interactions, and mental processes. Psychology seeks to understand how individuals perceive, think, feel, and behave, both individually and in groups. Psychological projection is a defence mechanism where individuals attribute their own unwanted or unacceptable thoughts, feelings, or characteristics onto others. It involves projecting one's own emotions, desires, or motivations onto someone else, often without realising it. This mechanism allows individuals to avoid acknowledging or dealing with their own inner conflicts, insecurities, or shortcomings. In *498A: Fears and Dreams*, there are instances of psychological projection in various discussion and events. This paper is an attempt to examine the technique psychological projections of human emotions in the abovementioned novel by Vikas Sharma.

Keywords: Psychology, Projections, Mechanism, Conflicts, Individual, emotions etc.

INTRODUCTION

Psychologists employ various research methods and approaches to investigate and explain human behaviour. They may conduct experiments, surveys, observations, or analyse existing data to gather evidence and gain insights into psychological phenomena. Through this scientific inquiry, psychologists aim to develop theories and models that

Krishna Kumar Sharma and Kanwar Pal Singh

explain human behaviour, as well as provide practical applications to improve well-being and enhance the understanding of individuals and society. Psychology plays a crucial role in understanding and explaining human behaviour, thoughts, and emotions, and it has practical applications in various domains, such a mental health, education, business, sports, and more. It provides valuable insights into how individuals perceive the world, interact with others, and navigate their internal and external experiences.

It is important to understand that psychological projection is often an unconscious process, and individuals may not be aware that they are projecting their own emotions onto others. Recognising and addressing projection can be helpful in gaining self-awareness and understanding one's own emotions and motivations more accurately.

498A: Fears and Dreams is a novel by Prof. Vikas Sharma. This work deals with dowry system, a social evil and its effects in psychological lives of the characters in Indian society. Aftermaths of the section 498a of IPC that provides protection for women under the circumstance when a bridegroom or his family tortures a woman for dowry. The novelist has depicted the misuses of this code of Indian justice system.

Vikas Sharma is an Indian writer who has penned a number of novels with various themes such as modernity, love, crime, physical needs, and the absurdity of life with positive effects leading to purgation of human emotions. He is a professor of English in the department of English at Chaudhary Charan Singh University, Meerut,Uttar Pradesh. He has written many novels such as *Love's Not Time's Fool, Ashes and Fire, Hope against Hope, IAS Today, 498A Fears and Dreams*, etc. He touches avoidable taboos in his novels. Sex, nudity, the quest for physical intimacy, and correlative themes are the main component of his novels. Most of his novels are knitted around the realistic picture of society. In the present society, it is very common for some women in rich families in unfamiliar situations, to have physical relation with young boys with a sense of safety and security. It has been delineated smartly in his novels how women of the elite class use young boys to quench their thirst buried in unconscious mind. Sometimes, it creates social and family problems in a country like India which bears a long traditional and cultural background. Such scenes have been depicted by the writer in most of his novels.

Research Objectives
To study psychological projections in the novel *498A: Fears and Dreams*
To study these projections on various characters
To analysis the impact of psychological projections of a particular character on various characters.

RESEARCH METHODOLOGY

This piece of research has used analytical and descriptive methods of research. The present research work employed an intensive reading of primary and secondary data as per the availability of study material to formulate a concrete conclusion to the subject undertaken; the research exploits the library methodology for information related to the present research. In order to achieve a constructive conclusion, the researcher remained objective in analysis.

FINDINGS AND DISCUSSION

In this section of the research findings through primary and secondary sources have been discussed. In the chosen novel, psychological projections leave crucial impact on various characters; sometime due to these projections, story of the novel turns around. Several incidents of projections have been delineated through direct quotations.

Tanvi's Emotional Suppression
Tanvi Dixit, newly married to Jatin expresses her depressed desires for materialistic comfort as she is welcomed in new family of Jatin. Her parents did not possess materialistic luxurious things and yet she found herself restless without material comforts.

Krishna Kumar Sharma and Kanwar Pal Singh

She expressed her desire to live in a grand bungalow that Jatin could never dream of. Sheh also aspired at least for a scooty along with other luxurious things like A.C., T.V. and costlier furniture. (p 14)

Abovementioned statement signifies her depressed desires which were within brain while she was unmarried and living with her parents but as she got married, she eagerly expressed her suppressed desires for materialistic comfort.

Another example of her psychological projections in the form of insecurity and jealousy is seen when she removes the picture of Prem Lata, late wife of RK Sharma, whom Tanvi married after getting divorced from Jatin, from her bedroom and hung two pictures there-one of Lord Shiva along with Maa Parvati and second that of herself. (p-39) When Sharma ji noted the change next morning, she kissed him first and said,

Let Didi ji rest in peace wherever she is. Look at Lord Shiva and Maa Parvati for a nice day and see your lively loving wife and not the departed soul. Begin every day with fresh blessings and love. Why to go on lamenting for one who can't be brought back? (39)

Except, she projects her suppressed desires onto Pratiyush, her step-son. Being sexually unsatisfied from her old age husband R.K. Sharma, she projects her emotional and sexual desires onto Pratiyush and seduced him for the fulfilment of her desires. Now her desires which were suppressed for a time is projected on Pratiyush. Sarwar Ahmad Narzar writes in his article *Beyond Feminism: A Study of Prof. Vikas Sharma's498A: Fears and Dreams*,
Since her second husband can't fulfill her physical desires because of his old age and busy schedule. As they fail to develop any physical relationship, Tanvi feels need to turn towards her stepson, to satisfy her physical needs.(4)

Jaitn's Detachment
Jatin who earned a diploma and got a job in Larsen & Toubro become detached from several human emotions after unsuccessful marriage with Tanvi. He failed to tolerate the growing demands of his wife and could not manage for extra money to buy luxurious things for Tanvi. The frustration of his unsuccessful marriage is seen in his further life. He projects his frustration and desires onto others. He reaches Goa to get a job in Joseph Shipping Company on the call of his friend Tirath Raj. Joseph, the owner of the that company offer him a good job and ask him,
'What do you wish to do in life?"
'A job that gives me bread and butter.'
"What are your ambitions in life?'
'Not much sir. I hail form an ordinary family and quite often my parents expect financial support from me. Alas! I fail to help them due to unemployment in India.' (20)
These statements show his suppressed desires which are projected on Joesph. Later in the novel he also projects his desires on Sophia whom he marries. He has suppressed desires to get intimated with opposite gender because of his failure in marriage with Tanvi. Jatin projects these desires on Sophia and Procne respectively. Besides, he is seen projecting his emotions, desires on other on several occasions in the novel.

Jay's Digression
Jay, brother of Jatin alias Joe Beverley fall in love with the girl Procne during his stay in the house of Joe and Sophia but after a short span of togetherness Procne leaves him because of her attitude that always attempts to flow with the water. Jay did not do well in his Master Degree and could not get a good job in Joseph University while Procne becomes Lecturer in the same university. She achieves more than that of Jay hence as usual she starts ignoring Jay. This act of unwilling in love digresses the mind of Jay. He begins writing and projects all his suppressed emotions and desires onto pages. It helps him out to become a good writer. He won the Booker Award and the Pulitzer Prize for his books. (p-171).

Now his status was elevated. He was asked to deliver guest lectures on Teaching Techniques. This all happened due to his mental situation which was projected into writing just after several situations that had happened in his life time during the stay in the United States of America.

When he realised the wish of his parents of staying him in India, he feels sorry. He had tears in his eyes when he analysed his affection for his parents and failed to answer questions that his subconscious mind asked him-How is he a responsible son? What has he done so far for his parents? What does he propose to do for them in their old age? (p-151)He recollected the names of Lord Rama, Lakshamana, and Shrawan Kumar who obeyed their parents till the last hour of death. Had he settled in India, he would have proved as old man's stick. But alas! He had taken the untraveled road and his destination was far away.

Through these examples we come to know that Jay is most sensible and acute male character who never try to project his emotions on others. He aptly uses them in the form of writing and get fame and popularity just because of it.

Sophia's Anger and Emotions

Sophia, who is another major character of the novel projects her anger on others. She is very dedicated and honest lady still she is betrayed by her husband Joe who cheated her in order to find pleasure and physical fulfilment from Procne. Procne and Joe cheat Sophia and go to several cities including Indian cities like Agra, Delhi and Bombay where they enjoy their life. Dr Nisha Singh in her article *498A: Fears and Dreams: Voice of Homosapians* quoted the novelist and writes,

"Highly materialistic people believe that owning and buying things are necessary means to achieve important goals, such a happiness, success, and desirability."

When it is realised by Sophia that her husband is cheating her, she becomes very emotional. During the time of her delivery, she finds only Jay beside her while it is supposed for a husband to be with his wife at the time of child delivery. The absence of her husband creates emotional space in the mind of Sophia. She collected various human emotions due to the betrayal acts of her husband Joe. These emotions are projected onto others at her work place. It is obvious that when she fired at Ford in the Joseph University campus, it is just a projection of rage and frustration she received from her husband.

CONCLUSION

Various emotions and unfulfilled desires stored in the unconscious mind are projected onto others if a person is not capable to project them at right time. Sometimes, this creates chaos and frustration in human life along with various other upheavals leading to the emotional and behavioural disturbance. He or she will feel himself/herself uncomfortable in his surroundings. This paper has dealt many emotional upheavals, felt by different characters in the novel. The author is successful enough to study the psychology of the characters in conscious and unconscious mind. Psychological projections have been vital throughout the novel. Human emotions of various characters divert the scene on several occasions. Despite having dealt with social issues, *498A: Fears and Dreams*, occupies a significant place in psychological dimension of its characters.

ABSTRACT

The Cauvery basin tributaries of kabini which form of Taraka watershed is situates about 58km of Mysuru city. The study area is mainly hard rock terrain comprising of Migmatitic-Tonolitic gneiss , charnokite gneiss , Granodirite & Granite and Amphibolites Dyke. Groundwater samples was collected from 30 sample location and their major ion concentration have been analysed to identify the controlling mechanism . P^H ranges of Pre and post-monsoon 6.66 to 8.36 and 6.77 to 8.26 indicating basis nature of groundwater. The Migmatitic-Tonolitic gneissic terrain has the Electical conductivity ranging from Pre and Post-monsoon is 173 to 1622 and 312 to 1969. The area found that oldest group of rock in sargur schist belt. The Granodiorite & granite ,charnokite , pegmatite vein and dolerite dyke are ingneous rock. Corbonate was found to be the predominant anion in both seasons. The lithology map as shows in the concentration of dissolved ions are more in northern part and north-eastern part, attributing to the lithological variations.

Keywords: Taraka watershed, groundwater chemistry and Lithology.

INTRODUCTION

On a global scale, groundwater is a valuable natural resource. The last several decades have seen an increase in emphasis paid to safeguarding these essential renewable resources. Investment in the water sector will be necessary as the population grows and water demand for various purposes increases, including agricultural, drinking, and industrial expansion. Water is a necessity for every living thing on Earth, either formally or informally. Numerous factors affect the groundwater. While some are created by humans, others are created by nature (Batabyal, 2015). Soil strata, precipitation and surface water chemistry, climate, terrain, and a combination of human activities all affect groundwater composition (Balasubramanian, 1986). In order to evaluate the water quality for drinking, one must know the make-up of the groundwater as well as the corrective actions to be taken (Behera et al. 2018). Target audiences including politicians and the general public can easily and rapidly understand the overall indicator value of the best methods for informing decision-makers about water quality. This will be helpful for prioritising management efforts, resources, and management decisions by analysing and communicating the overall consequences of current, planned, or proposed water quality interventions at various locations and periods within the research region.

Study Area and lithology

The current research area, Taraka Watershed H.D.Kote Taluk, in the Karnataka State's Mysuru district, is situated geographically between latitudes 12° 00' 00" and 12° 15' 00" north and 76° 05' 00" and 76° 25' 00" east (Fig.1). The survey of India Toposheets Nos. 57D/4, 57D/8, 58A/1, and 58A/05 cover the entire 429 square km research area. on the 1:50,000 scale. The study region was accessible by a road that could be driven on in any weather. In relation to the research region, the Taraka watershed H D Kote is in the south and the River Cauvery is to the north. The region has a semi-arid weather with warmer seasons, low precipitation, and a pleasant winter monsoon. The annual mean temperature is 15º C, and the average rainfall is 560 mm (Basavaraju and D Nagaraju, 2020). The classification of soils have been carried out six types of soils occurred in the study area. They are clay, loam sand, sandy clay loam, sandy loam, Black and mixed loam and Red loam. These soils are considered to be residual concentrations derived by the weathering of parent rocks represented by peninsular gneisses of the basement complex. The soils are highly porous and increase infiltration and water holding capacity from surface runoff in the study area. This area is a typical hard rock terrain. The main litho-units study area are old supra crustal sargur group of Metamorphic & igneous rock (Fig-2). About 59.84% of Major area is occupied by Migmatites And Granodiorite - Tonalitic Gneiss falling in the Eastern and southern parts of the area and 21.76% & 18% area is occupied by charnokite & Granodiorite and Granite.

Groundwater Chemistry

The present study comprises of determination of ion concentration of chemical relationship, irrigation suitability and mechanism controlling the groundwater chemistry. In 2022, pre- and post-monsoon hand pumps and drill holes were used to gather 30 representative water samples (Fig. 3).Pre-monsoon season is regarded as lasting from March to May, and post-monsoon season is regarded as lasting from October to December. The American Public Health Association (APHA) devised a methodology that was followed for collecting a total of 30 groundwater samples. The results are reported in Table 1 and the locations of the samples are indicated in (Fig 3).

METHODOLOGY

Groundwater samples collected at 30 various tube wells by simple random Taraka watershed Heggadadevankote taluk, Mysuru district, Karnataka, India. During the pre and post- monsoon of 2022 (Fig. 2). Samples were collected and stored in thoroughly washed polythene containers after 5 minutes of pumping. Standard procedures were used to estimate the amounts of sodium (Na^+), calcium (Ca^{2+}), magnesium (Mg^{2+}), chloride (Cl^-), potassium (K^+), and sulfate (SO_4) (APHA 2005). Volumetric titration techniques were used to determine calcium and magnesium concentrations in the laboratory, whereas an auto titrator (Metrohm Titrando 905) was used to estimate chloride concentration. The ions were analyzed using a Spectroqunat Prove Spectrophotometer 100. Standards were run often

to ensure that the analyses were accurate. In order to validate that the outcomes were precise to within 5%, the ion balance error was also calculated. After the study was completed, the data was processed using WATCHIT software (Balasubramanian and Nagaraju, 2019) and thematic maps were made using ARC GIS 10.8 software (Pramoda et al.,2022),(Tab. 1). Following five minutes of pumping, the samples were collected and stored at 4°C in meticulously cleaned polythene containers until the study's conclusion.By analysing sampled groundwater, the Bureau of Indian Standards' recommendations were compared and tested (BIS, 2012). The following physico-chemical factors, including bicarbonate (HCO_3), sodium (Na^+), nitrate (NO_3^-), iron (Fe), and total dissolved solids (TDS), are measured in laboratories: electrical conductivity (EC), pH, total dissolved solids (TDS), calcium (Ca^{2+}), magnesium (Mg^{2+}), potassium (K), sulphate (SO_4^-), nitrate (NO_3^-), and total hardness. Various graphical and statistical techniques have been used to analyse the amounts or relative abundances of important and minor components, as well as patterns of fluctuation, in various water samples. While other parameters were investigated in the lab using established techniques defined by the APHA (American Public Health Association), PH and EC were assessed in situ. The findings were then analysed using WATCHIT (Water Chemistry interpretive Techniques). The GPS data were recorded at each place and utilised with the ARCGIS to create thematic maps.

Ionic concentration of Groundwater Quality

P^H:

A pH of 7 shows that water is neutral and represents the concentration of hydrogen ions in pure form. According to BIS (2012), drinking water should have a pH range of 6.5 to 8.5. The pH of the groundwater that flows through Tonalitic Gneiss and Granite, two rocks rich in chlorite, is typically higher than 7. In the study region, the pH ranges from 6.66 (minimum) to 8.36 (maximum) during premonsoon precipitation (Table.1) and from 6.77 (minimum) to 8.26 (highest) during postmonsoon precipitation (maximum) (Table.2). In the research region, all of the samples—both pre- and post-monsoon—fall inside the permissible range.

Electrical Conductivity (EC)

 It gauges how much stuff is dissolved in an aqueous solution; The EC increases as a water's amount of dissolved material increases. 2018 (Chaurasia). An optimum EC cap for potable uses is 300 S/cm. Electrical conductivity (EC) varies from 173 µs/cm to 1622 µs/cm before the monsoon whereas it fluctuates from 192 µs/cm to 1050 µs/cm after. Approximately 10% of the Pre-monsoon samples and 13.3% of the Post-monsoon samples had concentrations that were below the allowed limit of 300 µs/cm.

Total Dissolved Salt(TDS):

It is a fundamental standard for drinking water. High TDS levels make water unsafe for drinking and have negative health effects. It is primarily composed of inorganic salts, with a very little percentage of melted organic material (Fetter 1994). The BIS states that a TDS level of no more than 500 mg/L and no more than 2000 mg/L is appropriate for water used for human consumption. The TDS in the study area varies in 2019 from 113 mg/l to 1054 mg/l in the pre-rainfall and from 312 mg/l to 1769 mg/l in the post-rainfall. The permissible level of 500 mg/l is not met by about 40% of samples taken prior to the monsoon and 60% of those taken after the monsoon.

Total Hardness (TH)

TH is a crucial element of water for its use in the residential sphere. Water hardness is used to gauge a substance's capacity to produce soap lather (Adams et al. 2001). In addition to causing stomach issues, hard water can cause kidney stones (calcium oxalate crystals) to form. According to Batabyal (2015), it occurs because of the presence of calcium and magnesium. Total hardness (TH) varies between 70 mg/l and 630 mg/l prior to rainfall, and between 165 mg/l and 918 mg/l following the wet season. The authorised threshold of 500 mg/L is not reached in approximately 46.67% of samples taken before rainfall and 50% of samples taken after the rainy season.

Cation concentration

The cation concentration Pre and Post monsoon are Sodium Potassium (Na+k) varies from 0.67 to7.28 (epm) Shanthipura to Yedathore and 2.13 to 8.66 (epm) Hosavarachi to Yedathore is both seassion is hard rock terrain. The

Basavaraju and Nagaraju

alkaline earths calcium varies from 0.80 to 6.51 (epm) and 0.95 to 6.75 (epm) pre and post monsoon is same sample representative is Shanthipura and H D Kote. The Magnesium contests are pre and post monsoon in the order of Pre is 0.60 to 6.52 (epm) shanthipura to kodasige and post monsoon are 0.76 to 7.98 (epm) shanthipura to Jakkahalli The ionic concentration is more in Northern and North-eastern part of study area. The variation of ionic concentration is mainly due to the lithological changes and the dissolution coefficient of minerals present in the rocks. As per the Indian standard specifications (1983) the ionic concentrations of the water samples of the area.

Anion concentration

Carbonate is the predominant anion in both pre and post- monsoon varied from 3.03 to 14.38 epm (Halemagge to Yedathore) and 2.27 to 16.53 epm (Shanthipura to Hyrige) respectively. Bicarbonate occurs as a 1.25 to 9.81 epm (Shanthipura to Yedathore) and 2.05 to 10.63 epm (Shanthipura to krishnapura) in pre and post-monsoon is medium constituent of Migmatite, Granodiorite and tonalitic gneiss terrain (Table-1 & 2). Chloride is the principal anion among the varied from pre and post-monsoon 0.47 to 4.78 epm (Chakanahalli to Hyrige) and 1.00 to 5.23 epm (Shanthipura to Taraka) respectively. Sulphate varied from pre and post-monsoon 0.16 to 2.20 epm (Shanthipura to Budunuru) and 0.26 to 2.61epm (Yerahalli to Budunuru) are respectively. Floride varied from pre and post-monsoon 0.26 to 1.31epm (Siddapura to Hyrige) and 0.32 to 1.32 epm (Mattekere to Hyrige) show in (Table-1 & 2).

RESULTS AND DISCUSSION

Classification of Water Type

Piper trilinear diagram is widely used classify water type based on ionic composition. These methods understand progressive changes in the geochemical charecteristics of the Groundwater. The study area was classified based on the pre and post-monsoon 2022 hydrogeochemical charecteristics (Piper AM, 1994). Study of Groundwater chemistry revealed that Calcium and Carbonate were the major dominating cations and anions in all water types of both season. The piper plot diagram for both season was plotted which that considerable variation in water charecterstics in the study area.

In pre-monsoon 2022, most of the water samples fall in the lower half of the diamond field, suggesting that these waters are primarily saline and secondary alkaline in nature. In contrast, a few samples fall in the lower half of the diamond field, indicating their primary saline and secondary alkaline character, acquired by constant interaction between groundwater, rock, and soil of the area. In post-monsoon, the Magnesium bicarbonate dominated in both years, followed by the mixed type, from the piper plot suggesting that we can see a considerable variation in water characteristics in the study area.

In the cation field during pre-monsoon 2022, 73.33% of samples fell in the non dominant category; the rest of the 22% fell under the Sodium and Potassium category except 2% of samples. Around 20% & 12% of samples fall under the calcium and Na & K categories, respectively; the rest fall under the Magnesium type. No-dominant category lion shares across all 2 seasons; the rest of the category varies. In the anion field, the bicarbonate type has 96% of the sample, followed by the no-dominant category in pre-monsoon and post-monsoon 2022. Chloride types have been absent in pre and post-monsoon 2022. The sample fall in types varies from 1-3%

Mechanism Controlling Groundwater Chemistry

Gibbs diagrm is widely used to estarblish the relationship b/w water composition and aquifer lithological characteristics, including water chemistry mechanism (Gibbs, 1970) had introduced a scattered diagram to plot the ratio of $Na^+/(Na^+ + Ca)$ and $Cl^-/(Cl^- + HCO_3)$. It has been discussed in detail that majority of rock interaction occupying the major area extent of 93.34% and 96.67% in pre monsoon and post monsoon respectively and it is followed by evaporation is around 6.66% and 3.33% in pre monsoon and post monsoon. The rock water interaction dominance cation field indicates the interaction b/w rock chemistry is percolated water under subsurface. In anion

field majority of the water samples fall under a rock-water interaction, except pre and post monsoon two and one evaporation and precipitation dominance sample.

CONCLUSION

The study area is Sargur supra crustal group of rock in igneous and metamarfic group. The P^H ranges is indicate good condition of groundwater. The lithology map show that the ionic concentration of groundwater is more than in northern and north-eastern part of the study area. The ionic concentration is also more in Migmatite & granodiorite and tonalitic Gneiss. The piper trilinear diagram shows that, in general of the study area has acidic & mafic of rock water. The entire area should be pre and post monsoon is carbonate is dominant. The Gibbs plot indicate that the groundwater chemistry majority of rock weathering interaction of $Na^+/(Na^+ + Ca)$ and $Cl^-/(Cl^- + HCO_3)$ in Pre and post monsoon.

ABSTRACT

Hypothyroidism is a clinical condition characterized by reduced synthesis and secretion of the thyroid hormones T4 and T3 which affecting multiple organs including cardiorespiratory system. Cardiorespiratory fitness (CRF) is a measure of the heart and lung's functionality and it is assessed by maximal oxygen consumption (VO2max) and Pulmonary Function Test (PFT). Simplified practical walking tests are appealing to estimate VO2max in which the 6MWT is easy to administer and better tolerated. Hypothyroidism may also cause various psychiatric and physical disturbances which is assessed by Health-related quality of life (HRQL). SF-12 is the abridged practical version of SF-36 and it is more suitable for large health surveys. The impairment of CRF & HRQL may be considered as the indication for initiation of physical exercise. There are limited studies to report the effect of Hypothyroidism on CRF & HRQL. So, the purpose of this study is to find out CRF & HRQL in females with hypothyroidism. 40 Females with Hypothyroidism from at least 1 year between 20-45 years of age were included by convenience sampling. The study was approved by the Ethical Committee. All participants were participated voluntarily with their consent. Cigarette smokers, patients suffering from pulmonary diseases, Cardiac disease, hypertension, diabetes mellitus, any recent surgery are excluded from the study. CRF was examined by 6 MWT (Vo2 max) & PFT was examined by computerized spirometer in which FEV1%, FVC%, FEV1/FVC%, PEFR%, MVV% and HRQL was examined by SF 12. Data was analysed with the help of SPSS. In the present study, there was a decrease in means of MVV%. But there was not reduction in means of FEV1%, FVC%, FEV1/FVC %, PEFR %. There was a decrease in means of 6MWD & VO2 max which were 456.05±63.21 and 17.10±2.37 respectively. There was a decrease in PCS & MCS Score which were 43.82±8.73 & 49.91±7.78. Pulmonary functions are normal except MVV % compared to their % predicted values indicate poor respiratory muscle endurance. There was decrease

67043

in Vo2 max which indicates poor CRF. PCS & MCS is below average which indicates poor quality of life. Based on these results low CRF & quality of life can be improved by various physiotherapy treatment.

INTRODUCTION

Hypothyroidism is a clinical condition characterized by reduced synthesis and secretion of the thyroid hormones thyroxine (T4) and triiodothyronine (T3) which affects the multiple organs [1]. It is a most common pathological hormone deficiency and arising more often in women than men [2]. The prevalence of hypothyroidism in india was 10.95% [4]. Physical fitness is typically expressed as cardiorespiratory fitness (CRF) and is assessed by exercise tolerance testing [5]. CRF is a strong predictor of future health and functioning and is a measure of the heart and lung's functionality which is assessed by VO2max and Pulmonary Function Test (PFT) [6].

Low levels of CRF are associated with higher risk of premature death from all causes, and specifically from cardiovascular disease. Understanding of aerobic fitness is required for appropriate exercise prescription. Due to the laborious, expensive, and time-consuming nature of the graded exercise testing, simplified practical tests are appealing [8]. Aerobic fitness is typically assessed by looking at maximal oxygen consumption (VO2max). The higher this value is, the better your aerobic fitness is. Complex laboratory tests can most precisely determine your VO2max, but you can get a reasonable estimate from simple tests such as the Rockport One-Mile Walking Test or the 1.5-mile run test and 6-minute walk test. Each test and the associated calculations produce an estimation of your aerobic capacity [7].

A recent review of functional walking tests concluded that "the 6MWT is easy to administer, better tolerated, and more reflective of activities of daily living than the other walk tests" [10]. Studies have independently shown that both the 6MWT and aerobic fitness are predictive of morbidity and mortality, and equations relating the 6MWT to peak oxygen consumption have been recently developed for patient with cardiopulmonary disorders [8]. Thyroid dysfunction may cause various psychiatric symptoms and disturbances [11]. Health-related quality of life (HRQL) is a subjective assessment of the effects of disease and its treatment on the physical, social, psychological, and somatic dimensions of a patient's life [12]. Previously, various instruments for measuring health-related quality of life have been developed for general population. Among these instruments, SF-12 is the abridged practical version of SF-36 which is more suitable for large health surveys with advantages of fewer items, easier to understand, and reduced time of interview compared with SF-36 [13].

NEED OF THE STUDY

There are limited studies to report the effect of Hypothyroidism on Cardiorespiratory fitness & Health-related quality of life. The impairment of Cardiorespiratory fitness & Health-related quality of life may be considered as the indication for initiation of physical exercise. Hence, the aim of the present study is to do Analysis of Cardio respiratory Fitness and Health-related quality of life in females with hypothyroidism.

MATERIALS AND METHODOLOGY

40 Females with Hypothyroidism from at least 1 year between 20-45 years of age were included by convenience sampling. CRF was examined by 6 MWT (VO_2 max) & PFT was examined by FEV1%, FVC%, FEV1/FVC%, PEFR%, MVV% and HRQL was examined by SF 12.

Asha Satasiya and Hardini Prajapati

Inclusion criteria: Females aged 20-45 years diagnosed with Hypothyroidism who regularly taking medicines and having hypothyroidism from at least 1 year. Females diagnosed with Primary Hypothyroidism with TSH value >4.7 mU/L with low T4 &T3.

Exclusion criteria: Patients with chronic pulmonary disease, hypertension, diabetes mellitus, Cardiac disease, stroke. those with musculoskeletal inability to perform physical exercises, Cigarette smokers, postmenopausal Women, any recent surgery, any known psychological illnesses, Patients who are taking drugs that alter the cardiovascular functions, having any other systemic illness, Unwillingness to participate

Procedure for Outcome measures:
CRF was examined by 6 MWD (VO2 max) & PFT (FEV1%, FVC%, FEV1/FVC%, PEFR%, MVV%) by computerized spirometer. HRQOL was examined by SF 12 - OrthotoolKit (Physical score PCS & Mental Score MCS)

SIX MINUTE WALK TEST (6MWT): Distance walked & VO_2max - To assess the Cardio respiratory Fitness. The American thoracic association (ATS) recommend that the 6MWT is conducted on a 30-m indoor track. In this study, we used 30-m indoor tracks for walking. Plastic cones were placed in both ends to mark the turn around points of the track. Before tests vital signs (HR,RR, BP, SPO2 & RPE Scale) were taken and than Subject was asked to walk for 6 minutes. The test instructions are as follows: 'Walk back and forth around the cones as fast as possible for 6 min. You may not jog or run. At the end of the test again vital signs were taken. Distance walked were measured. From distance walked VO2 max were calculated from following formula.

(VO2max = VO2 mL · kg^{-1} · min−1 = (0.02 × distance [m]) − (0.191 × age [yr]) −(0.07 × weight [kg]) + (0.09 × height [cm]) + (0.26 × RPP [× 10^{-3}]) + 2.45
where m = distance in meters; yr = year; kg = kilogram; cm = centimeter; RPP =rate-pressure product (HR × SBP in mm Hg);

PULMONARY FUNCTION TESTS (PFT)
The test was done in sitting position. The forced vital capacity (FVC) & MVV manoeuvre were done. The subject was asked to take a maximal inspiration to total lung capacity, and then to breathe out as fast as rapidly as he can. In MVV manoeuvre subject was asked breath forcefully & rapidly for 15 seconds. Each subject was given three trials and best of the three test readings was taken. Forced vital capacity (FVC %), Forced Expiratory volume in 1 second (FEV1%), FEV1/ FVC%, Peak Expiratory flow Rate (PEFR %) & Maximal voluntary ventilation (MVV%) predicted - To assess the pulmonary functions.

HRQL (SF 12 (Short form) 12 Health survey) – To assess the Health -Related Quality of life. The 12-item Short-Form Health Survey is one of the generic instruments that has been widely used to measure HRQL. The various components of scale are divide into physical and mental components. The scoring format of SF-12 is summary scores of PCS-12 and MCS-12 which was obtained from orthotoolkit. Reliability of SF-12 for PCS-12 was 0.77 and for MCS-12 was 0.80.

RESULTS

Data was analysed by Microsoft office excel 2019. There were decrease in means of 6MWD & VO2max 456.05±63.21 and 17.10±2.37 respectively. There was decrease in mean of MVV% (69.73±13.70) and no reduction in means of FEV1%, FVC%, FEV1/FVC%, PEFR% compared to their % predicted values. The means of PCS & MCS 43.82±8.73 & 49.91±7.78 respectively which is below average.

DISCUSSION

In this study females with Hypothyroidism shows greater reduction in VO2 max. (Pawaria et al. 2020) have assessed the Effects of Hypothyroidism on Cardio-Respiratory Fitness on 50 subjects of 30 to 40 years of age with Harvard step test. VO2 max was calculated which was significantly decrease in patient with hypothyroidism is justified by the decrease in myocardial contractile force which reduced cardiac output caused by the decrease in circulating thyroid hormones [14].

Also Results shows the only reduction in MVV Which suggest poor respiratory muscle endurance. (G Ramachandran et al. 2016) have done a study on 50 patients with primary hypothyroidism. The FEV1, FVC, PEFR were found to be decreased and the FEV1/ FVC % was found to be increased in Primary hypothyroidism group when compared to control group. Decreased in FVC and FEV1 among the hypothyroid subjects suggested that the degree and the duration of thyroid disorders lead to reduced ventilator lung function in patients with thyroid dysfunction [15].

Patient reported below average PCS & MCS in which physical score is more affected than mental due to perceived diminished health status related to fatigue & mood/behaviour changes. (C. Shivaprasad, Boppana Rakesh, et.al. 2020) assessed HRQL among 244 Indian patients of >18 years old with hypothyroidism whose data were compared to data from 250 age-matched and sex-matched healthy controls had significantly lower scores for six of the eight SF-36 scales. Hypothyroidism was associated with reduced HRQL among Indian patients who experienced greater reductions in physical dimensions, compared to social and emotional dimensions [12].

CONCLUSION

Pulmonary functions are normal except MVV % compared to their % predicted values indicate poor respiratory muscle endurance. There was decrease in Vo2 max which indicates poor CRF. PCS & MCS is below average which indicate poor quality of life.

Clinical implication
Based on these results low CRF & quality of life & lung function can be improved by various physiotherapy treatment. Hypothyroidism is associated with reduced VO2 max indicates poor CRF. Low levels of CRF are associated with higher risk of premature death. Reduced MVV% indicates poor respiratory muscle endurance. PCS & MCS are below average which indicate poor HRQOL. Poor CRF and HRQOL can be improved by cardiopulmonary rehabilitation programme.

Limitation: Duration of disease is not taking in consideration. Effect of medicine is not taking in consideration

Future recommendation: As CRF & HRQL is affected in hypothyroidism we can prescribe rehabilitation programme which can improve fitness & quality of life.

ABSTRACT

Academic achievement plays an important role in life of an individual, shaping the vocation, career, profession and planning for further education. Self-confidence is the idea of having faith in oneself and one's skills. Self-confidence has important role in the development of academic achievement, learning as well as success. Scientific attitude refers to individual's behavioural traits, including honesty, awareness, responsibility and critical thinking. The primary benefit of teaching science is the development of a scientific mindset. In today's scenario the majority of the students are choosing science as a main subject because of its scope. It is of great importance to know if the self-confidence and scientific attitude influence pupil's academic achievement or not and from there to design possible means of intervention for promoting effective learning and achievement. This paper is inclined to study the correlation of academic achievement with self-confidence and scientific attitude among Higher Secondary School Students in District Kathua. Secondly, this paper attempts to indicate the relationship among the self-confidence, scientific attitude and academic achievement separately. The subjects in the empirical study were 354 Higher Secondary School Students studying in class XI of Government schools of District Kathua. The reflections of the study will be helpful for the respective stakeholders i.e. teachers, administrators, curriculum developers etc.

Keywords: Self-Confidence, Scientific Attitude, Academic Achievement, Gender, Rural, Urban.

INTRODUCTION

Education is a process of enlightens and development for achievement of improved and higher quality of life. Self-confidence is the idea of having faith in oneself and one's skills. Self-confidence is an interior condition that is framed by one's thoughts and feelings about oneself and their talents. Thus, self-confidence is the bravery to accept oneself, have faith in one's talents, and take successful action based on those beliefs and capabilities. Self-confidence is a mindset that enables individuals to have a positive and realistic outlook on themselves as well as their surroundings and life's situations (Lone, 2021). Science is an organized, systematic, and primarily pragmatic approach to learning about and comprehending the world. The goals of teaching and learning science should be the attainment of knowledge of scientific words, ideas as well as concepts, a thorough understanding of them, the capacity to apply such information in a variety of contexts, and the development of skills. Additionally, it enhances their scientific skills and competencies (Singh & Bai, 2017). Scientific attitudes play a major responsibility in the educational in addition to life sciences of students pursuing educational science. Regarding the demands of 21st century learning, learning prioritizes the cognitive aspect and develops scientific attitude and skills (Sumardi et al., 2020). The development of student's cognitive ability, attitude, and skills will result in individuals ready to face complex problems in the era of globalization. Academic achievement is the degree of accomplishment or proficiency in a certain field of academic or scholastic activity. Academic achievement was defined as successful achievement or performances; in particular subjects, areas, or courses, the results of which are given in the form of grades or marks.

REVIEW OF RELATED LITERATURE

Ballane (2019) studied the understanding of Self-confidence in High School Students. The results of the study found that self-confidence have important role in academic performance, learning as well as success. Also, found that self-confidence act as indicator of academic performance. Higher the self-confidence betters the academic performance.
Lone (2021) conducted a study on Self-confidence among Students and its Impact on their Academic Performance: A Systematic Review. The results of the study found that positive attitude of parents to their children increases self-confidence among children and negative attitude decreases self-confidence. Mao et al. (2021) studied the relationship between Attitude toward Science and Academic Achievement in Science: A Three-Level Meta-Analysis and found out that there is a positive and significant relationship between student's attitude toward science and their academic achievement in science. Bettaswamy and Kumar (2022) studied the relationship between Scientific Attitude and Achievement in Science among Secondary School Students. Findings revealed that there is a significant relationship between scientific attitude achievement in science. Olutola et al. (2023) investigated Self-Confidence in relation to academic performance and revealed that there is a significant relationship between self-confidence and academic performance.

JUSTIFICATION OF THE STUDY

After reviewing the related literature, the investigator found out that although numerous studies have been conducted on variables such as academic achievement, self-confidence and scientific attitude separately but no study has been found connecting these three variables altogether. Therefore, this study will be novel on its approach by conducting research in a new perspective. There is need for measuring student's self-confidence and scientific attitude and its relationship with academic achievement to fill somehow the existing gap. In this premise, the present study was designed to assess the correlation study of self-confidence and scientific attitude with academic achievement among Higher Secondary School Students in District Kathua. The results of the proposed study may facilitate teachers and other stakeholders promoting self-confidence and scientific attitude thereby improving academic achievement. In addition to that, this study will benefit the concerned stakeholders such as the ministries, curriculum framers ,teachers in identifying the causes and plan possible solutions accordingly

Minakshi Thapa *et al.,*

STATEMENT OF THE PROBLEM

The statement of the problem is "A CORRELATIONAL STUDY OFACADEMIC ACHIEVEMENT WITH SELF-CONFIDENCE AND SCIENTIFIC ATTITUDE AMONG HIGHER SECONDARY SCHOOL STUDENTS OF DISTRICT KATHUA".

OPERATIONAL DEFINITIONS OF THE TERMS USED

The following operational terms have been used in the study:

Self-Confidence - In the present study, scores obtained by the students of class 11 in the self-confidence scale prepared and standardized by Dr. D.N. Sansanwal and Dr. Smita Bhawalkar (2011) was taken for study.

Scientific Attitude - In the present study, scores obtained by the students of class 11 in the scientific attitude scale prepared and standardized by Dr. Savita Mishra (2017) was taken for study.

Academic Achievement- In the present study, academic achievement was the percentage of marks obtained by the students in their previous class examination.

OBJECTIVES OF THE STUDY

The following objectives were framed for the present research study:

1. To study the relationship between the following variables among Higher Secondary School Students:-
(i) Academic Achievement and Self-Confidence
(ii) Academic Achievement and Scientific Attitude
(iii) Self-Confidence and Scientific Attitude

2. To study the combined relationship of self-confidence and scientific attitude with academic achievement of Higher Secondary School Students.

3. To study the relationship between the following variables among male Higher Secondary
School Students:-
(i) Academic Achievement andSelf-Confidence
(ii) Academic Achievement and Scientific Attitude
(iii) Self-Confidence and Scientific Attitude

4. To study the combined relationship of Academic achievement with self-confidence and scientific attitudeof male Higher Secondary School Students.

5. To study the relationship between the following variables among female Higher Secondary
School Students:-
(i) Academic Achievement and Self Confidence
 (ii)Academic Achievement and Scientific Attitude
(iii) Self-Confidence and Scientific Attitude

6. To study the combined relationship of Academic achievement with Self-Confidence and Scientific Attitude of female Higher Secondary School Students.

7. To study the relationship between the following variables of Students studying in Higher
Secondary Schools situated in rural areas:-
(i) Academic Achievement and Self-Confidence
(ii) Academic Achievement and Scientific Attitude
(iii) Self-Confidence and Scientific Attitude

8. To study the combined relationship of self-confidence and scientific attitude with academic achievement of Students studying in Higher Secondary Schools situated in rural areas.

9. To study the relationship between the following variables of Students studying in Higher
Secondary Schools situated in urban areas:-
(i) Self-Confidence and Academic Achievement
(ii) Scientific Attitude and Academic Achievement
(iii) Self-Confidence and Scientific Attitude

10. To study the combined relationship of Academic Achievement with Self-confidence and Scientific attitude with Academic achievement of students studying in Higher Secondary Schools situated in urban areas.

HYPOTHESES OF THE STUDY

The following hypotheses were framed for the present research study:

1. There will be no significant relationship between the following variables among Higher

Secondary School Students:-

(i) Academic Achievement and Self-Confidence

(ii) Academic Achievement and Scientific Attitude

(iii) Self-Confidence and Scientific Attitude

2. There will be no significant combined relationship of Academic achievement withSelf-Confidence and Scientific Attitude of Higher Secondary School Students.

3. There will be no significant relationship between the following variables among male

Higher Secondary School Students:-

(i) Academic Achievement and Self-Confidence

(ii) Academic Achievement and Scientific Attitude

(iii) Self-Confidence and Scientific Attitude

4. There will be no significant combined relationship of Academic achievement with Self-Confidence and Scientific Attitude of male Higher Secondary School Students.

5. There will be no significant relationship between the following variables among female

Higher Secondary School Students:-

(i) Academic Achievement and Self-Confidence

(ii) Academic Achievement and Scientific Attitude

(iii) Self-Confidence and Scientific Attitude

6. There will be no significant combined relationship of Academic achievement withSelf-Confidence and Scientific Attitude of female Higher Secondary School Students.

7. There will be no significant relationship between the following variables of Students studying in Higher Secondary Schools situated in rural areas:-

(i) Academic Achievement and Self-Confidence

(ii) Academic Achievement and Scientific Attitude

(iii) Self-Confidence and Scientific Attitude

8. There will be no significant combined relationship of Academic Achievement with Self-Confidence and Scientific Attitude of Students studying in Higher Secondary Schools situated in rural areas.

9.There will be no significant relationship between the following variables of Students studying in Higher Secondary Schools situated in urban areas:-

(i) Academic Achievement and Self-Confidence

(ii) Academic Achievement and Scientific Attitude

(iii) Self-Confidence and Scientific Attitude

10. There will be no significant combined relationship of Academic achievement with Self-Confidence and Scientific Attitude of Students studying in Higher Secondary Schools situated in urban areas.

DELIMITATIONS OF THE STUDY

The students (male/female) studying in 11th standard of Government Higher Secondary Schools (JKBOSE) of District Kathua (J&K) were considered for the study.

METHOD

Survey method under Descriptive method of research was used for the present study.

POPULATION

In present investigation, the students studying in class 11 of Govt. Higher Secondary School located in District Kathua constituted the population.

SAMPLE

From a total of 51 Government Higher Secondary Schools, 20% schools (i.e. 10 schools) were randomly selected to collect the required sample. From each school 20% students were randomly selected depending upon the total number of students studying in class 11 in each of the school. Thus, the sample comprised of 354 students studying in Government Higher Secondary School of District Kathua. The list of schools and number of students selected is given in Table 1.

VARIABLES STUDIED

The following variables have been studied in the present study:

Dependent Variables:- Self-Confidence, Scientific Attitude and Academic achievement **Independent Variables**:- Gender and Locality.

TOOLS USED

In the present research the following tools have been employed for the collection of the requisite data.

ANALYSIS AND INTERPRETATION OF DATA

The information related to the analysis and interpretation of data has been indicated in the tables below:

FINDINGS OF THE STUDY

From the analysis of data following findings have been pointed out:

- There is a positive and significant relationship between the following variables among Higher Secondary School Students:-

(i) Academic Achievement and Self-Confidence

(ii) Academic Achievement and Scientific Attitude

(iii) Self-Confidence and Scientific Attitude

- There is a positive and significant combined relationship of self-confidence and scientific attitude with academic achievement of Higher Secondary School Students.
- There is a positive and significant relationship between the following variables among male Higher Secondary School Students:-

(i) Academic Achievement andSelf-Confidence

(ii) Academic Achievement and Scientific Attitude

(iii) Self-Confidence and Scientific Attitude

- There is a positive and significant combined relationship of Academic achievement with self-confidence and scientific attitude of male Higher Secondary School Students.
- There is a positive and significant relationship between the following variables among female Higher Secondary School Students:-

(i) Academic Achievement and Self Confidence

 (ii)Academic Achievement and Scientific Attitude

(iii) Self-Confidence and Scientific Attitude

- There is a positive and significant combined relationship of Academic achievement with Self-Confidence and Scientific Attitude of female Higher Secondary School Students.
- There is a positive and significant relationship between the following variables of Students studying in Higher Secondary Schools situated in rural areas:-

(i) Academic Achievement and Self-Confidence

(ii) Academic Achievement and Scientific Attitude

(iii) Self-Confidence and Scientific Attitude

- There is a positive and significant combined relationship of self-confidence and scientific attitude with academic achievement of Students studying in Higher Secondary Schools situated in rural areas.
- There is a positive and significant relationship between the following variables of Students studying in Higher Secondary Schools situated in urban areas:-

(i) Self-Confidence and Academic Achievement

(ii) Scientific Attitude and Academic Achievement

(iii) Self-Confidence and Scientific Attitude

- There is a positive and significant combined relationship of Academic Achievement with Self-confidence and scientific attitude with Academic achievement of students studying in Higher Secondary Schools situated in urban areas.

CONCLUSIONS OF THE STUDY

The findings of the study indicate that there is a positive and significant relationship between self-confidence, scientific attitude and academic achievement separately in total number of students, as per their gender and location of school. The combined relationship of self-confidence, scientific attitude with academic achievement has also been found positive and significant in total number of students, as per their gender and location of school.

EDUCATIONAL IMPLICATIONS OF THE STUDY

The present study has the following implications for students, teachers, parents, educational administrators and curriculum developers:

- Teachers should give importance for "activity method", "project method", and   "heuristic method",for developing scientific attitude among the students.
- Schools and teachers should launch programmers' such as science exhibitions, educational tours, projects, workshops, science fair, organizing science club and science quiz etc. which help in developing scientific attitudes among students.
- In the laboratory, students should do practical, experiments or activities. Over the time, such practices may facilitate the students to develop scientific attitude and score better in science.
- Lectures should give by professors to their students for strengthen and enhance the level of self-confidence of students.
- Parents should provide such an environment to their children where they can openly express themselves and share their emotions with others thereby building their self-confidence and contributing the development of balanced personality.
- Administrators should try to organize parents' teachers meeting regularly and discuss openly the problem faced by the students so as to resolve them by collective efforts.
- In science text books, at the end of a chapter there must be some open-ended questions to facilitate the diversification of students' thinking.

ABSTRACT

The processing of organic waste into organic fertilizers via vermicomposting has been used to address the issues of environment pollution. In recent years, the use of earthworms in wastes degradation has spurred interest in processing large quantities of organic waste materials. Hence the present study was selected to vermicomposting of leaf litter of *Poliyalthia longifolia* and *Samanea saman* using Indian earthworm species, *L.mauritii.* Vermibeds were prepared from the mixture of *c*owdung and dried leaf litter of *P. longifolia* and *S. saman* in the ratio of 1:1:1, 1:2:1, 1:1:2 and 1:2:2 ratios. 20 preclitellate *L. mauritii* was introduced into each experiment. During vermicomposting of leaf litter, biomass of earthworm, gut's bacterial and fungal population and nutrient analysis of vermicompost was observed. Maximum biomass was recorded in 1:2:2 ratio of vermibed. Whereas microbial population and nutrient content was more in the same culture media. The results of the study reported that 1:2:2 ratio of cowdung and leaf litter of *P. longifolia* and *S. saman* vermibed was suitable feed media for earthworm culture. Moreover this, the study also proved that vermicomposting is a proper organic waste management system in the world.

Keywords: Vermicompost, *Lampito mauritii*, biomass, microbes, nutrients.

INTRODUCTION

Earthworms are considered as the farmer's friend of the since ancient time due to their role in soil ecology. Earthworms have been mentioned in history as far back as Aristotle, who described them as "the intestines of the earth." Charles Darwin studied earthworms for 39 years and demonstrated that they improve soil conditions and enhance plant productivity. Bhawalkar (1995) designated earthworm as the "Natural Bioreactor" as they harness the beneficial soil micro flora, destroy soil pathogen and convert organic waste to wealth such as biofertilizers, biopesticides, vitamins, enzymes, antibiotics, growth hormones and proteinaceous worm biomass. Beneficial effects of earthworm are mainly due to various activities like burrowing, feeding and excretion that affect physical, chemical and biological properties of soil (Bhatnagar and Palta, 1996).

Solid waste collection and its management is one of the burning issues of environment today in most nations worldwide. Although many methods have been proposed and implemented for proper solid waste disposal but some of these treatment and disposal strategies can cause severe environmental issues. In recent years, vermicomposting technique has advanced considerably because it is eco-friendly, economically feasible and socially acceptable approach for waste management. In simple words, it is a way of converting waste to wealth. Vermicomposting is aerobic process in which detritivorous earthworms play an important role in decomposition of organic waste converting it to nutrient rich medium for plant growth known as vermicompost. Various species of earthworms were used for the technology. In India, many research studies have been proved that *L.mauritii* is an efficient species for vermitechnology.

The physical actions include fragmentation, turnover and aeration. Whereas biochemical actions include enzymatic digestion, nitrogen enrichment, transport of inorganic and organic materials (Edwards and Lofty 1972). During this process, important plant nutrients such as nitrogen, potassium, phosphorus and calcium present in the waste materials are converted through microbial action into such chemical forms which are much more soluble and available to the plants than those in the parent substrate (Ndegwa and Thompson 2001). This may be due to the presence of various enzymes in earthworms gut viz., proteases, lipases, amylases, cellulases, chitinases etc. which degrade the cellulosic and proteineceous materials inorganic waste and enzymatic activity vary with temperature and other climatic factors. Approximately 80 – 90 % of the ingested material is excreted as vermicast while only 5-10% is absorbed by earthworms for their growth and maintenance. Castings help air and water to permeate soil. When castings are added to soil, they boost nutrients that are available to the plant and enhance soil structure and drainage.

Observation of earthworm biomass, microbial population in intestine and nutrient levels in vermicompost are useful biological tools to determine the ability of *L. mauritii* as well as quality of vermicompost. *L. mauritii* is an anecic, indigenous, detrivorous, tropical earthworm, most commonly distributed in all parts of India and abundantly inhabiting in south India. Whereas *P. longifolia* and *S. saman* is widely distributed in south India. Many researchers have been studied that biological, biochemical and microbiological role of various species of earthworm during vermicomposting of organic wastes. No one used Indian earthworm species *L.mauritii* for vermicomposting of leaf litter of *P. longifolia* and *S. saman*. Therefore, the present study was aimed to investigate biomass of *L.mauritii,* their gut's microbial population and nutrient contents of vermicompost during vermicomposting of leaf litter of *P. longifolia* and *S. saman*.

MATERIALS AND METHODS

Materials
Earthworm and Cowdung
Specimens of *L. mauritii* and cowdung were collected from agricultural land and diary yard in Asoor village, Kumbakonam. The worms were stocked in plastic trough. Sundried and powdered cow dung was used as substrate

to maintain the adult worms and hatchlings, since cow dung was deemed as a highly suitable natural feed for worms (Graff, 1981 and Lee, 1985).

Collection of leaf litter

Poliyalthia longifolia and *Samanea saman* leaf litter were collected from Government College for Women (A), Kumbakonam. It was sundried and chopped into small pieces.

METHODS

Experimental Set-up

Vermibeds were prepared from mixture of *c*owdung and dried leaf litter of *P. longifolia* and *S. saman* in the ratio of 1:1:1(E1), 1:2:1 (E2), 1:1:2 (E3) and 1:2:2 (E4) ratios (2 Kg). Five experiments were designed for the study. They were kept in 40x40 cm size of the plastic containers. Cow dung alone (1Kg) was taken as a control. After preparation of experimental media, the required quantity of water was added. The media was allowed to pre-decomposition for 15 days. After predecomposition, 20 non-clitellated earthworms were introduced into each experiment. The moisture content was maintained at 60-70% throughout the study period by periodic sprinkling of adequate quantities of water. The containers were kept in the dark under identical ambient conditions (room temperature 25 ± 3°C). The present study was followed by the method of Gopal *et al*. (2009) with few modifications. Three replications were maintained for each treatment to observe the similarity of results.

Growth of *Lampito mauritii*

Earthworm growth is measured in terms of increase in biomass (weight). Once in 10 days upto 60 days, the worms are collected from C, E1, E2, E3 and E4 and weighed by an electronic balance.

Hatchlings production

Number of hatchlings were collected and counted from C, E1, E2, E3 and E4 at 60th day of experiment.

Microbial Study

Enumeration of bacterial and fungal population

Earthworms were removed from C, E1, E2, E3 and E4 on day 1, 10, 30 and 60 sacrificed to study their microbial composition. The dilution plate technique was used to study the bacterial and fungal population in the gut of *L. mauritii*. The gut contents (3–4 cm of gut spanning 20–30 segments) were dissected using sterile scissors and placed in sterile test tubes containing 1 ml of sterile saline (1 g $NaCl_2$ in 100 ml distilled H_2O). The tubes containing the gut contents were shaken vigorously and used as inocula. Using a micropipette, 0.01 ml of the inocula was spread using a standard platinum loop onto nutrient agar plates for bacterial growth and Sabouraud Dextrose Agar plates for fungal growth. The plates were incubated 18–24 h at 37 °C and 4–7 days at 28 °C for enumeration of bacterial and fungal growth. The Colony Forming Units (CFU) on the media were estimated using a colony counter and expressed as CFU × 10^3cm^{-1} for bacteria and CFU × 10^4 cm^{-1} for fungi as per a previously described protocol (Baron *et al*., 1994).

Nutrient analysis

After 60th day of experiment, vermicompost was collected from C, E1, E2, E3 and E4. They were air dried, sieved and stored in polythene bags for N,P,K, OC, pH and EC analysis. The total nitrogen of vermicompost sample was estimated by the Kjeldahl method, as detailed by Tandon (1993). Total phosphorus content of the sample was also estimated as per Tandon (1993) by colorimetric method. Total potassium content of the substrate was determined by Flame Photometric method as described by Tandon (1993).   The determination of organic carbon was carried out as per the procedure of ISI Bulletin (1982). The electrical conductivity (EC mm hos/cm) was determined by the method of Jackson (1973) using conductivity bridge.

Kavitha *et al.,*

The ratio of the percentage of carbon to that of nitrogen ie., C/N ratio was calculated by dividing the percentage of carbon estimated for the manure sample with the percentage of nitrogen estimated for the same manure sample. The ratio of the percentage of carbon to that of phosphorus ie. C/P ratio was calculated by dividing the percentage of carbon estimated for the manure sample with the percentage of phosphorus estimated for the same manure sample in the present study statistical analysis.

Statistical analysis
By using computer, mean values ($\overline{x}$) with standard error (SE) were obtained for the data. The statistical significance between treatments were analysed using 't' test.

RESULTS

Biomass of *L.mauritii*
The biomass of *L.mauritii* was recorded for 60 days at the interval of 10 days (1, 10, 20, 30, 40, 50 and 60 days). Growth and reproductive performance of earthworm were determined by its biomass and rate of multiplication. In control, the initial biomass of the *L.mauritii* is 7.3±0.06 g. The The biomass was gradually increased upto 60 th day (13.1±0.05g). Whereas in E1, the initial biomass was 7.5±0.03g. On the day 60 it gained 14.3±0.05g biomass. In E2, the initial biomass was 7.4±0.02 g. On 60th day of experiment, the biomass was 15.1±0.05g. In E3, the initial biomass was 7.2±0.04 g. On the day 60, the biomass was 15.2±0.03g. In E4, the initial biomass was 7.1±0.04g. At the end of the experiment, it was 19.5±0.06g. Maximum biomass was observed in E4 (1:2:2 ratio of *c*owdung and leaf litter of *P. longifolia* and *S. saman*) followed by E3, E2 E1 and C (Table.1). Moreover this, in all the treatments the degrees of biomass gain was decreased on 60th day compared with other experimental period.

Hatchlings production
On 60th day, total number of hatchlings were recorded in all the experiments. In control 55 hatchlings were recorded while 70 in E1, 86 in E2, 95 in E3 and 120 in E4. The maximum number of hatchlings production was observed in E4 followed by E3, E2, E1 and C (Table.2).

Microbial study
Bacterial and fungal population were observed in gut contents of *L.mauritii* on 1, 10, 30 and 60th day of experiment.

Bacterial population
Microbial load count in the gut of the earthworm samples showed that the gut of *L.mauritii* from E4 had higher bacterial and fungal count compared to those from the E3, E2, E1 and control (Table 3). Bacterial population in control were 220 ± 5.48, 290 ± 3.25, 350 ± 4.45 and 410 ± 5.58 CFU X 10^{-4} on 1, 10, 30and 60th day of experiment. Whereas in E1, 220 ± 4.48, 350 ± 3.64, 565 ±3.26 and 616 ±2.35 CFU X 10^{-4} were observed. In E2, they were 220 ± 5.48, 411 ±2.55, 629 ±2.69 and 676 ± 3.21 CFU X 10^{-4}. Similarly 220 ± 5.48, 426 ± 2.35, 638 ±3.66 and 690 ±2.11 CFU X 10^{-4} were counted in E3. 220 ± 5.48, 460 ± 3.58, 770 ± 2.56, 840 ± 2.15 CFU X 10^{-4} were counted in all the period (Table. 3) Comparison of results showed that more number of bacterial population were observed in E4 than E3, E2, E1 and C.

Fungal population
In control, 110 ± 3.48, 160 ± 2.25, 310 ± 3.45 and 380 ± 2.58 CFU X 10^{-3} were counted in gut contents of *L.mauritii*. whereas 110 ±3.48   190 ± 2.54 365 ±4.56 443 ±3.25 CFU X 10^{-3} were observed in E1 on 1, 10, 30 and 60th day of experiment. Similarly 110 ±3.48 211 ±2.55, 390 ±2.69, 465 ±3.21 CFU X 10^{-3} were also recorded in E2. 110 ±3.48, 230 ±2.35, 410 ±3.66 and 480 ±2.11 CFU X 10^{-3} were noted in E3 whereas in E4, 110 ± 3.48, 290 ± 3.58, 570 ± 2.56 640 ± 2.15 CFU X 10^{-3} were observed (Table.4) Similar to bacterial population, comparison of results showed that more number of fungal population were observed in E4 followed by E3, E2, E1 and C.

Nutrient Analysis

The organic carbon content in C, E1,E2, E3 and E4 was 270, 390, 440, 457 and 660 gKg^{-1}. Whereas nitrogen level was 11.9, 14.8, 16.1, 15.7 and 20.1 gKg^{-1}; phosphorus content was 5.3, 5.7, 7.9, 8.1 and 8.4 gKg^{-1}; potassium content was 15.7, 16.4, 20.7, 21.9 and 23.7 gKg^{-1}; C:N and C:P ratio was 27.22, 24.61, 22.32, 20.39, 18.47 gKg^{-1} and 115.19, 89.17, 86.41, 79.51, 68.42 gKg^{-1} in C, E1, E2, E3 and E4. Whereas pH and EC was 7.8, 7.4, 7.2, 7.0 7.0 and 0.78, 0.66, 0.65, 0.64 and 0.62 in C, E1, E2, E3 and E4. The OC, N,P,K level was more in E4 followed by E3, E2, E1 and C. Instead of this, C:N and C:P ratio, pH and EC was decreased in E4 followed by E3, E2, E1 and C. (Table.6).

DISCUSSION

Growth and Reproduction

Several ecological parameters viz. temperature, moisture, adequate dissolved oxygen, p^H, available organic matters and also the presence or absence of toxic chemicals governed the distribution, abundance, growth and reproduction of earthworms (Kale and Krishnamoorthy, 1981; Lee, 1985 ; Curry, 1998 ; Bhattacharjee, 2002). The growth of earthworms is most commonly measured in terms of increase in weight (biomass). The increase in biomass of the whole body (growth rate) is expressed as in mg or g/worm/day or in terms of percentage. Earthworms continue to grow throughout their lives with enlargement of their body segments following emergence from the cocoons (Edwards and Bohlen, 1996).

In the present study, *L.mauritii* attained maximum biomass and hatchling production in E4 (1:2:2 ratio of *c*owdung and leaf litter of *P. longifolia* and *S. saman*) by E3, E2, E1 and C (Table.1). In accordance with the results Jesikha and Lekeshmanaswamy (2013) reported, the gradual and continuous increased total of weight of *E.euginea* in cow dung and pongamia leaf media on 11th week. Suthar (2007) also studied that the earthworm *E.euginea* growth performance in kitchen waste and the worm reached 0.982 mg in farmyard manure. Ritu Nagar *et al*. (2017) observed that 50:50 ratio of cattle dung and Eucalyptus leaf litter was suitable proportion for production of organic rich vermicompost by using *Eisenia fetida* and *Eudrilus eugenia.*

Prasad and Saini (2013) also reported that high multiplication of *E.foetida* species was observed in 3:1 ratio of Eucalyptus leaves and cow dung mixture. The reason for the multiplication of earthworm during vermicomposting of Eucalyptus leaves upon the chemical composition of leaves i,e C:N content of ratio, polyphenol concentrations, terpenoides are enhanced litter palatability of earthworms. It also increased reproductive ability of earthworm (Ketar, 1993 and Aira *et al*., 2006).

Table.2 showed that total number of hatchings production by *L.mauritii* on the day 60. Similar to biomass study, highest number of hatchings were observed in E4 than E3, E2 and E1. The result was supported by various researcher's findings. Siddique *et al*. (2005) reported that growth and reproduction of *E.felida* was increased during the vermicomposting of different organic media manures i.e, cow manure sheep / goat manure and dry leaves.

Microbial population

The present study showed that more number of bacterial and fungal population in gut contents of *L.mauritii* was observed in cowdung mixed leaf litter experiment than control (cow dung alone). Higher microbial load in the gut of earthworms from the study leaf litter could be responsible for source of carbon and energy in the gut of these earthworms. The present results also supported by findings of Bamidele *et al*. (2014). They reported that higher microbial counts and microbial diversity were recorded in the gut of earthworms of the saw mill locations than those of the control site. It is obvious that all carbon containing compounds undergo essentially oxidation process by the action of microbes, which results in the release of nutrients, CO2 and humus. Soft plant organic materials are easily decomposed by microbes. However, tougher plant materials do not breakdown readily by soil animals. The breakdown is brought out by microorganisms, and further accelerated when they pass through the guts of earthworms, due to the presence of intestinal microflora and enzymes in the gut (Lee 1985). The microbial activities

in the gut and cast of earthworms was described by Devi *et al*. (2009) to be essential for the degradation of organic wastes which results in the release of nutrients to plants. Earthworms transform organic waste constituents into more useful forms by grinding and digesting with the aid of aerobic and anaerobic microflora (Maboeta and Van Rensberg, 2003).

Nutrient analysis

Compared with the other treatments more level of N, P and K and less level of OC, C:N ratio, C:P ratio, pH and EC was observed in E4 than E3, E2, E1 and C. The results are supported by Khucharoenphaisan Khwanchai and Sinma Kanokkron (2018). They reported that the coffee ground mixed vermicompost has more macro nutrients such as nitrogen, phosphorus and potassium and less pH and EC values.

Mechanism of increase in NPK and reduction in OC, C:N and C:P ratio

The reduction in carbon and lowering of C:N and C:P ratio in the worm worked compost could be achieved on the one hand by combustion of carbon during respiration and worm gut microbial utilization (Edwards and Bohlen, 1996) and on the otherhand an increase in the level of N due to loss of dry matter (Viel *et al.,* 1987) coupled with addition of worms nitrogenous wastes through excretion and mucus secretion (Curry *et al*., 1995). Acid production during organic matter decomposition by the microorganisms is the major mechanism of solubilization of P and K (Pramanik *et al*., 2007). Besides the presence of large number of microflora in the gut of earthworm might play an important role in increasing P and K content during the process of degradation of organic wastes thereby decreasing C:P ratio (Sharma, 2003). The rise in the levels of phosphorous and potassium content during vermicomposting is probably due to the mineralization, solubilization and mobilization of phosphorus and potassium because of bacterial and earthworm activity. Suthar (2006) investigation support the hypothesis that earthworm can enhance the minerals NPK during their inoculation in waste system. Dosoretz et al. (1990) also reported the reduction in carbon content of sawdust when subjected to microbial degradation.

Sakthivel Vellaikannu *et al*. (2017) was reported that high content of N, P, K, Ca, Mg, Fe, Zn, Cu and Ec and low level of OC and pH was observed in vermicompost of tea leaves waste mixed with cowdung (30th day) than control. Reduction in pH towards neutrality should be important in retaining nitrogen and seems to promote the nutrients availability to plant (Brady, 1988). The reduction in carbon and lowering of C/N ratio in the worm worked compost could be achieved on the one hand by the respiratory activity of earthworms and microorganisms (Edwards and Bohlen, 1996) and on the other hand increase of nitrogen by microbial mineralization of organic matter (Syres *et al.,* 1979) combined with the addition of worm's nitrogenous wastes through excretion. The pH is one of the most frequent parameters used to characterize the vermicompost quality. The pH range of 6.0-8.5 is found to be suitable for the soil in order to ensure compatibility with most plants (Cerozi and Fitzsimmons 2016). Aalok and Tripathi (2010) indicated that Eucalyptus leaf litter and municipal soild waste vermicomposts has high soil nutrients than compost.

The results of the present study indicate that compared with control, 1:2:2 ratio of cowdung mixed with leaf litter of *P. longifolia* and *S. saman* (E4) was better in terms of the following aspects followed by E3, E2 and E1.
i. Highest rate of biomass.
ii. Maximum number of young ones production in the medium.
iii. Highest bacterial and fungal population
iv. Maximum level of nutrients in vermicompost, which are useful for direct uptake of plants.
Hence, the study recommended that mixed leaves litter with cow dung at all the three concentrations bioconverted into a nutrient rich vermicompost, which can be used as a bioorganic fertilizer for crops.

CONCLUSION

It was concluded that earthworms are capable of working hard to convert all the organic waste into manure. They serve as nature's plowman and form nature's gift to fulfill the nutritional needs of crops. Vermicomposting appears to be the most promising as high value biofertilizer which not only increases the plant growth and productivity by nutrient supply. It reduces the requirement of more land for disposal of wastes. It helps to create better environment. Thus reduces ecological risk. It results in several benefits to farms, industries, and environment and over all national economy.

ABSTRACT

The Contract Research Organization (CRO) is a service organization that plays an important role in the pharmaceutical and biotechnological industries for the new drug development process, research and development areas and the conduct of clinical trials. The role played by the sponsor is also essential in the clinical trials and the sponsor is the financial authority for the entire studies. This article contains the detail roles of the sponsor and CRO in the conduct of clinical trial. It also contains the process and executive services of the CRO.

Keywords: Clinical research organisation, Sponsor, Global clinical trial Approval, Regulatory authority, Drug development process.

INTRODUCTION

A service company known as a contract research organisation or clinical research organisation (CRO) offers a variety of products and services to the biotechnology, pharmaceutical, and medical device sectors. According to a written agreement between the sponsor and the CRO, these CROs lend a helping hand to these industries by offering research services. Studies have shown that CROs increase productivity and improve the efficiency of clinical trials. A CRO provides its customers with access to a greater range of knowledge on pharmaceutical research, drug development, and the creation of medical devices. The goal of contract research firms is to lower the costs associated

with the process through which pharmaceutical and biotech companies develop new drugs. The sponsors and CROs are related in a direct way. Financial authority for the entire organisation rests with the sponsor [1].

The executive services provided by the CRO are as follows

Product development, creation, and manufacturing; administration of clinical trials; administration of health and safety monitoring; processing of trial samples in preclinical, toxicological, and clinical laboratories, administration. The process of CRO has been shown in the figure1.For the development of an FDA new drug application, biostatistics and medical writing services are required (NDA),regulatory affairs support, abbreviated new drug applications (ANDA), and a wide range of additional services. The clinical research and Phase I, II, and III of clinical trials take up the majority of time in a pharmaceutical company's R&D department. [1,4].

CONTRACT RESEARCH ORGANIZATIONS (CRO) IN INDIA:

Even though India currently only makes up a relatively small portion of the share related to the global market for clinical trials, by 2012 it is expected to conduct up to 5% of all studies worldwide. The CRO market was valued at $18 billion globally in 2008, up 14% from 2007. The CRO market is anticipated to increase at a rate of 14% per year between 2009 and 2013. Itincreases further, with the expansion of the services available. Then latter CRO was developed to the worlder wide to support the pharmaceutical and biotechnological industries. An Indian CRO is typically assessed on factors such as innovations, adherence to GCP-ICH requirements, economic safety and effective. Clinical Trials Registry in India (CTRI), created by the Indian Council of Medical Research (ICMR), serves as a database for all clinical trials carried out in India. Some of the leading CRO in India are shown in the table 1. The sponsors and CROs have two options for conducting the trials they may use the same, crowded hospital location. After it enter to the ethics committee that are unfamiliar with GCPs, hospital staff, and site workers, but they benefit greatly from investigators and auditors who are generally less busy [1].

The important roles of CRO in clinical trials:

- A Contract research organization has a helping tendency and shows themselves as a helping hand in bio pharmaceutical development, initiation and conduction of clinical trials and Pharmacovigilance.
- CRO also expand their service and support to the government institutes and the several other University.
- For pharmaceutical and medical device businesses, many CROs facilitate the conduct of clinical studies.
- CRO in the world wide mainly focus on clinical trials for the new drug development process.
- CRO might involved correct sponsor that will reduce the correct outcomes of the drug.
- CRO having perfectly trained persons for conducting complex drug development programme [4].

Global clinical trial Approval

In terms of conducting the clinical trial and research for new drugs GCT approval is much more important for CRO. The followings are the flow of GCT, the GCT approval application form with, investigators informed consent from trial site details, investigators brochure, data involving in preclinical studies, pharmacological animal studies, toxicological studies and finally phase I, II, IIIresults and reports. List of protocol developed and import licence with TR6 challan. Figure 3 represents the approval process of the corresponding regulatory authority.

Test license

It is the key for importing drugs, cosmetics, medical device research and development, testing of the sample and analysis purpose. Form 11 includes information on the application's content and a list of the documents it is attached.

Safety report

It is an important component of pharmaco vigilance. According to schedule Y, Period safety update reports are submitted for every six months once for two years.

CTRI
India's National Institute of Medical Statistics is a part of the Indian Council of Medical Research has administrative responsibility over it. For the registration of clinical trials carried out in India as well as international trials in which India is also taking part, it provides a free online public record system. For any trail being undertaken in India, a registration number must be provided in case of publishing. The CTIR contains information about the Indian Investigators, trail locations, sample, and enrolment date.

Ethical Committee Registration
The ethical committee approval is necessary for the conduct of clinical trial. The Drug Controller General of India is an important for the trail registration in CTIR. The amendments in Drugs and cosmetic rules dated Feb 8,2013 inserted rule 122D in schedule Y along with amendment [5].

Role of investigator:
Community with IRB/IEC
The members of Institutional Record Board/Independent Ethics Comity evaluate the safety, medical, non medical and ethical rules of the clinical trials. Before conducting the clinical trial, the investigator should have a legal documents and date approved from IRB for their trial protocol and procedure. The investigator should submit all the data related to the trial to the IRB for the review for approval[2].

Subject care with trials:
A qualified physician is required for the clinical trial study. The primary care physician should explain all the specifics of the experiment. The trial-related information should be thoroughly documented regardless of whether the subject agreed or disapproved. The doctor must provide the proper justification for the subject's departure from the experiment if they choose to do so.

Protocol observance
 If the researcher wanted to conduct the trial, it had to adhere to the rules and regulations set forth by the sponsor and regulatory bodies and approved by the IEC/IRB. The investigator must obtain permission from the sponsors before changing any ideas or protocols, and any changes to the IRB amendment must be reviewed in advance by the IRB. Some of the leading role of investigator has been shown in the table 3.

Products under investigation
The sponsor's instructions and all relevant regulatory requirements should be followed when storing the investigational product. The investigator must make sure that the researcher product is only utilised in compliance with the procedure that has been approved. Each subject should be instructed on how to use the investigational products properly by the investigator or a person they have authorised[3].

Role of Sponsor
The sponsor is a person, business, group of institutions, or organisation who bears full responsibility for the planning, coordination, and funding of clinical studies. The sponsor plays on important roles in the clinical trials. The sponsor gives the detailed information of the drug products to the Contract research organization which is responsible for the conduct of clinical trials.   The sponsor is the financing authority for the entire trials and any compensation given to the subject matter take part in the trials.

Assurance and supervision of quality
The sponsor takes the lead in establishing and managing quality control and assurance procedures with a Written Standard Operating Procedures (SOP's) are required to guarantee that trials are carried out, data is generated the reports and documentation and that all of these things happen in accordance with the protocol, SOPs, ICH guidelines, and any relevant regulatory authority. To verify that all created data are trustworthy and have been

Sathishkumar and Kathiresan

handled properly, quality control should be conducted at every stepof data management. Table 3 represents the important role of sponsor in the clinical trials conducted by the CRO.

Choosing a CRO
Sponsor may delegate to a CRO any or all of its written-up trial-related responsibilities and obligations. It should guarantee ongoing supervision of all CRO activities, including those that the CRO subcontracts to a third party. The sponsor is always ultimately in charge of ensuring the accuracy and reliability of the trial data.

Specialist in medicine
The sponsor has the legal authority to select internally certified medical professionals or to employ an outside expert to offer advise on trial-related medical matters.

Compensation to Subjects matter
The sponsor must give the compensation to the subject who take part in the clinical trial programme if any problems happened to the subject and the investigator, the sponsor shall offer insurance to the trail participants. If any trial related injuries happened to the subject matter, the sponsor's procedure and policies must address the cost of treatment[4].

Financing
The sponsor plays on important role of financing the clinical trial.It is an agreement between the sponsor and the CRO. And the agreement (like a clinical trial agreement) should provide a written description of the financial aspects of the experiment. The schematic representation of CRO has been shown in the figure 4.

Clinical Research Coordinator:
❖ The CRC and the workers in this team plays an important role in the clinical research. All the trial related details are handled by the CRC. It is responsible for the entire clinical trial, coordination of ethical committee, site selection, physician, investigators, maintaining the standard operating procedures and record monitoring. Creation of new ideas related to the trial. The clinical trial data are maintained by the clinical research coordinator.
❖ The CRC maintains the coding and documentation, budget and contract, patient management.

What motivated the CRO's creation?
Pharmaceutical corporations were obliged to staff at the trough and turn to CROs to meet their needs as a result of pressure from the health care reform and rising R&D costs[5]. The market share of Indian CRO has been represented in the figure 5.

CONCLUSION

Some pharmaceutical and biotechnological industries do not have enough workers, instrument and facilities for the conduct of clinical trial in the development of new drugs, so they focused on the Contract research organization. CRO provides for efficient trial execution, site monitoring and data management. The role of CRO's had little to do with innovative knowledge production. The CRO can conduct the clinical trial, manufacture, labelling, packaging and marketing and also monitoring of the final drug products.

ABSTRACT

The present study investigated the phytochemical analyses and mineral elements composition of eight medicinal plants *viz. Artemisia nilagirica*, *Erigeron karvinskianus*, *Ageratina adenophora*, *Houtunnyia cordata*, *Plantago major*, *Persicaria chinensis*, *Drymaria cordata* and *Pseudognaphalium Luteoalbum* with the aim of evaluating the therapeutic benefits and safety aspects of the plants in ethnomedicine. The initial phytochemical screening involved employing a standard method with three distinct organic solvents; chloroform, methanol, and aqueous solution. Quantification of total flavonoid content in the methanol extracts was executed through the Aluminium Chloride method, while the analysis of total phenols was conducted using the Folin-Ciocalteau assay. On the other hand, the levels of trace elements were analyzed by using Atomic Absorption Spectrophotometry (AAS) and the content of minerals per sample was expressed in mg/100g. The study showed that methanol solvent was better then chloroform and aqueous solution and a significant result in the presence of various pharmacologically active compounds such as alkaloids, terpenoids, steroid, saponins, flavonoids, tannin, glycoside and xanthoproteins in almost all the plants tested. The highest flavonoid contents obtained in *Erigeron karvinskianus* 1240.62 mg QE/100 g, and lowest at *Ageratina adenophora* 494.91 mg QE/100 g. The highest phenol content was observed at *Erigeron karvinskianus* 125.19 mg GAE/100 g and lowest at *Persicaria chinensis* 34.88 mg

Toshienla Pongen *et al.,*

GAE/100 g. Among the trace element, Iron (34.92±0.003 mg/100g) concentration observed the highest content, followed by zinc, manganese and Copper. The results demonstrated that these eight selected traditional medicinal plants have great nutritional significance, invaluable for pharmaceutical utilization and aiding local practitioners in effectively harnessing these herbs for diverse ailments.

INTRODUCTION

Since ancient times, the significance of medicinal plants has remained evident, and even in the modern era, their importance continues to be recognized. Ethnobotany has, for centuries, been a pivotal and influential factor in unearthing and advancing new medicinal remedies for a diverse range of diseases and health conditions. Our ancestors relied heavily on plants and animals for survival, and historical records indicate that 80% of the world's population still relies on traditional medicines, particularly plant-based remedies, for their healthcare needs [1]. The assessment and utilization of these plant resources have been primarily conducted by indigenous tribal communities, whose way of life is intertwined with nature. This traditional knowledge system is born from the intricate web of interactions between humans, plants, animals, natural forces, and the landscape they inhabited [2]. The regions inhabited by tribal communities in North-East India are recognized as integral components of the Indo-Burma biodiversity hotspot region [3]. Nagaland is renowned for its rich biodiversity, with a diverse range of flora and fauna. The area's rich floral diversity is a result of varying altitudes, diverse topography, distinct soils, and favorable climate, supporting abundant plant growth. Hill tribal communities demonstrate their traditional knowledge by using a wide array of wild edible plants, fruits, and medicinal herbs from this diverse ecosystem [4]. Mokokchung district is the homeland of the Ao-Nagas in the state of Nagaland, India. The district lies between 26.12º and 26.45º North Latitude and 94.18º and 94.50º East Longitude and covers an area of 1,615 sq km. It is bounded by the state of Assam to its north, Wokha district to its west, Tuensang district to its east and Zunheboto district to its south. Majority of the population in the district is concentrated in villages situated at hill-tops surrounded by natural forests. Thus, naturally, the Ao-Nagas have organically developed an intimate connection with nature, that helped them to practice traditional medicine since for generations to treat and cure various ailments [5]. Therefore, it is a reasonable assumption that a substantial aspect of plant-based therapy incorporates the application of plant extracts or their active compounds [6]. The most important of these bioactive groups of plants are alkaloids, flavonoids, terpenoids, tannins, saponins and phenolic compounds [7].

Numerous reports abound on phytochemicals, widely utilized as traditional herbal remedies across the globe. However, research into the traditional medicinal plants indigenous to this region pales in comparison to the comprehensive exploration of its diverse natural flora. To date, in-depth investigations into the active chemical constituents of many of these medicinal plants remain notably scarce, indicative of a limited venture into the realm of phytochemical research, and more specifically, the domain of pharmacognosy [8]. Over the recent decades, there has been a notable increase for adoption of herbal remedies, attributed to their limited side effects, widespread availability, and broad acceptance among the majority, particularly in developing nations. The consumption of these plants further adds to the intake of both essential and non-essential minerals by people of all ages, from infants to the elderly [9]. Traditional medicinal plants have been subjected for experimental validation in effective addressing a wide range of metabolic disorders that lead to human ailments. Within these botanical remedies, the presence of trace elements stands out as an essential contributor to their healing potential [10]. Accurate assessment of trace element concentrations holds key importance in evaluating the efficacy of medicinal plants for addressing diverse diseases and gaining insights into their pharmacological mechanisms [11]. Moreover, this process aids in fortifying the foundation for better understanding and valuing the traditional knowledge regarding the therapeutic capacities of these plants. Furthermore, the concentration of trace elements within medicinal plants varies based on the geographical area and among different species due to differ in soil composition [12]. Here, the trace elements in this eight medicinal plants *viz. Artemisia nilagirica*, *Erigeron karvinskianus*, *Ageratina adenophora*, *Houtunnyia cordata*,

Toshienla Pongen *et al.,*

Plantago major, *Persicaria chinensis*, *Drymaria cordata* and *Pseudognaphalium Luteoalbum* were analyzed by using Atomic absorption spectroscopy (AAS).Thus, the objective of the present study was to determine the trace elements content and phytochemical analyses present in the eight selected ethnomedicinal plants of the nagas in northeastern India commonly used as traditional home remedy for various ailments. The selection of the eight medicinal plants for this study was based on their significant economic importance, profound therapeutic qualities, and abundant presence within the study area's natural environment. The study primarily focused on wild and domesticated variants of medicinal plants that are more commonly recognized.

Traditionally, these medicinal plants data was collected by conducting interviews with local practitioners and village elders, who shared insights into the utilization of plants for treating a range of ailments. This information encompassed vernacular names, the specific plant parts used, and the medicinal applications, all obtained through verbal interactions. The plants were collected from wild, cultivated land, along the roadside, in shady and moist places. The method of preparation of *Artemisia nilagirica*, *Erigeron karvinskianus*, *Ageratina adenophora*, *Houtunnyia cordata*, *Plantago major*, *Persicaria chinensis*, *Drymaria cordata* and *Pseudognaphalium Luteoalbum* is the same either the decoction or infusion is promptly consumed or crushing the leaves into paste and applying externally on the infected area. *Artemisia nilagirica* oral consumption involves ingesting a decoction made from boiled leaves for treating piles. Additionally, it is employed for basic treatment of cuts, wounds, and skin infections. *Erigeron karvinskianus* leaf paste applied on the affected area of skin, and also decoction in water taken orally for urinary disorders. *Ageratina adenophora* liquid extract from crushed leaves is applied to cuts and wounds to halt bleeding, while a paste made from the leaves is externally applied to treat piles. *Houtunnyia cordata* decoction of leaves is used for stomachache and cholera. *Plantago major* infusion of leaves are taken orally for diarrhoea and diabetes. Furthermore, the paste created from the leaves is used to soothe insect bites. *Persicaria chinensis* leaves are boiled in water, and the resulting filtrate is ingested orally for the treatment of constipation. *Drymaria cordata* entire plant extract is employed to address mouth-related ailments, while the paste made from the leaves aids in wound healing and *Pseudognaphalium Luteoalbum* powdered leaves and stem are boiled in water and consumed to alleviate cough and asthma. A brief overview of the eight medicinal plants in (Table.1), highlighting their traditional utilization methods and the range of ailments they are recognized for treating.

METHODS AND MATERIALS

Collection and preparation of plant sample
Embracing the well-established traditional practices of the Nagas from northeast India, the current study involved the collection of eight commonly used medicinal plants. Voucher specimens of the eight medicinal plants were prepared. The collected plants were taxonomically identified and authenticated at Botanical Survey of India (BSI), Eastern Regional Centre, Shillong, Meghalaya (Table.1). The plants selected for the study were collected from wild and domesticated habitat from Khar village, Mokokchung district of Nagaland (Fig.1). Extraction of plant powder was carried out using three distinct absolute solvents: methanol, chloroform and aqueous solutions. 20 grams of plant powder were dissolved in 250 ml of each solvent, followed by heating on a hot plate with continuous stirring at 30°-40°C for 20 minutes. After a 24-hour period, the plant materials underwent filtration using Whatman filter paper, and the resulting filtrate was collected for subsequent phytochemical analysis.

Preliminary phytochemical analysis
Individual preliminary phytochemical analyses were conducted on all eight extracts to investigate the presence or absence of various phytochemical constituents, including alkaloids, terpenoids, steroids, saponins, flavonoids, tannins, glycosides and xanthoprotein by adopting standard methods [13-16].

Toshienla Pongen *et al.,*

Quantitative analysis
Extraction of plant materials
One gram of each fresh sample was extracted overnight in 5 mL of 80% methanol. The extract was centrifuged at 5000 rpm for 10 min, and the supernatant was taken for the estimations.

Determination of Total Flavonoid content
The total concentration of flavonoids in the plant extract was determined using the aluminum chloride colorimetric assay, following the procedure outlined by [17]. In this method, 0.2 ml aliquot of the extract was placed in a test tube and diluted to 3 ml with distilled water. Subsequently, 150 µL of 5% sodium nitrite solution ($NaNO_2$, w/v) was added, and the mixture was incubated at room temperature for 5 minutes. Following this, 150 µL of 10% $AlCl_3$ solution was added, and the reaction was incubated for 6 minutes at room temperature, 1 ml of 1 M sodium hydroxide (NaOH) was promptly added and mixed using vortex. The absorbance was measured at 510 nm against a blank using a spectrophotometer (Shimadzu UV-1700, Japan).The content of total flavonoids was quantified in terms of milligrams of Quercetin equivalents (QE) per gram of dry weight ($g^{-1}dw$).

Determination of Total Phenol content
The determination of total phenol content followed the procedure outlined by [18] using the Folin-Ciocalteau reagent. Initially, 0.2 ml aliquot of the plant extract was adjusted to a total volume of 3 ml using distilled water. Subsequently, 1 ml of DMSO and 1 ml of 10% Folin-Ciocalteau reagent was mixed and vortex. After a 3-minute incubation period, 3 ml of a 7.5% Na_2CO_3 solution was added, and the tubes were incubated at room temperature for 2 hours. The absorbance was measured at 760 nm using (Shimadzu UV-1700 spectrophotometer, Japan). The results were expressed in milligrams of gallic acid equivalents (GAE) per gram of dry weight ($g^{-1}dw$).

Trace Element Analysis
For trace element analysis [19] method was determined. 1 gram of powdered leaves and entire plant part was placed in 100 ml conical flask and digested for 3 hours at 85°C. The digestion process utilized a mixture of concentrated HNO_3 and $HCLO_4$ (3:1) on a hot plate situated within a digestion chamber, and digestion continued until a clear solution was obtained. After cooling, the solution was filtrate with Whatman No.42 filter paper. The resulting solutions were diluted to a final volume of 50 ml using distilled water. The resulting solution were determined for elemental analysis by atomic absorption spectrophotometer (Ice 3000 SERIES) using a mixture Acetylene-air flame. The instrument was calibrated using high purity grade salts of respective elements.

STATISTICAL ANALYSIS
Each experiment were replicated three times, and the results were reported as mean ± SE). R Studio (Agri col package) software was used for the analysis and diagram. For all tests, $P < 0.05$ was considered to indicate a statistically significant difference.

RESULTS

The preliminary photochemical screening revealed the presence of alkaloids, saponins, flavonoids, tannins, and xanthaproteins in methanol extracts in all the plant samples. Glycosides were absent in three plants in methanol extract i.e, *Ageratina adenophora*, *Persicaria chinensis* and *Pseudognaphalium Luteoalbum*. In methanol extracts steroids were present in most of the plants except for *Drymaria cordata* and terpenoids were absent in *Persicaria chinensis* and *Pseudognaphalium Luteoalbum* (Table.2). In chloroform extracts alkaloids were absent in all the plant samples. Terpenoids were absent in *Erigeron karvinskianus*, *Ageratina adenophora*, *Houtunnyia cordata*, *Plantago major*, *Persicaria chinensis* and *Pseudognaphalium Luteoalbum*. Steroids were absent in *Erigeron karvinskianus*, *Ageratina adenophora* and *Pseudognaphalium Luteoalbum*. Glycoside were absent in *Erigeron karvinskianus*, *Ageratina adenophora*, *Persicaria chinensis* and *Pseudognaphalium Luteoalbum*. Flavonoids were absent only in *Persicaria chinensis*. In aqueous solution terpenoids and steroids were absent in *Artemisia nilagirica*, *Erigeron karvinskianus*, *Houtunnyia cordata*, *Plantago major*,

Toshienla Pongen *et al.,*

Persicaria chinensis and *Pseudognaphalium luteoalbum*. Flavonoid was absent only in *Ageratina adenophora* and glycoside in *Plantago major*. The quantitative estimation of the phytochemicals have shown that *Erigeron karvinskianus* contained higher amount of flavonoids (1240.62±1.39) and total phenolics (125.19±0.11) content (Table.3). *Ageratina adenophora* possesses the lowest quantity of flavonoids (494.91±13.92). Whereas, *Persicaria chinensis* exhibits the least amount of total phenolics (34.88±0.13) respectively (Table.3 , Fig.2 & Fig.3).

The analysis of trace elements showed that Zn, Fe and Mn were detected in all the medicinal plants analyzed, with the exception of non detection of Cu in *Artemisia nilagirica*. The distribution levels of the eight plant samples resulting from the analysis of the four trace elements *Viz,* Zinc, Iron, Manganese and Copper are given in (Table.4). The distribution levels of the trace elements analyzed in the present study follows the order Fe > Mn > Zn > Cu (Fig.4-7). Among the eight medicinal plants, *Persicaria chinensis* exhibited the highest iron distribution, measuring (34.92±0.003) mg/100g. The concentration of Mn and Zn was similar in almost in all the plants analyzed. While there were some variations in the concentration of Cu. Differences in the elemental content observed among plants could potentially arise from variances in their physical structures, which in turn impact their selective absorbability, as well as the characteristics of the soil they inhabited. These soil attributes in a reciprocal relationship and are closely tied to the climatic conditions of the specific growth location. The comparatively lower concentration of the analyzed parameters, in contrast to findings from other studies, can be attributed to the pollution-free environment from which the plant materials were collected.

DISCUSSION

Plants are rich in various natural compounds, many of which are known to be biologically active compounds and are responsible for exhibiting diverse pharmacological activities [20]. Certain plant secondary metabolites play a crucial role as valuable reservoirs of natural antioxidants, which are favored over synthetic alternatives due to safety considerations [21]. Through a variety of biological mechanisms, the bioactive secondary metabolites have been evidenced to decrease the risk and hinder the advancement of diseases like cancer, cardiovascular issues, and neurodegenerative disorders by effectively neutralizing free radicals [22]. The present study carried out on the eight selected medicinal plants extract revealed the presence of medicinal active constituents. The phytochemical active compounds of eight medicinal plants were qualitatively analyzed and the results are presented in (Table.2). In these screening process alkaloids, terpenoids, steroids, saponins, tannins, glycoside, flavonoids and xanthoproteins showed different types of results in different solvents. This phenomenon is linked to the polarity of the compounds extracted by various solvents. The data suggests that utilizing methanol to extract dried plant material serves as a reasonable approach to preparation of phytochemical analyses. Aqueous plant extracts of eight medicinal plants was found to have moderate amount of phytocomponents like alkaloids, flavonoids, saponins, tannins and xanthoproteins. Methanol plant extracts was found to have wide range of bioactive compounds like alkaloids, steroids, terpenoids, saponins, tannins, flavonoids, glycosides and xanthoproteins. Chloroform extracts was able to extract very less compound characterized in all the selected eight medicinal plants. The presence of bioactive constituents indicates that the selected eight medicinal plants can find application in a variety of ways for the betterment of the population.

Phytochemicals present within various extracts led to a diverse array of biological activities exhibited by the components offers protection against a multitude of chronic diseases [23]. For example, Terpenoids utility extends to the prevention and treatment of numerous conditions, notably cancer. These compounds also exhibit a wide range of beneficial attributes, encompassing antimicrobial, antifungal, antiparasitic, antiviral, anti-allergenic, antispasmodic, antihyperglycemic, anti-inflammatory, and immunomodulatory properties [24]. A wealth of research has substantiated saponins distinct ability to induce the precipitation and coagulation of red blood cells [25]. Saponins found in plants have been identified as the source of the tonic and stimulating properties found in traditional Chinese and Japanese herbal remedies [26]. Steroids and saponins were responsible for central nervous system activities [27]. Glycosides have been reported to possess medicinal importance and used in the treatment of

Toshienla Pongen *et al.,*

congestive heart failure and cardiac arrhythmia [28]. Plants use natural substances like tannins, flavonoids, and aromatic compounds to protect themselves as defense mechanism against many microorganisms, insects and herbivores. The curative properties of medicinal plants are perhaps due to the presence of various secondary metabolites in them [29]. Flavonoids are termed as nature's biological modulators of response, owing to their innate potential to alter the body's responses to allergies and viruses. They have demonstrated their capabilities in exhibiting anti-allergic, anti-inflammatory, anti-microbial, and anti-cancer properties [30]. Several researchers have documented on the analgesic, anti-HIV, antipyretics properties of alkaloids [31]. While tannins, as reported by [32], have demonstrated anti-inflammatory and anti-bacterial properties. These types of compounds are recognized for their ability to heal from bacterial infections, the plant extracts which are generally used by the traditional healers to treat such health issues. Tannins, due to their capacity to make proteins clump together and narrow blood vessels, might have a role in preventing ulcers from forming [33]. Alkaloids found in plants are utilized in medicine as anesthetic agents, antispasmodic, antibacterial and analgesic [34].

The plant extracts *viz. Artemisia nilagirica*, *Erigeron karvinskianus*, *Ageratina adenophora*, *Houtunnyia cordata*, *Plantago major*, *Persicaria chinensis*, *Drymaria cordata* and *Pseudognaphalium Luteoalbum* has been further subjected to quantification of total flavonoids and total phenols content, which was determined by using standard methods. The analysis of secondary metabolites is essential for the extraction, purification, separation, crystallization, and identification of diverse phytocompounds. The amount of total phenol was determined with Folin-Ciocalteu reagent. The maximum total phenolic content was shown in *Erigeron karvinskianus* (125.19±0.11) mg GAE/100 g plant extracts, respectively. An increased quantity of phenols plays a significant role in regulating plant growth, development, and resistance to diseases. The consumption of diets abundant in plant polyphenols provides safeguards against the onset of conditions such as cancer, cardiovascular diseases, diabetes, osteoporosis, and neurodegenerative diseases [35]. *Erigeron karvinskianus* was earlier reported to have anticancer activities on the inhibiting activity of dual human topoisomerases I & II [36]. *Artemisia nilagirica* have the property of antioxidant and anticancer in methanol solvent of plant extracts [37]. *Plantago major* has good property of antioxidant and antimicrobial activity [38]. *Persicaria chinensis* was reported to have antioxidant activity[39]. *Drymaria cordata* phytoconstituents are accounted to be very powerful against antidiabetic and antioxidant [40]. *Ageratina adenophora* has been turned out to be very powerful hostile to diabetic and antioxidant [41]. *Houtunnyia cordata* have been reported to have antioxidant properties [42]. *Pseudognaphalium Luteoalbum* commonly known as cudweed plant, previous studies confirmed that the plant has pharmacological properties like antioxidant, antifungal, antibacterial, anti-inflammatory and cytotoxic effects [43].

Trace elements like manganese, iron, and zinc play a crucial role in enzyme metabolism. The levels of these elements within plants hold significant importance. The analysis of the present study revealed that iron (Fe) was found to have the highest concentration among all the examined trace elements, in comparison to the other recorded elements. The highest concentration of the Fe among the studied medicinal plants was found in *Persicaria chinensis* (34.92±0.003 mg/100g). The significance of iron in nourishing good health has been recognized, it is one of the most important elements known to produce red blood cells in the human body. It is needed for healthy immune system and energy production. Generally, iron is not considered to have harmful health effects, except when taken at extremely large doses [44]. Considering the beneficial effects of iron on the immune system, the incorporation of these medicinal plants into traditional skin infection treatments could be attributed to their significant Fe content. Like Fe, Manganese holds significance in regulating immune responses within the body, breaking down amino acids, overseeing energy production by controlling the metabolism of vitamins B, C, and E, and activating a range of enzymes crucial for appropriate digestion and efficient utilization of nutrients [45]. In addition, it can be correlated with therapeutic properties against diabetic and cardiovascular diseases [46]. The concentration of Mn recorded in the present study ranges from (0.34±0.006) to (3.58±0.003) mg/100g with *Plantago major* containing the highest concentration. Considering the beneficial role of Mn on the immune system through the enzymes of the antioxidant defense system, the traditional use of this medicinal plants for treatment of diabetes and wound healing may be attributed to considerable amount of Mn present in them. Zinc is essential for cell growth and division (enzymes that make DNA and RNA), maintaining healthy skin, supporting bone health, and ensuring proper taste and eyesight functions [47]. The high concentration of zinc in *Persicaria chinensis* (0.82±0.003 mg/100g) suggests the possible

recommendation of this medicinal plant for treatment of worms and skin disease [48]. Copper content was found to be in varying concentrations in all the medicinal plants samples in the range of (0.41±0.033) to (0.02±0.001) mg/100g. Whereas, in *Artemisia nilagirica* it was not detected for copper. Similar to iron, copper holds a vital place in human health. Its functional significance is comparable to that of iron and is evident in processes such as erythropoietin's, myelin formation, modulation of catecholamine metabolism, antioxidant defense, immune function regulation, as well as the management of cholesterol and glucose metabolism. Genetic disorders can emerge when the body struggles to effectively utilize copper, especially when it becomes excessive. However, when it comes to medicinal plants, the World Health Organization (WHO) has not defined specific limits for copper content (WHO).

CONCLUSIONS

The findings of the study documented an account of the traditional practices and beliefs held by local ethnic tribes, preserving them from potential loss over time. The results indicated that the selected eight medicinal plants contains a variety of phytochemical constituents, the presence of alkaloids, terpenoids, steroids, saponins, tannins, flavonoids, glycoside and xanthoproteins attributes to antifungal, antibacterial, anti-diarrhoeal, anticancer, antidiabetic, antiulcerative, antiviral, antimicrobial, anti-inflammatory, antipyretic, antitussive, anxiolytic, cytotoxic activities and astringency property of the eight medicinal plants use among the naga community but also, can be a potent antioxidant. However, further investigation on the metabolic regulation and biological properties of phytochemicals are needed to recommend its use in pharmaceuticals.

The study also showed that these medicinal plants *viz. Artemisia nilagirica*, *Erigeron karvinskianus*, *Ageratina adenophora*, *Houtunnyia cordata*, *Plantago major*, *Persicaria chinensis*, *Drymaria cordata* and *Pseudognaphalium Luteoalbum* possess a fairly good amount of trace elements. Our findings additionally indicated that the trace elements identified in the medicinal plants under investigation stayed within the acceptable limits set by FAO and WHO. In general, most of the herbal plants discovered in Nagaland, India, do not raise issues regarding trace metal levels for human consumption, owing to the limited presence of polluting industries and minimal pollution. The findings from this study provide support for the utilization of these medicinal plants in traditional remedies for treating diverse illnesses, as they have been found to contain appreciable amount of iron, zinc, copper and manganese. These analyzed medicinal plants show potential as viable sources of essential elements in the diet, highlighting their possible nutraceutical value for traditional healers and individuals seeking herbal remedies. Additionally, conducting more thorough investigations on these medicinal plants for their effectiveness against other diseases could unveil untapped potential. These plants could emerge as promising sources of chemically captivating and biologically significant drug candidates.

ABSTRACT

Diffuse large B Cell lymphoma (DLBL), seen primarily in children or young adults, is a malignant neoplasia that originates from B or T lymphocyte precursors and rarely occurs in the oral cavity. Histopathologically, it presents as a round blue cell tumor. An early and accurate diagnosis of this entity is very important due to its high cure rate. We report a case of DLBL involving oral cavity in a 14-year-old child in left side of maxiila. The purpose of this report is to explore the diagnostic workup.

Keywords: Diffuse large B cell lymphoma, Maxilla, Malignant Neoplasia, round blue cell tumor.

INTRODUCTION

Non-Hodgkin's lymphoma (NHL) is a broad term for lymphocytic cancers that arises predominantly within the lymph nodes. However, 24% of lymphomas may assume extra nodal sites, such as the gastrointestinal tract, testes, thyroid gland, breast, skin, bones, and Waldeyer's ring of the palate[1-3]. Of the different variants of NHL, diffuse large B-Cell lymphoma (DLBCL) is the most commonly seen.[4] DLBCL is most often observed in adults, but can occur in children. The incidence ranges from 10-88 year (median age 57years). Initial signs and symptoms of DLBCL

frequently appear as a painless, rapidly developing swelling in the neck, armpit or groin due to enlarging lymphnodes.[4-5]Here we present a case of DLBCL in a 14 year girl in upper left maxillary region.

CASE REPORT

A 14 year old female reported with a complaint of a painless swelling in her upper left side of the jaw since one month which was rapidly progressing in size. There was no toothache or pain associated with it. The patient had nasal stuffiness leading to difficulty in breathing since 8 days and blurred vision and watering of eye since 3 days. On extra oral examination facial asymmetry due to a diffuse swelling on the left side of face was present in middle 3rd region involving supra-orbital region and infra-temporal area, measuring approx. 5x 6 cm in size, Overlying skin appeared normal.(Fig-1:A & B) On palpation the local temperature was normal and the swelling was non tender. It was firm to hard in consistency and the surface was smooth. There was no altered sensation over cheek region. Single left submandibular lymph node,1x2cm in size, was firm and non tender. Intraorally swelling was present involving complete left side of palate from 24-28 region with obliteration of buccal vestibule. Overlying mucosa was normal and intact (Fig 1-C). On palpation swelling was soft and tender. Grade I mobility with 24 and grade II mobility with 25, 26 and 27 was present with no other dental findings.

Radiographic examination (OPG & PA Waters view) showed opacification of left maxillary sinus with loss of posterior, medial and lateral walls. Irregular alveolar bone destruction was also evident from 23 to28 region with slight posterior displacement of 27, 28(Fig 2-A& B) Based on clinical and radiographic examination a provisional diagnosis of a soft tissue malignant tumour was made. Differential diagnosis included osteosarcoma, fibro sarcoma and lymphoma. To assess the exact boundaries and invasion into the adjacent areas, contrast enhanced computed tomography (CECT) was performed. CECT revealed a minimally enhancing soft tissue density lesion in the left maxillary sinus showing erosion of the sinus walls, extending medially into the ipsilateral part of nasal cavity, inferio- medially into the upper gingival labial space, causing erosion of alveolar ridge of maxilla with extending posteriorly oblitering retro-antral fat pad into the masticator space. Superiorly the lesion was extending into the left infra orbital fissure& left sphenopalatine foramen. There was also erosion of left floor of orbit with extension of lesion into the orbital cavity causing abutment of inferior and lateral rectus muscle(Fig 3-A,B &C).All these findings were suggestive of aggressive neoplastic lesion.

USG guided FNAC was suggestive of malignant small round cell tumor of primitive neuroectoderm tumor. Incisional biopsy showed tumor composed of small round cells with round to oval hyperchromatic nuclei and scant cytoplasm arranged in diffuse sheets. The tumor cells are seen to accentuate around blood vessels. No necrosis seen. Occasional mitotic figures seen suggestive of Small Round Blue Cell Tumor. On immunohistochemical analysis, tumor cells were positive for CD 10,CD 20,TDT (Fig 4-A &B) and BCL2 and negative for CD99,CD5,CD23 and Cyclin D1. Thus the final diagnosis of DLBCL was made. Chest X-ray, ultrasound of abdomen, bone scan and bone marrow biopsy did not reveal any abnormality and confirmed the lesion to be localized. For treatment patient was referred to oncology department where a total 6 cycles of chemotherapy were advised at the gap of every 3 weeks. The treatment regimen followed was that of classical CHOP therapy [Cyclophosphamide, Hydrodoxorubicin (doxorubicin), Oncovin (vincristine) and Prednisolone]. Patient discontinued the treatment after two cycles due to intolerance to chemotherapeutic drugs and lost for follow up.

DISCUSSION

DLBCL is the second most common type of NHL in childhood and adolescence, accounting for 25–35% of all cases. The majority, 70–80%, is of T-lymphoblastic origin while 20–25% arise from B lymphoblasts. NHL principally involves lymph nodes, spleen, and other nonhemopoietic tissues of the body. Approximately 24%–40% of NHLs prevail in the extranodal sites (primary or occult); among which highest number of cases are seen in the head and neck region accounting for 2%–3% of them in the oral cavity and jaws.[7]Waldeyer's ring is considered to be the most

common site of NHL in orofacial region whereas the association of the jaws by the neoplasm is rare; maxilla being more commonly involved than the mandible, as seen in our case. There are no classic clinical presenting features when jaw bones are concerned. These lesions present as swelling of the jaw, pain, numbness, tooth mobility, or cervical lymphadenopathy as seen in the reported case except numbness[7]. In a systematic review of 15 studies and a total 714 patients, Guevara Canales et al found that the most frequent intraoral site for NHL was gingiva, followed by palate which is similar to our case.[8]. As DLBCL is a heterogenous neoplasm it shows variable clinical, morphologic, immunophenotypic, cytogenetic and genetic features. Lymphomas can be characterized by haematoxylin eosin staining of tumor sections; nonetheless, immunophenotyping is often employed as a main diagnostic method. The tumor cells are typically positive for terminal deoxynucleotide transferase (TDT), a unique DNA polymerase which is present in T-cell and B-cell precursors, used to differentiate between LBL and Burkett's lymphoma.[9]. Though DBCL is an aggressive it's a treatable neoplasm with a varying clinical course. A free of disease survival is shown to be 50% and can reach 80% when lymphoma is localized during diagnosis.

Present treatment regimen of DLBCL usually begins with multi agent chemotherapy, typically CHOP. Initial stage disease care involves either chemotherapy alone or a combination of chemotherapy and radiotherapy. Bone marrow transplantation should be considered if remission is not maintained. The role of surgery is very limited in the treatment of DLBCL. Chemotherapy for advanced stage disease usually involves various combinations of methotrexate, bleomycin, doxorubicin, vincristin, dexamethasone, leukcovorin, etoposide, mechlorethamine, procarbazine and cytarabine.[10]

CONCLUSION

Painless swelling and numbness of the lip or chin that cannot be attributed to dental infections, or other findings raises suspicion about DLBCL. Such patients should be immediately referred for appropriate imaging and accurate biopsy testing. This strategy should allow for early and accurate diagnosis of DLBCL that presents in the jaw which will lead to improvements in prognosis.

ABSTRACT

In this article, we look at a non-Markovian feedback queue (M/G/1) with disaster events, working breakdown, and working vacation. A primary and a backup server make up the system. On a first-in first-out (FIFO) pattern, the primary / backup server serve each customer individually. Following every service, a customer has the option of rejoining the system or permanently leaving it. When a disaster happens, all customers are made to evacuate the system, as well as the primary server crashes. The primary server is dispatched to repair at the first sign of a breakdown and the repair period begins right away. During the repair period, new arrivals continues. The backup server (which is on working breakdown mode), is serving at a reduced rate. If a system is inactive while it is in operation, the primary server will just go on vacation. The backup server (which is on working vacation mode), is serving at a reduced rate. We assume that the disasters have no effect on working vacation period. The supplementary variable methodology is used to determine the Probability Generating Function (PGF) of the number of customers throughout typical peak period, repair period, and vacation period, as well as specific metrics of effectiveness. Some statistical analysis is shown at the end.

Keywords: non-Markovian, feedback queue, disasters, working breakdown and working vacation.

INTRODUCTION

In queueing models with feedback, we consider that each customer may re-enter the system or depart it permanently following the completion of service. A queueing approach with feedback was first presented by Takacs[19]. A few of the researchers listed were Disney et.al.[5], Simon[16], and Thangaraj and Vanitha[21]. The concept of disasters occurring at random compels everyone to leave at the same mo- ment. Towsley and Tripathi[23] were the first to present queueing models with disasters. 'Mass exodus'[4], 'queue flushing'[23], 'catastrophes'[10] and 'stochastic clearing'[25] are all terms used to describe disasters. Jain and sigman [6] extended the M/G/1 queueing model to include disasters. Sridharan and Jayasree [17], Lee et.al.[11] and Sudhesh [18] are only a few of the researchers mentioned.

In breakdown queueing model, A great deal of thought goes into the queuing model with an unstable server. In the majority of studies, the server is supposed to have experienced a difficulty and is instantaneously sent off to repair. More researchers put forward queueing models with server breakdown. An M/G/1 queueing system with a repairable server was proposed in Cao and Cheng [3]. Thirurengadan [22] discussed about the queueing concept in terms of breakdowns. Thangaraj and Vanitha [20] investigated single server queueing models with unpredictable breakdowns. Throughout a working breakdown, the server served at a reduced rate. A first queueing model with working breakdown was developed in Kalidass and Kasthuri [7]. Following that, Kim and Lee [9], Liou [12], Yang and Wu [26] studied non-Markovian queueing models with working breakdowns. To use the vacation queueing strategy, the server suspends all operations for the duration of the vacation. Working vacation is a term that describes when a server operates at a reduced rate throughout a vacation period. Servi and Finn [15] developed the working vacation queueing approach, which was then generalised by Kim et.al. [8] and Wu and Takagi [24]. Following that, several authors added working vacation Baba [2], Begum and Parveen [1] and Pazhani Bala Murugan and Santhi [14] to their queueing models.

We investigate "A non-Markovian modelling approach (M/G/1) including feedback, disasters , working breakdown, and working vacation." A primary server and a backup server make up the system. Following every service, a customer has the option of rejoining the system or permanently leaving it. As a reaction of the disasters, all existing customers just vanish, prompting the primary server to crash. The primary server is dispatched to repair in the event of a crash and instantly, the repair period started. During the repair period, a new arrivals continues. The backup server (which is on working breakdown mode), is serving at a reduced rate. If the repair is completed while there are customers inside the system, the backup server suddenly stops serving them, and the system is rebooted with regular service rate by the primary server. If a system is inactive while it is in operation, the primary server will just go on vacation. The backup server (which is on working vacation mode), is serving at a reduced rate. If the system is empty when a vacation ends, the primary server joins it and remains idle until a new customer arrives. This is referred to as a single working vacation. We assume that the disasters have no effect on the working vacation period. During the working breakdown and the working vacation, the backup server provides different service rate. This study is structured as follows. An overview of the model is summarised in section 2. In section 3, we calculate the steady state system size distribution. In section 4, we have derived metrics of effectiveness. In section 5, we perform a statistical analysis of the model.

Overview of a Model
Consider a single server queue whose arrival is governed by a Poisson process with arrival rate λ. The FIFO (first in, first out) rule of service discipline governs the system. When the primary server seems to be in a typical peak period and if there are no customers inside the system, it will take a fixed- length vacation. If a customer arrives throughout a vacation, the backup server would then serve them at a reduced rate which we call a "working vacation period." Let η be the vacation completion rate, and let S_{wv} be the working vacation time, exponentially distributed whose probability density function (PDF) is $s_{wv}(x)$ and its Laplace Stieltjes Transform(LST) is $S_{wv}^*(\theta)$. At the vacation completion epoch, the service to the last customer is lost, and the service is restarted during the typical peak period

by the primary server with a different distribution.

If the working vacation ends, then the primary server resumes the typical peak period with the typical service rate $\mu_{rb}(>0)$, and the typical service time S_{rb}. Let us denote it by the PDF $s_{rb}(x)$ and the LST $S^*_{rb}(\theta)$. Disasters occur only when the primary server is operational, which is exponentially distributed with rate δ. When disaster happens, all customers are compelled to exit the system, and the primary server crashes. The primary server is dispatched to repair at the first sign of a breakdown, and the repair period begins right away. During the repair period, service is provided by the backup server at a reduced rate $\mu_{wb}(>0)$, which we call the "working breakdown period," and that the repair duration is distributed exponentially with rate γ. If there are no customers in the system at the completion of a repair, the primary server returns to the system, remains idle, and waits for customers to arrive. When providing feedback, a customer has the option of choosing to have their service repeated with probability p or to depart with probability q = 1 − p. Let S_{wb} denote the working breakdown time, its PDF by $s_{wb}(x)$, and its LST by $S^*_{wb}(\theta)$. Also, the S_{wv}, S_{rb}, and S_{wb} are considered to be mutually independent.

The Steady State System Size Distribution

Let $\mathcal{N}(t)$ represent the number of customers in the system at time t, and $\zeta(t)$ represent an indicative random variable at time t, defined by

$$\zeta(t) = \begin{cases} 0, & \text{if the primary server is on vacation,} \\ 1, & \text{if the primary server is busy in typical peak period,} \\ 2, & \text{if the primary server is under repair.} \end{cases}$$

Let $S^0_{wv}(t)$, $S^0_{rb}(t)$ and $S^0_{wb}(t)$ signify the remaining service time in the working vacation, typical peak time and repair periods, respectively, at time t.

$$\chi(t) = \begin{cases} S^0_{wv}(t), & \text{if } \zeta(t) = 0, \\ S^0_{rb}(t), & \text{if } \zeta(t) = 1, \\ S^0_{wb}(t), & \text{if } \zeta(t) = 2. \end{cases}$$

The process $\{(\mathcal{N}(t), \zeta(t), \chi(t)) ; t \geq 0\}$ is transformed into a Markov process with the supplementary variables $S^0_{wv}(t)$, $S^0_{rb}(t)$, and $S^0_{wb}(t)$. The following limiting probabilities are defined.

$$\mathcal{V}_0 = \lim_{t \to \infty} Pr\{\mathcal{N}(t) = 0, \zeta(t) = 0\}$$

$$\mathcal{B}_0 = \lim_{t \to \infty} Pr\{\mathcal{N}(t) = 0, \zeta(t) = 1\}$$

$$\mathcal{R}_0 = \lim_{t \to \infty} Pr\{\mathcal{N}(t) = 0, \zeta(t) = 2\}$$

$$\mathcal{V}_n(x)dx = \lim_{t \to \infty} Pr\{\mathcal{N}(t) = n, \zeta(t) = 0, x < S^0_{wv}(t) < x + dx\}, n \geq 1$$

$$\mathcal{B}_n(x)dx = \lim_{t \to \infty} Pr\{\mathcal{N}(t) = n, \zeta(t) = 1, x < S^0_{rb}(t) < x + dx\}, n \geq 1$$

$$\mathcal{R}_n(x)dx = \lim_{t \to \infty} Pr\{\mathcal{N}(t) = n, \zeta(t) = 2, x < S^0_{wb}(t) < x + dx\}, n \geq 1$$

With the previously indicated probabilities, the Kolmogorov equations for the system size distribution are provided as follows.

Santhi and Epsiya

$$0 = -(\lambda + \eta)\,\mathcal{V}_0 + q\,\mathcal{V}_1(0) + q\,\mathcal{B}_1(0) \tag{1}$$

$$-\frac{d}{dx}\mathcal{V}_1(x) = -(\lambda+\eta)\mathcal{V}_1(x) + \lambda\,\mathcal{V}_0\,s_{wv}(x) + q\mathcal{V}_2(0)s_{wv}(x) + p\,\mathcal{V}_1(0)\,s_{wv}(x) \tag{2}$$

$$-\frac{d}{dx}\mathcal{V}_n(x) = -(\lambda+\eta)\mathcal{V}_n(x) + \lambda\,\mathcal{V}_{n-1}(x) + q\,\mathcal{V}_{n+1}(0)s_{wv}(x) + p\mathcal{V}_n(0)s_{wv}(x), n \ge 2 \tag{3}$$

$$0 = -\lambda\,\mathcal{B}_0 + \eta\,\mathcal{V}_0 + \gamma\mathcal{R}_0 \tag{4}$$

$$= -(\lambda+\delta)\mathcal{B}_1(x) + \lambda\,\mathcal{B}_0\,s_{rb}(x) + q\,\mathcal{B}_2(0)s_{rb}(x) + p\,\mathcal{B}_1(0)s_{rb}(x)$$
$$+\eta\,s_{rb}(x)\int_0^\infty \mathcal{V}_1(y)dy + \gamma s_{rb}(x)\int_0^\infty \mathcal{R}_1(y)dy \tag{5}$$

$$-\frac{d}{dx}\mathcal{B}_n(x) = -(\lambda+\delta)\mathcal{B}_n(x) + \lambda\,\mathcal{B}_{n-1}(x) + q\,\mathcal{B}_{n+1}(0)s_{rb}(x) + p\,\mathcal{B}_n(0)s_{rb}(x)$$
$$+\eta s_{rb}(x)\int_0^\infty \mathcal{V}_n(y)dy + \gamma s_{rb}(x)\int_0^\infty \mathcal{R}_n(y)dy, n \ge 2 \tag{6}$$

$$0 = -(\lambda+\gamma)\mathcal{R}_0 + q\,\mathcal{R}_1(0) + \delta\sum_{n=1}^\infty \mathcal{B}_n \tag{7}$$

$$-\frac{d}{dx}\mathcal{R}_1(x) = -(\lambda+\gamma)\mathcal{R}_1(x) + \lambda\mathcal{R}_0\,s_{wb}(x) + q\,\mathcal{R}_2(0)s_{wb}(x) + p\,\mathcal{R}_1(0)s_{wb}(x) \tag{8}$$

$$-\frac{d}{dx}\mathcal{R}_n(x) = -(\lambda+\gamma)\mathcal{R}_n(x) + \lambda\mathcal{R}_{n-1}(x) + q\,\mathcal{R}_{n+1}(0)s_{wb}(x) + p\,\mathcal{R}_n(0)s_{wb}(x), n \ge 2 \tag{9}$$

where

$$\mathcal{V}_n = \int_0^\infty \mathcal{V}_n(y)dy; \quad \mathcal{B}_n = \int_0^\infty \mathcal{B}_n(y)\,dy; \quad \mathcal{R}_n = \int_0^\infty \mathcal{R}_n(y)dy$$

The following LSTs and PGFs are used to solve (1) - (9).

$$\mathcal{V}_n^*(\theta) = \int_0^\infty e^{-\theta x}\,\mathcal{V}_n(x)dx; \quad \mathcal{B}_n^*(\theta) = \int_0^\infty e^{-\theta x}\mathcal{B}_n(x)dx; \quad \mathcal{R}_n^*(\theta) = \int_0^\infty e^{-\theta x}\mathcal{R}_n(x)dx$$

$$\mathcal{V}^*(z,\theta) = \sum_{n=1}^\infty \mathcal{V}_n^*(\theta)z^n; \quad \mathcal{B}^*(z,\theta) = \sum_{n=1}^\infty \mathcal{B}_n^*(\theta)z^n; \quad \mathcal{R}^*(z,\theta) = \sum_{n=1}^\infty \mathcal{R}_n^*(\theta)z^n$$

$$\mathcal{V}(z,0) = \sum_{n=1}^\infty \mathcal{V}_n(0)z^n \quad ; \quad \mathcal{B}(z,0) = \sum_{n=1}^\infty \mathcal{B}_n(0)z^n; \quad \mathcal{R}(z,0) = \sum_{n=1}^\infty \mathcal{R}_n(0)z^n$$

We acquire the LSTs from equations (2), (3), (5), (6), (8), and (9) as follows.

$$-\big(\theta\,\mathcal{V}_1^*(\theta) - \mathcal{V}_1(0)\big) = -(\lambda+\eta)\mathcal{V}_1^*(\theta) + \lambda\,\mathcal{V}_0 S_{wv}^*(\theta) + q\mathcal{V}_2(0)S_{wv}^*(\theta) + p\,\mathcal{V}_1(0)S_{wv}^*(\theta) \tag{10}$$

$$-\big(\theta\,\mathcal{V}_n^*(\theta) - \mathcal{V}_n(0)\big) = -(\lambda+\eta)\mathcal{V}_n^*(\theta) + \lambda\,\mathcal{V}_{n-1}^*(\theta) + q\mathcal{V}_{n+1}(0)S_{wv}^*(\theta) + p\mathcal{V}_n(0)S_{wv}^*(\theta), n \ge 2 \tag{11}$$

$$-\big(\theta\,\mathcal{B}_1^*(\theta) - \mathcal{B}_1(0)\big) = -(\lambda+\delta)\mathcal{B}_1^*(\theta) + \lambda\,\mathcal{B}_0 S_{rb}^*(\theta) + q\,\mathcal{B}_2(0)S_{rb}^*(\theta) + p\,\mathcal{B}_1(0)S_{rb}^*(\theta) + \eta\mathcal{V}_1 S_{rb}^*(\theta) + \gamma\mathcal{R}_1 S_{rb}^*(\theta) \tag{12}$$

$$-\big(\theta\,\mathcal{B}_n^*(\theta) - \mathcal{B}_n(0)\big) = -(\lambda+\delta)\mathcal{B}_n^*(\theta) + \lambda\,\mathcal{B}_{n-1}^*(\theta) + q\,\mathcal{B}_{n+1}(0)S_{rb}^*(\theta) + p\,\mathcal{B}_n(0)S_{rb}^*(\theta) + \eta\mathcal{V}_n S_{rb}^*(\theta)\,\gamma\mathcal{R}_n S_{rb}^*(\theta), n \ge 2 \tag{13}$$

$$-\big(\theta\,\mathcal{R}_1^*(\theta) - \mathcal{R}_1(0)\big) = -(\lambda+\gamma)\mathcal{R}_1^*(\theta) + \lambda\,\mathcal{R}_0 S_{wb}^*(\theta) + q\mathcal{R}_2(0)S_{wb}^*(\theta) + p\mathcal{R}_1(0)S_{wb}^*(\theta) \tag{14}$$

$$-\big(\theta\,\mathcal{R}_n^*(\theta) - \mathcal{R}_n(0)\big) = -(\lambda+\gamma)\mathcal{R}_n^*(\theta) + \lambda\,\mathcal{R}_{n-1}^*(\theta) + q\mathcal{R}_{n+1}(0)S_{wb}^*(\theta) + p\mathcal{R}_n(0)S_{wb}^*(\theta), n \ge 2 \tag{15}$$

Multiplying (11), (13), and (15) with z^n and summing over n from 2 to ∞ and adding the resultant with the resultant of z times with (10), (12), and (14) respectively, we get

67096

$$(\theta - \eta - \lambda(1-z))\mathcal{V}^*(z,\theta) = z^{-1}\mathcal{V}(z,0)(z - (q+pz)S_{wv}^*(\theta)) - S_{wv}^*(\theta)(\lambda\mathcal{V}_0 z - q\mathcal{V}_1(0)) \quad (16)$$

$$(\theta - \delta - \lambda(1-z))\mathcal{B}^*(z,\theta) = z^{-1}\mathcal{B}(z,0)(z - (q+pz)S_{rb}^*(\theta)) - S_{rb}^*(\theta)(\eta\mathcal{V}^*(z,0)$$

$$+\gamma\mathcal{R}^*(z,0) + \lambda\mathcal{B}_0 z - q\mathcal{B}_1(0)) \quad (17)$$

$$(\theta - \gamma - \lambda(1-z))\mathcal{R}^*(z,\theta) = z^{-1}\mathcal{R}(z,0)(z - (q+pz)S_{wb}^*(\theta)) - S_{wb}^*(\theta)(\lambda\mathcal{R}_0 z$$

$$-q\mathcal{R}_1(0)) \quad (18)$$

Inserting $\theta = \eta + \lambda(1-z)$ into (16), $\theta = \delta + \lambda(1-z)$ into (17) and $\theta = \gamma + \lambda(1-z)$ into (18), we get

$$\mathcal{V}(z,0) = \frac{zS_{wv}^*(\eta + \lambda(1-z))(q\mathcal{V}_1(0) - \lambda\mathcal{V}_0 z)}{(q+pz)S_{wv}^*(\eta + \lambda(1-z)) - z} \quad (19)$$

$$\mathcal{B}(z,0) = \frac{zS_{rb}^*(\delta + \lambda(1-z))(q\mathcal{B}_1(0) - \eta\mathcal{V}^*(z,0) - \gamma\mathcal{R}^*(z,0) - \lambda\mathcal{B}_0 z)}{(q+pz)S_{rb}^*(\delta + \lambda(1-z)) - z} \quad (20)$$

$$\mathcal{R}(z,0) = \frac{zS_{wb}^*(\gamma + \lambda(1-z))(q\mathcal{R}_1(0) - \lambda\mathcal{R}_0 z)}{(q+pz)S_{wb}^*(\gamma + \lambda(1-z)) - z} \quad (21)$$

Substituting (19), (20), and (21) into (16), (17), and (18), respectively.

$$\mathcal{V}^*(z,\theta) = \frac{z(q\mathcal{V}_1(0) - \lambda\mathcal{V}_0 z)(S_{wv}^*(\eta + \lambda(1-z)) - S_{wv}^*(\theta))}{(\theta - \eta - \lambda(1-z))((q+pz)S_{wv}^*(\eta + \lambda(1-z)) - z)} \quad (22)$$

$$\mathcal{B}^*(z,\theta) = \frac{z(q\mathcal{B}_1(0) - \eta\mathcal{V}^*(z,0) - \gamma\mathcal{R}^*(z,0) - \lambda\mathcal{B}_0 z)(S_{rb}^*(\delta + \lambda(1-z)) - S_{rb}^*(\theta))}{(\theta - \delta - \lambda(1-z))((q+pz)S_{rb}^*(\delta + \lambda(1-z)) - z)} \quad (23)$$

$$\mathcal{R}^*(z,\theta) = \frac{z(q\mathcal{R}_1(0) - \lambda\mathcal{R}_0 z)(S_{wb}^*(\gamma + \lambda(1-z)) - S_{wb}^*(\theta))}{(\theta - \gamma - \lambda(1-z)))((q+pz)S_{wb}^*(\gamma + \lambda(1-z)) - z)} \quad (24)$$

Substituting $\theta = 0$ into $(10)-(15)$ and then summing over n from 1 to ∞, we get

$$q\,\mathcal{V}_1(0) = -\eta\mathcal{V}^*(1,0) + \lambda\mathcal{V}_0 \quad (25)$$

$$q\,\mathcal{B}_1(0) = -\delta\mathcal{B}^*(1,0) + \eta\mathcal{V}^*(1,0) + \gamma\mathcal{R}^*(1,0) + \lambda\mathcal{B}_0 \quad (26)$$

$$q\,\mathcal{R}_1(0) = -\gamma\mathcal{R}^*(1,0) + \lambda\mathcal{R}_0 \quad (27)$$

The PGF of the system size, denoted by $P(z)$, can be calculated as follows.

$$P(z) = \mathcal{V}_0 + \mathcal{B}_0 + \mathcal{R}_0 + \mathcal{V}^*(z,0) + \mathcal{B}^*(z,0) + \mathcal{R}^*(z,0)$$

$$= \mathcal{V}_0 + \mathcal{B}_0 + \mathcal{R}_0 + \frac{z(\lambda \mathcal{V}_0(1-z) - \eta \mathcal{V}^*(1,0))(1 - S^*_{wv}(\eta + \lambda(1-z)))}{(\eta + \lambda(1-z))((q+pz)S^*_{wv}(\eta + \lambda(1-z)) - z)}$$

$$+ \frac{\left\{ \begin{array}{c} z(\lambda \mathcal{B}_0(1-z) + \eta(\mathcal{V}^*(1,0) - \mathcal{V}^*(z,0)) + \gamma(\mathcal{R}^*(1,0) - \mathcal{R}^*(z,0)) \\ - \delta \mathcal{B}^*(1,0))(1 - S^*_{rb}(\delta + \lambda(1-z))) \end{array} \right\}}{(\delta + \lambda(1-z))((q+pz)S^*_{rb}(\delta + \lambda(1-z)) - z)}$$

$$+ \frac{z(\lambda \mathcal{R}_0(1-z) - \gamma \mathcal{R}^*(1,0))(1 - S^*_{wb}(\gamma + \lambda(1-z)))}{(\gamma + \lambda(1-z))((q+pz)S^*_{wb}(\gamma + \lambda(1-z)) - z)} \tag{28}$$

Let $\psi(z) = (q+pz)S^*_{wv}(\eta + \lambda(1-z)) - z$ be defined as an analytic function in the unit circle $|z| < 1$, with $\psi(0) > 0$, and $\psi(1) < 0$. Make the analytic assumptions $m(z) = -z$ and $n(z) = (q+pz)S^*_{wv}(\eta + \lambda(1-z))$. It can be demonstrated that $|n(z)| < |m(z)|$ on the circle's contour, because

$$|m(z)| = |z| = 1,$$

$$|n(z)| \leq n(|z|) = (q+p|z|)S^*_{wv}(\eta + \lambda(1-|z|)) = S^*_{wv}(\eta).$$

As a result of Rouche's theorem, $m(z)$ and $m(z) + n(z)$ will have the same number of zeros inside $|z| < 1$. Because $m(z)$ contains only one zero within this circle, $m(z) + n(z) \equiv \psi(z)$ will also contain only one zero within $|z| < 1$. This implies that there is only one solution, represented by z_0. Assuming $z = z_0$, the denominator for $\mathcal{V}^*(z,0)$ be zero, the numerator must also be zero as well. Likewise, $(q+pz)S^*_{rb}(\delta + \lambda(1-z)) - z = 0$. For $|z| < 1$, there is only one solution, represented by z_1. Assuming $z = z_1$, the denominator $\mathcal{B}^*(z,0)$ for is zero, the numerator must also be zero as well. Furthermore, $(q+pz)S^*_{wb}(\gamma + \lambda(1-z)) - z = 0$. For $|z| < 1$, there is only one solution, represented by z_2. Assuming $z = z_2$, the denominator $\mathcal{R}^*(z,0)$ for is zero, the numerator must also be zero as well.

$$\eta \mathcal{V}^*(1,0) = \lambda(1 - z_0) \tag{29}$$

$$\delta \mathcal{B}^*(1,0) = \lambda \mathcal{B}_0(1 - z_1) + \lambda \mathcal{R}_0(1 - z_2) - \eta \mathcal{V}^*(z_1,0) - \gamma \mathcal{R}^*(z_1,0) \tag{30}$$

$$\gamma \mathcal{R}^*(1,0) = \lambda(1 - z_2) \tag{31}$$

From (7) and (27), we get

$$\delta \mathcal{B}^*(1,0) = \gamma(\mathcal{R}_0 + \mathcal{R}^*(1,0)). \tag{32}$$

Substituting (29), (31), and (32) into (30), we get

$$\mathcal{B}_0 = \frac{\gamma \lambda(1 - z_0)(1 - X_{wv}(z_1)) + \eta(\gamma + \lambda(1 - z_2)X_{wb}(z_1))}{\lambda[\eta(1 - z_1) + \lambda(1 - z_0)(1 - X_{wv}(z_1))]} \mathcal{R}_0, \tag{33}$$

Where

$$X_{wv}(z_1) = \frac{\eta z_1}{\eta + \lambda(1 - z_1)} \frac{z_1 - z_0}{1 - z_0} \frac{S_{wv}^*(\eta + \lambda(1 - z_1)) - 1}{(q + pz_1)S_{wv}^*(\eta + \lambda(1 - z_1)) - z_1},$$

$$X_{wb}(z_1) = \frac{\gamma z_1}{\gamma + \lambda(1 - z_1)} \frac{z_1 - z_2}{1 - z_2} \frac{S_{wb}^*(\gamma + \lambda(1 - z_1)) - 1}{(q + pz_1)S_{wb}^*(\gamma + \lambda(1 - z_1)) - z_1}.$$

From (4) and (33), we get

$$V_0 = \frac{\gamma z_1 + \lambda(1 - z_2)X_{wb}(z_1)}{\eta(1 - z_1) + \lambda(1 - z_0)(1 - X_{wv}(z_1))} \mathcal{R}_0, \tag{34}$$

We will now use the normalising condition $P(1) = 1$ to find the unknown $\mathcal{R}_0$ in (28). We get by substituting $z = 1$, (29), (31), and (32) into (28).

$$1 = \frac{(\eta + \lambda(1 - z_0))}{\eta} V_0 + \mathcal{B}_0 + \frac{\delta + \gamma}{\delta \gamma}(\gamma + \lambda(1 - z_2))\mathcal{R}_0 \tag{35}$$

Substituting (33) and (34) into (35), we get

$$\mathcal{R}_0 = \frac{\eta\lambda\delta\gamma[\eta(1 - z_1) + \lambda(1 - z_0)(1 - X_{wv}(z_1))]}{\begin{cases}\eta\lambda(\delta + \gamma)[\eta(1 - z_1) + \lambda(1 - z_0)(1 - X_{wv}(z_1))](\gamma + \lambda(1 - z_2)) \\ +\delta\gamma\begin{cases}\eta^2(\gamma + \lambda(1 - z_2)X_{wb}(z_1)) + \eta\lambda\gamma(1 - z_0)(1 - X_{wv}(z_1)) \\ +\lambda(\gamma z_1 + \lambda(1 - z_2)X_{wb}(z_1))(\eta + \lambda(1 - z_0))\end{cases}\end{cases}} \tag{36}$$

Substituting (36) into (31), we get

$$R^*(1,0) = \frac{\eta\lambda^2\delta(1 - z_2)[\eta(1 - z_1) + \lambda(1 - z_0)(1 - X_{wv}(z_1))]}{\begin{cases}\eta\lambda(\delta + \gamma)[\eta(1 - z_1) + \lambda(1 - z_0)(1 - X_{wv}(z_1))](\gamma + \lambda(1 - z_2)) \\ +\delta\gamma\begin{cases}\eta^2(\gamma + \lambda(1 - z_2)X_{wb}(z_1)) + \eta\lambda\gamma(1 - z_0)(1 - X_{wv}(z_1)) \\ +\lambda(\gamma z_1 + \lambda(1 - z_2)X_{wb}(z_1))(\eta + \lambda(1 - z_0))\end{cases}\end{cases}},$$

Substituting (36) into (34), we get

$$V_0 = \frac{\eta\lambda\delta\gamma[\gamma z_1 + \lambda(1 - z_2)X_{wb}(z_1)]}{\begin{cases}\eta\lambda(\delta + \gamma)[\eta(1 - z_1) + \lambda(1 - z_0)(1 - X_{wv}(z_1))](\gamma + \lambda(1 - z_2)) \\ +\delta\gamma\begin{cases}\eta^2(\gamma + \lambda(1 - z_2)X_{wb}(z_1)) + \eta\lambda\gamma(1 - z_0)(1 - X_{wv}(z_1)) \\ +\lambda(\gamma z_1 + \lambda(1 - z_2)X_{wb}(z_1))(\eta + \lambda(1 - z_0))\end{cases}\end{cases}},$$

Substituting (36) and (34) into (29), we get

$$V^*(1,0) = \frac{\lambda^2\delta\gamma(1 - z_0)[\gamma z_1 + \lambda(1 - z_2)X_{wb}(z_1)]}{\begin{cases}\eta\lambda(\delta + \gamma)[\eta(1 - z_1) + \lambda(1 - z_0)(1 - X_{wv}(z_1))](\gamma + \lambda(1 - z_2)) \\ +\delta\gamma\begin{cases}\eta^2(\gamma + \lambda(1 - z_2)X_{wb}(z_1)) + \eta\lambda\gamma(1 - z_0)(1 - X_{wv}(z_1)) \\ +\lambda(\gamma z_1 + \lambda(1 - z_2)X_{wb}(z_1))(\eta + \lambda(1 - z_0))\end{cases}\end{cases}},$$

Substituting (36) into (33), we get

$$B_0 = \frac{\eta \delta \gamma \left[\gamma\lambda(1-z_0)\big(1-X_{wv}(z_1)\big) + \eta \left(\gamma + \lambda(1-z_2)X_{wb}(z_1)\right)\right]}{\left\{\begin{array}{l}\big(\eta\lambda(\delta+\gamma)\big[\eta(1-z_1) + \lambda(1-z_0)\big(1-X_{wv}(z_1)\big)\big](\gamma+\lambda(1-z_2))\big) \\ +\delta\gamma \left\{\begin{array}{l}\eta^2\big(\gamma+\lambda(1-z_2)X_{wb}(z_1)\big) + \eta\lambda\gamma(1-z_0)\big(1-X_{wv}(z_1)\big) \\ +\lambda(\gamma z_1 + \lambda(1-z_2)X_{wb}(z_1))(\eta+\lambda(1-z_0))\end{array}\right\}\end{array}\right\}},$$

Substituting (36) and (31) into (32), we get

$$B^*(1,0) = \frac{\eta \lambda \gamma \left[\eta(1-z_1) + \lambda(1-z_0)\big(1-X_{wv}(z_1)\big)\right]\big(\gamma+\lambda(1-z_2)\big)}{\left\{\begin{array}{l}\big(\eta\lambda(\delta+\gamma)\big[\eta(1-z_1) + \lambda(1-z_0)\big(1-X_{wv}(z_1)\big)\big]\big(\gamma+\lambda(1-z_2)\big)\big) \\ +\delta\gamma \left\{\begin{array}{l}\eta^2\big(\gamma+\lambda(1-z_2)X_{wb}(z_1)\big) + \eta\lambda\gamma(1-z_0)\big(1-X_{wv}(z_1)\big) \\ +\lambda(\gamma z_1 + \lambda(1-z_2)X_{wb}(z_1))(\eta+\lambda(1-z_0))\end{array}\right\}\end{array}\right\}},$$

The inequality $\delta > 0$ is both a necessary and sufficient condition for the system to be stable in our study (Kim and Lee [9]).

Special Cases

Case (i): In our model if we place $\eta \to \infty$ and $p = 0$ then our model is remodeled as "An M/G/1 queue disasters and working breakdowns"(Kim and Lee [9]).

Case (ii): In our model if we place $\eta \to \infty$, $p = 0$, $\delta = 0$ and $\gamma = 0$ then our model is remodeledas "An M/G/1 queue"(Medhi [13]).

Metrics of effectiveness

Mean system size

Allow L_{wv},L_{rb} and L_{wb} to represent the average system size throughout vacation period, typical peak period, and repair period, respectively and let W_{wv},W_{rb} and W_{wb} represent the average waiting time of a customer in the system throughout vacation period, typical peak period, and repair period, respectively. Then

i) Differentiating $V^*(z,0)$ with regard to z and calculating at $z = 1$ provides the expected number of customers in the system during the vacation period (L_{wv}).

$$L_{wv} = \frac{D_{wv}(1)N'_{wv}(1) - N_{wv}(1)D'_{wv}(1)}{[D_{wv}(1)]^2},$$

where

$$N_{wv}(1) = -\eta V^*(1,0)(1 - S^*_{wv}(\eta)),$$

$$D_{wv}(1) = \eta(S^*_{wv}(\eta) - 1),$$

$$N'_{wv}(1) = -\eta V^*(1,0)(1 - S^*_{wv}(\eta)) - \eta\lambda V^*(1,0)S^{*'}_{wv}(\eta) - \lambda(1 - S^*_{wv}(\eta))V_0,$$

$$D'_{wv}(1) = -\lambda(S^*_{wv}(\eta) - 1) + \eta(-\lambda S^{*'}_{wv}(\eta) - 1).$$

We used little's formula to calculate $W_{wv} = \frac{L_{wv}}{\lambda}$, and obtainedthe average waiting time of a customer in the system During the vacation period.

(ii) Differentiating $\mathcal{B}^*(z, 0)$ with regard to z and calculating at z = 1 provides the expected number of customers in the system during typical peak period (L_{rb})

$$L_{rb} = \frac{D_{rb}(1)N'_{rb}(1) - N_{rb}(1)D'_{rb}(1)}{[D_{rb}(1)]^2},$$

$$N_{rb}(1) = -\delta \; \mathcal{B}^*(1,0)(1 - S^*_{rb}(\delta)),$$

$$D_{rb}(1) = \delta(S^*_{rb}(\delta) - 1),$$

$$N'_{rb}(1) = -\delta \; \mathcal{B}^*(1,0)(1 - S^*_{rb}(\delta)) - \lambda\delta \; \mathcal{B}^*(1,0)S^{*'}_{rb}(\delta) + (-\lambda \, \mathcal{B}_0 - \eta \, V^{*'}(1,0)$$
$$- \gamma \mathcal{R}^{*'}(1,0)) \, (1 - S^*_{rb}(\delta)),$$

$$D'_{rb}(1) = -\lambda \, (S^*_{rb}(\delta) - 1) + \delta \, (-\lambda \, S^{*'}_{rb}(\delta) - 1).$$

We used little's formula to calculate $W_{rb} = \frac{L_{rb}}{\lambda}$, and obtained the average waiting time of a customer in the system during typical peak period.

(iii) Differentiating $\mathcal{R}^*(z, 0)$ with regard to z and calculating at $z = 1$ provides the expected number of customers in the system during the repair period (L_{wb}).

$$L_{wb} = \frac{D_{wb}(1)N'_{wb}(1) - N_{wb}(1)D'_{wb}(1)}{[D_{wb}(1)]^2},$$

Where

$$N_{wb}(1) = -\gamma \, \mathcal{R}^*(1,0)(1 - S^*_{wb}(\gamma)),$$

$$D_{wb}(1) = \gamma(S^*_{wb}(\gamma) - 1),$$

$$N'_{wb}(1) = -\gamma \, \mathcal{R}^*(1,0)(1 - S^*_{wb}(\gamma)) - \gamma \lambda \, \mathcal{R}^*(1,0)S^{*'}_{wb}(\gamma) - \lambda \, (1 - S^*_{wb}(\gamma)) \, \mathcal{R}_0,$$

$$D'_{wb}(1) = -\lambda \, (S^*_{wb}(\gamma) - 1) + \gamma \, (-\lambda \, S^{*'}_{wb}(\gamma) - 1).$$

We used little's formula to calculate $W_{wb} = \frac{L_{wb}}{\lambda}$, and obtained the average waiting time of a customer in the system during repair period.

Statistical Analysis

Setting $\mu_{wb} = 3.2$, $\mu_{wv} = 3.4$, $q = 0.2$, $z_0 = 0.7$, $z_1 = 0.9$, and $z_2 = 0.8$,, and changing η from 1.0 to 1.4 insteps of 0.2, δ from 1.2 to 1.6 insteps of 0.2, and γ from 1.5 to 1.9 insteps of 0.2, we calculated the measured value of L_{wv} and tabulated them in Table 1, Table 2, and Table 3, respectively. The correlating graphs for λ versus L_{wv} are seen in Figure 1, Figure 2, and Figure3, respectively. As λ rises, L_{wv} rises for various values of η, δ, and γ, as seen in the graphs.

Setting $\mu_{wb} = 3.5$, $\mu_{rb} = 4.0$, $\mu_{wv} = 3.1$, $q = 0.4$, $z_0 = 0.8$, $z_1 = 0.9$, and $z_2 = 0.8$, changing η from 1.0 to 1.4 insteps of 0.2, δ from 1.2 to 1.6 insteps of 0.2, and γ from 1.3 to 3.3 insteps of 1.0, we calculated the measured value of L_{rb} and tabulated them in Table 4, Table 5, and Table 6, respectively. The correlating graphs for λ versus L_{rb} are seen in Figure 4, Figure 5, and Figure 6, respectively. As λ rises, L_{rb} rises for various values of η, δ, and γ, as seen in the graphs.

Setting $\mu_{wb} = 3.3$, $\mu_{wv} = 3.5$, $q = 0.4$, $z_0 = 0.8$, $z_1 = 0.9$, and $z_2 = 0.7$, and changing η from 1.3 to 1.7 insteps of 0.2, δ from 1.0 to 1.4 insteps of 0.2, and γ from 1.2 to 1.8 insteps of 0.3, we calculated the measured value of L_{wb} and tabulated them in Table 7, Table 8, and Table 9, respectively. The correlating graphs for λ versus L_{wb} are seen in Figure 7, Figure 8, and Figure 9, respectively. As λ rises, L_{wb} rises for various values of η, δ, and γ, as seen in the graphs.

CONCLUSION

We looked at an M/G/1 feedback queue with disasters, working breakdown, and working vacation in this article. The equations of Kolmogorov are constructed. Using the PGF and supplementary variable technique, we constructed steady state system size distributions.

ABSTRACT

The present investigation was undertaken to evaluate the anti-histaminic activity of polyherbal solution of ethanolic extract of *Urtica dioica* and *Adhatoda vasica*. The anti-asthmatic activity of the extract by using different concentration of ethanolic extract at 500, 1000 and 1500 µg/ml was evaluated in isolated goat tracheal chain preparations by using histamine. Histamine induced contraction in isolated goat tracheal chain showed that polyherbal solution inhibited the contractile effect of histamine ($P<0.05$). The modified physiological salt solution containing ethanolic extract of *Urtica dioica* and *Adhatoda vasica* (1000 and 1500 ug/ml) significantly inhibited the contractile effect of histamine thus produces significant bronchodilation. It is concluded that 1000 µg/ml of solution showed potent (95.85%) antiasthmatic activity due to bronchodilator activity. Concisely, the present study evidenced the traditional claim in the management of asthma. By virtue of the said actions will prove to be very effective in the antihistaminic therapy of asthma.

Keywords: Asthma, *Urtica dioica*, *Adhatoda vasica*, antihistaminic, Histamine, Goat Tracheal Chain.

INTRODUCTION

Asthma is a heterogeneous disease characterized by reversible airflow obstruction, bronchial hyper-reactivity, airway inflammation, mucus hyper secretion and structural changes to the airways (remodelling). These manifestations lead to breathlessness attacks, wheezing, coughing, and tightness in chest often occurring after exposure to allergens, pollutants, infections or drugs. damage when this advantageous reaction happens in an unregulated manner (ROS) [1]. More than 300 million people globally, roughly one in ten of whom living in India, currently suffer from asthma. The prevalence of asthma has been estimated to range 3-38 % in children and 2-12 % in adults, being the commonest chronic disorder among children [2].Synthetic medications used in the treatment of asthma are anti-inflammatory agents, mast cell stabalizer, leukotriene antagonists and bronchodilators. Despite the availability of a vast variety of drugs, the relief offered by them is mainly symptomatic and short lived. Moreover, these drugs leads to side effects. Therefore, there is a need to identify effective and safe remedies to treat bronchial asthma [3]. Ayurveda, an ancient system of Indian medicine, has recommended a number of drugs from indigenous plant sources for the treatment of bronchial asthma and allergic disorders [4]. Ayurveda suggests that the herbal plants have comparatively less toxic values and are more efficacious. They also have fewer chances of side effects and complications to patients as compare to available synthetic drug treatments [5].

Urtica dioica is a herbaceous perennial flowering plant in the family Urticaceae, also known as common nettle, stinging nettle (although not all plants of this species sting), or nettle leaf. This plant was used to cure conditions like arthritis, anaemia, hay fever, and as a diuretic, astringent, and blood builder. Phytochemical constituents of *Urtica dioica* are alkaloida, carbohydrates, steroids, flavonoids, tannins which shows antiinflamatory activity [6]. *Adhatoda vasica* Nees, frequently referred to as "vasaka, adosa, Malabur nut tree," is a member of the Acanthaceae family. Alternatively, it is referred to as Justicia adhatoda. leaves are more frequently used, particularly for respiratory tract disorders including chronic and severe bronchitis. The fresh leaf juice has been used for diarrhoea and dysentery as well as being a useful antibacterial, antiperiodic, and anthelmintic, while the dried leaves are smoked as cigarettes in the treatment of asthma [7].The present study concentrates on the synergistic activity of the *Urtica dioica* and *Adhatoda vasica* extracts against bronchoconstriction. The herbal composite was prepared by the ethanolic extracts of *Urtica dioica* and *Adhatoda vasica*. Based on the literature review, this is the first reported work on the anti-asthmatic activity of the *Urtica dioica* and *Adhatoda vasica* composite extracts in goat tracheal chain preperation.

MATERIAL AND METHODS

Drugs And Chemicals
Procurement Of Plant Material
The dried powder from the leaves of *Urtica dioica* and *Adhatoda vasica* were collected from the local vendors of Pune.

Preparation Of Extract
The leaves of *Urtica dioica* and *Adhatoda Vasica* were air-dried. After 10 days of drying, the leaves were powdered and passed through sieve no 40. The ethanolic extract was prepared by maceration method. The extract was concentrated and dried at 60°C. The simple syrup (66.67% w/v) was prepared as per Indian Pharmacopoeia. One gram of each extract of *Urtica dioica* and *Adhatoda vasica* dissolved in simple syrup I.P. and the volume was made up to 100 ml.

Tissue Preparation
Goat trachea was obtained from the slaughter house and kept in Krebs's solution.

Isolated Goat Tracheal Chain Preparation
Isolated adult goat tracheal tissue was obtained immediately after slaughter of the animal from the slaughterhouse. Trachea was cut into individual rings and tied together in series to form a chain and then suspended in organ bath containing Kreb's solution which was continuously aerated and maintained at 37 ± 0.5°C. Tissue was allowed to

67108

equilibrate for 45 min under a load of 400 μg [8]. A dose response curve (DRC) for histamine (20 μg/ml) was taken in variant concentrations, by maintaining a 15 min time cycle. After obtaining a dose response curve of histamine on trachea, 0.1 ml of the concentration 500 μg/ml of formulation was added to the reservoir and allowed to react for 20 minutes. Thereafter the same doses of histamine were repeated. The change in the DRC was noted down. Similar procedure was followed for the concentrations of 1000 μg/ml and 1500 μg/ml of formulation. Graph of average percentage contractile response on ordinate and logarithm dose of histamine on abscissa was plotted to record dose response curve of histamine, in absence and in presence of the test formulations.

STATISTICAL ANALYSIS

Statistical analysis was done by using GRAPHPAD PRISM 5.0. All the values of biochemical parameters and body weight were expressed as mean standard error mean (SEM). The values were analyzed for statistical significance using one-way analysis of variance (ANOVA), comparison was done by using Dunnett's t test. $P<0.05$ was considered as significant.

RESULT

A notable contraction produced by histamine at a dose of 1.6 ml on isolated goat tracheal chain preparation. Polyherbal solution at a dose of 1000 mg/ml exert significant antagonistic effect ($p<0.05$) on histamine induced (1.6μg/ml) contraction as compared to Average % response in absence of formulation (control group).

DISCUSSION

Pharmacotherapy using plant-derived substances can be currently regarded as a very promising future alternative to current synthetic drug therapy. The advanced techniques and technologies available today enable to investigate chemically well-defined bioactive plant components as sources of novel drugs. [8] Histamine is an autacoids, is one of the major inflammatory mediators in the immediate phase of asthma, causing airway hyper responsiveness and bronchial airway inflammation. Besides the triple response caused by it, histamine has spasmogenic response on intestinal smooth muscle by acting on H1-histamine receptor that causes the contraction of intestinal smooth muscle [9]. Histamine is synthesized, store and released by mast cells in the airway wall. In blood, histamine is stored in basophils, The non-mast cell histamine is stored in histaminocytes in the stomach and in histaminergic neurons in the brain apart from this number of mediators releases on antigen antibody reaction like Kinins and others. [10] Although, airway mast cells are likely to be the major cellular source of histamine in asthma there is increasing evidence that basophiles may be recruited to asthmatic airways and may release histamine in response to cytokine histamine-releasing factors hence, Histamine has multiple effects on airway function that are mediated by specific surface receptors on target cells. H1 receptors mediate most of the effects of histamine that are relevant to asthma. [11]This paper suggested that H1 receptors are responsible to produce bronchial, smooth muscle contraction. In the present study we have used isolated goat tracheal chain preparation. The similar response exhibited by the extract in case of goat tracheal chain preparation, which support the ethanolic extracts of *Urtica Dioica* and *Adhatoda Vasica* was acting on H1 receptor as antagonists.

CONCLUSION

This work will be useful to find new anti-asthmatic drugs with the help of an *in vitro* model. It can be concluded that the formulation of ethanolic extracts of *Urtica Dioica* and *Adhatoda Vasica*, possess significant antiasthmatic activity. The results will be obtained in the study to provide basic data for further progress and application.

ABSTRACT

The Photographers are at risk for holding injuries to elbows, upper arms and wrists due to keep their arms bent when holding a camera, which is usually bulky and heavy and typically hold and grip their cameras tightly - intentionally for stability and unintentionally with tension to the joints and body regions. while holding our cameras in a tight, bent position, twist elbows and wrists to change the zoom or focus on the camera lens. As a result, there is a chance for any of a number of musculoskeletal injuries, which all involve swelling, discomfort, and heat in tendons and joints. To evaluate the rapid upper limb analysis of ergonomic risk factors among photographers. To Identifying the risk factors of musculoskeletal disorders in the body regions among photographers. Methodology: A convenience samples of 40 subjects taken from this study and fulfill the selection of criteria with collected the informed consent form for the photographers. The male photographers with the age group between 25 to 40 and more than 2 years of experienced persons were taken from this study. The photographers were asked to fill the questionnaire to identify the affected body regions. They were' divided into the two categories of photographers such as marriage photographers and free freelance photographers were included from the study. Outcome measures: Rapid Upper Limb Analysis. Rapid Upper Limb Assessment can be applied to photographers to evaluate ergonomic risk factors associated with their upper extremities. Photographers often engage in repetitive tasks, prolonged periods of holding and operating equipment, and maintaining specific postures while capturing and editing images. This study analysis of the upper extremity affected the body regions such as the neck, shoulder, elbow, wrist and hand. The professional photographers handling their camera for different awaked posture during their working place and overuse injuries occurs in the upper extremities. The observation analysis of the upper

67111

extremity most common problems presents in the neck and shoulder region. The rapid upper limb analysis to find out the musculoskeletal disorders among the photographers.

Keywords: photographers, heavy, camera, problems, musculoskeletal

INTRODUCTION

Work related musculoskeletal disorders are very common health problem in the worldwide. The work related musculoskeletal disorders of photographers such as the improper handling the camera, repetitive use of upper extremity while using the camera, awaked posture to concentrate on the unilateral side, pressure over the anyone of the joints, bending position to take photo shoot, photo and video shoot more than 5 -6 hours to stay in one position[2]. The strain over the upper extremity to hold the camera in side of the neck and shoulder in prolonged periods. The photographers have inadequate or uncomfortable postures, performing certain angles for photograph, carrying heavy lens luggage on the back and psychosocial factors. Standing for more than half a day in an awkward position due to increases the musculoskeletal disorders. The musculoskeletal problems are start with fascia, tendon, ligaments, bones, muscles and nerves. The photographer has repeated use of their hands, shoulder, elbow and other parts of the body to get stress and pressure over the affected area, finally inflammation of the joints. The result of inflammation of the affected parts the symptoms can occurs pain, and discomfort in the joints and muscles [1].

Biomechanically the photographers refer to work related musculoskeletal disorders includes static posture; repeated pushing, pulling, lifting, and neck bending highly repetitive work and forceful exertion in work. In addition, workplace factors such as time pressure, poor work and rest schedule, and low job control, physical factors and psychosocial stress have also been reported as risk factors for work related musculoskeletal disorders in photographers [2]. A study has reported that these ergonomic risk factors are present in workplaces for cameramen and that they affect the incidence of WRMDs among cameramen. Another study has reported that because cameramen perform physically demanding tasks and thus experience high levels of physiological stress, their occupation must be classified as heavy work. Cameramen can also be exposed to ergonomic risks depending on the type of camera and filming methods they use [3].

Standard studio cameras used in studios have wheels attached to them for mobility. Although these cameras are usually used in the erect state, cameramen are forced to repeatedly use pulling and pushing forces to change the filming angle and distance[4]. While filming, they must twist their bodies and tilt their head up to look at the viewfinder for monitoring. There are three main methods of outdoor filming: filming using a tripod, filming by directly holding the camera, and filming using a jimmy jib camera. When filming with a camera fixed in a tripod (Electric News Gathering Camera, Electronic Field Production camera, Electric cinematography), cameramen must squat or bend their waist to adjust the height according to the position of the subject, and thus cannot film in a comfortable posture. Their bodies twist, and their necks bend downward to look at the viewfinder. When filming by directly holding a camera (Electric News Gathering Camera) [4], cameramen must carry the weight of the camera, which is over 10 kg. They usually place the camera on their right shoulder for a long period of time without moving and must use different postures such as lifting the camera above the shoulder or lowering it to below the waist or knee level depending on the situation [5].

GK Karatas and F Gogus proposed that these risk factors induce suprascapular nerve entrapment among cameramen. Meanwhile, a jimmy jib camera in the shape of a long lever is used to get an overall shot from high places. A weight is added to one end of the lever and a camera at the other end to adjust the camera height. It is the cameraman's job to lift the weight above the head or lower it below the knees. Outdoor filming requires continuous angle adjustment, focus, and light exposure before the actual shooting begins [6]. Therefore, they should be considered as working hours for the cameramen other than moving hours and resting hours, the cameramen's

filming posture can vary for each scene, each angle. This observational analysis study to evaluate the ergonomic risk factors in photographers [6].

OBJECTIVES
To evaluate the rapid upper limb analysis of ergonomic risk factors among photographers.
To Identifying the risk factors of musculoskeletal disorders in the body regions among photographers.

METHODOLOGY
The convenience samples of 20 male photographers were taken from this study, the data was solicited from photography studios, media studies and film industry to the basis upon the inclusion and exclusion criteria. This subjects were asked to fill the questionnaire form and inform consent form.

Inclusion criteria:
- Male photographers
- 25 to 50 years of age
- CMDQ score more than 8
- Freelance and wedding photographers
- Photographers had more than 1-year experience.
- cameramen who specialized in outdoor filming including those who filmed dramas, entertainment shows.

Exclusion Criteria
- Current history of arthritis
- Trauma
- Fractures or dislocation in upper extremity
- Diabetes Mellitus
- Systemic lupus erthymatosis
- Infectious conditions
- Malignancy
- Recent surgery
- Medically ill persons

PROCEDURE
20 male photographers were randomly selected for this study and to collect the information about the photographers such as age, gender, BMI and asked to fill the Cornell musculoskeletal discomfort questionnaire for identify the musculoskeletal disorders in affected body regions. Then Rapid upper limb analysis tool used to assess the static posture, repetitive movements, force and risk factors due to any awkward position during the photographic work. This observation analysis for 6months' duration to completed the study [8].

RESULTS

The results shown below the sociodemographic data, Cornell musculoskeletal questionnaire for identifying the affected body regions, Rapid upper limb analysis for level of work and ergonomic risk factors. The data was analyzing SPSS Latest version.

DISCUSSION

Rapid Upper Limb Assessment (RULA) can be applied to photographers to evaluate ergonomic risk factors associated with their upper extremities. Photographers often engage in repetitive tasks, prolonged periods of holding and operating equipment, and maintaining specific postures while capturing and editing images[9]. Here's a

discussion of how RULA can be utilized in the context of photographers: RULA can help assess the posture of photographers while they are actively shooting. It considers factors such as the position of the neck, back, arms, and wrists. For example, photographers may adopt awkward postures, such as prolonged neck extension or forward shoulder positioning, while looking through the viewfinder or holding the camera. RULA can identify these deviations from neutral positions and rate their ergonomic risk levels[10]. Posture during image editing: In addition to capturing images, photographers spend a significant amount of time editing their work on computers or other devices. RULA can evaluate the posture adopted during editing, including the position of the upper limbs, neck, and back. Poor workstation setup, such as inadequate monitor height or improper keyboard and mouse placement, can contribute to ergonomic risk factors. RULA can help identify these issues and suggest improvements [11]. Photographers often engage in repetitive movements while adjusting camera settings, focusing, or operating controls. RULA can assess the frequency and duration of these movements, as well as the posture associated with them[12]. It can help identify tasks that involve high levels of repetition and determine if modifications are needed to reduce the risk of repetitive strain injuries. Use of camera equipment: RULA can consider the ergonomics of the camera and other equipment used by photographers. Factors such as the weight, size, and grip of the camera, as well as the placement of buttons and controls, can affect the ergonomic risk. Evaluating these aspects can help photographers select equipment that better suits their ergonomic needs and reduces the potential for strain or discomfort. Based on the RULA assessment, recommendations can be made to improve the ergonomic conditions for photographers. This may involve adjusting workstations, modifying equipment, providing training on proper postures and techniques, or implementing rest breaks to minimize the risk of musculoskeletal disorders. These interventions can help photographers maintain healthier working postures and reduce the potential for injuries or discomfort. It's important to note that RULA is a qualitative assessment method and should ideally be complemented with other ergonomic evaluation techniques and input from ergonomic professionals who have experience working with photographers [13] . They can provide further insights into the specific challenges and ergonomic requirements of the photography industry, ensuring a more comprehensive approach to mitigating ergonomic risks.

The mean age is 6.588 years, with a standard deviation of 36.3. This suggests that the data has a relatively wide spread, indicating a diverse range of ages within the sample population. The mean height is 3.096 units (e.g., meters, feet, or inches), with a standard deviation of 161.9. Similar to age, the data exhibits a considerable dispersion, suggesting a wide range of heights among the individuals. The mean weight is 5.918 units (e.g., kilograms or pounds), with a standard deviation of 74.35. The standard deviation indicates a notable variation in weights within the sample population, possibly reflecting different body compositions and sizes. The mean BMI is 2.634, with a standard deviation of 27.6. BMI is a measure of body mass relative to height and is calculated by dividing weight (in kilograms) by the square of height (in meters). The standard deviation in this case is quite high, indicating significant variability in BMI values among the individuals. It's important to note that without knowledge of the specific units used for height, weight, and BMI, it's difficult to provide a precise interpretation [14]. However, based on the provided mean and standard deviation values, it appears that the sample population for the demographic data is diverse in terms of age, height, weight, and BMI. The standard deviations suggest a wide range of values within each factor, indicating potential differences and variations among the individuals in the sample. The data represents the percentage of individuals experiencing issues in different body regions, specifically Neck, Shoulder, Elbow, Wrist, and Hand.

According to the data, 57.8% of individuals reported issues related to the neck. This suggests a relatively high prevalence of neck discomfort or pain within the sample population. Common causes of neck problems in photographers may include maintaining prolonged forward head positions while looking through the viewfinder or prolonged neck extension when photographing subjects from low angles. The data indicates that 56.4% of individuals reported shoulder-related issues. Shoulder problems can arise from various factors such as holding heavy camera equipment, repetitive arm movements, or maintaining awkward postures while shooting. These factors can contribute to shoulder muscle strain, impingement, or other forms of shoulder discomfort. The data shows that 42% of individuals experienced elbow issues. Photographers may develop conditions like tennis elbow

(lateral epicondylitis) due to repetitive motions, such as pressing the shutter button or adjusting camera settings [15]. Awkward postures, such as excessive bending or reaching, can also contribute to elbow problems. Approximately 22.3% of individuals reported wrist-related issues. Wrist discomfort can be caused by factors such as repetitive movements during shooting or editing, awkward wrist positions, or prolonged gripping of camera equipment. Conditions like carpal tunnel syndrome or tendinitis can develop due to these repetitive motions and strains on the wrist. The data indicates that 8.5% of individuals experienced hand issues. Hand-related problems in photographers can include issues like trigger finger, numbness or tingling, or general hand fatigue. These issues can arise from repetitive finger movements, gripping camera equipment for extended periods, or maintaining a tight grip on the camera. The data suggests that photographers commonly experience musculoskeletal issues in the neck, shoulder, elbow, wrist, and hand regions. It underscores the importance of ergonomic considerations and preventive measures to minimize these risks. Proper equipment selection, good posture, regular breaks, stretching exercises, and maintaining overall fitness can help reduce the prevalence of these issues and promote healthier working conditions for photographers. Seeking guidance from ergonomic specialists or healthcare professionals can also be beneficial in managing and preventing these types of discomfort or injuries [11].

The analysis of type of work performed by photographers and the associated ergonomic risk factors, along with the percentages of individuals experiencing issues. Holding the camera: This factor is associated with a 9.2% prevalence of neck discomfort. Holding a camera for extended periods can strain the neck muscles, especially if the camera is heavy or if photographers maintain awkward postures while shooting. It's important for photographers to consider the weight and ergonomics of their equipment to minimize neck strain[12]. Position of the camera: The data shows that 8.4% of individuals reported shoulder-related issues associated with the position of the camera. Holding the camera at an awkward angle or position can place stress on the shoulder joints and muscles, leading to discomfort or pain. Proper positioning techniques, such as using tripods or supports, can help reduce shoulder strain. Weight of the camera: This factor contributes to both neck and shoulder issues, with a prevalence of 9.6%. Carrying a heavy camera can strain the neck and shoulder muscles, especially during prolonged shooting sessions. Photographers should consider the weight distribution and use ergonomic straps or harnesses to help distribute the load and minimize the risk of musculoskeletal problems.

Hanging the camera in the neck: The data indicates that 9.2% of individuals experienced neck and shoulder discomfort from hanging the camera around their neck. This practice can put strain on the neck muscles and cause fatigue over time. Using camera straps or harnesses to distribute the weight and relieve pressure on the neck can be helpful [10].Carrying the bag: Carrying camera bags is associated with a 9.0% prevalence of neck discomfort. Camera bags can be heavy, especially when carrying multiple lenses, accessories, and other equipment. Carrying the bag on one shoulder or overloading it can strain the neck and contribute to discomfort. Using backpack-style camera bags or distributing the weight evenly can help reduce the strain on the neck. Twisting the camera: Twisting the camera is associated with a 5.6% prevalence of wrist and hand issues. Rotating or twisting the camera excessively can strain the wrist and hand muscles, potentially leading to overuse injuries or discomfort. Maintaining proper hand and wrist positions and using ergonomic grips or handles can help mitigate these risks [12].

The data suggests that various aspects of the photographer's work, such as holding the camera, the position and weight of the camera, carrying camera bags, and twisting the camera, contribute to ergonomic risk factors. It is important for photographers to be aware of these risks and take preventive measures to minimize the strain on their neck, shoulder, wrist, and hand. This can include selecting lighter equipment, using proper support and ergonomic accessories, and adopting good posture and handling techniques. Regular breaks, stretching exercises, and maintaining overall fitness can also contribute to reducing the prevalence of these ergonomic issues [14].

CONCLUSION

The study revealed that photographers are exposed to significant ergonomic risk factors in their work. These risks primarily affect the neck, shoulder, elbow, wrist, and hand regions, indicating the potential for musculoskeletal disorders among photographers. Neck and shoulder strain: The study identified neck and shoulder issues as particularly prevalent among photographers. Holding the camera, the weight of the camera, and hanging it around the neck were associated with increased risks and discomfort in these areas. Addressing these factors is crucial to prevent neck and shoulder-related problems. The weight of the camera was found to be a significant contributing factor to ergonomic risks. Carrying heavy equipment for prolonged periods can strain the muscles and lead to potential injuries or discomfort. Using lighter camera options or distributing the weight more evenly can help mitigate these risks. The study highlighted the importance of maintaining proper postures during photography. Awkward positions, such as twisting the camera or adopting incorrect body postures, were associated with increased risks for the wrists, hands, neck, and shoulders. In conclusion, the cross-sectional study utilizing RULA provided valuable insights into the ergonomic risk factors faced by photographers. The findings underscore the importance of addressing neck and shoulder issues, considering camera weight, promoting proper postures, and implementing tailored ergonomic interventions. By adopting these measures, photographers can enhance their occupational health, work comfortably, and minimize the potential for work-related injuries or discomfort.

ABSTRACT

Heterogeneous catalysis reactions in most of the pharmaceutical industries involve the usage of Pd/C. In this study nitro compounds viz., 2 – chloro nitro benzene reduced by 10% Pd/C (50% wet) to 2 – chloro aniline and it is confirmed from MASS and NMR studies. The product yield was 75%.   The hydrogenation was complete in 7 h. The catalysts were then irradiated by electron beam to various dosages from 0 kGy to 250 kGy by Microtron & RF Linac. The reduction reactions were conducted under similar conditions using irradiated 10% Pd/C samples. Now the product yield was 85 - 95%.   The hydrogenation was fast and completed within 1 h to 2 h.   With the electron beam irradiated catalyst, the reaction time has decreased by 15 -70% and the completion of reaction is in the order of dosages 250 kGy > 200 kGy >150 kGY > 0 kGy. The fastness of reduction reaction in both the steps upon irradiation could be attributed to the increase in surface area. The increase in BET and Langmuir surface area of the irradiated catalysts confirms the increase in the degree of dispersion of Pd particles which contributes to the enhanced catalytic activity. The studies were also conducted using Micro powder form of Pd/C catalyst both in non-irradiated and in the irradiated form. The decrease in reaction time and the increase in product yield have been attributed to higher dispersion of Pd particles upon irradiation. Moreover the effect of electron beam irradiation of the catalyst persisted even after 9 months of irradiation.   This study enhances the greener approaches of Pd/C catalyst.

Keywords : Electron beam irradiation, Pd/C catalyst, nitro compounds, reduction

INTRODUCTION

Effectiveness of heterogeneous catalysis relies on the micro surface nature and structure of the solid phase on to which both the reagent and the starting material get adsorbed prior to the reaction. Uniformity of the surface also plays a major role in effecting selectivity or specificity. If one were able to treat the solid surface appropriately, it is possible to control the progress and path of the reaction in such a manner to achieve the desired molecular conversion, as the very reaction primarily depends on the micro structural features of the solid surface. Microtron-treatment of the solid phase of heterogeneous catalysts could be one such option, but not a well-studied area to effect selective organic transformations.

Non-traditional methods like Electron Beam Treatment of catalyst activation attract significant attention of researchers working in the field of heterogeneous catalysis.   This method creates active sites on the catalyst surface possessing higher activity and selectivity. Electron-beam-induced surface chemistry in high vacuum conditions has been studied for various solid surfaces, generating interesting results and enriching the knowledge of the surfaces and surface reactions. The present study aims at developing the effective heterogeneous catalysts suitable for synthesizing organic compounds through electron beam irradiation. The catalyst selected is palladium adsorbed on carbon (solid and micro powder form). Organic reactions involving palladium catalysed reduction of mono functional organic compound 2 – chloro nitro benzene. The same reactions were carried out using electron beam irradiated catalysts and the catalytic efficiencies were compared. The studies on surface morphological changes of the catalysts were also undertaken.

EXPERIMENTAL

Chemicals and instruments

The chemicals 2 – chloro nitro benzene, methanol were procured form Aldrich Chemical Company (USA), 10% Pd/C from Hindustan Platinum Limited, Mumbai and Micro Pd/C from Sigma Aldrich. All the chemicals were of analytical grade and used as received .Pd/C (10%) samples were irradiated by electron beam of 8 MeV using Microtron at the Microtron Centre of Department of Atomic Energy, Mangalore University. Also, Pd/C (10%) and Micro Pd/C catalysts were irradiated by electron beam of 10MeV using RF Linac operational at the Electron Beam Centre, BARC, Navi, Mumbai. Hydrogenation reactions were carried out using Catalytic hydrogenation apparatus Low Pressure Shaker Type SUPERFIT Model SS316. Thin layer Chromatography was performed on pre-coated Silica gel plates (Merck F254, 0.2 mm thickness). The NMR spectra for organic compounds were recorded on Bruker 400 MHz FT-NMR spectrometer in $CDCl_3$Solution. The surface areas of catalysts were measured with a Micromeritises Tristar 3000 model, (USA make). BET and Langmuir Surface area analysis are based on adsorption of N_2. Scanning Electron Microscopy images of catalysts surface were taken with a [SUPRA 55]-CARL ZEISS, (Germany make) and UPRIGHT MICROSCOPE, BX 51, OLYMPUS, (Japan make). The images were registered under magnifications 1 K X and 250 K X. EDS studies were undertaken using Oxford Instruments.

Catalytic Reactions Studied

Reduction of 2-chloro-nitrobenzene

A solution of 2-chloro-nitrobenzene (2 g) in methanol (40 mL) and 10% Pd/C (0.3 g; 50% wet) were charged into a Parr hydrogenator vessel and flushed with nitrogen. Hydrogen was passed into the vessel at a pressure of 5 atm and temperature of 26-28 ^{0}C.The progress of the reaction was monitored by TLC for every half an hour till the completion of the reaction.
The course of the reaction was monitored by TLC using a mixture of heptane and ethyl acetate (7:3) as mobile phase and silica gel coated alumina plate as Stationary Phase. After completion of the reaction, the reaction mixture was filtered and washed with methanol. The filtrate was concentrated using a Buchi Rotary evaporator. The Product   2-chloro aniline was obtained. The reactions were conducted under similar conditions using 150 kGy, 200 kGy, 250 kGy irradiated 10% Pd/C samples. Also similar reactions were carried out using Micro Pd/C catalyst of both non-irradiated and irradiated forms (250 kGy). The results are tabulated in Table 1,2

RESULTS AND DISCUSSION

NMR spectroscopy

The structure of the Product 2-chloro aniline was characterized by ^{1}H NMR spectroscopy. The multiplets between δ 6.32 – 7.25 ppm show the presence of aromatic protons. A signal at δ 3.71 ppm shows the presence of -NH$_2$ protons. (Fig.1).

MASS spectroscopy

The molecular mass of the product 2-chloro aniline was characterized by MASS spectroscopy. The molecular mass in positive scan is *m/z* 128.2 (Fig. 2).

Surface area measurements

The surface area measured by using low pressure N$_2$ BET surface Analyzer. The surface area of Pd/C catalysts, both irradiated and non-irradiated, are given in Table 3.

It was observed that the surface area of the irradiated catalysts has increased than the non-irradiated ones revealing the dispersion of palladium particles

Scanning electron microscopy
The SEM pictures (Fig. 3-10) reveal that Pd/C agglomerates are broken into small size particles leading to the increase in surface area. Particle size of Pd/C decreases with the increasing dosages of electron beam irradiation.

EDS studies
EDS studies (Fig 11 – 18) reveal that Atomic percentage of palladium in 10% Pd/C (50% wet) is 79.91% and the micro powder Pd/C is 94.35%.

Catalytic Studies
All these reduction reactions using various electron beam treated Pd/C catalysts showed, enhanced catalytic activity. Upon repeating the same reactions after 3, 6 and 9 months using the irradiated Pd/C catalyst, the reaction efficiency with respect to product yield and reaction time for hydrogenation were found to be maintained while comparing with the freshly irradiated catalysts. The irradiated catalyst efficiency has been found to be unaltered for nearly one year. So this study enhances the greener approaches of Pd/C catalyst.

CONCLUSION

The reaction time using Micro Pd/C is in the order of 250 kGy > 200 kGy > 150 kGy> un-irradiated Micro Pd/C (0 kGy). The rate of the reaction using 10% Pd/C is in the order of 250kGy > 200 kGy > 150 kGy > un-irradiated 10% Pd/C (0 kGy). The results show that with the increase in dosage the reaction time is found to decrease progressively with a net decrease of   55 -75% relative to that of the original system without irradiation. The reaction time using Micro Pd/C is lesser than that of 10% Pd/C. This may be attributed to the high BET surface area and atomic percentage of Micro Pd/C. XPS data for the Pd/C catalyst suggests that, after irradiation with high-energy electrons, the metal particles are stabilized on the surface of the carbon support, their degree of dispersion is increased, and their sintering is suppressed. The increase in BET and Langmuir surface area of the irradiated catalysts confirms the increase in the degree of dispersion of Pd particles which contributes to the enhanced catalytic activity. This study enhances the greener approaches of Pd/C catalyst.

ABSTRACT

The essential work of fracture and Cohesive zone model concept is widely used for crack propagation analysis in various material systems when subjected to different loading. The essential work characterizing the resistance of a structure to ductile fracture is important for many applications, from structural design to impact protection. The EWF approach is a means of separating the energy associated with fracture into two parts i.e. in inner fracture process zone and in plastic work zone. Present study uses double-edge notched tension (DEN-T) specimens for essential work of fracture for crack propagation. The main objective of the work is to apply the well-developed concept of EWF to derive the cohesive stress-critical opening relationship. This relationship is generally known as cohesive law to found the traction separation curve which was independent of the loading rate and dependent on the thickness.

Keywords: Essential work, Cohesive zone law, Polycarbonate, ductility, toughness.

INTRODUCTION

Polycarbonate materials are used in wide ranges of structural and industrial products such as automotive and aircraft industries [1]. It is important to understand the failure properties of polycarbonate materials. Failure of materials may occur due to several reasons like presence of defects, least maintenance service, environmental conditions, thermal crack, fatigue crack and design defect [1,2]. The deficiencies in materials, resulting into failure, may be disastrous to human life if the materials are not properly inspected, least serviced or replaced on time. Fracture design is a new technique to adopt in the field of research [3]. Many researchers with keen interests in the

67125

area of fracture design have given several theories of fracture and its cause. Failure of structural materials when studied from past shows the reason behind it [4]. Beneath the importance of study of failure of structural materials arises from failure of fabricated parts of ships during World War II. Failure of ships due to temperature decrement shows interest of study for many researchers of era age [3]. Later on, riveted plates were used in ships by changing the design part. Although this have achieved a new design concept regardless of failure analysis but there were many possibilities that brittle fracture may occur on rivetted joints [3]. Welded joints, thus replacing rivet joint shows great advantages toward making ship structures durable and reliable [1,3].

In line to the current research on essential work of fracture (EWF), Cotterell et. al. [5] used the essential work for plain stress ductile fracture. They have used cold low rolled alloy steel of 16-gauge sheet with DENT specimen. The work concludes that essential work of fracture which depends on thickness but not for the material constant. Mai et. al. [6] used the essential work of fracture for plain stress ductile fracture for strain aged steel. They used temper-rolled low carbon (~ 0.1%) 16 gauge sheet with DENT specimen. The pre-strained applied was from 2% to 12% and the aging temperature was 80° and 100°. From this study it was found that essential work was independent of pre-strain applied to specimen and was dependent on the strain aging. This was concluded with essential work decreases with strain-aging due to embrittlement of steel because of aging. In continuation to the work Mai et. al. [7] used essential work of fracture method for plane stress ductile fracture to know effect of specimen geometry on essential work of fracture. The material used was low work hardening aluminium sheet metal alloy (AA2S) of 1.6mm thickness. For their specimens used were Double edged notched tension specimen (DENT), Deeply centre notched tension specimen (DCNT), Deeply single edge notched tension specimen (SENT/DSENT) and Modified double edge notched tension specimen (MDENT). The study reported that FPZ was crack tip necked down zone for which specific essential work of fracture was independent of specimen geometry. Based on the adopted research on essential work of fracture, Hashemi [8] used the same concept but the work was carried for plane stress ductile polymer fracture. To examine the same, Hashemi [8] used poly (ether-ether ketone) (PEEK) material with three different thickness 0.10,0.250, 265mm and type of specimen used was SENT specimen. Results proposed that essential work of fracture was dependent on thickness. Similar study was carried by Chan et. al [9] for determination of fracture toughness of polymeric films through essential work of fracture. The material used were two types of Nylon, three types of Polyethylenes and two types of Polyimide with DENT and SENT specimen. Their report establish the relation between essential work, specimen width and material test speed and it was concluded that essential work is not sensitive to specimen width and test speed. In statement literature studies presented, present study focuses on the effect of elastic deformations for which the ligament length dependence of maximum net-section stress was analyzed on DENT specimens for a single type material.

EXPERIMENT AND RESULT

Material Selection

Literature report suggests that for Essential work of Fracture method the material used should be ductile. Also, literature report suggests that aluminium and polymers were highly ductile material. In accordance to the research report, many research paper states that EWF method was highly relevant for Polymers to find the cohesive zone law through toughness test and performing analysis using EWF method was an easy and reliable procedure. In polymers, Polycarbonate was selected because of its wide range of applications. Polycarbonate was collected from Kapoor Enterprise, Vadodara. Collected Polycarbonate was Lexan make polycarbonate sheet of dimension 4ft. X 8ft. Geometry of test specimen was selected as Double edge notched Tension specimen (DENT). DENT specimen was preferred as plane stress condition to overcome owing to the collinear notches in specimen cut from thin sheets.

Specimen Preparation

The specimen Geometry was selected as DENT so the specimen dimension needs to be selected based on various condition available in research papers for the plane stress condition. The conditions for plane stress fracture of polycarbonate are L > 5t and L < W/3. If this condition were violated then there might be mixed stress condition or

plain strain condition due to change in stress condition which results to drastic change in specific essential work of fracture. The thickness of PC sheet prepared was 0.8 mm with ligament length varying from 6-9mm. Specimen dimension and geometry is represented in figure 1a and the dimension of dog bone specimen is shown in figure 1b. Specimen were made on CNC Laser cutting machine and the crack notching was done on CNC Laser cut of 0.2mm width. The straps are adhered on end of specimen for proper gripping in tensometer.

Tensile Test

The primary objective of tensile test was to determine the stress strain behavior of a Polycarbonate material. To measure tensile tests, Universal testing machine was employed. In this cross-head (CH) travel rate was varied from 0.5 mm/ min to 500 mm/ min. The machine was connected to computer to compile data through data acquisition system. As C.H. travel rate can be controlled it should be given input data to software. In this case 1 mm/min was given for testing. Specimens were gripped in Universal Testing Machine.

RESULTS AND DISCUSSION

Determination of Ductility level

The tensile testing of polycarbonate is done on UTM and from Load-Displacement curve the Stress-Strain curve were found. The graph shown in figure 2a shows as strain rate increase there was increase in yield stress and decrease in percentage elongation. It was found that the polycarbonate was highly rate dependent material. Figure 2b shows the ductility levels for 0.8 mm thick specimen which was found between $0.15 < D_L < 1$ so it was confirmed that EWF approach can be applied. Whereas, Figure 2c shows the post yielding phenomena in test specimen. Results shows wide range crack tip formation during the process of fracture and there are only few cases in which brittle behaviour was observed. Such differences were brought out on the load verses displacement curves and their evaluation allowed a classification of the different behaviours of fracture on the basis of applicability of the essential work of fracture method which is described as:

Brittle: Catastrophic failure occurs before yielding of the ligament area.

Ductile Instability: the crack starts to plastically deform, when the elastic energy stored ahead of the crack tips, reaches to a critical value and causing unstable crack propagation and sudden rupture. The post-mortem specimens show whiteness at the extremities of the ligament indicating the occurrence of plastic deformation.

Blunting: It is characterized by larger plastic deformation of the crack tip, which is help to kept off the steady crack propagation.

Necking: DENT specimens show no crack propagation in the yielded ligament area and continue to deform plastically.

Determination of Fracture Toughness using EWF method

Essential Work of fracture (EWF)was used to find fracture toughness and requirement of EWF method is based on following terms:

1. Entire ligament must yield prior to crack initiation.
2. The Load-Displacement curve should be similar.

In experiment both of above condition is were satisfied and the load-Displacement Diagram shows that yielding occurs prior to crack initiation is as shown in figure 3a. Load-Displacement curve found for specimen of 0.8 mm thickness for loading rate all loading rate showing the load displacement curves are similar for all specimens. Based on load displacement curve the essential work of fracture was found out by extrapolating the line to zero ligament on graph of specific work of fracture vs ligament length graph as shown in figure 3b for 0.8mm thickness and for all loading rate. Based on load displacement curve the essential work of fracture was found out by extrapolating the line to zero ligament on graph of specific work of fracture vs ligament length graph as shown in Figure 3c for 0.8 mm thickness and for all loading rate.

CONCLUSION

Present work concludes that in DENT specimen cohesive zone and specific essential work of fracture is independent of ligament length and loading rate. But non-essential work of fracture is independent on loading rate. Results also states that cohesive zone law is dependent of thickness of the specimen. Using the above concluded statement, the future work will be modeled on estimation of stress triaxiality and determination of plastic strain and stress distribution in yield zone using FE simulation. Also, other ductile material will be used for deriving cohesive law using EWF method. Mining to the effect of cohesive zone on EWF, it was also concluded to apply the same principle to wide range of materials.

ABSTRACT

Coal bed methane or Coal mine methane is a green source of energy has gained extensive ground as an unconventional source of energy in recent decades. The methane level in both CBM/CMM is high which make it suitable for used as a fuel in both industrial and domestic sectors. From the existing investigation, it was found that all samples have a significant amount of gas content, making them suitable for hydrocarbon production. The gas contents of the studied coal samples show a linear relationship with depth, which increases with depth. The organic matter present in coal shows a positive trend with gas, but the mineral matter reduces the gas content of coal samples. As the coal matures, the gas content value increases in a linear manner. The overall study concluded that the block is suitable for methane production in the form of CBM or CMM.

Keywords: CBM/CMM; Fixed carbon; Vitrinite reflectance; Gas content; Coal rank

INTRODUCTION

Energy plays a vital role in the growth of any nation. At the current stage, energy consumption in India increases rapidly day-to-day [1-3]. The primary energy (conventional) sources like coal, oil and gas decreases day-by-day, which attract the world towards an unconventional source like Coalbed Methane, Coal Mine Methane, Gas hydrate, shale gas, wind energy, solar energy, etc [4-8]. Coal Mine Methane (CMM) may be fulfills the energy consumption demand of our nation if it properly utilized. CMM is recovered with coal during underground coal winning to reduce the methane concentration

67131

Deepak Singh Panwar *et al.,*

in the mine workings and to utilise it [9-12]. CMM is a form of natural gas, which was originated during the maturation of sedimentary rock (coal) and trapped in seams. The gas generation in coal through the two stage process; first is biogenic and second, thermogenic. Biogenic gas has formed during initial stage of coal formation and thermogenic gas has formed during the maturation of coal from lignite to anthracite [13-17].The most of thermogenic gas is produced during Sub-bituminous to bituminous stage [18-22]. Though coal is still the significant driver of India's energy segment and will continue to occupy center stage in India's energy basket in the foreseeable future, stipulate for CNG has steadily amplify over the years registering an annual growth rate of 6.8% in the last decade [23-25]. Being a less polluting and exuberant efficient fuel than coal, it is finding application in power and transport sector apart from acting as a feedstock in fertilizer, chemicals and petrochemical industries. India's natural gas supply sources are domestic production and LNG imports [26-27]. India's natural gas production reached 130 MMSCMD (47.51 BSCM) in 2009-10. Coal Bed Methane (CBM) production began commercially in 2007 in small quantity of about 6,300 SCMD . When compared to the present level of production in the nation, which was 0.23 million standard cubic metres per day (mmscmd) in 2011–12, it is anticipated that its output will reach 4 million standard cubic metres per day (mmscmd) by the year 2016–17 as revealed in Fig. 1. Methane reserves have been found in Jharkhand, West Bengal, Chhattisgarh, Orissa, Madhya Pradesh, Assam, Maharashtra, Gujarat, Rajasthan and Tamil Nadu provinces in India (Fig. 2).

Our nation is one of the leading country, who have taken steps through a translucent policy to exploit household natural gas resources. Several Indian firms, including Natural Gas Corporation (ONGC) and Oil India Limited (OIL) and, have been actively exploring and exploiting hydrocarbons (oil and gas) in India [28-29]. Essar Oil Limited, Reliance Industries Limited, ONGC, GAIL (India) Limited, and Reliance Industries. The Indian government has recently come to appreciate the hydrocarbon-generating potential of India's coalfields [30-32]. Exploring, developing, and using this potential has required a number of projects, including Shale gas, CBM, ventilation air methane (VAM) and CMM, gas hydrate in India [33-35]. The Oil & gas disquisition and exploitation operations are yet in the research and development (R&D) phase there; this study might help inform future Methane exploration in the region [36- 40].In this present examination, the Kulti coal block, which is located inside the Raniganj coalfield, will serve as the focus of the study. Coal samples were collected from diverse locations and depths using the standard method to evaluate hydrocarbon generation potential.

MATERIALS AND METHODS

For the present investigate samples were collected from random depth interval from Kulti block of Raniganj coalfield. The co-ordinates of the Kulti block are Latitude N 23°42'9.73" to N 23°43'59.15" & Longitude E 86°50'3.51" to E 86°52'43.16". This study area is located in the Burdwan district of West Bengal India as shown in Fig.3. Freshly channelled coal samples were obtained from five coal seams. Raw coal samples were crushed to -212 μm for proximate and ultimate analyses. The depth under study varies from 695.4 m to 1206.3 m.

RESULTS AND DISCUSSION

Maturity of coal

The gas content of coal generally augment with increasing coal maturity. As coal matures, the organic material undergoes thermal decomposition, resulting in the release and accumulation of methane within the coal matrix. Therefore, highly mature coals tend to have higher gas content, which can enhance CBM production [41-43]. Vitrinite reflectance (Ro %) provide an initiative about the maturity of coal. In existing study, the Ro % is determine by applying the formula developed by Meissner as follows:

VMdaf = 51.2-18.26 Ro   (1)

The Ro varies from 1.1094 to 1.673%. Hence, the vitrinite reflectance value illustrate that investigated samples belong to sub- bituminous to bituminous coal rank. Since the depth of collecting samples is high which enhancing rank and the adsorption capacity [44-47]. For commercial CBM production Ro value should be in between 0.7-2.0% [48-49]. The Vitrinite reflectance value which is estimated in the field fall in this range makes it suitable for CBM production. The relationship between depth, fixed carbon and gas content given in Fig.4.

Estimation of Methane Content

During coalification, the organic material undergoes thermal decomposition, releasing gases as by products. The primary gas generated is methane (CH_4), which is adsorbed and stored within the coal matrix. Methane is produced through several mechanisms, including thermal cracking of complex organic molecules, microbial activity, and the breakdown of 6 kerogen (organic matter) within the coal. The gas is adsorbed on coal surface by physical adsorption and its flow in coal matrix by using cleat network system. The quantity of methane gas which is retained in coal seam is rely on many parameters such as pressure, temperature, sorption time, depth of burial, maceral composition and inter surface area of micro-pores [50-51]. The quantity of gas is directly proportional to pressure and contrary proportional to temperature [52]. Kim's empirical equation was used to determine the connection between the volume of adsorbed gas, the pressure, and the temperature of the coal samples, taking into account mainly moisture and ash in the coal [53]. The variation of gas with depth is given in Fig.5.

Kim's correlation:

$$V = \left\lceil \frac{(100-M-A)}{100} \right\rceil \times \frac{V_w}{V_d} \times [K(P^N) - b \times T]$$ (2)

Where, V is volume of methane gas adsorbed (cc/g), M is moisture content (%) and A is ash content (%).

$$\frac{V_w}{V_d} = 1/(0.25 \times M \times 1)$$ (3)

Where V_w=Volume of gas adsorbed on wet coal (cc/g) and V_d= Volume of gas adsorbed on dry coal (cc/g). The gas content value of collecting coal samples varies from 8.57 to 16.56 (cc/gm) which is suitable for economical viability (8 to 15cc/g) [54].

Proximate and ultimate analysis

The moisture, volatile matter, fixed carbon and ash were estimated by proximate analysis. In the current investigation the maturity increases with depth that means the fixed carbon value is also rising as shown in Fig. 6. From the result obtained, it was seen that mineral matter varies from 15.3 to 27.4% moisture ranging between 0.9 to 2%, whereas volatile matter, content 16.6 to 24.3%, and the percentage of fixed carbon might range anywhere from 49.1 to 67.9%. According to the results of elemental

analysis, the total carbon content might range anywhere from 51.63 to 70.76%. It was obvious that the fixed carbon content increased with depth, which is exactly related to the coal's maturity [55].

Effect of organic and Inorganic substance on Gas content

The organic matter content in the coal affects the gas content. Higher organic matter content generally leads to higher gas content. This is because the organic material is the source of methane generation during the coalification process. Coals with higher organic matter content, such as those derived from woody plant material, typically have higher gas content compared to coals with lower organic matter content. Coal macerals are the individual microscopic constituents of coal, such as vitrinite, inertinite, and liptinite as revealed in Fig.7. The maceral composition can impact gas content. During coalification, the decomposition of organic material can produce various volatile products, including gases. Variation of the gas content with organic matter is given in Fig.8. These decomposition products can contribute to the overall methane in the coal seam. Existence of mineral matter in coal, such as clays, silicates, and carbonates, can affect gas content. Variation of the gas content with inorganic matter is given in Fig.9. Mineral matter can influence the permeability of the coal matrix, affecting gas flow and release. Some minerals may also possess adsorption capacity, potentially competing with the coal matrix for methane adsorption sites. Inorganic substances, particularly water, can affect gas content in coal seams. Water saturation within the coal matrix can impede gas flow and reduce effective gas storage capacity. The occurrence of water can also alter desorption characteristics of methane from the coal, affecting its release and recoverability. There are two types of substance present in coal one is organic which takes part in gas formation and second is inorganic (mineral matter) which reduced the sorption of gas on the surface of coalbed. The methane adsorption capacity of coal diminishes proportionately with the amount of ash present in the coal because the mineral matter displaces the organic content [56]. The fractures and cleats network get affected by the mineral matter, it reduces permeability and affect the economical production of gas [57]. Variation of the gas content with organic matter is given in Fig.8. The porosity of coal decreases from 25% to 5% as per moisture content decreases from 25% to 5% [58]. It was also observed that small quantity of mineral matter such as 1% to 5% might diminish the adsorption capacity of coalbed by 25% to 65% [59]. The minor amount of moisture and normal mineral matters are present in the field which is varies from 0.9% to 2 % and 15.3% to 27.4% which make it suitable for methane production.

CONCLUSION

LNG is a significant contributor to clean energy supply in India. Since we have a huge amount of coal resources available in the country, there is a great potential for CBM, CMM, VAM, shale gas, and gas hydrates to explore, develop, and utilise this potential. The proximate and petrographic analysis data reveal that medium-volatile to low-volatile bituminous coal is present in the Kulti block. From the existing investigation, it was found that all samples have a significant amount of gas content, making them suitable for hydrocarbon production. The gas contents of the studied coal samples show a linear relationship with depth, which increases with depth. The organic matter present in coal shows a positive trend with gas, but the mineral matter reduces the gas content of coal samples. As the coal matures, the gas content value increases in a linear manner. The overall study concluded that the block is suitable for methane production in the form of CBM or CMM.

ABSTRACT

Inadequate access to potable water in specific global areas is a significant concern. To address the issue, the primary solutions are to explore alternative water sources or purify polluted water to generate potable water. Several conventional and non-conventional methods have been proposed to address such issues. Concentration polarisation (CP) and membrane fouling are the primary factors that cause a reduction in the permeate flux during membrane separation processes. This research proposes a novel approach to enhancing flux by examining two primary techniques: flow reversal and pressure pulsation. Alternating the feed stream direction at regular intervals (5 m forward and 1 m reverse continuously) and pulsing compressed air (at frequencies of 1, 2, and 3 m) alongside the feed stream can reduce the permeate concentration. The in-series resistance model was used to measure the impact of flux enrichment and establish the relationship between resistances, taking membrane hydraulic resistance as the foundational factor. Pore blockage and gelation layer accumulation on the membrane surface result in decreased membrane permeability, leading to insufficient filtration. The membrane's hydraulic resistance exhibits consistent behaviour across varying pressures. At 294 kPa, the concentration polarisation resistance (R_{cp}) for unidirectional flow is roughly 0.38 times the membrane resistance (R_m) and 0.35 times R_m for flow reversal (5 mof feed forward and 1 m of reverse flow). R_{cp} rises for unidirectional flow but drops for flow reversal when pressure climbs to 490 and 686 kPa, respectively. CP

67140

is around 0.52 Rm and 0.45 R_m at 490 kPa pressure. At a greater pressure of 686 kPa, CP rises to between 0.61 $R_m$and 0.51 R_m. The pressure pulsation method was also used to study the development kinetics of CP resistance at different time intervals but promising results were not reported as compared to flow reversal technique.

Keywords: Membrane Separation Processes; Flow Reversal; Pressure Pulsation; Resistance; Concentration Polarization.

INTRODUCTION

In recent years, membrane separations have emerged as a prominent technique that is extensively employed in various industries. A growing body of research has demonstrated that membrane separation processes are a highly effective and environmentally sustainable method of separation [1, 2]. The primary concerns in membrane processes are the reduction in flux, fouling, and concentration polarization (CP), which arise from the accumulation of solids on the membrane's surface. Significant quantity of wastewater is discharged directly into rivers, streams, and oceans [3, 4]. The marine environment and fisheries have experienced significant impacts. The conservation of water is imperative due to its significant value as a resource. The primary objective of wastewater treatment facilities is to mitigate environmental pollution by reducing organic and suspended solids [5-8]. The progress in both societal requirements and technological capabilities has resulted in the development of treatment methodologies that effectively eliminate dissolved matter and hazardous substances. Membranes, serving as a discerning partition, are capable of accomplishing the objective of segregation and refinement [9]. Pressure-driven membrane processes (PDMPs) employ a pressure gradient as the primary driving force and are categorized into four distinct types based on decreasing membrane pore size: microfiltration (MF), ultrafiltration (UF), nanofiltration (NF), and reverse osmosis (RO) [10-13]. Membrane filtration is a separation technique that offers several advantages over conventional methods like centrifugation, distillation, extraction, and crystallization. These benefits include ease of operation, higher separation efficiency, energy savings, scalability, and compatibility with other separation and reaction processes [14]. As a result, membrane filtration has found extensive applications in various fields, including but not limited to the treatment of wastewater and reuse, purifying water, seawater desalination, food processing, and bio-separation. Despite the steady increase in the number of applications, this technology continues to face several challenges, including channeling problems and fouling of the membrane [15, 16]. The decline in permeate flux during filtration owing to CP and membrane fouling has adverse effects on production efficiency and energy consumption. Consequently, the utilization and advancement of membrane separation are significantly limited by the substantial decline in flux. In theory, convective transport is responsible for conveying solutes and solvents to the surface of the membrane [17]. The solvent molecules are able to traverse the membrane with ease, while the solutes that are retained lead to a rise in local concentration. This, in turn, causes the formation of a cake/gel/scaling layer on the membrane, and may even result in pore blockage. Separation exhibit varying forms of membrane fouling, such as biofouling, organic fouling, and inorganic fouling, contingent upon the nature of the solutes present [18]. This research study primarily concentrates on two flux enhancement techniques, namely pressure pulsation and flow reversal, with the aim of discerning a comparative analysis and arriving at conclusive findings. This study examines two flux enhancement techniques utilized to augment the permeate flux and alleviate the decline in permeate. This methodology was implemented with consideration of the contemporary environmental conditions and the human population.

MATERIALS & METHODS

A laboratory-prepared synthetic solution containing 160 reactive red dye molecules with a molecular weight of 818.13 Dalton (Da) was filtered using an HFF-150 membrane with a thickness of 125 microns and a molecular weight cut-off (MWCO) of 150, along with a support cloth The membrane element is made up of many thin films laminated

together with the base film is non-woven polyester, and the top film is polyether sulfone. Solution casting and phase inversion gelling were used to create the membrane. A membrane area of 0.016 m^2 was measured. India's Permionics Membrane Pvt. Ltd., which is based in Baroda, provided the membrane.

Experimental setup

The experimental set-up is shown in Figure 1. The apparatus incorporates a square membrane module for counter current nanofiltration. The test chamber was made of stainless steel and measured 225 mm x 150 mm x 50 mm on the outside, with an interior size of 160 mm x 100 mm x 2 mm. A perforated stainless-steel plate 1 mm thick was laid on top of a stainless-steel gauge with a mesh size of 350. Next, the membrane was laid on the highest of the gauge, next to filter paper. The testing membrane is supported by a strong mechanical structure and high pressure in this arrangement. The pilot plant assembly had an intake pressure gauge, an exit pressure gauge, and a high-pressure switching (HPS) to control the flow rate. The standard input voltage used in the tests was 230 volts. The feed solution was pumped into the test cell at high pressure (50-400 psi) using a powerful plunger pump. The cell has a membrane support at its base and a flow distributing chamber at its top. The test cell's top has a groove cut out for an HDPE "O" ring to be installed to seal up any potential leak points during high-pressure testing. To conduct the experiment, a powerful plunger pump was used to pressurise a solution of reactive red dye. Using a rotameter, the rejected stream was redirected into the feed tank. Due to a consistent feed volume (25 litres), the permeated flow was reused in the feed container in order to preserve the same concentration throughout the experiment. The order of events for both forward and reverse flow is determined by valve positions 1 through 5. In the forward flow mode, the feed was allowed to pass through the membrane by closing Valves 3, 4, and 5. A tank was used to store the permeate, and some of the water was diverted for reuse. By closing Valves 3 and 4, we were able to reverse the flow direction from Valves 1 and 2. The recovered permeate was recycled back into the water supply storage tank. Nanofiltration studies using forward feed and flow reversal devices are shown in Figure 1. Figure 2 depicts a similar setup, with the added technology of pressure pulsation. A pressure gauge (PG), high-pressure switch (HPS), and reject rotameter (RR) are all part of the package.

Varying the frequency of compressed air pulsation at intervals of 1, 2, and 3 m can reduce solvent accumulation in the permeate section and enhance system flux. The method is implemented with adjustments to the current system based on these assumptions. The fundamental approach involves introducing air that is compressed to the top layer of the membrane's surface at a distinct injection point during solute filtration. The air injection point and material feed inlet are be separated. The compressor is connected to the buffer tank to generate and supply pressurised air. An automatic relay timer is used to inject air into the system at specific intervals with a definite frequency of injection. The experiments were conducted at a different pressure from the buffer reservoir and varying pressures from the system.

RESULTS AND DISCUSSION

Membrane resistances in NF

The HFF-150 membrane module was utilised in a flat sheet nanofiltration pilot to conduct cross-flow membrane filtration experiments. Transmembrane permeate flux data was collected for both forward feed and flow reversal conditions. This section will discuss the correlation between the growth of obstruction, the pressure of operation, and the duration of feed dye solution passage. The membrane resistance's temporal growth is assessed at various pressures, and Figure 3 indicates that the membrane resistance remains relatively constant over time at different pressures. Fig. 4 illustrates that the adsorption resistance initially increases over a period of 20 m, after which it stabilises at a level that is approximately 40% of the membrane's hydraulic resistance. The resistance to adsorption increases over time. R_P was assessed according to the methodology outlined in Table 1. Figure 5 displays the R_P profile at different pressure levels. Pore-blocking resistance exhibits a gradual increase over time. After 60 m, the membrane's hydraulic resistance is approximately 37.8%. The valve R_P is approximately 0.22 R_m under low operating pressure conditions. R_P is approximately 41% lower than R_m for all pressure valves. R_P values increase with stronger

67142

polarisation conditions, i.e., at higher pressure values. Higher transmembrane pressure leads to increased solute convection towards the membrane's surface, resulting in significant pore plugging.

Comparing the flow reversal technique with the feed-forward system, it can be observed from Figure 4 that the flux gain is notably higher with flow reversal. The feed forward system (unidirectional) exhibits almost constant R_{CP} during operation. The increase in pressure results in the transportation of more solutes towards the membrane surface, leading to increased deposition and fouling resistance. At 60 m, R_{cp} is approximately 0.63 R_m at a pressure of 686 kPa and 0.40 R_m at a pressure of 294 kPa. Periodic reversals of feed flow reduce concentration polarisation and membrane fouling. At 686 kPa pressure, the 60 m run exhibits a R_{cp} of approximately 0.53 R_m, while at 294 kPa pressure, the R_{cp} is approximately 0.39 R_m. The results indicate a noteworthy reduction in R_{cp} under flow reversal conditions at higher pressures as compared to feed-forward flow. Figure 4 displays the resistance of cake formation for forward motion and flow reversal at varying pressures. The NF process experiences back pressure instability due to periodic flow reversal, which significantly hinders solute molecule retention by the membrane as the operation continues. Regular movement of the feed solution in reverse reduces the accumulation of molecules of solute at the membrane surface, leading to increased permeate flux. The concept of reversible R_{CP}, primary resistance among the four is resistance with a feed-forward condition, while adsorption resistance and pore hindering resistance have comparable effects on the system due to the initial blockage of pores. Adsorption and pores plugging resistance exhibit a positive correlation with pressure. The R_{CP} with flow reversal exhibits a significant reduction in resistance compared to the R_{CP} with unidirectional motion.

The pressure pulsation technique involves periodically applying compressed air or nitrogen gas to the membrane surface to improve system capability and permeability. The NF pilot plant's flat sheet module comprises a compressor series, buffer tank, solenoid valve, and timer. The compressed air is directed through the buffer tank in order to ensure an adequate air supply during purging. The built-in timer relay is installed in conjunction with the solenoid valve's mechanism to facilitate intermittent operation as needed. The HFF-150 membrane flat sheet module features perforations for connecting the pressurised valve piping to the system. The experiments began with the initial flux being determined as the reference point for the forward flow system. A synthetic solution with a concentration of 100 ppm was introduced into the system with a pressure pulsation frequency of 1 m intervals. The permeate flux was determined using the permeate obtained during a 10 m performance. The results were compared and presented in Figure 6(a). The R_{CP} experiences rapid growth during experimentation, while its feed-forward structure (unidirectional) remains largely unchanged during operation. Higher operating pressure results in higher R_{CP} values at a given operating time. The increase in pressure results in the transportation of more solutes towards the membrane surface, leading to increased deposition and fouling resistance. At 60 m, Rcp is approximately 0.54 R_m at 686 kPa and 0.43 R_m at 294 kPa. The application of a pressure pulse with a frequency of 1 m did not result in any significant change in the observed resistance within the system. Subsequently, the permeate flux exhibited a reverse effect. When applying pressure pulses at various frequencies, there is typically no significant decrease in the resistance decline (R_{CP}) or permeate flux. However, an increase in R_{CP} is sometimes observed at certain pressures. Figure 6(b) displays the temporal profiles of pulse resistance under conditions of both pressure and no pressure. The building of a dual-phase flow layer is noticed as a result of the creation of an air-compressed slugs on the membrane's top surface. Air and water that is fed create a bubble environment, increasing resistance at the membrane's surface and altering the system's flow and pressure. Pulse pressure from R_{CP} is ineffective for lowering resistance. However, the presence of a two-phase slug mixture may cause a slight increase in R_{CP} resistance, which may not be sufficient to improve flux in membrane separation processes.

Flow Reversal method
The most frequent flow scheme used in cross flow membrane filtering is the flow reversing flow scheme. By utilising 2-way valves that may be manipulated manually or automatically by solenoids controlled by a relay timer, the direction of the feed stream and the permeate flow can be altered at regular intervals in reverse flow mode. The reactive red dye 100 ppm solution is directly passed through the NF unit at 3 kg/cm² pressure for 1 h and samples were collected at each 10 m of interval in forward flow direction. As a same procedure continued for flow reversal

Balraj Tudu *et al.,*

but the difference is each 5 m interval direction of flow is changed for 1 m as reverse flow and again switched back to forward flow. The samples are collected at each 10 m of interval (5 m from feed side and 1 m from the permeate side). The same procedure was performed with different pressure of 5 and 7 kg/cm². As NF is a pressure driven membrane, the flux will increase with increase in pressure. Permeate flux with forward flow and Flow reversal at different pressure is shown in table 3.

Figures 8–10 indicate that, over a range of pressures, Flow reversal (FR) achieves higher permeate flux recovery rates than Feed forward. The FR approach is superior because it can more effectively remove particles of solute from the membrane surface. In contrast to the feed forward system, which loses 2.22% of permeate flow after 60 m of operation at 3 kg/cm2 pressure, the Flow reversal approach loses just 0.70%. For the same pressure circumstances in a unidirectional feed system, the FR approach results in a 1.31 % and 0.87 p% decrease in permeate flow, respectively. Therefore, it is evident that the flow reversal approach can reduce CP resistances and improve NF membrane performance.

Pressure Pulsation method
Various flux enhancement techniques are applied to alleviate the permeate quantity in a membrane separation processes and one of the investigating methods involves the pressure pulsation method. This method involves the application of the pulse of air / compressed air at the feed side inlet parallel to the feed line at different frequency of time intervals which provide the external pressure to the upper surface of the membrane where the turbulence of the fluid happens may create the external pressure on the membrane along with the system pressure. The reactive red dye 100 ppm solution is directly passed through the NF unit at 3 kg/cm² pressure for 1 hour and samples were collected at each 10 m of interval. At every interval frequency of the 1, 2 and 3 m, pulse of compressed air is automatically applied on the system at the feed side to alleviate the permeate flux with the different pressure applied. The experiments were performed at different pressure of 5 kg/cm² and 7 kg/cm² respectively. Experiments reveal the fact that system at 3 kg/cm² with pressure pulsation frequency of 1, 2 and 3 m shows permeate loss of 2.58, 5.12 and 5.12 % respectively compared to the normal feed forward system without pulsation of pressure. Similarly, at 5 and 7 kg/cm², the % loss of permeate flux value at 1,2 and 3 m are 1.31, 2.03 and 2.69 % and 1.52, 2.06 and 2.60 %respectively. As the pressure increases, the % permeate loss decreases (as it is a pressure driven process) and as the frequency of pulse time interval increases, the permeate flux increases. Thus, it can be said that applying the pressure pulse technique at different frequency of time and at different pressure show the intermediate results as sometimes permeate flux get enhanced or remains equivalent to the water flux calculated. Due to continuous pressure is subjected to the system at different frequency of time intervals, it is observed that two phase layers might be formed on the upper membrane surface creating another phase offering resistance to the feed flow unidirectional and formation of air-liquid bubbles get adhere on the membrane surface. Applying pressure pulsation technique does not provide proper suggestion for the flux enhancement rather decline the permeate flux.

Fourier transform infrared spectroscopy analysis
The alterations to the membrane's interior structure were studied using FTIR analysis. Important bands' FTIR assignments are shown in Table 5 below. The magnitude of the light transmitted during spectral analysis, which may be measured using FTIR, provides insight into the bond strength present, which can be fragile, medium-sized, or robust. Secondary N-H stretching vibrations at 1585 cm-1 have been isolated and characterised. C-N vibrations of aromatic compounds, in addition to O-H stretching and C-H vibrations that stretch of tertiary alcohols and phenols, are present in the unused membrane. The utilised membrane sample does not include any of these. Interaction with the solution of dye may be to blame for this. There are no C-F stretching vibrations seen in the membrane. The presence of alkane, as shown by C-H stretching in the membrane sample, may have resulted from reactions with the dye wastewater. In contrast to the unused sample, the membrane sample showed vibrations that stretched of C-Cl halogen compounds. The structure cannot be fully understood through FTIR analysis alone. More study is required to determine how membrane shape affects permeate quality.

SEM analysis

The surface morphology of the used and unused membrane is studied using Scanning electron microscope. There is a close relationship between the membrane morphology and the performance. Fig. 16 (a)-(d) describes the SEM images of top layer view of unused and used HFF-150 polymeric membrane. All the images were recorded at 5 kV voltage with magnification 500 X and keeping the maximum scale of 200 μm. The polymeric HFF-150 unused membrane (Fig.16 (a) and (b)) is smooth compared to used membrane (Fig.16 (c) and (d)). The shape and size of cellular pores observed in both used and unused membrane are different. It is observed that pores are getting denser and filled with tiny particles initiating the accumulation of solute particles moving towards fouling phenomena. Both the used and unused membranes have different microscopic view and trapping of various inorganic salts is observed in the photographs. The microscopic view of used membrane is depicting the layer by layer line deposition which gives definite cake layer formation on the top surface.

CONCLUSION

Reclamation of waste dye solution is found adequate with the NF process. Two flux enhancement techniques, Flow reversal and Pressure pulsation were applied to evaluate resistances and permeate flux in a reactive 160 red dye solution. The unidirectional flux calculated at three consecutive pressure are 0.38 R_m, 0.52 R_m and 0.61 R_m. It is observed that flow reversal technique has remarkable results as compared to pressure pulsation. The R_{cp} is 0.35 R_m, 0.45 R_m and 0.51 R_m at 296, 490 and 686 Kpa pressure respectively while applying flow reversal technique. Likewise, R_{cp} in case of pressure pulsation technique found nearly 0.38 R_m, 0.50 R_m and 0.54 R_m at different three pressures. This study reveal the membrane capability for the removal of dye particles from the waste water and implementation of flow reversal technique can minimize the usability of membrane. It also insight that NF has the potential to remove the dye particles efficiently. Experimentally more studies are further required to implement such technique on the commercial scale.

ABSTRACT

The research objective is to integrate nanoparticles into fuels- i.e., diesel, biodiesel, biodiesel blended with diesel, plastic derived fuels, etc. to increase the fuel efficiency. Alumina and copper oxide nanoparticles have been synthesized by sol-gel method. The characterization was done by Fourier Transform Infrared Spectroscopy (FTIR), X-Ray Diffraction (XRD), Scanning Electron Microscope (SEM) and Energy Dispersive X-ray Spectroscopy (EDS). The size of the particles was determined by XRD to be 28.6 nm and 28.06 nm for Alumina and copper oxide nanoparticles respectively. Different concentration blends- 50, 100, 150 ppm were prepared by adding the required weight of metal oxides in 1 liter of diesel and sonicating for 30 minutes at 500W. The blend properties- calorific value, viscosity, and flash point was analyzed. For the aluminum oxide blended diesel there was a maximum increase of 5.544% in the calorific value but at the same time there was an increase in the flash point from 43°C to 58.5°C and an increase in the viscosity from 2.45 cP to 3.25 cP. On the other hand, for the copper oxide blended diesel there was a maximum increase of 2.012% in the calorific value while the flash point increased from 43°C to 51.5°C and the viscosity increased from 2.45 cP to 2.94 cP. There was a linear increase in the calorific value, viscosity and flash point when the concentration of the metal oxide nanoparticles in the blend was increased. For the 50 ppm Al_2O_3 and 50 ppm Co_3O_4 blend the increasing the calorific value was 1.228 % and the viscosity changed from 2.45 cP to 2.64 cP and the flash point increased from 43°C to 50.5°C. Clearly the Alumina nanoparticles increase the calorific value but at the cost of flash point and viscosity, thus it is better to use the 50 ppm Alumina and 50 ppm copper oxide blended diesel.

INTRODUCTION

The quest for more efficient and sustainable energy sources has been a driving force in scientific research. In recent years, nanotechnology has emerged as a promising field that holds tremendous potential for enhancing fuel properties and addressing environmental challenges associated with conventional fuels. One such area of interest lies in the utilization of active alumina and copper oxide nanoparticles as fuel additives. This research article aims to explore the effects of these nanoparticles on fuel efficiency, emissions, and combustion characteristics, providing valuable insights into their role in advancing energy science. The incorporation of nanoparticles into fuels has gained significant attention due to their unique physicochemical properties at the nanoscale. Active alumina nanoparticles exhibit high surface area, thermal stability, and catalytic activity, while copper oxide nanoparticles possess excellent redox properties and reactivity. By introducing these nanoparticles into conventional fuels, researchers anticipate significant improvements in various fuel parameters, ultimately leading to enhanced performance and reduced environmental impact. Metal oxide additives have been studied as fuel additives and the combustion enthalpy and the quality of blended fuel improves, the additives also increase the energy density of the fuel. Nanoparticle blended fuel shows improved thermophysical properties when compared to unblended diesel. Considerable changes occur in thermophyical properties when metallic particles approach nano particle range. At the nano scale, the surface area to volume ratio increases significantly and this provides a considerably higher contact area during the oxidation reactions. Although there are quite a lot of combustion improvements which result by adding nanoparticles to fuel, very little experimental and investigative study has been carried out on nanoparticle blended fuel. Nano particles when stably suspended in fuel can lead to stimulating new properties and phenomena. One study has determined that adding n-Al to diesel fuel resulted in an enhancement of ignition probability.

Cerium oxide nanoparticles have been known to increase the catalytic activity of the hydrocarbon oxidation reactions; it also acts as a buffer against nitrogen oxides formation. Also due to the small scale of nanoparticles, the stability of the fuel suspension will increase. Aluminium is used due to its numerous applications as an energetic material [1]. Due to the various properties resulting from their variable oxidation state transition metal oxides have many applications. Cobalt oxide has high catalytic activity and selectivity due to the difference in oxygen defects, oxygen holes and oxygen absorbed in the different variable states of cobalt oxide (a mixed valence material $Co^{II} Co^{III} O_4$) [2]. Thus, Alumina and copper oxide were considered to be studied as nano fuel additives for diesel. Escribano et al. [3] studied the structural and morphological characterization of a Ce-Zr mixed oxide supported Mn oxide as well as on its catalytic activity in the oxidation of particulate matter arising from Diesel engines. Mn-Ce-Zr catalyst shows high activity in the soot oxidation producing CO_2 and CO as a by-product in the range 425-725K. Idriss studied the complexity of the ethanol reactions on the surfaces of noble metals/cerium oxide catalysts [4].

Recently, Alagu Sundarapandian et al.[5] studied the effect of organo metallic additives in diesel fuel and found that the property variation is desired for better performance. L.Prabhu et al.[6] studied the physic chemical properties of Titanium oxide nano particle as a biodiesel blend at the dosing level from 250 ppm 500 ppm. They inferred that Titanium nanoparticle additives shows positive effect in the fuel for better performance. S Karthikeyan et.al. [7] observed the effect of Alumina nano additives in biodiesel and discovered that flash point and fire point and viscosity are showed a decrement in their values. C David Truly et al.[8] experimentally found that Barium additives are diesel smoke suppressant and improves the fuel properties. Several studies have already demonstrated the potential benefits of nanoparticles as fuel additives. For instance, researchers have shown that the introduction of metal oxide nanoparticles can improve fuel efficiency through enhanced combustion kinetics and increased energy release rates [9]. Furthermore, nanoparticles have the ability to influence the fuel-air mixing process, resulting in more homogeneous combustion and reduced pollutant emissions [10]. These promising findings have paved the way for further investigation into the specific effects of active alumina and copper oxide nanoparticles on fuel properties.

EXPERIMENTAL SECTION

Chemicals

All chemicals used in the nanoparticles synthesis were of analytical grade. The chemicals used in the synthesis were aluminium nitrate ($Al(NO_3)_2.9H_2O$), methanol (CH_3OH), copper nitrate ($Cu(NO_3)_2.6H_2O$), potassium hydroxide (KOH), and distil water.

Synthesis of Nanoparticles

Synthesis of Alumina nanoparticles

A Sol gel technique is used to synthesize aluminum oxide nano-particles. 10 g of aluminium nitrate was dissolved in 150 ml of distilled water by stirring at 80ºC. 14 ml of methanol was added drop-wise with continuous stirring. The pH will change from 2 to 3 (pH paper color will change from pink to dark brown). This solution is heated for 3 hours in a water bath following by direct heating until the gel is formed. This gel is calcined at 500ºC for 5 hours in a muffle furnace to produce Alumina nanoparticles. The Alumina nanoparticles were annealed at 1000ºC for 3 hours to convert the γ-phase to α- phase of Alumina [3]

Synthesis of Copper Oxide Nanoparticles

100 ml of 0.6 M copper nitrate solution was prepared by stoichiometrically required copper nitrate in distil water with continuous stirring. 100 ml of 3.2 M potassium hydroxide solution was prepared by dissolving 17.952 g of potassium hydroxide in distil water with stirring. The potassium hydroxide solution was added drop-wise to the precursor solution. Pink precipitates are immediately formed, which on oxidation with air turn brown. These precipitates are separated and washed with distilled water to remove impurities. The precipitates are dried in an oven at 110°C for 20 hours, after which they were calcined at 300°C for 4 hours [2].

$$Cu(NO_3)_2.6H_2O + KOH \rightarrow Cu(OH)NO_3 + KNO_3 \qquad (1)$$
$$Cu(OH)NO_3 + KOH \rightarrow Cu(OH)_2 + KNO_3 \qquad (2)$$
$$4Cu(OH)_2 + O_2 + H_2O \rightarrow 4Cu(OH)_3 \qquad (3)$$

CHARACTERIZATION

The morphological and elemental analysis of synthesized nanoparticles was carried out. The prepared Alumina and copper oxide nanoparticles were characterized by XRD (X'pert Pro, PANalytical), SEM, and EDS. The nanoparticles were also characterized by FTIR (PerkinElmer,) in the wavelength range 4000-400 cm^{-1}.Blends of various concentrations (50, 100, and 150 ppm) of both Alumina and copper oxide nanoparticles in diesel were prepared individually by mixing using an ultrasonic probe for 30 minutes at 20 KHz with a power rating of 500 W [4]. A blend of 50 ppm Alumina and 50 ppm copper oxide was also prepared in diesel and tested. The effect of nanoparticles addition on calorific value of the blend was measured using a bomb calorimeter. The effect of the nanoparticle's addition on the viscosity of the blend was measured using a Brookfield viscometer and the effect on the flash point of the blended diesel was measured using a Pensky-Martin Apparatus.

RESULTS

The surface functional groups of the Alumina nanoparticles were studied using the Fourier transform infrared spectroscopy. The spectra of Alumina and copper oxide are obtained in the region of 4000 to 400 cm^{-1}. Figure 1 shows characteristic IR band representing Alumina after calcinations at 500ºC. The appearance of the peaks at 554.67 cm^{-1} and 1404.2 cm^{-1} are assigned to Al-O vibrations of Al_2O_3 [4].Figure 1(B) shows characteristic IR band representing copper oxide after calcinations at 500ºC.There are two strong bands due to CuO modes at 656.34 cm^{-1} and 552.41 cm^{-1}, which indicates the presence of crystalline CuO[2].SEM analysis was used for the morphological study of sample.

Rohit Sunil Khedkar *et al.,*

The analysis at 1000°C for Alumina should show high homogeneity emerged in the surface by increasing annealing temperature. By increasing annealing temperature, the morphology of the particles changes to the sphere-like shape [3].EDS was used to analyses the chemical composition of the material under SEM. It confirms the presence of Alumina and copper oxide. The elemental compositions of the Alumina and copper oxide samples are given in table 1 and 2. Figure 2 shows SEM image of copper oxide nanoparticles with the smallest diameter of 70.78 nm. The morphological structure can be seen as a micro-sphere structure from the figure [2].

X-ray Diffractometer was used to identify the crystalline phase and to estimate the crystalline size. Figure 4 shows XRD pattern for Alumina. A α Al_2O_3 transformation took place by annealing at more than 1000°C. By comparison with standard data, the peaks correspond to a rhombohedral structure of α Al_2O_3.XRD pattern for copper oxide. The XRD patterns indicate he monophasic FCC CuO phase has been obtained. The peak intensities in the figure 5 can be indexed to a pure cubic phase of CuO as reported in the literature [2]. The particle size was calculated for Al_2O_3 and Co_3O_4 nanoparticles using the Scherer equation based on the XRD data as

$$D\_p = 0.94\lambda/(\beta\_(1/2)\,cos\theta)$$

Where D_P= particle size, K= a dimensionless shape factor (0.94), λ is the X-ray wavelength, $\beta_{\frac{1}{2}}$ is the line broadening at half the maximum intensity (FWHM), θ is the Bragg angle [5].

For Alumina the size of nanoparticles (D_P) is calculated to be from 28.6 nm from the values of λ = 1.54056 A°, $\beta_{\frac{1}{2}}$ = 0.35° and θ= 68°.

For copper oxide the size of nanoparticles (D_P) is calculated to be from 28.6 nm from the values of λ = 1.54056 A°, $\beta_{\frac{1}{2}}$ = 0.35° and θ= 68°.

The effect of the nanoparticle on calorific value is tested by blending the Alumina and copper oxide nanoparticles in diesel. The calorific value of unblended diesel was measured in the bomb calorimeter and was reported as 45.322 MJ/kg. There was an increase of 5.544 percent for the 150 ppm Alumina blended diesel and a 2.012 percent increase for the 150-ppm copper oxide blended diesel. The metal oxide nanoparticles catalyze the combustion reactions in the engine by donating their oxygen atoms this leads to more complete combustion of fuel giving an increase in the calorific value of the blended fuel [6, 7].The effect of the nanoparticle on the flash point is tested by blending the Alumina and copper oxide nanoparticles in diesel. The flash point of unblended diesel was measured in the Pensky-Martin apparatus and was reported as 43°C. There was an increase of 51.5 percent for the 150 ppm Alumina blended diesel and a 19.7 percent increase for the 150-ppm copper oxide blended diesel. The nanoparticles delay the ignition thus increasing the flash point of the blended fuel. The flash point increases with the increase of the concentration of the nanoparticles in the blend.

The effect of the nanoparticle on the viscosity is tested by blending the Alumina and copper oxide nanoparticles in diesel. The viscosity of unblended diesel was measured in the Brookfield Viscometer and was reported as 2.45 cP. There was an increase of 32.6 percent for the 150 ppm Alumina blended diesel and a 20 percent increase for the 150-ppm copper oxide blended diesel. The viscosity of blends at room temperature (34°C) increases with the increase in the concentration of nanoparticles.

CONCLUSION

Alumina and Copper oxide nanoparticles were synthesized by sol-gel method. The particles were characterized by FTIR, XRD and SEM. These particles were blended with diesel at different concentration (50, 100, 150 ppm). The effect of this blending of nanoparticles in diesel on the calorific value, flash point and viscosity were tested. The Alumina nanoparticles increase the calorific value but at the cost of flash point and viscosity, whereas the copper oxide nanoparticles increase all three- calorific value, viscosity and flash point uniformly. Therefore, it is better to use the 50 ppm Alumina and 50 ppm copper oxide nanoparticles blended diesel.

ABSTRACT

In recent years, multilevel inverters (MLI) have been extensively used in high voltage and high-power applications due to their exceptional performance. The reliability of power electronics equipment is crucial and detecting and locating faults promptly is essential to ensure stable operation of multilevel inverter systems. This paper aims to develop a fault diagnosis technique for detecting open switch faults in three-phase Battery-Fed capacitor clamped multilevel inverters (CCMLI) using machine-learning algorithms. The proposed fault diagnosis technique involves extracting features using Fast Fourier Transform (FFT) technique, from the inverter current and voltage signals and using them to train a machine-learning algorithm to classify the faults. In this paper, K- nearest neighbour (K-NN) and Support Vector Machine (SVM) are used to classify the switch fault and do the comparative analysis. The performance of the proposed technique is evaluated through Matlab simulations under various fault scenarios. The results show that the SVM technique is effective in detecting open switch faults in the multilevel inverter with high accuracy and fast response time.

Keywords: MLI, capacitor clamped multilevel inverters (CCMLI), Fast Fourier Transform (FFT), K-nearest neighbour (K-NN), Support Vector Machine (SVM), fault diagnosis, Machine-Learning.

INTRODUCTION

A multilevel inverter is a power electronic device used to convert DC (direct current) power into AC (alternating current) power of higher voltage and/or frequency than the input. It achieves this by synthesizing the output waveform from multiple levels of DC voltages, typically generated using capacitors or DC sources.Unlike traditional two-level inverters, which use only two voltage levels to generate a stepped output waveform, multilevel inverters use three or more voltage levels to create a more sinusoidal waveform with less harmonic distortion. This can improve the performance and efficiency of AC motors, reduce stress on power system components, and enable the

Sandeep Mishra and Manoj Kumar Nigam

use of renewable energy sources like solar or wind power.With their higher voltages and lower total harmonic distortion (THD) output voltage waveforms, MLIs are ideal for high-voltage applications **[1]**. As well as interacting in a variety of ways with sustainable energy sources, multilayer converter systems can also interact with biofuels, fuel cells, and photovoltaic cells **[2]**. In general, the control algorithm determines the applications, efficiency ratings, and MLI operation **[3]**.Over the last few decades, several topologies for multilevel inverters (MLIs) have been proposed [4, 5]. These topologies can be classified into two major categories based on the number of DC sources used. The most commonly implemented and widely used topologies in the commercial sector are the fly capacitor, neutral-point clamped (NPC), and cascaded H-bridge topologies [6].

Fly capacitor inverters, also known as capacitor clamped inverters (CCMLI), are one of the most popular types of MLI. In a CCMLI, the DC voltage is divided into multiple voltage levels by connecting capacitors in series. The voltage levels are then used to produce a stepped waveform that approximates a sine wave. CCMLI are popular due to their low THD, high efficiency, and simple control scheme. For example, a recent study of a grid-connected photovoltaic (PV) system found that a CCMLI was the most suitable option due to its low THD and high efficiency **[7]**.Compared to a two-level inverter, the number of switches in a CCMLI is significantly higher. This increases the likelihood of switch faults occurring in the CCMLI inverter, as compared to a two-level inverter. The specific impact of a switch fault on a multilevel inverter will depend on the type of fault that occurs. Common switch faults that can occur in multilevel inverters include open-circuit faults and short-circuit faults [8]. Regardless of the type of fault, the resulting impact on multilevel inverter performance can include decreased output voltage, increased harmonic distortion, and decreased efficiency. These facts are supported by research and literature on power electronics and multilevel inverter design. Additionally, switch faults can cause thermal stresses on the remaining switches, leading to further failures and reducing the overall reliability of the inverter **[9]**. That's why overall, fault diagnosis is crucial in MLI systems to ensure the system's reliability, safety, and performance, as well as to prevent unnecessary costs and downtime associated with system failure **[10]**.

Machine-learning algorithms have gained popularity in recent years for fault diagnosis due to their ability to identify patterns in data. Support vector machines (SVMs) and k-nearest neighbors (k-NNs) are two common machine-learning algorithms used in the power industry. For instance, in a comprehensive review of machine learning algorithms presented in [11], SVMs and k-NNs were among the algorithms discussed for analyzing energy efficiency in the power industry. These machine-learning algorithms have also been utilized in various other applications, including energy regulatory systems, urban environmental planning, and fault diagnosis, as supported by research in the field of power systems. The SVM algorithm was employed in **[12]** for detecting and diagnosing faults in machines, and the k-NN algorithm was employed in **[13, 14]** for detecting and diagnosing faults in high-voltage direct current systems. Furthermore open, switch faults in CHMLIs employed in distributed generator units as compared to SVM and k-NN in **[15]**. Furthermore, the SVM technique has been discussed in **[16]** for fault detection. It has been demonstrated that it can detect faults more quickly and does not require information about a complete current cycle compared to other fault detection methods. The paper describes a topology for 3-level inverters that can endure switch open circuit faults. The proposed configuration is evaluated under both normal and abnormal conditions. MATLAB/Simulation domain is used to simulate the MLI structure under normal and abnormal states.

3 LEVEL CCMLI TROPOLOGY

Basic configuration

The capacitor-clamped multilevel inverter (CCMLI) topology provides additional flexibility for voltage balancing and waveform synthesis. In this inverter, floating or clamping capacitors are utilized to clamp the voltages. Each phase-leg of the inverter contains a corresponding assembly [17]. Figure 1 illustrates a three-phase, three-level CCMLI, with each switch of phases S1abc, S2abc, S3abc, and S4abc consisting of a power semiconductor switch and an anti-parallel diode. Switches S1 and S3 are complementary to each other, meaning that if S1 is ON, S3 is OFF and vice versa. Similarly, switches S2 and S4 are complementary. All the capacitors in the figure have equal voltage

Sandeep Mishra and Manoj Kumar Nigam

ratings; with capacitor C_1 forming the main DC-link whose voltage is externally regulated. Table I provides the parameters and their respective specifications.

Figure 1 illustrates the switching states S1 and S2 for each phase, where a value of 1 indicates conduction and 0 indicates non-conduction. Table II provides the switching combinations utilized to generate the output voltage Van of phase A with respect to the neutral point n. Moreover, Table II specifies the state of the flying capacitor corresponding to the selected switching combinations. In this context, the state NC indicates that the capacitor neither charges nor discharges, while the states + and - represent the charging and discharging, respectively, of the corresponding capacitors. It is important to note that the given switching states apply only to the positive half cycle of the current waveform, and the capacitor states (+ and -) will reverse during the negative half cycle of the current.

Modulation scheme

All carrier waveforms above zero reference are in phase and 180 degrees out of phase with those below zero reference in Phase Opposition Disposition (POD) modulation. In the case of N = 3, the phase opposition disposition method is as follows:

• A pair of N-1 = 2 carrier waveforms is arranged in such a manner that all carrier waveforms above zero are in phase, and those below zero are 180 degrees out of phase with one another.
• When the reference waveform exceeds both carrier waveforms, the converter switches to +Vdc/2.
• When the reference waveform is larger than that of the lower carrier waveform but smaller than that of the upper carrier waveform, the converter is switched to zero.
• When the reference waveform is less than the two carrier waveforms, the converter switches to -Vdc/2.

In Figure 2, switching functions are illustrated using a POD carrier-based PWM scheme. In PWM, two triangles are used, an upper triangle with a magnitude of 400 to 800 and a bottom triangle with a magnitude of 0 to 400. Switches S1 and S2 are turned on when the modulation signal exceeds the carrier waveforms, resulting in the converter switching to positive node voltage. Whenever the reference waveform is less than the upper carrier waveform but greater than the lower carrier waveform, switches S2 and S3 are activated, and the converter switches to neutral mode. A converter is switched to negative node voltage when the reference waveform is lower than both carrier waveforms. When the reference waveform is lower than both carrier waveforms, switches S3 and S4 are turned on.

STRUCTURE OF GENERALIZED FAULTY PHASE AND SWITCH IDENTIFICATION

The generalized approach for fault diagnosis in inverters is depicted in Fig. 3. This approach involves the use of a Multilevel Inverter (MLI), which utilizes multiple DC sources and generates a periodic switching pattern to produce a smooth sinusoidal waveform. The fault diagnosis process involves measuring the output voltage and current signals of the MLI, as they contain reliable information and are not affected by load fluctuations. These signals undergo preprocessing, and relevant features are extracted from them. The extracted features are then fed to the fault classifier, which uses them to determine the defective phase and classify the faulty switches. This fault classification method is effective because it relies on the accurate analysis of the MLI signals to pinpoint the fault location and type, which can help in timely repair and maintenance of the inverter system.

METHODOLOGY

To develop a reliable ML-based fault classifier for inverters, a dataset containing information about various fault conditions that can occur in the inverter is required. Therefore, the inverter is subjected to various faults, and the output voltages are measured and recorded. From the output voltage signal, features are extracted, and a dataset is prepared that includes the corresponding fault class. The ML-classifier is trained using a training dataset, and a separate dataset is used to test the trained classifier. To ensure the effectiveness of the classifier, appropriate features and classifier must be selected, which have been investigated in this study. The testing performance is evaluated

using standard performance metrics, and once the classifier is deemed reliable, it can be deployed. By following these steps, a fault classifier based on ML can accurately identify faulty phases and classify faulty switches in the inverter system, allowing for timely maintenance and repair.

Dataset Preparation

The proposed technique for diagnosing faults considers the output voltage and current waveform as a crucial diagnostic parameter. However, the output current varies depending on the load. In order to diagnose faults in an inverter, faults are intentionally induced in the switches and the resulting output voltage and current waveforms are measured and recorded. Whenever a fault occurs in the inverter, there are distinct changes or distortions in the voltage and current waveforms. These alterations in the waveform contain information about the fault, which can be extracted using various signal-processing techniques.

As shown in Fig 4 (a and b), the output current waveforms of healthy condition and switch fault in Sa_1 of phase A demonstrated a unique pattern for each switch fault condition, which provides a dependable marker for identifying the faulty switch.

Fault Class Description

This section provides a description of the various faults that were investigated in this study. The primary cause of malfunction in the CCMLI is the failure of power semiconductor devices. When one of the power electronic switches in an inverter experiences an open-circuit (O.C.) fault, the current and voltage waveforms deviate from normal operating conditions and exhibit abnormal distortions. The location of the faulty switch determines the type and extent of the distortions observed in the inverter output voltage and current waveforms.

In the proposed work, all twelve switches in the three-phase CCMLI are considered. Each switch is tested under open-circuit (O.C.) conditions to simulate various fault conditions. These include single switch faults in the same phase as shown in Table III.

Feature Extraction

The process of ML-based classification involves two key steps: feature extraction and classification. In the feature extraction step, relevant features are extracted from the measurement signal for subsequent classification. These features are abstractions of the measurement signal and are essential for accurate classification. Ideally, a unique combination of features for a specific class should be chosen, enabling a precise and reliable classification. Therefore, the selection of appropriate features is critical for achieving high classification performance in an ML-based fault classifier.

The feature extraction step in this study involves the application of the Fast Fourier Transform (FFT) technique to the faulty signal. FFT is a popular signal processing method that transforms a signal from the time domain to the frequency domain. By analyzing the frequency components of a signal using FFT, relevant features can be extracted for use in classification. Here's a general process of using FFT for feature extraction:

1. Acquire the signal: The first step is to obtain the signal you want to analyze, which can be a sound wave, image or any other type of data.
2. Preprocessing: Preprocessing the signal may be necessary depending on the application. For example, if you're analyzing a sound wave, you may want to remove noise or filter out certain frequencies.
3. Apply FFT: The next step is to apply the FFT algorithm to the signal to obtain its frequency domain representation. This involves taking the discrete Fourier transform of the signal using the FFT algorithm, which produces a set of complex values representing the signal's frequency components.
4. Frequency domain analysis: Once the signal has been transformed into the frequency domain, analyze its frequency components to extract relevant features. For example, you may want to identify the frequency peaks or ranges that contain the most energy or activity.

Sandeep Mishra and Manoj Kumar Nigam

5. Feature extraction: Based on the frequency domain analysis, extract features that capture relevant information about the signal. These features can be used for various applications, such as classification, clustering, or anomaly detection.

Proposed ML-Based Classifier

This proposed work includes the examination of five distinct classifiers, which are widely recognized and recommended by the literature for their effectiveness in fault classification applications. The classifiers considered in this work include K-nearest neighbour (KNN), and Support vector machines (SVM).

SIMULATION RESULTS AND DISCUSSION

The objective of this research is to develop an automated approach for designing a machine learning-based fault classifier. The technique involves the selection of features and the classifier using a FFT method. The distorted current and voltage signals are analyzed using a Fast Fourier transform that isolates the fundamental frequency while disregarding any harmonics then computed to derive the features that will be fed to the ML classifier, which will maximize the fault classification accuracy.

The proposed fault classification method is explained considering the open-circuit faults in the single switch in the same phase (see Table II). The faulty phase and group of switch faults are identified based on distorted voltage and current characteristics.

The aim was to classify the defective switch and phase using a machine-learning algorithm. There were 12 possible switch combinations, but only six were considered. Because if a fault occurs in the upper two switches (S_1, S_2) and lower two switches (S_3, S_4) of phases A, B, or C, the output voltage and current will be the same. That is why at the time of data collection; only take data from S_1 or S_2 and S_3 or S_4 from different phases. After collecting 27 samples from each combination, the total data size was 189$\times$7, out of which 30% is used for testing and the remainder for training, as shown in Table IV.

The objective of this study was to compare the performance of K-NN and SVM classifiers for classifying switch faults in CCMLI. The accuracy of both classifiers was evaluated and compared to determine which one provides better results.

In the case of an open switch fault in CCMLI, changes occur in the current and voltage values, which are considered as features by machine learning classifiers. The accuracy plots of both classifiers are shown in Fig. 6(a) and 7(a), and after analyzing the results, it can be concluded that the SVM technique performs better than the K-NN techniques. A confusion matrix is used to summarize and calculate the performance of the classifier method based on a set of test data, which involves actual values being recognized. By calculating a confusion matrix, it is possible to obtain a clear idea of the correct classification models and the types of errors they make. Fig. 6(b) and 7(b) represent the confusion matrix of the SVM and K-NN classifier, where the rows indicate the actual class and the columns indicate the predicted classes. Based on the confusion matrix, it can also be concluded that the SVM technique is superior to the

Table V indicates that the performance of the SVM classifier is superior in terms of precision, recall, F1-score, and accuracy.

CONCLUSION

The main objective of this research is to develop a machine learning-based fault diagnosis technique to detect open switch faults in a three-phase battery-fed CCMLI. This involves extracting features from the current and voltage signals of the inverter and using them to train a machine-learning algorithm to classify faults. The results of the study demonstrate the effectiveness of the proposed technique, with SVM exhibiting the highest accuracy followed by K-NN. The SVM classifier shows an accuracy of 93% for single switch faults, making it a reliable and efficient tool for fault diagnosis in CCMLI. The integration of machine learning techniques with control systems can enable real-time

monitoring and prompt corrective actions to be taken to prevent system damage or shutdown. This study highlights the potential of machine learning algorithms in fault diagnosis for power electronics systems, which can help reduce downtime and maintenance costs and improve system reliability and performance.

ABSTRACT

The study aimed to isolate and identify the marine bacteria isolated from mangrove sediments and screen them for production of antimicrobial secondary metabolites. Twenty-four isolates were isolated from sediments sample collected from Kalpakkam mangroves. Among the 24 isolates obtained, three isolates showed substantial antibacterial activity with more than 12mm of zone of inhibition against three clinical test pathogens. One of the isolates showed the highest activity with a zone of inhibition of 15mm against *E.coli,* 14mm against *K.pneumoniae* with the lowest minimum inhibitory concentration (MIC). Based on 16S r DNA sequence data, the selected isolate was shown to be closely related to S*treptomyces aldersoniae.* The results revealed that the Actinomycetes from mangrove environment would be a good source of bioactive metabolites against UTI pathogenic bacteria.

Keywords: Mangrove, sediments, UTI, Streptomyces

INTRODUCTION

Mangroves situated in tropics and the sub-tropics of the world consist of forest ecosystems growing under brackish water conditions the seashore. Mangroves interacting effectively with aquatic, inshore, upstream and terrestrial ecosystems support a diverse flora and fauna of marine, freshwater and terrestrial species.[1] India has 2.66% of the world's mangroves and among them about 57% are found on the East Coast. The east coast is endowed with the

world's largest mangrove forest, the Gangetic Sunderbans in West Bengal which has 30 of 50 true mangrove species.[2] In Tamil Nadu coast, mangrove forests exists at Pichavaram and in Muthupet areas. Prioritizing assessment studies through this preliminary study on the existing biodiversity helps to understand the wealth and wellbeing of Pondicherry mangroves. [3]. Distribution of micro-organisms mainly depends on the changes in the temperature, salinity and other different parameters. Due to high concentration of salinity, halophilic bacteria are predominant in the ecosystem. It plays an important role in serving food to the marine organisms and maintains the nature of the environment.[4] Microbial natural products are an important source of both existing and new drugs. Among the producers of commercially important metabolites, bacteria have proven to be a prolific source with a surprisingly small group of taxa accounting for the vast majority of compounds discovered till date. [5]

Among these, Actinomycetes are the most economically and biotechnologically priceless prokaryotes, widely distributed in the marine environment, in marine species such as *Streptomyces*, *Nocardia* and *Micromonospora*. Their occurrence on the contact slides and dead marine algae suspended in the sea has been reported. [6]Secondary metabolites produced by actinomycetes possess a wide range of biological activities.[7] Above 500 species of Streptomyces account for 70–80% of relevant secondary metabolites, may form the basis for the synthesis of novel therapeutic drugs, which may be efficient to combat a range of resistant microbes.[8] *Actinomycetes,* belonging to the order Actinomycetales, are members of a heterogeneous group of Gram-positive bacteria, consisting of up to >55% GC content in their DNA. They are aerobic, with filamentous fungal morphology and branched growth patterns. They exhibit diverse genetic, biological and functional activities and are a good source of many new secondary metabolites.[9] *Actinomycetes* contribute 70% of antibiotic sources and numerous non-antibiotic bioactive metabolites, including enzymes, enzyme inhibitors, anti-oxidation reagents, immunological regulators, etc. In other words, currently, almost two-thirds of the antibiotics developed are derived from *Actinomycetes*. [10] Streptomyces strains remain a rich source of commercially significant antibiotics. In the search for new therapeutic compounds, it is important to screen novel isolates. *Streptomyces aldersoniae* is gram-positive, spore-forming, mesophilic bacterium that builds an aerial mycelium and produces antibiotic compounds.[11]

Bacterial infections have a large impact on public health. Disease can occur at anybody site and can be caused by the organism itself or by the body's response to its presence. Bacterial resistance to antibiotics is a growing concern mandating their prudent use.[12]Urinary tract infections (UTIs) are some of the most common bacterial infections, affecting 150 million people each year worldwide. UTIs are caused by both Gram-negative and Gram-positive bacteria, as well as by certain fungi. The most common causative agent for both uncomplicated and complicated UTIs is pathogenic *Escherichia coli* (UPEC).[13]*UTI infection*difficult to treat because of drug resistance of many *B. faecalis* isolates.[14]

Recent reports are available forthat secondary metabolite from marine microorganism producing compounds showing anti-bacterial, anti-cancer, anti-fungal, anti-viral, anti-parasitic, anti-malarial and antifouling properties [15].Bioactive compounds Lavanducyanin and Naphthomevalin produced from *Streptomyces sp.* Active against bacterial pathogens. Moreover, Shellmycin has anticancer property produced from*Streptomyces sp.*[16]Different geographical locations all around the world have different mangrove habitats for Actinomycetes.[17].To our knowledge, no studies have reported the diversity and antimicrobial activities of Actinobacteria from Kalpakkam mangrove environment. Therefore, there is a high possibility to identify novel Actinobacteria and discover valuable antimicrobial secondary metabolites. The aim of this study was to isolate and identify the Actinobacteria and screen them to discover potential sources for antimicrobial secondary metabolites.

MATERIALS AND METHODS

Samples collection
Sediments were collected from mangrove forest located in backwater, Kalpakkam Tamilnadu, South India. The sediment sample were collected in pre-labelled plastic bag and screw cap bottles respectively. The sample were

Ezhil Malar *et al.,*

preserved in an ice box and brought to the laboratory. Geographically the study area of Kalpakkam Mangrove Forest is lying within the boundaries of latitudes 12.512528°S to 80.159328" E (Figure 1).

Pre-Treatment and Isolation of Actinobacteria
Pre-heat treatment was performed by incubating the sediment samples in water bath at 60℃ for 60mins. For isolation of actinomycetes, about one-gram of each sediment sample was suspended in 9 ml of sterile double distilled water and then the dilution was carried out up to 10^{-5} dilutions and plated on ISP5 media supplemented with nalidixic acid (25 μg/ml) and cycloheximide (25 μg/ml). Plates were incubated at 30ºC for 21 days. The plates were observed intermittently for the growth during incubation. Actinobacteria colonies were selected based on the morphological appearance and purified by streaking on the same medium.

Crude extraction for secondary metabolites
The isolated cultures of actinomycete strains were inoculated into test tubes, each containing 10 ml of the production medium. The cultures were incubated on a rotary shaker (180 rpm/ min) at room temperature for 7 days. After the incubation period was finished, the culture was extracted using liquid-liquid extraction method. The filtrate of selected culture and the solvent ethyl acetate was mixed at 1:1 proportion. Then the separation was done in the separating funnel and the upper layer containing secondary metabolites was collected. Finally the collected upper layer was concentrated in vacuum rotatory evaporator to separate secondary metabolites from the ethyl acetate and tested for antimicrobial activity by agar well diffusion method.

Assessment of the antimicrobial activity
Test Microorganisms
The test bacterial strain included bacterial pathogens associated with UTI, Gram-negative bacteria, viz. *Escherichia coli*, *Klebsiella pneumoniae.*, Gram-positive bacteria, viz. *Bacillus faecalis.,* isolated from UTI patients. All these clinical isolates were obtained from the Dr RELA Institute and Medical Centre, Chrompet, Tamilnadu.

Screening for bioactive compound
Agar well diffusion method is widely used to evaluate the antimicrobial activity of crude extractagainst test UTI pathogens. Test pathogens were individually spread on the entire surface of the MHA agar medium. Then, a well is punched aseptically with a sterile cork borer or a tip. A volume (50μL) of the ethyl acetate extract of 24 isolates was introduced into eachwell and positive and negative control were pipetted into respective wells. Then, agar plates are incubated at 37℃ for 24 hrs. The Actinobacteria extract diffuses in the agar medium and inhibits the growth of the test microorganism. [18]

Morphological, Physiological, and Biochemical Characterizations of Isolate of Actinobacteria
The cultural, morphological, biochemical, and physiological characterizations of the Actinobacteria isolate were performed [19]. Light microscopy was used to observe the morphologies of selected isolates after incubation on ISP 2 medium at 30ºC for 21 days, biochemical characterizations such as Gram staining and specific biochemical analyses were performed. The selected isolate was subjected for the biochemical tests include IMVIC tests, H_2S production, Urease activity, Catalase activity, Oxidase test, Nitrate reduction test and Carbohydrate utilization test.[20].

Fermentation in Production media
A loopful of selected culture was inoculated into 25 ml of production medium consisting of 1% fructose, 1% yeast extract, and 3% NaCl with pH 6. The inoculated flasks were incubated on rotary shaker at 29.8 °C and incubated for 7 days. The fermented broth collected at the end of 7 days and the culture filtrate obtained was extracted with ethyl acetate and the resultant crude extract used for further study.

Purification of Secondary Antimicrobial Metabolites
The purification of active crude compounds was separated by thin layer chromatography (TLC) method. The readymade pre-coated TLC plates were used for separation of active crude compounds. Using the capillary tube, a

67168

row of spots of the active eluent was applied a line 1.5 cm above from the bottom of TLC plates. The spots were left to dry. The TLC plate was placed vertically in a trough containing the solvent (methanol: chloroform) 1:9. When the solvent moved up to 80% of TLC plate, the plate was taken out and dried. The Rf values were calculated. [21]

Determination of MIC and MBC

To determine the minimum inhibitory concentrations (MICs), sterile nutrient broth supplemented with different concentrations of ethyl acetate extract of NV, dissolved in DMSO, were inoculated separately with the microbial indicators and incubated for 24 hours. The lowest concentration inhibiting the growth of the test microorganism was recorded as the MIC[22].The dilution in broth method was used to calculate the MBC for the antimicrobials [23]. A volume of 0.1 mL was removed from the wells of the microtiter plates and added in the tubes were incubated at 37°C for 18 to 24 h and thereafter observed for growth or turbidity. Subsequently, a loopful of broth from each test tube not showing growth, was inoculated into nutrient agar plate. Thereafter, equal volumes of sterile nutrient broth were added into the test tube cultures and incubated further for 24 h at 37°C. Then, the tubes and agar plates were examined for growth or turbidity.

Isolation of genomic DNA from selected Actinobacteria culture

DNA extraction was done by 1.5 ml of the overnight selected RE03 culture was transferred to a 1.5 ml Eppendorf tube and centrifuge at 10,000 rpm for 10 min to pellet the cells. The pellet was resuspended with 200μl in TE Buffer and 400μl of Sarkoryl reagent. Incubate at room temperature for 15 minutes. An equal volume of phenol/chloroform was added and mixed well by inverting the tube until the phases are completely mixed.Centrifuge at 10,000rpm for 10 min at room temperature. The upper aqueous phase was transferred to a new tube by using 1 ml pipette and 0.1 volume of 3M Sodium acetate at pH – 5 and 0.8 volume of ice-cold isopropanol was added. Centrifuged at 10,000 rpm for 10 mins and 1ml of −20°C 70% ethanol was added Centrifuge at 10,000 rpm for 10 minutes. The pellet was resuspended in 50μl TE (Tris-EDTA) buffer and kept overnight at 4°C. Confirmed the presence and concentration of bacterial DNA by running 5μl of product on a 1.5% agarose gel. (24)

16S rRNA gene amplification and DNA sequencing

PCR amplification was performed using a 20μl reaction mixture containing 100 ng of template DNA, 20μl of 16S rRNA primers, 200μm of dNTPs, 1.5 mM of MgCl2, 1U of Taq DNA polymerase and 10μl of 10x Taq polymerase buffer. The sequences of 16S rRNA primers used were 27f: (5'-AGAGTTTGATCCTGGCTCAG-3') 1522r: (5′-AAGGAGGTGATCCANCCRCA-3') Amplification was carried out with an initial denaturation at 95°C for 5 min followed by 35 cycles of denaturation at 94°C for 45 sec, annealing at 56°C for 45 sec, extension at 72°C for 1 min and final extension at 72°C for 5 min using a thermocycler (TC 1000G; Apex biotech Laboratories, CA). PCR products were analysed on 1% agarose gel for 16S rRNA amplicons in 1x TBE buffer at 100 V.[25]

Phylogenetic analysis

The 16S rRNA amplified fragments were purified using the QIA quick gel extraction kit (Qiagen, Valencia, CA) from the agarose gel and sequencing using automated DNA sequences (Model 3790, Applied Biosystems, USA). The sequences were analysed using the option Basic Local Alignment Search Tool (BLAST) software available in NCBI (http://www.ncbi.nlm.nih.gov/blast). The sequences of these 16SrRNA genes were compared against the sequences available from GenBank using the BLASTN program and were aligned using CLUSTAL W software. Distances were calculated according to Kimura's two-parameter correction. Phylogenetic trees were constructed using the neighbour-joining method. Bootstrap analysis was done based on 1000 replications. The MEGA4 package was used for all analyses [26].

RESULTS

Isolation of Marine Bacteria

Isolation of Actinomycetes from soil samples collected from mangrove ecosystem at the Kalpakkam backwater by serial dilution method resulted in the isolation of twenty-four different marine isolates. Among them, an isolate exhibited a strong antimicrobial activity against test microorganisms was selected for further characterization (Figure 2)

Physiological and biochemical characteristics

Gram's stain was used to study the morphology and staining properties of the bacterial isolates. The selected isolate culture was subjected to ascertain their Gram's staining properties and it was indicated that all the isolates were belongs to Gram positive rod. (Figure3) The selected isolate RE03 were chosen for characterization studies, specific biochemical tests were performed which include following tests Citrate utilization test, Methyl red test, Oxidase test, Voges Proskauer (VP) test, Urease test, Indole production test, Catalase test. The selected isolate was showed positive result to Oxidase and triple sugar ion (TSI) test and showed negative result to Indole, Methyl red, VP, catalase and urease, and the results are tabulated (Table-1).

Screening of bioactive compounds

The antimicrobial activity of 24 strain representative colonies were chosen and marked as RE01 to RE24, was evaluated by cultivation on ISP5 media prepared in 50% sea water and adjusted to pH 7. The three isolates viz., RE23, RE03and RE19 showed varied levels of antibacterial activity against the test pathogen (Table-2) (Figure4). The isolates RE03 were highly effective against *Klebsiella pneumoniae*, *Escherichiacoli* and *Bacillus faecalis* with 15 mm, 17 mm and 20mm zone of inhibitions, respectively. Whereas, RE23 showed highest and equal effectiveness against *K. pneumonia., E.coli and B. faecalis* with 16 mm, 14mm and 17mm zone of inhibition. Among these isolates, RE03 were selected as showed best antibacterial activity against test microorganisms. (Figure 5)

Purification of bioactive compound

The concentrated ethyl acetate Extract was subjected to TLC analysis with chloroform: methanol (9:1) give best separation. The Rf value of the active band was measured as 0.60 in TLC (Figure 8).

Determination of MIC-MBC

The MIC is the lowest concentration of antimicrobial agent that completely inhibits growth of the organism in micro dilution wells as detected by the unaided eye. Depicted here is a typical MIC assay conducted according to CLSI micro dilution guidelines. Up to 7 compounds and one quality control (QC) bacterial sample are serially diluted from column 21 to column 41 of a 96-well microplate to form a concentration gradient. Column 21 serves as a positive growth control. In the illustration, "no growth" is represented by white circles and "growth" is represented by yellow circles. The MIC value is the lowest concentration of a bacterial sample at which no growth is observed. (Figure 6). The determination of minimum bactericidal concentration (MBC) is the most common estimation of bactericidal activity. The MBC is defined as the lowest concentration of antimicrobial agent needed to kill 99.9% of the final inoculum after incubation for 24 h under a standardized set of conditions, in which the MBC can be determined after broth micro dilution by sub-culturing a sample from wells, yielding a negative microbial growth after incubation on the surface of non-selective agar plates to determine the number of surviving cells (CFU/mL) after 24 h of incubation. The bactericidal endpoint (MBC) has been subjectively defined as the lowest concentration, at which 99.9% of the final inoculum is killed. (Figure 7)

16 S rRNA GENOMICSEQUENCING

Genomic DNA was isolated from the marine actinobacteria as shown in Figure 8. Approximately 25 kb of genomic DNA was obtained (Figure 9). The obtained genomic DNA was subjected to the amplification of the 16S rRNA gene and it was amplified well and observed in a 1% agarose gel electrophoresis. The expected amplicon size was 1.5 kb

and has also been recorded as the same size in the obtained amplicon. The amplified product was purified using the Exo-sap method and run in an ABI Prism gene sequence. About 1156 base pairs were obtained in the sequence through forward and reverse primer set.

Molecular phylogeny

The sequences analysed BLAST program at the NCBI website showed sequences similarities with existing bacterial 16S rRNA gene sequences up to 99.5% sequences similarities. Closed similar species 16S rRNA gene sequences were obtained and used for CLUSTAL W alignment. The CLUSTAL W aligned sequences were analysed. Neighbour-joining method and found that the sequences obtained from selected bacteria were closely related to *Streptomyces aldersoniae* with a single clade. Based on the BLAST analysis in the NCBI, RDB taxonomy analysis and phylogeny tree clearly revealed that the given sample belonged to the taxa ***Streptomyces aldersoniae***(Figure 10).

DISCUSSION

Actinomycetes have been looked upon as potential sources of bioactive compounds and are the richest sources of secondary metabolites. The mangrove ecosystem is a largely unexplored source of actinomycetes with the potential to produce biologically active secondary metabolites.[27]The discovery of new bioactive compounds is a never-ending process to meet the everlasting demand for novel drugs and other biomolecules with antimicrobial and therapeutic properties, in order to combat bacterial pathogens in human beings. [28]The soil bacteria resembling to the genus Streptomyces are rich sources of large number of bioactive natural products; they are widely used as antimicrobials. Streptomyces species produce about 75% of useful antibiotics. [29]

Nocardiopsis sp. isolated from Puducherry coast was found to be 18 mm, 20 mm and 15 mm zone of inhibition against *E. coli, P. aeruginosa and K. pneumoniae* respectively [30]. Actinobacteria isolated from Caspian Sea were exhibited zone of inhibition against *E. coli, P. aeruginosa and K. pneumoniae* with 17, 20 mm and 18 mm respectively [31]. Our result showed RE03 isolate gave15 mm, 17 mm and 20mm zone of inhibitions, against test organism.Streptomyces synthesize the antibiotics through microbial fermentation in response to environmental signals including the nature and level of carbon and nitrogen sources, temperature, oxygen concentration, pH, and light. [32]

The nature and the amount of the nitrogen sources and amino acids are considered as direct precursors for antibiotic synthesis.[33]The determination of minimum inhibitory concentration and minimum bactericidal concentration is the most common estimation of bactericidal activity. The dilution method, mainly useful in determining minimum inhibitory concentration (MIC), which is the least concentration of antimicrobial agent that prevents microbial growth, as well as the determination of minimum bactericidal concentration (MBC), which is the least concentration of antimicrobial agent required to kill microorganisms.[34]The secondary metabolites extracted were further chromatographed in TLC. The metabolites isolated from bacterial endophytes were found to have similar Rf values (i.e., 0.65) as recorded by TLC chromatogram. [35], our result revealed Rf value as 0.60.

Actinomycetesisolates against *P.aeruginosa* was screened and identified as *Streptomyces* sp. by morphological characterization and biochemical assays and was further confirmed by comparison of its 16S rRNA gene sequence. The comparative BLAST analysis revealed that the Actinomycetes isolate was found to be 96% similar to that of Streptomyces sp. [36]Previously, many antimicrobial metabolite-producing actinomycetes isolated from marine sediments were identified as *S. roseoverticillatus, S. roseorubens* and *S. septatus* . Based on the BLAST analysis in the NCBI, RDB taxonomy analysis and phylogeny tree clearly revealed that the given sample belonged to the taxa *Streptomyces aldersoniae*.

CONCLUSION

The present study was an attempt to identify strains of streptomyces from the mangrove sediments of Kalpakkam that display activity against microbial pathogens. Such attempts need to be sustained so as to screen more isolates for novel therapeutics. However, the study only provided a basis for antimicrobial potential of the crude extracts of the isolates. There is need to carry out molecular analysis to isolate the actual bioactive compounds from the extracts, which could be effective in the treatment of nosocomial, UTI, chronic infections etc

ABSTRACT

This paper proposes a hybrid method based on analytical expressions incorporating particle swarm optimization (PSO) to find the optimal location and optimal DG size with an objective of minimizing losses and improving voltage profile. DG optimization problem is also solved with an objective of minimizing power loss only. The proposed method is tested on 33 and 69 radial distribution systems.

Keywords : Analytical expression; particle swarm optimization; multiple DG allocation; loss reduction; voltage profile improvement.

INTRODUCTION

Due to the increase in power demand, the need for generation of power is steadily increasing. To give uninterrupted service to consumers, it is necessary to increase the penetration of distributed generation into distribution systems.

67177

Suma Deepthi Veeraganti *et al.,*

Due to the problems of poor voltage regulation, shortage of transmission capacities and increased environmental concerns, the conventional methods of supplying power could not meet the whole demand. To overcome this, distributed generator (DG) has become the alternative source for power supply.

Apart from meeting the energy demand, the optimal location and size of DG units can reduce distribution losses; improve voltage stability and voltage profile. Loss minimization is an important factor in planning and operation of DG. Many techniques have been proposed in literature to find the optimal allocation and optimal size of DG. In ref [1], genetic algorithm has been implemented for placing distributed generator in power distribution system to reduce losses. But this method is computationally demanding and slow in convergence. Wang C and Nehrir proposed an analytical method for optimal placement in radial as well as meshed system. But in this paper, a fixed DG size was considered for analysis. A 2/3 rule which is traditionally applied for capacitor allocation has been applied for DG allocation in ref [3] but this technique cannot be applied to meshed distribution system. N. Acharya, P. Mahat, and N. Mithulananthan proposed a new method to find the optimal size and location of DG for minimizing the total power lossesin primary distribution systems. In this paper, DG capable of injecting real power was only considered. Loss sensitivity factor method which was used to solve the capacitor allocation problem when applied for DG allocation as in ref [5] needs a large number of load flow solution.

In this paper, an improved analytical method is proposed for allocation of multiple DGs. Unlike the previous methods, DG is capable of injecting both real and reactive powers. As DG units can supply a portion of total power to loads, the feeder current reduces from the source to the DG location.

LOAD FLOW SOLUTION
The load flow solution is obtained by using two developed matrices – the bus injection to branch current (BIBC) and the branch current to bus voltage matrix (BCBV). A simple matrix multiplication gives the load flow solution. This method is proposed in ref [6].
Algorithm:
1. Input line and load data of distribution network.
2. Form the BIBC and BCBV matrices.
3. Obtain DLF matrix by multiplying BIBC and BCBV matrices.
4. Set iteration count t = 0.
5. Obtain the values of current injection at the t-th iteration using

$$I_l^t = conj(\frac{S_l}{V_l^t})$$

6. Calculate the change in voltage using

$$[\Delta V^{t+1}] = [DLF][I^t]$$

7. Update the voltage values using
$$[V^{t+1}] = [V^0] + [\Delta V^{t+1}]$$

Repeat steps 5 to 7 until iteration t is equal to maximum iteration.

9. If iteration = maximum iteration, calculate branch currents. Branch current (i$_{br}$) = BIBC*I
10. For each branch calculate real loss and reactive loss.
Real loss = |i$_{br}$|2* branch resistance
Reactive loss = |i$_{br}$|2* branch reactance

MULTIPLE DG ALLOCATION AND DG SIZE

An analytical method is proposed in this paper to allocate multiple DG units for achieving high loss reduction in a distribution system.

DG size expression

The expressions used to find the DG size at each bus [7,8] is given by (1) and (2)

$$P_{DG_l} = \frac{a_{ll}(P_{D_l} + uQ_{D_l}) - G_l - uH_l}{u^2 a_{ll} + a_{ll}} \tag{1}$$

$$Q_{DG_l} = uP_{DG_l} \tag{2}$$

in which,

$$u = (sign)\tan(\cos^{-1}(PF_{DG})) \tag{3}$$

sign = +1 for DG injecting reactive power

sign = -1 for DG consuming reactive power

$$G_l = \sum_{\substack{m=1 \\ m \neq l}}^{N}(a_{lm}P_m - b_{lm}Q_m) \quad H_l = \sum_{\substack{m=1 \\ m \neq l}}^{N}(a_{lm}Q_m + b_{lm}P_m) \tag{4}$$

Where

$$a_{lm} = \frac{r_{lm}}{V_l V_m}\cos(\theta_l - \theta_m); \quad b_{lm} = \frac{r_{lm}}{V_l V_m}\sin(\theta_l - \theta_m) \tag{5}$$

$V_l \angle \theta_l$	voltage at the lth bus;
$Z_{lm} = r_{lm} + jx_{lm}$	lm^{th} element of impedance matrix;
P_l and P_m	real power injections at the lth and m^{th} buses, respectively,
Q_l and Q_m	reactive power injections at the l^h and m^{th} buses, respectively;
N	number of buses

Types of DG

There are four types of DG depending on the injection of real and reactive powers.

Type 1: DG capable of injecting both P and Q

The power factor of the DG is in between 0 and 1. By using equations (1) and (2), the optimal size of DG at each bus for the loss to be minimal is obtained.

Type 2: DG capable of injecting P but consuming Q.

Similar to the type 1 DG, the optimal size is obtained by using equations (1) and (2).

Type 3: DG capable of injecting P only

As the DG is injecting only real power, the power factor of the DG is one. The optimal size of DG at each bus [8] for minimum power loss is given by [8]

$$P_{DG_l} = P_{D_l} - \frac{1}{a_{ll}}\sum_{\substack{m=1 \\ m \neq l}}^{N}(a_{lm}P_m - b_{lm}Q_m) \tag{6}$$

Type 4: DG capable of injecting Q only

DG is capable of injecting only reactive power and the power factor of the DG is zero. The optimal size of the DG at each bus [8] for minimum power loss is given by

$$Q_{DG_l} = Q_{D_l} - \frac{1}{a_{ll}}\sum_{\substack{m=1 \\ m \neq l}}^{N}(a_{lm}Q_m + b_{lm}P_m) \tag{7}$$

Calculation of combined power factor

The power factor of the system is obtained by using the following equation

$$PF_D = \frac{P_D}{\sqrt{P_D^2 + Q_D^2}} \tag{8}$$

$$P_D = \sum_{l=1}^{N}P_{Dl}; Q_D = \sum_{l=1}^{N}Q_{Dl}$$

Algorithm to find optimal location and size

Step 1: Input the number of DG units to be integrated.

Step 2: Obtain losses for the case without DG using the load flow solution described above.

Step 3: Calculate the power factor of DG using (8).

Step 4: Obtain the values of PDG and QDG using (1) and (2).

Step 5: calculate the loss by placing the DG at each bus one at a time using the BIBC and BCBV load flow method.

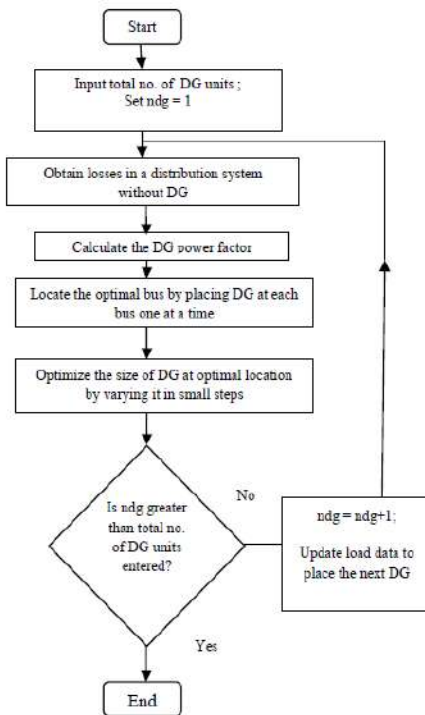
Step 6: The bus with minimum loss gives the optimal location.

Step 7: Optimize the PDG value at optimal location by varying it in small steps.

Step 8: The optimal size of DG is the size which gives minimum loss.

Step 9: To integrate the next DG, load data is updated by placing the DG with optimal size obtained in previous step.

Step 10: Repeat steps 2 to 9 until all DG units have been integrated

Flow chart


PARTICLE SWARM OPTIMIZATION

In this paper, Particle swarm optimization (PSO) algorithm is used to optimize the size of DG. PSO is a technique proposed by Kennedy and Eberhart [9] by observing the behaviour of bird flocking or fish schooling. In this technique, each individual adjusts its position depending on its own experience – known as pbest and on the experience of neighbouring particle-known as gbest. It generates random values of a given parameter such as DG size, location, velocity etc.

Key terms

particle/individual/agent: each individual in the swarm; swarm: the entire collection of particles; population size: number of random values considered in between maximum and minimum values of a particular parameter; fitness: value that gives best solution to the optimization problem; pbest (personal best): the position in parameter space of the best fitness returned for a specific particle; gbest (global best): the position in parameter space of the best fitness returned for the entire swarm; Vmax: the maximum velocity value allowed in a given direction;

Basic algorithm

Step 1: Generate an initial population of velocities and DG sizes randomly.

Step 2: Initialize the iteration with k = 1.

Step 3: Calculate the objective function at each bus.

Step 4: For first iteration, pbest will be equal to the values of the objective function obtained for each particle/bus and gbest is the value with minimum value in the values of pbest.

Step 5: Increment the iteration count and update the values of velocities and DG sizes using (9) and (10)

$$v_{id}^{k+1} = \omega v_{id}^{k} + c_1 rand * \left(pbest_{id} - s_{id}^{k}\right) + c_2 rand * \left(gbest_d - s_{id}^{k}\right); \tag{9}$$

$$s_{id}^{k+1} = s_{id}^{k} + v_{id}^{k+1}; \tag{10}$$

Where

$$\omega = \omega_{max} - \left(\frac{\omega_{max} - \omega_{min}}{maxitr}\right) * itr; \tag{11}$$

$$\omega_{max} = 0.9; \quad \omega_{min} = 0.4.$$

Step 6: Compare the objective value obtained at a particular bus with its previous iteration. If it is less than value obtained in previous iteration, set this value as current pbest. Gbest is the best value (i.e. with minimum objective value) among current pbest values.

Step 7: If iteration = maximum iteration, go to step 8. Otherwise go to step 3.

Step 8: gbest gives the optimal DG sizes.

MULTI-OBJECTIVE FUNCTION

Here, three objective functions viz. f1, f2 and f3 are combined into one for minimising loss and improving voltage stability and voltage profile. The three parameters f_1, f_2 and f_3 are in p.u.

A objective function

The multi-objective function expression is given by

$$f = \min(f_1 + k_1 f_2 + k_2 f_3); \tag{12}$$

f_1 is the loss in the distribution system calculated using the load flow solution described above.

f_2 is the voltage profile given by

$$f_2 = \sum_{n=2}^{N} \left(|V_n - V_{rated}| - (V_n - V_{rated})\right); \tag{13}$$

f_3 is the network voltage stability index is given by

$$f_3 = \frac{1}{\min\{SI_2, SI_3, \ldots, SI_N\}}; \tag{14}$$

Where

$$SI(n) = |V_m|^4 - 4[P_n(n)R_n + Q_n(n)X_n]|V_m|^2 - 4[P_n(n)R_n + Q_n(n)X_n]^2 \tag{15}$$

n = receiving bus number;

m = bus number that is sending power to bus n;

br = total number of branches;

C_1, C_2 (constants)= 2 ;

V_{rated} = rated voltage (1 p.u.);

k_1 = penalty coefficient (k_1 = 0.6);

k_2 = penalty coefficient (k_2 = 0.35);

P = net real power flow;

Q = net reactive power flow.

METHODOLOGY

The objective of minimizing loss, improving voltage profile and increasing voltage stability is achieved by using analytical expressions incorporating PSO. To determine the optimal locations of DG units, the bus with minimum

67181

functional value f is located. The DG location and size are determined similar to the method followed in obtaining optimal location and size of DG where the objective is to minimize only loss. But instead of changing the DG size in small steps, random sizing of DG is carried out by using PSO algorithm as described above. The optimal DG size is the size for which the objective function f is minimal.

RESULT

Table 1 and Table 2 presents the results of the optimal locations and sizes for loss minimization objective and multiple objective function for 33 and 69 distribution systems respectively. It is observed from tables 1 and 2 that the voltage profile is improved and DG size is reduced using multi-objective function. The DG size and location has been mentioned for single DG placement, two DG units placement and three DG units placement. It is observed from the table that there is a high loss reduction when three DG units are integrated in distribution system.

CONCLUSION

In this paper, the optimal locations are obtained using analytical expressions and the size of DG obtained from equations (1) and (2) is fine tuned using PSO algorithm considering the real power loss, voltage profile and voltage stability index. These values are compared with the optimal sizes of DG which are obtained considering only loss minimization.

ABSTRACT

Deep learning models have revolutionized many industries, including computer vision, natural language processing, and robotics. However, deploying these models in edge devices like Embedded-IoT has its own set of challenges and considerations. Edge devices often possess restricted computing capabilities, memory, storage, and they operate under resource-constrained conditions. This articleexplores the intricacies involved in deploying deep learning models on edge devices and addresses the key concerns related to latency, memory constraints, power consumption, and network bandwidth. We also explore the challenges and best practices for deploying deep learning models on edge devices, and how to make the deployment process efficient, fast, and cost-effective. Additionally, we explore the challenges associated with handling dynamic and evolving data streams in real-time scenarios.Our findings highlight the viability and importance of deploying deep learning models on edge devices, facilitating the development of real-time applications with lower latency, improved privacy, and reduced dependence on cloud connectivity. This research opens up new avenues for deploying sophisticated deep learning models at the edge, paving the way for smarter and more efficient edge-based systems in diverse application domains.

Keywords: Deep learning, Edge Computing, Internet of Things , Edge devices, Real Time Embedded Systems.

Mohammed Aarif and Afroj Alam

INTRODUCTION

Deep learning has become increasingly important due to its ability to learn from large and complex datasets, automatically discover features, and make accurate predictions or decisions. Deep learning algorithms are capable of handling unstructured and high-dimensional data such as images, video, speech, and text. They can automatically discover patterns and features from these data without requiring explicit instructions from a programmer. Deep learning models have shown exceptional accuracy in diverse applications, outperforming traditional machine learning models. Examples include image recognition, speech recognition, natural language processing, and medical diagnosis [1].A key advantage is their capacity to automatically extract data features and representations, reducing the reliance on manual feature engineering. This becomes particularly valuable in scenarios where human expertise is limited or unavailable. Deep learning models can be deployed on edge devices, such as smartphones, cameras, and IoT devices, for real-time processing of data [2]. This enables new applications and use cases that require low latency and reduced network traffic. Deep learning models can be trained on large datasets using parallel computing and distributed systems, which allows them to scale to handle massive amounts of data. This is important for applications such as recommender systems, personalized marketing, and fraud detection. Deep learning models have demonstrated the ability to generalize well to new and unseen data, which is crucial for real-world applications where the data distribution is constantly changing. Deep learning has become an essential tool in data-driven decision-making, with applications across a wide range of fields such as healthcare, finance, transportation, manufacturing, and entertainment. Its importance is likely to continue growing as new advancements in hardware, software, and algorithms are made.

There have been many recent developments in deep learning, which have enabled new applications and improved the performance of existing ones [3]. The notable developments are Transformer architectures, Generative models, Federated learning and Self-supervised learning. Transformer architectures, such as BERT and GPT-3, have revolutionized natural language processing (NLP) by achieving state-of-the-art performance on a range of tasks, including language modelling, sentiment analysis, and machine translation. These models use self-attention mechanisms to process sequences of words, allowing them to capture long-range dependencies and context [4].Generative models, such as GANs and VAEs, have enabled the generation of realistic images, videos, and audio. These models can also be used for data augmentation, style transfer, and other applications that require the synthesis of new data [5].Federated learning is a decentralized learning method that empowers multiple edge devices to collectively train a deep learning model without sharing raw data among themselves. This allows for privacy-preserving machine learning and enables new applications such as personalized recommendations and predictive maintenance [6].Self-supervised learning is a form of unsupervised learning that uses pretext tasks to train a deep learning model to learn useful representations of data [7]. This approach has shown promising results in domains such as computer vision, NLP, and robotics. Overall, these recent developments in deep learning have expanded its capabilities and opened up new possibilities for AI applications in a wide range of fields.

Deploying deep learning models in edge devices has become increasingly important due to several reasons. In the past, a single deep learning model used by an edge device would be very slow, or even stop working because it was unable to work with the right configuration. Fig.1 Shows the framework of deep learning model deployment in edge computing. These are several key rationales highlighting the significance of deploying deep learning models on edge devices:(1) Real-time processing: Implementing deep learning models on edge devices allows for immediate data processing, a crucial aspect for applications demanding low latency and swift response times. Such applications include autonomous vehicles, drones, and mobile applications [8]. Additionally, this approach helps minimize data transmission across the network, effectively reducing both bandwidth consumption and latency.(2) Privacy and security: Edge devices can process data locally, without the need to transmit it to a central server, which can help preserve user privacy and enhance security [9]. This is particularly important for applications that handle sensitive data, such as healthcare, finance, and personal assistants.(3) Reduced network traffic: Deploying deep learning models in edge devices can help reduce network traffic by processing data locally, which can help alleviate network

Mohammed Aarif and Afroj Alam

congestion and reduce latency. This is particularly important in applications that require real-time response, such as video surveillance and traffic monitoring.(4) Improved reliability: Edge devices can continue to operate even when the network connection is lost or unstable, which can help improve reliability and ensure continuous operation. This is important in applications that require high availability, such as industrial automation and critical infrastructure.(5) Cost savings: Deploying deep learning models in edge devices can help reduce the cost of data transmission and storage by processing data locally and transmitting only relevant data to the cloud. This can also help reduce the cost of cloud services, as edge devices can perform some of the processing locally. So, deploying deep learning models in edge devices has become essential for many applications that require real-time processing, privacy and security, reduced network traffic, improved reliability, and cost savings. With the continuous expansion in the number of edge devices, the significance of deploying deep learning models in such devices is expected to rise further.

CHALLENGES OF DEPLOYING DEEP LEARNING MODELS IN EDGE DEVICES

Deploying deep learning models in edge devices presents several challenges. In addition to having to maintain accurate representations of the model's current environment, the model must keep data relevant during long-term storage [10]. Fig.2 represent the challenges of deploying deep learning models and we also listed some of the main challenges:

1. Inadequate computational resources: Edge devices typically have inadequate computational resources, such as memory, processing power, and energy, which can make it challenging to deploy deep learning models that require significant computation and storage resources [11].
2. Data quality and diversity: Edge devices may not have access to the same level of high-quality and diverse data that cloud-based models have access. This can lead to biased or inaccurate predictions and limit the generalizability of the models.
3. Heterogeneous hardware: Edge devices may have different hardware architectures, which can make it challenging to develop models that can run efficiently on all types of devices. This can also make it difficult to optimize the models for each device's hardware[12].
4. Real-time processing requirements: Many edge applications require real-time processing, which can be challenging for deep learning models that require significant computation and processing time. This can also lead to increased latency, which can affect the performance of the models.
5. Data privacy and security pose: When deploying deep learning models on edge devices, as they often handle sensitive information like medical records, financial data, or personal details. Mishandling such data can lead to privacy and security risks, necessitating additional security measures like encryption and access controls to safeguard the data.
6. Model update and maintenance: Managing model updates and maintenance on edge devices can be arduous, especially when these devices are dispersed across different locations and have limited connectivity to the cloud. Ensuring timely and efficient updates and maintenance requires careful coordination and management to maintain the models effectively.
7. Model size and complexity: Deep learning models are typically large in size and complex, which can cause storage and memory issues on edge devices. Reducing the size of the model or using model compression techniques can help address these issues.
8. Computational power: Edge devices often have limited computational power, which can result in slow model inference times. Using hardware-accelerated inference engines, such as TensorRT, can help speed up inference times[13].
9. Power consumption: Edge devices are typically battery-powered, which means that they need to conserve energy as much as possible. Deep learning models can be computationally intensive and can consume a lot of power.
10. Latency: Edge devices need to provide real-time responses, which means that the latency of the model should be kept to a minimum. Using techniques such as model pruning and quantization can help reduce the latency of the model[14].

Deploying deep learning models in edge devices presents several challenges that need to be addressed to ensure optimal performance, reliability, and security. These challenges require innovative solutions and approaches to

optimize models for edge devices, ensure data quality and diversity, handle real-time processing requirements, and address privacy and security concerns.

Best Practices for Deploying Deep Learning Models in Edge Devices

Below are several recommended best practices for the deployment of deep learning models on edge devices.:

1. Optimize models for edge devices: To ensure optimal performance on edge devices, models should be optimized for the device's hardware and computational resources[15]. To achieve this, employing methods like model compression, pruning, and quantization can help minimize the size and complexity of the models.

2. Reduce data transfer: Edge devices typically have limited bandwidth and connectivity, so it's important to reduce the volume of data that requires to be moved between the device and the cloud. This can be achieved by compressing data, using local data caching, and filtering out unnecessary data.

3. Ensure data privacy and security: Edge devices often handle sensitive data, so it's important to implement robust data privacy and security measures. This can involve techniques such as encryption, access controls, and secure communications protocols.

4. Consider hybrid cloud-edge architectures: Hybrid cloud-edge architectures can combine the benefits of edge devices, such as low latency and real-time processing, with the scalability and computational resources of the cloud. This can involve distributing computation across both edge devices and cloud-based resources.

5. Perform continuous model monitoring and maintenance: Deep learning models deployed on edge devices may need to be updated or retrained over time to ensure optimal performance. Continuous monitoring and maintenance can help identify issues and ensure that models are updated in a timely and efficient manner.

6. Model optimization: Optimizing the deep learning model to address the storage and memory limitations of edge devices is crucial. Techniques such as quantization, pruning, and compression can effectively reduce the model's size. By making the deep learning model more efficient and adaptable to resource-constrained devices like mobile phones or embedded systems, its deployment becomes easier. Here are strategies for optimizing a deep learning model:

7. Utilize a smaller model architecture: A highly effective approach to decrease the size and complexity of the deep learning model involves employing a smaller architecture. This can entail reducing the number of layers, neurons in each layer, or opting for more efficient layer types, such as depth wise separable convolutions instead of standard convolutions. However, finding the right balance between model size and accuracy requires experimenting with various architectures.

8. Prune unnecessary weights: Another method for reducing the model size is to prune unnecessary weights, identifying and eliminating those with minimal impact on the model's performance. Weight pruning or structured pruning techniques can be used, removing up to 90% of the model's weights without significantly compromising its performance.

9. Quantize the model: Quantization involves reducing the precision of weights and activations in the deep learning model, leading to a reduction in size and complexity. This process converts 32-bit floating-point weights to 8-bit integers or even binary weights, significantly reducing the model's size while maintaining reasonable accuracy.

10. Employ knowledge distillation: Knowledge distillation entails training a smaller model to mimic the behaviour of a larger, more complex model. The larger model generates soft targets (e.g., probabilities) for the training data, which the smaller model aims to match. This results in a smaller model that performs almost as well as the larger model, but with reduced size and complexity.

Hardware Consideration

Deploying deep learning models in edge devices requires careful consideration of the device's hardware and computational resources, data privacy and security, and data transfer requirements[16]. By optimizing models for edge devices, using transfer learning, reducing data transfer, ensuring data privacy and security, considering hybrid

Mohammed Aarif and Afroj Alam

cloud-edge architectures, and performing continuous model monitoring and maintenance, organizations can deploy deep learning models on edge devices that are reliable, secure, and effective which is summarized in Fig.3.

Hardware-accelerated inference: Using hardware-accelerated inference engines, such as TensorRT, can help speed up inference times and reduce the power consumption of the model. Hardware acceleration can greatly speed up the inference process for deep learning models, especially for large and complex models. Here are some hardware acceleration techniques for deep learning inference:

1. Graphics Processing Units (GPUs): GPUs are specialized processors designed for parallel computation, making them ideal for accelerating the matrix calculations that are common in deep learning models. They can greatly speed up the inference process compared to traditional CPUs. Graphics Processing Units (GPUs) are specialized processors designed to perform complex mathematical calculations with a high degree of parallelism. Originally developed for rendering graphics in computer games and other visual applications, GPUs have become an important tool for accelerating deep learning computations, particularly for training large and complex deep neural networks. By using a GPU to perform these calculations, deep learning models can be trained much more quickly than on a traditional CPU. Many deep learning frameworks, including Tensor Flow, PyTorch, and Keras, support the use of GPUs for training and inference. GPUs can be used in conjunction with CPUs to accelerate deep learning computations, with the CPU handling tasks such as data loading and model management while the GPU performs the bulk of the computations. NVIDIA is one of the leading manufacturers of GPUs for deep learning, with their NVIDIA Tesla and NVIDIA Titan product lines specifically designed for deep learning applications. NVIDIA also provides specialized software tools, such as the CUDA toolkit and cuDNN library, to enable developers to use GPUs for deep learning computations. GPUs have become an essential tool for deep learning, enabling faster and more efficient training of complex deep neural networks.

2. TensorRT is an NVIDIA-developed deep learning inference optimizer and runtime engine, designed specifically to accelerate inference processes on NVIDIA GPUs. It is designed to optimize and deploy deep learning models in production environments, particularly for real-time and low-latency applications. TensorRT uses several optimization techniques to accelerate deep learning inference, including layer fusion, precision calibration, and kernel auto-tuning. Layer fusion combines multiple layers of a deep learning model into a single layer to reduce the overhead of transferring data between layers[17]. Precision calibration allows TensorRT to use lower-precision data types, such as INT8 or FP16, to perform computations, which can significantly reduce memory bandwidth and computation time. Additionally, it offers an array of tools and utilities for profiling and enhancing deep learning models, along with extensive documentation and examples to help users get started. TensorRT can provide significant performance improvements for deep learning inference on NVIDIA GPUs, particularly for real-time and low-latency applications. However, it requires specialized knowledge to use effectively and is only compatible with NVIDIA GPUs.

3. Field Programmable Gate Arrays (FPGAs): FPGAs are programmable chips that allow customization of hardware circuits tailored to perform specific computations, making them ideal for accelerating inference on targeted segments of a deep learning model. Compared to GPUs, they can offer improved power efficiency and lower latency, though their programming demands more specialized knowledge. On the other hand, Application-Specific Integrated Circuits (ASICs) are custom-designed chips optimized for specific deep learning tasks, potentially providing even greater performance gains than GPUs or FPGAs. However, developing ASICs necessitates significant investment in hardware design and fabrication.

4. In the realm of deep learning, ASICs can be designed to execute specific operations essential for deep neural networks, such as matrix multiplication and convolution, in a highly optimized and energy-efficient manner. This results in substantial enhancements in both performance and power efficiency compared to conventional CPUs and GPUs. ASICs can be tailored to optimize both training and inference for deep learning models. For instance, Google's Tensor Processing Unit (TPU) is an ASIC dedicated to deep learning inference, while companies like Bitmain and Canaan produce specialized ASICs for deep learning tasks.ASICs are a promising technology for accelerating deep learning computations, offering potentially significant improvements in both performance and power efficiency. However, they are currently less widely used than GPUs for deep learning, due in part to the cost and complexity of ASIC design and fabrication.

Mohammed Aarif and Afroj Alam

5. Tensor Processing Units (TPUs): TPUs are custom-designed ASICs developed by Google specifically for deep learning tasks. They provide extremely high performance and power efficiency for deep learning inference, especially for models trained using Google's TensorFlow framework. TPUs are designed to perform the matrix multiplications and other linear algebra operations commonly used in deep learning computations in a highly optimized and energy-efficient manner. TPUs were first announced by Google in 2016 and have since been used extensively within Google for both training and inference of deep learning models. TPUs allows users to take advantage of the performance and efficiency benefits without requiring specialized knowledge of hardware design or programming. TPUs can also be used in conjunction with CPUs and GPUs to accelerate deep learning computations even further. Compared to traditional CPUs and GPUs, TPUs offer several advantages for deep learning computations, including significantly faster training times, higher throughput, and lower power consumption. This makes them well-suited for large-scale deep learning applications, such as natural language processing, image and video recognition, and speech recognition.

6. Neural Processing Units (NPUs): NPUs are specialized chips designed specifically for deep learning inference, often found in mobile and embedded devices. They can provide high performance and power efficiency in a compact form factor. Neural Processing Units (NPUs) are specialized chips designed specifically for accelerating deep learning computations. NPUs can be used for both training and inference of deep learning models, and they are particularly well-suited for complex neural network architectures[19]. One of the advantages of NPUs over more general-purpose processors like CPUs and GPUs is their energy efficiency. Because they are specifically designed for deep learning computations, they can perform these calculations much more efficiently than general-purpose processors. This can lead to significant improvements in both performance and power efficiency for deep learning applications. NPUs are still a relatively new technology, and there are currently only a few companies producing them. However, as deep learning continues to grow in importance, it is likely that more companies will begin developing NPUs to meet the increasing demand for high-performance and energy-efficient deep learning hardware. NPUs represent an exciting development in deep learning hardware, offering significant performance and energy efficiency improvements for a wide range of applications. While they are not yet as widely used as GPUs or TPUs, they have the potential to become an important tool for accelerating deep learning computations in the future.

Optimizing Deep Learning Framework

To take advantage of hardware acceleration for deep learning inference, you will need to optimize your model and software to take advantage of the specific hardware platform you are using. This can involve techniques such as quantization, pruning, and weight sharing, as well as optimizations for the specific hardware platform you are using as pictured in Fig.4. Many deep learning frameworks, such as Tensor Flow and Py Torch, provide support for hardware acceleration and can make it easier to optimize your models for specific hardware platforms.

Transfer learning: Transfer learning is a machine learning technique that involves fine-tuning a pre-trained model on a smaller dataset to reduce its size and complexity. The pre-trained model has already learned to recognize complex patterns and features from a large dataset for a specific task, like image classification or natural language processing. To adapt the pre-trained model for a new task, its output layer may be changed or new layers can be added. The weights from pre-training are then fine-tuned on the new task using a smaller dataset, optimizing the model further. Transfer learning is especially valuable when labeled data is limited or training from scratch is computationally expensive. It is widely applicable to various tasks like image classification, object detection, natural language processing, and speech recognition. Leading deep learning frameworks, such as TensorFlow and PyTorch, offer pre-trained models for easy application of transfer learning to new tasks. This powerful technique enhances the accuracy and efficiency of machine learning models, particularly when resources are constrained, and expedites the development of new applications.

Py Torch is an open-source machine learning framework predominantly used for developing deep learning models. Originally created by Facebook's AI research team, it is now maintained by a vibrant community of developers and researchers. A notable feature of PyTorch is its dynamic computational graph, enabling runtime modifications for

Mohammed Aarif and Afroj Alam

simpler debugging and complex model development. The framework also provides an intuitive API, making it user-friendly for newcomers to deep learning. PyTorch supports a wide array of deep learning models, including convolutional neural networks (CNNs), recurrent neural networks (RNNs), and transformers. Moreover, it offers a variety of pre-trained models for common tasks like image classification and object detection. PyTorch boasts extensive customization options and advanced features such as automatic differentiation, distributed training, and support for multiple hardware platforms like CPUs, GPUs, and TPUs. It also seamlessly integrates with other popular deep learning frameworks, like TensorFlow and ONNX. In addition to its core functionality, PyTorch also provides a number of tools and libraries for developers, such as PyTorch Lightning, which provides a lightweight wrapper for PyTorch that simplifies the development of complex deep learning models, and TorchVision, which provides a set of pre-trained models and datasets for computer vision applications. PyTorch is a powerful and flexible machine learning framework that provides developers with the tools they need to build, train, and deploy deep learning models for a wide range of applications.

Model deployment frameworks: There are several model deployment frameworks, such as TensorFlow Lite and CoreML, which can help simplify the deployment process and provide optimized implementations for edge devices.

Tensor Flow Lite is a streamlined edition of the TensorFlow deep learning framework, tailored specifically for mobile and embedded devices. It is optimized to efficiently execute deep learning models on devices with restricted computational capabilities, such as smartphones, tablets, and IoT devices. TensorFlow Lite incorporates several features that make it highly suitable for deployment on devices includesmall size. TensorFlow Lite is designed to be as small as possible, so that it can be easily installed and run on devices with limited storage space. TensorFlow Lite is optimized for low-latency inference, making it suitable for applications that require real-time processing, such as object detection and speech recognition. TensorFlow Lite supports hardware acceleration on a wide range of devices, including GPUs, TPUs, and custom ASICs, to further improve performance. TensorFlow Lite is designed to be easy to integrate with existing mobile and embedded applications, making it easy to add deep learning capabilities to existing applications.It also supports a variety of input types, including images, audio, and text.TensorFlow Lite is a powerful tool for deploying deep learning models on mobile and embedded devices, making it possible to bring the benefits of deep learning to a wide range of applications and devices.

CoreML is a machine learning framework developed by Apple for iOS, macOS, watchOS, and tvOS. It allows developers to integrate trained machine learning models into their applications, enabling a wide range of use cases, such as image recognition, natural language processing, and speech recognition. CoreML is compatible with diverse machine learning models, encompassing deep neural networks, tree ensembles, and support vector machines. Additionally, it provides a collection of pre-trained models that prove useful for typical tasks like object recognition and sentiment analysis [20]. One of CoreML's notable capabilities is running machine learning models on-device, eliminating the need for an internet connection or cloud computing resources. This makes it possible to perform real-time inference on mobile devices, with low latency and high accuracy. CoreML also provides a number of tools and APIs for developers to train and optimize their own machine learning models. These tools include CoreML Tools, which allows developers to convert trained models from other frameworks, such as TensorFlow and Keras, into CoreML format, and Create ML, which provides a visual interface for building and training custom models using Apple's machine learning technology. CoreML is a powerful tool for adding machine learning capabilities to iOS and macOS applications, enabling a wide range of use cases and providing developers with the tools they need to build and optimize their own machine.

CONCLUSION

The deployment of deep learning models on edge devices for real-time applications offers significant advantages and presents new challenges. Through this study, we have explored various techniques and optimizations to address these challenges and enable efficient execution of deep learning models at the edge. Our findings highlight the

importance of considering resource when deploying models on edge devices.Deploying deep learning models in edge devices presents its own set of challenges and considerations, including limited computational power, memory, and storage. However, by using best practices such as model optimization, hardware-accelerated inference, transfer learning, and model deployment frameworks, it is possible to deploy deep learning models in edge devices efficiently and effectively. Model monitoring is also important to ensure that the deployed model continues to perform well over time. The successful deployment of deep learning models on edge devices opens up new possibilities for diverse application domains. Edge-based systems can now leverage sophisticated models to make intelligent and immediate decisions locally, without relying heavily on cloud computing. This not only improves the responsiveness and efficiency of real-time applications but also addresses concerns regarding data privacy and security. As technology continues to advance, it is crucial to further explore and develop innovative techniques for deploying deep learning models on edge devices. Continued research in this area will drive the evolution of smarter, more autonomous, and resource-efficient edge-based systems. The deployment of deep learning models in edge devices for real-time applications marks a significant milestone in the field of artificial intelligence. It presents opportunities to unlock the full potential of edge computing and revolutionize various domains, ranging from autonomous vehicles and industrial automation to healthcare and Internet of Things (IoT) applications. By embracing this paradigm shift, we can create a future where intelligent decision-making is seamlessly integrated into our daily lives, transforming how we interact with and benefit from technology.
