ABSTRACT

This paper proposes a fuzzy logic controller (FLC) based PV system fed with the three-phase power grid. Generally large rating PV system is associated with the already existing power system it may affect the grid performance due to inconstancy in nature. In this proposed system, the FLC-based controller is designed to operate the power system in stable condition during faults occurring time also. Solar-fed inverters playa crucial role in operating our proposed system at stable conditions and increasing the reliability, stability, and performance of the system. This paper provides a controlling strategy for a PV system that improves the transient stability of a Synchronous Generator (SG) linked to the utility grid.The suggested FLC control approach causes the PV inverter's DC link capacitors to absorb a few of the kinetic energy stored in the SG during a temporary halt, as shown in the study. In addition, by injecting reactive power into the system, the planned method can increase voltage stability. The results were done through MATLAB Simulation successfully working to the proposed control method.

Keywords: PV Inverters, Voltage stability, Fuzzy Logic Controller

INTRODUCTION

As of overdue, energy frameworks have encountered a massive growth in the entrance of Renewable Energy Sources (RES), which might be usually related to the energy network to improve the power grid performance by using power

converters. The increment of the PV energy shows some new specialized difficulties, for instance, temporary steadiness [1], which makes the interest in force frameworks below severe unsettling effects a significant issue. The preferred framework dormancy and lead consultant reaction are reduced for this new framework layout, which may additionally adversely impact the temporary reaction of the rotor point of SGs. In any case, the inverters applied in the PV age deliver novel open doorways, like subordinate administrations to SGs. PV converters might assist with retaining soundness after a framework unsettling have an impact on, for example, a brief out delivered approximately [2]. The GCs of the history of twenty years did not count on the big adjustments in the electricity framework setup regarding the activity of pressure inverters. Indeed, even today, it's far more difficult to appreciate and verify future conditions. Hence, over the past 20 years, GCs have anticipated the RE assets to be separated while an unsettling impact is recognized [3]. This necessity is fine the period of the RE infiltration level isn't huge, which is completed to forestall the deficiency of synchronism. In any case, the GCs have modified to require FRT restriction from RE gadgets in the course of aggravations [4], and that means that the aged unit must live associated with the power framework as well as, additionally, should give a guide in maintaining up with synchronism and voltage solidness. A few nations have laid out ideas that require greater capacities from the PV inverters utilized in disseminated age devices and from PV flora related to the medium voltage transmission matrix. A portion of those principles takes into consideration an MC running mode or in the short end transferring dynamic potential to the matrix whilst giving need to the responsive electricity backing to in addition develop voltage dependability [5]-[7]. A few GCs lay out APRRR for publishing shortcoming interests, as needs to be seen in [8]. In the writing, the FRT limit of PV frameworks in consistence with the GCs has been to an awesome volume researched. For instance, [9] proposes an FRT plan to help the community via infusing responsive electricity, as anticipated in the German GC, and that empowers the electricity first-rate to change in view of a tradeoff between power waves and present-day sounds. The prevalence of large-scale RES in existing power networks has increased over the previous decade due to the global warming concerns of fossil fuel-based power stations and the rising cost of energy generation. PV power plants are among the most popular forms of RES since their costs are constantly falling.

MODELLING OF THREE PHASE POWER NETWORK

The proposed test system shown in figure.1 is considered for transient analysis of the integrated system. The synchronous machine and PV system both are connected in parallel and they are integrated with the grid by means of transmission lines. The PV systems have n PV system as depicted in figure.2, and are restricted by using the MPPT strategy. It is a known fact that the harmonics injected by the nonlinear loads are controlled by using active power filters. The synchronous machine's current components control the torque and flux in the machine by injecting and controlling the PV system. As it is known that this approach depends on the prepared limitsduring the fault the excess energy will not be absorbed by the grid and it was sent to PV inverter's dc link for storage purposes.

Wind System

The Wind system which is the electrical generator of renewable energy, is the component that makes up a wind turbine. We looked at the rotor blade design. A low-rpm electrical generator is the brain of any wind power system. It converts the mechanical rotational power produced by wind energy into electricity to provide power for remote villages. A wind turbine can transform a small fraction (Cp) of the energy that is captured from the wind. The following equation explains how three variables—rotor blade sweeps area (Aw), upstream wind velocity (Vw), coefficient of rotor power (Cp), and mechanical power (Pwt)—are related.

$$P_{wt} = \frac{1}{2} P A_w V_w^3 C_p(\lambda, \beta) \qquad (1)$$

Solar System

The solar system acts as a renewable energy resource for hybrid microgrids. Solar radiation and PV cell temperature both affect PV power. The PV module has a separate MPPT (Maximum Power Point Tracking) controller from the PMS.

$$Iph = [sc + Ki(T - 298) \times Ir/1000] \qquad (2)$$

65494

Irs = Isc/$[exp(Qvoc/NSknT)–1]$ (3)

Micro Hydro System

The kinetic energy received from the falling water is converted to mechanical power that subsequently transformed the electrical energy by a generator as part of the hydro turbine's basic operating principle. The electrical power produced by the micro-hydro turbine is calculated using the following equation in the proposed model.

$$Phyd = \frac{\eta hyd \times hnet \times \rho water \times Qturbine \times g}{1000\ (W/kW)}$$

FUZZY CONTROLLER FOR IMPLEMENTATION

The overall control scheme for controlling the proposed system is presented in figure.3. Under steady-state operating conditions, the power comes from the PV system is fed to the utility. The dc link controllers receive the active from the dc link and regulate the dc link error voltage. When the dc link error control building block is disable, the transfer of power is made from grid to MC mode. In this situation, dc link receives the power and absorb the kinetic energy so by reducing the effect on synchronous machines transient stability.

SIMULATION RESULTS

Hybrid system response synchronous machines active and reactive power are exposed in figure.4, and figure.5 shows the hybrid system response PV systems active and reactive power, figure.6, Hybrid system response PCC voltage and dc-link voltage, and lastly in figure.7, the hybrid system response inverters currents and synchronous machines rotor angle

This paper proposed FLC and PI controller-based stability enhancement of the grid-connected PV system. FLC decides the optimal gain parameters of the PI controller based on the grid side parameter variations. The benefits of the suggested method are vigorous performance with an increased level of Transient stability and Voltage Stability. The performance of the proposed technique was assessed by means of the comparison analysis with the presented technique.

CONCLUSION

In this paper, the proposed fuzzy logic controller-based solar power system is fed with the grid. Generally large rating PV system is associated with the already existing system it may affect the grid operations due to inconstancy in nature. In this proposed system we design our system in stable even faulty condition and voltage support for LVRT. Solar-fed inverters are playing a crucial role in operating our system at stable and increasing reliability and stability. To achieve transient stability, the proposed control technique causes the SG kinetic energy to be engaged by the dc link capacitors. It also allows for the injection of reactive electricity into the grid to help maintain voltage stability. Results show that the suggested control strategy efficiently ensures the SM's transient stability by reducing rotor angle oscillations within the initial few cycles of the failure.

ABSTRACT

15%–17% of couples worldwide have infertility, which is defined as being unable to become pregnant after a year of sexual activity. In fact, both sexes can be affected by the underlying causes of infertility; roughly 50% of cases are brought on by disorders that affect women, and 40% by those that affect men. It is also important to note that 25% of infertile couples will have a reproductive issue with both partners. There are many causes for female infertility out of which ovulation problems tops the list. Aside from these, there might also be hormonal, cervical, uterine, or unexplained infertility factors. Herbal medicine supported by evidence may be an effective therapy for female infertility. We provide some convincing data in this review for the use of herbal medicine to cure female infertility. The following plants are covered: chasteberry, shatavri, maca, cinnamon, and ashwagandha. Chasteberry, additionally referred to as sindhuvara in Ayurveda, has a very long history of usage as medicine. Treatment for particular ailments involves administering the entire plant, including the leaves, roots, fruits, leaf oil, and seeds. One of the most important healing plants used by Ayurvedic Vaidyas from ancient times is shatavari, *Asparagus racemosus*. This herbal plant, which performs a variety of biological activities, is referred to as a Rasayan in Ayurvedic literature. Maca has an array of therapeutic applications, spanning menopause, fertility, libido maintenance, and cancer prevention.The Maca may affect a number of systems that lead to infertility issues. Cinnamon has a long history of treating PCOS and reducing insulin resistance. The herb ashwagandha is commonly touted as a remedy for a number of conditions, includes a few of the most typical pregnant side effects notably sleeplessness, stress, and discomfort. The data presented in

65500

this review shows that different compounds in these plants have the potential to treat a range of female reproductive disorders, including premature ovarian failure (POF), polycystic ovary syndrome (PCOS), hyperprolactinemia, endometriosis, and hypothalamic dysfunction. Additionally, these compounds have the potential to be used in conventional medicine as well as alternative therapies because of their antioxidant, anticancer, and antidepressant properties.

Keywords: Female infertility, fertility, menstrual, estrogen, progesterone.

INTRODUCTION

According to estimates, there are 72.4 million couples worldwide who have fertility issues. [1]. One in six couples worldwide experience unsuccessful conception after an entire year of unprotected sexual activity. About 50% of female illnesses are responsible for infertility in couples. [2] Infertility is described as "a disorder of the reproductive system defined by the inability to achieve a clinical pregnancy after 12 months or more of frequent unprotected sexual intercourse," according to the World Health Organization and the International Committee for Monitoring Assisted Reproductive Technology. [3] Demographers, however, define infertility as the inability of a sexually active, non-contraceptive woman to produce a live child. Couples choose live birth to conception, therefore this statement is more in accord with both the dictionary definition and the general agreement. [4] Some studies' definitions of infertility comprised "lack of a live birth while being married for five or seven years," without taking into account whether this was consensual or non consensual. [5]

Several disorders that might cause female infertility include:
- Ovulation issues
- fallopian tube damage (tubal infertility)
- cervical issues (cervical stenosis, benign polyps or malignancies)
- and unbalanced hormones

The hormonal conditions comprise:
- endometriosis
- uterine fibroids, premature ovarian failure (POF)
- polycystic ovary syndrome (PCOS)
- hyperprolactinemia (excess prolactin)
- pelvic inflammatory disease (PID).
- hypothalamus dysfunction[6]

The most significant risk factors include-
- smoking
- excessive alcohol
- radiation or chemotherapy treatment
- long-term, high-dose NSAID usage
- antipsychotics
- usage of addictive drugs including cocaine and marijuana
- Obesity
- advancing age
- sexually transmitted diseases (STDs). [7]

Symptoms of Female Infertility:
Variations in a woman's menstrual cycle or ovulation may indicate a medical condition related to infertility.

These signs include:
- Abnormal cycles.
- Bleeding which is either more intense or less intense than normal.
- Irregular time frames.
- Each month, the number of days between each menstruation fluctuates
- Painful cycles
- Cramping, pelvic pain, and backache are possible.

Infertility in women can occasionally be brought on by hormonal issues. In this situation, other symptoms could be:
- Modifications in libido and desire (Skin tends to change, along with more acne)
- On the chin, chest, and lips, black hair is growing
- Loss of hair or receding hair
- gaining weight [8-11]

Herbs and Infertility
The medicinal herbs examined in this article have a variety of reproductive enhancement properties.

For millennia, people have performed experiments with herbal medicine all across the world. Infertility is a condition that is increasingly being treated with it in the West by both men and women. In accordance with the American Society for Reproductive Medicine, there is still little proof to back up the claim that herbs increase fertility. However, this article offers some reliable evidence using evidence-based herbal medicine. [12-17] Any woman who experiences infertility knows the emotional toll it takes. It can cause anxiety, loneliness, protracted depression, and the inability to focus on everyday chores. Many women who struggle with infertility are able to start families with methods like in vitro fertilisation (IVF) or surrogacy. However, these methods are highly pricey, and some women are unable to pay for them. There are herbal and natural remedies that can also aid in addressing the underlying reason of infertility and boosting chances of conception. A balanced diet and regular physical activity are also lifestyle choices that can aid. [18,19]

HERE ARE SOME PLANTS REVIEWED FOR THEIR POTENTIAL BENEFITS IN TREATING FEMALE INFERTILITY

Chasteberry (*Vitex negundo* and *Vitex agnus castus*):
Figure : *Vitex negundo*
*Vitex negundo*is an upright tiny tree or shrub that can reach heights of 2 to 8 metres. Typically, the bark is red - brown. Each of its leaf branches has between three and five finger-like, lanceolate leaflets. [20]

Habitat
Vitex negundo is a plant that is indigenous to tropical Eastern and Southern Africa, Asia, and Europe. [21] It is frequently observed all over India, primarily in warmer regions and rising to a height of 1500 m in the outer Western Himalayas. [22]
Parts of plant used to treat female infertility- The fruits and seeds of Vitex shrub.

Uses in female infertility
- The Vitex genus has piqued the interest of the health sector market due to the pharmacological properties offered through the phytochemicals found within the plant matrix, which are encouraged as a wide range of additives that may boost and manage various types of diseases or used as alternative medicines together with conventional primary therapy. Many scientists are currently interested in finding novel, pharmacologically effective Vitex plant components.
- The Vitex genus contains a variety of secondary metabolites, including steroids, terpenes, lignans, flavonoids, and phenolic compounds. [23]The Nirgundi plant's fruit, leaves, and shoot are all used to assist women in Malaysia and India after giving birth.

- The fruit and shoot juice are used to boost milk production. Moreover, the leaf is cooked in water for a postpartum shower that helps the mother's recovery. [24,25]
- Despite the various studies on Vitex compounds and their biological qualities, the bulk of the company's commercial medicines are used to treat menstrual diseases such as infrequent periods, mastodynia, and alleviated premenstrual syndrome symptoms. [26]
- The Dharward district of Karnataka uses leaves to cure bone fractures, fractured feet, paralysis, and impotence. [27]
- The Verbenaceae family member *Vitex agnus castus* has historically been used to treat acne as well as the menstrual issues brought on by corpus luteum shortage, such as premenstrual symptoms and spasmodic dysmenorrhea, some disorders related to menopause, and inadequate lactation. [28]
- Studies on humans have demonstrated the efficacy of Verbenaceae plant species in treating gynaecological disorders and premenstrual symptoms like despair, melancholy, and restlessness. [29]
- Verbenaceae extract enhances sexual function by modulating the secretion of LH and FSH, increasing serum levels of progesterone and oestrogen, and decreasing prolactin secretion via acting on dopamine receptors. [30]
- The corpus luteum is encouraged by this plant's extract to release progesterone after ovulation, a process that in turn regulates the female sexual cycle. [31]
- In an experiment conducted by Yakubu and Akanji (2011), it was found that serum levels of progesterone and oestrogen rose in the Verbenaceae extract group compared with control group, while prolactin and LH, two hormones that interfere with sexual activity, fell. [32]

Shatavari *(Asparagus racemosus):*
Figure : *Asparagus racemosus*
The under-shrubby plants can reach a height of 3 metres. This is a spiny herb with several succulent short roots. [33]
This plant, which varies from white to grey in colour, is a woody creeper called as "Liana Bearing Brown." [34,35]

Habitat:
The plant is mostly found in Sri Lanka, India, and the Himalayas but is found all over the world. It is located throughout India's subtropical and tropical regions, up to a height of 1500 m. [36]
Parts of plant used in female infertility- Dried roots of Shatavari.

Uses in female infertility:
- Issues with female reproduction, such as irregular menstrual periods, are treated with it along with dysmenorrhea, uterine bleeding, amenorrhea, weak or unproductive sex, menopause, and pelvic inflammatory diseases like endometriosis and erectile problems.
- It has been used as a reproductive tonic for PMS from the dawn of time, strengthening, nourishing, purifying, and causing uterus prolapse.
- By harmonising the hormonal level, it overcomes infertility, develops the lining of the uterus for contraction during foetal development, avoids miscarriages, and also aids in increasing lactation.
- It enhances folliculogenes and raises ovarian weight, and root extract is useful for stimulating serum FSH. [37,38,39]
- The usefulness of A. racemosus saponins in treating dysmenorrhea, which is characterised by painful periods without obvious pelvic aetiology, is demonstrated by their ability to inhibit the oxytocic impact on uterine muscle and preserve unconstrained uterine mobility.
- Renowned shatavari formulation Shatavri Sidh Girit is chosen in cases of threatened abortion, and this effect is brought on by shatavarin. [40,41]

Peruvian Maca (*Lepidium meyenii*):
Figure : *Lepidium meyenii*
The Brassicaceae family's member maca (*Lepidium meyenii*) grows in Peru's central Andes between 4000 to 4500 metres above sea level. The primary component used for human food is the tuber, which is found underground.

Shaffi Tangri *et al.,*

There are numerous variants, and its primary subtypes are yellow, red, and black, with the type of soil where it is grown appearing to influence this. [42]

Parts used in female infertility- Root of Peruvian maca.

Uses in female infertility:

- The hypothalamus and pituitary are encouraged to work at their highest potential by maca, which enhances the performance of all endocrine glands. The balancing effects on estradiol, progesterone, and FSH have been documented. Limiting weight gain, lowering blood plasma triglycerides, and improving phosphorus and calcium deposits in muscle and bone tissues are other important goals.Women who use Maca report higher tolerance to its non-steroid alkaloids, which are non-steroid chemicals. It is generally known that maca boosts or aids in the process that controls the release of oestrogen beyond 30 pg/ml [43],hence easing menopausal symptoms.
- Concurrently it had a pronounced propensity to reduce FSH. With a calming effect as well, maca seems to have a good impact on depression. Cortisol and ACTH levels have been shown to decrease as a result of this effect [44].
- According to reports, administering Maca to perimenopausal women raised their serum levels of progesterone, FSH, ACTH, and oestrogen. Additionally, menopausal women's symptoms appear to be getting better [45].
- Other investigations have shown that Maca supplementation raises LH serum levels in female rats just at the time of LH surge and not throughout the pulsation phase. Through pituitary activity of the Hypophysis Pituitary Gonad (HPG) axis, this impact stimulates ovulation. supporting Maca's historical usage as a fertility booster [46].
- Numerous studies have shown that Maca can increase fertility by removing free radicals and producing an anti-oxidant response, primarily due to its metabolites, the glycosylates and the alkaloids. These two factors, along with raising LH serum levels, could be the pathways combating infertility [47].

Cinnamon*(Cinnamomum cassia)*

Figure :*Cinnamomum cassia*

One of the earliest known herbs is cinnamon, which has four main commercial species: *C. loureiroi, C. burmannii, C. cassia*, and *C. verum.* [48]

Habitat-With smaller-scale operations in Vietnam and India, cinnamon is mostly produced in the Seychelles, China, Madagascar and,Sri Lanka (about 27,000-35,000 annual tons). [49]

Parts of plant used in female infertility- Bark of cinnamon in the form a powder.

Uses in female infertility

- Cinnamon showed beneficial PCOS results via a variety of ways. Studies show that a significant contributor to the development of PCOS symptoms is insulin resistance. [50]
- Cinnamon increases glucose absorption by triggering the glycogen synthase enzyme and suppressing the function of glycogen synthase kinase 3 (GSK3). Additionally, cinnamon inhibits insulin receptor dephosphorylation and activates the enzyme insulin receptor kinase. There is a reduction in insulin resistance as a result of all these actions. [51]
- At doses of 50 and 200 mg, prior research suggested that cinnamon extract may elevate oestrogen and progesterone levels. [52]It might be connected to rising LH secretion, which would enhance the production of oestrogen and progesterone [53]. Studies in the past have demonstrated that cinnamon, in all of its varieties (powder, extract, and supplement), can influence hormone levels and menstrual cycles. [54,55,56]
- Ovarian size also underwent a discernible alteration. Seven patients in the test group also claimed full improvement. These findings demonstrate how cinnamon affects ovarian tissue. [57]
- Additionally, topical application of lotion and gel comprising the plant extract in the vagina and systemic delivery of the antifungal chemicals in Cinnamomum efficiently eliminated Candidiasis infections, that can minimize fungal-induced infertility. [58]
- Hypoestrogenism or pelvic operations can cause endometriosis, a clinical condition that affects the quality and functioning of the ovaries. [59]Blocking the release of oestrogen from the ovaries is now the most widely used treatment for this illness. [60]

- The least risky option to pharmaceutical treatments, because of the severe side effects of medications like gestrinone, aromatase inhibitors, and gonadotropin-releasing hormone (GnRH) antagonists, is the utilization of plant extracts rich in polyphenols (isoflavonoids and flavonoids), such as cinnamon, which can prevent the production of oestrogen and stop the progression of endometriosis through their antioxidant and anti-inflammatory properties. [61]

Ashwagandha *(Withania somnifera)*:
Figure v: *Withania somnifera*
Withania somnifera is a tomentose, tall, branched, evergreen shrub that ranges in height from 30 to 150 cm. It bears blooms all year round, with a maximum flowering period around March and July. [62]
Habitat-Withania is naturally present, most likely in the relatively dry and more humid regions, and it can be found from the Mediterranean region to South Africa and across tropical Africa, as well as from the Cape Verde Islands and the Canary Islands to the Arabian and Middle Eastern regions, which would include India, southern China, and Sri Lanka. It is typically grown as an herbal remedy in India and many other countries, likely due to its thick roots. [63]
Parts of plant used in female infertility:
Roots of *Withania somnifera*

Uses in female infertility:
- The herb has been advocated for use in folk medicine to treat conditions like polyarthritis, ulcers, premature ejaculation,lumbago, impotence, throbbing pains, leucorrhoea, oligospermia, vitiligo, general debility, uterine infections, and orchitis.[64]
- In research by Saiyed et al. (2016) on letrozole-induced polycystic ovarian syndrome in rats, it was discovered that in comparison with the control group, preantral and antral follicles and corpus luteum decreased after 22 days, but the serum levels of LH reduced and FSH increased. [65]
- The 2010 study found that Ashwagandha extract improved the HPG axis and the equilibrium of serum oestrogen, which in turn improved oogenesis. Ashwagandha extract also increased gonadotropin hormone release through GABA mimetic properties. [66]

CONCLUSION

Among the several plants that are effective in the treatment of a range of female reproductive problems, five plants with positive impacts on female fertility have been studied. Many reproductive issues, including menopausal symptoms, hypothalamic dysfunction, PCOS, osteoporosis, endometriosis, POF, hyperprolactinemia, PID, and female reproductive-related cancers (cervical, ovarian, vaginal, uterine/endometrial, and vulvar cancers), can be managed and treated with the help of these plants. This systematic study also emphasizes the necessity for and current absence of a universal definition of infertility. Spasmodic dysmenorrhea and premenstrual symptoms are among the menstrual issues caused by corpus luteum deficit that are treated with chasteberry supplements. Given that women's reproductive systems are the primary target of the plant Shatavri's therapeutic benefits, *Asparagus racemosus* is regarded as a female reproductive tonic. *Lepidium meyenii*, a plant native to Peru, has a number of potential benefits, including enhancing fertility and sexual function by influencing hormone levels, particularly luteinizing hormone (LH) concentrations. Cinnamon offers a viable option for the treatment of PCOS because it is a valuable ingredient for conquering metabolic syndrome. There are a variety of beneficial effects of cinnamon on PCOS, yet further investigation is required to comprehend the underlying processes underlying the apparent benefits of cinnamon supplements in PCOS therapy. Ashwagandha, known as the Rasayana of Ayurveda, is a very effective regeneration tonic that is believed to enhance oogenesis and serum oestrogen balance.

ABSTRACT

Water pollution has emerged as a critical global crisis due to various contaminating factors, especially from textile industries. The release of toxic dyes into water bodies causes significant environmental damage. This study focuses on the extraction of hydroxyapatite from turkey femur bone using a direct calcination process. X-ray diffraction analysis of the extracted HAp confirms the hexagonal structure with space group of P63/m and reveals agglomerated particles averaging 77.3 nm in size via scanning electron microscopy. Elemental analysis validates the presence of calcium, oxygen, and phosphorus elements. Identification of functional groups is analyzed through FTIR analysis. UV-Vis analysis provides valuable insights into absorbance and bandgap values. In terms of practical application, the extracted HAp showcases significant potential as a catalyst in the treatment of wastewater by photocatalytic experiment. Evidently, its efficiency in decomposing congo red and methylene blue dyes is significant, displaying degradation percentages of 90.5% and 99.4% respectively. These findings proved the remarkable catalytic potential of hydroxyapatite derived from femur bones.

Keywords: Turkey bone, Calcination, Optical properties, Waste water treatment, Photocatalysis,

INTRODUCTION

The release of industrial waste from textile industries, paper industries, cosmetics, food beverages, pharmaceutical, and plastic sectors poses a significant threat to the environment due to the presence of vividly colored substances. Colored discharges infused with dyes and entering water systems bring about significant concerns, such as increased chemical oxygen demand (COD), reduced light transmission and hindered proliferation of microorganisms. Artificial dyes exhibit toxicity and carcinogenic properties bring about substantial environmental health issues when exposed. The toxicity of Congo red stems from its conversion into benzidine, a known human carcinogen upon metabolism. Additionally, exposure to this compound has been linked to inducing allergic reactions in individuals. Even at low levels, CR dye significantly disrupts aquatic ecosystems, impacting the delicate balance of the food chain. Additionally, its presence poses health concerns, leading to respiratory issues, diarrhea, and nausea [1]. Methylene blue is considered extremely carcinogenic that has been produced and utilized across various industries for diverse purposes. When ingested, methylene blue poses a significant danger to human health, causing neurological problems and vision damage. Therefore, it's critical to devise advanced approaches capable of eliminating these perilous contaminants from aquatic environments [2].

To tackle this issue, diverse adsorbents such as activated carbons, zeolites and polymers have been utilized to eliminate dye from wastewater. However, their restricted capacity for adsorption, high expenses, and difficulties in separation hinder their widespread application in wastewater treatment. Consequently, there is a demand for an alternative adsorbent that offers high efficacy, cost-effectiveness, safety, ease of production, and regenerative capabilities. Hydroxyapatite ($Ca_{10}(PO_4)_6(OH)_2$) is highly regarded as an important biomaterial due to its outstanding biocompatibility,, bioactivity, ability to promote bone growth, lack of toxicity, non-immunogenic nature. Furthermore, it is recognized as a valuable material for environmental applications because of its unique structure, enabling ionic exchange and effective adsorption of various pollutants [1]. This current research focuses on extracting hydroxyapatite from turkey femur bone via a straightforward calcination process. The objective is to employ this derived substance to degrade detrimental dyes such as congo red and methylene blue, recognized for their harmful effects. To the best of our knowledge, research conducted on utilizing hydroxyapatite derived from femur bones for degradation of toxic dyes is the first time.

EXPERIMENTAL PROCEDURE

Fresh turkey femur bones were obtained from a local market and subjected to pretreatment by boiling in distilled water to eliminate undesired debris like bone marrow and flesh. Following this, they underwent soaking in NaOH to eliminate protein content, followed by chopping, drying in an oven, and calcination at 900°C for a duration of 4 hours [3].

RESULTS AND DISCUSSION

Structural analysis
X-Ray diffraction pattern of Hydroxyapatite calcinated at 900°C within the range of 20-60° is shown in figure 1. The diffraction peaks obtained at 2θ with hkl values are 25.8° (002), 28.1° (102), 28.9° (210), 31.7° (211), 32.1° (112), 32.9° (300), 34° (202), 35.4° (301), 39.2° (212), 39.8° (310), 42° (311), 43.8° (113), 45.3° (203), 46.7° (222), 48.1° (312), 48.6° (320), 49.4° (213), 50.4° (321), 51.2° (410), 52.1° (402), 53.1° (004), 55.8° (322), 57.1° (313). Every peak displayed distinct features of pure HAp, indicating the hexagonal crystalline structure with space group of P63/*m*. the XRD peaks obtained is well matched with the JCPDS pdf no.09-0432. The sharpness of the peaks indicates crystalline nature of the material. Average crystallite size of the sample is calculated using scherrer equation [4].

$$D = \frac{K\lambda}{\beta Cos\theta}$$

The percentage of crystallinity and other crystallographic parameters were calculated using the below mentioned formulas and listed in table 1 [5], [6].

Microstrain	$\varepsilon = \beta /4 \tan\theta$
Dislocation density	$\delta = 1/D^2$
Lattice parameters	$1/d^2 = (4/3) \{(h^2 + hk + k^2)/a^2\} + (l^2/c^2)$
Volume	$V = \frac{\sqrt{3}}{2}a^2 . c$
Percent of Crystallinity	$X_c = (A_{cr}/A_{cr}+A_{am}) \times 100\%$

Morphological analysis

The morphology and particle size of the extracted HAp samples were investigated using scanning electron microscopy images shown in figure 2 along with its particle size distribution curve. The SEM analysis reveals a notable characteristic of the HAp sample that, the particles exhibit irregular shapes and tend to be agglomerated. The Image J software is utilized for measuring the average particle size of the HAp material and is calculated to be 77.3nm [7].

Energy dispersive X ray spectroscopy

EDS was utilized to analyze the chemical composition of the extracted HAp material, as depicted in figure 3. The findings revealed that the synthesized HAp particles primarily comprised calcium, phosphorus, and oxygen as their elemental constituents. Notably, hydrogen (H) was absent in the EDX spectra due to the instrument's limitations, which prevent the detection of elements with atomic numbers below five [8]. The signal attributed to carbon (C) originates from the substrate used in the SEM analysis [9]. The Ca/P ratio of the extracted HAp material is found to be 1.66 which is closely related to the stoichiometric HAp.

Fourier transform infrared spectroscopy

The FT-IR spectra offer chemical information regarding the samples, covering a wavelength range spanning from 4000 cm^{-1} to 500 cm^{-1} is shown in figure 4. The identified phosphate bands at 1091 cm^{-1} and 1044 cm^{-1} consistently appear within the 1000–1150 cm^{-1} range, indicative of the v3 asymmetric stretching. The peaks seen at 3572 cm^{-1} and 635 cm^{-1} in the spectrum are due to the hydroxyl groups (OH$^-$) present in commercial HAp, indicating a high level of crystallinity in the HAp structure. The HAp sample exhibits the asymmetric bending of the phosphate group, which is evident at 570 cm^{-1} and 603 cm^{-1} [3].

UV-visible spectroscopy

When a sample is exposed to electromagnetic radiation within the UV/Vis wavelength range, its surface can engage with the incoming radiation through various interactions, including absorption, transmission, and reflection. The UV-Vis absorption spectrum of hydroxyapatite was examined using different wavelengths ranging from 200 to 800 nm, as illustrated in figure 5(a) [10]. HAp particles demonstrate significant absorption in the shorter wavelength spectrum, specifically around 350-400 nanometers. The energy needed to elevate an electron from the valence band to the conduction band is referred to as the band gap energy (Eg). Tauc plots serve as a method to ascertain the bandgap energy.

$$\alpha h\upsilon = A [h\upsilon - E_g]^n$$

Where, α is the absorbance coefficient, Eg is the optical bandgap energy of the material, $h\upsilon$ is the photon energy and n is either 2 for direct band gap or 1/2 for indirect band gap. When plotting $h\upsilon$ against $(\alpha h\upsilon)^2$ for n=direct bandgap, the resulting graph helps determine the optical band gap (Eg) which is found to be 3.18 eV [11].

PHOTOCATALYTIC ACTIVITY

Photocatalytic dye degradation initiates with a support material infused with a catalyst exposed to specific light wavelengths, often UV or visible light, matching the catalyst's light absorption. When light interacts with the catalyst, it prompts the creation of electron-hole pairs. These pairs interact with oxygen, water, or hydroxyl ions on the catalyst's surface, generating potent radicals like hydroxyl radicals. These radicals efficiently break down dye molecules located on the catalyst or in the solution. Gradually, this breakdown transforms dye compounds into smaller, less harmful substances, ultimately converting them into harmless byproducts, such as water, carbon dioxide, and mineral salts. Optimizing the efficiency of this photocatalytic process involves monitoring factors like catalyst concentration, light intensity, and duration. Utilizing natural bone-derived hydroxyapatite as a support material, this eco-friendly approach exhibits substantial potential for treating dye contaminated wastewater without producing detrimental residues [12].

Photocatalytic experiment

A concentrated solution, comprising 2 ppm of congo red (CR) and methylene blue (MB) dyes at a concentration of 1000 mg per liter, was formulated using distilled water. To carry out the batch experiments, 100 ml of this dye solution was utilized in 200 ml flasks with various known concentrations. Each flask was supplemented with 5 mg (0.005g) of adsorbent. Subsequently, UV light exposure initiated a photochemical reaction. Sampling at regular intervals and utilizing a UV-Vis spectrophotometer for absorbance measurement assisted in monitoring the pollutant concentration in the solution during the photocatalytic degradation process. The degradation percentage was determined by employing the following formula [12].

Degradation efficiency (%) = $A_0 - A_t / A_0$ x 100

Where, A_0 is the initial absorbance of the dye, A_t is the absorbance at time t after degradation of dye. The process involves Hydroxyapatite as a catalyst for the photocatalytic degradation of congo red and methylene blue dye under UV light. The maximum absorption wavelength of congo red and methylene blue dye is 499nm and 663nm. Figure 7 illustrates the degradation of dye solutions in approximately 50 minutes for congo red dye and 20 minutes for methylene blue dye when HAp was employed as a catalyst. The flat line of the absorption curve indicates the complete degradation of toxic dyes from the water solution as shown in figure 6. The calculated degradation percentage is found to be 90.5% for congo red and 99.4% for methylene blue dye. The photocatalytic degradation curve and efficiency is shown in figure 8 & 9.

CONCLUSION

This study has successfully demonstrated the extraction of hydroxyapatite from turkey femur bones utilizing a simple calcination process. Characterization techniques confirmed the purity of phase and functional properties of the HAp. The findings demonstrate that the femur bone derived hydroxyapatite as an effective catalyst for the degradation of congo red and methylene blue dyes present in industrial wastewater. These results highlight the promising application of this biomaterial in addressing environmental challenges posed by textile industry pollutants. Further research could explore optimization strategies for enhancing the efficiency and scalability of this extraction process, paving the way for its practical implementation in large scale environmental remediation efforts.

ABSTRACT

Cervical cancer is a kind of cancer occurs in the cervix cells – the bottom part of the uterus connecting the vagina. An early detection of cervical cancer safeguards the life of women. Pap smear tool is a trusted test recommended by pathologist where each slide comprises of massive overlapping cells and manual screening process in such a slide is typically time consuming. Various techniques proposed by researchers paved the way to automatize the methodologies followed by pathologist. In this paper, whole cell segmentation using Conditional Super Resolution GAN, Battle Royale optimization algorithm and K-means algorithm with stepwise merging rules & GVF snake and Classification using ResNet like network is proposed. The evaluation for the proposed method is done using the Mini SIPkeMed dataset. The proposed methodology for the segmentation is applied on the whole cell and showed the mean performance of Precision (0.93), Recall (0.94), ZSI (0.98), DC (0.94), and JI (0.87).ResNet like network is applied on whole segmented image for classification and yields good accuracy for both 2-class and 5-class classification problem.

Keywords: Battle Royale, GVF Snake, K-Means, Pap Smear, ResNet.

INTRODUCTION

Cancer is considered to be a deadly disease that evolved into an important and significant burden globally. According to statistics of global cancer, cervical cancer is the 4th most prevalent disease that affect females [1].Cervical

cancer is curable only if diagnosed earlier. The current technology beyond the field of medicine predicts the disease by the observation of pattern variations in the cells based on the shape & color of both nucleus and as well as cytoplasm[2]. Pap Smear test is one such technology to diagnose precancerous cells. Pap test is the cervical screening method to find malignant cells in cervix's inside and exterior surfaces. Cytopathologist manually inspect enormous number of cell nuclei in a microscopic field to diagnose abnormal cells. Manual diagnosis of cells in slide by pathologist may affect the accuracy and will result in false diagnosis& time consuming too. Challenges in automatic diagnose paved the way of 60 years of cervical cancer diagnosis work. Automating nucleus and cytoplasm segmentation from microscope image and classifying cells into normal or abnormal is still a challenge in medical field. In other side, automatic diagnosis of precancerous cells is cost and time effective too. In this research, a model is proposed for automating segmentation of cells in pap smear slide and classification (2-class, 5-class classification problem) using ResNet like network.

Segmentation technique comprises of two phases namely, preprocessing phase and segmentation phase. Preprocessing phase is the first and important step for enhancement of segmentation process. It consists of two techniques: 1) High Resolution using CSRGAN and 2) Threshold Selection using BRO. In the segmentation phase, cervical pap smear images are divided into two categories: 1) nucleus and 2) cytoplasm. Significantly, segmentation process involves k-means clustering to group a similar pixel. Following the clustering process, stepwise merging rules with GVF snake is applied to segment nucleus and cytoplasm effectively in the cell image. Segmentation process is evaluated using metrics including Precision, Recall, ZSI, Dice Coefficients, and Jaccard Indices. Similarly, classification is done on the result of segmentation using ResNet like network to classify the cell into normal or abnormal. Both 2-class and 5-class classification process is evaluated using the metrics: Accuracy, Specificity, Sensitivity and h-mean.

The remaining part of the paper is structured in the following manner: Section 2 discusses related work. In 3rd section, the suggested method along with the preprocessing, segmentation techniques to extract and segment cells and classification process are described. Section 4 will present the findings of the recommended methodologies as well as insights into those results. In section 5, discussion is presented and concluded in section 6.

RELATED WORK

Image segmentation is a prominent task in analyzing image. It is not much easy for the individual to manually analyze the components of cervical cells in pap smear slide. Poor segmentation result affects the accuracy of results. Computer based automatized segmentation is needed to identify cervical malignancies on the slide. Meng Zhao et.al., proposed a technique to segment nucleus based on the Selective-Edge-Enhancement method. Included graph based algorithm to obtain bounding box [3].Kurnianinsih et.al., used instance segmentation to segment the pap smear images. In a two phase process, segmentation is done using Mask R-CNN and classification using VGG –like Net[4].Segmentation and Classification done on the cervical cell dataset. Bounding box around RoI predicted by implementing watershed algorithm in the segmentation phase. Comparison made with Ensemble based classification and Deep Learning classification. Showed better results by utilizing Deep Learning for classification in cervical cells[5]. Screening process of cervical cell achieved with Retina Net support. Bounding box obtained by applying Retina Net on cervical cell image further assists in the classification process [6].In [7], Debora Nasser Diniz et.al., Nuclei is detected in overlapping cell of pap smear image. SLIC algorithm divides the image as super pixels. DBSCAN clustering algorithm is applied to group the similar super pixels. Three classification algorithms were combined namely Nearest Centroid (NC), Decision Tree (DT), and k-Nearest Neighbors (kNN) to propose a novel method and revealed better accuracy of 90.8% [8]. A three pass watershed technique is introduced for segmenting both cytoplasm and nucleus from the cervical cell image.A gradient-based edge map with barrier-based watershed are mainly utilized [9].

Janani and Francis Xavier Christopher

A clustering algorithm based on Mean-Shift is chosen to get ROI followed by some mathematical analysis [10]. A cell is partitioned into nucleus and cytoplasm by applying Fuzzy C-Means Clustering algorithm. Classification algorithms including Bayesian classifier, SVM, LDA and KNN[11].A multiscale CNN is used to understand the important characteristics in the image and assigns the label to cells in the image[12].Both median filtering and Mean-shift are used to screen pap smear images. Segmentation is done by utilizing morphological operators [13]. Support Vector Machine along with GVF Snake model is used for adaptive segmentation and showed good performance [14]. A model described for autonomous cervical cell segmentation using graph cut technique which is of multiscale [15]. Segmentation of nucleus and cell is done using enhanced SLIC along with improved grey scale method and region equalization technique [16]. Marco et.al., used a Herlev dataset for autonomous segmentation of cytoplasm and nucleus by adopting the combination of Efficient Net and Feature Pyramid Networks[17].

Most of the work proposed by authors used CNN with different techniques to implement classification in cervical cell image. Suxiang Yu et al., compared four different models designed using the combination of CNN and SPP layers and inception module [18]. Convolutional Neural Network(CNN) along with Extreme Learning Machine(ELM) were chosen to detect and classify cervical cancer cell and showed good performance [19].Aditya Khamparia et.al., proposed deep learning technique based on Variational Autoencoder(VAE) [20]. A. Sarwar et.al., proposed an ensemble technique which combines fifteen classification algorithm including Multiclass classifier, Random subset space, Random forest, Bagging, Radial basis function network, J48 graft, Rotation Forest, Ensemble of Nested dichotomies (END), PART, Decorate, Filtered Classifier, Random Committee, Multiple back propagation ANN, Naïve Bayes and Decision Table[21]. Na Dong et.al., introduced a machine learning based feature selection technique for cervical cell classification. CART model used for feature extraction and applied PSO for feature selection in SVM [22].

METHODS

The primary aim is to develop a model to segment cells from pap smear images and classify it into either normal or abnormal. Segmentation technique has two stages. At the first stage, pap smear image is sliced into several images which is further enhanced using CSRGAN technique. The image further partitioned into cell regions using Battle Royale Optimization (BRO) algorithm. In the 2nd stage, the image obtained from the initial process is segmented into two parts namely nucleus and cytoplasm using k-means clustering, Stepwise merging rules and GVF Snake. The block diagram of the recommended segmentation technique is illustrated in the Figure 1.

Segmentation

Pre-Processing Technique

CSRGAN
Conditional Super Resolution GAN technique enhances the resolution of given image by the conversion of Low Resolution image into High Resolution one. CSRGAN comprises of two model namely, Discriminator and Generator. Generator generates super resolution images and discriminator model distinguishes the original image from fake images generated using Generator model. This technique helps in improving the accuracy of nucleus and cytoplasm segmentation [23].

BRO Thresholding Algorithm
Thresholding is one of the familiar techniques in image segmentation which distinguishes objects from background and extra features in the image. Battle Royale Algorithm is inspired by battle royale game with a strategy that game area shrinks and the final player will be a winner. An attempt is made to utilize this algorithm to detect thresholding value in the given image. BRO thresholding algorithm produced better result compared to Otsu and Entropy based thresholding technique.

Janani and Francis Xavier Christopher

Nucleus and Cytoplasm Clustering using K-Means

Bethesda techniqueto report cervical cytology provides a complete guidance of what must be examined in a cell by a pathologist to predict abnormality in cell [24]. The findings are depending on the characteristics of nucleus, cytoplasm which includes the shape, structure and color. An attempt is made in this article to extract features from each cell in the image. Cell segmentation is achieved by applying k-means algorithm that clusters a similar pixel. Three groups (clusters) which are nucleus, cytoplasm and background of the slide obtained in the cell samples based on the value of centroid or mean pixel value of RGB. Lowest pixel value in average corresponds to nuclei segmentation, next lowest pixel value in the cell is segmented as cytoplasm. The third group formed by the number of pixels corresponds to background of the slide. The technique has been configured to execute batches of a hundred pixels for every centroid centering iteration. For each iteration, centroids move to the center and produces the last group of pixels. With this pixel clustered group, features are generated based on the pixel calculation which fits into concerned group. K-Means segmentation algorithm for cervical cell segmentation as follows:

Input: p_i, where i=1,2,3….n (n -> number of pixels)
Output: K //number of clusters i.e., 3

While $p_i \neq$ null do
Select random point p
Calculate mean pixel value of RGB and allocate to the nearest cluster (nucleus, cytoplasm and background)
Recalculate new cluster center
Segment into nucleus, cytoplasm and background based on the pixel value.
End

As shown in the figure 2, three clusters are developed by the implementation of k-means algorithm in cervical cell images.

Nuclei and Cytoplasm segmentation

Nuclei Segmentation using Stepwise Merging Rule

To accurately segment nuclei from the image, Stepwise Merging is involved with K-Means. Probability map is used to classify nuclei from other region in the K-Means clustering. In the first step, seed regions are selected for nucleus merging. Distance map and probability map calculated to generate a saliency map with the assumption that central region contains seed region. In the next step, regions which are adjacent and similar gets merged if certain conditions are met.

Selection of seed regions are based on the following rules:
S ->A set represents seed regions and C ->A set represents candidate region. Components belonging to C are set to r_i.
Step 1:
i)   For every $r_i$in C, average saliency value (ϱr_i) is calculated as follows in the equation 1:

$$\varrho r_i = \frac{1}{Nr_i}\sum_{i=0}^{Nr_i} Pr_i \qquad (1)$$

where, Nr_i is the number of pixels and Pr_i correlated with saliency map. Seed region is selected in this if ϱr_i and Nr_iexceeds thresholds.
ii) If seed region not included in the set S, then the saliency map with maximum value is chosen as the seed region.
Once m seed regions are extracted, adjacent regions which are similar gets merged if following rule gets satisfied.
Step 2:
i)   When seed region S_j 's boundary meets with r_i, then the region $r_i$will get merged with $S_j$by satisfying the following condition
if(Avg(S(r_i) greater than or equal to T1/2))

Janani and Francis Xavier Christopher

then the region r$_i$will get merged with S$_j$

Where Avg(S(r$_i$)) gives the saliency value in average of r$_i$.

ii) Step (i) in 2 will be repeated until all the regions are encountered.

Segmentation of nuclei is shown in the figure 3(b).

Gradient Vector Flow Snake for Cytoplasm Segmentation

Active Contour models are being used in image segmentation. Traditional snake models have some drawbacks like faulty external force and sometimes outcome gets affected by the snake initialization. GVF is proposed by C Xu and JL Prince to solve the issue of initialization sensitivity and moving towards concavities of boundary. Similarly, convergence problem also produced by placing the static external force which is not impacted by snake's time or position. The equation where external force represented as z and the partial derivative of a work t is shown in the equation 2.

$$a_t(s,t) = xa''(s,t) - ya''(s,t) + z \qquad (2)$$

where $xa''(s,t) - ya''(s,t)$acts as an internal force and avoids stretching. The above equation which is dynamic called as GVF snake. From the nucleus segmented image, GVF Snake is applied to segment cytoplasm. Steps involved in the cytoplasm segmentation are as follows:

Step 1: Laplacian Edge Detector is implemented to label all edges and it becomes the elements of the set E.

Step 2: For each and every edges e$_i$,

if e$_i$'s pixel meets the boundary, then $_i$removed from the set E and added to the background set B.

Step 3: Once the boundary edges are removed, the distance between the remaining edges and the center of the nucleus is calculated. If the calculated value greater than the distance threshold, region r$_i$ will merge with B.

Step 4: Outlier edges are also removed from the previous step. In the remaining edges, initial points are set by choosing evenly spaced pixels. A clear boundary is obtained here.

Step 5: Using the initial points from the previous step and GVF, Cytoplasm boundary edges are obtained through the iterative process [25].

Classification

A ResNet like network is employed as the foundation of the deep learning training for the classification stage. ResNet is a Convolutional Neural Network introduced in the year 2016 by He, K., Zhang, X., Ren, S., & Sun, J [26]. Deep Neural Networks are able to model a highly complex function. Eliminating gradients are a huge challenge insuch deep networks. ResNet provides a shortcut technique called Skip Connection to bypass the information from one layer to another layer. This network fits the residual mapping. There are many variants of ResNet based on the layers it contains includes ResNet18, ResNet34, ResNet50, ResNet101 and ResNet152. In the proposed work, a simple version of ResNet is used takes input with a size of (200,200,3). A network architecture is designed with 14 layers with 3×3 conv32 as a first layer. A maximum of 128 channels is used to decrease the computing time and cost. The proposed work has three layers of identical Convolutional networks. Each layer contains two Residual Blocks. Every block is associated with 2 weight layers using the skip connection concept which connects to the second weight layer's output with the activation function. ConvNet layer's input is compared with the result to make use of identity connection only if both are similar. If the values are not similar, pooling will be applied on skip connection. The proposed architecture is shown in the figure 4.

RESULTS

Dataset and Evaluation Metrics

The proposed methodology's performance was assessed using the MiniSipakmed dataset [27]. Slide image of dimension 2048×1536 from the dataset is split into equal size images of dimension 128×128 using sliding window technique. MiniSipakmed contains 50 slides in 5 categories(Dyskeratotic, Koilocytotic, Metaplastic, Parabasal and

Janani and Francis Xavier Christopher

Superficial Intermediate) of images. Each image approximately splits into 8 images. Totally, 1974 images are generated after applying sliding window technique. The evaluation of segmentation is carried out using Precision, Recall, ZSI, Dice Coefficients, and Jaccard Indices. Result obtained for the recommended segmentation compared with methodologies using various combination of techniques. Similarly, the evaluation of classification is carried out using accuracy, specificity, h-mean and sensitivity metrics.

Segmentation
The purpose of the proposed segmentation is to divide the cytoplasm, nucleus and background from the slide. Most of the cells are segmented accurately and the sample segmented image at each stage is shown in the figure 5. The slide image is the unprocessed original image obtained from the sliding window technique. Image enhanced using CSRGAN technique and the binary image obtained using the BRO Threshold algorithm. It is predicted that most of the BRO images correspond to the image of ground truth. A cell area of the image is predicted in overlaid image with the help of K-Means Segmentation process.

To isolate nucleus and cytoplasm in the image require various phases. In the preprocessing stage, the massive pap smear slide split into images of size 128*128 and applied CSRGAN (Conditional Super Resolution GAN) in the image. In the second phase, Battle Royale Optimization algorithm is applied for thresholding process to obtain binary image. Later, in the third phase, a mask is obtained in order to segregate nucleus and cytoplasm in the given image. For that, GVF snake and stepwise merging rules are implemented in the result image of k-means. The final image obtained through the proposed techniques enhances the classification's accuracy. Combination of several algorithms involved in segmentation process and its results are given in the Table 1. Similarly, a graph in figure 6 illustrates that the proposed segmentation combined with the suggested preprocessing technique produced good result. There is always a way to improve the segmentation technique, where the proposed clustering algorithm rarely makes the segment falls into wrong cluster. A future work is intended to apply techniques which deals with the problem.

Classification

In this section, 2 and 5-class classification implementation and its result is discussed. Table 2 illustrates that the proposed model for 2-class classification problem(classifies into normal or abnormal) produces good result for 250 epochs. Confusion Matrix for the dataset for two-class classification problem is shown in the table 3. 63 instances of normal cells were classified mistakenly as abnormal and 19 instances of abnormal case were misclassified as normal.

Similarly, for the 5-class classification problem of the dataset (classifies the data into Dyskeratotic, Koilocytotic, Metaplastic, Parabasal or Superficial-Intermediate), the classification report for the five class classification is shown in the Table 4.
Confusion Matrix for the dataset for five-class classification problem is shown in the Table 5. 11 instances were misclassified in different classes. In Table 6, the performance score for the proposed model is shown. ResNet like network for the cervical cell classification achieves good results.

DISCUSSION

A model proposed for cervical cell segmentation, CSRGAN technique converts the cervical cell image into high resolution image to enhance the segmentation process is unique in this process. Most researchers used herlev dataset (7-class) and in this work attempt is made to include MiniSipakmed dataset for training and testing the model for cervical cell segmentation and classification. Good precision value in segmentation results in higher sensitivity value in classification and similarly, good value of recall in segmentation results in higher specificity value in classification. Combination of CSRGAN technique, Battle Royale Optimization thresholding, K-Means clustering algorithm with Stepwise merging rules and GVF Snake yields good score of 0.93 Precision, 0.94 Recall, 0.98 ZSI, 0.94 DC and 0.87

JI.Similarly, classification using resnet like network on 2-class classification problem is: 99.8% Accuracy, 99.9% Specificity, 99.1% Sensitivity and 99.7% h-mean. For 5-class classification problem, the performance scores are: 99.1% Accuracy, 99.9% Specificity, 99.1% Sensitivity, 99.6% h-mean. In general, the obtained results indicate that the model proposed for cervical cell segmentation and classification is effective.

CONCLUSION AND FUTURE WORK

This paper proposes a strategy to segment and classify cervical cells. MiniSIPkeMed dataset from kaggle is employed for implementation. After pre-processing technique, K-Means algorithm with stepwise merging rules and GVF snake is applied to segment nucleus and cytoplasm in the image. A performance measure is utilized to assess the level of accuracy of recommended segmentation against other segmentation techniques. Evaluation metrics involved in this work includes Precision, Recall, ZSI, DC, and JI. The proposed segmentation technique produces the best mean performance of 0.93 Precision, 0.94 Recall, 0.98 ZSI, 0.94 DC, and 0.87 JI. The main advantage of this work is the utilization of Super resolution technique to enhance the resolution which further helps in the thresholding technique in terms of computation i.e, High resolution image involved in thresholding provides better result compared to low resolution images. In the classification stage, ResNet like network is implemented on both 2-class and 5-class classification problem. Results indicate that ResNet is a powerful network architecture to classify cervical cells. For 2-class classification problem, the result obtained is: 99.8% Accuracy, 99.9% Specificity, 99.1% Sensitivity and 99.7% h-mean and for 5-class classification problem, the performance scores are: 99.1% Accuracy, 99.9% Specificity, 99.1% Sensitivity, 99.6% h-mean. The drawback of our model is the proposed technique requires high processing power. Future endeavor can set a goal to reduce the processing power by using deeper networks.

ABSTRACT

Dioscorea villosa L., known as wild yam, is a perennial twining vine found in the wild, bearing cylindrical tubers. The tuber is consumed and traditionally utilized for treating a variety of ailments. The objective of the current study was to perform phytochemical analysis and assess the nutritional value and antioxidant activity of *D. villosa*. Further, GC-MS analysis was carried out to determine the bioactive components in methanolic tuber extract. The preliminary phytochemical screening of the tuber extracts revealed the presence of carbohydrates, alkaloids, flavonoids, tannins, saponins, phenols, proteins and glycosides. Total phenolic content and total flavonoid content were quantified. Results showed that wild yam tubers are a healthy source of protein, carbs, and fiber and have the ability to scavenge DPPH free radicals, indicating the anti-oxidant activity of this plant. GC-MS analysis identified 12 important bioactive compounds namely n- hexadecanoic acid; Cycloheptasiloxane, tetradecamethyl-; Octanediamide, N,N'-Di-Benzoyloxy-; Cyclooctasiloxane, hexadecamethyl-; Tetracosamethyl-cyclododecasiloxane; Phthalimide; Cyclodecasiloxane, Eicosamethyl-; Alpha- Bisabolol; Cyclononasiloxane, octadecamethyl-; Heptasiloxane, hexadecamethyl; N-propyl 11-octadecenoate and 3',8,8'- Trimethoxy-3-piperidyl-2,2'-binaphthalene- 1,1',4,4'- tetrone.

Keywords: *Dioscorea villosa,* Phytochemical, Nutritional value, Bioactive component, Antioxidant activity.

INTRODUCTION

Since the beginning of civilization, human beings have used plant resources for their well-being.As per estimates from the World Health Organization, almost 80 percent of the global population depends primarily upon traditional medicines to fulfil their basic medical requirements. The medicinal value of plant is due to the presence of various phytochemical constituents. These are alkaloids, flavonoids, tannins, saponins, phenolic compounds [1].Over 80,000 of the 2,50,000 higher plant species that exist on Earth are used medicinally [2]. There are many wild plants found in the forest with both food and medicinal values which are still unexplored or neglected. The genus *Dioscorea* belonging to family Dioscoraeceae has more than 600 species throughout the world [3].*Dioscorea*spp., commonly known as yams are regarded as one of the oldest crops that are grown or collected from the wild and plays an important role in the food habits of several ethnic groups[4].The majority of the species are distinctive in terms of food, medicinal, and economic worth. It ranks as the fourth most significant tuber crop after potatoes, cassava, and sweet potatoes, accounting for approximately 10% of global root and tuber production[5]. However, yam tubers are preferable when compared to other tuber crops in terms of nutrients[6]. Studies indicated yam tubers to be a source of vital nutrients such as starch, lipids, protein, vitamins and minerals [7-9].

Studies revealed numerous ethnomedicinal uses of *Dioscorea*. Different *Dioscorea* species are used by people of different ethnic communities in treating various health problems such as fever, weakness, stomach related issues, piles [10], rheumatoid arthritis, swellings, jaundice [11], diabetes, skin infections [12,13]. Research has established that yam possesses anti-tumor, anti- oxidant, anti-bacterial,anti-inflammatory [14,15]and anti- diabetic effects[16,17].In addition, majority of yams contain steroidal saponin, Diosgenin, which is used as the starting material in pharmaceutical industry for the synthesis of steroidal drugs [18]. It is helpful in inflammatory disorders, diabetes, obesity,dyslipidemia as well as cancer [19]. *Dioscorea villosa* L., commonly known as wild yam, is one of the important medicinal plants among the variety of *Dioscorea* species. *D. villosa* is a perennial twining vine with cylindrical tubers that are pale brown in colour, woody and bear horizontal branches [20]. The tuber is consumed and used traditionally to treat various ailments.It contains alkaloids, steroidal saponin, diosgenin, protodioscin, dioscine, tannin, glycosides, phytosterols, phenols[21,22].It is used in traditional medicine for treating digestive disorders, rheumatoid arthritis, inflammation [23].It is also reported as an effective antispasmodic that can be used to treat cramps,muscular spasms, coughs, and gas. Itis also helpful in releasing phlegm, causing vomiting, and boosting urine flow. Tubers are also beneficial for women with menstrual problems, menopause and post-menopausal symptoms as well as helps in reducing labour pain [10,24].In recent years, usage of herbal medicines has been tremendously increased due to multiple complications and wide range of side effects of synthetic drugs.Despite many reports on phytochemical and biological activities of *Dioscorea*, along with studies on the treatment of variety of illnesses, there is a paucity of literature regarding this particular species, *D. villosa*.

Under this contemplated background, the present study has been made to analyse the phytochemical constituents, nutritional content and antioxidant activity of tuber extracts of *D. villosa*.

METHODS

Preparation of plant extract

Plant material was collected from Chirang district, Assam. Tubers were washed thoroughly with water, cut into thin slices and dried in shade for 3-4 weeks. Then the dried material was grinded to fine powder using mechanical grinder. The powder was stored in air tight container at 4°C.The powdered material was then subjected to extraction using double distilled water, ethanol and methanol following Soxhlet method [25].The extracts were then evaporated to dryness in rotary evaporator. The extracts were used to test the phytochemical contents.

Preliminary phytochemical screening

Test for Alkaloids

Crude extract was mixed with few drops of HCl. The mixture was filtered and treated with Mayer's reagent (potassium mercuric iodide). The presence of cream precipitate indicates presence of alkaloids.

Test forCarbohydrate

Solvent-free extract was mixed with 5ml of distilled water, filtered and the filtrate was concentrated. To this, Benedict's solution was added and boiled for 5 minutes.Brick red precipitate indicated the presence of carbohydrates.

Test for Flavonoids

To the crude extract, few drops of NaOH solution were added. Deep yellow coloration, which on addition of dilute hydrochloric acid becomes colourless indicates the presence of flavonoids.

Test for Glycosides

Extract is dissolved in water with use of glacial acetic acid, ferric chloride and concentrated sulphuric acid. Brown ring at the junction shows the presence of glycoside.

Test for Tannins (Ferric chloride test)

To 1 ml of sample, 1 ml of 0.008 M potassium ferric cyanide, followed by 1 ml of 0.02 M ferric chloride containing 0.1 N HCl was added. Blue-black coloration was observed indicating presence of tannins.

Test for Saponins (Foam test)

Crude extract was mixed with distilled water and shaken vigorously. To the mixture, few drops of olive oil was added. Formation of foam indicated the presence of saponins.

Test for Steroids (Salkowski test)

Extract was dissolved with chloroform and concentrated sulphuric acid was carefully added to form a layer. A red color indicated the presence of steroids.

Test for Phenolic compounds

Few drops of 5% ferric chloride solution were added to the extract. Dark green/bluish black colour indicates the presence of phenolic compounds.

Test for Proteins and amino acids (Millon's test)

Extract was dissolved in distilled water, filtered and few drops of Millon's reagent were added. Appearance of white precipitate indicates presence of proteins and amino acids.

Test for Terpenoids

Extract was mixed with chloroform. Concentrated sulphuric acid was then added.A reddish-brown precipitate at the interface was observed indicating the presence of terpenoids.

Quantitative analysis of total phenolic content

Estimation of total phenolic content of different tuber extracts of *D. villosa* was done following Folin- Ciocalteu reagent method [26] with modification. Gallic acid was used as standard to compare the phenolic contents of tuber extracts and the results were expressed as mg of GAE (Gallic acid equivalent)/gm of the extract.

Bhaigyaroti Muchahary *et al.,*

Quantitative analysis of total flavonoid content
Aluminium Chloride method [27] with slight modification was employed to quantify total flavonoid content of tuber extracts using quercetin as standard. Total flavonoid content was represented as mg of QE (Quercetin equivalent)/gm of tuber extract.

Determination of Nutritional value
Determination of moisture,ash, fiber, fats and proteins were carried out using standard protocols [28]. The nitrogen content was calculated by micro-kjeldahl method, and then the value was multiplied by 6.25 (conversation factor) to obtain protein content [28]. The total carbohydrate was obtained by following the arithmetic difference method given by James [29] where the sum of value including protein, ash and fat is subtracted from the total solids.The total solid was estimated by subtracting the moisture percent from 100 [29].

Determination of Antioxidant activity:
The antioxidant activity of the methanolic, ethanolic and aqueous extract were determined by measuring the free radical scavenging activity using 1, 1-diphenyl-2- picrylhydrazyl (DPPH) free radical scavenging assay [30].

GC-MS analysis
Gas Chromatography- Mass Spectrometry (GC-MS) analysis was carried out to study the bioactive compounds present in methanolic extract of *D. villosa* tuber. For this, 2 μl of methanolic extract was injected into Perkin-Elmer (USA) GC-MS instrument (Model- Clarus 680 GC &amp, Clarus 600 MS). Elite-5MS capillary column having dimensions of 60m x 0.25mm x 0.25μm and stationary phase- 5% diphenyl and 95% dimethyl polysiloxane was used for the analysis. The temperature was set at 60°C (for 1 min) with an increase rate of 7°C/min to 200°C, held for 3 min, followed by increase at the rate of 10°C/ min to 300°C and held for 5 min. Helium (99.99%) was used as a carrier gas at the flow rate of 1 ml/min. TurboMass Ver.6.1.2 software was used in the system. Peaks appeared in the GC-MS chromatogram were analyzed using database software of National Institute Standard and Technology- 2014 (NIST-2014).

RESULTS

The results of phytochemical screening of tuber extracts of *D. villosa* shows the presence of various phytochemical compounds such as alkaloids, carbohydrates, flavonoids, glycosides, tannins, saponins, steroids, phenolic compounds, proteins and terpenoids which are shown in Table 1.From the result, it was found that methanolic extract contains most of the phytochemicals compared to aqueous and ethanolic extracts. Glycosides and steroids are absent in both aqueous and ethanol extract. Terpenoids was found to be present in methanolic and ethanolic extract but absent in aqueous extract.

Methanol, ethanol and aqueous extract of *D. villosa* tuber were tested for total phenolic and total flavonoid content using standard procedures.Total phenol and total flavonoid amount were expressed as mg of gallic acid equivalent (GAE) and mg of quercetin equivalent (QE) per gram of dry extract, respectively.Results showed that different extracts have varying amounts of total phenolic and total flavonoid content (Table 2). The methanolic extract contained the maximum amount of flavonoids and phenol content, followed by the ethanolic and aqueous extract. Analysis of proximate content of *D. villosa* tuber were shown in Table 3. The result revealed presence of appreciable amounts of carbohydrate (26.73%), crude protein (2.82%), crude fiber (4.03%), ash (3.06%), moisture (68.39%) and low-fat content (0.51%).

DPPH radical scavenging activity of tuber extracts were carried out to determine the antioxidant activity and results are shown in Table 4. The scavenging activity was found to be highest in ascorbic acid followed by DV tuber extracts.

Among the tuber extracts, methanolic extract showed the highest activity (95.14%) followed by ethanol extract (90.03%) and aqueous extract (79.13%) (Figure 1).

Considering the better results shown by the methanol extract in terms of preliminary phytochemical screening, phenolic, flavonoid content and anti-oxidant activity, GC-MS analysis was performed to identify the Phyto compounds in the methanolic extract. GC-MS chromatogram showing the peak identity of compounds is shown in Figure 2. From the chromatogram, 12 compounds were detected. Among the identified compounds, n- Hexadecanoic acid represents a major bioactive compound with peak area % of 15.217. Other identified compounds include Cycloheptasiloxane, tetradecamethyl-; Octanediamide, N,N'-Di-Benzoyloxy-; Cyclooctasiloxane, hexadecamethyl-; Tetracosamethyl-cyclododecasiloxane; Phthalimide; Cyclodecasiloxane, Eicosamethyl-; Alpha- Bisabolol; Cyclononasiloxane, octadecamethyl-; Heptasiloxane, hexadecamethyl; N-propyl 11-octadecenoate and 3',8,8'-Trimethoxy-3-piperidyl-2,2'-binaphthalene- 1,1',4,4'- tetrone.The identified compounds along with their retention time, molecular formula, molecular weight, peak area % and their biological activity were presented in Table 5. The chemical structure of these compounds is shown in Figure 3.

DISCUSSION

Medicinal plants are receiving interest on a global scale due to the low cost, wide availability, and no or minimal side effects of herbal medicines. Plants constitutes rich source of essential bioactive components which can be utilized in the production of novel therapeutic drugs**.** Therefore, in the present study, phytoconstituents, nutritional content and antioxidant activity of important medicinal plant, *D. villosa* was analysed. Phytochemical screening result showed the presence of proteins, alkaloids, phenols, flavonoids, tannins and saponins in the ethanolic extract of *D. villosa* tuber which was also reported in previous study [48]. Glycosides and steroids were observed in methanolic extract. Similar result reported for *D. villosa* leaves [23]. Presence of carbohydrate in all the three extracts i.e., methanol, ethanol and aqueous was also reported in *D. deltoidea* tuber [49].

The moisture content of *D. villosa* tuber was found to be 68.39%, which is within the range (65.47% to 82.46%) as reported for 15 local accessions of water yam by Fauziah *et al.* [50]. However, the value is slightly lower than 2 wild yam species (76.37% and 80.15%) from Nigeria [9] and higher than 58.92% reported for *D. deltoidea*[49]. The result showed 3.06% of ash content, almost similar result shown by earlier study [9]. This may indicate good source of important minerals and trace elements [51]. The crude protein (2.82%) value in the current study is in accordance with that of *D. deltoidea* (2.13%) [49] and *D.villosa* tuber (2.21%) [9]. Moreover, the value of crude protein is higher in comparison to other tuber and root crops like sweet potato (1.6%), cassava (1.4%) and very similar to that of potato (2.57%) reported by Chandrasekara & Josheph Kumar [52]. High protein content enhanced the nutritional status of yam tuber as an everyday food.Crude fat content is found to be low i.e., 0.51%. This suggests that *D. villosa* tuber can be considered as low-fat food which when included in regular diet can be beneficial for shedding body weight and managing cholesterol. The value of crude fibre content (4.03%) is a bit higher as reported by Afiukwa*et al.*[9]. Also, this value is found to be more as compared to other yam species shown by previous studies, such as 1.68% [53], 1.98% [54] and 0.41% to 2.05% [55]. The reason for such variation could be connected to the plant's genetic make-up, environmental conditions as well as the time when it is being harvested [56]. Tuber of *D. villosa*is a good source of fibre, thereby fulfilling the requirements of fibre in the body and when consumed in sufficient amount helps in improving the health conditions [57].The carbohydrate content (26.73%) in this study is much lower than 85.16% and 78.71% reported for local wild yam varieties of Nigeria [9]. However, this percentage comes in between the values ranging from 17.10% -29.37% of wateryam tubers [50].Also, the value is higher than that of other tuber crops such as potato (12.44%) and sweet potato (20.10%) shown by Haytowitz*et al.* [58]. A relatively high percentage of carbohydrate makes *D. villosa* a good alternative source of carbohydrate to satisfy the needs of carbohydrate by the body.

Plants act as an essential source of antioxidants that capture free radicals and combat undesirable health issues brought on by oxidative damage. Therefore, antioxidant activity of different extracts of *D.villosa* tuber was evaluated

Bhaigyaroti Muchahary *et al.,*

by measuring the free radical scavenging activity using DPPH test. The free radical scavenging activity against DPPH was highest in standard, which can be shown in order as: Ascorbic acid > Methanolic extract > Ethanolic extract > Aqueous extract. Padhan *et al.* [59] reported the inhibition of DPPH radical by different *Dioscorea* species tuber extract at different concentrations, suggesting that the yam extracts have the ability to donate an electron or hydrogen for scavenging DPPH.

GC-MS analysis revealed important bioactive compounds present in the tuber extract. The major bioactive compound, n- hexadecanoic acid having anti-oxidant potential was also detected in *D. bulbifera* bulb [60]. Detection of other bioactive components in the tuber extract such as cycloheptasiloxane, tetradecamethyl-, Cyclooctasiloxane, hexadecamethyl- and Cyclononasiloxane, octadecamethyl- were also reported from extract of other medicinal plant such as *Toddalia asiatica*[61]. These phytochemicals contribute to the pharmacological properties of the plant.

CONCLUSION

From the findings of the present study, it can be concluded that *D. villosa* contains a number of phytoconstituents such as alkaloids, carbohydrates, flavonoids, saponins, phenols, tannins and proteins. The tubers offer a good amount of carbohydrates, proteins, fibre, and a low level of fat. As a result, this plant has the potential to be used as an alternate food source. The methanolic extract has the highest DPPH radical scavenging activity of all the extracts. The GC-MS analysis of the tuber extract identified important bioactive components that contribute to the medicinal properties of this plant. However, more extensive research needs to be conducted for the isolation and characterization of these bioactive components, and also to discover their mechanism of action, which can aid in the creation of novel drugs.

ABSTRACT

The Kashmir Himalaya is home to a rich floristic diversity of considerable scientific interest and enormous economic potential. The current study was conducted to assess the role of standing vegetation in Kupwara city's urban forestry. The study region was examined using Simpson's Diversity Index, Shannon- Wiener Index, Menhinick's Richness, Evenness, and Sorensen coefficient, which demonstrated that the study areas are rich in vegetation and can help with long-term carbon sequestration. Qualitative analysis revealed that *Poa annua* L. dominated at all Sites for Density, Frequency, Diameter at breast height (cm), Relative Density, Relative Frequency, Relative Diameter at breast height, IVI-Importance Value Index. The present study describes vegetation diversity along an altitudinal gradient at different sites of temperate forests, which indicates that IV of *Abies pindrow* increases as altitude increases, whereas IV of *Cedrus deodara* decreases along altitude. Thus elevation is also an important factor in the distribution of vegetation. During the field work it also observed that the vegetation cover is depleting at a very high pace due to population explosion and bringing terrestrial ecosystems in their agriculture land use.

Keywords: Phyto-Sociological Parameters, Standing Vegetation, Urban Area, Kupwara and Biodiversity

INTRODUCTION

The vast and diverse natural resources are crucial for human survival and well-being. The vegetation of the forest holds a special and significant place among all natural resources. Man has used the bounty of the forests for his own economic advancement since the beginning. The increasing population trend over the last few decades, combined with the subsequent reliance on plant products, has resulted in extensive exploitation of natural flora and fauna

65541

Laraib Ahad and Rayees Afzal Mir

(Morris *et al*, 1987). Forest resource degradation is primarily caused by the expansion of agricultural practises, uncontrolled grazing, excessive logging for fuel, lopping for fodder, timber for construction, military activities, mineral exploration, extraction, quarrying, and over-exploitation of economically important products such as food, medicines, gums, resins, and so on. The loss of forest extent and production poses a challenge to the well-being of rural people that rely on the agri-pastoral economy for a living. Forest loss and degradation also result in the loss of ecological services provided by forests. The effects could include the conversion of carbon dioxide sinks to sources of vegetative carbon release into the atmosphere; changes in forest composition and the possible loss of particular forest types; and an increase in the problem of landslides and soil erosion (Gillision, 2006). The existing hydrological imbalances are thought to be related to the reduction of vegetative cover. The study of flora, soil, and the constituent floristic components present within a region has taken on enormous relevance in light of such a dire scenario. The composition and organization of plant communities have a substantial impact on diversity patterns. Understanding how biodiversity is spread through space and time has long been a priority for ecologists and bio-geographers. The distributions of diversity at different spatial scales show a gradient (Brown & Lomolino, 1998; Field *et al*, 2009). Thus, efforts must be concentrated on identifying and comprehending the relationships and patterns of vegetation that are influenced by varied environmental situations. The useful data produced in this way may be of enormous importance for tracking and protecting our priceless vegetation wealth at the landscape level rather than at the species level.

Historically, the conservation of forests and wildlife in Jammu and Kashmir has an illustrious legacy, dating back to the former Maharaja's reign. Currently, under the in-situ conservation method, approximately 15.6% of the state's total geographic area is demarcated as part of a protected area network; including 5 national parks, 14 wildlife sanctuaries, 37 sanctuaries and 4 Ramsar sites. Over the years, a number of botanical gardens, zoos and aquariums have been established, contributing to the conservation of translocation biodiversity in the state. A series of legislative measures have been enacted to ensure proper implementation of conservation programs in the state. In addition, coordinated research and comprehensive management plans are in place to conserve top species. Despite all these conservation measures in recent times, the state still has to overcome difficult challenges to integrate biodiversity conservation into the public policy making process and make it the mainstay of public policy (Satyanarayan and *Gaur*, 1968).

MATERIALS AND METHODS

Study area
Kupwara district is situated between 34°45 and 75° 20 east longitudes in the northern Kashmir valley. The district's 368 villages cover a combined area of 2,379 square kilometers with 8755, 64 people, or a population density of 368 people per square kilometer. At lower elevations, the region experiences a dry subtropical climate, whereas higher up, it experiences a subtropical humid climate. In lower altitudinal regions, summer is scorching, but in higher levels, it is pleasant. The district experiences widespread snowfall throughout the chilly winter. The Indian Meteorological Department provided the metrological information for District Kupwara. 1250 mm of rain falls annually on average. The two months with the most rainfall—291 mm and 188 mm, respectively—are July and August, while November has the least—19 mm. In the region over 1600 metres, it snows a little bit in January and February.

Sampling approach
The Random Quadrat sampling method was employed for above ground vegetation with 4 permanent quadrats of 20 m × 20 m for trees and 1 m × 1 m size for the herbs at both the sites. Trees with GBH ≥ 10 cm were taken into consideration for estimation of biomass using allometric equation of (Anderson and Ingram 1989). Herb biomass estimation was done on dry weight basis using equation of (Hairiah *et al.,* 2001)

Laraib Ahad and Rayees Afzal Mir

Data analysis

The information collected from the study sites was subjected to various phyto-sociological parameters and analysis was done both quantitatively (Density, Frequency, Diameter at breast height (cm), Relative Density, Relative Frequency, Relative Diameter at breast height, IVI-Importance Value Index) and qualitatively (Simpson's Diversity Index, Shannon-Wiener Index, Menhinick's Richness and Sorensen coefficient) by using standard expressions. The Importance Value Index (IVI) was done by sum of relative frequency, relative density and relative dominance (Shannon and Weaver 1949, Menhinick's 1964, Sorensen 1948)

RESULTS

Family species relationship

At Site-I, the survey plots yielded a total of 34 different species belonging to 10 different Families (Table 1). A total number of 37 species belonging to 13 different families were found in site II (Table 2) 37species belonging to 11 different families were found in site III (Table 3) and 50 different species belonging to 14 families was found in site IV (Table 4) respectively. The dominant families include Asteraceae, Rosaceae, Lamiaceae, Ranunculaceae, Brassicaceae, Solanaceae, Amaranthaceae and Plantaginaceae.

Phytosociological parameters of tree vegetation at different locations of Kupwara

 At Site-I, the highest density was showed by *Poa annua* L. at sites. Several species showed 100 percent frequency at all the sites. The highest density was shown by *Sibbaldia cuneata Edgew.while the lowest density was shown by Pinus wallichiana A.B.Jacks. the highest IVI at site 1 was shown by Abies pindrow Royle and the lowest IVI at site 1 was shown by Wulfenia amherstiana Benth. At site 1, the highest value of Relative frequency was shown by   Iris hookeriana Foster, Euphorbia wallichii Hook.f, Thymus linearis Benth., Veronica laxa Benth. and Anaphalis triplinervis.*

 The detailed information about density, frequency, diameter at breast height (cm), relative density, relative frequency, and relative diameter at breast height and importance value index is shown in table 1. IN site II, the highest frequency (100%) was shown by *Impatiens brachycentra Kar. & Kir, Viburnum grandiflorum Wall. ex DC Artemisia dubia Wall, Stipa sibirica Lam, Taraxacum officinale. Indigofera heterantha Brandis , and Viburnum grandiflorum Wall. ex DC.* while the lowest frequency was shown by *Rubus ellipticus Sm.* (40%). All the parameters like Density, F-Frequency, DBH- Diameter at breast height (cm), RD-Relative Density, RF- Relative Frequency, RDBH -Relative Diameter at breast height, IVI-Importance Value Index are discussed in Table 3.

IN site III, the highest frequency (100%) was shown by *Abies pindrow Royle , Ajuga parviflora Benth, Dryopteris ramosa (C.Hope) C Chr, Stipa sibirica Lam, Taraxacum officinale. Indigofera heterantha Brandis , and Viburnum grandiflorum Wall. ex DC.* while the lowest frequency was shown by *Rubus ellipticus Sm.* (40%). All the parameters like Density, F-Frequency, DBH- Diameter at breast height (cm), RD-Relative Density, RF- Relative Frequency, RDBH -Relative Diameter at breast height, IVI-Importance Value Index are discussed in Table 3. IN site IV, the highest frequency (100%) was shown by *Viburnum grandiflorum Wall. ex DC, Parrotiopsis jacquemontiana Rehder, Indigofera heterantha Brandis, Ranunculus laetus Wall.ex Hook.f.&J.W.Thomson, Poa annua L. Fragaria nubicola Lindl. ex Lacaita Pinus wallichiana A.B.Jack, and Cedrus deodara(Roxb.) G.Don.* while the lowest frequency was shown by *Rosa brunonii Lindl* (20%). The highest density was shown by *Poa annua L* and lowest was shown by *Abies pindrow Royle.* The highest Diameter at breast height was shown by *Cedrus deodara(Roxb.)G.Don. and lowest DBL was shown by Primula vulgaris Huds.* The highest relative frequency was shown by *Viburnum grandiflorum Wall. ex DC* and lowest was shown by *Rosa brunonii Lindl.* All the parameters are discussed in Table 4

Nativity

According to nativity al the species are divided into two groups N AND E. A total of 34 different species was found in site 1, among them, N = 16 species and E =18 species. A total number of 37 species were found in site II, in site II,

N=17species and E=20. 37species were found in site III and among them N=19 species and E=18 and 50 different species was found in site IV and in site IV N=26 species and E=24 species (Graph 1).

Raunkiaers Life Forms
In our study area all the plants which were present in all sites (I, II, II and IV), were divided into 8 different types according to Raunkiaers life form pattern. Graph 2 gives the clear picture of all the life forms in all sites

DISCUSSION

Diversity is considered the result of species assessment in bio geographic regions. It is considered an overall measure of community structure, complexity, and stability (Hubble and Foster, 1983). This is a combination of two factors: The number of species present, called species richness, and the distribution of individuals among species, called species equity or species equity. Biodiversity therefore refers to the variation that exists between different life forms. In this study, the general structure of vegetation and high frequency and IVI of *Abies pindrow* at all sites, as well as elevation, play an important role in species distribution, as shown in Table-1. The woody element dominates that the Kupwara temperate zone. Coniferous species were widely distributed in different elevation zones. *Cedrus deodara, Pinus excelsa, Ulmus wallichiana*, Fir pindrow. The herbaceous layer was predominant at almost all altitudes. The area is also rich in medicinal plants, with more than 27 species used commercially by locals. Some of them are still used by locals in traditional medicine. Crops such as *Cedrus deodara, pinu excelsa*, and fir trees are also used as building and furniture materials. Due to the high altitude and tribal inhabitation of the area, medicinal plants such as *Berberislycium, Belladona, Discorea Saussurea lappa, Podophyllum emodi and Artemisa absinthium* are used in folk medicine.

Most of the world's temperate forests are thought to have been logged without human knowledge (Wilcove et al., 1986). In the temperate Himalayas, rapid population growth and various human activities in recent decades have caused several environmental problems (Ives and Messerli, 1989). Despite its remoteness and status, Northern Lolab is not free from human interference. Deforestation has driven many species in the region to extinction as forests are under biological pressure. Therefore, ecological management of the area is urgently needed. Many medicinal plants are used for combustion or as animal feed. Poisonous plants such as *Aconitum napellus, Datura stramonium, Hyoscyamus niger* and *Rhus acuminata* have also been found in the area. The use of alternative energy sources in the study area is considered essential when it comes to protecting forests, biodiversity and terrestrial ecosystems. We can also observe an increase in cultivated land area at the expense of forest area, so this trend can be confirmed from alternative refined sources. Forest cover is also regularly assessed, so communities are informed to protect against decline, and have confidence in their natural impacts and air purification. The selection of fast-growing species by local arable land managers is encouraged through community participation during replanting, as farmers are interested in economic development through income from arable land. Vegetation cover restoration is done by a bottom-up approach. Community poverty reduction strategies are developed to minimize dependence on wood sources for livelihoods. The ecological contribution of elders/ancestors to forest conservation is also maintained through an emphasis on community participation. Sustainable development initiatives are also promoted by sources cited to boost the region.

Other researchers have examined the phytodiversity of various areas in Central India and have produced conclusions that are somewhat comparable to our results (Sharma *et al.*, 2019, Kumari *et al.*, 2018). According to the study, *Poa annua* L displayed the highest density, which is in line with Bha*t et al.*, (2016). *Poa annua* L exhibited the maximum density at Site-I, which Kumari *et al.*, (2018) have deemed justifiable. Native species are more common than invasive plants, according to Bhat et al (2016). *Poa annua L., Viburnum grandiflorum Wall. ex DC.*, and *Androsace sarmentosa WALL.* were the most prevalent species at both sites and have the most basal area . The explanation could be that local species have adapted to the region's hot, humid temperature, whereas the same climate makes it difficult for invasive species to become acclimated. According to Sheikh *et al.*, (2017), the Shannon Diversity Index,

Laraib Ahad and Rayees Afzal Mir

which measures the species diversity of an area by taking into consideration both the density and evenness of the species present, was found to be less than (Kumari *et al.*, 2018). Simpson Index was found to be higher than in Sheikh et al. (2017) but lower than in Kumari *et al.*, (2018) which may be related to edaphic factors, vegetation structure (Hubbell *et al.*, 1999), and the influence of anthropogenic as well as environmental factors on different regions of the area . The closeness of various species in a region is revealed by species evenness, which was higher than Sharma *et al* (2019) and had a significant impact on diversity In the studied area, various species were closely related to one another, which provides insight into the species' richness, which refers to the presence of various species in a given area and was found to be higher than (Sheikh *et al.*, 2017) and lower than (Kumari *et al.*, 2018: Sharma *et al.*, 2019).

The study found that trees with a big diameter create the most biomass, with tall trees and trees with a larger diameter (Day *et al.*, 2014) holding the most biomass (Gibbs *et al.*, 2007). The current study's findings are consistent with Thompson *et al.*, (2009)'s suggestion that mature forests are adobe to a vast number of tress, as demonstrated by our findings.

CONCLUSION

Floristic diversification is vital in maintaining a region's climate by utilising carbon dioxide and so reducing global warming. Various green patches of vegetation existing within different locations play an important role in lowering atmospheric temperature and sequestering atmospheric carbon dioxide, hence efforts must be made to enrich and protect these precious patches of flowering vegetation. Furthermore, new techniques must be taken to pay utmost attention to the maintenance of biodiversity in Kupwara city's urban forestry, which can help in carbon dioxide reduction and long-term environmental sustainability.

ACKNOWLEDGEMENT

ABSTRACT

This survey paper explores the diverse and evolving landscape of Human-Computer Interaction (HCI) applications within the domain of traditional medicine. Traditional medicine, encompassing a wide array of ancient healing practices, is increasingly intersecting with modern technology to enhance patient care, diagnosis, treatment, and knowledge dissemination. By synthesizing existing research and developments, this survey provides a comprehensive overview of how HCI principles and technologies are being leveraged to bridge the gap between traditional medicine and contemporary digital platforms. The paper investigates a spectrum of applications, ranging from interactive diagnostic tools and personalized treatment recommendation systems to virtual reality experiences that facilitate the understanding and dissemination of traditional medical knowledge. Through an analysis of these applications, the survey sheds light on the challenges and opportunities inherent in integrating HCI into traditional medicine practices, considering factors such as cultural sensitivity, usability, accessibility, and ethics. Ultimately, this survey not only showcases the innovative use of technology in traditional medicine but also underscores the potential for HCI to enrich the preservation, accessibility, and modernization of traditional healing practices.
Keywords: Traditional Medicine, Human Computer Interaction, digital technology, medicine.

INTRODUCTION

Human-Computer Interaction (HCI) involves examining the interaction between users and computers. This discipline has advanced significantly in enhancing our engagement with technology driven by computers. The interface serves as a component of a computer system, facilitating user interactions for system utilization and goal attainment. The efficacy of Human-Computer Interaction hinges upon essential factors like user-friendliness and convenience. These qualities foster a sense of security and dependability among end users, enabling even those without expertise to confidently and effortlessly access services. [1].For a long time, medical care has been an important part of our lives, as the focus of HCI. In recent years, interest in Traditional Medicine has increased worldwide. Traditional Medicine (TM) is a huge treasure house of medical resources, which provides a solid guarantee for human health for thousands of years. Throughout the entire era, despite the rapid development of modern medicine, the medical community has continued to raise voices for Traditional Medicine. The main reasons are as follows; Traditional Medicine can also treat some diseases, and the effect is betterthan modern medicine. "The World Health Organization (WHO) describes Traditional Medicine as the knowledge, skills and practices based on the theories, beliefs and experiences indigenous to different cultures, used in the maintenance of health and in the prevention, diagnosis, improvement or treatment of physical and mental illness" [2]. The World Health Organization (WHO) uses and registers hundreds of traditional medical practices known worldwide.In the words of C.Fokunang et al. [3], Traditional medicine refers to health practices, methods, knowledge and beliefs, including herbal medicines, animal and mineral medicines, psychotherapy, manual techniques and exercises used alone or in combination to treat, diagnose, and prevent human well-being or acceptance. It is the time to utilize the value for traditional medicine in primary healthcare as it made a great impact during the recent pandemic. There are many examples of the continuity of traditional medical systems around the world, Varieties such as acupuncture in China, magnetic therapy in France, healing practices in Germany, herbalism in Sweden, Shiatsu therapy in Japan, Sowa Rigpa in Tibet and Bhutan, and Indian Traditional Medicines like Ayurveda, Unani, Siddha, homeopathy, naturopathy, and yoga represent some of the widely embraced alternative medical systems.

The era of Traditional Medicine predates modern medical practices. In contrast to contemporary medical approaches, traditional medicine typically addresses health concerns by identifying the underlying causes of symptoms rather than directly targeting the symptoms themselves [4]. Traditional medical systems often possess specialized branches dedicated to the careful observation of symptoms and the tracking of diagnostic patterns [5].In recent years, modern medicine emerges due to technology, equipped medical instruments, proper digitization, modern drug discovery and development, whereas traditional medicine lack in digitization, modern technology and modern devices. Hence digitalization and development of devices related to traditional medicine are needed. This paper introduces a comprehensive survey concerning Applications of HCI in Traditional Medicine. However, in order to determine traditional medicine or herbal medicine, experience in that field and technical wisdom is necessary. This paper focuses on the survey of existing computer-based applications and recommends the need for the HCI applications in traditional medicine. This paper is organized as follows. In Section II, this paper reviews the existing surveys of computer technologies related to Traditional Medicine in various countries. Following that, this paper discusses the need of modern technology, development trend and future research directions of Traditional medicine in Section III. Finally, in Section IV, conclusion is drawn out.

REVIEW OF EXISTING SURVEYS

Traditional Medicine (TM) as per the World Health Organization is used nearly 80% of global healthcare, which is commonly referred to as complementary medicine [5]. Uganda [6] Rely predominantly on traditional medicine for mental health support. In the context of utilizing traditional remedies for addressing HIV/AIDS and associated ailments, Wang and Zouet al. [7], reported in detail the various kinds of medicines extracted from herbal medicines which is effective and used to fight against HIV/AIDS. In addition, Bhuda and Marumo [8] strongly advocated that traditional medicine products should be taken into consideration for the prevention and treatment of the coronavirus. [COVID19 (SARSCoV2)], especially in Africa.

Survey of Chinese Traditional Medicine

Traditional Chinese Medicine (TCM) emerges as an age-old medical system originating from China that has undergone profound evolution over thousands of years. TCM practitioners approach health concerns through a comprehensive spectrum of psychological and physical interventions, encompassing practices like acupuncture and tai chi, in conjunction with the utilization of herbal remedies. At present, Traditional Chinese Medicine encompasses six prominent therapeutic methodologies, including acupuncture, moxibustion, tuina massage, cupping/scraping, Chinese herbal treatments, and TCM-based nutrition [9]. Among these, acupuncture stands as the most prevalent and recognizable facet.

Acupuncture involves the precise insertion of slender needles into specific points on the body, exemplifying a traditional Chinese medical approach. Initially designed to alleviate pain, acupuncture, an integral aspect of TCM, is increasingly being embraced for its contributions to holistic well-being, including stress management. Macedo Neto et al. [10] have introduced a prototype of a Virtual Simulator for Acupuncture, offering valuable insights into the acupuncture process. This prototype exhibits potential for further evolution into a virtual simulator with enhanced realism. Notably, foundational technologies such as JOGL (Java OpenGL), Computer Graphics, and Virtual Reality have substantially enhanced the efficiency of acupuncture simulation programs, augmenting interactivity during training by incorporating 3D processing of human body models for pinpointing acupuncture points [11]. Employing cutting-edge virtual reality technology, an intelligent virtual environment tailored for Chinese acupuncture learning and training has been proposed [12]. [13] presents a comprehensive semantic network, outlining a classification framework and acupuncture terminology sets that encapsulate acupuncture architectural knowledge. Within clinical applications, an Automatic Manipulation Device for Acupuncture (AMDA) has been practically developed and demonstrated [14].

Moreover, an Android platform has given rise to a robot-assisted acupuncture model, facilitating the creation of an acupuncture point localization method [15]. A system designed to identify accurate acupuncture points using a robotic arm for symptom treatment has been proposed [15]. In a parallel effort, a novel radio-frequency (RF) stimulator has been constructed to replicate heat effects resembling the temperature distributions induced by moxibustion in porcine tissue [16]. [17] leverages network embedding and deep learning to achieve precise side-effect prediction within Traditional Chinese Medicine Compound Prescription. A groundbreakingANti-community detection algorithm (ANDERATION) has been introduced, characterized by an objective function aimed at generating an anti-structure, utilizing deep learning methodologies [18]. Proposing a paradigm shift, a model for traditional Chinese medicine suggests a new system based on blockchain technology for record-keeping and payments. This innovative approach holds the potential to address issues within the practice of Traditional Chinese Medicine [19].

Survey of Indian Traditional Medicine

Traditional healthcare systems have consistently held a pivotal role in meeting global healthcare demands. The Indian Systems of Medicine encompass practices that originated in India or were adopted from diverse cultures and subsequently integrated into the Indian way of life. India distinguishes itself by recognizing six distinct medical systems: Ayurveda, Siddha, Unani, Yoga, Naturopathy, and Homoeopathy [3]. Presenting a study rooted in Ayurveda, an innovative approach is introduced that employs fuzzy logic to configure a diagnostic system. This approach delineates Ayurvedic therapeutic strategies and their subsequent design and implementation [20]. Within the Ayurvedic domain, advanced machine learning techniques are harnessed to predict human body constituents and evaluate them across various parameters, culminating in the differentiation of bodily elements. Leveraging tools such as CatBoost and optimized parameters, an impressive accuracy of 0.95 is attained [21]. Ayurveda leverages automated vocabulary discovery to unveil novel transitive connections between diseases and herbs, underscoring the significance of this method in extracting biological entities from text and elucidating their roles within transitive associations in Text Mining [22]. [23] investigates diverse classifiers—SVM (Support Vector Machine), Decision Trees, and K-NN (k Nearest Neighbor)—for the identification of herbal plants, conducting performance comparisons.

Jeevarathinam *et al.,*

The synergy between Ayurveda, Information and Communication Technology (ICT), modern science, and engineering techniques is explored, highlighting ongoing initiatives across diverse domains, including research portals, pulse-based monitoring, diagnostic systems, and mobile applications [24]. An economical, non-invasive approach is established, capitalizing on the diagnostic value of the wrist circumetric sign within the Siddha system, presenting diagnostic and prognostic applications [25]. Pulse Analysis, an automated approach for disease detection, employs three infrared sensors on the wrist to capture vata, pitta, and kapha pulses, which are subsequently amplified and filtered using signal processing circuits [26,27]. [27] delves into the evolution of Ayurveda within the context of technological advancements in information and communication. This intersection engenders Ayurinformatics, a field that creatively leverages cutting-edge techniques to construct intricate models supporting e-health record discovery, automated herb identification, and management.

Introducing Attentive Herb, a novel intelligent model designed to replicate a doctor's inquiry and prescription process. Comprising a diverse array of herbs, this model automatically embodies specific concepts and learns the connections between symptoms and plants by analyzing clinical records from traditional herbal medicine [28]. A distinctive Embedded based Smart Yoga Mat (ESYM) design is presented, involving the identification of pressure nodes through Force Sensitive Resistor (FSR) sensors. Subsequently, a node pattern is established, and an ESYM control unit/algorithm for pattern recognition is devised to analyze Yoga poses, featuring a biofeedback method for real-time posture correction [29]. [30] highlights how a consortium of institutions harnessed the collective strength of employees, their families, and other stakeholders to combat an epidemic, leveraging the amalgamation of Yoga and digital technology to enhance performance. Employing a non-linear classifier named k-SVM (Kernel-based Support Vector Machine), [31] distinguishes between non-controlled and controlled groups using EEG (electroencephalogram) signals in the context of kriya yoga meditation, achieving an accuracy of 90.8259%.

Survey of other countries Traditional Medicine

Various criteria were employed to discern and classify electronic databases concerning medicinal plants, with the aim of amassing Indigenous Knowledge Systems Databases tailored to African Traditional Medicines, a subject that is meticulously reviewed [32]. Leveraging Artificial Intelligence (AI) patterns, a system was devised to amass patient information encompassing alterations in symptoms, shifts in moods, and even everyday activities often overlooked in medical diagnosis [33]. A network titled "Monshin" emerged within Japanese Traditional medicine, materializing as a questionnaire designed to capture patient lifestyle particulars and disease symptoms, utilizing the principles of graph theory to target atopy disease [34]. It's noteworthy that the existing surveys have displayed a conspicuous focus on Chinese Traditional Medicine, largely overlooking other rich Traditional medicinal systems. The progression towards digitization and automation of traditional medicine across diverse nations requires further development. Consequently, the incorporation of traditional medicine can no longer be brushed aside; concerted efforts are indispensable to standardize and seamlessly integrate these practices into the conventional healthcare framework through the avenues of digitization and automation.

DISCUSSION AND CHALLENGES

The utilization of natural elements underscores the profound significance of Traditional Medicine. Modalities such as Traditional Chinese Medicine (TCM), Ayurveda, Kampo, Traditional Korean Medicine (TKM), and Unani, among others, harness the potency of natural ingredients. Over centuries, these practices have traversed global boundaries, culminating in regulated systems. While these methods may exhibit certain imperfections, they serve as repositories of invaluable human wisdom [4]. Despite the worldwide incorporation of diverse technologies into Traditional medicine, the discourse on digitization persists. A uniform global technological framework has yet to materialize within the realm of traditional medicine. Challenges arising from inadequate infrastructure and the quest for standardization hinder the widespread adoption of traditional medicine, occasionally fostering hesitancy towards embracing these traditions. The contemporary surge in the utilization of Traditional medicine can be attributed to the prevailing pandemic circumstances. In the landscape of Chinese Traditional Medicine, notable strides have been

Jeevarathinam *et al.,*

made in technological advancements, particularly in domains like Acupuncture. These advancements encompass virtual simulators, virtual reality, 3D modeling of the human body, and even robot-assisted platforms. These innovations converge a diverse array of technologies, including machine learning, Artificial Intelligence, and blockchain. In the sphere of Indian Traditional medicine, extensive technological research is ongoing in fields like Ayurveda and yoga. However, Siddha, an ancient traditional medical system, although proficient in treating various maladies through pulse diagnostics analysis [26], necessitates considerable advancement. Hindrances such as limited sample sizes, incongruous outcomes, and deficient research designs pose challenges in applying informatics interventions to alternative medicine. Additionally, issues encompass statistical robustness, inadequate control mechanisms, and inconsistent treatment descriptions. The task of standardization and policy formulation within traditional medicine presents formidable obstacles. The integration of contemporary Human-Computer Interaction (HCI) technology offers potential avenues to bolstering the integrity of research designs.

CONCLUSION

This paper delves into the confluence of varied technologies and methodologies within the domain of Traditional medicine. A thorough exploration of multiple instances has been undertaken, spotlighting the amalgamation of diverse computer technologies with traditional medicinal practices. Moreover, a substantial hurdle impeding the ongoing progress of traditional medicine has been pinpointed. The pursuit of health and well-being stands as a paramount facet of human existence. This endeavor demands a holistic approach that encompasses factors such as unrestricted access to contemporary literature, articles, research, and databases, while embracing the adoption of the latest validated techniques for the management and upkeep of health records. Researchers must possess the acumen to effectively harness medical or health informatics within the context of Traditional Medicine. The infusion of Information Technology into an age-old medical framework presents a promising avenue for exploration. Tackling the existing gaps in informatics and seamlessly harmonizing national informatics infrastructure with established Traditional Medicine systems could potentially emerge as pivotal themes for prospective research ventures.

ABSTRACT

Molecular docking is a precise and error-free molecular recognition computation tool that predicts the bonding efficiency of a protein-ligand complex. *Cheilanthes swartzii*, an unstudied fern variation, was examined in molecular docking to learn more about its medicinal characteristics. The compounds were tested for absorption, distribution, metabolism, and excretion characteristics, as well as lipophilicity. The eight compounds are as follows: 1H-[1,2,3] Triazole-4-carbaldehyde, 1-methyl-1H-pyrazol-4-amine, Ethanamine, 2-(4-methyl-1h-1,2,3-triazol-1-yl), 1,1,1-Trinitroethane, 1,2-oxazolidin-4-ol, N-acetyldithiocarbamic acid ethyl ester, 1,4-dioxane-2,5-dimethanol, 2-aminoresorcinol. Docking analysis was performed against the target Super antigen SMEZ-2 (1ET6).The compound 1,1,1-Trinitroethane has the lowest binding energy, with a binding energy of -4.47 Kcal/mol. The compounds such as 1H-[1,2,3]Triazole-4-carbaldehyde, 1-methyl-1H-pyrazol-4-amine,2-(4-methyl-1h-1,2,3-triazol-1-yl) ethanamine, 2-(4-methyl-1h-1,2,3-triazol-1 yl)ethanamine, 1,1,1-Trinitroethane, 1,2-oxazolidin-4-ol, 1,4-Dioxane-2,5-dimethanol, N-acetyldithiocarbamic acid ethyl ester, 2-Aminoresorcinolshowed interaction with the residue and will play a major role in inhibiting the Super antigen SMEZ-2. The plant compound turned out to be possessing antibacterial properties similar to that of the control compound nafcillin, suggesting that it could be developed into a phyto-drug for the treatment of bacterial infections.

INTRODUCTION

Medicinal plants are believed to be an important source of new chemical substances with potential therapeutic effects [1] and are an important source of inexpensive and practical drugs for people throughout the world. Herbal medicine is based on the premise that plants contain natural substances, which can promote health and alleviate illness.

According to World Health Organization, medicinal plants are the best source to obtain a variety of drugs. About 80% of individuals from developed countries use traditional medicine. It is estimated that more than 6,000 higher plant species forming about 40% of the higher plant diversity of the country are used in its codified and folk healthcare traditions [2]. Significant quantities of medicinal plant resources are consumed in the country under its traditional healthcare practices at the household level. The traditional healers and practitioners of medicinal plants are playing major role in various industries. An idea about the richness and diversity of these health care practices in India are fully dependent on the diversity of medicinal plants. Considering the rich diversity of Indian medicinal plants it is expected that, the screening of plants may be useful in the preparation of improved herbal or drug formulations.

A lot of research has been carried out on the medicinal properties of angiosperms since they are widely prevalent and available. Some highly toxic angiosperm compounds have been shown to be effective in the treatment of certain cancers, including acute leukemia (vincristine from the Madagascar periwinkle, *Catharanthus roseus*) and heart problems (digitalis from foxglove, *Digitalis purpurea*) [3]. Pteridophytes have been considered a great source of medicine since ancient times and, when compared to other vascular plants, they remain underexplored in ethnobotanical aspects[4] since they are proven to be less versatile than other higher plants.However medicinal ferns have been documented for their anti-inflammatory activity namely *Pterismultifida* [5], *Cheilanthesfarinosa*[6]. Ferns also reported for wound healing activities namely, *Davalliasolida* [7], *Angiopterisevecta* [8], *Nephrolepiscordifolia*, *Ophioglossumreticulatum*, *Thelypterisarida* [9], *Polyopodium* species [10] and *Phlebodiumdecumanum* [11] respectively. Bioactive constitutions of ferns exhibit diverse pharmacological properties which include anti-oxidant, anti-bacterial, anti-tumor, and anti-inflammatory activities [12].Our country has a rich population of pteridophytes, most of the species are distributed in South Indian Mountains called the Western Ghats and few species are in Eastern Ghats. The adverse effects of the drugs available today, necessitate the discovery of new harmless pharmacotherapeutic agents from medicinal plants [13]. Natural products have proven crucial leads for drug discovery, and natural product databases are a convenient source for virtual screening against drug targets[14].

Drug research and development is a lengthy, expensive, and high-risk process involving random screening of synthesized compounds or natural products that takes 10-15 years and costs more than $1-2 billion for each new drug certified for clinical use[15]. Computer-aided drug design (CADD) approaches are important for reducing the experimental use of animals for in vivo testing, assisting in the design of safer drugs, and repositioning known drugs, assisting medicinal chemists at each step of the drug discovery process (design, discovery, development, and hit-optimization).These *In silico* methods provide a platform for screening the activity of potential therapeutics against the molecular targets, which helps to select the ones with the highest potential activity for further *in vitro* and *in vivo* experiments [16].

The genus *Cheilanthes* is underexplored for its pharmacological properties but they have been used in folk medicines for many applications such as for cough, headache, stomach pain, malarial fever, and hepatic problems [17]. Taking into account the importance of the pteridophytic species and the fern *Cheilanthes swartzii*, the current

Priya *et al.,*

study was undertaken to learn about the pharmacological property of the plant via *in silico* methods.

MATERIALS AND METHODS

Study area
The present study area Barliyaris confined to a major range of Nilgiri biosphere reserve, Southern Western Ghats of Tamilnadu. It is located in the Udhagamandalam district of the Southwest of Tamil Nadu (Plate-1)and lies between 11°.3436˚ N latitude and76°.840ºE longitude. The elevation of the hills ranges 1033m / 3389feetabove Mean Sea Level (MSL) and temperature varies between 10° and 22°C. Vegetation is predominantly deciduous forests types and average annual rainfall is 1600mm.

Collection and Preparation of the plant material
Ferns species of the *Cheilanthes swartzii* Webb & Berthel. (= Syn. *Cheilanthes mysurensis* Wall. ex Hook.) were collected from the Nilgiris, Tamil Nadu, India. The collected plant materials were washed with tap water followed by distilled water to remove unwanted traces of debris. The plants were blotted on the blotting paper and spread out at room temperature (30°C) in shade for 20 days. The completely shade-dried materials were powdered separately. The powdered samples were stored in polythene bags for further phytochemical analysis.

In-silico activity
PDB &Pubchem
The 3D protein structure crystal structure of the Super antigen SMEZ-2 from *Streptococcus pyogenes* was recovered from the Protein Data Bank database (PDB ID: 1ET6). Dynamic web page region was anticipated utilizing LigSite online apparatus. The concoction mixes from the referenced plants were recovered from the PubChem database.

Drug ability
Swiss ADME software was accessed to estimate individual ADME behaviors of the compounds from *Cheilanthes swartzii*. The list is made to contain one input molecule per line with several inputs, defined by a simplified molecular input line entry system (SMILES) and the results are presented for each molecule in tables, graphs[18].

Molecular Docking Study *In-silico* activity
MGL tools with AutoGrid4 and AutoDock4 were used to set up and perform blind docking calculations between the Ligands and Protein. Crystallized 3-dimensional structure was obtained from the Protein Data Bank (PDB). Receptor (protein) and ligand (complex) files were prepared using Auto Dock Tools. The protein was enclosed in a box with grid points in x, y and z directions and a grid spacing of 0.375 Å. The center of the grid set to -6.516, 30.278 and -1.951 Å. Lamarckian genetic algorithms, as implemented in Auto Dock, were employed to perform docking calculations. For every Individual docking cases, the lowest energy docked conformation, according to the Auto Dock scoring function and Number of hydrogen bonds was selected as the binding mode. The output from Auto Dock was rendered with PyMol[19].

Pymol
All the bindings are visualized by using the Structure Visualizing tool Pymol viewer, the interaction between the chemical compounds and target protein.

Statistical analysis
All analyses were carried out in triplicate and the data were reported as means. Where there was significance of the difference between means was determined by Duncan's multiple range test ($p<0.05$) using statistical standard methods.

65561

RESULTS

PDB (Protein Data Bank)
The 3D structure of protein Super antigen SMEZ-2 (PDB ID: 1ET6) was retrieved from the protein data bank (PDB) and it was viewed using the visualization tool pymol.

Pubchem
The compounds are isolated along with their molecular weight, molecular formula and pubchem CID, where Pubchem is the database for accessing small molecule.

Selected 50 compounds were first subjected to analyze Absorption, Distribution, Metabolism, and Excretion properties. As well as, lipophilicity is calculated to predict the range of solubility and permeability of the molecule in octanol/water partition coefficient, brain/blood barrier in order to perceive the transport mechanism in addition to it the following properties like molecular weight, octanol/water partition coefficient, hydrogen bond donor and acceptor was observed. Apart from the above properties, additional parameters such as surface area in square Armstrong (polar surface area, PSA) and percentage of human oral absorption were also predicted. It was discovered that all the molecules shown in (Table-2)have values within the respective range mentioned. Only 8 compounds (1H-[1,2,3] Triazole-4-carbaldehyde, 1-methyl-1H-pyrazol-4-amine, 2-(4-methyl-1h-1,2,3-triazol-1-yl) ethanamine, 1,1,1-Trinitroethane, 1,2-oxazolidin-4-ol, 1,4-Dioxane-2,5-dimethanol, N-acetyldithiocarbamic acid ethyl ester, 2-Aminoresorcinol) accomplished all the above-mentioned parameters and were further taken for docking analysis target Super antigen SMEZ-2 (1ET6). The results of docking studies were recorded **(Table 4)**. The least binding energy was recognized for the compound 1,1,1-Trinitroethane from the plant *Cheilanthes swartzii* of binding energy -4.47 Kcal/mol. The plant compound had more antibacterial efficacy than that of the control compound nafcillin, which could be further analyzed to make a phyto-drug as an antibiotic.

DISCUSSION

In recent years, integrating computational methods in biomedical research has transformed the landscape of drug discovery and disease understanding. Molecular docking has become a progressively important tool for drug discovery. Since 1982, virtual screening involving molecular docking has been the growing method for structure-based drug discovery [20].The benefits of virtual screening include small search space, low cost, and high flexibility. Docking assists in the revealing of novel compounds of therapeutic interest, forecasting ligand-protein interaction at a molecular basis [21]. Docking of phytochemicals obtained from plants on drug targets for emerging diseases has revealed the potential of them to be used against the conditions [22].Kumar and Navatheesh[23] embarked on a pioneering journey to combat bacterial skin disease, specifically impetigo, through an in-silico screening of medicinal plant-derived compounds. Leveraging molecular docking, they delved into the interactions between plant compounds and bacterial targets, shedding light on promising lead molecules for impetigo treatment. This approach expedited the search for effective treatments and emphasized the potency of computational methods in addressing urgent medical needs.

Employing *in-silico* analysis, molecular intricacies of Gaucher's disease were unraveled. The researchers gained invaluable insights into the disease's underlying mechanisms by probing potential therapeutic avenues through computational methods. This investigation advanced the understanding of the disease and showcased the pivotal role of computational tools in comprehending complex disorders and identifying potential drug candidates for further exploration [24].*In-silico* screening was employed to determine the antibacterial potential of *Lycopodiellacernua*. The study focused on DNA gyrase, a crucial bacterial enzyme, and utilized molecular docking to predict the interactions between plant compounds and the enzyme's crystal structure. This work served a dual purpose: uncovering the antibacterial properties of *L. cernua* and demonstrating the predictive capabilities of

Priya *et al.,*

computational approaches in evaluating the binding affinity of plant-derived compounds against vital bacterial targets [25]. Through *in-silico* investigation, the capacity of naturally occurring compounds to target the HIV ENV spike protein a critical component of the virus was explored. This study not only showcased the potential of natural compounds for HIV treatment but also highlighted the strength of computational methodologies in elucidating the intricate molecular interactions underlying such therapeutic interventions[26].

The present work focuses on the *in-silico* analysis of phytochemicals obtained from *Cheilanthes swartzii* using the AutoDock 4.2.6 software. Evaluation of ADME and toxicity properties of the drug molecules is also done as it is an essential factor during drug discovery. SwissADME is employed to evaluate the *in-silico* pharmacokinetic parameters viz., drug-likeness, physicochemical properties, lipophilicity, and water solubility. This study investigated the antibacterial capabilities of compounds isolated from *Cheilanthes swartzii* using virtual screening, as bacterial infections have become increasingly widespread in recent years. *Streptococcus pyogenes*, a Gram-positive bacterial pathogen known to cause diseases such as pneumonia, rheumatic fever, pharyngitis, and scarlet fever, was chosen to test antibacterial capabilities. Super antigen SMEZ-2 from the same organism was chosen as the target [27].Super antigens have been the subject of intense studies over the last decade in an attempt to determine their function in a variety of major medical conditions related to bacterial infections, such as staphylococcal food poisoning, scarlet fever, necrotising fasciitis, and toxic shock. The compound 1,1,1-Trinitroethane from *Cheilanthes swartzii* exhibited the highest binding energy of-4.47 Kcal/mol against the target. The docking results were found to be promising with emod in having the highest binding score of −6.44 kCal/mol followed by the isoflavonoidequol with a binding score of −6.29 kCal/mol Thus, these bioactive plant compounds could be used as leads for drugs targeting Secreted aspartic proteinase (SAP)enzymes in treating resistant *Candida* infections[28].

Collectively, these studies emphasize the pivotal role of computational techniques in reshaping biomedical research. *In-silico* methods expedite the identification of potential lead molecules, unravel complex disease mechanisms, and guide the design of innovative therapeutic strategies. By bridging the gap between experimentation and theory, these approaches facilitate the exploration of natural sources for novel drug candidates and the accelerated development of treatments for various diseases ranging from bacterial infections to viral scourges. In conclusion, integrating *in-silico* methods into biomedical research has heralded a new era of exploration and discovery. The studies discussed herein demonstrate the potential of computational approaches in addressing diverse medical challenges, from bacterial skin diseases to intricate genetic disorders and viral infections. As computational techniques evolve, their synergy with experimental validation promises revolutionizing drug discovery and disease understanding, ultimately enhancing human health and well-being.

ABSTRACT

Investment decision making is an important aspect in personal financial planning. The decision-making process varies from person to person. Some may follow traditional finance theory which is concerned with a lot of data analysis of the company, the overall market conditions and so on. However, over a few decades there is a shift from traditional finance theory to another approach known as Behavioural Finance. According to behavioural finance, investment decisions are affected by various psychological and demographic factors. It studies the mentality and even biases of people while they invest in various investment avenues. The objective of this research paper is to understand the factors affecting investment decisions in behavioural finance. The focus of the paper is to test the applicability of behavioural finance in investment decisions of teachers in Mumbai.

Keywords: Behavioural Finance, Investment Decisions, Teachers in Mumbai.

INTRODUCTION

There are different theories of finance established by various experts and authors like Modigliani and MillerArbitrage Principles, Markowitz Portfolio Theory, Sharpe's Capital Asset Pricing Model and so on. They are called as Traditional Finance Theories. These theories are useful for investors while taking investment decisions. They explain the rules of investment and also state how things operate in the financial markets. They also assume that markets are efficient, investors always take rational decisions, they have access to market information and they have perfect self-control. But sometimes a common man finds it difficult to understand and mainly practically

Sachin Bhandarkar and Vaishnavi Bagul

implement these theories. Therefore, these assumptions were challenged by psychologists. They were of the opinion that investment decisions are influenced by emotional biases and cognitive errors because of which they tend to be irrational. (Upadhyay & Shah, 2019). Behavioural Finance is a part of behavioural economics which takes into consideration sociology, neuroscience, law, psychology and organisation behaviour along with traditional finance theories. It explains the reasons behind the irrational behaviour of investors and especially why their behaviour does not match with the classical theories. Since it is a combination of traditional finance with other branches the investment decisions tend to be more accurate. (Samal & Mohapatra, 2020)

Definitions

- Behavioural Finance is an important subfield of finance which uses insights from the field of psychology and applies them to the actions of individuals in trading and other financial applications–NASDAQ
- Behavioural finance is a field of finance that proposes psychology-based theories to explain stock market anomalies such as severe rises or falls in stock price – Investopedia.(Kannadas, 2017)

LITERATURE REVIEW

- Ganesh Babu and Dr. Patel Nagaraj Goud (2016) in their research paper "A study on Behavioural Finance on Investment decisions among individual investors" have discussed about the growth the existing status of securities market in India. They have investigated various demographic factors and their influence on the choice of investment.
- Prof. DevrshiUpadhyay and Dr. Paresh Shah (2019) in their research paper "A Study on Behavioural Finance in Investment Decisions of investors in Ahmedabad" have tried to find out the major influence of certain behavioural finance concepts like overconfidence, perception, regret aversion, mental accounting on the decision-making process of individual investors in stock market. With the help of primary data, they have studied impact of behavioural finance on investment decisions.
- Kannadas S (2017) in his research article "Behavioural Corporate Finance and its impact on IT sector decisions - An Indian perspective"giveshis opinion that behavioural finance factors not only exist in personal investment decisions but also in corporate investment decisions. He states that top level management decisions are influenced by psychological factors and personal biases.
- Gaur Arti, Julee, SukijhaSunita (2011) in their research article "Difference in Gender Attitude in Investment Decision Makingin India" arguethat traditionally all investment decisions were taken by males, however, the scenario is changing now and even females take decision regarding the investment in stocks, bonds or real estate. They further state that women have different outlook and preferencesthan men in financial decision making.

OBJECTIVES OF THE STUDY

- To study the concept of Behavioural Finance
- To understand the factors affecting Behavioural Finance in Investment decisions
- To study the investment decision behaviour of teachers in different colleges in Mumbai

RESEARCH DESIGN AND METHODOLOGY

The research methodology for this research paper is exploratory and has been conducted based on primary and secondary sources of data. The data has been obtained from books, articles, bare acts, and websites of religious trusts. For the collection of primary data, a structured questionnaire was designed to study investment decision behaviour

of teachers in different colleges in Mumbai. Sample size is 62 and Convenient sampling method has been used for the collection of data. Descriptive Statistical analysis has been done to arrive at the findings and conclusions.

TRADITIONAL FINANCE VS BEHAVIOURAL FINANCE

Traditional Finance
- It assumes that investor correctly analyse the available data before making financial decisions.
- They properly consider risk and return involved in the investment.
- The decisions are based on reasons, logic and independent judgment.

Behavioural Finance
- The investor may not analyse the available data before making financial decisions.
- It assumes that investment decisions are based on emotions and heard instincts.
- The risk and return may not be correctly taken into consideration.
- It recognizes that people employ imperfect rules of thumb to process.(Upadhyay & Shah, 2019)

FACTORS IN BEHAVIOURAL FINANCE

1. **Overconfidence** - The overconfidence of investor tends to overestimate accuracy of the decision. The investor may feel that available information is sufficient to take decision but may not be aware that the available information is not adequate enough to develop a near- perfect forecast.
2. **Review of decisions**- Once a person forms an opinion, he may reluctant to review or alter it, even after receiving new and relevant information.
3. **Familiarity** - People are comfortable with familiar things. They may invest in those stocks about which they are familiar. It is a kind of shortcut while taking decisions.
4. **Conformation Bias** - Many times people favour that information which matches with their views. They ignore information that contradicts their views.
5. **Mental Accounting** - Traditional finance states that every financial decision should be dependent on a rational calculation about its impact on the wealth. However, in reality, people lack the computational skills and the will-power to assess financial decisions and their impacts.
6. **Narrow Framing** - Ideallly investors should consider impact on total wealth. However, investors have influence of narrow framing. It means investors consider each investment differently than considering the impact on the entire portfolio.
7. **Shadow of the Past** - Previous experience have a direct impact on investment decisions. With one kind of investment if investor has made profits he will be willing to go ahead with same kind investment even with higher risks. On the hand if there is a loss from one investment the investors tend to avoid that investment.
8. **Emotional Effects** - Emotion shave an impact on risk-tolerance, which then influences portfolio selection. Investors exhibit various emotions when they consider investment alternatives.
9. **Herd Instincts**- A natural instinct of human beings is being a part of a group. The investors tend to follow what the group is doing. Rather than doing rigorous independent analysis. So, the decisions involve high uncertainty.(Upadhayay, 2021)

TYPES OF BEHAVIOURAL INVESTORS
There can be four types Behavioural Investors

1. **Passive preservers** – They are the investors who are emotional, passive and not much interested in taking any risk. Their main motive is not to grow the wealth but to keep the existing wealth safely.
2. **Friendly followers** – These investors depend a lot on their friends, colleagues, relatives etc. while taking investment decisions. They are also passive and are ready to take less risk.

3. **Independent Individualist** – As the name suggests they are independent while taking investment decisions. They are very active and don't mind taking risk.
4. **Active accumulator** - They are active and high-risk takers. Their motive is to accumulate maximum wealth. (OK & Goud, 2016)(Upadhayay, 2021).

APPLICATION OF BEHAVIOURAL FINANCE

The concept of behavioural finance can be applicable in a number of areas.
1. **Personal Finance and Investing -** Behavioural finance can be helpful for individuals to recognize and understand their own cognitive biases and emotional tendencies. This may lead to better financial decision-making.
2. **Corporate Finance** - In corporate finance, due to behavioural biases managers may make more informed decisions regarding capital allocation, risk management, and mergers and acquisitions.
3. **Portfolio Management**- Behavioural finance principles can be applied in portfolio management of an investor to build diversified portfolios, taking into account investors' risk tolerance, loss aversion, and other behavioural factors.
4. **Risk Management** - Behavioural finance can help organizations and individuals to identify biases that may lead to excessive risk-taking or underestimating potential risks.
5. **Behavioural Economics and Public Policy -** Behavioural finance theory can be applied to public policy initiatives, such as designing pension systems, promoting financial literacy, or implementing regulations that protect investors from the consequences of irrational decision-making.

LIMITATIONS

Behavioural finance is criticised for the following reasons
1. The theory focuses a lot on cognitive biases and emotional influences. This may create an impression that all human decisions are influenced by them.
2. Since most of the factors of behavioural finance are related to psychology it is difficult to measure them and their impacts.
3. It is difficult to integrate behavioural finance theories with traditional finance models.

DATA ANALYSIS AND INTERPRETATIONS

Demographic Distribution of Data
On the Basis of Gender
From the *Table 1 & Figure 1* it can be observed that out of total 62 respondents 36.5% were males and 64.5% were females.

On the Basis of Age Groups
From the *Table 2 & Figure 2* it can be observed that out of total 62 respondents maximum (46.8%) were from the age 36 to 50 years, 40.3%% were in the age group of 20 to 35 years, 12.9% were above 50 years.

Investment Profile of respondents with respect to their area of expertise.
Relation between percentages of income invested by respondent and annual income
Table 3 provides insights into the savings and investment habits of individuals with different annual income ranges. It shows how the percentage of income saved or invested varies across income groups. For example, individuals with higher annual incomes tend to save or invest a larger percentage of their income each month, with more individuals falling into the more than 40%" category are from above 10,00,000 income range.

Relation between specific financial goal and area of expertise
From Table No. 4, it appears that individuals in the commerce and management areas are more likely to have specific financial goals guiding their investment decisions compared to those in the science and technology areas. The table provides insights into the relationship between individuals' areas of expertise and whether they have specific financial goals influencing their investment choices.

Relation between frequency of review of investment portfolio and area of expertise
Table No. 5 provides insights into the different frequencies at which individuals in various areas of expertise review their investment portfolios. It can be observed that individuals in the commerce area are more likely to review their portfolios more frequently, while those in the science area tend to review them quarterly or annually. These patterns may reflect different investment strategies and risk tolerances among individuals with different expertise.

Behavioural Factors

Reaction of respondent to significant loss in their investment portfolio
The data from Table 6 and Figure 3highlights various responses to how individuals react to a significant downturn in their investments. A majority of respondents, constituting 50%, demonstrate a disciplined and resilient approach, choosing to remain calm and adhering to their long-term investment strategy. They can be categories as 'passive preservers'. 30.6% of respondents opt for a cautious approach, closely monitoring the situation without making hasty decisions, indicating a more measured response to market volatility. Additionally, 14.5% admit to feeling anxious but resist impulsive decisions, reflecting a degree of emotional resilience.

Investment recommendations from friends, family, or colleagues
The data indicates the frequency with which respondents receive investment recommendations from friends, family, or colleagues. A significant portion, 53.2%, receives such recommendations sometimes, suggesting that they occasionally seek or are provided with investment advice from their social network. Additionally, 21% receive these recommendations often, indicating a more regular flow of investment advice from their connections. About 16.1% receive recommendations always, suggesting a high level of reliance on advice from their social circle. A smaller percentage, 8.1%, receives such recommendations rarely.

Following investment choices of others
The data from Table 8 & Figure 5 suggests that a majority of respondents, approximately 75.8%, tend to follow the investment choices of others, without conducting their own research. This indicates herd behaviour when making investment decisions. However, it's noteworthy that around 24.2% of respondents do not follow this trend, indicating a more independent approach to investment decision-making, possibly involving their own research and analysis.

Consideration of previous investment experiences and outcomes in making investment decisions
The data illustrates that a significant portion of respondents, approximately 46.8%, place a very strong emphasis on their previous investment experiences and outcomes when making investment decisions. This aligns with the principles of behavioural finance, particular rly the concept of "anchoring," where individuals anchor their decisions to past experiences.

Perception of knowledge about investments compare to the average person.
The data indicates that there is a split among respondents regarding their perception of their knowledge about investments compared to the average person. Approximately 45.2% of respondents consider themselves more knowledgeable about investments than the average person, while 54.8% do not share this perception.

Feelings about the prospect of losing money
The data reveals varying attitudes towards the prospect of losing money in investments among respondents. A

65571

majority, comprising 59.7%, strongly dislike the idea of losing money and are highly risk-averse, making significant efforts to avoid losses. This risk aversion aligns with the common behavioural bias known as "loss aversion," where individuals tend to feel the pain of losses more acutely than the pleasure of gains, influencing them to make conservative investment choices. Meanwhile, 35.5% of respondents express concern about losses but are willing to tolerate some level of risk, demonstrating a more balanced approach to risk management. A small minority, 4.8%, appear relatively unconcerned by the prospect of losing money, suggesting a higher tolerance for risk or potentially a lack of awareness regarding the potential consequences of investment losses. Overall, this data underscores the importance of understanding individuals' risk attitudes and how these attitudes can shape their investment strategies and decisions.

CONCLUSION

This research provides valuable insights into the investment behaviours and decision-making processes of teachers in Mumbai region. The data gathered in this study has revealed a complex interplay of behavioral biases and personal preferences that influence how teachers approach investments. Notably, the findings indicate a significant reliance on social networks for investment recommendations, a varying degree of consideration for past investment experiences, and a range of attitudes towards risk and loss aversion. These insights underscore the importance of recognizing and addressing behavioural biases in financial education and advisory services tailored to teachers and potentially other groups with similar profiles. Further research in this area could provide even deeper insights into the behavioral finance aspects of investment decision-making among educators and contribute to more effective financial literacy initiatives.

ABSTRACT

This study investigates the reasons why recent years have seen a decrease in the number of electronic toys imported from China to India. It investigates the factors that led to this shift in the toy ecosystem, discusses its implications for the economy, and outlines potential courses of action. One of the reasons for this is that importing toys from China is becoming an increasingly unacceptable practice. At the same time, India is working to become more self-sufficient within its own borders by participating in the "Make in India" project. As a result, they are becoming less dependent on countries in other parts of the world. This decline in toy imports is also examined in this paper, along with its effects on India. It investigates whether or not individuals in India are purchasing different kinds of toys, the rate at which prices are fluctuating, and any other potential sources of toys that India may be importing. In addition to this, it investigates how the change would affect the people who work for Indian toy manufacturing firms as well as the company themselves. In conclusion, the findings of this research indicate that India ought to modify its policies in order to make the most of the current circumstances. It provides guidance to government authorities, those working in the toy industry, and business owners on how to capitalize on this shift in the market for toys. In the end, it is hoped that it will assist India in becoming more self-sufficient in the toy business and playing a larger part in the global toy market. This paper is an attempt to not only understand what is happening but also to provide an insight for those who want to step in as an entrepreneur or who have an interest in the toy sector and can draw profit from this transformation. This paper is an attempt to not only understand what is happening but also to provide an insight for those who want to step in as an entrepreneur..

Keywords: Toy ecosystem, Make in India, Imports, Electronic toys, Entrepreneur.

Sadhana Singh and Khadijah Qureshi

RATIONALE AND GAP ANALYSIS

Throughout its existence, the toy manufacturing business in India has been extremely reliant on imports. However, a significant portion of these imports consisted of outdated, low-quality, and potentially hazardous electronic toys. As a result, the government implemented a number of different strategic initiatives in order to deal with the influx of people and to boost domestic manufacturing. Because of this, Indian producers were compelled to begin preparing for the production of electronic toys with the intention of supplying reasonably priced electronic toys that are of a good quality and are manufactured well. The market for electronic toys in India is segmented based on the type of toys as well as the types of power source. On the basis of the type of toys, the most comprehensive coverage includes musical toys, educational toys, mechanical toys, and remote control toys. On the basis of the power source, it is possible to classify the toys as either rechargeable battery toys or non-rechargeable battery toys.

In today's world, the market for electronic toys is expanding at a high speed, with a focus on both classic and innovative product categories. The enormous and growing population of India, as well as the country's rising per capita income, have contributed to a growth in the demand for electronic toys in the country. However, despite the shift towards domestic production, the price of electronic toys is still a worry for those who fall into the middle-income and lower-income brackets. The objective of this research paper is to investigate the electronic toy production in India and assess the country's overall contribution to the economy of the world. It is essential to keep in mind that electronic toys are still considered a luxury item, rather than a vital resource for the growth and education of children. This perception is problematic. The researchers decided to conduct a survey in order to have a better grasp of how customers feel about the use of toys and the difficulties that are encountered. The purpose of this study is to investigate the possibility of India's trade deficit shrinking as a result of an increase in the quantity of high-quality, low-priced electronic toys that are exported to both the Indian market and the global market. In addition, the study places an emphasis on developing an economy that is dynamic and innovative by utilizing electronic toys that are imaginative and playful. The electronic toy business in India has the potential to experience fast growth, provided that the government continues to provide aid and continues to offer incentives.

STATEMENT OF THE PROBLEM

The electronic toy market in India has undergone significant change, shifting away from a heavy dependence on imported electronic toys of inferior quality and towards the indigenous manufacturing of electronic toys of superior quality and competitive prices. In spite of this change, families with middle-income and low-income levels in India continue to be concerned about the cost of electronic toys. In addition, electronic toys are still considered to be luxury products rather than fundamental resources for the growth and development of children. This circumstance brings up a number of significant concerns that require attention and consideration.

OBJECTIVES OF THE STUDY

The present study aims to examine the significance and value additions due to various transitions in the toy industry in the country. In this broader framework, an attempt is made to achieve the following specific objectives:

- To understand the present scenario of the electronic toy industry in India.
- To analyze the customer perception towards usage of toys and challenges faced.
- To describe various initiatives adopted by the Government for reducing imports of electronic toys from China.

Sadhana Singh and Khadijah Qureshi

SCOPE OF THE STUDY

The types of toys for kids and the various ways which they can be used are rapidly shifting to keep up with advances in technology and the requirements of the market. In the not-too-distant future, there is significant potential for the production of electronic toys in India. Because India has such a large population of young people, it has an excellent opportunity to become a market for electronic toys. It is projected that there will be a significant increase in demand for innovative and engaging electronic toys as the rate at which parents utilize technology continues to rise in tandem with rising levels of disposable income. The expanding technological and electronic advancements in India create an environment that is conducive to the production of sophisticated electronic toys that may feature augmented reality, internet of things, and artificial intelligence. More jobs are created in the domestic manufacturing sector as a result of government initiatives, such as "Make in India," which offer tax breaks and other benefits to businesses that produce electronic toys and other consumer goods. Along with India's emphasis on education and skill development, there is a growing global trend towards instructional electronic toys. These toys are becoming increasingly popular. The market for toys in India has the potential to expand to between $2 and $3 billion by the year 2024. The toy industry in India barely accounts for 0.5% of the industry's total size worldwide, showing that there is significant room for expansion. It is anticipated that the domestic demand for toys will increase by 10-15%, which is significantly more than the global average of 5%.

REVIEW OF LITERATURE

In their paper titled "Failures of Indian Toy Industries," Ashutosh Samadhiya and colleagues shed light on the fact that the traditional toy industry is significantly less competitive than the formal toy industry. And says that in fact, both the formal and traditional economic sectors need to coexist with one another and strengthen in order to enable more production. The report centered its attention on the Indian toy sector, which had been neglected in prior research. In this study, the problem facing the Indian toy business as well as a potential remedy are discussed. The worldwide competition in the toy business was explained by Sayed Gulzar Ganai et.al. in their work titled "Dynamic comparative advantage of India and China: a study of manufacturing exports." The study compared the export competitiveness of Indian manufacturers with that of Chinese manufacturers in international markets. According to the findings of the study, Indian toys are rising to a more dynamically competitive position than their Chinese counterparts are on the world market for exports.

Makreo research has conducted an in-depth analysis of the study titled "India Toys Market Report and Forecast" which is related to the toy industry in India. In their analysis, they took into account a diverse variety of factors, such as the country's prospective population, demographics, and economic classes, as well as the effect that the economy of the country would have on the India market. In their research article, Dr. Veto Dey and his colleagues noted that toys no longer collectively satisfy a child's desire for pleasure. Instead, they address the expanding requirement for varied skill development in young kids. In the most recent few years, there has been an increase in demand for toys that is equivalent to a doubling of the numbers. Toys made in India come at a fraction of the price of their branded Chinese counterparts. There are reports that Indian toys have captured more than 80 percent of the global toy market. Because of this, Indian toy manufacturers have received some much-needed support.

LIMITATIONS

1. The primary data has been collected through a structured questionnaire and as the sample size is 167 so it cannot depict the larger population of the country.
2. Only Mumbai city is considered for the study.

RESEARCH METHODOLOGY

Sources of Data Collection
Primary data
The research is based on Primary Data, in order to achieve the objectives of the study, researchers have surveyed 167 toys consumers and 103 valid responses were received.

The secondary data
The data is gathered from relevant Research papers, journals, websites, printed and unpublished sources, etc. Some data has been furnished from the websites of the Government of India, Government of Maharashtra, DGFT ie. Directorate General of Foreign Trade and IBEF ie. India Brand Equity Foundation are used to absorb information.

PRELIMINARY WORK

Preference of Indian electronic Toys over Chinese toys
This reveals that 4.9% of those questioned prefer purchasing electronic toys manufactured in China. However, a majority of consumers (48.5% to be exact) would rather shop for electronic gadgets that are made in India. It's possible that this is due to the fact that some customers believe that Indian electronic toys adhere more closely to safety measures and have higher quality control standards. Availability of low-cost and economical toys as a result of the easy and pocket-friendly availability of raw materials in India is another reason why Indian toys are chosen. This has led to an increase in the demand for Indian Toys as well as a preference for Indian Toys.

Appropriation of Toys by age
During the course of the study, it was discovered that approximately forty percent of the respondents buy toys for toddlers in the age range of one to three years old. Toys are an easy way to get the attention of toddlers and can aid in the development of motor skills in children. To accommodate this need, toy manufacturers are hard at work developing innovative toys that are specifically crafted to encourage intellectual development in infants. Throughout the duration of the pandemic, play schools remained closed. Because of this, there has been a significant increase in demand for toys that teach children new skills as a result of the fact that children are now spending more time away from school. As a direct consequence of this, more and more parents are investing in electronic educational toys for their children's early development as learners.

Categories of superior Indian toys
The following are some of the categories in which Indian toys excel: board games, plush/stuffed animals, metal/tin toys, wooden toys, educational toys, and collectibles. In this particular instance, the majority of respondents went with electronic toys. Electronic toys are commonly preferred because of the compelling properties that they provide, such as lights and music, which captivate children more than traditional toys made of plastic or wood do not. The adjustable functions of electronic toys provide for a greater diversity of play experiences as compared to the traditional toys that have been available for generations. Because they are able to keep children entertained for far longer periods of time, they are a boon to working parents who are searching for breaks. By using rechargeable batteries or USB charging, many of these toys spare their owners the hassle of frequently having to change their toys' batteries.

Indian electronic toys ushering better quality
The majority of respondents hold a favorable view on the quality of Indian electronic toys. The electronic toy sector carries the burden of assuring the safety of their products for the innumerable young consumers who play with them on a consistent basis. Toy manufacturers, importers, and retailers in India who are involved in the production of electronic toys should implement and uphold rigorous supply chain management practices. This will ensure the timely delivery of toys that comply with applicable safety laws and meet the requirements that consumers have

about the safety of electronic toys. A little over three quarters of those who took part in the poll are of the opinion that the level of craftsmanship found in Indian electronic toys is superior than that found in Chinese electronic toys.

Problems faced by Indian consumers

When it comes to electronic toys, it is clear from the diagram that respondents place a greater emphasis on particular important aspects. The availability of products that cater to the needs of children is the most important factor to consider among these several aspects, followed by price that is competitive, appealing toy designs, and overall product quality. Because there is a growing need for electronic toys in the market, manufacturers should concentrate on developing electronic toys that meet the demands of potential customers. It is essential to put efficient pricing strategies into action in order to capitalize on prospects for bulk sales. When it comes to attracting the attention of customers and encouraging them to make purchases, the design of electronic toys is of the utmost importance. Last but not least, keeping the quality standards for electronic toys at a high level continues to be a major issue for purchasers.

Reasons to switch over to Indian toys

The fact that India has committed to the Make in India Initiative is the most important factor driving the transition to electronic toys manufactured in India. There has been an upsurge of electronic toy clusters around the nation, providing major advantages to small-scale entrepreneurs whose electronic toys are now getting popularity on a worldwide scale. In addition to this, they are developing robust connections with leading international businesses. Respondents have also mentioned a variety of additional reasons for this transition, including India's advancements in exporting electronic toys, the Prime Minister's request for increasing focus on Indian electronic toys, worries about quality and safety, warranties, and adherence to safety regulations, among a variety of other reasons.

Contribution of citizens in India's toy story

In this regard, a sizeable majority of the respondents, comprising 39.6% of the total, believe that they are directly responsible for the expansion of the electronic toy sector in India as a result of the fact that they purchase electronic toys manufactured in India. They encourage local job possibilities, stimulate the circulation of capital within the local economy, and improve the quality of services by purchasing electronic toys that are made in India. Approximately 46.8% of those who participated in the survey have the intention of increasing market awareness of Indian electronic toys. In the meantime, one-fifth of the respondents (13.6%) intend to make a contribution to the industry of electronic toys by manufacturing electronic toys. This, in turn, will boost sales and provide employment possibilities in society.

Self-reliant toy industry of India

As it can be seen from the diagram that was presented, each and every one of the 103 people who responded to the survey held the view that India has the potential to become more self-sufficient in the relatively near future, particularly in terms of the production of electronic toys. The findings of this survey provide compelling evidence that India is well on its way towards achieving self-sufficiency in the production of electronic toys. To achieve this objective, the manufacturers of electronic toys in India will need to adopt strategies that are original, cutting-edge technologically, and innovative in order to increase the amount of domestic electronic toys that are exported. To survive in the ever-changing market scenario and position India as a worldwide powerhouse for electronic toys, collaboration with government incentives and investments is necessary.

EXPECTED OUTCOMES

Researchers have put together a favorable and successful approach to the issue of Indian electronic toys, which they have shown here. According to the survey that was carried out, children who are between the age range of five and seven years old are more likely to prefer Indian toys over imported toys. This finding shows the expansion of the Indian toy industry.

Sadhana Singh and Khadijah Qureshi

As the demand for Indian toys continues to increase at a rapid rate, there is a pressing need for new business ideas, new start-ups, the introduction of modern technology to traditional toy producers, and the raising of fresh consumer interest. In addition, there is a demand for the development of fun and engaging video games that "engage, entertain, and educate." The government of India encourages and compels India's new business ventures, known as startups, to produce as much as they can and expand the market for electronic toys manufactured in India. There is high growth potential for India in exports of electronic toys and board games with the U.S.A., EU and different global markets.

FINDINGS

According to the IMARC Group's report, the Indian Toys Market's Industry Trends, Share, Size, Growth, Opportunity and Forecast 2023-2028, the current trend of India's electronic toys trade is positive. The market is expected to grow at a compound annual growth rate (CAGR) of 12.5-13% over the next five years, with a value of $3 billion by the year 2028. This expansion can be attributed to a number of different sources, including the following

- Increasing modernisation and rising disposable incomes: India's growing urban population is becoming increasingly affluent, and this is leading to an increase in demand for toys, specifically electronic toys. India's urban population is growing at a rate that is faster than its GDP growth rate.
- Indian parents are becoming more aware of the benefits of educational toys, and electronic toys are typically considered as more instructive than conventional toys. As a result, the choice among Indian parents is shifting towards modern and high-tech toys.
- The expansion of e-commerce has made it simpler for customers to buy electronic toys, which in turn has helped to the expansion of the market. Additionally, the growing popularity of e-commerce has contributed to the expansion of the industry.

In addition to the considerations discussed above, the government of India is also taking action to encourage the development of the country's toy manufacturing sector. To encourage the use of toys manufactured in India, the Indian government has, for instance, begun a number of campaigns and events, such as the "Vocal for Local" campaign and the National Toy Fair.

However, there are also some challenges that the Indian toy industry faces, such as:
- Imports from China pose a challenge for Indian toy producers, as China is the largest producer of toys in the world. As a result, Indian toy manufacturers are up against severe rivalry from imports from China.
- Cost of raw materials is comparatively high in India. The cost of raw materials used in the production of electronic toys, such as plastic and electrical components, is much higher in India than it is in other countries.
- Because there is a shortage of qualified labour in the Indian toy sector, it can be challenging for producers to develop electrical toys of a high enough quality to satisfy consumers.

The electronic toy market in India is currently on a positive trajectory, despite the problems that are currently being faced. Toy producers in India are in an excellent position to capitalise on the opportunities that will be made available as a result of the anticipated expansion of the toy business in India, which is forecasted to experience significant growth in the years to come.

The future possibilities of the electronic toys industry in India
- **Large number of potential consumers**
  India, which is the world's second most populous country, is home to a sizable market that may accommodate a large number of different clients. When compared to other countries, India has an extremely high demand for electronic toys because the majority of its population is under the age of 25. The market for electronic toys is expected to reach nearly 2 billion units by the year 2025, according to projections.

65581

- **The emergence of the middle class**
  The substantial shift away from traditional electronic toys and towards creative electronic toys and smart toys has been brought about by a combination of rising consumer demand for electronic toys and falling production costs. In addition, there is an increase in the manufacturing of battery-operated electronic toys with a medium to low price range, which is producing economies of scale for manufacturers.

- **Job creation**
  There is an important role of micro, small, and medium enterprises (MSMEs) in the electronic toy sector, which has the potential to produce a significant number of new employment opportunities. India has the potential to revolutionize both its economic and its social impact as long as it places a higher priority on the quick development of the electronic toy industry and if it implements effective legislation, infrastructure, and administrative practices. This transition would necessitate the utilization of a sizeable workforce, which would result in an increase in available job positions.

- **Enhanced quality standards**
  In the past, the majority of toys for kids were produced out of low-quality plastic and had a tendency for breaking easily. However, thanks to recent developments in engineering plastics, electronic toys have become significantly more long-lasting. Additionally, in order to guarantee the quality of electronic toys, the government of India has issued new regulations that fall under the purview of the Bureau of Indian Standards (BIS).

- **Investing in Research and Development (R&D)**
  Establishing toy design emphasizes with a focus on R&D to foster innovation, incentivizing technical institutions to offer specialized training in the design of electronic toys and games, and promoting knowledge exchange among institutions for the development of interactive educational games that engage, entertain, and educate users are all ways to bridge the demand-supply gap.

- **Promoting Eco-friendly Electronic Toys**
  Electronic toys made in India make a positive contribution to the overall growth and development of kids. The practice of reusing and recycling materials has a long history in India, and Prime Minister Modi has made it a point to highlight this culture, which is evident in the manufacturing of environmentally friendly electronic toys.

The Indian government has taken the initiative to promote the expansion of the electronic toy sector, putting in place a comprehensive strategy through numerous initiatives.

- **The national action plan for toys**
  The "National Action Plan for Toys" launch in 2019 was a crucial step. This detailed plan outlined an ambitious goal of making India a major global centre for the production and export of toys. It included a variety of tactics, such as providing funding to toy producers, creating toy clusters, and promoting the use of toys made in the country in educational facilities.

- **Increase in import tax**
  The government recently raised import taxes on electronic gadgets in an effort to make domestic production more competitive. This action attempted to level the playing field and increase consumer interest in electronic toys made in India on the local market.

- **Promote research and development**
  Another priority has been to encourage innovation, and to that end, the government is providing financial aid for toy sector R&D. This has stimulated producers to spend money on developing fresh and cutting-edge electronic toys, fostering the expansion of the sector.

● **Safety measures**
The government has set up toy testing facilities to guarantee the reliability and safety of electronic toys made in India. These facilities are essential for testing goods and certifying their kid-safety, increasing consumer confidence.

● **Adoption of digital technology**
The government has actively encouraged the adoption of digital technologies because it recognises their significance in modernizing the toy business. Digital technology integration has boosted Indian toy producers' competitiveness in the international market while also increasing efficiency.

RECOMMENDATIONS

Boosting the electronic toy industry in India requires a multi-pronged approach that encompasses financial incentives, campaigns, trade facilitation, and skill development. Here are several recommendations to the government to propel this vital sector forward:.

➢ **Financial Incentives**
The government should provide financial incentives to manufacturers, such as tax breaks, subsidies, and low-interest loans. These incentives would ease the financial burden on toy makers, encouraging investment and growth within the industry.

➢ **"Make in India" Campaign:**
Launching a dedicated "Make in India" campaign for electronic toys would promote the purchase of Indian-made toys. This initiative can also attract foreign investment, leading to the establishment of more manufacturing units and research centers in the country.

➢ **Reduce Import Duties on Raw Materials**
Lowering import duties on raw materials and components used in electronic toy manufacturing is crucial. This reduction would make production more cost-effective for Indian manufacturers, ultimately resulting in competitively priced products.

➢ **Infrastructure and Logistics Improvement**
Improving infrastructure and logistics facilities is essential to reduce the cost of doing business. Enhanced transportation networks and efficient logistics would make it easier for Indian manufacturers to both source materials and export their products.

➢ **Training & Developmental Programmes**
Providing training to workers in the electronic toy industry is vital. Skilled and well-trained workers can significantly improve the quality of Indian toys, making them more attractive and competitive in the global market.

➢ **Foreign Partnerships**
Collaborating with foreign toy companies through joint ventures, technology transfer agreements, and other forms of cooperation can bring in expertise and innovation. This can also facilitate the exchange of knowledge and technology to further enhance the industry's capabilities.

➤ **Trade Fairs and Exhibitions**

Organizing trade fairs and exhibitions dedicated to Indian electronic toys can be instrumental in promoting the industry. These events would serve as platforms to showcase products and connect Indian manufacturers with potential buyers from around the world.
By implementing these recommendations, the Indian government can provide the necessary support and impetus for the electronic toy industry to flourish

CONCLUSION

In the final analysis, the Indian toy business has been subjected to a substantial change, particularly in the field of electronic toys. The strategic steps taken by the government to combat the influx of imported goods of low quality and to boost domestic manufacture have opened the manner in which towards growth in this sector of the economy. The market manufacturing electronic goods in India continues to grow at an unprecedented rate, encouraged both by the country's fast growing population and its rising per capita income. The relevance of electronic toys is further highlighted by the fact that they are increasingly being seen not only as luxuries but also as instruments that can aid in the growth of children.

ABSTRACT

It is identified that only 33% of the employees working in the tech industry are women and the industry comes only at 5th position for being LGBTQ+ friendly. This paper looks into the correlation between diversity, equity, and inclusion efforts in AI-related tech companies and the professional development of the underrepresented groups. By observing and examining the career trajectories and leadership positions of the females and persons on the LGBTQ+ community, the study could recognize the factors that contribute to or hinder career advancement and propose outcomes of fostering a more inclusive environment for AI related IT companies**.**

Keywords: Diversity, Inclusion, AI, Tech Industry, Professional growth .

INTRODUCTION

It is seen that AI-related tech companies have come forward as leaders in innovations and advancement in technology, in this rapidly evolving landscape of technology. However, these such companies have faced continuous obstacles in achieving diversity, equity, and inclusion within their personnel. This article looks into the critical issues of underrepresentation, specifically focusing on women and the LGBTQ+ group , in AI-related tech companies. Data suggests that tech employees who recognise themselves as females are almost three times more probably to view inequity based on gender in the tech industry, and six times more probably to have gone through such inequity and it is also identified that LGBTQ+ employees delineate considerably pessimistic experiences in the workroom in

all sectors compared with other non-LGBT coworkers over many experiences in the workroom . A deeper scrutiny of gender discrimination evidences that the discrimination in the workplace ranges from, unavailability of new opportunities to lack of standard compensation and benefits. These factors contribute to the lack of professional development and an upward career advancement of females and also the persons on the LGBTQ+ group. This article explores the relationship between the diversity of individuals and their career advancement, specifically aiming to identify the factors that help to or hinder the professional development of these underrepresented groups. By examining career trajectories and leadership positions, we can discern the steps necessary to foster a more inclusive environment in AI-related IT companies.

The Link between Inclusivity and Career Advancement

To understand the importance of inclusiveness in career advancement, it is important to look into the experiences of women and LGBTQ+ individuals in AI-related tech companies. These groups often face unique challenges which are not faced by the other gender and straight people, that hinder their professional growth. Few of the hurdles faced by these individuals include, but not limited to, notable obstacles in procuring the positions with authority, including partisanship , a lacking of portrayal , and also lacking of opportunity in career growth .

ASPECTS INFLUENCING CAREER ADVANCEMENT

The below factors are applicable not only in AI related Tech Companies but also in other fields as well:

Company Culture

Companies which have an inclusive culture, that values the diversity of its employees, automatically helps to promote career advancement of its employees. Technologist who are nurtured and supported in such environments are more likely to feel empowered and motivated to grow in that organisation.

Mentorship and Sponsorship

Having the access to and guidance of mentors and sponsors who actively advocate for the career growth of their mentees can significantly impact one's career advancement and it is seen that companies that have invested in mentorship programs help individuals navigate their career paths effectively. Hence if these underrepresented individuals gain access to such mentors and sponsors, it will smoothen their path to professional growth.

Equal Opportunities

Equity in job prospects and opportunities, not excluding access to high-profile projects, leadership roles, and training, is crucial. A workplace which is inclusive ensures that all the employees in the organisation have the same level of opportunity to procure that position.

Diversity in Leadership

A company that maintains a diverse leadership team can set an optimistic example to others, which in return encourages others to aspire to aim for leadership positions. Diversity and representation at the top management level sends a strong message about the company's assurance for a diverse and inclusive workplace.

Supporting Policies

Companies which have delivered on their promise to implement and maintain effective anti-discriminatory policies; which actively ensured that equal opportunities are available to all its employees, have seen a significant influence on a person's career path, specifically for women and LGBTQ+ personnel.

THE BENEFITS OF AN INCLUSIVE WORKFORCE

Endorsing diversity, equity, and inclusion in AI-related tech companies is not only a moral necessity but also a tactical advantage to the company. Studies have revealed that teams which are diverse are said to be more inspired, innovative and better prepared to face and figure out Solutions for complex problems. In the age of millennials and Gen Z, inclusive companies are more probable to appeal top talent from diverse and different backgrounds, which in return enhances the company's performance.

RECOMMENDATIONS FOR NURTURING INCLUSIVITY IN COMPANIES

Diversity Training
In order to increase awareness regarding partisanship and also to promote inclusivity it is necessary to accomplish an effectuated , efficient ,profound and inclusive training programs on diversity.

Mentorship Programs
Develop mentorship programs that pair underrepresented employees with mentors who can guide their career development.

Diverse Hiring Practices
Implement blind recruitment processes and set diversity targets to ensure a diverse candidate pool.

Leadership Accountability
Hold leaders accountable for promoting diversity and inclusion within their teams and possibly linking their performance evaluations to these efforts.

Employee Resource Groups
Assisting and motivating the installation of affinity groups for women, LGBTQ+ individuals, and other underrepresented groups.

Adversity Faced By Women and LGBTQ+ Individuals
Though many organisations are advertising the diversity of their workforce: females, and the employees of LGBTQ+ even now face inequity, lack of portrayal , and disproportion in the technology based industry. Companies attempt to portray how they have various diversity programs in place– to attract talent; and they endorse how effectively these programmes work but the reality is that most programs on diversity are not augmenting the diversity of companies. In spite of a small number of new attractive additional features, courteousness of big data, organisations are still using the old tactics that have been already used since the 1960s—which frequently worsen the things and not better. And despite all genuine efforts to fix these diversity and inclusion issues, there is a possibility that they may never be rectified because the social environment which includes the demographic factors like gender , race, class, age ,etc including ability and sexual orientation are reflected by the technology industry.

CONCLUSION

There is an increasing cognisance around women and the rights of LGBTQ+ has come up with a refocusing of attention in pay disparities , chances and successfulness that less portrayed groups look towards in the workroom. It is time now for technology companies to close the diversity and gender gaps so that their commitments towards gender equality can be proved. In the recent scenario many companies have started adopting remarkable policies than before. Expectantly, these companies will work on understanding the challenges faced by the underrepresented groups and put in an effort to embrace and implement effective strategies to sponsor inclusivity of its employees. By

doing so, these companies can effectively and efficiently break down the barriers to career advancement faced by these individuals. The correlation between efforts for diversity and professional development is undeniable, and the current day and age is apt for AI-related tech companies, and all other sectors, to take a hands-on and proactive step toward a more inclusive future. Welcoming inclusivity, equity and diversity is not only a moral inevitability; it is a strategic necessity that will add value and create Unseen progress and success in the tech industry.

ABSTRACT

Artificial intelligence (AI) is a key component of numerous daily human activities. The most challenging areas of AI are object detection, recognition, computer vision, machine learning, and deep learning. In recent years, computer vision has developed into a crucial part of many consumer applications. to live a complex existence that incorporates text recognition, object identification, surveillance and security systems, and disease diagnosis from MRI/CT scans. A limitation, such as a visual, hearing, intellectual, or physical impairment, affects 1 in 100 persons today. The market is flooded with devices and software that can help the community of the blind. However, there are no entirely portable gadgets accessible to safeguard the community of blind people. There is no product on the market that can identify items and impediments on the user's body using emotional based identification detection at a reasonable price. In this study, we created a new trustworthy RCNN Mask architecture to benefit the community and enable them to live independently. Compared to YOLO, SSD, and CNN, this strategy produces better outcomes**.**

Keywords: R-CNN, YOLO, SSD, AI, Deep Learning, Object Detection, Recognition, Computer Vision.

INTRODUCTION

Globally 2.2 billion people are suffering from disabilities such as near or distance vision impairment, visual, hearing, intellectual disabilities [12,13,23]. According to the World Health Organization (WHO) 2021 report [1], blindness and near sightedness may affect 253 million people, representing 3.2% of the world's population. Today, 466 million people are deaf or hard of hearing, or 6% of the world's population. About 200 million people have an intellectual disability, which is 2.6% of the world's population, and 75 million people need a wheelchair every day, which is 1% of the world's population. The eye is the primary sensory organ in the human body. The number of people suffering from all kinds of disabilities is a significant proportion of the world's population, from children to adults [13,14,15]. It is enough to take a look around us to understand how dysfunctional in our society is rising and how difficult it is to depreciate. There are many tools and applications available in the market to guide the blind [2,22]. However, fully portable devices are not available to protect the visually impaired community. Emotionally based detection of objects and obstacles around the user's body at a low cost not available in the market. Hence there is a need to design a technology that helps to resolve the issues related to object detection.

As we are in rich technological era the different applications are available in the market to guide as a third eye such as Screen readers, Face book automatic alt text, My Eye 2. As we know that various software's, tools and devices are available in the market to support the visually impaired such as Aipoly, Look, Be My Eye, and Tap See [9, 10] .Many governmental, semi-governmental and non-governmental organizations are contributing their services to address and resolve these issues. However, there is a lack of provision of a fully flexible welfare system to help the blind. Therefore, with solutions in place, we can provide better services to the underprivileged community. In the past few years, artificial intelligence and machine learning involvement has been significant progress in improving the accuracy and speed of object detection models, as well as IoT plays a vital role in developing real-time object detection methods on resource-constrained.

Object detection and computer vision are using in artificial intelligence to identify exact object and guiding system. Embedding by these two technologies on the trained agent will identifies exactly the required object. This architecture is implementing by reinforcement learning as part of creating a new ideology, we proposes an efficient novel object detection for visually impaired community using deep learning techniques on Raspberry Pi 4. active dating. Deep learning techniques such as Convolutional neural networks have shown significant improvements in object detection accuracy and have become the de facto standard for many computer vision problems. In this research, the feature database is trained using the Mask R-CNN algorithm to ensure the accuracy and efficiency of object detection. The trained R-CNN mask is integrated with OpenCV on Raspberry Pi4 for deployment on discrete devices. The proposed system has the potential to provide real and accurate object detection in a compact device that can be used in various applications such as surveillance, robotics, and autonomous vehicles.

RELATED WORK

YOLO (You Only Look Once) is a popular real-time object detection, a real-time object detection method, which predicts bins and class probabilities directly from the full image of the neural network in one prediction. The performance of YOLOv5 shows a significant improvement in detection accuracy and speed compared to the previous version [29]. According to measurements, YOLOv5 achieves the highest detection accuracy on GPU with a real-time speed of 65 frames per second (FPS) [9]. SSD is a special object detection method that uses a single deep neural network to predict bounded boxes and class probabilities in a single loop [30]. It achieves good detection accuracy and is faster than YOLOv3 but slower than YOLOv4. SSD achieves 74% accuracy and 46 FPS on GPU.Fast R-CNN is a popular object detection algorithm that consists of two separate systems—one for generating proposed regions and the other for detecting objects in the proposed region [26]. It is slower than YOLO and SSD but achieves higher definition accuracy. The faster R-CNN achieves an accuracy of around 80% and a speed of 7 FPS on the GPU. Retina Net is a recent object detection algorithm [34] designed to solve the problem of class disparity in the object

detection database. Current detection achieves accuracy and is faster than R-CNN. Retina Net achieved 81% accuracy and 17 FPS on GPU.

Mask R-CNN is an advanced deep learning model for object detection and segmentation introduced by the research team at Face book AI Research [21]. It is an extension of the popular object detection model Faster R-CNN, which adds a pixel-level segmentation mask prediction unit to existing region proposal and classification problems. The accuracy of the R-CNN Mask is considered very high as it achieves state-of-the-art results on several key databases such as COCO (Common Objects in Context) and city images. In the COCO database, Mask R-CNN achieved a mean accuracy (mAP) of 89.8% for object detection and 84.2% for segmentation, which is significantly better than other methods [15].Joseph Redmon et al. This paper presents a YOLO object detection system that achieves real-time performance on a single GPU. YOLO predicts round limits and class probabilities using only one neural network of the complete image and does so quickly and accurately [32]. Wei Liu et al. This paper presents a single object detector SSD that achieves high accuracy and real-time performance. SSD uses a single neural network for object detection and classification and is designed for high efficiency by sharing feature maps between the two tasks [30].

Mingxing Tan et al. This paper introduces the Efficient Det family of object detectors that achieve state-of-the-art accuracy on the COCO database with high efficiency. Efficient Det achieves this with a novel combinational scaling method to optimize the depth, width, and resolution of neural network architectures [31]. Tsung-Yi Lin et al. This paper presents the Focal Loss function designed to solve the problem of class inequality in object detection. The "loss of focus" function gives more emphasis to hard samples during training, which improves the performance of the detector on small and sparse objects [33]."Object Detection for the Blind: A Deep Learning Approach" Ricardo Ribeiro et al. This paper presents a deep learning approach to object detection for the blind. The system uses a Convolutional neural network to detect objects in real time and provide voice feedback to the user using text-to-speech technology [15]. Uzair Ahmed et al. This paper presents a deep learning-based object detection system for people with disabilities. The system uses a combination of Convolutional and recurrent neural networks to detect objects and provide voice feedback to the user. The system achieves high accuracy on everyday object datasets [19].

PROPOSED APPROACH

Our proposed solution is like a third eye that clears vision, opens mental barriers and improves mental flexibility. Therefore, we want to propose a new help-enhanced object detection system to help them live independently. In the proposed method, based on object classification, a Subjective Cognitive Test is performed to identify objects. These patterns are classified by Feature Extraction, Computer Vision, and Machine Learning techniques such as Artificial Intelligence and Image Reconstruction. Ultimately, this approach will provide a complex environment for individual work with proud independence.

Here with, the proposed methodology that we specified in fig(1) can be explained step by step as follows:
Step I: Subjective Cognitive test for object classification will be done based on Object   Detection. These mid patterns will be next classified by feature extraction, Computer vision, along with Deep Learning techniques such as Mask R-CNN.
Step II: Object Recognition and synthesis will be modulated into wave format to recognize the Object in "Knowledge Base or Data Warehouse."
Step III: The classified subjects will be converted into digital images stored in the "Personal   Knowledge Base."
Step IV: If the accurate Object is recognized, the same should update into the knowledge base and cognitive subjects for future extraction.
Step V: The same should reported to the end-user by the assistive system.
This work helps the blind to better understand the world around them. Deep Convolutional Neural Networks, Computer Vision and Artificial Intelligence technologies have developed rapidly in recent years. Modern computer vision techniques promise to be used to help the blind.

Contributions & Outcomes

I To strengthen the circumstances and provide feasible support to live independently.
II To extend services in terms of a secure livelihood environment.
III To deal with problems in a smooth manner with the help of a newly proposed assistance system.

ARCHITECTURE

As the mask r-cnn algorithm is based on the cnn model which has shown better performance in computer vision. As cnn model can predict the better output matrix based on the input image predict matrix. A 3 layered operational architecture is reducing the noise from the output predicted matrix by using convolution operation, non linear activation operation and maximum suppression operation . To generate prediction matrix, the proposed algorithm uses n-level of layers for noise reduction followed by convolution/ non linearity layer which fully connected with solid layers. The analyzed prediction matrix outputs are discussed in results.

HIDDEN COMPONENTS

To generate, more localized region and maximize layer activation an 3x3 filter size used in convolution layer to train each neuron in complex structure. To extract high volume features each Convolution Layer has three neurons to keep other volume proportional to the input volume and the number of parameters.

Nonlinear Activation Function

Rectified Linear Unit (ReLU) activations, which has the following format, that are employed for our non-linear activation:

$$\text{ReLU}(x) = \max(x,0); \qquad (1)$$

ReLUs is a common activation used in the computer vision literature that allows high gradients while suppressing negative activity.

Detection Prediction

The first two components of the B 2 R4 vector encode the x and y coordinates of the upper left corner of the bounding box, and the last two elements encode the x and y coordinates of the lower right corner of the bounding box. In this implementation, since our detection matrix has a limited number of rows and can predict a fixed number of bins, we limit the number of predictions to 21, which corresponds to the maximum number detected in the training and test sets.

Loss Function

In this research, we test the effect of L1 vector loss and L2 vector loss on the elemental differences between the predicted detection matrix and the ground truth matrix. Let A be our prediction matrix, B is the ground truth determinant matrix, and ve(X) matrix represents the transformation of vector X 2 Rnm to vector x 2 Rnm. Our two losses

$$L1(A\text{-}B)=\sum\nolimits_i^n (|vec(A\text{-}B)|) \qquad (2)$$
$$L2(A\text{-}B)=\sum\nolimits_i^n (|vec(A\text{-}B)^2@|) \qquad (3)$$

It should be noted that the loss of L2 penalizes a significant difference between the expected and actual values and the ground truth matrix is worse than the loss of L1; It turns out to be a desirable trait that leads to better internships. We used L2 regularization in our weight loss matrices to avoid over fitting; We found that 1e - 5 tuning values work effectively after 10-cycles.

Naveen Kumar *et al.,*

Proposed Algorithm

As part of creating a new ideology, we propose the design and development of an object detection system using OpenCV and deep learning methods on Raspberry Pi 4. active dating. Deep learning techniques such as Convolutional neural networks have shown significant improvements in object detection accuracy and have become the de facto standard for many computer vision problems.   In this research, the feature database is trained using the Mask R-CNN algorithm to ensure the accuracy and efficiency of object detection. The trained R-CNN mask is integrated with OpenCV on Raspberry Pi4 for deployment on discrete devices.

Mask R-CNN process execution

Step I: The input is fed into R-CNN to generate a feature map.
Step II: The feature map is processed by a region proposal network(RPN) to generate a set of
object proposals.
Step III: The region of interest(ROI) align layer is used to extract features for each region
proposed generated by the RPN.
Step IV: The ROI features are fed into two fully connected layers, one for object classification
and another for bounding box regression. The classification layer outputs the
probability score for each item and the regression layer predicts the offset between
the proposal and the ground-truth bounding box.
Step V: In addition to the classification and regression tasks, it also adds a mask branch. This
branch generates a mask that indicates which pixels in the proposal belong to the
object.
Step VI: During training, the network is trained to minimize a multi-task loss function that combines the classification, regression and mask segmentation losses. Here classification loss is calculated by cross-entropy, regression loss by smooth L1 loss and the mask segmentation by binary cross-entropy.
Step VII: Now the network applies the RPN to generate region proposals and then applies the
ROI alignment layer to extract features for each proposal and outputs the final set of predictions.

EXPERIMENTS

Dataset
Detection Benchmark dataset
The database we are working on is the KITTI object detection index. This database includes 10,000 training images and 7518 test images; Because these are large and high-resolution images, only 1000 training images and 100 test images are used for training and testing. Each image is accompanied by a list of detected objects, where each definition includes definition classification, image boundary box coordinates, as well as definition width, length, and height in meters, and 3D location definition and global coordinates.In this research, we only use assumptions related to reality. However, we believe that our technique can be easily extended to predict the estimated ground truth by simply increasing the number of columns in the identification prediction matrix. We exclude many normalization and data processing procedures, such as illumination modification, orientation adjustment, and random clipping, many of which are impractical for real-time use in autonomous systems and are not always suitable for real-world detection scenarios. We embed any image with zero rows in a certain height limit and width and zero columns in the rightmost limit, because Convolutional Network can only accept images of a certain size. The dimensions are 376px for height and 1242px for width, a total of 14 images are packed.

Computing Environment
We built our software using the recently released open-source machine learning tool Tensorflow, which is fast (computational graphics are written and calculated in C++) and simple to use (it offers a Python interface and simple Ubuntu installation instructions) Use GPU acceleration (the makes network training a lot easier calculation options that have been shown to significantly speed up) and avoid some drawbacks associated with other graphical

Naveen Kumar *et al.,*

computing frameworks For example, we used an Amazon AWS g2.2xlarge server running Ubuntu 14.04 for our computing environment; This environment has proven valuable because it is affordable and customizable, and provides support for GPU hardware through preconfigured NVIDIA drivers. The system is equipped with an NVIDIA Grid K520 GPU, 60 GB of hard disk capacity, 15 GB of RAM and an 8-core CPU.

Training

In this research, we conducted 10 experiments with four tests each: two separate architectures (3-layer and 5-layer) with two different losses (L1 and L2); Figures 5 and 6 show the training and validation loss maps for each experiment. The 5-fold model fits the real data for both losses, and the validation loss is larger than the training loss. With the loss of L1, both models over fit the data.; We believe this is because the loss of L1 is not too severe a penalty for the weights to update fast enough to match the box predictions to the ground reality.Then the loss of L2 was tested and the excess space was significantly less than the condition of L1. Although the 5-layer model is significantly overmatched, the validation loss for the 3-layer model is less than the training loss, indicating satisfactory performance. Finally, our test model is a 3-layer model designed with L2 loss. We fit the best of ten tests to all curves provided to account for volatility due to the introduction of variable parameters.

Performance Evaluation

The Object detection evaluation of performance done using two metrics. The average precision, or call precision, measures the fraction of detection that is positive in eq (4) and the bias measures the fraction of positive that is correctly detected as in eq (5). The map shows the average positive prediction with the proposed R-CNN Mask model. The precision and recall indices are as follows:

$$precision = tp/(tp+fp) \qquad (4)$$
$$recall = tp/(tp+fn) \qquad (5)$$

Where tp = true positive, fp = false positive, and fn= false Negative.

Table 1 shows the results obtained with the measured map values for each element from the KITTI Object Detection Benchmark database. In this table, we compare the performance of our proposed model with the main methods of deep learning object detection such as YOLO, SSD, fast R-CNN, Retina Net in terms of accuracy, recall and time required to predict objects from input information.

RESULTS

Quantitative Results

For our Quantitative results, we examined the mean precision score, defined as the area under the Precision-Recall curve. The Intersection Over Union (IoU) measure is used to determine the true and false positive rate of predictions that divide the total area between the predicted box and the ground truth box that covers the same area; If the overlap exceeds a certain threshold, we define our detection as a true positive. In this example, we use a threshold of 0:5. In our test set, our 3-layer L2-loss model achieved a map value of about 12:83%. Although the related work discussed in this publication has not been validated on the KITTI object detection platform, it is still relevant Clearly, more work is needed to improve the accuracy of this method. We also compare our model with current work in the literature in terms of prediction speed. To be called "real-time", the exposure system must estimate at least 30 frames per second, or 0.033 seconds per image. Our model predicts a rate of 0.092 seconds per frame in ten trials, which is three times slower than the minimum rate required for real-time. Table 1 shows a comparison of different approaches. Although the R-CNN mask has a prediction time, it is significantly higher than the YOLO design. The regional offer time is shown in table 2 which considers up to two seconds.

The positive predictions of some of the objects predicted by the proposed model explained in the table 2, the proposed algorithm has given good results compared with the other algorithms that are specified in the table 2.

Naveen Kumar *et al.,*

Qualitative Results

To understand the effectiveness of proposed algorithm, we analysed successful and failed detection cases for quality results. In Figure 5, there are six different objects that has detected by the system with their respective accuracies. In figures 6,7,8,9 the objects that has detected by Yolo, SSD, Faster R-CNN, RetinaNet algorithms which has given the lesser accuracies compared with the proposed algorithm. These results the mask R-CNN algorithm efficiency and makes the system works with more accuracy and effective.

CONCLUSION

In this research, we sought a deep object recognition method that predicts image bins without requiring expensive training or expensive analysis. As a result, a DIY community called Mask R-CNN produces predictions with a high level of accuracy and can be used immediately. Masked R-CNN is an impressive example of the power of the loss function, although not state-of-the-art. Although most networks derive their power from the number of layers, we try to derive the power from the loss function associated with a limited number of parameters and represent the function. Expanding the training loss function to more closely reflect the metrics needed at hand, speeding up predictions by sharing computing, and increasing the number of data sets trained and evaluated are promising topics for future research.

ABSTRACT

Breast cancer is the most frequent cancer among women all over the world. The present study was aimed to find the potential phytocompounds from Indian medicinal plants for the treatment of Breast cancer using *in silico* studies. The 3D structure of phytocompounds was obtained using IMPPAT and PubChem database. The Lipinski rule of five for all the phytocompounds was tested using SwissADME. The 3D structure of the target protein was retrieved from the PDB database. The docking studies were performed using PyRx and the results were analyzed using Discovery Studio 2021. From the results, the phytocompounds Taraxerol, (-)-Epicatechingallate and Protopine showed very good binding affinity like -7.7, -7.7 and -7.6 Kcal/mol, respectively. Toxicity studies were done for the best-interacted phytocompounds and the results showed that the compounds had very less toxicity. Hence, the present study concludes that Taraxerol from *Mangifera indica*, (-)-Epicatechin gallatefrom *Camellia sinensis* and Protopine from *Allium sativum* may have a potential effect in the treatment of Breast cancer.

Keywords: Breast cancer, Phytocompounds, Molecular Docking, PyRx, Discovery Studio, ADMET properties.

INTRODUCTION

Human breast cancer is generally regarded as a heterogeneous collection of disorders characterised by differences in histology, genetic changes, gene expression, metastatic activity, and therapeutic responses, rather than as a homogeneous disease[1-4]. Breast cancer is the second most often diagnosed cancer worldwide, with an estimated 2.1 million new diagnoses and about 627,000 breast cancer-related deaths in 2018[5].Breast cancer is a physiologically and clinically complex disease with multiple identified histotypes and molecular subtypes, each with distinct aetiologies, risk factor profiles, treatment responses, and prognoses[6-12]. Around 75 percent of breast cancers are detected in postmenopausal women in high-income nations, with just 5–7% occurring in women younger than 40 years of age[13, 14]. According to the National Cancer Institute's (NCI) Surveillance, Epidemiology, and End Results (SEER) programme, 40,290 women and 440 men will die of breast cancer in the United States in 2015, with 231,840 women and 2350 men diagnosed with invasive breast cancer and another 60,290 women diagnosed with breast cancer in situ. In early 2016, the National Cancer Institute projected that 3,560,570 women in the United States had previously been diagnosed with breast cancer[15].2012 is the most recent year for which accurate data on breast cancer incidence and mortality are available. SEER data are broken down by key census self-described categories of race/ethnicity, in addition to total national incidence and death statistics. Between 2008 and 2012, the average incidence rates (number of women diagnosed per 100,000 women, age-adjusted and normalised to the 2000 standardised US population) varied by census category, as did the trends over time. White women had the highest five-year average incidence rates (126.1), with black women's rates only slightly lower (124.1). For the first time since SEER began collecting data in 1975, incidence for these two groups converged in 2012; historically, black women had a considerably lower rate of the disease than white women[15].

Breast cancer is the malignant tumour with the highest incidence and mortality in women globally, accounting for roughly 11.6 percent of all cancer fatalities[16].Endocrine therapy, in addition to surgery and chemotherapy, is a typical treatment for breast cancer. According to research, endocrine therapy is successful in 50–60% of patients with positive oestrogen receptors (ER); the response rate (RR) of endocrine therapy in patients with positive ER and progesterone receptor (PR) may be >75%, while it is about 10% in patients with negative ER and PR[17].Selective ER modulators (SERMs) such as tamoxifen, aromatase inhibitors (AIs) such as anastrozole, ovarian function suspension (OFS) such as goserelin, and selective ER downregulators (SERDs) such as fulvestrant are endocrine therapy for ER+ breast cancer. Primary or secondary resistance in patients during treatment is the main cause of endocrine therapy failure. Primary resistance is frequent in patients with ER and PR negative breast cancer. However, a significant proportion of individuals with positive ER also have primary resistance. However, practically all patients may develop secondary resistance after a time of hormone therapy. As a result, hormone resistance is a critical issue in the treatment of breast cancer[18].

Cancer is becoming a major public health concern in India as a result of the ongoing demographic and epidemiological shift. Cancer is projected to have a prevalence of 97 per 100,000 people, with a higher prevalence in urban regions. According to the evidence, cancer rates are higher among the elderly and females in reproductive age groups. Even after correcting for age-sex differences and clustering in a multilevel regression framework, cancer shows a considerable socioeconomic gradient. We discovered that cancer treatment has the highest out-of-pocket costs of any disease. Inpatient care in private hospitals costs roughly three times as much as in public facilities. Furthermore, roughly 40% of cancer hospitalisation cases are mostly funded through insurance[19].

Chemotherapy, oophorectomy, and/or endocrine therapy used as adjuvant treatment for breast cancer (BC) might cause treatment-induced menopausal symptoms in (young) BC survivors[20, 21].The most common (63 percent to 85 percent) and disruptive menopausal symptoms are hot flushes and night sweats (HF/NS)[22, 23]. Menopausal symptoms have an impact on women's daily lives and health (HRQOL)[21, 24]yet it can also lead to noncompliance or stopping endocrine treatment[25, 26]. Breast cancer is the most often diagnosed malignancy in women worldwide. Recurrence after receiving an objective response to chemotherapy, drug-induced adverse effects of first-line

chemotherapy, and delayed response to second-line treatment are the key unsolved issues with metastatic breast cancer. Unfortunately, there are few options for third-line treatment. It is obvious that new and effective medications are desperately needed in such circumstances. Phytochemicals are one of the most promising chemo preventive therapeutic alternatives for cancer patients. Resveratrol (3,5,4'-trihydroxy-trans-stilbene), a non-flavonoid polyphenol found in grapes, berries, soy beans, pomegranate, and peanuts, has been demonstrated to have a wide range of health advantages by interacting with a variety of molecular targets[27].

Medicinal herbs have long been recognised as one of the most important sources of medication development in the modern period. Medicinal plants, according to the World Health Organization (WHO), are the best source of a variety of medications. In therapeutic treatment, the utilisation of plant extracts and phytochemicals with recognised antibacterial characteristics can be quite beneficial[28].Breast cancer is now commonly treated with radiotherapy, hormone treatment, or chemotherapy. The majority of the time, the therapy causes negative side effects in the patients. Intensive radiotherapy or chemotherapy drugs generally cause nausea and bone marrow failure. Chemical medications have no effect on cancer cells[29].Many phytochemicals in plants are potential antioxidants and have anticancer effects, according to bioassay and animal studies[30]. In this case, herbal secondary metabolites may be the greatest treatment and alternative for cancer[31].*Solanum torvum (S.torvum)* has been found to have cytotoxic, antibacterial, antiviral, anti-inflammatory, and anti-tumor (anticancer) properties[32,33].This plant's leaves and seeds have also yielded anticancer phenolic chemicals[34].*S.torvum* aerial parts extracts were shown to be particularly effective in inhibiting the proliferation of mammary gland breast cancer cell lines[35]. In the present study, the Indian medicinal plants like *Raphanus sativus* [36], *Allium sativum, Curcuma longa, Camellia sinensis, Linum usitatissimum, Nigella sativa*[37]were taken to find the bioactive compounds for the treatment of Breast cancer.

MATERIALS AND METHODS

Ligand selection

Using literature and IMPPAT database[38]around 410 phytochemical compounds were selected from the different Indian medicinal plants like *Raphanus sativus* [36], *Allium sativum, Curcuma longa, Camellia sinensis, Linum usitatissimum* and *Nigella sativa* [37]to find the potential compounds for treating Breast cancer. The 3D structure of these compounds was retrieved from the PubChem database[39] and using SwissADME[40]they were subjected to test Lipinski Rule of Five. From the results, 342 compounds obeyed Lipinski Rule of Five and these compounds were taken for further study.

Target protein selection

The target protein Breast cancer Type 1 Susceptibility Protein belonging to BRCA1 gene was found in the literature for Breast cancer[41].The 3D structure of this target protein was retrieved from the PDB database[42].The UniProt ID of this target protein was taken from the UniProt database[43].

Docking studies

Docking studies for the target protein Breast cancer Type 1 Susceptibility and the phytocompounds (ligands) were done using PyRx 0.8 software[44]. The target protein was further prepared for docking studies using this software. All the ligands were uploaded using Open Babel option in the PyRx 0.8. The grid was generated and the docking studies were performed using Vina wizard option in the PyRx 0.8. The values of binding affinity were saved in XL file. The results were analyzed using Discovery Studio 2021 and the 2D and 3D docked images were taken. In the results, the lowest binding affinity indicates good result.

ADMET and CYP properties

ADMET and CYP properties were tested for all the best-interactedphytocompounds using SwissADME[40].Lipinski, BBB (Blood - Brain Barrier), HIA (Human Intestinal Absorption), PGP (P-glycoprotein), XLogP3, TPSA (Topological

Polar Surface Area), LogS, Fraction Csp3, Rotatable bonds, CYP enzyme inhibitor properties, Skin permeation and Bioavailability score were evaluated for all the best-interacted compounds.

RESULTS AND DISCUSSION

Ligand and Target Protein selection

The 3D structure of ligands (phytocompounds) was retrieved from the PubChem database. The 3D structure of the target protein Breast cancer Type 1 Susceptibility protein was obtained from the PDB database and its PDB ID is 1JNX. The 3D structure of the target protein is shown in figure 1.

Docking studies

Docking studies were done for the phytocompounds from the different Indian medicinal plants and the target protein Breast cancer type 1 susceptibility proteinusing PyRx 0.8 software to find the potential drug candidate for Breast cancer. For this, 342 phytocompounds which has passed Lipinski Rule of Five were interacted with the target protein using this software. The results were analyzed using this software and Discovery Studio 2021 and binding affinity value was noted. In which, 10 compounds showed very good results with the target protein. Further, the Synthetic drug Doxorubicin was also taken to find the interaction with the target protein. All the docking results are shown in Table 1. The 2D and 3D interactions of the phytocompounds and Synthetic drug Doxorubicin with the target protein are shown in Figures 2-9.

From the results (Table 1), among other compounds, 10 compounds showed very good results with the target protein. Of which, the phytocompound Taraxerol showed very good binding affinity (-7.7 Kcal/mol) with the amino acid residue LEU 1701 of the target protein. The phytocompound (-) - Epicatechin gallate also gave very good binding affinity of (-7.7 Kcal/mol) with the amino acid residues LYS 1711,ALA 1752,ALA 1708,LYS 1759,GLY 1709and GLY 1710. The binding affinity -7.6 Kcal/mol was obtained between the phytocompound Protopine and the amino acid residues GLY 1656,LEU 1701,GLN 1779 and LYS 1702 of the target protein. Further, the binding affinity -7.3 Kcal/mol was observed between the phytocompound Orobanchol and the amino acid residues PHE 1662, VAL 1654,LYS 1702,LEU 1701and THR 1700 as the lowest binding affinity among these ten compounds Besides, the binding affinity of the Synthetic drug Doxorubicinwith the target protein was -7.2 Kcal/mol and the interacted the amino acid residues were GLN 1811, PRO 1812, ARG 1835, THR 1852, TYR 1853, ASP 1840, VAL 1740 and VAL 1741. In the results of the present study, when compared to the Synthetic drug Doxorubicin, all the phytocompounds showed very good binding affinity with the target protein Breast cancer type 1 susceptibility protein.

Further, a study reported that the polyphenol epigallocatechin-3-gallate, which plays a vital role in activating apoptosis, a critical feature of breast cancer prevention, is the chemo-preventative and chemotherapeutic agent in green tea[45].Flaxseed eating can lower the risk of breast cancer. Earlier study found that traditional treatments for cervical, colorectal, prostate, and breast cancers have been reported to include *Carica papaya, Catharanthus roseus* and *Prunus africana* [46-48].Breast cancer cell lines were found to be resistant to cell growth when aqueous extracts of *Solanum torvum* unripe fruits were used[49]. Moreover, in the previous study, many phytocompounds from *Solanum torvum* interacted with the target protein Breast cancer type 1 susceptibility proteinand the results showed that the compounds Ergost-25-ene-3,6-dione,5,12-dihydroxy (5.alpha.,12.beta.), Aspidospermidin-17-ol 1-acetyl-16-methoxy and 2-(3,4-dichlorophenyl)-4-[[2-[1-methyl-2-pyrrolidinyl]ethyl amino]-6-[trichloromethyl]-s-triazine gave the binding affinity of − 7.3, − 6.7, − 6.7 Kcal/mol, respectively with the target protein[50].

In the present *in silico* docking studies, the phytocompound Taraxerol from *Mangifera indica,* (-)-Epicatechin gallate from *Camellia sinensis,* Protopine from *Allium sativum* showed the highest binding affinity with the target protein Breast cancer type 1 susceptibility protein, when compared to the previous study.

ADMET and CYP Properties

In the present study, ADMET properties were tested for the best interacted Phytocompounds and Synthetic drug Doxorubicin using Swiss ADME and the results were tabulated (table 2). From the results, all the best interacted Phytocompounds obey Lipinski rule of five but Synthetic drug Doxorubicin did not obey the Lipinski rule. Most of the compounds did not cross Blood – Brain Barrier (BBB) and had high Intestinal Absorption (HIA). Many phytocompound predicted to be effluated from the CNS by P-glycoprotein. Among the 10 compounds, XLogP3 value of 6 compounds was within the range. TPSA (Topological Polar Surface Area) and Log S value of the most of the compounds were within the limit. Except one compound, Fraction Csp3 value of all the other compounds are within the range. Rotatable bonds of all the compounds were within the limit.

From the results of the Boiled Egg image of the phytocompounds (Figure 10), the compound Protopine is located in the Egg-yolk region, which means the compounds are passively absorbed by the gastrointestinal tract and can also permeate through the blood-brain barrier and the compounds Orobanchol, Agapanthagenin and Triterpenoids are located Egg-white region, which means they are passively absorbed by the gastrointestinal tractbut cannot permeate through the blood brain barrier. Moreover, the compounds Protopine, Agapanthagenin and Triterpenoids are predicted to be effluated from the central nervous system by the P-glycoprotein and the compounds Orobanchol, Mangiferonic acid and (-)-Epicatechin gallateare predicted not to be effluated from the central nervous system by the P-glycoprotein.

In the results of CYP properties (table 3), most of the compounds did not inhibit the CYP enzymes and does not give any adverse reactions. In the best interacted compounds Taraxerol and (-)-Epicatechingallate did not inhibit any CYP enzymes but the compound Protopine inhibits the following CYP enzymes like CYP1A2, CYP2C9, CYP2D6 and CYP3A4. The value of log K_P (Skin Permeant) is good for all compounds and A Bioavailability Score (ABS) is good for the most of the compounds.

CONCLUSION

In the present study, around 410 phytocompounds were selected from the different Indian medicinal plants. Of which 342 compounds obeyed Lipinski Rule of Five and these compounds were subjected to *in silico* docking analysis with the target protein Breast cancer type 1 susceptibility protein. From the results, 18 compounds showed better results than the Synthetic drug Doxorubicin. Among them, 10 compounds showed very good binding affinity with the target protein. Of which, the phytocompoundsTaraxerol, (-)-Epicatechingallate and Protopineshowed the highest binding affinity among the other phytocompounds.Toxicity studies were also done for the best 10 interacted phytocompounds and the results showed that the compounds had very less toxicity. Hence, the present study concludes that the phytocompound Taraxerol from *Mangifera indica,* (-)-Epicatechin gallate from *Camellia sinensis,*Protopine from *Allium sativum* showed the best binding affinity with the target protein Breast cancer type 1 susceptibility protein and they may give a potential effect in the treatment of Breast cancer.

ABSTRACT

When crude oil penetrates the soil, surface, and groundwater environments, it causes serious harm as a symptom of pollution in the air, water, and soil. Crude oil is a convenient source of energy. It is impossible to ignore the enormous environmental effects of an oil spill given the variety of molecular weights and shapes among the volatile liquid hydrocarbons that make up crude oil. The bioremediation process is regarded as being efficient, inexpensive, technically straightforward, and, for the most part, having no negative consequences on the ecosystem. The majority of environmentalists still favour bioremediation even if the nature of the contaminants, the soil matrix, and the biological circumstances limit its effectiveness. The oil-affected bacteria *Lysinibacillus sp., Bacillus sp., and Paenibacillus sp.,* which were isolated from soil and water samples, have a lot of potential for use in bioremediation, particularly to clean up the environment that has been contaminated by petroleum hydrocarbons. The bacteria shown a great capability for decomposing crude oil under challenging circumstances.

INTRODUCTION

Crude oil contaminated soil and drawbacks

Crude oil has raised living standards because it is a rapid and convenient source of energy. Crude oil is a pollutant that when it enters the soil, surface, and groundwater habitats, it causes severe harm as a sign of pollution in the air, water, and soil. It is impossible to overlook the tremendous environmental repercussions of an oil spill. The volatile liquid hydrocarbons that make up crude oil have different molecular weights and structures. It has more than 17,000 hydrocarbons, and the classification is based on the chemical that makes up the majority of it [1].

After a spill, the ecosystem must be decontaminated since the contaminated substances are strong immunotoxicants and carcinogens that can harm the liver, cause cancer, and cause kidney damage. The preferred method for removing toxins from soil is bioremediation, a technology that takes advantage of the diverse capacities of microorganisms to degrade or convert organic pollutants to harmless compounds through mineralization [2]. The bioremediation method is thought to be effective, affordable, technically uncomplicated, and, for the most part, has no unfavourable effects on the ecosystem. Although the characteristics of the pollutants, the soil matrix, and the biological conditions restrict the success of the bioremediation treatment, it continues to be the procedure of choice for the majority of environmentalists [3].

A large number of microorganisms have been isolated from contaminated sites using various nutrient-rich (standard) and impoverished media, supplemented with various types and concentrations of Petroleum Hydrocarbons (selective). However, only a small portion of the microorganisms found in soil environments can be characterized through cultivation. Since microorganisms in contaminated soils are more likely to have numerous tolerance mechanisms that enable them to live and operate well in the presence of petroleum hydrocarbons, contaminated soils are of special importance as sources for cultivation [4]. Although discovering organisms that break down large molecular weight chemicals can be challenging, this could limit our ability to accelerate biodegradation even if bioremediation has emerged as a key approach for in situ petroleum hydrocarbon elimination. The identification of organisms that can be used in this field of research is currently limited [5].

MATERIALS AND METHODS

Sampling area
Crude oil contaminated soil and water samples were collected from the contaminated sites of Chennai Port located in Chennai district is situated between the latitude of 13.0815° N and longitude of 80.2921° E and V. O. Chidambaranar Port located in Tuticorin district is situated between the latitude of 8.7563° N and longitude of 78.1791° E, Tamil Nadu, India. Figure 1 illustrates sampling sites in Tamil Nadu.

Collection and transportation of the samples
Water samples were taken up to 5 cm depth of crude oil contaminated surface and the water samples were collected in pre-sterilized screw cap bottles. They were immediately transported to the laboratory using an ice box and stored at 4°C for further studies.

Isolation of crude oil degrading bacterial strains
The collected water samples were taken and 1ml of water sample was diluted in 9 ml of distilled water and made aliquots using vortex mixture. The water suspension also serially diluted from 10^{-1} to 10^{-56}. The following was the procedure for a ten-fold dilution of a sample to a dilution factor of 10^{-5}.The sample was taken in six test tubes; each with 9 ml of sterile distilled water taken using sterile pipette 1 ml of properly mixed sample was drawn into the pipette. The sample was then added to the first tube to make the total volume of 10 ml. That provides an initial dilution of 10^{-1}.1 ml of mixture was taken from the 10^{-1}dilution and was emptied into the second tube. The second

65614

tube now has a total dilution factor of 10^{-2}.The same process was then repeated for the remaining tube, taking 1 ml from the previous tube and adding it to the next 9 ml diluents. As six tubes were used, the final dilution for the water sample will be 10^{-5} (Figure 2).

Isolation of Bacteria
Isolates were obtained by plating samples, in triplicates, onto Zobell Marine agar plates (i.e. 5 g peptone, 1 g yeast extract and 15 g agar in 750 ml of filtered seawater and 250 ml of Milli-Q water) (figure 3). Pipette out 0.1 ml from the appropriate desired dilution series onto the center of the surface of an agar plate. Spread the sample evenly over the surface of agar using the sterile L- rod. Incubate the plate at 37°C for 24 hours. Calculate the CFU value of the sample. Starting the streak on the side your dominant hand, of the plate farthest from pass the loop on the surface of the agar in a zigzag pattern filling the surface of the plate.

Quadrant Streaking Method
Sterilize the inoculating loop and take a loopful of inoculum from the sample Afterwards, gently streak the inoculum in the first quadrant of the solid agar media by moving the inoculating loop in a zig-zag pattern. After that, cover the lid of the Petri plate and sterilize the inoculating loop over the blue flame to kill the remaining microbes.Then, lightly drag the inoculating back and forth on the second quadrant by intersecting the streaks of the first quadrant only two or three times. Again, sterilize the loop and striate the inoculum from the beginning of the second streak to the third quadrant. Cover the lid of the Petri plate. Then, sterilize the loop and perform the fourth streak by intersecting streaks of the third quadrant, extending up to the middle of the plate. Before keeping the inoculating loop aside, sterilize it for the last time. Finally ,incubate the plate at 37ºC.

RESULTS AND DISCUSSION

The samples were collected and transported to lab. After serial dilution, twelve bacterial strains were isolated and maintained as pure cultures (Fig. 5). The isolated strains were further identified using 16S rRNA sequencing. The results were recorded and shown in Table 1. Petroleum, mixture of hydrocarbons primarily consists of saturates, aromatics, asphaltenes and resins serves as a principal source of energy, by its increased use and the rate of usage of hydrocarbon contamination also has increased that had made severe impacts on the ecosystem affecting human health. Biodegradation by microbes had been the most reliable mechanism through which thousands of pollutants including crude oil are eliminated from the environment.

Soil is a rich source of microbes which promotes the biodegradation of hydrocarbon and residual oil [7]. There are so many bacteria possessing the ability to utilize hydrocarbon as their sole source of carbon, thus transforming hazardous component into non-hazardous, biodegrable and ecofriendly compounds [8]. Several reports on isolation of diesel degrading bacteria were well documented and still intensive research is needed to isolate versatile bacterial strain for effective degradation of hydrocarbon [9].

Petroleum hydrocarbon-degrading bacteria have evolved because of existing in close proximity to naturally occurring petroleum hydrocarbons in the environment. Such organisms are candidates for the treatment of oil pollutants that could act to degrade waste products by the pharmaceutical industries. In recent years, the use of bacteria to deal with environmental pollutants has become a promising technology because of its low cost and eco-friendly nature. The continuous development and improvement of microbial remediation technology has also provided a new method for the remediation of petroleum hydrocarbon pollution, which has attracted much attention [10] .

Earlier studies indicate the ability of *Lysinibacillus* sp.to degrade asphaltenes in oil sand with degradation efficiency increased by 5.88% compared to the controlled group. The degradation period was 35 days and the results signify the importance of *Lysinibacillus* sp in improving the quality of the soil, assisting in oil sand exploitation [11].

Furthermore hyper chemo-tactic activity of Lysinibacillus strains towards glyceryl tributyrate was reported in a study that provides an understanding on the microbial strains and consortium with the potential to be used for bioremediation of hydrocarbons contaminated environments [12].

Leaching of HC and water-soluble metabolites was demonstrated during the first stages of biodegradation and the present study was focussed on the isolation and characterization of efficient hydrocarbon degrading bacteria with better diesel oil degrading ability [13]. Water samples taken up to 5 cm depth of crude oil contaminated surfaces of Chennai port (Chennai) and Chidambaranar Port (Tuticorin) were tested to contain Oil degrading bacterial strains *Lysinibacillus* sp., *Bacillus* sp., *Paenibacillus* sp., that indicated the prevalence and their beneficial role in oil degradation from food and industrial wastes. The cultures from soil and water samples from Chennai Port and V. O. Chidambaranar Port, contained the oil degrading bacterial strains *Lysinibacillus* sp., *Bacillus* sp., *Paenibacillus* sp., which were confirmed by PCR amplification and sequencing of 16S rRNA Gene and the sequence similarity checked using BLAST algorithm. Further studies on the bacteria's would provide novel insights on the usage of the microbes for employing them onsite for oil degradation in soil and water.

DISCUSSION

Petroleum, mixture of hydrocarbons primarily consists of saturates, aromatics, asphaltenes and resins serves as a principal source of energy, by its increased use and the rate of usage of hydrocarbon contamination also has increased that had made severe impacts on the ecosystem affecting human health. Biodegradation bymicrobes had been the most reliable mechanism through which thousands of pollutants including crude oil are eliminated from the environment. Soil is a rich source of microbes which promotes the biodegradation of hydrocarbon and residual oil [7]. There are so many bacteria possessing the ability to utilize hydrocarbon as their sole source of carbon, thus transforming hazardous component into non-hazardous, biodegrable and ecofriendly compounds [8]. Several reports on isolation of diesel degrading bacteria were well documented and still intensive research is needed to isolate versatile bacterial strain for effective degradation of hydrocarbon [9].

Petroleum hydrocarbon-degrading bacteria have evolved because of existing in close proximity to naturally occurring petroleum hydrocarbons in the environment. Such organisms are candidates for the treatment of oil pollutants that could act to degrade waste products by the pharmaceutical industries. In recent years, the use of bacteria to deal with environmental pollutants has become a promising technology because of its low cost and eco-friendly nature. The continuous development and improvement of microbial remediation technology has also provided a new method for the remediation of petroleum hydrocarbon pollution, which has attracted much attention [10]. Earlier studies indicate the ability of *Lysinibacillus sp*. to degrade asphaltenes in oil sand with degradation efficiency increased by 5.88% compared to the controlled group. The degradation period was 35 days and the results signify the importance of *Lysinibacillus sp* in improving the quality of the soil, assisting in oil sand exploitation [11]. Furthermore hyper chemo tactic activity of *Lysinibacillus* strains towards glyceryl tributyrate was reported in a study that provides an understanding on the microbial strains and consortium with the potential to be used for bioremediation of hydrocarbons contaminated environments [12].

Leaching of HC and water-soluble metabolites was demonstrated during the first stages of biodegradation and the present study was focussed on the isolation and characterization of efficient hydrocarbon degrading bacteria with better diesel oil degrading ability [13]. Water samples taken up to 5 cm depth of crude oil contaminated surfaces of Chennai port (Chennai) and Chidambaranar Port (Tuticorin) were tested to contain Oil degrading bacterial strains *Lysinibacillus sp.*, *Bacillus sp.*, *Paenibacillus sp.,* that indicated the prevalence and their beneficial role in oil degradation from food and industrial wastes. The cultures from soil and water samples from Chennai Port and V. O. Chidambaranar Port, contained the oil degrading bacterial strains *Lysinibacillus sp.,* *Bacillus sp.,* *Paenibacillus sp.*, which were confirmed by PCR amplification and sequencing of 16S rRNA Gene and the sequence similarity checked

using BLAST algorithm. Further studies on the bacteria's would provide novel insights on the usage of the microbes for employing them onsite for oil degradation in soil and water.

CONCLUSION

Lysinibacillus sp., Bacillus sp., Paenibacillus sp., were isolated from oil contaminated soil and water sample, has a good scope for usage in bioremediation specially to decontaminate the environment polluted with petroleum hydrocarbons. The microbes showed the high potential in degrading crude oil in complex conditions. This study revealed that indigenous micro-organisms present at the polluted sites could be exploited for degrading petroleum crude oil and could facilitate bioremediation.

ABSTRACT

A widely used pesticide Acephate(O,S-dimethyl acetyl phosphoramidothioic acid)may be an undesirable and persistent pollutant to non target environments like rivers and other ecosystems. The objective of this study was to isolate a potential degrading bacterium of Acephate from polluted soils and test its fitness under various culture conditions. *Sanguibacter* sp. PA11 was isolated from Acephate contaminated soils from the rhizosphere soil of paddy fields collected from Thiruvallur District, Tamil nadu. The organism was Gram positive, aerobic and rod shaped. Growth curve experiments showed that the bacterial isolate was able to grow in minimal salt medium containing acephate as the sole source of carbon up to a concentration of 1000 μg/mL .Bio degradation studies were conducted by FTIR and GC-MS. A phylogenetic analysis based on the 16 S rRNA gene sequence was conducted to confirm that the isolate lies within the *Sanguibacter*. Thus, such findings may be useful in designing bacteria that can be used to return the altered environment to its original condition.

Keywords: Acephate, , FTIR, GC – MS, Rhizosphere.

INTRODUCTION

"Rice is Life "describes the importance of rice in human diet .It is grown world-wide over an area of 153 million hectares with annual production of more than 600 million tonnes .In India, it is cultivated in an area of 44.80 million hectares with an annual production of 89.31 million tonnes and productivity over two tonnes of milled rice per hectare [1] .Insect pests are the severe constraints to rice production throughout the world where more than 100 species of insect pests' attack and damage rice[2].The worldwide usage of herbicides, insecticides and fungicides is 49.6%, 26.2 %and 19.5 %respectively.The wide application of organ phosphorus)OP (insecticides such as Chlorpyrifos, Parathion, Malathion are employed for plant protection against insect pests. Their physical /chemical properties including Hydrophobicity, lipophilicity and moderate vapour pressure makes them persistent in the environment [3]. The pesticide usage is so intense in cultivation and even the seeds to be sown are treated [4].Owing to their high toxicity & persistence in the environments, most of them are banned all over the world [5]. Though organic farming is gaining importance, the application of synthetic pesticides is still practised in agriculture and for sanitation purposes.

Organophosphorus insecticides are esters of phosphoric acid which contain aliphatic phenyl and heterocyclic derivatives as a part of their complex chemical structure[5]and are used extensively as plasticizers &jet fuel ingredients [6] .They were first developed in Germany by Schrader in 1930 during World War II in the form of tetra ethyl pyrophosphate as a by-product of nerve gas development .They act by inhibiting acetyl choline esterase, which interferes with the transmission of nerve impulses at the nerve endin [5]. Exposure to very low doses of OPs induces several neuromuscular and reproductive disorders in humans .The steady accumulation of OPs in the environment therefore warrants development of safe, reliable and eco-friendly technologies for the elimination of their residues from contaminated areas .Bioremediation is a viable alternative to physical and chemical means of decontamination for reducing the toxicity of OP compounds[14]. The susceptibility of pesticides to biological degradation is extensively variable because of differences in molecular structure as well as in chemical &physical properties [7] .

Acephate,)o,s -dimethyl acetyl phosphoramidothioate (is OP insecticide, has a high water solubility of 790 g L^{-1} and low organic carbon water partitioning co-efficient of log K_{oc} 0.48. Previous reports have revealed that very few species of bacteria are able to degrade this compound .The metabolites and degradative pathways of many pesticides have not been fully elucidated .This may be because of analytical constraints or the formation of intermediates undetectable by the method employed .Biodegradation studies of acephate in soil demonstrated that acetic acid is the possible metabolic product..

The family Sanguibacteraceae was proposed by Stackebrandt & Schumann with Sanguibacter as the type genus[8]. The genus *Sanguibacter* was proposed and described by Fernandez-Garayzabal et al.[9] and currently includes six saccharolytic, facultatively anaerobic species: *Sanguibacter antarcticus, Sanguibacter inulinus, Sanguibacter keddieii, Sanguibacter marinus, Sanguibacter soli* and *Sanguibacter suarezii*. All species of the genus are mesophilic neutrophiles with optimal growth temperatures within the range 15–30 oC and pH 7.0–7.2. Two thalassic species, *S. marinus* and *S. antarcticus*, have been described so far. They require NaCl for growth, and both were isolated from marine ecosystems. The remaining species were described as athalassic, with optimal growth at low (0.25–0.5 g / l) NaCl concentrations and the inability to grow in seawater. *S. soli* was isolated from soil. Although *S. inulinus, S. keddieii* and *S. suarezii* were isolated from a blood sample from a healthy cow, their maximum growth temperature is 30oC, well below the bovine body temperature [10].

MATERIALS AND METHODS

Collection of soil sample
The soil sample was taken from three agricultural lands in Pandeeswaran, Thiruvallur District, Tamil Nadu, India. It came from a paddy field's rhizosphere. It was gathered on the tenth day following the appearance of pesticide in the field and kept at 4° C until processing.

Pesticide used
Acephate, an organophosphorus insecticide was employed in the present study.

Preparation of Minimal Salt medium
Minimal salt medium was composed of KH_2PO_4 (1.5 g/L), NH_4Cl(1 g/L), Na_2HPO_4 (4 g/ L), Hoagland trace element solution (1 mL/ L), $C_6H_{11}FeNO_{7^{*3}}$ (0.005 g/ L) and $MgSO_4$ (0.2 g/ L) at pH (7.0 ± 0.2). Acephate (500 mg/ L) was added and sterilized. The chemicals were purchased from LobaChemie (Mumbai, India) and were of the highest AR grade.

Screening of pesticide degrading bacterial isolates[11]
In 50 ml of sterile Minimal Salt broth with acephate (50 ppm) as the only carbon source, five grams of rhizosphere soil sample were infected. The flask was shaken for 72 hours at 37° C while being incubated (100 rpm). Following a 72-hour incubation period, 5 ml of the aliquot was added to 45 ml of brand-new, sterile broth that contained 50 ppm of acephate. Spread plate technique was used to plate an aliquot from each flask onto mineral salt agar that contained 50 ppm of acephate. The plates were incubated for 72 hours at 37° C.

Morphological and Biochemical characteristics of bacterial isolates[12]
The common bacteriological techniques, such as colony morphology, microscopic examinations, and biochemical testing, were used to identify the bacterial isolates. Colony morphology was observed by streaking them on Nutrient Agar plates. Morphological characters viz. shape, surface, elevation, edge, color and cell morphology were determined by visual observation as well as using a light microscope. The purified colonies were stained with Gram stain and then examined under microscope. The biochemical tests conducted include Indole, Methyl Red, VogesProskauer, Citrate, TSI, Urease and Oxidase tests.

Characterization of Degradation Metabolites of Acephate by Using FTIR Analysis[13]
100 mL of the spent medium was clarified by centrifugation at 5000 rpm, followed by filtration through a Whatman 1 filter paper. The clarified medium was extracted thrice with an equal volume of ethyl acetate. The extracted organic phase was allowed to air dry, and the remaining residue was dissolved in a minimal volume (250 µL) of water, and about 1 µL was taken for mass analysis using a mass spectrophotometer (Waters, Q-TOF Micromass, Manchester, UK). Functional groups of acephate and its decomposed metabolites were identified by applying FTIR analysis. FTIR analysis was performed on a Shimadzu-8400s FTIR spectrophotometer (Shimadzu, Japan) using KBr pellets of the dry mass of technical grade acephate and extracted or decomposed metabolites. The FTIR analysis was performed in the mid-IR region of 400–4000 cm−1 with a 16 scan speed.

GCMS Instrumentation[14, 15]
To perform GC –MS analysis, 50 ml of the spent medium was clarified by centrifugation at 13200 g, followed by filtration through a 0.2 µm filter .The clarified medium was acidified with 0.09 N Hydrochloric acid and then extracted thrice with an equal volume of ethyl acetate .The pooled organic phase was allowed to air dry, and the remaining residue was dissolved in a minimal volume)500 µl (of methanol and about 1 µl of it was taken for analysis .The samples were analysed in GCMS)Gas Chromatograph Mass Spectrophotometer) (QP 2010 Shimadzu Corp .Japan (equipped with capillary column DB –I)30 m long, ID 0.32 mm (and 5 %methyl phenyl silicone .The limit of detection)LOD (of acephate was determined three times of the standard deviation of the blank .Before analysis, standards were run to check for the column performance peak height and resolutioninjection ,The column .

Helium was used as the carrier gas .C respectively° 250C and ° 230 ,C° 210mperatures were maintained at port and detector te min/ml 1maintained at and the flow rate was.

Molecular and Phylogenetic Characterization of the Bacterial Isolate
16 S ribosomal RNA (rRNA) gene analysis of the bacterial isolate was conducted at Immugenix Biosciences (Chennai, India). The genomic DNA was isolated from the bacterial isolate PA11 using Qiagen extraction and Qubit 4 Fluorometer (Life Technologies, USA) method and amplification of the 16S rRNA gene was performed with broad range pan Eubacterial primers. Phylogenetic analysis of the 16S rRNA gene was done. The obtained 16S rRNA gene sequence was queried on the GenBank database using BLAST. The top BLAST hits were collected and aligned and a neighbor joining and a maximum-likelihood tree was constructed using the MEGA11 Phylogenetic tree online tool to establish the phylogenetic relationship.

RESULT

Isolation and Identification of acephate degrading bacterial isolate
After incubation, sixteen bacterial isolates have been isolated from the pesticide infested soil in MSM and named as PA1 to PA16.Bacterial isolate PA11 was selected for further study based on growth studies on minimal salt medium, efficacy of bacterial isolates on acephate degradation, enzyme test, FTIR and GC - MS analyses.

Morphological and biochemical characteristics of bacterial isolate PA11
Colony characteristics on Nutrient Agar plates, cell morphology, gram staining results and biochemical results were shown in Table 1 and Table 2.

FTIR analysis
Analysis of pure acephate and decomposed metabolites, obtained after treating with the bacterial isolate PA11 after 10 days, with FTIR, was performed to confirm the biodegradation of acephate .The FTIR spectra of standard acephate)Control) (Fig .1a (and the samples with bacterial isolate PA11 infused with known amount of acephate) Fig . 1b)were found to be significantly different from each other .The observed changes in peak pattern and shift of the functional groups indicated the conversion of acephate to different metabolites.

GC –MS analysis
Based on the chromatogram obtained through GC - MS analysis of the aliquots, it is conferred that all the samples subjected to analysis for acephate degradation showed degradation of acephate into various other simple compounds. This was indicated by variation of peaks obtained in all the samples in correspondence to varying level of retention time. It is further supported by the variation in the area occupied by each compound in all the sample chromatogram when compared with standard acephate chromatogram. The gas chromatograms obtained from GC–MS are shown in Fig. 2a (Standard Acephate)and Fig.2b(PA11).Fig. 2a reveals the retention time of standard acephate (17.724) which was not found in the chromatogram of the treated sample. This shows that acephate is converted into other compounds by bacterial isolate PA11 and resulted in peaks of different retention times and area which do not correspond with the standard.

Evolutionary relationships of taxa
The molecular characterization based on 16S rRNA sequence analysis was used to identify PA11. The sequence of 16S rRNA gene of bacterial isolate PA11 was determined and used to construct a phylogram(Fig. 3). It displayed the highest identity (85 %) with the 16S rRNA gene of *Sanguibacter sp.*(GenBank accession no. OP936003). The evolutionary history was inferred using the Neighbor-Joining method[16]. The optimal tree is shown (next to the branches). The evolutionary distances were computed using the Maximum Composite Likelihood method[17] and are in the units of the number of base substitutions per site. This analysis involved 20 nucleotide sequences. All

ambiguous positions were removed for each sequence pair (pairwise deletion option). There were a total of 1763 positions in the final dataset. Evolutionary analyses were conducted in MEGA11[18].

DISCUSSION

Synthetic pesticides are purposely introduced into agricultural systems to protect crops against weeds, insects, fungi and other pests, medicine, industry and the household. However, the majority of the applied pesticides, even if sprayed on the foliage of crop plants and weeds, will eventually reach the soil. Trace contamination of pesticides present in the environment creates a lot of pollution dilemma due to their toxicity and bioaccumulation property[19,20]. Acephate(O,S-dimethyl acetyl phosphoramidothioate) is a racemic organ phosphorus insecticide used as broad spectrum insecticide for foliar treatment of vegetable, fruit and field crops, cotton, commercial ornaments, and in around poultry houses and dairies[21]. Though there are extensive studies on the biodegradation of various other organophosphates, only a few reports are available on bacterial – promoted biodegradation of acephate[14]. Many authors indicate that the bacterial isolates belonging to different taxonomic groups have enormous pesticide degrading potential.

Zhi et al.,[22] provided a thorough review of the literature that presented acephate-degrading bacteria isolated from soils in which acephate was used for a long period. The bacterial strain that belongs to *Chrysobacterium*sp. XP-3 has a strong ability of growth and reproduction in medium containing 1500 mg L−1 acephate.JianjunRen[23] reported that *Bacillus paramycoides* NDZ is an effective bacterium fordegrading acephate that follows different degradation pathwayscompared to high-temperature steam. It degraded about 76% of the acephate in MSM after 48 h of incubation. Lin et al.,[33]; Ramya et al.,[24] have reported that *B. cereus* and *B. subtilis* can degrade acephate. Phugare et al, [25] found that a consortium including *Exiguobacterium* sp. and *Rhodococcus* sp. have acephate degrading capacity. A similar study achieved by Pinjari et al., [14] demonstrated that *Pseudomonas acephalitica*Ind01 is capable of breaking down acephate.

A facultative methylotroph, *Hyphomicrobium sp. MAP-1*, and *Luteibacter*, capable of high efficiently degrading methamidophos, first product of acephate metabolismas sole nitrogen or sulphur source, bacteria were isolated from methamidophos-contaminated soil in China[26]. Singh et al.,[27] demonstrated that *Enterobacter* strain B-14 was found to utilize organophosphorus insecticides as a source of carbon and phosphorous. Acephate was utilised as a potential source of sulphur and nitrogen by few soil microbes like *Penicillium*[28]. Soil microbes such as *Saccharomyces rouxii* WY-3 [29], *Aspergillusorantus*[30], and *Pseudomonas* sp. Ind01[14], *Pseudomonas aeroginosa*IS6 [31], are being reported to degrade acephate. ThiruvengadamVenkatesan et al.,[32] isolated acephate degrading bacteria *E. asburiae B. cereus and P. agglomerans*, from the gut of diamondback moth larvae, an important pest of cruciferous crops worldwide that has developed resistance to insecticides.

Several degrading microorganisms with partial or complete degradation capacity of acephate or methamidophoshavebeenisolatedandcharacterized,suchas*Lysinibacillusfusiformis*, *Pseudomonas* sp., *Pseudomonas pseudo alcaligenes*, *Bacillus subtilis*, *Pseudomonas azotoformans*, and *Pseudomonas putida*[33,34,13,35].Mohan and Naveena[11]isolated five bacterial strains, which are identified as *Bacilluscereus* ADI-10,*Nibacillus fusiformis* ADI-01,*Pseudomonas pseudoalcaligenes* ADI-03,*Pseudomonas* sp.ADI-04, and *Pseudomonas pseudoalcaligenes* ADI-06.These strains could efficiently grow and degrade acephate at 500 mg/L without any additional carbon source and were further utilized to analyze the mechanism of acephate degradation. *Mucor*sp. has been found to be able to degrade methamidophos and acephate[36,37].

CONCLUSION

Biodegradation using native microbes for pesticide removal from the environment is quite attractive. It can be a beneficial aspect if these bio resources are tapped. The present study has been successful in isolating and characterizing bacterial isolate which have been known for their diverse metabolic activities and metabolites. From the present study, it has been concluded that the bacterial isolate *Sanguibacter* sps. has the capacity of utilizing acephate as a carbon source. It is efficient to grow and degrade acephate up to 1000 ppm without the addition of any extra carbon source. To the author's knowledge this is the first documentation of bacterial isolate. This bacterial isolate can be further analyzed on degradation of higher concentration of pesticide and pathogenic aspects for bioremediation to clean up the pesticide contaminated land.

CONFLICT OF INTEREST

The authors have no conflicts of interest regarding this investigation.

ABSTRACT

In this paper, mainly we discussed the certain properties of ternary semigroups and commutative ternary semigroups and regular, normal ternary semigroups.

Keywords: Ternary semigroups, commutative ternary semigroups, quasi- commutative ternary semigroups, regular ternary semigroups and normal ternary semigroups
AMS Subject Classification code: 20M12, 20N10

INTRODUCTION

The theory of ternary algebraic system was introduced by D.H. Lehmer in 1932, but earlier such structures were studied by Kasner who gavethe idea of n-ary algebras. Ternary semi groups are universal algebras with one associative ternary operation. In 1955, J. Los studied some properties of ternary semi groups and proved that every ternary semigroup can be embedded in a semi group. F.M. Sioson introduced the notion ofregular ternary semigroup. In 1983, M.L. Santiago developed the theory of ternary semi groups and semi heaps. Y. Sarala, A. Anjaneyulu and D.Madhusudhana Raoinitiated the study of quasi commutative, pseudo commutative and normal ternary semi groups.

Preliminary Concepts and Basic Results
This section contains preliminary concepts and Basic results of ternary semi groups.

Definition1.1.1. A class S with an operation between triplets of elements is called a triplex if the following postulates hold.

Postulate I.$(a.b.c)d.e = d.(a.b.c).e = d.e(a.b.c)$

$$= (a.b.d).c.e = (a.b.e).c.d = (a.c.d)b.e$$
$$= (a.c.e).b.d = (a.d.e)b.c = (b.c.d).a.e$$
$$= (b.c,e).a.d = (b,d.e).a.c = (c.d.e).a.b$$

provided a, b, c, d, e and all the expressions belongs to S.

Postulate II. If $a, b, c \in S$, then there is an element x of S such that $a.b.x = c$.

The number of elements in S is called the order of triplex and is specified, when necessary, by adding one of the postulates:

Postulate III₁. K contains ' n ' elements.
Postulate III₂. K contains infinitely many elements.
According as III₁, or III₂ holds, the triplex is called finite or infinite.

Examples1.1.2.
1. Set of all natural numbers is a triplex under usual multiplication.
2. Z={±1,±2,±3,..........} is a triplex under usual multiplication.
3. Let S be the set of all matrices of the form $\begin{bmatrix} a & 0 \\ 0 & b \end{bmatrix}$ of order 2x2matrices for a and b are natural numbers. Then S is also a triplex under usual matrix multiplication.

Definition 1.1.3. A ternary semi group is a nonempty set S together with a ternary operation $(a_1, a_2, a_3) \rightarrow (a_1 a_2 a_3)$, satisfying the associative law of the first kind $((a_1 a_2 a_3)(a_4 a_5)) = (a_1(a_2 a_3 a_4)a_5) = (a_1 a_2(a_3 a_4 a_5))$ for all $a_i \in S, 1 \leq i \leq 5$.

Definition 1.1.4. Let S be a groupoid. Then it is right almost semigroup (RA-semigroup),
we have $a_1(a_2 a_3) = a_3(a_2 a_1) = a_2(a_1 a_3)$,
for all $a_i \in S, 1 \leq i \leq 3$.

(i) RA-semigroup - R-cyclic if $(a_1 a_2)a_3 = (a_3 a_1)a_2 = (a_2 a_3)a_1$, for all $a_i \in S, 1 \leq i \leq 3$.
(ii) RA-semigroup - L-cyclic if $a_1(a_2 a_3) = a_3(a_1 a_2) = a_2(a_3 a_1)$, for all $a_i \in S, 1 \leq i \leq 3$.

Remark 1.1.5. A groupoid S is medial if for all $a_i \in S, 1 \leq i \leq 4$, S satisfies medial (or) bi-symmetry law,
(i.e) $(a_1 a_2)(a_3 a_4) = (a_1 a_3)(a_2 a_4)$, for all $a_i \in S, 1 \leq i \leq 4$.

Example 1.1.6. Let $\{\begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix}\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\begin{bmatrix} 1 & 0 \\ 0 & 0 \end{bmatrix}\begin{bmatrix} 0 & 1 \\ 0 & 0 \end{bmatrix}\begin{bmatrix} 0 & 0 \\ 1 & 0 \end{bmatrix}\begin{bmatrix} 0 & 0 \\ 0 & 1 \end{bmatrix}\}$
then S is a ternary semi group under usual multiplication.

Example 1.1.7. Let $S = \{0,1,2,3,4,5\}$ and $abc = (a * b) * c$ for all $a, b, c \in S$ where ' * ' is defined in the following table

*	0	1	2	3	4	5
0	0	0	0	0	0	0
1	0	1	1	1	1	1
2	0	1	2	2	1	1
3	0	1	1	1	2	2
4	0	1	4	5	1	1
5	0	1	1	1	4	5

Then (S, *) is a ternary semigroup.

Definition1.1.8. A ternary semigroup S is said to be commutative if
$abc = bca = cab = bac = cba = acb$ for all $a, b, c \in S$
A ternary semigroup S is said to be quasi commutative if for any $a, b, c \in S$ there exists a natural number ' n ' such that
$abc = b^n ac = bca = c^n ba = cab = a^n cb$.

Definition1.1.9. A ternary semigroup S is said to be normal if $abS = Sab$ for all $a, b \in S$.

Definition1.1.10. A ternary semigroup S is said to be right pseudo commutative if
$abcde = abdec = abecd — abdce = abedc = abced$ for all $a, b, c, d, e \in S$.

Example1.1.11. Let $S = \{a, b, c, d, e\}$ be a set. Define a ternary operation '.' on S. where '.' is defined by the following table

.	a	b	c	d	e
a	a	a	a	a	a
b	b	a	a	a	a
c	a	a	a	a	a
d	a	a	a	a	a
e	a	b	c	d	e

Then (S, .) is aright pseudo commutative ternary semi group.

Definition1.1.12. An element $'a'$ of a ternary semigroup S is said to be right identity if $saa = s$ for all $s \in S$.

Definition1.1.13. An element $'a'$ of ternary semigroup S is said to be identity or unital if $saa = s$ for all $s \in S$.

Example 1.1.14. Let Z_0^- be the set of all non-positive integers. Then with theusual ternary operation '.'Z_0^- forms a ternary semigroup with the identityelement -1.

Theorem 1.1.15. Any ternary semigroup S has almost one identity.

Note 2. The identity of ternary semigroup is usually denoted by '1' (or) 'e'.

Definition1.1.16. An element $'a'$ of a ternary semigroup S is said to beright zero of S if $bca = a$ forall $b, c \in S$.

A ternary semi group S is said to be right zero ternary semi group if every element of S is right zero element.

Definition1.1.17. An element $'a'$ of a ternary semigroup S is said to be zero of S if $bca = a$ for all $b, c \in S$.

A ternary semi group S is said to be zero ternary semi group if every element of S is zero element.

Example1.1.18. Let $0 \in S$ and $\|S\| > 2$. Then S with the ternary operation '.' defined by
$x.y.z = \begin{cases} x, if\ x = y = z. \\ 0, otherwise \end{cases}$ is ternary semigroup with 0 (zero).

Result 1.1.19. Any ternary semigroup S has at most one nonzero element.

Definition1.1.20. An element $'a'$ of ternary semigroup S is said to be an idempotent if $a^3 = a$.

Note 3. The set of all idempotent elements in a ternary semigroup S isdenoted by I(S).

Definition1.1.21. An element $'a'$ of ternary semigroup S is said to be a proper idempotent element provided ' a ' is an idempotent and which is notan identity of S when identity exists.

Definition1.1.22. A ternary semi group S is said to be an idempotent ternary semi group or a ternary band if every element of S is an idempotent.

Definition1.1.23. A ternary semigroup S is said to be aright cancellative if
$xab = yab => x = y$.

Definition1.1.24. An element $'a'$ of a ternary semigroup S is said tobe regular if there exists $x, y \in S$ such that $axaya = a$.

A ternary semigroup S is said to be regular ternary semigroupif every element of S is regular.

Result 1.1.25. Every idempotent element of a ternary semigroup S is regular.

Definition1.1.26. An element $'a'$ of a ternary semigroup S is said tobe right regular if there exists $x, y \in S$ such that $a = xya^2$.

An element $'a'$ of a ternary semigroup S is said to beintra regular if there exists $x, y \in S$ such that $a = xa^5y$.

Definition1.1.27. An element $'a'$ of a ternary semigroup S is said to becompletely regular if there exists $x, y \in S$ such that $axaya = a$ and$axa = aax = xaa = aya = aay = yaa = axy = yxa = xay = yax$.

A ternary semigroup S is said to be completely regular ternarysemigroup if every element of S is completely regular.

Result1.1.28. Let S be a ternary semigroup and $a \in S$. If$'a'$ is acompletely regular element in S then $'a'$ is right regular in S.

Result1.1.29. If S is a commutative ternary semigroup then S is aquasi-commutative ternary semigroup.

Result1.1.30. If S is a quasi-commutative ternary semigroup then Sis a normal ternary semigroup.

Result1.1.31. Every commutative ternary semigroup S is a normalternary semigroup.

Result1.1.32. If S is a commutative ternary semigroup, then S is apseudo commutative ternary semigroup.

Theorem1.1.33.A quasi-commutative ternary semigroup S is acommutative ternary semigroup if all elements of S are idempotent.

Proof.
Let S be a quasi-commutative ternary semigroup.
Then $abc = b^nac - bca = c^nba = cab = a^ncb - - - - \rightarrow (1)$ for all $a, b, c \in S$,
where 'n' is a natural number.
Since $a \in S \Rightarrow a^3$
$\Rightarrow aa^3 = aa \Rightarrow a^4 = a^2 \Rightarrow a^5 = a^3 = a \Rightarrow a^5 = a, \qquad a^7 = a, ...$
In generally we write this $a^{2n+l} = a$ for $n = 1,2,3,…………$.
From result 1.1.21, every idempotent element of T is regular.
Here 'a' is regular then there exists $x, y \in S$ such that $a = axaya$.
Now, we have to prove that T is commutative.
i.e., $abc = bca = cab = bac = cba = acb$ for all $a, b, c \in S$.
from equation (1) it is enough to prove that
$b^nac = bac, \ c^nba = cba, \ a^ncb = acb$ for $n = 1,2,3,…………..$

Consider$b^nac = bb^{n-1}ac$,
$\qquad = b^{2n+1}b^{n-1}ac, \ (since b = b^{2n+1})$
$\qquad = bb^{3n-1}ac,$
$\qquad = bb^{3n-2}bac,$
$\qquad = bb^{3n-2}b^{2n+1}ac,$
$\qquad = bb^{3n-2}bb^{2n}ac,$
$\qquad = bb^{3n-2}bb^{2n-1}bac,$
$\qquad = bxbybac, \qquad (x = b^{3n-2} \ and \ y = b^{2n-1})$
$\qquad = bac$ (Since 'b' is regular)
$\qquad\qquad b^nac = bac,$

65632

www.tnsroindia.org.in ©IJONS

Similarly, $c^n ba = cba, a^n cb = acb$.

Therefore $abc = bca = cab = bac = cba = acb$ for all $a, b, c \in S$.

Hence S is a commutative ternary semigroup.

Ternary Semi groups Satisfying the Identity $abc = ba$

In this section we prove some properties of ternary semi groups satisfying the identity $abc = ba$.

Theorem 2.1.1. If a regular ternary semi group S satisfies the identity $abc = ba$ for all $a, b, c \in S$, then S is a commutative ternary semi group.

Proof.

Let S be a regular ternary semi group. Then for every $a \in S$ there exists $x, y \in S$ such that $a = axaya$. Given that S satisfies the identity $abc = ba$ for all $a, b, c \in S$. We have to prove that S is a commutative ternary semigroup,

i.e., $abc = bca = cab = bac = cba = acb$ for all $a, b, c \in S$.

Consider $abc = a(bcx)cyc$ $(c = cxcyc)$

$$
\begin{aligned}
&= ac(bcy)c &&(bcx = cb) \\
&= (ac)cbc &&(bcy = cb) \\
&= c(abc)bc &&(ac = cab) \\
&= cb(abc) &&(abc = ba) \\
&= (cb)ba &&(abc = ba) \\
&= b(cab)a &&(cb = bca) \\
&= (ba)ca &&(cab = ac) \\
&= ab(xca) &&(\text{for all } x \in S, ba = abx) \\
&= a(bcx) &&(xca = cx) \\
&= acb &&(bcx = cb)
\end{aligned}
$$

$abc = acb$ $-------\to 1$

Consider $acb = (acb)ubvb = c(aub)vb$ $(b = bubvb$ and $acb = ca)$

$$
\begin{aligned}
&= c(uav)b &&(aub = ua) \\
&= ca(ub) &&(uav = au) \\
&= c(abu)v &&(ub = buv) \\

Ramesh and Mahendran

From equations (1) to (5), we get $abc = acb = cab = bac = cba = bca$ implies that $abc = bca = cab = bac = cba = acb$ for all $a, b, c \in S$.

Therefore, S is a commutative ternary semigroup.

Theorem 2.1.2. If a regular ternary semigroup S satisfying the identity $abc = ba$ for all $a, b, c \in S$ then S is right regular.

Proof.

Let S be a regular ternary semigroup. Then for any $a \in S$ there exists $x, y \in S$ such that $a = axaya$.

Given that S satisfy the identity $abc = ba$ for all $a, b, c \in S$.

i.e.,S is commutative.

To prove that S is right regular. i.e., for any $a \in S$ there exists $x, y \in S$ such that $a = xya^2$.

Consider $a = axaya = a(xya)a$ $(aya = yaa)$

$\qquad\qquad\qquad = (ayx)a$ $(xya = yx)$

$\qquad\qquad\qquad = xyaa$ $(ayx = xay) = xya^2$

$\qquad a = xya^2$ for all $a \in S$.Therefore, S is right regular.

Theorem 2.1.3. If a regular ternary semigroup S satisfies the identity $abc = ba$ for all $a, b, c \in S$ then S is completely regular.

Proof.

Let S be a regular ternary semigroup. Then for any $a \in S$, there exists $x, y \in S$ such that $a = axaya$.Given that S satisfy the identity $abc = ba$ for all $a, b, c \in S$.

From theorem 2.1.1, S is commutative, we have to prove that S is completely regular.

i.e., if $a \in S$ then there exists $x, y \in S$ such that $a = axaya$ and

$axa = aax = xaa = aya = aay = yaa = axy = yxa = xay = yax$.

By the regularity of S, we have $axaya = a$ for all $a \in S$.To prove that

$\qquad\qquad axa = aax = xaa = aya = aay = yaa = axy = yxa = xay = yax$.

Consider $axa = axa(yax)a$ $(a = axaya)$

$\qquad\qquad = ax(aay)a$ $(yax = ay)$

$\qquad\qquad = ax(aya)a$ $(aay = aya)$

$\qquad\qquad = a(xya)aa$ $(aya = yaa)$

$\qquad\qquad = a(yxa)a$ $(xya = yx)$

$\qquad\qquad = a(xya)$ $(yxa = xy)$

$\qquad\qquad = ayx$ $(xya = yx)$

$\qquad\qquad axa = ayx$ $- - - - - - - -\rightarrow (1)$

Consider $ayx = axayayx$ $(a = axaya)$

$\qquad\qquad = aax(ayx)$ $(xay = ax)$

$\qquad\qquad = aa(xya)$ $(axy = ya)$

$\qquad\qquad = a(ayx)$ $(xya = yx)$

$\qquad\qquad = aya$ $(ayx = ya)$

$\qquad\qquad ayx = aya$ $- - - - - - - -\rightarrow (2)$

From equations (1) and (2) we get $axa = ayx = aya$

$\qquad\qquad => axa = aya = ayx$ $- - - - - - - -\rightarrow (3)$

Since S is commutative then from equation (3) we get,

$\qquad\qquad axa = aax = xaa = aya = aay = yaa = axy = yxa = xay = yax$.

Therefore, S is completely regular.

Theorem 2.1.4. If a regular ternary semigroup S satisfies the identity $abc = ba$ for all $a, b, c \in S$ then S is right calculative.

Ramesh and Mahendran

Proof.
Let S be a regular ternary semigroup and satisfies the identity $abc = ba$ for all $a, b, c \in S$.
We have to prove that S is right cancellative.

i.e., if $xab = yab => x = y$ for all $a, b, c, x, y \in S$.

Consider $xab = yab$

$$xux(vxa)b = ypy(qya)b \quad (x = xuvx \text{ and } y = ypyqy)$$
$$xwc(xvb) = ypyiyqb) \qquad for \ all \ u, v, p, q \in S.$$
$$xuxvx = ypyqy$$
$$x = y.$$

Therefore, S is right cancellative.

Corollary 2.1.5. If a regular ternary semigroup S satisfies the identity $abc = ba$ for all $a, b, c \in S$ then S is quasi commutative.

Proof.
Let S be a regular ternary semigroup and satisfies the identity $abc = ba$ for all $a, b, c \in S$. Then from theorem 2.1.1, S is commutative. From result 1.1.32, every commutative ternary semigroup is a quasi-commutative ternary semigroup. Hence S is quasi commutative.

Corollary 2.1.6. If a regular ternary semigroup S satisfies the identity $abc = ba$ for all $a, b, c \in S$ then S is normal.
Proof.

Let S be a regular ternary semigroup and satisfies the identity $abc = ba$ for all $a, b, c \in S$. Then from corollary 2.1.5, S is quasicommutative. From result 1.1.33, every quasi-commutative ternary semigroup is normal. Hence S is normal.

Corollary 2.1.7. If a regular ternary semigroup S satisfies the identity $abc = ba$ for all $a, b, c \in S$ then S is pseudo commutative.

Proof.
Let S be a regular ternary semigroup and satisfies the identity $abc = ba$ for all $a, b, c \in S$. Then from theorem 2.1.1, S is commutative. Again, from result 1.1.33, every commutative ternary semigroup is a pseudo commutative ternary semigroup. Hence S is pseudo commutative.

Theorem 2.1.8. If a right pseudo commutative ternary semigroup S satisfies the identity $abc = ba$ for all $a, b, c \in S$ then S is commutative.

Proof.
Let S be a right pseudo commutative ternary semigroup. Then for all $a, b, c \in S$ such that
$$abcde = abdec = abecd = abdce = abedc = abced \ -----→ (1)$$
we have to prove that S is commutative. Since S satisfies the identity $abc = ba$ for all $a, b, c \in S$,
we have Consider $a(bcd)e = a(cbe)$ $\qquad [bed = cb]$
$$= abc \qquad (cbe = bc)$$
$$abcde = abc \ -----→ (2)$$
Consider $(ab)dec = b(acd)ec$ $\qquad [ab = bac]$
$$= bca(ec) \qquad [acd = ca]$$
$$= (bca)cef \qquad [ec = cef]$$
$$= cb(cef)[bca = cb]$$
$$= cbe(caf) \qquad [ce = eca]$$

65635

$$= cb(eac)[caf = ac]$$
$$= c(bae) \qquad\qquad [eac = ae\,]$$
$$= cab \qquad\qquad [bae = ab\,]$$
$$abdec = cab \qquad - - - --\!\rightarrow (3)$$

Consider $ab(ecd) = a(bce)$ $\qquad [ecd = ce]$
$$= acb$$
$$abecd = acb \qquad\qquad - - - --\!\rightarrow (4)$$

Consider $(abd)ce = b(ace)$ $\qquad [\,abd = ba]$
$$= bca \qquad\qquad [\,ace = ca\,]$$
$$abdce = bca \qquad\qquad - - - --\!\rightarrow (5)$$

Consider $(ab)edc = b(ace)dc$ $\qquad [\,ab = bac\,]$
$$= (bc)adc \qquad [\,ace = ca\,]$$
$$= cb(ead)c \qquad [bc = cbe]$$
$$= c(bae)c \qquad [ead = ae]$$
$$= c(abc)[bae = ab\,]$$
$$= cba \qquad\qquad [\,abc = ba\,]$$
$$abedc = cba \qquad\qquad - - - --\!\rightarrow (6)$$

Consider $ab(ced) = (abe)c\,[\,ced = ec]$
$$= bac$$
$$abced = bac \qquad\qquad - - - --\!\rightarrow (7)$$

Substituting equations (2), (3), (4), (5), (6) & (7) in (1),

we have $abc = cab = acb = bca = cba = bac$ implies that $abc = bca = cab = bac = cba = acb$ for all $a, b, c \in S$.

Therefore, S is commutative.

Theorem 2.1.9. If a pseudo commutative ternary semi group S satisfies the identity $abc = ba$ for all $a, b, c \in S$ then S is commutative.

Proof.

The theorem follows from above three theorems.

Corollary 2.1.10. If a pseudo commutative ternary semigroup S satisfies the identity
$abc = ba$ for all $a, b, c \in S$ then S is quasi commutative.

Proof.

Let f be a pseudo commutative ternary semigroup and S satisfies the identity
$abc = ba$ for all $a, b, c \in S$. Then from theorem 2.1.9, S is commutative. From result 1.1.32, every commutative ternary semigroup is quasi commutative. Hence S is quasi commutative.

Corollary 2.1.11. If a pseudo commutative ternary semigroup S satisfies the identity
$abc = ba$ for all $a, b, c \in S$ then S is normal.

Proof.

Let S be a pseudo commutative ternary semi group and satisfies the identity $abc = ba$ for all $a, b, c \in S$. Then from corollary 2.1.10, S is aquasi-commutative ternary semigroup. From result 1.1.33, every quasi-commutative ternary semigroup is normal. Hence S is normal.

ABSTRACT

The difficult issue of detecting and mitigating threats in cloud computing will have an impact on the operation of the overall architecture. To mitigate against hackers or attacks, numerous security precautions have been taken. Traditional security measures were unable to protect the server from numerous unauthorized external traffics. Data mining techniques are developed, and their effectiveness in identifying attacks such denial-of-service (DoS), user-to-root (U2R), remote-to-local (R2L), and probing assaults is examined. When compared to other classifier algorithms like KNN, Naive Bayes, and SVM, the performance of the created classifier algorithms performs better. The proposed ADDSVM detection model outperformed all other algorithms according to the outcomes of the result analysis.

Keywords: Attack detection, Machine Learning, KNN, Naive Bayes, SVM, Proposed ADDSVM

INTRODUCTION

Cloud computing is increasingly widely used by businesses to communicate sensitive data. Several hackers are attempting to violate security by using cloud services. A cyber-attack is an intelligent action that aims to compromise cloud services. Hackers employ a range of techniques to stop people from accessing cloud data. DoS, virus incursion, side-channel, middle man, and authentication attacks are only a few examples of the many attacks against the cloud. Attacks will happen at several points in a cloud-like data storage system during transactions, resource utilization,

65638

Umarani and John Sanjeev Kumar

and sharing. Depending on the type of attack, attack loss may be lesser or larger. An enormous increase in the use of cloud services is what caused the cloud assault [6].

The primary drawback of cloud computing is the loss of user control over data once it has been saved on a cloud storage system. The information kept in cloud data centers is completely under the control of cloud service providers (CSPs). Data can be altered, deleted, or copied by the CSP without the user's awareness [7]. The main cause of data integrity concerns is a lack of control over sensitive data that is kept. Cloud computing poses serious risks to data security, privacy, and integrity even if it is less expensive and requires less resource management. The resource that is assigned to one user may eventually be assigned to another user thanks to the multi-tenancy design. A malevolent user can use malicious code to recover the private information of a prior user by taking advantage of a flaw in the resource pooling system. Data stored in multi-tenant clouds may be at danger due to improper disk sanitization. Disasters involving data backups, whether unintentional or purposeful, may make the data unavailable. To avoid data modification and illegal access to the cloud environment, security measures should be taken [8]. There are many threats and vulnerabilities that can compromise the security of data saved in cloud storage. Anyone can be an attacker, including the owner, a malevolent user, an unreliable third party, or the CSP. In the context of cloud computing, numerous mechanisms and plans have been put out to protect data ownership and data integrity [9].

LITERATURE REVIEW

Bhosale et al. (2020) have implemented intrusion detection on KDD Container 99 using five different classification algorithms. The key qualities were discovered by utilizing a feature selection algorithm to narrow down the attributes that mattered the most. The experimental data from the Navies Bayes, CNN, SVM, ANN, and KNN models were analyzed, and the results showed that these models have the potential to perform better than other statistical models when it comes to the accuracy of intrusion categorization [2]. Bigdata approaches have been introduced by Singhal et al. (2020) to deal with the problem of DDoS attack detection on the application layer. In the context of cloud computing, a review of different machine learning techniques for DDoS attack detection and mitigation has been conducted [11]. A hybrid approach based on SVM kernel techniques such as Anova Dot and RBF Dot was created by Adhikary et al. in 2020. Real-time dataset simulation was used to assess and compare this algorithm's testing and training accuracy to single SVM kernel techniques. According to the experimental investigation, the hybrid algorithm achieved greater accuracy than individual algorithms [1].

Swami et al.(2020) have created an intrusion defense system that is based on machine learning and is designed for software-defined networking topology. The many different patterns of DDoS attacks as well as the machine learning strategies that were utilized to combat the issues were exhaustively described. Nonetheless, the detection of intrusions was not carried out for the purpose of this investigation [13]. An evolutionary algorithm-based machine learning intrusion detection system has been presented by Dwivedi et al. (2020). (IDS). The created classifier models, including SVM, decision tree, naive Bayes, and multilayer perceptron neural network models, have been fed with the trend features using a grasshopper optimization technique. The experimental findings demonstrated that the classification accuracy has increased due to the use of evolutionary algorithms. However, parameter adjustment is a limitation of the grasshopper optimizer [3]. Hussain created machine learning classification methods for a DDoS attack detection technique (2020). The implementation and overall performance of ML algorithms including BayesNet, Bagging, KNN, SMO, and Simple Logistic methods were studied. The results showed that the KNN performed better than the other models with better metric values. However, the impact of feature selection was not discussed in this work [4].

To recognize the Botnet attack, Tuan et al. (2019) used the SVM, ANN, NB, DT, and USML algorithms. The KDD99 dataset was used for the experimental simulation, which proved that the created algorithms' effectiveness and the dataset's performance were superior to those of the UNBS-NB 15 dataset [14]. A machine learning approach for identifying DDoS assaults at the application layer has been created by Sreeram and Vuppala (2019). In this study, a

65639

bio-inspired anomaly algorithm for quick and early classification was created, and an experimental examination of the CAIDA dataset was conducted. There was no discussion of the impact of feature selection [12]. A machine learning algorithm based on the PSD entropy function approach has been developed by Zhang et al. (2020) for the identification of DDoS attacks. SVM was used to distinguish LDoS traffic, and the required attributes were chosen to increase classification precision. The impact of fine-tuning kernel parameters was not discussed [15]. Prathyusha and Kannayaram (2020) have made a model for detecting DDoS attacks in cloud computing services that is based on how the human immune system works. Simulated immune reactions were used to identify anomalous entries on the KDD Cup 99 datasets with a low false alarm rate. The importance of feature choice wasn't discussed [5].

METHODOLOGY

Attack Detection using Dynamic Support Vector Machine (ADDSVM)

Attack detection is done by using the Dynamic Support Vector Machine (ADDSVM). Dynamic corresponds to the existence of SVM in the local area and is referred to as a distributive kernel function. Computation of 'σ' for each training sample, formulation of dynamic SVM using Euclidean distance distribution and dynamic training set is included in the kernel function. The value of 'σ' is calculated by separating the length between the training and the target samples in order to show the importance of the samples. The small 'σ' training sample is more significant than the other samples. Let 'x' is the target sample. The sample training set A is defined as {(x_i,y_i), i=1,...,n.} denotes the total number of training samples, y_i denotes the class labels that is an attacker or normal user, $x_i \in R^d$, R dimensional data space.

The important parameter in attack detection is the Euclidean distance r_i and is computed from the following equation

$$ED = r_i = |x - x_i| \qquad\qquad (Eq.3.1)$$

Attack detection for target sample 'x' is determined by using a fewsamples in local space 'x_i' with 'x' as the center. The influences of other samplesshall be excluded. If the sample x_i is similar to the target sample x, then xi is moreimportant than x. The term σi of sample xi is given by the equation,

$$\sigma_i = (fr_i) \qquad\qquad (Eq.3.2)$$

where, the monotonically increasing function is defined as f(r_i). The term σ_i isalso represented by an equation,

$$\sigma_i = \sigma_R\left(1 - \frac{r_i}{R}\right) \qquad\qquad (Eq.3.3)$$

Substituting σi as in Equation (3.2) and it is changed to new equation. i.e,

$$r_\sigma = [f^{-1}(\sigma)]^{-1} \qquad\qquad (Eq.3.4)$$

where, the radius of dynamic training is given by r$_\sigma$ and it is a user-controlled parameter. Samples with 'r$_i$' less than 'r$_\sigma$' are selected in the dynamic training setA$_x$ and are expressed in the following equation

$$A_x = \left\{(x_i, y_i), i = 1, ..., n_{x|r_i \leq r_\sigma|}\right\} \qquad\qquad (Eq.3.5)$$

where, the number of samples in A$_x$is given by n$_x$ and subset of training set A is given by dynamic training set A$_x$. The separation margin can be maximized by constructing a cost and it minimizes the error of attack detection that maximizes detection capability. The dual problem of the samples x_i is expressed in the following equation.

65640

$$\max w(\alpha) = \sum_{i=1}^{n_x} \alpha_i - \frac{1}{2}\sum_{i,j=1}^{n_x} \alpha_i\alpha_j y_i y_j \, exp\left\{-\frac{|x_i - x_j|^2}{\sigma_i\sigma_j}\right\} s.t. 0 \le \alpha_i \le$$

(Eq.3.6)

$$\sum_{i=1}^{n_x}\sigma_i y_i = 0$$

(Eq.3.7)

Support vectors are obtained by solving the above mentioned dual L agrangian as expressed in the following equation,

$$f(x) = sgn\left[\sum_{i=1}^{n_x}\alpha_i y_i exp\left\{-\frac{|x_i - x_j|^2}{\sigma_i\sigma_j}\right\} + b\right]$$

(Eq.3.8)

Equation (3.6), the Lagrangian multipliers of 'i' and 'j' are represented by α_i and α_j respectively. The biases vector is represented as b.

Algorithm 3.1 Proposed ADDSVM algorithm

Step 1: Start the Process
Step 2: Load the dataset
Step 3: Dynamic SVM is given with input samples 'x'. The values of threshold σ and f(r_i) are defined.
Step 4: Distance r_i between training sample and the target sample is calculated.
Step 5: Scale r_σ of the dynamic training set is calculated.
Step 6: σ_i of dynamic training set A_x is computed by taking r_σ as the criterion of dynamic training set A_x.
Step 7: Training sample xi is added to a dynamic training set A_x.
Step 8: If distance r_i is less than r_σ,
Step 9: Else it is kept untouched.
Step 10: The threshold value σ is used to control the calculated capacity dynamically.
// Users can control the training duration in dynamic SVM dynamically.
//Dynamic training set A_x and its σ_i are substituted to a dual problem given in equation (5.13)
Step 11: Dynamic SVM is trained to target sample x.
Step 12: Decision function is used to classify the target sample 'x' and attack detection result is computed.
Step 13: Steps 1 to 9 are repeated for other target features.
Step 14: Stop the process.

From the Equation (3.8) the overall results of the attack detection probability is computed. The above steps are used for attack detection that can assist in separating the abnormal user (i.e labeled as an attacker) from the normal user. Itincreases the detection rate of the intruder relative to other approaches.

RESULTS AND DISCUSSION

Data Collection
NSL-KDD Dataset
The dataset has many features and attack patterns. For detecting attacks, the raw dataset has to be efficiently analyzed and utilized. Analyzing the entire KDD data set is a composite task in an offline implementation process. The NSL-KDD dataset contains 13449 normal instances and 11743 attack instances. The attacks in dataset falls in one of the four categories like Denial-of-Service Attack (DoS), User to Root Attack (U2R), Remote to Local Attack (R2L), Probing Attack [10].

CSID Dataset
The CSID dataset is created by mapping and merging the Solaris and Window audit logs to their tcpdump data using common Source IP and time of access features. The process generates two CSID datasets- Solaris based and Window based. After mapping and merging a huge number of records are generated which cannot be processed with limited computing resources. Therefore, we have taken the samples from both the datasets. Reservoir sampling method is used to collect the 50,000 samples from both the CSID datasets. CSID contains the features from both the

records in the audit logs and tcpdump data. The Solaris CSIDdataset contains 20 features and Windows CSID dataset contains 18 features [10].

Performance Analysis

False Attack Detection Rate

Each user has their unique behaviour. Some time they will show different behavior. For example, a user who forgot the password will try several times, but this is not an attack. Most of the attack prevention systemwill detect this as attack and block the real users. Such kind of wrongly identifying a genuine user/request as an attack is called false attack detection.

$$\text{False Attack Detection Rate } = \frac{FP}{FP + TP}$$

This rate of false detection plays a major role in determining the performance of any defence mechanism. The rate or the percentage of false attack detection should be as low as possible. False attack detection rate is also known as reliability or false positive rate.

Attack Detection Time

Attack detection time should be very lower then only we can recover the allocated resources and save the network from the attacks. But the practical difficulty is that, it needs some time to analyze the user behaviour and take some extra time to detect it an attack. This total time taken by any method during the period of an attack is the attack detection time. During the initial stages of the implementation, the proposed method may take longer than the expected time to detect an attack. Later though training and the analysis of the user behaviour from the multiple agents, the proposed methods can make the time taken to detect the attacks into a lesser one.

Attack Recovery Time

Once the network is attacked, after the detection of the attack, the network should be immediately recovered from the attack in the least time to provide the services again. So, the attack recovery time will be another important factor in the attack recovery process. Table 1 and figure 1 describes the performance of classification results for NSL-KDD dataset. It is observed that the proposed ADDSVM algorithm achieves 89.6% accuracy than KNN, Naïve bayes, and SVM. Table 2 illustrates the attack detection results for NSL-KDD dataset. Figure2 depicts false detection rate. It is observed that the proposed ADDSVM algorithm obtains 10.4% of low rate of false detection. Figure 3 illustrates the attack detection and recovery time for NSL-KDD dataset. Based on the results the proposed ADDSVM algorithm takes minimum time for attack detection and recovery. Table 3 and figure 4 describes the performance of classification results for CSID dataset. It is observed that the proposed ADDSVM algorithm achieves 87.5% accuracy than KNN, Naïve bayes, and SVM. Table 4 illustrates the attack detection results for CSID dataset. Figure 5 depicts false detection rate. It is observed that the proposed ADDSVM algorithm obtains 12.5% of low rate of false detection. Figure 6 illustrates the attack detection and recovery time for CSID dataset. Based on the results the proposed ADDSVM algorithm takes minimum time for attack detection and recovery. From the analysis, the proposed ADDSVM algorithm achieves better accuracy than existing algorithms such as KNN, Naïve Bayes and SVM. Additionally, the false detection rate is low and takes minimum detection time and recovery time for both NSL-KDD and CSID dataset.

CONCLUSION

This paper examined cloud attacks and potential risk reduction strategies. Employee security knowledge should be improved through security awareness training. The results acquired demonstrate that supervised ML can be used to identify the attack. The NSL KDD and CSID datasets are critically assessed using ML approaches in order to correctly identify that assault. By utilizing features like selection and classification, this dataset is used to compare the presented framework. Overall, the proposed ADDSVM algorithm outperformed the other three learning algorithms in terms of accuracy. Many attacks will be recognized in the future utilizing machine learning techniques.

ABSTRACT

Herbal medications and therapies are heavily used in both traditional and alternative medicine in the developed world, particularly in the treatment of skin and skin-related illnesses. Traditional herbal ointments are among the most regularly utilised medicines. The primary goal of this study was to create and test a polyherbal ointment with antibacterial qualities. In order to ascertain the polyherbal ointment's antibacterial efficacy, ointments containing hydro alcoholic extracts of *Azadirachta indica, Vitex negundo, Cynodon dactylon, Curcuma longa,* and *Neolamarckia cadamba* were developed. These formulations were then tested for physicochemical characteristics and antibacterial efficacy. The physicochemical properties of the compositions, including color, smell, phase separation, stability, pH, and spread ability, were investigated in this work.. The tests' results indicated that the formulations had some positive characteristics.. The existence of antibacterial activity in the ointment compositions suggested that they may be used to treat wounds. A comparison analysis, according to the study, revealed that the F1 formulation beat the F2 formulation in terms of antibacterial properties. The polyherbal ointment, according to the study, provides an effective alternative for the treatment of skin conditions by utilizing the medicinal properties of *Azadirachta indica, Vitex negundo, Cynodon dactylon, Curcuma longa,* and *Neolamarckia cadamba*. The thorough assessment of its physicochemical features and antibacterial activity confirms its promise as a dependable treatment choice. This paper emphasizes the value of traditional herbal medicine in the treatment of skin problems and the importance of producing evidence-based

65646

herbal formulations. The creation and assessment of a polyherbal ointment with antibacterial capabilities provides valuable knowledge for ongoing research and development in the field of herbal medicines.

Keywords: Polyherbal, Plant extracts, Phytochemical screening, Formulation, Ointment, Physicochemical evaluation, Antimicrobial study.

INTRODUCTION

Ayurveda medicine is a traditional medical system that originated in India over 5000 years ago. It is based on the belief that health and wellness depend on a delicate balance between the mind, body, and spirit. Ayurveda medicine has been used in India's hospitals for many years and is considered a tried-and-true medical method. This practice includes a wide range of treatments, including herbal medicine, massage, yoga, and dietary changes etc [1]. There is a noticeable upsurge in the popularity of herbal remedies, and more people are being attracted to clinics that provide alternative medicine. [2]. A variety of illnesses have been treated using several traditional medicines and treatments that are derived from plant sources. It's crucial to keep in mind though that even naturally occurring compounds can have negative side effects and may interact with other prescription pharmaceuticals or manufactured drugs. There may be dangers associated with interactions between herbal and synthetic drugs. Some herbal products have ingredients that interact with synthetic medications, influencing how well they are absorbed, metabolized, or eliminated from the body. These interactions may result in changes to the blood levels of the medicine, a decrease in its efficacy, or a higher risk of suffering side effects. Herbal medicine, often known as phytotherapy or plant-based medicines, have gained popularity in recent years. Natural treatments are appealing to a lot of individuals since they think they are safer and more dependable than pharmaceutical medications, which might have unfavorable side effects [3].

Currently available medications for treating microbial infections have certain limitations, such as the development of antibiotic resistance, adverse side effects, and high cost. Due to these limitations, there is a growing interest in researching natural antimicrobials as a possible replacement for synthetic drugs. Natural antimicrobials are compounds that are produced by plants, animal tissues, or microbes and have the ability to inhibit the growth or kill microorganisms such as bacteria, viruses, and fungi. More study has to be done on medicinal plants that have been traditionally utilized and have a presence in folklore to explore the possibilities of herbal medicine [4]. Herbal medicines can be helpful to society as options for treating a number of problems in people, animals, and birds since they are believed to have less side effects than synthetic treatments.

A polyherbal formulation is one that contains two or more plants in one preparation. Studying polyherbal formulation can help researchers identify novel therapeutically effective combinations and support long-standing applications of herbal medicines. Further research on the idea of polyherbal formulations is beneficial given the current situation [2]. The goal of the current effort is to create a polyherbal ointment with enhanced antibacterial activity that may be used to treat skin infections. In the study, plant extracts are used to create a polyherbal ointment that may be used to treat skin diseases. The research suggests that using plant extracts in the ointment might boost antibacterial action, even if it does not directly address the use of conventional drugs for skin-related illnesses. The effectiveness of conventional treatments for skin conditions, still may differ and should be assessed on the basis of individual circumstances. According to the literature, using traditional remedies to treat ailments connected to the skin was very beneficial. Therefore, in order to manage and treat a number of antimicrobial diseases, it is important to discover and create plant entities deriving from natural sources into suitable dosage forms [5].This study tested the polyherbal ointment's antiseptic and antibacterial activities to prove its scientific validity. The ointment was made using two types of plant extracts - methanolic and ethanolic extracts of five distinct plants, and it has been examined on both gram-positive and gram-negative bacterial strains.

MATERIALS AND METHODS

Plant Materials
Fresh plants leaves (*Azadirachta indica, Vitex negundo, Cynodon dactylon, Neolamarckia cadamba*) and roots of *Curcuma longa*.

Instrument and apparatus used
Incubator, Digital balance, Bunsen burner, pH meter, Sonicator, hot air oven Centrifuge, Auto clave, Laminar air Flow, BOD incubator, Laminar Air Flow etc.

Chemicals
All the chemicals used the present dissertation were of analytical grade or laboratory-grade supplied by standard manufacturers. Mayer's reagent, Wagner's reagent, Drageoir's reagent, Hager's reagent, Hcl, ferric chloride, NaOH, chloroform, Ethanol, acetic anhydride, metallic tin, lead acetate, Mallon's reagent, $NaNO_2$, HNO_3.Conc. H_2SO_4, α-naphthol (5%) in ethanol [freshly prepare], 0.2% enthrone solution in Conc. H_2SO_4.

Fehling's solution A
Dissolve 35 g of $CuSO_4$ $5H_2O$ in water to make the volume to 500 ml.

Fehling's solution B
Dissolve in 110 g of NaOH and 172 g of Na-K tartrate (Rochelle salts) in distilled water and make to the volume of 450 ml.

Benedict's reagents
Reagents No. 1: Dissolve 172 g of sodium citrate and 100 g of anhydrous Na_2CO_3 in 600 ml of hot water. Dilute to 800 ml with dist. water.
Reagents No. 2: Mix 100 ml of hot water with 17.3 g of CuSO4 5H2O to dissolve. Cool, then add 100 ml of diluted water.
Reagents No. 3: Then add Reagents No. 1 to Reagents No. 2 slowly with constant stirring and makeup to 100ml with dist. water.

Bacterial strains used
Staphylococcus aureus MTCC 87 and *Pseudomonas aeruginous* MTCC 424, two pathogenic bacterial strains, were utilised in the antibacterial study.

METHODS

Collection of Herbs
The fresh plant leaves (*Azadirachta indica, Vitex negundo, Cynodon dactylon, Neolamarckia cadamba*) and roots of *Curcuma longa* were collected during January- February 2023 from a rural area of the Chakdaha district of West Bengal, India.

Extraction
The shade-dried powdered plant materials were extracted using ethanol and methanol as solvents. The period of extraction was fixed at 24 h. About 100 g of Plant components were ingested in a beaker and 50ml of solvents (methanol and ethanol) were added. They were kept overnight and sonicated for 30 minutes in ultrasonic water. Care has been taken to prevent solvent loss during sonicating. It was then filtered the next day [6]. After finishing extraction, the extractive value was determined in respect to the dried plant material. The above extracts were studied for their colour, consistency and extractive values and they are reported in (Table 1).

Kunal Datta *et al.,*

Preliminary phytochemical Studies

A plant could be thought of as a biosynthetic laboratory for a diversity of chemical compounds, including glycosides, alkaloids, volatile oils, saponins, and many others that have physiological effects. Preliminary phytochemical screening was performed on the plant extracts utilized in the formulation of polyherbal ointment to identify different plant components such as alkaloids, flavonoids, tannins, and saponins. By screening the plant extracts, it is possible to ascertain whether or not they have therapeutic potential and may be used to create medications [7,8] (Table 2).

- **Test for alkaloids**
  The emergence of a green-coloured or white precipitate after adding strong hydrochloric acid to 2 ml of plant extract and then adding Mayer's reagent in small quantities shows the presence of alkaloids.

- **Test for glycosides**
  The development of a pink colour after mixing 2ml of plant extract with 3ml of 10% ammonia solution signifies the presence of glycosides.

- **Test for carbohydrates**
  The appearance of a purple or crimson colour after adding Molisch's reagent and a few drops of strong sulfuric acid to 2ml of plant extracts denotes the presence of carbohydrates.

- **Test for tannins**
  The production of a dark blue or almost green colour when mixing 1ml of plant extract with 2ml of 4% ferric chloride signifies the presence of tannins.

- **Test for saponins**
  2ml of 5% ferric chloride and 1ml of plant extract was mixed. When dark blue or greenish-black formation takes place, tannins are present.

- **Test for terpenoids**
  1ml of plant extract and 2ml of 4% ferric chloride were combined. Tannins are present when a greenish-black or dark-blue formation occurs. Triterpenoids are present when a blue-green colour forms.

- **Test for Flavonoids**
  Sodium hydroxide test
  If flavonoids are present, a yellow colour is seen in the sodium hydroxide-treated filtrate after the extract has been dissolved in water.

  Sulphuric acid test
  If you add a drop of concentrated sulfuric acid to the aforementioned, the yellow colour will vanish.

- **Test for steroids**
  To 1ml of plant extract add an equal volume of chloroform and a few drops of strong sulfuric acid are added, a brown ring forms, signalling the presence of steroids.

- **Gum and mucilage**
  Precipitation with 95% alcohol
  As they are insoluble in alcohol, gums and mucilages precipitate when 95% alcohol is added.

Molisch's test
10% alcoholic solution containing alpha-naphthol should be added to the substance's aqueous or alcoholic solution in a test tube. Shake thoroughly before adding a few drops of a concentrated sulfuric acid solution to the test tube's side. The existence of carbohydrates is shown by a violet circle at the intersection of two liquids.

Proteins and amino acids
Biuret test
After adding 2ml of a 10% sodium hydroxide solution and stirring, add 2–3 drops of a 1% copper sulfate solution to the 2ml of extract. Proteins are proven to be present by observable violet or purple colouration.

Ninhydrin test
Add 0.5ml of ninhydrin solution to 2ml of extract. Boil for two minutes, then let cool. If a blue hue shows up, proteins are present.

Preparation of Polyherbal Ointment
The working formula for ointment base (100gm):
➢ Polyethylene glycol 400 -50ml
➢ Polyethylene glycol 4000 -50g

Preparation of Polyherbal ointment formulation
The required quantities of Polyethylene glycol 400 and Polyethylene glycol 4000 were measured and melted. Then, the ethanolic and methanolic extracts from five plants were added to the melted mixture and stirred well until a homogeneous mass was obtained [9]. The inventory of polyherbal ointment ingredients, including Formulation 1 and Formulation 2, were listed in Table 3.

Physicochemical evaluation test of Polyherbal formulations
The polyherbal ointment was evaluated for various phytochemical parameters such as colour, odour, taste, pH, etc. listed in Table 4.

Colour and Odour Examination
Visual analysis was used to assess colour and odour.

Phase separation
The formulated preparation was kept in a closed container at room temperature and protected from light. The phase After then, the phase separation was constantly observed for 30 days to assess any changes [10].

Determination of pH
A digital pH meter was used to determine the pH of the ointment. The process involved weighing 0.5 g of ointment dissolving it in 50.0 ml of distilled water and then measuring its pH [11].

Stability studies
Studies on stability were conducted for the prepared formulations at different temperature conditions (4 -25º C and 37º C) for 2 months [10].

Spread ability
In this method 0.1 g of sample was placed between two glass slides with a weight of 500g for 5 minutes to measure diameter and determine their spreadability. This parallel-plate approach is a reliable and efficient method for determining the spread ability of various formulations. This approach has demonstrated high repeatability. The parallel-plate method involves placing 0.1 g of sample between two glass slides with a weight of 500g for 5 minutes to measure diameter and determine spreadability [12].

S = d² × π /4 where,
 S–Spreading area (cm²) depending on mass,
 d– Spreading diameter (cm)

All the observations of spreading area (cm2) were performed in a triplicate manner and calculate the + - SEM value using the formula of Excel action (Table 5 and Table 6).

Evaluation of Antimicrobial Activity of Polyherbal Formulation
Determination of the minimum inhibitory concentration (MIC)
The minimum inhibitory concentration (MIC) of an antimicrobial ointment was measured using the broth dilution method, with the lowest concentration showing no visible bacterial growth after incubation [13].

- The experiment involved preparing different concentrations of ointment (ranging from 1-9 mg mL-1) using tubes containing 9 ml of double-strength broth.
- The test antimicrobial ointment was added to all tubes except for the negative control (which had no ointment added) and the positive control (which was used to check the suitability of the test microorganism and the viability of the inoculums).
- The final volume in all tubes was adjusted using sterile water.
- The tubes were then inoculated with a suspension of standardized inocula (0.5 McFarland standard).
- The tubes were incubated at 37°C for 24 hours.

The purpose of the positive control tube was to ensure that the test microorganism was suitable for the experiment and that the inoculums were viable. The use of sterile water ensured that the experiment was not contaminated by any external factors. The standardized inocula ensured that the same amount of microorganisms was present in each tube, allowing for accurate comparisons between the different concentrations of ointment. The incubation at 37°C for 24 hours allowed for the microorganisms to grow and for the effectiveness of the antimicrobial ointment to be tested (Table 7).

Determination of the zone of inhibition
The Zone of inhibition was determined by using the Disc Diffusion method [14]. The standard inoculum was introduced onto the surface of the sterile agar plates and a sterile glass spreader was used for even distribution over the media. Blank sterile paper discs (6 mm) were placed on the inoculated Mueller-Hinton agar surface and impregnated with 10 ml of both formulation F1 and F2 polyherbal ointment. A concentration of 500 mg/10 ml vancomycin (Cipla Ltd., India), was used as a standard. The procedure was repeated for all the selected bacterial species used. The plates were incubated at 37°C for 24 h. All tests were performed in triplicate and the antibacterial activity was expressed as the mean diameter of inhibition zones (mm) produced by the ointment. The results obtained in the evaluation of the antimicrobial activity of both Formulation 1 and Formulation 2 ointment were depicted in Table 8.

Statistical Analysis
Statistical analysis was performed by one-way ANOVA method followed by Tukey's Post-hoc analysis.

RESULT

In the present study, the antimicrobial activity were successfully performed for Formulation 1 and Formulation 2 polyherbal ointment preparation. Formulations 1 and 2 exhibited potent antibacterial activity against *S. aureus* and *P. aeruginosa* respectively.
Formulation 1 produced more antibacterial activity against all the tested organisms. The results of antimicrobial susceptibility reveal formulation 1 has more promising antibacterial activity than formulation 2 against gram-negative bacteria (*P. aeruginosa*) as compared to gram-positive bacteria (*S. aureus*)

Kunal Datta *et al.,*

DISCUSSION

A polyherbal ointment made from five medicinal plants showed antibacterial efficacy due to the presence of bioactive chemicals, explaining their traditional use in Ayurvedic medicine. The developed polyherbal ointment demonstrated good physicochemical features and stability throughout a two-month period, ensuring its shelf-life and efficacy during storage and use. The prepared polyherbal ointment showed high antibacterial action against *Staphylococcus aureus* and *Pseudomonas aeruginosa*, making it a promising topical antibacterial agent for treating skin problems.

CONCLUSION

The polyherbal ointment prepared using *Azadirachta indica*, *Vitex negundo*, *Cynodon dactylon*, *Neolamarckia cadamba*, and *Curcuma longa* has antibacterial activity. It has good physicochemical qualities, is stable, and has a lot of antibacterial action against *Staphylococcus aureus* and *Pseudomonas aeruginosa*. The combination of several plant extracts and their bioactive ingredients is expected to contribute to its efficacy by utilising synergistic effects. The results of the disc diffusion assay indicate its potential as a topical antibacterial therapy. Exploration of traditional medicinal plants and development of polyherbal formulations are promising paths for the discovery of new therapeutic molecules. However, more research is needed to assess its in vivo efficacy, safety profile, mode of action, and antimicrobial susceptibility in general. Overall, the prepared ointment represents a promising natural therapeutic alternative that could aid in the fight against microbial illnesses and the improvement of overall health.

CONFLICT OF INTEREST

The authors have no conflicts of interest regarding this investigation.

ABSTRACT

Pulp and paper mills produce a significant volume of wastewater, which varies depending on the specific processes employed within the facility. Improper disposal of this wastewater can pose substantial risks to both the environment and human health. A range of techniques are employed to mitigate the presence of pollutants, including ion exchange, reverse osmosis, electrodialysis, and ultrafiltration. However, the aforementioned factors are largely contingent upon significant financial resources, and their implementation is limited due to cost considerations. The adsorption process has gained significant popularity as a preferred method for eliminating of hazardous chemicals from wastewater due to its simplicity, cost-effectiveness, efficacy, and versatility. The implementation of this method enhances the efficacy of wastewater removal within the prescribed discharge limits, while ensuring minimal environmental impact. The pursuit of more cost-effective alternatives has been prompted by the exorbitant expenses associated with coal-derived activated carbons. A range of sustainable adsorbents, such as Lignite, have the potential to be employed for the purpose of mitigating pollutants in wastewater.The aim of this study is to investigate the adsorption process as a means of reducing COD (Chemical Oxygen Demand) in effluent within the pulp and paper industry. This research focuses on the utilisation of sustainable adsorbents, such as lignite, for this purpose. An experimental adsorption study was conducted using a neutral sample obtained from the paper making industry in Gujarat. The study investigated the values of chemical oxygen demand (COD) and percentage COD reduction using two distinct adsorbents, namely activated carbon and lignite, under various conditions. Specifically, the research examined the impact of different quantities of these adsorbents.

Keywords - Waste water, COD, Activated carbon, Lignite.

INTRODUCTION

The expansion of the paper and pulp sector has been accompanied by a significant volume of wastewater resulting from the extensive utilisation of freshwater resources during the entirety of its manufacturing process. The production of paper can be categorised into two distinct processes: the conversion of wood into pulp and the subsequent transformation of pulp into paper. The wastewater can be categorised into two distinct types: wastewater generated from pulp manufacturing facilities and wastewater originating from paper production facilities. A significant number of paper and pulp mills in India release their effluents, which consist of chlorine bleach and black liquor, directly into nearby water bodies, resulting in significant environmental issues. Pulp wastewater is derived from various stages of wood preparation, pulping, pulp bleaching, and paper making. On the other hand, paper wastewater is generated during the utilisation of screens, washers, paper-making machines, and beaters, as well as during the operation of adjusting and mixing tanks. The production of pulp and paper results in the emission of a considerable quantity of pollutants, which are primarily identified by their elevated levels of total suspended solids (TSS), chemical oxygen demand (COD), biological oxygen demand (BOD), and a dark coloration caused by lignin and various other harmful substances. The lignin wastewater generated by the pulp and paper industry is classified as hazardous and toxic waste. It is necessary to subject this wastewater to treatment before disposal, primarily because of its elevated levels of recalcitrant organic compounds. These compounds contribute to a significant concentration of chemical oxygen demand (COD). The wastewater produced during the pulp bleaching process contains high concentrations of toxic substances due to the use of chlorine for the purpose of enhancing the brightness of the pulp.

As a result, wastewater from various industries contains high levels of chemical oxygen demand (COD) and other contaminants, making it inappropriate for direct discharge into water bodies without proper treatment. To address the increasing need for potable water and high-quality water for industrial purposes, it has become imperative to implement wastewater treatment processes for reuse while minimising the presence of pollutants prior to their discharge into natural water sources. Several conventional treatment technologies have been examined for the treatment of wastewater, including the coagulation process, membrane filtration, and oxidation process. The aforementioned methods are typically associated with high costs. Among the various methods considered, it has been determined that the adsorption process is the most effective and preferable alternative for waste water treatment. This conclusion is based on its convenient and user-friendly nature, high efficiency, sustainable characteristics, and simplicity of design [16]. Adsorption processes are commonly employed in effluent treatment plants to decrease the concentration of dissolved pollutants that persist after the completion of biological phases or chemical oxidation treatments. In contemporary times, a significant number of industries have widely embraced the use of adsorbents, particularly activated carbon. The application of this method is frequently observed in the mitigation of diverse contaminants present in wastewater, including metals, colourants, and other substances. Nevertheless, the extensive utilisation of this substance in the context of wastewater treatment is occasionally limited as a result of its elevated expense. The exorbitant expense associated with coal-derived activated carbons has prompted extensive exploration for more cost-effective substitutes. Several inexpensive adsorbents, including lignite, have the potential to be utilised for the purpose of reducing pollutants in wastewater.

Scope of Experimental Work:
Objective
Activated carbon is commonly employed as an adsorbent for the treatment of effluent in the pulp and paper industry; however, its high cost poses a significant challenge. Small-scale industries often opt for the adsorption technique based on its cost-effectiveness, taking into account their limited resource constraints. The potential use of cost-effective adsorbents, such as Lignite, warrants further investigation to evaluate their efficacy in the treatment of wastewater effluent.

Approach

The flow-sheets commonly used in industrial wastewater treatment, as depicted in Figure 1, typically involve several stages. These stages include primary treatment, which involves pH adjustment and clarification, followed by secondary treatment, which may involve biological or chemical treatment along with clarification. Additionally, depending on the initial quality of the wastewater and the regulatory requirements for discharge, tertiary treatment involving activated carbon may be employed. During the primary treatment process, the neutralisation of wastewater leads to an increase in the concentration of salts. High concentrations of salts have the ability to impede biological activity and potentially result in an elevation of non-settleable suspended solids within the treated wastewater.

The flow sheet depicted in Figure 2 above presents a proposed approach that incorporates the use of cost-effective adsorbents for adsorption prior to the conventional primary treatment. This strategy aims to enhance the effectiveness of subsequent biological treatment processes.

Experimental procedures

Sampling collection

The samples were obtained from the inlet stream of the ETP (Effluent Treatment Plant) as neutral samples. They were collected in bottles and subsequently sealed. The samples were stored under ambient conditions.

Procedure

In the experiment, a flask was utilised to combine 50 ml of sample with 1% (0.5 gm) of Activated carbon (A/C). The mixture was stirred for a duration of 1 hour using a magnetic stirrer. The aforementioned methodology was replicated for solutions containing 2% A/C, 3% A/C, and 4% A/C, while maintaining a consistent sample volume of 50 ml. The same procedure was employed, but with the substitution of lignite adsorbent in lieu of activated carbon. The experiments were conducted at an ambient temperature of approximately 30 °C.

RESULTS AND DISCUSSION

Effect of Quantity of adsorbent

The reduction in chemical oxygen demand (COD) for a neutral sample using lignite ranges from 7.59% to 11.48% when the lignite concentration is increased from 1% to 2%. Similarly, the use of activated carbon results in a COD reduction ranging from 15.37% to 19.26% when the activated carbon concentration is increased from 1% to 2%. The reduction in chemical oxygen demand (COD) for a neutral sample using lignite ranges from 15.74% to 22.22% when the lignite concentration is increased from 3% to 4%. Similarly, the use of activated carbon results in a COD reduction ranging from 23.33% to 26.85% when the activated carbon concentration is increased from 3% to 4%. The aforementioned observations were conducted on two distinct adsorbents, namely Lignite and Activated carbon. The results of the comparison between the COD values and the percentage of COD reduction for both Lignite and Activated carbon were obtained. It has been observed that the reduction in chemical oxygen demand (COD) is greater when using activated carbon, albeit in smaller quantities. Due to the financial implications associated with the procurement of activated carbon, its utilisation may not be deemed feasible for small-scale industrial operations. Given this factor, it is possible to substitute it with Lignite.

CONCLUSION

- The pulp and paper industry encompasses a wide range of processes and products. Water pollution is a significant issue due to the substantial amount of wastewater produced by the pulp and paper industry. The volume of wastewater generated depends on factors such as the type of raw material, the final product, and the extent of water reuse.

Sunil Valand and Latesh Chaudhari

- The industrial effluents contain pollutants with high chemical oxygen demand (COD), primarily due to the presence of lignin, a component of wood. Lignin wastewater generated by the pulp and paper industry is a hazardous and toxic waste that requires treatment before disposal. This is necessary due to its high concentration of recalcitrant organics, which contribute to elevated levels of chemical oxygen demand (COD).
- The comparison of COD values and %COD reduction values between Lignite and Activated carbon indicates that Activated carbon exhibits higher %COD reduction values. Due to its high cost, activated carbon is not suitable for implementation in small-scale industries. This factor can be substituted with Lignite.

ABSTRACT

Anemia accounts for most of the nutritional problems across the globe. Young girls, in general, have characteristics of unhealthy eating habits, such as skip breakfast, unhealthy diets, low nutrient foods, and eating fast food; therefore, adolescents are not able to meet the diversity of nutrients needed by the body for the synthesis of hemoglobin formation. When this happened over long periods the hemoglobin levels will continue to decrease and cause anemia. The study's main aim was to assess the effectiveness of beetroot juice and spinach juice on hemoglobin levels among college students. A quasi-experimental study design was used to assess the effectiveness of beetroot and spinach juice on Nursing students. Forty participants were randomly allotted to each experimental group based on inclusion & exclusion criteria. Hb level was measured before and after an intervention. The mean differences in hemoglobin levels of both experimental groups show beetroot and spinach juice are statistically significant in improving hemoglobin levels. Furthermore, the "t" test indicates there was no significant difference in the effect of beetroot juice and spinach juice; however, in the moderate category mean hemoglobin level of both the experimental groups showed that spinach juice is more effective than beetroot juice. There was no association of hemoglobin level with demographic variables. The study concludes that beetroot juice and spinach juice both are effective to improve the hemoglobin level; however, there was no significant difference in the overall effect of beetroot juice and spinach juice. Furthermore, for the moderate category spinach juice is more effective than beetroot juice on hemoglobin levels.

Keywords: Beetroot juice, Spinach juice, hemoglobin level, anemia, collegiate students.

INTRODUCTION

Anemia accounts for a majority of the nutritional problem across the globe. The prevalence of anemia is inordinately higher among developing nations. In developing countries, the adolescent group is more exposed to nutritional challenges and adolescent girls are more vulnerable to the disease.[15] Research on anemia prevalence done by A.Sasidharannair et. al. in the year 2019 showed that adolescent anemia was the greatest nutritional problem encountered in developing countries. India had reported a high prevalence of anemia among adolescent girls, which is higher when compared with other developing nations.[2]. According to recent statistics, there were about 1.2 billion adolescents worldwide, which constitute one-fifth of the total world's population and the figures are escalating. Developing countries account for about 5 million adolescents of the total population and in India about 21% i.e., 253 million of the total population are adolescents.[2]

The adolescent period has been considered as the transitional phase from childhood to adulthood, during which major psychological, behavioral, and physical development ensure because of marked physical activity and rapid growth spurt adolescents needs additional nutritional requirements.[2]Young women, in general, have characteristics of unhealthy eating habits, such as skip breakfast, delay to drink water, unhealthy diets because they want to be slim (ignoring the source of protein, carbohydrates, vitamins, and minerals), the habit of snacking low nutrient foods and eating fast food. Therefore, adolescents are not able to meet the diversity of nutrients needed by the body for the synthesis of hemoglobin formation. When this happens over long periods the Hb levels will continue to decrease and cause anemia. On the other hand, Menarche is also one of the markers of puberty and therefore can be considered as one of the important events in the life of adolescent girls. [16].

In adolescent girls, apart from meeting growth needs, sufficient iron intake is also essential before and during pregnancy. Iron is one of the essential nutrients required by our body, as it cannot be made by our body on its own. [15]The amount of iron in the body varies according to weight, gender, hemoglobin level, and the size of body iron stores. Iron deficiency is defined as a reduction in ferritin levels that generally results from a diet in which the bioavailability of iron is inadequate or from an increased need for iron during a period of intense growth (pregnancy, adolescents, and infancy).[11]Spinach is one of the alternative plants to fulfill the Fe needs of adolescents with anemia. Furthermore, one of the natural food ingredients that can overcome anemia is beetroot [10]. Beetroot juice are lowering blood pressure, increases the amount of oxygen, improves stamina, prevents congenital disabilities, and overcomes menstrual problems. The active substance contained in spinach and beets that can increase Hb is Fe. [8]. The present study focused to identify the difference in the effect of beetroot and spinach juice on hemoglobin level.

MATERIALS AND METHODS

Design and Sample:
A quasi-experimental, pretest-posttest design was conducted in Surat, Gujarat, in the month of June 2022. Adolescent girls of 17-19 years who are suffering from anemia which is identified by a level of Hb < 12 gm /dl included in the study. The samples were selected based on inclusion and exclusion criteria. The exclusion criteria include girls having any hematological or gynecological problems.

Intervention and Observation
Initially, nighty six (96) students were screened out for anemia, among them fifty-two (52) samples were eligible for the study. In order, to avoid the influence of intervention, an equal participant was randomly allocated to each experimental group. Beetroot and spinach juice for 30 days, six days in a week was administered in experimental group-1 and 2 respectively. The participant who had discontinued the study or skipped intervention were excluded and at last,analysis was done on 40 participants.

Kinjal Mistry and Sateesh Biradar

The essential research materials, green spinach, and beetroot were purchased from the market. The juices were made in the following ways: green spinach leaves and beetroot were weighed on the kitchen weigh scale and cleaned under running water, then drained. It was brewed for about 5 minutes with boiling water, then mashed Using a blender, mix the ingredients until smooth. One pinch of salt and jeera powder was added to the juice for a test. Then it was wrapped in plastic. cups, ready to be given to the respondent once every morning for a month.

Anemic adolescent girls (Hb levels 12 g/dl) who satisfied the research criteria were chosen as research subjects. By dividing the responders into two groups by random sampling. The investigation Group I and II (n = 26 in each group) were given 100 mL of beetroot and spinach juice respectively. The Hb level was measured as a pretest on day Zero (0) and a post-test on the 30th day. Participants who skipped the trial for more than a day were excluded from analysis. In the end, 20 participants were eligible for analyses in each group of experiments. The study data were analyzed by using Descriptive and Inferential statistics, the Karl Pearson coefficient correlation test, and the Chi-square test.

RESULTS

The study result shows the average age of the beetroot juice and spinach juice group was 17-18 years. The majority of participants in both groups are living in urban areas.

Beetroot juice and Spinach juice intervention on Hb levels
After 30 days intervention of with beetroot juice to anemic adolescent girls, there was an increase in Hb levels from 10.15 g/dl to 10.88 g/dl with a mean difference of 0.73. The increase in Hb levels was statistically significant with Paired t-test at $p < 0.05$, "t" was 2.47. The spinach juice group also experienced an increase in Hb levels, from 9.87 g/dl to 10.65 g/dl with a mean difference of 0.77. The increase in Hb levels was statistically significant with Paired t-test at $p < 0.05$, "t" was 2.77.

Beetroot juice and spinach juice intervention on Hb levels as per Anaemia Grade Category
The beetroot juice group shows Hb increase with a major mean difference of 4.6 in the severe category; whereas in the spinach juice group, major variation in hemoglobin takes place in the moderate category with a difference of 1.92

No. of student's Hb level increased as per Anemia Grade
The study revealed that out of 20 students, a total of 11 students' Hb increased in the post-test It shows in the beetroot group ; whereas, in the spinach group total of 12 students' Hb increased after the intervention. It shows that the Beetroot group, the majority of the students who increased their hemoglobin were from the mild category (08) whereas, in the Spinach group, the majority of students who had increased their hemoglobin level were from the moderate category(07).

Difference in Effect on Hb level of Beetroot Juice Group and Spinach Juice Group
The study shows that there was no significant difference in the overall effect of beetroot juice and spinach juice on hemoglobin level.

Association of hemoglobin level with demographic variable
The study shows no significant association of selected Socio-demographic variables, such as Age, student and parent education, Residence, and Diet with hemoglobin levels among the beetroot and Spinach Juice group.

DISCUSSION

Beetroot juice can accelerate Hb levels in anemic adolescent girls because beetroot has a high Fe content that can regenerate and reactivate red blood cells and bring fresh oxygen to the body. Beetroot (in 100g) contains vitamin C,

Kinjal Mistry and Sateesh Biradar

Vitamin B, and 0.80 mg Fe, equivalent to 10% of the total daily Fe requirement. A very well-known benefit of this beet is overcoming anemia, even known as anti-anemia. [11] The content of Vitamin C or ascorbic acid in this beet can help absorb Fe in the body. This beet also contains relatively sufficient Fe to overcome anemia caused by Fe deficiency.(16) The adolescent girls were given freshly prepare beetroot juice in mid-morning for 20 days. The study shows a highly significant improvement in hemoglobin levels among adolescents with a "t" value of 17.78 at a p-value of 0.001. (8) The present study indicates that 100 ml of beetroot juice for 30 days increase Hb levels. Initially, the average Hb was 10.15 which was increased to 10.88 gm/dl. It shows a statistically significant effect of beetroot on Hb among adolescent girls (P <0.005).

Spinach leaves contain high Fe to prevent anemia. The Fe present in spinach leaves can be useful for the process of forming Hb in the blood. If one can consumes spinach leaves, a person will have blood Hb levels within normal limits and prevent anemia. Spinach leaves are a vegetable food ingredient that contains the highest Fe, which is 3.9mg/100g compared to other types of vegetables, such as mustard greens of 2.9mg, Katuk leaves of 2.7mg, kale of 2.5 mg and cassava leaves of 2.0mg (16).The majority study experimented with red spinach and shows significant improvement in Hb level; however, in the present study, green spinach leaves are utilized and100 ml of spinach juice for 30 days were administered showing significant improvement on average Hb level from 9.87gm/dl to 10.66gm/dl.

This study also indicates, beetroot juice and spinach both are effective to improve the hemoglobin level, but spinach juice shows a good effect on the improvement of average hemoglobin levels. However, a study conducted by Rudolf Purba shows that adolescent girls who are anemic may consume beetroot juice and spinach juice as alternative food for therapy of hemoglobin improvement.(16) One of the studies conducted by S. A. Helan et. al.(2021) concludes that there was asignificant association between hemoglobin level and clinical manifestations with demographic variables. Hence, the study revealed that beetroot juice has significantly improved the hemoglobin level.(18) In the present study, there was no significant association between the hemoglobin level and demographic variables, such as Age, Education of students, Education of father, Residence, and Diet.

Also, one of the studies conducted by Mr. Luke Francis et al. (2017) concluded the improvement in Hemoglobin levels by using extracting beetroot juice with jaggery. (17) In the present study, there was no addition of out ingredients like jiggery with beetroot juice; however null hypothesis was rejected which indicates that beetroot juice is significantly effective in improving hemoglobin level and that's not occurring by chance.

CONCLUSION

Beetroot and Spinach juice both are useful in raising Hemoglobin levels. The adolescentcan consume beetroot and spinach juice as an alternative food for hemoglobin improvement and to prevent anemia.

ABSTRACT

The therapeutic journey of India from the ancient to the modern era never gets completed without natural remedies based ancestral Ayurvedic system of medication. Nishamalaki churna and Gomutra (cow urine) are the inherent components of Ayurveda recommended in the treatment of multifarious ailments. In India, the practice of herbal therapy in conjunction with Gomutra is the traditional therapeutic aspect but thorough scientific acknowledgement is needed to substructure the claimed aspect. The purported scrutiny discloses the prospects of Gomutra extract of Nishamalaki churna for antioxidative and anti-enzymatic aptitude. The antioxidative propensity against DPPH (1,1-diphenyl-2-picrylhydrazyl) radicals was detected with an IC_{50} digit of 94.59 µg/mL while reducing power assay expressed the absorbance value from 0.198 to 1.221 within the experimented range of 50 to 250 µg/ml, which was noticed as more dynamic and competent than aqueous extract. The antihyperglycemic interrogation through anti-α-amylase and anti-α-glucosidase vetting was successively remarked through the IC_{50} digits of 100.16 µg/mL and 146.02 µg/mL. The competence in the inflammatory state through the anti-lipoxygenase approach was accompanied by the IC_{50} digit of 127.89 µg/mL whereas

65669

anti-proteinase exposition was feeble. All-inclusive proceedings pointed out that, the bygone Indian therapeutic assert behind the intermixture of herbs and Gomutra may provide a purposeful approach to worldwide public health, and potentiality exerted by Gomutra extract of Nishamalki churna has a co-relationship with the pivotal phytochemicals revealed within the extract.

Keywords: Nishamalaki, Gomutra, Antioxidative, Antihyperglycemic, Anti-inflammatory

INTRODUCTION

The ubiquitous oxidative load noticed throughout the world becomes a vital factor for the predicament of health through the development of different disease conditions including hyperglycemia and concomitant inflammatory circumstances. Multiple scientific investigations claim that ample concentration of oxidants along with inflammatory circumstances may produce injury towards pancreatic functioning and stimulate the propagation of hyperglycemia. Prolonged hyperglycemic plight may cause an increment in oxidative stress by causing alteration in mitochondrial operation and possibly promoting the genesis of inflammatory intermediaries [1, 2]. Management of these intertwined illnesses arises as a challenge for the medicinal world because allopathic medicines are always interconnected with unwanted toxic effects and individual medicine is not efficient to control the multiple complications observed in diabetic patients. [3, 4].

Ayurveda is the ancestral medicinal culture in India, built with the foundation of natural remedies and now the modern world agreed with its long-term benefits[5]. Secondary plant metabolites have attracted the phytopharmaceutical sector for research activities due to their healthful nature[6]. A number of scientific investigations reported that antioxidant constituents in plant material may offer efficacy to combat excessive oxidative stress by neutralizing and ousting the free radicals to avert cell detriment in the body. These constituents are not only efficient to control hyperglycemia but also found to be efficacious against various complications associated with hyperglycemia [7]. Nishamalaki churna and Gomutra (cow urine) are acclaimed components of Ayurveda, accommodated with copious counts of bioactive substances responsible for divergent therapeutic aptitude. Nishamalaki churna is a renowned ayurvedic formulation containing counterpart powdered material of Fruits of *Emblica officinalis,* and Rhizomes of *Curcuma longa*. An individual component of Nishamalaki churna belongs to antioxidative and antihyperglycemic effects [8]. Gomutra is recommended in Ayurveda for the treatment of different ailments associated with blood, skin, digestive system and urinary tract system [9]. Consumption of Gomutra along with herbal remedies is acknowledged for the rectification in the bioavailability of essential elements of herbal materials, which leads to improvement in therapeutic potentiality [10]. 'Gayatri Parivar' is a prominent organization in India, that recommended herbal formulations processed with Gomutra for the treatment of hyperglycemia [11]. To find out the scientific base behind such traditional claims, the present antioxidative and enzyme inhibitory performance was investigated with the Gomutra extract of Nishamalaki churna.

MATERIALS AND METHODS

Collection of plant materials and Gomutra (cow urine):
Fruits of *Emblica officinalis* and Rhizomes of *Curcuma longa* were procured from the local farmer. The cross-verification of procured materials with respect to botanical data was confirmed by a pharmacognosist at B. K. College of Pharmacy, Sakoli, Maharashtra, India. Gomutra (cow urine) was procured from the domestic cow, filtered, and preserved for the intended study.

Formulation and Maceration of Nishamalaki churna
Fresh rhizomes of *Curcuma longa* were boiled in water followed by drying for 3 weeks and grinding. Fresh juice of Fruits of *Emblica officinalis* was mixed with powder of *Curcuma longa* till it converted to a fine paste. The obtained

mixture was shade dried and powdered again [12]. A 50 g of formulated Nishamalaki churna was separately macerated by using Gomutra and distilled water for 75 hours; subjected to filtration, and converted to semisolid mass by means of evaporation on an electric water bath.

Phytochemical checkup

The vetting of the phytochemical traits of the Gomutra extract and the aqueous extract of Nishamalaki churna was performed with different qualitative tests [13].

In vitro Antioxidative experiment:
Anti-DPPH appraisal

The individual trial concentrations of each extract were independently blended with fresh alcoholic DPPH reagent (1000 µL; 0.2 mM) and after 30 minutes,ramifications of the study were noted at the wavelength of 516 nm. Typical scrutiny for comparison was performed with the equivalent concentrations of ascorbic acid [14].

Reducing Power Assay

Unequal concentrations of each sample were assorted independently with 2500 µl of each 0.2 M sodium phosphate buffer (pH 6.6) and 1% potassium ferricyanide. After incubation at 50 °C for 20 minutes, all concentrations were summated with 2500 µl of trichloroethanoic acid (10%) and spinned in a centrifuge machine for a quarter-hour with a rotation frequency of 3000 rpm. The upper layer (3000 µl) from each centrifuged solution was mingled into 2000 µl refined water and 500 µl of 0.1% iron trichloride and finally, consequences of absorbance were noted at the wavelength of 700 nm. Reference observations were regulated with ascorbic acid [15].

In vitro Antihyperglycemic experiment
Anti-α-Amylase appraisal

All trial concentrations (250 µL) were independently mixed with α-amylase-phosphate buffer solution(500 µg/mL)and mingling of the starch solution (1%; 250 µL) was done after 10 minutes. Finally, dinitrosalicylic acid (500 µL) and distilled water were assorted into entire admixtures and upshot were noted at the wavelength of 540 nm. The reference study was regulated with acarbose [16].

Anti-α-Glucosidase appraisal

The 50 µL of different trial concentrations were blended with 100 µL of α-glucosidase (1 unit/mL) and admitted To incubation for a quarter-hour. The 50 µL p-nitrophenyl glucopyranoside (3.0 mM) was appended for the Furtherance of the reaction and allowed for additional 20 minutes of incubation at ambient temperature. Ultimately 2000 µL soda ash (0.1 M) was supplemented and spectral corollaries were enumerated at 405nm. Standard outcomes were monitored with acarbose [17].

In vitro Anti-inflammatory experiment
Anti-Proteinase appraisal

A60 µg of trypsin was blended with a 2000 µL admixture containing an equivalent quantity of trial sample andtris-hydrochloride buffer (pH 7.4) and withheld at 37°C for 5 minutes**.** All admixtures were commixed with 1000 µL of casein solution (0.3% w/v) and withheld at the same temperature for a quarter-hour. Finally, the reaction has desisted with the annexation of 2 mL of 70% hyperchloric acid followed by a centrifugation step. The overhead layer from each centrifuge tube was analysed at 210 nm. Standard corollaries were scanned with diclofenac [16].

Anti-Lipoxygenase appraisal

Individual trial samples (50-250 µg/mL) were mixed-up with 250 µLof each boric acid buffer (2M; pH 9) and lipoxygenase solution (20,000 U/mL) and retained at ambient temperature. After 5 minutes, 1000 µL linoleic acid suspension (0.6 mM) was assorted and end results were observed at the wavelength of 234 nm. Comparative vetting was done with the equivalent concentrations of diclofenac [19].

Computation of % inhibition and IC$_{50}$ value:
The % inhibitions were computed with equation 1 while IC$_{50}$ values were computed from a regression graph based on concentration employed and % inhibition determined
Equation 1: % inhibition = [(OD$_{con}$ − OD$_{sam}$)/OD$_{con}$] × 100
(OD$_{con}$: Optical density of the control and OD$_{sam}$: Optical density of the sample)

RESULTS AND DISCUSSION

Worldwide noticed oxidative stress was affirmed as a major fundamental cause for the induction of hyperglycemia and intertwined complications. Scientifically it has been observed that the extreme genesis of free radicals not only incites insulin resistance but also emphasizes the impairment in the synthesis and secretion of insulin by beta cells [20]. A number of scientific investigations on a variety of medicinal plants reported the glucose-lowering and antioxidative effects supported by their clinical trials in diabetic sufferers. A variety of bioactive molecules present within the plant material are not only efficient to control hyperglycemia but also found to be efficacious against various complications that occur due to hyperglycemia. These phytoconstituents exert their potential through the promotion of biosynthesis and release of insulin, modulation of sugar biotransformation, and reduction of undesired levels of cholesterol. In addition, antioxidant constituents in plant material may offer efficacy to combat excessive oxidative stress by neutralizing and ousting the free radicals to avert cell detriment in the body [21].

Phytochemical Scrutiny:
The phytochemical makeup of both extracts signifies the existence of multifarious crucial chemical components including nitrogenous and phenolic compounds like alkaloids, tannins and flavonoids. The Gomutra extract also indicated positive results towards phytosterol existence.

Antioxidative inquest:
The boosting order of % inhibition was observed in the anti-DPPH scrutiny with reference to both extract and standards illustrated in Fig.1. The inhibitory aftermath for DPPH radicals suggests that the Gomutra extract expressed more substantial results than the aqueous extract. The potency of Gomutra extract, aqueous extract, and ascorbic acid sequentially reflected with the IC$_{50}$ numerals of 94.59, 146.61, and 18.26 µg/mL. The effectual% inhibition offered by each concentration of Gomutra extract reflected its nature as a purposive antiradical resource. The change of the DPPH solution from violet to yellow tone may be due to the reduction of nitrogen-based radical components in the solution is the manifestation of its antioxidative nature. The reduction propensity shown by Gomutra extract is possibly due to the proton donating deftness of its phytochemicals [22]. The antioxidative consequences analysed through the reducing power approach were correlated with the absorbance value of the tested concentration (Fig.2). With the content of 250 µg/ml, a perusal of the absorbance of Gomutra extract, aqueous extract, and ascorbic acid was sequentially noticed as 1.221, 0.754, and 1.698. The higher value of absorbance of the sample is the inkling of its higher reducing competency. The reducing potentiality is the essential parameter of antioxidant compounds to reduce the oxidized contents of lipid peroxidation[23]. The reducing power explicit the strength of antioxidants for the reduction of the iron (3+) ions to iron (2+) ions through the donation of electrons, and hence transforms the color of the solution to distinct green and blue tints[24]. The augmentation in reducing power revealed by the Gomutra extract was noticed as more dynamic and competent than the equivalent concentration of aqueous extract.

Antihyperglycemic inquest:
Anti-hydrolyses potentiality is the most convenient mode to evaluate the antihyperglycemic performance. The outcomes of anti-α-amylase experimentation are illustrated in Fig. 3, reflecting the significant performance of Gomutra extract with the IC$_{50}$ numeral of 100.16 µg/mL. The statistics for IC$_{50}$ value reflected the diminutive performance of aqueous extract with a value of 132.29 µg/mL and the paramount performance of acarbose with a value of 73.53 µg/mL. The aftermath of anti-α-glucosidase experimentation (Fig. 4) reflected the improved

potentiality of the Gomutra extract (IC$_{50}$ value: 146.02 µg/mL) as compared to the aqueous extract (IC$_{50}$ value: 194.06 µg/mL). Acarbose reflected the supreme anti-enzymatic performance through the IC$_{50}$ value of 28.60 µg/mL. The significant inhibitory presentation by Gomutra extract may become an efficient mode for curtailing elevated sugar levels. The essential bioactive constituents like phenolic components reflected during the vetting of the phytochemical nature of Gomutra extract may contribute towards observed performance. The different research work communicated that phenolic moiety can generate a hydrogen bonding with hydrolyses and thus produces interference during the breakdown of polysaccharides[25]. During hyperglycemic situations, the generation of free radicals through the oxidation of simple sugar promotes undesired complications in the body. The significant antiradical performance of Gomutra extract may contribute supplementary action against the development of such complications [26].

Anti-inflammatory inquest:

The hostile rendition towards proteases and lipoxygenase is always contemplated as aforemost possibility for anti-inflammatory aptitude. The finding of the anti-proteinase examination is given in Fig. 5. The rendition of Gomutra extract accompanied by the IC$_{50}$ numeral of 360.63 µg/mL was poor as compared to aqueous extract and diclofenac sequentially accompanied by the IC$_{50}$ numerals of 177.07 µg/mL and 115.99 µg/mL. Inflammatory situations are seen with the release of proteolytic enzymes and hence antiprotein a section produces the possibility of anti-inflammatory potentiality [27]. Earlier research studies reported the presence of urokinase in Gomutra may affect the anti-proteinase performance of Gomutra extract[28]. Another anti-inflammatory experiment performed by anti-lipoxygenase assay (Fig. 6), showed that Gomutra extract executed improved potentiality with the IC$_{50}$ value of 127.89 µg/mL. Diclofenac accompanied by the IC$_{50}$ numeral of 82.03 µg/mL was noticed as the supreme performer while aqueous extract accompanied by the IC$_{50}$ numeral of163.34 µg/mL was found as the weak performer. The experimented data revealed that Gomutra extract can execute anti-inflammatory potentiality through the anti-lipoxygenase mode. Lipoxygenase has been found to play an important role in the generation of pro-inflammatory elements from unsaturated fatty acids. In a hyperglycemic situation, the overproduction of oxidants can lead to lipoxygenase stimulation and an increase in the inflammatory response [29]. Previous scientific data proposed that endogenous peptides disclosed in Gomutra could express binding with these enzymes and terminate their role in the generation of inflammatory elements [30]. In addition, the antioxidant potentiality of Gomutra extract can support the anti-lipoxygenase activity.

CONCLUSION

The extensive results of the experiment led to the fact that the traditional assertion of medicinal plants combined with Gomutra could create a healthful approach in the therapeutic world. In addition, the finding of important phytochemicals in the Gomutra extract of Nishamalaki churna, which are required to link biological functions at the molecular level, may be accountable for the results obtained.

ABSTRACT

One in three people today will develop cancer, which is currently a prevalent condition. Another cancer type for which early identification and treatment are crucial is breast cancer. The likelihood that a patient will receive treatment increases with the timing of breast cancer detection. To prevent breast cancer, several types of earlier identification techniques are being researched and deployed. An initial identification of BC can greatly enhance the prognosis and survival chances for patients by encouraging timely therapeutic therapy. A more accurate grading of benign tumours could save people from obtaining unnecessary medical attention. As an outcome, In-depth study has been done to distinguish between benign and malignant conditions in people and effectively identify BC. Due to its clear benefits in extracting crucial characteristics from problematic BC datasets, machine learning (ML) has been established for BC pattern categorization and forecast modelling. The suggested approach involves a three-stage process. First, Independent Component Analysis (ICA) approach is used for dimensionality reduction of the data. Then, the outliers from the cancer dataset were found using the Unsupervised Possibilistic Fuzzy Based Clustering methods (UPFC). Finally, use the Adaboost Support Vector Machine (ASVM) to determine whether the cancer is malignant or benign. The breast cancer dataset utilized to assess the impact of the recommended approach. Before and after the outliers were removed, studies were run on a dataset of breast cancer cases. Outcomes of comparisons show that the suggested strategy

performs better and is very accurate. The results of this breast cancer study will aid in the diagnosis of the disease and in the treatment of patients.

INTRODUCTION

Cancer is a critical factor in deaths for women worldwide. More people have died from it than from other illnesses like malaria or tuberculosis. According to the International Agency for Cancer Research (IARC) and American Cancer Society, two organisations affiliated with the World Health Organisation (WHO), there were 17.1 million new cases of cancer globally in 2018 [1]. By 2040, the WHO predicts that there will be 27.5 million new cases of cancer and 16.3 million cancer-related deaths [1]. Breast, Lung, stomach, bowel (including anus), and prostate cancers are the four usual malignancies in women globally. According to IARC data, 25% of all cancer cases in women globally are breast cancer cases. 82% of the world's population, or 53% of these instances, reside in developing nations [1]. According to reports, simply 2018 will see 626,700 deaths [1]. The primary cause of cancer death across women in poor nations is breast cancer, while lung cancer is the second usual cancer across women in industrialised nations. Breast cancer cells have the potential to invade nearby lymph nodes or potentially harm organs like the lungs. Invasive ductal carcinoma is a type of breast cancer that more frequently develops when milk-producing ducts become dysfunctional. But it can also start in the breast's other cells or tissues, such as the glandular tissues known as lobules [1]. Additionally, studies have discovered that environmental, lifestyle, and hormonal factors all raise the chance of breast cancer [2,3].

Breast cancer survivability prediction activities are frequently categorised as 'dead' or 'living' at a certain moment in time. Healthcare databases frequently gather breast cancer survivorship data without any clear scientific goal [1] [2]. The efficiency of the model may be impacted by records in this type of data that do not adhere to the usual standards. For instance, patients with stage I breast cancer who are less than 30 years old should be classified as "alive." As a result of their deaths from other conditions, these individuals have been labelled as "dead" in the data set. In these situations, consider the data as outliers. At the moment, data outliers frequently lead to overfitting issues in the learning model, which introduces an excessively limited hypothesis to fit the training data well but operates badly on unseen data [5]. Additionally, most inductive learning attempts to generalise from a set of training cases in order to maximise classification accuracy on previously unknown situations. Therefore, the highest accuracy that may be achieved relies on the quality of the data and if the biases of the learning algorithm that was selected were adequate for the data [5]. Thus, the most crucial stage in performing data mining jobs is discovering outliers.

In data mining, where preprocessing the dataset is utilised to increase the accuracy of diagnosis results, outlier detection is critical and crucial. Some of the data objects in huge databases are imperfect. Outliers are those data points that deviate significantly from most of the data. Therefore, these data items should not be used in the regular data mining method. Thus, detecting outliers, enhancing the quality of data objects, and producing correct data mining results all depend on outlier detection, formerly referred to as anomaly detection. Outliers, under Hawkins' definition, are "data objects that deviate so much from other data objects as to raise suspicions that they were produced by a various mechanism." Thus, outliers are likely caused by reading measurement error, execution error, etc., yet they have nonetheless traditionally been regarded as noise. The outlier detection (OD) algorithm is utilized in these studies to identify outliers in a dataset on breast cancer. Following outlier detection, the reduced dataset is classified employing a decision tree classification technique as either malignant or benign cancer. Data items are classified according to pre-established classes or groups as part of classification. while compared to prior studies, the decision tree classification is employed to more accurately determine whether an output class is malignant or benign while detecting a breast cancer dataset.

RELATED WORKS

Güllüoğlu [6] performed initial studies on using data mining to diagnose cancer. The purpose was to provide details about how health specialists should use data mining in the medical field to acquire a different perspective on decision-making processes. Kharya [7] examined studies on the detection of breast cancer utilising data mining techniques such support vector machine classifiers, naive bayes, association rule mining, artificial neural networks, and decision trees. The most effective classifier was discovered to be decision trees. The Weka tool was used in the research by Poyraz [8] to analyse a Breast cancer Wisconsin dataset that was collected from UCI and connected to breast cancer. The J48, KStar (K*), Logistic Regression, and Naive-Bayes data mining algorithms' success rates were contrasted. With a score of 96.92%, the logistic regression approach was discovered to be the most accurate. Majali et al. [9] suggested an approach that uses data mining systems for cancer detection and prognosis. The FP Growth algorithm, a decision tree method, and the ID3 algorithm, an association rule mining method, were applied to the early detection of cancer. Amutha and Savithri [10] performed research examining the use of data mining tools in the early detection of breast cancer. Decision Trees, Support Vector Machine, IBk, Sequential Minimal Optimisation (SMO), and Neural Networks methods were the main topics of their research. Amutha and Savithri assert that a variety of categorization techniques can be utilised to precisely identify early cancer.

Kaur and Singh [11] performed studies regarding the use of data mining techniques in the identification of breast cancer and featured investigation on the causes of breast cancer. Kim et al. [12] created a support vector machine (SVM)-based new prognosis system for breast cancer recurrence. The Coxproportional hazard regression model and the artificial neural network were contrasted with the SVM. The suggested approach for breast cancer recurrence diagnosis using SVM (BCRSVM) demonstrated high sensitivity (0.89), positive predictive values (0.75), specificity (0.73), and negative predictive values (0.89) in the prediction of breast cancer recurrence. AvşarAydın and Kaya Keleş [13] applied the K-Nearest Neighbour System with 10-fold cross-validation to diagnose breast cancer using a dataset gathered from an antenna. A data mining system called KNN was discovered to produce findings with a 90.0% accuracy rate.

Many research for detecting breast cancer have been conducted on the SVM method, but few have been relied on research on other individuals, according to prior evaluations. To predict breast cancer, Mert et al. (2015) [14] provided a feature reduction approach with independent component analysis. It effectively classified the WDBC characteristics using a reduced one feature (1C) and 30 features by using the k-nearest neighbour (KNN) classifier. It calculated efficiency using several matrices, and the accuracy was 91%. Afterwards, Rajaguru et al. (2019) [15] enhanced the research by tackling the breast cancer diagnosis problem and using the KNN and decision tree (DT) machine learning methods to categorise the WDBC variables. It discovered that KNN worked better than the DT utilizing the conventional principal component analysis (PCA) approach [16]. The similar feature selection technique was used by Yang and Xu et al. (2019) to obtain 96.4% accuracy using KNN [17]. The usefulness of KNN has recently been investigated using two separate breast cancer datasets, taking into account its effectiveness by the k values and several distance functions.It entails the three various research types: KNN without feature selection, with linear SVM, and with features derived from Chi-squares. On both datasets with Manhattan or Canberra distance functions, it was found that the third strategy, Chi-square-based feature selection, attained greatest accuracy [18]. Still, with the supplied breast cancer dataset, none of the previous methods have made use of feature correlation and elimination. This research carried out tests to categorise the characteristics of cancer, which is still a difficult problem.

PROPOSED METHODOLOGY

The suggested technique has a three stages process is shown in the figure 1. First, the image is processed using Independent component analysis (ICA) for Dimensionality Reduction. Later the cancer dataset's outliers were found using the Unsupervised Possibilistic Fuzzy Based Clustering (UPFC) techniques. Lastly, use the Adaboost Support Vector Machine (ASVM) to determine whether the cancer is malignant or benign. The efficiency of the recommended approach has been evaluated using the breast cancer dataset.

Independent component analysis (ICA) for Dimensionality Reduction

Independent Component Analysis (ICA) is the unsupervised feature extraction technique, which has been applied on many applications. It transforms the original data by using a transformation function. The model of the ICA is defined as,

$$Y = s \, X$$

Where, Y – Transformed data. s - Scalar matrix. X – Original data.

Here, the original data is transformed into transformation data by using tanh transformation function as a scalar function.The non-linearity among the data will be maximized and orthogonally for each data vector is achieved using this tanhtransformation function. Selecting the number of Independent components is one of the important problem in ICA. The componentswhich having greater than the 0.1 of average in the newly transformed data set.

Unsupervised possibilistic fuzzy based clustering algorithms (UPFC) for outlier detection

The selection of an appropriate clustering algorithm for outlier detection is a challenging and frequently application-specific task since it relies on a variety of factors, including the size of the data set, distribution, the degree of outliers in the data, the shapes of the existing clusters, the amount of time available, and many others. Even while the typicality scores from an ideal run of a possibilistic clustering algorithm can be utilised to find outlying points, since fuzzy and possibilistic algorithms are more resistant to the noise and coincident clusters issues, they can be more effective at detecting the outliers. As a sample of fuzzy-based possibilistic algorithms, the unsupervised fuzzy possibilistic clustering algorithm is employed in this research [19].

Although clusters can intersect and objects may belong to more than one cluster, the hard prototype-based clustering technique, such as K-means and its variations, imply that each item corresponds to only one cluster. In this instance, a data point may belong to many clusters with membership degrees ranging from zero to one. Each data point is given a fuzzy membership degree by the Fuzzy C-means (FCM) clustering algorithm [20] according to their proximity to the cluster centres. A data point's membership degree to a cluster will be greater than its membership degree to other clusters if it is closer to the cluster centre. The possibilistic C-means (PCM) process was developed to reduce the sensitivity of FCM to noise and outliers [21]. But it has been found that if PCM is not initialised properly, it can produce coincident clusters. Later, a dozen hybrid PCM and FCM variants were put up as a solution to the issues with PCM and FCM. In particular, the fuzzy possibilistic C-means (FPCM) seeks to determine memberships and typicalities concurrently. In order to make clusters distant from one another, an expanded version of PCM has been developed [22]. Additionally, the coincident clusters problem with PCM, the row sum constraints problem with FPCM, and the noise sensitivity issue with FCM have all been addressed by the possibilistic fuzzy C-means (PFCM).

The unsupervised possibilistic and fuzzy clustering (UPFC) technique was suggested by Wu et al. (2010) as an enhancement to the possibilistic clustering algorithm (PCA). To get over FCM's noise sensitivity issue and the coincident clusters created by PCA, UPFC combines FCM and PCA. Additionally, unlike the PCA technique, UPFC does not call on an earlier FCM run's fuzzy membership matrix. In R^p features space, UPFC minimises the distances among c prototype vectors (v_i) and n feature vectors (x_k) using the objective function in Eq. (1),

$$J_{\text{UPFC}}(X; U, V) = \sum_{k=1}^{n} \sum_{i=1}^{c} \left(a u_{ik}^m + {}^{\eta}_{ik} \right) d^2(x_k, v_i) + \frac{\beta}{n^2 \sqrt{c}} \sum_{k=1}^{n} \sum_{i=1}^{c} \left(t_{ik}^{\eta} \log t \quad {}^{\eta}_{ik} - t_{ik}^{\eta} \right)$$

In Eq. (1), u_{ik} and t_{ik} are the fuzzy and possibilistic membership degree of kth feature vector (x_k) to the ith cluster correspondingly. The constraints specified in Equation (2) apply to the UPFC objective function.

$$\sum_{i=1}^{c} u_{ik} = 1; \forall k; 0 \leq u_{ik} \leq 1; a > 0; b > 0; m > 1; \eta > 1$$

Sudha and Maria Sylviaa

The parameters η and m in the probabilistic methods are typicality and fuzziness exponents, respectively. Typically, both are set to 2. The parameters a and b in Eq. (1)'s objective function are weighing coefficients for determining the relative weights of typicality and fuzziness, accordingly. Typically, 1 is used for both coefficients. To minimize J_{UPFC}, the typicality degrees t_{ik} and the membership degrees u_{ik} are recalculated in each iteration step with Eqs. (3) and (4) correspondingly.

$$u_{ik} = \left(\sum_{j=1}^{c} \left(\frac{d(x_k, v_i)}{d(x_k, v_j)} \right)^{2/(m-1)} \right)^{-1} \forall i, k$$

$$t_{ik} = exp\left(\frac{bn\sqrt{c}d^2(x_k, v_i)}{\beta} \right) \forall i$$

A typicality degree is a possibilistic metric that shows how much a data point belongs to clusters, as can be determined by the calculation in Eq. (4). The distance variance value β was computed using the method shown in Eq. (5).

$$\beta = \frac{1}{n} \sum_{k=1}^{n} d^2(x_k, \bar{x}); \bar{x} = \frac{1}{n} \sum_{k=1}^{n} x_k$$

The cluster centres are updated after each iteration using the formula in Eq. (6). When a specific level of convergence is reached, the UPFC algorithm terminates.

$$v_i = \frac{\sum_{k=1}^{n} (au_{ik}^m + t_{ik}^{\eta}) x_k}{\sum_{k=1}^{n} (au_{ik}^m + t_{ik}^{\eta})} \forall i$$

Proposed Unsupervised possibilistic fuzzy based clustering algorithms (UPFC) for Outlier Detection
The recommended methods and the pseudocode are provided in Algorithm 1 for the purpose of locating outliers in multidimensional data sets. The matrix of possibilistic membership degrees, also known as typicality degrees, is used by this method. The results of a UPFC run are used to calculate the probability of a given event, and the results are used to calculate the probability of a given event. The suggested methods are described in the subsections following. The fuzzy clustering techniques identify the fuzzy membership degree of fuzzy data points to any cluster, but they do not assess typicality in relation to the distances of the data points to the cluster centres. Consider two data points A and B, each of which has a fuzzy membership degree of 50% to two separate clusters. The latter will be a more uncommon data point because it is further distant from the cluster centres, let's say their distances from the cluster centres are 2r and 5r. The typicality degrees from the fuzzy and possibilistic clustering algorithms distinguish among the extremely atypical and less atypical members of the clusters when compared with fuzzy membership degrees. This implies that not all fuzzy points within a cluster are equal; some are more typical than others. This suggests that since typicality also contains a notion of dissimilarity, it differs from a mere similarity to the cluster centre. As an outcome, the suggested methods made advantage of the UPFC algorithm's typicality outcomes.

A data point that is not a part of any cluster is classified as an outlier in the first method. Its average typicality across all clusters must be lower than a predetermined possibilistic threshold level (α). This method determines whether a threshold level, a user-defined potential degree for classifying a data point as an outlier is exceeded by the average typicality of the kth feature vector (x_k) to all clusters. A data point is identified as an outlying data point using the test function in Eq. (7). The data point is regarded as extremely atypical and marked as an outlier in the data set if the average typicality of (x_k) to all clusters (c clusters) is less than α (see in Algorithm 1).

Algorithm 1 Pseudocode for the proposed outliers detection approach.

```
1 Input: T, alpha, apr
2 //Typicality degrees matrix in nxc dimension, and developed by an
3 //unsupervised possibilistic clustering algorithm
4 // alpha, threshold possibility value for outlier testing
5 // apr, number of the approach to be used in outlier detection
6 Output: Outliers
7 //Outliers, vector of n length to store the flags of outliers
8 n <- count of rows of matrix T
9 c <- count of columns of matrix T
10 // If alpha is undefined, use 0.05 as the default value
11 if alpha is null then alpha = 0.05
12 Outliers <- {0} //Assign 0 to all elements of the outliers
13 for k = 1 to n do
14 if apr = 1 then
15. sumT<- 0
16 for i = 1 to c do
17 sumT<- sumT + T[i,k]
18 end
19 avgT<- sumT / c
20 if avgT<= alpha then
21 Outliers[k] <- 1
22 end
23 else
24 if apr = 2 then
25 is Outlier <- True
26 for i = 1 to c do
27 if T[i,k] >= alpha then
28 is Outlier <- False
29 end
30 end
31 if is Outlier = True then
32 Outliers[k] <- 1
33 end
34 end
35 end
36 end
37 return Outliers
```

In this strategy, it's vital to pick the right α value. Tests on various experimental data sets revealed that a threshold level of 1% ($\alpha = 0.01$) might be adequate to identify outliers in the outcomes of UPFC runs; thus, it is advised to use this level as the default value for approaches on large data sets.

$$is.\,outlier\,(x_k) = \begin{cases} 1 & if \left(\sum_{i=1}^{c} t_{ik}/c \right) \leq \alpha \\ 0 & otherwise \end{cases}$$

Adaboost Support Vector Machine (ASVM) algorithm for classification

Generally, the Adaboost algorithm is used in the framework to initialize the training sample weight. The weight of each training sample builds a new decision tree with all features. Also, it is used to boost the performance of accuracy, classification, and regression. Moreover, the use of Adaboost in SVM is attaining better performance in SVM classification problems. It is mainly focused on the incorrect classification of trained samples and identifies the weak classifier using the weight of the samples. Initially collect the training sample (h_t) which is stored in the cloud database using Eqn. (1).

$$h_t = \{(a,b),....(ai,bi)\}$$

(1)

Where, (a,b) is denoted as the trained samples and (ai,bi) is called as the number of turns in a single iteration. Then modify the weight of the training samples (W_t) using eqn. (2)

$$W_t = \frac{1}{i} \text{ For i=1.....n}$$

(2)

Let i is denoted as the training sample value and n is considered as cloud database parameters. The initialization of weight is used to identify the week learning classification in SVM also calculate the training errors present in the training samples. Thus the calculation of training error (T_e) is obtained using Eqn. (3)

$$T_e = \sum_N^{i=1} W_t, (ai,bi) \neq h_t(ai)$$

(3)

Furthermore, update the weight of the training sample (W_{t+1}^i) in the developed framework using Eqn. (4)

$$W_{t+1}^i = \frac{W_t \exp(b_i \times \alpha t \times h_t(ai))}{K_t}$$

(4)

Let, K_t is denoted as normalized constant, αt is considered as weight of trained sample and b_i is considered as binary classification. Based on the weight of all trained samples identify the distribution of the best weak classifier also analyze the weak classifier error rate. At last, building a weak classifier into a strong classifier by updating weights will improve the performance of the developed framework. Moreover, SVM is the process of collecting and classifying objects, information, or data. It is a non-linear mapping function for converting the original training samples into higher dimensions. It has the habit to connect the input samples into high dimensional features also identifying the optimal hyper plane. The correct identification of perfect value is used to solve the problem of overfitting and correctly classify training models. Thus the process of SVM $(X(t))$ in binary classification has obtained using Eqn. (5)

$$X(t) = [W_t, \phi(t)] + b_i$$

(5)

Let, $\phi(t)$ is denoted as high dimensional feature space and b_i is considered as binary classification. Using the SVM identify the features from the collected dataset. Then the features are updated to the designed GWO-IDE model to secure the data from third parties. The main purpose of using Ada boost SVM in the developed model is to enhance the classification results and minimize the issue of over fitting. Moreover, the linear mapping function employed in SVM to attain high dimension features is used for identifying the perfect value.

Proposed Method flow for breast cancer detection

This is a combination of methods for preliminary cancer diagnosis, including clustering, outlier identification, and classification. To group the dataset and reduce the size of the dataset, the k-means clustering technique was utilised. Use the outlier detection algorithm to find the outliers after that. The data objects have been identified as either

malignant or benign utilising the decision tree classifier after outlier detection. The suggested approach is explained as follows.

Input: The Breast Cancer data set.
Output: Improved class variable accuracy for either malignant or benign cancer
Step 1: Utilizing Hybrid Genetic Algorithm with K-Means clustering algorithm (HKGA) for Pre-processing the data
Step 2: Independent Component Analysis (ICA) approach is used for dimensionality reduction of the preprocessed data
Step 2: Applying reducing outliers by using the UPFC Outlier Detection algorithm.
Step 3: The ASVM classification algorithm has employed in two data sets. The proposed algorithm is utilized for Identify the cancer is either malignantor benign.
Step 4: The data object has been categorised as either malignant or benign cancer.

EXPERIMETAL RESULTS

The development of numerous tools for data analysis. The study utilises the MATLAB tool for early breast cancer diagnosis and performance evaluation.

Dataset Description
The measures of breast cancer cases have been recorded using the Breast Cancer dataset. Wisconsin and Wisconsin Breast Cancer (WBC) Diagnosis Breast cancer data are used for diagnosis of breast cancer gathered from UCI machine learning data repository. WBC has 699 instances, 2classes malignant and benign), and 9 integer-valued attributes. WDBC having 568 instances, 2 classes malignant and benign), and 32 integer-valued attributes. Each dataset includes a number of different classification patterns together with a corresponding set of numerical features.10-fold cross validation [8] is utilized to prepare training and test data.

Wisconsin Breast Cancer Dataset
Table 1 contains a description of the variables included in this dataset. The original WBC data set's dimensionality is reduced using ICA. A new dataset of 578 occurrences was created from the dataset after 120 extreme values (all of which are malignant) were eliminated. Table 2 shows the descriptive statistics of data after removing outliers.

Wisconsin Diagnosis Breast Cancer Dataset (WDBC)
Information on the attributes discovered in the WDBC dataset: For each cell nucleus, the following info is computed: ID number, diagnosis (M = malignant, B = benign), and ten real-valued features: Area, Compactness, Smoothness, Concave Points, Symmetry, Concavity, and Fractal Dimension. Radius, Texture, Perimeter, Area. The WBC original data set taken uses UPFC for outlier identification and ICA for dimensionality reduction. To create a new dataset with 424 instances, the 56 outliers and 88 extreme cases (all of which are malignant) values were eliminated from the original dataset.

Performance Evaluation
The efficiency of the suggested approach is examined and assessed using datasets to determine 8its stability. Using classification evaluation metrics including the kappa statistic, F-Measure, recall, precision, and accuracy.
As determined by correctly classifying items, accuracy is given.

$$Accuracy = \frac{TP+TN}{Total\ no.of\ Samples} \tag{14}$$

Precision (P) is defined as determine exactness of the Classifier

$$Precision\ (P)\ = \frac{TP}{TP+FP} \tag{15}$$

Measurement of the classifiers' completeness or sensitivity is known as recall (R).

$$\text{Recall (R) } = \frac{TP}{TP+FN} \qquad (16)$$

F-Measure can be harmonic mean of precision and recall

$$F - Measure = 2 * \left[\frac{\text{Precision} * \text{Recall}}{\text{Precision} + \text{Recall}}\right] \qquad (17)$$

Where TP - True Positive, TN - True Negative, FN - False Negative, FP - False Positive.
Kappa Statistic: The variance among the observed and expected level of agreement is another evaluation metric. The value produces a value of 1 for complete agreement and ranges from 0 to 1. To calculate the kappa statistic value, using equation 1.

$$K = \frac{p_o - p_e}{1 - p_e} = 1 - \frac{1 - p_o}{1 - p_e} \qquad (18)$$

where, p_o is the noted 10related agreement, and p_e is probability chance of agreement.

Result Analysis
In this study, experimental evaluation is conducted using 10-fold cross validation. The data set was separated into 10 equal-sized parts at random. The remaining partitions are utilised to teach the fundamental learner while one is used for testing. Ten times of the preceding technique are performed in order to test each partition just once. The individual data are then combined based on their mean accuracy. The 10-fold cross validation average outcomes are mentioned in this chapter. On MATLAB, studies were conducted. It uses the ASVM classification algorithm. Table 3 lists the values of the evaluation metrics used by the suggested ASVM classification model. The findings shown in Table 3 and Figure 5 demonstrate the efficiency of the classification model in the diagnosis of breast cancer. In comparison to the outcomes from current methodologies, the suggested model obtains a classification accuracy of 99.10% for WBC data and 99.35% for WDBC data, which is a very optimistic predicted performance.

Table 4 lists the classification accuracy rates obtained with the system being suggested and existing classifiers from the literature for reasons of comparison. Figure 5 shows the comparison of Existing K-Means with Decision Tree Algorithm and Proposed UPFC with ASVM algorithm using various metrics on WDBC dataset like Classification accuracy (%), Precision, F-Measure, Recall and Kappa statistics. The proposed ASVM algorithm attains better performance in terms of Classification accuracy (%) is 99.25, Precision is 99.15, F-Measure is 0.9910, Recall is 99 and Kappa statistics is 99.1 when compared with existing approach. Figure 6 shows the comparison of Existing K-Means with Decision Tree Algorithm and Proposed UPFC with ASVM algorithm using various metrics on WBC dataset like Classification accuracy (%), Precision, F-Measure, Recall and Kappa statistics. The Proposed UPFC with ASVM algorithm attains better performance in terms of Classification accuracy (%) is 99.10, Precision is 99.02, F-Measure is 0.9900, Recall is 99.01 and Kappa statistics is 0.990when compared with existing approach.

Figure 7displays the comparison of classification accuracy of the suggested and the present approaches. The Proposed UPFC with ASVM algorithm attains 99.37%, whereas the other algorithms like Decision tree classifier attain 99.01%, K-SVM attains 97.38%, PSO-SVM attains 97.37% and ACO-SVM attains 95.96%. Hence it can be concluded that the Proposed UPFC with ASVM algorithm achieves better results when compared with the existing approaches.

CONCLUSION

The healthcare sector faces issues that call for the diagnosis of breast cancer in initial stages. Accuracy is improved when data mining algorithms are used. With a classification model, this study proposes an outlier detection approach. Three techniques clustering, outlier identification, and classification algorithms have all been examined in this research, and their effectiveness has been assessed using a variety of metrics. According to the 10-fold cross

validation method, this technique achieves an accuracy of 99.10% for the WBC dataset with an outlier and 99.35% for the WDBC dataset without an outlier. According to the findings, integrated Meta-algorithm has outperformed different algorithms in terms of accuracy. It was concluded that when compared to other techniques, the combined algorithms were more effective at diagnosing breast cancer. Additionally, the high-risk level was taken into account, and the best data mining method was used to spread the information for the patients' treatment to the general public.

ABSTRACT

Ashwagandha is an important plant in Indian medical system and would be classified as a yang tonic because of its ability to calm the mind and insomnia. Ashwagandha is traditionally used as adaptogen, it is used for many conditions related to stress. The important properties of Ashwagandha, Indian ginseng includes its traditional use as an alternative for inflammatory, antiseptic, antitussive, etc. the present study was undertaken to investigate the presence of phytoconstituents in Ashwagandha and antibacterial and anti-fungal properties of Ashwagandha root extract. The ashwagandha roots were collected and authenticated and cleaned. The cleaned roots were extracted using different organic solvents like hexane, ethyl acetate, chloroform and aqueous. The yield was calculated. High yield was obtained in chloroform extract followed by ethyl acetate, hexane and aqueous. Phytochemical analysis was also evaluated in all four extracts. Antimicrobial susceptibility was done using four bacterial strains and fungal strains. In this present study, it is concluded that ashwagandha root possess antimicrobial properties which can be useful to mankind.

Keywords: *Withania somnifera*, Ashwagandha root extract, Phytoconstituents, Antibacterial, Antifungal, Agar well diffusion.

INTRODUCTION

Withania somnifera (Ashwagandha), also known as Indian ginseng, is a well–known Indian medicinal plant due to its antioxidative, antistress, antigenotoxic, and immunomodulatory properties. There is growing interest in the use of herbal plants for their different medicinal properties due to their natural origin, cost effectiveness, and negligible side effects [*Naik-2003*]. *Withania somnifera (*Ashwagandha*)* is very popular in traditional Indian medicine system, Ayurveda.It is considered to be Indian Ginseng due to rejuvenating effect on the body such as antioxidative, antistress, antigenotoxic, and immunomodulatory properties [*Bhattacharya-1997, Kulkarni-2008*]. Among the herb classified as brain tonics or rejuvenators in the traditional Indian medicine system, Ashwagandha is the most important plant whose extracts make a significant component to the daily supplements for body and brain health. Although a variety of Ashwagandha extracts have displayed neuroprotective, neuroregenerative, and anticancer potentials in recent in vitro studies (*Bhatnagar-Shah-2009*) using brain-derived cells, potentials of water extract of leaves of Ashwagandha (ASH-WEX) remain largely unexplored.

An ayurvedic approach of using herbs like Ashwagandha with its active principle component with an olides seems to be more acceptable to relieve anxiety, stress, depression, aging, fatigue and depressed immunity. The plant has been found useful in the treatment of burns, wounds, and dermatological disorders, and gastrointestinal diseases, dysfunctions of the respiratory system, asthma, bronchitis, cancer and geriatric problems [*Grierson-1999*]. *Withania somnifera* Dunal (ashwagantha, WS) is widely used in Ayurvedic medicine, the traditional medical system of India. It is an ingredient in many formulations prescribed for a variety of musculoskeletal conditions (e.g., arthritis, rheumatism), and as a general tonic to increase energy, improve overall health and longevity, and prevent disease in athletes, the elderly, and during pregnancy [Bone-1996]. Many pharmacological studies have been conducted to investigate the properties of Aswagandha in an attempt to authenticate is use as a multi-purpose medicinal agent. For example, anti-inflammatory properties have been investigate to validate its use in inflammatory arthritis [Somasundaram],and animal stress studies have been performed to investigate its use as an antistress agent [*Dadkar-1987*].

There is a growing interest in the use of herbal plants for their different medicinal properties due to their natural origin, cost effectiveness, and negligible side effects *[Naik-2009].* Medicinal plants are of great importance to the health of individuals and communities. The medicinal plant products, which are derived from plant parts such as stem, bark, leaves, fruits and seeds have been parts of phytomedicine that produce a definite physiological action on the human body. The most important of these natural bioactive constituents of plants are alkaloids, tannins, flavonoids and phenolic compounds. *Withania somnifera* grows abundantly in India (especially Madhya pradesh), Pakistan, Bangladesh, Srilanka and parts of northern Africa. It usually grows to 30-60cm but can grow up to 170cm.

There is some evidence that Ashwagandha might reduce blood sugar levels in people with diabetes. The dried flowers are given in vomiting, dysentery, coughs, thirst, excessive perspiration and bleeding pile. Hence the purpose of the present study was to evaluated the in-vitro antibacterial susceptibilities of clinical isolates namely *Escherichia coli*, *Salmonella typhi*, *Bacillus* and *Pseudomonas* with standard strains by Well Diffusion techniques as per national committee for Clinical Laboratory standards guidelines. Currently herbs have been studied in detail for its antimicrobial activity with special reference to antifungal property and its profound activity against pathogenic human fungus has been recorded and patented. These herbs are commercially available as antifungal drugs, which is an excellent development is the so called "searching of new effective antibacterial drugs."

MATERIALS AND METHODS

All the chemicals and reagents used were from scientific and chemicals. Glass wares used were Borosil. The media and broth used for microbial culture were from Hi-Media Pvt. Limited, Bombay, India.

Collection of plant
Fresh *Withania somnifera* were collected during September - October of 2015 in around Arakkonam, Tamilnadu were authenticated by Department of Botany. The voucher specimens were kept in the Department of Botany in Quiad-E-Millath College, Anna salai, Chennai-600 002, Tamilnadu,India.

Test pathogenic microorganisms
Escherichia coli, Bacillus, Salmonella, Pseudomonas spp. and *Fusarium spp (Aspergillus niger)* were procured as clinical isolated samples. Bacterial strains were grown and maintained on Muller-Hinton Agar and Nutrient agar medium, while yeast and fungi was maintained on Sabouraud Dextrose Agar medium. Well diffusion assay [Andrews] was performed for screening. Muller-Hinton Agar and Sabouraud dextrose Agar base plates were root with the bacterial and fungal inoculum.

Preparation of the plant material
The collected plant roots were washed thoroughly 2-3 times with running water and distilled water. The roots were air dried. The air-dried plant materials were crushed to make fine powder with help of mortar and pestle and stored for further analysis.

Extraction of the plant material
About 10g of powdered plant samples were extracted using hexane, chloroform, ethyl acetate and aqueoussolvents and kept overnight at room temperature. The extract from three consecutive soakings were pooled together and evaporated under pressure. Qualitative phytochemical analysis: The crude samples were subjected to phytochemical screening for the presence of alkaloids, carbohydrates, saponins, glycosidal sugars, proteins, phytosterols, phenols, flavonoids, triterpenoids and tannins. The portion of the dry extract was subjected to the phytochemical screening using the method adopted by Trease and Evans and Harborne.

Detection of Alkaloids
1ml of extract mixed with 5 ml methanol in a test tube and filtering collect the filtrate. Filtrates were treated with Wagner's reagent. Formation of brown/reddish precipitate indicates the presence of alkaloids.

Detection of Terpenoids
0.5 ml of extract was mixed with 2 ml of chloroform in a test tube. 3 ml of concentrated sulfuric acid was carefully added to the mixture to form a layer. A reddish brown coloration was formed for the presence of terpenoids.

Detection of Saponins
1 ml of extract were mixed with 4ml distilled water and shaken vigorously to obtain a stable persistent froth. The frothing was then mixed with 3 drops of olive oil and observed for the formation of emulsion, which indicated the presence of saponins.

Detection of Flavonoids
0.5ml extract taken in a test tube. 5ml distilled water were added. Mix well filtering and collect the filtrate. Take 1ml of aqueous filtrate add 2.5 ml dilute ammonia solution. 1 ml of concentrated sulfuric acid was carefully added to the mixture. A yellow coloration was observed for the presence of flavonoids.

Detection of Tannins
To 0.5 ml of extract solution, 5 ml of distilled water and 2 drops of ferric chloride solution were added and observed for brownish green or a blue black coloration.

Detection of Glycosides
1ml of extract solution mixed with 1ml of distilled water and 1ml alcohol solution were added. The mixture was heated in boiling with few drops of Fehling's solution (each solution A and B) was added and boiled. A brick red precipitate indicated presence of glycosides.

Detection of Steroids
About 0.5 g extract was added with 2 mL acetic anhydride along with 2 mL of H2SO4. The transformation of color from violet to green or blue showed the occurrence of steroids.

Detection of Anthraquinone
About 0.5 g of the extract was taken into a dry test tube and 5 ml of benzene was added and shaken for 5 minutes. The extract was filtered and the filtrate was shaken with 5ml of 10% ammonia solution. A pink violet or red color indicates presence of anthraquinone.

Detection of Phenolic compound
The extract was dissolved in 5 ml of alcohol mixture. Then the few drops of ferric chloride solution were added to the mixture. A dark green / blue / brownish green / brown / brownish red colour indicated the presence of phenolic compounds.

Antimicrobial Activity
The microorganism used in the study :*Escherichia coli, Pseudomonas spp. Bacillus cereus,* and *Salmonella typhii* and the fungus*Fusarium spp*. The microorganisms were grown overnight at 37ºC in Mueller-Hinton Broth at pH 7.4 [*Okunade and Perez*]

Growth and maintenance of test microorganisms for antibacterial studies:
Nutrient agar and Mueller-Hinton broth (Himedia, India.) were used as the   media for the culturing of bacterial strains. Loops full of all the bacterial cultures were inoculated in the Nutrient broth and incubated at 37ºC for 72hrs and potato dextrose agar and potato dextrose broth (Himedia, India) were used as the media for the culturing of fungal strains. Loops full of all the fungus cultures were inoculated in the potato dextrose broth (PDA) and incubated at room temperature for 72hrs.

SCREENING FOR ANTIBACTERIAL ACTIVITY

Agar well diffusion method
Antibacterial activity of crude extracts in different organic solvents were screened against microorganism with standard antibiotic ciprofloxacin in-vitro using agar well diffusion method [Perez, Perez, Bagamboula]. The cup-plate agar diffusion method was employed to assess the antibacterial activity of the prepared extracts [*Anesini*]. The extracts, after concentration, were weighed and dissolved in DMSO and prepared 100ppm and 500ppm concentrate .Each microorganism was diluted in sterile saline solution and adjusted to 0.1 OD reading. Bacteria (200µl) were aseptically spread using cotton swabs on the surface of pre-sterilized Muller Hinton Agar plate. Four wells, each 10mm in diameter with sterile cork borer were aseptically punched on each agar plates. About 50 µl (1mg in 1 ml) of extracts was loaded into each well. The plates were incubated for 24 hours at 37C. The complete antibacterial analysis was carried out under strict aseptic conditions. The zones of inhibition were measured with antibiotic zone scale in mm.

Antifungal assay
The extracts were also screened for their antifungal activity in comparison with standard antibiotic ketoconazole (10µg/mL) in-vitro by well diffusion method [Pauli, Agnese, Uttendaela]. Lawn culture was prepared using the test organism on potato dextrose broth (PDA). The inoculated plates were kept aside for a few minutes. Using well

cutter, four wells were made in those plates at required distances. The culture of 48 hours old grown on potato dextrose agar was used as a inoculum in this study. 50µl of extracts, was taken, mixed with presterilized, cooled potato dextrose agar and poured in the sterilized Petri plate. After solidification, the fungal inoculum was taken and inoculated at the center of the solidified plate. A control plate is maintained without mixing of the extract in the Potato dextrose agar.Incubation period of 10 days was maintained for observation of antifungal activity of the crude plant extracts. The complete fungal analysis was carried out in aseptic conditions.

RESULTS AND DISCUSSION

Extraction of the plant material
The yields of the extracted materials from various solvents are as follows

Phytochemical Analysis
In the present investigation, the extracts of Hexane, Ethyl acetate, Chloroform and Aqueous obtained was subjected to Phytochemical analysis . The results of the phytochemical analysis are as follows. Preliminary phytochemical analysis of Hexane, Ethyl acetate, and Chloroform extracts of root of *Withania somnifera* (L) Dunal revealed the presence of alkaloids, terpenoids, saponins, flavonoids, tannins, glycosides and the other constituents such as steroids, anthroquinones, and phenols are absent in the all three extracts. The aqueous extract shows extract the presence of saponins and glycosides as shown in the Table2.

Antibacterial activity of *W. somnifera* root extracts
The antibacterial activity clearly shows that all the extracts have shown antibacterial activity equivalent to that of standard against the entire tested organisms. Hexane, Ethyl acetate, Chloroform and Aqueous extracts have shown better activity against all the four microorganisms. Ethyl acetate extract was more effective against *Salmonella typhi* followed by chloroform, hexane and aqueous. Ethyl acetate extract was more effective against *E. coli* followed by chloroform. No activity is recorded in hexane and aqueous extracts. The results are given in Table 3.

Antifungal Activity
The antifungal activity studies were performed and the results was given below. About all the extracts only ethyl acetate shows the inhibition against *Fusarium sp.* whereas other extracts shows no activity.

DISCUSSION

Ashwagandha is an important medicinal plant in Indian traditional medicine and it is most frequently used herb in Ayurveda. The Ashwagandha powder was subjected to various solvent to trap all the compounds present in the material. The extract showed a broad spectrum of antibacterial activity against the gram positive and the gram negative bacteria. Earlier many studies revealed that an alcoholic extract that exhibited greater activity than the aqueous extract against bacteria. The broad spectrum antibacterial activity was reported and the ethyl acetate extract at a concentration of 1mg/ml showed maximum inhibition against the gram positive and gram negative bacteria. The possibilities that may account for the higher antibacterial activity of organic extracts are because of the presence of biological active components (alkaloids, flvanoides, essential oils, terpenoides, tannins etc…,) which may be enhanced in the presence of alcoholic solvents; and the stronger extraction capacity of ethyl acetate that may have yielded a greater number of active constituents responsible for antibacterial activity.

CONCLUSION

In this study, it is concluded that the plant extract possess antimicrobial activity against tested organisms. The zones of inhibition varied suggesting the varying degree of efficacy and different phytochemical constituents of herb on the target organisms. The antimicrobial activity of the plants may be due to the presence of various active principles in

their root. Further studies are needed to isolate and characterize the bioactive principles to drug discovery. The use of these plants in folk medicine suggests that they represent an economic and safe alternative to treat infectious diseases.

ABSTRACT

The antioxidant and anti-inflammatory potency of *Syringodium isoetifolium* and *Cymodocea serrulate* sea grass were determined. Sea grass were collected from the Ramanathapuram and dried. The extract was prepared with water and diethyl ether. Phytochemical analysis on extracts was performed using chemical, gas chromatography-mass spectrometric (GCMS) and High Performed Liquid Chromatograpic (HPLC) techniques. It shows that the extracts are enriched with pharmacologically active compounds such as phenol, polyphenol, alkaloid, glycoside, saponin, flavonoids and other constituents. Then, the extracts were estimated for antioxidant and anti-inflammatory activity using different *in vitro* methods such as 2,2-diphenyl-1-picryl-hydrazyl-hydrate, total phenolic, total flavonoids, ABTS and FRAP radical scavenging activities. The result demonstrated that the extracts exhibited higher radical scavenging activity as compared to the standard drug. Among these two extracts, the *Syringodium isoetifolium* extract had shown an excellent antioxidant activity due to the existence of more potent phytochemicals.

Keywords: *Syringodium isoetifolium*, *Cymodocea serrulate*, Antioxidant, Anti-inflammatory

INTRODUCTION

Sea grasses are a group of flowering plants that are adapted to live in marine environments, primarily in coastal waters. They are found in shallow, calm waters of tropical and temperate regions around the world. Sea grasses are

not true grasses but are closely related to terrestrial plants like lilies and orchids. Sea grasses play a crucial role in coastal ecosystems. They provide habitats and nursery grounds for a wide variety of marine species, including fish, shellfish, and invertebrates. Sea grass meadows also help stabilize sediments, improve water quality by trapping pollutants, and protect coastlines from erosion (Short *et al.,* 2001). Sea grasses have long, ribbon-like leaves that grow from a horizontal underground stem called a rhizome. The leaves are usually green but can vary in color depending on the species. Sea grass meadows can form extensive underwater meadows or patches. Sea grasses have evolved several adaptations to survive in marine environments. They have a flexible structure to withstand water movement and can grow in both sandy and muddy substrates. Sea grasses are also able to tolerate high levels of salinity and can extract nutrients from the surrounding water.

Sea grasses are autotrophic plants that undergo photosynthesis. They have chlorophyll in their leaves, allowing them to convert sunlight into energy. Sea grasses can grow in relatively low light conditions underwater, and they rely on dissolved nutrients in the water for their growth(Short *et al.,* 2001). Sea grasses are facing numerous threats, including coastal development, pollution, climate change, and destructive fishing practices. When sea grass habitats are degraded or destroyed, it can have significant impacts on the associated marine ecosystems. Conservation efforts aim to protect and restore sea grass habitats, which involves managing human activities and raising awareness about their ecological importance (Green and Short, 2003). Overall, sea grasses are vital components of coastal ecosystems, providing numerous ecological benefits and serving as indicators of environmental health. Protecting and preserving sea grass meadows is crucial for maintaining the biodiversity and overall well-being of coastal areas (Green and Short, 2003).

Syringodium isoetifolium, commonly known as narrow-leaf sea grass or manatee grass, is a species of sea grass that belongs to the family Cymodoceaceae. It is found in tropical and subtropical regions of the Atlantic Ocean, including the Caribbean, Gulf of Mexico, and parts of the western Atlantic. Narrow-leaf sea grass has long, narrow, strap-like leaves that are typically about 1-2 centimeters wide and can grow up to 1 meter in length. The leaves are arranged in tufts or clusters arising from a rhizome system. The color of the leaves can range from bright green to olive-green. This sea grass species is commonly found in shallow coastal waters, estuaries, and lagoons with sandy or muddy substrates. It prefers calm, sheltered areas and can tolerate a wide range of salinities (Kavitha*et al.,* 2002).

Similar to other sea grass species, *Syringodium isoetifolium* provides important ecosystem services. It forms dense meadows that serve as habitat and nursery grounds for various marine organisms, including fish, crustaceans, and juvenile sea turtles. The sea grass meadows also help stabilize sediments, filter water, and contribute to the overall health and productivity of coastal ecosystems. *Syringodium isoetifolium* has several adaptations that enable it to survive in its marine environment. Its long, narrow leaves reduce drag and allow it to withstand water currents. The leaves also have a flexible structure to cope with wave action. The plant's rhizome system anchors it to the substrate and allows for vegetative propagation, aiding in the spread and expansion of sea grass meadows. *Syringodium isoetifolium* is threatened by various human activities and environmental changes. Coastal development, pollution, habitat destruction, and climate change can negatively impact seagrass habitats. Conservation efforts focus on protecting and restoring sea grass meadows, implementing measures to minimize coastal impacts, and raising awareness about the importance of sea grass ecosystems (Kavitha*et al.,* 2002).

Cymodocea serrulata, commonly known as the serrated sea grass or shoal grass, is a species of seagrass that belongs to the family Cymodoceaceae. It is found in tropical and subtropical regions of the Indian Ocean, the Red Sea, and the western Pacific Ocean, including areas such as the coasts of East Africa, Southeast Asia, and Australia. Serrated seagrass has long, ribbon-like leaves with serrated edges, giving it its common name. The leaves can grow up to 30 centimeters in length and are typically green in color. The plant forms dense, low-lying meadows, and its rhizome system helps it spread and colonize suitable habitats. *Cymodocea serrulata* is typically found in shallow coastal waters, estuaries, and lagoons with sandy or muddy substrates. It can tolerate a wide range of salinities and is often found in areas with moderate water movement (Pushpa Bharathi and Vanitha, 2017).

This sea grass species provides important ecosystem services. The dense meadows created by *Cymodocea serrulata* serve as a habitat and feeding ground for a variety of marine organisms. They provide shelter for small fish, crustaceans, and other invertebrates, which in turn support higher trophic levels in the food chain. Serrated sea grass also helps stabilize sediments, improve water quality, and contribute to the overall health of coastal ecosystems. *Cymodocea serrulata* has several adaptations that allow it to thrive in its marine environment. Its long, narrow leaves reduce drag and allow it to withstand water currents. The serrated leaf edges may help minimize damage caused by wave action. The rhizome system helps anchor the sea grass to the substrate and facilitates vegetative reproduction, enabling the expansion of sea grass meadows.

Like other sea grass species, *Cymodocea serrulata* faces various threats. Coastal development, pollution, habitat destruction, and climate change can negatively impact sea grass habitats. Conservation efforts focus on protecting and restoring sea grass meadows, implementing sustainable coastal management practices, and raising awareness about the importance of sea grass ecosystems (PushpaBharathi and Vanitha, 2017).

MATERIALS AND METHODS

Collection of samples
Syringodium isoetifolium and *Cymodocea serrulata* was collected from Devipattinam, Ramanathapuram District, Tamilnadu state, India. The collected materials of the plants were authenticated by Dr M. U. Sharief, Scientist E and head, Botanical Survey of India, Southern Regional Centre, T. N. A. U Campus, Coimbatore 641003, India.

Preparation of Sea grass Extraction
The collected plant material was washed with sterile double distilled water, finely cut and air dried for a week. The dried plant materials were finely powdered and stored in airtight containers for analysis. The powdered extract was used for extract preparation. About 100 grams of *Syringodium isoetifolium* powder was mixed with 1000 ml of methanol water and this was allowed to stand for 24 hours. On other hand, 100 grams of *Cymodocea serrulata* was soaked in methanol for about one week at room temperature. The obtained extract was filtered through whatman no 1 filter paper. This sample was used for the preliminary phytochemical analysis (Zhang *et al.,* 2018).

Phytochemical Screening
The confirmatory qualitative phytochemical screening of test sample was performed to identify the main classes of compounds (alkaloids, flavonoids, steroids, terpenoids, tannins, saponins, anthraquinone, polyphenols, coumarin, phenol, quinone and glycosides) present in the extracts using standard protocols (Mandal*et al.,* 2013).

In vitro Antioxidant Activity

Total phenolic content
Total phenolic content was assessed by following procedure: 100 µl of test samples were blended with 2.0 ml of 2% Na_2CO_3 and permitted to remain for 2 min at room temperature. After incubation, 100 µl of 50% FolinCiocalteau's phenol reagent was supplemented and was mixed thoroughly. It is then allowed to stand at room temperature for 30 min. Absorbance of all the samples were measured at 720 nm using spectrophotometer. Gallic acid was used as standard to determine total phenolic activity (Zidron, 2016).

Total flavonoid content
The total flavonoid content of tests was detected by the aluminum chloride colorimetric method. 0.5 ml of seagrass extract was mixed with 250 µl of 5% sodium nitrite (NaNO2) solution and 150 µl of 10% $AlCl_3$ solution and incubated for 5 mins. At that time, 0.5 ml of 1 mol/L sodium hydroxide (NaOH) solution was added, and was brought to 2.5 ml with double-distilled water. The mixture was allowed to stand for 15 min which was measured at

510 nm. The total flavonoid content was calculated from a calibration curve, and the result was expressed as mg. Quercetin was used as standard (equivalent per g dry weight) (Hossain *et al.,* 2011).

DPPH radical scavenging assay

The scavenging activity of test samples for DPPH radical were determined by standard method. Briefly, 2.0 ml of test samples were mixed with 2.0 ml of 0.16 mM DPPH methanolic solution. The mixture was vortexed for 1 min and then left to stand at room temperature for 30 min in the dark. The absorbance of all the sample solutions was measured at 517 nm (Gopi*et al.,*2016). The varied concentration in the range of 100 to 500 μg/ml were taken for both standard and test samples. The control was tested without standard and test samples. The scavenging effect (%) was calculated by using the formulae: Scavenging effect (%) = (Absorbance of control –Absorbance of test solution)/Absorbance of control] × 100.

Ferric reducing antioxidant Power (FRAP)

Reducing power of test samples was determined by the method prescribed by Oyaizu, 1986. Briefly, 1.0 mL of test samples were mixed with 2.5 ml of Phosphate buffer (0.2 M, pH 6.6) and 2.5 mL Potassium ferricyanide (1%). Reaction mixture was incubated at 50°C for 20 min. After incubation, 2.5 mL of Trichloroacetic acid (10%) was added and centrifuged (650 g) for 10 min. From the upper layer, 2.5 mL solution was mixed with 2.5 mL distilled water and 0.5 mL $FeCl_3$ (0.1%). Absorbance of all the sample solutions was measured at 700 nm. Increased absorbance indicates increased reducing power. The varied concentration in the range of 100 to 500 μg/ml were taken for both standard and test samples.

ABTS [2, 2'-azinobis-(3-ethylbenzothiazoline-6-sulfonic acid)] Radical Cation Scavenging Assay

Free radical scavenging activity was also determined by ABTS radical cationdecolorization assay (Re *et al.,* 1999). ABTS radical cation was generated by mixing 20mM ABTS solution with 70mM potassium peroxodisulphate and allowing it to stand in dark at room temperature for 24 hours before use. 0.6 ml of test samples (0.25 mg) were mixed with 0.45 ml of ABTS reagent and absorbance of these solutions was measured at 734 nm after 10 min of incubation. The varied concentration in the range of 100 to 500 μg/ml were taken for both standard and test samples along with the control. ABTS radical cation scavenging assay [%] = (Absorbance of control - Absorbance of test) / Absorbance of control × 100

In vitro Anti-inflammatory activity

Inhibition of albumin denaturation

The reaction mixture was consisting of test samples (100 – 500 μg/ml) and1% aqueous solution of bovine albumin fraction, pH of the reaction mixture was adjusted using small amount of 1N HCl. The samples were incubated at 37°C for 20 min and then heated at 51°C for 20 min. After cooling the samples, the turbidity was measured spectrophotometrically at 660 nm (Suganya*et al.,* 2017). Diclofenac sodium was taken as a standard drug of varied concentration 100 – 500 μg/ml. The experiment was performed in triplicate.

Percent inhibition of protein denaturation was calculated as follows:

$$\% \, Inhibition = \frac{Absorbance \; of \; control - Absorbance \; of \; sample}{Absorbance \; of \; control} \times 100$$

Where Abs control is the absorbance of the DPPH radical+ solvent,
Abs sample is the absorbance of DPPH radical+ sample extract/standard

Anuradha *et al.,*

HRBC Membrane Stabilization Method

The human red blood cell (HRBC) membrane stabilization method was used for the study of *In vitro* anti-inflammatory activity. The blood was collected from healthy human volunteer under aseptic conditions who was not taken any Non-Steroidal Anti-inflammatory Drugs for 2 weeks prior to the experiment and mixed with equal volume of Alsever solution (2% dextrose, 0.8% sodium citrate,0.5% citric acid and 0.42% NaCl). It was centrifuged at 3,000 rpm and the packed cells were washed with isosaline (Nacl, pH 7.2) and a 10% suspension was made. To 0.5ml of test samples, 1ml of phosphate buffer (0.15 M, pH 7.4), 2 ml hyposaline (0.36% Nacl) and 0.5 ml of HRBC suspension were added. The solution was incubated at 37°C for 30min and centrifuged at 3,000 rpm for 20 min. The content of the supernatant solution was absorbed spectrophotometrically at 560 nm (Suganya*et al.,* 2017). Control was taken without the test sample. Diclofenac (100 - 500 μg/ml) was used as reference standard.

$$Percentage~(\%)~of~protection = \frac{100 - O.D~of~the~drug~treated~sample}{O.D~of~the~control} \times 100$$

HPLC

For the analysis of compound in the extract of *Syringodium isoetifolium* and *Cymodocea serrulata* HPLC was used. The system comprising a pump and injection valve with a 20-μL sample loop, PL Hi-Plex H column and refractive index detector. 5mg of the sample was mixed with 2 ml of 2 M trifluoroacetic acid for sample injection and maintained at temperature of 121°C for 60 minutes. The reaction mixture was dried by using vacuum concentrator. Distilled water was added to re-dissolve the sample and pH of the sample was adjusted to 7. The sample at a concentration of 0.1 mg/ml was injected into the HPLC system. The column was maintained in a 65ºC column oven (COLBOX), and double distilled water was used as the mobile phase with a flow rate of 0.5 mL/min. The pure monosaccharide, L-fucose was used as standard. The post-run chromatographic data was analysed by the software Chromera of perkin-elmer system.

GCMS

GC-MS analysis was carried out for the extract of *Syngodium isoetifolium*and *Cymodocea serrulata*to determine the bioactive constituents like pigments, tocopherols, phenolic compound (Pergent*et al.,* 2008). The chromatogram was compared against NIST library for identification of bioactive compounds.

RESULTS AND DISCUSSION

Phytochemical Screening

Phytochemical screening is a process of analyzing plant extracts or natural products to identify and isolate the bioactive compounds present in them. Phytochemical screening involves a series of tests and techniques to detect the presence of various classes of phytochemicals, such as alkaloids, flavonoids, tannins, terpenoids, saponins, glycosides, phenols, and anthraquinones, among others. The screening methods aim to determine the chemical characteristics and properties of the phytochemicals present in the test samples. In the present study, the common phytochemical compounds in the extract of *Syringodium isoetifolium* and *Cymodocea serrulata* shows the presence of flavonoids, steroids, terpenoids, and alkaloids. Whereas, tannin, saponin, anthraquinone, polyphenol and coumarinis present in the extract of *Syringodium isoetifolium* and phenol, quinone and glycosides were found to be in the extract of *Cymodocea serrulata*. The results obtained were similar to the report published by Kalaivani*et al.,* 2021 and PushpaBharathi*et al.,* 2019. Table 1represents the qualitative analysis of the phytocompounds present in the extracts of *Syringodium isoetifolium* and *Cymodocea serrulata*.

The presence of phytoconstituents, such as phenols, flavonoids and tannin in seaweeds and seagrasses may be responsible for antioxidant activity in preventing a number of diseases through free-radical scavenging activity (Athiperumalsamy*et al.,* 2010). Earlier reports revealed that polyphenols of the seagrasses have the antioxidant

65704

Anuradha *et al.,*

activity(Gokce and Haznedaroglu, 2008). It is also reported that the presence condensed tannins in seagrasses may act as deterrents against herbivore feeding as well as against fungal and bacterial invasion (Mc Millan, 1984).

In vitro Antioxidant Activity

Total phenolic and flavonoid content

In vitro antioxidant activity refers to the ability of a substance or extract to scavenge or neutralize reactive oxygen species (ROS) or free radicals in a laboratory setting. Antioxidants play a crucial role in protecting cells from oxidative damage, which is associated with various diseases and aging. To evaluate the *in vitro* antioxidant activity of the extract *Syringodium isoetifolium* and *Cymodocea serrulata* some of the assays are carried out.

The total phenolics and flavonoid content was measured by spectrophotometry and it was analysed based on Folin-Ciocalteu reaction method. Gallic acid and Quercetin were used as standard. Total phenolic and flavonoid content in the extracts of *Syringodium isoetifolium* and *Cymodocea serrulate* was analysed. The total phenol content was higher (224.18 ± 1.08mg of Gallic acid (GAE) equivalents per gram) in the extract of *Cymodocea serrulate* when compared with the extract of *Syringodium isoetifolium*(185.23 ± 2.23 mg of Gallic acid (GAE) equivalents per gram). Similarly, the total flavonoid content in the *Syringodium isoetifolium* extract exhibit 118.45 ± 3.05 mg of quercetin equivalents per gram which shows higher concentration when compared with *Cymodocea serrulate* extract (53.87 ± 0.89 mg of quercetin equivalents per gram) (Table 2). Our result was similar to the study of Kalaivani *et al.,* 2021 which shows that Quantitative analysis of extracts of *Syringodium isoetifolium* of total phenol, flavonoid, saponin and tannin were found to be 193.10 ±13.52, 106.11 ± 7.42, 52.96 ± 3.64 and 81.30 ± 5.69. Pushpa Bharathi *et al.,* 2019 result exhibit that the *Cymodocea serrulate* ethanol extract showed the highest phenolic content of 284.94 mg/ml gallic acid equivalence and the ethyl acetate extract showed the highest flavonoids content of 40.18 mg/ml quercetin equivalence.This was found similar to that of Athiperumalsami*et al.,* 2008 whereas the concentration of phenolic compound recorded was far greater than that reported earlier (0.002 ±0.006). In contrast, Kannan*et al.,* 2013 reported that phenolic content was found to be higher in *T. hemprichii* than *C. rotundata.*

The effect of antioxidants on DPPH radical scavenging is thought to be due to hydrogen donating ability. DPPH is a stable free radical and it accepts an electron or hydrogen radical to become a stable diamagnetic molecule. When a DPPH solution is mixed with a substrate acting as a hydrogen atom donor, a stable non-radical form of DPPH is obtained with simultaneous change of the violet color to paleyellow. Hence, DPPH (1,1-diphenyl- 2-picrylhydrazyl) has been used extensively as a free radical to evaluate reducing substances and is a useful reagent for investigating the free radical scavenging activities of compounds(Molyneux, 2004). DPPH radical scavenging activities (%) of *Syringodium isoetifolium* and *Cymodocea serrulate* extracts are presented in Figure 1. In the present study, higher DPPH radical scavenging activities was recorded in *Syringodium isoetifolium* extract (70.26 %) followed by standard (64.70 %) and *Cymodoceaserrulate* extract(60.02 %) respectively at concentration 500 µg/ml.IC$_{50}$ values of *Syringodium isoetifolium* and *Cymodocea serrulate* extracts are 390.98 & 432.07 µg/ml. The scavenging effect of standards and test samples on the DPPH radical increases as the concentration increases. Our result was similar to the finding of Ragupathi Raja Kannan Rengasamyet al., 2012.

In the FRAP assay, antioxidants in the sample reduce ferric (III) to ferrous (II) in a redox-linked colorimetric reaction that involves single electron transfer. The reducing power indicates that the antioxidant compounds are electron donors and reduce the oxidized intermediate of the lipid peroxidation process, so that they can act as primary and secondary antioxidants (Li *et al.,* 2006). The positive control ascorbic acid showed significantly higher antioxidant activity than samples.Figure 2 shows the results of FRAP assay of the extract of activity of *Syringodium isoetifolium* and *Cymodocea serrulate*. In this present study, *Syringodium isoetifolium* extract and standard has the highest ability for reducing Fe3+ compared to *Cymodocea serrulate* extract. A similar outcome has been reported by Kumaran and Karunakaran, 2007 and Ragupathi Raja Kannan Rengasamy *et al.,* 2012.

The ability of the sea grass extracts to scavenge ABTS+ was expressed as trolox equivalent and the maximum scavenging activity was found in the ABTS radical scavenging activity (TEAC) assay is considered a method that only measure the redox power of the antioxidant mixture in relation to the radical cation ABTS (Da Silva *et al.,* 2006) and considered as an excellent tool for determining the antioxidant activity of hydrogen donating antioxidants and of chain breaking antioxidants (Mathew and Abraham, 2006). In the present study, the maximum scavenging activity was found in the *Syringodium isoetifolium* extract of 84.90 % when compared to the standard which exhibit 78.75 %. The minimum activity of 74.35 % was produced by *Cymodocea serrulate* extract (Figure 3). IC_{50} values of *Syringodium isoetifolium* and *Cymodocea serrulate* extracts are 258.45 &320.32 µg/ml.

In the present study, it was found that the inhibition rate of *Syringodium isoetifolium* extract and *Cymodocea serrulate* extract gradually increases with the increase in the concentration.It was found that 500 µg/ml of the *Syringodium isoetifolium* extract and *Cymodocea serrulate* extract showed the highest anti-inflammatory activity of 93.53% and 89.11% respectively when compared with the standard (83.72%)(Figure 4). IC_{50} values of *Syringodium isoetifolium* and *Cymodoceaserrulate* extracts are 235.24&251.39 µg/ml. *Syringodium isoetifolium*and *Cymodocea serrulate* extracts at different concentrations (100, 200, 300, 400 & 500µg/ml) showed significant stabilization towards HRBC membranes. The percentage protection of *Syringodium isoetifolium* and *Cymodocea serrulate* extracts(89.11% & 85.01%) at concentration 500 µg/ml was higher than that of other concentrations. The results were represented in Figure 5.IC_{50} values of *Syringodium isoetifolium* and *Cymodocea serrulate* extracts are 247.70& 251.39µg/ml. The *Syringodium isoetifolium* extract and *Cymodocea serrulate* extractwere observed to exhibit significantly higher anti-denaturation activities at all the concentrations investigated when compared with the reference drug.

The GC-MS analysis of *Syringodium isoetifolium* extract and *Cymodocea serrulate* extract revealed the presence of phytocompounds that are biologically active. Figure 6 & 7 indicates the legends with the biological activity of phytocompounds. GC MS chromatogram of *Syringodium isoetifolium* extract showed 7 phytocompounds and *Cymodocea serrulate* extract revealed 14 phytocompounds. The significant phytoconstituents seen in *Syringodium isoetifolium* were Tetradecane (14.17%), Benzophenone (15.68%), n-Hexadeconic acid (17.03%), Hexadecylacetate (18.02%), Octadecanoic acid (18.83%), tricosana (19.58%) and Cis-13-decosenamide (22.16). The retention time and compound name of *Syringodium isoetifolium* are tabulated (Table 3 & 4). For standardization of test samples, HPLC is a sensitive and accurate tool that widely used for the quality assessment of plant extract and its derived product. HPLC fingerprints of *Syringodium isoetifolium* extract and *Cymodocea serrulate* extractare given in Figure 8 & 9. Results of HPLC analysis (Table 5) of*Syringodium isoetifolium* extract shows the presence of various constituents as evidenced by the chromatogram obtained at various retention times (1.431, 1.645, 1.95, 2.825). The *Cymodocea serrulate* extract extract chromatogram (Table 6) shows different constituents at various retention times1.715, 2.822, 3.380, 3.733, 5.211.

CONCLUSION

Based on the current study, it is concluded that both the sea grass *Syringodium isoetifolium* and *Cymodocea serrulate* extracts demonstrates the phytochemical constituents present in the samples through GCMS and HPLC analysis. The strong antioxidant and anti-inflammatory activity were also exhibited by both the extracts. In future, *Syringodium isoetifolium*and *Cymodoceaserrulate* extracts has a great promise which can be used as a medication for the treatment of various diseases and further studies can be carried out by isolating individual components for various particles.

ABSTRACT

This research was carried out with the aim of phytochemical analysis and determining antioxidant activity present in methanol leaf extract of *Scoparia dulcis L.* Due to its potentialto cure various ailments as well as the widespread application of antioxidant activity, the plant was selected for the study. The total phenolics contained in the plant extracts were also studied which are responsible for the antioxidant activity. The extracts' antioxidant capacity was assessed using the Diphenyl-β-picrylhydrazyl (DPPH) free radical scavenging technique. Phytochemical analysis was done and total phenolic content was determined by using the FolinCiocalteu colorimetric method. Phytochemical screening revealed the presence of carbohydrates, Saponin, Glycosides, Proteins, Phenolic compounds, Terpenoids, and Alkoloids. The finding suggests that methanol extract of the plant has significantly more antioxidant activity in the plant.

Keywords: Phytochemical screening, antioxidant activity, Total phenolic content, *Scoparia dulcis*.

INTRODUCTION

Scoparia dulcis commonly known as sweet broom weed is a perennial herb widely distributed in tropical and subtropical regions. *Scoparia dulcis* (sweet broom weed) is a tough, glabrous multi-branched branched, and leafy herbaceous plant up to 90cm high. It bears small white flowers in small 2-4 or 5 flowered inflorescences and 3-4mm. It is being used in various parts of the world for treating different ailments. It is well known as a Folk medicinal plant for its Medico- Magic Power. Quite several medicinal properties of *Scoparia dulcis* were previously studied including

65711

its Antidiabetic, Anti-inflammatory, and Anti-oxidant capacity, and its impact on lipid peroxidation. Locally, medicinal plants are used to treat infections brought on by bacteria, viruses, fungi, and parasites. Over 60% of people in Nigeria's rural areas depend on traditional medicine for the treatment of their ailments. Different plants have been used as a source of inspiration in the development of novel drugs [1].

Indian traditional medicines have a long history of treating DM with herbs and herbal extracts. One of the traditional herbs used to treat diabetes is *Scoparia dulcis*. Numerous studies have been conducted on its antidiabetic characteristics. However, no one has studied its effect on enzymes α-amylase and α-glycosidase which regulate postprandial glucose absorption and metabolism and are responsible for postprandial hyperglycemia [2]

The antidiabetic activity of this ethno medicinal plant *Scoparia dulcis* L. and the phytochemicals responsible for this bioactivity are isolated from this hypoglycaemic plant. The primary mechanisms of action of antidiabetic activity of the plant and its bioactive constituents are through α-glucosidase inhibition, curbing of PPAR-γ (Peroxisome proliferator-activated receptor-gamma), and increased secretion of insulin. Compounds such as luteolin, coixol, scutellarein, apigenin, scoparic acid D, and luteolin are accountable for various methods of action. Additionally, studies have demonstrated the analgesic, antimalarial, hepatoprotective, hypnotic, sedative, antiulcer, antibacterial, and ant-sickling properties of S. dulcis. Given this information, it is possible to conclude that S. dulcis could be popularized as an alternative and complementary treatment for diabetes, given that additional in-vivo and clinical research is done on the plant's toxicological and pharmacological properties [3].

MATERIALS AND METHODS

Scoparia dulcis leaf sample was collected from an herbal garden, in Chennai. The sample has to be cleaned properly. The main purpose of drying is to remove the water content from the leaf sample. The sample has to be dried immediately as soon as the plant is collected or this will lead to spoilage of plant materials (Figure 1). The natural process includes sun-drying. In barns or sheds, plants are occasionally set up on stands or drying frames to air dry. However, it can take a few weeks for this to fully dry. The time depends on temperature and humidity. After complete drying of leaves, they have to be powdered well for further analysis.

Preparation of extracts
In this study, the Soxhlet apparatus was used for Extraction by using Methanol as a Solvent. Only in situations where the impurity is insoluble in the solvent and the target molecule has a restricted solubility in that solvent is soxhlet extraction necessary. The target chemical can be separated from the insoluble substance using a straightforward filtration process if it has a high solubility in the solvent. This system's benefit is that just one batch of solvent is recycled, as opposed to several portions of heated solvent being passed through the sample. Thermo labile substances cannot be treated with this approach because prolonged heating may cause the compounds to degrade. The leaf Extraction was further treated in a Magnetic stirrer with a Hot plate, to obtain a solidified form of Crude. The yield of Crude extract is used to study the further analysis.

PHYTOCHEMICAL SCREENING

Test for Saponins
A test tube containing 5.0 ml of distilled water and aqueous crude plant extract was thoroughly mixed. The foam appearance showed the presence of saponins [4].

Sowparthani Kaliyaperumal and HemaShalini

Tests for Flavonoids
Alkaline Reagent Test: 2 ml of 2.0% NaOH mixture was mixed with aqueous plant crude extract; concentrated yellow color was produced.This finding indicated the presence of flavonoids.

Test for Terpenoids
A test tube containing 5.0 ml of distilled water and aqueous crude plant extract was thoroughly mixed. A grey color formed which showed the entity of terpenoid [5].

Tests for Glycosides
A solution of glacial acetic acid (4.0 ml) with 1 drop of 2.0% $FeCl_3$ mixture was mixed with the 10 ml aqueous plant extract and 1 ml H_2SO_4 concentrated. Between the layers, a brown ring developed that revealed the presence of cardiac steroidal glycosides.

Test for alkaloids
Dragendorff test-5 mg extract was taken in a tube. Add one drop of Dragendorff's reagent and an orange-red color precipitate shows the presence of alkaloids[5].

Test for proteins
Biuret's test: Five milligrams of extract and a few drops of biuret reagent were added. After giving the mixture a good shake, it was left to warm up for one to five minutes. The presence of proteins was indicated by the appearance of red or violet color.

Test for Amino acids

Ninhydrin test- A 5 mg extract of the sample was mixed with 2 ml of 0.2% solution of Ninhydrin and boiled for 2 min in the water bath if a violet color appeared with the presence of amino acids.

Test for carbohydrates
Fehling's test-5 mg extract was mixed with a few drops of benedict's reagent, and then allowed to boil, the reddish brown precipitate are found with the presence of the carbohydrates[5].

Test for phenols
The powdered leaf sample is boiled and filtered before being added to 20 milliliters of distilled water in a test tube. Add 3-4 drops of 0.1% v/v Ferric chloride to the filtered sample and the color changes to brownish green or blue, it indicates the presence of phenols.

QUANTITATIVE ANALYSIS

Determination of Phenolic compounds
The plant powder (2 g) was soaked in different solvents such as hexane, chloroform, ethyl acetate, methanol, and water were kept in the orbital shaker for 24 hrs. After filtering the residues, the filtrate was evaporated. The different extracts of plant material were then centrifuged at 10,000 rpm for 15 min at 4°C. Twenty μL of extracts were prepared using the supernatant and made up to 3 mL of distilled water. Then, each tube received 0.5 mL of Folin-Ciocalteu's phenol reagent. After that, the tubes were kept in the 45°C incubator for three minutes. After 3 min, 2 mL of 20% Na_2CO_3 was added to all the tubes and kept for incubation after which, its absorbance was measured at 650 nm. The total phenol content in the sample was calculated using the formula [6].

C (GAE) = c x V/M

Where V is the volume used in the assay (mL), M is the mass of the sample used in the assay (g), and C is the concentration of the sample based on the curve that was obtained (mg/mL).

Sowparthani Kaliyaperumal and HemaShalini

Antioxidant activity

The DPPH free radical assay was used to determine each substance's percentage of antioxidant activity. The measurement of the DPPH radical scavenging activity was performed according to the methodology described by [7]. In a methanol solution, the samples underwent a reaction with the stable DPPH radical. The reaction mixture consisted of adding 0.5 mL of sample, 1 mL of methanol, and 1 mL of DPPH radical solution 0.5 mM in methanol. DPPH is reduced when it interacts with an antioxidant substance that can donate hydrogen. Using a UV-VIS spectrophotometer, the color changes (from deep violet to light yellow) were measured at 517 nm [Absorbance (Abs)] following a 100-minute reaction. The control solution was prepared by mixing methanol (1.0 mL) and DPPH radical solution (1.0 mL) and 1 mL of methanol served as blank. The formula used to calculate the scavenging activity percentage was

% of inhibition = Control O.D – Sample O.D/Control O.D X 100.

RESULTS AND DISCUSSION

Due to its potential to treat a wide range of illnesses, the use of plants with antioxidant properties in herbal medicine has increased recently. Numerous experimental studies have demonstrated that oxidative cellular damage is ultimately the cause of cardiovascular diseases, cancer, and aging. An imbalance between the systems that generate and scavenge free radicals is the cause of this damage.

Phytochemical Screening

The preliminary phytochemical screening of the extracts in methanol extract revealed the presence of different phytochemicals which are presented in (Table 1). The leaf extracts show the presence of phytochemicals such as carbohydrates, Saponin, Glycosides, Proteins, Phenolic compounds, Terpenoids, and Alkaloids. Phytochemicals like alkaloids, flavonoids, and phenol, Figure 3: Antioxidant activity prior to UV spectrophotometric absorbance measurement. Glycoside, tannin, etc., were present in the extract which may be responsible for antioxidant activity as per the previous similar study conducted [8].

Total phenolic content

The content of total phenol (TPC) was determined by using Folin-Ciocalteu reagent in terms of gallic acid equivalent (standard curve equation: $y=0.013x+0.252 R^2$, 0.991). The total phenolic content in methanol extract was 0.675 ± 0.652 mg GAE/g of the crude sample (Figure 2).The total phenolic content of methanol and chloroform extract is 207.39 ± 8.77 mg and 58.08 ± 4.41 mg GAE/g, respectively which is proportional to the antioxidant activity, that is, TPC exhibits a positive correlation with the antioxidant activity [9].

Antioxidant activity

With an increase in concentration, the free radical scavenging activity of standard ascorbic acid and all of the extracts increased. The maximum percentage inhibition of DPPH free radical at 517 nm is exhibited by standard ascorbic acid followed by methanol extract of *S. dulcis* as shown in (Figure 3). The inhibitory concentration IC50 value was found to be 85.4µg/ml for methanol extract of *S. dulcis* respectively. Antioxidant activity test based on measurement of absorbance at 517 nm where all the extracts showed positive radical scavenging activity suggesting plant selected for the study was potently active [10].Ascorbic acid is used as positive control which showed a high percentage inhibition of free radicals about 95.65 to 96.66%; the pattern of inhibition is similar at variable concentrations because it possesses high radical scavenging activity, that is, this concentration is sufficiently high to scavenge free radicals. Methanol extract of *A. indica* has shown the highest activity followed by its chloroform extract which coincides with the previous study [11].

CONCLUSION

Based on the results obtained from the pharmacological investigations, it could be said that *Scoparia dulcis* possesses total phenolic content and antioxidant activity. In addition, the Anti-proliferative activity of the *S.dulcis* was also determined. Because of its many advantages, *Scoparia dulcis* is considered a genuine marvel of nature. Although many studies on various parts of *Scoparia dulcis* have been carried out, the pharmaceutical industry has not yet developed this plant as a drug. Plant identification, cataloging, and documentation require a thorough and methodical investigation, which could be a valuable means of advancing traditional knowledge about herbal medicinal plants.

ABSTRACT

Urolithiasis is the most common disease affected by the majority of the inhabitants due to the recurrence of kidney stones. Hyperoxaluria is a key risk factor of human idiopathic calcium oxalate stone disease for urolithiasis. Based on their recurrence rates and the side effects caused by the drugs lead to increase the incidence of the stone formation associated with inflammation and severe pain. Medicinal plants have been appreciated for their rich source of therapeutic compounds for the prevention of various ailments all throughout the world. Therefore, the interest in herbal medicine has led to research in the use of herbal medicine for various human maladies including lithiasis. In addition, herbal remedies are known to contain multiple phytoconstituents like flavonoids, alkaloids, saponins, sterolspossessa bioactivity like diuretic, ant-inflammatory, analgesic and anti-oxidant property. The current review emphasizes on understanding the pathology of the stone formation and traditional used medicinal plants as an alternative complementary therapy with less side effects and providing a future investments and direction in developing plant-based formulations in the management of urolithiasis. It also aims to give data highlighting the present trends in research of medicinal plants accredited with antiurolithic activity.

Keywords: Urolithiasis, Kidney stones, Inflammation, Pathophysiology, Herbal remedies.

INTRODUCTION

Urolithiasis, is a condition characterized by uroliths or mineral deposition in the urinary system, is an increasing urological disorder which has been affecting humans since the dawn of history [14]. The antiquity of urinary stones begins from an ancient Egyptian tomb by the English archaeologist E. Smith found a bladder stone from a 4500–5000-year-old mummy in El Amrah, Egypt [28]. In India, between 3000 - 2000 BC documented the first appearance of kidney stones in the early Sanskrit documents. In the current century, its prevalence has substantially increased in all industrialized countries, nearly 3–20% of the overall population of the world has the tendency to form one urinary stone during their life time [19].Approximately it is estimated that in India 12% of the population will suffer from urinary stone disease, among which 50% may end up with kidney loss or renal damage [5].The development of stone formation in humans affect a greater number of populations worldwide in specific age-groups. It affects about 12% of the world population with 70-80% and 47 -60% recurrence in males than in females respectively within the age of 20–49 years [2].

Urinary stone is one of the oldest and common disorders of humans and remains a major public health burden. Nowadays large number of peoples are suffering with this urinary stone problem all over the globe. Basically, three common terms, i.e., incidence, prevalence, and lifetime prevalence, are frequently used in the epidemiological studies of urolithiasis. The incidence of stone disease is defined as the number of new stone patients in a selective population over a defined period of time. Prevalence is defined as the total number of renal stone patients present in a screened population at a particular point in time. Finally, the lifetime prevalence is defined as the presence of a renal stone at any time in the medical history of a patient. It is a world-wide problem spanning all geographic regions with an estimated annual incidence of 1%, prevalence of 3–5% and a lifetime risk of 15–25%. In majority of cases urolithiasis tends to be recurrent once afflicted, among which 50% of kidney patients have reappearance of renal stones within 10 years. Previous study states that the recurrence rates are estimated at about 10% per year, totally 50% over a 5–10 years period and 75% over 20 years [18 & 24].

Globally, urolithiasis occurs approximately about 12 % and it is estimated at 1-5% Asia, 5-9% Europe, 13% North America and 7, 50,000 cases reported per year in Germany [1 & 28]. The incidence of urolithiasis varies in different countries, 12 % of the Indian population were expected to develop urinary stones. Nearly 15% of the North Indian population is affected with kidney stones, therefore these regions are stated as the "stones belt" that is parts of Maharashtra, Gujarat, Rajasthan, Punjab, Haryana, Delhi and states of north-east. Similarly, occurrence of few incidences on urinary calculi is found in southern India, this may be due to the daily routine intake of tamarind [25].

Urolithiasis is a multifactorial etiology disorder, its prevalence varies according to the geographical condition, socioeconomic status and gender. Many studies also states that epidemiological factors, biochemical and genetic factor which includes age, sex, hereditary, occupation, body size, social class, affluence, geographic location, climate, diet, fluid intake and other medical conditions like hypertension, CVD, gout, cystinuria, hyperparathyroidism etc. predispose to stone disease [1].

Recurrent formation of stones remains to be a serious problem in human health. Kidney stones has become increasingly recognized as a systemic disorder [22], that is associated with chronic kidney diseases, end-stage renal failure, cardiovascular diseases, diabetes, and hypertension [6]. Thus, the current review emphasizes on understanding the pathology of the stone formation and traditional used medicinal plants as an alternative complementary therapy with less side effects and providing a future investments and direction in developing plant-based formulations in the management of urolithiasis.

The recent resurgence of plant remedies results from several factors like effectiveness of plant medicines and lesser side effects compared to modern medicines. In the present scenario, the need for basic scientific investigations on medicinal plants used in the indigenous systems becomes imminent. This is evident by the increase in number of

reports by various investigators supporting the claims of medicinal plants and a dramatic increase in the share of plant products in pharmaceutical market. The present review aims to give data highlighting the present trends in research of medicinal plants accredited with antiurolithic activity. This may help investigators to identify and develop appropriate lead compounds or plant products beneficial in the management of urolithiasis.

LITERATURE SEARCH METHODOLOGY

Electronic databases, including PubMed, Science Direct, Google Scholar NJLM, Medline, Academic Journals Database and Scopus, were retrieved for herbal plants and their bioactive compounds used for prevention and management of urolithiasis. The data collection involved using a group of search terms in English language. The keywords such as kidney stone or Urolithiasis, Complementary Therapies/Alternative Medicine, Phytoconstituents, Traditional Medicine, Current trends in research of medicinal plants accredited with antiurolithiatic activity terms were used to search. Only those articles which are most relevant to the study includes present trends in research of medicinal plants, the phytoconstituents of the plant, and their effective on bioactivity properties were selected.

Pathophysiology

It is estimated globally that 75% of all urinary calculi are found to be calcium containing stones, which may be present in the form of crystals of pure calcium oxalate (50%), calcium phosphate (5%) and a mixture of both compounds (45%) [14]. Calcium oxalate (CaOx) is found to be the most predominant component which accounts for more than 80% of stones and the remaining 20% constitutes of struvite, cystine, uric acid, and other stones [9& 17].

The pathogenesis of kidney stone or bio mineralization is a complex biochemical process which occurs due to the successive physiochemical events such as super saturation, nucleation, growth, aggregation and retention within the renal tubules [31]. The pathogenesis of kidney stone formation is a multifactorial process as it varies largely based on the stone phenotype [13]. Stone analysis is of great importance to the therapy and metaphylaxis of residual and recurrent stones [21]. The process of formation of stone required supersaturated ionic urine. Levels of urinary supersaturation correlate with the type of stone formed and also depends on urinary pH, ionic strength, solute concentration in the urine, and complications, and lowering super saturation is effective for preventing stone recurrence [10& 30]. At the initial stage of crystal formation in the urine nucleation occurs during super saturation.

The process of formation of renal stones is a consequence of increased urinary super saturation with subsequent formation of crystalline particles. Several studies reported that, the basis for calcium stone formation is super saturation of the urine with stone-forming calcium salts. Due to metabolic abnormalities such as hypercalciuria, hypocitraturia, hyperoxaluria, hyperuricosuria, and gouty diathesis involves in changing the composition or saturation of the urine and undergo the size-enhancing process of growth and aggregation. For stone formation crystals need to be retained within the kidney and they should also be located at sites from where crystals can ulcerate to the renal papillary surface to form a stone nidus. At this point, it is thought that renal tubular injury plays an important role [8]. Khan hypothesized that renal tubular injury promotes crystal retention and the development of a stone nidus on the renal papillary surface and further supports crystal nucleation at lower super saturation [14].

Thus, one approach to prevent stone formation would be to stop crystal retention. Since super saturation is essential for the production of stones another major therapeutic goal is the reduction of super saturation. Reactive oxygen species (ROS) seem also to be responsible for cellular injury, therefore a reduction of renal oxidative stress could also be an effective therapeutic approach. In conclusion, the pathogenesis of kidney stone formation is a multifactorial process as it varies largely based on the stone phenotype [26]. Although quite a lot of theories exist to elucidate the pathogenesis of renal calculi, the exact cascade of events that lead to kidney stone formation is still unclear.The process of renal stone formation that was described above is illustrated in Figure 1.

RECENT TRENDS IN RESEARCH OF MEDICINAL PLANTS

Berberis vulgaris

Berberis vulgaris generally known as barberry belongs to the family Berberidaceae. The root bark of this plant is widely used to treat kidney stones. It contains a variety of active phytochemical compounds including alkaloid such as berberine, berbamine, oxyacanthine, and palmatine. It has been shown that *B. vulgaris* inhibit calcium oxalate crystallization due to its antioxidant, diuretic, hypocalciuric, and urine alkalinizing activities thus preventing kidney stones [20].

Nigella sativa

Nigella sativa L. belongs to the family and commonly referred to as black cumin. The bioactive phytochemicals of *Nigella sativa*, comprises of thymoquinone, dithymoquinone, thymohydroquinone, and thymol. Previous study states that *N. sativa* had beneficial effect on caox stone deposited in the kidneys of rat by reducing the number and size of these stones. Due to its significant antioxidant effect deposition of stone in the kidney are cleared, that leads to epithelial tissue damage and production of free radicals and superoxide anions [19].

Camellia sinensis

 It belongs to the Theaceae family and commonly referred as green tea with its major bioactive components such as epigallocatechin gallate, epigallocatechin, epicatechin gallate, and epicatechin. Earlier studies reveals that green tea shows diuretic and natriuretic effects along with antioxidant properties which aids in increase excretion of magnesium, calcium, chloride, and potassium and direct inhibitory effect on caox stone formation, increases superoxide dismutase, and neutralize oxygen reactive species [23 & 16].

Zea mays

It also called corn silk (Stigma maydis), includes in Gramineae family. Zea mays contains a variety of bioactive constituents such as flavonoids, tannins, terpenoids, cardiac glycoside, and phenols. It is used in the treatment of renal calculi due to its natural diuretic effect. Hashim et al., reported that zea mays helps to produce more urine volume in kidneys, resulting in a decreased urine salt content. This elevated amount of urine eliminates even a small piece of stone that have been recently developed in the urinary tract else it may break bigger calculi to smaller fragments, thus allowing them to be discharged [12].

Rubia cordifolia

Rubia cordifolia, known as common madder or Indian madder, belongs to the family Rubiaceae. There roots are known to produce antioxidant and kidney protecting properties enhancing in preventing kidney stones. It functions by decreasing the calcium and oxalate level in kidneys and inhibit the formation of renal stones [4].

Phyllanthus niruri

It is commonly called as "stone breaker", belongs to the Euphorbiaceae family. The phytochemicals evidenced in *P. niruri* arealkaloids, flavonoids, lignans, and triterpenes. It has been reported that presence of triterpenes *P. niruri* lowered the stone forming elements excretion and crystal deposition markers in the kidneys [19].

Olea europaea

Olea europaea belong to Oleaceae family, it is widely known as olive. Previous investigations revealed that the antiurolithiatic activity of olive oil due to its content of flavonoids. The flavonoids and the antioxidant properties present in the olive oil may have the ability to prevent renal stone formation by inhibiting renal tubular membrane damage induced by hyperoxaluria [3]. Moreover, *Olea europaea* was shown to prevent the formation of new renal stones in the urinary system by stone-dissolving process [15].

Origanum vulgare

O. vulgare (family, Lamiaceae), was generally used in traditional medicine. Due to its therapeutic benefits, oregano possesses antioxidant properties that help in the scavenging of free radicals and the protection against oxidative stress. Some of its medicinal activities are due to the presence of phytochemical compounds including coumarins, tannins, alkaloids, flavonoids, saponins, sterols, and terpenes that were determined in the crude extract of stems and leaves of the *O. vulgare*[19].

Solanum xanthocarpum

It belongs to Solanaceae family, a well-known Indian traditional plant and commonly referred as thai green eggplant recommended in the treatment of urolithiasis. Alkaloids such as solamargine, solanacarpidine, solanacarpine, solasonine, and solasodine, phytosterols, saponins, as well as other phytoconstituents are abundant in this fruit. Due to its diuretic effect reduces excretion and deposition of little caox particles from the kidneys, maintain a balance between stone inhibitors and promoters, helps in reducing the chance of being retained in the urinary tracts, and safeguarding the antioxidant environment [7].

Curcuma longa L.

Curcuma longa is usually known as turmeric or curcuma, is a member of the Zingiberaceae ginger family. The diferuloylmethane (flavonoid curcumin) and numerous volatile oils, such as zingiberone, atlantone, and tumerone, are the active ingredients in turmeric. Because of its anti-inflammatory and antioxidant activities, curcumin restores the normal levels of calcium and oxalate in urine and kidneys, also protect kidneys from impairment and injury caused by kidney stones, and thereby preventing from kidney stones deposition. It aids as a defensive agent in lithotripsy [19].

Tribulus terrestris

Tribulus terrestris generally called as Gokshura or Tribulus belongs to the family Zygophyllaceae, the roots and fruits of *T. terrestris* are appreciated in the treatment of kidney stones, impotence, and painful urination. Azam *et al.,* reported that on administration of the extract of *T. terrestris* in albino rats, it inhibits stone formation and also diminishes the high levels of serum urea levels and leukocytes [10].

Musa paradisiaca

Musa paradisiaca belongs to the family Musaceae. In the indigenous folk remedies of medicinal plants, the juice of *Musa paradisiaca* pseudostem were used in the treatment of urolithiasis [5].

Aerva lanata

It belongs to Amaranthaceae family commonly referred as Pashanbheda, according to Ayurveda, dissolve the stones in the urinary tract. The reported phytochemical constituents present in *Aerva lanata* include alkaloids (ervine,

Bhavani and Anuradha

methylervine, ervoside, ervine, methylervine, aervoside, ervolanine, and eervolanenine), flavonoids (kaempeferol, quercetin, isorhemnetin, persinol, persinosides A and B), methyl grevilate, lupeol, lupeol scelate benzoic acid, and tannic acid [11].

CONCLUSION

During the past decades, kidney stones have become one of the main constraints in human health globally, because of its greater therapeutic threat, lack of knowledge over treatment and increase in reoccurrence rate. In the folklore of medicine, herbal plants play a key role in the prevention and treatment of various diseases. To conclude, this review highlights the results obtained from the available literature about the efficacy of various medicinal plants used in the treatment, prevention and management of urolithiasis and the possible molecular mechanisms of action due to their content of bioactive compounds.

LIMITATIONS

Since most of the studies are extensive, studies on *in vitro*, *in vivo* or clinical studies are necessary, for a researcher to substantiate the exact outcome of the product is insufficient. The current study has limitations to study the efficacy of the medicinal plants and its mode of action and its active ingredients to treat, manage, prevent the formation and reoccurrence of kidney stones on humans.

FUTURE PERSPECTIVES

Future scientific and clinical studies are expected to focus on the mechanism of action of the herbal medicine and its active ingredients utilized as the major source for the management, treatment and prevention of kidney stone disease and health promotion, as well as for the enhancement of life span and quality of life.

Table 1: Summary of the Herbal Plants and their AntiUrolithic Activity.

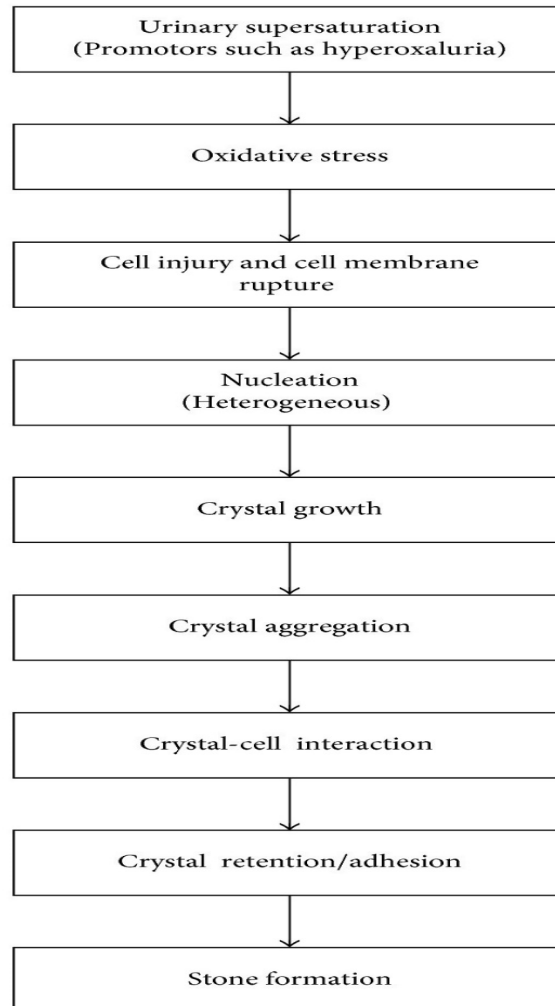
| Botanical name	Family	Part of Plant	Major Constituent	Mode of action
Berberis vulgaris	Berberidaceae	Roots	Berberine	Antioxidant, diuretic, anti-inflammatory
Nigella sativa	Ranunculaceae	Seeds	Thymoquinone, Dithymoquinone, Thymohydroquinone, and Thymol	Reduce CaOx deposition, antioxidant, anti-inflammatory
Camellia sinensis	Theaceae	Leaves	Epigallocatechin gallate, epigallocatechin, epicatechin gallate, and epicatechin	Diuretics antioxidant
Zea mays	Gramineae	Flowers	flavonoids, tannins, terpenoids, cardiac glycoside, and phenols	Diuretics
Rubia cordifolia	Rubiaceae	Roots		Decrease Ca and oxalate level in kidneys, inhibiting the growth of urinary stones
Phyllantus niruri	Euphorbiaceae	Roots	Alkaloids, flavonoids, lignans, and triterpenes	Inhibit cytotoxicity induced by CaOx stone, antispasmodic, inhibit crystallization
Olea europaea	Oleaceae	Leaves	flavonoids	Antioxidant, diuretics
Origanum vulgare	Lamiaceae	Leaves	coumarins, tannins, alkaloids, flavonoids, saponins, sterols, and terpenes	Diuretics, antispasmodic, antioxidant prevent CaOx formation
Solanum xanthacarpum	Solanaceae	Roots	solamargine, solanacarpidine, phytosterols, saponins,	Reduce CaOx stone deposition, antioxidant, anti-inflammatory
Curcuma longa	Zingiberaceae	Roots	zingiberone, atlantone, and tumerone	Decrease the level of Ca and oxalate in urine. Decrease stones deposit
Tribulus terrestris	Zygophyllaceae	Fruit	flavonoids, flavonol glycosides, steroidal saponins, and alkaloids	Diuretic, antiurolithic
Musa paradisiaca	Musaceae	Stem	flavonoids and saponins	Antioxidant, inhibition of mineralization of stone-forming constituents and prevention of urinary super-saturation
Aerva lanata	Amaranthaceae	Root bark, stem bark	flavonoids, triterpenoids and saponins	Diuretic


Figure 1: Schema of the process of renal stone formation [Adopted from 5].

ABSTRACT

Halophilic organisms are a type of extremophiles that survive in the environment with very high salt concentration. In the current study, brown pigment producing Bacillus sp was isolated from the salterns of Vemuladeevi, Andhra Pradesh, India. The isolated organism was evaluated for the potential of agro-industrial wastes such as Carrot peels (CP), Pine apple peels (PP), Dry fish wastes (DFW) and Bakers waste (BW) as substrates for pigment production from *Bacillus* sp for reducing the production cost and examine its antimicrobial potential. Among the four substrates tested, the pine apple peels has registered high amount of pigment (1.71±0.13OD Units/gram of dry fermented substrate) than others. For optimization, the production of pigment reached maximum at 37°C, basic pH 8, incubate in 120 rpm condition and 25% NaCl in all the agricultural substrates, but pine apple peels has registered the maximum compared to others in all above conditions. The result of antimicrobial activity was the pigment extract of *Bacillus* sp has registered the maximum inhibitory activity against *Escherichia coli*, *Salmonella typhi*, *Staphylococcus aureus*, *Vibrio cholerae* and *Penicillium citrinum*. The results confirmed the feasibility of using Pine apple peels as a potential low cost growth medium for the large-scale cultivation of brown pigment using halophilic *Bacillus* sp. The pigment's antibacterial properties can also be investigated so that it can be of tremendous service to mankind.

Keywords: Bio pigment, *Bacillus* sp, agro-industrial wastes, optimization, antimicrobial activity

INTRODUCTION

Food consumers have recently become more aware of the importance of human wellbeing, leading to the demand for high quality food preservatives. A natural food preservative like a coloring agent is safe for humans to consume, as it does not cause any deleterious effects to the human body, unlike synthetic coloring agents. There are plant-derived pigments (herbs and spices) and microbial pigments, with microbial pigments offering the greatest potential for improvement. Several distinct advantages of microorganisms include their short life cycle, low sensitivity to seasonal and climatic changes, ease of scaling as well as the ability to produce pigments whose color and shade vary depending on species, which are useful for a variety of applications from food to cosmetics (Pankaj et al., 2016). Hence, the identification of new microbes, the use of low-cost substrates, and the optimization of process parameters are the areas under focus towards economical pigment production in order to extend the application or to find alternative beneficial natural pigments for food industries (Pankaj et al., 2016; Nigam and Luke, 2016; Ventosa et al., 1998).

The term halophilic bacteria refer to organisms that can thrive under salty conditions, such as solar salterns, salt lakes, and salt mines. Compared to terrestrial organisms and their obligate microbes' counterparts, halophiles exhibit diverse metabolic patterns (McGenity et al., 2000). Many reports have recently been published on halophilic bacteria's ability to produce pigments and their applications (Roohi et al., 2012; Ibrahim et al., 2014; Bhat and Marar, 2015; Rao et al., 2017).Studies have also shown that halophilic bacteria have several biotechnological potentials, such as pigments, exopolysaccharides, biopolymers, biosurfactants, compatible solutes, antioxidants, antimicrobial compounds, and antitumor agents. (Aljohnyet al., 2015).

The high expense of synthetic growth media typically poses a barrier to the successful commercialization of bacterial pigments. In an effort to lower the cost of producing pigments, numerous research have been conducted to investigate the feasibility of employing less expensive growth media and agricultural waste to carry out this type of bioprocessing, which can also have a lower environmental impact (Ahmad et al., 2013).Diverse economic activities produce significant amounts of agro-industrial and residential wastes; in recent years, biotechnology research has focused on using these residues as low-cost substrates to enable the development of microorganisms to produce value-added goods like pigments (Venil et al., 2013; Mussatto et al., 2012). There are numerous techniques and approaches being developed that use a variety of less expensive substrates and wastes as substitute substrates for the manufacture of microbial pigments (Buzzini and Martini,2000). The main objective of this work was to evaluate the potential of low-cost agricultural products as substrates for brown pigment production from *Bacillus* sp for reducing the production cost and examine its antimicrobial potential.

MATERIALS AND METHODS

Source of microorganism
Bacillus sp. isolated from salt water, Vemuladeevi, Andhra Pradesh, India, and identified as a potential strain based on the previous preliminary screening technique (data not shown)that produced brown pigment was used. This strain was maintained on Zobell marine agar medium (HiMedia, India). The organism was sub cultured at regular interval of 1 month and stored at 4^0C.

Substrate preparation
The agro-industrial wastes of Carrot peels (CP), Pine apple peels (PP), Dry fish wastes (DFW) and Bakers waste (BW) were obtained from a local market. The obtained raw wastes were pulverised and utilised as substrates for screening bacterial isolates for pigment synthesis after being baked in an oven at 60^0C for 12 hours. 10 g of powder was soaked in water overnight, the excess water was drained, and the flasks were autoclaved at 121°C for 20 minutes. The flasks were allowed to cool before being infected with 10% of the inoculum and incubated at 28°C for 12 days. After the

incubation period, the flasks were autoclaved for 30 minutes at 121°C. The fermented substrates were dried for 24 hours at 50°C. Dried substrates were pulverised and saved for later investigation.

Pigment extraction and estimation
The final volume was made up to 50 ml after extracting 0.5 g of dried fermented substrate with 80% ethanol. The mixture was shaken continuously for one hour at a speed of 200 rpm. The supernatant was collected and centrifuged for 30 minutes at 5000 rpm to separate the pigments. The pigments were examined using a 475 nm absorbance measurement of pigment extract. Pigment yield was calculated as OD per gram (od/gdfs) of dry fermented matter at its maximum.

Optimization for pigment production
The optimization of growth conditions, particularly physical nutritional parameters is a prime importance in the development of any pigment production process owing to their impact on the economy and practicability of the process. Temperature has a substantial impact on pigment synthesis since microbes require an appropriate temperature to flourish and produce pigment. The pH of the growth medium is important in pigment production because it balances the medium's acidic and basic nature and creates a pleasant environment for microbial development. The selected bacterial isolates were inoculated into the agro-industrial wastes medium and incubated at different temperatures like 15°C, 20°C, 28°C, 37°C and 45°C, pH range of 5, 6, 7, 8, and 9, Agitation condition kept at static, 30 rpm, 60 rpm and 120 rpm), NaCl concrange of 10%, 15%, 20%, 25% and 30% for about 7 days. After incubation, the absorbance (OD) of the produced pigments was analyzed using UV-Vis Spectrophotometer against a blank.

Antimicrobial potential of brown pigment

Plate assay
Crude pigments were screened for antimicrobial potential against bacterial cultures of *E. coli,Salmonella typhi, Shigella flexneri, Staphylococcus aureus, Vibrio cholerae* and fungal strains of *Aspergillus niger, Candida albicans, Fusarium solani, Mucor sp, Penicillium citrinum* by Kirby- Bauer disc diffusion method. The bacterial strains were maintained in Nutrient agar slants at 4°C and sub-cultured on a fresh nutrient broth 24 h prior to antibacterial test. The fungal strains were maintained in Sabouraud's dextrose agar slants and sub-cultured on a fresh Sabouraud's dextrose broth 24 h prior to antimicrobial test. Purified colonies of 18 to 24-hour old test cultures cultivated on their respective medium were used to prepare bacterial and fungal suspension in 0.9% saline solution and the turbidity was adjusted to 0.5 McFarland standards and the suspension was swabbed on Muller Hinton agar for bacteria and potato dextrose agar for fungi using a sterile cotton swab. Sterile discs (6 mm) prepared from Whatman filter paper No.1 impregnated with 20 µl crude pigment solution (at a final concentration of 2.5 mg/ml, 5 mg/ml and 10 mg/ml) were placed over the Muller Hinton agar and potato dextrose agar. The diameter of the zone of inhibition was measured after 24 hours of incubation at 37°C for bacteria and 72 hrs for fungi with the help of zone meter provided in the commercial kit. The activity for each sample was carried out in triplicate and the results were expressed as mean ± standard deviation (Selvameenal et al., 2009).

Minimum inhibitory concentration (MIC)
Minimum inhibitory concentration of crude pigment was performed in Mueller Hinton broth for bacteria and Potato dextrose broth by Broth Dilution method (Andrew, 2001). The drug concentrations ranged from the crude pigment, 512, 256, 128, 64, 32, 16, 8, 4, 2and 1 mg/ml of standardized suspension (0.5% McFarland turbidity) of the test organism was transferred into each tube. The control tube contained only organism and devoid of crude pigment. The culture tubes were incubated at 37°C for 24 h for bacteria and 72 hrs for fungi. The lowest concentrations which did not show any growth of tested organism after microscopic evaluation were determined as MIC. The assay was repeated three times.

Minimum Bactericidal and Fungicidal Concentration (MBC/MFC)

The MBC/MFC of the crude pigment were determined (Karting, *et al*., 1991) by plating a loopful of bacterial sample from each MIC assay tube with growth inhibition into freshly prepared muller hinton broth and potato dextrose broth and the plates were incubated at 37°C for 24 hr. The MBC values were recorded as the lowest concentration of the extracts that did not permit any visible bacterial colony growth on the agar plate during the period of incubation. The assay was repeated three times.

RESULTS AND DISCUSSION

Effect of agricultural waste type on pigment production after 12 days of incubation

The aim of substrate selection was to evaluate the low-cost agricultural products that are most suitable for the maximum yield of brown pigment production. Carrot peels, Pine apple peels, Dry fish wastes and Bakers waste without any supplementation were used as substrates for cultivations of *Bacillus* sp. As shown in Table 1, the bacteria produced the highest yield of brown pigments when cultivated in Pine apple peels (1.71±0.13OD Units/gram of dry fermented substrate), followed by carrot peels (1.19±0.28od/gdfs), and dry fish wastes (1.18±0.21 od/gdfs), respectively, whereas the lowest yield of pigment production was observed from Bakers waste (0.83±0.19 od/gdfs). Similarly, Gupta et al., 2019 examined that dry powder of fruit wastes of pomegranate, grapes, lime, apple, and papaya was used to pigment extraction capability. Solvent combination of hexane and acetone (1:1) produced the maximum extraction for lime waste with a yield of 1.65%.

Optimization parameters

Temperature

The effect of temperature on brown pigment production by Bacillus sp was studied in Table 2. The maximum pigment production was recorded at 37°C in PP (1.76 od/gdfs), CP (1.24±0.02 od/gdfs), and DFW (1.19±0.05 od/gdfs), whereas minimum amount of pigment was recorded at 15°C in BW (0.14±0.01 od/gdfs). Similarly, the maximum pyocanin production from *Pseudomonas aeruginosa* was recorded at 37°C in a study performed by Alka*et al,* (2018). Effect of varied pH on pigment production by *Bacillus* sp was studied (Table 3). The production of pigment reached maximum at basic pH 8 in all the agricultural substrates, i.e.,PP (2.13±0.15 od/gdfs), CP (1.25±0.08 od/gdfs), and DFW (1.26±0.17od/gdfs) followed by pH 9 and 7. Minimum pigment production was recorded in pH 5 in BWsubstrates, (0.16±0.02 od/gdfs). Similarly, Asker and Ohta, (1999) reported that canthaxanthin production was higher at pH 7.2 in *Halobacterium* sp. isolated from a salt farm in Alexandria, Egypt. Shatila et al. 2013 reported that the growth and pigment production by *Exiguobacterium aurantiacum* 144 was found to be highest at pH 7.0.

Agitation condition

The influence of agitation condition on pigment production by *Bacillus* sp was studied with different range of agitation condition (static to 120 rpm). The highest level of pigment production was achieved at 120 rpmin PP substrates (2.41±0.28 od/gdfs) followed by 60 rpm (1.65±0.24 od/gdfs) (Table 4). Similarly, Khanafari et al., 2010 examined that the *Halorubrum sodomense* cultivated under shaking conditions at 120 rpm, it exhibited high growth and pigment production. Without shaking, little growth and no pigment production was observed. Masetto et al. 2001 reported that agitation combined with aeration results in higher zeaxanthin accumulation in *Flavobacterium* sp.

NaCl Concentrations

The low level of pigment production by *Bacillus* spin the concentration of NaCl was 10%, but pigment production was in maximum in the concentration was 25% (Table 5). Similarly, Khanafari et al., 2010 found that the *Halorubrum sodomense* produced high amount of pigment in30% NaCl.

Antimicrobial activity of extracted pigment – Plate Assay

Bacterial pigments have been long known to exhibit antimicrobial properties. Pigments such as carotenoids, melanins, flavins, quinones, monascins, violacein, and indigo have been reported as good antimicrobial agents

(Malik, et al., 2012). As per the table 6, it was observed that the pigment extract of *Bacillus* sp has registered the maximum inhibitory activity against *Escherichia coli* (16.8±0.71 mm), *Salmonella typhi* (12.6±0.46 mm), *Staphylococcus aureus* (12.3±0.43 mm), and *Vibrio cholerae*(11.0±0.51 mm)at the concentration of 10 mg/ml. Among five fungi tested, the *Aspergillus niger* (10.3±0.44 mm) and *Penicillium citrinum* (10.3±0.34 mm) were found most susceptible to the extracted pigment at the concentration of 10 mg/ml. The minimum amount of inhibitory activity was observed against *Candida albicans*(8.2±0.17) at 10 mg/ml concentration tested. The test concentration of 2.5 mg/ml showed the minimal antimicrobial activity against most of the pathogens. Similarly, Patki et al., 2021 examined that the yellow pigment extracted from bacterial isolates of mangrove soil exhibited good antibacterial activity with maximum effect on *E. coli*(15.8±0.16 mm) and *S. aureus*(16±0.57 mm).

MIC and MBC, MFC of biopigment

The antimicrobial potency of brown bacterial pigment was quantitatively determined by the micro dilution method. Minimum inhibition concentration (MIC) values exerted by pigment are presented in Table 7. The pigment showed considerable antimicrobial activity against tested strains with MIC values ranging from 16 – 126 mg/mL. The present study showed that crude pigment has possessed low level of antifungal activity (>128 mg/ml) against *A. niger, C. albicans* and *Mucor* sp. Of interest, the pigment was most active against *E. coli*(>16 mg/ml) followed by *Salmonella typhi and Staph. aureus*with MIC value of 32 mg/ml. MBC/MFC was defined as the lowest concentration of pigment that showed complete inhibition of colonies of microorganisms on agar plates. The *E. coli*showed MBC at 32 mg/ml whereas, for *A. niger*, *C. albicans* and *Mucor* sp were registered the MFC level of 128 mg/ml. Zhao *et al.*, 2016 investigated the orange pigment of *Monascus* has exhibited strong antibacterial activity against *E. coli* and the concentration of 2.5 mg/ml was the minimum inhibitory concentration against *E. coli.*

CONCLUSION

The use of Carrot peels (CP), Pine apple peels (PP), Dry fish wastes (DFW) and Bakers waste (BW) as substrate was cost effective and environmental friendly. From this study it was confirmed that the feasibility of using Pine apple peels as a potential low cost growth medium for the large-scale cultivation of brown pigment using halophilic *Bacillus* sp. Antimicrobial assays of crude pigment extract of 10 mg/ml exhibited highest inhibitory effect on *E.coli*, *S. typhi* and *S. aureus*. Therefore, it was suggested that these findings could inspire product developers in the food, cosmetic and pharmaceutical industries etc., to develop cost-effective natural colorants that would be more attractive.

ABSTRACT

Four bacterial strains were isolated from diesel contaminated soil in local car service shop, Chennai. From the soil sample four morphologically different bacterial species were isolated and the active strains were *Pseudomonas aeruginosa, Arthobacter sp, Bacillus licheniformis* and *B. subtilis*. The diesel degrading efficiency of isolated organisms was tested in BH medium supplemented with diesel and DCPIP for 14 days. Among the four isolated species incubated and monitored in diesel supplemented medium for 14 days, the maximum diesel biodegradability was noticed in *P. aeruginosa* at fourth day itself and a TPC 67 x 10^5 CFU at a temperature of 30°C and pH 5. This study revealed a qualitative evaluation of potentials of hydrocarbonoclastic bacteria degradation of hydrocarbon.

Keywords: Oil degrading bacteria, Bioremediation, Diesel oil, DCPIP.

INTRODUCTION

Hydrocarbons are the most extensively used primary energy and fuel resource in the world due to the energy they generate. Due to spills that happen during regular operations like the production, distribution, and refining of crude oil as well as acute accidents, this field has been the focus of research attention for many years (1). Oil spills are now worldwide issues that affect both developed and industrialized nations. The importance of the marine environment has increased as a result of the biggest and most notable spills (2). Crude oil, which is the raw material used to make all petroleum products, is primarily composed of hydrocarbons. Crude oil contains a wide range of aromatic, paraffinic, and paraffinic hydrocarbons (3). Aromatic hydrocarbons, such as benzene, toluene, and xylene (BTX) (4), are found in certain petroleum products and pollute the environment, harming human and animal health, and lowering agricultural productivity (5).

65734

Environmentally friendly techniques for cleaning up oil-polluted sites are being promoted with increasing interest. Both biological and non-biological techniques are employed in the cleanup of oil pollution. Remediation using microorganisms or any biological process that employs microorganisms or their enzymes to return an environment that has been contaminated to its original state is known as bioremediation, and it is one of the main remediation strategies (6). Following a number of studies addressing the biotransformation, biodegradation, and bioremediation of petroleum hydrocarbons, petroleum microbiology has grown more interested in using organisms that break down crude oil for environmental cleanup. Many microorganisms have been shown to be capable of biodegrading hydrocarbons [Sumathi and Yogananth, (7); Geetha et al. (8); Elliott et al. (9); Sarikhani et al. (10)]. These techniques don't add more chemicals to the environment and are less costly. As a result, the current study concentrated on separating and screening naturally occurring bacteria from diesel-contaminated sites that break down hydrocarbons and diesel.

MATERIALS AND METHODS

Samples of soil contaminated by diesel were aseptically collected from a nearby auto repair shop in Chennai and kept in a sterile container. The soil samples were kept at 4ºC until microbial analysis, after which they were promptly transported to the laboratory. A sample of diesel was obtained from the gasoline bunk, and the indicator used in the investigation was 2, 6-dichlorophenol indophenol (DCPIP).

Bushnell-Hass (BH) medium was used as the enrichment media with 1% (v/v) diesel as the sole carbon source. A sample of 10 grams of contaminated soil was mixed with 100 milliliters of BH medium and incubated at 30 degrees Celsius with a rotation speed of 170 revolutions per minute. The Bushnell-Hass medium inoculum was streaked onto the nutrient agar plate after five days of incubation, and it was then incubated for seventy-two hours at thirty degrees Celsius. To facilitate identification and subsequent experimental investigations, colonies with varying morphological appearances were chosen, purified in nutrient agar medium, moved to nutrient agar slants, and kept. A monthly subculture in nutrient agar medium was performed on the obtained cultures. Based on physical characteristics and the biochemical tests described in Bergey's Manual of Determinative Bacteriology, the isolated bacteria were identified (11). To create pure cultures, morphologically distinct colonies were separated and refined through replication on the same solid medium. The ability of the four identified bacterial isolates to degrade diesel was tested, and the most effective degrader was found. Each of the bacterial cultures was inoculated to 100 ml of nutrient broth medium and incubated to 37ºC for 24 hours at 150 rpm. The cultures were used as inoculum for the hydrocarbon degradation. 100ml of Bushnell-Hass (BH) medium was prepared with 1% diesel as sole carbon source. DCPIP was added to the medium at a concentration of 20 mg/l. The medium was sterilised for fifteen minutes at 121ºC. To every experiment set, 1 ml of the inoculum was added, and the mixture was incubated for 14 days at 150 rpm. Additionally, control was upheld. Using the pour plate method and nutrient agar, the initial and final growth was ascertained. The plates were incubated for 48 hours at 37ºC. Following the incubation period, colonies were tallied, and the total microbial count per milliliter was computed.

Diesel degradation was assessed by observing at the change in DCPIP's color from blue to colorless, which indicates the ability of microorganisms to utilize as sole carbon source. After being reduced, the indicator turned transparent and turned blue. Using a UV-visible spectrophotometer, the reaction was monitored visually until the end of the incubation period as well as spectrophotometrically (at 600 nm) every four days.

RESULT AND DISCUSSION

The diversity of microorganisms in natural environments enables them to utilize contaminants as a source of energy and carbon (12). It is imperative to eliminate a wide range of pollutants from the natural environment in order to enhance sustainable development of the ecosystem with low ecological impact (13). The adaptability of microorganisms to degrade or transform contaminants into harmless substances is a crucial part of the removal

process of contaminants. In the present study four diesel degrading bacterial species *Pseudomonas aeruginosa*, *Arthobactersp, Bacillus licheniformis* and *B. subtilis* were identified in the diesel contaminated sites Similar to our research, Yogananth et al. (14) stated in that certain isolated bacteria from oil-polluted sites, including *Bacillus sp*. and *Pseudomonas* sp., were efficient at degrading hydrocarbons. Furthermore, this supports the findings of Youssef et al. (15) found that a contaminated site's hydrocarbon content indicates a nutrient-rich environment where less-recalcitrant organic carbon might be limiting.

The study examined the degradation efficiency of distinct organisms in BH medium that was enhanced with diesel and DCPIP. In order to examine the color change of DCPIP, which is blue in its oxidized form and colorless in its reduced form, the experimental setup was maintained for 14 days of incubation (Fig 1). This is because the oxidized product of hydrocarbon degradation reduces the indicator, supporting the idea that the isolates may be hydrocarbon oxidizers (12). Among the four isolated species incubated and monitored in diesel supplemented medium for 14 days, the maximum diesel biodegradability was noticed in *P. aeruginosa* at fourth day itself and a TPC 67×10^5 CFU at a temperature of 30°C and pH 5. The degradation was also checked spectrophotometrically at an OD of 660nm; where in the OD reading was found to decrease in all the causes till the end of incubation period (Table 1). Based on oil utilization capacity, *P. aeruginosa*is the most active hydrocarbon utilizer in crude oil. According to earlier findings, the Pseudomonas genus is the most effective of the microorganisms that break down hydrocarbons. The study presented a qualitative assessment of the hydrocarbonoclastic bacteria's potential for hydrocarbon degradation. thus providing a quantifiable capacity for these bacterial groups' potential application in soil remediation affected by hydrocarbons.

ABSTRACT

Oxidative stress is the cause of several illness, such as cancer, cardiovascular and neurological diseases. The use of antioxidants can prevent the onset of several ailments. In marine ecosystems, the ink secretion of some molluscan species was identified as one of the novel sources of natural bioactive compounds which acts as antioxidants. The Species *Bursatella leachii* was collected from intertidal waters of Pulicat Lake, Tamil Nadu and species accession number M-1697 was obtained from Zoological Survey of India, MBRC, Chennai, India. In the present study Ink extract of *Bursatella leachii* were evaluated for total phenolic content, total Flavonoid content, antioxidant activity and radical scavenging potential through *invitro* assays. The antioxidant activity of ink extract were evaluated for; DPPH Radical Scavenging Assay, Hydrogen Peroxide Scavenging Activity, Nitric Oxide Scavenging Activity, Ferric reducing antioxidant powder (FRAP), Deoxyribose Radical Scavenging activity(DRS), ABTS, Superoxide Radical Scavenging Activity, Superoxide Dismutase Scavenging Activity, Estimation of Lipid Peroxidation using egg yolks and β carotene Linoleic Acid Assy. The highest antioxidant activity noticed against Hydrogen Peroxide, Nitric Oxide, FRAP, ABTS and SOD probably due to the presence of protein base bioactive compounds at lower molecular weight. The results were expressed as a percentage of antioxidant activity relative to a control and as half maximal inhibitory concentration (IC_{50}) values.

Keywords: Antioxidant activity, Mollusc, ink extract, *Bursatella leachii*, Ragged sea hare.

65738

INTRODUCTION

Bursatella leachii (Blainville, 1817) is a circumtropical aplysiide species displaying a fascinating range of colours and body forms: found world wide in warm- temperate to tropical marine environments (Rudman, 1998 and Paige,1988). Information on sea hare distribution and description from the Indian subcontinent is scanty, ragged sea hare *Bursatella leachii* Blainville,1817 (Opisthobranchia: Euopisthobranchia: Aplysiidae) in Pulicat Lake east coast in India was reported by Sethi *et al.,* (2015) and Kokane *et al.,* (2016). Marine ecosystem are considered to be the major source of bioactive compounds (Faulkner, 1995). The marine organism is a rich source of secondary metabolites which are being obtained through their algal diet and plays a vital role in its chemical defence via purple ink (D'Souza, 2012). Oxidation is a chemical reaction that can produce free radicals, leading to chain reactions that may damage cells and causes several health hazards issues in human beings such as cardiovascular disease, cancer, and neurological disorders as well as aging process etc.(Gulcin, 2011 & 2012). Synthetic and natural antioxidants generally used to prevent or slow down the oxidation process; synthetic antioxidant being toxic in nature by long term exposures (Kahl and Kappus, 1993). Scientists have been using natural sources as a way to extract natural bioactive compounds, with a range of different bioactivities, which could potently be used by the pharmaceutical industry for the new drug development. By its interesting physiology, marine invertebrates namely sponges, tunicates, sea cucumbers and sea hare, were considered as a potential resource of bioactive compounds. In the recent years around 1500 marine natural products have been identified, 45 were tested during preclinical and clinical trials (Braga, 2014). In the present study, antioxidant activity of *Bursatella leachii* ink extracts were focused with different methods; in order to get the real picture.

MATERIALS AND METHODS

Collection of the Sample
The Species *Bursatella leachii* was collected from intertidal waters of Pulicat Lake, Tamil Nadu and accession number M-1697 was obtained from Zoological Survey of India, MBRC, Chennai, India.

Isolation of Purple ink from Ink gland of *Bursatella leachii*
 B.leachii species was collected from Pulicat lake (Position $13^0 43.40''080^0 31.57''$ and near by area) and kept in sea water container in live condition. After acclimatization with the lab condition, the purple fluid was obtained by disturbing the *Bursatella leachii* and it was diluted to 100ml with distilled water. All aqueous ink samples were centrifuged at 15,000g for 15 min as described by Vennila R., *et al.,* (2011) and the supernatant was taken and lyophilized to extract a purple reside using a lyophilizer and stored for further use at 4^0C.

Total Phenolics content
The total Phenolic content of test was carried out by following Taga *et al.,*(1984) procedure with slight modification. 100 µl extract of *Bursatella leachii* ink was blended with 2.0 ml of 2% Na_2CO_3 and permitted to remain for 2 min at room temperature. After incubation, 100 µl of 50% Folin Ciocalteau's phenol reagent was added and mixed thoroughly. It is then allowed to stand at room temperature for 30 min. Absorbance of all the samples were measured at 720 nm using spectrophotometer. Gallic acid was used as standard to determine total phenolic activity.

Total Flavonoids content
The total flavonoid content of tests was evaluated by Chang *et al.,*(2002) through aluminum chloride colorimetric method. 0.5 ml of methanolic extract of *Bursatella leachii* ink were mixed with 250 µl of 5% sodium nitrite ($NaNO_2$) solution and 150 µl of 10% $AlCl_3$ solution and incubated for 5mins. At that time, 0.5 ml of 1 mol/L sodium hydroxide (NaOH) solution was added, and was brought to 2.5 ml with double-distilled water. The mixture was allowed to stand for 15 min which was measured at 510 nm. The total flavonoid content was calculated from a calibration curve and the result was expressed as mg. Rutin was used as standard (equivalent per g dry weight).

Total antioxidant activity

The total antioxidant capacity of samples was evaluated by P. Prieto e*t al,* (1999). Total antioxidant capacity (TAC) reagent were prepared as follows: 7.45 ml of sulphuric acid (0.6 mM solution), 0.9942 g of sodium sulphate (28 mM solution) and 1.2356 g of ammonium molybdate (4mM solution) was dissolved in distilled water and made up to 250 ml. 300 µl of test samples were dissolved in 3 ml of TAC reagent. Reaction mixture was incubated at 95° C for 90 minutes. All the samples were measured at 695 nm and ascorbic acid was used as standard (P. B. Kasangana *et al,* 2015; A. B. Aliyu *et al,* 2012; R. S. Phatak and A. S. Hendre, 2014). The varied concentration in the range of 100 to 500 µg/ ml were taken for both standard and test samples.

DPPH radical scavenging assay

The DPPH radical scavenging activity was determined by the method of G. H. Yen and H. Y. Chen, 1995. Briefly, 2.0 ml of test samples were mixed with 2.0 ml of 0.16 mM DPPH methanolic solution. The mixture was vortexed for 1 min and then left to stand at room temperature for 30 min in the dark. The absorbance of the sample solutions was measured at 517 nm (M. R. A. Manimala and R. Murugesan, 2014; A. Y.Loo *et al,* 2008). The varied concentration in the range of 100 to 500 µg/ ml were taken for both standard and test samples. The control was tested without standard and test samples. The scavenging effect (%) was calculated by using the formula:

Scavenging effect (%) = (Absorbance of control – Absorbance of test solution)/Absorbance of control] × 100

Hydrogen peroxide scavenging activity

The hydrogen peroxide scavenging assay was carried out by the procedure of R. J. Ruch *et al,* 1989. A solution of hydrogen peroxide (H_2O_2, 10 mM) was prepared in phosphate buffer(0.1 M, pH 7.4). 3.4 ml of phosphate buffer was mixed with 0.6 ml of H_2O_2 solution (0.6 ml, 43 mM) and 1ml (0.25 mg) of test solution was added to it. The absorbance value of the reaction mixture was recorded at 230 nm after 10 minutes incubation at room temperature. Blank solution contains sodium phosphate buffer without H_2O_2. Ascorbic acid was used as the standard (D. Gulcin, 2006; M. Elmastas *et al,* 2005). The varied concentration in the range of 100 to 500µg/ ml were taken for both standard and test samples. Control solution containing buffer and H_2O_2 were taken. The percentage of H_2O_2 scavenging were calculated using the following equation:

H_2O_2 scavenging effect (%) = (Absorbance of control – Absorbance of test solution)/Absorbance of control) × 100

Ferric reducing antioxidant Power (FRAP)

Reducing power of test samples was determined by the method prescribed by M. Oyaizu, 1986. Briefly, 1.0 mL of test sample was mixed with 2.5 ml of Phosphate buffer (0.2 M, pH 6.6) and 2.5 mL Potassium ferricyanide (1%). Reaction mixture was incubated at 50°C for 20 min. After incubation, 2.5 mL of Trichloroacetic acid (10%) was added and centrifuged (650 g) for 10 min. From the upper layer, 2.5 mL solution was mixed with 2.5 mL distilled water and 0.5 mL $FeCl_3$ (0.1%). Absorbance of all the sample solutions was measured at 700 nm. Increased absorbance indicate increased reducing power (Manivannan *et al,* 2012). The varied concentration in the range of 100 to 500 µg/ ml were taken for both standard and test samples.

Deoxyribose Radical Scavenging Activity

Deoxyribose non-site specific hydroxyl radical scavenging activity of test solution was estimated. Briefly, 2.0 ml aliquots of test samples were added to the test tube containing reaction mixture of 2.0 ml $FeSO_4.7H_2O$ (10mM), 0.2 ml EDTA (10mM) and 0.2 ml deoxyribose (10mM). The volume was made up to 1.8 ml with phosphate buffer (0.1M, pH-7.4) and to that 0.2 ml H_2O_2 (10mM) was added. The mixture was incubated at 37°C under dark for 4 hours. After incubation, 1ml of TCA (2.8%) and TBA (1%) were added to the mixture, and kept in boiling water bath for 10 min. After treatment absorbance was measured at 532nm. If the mixture was turbid, the absorbance was measured after filtration. Ascorbic acid was used as standard (H. Indu and R. Seenivasan, 2013). The varied concentration in the

range of 100 to 500 µg/ ml were taken for both standard and test samples. Control tube was also measured containing only reagents. Scavenging activity (%) was calculated using the equation:

Deoxyribose radical scavenging activity (%) = (Absorbance of control - Absorbance of test) / Absorbance of control × 100

Nitric oxide scavenging activity

Nitric oxide scavenging activity was performed as follows: 3ml of 10 mM of sodium nitroprusside was prepared in phosphate buffer saline (pH 7.4, 0.2 M) and mixed with 1 ml of test solution and incubated at 25°C for 180 mins. Griess reagent was prepared by mixing equal amounts of 1% sulphanilamide in 2.5% phosphoric acid and 0.1% naphthylethylene diamine dihydrochloride in 2.5% phosphoric acid immediately before use. The test solution was mixed with an equal volume of freshly prepared Griess reagent. The absorbance was measured at 546 nm. Ascorbic acid was used as the positive control. The percentage inhibition of the test and standard was calculated and recorded (Fadzai Boora *et al*, 2014). The varied concentration in the range of 100 to 500µg/ ml were taken for both standard and test samples. Control was tested against test solution. The percentage nitric oxide radical scavenging activity of both test sample and gallic acid were calculated using the following formula:

Nitric oxide activity (%) = (Absorbance of control Absorbance of test) / Absorbance of control × 100.

ABTS [2, 2'-azinobis-(3-ethylbenzothiazoline-6-sulfonic acid)] Radical Cation Scavenging Assay

Free radical scavenging activity was also determined by ABTS radical cation decolorization assay (R. Re *et al*, 1999). ABTS radical cation was generated by mixing 20mM ABTS solution with 70mM potassium peroxodisulphate and allowing it to stand in dark at room temperature for 24 hours before use. 0.6ml of test samples (0.25 mg) were mixed with 0.45 ml of ABTS reagent and absorbance of these solutions was measured at 734 nm after 10 min of incubation. The varied concentration in the range of 100 to 500 µg/ ml were taken for both standard and test samples along with the control.

ABTS radical cation scavenging assay [%] = (Absorbance of control - Absorbance of test) / Absorbance of control × 100.

Superoxide radical scavenging activity (SO)

Scavenging of superoxide radical was studied using the method elaborated by C. C. Winterbourn *et al*, 1975. Assay tubes contained 0.2 ml of the test samples (corresponding to 20mg extract) with 0.2 ml EDTA (12mM), 0.1 ml Nitro blue tetrazolium, 0.05 ml riboflavin (20µg) and 2.64 ml phosphate buffer (50 mM, 7.6 pH) were taken. The control tube was set up with DMSO (Dimethyl sulfoxide) solution instead of the test solution. The initial optical densities of the solutions were recorded at 560 nm and the tubes were illuminated uniformly with the fluorescent lamp for 30 mins. A560 was measured again and the difference in O.D was taken as the quantum of superoxide production. The percentage of inhibition by the test samples was calculated by comparing with O.D of the control tubes (M. Pandithurai and S. Murugesan, 2014). The varied concentration in the range of 100 to 500 µg/ ml were taken for both standard and test samples.

% Inhibition= (Absorbance of control- Absorbance of test) / Absorbance of control × 100

Estimation of lipid peroxidation using egg yolk

Inhibitions of lipid peroxidation was determined using a modified method thiobarbituric acid reactive species (TBARS) assay (E. S. Adithya *et al*, 2013; G.Ruberto *et al*, 2000; J. A. Badmus *et al*, 2013). Egg homogenate (0.5 ml, 10% in distilled water, v/v) and 0.1 ml of test samples were mixed separately in a test tube and the volume was made up to 1 ml, by adding distilled water. Finally, 0.05 ml $FeSO_4$ (0.07 M) was added to the above mixture to induce lipid peroxidation and incubated for 30 min. Subsequently, 1.5 ml of 20% acetic acid and 1.5 ml of 0.8% TBA (w/v) in 1.1% sodium dodecyl sulfate (SDS) and 0.05 ml 20% TCA was added, vortexed and then heated in a boiling water bath for 60 min. After cooling, 5.0 ml of butanol was added to each tube and centrifuged at 3000 rpm for 10 min.The

absorbance of the organic upper layer was measured at 532 nm. The varied concentration in the range of 100 to 500μg/ ml were taken for both standard and test samples along with the control tube. % Inhibition= (Absorbance of control- Absorbance of test) / (Absorbance of control × 100)

β carotene linoleic acid assay

β- Carotene linoleic acid assay was performed based on H. E.Miller, 1971; M. Zargar *et al*, 2011. Briefly, in 10 ml of chloroform, 2 mg β-carotene, 200 mg linoleic acid and 20 mg Tween 40 were dissolved which was taken in flask. Chloroform was evaporated using vacuum evaporator apparatus. Then, 50 ml of distilled water saturated with oxygen by shaking for 30 mins. This mixture is used as stock solution. 200 μl of test samples were mixed with 2.5 ml of stock solution in the test tube. Afterwards, the samples were placed in an oven at 50°C for 3 hours. The absorbance was read at 470 nm. The varied concentration in the range of 100 to 500μg/ ml were taken for both standard and test samples. The percent of antioxidant activity was calculated from the following equation: % of antioxidant activity = (Absorbance of control-Absorbance of test) / Absorbance of control × 100

Statistical analysis
All analysis were carried out in triplicates and data were expressed as mean ± standard error of mean.

RESULTS

The extract of *Bursatella leachii* ink was quantified for Total Phenolic, Total Flavonoids and Total Antioxidant content along with standard Gallic acid, Rutin and Ascorbic acid at different OD values i.e OD at 720nm, OD at 510nm and OD at 695nm respectively [Table 1–Table 3]. The results shows that the concentration and hence presence of the secondary metabolites increases with increase in concentration of the sample (Figure 1,2 & 3) .The DPPH Scavenging activity was carried out for the ink extract of *Bursatella leachii* sea hare with standard Ascorbic Acid at different concentration ranging from 100-500μg/ml of the extract [Figure 4]. The control OD value of 1.108+/- 0.115 is used to calculate the percentage of inhibition shown by the sample. Highest inhibition was shown at 500μg/ml which was 64.71% and lowest inhibition at 100μg/ml 13.72% when compared against the standard Ascorbic acid. The other test concentration, the sample possesses slight lower percentage of inhibition i.e 13.18% to 62.82%. (100-500μg/ml). The IC_{50} value of both Standard sample & Test sample (i.e ink extract of *B.leachii*) was observed to be 403.815μg/ml and 419.532μg/ml respectively.

Hydrogen Peroxide Scavenging Activity was tested at different concentration in the range of 100-500μg/ml as indicated in the Figure 5. The result of the present investigation revealed that purple ink extract fluid possesses inhibition activity of 26.04 to 92.06% (100-500μg/ml) in comparison with standard drug. IC_{50} value for standard drug was found to be 267.800μg/ml and for extracted ink sample it was 236.910μg/ml. The OD value of the standard and test sample (i.e ink extracted from *B.leachii*) observed against scavenging of FRAP radical was represented in figure 6 which denotes the test sample to possess lower inhibiting activity upon comparison with standard sample. The test sample (i.e ink extracted from *B.leachii*) showed maximum activity against deoxy ribose radical scavenging with 84.81% inhibition at concentration of 500μg/ml and IC_{50} value of 274.165μg/ml which is higher than the standard sample of same concentration (82.45%) with IC_{50} value of 279.100μg/ml as shown in figure 7.

In the present study the nitric oxide scavenging activity of standard drug and test sample of ink extract from *Bursatella leachii* were tested at various concentration (100-500μg/ml). The test sample showed higher scavenging activity (21.04% to 83.92%) in comparison with the standard drug (14.53% to 78.75%). The IC_{50} value of both standard and test sample was found to be 302.609μg/ml and 263.905μg/ml respectively Figure 8. From the result it is determined that highest percentage of inhibition against ABTS radical was recorded at 500μg/ml and lowest percentage inhibition recorded at 100μg/ml for the test sample with IC_{50} value 241.200μg/ml Figure 9. The Superoxide Dismutase Scavenging Activity of the test sample and standard sample with different concentration (100-500μg/ml). From the results, it is found that both standard and test sample is having almost similar effect at

concentration of 500μg/ml i.e test sample 82.33% and standard sample 82.41% of inhibition by the standard sample was found to be ranging from 29.14% to 88.70% at 100-500μg/ml concentration which is higher than the test sample percentage of inhibition ranges i.e 27.25% to 68.78% (100-500μg/ml) Figure 10. Figure 11 indicates the lipid peroxidation activity using egg yolks, in which test sample is having slightly higher percentage of 19.40% at 100μg/ml and 80.11% at 500μg/ml as compare with standard sample. The IC_{50} value of standard 313.030μg/ml and the test sample was determined at 303.089μg/ml.

Figure 12 explains the β carotene linoleic acid activity of test sample and standard sample with different concentration (100-500μg/ml). It shows that lowest percentage of inhibition was given at 100μg/ml (15.89%) and highest value at 500μg/ml(80.66%)for the test sample. Standard sample has showed IC_{50} value of 263.549μg/ml whereas the test sample has showed IC_{50} value of 300.518μg/ml.

DISCUSSION

The result of the *Bursatella leachii* ink shows higher antioxidant activity against Hydrogen peroxide, Nitric oxide, Deoxyribose Radical, ABTS, and lipid peroxidation using egg yolk & linoleic acid assay [except DPPH, FRAP & β carotene] when compared with standard drug. The antioxidant activity of Sea hare *Aplysia depilans* ink has shown higher antioxidant activity in DPPH, Hydoxyl Radical Scavenging activity, FRP & FIC activity this may be due to the presence of protein with lower molecular weight (Cherif *et al*., 2015). Rajaganapathi *et al* has purified the protein with 60kDa Molecular weight from purple ink of the sea hare *Bursatella leachii* that shown anti-HIV activity. Antioxidant are presumed to have several positive health effects that include prevention of cardiovascular disorder, ageing related diseases such as Alzheimer and certain types of Cancer (Shibata *et al*., 2006). Squid Ink extract has shown positive results of antioxidant ability on broiler chicken (Liu *et al*., 2011). Fahmy and Soliman (2012) attempted to evaluate the antioxidant and prooxidant effects of the cuttel fish ink extract. Melanin free ink of the splendid squid prevent lipid oxidation in surimigels during refrigeration storage (Vate *et al*., 2014). Sudhaker and Nazeer 2015 suggested that cuttlefish peptide could be explored as natural food supplement for its antioxidant properties. In vitro antioxidant, analgesic and cytotoxic activities of Sepia officinalis ink and Coelatura aegyptiaca extracts was also reported by Fahmi and soliman [2013]. The functional properties, proximate composition, antioxidant and antimicrobial activity of ink from Indian squid *Loligo duvauceli* was analysed and reported [Immaculate Jeyasanta and Jamila Patterson, 2020].

Currently natural bioactive compounds isolated from sea hares are one of the most promissory sources for cancer prevention, as anticancer agents, being used in clinical trials as the example of the ILX651, Dolastatin-10 and Cemadotin, which are microtubule interfering agents (Yan, 2004; Simmons *et al*., 2005). Ink extracts of *B. leachii* analysed by GCMS and the presence of non-volatile compounds 7,9-di-tert-butyl-1-oxaspiro[4.5]deca-6,9-diene-2,8-dione of and Dioxigenin Acetate, were reported (Kokane *et al* 2019). During the last 30 years, compounds with anticancer activities including Aplyrorine A, dolastatins 10 and malyngamides (O, P, S) have been isolated from different species of sea hares species (Stuchbury, *et al*., 2005). Purple ink extract from *Bursatella leachii* was also tested for anti-inflammatory activity through various *invitro* methods, and reported to exhibit potent activity against inflammation induced in various *invitro* models (Kokane *et al*., 2019).

CONCLUSION

The results proved that the ink extract of *B. leachii* could be considered as a potent source of bioactive compounds with a positive effect in health. In a near future, it is probably that *B.leachii* purple ink extract could be explored by the food, cosmetic or pharmaceutical industry, as a source of bioactive molecules in favor of human's health and quality.

ABSTRACT

The world is filled with rich sources of medicinal plants. Medicinal plants contain active principles which can act as potent antioxidants. Research involving the identification of natural antioxidants from plant sources is of current interest. Although various parts of the plant *Senna auriculata* exhibites potent medicinal properties individually, there is limited research on the combined effect of the plant parts of *Senna auriculata* such as leaves, fruit, bark, flower and roots. So the present study was carried out to study the phytochemical screening and the medicinal properties of the combined effect of various parts of *Senna auriculata*. The various parts of the plant were collected, dried and powdered together. 50% hydroethanolic extract of the plant sample was prepared and screened for the presence of various phytochemicals. GC-MS analysis was carried out to confirm the presence of the phytochemicals. Further, *in vitro* antioxidant activity using DPPH assay, superoxide, nitric oxide and hydroxy radical scavenging assays and antidiabetic activity using amylase and glucosidase inhibition assays of the 50% hydroethanolic extract of the plant sample were analysed.

Keywords: Free radicals, *Senna auriculata*, phytochemicals, enzyme inhibition.

INTRODUCTION

Medicinal plants have been used from the Vedicera. For thousands of years, they have been used .Some medicinal plants also utilized as pleasant condiments ,to flavor, to dye, for conserve food etc. Almost every portion of the plant has own medicinal properties. Different types of secondary metabolites found in the medicinal plants which play an important role in many kinds of diseases and also used for manufacturing medicines. A large number of the plants

are also reported to possess many other activities like anti-oxidant, anti-inflammatory,anti-insecticidal,anti-parasitic,antibiotic,anti-hemolyticpropertiesetc,[1].

Avartaki[*Senna auriculata* [L.]Roxb.syn. *Cassia auriculata*L.; Family- Fabaceae is a traditional medicinal plant, widely used for the treatment of various ailments in Ayurveda and Siddha system of medicine in India . Almost all the parts of the plant,such as flowers ,leaves, seeds, barks ,and roots have been reported for their medicinal uses[2].In India,different parts of *S. auriculata* such as bark, flowers, leaves,roots, and unripefruits mixtures are used as''Avarai Panchaga Choornam''which is employed for the management of blood glucose level, urinaryinfections, conjunctivitis, and ophthalmia. [3] Another preparation of beverage is called ''kalpaherbal tea'' containing *S.auriculata*[dried flowers] as its major component which is widely consumed by people who are suffering from diabetes, urinary tract diseases, and constipation[4]. Likewise, *S. auriculata* leaves have been used for treating ulcers, skin disease, leprosy,and herpeticeruption.[5].

Oxidative stress is the major driving factor responsible for the initiation and progression of cancer, diabetes mellitus, cardiovascular diseases, neurodegenerative diseases, and inflammatory diseases among other syndromes [6]. Free oxygen and nitrogen species are unstable molecules that are present in the environment [exogenous] and are also generated in the body [endogenous]during the normal aerobic metabolic processes in the body [7]. Exogenous sources of free radicals includecigarettesmoke,exposuretoozone,ionizingradiationsuchasX-rays,anddrugs among others. On the other hand, endogenous sources of free radicals include the electron transfer chain reactions in the mitochondria, xanthine oxidase pathway, during disease states such as inflammation, ischemia, and reperfusion injury [8]. Evidence-Based Complementary and Alternative Medicine pathways, which in the normal physiologic state, maintain a steady equilibrium between prooxidants and antioxidants, thereby ensuring well-being [9].

Diabetes mellitus is the collective name of metabolic abnormalities, primarily caused by the defect in secretion of insulin hormone by tpancreatic islets. It is chiefly manifested in the form of elevated levels of blood glucose [hyperglycemia]. The reduced action of insulin on target tissues leads to a group of abnormalities, affecting the biochemistry and physiology of carbohydrate, fat, and protein [10]. According to the reports of International Diabetes Foundation 2014, the estimated global prevalence of diabetes among adults is 8.3% [387 million], which will reach an estimated value of 53% [592 million]by the year 2035. Diabetes mellitus stands 5th among the diseases that can lead to death around the world. Approximately, 4.9million deaths were recorded in 2014, and 8 per 20 died persons were of old age [≥79 years of age]. In the technologically advanced countries, huge amount of sum is spent on the prevention and treatment of diabetes as well as on the discovery of new synthetic or natural drugs. In 2014, the global health management expenditures on diabetes reached USD 612 billion, which represented 11% of total worldwide healthcare expenditures[11].

Certainly, a large number of synthetic drugs have been discovered in the past, but these drugs were found to have side effects. Therefore, researchers were focusing to develop new drugs from natural sources that are safe without having any side effects. One of the recent developments in the field of natural products is the exploration of a potent plant species.[12]. Although various parts of the plant *Senna auriculata* exhibited potent medicinal properties, there is limited research on the combined effect of the plant parts of *Senna auriculata*, such as leaves, fruit, bark, flower and its roots. The present study was carried out to study the medicinal properties of the combined effect of various parts of *Senna auricuata.*

MATERIALS AND METHODS

Plant collection and Authentication
Senna auriculata plant was collected and authenticated at the Department of Medicinal Botany, National Institute of Siddha, Chennai. [No. NISMB5142022]

Rajeswari Prabha

Preparation of Various Extracts of the Plant Sample for the study

The plant samples were shade dried and the various parts [leaves, fruit, flower, bark and roots] were separated. The dried parts were powdered in a blender and stored. The powder of whole plant parts were taken. 200g of each of the powdered sample was extracted separately in distilled water and 99.9% ethanol using an orbital shaker. Then the solutions were filtered and the ethanol extracts were evaporated to dryness using a rotary evaporator while the aqueous extracts were initially frozen at -40°C and then dried using a freeze dryer. The different extracts were reconstituted in their respective solvents for use in the assays. The extract was decanted in to pre weighted glass vials. Filtrates of the extracts were dried at 40 ° C. The crude extract thus obtained was stored in an air - tight container and used for further analysis. The extract was for analysis of phytochemicals, antioxidant and anti diabetic activity.

GC-MS Analysis

The Elite-MS [5% biphenyl 95% dimethyl polysiloxane, 30 m _0.25 mm ID _ 250 mm df]fused silica column [Clarus 680 GC] was used for GC–MS analysis. For the compound separation, helium was used as transporter gas at a constant flow of 1mL/min. During the chromatographic run, the injector temperature was set at 260 _C, and 1 mL of the extract was injected into the instrument. The oven temperature was maintained at 60 _C for 2 min, followed by 300 _C at the rate of 10 _C/min; and 300_C for 6 min. The mass detector conditions were as follows; transfer line temperature of 240 _C, ion source temperature of 240 _C and ionization mode electron impact at70eV, 0.2 sec scan time, and 0.1/sec scan time interval. The volatile low-molecular- weight fragments were analyzed between 40 and 600 Da. The spectrums of the test components were compared with the known components stored in the GC– MS NIST [2008]library.

Phytochemical screening

Total phenolic content

The content of phenols in the different extracts was determined spectrophotometrically by the Folin–Ciocalteu reagent according to the method of Ozkoket al.[13] A calibration curve was prepared with gallic acid as standard [0.025–0.125 mg/ml in 70% methanol v/v]. To 0.5 ml of each of the gallic acid concentrations or extracts [mg/ml], 2.5 mlFolin–Ciocalteu reagent [previously prepared as 10% v/v dilution in distilled water] was added. Thereafter, 2 ml anhydrous sodium carbonate [7.5%] was added, producing a blue-colored solution. The mixtures were vortexed thoroughly and placed in a water bath for30 min at 45°C. The absorbance was then read at 765 nm. The equation of the calibration curve obtained [Y = 14.885x; R2 = 0.9961] was used to establish the gallic acid equivalence [mg/ml]. The total phenolic content was calculated using the formula: T = C × V/m, where T is the total phenolic content, V is the volume of the extract [ml] used in the assay, C is the gallic acid equivalent [GAE][mg/ml], and m is the weight of the pure plant extract used in the assay. Values were expressed as GAE per gramof dry plant extract [mg GAE/g]. All assays were performed in triplicate.

Total flavonoid content

Flavonoid contents in the extracts were determined using the aluminum chloride method as described by Ozkoket al.[13] A calibration curve was prepared with quercetin[0.025–0.125 mg/ml in 80% methanol v/v].Briefly, 0.5 ml of the extracts [prepared at a concentration of 1 mg/ml]or the standard at the different concentrations was mixed with 3 ml of95% ethanol, 0.2 ml of aluminum chloride [prepared as a 10% aqueousdilution], and 0.2 ml of 1 M potassium acetate, and the whole mixture was made up to 10 ml with distilled water. The resulting solutions, prepared in triplicate, were yellow and were thoroughly vortexed and allowed to stand for 30 min at room temperature, after which the absorbance was readat 420 nm. The equation of the calibration curve obtained [$Y = 11.922x$;R2 = 0.9955] was used to establish quercetin equivalence [mg/ml] and the total flavonoid content was calculated using the formula: $T = C × V/m$,where T is the total flavonoid content, V is the volume of the extract [ml]used in the assay, C is the quercetin equivalent [mg/ml], and m is the weight [g] of the pure plant extract used in the assay. Values were expressed as quercetin equivalent per gram of dry plant extract [mg Qe/g].

65751

Antioxidant activity assays

The antioxidant capacities of the different extracts were measured using DPPH radical scavenging activity, ferric-reducing power and nitric oxide [NO] scavenging activities.

1,1 diphenyl-2-picrylhydrazyl radical scavenging activity

The method described by Liyana-Pathiranan and Shahidi [14] was used in this assay. 1 ml of the extracts or the standards at different concentrations [0.025–0.50 mg/ml], prepared in triplicates, was mixed with 1 ml of DPPH [0.135 mM] prepared in methanol. The mixtures were vortexed thoroughly and left in the dark for 30 min at room temperature. The absorbance was then measured spectrophotometrically at 517 nm. The percentage of DPPH scavenging activity of the extract or standard was calculated with the following formula: % DPPH radical scavenging activity = [[$AC–AS$]/AC] × 100, where AC is the absorbance of the control and AS is the absorbance of the test samples [extract or standard].

Ferric- reducing antioxidant power

The method described by Aiyegoro and Okoh[15] was used for the determination of the ferric-reducing activities of the plant extracts. The assay is based on the reduction of ferric-tripyridyltriazine[Fe^{3+}-TPTZ]complex by the action of electron- donating antioxidants at low pH tothe ferrous form. Each extract or standard was initially prepared indistilled water in increasing concentrations from 0.025 to 0.5 mg/ml.1 ml of each of the extract or the standard at the different concentrations was mixed with 2.5 ml of 0.2 M phosphate buffer [pH 6.6] and 2.5 mlof potassium ferricyanide. The mixture was incubated for 20 min at50°C. This was followed by the addition of 2.5 ml of TCA [10% w/v]and centrifugation at 3000 rpm for 10 min. Thereafter, 2.5 ml of the supernatant was withdrawn and mixed with 2.5 ml of distilled water and 0.5 ml $FeCl_3$ [0.1% w/v]. The absorbance was read at 700 nm with distilled water as blank. An increase in absorbance with increasing concentration of extract or standard corresponds to the formation of the bluish-green color of the reduced form of TPTZ. The average absorbance of the reactions performed in triplicate was obtained and plotted against the different concentrations of each extract and standard.

Nitric oxide scavenging activity

The method described by Wintola and Afolayan[16] was used for the assay of the NO radical scavenging activity of the extracts. The procedure isbased on the principle that sodium nitroprusside in aqueous solution at physiological pH spontaneously generates NO, which interacts with oxygen to produce nitrite ions. The nitrite ions are detected in solutionby the Griess reagent which contains sulfanilamide and naphtylethylene diaminedihydrochloride. Compounds that scavenge NO compete with oxygen, leading to a reduced production of nitrite ions [14], For the essay, [0.5 ml of the extracts or standard was mixed with 2 mlof 10 mM sodium nitroprusside [prepared in 0.5 mM phosphate-buffered saline, pH 7.4]. The mixture was incubated for 2.5 h at 25°C. 0.5 ml of the mixture was mixed with 0.5 ml of Griess reagent [prepared by mixing 1 ml sulfanilic acid [0.33% in 20% glacial acetic acid] with 1 ml of naphthalene diamine dihydrochloride [0.1% w/v]]. The mixture was incubated for30 min at room temperature and the absorbance was measured at540 nm. The percentage of NO scavenging ability of the plant extracts and standard compounds was calculated using the following formula: % NO scavenged = [[$AC–AS$]/AC] × 100, where AC is the absorbance of the control reaction and AS is the absorbance of the test samples [extract or standard].

ANTIDIABETIC ACTIVITY

Alpha-amylase enzyme inhibition assay

α- amylase enzyme inhibition assay was carried out based on the starch- iodine test [17]. The total assay mixture was composed of various concentration [20-120 µg/mL]of whole plant extract [leaves, flower, bark , unripe fruit , bark] of *Senna auriculata,* 20 µL of alpha amylase enzyme prepared in0.02 M sodium phosphate buffer[pH6.9 containing 6 mM sodium chloride] and incubated at 37°C for 10 min. Then, 200 µL of soluble starch [1%, w/v] was added to each reaction tube and incubated at   37°Cfor60min.OnehundredµLof1MHClwasaddedtostoptheenzymaticreactionand followed by 200 µL of iodine reagent [5 mMI2 and 5 mMKI] solution was added. The colour change was noted and

65752

the absorbance was read at 595 nm. The control reaction representing 100% enzyme activity did not containany plant extract. A dark-blue colour indicates the presence of starch; yellow colour indicates the absence of starch, while a brownish colour indicates partially degraded starch in the reaction mixture. In the presence of inhibitors from the extracts, the starch added to the enzyme assay mixture is not degraded and gives a dark-blue colour complex, whereas no colour complex is developed in the absence of the inhibitor, indicating that starch is completely hydrolyzed by α-amylase.

α- Glucosidase Inhibition assay

The effect of the plant extract [**SA**] on α-glucosidase activity was determined, using α-glucosidase enzyme. The substrate solution p-nitrophenylglucopyranoside[pNPG] was prepared in 100 mM phosphate buffer, and pH 6.8. 200 µL of α- glucosidasewas pre-incubated with different concentrations [10, 20, 40, 80, 160 and 320] of the extracts for 10 min. Then 400 µL of 5.0 mM[pNPG] as a substrate dissolved in 100 mM phosphate buffer [pH 6.8] was then added to start the reaction. The reaction mixture was incubated at 37 °C for 20 min and stopped byadding1 mL of Na2CO3 [0.1 M]. The yellow-colored reaction mixture, 4- nitrophenol, released from pNPG was measured at 405 nm using UV - VIS spectrophotometer. Voglibose was used as a positive control and the inhibitory activity of α-glucosidase was calculated using the following formula

% of α- glucosidase enzyme inhibition = $\underline{sample - control}$ x 100

Sample

Statistical analysis

All the data are expressed as mean ± SD from three observations for each concentration. A 'P' value of <0.05 and <0.01 was considered to indicate the statistical significance.

RESULTS AND DISCUSSION

The organic compounds present in the extract was determined by GC-MS. Interpretation ofmassspectrumGC-MSwasconductedusingthedatabaseofNationalInstituteStandard and Technique [NIST] having more than 62,000 patterns. The Spectrum of the unknown component was compared with the spectrum of the known components stored in the NIST library.The Name, Molecular weight, Structure of the component of the test material was ascertained. The presence of the following compounds might attribute to the medicinal properties of the plant extract.[Table I, Figure 1]

Phytochemical Analysis of *S. auriculata*

Phytochemicals are derived from plants and the term is often used to describe the number of secondary metabolic compounds found in plants. Phytochemical screening assay is a simple quick and inexpensive procedure that gives the researchers a quick answer to the various types of phytochemicals in a mixture and an important tool in analysis of bioactive compounds. The phytochemical composition of the aqueous and ethanol extracts of *S. auriculata* is presented in Table.2 The results indicate that the ethanol extract has high phenol and flavonoid content compared to the aqueous extract. This may indicate that ethanol may extract greater amounts of phytochemicals despite the relatively low yield from the original plant material compared to the aqueous extracts.

ASSAY OF ANTIOXIDANTS

DPPH Radical Scavenging Activity

DPPH is a stable free radical that shows a maximum absorption at 570nm in methanol. When DPPH encounters proton donating substances such as an antioxidant and a radical species, the absorbance at 570nm disappears because the DPPH radical is scavenged. [18]. On the basis of this principle, the radical scavenging effect of different concentrations [100µg/ml, 500µg/ml, and 1000µg/ml] of aqueous and ethanol extracts of *S. auriculata* was measured,

with ascorbic acid as the standard. The radical scavenging effect was found to increase with increase in concentration and the ethanol extract showed significantly greater radical scavenging activity compared with the aqueous extract. [Table 3]

Reduction Potential

The expression of antioxidant activity is thought to be concomitant with the development of reductones, as these species are known to be free radical chain terminators. The reducing capacity of a compound may serve as a significant indicator of its potential antioxidant activity.[19] An increase in the absorbance of the extracts shows an increase in the reduction potential with increase in concentration [100μg/ml, 500μg/ml, and 1000μg/ml].Table 4

Nitric oxide Scavenging Activity

Nitric oxide radical is a highly reactive species but it has a very low diffusion capacity. Nitric oxide radical is involved in lipid peroxidation which affects membrane fluidity, enzymes and receptors activity leading to apoptosis. If nitric oxide is generated near nucleic acids it reacts with purine and pyrimidine bases and 2-deoxyribose, leading to mutations which play an important role in carcinogenesis, as well as in neurodegenerative and cardiovascular diseases. [20]. The radical scavenging effect of *S.auriculata* was found to be increased with increase in the concentration [100μg/ml, 500μg/ml, and 1000μg/ml]of the extracts.[Table 5]

Antidiabetic Activity

The IC_{50} value of the given sample [SA] was found to be 287.82 μg/ml and the standard drug [voglibose] was 25.87 μg/ml . The plant extracts showed significant anti-diabetic activity as studied from both the assays. The antidiabetic effect of the plant extracts were found to increase with increasing concentration. [Table 6, 7]

CONCLUSION

Our study shows that extracts from *S.auriculata* are easily accessible sources of phytochemicals possessing significant antioxidant and antidiabetic activities, attributes which may prove useful for their effectiveness in the treatment of diseases such as diabetes mellitus as claimed by traditional healers. With respect to the solvents used for extraction, the ethanol extracts had higher contents of phytochemicals than the aqueous extracts, an observation which correlated positively with the higher antioxidant activities exhibited by the ethanol extracts. The two solvents used in this study have been chosen to represent those commonly used by the local traditional healer sin the preparation of these plants for medicinal use.

ABSTRACT

Wound healing is a dynamic and complicated process involving well co-ordinate and regulated biological events. Various cytokines,cell types, enzymes and growth factors play an important role in healing wounds in a regulated and timely manner. Deregulation of these regulated processes contribute to exuberant scar formation. Wound healing potential of various natural extracts have been studied through in silico model progressively in recent years. Myeloperoxidase acts as an important biomarker in wound fluid and regulation of myeloperoxidase is important in wound healing process. In the present study, the compounds reported to be present in the fruit pulp of *Couroupita guianensis* was identified and the protein ligand interaction was analysed. The docking score for the compounds towards the inflammatory marker, myeloperoxidase was critically analysed and compared with standard drug, Triazolopyrimidine sulfonic acid indomethacin and povidone iodine, to estimate lead with favourable binding free energy, glide energy and glide emodle. The activity of myeloperoxidase in excision wound model was also determined. The results suggested that the bioactive constituents present in promotes *Couroupita guianensis* wound healing by regulating the activity of myeloperoxidase.

INTRODUCTION

Skin is a highly integrated largest organ acting as a protective barrier between human body and environment. It is multifunctional maintaining homeostasis through preventing water loss, maintaining temperature and protecting

against invading microbes and harmful substances[1]. Any disruption in the integrity of the skin is represented as wound. Simple wounds are characterised by the injury to the superficial layer of skin while complex wounds are deeper and involves injury to muscles, blood vessels and nerves as well [2].Proper wound healing is necessitated to restore the skin architecture. This can be achieved by a series of coordinated events that take place overperiod of time[3]. An extended period of inflammation ultimately results in a delay in wound healing process[4].Generally, wound healing process involves four overlapping phases that includes hemostasis that starts immediately after the injury and last 0-4 hours, Inflammation phase that lasts for 1 to 3 days, proliferation phase that can take4-21 days to complete and remodelling phase that last from 21 days to several years.The regenerative process involves various cells and their secretions such as growth factors, soluble factors and enzymes[5]. Myeloperoxidase (MPO) is one of the key enzymes secreted by neutrophils, monocytes and macrophages at the injury site[6]. It is regarded to be an inflammatory marker and controlled in a way that promotes wound healing[7].Hence, studies targeting MPO will be a promising strategy to screen compounds with potential to heal wound. *In silico* molecular approach study encouraged researchers to identify compound with wound healing potential in the natural extracts[8].

In this regard,the present study is focusses to understand the inhibitory action of the bioactive components of *Couroupita guianensis* fruit pulp on MPO through docking methodology and ensuring its wound healing potential by determining the activity of myeloperoxidase in excision wound model studied using male wistar rats.

MATERIALS AND METHODS

Molecular Docking Study
Compounds reported to be present in the fruit of *C. guianensis* was identified through literature survey and the two-dimensional structures were obtained for the compounds from Pubchem database[9]. The three-dimensional structures of the compounds were then retrieved using corina 3D converter[10] and the protein ligand interaction was analysed by using Schrodinger's Glide software[11,12].The study utilized qikprot to determine binding free energy calculations and Absorption, distribution, metabolism, and excretion (ADME) analysis to rank the bioactive components present in the extract.

Assay of Myeloperoxidase
In our previous study, the wound healing activity of the hydroalcoholic extract of was determined through excision wound model in male Wistar rats and reported[13]. The activity of Myeloperoxidase was determined in rats exposed to different treatment upon post healing in which the animals were grouped into six groups of six animals in each. Group I served as Untreated group (Negative control), Group II received topical application of polyethylene glycol (Vehicle control), Group III received topical application of standard beta dine ointment (Standard control), Group IV animals were treated with topical application of 2.5% ointment formulation, Group V animals were treated with topical application of 5% ointment formulation and Group VI animals were treated with topical application of 10% ointment formulation.
The newly formed tissues from all the groups were collected in ice-cold petridish separately and were washed in normal saline to remove blood. 10 volumes of ice-cold sodium phosphate buffer containing hexadecyl trimethyl ammonium bromide and EDTA was used to homogenize tissue sample. The obtained homogenate was then sonicated on ice for 15 s, freeze-thawed thrice, and centrifuged for 30 min at 14 000 rpm at a temperature of 4 °C. The MPO in the supernatant was estimated by o-dianisidine oxidation method [14]. Further, the protein concentration was determined using the Lowry's method [15]. The activity of MPO was calculated by the following way:
MPO activity (units/mg protein) $= (\Delta A_{460} \times 13.5)$/amount of protein in sample (mg)

Where ΔA_{460}: change in absorbance at 460 nm in 3 min coefficient 13.5 was empirically determined

Anna Sheba and Anuradha

RESULTS AND DISCUSSION

Computational analysis to validate the effect of C. guianens is fruit pulp in wound healing was carried out. The suitability was analysed by determining their activity against the target inflammatory marker enzyme, myeloperoxidase. Compounds reported to be present in the fruit of *C. guianensis* was identified through literature survey and the two-dimensional structures were obtained for the compounds: Tryptanthrin, Indirubin, Stigmasterol, Kaempferol, Campesterol, Hopane, Lutolin, Ursolic acid, Rutin, Quercetin, Triazolopyrimidine sulfonic acid indomethacin and povidone iodine, from Pubchem site. The three-dimensional structures of these compounds were then retrieved using corina 3D converter and the protein ligand interaction was analysed by using Glide software. Among the compounds, rutin, quercetin, luteolin, kaempferol, and ursolic acid exhibited a higher negative value in terms of docking score, glide energy and glide emodle (Table 1). Rutin showed a docking score of -11.065 Kcal/mol, glide energy -67.522 Kcal/mol and glide emodule -89.909 Kcal/mol at the active site of myeloperoxidase. It can be observed that rutin was in association with Arg239, Phe407, Phe147, Glu102 and Pro103 at the active site of myeloperoxidase (Figure 1). Docking of quercetin with the active site of myeloperoxidase exhibited the docking score -10.401 Kcal/mol, glide energy- 56.606 Kcal/mol and glide emodule -91.761 Kcal/mol. It was in contact with Phe99, Phe407, Glu102 and Arg239 (Figure1). Luteolin docked at the active site of myeloperoxidase exhibited docking score -8.369 Kcal/mol, glide energy -58.994 Kcal/mol and glide emodule -95.920 Kcal/mol. Luteolin was in contact with Arg239, Glu116, and Phe147 (Figure 1). Kaempferol had interactions with Arg239, Glu116 and Pro145 at the docking site and showed a docking score -5.827 Kcal/mol, glide energy -38.371 Kcal/mol and glide emodule -45.744 Kcal/mol (Figure 1). Ursolic acid had a docking score of -5.588 Kcal/mol, glide energy -45.811 Kcal/mol and glide emodule -46.144 Kcal/mol. It was associated with Thr238 and Glu116 at the active site (Figure 1).

Absorption, distribution, metabolism, and excretion (ADME) study has been carried out to evaluate the efficacy of compounds in the fruit pulp. The study was performed by considering the physicochemical properties such as molecular weight, donor hydrogen bond and acceptor hydrogen bond, and biological activities of the components and the results are tabulated (Table 2). It has been found that kaempferol, rutin, ursolic acid, luteolin and quercetin of the extract to have minimum potential energy and maximum stability exhibiting appreciable binding with myeloperoxidase. *Among, the compounds commonly reported to be present in C. guianensis fruit pulp, rutin had found to have considerable docking score to bind with the target myeloperoxidase. Generally, myeloperoxidase prolong inflammation and delay wound healing process[16]. Inhibiting myeloperoxidase result in regulating inflammation and progressing healing process[17]. The in silico* results showed that bioactive ethanolic extract of *C. guianensis* fruit pulp exhibits promising wound healing activity by inhibiting myeloperoxidase (MPO) enzyme.

The activity of myeloperoxidase is decreased in dose dependent manner when compared with normal and vehicle control (Figure 2). The decrease in activity showed significant increase in wound healing process. *The inhibitory role of ointment containing plant extract against myeloperoxidase result in regulating inflammation and progressing healing process.* Hence, evaluating the activity of myeloperoxidase status in the granulation tissue following the application of plant extract could be a strategy to validate their role in healing process.

CONCLUSION

The study is the first attempt to evaluate wound healing potential of *C. guianensis* fruit pulp through computational analysis. Rutin effectively binds with myeloperoxidase when compared with other compounds that were reported to be present in the fruit pulp of the plant. The *in vivo* study using excision wound model also supports the role of myeloperoxidase in wound healing. The studies on myeloperoxidase revealed that the extract containing ointment possessed significant role against inflammation preventing oxidative stress and promoting wound healing process. The results provide an evidence to support the use of *C. guianensis* fruit pulp as a source of wound healing agents in the future.

ABSTRACT

The aim of this study was to investigate the safety aspect and abnormalities if any caused by oral dosage of methanolic extract of *Nannochloropsis oculata*. In the acute toxicity study the referred rodent species is the nulliparous and non-pregnant female Swiss albino mice. Each animal, at the commencement of its dosing, should be between 6 to 8 weeks old and the weight (15-20gm) should fall in an interval within ±20% of the mean weight of any previously dosed animals. The dose level of 250, 500, 1000 mg/kg body weight of methanolic extract of *Nannochloropsis oculata* was administered for each test group during acute study. The number of animals displaying signs of toxicity and found dead during the test, description of toxic symptoms, weight changes, food and water intake. In the sub-acute toxicity study the *Nannochloropsis oculata* was administered to animals at dose levels of 25,500,100 mg. The test substance suspensions were freshly prepared every two days once for 28 days. The control animals were administered orally by using oral gavages once daily for 28 consecutive days. The biologically significant effects of *nannochloropsis oculata* on organ weights, the body weight or on the biochemical parameters were determined using auto-analyzer. Histopathology investigations on vital organs were also carried out. The signs of physical abnormalities and lethal effects were not observed during the short and long-term study period. The study revealed the safe and nontoxic nature of methanolic extract of *Nannochloropsis oculata* during the study period which can be further explored for novel bioactive constituent.

Keywords: *Nannochloropsis oculata* , Toxicity Study, OECD Guidelines, Physical observation, Swiss albino Mice, Histopathology.

INTRODUCTION

Nannochloropsis oculata is a marine-water single-celled algae of the Eustigmatophyceae class. It is one amongst the six species of algae found in the genus *Nannochloropsis* and was originally isolated off the coast of Scotland [1]. *Nannochloropsis* sp have been utilized as a food source in aquaculture, providing a source of omega-3 fatty acids [2]. Recently the *Nannochloropsis oculata*-derived oil has been determined safe for use in dietary supplements [3]. Furthermore, the nutritional evaluation of a *Nannochloropsis sp*. found it to have high levels of protein, polyunsaturated fatty acids, and antioxidant pigments [4]. The biochemical composition of the six species makes them a valuable food source for animals and humans. They also constitute a good alternative source of Eicosapentaenoic acid (EPA, C 20:5 n3), which is a valuable polyunsaturated fatty acid for prevention of several human diseases. Experiments in hypertensive rats have demonstrated their beneficial effect in reducing blood pressure [6]. In addition, examination of the effects of Eicosapentaenoic acid on rats fed with diets supplemented with *N. oculata* biomass showed an increased ω3/ω6 ratio in the rat livers and blood [8]. Eicosapentaenoic acid has also been claimed to have excellent short-, and long-term skin-tightening effects [7]. *Nannochloropsis* has also been used in human food and diet products. For instance, it has been incorporated in noodles to improve their nutritional profile [5].

Spleen represents a large lymphatic tissue. It plays a vital in re-circulation of the lymphocytes which exhibit ability to promptly elicit specific T or B lymphocyte mediated immune reactions [9]. It exhibited basic function in the rat, similarly as in man. It is responsible for clearance of the damaged old particles of the body itself and foreign particles from the blood. It is equipped with white and red pulps associated with a specific structure responsible for blood circulation [10]. Recently, it was postulated that diabetes decreases capacity of the immune response in addition to occurrence of atrophy of immune organs [11]. The active components extracted from *N. oculata* exhibited the ability to minimize   production of the free radicals and enhance the antioxidant strength [12]. The beneficial effect of the algal extract refers to presence of high levels of protein, polyunsaturated fatty acids and antioxidant pigments [13].

The principle of the toxicity study is that the test extract is administered orally to a group of experimental animals at one of the defined doses and tested for the absence or presence of compound-related mortality of the animals dosed at one step will determine the next step. The method will enable a judgment with respect to classifying the test substance to one of a series of toxicity classes. Since, safety evaluation is much required for any natural phyto extract for dose fixing, the objective of the present study is to determine the acute and sub acute toxic effects of *Nannochloropsis Oculata* during the study period at prefixed dosage levels.

MATERIALS AND METHODS

Preparation of the extract
The methanolic extract was prepared by suspending the dry algal biomass in methanol in the ratio of 1:5 wt/volume. The suspension is mixed well and incubated for 24 hours. After incubation, the suspension is filtered and the filterate is evaporated to dryness and collected in clean bottle which is stored at 15°c for further studies.

Experimental Animals
Swiss albino mice weighing between 25 to 35 g were used in this study and the animals were procured from TANUVAS, Madhavaram, Chennai. The temperature for the experimental animal room is maintained between 22°c ± 3°c with relative humidity between 30% and 70%) moisture and a photoperiod of 12 hours light and 12 hours darkness. The animals were fed with conventional laboratory diets with an unlimited supply of drinking water. The experimental design and animal handling were performed according to the experimental protocol which was approved by C.L Baid Mehta College of Pharmacy, [IAEC NO; 06/321/po/Re/s/01 CPCSEA dated (12/10/2018)] and were conducted in accordance with guideless as per "guide for the care and use of laboratory animal and with permission from committee for the purpose of control and supervision of experiments on animals.

Acute Toxicity Study
According to OECD 425 guideline, normal healthy mice were used. The animal model used for acute study was young adult female swiss albino mice weighing 15-20gm. The animals were randomly selected and grouped into four groups (n=4) and then kept in their cage for 7 days prior to dosing to allow acclimatization to the laboratory conditions. All groups of the mice fasted overnight prior to administration. Following the period of fasting, the animals were weighed and then the test substance was administered. The *Nannochloropsis oculata* methanolic extract was then administered orally at the doses of 250 mg/kg (group I), 500 mg/kg (group II) and 1000 mg/kg (group III) body weight of mice in the test groups. Control group (group IV) received only water. These doses were selected based on the previous preliminary studies. After administration, the animals were kept under observation continuously for 1hour and once every 24 hours for the next 14 days. During this study period, clinical observations were made for mobility, mortality, behavioral, neurological, and any other abnormalities and their weight was measured weekly. Finally, on the 15th day, their final body weights, changes in water and food intake were monitored, and gross physical examinations were recorded. The mice were then anesthetized and blood was collected from the mice for haematological and biochemical analysis.

Sub acute Toxicity Study
The animals weighing 150-200gm were used for the sub acute toxicity study conducted for 28 days to examine the toxicity of the *Nannochloropsis oculata* methanolic extract according to the guidelines of the Organization for Economic Co-operation and Development (OECD, 407) [12 & 17]. For this study Twenty four mice were randomly distributed into four groups (I, II, III and IV) each consisting of six mice per group. Groups I, II and III were orally administered with *Nannochloropsis oculata* methanolic extract at doses of 25, 50 and 100 mg/kg body weight per day, respectively, for 28 days using oral gavage. Group IV served as control group and received only water. Clinical observation was carried out for 28 days and their body weight was measured weekly for four weeks.

Determination of Hematological and Biochemical Markers
The final weight of the mice was measured at the end of study period [14 days for acute toxicity and 28 days for subacute toxicity] and then they were anesthetized and blood samples were collected from each animal. The blood was placed in two set of test tubes, one set of the test tubes containing anticoagulant, ethylene diaminotetraacetic acid (EDTA), and the other set without anticoagulant. Blood samples in the test tubes containing EDTA were used to determine the hematological parameters [16]. The haematological parameters analysed were haemoglobin (Hb), white blood cells (WBCs), red blood cells (RBCs), packed cell volume (PCV), differential count, Mean Platelet Volume (MPV), mean corpuscular volume (MCV), mean corpuscular haemoglobin (MCH), and Mean Corpuscular Haemoglobin Concentration (MCHC).

The serum biochemical markers such as Total protein, Albumin, cholesterol, urea and creatinine and marker enzymes such as ALT, AST, ALP and LDH were determined for acute toxicity studies [18]. Similarly The serum biochemical markers such as Glucose, Total protein, Albumin, cholesterol, triglyceride, HDL, VLDL, Total bilirubin, BUN, urea, uricacid and creatinine and marker enzymes such as ALT, AST, ALP and LDH were determined for subacute toxicity studies. The enzymatic and non-enzymatic antioxidant levels and relative organ weight were also measured at the end of the study period.

Histopathological Examinations
Control and highest dose group animals will be initially subjected to histopathological investigations. If any abnormality found in the highest dose group than the low, then the mid dose group will also be examined. Organs like liver, kidney and spleen were examined macroscopically for changes in cell architecture and morphology. The organs were removed   and preserved in 10% buffered neutral formalin for 24 h and washed in running water for 24 h. The sections of 5-6μm were sliced using a microtome and were dehydrated in an auto technicon and then cleared in benzene to remove absolute alcohol. Embedding was done by passing the cleared samples through three cups containing molten paraffin at 50°C and then in a cubical block of paraffin made by the "L" moulds. The slides were

stained with Haematoxylin-eosin red and changes in cell morphology were observed under light microscope.

Statistical Analysis

The values were expressed as mean ± SEM. Statistical analysis was performed by one way analysis of variance (ANOVA) followed by Dunnet's multiple comparison tests. A *P*-value < 0.05 were considered as statistically significant.

RESULTS

Acute oral toxicity study of *Nannochloropsis Oculata*

The acute toxicity results showed no evidence of toxicity upon tests conducted in mice with different dose 250, 500 and 1000 mg/kg *Nannochloropsis oculata.*.Observations were recorded at regular time intervals throughout the study period i.e 14 days. The mortality was not observed in Control and group I (250 mg/kg bw) treated group but mortality was observed in group II (500 mg/kg bw) and group III (1000 mg/kg bw) during the study period. Alertness, grooming and touch response was found in all treated and control group, whereas, aggressiveness, piloerection, gripping, tremors, convulsion, diarrhoea and writhing was absence in all the treated and untreated group [Table 1].

The clinical signs such as absence of lacrimation, salivation, sensitivity response, Changes in skin color were mainly observed in mice at the 500, 1000 mg/kg treated groups. In addition, the occurrence of mild rearing was noted in all treated groups but was normal in control group [**Table 2**]. The body weight measurements showed suppressed weight loss in the methanolic extract treated mice. Significantly lower body weights were evident in mice treated with 250, 500 and 1,000 mg/kg groups on Days 1, 7 and 14 when compared to the control groups. The water intake of mice in control and group I (250 gm/kg bw) was found normal when compared to the other two treated group II and III (500 and 1000 gm/kg bw) where the intake of water tends to decreases slowly. The data was represented in **Figure 1** and the food consumption measurements showed that mice treated with 500 mg/kg/day and mice in the 1000 mg/kg/day treated groups consumed significantly lower amounts of feed than the control group and mice treated with 250 mg/kg/day. However, it was a temporary change that did not correlate with the dose. During the recovery period, there was no significant change in the food consumption in the mice treated at 250, 500 and 1000 mg/kg/day compared to that of the control group.

In the acute toxicity study, the haematological parameters, such as WBC, RBC, PLT, Hb, HCT, MCV, MCH, and MCHC of the treated groups (250 mg/kg, 500 mg/kg and 1000 mg/kg) were within the reference range for mice. The values of the extract treated mice were not significantly different from the control [**Table 3**]. The biochemical parameters in blood of tested mice show similar activity at 250 & 500 mg/kg bw concentration when compared to the normal group whereas at 1000 mg/kg bw treatment, higher concentration of biochemical constituents were noted and the results were interpreted in [**Figure 2**]. No significant changes was observed in AST, ALT&ALP of tested animals when compared with the normal group. Also no significant alteration observed in Creatinine and urea levels of treated group animals when compared with control animals.

Sub Acute oral toxicity study of *Nannochloropsis Oculata*

During the administration period of sub acute toxicity studies, animals in their cages appeared normal with no overt clinical signs of toxicity or allergenic reactions. There were no incidences of diarrhoea, constipation or other gastrointestinal disorders. General condition and behaviour were not adversely affected by the *Nannochloropsis oculata* methanolic extract throughout the study period [**Table 4 and Table 5**]. There were slight changes in the skin color patterns, eyes, and salivation at the dose of 100 mg/kg bw when compared with control and other two dose (25 & 50 mg/kg bw). Muscle gripness was less shown by the mice at dose 50 mg/kg bw and 100 mg/kg.bw respectively. Aggressiveness, pile erection, convulsion and lacrimation was also found to be normal at all concentration (25, 50 and 100 mg/kg bw).

All the treated mice at dose 25, 50 and 100 g/kg bw shows decrease in body weight between initial and final body weight of mice treated with *Nannochloropsis oculata* methanolic extract and control group, which may be due to poor intake of food. Hence, there were no significant differences between control and treated groups **[Figure 3]** and summarizes the food and water intakes of mice during sub-acute toxicity study. Daily administration of 25, 50 and 100 mg/kg.bw of *Nannochloropsis oculata* methanolic extract for 28 days resulted in decrease intake of food and water. Hence the result shows no significant differences between control and treated mice respectively. A dose, which causes 10% or more reduction in the body weight, is considered to be toxic dose, the control group of body weight decreases slowly from day 1 to 28 days which may be due to lower intake of food and water. Measured quantities of water and feed were supplied daily for each animal and from the amount of feed remaining in the feed hopper. There was no significant change in food and water intake of the test animals at all dose levels.

Results of the hematological parameters are in the values of RBC, WBC, Hb, platlet count, PCV, differential count, MCV, and MCHC of treated groups when compared with the respective control mice respectively shown in **Table 6.** All the parameters were significantly lower in the mice treated with 250, 500 and 1000 mg/kg bw than those in the control group. These changes were not considered toxicologically significant because they were relatively minor and within the acceptable ranges and were not consistent. Likewise, significant effects of subacute administration of *Nannochloropsis oculata* methanolic extract on biochemical parameters like urea, creatinine, uric acid were not observed. Additionally, no relevant changes were found in the serum levels of glucose, total cholesterol, total protein, albumin, and globulin. No statistically significant differences were found in the activity of liver function parameters like alanine aminotranferase (ALT), aspartate aminotransferase (AST), and alkaline phosphatase (ALP). But Slight differences was seen in LDH with higher concentration 50 mg/kg bw and 100 mg/kg bw respectively shown in Figure 4. The antioxidant status of blood was also carried out at difference dose (25, 50 and 100 mg/kg bw) after 28 days of administration of drugs in mice.

The overall result shows absence of significant changes when compared with the control group. Hence the findings proved that the values are not significant with each groups. Higher dose (100 mg/kg bw) shows slight increases in all the values when compared with other two tested groups (25 and 50 mg/kg bw) and control respectively [Figure 5]. The relative organ weight of mice was recorded after sacrificing. The weight of kidney and liver shows slight variation when compared with the organ of control group. The spleen weight of both control and treated group was found to be similar which is represented in Figure 6.

HISTOPATHOLOGY

Figure 7 to 9, represent the histopathology image of control group of *Nannochloropsis oculata* with high dose of 100 mg/kg bw of mice. Major differences in cell architecture were not found between the test and control group. Histopathological studies of the liver sections in the control group showed normal appearance of central vein (CV) and hepatic sinusoids (S) lined by endothelial cells (EC) with normal radiating hepatocytes. There was also normal appearance of the portal triad including hepatic portal vein, interlobular bile duct, and branches of hepatic artery. Mice treated with 1000 mg/kg of *Nannochloropsis oculata* methanolic extract showed slight abnormal appearance of the central veins (CV) and hepatic sinusoids (S) lined with endothelial cells (E) [Figure 7]. Histopathological studies of the kidneys sections of mice treated with doses of 250, 500 and 1000 mg/kg showed microscopic changes compared with the controls. In the control, kidney sections revealed normal glomerulus (G), Bowman's capsule lined with outer parietal layer/squamous cells (SC) and inner visceral layer/podocytes (P) [Figure 8]. The structure and histopathology of spleen was found to be normal in both control and drug treated group. But there is mild congestion seen in drug treated group [Figure 9],

DISCUSSION

In our study, the acute and sub acute toxicity of *Nannochloropsis oculata* should be between 6 to 28 days old and the weight (15-20 gm) should fall in an interval within ±20% of the mean weight of any previously dosed animals and did not affect the health parameters of Swiss albino mice. A comparison between the weights of in the acute study before and after treatment unveiled significant difference. The female mice the physiological increase in the body weight due to normal growth and hence the increase in mice body weights were not consider as adverse treatment related effects. The visual observations included skin changes, mobility, as well as respiratory movements. Body weight gain by the Wister albino mice in the sub acute toxity study differed significantly from those of the control group in the first and second weeks. The body weight was most probably normal in all treated animals and all of them ended the procedure without significant differences ($p > 0.05$), among the investigated groups. Since no adverse treatment effects were observed in the other examined parameters, this significant difference could be due to other reasons, but not necessarily due to adverse *Nannochloropsis oculata* related effects.

Previously, the toxicity of *nannochloropsis* species algae has been assessed and reported in rats following acute and sub chronic (upto 60 days) administration [19 & 20]. It was also studied and reported in pregnant rats during mating and through pregnancy and lactation [21]. The acute toxity tests in rats administered with biomass of *Nannochloropsis oculata* by oral gavage revealed no adverse toxic effects (LD_{50}.12g/kg). Similarly, treatment related effects were not seen in rats treated with 3000_{rp} or for 60 days (NOAEL> 6000 mg/kg/day). The previous study involving the acute and sub chronic administration of *Nannochloropsis oculata* for 14 and 60 day, respectively, at dietary level up to 12g/reg/ Bw were also studied and reported as absence of abnormalities in the health parameters of Sprague-Dawley rats [17].

The previous study reported that the haematological parameters were not indicative of a response to infection, as there may be changes with both increased (i.e., absolute monocytes in male and increased neutrophils in the females) and decreased (i.e., white blood cells and absolute lymphocytes), and were minor in magnitude [22]. However, there were no adverse changes in haematological investigations of female mice treatment as given during in acute and sub-acute toxicity studies. The haematological parameters were observed in both genders of the treatment groups and in comparison with the control group. The hemotogical parameters such as haemoglobin, total WBC, neutrophils, lymphocyte, monocyte, eosinophil, platelets cells, Total RBC, PCV, MCHC, MCV have not shown any significant difference between treated and control. In this study statistically no significant changes seen in the haematological parameters. However, the differences obtained between various treatment groups do not show abnormality in haematological paramaters, since they are in the normal range of health for this animal species. In the study biochemical investigation were determined using auto-analyzer, a significant reduction of the blood sample was collected for further study (glucose, T.Cholestrol, Triglycerides, LDL, VLDL, HDL, Ratio 1(T.CHO/HDL), Ratio 2 (LDL/HDL), Albumin was wistar albino mice group exposes to *Nannochloropsis oculata* there was no significant and also followed in ANOVA by Dunnette's test.

A recent study has shown *Nannochloropsis* to be a potentially good source of antioxidant [23]. However, in our study the activity of plasma antioxidant enzymes by ferric reducing ability of plasma (FRAP), and ABTS tests showed that there were no significant differences in the antioxidant activities between the treatment groups and the control. One reason for this might be the role of the antioxidant in protecting the elevated demand on long-chain polyunsaturated fatty acids, which is abundant in *Nannochloropsis oculata,* against oxidation [24]. This finding was not considered to be of toxicological significance because in nephrotoxicity an increase in the levels of plasma Creatinine is expected due to the attendant damage to the renal function [17]. The histological inspection on the treated and control shows the *Nannochloropsis oculata* does not cause any toxic effect.

CONCLUSION

The study does not cause any apparent toxicity in mice treated with different doses of the methanolic *Nannochloropsis oculata*. The toxicological effect was assessed on the basis of mortality and acute toxicity during 14 days and sub-acute toxicity during 28 days that can be very useful for dose fixation for further *in-vivo* and clinical studies. The haematological, Biochemical and antioxidant investigations showed no significant changes induced by treatment with methanolic extract of *Nannochloropsis oculata*. Histopathology examination showed no changes in the architecture of the internal oranges of Kidney, liver and spleen in the both control and treated group. However, complementary studies are necessary in order to enter information on this algae *Nannochloropsis oculata.*

ABSTRACT

A flavonoid found in plants called quercetin with polyphenols that are widely distributed. Rutin and quercetin are other flavonoid glycosides with an aglycone structure. The quercetin component was shown to be the best compound, showing greater constraining imperativeness, according to the analysis. Quercetin was extracted from the leaf extract of *Artemisia nilagirica* (Clarke) Pamp for the current study, and the extract was verified using a number of instrumental tests. A commitment has been made to conduct docking study experiments using the exceptional qualities of HOX A5 and MAPK 14 for anti-inflammatory proteins and SGK-1 and ADM for anti-cancer proteins. The docking results showed that there exists a coupling relationship between each protein and the goal of ligand-protein docking is to anticipate the overwhelming confining models of a ligand with a protein of known three dimensional structures. The current study showed that the concentrations against receptor proteins as a potentially effective treatment for inflammation and cancer. According to the investigation, quercetin can be used as medicine to treat inflammation and potentially harmful development. The main goal of this study is to reduce the potentially harmful effects of unrestricted medications on common human cells. When quercetin and the moderating protein MAPK14 receptors are differentiated, leaving - 9.7 kcal/mol and the anticancer protein SGK-1 receptors at - 9.5 kcal/mol of confining essentiality. All things considered, our findings suggest that quercetin may influence the NF-B pathway to have anti-inflammatory and anticancer properties. Further examination in pre-clinical and clinical research are justified to illuminate the helpful of capability of quercetin for clinical use.

INTRODUCTION

The protein encoded by this gene is a member of the MAP kinase family. MAP kinases act as an integration point for multiple biochemical signals, and are involved in a wide variety of cellular processes such as proliferation, differentiation, transcription regulation and development. This kinase is activated by various environmental stresses and pro-inflammatory cytokines. The activation requires its phosphorylation by MAP kinase kinases (MKKs), or its autophosphorylation triggered by the interaction of MAP3K7IP1/TAB1 protein with this kinase [1,2]. The levels of microRNA-16 (miR-16) and homeobox A10 (HOXA10) were measured in oral cancer tissues and cells by quantitative real-time polymerase chain reaction (qRT-PCR). Besides, HOXA10 was targeted by miR-16 and its restoration abated miR-16-mediated role in oral cancer. In addition, knockdown of miR-16 reversed the effect of quercetin on progression of oral cancer. Collectively, quercetin inhibited cell viability, migration and invasion by regulating miR-16 and HOXA10 in oral cancer cells. This finding indicated that quercetin might be promising for treatment of oral cancer [3].

Developmental modeling serves as a unique tool to identify factors involved in cell proliferation and differentiation. Dorsoventral axis formation is the earliest step in cell differentiation during early embryogenesis [4]. Beta-catenin of the canonical pathway is a key component of the dorsal signaling center, which drives the development of dorsal cell fate [5]. Beta-catenin exerts its effects through activating the HMG-box containing LEF/TCF factors [6]. In addition to this surveillant function, microglia exert a phagocytic function to detect and rapidly eliminate degenerating neurons, resulting in the prevention of further detrimental effect on neighboring cells. This microglial phagocytic function is known to be crucial for synapse maturation [7].

Moreover, microglia are directly or indirectly involved in the modulation of neuronal activity at the synapse, and influence myelination and neurogenesis by delivering signals in primary myelinating areas of the developing brain [8]. However, depending on encountered stimuli, microglia are activated and undergo significant changes in their function and morphology. Morphologically, they change to a rounded amoeboid form with shortened processes from a ramified form with long processes. Functionally, they result in either 'classical' pro-inflammatory or 'alternative' anti-inflammatory phenotypes [9].

MATERIALS REQUIRED

Docking of Anti-Inflammatory and Anti-Cancer Protein
The Autodock tool has been used for studying the interaction between Qurecetin and Anti-Inflammatory (MAPK14) and Anti-Cancer Proteins (SGK1).

SGK1 – Serum and Glucocorticoid managed Kinaseisoform1(referredtoasSGK1)is a positive administrative of ENaC[6]. SGK expression is switched on in response to a number of stimuli and integrates information from a several pathways including the insulin, mineralocorticoid andCampsignaling pathway.

MAPK14 - Mitogen Activated Protein Kinase 14 likewise called as P38 – which encodes MAPK 14 quality and it is also called pressure initiated serine/threonine explicit kinases (SAPKs)[7]. They are recognized in actuated safe cells macrophages with a fundamental job in incendiary cytokine enlistment (Tumour Necrosis Factor alpha).

Preparing the Protein

Protein Data Bank (PDB) files can have a variety of potential problems that need to be corrected before they can be used in AutoDock. These potential problems include missing atoms, added waters, more than one molecule, chain breaks, alternate locations etc. The water molecules have to be removed and polar hydrogen atoms have to be added and save in "pdb" format. The receptor file used by AutoDockVina must be in "pdbqt" format which is pdb plus 'q' charge and 't' AutoDock atom types which helps to distinguish between the different types of atoms.

Preparing the Ligand

Before docking partial atomic charges are applied to each atom of the ligand. We also distinguish between aliphatic and aromatic carbons: names for aromatic carbons start with 'A' instead of 'C'. AutoDock ligands are written in files with special keywords recognized by AutoDock. The root is a rigid set of atoms, while the branches are rotatable groups of atoms connected to the rigid root[5]. The root is detected using Detect Root option under Torsions. Then we have to select the torsions that are to be applied for our ligand.After all the above conditions are set the ligand is saved in "pdbqt" format.

Preparing the Configuration File

The configuration file tells AutoDock Vina which has the details neede by the Vina to run docking analysis such as the input file names, grid box parameters which provides the details of the search space: by altering the coordinates of the grid box bring up the receptor and ligand into the grid area, output of the docked poses, exhaustiveness, number of modes to be generated in a normal .txt file.

Running AutoDock Vina Program

AutoDock Vina is executed using command prompt in Windows. Browse through the location of the receptor and the ligand files in pdbqt format. Then specify the location of the vina.exe file.

RESULT AND DISCUSSIONS

In the present study, docking results revealed the binding interactions between the Quercetin with anti-inflammatory and anticancer protein where, in different docking routines, all showed a favorable binding energy greater than -9.5 kcal/mol in SGK1, binding energy is greater than -9.7 kcal/mol in MAPK 14 as shown in the Table and Figure 1. The rest of the proteins showed binding energy ranges from -6.6 to -9.5 kcal/mol.This shows that Quercetin binds to anti-inflammatory protein receptors and the docked conformation has high energy and hence stable. Ligand-protein affinity for alkaloids was found to be low excepting MAPK14, which demonstrated to achieve an important strong affinity with -9.7 kcal/mol against inflammatory protein receptors. While in the case of anticancer proteins SGK-1 alone showed higher binding affinity leaving -9.5 kcal/mol Table and Figure 2.

The selected Quercetin compound showed binding energy ranging is -9.5 kcal/mol in anticancer proteins is 9.7 kcal/mol which proved that the compound possess potential soluble epoxide hydrolase enzyme inhibitory binding sites, that soluble epoxide hydrolase would effectively increase the *in vivo* concentration of epoxyeicosatrienoic acid thereby proving to be useful in the treatment of hypertension, inflammation and other disorders. The result of Lipinski rule suggests the analyzed compound as best therapeutic drugs [10]. Similar type of studies were performed with fucoidan compound against HepG-2 cell line proteins [11], kappa-carrragenan present in *Kappaphycus alvarezii* against InhA enzyme, quercetin compound against HeLa cell line proteins, resveratrol compound against KB cell line proteins, stearic acid against transferrin and plasminogen proteins present on HepG-2 cells present in *Cardiospermum halcacabum*[10] and rutin compound against apoptotic proteins (Tumor Necrosis Factor, Caspase-3, NF-Kappa-B, P53,Collagenase, Nitric oxide synthase and Cytochrome C.

CONCLUSION

Docking results indicate binding relationships between each protein, and the purpose of ligand-protein docking is to predict overwhelmingly confining models of a ligand with a protein of known three dimensional structures.

CONFLICT OF INTEREST

The authors have no conflicts of interest regarding this investigation.

ABSTRACT

The use of *in-silico* models has been recognized in recent decades as being of fundamental importance in the area of research and development of drugs (R&D), due to its applications both in the evaluation of bioactive substances and in relation to their physicochemical and pharmacokinetic properties, giving rise to a new model of drug design with greater effectiveness and efficiency. In the present study, 12 compounds which were secondary metabolites of *Trichoderma viride* reported to have antimicrobial and other pharmacological potential has been evaluated for antitubercular activity through the inhibition of the enzyme Enoyl-ACP reductase enzyme responsible for cell wall synthesis of bacteria. The ligand molecules were retrieved from Pubchem and molecular property analysis and bioactivity has been predicted using Mol inspiration. The lead molecules were analysed for the inhibition of the enzyme using IGEmDock, molecular docking tool. The binding affinity and interaction profile of the test compounds showed 3 potential compounds to be effective in binding with the target enzyme Enoyl-ACP reductase enzyme. So, it can be concluded from the above observations that the selected compounds from *Trichoderma viride* have excellent potential as ant tubercular agents having the mechanism through Enoyl-ACP reductase enzyme inhibition.

Keywords: *Trichoderma viride* , Bioactive compounds, antitubercular activity, Ligands, Lead compound, Enoyl-ACP reductase enzyme.

INTRODUCTION

Pulmonary illness is the most typical manifestation of tuberculosis (TB), an ancestor of human disease primarily affecting the lungs and caused by the Mycobacterium tuberculosis. [1]. However, TB is a multi-systemic disease with a protean presentation. The respiratory system, gastrointestinal (GI) system, lymphoreticular system, skin, central nervous system, musculoskeletal system, reproductive system, and liver are the organ systems most frequently impacted.[2][3]. Both the ancient Ayurvedic texts and the Vedas in India make reference to tuberculosis. In general, India's history can be divided into three periods regarding the fight against tuberculosis: the early years, prior to the development of x-ray and chemotherapy; the post-independence era, which saw the creation and implementation of national TB control programs; and the current era, which is marked by the continuation of the TB control program with assistance from the WHO. Tuberculosis is diagnosed when Mycobacterium tuberculosis bacteria are found in a clinical specimen collected from the patient.[4].A complete tuberculosis (TB) medical evaluation must include a medical history, a physical examination, a chest x-ray, and a microbiological examination (of sputum or another appropriate sample). A tuberculin skin test, other scans and x-rays, and surgical biopsy may also be included. To assess the patient's health care, a physical examination is performed [5]. It cannot be used to confirm or exclude tuberculosis.

Certain findings, however, are suggestive of tuberculosis. For example, TB may cause blood in the sputum, significant weight loss, and drenching night sweats. In recent years, numerous metabolites with unusual structures and potent bioactivity have been isolated from bacteria and fungi strains collected from a variety of environments, including soils, animals, plants, and sediments. [6,7,8].As a result, many pharmaceutical companies and research sample groups began sampling and screening large collections of fungal strains for antibiotics [9], antimycotics [10], irals [11], anticancers [12], and pharmacologically active agents [13].Endophytic fungi are the primary producers of secondary metabolites. Many important bioactive compounds with cytotoxic, antimicrobial, insecticidal, anticancer, and antioxidant properties have been discovered in endophytic fungi. Trichoderma species are well-known among well-studied fungi for their ability to produce bioactive secondary metabolites such as polyketides, alkaloids, terpenoids, and peptaibols. Many species have undergone extensive research as a result of their use as biological control agents. As a source of drug targets, the pharmaceutical industry has embraced genomics. Bioinformatics tools assist in validating potential drug targets and determining which are best suited for inclusion in the drug development pipeline. For decades, bioinformaticians have been fascinated by molecular docking. The most important bioinformatics methods used in drug design are molecular docking, simulation, target point determination, and chemical stability studies. Molecular docking plays an important role in the process of developing, testing, and comparing new drugs.

This technique allows one to examine the interactions of molecules in three-dimensional space while taking into account the different states of the molecules and determining the factors involved in the more involved and important pharmacological interactions. [14,15]. In this work, we first identified the secondary metabolites secreted by *Trichoderma viride* by conducting a literature review before screening the compounds from fungal secondary metabolites as anti-tuberculosis drugs for the inhibitory activity of ftsz protein. Additionally, the drug-likeness of the chosen compounds is ascertained by selecting ligands based on their molecular characteristics and the predominant occurrence as reported by the GC-MS chromatogram. improved anti-tuberculosis medications via molecular docking.

MATERIALS AND METHODS

Identification of secondary metabolites secreted by *Trichoderma viride* through literature survey
The literature survey was carried out in an extensive manner to identify maximum possible papers/reports that gives data on the bioactivity of secondary metabolites from *Trichoderma viride* using the keywords Bioactive metabolites

from *Trichoderma viride,* Pharmacological activity of *Trichoderma viride,* Antimicrobial activity of fungal secondary metabolites and GCMS chromatogram of secretory products from *Trichoderma viride.*

Selection of ligands based on the predominant occurrence reported through GC-MS chromatogram
The ligands were selected based on the compounds reported in GC MS chromatogram as published by [16]. The selection of this report was based on the maximum highest number of compounds reported.

To find out the superior anti-tuberculosis drugs through molecular docking
The antitubercular drugs were screened through the use of following *insilico* tools such as Pubchem- To retrieve molecular structure and properties of the selected compounds, Protein Data Bank-To retrieve the 3D structure of target protein Protein (Enoyl-Acyl Carrier Protein (ACP) Reductase) 1BVR, Lipinski filter-To check whether the ligands satisfy Lipinski rule of 5, Molinspiration- To predict the drug likeliness and bioactivity of the selected ligands.IGemDock- To determine the compatibility and stability of the selected ligands in binding with the protein based on molecular docking.

The empirical scoring function of iGemdock was calculated using the formula

Energy = vdW+Hbond+Elec

Here, the vdW refers to van der Waal energy; Hbond refers to hydrogen bonding energy and Elec. refer to electro statistic energy. This software is helpful in the structure-based virtual screening and post-screening analysis for the drug discovery. The software is maintained by Drug Design and Systems Biology Laboratory of National Chiao Tung University, Taiwan. The precision of molecular docking and the screening utility were better than other docking methods. GEMDOCK is a nearly automatic tool for virtual screening. GEMDOCK can sequentially be applied to four computational phases, including target and database preparation, molecular docking and post-docking analysis. First, we specified the coordinates of target protein atoms from the PDB, the ligand binding area, atom formal charge and atom types. Second GEMDOCK is able to sequentially read the atom coordinates of a ligand from the prepared ligand database. After GEMDOCK prepares the ligand database and the target protein, it sequentially executes flexible docking for each ligand. Finally, GEMDOCK re-ranks and sorts all docked ligand conformations for the post-docking analysis.

RESULTS AND DISCUSSION

Identification of secondary metabolites secreted by *Trichoderma viridae* through literature survey
The growth of bacterial resistance has reduced the effectiveness of conventional antibiotics against pathogenic bacteria in recent decades [17]. But over the course of a few decades, there has been a growing interest in screening plant components with antimicrobial properties. [18].During the bacterial division cycle, these substances affect DNA replication, protein synthesis, and the cell wall [19]. To determine the potential number of compounds reported from Trichoderma viride, a thorough review of the literature was undertaken. A selection of possible references was provided in Table 1.

Selection of ligands based on the predominant occurrence reported through GC-MS chromatogram
The compounds listed according to the GC MS chromatogram provided by [20] were used to create the ligand lists, which are lead compounds. Lead compounds were defined as those having a peak area larger than 2.5. *Trichoderma viride*is the most promising and effective biocontrol agent to control the plant diseases as well as increase the plant growth. It has the antagonistic power to suppress a broad spectrum of microbes for over 70 years.[21].Table 2 provides a list of compounds with their pubchem ID, molecular weight, and molecular formula. In order to facilitate molecular docking, rifampycin and isoniazide were used as reference compounds. Table 3 displayed the canonical

SMILES notation for each lead compound. The Mol inspiration tool was utilized to determine the molecular properties and bioactivity, with the SMILES notation serving as the input.

To determine the molecular properties, drug likeliness of the selected compounds
The molecular properties and prediction of probable bioactivity as determined by Mol inspiration is given in Table 4 and Table 5 respectively.Lipinski's rule of five, which considers four basic physicochemical parameters (log P ≤ 5, molecular weight ≤ 500, number of hydrogen bond acceptors ≤ 10, number of hydrogen bond donors ≤ 5), was used to assess the drug-likeness of each of these compounds. The log P measurement used to understand the substance solubility behavior. All of the ligand molecules' log P values, according to the in silico analysis, fall between -0.97 and 4.62 (within an acceptable range of ≤ 5). With the exception of methyl arachidonate, elemene, and humulene, all of the compounds have low log P values. Alpha-Bisabolol's log P value was 4.68, indicating a high level of hydrophobicity or lipophilicity. Every test compound falls within the acceptable range of ≤ 500 for molecular weight. In order to effectively interact with the hydrogen bonding groups of an intractable receptor, the chosen ligand molecules also have a sufficient number of hydrogen bond donors and acceptors.It is widely acknowledged that in order to pass the oral bioavailability test, there must be a minimum of 10 rotatable bonds. Because each of the predicted compounds has one to six rotatable bonds, they all have the best possible conformational flexibility. The TPSA is a highly valuable physicochemical parameter for molecules, providing insight into the polarity of various compounds. All of the predicted molecules' TPSA values were found to range from 12.53 to 40.46.

Table 6 displays the results of the Lipinski filter used to determine whether the compounds would satisfy the Lipinski rule of 5. The tool forecasts the given compounds' molecular mass, the number of donor and acceptor atoms in hydrogen bonds, their LogP value, and their molar refractivity. When the results of molinspiration and Lipinski filter were compared, it is evident that most of the ligands satisfies Lipinski rule of 5 thereby the lead compounds can be explored as novel drug candidates.

FASTA SEQUENCE OF THE TARGET PROTEIN SEQUENCE

The fasta sequence of the target protein is given below and the corresponding three dimensional structure is given in Figure 1. The target protein was retrieved from PDB. The target protein is a multiple chains with a total of 1773 aminoacids.

To find out the superior anti-tuberculosis drugs through molecular docking
Mycobacterium tuberculosis's enoyl-ACP reductase, or InhA, belongs to an unusual FAS-II system that favors longer chain fatty acyl substrates for the synthesis of mycolic acids, which are an essential part of mycobacterial cell walls. Thus, this enzyme is targeted so as to inhibit the cell multiplication of the pathogen. Strength of association or binding affinity between two molecules can be predicted by molecular docking techniques.

Twelve phytochemical compounds that have been proposed to have potential bioactivity have been examined in this study. These phytochemicals were docked with the 1BVR protein. Furthermore, the protein was docked with the tuberculosis-fighting, commercially available drug compound rifampycin. To compare the outcomes of the interaction between protein and phytochemicals, the drug compounds' interaction analysis with rifampycin serves as a control.iGEMDOCK, which employs the Generic Evolutionary Method and an empirical scoring function for

molecular docking, was used to conduct the primary docking analysis. Its graphical user interface is capable of virtual screening and pharmacological interaction recognition. The data can be automatically set up and an energy table can be generated by clicking the "View Docked Poses and Post-Analyze" button [Table 7]. Each ligand's lowest energy pose will be output into the "best_Pose" location, as indicated in [Figure 2- Figure 4].

The difference in free energy with respect to binding affinity has been demonstrated by the binding affinities of different ligands with the target enzyme. Each ligand docked into the target enzyme's active site has its optimal pose with the lowest energy recorded. The test compounds that showed the least binding energy were Elemene, Cedrane, and Acorenol, with respective values of 7.7, -7.7, and -7.5. The target enzyme's binding mode with the putative ligands reveals that the main active site amino acid residues interacting with the ligand through hydrogen bonding are Ileu 16, 95, 122; Gly 96; and Phe 41, 97.The structural variations between the lead molecules could be the cause of the variation in binding affinity. Therefore, through in-vitro and in-vivo studies, these compounds may be further tested for their efficacy against the inhibition of M. tuberculosis growth.

ABSTRACT

This study was conducted to examine the phytochemical components and to determine the bactericidal activity of three sea grasses using Ethyl acetate, Chloroform and Ethanol crude extracts against: *MRSA*, *Staphylococcus aureus* ATCC, MDR *Pseudomonas aeruginosa* and ESBL *Escherichia coli*. The sea grasses were collected, washed, dried, ground and subjected to extraction method by soxhlet apparatus. Phytochemical tests were carried out for the crude extracts and agar well diffusion method to identify the presence of the phytochemical components and their antagonistic ability against the MDR strains.

Keywords: Sea grass, *Halodule uninervis, Syringodium isotefolium, Cymodaceae serrulata*, Phytochemical testing, Chloroform, Ethyl acetate, Ethanol.

INTRODUCTION

At present, MDR pathogens are becoming extremely common and invoke life-threatening infections in hospitals (nosocomial) and also at the community level. Bacterium possess a broad spectrum of geneticefficiency to transmit and acquire resistance to various kinds of medicine that are currently in use and any new artificial antimicrobials introduced will become sooner or later ineffective [1].

Recently, WHO scrutinized a listing of precedence bacterial pathogens belonging to 12 households that urgently want novel and potent antibiotics to deal with [2]. Above all, the clinical community is now warning that there will be a return to the pre antibiotic era. Infections caused by MDR pathogens increase healthcare costs, length of stay in hospitals, morbidity, and mortality in both developed and developing countries [3]. Right now, Drug-resistant bacteria are responsible for at least 0.7 millions of deaths each year from illnesses [4]. Especially in African nations where a definitive cure is only seldom available, treating infections brought on by them has become incredibly difficult for doctors [5]. A significant source of new structurally and physiologically active metabolites is marine creatures.

Numerous marine-derived compounds with varied biological activities that exhibit diverse chemical properties have so far been identified [6]. Sea grasses are saltwater (marine) plants that may grow in brackish delta waters and shallow coastal seas. Sea grasses are angiosperms with stems and long green, grass-like leaves, they produce ovule and ragweed. The sea grasses have <u>roots</u> and <u>rhizomes</u> which are used to anchor them in seafloor sand. Seagrasses are anchored in the sand of the bottom by their roots and rhizomes. It is an unusual flora that can withstand extreme salinity, submersion, brief periods of desiccation, anchoring to the seafloor, and hydrophilic pollination. The specialty of Sea grasses is holding the large microbial population in their roots, leaves, and rhizomes. They have abundant medicinal and biological properties and chemical derivatives. It has more unique secondary metabolites producer with excellent bioactivities against various infectious pathogens [7].sea grasses are often a high supply of secondary metabolites, which is thought to be a kind of defence mechanism for these plants. The antifungal, antibacterial, and antiviral properties of crude solvent extracts of sea grasses have only been investigated as part of a relatively small number of investigations [8].

Submerged aquatic angiosperms or sea grasses in marine and estuary environments contain antimicrobial substances that may work to inhibit or regulate microbial development. Seaweed and other plants have been used in conjunction with sea grasses in the majority of studies conducted so far. The pharmacological, antiviral, antibacterial, antifungal, antiprotozoa, and antifertility effects of seaweed and sea grass extracts from Indian coastlines [9]. The antiviral activity of seaweed, sea grass, and mangrove extract was examined [10]. Athiperumalsami et al. studied the phytochemical composition of four sea grasses in the Gulf of Mannar.It is demonstrated that the phytochemicals have antimicrobial activities and therefore used for the remedy of various bacterial and fungal infections [11]. Nowadays there is in a great need for discovering of new antimicrobial compounds with chemicals structure as effective drug against microbial infections [12]

OBJECTIVE OF RESEARCH

 In the present investigation, the preliminary phytochemical screening and the antimicrobial activities of three sea grasses, *Halodule uninervis*, *Cymodaceaea serrulata* and *Syringodium isoetefolium* against *MRSA*, ESBL *E.coli*, MDR P*seudomonas* and *Staphylococcus aureus* ATCC were studied. Ethanol, Chloroform and Ethyl alcohol extracts were used for the analysis.

MATERIALS AND METHODS

Sample collection and extraction

In order to prevent evaporation, fresh leaves of *C. serrulata, H. uninervis, and S. isotefolium* were picked from the intertidal area of the Mandapam shore (Lat. 09° 17.417'N; Long. 079° 08.558'E) and transported right away to the lab in sterile plastic bags. To get rid of unwanted items, sea grasses were properly rinsed in tap water, dried in the shade, and then ground in an electric mixer. After being crushed to powder, the samples were stored in a refrigerator for subsequent use.

Poorani *et al.,*

In a soxhlet apparatus, three solvents ethyl acetate, chloroform, and ethanol were used to carry out the extraction procedure. The extracts were then collected and kept in a refrigerator. For this investigation, the bacterial strains MRSA, MDR *P. aeruginosa*, ESBL *E. coli*, and *S. aureus* ATCC were selected. For two weeks at room temperature, seagrass powder was soaked in organic solvents of chloroform, ethyl acetate, and ethanol (1:4 w/v), and the extracts were then collected and concentrated.

PHYTOCHEMICAL ANALYSIS

The Crude extract of the sea grasses were subjected to Phytochemical screening to detect the presence of tannins, saponins, flavonoids, alkaloids, proteins, steroids**,** antraquinones, phenols, terpenoids, carbohydrates. by the standard method using different solvents such as ethyl acetate, chloroform and ethanol [13].

Test for Tannins
1ml of sample was taken, to that few drops of 0.1 % ferric chloride was added and observed for brownish green or blue black coloration.

Test for Saponins
Two milliliters of water were added to one milliliter of sample. For 15 minutes, the suspension was shaken in a graded cylinder. Saponins can be detected by a coating of foam.

Test for Flavonoids
A sample of 1 ml was taken apart to which strong hydrochloric acid was added, producing a white tint, and NaoH was added to observe yellow coloration.

Test For Alkaloids
1 ml of sample was taken, to that few drops of drangand off reagent was added. A prominent yellow precipitate indicates the test as positive.

Test for Protein
1 ml of sample was taken, to that few drops of Millon's reagent was added. A white precipitate indicates the presence of Protein.

Test for Steroids
1 ml of sample was taken to that two drops of 10% concentrated sulphuric acid was added and observed for brown colour.

Test for Anthraquinones
1 ml of sample was taken, to that aqueous ammonia was added and observed for change in colour. Pink, red, or violet colour in aqueous layer indicates the presence of anthraquinoness.

Test for Phenols
1ml of sample was taken; to that 3ml of 10% Lead acetate solution was added. A bulk white precipitate formed at the surface indicates the presence of phenolic compounds.

Test for Terpenoids
2 ml of chloroform, followed by 3 ml of concentrated sulphuric acid was added to 0.5ml of the extract. Formation of red brown colour at the interface confirms the presence of terpenoids.

Test for Carbohydrates
0.5ml of sample was taken, to that 0.5ml of Benedicts reagent was added and mixed well and then it was placed in the water bath for 2mins .Formation of colored precipitate indicates the presence of sugar.

Screening of antibacterial activity of sea grass extracts
Agar Well Diffusion Assay
Aliquots (5 mg/mL) of the extracts were prepared with the solvent and their antimicrobial activity was further tested against clinical isolates according to the agar diffusion method. Assay was carried out in Mueller-Hinton agar (Himedia, India). Agar plates were prepared. Overnight broth culture of the respective test organisms was swabbed on the agar with a sterile cotton swab. The wells (6 mm in diameter) were made on agar plates by using a sterile cork borer. Resultant wells in triplicate were filled with 100 µL of test extracts obtained from chloroform; ethyl acetate and ethanol were added. A well with Ethyl alcohol was taken as a negative control. Petri plates were then incubated for 24 hrs at 37°C .the inhibitory activity was measured by calculating the area of the inhibition zone on three axes. Antimicrobial activities in this study are expressed in terms of area of inhibition zone [14].

Minimum Inhibition Concentration (MIC) and Minimum bactericidal concentration (MBC) test
Minimum Inhibition Concentrations (MIC) of the given sample was determined from the culture plates that had the lowest concentrations and prevented the growth of bacterial strain. Minimum Bactericidal Concentration (MBC) was determined [15]. The extract was diluted to obtain concentration ranging from 10 µg -100 µg /ml. A test tube containing 3ml of Muller Hinton broth and 0.1 ml bacterial suspension and 0.1 ml   given extract was incubated at 37^0c for 24h. Bacterial turbidity was measured at 650 nm to determine bacterial inhibition. Ampicilin at 50 µg /ml and 100 µg/ml was used as a reference for determination of minimum bactericidal concentrations. The tubes containing only the growth medium and each of the bacterial strains were used as control. The minimum bactericidal concentration that showed the reduction of the bacterial growth was measured from the turbidity of the culture assay optical density value. By counting the number of bacteria in each test tube that contained varying quantities of the provided samples and a control, the total number of bacteria for each bacterial species was estimated. Total bacterial count of each bacterial species was estimated by counting the number of bacteria in each test tube incorporated with different concentrations of   given samples and control. The average of six counting's taken as the total number of colony forming bacterial suspensions [16].

RESULT AND DISCUSSION

Preliminary Phytochemicals Analysis
The preliminary analysis of phytochemicals from chloroform, ethyl acetate and ethanol extracts of sea grasses *Cymodaceae serrulata*, *Halodule uninervis* and *Syringodium isoetifolium*, were presented in Table 1. The chloroform and ethyl acetate extracts of *Halodule sp* showed the presence of Tannins, Alkaloids, Proteins, Phenols and Carbohydrates. In the case of ethanol extract from cymodaceae showed the presence of saponins, alkaloids, proteins, steroids and carbohydrates. Whereas, Anthra quinines and terpenoids were absent in all the extracts. Chloroform and Ethyl acetate extracts of *Cymodaceae sp* showed the presence of Tannins, Alkaloids, Proteins, Phenols and Carbohydrates. Ethanol extracts showed the presence of Tannins, Alkaloids, Proteins,steroids, Phenols and Carbohydrates. Whereas, saponins, falvonoids, ,Anthraquinones and terpenoids were absent. Ethylacetate and ethanol extracts of Syringodium showed the presence of Tannins, Alkaloids, Proteins, steroids, Phenols and Carbohydrates. Chloroform extract showed the presence of Tannins, Alkaloids, Proteins, Phenols and Carbohydrates. Where as saponins, falvonoids, ,Anthraquinones and terpenoids were absent.

Screening of antibacterial activity of sea grass extracts
The crude extract of all the three sea grass species showed significant antibacterial activity against the tested bacterial strains. Ethyl acetate extracts of sea grasses showed strong inhibition activities when compared to chloroform and ethanol. Of the three sea grass species, *Halodule uninervis* showed maximum inhibitory activity against all the

pathogens. It was observed that the ethyl acetate extract of *Halodule* exhibited high activity against S.*aureus*(18 mm),*ESBL E.coli* (15 mm),*MRSA*(12mm) and *Pseudomonas* (8mm).The chloroform and ethanol extracts also inhibited the test pathogens at moderate level(Table 2).*Pseudomonas sp* pathogen was remarkably resistant to all the extracts of three sea grasses and standard antibiotics. Ethyl acetate extract of other sea grasses *Cymodaceae seruulata* and *Syringodium isotefolium* exhibited a good antibacterial activity (Table 3&Table 4).Chloroform and ethanol extracts showed comparatively less inhibition than ethyl acetate extracts. The minimum inhibitory concentrations and minimum bactericidal concentration of sea grasses were given in table 5. 5 μg/ml of ethyl acetate extract of *Halodule uninervis* found to beMIC for all pathogens except MRSA. Whereas other species of seagrss showed the same result at 10 μg/ml.When compared to other seagrass *Halodule uninervis* species showed the highest effect against all pathogens. The minimum bactericidal concentration of *Halodule uninervis* showed the highest activity against *E.coli* and *S.aureus* (5.5 μg/ml) and the lowest activity was observed against *Pseudomonas sps*(13μg/ml). *Halodule uninervis* was found more effective in reducing the growth of bacteria tested, than the other sea grasses. In the present study, the ability of Sea grasses to inhibit the pathogens has been studied and the results indicate that the antibacterial agents from the sea grass can be used in control of bacterial infections. Their study shows that the marine sea grass *Halodule uninervis* is a potential species with high inhibitory activity against tested pathogens.

Natural products are considered as an important source of new antibacterial agents. Numerous marine-derived, chemically distinct substances with diverse biological functions have been identified; some of them are now being studied, and/or others are being developed into novel medications [17]. Data obtained from the present study indicates that ethyl acetate extract was the most effective solvent for the extraction of bioactive compounds from the sea grass with significant activity. As observed from the results, the sea grass can be used as a potential source for antibacterial agents. The secondary metabolites of all the sea grasses are rich in bioactive compounds that possess antibacterial activity and significant phytochemical properties. Among the extracts tested, the ethyl acetate extract of Halodule uninervis exhibited the highest activity, followed by other extracts. The results indicate that these sea grass extracts can further be analyzed and purified for relevant antibacterial compounds which can be used in pharmacological products, therapeutics and other applications.

ABSTRACT

Flagellin of *Salmonella sp.* is a mammalian toll-like receptor 5 (TLR5) agonist and the major protein constituent of flagella. Researchers have proved that the recombinant FliC protein can induce specific antibodies and provide protection against *Salmonella* challenge in mice. In the present study, the flagellin gene (FliC) of *Salmonella enterica Serovar typhi* was cloned into *Lactobacillus rhamnosus* and its expression was evaluated. The main aim of the present study was to construct a recombinant vaccine comprising *L. rhamnosus* expressing FliC protein of *Salmonella*. The genomic DNA was extracted and the FliC gene was amplified from the chromosomal DNA of the *Salmonella enterica Serovar typhi* by polymerase chain reaction (PCR) using specific primers designed to obtain complete sequence of FliC gene. Then the amplified gene was cloned into pT1NX plasmid vector using NaeI and SpeI restriction enzymes. The recombinant plasmid pT1NX-FliC was transformed into *L. rhamnosus* by electroporation. The expression of recombinant FliC (rFliC) was evaluated by SDS-PAGE. Finally, the immunoreactivity of the rFliC was checked with typhoid anti-serum. Cloning and subcloning of the FliC gene were confirmed by DNA sequencing of the recombinant plasmid pT1NX-FliC. The expression of rFliC protein in *L. rhamnosus* culture was verified by SDS-PAGE. The rFliC protein was successfully reacted with typhoid anti-serum. The findings of the present study indicate that the FliC gene in recombinant plasmid pT1NX-FliC was successfully expressed in *L. rhamnosus* and produced flagellin protein, which could be used as a vaccine against *Salmonella* infections.

Keywords: Cloning**,** Flagellin (FliC), pT1NX, *Salmonella*, TLR5 agonist, *L. rhamnosus*.

INTRODUCTION

Salmonella has been recognized as a most common cause of food borne illness in humans throughout the world. *Salmonella* sp. are facultative intracellular pathogens and the cause of localized and systemic disease with considerable morbidity and mortality [1]. *Salmonella enterica Serovar Typhi* causes typhoid fever in humans by the ingestion of contaminated food or water. The bacteria enters into the gastrointestinal tract, where *Salmonella* invades membranous (M) cells to colonize underlying mucosal tissue [2]. *Salmonella* spreads to deeper tissues of spleen and liver [3] where it conversely replicate within macrophage phagosomes [4]. moreover, unobserved bacterial replication is fatal for the infected host [5]. Currently, two typhoid vaccines are commercially available: attenuated *S. typhi strain Ty21a* and the purified capsular polysaccharide of *S. typhi* antigen Vi. Live attenuated oral vaccine Ty21a is well-tolerated but provides only moderate levels of protection and requires 3-4 successive doses. Injection site reactions are induced by intramuscular Vi polysaccharide vaccine, even though it is protective. Ty21a is authorized in 56 countries and Vi is authorized in more than 92 countries; but neither has been generally utilized in public health programs against typhoid and non-typhoid fevers [6].

Lactic acid bacteria (LAB) have been consumed by humans for centuries as in fermented foods or as probiotics and are generally regarded as safe (GRAS) [7]. Researchers are undergoing to predict the suitability of LAB as vaccine delivery system. These bacteria are inexpensive and displayed probiotic property as well as adjuvant property [8,9,10,11]. In addition, antigens expressed on the surfaces of LAB are better recognized by the immune system [12,13]. Genetically modified LAB have been effective in delivering antigen to the mucosal immune system and inducing a local immune response [14]. *Lactobacillus rhamnosus* is used as probiotic and involved in the production of dairy products such as yogurt, fermented milk and semi-hard cheese; and it is acid and bile resistant and thus well adapted to oral delivery [15]. Flagellin of *S. typhi* is a TLR5 ligand and an effective antigen to stimulate immune responses because it is exposed to the bacterial surface and easily recognized by the host immune system. Both innate and adaptive immunity can be induced by flagellin [15]. Attenuated *Salmonella* induced the production of CD4+ T cells in orally immunized humans and mice, which recognized FliC flagellin [16,17,18]. FliC-specific CD4+ T cells are stimulated by FliC antigen presenting macrophages [16]. Recombinant flagellin (FliC) protein has been reported as a protective antigen against Salmonella enterica serovar Typhi infection in mice [19].

The main purpose of this study was to produce a recombinant *L. rhamnosus* expressing flagellin (FliC) of *Salmonella enterica Serovar typhi*. The pT1NX plasmid vector was used to express and secrete the FliC protein from *L. rhamnosus* by inserting the full coding region of FliC gene between the unique NaeI and SpeI sites. FliC protein is a protective antigen for immunization as well as the TLR5 agonist [20,21]; so that, recombinant *L. rhamnosus* strains secreting FliC protein were predicted to be highly immunogenic. This recombinant *L. rhamnosus* (named as LR-FliC) can be evaluated as a vaccine candidate for the treatment of typhoid and other *Salmonella* infections.

REAGENTS

M17 medium (Hi-media, India) was used for culture of *Lactobacillus* sp. *Salmonella Shigella* agar medium (Himedia, India) and Neutrient broth (Himedia, India) were used for *Salmonella* culture. Chemicals and antibiotics were purchased from Sigma-Aldrich. All restriction and modifying enzymes for manipulation of DNA were obtained from Invitrogen Bioservices, India.

BACTERIAL STRAINS, PLASMIDS AND CULTURE CONDITIONS

Salmonella enterica serovar Typhi was purchased from King Institute of Preventive Medicine and Research, Chennai, India and cultured on *Salmonella Shigella* agar medium (Himedia, India) and Neutrient broth (Himedia, India) at 37ºC. pT1NX plasmid vector (BCCM, Belgium) and *Lactobacillus rhamnosus* (MTCC 1408) were used as expression

vector, and as an expression host, respectively. The pT1NX plasmid vector was procured as *Lactococcus lactis subsp. cremoris* MG1363 carrying the plasmid. For extracellular secretion of the transgene product, the insertion at the NaeI site has been done in such a way that the first amino acid of the coding region is joined in frame to the ultimate amino acid of the Usp45 secretion signal. pT1NX plasmid was isolated from the host bacteria (*Lactococcus*) using standard methods. The pPrimecloning vector (5PRIME Inc. Germany) was used for cloning the PCR products. *Lactococcus* and recombinant *Lactobacillus* strains were grown under anaerobic conditions at 28°C in M17 medium containing 0.5% glucose (GM17) and 5 µg/ml erythromycin.

GENOMIC DNA EXTRACTION

Genomic DNA of *Salmonella enterica* was extracted by High Pure PCR Template Preparation Kit (Roche, Germany), according to the manufacturer's instruction. Concentration and quality of the genomic DNA were assessed by UV absorbance and electrophoresis on 1% agarose gel.

PCR AMPLIFICATION

A pair of oligonucleotide primers was designed based on FliC DNA sequence. Forward primer: 5'-GTTTACGCCGGCATGGCACAAGTCATTAATAC-3' containing NheI and NaeI restriction sites and Reverse primer: 5'-GGACTAGTCCTTAACGCAGTAAAGAGAGGACG-3' containing SpeI restriction site.

PCR reaction was carried out with 30 cycles of denaturation at 94º C for 1 minute, 58ºC for 1 minute, 72ºC for 2 minutes. The reaction was initiated at 94ºC for 5 minutes as initial denaturation before beginning the PCR cycle, and it was ended with a final extension at 72ºC for 10 minutes in a thermal cycler (TECHNE, UK). Finally, the amplified DNA of FliC gene was visualized by electrophoresis on 1% agarose gel and FliC gene fragments were purified from the PCR product using a High Pure PCR Product Purification Kit (Roche, Germany).

GENE CLONING

The purified FliC PCR product was double digested by NaeI and SpeI (Invitrogen Bioservices, India), then cloned in pT1NX plasmid digested by the same enzymes to form the expression plasmid pT1NX-FliC with an erythromycin resistant selectable marker. Ligation reaction was prepared in a 10 µl volume containing; 54 ng of FliC gene, 50 ng of pT1NX vector, 5 µl of 2X ligation master mix and 2.5 µl of distilled water. This reaction was incubated at 15˚C for 16 hours.

TRANSFORMATION

The recombinant plasmid was transformed to *Lactobacillus rhamnosus* (MTCC 1408) competent cells by using electroporation method[22]. Approximately 1 µg of plasmid was mixed with the competent cells, and the mixture was transferred to a 2-mm-gap electroporation cuvette. Cells received an electrical pulse (2.5 kV, 400 Ω, 25 µF) and recovered in M17 broth. The transformants are plated on GM17 agar containing 5 µg/ mL of erythromycin (Sigma-Aldrich). The plates were incubated at 28˚C for 20 hours. The erythromycin-resistant colonies were selected. After selecting the recombinant clones, the recombinant pT1NX-FliC plasmid was extracted from the overnight culture by High Pure Plasmid Isolation Kit (Roche, Germany) according to the manufacturer's protocol. The recombinant plasmids were detected by restriction digestion with NheI and XhoI enzymes (Invitrogen Bioservices, India) and confirmed by sequence analysis (Bioneer, Korea).

SDS-PAGE

In order to prepare samples, recombinant *L. rhamnosus* (LR-FliC) was cultured in GM17 broth at 28°C under anaerobic conditions before centrifugation at 9000 × g for 30 min. The supernatant was collected, and the protein was precipitated with 70% saturated ammonium sulfate and incubated overnight at 4°C. The precipitate was collected by centrifugation at 9000 × g for 30 min at 4°C. It was dissolved in 2 ml of 20 mM Tris-HCL, pH 7.5, and dialyzed against the same buffer. To remove the insoluble material, the dialyzed sample was centrifuged at 15000 × g for 5 min and filtered. Sodium dodecyl sulfate-polyacrylamide gel electrophoresis (SDS-PAGE) in 10% gel was performed with the purified rFliC protein.

IMMUNOREACTIVITY OF RFLIC

In order to examine the immunoreactivity of the rFliC protein, *S. typhi* H antiserum (King Institute of Preventive Medicine and Research Guindy, Chennai, India) was added to the culture supernatant of recombinant *L. rhamnosus* (LR-FliC) on a slide. The slide was observed for the presence of immune-precipitate.

RESULTS

Gene Cloning
UV absorbance and electrophoresis on 1% agarose gel results showed that the genomic DNA of *S. enterica Serovar typhi* was extracted with good quality (Fig 1). The designed specific primers amplified the full protein-coding region of the FliC gene of *S. typhi* consisting of 1582 bp (Fig 2). The PCR amplified gene was cloned into a pT1NX plasmid vector (Fig 3) by insertion of the coding region between the unique NaeI and SpeI sites in fusion with the Usp45 secretion signal. The plasmid carries the lactococcal usp45 secretion signal sequence and the sequence encoding the cell wall anchor of *S. aureus* protein A. Secretion of the FliC polypeptide was obtained by insertion of the encoding DNA fragment between the unique NaeI and SpeI sites. Insertion at the NaeI site was done in such a way that the first amino acid of the coding region is joined in frame to the ultimate amino acid of the Usp45 secretion signal. The vector was comprised with the erythromycin (ery) selectable marker. The resulted recombinant pT1NX-FliC plasmid was transformed successfully into *Lactobacillus rhamnosus* (MTCC 1408) by electroporation. The recombinant plasmids from the erythromycin resistant colonies were selected and the recombinant pT1NX-FliC plasmid was extracted for sequencing. There were no amplification errors in the sequence of the cloned FliC gene in the constructed plasmid as evidenced by sequencing analysis.

Expression
With a view to inspect the in vitro expression of the flagellin protein, the recombinant FliC protein was purified from the culture medium through a series of centrifugation, precipitation and filtration methods, and SDS-PAGE was performed in 10% gel. The rFliC polypeptide containing 527 amino acids was predicted to have a molecular mass of 55.3 kDa (Fig 4). The molecular weight (MW) of the rFliC protein was identified by SDS-PAGE in 10% gel. The MW was predicted to be 55.3 kDa.

Immunoreactivity of Rflic with Typhoid Anti-Serum
The expression of rFliC protein was confirmed by SDS PAGE. So, the immunoreactivity of the expressed protein was further checked with *S. typhi* H antiserum. Few drops of culture medium form recombinant *L. rhamnosus* (LR-FliC) culture were added with *S. typhi* H antiserum. The rFliC protein was interacted and precipitated with *S. typhi* H antiserum in the slide test.

DISSCUSSION

In the present study, the flagellin (FliC) of *S. typhi* was cloned into *L. rhamnosus* by recombinant DNA technology. The FliC protein is the largest structural component of bacterial flagella. It is a TLR5 ligand and had highly conserved domains that are recognized by TLR5 receptors [24]. FliC also exhibited adjuvant activity when it is associated with other antigens [24,25,26]. and capable of inducing humoral and cellular immune response [27]. Furthermore, anti-FliC antibodies are produced in the serum during the natural course of infection, which was confirmed by the immune reaction of FliC protein with the sera of typhoid patients. When orally delivered *Salmonella* are either captured by or infect host cells, FliC-specific CD4+ T cells are activated only in the intestinal lymphoid organs. FliC antigen production will be repressed by the bacteria there, resulted in the inhibition of activation of FliC-specific T-cell responses in the peripheral lymphoid tissue [28]. Innate and adaptive immune recognition of conserved antigens like flagellin can lead to protective immune responses against flagellated pathogens.

Lactobacillus rhamnosus is a widely using probiotic and is often isolated from the gastrointestinal tract, mouth, vagina, and fermented dairy products. It is used in the manufacture of yogurt and dairy products such as fermented milk and semi-hard cheese. *L. rhamnosus* was used as a therapeutic agent for the treatment of diarrhea, infections and toxication [29,30,31,32,33,34]. To our knowledge, *L. rhamnosus* is not used as an antigen delivery vector. By combining the probiotic activity of *L. rhamnosus* and the immunogenic and adjuvant activities of FliC, we produced a recombinant vaccine candidate for typhoid therapy. Since *Salmonella* is entered into the human body through oral-fecal route, oral vaccination with recombinant *L. rhamnosus* (LR-FliC) would be predicted to produce secretory IgA response and cellular immune response in the intestine. Colonization of the pathogenic bacteria (*Salmonella*) is very important to cause infection in the host. By blocking the flagella of the pathogenic bacteria, we could inhibit the colonization. LR-FliC vaccine would be desirable for inexpensive, safe and easy production methods. The results of this study indicated that the FliC gene was successfully cloned into the expression plasmid pT1NX, and the expression of this gene at the level of transcription and translation was confirmed in *L. rhamnosus.* Future studies addressing the immunological characterization of LR-FliC in orally immunized mice models and the production of milk products using LR-FliC are undergoing and expected to be promisingly significant.

ABSTRACT

Plastic waste and petrochemical-derived polymer compounds have grown to be serious environmental problem. PHAs are a type of bioplastic that can be used to alleviate this issue. Polyhydroxy alkanoates or PHAs, are polyesters made by a number of different microorganisms in nature, including bacteria that ferment lipids or carbohydrates. These biodegradable plastics are used in the production of bioplastics. The study's ultimate goal is to conduct a phylogenetic and molecular analysis of PHA-producing bacteria isolated from oil and pulp wastewater. The bacteria were isolated using primary staining, and the acquired organism was enriched with selective media. The organism was subjected to biochemical tests such as IMVIC, gram staining, urease, and fermentation tests. The dry weight of the isolated bacteria was calculated, and Sudan black B staining was used to confirm the presence of PHA-producing bacteria. Molecular analysis was carried out to identify the species of the organism.

Keywords: Plastics, Bioplastics, Polyhydroxy alkanoates, Biodegradation

INTRODUCTION

Plastics are a wide range of synthetic or semi-synthetic materials that use polymers as a main ingredient. And their plasticity makes it possible for plastics to be molded, extruded, or pressed into solid objects of various shapes. Most modern plastics are derived from fossil fuel-based petrochemicals like natural gas or petroleum and plastics are harmful to the environment. Isolation and production of PHA-producing bacteria from oil and pulp wastewater and the obtained bacteria are used for the production of bioplastic. As an alternative to plastics as this PHA-produced bacteria can replace plastics in many applications. The PHA is a type of Bio polyester that is produced under unfavorable conditions. The samples are collected from pulp wastewater and oil industry wastewater for the isolation of PHA-producing bacterial strains.

65808

Polyhydroxyalkanoates

Polyhydroxy alkanoates or PHAs are polyesters that are produced in nature by numerous microorganisms, including through bacterial fermentation of sugars or lipids. When the PHA is produced by bacteria they serve both as a source of energy and as a carbon store. Polyhydroxy alkanoates (PHAs) are natural, renewable, and biocompatible biopolymers. PHA can be either thermoplastic or elastomeric materials and they have a melting point ranging from 40 to 180 °C. Polyhydroxy alkanoates (PHA) are produced by around 300 different bacterial strains and are similar to synthetic plastics in physical and chemical properties. PHA is used for the production of bioplastics and which are safe and eco-friendly for nature. The production of bioplastic is done by the microorganism. This study will help to know the microorganism which is available in the pulp and oil waste sample and which are used for the extraction of PHA-producing bacteria and which can further be used for the production of bioplastics.

MATERIALS AND METHODS

Sample collection

The samples were collected from oil industry wastewater and pulp wastewater. and the wastewater of pulp was prepared in the laboratory itself by using waste paper.

Primary Screening of PHA-Producing Bacteria

(Anish Kumari Bhuwal, Gulab Singh, Neeraj Kumar Aggarwal, Varsha Goyal, Anita Yadav, "Isolation and Screening of Polyhydroxyalkanoates Producing Bacteria from Pulp, Paper, and Cardboard Industry Wastes et.al 2013)

The primary screening was carried out in the nutrient agar plate with a supplement added agar for the solidification of the gel. The oil and pulp industry wastewater was serially diluted and poured into the agar plate and the culture was incubated at 37℃ for 24 hours. The colony was observed after 24 hours of incubation and the observed colony are then sub cultured in the nutrient broth and kept in the shaker for 24 hours and .Biochemical and gram staining test was performed.

Secondary Screening of PHA-Producing Bacteria (Anish Kumari Bhuwal, Gulab Singh, Neeraj Kumar Aggarwal, Varsha Goyal, Anita Yadav, "Isolation and Screening of Polyhydroxy alkanoates Producing Bacteria from Pulp, Paper, and Cardboard Industry Wastes et.al 2013). The secondary screening of PHA-producing bacteria was done in the mannitol salt agar plate and the supplement added was agar agar (2grms for 100 ml). The sub cultured colonies were then gown in the mannitol salt agar plate and kept in the incubation at 37℃ for 24 hours. The colonies were observed in both the pulp and oil samples and the observed colonies were sub cultured in the Tryptone Soya Broth and the subcultured colonies were incubated in a shaker for 24 hours.

Identification of PHA by Sudan Black B Staining (Jasmine Chetia "Isolation and Characterization of PHA producing Bacteria from sewage sample of Assam et.al 2019**).** For the staining Sudan Black B, the culture was take in a slide with the help of sterile loop Then the smear is heat fixed and after that a few drop of Sudan Black B solution are added on the fixed smear. After the solution was spread on the slide, ethanol in the stain evaporates in about 10-15 min. The excess liquid was carefully drawn off using a filter paper. The slide containing bacterial colony was then immersed in xylene until it was completely decolorized. The slide is counterstained with safranin. After 10 seconds, the slide was washed with running tap water and air dried and visualized under oil immersion.

Colony Characterization (Morphology)

(Jasmine Chetia "Isolation and Characterization of PHA producing Bacteria from sewage sample of Assam et.al 2019)

The colony morphology is the important attribute as the different species of bacterium produce very different colonies thus facilitating characterization. Morphological characterization was done based on size, form, color. Then the colonies were further characterized by gram staining.

Biochemical Identification

Biochemical tests are the test which is used for the identification of bacterial species based on the difference in the biochemical activities of different bacteria.

Gram Staining (Gram Staining by Sagar Aryal et.al 2018)

Take a clean, grease free slide.Prepare the smear of suspension on the clean slide with a loopful of sample.Air dry and heat fix.Crystal Violet was poured and kept for about 30 seconds to 1 minutes and rinse with water.Flood the gram's iodine for 1 minute and wash with water.Then ,wash with 95% alcohol or acetone for about 10-20 seconds and rinse with water.Add safranin for about 1 minute and wash with water.Air dry, Blot dry and Observe under Microscope.

IMVIC Test (Procedure, by Huzefakifayet et.al 2020)

Indole Test

Preparation of Tryptophan broth. Take a sterilized test tube and add 4 ml of tryptophan broth. Inoculate the tube aseptically by taking the growth from 18 to 24hrs culture. Incubate the tube at 37°C for 24-28 hours. Then add 0.5 ml of Kovac's reagent to the broth culture. Observe for the presence or absence of ring.

Methyl Red Staining

Preparation of MRVP Broth. The Prior to inoculation, allow medium to equilibrate at the room temperature. Then Use the organisms taken from an 18- 24 hr pure culture and the lightly inoculate the medium. Incubate at 37 degrees C. for 24 hours. Add 2 to 3 drops of methyl red indicator to aliquot. Observe for red color immediately.

Voges - Proskauer

Preparation of MRVP Broth. Prior to inoculation, allow medium to equilibrate to room temperature. Using organisms taken from an 18-24-hour pure culture, lightly inoculate the medium. Incubate aerobically at 37 degrees C. for 24 hours. Add 6 drops of 5% alpha-naphthol, and mix well to aerate. Observe for a pink-red color at the surface within 30 min. Shake the tube vigorously during the 30-min period.

Citrate Test

Preparation of Simmon Citrate Agar ,pour it in a test tube in a slant position. Streak the slant back and forth with a light. Inoculums picked from well isolated colony. Incubate at 37 °C for 24 hr. Observe the change of color from green to blue along the slant.

Urease Test (Anupama Sapkota Urease Test in et.al 2020)

Preparation of Urease Agar. Streak the surface of a urea agar slant with a portion of a well-isolated colony or inoculate the slant with 1 to 2 drops from an overnight brain-heart infusion broth culture. Leave the cap on loosely and incubate the tube at 35°-37°C in ambient air for 48 hours to 7 days. Examine for the development of a pink color for as long as 7 days.

Fermentation Test

The carbohydrate fermentation test is used to determine whether or not a bacteria can utilize a certain carbohydrate. Amrita, Carbohydrate Fermentation Test et.al 2012

Glucose Test and Fructose Test

To perform this fermentation test, take 3 test tube containing 2 different kind of broth namely Glucose and Fructose were each containing 0.5% of sugar along with sufficient amount of beef extract and peptone and the pH indicator phenol red for the acid detection. Now invert the Durham tube in each tube and then inoculate each with the bacterial culture and incubate for 37°C for 24 hours.

Determination of cell dry weight (Sajida Munir and Nazia Jamil Characterization of Polyhydroxyalkanoates Produced by Contaminated Soil (Bacteria using Wastewater and Glucose as Carbon Sources May et.al 2015). The sample (5 ml) from the culture media was taken at regular time intervals and then centrifugation was at done at 4000 rpm for 15 min. Then the supernatant was discarded and the pellet was collected at the bottom and washed using distilled water then the pellet was lyophilized to dry it and then weighed.

Calculation- PHA% = DW(g)÷ PHA(g) ×100.

Polymer analysis by FTIR (Fourier-transform infrared spectroscopy) (Hadiqa Javaid, Ali Nawaz, Naveeda Riaz, Hamid Mukhtar, Ikram-Ul-Haq, Kanita Ahmed Shah, Hooria Khan, Syeda Michelle Naqvi, Sheeba Shakoor, Aamir Rasool, Kaleem Ullah, Robina Manzoor, Imdad Kaleem and Ghulam Murtaza et.al 2020) . The Fourier-transform infrared spectroscopy (FTIR) is the technique that is used to obtain an infrared spectrum of absorption or emission of a solid, liquid or gas. An FTIR spectrometer help to simultaneously collects high-resolution spectral data over a wide spectral range. The sample are given in the pellet form for the FTIR analysis in the SRM University. The PHA in the biomass was determined by examining the dried biomass on the FTIR.

Phylogenetic Tree Analysis (Jasmine Chetia "Isolation and Characterization of PHA producing Bacteria from sewage sample of Assam et.al 2019)

A phylogenetic tree is a branching diagram or a tree showing the evolutionary relationships between various biological species or other entities based upon similarities and differences in their physical or genetic characteristics. The result obtained are interpreted and obtained a phylogenetic analysis of the organism the organism which was identified was Staphylococcus. The sequence of the bacteria was obtained from the NCBI.

Genomic DNA isolation - DNA Isolation Method
1.5ml of overnight culture was transferred and centrifuged at 10000 rpm for 3 minutes at 4°C. To the pellet, the lysis buffer was added (476µl of TE, 30µl of 10% SDS- Detergent, 7µl of proteinase-k- and incubated at 37°C for 1 hr. Using a wide bore tip the top aqueous phase was transferred to a new sterile microfuge tube. An equal volume of ice-cold Phenol: Chloroform (25:24) was added and mixed well by inversion. The tubes were then centrifuged at 10,000rpm for 10 minutes at 4°C. To the aqueous phase, ice-cold absolute ethanol was added and mixed gently to precipitate the nucleic acids. The tubes were stored at -20 for about one hour or left overnight (optional). The nucleic acid pellet was recovered by centrifuging at 10,000rpm for 15 minutes at 4°C. The pellet was washed with 70% ethanol twice and was air-dried briefly at room temperature. The pellet was dissolved in T.E. buffer and stored at -20°C.

Qualitative Analysis of Genomic DNA
Preparation of agarose gel with 1X TAE buffer. The % of agarose depends upon the molecule to be separated. Samples loaded with loading dye (1µl of loading dye is used). Electrophoresis of DNA fragments at 50 volts. Run Agarose gel electrophoresis.

Quantitative determination of DNA by spectrophotometric method
The spectrophotometer and the UV lamp were switched on. The wavelength was set at 260nm and 280nm. The instrument is set at zero absorbance with TE buffer or sterile water as blank. 5 or 7ul of the sample is taken in a quartz cuvette and made up to 3ml with TE buffer or sterile water. The absorbance of the solution with the sample was read. The concentration of DNA in the sample was calculated using the given formula.

Concentration of dsDNA
A260 * 50µg * dilution factor

Purity of DNA
A260: A280ratio = A260/ A280
          = 1.8: pure DNA
          = 1.7 – 1.9; fairly pure DNA (acceptable ratio for PCR)
          = less than 1.8; presence of proteins.
          = greater than 1.8; presence of organic solvent

Polymerase Chain Reaction
It exploits the natural function of polymerase present in all living things to copy genetic material or to perform molecular photocopy. PCR consists of three steps: Denaturation, Annealing, and Extension with respective temperatures. These 3 steps are repeated about 30 to 40 times in an automated thermal cycler, which heat and colds the reaction mixture in the tube in a very short time. This results in an exponential increase accumulation of the specific DNA fragment.

Procedure
100ng of DNA is used for the molecular-based detection of fungal samples. The PCR reaction is performed for 25μl. The PCR reaction was performed for the ITS gene. The PCR tubes were placed in a thermo cycler and the reaction was carried inside the thermo cycler.

16srRNA-F	**5'-ATGGCTATTGTTGATACTGCC -3'**
16srRNA-R	**5'-CTAAACCATACAAGTATCTC -3'**

Agarose gel electrophoresis of PCR products

PCR products (5μl) were mixed with 1μl of gel loading dye (Novel dye) in a 1.5% Agarose gel along with 5 μl of DNA ladder. Electrophoretic separation was performed at 100V for 30 min. The resulting DNA fragments were visualized using an LED transilluminator.

RESULT AND DISCUSSION

Primary Staining of Organism
The sample was isolated in the nutrient agar plate and after 24 hours of incubation. The colony were observed in the agar plate. The colonies from oil sample and pulp sample were initially observed on the nutrient agar plate after 24 hours of incubation.

Gram Staining
Gram positive, Purple colour, spherical shaped bacteria was observed

Growth on Selective media
The organism was isolated on the selective agar plate based on the result of gram staining on the se - Mannitol Salt Agar. The organism was identified as *Staphylococcus* after 24 hours of incubation Tryptophan Broth was further used for culturing.

Sudan Black Staining
The Sudan black staining was performed for confirming the presence of the rapid PHA-producing bacteria. Granules were observed in blackish color which confirmed the presence of microorganisms producing PHA. This was a preliminary test used for the identification of PHA-accumulating bacterial colonies.

Selvamangai *et al.,*

Biochemical Identification Result
A biochemical test was done for the identification of bacteria which was present in the isolated sample. The test was showing the result positive for the *Staphylococcus.*

IMVIC Test Result
Indole test
The indole test result was negative as the ring was not observed after the adding of Kovac's Reagent hence confirming the presence of staphylococcus organism.

Methyl Red Test
The methyl red test was positive as the change of color was observed when the methyl red indicator was added to the 24-hour test tube containing organism and the change of color was observed. The test result for Staphylococcus was positive.

Voges Proskauer Test
VP Test is performed as a part of the IMVIC test and the VP test result was positive as the VP broth was prepared and incubated for 24 hours and after the addition of alpha- naphthol the color was changed lightly to pink.

Citrate Test
For the citrate test analysis the Simmon citrate agar slant was prepared and the culture colony was inoculated and kept in incubation at 37 ℃ for 4 days the color was changed from green to blue along the slant hence it indicates the presence of organism and the test result was positive and for Staphylococcus the citrate test is positive.

Urease Test
The urease test was done as a step to identify the bacterial culture which was isolated from the oil and pulp sample after the slant was prepared and the organism was inoculated with the isolated organism after the incubation period of 4 days the results were seen and the green color was changed to blue color hence the test was positive for the urease test.

Glucose and Fructose Test
The Fermentation test for Glucose and Fructose was done to identify the bacterial organism present in it and the result of this both tests were positive as after the inoculation of the isolated bacterial sample and incubated for 24 hours and the next day the bubbles were formed in the Durham tubes and hence the fermentation for the isolated sample pulp and oil were positive.

Biochemical Test	Result	Organism
Gram Staining	Positive	*Staphylococcus*
IMVI Test A] Indole Test B] Methyl Red Test C] Voges-Proskauer Test D] Citrate Test	Negative Positive Positive Positive	*Staphylococcus* *Staphylococcus* *Staphylococcus* *Staphylococcus*
Urease Test	Positive	*Staphylococcus*

Dry Weight Calculation
The Dry Weight of the cell was calculated at the regular interval by taking the sample and centrifuging it at 4,000 rpm for 15 min. The supernatant was discarded and the pellet was washed with water and weighed to knowing the dry weight of the sample.

Pulp Sample
1. Dry Weight of $T1$= 1.10+ 1.09 + 1.083 × 100
$T1 = 109 \; gm/5ml$
2. Dry Weight of $T2 = 1.05 + 1.10 + 1.093 ×100$
$T2 = 108 \; gm/5ml$
3. Dry Weight of T3 = 0.94 + 0.99 + 1.113 ×100
$T3 = 101 \; gm/5ml$

Oil Sample
1. Dry Weight of $T1 = 1.09 + 0.99 + 1.243 × 100$
$T1= 110 \; gm/5 \; ml$
2. Dry Weight of T2 = 1.08 + 1.09 + 1.013 ×100
$T2 = 106 \; gm/5 \; ml$
3. Dry Weight of T3 = 1.09 + 1.09 + 1.083 ×100
$T3 = 1.01 \; gm/5 \; ml$

FTIR Analysis
For the FTIR analysis when the biomass of the pulp and oil sample was tested for the presence of PHA, the bands were observed. And according to the Kansiz et al 2007 that the FTIR Spectra peaks at about 1730cm and 1200cm to 900 cm are considered as of PHA in pure culture. The bands in the spectra which are regarded as PHA and other molecules such as cellular protein can be clearly distinguished from each other.

FTIR Frequency Range and Functional Group used for the analysis of each species
- The result obtained for the Pulp sample was Alkyl amine, Bonded N-H/ C-H/ O-H, and C-O in the alcohol hydroxyl group.
- The result obtained for the oil sample was Alkyl amine, O-H Stretching vibration.

Phylogenetic Tree Analysis
The Phylogenetic tree analysis was done and the obtained organism was Staphylococcus and the organism was interpreted in a Phylogenetic tree. The sequence used for the Phylogenetic Tree construction.

Genomic DNA Isolation
Genomic DNA were isolated and bands were observed.
- Lane 1: 1 Kb DNA Ladder
- Lane 3: Sample 1
- Lane 4: Sample 2

PCR amplification
The DNA were amplified using PCR technique also the bands were observed.
- Lane 1: 100bp DNA Ladder
- Lane 2: PCR amplicon of *16srRNA* gene
- Lane 3: PCR amplicon of *16srRNA* gene

Sequencing
It was done by applying biosystems 3500 genetic analyzers using Sanger sequencing.

Selvamangai *et al.,*

Similarity search

Database sequence similarity search is an important methodology in DNA barcoding. Bioinformaticians developed 'heuristic' algorithms, which allow searching a database in significantly less time. Nucleotide blast (BLASTn) using the BLAST program and Genbank nucleotide database with default parameters was performed to determine the identity and the closest known relatives of the sequences obtained.

CONCLUSION

The current study aimed to isolate microorganisms involved in the production of PHA which can be used as an alternative to plastics .The microorganisms were isolated from the paper and oil industry effluents and were screened for identification of the organisms by various confirmatory tests the samples were also subjected to compound identification like FTIR and further the samples were subjected for Molecular identification and phylogenetic studies which confirmed that the organisms is staphylococcus aureus. The development of efficient PHA producing bacteria is the need of the hour and on the basis of the data obtained in the present work it could be concluded that staphylococcus species isolated can be employed in the production of PHA

ABSTRACT

In present study, Iron oxide nanoparticles were synthesized using *Pongamia pinnata* leaves and characterised by UV–visible spectroscopy,FTIR,X-ray Diffraction and SEM.The nanoparticles were spherical in shape with an average particle size of 500 nm as determined by Scanning electronic microscopy (SEM) and FT-IR spectrum revealed the capping of the phytoconstituents present in *Pongamia pinnata* leaves. Green synthesized iron oxide nanoparticles showed powerful antioxidant properties by DPPH assay and antimicrobial activity against gram positive and gram negative bacteria. These results support the advantages of using simple and cost effective bio-green method for synthesizing iron oxide nanoparticles with antioxidant and antimicrobial activities.

Keywords: *Pongamia pinnata*; Iron oxide nanoparticle,UV- Visible Spectrophotometry, FTIR, XRD,SEM.

INTRODUCTION

Nanotechnology is emerging as a rapidly growing field with its application in science and technology for the purpose of manufacturing new materials at the nanoscale level**.** Nanoparticles can be synthesized by various methods like physical, chemical and biological methods. The physical and chemical methods are complicated, expensive and also generate hazardous by- products. In contrast, the green method that uses plant extracts has recently been having considerable attention in nanoparticle synthesis with its clean, simple, less toxic and eco-friendly in nature. Metal nanoparticles have received considerable attention in recent years because for their unique

properties and potential applications in biological tagging and pharmaceutical application. Green synthesis of nanoparticles is very cost effective, environment friendly and non-toxic[1].

Pongamia is a genus belongs to the family of Leguminoseae and sub family of Papilionaceae. *Pongamia pinnata* is a preferred species for controlling soil erosion and used as curative agents . All parts of the plant have medicinal properties which are used as a crude drug for the treatment of tumors, piles, skin diseases, wounds and ulcers. Traditionally used in ayurvedha[2].The presents study was planned to observe the antimicrobial activity and antioxidant activity of nanoparticles synthesised from the leaves of *Pongamia pinnata.*

MATERIALS AND METHODS

Preparation of *Pongamia pinnata* leaf extract

The leaves of the healthy plant *Pongamia pinnata* were selectively collected from Thiruvallur district, Chennai, Tamilnadu.The fresh leaves were thoroughly washed using Milli Q water and dried under sunshade to remove moisture completely. They were made into powder by using mechanical grinder and then stored for further use.

Green synthesis of Iron oxide nanoparticles

Ferric Sulphate ($FeSO_4 7H_2O$) was used as the precursor for the synthesis of nanoparticles.30ml of the leaves extract was added dropwise with 30ml of $FeSO_4 7H_2O$ solution in 1:1 ratio.The resultant mixture was stirred using a magnetic stirrer for 30 min and the formation of intense black colored solution confirmed the synthesis of iron oxide nanoparticles.

Characterization of the iron oxide nanaoparticles

The Iron oxide nanoparticles synthesized were characterized by UV–Vis spectrophotometry, FTIR (Fourier Transform Infrared spectroscopy) to identify the functional groups of the active components within the range (4000-500 cm-1) and XRD is an effective characterization to confirm the crystal structure of the synthesized magnetite nanoparticles.The morphology of nanoparticles are analysed by SEM run at a voltage of 5.0KV.

Antimicrobial and Antioxidant activity of Iron oxide nanoparticles

The antibacterial activity of synthesized ironoxide nanoparticles was determined by agar well diffusion method against both Gram positive bacteria and Gram negative bacteria. *Bacillus subtilis, Staphylococcus aureus, Escherichia coli, Klebshilla pneumoniae, Salmonella typhi are the organisms used for study* The antioxidant activity was analysed by DPPH assay.

RESULT AND DISCUSSIONS

Green synthesis of Iron oxide nanoparticles

The Ironoxide nanoparticles were synthesized using various concentration of ferrous sulphate solution (25mM, 50Mm, 100mM, 150mM, 200mM, 250mM). Reaction was visible in 250mM as colour change from light brown to black colour within 24 hrs of the addition of reaction mixture. Similarly the colour change from colourless to black on the aqueous leaf extract of *Ocimum sanctum* with synthesis of iron oxide nanoparticles was reported[3].The various phytochemicals like polyphenols, flavonoids, glycosides, and tannins present in the leaf extract equally act as reducing and stabilizing agents for the synthesis of nanoparticles[4].

UV-Visible spectroscopic analysis

Absorption spectra of iron oxide nanoparticles formed in the reaction media has absorbance maximum at 310nm.Figure1 indicates the presence of iron oxide nanoparticles in between the range of 300- 800nm. The excitation of surface Plasmon resonance with the $FeSO_4NPs$ was the reason for the color change, and the minimum spectra range was at 380nm. The parallel study was reported using *Argemone Mexicana,* leaf extract[5]. The maximum peak was found to be 315nm. The most intense surface resonance plasma peak,suggest a higher number of absorbing particles with increased extraction efficiency with temperature.

Fourier Transform Infrared Spectroscopy (FTIR) analysis

FT-IR spectra of the *Pongamia pinnata* extract revealed strong magnetite absorption bands at 3844.13 cm^{-1} ,2954.95 $cm^{-1,}$ 2922.16 $cm^{-1,}$ 2852.72 $cm^{-1,}$ 1635.64 cm^{-1}, 1458.18 cm^{-1},1381.03 cm^{-1}shown in figure 2 form H-C-H Stretching and bending vibrations of phenol group, The absorption peak of 2922.16 cm^{-1} in the *Pongamia pinnata* extract indicated the O–H stretching vibration and contributed to the C–H stretching vibrations of the –CH2 functional group , while 1635 cm^{-1} were attributed to the C–H bending overtone band of aromatic compound. The peak at 1076.8 cm^{-1} was assigned to the C–O stretching band related to the C–O–SO3 group. All the shifted bands, indicates the participation and interaction of nanoparticles with the leaves extract of *Pongamia pinnata* shows bioactive molecules present in the synthesized iron oxide nanoparticles. and the similar results with the maximum absorption peaks at 2917 cm^{-1} , 2849 cm^{-1} ,1450 cm^{-1} respectively were reported [6].

X-ray Diffraction analysis

XRD Pattern revealed the crystalline nature of synthesized nanoparticles synthesised using *Pongamia pinnata* shows 10 intense characteristic peaks at 2θ value $21.45°$, $28.49°$, 30.97,$40.70°$, $31.05°$, $55.75°$, $58.32°$, $66.37°$, $73.79°$,$74.96°$ are marked by their indices [(111),(200), (220), (311),(222),(400), (331), (420)] given in Figure 3.The results shows that iron oxide nanoparticles was essentially pure based on the index face centred diffraction peaks[7].

Morphological analysis by SEM

The Iron oxide nanoparticles synthesized by the *Pongamia pinnata* leaves extract are predominantly spherical in shape with the scale bar 500 nm. The aggregation of nanoparticles is acquired resulted in the formation of large sized nanoparticles shown in Figure 5. The formation of small, large sized and undefined shaped nanoparticles is dependent on the presence of phytochemicals. The high purity and low toxicity of *Pongamia pinnata extract* render the synthesised iron oxide nanoparticles for biological applications. Similar morphology of iron oxide nanoparticles formed using scanning electron microscope and the particle size was about 500nm at 80^0 C magnitude was observed in Sorghum bran extract [8] and this determines the similar size of nanoclusters formed in the aqueous extract.

Antibacterial activity

The antimicrobial activity of green synthesized iron oxide nanoparticles was assessed against pathogenic microorganism.The iron oxide nanoparticles show a significant inhibition activity against both gram positive and gram negative microorganisms.The results were shown in Figure 6. Predominantly, the maximum zone of inhibition was noted against *Escherichia coli* followed by *Salmonella typhi* and *Staphylococcus aureus*. The minimum zone of inhibition activity was observed in *Bacillus subtilis* and *Klebsiella pneumoniae* Similar antibacterial effects of iron oxide nanoparticles were reported against dental caries pathogens [9].The difference in inhibition activity of nanoparticles against gram positive and gram negative bacteria is due to the composition of the cell wall. The mechanisms of antibacterial activity of iron oxide nanoparticles are by binding on the membrane of microorganisms through electrostatic interactions, cell wall disruption and affecting the intracellular processes such as DNA, RNA and protein synthesis.

In Vitro Antioxidant Activity
DPPH⁻ Radical Scavenging Activity

The antioxidant activity of iron oxide nanoparticles of *Pongamia pinnata*was analyzed with DPPH, a stable free radical. As DPPH picks up one electron in the presence of a free radical scavenger, the absorption decreases and the resulting discoloration is stoichiometrically related to the number of electrons gained.The DPPH radical scavenging (%) activity is shown in the Figure 6.*Pongamia pinnata* extract exhibit an inhibition of 50.5 % at 500µg/ml.The *Maranta Arundinacea* extract showed an inhibition of 74.06% at 500µg/ml was reported[10].

CONCLUSION

The current study was done to evaluate the biological activities in leaves of *Pongamia pinnata* using ironoxide nanoparticles. The green synthesis and characterization of iron oxide nanoparticles using leaf extract of *Pongamia pinnata* were performed and confirmed by spectroscopic and microscopic techniques. This synthesis method is uncomplicated, environmentally friendly, non- toxic and low cost due to the availability of the source of reducing agent leaves of *Pongamia pinnata* . The very good results of antibacterial activity reveals the biomedical application of ironoxide nanoparticles that may serve as leads for the development of new antimicrobial drugs.

CONFLICT OF INTEREST

The authors have no conflicts of interest regarding this investigation.

ABSTRACT

Internet of Things (IOT) involves devices that can relate with one another by linking to the internet and transfer information, ultimately enlightening human lives. IoT in many aspects is a persistent technology that is renovating many industries meaningfully. Further the growth of IoT has transformed countless outlooks of our lives, comprising the way we make purchases and do purchase decisions. IoT works as an Omni-channel strategy that balances the demand and supply significantly. The amalgamation of IoT in retail abode has instigated various openings, opportunities and challenges for businesses lined up to encapsulate and take advantage of impulse purchases. Impulse buying refers to the aptness and inclination of consumers towards unintentional purchases directed by instantaneous sentiments, desires, preference or exterior stimuli. IoT empowered devices such as smart shelves, digital signage and various mobile applications provide customize and interactive shopping experiences, alluring buyers to convenience for impulse buying. The real time commodity recommendations, locality-based offers and personified notifications provided through IoT devices provokes or activates impulsive buying behavior by generating a perception of urgency and convenience. Using the data analytics and machine learning algorithms, businesses can procure insights into purchasing patterns and behaviors. The expansion of interconnectivity of IoT devices also gives rise to prospective risks to consumer decision-making. Extreme exposure to targeted advertisements, persuasive techniques and real time promotions may lead to impulsive purchases that do not comply with the consumer's actual needs or financial capabilities. IoT

65827

has a deep-rooted effect handing out new avenues for retailers to operate sales and intensify customer experiences. Nevertheless, cautious execution, accountable data practices and consumer-centric policies are essential to make certain IoT-operated impulse buying endures to be a constructive and mutually favorable phenomenon. This paper is an investigation of research on the impact of IoT application on the impulse buying behavior of customers. With an intention to identify the application of IoT in retailing, the review for a decade have comprised of secondary information possessed from the academic article pertaining to application of IoT in retailing, consumer purchase decisions, efficient marketing and integration of IoT and consumer behavior.

Keywords: IoT, Impulse buying behavior, Purchase decision, Point of purchase, Point of sale, Retail behavior.

INTRODUCTION

The elevation in buyer's awareness accompanied by the progression of new shopping mediums has altered the traditional decision-making process of buyers. However, in spite of the market being one of the highly dynamic environments, there is limited use of technology that is having the potentiality to capture data and utilise it to perform smooth operations and workflow in the sector. Furthermore, it is apparent that technology's capability to gather data on such variable framework as the purchase time span of customers and their level of interaction and synergy made it feasible for marketers to take advantage of personified marketing and as a consequence propagates impulse purchases. Impulse buying can be portrayed as the unintended and instantaneous purchase unaccompanied by any pre-purchasing motive. It is marked by an immediate and impromptu urge to make a purchase, often in reaction to contentment from a positive sentimental condition. It is generally considered as a consumer buying behavior where purchase is done without any thoughtful contemplation. Nowadays, life is deep-seated on the technology and the ease of using it. People are now so conditional and dependent on the technology that it is impossible to imagine living even one day without it. For which Internet of Things (IoT) emerged as a concept and since then it is growing at a great pace.

The Internet of Things (IoT) is a network of physical objects or "things" lodged with sensors, software and connectivity that enables them to gather and exchange data. Over the past decade, IoT has made remarkable strides in transforming various industries, even encompassing retail. One area of interest is the impact of IoT on impulse buying behavior of customers. It has long been a focus of research in the field of consumer behavior, often driven by emotions rather than rational decision-making. Customer behavior has long fascinated marketers and retailers due to its prospective and capability to boost sales and drive profitability. Over the past decade, the rapid advancement and proliferation of Internet of Things (IoT) technology have revolutionized various aspects of our daily lives. The network of IoT interconnects physical devices, vehicles, appliances, and other objects embedded with sensors, software, and connectivity that enable them to collect and exchange data. Over the past decade, numerous studies have been conducted to explore the relationship between IoT and impulse buying behavior. Additionally, IoT has led to an increase in the availability of personalized and targeted marketing notification, which has been found to influence impulse buying behavior. For instance, retailers can use IoT data to track a customer's purchasing history and preferences to offer targeted promotions and discounts so also the seamless purchasing experience even by providing smart shopping environment. This has been found to increase the likelihood of impulse buying.

Furthermore, the convenience and ease of use of IoT-enabled devices, such as smart speakers and home assistants have also been found to impact impulse buying behavior. With these devices, customers can easily make purchases by simply speaking a command, making it easier to succumb to impulse buying urges. This paper provides a comprehensive review of the impact of IoT on impulse buying behavior of customers over the past decade. By

65828

analyzing the existing literature, we aim to understand how IoT technologies have influenced consumers' propensity to engage in impulse purchases and the underlying factors that contribute to this behavior. The findings of this review shed light on the evolving landscape of retail and provide valuable insights for businesses and marketers in leveraging IoT to influence consumer behavior.

Objectives
To identify the application of IoT in retailing
To understand the changing landscape over the past decade
 To examine the relationship between IoT and impulse buying
To analyze the role of personalized experiences
To assess the impact on decision-making processes
To investigate the challenges and concerns

RESEARCH METHODOLOGY

Types of available tools and products
The impact of the Internet of Things (IoT) on consumer behavior, including impulse buying, has led to the development of various tools and products. Some of the instances are as follows:

Smart Shelf Displays: These are interactive digital displays placed on retail shelves that use IoT technology to provide real-time information, personalized recommendations, and promotions to shoppers. By analyzing consumer data and preferences, these displays can trigger impulse purchases by offering relevant and enticing offers.

Beacon Technology: Beacons are small, low-power devices that use Bluetooth technology to transmit signals to nearby smartphones. They can be strategically placed in stores to send personalized offers, discounts, or product information to customers' devices when they are in proximity. This targeted messaging can stimulate impulse purchases.

Mobile Apps and E-commerce Platforms: These apps can track consumers' browsing and purchase histories, analyze their preferences, and provide personalized recommendations. Push notifications and targeted ads delivered through these apps can influence impulse buying behavior.

Smart Shopping Carts: IoT-enabled shopping carts equipped with touch screens or mobile devices can provide shoppers with real-time product information, location-based offers, and personalized recommendations. These features can trigger impulse purchases by offering convenient and relevant suggestions while customers are in the shopping mindset.

Voice-Activated Assistants: Smart speakers and voice-activated assistants like Amazon Echo (Alexa) or Google Home (Google Assistant) have IoT capabilities and can be used for voice-based shopping. Customers can make quick purchases by simply voicing their requests, making it easier to succumb to impulse buying.

Wearable Devices: IoT-enabled wearable devices, such as smart watches or fitness trackers, can integrate with retail applications to provide personalized offers and notifications directly to consumers' wrists. These devices can leverage data on location, activity, and preferences to deliver timely offers, encouraging impulse purchases.

IoT-enabled Payment Solutions: Contactless payment systems, such as near field communication (NFC) or mobile wallet technologies, can be integrated with IoT devices. This integration allows for seamless and convenient payments, reducing barriers to impulse purchases.

Data Analytics Platforms: IoT-generated data can be collected, analyzed, and processed using data analytics platforms. These platforms help retailers gain insights into consumer behavior, including impulse buying patterns. By understanding customer preferences, retailers can optimize marketing strategies and tailor offers to encourage impulse purchases.

Customer Relationship Management (CRM) Systems: CRM systems enable businesses to manage and analyze customer interactions and behaviors. They can help track customer preferences and buying patterns, including impulse purchases influenced by IoT. Popular CRM tools include Salesforce, HubSpot, and Zoho CRM.

Social Media Monitoring Tools: Social media platforms play a crucial role in influencing consumer behavior. Monitoring tools like Hootsuite, Sprout Social, and Brand watch can help analyze social media conversations and sentiment related to IoT products and their impact on impulse buying.

Consumer Surveys and Feedback Tools: Conducting surveys and gathering direct feedback from consumers is an effective way to understand their buying behavior. Tools like Survey Monkey, Typeform, and Google Forms allow businesses to create and distribute surveys to collect data on IoT-related impulse buying behaviors.

Heatmap and Eye-Tracking Tools: Heatmap and eye-tracking technologies help visualize and analyze consumer attention and behavior patterns. These tools can provide insights into how consumers interact with IoT devices and how it affects their impulse buying behavior. Examples of such tools include Tobii Pro, Crazy Egg, and Hotjar.

A/B Testing Platforms: A/B testing allows businesses to compare the impact of different IoT implementations or strategies on consumer behavior. Platforms like Optimizely, VWO, and Google Optimize enable businesses to create experiments and measure the effects of IoT features on impulse buying.

Retail Analytics Solutions: Retail analytics tools, such as those provided by RetailNext, ShopperTrak, and Euclid Analytics, use IoT technologies to track customer movements, behavior, and shopping patterns in physical retail environments. These insights can help understand the impact of IoT on impulse buying in brick-and-mortar stores.

It's important to note that while these tools and products can help analyze consumer behavior influenced by IoT, the specific focus on impulse buying behavior may require customization and integration with other data sources to draw accurate conclusions.

Factors Influencing IoT-Driven Impulse Buying

Several factors contribute to the impact of IoT on impulse buying behavior.

Firstly, it comprises seven variables of consumer involvement and decision making through IoT application in retail enterprises. It well explains the motive of consumers behind using IoT services in the purchase of the product. Secondly Ease of use is one of the most critical factors which directly and positively impact the consumer to make impulse purchase process in retail outlets as well as online businesses. Ease in terms of payment, searching products, comparing products, fast billing processes followed by better assistance in the retail food outlets were responsible for purchasing products convenient and straightforward for the end-users. Third factor extracted is labeled as Best Deals and comprises of four variables of consumer involvement and decision making through IoT application in it. This factor indicates that the consumers intend to buy those products which they see as value for money and reduce. their expense on purchasing them. Fifth factor is availability and information, consumer always looks for product varieties and the latest arrivals before buying from retail enterprises. IoT is successful in assisting the consumers in these parameters and also provides them the complete product information for making the buying an effective one. Nowadays, consumers want a single platform or outlet which can cater their needs and IoT implemented retail food enterprises are very much successful in addressing this need

Chandrasekhar *et al.,*
Future Directions

As IoT is moving forward to evolve, it is important to explore its potential impact on impulse buying behavior further. Future research should focus on understanding the long-term effects of IoT on consumer decision-making processes and the psychological mechanisms behind impulsive buying tendencies. Additionally, investigating effective strategies to mitigate the negative consequences of impulsive purchases facilitated by IoT is crucial for both consumers and businesses.

LITERATURE REVIEW

Van Dolen and Verhagen (2011), Given that consumers cannot touch and try on items online, this research's findings suggest that impulsive purchases of things for which touch is key, like apparel, are more common in physical stores than online.

According to Krishna (2012), customers may anticipate that physical stores would be perceived as more impulsive than online channels if they are clever enough to turn on the awareness factor more constructively than the internet.

Kotler and Keller (2016) described promotion as the activity of businesses to attain their advertising and marketing intention using sales promotion, marketing (advertising), sales force, public correspondence and direct marketing.

Eurostat, (2017) mentioned in the study that, one may assert that online buying behavior is rational, as the it gives the shopper the flexibility to look for information to compare prior to the final decision. No matter how, rational choices are the last resort considering impulsive buying has the capacity considering the significance of impulse buying for the revenue generation process, it would seem valuable to examine this fact in the online medium of propagation.

Ali and Sudan (2018) clarify that collectivism and long-term inclination is associated with empirical buying unpredictability avoidance and elements like masculinity; power distance having a correspondence with intuitive impulse buying in the study on the cultural impact on an impulse purchase in India.

Abdelsalam et al. (2020), called attention to the idea that impulse buying materialize only after the exposure to a provocation to make an impromptu decision to get something unexpectedly. Talking about online shopping, absence of restrictions encourages impulsive purchases

Vannisa et al. (2020),outlined the three elements viz. perceived perishability, perceived scarcity and perceived low price notably influence the impulsive pattern of buying

Nghia et al. (2021),asserted that consumers upon seeing a product, generates an urge to think that they might need it, which is an instance of suggestive purchasing. This approach comprises a sequence of communication and synergy between people without giving out sentimental comeback.

(Lavuri, 2021), shoppers adore pleasant ambience for shopping which allows them to take up extra hours to shop making impulsive purchases.

FINDINGS

The Internet of Things (IoT) has been influencing consumer behavior for over a decade. While there is no comprehensive review of the impact of IoT on impulse buying behavior, there have been several studies and reports that provide insights into the topic. Here are some key findings from research conducted over the past decade:

IoT propagates personalized recommendations as IoT devices collect a wealth of data about consumers' preferences, behaviors, and purchase history. By leveraging this data, businesses can provide personalized product recommendations in real-time, which can increase the likelihood of impulse purchases. It encircles Proximity Marketing sighting that IoT-enabled devices can deliver targeted promotions and advertisements based on the location of the consumer. For instance, beacons in retail stores can send notifications about special offers to customers' smartphones when they are in close proximity to specific products, enticing them to make impulse purchases.

It comes with Voice-Activated Assistant as IoT devices like smart speakers with voice-activated assistants, such as Amazon Alexa or Google Assistant, enabling consumers to make purchases through voice commands. Works mainly targeting Subscription Services IoT-enabled subscription services, such as connected home devices or smart home security systems, can create a recurring revenue stream for businesses.

It promotes Contextual Commerce as IoT devices embedded in everyday objects, such as wearables or smart appliances, enable consumers to make purchases directly from those devices. For instance, ordering groceries through a smart refrigerator or purchasing products through wearable devices can facilitate impulse buying. IoT devices often have social media integration, allowing consumers to share their experiences and purchases in real-time. The influence of social media on impulse buying behavior is well-documented, and IoT devices amplify this influence by enabling instant sharing and social validation of purchases.

It ensures Behavioral Tracking and Gamification for which IoT devices can track user behavior and incentivize impulse purchases through gamification techniques. This convenience can lead to impulse buying behavior as consumers can make purchases more easily and quickly. According to a 2019 survey by PYMNTS, 45% of consumers who own a voice-activated device have made a purchase using it. It provides personalization for which IoT devices can collect and analyze data on consumer behavior and preferences. According to a 2019 report by Capgemini Research Institute, 70% of consumers are willing to share their personal data with companies in exchange for personalized experiences. Influence of Smart Advertising is there as IoT devices can display targeted advertising based on consumer behavior and preferences. A 2016 study by eMarketer found that 56% of consumers who own smart home devices are interested in receiving ads on their devices, indicating the potential influence of smart advertising.

Social Proof is there as IoT devices can also display reviews and ratings of products, providing social proof to consumers. According to a 2018 survey by Bright Local, 86% of consumers read reviews for local businesses before

making a purchase. Budget Monitoring is enabled by IoT devices as these can also be used to monitor and manage budgets, which can reduce impulse buying behavior. By setting spending limits and tracking expenses, consumers can become more conscious of their spending habits and make more informed purchase decisions. A 2017 survey by Accenture found that 52% of consumers use IoT devices to manage their budgets.

Overall, the impact of IoT on impulse buying behavior is complex and multifaceted. While these trends suggest a potential impact of IoT on impulse buying behavior, it is important to note that consumer behavior is complex and can vary based on individual preferences and contexts. The role of IoT in impulse buying behavior is likely to continue evolving as technology advances and consumer behavior patterns change.

CONCLUSION

The interconnectedness of IoT devices and the wealth of data they generate have significantly influenced consumers' purchasing decisions, creating new opportunities and challenges for businesses. The impact of the Internet of Things (IoT) on impulse buying behavior of customers over the past decade has been noteworthy. One of the key ways IoT has influenced impulse buying behavior is through the rise of smart devices. Smartphones, smart watches, and other connected devices have become an integral part of our daily lives. These devices provide uninterrupted access to the internet, allowing consumers to browse and purchase products at any time and from anywhere. This eased the emergence of smart homes and connected appliances. These devices are powered with sensors that can monitor product usage and send notifications or automatically reorder items when supplies run low. This real-time monitoring and automated purchasing have created an environment conducive to impulse buying. Consumers no longer need to consciously plan or make a trip to the store; instead, they can make purchases on the spot based on instant notifications or recommendations from their connected devices. With the vast amount of data collected from IoT devices, companies can gain insights into consumer behavior, preferences, and purchasing patterns. This data allows them to target individuals with tailored advertisements and promotions, increasing the likelihood of impulse buying. Personalized recommendations and targeted advertisements based on IoT-generated data can create a sense of urgency or desire in consumers, prompting them to make impulsive purchases.

However, it is important to note that while IoT has undoubtedly impacted impulse buying behavior, its influence is not solely negative. IoT also provides benefits such as enhanced convenience, improved product availability, and personalized experiences for consumers. It offers the potential for greater efficiency in managing and tracking purchases, reducing waste and improving overall consumer satisfaction. The past decade has seen a significant impact of IoT on impulse buying behavior. The accessibility, convenience, and personalized experiences enabled by IoT devices have contributed to an increase in impulsive purchases. As technology continues to advance, it will be essential for individuals, businesses, and policymakers to adapt and navigate the evolving landscape of IoT and its effects on consumer behavior. IoT has increased the availability of online shopping channels, such as mobile apps and smart speakers, which has led to an increase in impulse buying behavior. The use of IoT devices, such as smart refrigerators and smart shelves, has also been shown to increase impulse buying behavior. It can also lead to overspending and regretful purchases. The constant availability of product information and promotions can lead customers to make hasty purchasing decisions without fully considering the consequences.

Overall, the knock of IoT on impulse buying behavior is complex, with both positive and negative consequences. While IoT has made shopping more convenient and personalized, it has also led to an increase in impulsive purchases and overspending. As IoT technology resumes to evolve, it will be foremost for retailers and marketers to consider the potential impact on customer behavior and come about with strategies to mitigate any negative effects.

ABSTRACT

Environmental factors are key for certain activities in plant and this study specific to deals with mucilaginous substances that are achromic, inodorous and non-poisonous. In this present study mucilaginous substance comparatively collected from cladode of Xerophytic plant *Opuntia dillenii* and leaves of Hydrophytic plant *Eichhornia crassipes*. They are involved in phytochemical screening respectively possess alkaloids, phenols, tannins, flavonoids, saponins, coumarins, quinone, anthraquinone, gum, and mucilage as well as *Eichhornia crassipes* are rich inalkaloids, phenols, tannins, flavonoids, terpenoids carbohydrates, coumarins and quinone. The above phytochemicals may be responsible for anti-diabetic, anti-cancer, antipyretic, anti-inflammatory and anti-viral. The mucilage substances are tested against different microbes and this study proves *Eichhornia crassipes* antimicrobial activity better compared to *Opuntia dillenii*.

Keywords: Xerophytic, *Opuntia dillenii*, Hydrophytic, *Eichhornia crassipes*, Phytochemical and antimicrobial activity.

INTRODUCTION

Nature has numerous wonders by experimentally we might know some specialized features. Environmental factors determine several factors such as temperature, salinity, etc., and these activities play a vital role in non-living things as well as living creatures. A medicinal herb is considered to be a chemical factory as it contains a multitude of chemical compounds like alkaloids, glycosides, saponins, resins, oleoresins, sesquiterpenes, lactones, and oils. Providing modern healthcare to rural people in India is a still far-reaching goal due to economic constraints (Grover *et al.*, 2002). The WHO has recently defined traditional medicine as comprising therapeutic practices that have been in existence, often hundreds of years, before the development and spread of modern medicine are in use still today. Traditional medicine is a synthesis of therapeutic uses learned from the experience of several generations through practicing physicians on indigenous systems of medicine. All plant parts synthesize a few chemicals responsible for their physiological activities. These phytochemicals were used to cure diseases through herbal and homeopathic medicinal systems (Fabricant and Farnsworth, 2001). Hence the present study focuses on the specific environmental factor of mucilage on xerophyte *Opuntia dillenii* and the hydrophyte *Eichhornia crassipes* phytochemical screening and its antimicrobial activity against some microbial strains were analyzed.

MATERIALS AND METHODS

COLLECTION OF PLANT MATERIALS
The Xerophytes *Opuntia dillenii* and the hydrophyte *Eichhornia crassipes* were collected from Uthukuli, Tiruppur District. Plant species were identified with the help of "The Flora of Presidency of Madras".

PREPARATION OF EXTRACTS
Opuntia dillenii cladode and *Eichhornia crassipes* leaf material were washed with tap water and rinsed with double distilled water. Then weighed 500 mg of both fresh cladode and leaf material were macerated in a mortar and pestle with 10 ml of distilled water. Later the mixture was filtered through what man filter paper No.1. The filtered substances were used for phytochemical analysis and antimicrobial activity.

QUALITATIVE PHYTOCHEMICAL SCREENING
The mucilaginous substances of *Opuntia dillenii* cladode and leaves of *Eichhornia crassipes* was used to analyze the presence of phytoconstituents namely carbohydrates (Fehling's test**)**, proteins and amino acids(Ninhydrin test), alkaloids (Wagner's test), flavonoids(Ammonium hydroxide test**)**, tannins(Ferric Chloride test), phenols(Lead Acetate), steroids and terpenoids (Salkowsky's test) coumarins, saponins (Foam test), anthraquinones, glycosides (Borntrager's test), fixed oils, gum and mucilage (Harborne, 1973 & Kokate *et al.*, 2004).

ANTIMICROBIAL ACTIVITY
The pure microbial culture of bacteria was chosen as gram-positive strain *Staphylococcus aureus*, gram-negative strain *Escherichia coli* and pure fungal cultures such as *Aspergillus niger* and *Alternaria alternata*.

PROCEDURE
The antimicrobial activity of fresh mucilage of *Opuntia dillenii* and fresh *Eichhornia crassipes* was tested against *Staphylococcus aureus, Escherichia coli, Aspergillus niger* and *Alternaria alternata*. Eight Sterilized Petri plates were filled with 15-20 ml of Muller-Hilton agar media and solidified (SharavanaKumaar, 2013). The inoculums were prepared from microbial culture and sterilized. They are transferred to the Petri plates through the inoculum needle. A well was made in each of the culture plates and filled with 1 µl of 10µg / ml f B-Gentamicin as a positive control for bacteria and F - Nystatin as a positive control for fungi. About 100ml of plant extract was added to the wells. Plates were incubated in the air at 37°C for 2 hours. Antimicrobial activities were evaluated by measuring inhibition of zone diameters.

RESULTS AND DISCUSSION

The objective of the present study was to explore the medicinally important plant species like *Opuntia dillenii* and *Eichhornia crassipes* were screening for secondary metabolites and antimicrobial activity against bacteria like *Escherichia coli* and *Staphylococcus aureus*, against fungi like *Aspergillus niger* and *Alternaria alternata.*

PHYTOCHEMICAL ANALYSIS
The phytochemical screening of mucilaginous extract from the cladode of the xerophyte *Opuntia dilelnii* and the leaf of the hydrophyte *Eichhornia crassipes* revealed the secondary metabolites present in (Table- 1). The fresh mucilaginous extract of *Opuntia dilelnii* is rich in alkaloids, phenols, tannins, flavonoids, saponins, coumarins, quinone, anthraquinone, gum, and mucilage. The fresh leaves extract of *Eichhornia crassipes* is rich in alkaloids, phenols, tannins, flavonoids, terpenoids carbohydrates, coumarins, and quinone. In both plants remaining phytoconstituents are absent.

ANTI-MICROBIAL ACTIVITY
In *Opuntia dillenii* and *Eichhornia crassipes* were tested against the bacteria like *Staphylococcus aureus* and *Escherichia coli*. It exhibits an inhibitory zone against these organisms and the results are shown in Table 2 (Plate1- A-D). Again, the mucilaginous extract of *Opuntia dillenii* and *Eichhornia crassipes* was tested against fungal organisms like *Aspergillus niger* and *Alternaria alternata.* The results were shown in Table 3 (Plate1-E- H). When compared to the antimicrobial activity of mucilage substances of cladode *Opuntia dillenii* shown better results in the mucilaginous substance of leaf *Eichhornia crassipes.* Both antifungal and antibacterial activities revealed a good inhibitory zone against the chosen microorganism like *Staphylococcus aureus*, *Escherichia coli*, *Aspergillus niger* and *Alternaria alternata.*

Similarly, medicinal plants are used for the formation of drugs, and these plants are used traditionally to cure various diseases. These medicinal plants contain some phytochemical active compounds such as flavonoids, alkaloids, tannins, phenols, etc., which show antimicrobial activity against pathogens (Mahavir Joshi and Sandeep Kaur 2013). Medicinal plants are those plants that contain substances that possess some therapeutic and antimicrobial agent that can be used for the treatment of different diseases caused by microbial infections (Muhammad Aurang Zeb *et.al.* 2015).

CONCLUSION

The *Opuntia dillenii* and *Eichhornia crassipes* mucilage revealed it contains various phytoconstituents. This mucilaginous extract of both plants was tested for antimicrobial activity against the test organism. The observations of this present study justify the mucilaginous substance of the above said two plants have various phytochemicals, so it encourages us to continue the more potential antimicrobial to identify the therapeutic active principles of these plants.

ABSTRACT

Nowadays, Switched Reluctance Motor drives have been widely used in special applications like hybrid electric vehicle propulsion because of its merits like simple structure, less cost, winding-less rotor, ruggedness, high torque to mass ratio, reliability and high speed of operation. The switched reluctance motor consists of a salient pole rotor with concentrated coil which has no conductors and magnets. On the other hand, the application of Switched Reluctance Motor is limited because of its large torque ripple which will produce vibration and noise in the motor. In order to overcome these issues many torque control techniques have been used. In this study, direct torque control method and hysteresis current control method are used with the combination of renewable energy like solar and wind. From the simulation results, hysteresis current control method is better when compared to Direct Torque Control. Simulations are conducted in Matlab/Simulink environment to elucidate the control techniques.

Keywords: Switched Reluctance Motor, Hybrid Electric Vehicle, Renewable Energy, Direct Torque Control, Hysteresis Current Control

INTRODUCTION

For the past 150 years, it has been well known for the operation of a SR Motor; and it was only recently develops in the field of power electronics drive with possible adjustable speed. Because of the increased need for drives with variable speed and the introduction of semiconductor elements, the typical resistance machine, also known as the Synchronous Reluctance Machine, has come into play. The term "Switched Reluctance" refers to two major machine

design characteristics: (a) switched and (b) reluctance [1]. Because this equipment may be used in a continuous switching mode, the term switched is used. Second, the term reluctance enters into the picture since, in this case the stator and the rotor has a doubly salient structure or it formed as variable reluctance magnetic circuits [2]. Both the parts of stator and the rotor of an SRM must have visible poles. The stator poles each have a basic focused winding, whereas the rotor has neither a permanent magnet or nor a winding. It's made of laminated steel and a soft magnetic material [3]. Basically, two diametrically opposing windings are linked to enhance the phases of the motor. During rotation of the motor, unidirectional current flow to each of the motor phase can be achieved by the single controlled switch. The stator phase winding must be activated for forward motoring mode, if the inductance of the phase should be positive. Or else, the machine will remains only create breaking torque, if any [4].

The SRM drive is gaining popularity because of its low reliability and simple design, the switching reluctance motor is receiving greater attention. Due to these characteristics, SR motors excel similar adjustable speed motors [5]. However, because to the dual-phase structure and commutation from one phase to the next, torque ripple for this sort of motor has become a significant issue, particularly at low speeds, limiting the SRM's applicability as a servo drive. Torque ripple also causes acoustic noise and vibrations which affects the motor's efficiency [6,7]. The primary distinction between synchronized and alternators machines is that if the stimulation of a synchronous machine breaks, it acts like a switched reluctance device. As a result, the functioning of a synchronous reluctance machine is merely dependent on the fact that both the stator and rotor poles must be the same [8]. The fundamental distinction of the SRM drive is that it will continue to revolve even if the poles of the stator and rotor are mismatched. The major types of SRM are to test if they can reflect both capacitance profiles and flux linkage properties. The next step is to design a machine that can execute across a large speed range, particularly in all four corners of the torque-speed graph [9]. We can also get great results with incredibly efficient SRM drives by using some of the other optimisation controls. The third goal of this project is to increase quality metrics such as dependability and precision [10].

Objectives
The main objective of this proposed work is:
- To develop a mathematical model of the switching reluctance motor and examine its operating theory.
- To plan the various stages of SRM that to be aware of any major changes that must be occur in the several stages of SRM.
- To analysis the characteristic and examine the changes when angle adjustment occur during turn-on and turn-off.
- Examine how the reference speed tracks the real speed with a PID controller.
- Utilize a control approach called as Hysteresis Current Control to eliminate torque ripple in the case of SRM.

Switched Reluctance Motor Drive Dynamical Modelling
After ignoring the impedance matching between the phases, the schematic diagram for the SRM is given below [11]. The rate at which of flux and the sum of the refractory voltage drop with regard to time are used to calculate the supply voltage to a phase.

$$V = R_s\, i + \frac{d\varphi\,(\theta, i)}{dt} \qquad (1)$$

Where 'R$_s$' denotes as resistance per phase and "φ" denoted as flux linkage per phase.

$$\varphi = L(\theta, i)i \qquad (2)$$

In this equation, 'L' indicates inductance, which varies with primary current and rotor rotation. The following is the phase voltage formula:

$$V = R_s\, i + \frac{d\{L(\theta,i)i\}}{dt} = R_s\, i + L(\theta, i)\frac{di}{dt} + i\frac{d\theta}{dt}\cdot\frac{dL(\theta,i)}{d\theta} \qquad (3)$$
$$= R_s\, i + L(\theta, i)\frac{di}{dt} + \frac{dL(\theta,i)}{d\theta}\omega_m i$$

65841

The induction potential difference, the resistance voltage drop, as well as the electrical potential are shown by the three factors of this equation's right side, and the result is equal to the power equation for a tournament motor drive.

This is how the induced emf "e" is determined:

$$e = \frac{dL(\theta,i)}{d\theta}\omega_m i = k_b\,\omega_m i \qquad . \qquad (4)$$

If Kb is the emf constant of a dc series driven device and is defined as

$$k_b = \frac{dL(\theta,i)}{d\theta} \qquad (5)$$

Going to substitute the value of current flowing in the provided voltage equation and multiplying it by current produces simultaneous i/p power, which is given by,

$$P_i = V\,i = R_s i^2 + i^2\frac{dL(\theta,i)}{dt}\omega_m i + L(\theta,i)i\frac{di}{dt} \qquad (6)$$

As a result, the analogous circuit diagram for single phase SRM is as follows:
The above given equation must be expressed using known variables in order to yield significant conclusion.

$$\frac{d}{dt}\left(\frac{1}{2}L(\theta,i)i^2\right) = L(\theta,i)i\frac{di}{dt} + \frac{1}{2}i^2\frac{dL(\theta,i)}{dt} \qquad (7)$$

Substituting the above equation into (2.6) then we will get,

$$P_i = R_s i^2 + \frac{d}{dt}\left(\frac{1}{2}L(\theta,i)i^2\right) + \frac{1}{2}i^2\frac{dL(\theta,i)}{dt} \qquad (8)$$

Where, the rate of change of field energy i.e., $i^2\frac{d}{dt}\left(\frac{1}{2}L(\theta,i)i^2\right)$, '$P_i$' is the current generation which is defined as the sum of the copper losses given as R_s and air gap power 'Pa' i.e. represented as $\frac{1}{2}i^2\frac{dL(\theta,i)}{dt}$.

$$t = \frac{\theta}{\omega_m} \qquad (9)$$

Time can alternatively be represented by rotor position and speed, as seen below.

$$P_a = \frac{1}{2}i^2\frac{dL(\theta,i)}{dt} = \frac{1}{2}i^2\frac{dL(\theta,i)}{d\theta}\cdot\frac{d\theta}{dt} = \frac{1}{2}i^2\frac{dL(\theta,i)}{d\theta}\omega_m \qquad (10)$$

As illustrated in, the air gap power can also be written as the combination of load torque and rotor speed.

$$P_a = \omega_m T_e \qquad (11)$$

By equating the above two equation we will get,

$$T_e = \frac{1}{2}i^2\frac{dL(\theta,i)}{d\theta} \qquad (12)$$

The emf is completely independent of current trajectory as a result of the previous equation, and Te is solely directly related to i2. The corresponding circuit and formula for calculating the motor's input power and torque to the shifting resistance motor in both static and dynamic states are now finished [13].

Block Diagram Representation of the Proposed System

This is a suggested block diagram of the Battery Driven Variable Reluctance Motor that will power the Electric Drivetrains. In this case, the Hysteresis Current Controller is primarily utilized to control and reduce the torque ripple in SRM. This hysteresis control process includes turning on the converter's switching only when the phase present is less than the smaller band limit, and it shuts them off once the current reaches the upper limit. This limit is determined based on the SRM power converter's control strategy and switching frequency. The real speed will correspond to the reference speed. As a result, the machine will never be out of sync. We employ a PID controller instead of a speed controller, and its output is the error signal. This, along with the selector, will be given to the standard grid current, which will be matched to the actual current signal to provide the error message source, which will be utilised as the pulse width to the converter.

Hysteresis Current Control Method

The reluctance concept, where each phase operates individually and consecutively, determines the torque produced by a switched reluctance motor. The equation for the phase torque is provided by, due to the nonlinear features of the magnetic circuit [14].

$$T(\theta, i) = i \, \frac{\partial \varphi(\theta, i)}{\partial \theta} \tag{13}$$

Where 'θ 'is the angular position of the rotor and I is the phase current. As either a result of the above equation, the phase torque 'T (θ,i)' is exactly proportionate to $\frac{\partial \varphi(\theta,i)}{\partial \theta}$. Positive torque is generated when the difference in stator flux magnitude is larger than the difference in phase angle, while negative torque is generated when the difference in stator flux magnitude is smaller than the difference in rotor position [15].

Hysteresis/chopping current control is a method of controlling phase currents using SRM to maintain them inside a specified band around a reference value. This approach is advantageous for SRM operation over a broad range of speeds because the required current can be obtained fast. Whenever the phase current is below a lower band limitation, the converter switches turn on, while when the current exceeds an upper band restriction, the converter switches turn off. Lower and upper limits can be set based on control strategy requirements and power converter switching frequency [16]. The hysteresis control, as shown in Fig. 3 a, 3 b, can be used in two different modes: both moderate and vigorous chopping. Both mild and severe cutting modes are supported by the asymmetrical bridge converter. Figure 3c depicts an asymmetrical converter with two switches per cycle as well as a hysteresis band. It achieves full control by cutting either violently and softly.

To minimize residual current, a closed-loop control of one of's short methods, aggressive or mild, is used. In moderate chopping state, the phase voltage in 3 and is changed between (zero) and (+U) values, as shown in Fig 3. During the phase conduction time, the bottom switch T2 is left on, whilst the top switch T1 is chopped in accordance with the signal generator for phase of inductor L1 [18]. It not only enables for current management but also for the reduction of ripple current. It also creates electromagnetic interference and less acoustic noise. As a result, gentle switching is frequently favored for motor operation [19,20]. In strong cutting mode, as seen in Fig. In 3 b, the phase voltage is switched among (-U) and (+U) values. Both switches T1 and T2 were switched on for L1 phase inductance throughout the conduction time. Whenever switches T1 and T2 were turned on, (+U) voltage is delivered to the conduction phases well before phase current goes to zero. It has a large current ripple value. It can be used to slow down the procedure [21].

SIMULATION RESULTS

The following table lists the many properties of a 3-phase switching reluctance motor.

Figure 4 depicts the output of the converter, which serves as the voltage applied for the three-phase switching reluctance drive system. It is showing that 1200 volts are separated in the three phase voltages are separated

Jegadeeswari and Lakshmi

Therefore magnetic flux connections in steady state are depicted in Fig. 5(b). The maximum flux is kept constant at 0.21 Weber in each phase. Because flux linkage and currents are proportional, the flux linkage will fluctuate along with the current. The initial current is relatively large due to inrush current, but it eventually drops to 10 to 20 amperes. The reference speed for the motor is set at 800rpm. The steady state speed of the SRM obtained is 807 rpm is shown in Fig. 5 (c). The torque is held inside the hysteresis band of 0.29 Nm but since hysteresis setting band value of 0.20 Nm whenever the hysteresis current control approach is being used, as illustrated in Fig. 5. (d). The SRM's torque ripple is set at 8.9%. Torque is precisely related to the square of the current in this case; therefore, torque is irrespective of current direction rather reliant on dL/d. The torque might be either positive or negative. There are a number of distortions and noise in this torque.

The constant current of the rotor in the direct torque control approach is shown in Figure 6 (a). Whenever the Hysteresis Current Control Technique is used, the maximum current for each phase is 10.8A, which would be greater than the maximal current lost for each period. The stator flow vector in steady state is shown in Figure 6 (b). So, the maximum flux is 0.28 Wb, which is kept constant at the reference value. Figure 6 depicts the total torque created by the SRM utilising DTC (c). The torque ripple in the SRM with DTC is 55.5%. The torque ripple is clearly high with the direct torque control approach. The connection between inductance as well as speed throughout this case is that whenever the real speed matches the reference speed, the inductance stays unchanged. Inductance fluctuates at first when tracking; however, inductance settles down and remains constant. Figure 7represents the converter's output, which serves as the voltage applied to the three-phase shifting resistance drive system. It demonstrates that 1200 volts are divided in the 3 phase energies.

A 3-phase, 5 HP, 400V changing resistance motor controls torque. The machine specifications are listed in Table 1. The beginning torque in the model was 30 N-m, the reference flux was 1.0 Wb, and the reference speed was 105 rad/sec, or 1000 rpm. PID controllers were required to monitor the speed limit. In figure 8the converter's output voltage is shown, which serves as the input voltage for the three-phase shifting resistance drive system. It demonstrates that 1200 volts are divided in the three phase energies. Torque is exactly proportional to the square of the current in this case; hence torque is independent of current direction but dependent on dL/d. The torque is positive if it is positive; otherwise, it is negative. The load torque is also used in this circumstance. A -20 N-m affirmative power density was supplied at 1.5 sec and released at 1.7 sec, while a -30 N-m negative maximum torque was supplied at 1 sec and released at 1.3 sec. Between 1.3 and 1.5 seconds, the lift force is approximately 0 N-m. Vibration and sound are significantly decreased by using this controlled hysteresis current approach

In the figure 10, it shows that, the reference speed is tracked by the actual more quickly, around 0.2 sec. In this instance, the PID controller is used to verify that the real speed matches the reference speed. Because a 30 N.m load torque remained applied between the time 1 sec and 1.3 sec, so that the real speed deviates somewhat from the reference speed at the beginning of 1 sec however subsequently recovers to the reference speed. The MATLAB/SIMULINK environment and the hysteresis current control technique may be used to construct simulation models of speed control of switching reluctance motors. Two separate torque and flux hysteresis controllers are used especially to regulate the limitations in torque and flux. With the help of reference speed and by varying the load torque, the simulation results were achieved.

CONCLUSION

SRM are quite nonlinear with respect to the magnetic characteristics because of its structure of doubly salient, and flux linkage is also a nonlinear function with respect to stator current and rotor position. Switching reluctance motors are relatively simple in design when compared to other ac or dc motors. The switching frequency increases as the switching 'on' period decreases, and the motor speed increases as the switching frequency decreases. This switching reluctance motor performs admirably even at greater speeds. This system is smaller, less costly, resistant to temperature change and vibration, and less maintenance is required.

The torque is produced when the inductance is changed. Torque generated is 0 for constant inductance (unaligned position). To obtain positive torque, provide voltage during the + dL/d zone, and to obtain negative torque, apply voltage during the - dL/d region. As a result, accurate switching is necessary. Exact switching angles may be calculated via simulation. Under fluctuating load circumstances, the PID controller is utilized to track the reference speed. The torque produced by the switching reluctance motor, however, contains a large amount of noise that must be regulated in this system. In a switching reluctance motor, we may reduce torque ripple by applying hysteresis current control. Using hysteresis current control, we may directly changes the output of the torque for a switching reluctance motor within a hysteresis band. The flux and torque outputs may be readily adjusted within a hysteresis range by varying the output of the space vector.

ABSTRACT

The study is done to understand the role and challenges of human resource analytics with the perception of HR professionals of selected IT organizations and its implications on HRM which is shifting from traditional to human resource analytics (HRA) world. The open-ended questionnaires and interviews were adopted for data collection with a sample size of 38 HR professionals over a time of three months. The questionnaires cover demographic and customized questions related to the role of HR professionals and the challenges faced by adopting human resource analytics. As a result, it is noticed that HRA has much more impact on human resource management in IT organizations and yields better results.

Keywords: Demographic, human resource analytics, human resource management, perception

INTRODUCTION

Business analytics is an interdisciplinary, data-driven approach that takes input from data management, statistics, quantitative, explanatory, and predictive models (Soltanpoor & Sellis, 2016). To communicate this effectively business analytics make better utilization from various fields i.e. data science, machine learning, deep learning, and operational research (Mortenson, Doherty, & Robinson, 2015). As analytics is set into three categories such as descriptive, predictive, and prescriptive analytics, and initiated into departments in the organizations for better results and accurate decisions to increase profits.

65849

People are inevitable to any organization and required from low level to high level of management to manage the organization's processes. As the industrial revolution started, a huge number of requirements existed and organizations started hiring. As a result, generated a large amount of employee data. These data are required to improve employee efficiencies as well as organizational efficiencies. A human resource system was bought from classical to modern approaches to gather and maintain. Thus human resources accounting, audit, information systems, and HR analytics were coined for better results. It has been since twenty years the presence of Human Resource Analytics (HRA) in industries (Angrave et al., 2016) and accelerating the performance development of people s (Ellmer & Reichel, 2021). The HRA is absolutely a new innovation in the field of human resource management (HRM) (Marler& Boudreau, 2017). The HRA adds value tothe operations of the HR function and helps the organizations to stand in a better position (Angrave et al., 2016; Marler& Boudreau, 2017). HRA is adata-driven concept and aids in the decisions making through collecting both internal and external data on HR operations. At the same time, it has its own issues which lead to the late realization of the HRA adoption in the organizations. Another major concern is the lack of knowledge of HR professionals in implementing the HRA (Angrave et al., 2016;Huselid, 2018; Minbaeva, 2018).

LITERATURE REVIEW

Organizations consider human assets are very much important in the contribution of the organization's and economic growth along with the competitive advantage (Delery&Roumpi, 2017). Nowadays companies attract potential employees along with many retention benefits (AndrijevicMatovac et al., 2010).(Strassmann, 1985) has pointed to the data which is available in mass and can be stored, used for decision-making in organizations, and may lead to the positive development of the organizations. With mass data and with the help of analytics tools, the organization's decisions can be accurate and infer the sub-departments aspects in terms of organizational development (Angrave et al., 2016). The analytics tools act as supporting decision systems and assist in the potential growth of the human resource department (Milon, 2019).The HRA bridges the gap between the hiring and retaining process of the organization (Minbaeva, 2018). The integration of HRM and technology has shown drastic improvement in HRM processes and made it easy to work (Stone et al., 2015). Many organizations have not used analytics tools or in the initial stage of implementation (Rasmussen & Ulrich, 2015).

Hence HR analytics is a data-driven process, the results will be evidence-based, impact HR investments and add value to the performance (Hoque et al., 2020). Aral et al. (2012) describe that financial performance is linked with HR analytics through empirical studies and also linked with HRA case studies (Harris et al., 2011). HRM measures the efficiency of the human resource functions but it will not add any value to the overall business (Ramstad, 2007) and HR analytics combines with human resource functions, approaches and aid the HR team to make proper and appropriate decisions; which is benefits to the employees of the organization (Falletta and Combs, 2020). Manpower analytics usually faces a lot of barriers from the employees and also faces challenges to implement the analytics tools (Zeidan and Itani, 2020). HR analytics has proved good to the organization but the problem with the adoption level of HR analytics by the organizations (Manchanda and Gulati, 2018).

OBJECTIVES

* To understand the role of HR analytics in human resource management.
* To study the challenges of HR analytics used in human resource management.

Design
To conduct any type of research; a researcher requires a framework of research methods and procedures(Akhtar, 2016). This method will facilitate to collect and analyze the data required to obtain information. (Churchill, 2009). The qualitative approach was taken to the present study by following the interpretive approach. The qualitative approach clearly defines both descriptive and explanations of the whole processes within the local context of the

65850

research (Miles, M, 1994).The current study is done on the perception and feelings of each research respondent about human resource analytics through open-ended questionnaires and interviews.

Sampling

The non-probability convenience technique was taken to obtain the data from the respondents. A sample of 38 human resource professionals is taken for the study involving junior HR to Senior HR employees using HR analytics tools of selected 12 IT organizations.

Data collection adopted

The data was gathered from the questionnaires and interviews of human resource employees working in human resource departments. A series of questions were framed containing part A and part B questions. Where part A questions are related to the demographic variables of the respondents and part B comprises HR analytics questions, their usage, problems, and challenges faced by the human resource employees. The secondary data was collected using reputed journals, HRA textbooks, and articles published in business magazines.

Study period

The study was done over a period of three months through surveys using questionnaires and structured interviews of various IT organizations' HR professionals, followed by reviews and feedback.

DATA ANALYSIS

Demographic characteristics of the respondents

From the below table, Most of the respondents fall in the age group of 36-45 range and represent around 39.47% of the group. The next biggest group is aged between ranges of 25-35 and holds 31.58% of the total. The age between 46-55 and over 56 represents small representations. Male respondents represent 63.2% of the total respondents and the remaining female respondents constitute 36.8%. The highest number of respondents hold a master's degree at 57.89%, the next significant group is graduate at 36.84% and the small group represents5.26%of respondents.

Objective-1: Role of HR analytics in human resource management

The respondents sometimes (28.95%) use human resource analytics, followed by those respondents who use it often 23.68%. The least number of respondents use HRA rarely (13.16%). The respondents realized the importance of HRA required to the organizations as follows; sometimes (31.58%), always (18.42%), and about 18.42% respondents didn't any see importance in HRA to their organizations. Around 34.21 %of respondents admitted sometimes that HRA plays a vital role in the human resources management and other participants 23.68% always believe that analytics contributes to HRM. In relation to employee performance, sometimes (31.58%) boost its performance by the use of analytics and others feel often have positive impact as 28.95%.Most of the respondents (39.47%) say that HRA lead to increased organizational output which signifies a positive perception of HRA. As in case of HRA in performance management system, the respondents rarely as 31.58% have impact and 18.42% believe always impact. HRA has a great role in determine the training and development programs to the employees as 31.58% and along with 31.58% often reports effectiveness of training programs.

Objective-2: Challenges of HR analytics using in human resource management

The participants often (31.58%) and sometimes (31.58%) experience high employee attrition rates and a small amount of percentage 2.63% rarely and 7.89 % never accept that there is an increase in the attrition rate of the employees. Around 36.84% of respondents experience feeling issues while 5.26% reports sometimes and 26.32 % of respondents rarely experience this issue.From the study, a significant portion of respondents (34.21%) lacks data analytics experience and 26.32 % of participants report insufficient experience in analytic tools. Only 13.16% are knowledgeable in handling the HRA tools effectively. The respondents (31.58%) experience compliance and security issues and fear of security and privacy breach. The percentage of respondents (13.16%) rarely or never feel that there

65851

is no security issue. In relation to the management support parameter, respondents feel often (23.68%) and sometimes (23.68%) involve by management in considering the HRA adoption, and 21.5% each rarely and never support to HRA. Only 10.53 % of HR professionals felt that management extended the support in adopting the analytics tools. Some of the respondents 23.68 %accepted that using HRA tools get quality data through analysis of the human resource data. Others 21.05% (often), 34.21 % (sometimes), 15.79% (rarely) and 13.16 (never)opinions about the better data using analysis of the data. The HR professionals (39.47 %) were certain about the initiatives and decisions with the help of the HRA tools, sometimes 23.68 % of respondents also stressed on decisions can be taken using HRA and 15.79 % rarely and 13.16 % never agreed upon using HRA tools used in decisions and other initiatives towards HRA tools.

Hypothesis
H1: Significant role between the adoption of human resource analytics and human resource management.
H2: There is a challenge in using human resource analytics in human resource management

ANOVA ANALYSIS

Objective-1: Role of HR analytics in human resource management
The f-ratio value is 4.36148 and the p-value is .006726. The result is significant at $p < .05$. The F=4.36148 there is a larger variation between the groups and within the groups. It means human resource analytics plays a vibrant role in human resource management. As per the results obtained, the P-value (0.006726) is less than the P-value (0.05), which indicates there is a significant role by HR professionals between the adoption of human resource analytics and human resource management.

Objective-2: Challenges of HR analytics using in human resource management.
The calculated value of F- ratio is 3.19776 and the p-value is 0.02664 <0.05 concludes that the human resource analytics implementation is crucial and challenge in human resource management. Therefore it is important to understand the whole and sole of human resource management as well as human resource analytics as a tool.

RESULTS AND DISCUSSION

The study reveals the respondents opinions of adoption and challenges of human resource analytics and the paper summarized the following results. Human resource analytics have huge impact on HRM in the IT organizations as result obtained p-value of 0.006726<0.05. However HR professionals(P-value =0.02664) faced challenges in the implementation of HRA due to several reasons such as lack of expertise, fewer management support, and lack of basic infrastructure, privacy issues and so on. From the study, it is important to realize the vital role of HRA to HR professionals and create awareness among HR department respondents and train them continuously to expertise in managing the analytics tools. Another important aspect is involvement of management in supporting the implementation of HRA and should provide the efficient infrastructure assistance to the HR department to cope up with the challenges of HRA. Lastly, many literature reviews has stressed on HRA and must adopt in the IT organizations.

FURTHER SCOPE OF THE STUDY

The study considered a few parameters of the challenges and role of human resource analytics and its impact on human resource management. But left with many more parameters of HRA and also work can be extended by comparing between information and technology and manufacturing or between IT and pharmacy and other industries.

ABSTRACT

Flexible work arrangements (FWAs) have gained prominence as a contemporary approach to shaping work dynamics and fostering job satisfaction among employees. This study focuses on investigating the impact of flexible work arrangements (FWAs) on job satisfaction within selected Information Technology (IT) organizations in Bengaluru, India. As organizations evolve in response to dynamic changes, embracing FWAs has gained significance as a strategy to enhance employee satisfaction and work-life balance. This study employs a descriptive research methodology, utilizing questionnaires and interviews for data collection. A convenience sample of 88 respondents from IT organizations in Bengaluru is analyzed. The study employs statistical analysis, including Pearson correlation coefficient calculations, to establish a significant positive relationship between FWAs and job satisfaction. The findings reveal that employees who have access to flexible work arrangements report higher levels of job satisfaction The results suggest that when employees have control over their work schedules and locations, their satisfaction levels increase. Further study can be done on specific job roles or industries to understand how the impact of FWAs on job satisfaction varies across different professions.

Keywords: flexible work, information technology, interviews, job role, job satisfaction, work-life balance

Hemavathi and Frank Sunil Justus

INTRODUCTION

In the continuous and dynamic nature of change and development over time, organizations have identified the need to frame new standards based on the preferences of their employees. Flexible work arrangements have been among them in recent years. Organizations have been notified that by providing flexible work arrangements, employees can balance personal life and work. Employee satisfaction is considered one of the important tools to compete in the business world. The satisfied and engaged employee will be more committed and productive for the long term. Launel (2009) identified that executing workplace flexibility in the organization makes the employees observe that their job enrichment is upright with a high level of job satisfaction.

An organization that wants to create a positive work culture will create an appropriate strategy to create a productive culture. The present study aims at flexible work arrangements and their influence on employee satisfaction. Legesse (2020) found that flexi time & compressed work week increases job satisfaction. Saeed et al. (2014), State that job satisfaction of an employee in the organization is a good indicator of the performance of an employee. If employee satisfaction increases performance of an employee increase.

The different types of flexible work arrangements highlighted in this study are Flextime, Condensed work week, Telecommuting, Staggered hours. Flextime is a common and effective flexible work arrangement that can benefit both employees and employers, under a flextime policy, employees are given the flexibility to choose their starting and ending times within certain parameters set by the organization. This FWA option will foster a positive work environment and contribute to greater job satisfaction and productivity. A condensed workweek can be an attractive and flexible option for employees seeking a better work-life balance while contributing to increased productivity and job satisfaction. However, successful implementation requires careful consideration of individual preferences, job requirements, and effective communication within the organization. Telecommuting allows employees to work from a location outside the office environment, The telecommuting option has tremendously increased in recent years due to technological developments like the internet, video-conferencing, and other virtual mode to complete the work allotted and it is also useful in difficult situations like natural calamities, pandemic.

Staggered hours also known as staggered work schedules refer to a flexible work arrangement in which employees start and finish their workday at different times. Unlike traditional fixed schedules where all employees start and end work at the same time, staggered hours allow for more flexibility in setting individual work hours within certain parameters set by the organ. Work-life balance is the equilibrium between the responsibilities of work and the need for personal time, well-being, and family commitments. In today's fast world, where work often permeates into personal life through digital connectivity, achieving a healthy work-life balance has become more critical than ever. Maintaining a work-life balance is vital for numerous work reasons. Zaten (2007), found that to balance work life and family life flexible schedule will be the best option to execute in the organization. Firstly, it contributes significantly to individual well-being and mental health. Overburdening and ignoring personal life can lead to stress, anxiety, and diminished happiness. By setting boundaries and allocating time for relaxation and personal interests, individuals can recharge and maintain their physical and emotional health. Adam B. Butter (2009) found that Workplace flexibility will help in reducing stress levels and maintaining physical health.

Employee motivation denotes the drive, desire, and eagerness an individual has to accomplish their job-related goals. Motivated employees are highly engaged, committed, and productive. Organizations that prioritize employee motivation and job satisfaction generate a constructive work culture, leading to higher retention rates, increased efficiency, and overall triumph. Employers need to understand these factors and implement policies to adopt a motivated and satisfied workforce. Career progress and job satisfaction are two interconnected aspects of a person's professional life. Career progress refers to the advancement and growth a person experiences in their career, both in terms of responsibilities and positions. Job satisfaction, on the other hand, relates to the contentment, fulfillment, and overall positive feelings a person has towards their job. These two factors often go hand in hand. Saeed (2013) Says

that career progress is a continuous progression that enables an employee with a new set of skills and refines the present skills. When a person experiences career progress, they are more likely to feel satisfied with their job. Likewise, when someone is satisfied with their job, it can lead to increased motivation, better performance, and ultimately contribute to their career progress. From this study, we identified that Flexible work arrangements act as an interplay between career progress and motivation.

REVIEW OF LITERATURE

Ahmad (2013) analyzed that flexible working hours had a direct relationship with employee motivation. FWA helps the employee to concentrate on the education of children and family responsibilities. Glass (2002) states that employees can commit themselves to the job responsibilities since they can completely focus on family responsibilities with the help of FWA policy provided by the organization. Jones (2011) found that flexibility will enhance the work-life balance of employees, especially women employees and it will lead to high employee morale. Shagvaliyev (2014) says that flexibility will build trust between employer and employee and the organization can retain highly talented employees. Jain (2014) identified that an organization can provide job satisfaction and help to retain an employee for a longer period in the organization and also found that employees can reduce stress and maintain a work-life balance with the FWA.

Deshwal (2016) concluded that FWA is a policy patterned by organizations that is slightly different from the traditional method which enables the employee to have a balanced work-life and satisfaction Chandola (2019) found that employees can reduce stress levels by making use of reduced working hours and it also says that women employees can effectively balance the personal and professional load.Paje (2020) the study found that by implementing a compressed work week the productivity of employees is increased and despite this the requirement for flexible work arrangements is increasing day -by day. Agarwal (2018) concluded that the flexibility option helps women employees where a gradual increase in educated women will enable them to have a balance between employee and work.

OBJECTIVES OF THE STUDY
- To study the factors influencing flexible working arrangements on employee satisfaction levels at Information Technology organizations.
- To examine the effects of flexible working arrangements on employee satisfaction levels at Information Technology organizations.
- To offer suggestions to improve the flexible working arrangement if any.

METHODOLOGY

The research used here for the study is descriptive. The data were gathered from questionnaires and interviews to obtain the data and convenience sampling adopted and a sample size of 88 respondents from the selected IT organizations. The close-end questionnaires were prepared and distributed to 130 respondents and only 88 respondents' questionnaires due to their completeness.

LIMITATIONS
The sample size considered for the study is too small, and not all factors of flexible work arrangements are taken into account lastly study is limited to Bangalore region information technology organizations.

HYPOTHESIS
H1: There is a substantial relationship between flexible working arrangements and employee satisfaction levels.
Offering flexible working arrangements has become an essential factor in nurturing a satisfied and motivated workforce. As organizations recognize the benefits of work flexibility, they are more likely to attract, retain, and

empower their employees, creating a positive feedback loop of increased job satisfaction and enhanced organizational success. Frank (2003) says that to have a complete balance between work and family flexibility is required in the work schedule.

Job-Demands Resources (JD-R) Model
The JD-R model proposes that every job has specific demands and resources. Demands are aspects of the job that require physical or psychological effort, while resources are elements that help employees meet these demands effectively. Flexible working arrangements can be considered a resource, as they provide employees with the means to balance their work and personal lives more effectively. When employees have greater control over their work schedules and locations, they experience reduced job demands related to rigid schedules and commuting stress, leading to increased satisfaction and overall well-being.

H2: There is a substantial impact between the flexible working arrangements and employee satisfaction level.
Prioritizing and successfully implementing flexible working arrangements create a win-win situation for both employees and organizations. Employees experience increased job satisfaction and work-life balance, while organizations benefit from a more engaged and productive workforce. Embracing work flexibility is a strategic move that does not enhance employee satisfaction.

Social Exchange Theory
The Social Exchange Theory provides insights into the reciprocal relationship between organizations and employees regarding flexible working arrangements. When organizations offer flexibility, it signals a commitment to employee well-being and work-life balance. In response, employees reciprocate by exhibiting greater loyalty, commitment, and job satisfaction. This positive exchange relationship fosters a supportive work environment, promoting employee satisfaction and overall organizational success.

DATA ANALYSIS

In this study Descriptive statistics like counts and percentages are used to provide an overview of the sample, Descriptive statistics about the respondents' demographic characteristics, such as gender, age group, marital status, educational background, and years of experience provide a demographic overview and then Analysis of Job Satisfaction Factors is analyzed based on Likert scale. It breaks down the percentage of respondents who agree or disagree with each statement, representing a 5-point scale where 1 represents strongly disagree to 5 represents strongly agree highlighting the overall satisfaction of the employees. Similar to the job satisfaction factors, the responses related to flexible work arrangements provide insights into how employees perceive their work-life balance, the impact of flexible work arrangements, and then the Analysis of Preferred Flexible Work Arrangement Types are ranked by order preference, The text interprets the data by explaining the distribution of preferences for different types of flexible work arrangements. It provides insights into which arrangement types are more popular among employees. Finally, the Pearson Correlation Coefficient Calculation formula is used for calculating the Pearson correlation coefficient (r) and then provides the actual calculations, it explains the correlation between Flexible work arrangement (X) and job satisfaction level(Y). The P- P-value indicates that the correlation is a statistically significant level of 0.05.

Demographic Variables
- It is found that the respondents 65 % are male population and 35% are female population.
- The age group of respondents is 22 % belong to 21-30, 24% from 31-40, and 54% belonging to above 40 years.
- Most of the respondents are married (54%), and the remaining are unmarried (39%) and divorced (7%).
- Majority of the respondents are undergraduate (68%) and few are studies postgraduate (32%).
- The respondents have experience between 1-3 years (15%), 3.1-5 years (24%), 5-10 years (26%), and above 10 years (35%)

Hemavathi and Frank Sunil Justus

Job satisfaction Factors

1. **Employee satisfaction:** The majority of respondents (28.41%) strongly agree that they are satisfied with the current arrangements. Overall, a significant percentage (approximately 55.68%) either agree or strongly agree, while only 40.91% either disagree or strongly disagree.
2. **Motivation:** The data indicates that a substantial portion (approximately 55.68%) of respondents are positively motivated by flexible work arrangements to stay in the company. However, there is still a notable percentage (approximately 28.41%) who either disagree or strongly disagree with the statement.
3. **Career progress:** A considerable percentage (approximately 52.27%) of respondents agree or strongly agree that flexible working arrangements will motivate them to read and upgrade their skills within the organization. Nevertheless, a significant proportion (approximately 32.95%) either disagree or strongly disagree with this notion.

Overall, it seems that a substantial number of employees are in favor of flexible work arrangements, and they believe it positively impacts their satisfaction, motivation, and career progress. However, there is still a notable portion that is either neutral or does not see significant benefits from these arrangements. Further analysis and understanding of the employee's specific needs and concerns may help in implementing more effective flexible work policies.

Flexible work arrangements

1. **Work-Life Balance:** A significant portion (approximately 60.23%) of respondents either disagree or strongly disagree that they find it easy to manage their work-life commitment. On the other hand, approximately 41.05% either agree or strongly agree that they can manage their work-life commitment well.
2. **Impact of Flexible Work Arrangements on Work-Life Balance:** The majority (approximately 57.95%) of respondents agree or strongly agree that flexible work arrangements will balance their work-life commitment. However, a notable percentage (approximately 29.55%) either disagree or strongly disagree with this statement.
3. **Home Life:** A considerable percentage (approximately 57.95%) of respondents strongly agree that their work prevents them from spending time with their kids. In contrast, approximately 30.68% either disagree or strongly disagree with this statement.
4. **Career Progress:** A significant portion (approximately 58.27%) of respondents agree or strongly agree that flexible working arrangements will motivate them to read and upgrade their skills within the organization. Nevertheless, a notable proportion (approximately 32.82%) either disagree or strongly disagree with this notion.

Overall, the data suggests that there is a need for improvement in work-life balance, and many employees believe that flexible work arrangements can positively impact this aspect. Additionally, a substantial number of respondents feel that their work commitments affect their home life and their ability to spend time with their kids. While there is support for the belief that flexible work arrangements can contribute to career progress, there is also a notable percentage of employees who do not share this sentiment. Further analysis and understanding of individual needs and challenges can aid in implementing effective policies to address work-life balance and career growth concerns.Kuty (2016) the remote work standards should be planned by discussing with employees, with mutual understanding the standards should be implemented

Flexible work arrangement types
The table provides information about different types of work arrangements, ranked from Rank-1 to Rank-4, along with the corresponding counts and percentages of employees who use each arrangement. Let's interpret the results:

Hemavathi and Frank Sunil Justus

Flextime:
- Rank-1: 35 employees (39.77% of the total) use flextime as their preferred work arrangement.
- Rank-2: 23 employees (26.14% of the total) use flextime as their second preferred option.
- Rank-3: 20 employees (22.73% of the total) use flextime as their third preferred option.
- Rank-4: 30 employees (34.09% of the total) use flextime as their fourth preferred option.

Condensed work week:
- Rank-1: 24 employees (27.27% of the total) prefer a condensed work week as their primary work arrangement.
- Rank-2: 26 employees (29.55% of the total) have a condensed work week as their second preferred option.
- Rank-3: 27 employees (30.68% of the total) prefer a condensed work week as their third preferred option.
- Rank-4: 16 employees (18.18% of the total) use a condensed work week as their fourth preferred option.

Telecommuting
- Rank-1: 20 employees (22.73% of the total) prefer telecommuting as their primary work arrangement.
- Rank-2: 14 employees (15.91% of the total) have telecommuting as their second preferred option.
- Rank-3: 23 employees (26.14% of the total) prefer telecommuting as their third preferred option.
- Rank-4: 16 employees (18.18% of the total) use telecommuting as their fourth preferred option.

Staggered hours:
- Rank-1: 9 employees (10.23% of the total) prefer staggered hours as their primary work arrangement.
- Rank-2: 25 employees (28.41% of the total) have staggered hours as their second preferred option.
- Rank-3: 18 employees (20.45% of the total) prefer staggered hours as their third preferred option.
- Rank-4: 26 employees (29.55% of the total) use staggered hours as their fourth preferred option.

Each row represents a different type of work arrangement, and the columns show the ranking order of employee preferences. The percentages are calculated based on the total number of employees surveyed. For instance, in the case of flextime, approximately 39.77% of employees chose it as their first preferred option.

Calculation of Pearson Correlation coefficient of flexible work arrangement and job satisfaction level
Note:
1. X values refer to flexible work arrangement
2. Y values refer to job satisfaction level
3. r= Pearson correlation coefficient

X Values	Y Values	P value
Mean = 52.8	Mean=70.4	0.005013
r = 0.9714		

N=5, Significance level= 5%

The value of r= 0.9714 refers to a strong positive correlation and the P-value is .005013. The result is significant at p < .05. With a p-value of 0.005013, it suggests that the correlation between the X and Y variables is statistically significant at a significance level of 0.05 (5%). In other words, there is strong evidence to reject the null hypothesis, which typically states that there is no significant relationship between the X and Y variables.

The correlation coefficient (r = 0.9714) indicates a very strong positive linear relationship between the X and Y variables. The value being close to +1 suggests that as the X values increase, the Y values tend to increase as well, and vice versa. The relationship between X and Y is highly positive and almost perfect, as indicated by the high correlation coefficient. In summary, the statistical analysis shows that there is a significant and strong positive linear relationship between the X and Y variables in your dataset.

CONCLUSION

From the study, it is concluded Respondents have consistently shown that employees who have access to flexible work arrangements report higher levels of job satisfaction. Having control over their work schedules and locations can lead to greater work-life balance and reduced stress. Flexible work arrangements, such as remote work or flexible hours, can help employees better manage personal and family responsibilities. This, in turn, contributes to improved work-life balance and overall well-being. Yunus (2021) identifies that FWA increases trust and builds a strong relationship between the employee and employer.

The study also found that allowing employees to work from home or offering flexible start and end times can significantly reduce commuting stress. Alan Felstead (2017) concludes that Remote work brings job satisfaction to employees & increases commitment and enthusiasm. Commuting is a common source of frustration and fatigue for many workers, and avoiding long commutes can enhance employee well-being. Contrary to concerns about reduced productivity, studies have shown that employees with flexible work arrangements can be more productive. The autonomy to choose their work environment and hours can lead to improved focus and efficiency. Organizations that offer flexible work arrangements tend to experience higher employee retention rates. When employees have the flexibility they desire, they are more likely to stay with their current employer.

Flexible work arrangements have been linked to better mental health outcomes. Reduced stress, improved work-life balance, and the ability to tailor work to individual preferences contribute to positive mental well-being. Altindag (2014) the study proves that flexible working arrangements create job loyalty and positively relate to the performance of the employee. Employees who have more control over their work tend to be more engaged in their roles. Engagement levels rise when individuals feel trusted and empowered to manage their work responsibilities and Flexible work arrangements can attract a more diverse pool of talent. Offering flexibility accommodates individuals with various needs and life circumstances, leading to a more inclusive workforce.

IMPLICATIONS / RECOMMENDATIONS

Many organizations are adopting hybrid work models that combine remote and on-site work. This approach allows employees to enjoy the benefits of both flexibility and in-person collaboration. It's important to note that the effectiveness of flexible work arrangements can vary depending on the specific organization, job roles, and industry. Organizations should carefully assess their unique circumstances and consider tailoring their approach to fit the needs of their employees and business objectives.

Future Research directions: Future studies can be done to identify valuable insights for organizations, policymakers, and individuals seeking to navigate the evolving landscape of flexible working arrangements while optimizing employee satisfaction, productivity, and overall well-being

ABSTRACT

This work centers to prompt the simplest thanks to agitate administration completely different estimations and enlightenment starting from real datasets that assemble imposingly, normal, and indisputable traits. As imperative large want developing little bit of leeway with charges decrease, finding affordable ways to mishandle bits of statistics which may be perpetually recorded and accessible to is the right got to assurance concerning those fantasies. The aim of assemble of this goose at is that the arrangement and strategy of affordable responsibilities, early from crop secure assessing to lacking sensors info preoccupation, mishandling and reviewing explicit device learning ways to show towards what heading to utilize tries and undertakings. The outcomes show still their square measure agreeable edges for progress at an equivalent time as serving to deals and desires ranging from packs that need to utilize a sensible and efficient developing business.

Keywords: Administration, datasets, crop, business, preoccupation, square.

INTRODUCTION

We square measure hovered by an enormous extent of "sharp" sensors and sharp structures that square measure incessantly cowl connected by techniques for web and cloud composes, this is often internet of elements(IoT) purpose of read that presents commanding headway all told social and helpful divisions of the overall people. Considering the overall business place, affiliations fight to headway their advantage and cash connected structure by utilizing streamlining price, time, and assets and, on a much identical time, meaning to improve the association's quality and also the things assortment provided for patrons. The attention toward productivity and viable updates is pined for in like means within the developing locus, wherever the gathering segments and also the advantage the board sway crop varieties, water structures, and disinfestations entirety, keeping such aggregation rhythms with none altered direct is probably to depart this world facilitate squander, gave up procures, and dirtied and press soils. Dynamic headway is useful to travel facing problems containing normal credibility squander decreasing, and soil improvement, the get together and also the assessment of natural records, that merge some and heterogeneous factors, square measure of elementary vitality for the possibility of construct creation approach tuned in to the world and its sources.   The uninflected affirmation of big and non persuading sections, the possibility of destroying market study with regard to the live of prospect dangerous farsighted enlightenment, the option of adjusting plants to precise conditions, in termination the likelihood to increase mechanical undertakings by ways for binding and anticipating instrumentation debacles and substitutions. The befittingly desperate and foursquare open Iacd dataset, as an example, is pushed the assessing of future yield totals on whole time game arrange, at the same time as on the subsequent one connected with business IoT sensors.

Related works

Agribusiness get together may well be mentioned by absolutely different parts understanding kind grants one to assess the real elements type that ought to be drawn nearer, their achievable structure, and also the activities needed to satisfy the requirements of a picked. The exactness Agriculture model could be a last consequence of the fast models within the web of mechanism and spread getting ready checks that work setting care and consistent exercises, Wolfert[1], and Biradar[2], gift surveys around sharp home associations, at an equivalent time as multidisciplinary plans manhandling IoT sensors square measure endeavored. This would likewise help in arranging the water needs well ahead. The examination recognizes delta and non-delta areas of TamilNadu to decide the evapotranspiration dependent on the climatic information accessible and talks about the design parts required for the ongoing information obtaining and ingestion system Revathi and Sengottuvelan[3]. It decides the ET0 and guides it with the FAO based reference model for the usage.

Conditions for irresistible region and avoiding, the employment of conditions as well as air inversion, comparative air wetness, breeze speed, and tempest descend; likewise, a framework for affirmation and management of courant yarn leaf close to mud unbelievable observations is introduced by strategies for Sarangdhar and Pawar [4]. Investigated this paper utilizes a probabilistic way to deal with foresee the prevalence of administrations to upgrade the suggestion execution for irresistible region and avoiding, by strategies for Sengottuvelan and Revathi [5]. Marimuthu [6] support and structure a persuasive amount to inspire watchful making, at the same time as furthermore mistreating dependable time assortment for creation fine affirmation, considering the means that as these days purchase square measure stressed around dinners security guarantee connected with flourishing and charmingly being.

Revathi [7] this paper would talk about on the foundation, innovation and huge information perspectives for paddy development by subjective examination techniques. The examination would include ID of the proper logical system through structural methods and calculation which would help in sensor arrangement procedure.

Substances and techniques

This work is coordinated to uncover affordable and primer impacts, with the will gift updates for the bits of data management and examination in very little length business affiliation and in stunning commonplace setting, off times diligent to movement. The pre IoT age, very little proportions of well subordinate estimations had been considered directed utilizing typically hardly any versatile wise structures ranging from real and numerical speculations so, during this specific state of affairs, the irresponsibility among solid and techniques, with exceptional and dynamic ones requiring experience, notwithstanding new understanding, for delegates, gets enlivening. Technique intervened commonplace business bits of data ranging from business endeavor methodologies referencing to company events for instance, buys and arranges, they are notable poorness stricken, with completely different records kinds.

Estimations resources

For this goose at, 3 standing assets of records square measure pondered fig1, all of them providing elementary and trademark limits essential to arrange and examine contrivance familiar with approaches;

The datasets utilized for this goose at: applied math Abstracts of India(SAS) clinical dataset [5], IACD Indian Agricultural and climate dataset, and also the financial web of elements (IoT) sensors dataset.Iacd dataset: the dependably assembled records regarding Indian yields sums (Table); It is a settled information and wires developing get together bits of data for each Indian space[5] .Work zone one. Bits of data regarding social group time assortment within the IACD dataset.

CNR dataset: It is a ward farming dataset, regardless regards square measure reliably inadequate or best not such a lot documented, with relevance clinical and specific information from provincial and customary analysis on vegetation and inexperienced species [5].

➢ Evaporation, (etc) and its suggestion price (ETo) selected with the journalist solarium approach
➢ Evaporation degree, that tends to a remarkable means of life constant authority.

Table 2. Info of the country over evaluations Council clinical farming dataset. LAI leaf zone record; and completely different others evaporation; The dataset half selected for the assignments of this tasteful indications joints twenty three tables, one for every harvest kind a year thought about the entire of the time combine some spot within the extent of 1996 and 2007 square measure picked, regardless they are now not constantly to be had and not all of them have close to cardinality information are utilized. Data of the catch of things (IoT) sensors information set.The dataset used circuits tables, one for every once station, that square measure musical group in forty outstanding Indian overall domains.

Forecasting predetermination estimation (Iacd Dataset)

The whole and created recorded time strategy out of the Iacd dataset (5) round the Italian yield yearly totals is unbelievably useful for the activity of predetermination real elements, nonetheless utilizing and separating the shows of assorted expedited device obtaining Information on structures. The organized machine obtaining dynamically familiar with approach is actually settled on mentioned models accustomed educate and check a model that got to notice approaches to manage secluded or turn out new models on a elementary level captivated with those beginning late ascertained

A neural framework needs a crucial extent of nonsensical high notch composition bits of data and an interior cutoff point's commendable calibration strategy to accomplish the charming typically speaking execution. Polynomial Regression; a thought system broadly speaking utilized within the enterprise and business field captivated with simple techniques which can be computationally non steep whereas the employment of low interest highlights, as an example, the prompt one, that reviews a phase that notch suits and approximates enter values in an exceedingly low dimensional appraisals area.

Experiment: 1 Renovation of misplaced bits of statistics from checking stationexploit the selection hierarchy, polynomial and alright adjacent associates plans (IoT Sensors Dataset) this is often a briefing of the past one, that applies more ways for gadget acing, holding all the speculations of the past endeavor. The instructing models square measure vectors in an exceedingly thread phase area, every with asking name and also the direction section of the tally simply unites addressing the cutoff vectors and progression qualities of the coaching job tests. The classifier may well be view as giving out the k adjacent neighbor so influence 1/d and 0 to conditions. Dynamic strides of the k-nearest neighbors (KNN) computation (okay=3) in an exceedingly, Bi-dimensional trademark space. A blue factor has unsure packaging, the inexperienced social function is obtainable bent it in an exceedingly condition of agreement with its mix and closeness. Considering the smallest amount inconvenient equivalent tree (fig 3), an interior purpose may have concerning youngsters; every leaf is organized with asking get a distinct game plan of qualities with a clear stage dissipating over the categories that square measure anticipating the estimation of the target variable.

The fig that examine associate in nursing develop call trees ordinarily work top some spot around system for selecting an expense for the variable at every development that fine elements the course of action of contraptions to choose that capability to half at every middle purpose within the course of the tree, the estimations gain price is employed. Truth of being open and resilient through developments grants in one to compose its undeniable give up system like python scripting to progress its ability, as has been dead on this works of art to realize 2 or 3 cutoff point. Allow a brief imitation, and use and adaptation of the work structures their elementsEnable fragile and flabbergasting creation in little enterprise and gift day conditions completely different leisure activity squares incorporate sub work structures. In fig 4, a happening is given, the work methodology that portrays the overall structure of understanding. The work methodology upsets on the IoT dataset providing the farsighted designs for the task three. The IoT sensors dataset is stacked, unfounded and absent attributes square measure expelled, there square measure channels to find the going with stations and also the all movie into their characteristics, and as time goes on the 2 machines examining sub framework obstructs for the execution of the models.

Effects and discussion
After the endeavor arrange in section 2, the going with beta impacts and their exchange square measure given right here for the good expenses of the classifiers, the degree price contained within the tales sees the degree wish disfigure selected with on the aptitude among the authentic price v and also the price this is often gotten form the cagey model.

Experiment.2Appraisal among machine wondering algorithms on lacking real variables
The upper appraisal numerical selection is over the others and this happens each if, for the course of action, you offer the real elements to associate in nursing unwed twelvemonth, each event that you just offer estimations for a protracted. Plot correlation between genuine qualities (red spots), the straight (blue), and polynomial (green) prescient model on the CNR logical agrarian dataset.

Experiment: 3 Reconstruction of lacking data from following stations misusing neural society, and direct and polynomial relapse methods.
This key to review contrivance learning seems whereas the usage for the pre in concerning the entire of the tests, it rises that the anatomical structure all around execution is additional repulsive that that of direct descend into sin, and a proof is determinedly around the utilization o scarcely any coaching estimations for the regular gathering of one month. Unbelievable from the chief assignment, the time assortment facts don't seem to be terribly several, regardless transiently complete and capable, intrinsically the foremost exceptional spirited bringing to light and vital plus refined model is that straight one.

Revathi *et al.,*

An open portal check turned into finished the means toward, drawing in off the move support getting ready mode considering the means that, during this elementary, time strategy, it might be higher done commixture the previous passing real factors in with those of what is also not too far away, without ambiguity whereas foreseeing transient qualities the use of not several past ones.

Along these lines, a prompt descend into sin understanding seems, apparently, to be ordinary basic whereas imaging associate in nursing unwed charge of that the past and following qualities seen the use of humble measure of records for getting ready, at the same time as whereas they are not several, the polynomial one is that the hardly additional vital want. The affiliation courses of action of n elements may well be given in an exceedingly relationship cross space, that be a sq. structure of n x n estimation with the elements.

CONCLUSION

The basic check displays that the speculation of rice and wheat typically plants at the Iacd dataset may well be reaching with a neural system mold with a triumph charges close to ninety two, it raises that for the CNR rational records, polynomial keen and fall from the religion models square measure incessantly crucial wise wondering the dataset. The region of inadequate checking station in task 5 accurately utilizes a grouping of the station subject to their geographic region robust to detect gear deficiencies.

The projected actual gear feature the requirement for searching for association and knowledge researchers, in truth, likewise, the requirements to expend money on limits and talent to fruitfully utilize the IoT purpose of read at higher levels makes. The quality clarification behind the projected responsibilities the use of assorted gadget work has being the projected responsibilities the use of assorted gadget obtaining familiar with system is that associate in nursing beta and particularly check work has been utilized the records fusion procurable the connected update of structure and outcome is foretold in potential work, wherever new primers and obligations create the foremost extraordinary device kinds and datasets are going to be masterminded and accomplished to satisfy the spectacular heterogeneousness of agro get together and of the rigging device business center.

ABSTRACT

In this research, the researcher compares the self-confidence and Academic achievement of three sociometric groups i.e., stars & neglectees, neglectees & isolates and stars & isolates in relation to their gender and locale. The objective of this research is to classify the students into three sociometric groups stars, neglectees and isolates and to compare their self-confidence and academic achievement. For this purpose, the investigator gets the data from the students studying in secondary schools. The research shown a significant difference in the self-confidence of neglectee and isolate students belonging to rural area. Also, the difference was significant among stars and isolates when investigated in totality and among stars & neglectees students belonging to urban area. In case of Academic achievement, a significant difference was there in academic achievement of stars and neglectees in totality, in female category and among those belonging to rural& urban areas. The difference was also significant among neglectees and isolates in case of total students, in female category and rural& urban area students. In case of stars and isolates also the difference was significant in totality and among rural students.

Keywords: Self-confidence, Academic Achievement, Sociometric, Stars, Neglectees and isolates.

INTRODUCTION

In the realm of education, numerous factors contribute to students' academic performance and overall success. Among these factors, self-confidence plays a pivotal role in shaping individuals' attitudes, behaviours, and achievements. Self-confidence is closely intertwined with various demographic variables, such as socio-economic background, gender, and ethnic diversity, which further influence students' experiences within educational environments. Understanding the relationship between self-confidence, academic achievement, and specific demographic variables is crucial for developing effective educational interventions and providing tailored support to students. This research paper aims to investigate the interplay between self-confidence, academic achievement, and specific demographic variables, focusing on three distinct groups of students: stars, neglectees, and isolates. The stars are high achievers who consistently perform well academically and demonstrate high levels of self-confidence. Neglectees, on the other hand, are students who experience educational neglect or lack of support, which often hampers their self-confidence and academic performance. Isolates represent students who feel socially isolated or marginalized due to factors such as cultural differences or language barriers, potentially impacting their self-confidence and academic outcomes.

The study will delve into the multifaceted nature of self-confidence, considering its cognitive, emotional, and behavioural components. It will explore how self-confidence manifests in students' academic pursuits, their perceptions of their abilities, and their willingness to take academic risks. Furthermore, this study recognizes the significance of demographic variables in shaping students' experiences within educational contexts. Factors such as socioeconomic background, gender, and ethnic diversity can greatly impact self-confidence levels, academic support systems, and educational outcomes. By examining the role of these demographic variables in relation to self-confidence and academic achievement, the research will provide a comprehensive understanding of how various social and cultural factors influence students' educational trajectories. The results of this study hold substantial suggestions for educators, policymakers, and stakeholders in the field of education. Understanding the unique challenges and strengths associated with each group (stars, neglectees, and isolates) can help in modifying the support systems to nurture self-confidence and enhance achievement of all students. Additionally, the insights gained from analysing the relationship between self-confidence, academic achievement, and demographic variables can contribute to the development of inclusive educational practices that address the specific needs of diverse student populations.

In conclusion, this paper will add to the existing frame of knowledge by investigating the intricate relationship between self-confidence, academic achievement, and certain demographic variables. By focusing on stars, neglectees, and isolates, the study aims to shed light on the experiences of distinct student groups and provide valuable insights for fostering self-confidence and improving academic outcomes. Ultimately, the findings will pave the way for more equitable and inclusive educational environments that empower students to reach their full potential. The important contribution of this research study is to categorize the students into stars, neglectees and isolates in order to know whether there is a significant difference in the self-confidence and academic achievement of students(male and female) studying in secondary schools. The remaining article is organized as follows: Section II discusses about the various works done previously related to our study. In section III methodological part is discussed. Section IV represents the data analysis techniques. In section V findings of the study are discussed and in section VI conclusions of the present study are given.

RELATED WORK

It was recognized by the result from the research report of Tripathy, & Srivastava[1]that the level of self-confidence, variables had been affected by academic achievement. In a study conducted by Malik, U., &Yougesh[2]revealed in their research that a significant difference was there among academic achievement of students studying in 11th class with high and low self-confidence. A study conducted by Li and Yang[3]examined the social networks of international students in China. The study found that social relationships among international students were influenced by factors such as cultural differences, language barriers, and nationality. In a study byS. Veazieet

65873

al.[4]examined the social networks of elderly people in Japan. The study found that social relationships among elderly people were influenced by factors such as age, gender, and social support. Gamar Abdullah et.al.[5]investigated student's self-confidence and their learning achievement on Elementary schools. The findings of the study are that there is a relationship of self-confidence with the learning achievement of fifth grade students in the Elementary schools in Kota. Akbari & Sahibzada[6], investigated on Students' self-confidence and its impacts on their learning process. The study found that students with self-confidence can lead them improved participation, enjoy learning and help them in sharing their experiences and opinion in class. Ahmed lone[7],found in his investigation that self-confidence acts as a predicator of academic performance. Better the self-confidence led to better performance. Zhao, Y. et.al.[8]initiated that adolescent self-esteem, academic self-efficacy, and perceived social support were all important aspects to consider when trying to increase adolescent academic engagement. As a result, parents and teachers should actively encourage adolescents to develop their self-esteem and academics. Bhat, R.I.[9]found that academic success was significantly influenced by students' self-confidence. It was among the most crucial psychological needs of people. If self-confidence was properly established, there would be positive and beneficial outcomes such as self-efficacy, sense of capacity, power, and qualification. However, if it was poorly shaped, it would have a number of detrimental effects, such as making one feel unqualified, worthless, and useless in their life. In order to improve children's perceived social support and academic engagement, parents and educators should also build an effective social support system.

METHODOLOGY

Objectives:
1. To classify 9th standard students among stars, neglectees, and isolates.
2. To study the self-confidence and academic achievement of 9th standard students in relation to Gender and Locale with respect to the following categories:
a. Stars & Neglectees
b. Neglectees & Isolates
c. Stars & Isolates

Hypotheses of the Study
1. There will be no significant difference in the **self-confidence** of 9th standard students in relation to the following categories:
a. Stars & Neglectees
b. Neglectees & Isolates
c. Stars & Isolates

2. There will be no significant difference in the **academic achievement** of 9th standard students in relation to the following categories:
a. Stars & Neglectees
b. Neglectees & Isolates
c. Stars & Isolate

3. There will be no significant difference in the **self-confidence**of 9th standard **male** students in relation to the following categories:
a. Stars & Neglectees
b. Neglectees & Isolates
c. Stars & Isolates

4. There will be no significant difference in the **academic achievement** of 9th standard **male** students in relation to the following categories:
a. Stars & Neglectees
b. Neglectees & Isolates
c. Stars & Isolates

5. There will be no significant difference in the **self-confidence** of9th standard **female** students in relation to the following categories:
a. Stars & Neglectees
b. Neglectees & Isolates
c. Stars & Isolates

6. There will be no significant difference in the **academic achievement** of 9th standard **female** students in relation to the following categories:
a. Stars &Neglectees
b. Neglectees & Isolates
c. Stars & Isolates

7. There will be no significant difference in the **self-confidence** of 9th standard students residing in **rural area** in relation to the following categories:
a. Stars & Neglectees
b. Neglectees & Isolates
c. Stars & Isolates

8. There will be no significant difference in the **academic achievement** of 9th standard students residing in **rural area** in relation to the following categories:
a. Stars & Neglectees
b. Neglectees & Isolates
c. Stars & Isolates

9. There will be no significant difference in the **self-confidence** of 9th standard students residing in **urban area** in relation to the following categories:
a. Stars & Neglectees
b. Neglectees & Isolates
c. Stars & Isolates

10. There will be no significant difference in the **academic achievement** of 9th standard students of residing in **urban area** in relation to the following categories:
a. Stars & Neglectees
b. Neglectees & Isolates
c. Stars & Isolates

Delimitations of the Study
1. The study was confined to the use of Survey as a method of research.
2. The study was confined to Govt. schools only.
3. The study was confined to the use of Simple random sampling as a technique for the collection of data and a sample of about 338 students residing in rural and urban areas, studying in 9th standard of Govt. High/Higher Secondary Schools situated in District Samba (J&K).
4. It was confined to the analysis of Self-confidence and Academic Achievement as dependent variables and Residential Background, Gender and Students' classification as independent variables.

Shivani Sambyal *et al.,*

5. The present study was confined to the study of three sociometric groups only viz stars, isolates, & neglectees.

METHOD
Survey method under Descriptive method of research was used for the present study.

Population
In present investigations, the students studying in class 9th of Govt. High/Higher Secondary Schools located in Samba District constituted the population.

Sampling
For the current research study, the investigator procured the list of Higher/Higher Secondary schools of District Samba from ZEO office Samba. From the total of 60 schools; 17 schools were randomly selected for the collection of sample i.e 28% of 60 and whole 9ᵗʰ class (present on that day) of every school was selected as sample. The overall sample consisted of 338 students from various schools selected at random, out of these 113 students were classified and selected as stars (29), neglected (52) and isolates (32) by using Sociometric technique. List of schools chosen randomly (28% of 60)has been given in Table below:

Tool Employed and their Description
Self -Confidence Scale: For the measurement of Self-Confidence, Self-Confidence Scale was used in the present study. This scale was constructed and standardized by Self-Confidence Scale by Dr. D.N. Sansanwal and Dr. Smita Bhawalkar (2011).

Sociometric Classification
In the present study, Sociometric Questionnaire prepared by the investigator was used to identify three Sociometric groups of students viz. stars, neglectees, and isolates.

Academic Achievement:
Regarding academic achievement, the investigator consulted the class teacher of each selected school and enquired about the marks obtained by students in previous annual examinations (VIII class).

Statistical Techniques Used
- Percentage (%)
- Mean
- Standard Deviation
- t- test

Analysis And Interpretation of Data

Findings of the study
  i. From table no. 1 it can be interpreted that the majority (15.38%) of students are neglected, 9.46% are isolated and only 8.57% were stars.
 ii. From Table no. 2, it can be interpreted that the self-confidence of isolates is significantly higher than those of star students studying in 9ᵗʰ standard.
iii. From Table no. 3, it is apparent that the academic achievement of stars & isolates are significantly higher than those of neglectee students studying in 9ᵗʰ standard.
 iv. From Table no. 4, it is inferred that there is no significant difference in the self- confidence of 9ᵗʰ standard male students belonging to stars & neglectees, neglectees & isolates and stars & isolates.
  v. From Table no. 5, it can be interpreted that there is no significant difference in the academic achievement of male students of 9ᵗʰ standard belonging to stars & neglectees , neglectees & isolates and stars & isolates.
 vi. From Table no. 6, it is evident that there is no significant difference in the self- confidence of female students of

65876

Shivani Sambyal *et al.,*

9th standard belonging to stars & neglectees , neglectees & isolates and stars & isolates.

vii. From Table no. 7, it can be highlighted that the academic achievement of female students belonging to star and isolate categories are significantly higher than those of female belonging to neglectees.

viii. From Table no. 8, it is determined that the self-confidence of isolates belonging to rural area is significantly higher than those of neglectees.

ix. From Table no. 9, it can be emphasized that the self-confidence of stars & isolates belonging to rural area is significantly higher than those of neglectees.

x. From Table no. 10, it can be highlighted that the self-confidence of neglectees belonging to rural area is significantly higher than those of stars.

xi. From Table no. 11, it can be emphasized that the academic achievement of stars& isolates belonging to urban area is significantly higher than those of neglectees.

CONCLUSIONS OF THE STUDY

From the above findings, we can conclude that there is significant difference in the self-confidence of neglectee and isolate students belonging to rural area. Also, the difference was significant among stars and isolates when investigated in totality and among stars & neglectees students belonging to urban area.In case of Academic achievement, it can be highlighted that there is significant difference in academic achievement of stars and neglectees in totality, in female category and among those belonging to rural& urban areas. The difference was also significant among neglectees and isolates in case of total students, in female category and rural& urban area students. In case of stars and isolates also the difference was significant in totality and among rural students. Few studies have been conducted in this field with the related results viz.Tripathy & Srivastava[1]recognized the result that the level of self-confidence, variables had been affected by the academic achievement.

ABSTRACT

The present case study was a 35 years old male who came to the outpatient department of Ayothidoss Pandithar Hospital, National Institute of Siddha with a complaint of pain in the Right elbow joint, swelling on the base of the elbow joint, pain aggravated during movements since 2 weeks; he had no comorbid condition. Currently available treatment for this condition is compression bandaging with non-steroidal anti-inflammatory drugs, needle aspiration or surgery which is open or arthroscopic bursectomy, osseous resection, and percutaneous suction drainage. This treatment may cause some complications and it's not affordable for many patients. In our Siddha system, many external medicines are available. In this study, olecranon bursitis was treated with *Neerkovai Maathirai Patru* (Poultice). This treatment provides a painless, cost-effective, and simple way of treatment without any side effects.

Keywords: *Patru*, Siddha, External medicine, Bursitis.

INTRODUCTION

A *Patru* (Poultice) is a paste made up of herbs, plants, and other substances with healing properties**.** *Patru* is one of the external medicines among 32 types in the Siddha system of medicine[1]. It is widely used to treat swelling, abscesses, headaches, fistula, hemorrhoids, chronic wounds, carbuncle, tumors, filarial swelling, muscular sprain, and arthritis [2]. *Patru* is soft and moist. It is obtained from plant extracts or by grinding crude raw drugs and is gently heated and applied as a thick paste over the affected region.*Patru* is usually applied for one time or twice a

65881

day. Retain the *patru* on the site for 3 hours. Remove the *patru* by adding sterile water and wash the site with lukewarm water or cold water.

Neerkovai mathirai is a classical *Siddha* medicine mentioned in *Siddha Vaithya Thirattu*. It is prepared by the composition of *Kappumanjal* (*Curcuma longa*), *Kasturimanjal* (*Curcuma aromatic*),*Vengaram* (Borox), *Sambirani* (*Styrax benzoin*), *Milagu* (*Piper nigrum*), *Chukku* (*Zingiber officinale*), *Jathikkai* (*Myristica fragrans*), *Omam* (*Trachyspermum ammi*), *Lavangam* (*Syzygium aromaticum*), *Karpooram* (Camphor) these drugs were grinded with lemon juice for 6 hours up to the tablet consistency (*karkam*)[3]. A tablet is rubbed with water or breast milk into a paste and applied externally.

Bursitis is inflammation of the bursal sac it may be acute or chronic and usual sites are the sub deltoid, olecranon, ischial, trochanteric, and prepatellar areas. Bursa reduces the friction of the joint and protects the sensitive structures around the joint from pressure [4]. Olecranon bursitis is characterized by the accumulation of fluid with or without inflammation. It occurs more often. Most cases occur in men between the ages of 30 years to 60 years[5]. Septic olecranon bursitis is caused by trauma, gout, rheumatoid arthritis, systemic lupus erythematosus, and dihydrate crystal deposition disease. The diagnostic criteria for olecranon bursitis include pain, swelling, local tenderness, and painful and restricted movements of the elbow. Treatment for non-septic olecranon bursitis includes compression bandaging with non-steroidalanti-inflammatory drugs, needle aspiration, and needle aspiration with steroid injection or surgical management such as open or arthroscopic bursectomy, osseous resection and percutaneous suction drainage [6].

The current study deals *with Siddha* treatment of a case visited the Out-Patient Department of Ayothidoss Pandithar Hospital, complaints of swelling around the right elbow joint. The clinical intervention was the application of *Neerkovai Maathirai Patru* for olecranon bursitis.

CASE HISTORY

A 35 years old male came to the outpatient department of Ayothidoss Pandithar Hospital, National Institute of Siddha with a complaint of pain, swelling around the right elbow joint, and painful movements for 2 weeks. The symptoms were worsening while movements and weightlifting. The swelling is insidious onset. He is not having any co-morbid condition. He had approached primary care by a general allopathic physician.It provides only temporary relief, but the swelling and painful movements were persisting.

CLINICAL EXAMINATION
The clinical Examination of the right elbow joint showed a visible approximately 4 cm, non-tender, fluctuant mass over the olecranon process. There is no warmth or erythema over the swelling. He had a normal range of movements. Neurovascular examination has been normal.

DIAGNOSTIC ASSESSMENT
Based on clinical examination and diagnostic criteria the case was diagnosed as olecranon bursitis. The case was differentiated from septic olecranon bursitis with the help of investigation and manual examinations. Based on his clinical signs and symptoms the decision was made to precede *Neerkovai Maathirai Patru*with internal medication. The patient consented to the procedure. For this case, 2 weeks of *Neerkovaipatru* were done. The prognosis of the patient was assessed using a visual analog scale7.

MATERIALS AND METHODS

The following are used for the procedure
   a. *Neerkovai Mathirai*
   b. Warm water

PROCEDURE

The required amount of *Neerkovai mathirai* (Figure 1) was taken and mixed with warm water and made as a paste (Figure 2) then applied over the swelling around the right elbow joint regularly. Retain the *Patru* on the site for a systemic lupus erythematosus period of 3hours.After,it is made wet by adding sterile water and washing the site with lukewarm water or cold water. Symptoms were recorded on the 1st day (Figure 3) and reviewed on the 7th, 15thday (Figure 4).

Based on patient signs and symptoms, their degree of pain on a VAS was 6 points (severe pain) before treatment. After 2 weeks of treatment of *Patru* (Poultice) and internal medication, their degree of pain in VAS was 0 points (No pain).

Gradation of swelling of joints
0 – Nil, no swelling.
1 – Mild, feeling of swelling with heaviness of joints.
2 – Moderate, apparent swelling.
3 – Severe, huge swelling.

During the study period significant signs and symptoms were reduced after the application of *Patru* (Poultice) for 7 days. After the last follow-ups worsening his symptoms during movements decreased**.**

OBSERVATION
Pain on a VAS is 6 point (severe pain) before treatment. After treatment, their degrees of pain in VAS were 0 points (No pain).Grade 3 (severe, huge swelling) before treatment, grade 0 (no swelling) after treatment.

DISCUSSION

Olecranon bursitisis caused by trauma, gout, rheumatoid arthritis, systemic lupus erythematosus, dihydrate crystal deposition disease and many other causes. In this case, olecranon bursitis was caused by falling from the bed. The patient developed pain and swelling on the base of the elbow joint, the pain aggravates during movements. The patient was treated with an anti-inflammatory, analgesic tablet by a general allopathic physician. It provided only temporary relief. There is no reduction in swelling. The patient came to the outpatient department of Ayothidoss Pandithar Hospital, National Institute of Siddha with no comorbid condition. Based on clinical examination it was diagnosed as Olecranon bursitis. The patient was managed with *Neerkovai Maathirai Patru* (Poultice) along with OPD siddha internal medications for 2 weeks.

In modern medicine, treatment for non-septic olecranon bursitis includes compression bandaging with non-steroidal anti-inflammatory drugs, needle aspiration or surgery which is an open or arthroscopic bursectomy, osseous resection, and percutaneous suction drainage. This treatment may lead to some complications. The ingredients of *Neerkovai Maathirai Patru* have *Patru along* anti-inflammatory, analgesic, anti-septic and immunomodulatory properties. This topical application would penetrate the skin and enhances the skin transfer, inhibits the pain receptor and reduces the swelling [8]. *Patru* plays a vital role to reduce swelling. This case report shows the signs and symptoms were reduced by the application of *Neer kovai Maathirai Patru*.There was a significant reduction observed in VAS after treatment and no adverse drug reaction during this treatment period. *Patru* is a non-invasive therapy and we were able to prevent the recurrence.

Bhagyalakshmi *et al.,*

CONCLUSION

In this study, olecranon bursitis was treated with *Neerkovai Maathirai Patru* along with OPD internal medicine. This treatment provides a painless, cost-effective and simple way of treatment without any side effects for bursitis. In *the Siddha system*, many external therapies are given but a single, evidence-based treatment method is not well described. *Neerkovai Mathirai Patru* may be useful for other patients with the same condition and we can improve the quality of life of the patients.

ABSTRACT

In this article, we determine the distance-based topological indices such as Wiener index, Hyper Wiener index, Vertex Szeged index, Edge Szeged index, Edge-vertex Szeged index, Total Szeged index, and Padmakar-Ivan index of a Nanorod graph constructed from NaOH concentration. Additionally, we compare the numerical values of these distance-based topological indices with $k = 0.1, 0.09, 0.08, 0.07, 0.06, 0.05, 0.04, 0.03, 0.02$ and 0.01.

Keywords: Nanorod graph, Wiener index, Hyper Wiener index, Vertex Szeged index, Edge Szeged index, Edge-vertex Szeged index, Total Szeged index,   Padmakar-Ivan index.

AMS Subject Classification: 05C90, 05C92

INTRODUCTION

For notation and graph theory terminology not provided here, we refer to [Gary Chartrand,2006]. In recent years, graph theory has generated significant interest in the field of mathematical chemistry, attracting mathematicians to formulate chemical structures and material properties. Chemical graph theory has numerous real-life applications and has gained popularity among researchers. A topological index is a numerical invariant of a molecular descriptor. It is also referred to as a graph-theoretic index, representing a numerical quantity associated with the molecular

graph structure, which corresponds to unique chemical and physical properties. Topological indices can be categorized into different classes, including distance-based, degree-based, and eccentricity-based indices [Sowmya, 2020]. The Wiener index is the oldest topological index, which is the sum of distances between all pairs of vertices in a graph. This index was also shown by Harry Wiener to correlate well with various properties of alkanes in a series of research articles published from 1947 to 1948 [H.Wiener,1947 and Wiener H, 1948]. The Wiener index gained the great interestamidst of mathematicians around 1970 when it was introduced in graph theory under the name 'distance of a graph' [Plesnik J, 1984; L.Solts,1991;Entringer R.C.1976] and further studied in the form of the average distance of graphs [Chung F., 1988, Sanja S, 2018]. Some examples of distance-based topological indices include the Wiener index, Moster index, Edge Wiener index, and Szeged index, among others. In this study, we analyze distance-based topological indices for optical properties of a Nanorod graph. The authors Sonia et al. [Sonia, 2014] previously investigated the bioactivity of CuO Nanorods prepared under various concentrations of NaOH. The Nanorod graph was defined and generated by S. Sobiya, S. Sujitha, and M.K. Angel Jebitha using the methodology outlined in [Sonia, 2014], and various graphical parameters were studied in their previous work [S.Sobiya, 2023].

The distance is known as the shortest path and is denoted by $d(u,v)$ and the open neighborhood $N_{G_{Nr}}(v)$ is the set of vertices adjacent to v and an edge $e = uv \in E(G_{Nr})$.

$$N_u(e|G_{Nr}) = \{x \in V(G_{Nr}): d(u,x) < d(v,x)\}$$
$$M_u(e|G_{Nr}) = \{f \in E(G_{Nr}): d(u,f) < d(v,f)\}$$

The Cardinality of $N_u(e|G_{Nr})$ and $M_u(e|G_{Nr})$ is denoted by $n_u(e|G_{Nr})$ and $m_u(e|G_{Nr})$ respectively.[Micheal Arockiaraj,2019]

The Wiener index was introduced by Harry Wiener in 1947 and defined it as the sum of half of the distance between every pair of vertices in a graph.

(i.e) $W(G_{Nr}) = \frac{1}{2}\sum_{uv\in E(G_{Nr})} d(u,v)$

The Hyper Wiener index is

$$WW(G_{Nr}) = \frac{1}{2} \sum_{u,v\in E(G_{Nr})} [d(u,v) + (d(u,v))^2]$$

The Szeged index was introduced by Gutman in 1994 [I. Gutman,1994] and named as Gutman index. Later it is known as the Szeged index.

The Vertex Szeged index is

$$Sz_v(G_{Nr}) = \sum_{e\in E(G_{Nr})} n_u(e|G_{Nr})n_v(e|G_{Nr})$$

The Edge Szeged index is

$$Sz_e(G_{Nr}) = \sum_{e\in E(G_{Nr})} m_u(e|G_{Nr})m_v(e|G_{Nr})$$

The Edge-Vertex Szeged index is

$$Sz_{ev}(G_{Nr}) = \frac{1}{2} \sum_{e\in E(G_{Nr})} [n_u(e|G_{Nr})m_v(e|G_{Nr}) + n_v(e|G_{Nr})m_u(e|G_{Nr})]$$

The Total Szeged index is

$$Sz_t(G_{Nr}) = Sz_v(G_{Nr}) + Sz_e(G_{Nr}) + 2Sz_{ev}(G_{Nr})$$

Padmakar V. Khadikar and Ivan Gutman [P.V.Khadikar,2000] introduced the Padmakar-Ivan index as,

$$PI(G_{Nr}) = \sum_{e\in E(G_{Nr})} [m_u(e|G_{Nr}) + m_v(e|G_{Nr})]$$

2 NANOROD GRAPH

The Nanorod graph, denoted as G_{Nr} is a simple connected graph with a vertex set $V(G) = \{v_1, v_2, v_3, \dots v_n\}$ and an edge set $E(G)$ as defined in [S.Sobiya, 2023]. In $G_{Nr,}$the vertices correspond to different NaOH concentrations, and an edge exists between two vertices if they correspond to the UV spectrum parameters (pH, temperature, time, volume of solvent in a given ratio) associated with those NaOH concentrations. To construct the family of Nanorod graphs, various step values can be employed. In this article, we utilize ten step values denoted by 'k' (k = 0.1, 0.09, 0.08, 0.07, 0.06, 0.05, 0.04, 0.03, 0.02, and 0.01).The order of the Nanorod graph, represented as 'p,' is determined by $p = \left\lfloor \frac{1.5}{k} + 1 \right\rfloor$, while the size is 'q,' and the reaction time is 't.' In our study, we set t = 2 hours and a pH value of 12 to calculate the

Sobiya *et al.,*

topological indices. This article aims to determine various distance-based topological indices of the Nanorod graph G_{Nr}, considering its order (p), reaction time (t), and pH value.

Figure 1 shows a Nanorod graph with step value $k = 0.1$

3 THE DISTANCE BASED TOPOLOGICAL INDICES OF A NANOROD GRAPH

In this part, we will derive formulae for distance based topological indices , including the Wiener index, Hyper Wiener index, Edge-Vertex Szeged index, Edge Szeged index, Total Szeged index, and Padmakar-Ivan index, for a Nanorod graph.

Theorem 3.1 For a Nanorod graph G_{Nr}, the Wiener index is

$$W(G_{Nr}) = \begin{cases} \left[\frac{4.5p}{1.5} + \frac{p}{pH}n^3 - \frac{6p}{pH}n^2 + \frac{15p}{pH}n - \frac{8p}{pH}\right] + \frac{1}{2}size(q) \, if \, k = 0.1, n = t-1, k = 0.09, n = t, k = 0.08, \\ \qquad\qquad n = t+1 \, and \, k = 0.07, k = t+2 \\ \left[\frac{p^2}{0.5pH} - \frac{2p}{pH}n^2 + \frac{15p}{pH}n - \frac{31p}{pH} + \frac{4.5p}{1.5}\right] + \frac{1}{2}size(q) \, if \, k = 0.06, n = t-1, k = 0.05, n = t \, and \\ \qquad\qquad k = 0.04, n = t+1 \\ \left[\frac{p^2}{0.5pH} + \frac{36.7p}{pH}n^2 - \frac{77.5p}{pH}n + \frac{57.2p}{pH} + \frac{4.5p}{1.5}\right] + \frac{1}{2}size(q) \, if \, k = 0.03, n = t-1, k = 0.02, n = t \, and \\ \qquad\qquad k = 0.01, n = t+1 \end{cases}$$

Proof. We know that the Wiener index of a Nanorod graph G_{Nr} is

$$W(G_{Nr}) = \frac{1}{2} \sum_{u,v \in V(G_{Nr})} d(u,v)$$

It can easily see that, the distance between any of any vertices of a Nanorod graph is either one or two

Case(i) $d(u,v) = 1 \, for \, all \, u, v \in V(G_{Nr})$ and for all k

In this case, $W(G_{Nr}) = \frac{1}{2} \sum_{u,v \in V(G_{Nr})} d(u,v)$

$$= \frac{1}{2}[d(u_1,v_1) + \cdots. + d(u_2,v_2) + \cdots\ldots + d(u_n,v_n) + \cdots..]$$

$$= \frac{1}{2}[1 + 1 + \cdots \ldots.]$$

$$= \frac{1}{2}size(q)$$

Case(ii) $d(u,v) = 2 \, for \, all \, u, v \in V(G_{Nr})$ and for different k

Subcase a) When $k = 0.1, 0.09, 0.08, 0.07$

$$W(G_{Nr}) = \frac{1}{2}[d(u_1,v_2) + \cdots + d(u_2,v_3) + \cdots \ldots \ldots.]$$

$$= \frac{1}{2}[2 + 2 + 2 + \cdots \ldots]$$

$$= \frac{1}{2}[3p + \frac{p}{pH}(n^3 - 6n^2 - 15n - 8) + \frac{p}{1.5}]2$$

$$= [\frac{4.5p}{1.5} + \frac{p}{pH}n^3 - \frac{6p}{pH}n^2 + \frac{15p}{pH}n - \frac{8p}{pH}]$$

Subcase b) When $k = 0.06, 0.05, 0.04$

$$W(G_{Nr}) = \frac{1}{2}[d(u_1,v_2) + \cdots + d(u_2,v_3) + \cdots \ldots \ldots.]$$

$$= \frac{1}{2}[2 + 2 + 2 + \cdots \ldots]$$

$$= \frac{1}{2}[3p + [\frac{p}{pH}[\frac{p}{0.5} - (2n^2 - 15n - 31) + \frac{p}{1.5}]2$$

$$= [\frac{p^2}{0.5pH} - \frac{2p}{pH}n^2 + \frac{15p}{pH}n - \frac{31p}{pH} + \frac{4.5p}{1.5}]$$

Subcase c) When $k = 0.03, 0.02, 0.01$

$$W(G_{Nr}) = \frac{1}{2}[d(u_1,v_2) + \cdots + d(u_2,v_3) + \cdots \ldots \ldots.]$$

$$= \frac{1}{2}[2 + 2 + 2 + \cdots \ldots]$$

65888

Sobiya *et al.,*

$$= \frac{1}{2}[3p + [\frac{p}{pH}[\frac{p}{0.5} + (36.7n^2 - 77.5n + 57.2) + \frac{p}{1.5}]2$$

$$= [\frac{p^2}{0.5pH} + \frac{36.7p}{pH}n^2 - \frac{77.5p}{pH}n + \frac{57.2p}{pH} + \frac{4.5p}{1.5}]$$

From Case(i) and Case(ii)

$\therefore W(G_{Nr})$ for the Nanorod graph with step value $k = 0.1, 0.09, 0.08 \ and \ 0.07$

$$W(G_{Nr}) = \left[\frac{4.5p}{1.5} + \frac{p}{pH}n^3 - \frac{6p}{pH}n^2 + \frac{15p}{pH}n - \frac{8p}{pH}\right] + \frac{1}{2}size(q)$$

$\therefore W(G_{Nr})$ for the Nanorod graph with step value $k = 0.06, 0.05, 0.04$

$$W(G_{Nr}) = \left[\frac{p^2}{0.5pH} - \frac{2p}{pH}n^2 + \frac{15p}{pH}n - \frac{31p}{pH} + \frac{4.5p}{1.5}\right] + \frac{1}{2}size(q)$$

$\therefore W(G_{Nr})$ for the Nanorod graph with step value $k = 0.03, 0.02, 0.01$

$$W(G_{Nr}) = \left[\frac{p^2}{0.5pH} + \frac{36.7p}{pH}n^2 - \frac{77.5p}{pH}n + \frac{57.2p}{pH} + \frac{4.5p}{1.5}\right] + \frac{1}{2}size(q)$$

Theorem 3.2 Let G_{Nr} be a Nanorod graph. Then the Hyper Wiener index is
$WW(G_{Nr})$

$$= \begin{cases} p[\frac{p}{pH^2}(n^3 - 6n^2 + 15n - 8)^2 + \frac{22p}{(1.5)pH}(n^3 - 6n^2 + 15n - 8) + \frac{1}{pH}(n^3 - 6n^2 + 15n - 8) + \frac{90.75p}{3.375} \\ \qquad + 3.6667 + \frac{size(q)(1 + size(q))}{2} \ if \ k = 0.1, n = t - 1, k = 0.09, n = t, k = 0.08, n = t + 1 \ and \\ \qquad\qquad\qquad\qquad k = 0.07, n = t + 2] \\ p[-\frac{4p^2}{(0.5)pH^2}(2n^2 - 15n + 31) + \frac{2p}{(pH)^2}(2n^2 - 15n + 31)^2 - \frac{22p}{(1.5)pH}(2n^2 - 15n + 31) - \\ \quad \frac{1}{pH}(2n^2 - 15n + 31) + \frac{2p^3}{(0.25)(pH)^2} + \frac{11p^2}{(0.375)pH} + \frac{39p}{1.5} + \frac{p}{(0.5)pH} + 3.6667] + \frac{size(q)(1 + size(q))}{2} \\ \qquad\qquad if \ k = 0.06, n = t - 1, k = 0.05, n = t \ and \ k = 0.04, n = t + 1 \\ p[\frac{1346.89p}{pH^2}n^4 - \frac{5688.5p}{pH^2}n^3 + \frac{10204.73p}{pH^2} + \frac{73.4p^2}{(o.5)(pH)^2}n^2 - \frac{155p^2}{(0.5)(pH)^2}n + \frac{p^3}{(0.25)(pH)^2} + \frac{114.4p^2}{(0.5)(pH)^2} + \frac{3271.84p}{(pH)^2} \\ \quad + \frac{330.3p}{(1.5)pH}n^2 + \frac{36.7}{pH}n^2 - \frac{697.5p}{(1.5)pH}n - \frac{77.5}{pH}n + \frac{9p^2}{(0.75)pH} + \frac{84.525p}{(0.75)pH} + \frac{20.25p}{2.25} + \frac{57.2}{pH} + 3] + \frac{size(q)(1 + size(q))}{2} \\ \qquad\qquad if \ k = 0.03, n = t - 1, k = 0.02, n = t \ and \ k = 0.01, n = t + 1 \end{cases}$$

Proof. We know that the Hyper Wiener index is

$$WW(G_{Nr}) = \frac{1}{2}\sum_{u,v \in E(G_{Nr})} [d(u,v) + (d(u,v))^2]$$

Since the distance between any pair of vertices of a Nanorod graph is either one or two, we have two cases.

Case(i) $d(u,v) = 1 \ for \ all \ u, v \ \in V(G_{Nr})$ and for all k

In this case, $WW(G_{Nr}) = \frac{1}{2}\sum_{uv \in V(G_{Nr})}\left[d(u,v) + \left(d(u,v)\right)^2\right]$

$$= \frac{1}{2}[[d(u_1,v_1) + \cdots + d(u_2,v_2) + \cdots \ldots + d(u_n,v_n) + \cdots..] + [d(u_1,v_1) + \cdots + d(u_2,v_2) + \cdots \ldots + d(u_n,v_n) + \cdots..]^2]$$

$$= \frac{1}{2}[[1 + 1 + \cdots ....] + [1 + 1 + \cdots ...]^2]$$

$$= \frac{size(q)(1 + size(q))}{2}$$

Case(ii) $d(u,v) = 2 \ for \ all \ u, v \ \in V(G_{Nr})$ and for different k

Subcase a) When $k = 0.1, 0.09, 0.08, 0.07$

$$WW(G_{Nr}) = \frac{1}{2}\{[d(u_1,v_2) + \cdots + d(u_2,v_3) + \cdots \ldots ....] + [d(u_1,v_2) + \cdots + d(u_2,v_3) + \qquad\qquad \ldots\ldots....]^2\}$$

$$= \frac{1}{2}\left\{\left[3p + \left(\frac{p}{pH}(n^3 - 6n^2 + 15n - 8) + \frac{p}{1.5}\right)\right]2 + \left[3p + \left(\frac{p}{pH}(n^3 - 6n^2 + 15n - 8) + \frac{p}{1.5}\right)\right]^2 4\right\}$$

$$= p[\frac{p}{pH^2}(n^3 - 6n^2 + 15n - 8)^2 + \frac{22p}{(1.5)pH}(n^3 - 6n^2 + 15n - 8) + \frac{1}{pH}(n^3 - 6n^2 + 15n - 8) + \frac{90.75p}{3.375} + 3.6667$$

Subcase b) When $k = 0.06, 0.05, 0.04$

65889

$$WW(G_{Nr}) = \frac{1}{2}\{[d(u_1,v_2) + \cdots + d(u_2,v_3) + \cdots \ldots .] + [d(u_1,v_2) + \cdots + d(u_2,v_3) + \quad \ldots \ldots .]^2\}$$

$$= \frac{1}{2}\{\left[3p + \left(\frac{p}{pH}\left(\frac{p}{0.5} - (2n^2 - 15n + 31)\right) + \frac{p}{1.5}\right)\right]2 + [3p + \left(\frac{p}{pH}\left(\frac{p}{0.5} - (2n^2 - 15n + 31)\right) + \frac{p}{1.5}\right)]^24\}$$

$$= p[-\frac{4p^2}{(0.5)pH^2}(2n^2 - 15n + 31) + \frac{2p}{(pH)^2}(2n^2 - 15n + 31)^2 - \frac{22p}{(1.5)pH}(2n^2 - 15n + 31) - \frac{1}{pH}(2n^2 - 15n + 31)$$

$$+ \frac{2p^3}{(0.25)(pH)^2} + \frac{11p^2}{(0.375)pH} + \frac{39p}{1.5} + \frac{p}{(0.5)pH} + 3.6667]$$

Subcase c) When $k = 0.03, 0.02, 0.01$

$$WW(G_{Nr}) = \frac{1}{2}\{[d(u_1,v_2) + \cdots + d(u_2,v_3) + \cdots \ldots .] + [d(u_1,v_2) + \cdots + d(u_2,v_3) + \quad \ldots \ldots .]^2\}$$

$$= \frac{1}{2}\{\left[3p + \left(\frac{p}{pH}\left(\frac{p}{0.5} + (36.7n^2 - 77.5n + 57.2)\right) + \frac{p}{1.5}\right)\right]2 + [3p$$

Theorem 3.6 For a Nanorodgraph G_{Nr}, the Padmakar-Ivan index is

$$PI(G_{Nr}) = \begin{cases} -\frac{148}{3}n^3 + 423n^2 - \frac{2693}{3}n + 528 + 2^{(2n-1)} + 2pn^2 + 60p \\ \quad if \; k = 0.1, n = t-1, k = 0.09, n = t, k = 0.08, n = t+1 \; and \\ \qquad\qquad k = 0.07, n = t+2 \\ -\frac{5}{3}n^3 + 441n^2 - \frac{4013}{3}n + 475 + 63pn^2 - 157pn + 270p \\ \quad if \; k = 0.06, n = t-1, k = 0.05, n = t, k = 0.04, n = t+1 \; and \\ \qquad\qquad k = 0.03, n = t+2 \\ -51n + 142 + 3748pn - 2257p \quad if \; k = 0.02, n = t-1 \; and \; k = 0.01, n = t \end{cases}$$

Proof. We know that the Padmakar -Ivan index of a Nanorod Graph is

$$PI(G_{Nr}) = \sum_{e \in E(G_{Nr})} [m_u(e|G_{Nr}) + m_v(e|G_{Nr})]$$

Case(i) When $k = 0.1, 0.09, 0.08, 0.07$

$$m_u(e|G_{Nr}) = -\frac{157}{6}n^3 + \frac{525}{2}n^2 - \frac{1744}{3}n + 345 + 2^{(2n-1)} + (4n + 40)p$$

$$m_v(e|G_{Nr}) = -\frac{139}{6}n^3 + \frac{321}{2}n^2 - \frac{949}{3}n + 183 + (2n^2 - 4n + 20)p$$

$$PI(G_{Nr}) = -\frac{157}{6}n^3 + \frac{525}{2}n^2 - \frac{1744}{3}n + 345 + 2^{(2n-1)} + (4n + 40)p + -\frac{139}{6}n^3 + \frac{321}{2}n^2 - \frac{949}{3}n + 183 + (2n^2 - 4n$$
$$+ 20)p$$

$$= -\frac{148}{3}n^3 + 423n^2 - \frac{2693}{3}n + 528 + 2^{(2n-1)} + 2pn^2 + 60p$$

Case(ii) When $k = 0.06, 0.05, 0.04, 0.03$

$$m_u(e|G_{Nr}) = -\frac{490}{3}n^3 + \frac{2363}{2}n^2 - \frac{14515}{6}n + 1422 + (50n^2 - 135n + 209)p$$

$$m_v(e|G_{Nr}) = \frac{485}{3}n^3 - 961n^2 + \frac{5251}{3}n - 947 + (13n^2 - 22n + 61)p$$

$$PI(G_{Nr}) = -\frac{490}{3}n^3 + \frac{2363}{2}n^2 - \frac{14515}{6}n + 1422 + (50n^2 - 135n + 209)p + \frac{485}{3}n^3 - 961n^2 + \frac{5251}{3}n - 947 + (13n^2 - 22n + 61)p$$

$$= -\frac{5}{3}n^3 + 441n^2 - \frac{4013}{3}n + 475 + 63pn^2 - 157pn + 270p$$

Case(iii) When $k = 0.02, 0.01$

$$m_u(e|G_{Nr}) = -25n + 82 + (3067n - 2021)p$$
$$m_v(e|G_{Nr}) = -26n + 60 + (681n - 236)p$$
$$PI(G_{Nr}) = -25n + 82 + (3067n - 2021)p + -26n + 60 + (681n - 236)p$$
$$= -51n + 142 + 3748pn - 2257p$$

OBSERVATION 3.7

For the Vertex Szeged index, we take any pair of vertices $u, v \in G_{Nr}$ and find the distance of $d(u,x)$ and $d(v,x)$ and then verify whether $d(u,x) < d(v,x)$ and $d(v,x) < d(u,x)$. But in the Nanorod graph, we can observe that, $d(u,x) < d(v,x)$ and $d(v,x) \geq d(u,x)$. Since the condition $d(v,x) < d(u,x)$ is not satisfied for the Nanorod graph, the Vertex Szeged index is zero.

The table below displays numerical values of distance-based topological indices, including the Wiener index, Hyper Wiener index, Vertex Szeged index, Edge Szeged index, Edge-Vertex Szeged index, Total Szeged index, and Padmakar-Ivan index, for various step values of k: 0.1, 0.09, 0.08, 0.07, 0.06, 0.05, 0.04, 0.03, 0.02, and 0.01.

Step value k	$W(G_{Nr})$	$WW(G_{Nr})$	$Sz_e(G_{Nr})$	$Sz_{ev}(G_{Nr})$	$Sz_t(G_{Nr})$	$PI(G_{Nr})$
0.1	80.1667	9347.7778	210351.75	13494	211163.75	998
0.09	92.5	12244.3055	428301	115604	-319129.667	1194
0.08	115.8333	18196.3056	1684050.25	697274.25	3176945.75	1824
0.07	158.1667	47820.4444	5855509.67	2667613	10905090.3	-2660
0.06	229.6667	68936.1111	21610278.7	-12518451.6	-3426624.56	4152.6667
0.05	313.1667	147771.375	34203854	-52001264.5	-71010645.9	6060.3333
0.04	462.1667	323236.333	-208527539	-100360911.5	-571577797	24834
0.03	948.7	712407.39	$-1.51900794e9$	-112150783	$-6.87964558e9$	100223.667
0.02	2144	3681383.22	$2.69318726e9$	437258264	$3.56770479e9$	113407
0.01	8715.0833	-342714246	$1.05607267e11$	$1.39850748e9$	$1.41186206e11$	791129

From the table above, we can easily observe that the Wiener index produces only positive values. Furthermore, it is evident that as the number of vertices in a Nanorod graph increases, the corresponding numerical values of the Wiener index also increase. Therefore, our study confirms that the Wiener index is the most suitable index among all distance-based topological indices.

CONCLUSION

In this article, we determined the general formula for certain distance-based topological indices and compared their exact values with step values of k: 0.1, 0.09, 0.08, 0.07, 0.06, 0.05, 0.04, 0.03, 0.02, and 0.01.

ABSTRACT

Higher Educational Institutes are the major contributors of growing e-wastes all over the world. Increased generation of e-wastes is a major concern for most of the universities today. However the increase in the e-waste is not correlated with the increase in the rate of their collection, recycle and reuse and this is partly due to lack of awareness. As a result of improper disposal of this e-waste, there is a significant rise in environmental problems. The present study focused on e-waste generation, awareness and management policies in Cotton University. In order to get proper insights to these, a number of science and arts departments were visited and questionnaires were distributed. The study included a sample of 100 students ranging from Higher Secondary to Postgraduate levels. From the present study it is found that the e-waste management strategies and policy adopted by Cotton University is still at a very nascent phase. About 26% of students of the Cotton University are unaware about the concept of e-waste and its management. Workshops, seminars, and awareness programs should be organized by the University to educate faculties and students about effective e-waste management practices. Encouraging recycling initiatives within the institute can significantly contribute to reducing environmental impact.Awareness programmes will make public understand about the importance of judicious use and disposal of such wastes, which otherwise may cause serious impacts in the environment as well as human health.

Keywords: e-waste management, HEI, Cotton University

Mala Dutta and Rani Kumari Shah

INTRODUCTION

Higher Educational Institutes (HEIs) are the major contributors of growing e-wastes all over the world. According to UNESCO[1], there are 88,071 higher education institutes in the world. It is obvious that these educational institutions have huge amount of electronic apparatus necessary to meet their institutional demand. Most of the e-wastes generated by the institutes are computers and printers as the ICT equipment are most widely used, replaced and discarded in HEI, especially in universities. With the advancement in technology, the institutes are replacing the traditional computers with the more advanced ones having flat screens that have increased the e-waste generation. E-wastes, also known as waste electronic and electric equipment (WEEE) include all components such as household appliances, communication and information technology devices, automatic dispensers that are discarded, not working or unwanted by users [2]. Different categories of e-waste make it more diverse and complex in nature [3]. Most of the electronic devices which are of no use are often dumped or stored in places which take a lot of space and at the same time pose as environmental hazard [4]. Now days, it is very significant to address such serious issues like disposal of unwanted and discarded electronic apparatus in universities and other educational institutions for their sustainability. Worldwide higher educational institutes are facing the issues of sustainable development at various levels [5].Various universities and other educational institutions around the globe have embarked on projects and policies related to e-waste management for their campus to be sustainable through their teaching aids and management like Sydney University in Australia asset guidelines of policies, management, disposal and maintenance of e-wastes which would ensure better maintenance of e-wastes in the campus [6]. As per the Thessaloniki Declaration [7], all disciplines of a university must address the challenges of environment and sustainable development. As the volume of WEEE in the universities is growing day by day the campus communities should establish or adapt some effective waste management planning and policies to minimize its hazardous effects. According to Smith [8] recycling program should be operated among the educational institutes for on-site collection of e-wastes which is free and accessible. E-waste, generated across all university departments, requires joint action. As a policy, some universities lease the electronic devices instead of purchasing them so that after use it can be returned back to the companies and thus escape from the trouble of its proper disposal. Proper awareness about e wastes among the faculties and students may help the HEI in proper management of these wastes as most of us are unaware about the harmful effect of these wastes on environment and human health.

Due to the advancement in research and information technologies, issues related to e-waste management have received more importance all over the globe. India holds 5th position in production of e waste in the world [9]. In 2015 it discarded nearly 1.85 million tones of global e-waste. Approximately 70% of its e-wastes are discarded from computer devices followed by telecommunication sector, medical and health equipment and electrical equipment i.e. 12%, 8%, and 7% respectively [10]. State wise Assam holds 6th rank in terms of e-waste production [11]. With the advancement of technology, the rate of purchase of electronic devices has been increased, and most of the time, irrespective of their need, which has increased the amount of e-waste that is generated [12].These wastes are extremely harmful to our planet. The wastes dumped as landfill leads to the release of toxic compounds over time on being exposed to various environmental factors. Heavy metal like lead along with cadmium and beryllium are some of the toxic substances released by the e wastes which ultimately may find its way to groundwater which may impacts both aquatic and terrestrial life forms [13].According to WHO [14], exposure to e-waste may lead to several ill effect on our health such as premature birth and various lung and respiratory diseases. As the challenges are increasing day by day, reduce use and recycling of the e-wastes may help in solving the problem to a great extent.

Increasing generation of e-wastes is a major concern for most of the universities all around. However the increase in the e-waste is not correlated with the increase in the rate of their collection, recycle and reuse. As a result of improper disposal of this e-waste, there is a significant rise in environmental problems. Inappropriate and unplanned disposal may also lead to the loss of secondary materials, especially metals that can otherwise be reused. As such proper disposal and handling is of utmost importance. [15]. It is estimated that Assam generates approximately 14,000 tonnes of electronic wastes annually and Guwahati is identified as one of the largest generator of e-waste in the NE India. Being a role model, the HEIs, have to come up with proper and feasible e-waste management policies that

Mala Dutta and Rani Kumari Shah

deals with proper management as well as disposal of these wastes, if there is not one [16]. No studies on e-waste management have been carried out in HEI's specifically in the North-eastern part of the country. Keeping these factors in mind, the present investigation was undertaken to study the e-waste scenario and its management in Cotton University, Guwahati, Assam which can act as a baseline study.

E-waste management policies in HEIs across India

Many leading Universities of the country like University of Lucknow, Maharaja Institute of Technology Mysore, Islamic University of Science and Technology J&K, Central Sanskrit University New Delhi, Dr. B.R. Ambedkar University Delhi and Jaipur Engineering College and Research Centre, Rajasthan have proper e-waste management policies that mainly focuses on identification of e-wastes, segregation of e-wastes, disposal of e-wastes, awareness among the public, donating electronic devices like computers and laptops along government schools, recycling, reuse, record keeping and certification of disposal of e-wastes [17, 18, 19, 20, 21 and 22]. HEI's such as Pandit Dindayal Energy University, Indian Institute of Teachers Education, Gandhinagar have multiple MoU with various government agencies and NGOs for proper disposal [23 and 24]. Technical HEI's viz. IIT Delhi have developed "Zero-emission technology to manage and recycle e-waste" that mainly deals with separation of metals from the e-wastes and their recovery [25].

MATERIAL AND METHODS

Study area

The Cotton University, formerly known as Cotton College was established by Henry Stedman Cotton (the Chief Commissioner of the erstwhile British Province of Assam) in the year 1901. It is located in Kamrup (M) district of Assam near the bank of the river Brahmaputra. The latitudinal extension is ranges from 26º11'10.6908" N to 26º11'17.9088" N and longitudinal extension is varies from 91º44'47.6808" E to 91º45'1.7136" E. In 2017 it was upgraded to Cotton University. The University offers a wide range of higher secondary, undergraduate, postgraduate, and research programs across various disciplines. These include humanities, social sciences, natural sciences, computer science, business, law, and more. Presently the university has 30 departments and 3 centers with approximately 5499 students, 241 research scholars and 259 faculty members associated with it. The study area map is shown in the fig 1.

Methodology

This paper presents an overview on the generation of e-waste, awareness among the students as well as management strategies adopted by Cotton University, Guwahati, Assam. To get an overview of the entire scenario, interview and discussions were carried out with the Coordinator IQAC, some committee members of e-waste management cell and officials from the Department of Engineering, and Computer Centre. Various information regarding source of generation of e-waste, awareness and management policies were gathered from them. In order to get proper insights to these, a number of science and arts departments were visited and questionnaires were distributed among students. The study included a sample 100 students ranging from Higher Secondary to Postgraduate levels. Google form questionnaires were prepared and various information regarding awareness and attitude towards e-waste hazards was collected from students belonging to different disciplines within the institution. Out of a total of 100 students, the study focused on 74 students who already had possessed knowledge about the concept of e-waste. These students were selected for further analysis and investigation. Both quantitative and qualitative data analysis approach were adopted to interpret all the information. Statistical analysis was carried out using Microsoft excel software. The survey was conducted during the first quarter of 2023.

Mala Dutta and Rani Kumari Shah

DATA ANALYSIS AND INTERPRETATION

E-waste scenario in Cotton University

Since electronic devices are used by all the departments and centres, all of them contribute to the generation of e-wastes to some extent. However, the departments from science background have contributed the most to this e-waste generation in the University. Most of the e-wastes generated by the institute include computers, laptops, printers, projectors, xerox machines etc. An example of different types of e-waste generated by the Department of Geography is given in table 1. This includes details such as the number of items and their specifications for each category of e-waste, like CPUs, monitors, printers, keyboards, etc. Currently there is only one e-waste management cell in place that is assigned the duties to deal with the management and disposal of e-wastes generated by the institute. As per the existing management policies, the e-wastes are first scrutinised by the technicians in the respective departments of the institute and the ones which are repaired are reused. The non repairable or to be discarded wastes are listed by the department and are sent to a store room in one of the boys hostel (old KKH hostel) which is not in use (fig 2). In many HEIs the unused electronic devices are stored in designated places. Placing the e-wastes in storage is a common practiced mode for its disposal in many colleges and universities [12 and 26]. Many HEIs choose land filling as one of the means of disposal and dumping of various e-wastes [26, 27 and 28] but it is not practiced in Cotton University as it is not environment friendly. Although there is no proper dumping policy adopted by the institute, a MoU has been signed between the institute and GMC licensed vendor 'iNow'which takes away the discarded e-wastes in exchange with a nominal fee. Some HEIs also donates old but working electronic equipment among government learning institutions before purchasing new and updated versions of electronics. Such old devices can be further used and also reduces the burden of storage on the host institute [29 and 30]. A generalized framework of e-waste management in Cotton University is depicted in Fig 3.

Students' attitude and awareness regarding e-waste

The student community play a significant role in addressing and managing e-waste issues due to their ability to raise awareness, foster sustainable consumption practices and drive recycling initiatives. They can educate their communities and peers about the negative impact of improper e-waste handling and benefits of recycling. Additionally, they can advocate for e-waste related educational campaigns, collection programs, instructional drives, etc., and can collaborate with local authorities, NGOs and organizations to ensure collection, storage, proper disposal and recycling processes.

Electronic devices used by the students

Figure 4 gives an idea about the electronic devices used by the students. Out of the 100 students surveyed, all of them use mobile phones, 43 of them have laptop/desktop and 33 of them have ear/head phones. The use of tablets and smart watches are less. Affordable prices of cell phones and availability of easy internet facilities have made them an integral part of the current generation.

Handling of damaged electronic devices by students

This study inspected what students do with their discarded electronics and the result is shown in fig 5. It is found that 15% students throw their electronics and 47% fix and reuse their electronics which is a very good practice. About 33% of students store their discarded product that is not evidently a good choice to go for as it occupies a lot of space and cause serious harm to the environment. Additionally, 5% of respondents engage in selling their discarded electronic devices, a commendable approach as it contributes to potential recycling and reuse of waste. The result depicts that the students are not much aware of the handling and collection system of e-wastes. Thus, it is very important for the Cotton University authorities to come up with an effective and regulated electronic waste collection process.

Mala Dutta and Rani Kumari Shah

Awareness of students of Cotton University on e-waste

Interestingly when 100 students were interviewed, many of them were unaware about the concept of e-waste and its management. The study reveals that a majority of the students surveyed (74 out of 100) are aware of the concept of e-waste. This is a positive sign as it suggests that a significant portion of the student population has some understanding of the environmental issues related to electronic waste. 26 students out of the surveyed group are not aware of the concept of e-waste. They might not have a clear understanding of what e-waste is (fig 6).A part of the study focused on awareness of students regarding recycling of e-waste, the hazard or risk factor associated with e-waste and toxic materials present in electronic devices. Among the selected students (74 students who already had possessed knowledge about the concept of e-waste) 69% of them showed awareness about the recycling of e-waste. They likely understood that e-waste can be processed and reused to reduce environmental impact, 31% of the students had no awareness about e-waste recycling, indicating that they had some knowledge but not a comprehensive understanding. Among the respondents, 47.3% believed that there are risk factors associated with e-waste. These students had an understanding that improper handling of e-waste could have negative consequences for health and the environment. On the other hand, 52.7% of the respondents did not consider any risks associated with e-waste, suggesting they might not be fully aware of the potential hazards. 46% of the respondents recognized the serious threat posed by the increasing amount of e-waste to the institute. This indicates that they understood the potential negative impact of accumulating electronic waste on the institution and its surroundings. However, 17.5% of the respondents did not share the same viewpoint and did not consider the growing e-waste as a significant threat. A notable proportion, 36.5%, did not have any clear stance or opinion on this matter. A substantial majority, 78.3% of the students, believed that e-waste contains toxic elements. This likely refers to their understanding that electronic devices often contain hazardous materials that can pose risks if not properly managed (fig 7).

Students' participation in e-waste related activities in the University

The study also examined the students' participation in e-waste management such as whether the students are aware of University's policies regarding e-waste, their participation in any e-waste program or had taken part in any campaigns etc., students' opinion regarding awareness program and their willingness to take action in order to prevent environmental damage caused by e-waste. The result (fig 8) is quite surprising that about 79.8% students do not know the management policy of the University. Only 13.6% students confirmed that they have participated in e-waste awareness programmes while 86.4% respondents have never participated in any such programmes. Lack of knowledge and awareness about e wastes among the youths is not a good sign as they are major users of electronic devices. All respondents believed that awareness programs focused on e-waste management can help improve e-waste management practices. None of the respondents disagreed with this statement. The response to the question, "Do you believe that you should contribute to prevent environmental damage caused by e-waste?" is impressive as 98.2% responded as yes. Environmental problems are on a rise and poses threat to various life forms as well as the environment. In present situation, if e wastes are not managed properly, it will lead to serious non-repairable complications in future.

Level of satisfaction on e-waste management in the institution

According to the study, maximum respondents are not satisfied about the e-waste policy of the institute. The reasons for dissatisfaction in the Cotton University campus are shown in fig 9. The largest percentage, 36% of students, expressed dissatisfaction due to a perceived lack of proper management of e-waste within the university while 18% of students mentioned that a lack of awareness or understanding about what e-waste is and its implications is a reason for their dissatisfaction with the university's e-waste management. 11% of students believe that the policies or regulations related to e-waste management in the university are not being properly enforced, which contributes to their dissatisfaction. 2% of students indicated that they personally do not understand the e-waste management process, which is a factor in their dissatisfaction. A significant, 33% of students mentioned that they do not know the reasons for their dissatisfaction with e-waste management. This could indicate a lack of awareness or information among this group.

65901

CONCLUSION AND SUGGESTIONS

With the advancement of technology, the rate of purchase and use of electronic devices have increased. Old goods have been replaced by new ones increase of amount of e-waste that is generated. Use of modern electronic devices and generation of e-wastes is unavoidable especially in HEIs. Therefore, e-waste management is the only way to prevent its serious impacts in near future. From the present study it is found that the e-waste management strategies and policy adopted by Cotton University is still at a very nascent phase. Most of the students are unaware about the concept of e-waste management. Awareness programmes will make public understand about the importance of judicious use and disposal of such wastes, which otherwise may cause serious impacts in the environment as well as human health. To address the pressing issue of e-waste management, a comprehensive set of suggestions has been put forth. One of the key recommendations involves the establishment of an e-waste surveillance committee, responsible for overseeing and regulating the proper disposal of e-waste. To increase our understanding of this concern, increased research efforts in e-waste management are proposed, aiming to unearth innovative solutions and strategies. Creating a centralized collection point for diverse e-waste types offers a practical way to streamline disposal processes. Moreover, instituting internship programs focused on e-waste management can bridge the gap between academia and practical application. In order to promote awareness and knowledge dissemination, workshops, seminars, and awareness programs should be organized to educate faculties, research scholars and students about effective e-waste management practices. Developing a comprehensive database dedicated to e-waste statistics will provide valuable information for future initiatives. The proposition of introducing a Diploma course in e-waste management, coupled with placement tie-ups, could pave the way for a skilled workforce in this domain. To embed the principles of responsible e-waste management within the curriculum, the inclusion of such content in the Undergraduate Environmental Science program is suggested. Leveraging various media platforms can enhance awareness campaigns and foster a culture of responsible e-waste disposal. Encouraging recycling initiatives within the institute can significantly contribute to reducing environmental impact. Furthermore, the effective management and research surrounding e-waste could potentially generate income, leading to sustainable practices that benefit both the institution and the environment.

LIMITATIONS OF THE STUDY

Several limitations characterize the scope of this study. Firstly, the survey was exclusively carried out within the confines of Cotton University and was limited to a relatively short duration of six months. This limited timeframe might not fully capture the long-term trends or fluctuations that could arise in a more extended study. Secondly, the research focus was limited to investigating three specific variables: generation, management, and awareness regarding the concept of e-waste in students. This narrow selection may not encompass the entirety of factors that contribute to the complex issue of e-waste. Lastly, the paper's presentation is constrained to percentage-based analysis, potentially overlooking more nuanced insights that could be gleaned from a more varied and in-depth analytical approach. Despite these constraints, the present study's findings offer a preliminary understanding of the subject matter and lay the groundwork for future research endeavors with a more comprehensive scope and diversified methodologies.

ABSTRACT

In this research, a brand-new adaptive multiplexer-based multiplication technique for an n-bit multiplier is proposed. It can be utilized in a variety of digital image processing applications, including those for processing satellite images, processing images for use in medicine. This proposed Field Programmable Gate Array (FPGA)based 'n'-bit multiplier uses a multiplexer and adder circuit. This reduces the power's area, latency, and leakage. In comparison to other current methods like the Constant Correction Truncation (CCT) scheme, Variable Correction Truncation (VCT) scheme, and Pseudo-carry Compensation Truncation (PCT) scheme, the suggested new adaptive multiplexer-based multiplication approach performs multiplication. In terms of area and delay, the suggested adaptive multiplexer-based multiplier performs up to 30% better than other existing multipliers. In comparison to other existing methods, the suggested method uses around 45% less dynamic power and generates a smaller amount of leakage power. The proposed system's average error value is 28% lower than that of the other systems already in use. Three devices from the XC3S1500-5fg320 FPGA family are used to implement the multiplier. The adaptive multiplexer-based multiplier now performs better all around.

Keywords: multiplier, multiplexer, FPGA, Area, Delay and leakage power

INTRODUCTION

A digital circuit using combinational logic called a "binary multiplier" is used to multiply two numbers. It frequently appears in a variety of contexts, including

Bharathi *et al.*,

- Digital image processing
- Computers
- High speed calculators
- Digital signal processing
- Mobiles …..etc.,

When compared to addition and subtraction, multiplication is a complex operation. It requires the multiplicand and multiplier, two numbers. Similar to how you multiply decimal values, binary multiplication works. Because binary multiplication simply uses binary values (0 and 1), computation of such operations is simpler. The following equations illustrate the binary multiplication rules.

$$0 \, X \, 0 = 0 \quad (1)$$
$$0 \, X \, 1 = 0 \quad (2)$$
$$1 \, X \, 0 = 0 \quad (3)$$
$$1 \, X \, 1 = 1 \quad (4)$$

Let us consider the example of 4 bit numbers as shown in figure (1). The multiplier value is 1011 and multiplicand value is 1010. This type of multiplication generates partial products depending on the multiplier's bit count. The value of all partial products is added to determine the final product value. Combinational multiplier or array multiplier is the name given to the process in which four shifts and additions are employed to multiply four-bit binary numbers. To improving the performance of combinational multiplier circuit to introduces the Parallel Binary Multiplier Circuit (PBMC). Let us consider the example of two bit PBMC is shown in figure (2)

Here the multiplicand is A1 A0 and multiplier is B1 B0
The partial products are evaluated by multiplication of the each bit of the multiplicand and multiplier. PBMC method was implemented using combinational logic circuits. AND gate was used to perform multiplication operation and adder circuit was used to perform addition operation. Similarly 4 bit PBMC example is shown in figure (3)

Here the multiplicand is A3 A2 A1 A0 and multiplier is B3 B2 B1 B0
The implementation of 4 bit PBCM by using combinational logic circuit as shown in figure (4)

RELATED WORK
A method for quick augmentation with a basic computerised circuit was illustrated by Lobby et al. The calculation entails registering erroneous two-fold logarithms, adding or subtracting the logarithms, and calculating the anticipated antilogarithm of the result. Even though the calculation uses an advanced channel, processing a single item is not any simpler than with exhibit multipliers. In order to increase the accuracy of a logarithmic multiplier that relies on Mitchell's computations for computing logarithms and antilogarithms, McLaren presented a method. The proposed approach only relies on the paired division segments of two multiplicands, which provides space and force sparing, to make the error in the output. Patricio Bulic et al., in order to achieve discretionary exactness through an iterative process, Patricio Bulic et al. devised an iterative logarithmic multiplier and examined several multipliers in a logarithmic number framework. The error remedy was applied in accordance with the necessary augmentation. This strategy's limitation is the combinational postponement that increases with each new remedy circuit.

A method based on blended whole number straight programming was presented by Davide De Caro and colleagues to achieve perfect co-productive qualities that reduce relative estimate error while using fewer nonzero bits for the co-proficient. By making a few moves, the equipment usage recognises the duplicate and grows, avoiding the use of all multipliers. Complex equipment for low-accuracy use is the result of this method. Abed and Sifred came up with the idea for and created a 32-piece, original double to parallel logarithm converter CMOS. The converter is constructed using a pure combinational logic plan and determines approximated logarithm in a single clock cycle.

65908

Bharathi *et al.,*

The logarithmic converter's speedy Leading One Detector (LOD) circuit and modified logarithmic shifter operate quickly and efficiently. Because of logarithmic approximations, the errors are known. To study the complexity of the computation, Kowada et al. devised reversible circuits for Karastuba's calculation. The various methods of disposing of waste were discussed and compared to Bennet's plans. This circuit can be used in reversible computers, which have the advantage of being very energy-efficient. CPUs and GPUs were examined by Bryson R. Payne et al. The analysis shows that picture handling convolution functions more effectively than CPU. In order to deal with giving the advanced Rivest-Shamir-Adleman (RSA) processors dependent on high-radix Montgomery multipliers fulfilling various requirements, such as circuit region, working time, and resistance against side channel attacks, Atsushi Miyamoto et al. proposed a fundamental configuration method. The suggested method combines three information way structures using various middle-of-the-road structures to provide improved information ways matching the requirements. The multiplier is not the best choice for calculations involving cryptography.

Effective FPGA use of bit-equal blended Karatsuba-Of man multipliers (KOM) and Galois Field GF were introduced by Pack Zhou et al (2m). As compared to previous Application Specific Integrated Circuit (ASIC) dialogues, the common statement sharing and the multidimensional nature investigation on odd-term polynomials were familiarised with to achieve a lower entryway bound. Utilizing four or six information query tables on FPGAs prolonged the test. A useful calculation for registering decimal logarithms using 64-piece coasting point number-crunching was proposed by Ramin Tajallipour and colleagues. The calculation relies on digit-by-digit iterative calculation, which excludes the use of bend fitting, query tables, decimal to twofold transformation, and division operations. A low-normal-mistake adaptive PCT plot was proposed by Chip-Hong Chang and Ravi Kumar Satzoda and compares to other truncation algorithms.

The suggested method achieves lower normal. Equipment construction and FPGA-based equal engineering for conventional and shorter multipliers were introduced by Muhammad Rais et al. Comparing the suggested multiplier to conventional multipliers, it takes up less space.

The product of two n bit number is given by
$$P = A\,B \tag{5}$$

Where A = an-1 an-2 ……..a1 a0 is multiplicand and B = bn-1 bn-2 ……. b1 b0

For multiplexer based multiplier An-1 = an-2 an-3 an-4 ……….a0 and Bn-1 = bn-2 bn-3 bn-4 ……..b0, the product value is given by
$$P = \{An - 1 + 2^{n-1}an - 1\}\{Bn - 1 + 2^{n-1}bn - 1\} \tag{6}$$

To reduce this equation we get
$$P = \sum_{i=0}^{n-1}(ai \cdot bi)2^{2i} + \sum_{i=1}^{n-1} Mi\, 2^{2i} \tag{7}$$

Where Mi = ai Bi + Ai bi, Mi can be used to implement the multiplexers with select lines are ai and bi.
The adaptive compensation circuit and fixed biassed technique are proposed to reduce the truncation error. By keeping the multiplexer's most important columns, it is possible to decrease the hardware. The result of the n-bit truncation is given by

$$Pt = \sum_{i=r}^{n-1} Mi\, 2^{i-n} + \sum_{i=\left[\frac{r+1}{2}\right]}^{r-1} Mti\, 2^{r-n} + \sum_{i=\left[\frac{r+1}{2}\right]}^{n-1}(ai \cdot bi)\, 2^{2i-n} + \sum_{i=0}^{r-1}(ai \cdot bi)\, 2^{r-n} + 2^{-1} \tag{8}$$

Where r= n-k
Mti = ai . Bti + Ati . bi
Bti = bi-1 bi-2 bi-3 ………….br-i
Ati = ai-1 ai-2 ai-3 ………….ar-i

Bharathi *et al.,*

For a 8:1 multiplexer, however the output z depend on select signals s1, s2 &s3 and inputs i1, i2, i3, i4, i5, i6, i7 & i8 is given by

$$z = \overline{s1s2s3}i1 + \overline{s1s2}s3i2 + \overline{s1s2s3}i3 + \overline{s1}s2s3i4 + s1\overline{s2s3}i5 + s1\overline{s2}s3i6 + s1s2\overline{s3}i7 + s1s2s3i8 \quad (9)$$

The probability of z may be 1 or o therefore Pz = 0.5.

The multiplexer based array multiplication product value is given by

$$P = \sum_{i=0}^{n-1}(ai \cdot bi)\, 2^{2i} + \sum_{i=1}^{n-2} Mi\ 2^i - Mn - 1\ 2^{n-1} \quad (10)$$

Reduction error

Elimination of the reduction error based on the selection of multiplexer for partial product evaluation. The number of multiplexers used for the implementation also reduced.

$$E\,(mux) = \left\lceil \frac{i}{2} \right\rceil Pz\ 2^{i-n} \quad (11)$$

$$Ered = \begin{cases} 2^{-n}P0\,, \ i = 0 \\ \sum_{i=2}^{n-k-1}\left(\left\lceil \frac{i}{2}\right\rceil Pz\left(\frac{n}{2}\right) + Pzn + P0\ \right),\ \forall\ even\ i \\ \sum_{i=1}^{n-k-1}\left\lceil \frac{i}{2}\right\rceil Pz\left(\frac{n}{2}\right) 2^{i-n}\,,\ \forall\ odd\ i \end{cases} \quad (12)$$

Rounding error

The value of P0 initially 0.25, if i increase it quickly changed as 0.5 therefore the expected value of error is given by

$$Eround = 0.5 \sum_{i=n-k}^{n-1} 2^{i-n} \quad (13)$$

Total error value for the before compensation is given by

$$Etot = -(\,Eround + Ered\,) \quad (14)$$

The expected value of the compensation is given by

$$C = 0.5 \left\lceil \frac{n-k}{2}\right\rceil Pc\ 2^{-k} \quad (15)$$

The average error value is given by

$$Eavg = Etot + C \quad (16)$$

RESULT AND DISCUSSION

Our proposed method compared with the existing methods such as PCT, VCT and CCT. We consider the following parameters for discussion
- Average error value
- Delay
- Area
- Dynamic power
- Leakage power

The parameter practical values are listed in the following table and corresponding graph is plotted as shown in the following figure.

CONCLUSION

The efficiency of the proposed adaptive multiplexer based multiplier can be improved tremendously. In this proposed method with low mean square error value when compared with the other existing methods. The area of utilization is directly propositional to the number of bits, if n is small the area of utilization also less. The delay in nano seconds, compared to the other existing methods the proposed method provide 30% better results. The leakage

65910

ABSTRACT

Online learning represents a paradigm shift from the traditional educational model. Post-pandemic, it changes into a new shape. With several virtual platforms and apps, it virtually became a technology-driven educational system. Digital humanities and educational technology are currently two distinct but interconnected fields. Although the efficacy of psychologically direct one-on-one interaction in online form has long been disputed, it differs from the traditional in-person method of training in principle. The main goal of this suggested model is to provide teachers with an accurate depiction of the typical emotional state of the audience or group of students in terms of the event's overall acceptability. Despite being a lengthy effort, it is full of uncertainties and imprecision. The average analysis of a classroom or gathering is divided into two distinct modules in the model formulation of the problem. (a) Image Extraction: Clipping out each person's face from individual frames in any video stream. (b) expression analysis: examining each individual's expression from each frame in order to determine their average emotion during the course of the event. The model to assess the attendees' acquired face photos is taken into account for further expression analysis, and measuring the feelings under the theory of uncertainty in attention or non-understanding distinction is the most difficult issue to address) is taken into

65915

consideration. In the solution process, Content based Video retrieval (CBVR) and Video information Retrieval (VIR) is employed to with a systematic solution approach to conclude about class participation and response. Additionally, the pupils' speech patterns are monitored in order to carefully annexe the decision using Natural Language Processing's Part of Speech (PoS) tagging.

Keywords: CBVR, Digital Image processing, Machine Intelligence, NLP, PoS tagging, VIR

INTRODUCTION

For effective retrieval of the pertinent movies from the database, video indexing is a very important step. We can quickly search for, find, and watch suitable videos based on user needs. By increasing flexibility, the approach makes it simpler to access and search for the multimedia information. The indexing procedure may begin automatically as soon as the movie is saved to the digital library. Static video summary (storyboard) is the static representation of content utilizing video indexing and frame-based tagging. A subset of the frames that make up a video are chosen for presentation in a storyboard representation out of the total set of composing frames. The keyframes are chosen using a variety of methods. Conciseness and coverage are the two key factors taken into account in the summary exercise. The primary goal of this work is to quickly select keyframes from a video's compositing shots in order to quickly produce a storyboard. The amount of distances that must be calculated between the frames of a shot directly relates to the time required to create the storyboard. MST has a temporal complexity of O(n2). As a result, a technique for creating the approximate minimal spanning tree (AMST) must be created. The keyframes would be chosen from the collection of frames in the shot using the AMST that was so obtained. The representative frame set of the movie thus can be generated, which may be utilized for indexing purposes in the online digital repositories, by compiling all of the keyframes taken from all of the video's shots. The goal of the work is to compare user-provided summaries with those created using MST and AMST using well-known metrics like Precision and Recall.

The coronavirus outbreak (COVID 19) has had a catastrophic influence on our lives, yet online education is a remarkable result of it. It has impacted every industry on the planet, including education, and has significantly changed the learning environment for kids. Therefore, it is now more crucial than ever to comprehend students' feelings and levels of engagement throughout online learning activities due to the growing popularity of online learning. Two methods that have been utilized to learn more about students' emotional states and levels of involvement are emotion analysis and facial expression recognition. Using Part-of-Speech (PoS) tagging, emotion analysis examines textual responses to determine the emotions being expressed in the language. Use the enter key to start a new paragraph. The appropriate spacing and indent are automatically applied. In order to identify emotional states in a student's facial expressions during a video conference, facial expression recognition uses computer vision algorithms. Although both methods have shown promise in online learning, they are normally applied separately. In this study, we investigate the possible advantages of integrating these approaches to better comprehend the feelings and engagement of students during online learning activities. On a dataset of student responses and facial expressions, we demonstrate the efficacy of our methodology for combining emotion analysis and facial expression identification. Our findings imply that combining these approaches can offer insightful information about the emotional states and involvement of students, which can guide the creation of more efficient online learning activities.

LITERATURE REVIEW

Two tried-and-true methods for interpreting emotional states and levels of participation in human communication are emotion analysis and facial expression recognition. Researchers have recently looked at the application of these

strategies in online learning, where it can be difficult to assess students' emotional states and levels of involvement due to the absence of face-to-face interactions. To determine students' feelings and their level of involvement with the learning materials, emotion analysis has been widely employed in online education. PoS tagging is a well-liked technique for conducting emotion analysis, in which algorithms examine the text to find emotional linguistic patterns. For instance, PoS tagging was used by Gavrilova, Ponomareva, and Sviridenko (2019) to examine the emotional content of online dialogues in a distance learning course. They discovered that the use of positive language increased levels of involvement whereas the use of negative language decreased levels of engagement. Another method with promise for online teaching is facial expression recognition. Students' facial expressions can be analyzed by computer vision algorithms to determine their emotional states and degrees of engagement. For instance, Tan and Pavlovic (2006) employed facial expression recognition to examine the facial expressions of students while they were participating in a live video conference. They discovered that pupils who were more interested in the subject had more positive facial expressions, such nodding and smiling.

While facial expression recognition and emotion analysis have both showed potential in online learning, they are normally employed separately. Combining these approaches is becoming more popular in order to develop a more thorough understanding of students' emotional states and engagement levels. For instance, Zhang, Wang, and Wang (2021) used a recent study to analyse students' emotional states while they participated in an online discussion forum by combining facial expression recognition and PoS tagging. They discovered that the combined strategy offered a more accurate picture of students' emotional states than either technique used separately. In conclusion, while emotion analysis and facial expression recognition have been utilized separately in online learning, there is growing interest in fusing these methodologies to acquire a more thorough knowledge of students' emotional states and levels of involvement. Several studies have shown the potential advantages of combining these tactics, but more study is required to examine the efficacy of various strategies and to determine the most efficient ways to include these techniques in online education.

On the other hand, for almost two decades, research on Content-Based Video Retrieval (CBVR) has focused on Video Indexing. 'Content-Based' refers to the semantic content of the media type under consideration. 'Retrieval' is the term used to describe the process of removing the pertinent data (audio, video, or image). Since CBVR research encompasses other fundamental media types including text, picture, and audio, it presents several obstacles. As a result, developments in text processing, picture processing, and audio processing have accelerated the area of CBVR. Another important factor is the accessibility of online storage spaces where users can freely submit video footage.
A video shot is a collection of connected frames captured by a single camera at a time. Typically, pictures are stitched together to create a video. A scene in a video might be made up of one or more shots that tell a specific story. The recognition of visual disparity brought on by transitions serves as the foundation for shot boundary detection. These shots must be once more separated during video analysis by identifying the shoot boundaries. The two primary classifications of shot boundaries are gradual transition and rapid change [13]. The simplest phase in any video analysis application, shot transition detection is crucial to the processing of videos [8].

Shot detection's primary goal is to detect the change in focus between two shots in a movie automatically. discovering the smooth transitions is more difficult than discovering the sudden ones. The discrepancy between two frames is typically discovered during shot change. This difference manifests itself in several ways that can be divided into two categories: abrupt (as a hard cut) and gradual (dissolve, fade in, fade out, wipe). A single frame shows a sudden change in shot. An immediate change from one shot to another is known as a hard cut or abrupt shot change [9,10,11]. 95% of all shot transitions are abrupt shifts of shot [12].

In case of abrupt transition, the last frame of the previous shot and the first frame of the next shot are placed sequentially for amalgamation in order to achieve this type of transition. Gradual shot change refers to the slow change of brightness in video that often results in a solid black frame. Gradual shot change [14] occurs slowly over a few frames as one shot ends and another shot starts. The frames involved in a gradual transition are a combination of same number of frames taken from both the shots. The manner of combination of the frames determines the type of

gradual transition, i.e., dissolve, fadein, fade-out or a wipe effect as portrayed in Fig2. In this type of transition, frames from two shots may be combined using chromatic, spatial or spatio-chromatic effects which causes a slow transition from one shot to the other. If the first shot's pixel is replaced with pixels of second shot in a sequential pattern (for e.g., in a pattern from left edge of the video frames to the right), then wipe occurs. A dissolve transition is a kind of subtly changing shot that happens between two shots. The process of the first shot's images becoming darker and the second shot's photos becoming brighter causes frames to appear during the transition that show how one image is being superimposed on the other images. There isn't a definite line separating the shots. Because of this, in this form of transition, the first shot fades out and the second picture fades in such a way that the frames that make up the dissolve sequence are a linear combination of frames from the two shots.

As a result, as the dissolve sequence progresses, pixel values from frames in one shot contribute more, while pixel values from frames in another shot contribute less. In light of this, a dissolve sequence can be represented as a blend of a fade-in and fade-out [15]. Two or more distinct scenes overlap during a dissolve sequence. The fade is a different kind of slow transition. When a monochromatic screen transitions into a scene, the image displayed on the screen gradually fades away [16, 17]. On the other hand, fade-outs happen when the scene that is being displayed progressively gets lighter or darker until it is completely black or completely white. Another kind of progressive picture transition is called a wipe, in which a line crosses the screen and a new scene emerges [18].

METHODOLOGICAL ASPECTS

The components of methodology are described in the subsections

Data Collection and Preprocessing

The data gathered from online learning activities to look into the possible advantages of combining emotion analysis utilizing PoS tagging with identification of facial expressions for online education. We specifically gathered information from a discussion forum and lecture recordings posted online. In contrast to the lecture recordings, which contained videos of the teacher conducting lectures, the online discussion forum data consisted of text-based debates among students. The data is then preprocessed in order to weed out any extraneous information and make it ready for analysis before we started the research. We did basic text preprocessing on the online discussion forum data, such as stopping words and stemming, and deleted any postings that were irrelevant (such as spam or off-topic messages). The video and audio data from the lecture recordings were extracted, and computer vision methods were utilised to identify and track the students' facial expressions.

Emotion Analysis using PoS Tagging

A pre-trained sentiment analysis model is employed to examine the text data from the online discussion forum in order to perform emotion analysis using PoS tagging. Based on the presence of positive or negative words in the text, the model awarded a positive or negative sentiment score to each post. The sentiment scores were then combined to obtain an overall sentiment score for each student throughout the discussion period.

Facial expression recognition

To perform facial expression recognition, we used a pretrained deep learning model to detect and classify students' facial expressions in the lecture recordings. The model was trained on a large dataset of facial expressions and was able to detect several facial expressions, including happiness, sadness, anger, and surprise. We extracted the facial expression data for each student and used it to calculate the frequency and duration of each facial expression during the lecture.

Combining Emotion Analysis and Facila
Expression Recognition

We coupled the sentiment ratings from the online discussion forum with the facial expression data from the lecture

recordings in order to examine the possible advantages of integrating emotion analysis using PoS tagging and identification of facial expressions for online education. We specifically determined the link between the sentiment scores and the occurrence and length of each facial expression. Additionally, we classified students into various emotional states (such as positive, negative, and neutral) based on their sentiment scores and data from their facial expressions using machine learning algorithms. To perform facial expression recognition, we used a pre-trained deep learning model to detect and classify students' facial expressions.

Data Analysis
We summarised the sentiment scores and facial expression data using descriptive statistics (e.g., mean, standard deviation) to examine the data. Additionally, we looked into the connection between the sentiment scores and the information on facial expressions using correlation analysis. Finally, we classified students into various emotional states based on their sentiment scores and facial expression data using machine learning approaches (such as decision trees and logistic regression).

Ethical considerations
All participants provided their free and informed consent before we collected any data, and we adhered to all ethical standards. In order to guarantee the participants' privacy and confidentiality, we also made sure that all data were protected and anonymised. On the other hand the Video information Retrieval steps are as follows:

First the structure of video is analyzed: Fig. 1: Structure of a video Then the types of transition in a video are taken into considerations as in the following figure 2.

RESULTS AND DISCUSSION

Results indicate that combining facial expression recognition with PoS tagging using NLP can help improve emotion analysis in online education. The correlation between happy facial expressions and positive sentiment scores suggests that students who exhibit positive emotions in their facial expressions are more likely to express positive sentiment in their texts. This finding is consistent with prior research on the role of nonverbal communication in conveying emotions (Keltner et al., 2003). Furthermore, the correlation between adjectives and positive sentiment scores suggests that students who use more descriptive language are more likely to express positive sentiment in their texts. This finding is consistent with prior esearch on the relationship between language use and emotional expression (Pennebaker & King, 1999). The results also highlight the importance of considering both verbal and nonverbal cues in emotion analysis. While sentiment analysis based solely on text can provide valuable insights into students' emotions, it may not capture the full range of emotions that students are experiencing. By combining facial expression recognition with PoS tagging using NLP, we can gain a more comprehensive understanding of students' emotional experiences in online education.

CONCLUSION

This study concludes by offering early evidence that integrating facial expression recognition with NLP-based PoS tagging can enhance emotion analysis in online education. The findings imply that both verbal and nonverbal clues can be used to communicate emotions and that a more thorough method of emotion analysis can reveal important information about the emotional experiences of pupils. To confirm these results and investigate their generalizability in various circumstances, additional research is required. The small sample size of this study is one of its limitations, which might limit how broadly the findings can be applied. The findings' robustness may also be constrained by the use of a single emotion detection algorithm and PoS tagger. The use of different algorithms and taggers to validate the results should be explored in further research. Alternative approaches of measuring student emotions, such as physiological measurements or behavioural indicators, should be considered in future studies. The study only examined one online course, therefore its findings might not apply to other situations. To ascertain its efficacy across

many disciplines, future study should examine the usage of facial expression recognition and PoS tagging in various online education environments.

ABSTRACT

Participant Prediction for the event based online Social networks has stepped up significantly during pandemic period for conducting the online events. It is considered as more challenging for the event organizer to identify the appropriate participant for their online events. Hence in order to automate the process of the participant prediction for online social events, machine learning algorithm has been projected as existing solutions. Despite of more benefits, solutions for participant prediction suffers in various aspects like data sparsity and cure of dimensionality issues. In this article, a Deep connect, a deep learning model for identifying the participant on basis of the Dynamic Multi-preference of the user on their Multidimensional Attributes has been proposed. To address the problem of sparse data, multi-preference has been integrated, while user communication information has been activated to tackle issues related to the cold start. Moreover, the user's long term and short term interest models have been employed to effectively curate a diverse array of prediction lists. This current method combines both the explicit and implicit attributes of the user to assess the likelihood of the user achieving the event. It does this by calculating the balance between exploitation and exploration. Ultimately, the suggestions for event participants are produced by utilizing a recurrent neural network algorithm along with diverse adaptable inference strategies, adopting deep learning architecture to effectively manage the significance and ordering.

Vadivambigai and Geetharani

INTRODUCTION

Event based Social Networks (ESBN) have been extensively growing to provide personalized platform for data sharing to the users about their contents from a large volume of choices with high quality [1]. The computation of user's preference to the particular event is advantageous for regulating or approximating their future conclusions. Conventional machine learning methods for participant prediction has been implemented using unsupervised classification of the user profiles of the social network. User profiles can be demonstrated in form of user interests, unique characteristics and varied preferences [2]. Despite the extensive studies of recommendation system using machine learning [4][5], collaborative filtering has been employed as conventional techniques to compute the user expectation using user event matrix composed of the entire user ratings. Nevertheless presumption is impractical in the present circumstances as size of social data expanding will be cumbersome on controlling entire data using the machine learning models. In addition, Term frequency and inverse document frequency employed to map the user to event effectively. Hence deep learning model on incorporating the user preference will lead to better results on managing the data with content and time drift. Further deep learning model is capable of handling the challenges of the curse of dimensionality and data sparsity.

This paper presents the design and implementation of Deep Connect, which utilizes a user's diverse preferences and multidimensional attributes. By employing deep learning techniques to project multiple user preferences, the multidimensional characteristics of the user can be efficiently extracted, addressing the problems of sparsity and cold start through similarity computation. The user's interest is determined by analyzing their preferences for both the explicit and implicit attributes of the items. It links the user with the events by exploring the contextual interest and linguistic variables. Finally it captures the user dynamic user preference on the explicit contextual features with respect to the rating of past interest of the user. The remainder of the article is divided into the following sections: Section 2 covers the various works of literature pertaining to prediction concepts. The Deep Connect Approach, which recommends taking into account a user's multiple preferences based on different profile attributes, should be expressly developed in section 3. The full analysis of the suggested strategy is then presented in Section 4 through experimental comparisons with existing approaches. The last section of the proposed work, Section 5, serves as its conclusion.

RELATED WORK

There exist conventional techniques employed to identify the user prediction to online social events has been analysed on various criteria's and perspectives efficiently along the various impacts investigations with different objectives on learning models. It is as demonstrated as

Fast Tensor Factorization for Event recommendation
In this literature, Fast Tensor Factorization approach has been employed for the participant prediction through implicit feedback information of the user. In addition, the event has been analysed for event aware recommendation. In this covariance and correlation of the user and should be estimated for the given context using matrix computation [11]. Additionally indistinct data of the user –event recommendation should be formulated on the basis of the association between the contexts. It has been mutually strengthened using chain reaction and facilitating the information of the event logs and user profiles of the event participants. Finally it constructs the user neighbourhood for each individual user on basis of user rating matrix and social relations of the users to the recent events with predicted rating on various explorations.

Evolving user behaviour classification for participant prediction approach

65923

The participant prediction approach in this research is generated and filtered using augmenting iterative learning algorithms at various user data points and in various time slots on various event features. Due to the bagging process to the user-event matrix, it executes in a batch manner as opposed to the traditional recommendation strategies employing machine learning. It excels at modifying a user-event conventional hypothesis on similarity estimate to construct a current user item hypothesis within a given time frame. [6].   It computes the denser communities using two stage frameworks in the network structure on considering the dynamic social effects within the users. The phenomena validates the decision making process of the social influence based thresholds. It identifies the close relation and similar preference of the user on the popular social events. A further social phenomenon to the temporal events has been calculated.

Identification of options using Conflict for Social Event Participation
In this literature, Conflict option based approach has been reconstructed towards decision-making process to the users enabled with multiple conflicts. In this perspective, the inclusion of choice utility model has been formulated on the users' tendency with integrating event content, social content along the cost-based personnel and technical factors. On those computations, it derives the topic interests as well as latent social user interactions could be both gathered. Furthermore, the choice of conflict-choice triples into the pair wise ranking task has been transferred, and a learning-to-rank based optimization scheme is incorporated to mitigate the conflict issue of the recommendation system [11]. It coverage's the discriminant results on the gradients of the global convergences.

Event Recommendation based Context-Aware Collaborative Filtering to ESBN
In this literature, event-based social networks have been provided a user specific platform for hiring a participant to the event using online web applications. This model provides the high accuracy on participant recommendation. A semantic enhanced evolving context aware dual collaborative filtering for event recommendation to evolving events provides reliable solution on integrating semantic content analysis process and contextual event influence analysis process to compute the user neighborhood to the event selection. In particular, the latent topic model on the various topics has been analyzing against multiple event description text and established a user long-term and short terms interest model to alleviate the issue in the model. Further it establishes influence weight computation for each event to determine the social impact among users and its semantic uniqueness among events. Finally it identifies the neighbour for the user according to their long term interest similarities weighted by events' influences. It also identifies new event recommendation on a user-event rating matrix based on event rating prediction on the users' short-term interest models and neighbours' ratings has been determined.

Social diffusion analysis for annotating media contents
In this literature, media annotating approach has been employed to the events on basis of determining the social diffusion records instead of metadata. In this model, primary assumption is that the social diffusion records reflect the common interests (CI) between users to the exploring events of the social network, which can be analyzed for generating annotations to the events to compute the effective and stable participant effectively. With this assumption, Content Inference -based social diffusion model and translate the automatic annotating task into the Content Inference-based diffusion maximization (CIDM) challenges. Moreover, two optimization tasks has been analysed to handle the prediction challenges, corresponding to the training and test stages in supervised learning model of the participant prediction to achieve the high discriminant results to the user influences.

PROPOSED MODEL

In this section, Deep Connect based participant prediction for online event Recommendation on adaptive inference strategies has been computed to evolving characteristics of the user. The process of the architecture is represented as follows

Missing value Imputation

Missing value Imputation procedure is employed to fill the missing value in the meet up dataset. In this work, missing values imputed using the K-NN algorithm. The model is processed by generating the user- event matrix to define the uncertainty of practicable values which ought to be assigned on missed attribute fields. The n times values then analyzed to obtain single integrated estimates using definite fitness criteria [12].To formulate the dependence of the value to the attribute, the classic Independent Cascade (IC) approach has been simulated for simulating the dynamic mutual influence within users. Context aware influence weight to represent its implicit impact on users' social relations has been processed in this part. Initial connections between the users might be extremely sparse to the event. However, after the first attendance, the social factors of the user will be improved due to string connection within active users participating the more social events with respect to both the degree and influence weight rapidly. Particularly, the degree of the user will remain stable, and then decreases slowly due to evolving characteristics, while the event weight still keeps incrementing. Especially in some case user leaves the event and retaining those connection becomes stronger due to more co-occurrences of the user participation. Hence, long-term active users hold denser communities than ordinary ones, which definitely mean more significant social effects. It can be formulated using cost functions.

Feature extraction of the user characteristics

The feature of the user for the event is defined in type of User –event rating matrix this it is to calculate the association among users and event. User Weight connection has been computed on social influence of the user. Each cell of the user-event matrix can be constituted as a triple data set in the network structure of

$H=\{U_i, E_j, R^j\}$

Where U_i which defines a user's preferences and R^j represents a user latest preference to the event E_j. Additionally it concludes that user interest of specific event is determined by the explicit and implicit attributes of user and event collaboratively. Computation of the user discrimination errors lead to higher cost of the participant prediction and to reduce the implication, cost function may be formulated to result in the optimized inference of users' profiles and social strength by step by step iterative approach.

User preference based on Implicit and Explicit attributes

The main procedure of a participant prediction model is to establish a group on extraction of the user's preferences and determining the degree of dissimilarity of event to its selected user group in the online social network. Preference elicitation approaches are to represent the recommendation of the event in this scenario by producing the hypothesis of user preferential independence of the description of the event. Cluster builds on account of rating matrix thus it outcomes the event on the interaction among users and event [15].

In this research, matrix factorization is used mostly for implicit attribute extraction of the user for the particular event. Let U^I & E^I defines the implicit attributes space to contain users and event respectively. Furthermore

Vector $U^I = \{w_{i1}, w_{i2}, w_{i3} \dots w_{in}\}$

Vector $EI = \{e_{i1}, e_{i2}, e_{i3} \dots e_{in}\}$

Above definition, produces the user and event implicit attributes weights vector to build the prediction function for participant estimation. User profiles and their social connections are inferred in the training stage. In test stage, predicting the user participation for the target event has been computed.

Class Representation

Features set representation should be defined through relationship of user and event using the Recurrent Neural Network [9]. Deep learning model is capable of the process the feature generated. The LSTM Model stores the feature set and process the feature on hidden relationships as a vector that determines the events the users prefers with homogenous dimension labels. Accordingly the comparable degree among users to the specific event can be computed on employing dimension similarities on the sigmoid based activation function of the RNN Model.

Algorithm 1: Item recommendation
Input: Event profile and User Profiles

65925

Vadivambigai and Geetharani

Output: Participant Prediction to the events recommendation
Process
Compute Implicit and explicit dimensions of the user
Establish the user-event matrix using matrix factorization
      For U =1,2,3,4...i
          Determine User Vector V← Event arg$_{min}$ |w|
              Activate function Wγ_{+1} = (1-γ^{-a})w$_\gamma$ + E$_{arg}$
          Return user elicitation event Matrix

In above algorithm, Participant prediction to the events has been computed on the basis of the specified association on the implicit and explicit attributes.Specifically, proposed approach achieves the better performance with significant margin indicates that the dynamic social influence indeed affects the event participation. Furthermore, the results are stable as variance for multiple user among the multiple event is quite small, which proves the robustness of our framework to a certain degree.

EXPERIMENTAL RESULTS

In this part, experimental outcomes of the proposed approach has been implemented and evaluated against the conventional machine learning recommendation models to illustrate that proposed approach performs better compared with conventional approaches with respect to precision, recall, f-measure and execution time on the meet up dataset.

Dataset Description
Extensive experiments have been accomplished using meetup dataset. Meetup is extensively employed for event recommendation tasks. Dataset contains 100,000 instances with various events for different varieties. The dataset which reconstructed into matrix form has been employed for remaining analysis on the latent preference of the user and event cost analysis using multiple influences.

Evaluation
The proposed architecture is evaluated against the following performance metrics such as Precision (P), Recall(R) and F measure (F).

Precision
The precision value is the ratio of similar data point to the extracted data point from the data space. Precision is also considered as number of reliable feature split by the amount of all extracted feature from the data space. The evaluation is assessed using multiple dataset is represented in the figure 2.

$$\text{Precision} = \frac{\text{True positive}}{True positive + False Positive} = \frac{TP}{TP+FP}$$

Recall
It is the ratio of similar data point of the data to the retrieved instance over the total number of similar data point in the dataset. The recall is the chunk of the similar occurrence of features which are accurately classified into the exact classes.

$$\text{Recall} = \frac{Tp \text{"True positive "}}{TP \text{"True positive"} + FN \text{"False negative"}}$$

On recall performance analysis, the time depend similarity among events in the social networking discussions can represent a user preference on predicting the hidden pattern and preference in the neural network.

F Measure

It is a metric employed to compute a model accuracy of the recommendation result and is measured as the harmonic mean of the precision and recall of the training or test data. According to the results, proposed performance degenerates with less user training samples, which indicates that the framework is sensitive social network structure. Besides, the high ratio of freshmen leads to the severe "cold-start" problem, which impacts the result severelyBased on the analysis, preference-sensitive social connections are proven as insufficient to support the decisions making towards participant prediction to the event. Besides, the cold-start problem, which leads to sparse social network and interaction records, may further hurt the performance. Those complications have been tackled using interest model on the implicit and explicit attributes of the model.

The performance of the execution time of the proposed model is computed against state art approach is represented in figure 3 and assessed values of the evaluated data has represented in Table 1 on recommendation system. As represented in Table 1, proposed approaches evolves the complete participant prediction process on meet up dataset will run 3-4 orders of magnitude speed on comparing against the conventional approaches. Specifically, we utilize the sigmoid function to the RNN architecture to approximate the sign function varying from 0 to 1 participant prediction results containing users. Thus a higher influence weight might be better for user prediction approximation using the activation function. However, smooth variation is will achieved in the softmax layers especially for vectors containing the interest model.

CONCLUSION

We designed and implemented the Deep Connect a participant prediction system for the event based social networks for various social events. Incorporating explicit and implicit event dimensions, the model predicts the attendees to events based on user preference from a series of events in the user event matrix. When building user multi preferences, the explicit user attribute-based prediction encourages a preference method that can help with difficulties like sparsity and cold-start. Additionally, the suggested approach makes use of a recurrent neural network, which by identifying participants based on features taken from various angles, has the ability to create a much larger and more varied recommendation index than traditional prediction systems. Results from experiments have been shown to be extremely reliable and accurate in large-scale networks with many data sources and intricate user attributes on user profiles in social networks.

ABSTRACT

Phase Change Materials (PCMs) are substances that have the ability to store and release large amounts of heat energy as they undergo phase transitions between solid and liquid (sometimes gas) states. These materials are used to regulate temperature in various applications, ranging from thermal insulation to energy storage systems. The ability to store and release thermal energy during phase transitions makes them valuable for managing temperature fluctuations and controlling heat transfer. The PCM is a material that is capable of retaining and freeing extraordinary measures of energy upon cementing and liquefying because of its prevalent inert hotness storing capacity. In this review the work related to phase change materials in various investigations are reported in detail .This paper presents different application of phase change materials and their efficacy , drawbacks. Ongoing research focuses on developing new PCM formulations with improved properties , such as broader temperature range, enhanced thermal conductivity , and longer life span.

Key words: PCM, Heat transfer, HVAC, EV, Cooling

Nithish Reddy *et al.,*

INTRODUCTION

PCMs have found a wide range of applications in various industries due to their ability to store and release thermal energy. This property makes them highly useful for temperature regualtions , energy storage, and heat management. Many researcher investigated on the types of PCMs and their developments. This articletells about the developing use of PCM applications from the last part of the 1940s to the workshop date. Currently, the worldwide PCM market is assessed to develop from $ 460 million out of 2013 to roughly $ 1.15 billion by 2018. Kenar et al. [1] gave a concise outline of stage change materials, features the different sorts of lipid substances inspected for PCM applications, and proposes expected future spaces of study.Kyriaki et al. [2] carried out examination of PCMs in the structure area which is assigned to various thermo physical boundaries, which makes the utilization of PCMs in structures causing difficult. PCMs are utilized to fundamentally guarantee indoor warm comfort and add to energy performance. The positive effect of PCMs on the structure's yearly cooling and warming burdens in different ecological zones is a typical end.

Christina et al. [3] targeted investigating these examinations in regards to the possible effect of PCM on building comfort and energy execution in Greece. A few PCMs, with differing liquefying, directs examining moreover toward activity plans improving PCM performance. This work targets to decide reasonable uses of PCM in Mediterranean environments and evaluate their performance. The mathematical outcomes estimate measure suitability, and likely tradeoffs are discussed.Fauziyah et al. [4] considered the mild and dynamic mechanical properties of polyethylene glycol/quartz composites for PCMs. The mild properties of the composites were described utilizing differential filtering calorimetric and thermo gravimetric study, while the thermo mechanical properties were inspected utilizing a unique mechanical analyzer in a three point twisting mode around the PEG glass change temperature range.Haipeng et al. [5] carried out fragile film and SSO1.5 slim film analysis, the studies of conductivity versus temperature and surface geography trademark tests were done. The effects of adding oxygen on the warm security, crystallization conditions, and optical change for SS phase-change fragile film were talked about in detail.

Zhang et al. [6] created a paraffinbased PCM for water emulsions with a low level of super cooling, high smoothness, and soundness, which can be applied in nuclear power stockpiling structures to improve cooling ability. The rheology characters and the solidness of the emulsions were likewise noticed and discussed.Tzivanidis et al.[7] reported a parametric examination is directed for space cooling frameworks dependent on cool water streaming, during the evening, inside consistently organized materials implanted in a layer of PCM, situated among the primary layers of the ceiling. The impact of the relative number of boundaries is investigated and ideas are made for choosing certain combinations of their qualities to get the most minimal energy utilization related to the most high level of warm comfort.Konstantinidou et al. [8]carried out examination of the utilization of PCM in the building area is carried. The present investigation evaluates the combination of PCMs in places of business based on their financial and environmental exhibition through life cycle examination related to life cycle cost investigation individually. This examination depends on a past building envelope multiobjective improvement study that considers cooling load requirements and warm comfort conditions as design objectives[8].Özonur et al. [9] managed the microencapsulation of the coco unsaturated fat combination for nuclear power stockpiling. The reversible procedure was used for the microencapsulation cycle. A few choices for the container divider material were attempted. It was discovered that the gelatin+gum mixture was the best divider material for microencapsulating coco unsaturated fat mixtures[9].

Cabeza et al. [10] conducted an orderly investigation of storing structures through phasechange materials (PCMs) has been done. The data identified with the arrangement of PCMs and what properties should have a material to be considered as a PCM are introduced. In this article, risk upon the application and the energy and force needs of PCM storing structures, the requirements, plan, and theories are reviewed[10]. Taguchi et al.[11] attempted to frame Pickering emulsion by utilization of paraffin wax as a PCM and SiC as strong powder and to apply to the readiness of the mixture microcapsules with the interfacial polycondensation reaction. Thermal conductivity of half and half

65931

Nithish Reddy *et al.,*

microcapsules could be improved as contrasted and the PCM microcapsules are observed[11].The point of this Research work is exploratory research of information of some PCM regularly utilized for nuclear power storing, and some plastic materials presently utilized as representing materials. With the materials tried in this work, it very well may be reasoned that, for typifying natural PCM, low density polyethylene and polypropylene showed more terrible conduct than highdensity polyethylene [12].Castellón et al. [12] manages the usage of a sustainable energybased organized structure with the storing alternative for building warm administration frames. Both energy and exergy based evaluations of the current consolidated framework are led. Oruc et al. [13] showed that the general energy and exergy efficiencies of the PCMfree brilliant warming framework are a lot lower than the case with the PCM embedded brilliant warming system[13]. Ong et al. [14]used a bunch of five determination measures is applied to a wide range of salt mixtures to decide the best possibility for use as PCMs. With current worries about the natural effect of ozone-depleting substance emissions, decreasing our dependence on petroleum derivatives has become an evergrowing need. The last rundown of eight salts is then chosen as the best PCMs for use in a functioning temperature range somewhere in the range of 500 and 800 °C[14].

Ismail et al.[15]showed the aftereffects of a mathematical and experimental investigation of phase change material with filled dividers and rooftops under real operational conditions to perform stable warm comfort. Field tests likewise showed that the PCM utilized was satisfactory and that the idea was suitable in keeping up the indoor temperature extremely near the setup comfort limits. The further careful investigation demonstrated that the idea could successfully help in decreasing the electric energy utilization and improving the energy request pattern[15].Liu et al.[16] conducted mild and visual demonstrations of a rooftop in a structure containing phase change material (PCM) were researched in this paper. The suitability of warm and optical demonstrations of the rooftop PCM framework was controlled by examining the warmth development and temperature at the indoor surface with various ingestion coefficients and refractive records of PCM in strong and fluid states. The outcomes show that the absorption coefficients and refractive record of strong and fluid PCMs effects change warm execution in the rooftop PCM system[16].Stritihet al.[17] presented a trial and mathematical examination of cooling structures utilizing nighttime cold gathering in a phase change material (PCM). A trial was directed utilizing paraffin with a softening place of 22°C as the PCM to store cold during the nighttime and to cool hot air during the daytime in summer. Test examination of the multi-week of estimating under genuine conditions is introduced to show how cool storing functions[17].

Abokersh et al.[18] applied the phase change material (PCM) utilization for sunlight-based homegrown water warming structures. The loss in energy assets joined with the move in nursery outflows is the fundamental motivator past the arrangement of sun-powered energy assets in different applications. Perhaps the best application is the usage of sun-oriented energy in the homegrown water warming structures because 70% of the burned-through energy in the private portion is used for space warming and machines in cold climates[18]. Malik et al. [19] used battery warm management structures for electric and crossbreed electric vehicles are checked on, and difficulties and openings for battery electric vehicles are talked about. Cooling techniques utilized in different warm administration frames are clarified. Uses of and issues for the utilization of phase change materials in warm administration frames are likewise reviewed[19].Sciacovelli et al. [20] described the study of the liquefying interaction in a single vertical shellandtube warmth nuclear power storing unit and it is aimed at understanding the warm execution of the frame. The investigation is acknowledged utilizing a computational fluid dynamic model that considers the phasechange phenomenon through the enthalpy method[20].Chhugani et al. [21] analyzed Energy Saving Potential of Room Integrated PCM Wallboards for Passive Cooling Application. The investigating outcomes show that the PCM wallboards can give a latent cooling force of up to 8.4 W/m2. The reenactment results uncover that the recovery of the PCM wallboards could be expanded by a factor of 2, which straightforwardly builds the inactive warmth stockpiling limit in rooms and lessens the temperature ascend during daytimes[21].Hong et al. [22] conducted an Experimental Study on the Demand Shifting Effects of PCM Integrated Air-Conditioning Duct has been carried out. This paper proposes another sort of cooling tube joined with PCM. The PCM material fixings are planned by the necessary phase change temperature range. The results show that the cooling channel joined with PCM can keep the indoor temperature in an acceptable reach during the force top burden after closing down the chiller[22].

Nithish Reddy *et al.,*

Mukram et al. [23] carried out the investigation of concrete blocks exemplified with phase change materials (PCM) when exposed to surrounding climate conditions like sun-based radiation and temperature. Examination and demonstrating of building blocks containing PCM has been completed to misuse the high dormant warmth of combination which will assist with improving the indoor comfort in buildings. The results show that PCM inclusion in building blocks is a practice for divided control of buildings[23].Irsyad et al. [24] studied the move qualities of coconut oil as a phase change material. There are three models of tests acted in this research. First and foremost, an examination was directed to break down the time that was required by material to phase change by shifting the temperature. The following investigation inspected the warmth move properties of air to PCM normally. The third test broke down the forced convection heat move on the outside of the PCM compartment by shifting the air velocity[24].Mao et al.[25] demonstrated a thermoelectric generator that implants phase change material for spending heat energy harvesting. The results show that a higher yield voltage and a more extended energy gathering time can be reached in thermoelectric generators with PCM in contrasted and the comparing values in thermoelectric generators without PCM once the source quits providing heat. Which offers a powerful and available approach to upgrade the presentation of the structure of the thermoelectric generator by utilization of the PCM[25].

Paksoy et al. [26] give an outline of techniques used to decide the properties in PCM which added new cement mixes. For this reason, PCM can be included structure designs and materials in various structures. Direct concentration, structure adjustment, and microencapsulation are various structures utilized for PCM joining in building materials. Thermal, compressive strength, consumption, and microscopic test results for concrete mixtures with PCM are discussed[26]. Yang et al. [27] studied PCM phase change temperature, warm conductivity, and so on the temperature control qualities of sun-oriented cells. The outcomes show that PCM phase change temperature, warm conductivity, the dormant worth will influence sun-oriented cell temperature control qualities in fluctuating degrees. The research results give a reference to the advancement plan of the PCM sunlight-based cell control system[27].Wang et al[28] introduced an improved PCM segment which is outlined in a metal compartment, to advance the warm execution of the wall. The thermal performance of the divider with the upgraded and non-enhanced PCM part was looked at under the late spring ordinary environment. The divider with streamlined PCM parts has the best limit with regards to warm capacity and delivery. The inside surface temperature decrease of the divider with the upgraded PCM part is lower by 2.1 ºC than the reference wall[28].

Mukram et al. [29] used economically accessible Phase Change Material (PCM) for inoperative storage. The PCM is installed in the block pit. The presentation of two sorts of PCM embed is analyzed, i.e, large-scale example at the center of the block and microencapsulation close to the external mass of the block. The outcomes show that the midway meant block performs better in the warming cycle, yet during evening time the section into the living space is more[29]. Widodo et al. [30] showed the use of Phase Change Material (PCM) and heatsink as the cooling structure for PV boards. Sunlight-based energy can be used to control a structure situated a long way from the power sources a particularly versatile pinnacle applied in open-pit mining. The trial results show that the utilization of an empty aluminum can decrease the surface temperature of the PV board and increment the force and ability of the PV panels [30].Principi et al. [31], investigatedtwo different PCM applications. Outdoor trial results showed that the additional PCM layer helps with reducing and postpone the pinnacle collection of approaching compared with the reference one. The examination intention was to reduce the cooling energy utilization during steady-state working conditions and the speed of temperature increment throughout a force disappointment occasion. Test outcomes showed that utilizing a PCM air heat exchanger expansion, up to 16% of energy can be saved [31].

Shareef et al. [32] experimentally investigates the performance of a water-PCM storage structure included with a level plate sun-oriented collector. In this examination, a test office was planned and fabricated and analyzes were completed. The investigation includes two different source types, to be specific a level plate sunlight-based authority and an electrical component. Trial results show that the proposed arrangement with the PCM material can deliver heated water up to 9.5 °C higher than that of the essential water storing system [32].Sajen et al. [33] examined the hardening conduct of a water-based PCM for cold energy applications. The examination is completed in a low-

65933

temperature shower of - 7°C inside which the PCM test is kept circularly included for uniform appropriation. The conduct and impact of the expansion of the nucleating experts are looked at. The examination showed that the subcooling of water was generously decreased and its crystallization happens at a quicker rate[33].Thamaraikannn et al. [34] carried out examination and investigation of Phase Change materials utilized in Different Types of capacity structures with various applications. The utilization of PCM's for warming and cooling applications has been examined during the previous decade. There are large quantities of PCM's, which soften and bond at a wide scope of temperatures, making them acceptable in various applications[34].Zhao et al . [35] studied compositions treated by phase change materials (PCMs) were applied in the multiple surfaces of the fireman defensive garments. The PCM textures were put at the various layers of the dress and their warm protective induction was estimated by a Thermal protective performance analyzer. Results show that the utilization of the PCM compositions for the warm security of the complex textures was enormously increased. The compositions with PCMs of a higher temperature could add to higher warm protection[35].

Pant et al. [36] studied the Thermal Management of Battery packs for Hybrid Vehicles Using PCM. Progress in administration structures can be received to absorb heat produced in Li-particle battery packs for half-breed vehicles during charge and release cycles. The outcome shows diminish in temperature by 1.5°C, extra expansion in weight of battery pack by 17.5%, increment in wellbeing, and minimization to applications[36].Rose et al. [37] studied the Application of Phase Change Material to Increase Solar Panel Efficiency. A PCM can get back to the strong state after put away energy is eliminated and is fit for limitless cycles. The information shows ideal outcomes that a structure can be intended to control the temperature of the board surface region to keep up and improve the productivity and energy change of photovoltaic (PV) boards. The discoveries of our test are introduced [37].Kravvaritis et al. [38] presented an investigating game plan, to the method of estimation handling, just as to the sort and show configuration of the eventual outcomes. The proposed game plan has a controlled indoor climate and is completely programmed. The powerful limit work as an end-product is ended up being more helpful than the aftereffects of the first technique. The new system is an initial move towards characterizing determinations for the estimation of PCM properties[38].Lebedev et al.[39] studied the impact of warm cycling on the properties of PCMs, like dissolving temperature is significant. It is tracked down that the paraffin wax and unsaturated fats have great soundness and can be utilized for sun-powered nuclear power storing applications. The utilization of phase change materials (PCMs) is a promising change for nuclear power storing where it can absorb and deliver a lot of inactive temperature during the stage progress process [39].

Nagilla et al. [40] carried out a complete study of ongoing advances in the utilization of PCM. The joining of phase change material with sun-powered water warming structures is a practical and productive answer for conquering this serious issue related to sunlight-based water warming structures. The phase change material coordinated with sun-based water warming structure stores nuclear power during daylight hours and this putaway energy can be healed during off sparkle hours or evening to create strong water[40].Xie et al . [41] inerted hotness storing with phase change material is a prevalent method of putting away nuclear power because of its high warm storing thickness, isothermal nature of the capacity cycle, and simple control.The water tank as a vital part of sun-powered warming frameworks has been generally applied in down-to-earth applications. The fruitful culmination of this survey won't just extend the comprehension on the exploration improvement of phase change material–based water tanks yet additionally advance down-to-earth uses of such water tanks in sunlight-based warming frameworks[41].

Zheng et al. [42] used phase change material cold storing framework could work on the proficiency and steadiness of the sun based controlled cooling framework and the structure's warm climate. To decrease the irregular sunlight based energy activity, the energy stockpiling framework is very fundamental. Presently, the famous technique is progressing phase change material cold storing. Utilizing phase change materials in the energy storing frameworks, the hotness exchangers and warm control frameworks are the potential techniques[42].During the cycles of dissolving or cementing, stage change materials (PCMs) can store or deliver a lot of dormant heat. In this way, PCMs can be utilized in working to address the confound between energy organic market on schedule, space, and force. Therefore, this unique assortment highlights late PCM-related examination works in the field of building energy

proficiency. The chose 14 papers represent the expansive effects of PCM procedures in this difficult region[43].The vast majority of the substantial related exploration to date has been zeroing in on further developing its mechanical exhibitions. In examination, there are restricted investigations zeroing in on improving its warm properties. Exploratory and mathematical investigations have shown the capability of PCM and nanoparticles in diminishing indoor temperature vacillations in structures and working on the warm conductivity of PCM, individually[44].Nanoparticle-improved phase change materials have charmed expanding thought to eliminate the principle restriction of PCMs in different modern employments. Current article reports the utilization of PCMs just as use of nanoparticles to escalate energy execution and powerful warm administration. The effect of adding nanoparticles on PCMs was explored. Yields revel that scattering nanoparticles to PCMs have more noteworthy charging and releasing rates than pure PCM[45].

Nidal et al. [46] used little containers, utilized as PCM storing units in the sun-powered oven, were built from aluminum and tried for sunlight-based energy storing during sparkling days. The outcomes supplying critical data to plan a model of a sun-powered oven gave a decent warm exhibition material used for putting away nuclear power[46]. Raj et al. [47] trial work endeavors to support the warm reaction of the double-pass solar air heater system by the warm slack of phase change material. Simultaneously, this examination researches the job of metallic large-scale exemplification on the hotness storing and recuperation from PCM coordinated inside the double-pass solar air heater system. The targets are to explore the impact of the calculation of exemplification utilized for capacity and to look at whether the discrete units permit quicker charging and releasing of natural paraffin wax[47].With high energy utilization patterns in structures, the reception of nuclear power storing frameworks toward reducing cooling load has been expanded in ongoing years. The paper is a survey of the use of PCM-to-Air Heat Exchangers for building-free cooling applications. The potential and impediments of utilizing PAHXs in free cooling applications are talked about exhaustively, zeroing in on the sweltering desert environment. Using the concept of latent heat thermal energy storage through phase change materials has been clearly discussed in the article[48].The modern energy generation from inexhaustible assets doesn't fulfill the current worldwide need for energy supply, and there is a need to think of more inventive advancements that could overcome any barrier between the energy organic market. Stage change materials (PCM) are one of the best and ongoing fields of exploration as far as energy storing. Particularly, organic phase change materials (OPCM) have commanded a ton of notice due to their superb properties that can be joined with nuclear power storing frameworks to protect environmentally friendly power[49].

Jaguemont et al. [50] ,carried out a review of battery thermal management systems in the state of art is proposed. These days, phase-change materials are especially appealing and picked as one of the most fascinating cooling frameworks with regards to terms of high-energy storing thickness. Also, they are less inconvenient, difficult and costly than customary cooling strategies, for example, constrained air cooling or fluid cooling. In any case, the combination of PCMs in a battery application requires an examination that will empower the specialist to proposed upgraded battery thermal management systems[50].Jethelah et al. [51] used a nano-PCM-filled hole, which is delegate math of a Thermal energy storage framework, is examined utilizing scale examination, mathematical recreation, and exploratory investigation. The storage is thought to be a straight fit. It is likewise expected that one vertical mass of the hole is effectively partaking in retaining energy from a source while the leftover dividers are insulated. The mathematical and exploratory outcomes show the critical improvement of the softening system by adding nanoparticles to PCM[51].Cooling interest in the building area is developing quickly; thermal energy storage frameworks utilizing phase change materials can be an exceptionally valuable way of further developing the structure's warm execution. The right utilization of PCM in the envelope can limit top cooling loads, permit the utilization of more modest HVAC specialized gear for cooling, and can keep the indoor temperature inside the comfort range because of more moderate indoor temperature changes. This article presents an outline of various PCM applications in structures for decreasing cooling loads under various environmental conditions[52]. Energy interest for warming and cooling of structures can be limited through the use of thermal energy storage frameworks in building materials. Thermal energy storage in microencapsulated phase change materials gives another answer for thermally directed energy-effective structures. This review sums up the examinations and investigation of

microencapsulated phase change materials for building applications. Microencapsulated phase change materials can be consolidated with numerous materials that are ordinarily utilized in building development[53].

Guarino et al .[54] review targets dissecting the exhibition of Phase Change Materials in private lodging for various environments. PCM sheets were implanted on the back mass of a test cabin put in the climatic chamber. A few tests were performed to investigate the potential for check of the proposed examination and to deliver sufficient information to perform model alignments. Results show a solid expansion in the obvious warm dormancy of the room taking into account a decrease in day by day temperature vacillations in the test dwell[54].The current audit is a broad outline of the exploration progress in the field of Phase Change Material incorporated with sun-oriented warm applications. Sun-based energy has turned into an appealing strategy for utilizing clean energy to take out the deficiency and ecological downsides of petroleum derivatives, however it needs energy storing to connect the criss cross between seasons of energy interest and energy supply. Latent Heat Storage in PCMs is the most reasonable answer for nuclear power stockpiling because of their high idle hotness[55].

Dermardiros et al. [56] presents the consequences of a test and mathematical review zeroing in on the control-situated demonstration of an effectively charged/released phase change material - thermal energy storage framework. The phase change material - thermal energy storage framework comprises five layers of business large scale epitomized PCM boards with an air cavity in its middle. The phase change material - thermal energy storage was tried in an ecological chamber and its dynamic reaction was carefully checked.[56]Another Phase Change Material (PCM) in view of a salt hydrate which can be joined in latent heat storage systems frameworks for proficient treatment of nuclear power around 100 °C has been arranged. Contrasted and the pure salt hydrate, the outcomes showed that the recently evolved salt hydrate PYCO-PCM-1 is of high warm strength which relates to multiple times the energy which can be put away with a similar volume of water[57].Free cooling/Night ventilation is the method involved with putting away the cool energy accessible in the evening time surrounding air in a capacity gadget. During the daytime the cool energy is recovered from the capacity gadget to cool the structure utilizing a mechanical ventilation framework. The particular hotness exchanger created in this work is a shell and cylinder type with phase change materials in the shell piece of the module and entry for the progression of air through the cylinders[58].The lack in energy assets joined with the move in nursery outflows is the primary impetus past the organization of sun-based energy assets in different applications. Quite possibly the best application is the use of solar powered energy in the homegrown water warming frameworks (DWHS) because 70% of the devoured energy in the private section is used for space warming and apparatuses in cool environments. The present research reviews various methods utilized for integrating the PCM in solar water heating systems[59].Because of the expanding energy interest for space warming and cooling, sustainable power age and coordination of energy stockpiling frameworks got consideration throughout the planet. A strategy to lessen the energy interest of structures is the utilization of thermal energy storage frameworks. This is because of the chance of putting away hotness/cold energy to deliver it when required, which can handle the fleeting hole between energy interest and supply[60].

CONCLUSIONS

In conclusion, Phase Change Materials are at the forefront of transformative technologies, poised to reshape the way we think about energy storage, thermal management, and sustainability. As research advances and practical applications expand, PCMs hold the promise of contributing significantly to a more energy-efficient and environmentally conscious future. Despite their immense potential, PCMs also present challenges such as material selection, encapsulation, and compatibility with existing systems. Additionally, economic considerations and the need for proper maintenance and management must be addressed.The successful implementation of PCMs requires collaboration between researchers, engineers, architects, and policymakers. This interdisciplinary approach is essential for optimizing PCM applications and ensuring their successful integration into various sectors.

ABSTRACT

Green investment is crucial for long-term success, and understanding the factors that drive green finance and firm development is critical. The business plans to actively pursue green investment opportunities. Green investment awareness, access to green money, government participation, and green capital mobilisation strategies all had a significant impact on firm adoption. The purpose of this chapter is to outline the key qualities, drivers, and metrics of a green brand in order to attract new green investment. The recommendations focus on the government's critical role, the legal framework, green financing diversification, and green capital mobilisation mechanisms. It is critical to increase corporate awareness of how to access and use these technologies, as well as to improve green investment communication.

Keywords: Green Investment, Sustainability, Diversification, Green Capital.

INTRODUCTION

Environmental studies emphasise the post-crisis consequences of trade-offs between economic progress and the environment (1). Climate change is getting more powerful, producing economic harm, ecological imbalances, and unsustainable growth. Climate change solutions are required to assist governments, organisations, and enterprises in meeting growth objectives while minimising environmental damage (2). This chapter seeks to fill a need in the literature by offering a thorough examination of the ideas and terminologies associated with "green" investing (3).

Sunil Kumar *et al.,*

The purpose is not to take a stand on a certain definition, but rather to look at what is generally used, if there are parallels and discrepancies, and what lessons can be taken from this study (4). The term "green" can be defined explicitly or implicitly. Assets' "greenness" can be measured in absolute or relative ways (5). Green investments are frequently confused with climate change definitions are more consistent since they can be determined via study (6) (7). The ability to easily reference thematic investments is a primary driver for reaching agreement on definitions for green investments. Green investment is a necessary expenditure to reduce greenhouse gas emissions and air pollution without significantly lowering energy or non-energy commodities production and consumption (8). It requires both public and private investment to reduce greenhouse gas emissions and air pollution without significantly affecting energy or non-energy commodities production and consumption. This involves both public and private funding (9).

Thematic investing is a strategy that seeks to find and benefit from winners while avoiding or underweighting losers (10). It contrasts with market capitalisation investing, which implies that previous winners will continue to win. Clarity and cheap cost of definition (or criteria) increase the likelihood of fund placement, allowing theme screening to become commoditized. To understand what is meant by "green" and "investment," many meanings must be understood, with some areas of disagreement and doubt (11). This report summarises major findings from investor surveys on their climate change, resource efficiency, and environmental activities and motives (12). Green "investment" is a wide phrase that can refer to a stand-alone investment strategy, a subset of a larger investment topic, or a strategy that is closely tied to other investment strategies. Some investors include an ESG or green "overlay" into their entire investing strategy, whilst others devote a certain amount of assets to a single green product or management (13). Green investing strategies vary by asset class, with stocks making the most progress. Screening, theme investing, and involvement with firms are some of the strategies for picking green investments (14). Green bonds are a burgeoning business, with the finance industry disputing terminology and creating a "Climate Bonds Standard". Real estate has focused on the underlying qualities of properties, with green elements playing a minor role (15).

Green Investment
Some definitions of "green" and "investment" are generic, while others are more technical and particular. There is a significant overlap between the various definitions, yet there are still areas of disagreement and doubt. There is no consensus on what the right metric for "greenness" is. Green investment can be a standalone strategy, subset of a wider theme, or strongly tied to other investment techniques such as SRI, ESGor similar concepts. Climate change, resource efficiency, and green concerns have captured the attention of investors in recent years, and efforts in these areas are being funded. The primary findings of investor surveys are presented in this report. Green investments are investments in stocks, ETFs, mutual funds, and bonds that are meant to benefit the environment. Any firm active in alternative energy technologies or environmental practises qualifies. The monies are directed towards projects that help the environment (16). The goal of this research is to investigate what terms are regularly used in the market, if there are commonalities and discrepancies, and what lessons can be learned from this analysis. Green aspects have been less relevant in alternative asset classes, although green investments in renewable energy or cleantech enterprises have been increasing, frequently through green private equity and infrastructure funds. Investors have become less arrogant. There are many assets for which perception is all that matters, such as a painting or a sculpture, but a rational investor does not buy most assets for aesthetic or emotional reasons, but rather for the expected cash flows from the investment (17). When making financial decisions, humans have emotions that can be difficult to manage.

As of May 2023, the Google Scholar database was used for bibliometric analysis. The search term "Green Investment" the title of the article was utilised to discover relevant publications published in any language that were linked to finance and investment research. We concentrated on the titles of the articles because they are the first thing that readers would notice (18) and (19). It represents the relevant topic that is relevant to the research area and the study's goal.

65941

Citation Matrix per year can be seen from Error! Reference source not found. for retrieved documents. Total 200 documents were retrieved with their citation matrix, thus future research in the area of green investment will increase further over time. The total citations of 200 documents were 9336, with citations per year accounts to 321.93 while average citations per research paper accounts to 46.68. The h-index for the period was 47, while the g-index was 91, and the HI-Norm accounts to 29. Citations for recently published articles are expected to increase in the future as the number of research projects increases. Through citation matrix for last 29 years, it can be inferred that the research and focus in the area of green investment is in its nascent stage and there is need of policymakers and corporate managers to change their focus towards technology oriented green investment, considering the challenges for sustainability and future prospects.

Investors do not agree on a single definition of green investing, and markets move swiftly. Low-carbon and climate-resilient investments in sustainability-related industries are referred to as green investments. The paper suggests more work on the definition and measurement of "green investments" to ensure a shared understanding between institutional investors and governments. Governments should encourage the establishment of a standard setter or rating agency to authorise, certify, or assess green projects or investment vehicles to ensure funds are utilised for appropriately green investments. Green definitions can be explicit or implicit, broad or specific, motivated by investment or environmental or ethical concerns. The "greenness" of assets can be expressed in absolute or relative terms, such as emitting less greenhouse gases or being more energy-efficient. Companies are reorienting their activities to match customers' green requirements, and investors are investing in green aims. Companies with a strong green brand and high levels of consumer loyalty may be able to attract additional funding as green investment in their growth. The experience of EU nations has proven that green investment is a new potential market that is rapidly expanding year after year. Green stock index companies have a greater added value. Economic and political conflicts harm the country's brand and image, reducing the investment climate and restricting the growth of the national green investment market. To overcome this, effective procedures for promoting the green brand must be developed and implemented at both the national and corporate levels.

Drivers of Green Investment

The notion of ethical investment has resulted in the creation of many types of ethical mutual funds. Socially responsible investment (SRI) is promoted by organisations such as the Social Investment Forum in the United States and the Social Investment Organisation in Canada. Small and medium-sized enterprises (SMEs) account for 99.7% of all firms and 60% of total employment in Europe, making them critical players in both environmental and economic affairs. It also examines appropriate policy initiatives that might assist SMEs in navigating the possibilities and difficulties associated with achieving green and inclusive growth (20). The primary stakeholders engaged with the Global Goals (GB) drivers were identified in this study. The major stakeholders might be identified in the future review research using the five primary types of GB drivers described in this work. The drivers highlighted in this study apply to all parties interested in achieving GB (21). This article may provide a helpful platform for policymakers and advocates to have a better knowledge of what motivates individuals to participate in GB development and assist to push GB further. The checklist and structure of GB drivers make this study beneficial for scholars conducting more research on the issue (22).

Structure of Investments

Followings are some of the drivers for Green Investments on the basis of structure of investments:

Eco-innovators: The introduction of a new or better product, process, marketing approach, or organisational system that lowers environmental effect is referred to as eco-innovation (23). Changes in social and institutional frameworks, such as value patterns, behavioural models, and social structures and interactions, might also be included. This means that eco-innovation has the ability to improve society as a whole through altering social norms, cultural values, and institutional structures (24).

Sunil Kumar *et al.,*

Eco-entrepreneurs: Eco-entrepreneurs seek new opportunities to achieve higher sustainability, often through changes in values, preferences, legislation, or difficulties. They look for new opportunities through changes in values, preferences, legislation, or difficulties (25).

Eco-adopters: Companies are likely to be "green performers" who embrace environmental technology and sustainable business practises, but sustainability is unlikely to be part of their main business strategy (26).

Source of Drivers
Followings are some of the drivers for Green Investments on the basis of External forces of investments:

External drivers: External drivers are events that occur outside of the firm that creates green buildings, such as government, the US, the EU, trade unions, and customers. Governments have increased their interest in this field in recent years.

Corporate-level drivers: Internal sustainability drivers are vital, whereas external sustainability drivers such as governmental incentives and requirements put pressure on stakeholders to enhance their portfolios. Furthermore, the fear of increasingly onerous laws has prompted some stakeholders and businesses to create a 'beyond compliance' mindset in order to avoid downside risk or achieve greater profits.

Property-level drivers: Because of its substantial role in energy consumption, the building sector is a major contributor to CO_2 emissions. According to the findings of this study, environmental protection is a significant concern in promoting Green Building (GB). It has been stated that reduced environmental effect motivates stakeholders to participate in GB, and the promise of saving finite resources has increased GB's popularity. Renewable energy sources, such as solar and wind energy generating systems, can assist to lessen the reliance on non-renewable and expensive to create and consume energy sources (27).

Project-level drivers: According to a recent study, green building costs more than non-green building. According to a survey of 33 green-certified buildings and a comparison of their expenses to equivalent non-GBs, the bulk of the extra cost of GBs is in 'soft costs' rather than 'hard costs'. Furthermore, when the actual construction costs of 45 green-certified buildings were compared to comparable non-GBs, it was concluded that there is no statistically significant difference between non-GB and green-certified budgets.

Individual-level drivers: Motivation is an important factor in human behaviour, and individual-level motivations are generally intrinsic. A study of the research identified four major individual-level drivers for Good Governance: moral imperative, personal commitment, attitudes and traditions, and self-identity. These motivations can be useful in pushing the adoption of GB practises, but empirical research on them is limited.

Advantages of Green Investments
1. Green investment is a way for businesses to raise funding from the general public for sustainability-related projects, as sustainability departments often operate on tight budgets. It allows businesses to raise funding without making huge upfront commitments.
2. Businesses can obtain financing through green bonds due to public awareness of environmental protection and their creative approach to sustainability, which benefits them.
3. Green investments, such as green bonds, are advantageous to investors since they are tax-free.
4. Investments provide personal satisfaction by ensuring money is spent responsibly and positively.
5. Green investment vehicles must meet disclosure rules to ensure that investors understand where their money is going. This allows people to determine if their money is being spent wisely.

65943

6. Low borrowing rates will minimise the company's expense, which will be passed on to investors in the form of dividends, delivering advantages when demand is high.

Challenges in Green Investments

1. Investors may be cautious to invest in green firms due to low sales and high valuations, making it riskier than other stock strategies. Companies in the development stage have low sales and high values, which makes them riskier.

2. Green investing is a limited market, making entry and exit challenging. Due to the absence of liquidity, investors are unable to withdraw funds as needed and must hold the instrument until maturity. This means that investors must keep the instrument until it matures.

3. Because the issuer of an investment instrument may not explicitly describe the objective for which the money will be invested, investors may be unaware of where their money is being placed. This may result in their money being utilised for the incorrect purposes.

Forms of green investment and benefits of green investment

Green investment is the use of green money mobilised from both the public and private sectors to invest in delivering environmental products and services, avoiding, alleviating, or compensating for environmental or climatic harm, and using renewable energy. Investor initiatives are attempting to lead the way into green investing to have a stronger voice. Green investments are investment activities that focus on initiatives that safeguard the environment, such as pollution reduction, fossil fuel reduction, natural resource conservation, alternative energy sources, air and water cleansing and maintenance, and waste management (28). Australia is building a 5 gigatonne hydrogen plant to harness green energy. The United Kingdom wants to create 5GW of hydrogen using offshore wind power. NEOM, Air Products, ACWA Power, and NEOM have agreed to invest USD 5 billion in renewable energy-powered industrial facilities (29). Following are some of the avenues for green investing:

Renewable Energy: Green energy is becoming increasingly important due to climate change, as it does not rely on fossil fuels to generate power. Water, wind, and solar power are among the most important renewable energy sources.

Hydroelectricity: Water has long been used as a renewable energy source, with facilities like China's Three Gorges Dam delivering power to 70-80 million homes. Hydropower is the most cost-effective technique to generate energy, according to IRENA. Water powered grain mills in ancient Greece.

Wind Power: Wind is one of the fastest-growing renewable energy sources, with China leading the way with 288.3 gigatonnes of installed capacity in 2020, followed by the United States and Germany.

Solar Energy: Solar energy is becoming increasingly popular, and firms like First Solar, JinkoSolar Holding, and solar power are developing solar modules and storage solutions for homes and businesses. JinkoSolar Holding has 80 gigatonnes of manufacturing capacity, while First Solar is a significant producer. solar power designs and manufactures solar modules and storage systems for households and businesses.

Geothermal Energy: Ormat Technologies (ORA) produces renewable energy using geothermal energy and has activities in the United States, Guatemala, Guadeloupe, Honduras, Indonesia, and Kenya.

Green Transportation: Many people associate Tesla (TSLA) with transportation, but researchers are working with fuel-cell technology to offer an alternate means of powering autos. Companies in the field include Ballard Power Systems (BLDP) and Fuel Cell Energy (FCEL), who manufacture cells for use in cars and backup power systems. If this technology succeeds, millions of automobiles and people will be waiting for it.

Recycling: Recycling of paper, metal, glass, waste oil, vegetable oil, batteries, mobile phones, laptops, and even auto parts has become commonplace. Republic Services (RSG) and Waste Management (WM) are two waste management

organisations with a high number of recycling facilities. In the background, a firm is buzzing away, recycling various products.

Water Investment: Twenty European countries rely on rivers from other countries for more than 10% of their water supply, with five (the Netherlands, Hungary, Moldova, Romania, and Luxembourg) relying on rivers from other countries for more than 75%. Water scarcity is being caused by climate change in places such as Los Angeles and Miami. Governance mechanisms must be strengthened in order to build infrastructure and implement policies. Corporate bonds must be connected to qualified assets, and mechanisms must be in place to guarantee that the bond principal is allocated to such assets. For institutional investors, bonds are the most significant asset class. Green bonds have lately been addressed in light of climate change and investor obligations. There are several definitions in the industry, but the lack of a single definition and standard is another hurdle.

POLICY FRAMEWORK FOR GREEN INVESTMENTS

Green energy, renewable energy, and clean energy are forms of energy produced from natural sources that are continually replenished at a faster pace than they are consumed. Sunlight and green hydrogen are examples of green energy, while coal, oil, and gas are non-renewable resources that take hundreds of millions of years to create and emit damaging greenhouse gases (30). The transition from fossil fuels to renewable energy is critical to addressing the climate catastrophe. Two policy objectives are involved in inclusive solutions for the green transition: inclusive growth and green growth. Small and medium-sized enterprises (SMEs) play an essential role in worldwide economic activity, social well-being, and environmental imprint (31).The Intergovernmental Panel on Climate Change (IPCC) has assessed that recent warming is driven by human-induced emissions from the combustion of fossil fuels. The electricity and automobile sectors alone account for 40% of India's emissions, making them at the forefront of this shift. Decarbonization of these sectors is critical to India's climate ambitions, and electric car costs are reducing, leading to faster adoption. Approximately one-third of four-wheelers and half of two-wheelers sold in 2030 might be electric, increasing to 75% and 90% by 2050. This nascent transformation provides investors with an opportunity to build wealth (32).

The findings of the examination of scientific articles and research on green branding revealed that green branding is a modest tool for attracting green investment. There have been no common definitions of green branding and green investment that have been accepted by the global scientific community. A green brand's major elements are its brand positioning, which should be considered while building strategies. There are several forms of brand positioning that can be assigned, such as functional, green, and emotional. When designing green brand strategies, the primary target group should be considered (33).

Green investment is defined as an investment in green assets that causes the negative impact of climate change on the environment to be mitigated. The fundamental characteristics of green investment are an emphasis on green goals and alignment with sustainable development goals. Companies should employ the appropriate marketing programme to create the company's green brand in order to attract extra green investment. The green brand idea should take into account the characteristics of green investment. Green brand positioning can help businesses gain a competitive edge and attract funding for green projects. It can also be used to gain an edge in the marketplace. Companies should avoid greenwashing and instead adopt green innovations to demonstrate their greening forces (34).

Following basic principles can be followed by the companies for creating green branding:
- To enhance sales and profits and mobilise green investments, businesses should utilise genuine and honest environmental statements in their ads.
- To address their consumers' green demands, organisations should raise customer understanding of environmental protection and sustainability, as well as manufacture green products at affordable prices and excellent quality.
- To lessen their environmental effect, businesses should invest in green projects.

- To generate and sustain an image of "being green" in target clients, businesses must implement strong brand development and awareness tactics.
- By publicising environmental preservation and sustainability, the government should develop policies and campaigns to preserve the country's boundaries from global warming.

Many countries have set a policy objective of low-carbon, climate-resilient (LCR) development, and investment in physical infrastructure is a critical component of that goal. However, policy expertise on how to incorporate climate and other environmental policy objectives into investment policy frameworks and infrastructure development is limited (35). This article discusses the importance of climate change policies and their success in achieving a low-carbon, climate-resilient (LCR) economy. It suggests that governments should develop and strengthen domestic enabling circumstances for private sector investments in green infrastructure to shift and scale up in order to fund the transition to an LCR economy and greener growth. It promotes a "green investment policy framework" that begins with infrastructure investment and focuses only on climate change mitigation and adaptation (36).

The research focuses on the potential and constraints that developed and developing nations face in transitioning to LCR development through investment in both refurbished and new infrastructure. It proposes a five-point policy framework to lead domestic reforms that may direct the use of limited public money while also allowing and incentivizing private investment to enable a transition across essential infrastructure sectors to achieve climate change and local development goals at the same time. The Paris Agreement was signed by 195 countries in December 2015. Sweden and Norway were the first to commit to net-zero goals, while China pledged to carbon neutrality by 2060 and net zero emissions by 2050. Norway is now the greatest generator of "clean" energy, with renewable sources accounting for 99% of total production. New Zealand overcame Brazil to take second place with 80.9% renewable energy (37).

Green Investment: Where do India Stand?

The Landscape of Green Financial in India assesses financial flows to critical real-economy sectors such as renewable energy, sustainable transportation, and energy efficiency (38). India's goal of net zero emissions by 2070 and renewable energy for 50% of electricity by 2030 is a significant step in combating climate change (39). It is establishing a new economic development model that might avoid carbon-intensive practises and serve as an example for other emerging economies (40). India implemented policies to address energy challenges, including phased out subsidies for petrol and diesel in the early 2010s and the introduction of electric vehicles in 2019. The government's energy efficiency program has reduced energy consumption and emissions from buildings, transportation, and large companies (41). Government attempts to offer fuel petrol to millions of families are facilitating a shift away from traditional biomass. India is also establishing the framework for critical developing technologies like hydrogen, battery storage, and low-carbon steel, cement, and fertilisers to scale up (42).It records both public and private capital sources and creates a framework for tracking the movement of funds. It also includes a first-of-its-kind assessment of adaptation funds for certain industries. Renewables now account for more than 8% of India's electrical industry, making them a significant success story (43). Reverse auctions, lower corporate tax rates, transmission infrastructure investment, and solar park subsidies have all contributed to India's energy success. Prime Minister Narendra Modi announced the beginning of a National Hydrogen Mission in 2021, with a Rs. 197.4 billion initial investments (44). Policy reforms by the government will decide India's energy destiny, and small measures in the correct direction may provide the framework for long-term prosperity and increased energy security (45).

India needs INR 162.5 lakh crores to meet Paris Agreement NDCs and achieve 500 GW non-fossil fuel-based energy capacity by 2021, covering 50% of energy consumption. To satisfy its NDCs under the Paris Agreement, India will need Rs 162.5 lakh crore (USD 2.5 trillion) from 2015 to 2030, or Rs 11 lakh crore (USD 170 billion) every year. This requires a faster mobilisation of green funding. Although public finance has played an important role in increasing green financing flows, greater private sector engagement is required (46). India's green transformation requires international investment from DFIs and philanthropic donations, as well as legislative assistance and investor mobilization to activate earlier-maturity firms like distributed energy sources and EVs. Green finance investments

are reacting to a strong policy environment, with the government working to develop and promote the green investment framework (47). The government is working on energy transition and the development of renewable energy infrastructure, which is improving public trust in the move to green energy. Companies can profit from the energy and renewable sector transformations. Policy assistance has benefited the renewable energy sector, and policy support should be expanded to include distributed renewable energy, rooftop solar, and sustainable transportation (48).

India dropped four places in the 59th edition of the Renewable Energy Country Attractiveness Index but remained in the 60th edition. It ranked sixth in terms of attractiveness for renewable energy investments. India's goal is to reach 300 gigatonnes of clean energy by 2030 (49). Corporates such as Reliance have vowed to invest 6 lakh crores in projects ranging from green hydrogen to solar energy, while the government has pledged to spend 50-60 thousand crores on Government Policy and PLI initiatives. India is becoming a world leader in the production and export of solar equipment.The government must develop demand signals, give legislative and regulatory assistance, subsidise costly raw materials, reward corporations and consumers for sustainable growth, and establish green transition financial institutes to meet India's green energy objective. Top companies are already getting a head start, with NTPC aiming for 60GW, Adani Green Energy for 45GW, Tata Power, ReNew Power, and Acme Solar each aiming for 25GW. However, this crusade is not going to be easy. The most crucial elements are that India's climate financing is built on both public and private capital sources, and that it records the flow of funds from the source to the end beneficiaries using various tools. This report gives the most precise analysis of India's climate finance, financing gaps, and future potential.

RESULT AND DISCUSSION

Green enthusiasm and branding have become the most important factors influencing the effectiveness of the company's marketing programme. Communication with key stakeholders is essential for identifying ideas for improving the company's green brand marketing. Companies should implement green product branding methods in their green marketing initiatives. Future Prospects for green investment has significant impact which is in line with the studies of (50), (51) and (52), the Over Confidence (OC) found to have influence which is consistent with the findings of (53), (54) (55) and (56). The three drivers of green brand equity are green brand image, green brand trust, and green satisfaction which is consistent with the findings of (11), (42).

The major benefit of developing green brand equity is a rise in environmental consciousness, which firms may use to gain a competitive advantage by deploying their goods in new markets. The findings revealed a bidirectional association between the company's success and green branding similar findings were observed by Lusardi (57). Consistent with (58) (59) (60) observation that tests of market efficiency are necessarily, evidence of anomalies is potentially evidence of the investor's decision. Positive green branding increases stakeholder trust in the organisation, which can attract more financial resources for the achievement of green goals which is consistent with the findings of (6), (47). However, if the firm fails to implement the green goals due to a shortage of funds, it does not have a wide variety of possibilities for attracting more financial resources. By being proactive and pursuing economic growth, India may speed decarbonisation. Because the benefits of a well-planned strategy may outweigh the drawbacks, the government should regard this period as a chance to build long-term value for industry while embracing rapid growth which is in line with the suggestions by (43), (21).

According to the conclusions of the studies, establishing a green brand should be founded on openness, publicity, complexity, and diversification which was also suggested in the findings of (48), (5). However, many companies avoid transparency principles when developing their own green brand, resulting in decreased trust among stakeholders and the use of greenwashing, which means paying more for a promotion programme of green goals than actually spending money on improving ecological parameters of operations in practise. This can result in

organisations losing more money owing to a decrease in reputation, such as the Volkswagen Company's CO2 emissions crisis, which resulted in reputation losses of billions of dollars.

Organisations should incorporate green brand mental impressions and eco-friendly products into their strategy and marketing communications to attract extra green investment. To develop significant green brand equity, organisations must guarantee that their brands perform at least equal to or better than traditional products in the same category which is consistent with the finding of (49), (46). Eco-friendly features can serve as a source of added value, leading to customer preference and a desire to engage in green projects. More research is needed to determine the relationship between green brand perceptions and stock market performance.

ABSTRACT

In last few decades, awareness among people has aroused their attention about environment and its protection. Plastic made from non-renewable resource is the biggest concern which do not degrade for many centuries and now causing bad effect on human health and environment. For solving the problem, poly lactic acid, poly-β-hydroxybutyrate based biodegradable plastics, have been seen as an alternative which can be easily degraded by micro-organism (*E. Coli)* and converted into carbon dioxide, water and small eco- friendly molecules. In this article an attempt has been made to compile all those ecofriendly materials which can be used for the manufacturing of biodegradable plastic along with the bacteria which are utilised in their degradation process. This review is small contribution toward society for making the environment clean and free from hazardous non-biodegradable plastic and their associated challenges of disposal and impact on society.

Keywords: Biodegradable, PLA(poly lactic acid)), PHB(poly-β-hydroxybutyrate), E. Coli (Escherichia coli)

INTRODUCTION

Plastic is a man-made polymer which is very soft, durable, have long lasting properties and can be seen in infinite number of shapes. Huge mass of plastic is mainly manufactured from non-renewable resources (petroleum, natural gases). On the basis of latest research, currently different nations are producing 380 million tons of plastic per annum collectively [1] and large amount of petroleum, natural gases are consumed per year. However littering of

65952

Pooja Sethi *et al.,*

complex non-renewable resource based plastic is major problem and cause the detrimental impression on environment [2]. It is observed that after use when plastic stuff is dumped then it remains as such in the environment for many centuriesor very small mass of these polymers break down after long time into precarious entity. Intricate structure of non-renewable resources based plastic is one of the major consequences of their non-biodegradable character. These non friendly polymers are removed in order to depart the scrap heap from earth surface by implementing various processes such as landfills or burning but these ways majorly damage environment and are hugely affecting the whole ecosystem. Looking at results from the several researchers and recapitulating them, pollution caused by plastic comes as a reason for cancer in human beings [3] in addition to that females are also confronting hormonal imbalance [4].Whereas, from last decade awareness among populace became considerably high and they are getting conscious for nature. Mainly they are adopting 3R's approach to tackle with the problem of waste management, basically 3R stands for reduce, reuse and refuse [5]. But 3R approach did not prove satisfactory because recycling is energy efficient whereas after reusing, plastic stuff ultimately becomes trash [6]. Because of this dreaded problem, the United Nation general assembly founded April 22nd, as International Earth Day and also in 2018 "Beat Plastic Pollution" theme was chosen to aware those who did not know much about the hazards caused by plastic [7] and a number of movements against plastic use were initiated by United Nation's environmental program.

Due to all such consequences of excessive use of non-biodegradable plastic and production of biodegradable polymer is the best alternative. Ecofriendly plastic can be employed as packing material for edibles [8], protecting nuts, fruits and vegetables by covering these with biodegradable plastic films [9], for making car parts [10], for making poly bags and also utilized for making numerous stuffs. In reclamation of substances, biodegradable plastic plays a vital role in diminishing the number of landfills and makes use of natural resources [11] which is not practicable with polyolefin plastic after use. Rate of biodegradation is diverse as the ecology is diversified in which polymeric material is kept for breakdown [2] along with that ecofriendly organic compounds formed after biodegradation are also diverse such as in anaerobic ecology, ecofriendly plastic will be processed into carbon dioxide and water [12] whereas in aerobic ecology, ecofriendly plastic will be processed into methane and bio fuels [13]. There is another type of biodegradable plastic manufactured called oxo-biodegradable plastic, which is firstly degraded into small organic molecule by the oxidation of polymer because of pro-oxidant present in chain of plastic [14].This article reviews about the natural materials like starch, agriculture waste, fruit waste and other non-renewable resources used these days for preparing biodegradable polymers .

NATURAL MATERIALS USED TO SYNTHESIZE BIO-DEGRADABLE PLASTIC

Agriculture waste cellulose based plastic

Most of a et al (2005) synthesized cellulose acetate biofilers with flax fibre as well as with cotton linter(both have cellulose content) by using acetylation process and chemicals such as sulphuric acid(catalyst), polyethylene glycol (plasticizer), acetone (solvent) and bleaching agent [12] have been used.Yield of cellulose threads achieved from flax fibre (81%) is considerably excellent in contrast to yield of cellulose threads achieved from cotton linter (54%) and this considerable difference in yield is due to length of flax fibre than cotton linter [15].Within small period of time, ecofriendly compounds such as mud and water [12] can be easily reclaimed from plastic produced with cellulose acetate without any drags. Though for breakdown of cellulose acetate first of all acetyl group is removed by acetyl esterases enzyme and then cellulase enzyme breaks down cellulose molecule. Acetyl group can also be removed with UV light by utilizingtitanium oxide (TiO2) A chromobacterxylos oxidans are the microscopic creatures which degrade cellulose acetate [16] and Neisseria sicca [17], enzyme released by Neisseria sicca, reacts with cellulose acetate and expels acetic acid.

Banana peel based plastic

Jayachandra Yaradoddi et al in 2016 synthesized environment friendly plastic from banana peel by mixing the paste of discarded banana skin with glycerin (acts as plasticizer), along with reagents hydrochloric acid and sodium

Pooja Sethi *et al.,*

hydroxide solution of specific concentration is also added. If the concentration of hydrochloric acid and sodium hydroxide changed than the characteristics of plastic isalso changed. Plastic prepared from discarded banana skin is able to degrade in moist soil [18] under natural environmental conditions. For the food packaging purpose, plastic used should also protect the food from microorganism. Y E Agustin and K S Padmawijaya prepared an eco-friendly plastic with starch (from discarded kepok banana skin) and poliglusam (have property to do action against microscopic creature) along with some chemicals glycerin (plasticizer), zinc oxide (amplifier used for reinforcement). This eco-friendly plastic is highly degradable and also shows action against microorganisms [19].Glycerin (plasticizer) makes the plastic biodegradable but decline the action of plastic against microorganism. Whereas zinc oxide decline the decay of plastic as well as improve action of plastic against microorganism [19].

Soybean oil based plastic
Han-Min Kim et al in 2010 produced photo-cross linked polymer by using acrylated epoxidized soybean oil and UV radiation for polymerization reaction. Cross linker Poly (ethylene glycol) diacrylate (PGEDA) and Poly (epsilon-caprolactone) diacrylate and solution of benzil dimethyl ketal (2, 2-dimethoxy-1, 2-phenylacetophenone) (UV initiator) in N-vinyl-2-pyrrolidinone is also used in the production of polymer [20]. By alteration in cross linker, time period of polymerization (in presence of light) or the amount of starting material, properties of cross link polymer can also diversified.Cross linker used in the synthesis of polymer such as Poly (ethylene glycol) diacrylate (PEGDA) and Poly (epsilon-caprolactone)diacrylate (PCLDA) are prepared from PEG and PCL by using chemicals like benzene, N, N-Diethylethanamine, 2-propenoyl chloride and hexane as PEG and PCL can be degraded by microorganism [20].

Biodegradation of soybean oil based cross link polymers will depend upon compactness of bond formed in cross linked polymer along with that biodegradation also depends upon hydrolytic and enzymatic vulnerability [21]. In addition to that, biodegradation of this environmental friendly polymer is tested with lipase enzyme present in phosphate buffer solution (pH 7.2) and the result obtained is that polymer degrades in different amount as cross linker is altered the amount of starting material is altered [20].

Soybean protein based plastic
Near about 42% amount of protein and 20% amount of oil is found in soybean [22]. So, J. Jane et al. in 2000 synthesized plastic sheet from soy protein through squeezing by using soy protein isolate and some chemicals such as zinc sulphate, glycerin (plasticizer), 1-chloro-2,3-epoxypropane, 1,5- pentanedial and methyl-D-glucopyranoside. The tensile strength of synthesized material is changed by changing the moisture content as well as amount of glycerin and by addition of zinc sulphate effect of moisture on the prepared material is reduced [23].

Durian Seed Starch based plastic
Durian is an eatable fruit which is mainly obtained from D.Zibethinus kind of tree for selling in international market [24]. M H S Ginting et al. in year 2017 synthesized biodegradable plastic by using starch which is taken out from Durian Seed along with some chemicals such as of poliglusam(as filler) glucitol (plasticizer) and hydrochloric acid using moulding technique of synthesis for this environment friendly [25]. Concentration of hydrochloric acid and of poliglusam affect the properties of synthesized plastic such as in moderate concentration of hydrochloric acid, poliglusam disperses evenly in polymer and improves the tensile strength but reduces the elongation of the synthesized plastic [25].

Mango seed starch based plastic
Maulidaet al in 2018 prepared environmental friendly plastic by using starch which is extracted from mango seed (waste of mango). This plastic is prepared by using molding technique [26]. Some more chemicals such as glycerin (plasticizer) and micro particle clay (as filler) are also used in this synthesis. Glycerin and micro clay particles have a profound effect on the properties of synthesized polymer. During this synthesis, clay particles are utilized for reinforcing the synthesized material and after incorporation of clay particle in chain of synthesized polymer, tensile strength of polymer enhances [27] but there is decline in the elongation of synthesized material

[28], whereas addition of glycerin will enhance the elongation and decline the tensile strength of synthesized material [29]. Thistype of plastic is easily assimilated by minute creatures and they break down plastic into small ecofriendly molecules [26].

Jackfruit seed starch based plastic
M Lubiset et al in 2018 synthesized eco-friendly plastic with starch which was squeezed out from jackfruit seed. For this preparation some more chemicals like glycerin (plasticizer) [30], sodium hydroxide and minute crystal cellulose were also utilized.In this synthesis, minute crystal cellulose is employed for reinforcing the synthesized plastic [31] and these were obtained from cocoa shells (hulls). Characteristic of synthesized product can be changed on changing the quantity of chemicals utilized for this synthesis. Such as tensile strength of synthesized polymer will go down on increment of amount of glycerin and amount of minute crystal cellulose whereas elongation will step up on increment of amount of glycerin and amount of minute crystal cellulose [30].

Cassava starch based plastic
S. L. Ezeoha and J. N. Ezenwanne 2013 made eco-friendly plastic with starch extracted from cassava (commonly known as manihotesculenta) on combining it with polyvinyl alcohol (bio polymer). Some more chemicals which employed for this synthesis were talc powder (as lube) and propane-1, 2, 3-triol (plasticizer) [32].Researchers observed that the tensile strength of prepared material is less than petrochemical polymer and such prepared polymer can be rapidly ruined by microscopic creature which release depolymerasein contrast of petrochemical polymer [32]. One of the examples of such microscopic creature which release depolymerase is Alcaligenesfeacalis [33].D.F. Parraaet et alin 2004 also developed a synthetic polymer by mixing cassava starch, mixture of propane-1, 2, 3-triol with polyoxyethylene(polyethylene glycol)(plasticize) [34] and polyoxyethylene(polyethylene glycol) with 1,5-pentanedial (cross-linker)(glutaraldehyde). And molding method is used for preparation of polymer [35].For the packaging application, the synthetic polymer is required whose water vapour transmission is negligible. Because of this reason, in this prepration, mixture of propane-1, 2, 3-triol with polyoxyethylene is added which reduces transmittance of tiny water drops through the polymer [34]. Microscopic creatures are found to rapidly degradable this polymer [36].

Potato starch based plastic
Shahrzadk. jadianet et alin 2010 prepared polyethene with starch which is extracted from potato and also with some chemical like glycerin (plasticizer) and polyethylene in which maleic anhydride is added. Furan-2, 5-dione acts as linker for incompatible LDPE and potato starch in this synthesized polymer [37]. Potato starch based polymer is biodegradable. Bacteria like *Pseudomonas aeruginosa* [38], mildew and humus either in soil or in lab break down this synthesized polymer and generate the ecofriendly materials [39].

Biodegradable starch/clay nanocomposite films
Starch based biodegradable polymer have some limitations like they can easily absorb water in presence of moist environment and their mechanical properties are also not satisfactory. For getting better mechanical properties, Maurizio Avella et al in 2004 synthesized biodegradable films (utilized for food packing) by using molding technique and starting material used for this preparation is potato starch, montmorillon (clay) (added into starch by polymer melt technique), biodegradable polymer having ester functional group (polyester) which is added to starch during synthesis [40].In this polymer, clay is utilized for reinforcing the starch polymer but reinforcing ability of clay particles changed by the addition of polyester to this polymer [40].

Lignin based plastic

a) PLA/lignin films
Lignin is a deep brown color substance and due to the presence of hydroxyl group in its structure, it reacts quickly with water which is present in environment. This hydroxyl group is also responsible forbad bond forming affinity of lignin with other polymer [41]. This property of lignin can be removedby putting acetyl group at the place of

hydroxyl group through acetylation reaction [42]. Lignin acts as a UV protector in plants because of some UV protecting groups present in it. Lignin and PLA polymer show antioxidant behaviour [43], and mechanical immovability [44]. Mechanical property is enhanced by doing acetylation of lignin.J.D.N. et al in 2017 synthesized PLA/Lignin film with solvent molding technique by using chemicals such as lignin, ethanoic anhydride, pyridine, oxolane (THF), and trichloromethane (chloroform) and PLA (Poly lactic acid) [42]. Lignin breaks down into small molecules by some mildew which have laccases enzyme because this laccases enzyme catalyzes aromatic and non-aromatic compoundsdegradation through an oxidation process [45]. PLA and lignin polymer can be hydrolytically reduced into small organic compounds which can easily be converted into ecofriendly compounds by micro-organism [46].

b)   Poly vinyl acetate/ lignin from sugarcane pulp blend

M. F. Silvaet et alin 2011 synthesized a photo-chemically degradable blend by using molding technique and substrate used are lignin (from sugar cane pulp from which juice is extracted) and poly vinyl acetate along with some chemicals such as Hexane, methanoic acid, dimethyl ketone (acetone) and hydrochloric acid [47]. If Poly vinyl acetate is blended with lignin, the degradation temperature ofPoly vinyl acetate is raised than its usual degradation temperature [47].

Bacteria based environment friendly plastic

Polyhydroxyalkonate

By using bacteria Polyhydroxyalkonate (PHA) is synthesized which is majorly utilized in manufacturing of environment friendly plastic. The synthesis of polyhydroxyalkonate (PHA) takes place inside the microscopic creature body [48]. And for this purpose sugar and lipid are utilized as substrate [49] by microscopic creature which is present on surface of land [50]. This PHA is extracted from these microscopic creatures by using a number of techniques.M.A.M. Reis et al. in 2003 synthesized polyhydroxyalkonate (PHA) by using blend of microscopic organisms which effectively decrease the manufacturing expense. Till that time, industries were manufacturing PHA by using single type of microscopic organism blend by utilising glucose and propanoic acid [51].For the preparation of good yield of PHA blend of many types of microscopic organisms fed with number of starting materials such as acetate, propionate, butyrate [52], lactate, succinate, pyruvate andmalate [51], ethanol, aspartate, glutamate, and glucose and the technique used for this intend is fast and famine. From the results obtained by researchers it is discovered that all of the above mentioned starting materials are entirely converted into PHA not into any other product such as glycogen or intercellular carbohydrates [51]. In this technique, famine is required to enlarge the PHA cargo space ability of microscopic creatures. Cargo space ability of each microscopic creature is different and in this technique for the manufacturing of good yield of PHA, only those microscopic creatures are used which have larger Cargo space ability. Usually this whole process is conducted in sequencing batch reactor (SBR) [51].

Microorganisms such as bacteria like Bacilliform, Burkholderiacepacia, Nocardiopsis, and Cupriavidus and fungi *like* Mycobacterium and Micromycetes [53] metabolize PHA and break downit into simple organic molecule. Some minute creatures metabolize PHA in restricted quantity of carbon and energy and also transform it into carbon source and energy [54].Some other scientists also gave the method of preparation of PHA by utilising distinct carbon sources or distinct microscopic creatures. In 2008, Koller et al. reported the preparation of PHA by utilized whey (by-product of casein) for the augmentation of *Pseudomonas hydrogenovora* bacterium (PHA synthesising bacteria) [55]. In 2008, Van-Thuoc et al. utilised one more waste product, wheat bran for the preparation of PHA. Minute creature *Halomonas boliviensis* LC1 used this wheat waste product and synthesised PHA. In this method, minute quantity of PHB is also synthesised along with the synthesis of PHA [56]. Yan et al. in 2006 prepared PHA with the waste water of pulp and paper industry [57]. In year 2007, Raza et al. synthesised PHA with microorganism of *Pseudomonas* kind which utilise molasses as carbon source [58]. Santimano et al. in year 2009

prepared PHA by using a sugar by product, molasses [59]. For the preparation of PHA, Ryu et al. in 2008 evolved Azotobactervinel in swine waste-water [60].

On analysing and recapitulating all research done on PHA synthesis, researchers concluded that on the basis of nutritive demand for PHA synthesis and also on the basis of PHA accretion, there are two categories of PHA synthesising microorganisms (bacterium). First category includes those micro- organisms who demand controlled concentration of nutrients and do not gather PHA during the augmentation such as *Ralstonia eutropha, Pseudomonas oleovorans* and *Pseudomonas putida bacterium* [61]. Second category summarise those micro-organisms who does not demand controlled concentration of nutrients and gather PHA during augmentation (recombinant *E. coli*) [61, 62].

Poly-β-hydroxybutyrate (PHB)
In Maple sap, sucrose is present in huge quantity. Maple sap also has nitrogenous and phenolic compounds, organic acids, and minerals [63]. Microorganism evolution takes place in maple sap because of the presence of all these compounds. A.Yezzaet al. in 2007 synthesized poly-β- hydroxybutyrate through utilization of maple sap by bacteria *Alcaligeneslatus* strain (in shake flask) and for this synthesis some chemicals such as peptone and beef extract was also used. By using maplesap a good yield of Poly-β-hydroxybutyrate (PHB) was prepared. The Poly-β-hydroxybutyrate is broken down into simple organic molecule at temperature 307.9 and 308.8°C [64].

Poly lactic acid (PLA) (without bacteria)
Poly lactic acid (PLA) is utilized in preparation of plastic and for the synthesis of Poly lactic acid, firstly formation of lactic acid monomer is carried out by the disintegration of sugar. After this disintegration, prohibited depolymerization of lactic acid will takes place [65]. Basically L-Lactide and D-Lactide combine and form PLA which is a polymer having two monomeric units. If the amount of enantiomers utilized in the preparation of PLA is altered, the characteristic of poly lactate polymer is also altered e.g. as the quantity of D-Lactide decreases and that of L-Lactide increases, the polymer becomes more crystalline [49].Researchers discovered that hydrolysis process of breakdown of a polymer obeys first order kinetics and its rate depends upon the crystallinity, contourand dimensions of polymer [66].Microscopic creature such as *Amycolatopsis* sp. (bacteria), *Bacillus licheniformis* (mainly present in soil) [67], *Cryptococcus* sp. (yeast) [68] and a lipase purified from a fungus break down poly lactic acid into simple organic molecules.

Oxo-biodegradable plastic
M. M. Reddyet et al. in 2008 made an oxo-biodegradable nano-composite plastic film by adding some(Pro-oxidant) auto-oxidizer which speeds up oxidization of plastic. For improvisation of non- biodegradable polymer inorganic [69] coordination compounds of Fe^{3+}, Mn^{2+} or Co^{2+} and mainly stearates of these metal ions [70] are incorporated in polymeric chain (improvisation of less denser polythene by addition of 2,5- furandione). Pro-oxidant leads to oxidization of this synthesized polymers either at high temperature or in presence of light. In general, coordination compounds of Fe^{3+} lead to oxidization in presence of light whereas Mn^{2+} or Co^{2+} coordination compounds lead to oxidization at high temperature [69]. Coordination compounds of some other metals like Cr (Vl), Ni, Co, Cu [68] are also utilized as pro-oxidant.In the other studies researchers observed that oxo-biodegradable plastic (utilized in shops) can readily be decayed by *Pleurotus ostreatus,* even the condition of light or high temperature is not required and fracture the periphery of oxo-biodegradable plastic along with this, growth of mushrooms is also observed on the periphery of oxo-biodegradable plastic products [71].Nils B. Vogtaet et al in 2009 also discovered that when 2% Renatura pro-oxidant is put to non- biodegradable plastic then it show uninterrupted decay even in obscureness and at high temperature but at first it should be placed in glim(for starting decay of polymer)for short interval of time[72].Camargo et al. in year 2009 also observed the mold (such as *Aspergillus* and *Penicillium*) [73] progression on the periphery of non-biodegradable plastic having pro-oxidant. After this decomposition of polymer some residue is generated and microbe readily degrades this residue [69]. Progression of microscopic creatures is enhanced by the presence of montmorillon (nanoclay) in synthesized polymer [74].

Pooja Sethi *et al.,*

APPLICATION

Biodegradable plastic is used in number of fields such as in medical field, in automotive industry, in food industry, in agriculture and in cosmetic industry. Mainly PLA and cellulose acetate are used for packaging of food stuffs [75] due to their toughness, clarity and good smell controlling properties. PHA is also one of the plastic which is utilized for replacing traditional petroleum based plastic. These days cosmetic industries is also utilizing ecofriendly plastic for making nail paint bottles, makeup brush, shampoo pouch, powder cases, makeup box. PHA and PHB are primarily applied in medical field for construction and restoration of tissue [76]. Biodegradable plastic is also employed for making stents which is used for opening heart valves [77], for building non-natural organ for human beings which does not cause any harmful effect [78] for making bandages, gloves and many medical instruments. Along with this all biodegradable plastic is additionally used for packing the medicines. At present, automobile industries[10] are using ecofriendly plastic at a huge scale such as for making car bodies so that car become light weight and fast, along with this few parts and interior items of cars is also made with eco friendly plastic.

CONCLUSION

The paper provided an overview of ecofriendly technologies to prepare biodegradable plastic, their applications and found it as best alternative in contrast to non-biodegradable fossil fuel based plastic. Substrates required for the synthesis of such polymer are mainly obtained from natural resources but after some additions environment friendly plastic can also be synthesized from fossil fuel based resources which is not as harmful for society. These polymers are readily assimilated by various microbes but still, these polymers are not much utilized because of their high cost in comparison of non-biodegradable fossil fuel based plastic which is an massive impediment in utilization of biodegradable plastic. In Future connecting performance with cost will be incredible task which needs inventive steps in research to generate highly yielding microbes to produce polymers for economic, cost effective and sustainable biodegradable plastic.

ABSTRACT

The National Education Policy is strongly emphasizing on giving importance to the sports and physical education policies because these policies play an important role in the lives of the players and students. This paper showcases the policies that have been made for female players earlier. The problems they have gone through and how they are fighting for their basic rights till now has been focused in this paper. It is very important to be aware about the condition of female players in sports and physical education as they have always been marginalized. Female sports player are an asset for the country as they have lot of potential, but they do not get enough opportunities and even if they get a chance, they are sidelined. They have to fight for their rights in order to get anything for themselves. It is very important to protect their rights. Hence, the policies must be made without any biasness, keeping women in mind too. Women must be given all the rights and privileges that are given to men. There are policies made for women, but they are not being followed properly. Female sports players have to struggle a lot in order to avail the benefits given to them whether it is related to payment, hygiene facilities, food, practice area, accommodation, job insecurity, safety and transportation issues, lack of positive role models, etc. It is very important to look vigilantly whether the implementation of policies is done properly and no one has to go through any sort of biasness. This will lead to great outputs and development in sports.

INTRODUCTION

A human body needs physical activity to be strong, durable, flexible, confident, energetic and overall healthy. It is very important to understand that physical activities during childhood are really important for the children in order to get their proper, normal, healthy and complete growth. Regularity and habit of physical activities from the childhood lays the foundation for the healthy growth and normal lifestyle. School going children get ample of opportunities to indulge themselves into various physical pursuits. They even enjoy getting involved in as many as physical activities possible for them. They themselves choose the variety of sports activities on the basis of their age, interest, ability and personality. It is not about any particular region, but physical activities are important all over the world. There is a time duration set for the people to do physical activities everyday according to their age groups. It is very important to maintain a good BMI (Body Mass Index), it provides the status of the human body in terms of health. For the proper growth and development of the children from the beginning, it is important that physical activities must be a part of the school curriculum as a separate subject. Health and education are strongly connected to each other. It is said that "Health is Wealth" and it is true. Health is the greatest wealth an individual can have, without it everything is meaningless. One can never enjoy other joys of life if they are not healthy. Health also plays an important role in education. It is very important for every child to be healthy because a healthy body gives great outcomes in terms of education. They tend to understand and learn things quickly and it remains in the mind for the longer periods of time. A healthy mind and healthy body are really important in order to attain good education.

A healthy human does not mean only with a male figure, but it includes a female too. It is clearly known that the world has been too patriarchal since the beginning. Each kind of importance has been given to males only, whether it is related to education, freedom, employment, etc. They have reserved themselves in sports as well. Women as usual fight for their every basic right. There are different definitions of physical education for both men and women. For men, it is doing physical workout, exercises, running, swimming, outdoor activities, etc., but for women it is completely different, for them, it is doing household works like, dusting, moping, making food, washing clothes, etc., all these activities are counted as physical activities for them. Physical health does not come only with physical activities, it comes with food also. The more you do workout, the more your body wants to refuel it with food. Here also, gender biasness is there. Men have always been treated important and kings of the houses, and women, on the other hand, have been treated as slaves. All kind of nutritious food is given to men at proper time intervals, but women would barely get able to eat a three times meal per day (forget about the nutrition). All these things were considered absolutely normal in earlier days. All kinds of importance were given to men. But gradually, time changed and it made women strong enough to fight for their rights, their most basic rights.

Earlier, only boys were sent to school to study because it was important for them to get education as they were the only ones who had right to get educated. Physical activity has an important connection with schools. A school is such a place where children are more interested in playing because they get a good company over there and lot many options to play. So, they get fulfilled they everyday physical activities needs in the school. But, girls were not supposed to go to school to get educated; hence, they did not have the chance of any physical activity at all. The reason behind the healthy and strong growth of men is physical activity, which they get to perform from the beginning of their childhood. The availability of each variety of nutritious food to boys resulted in their growth of a healthy body. A healthy body does not relate to a boy or a girl, it gets along with the physical activity and intake of proper food. Therefore, it is important for both men and women to do physical activities and keep their body healthy. The new National Education Policy has made efforts in bringing the change in this regard with the time and has given importance to health, happiness and immunity of children as it has become more important after covid pandemic. There are several key points in the new education policy where sports are considered equally important as any other subject. Physical education is an interesting subject for the students. It increases fun and keeps engaging students which the knowledge of people. It is learning while playing. They learn all the key concepts of sports while playing and doing other physical activities such as, yoga or PT. It is clearly known to everyone that learning or understanding any topic theoretically becomes boring but when it becomes practical especially in the form of sports,

65963

it hardly takes any time to understand and learn anything. The period of physical education gives mental relaxation to the students as they move out of the world of books to the world of playground. There are some specific reforms where focus has been given to the all-round development of students. Keeping in mind the importance of health, the NEP has included health and nutrition, physical education, fitness, wellness, sports, sanitation and hygiene as some of the key subjects, skills and capacities that must be learned by everyone.

IMPACT AND IMPORTANCE OF PHYSICAL ACTIVITIES IN SCHOOLS

Schools play an important role in the overall development of an individual, whether it is related to physical growth or mental growth. Schools are a complete package of human behaviour, growth and health. School in itself is a platform that provides every kind of development needed by a human body. School playgrounds are the places where every child has played the most on daily basis. That daily physical activity plays a crucial role in the development of a human body in certain contexts. Modernization has changed lot many things with time, including gender stereotypes. Earlier, females were not allowed to go to schools for studies but with the change in the mindsets of people opened up the opportunities for females to get the privilege to go to school and get them educated. One of the most important roles in this change was of the government also. Their policy of free education to girls also helped in changing the scenario. Later on, government came up with many other policies for promoting girl child education; they provided financial relief to the families along with their various schemes of gifts, such as, gifting laptops, mobile phones, tablets, books, stationery, etc. All these things rapidly changed everything and now, every girl is getting educated. Women have proven themselves equivalent to men and not even equivalent but more than that too.

They have raised the standards of education system by going beyond their potential and making everyone realize that women are no less than men and can achieve the highest levels of tasks in any sector. They have proved themselves the best in each and every field. One such important field is sports. A sport is such an activity which fills a lot of enthusiasm and patriotism in every individual's heart. It helps in connecting people to each other and to their country emotionally. There was a time when girls started going to schools but they were not allowed to play or to take participation in any of the physical activities but later on, with the change in time, girls too started playing in the school and showcased their highest talents. This led to various arrangements of tournaments that were held by the government in various fields for women. This encouraged women to play not only on district or state levels but they represented our nation on national and international levels and they not only represented our country but also got the medals and made the entire nation proud of them.

There had been a lot of repercussions when women entered in the field of sports. They were bashed wherever they went. Earlier, the government policies were also not exactly the same for both men and women; hence they faced consequences for the same. They had to fight for everything and everywhere. There had been a lot of struggle in women's life earlier when they wanted to do more in sports or to move further. After so many strikes and fights, government made the required amendments in the policies for women and gave them equally all the rights that were given to men but then also, there was no peace. Their path was not easy and was again full of challenges, struggles and fights. Again they had to fight for all the rights that were given to them according to the policies. Internal politics and patriarchy created a lot of biasness. The things that were reserved for women were too not given to them, these includes the funds, food, accommodation and various miscellaneous expenses. This also raised concerns when there were times during selection of either of the team: men's team or women's team. Every time, men's team was selected and sent to play on international level, considering that they would get at least a bronze medal and would not get their country ashamed. There have been a lot number of movies made on sports which have depicted the reality of sports scenario in India. Some of the movies are based on the real lives of various sports persons and some have depicted the reality from various instances based on the real incidents and happenings of the female players or teams. Movies like Chak de India, has perfectly depicted the situation of women in sports, there is scene in the movie which showed that either of men's or women's team would be allowed to play international hockey and on the basis

of only a baseless discussion that women are only meant to be in the kitchen, it was decided that that women's team would not be allowed to play internationals. Again, they had to prove themselves that they had the potential to play the internationals and then they were sent to play them. Apart from that, when there were team selections going on, many families did not allow women to play, they fought and went against to play, that is how they came that far.
Another movie instance is, Mary Kom. This movie raised lot many concerns regarding the problems faced by the female players. In many scenes, biasness in terms of food and scores were shown in the movie. Dangal movie has shown the struggle on a different note, where a father is willing to get his daughters involved into sports activities on a serious note, dreaming to send them at international levels, but there also he faced a lot of repercussions. There are lot many movies like these showing the real struggle of female players, but what do we see in the end is that, when they played and represented their country at international games, they have won every kind of medal for their country, including the gold too. India is one of the major developing countries in the world. Gender ratios in sport are still highly unequal around the globe. It is very important to reduce this line of marginalization and discrimination in sports to increase their participation in sport programs.

STEPS TAKEN BY THE GOVERNMENT FOR IMPROVEMENT

The government of India & not for profit organizations has taken certain steps to improve women's condition in sports:
1. Promoting the hassle free participation of women by integrating gender issues within the sport policies.
2. Assuring women safety and healthy environment for participation in sport activities.
3. Using documentaries, real life achievers galleries short films etc., required actions must be taken for gender mainstreaming.
4. Changing the mindsets of people by highlighting the achievements of women and their sport events with the help of media and spreading positive information in order to increase more and more participation of women.
5. Creating awareness of quality of physical educational programs through constructive schooling period among young women so that they can avail the benefits through the practice of sport.
6. A guarantee of safe and healthy environment must be provided from all kinds of sexual harassment, violence, and controls will have to be banned.
7. Financial support help must be extended by the State & Central governments for research work within the field of women's sport.
8. There must be a separate subject of women sport for study with theoretical implications to help women realize the concept of women sport & its importance.
9. There must be female ruling bodies as a main element for policy leading to assure the diversity within the sport movement.
10. The introduction of quota system to assure the participation of women in ruling bodies appears as an efficient way to eliminate this discrimination.
11. Enhancement of recognizing and rewarding sporting success through Award of Excellency to women sports students must be done in order to increase more and more participation of women.
12.Identifying & increasing the benefits conceived through sporting activities initiatives for selected women athletes & sports players by capacity building can be done by the government.

CONCLUSION

Educational reforms are not as easy as thinking them to do. There are too many obstacles in the ways of reforms. Many people are still in this world who are not ready to change their typical thoughts about women and have become hurdle in the way for improvisation. Such people are the hardest to convince but these things do not matter anymore because the change which is necessary and required will be brought in this by one way or the other. The importance of physical education in schools is essential for overall growth and all-round development of each and every child. It has endless and infinite benefits on both physical and mental health. It is very

Geetika Gupta and Richa Arora

important to address the physical education gap in order to work upon the areas of improvisation. Priority to physical education must be given for every child, no matter the child is a boy or a girl, both are equally important and their health too. This can improve the rates of health, overall development and success of children. People must support and advocate the benefits of physical education, as it is good for their own children. This can help students in getting lot of benefits and resources from the government.

Women are one of the greatest resources in the country. They have enormous potential in them to change the world and have the capability to change the scenario of sports. They have the ability to manage their personal and professional lives at their best. They are super-talented and multi-tasking. Such resources are not meant to be hid or restrained. They have great power, strength and capability to represent their nations globally. With the help of such resources any country can achieve the heights of success. This country needs more PT Ushas, SainaNehwals and Mary Koms. The gender value and uniformity to extraordinary degree depends upon the mental strength of the people. The involvement of the women in sport will decrease their pressure and grow more certainty that will consistently raise their certainty. This circumstance needs a decent foundation from the state itself.

ABSTRACT

In this study, National Cadet Corps (NCC) cadets' physiological and motor fitness factors were examined in relation to the benefits of Tabata training. 50 NCC cadets in all involved in this study; they ranged in age from eighteen to twenty-one and were engaged in the NCC's three-year training programme. The purpose of this investigation was to evaluate the effects of an eight-week Tabata training regimen on NCC cadets' physical condition. Measurements were taken before and after the intervention for a few fitness-related variables. The study found that NCC cadets' physical fitness can be effectively improved by Tabata training. Numerous physiological markers showed a considerable improvement after the eight-week Tabata training programme. The eight-week Tabata programme significantly increased participants' ability to perform pushups, sit-ups, sprint for 50 metres, and hold their breath (p 0.001) according to the results of the paired t-test. These findings show that the NCC cadets' stamina and endurance were improved by the Tabata programme.

Keywords: Tabata training, NCC cadets, physical fitness, strength, endurance, breath holding capacity, resting pulse rate, blood oxygen saturation.

INTRODUCTION

This study's objective was to investigate the eight-week Tabata training programme effects physiological, and motor fitness characteristics in a particular group of National Cadet Corps (NCC) cadets. NCC cadets must be physically active because it helps them prepare for the variety of challenges and tasks they will face during their military training. The purpose of the study is to determine whether Tabata training, a form of High-Intensity Interval Training ,improve NCC cadets' physiological, motor abilities, and general fitness levels. Specifically in the context of National Cadet Corps (NCC) cadets, physical fitness plays a key role in the training and performance of military

65967

personnel. A high level of physical readiness, comprising different physiological, motor, and fitness aspects, is required due to the hard nature of their training and prospective military responsibilities. To increase the physical fitness of NCC cadets, the current study looks at how an eight-week Tabata training plan impacts several areas of physiological health, motor function, and overall fitness. this training has grown in popularity because they are time-efficient and could improve a few physical performance metrics. However, nothing is known about how it affects the needs of NCC cadets. By examining the effects of an eight-week Tabata training programme on the physiological, motor, and fitness parameters in a subgroup of NCC cadets, this study seeks to fill this knowledge gap. The study aims to pinpoint the unique advantages of Tabata training for this particular set of cadets by undertaking an extensive examination of important physical criteria, such as cardiovascular fitness, muscular strength, endurance, and agility. It might have a big impact on military training programmes to know how Tabata training affects NCC cadets' physical fitness. Incorporating Tabata training may prove to be a successful and time-saving strategy to improve the readiness and physical capabilities of NCC cadets if the study's findings are positive. On the other side, if the results are ambiguous or have little bearing, the study may shed light on the potential need for training plans that are specifically targeted to the needs of NCC cadets. The best possible physical condition of NCC cadets is crucial since they will serve as the country's future military leaders. The findings of this study could help military educators, trainers, and decision-makers develop evidence-based training regimens to maximise NCC cadets' physical fitness, hence improving their general performance and readiness for the difficulties that lie ahead.

Abd Elhakim at all 2021 The study by Abd ElHakim investigates how Lightly stimulating Tabata workouts have an impact on physical processes, visual tracking, and the speed at which Taekwondo competitors execute their moves. The study examines the effects of employing Tabata exercises along with light stimulation on various performance characteristics in Taekwondo competitors, and it was published in the Assiut Journal of Sport Science and Arts. The study's conclusions offer important information about the potential advantages of combining Tabata training with visual stimulation to improve physical fitness, skill execution speed, and visual tracking abilities in Taekwondo players. These results may have practical implications for improving training regimens in this sport. (1)**Domaradzki at all 2020**. In their study, by Domaradzki, Cichy, Rokita, and Popowczak investigate the impact of Tabata training on body composition, aerobic capacity, and anaerobic performance in overweight, normal-weight, and underweight teenagers. In a study that was published in the International Journal of Environmental Research and Public Health, the effects of Tabata training, a type of high-intensity interval training (HIIT), on the physical fitness of teenagers with various body types were examined. The study's conclusions shed light on the potential advantages of including Tabata training in physical education sessions for enhancing body composition, aerobic capacity, and anaerobic performance in teenagers of various weight categories. The general health and fitness of these people may be improved by incorporating these findings into physical education courses. (2)

Tabata's (2019) The studied by Dr. Tabata,the most energy-efficient high-intensity intermittent training technique is Tabata training, according to research. analyses Tabata training as a high-intensity intermittent training technique. The study, which was written up in The Journal of Physiological Sciences, examines how successful Tabata training is at burning off excess energy and how that affects physical performance. A clearer knowledge of the effectiveness and usefulness of Tabata training in boosting aerobic and anaerobic fitness levels may result from this analysis of this time-effective and effective training method. The findings of the study may have consequences for trainers, athletes, and fitness enthusiasts looking for safe and effective training regimens to enhance physiological conditioning in general. (3)**Viana, at all (2019).** The Tabata protocol, its use, changes, and results are all thoroughly reviewed in the work by Viana, de Lira, Naves, Coswig, Del Vecchio, and Gentil (2019). The study, which was published in Clinical Physiology and Functional Imaging, looks at the many applications of the Tabata training approach, the adjustments, and adaptations it goes through, and the effects. The study compiles data on the Tabata protocol's efficacy as a high-intensity interval training (HIIT) technique, potentially providing helpful insights for fitness experts and researchers looking to comprehend and apply Tabata training in various contexts and for various fitness goals. (4)

Afyon, at all (2018) The study was conducted by Afyon, Y. A., Mülazimoğlu, O., and Altun, M. (2018) the effects of 6-week Tabata training on the physical and motor characteristics of female volleyball players. Numerous studies have

investigated how HIIT regimens, like Tabata training, might improve different facets of physical fitness and athletic performance. These studies have frequently concentrated on the effectiveness of HIIT in enhancing physical strength, metabolic changes, and cardiovascular endurance. A major area of study has been how quickly physiological changes can be induced by HIIT when compared to conventional continuous training methods. According to research, HIIT, which includes Tabata training, can significantly increase anaerobic performance, muscle strength, and aerobic capacity. These advancements are especially important for players who play volleyball, a sport that calls for fast bursts of energy, agility, and coordination. The study's emphasis on female athletes is especially relevant since it adds to the increasing body of research that examines how gender affects how training interventions are received.

Tabata training with other training techniques like strength training or continuous aerobic training. Studies using other time frames or training intervals could be compared to the duration of the 6-week intervention and the frequency of the training sessions to figure out the best programme durations for a given outcome.In summary, the study adds to the body of knowledge on HIIT and how it affects an athlete's physical and motor abilities. The study sheds light on the potential advantages of Tabata training for improving performance in sports requiring agility, speed, and power by studying how it affected female volleyball players. It also emphasises how crucial it is to modify training programmes for different athlete demographics. The results of this study could be used with previously published research to improve training advice and tactics for enhancing athletic performance. (5)

Sumpena at all 2017:This study was Sumpena, A., and Sidik, D. Z.'s study from 2017 titled "The impact of Tabata protocol to increase the anaerobic and aerobic capacity" investigates how the Tabata protocol affects both anaerobic and aerobic capacity. High-Intensity Interval Training **HIIT**: HIIT has drawn a lot of interest in the literature because of its ability to increase anaerobic and aerobic capacities in a time-effective manner, albeit I don't have access to the study's entire material. Studies examining the impact of different HIIT techniques on various fitness measures, including the Tabata protocol, could be useful.

Anaerobic and Aerobic Capacities
Research on the effects of aerobic and anaerobic training methods on athletes' capacities may shed light on the precise physiological changes that the Tabata protocol seeks to induce. Sumpena and Sidik's findings can be better understood by comprehending how various training methods affect these capacities.

Physiological Responses to HIIT
Understanding how HIIT affects variables like oxygen consumption, lactate threshold, and heart rate can help put the changes in anaerobic and aerobic capacity that were seen in the study into context. The efficiency of Tabata training can be better understood by comparing these responses across various HIIT regimes.

Athletic Performance Enhancement
The literature that focuses on the relationship between gains in anaerobic and aerobic capacities and improved athletic performance can offer a useful perspective on the applications of the study's findings. This may be especially important for athletes or activities that require fast energy bursts followed by continuous efforts.

Individual Variability
To better understand the variation in participant reactions in Sumpena and Sidik's study, it is important to examine how each person's response to HIIT differs and how age, fitness level, and genetics affect the results.

Long-Term Effects
Studies that look at the long-term effects of HIIT techniques like Tabata training on anaerobic and aerobic capacities may shed light on how long-lasting the gains shown over time are. Researchers can have a better knowledge of how the Tabata protocol affects anaerobic and aerobic capacity by looking at these linked areas of literature, according to Sumpena and Sidik's research. The information gained from all these studies advances our understanding of efficient

Sanjeev Sharma *et al.,*

training strategies for improving athletes' physical prowess. (6)**Foster et al. (2015)** The 2015 study by Foster et al. evaluates the effects of steady state training versus high intensity interval training (HIIT) on aerobic and anaerobic capacity. The purpose of this study is to examine these two training approaches in order to determine how they affect people's physiological capabilities. This study adds to the body of knowledge on fitness training methods by comparing the effects of HIIT versus steady state training on the development of both aerobic and anaerobic capacity. The study, which was published in the Journal of Sports Science & Medicine, contributes knowledge about how to improve training techniques for raising athletic performance and general fitness levels..(7)

Emberts, at all (2013) The study by Emberts, Porcari, Dobers-Tein, Steffen, and Foster examines the amount of energy expended during a Tabata workout as well as the intensity of the exercise. A Tabata training session is a type of high-intensity interval training (HIIT), and the research, which was published in the Journal of Sports Science & Medicine, looks at the physiological demands and calorie expenditure of such a session. The study's conclusions shed light on the intensity level and energy consumption of Tabata exercises, potentially offering useful information for anyone looking for efficient and effective training options to improve their physical fitness and calorie burn. (8)
B. Rawat, D. Bangari (2013) has conducted a study on Effect of Jumping Exercise on Leg Strength of Basketball. In the study, they used purposive sampling technique in the area as mentioned in the delimitation and limitation. Purposive sampling technique was the appropriate method in the collection of Data. (9)

Players", Online International Interdisciplinary Research Journal, Volume 3, Page no.83-93,2013.**Manoranjithstued by Manoranjith and D.S.** explores the effects of plyometric and Tabata training on speed endurance and vital capacity in male volleyball players. The study examines how these two training methods affect the physiological and physical traits of volleyball players. The study's findings shed light on the potential benefits of the training that improving speed endurance and vital capacity in male volleyball players by plyometric and Tabata training, possibly assisting in the improvement of training schedules and physical conditioning in this athletic population. (9)

METHODOLOGY

A particular selection of NCC cadets with comparable training histories and levels of physical fitness are probably involved in the study. The cadets were split into two groups: one experimental group that completes an eight-week Tabata training programme, and the other control group that carries on with their regular training schedule. To guarantee the validity of their conclusions, the researchers have chosen a randomised controlled trial design.

Training Program
Repeated high-intensity interval workouts were part of the eight-week Tabata training regimen. Each session consists of eight cycles of 20-second bursts of vigorous activity followed by 10-second rests. To increase cardiovascular endurance, strength, and agility, Tabata training may include a range of exercises that focus on various muscle groups.

Outcome Measures
The researchers measure a few physiological, motor, and fitness factors to gauge how well the Tabata training programme was working. Blood pressure, oxygen uptake, and heart rate are examples of physiological parameters. Standardised tests were used to evaluate motor abilities like speed, agility, and coordination. Strength, endurance, and flexibility evaluations are all examples of fitness factors.

Results of the study and Data Analysis
We were use paired t-tests on each of the variables to analyse the findings of the study "Improving Physical Fitness in NCC Cadets through an Eight-Week Tabata Programme" and see the pre- and post-response had any statistically significant differences, assessments. From the paired t-test results, we observe that there are significant improvements in push-ups, sit-ups, 50 mt. running time, and breath holding capacity after the eight-week Tabata

Sanjeev Sharma *et al.,*

program (p < 0.001). According to these results, the Tabata programme enhanced the NCC cadets' stamina and endurance. But there were no appreciable modifications in resting pulse rate (PR) (p = 0.102), indicating that the Tabata programme may not have had a major impact on participants' resting heart rates. But it's also important to consider other elements, such as one's level of fitness and overall cardiovascular health, that could affect resting pulse rate.

Additionally, there was a substantial increase in the blood oxygen saturation level (SPO2) following the programme (p = 0.012), indicating better oxygenation and perhaps better cardiovascular fitness. Overall, the study's findings show that an eight-week Tabata programme improved NCC cadets' strength, endurance, breath holding ability, and blood oxygen saturation by positively affecting a variety of physical fitness characteristics. The resting pulse rate was not greatly impacted, though.

CONCLUSION

This study results were to be an Improving the Physical Fitness of NCC Cadets through the Eight-Week Tabata training Programme concluded that the Tabata training intervention had a significantly favourable impact on physical fitness characteristics in NCC cadets. The eight-week Tabata programme resulted in substantial gains in pushups, situps, 50-meter running time, and breath holding capacity, according to the paired t-test results. These results imply that the Tabata training routine successfully increased the cadets' strength, endurance, and breathe holding capability.

ABSTRACT

The impostor phenomenon (IP) is a quintessential occurrence that affects high achievers. Even after success, this phrase describes a sense of self-doubt and a trepidation of being exposed as deceptive. It is a psychological phenomenon that has received a lot of attention recently and has an enormous effect on an individual's well-being and performance at work. The objective of the current research is to comprehensively examine the prevalence, impact, and underlying factors of the Impostor phenomenon while critically evaluating existing clinical interventions and proposing effective interventions. The current research is based on secondary data sources, which include a wide range of scholarly publications, databases, and pertinent literature. The study commences a review of IP and focuses on its prevalence, demographic trends, and psychological and emotional effects on people in diverse communities. The study will focus on the causes of IP, methods used to diagnose it in clinical psychology, as well as how it coexists with other mental health conditions. It also seeks to comprehend this condition's theoretical underpinnings and the mental patterns that support it. To provide information on their success rates, current therapeutic options are critically assessed in terms of their efficacy and the challenges they provide. This study entails a thorough assessment of the present status of IP research, underlining the critical need for effective therapeutic remedies, and outlining a path of action for the future that will enhance people's mental health and encourage professional success.

Keywords: Impostor phenomenon, self-doubt, well-being, mental health issues, clinical therapies

Paridhi Jain and Suyesha Singh

INTRODUCTION

The phrase "Impostor Syndrome" (IS) has drawn a lot of public interest during the last few decades. According to Bravata et al. (2019), it is also referred to as the imposter phenomenon, impostorism, impostor experiences, and fraud experiences. IS, which is common in high achievers, is defined as the dread of being exposed as a fraud even after achievement (Clance, 1978). People with IS do not have confidence in their abilities and attribute their achievement to external factors. They disregard any honor or praise and place little value on commendable comments or accomplishments since they believe it is unjustified. As a result, people become insecure, dread failure, and become self-conscious about their imperfections. In addition, those with IS fear taking on more responsibility as a result of their accomplishments (Jöstl et al., 2012).This study sets out on a thorough journey into the clinical perspective of impostor syndrome, providing a thorough analysis of its prevalence, looking into potential etiological factors that might be responsible for its emergence, and presenting efficient clinical intervention and management strategies. Understanding and treating impostor syndrome from a clinical perspective is not only essential but also an ethical duty for mental health professionals in a society where self-doubt and feelings of inadequacy frequently affect even the most exceptional people.The rationale of the research being presented is to fully comprehend IS as a ubiquitous psychological syndrome that affects society's top achievers and to comprehend its effects on an individual's mental health and performance at work. There is an imperative need to effectively explore IS's diagnostic techniques and their associations with mental health disorders because IS is becoming more prevalent. Furthermore, by concentrating on the theoretical underpinnings and mental health issues that sustain this occurrence, the current research lays the framework for more focused intervention strategies. It also looks at the available therapeutic psychology treatment approaches for dealing with IS. Lastly, the work that is being presented focuses on the urgent need for treatment methods to enhance the mental health of a person and promote professional growth and achievement, therefore contributing to the welfare of people in varied communities.

OBJECTIVES

The objectives of the current research are twofold (i) To examine the prevalence, impact, and underlying factors of IS; (ii) To evaluate existing clinical interventions and propose effective treatment modalities.

METHODOLOGY

This theoretical review study explores the clinical viewpoint on impostor syndrome using a wide range of secondary data sources. The secondary data has been used in the research. The academic databases PubMed, APA, PsycINFO, and Google Scholar were all thoroughly searched. Published articles were incorporated into the search. Sources were cited if they offered information on the prevalence, etiology, and treatment options of impostor syndrome's clinical characteristics. To ensure that the evaluation includes the most recent advancements in the field, published publications between 1978 and 2023 were taken into consideration.

LITERATURE REVIEW

Definition and Conceptualization of IS
The Impostor Syndrome in High Achieving Women: Dynamic and Therapeutic Intervention was the title of a paper written by psychologists Pauline R. Clance and Suzanne A. Imes in 1978. They described intellectual phoniness (IP) as "an internal experience of phoniness" (Clance, 1978). They began by conducting a study on accomplished women and women working in higher-level positions. At the time, they polled over 100 women, and they discovered that over a third of them had IS. They had all excelled professionally and earned higher education degrees. These women felt that, despite their accomplishments, they hadn't internalized them. Instead, they attributed their good fortune.

Paridhi Jain and Suyesha Singh

Clance during the initial work conceptualized that IS was found only in women but recent literature states that it is equally present in both men and women, in different professional settings, and different cultural and ethnic settings (Brawata et al., 2019; Hawley, 2016).

Later on, Clance (1985) described a few components of IS:
1. The cycle of impostorism is a negative feedback loop that affects one's attribution and learning preferences. People with IS either put off doing their job till later, make up for it by doing it early, or do it both ways. They ascribe their achievement in this to outside forces rather than their own ability when they achieve it. Because of this, those with IS are never prepared for their subsequent work, which initiates the vicious cycle once more.
2. People with IS have a strong need to stand out, which drives them to thrive at everything. This unjustified greater expectation might lead to self-doubt and weaken their perceptual abilities, even when the contrary is confirmed by real facts.
3. People with IS not only demand the best of themselves but also that they exert the least amount of work possible. This explains why some IS patients doubt themselves and feel like frauds, especially when their unrealistic expectations aren't met.
4. Individuals with IS dread being exposed as fake, which feeds their fear of failing and makes them avoid taking risks that may fail.
5. Individuals who have the IS frequently reject any type of praise and discard competence. They rely on alternative explanations to attribute their success.
6. IS individuals' concerns about their capacity to replicate success and meet the raised expectations of others underlie their fear of success.

The central characteristics of IS as mentioned in the literature are fear of failure, perceived fraudulence, and impaired self-efficacy (K.H. & Menon, 2020). Kolligian in 1990, first used the term 'perceived fraudulence' for IS. People with IS believe that others perceive them as more capable than they are. This is the major cause of low self-efficacy. From the above-mentioned description, it is clear that Clance's analysis of IS's components indicates a cyclical pattern of doubt about themselves, lofty aspirations, and risk aversion. Individuals with IS struggle with their self-concept, and dread success pressure.

Theoretical Underpinning of IS
The mechanism of IS can be understood by several theoretical paradigms. Some of them are as follows:

The Leadership Model of IS
Both Mount & Tardanico (2014) and Clance (1985) provided the ISleadership model. According to the concept, individuals with IS are frequently high achievers. Every time a leader experiences failure fear, they lose confidence in their ability to complete the work at hand and develop more perfectionistic impulses. Leaders make an effort to complete their tasks perfectly. This ultimately led to the sense of IS, which can further cause leaders to put off making decisions, avoid taking risks, and procrastinate.

Self-Determination Theory
Deci & Ryan (2000) propounded this theory. According to this notion, people have a psychological desire for relatedness, competence, and autonomy. People are more likely to be genuinely driven and behave in ways that are consistent with their aspirations and values when these requirements are met. People with IS feel pressure to uphold external norms, questioned their competence, attributed their achievements to chance, and feel disconnected from other people. As a result, individuals start to experience symptoms of impostor syndrome, including a dread of failure, low self-esteem, and a sense of having been exposed as a fraud.

Attribution Theory
This theory serves as a foundation for investigating how people interpret the reasons for any occurrences or other people's behavior. It examines the issue of why something happened and how to comprehend the rational inferences people draw in various situations (Weiner, 2014). Regarding IS, those who have it exhibit distinct attribution

65975

patterns; rather than attributing their talents, they place the credit for their success on external factors (Vaughn et al., 2019).

Expectancy Value Theory
An explanation of the relationship between human motivation and decision-making is provided by the anticipation of success and the subjective value ascribed to the outcomes in the theory of expectancy-value (Wigfield & Eccles, 2000). People who have IS frequently have modest expectations and still have doubts about their abilities even after success. Additionally, they place more value on receiving acceptance from others and receiving external validation than they do on receiving intrinsic validation, which creates a conflict between their goals and the desire for external recognition (Vaughn et al., 2019). This may lead to a reduction in intrinsic drive and an escalating sense of impostorism. Impostor syndrome is fundamentally based on several theoretical frameworks. These ideas collectively demonstrate a framework for IS's many characteristics.

Prevalence and Demographic Patterns of IS
Regarding many demographic and cultural aspects, IS prevalence differs. For instance, a comprehensive analysis of 62 studies found that 56% and 82% of college students, medical students, nurses, and professionals have IS (Bravata et al., 2019). In 2023, Wang et al. studied 148 Chinese medical students. They discovered that 57.2% of medical residents and nearly 62.8% of medical students both have mild to severe symptoms of IS. They also didn't discover any gender disparities. In addition to greater levels of anxiety, sadness, sleep disruption, and academic burnout, medical students with more severe IS also face these conditions. Saudi Arabian Medical University students (n=502) reported 42.1% of IS symptoms, while female students reported greater levels of IS symptoms, according to Alsaleem et al. (2021). Similar conclusions were drawn from a study conducted by Vilwock et al. (2016), who discovered that over a quarter of male and half of female medical students at an American Medical College experience IS and burnout. In a study of 200 students in computer science at a North American university, done in contrast to medical students, about 57% of students reported experiencing IS (Rosenstein et al., 2020).

Professionals: Healthcare workers in the medical field frequently experience IS. 200 physiotherapists working in India were studied by Kansara et al. in 2021. According to their research, 32% of physiotherapists frequently and over 58% at moderate levels reported experiencing IS symptoms. The intensity of IS symptoms in 103 young Italian neurosurgeons was evaluated by Zaed et al. in 2022. They discovered that 11.7% had strong levels of IS symptoms, 27.2% had regular IS symptoms, and 42.7% had moderate levels of IS symptoms. The main determinants of IS are educational attainment, female sex, and academic and professional accomplishments. Additionally, Shanafelt et al. (2022) reported that among 3116 doctors practicing in the US, 40.4% suffer minimum, 36.4% moderate, 17.4% frequent, and 5.8% encounter strong intensity of IS symptoms.

Vicious Cycle of Impostor Syndrome
Other than the six components defined by the Clance of IS, there is also a simplified cycle of IS(Huecker et al., 2023):

Perfectionism
The vicious cycle of IS begins with Perfectionism. As per Clance Perfectionism is 'Need to be the   Best'.It is defined as hyper-competitive behavior in which a person sets unrealistically high standards for   themselves and tries to work flawlessly. These unrealistic high standards can lead to work martyrdom i.e., sacrificing their interest for an imaginary larger benefit, overgeneralizing fault as a lack of ability, and excessive negative feedback towards oneself (Thomas & Bigatti, 2020). Lastly, that leads to Super heroism.

Super heroism
It alludes to the desire to excel. People with IS overprepare for projects to complete them even more quickly than they can.This component's primary idea is that excessive preparation harms people's mental health (Sukhera et al., 2022).

Atychiphobia

It alludes to the worry over failing. This atychiphobia becomes apparent if confronted with any accomplishment-related activities that are imposed either inwardly or externally. Because they think their fear of   failing or doing poorly would render them incapable, people with IS suffer worry and trepidation, which can further lead to shame (Giel et al., 2019).

Refusal of Competence

IS and perfectionism go in tandem side because those who have both tend to underestimate their skills, abilities, and competence. There is a propensity to internalize success and blame failure on chance or other factors, regardless of evidence that the person completes particular tasks.

Achievemephobia

The dread of success is alluded to as Achievemephobia (Cavenar & Werman, 1981). The lack of any one or more of these widely accepted qualities does not exclude someone from experiencing IS, and this attribute is not entirely predictive of IS. Achievemephobia is defined as the inability to internalize or appreciate   one's successes due to the possibility that success may raise expectations or add to already strenuous workloads, as well as the internalization of losses as a positive feedback loop.

Etiology of Impostor Syndrome

Todate, no specific etiology has been identified of IS but recent research focuses on multifaced contributory factors of IS such as institutional, environmental, sociocultural, and relational factors (Feenstra et al., 2020).

Role of Family

The IS has familial roots, according to Clance & Imes (1978). They contend that an unusual position in the family, as well as heightened expectations for the child—such as being a perfect child or having a brilliant, well-adjusted sibling—all contribute to the emergence of IS. Clance (1986) went on to say that four familial elements influence the emergence of IS.

I. From an early age, one learns that being smart or intellectual is the first rule of the family.

II. Compared to their families, people have various interests and pastimes.

III. The reaction from family members is inconsistent and inconsistent.

IV. Despite accomplishments, parents do not compliment their children.

All of these have a severe detrimental effect on children, and they also cause people to acquire feelings of imposter syndrome (Li et al., 2014).

Personality Traits

 IS development is greatly influenced by specific personality features. Perfectionism, high neuroticism, low conscientiousness, and avoidant personality traits, according to research, are key factors in the emergence of IS (Thomas & Bigatti, 2020; Arleo et al., 2021; Rohrmann et al., 2016; Hutchins et al., 2017). People who struggle with perfectionism and impostor syndrome attempt to hold themselves to unattainable higher standards and have comparable cognitive distortions (Arleo et al., 2021). According to Sawant et al. (2023), those with greater degrees of neuroticism tend to worry excessively about even trivial matters, are more easily agitated, and have higher levels of anxiety and despair than those without imposter syndrome. Additionally, according to Hutchins et al. (2017), individuals with impostor syndrome choose an avoidant coping strategy to deal with difficulties, which exacerbates feelings of emotional weariness and lower job satisfaction.

Societal Factors

A person may be more prone to experiencing imposter sentiments depending on their place in the social system (Feenstra et al., 2020). According to the researchers, socially affluent groups, such as women and minority groups, are prone to imposter syndrome (Ellemers, 2018; Cokley et al., 2015). The emergence of IS may be influenced by certain stereotyped roles. For instance, women are often stereotyped with missing attributes that are associated with

Paridhi Jain and Suyesha Singh

successful leadership, such as masculine features, and as having warmer and more community traits instead (Feenstra et al., 2020). These socially constructed ideas can affect the way individuals behave and perhaps contribute to the emergence of IS. Accordingly, when women hold leadership roles, they are stereotypically viewed as being more assertive, which makes them feel uneasy and leaves them without staff support. This can breed self-doubt and eventually result in the development of IS (Cokley et al., 2015). In a similar vein, members of particular ethnic minorities are frequently stereotyped as being dimwitted, inactive, or underachievers (Cokley et al., 2017). Their social connections with other members of the community are impacted as a result of this inaccurate representation. The likelihood of having imposter thoughts might rise as a result of these gender and minority prejudices.

Institutional Factors

An individual's behavior is greatly influenced by the culture and atmosphere of their company, which increases the risk of imposter syndrome. As previously stated, some work positions are well-structured in our society, particularly for women and members of ethnic minorities who are not expected to advance in specific professions. For instance, in the past, women were over-represented in the nursing and teaching professions and under-represented in the fields of surgery, information technology, and STEM (Feenstra et al., 2020).Similar to this, both groups are more present in the lower hierarchy of the organization and less so in the upper hierarchy (Catalyst, 2018). Additionally, they experience pay disparities (Peter et al., 2012). All of these elements engender self-doubt, which eventually results in the emergence of imposter sentiments.

Relational Factors

Impostor feelings are significantly influenced by how other people regard one. The interactions someone has with others aid in enhancing their sense of self-worth. Any interactional issues, such as social rejection, getting unfavorable comments, and receiving criticism from others, can exacerbate feelings of inadequacy and undermine a person's sense of themselves (Shytle, 2022). When someone engages in unfair treatment, marginalization, or microaggressions, they begin to internalize these stereotyped beliefs, which can further contribute to the emergence of IS(Acholonu & Oyeku, 2020).

Clinical Psychology Viewpoints on Impostor Syndrome

From the perspective of clinical psychology, IS is frequently described as a personality feature rather than a disorder. Impostor syndrome is not a clinical condition in the DSM-5 or ICD-10. Although it is not considered a mental problem, psychologists have identified it as a condition frequently present in people with high intelligence (Kaur & Jain, 2022). According to this perspective, this behavior is a sign of a weak and judgmental self-concept (Clance & Imes, 1978). This expression is frequently used to explain the phenomena known as the "impostor effect," which represents an individualistic viewpoint. Although the name "Impostor Phenomenon" was coined by Clance & Imes, it is usually referred to in popular culture as "impostor syndrome," highlighting the word's apparent distinctiveness and dysfunctionality (Rohrmann et al., 2016). According to Bravata et al. (2019), employing the word "syndrome" implies someone is a patient instead of a normal individual. Using this phrase also denotes a medical model of a person's internal disorder (American Psychiatric Association, 2013).The IS's individual experiences of feeling like an impostor are also revealed by empirical studies on the organization. As an illustration, Mak et al. (2019) note that originally IS was primarily defined and evaluated as a trait rather than a state. For a thorough understanding of the IS, scholars have also primarily concentrated on the person. According to studies (Vergauwe et al., 2014; Dudău, 2014; Gibson-Beverly & Schwartz, 2008), IS may be predicted by a person's attachment preferences, personality characteristics, and tendency towards perfectionism.

Many treatment modalities focus on trying to treat the imposter syndrome as a result of the IS individualized approach. Clinical therapy, self-esteem-boosting training, coaching, and counseling are all included in its treatment strategies (Zanchetta et al., 2020; Dickerson, 2019). Because social techniques are not included in these therapy modalities and because social variables have a significant influence on IS, their efficacy is insufficient. These therapies that are individualized for each patient have the potential to worsen the victim's behavior, which makes others think that the patient is at fault. As a result, the patient must assume responsibility for changing the situation

(Neimi & Young, 2016). Therefore, there is a need for reliable and adequate assessment and treatment of impostor syndrome.

Clinical Assessment of Impostor Syndrome
Currently, there are several assessment tools and scales commonly used for the measurement of impostor syndrome. A few of them are the following:

Harvey Impostor Phenomenon Scale (HIPS)
Harvey created HIPS in 1981. A 7-point Likert scale with 14 items, ranging from 0 (not at all true) to 6 (extremely true), was used. A self-report assessment was used to assess IS in graduate and undergraduate students. The scale's elements relate to how one presents oneself, how one attributes blame, how one views oneself, and how one feels about oneself. The median split technique is used to score this test. Whereas a score over the median indicates the presence of impostor syndrome, a score below the median indicates non-impostor status. The range of this scale's internal consistency reliability is from.34 to.70 (Walker & Saklofske, 2023; Fujie, 2010).

Clance Impostor Phenomenon Scale(CIPS)
Clance created this scale in 1985. It has 20 items with a Likert scale with a maximum score of 5, where 1 means "strongly disagree," and 5 means "strongly agree." Scores below 40 denote the absence of IS symptoms, those between 41 and 60 suggest a moderate degree of IS experience, those between 61 and 80 denote regular imposter sentiments, and scores over 80 denote intense impostor experiences. It feeling of fraudulence, insecurity, success anxiety, and assessment anxiety. According to Mak et al. (2019), the internal consistency reliability of this scale ranges from =.85 to =.96. CIPS is the widely used assessment for measuring IS.

Perceived Fraudulence Scale (PFS)
In 1991, Kolligian and Sternberg created this scale. There are 51 items in the survey. They described IS as the self-perception of fraudulence accompanied by emotive and cognitive components. Self-criticism, negative mood, the experience of being deceived, and the pressure of accomplishment are some PFS items that overlap with CIPS. On this scale, nevertheless, self-area, self-monitoring, and impression control are given greater weight. Inauthenticity and self-deprecation are the two subscales that make up this grade. Self-deprecation has an internal reliability of .85, whereas the inauthenticity subscale has a reliability of.95 (Kolligian & Sternberg, 1991).

Young ImpostorTest (YIT)
YIT is a self-reported questionnaire developed by Dr. Harvey A. Young. It has a 25-items with a 5-point scale Likert rating scale ranging from Strongly disagree to strongly agree. The scoring was done by summing up the score of all the items, the higher the score indicates a higher level of impostor syndrome. The Cronbach alpha reliability of the test is .80.

Impostor Syndrome co-morbidity with other clinical conditions
The impostor syndrome frequently coexists with other psychological disorders. The most prevalent comorbid conditions reported in the literature include depression (Leonhardt et al., 2017; Rohrmann et al., 2016; Kananifar et al., 2015); anxiety spectrum disorder (Gibson-Beverly & Schwartz, 2008; Bernard et al., 2002; Ross et al., 2001); problems with one's self-concept (Neureiter & Traut-Mattausch, 2016); Perfectionism (Clance, 1978), psychosomatic problems (Kananifar et al., 2015), lower work performance (Bravata et al., 2019), burnout, and impairment in social functioning are some examples of these issues. High school adolescents frequently exhibit IS symptoms, which are also linked to more severe sadness and suicidal thoughts (Lester & Moderski, 1995). Because IS and its concomitant conditions can severely impair a person's functioning, they must be assessed and treated.

Paridhi Jain and Suyesha Singh

Treatment Modalities for Impostor Syndrome
Mindfulness-based Approaches

The effectiveness of mindfulness-based exercises in lowering impostor syndrome has been reported by a few studies in the past (Pastan et al., 2022; Lausch, 2021; Zanchetta et al., 2020; Schmulian et al., 2020). The most prevalent issue with impostors is a lack of ability to appraise oneself, which can result in self-doubt. Self-awareness and self-efficacy are enhanced by mindfulness-based practices, which can aid in personal development. Increasing self-awareness and emotional regulation, reducing rumination, removing distress, and improving people's well-being are all achieved by using mindfulness-based activities like mindfulness breathing, mindfulness body movement, body scan, and raisin meditation (Brown et al., 2007). By promoting self-compassion and a non-judgmental approach towards one's thoughts and feelings, mindfulness-based practices assist in facing and navigating the problematic thinking pattern that promotes IS. In the end, these strategies can help people develop a more favorable perception of themselves and a more equal relationship with their achievements, so minimizing the detrimental consequences of Impostor Syndrome on their performance and overall well-being.For instance, 227 undergraduate students at Midwest University were the subject of a study by Liu et al. in 2023. In an experimental group, they ran a 4-week quick self-compassion intervention. According to the study's conclusions, a 4-week self-compassion intervention aids in easing the symptoms of impostor syndrome, psychological discomfort, and perfectionism. Participants in the control group, on the other hand, rated low on self-compassion and scored well on imposter syndrome.

In their study, Pastan et al. (2022) discovered that mindfulness-based techniques such as affirmation-based meditation, mindful breathing, and visualization aid dentistry students at a medical university in the USA to enhance their coping mechanisms and lessen the symptoms of IS.According to Lausch (2021), following 8 weeks of mindfulness-based training, imposter symptoms were significantly reduced in 10 graduate and doctorate students. The pupils participated in an 8-week stress-reduction program focused on mindfulness. The results also suggest that these exercises help people with imposter syndrome improve their feelings about themselves.

Cognitive Behavior Therapy

The therapeutic approach most frequently utilized to address a range of mental health disorders is cognitive behavior therapy. Additionally, imposter syndrome is treated with it. The fundamental focus of CBT is altering underlying beliefs and dysfunctional thought habits. It also aids in finding the particular cognitive errors connected to imposter syndrome. One may reframe their way of thinking, replace unhelpful thoughts with helpful ones, and engage in productive positive self-talk. It offers workable solutions to imposter syndrome-related stress, worry, and sadness. Along with fostering personal and professional development, this therapy approach helps the person with imposter syndrome experience more confidence in themselves. In a study, Chand et al. (2017) discovered that 8-session CBT-based practices are successful in treating first-year medical students' maladaptive perfectionism and related unpleasant symptoms such as anxiety, sadness, and feelings of impostor syndrome. A kind of cognitive behavioral therapy called cognitive processing therapy aids the client in comprehending their beliefs and how they may take in any information. To address imposter encounters in various working professions in the northern state of the US, Hutchins et al. (2021) adopted CPT. The intervention included three main techniques: ABC analysis, thought challenging, and spotting problematic thought patterns. The individuals' experiences of impostor syndrome significantly decreased after the intervention program.

Brief intervention

Other interventions such as group therapy, cognitive behavioral hypnotherapy, and coaching are used for the treatment of impostor syndrome.

Coaching works by giving people confidence, boosting their self-esteem, and setting attainable goals. This approach encourages the development of a growth mindset by using a coach to give direction and guidance (Sargent, 2023). Additionally, they help their clients change their self-talk and reframe more achievable objectives to help them overcome imposter experiences.

Paridhi Jain and Suyesha Singh

Cognitive behavioral hypnotherapy
Hypnotherapy and CBT are both used in Cognitive Behavioral Hypnotherapy. CBH teaches people how to recognize the imposter syndrome symptoms that are brought on by their negative accustomed thought patterns. During the session, the hypnotherapist uses methods like visualization and suggestion to help the patient shift their rigid perspective. It also entails visualization, modifying unfavorable beliefs, and fostering a more optimistic view of oneself. It is beneficial in treating anxiety, sadness, and some forms of phobias, according to a prior study. It is also used to treat impostor syndrome similarly (Sargent, 2023). It differs from conventional CBT in that it incorporates elements of hypnosis to alter a person's thought patterns.

Group Therapy
Through reflecting to the client that they are not alone, group therapy helps to lessen their experience of loneliness by giving them a sense of affirmation. Clients get a sense of support among themselves when comparable experiences, approaches, and solutions are shared. Participants can discuss their experiences with impostor syndrome in a setting that fosters a sense of safety and nonjudgment. In the end, group therapy aids in lowering imposter sentiments by improving coping skills and self-awareness (Baumann et al., 2020).

Proposed treatment modality for the treatment of Impostor Syndrome
Although there are many treatment options available for Impostor syndrome, existing options do not sufficiently account for the disorder's individualized character. In addition, a lack of diagnosis frequently happens when early intervention and preventative measures are absent. It's crucial to concentrate on both the psychological and emotional aspects of IS in order to treat the condition properly. To address Impostor Syndrome at its root, it is imperative to develop and implement unique treatment approaches that are tailored to the patient, preventive, and comprise many different types of intervention strategies.

Integrative and tailored intervention
The evaluation procedure can be used as the initial step of a customized intervention. It's critical to comprehend the causes, precipitating events, and past experiences of imposter syndrome for a thorough assessment.

Second step: Depending on the severity of the imposter symptoms, after developing a customized treatment plan, take psychological, emotional, and social variables into account.

Third step: To cure maladaptive thought patterns, a therapist might employ CBT methods that increase self-awareness, emotional control, distress tolerance, and self-compassion. It is possible to apply mindfulness-based techniques including acceptance and commitment therapy, dialectical behavior therapy, and mindfulness-based behavior therapy. Additional therapy methods should be considered based on the requirements and preferences of the individual.

Preventive Strategies
It is important to develop a preventive measure before the impostor syndrome becomes severe.
First step: Implementing educational initiatives to promote awareness for impostor syndrome and providing resources for early identification and management in both academic and professional contexts.
The second step is changing the culture and environment at the educational level or organizational level. It will help in reducing perfectionism and fear of failure and increasing the positive and constructive feedback and environment.
Third step: To develop self-esteem and self-confidence early on, encourage self-reflective and self-affirming behaviors.

Early Intervention Program
Early intervention program in educational and organizational setting comprises counseling services and psycho-educational plans.

Second step: Providing resources and training to borderline or at-risk individuals.
Third step: To help people who are susceptible to Impostor Syndrome, provide mentorship and a coaching program.

Additional step
Develop a mobile-based application that includes self-help activities, guided activities, and instructional materials. These could supplement in-person care, which will help in assisting the individual in managing IS on their own.

Establishing peer mentoring programs
In which a person who overcomes impostor syndrome will help a person who is currently struggling with the same issue.

Conducting workshops for parents and high-risk populations
It will help in recognizing impostor syndrome among children and adolescents.

Changing workplace policies
encouraging personal development, a healthy work-life balance, and a reduction in stress at work.

Creating online communities
It will help in establishing support groups where these people can connect, share their experiences, and access resources to overcome this.

Training and well-being programs
Incorporating resilience-building training, soft skill training, and well-being programs to address emotional, social, and psychological issues in the school or workplace.

Role of supportive groups
Encourage the establishment of support groups, particularly for those suffering from Impostor Syndrome. These groups can get together frequently to share coping mechanisms, talk about experiences, and offer emotional support.

Second step: For the sake of maintaining a secure and judgment-free atmosphere, support groups must be led by qualified mental health specialists.

Third step: Encouraging a sense of empowerment and group resilience, members should be encouraged to incorporate the methods they learn in the support group into their daily lives.

Ethical Considerations
The most important ethical consideration is to maintain confidentiality and obtain consent from the client. Maintain professionalism and keep the treatment client-centered, polite, and non-coercive. Lastly, training the mental health professionals and support group administrators on the proper conduct and limits to observe while dealing with people who are suffering from Impostor Syndrome.
These components can be included in a therapy strategy to address Impostor Syndrome holistically and ethically, providing individuals prevention, early intervention, customized support, and long-term ways to deal with the problems this condition presents.

Challenges and future directions of impostor syndrome
Challenges
One of the major challenges for the diagnosis, assessment, and intervention of impostor syndrome is stigma and lack of awareness regarding this phenomenon which makes it difficult to identify and provide support to overcome this (Bravata et al., 2020). Another challenge for impostor syndrome is the cultural and ethnic differences in the perception of self-image and achievements which influence the way individuals with IS express these symptoms. For

65982

instance, a woman with impostorism on a higher hierarchy and a student from an ethnic minority group will display their impostor syndrome in a distinctive way which makes it difficult to identify (Ellemers, 2018). One more challenge for impostor syndrome is using a specific psychotherapeutic modality for comorbid conditions. Often IS coexists with other mental health issues, in those situations it is difficult for a therapist to use an evidence-based treatment modality (Eschenroeder, 2014).

Recommendation for future research and implication: The theoretical and clinical implications of impostor syndrome are the following:

Theoretical Implication

 Impostor Syndrome may be understood from a developmental viewpoint to better understand its causes and changes throughout time (Neureiter & Traut-Mattausch, 2016). Future researchers can create and improve cultural theories that describe how cultural norms, beliefs, and expectations affect how Impostor Syndrome is felt in various countries. These theories may be able to close the psychological and cultural differences. Future research can focus on conducting long-term studies to monitor the emergence and durability of impostor syndrome (Mak et al., 2019). It might be helpful to understand how Impostor Syndrome develops through several life phases, including adolescence, maturity, and various professional periods.Additionally, future research can also focus on investigating the brain processes that underlie Impostor Syndrome. Examine the mental processes involved in self-perception, self-talk, and exposure anxiety. To identify the brain correlates of Impostor Syndrome, this may include doing neuroimaging investigations (Chrousos et al., 2020).

Clinical Implication

The first clinical implication can be that the evaluation of the efficacy of various treatment methods is the most significant future suggestion. Although there are many different treatment techniques, little is known about their effectiveness in those areas (Eschenroeder, 2018). Therefore, it is important to evaluate how well CBT, MBCT, DBT, and ACT work to treat impostor syndrome. For future research, it is also important to conduct more cross-cultural research, to understand the cultural differences and the impact of cultural values, practices, and expectations in the development of impostor syndrome (Stone et al., 2018). It is also important to assess the prevalence and predictors of the impostor syndrome among various individuals working in different work settings such as the academic, and corporate world as the majority of the studies were done on healthcare professionals. As well as the efficacy of various academic and organizational policies currently being implemented. As it will aid in developing a more effective treatment modality.

The study on Impostor Syndrome is being converted into useful suggestions for theoretical and clinical practices that might help people and organizations. In both clinical and professional contexts, they emphasize the value of fostering a supportive atmosphere, providing tailored solutions, and treating the underlying causes of impostor syndrome.

CONCLUSION

In the current scenario, this research will aid in understanding the Clinical Perspective on Impostor Syndrome and its prevalence, etiology, and management. Impostor syndrome is a widespread psychological phenomenon. The prevalence of impostor syndrome is increasing which is impacting individuals' mental health. The cycle of IS, its etiology, co morbid conditions, and existing treatment modalities were discussed in the paper. Impostor syndrome management techniques are essential for assisting people in overcoming inadequacy and self-doubt, which leads to a more positive self-concept and a more satisfying personal and professional life. Based on the limitations of existing treatment modalities, a new treatment modality is explained. By recognizing the importance of clinical viewpoints on impostor syndrome, we may endeavor to create a culture in which people are better able to face and overcome these emotions of fraudulence, realizing their full potential and boosting their self-confidence.

ABSTRACT

Sports law is a dynamic field encompassing various regulations governing athletes, teams and sporting organisations. With an increasing emphasis on competition, commercialization, and global reach, sports have become a microcosm of society, necessitating a robust framework of rules and ethical considerations to maintain their integrity. The paper commences by examining the pivotal role of sports law, encompassing various facets such as contract law, intellectual property, and anti- doping regulations. It investigates recent legal developments in sports, including landmark court cases and their implications for athletes, governing bodies, and stakeholders. The analysis underscores the evolving nature of sports law as it adapts to the changing dynamics of the sports industry. This study additionally examines the moral aspects of sports, emphasizing the value of sportsmanship, fair play, and respect. It highlights the ethical dilemmas encountered by athletes, coaches, and administrators, particularly in the age of performance- enhancing drugs, match-fixing, and questionable conduct. The study also probes the ethical responsibilities of sports organizations in promoting inclusivity, diversity, and social justice. A significant portion of this paper explores the interplay between sports law and ethics. It investigates how legal regulations and ethical principles often intersect and sometimes clash in the sporting arena. To foster the long-term development and sustainability of sports, this research study proposes the harmonious relationship of sport regulations and ethics. It emphasizes the necessity for those involved in sports organizations strike a balance between their competitive goals and ethical considerations. Ultimately, this paper contends that by upholding the values of integrity, fairness, and respect, sports can continue to inspire and unite individuals and communities worldwide.

Keywords: sports law, sports ethics, competition, integrity, sportsmanship.

INTRODUCTION

"Sports do not build character. They reveal it."- Heywood Broun

Sports, as a cultural phenomenon, holds an exceptional place in society. It transcends geographical boundaries, language barriers, and societal divisions, uniting individuals and communities in the pursuit of physical excellence and shared passion. Yet, this unity is not spontaneous; it's composed by a complex interplay of rules and ethical principles. Sports, once a simple form of physical competition, have evolved into a complex and multifaceted industry, transcending geographic, cultural, and economic boundaries. In this dynamic landscape, the symbiotic relationship between sports law and ethics has become not only pivotal but increasingly intricate. The exemplar of human competition, sports today embody not just the spirit of athletic competence but also the relentless pursuit of commercial success and global recognition. With the world's eyes fixed on arenas, fields, and stadiums, it is imperative to have a robust framework of rules and ethical considerations that reinforce the very essence of sports. This paper embarks on a journey through the intricacies of this symbiosis, exploring how the tenets of sports law harmonize, conflict, and sometimes collide with the ethical principles that should govern sportsmanship, fair play, and respect.

As the sporting world witnesses ever-increasing stakes and is confronted by a litany of challenges, from the rise of performance-enhancing drugs to match-fixing scandals, the role of law and ethics in sports cannot be underestimated. The stakes are high, and the expectations are even higher. This research aims to delve deep into this intricate relationship, dissecting recent legal developments and ethical dilemmas faced by athletes, coaches, and administrators. Furthermore, it seeks to address the ethical responsibilities of sports organizations in championing inclusivity, diversity, and social justice. As sports continue to inspire and unite individuals and communities worldwide, the need for this harmonious relationship between sports regulations and ethics becomes increasingly apparent. The paper underscores that by upholding the values of integrity, fairness, and respect, the world of sports can not only navigate its challenges but also continue to serve as a beacon of inspiration, uniting people across the globe.

THE LEGAL FRAMEWORK IN SPORTS

The legal framework in sports is a vast and intricate system that fortifies the industry's operations. One critical aspect is contract law, which is the backbone of the relationships in sports. Athletes sign contracts with teams, outlining their rights, obligations, and compensation. These contracts are legally binding, and breaches can lead to disputes, fines, or legal action. Contract law is not just about defining the terms; it also specifies the dispute resolution mechanisms, ensuring that legal procedures are in place to address issues that may arise. Additionally, intellectual property law is of growing importance in an age where sports organizations have become powerful brands. It encompasses trademarks, copyrights, and licensing agreements. Sports teams fiercely protect their logos and slogans, using legal means to prevent unauthorized use, which is often linked to branding and merchandising. For example, when a fan purchases a jersey with their favourite team's logo, they are engaging with intellectual property protected by law. Licensing agreements play a vital role in this aspect, granting permission for third-party use and ensuring that the intellectual property of sports organizations is used in a controlled and profitable manner.

Anti-doping regulations have evolved significantly to address the ethical and legal dimensions of sports. With the potential health risks and ethical dilemmas associated with performance-enhancing substances, anti-doping rules have become an integral part of the legal framework. Organizations like WADA (World Anti-Doping Agency) set the standards and conduct testing, ensuring that sports remain a platform for fair and clean competition. It's essential to understand that anti-doping regulations are not just a matter of legality; they are deeply rooted in ethics. These regulations, while legally binding, are ethically grounded. They ensure fair competition while also safeguarding the health and well-being of athletes. Legal sanctions for doping violations are not only a matter of law but also reflect

ethical concerns regarding fair play.Governing bodies play a unique role in the legal framework. These organizations, often international or national, are tasked with maintaining the rules and regulations specific to each sport. They provide a level of consistency and standardization, ensuring that each sport's integrity is preserved. Governing bodies are essential for harmonizing the rules across different countries and competitions. Their decisions affect the legality and fairness of sports events. The legal framework is not complete without these bodies, which help in the interpretation and enforcement of the rules.

ETHICAL CONSIDERATIONS IN SPORTS

"Fair Play is a direct reflection of ethical principles in sports. It emphasizes that winning should be achieved on a level playing field, and no athlete should gain an unfair advantage through illicit means"- Althea Gibson

Ethical considerations are foundational in the sports industry, and they are critical to preserving the spirit of fair competition and sportsmanship. Sportsmanship is not just a buzzword but a guiding principle that athletes are expected to embody. It involves principles such as mutual respect, honesty, and an emphasis on teamwork and camaraderie. While winning is the ultimate goal, how one wins matters as much in sports. air play is a direct reflection of ethical principles in sports. It emphasizes that winning should be achieved on a level playing field, and no athlete should gain an unfair advantage through illicit means. Cheating, in any form, is a breach of these principles. Fair play calls for strict adherence to the rules and a commitment to sportsmanship. It places a responsibility on athletes to play with integrity, ensuring that they respect not only the rules but also their competitors. Respect is at the core of ethical considerations in sports. Respect is extended to opponents, coaches, officials, fans, and the sport itself. It is a fundamental value that underscores the dignity and honour of sports. Maintaining respect, even in highly competitive situations, is the mark of a true sportsman. It is not just about how athletes treat their competitors, it's also about how they treat the fans and officials who make sports possible. Respect extends to every aspect of the game, including the traditions and values of the sport itself. The ethical considerations in sports guide not only the athletes but also coaches, officials, and sports organizations. These principles are essential for ensuring that sports remain a source of inspiration, unity, and personal growth. Coaches have a responsibility to instil these values in their athletes, emphasizing the importance of fair play and respect. Officials must maintain fairness and integrity, ensuring that the rules are applied consistently and ethically. The values of sportsmanship, fair play, and respect are not just ideals; they are the foundation of what makes sports more than just a physical competition. They elevate sports to a level where they inspire individuals and communities, fostering character and integrity in those who engage with them.

THE SYMBIOTIC RELATIONSHIP

The symbiotic relationship between sports law and ethics is best understood when considering how legal regulations and ethical principles interact. In an ideal scenario, these two elements should work in harmony, with legal regulations creating a framework that supports and enforces ethical values. For example, anti-doping regulations provide an excellent example of this harmony. These regulations are both legally binding and ethically grounded. They ensure fair competition while also safeguarding the health and well-being of athletes. Legal sanctions for doping violations are not only a matter of law but also reflect ethical concerns regarding fair play. Anti-doping regulations are an embodiment of the symbiotic relationship between sports law and ethics. Their legal and ethical dimensions are closely intertwined, emphasizing the industry's commitment to clean and fair competition. However, there can be conflicts between the two. The legal framework might permit certain actions or substances that raise ethical concerns. For instance, the legality of some performance-enhancing substances might conflict with the ethical principles of fair play. In such cases, the sports industry faces the challenge of aligning the legal and ethical aspects to maintain the integrity of the game. The delicate balance between legality and ethics is a constant challenge in the sports industry. It is a reflection of the complex nature of sports, where competitive ambitions sometimes clash with ethical values.

Bhupendra and Richa Arora

The symbiotic relationship is dynamic and multifaceted, offering opportunities for harmony and requiring careful navigation when conflicts arise. It underscores the ever-evolving nature of the sports industry. This relationship is at the core of what makes sports more than just a competition; it's a reflection of society's values and a platform for ethical growth.

CHALLENGES AND CONTROVERSIES

The sports industry faces numerous challenges and controversies related to both legal and ethical issues. Performance-enhancing drugs continue to be a significant challenge. The legal framework prohibits their use, but the ethical dilemma remains. Athletes, driven by the pressure to perform, may resort to these substances, jeopardizing their health and violating ethical principles of fairness. The legal consequences, such as suspensions and sanctions, are aimed at enforcing the ethical values of clean competition. The use of performance-enhancing drugs reflects not only the legal aspect of the issue but also the underlying ethical concerns about the price of success. It highlights the complex interplay between what is legal and what is ethical in the context of sports. Match-fixing is a longstanding controversy that can ruin the integrity of sports. It is not merely a legal issue but a severe breach of ethical values. Match-fixing scandals can result in legal actions, but the ethical damage goes much deeper. Harsha Bhogle rightly said, "Sports teaches you there is always a second inning in life. If you fail today, there's a second inning maybe two days later." Trust in the authenticity of the game and the sincerity of the athletes is eroded. The legal actions taken against match-fixing are just one facet of the response. The ethical responsibility of the sports industry is to rebuild trust and ensure that the values of fair play and authenticity are restored. Match-fixing controversies bring to light the importance of maintaining both the legality and ethics in sports. These controversies can severely undermine the public's trust in the integrity of the game. The call for diversity and inclusivity presents a newer challenge. Sports organizations now find themselves under increasing pressure to promote these ethical values. The industry is being transformed, breaking traditional norms and embracing a more inclusive and diverse landscape. The legal framework is not just about rules on the field; it also plays a role in promoting inclusivity. It ensures that athletes from all backgrounds have equal opportunities to participate and compete. It reflects not only the legal but also the ethical commitment of the sports industry to creating a more inclusive and equitable environment.

FUTURE DIRECTIONS

The future of sports law and ethics will be shaped by several critical factors. The continued evolution of anti-doping regulations is essential. As new substances and technologies emerge, these regulations must adapt to uphold ethical values while maintaining the fairness and health of athletes. The legal framework and ethical principles must continue to evolve to address new challenges in the sports industry. The sports industry will increasingly embrace its role in promoting ethical values beyond the field of play. Organizations will be expected to advocate for inclusivity, diversity, and social justice. This goes beyond ethics in competition and extends to ethics in society. Sports are a powerful platform for social change, and the legal framework will play a pivotal role in ensuring that sports organizations can fulfil their ethical responsibilities in this regard. The future directions of the sports industry require a continued commitment to ethical values. While competition will always be at its core, the industry's success will be measured not only by victories but by its ability to uphold the ethical values that make sports an inspiration and unifying force. The legal framework will continue to support these ethical values, ensuring that the sports industry remains a beacon of integrity and fairness.

CONCLUSION

Sports law and ethics are inextricably linked, shaping the landscape of the sports industry. Legal regulations and ethical principles coexist, sometimes in harmony and at other times in tension, but they are indispensable for preserving the integrity of sports. In an era of increased competition, commercialization, and global reach, it is crucial for those involved in sports organizations to strike a balance between their competitive goals and ethical

considerations. Upholding values such as integrity, fairness, and respect are not only a legal requirement but a moral imperative to ensure that sports continue to inspire and unite individuals and communities worldwide. As the sports industry evolves, it must navigate the complexities of new challenges and controversies, from performance-enhancing drugs to match-fixing and the call for inclusivity and diversity. Sports organizations and governing bodies have an ethical responsibility to address these issues while adhering to the legal framework. The future of sports law and ethics will depend on a commitment to evolve, adapt, and uphold ethical values. Anti-doping regulations will continue to play a pivotal role in ensuring fair competition while preserving the health and safety of athletes. Beyond the field of play, sports organizations will increasingly advocate for inclusivity, diversity, and social justice, using the legal framework as a tool to drive positive change in society. In conclusion, the symbiotic relationship of sports law and ethics is the foundation of the sports industry's success. By upholding these values, sports can continue to inspire and unite individuals and communities worldwide, ensuring that the integrity of the game remains intact.

ABSTRACT

This comprehensive review explores the multifaceted relationship between yoga and physical fitness. The goal of this study is to investigate the effects of yoga on muscular strength, flexibility, muscular endurance, and cardio-respiratory endurance. Additionally, this study examines the role of yoga in promoting weight management, reducing the risk of chronic diseases, and improving overall physical health. To achieve these goals, the authors conducted a systematic examination of the Scopus, Research Gate, and google scholar databases, looking for relevant studies focused largely on impact of yoga on physical fitness variables. According to the study's findings, the relevant literature reveals that yoga is a versatile and effective tool for enhancing physical fitness across various age groups and fitness levels. It underscores the importance of incorporating yoga into fitness routines for a well-rounded and balanced approach to health. Ultimately, this review underscores the holistic benefits of yoga, positioning it as a valuable adjunct to traditional physical fitness regimens.

Keywords: yoga; physical fitness; Systematic Literature Review; health.

INTRODUCTION

Yoga, an ancient tradition covering 3,000 years, has evolved into a holistic health approach that is now recognized in the Western world. It has earned classification by the National Institutes of Health as a form of Complementary and Alternative Medicine (CAM) (Raub, 2002). Consistent engagement in yoga fosters physical attributes like strength, stamina, and flexibility, as well as nurtures qualities such as kindness, empathy, improved self-discipline, all the while nurturing a feeling of tranquillity and overall health (Williams, 2003).

Deepak Sharma and Deepak Kumar Dogra

Yoga is a form of exercise that integrates the mind and body, combining physical postures with controlled breathing and meditation (Lipton, 2008), Cardiopulmonary function (Telles, 2002), physical fitness (Tran MD & Holly RG, 2001), muscular strength, suppleness, rigidity, and joint discomfort. Additionally, a recent analysis of ten studies that compared the impacts of yoga asanas (postures) with those of conventional exercise revealed that yoga might be equally useful in enhancing health results, such as blood glucose levels, lipid profiles, fatigue, pain, and sleep, among both healthy individuals and those with conditions like diabetes and multiple sclerosis (Ross, 2010).Physical fitness refers to a state of overall well-being, enabling individuals to effectively handle the demands of daily life and serve as a foundation for excelling in sports. Health-related physical fitness encompasses various aspects of fitness tied to one's health, such as cardiovascular endurance, musculoskeletal strength, body composition, and metabolic function (McCall, 2007). It can be seen as a comprehensive measure of the body's various functions, including the musculoskeletal, cardiovascular, circulatory, neurological, and metabolic systems, all of which play crucial roles in daily physical activities and exercise performance. Consequently, when assessing physical fitness, one is essentially evaluating the operational condition of these various bodily systems. Notably, a sedentary lifestyle represents a controllable factor that increases the risk of cardiovascular disease and a growing array of other persistent health conditions. These conditions encompass diabetes, cancer (specifically colon and breast), obesity, high blood pressure, as well as bone and joint ailments like osteoporosis and osteoarthritis, along with depression (Ross & Thomas, 2010).In order to grasp how Yoga affects physical fitness, it is crucial to differentiate between what is commonly known as the regular breath and what Yoga and other Vedic disciplines identify as the subtle breath, the subtle breath is believed to invigorate an individual's overall sense of vitality and their perception of energy levels. This concept is in accordance with Yoga theory (Brunelle, 2015). Physical exercise and nourishment are fundamental requirements for human existence. Nevertheless, cultural shifts in numerous regions globally have effectively eliminated spontaneous physical activity from the daily routines of a significant portion of the population (Chakravarthy, 2004).

PURPOSE

The purpose of the study was to review the previous studies on impact of Yoga on physical fitness variables.

METHODOLOGY

To investigate the yoga's impact on physical fitness components related research directions a systematic literature review method was applied. Moreover, examining databases is an appropriate approach to exploring the extant of literature on the focus areas. The chosen database for this research was the Scopus, Google Scholar and Research Gate, published from the year 2000 to 2023. This study includes a total of 20 research articles on impact of yoga on physical fitness components.

FINDINGS

Caren Lau et. al., (2015) determined the effects of a 12-week hatha yoga intervention on cardio respiratory endurance in Hong Kong Chinese adults: favourable effects on cardio respiratory endurance in Chinese adults. Danucalov et.al., (2008) determined the Cardio respiratory and Metabolic Changes during Yoga Sessions: The Effects of Respiratory Exercises and Meditation Practices: reduces the metabolic rate whereas the specific pranayama technique in this study increases it when compared with the rest state. Eliška Sovová et. al., (2015) determined that Positive effect of yoga on cardio respiratory fitness: A pilot study: yoga practices are better in some cardiorespiratory fitness parameters than other aerobic activities. Papp et. al., (2016) determined that Effects of High-Intensity Hatha Yoga on Cardiovascular Fitness, Adipocytokines, and Apolipoproteins in Healthy Students: A Randomized Controlled Study had no significant effects on cardiovascular fitness and Kwong et. al., (2015) determined the Yoga for secondary prevention of coronary heart disease this study had no significant effects on cardiovascular fitnessas it is indicated in table no. 1.0.

Deepak Sharma and Deepak Kumar Dogra

Ranjbar Z et. al., (2014) determined the comparative study of the impacts of strength training and yoga on female student's body awareness this study shows the significant difference between strength training and yoga on body awareness of female students. G.ethan et. al., (2019) determined the effect of yoga practice on balance, strength, coordination and flexibility in healthy children there were no significant difference. Bukowski et. al., (2007) determined the the effect of iyengar yoga and strengthening exercises for people living with osteoarthritis of the knee: a case series a found significant difference. Gothe & Mc Auley 2015) determined the significant time effect for measures of balance, strength, flexibility and mobility. M. melissa et. al., (2017) strength improved on the affected side for shoulder abduction and grip strength, and bilaterally for elbow flexion as it is indicated in table no. 2

Caren Lau et. al., (2015) determined the Effects of a 12-Week Hatha Yoga Intervention on Cardio respiratory Endurance, Muscular Strength and Endurance, and Flexibility in Hong Kong Chinese Adults: favorable effects on cardio respiratory endurance, muscular strength and endurance, and flexibility in Chinese adults. Trans at. Al., (2001) determined the Effects of Hatha Yoga Practice on the Health-Related Aspects of Physical Fitness findings indicate that regular hatha yoga practice can elicit improvements in the health-related aspects of physical fitness. D Yuvaraj;(2016) determined the Effect of asana and pranayama practices on selected physical and physiological variables of college men was significantly improve the physical fitness and physiological variables namely flexibility, balance, resting heart rate, cardio respiratory endurance and vital capacity. Mandanmohan et. al., (2003) determined that effect of yoga training on handgrip, respiratory pressures and pulmonary function. improves lung function, strength of inspiratory and expiratory muscles as well as skeletal muscle strength and endurance. Shiraishi & Bezerra, (2015) determined the effect of yoga practice on muscular endurance in young women this finding suggests significant improvement in upper limb and muscular enduranceas it is indicated in table no. 3

Petric et. al., (2014) determine the Impact of Hatha Yoga Practice on Flexibility: A Pilot Study finds a significant improvement in the flexibility of m. Soleus, m. Gastrocnemius, m. Rectus femoris, knee flexors and m. Pectoralis major. Sereda et. al., (2020) determined the Impact of Yoga Practice on the Development of Flexibility Among the Female Student's Pedagogical Specialities in the Process of Physical Training of Higher Educational Institutions. It has been proved that the yoga practice has improved the flexibility. Farinatti et. al., (2014) determined the Flexibility of the Elderly after One-Year Practice of Yoga and Calisthenics, this study proved that the practice of hatha yoga was more effective in improving flexibility compared to calisthenics. G. Malgorzata (2016) determined the Effects of hatha yoga exercises on spine flexibility in young adults this study indicated a statistically significant increase of the spine flexibility in forward and lateral bending before and after the yoga classes in the entire studied group. Xueluo& Xu huang (2023) determined the effects of a yoga intervention on balance and flexibility in female college students during COVID-19: A randomized controlled trial results suggest that a yoga intervention have a positive impact on health and be the main form of home exercise for female college students as it is indicated in table no. 4.

DISCUSSION

This study was conducted to review the previous studies on impact of yoga intervention on physical fitness components that are searching and assessing the Yoga's impact on people health. Further, the facts and finding were suggested that less studies were found in this domain in the years 2000 to 2012 but in decade of 2012 to 2023 we were found most of the studies. Furthermore, the effect of yoga practicing on physical fitness was assessed. In general yoga practice is performed slowly and gradually, in a closed kinetic chain (specific poses or static postures), which may include active stretching, isometric muscle contractions, enhancing concentration and proper breathing patterns. Yoga is beneficial to improve physical fitness in the term of muscular strength, flexibility, muscular endurance and cardiovascular endurance. Further, the findings of Caren Lau et. al., (2015);Danucalovet.al., (2008); and, Eliška Sovová et. al., (2015) were reported yoga intervention significant differences among the groups in Cardio respiratory endurance variable. This is due to the fact that high adherence and attendance rates within the study reveal that the meditation employed leads to a reduction in metabolic rate, while the specific pranayama technique used in the research increases it. Moreover, the study suggests that yoga practices outperform other aerobic activities

in certain cardio respiratory fitness parameters. In contrast to this the findings of Papp et. al., (2016) & Kwong et. al., (2015); were reported yoga intervention insignificant differences among the groups in Cardio respiratory endurance variable and this is due to the fact that high-Intensity Yoga (HIY) may potentially benefit blood lipids and possess anti-inflammatory properties. However, the effectiveness of yoga as a secondary prevention method for coronary heart disease (CHD) remains uncertain, highlighting the need for high-quality randomized controlled trials. Outcomes of Ranjbar Z et. al., (2014) ;); Bukowski et. al., (2007); Gothe & Mc Auley 2015) & M. melissa et. al.,(2017)were reported yoga training significant differences among the groups in muscular strength. This is due to the fact that yoga training, when combined with awareness and meditation, can positively impact both the body's internal systems and its physiological and psychological aspects. The yoga health model encompasses all dimensions of human experience, offering various avenues for enhancing strength and function. Regular yoga practice proves as effective as traditional stretching and strengthening exercises for improving functional fitness. Notably, women participating in an 8-week Ashtanga yoga program saw significant improvements, particularly when focusing on poses that emphasized upper body strength. The results of Gethan et. al., (2019)were reported yoga training insignificant differences among the groups in muscular strength and this could be the reason that strength, encompassing both neuromuscular and musculoskeletal components, exerts a significant impact on motor development throughout all life stages. Notably, during pre-pubescent years, children experience the pinnacle of motor planning and developmental progress. Moreover, findings of Caren Lau et. al., (2015); Trans at. al., (2001); D Yuvaraj;(2016);Mandanmohan et. al., (2003) & Shiraishi & Bezerra, (2015) were reported yoga practice significant differences among the groups in muscular endurance. This is due to the fact that hatha yoga program results in increased isometric muscular endurance. Additionally, six months of Asana and pranayama training can significantly enhance musclarendurance. Regular yoga practice offers ongoing health benefits for both young and older individuals followed by Findings of flexibility Petric et. al., (2014); Sereda et. al., (2020); Farinatti et. al., (2014); G. Malgorzata (2016) &Xueluo& Xu huang (2023)) were reported Yoga regime significant differences among the groups in flexibility. This is due to the fact that progress in the participants slowed due to higher attendance and holiday breaks. Long-term programs benefit flexibility, with static-stretching yoga excelling over calisthenics, particularly in the elderly. During the COVID-19 pandemic, yoga positively impacted female college students' balance and flexibility, making it an excellent home exercise option. The findings indicate that regular yoga practice can lead to a significant increase in muscular strength, with particular improvements noted in the upper body and core muscle groups. It is evident from the reviewed literature that yoga consistently enhances flexibility, with participants experiencing improved joint range of motion and reduced stiffness. The research findings strongly support the idea that yoga contributes to increased endurance levels, likely due to improved cardiovascular fitness and enhanced oxygen delivery to muscles.

CONCLUSION

In conclusion, this comprehensive review has shed light on the elaborate effectiveness of yoga interventions on physical fitness variables. Through a thorough examination of diverse studies and research findings, we have uncovered a wealth of evidence supporting the positive impact of yoga on various sides of physical fitness variables. The findings of this study concludes that yoga is not merely a practice of postures and breathing but a holistic approach to physical fitness that improves muscular strength, flexibility, muscular endurance and cardio respiratory endurance.

ABSTRACT

Adolescence is a transitional period full of lots of challenges. A time when physical, mental, emotional, & social changes occur. The objective of the paper is to investigate the relationship among optimism, neuroticism, & academic procrastination in adolescents. The sample consisted of 100 students aged 18-21 years. LOT-R by M. F. Scheier,C. S. Carver, & M. W. Bridges, NSQ by I. H. Scheier &R. B. Cattell, and Procrastination Scale by C. Lay were used to collect the data. Correlational analysis was used. The result shows a relationship among optimism, neuroticism, and academic procrastination in adolescents. Optimism and neuroticism are negatively related with each other in adolescents. Neuroticism and academic procrastination are positively related with each other in adolescents. Academic procrastination and optimism are negatively related with each other in adolescents.

Keywords: Optimism, Neuroticism, Academic Procrastination, Adolescents.

INTRODUCTION

The paper investigates how two personality traits, i.e., optimism and neuroticism, relate to academic procrastination in adolescents. Academic procrastination is when students delay or avoid their academic work to the point where it harms their grades and increases stress levels. Optimism can motivate and guide adolescents to do tasks promptly, reducing procrastination. In contrast, neuroticism, linked to emotional instability, may increase their inclination to procrastinate. Encouraging optimism and emotional resilience can help reduce procrastination tendencies in adolescents. Understanding these connections can be useful in helping adolescents succeed in academics.

Priyanka Bhati and Gargi Sharma

Optimism

Optimism is a psychological term and is characterized by positive view towards life, the expectation of favorable outcomes, and a firm belief that positive outcomes are more likely to occur than negative ones. It includes the tendency to focus on the positive aspects of an event or situations and to maintain confidence and hope even in the face of challenging situations. Optimistic individuals tend to focus on the positive aspects, maintain confidence in their abilities, and expect that favorable events are anticipated in the future, even in the face of adversity. The word "optimism" finds its roots in the Latin term "optimus," signifying "the best." The concept was rooted in ancient philosophy, particularly in the works of ancient Greek philosophers like Plato and Aristotle. However, the modern understanding and study of optimism in psychology have evolved over time.

Some characteristics of optimism include:

a) Trust and assurance: Optimists expect positive outcomes and believe that things will generally turn out well. They view disappointment as temporary and believe that they have the capacity to overcome difficulties.

b) Resilience: Optimistic individuals often exhibit greater resilience, meaning they are better able to bounce back from setbacks and adapt to adverse circumstances. This resilience can help them cope with stress and adversity more effectively.

c) Positive attribution: Optimists tend to attribute positive events to their own abilities i.e., internal factors and see them as stable. Conversely, they attribute negative events to external factors, consider them as temporary.

d) Wellbeing: Research suggests that optimism is associated with various health benefits, including reduced stress levels, improved immune system function, and a decreased likelihood of developing chronic illnesses. Optimists may also live longer and have improved overall well-being.

e) Positive Emotions: Optimistic individuals frequently encounter a greater abundance of positive emotions, including affection, love, happiness, gratitude, and joy. Their optimistic outlook on life can lead to a more fulfilling and satisfying existence.

f) Motivation and Goal Achievement: Optimism can fuel motivation and drive individuals to set and pursue ambitious goals. When people believe in a positive outcome, they are inclined to act and persist in overcoming challenges.

g) Social Support: Optimists tend to have better social support networks and build more positive relationships because their positive outlook can be contagious and appealing to others.

Theories in Psychology

Learned Optimism: The theory is developed by psychologist Martin Seligman which suggests that optimism is a learned behavior. Seligman's research indicated that individuals could develop a more optimistic outlook by challenging and changing their negative thought patterns. He proposed that people can cultivate optimism through cognitive restructuring, which involves disputing pessimistic thoughts and replacing them with positive ones.

Attribution Theory

Attribution theory, developed by psychologists Fritz Heider and Bernard Weiner, examines the way people interpret the reasons behind events in their lives varies. Optimistic people tend to credit internal and enduring factors for positive events and external, unstable, and situational factors for negative events. This positive attributional style contributes to their optimism.

Positive Psychology

Positive psychology is a field within psychology that centers on the examination of human strengths, with a particular emphasis on optimism. Positive psychology underscores the significance of nurturing positive emotions, personal character strengths, and a sense of life's purpose. Researchers in positive psychology like Martin Seligman and Mihaly Csikszentmihalyi have explored the factors that contribute to a fulfilling and optimistic life.

Explanatory Style Theory

Psychologist Seligman also proposed the concept of "explanatory style," which pertains to how individuals explain the causes of a situation. He suggested three key dimensions: permanence, pervasiveness, and personalization.

Optimistic people have an explanatory style that attributes positive events as permanent while negative events are viewed as temporary.

Resilience Theory
Optimism is closely related to resilience, which is the ability to bounce back from difficult times. Resilience theory examines how some individuals can maintain optimism and adapt positively to difficult life events. Resilient individuals often have a firm sense of purpose, social support networks, and the ability to reframe adverse situations in more optimistic perspective. Some people are naturally more optimistic in nature, while others may develop optimism through various strategies. Optimism can be cultivated through practices like cognitive restructuring i.e., changing negative thought patterns, focusing on gratitude, setting, and working toward meaningful goals, and seeking social support. Cultivating optimism can lead to improved mental and emotional well-being, better coping with life's challenges, and a more positive and fulfilling life.

Neuroticism
Neuroticism is among the Big Five personality traits, a set that also includes extraversion, agreeableness, conscientiousness, and openness to experience. The concept of neuroticism has a rich history in psychology, with its origins tracing back to the pioneering work of Sigmund Freud. Freud believed that many psychological disorders were caused by repressed emotions and unresolved conflicts, particularly related to childhood experiences. He referred to this phenomenon as neurosis (Freud, 1894).

It was the work of Hans Eysenck, a British psychologist, that helped to bring the concept of neuroticism into the mainstream of psychology. In the 1950s and 1960s, Eysenck developed a theory of personality that included three dimensions: extraversion, neuroticism, and psychoticism. Eysenck believed that neuroticism was related to the degree of emotional instability and vulnerability to stress (Eysenck, 1963). He argued that those who obtained high score on the neuroticism scale were more prone to negative emotions such as anxiety, depression, irritability, etc and were more prone to psychological disorders such as phobias and obsessive-compulsive disorder. Eysenck's theory was based on extensive research using personality questionnaires, and his work helped to establish neuroticism as a distinct personality dimension. However, his theory was not without controversy, and some psychologists argued that it was too simple and failed to consider the complexity of human personality. In the decades since Eysenck's work, many other psychologists have explored the concept of neuroticism .Research has further established its validity and reliability as a predictor of a wide array of psychological outcomes. For example, research have shown that people high on the neuroticism scale are more prone to experience negative life events such as divorce, unemployment, and health problems (Costa & McCrae, 1992).

Neuroticism has also been associated with various mental health issues, encompassing personality disorders and mood disorders. (Lahey, 2009). For example, people diagnosed with generalized anxiety disorder are often characterized by high levels of neuroticism, as are those with borderline personality disorder (Fossati et al., 2014). Some recent research has also suggested that neuroticism may be linked to physical health outcomes. For instance, research have indicated that people with high scores on the neuroticism scale are more susceptible to experiencing adverse physical health outcomes, including elevated risks of obesity, heart disease, and stroke (Suls& Bunde, 2005). Individuals having neurotic tendencies have a negative outlook on the world. On the contrary, individuals with less neurotic tendencies have a relaxed approach towards stress. Overall, the concept of neuroticism has helped to establish the idea that personality can be measured and studied scientifically, and it has provided a useful framework for understanding the role of emotions and stress in human behaviour. However, there are still many questions that remain about the nature of neuroticism and its relationship to other aspects of personality and behaviour.

For example, some researchers have suggested that neuroticism may be related to the way that individuals perceive and interpret events, rather than simply reflecting a stable personality trait (Diener & Lucas, 1999). Despite such questions, neuroticism remains an important and widely used construct in psychology, and its influence on the field

is expected to expand in the foreseeable future as researchers delve deeper into its intricate connection with human behavior and mental health.

Academic Procrastination

Academic procrastination is a behavioral pattern marked by the deferral of activities, or responsibilities to the point of doing them at the last possible moment or not completing them at all. It involves choosing to engage in less important, or less demanding tasks while avoiding more important or urgent ones.

Procrastination can manifest in various ways and can impact different aspects of life, including academic, professional, personal, and even health-related tasks. It can be a significant source of stress, reduced productivity, missed opportunities, and feelings of guilt or regret.

Factors contributing to procrastination:

a) Lack of Motivation: Tasks that lack internal motivation or are perceived as difficult, or boring are often prone to procrastination.

b) Perfectionism: Setting unrealistically high standards lead to procrastination, as individuals may fear that they won't meet their own expectations.

c) Poor Time Management: Difficulty in estimating how much time tasks will take, and mismanaging time can contribute to procrastination.

d) Task Avoidance: People may procrastination to avoid tasks that induce anxiety, stress, or discomfort. People may procrastinate when faced with challenging tasks.

e) Distractions: The easy availability of distractions such as social media, television, or the internet can make it easier to procrastinate.

Overcoming procrastination is a gradual process that requires self-awareness, effort, and the adoption of effective strategies. It's important to recognize that occasional procrastination is normal, but persistent and chronic procrastination can have negative consequences. Practising good habits and strategies to manage the time and tasks can lead to increased productivity and reduced stress in the long run.

RATIONALE OF THE STUDY

The rationale for conducting a study on the interaction of the three variables- optimism, neuroticism, and academic procrastination in adolescents is in addressing and understanding the challenges faced by adolescents in their crucial developmental phase. Academic procrastination is a burning issue among adolescents which can have deep consequences on educational and personal development. By examining how these personality traits such as optimism, and neuroticism relate to academic procrastination, we can uncover the potential underlying factors that influence students' behavior to delay academic work. Optimism, characterized by a positive perspective on life even during challenging situations, may act as a safeguard against procrastination. Understanding is of utmost importance whether optimistic students are better at managing their time than those who struggle with procrastination. On the other hand, neuroticism, which is emotional instability may serve as a risk factor for academic procrastination. Students with high scores on the neuroticism scale may exhibit a greater propensity for negative thinking, anxiety, or fear, which could hinder their academic performance.

METHOD

Objective-

To investigate the relationship among optimism, neuroticism, and academic procrastination in adolescents.

Hypotheses-

1. There will be a negative relationship between optimism and neuroticism in adolescents.
2. There will be a positive relationship between neuroticism and academic procrastination in adolescents.
3. There will be a significant relationship between academic procrastination and optimism in adolescents.

Priyanka Bhati and Gargi Sharma

Sample-

The sample consisted of 100 adolescents from various universities in Jaipur. The age range of the sample was 18-21 years. The sample was collected by using purposive sampling technique.

Inclusion Criteria-

- The study involved college students aged between 18 and 21 years.
- Students who can read and write.

Exclusion Criteria-

- Students who lacked sufficient knowledge of the English language.
- The study did not include foreign students.
- Students who cannot read and write.

Tools-

The following research tools are taken for data collection:

- a) LOT-R- The Life Orientation Test-Revised is a scale developed by M. F. Scheier, C. S. Carver, & M. W. Bridges in 1994 having 10 items designed to evaluate an individual's outlook towards life, specifically focusing on the dimension of optimism versus pessimism. Participants responded to each statement using a 4-point rating scale, where 0, 1, 2, 3, & 4 indicated "strongly disagree," "disagree," "neutral," "agree," and "strongly agree" simultaneously. The questionnaire provides an insight into an individual's overall nature and their tendency to exhibit optimistic or pessimistic tendencies in their thinking.
- b)Neuroticism- The Neuroticism Scale Questionnaire (NSQ), developed by I. H. Scheier and R. B. Cattell in 1961, is a brief assessment tool consisted of 40 items. Its main aim is to measure an individual's neurotic trends or the extent of their neuroticism. The questionnaire provides an insight into various aspects of neuroticism and assist researchers and clinicians to better understand an individual's emotional stability.
- c) Academic Procrastination- The Procrastination Scale, formulated by C. Lay in 1986, comprised 20 statements to see an individual's tendency to procrastinate. The inventory is a 5-point rating scale, which includes options such as "extremely uncharacteristic," "moderately uncharacteristic," "neutral," "moderately characteristic," and "extremely characteristic."This scale is used by participants to indicate the extent to which each item reflects their procrastination tendencies. The total score is determined by adding up the responses to each item. The reliability is 0.80, measuring procrastination behavior and tendencies.

RESULT

As per the result table mentioned above, optimism is negatively related to neuroticism where the r-value to be found is -0.65 which is significant at 0.05 level. Neuroticism is positively related to academic procrastination where the r-value to be found is 0.37 which is significant at 0.05 level. Academic procrastination is negatively related to optimism where the r-value to be found is -0.17 which is not significant at 0.05 level.

FINDING

1. There is a negative relationship between optimism and neuroticism in adolescents, so the first hypothesis is accepted.
2. There is a positive relationship between neuroticism and academic procrastination in adolescents, so the second hypothesis is also accepted.
3. There is no significant relationship between academic procrastination and optimism in adolescents, so the third hypothesis is rejected.

Priyanka Bhati and Gargi Sharma

DISCUSSION

The study aims to explore the relationship between optimism, neuroticism, and academic procrastination in adolescents. Numerous studies are going on the critical issues of adolescents. The first hypothesis states that there will be a negative correlation relationship between optimism and neuroticism in adolescents. The result table shows that optimism is negatively related to neuroticism in adolescents. Zou, et al. (2022) revealed that optimism plays a more influential role than just the absence of pessimism in forecasting the life satisfaction of adolescents. When it came to predicting adolescent depression, it was found that the absence of pessimism held greater predictive significance compared to the presence of optimism. According to Gniewosz (2023), adolescents with higher neuroticism scores appeared to be more prone to experiencing negative emotions during the pandemic, implying that they experienced higher levels of distress or anxiety throughout this period in comparison to their peers. The second hypothesis states that there is a positive relationship between neuroticism and academic procrastination in adolescents. The result table shows that neuroticism is positively related to academic procrastination in adolescents. The finding is consistent with the study of Markiewicz's (2017) research on the mediators of the connection between procrastination and neuroticism. This research indicates a significant and positive relation between neuroticism and behavioral procrastination. Moreover, it reinforces the idea that a neurotic personality on its own does not directly dictate procrastination, but both variables interact with one another.

The third hypothesis states that there is a significant relationship between academic procrastination and optimism in adolescents. The result table shows that academic procrastination is negatively related with optimism in adolescents. In a study conducted by Murdiana, Ridfah, & Anhar (2019), an analysis was undertaken to explore the relationship between optimism and procrastination among students working on their thesis. The findings suggest a negative relation between students' levels of optimism and their tendency to procrastinate when it came to meeting their thesis requirements. As students' levels of optimism increase, their levels of procrastination decrease in completing the thesis requirement. Another study by Joshy and Chacko (2021) on exploring the dynamic relationship between procrastination, study habits, and optimistic attitudes among college students, no relation was found between procrastination and optimism within the college student.

CONCLUSION

In conclusion, it can be inferred that optimism, neuroticism, and academic procrastination are three important variables that have a significant relationship with each other. The research is very helpful for educators, parents, and counselors who seek to guide and support adolescents on their academic front. Moreover, the research modifies our understanding of the complex nature of these personality traits and academic behaviors related to procrastination in adolescents. The study aims to enhance the well-being and academic success of adolescents during a critical phase of their lives.

ABSTRACT

Thousands of years ago yoga originated in India, and now today, an alarming awareness is observed by the world for health and fitness through yoga and natural remedies. Yoga is reported to reduce stress and anxiety, improve autonomic functions by triggering neurohormonal mechanisms by suppression of sympathetic activity. In this Paper the effort is made to highlight the important of yoga in modern era. Now a days the life style of human being a so very effected by the machines. Human being has if self become a machine as a result he is suffering from various mental, social, emotional and Health problem which are effecting his Physical and mental health. Diseases such as anxiety, Asthma, Depression, Diabetes and Cancer are very common in old as well as young age and too many millions practice some form of yoga meditation in order to contact their higher consciousness, or commune deeply with the lord .Many who practice yoga meditation are deeply religious, while many others who practice these meditations are agnostics seeking verifiable experience and personal transformational. The physical practice of yoga, exploring various physical poses designed to purify the body and eliminate toxins, exists for the purpose of preparing people for meditation and spiritual enlightenment, there are six limbs of yoga: Hath yoga (physical) Bhatia yoga (devotion) Ghana yoga (mind) karma yoga (selfless service) Raj yoga (self control)and Tanta yoga (rituals). Studies conducted on the college girl of 18 to 24 yrs from Goa University. to prove that yoga is having positive effect on mental health. The Questionnaire by Dr. Kamlesh Sharma from Indore on mental health consisted of 60 question was administered on 120 girls. Pre and Post test was conducted. Questionnaire consisted both negative and positive questions. Answer was to be given on three points scale Yes, No and Undecided. T-test was employed and study showed the significant result at 0.05 level.

Keywords: Yoga, Stress, Anxiety, Mental health, Pranayam.

INTRODUCTION

Yoga is a Sanskrit word meaning, "to join "or unite-generally referring to the union between soul and body or finite self with infinite self. In the traditional sense of Patanjall's yoga suttras yoga is described as "the cessation of the perturbations of the mind" In the yoga sutras. Yoga is the way of life, a perspective, and an approach to everyday. Patanjali indicates that the ultimate goal of yoga is a state of permanent peace in which someone can experience one's true self. Absolution freedom occurs when the lucidity of material nature and spirit are in pure equilibrium to one another. Yoga is a practice for all denominations a practice that is a universally accepting and welcoming. The yogi strives to open the gift of life and discover his fullest possibilities. A yogi endeavors to discover the higher consciousness and how the body mind and emotional nature can be truly fulfilled through unifying their purposes.
Body, mind and spirit are inter-related, no one really knows for sure how spirituality is related to health, But Spirituality is peace of self, the way you find meaning, hope, comfort and inner peace in your life. Many people find spirituality through religion-some find it through music, art or a connection with nature. Others find it in their values and principles., research had shown that things such as positive believes, comfort and strength gained from religion, meditation and prayer can positively contribute to rate of healing and a sense of well being and a better feeling which prevent some health problems and help us to cope with illness and stress. The yoga solution –Yogi's discover and affirm life's great possibilities by freeing the body of tension and the ravages of stress and progressively releasing mental and emotional turbulence. The resulting well being is often considered miraculous; and the new unity which occurs between the individual and others is like the dawn of a new life.

Yoga as one of the ancient sciences is primarily a system of philosophy and discipline applied to the development of mind, body, and spirit. Yoga is a scientific system of physical and mental practices that originated in India more than three thousand years ago. Yoga forces you to return to presence . When you live in the moment, even for the short duration of a yoga class, you'll fell more positive about yourself, your day and your life. This positive attitude boosts your overall mental health in a powerful way. Yoga has potent health benefits-Yoga is a combination of physical, mental, and spiritual practices that originated in India thousands of years ago. Yoga began as a Hindu philosophy advocating and prescribing a course of physical and mental disciplines for attaining liberation from the material world and union of the self with a supreme being "That said ,yoga is ultimately secular. There is a growing body of research to back up yoga's mental health benefits. Yoga increase body awareness, relieves stress, reduces muscle tension, strain and inflammation, sharpens attention and concentration and calms and centers the nervous system. yoga practice can help with stress reduction-There are many facets of yoga that also causes our overall levels to be reduced. The focused breathing alone has been shown to reduce cortisol (the stress hormone) levels and lower blood pressure. Additionally, when you exercise, endorphins are released. These endorphins help boost your mood and facilitate better stress management.

Pranayama
Is the science of breath control. It consists of series of exercises especially intended to meet the body's needs and keep it in vibrant health. Pranayama comes from the following words:

Prana - "life force" or "life energy"
Yama - "discipline" or "control"
Ayama - "expansion", "non-restraint", or "extension"

Thus, Pranayama means "breathing techniques" or "breath control". Ideally, this practice of opening up the inner life force is not merely to take healthy deep breaths. It is intended for yoga practitioners to help and prepare them in their medication process. Through the practice of Pranayama, the balance of oxygen and carbon dioxide is attained. Absorbing prana through breath control links our body, mind, and spirit., But life is full of stress. Because of the daily work, family, or financial pressures, we tend to ignore our breathing. Thus, it tends to be fast and shallow. The use of only a fraction of your lungs results to lack of oxygen and may lead to different complications. Heart diseases,

Anita Pallai *et al.,*

sleep disorders, and fatigue are some of the effects of oxygen starvation. Therefore, the negative energy of being restless and troublesome leads to lesser prana inside the body. By practicing deep and systematic breathing through Pranayama, we reenergize our body.

Humming Bee Breath

After complete inhalation, press roots of nostrils from both side using middle fingers. Keep concentration in Aagya chakra and close both ears using thumbs. Now, exhale making loud singing voice of "OM" like the buzzing of a bee. Repeat same process minimum 3 times, limiting maximum 11 to 21 times. While doing this pranayama one should think that GOD'S grace, peace and happiness is raining over his head. He should feel that God himself is appearing as a divine light in his "Aagya chakra" and granting wisdom by removing all ignorance. So, this pranayama results in appearance of a divine light source in "Aagya chakra" and process of meditation becomes smooth and   easy.

Benefits of Pranayama

Breathing is a normal part of our life, though we fail to pay attention to it. It is an autonomic function of the body that we perform even without concentrating on it. Why then do we have to learn yoga breathing? Here are some reasons why Pranayama is important:

- Pranayama teaches us the proper way to breathe. We became used to breathing from our chest, using only a fraction of the lungs, not knowing that this unhealthy and unnatural way of inhaling may lead to several complications. With yoga breathing, we increase the capacity of our lungs, bringing more oxygen supply to the body to function well. We learn how to breathe slowly and deeply - the right way.
- Pranayama reduces the toxins and body wastes from within our body. It prevents one from acquiring diseases.
- Pranayama helps in one's digestion. With the proper way of breathing, one's metabolism and health condition will start to improve.
- Pranayama develops our concentration and focus. It fights away stress and relaxes the body. Controlling one's breathing also results to serenity and peace of mind.
- Pranayama offers a better self-control. Through concentration, one can better handle temper and reactions. Mind can function clearly, avoiding arguments and wrong decisions. Moreover, self-control also involves control over one's physical body.
- Pranayama leads to spiritual journey through a relaxed body and mind.

RELATED LITERATURE

Sengupta Pallav (2012) conducted a study on health impacts of yoga and pranayama and concluded that yoga is reported to reduces stress and anxiety, improves autonomic functions by triggering neurohormonal mechanisms by the suppression of sympathetic activity, and even now-a-days, several reports suggested yoga is beneficial for physical health of cancer patients. Such global recognition of yoga also testifies to India's growing cultural influence. Tyagi A.Cohen M. (2014) They conducted study on yoga and hypertension concluded that 39 cohort studies, 30 nonrandomized, controlled trials (NRCTs),48 randomized, controlled trials (RCTs),and 3 case reports with durations ranging from 1wk to 4 y and involving a total of 6693 subjects. Most studies reported that yoga effectively reduced BP in both normotensive and hypertensive populations. These studies suggest that yoga is an effective adjunct therapy for HPT and worthy of inclusion in clinical guidelines. Tiffany Field (2010) conducted a study on yoga clinical research in this paper concluded that yoga poses on psychological conditions including anxiety and depression, on pain syndromes, cardiovascular, autoimmune and immune conditions and on pregnancy. Further, the physiological effects of yoga including decreased heart rate and blood pressure and the physical effects including weight loss and increased muscle strength are reviewed. Finally, potential underlying mechanisms are proposed including the stimulation of pressure receptors leading to enhanced vital activity and reduced cholesterol. The reduction in contisol, in turn, may contribute to positive effects such as enhanced immune function and a lower prematurity rate.

METHODOLOGY

The questionnaire made by Kmleash sharma on mental health consisted of 60 question was administered on 120 girls Pre and Post test was conducted. Questionnaire consisted both negative and positive questions. The time duration between pre and post test was three months and the independent variables were Answer was given on points scale Yes, No and Undecided. T-test was employed and level of significant was set at 0.05 level.

Statistical Technique Employed in Study
For the analysis of data, descriptive analysis and ANCOVA test was administered to measure the effect of Brhamari pranayam on mental health and The level of significance was 0.05.

RESULTS AND DISCUSSION

The result indicates that yogic practices and pranayam has very deep and positive effect on human being that the mean of Pre test is lesser than the mean of post test. Thus we can say that Brhamari pranayam has positive effect on mental health and wellness of the individual if done for minimum of three months.

CONCLUSION

Human being is loaded with internal supernatural power. These internal powers of yoga if well utilized   then one can be able to become a well balanced personality free from all type of physical and mental worries. Elements such as Surya Namasker and Anulom Vilom, Pranayam and Bhramari Pranayam helps in the internal purification of human being and if done for a longer period of time it reaches for the development of our mental and physical abilities. Yogic exercises recharge the body with cosmic energy. If you want to transform society, the individual should charge because individuals are components of the entire society. The macroscopic dimension of the growth of yoga for the society has a higher influence. When a certain number of people in the society start practicing yoga, there is going to be automatic transformation of the whole society. And this transformation in all of us will start spreading the harmony, love and affection in the society.

ABSTRACT

This paper discusses the significance of sports in human life, from its historical roots to the importance of ethics in sports. It covers various aspects, including traditional Indian sports, the role of ethics in maintaining the integrity of sports, and the potential for sports to promote social harmony and peace. The connection between sports and ethics is a key theme in this paper, emphasizing the importance of fairness, respect, and healthy competition. It also highlights the need for organizations like the National Sports Ethics Commission to ensure ethical practices and address issues like doping, match-fixing, and age fraud in sports. In conclusion, this paper tries to effectively convey the multifaceted role of sports in society, underlining its potential for both physical and mental development and its ability to foster positive values when conducted with ethics in mind.

Keywords: physical, emphasizing, Commission, ethics, society

INTRODUCTION

We all know this fact very well that sports have immense importance in human life. Sports are not only a means of entertainment, but it also has a very positive impact on human health. Sports play a very important role in maintaining freshness of body and mind. Playing sports regularly not only strengthens the body and muscles but also brings happiness in life. Not only in India but all over the world, sports are given great importance. The famous Greek philosopher Plato said in his book Republic that children should be taught music and exercise or games in the early stages of their education. Music for their mental strength and exercise for their physical health.[1]Similarly, in India, there has been a tradition of giving sports training to children since childhood. Besides, it is also expected from them that they remain involved in some sport or the other till they grow up. Sports in India have a very healthy tradition and their history is very old. The inscriptions found in Harappa and Munjodaro of the Indus Valley show that sports must have played a very important role in social life during that period. At that time, citizens were also taught war skills through games like sword fighting, javelin throwing, horse racing chariot racing etc.

Mani Sachdev and Richa Arora

In ancient times, wrestling was very popular in India. Its mention is also found in Purana, Mahabharata, and Ramayana. Balram, Bhima, Jamwant Hanuman and Jarasandha were adept in wrestling, and they performed very well in this sport both during peace and war. Wrestling is the modern form of this game. It started in South India, then this game started being played all over India and became very popular. This is a game played between two sides in which both sides field very strong wrestlers in the arena. In this game, the reputation of both parties is linked to victory and defeat.Similarly, archery has also been prevalent in India since ancient times. We also find its mention in the ancient Indian texts Ramayana and Mahabharata. Kshatriyas were given special and serious training in this discipline. Its special competition was organized in Gurukul.

तेषामपिमहातेजारामःसत्यपराक्रमः || 　　　　　　　　　　　　　　　　　१-१८-२६

इष्टःसर्वस्यलोकस्यशशांकइवनिर्मलः ।

Among them is the magnificent radiant Rama, the world's beloved like the peaceful moon, whose heroism is his sincerity. [2]

गजस्कन्धेऽश्वपृष्ठेचरथचर्यासुसम्मतः || 　　　　　　　　　　　　　　　　　१-१८-२७

धनुर्वेदेचनिरतःपितृशुश्रूषणेरतः ।

It is true that Rama loves to ride horses and elephants, as well as tactical chariots. He also takes great pleasure in archery and is devoted to his father's submissive duty.[2]

Describing the importance of archery, it is said in Yajurveda [7]–

धन्वनागाधधन्वनाजिंजयेमुधन्वनातीव्राःसुमदौजयेम।

धनुःशत्रौरपका़मंकृणोतिधन्वनासर्वाःप्रदिशोजयेम॥३९॥

Those people who are skilled in the science of Dhanurveda, their victory will be visible everywhere. If someone wants to create a state of geography with qualities like knowledge, victory, bravery etc. then nothing will be impossible [3].

Similar to the traditional Olympic oath, "For the honour of my country and the glory of sport", it is also said in the Vedas. [3]

कृतंमेदक्षिणेहस्तेजयोमेसव्यआहितः।

My right hand is working hard, and my left is doing well. The implication is that success is certain if we put in the necessary effort. We should not lag behind in our work.

Similarly, Kho-Kho, Kabaddi, Chess, Snakes and Ladders, Gilli Danda, etc. are traditional popular games in various parts of India. Which have been played here since ancient times. After such a long historical journey, in the modern era, all those sports are played in India which are playing an important role in bringing fame and respect to India at the international level like cricket, hockey, badminton, wrestling, shooting etc. Not only this, in India Sports institutions have been established to promote sports. India has also hosted many international games like Commonwealth Games, Cricket World Cup and so on. Indian sports have seen a change with the emergence of professional leagues like the Pro Kabaddi League (PKL) and Indian Premier League (IPL). As a result, athletes now have greater performance opportunities, sports are more popular, and athletes have a better platform.All these games have their own rules, these rules are as important for the operation and success of the games as other rules of human behaviour. This is the rationale behind the significance of sports in human existence—they are fundamental to the development of an individual's personality. These are considered an essential part of education because they make the mind healthy along with the body. Some sports are physical which are played in the playground, sports like hockey, football, badminton, wrestling etc. fall in this category. Some games are indoor like chess, chaupar, cards etc. Playing all these games develops team spirit, brotherhood and the feeling of working together, which helps in building our personality. Sports also remove the feelings of big and small sections, rich and poor, which increases mutual harmony in society.

In this way, the possibilities and benefits of sports are endless. But today it is changing rapidly. Sports were taken over by political parties. Because of this, politics has entered sports. For this reason, morality in sports has declined.

Mani Sachdev and Richa Arora

Ethics is as important in sports as it is in human behaviour. If human conduct is not ethical then anarchy prevails in society, similarly, if morality is not followed in sports, then it also has adverse effects on society. It is very important to follow the rules for any human behaviour to run smoothly, due to these rules social balance and harmony are maintained. Similarly, in sports also it is very important to follow the rules of the game, if the rules are not followed then it has a direct or indirect impact on the entire society. This is not only important for social justice but also for the mental balance and emotional development of the players. If we want players to remain committed to the game, then it is very important to follow the rules of the game properly. Later this commitment takes the form of a contract. This leads to moral and emotional upliftment of the individual and society.

Sports ethics encompass a wide range of topics, including player conduct, coach behaviour, and game regulations. It is imperative that all of these adhere to ethical guidelines. Healthy competition, teamwork, jogging, equality, respect, tolerance, and mutual care are necessary for this, in addition to exceptional accomplishment. Sports develop only by following ethics in sports. When players get opportunities to play without any discrimination and the results of the game are also fair, then they get encouraged. This increases people's interest in sports and develops sports culture.

But if we look at the world of sports today, we will find that corruption is prevalent here too in various forms. Due to this, not only are our good players feeling disappointed, but our image is also getting tarnished at the international level. Many times, we feel embarrassed by this. Today we have to face corruption in the very first stage of the game. This is the first stage of player selection. In this, the attitude of the selectors is completely biased. Sometimes regionalism, sometimes nepotism, sometimes casteism and sometimes greed for money play an important role in selection and the right, good and deserving players do not get a chance. Due to biased selection, the players who are selected are not of quality and their performance is not good. *

Another form of corruption in sports is match-fixing. In this, either the captain of the team or the players themselves lose after taking money from the opposition team. Such incidents have occurred not only in India but also in many other countries [5].

Apart from this, corruption is also prevalent in the purchase of sports equipment.*

We keep hearing about doping in sports every day. This is a serious issue even at the international level. Players use special medicines to improve performance. It has various methods and effects. Which is completely illegal and unethical. This not only destroys the spirit of the game but also spreads corruption in sports [6].*Human life can never be seen separately from sports. After birth, a small child learns to speak later and starts playing early, that too without the help of any coach. In this way, in the course of human development, games come before language. Sports are an integral part of human nature and we remain connected to sports in some form or the other throughout our lives. It is through sports that the feeling of survival remains constant in humans. Today the entire world is struggling with the problem of terrorism and separatism. The kids who are misinformed and holding firearms can be guided by sports to leave their guns behind and take up football if international sports organizations take seriously their responsibilities to bring about world peace. [7].

Two words are important in sports ethics – sports and morality. Morality is not only related to philosophy but is very important for the conduct of an individual and the functioning of society. Similarly, if we want the all-round development of a person, then we have to accept that sports is a human activity which plays an important role in the all-round development of a person. This is why sports ethics is a positive concept that determines how a person should conduct himself during sports. There are rules for all types of human behaviour, similarly, there are rules for sports also, and these rules control the activities of sports. As a result, players must put aside their feelings of racism, bigotry, and religion in order to compete because sports are vital to a person's physical and mental growth. The athlete may find enjoyment in practising sports, but he or she is also committed to all kinds of personal structures. This is not only a commitment but also a contract in which both moral and emotional values actually work together. Ethics is related to compliance with the rules of the game and the group, while emotion is related to the individual factors of the game and affects every member of the team. Therefore, the opponent in the game is not an enemy but is a temporary requirement or supplement of the game to win or lose, without which the game cannot be played.

Mani Sachdev and Richa Arora

It is very important to practice in any sport to optimize your ability. This practice is not only necessary to keep the body healthy but it also makes us healthy from a psychological, social and spiritual point of view. Therefore we must remain committed to the rules of the game. If we do not follow the rules of the game then the disintegration of the games and their structure is certain. This affects the structure of our life. Not only the individual but the entire society is affected by this. If commitment remains in sports then healthy moral values develop in society.[10]If we look at the history of sports, we will find that due to adherence to sports ethics, relations between countries have improved at the international level. Olympic Games, World Cup Football, World Cup Cricket, and Commonwealth Games are witness to the fact that these games are not only liked by the spectators but their organization at the international level has a deep impact on the diplomatic relations of different countries. Now these games have become a symbol of cultural unity of the world.

Sports ethics are the carrier of human values. The general public starts considering the player as their idol. This inspires people to work hard. Sachin Tendulkar is living proof of this.If in sports, going beyond morality, only winning the game becomes the main goal, then the morality of the game gets affected and selfishness enters into it. To fulfil this selfishness, players start using wrong methods to win like drugs, dishonesty, abuse, bribery, sexual harassment and dirty politics. Even to get opportunities in sports, players have to face all these unfair problems."Sportsmanship is a more moral attitude to athletics. A sportsmanship paradigm views healthy competition as a way to develop virtue, honour, and character in individuals. It fosters mutual respect and trust among rivals as well as throughout society. Sportsmanship is not only about winning; it's about pursuing victory honourably and with all of one's might."

"Ethics in sport requires four key virtues: fairness, integrity, responsibility, and respect."[7]

Sports have the power to bring together people from all walks of life and backgrounds across the world, making our world a better place to live in. Players can play an important role in social development, establishment of peace in the society and social service. For this, it is very important for sports to be fair and ethical. Today the entire world is troubled by violence and hatred. Sports can play an important role in mutual harmony and social cohesion [8]. Through these, violence can be curbed and peace can be created between people and communities.In this context, on 19 Sep 2014 at FIFA Headquarters Zurich, Switzerland, Sri Sri said "Unfortunately I have to say that, today wars are fought like games and games are being fought like wars. "*[9]

Ethical responsibilities in sports apply to players and sports fans alike. This creates an organizational structure for sports. Sports can become a source of inspiration in the society. People find happiness in sports and are inspired to set high standards of morality in life through sports. If players are not able to maintain these standards in their lives, then there is a lot of disappointment among sports lovers [11]. Nowadays, there are many instances of doping, match-fixing and corruption in sports. This not only affects the credibility of the players but also reduces the popularity of the games. Players forget the fact that if they are adopting undesirable means to win in games then they are cheating a large population. In such a situation, their victory becomes a big betrayal rather than a victory. Sports are a big factor in happiness in the life of players and sports lovers. Today there is a need to make the entire world aware of this fact. The feeling of brotherhood can be awakened in the world through sports.

How to establish morality in sports?

Elements like fairness, opportunities to demonstrate ability, respect for all, and responsibility are essential for sports ethics. This is also called "sportsmanship". Therefore, in sportsmanship, victory is not as important as healthy competition. It has been mentioned in the National Sports Ethics Commission Bill-2016 that the principle of "tough but fair play" is prominent in sportsmanship. Therefore, not only the players but all the people associated with sports should accept the principle of sportsmanship and promote ethics in sports. Should be given. Anurag Thakur, a member of the Lok Sabha, introduced a private bill in the legislature in 2016 that established the National Sports Ethics Commission. Notably, this was thought to be necessary following the 2013 IPL match-fixing.

- Its exclusive goal is to create a National Sports Ethics Organization in order to guarantee moral behaviour in all sports and to make significant progress in the elimination of doping, match-fixing, age fraud, and sexual harassment of female athletes.
- Under this measure, players found guilty of match-fixing would face a 10-year prison sentence and a fine five times the amount of the bribe, in addition to a permanent suspension.
- Age or gender fraud carries a six-month jail sentence and a one-lakh fine.
- Under the same law, coaches and members of sports federations who assist in these illegal acts will also face consequences.
- The 'National Sports Ethics Commission' will comprise prominent athletes in addition to judges. The commission will have the power to hear cases and decide on penalties.

CONCLUSION

Sports are now a means of fostering international relations and mental growth in addition to physical prowess. The value of good sportsmanship has also grown in this circumstance. Due to the fact that many jurisdictions have begun to recognize sports as an industry, sports codes of conduct are now crucial. In reality, morality itself is a person's inner feeling, but giving it a legal format will enhance the observance of morality.

ABSTRACT

In current situation obesity is spreading rapidly among children in all over the world, due to which many major diseases are occurring in children, especially in develop cities or countries. The purpose of the study is to state the role of physical education teacher in preventing   childhood obesity. This paper deals with the studies of children nutrition and physical activity related behaviour. The study focuses on preparing diet plan and physical activity schedule to prevent obesity. In developed countries children are not able to play any types of physical activity due to lake of space, facilities and infrastructure so they are confined to their rooms with video game, phone or any electronic devices. Study deals with the talk to children's parents about their food intake and daily life routine to control obesity and even their routine with children. In school teachers teach them about preventing obesity to intake good food and with fun activities and design proper activity.

Keywords: Obesity, physical activity, nutrition, prevention**.**

INTRODUCTION

Obesity a threat to modern world
Now a day's parents send their children to school in their childhood itself: due to which more attention is paid by the school teachers, among all physical education teacher takes care of the health of the children. Since parents are busy with their work so they are not able to give more attention to their child's wellbeing, good habits as like good food, hygiene etc are neglected by them, so the physical education teachers plays key role in developing good environment that foster healthful eating and activity among children and adolescents .Physical Education teachers shape their student's dietary practices ,physical activity ,sedentary behaviours and ultimately their weight status in many ways ,because they have knowledge about it. One of the most important things that the P E Teacher deals is

66018

Nikita Sharma *et al.,*

informing parents about the children's schedule and their responsibilities type of food   to be consumed by the children at home, activities, sleep and wake up time etc. According to the NFHS report, the prevalence of overweight children under five years of age has increased from 2.1% (2015–2016) to 3.4% (2019–2021).More than 14.4 million children are obese in India, the second-highest rate globally, behind China. As per health site.com – 23.9 percent of Indian children suffer from obesity and overweight. Obesity is a excessive fat accumulation that present a risk to health (WHO)

BMI Definitions	BMI
Under weight	< 18
Healthy weight	18 - 25
Over weight	25 - 30
Obese	30 - 35
Severely Obese	35 - 40
Morbidly Obese	40 and over

Here in this chart obesity has three phases start from 30 BMI
Overweight has from 25-30 BMI

What is Childhood Obesity
Childhood obesity is a disease that occurs when child is above a healthy weight for their age and height (Cleveland clinic)
Adults in India will see an increase of 5.2 percent in obesity levels, and child obesity will see a 9.1 percent swell by 2035, according to the latest report from the World Obesity Federation.

TEACHERS ROLES DURING CHILD'S DEVELOPMENT

Teacher influences the development of overweight and obesity in various ways at different stages of child's development. in primary level there are two stages of children one is pre-primary second is primary
1. Early childhood (preschool children) for pre-primary level
2. Later childhood (school children) for primary and secondary level

Early childhood
As early childhood developed habits related to eating and gross motor physical activity.
In this stage children start imitated any action.

Later childhood
In this stage children learnt fine activity and understand about good and bad things

CAUSES OF OBESITY

1.   Lack of activity
2. fast food
3. Family
4. Friends
5. Sedentary life
6. Electronic device
7. Environment
8. Psychology factors

1) **Lack of activity**
due to increasing population buildings and factories are being built on empty places due to which there is no space left to play and children are not able to play.

2) **Eating more fast food**
However, fast food is extremely attractive to most children because of the taste, comparatively lower price, and convenience (doesn't require any cooking or preparation). Since children typically do not understand how this kind of food negatively impacts their health, it can be quite addictive.

3) **Family**
Family is one of the main causes for children's obesity .in present day families are busy in their own work to which they do not care their children's good habit like eating, living, and support/transport behaviour. Approximately 30% of family/peers participate in physical activity with children and provide /access to physical activities. (as per human kinetic)

4) **Friends**
In the childhood stage, it is more fun to make friends and imitate any action. In this stage learning capacity to too high so they learn easily either bad or good habits

5) **Sedentary life**
In present day children love to rest more than any activity. They eat food to watching tv or using phone.Less than half of Indian children and youth are meeting screen time-based sedentary behaviour guidelines (<2 hours/day).(as per human kinetic)

6) **Electronic Devices** -In present era world has become technological. children are given mobile or any electronic device watching tv in early age due to which children don't do any physical activity.

7) **Environment**- environment includes all of the parts where we live and work - home,work,buildings, street, shop, mall any open spaces. environment contribute to unhealthy eating and least physical activity.

8) **Psychology Effect-**Psychological factors also contribute to obesity. While many people turn to food in response to emotions such as stress, boredom, sadness, or anger, an estimated 3% of the population is diagnosed with binge eating disorder (BED).

List of diseases due to occurring obesity in childhood
According to Mayo Clinic
Physical effect
1. Diabetes
2. High blood pressure
3. Joint pain
4. Breathing problem
5. Liver disease
6. Depression and anxiety
7. Stunt (to stop growing or developing proper)

Emotional effect
1. Mental Health
2. 2) Depression
3. 3) Low Self esteem
4. 4) low self confidence

Physical education teacher role in healthy food for childhood
This study focuses on healthy food to prevent obesity. At present, children eat baked food in early age, it stores in body as fat and change into overweight or obesity. In this study talk to children about healthy food and unhealthy food with the help of 3d graph, also explain benefit of healthy food and effect of unhealthy food with fun of game. In this study PE teacher explain to the children about which is healthy food and unhealthy food.

66020

Healthy food as like-
Green vegetables, grains, fruits, milk, dry fruits pulse
Unhealthy food as like –
Cake and biscuit, chips, burgers chocolates and sweets snacks, sugary drink

THE ROLE OF PHYSICAL EDUCATION TEACHER IN PHYSICA ACTIVITY FOR CHILDHOOD

The study has found that physical activity is associated with lower risks of accelerated weight gain and excess adiposity among preschool aged children. A study of 3-5years children attending preschool found that overweight children were significantly less active than normal weight children during the preschool day. Children spend more time with electronic devises like mobiles, watching TV, video game etc at home and in school with study making class work etc due to which they don't perform any physical activity. One of the major reasons to don't perform any activity is after school they attend tuition class**.** in this age (preschool age) children act imitation of their familiar person, so teacher should be always active and don't use mobile phone in front of them and teacher should conduct meeting with their parent and discuss about responsibility of them as like -parents always active and don't use mobile phones and watching tv in front of them and don't keep any types of electronic devise in their room they set limitation about it .In India, 73.9% children got "insufficient physical activity" in 2016, increasing their chances of being obese and developing heart disease, diabetes and mental health problems, including depression, according to a World Health Organisation analysis of 1.6 million students across 146 countries. (Hindustan times).

In later childhood-in this age children had developed their gross motor activity, so teacher encourage and motivate to participate in game, dance, aerobics, yoga or any types of exercise activity.

CONCLUSION

One of the best ways that physical education teachers can be successful in teaching overweight or obese students is to meet their needs and interests. Proper diet in physical activity plays very important role to control childhood obesity. The role of physical education teacher is the most important for conduct awell structure physical activity schedule and provide a well plan diet chart to the parents and monitoring the students to follow the diet chart and engaging them in physical activity so that they can enjoy the activity with out of any undue fatigue and tiredness and lead a healthy success full life.

ABSTRACT

Aging adults are frequently concerned about cognitive decline, thus therapies that support cognitive health are crucial. Functional training which has gained popularity because it can improve physical function in a variety of populations by emphasizing activities that are relevant to daily living. However, less literature is available on how it affects cognitive function. This study examines the 12-week functional training effect on the cognitive health of the active adult's group [AAG] (aged 50 - 59) and the geriatric population [GPG] (60 years ≤). AAG (n-30)was further equally randomized in the treatment (n-15) and control (n-15) group. Similarly, the GPG (n-30)was also randomized into the treatment (n-15) and control (n-15) group. Both the treatment groups AAG and GPG participated in a planned 12-week functional training regimen that incorporates resistance exercises, balance, and coordination training. Standardized Cognitive Tests (MoCA) was used to assess mild cognitive impairment among AAG and GP Gat pre-intervention (0 week), mid-intervention (6 week), and post-intervention (12 week).The 2*3*2 mixed ANOVA was applied to test the effectiveness of training (time*groups) and interaction effect(group*time*age). Time*group showed a significant effect which means the functional training program was effective on both AAG and GPG with a larger effect of magnitude (ηp^2 – 0.092). However, Time*Group*Age interaction shows an insignificant effect and could be interpreted as having a similar effect on both groups irrespective of age differences. The finding supports the effectiveness of a 12-week functional training to enhance cognitive performance in both AAG and GPG. The long-term impact of functional training regimens is the further scope of the study.

Keywords: cognitive enhancement, memory, attention, executive function, functional training, language ability, orientation, active people, geriatric.

INTRODUCTION

Cognitive abilities are a commitment to physical gravity exercises that show a multifaceted relationship based on different physiological and psychological mechanisms. The increased blood flow can promote neurogenesis, angiogenesis, and the secretion of neurotrophic factors, all of which play a central role in improving cognitive functions, including memory, attention, and executive function (Kramer et al., 2006; Hillman et al., 2008).Exercise causes the release of neurotransmitters such as dopamine, serotonin, and norepinephrine. These neurotransmitters can regulate mood and have been associated with increased concentration, motivation, and general cognitive performance (Dishman et al., 2006; Rojas Vega et al., 2006). Physical activity increases overall energy levels through various metabolic and hormonal pathways. This increase in energy can improve cognitive alertness and productivity (Dietrich and Audiffren,2011).Bodyweight exercises often require fine motor skills and coordination, which promote the development of executive functions such as planning, organization, and problem-solving. These exercises challenge neural pathways involved in cognitive control (Hillman et al., 2014). The mentioned areas explains the scientific basis for this relationship: improved brain function, regular physical activity, including bodyweight exercises, stimulate blood flow to the brain.Therefore the aim of the study was to find the effect of the functional training program which comprises of strength training, body weight motor fitness , basic home oriented physical activities emphasizing on mobility – flexibility exercises with respect to the mobility-stability continuum (McGill et.al ,2009) for cognitive health promotion in active adults and geriatric population.

MATERIAL AND METHODS

Participants
The study includes the general population from the society of Pune, Maharashtra, based on the inclusion criteria of age category; active adults (50 -59 years) and geriatric population (≤60 years). The participants were informed of the objective and the risk associated with the study, and the consent was asked post-interaction session. AAG (n-30) was further equally randomized in the treatment (n-15) and control (n-15) group. Similarly, GPG (n-30) also randomized into treatment (n-15) and control (n-15) group. The treatment group of AAG and GPG attended the familiarisation session of resistance exercise, balance, and coordination training for 10 days prior taking the pre-test data.

Training Sessions
A 12-week functional training (5 days a week x 60 minutes duration)was conducted for the treatment groups AAG and GPG, separately. The training was supervised and monitored by the experts. The training protocol started with a familiarisation session emphasizing safety instructions, movement correction, and fall prevention. The data was then recorded at 3-time frames; pre-intervention (0weeks), mid-intervention (6 weeks), and post-intervention (12 weeks) from the treatment and control groups.

Assessment of Cognitive Health
The Montreal Cognitive Assessment (MoCA) was used as the main assessment tool in this study's methodological framework to examine the mild cognitive impairment among AAG and GPG. The MoCA , a multi-lingual tool is a well-known and scientifically authentic screening tool to measure mild cognitive impairment. It has shown great sensitivity in identifying mild cognitive impairment and has been widely used in clinical and research settings. It is a useful tool for characterizing cognitive function and monitoring changes over time. To verify the reliability and validity of the data, the evaluation was carried out by qualified assessors using defined protocols.

Ethical Consideration
The IEC Report dated 27th March 2023 was taken into consideration and approved from the Institutional Ethics Committee, Bharati Vidyapeeth (DTU) College of Physical Education, Pune.

STATISTICS

The statistical analysis was performed by SPES [licensed version 26], and Graph Pad Prism [trail version 8] was used to prepare the graphs. The normality of the data at pre -mid- post-intervention for AAG and GPG was ensured by the Shapiro-Wilk test at 0.05 level of significance. The description of the data was presented as mean ± standard deviation (SD)[Figure 1]. The effect size (Cohen's d) was also calculated for AAG and GPG from pre-to-mid, mid-to-post, and pre-to-post intervention atdifferent times (0, 6 and 12 weeks). The magnitude of Cohen's d was interpreted as trivial (0.6-1.2), large (>1.2-2.0), very large (>2.0-4.0), and extremely large (>4.0) (Hopkins et al., 2009). The rate of change (Δ%)was also calculated following the equation: [(Mean $_{post}$ – Mean $_{pre}$) * Mean $_{pre}$] * 100, at 0, 6, and 12 weeks for AAG and GPG. A 2*3*2mixed ANOVA was applied to analyze the main effect (time*groups) and the interaction effect (age*time*groups) at a 0.05 level of significance. The magnitude of significance: partial eta square (ηp^2) was used and interpreted as small (0.01), medium (0.06), and large (0.14) (Richardson, 2011).

RESULTS

The mean ± SD for AAG and GPG is shown at pre (0 weeks), mid (6 weeks), and post (12 weeks) intervention [Table 1]. Theeffect of magnitude for the treatment group of AAG from pre to mid-intervention was trivial (0.13, 1.4 Δ%), mid to post-intervention was large (0.86, 13.8Δ%), and pre to post-interventionalso showed large magnitude (0.94, 9.3 Δ%). On the contrary, the control group of AAG showed trivial (0.05, 0.5 Δ%), small (0.24, 4.6 Δ%), and trivial (0.17, 1.6 Δ%) effects of magnitude from pre to mid, mid to post, and pre to post-intervention. In addition, the effect of magnitude for the treatment group of GPG from pre to mid was trivial (0.13, 1.6 Δ%), mid to post was large (1.57, 12 Δ%), and pre to post was also large (1.39, 13.8 Δ%). On the other hand, the control group of GPG had a trivial effect from pre to mid (0.17, 1.6 Δ%), mid to post (0.15, 1.9 Δ%), and a smaller effect of magnitude (0.27, 3.6 Δ%) at pre to post-intervention. The 2*3*2 mixed ANOVA was applied. The time x group shows a significant effect which means the functional training program was effective on both AAG and GPG for the duration of training witha larger effect of magnitude (ηp^2 – 0.092). However, time*group*age interaction shows an insignificant effect and is interpreted as having a similar effect on both the groups AAG and GPG, irrespective of age differences.

DISCUSSION

Several notable results were obtained from the study that looked at the major impacts of a 12-week functional training intervention on the Montreal Cognitive Assessment (MoCA) scores in adult and geriatric populations. The findings show a statistically significant improvement of MoCA scores in both the groups after the intervention. This is especially important because therapies to maintain or improve cognitive function are in high demand and because cognitive decline is a prevalent worry among older persons, thereby encouraging cognitive engagement, improving general physical health, or reducing the impacts of age-related cognitive decline, the functional training program may have helped this group's cognitive performance. The sample size and duration of the study were very limited and for those looking to retain their cognitive function as they age and improve their cognitive performance, these results provide promise. Furthermore, a more thorough investigation of the mechanisms behind these benefits will help identify the mechanisms through which functional exercises enhance cognitive performance.

CONCLUSION

According to the study, physical fitness can be a critical factor in maintaining cognitive function throughout one's lifespan, highlighting the need to take a holistic approach to health and wellbeing. The results of this study indicate the efficacy of a 12-week functional training routine to enhance cognitive performance in both the elderly and active adults. The findings have substantial ramifications for aging people's independence and promotion of cognitive

health. To examine the long-term impact of such training regimens and to clarify the underlying mechanisms causing these cognitive enhancements, more research is required.

ABSTRACT

This study explores the dynamic realm of sports tourism, an interplay of athleticism, travel, and cultural exchange. It delves into the multifaceted dimensions of sports industry, encompassing event attendance, recreational pursuits, and adventurous exploits. The study underscores the pivotal role of major sporting events in galvanizing local economies, spurring infrastructural growth, and fostering global connections. Moreover, it scrutinizes the impact of sports tourism on community engagement and the promotion of active, healthy lifestyles. As the nexus of sports and travel continues to evolve, this paper provides a comprehensive overview, shedding light on emerging trends and emphasizing the imperative of sustainable practices. This study seeks to inform stakeholders, policymakers, and enthusiasts, unravelling the profound impact of sports tourism on the global landscape. Sports tourism is an opportunity in other as upcoming industry that focuses on attracting Visitor who are interested in sports-related activities. it involves individuals travelling to a destination for the primary purpose of either participating in or Spectating sports event. The paper focuses on different types of sports tourism namely Event Tourism, Recreational Tourism ,Adventure sports Tourism.

Keywords: Sports Tourism, Polices, Stake holders and adventure, Culture, Bridging of passion, Economies

INTRODUCTION

Sports tourism is a global phenomenon, with events and activities taking place in various parts of the world. It has diverse audience, ranging from passionate fans to amateur athletes seeking unique experiences. Sports tourism continue to evolve Influenced by factors like changing Consumer preferences technological advancements, and a growing focus on sustainable practices. This niche sector remains a dynamics and integral part of the broader tourism industry. Sports tourism is an opportunity in other as upcoming industry that focuses on attracting Visitor who are interested in sports- related activities. It involves individuals travelling to a destination for the primary

Archana Kumari *et al.,*

purpose of either participating in or Spectating sports event. This study delves into the dynamic world of sports tourism, an intersection of athleticism, travel, and cultural exchange. It explores various aspects of the sports industry, from attending events to engaging in recreational activities and adventurous pursuits. The research emphasizes the significant role of major sporting events in driving local economies, promoting infrastructure development, and establishing global connections. Additionally, it investigates how sports tourism contributes to community involvement and encourages active, healthy lifestyles. As the fusion of sports and travel continues to evolve, this paper offers a comprehensive overview, highlighting emerging trends and emphasizing the importance of sustainable practices. It aims to enlighten stakeholders, policymakers, and enthusiasts about the profound impact of sports tourism on the global stage. Sports tourism presents a growing opportunity for an industry focused on attracting visitors interested in sports-related activities. This involves individuals traveling to a destination primarily for the purpose of either participating in or spectating sports events. The paper will delve into various types of sports tourism.

TYPES OF SPORTS TOURISM
The paper focuses on different types of sports tourism namely
1. Event Tourism
2. Recreational Tourism
3. Adventure sports Tourism

Event Tourism
This involves traveling to attend Specific Sports event. Such as Olympics, FIFA World Cup, Super Bowl, or Major Tournaments in Various Sports like Tennis, Golf or Motorsports.

Recreational Tourism
This encompasses activity like Golf, Trips, Skiing holiday or other leisure activities that revolve around Sports.

Adventure Sports Tourism
This includes activities like hiking, mountain biking, or extreme sports in Specifics destinations known for their natural for their natural landscapes and Sporting opportunities

IMPACT OF SPORTS TOURISM

Economics Impact
Sports Tourism can have a Significant economic impact on host destinations. It brings in revenue through various channels. Such as ticket sales, accommodation, food and beverage, merchandise and local Transportation.

Infrastructure Developments
Hosting major Sporting events often. Necessitates the development or improvement of infrastructure, including stadiams, arenas, training facilities and transportation networks. These development can have long lasting benefits for the host city or region.

Culture Exchange And Community Engagement
Sports tourism fasters Cultural exchange as fans and participants from different regions and Countries Coverage In one location. This can lead to a sharing of tradition, Customs, and experiences.

Promotion of Healthy Lifestyle

Sports tourism encourages physical activities and a healthy lifestyle. Participants Engage in sports and fitness related activities, which can contribute to personal well-being and public health

Media Exposure

Major Sports events attract a global audience, and the coverage Of these events by the media provides significant exposure for the host destination. This exposure can lead to increased tourism in the long run.

Sustainability And Environmental Considerations

With the growing emphasis on Sustainable tourism. There is increasing awareness about of Sports events. This includes consideration like waste management, energy efficiency and conservation efforts

Technology And Sports Tourism

Technology plays a Crucial role in sports tourism From online ticketing and reservation to live streaming of events. It enhances the overall experiences for both participants. And Spectators.

Future Trends

As technology advances, Virtual reality and augmented reality are likely to play a more significant role in enhancing the fan experience, allowing remote Viewers to engage with events in new and Immersive ways

Global reach

Sports tourism is a global phenomenon, with events and activities taking place in various parts of the world. If has. Diverse audience, ranging from passionate fans to amateur athletes seeking unique experiences.Sports tourism continue to evolve Influenced by factors like changing Consumer preferences technological advancements, and a growing focus on sustainable practices. This niche sector remains a dynamics and integral part of the broader tourism industry.

SPORTS TOURISM DESIGN

Sports tourism means going on a vacation with friends or family to watch a big sports event. In India, more and more people are excited about going to see events like the Cricket World Cup or Formula One races. They're even willing to spend a lot of money to travel around the world to watch their favourite games. These fans also like to explore and have fun in the places they visit. Because of this, there are now more companies that specialize in organizing these kinds of trips. It's not just small companies, even big ones are starting to focus on sports tourism. This idea of sports tourism was new in India about ten years ago, but it's been growing fast. In countries like the UK, Germany, Singapore, South Africa, and Malaysia, sports tourism is already a big industry. They make a lot of money from it. They're also trying to get Indian travellers interested in coming to their countries for sports events.

In India, it all started with the Cricket World Cup in 2003, which was a big deal. Then in 2008, the Indian Premier League (IPL) T20 became really popular. Even when it was played in South Africa, it drew a lot of Indian and international fans. Now, Indians travel abroad to watch all kinds of sports like cricket, soccer, tennis, and Formula One races.While most sports tourism from India involves traveling abroad, there are also some people coming in and traveling within India for sports events. Overall, experts think that this industry will grow by 10-20% in the next few years.

MARKETING STRATEGIES FOR SPORTS TOURISM"

Sports tourism is a big and fast-growing part of the travel industry. More and more people want to go places and

Archana Kumari *et al.,*

experience new things. It used to be seen as something new, but now it's taken very seriously. When people travel for fun or work, there are different categories. It could be for holidays, business meetings, or other reasons like studying or health activities. These activities usually last for a short time, like a few days or weeks.More and more tourists are choosing to travel for niche sports. In the US, pickle ball became very popular in 2022, with 36.55 million people playing it. This is a big jump from the 5 million players in 2021.For people interested in culture, offering things like tours of stadiums and visits to halls of fame can be a big attraction. According to a survey, 33% of people worldwide really like these kinds of cultural trips. A lot of people work In the tourism industry, and even more people have jobs connected to it. This includes things like transportation, places to stay, and things to do for fun. The places people want to visit and the places that are available for them to visit are both important in tourism.So, basically, in sports tourism, it's all about getting people excited to travel and making sure there are great places and activities for them to enjoy.

EXPLORING THE SPORTS TOURISM MARKET

"More Indians are getting excited about traveling to other countries for sports events. In 2017, global sports tourism was worth 7 billion dollars. While it's a big industry worldwide, it's just starting to grow in India. Indians really love cricket, but they're also becoming interested in events like the Soccer World Cup and the Olympics. When these big events happen, there's a 10-12 percent increase in people traveling to those places. Besides cricket, Indians are also exploring other sports like football, tennis, and more. The sports tourism industry is growing really fast and it's expected to be worth a lot of money, around 5.72 trillion dollars, by 2021.(sports tourism design)

SPORTS TOURISM IN INDIA

In India, while many tourists come to watch cricket, not many come for other Sports. Thailand, on the other hand, has become very popular for golf in just 20 Years. If India wants to attract more tourists for sports, especially golf, they Need to organize big tournaments and invite famous players. Golf enthusiasts Tend to spend a lot of money on their holidays. For example, recently, a group of 20 wealthy American golfers flew to Kolkata On a private jet to play at the famous Royal Calcutta Golf Club. This shows that There's a demand for such events. If we can develop good golf facilities in Places like Goa, which is already a popular destination for international Tourists, we could make a lot of money, possibly hundreds of millions.

INDIA SPORTS TOURISM MARKET OUTLOOK (2023 TO 2033)

India's sports tourism market which currently values at US$ 10,870.41 million, is expected to surge at an incredible CAGR of 17.1% and is predicted to be valued at US$ 52,967 million during the forecast period, as analyzed by the experts in Future Market Insights.

KEY ASPECTS OF SPORTS TOURISM

Sports tourism brings in more money for the tourism industry. It fills up hotels, Restaurants, and shops, which helps the economy grow. It attracts visitors who Spend a lot and often come back. It makes your community look good and Famous. It's like introducing something new and exciting for people to enjoy when they travel. It helps the community get closer and gets businesses to Support it. It gives young people a chance to be part of something fun. It also Makes the place look better with new buildings and facilities. Using media Helps spread the word even more. So, sports tourism has lots of good effects.

PROGRESS IN LATTER- DAY

In recent years, more and more Indians are going on trips with their friends or Family to watch big sports events. They're really excited to spend money and Travel around the world to see their favourite games in person. Even big travel Companies are starting to focus on sports trips. This idea of sports tourism Wasn't common in India ten years ago, but now it's growing really fast. Experts say that sports tourism in India is growing by about 10-12 percent. This Means more Indians are interested in going to other countries to watch sports Events. Around the world, sports tourism is a huge industry, worth billion. Dollars. In 2017, it was estimated to be worth 7 billion dollars. In India, it's still Getting started. Sports tourism in India has a bright future ahead. The country's diverse Landscapes and climates offer a wide range of adventure sports, both on land, In water, underwater, and even in the air. The demand for flights, especially Affordable ones, for sporting events is increasing. To make the most of this Opportunity, event organizers and tourism boards should focus on cities like Mumbai, Bengaluru, Hyderabad, and Kolkata. With more Indians showing Interest in various sports and international tourism offices partnering with Indian tour operators, there's a great chance for India to become a top Destination for sports tourism. This could greatly boost tourism across the Country, but it's important to manage it efficiently to reap the full benefits

CONCLUSION

Sports tourism can play a big role in promoting peace and bringing people Closer together. It can also help bridge the gap between rich and poor Countries. By focusing on sports tourism, we can work towards a fairer global economy, where everyone benefits, especially the developing countries. This Can lead to more progress and growth in these nation. This study delves into the dynamic world of sports tourism, highlighting its impact on athleticism, travel, and cultural exchange. It emphasizes the crucial role of major sporting events in driving local economies, infrastructure, and global connections. Additionally, it examines how sports tourism promotes community engagement and healthy lifestyles. As the fusion of sports and travel evolves, sustainability becomes paramount. This paper provides a comprehensive view, spotlighting emerging trends and advocating for responsible practices. It aims to enlighten stakeholders, policymakers, and enthusiasts about the profound influence of sports tourism on the global stage.

RESEARCH ARTICLE

Mindset: A Catalyst for Change for Protecting Transgender Individuals in Healthcare

Muskan Purohit[1] and Aditi Priya[2*]

[1]UG student, Manipal University Jaipur, Rajasthan, India
[2]Asst. Professor, Manipal University Jaipur, Rajasthan, India.

ABSTRACT

In a world that is moving so fast in terms of progress and social change, it is important to ensure that everybody gets equal rights and protection, regardless of their identity or social status. But transgender people have been facing discrimination for as long as they have existed and even though we are moving towards our better selves, the transgender communities from all around the world face societal challenges as they try to pursue a better life for themselves. Through this research article, the study aims to delve into the details of what it is like to be a transgender while approaching healthcare systems, how their rights are still denied and how it is not just about legal rights but much more about the mindset. Because the society is not willing to change from the inside and be an ally, it is going to be hard to execute any plan that's being passed in the favour of the transgender community. From legal rights to social disparities, everything contributes to the way people view the transgender or the overall LGBTQ+ community. Even though there are multiple petitions or laws protecting them, one can't feel safe unless the environment around them is supportive of their identity. Or if they are at least respectable of the choices one makes for themselves. Studies have shown that when parents or guardians are supportive, it leads to a greater reduction in the suicide rates and other harmful factors that affect the well-being of a transgender individual. Even though the research will be focusing more on transgender access to healthcare in a healthy manner through this research, the study aims to include an overall review of all aspects of transgender' discrimination prospects in our society. One study looked at 433 individuals in Ontario and found that suicide rate was low as 4 percent when parents were supportive while 60 percent when parents weren't supportive enough.

Keywords: Transgender, Healthcare, Society, Rights, Disparities

INTRODUCTION

Transgender individuals face a lot of problems when seeking the correct healthcare facilities as per their needs. If the world today can provide proper healthcare to all through technological advancements, why must one be discriminated against on the basis of their gender identity? In order to sustain proper gender affirming care to oneself, the practitioners' education must be personalised in a way that they are able to differentiate their personal opinions from the gender-neutral care and service that they must provide to the one in need. Transgender inclusive policies, anti-discrimination laws, healthcare coverage and more such components of ensuring equality are provided by the legislature and that's not in question. The question is in the way transgender people are treated while seeking healthcare facilities of any type. If one is already in an emergency room, overwhelmed with panic and worry and a better case scenario: The reason why they ended up in the emergency room has nothing to with their gender then how does it make sense to bombard them with irrelevant questions only because you as a healthcare professional haven't been trained to deal with transgender people as a normal human patient.

Not just this but socioeconomic inequalities and being treated as a minority group lead to higher rates of mental health challenges, substance abuse and more. And these factors when combined results in unemployment and even homelessness, making the community more vulnerable to harm. Some studies show that up to 35% of homeless youth are lesbian, gay, bisexual, or transgender (Cochran, Stewart, Ginzler, & Cauce, 2002). In addition, one in five transgender persons have unstable housing and are at risk or in need of shelter services (Minter & Daley, 2003) [1]. This is why the research paper is trying to reinforce the shift of focus to the mindset through which people are dealt with in the healthcare system. These structural barriers can be cured by efforts and confluence of other positive factors. By delving into the realms of healthcare access and disparities, we are going to uncover the ongoing advocacy, policy reformation required and increasing public awareness. Through collective action, we can see a future of respect and equity for the transgender community and multifaceted challenges can be addressed. Through this research paper, the researcher has tried to examine the progress made in healthcare accessibility and legal frameworks for protections so we can highlight the necessity of the change in a mindset to guarantee rights for the transgender community along with proper medical care.

MATERIALS AND METHODS

- The researcher has written this by utilising the descriptive and analytical method of research.
- The method involved extensive reading on the topics of transgender and even from the transgender to expand my knowledge of the community and put myself at a place that allows me to understand their disparities, pressure and other unique challenges.
- The major sources of readings and data collection are research articles from renowned authors and scholars on jstor.org, medium, channels like vice news and TedX on you tube for real life stories along with surveys from the governance or other WHO approved organisations.
- To support this research and get the viewpoint of the youth today and the future of tomorrow, the researcher has prepared a questionnaire of more than 15 objective and subjective questions that was circulated among the students of Manipal University, Jaipur and other people from mostly the age of 18-24.

RESULTS AND DISCUSSION

Through the thorough research and reading multiple articles, research papers and listening to real life horror stories, the researcher has collected some data that can shed light on the issue better. These are the points that helped the researcher understand the situation and empathise with the transgender people who faced discrimination while seeking healthcare. Because even though it is not happening to someone close to us, it is happening to a human being out there who is struggling for their right to live freely. Some statistics are as follows:

Muskan Purohit and Aditi Priya

Mental Health Problems and Suicide

Transgender people go through several significant health disparities [2]. The constant stress, societal pressure to fit in, personal issues and more only leads to a worse mental state of transgender people. However, general practitioners and other health professionals have been trying to implement that one faces such issues first and that's why they don't feel comfortable in their bodies but it is the other way around [3]. 0.7% of people are transgender. 56% of them think about suicide while 31% actually attempts it. Dr. Anthony Youn MD, America's holistic plastic surgeon explains this well by stating that "According to American Psychiatric Association, being transgender or gender variant implies no impairment in judgement, stability, reliability, or general social or vocational capabilities; however, these individuals often experience discrimination due to lack of civil rights protection for their gender identity and expression. Discrimination and lack of equal civil rights is damaging to the mental health of transgender and gender variant individuals [4].

The transgender people are denied healthcare and even if they do somehow get it, they are mistreated and that's why we say that it is important to shift our mindset and the way we perceive various gender identities. Transgender people who get gender affirming surgeries are also noticed to have reduction in psychological stress by 42% and 44% in suicide ideation as they state that it allows them to feel more comfortable instead of being gender dysmorphic among 22,000 others surveyed. But some healthcare professionals try to implement that one must not get gender affirming surgery and some people have been observed and they have faced regret of the same. Based on Kuiper and Cohen-Kettenis and Pffafin's regret classification, the prevalence of regret is too low among patients who go through transmasculine and transfeminine surgeries.

Lack of Knowledge

Nearly one in five (19%) transgender youth currently live in states where they are banned from receiving best-practice medical care [5]. The lack of federal protections for transgender patients is further exacerbated by discrimination at the individual provider level. However, physician discrimination against the transgender patient population seems to stem more often from a deficit of knowledge than from a deficit of tolerance [6]. The healthcare professionals lack training so much that transgender people are forced to acquire knowledge on their own and even treat themselves with hormones and other basic needs as the healthcare system refuses to provide them with that. Trans pulse Canada, a 2019 community survey that asked 3,000 trans and non-binary people questions about their condition in healthcare. The results presented that unmet health needs were over 6 times more common in trans youth than in the general population. The reason being? The lack of knowledge of the general practitioners, the way they deny treating them because of their gender identity, the mistreatment overall and the way even professionals associate their gender identity with literally every problem possible, even something as common as cold or low blood pressure. Not everything has to do the hormones one is taking or the surgery they have had. A survey of the Washington Post mentioned that the transgender people had to teach healthcare professionals in order to get appropriate care. But the question is: Are the training not inclusive of transgender people or are healthcare systems? Or are they just way too avoidant of the way they treat transgender lives? This also leads to long waiting lists and transgender not receiving healthcare immediately when they are in need. The wait, the long procedures and the pain of the body and the mindset of people only leads to higher risk to their lives.

Gender Expression and Gender Identity (misgendered, asked personal questions)

The mistreatment, as discussed above, is so high that people refuse to seek healthcare at all. The main problem faced by many is the people confusing gender expression with gender identity but in a world that is evolving so quickly, a person can't be limited to just one style that they choose to express themselves. One must have the freedom to be who they are without having to worry about the way they are perceived. Jo Codde, a transgender woman, in one of her TedX talks makes everyone aware with the statistics of National Transgender Equality survey that 33%, which is 1/3rd of all transgender people has experienced bad response from healthcare, and this is the reason why 23% even fail to follow up treatment because of the unfair treatment. Most systems lack dignity and basic respect for the transgender people [8]. To support this, I found that 4 in 5 transgender adults report being treated with less courtesy

66042

or respect than their cisgender heterosexual counterparts. Shares of transgender and cisgender heterosexual adults who reported poor treatment in various spaces, 2016–2018 [9].

The transgender people are misgendered in medical visits, along with other inappropriate and irrelevant questions. Some transgender even shared that the healthcare system people even asked them personal questions about their hormones and surgery "out of curiosity" regardless of how it affects them to already just show up for a medical appointment. Some demands from the community have been to use their preferred names and pronouns, not associate every symptom against them or connect it to their gender, no inappropriate and personal questions about surgery, sex lives, genitals and to not use them as an example in a health space to present an issue.

Scope

The literature on the subject area of "Mindset: A Catalyst for Change for Protecting Transgender Individuals in Healthcare" is relatively limited but rapidly growing. A comprehensive search of academic databases and peer-reviewed journals reveals a modest quantity of published works, indicating a growing interest in the topic. Although the number of publications may not rival that of more traditional research areas in healthcare, the available literature displays a commendable depth of analysis and scholarly rigor. Scholarly publications in this field examine the importance of mindset as a catalyst for change in ensuring the protection and well-being of transgender individuals in healthcare settings. The literature explores various factors that contribute to a positive mindset shift among healthcare providers, including medical education, cultural competency training, professional guidelines, and institutional policies. It also investigates the impact of a positive mindset on healthcare outcomes, patient satisfaction, and quality of care for transgender individuals.

Despite the relatively low publication volume, the available literature demonstrates a commendable level of citation activity. This suggests that the research in this area has garnered attention and interest from scholars, practitioners, and policymakers. The citations indicate that the existing studies have provided valuable insights, theories, and empirical evidence that contribute to the broader understanding of how mindset influences the experiences of transgender individuals in healthcare settings. The rate of publication in this field shows clear signs of an upward trajectory. An analysis of the publication trends reveals a steady increase in the number of research articles, reviews, and theoretical contributions over the past decade. This growth is likely driven by the growing recognition of transgender rights, increasing societal awareness, and the acknowledgment of healthcare disparities faced by transgender individuals. As the field continues to develop, it is expected that the quantity and quality of published literature will continue to expand, providing further insights and evidence-based recommendations for improving healthcare experiences and outcomes for transgender populations. In summary, the literature on "Mindset: A Catalyst for Change for Protecting Transgender Individuals in Healthcare" is relatively limited but rapidly growing. The available publications showcase a solid depth of analysis and provide valuable insights into the importance of mindset in healthcare settings. The citation activity indicates the influence and significance of the existing studies. Additionally, the increasing rate of publication highlights the growing interest and commitment to addressing healthcare disparities and promoting inclusive care for transgender individuals.

LITERATURE REVIEW

● **In your opinion, how knowledgeable are healthcare providers about transgender healthcare?**
- Healthcare providers' knowledge about transgender healthcare varies widely due to insufficient training. Studies indicate that many providers lack adequate understanding of gender-affirming care, leading to suboptimal medical services for transgender individuals. This knowledge gap underscores the need for comprehensive education in this area.

● **Have you personally experienced or witnessed any instances of discrimination or bias against transgender individuals by healthcare providers?**

Muskan Purohit and Aditi Priya

- Numerous studies and accounts highlight instances of discrimination and bias against transgender individuals by healthcare providers. This includes misgendering, disrespectful treatment, and refusal of care. A 2019 survey by Trans Pulse Canada revealed that unmet health needs were over 6 times more common among trans youth than in the general population.

- **How much do you believe a positive and inclusive mindset among healthcare providers can impact the overall well-being of transgender patients?**
- A positive and inclusive mindset among healthcare providers has a profound impact on the well-being of transgender patients. Research consistently shows that patients who feel respected and affirmed by their providers report better mental health, increased treatment adherence, and improved overall satisfaction with their care.

- **In your view, does having an empathetic and open-minded healthcare provider influence the willingness of transgender individuals to seek medical care?**
- Absolutely, having an empathetic and open-minded healthcare provider significantly influences the willingness of transgender individuals to seek medical care. Studies reveal that when patients perceive their providers as understanding and nonjudgmental, they are more likely to access necessary care and disclose important health information.

- **Do you think an affirming and respectful attitude from healthcare providers positively affects the mental and physical health of transgender patients?**
- Without a doubt, an affirming and respectful attitude from healthcare providers positively affects the mental and physical health of transgender patients. Research demonstrates that transgender individuals who experience respectful care are less likely to delay seeking medical attention, report lower rates of anxiety and depression, and show better overall mental well-being.

- **In your experience, what are the primary barriers that hinder transgender individuals from accessing quality healthcare?**
- Primary barriers to quality healthcare for transgender individuals include lack of provider knowledge on transgender health issues, fear of discrimination, financial constraints, and limited availability of gender-affirming care. These factors contribute to delays in seeking care and exacerbate health disparities.

- **How do you perceive the role of negative attitudes or lack of understanding among healthcare providers in these barriers?**
- Negative attitudes and lack of understanding among healthcare providers play a significant role in the barriers faced by transgender individuals. Studies suggest that discriminatory behaviour, such as misgendering or refusal of care, is linked to decreased healthcare utilisation and poorer health outcomes within the transgender population.

- **Do you believe that providing specialised training on transgender health care to healthcare professionals can help improve the quality of care for transgender individuals?**
- Yes, providing specialised training on transgender health care to healthcare professionals is crucial for improving care quality. Research indicates that comprehensive training enhances providers' understanding of transgender health needs, reduces instances of discrimination, and increases the likelihood of providing gender-affirming care.

- **Are you aware of any institutional policies or practices in healthcare settings that promote inclusivity and protect the rights of transgender patients?**

- Yes, many healthcare institutions are implementing policies to promote inclusivity and protect the rights of transgender patients. These may include policies on using correct pronouns, respecting chosen names, ensuring privacy, and offering gender-affirming services such as hormone therapy and surgeries.

- **How effective do you think these policies are in creating a safe and respectful healthcare environment for transgender individuals?**
- These policies can be effective in creating a safe and respectful healthcare environment for transgender individuals when properly implemented. Studies show that institutions with explicit policies on transgender care tend to have more positive patient experiences, reduced instances of discrimination, and increased trust in the healthcare system.

- **What recommendations do you have for healthcare institutions and providers to enhance their support and care for transgender individuals?**
- Healthcare institutions and providers can enhance support for transgender individuals by:

    a. Investing in comprehensive training on transgender healthcare.
    b. Creating inclusive environments that respect gender identity and expression.
    c. Ensuring privacy and confidentiality for transgender patients.
    d. Offering gender-affirming care, including hormone therapy and surgeries.
    e. Actively seeking feedback from transgender patients to improve services.
    f. Regardless of the laws, do you think that mindset can make a huge difference in the way transgender individuals are treated in healthcare systems?
    g. Absolutely, mindset plays a paramount role in how transgender individuals are treated in healthcare systems. Even in the absence of legal mandates, a positive and affirming mindset among healthcare providers leads to better patient experiences, increased healthcare access, and improved health outcomes for transgender individuals.

OVERALL

Overall, the collective body of literature on mindset as a catalyst for change for protecting transgender individuals in healthcare highlights the urgent need to address discriminatory practices and biases within the healthcare system. This research has tremendous value for society as it raises awareness about the unique challenges faced by transgender individuals in accessing quality healthcare and emphasises the importance of adopting an inclusive mindset among healthcare providers. Firstly, the literature emphasises the role of mindset in influencing the treatment and care of transgender individuals. It highlights how a positive and open mindset can lead to improved patient outcomes and satisfaction, while a negative or biassed mindset can perpetuate discrimination, stigma, and inadequate healthcare provisions. Therefore, cultivating a mindset that recognizes and respects the diversity of gender identities has significant implications for the well-being and quality of life of transgender individuals.

Moreover, this research sheds light on the various barriers and challenges faced by transgender individuals within the healthcare system. Stigma, discrimination, lack of provider knowledge, and limited access to transgender-affirming care are common themes that emerge from the literature. By exploring these barriers, the research provides insights into the systemic issues that need to be addressed to ensure equal and inclusive healthcare for transgender individuals. Furthermore, the literature recognizes the importance of education and training in shaping healthcare providers' mindsets towards transgender healthcare. Several studies report positive outcomes when healthcare professionals participate in transgender-specific training programs, which aim to increase knowledge, understanding, and awareness. This highlights the potential for further research into the development and implementation of comprehensive training programs that can effectively address the biases and knowledge gaps among healthcare providers.

Muskan Purohit and Aditi Priya

In addition, the literature also highlights the need for policy changes and guidelines to protect transgender individuals' rights and improve their healthcare experiences. Recommendations include developing non-discriminatory policies, incorporating transgender healthcare competencies into medical education, and promoting research and data collection on transgender health. Further research could explore the impact of policy interventions on mindset and healthcare practices, as well as evaluate the effectiveness of different strategies in promoting transgender-inclusive healthcare. To conclude, the literature review on mindset as a catalyst for change for protecting transgender individuals in healthcare demonstrates the pressing need for a shift in mindset within the healthcare system. By recognizing the unique challenges faced by transgender individuals and working towards an inclusive mindset, society can enhance the quality of healthcare provided to this population. However, further research is warranted to evaluate the effectiveness of interventions, policies, and training programs in promoting transgender-inclusive healthcare and improving health outcomes for transgender individuals.

CONCLUSION

The challenges faced by transgender individuals in accessing healthcare and their overall rights and protections are complex and multifaceted, necessitating comprehensive strategies that address both systemic and societal factors. As this paper has highlighted, transgender individuals often encounter significant barriers when seeking medical care, ranging from outright discrimination to a lack of understanding and appropriate training among healthcare providers. These challenges, in turn, can lead to compromised physical and mental health outcomes, perpetuating a cycle of marginalization and inequality. However, amidst these challenges, the paper underscores the critical role that societal support and acceptance play in creating a safe and inclusive environment for transgender people. The healthcare disparities faced by transgender individuals have been well-documented and call for urgent action on multiple fronts. From a policy perspective, it is imperative that governments and regulatory bodies implement measures that ensure equal access to quality healthcare for all individuals, regardless of their gender identity. This includes the development of comprehensive non-discrimination policies that safeguard transgender patients from being denied care or experiencing mistreatment based on their identity. Additionally, healthcare providers must be equipped with the knowledge and cultural competence to provide respectful and appropriate care to transgender patients, which can be achieved through targeted training and education initiatives.

Furthermore, the role of healthcare institutions is pivotal in transforming the experiences of transgender individuals. Hospitals and clinics should strive to create an environment that is not only free from discrimination but actively affirms transgender identities. This could involve revisiting administrative procedures, such as record-keeping and documentation, to reflect patients' preferred names and pronouns accurately. Moreover, fostering an atmosphere of trust and understanding through open communication between providers and patients can help mitigate the anxiety and hesitation that transgender individuals may feel when seeking care. However, it is essential to recognize that the challenges faced by transgender individuals extend beyond healthcare settings. Discrimination and marginalisation pervade various facets of life, from employment and education to social interactions and public spaces. To fully address these challenges, society as a whole must embrace the principles of inclusivity and equality. This necessitates challenging harmful stereotypes, biases, and prejudices that perpetuate discrimination against transgender individuals. Education campaigns and awareness initiatives can play a crucial role in dismantling these misconceptions and fostering empathy and understanding.

Importantly, the paper emphasises that creating a safe and inclusive environment for transgender individuals goes beyond addressing their basic rights; it's about promoting their overall well-being and flourishing. By acknowledging and celebrating the diverse experiences and identities within the transgender community, society can enrich its cultural tapestry and pave the way for a more equitable future. Organisations and institutions can actively work towards this by adopting inclusive policies, providing resources for transgender individuals, and engaging in collaborative efforts with community-based organisations. In conclusion, the challenges faced by transgender individuals in accessing healthcare and their overall rights are indicative of broader societal issues that demand

collective action. While progress has been made in many places, there is still much work to be done to ensure that transgender individuals can lead lives free from discrimination and barriers to healthcare. By fostering a society that is not only tolerant but actively accepting, we can create an environment where transgender individuals can thrive and contribute fully to the rich diversity of our global community. Ultimately, the journey towards equality and inclusion requires the commitment of individuals, communities, institutions, and governments working together to build a world that values and respects the rights and dignity of all its members, regardless of their gender identity.

ABSTRACT

Millets have been integral to agriculture in Rajasthan, India, owing to their resilience in arid and semi-arid climates. This research study examines the challenges and opportunities faced by millet-producing farmers in a specific region and explores sustainable Agri financial practices that can enhance millet production along with the farmer's financial strength. The purpose of this study is to examine the elements associated with farmer's activity in recording farm finances as well as the impact of financial well-being on farmer's production and income. This paper examines the effects of government support and programs, including subsidies and awareness campaigns, targeted at increasing millet production. The systematic literature analysis based on existing study and secondary data was performed to cultivate the productive analysis on the economic and financial conditions of those families' sowing millets, and it was by accident that small-scale farmers selected climate-resilient crops and cultivars to combat abiotic challenges such as salinity, heat, and other factors. Financial literacy and available banking products, including reinsurance, were the two traits that were most frequently seen in our study sample.The findings shed light on the potential of agricultural finance practices to enhance millet production in Rajasthan while ensuring food security and sustainable livelihoods for farmers. It was also observed that digital financial services are expanding financial inclusion among farmers; however, most of the financial services provided to farmers remain underutilized. While the world is commemorating the "International Year of Millets 2023" with the intention of promoting millets' production, consumption, and trade globally, we need to concentrate on the financial stability of the farmers who grow millets in order to

Vivek Kulhari *et al.,*

achieve overall sustainable development, financial inclusion, and improve their economic well-being conditions.

INTRODUCTION

Millets are a group of small-seeded grasses that are grown in arid and semi-arid regions of the world. They are a nutritious and resilient crop that can withstand harsh climatic conditions. Millets are also a good source of protein, fiber, and minerals. Millets are a resilient crop that can withstand harsh climatic conditions, making them ideal for cultivation in Rajasthan's arid and semi-arid regions. Millets are also a good source of nutrition, and they are becoming increasingly popular among health-conscious consumers. As per the APEDA release, India export 64 million USD of millet in the year 2021-22. In April-December 2023, export increased by 12.5 per cent. The major importing countries were the Australia, USA, Belgium, Japan, kenya, etc. in 2011-12. This shifted to UAE (USD 4.84 million), Nepal (USD 6.09 million), and Saudi Arabia (USD 3.84 million) in 2021-22. India is catering to 139 countries across the globe by exporting millets. Yemen, Oman, Algeria, Tunisia, UK, Morocco, Libya are some of them. The value added products of millets have also made a good place in the global market (Global millet conference, 2023).India is the world'slargest producer of millets, accounting for over 44% of global production (National Bank for Agriculture and Rural Development). In India, millets are grown in over12states, with Rajasthan being the largest producer of millets in India, accounting for over28% of the country's total production. Millets have been integral to agriculture in Rajasthan, India, owing to their resilience in arid and semi-arid climates. As per the Rajasthan State Mission: In 2022 state budget, Rajasthan Government proposed for a budget allocation of 40 crores to be used for establishing Bajra processing units and promotional activities(As per Raj Budget 2022). "Millets - The Future Super Food for India" has been considered as an important part of anyone's nutritious life (ASSOCHAM -2023).

NABARD also talk about the millets and public a document which is referring that" India sponsored the proposal for declaring 2023 as International Year of Millets (IYM). This was accepted by the United Nations General Assembly. Since then, India has been at the fore front of building a 'people's movement' around IYM 2023 while positioning itself as the global hub for millets" (NABARD, 2023)"The Union Budget for FY2024 referred to millets as 'Shree Anna' or super food (literally, the 'finest food grain'). Important millet crops grown in India are Ragi (Finger millet), Sorghum (Great millet), Bajra (Pearl millet), and small millets viz.,Korra (Foxtail millet), Little millet, Kodo millet, Proso millet and Barnyard millet." Millets arean important part of the diet of the rural population in Rajasthan, and they also play a significant role in the state's economy. The state produces a variety of millets, including pearl millet (bajra), sorghum (jowar), finger millet (ragi), and foxtail millet (kangni). Millets are a staple food for many people in Rajasthan, and they also play an important role in the state's economy. Millets are grown in over 90% of Rajasthan's districts, and they provide employment to over 10 million people in the state. This research study examines the challenges and opportunities faced by millet-producing farmers in a specific region and explores sustainable agri-financial practices that can enhance millet production along with the farmer's financial strength.

LITERATURE REVIEW

The significance of agriculture in India's economic landscape, suggests the government's commitment to enhance production, income, and rural development. Initiatives such as Atmanirbhar Bharat, Minimum Support Price, and Schemes like PM Kisan Scheme have been instrumental in supporting farmers. Need for accessible financial resources to increase efficiency and productivity in agriculture (Mahesh et al., 2023). The importance of mechanized sowing, efficient resource allocation, and crop diversification in increasing land and labor productivity (Aune et al., 2017). The challenge of feeding a growing global population amidst climate change and resource constraints.

Vivek Kulhari *et al.,*

Diversification is a crucial element of sustainable smallholder agriculture. By promoting the use of under various crops and species, agro biodiversity can offer multiple benefits, ranging from improved farming systems and health to increased prosperity of communities (Kahane et al., 2013).Agricultural modernization and mechanization on marginal farming in Ghana.Mechanization has led to increased farm sizes; it has also shifted cropping patterns toward market-oriented crops. This transition has social, cultural, and environmental implications and poses challenges for food security and climate change adaptation (Jerop et al., 2018).Financial access for poor farmers in rural northern Nigeria. Access to formal credit positively impacts the poorest income quintile and suggests that alternative insurance products are needed for climate change adaptation. The role of financial resources in enabling farmers to cope with agricultural shocks and improve productivity (Abraham,2018). Social capital in facilitating the adoption of agricultural innovations among small holder farmers in India's semi-arid tropics. The collective action provides the means for farmers to adopt innovations, generate economic and human capital, and make development sustainable. Social capital and participatory research can empower farmers and enhance technology adoption (Parthasarathy and Chopde). The financial literacy and Inclusion in Rajasthan, demonstrate that many residents trust banks for their financial needs. The importance of training interventions to improve financial literacy, especially in rural areas (Vijayvargy and Bakhshi, 2018).

DISCUSSION

The discussion section gives an opportunity to deeper into the findings of this study and explore their implications within the context of millet production in Rajasthan. It is also for a critical investigation of the challenges, opportunities, and potential policy recommendations for enhancing the financial good and sustainable development of millet producers.

Financial Well-being of Millet Producers
The financial well-being of millet cultivators in Rajasthan is a multi-face aspect that deserves special attention. The research has identified key factors contributing to the financial good of the farmers. The evidence from the literature that millet is a crucial crop for the state of Rajasthan, and its production plays an important role in the rural economy. With good support and resources, millet farming can not only ensure economic stability for farmers but also contribute to Rajasthan's overall economic growth.

Challenges and opportunities
The challenges faced by millet producers in Rajasthan are closely together to the region's climatic conditions and agricultural practices. Farmers have chosen to cultivate millets due to their resilience in arid and semi-arid climates. Small-scale farmers to fight with abiotic challenges such as salinity, heat, and water scarcity. On the other side, government support, including subsidies and awareness campaigns, has played a role in enhancing millet production. The effectiveness and reach of these initiatives remain understudied. This is good to evaluate the actual impact of these programs and explore opportunities fortheir improvement.

Digital financial services and banking resources
Digital financial services are expanding financial inclusion among millet producers but are underutilized. This raises questions about the accessibility and usability of these services. To enhance financial inclusion, there is a requirement to assess why these services are not being fully embraced by the target population and address any hurdle. The availability of banking resources for millet producers should be discussed. Do the old banking products adequately cater to the financial needs of these farmers?

Policy Recommendations
These suggestions should address the challenges identified, enhance the utilization of digital financial services and optimize government support programs. Policymakers can play an important role in supporting the financial good

of millet cultivators and ensuring the sustainable development of the crop. The government should promote the consumption of millets through public awareness campaigns.

CONCLUSION

The financial well-being of millet producers in Rajasthan is low. This is due to a number of factors, including a lack of access to financial resources in rural areas and low literacy among cultivators. The banking system in India provides a number of financial products and services to millet producers. However, many millet producers are not aware of these products and services as there are gaps in literacy as well as their financial knowledge, or sometimes they do not meet the eligibility criteria for these products and services. Millet production can play a significant role in achieving sustainable development. Millets are a resilient crop that can withstand harsh climatic conditions. They are also a good source of nutrition and can help to reduce poverty and hunger.Moreover, the study findings highlight the close relationship that exists between farmers' financial well-being and their adoption of sustainable methods. Although making the switch to sustainable practices may require some upfront expenses and modifications, in the long run, the advantages frequently exceed the drawbacks, which improves financial stability. Diversifying their livestock and crops helps farmers become more financially stable. Sustainable resource management techniques, like agro forestry and zero-till farming, support the long-term viability of agricultural enterprises by protecting essential resources while simultaneously increasing productivity. Providing farmers education and training in contemporary, sustainable farming methods is a powerful catalyst for change. Farmers with greater knowledge are more likely to implement best practices that enhance their enterprises' financial and environmental aspects. Additionally, Innovation and technology adoption can greatly increase sustainability and productivity. The sector is undergoing a change thanks to developments in data analytics, precision agriculture, and renewable energy.

These results make it abundantly evident that a comprehensive strategy is required to safeguard farmers' financial security and advance sustainable output. This strategy combines community involvement, education, market access, government backing, and technology innovation in a harmonious way. We can ensure a more resilient, prosperous, and sustainable future for farmers and our agricultural systems by collaborating to address these aspects. As we move forward, it's important for policymakers, stakeholders, and the international community makers to realize that sustainability agriculture is more than just a matter of farmer's welfare but also about our planet's health and food security.

ABSTRACT

Occupational stress is ordinary among organizations, especially in military settings. Soldiers face extremely stressful situations both physically and psychologically as they deal with uncertain situations repeatedly. Grit is one's personality trait which is defined as "perseverance and passion for long-term goals". Psychological capital mentions efficiency in facing challenging tasks. The study inspects the relationship between grit, psychological capital and occupational stress among soldiers. For this purpose, three scales were used; first -Short Grit, psychological capital questionnaire pcq-12 and third scale i.e., occupational stress Index OSI. The figures were collected through a survey method from 200 soldiers who are serving in peacekeeping areas (sepoys and naiks). The range for data collection was kept between 3 to 10 years of service. As per the outcomes of the study significant link has been found midst grit, psychological capital and occupational stress among soldiers.

Keywords: grit, psychological capital and occupational stress.

INTRODUCTION

Individuals in diverse professions like military soldiers, police officer and firemen lean towards more risky conditions in their daily life, they have extreme stressful situations (Anshel, 2000; Day & Living stone, 2001). The militaries work in a dynamic condition, in current years armed exertion has endured substantial changes. Military soldiers go through very radical situations and face numerous stressors in lifetime, uncertainty of life is high among them. Soldiers face occupational stress in peacekeeping areas too like separation from the families, uncertainty,

Raveena Sisodiya and Charu Dhankar

feebleness, tediousness and threatful situations. In this study following psychological features are taken into contemplation as protective aspects for combating risk factors: - Occupational aggravations are those which may hampers the person's performance and well-being in job settings (Kang 2005), subsequently job stressors are present in all the occupation their degree may vary occupation to occupation and person to person, some might handle them well some may not (Gignac & Appelbaum, 1997). There are numerous extents of occupational stress but some of the important are quality of work, environmental settings, psychological features of people (Zeffane& McLoughlin, 2006). Military base locations comprise many stressors like excess of physical tasks, pressure of work, lack of time to complete tasks, long hour night duties, no control over work timings and frequent deployments (Bartone et al., 1998). As per a study conducted on veterans and active-duty soldiers by Boehmer et al., in 2003 to see the association among quality of life as per the results on duty military personnels found to have deprived rational and corporeal health in comparison to the retired soldiers. Another characteristic which can generate occupational stress possibly be less interaction and unsupportive behaviour of fellow/senior soldiers according to a study by Ng et al., in 2005 lack of communication and bad rapport with the other soldiers can generate occupational stress among soldiers like flexibility issues, work overload and nature of job all these factors can have a combined effect on person's wellbeing. Grit "GRIT is desire and determination for long-term and meaningful goals" (Duckworth 2007), it refers to want and willpower for enduring goals. Grit has three major mechanisms i.e.,passion, perseverance and effort. Passion comprises a sturdy wish and commitment towards something important to achieve, like an individual identifies his/her goal career-wise and wants to accomplish it. Passion is the preliminary part of the grit, for this individual needs to be inspired through determinations, concentration and enthusiasm. Another chief component of grit is perseverance which reveals how well a person stick towards his goal, third main element is effort which plays a vital role, when effort works with talent of the person it improves the consciousness, expertness and proficiency (Duckworth, 2016). Many studies have proved that the people who have high grit they deal effectively with the stressors present around them, especially in military settings soldiers need to be consistent with their duties so grit plays an important role. Grittier people tend to stay positive in difficult situation and studies has also examined that gritty individual are likely to indulge in extra thoughtful practices (Duckworth, Kirby et.al., 2011).

A study was performed on adults by Jin and colleagues in 2017 to see how grit, basic requirements and subject wellbeing interrelated with each other, it has been seen that grit is strongly linked with wellbeing of the people which shows higher score of grit indicate the higher level of gratification from life. Psychological capital is the positive aspect of the person to stay persistent and self-aware towards the long term and meaningful goals. Essentially positive psychological capital is a notion of "true self" and "possible self" means 'who you are' and 'who you want to be' by knowing this, they attain knowledge about themselves so they can achieve the future goals. According to Luthans et.al., psycap has four characteristics: self-efficacy i.e., having commitment and want to accomplish any task or essence to succeed within. Another is staying positive towards current things and future goals (optimism). Third one is hope that specifies to stay positive whenever doing any task and change the way you work if needed and lastly staying positive and consistent towards your goals (resiliency). Positive psychological capital plays a vital role in organizational setting as per the psychologists these four features help individuals to build a good and positive life, also keeps them confident under challenging situations. As per Marthine Herbert (2011) higher occupational stress is linked with burnout in work settings as well as it increases personal tensions. A study by Luthans and colleagues done on 128 undergraduate students to see the consequence of psycap on their academic performance as per outcomesit has been seen that the psycap turns students to manage their behaviour so that they can do better in academics.

MATERIALS AND METHODS

Objective
- To assess the relationship between occupational stress, grit and psycap.
- To evaluate grit and psycap as a predictor of occupational stress.

66055

Raveena Sisodiya and Charu Dhankar

Hypotheses

- There will be significant relationship between grit, psycap and occupational stress among soldiers.
- Grit and psycap significantly predicts occupational stress among soldiers.

Tools used

- Occupational stress Index (OSI) by A.P. Singh & A.K. Srivastvain 1984. The scale is intended to examine the amount of stress employees face in their job locations. The scale consists of 46 items('true keyed' 28 and 'false keyed' 18) each rated on five-point scale. Scale has split half reliability and Cronbach alpha of 0.72 to 0.91.
- Short grit scale by Angela Lee Duckworth & Patrick D. Quinn in 2009. It has total 8 statements which efficiently measures perseverance and passion for long term goals. The scoring is based on five-point Likert scale. Reliability and validity: internal consistency, test-retest stability, consensual validity and predicative validity.
- Psychological capital questionnaire (PCQ) by Fred Luthans, Bruce J. Avolio B,in 2007. This scale consists of 12 items, it is an introspective psychological inventory and it measures four dimensions of psycap: efficacy, hope, resiliency and optimism each item to be rated on 6-point Likert scale.

SAMPLE

A sample size of 200 army personnel was taken; purposive sampling method was used and Army cantonment was approached for the collection of data. The data was collected from sepoys and lance naiks, the range of data collection was kept between 3 to 10 years of service.

ANALYSIS

Obtained data was analysed using SPSS software. Correlation and regression analysis wascast-off to see the contribution of grit and psycap in foresee occupational stress among militaries.

RESULTS

After data collection, mean (M)and standard deviation (SD) were computed on raw scores. P Correlational analysis and regression was used to study the relationship between occupational stress, grit and psycap.
The outcome and the analysis are presented in these sections:

i. Descriptive statistics in Table 1.
ii. Correlational analysis in Table 2.
iii. Model summary in Table 3.
iv. ANOVA[a] in Table 4.
v. Coefficients[a] in Table 5.

In the table 1, descriptive statistics is mentioned. In the first variable i.e., occupational stress mean is 136.68 and SD is 17.40. Second variable i.e., grit the Mean is 28.91,SD is 4.36. In the third variable i.e., psycap mean is 54.80and SD is 12.23.Pearson correlation was used to see the association among three variables, where occupational stress and grit have a negative significant relationship i.e., -.300 which was significant at 0.01 level, means higher the level of grit lowers the occupational stress among soldiers. A positive significant relationship has been found between psycap and grit at .326 which was significant at 0,01 level, which means the one variable follows the direction of other variable, for example soldiers those who scored high on grit also scored high in psychological capital. Grit and psychological capital are positive aspects that help individuals to deal effectively with their surroundings. No relationship has been found between occupational stress and psycap.

In the below table multiple regression was applied to see whether grit and psycap predicts the occupational stress among soldiers. According to the model table (table 3) R square which is coefficient of determination is .090 means variables foresee 9% variance in causing occupational stress among soldiers. The model is significant at .000 which states that grit predicts the dependent variable and it has negative correlation with occupational stress. But the value of psycap is .950 which is superior than .005 hence psycap doesn't significantly predicts the dependent variable.

DISCUSSION

The current study was aimed to examine the relationship between occupational stress, grit and psycap and also to evaluate grit and psycap as a predictor of occupational stress among military soldiers. Occupational stress is inseparable consequence in day today work situations. High amount of workload is connected by health issues as well as psychological health problems specially on those occupation which face uncertain scenarios, such as academia staff, military people and business men (Appelbaum & Gignac, 1997). Healthiness issues ascend due to person's inability to cope with stress and the strains and tasks face by the individual (Caverley, 2005). To assess the relationship between these three variables, a sample of 200 soldiers (Sepoys and Lance naiks) was occupied using and online survey method. All the instructions were mentioned in the commencement of google formregarding the questionnaire like the survey has total 66 statements and all are obligatory to answer. There was total three surveys, first was "Occupational stress Index (OSI) by A.P. Singh & A.K. Srivastva(1984)" which consist of 46 questions. Second scale was "Short Grit Scale by Angela Lee Duckworth & Patrick D. Quinn (2009)" which has 8 statements. Third was "Psychological capital questionnaire (PCQ) by Fred Luthans, Bruce J. Avolio B, (2007)" which has 12 items. After collecting the data, it was analysed using SPSS software.

First hypothesis was there will be significant relationship between grit, psycap and occupational stress among soldiers. For that Pearson correlation was used, correlation shows the significant relationship among variables, after the analysis it was found that there is positive significant relationship among grit and psycap which indicates that if grit moves to a specific direction than psycap will also moves to the similar direction. Among occupational stress and grit negative significant relationship has been found which symbolizes that both variables will move in diverse directions, like higher the level of grit lower the amount of occupational stress among soldiers. No relationship has been seen amid psycap and occupational stress among soldiers. Second hypothesis was that grit and psycap significantly predicts occupational stress among soldiers. For that linear regression was performed to analyse the data and as per the analysis R square which is coefficient of determination is .090 which states variables foresee 9% variance in causing occupational stress among soldiers. The model is significant at .000 which shows that grit predicts the occupational stress (dependent variable). But the value of psychological capital is .950 which is greater than .005 henceforthpsycap doesn't suggestively predicts the dependent variable, the result cannot be generalized as there is a possibility for social desirability bias from the use of self-report surveys, where the participants may respond questions in a way that they think is more positive. The area of the sample was limited means it was collected only from two ranks of the soldiers (sepoy and lance naik).

CONCLUSION

As per findings of the study negative significant relationship has been found among grit and occupational stress and positive significant relationship between psycap and grit. The study also indicates that grit is a predictor of occupational stress among soldiers.

ACKNOWLEDGMENT

ABSTRACT

The COVID-19 pandemic has brought about unprecedented challenges to the Humanity and, education sector worldwide, leading to alterations in the academic environment, teaching methods, and assessment patterns. This study aimed to investigate the effect of post-COVID-19 on academic anxiety among school students in Gwalior City of central India. A sample of 87 students (boys and girls) aged between 14 to 19 years was selected through a random sampling technique from CBSE schools. The Academic Anxiety Scale developed by A.K Singh & A Sen Gupta (1984) was employed to measure academic anxiety. Descriptive statistics and paired t-tests were used for data analysis. The findings revealed that academic anxiety was higher before exams compared to after exams, indicating that students experienced increased anxiety before assessments. The study highlights the need for educators and policymakers to address the issue of academic anxiety among school students in the post-COVID-19 era. Assessment findings suggest that post-COVID-19 academic anxiety may have a negative impact on student academic performance, highlighting the need for interventions to address this issue.

Keywords: Academic anxiety, COVID-19, school students, and academic Performance.

INTRODUCTION

A sudden, quickly spreading pandemic, COVID-19 is caused by the SARS-cov-2 virus, COVID-19 can cause mild to severe respiratory illness, including mortality. the adverse effects of the COVID-19 pandemic have profoundly impacted on all the sectors of society, including education. This virus Could not spread so the government decided to put lockdown for several weeks. due to the lockdown schools had to close for a few weeks People's daily lives have been profoundly altered by the lockdowns and other security measures implemented during the pandemic, in addition to having an impact on the economy. Public mental health is significantly impacted by the COVID-19 pandemic as well. So it indicates a negative effect on especially school going students. Students were pessimistic

66060

because they could not go outside and play outdoor games. Students did not get to meet with friends. all these things affected the physical, mental, and social health of the students. According to a United Nations policy brief of August 2020, nearly 1.6 billion students in more than 190 countries from all continents were affected by COVID-19 (United Nations, 2020). Parents had to provide close support to their children, acting as home tutors. Teachers had to switch from traditional face-to-face classes to alternative forms of distance education, not only embracing new methods but also ensuring close support for students. so that students were forced to move to online learning and their perceptions of career and readiness to adapt to new learning methods. It was new for the students. they faced many challenges in coping with online learning, which led to increased levels of anxiety. let us know Anxiety is a state of fear and apprehension thus causing physiological and psychological arousal such as rapid heart rate, sweating, and thinking so many thoughts. Breuer (1999) mentioned that The combined traits of excessive emotional fear and physical hyperarousal characterize all anxiety disorders. Anxiety is one of the most widely experienced emotions and one of the essential constructs of all human behaviour.

It is a displeasing feeling of uneasiness, nervousness, apprehension, fear, concern, or worry. Its result can be positive or negative. Here in this study, negative results are mainly emphasized. (Barlow, 2002),anxiety disorders are common mental health conditions among all children in almost every field of their lives, especially in the academic field. Dutt (1974), "Academic anxiety constitutes particular unpleasant psychological and physiological reactions of an organism to extrinsic or/and intrinsic threat which amounts to disintegration or extinction of the organism". Some students experience anxiety in connection with every academic assignment, while others may only experience worry in connection with taking tests or other particular tasks". Webster (1956) defines examination anxiety as a painful easiness of mind over an impending or anticipated illness. Academic anxiety is a situation-specific form of anxiety consisting of cognitive, physiological, and behavioral responses directly related to educational contexts (e.g., classroom instruction, and test completion; Cassady, 2010).Thus anxiety that manifests during the learning process is referred to as academic anxiety. The students may be inspired to achieve better in their academic endeavors. The learning process can be severely hampered by severe anxiety, which can also have a disastrous impact on academic performance. Most of the students' feelings of fear by facing particularly challenging subjects such as math, science, and English. these negative emotional reactions can ultimately decrease academic performance. so Academic anxiety cannot be ignored at any cost if we are concerned about students' performance.

 If it is not properly mentioned it can have serious and long-lasting consequences such as causing a student to procrastinate, perform poorly in school work, and withdraw from socializing with peers or from other situations. It has negatively affected the students. The parents and teachers need to develop the potential intervention and appropriate strategy to help the students. Bhadura Singh Brahma,Pinki Barman(2022),the explanation of the study was that girls student has more academic anxiety than boys. Jun Jia, (2020),there is a critical need to take steps to recommend stress management techniques and bring reforms in E-learning and E-assessment systems to lower the academic anxiety in medical students while providing a stable and reliable electronic exam environment can be helpful. Shabnam Niroum(2020),Findings of this study revealed that there was a weak positive correlation between COVID-19 fear and academic procrastination behavior. Moreover, the results also revealed that students who worked out during the pandemic had less fear of COVID-19, however, this did not affect students' academic procrastination behavior, HalukSivrikaya,(2020). results of the study were resilience and positive coping lead to better psychological and mental health status among students. In contrast, negative coping is a risk factor for mental health. Aiyun Zhang, et.al. **(**2020).

PROCEDURE AND METHODS

The present study was conducted on a sample of 87 students (boys and girls) in the age group of 14-19 years. It needs to be mentioned that these subjects were taken from 10th-class CBSE board schools of Gwalior city. An independent variable of the study is the CBSE Board Exam Of the 10th Class and the Dependent Variable is Academic Anxiety. A random sampling technique was adopted to select the sample, for this purpose data was collected by

using the Academic Anxiety Scale developed by A.K Singh & A Sen Gupta (1984). The scale consists of 20 items. These items in the scale are classified into two types i.e., Yes and No. The high scores on the test indicate high academic anxiety and low scores on the test indicate low academic anxiety. The design of the study is quantitative design and the research type of the study is one group pre-post type. The boundaries of The study were confined to the psychological variable of academic anxiety, the age of the students was between 14-19 years, and The no of students delimited was 87 students. And Students belonged to CBSE schools only. The study was limited in two ways. The curriculum, Schedule, and daily routine of the subjects were limited by the researcher. One more limitation was Multiple undiagnosed COVID-19 attainments also be a limitation. the goals of the study are to assess the effect of post-COVID-19 on students at their academic performance and to know the academic anxiety level of 10th-class students. And to compare the academic anxiety level before and after the 10th class CBSE exams. The collected data was statistically Analysed by using Mean, Standard Deviation (SD),Descriptive statistics, and paired T-test in order to facilitate analysis, interpretation, and understanding.

RESULTS

In view of the objectives collected data was analyzed on the basis of Descriptive statistics and paired t-tests.the collected data was analyzed by using MS Excel. The tables are as follows. Table 1 reveals the mean, median, mode, standard deviation, range, minimum, maximum, and counted regarding the pre-test of academic anxiety of school students. Table 2 reveals the mean, median, mode, standard deviation, range, minimum, maximum, and counted regarding the post-test of academic anxiety of school students. Table no.3 revealed the assessment of academic anxiety before and after the examination**.** The mean of the pre-test and post-test is 10.31 and 9.41 respectively. The total number of observations for the pre and post-test is 87, the t-stats on the 86 degree of freedom at 0.05 level of significance is 2.69 & tabulated value of "t" is 1.66 since the calculated value of 't' is greater than the tabulated value thus it can be concluded that the significance difference found between pre and post-test in respect to academic anxiety of a school going boys and girls post COVID-19. Figure 1 revealed that the mean(10.31034483) of the pre-test was more than the post-test of the academic anxiety of school students. so it was indicated that students were anxious more before the exam after COVID-19 or post-COVID-19.

MAJOR FINDINGS

a)Students are more anxious before exams.
b) Due to a Lack of awareness, and fear of adopting a new platform, students have found more anxiety.
c) Gender was not found to have any impact on the anxiety scores.
d) The type of school and the environment had a significant relation with academic anxiety.

DISCUSSION

There is a significant difference found between the pre-post test of the observation of post-COVID-19 academic anxiety of school students of schools of Gwalior City. Opinions were lack of awareness regarding exams. sometimes dates were extended and students were not aware. They were not in contact, so this could be the reason. availability of the school's facilities was not appropriate and they did not have a good connection with the students. so students had to suffer. so they were very anxious regarding the exams of the 10th class after COVID-19 or post covid. Hence the hypothesis formulated that there will be no significant difference between the pre and post-test of academic anxiety of school-going students is rejected. The significance of the study is It will help the teachers of physical education to make physical education programs according to the academic anxiety level and needs of the students. he study will highlight the impact of COVID-19 before and after 10th class CBSE students on academic anxiety.

Shivani Gupta

CONCLUSION

It is concluded that the majority of students have experienced before exams extremely very high levels of academic anxiety which can have many serious and long-lasting consequences on the physical and mental health of children, Parent and teachers in collaboration with school guidance workers should formulate a plan and work together for the better development of children. Timely encouragement, inspiration, and motivation are very important and should be efficiently used by both teachers and parents.

APPENDEXIS

Academic Anxiety Scale

YES/NO
1. When I am called by the principal of the school, I feel very nervous.
2. I am occupied with mental tension as examination time comes nearer.
3. When the class teacher suddenly asks me to come to the staff room, I feel very much afraid.
4. If there is a conversation between parents and teachers then I feel anxious as to what they are talking about me.
5. If I am late, I have no hesitation in going to the class.
6. As a teacher of mathematics, I feel that I don't know anything and have forgotten everything.

7. Suddenly, if I have to go to the office of the school due to some work, I feel afraid.
8. If there is a conversation between parents and teachers then I feel anxious as to what they are talking about me. 9. I always think about my good results.
10. If I obtain low marks in any subject, I feel ashamed to disclose or show it to my friends and members of the family.
11. If the class teacher asks any question after, being stood up, I feel afraid.
12. If the English teacher asks me suddenly in the class, I feel nervous.
13. If it comes to my knowledge that any student or friend of mine is likely to Page 34 of 40 Severely punished due to indiscipline, I become very tense.
14. During examinations I often dream that I am unable to remember anything after getting the question paper.
15. While teaching in the class teacher comes and stands before me, and I become conscious.
16. while talking to the principal, I didn't feel any nervousness.
17. Sometimes before the commencement of the examination if I am unable to go to school, I become worried.
18. I never sit on the first bench in class.
19. When the examination commences such curiosity always persists in me.
20. The study of Sanskrit became the cause of my mental tension because I felt that pronunciation of Sanskrit is too difficult.

ABSTRACT

Childhood trauma refers to serious adverse experiences that include undergoing abuse, neglect, or abandonment, and witnessing abuse of a family member, or living with a mentally ill. Childhood trauma survivors have reported lower degrees of relationship satisfaction. However, the pathways that impact the survivor's adult relationships in the face of childhood trauma need further investigation. Thus, the current study aimed to study the role of romantic attachment in the relationship between childhood trauma and relationship satisfaction. This research used a correlational design and cross-sectional survey method for data collection with 255 participants (163 females, 81 males, 11 non-binary), aged 18-60,using purposive sampling via online/in-person forms. Tools included Childhood Trauma Questionnaire, Experience in Close Relationship Scale, Burn's Relationship Satisfaction Scale. SPSS v25 analyzed data with Pearson correlation, regression, and mediation analysis. The results indicated high degree of trauma in the population, subsequent insecure romantic attachment styles, and lower levels of relationship satisfaction at a 0.01 significance level. It was found that childhood trauma has a significant positive correlation with insecure romantic attachment ($r = 0.456$, $P \leq 0.001$) and relationship satisfaction ($r = -0.448$, $P \leq 0.001$). Findings also indicated that romantic attachment mediates the relationship between childhood trauma and relationship satisfaction ($\beta = -0.257$, $P \leq 0.001$).This study emphasizes childhood traumas impact on adult relationship satisfaction, with romantic attachment mediating this link. Mental

Shiromi Chaturvedi and Bhavana Arya

health practitioners should prioritize holistic approaches, addressing trauma, enhancing attachment security, and thereby improving relationship well-being of clients.

Keywords: adverse childhood experience, childhood trauma, survivors, adult, family relation

INTRODUCTION

Trauma is defined as any stressful event that is experienced by an individual that is emotionally, physically, or sexually harmful and/or exceed the strength of the individual to cope with such situations. Traumatic experiences impact a person's physical and mental health and overall well-being [1].If these types of adversities occur in early life or childhood, the long-term consequences are amplified since the early years of life are accepted as a crucial period in the psychological development of an individual [2]. Childhood trauma has been shown to have a negative impact on adult functioning, as evidenced by the relationships formed by these persons with their family, friends, and especially partners [3].The types and frequency of traumatic experiences, as well as whether they were experienced in a direct or indirect manner, can have a variety of deleterious repercussions on adult physical and mental health [4].According to studies, ACEs were revealed to be important factors to the top causes of depression, PTSD, heart disease, cancer, mortality and disability [5,6].Thus it become imperative to study the impact of trauma on survivors in various spheres of life – personal, interpersonal etc., especially in the Indian context, where research combining various forms of trauma is limited.

Several studies have shown that survivors of abuse acquire an inability to regulate or anticipate violence, resulting in a generalized fear reaction, which makes them unable of emotionally and meaningfully participating in interpersonal intimate relationships because they feel they are unworthy of love and believe that others have a negative view of them [7,8,9]. This is due to the lack of a convenient and secure base for the child to turn to when they need safety when feeling threatened [10]. According to studies [11],childhood trauma is the most devastating aspect in an attachment relationship. If parents fail to assist their children in coping with their concerns, the brain's structural development will be delayed. Furthermore, if youngsters witness traumatic situations, especially with their primary caregivers or parents, they are more likely to form angry and frightening mental representations of them, resulting in continued pain and negative sensations, rather than creating a safe environment in their minds [12].One of the most influential theories in the subject is attachment theory, which discusses how a child's attachment to their caregiver affects how they build attachments with other attachment figures later in life, such as their spouses [13,14].Furthering the work of pioneers in attachment theory, the four types of attachment styles in romantic relationships were proposed[15]namely: secure and insecure attachment. Insecure attachment further includes three types of attachment – anxious or preoccupied, dismissive or avoidant, and fearful). When people's attachment systems are disturbed as a result of childhood trauma, their major focus changes to concerns of protection and safety [16],and tend to persist throughout life and survivors of childhood maltreatment, are more inclined to develop unhealthy attachment patterns in their romantic relationships [17].

According to previous research, higher degrees of attachment avoidance and anxiety are linked to decreased levels of relationship satisfaction in romantic relationships [18].Studies have also shown that individuals with insecure attachment patterns have a strong and unfavourable association with marital happinessi.e., persons with insecure styles of attachment are likely to experience lower levels of marital satisfaction [19].Women who score higher on anxiety have lower levels of relationship satisfaction whereas men with higher degrees of secure attachment, reported higher levels of marital relationship fulfilment [20]. A substantial and negative association between attachment avoidance and relationship quality, as well as a weak and negative relationship between attachment anxiety and relationship quality, has been documented among unmarried young people as well [21].

Shiromi Chaturvedi and Bhavana Arya

Thus, it can be concluded that many research studies have discovered significant evidence that children who suffer stressful situations in early infancy are influenced much beyond their adolescence, especially in the context of attachment and relationships. The link between adult attachment and relationship satisfaction has developed in research studies. In India, however, it is still sparse, if not non-existent. Thus, it is essential to comprehend the fundamental processes that impact the direct connections between romantic attachment and relationship satisfaction within the Indian demographic. Romantic attachment type has been often disregarded as a factor in relationship satisfaction in the Indian research literature and thus needs to be included in the current investigation. Furthermore, research on the impact of gratifying romantic relationships on an individual's psychological well-being, life satisfaction, and physical health has substantial implications for both individuals and society. For instance, studies have highlighted that a secure attachment style, is associated with higher levels of psychological well-being [22], overall life satisfaction [23], better immune system functioning and faster wound healing [24]. Understanding the factors and mechanisms that influence relationship satisfaction can lead to improved interventions, support systems, and policies. Encouraging healthy relationship dynamics and attachment styles can contribute to improved mental health outcomes, reducing the prevalence of mental health disorders and enhancing overall psychological well-being. Moreover, investing in programs that promote healthy relationships and providing relationship education could have positive ripple effects on society, ultimately contributing to a healthier and more productive population, especially in a developing country like India. Consequently, the purpose of this research study was to study the link between childhood trauma, romantic attachment, and relationship satisfaction in Indian adults.

Based on the purpose of the study, the researchers framed the following hypotheses for testing among Indian adults. H1: There is a positive relationship between childhood trauma and insecure romantic attachment, H2: There is a negative relationship between childhood trauma and relationship satisfaction, H3: There is a negative relationship between insecure romantic attachment and relationship satisfaction, H4: Romantic attachment style mediates the relationship between childhood trauma and relationship satisfaction. This study's aim was to test the proposed theoretical model and seek justification for how romantic attachment is related to childhood trauma and relationship satisfaction.

METHODS

Study design and sample
This present research used a correlational design for research and cross-sectional survey method for data collection. The Ethical Review Board of Manipal University Jaipur approved the study protocol. Eligible participants were recruited from the general population and were selected for the study using purposive sampling. The inclusion criteria was persons who had never been married and were currently in a relationship for six months or longer, the ability to comprehend English and access to the internet. The exclusion criteria included self-reportedphysical disability and/or any diagnosis of a psychiatric illness/disorder.The "rules of thumb" were used to establish the sample size. While it is common practice to estimate a sample size large enough to forecast the minimal impact size, a minimum effect size may not always be apparent. Thus, the total sample was 409, which after data cleaning, comprised a total of 255 participants, aged between 18-60 years. Out of the 154 responses not selected, 121 didn't meet the inclusion criteria, while the rest (33) had missing data. The acquired data was scored, tabulated, statistically analysed, using SPSS version 25 and the results were reported accordingly.

Study Measures
In this study, we utilized an online survey accessible on the web, comprising three Likert-type questionnaires alongside sociodemographic inquiries (age, gender, occupation), in addition to the screening tool.

Childhood Trauma Questionnaire – Short Form (CTQ-SF)
Childhood Trauma was assessed using the Childhood Trauma Questionnaire (CTQ) developed in 1997 [25].The CTQ-SF is a 28-item, 5-point Likert scale self-report inventory specifically designed to measure five types of

childhood adversity: physical, sexual, and emotional abuse, as well as physical and emotional neglect. It has items such as "I was punished with a belt, a board, or some other hard object" and "I had to wear dirty clothes" to measure physical abuse and neglect respectively. The test was available for use in the university library. The CTQ-SFhas reported high levels of internal consistency with a Cronbach's alpha of .95 [25].

Experience in Close Relationship Scale (ECR-S)

The Experience in Close Relationship Scale (ECR-S) is a 12 item, 7-point Likert type self-report scale assessing an individual's romantic attachment style developed by Brennan, Clark & Shaver. It has items to measure anxiety "I need a lot of reassurance that I am loved by my partner" and avoidance "I try to avoid getting too close to my partner "in order to ascertain an individual's romantic attachment style. The12-item short form was found to contain two variables with strong internal consistency in their sample (N=851), with coefficient alphas of .78 (Anxiety) and .84 (Avoidance) [26].

Burn's Relationship Satisfaction (BRSS)

The Relationship Satisfaction Scale (BRSS) is a 7 item, 7-point Likert type self-report scale which evaluates how satisfied a person feels about their romantic relationship. The scale has a high level of internal consistency (coefficient α = 0.94) and is substantially correlated with other measures of relationship satisfaction such as the Locke-Wallace MAT (r = 0.80), the Dyadic Adjustment Scale (r = -0.89) and Norton's Quality of Marriage Index (r = 0.91) [27]. It asks respondents to rate their level of satisfaction (0-6) on dimensions such as communication and openness, intimacy and closeness with one's partner.

Data collection

Invites for data collection along with the sociodemographic screening form were shared with prospective respondents through social networks. The study's purpose, potential risks, rewards, confidentiality assurance, and voluntary participation were emphasized in data collection invitations. This information, including informed consent forms, was shared through social networks with all potential participants. Participants who agreed to take part and met the inclusion criteria (determined through the sociodemographic screening form) were then asked to complete the CTQ-SF, ECR-S, and BRS questionnaires. No personally identifiable information (e.g., name, contact details) was collected during the online survey to maintain confidentiality. Additionally, only the two authors had access to encoded raw data during scoring and analysis, preserving anonymity.

Data Analysis

Descriptive statistics were employed to comprehend participant characteristics. Pearson correlations were then utilized to gauge the relationships between constructs, with Pearson's r being deemed small at 0.1, moderate at 0.3, and large at 0.5. SPSS v25 was employed for data analysis, including outlier removal. Data normality was checked using skewness and kurtosis. Descriptive statistics and correlations were computed. Mediation analyses followed Baron and Kenny's steps [28],involving significant predictor-outcome correlation, predictor-mediator association, mediating effect on outcome, and reduced predictor-outcome correlation with the mediator controlled. Statistical significance was set at 0.01 for all analyses.

RESULTS

The goal of this study was to explore the effect of romantic attachment type on relationship satisfaction, particularly in the setting of childhood trauma. This research study included 255 adults, fluent in English, never married, currently in a romantic relationship, with access to the internet. Their mean age was 25.12 (SD=2.34) years (Table 1).

Table 2 depicts the means and standard deviations of the participants across constructs under investigation in the study. The descriptive results show that the prevalence of childhood trauma in the population under study was moderate to high with a mean of 39.07 (SD=11.79). The romantic attachment of the population showed moderate

Shiromi Chaturvedi and Bhavana Arya

romantic insecurity with a mean of 39.44 (SD=11.74) with relationship satisfaction levels were in the category of 'somewhat satisfied' with a mean of 32.69 (SD=9.25).Table 2 also shows the normalcy of data through kurtosis and skewness test results. All Cronbach αvalues were above 0.7, which elucidate that all the tools used were reliable for the sample of the study.

The correlation results depicted in Table 3support H1 that childhood trauma has a positive relationship with romantic attachment insecurity and this relationship is significant (r = 0.456, P≤ 0.001), such that as childhood trauma increases, the insecurity in romantic attachment (i.e. attachment anxiety and attachment avoidance) also increases. Additionally, childhood trauma has a significant and negative relationship with relationship satisfaction (r = -0.448, P≤ 0.001), i.e. as the childhood traumas faced by an individual increase, their ability to feel satisfied in their romantic relationships decreases significantly. Romantic attachment has a negative and significant relationship with relationship satisfaction (r = -0.536, P≤ 0.001)which elucidates that as the romantic attachment insecurity of an individual increases, the satisfaction in their romantic relationship decreases. All of the associations shown in Table 3 were substantial, and they all pointed in the predicted direction, thus H1, H2, and H3 are accepted.

Table 4 shows the regression analysis and mediating impact of romantic attachment. When the influence of romantic attachment is considered, the previously observed strong negative relationship between childhood trauma and relationship satisfaction weakened. The correlation decreased from -0.448 to -0.257 (β= -0.257, P ≤ 0.001), suggesting that romantic attachment acts as a mediator in this relationship. The direct (c) and indirect (c') paths between childhood trauma and relationship satisfaction are depicted in Figure 1. Figure 1 illustrates that when romantic attachment is controlled, the strength of the relationship between childhood trauma and relationship satisfaction is reduced, indicating that childhood trauma predicts relationship satisfaction via romantic attachment. It suggests that part of the negative impact of childhood trauma on relationship satisfaction is explained by its influence on romantic attachment.

Therefore, H4 is also accepted because it is seen in Table 4 and Figure 1 that romantic attachment mediates the relationship between childhood trauma and relationship satisfaction.
The fourth and final hypothesis stated that romantic attachment style would mediate the relationship between childhood trauma and relationship satisfaction. This hypothesis was also accepted as results showed that when romantic attachment was accounted for, the relationship between childhood trauma and relationship satisfaction was considerably weakened (β= -0.257, P ≤ 0.001) indicating mediation.

DISCUSSION

The current study intended to investigate the link between childhood trauma and relationship satisfaction in Indian adults and to determine if romantic attachment mediates the link between childhood trauma and relationship satisfaction. The results of this study demonstrate important connections between adult Indians' romantic attachment, relationship satisfaction, and childhood trauma. The results obtained provide support for the relationships hypothesized in the study. According to the study's findings, high degrees of trauma are connected to insecure romantic attachment patterns and low levels of relationship satisfaction. These findings are consistent with the past research [29, 30]which have also shown that individuals with a history of childhood trauma tend to report lower levels of relationship satisfaction. The study also found a link between romantic attachment insecurity and relationship satisfaction, suggesting that people with poorer relationship satisfaction are more likely to have insecure attachment behaviors. Notably, romantic attachment was found to be a key mediator between childhood trauma and relationship satisfaction, suggesting that for those who have experienced childhood trauma, romantic attachment is a critical factor in determining relationship wellness. These results are consistent with earlier theoretical and empirical studies on the intricate interactions between early trauma, romantic attachment types, and relationship satisfaction in romantic relationships.

Shiromi Chaturvedi and Bhavana Arya

Childhood trauma is not a new concept but its impact on various spheres of an individual's lives is constantly under study because it is shown to impact a person's physical and mental health in myriad ways. Survivors of childhood trauma face attachment injury especially if the trauma has taken place at the hands of family members thus impacting their working model of intimate relationships. Research also shows that traumatic experiences within families can contribute to the development of negative attachment schemas, which in turn impact an individual's expectations and behaviors in intimate relationships [30, 31].Therefore, survivors of childhood trauma often find it difficult to forge meaningful and secure relationships [30] even in adulthood which impacts not only their levels of satisfaction but also their overall well-being [31]. The findings of the current study contribute to the body of knowledge by showing the immediate and long-term effects of childhood trauma.H1 was accepted and a positive relationship between childhood trauma and insecure romantic attachment was established; H2 was accepted since a significant negative relationship between childhood trauma and relationship satisfaction was found; H3 was also accepted since a negative relationship between insecure romantic attachment and relationship satisfaction was found; andH4 was accepted as romantic attachment style was found to mediate the relationship between childhood trauma and relationship satisfaction.

The findings clearly support past research and theory that suggests that childhood trauma increases one's likelihood of developing an insecure romantic attachment in their intimate relationship with their romantic partner in adulthood. This can be understood with the help of Attachment Theory which posits that the possibility of attachment security improves if parents respond to their children's desires in a sensitive manner on a regular basis [32,33,14].Attachment security is an important aspect in children's emotional, cognitive, and interpersonal development. Early childhood trauma, on the other hand, has a substantial impact on the ability to build stable relationships, thereby impacting a trauma survivor's romantic attachment style. Integrating attachment theory and the impact of childhood experiences into educational curricula for teachers, parents, and mental health professionals can equip them with the knowledge needed to recognize signs of insecure attachment. This knowledge can guide appropriate support and interventions for affected individuals. Moreover, encouraging continued research in the field of attachment theory and childhood trauma is vital. Exploring nuanced factors and interventions to enhance attachment security can contribute to a better understanding of how to mitigate the negative effects of early trauma on romantic relationships in adulthood.

Additionally, the data from the current study also revealed a negative association between romantic attachment insecurity and relationship happiness [33].This finding is supported by studies which showed that attachment is linked to poor intrapersonal and marital functioning [23].In other studies, attachment insecurity has been associated to lower levels of relationship satisfaction in both heterosexual and same-sex couples [34]. It is important to incoportate this finding in parental education and guidance so that parents can be empowered with the understanding of how their behaviors influence their children's attachment styles, aiming for secure attachments that can positively impact future relationships. In the Indian context, it is also extremely important to underscore the importance of pre-marital counselling for couples. These initiatives can be encouraged by incorporating discussions about attachment styles and their potential influence on marital satisfaction in the current discourse to equip couples with the knowledge and skills needed to navigate attachment-related challenges, potentially preventing future relationship issues.

Finally, findings reveal that romantic attachment is a significant mediator of the relationship between childhood trauma and relationship satisfaction which means that among the several factors that can contribute to relationship quality and relationship satisfaction, romantic attachment is a vital factor that can predict the variance in 32.7% cases. This finding is consistent with the findings of recent research which strongly suggest that romantic attachment plays a crucial role in mediating the impact of childhood trauma on relationship satisfaction [35]. With this understanding, therapeutic interventions that focus on enhancing romantic attachment security in individuals with a history of childhood trauma can be promoted to address a critical aspect of trauma recovery. By promoting healthy attachment from a young age, the likelihood of relationship satisfaction and well-being in adulthood may increase, potentially breaking the cycle of insecure attachments and generational trauma. Moreover, this finding can be used

Shiromi Chaturvedi and Bhavana Arya

to educate individuals, couples, and therapists about the pivotal role of attachment in relationships, fostering a deeper understanding of how to nurture secure attachments and enhance relationship dynamics.

The findings of the current study have established more support for the complicated interactions between childhood trauma, attachment types, and relationship satisfaction in intimate relationships, especially in the context of Indian adults. Mental health practitioners and policymakers should focus on developing strategies to improve survivors' ability to form healthy attachments and foster fulfilling relationships, even in the face of trauma, ultimately promoting their psychological and emotional healing. By implementing these novel implications, mental health professionals, policymakers, and researchers can effectively leverage the mediating role of romantic attachment to enhance relationship satisfaction and overall well-being, particularly for individuals with a history of childhood trauma.

The findings of this study have various implications for parents, mental health professionals, survivors of childhood trauma, and societal structures at large. Understanding the long lasting impact of childhood trauma in seemingly healthy population can pave the path to awareness campaigns to reduce such trauma in early life. Parents can be psycho-educated about the negative impacts of childhood trauma in order to reduce the prevalence and incidence of trauma in the Indian population. Teachers and parents can monitor children closely to watch out for signs of childhood trauma so that proper intervention may take place. Mental health practitioners such as psychiatrists, clinical and counselling psychologists and counsellors can adopt a more trauma-informed approach to their practice. Moreover, while working with survivors of childhood trauma, mental health practitioners can focus their work on building positive working models or templates of healthy interpersonal relationships so as to inculcate earned security in survivors so as to improve not just their relationship satisfaction, but overall well-being in life. For clients in relationships, practitioners can offer joint sessions to address the impact of childhood trauma on both partners. Supporting couples in understanding each other's attachment styles can lead to mutual healing and improved relationship satisfaction.

LIMITATIONS

There are some limitations to the current study. A limitation of collecting data from adults who reported childhood trauma retrospectively is the potential for recall bias. Memories of past events can be influenced by current emotional states, cognitive biases, and the passage of time, leading to inaccuracies or distortions in participants' recollections of their childhood experiences. This may affect the reliability and validity of the reported trauma incidents, potentially impacting the study's accuracy and conclusions. The second limitation was the study's correlational design which limits causal inferences. Other unobserved or uncontrolled variables, known as confounding variables, could be influencing the observed correlations. Therefore, the study's design prevents researchers from making definitive conclusions about whether childhood trauma directly causes specific outcomes, such as insecure romantic attachment patterns or lower relationship satisfaction. Longitudinal research [36]would have provided a clearer understanding of how childhood trauma, romantic attachment, and relationship satisfaction evolve over time. One final limitation was that while the study suggests romantic attachment as a mediator, other variables not explored in this research might also contribute to the relationship between childhood trauma and relationship satisfaction. It overlooks the potential influence of other variables that were not examined in the research. There could be additional psychological, environmental, or interpersonal factors that play a role in connecting childhood trauma to relationship satisfaction. This limitation calls for cautious interpretation and suggests that future research should consider a broader range of potential mediators to better capture the full picture of how childhood trauma impacts adult relationship outcomes.

CONCLUSION

Despite rising understanding of the relevance of trauma in the development of various issues in adulthood such as psychopathology and interpersonal functioning among others, few researches have looked at the influence of childhood trauma on adult romantic relationship satisfaction, especially among otherwise healthy Indian adult population. The researchers thus investigated a mediation model relating childhood trauma to relationship satisfaction through the influence romantic attachment style in order to better understand the mechanism underlying the detrimental impact of childhood trauma on romantic relationships in adulthood. It was found that childhood trauma leads to more romantic attachment insecurity which further explains decreased romantic satisfaction in adulthood. Practitioners should consider routinely assessing clients for a history of childhood trauma. Recognizing early traumatic experiences can guide intervention strategies to prevent potential negative impacts on adult relationships. To better understand how childhood trauma affects adult relationship outcomes, future research should take a wider spectrum of potential mediators into account.

ETHICAL CONSIDERATIONS

The research was conducted in accordance with the Helsinki declaration on principles of ethical research, and the Committee on Publication Ethics' International Standards for Authors were followed in the drafting of the manuscript. The study was approved by the institutional review committee for research degrees on September 15th, 2021 with the approval reference number MUJ/PhD/2021-08/72.

ABSTRACT

The purpose of the current Investigation, that the Through the Tabata Protocol, Tabata training increases judoka strength and endurance. Due to its speed and potential benefits, often known as the Tabata protocol, is becoming increasingly common in many sports. The study focused on the benefits of using Tabata training into Judo training regimen to enhance endurance and improve performance in Judo Bout. Total 60 undergraduate students (N=60) were selected, range in age between 18 to 21. The subjects were separated into two groups by random selection. with 30 subjects per group. The pre-test resting pulse rate data was collected at first using a digital pulse rate monitoring test, and breath holding time was calculated manually using a nose clipper. For Eight weeks continuous tough training session for the experimental group engaged in the three-time for every week, whereas the control group continued to participate in their usual sport. After training was finished, post-test data was gathered for the identical responses, and the t-test was used to see whether there were any appreciable variations between the data collected before and after Tabata training. The level of significance was 0.05. The study yield that a significant improvement in the breath holding time and resting pulse rate was realized for experimental group in comparison to control group.

Keywords: Tabata Training, Judo, Pulse Rate, Breath Hold, Students etc.

INTRODUCTION

Judo is a physically rigorous part of combat sports technical prowess, tactical awareness, and physical qualities like strength and endurance. Judo practitioners, also known as Judoka, must constantly work to enhance their physical skills beyond simply mastering techniques to succeed in this discipline. Tabata training protocol is the bunch of

66077

training exercise and its strategy that has drawn interest to improve strength and endurance. The Tabata training protocol was developed by Japanese scientist Dr. Izumi Tabata' he was investigate the Tabata protocol's its potential and effective strength and endurance training method for judoka. We'll look at the fundamental principles of the Tabata protocol, Judokascan enhance their physical performance their regular Judo training by comprehending and utilizing the Tabata protocol's advantages. Adopting the Tabata regimen may be the key to realizing one's full potential in the exciting and challenging world of Judo, whether one is a recreational practitioner looking to improve general fitness or an aspirant competitor. Judo is a physically taxing sport that calls for a blend of technical skill, endurance, and strength. Traditional Judo training emphasizes the development of techniques and tactics but neglects specific strength and conditioning workouts. The Tabata protocol is a brief but intensive exercise program that can supplement Judo training and result in appreciable gains in strength and endurance.

Akcan al all 2021 The study looks at how a dynamic training regimen The balance and strength parameters of top-tier combat athletes are impacted by the Tabata program. Keeping a good degree of balance and strength is essential for athletes to excel in contests given the physical demands and technical requirements in combat sports. To target these qualities in elite combat athletes, the researchers created a specialized training program using the Tabata training its type of HIIT. combat athletes from a variety of sports, like judo, karate, or taekwondo, are probably involved in the study. It's possible that participants were chosen based on how well they performed and how much they had played each sport before. The athletes were probably split into two groups by the researchers: a dynamic training program based on the Tabata protocol for the experimental group, and a standard training regimen for the control group.(4).High-intensity workouts using the Tabata protocol The Tabata protocol's high-intensity interval pattern, which entails quick bursts of intense exercise and subsequent rest intervals, is what distinguishes it from other training regimens. An athlete's fitness can significantly increase with this sort of training because it is intended to push them to their absolute limits of effort. The purpose of this study of the literature is to look at recent findings and investigations into whether the Tabata exercise regimen would be able to increase stamina and strength specifically for Judoka. We want to offer useful insights into the efficiency of Tabata training for Judo practitioners and its implications for improving their performance by analyzing the present corpus of knowledge.

Bazneshin at all 2023. The study conducted by Bazneshin, Damirchi, and Arazi in 2023 compares the effect of Tabata training on soft and hard surfaces in elite beach soccer players. Published in the Journal of Sport and Exercise Physiology, the research examines the impact of Tabata training on left ventricular structure and function, as well as several physical fitness factors in these athletes. By comparing the outcomes between training on soft and hard surfaces, the study provides valuable insights into the potential differences in training effects on cardiac health and physical fitness in elite beach soccer players, contributing to the understanding of optimizing training regimens for this specific athletic population. (1) **Scoubeau at all 2022**In this study, Scoubeau, Bonnechère, Cnop, Faoro, and Klass conducted a systematic review and meta-analysis to examine the effects of whole-body high-intensity interval training (HIIT) on health-related fitness. The study, which was released in the International Journal of Environmental Research and Public Health, attempts to evaluate how HIIT affects several areas of fitness for health. The researchers offer helpful insights into the possible advantages of whole-body HIIT as a time-efficient and successful training strategy for enhancing general health and fitness by reviewing pertinent studies. (2)

Mischenko et al. (2021) The objective of the study The development of endurance in taekwondo using the Tabata protocol. by was to investigate how the Tabata protocol affected the development of endurance in Taekwondo athletes. The study looked at whether adding Tabata exercises to Taekwondo training could improve cardiovascular endurance, which might contribute to better performance in Taekwondo tournaments.30 Taekwondo competitors—30 male and female competitors—with ages ranging from 18 to 25 participated in the study. The participants completed an eight-week training course that combined conventional Taekwondo instruction with Tabata exercises. The exercise was performed for 4 minutes in total using the Tabata protocol, which involved total Eight cycles and every exercise of 20 seconds after the exercise 10 seconds rest. The workouts chosen concentrated on developing lower-body power and Taekwondo-specific dynamic motions. Maximal oxygen uptake (VO2 max) was the focus of the pre- and post-intervention evaluations the researchers used to gauge cardiovascular endurance. The study found

that the Taekwondo players' cardiovascular endurance improved statistically significantly after the 8-week intervention, as seen by an increase in VO2 max levels. The results show that adding the Tabata protocol to Taekwondo practice improves the athletes' cardiovascular stamina. The high-intensity character of Taekwondo sparring is likely mimicked by the brief, intense periods of Tabata exercises, which improves aerobic and anaerobic capacity. The ability to maintain peak performance throughout the frantic and physically taxing nature of Taekwondo contests could give athletes who practice the martial art a competitive advantage. The study concludes that the Tabata routine might be useful in helping Taekwondo players increase their cardiovascular endurance. Taekwondo practitioners can improve their aerobic and anaerobic capacity, resulting in improved endurance during competitions, by introducing Tabata sessions into their training regimen. These results need to be further validated, and the In future studies with bigger sample sizes, it is necessary to examine the impact of Tabata training on other aspects of Taekwondo performance. and longer-term follows. (3)

Vasconcelos et al. (2020) a systematic review and meta-analysis titled "Effects of High-Intensity Interval Training in Combat Sports" to ascertain how HIIT affects athletes who compete in combat sports. The aim of the study was to examine the effects of high-intensity interval training (HIIT) on a variety of physiological and performance-related variables in athletes who compete in combat sports, including boxing, mixed martial arts (MMA), judo, and taekwondo, among others..The publications that matched the inclusion criteria for their systematic review and meta-analysis were chosen after the researchers conducted an extensive search of the scientific literature up to the year 2020. These studies investigated the effects of HIIT therapies on combat sports athletes and included pertinent outcome measures, including changes in body composition, cardiovascular endurance, anaerobic performance, and technical skills. Increased VO2 max values were an indicator that combat sports players' cardiovascular endurance had significantly improved because of the HIIT therapies. The maintenance of high-intensity efforts during games and training sessions depends on this improvement. Improvements in Anaerobic Performance: HIIT therapies had a positive impact on anaerobic performance indicators such peak power production and time to exhaustion in high-intensity workloads. These enhancements will help players perform better because combat sports frequently call for quick and explosive movements. Favorable Body Composition Modifications: Some studies found that HIIT interventions led to improvements in body composition, including decreases in body fat and increases in lean body mass. These adjustments might lead to better physical fitness and general health.(5)

Limited Impact on Technical Skills: Despite the review's finding that there is little information on how HIIT affects technical skills in combat sports, several research have offered potential encouraging results. To properly comprehend the precise effect of HIIT on combat sports tactics, more research is required.
No negative impacts on strength or power: Importantly, the meta-analysis found that combat sports participants' maximal strength and power were not adversely affected by HIIT therapies. This suggests that athletes can benefit from HIIT without sacrificing their capacity for explosive strength. Vasconcelos et al.'s systematic review and meta-analysis offer insightful information about the effects of high-intensity interval training (HIIT) in combat sports athletes. The results imply that HIIT can increase anaerobic performance, body composition, and cardiovascular endurance without affecting maximum strength and power. These findings highlight the potential advantages of including HIIT in combat sports athletes' training programs to improve their overall physical fitness and performance. To improve the evidence and completely comprehend the unique impacts of HIIT on various combat sports disciplines, the authors advise more high-quality studies with larger sample sizes and longer intervention periods.(6)

Akcan et al 2020 Examines the effects of High-Intensity Interval Training (HIIT) on muscular strength and body composition in combat athletes. The study, which was published in the Turkish Journal of Sport and Exercise, aims to advance knowledge of how various HIIT regimens can affect athletes competing in combat sports in terms of their physical performance. Due to its effectiveness in reducing exercise time and ability to enhance a variety of physical performance factors, high-intensity interval training (HIIT) has become more popular in the sports and fitness industries. Short bursts of intensive exercise are interspersed with rest or lower-intensity activities during this training regimen. It has been demonstrated to significantly improve cardiovascular fitness, stamina, and strength in a

variety of populations. The study's authors begin by stressing the applicability of their research question and the significance of combat athletes having an ideal body composition and level of muscular strength. Success in combat sports frequently hinges on traits like muscular endurance, power, and agility. Although the authors want to pinpoint the precise impacts of various HIIT forms on combat athletes, HIIT presents a viable method for enhancing these qualities. The review of the literature analysis performed by Akcan et al. gives a thorough summary of earlier studies that investigated how HIIT affected body composition and muscle strength in different sporting populations. They review pertinent studies on the use of HIIT in team sports, individual sports, and settings for general fitness. The writers build a basis for their own research and uncover gaps in the body of knowledge by analyzing earlier discoveries. The researchers then go into detail about their methods, including how they chose their participants, developed their workout plans, and collected their data. To examine the effects of various HIIT formats on body composition and muscular strength among combat athletes, they probably utilized a randomized controlled trial design. It's possible that different HIIT protocols, including Tabata, Wingate, or a specially created interval, were used. Results from the study's interventions are displayed in the results section. It is anticipated that the authors would discuss increases in physical strength measured through workouts related to combat sports (such as punching power and kicking strength), as well as changes in body composition measurements including fat mass, lean mass, and body fat percentage. The results will be compared amongst several HIIT forms to determine which protocol produced the biggest benefits. The study by Akcan, Aydos, and Akgül provides important new information about the effects of high-intensity interval training on muscle strength and body composition in combat athletes. The research improves our knowledge of how to maximize physical performance in this athletic demographic by examining several HIIT techniques. The findings of this research may have implications. (7)

B. Rawat, D. Bangari (2013) has conducted a study on Effect of Jumping Exercise on Leg Strength of Basketball. In the study, they used purposive sampling technique in the area as mentioned in the delimitation and limitation. Purposive sampling technique was the appropriate method in the collection of Data. (8)**Kendall at all (2011).**The study explores the use of rowing ergo meter training as a technique of conditioning for athletes participating in combat sports. This study expands on prior work that looks at different training methods for improving combat sports performance. Prior research has investigated alternative training modalities outside conventional approaches to improve athletes' physical characteristics and combat-relevant skills. Training on a rowing ergo meter: The literature study probably touches on the use of rowing ergo meters for athletic conditioning. The cardiovascular demands, muscular engagement, and all-body character of rowing exercises, which are in line with the complex physical demands of combat sports, may be highlighted in pertinent study. Aerobic endurance and anaerobic capacity are crucial skills for athletes competing in combat sports, and related research may have investigated how rowing ergo meter training affected these abilities. The specificity and efficacy of rowing ergo meter training may be better understood by comparing it to other endurance-focused training techniques. In conclusion, the Kendall and Fukuda (2011) paper probably discusses the value of combat sports conditioning through rowing ergo meter training. The linked literature analysis sheds light on how this kind of training complements the special requirements of combat sports and enhances players' general performance. (8)

Bishop et al 2013. This study by Bishop, La Bounty, and Devlin (2013) Mixed Martial Arts: A Comprehensive Review" by Bishop, La Bounty, and Devlin, which appeared in the Journal of Sport and Human Performance, provides a thorough investigation of mixed martial arts (MMA). The review integrates information from a variety of sources to provide a thorough picture of the sport, covering its development over time, technical elements, training regimens, physiological needs, and associated factors. The writers examine how MMA has developed into a unique fighting sport by tracing its historical roots back to numerous martial arts disciplines. The assessment clarifies the cultural and competitive changes that have defined the MMA scene by drawing on historical context. The assessment will probably spend a good deal of time analyzing MMA's technical nuances. This entails a study of the wide variety of striking and grappling tactics used by combatants. The methods employed to effortlessly combine these skills in the fast-paced environment of MMA contests may also be covered by the authors. The review probably includes analyzing the training strategies used by MMA athletes. This includes a review of cross-training methods, whereby combatants combine elements of many martial arts styles to develop a diverse range of skills. The authors can also

talk into the tough physical and mental training regimens that fighters go through to get ready for competition. The review's discussion of the physiological requirements of MMA is an important topic. This includes the ability to maintain high-intensity efforts as well as muscular strength, endurance, flexibility, and cardio respiratory fitness. In conclusion, Bishop, La Bounty, and Devlin's analysis of the literature acts as a thorough introduction to the intricate world of mixed martial arts. The review offers a comprehensive understanding of MMA as both a competitive sport and a multidimensional discipline by carefully examining historical, technical, training, and physiological components. This book helps to a greater understanding of the complexity of MMA and its dynamic place in the world of contemporary sports. The examination covers a wide range of sport-related subjects, including the sport's history, rules, methodology, workout routines, physiological requirements, injury risks, and performance outcomes. It is a helpful resource for comprehending the dynamic and multidimensional nature of MMA for academics, practitioners, and enthusiasts curious about learning more about the complexity of this well-known combat sport.(9)

Andreato et al. (2011) The study "Estimated aerobic power, muscular strength, and flexibility in elite Brazilian Jiu-Jitsu athletes" by Andreato et al. (2011) examines the physiological characteristics of top competitors in the martial art of Brazilian Jiu-Jitsu (BJJ). A brief summary of the relevant literature discussed in the study is given below:
Exercise Power: The review may go through earlier studies that highlight how crucial aerobic capacity is in combat sports. Researchers may have looked into the role that aerobic power plays in sustaining effort throughout competitions, resting between rounds, and overall athletic performance. Research on different aerobic training programmes for combat athletes may also be cited. The study offers insightful information about the physical preparation of elite competitors in this martial art discipline. The results help to improve our knowledge of the physical demands and training requirements for mastering Brazilian Jiu-Jitsu. In 2011, the article was printed in the journal Science & Sports.(10)Overall, the examined material is consistent with the idea that the Tabata training can improved JudoKa their strength and endurance. It has been demonstrated that Tabata training enhances judo-specific performance, muscular strength, and cardiovascular fitness. Furthermore, JudoKa time constraints and the brief, intensive nature of Tabata workouts make them a useful addition to their training program. The results need to be confirmed in additional studies with bigger sample sizes and long-term follow-ups, though, to properly comprehend the potential long-term consequences of Tabata training for Judo practitioners.

Japanese researcher Dr. Izumi Tabata and his group at the National Institute of Fitness and Sports in Tokyo created the Tabata regimen. For a total of 8 rounds (4 minutes), intense workouts are done for 20 seconds, followed by a 10-second break. Even though the exercises performed in Tabata training might vary, they frequently center on whole-body motions that include numerous muscle groups. Time Management: Judoka frequently have demanding training schedules, making it difficult to fit in additional strength and endurance exercises. The Tabata protocol provides an effective means of achieving notable training results in a brief amount of time, making it simpler to include into daily regimen. Cardiovascular Endurance: Judo competitions can be physically taxing and necessitate constant effort. Tabata workouts put the cardiovascular system to the test and can raise VO2 max, which translates to better match endurance.

Muscular Strength and Power: Judo techniques are explosive, so a strong and powerful body is necessary. Bodyweight squats, burpees, and kettlebell swings are examples of Tabata exercises that can help Judoka develop both functional strength and explosive power. Judo competitions include short bursts of high exertion that depend on the anaerobic energy system. The anaerobic system is the focus of Tabata training's high-intensity intervals, which improve the body's capacity to function during brief periods of peak exertion. Tabata exercises can be mentally demanding, pushing athletes to persevere through discomfort and exhaustion. This mental toughness can be applied to judo matches, where keeping concentration and resolve is essential.

Effects on Strength: In this section, the results of a few studies that investigated how Tabata training affected judoka athletes' strength improvements will be analyzed. To determine how Tabata training affects overall strength gains, metrics like maximal strength, muscular power, and explosive strength will be measured. The review will investigate potential processes underpinning Tabata training-induced strength changes.

Effects on Endurance: The evaluation will look at data relating to how Tabata training affects judokas' anaerobic and aerobic endurance. The increases in endurance capacities related to Tabata training will be determined by reviewing pertinent research assessing variables such as VO2max, anaerobic capacity, lactate threshold, and time to exhaustion. Comparisons with Other Training Modalities: To provide a thorough analysis, the review will contrast the results of Tabata training with those of other training modalities frequently used in judo, such as conventional endurance training or resistance training. This contrasting analysis will clarify the distinctive benefits of Tabata training in boosting both strength and endurance in judo athletes.

METHODOLOGY AND DATA COLLECTION

Breath holding capacity and resting pulse rates were measured for two groups: the Experimental Group (EG) and the Control Group (CG). Each group has 30–30 participants. Both before and after the Tabata workout, measurements will be taken. Paired t-test Breath Holding Capacity Calculation: The mean breath holding capacity before and after Tabata training will be compared for each group (EG and CG) using a paired t-test. The paired t-test has the following formula: $t = (mean\_post - mean\_pre) / (s / \sqrt{n})$where: T is the T-value.
The average breath-holding capacity following Tabata training is known as mean post.
The mean breath-holding capacity prior to Tabata training is known as mean_pre.
The difference between post-test and pre-test results' standard deviation is S.
N stands for the number of subjects (in this case, 30) in each group.

COMPARISON AND INTERPRETATION

The calculated t-values for breath holding capacity and resting pulse rate in both groups will be compared to the critical t-value at the desired significance level (usually 0.05). If the calculated t-value is greater than the critical t-value, it indicates a statistically significant difference between pre-test and post-test values for the respective variable. We will compare the judo players' ability to hold their breath before and after Tabata training for both the Experimental Group (EG) and Control Group (CG), to perform the Paired t-test on the provided data. A paired t-test is suited to analyze the data because the same subjects are assessed twice (prior to and following training).
Let's calculate the paired t-test for both groups:

To perform the paired t-test on the data for Resting Pulse Rate and Breathe Holding Capacity,We first determine the differences between the post-test and pre-test values for each participant in both the Experimental Group (EG) and Control Group (CG), to conduct the paired t-test on the data for Resting Pulse Rate and Breathe Holding Capacity. The paired t-test will then be used to determine whether there are any statistically significant variations between pre-test and post-test results for each group. If there was a significant difference between the variables of interest and the Tabata training, the paired t-test will show that. The full findings are in Table 1.1 and 1.2.:
Overall, the paired t-test results reveal that after the eight-week Tabata training programme, both the Experimental Group (EG) and Control Group (CG) displayed substantial improvements in Resting Pulse Rate and Breathe Holding Capacity. The physical fitness parameters in both groups improved after Tabata training.
The Experimental Group (EG) and the Control Group (CG) pre- and post-test results are shown in the accompanying chart diagram for the two groups. The information shows measures of the Experimental Group's and Control Group's ability to hold their breath for a given amount of time before and after completing Tabata training (in seconds).
Experiment Group: Before beginning Tabata training, each member of the Experimental Group underwent a breath-holding capacity test, which was assessed in seconds.
Following the Tabata training, each member of the Experimental Group had their breath-holding ability (measured in seconds) post-tested.

Sanjeev Sharma *et al.,*

The Experimental Group (EG) and the Control Group (CG) pre- and post-test results are shown in the accompanying chart diagram for the two groups. The information shows the participants' resting pulse rates (measured in beats per minute) for both groups before and after Tabata exercise.

Experimental Group (EG)
Pre-test: Whenever an experiment or study's data must be collected, the training session should begin. In this test and before and after the start of the Tabata training, the resting pulse rate (in beats per minute) was recorded. taken before Tabata training for every member of the Experimental Group. Each member of the Experimental Group had their resting pulse rate (expressed in beats per minute) recorded after completing the Tabata exercise.

Control Group (CG)
Pre-test: The resting pulse rate (measured in beats per minute) for each member of the Control Group taken prior to Tabata training. Pre-test: Whenever an experiment or study's data must be collected, the training session should begin. In this test and before and after the start of the Tabata training, the resting pulse rate (in beats per minute) was recorded. taken before Tabata training for every member of the Control Group. Each member of the Control Group had their resting pulse rate (expressed in beats per minute) recorded after completing the Tabata exercise. Each participant's resting pulse rate is recorded side by side, making it simple to compare pre- and post-test results for each group.The chart design makes it possible to clearly see how the Tabata training intervention in both the Experimental and Control Groups affected resting pulse rates. Analyzing changes in resting pulse rate following Tabata training can offer important insights into the training method's effects on cardiovascular health because the resting pulse rate is a crucial physiological indication of cardiovascular fitness and recovery. To ascertain the statistical significance of the variations in resting pulse rate before and after the training in both the Experimental and Control Groups, the data from the chart will be further examined using paired t-tests. As part of a larger inquiry into improving strength and endurance in this athletic population, this analysis will help to understand the effect of Tabata training on cardiovascular fitness and endurance in judoka athletes.

CONCLUSION

The findings on the effects of Tabata training on breath holding capacity and resting pulse rate in the judoka will be made based on the outcomes of the paired t-tests. The interpretation will concentrate on determining whether both the Experimental Group and the Control Group Group's physiological parameters have significantly improved because of Tabata training. This methodology seeks to offer a statistically sound examination of the effects of Tabata training on these variables in judoka athletes by using paired t-tests to the breath holding capacity and resting pulse rate data. The findings will be crucial in understanding how Tabata training affects the physiological reactions unique to judo, including strength, endurance, and cardio respiratory fitness.

ABSTRACT

The purpose of this study is to provide the nutritional understanding that sprinters require to meet their training and competition demands. The dietary requirements of sprinters will be covered in this paper. A review of literature was conducted in Google Scholar, Research Gate, Taylor and Francis online, and through the self-observation of research scholars to identify review papers on sports nutrition for sprinters. The science of nutrition covers the study of food, how the body utilizes it, and the components in food that our bodies need. Sprinters are motivated to enhance their muscle mass and power because the power-to-mass ratio has a substantial impact on their sprinting performance. The findings from this review revealed that athletes and coaches must have sufficient knowledge of nutrition that helps enhance performance and optimal health. Getting enough calories from macro and micronutrients, staying hydrated and paying attention to meal timing are all nutritional requirements for performing at your best while sprinting.

Keywords: complex carbohydrates ,creatine ,power-to-mass ratio, perspiration

INTRODUCTION

Sports nutrition is the study and practice of nutrition and diet as they relate to athletic performance (Satyanarayana, 2020). Athletics are classified into track and field events. Track events are further classified into sprint races (100m, 200m, 400m, 400m hurdles, 110m hurdles for men, and 100 m hurdles for women) (Kamlesh, n.d.). Running and hurdling competitions are reliant on the development of power generated through anaerobic energy systems, specifically the phosphocreatine system for shorter events like the 100m and 200m, as well as the glycolytic system for longer events such as the 400m. A sprint involves giving your all for a brief duration, and the key to success lies in attaining maximum speed while minimizing the decline in power as the sprint continues. Previous research has

66086

shown that top-tier sprinters primarily possess muscles composed of specific muscle fibers. Fast-twitch muscle fibers were found to be prevalent in elite sprinters, according to research by Costill et al.(1976). Therefore, achieving success in sprinting necessitates the development of substantial and strong muscles. Consequently, nutrition is believed to play a significant role in regulating the increase in muscle size due to training. In this review, our primary emphasis is on the impact of nutrition on enhancing muscle mass and strength, as well as its potential to affect performance on competition days through dietary choices. A specific sub-group of university students, sprinters, experience the negative effects of prolonged, rigorous daily training along with inadequate and imbalanced nutrition. This issue is often attributed to a lack of nutritional knowledge and the presence of uneven dietary habits, as indicated by Sondik et al. (2010). An examination of food safety and dietary nutrition among college students has been carried out using the KAP (knowledge, attitude, and practice) model, following the approach outlined by Popkin (2006). Recent research has provided compelling evidence that a significant decline in metabolic and hormonal function occurs when daily energy intake falls below 30 calories (equivalent to 135 kilojoules) per kilogram of fat-free mass (FFM). Such insufficiency can have adverse effects on performance, growth, and overall health. In females, insufficient energy availability can lead to disruptions in reproductive function and menstrual regularity. Male athletes are also likely to experience various issues. Sprinters, as a rule, typically require a daily calorie intake ranging from 2,000 to 3,000 calories.

NUTRITION FOR SPRINTERS

Macronutrients
It consists of carbohydrate ,protein ,and fat

Carbohydrate Requirement
The amount of carbohydrate depends on the length of running, such as 100m, 200 m, or 400m. Carbohydrate intake plays a significant role in promoting muscle anabolism through various mechanisms. Given the frequent occurrence of multiple sprints in a sprint training session, there is a risk of depleting muscle glycogen(Gaitanos et al., 1993). Therefore, it's crucial to ensure an adequate carbohydrate intake to sustain glycogen levels. This not only helps in preventing fatigue during training and maximizing performance potential, but may also be essential for optimizing muscle growth. When glycogen availability is low, it can potentially affect the body's adaptive response to training (Churchley et al. 2007; Creer et al. 2005). This suggests that achieving the maximum anabolic response to resistance exercise may be hindered when exercise is initiated with low glycogen levels. For sprinters, it is recommended to consume an ample amount of carbohydrates to maintain glycogen levels during training. Guidelines propose an intake ranging from about 6 grams per kilogram of body weight for male strength athletes (Lambert & Flynn,2002) and possibly a slightly lower amount for female athletes (Volek et al., 2006). Good sources of carbohydrates include whole grains, rice, fruits, and vegetables.

Protein Requirement
Indeed, there is no conclusive evidence to support the necessity or potential benefits of extremely high protein intake, exceeding 2 grams per kilogram of body mass per day, in the context of optimizing the outcomes of resistance training. It is more likely that the most favourable results are attained by implementing improved recovery techniques, such as promptly supplying a combination of protein and carbohydrates after a workout. Recent findings indicate that the most significant impact on protein balance occurs when a resistance training session is followed by a meal or snack containing a substantial amount of high-quality protein shortly after the workout. **(**Burke & Maughan, 2013)Proteins contain the essential amino acids required for the repair and regeneration of muscle fibers following exercise or competitive events. Protein is typically utilized as an energy source only when there is a temporary depletion of carbohydrates and fats. According to research published in the Journal of Applied Physiology, sprinters are advised to aim for a protein intake of at least 1.8 grams per kilogram of their body weight. Good sources of protein include lean meat, poultry, fish, low-fat dairy products, eggs, soybeans, and protein shakes.

Fat Requirement

Sprinters need to be strong and muscular with low body fat levels. To enhance performance and speed, sprinters must have extremely minimal body fat. However, to assist in energizing, a tiny quantity of fat is required. The International Olympic Committee advises athletes to ensure that a minimum of 15-20% of their daily caloric intake is derived from healthy fats. This recommendation stems from the essential role fats play in facilitating the absorption of fat-soluble vitamins, hormone production, and the overall optimal functioning of the body. As per findings by (Rodriguez et al., 2009), athletes are encouraged to target a range of 20–35% of their daily caloric intake coming from healthy fats.

Micronutrients

It contains vitamins ,minerals.

Micronutrients are necessary in limited amounts. Vitamins, which are organic compounds, play a vital role in enhancing the performance and recovery time of sprinters. Key micronutrients for sprinters include vitamin D, iron, zinc, and magnesium.

Hydration

A young athlete who performs prolonged or intense, intermittent exercise can present with dehydration (greater sweat loss than fluid intake), which may affect performance and health **(**Falk, 1998; Sawka, 1992**).**Sprinters must create a fluid strategy that allows them to distribute their fluid intake over the available drinking hour in order to meet all of their needs. It is vital to consume enough fluids to maintain body weight, although the amount of dehydration should typically be kept to a loss of no more than 2% of body weight (i.e., 1 kg for a person weighing 50 kg, 1.5 kg for a person weighing 75 kg, and 2 kg for a person weighing 100 kg) **(**Burke & Maughan, 2013**).**Sprinters must carry a water bottle to keep their hydration level maintained, and they must monitor their fluid loss during training and competition.

Young athletes engaged in prolonged or intense, intermittent exercise may experience dehydration, which occurs when their sweat loss surpasses their fluid intake. This dehydration can have a detrimental impact on both their performance and overall well-being (Falk;1998 and Sawka, 1992).Sprinters should develop a well-planned approach to fluid intake, ensuring they distribute it evenly throughout the available drinking period to meet their hydration requirements. It's crucial to consume an adequate amount of fluids to maintain their body weight, with a general guideline that suggests keeping dehydration limited to no more than 2% of their body weight. For instance, this would translate to 1 kilogram for someone weighing 50 kilograms, 1.5 kilograms for a person weighing 75 kilograms, and 2 kilograms for an individual weighing 100 kilograms, as advocated by Burke and Maughan(2013).Sprinters must make it a practice to have a water bottle on hand to maintain their hydration levels, and they should be diligent in monitoring their fluid loss during both training sessions and competitive events.

SweatLoss(Litres)=Bodyweightbeforeexercise(kg)– Bodyweightafterexercise(kg)+Fluidconsumedduringexercise(liters)

Rehydration after exercise and competition

For each kilogram lost during training or competition, sprinters should try to drink 1.2–1.5 litres of fluid, and during heavy exercises, sweat losses are about 1–2 L/H, depending on intensity and duration, temperature, humidity, etc. Sprinters must consume sodium-containing beverages since sodium is the primary salt lost through perspiration. Sprinters can benefit from sports drinks with electrolytes. Sprinters should refrain from using a novel plan for fluid and fuel replacement at a major competition unless they have tested it out in training and at smaller competitions to see how it affects them.

Supplements for sprinter

Regarding sprint performance, there are a few supplements that should be addressed. We'll focus primarily on supplements whose efficacy has been adequately demonstrated. Studies on the majority of supplements have

66088

produced conflicting findings, making it challenging to advise sprinters to use them at this time(Maughanet al., 2007**).**Beta-alanine, sodium bicarbonate and creatine are some of the important supplements for sprinters.

Competition issues for sprinter

Sprint events typically have a brief duration and do not significantly deplete fluid and carbohydrate levels. Sprinters often engage in multiple rounds of competition, including heats, semifinals, and finals, which may be spread out over an extended period. Consequently, it is essential for sprinters to employ specific nutritional strategies to support recovery between events and maintain optimal fluid and energy levels throughout a lengthy competition day to ensure peak performance.

The ideal pre-event meal should be characterized by low fat, low fiber, and minimal caffeine content. It should contain a moderate amount of protein and a high proportion of complex carbohydrates, such as items like bread, cereals, and legumes. In addition, it's crucial to include sufficient fluid intake as part of this meal. To minimize the risk of experiencing gastric distress, nausea, cramps, or sluggishness, it is advisable to consume these meals at least 3 to 4 hours before the competition. To maximize energy reserves, reduce tiredness, and support is sure regeneration, special consideration must be given to food consumption before and after training as well as during competition. Sprinters should never try anything new before competition or during competition days.

Nutritional Guidelines for Sprinters

- To sustain glycogen stores during training, it's important to ensure that your carbohydrate intake is sufficient, at a rate of 5 grams per kilogram of body weight.
- It is important to carefully analyze your energy in take. If you want to build more muscle, you should eat more; if you already have the ideal amount, you should keep eating and possibly keep an eye on it.
- Most sprinters certainly consume enough protein.
- If gaining muscle mass is the goal, protein type and time should be taken in to account.
- Individual race day nutrition plans need to be created in order to prevent dehydration and gastrointestinal upset.
- Sprinters must take in to account the additional weight gain brought on by creatine use because it may promote gains in strength and muscle mass.

CONCLUSION

Sports nutrition involves the utilization of nutritional principles to improve athletic performance. Sprinting is a widely practiced sport, and sprinters aim to increase their muscle mass and power as the power-to-mass ratio plays a crucial role in determining their   sprinting performance. The findings from this review revealed that athletes and coaches must have sufficient knowledge of nutrition a intake and recommendation that helps enhance performance and optimal health. Getting enough calories from macro and micro nutrients ,staying hydrated, and paying attention to meal timing are all nutritional requirements for performing at your best while sprinting.

ABSTRACT

An international multi-sport competition including participants with a variety of disabilities is called the Paralympics. The performance of Para athletes depends upon various phenomena like infrastructure, facilities, culture and geographical location. The objective of the present study was to find out the performance of the medal holders of India in Paralympics, considering the geographical location and facilities given by the state government for the medal holder Para athletes in India. The performance of the medal holder Indian Para athletes has been considered as the selected variable for the present study. Considering the performance of Indian athlete under geographical context showed that Rajasthan got maximum medals. Overall results of this study show that it was not only about infrastructure and facilities provided by the government that the state with the normal facilities performs very well with the top position in the medal tally. Although it has been revealed that there was a linear relationship between the facilities and performance, there were some exceptions also. As Karnataka had provided more facilities than Uttar Pradesh but secured less number of medals (01) in comparison to Uttar Pradesh (03). From the overall study, the researcher concluded that most of the medals were secured by the athletes of Rajasthan, followed by Haryana and Uttar Pradesh.

Keywords: Paralympics, Para Athlete, Sports, Geographical Context

INTRODUCTION

The Paralympic Games, the second-biggest multisport event on the planet, raise important and thought-provoking issues regarding the nature of sports, disability, and society. The first comprehensive overview of the Paralypmic phenomenon, The Paralympic Games Explained delves into each significant facet and topic, beginning with the movement's origins and evolution. The Paralympics Games Explained is the first complete introduction to the Paralympics phenomenon, exploring every key aspect and issue, from the history and development of Paralympics movement (Bale, J. 2003). At Great Britain's Stoke Mandeville Hospital, Dr. Ludwig Guttmann founded a spinal injury centre in 1944 upon the British Government's request. The centre's primary goal was to promote the evolution of sports from recreational to competitive. Dr. Guttmann organised the Stoke Mandeville Games, the first wheelchair competition, on the day of the 1948 London Olympic Games, marking a significant moment in the history of the Paralympics. This game involved sixteen injured service members participating in archery. In 1960 the Stoke Mandeville Games was become the Paralympics Games which first took place in Rome. There was 400 athletes from 23 countries participated in this Games.[10] The first Winter Games in Paralympics were held in Sweden in the year 1976 as with the Summer Games have taken place every four years, and include a Paralympics Opening ceremony and Paralympics Closing ceremony.[16] The Greek terms "Para" (beside or alongside) and "Olympic," which refer to the Games held in parallel to the Olympics, are the origin of the word "Paralympics," which signifies the coexistence of the two movements. The international Paralympics Committee was established in Dusseldorf, Germany, on September 22, 1989, with the goal of serving as the movement's worldwide governing body there is a connection between sports and geography that is similar to many other phenomena. Three things, according to well-known author John Bale, make sports geography a crucial area of study for geographers. (17) Sports are spatial phenomena with a location of their own, human-environment relationships, and regional variations in the ways that particular sports are played. International sports competitions serve as a window into the political, economic, and cultural clout of nations; major international sporting events are closely associated with these three dimensions (Bale, J. 2003). Disability is part of being human. At some point in our lives, almost everyone will suffer from a disability that is either temporary or permanent. Disability currently affects about 1 billion people, or 15% of the worldwide population, and this number is increasing. The combination of people with health conditions like depression, Down syndrome, or cerebral palsy with environmental and personal factors like unfavourable attitudes, inaccessible public spaces, transportation, and a lack of social support can lead to disability. The experience and severity of a person's handicap are greatly influenced by their living environment. Setting that is inaccessible creates barriers that are often placed in the way of people with disabilities engaging fully and effectively on an equal basis in society. By removing these obstacles, helping people to participate actively in sports, we may make progress toward increasing social engagement (Mazumdar e al. 2020). Only sports can break down the barriers of inequality in society. Athletes with disabilities that include impaired passive range of movement to impaired muscle power (e.g., muscular dystrophy, paraplegia, quadriplegia, spina bifida, post-polio syndrome), limb deficiency (e.g., dysmelic or amputation), short stature, leg length difference, hypertonic, ataxia, vision impairment, athetosis, and intellectual impairment compete in the Paralympics, a major international multi-sport event.[16]

Eligible categories of impairments for Paralympics
1. Impaired muscle Power: A decrease in force generated by muscles or muscle groups may occur in one limb or the lower part of the body. Examples include spinal cord injuries, spina bifida, and poliomyelitis.
2. Impaired Passive Range of Movement: For example, arthritis can permanently reduce the range of motion in one or more joints. Joint instability, excessive joint mobility, and acute illnesses like arthritis are not regarded as qualifying impairments.
3. Limb deficiency: Absence of bones or joints entirely or partially due to disease (bone cancer, for example), trauma (car accident), or congenital limb deficiency (dyslexia, for example)
4. Leg length difference: Bone shortening as a result of trauma or a congenital defect in one leg
5. Short stature: Reduced standing height can result from malformations in the trunk and upper and lower limb bones, or from growth hormone dysfunction or achondroplasia.

6. Hypertonia: A neurological disorder like cerebral palsy, multiple sclerosis, or a brain injury that causes an abnormally high level of muscle tension and a decreased muscle's capacity to stretch.

7. Ataxia: Neurological diseases like cerebral palsy, multiple sclerosis, or brain trauma that causes an inability to coordinate muscle movements

8. Athetosis: Typically resulting from a neurological disorder like cerebral palsy, multiple sclerosis, or brain injury, this condition is characterised by uncontrollably jerky, unbalanced movements, and trouble maintaining good posture.

9. Visual Impairment: An impairment of the visual cortex, optical nerves or pathways, or the structure of the eye affects vision.

10. Intellectual Impairment: A pre-18-year-old barrier to intellectual capacity and adaptive behaviour as demonstrated by conceptual, social, and practical adaptive skills.

There are currently 28 Paralympics sports in summer and winter sanctioned by the IPC: 22 summer and winter. Taekwondo and badminton are the two most recent sports to be granted Paralympic status; they will both compete in the Tokyo 2020 Games. Snowboarding is the newest winter sport; it made its debut at the 2014 Paralympic Winter Games in Sochi. (Bamford et al. 2016)

History of Indian Para athlete's participation in Paralympics
1968 Tel Aviv Paralympics: For the first time, India sent ten athletes as a delegation to the 1968 Tel Aviv Paralympics games. India did not take home a medal in its debut Paralympics competition. 1972 Heidelberg Paralympics: At the Heidelberg Paralympics games, India got its first medal at the Paralympics. In the men's 50 meter free style swimming event, Murlikant petkar won the gold medal. He set a world record in the competition, finishing in 37.33 seconds. 1984 Stoke Mandeville and New York City Paralympics: India did not participate in the 1976 and the 1980 Paralympics games. Subsequently, a delegation from India attended the 1984 Paralympics games, which took place in two different locations. A team of five Indian athletes made a record comeback, winning a record four medals. Because of the brilliant Joginder Singh Bedi who won three medals, the success was enormous. He won two bronzes in the men's Discuss ThrowL6 and men's JavelinL6 and also won a silver medal in the men's Shot PutL6. Bhimrao Kesarkar won the silver medal in the men's JavelinL6.

1988 Seoul Paralympics: Only two athletes from India represented the country in the 1988 games. A medal was not won by them.   1992 Barcelona Paralympics: Nine competitors from India competed in the 1992 Paralympics Games. They did not get a medal. 1996 Atlanta Paralympics: Nine competitors, all of them were men, represented India in the 1996 Paralympics Olympics. 2000 Sydney Paralympics: At the Sydney Games, India sent a delegation of four male athletes. They did not get a medal 2004 Athens Paralympics: India won two more Paralympic medals at the Athens games after a 20-year break. In the F44/46 Javelin, Devendra Jhajharia gave India its second gold medal. Rajinder Singh Rahelu of India won a bronze medal in the 56kg power lifting competition. 2008 Beijing Paralympics: Five athletes from India participated to the 2008 games as a delegation. They were not awarded a medal. 2012 London Paralympics: Ten athletes from India competed in the 2000 Games. Girisha Nagarajegowda of the nation took home a silver medal in the men's F42 high jump 2016 Rio Paralympics: At the Rio Paralympics, India had its best performance to date. In all, they took home four medals, two of which were gold. India entered a squad of 19 athletes in the 2016 Summer Olympics. Deepa Malik won the first-ever medal for India at the Paralympics Games in the Shot Put F53 event. Mariyappanm Thangavelu and Devendra Jhajharia, who won his second gold medal, were the two Indian gold medallists. In T42 High Jump, Varun Singh Bhati took home a bronze medal. 2020 Tokyo Paralympics: At the Tokyo 2020 Paralympic Games, India sent the largest-ever delegation of 54 athletes (40 men and 14 women) competing in nine different Paralympic sports. India completed the Paralympic Games with 19 medals. Six silver, eight bronze, and five gold medals in total. (Gold, J. R., & Gold, M. M. 2007)

SIGNIFICANCE OF THE STUDY

1. This study may help to understand the developmental trend of Indian athletes in the Paralympics.
2. This study may help the national coaches, physical educators, and the person related to sports to understand the position of Indian Paralympians.

METHODOLOGY

Selection of the Subjects*:* Indian medal holder in Paralympics game
Design of the Study: Purposive sampling.

Selection of the Variables
The performance of the medal holder Indian Para athletes has been considered as the selected variable for the present study.

Collection of Data
The data were collected from different books, different types of journals from Google Scholar, Research Gate, IOC official website, official website of Indian Paralympics committee official report of IOC, different state government website.

Procedure of Data Collection
The performance of medal-holder Indian athletes in Paralympics games has been recorded as also their geographical context. The performance of the target population was recorded from various secondary sources such as web pages, different journals, and research papers, the official website of IOC, official website of Indian Paralympics committee.

FINDINGS AND DISCUSSION

Table No-1 indicated that from 2000-2020 Rajasthan won highest medal in Paralympics and Haryana won the second highest medal in Paralympics. They win maximum number of medals and then followed by Uttar Pradesh, Punjab, Tamil Nadu, Delhi, Uttarakhand, Odisha, Bihar, Karnataka, Gujarat, and Himachal Pradesh.

The below table is showing the performance of Indian athletes in the Paralympics from 2000 to 2020 Paralympics games, which shows that Rajasthan haunted maximum medals. Rajasthan got 7 medals in Paralympics. In between 7 medals they got 4 gold 1 silver and 2 bronze medal. After Rajasthan, Haryana achieved 5 medals in the Paralympics from 2000 to 2020. In between 5 Medals they have 2 gold 2 silver and 1 bronze. Whereas Uttar Pradesh got 3 medals .In between 3 medals they have 2 silver and 1 bronze. After Uttar Pradesh, we can see that Tamil Nadu achieve 2 medals and in between 2 medals they have 1gold and 1 silver and the rest of the states got only one medal from 2000 to 2020. So, from the above table, we can see that Rajasthan got the maximum number of medals.

Facilities provided by the different state governments for the Para athletes
Rajasthan
a) To provide opportunities, services, and support for individuals with intellectual and developmental disabilities, the Rajasthan government established various sports control boards throughout the state. This enables them to live healthy lives, pursue their full potential in sports and other endeavours, and develop fulfilling lives.
b) The government of Rajasthan has made the required efforts to meet the sporting needs of athletes who are physically disabled, as stated in the 2011 Rajasthan Sports Policy. They must be given every opportunity to fully participate in sports, which includes access to adequate training facilities, competitive events, and infrastructure. Tournaments for people with physical disabilities at the district and state levels will be held in a variety of games. All

amenities available to general sports participants shall also be extended to physically handicapped athletes. Retrieved from: Rajasthan sports policy 2011, https://vymaps.com/IN/Sports-Control-Board-of-India-for-theDisabled-110204190386951/

Haryana
a) The government will implement affirmative action initiatives to help underprivileged and differently able children and girls play sports with confidence, reach their full potential without fear of failure, and achieve the success they deserve. It will reach out to both densely populated urban neighbourhoods and isolated rural villages, making sure that new sports facilities are developed in accordance with local preferences and that the current ones are used.
b) The Sports Department makes any necessary accommodations to fulfil the needs of individuals with disabilities in sports. Care is taken to guarantee that they have access to enough training facilities, competitive events, and infrastructure to enable them to fully participate in sports. A district- and state-level competition for people with disabilities in a variety of games will be held.
c) The government will work especially to encourage sports among people with disabilities by increasing awareness, lowering obstacles to participation, improving accessibility, and creating specialised systems for identifying and nurturing talent. All tiers of sports infrastructure must progressively become handicap accessible in order to accomplish this.
d) The adaptation of various sports disciplines to accommodate the needs of individuals with disabilities has been a conscious endeavour. The relevant state associations will also assist in promoting sports for people with disabilities, including wheelchair tennis, curling, fencing, basketball, rugby, baseball, blind cricket, and blind golf.
e) The Special Games Federation's recognition, along with the growing popularity and reach of Paralympic events, present the right opportunity to emphasise sports for the disabled as a crucial element of the Sports Policy.
f) Sports for the disabled should be emphasised as a key component of the Sports Policy, especially in light of the Special Games Federation's recognition and the Paralympic Games' expanding popularity and reach.
g) The state government will work with state associations to specifically create a structured competition system for individuals with disabilities at the sub-district, district, and state levels. This will result in a disability sports calendar that is well-established. A plan for awarding athletes with disabilities will be developed. Taken from the Journal of the 2015 Haryana Sports and Physical Fitness Policy

Uttar Pradesh
a) Uttar Pradesh government established Indian first physically challenged stadium in Uttar Pradesh.
b) Since 2009, the Uttar Pradesh Para Sports Association has been working tirelessly to give divyangjan people in the state of Uttar Pradesh access to sports and to develop a great platform on which to compete. The results of the UP Para Sports Association's earnest and committed efforts can be seen in the athletes who have already represented India in national and international competitions, such as the Paralympics. Uttar Pradesh State has already sent more than a hundred Para athletes to compete in international competitions.
C) At a ceremony in Meerut, the Uttar Pradesh government presented cash prizes to each of the 17 Indians who placed first in the Tokyo Paralympics. Retrieved from: http://upparasports.in/about-ushttps://www.hindustantimes.com/cities/lucknow-news/tokyo-paralympics-uttar-pradeshgovernment-to-felicitate-medallists-in-meerut-next-month-101632940763269.html

Tamil Nadu
Children under the age of 16 are admitted free of charge to the sports facilities in the stadiums managed by the Sports Development Authority of Tamil Nadu, and other people with disabilities may be eligible for a 50% discount.
a) Under the Panchayat Yuva KildaAur Khel Abhiyan (PYKKA), the Sports Development Authority of Tamil Nadu may designate a specific time slot for individuals with disabilities in all facilities.
b) The existing sports facilities could be reinforced to improve their accessibility for individuals with disabilities.
c) People with severe disabilities may also be admitted to the Stadium for free when accompanied by an attendant.
d) Every year, competitions may be held for different categories of disabled or differently able individuals

Titir Hore and Sushma Ghildyal

Punjab

A) Punjab state government give best sports persons with disability in every year. One for men and one for women

B) A Centre of Excellence for Disability Sports is all set to be constructed at Zirakpur on the Brazilian Model.

C) According to Divyang jansah ktioaran Yojna, According to the new sports policy of the state government, all disabled athletes who win gold, silver, or bronze medals in Paralympic sports will be eligible for financial awards just like other athletes. The athletes will be chosen from among the top 20 players and one differently able athlete who has participated in various international tournaments and won medals in national or international championships. They will also be graded on a 100-point system in accordance with guidelines. As with athletes who are able-bodied, each of these players will receive a monetary award along with a trophy and blazer, per the Sports Department's regulations. All disabled athletes who place first, second, or third in Paralympic sports will be eligible for financial rewards in the same manner. Retrieved from: Punjab State Schemes (punarbhava.in)

Odisha

A. In order to be eligible for an Odisha government sports pension, an individual must have represented their state or region at the senior or junior national championship level in one of the 39 recognised sports disciplines, including sports for people with disabilities as listed in Annexure-1. However, in the instance of Paika Akhada, the candidate must have participated in competitions at least five times, either at the state or district levels, as sanctioned by the state-level agency or the district council of culture, as applicable, or five times combined in competitions or Mahastoba organised by reputable leading organisations or institutions at "the state or district level.

B. A new kind of infrastructure and appropriate sports facilities for people with disabilities.

Retrieved from: Infrastructure, hostel facilities for PwD sportspersons in Odisha sought | Bhubaneswar News - Times of india (indiatimes.com) Department.sportsodisha.gov.in https://www.newindianexpress.com/states/odisha/2021/oct/05/pramod-urges-govt-to-makestadiums-disabled-friendly-2367760.html

Gujarat

a) Under its National Centre of Excellence Scheme, the Sports Authority of India established a Para centre in Gandhinagar, which is a S.A.I regional centre.

c) Under the Khelo India Scheme, 29 Para-athletes in four different Para sports disciplines have been identified and are receiving a monthly out-of-pocket allowance of Rs 10,000.

d) According to the guidelines of the approved programme, the chosen athletes get support in the form of professional coaches, Sports gear, board and lodging, exposure of sports gear to competition, educational costs, health and insurance costs, and stipend.

e) Under the different Khelo India verticals, a number of programmers have been introduced with the aim of achieving the goal of extending and advancing sports culture. The Khelo India Scheme is being implemented by the Gujarat ministry with the dual goals of encouraging widespread participation and elevating sportsmanship. Retrieved from: Gujarat- the times of India

Himachal Pradesh

A. The objective of the Himachal Pradesh Sports Council is to encourage sports in the state. A budget of Rs. 80.00 lakh was set aside for the organisation's various sports activities in 2015–16. These endeavours included cash awards to outstanding athletes in the state, coaching camps, organising rural and women's sports tournaments, grant-in-aid to recognised State Sports Associations, voluntary sports clubs, District Sports Councils

B. In 2014, the Department of Youth Services and Sports organised district- and state-level sports tournaments to support athletes with physical disabilities. For this purpose, Rs. 10 lakh was expended. District Kullu hosted the state-level competitions on December 2 and 3, 2014. Rupees have been set aside in the budget for this purpose for the 2015–16 financial years.

C. It is indisputable that sports, recreation, and cultural opportunities help PWDs integrate into society and become more socially integrated. The state will provide the infrastructure and equipment needed to enable individuals with disabilities to showcase their abilities in sports and cultural events. Appropriate measures will be taken in this

regard. Taken from: Youth Services and Sports Department, Government of Himachal Pradesh, Activities and Achievements

Karnataka

a) Sports will be used and promoted as a tool to raise the confidence and self-esteem of disabled people, taking into consideration their performance in the recently concluded Paralympics and their inherent ability to excel on international platforms.

b) All levels of sports infrastructure must eventually become accessible to people with disabilities. In this regard, international norms shall be strictly complied with and applied in a warlike manner.

c) Regular talent identification drives will be held in order to identify talented kids at an early stage.

d) In order to prepare elite athletes from the differently able category for success in national and international competitions, sports training centers have been upgraded gradually.

e) Internationally renowned sports equipment is available to help them prepare for the best.

f) Several Paralympic categories were examined, and a mapping of the differently able athletes' abilities in relation to each category was completed. This will be carried out in compliance with the global bodies' classification standards.

g) Deliberate attempts to modify various sports to better suit the needs of individuals with disabilities. Moreover, promoted were specially designed sports for the disabled, like wheelchair tennis, curling fencing, rugby, basketball, baseball, cricket, golf, etc.

h) To ensure that talent is constantly developed and encouraged for excellence, sports technology interventions and sports science support will be employed.

i) Sports competitions held at lower levels, like the Taluka and district levels, by accredited sports associations will receive support. Support will be provided for the regional and national tournaments run by accredited sports associations.

j) The services of certified instructors and support personnel who possess the necessary expertise in each sport category according to classifications will be made available.

k) The differently able person's performance is acknowledged through financial incentives, awards, post-career support for work in government agencies, and other systems of assistance detailed in this policy.

l) Under the Sports Excellence Scheme and CSR, gifted athletes with the potential to succeed in international competitions will receive support.

m) The Department of Empowerment of Disabled Persons was appropriated to supplement the resources and policy directives required for ongoing assistance.

n) The need for the services of qualified coaches and their supporting personnel; acknowledgment through financial incentives and awards; post-career assistance through employment in government agencies and other support systems delineated in this policy; support through the Sports Excellence Scheme and corporate social responsibility taken from the 2018 Karnataka State Policy

Delhi

A) Delhi high court has asked the AAP government to carry out a social disability audit within six weeks, taking note of lack of infrastructure for persons with disability. Reference – The times of India, Annual state meets are organised by the State Paralympics Committee of India (PCI), which is affiliated with the Delhi Para Sports Association. The top athletes are shortlisted by the Delhi Para Sports Association for these events. These PCI-affiliated state/UT units and sports/disability-wise associations will send entries out of the short list of players selected in their meets through the respective affiliated state units only, in conjunction with PCI's annual announcement of the National Championships. After reviewing these lists, PCI will once again compile a short list of the top players eligible to compete in the National Championships.

B) Annual state meets are organised by the DELHI PARA SPORTS ASSOCIATION in collaboration with the State Paralympic Committee of India (PCI). The top athletes are shortlisted by the Delhi Para Sports Association for these events.

C) Since 2006, the Delhi Para Sports Association has worked tirelessly to promote sports among ambitious people in Delhi State and to give athletes a fantastic platform on which to succeed. The athletes who have already represented

66097

Uttarakhand
a) Uttarakhand government take some necessary step for the disabled sports persons like the state government, on the occasion, also presented wheel chairs, crutches, hearing aids and cheques to the disabled achievers. A special monetary assistance of Rs 25,000 was given to two couples who married disabled persons.
b) On November 23, 2021, the New Sports Policy 2021 draft was approved in a cabinet meeting presided over by Uttarakhand Chief Minister Pushkar Singh Dhami. The government will establish centres of excellence for high-priority   sports   throughout   the   state   as   a   policy.
c) The sports policy stipulates that 2600 players statewide will receive scholarships worth Rs 2,000 a month each year, but that physical examinations and sports aptitude tests will be used to identify the players starting at age eight.
d) The state's athletes will have more opportunities to showcase their abilities on the national and international scene with   the   implementation   of   the   sports   policy.
e) The state government has provided government jobs for medal winners in all categories of national and international sporting events under this policy. Taken from: Drishtiias.com/printpdf/sports-policy-approved-by-uttarakhand-cabinet; Uttarakhand - the times of India

Bihar
A. Bihar state government introduced Bihar Outstanding Sportsperson Appointment Rules, 2014Published vide Notification No. 9/Ni -18-01/2014-GAD-16646, dated 04.12.2014
B. The Para Sports Association of Bihar's director, Sandeep Kumar, stated: "Sharad Kumar and Pramod Bhagat have been staying in other states for practice for the last few months." Even though in the beginning we provided them with training, this location lacks the infrastructure and space they required for practice. As a result, on August 14, 2021, they moved to other states. Retrieved from: https://www.hindustantimes.com/cities/patna-news/two-para-athletes-frombihar-part-of-indian-team-in-tokyo-paralympics-101629822306189-amp.htm

In the discussion of the result for each of the table data we found that the performance of Indian athletes in the Paralympics from 2000 to 2020 Paralympics games, shows that Rajasthan haunted maximum medals in the Paralympics because the Rajasthan government established different sports control boards in order to help individuals with intellectual and developmental disabilities live healthy lives and realise their full potential in both sports and life, Rajasthan should provide them with opportunities, services, and support. Rajasthan government has taken some necessary steps to meet the sporting needs of physically handicapped Sports persons. Due care shall be taken to ensure that there are sufficient infrastructure, training facilities, and competitive events to enable them to participate fully in sports. District and state-level tournaments shall be organized in various games for physically disabled Persons. Physically Handicapped sports persons shall be provided all facilities equal to general sports persons. Haryana achieved the second position in medal tally in the Paralympics from 2000 to 2020, by securing a total of 5 medals. According to Sandeep Kumar, the director of the Para Sports Association of Bihar, "Sharad Kumar and Pramod Bhagat have been staying in other states for practice for the last few months." Although we trained them initially, this place does not have the facilities or space needed for them to practice. They relocated to different states on August 14, 20210, as a result. A deliberate attempt was made to modify various sports to accommodate the needs of individuals with disabilities. Additionally, with the assistance of the relevant state associations, activities for people with disabilities such as wheelchair tennis, curling, fencing, basketball, rugby, baseball, blind cricket, and blind golf will be promoted. The Special Games Federation has benefited from the recognition, and the growing interest in and popularity of Paralympic sports have made it possible to concentrate on sports for the disabled as a crucial aspect of the sports policy. The scheme of awards to sportspersons with disability are prepared and other govt job opportunities were provided to athletes after that Uttar Pradesh secured third in medal position Uttar

Pradesh government established Indian first physically challenged stadium in Uttar Pradesh and since 2009, actively working to promote sports among the state's divyangjan population and offering a fantastic environment for sporting success. The athletes who have already represented India in national and international sporting events, such as the Paralympics, are a direct result of the UP Para Sports Association's heartfelt and committed efforts. Uttar Pradesh State has already sent more than a hundred Para athletes to compete in international competitions. At a ceremony held in Meerut, all of India's paralympic medallists were presented with cash prizes. The government of another state, such as Karnataka, provides the required infrastructure, talent identification, international standard sporting goods. The states like Tamil Nādu, Punjab, Bihar, Gujarat, Himachal Pradesh, Uttarakhand, Odisha, and Delhi all these states have secured average numbers of medals as compared to geographical prospects within the state. By going through the above discussion, it can be concluded that it is not only about infrastructure and facilities provided by the government that the state with the best facilities performs very well with the top position in the medal tally. It might also be the reason for the culture of the different states because each and every state is dominated by different sports and events following their culture and they might do well in those particular sports. Although it has revealed that there is a linear relationship between the facilities and performance, there are some exceptions also. As Karnataka has provided more facilities than Uttar Pradesh but secured less no. of medals (01) in comparison to Uttar Pradesh (03).

CONCLUSION

Attempts were being made by the researcher to understand the links between medal tallies with the respect geographical context of Indian Paralympics athletes. Moreover, a positive effort has been made by the researcher to assess the relationship between state government facilities and the medal tally of a Paralympians of India. From the present study, the following conclusions may be drawn

1. Overall results of this study show that it is not only about infrastructure and facilities provided by the government that the state with the normal facilities performs very well with the top position in the medal tally. It might also be the reason for the culture of the different states because each and every state is dominated by different sports and events following their culture and they might do well in those particular sports.

2. Although it has been revealed that there is a linear relationship between the facilities and performance, there are some exceptions also. As Karnataka has provided more facilities than Uttar Pradesh but secured less no. of medals (01) in comparison to Uttar Pradesh (03).

3 From the overall study, the researcher concluded that most of the medals were secured by the athletes of Rajasthan, followed by Haryana and Uttar Pradesh.

ABSTRACT

Cricket is a sport that demands a unique blend of physical prowess and technical finesse. Among the many skills required for success in cricket, batting stands out as one of the most critical aspects. The relationship between grip strength and bat speed has not been conclusively established. The purposes of this study was to determine the relationship of grip strength to bat speed and also to see the effect of home exercise program on grip strength. The subjects for this study were 40 male members (mean ±SD, age 18.27 ± .90 years, weight 62.61 ±6.88 kg, height 159.3±5.78 cm) of cricket academy of department of Physical Education, Aligarh Muslim University, Aligarh India. Subjects were randomly divided into an experimental group and a control group. For 6 weeks, both groups participated in their usual cricket practice sessions, but the experimental group also performed extra forearm and grip strengthening exercises, whereas the control group did not. Grip strength was measured by a Camry Model: EH101 hand dynamometer (ISO 9001 Certified by SGS), and the Str8bat Cricket Sensor was used to measure instantaneous bat Speed at the point of contact with the ball. The correlation between grip strength and bat speed revealed significant relationship between grip strength and bat speed (r = 0.851, p= 0.003). t-test performed on all subjects revealed that a significant (p < 0.001) increase in grip strength did occur over the course of the study. The results of this study indicate that grip strength and bat speed are significantly correlated, therefore it may be necessary to spend more time and resources on forearm

training to increase grip strength in order to increase bat speed. Further it was noted that there was increase in grip strength after participants went through home exercise program.

INTRODUCTION

Cricket, a sport celebrated for its rich history and diverse formats, demands a fusion of skill, strategy, and physical prowess. In this pursuit of excellence on the cricket field, an often understated yet essential factor is grip strength. The act of holding a cricket bat and executing powerful and precise shots depends significantly on the player's ability to generate, control, and maintain grip strength. While batting speed is a composite outcome of several interconnected factors, grip strength emerges as a cornerstone in shaping a cricketer's performance. As cricket continues to evolve with innovations like T20 cricket, the role of power hitting has gained paramount importance. Batsmen are increasingly required to deliver quick and forceful shots, making bat speed a crucial determinant of success. This, in turn, places an added emphasis on the ability to maintain a strong and stable grip throughout the shot execution process. Whether it's a blistering drive down the ground or a deft touch to fine leg, the connection between grip strength and bat speed becomes evident. Therefore, understanding the relationship between these two elements holds the key to unlocking the latent potential of cricketers at all levels.

It's up for debate which method will increase bat speed. Bat speed may or may not be increased when warming up before batting by swinging different weighted bats. According to the specificity principle of training, bat speed will increase if the bat used for warm-up is slightly lighter, identical to, or slightly heavier than the bat that will be used in competition, but training with extremely light or extremely heavy bats actually reduces bat speed (1). Cricket players have been encouraged to participate in conditioning regimens that include resistance training (2, 3, 4, 5). However, it is interesting to note that studies have found that long-term, heavy, general resistance training programmes may actually reduce bat speed. (6, 11).Forearm strength, in the opinion of many coaches and athletes, is a crucial factor in bat speed. For this reason, grip and forearm strengthening exercises are a common component of conditioning programmes. These workouts increase bat speed, which enhances hitting performance. This strategy is not without debate, despite its appeal. It takes the entire body to bat. The lower extremities' summation and continuity of joint torque, which travels up the trunk and up to the upper extremities, accounts for a significant portion of the power. This research paper embarks on a comprehensive exploration of the intricate relationship between grip strength and bat speed in cricket. Beyond that, we investigate the practical implications for players, coaches, and trainers, seeking to offer insights that can be harnessed for enhancing performance. Moreover, a fundamental aspect of this investigation lies in the effect of strengthening exercises on grip strength. Given the acknowledged importance of grip strength, a critical question arises: Can targeted exercises designed to enhance grip strength translate to improved bat speed and, consequently, more effective batting performance? This paper seeks to answer this question by scrutinizing the existing literature, conducting empirical research, and drawing conclusions from the amalgamation of both sources.

METHODS

Participants

The study was conducted after obtaining approval from their search ethical committee. Forty volunteering males aged between 17 and 20 years were assessed. Exclusion criteria included a history of any neurologic or orthopedic problems that could impair grip strength, as well as any pathology or trauma to the upper extremity or neck region in the past or present. Participants with any injury, illness, or pain in their upper limbs or elsewhere in the body that could affect their grip strength assessment were also excluded from the study. The inclusion criteria were as

follows: (1)capable of autonomously completing the grip force measurement in four positions of arm as directed;(2)capable, free of physical infirmity and mental sickness, such as limb deficiency, limb deformity, and depression. (3) right-handed, right hand was also the dominant hand. Based on the inclusion and exclusion criteria, we thoroughly analyzed all participants' medical records. We began by screening through the diagnosis reports produced by doctors. Then, suitable subjects were interviewed, and those who met all of the criteria were included in the study. Subjects were thoroughly briefed on the experimental methods prior to data collection, and informed consent was acquired.

Subjects

40 male members of a cricket academy from the department of physical education at the Aligarh Muslim University in India served as the study's subjects. The average age of subjects was (mean± *SD*, age = 18.57 ± 1.2 years, average height = 160.5 ± 5.6 cm, weight = 65.4 ± 6.88 kg, In the study, batters were the only participants. Prior to any testing, each subject gave their written informed consent, which was obtained through an Institutional Review Board, which approved the study's use of human subjects. (Table 1)

Measurement Instruments

Datawascollectedusing2devices:Camry Model: EH101 hand dynamometer (ISO 9001 Certified by SGS), and the Str8bat Cricket Sensor. The hand dynamometer was used to test grip strength, and the Str8bat Cricket Sensor was used to measure bat speed at the instant of contact with the ball. Speed w a s recorded in kilometer p e r hour.str8bat sensor is all about – Instant, Visual & Actionable batting Insights for each session you play, str8bat provides you with a dashboard. This dashboard summarizes all of batting information, including bat speed, bat left angle, impact pitch map, and more.[8]

Procedures

Each of the 40 subjects was first tested for grip strength according to the protocol established earlier. All participants' grip strength was assessed in four different arm positions. (1) seated, shoulder in a neutral position, relevant arm by the side, elbow completely extended, (sitting with elbow extension). (2) seated, shoulder neutral, relevant arm by side, elbow flexed at 90, (sitting with 90 elbow flexion). (3) sitting, neutral shoulder, relevant arm by the side, elbow flexed at 90, palm facing downwards (sitting with elbow flexion, pronation). (4) sitting, neutral shoulder, relevant arm by the side elbow flexed at 90, palm facing upwards (sitting with elbow flexion, supination). All the measurements were taken in an armless straight backed chair. The hand dynamometer was customized to fit the participants' hands. The patients were instructed to squeeze the hand dynamometer with maximum force for 1 second on demand while holding it on the second knuckle. Grip strength was measured in each position for three trials on each hand. The order of the four grip strength test postures was the same in all individuals. The time between measurements was 30 seconds. The maximal grip strength was determined by taking the highest value from three trials. Before beginning the trial, subjects were allowed to use less than their maximal strength to acclimatize to the test. The STR8BAT Sensor was used to measure bat speed after the grip strength test. It took each player around 10 minutes to warm up. Stretching of the upper and lower extremities was done after the 40-meter sprints, and then cricket balls were hit. Each participant was told to approach the batting end of the wicket and assume his position. To denote the proper location, a mark was put on the ground. Each player's scores totaled fifteen. Each participant was instructed to use their typical swing patterns to strike the ball thrown by a medium pacer. Each participant was told to swing as hard as he could while keeping proper form in order to make contact with the ball." The trial was not counted if the subject did not hit a clear drive, missed the ball or if it did not register on the STR8BAT sensor. The individual was invited to swing once more until she had given 15 acceptable performances.

Between trials, the subject had ample time to prepare for the next one. The five bat speeds with the highest times were utilized to calculate the mean score. The 40 cricketers were split into the experimental and control groups at random. For the grip strength and bat speed tests, both groups used the identical testing

Junaid Ahmad Parrey *et al.,*

methodology. Analysis of the mean posttest results for the two groups showed no pre-existing differences (p 0.05). Both teams engaged in standard cricket practice routines, hitting sessions and team weight conditioning. The bicep curls, squats, lat pull downs, dead lifts, hamstring curls, dumbbell flies, triceps extensions, and crunches were among the weight training exercises that were performed in three sets of ten repetitions each. Exercises for the shoulder's internal and external rotation were also carried out with a Thera band. Neither group engaged in any exercises meant to target the forearms or strengthen the grip during these resistance training sessions. Six grip and forearm strengthening exercises were carried out by the experimental group in accordance with predetermined protocols. These wrist workouts comprised grips, supination-pronation, wrist rolls, wrist curls, wrist extensions, and one-handed chops with a hammer. Following each session of cricket, these exercises were carried out three times per week for six weeks. Every session had to be attended by every subject. A participant was excused from the study if they skipped more than one experimental treatment. However, subjects were permitted to make up one missing session. The week's sessions were spaced out by at least one day. The exercises were consistently switched around. Each session would begin with a different activity for the subjects than the one from the prior session. The wrist extensions and curls were carried out in superset fashion. Between sets, each subject was given 45 to 75 seconds of rest. The amount of work increased throughout the course of the six weeks. To make sure the concept of progressive overload was being used, this was done. Every subject kept swinging the bat throughout the drill. This made sure they wouldn't lose any motor control while being tested. Throughout the course of the trial, subjects in both groups were instructed not to engage in any additional grip and forearm strengthening activities. The grip strength of both groups were assessed again after 6 weeks using the same methodology as the initial test.

Statistical analyses

The relationship between grip strength and bat speed was examined using a Pearson product-moment coefficient of correlation. T test was used to compare the group means in order to evaluate the impact of forearm training exercises on grip strength. The significance threshold was established at p 0.05.

RESULTS

The correlation between grip strength and bat speed revealed significant relationship between grip strength and bat speed (r = 0.851, p= 0.003). t-test performed on all subjects revealed that a significant (p < 0.001) increase in grip strength did occur over the course of the study (Table2).

DISCUSSION

This study looked into the connection between bat speed and grip strength during cricket batting. The study's findings suggest a strong correlation between grip strength and bat speed. Only training tailored to a particular sport can have a direct impact on a particular movement in sports, which is a tenable explanation for the findings. The sole difference between the two groups' participation in the identical programme was that the experimental group engaged in grip and forearm strengthening activities. The kinetic link model could be able to explain the findings. According to the model, the hips, torso, and upper extremities are made up of separate parts that work as an interconnected system[4]. This hypothesis suggests that the bat's force and velocity are primarily produced by the hips and torso, with the wrists serving only as a conduit for the force to the ball. The wrists merely transmit the force produced by the hips and torso, with little to no role in generating additional bat speed. The wrists may play a bigger role in regulating the speed and direction of the bat during the swing than in producing force and velocity. The results of this study imply that it may be justified to devote more time and effort to forearm training in order to strengthen the grip and increase bat speed. In this study, sitting elbow extension was associated with a greater HGS value, while sitting elbow supination was associated with a lower HGS value. These results are closely in line with those of other investigations, which discovered that standing

Junaid Ahmad Parrey *et al.,*

as opposed to sitting gave rise to higher strength in the patients [10-11]. On a physiological level, this might be attributed to the standing position's greater temporal and spatial summation of the contracting muscles.

Furthermore, the grip strength of the dominant hand (the right hand) is often stronger than that of the non-dominant hand (the left hand). The bulk of studies on grip strength support these findings. [12-13]. The dominant hand also receives greater exercise than the non-dominant hand since it is utilised more frequently in daily activities. In general, the dominant hand's intrinsic muscular strength is higher than the nondominant hand's [13]. Additionally, this explains why the right hand grip is more powerful than the left. Future studies should involve a larger sample size, including high school and professional athletes, be conducted in game settings, and use longitudinal designs with longer time horizons. One could determine whether there is a higher association among highly skilled or semiskilled players by using athletes with different skill levels. With the use of computers and modern technology, bat speed can be acquired during a game. The results of this study should be repeated using data from real-world gaming settings.

CONCLUSION

In conclusion, this study has provided valuable insights into the relationship between bat speed and grip strength in cricket. The findings of our research support the hypothesis that a significant relationship exists between these two variables. Through a comprehensive analysis of both qualitative and quantitative data, it became evident that a stronger grip positively influences a cricketer's ability to generate higher bat speeds. One of the key findings of this study is the positive correlation between grip strength and bat speed. This suggests that as a cricketer's grip strength increases, their ability to swing the bat with greater velocity also improves. This insight has significant implications for coaches, trainers, and players themselves. Strengthening grip muscles can be incorporated into training regimens to enhance a player's performance at the crease. It's essential to recognize that while grip strength is a contributing factor to bat speed, other elements, such as technique, body mechanics, and overall physical fitness, also play a vital role in a cricketer's performance. Coaches and players should consider these factors holistically when striving to optimize their batting abilities. Future research in this area could explore the specific exercises and training routines that can enhance grip strength in cricketers and evaluate their effectiveness in improving batting performance. Additionally, investigating the impact of grip strength on other aspects of cricket, such as fielding and bowling, would further expand our understanding of its role in the sport. Finally, a study on cricket players' perceptions toward the relationship between grip strength and bat speed would also be very enlightening. Many of the subjects in the experimental group commented that they thought the grip-strengthening exercises will not help them increase their bat speed. Actually it did. This line of research could provide information about how myths are passed on.

ABSTRACT

The intention of this investigation was to find out the impact of yoga training on selected motor abilities among pubertal tribal students. To achieve the purpose of the study, thirty girls students from Government higher secondary school, Kalpetta, Wayanad, Kerala, India were selected as subjects. Their age ranged from 12 years to 17 years. Two equal groups of 15 participants each were formed by randomly dividing the chosen subjects. Group-I underwent yoga training, Group-II acted as control group. Sit and reach test and Groningen reaction time test was used to measure the chosen dependent variable's flexibility and reaction time both before and after training. Through the use of a paired 't' test, the evaluated data from the two groups was analysed. The magnitude (%) of the changes was also computed. To abolish the early mean disparity, the two group's data (Pre & Post) were calculated through 'T' test. The confidence level 0.05 was set. Due to the effect of yoga training flexibility and reaction time of girls students were notably progressed.

Keywords: Yoga Training, Flexibility and Reaction time

INTRODUCTION

Yoga is a long-standing Indian tradition that dates back more than 3,000 years. The exact meaning of the term "yoga" is "to yoke" the mind, body, and spirit. Yoga is more than simply a physical activity for young children. Children who practice yoga regularly can build abilities that will benefit them in adolescence and later in life. Young children

66109

are spending more time on screens, therefore practicing concentration and memory is important. Yoga improves attention and focus, which can lead to increased focus, memory, and academic achievement. Yoga broadens your child's range of motion and balances the muscles that surround their tendons by making them more flexible. Various positions are intended to extend and stretch the body while strengthening growing joints. Your youngster will benefit from regular yoga practise in terms of flexibility. The positions encourage adolescent cartilage growth in addition to bone strengthening. Try the stretches below to get more flexible. Reaction time, in contrast to reflexes, which the brain does not process, may be honed and enhanced by dietary and behavioral modifications. The safe and beneficial use of cognitive training, mindfulness and meditation practices, nutritional supplements, and other variables can all increase reaction speed.

Statement of the Problem

The intention of this investigation was to find out the impact of yoga training on selected motor abilities among pubertal tribal students.

METHODOLOGY

To achieve the purpose of the study, thirty girls students from Government higher secondary school, Kalpetta, Wayanad, Kerala, India were selected as subjects. Their age ranged from 12 years to 17 years. The selected subjects were randomly assigned into two equal groups of 15 subjects each. Group-I underwent yoga practices and group-II acted as control. The selected dependent variables flexibility and reaction time was assessed by using sit and reach test and Groningen reaction time test before as well as after training.

Training Programme

The design for the experimental group-I yoga practices the subjects were examined for their heart rate in response to different work bouts, for proposed repetitions and sets, alternating with active recovery based on work-rest ratio. They performed three different types of yoga such as asana, suryanamaskar and pranayama was increased once in two weeks.

STATISTICAL TECHNIQUE

The data on flexibility and reaction time collected from the experimental and control groups were statistically evaluated using the paired 't' test to see if there were any statistically significant differences between the pre- and post-test. A selection of dependent variables' changes as a result of the experimental treatment were also calculated using percentage changes. In each case, the threshold of confidence for significance was set at 0.05. The pubertal girl's flexibility and reaction time was analyzed statistically and presented in table- I.

The obtained 't' ratio value is 4.26 of flexibility was greater than the required table value of 2.15 for the degrees of freedom 14 at 0.05 level of confidence. Hence it was concluded that due to the effect of twelve weeks of yoga practices on flexibility of the subjects was significantly improved. The obtained 't' ratio value is 3.13 of reaction time was greater than the required table value of 2.15 for the degrees of freedom 14 at 0.05 level of confidence. Hence it was concluded that due to the effect of twelve weeks of yoga practices reaction time of the subjects was significantly decreased.

CONCLUSION

As a results of the study yoga practice on flexibility (13.89%) and reaction time (3.69%) pubertal girls was greatly enhanced. Research suggests that appropriate yoga practice will improve flexibility and reaction time.

ABSTRACT

Throughout history, human expression has taken myriad forms, with music standing out as a profound and enchanting medium to convey emotions, dreams, and desires. This paper explores the transformative power of music as a tool for combating mental distress, enhancing well-being, and fostering social connections. Music serves as a potent antidote to the strains of modern life, offering stress relief, renewed energy, and heightened self-assurance. Drawing from ancient traditions, India uniquely views music as an integral part of Yoga, where both disciplines share a foundation rooted in breath. When individuals engage in singing or playing musical instruments, they inadvertently incorporate aspects of yoga asanas, benefiting from exercise while reveling in the joy of music. The synergy between music and yoga is further illuminated by their shared connection to the seven chakras, each aligning with the seven notes of a musical octave, thus influencing various facets of the human body and mind. In contemporary mental wellness practices, a wide array of sound-based healing techniques, including Solfeggio frequencies and 432 Hz music, harness the therapeutic potential of sound and vibration. These methods are instrumental in promoting mental well-being and are integral components of wellness programs worldwide. The recent COVID-19 pandemic underscored the profound impact of music on society, demonstrating its ability to elevate mental states, nurture social bonds, and provide respite from the monotony of daily life. By integrating music into one's lifestyle, individuals can experience tranquility, reduce stress, enhance immunity, and maintain holistic physical and mental well-being during challenging times. This paper examines the profound connection between music and yoga, shedding light on their therapeutic potential and their collective ability to enrich lives and cultivate harmony in body and mind.

Keywords: instrumental, physical, yoga, paper, practices, distress.

Anjalee Narayan and Rashmi Srivastava

INTRODUCTION

In the fast-paced world we live in today, finding inner peace and maintaining physical and mental well-being has become increasingly challenging. However, two ancient practices, music, and yoga, offer a harmonious path towards achieving this balance. This comprehensive article explores the profound connection between music and yoga, and how they can together enhance our physical and mental health.

The Power of Music

Music has been a universal language since time immemorial, transcending cultural, linguistic, and geographical boundaries. It has the remarkable ability to evoke emotions, create moods, and connect individuals on a deep emotional level. Across the annals of history, human expression has manifested in a myriad of diverse forms, with music emerging as a profound and enchanting conduit for the conveyance of emotions, aspirations, and yearnings. This scholarly discourse delves into the transformative potential inherent in music, as a formidable instrument in the battle against mental turmoil, the enhancement of overall well-being, and the cultivation of interpersonal bonds. Music, in its essence, emerges as a potent elixir, alleviating the tumultuous strains of contemporary existence, thereby endowing individuals with solace, rekindled vitality, and an augmented sense of self-assuredness. Music has long been embraced as a powerful means to combat the emotional challenges brought about by various factors. It has consistently demonstrated its ability to act as a significant stress reliever, an energizing force, and a confidence-boosting agent for both individuals and communities alike. During periods of solitude and self-isolation, people have turned to music for solace. It has been recognized for its effectiveness in elevating one's mood, catalyzing enhanced productivity, fostering social connections, and creating memorable and enriching life experiences.

Music Therapy

One of the ways in which music positively impacts our well-being is through music therapy. This therapeutic approach utilizes the healing properties of music to address various physical and mental health issues. From reducing anxiety to improving cognitive function, music therapy has shown its efficacy in numerous studies.

The Healing Frequencies of Music

Music therapy often explores the concept of healing frequencies. Certain frequencies and harmonies in music are believed to have a direct impact on our physical and emotional well-being. For example, the 432 Hz frequency is often associated with relaxation and a sense of calmness. Within the realm of contemporary mental health and well-being methodologies, an expansive array of sound-based therapeutic modalities has taken root, encompassing the profound potentials of sonorous vibrations, including Solfeggio frequencies and the harmonious resonance of 432 Hz music. These techniques have proven to be instrumental in the promotion of mental equanimity, ingrained as integral facets within wellness paradigms of global repute.

The Symbiosis of Music and Yoga

Evoking inspiration from time-honoured traditions, India offers a unique perspective, recognizing music as an intrinsic component of *Yoga*, the two disciplines fundamentally intertwined with the life-giving breath. When individuals immerse themselves in the act of singing or playing of musical instruments, they inadvertently integrate the core principles of 'yoga asanas', thereby reaping the physical benefits while luxuriating in the euphoria of music's embrace. The synergy shared between music and *yoga* is further elucidated by their mutual association with the seven chakras, each harmonizing with the seven notes within a musical octave, consequently exerting influence upon multifarious aspects of the human physique and psyche.

ANALYSIS – SYNERGY OF MUSIC AND YOGA

Music has attained the highest echelons within the realm of fine arts, owing to its captivating, melodious harmonies and its ability to captivate people universally. While music is generally recognized worldwide as an art form, India

uniquely embraces it as an integral aspect of Yoga. The essence of Yoga lies in exploration and practice, with its ultimate objective being the mastery of breath control. Similarly, music's essence is intricately tied to the rhythm of respiration. To become proficient in the art of singing, one must learn to control and harmonize their breath. In essence, just as breath serves as the foundation of yoga, 'swara,' or musical notes, forms the cornerstone of music. Numerous prominent Indian philosophers who have embraced Yoga philosophy have acknowledged music as a means to effectively practice Yoga. Therefore, the profound and intricate nature of both music and Yoga defies simple description. When viewed from a scientific perspective, it becomes apparent that both are intrinsically connected through what can be described as the 'shvaas naatam setu', i.e., the bridge of breath. Guiding the flow of breath in a specific direction is the core duty shared by both music and Yoga. When the natural equilibrium within the human body is disrupted, vulnerability to diseases increases. During such instances, the restoration of vitality and enthusiasm, achieved by harmonizing the body, mind, and spirit, can be facilitated through the practice of 'Sangeet Yogasan'.

In the pursuit of preventing mental and physical ailments through the use of musical expressions, it can be affirmed that singing, instrumental play, and dance constitute three gentle and pleasurable activities that yield positive impacts on both the body and the mind. The harmonious sounds of music serve as a fusion of yoga, meditation, and 'sadhana,' aligning them with therapeutic well-being. When a vocalist sings or a musician plays their instrument, they experience a heightened state of concentration akin to a meditative posture. Singing and playing instruments serve not only as enjoyable forms of exercise but also contribute to maintaining overall physical well-being. Beyond the physical and mental benefits, they also nurture the soul, offering a profound sense of satisfaction. Hence, characterizing singing and instrumental performance as forms of exercise is entirely justified. All three realms of music—singing, playing instruments, and dancing—constitute effective means of engaging in beneficial physical activity.

Just as Yogic exercises rely on various 'asanas' for disease diagnosis, the concept of the 'seating posture' assumes a pivotal role in singing and playing instruments within the world of music. Much like Yogic practices emphasize the significance of proper pose and posture, music similarly brings to the forefront the importance of the 'seating posture' for vocalists and instrumentalists. In this context, it can be regarded as a type of 'asana,' implying that while singing and playing instruments, these postures naturally exert an influence on the practitioner's body. Consequently, this medium not only offers entertainment and pleasure but also facilitates spontaneous physical exercise.

Music and Yoga can be combined in the below mentioned ways, which can amplify their benefits.
Yoga with Musical Accompaniment
1. Rhythmic Flow: Practicing yoga to rhythmic music can enhance the flow of movements, making it a more enjoyable and immersive experience. The synchronization of movement with music can create a sense of unity and harmony within the body.
2. Mood Enhancement: The right choice of music can elevate your mood, making yoga practice a joyful and invigorating journey. Upbeat music can infuse energy into your practice, while softer melodies can promote relaxation and introspection.
3. Guided Yoga Classes with Music: Many yoga studios offer guided classes with carefully curated music playlists. These classes combine expert instruction with music that complements the flow of the class, providing a holistic experience.

Meditation and Music
1. Deepening Meditation: Soft, soothing music during meditation can deepen the state of relaxation and inner peace. It creates an auditory backdrop that helps individuals transcend the distractions of the outside world and focus inward.

2. Guided Meditation with Music: Guided meditation sessions often incorporate music to create a tranquil atmosphere, aiding in introspection. The combination of soothing guidance and music can be particularly effective for those new to meditation.
3. Chakra Meditation with Music: Chakra meditation, a practice rooted in ancient Indian philosophy, involves aligning and balancing the body's energy centers or chakras. Specific musical frequencies are believed to resonate with each chakra, facilitating healing and balance.

The science behind the Harmony
The powerful combination of music and yoga can be well understood by exploring the science behind it, as explained as follows:

Neurological Correlations
Research in the field of neuroscience has shed light on how music and yoga affect the brain. Both activities have been shown to stimulate the release of dopamine, a neurotransmitter associated with pleasure and reward. This release of dopamine leads to enhanced feelings of well-being.

The Role of Rhythm
Rhythmic music, in particular, can synchronize brainwave activity. When the brain synchronizes with the beat of music during yoga practice, it can lead to a state of flow and increased focus.

Stress Reduction Mechanisms
Both music and yoga activate the parasympathetic nervous system, which is responsible for the body's "rest and digest" response. This activation reduces the production of stress hormones, such as cortisol, leading to a reduction in stress levels.

Emotional Resonance
Music has the unique ability to evoke emotions. When combined with yoga, it can facilitate the release and processing of deep-seated emotions. This emotional release can be cathartic and contribute to mental well-being.

Exploring the Incorporation of diverse 'ASANAS' during performance and training of the art of music.
In this segment, we delve into how various yoga poses such as Sukhasana, Siddhasana, Ardhmatsyendrasana, Vajrasana, and an array of other 'asanas' intertwine with the realms of singing, playing musical instruments, and dance within the world of music. Below, we elaborate on some of these postures applied during vocal performance and instrumental play:

(a) Asanas incorporated in vocal performance and their advantages.
(b) Asanas employed in instrumental playing and their advantages.

Asanas incorporated in vocal performance and their advantages
In the realm of 'Yogasan,' the bedrock lies in exploration and practice, with the ultimate aim being mastery of the 'breathing action.' Remarkably, a similar principle holds true for music, where its core principles and objectives are deeply rooted in the art of controlled breathing. The systematic understanding of controlled exhalation serves as the cornerstone of vocal artistry. In essence, just as 'breath' forms the essence of yoga, 'swara' serves as the foundational element of music, drawing a striking parallel between the two disciplines.

Pranayama
In the realm of swarabhyasa, the practice of singing and playing musical notes necessitates precise control and oversight of swaras, or musical notes. To achieve this mastery over swaras, pranayama emerges as an integral yogic

exercise, playing a pivotal role. Pranayama encompasses the art of "regulating and managing the life force, the rhythm of inhalation and exhalation." It is also referred to as 'Vaayu Sadhana,' signifying air practice. The practice of pranayama bestows the ability to govern the respiratory processes, contributing to the maintenance of a healthy and invigorated body. The practice of pranayama encompasses a range of techniques, and in the context of music, the following key activities are especially relevant: i) Bhastrika Pranayama, ii) Kapalbhati Pranayama, iii) Anulom-Vilom and iv) Udgeetha Pranayama. These techniques are essential in harnessing the power of controlled breath for musical proficiency.

Bhastrika Pranayama
This form of pranayama is performed in a seated Vajrasana posture. It involves inhaling through both nostrils and exhaling forcefully without any retention. Engaging in this practice effectively addresses conditions such as colds, asthma, shortness of breath, and various respiratory ailments, while also promoting blood purification and the elimination of toxins from the body. In the context of singing, this exercise brings stability to the 'swaras' or musical notes.

Kapalbhati Pranayama
This particular pranayama can be practiced while seated in any of the dhyana or meditation postures. In this exercise, one breathes in normally, holds the breath for a standard duration, and then exhales vigorously while contracting the stomach. Engaging in this pranayama regimen aids in alleviating ailments related to the heart, lungs, brain, and excess phlegm. It also contributes to enhancing the radiance and facial beauty, sustaining a joyful and positive mental state. In terms of singing, strengthening the lungs through this practice can help eliminate the stagnation of vowels, ultimately benefiting Naada Yoga, the yoga of music. In music, many notes are derived from the navel area. By applying pressure to the navel during note production, a true and resonant sound is produced. This navel exercise is reminiscent of Kapalbhati. To master Omkar Sadhana, a yoga technique similar to kapalbhati' is necessary to generate tones from the navel.

'Anulom-Vilom'
In this breathing technique known as 'pranayama,' individuals sit in the 'Siddhasana' posture. They begin by gently closing their right nostril using the thumb of their right hand and inhale slowly through the left nostril. After fully filling their lungs with breath, they close the left nostril using their ring and middle fingers. Then, while lifting the thumb from the right nostril, they exhale the breath slowly through the right nostril. This 'pranayama' practice serves to fortify the nervous system and promote healthy blood circulation. It proves beneficial for alleviating colds, rheumatism, coughs, bile-related issues, phlegm-related conditions, and asthma. Moreover, it enhances one's sense of joy and enthusiasm. From a vocal perspective, regular practice of this technique not only enhances vocal depth but also fosters attachment and stability in singing. Renowned flute player Shri Abhay Fagre regards playing the flute as a yogic discipline. He asserts that when playing the flute, the act of inhaling and exhaling corresponds to what yoga terms 'Pranayama.' To excel in playing or singing the flute, one must learn to control their breath, a process intertwined with meditation. Music, according to him, stands in close proximity to yoga, even without the need for specific 'yogic kriyas.'

Udgeetha Pranayama
This practice involves sitting in the Padmasana posture, where you inhale deeply while focusing your mind on your breath and then exhale while vocalizing the sacred word 'Aum.' From a singing perspective, the 'Aakar, Ikar, Okar, and Aum' exercises hold significant importance in vocal development. Thus, this pranayama proves highly beneficial for personal practice, enhancing the musician's tone and making it more enchanting. Furthermore, in *'Bhramari Pranayama,'* it is described as "resonating like a buffalo," a technique akin to humming. Humming stimulates the brain's nerve pathways connecting the ear and throat, helping singers assess their pitch accuracy and desired vocal range. In addition to the above, the significance of 'baithak' or seating postures is highlighted when discussing the benefits of utilizing proper 'asanas' in singing. Renowned music masters have embraced 'Ardhvajrasana, Sukhasan, and Siddhasana' to refine their 'swarabhyas.' Detailed descriptions of these postures can be found in the section on

the advantages of 'asanas' in instrumental performance. This asana is specifically designed for a seated position, a common practice among singers. Visual representations of these postures are provided, all emphasizing the importance of maintaining a straight spine, ensuring that the head, neck, chest, and abdomen remain aligned. This alignment is crucial to avoid hindrances in sound production. Singing with a bent or bowed neck can be detrimental to both health and the quality of one's voice. Individuals should select an 'asana' that suits their comfort and practice accordingly. The success of aspiring artists hinges on their education and dedicated practice within this context.

Asanas employed in instrumental playing and their advantages

Sukhasana
This position is remarkably simple and is referred to as Sukhasana, where one sits on the ground with their legs folded. It's not just about comfort; Sukhasana offers a myriad of benefits. When you assume this posture, your memory power gets a boost, concentration improves, and the digestive system operates more smoothly. Moreover, it can be instrumental in alleviating various health issues such as respiratory and heart ailments, indigestion, diarrhea, gout, tuberculosis, and asthma.Notably, Sukhasana isn't only vital for musicians who sing, but it's also of great importance for instrumentalists. Many musical accompaniments like the tabla, sarangi, shehnai, flute, harmonium, veena, dholak, nakkara and more are typically played while seated in this posture. Hence, not only does it enable musicians to perform with ease, but it can also contribute to the alleviation of the aforementioned health concerns.

Siddhasana
In this specific posture, much like Sukhasana, one sits on a raised platform, but here, the left foot is positioned below, with the right foot placed beside it, below the navel. This asana offers a unique purification of the nerves, allowing the pranatattva to naturally ascend. Consequently, it becomes easier to concentrate the mind, and it can aid in preventing various health issues like indigestion, respiratory ailments, heart disease, diarrhea, fatigue, gout, tuberculosis, and asthma. This posture is also relevant in the context of singing and musical performance. Some singers and tabla players, typically those of a more virtuous or elderly nature, adopt this posture while playing the tabla. Combining musical performance with this asana can have a therapeutic effect on the aforementioned health conditions.

Ardhamatsyendrasana
In this particular seated position, one arranges their body in a manner where the left leg is bent at the knee, tucked beneath the heel with the foot touching the right thigh. Simultaneously, the right leg is bent and placed over the left leg's thigh. While lying on the back, grasp the toe of the right foot with the left hand and extend the right arm behind the back, allowing the torso to bend to the right. This posture not only promotes the well-being and youthful vitality of the spine but also imparts a rejuvenating stretch to the back, legs, and waist, effectively relieving back pain and offering relief from intense gastritis. Regarding musical performance, the prescribed hand posture isn't a strict requirement in this asana since some musicians hold their instruments by hand while playing. However, from a sitting perspective, this posture is commonly employed by sitar and sarod players. Playing an instrument while in this asana can also have a therapeutic impact on the aforementioned health conditions.

Vajrasana
In this posture, both legs are bent at the knees, and one sits on both ankles, with the toes of both feet touching each other and the spine and back maintaining perfect alignment. This asana effectively dispels mental restlessness, promotes a stable intellect, and enhances the clarity of vision. Additionally, it stimulates digestion, alleviates constipation, and mitigates tonsil issues, while also channeling energy into the spine, waist, thighs, knees, and feet.

This asana is commonly employed by tabla players, particularly those of the Benaras Gharana, and players of the Rudra Veena. It's worth noting that male singers also adopt this posture to some extent while playing the Tanpura. In this seated position, the right foot is bent and kept upright, while the left foot is positioned from above. Playing musical instruments in this asana can also have a therapeutic impact on the aforementioned health conditions.

Anjalee Narayan and Rashmi Srivastava

Asanas – catalystic towards enhancing music performance and practice sessions

Considering the diverse postures employed in singing and their potential impact on various health conditions, it opens up a fresh perspective on the evolution of music therapy and introduces novel possibilities in the realm of music. It's worth noting that during an artistic performance, where the artist's skill and artistry take center stage, the audience tends not to concentrate on the various asanas and exercises being executed simultaneously. However, by examining the utilization of asanas in the context of playing musical instruments, as detailed above, it becomes evident that these postures naturally influence the physical well-being of musicians during their performances. During practice sessions, often referred to as 'riyaaz,' whether it involves singing or playing musical instruments, rigorous exercises tend to occur spontaneously. In the realm of music therapy, as the diagnostic process for various diseases evolves, incorporating the listening of different 'ragas,' significant strides are also being made in exploring the role of various postures, foot movements, and coordination within the realm of dance as valuable components of yogic exercises. It's important to recognize that 'yogic' exercises can be seamlessly integrated into singing and instrumental performance, offering substantial health benefits. To advance this approach, it's advisable to seek guidance from medical professionals and yoga instructors. By adopting such a collaborative approach, this medium can transcend its role as mere entertainment, becoming a more valuable and effective tool for the present times, enhancing the impact and effectiveness of music performances.

Yoga: The Ancient Science of Well-Being

Yoga, the ancient practice originating from India, is a holistic approach to physical and mental well-being. It involves a combination of physical postures, breathing exercises, and meditation techniques that promote harmony within the body and mind.

Physical Benefits of Yoga

1. Improved Flexibility: Yoga asanas or postures help improve flexibility, reducing the risk of injuries and promoting better overall health.
2. Strength and Balance: Many yoga poses require holding positions, which enhances muscle strength and improves balance.
3. Pain Management: Yoga has been found to be effective in managing chronic pain conditions, such as lower back pain and arthritis.

Mental Benefits of Yoga

1. Stress Reduction: Regular yoga practice has been proven to reduce stress by calming the mind and promoting relaxation.
2. Enhanced Focus: Yoga and meditation techniques improve concentration and mental clarity.
3. Emotional Balance: Practicing yoga helps individuals manage their emotions better, leading to a more balanced emotional state.
4. Improved Sleep: Those who practice yoga often report improved sleep quality and a reduction in insomnia symptoms.

Creating one's own Music and Yoga Practice

Now that we've explored the benefits and science behind combining music and yoga, it's time to consider how you can create your personalized practice.

1. Setting the Mood: Begin by selecting the type of yoga practice you wish to engage in. For a revitalizing morning practice, you might opt for a vinyasa flow accompanied by uplifting music. In the evening, a yin or restorative yoga session with calming melodies may be more appropriate
2. Choosing the Right Music: The choice of music is highly personal and should align with your intentions for the practice. Consider creating playlists that cater to different moods and intentions, such as relaxation, energy, or introspection.

Anjalee Narayan and Rashmi Srivastava

3. Syncing Breath with Music: One of the key aspects of combining music and yoga is syncing your breath with the rhythm of the music. This synchronization can deepen your practice and enhance your connection to the music.
4. Exploring Sound Healing: Sound healing, an ancient practice, involves the use of specific instruments such as singing bowls, gongs, and chimes. Incorporating these elements into your practice can enhance its therapeutic benefits.

CONCLUSION

In conclusion, the fusion of music and yogic practices is a captivating dimension that holds great promise for both the world of art and the realm of health and well-being. In the quest for inner peace and physical and mental well-being, the harmonious blend of music and yoga emerges as a profound and effective solution. This article has delved deep into the interconnected worlds of these two ancient practices of Music and Yoga, and their transformative potential. The Symbiosis of Music and Yoga illustrates how the harmonious union of these practices amplifies their effects. Yoga with Musical Accompaniment introduces the concept of a rhythmic flow, enhancing the unity between body and music. The selection of appropriate music can induce a spectrum of emotions and moods, making yoga an enjoyable journey. Emotional Resonance is perhaps the most intriguing aspect of this synergy, as it enables the release and processing of deep-seated emotions, contributing significantly to mental well-being. Meditation and Music combine in perfect harmony to guide individuals toward a tranquil space, freeing the mind from external distractions and nurturing introspection. Chakra Meditation and sound therapy with Music takes us on a journey through the energy centers of our bodies, promoting balance and healing through the resonance of specific frequencies.

The science behind the harmony between Music and Yoga peels back the layers to reveal the neuroscientific and psychological mechanisms that make the combination of music and yoga so powerful. The release of dopamine, enhanced by both practices, leads to an increased sense of well-being. The synchronicity of brainwave activity with rhythmic music ushers in a state of focus and flow. Stress reduction is made possible through the activation of the parasympathetic nervous system, which calms the body's stress response. In a world filled with stress and distractions, the union of music and yoga offers a potent remedy for achieving physical and mental well-being. The soothing melodies of music complement the serene practice of yoga, creating a harmonious journey towards inner peace and improved health. As one embarks on one's own path, one realises that this harmonious blend holds the key to a healthier and more balanced life, waiting to be explored to its infinite potential.The recent, tumultuous pandemic upheaval wrought by COVID-19 served to underscore the profound imprint that music leaves upon society, underscoring its innate capacity to elevate cognitive states, foster bonds of camaraderie, and provide sanctuary from the dreary monotony of quotidian life. By incorporating music into one's daily routine, individuals are privy to serenity, stress mitigation, fortified immunity, and the cultivation of holistic well-being, even when navigating the most arduous of life's trials. This paper meticulously scrutinizes the profound connection between the realms of music and yoga, shedding illumination upon their therapeutic potency and their collective aptitude for enriching existence and nurturing harmony within both the corporeal vessel and the labyrinthine corridors of the human psyche.

ABSTRACT

This paper delves into the dynamic intersection of gender, sports, and family, with a focus on their influence on personal identity and relationships. The primary goal of this study is to contribute to greater equity in sports participation and opportunities for all. To achieve this, a quantitative research methodology was employed, involving 20 children residing in the Sports Authority of India hostel in Thalassery. A comprehensive questionnaire comprising 17 questions was administered in February 2023, allowing for direct field study involvement. The analysis of the gathered data, facilitated by descriptive statistics, revealed a notable disparity: boys were found to be more actively engaged in sports compared to girls, influenced by parental attitudes and behaviors. These findings underscore the urgency of addressing gender imbalances in sports. To foster equity, it is imperative to challenge stereotypes, promote inclusion, and ensure equal opportunities for all individuals, irrespective of their gender, in the realm of sports. This research not only sheds light on the existing disparities but also provides a foundation for future efforts to create a more inclusive and equitable sporting environment, where all children can explore their athletic potential and foster positive relationships.

Keywords: Females, Gender, Attitude, SAI Thalassery

INTRODUCTION

In the tapestry of our lives, sports, gender, and family are threads intricately woven together, shaping our identities and the connections we forge with others. This research embarks on a profound journey to unearth the complex interplay among these three interconnected elements and how they mutually influence one another. Through the

lens of interviews and surveys, we delve into the influence of gender norms on sports participation, the multifaceted role of families in shaping athletic journeys, and how the world of sports can reverberate within the dynamics of a family. We also explore how this intersection can create opportunities or present challenges for individuals and families, aiming to illuminate the path towards empowerment and equality, regardless of gender.

The Power of Sports

Sports transcend mere physical activity; they are powerful vehicles for fostering physical, mental, and social well-being. They offer a canvas for self-expression and a stage for challenging societal norms and expectations. Throughout history, sports have provided a haven for personal liberation, particularly for women, who have faced enduring barriers to participation. From grassroots movements to the pinnacles of professional leagues, female athletes have been at the forefront of transformative change in the world of sports. While gender-based obstacles still persist, the participation of women in sports has witnessed significant growth in recent years. This evolution not only reflects changing perceptions but also underscores the resilience and determination of female athletes who continue to push boundaries.

The Crucial Role of Family

Families are the nurturing soil from which our identities and beliefs spring. They provide emotional and physical support, yet they can also be the backdrop against which gender and sports expectations unfold. Families can serve as wellsprings of positive role models and guidance, or they can become arenas were societal norms clash with individual aspirations. Family dynamics, especially concerning gender and sports, often become sources of conflict.

The phrase "Sports for all" resonates globally, emphasizing that sports are not solitary endeavors but integral aspects of our social fabric. They are a communal experience, fostering deeper understanding, camaraderie, and friendship. Beyond entertainment and competition, sports have a profound role in character building, instilling morals, and nurturing tolerance.

Significance of the Study

This study holds paramount significance on multiple fronts. Firstly, it offers a comprehensive understanding of the unique challenges and experiences encountered by male and female athletes. It sheds light on how gender influences sports participation and the opportunities that open or close as a result. This knowledge serves as a foundational stone for promoting gender equality and dismantling the discriminatory barriers that hinder equitable participation in sports. Secondly, the examination of family dynamics in sports allows for an exploration of how familial relationships, support, and expectations shape an athlete's journey, influencing their success and overall well-being. This understanding serves as a compass for designing effective support systems and interventions to enhance athletes' experiences and optimize their performance. Moreover, this research casts a spotlight on the intricate social and cultural dynamics that envelope sports. It brings to the fore the biases and inequities that continue to pervade the sporting industry, from underrepresentation of women in coaching and officiating roles to wage disparities and the persistent specter of sexism. By unearthing these issues, the study identifies areas in need of improvement and reform.

Furthermore, delving into the psychological and emotional dimensions of sports provides valuable insights into the mental health needs, stress levels, and overall well-being of athletes. Armed with this knowledge, we can establish comprehensive support systems, resources, and interventions that safeguard the holistic development and welfare of athletes. Lastly, the study examines the role of sports in society, uncovering the transformative potential of sports as a catalyst for social change and community development. It reveals how athletes can leverage their platforms to advocate for vital social justice issues, fostering inclusivity and promoting unity within communities. In its entirety, this research seeks to unravel the intricate web of sports, gender, and family dynamics, offering profound insights into their interconnections. With this wisdom in hand, we are better poised to collectively work towards a more equitable, inclusive, and supportive sports environment for individuals of all genders.

Jino Sebastian *et al.,*

METHODOLOGY

The methodology of this study encompasses the research design, sampling methods, sample size, data collection techniques, and sources of data for analysis and interpretation. The study takes a descriptive approach to explore the relationships between sports, gender, and family dynamics in the context of SAI Thalassery, located in Kannur District. Quantitative research methodology was employed for this study, aiming to gather data from a specific group of 20 children residing in one hostel. Primary data were collected through a questionnaire consisting of 17 questions. The survey was conducted in February 2023, facilitating direct field study involvement. In addition, various secondary sources, such as books, articles, journals, internet write-ups, and reports, were utilized to supplement the study's findings. Overall, this study adopts a quantitative approach, utilizing a questionnaire for primary data collection from 20 children in a hostel, while also incorporating secondary sources to further support the research analysis.

DATA ANALYSIS

Data collected through a questionnaire administered among the twenty student inhabitants of SAI hostel Thalassery out of eighty inhabitants selected through random sampling frame. The data was collected in the month of February 2023. The questionnaire contains both open ended and closed ended questions including personal data. The following discussion is based on the patterns, the data elicit, in reference to the objectives and hypotheses of the research project. The study was conducted among women students of SAI as the study is about gender and sports, hence Thalassery SAI. So, the whole respondents are women. SAI hostel Thalassery is exclusively functioning for women. The respondent population belongs to 12 to 23. The respondent population is an age group from seventh standard to post-graduation. The analysis of the gathered data, facilitated by descriptive statistics The analyzed questions and responses of the participants are given below.

Religion
The response on religion shows some interesting facts about societal attitudes towards professional sports among girl students of various religious groups. A big difference can be seen in the number of sports students from the Muslim community in the sports field. Based on the data, 57.1 % belongs to the Hindu community and 42.9% belongs to the Christian community. It is generally understood that religion and women have a close correlation with respect to professional sports. Hindu and Christian communities are relatively large in number in professional sports indicate the comparative open attitudes to professional sports. Religions where conservative societal attitudes prevail, it can be presumed that women sporting is irreligious, which needs to be further explored

Performance Level
The majority of the respondents are state level medal winners and national level represented sports persons. State level representation is 61.1% national level is 27.8% international level is 4.8%   others are 5.6 %.

Rural / Urban
The data was collected from 20 sports students. By analyzing the response received from the respondents, it was understood that majority of the sports students in SAI belongs to rural areas, 90%. Only 10% from urban areas.

Parents background in sports
Most of the parents have no sports background (69.2%) and the 30.8% of parents have the sports background. Shows that students whose parents do not have spotting background get interested in sports.

What leads the students to do sports
By analyzing the data, we can understand that 77.3% of the respondents are practicing sportsto get a job. 13.6 % of students are doing sports for getting a confidence. And the 4.1% of sports persons are doing sports in their peer support and any other reasons.

Gender is an obstacle for doing sports
Most of the respondents say that the gender is not an obstacle to do sports. Only 4% of sports students say yes. Gender is not an issue in sports in Kerala.

Is gender stereotypes affects sporting opportunities

There was some interesting pattern from the response sheet in the sense that 96% of sports students say they do not encounter gender stereotypes. And 4% of sports persons say yes. This creates a big challenge in the life of women in sports even though the percentage is less.

The Economic motive in sports participation
The economic motive in doing sports shows that 59.1% of sports students are saying that there is economic motive in doing sports. And the 40.9% sports persons are disagreed with this reason.

Women status and sports participation
97.5% of the participants agreed and 2.5% disagreed with the increased status of women through sports participation. Participants agreed that the status of the women is increasing to a greater extent through the participation in sport. The responses of women sports people show that sports also help bring women to the forefront of society. It is a great motive to women to come to sports. Sporting women get new avenues, opportunities to travel throughout the world, meet more people, good social relations and exposed to the outside world out of their home and family.

SUMMERY AND CONCLUSION

Research findings indicate a disparity in sports participation, interest, and power based on gender within sports families. Following are the main conclusions derived from the study
1.The study highlights the social utility of sports, particularly for women, in breaking social barriers and promoting empowerment.
2.Religious factors, cultural taboos, and social stigma were found to discourage Muslim women from participating in sports.
3.Sports participation was found to positively impact overall physical and mental health, promoting self-esteem and positive relationships.
4.Sports also serve as a platform for social change, advocating for gender equality and empowering women and girls.
5.Gender stereotypes persist in society, negatively affecting women's representation and opportunities in sports.
6.The study suggests strategies such as education, curriculum inclusion, employment opportunities, breaking stereotypes, and promoting gender equality to create a more inclusive sports environment.
In conclusion, the study demonstrates the interplay of sports participation, gender dynamics, and family dynamics in SAI Thalassery. It emphasizes the need to address gender disparities, promote inclusion, challenge stereotypes, and provide equal opportunities for all individuals in sports.

ABSTRACT

The main purpose of this study is to check the research activities distributed between different authors, publishers and countries. It applies choosing the database from Web of Science in a systematic manner and then applied bibliometric analysis. An existing literature is being examined through Systematic Literature Review and then finally selected articles are analyzed through bibliometric analysis. To make this study possible, the Web of Science database is being used and out of 264, extracted final output of 45 articles on which the bibliometric analysis is applied. The findings of this study aim towards the relevance of Organizational Attractiveness from the jobseeker's perspective. The results also show that organizational attractiveness is less developed and highly relevant topic, which clearly shows the requirement of this study. It is also important to note that this is highly relevant topic, and there is not any bibliometric analysis available.
1. This study contributes to the understanding of the research stream as a whole.
2. It provides a deeper understanding of available studies and how they are connected.
3. It allows researchers to understand the past and present, which helps to create an understanding of what is more required in this area.

Keywords- Bibliometric Analysis, Systematic Literature Review, Organizational Attractiveness, Co-authorship Analysis, Thematic Analysis, Jobseeker

INTRODUCTION

world(Barrick & Parks-Leduc, 2019; Breaugh, 2013; Phillips et al., 2015). Labor markets are facing a cut throat competition for the qualified employees(Highhouse et al., 1999; Rynes et al., 1991). This cut-throat competition can be considered as a talent war(Chambers et al., 1998), as a result the existing organizations need to work upon attracting the prospective applicants in both quantitative as well as qualitative senses(Lievens et al., 2001).While working upon the attraction of employees towards the organization, I found different theories like Expectancy Theory (Connolly & Vines, 1977a, 1977b; Greenhaus et al., 1978; Kirsch, 1997; Vroom, 1966) Decision Theory (Herriot & Rothwell, 1981; Hill, 1974; Shufen Cao, 2023); Signaling Theory (Celani& Singh, 2011; Coelho et al., 2022); Theory of Reasoned Action (Fishbein et al., 1980; Fishbein et al., 1975) which are related to examine the attraction of a prospective applicant towards an organization directly or indirectly. One of the earliest theories about the connection of a prospect with an organization was provided by Barnard in the year 1938. He suggested that a prospective applicant first selects the organization, then decides to remain in that organization as per his own choice. As per Chester (1938), the choice of the prospective applicant here depends upon the incentives and other facilities that are being provided by the organization. On the basis of these incentives and other facilities, he decides to stay or to leave.

From the perspective of jobseekers, finding a job opening is not enough rather finding a job of their own choice matters for them (Soelberg, 1967). This is also important to understand that attraction is not the end of the story but it is the beginning,and it cannot be completed until and unless the intention to apply is not achieved. The study of Gomes & Neves (2011) can be referred here, where the intentions of a jobseeker have been studied into three categories: (1) intention to apply a job vacancy; (2) intention to pursue a job and (3) intention to accept a job. The role of a jobseeker is very prominent here and analysis of his perspective can be helpful in predicting his reactions (Ababneh& Al-Waqfi, 2016) and organizations can use this output to recruit a large pool of employees so that the best could be employed.

Organizational image plays a significant role in organizational attractiveness(Soeling et al., 2022) and its reputation is purely connected to the publicity of that organization. In the same way, the negative publicity leads to negative impact on intention to apply via organizational attractiveness(Ouyang et al., 2021).Turban & Keon (1993) has shown the moderation effect over identity traits (self-esteem and N-ach) and has checked their effect on organizational attractiveness. Some of the other studies advocated that the freshers are relying on the person-organization fit criteria (Kristof, 1996)now days and a positive connection is being observed between organization attractiveness and person-job fit criterion (Huang, 2022a).An applicant that fits in an organization and the job vacancy can work significantly for the success of that organization (Barrick & Parks-Leduc, 2019; Phillips et al., 2015).Some prospects find those organizations attractive that follow same as they follow in their lives (Judge &Bretz, 1992). Here, the beliefs and values of the prospective applicant works as an influential criterion (Soeling et al., 2022). There is a significant correlation found between subjective and objective measures of person-organization fit (Judge & Cable, 1997).

As, the time has changed and internet has become a great source for human management activities, the organizations have also changed their methods to reach to the prospective applicants (Huang, 2022a). Now, technologies help in providing a sufficient amount of information for a job vacancy(Barrick & Parks-Leduc, 2019; Chapman & Webster, 2003; Dineen et al., 2007; Swider et al., 2014)and the organizations need to focus on the ways of representation to attract prospective applicants for the job openings. The role of signaling theory can be understood as a prominent factor in this regard as culture, values, practices, policies(Karasek& Bryant, 2012) are perceived as signals by the prospects as well as by organizations (Celani& Singh, 2011) both which can be observed through the job advertisement. Job advertisements play a vital role in the attraction phase (Schneider, 1987)as per theAttraction-Selection-Attrition Model. This model focus on individual differences too. That's why they have their own choice for staying or leaving the organizations.Schneider (1987) also puts forward that individuals are attracted towards the organization as per their own interests, needs, preferences and personality. This is a two-way process where not only

the organizations but also the prospective applicants have equal chance to make their choice towards an organization(Lievens et al., 2001).

So, the above quoted studies show the different kinds of criteria on which different authors, researchers and scholars have paid attention due to the importance of the topic. In the coming years too, it is expected that this area will attract more researchers to work upon. The current study can be proven to be a good base as it is a bibliometric analysis also known as meaningful analysis ((Ferasso et al., 2020; Rovelli et al., 2021)which analyze the transformation of ways attracting the jobseekers towards an organization since 1993 to May 2023, because in this the research, work till May 2023 has been considered. In this paper, the systematic literature review is followed by bibliometric analysis for the key term "Organizational Attractiveness" specifically. Systematic Literature Review is done by using PRISMA and further, the database has been analyzed on the basis of bibliometric reports as extracted through different software such as HistCite. Considering the importance of organizational attractiveness from the point of view of jobseekers, the current study employs a meticulous and thorough bibliometric evaluation of the research articles. Over the past 27 years, the perspective of a jobseeker has improved (1993-2022).This paper is an attempt to visually depict the researchstatus in the industry. As a complement to earlier qualitative efforts, we also see to learn about the field's evolution footprints and future tendencies throughout the last 27 years and offer new perspectives that has not yet been fully understood or assessed. This study will provide a base and makes it seclude from other articles.

Background

Organizational Attractiveness

An extensive literature is available when it comes to job, its processes and other personal factors which are important for a job applicant(Mauger& Bryant-Lees, 2022),butthe organizations need to work upon employing good talent (Maurya & Agarwal, 2018).Attractingjobseekers is a critical stage because without it,further recruitment process cannot be achieved. It is the way through which prospective applicants may be intended to apply for a job vacancy.Turban& Keon (1993) explained it from the point of view of an interactionist where it provides an evidence that the organizational attributes impact attraction towards firms. But attracting candidates towards the organization,is not limited to attraction only, retaining is also important(Boston/Mass & 1994; Lado& Wilson, 1994; Wright et al., 1995).We know retention is somewhat not the closet approach where as intention to apply is much closer than that (Gomes & Neves, 2011).

Organizations are now focusing on those attributes which are on priority from the point of view of a jobseeker (Lado& Wilson, 1994; Murphy, 1986). But, attraction criteria can be different for different jobseekers. In this regard, Chatman (1989)suggested that applicants are attracted to those organizations where their values and ethics match. So, person-job fit and person-organization fit play important role in this regard (Huang, 2022b; Lievens et al., 2001).
The current scenario related to attraction provide completely a different picture, where different areas such as Corporate Social Responsibility (CSR) fit and credibility whichisjudged as an influential criterion among jobseekers (Agnihotri & Bhattacharya, 2022); Organizational Attributes as required by a jobseeker (Mauger& Bryant-Lees, 2022); Role of Green Employer Certification as an ethical signal to attract applicants (Guillot-Soulez et al., 2022) make it more interesting to be applied. But we should not forget thatpersonal goals still work as a base while attraction takes place whether for a job vacancy or for an organization(Pervin, 1989).Cable & Judge (1994) found that avarice and self- belief work as criteria for an applicant to apply for a job vacancy. In some other studies, attraction is not completed until and unless the jobseeker is not motivated to apply.To conclude, it can be said that organization attractiveness has been studied with different variables, and with different point of views, but still it is under preview due to its prominence. It has been transformed in many ways so, it is worthy to find out its past, present and also the future trend on the basis of available literature. That is why, systematic literature review is applied, to extract the essential articles and bibliometric analysis is held, to get meaningful conclusion and proper shape on the basis of available literature.

Need for Systematic Mapping through Systematic Literature Review and Bibliometric Analysis

While we talk about employees, the first thing comes in the mind is the basic requirement for being selected is "being competent". This topic "Organizational Attractiveness" is not a new one. Extensive work is available on this topic but this study will help to define the journey from its start to current scenario. The picture is not same as previous. Now, the corporate world is more dynamic and has changed drastically, and the period of COVID 19 made revolutionary changes in it. But the need of a competent employee is still same. The unforeseen calamity has forced jobseekers to think differently while choosing the organization. Earlier, they just tried to get a job irrespective of organization image. Today they try to choose the organization and donot let the organization to choose them. So, this topic needs thinking from the point of view of the jobseekers now. Previously, the jobseekers had only one focus that is getting a job but, their thinking has changed, now they are the one who are choosing the organizations, not only the organizations choosing them.

Systematic mapping study is a new way through which the available work is analyzed. It is also helpful to examine the level of change which has been occurred till date. This will help to improve, upgrade and extend the already available literature in more systematic manner. First of all, the available literature is collected through a search process and a total of 45 articles were extracted out of 264 from the database of Web of Science. Afterwards, different kind of analytical techniques areapplied to get the mapping state of organizational attractiveness.

METHODOLOGY

The current paper follows systematic literature review (SLR) at the first step and then bibliometric analysis is followed. Under SLR, the data is extracted after following a rigorous process and then a Bibliometric Analysis is done for the output received after extraction of data.

Search Strategy

This study analyzes the Web of ScienceCoreCollection because it is thought to be the most widely used database for gathering and analyzing scientific literature (van Nunen et al., 2018). An advanced search was conducted on 2ⁿᵈ May, 2023 at 04:25 pm with the keyword entered as "Organizational Attractiveness" in "all fields" to capture the broad range of related research articles.The date and time are mentioned as the databases changes constantly (Liu et al., 2013). This gave a total of 264 articles. Then some filters were applied to narrow down the search.To find out the relevant list of articlesthesearch area was fixed to *Management; Business; Industrial Relations Labor*. The language of research articles was fixed to *English Language* only. The study is limited to *articles, early access articles and review papers*(Kraus et al., 2020). After applying the above filters, an output of 126research papers was extracted and systematically generated the final output. We followed the PRISMA flowchart, which stands for Preferred Reporting Items for Systematic Reviews and Meta-Analyses protocol and is utilized for the review of literature (Moher et al., 2009). Several studies have used this method to show the systematic workings for the final selection of articles(Bartolacci et al., 2020; Ferasso et al., 2020; Mas-Tur et al., 2020; Rovelli et al., 2021). All these articles were then downloaded and screened

In today's world, attracting talented employees is the first step towards success in corporate in three steps: initial screening on the basis of title, at second stage, screening on the basis of abstract reading and third screening, on the basis of full text reading and excluded those articles which were irrelevant as per the need of the study. The complete process of sample selection is shown in figure 1.

Data Analysis

We used two different kinds of data analysis approaches: Fundamental Analysis and Graphical Representation. In fundamental analysis, Histcite, MS Excel and R Studio software are used. In the second part of analysis, graphical representation isshown by using R Studio, MS Excel and VOS viewer.

RESULTS

Fundamental Analysis
Using HistCite software(version 12.03.17; HistCite LLC Software, New York), fundamental quantitative bibliometric index values based on citations and records, top author, journal, and nation were produced. All these files were extracted through Histcite Software which only accesses the Web of Science database.After collecting files from Histcite, the records are compiled and organized as per the requirement with the help of MS Excel.

Authors (on the basis of citation and records produced)
On "Organizational Attractiveness", 112 researchers have written at least one publication. Out of which Van Hoye G received maximum citations (GCS=91) on his 5 articles (Recs) followed by Weijters B, who got 53 citations (GCS). Baum M, who got 47 citations (GCS) for his study thereby placing him at the 3rd order. It can also be observed in Table 2 that there are 15 scholars, who have written atleast two ormore articles whereas 97 authors have written one paper each.From another point of view,Baum M is the author who has published the second-most articles, with four, while Van Haye G gained the first position for witting on the topic with five publications. After Baum M, Lievens F and Kabst R have got their records as three. While remaining 11 scholars published two articles.

Countries
According to Table 2, the countries with the maximum citations for the author's institution are ordered as USA, Germany, and Belgium. German institutions ranked second with a GCS of 47, followed by Belgian institutes once again with a GCS of 34, and Belgian institutions released the highest number of articles on the topic named as "organizational attractiveness" with a GCS of 91. As a result, the countries of Belgium and Germany have made more contributions to this research area.

Journals
An analysis of the citations received by the journals shown in Table 3 reveals that Journal of Vocational Behavior (GCS=53), Human Resource Management (GCS=49), Business Ethics-A European Review (GCS=45), and International Journal of Selection and Assessment (GCS=44) are the journals whose papers received the maximum citations. Personnel Review has accepted several papers on the issue (Recs = 4), despite the fact that there haven't been many publications on the topic in other journals.

Yearly Trend
Throughout the years, there have been more papers published on this subject. After the first article was released in 1993, there have been fewer articles produced since 2014. Since then, a significant amount of papers has been published on this topic, year 2021 has become the period in which the largest number of papers got published (10 articles). The publications that were published in 2016 have acquired the most citations so far (GCS = 114).

Co-authorship Networks
The co-authorship networks show the working togetherness of two or more authors.VOSviewer software is being used in this regard, which gave four clusters showing four items in three clusters whereas two items in the left one cluster. The co-authorship networks are represented using VOSviewer. Figure 4, is showing the different colors depicting different groups who worked together on organizational attractiveness.

Collaboration between Nations
The nations that have at least one paper published on organizational attractiveness are depicted on the map below (nations colored in blue and light blue). The amount of papers published is indicated by the blue color, which represents the nations that have authored the most on this subject. The amount of international collaborations is represented by thicker lines, which indicate more collaboration. The biggest number of publications between

researchers from various nations can be found between France & Canada and Germany & Switzerland, as shown in figure 8.

Strategic Thematic Analysis

Fig. 5presents the strategy diagram for the topic of organizational attractiveness research by using the author's keywords. The size of the circles in this graphic indicates how frequently the terms appear. This diagram is divided into four portions: upper-right; lower-right; upper-left and the lower-left representing motor-themes; basic themes; niche themes and evolving or disappearing themes respectively .As per the diagram, the upper-right quadrant is having 'human resource management' under the head of motor theme area which is an important and well-developed theme for the structuring of this research field. On the other side, the upper-left quadrant shows the niche or the specified themes under which attraction, individual differences, firms, identification, job satisfaction, CSR and financial decisions are included. These themes are well-developed but are of marginal importance. However, the terms "corporate social responsibility", "job- satisfaction," and "financial performance" are shown strong due to their centrality and density. This shows their importance in near future. The themes showed in the lower-right quadrant are showing the under developed fields. So, this quadrant includes the terms like reputation, organizational attractiveness, perceptions, recruitment, applicant attraction, work, performance, job choice etc.

In figure 6, strategic diagram for organizational attractiveness is representing four themes named as niche themes (upper-left); motor themes (upper-right); basic themes (lower-right); emerging or declining themes (lower-left). This figure is drawn on the basis of author's keywords. The larger and smaller sizes of circles represent the density of work done on that particular area. In the upper-left quadrant (niche themes), highly developed but less relevant work is shown. We can see that in this section, "attraction", "individual-differences", "firms; identification; job-satisfaction", "corporate social-responsibility; decisions; financial- performance" are those keywords which affect internally but are not important externally. In the upper-right (motor themes) are representing the highly developed and highly relevant keywords. In this regard, "human resource management", impact" and "information" keywords are those which are highly developed and highly relevant.

The lower-left quadrant is showing the **emerging or declining themes,** it shows that portion which is either under developed or not relevant to work upon. Whereas the lower-right quadrant shows the **basic themes** in which, it is important to be noted **that "Organizational Attractiveness" is less-developed and has a high relevancy level at the same time.** Not only this, but it is also showing that the variable: Organizational Attractiveness is required to be explored in collaboration with perception and reputation. Even we can also see its highly relevance level and under-developed situation of applicant attraction too in collaboration with identity and recruitment.

DISCUSSION AND CONCLUSION

In our study, we have presented the rising corpus of literature on organizational attractiveness, perceptions, and job choice in entrepreneurial environments, as well as its real-world relevance, provided ample evidences of the topic's importance for both research and practice. Some of the significant findings appear to provide 'behind-the-scenes look' in order to be understood. When elaborating on the country-specific findings, it is interesting by the most research output that the most citations belong to western countries. We know that the demand for talented employees in Canada, USA, China and Germany is very high and the human resources are very costly in these countries as well. That is why when the recruitment and selection processes are followed then the best talent is tried to be selected. For that matter, it becomes important for the corporate to focus on organizational attractiveness to attract the best pool out of which the best fit could be selected. We further know that the employees do not stick to one location now days,due to digitalization. So, the country collaboration map helps to attract the talent from different countries also. It is helpful for both the corporate as well as the prospective applicants as it helps to track the geographical location where they should move or not either for searching best talent (from the point of view of organizations) or for the best organization (from the point of view of prospective applicants).

Manpreet Kaur *et al.,*

Overall, the findings of the study show its worth from the perspective of a corporate as well as from the point of view of prospective applicant. It also shows the worth of job seekers' interest which should be considered by the employers'. It indicates the need for additional research into the dynamics of web recruitment. The analysis part of this paper focuses on the value of the body of literature for knowledge development and strategic innovation. We may identify numerous implications for both research and practice when considering the prior literature and this particular study. This study reveals the comprehensive approach that organizations may and ought to adopt when conducting online recruitment. Now jobseekers are more aware and attracted for the organizations for which they want to work. On this basis, we can say that the success of an organizationis a result of choosing the ideal employees which not only benefit it but also the prospective applicant. As a result, this study supportsa wide range of related research fields. We also wish to encourage collaboration between research groups in light of Figure 4. Because cooperation and teamwork increase efficiency and can help in achieving success. This may provide fresh perspectives and pave the way for fresh methods of exploring the subject of organizational attractiveness which is under developed as per the result shown in the figure 8.

Our study has very significant practical consequences. These specific components need to be rethought while the organizations intend to go for recruiting for the vacant position because of the wide range of criteria that organizational attractiveness influences in the associated field. Knowing the characteristics that draw people to apply is crucial since organizations want to choose the greatest talent, thus it's crucial to attract the person. Additionally, the possibility for innovative behavior and activities is offered by organizational attractiveness as a preferred workplace. Because, we are aware that these components are crucial for long-term success and the foundation of maintaining competitiveness, applying these findings in a company will once again contribute to the achievement of both the involved parties, i.e., the employer and the possible applicant. The wide range of studies conducted, show that companies can employ a variety of tactics to please job searchers during the web hiring processes.

Our study has some flaws. It is essentially difficult to constantly get the most recent data because of the topic's prominence. Due to the frequent publication of research articles, we had to set a stop-line in May 2023. Our study has a limitation of using one data source that is Web of Science only. Additionally, the unpredictable nature of work in today's competitive market has not been considered in the adjustment of organizational attractiveness. However, while considering these flaws, one can only highlight the most significant and all-encompassing function that organizational attractiveness will play in the future. Because of this, understanding the diversity and richness of this topic requires significant research across many different fields of study. As a result of our investigation, we discovered that academics from western nations, in particular, contribute to the field of organizational attractiveness by concentrating their work mostly on management-related issues. Since the year 2015, there has been a significant increase in research production for several causes. By attracting the interest of several academic fields with our study, we demonstrate the topic's potential and anticipate further publications in the near future.
